INTRODUCTION

The proposed changes published herein have been submitted in accordance with established procedures and are distributed for review. The publication of these changes constitutes neither endorsement nor question of them but is in accordance with established procedures so that any interested individuals may make their views known to the relevant code committee and others similarly interested. In furtherance of this purpose, the committee will hold an open public hearing at the date and place shown below for the purpose of receiving comments and arguments for or against such proposed changes. Those who are interested in testifying on any of the published changes are expected to be represented at these hearings.

This compilation of code change proposals is available in electronic form only. As part of ICC's green initiative, ICC will no longer print and distribute this document. The compilation of code change proposals will be posted on the ICC website, and CD copies will be distributed to all interested parties on our list.

2013 ICC COMMITTEE ACTION HEARINGS

These proposed changes will be discussed in public hearings to be held on April 21st, 2013 through April 30th, 2013 at the Sheraton Dallas Hotel, Dallas, Texas. The code committees will conduct their public hearings in accordance with the schedule shown on page xlii.

REGISTRATION AND VOTING

All members of ICC may vote on any assembly motion on proposed code changes to all International Codes. **For identification purposes, eligible voting members must register, at no cost, in order to vote.** The registration desk will be open in the lobby of the convention center according to the following schedule:

Saturday, April 20 th	4:00 pm to 6:00 pm
Sunday, April 21 st through Tuesday, April 30 th	7:30 am to 5:00 pm

Council Policy #28-Code Development (page xii) requires that ICC's membership records regarding ICC members reflect the eligible voters 10 days prior to the start of the Code Development Hearings. This process includes new as well as changes to voting status. Section 5.7.4 of CP #28 (page xxii) reads as follows:

- 5.7.4 Eligible Voters:** All members of ICC in attendance at the public hearing shall be eligible to vote on floor motions. Each member is entitled to one vote, except that each Governmental Member Voting Representative in attendance may vote on behalf of its Governmental Member. Code Development Committee members shall be eligible to vote on floor motions. Application, whether new or updated, for ICC membership must be received by the Code Council ten days prior to the commencement of the first day of the public hearing.

As such, new membership applications as well as renewal applications must be received by ICC's Member Services Department by April 11th, 2013. These records will be used to verify eligible voter status for the Code Development Hearings. Members are strongly encouraged to review their membership records for accuracy well in advance of the hearings so that any necessary changes are made prior to the April 11th, 2013 deadline. For information on application for new membership and membership renewal, please go to www.iccsafe.org/membership/join.html or call ICC Member Services at 1-888-ICC SAFE (422-7233)

It should be noted that a corporate member has a single vote. Only one representative of a corporate member will be issued a voting badge. ICC Staff will be contacting corporate members regarding who the designated voting representative will be.

ADVANCED REGISTRATION

You are encouraged to advance register by filling out the registration form available at www.iccsafe.org/springhearings.

CODE DEVELOPMENT PROCESS SCHEDULE

As noted in the posted Advisory Statement of February 4, 2009, the revised Code Development Process includes maintaining the current 3-year publication cycle with a single cycle of code development between code editions. The schedule for the 2012 -2014 Code Development Cycle is the first schedule for the revised code development process (see page ix).

PROCEDURES

The procedures for the conduct of the public hearing are published in *Council Policy #28-Code Development (CP#28)* ("Procedures") on page xv. The attention of interested parties is specifically directed to Section 5.0 of the Procedures. These procedures indicate the conduct of, and opportunity to participate in the ICC Code Development Process. Please review these procedures carefully to familiarize yourself with the process.

There have been a number of revisions to the procedures prior to the start of the Group A hearings. Included among these revisions are the following:

- | | |
|---------------------------------------|--|
| Section 1.6: | Recording. This section was revised to clarify that ICC maintains sole ownership in the content of the hearings and has the right to control its subsequent distribution. In addition, the technology references were updated, using the term "recording" to replace "videotaping". |
| Section 2.4 | Emergency Procedures. This section was revised create a 'metric' to aid in the determination of when an issue rises to the level of concern appropriate to an emergency amendment. Furthermore, it now stipulates a process by which a proposed Emergency Amendment is reviewed by the ICC Codes and Standards Council who is responsible for the implementation and oversight of ICC's Code Development Process. |
| Section 3.3.1
&
Section 6.4.1 | Proponent. An e-mail address for each code change/public comment proponent will be published in the monograph, unless the proponent requests otherwise. |
| Section 3.3.5.3
&
Section 6.4.5 | Substantiation. ICC evaluates whether substantiating material is germane, but the amendment makes it clear that ICC does not in all circumstances evaluate substantiating material for quality or accuracy. |
| Section 3.3.5.6 | Cost Impact. The proponent should submit information that supports their claim regarding cost impact. Any information submitted will be considered by the code development committee. This language is intended to emphasize the need to provide information on how the proposed change will affect the cost of construction. |
| Section 3.6.3.1 | If a proposed new standard is not submitted in at least draft form, the corresponding code change proposal shall be considered incomplete and shall not be processed. |
| Section 4.5.1 | Standards referenced in the I-Codes. The deadline for availability of updated referenced standards and receipt by the Secretariat is December 1 st of the third year of each code cycle. For the 2012/2013 cycle, the deadline is December 1 st , 2014. |

- Section 5.2.2 **Conflict of interest.** The original language, “Violation thereof shall result in the immediate removal of the committee member from the committee.” was removed because there was no mechanism to enforce it. The recourse for someone who feels this section has been violated is to appeal.
- Section 5.4.2 **Open meetings.** A provision has been added that stipulates that participants shall not advocate a position on specific code changes with Committee Members other than through the methods provided in this policy.
- Section 5.4.3
&
Section 7.3.3 **Presentation of Material at the Public Hearing.** All participants are to make it clear what interests they are representing. This disclosure provides additional information upon which to evaluate the testimony.
- Section 5.7 **Assembly consideration.** A successful assembly action will no longer be the initial motion at the Final Action Consideration.
- Section 5.7.3 **Assembly action.** A successful assembly action shall be a majority vote of the votes cast by eligible voters, rather than a 2/3 majority (see below).
- Section 5.7.4 **Eligible voters.** This section is revised to clarify that each member, including Governmental Member Voting Representatives, gets only one vote.
- Section 7.4 **Eligible voters.** This section requires that all Governmental Membership applications must be received by April 1 of the year of the Final Actions for a Governmental Member to be eligible to vote at the Final Action Hearings.

ASSEMBLY ACTION

The procedures regarding assembly action at the Code Actions Hearings have been revised (see Section 5.7 of CP #28 on page xxii). Some important items to note regarding assembly action are:

- A successful assembly action now requires a simple majority rather than a 2/3 majority.
- After the committee decision on a code change proposal is announced by the moderator, any one in the assembly may make a motion for assembly action.
- After a motion for assembly action is made and seconded, the moderator calls for a floor vote in accordance with Section 5.7.2. *No additional testimony will be permitted.*
- A code change proposal that receives a successful assembly [action](#) will be placed on the Final Action Hearing Agenda for individual consideration.

GROUP A, GROUP B AND GROUP C CODE CHANGES

Note that, for code changes submitted to the 2012 I-Codes for the development of the 2015 Edition of the I-Codes, there will be three groups of code development committees and they will meet in separate years. The groupings are as follows:

Group A Codes (Heard in 2012)	Group B Codes (Heard in 2013)	Group C Codes (Heard in 2014)
<i>International Building Code Committees:</i> <i>IBC-Fire Safety (Chapters: 7- 9, 14, 26 and App. D)</i> <i>IBC-General (Chapters: 2-6, 12, 13, 27-34, App. A, B, C, F, H, K)</i> <i>IBC-Means of Egress (Chapters: 10, 11 and App. E)</i> <i>IBC-Structural (Chapters: 15-25 and App. G,I, J, L, M)</i>	<i>Administrative Provisions (Chapter 1 all codes except IgCC, IRC, IECC , ISPSC, Performance Code, designated definitions, and administrative update of referenced standards, including administrative updates of referenced standards in IgCC)</i> <i>(Administrative Code Committee)</i>	<i>International Green Construction Code Committees:</i> <i>IgCC—Energy/Water Committee (Chapters: 6 and 7)</i> <i>IgCC—General Committee (Chapters:2-5, 8-11 and Appendices)</i>
<i>International Fuel Gas Code (IFGC Committee)</i>	<i>International Energy Conservation Code (Commercial Energy Committee – see Note) (Residential Energy Committee – see Note)</i>	
<i>International Mechanical Code (IMC Committee)</i>	<i>International Existing Building Code (IEBC Committee)</i>	
<i>International Plumbing Code (IPC Committee)</i>	<i>International Fire Code (IFC Committee)</i>	
<i>International Private Sewage Disposal Code (IPC Committee)</i>	<i>International Performance Code (ICC Performance Code Committee)</i>	
	<i>International Property Maintenance Code (IPMC/IZC Committee)</i>	
	<i>International Wildland-Urban Interface Code (IFC Committee)</i>	
	<i>International Zoning Code (IPMC/IZC Committee)</i>	
	<i>International Residential Code Committees:</i> <i>IRC-B (Chapters: 1-10 and App. E, F, G,H, J, K, L, M, O)</i> <i>IRC-M/P (Chapters: 12-33 and App. I, P)</i> <i>IRC-E (Chapter 11 – see Note)</i>	
	<i>International Swimming Pool and Spa Code (ISPSC) Committee</i>	

NOTE: Residential Energy Committee is responsible for Chapter 11 of the IRC and the Residential Provisions of the IECC.

GROUP B CODE DEVELOPMENT COMMITTEE RESPONSIBILITIES

Some sections of the International Codes have a letter designation in brackets in front of them. For instance, Section 415.1 of the IBC has a [F] in front of it, meaning that this section is the responsibility of the IFC Code Development Committee.

Code change proposals submitted for such code sections that have a bracketed letter designation in front of them will be heard by the respective committee responsible for such code sections. Because different committees will meet in different years, some proposals for a given code will be heard by a committee in a different year than the year in which the primary committee for this code meets.

The code change proposals pertaining to the codes from Group A will be assigned their traditional code change prefix. In the example above, the code change proposal would be identified as G-XX because Chapter 4 of the IBC is the responsibility of the IBC – General committee. This item would then be placed on the agenda of the IFC committee.

Note that there are several in the Group B codes that have already received code changes during the Group A hearings. In particular, there were several code change proposals in the IBC-Structural hearing order that were changes to the International Existing Building Code (marked with prefix “EB”). These are changes to sections of the existing building code that were the responsibility of the IBC-Structural Code Development Committee. A complete summary of the Group A and Group B and Group C Code Development Committees’ responsibilities can be viewed at the ICC Website: http://www.iccsafe.org/cs/codes/Documents/2012-13cycle/GroupA-B_CDC-Responsibilities.pdf.

ANALYSIS STATEMENTS

Various proposed changes published herein contain an “analysis” that appears after the proponent’s reason. These comments do not advocate action by the code committees or the voting membership for or against a proposal. The purpose of such comments is to identify pertinent information that is relevant to the consideration of the proposed change by all interested parties, including those testifying, the code committees and the voting membership. Staff analyses customarily identify such things as: conflicts and duplication within a proposed change and with other proposed changes and/or current code text; deficiencies in proposed text and/or substantiation; text problems such as wording defects and vagueness; background information on the development of current text; and staff’s review of proposed reference standards for compliance with the Procedures. Lack of an analysis indicates neither support for, nor opposition to a proposal.

REFERENCE STANDARDS

Proposed changes that include the addition of a reference to a new standard (i.e. a standard that is not currently referenced in the I-Codes.) will include in the proposal the number, title and edition of the proposed standard. This identifies to all interested parties the precise document that is being proposed and which would be included in the referenced standards chapter of the code if the proposed change is approved. Section 3.6.3.1 of CP #28 now requires that a code change proposal will not be processed unless a consensus draft of the standard has been provided. Proponents of code changes which propose a new standard have been directed to forward copies of the standard to the Code Committee. An analysis statement will be posted on the ICC website providing information regarding standard content, such as enforceable language, references to proprietary products or services, and references to consensus procedure. The analysis statements for referenced standards will be posted on or before April 1st, 2013. This information will also be published and made available at the hearings.

REFERENCED STANDARDS UPDATES

Administrative updates of any standards already referenced in any of the I-Codes will be contained in a code change proposal for consideration by the Administrative Code Development Committee. The Administrative Code Development Committee is a Group B committee which will conduct hearings on the administrative provisions (Chapter 1 and certain definitions) of all I-Codes, and the referenced standards update. Therefore, this committee will conduct its code development hearing during these code development hearings.

It should be noted that, in accordance with Section 4.5.1 of CP #28 (see page xviii), standards promulgators will have until December 1, 2014 to finalize and publish any updates to standards in the administrative update. If the standard update is not finalized and published by December 1, 2014, the respective I-Codes will be revised to reference the previously listed year edition of the standard.

MODIFICATIONS

Those who are submitting a modification for consideration by the respective Code Development Committee are required to submit a Copyright Release in order to have their modifications considered (Section 3.3.4.5 of CP #28). It is preferred that such release be executed in advance – the form is at

<http://www.iccsafe.org/cs/codes/publicforms.htm>. Copyright release forms will also be available at the hearings. Please note that an individual need only sign one copyright release for submittals of all code change proposals, modifications, and public comments in this code change cycle for which the individual might be responsible.

Please be sure to review Section 5.5.2 of CP #28 for the modification process. The Chair of the respective code development committee rules a modification in or out of order. That ruling is final, with no challenge allowed. The proponent submitting a modification is required to supply 20 printed copies. The minimum font size must be 16 point.

Example:

Original code change proposal.

The original code change proposal requested the following change to Section 305.3 of one of our I-Codes: (Note that the example is fictional.)

PM10-13 305.13

Proponent: John West representing self

Revise as follows:

305.3 Interior surfaces. All interior surfaces, including windows and doors, shall be maintained in good and clean condition. Peeling, chipping, flaking or abraded paint shall be repaired, removed or covered. Cracked or loose plaster, ~~decayed wood~~ and other defective surface conditions shall be corrected. Surfaces of porous materials made of or containing organic materials, such as but not limited to wood, textiles, paint, cellulose insulation, and paper, including paper-faced gypsum board, that have visible signs of mold or mildew shall be removed and replaced or remediated in an approved manner.

Exception: Porous materials that do not contain organic materials, such as clean unpainted bricks and concrete.

Proposed modification:

A modification to the code change proposal is proposed:

1. To add “and sanitary” after “clean” in the first sentence.
2. To add “or water permeable” after “porous” in the third sentence.
3. Delete “in an approved manner.” in the last sentence.
4. Delete the proposed new exception.

The modification should read as follows. Note that the font style is Ariel, and the font size is 16 pt. The ~~cross-out~~, underline format is removed from the text of the original proposal and the requested revisions in the original proposal are made and shown as original text. The modification to the original proposal is shown with ~~cross-out~~, underline format applied to the changes proposed in the modification.

Example of proposed modification:

PM10-13
305.13

Proponent: Sam Sumter representing self

Modify the proposal as follows:

305.3 Interior surfaces. All interior surfaces, including windows and doors, shall be maintained in good, ~~and clean~~ and sanitary condition. Peeling, chipping, flaking or abraded paint shall be repaired, removed or covered. Cracked or loose plaster and other defective surface conditions shall be corrected. Surfaces of porous or water permeable materials made of or containing organic materials, such as but not limited to wood, textiles, paint, cellulose insulation, and paper, including paper-faced gypsum board, that have visible signs of mold or mildew shall be removed and replaced or remediated ~~in an approved manner.~~

~~Exception:~~ ~~Porous materials that do not contain organic materials, such as clean unpainted bricks and concrete.~~

***Note:** The modification should be able to be shown on the overhead screen on a single page. Only show the pertinent part of the code change proposal that shows the intended revisions. The entire code change proposal need not be shown.*

CODE CORRELATION COMMITTEE

In every code change cycle, there are code change proposals that are strictly editorial. The Code Correlation Committee approves all proposals deemed editorial. A list of code correlation committee actions are shown at the end of this document (CCC-1).

ICC WEBSITE – [WWW.ICCSAFE.ORG](http://www.iccsafe.org)

This document is posted on the ICC Website, www.iccsafe.org. While great care has been exercised in the publication of this document, errata to proposed changes may occur. Errata, if any, will be identified in updates posted prior to the Code Development Hearings on the ICC website at <http://www.iccsafe.org>. Users are encouraged to periodically review the ICC Website for updates to the 2012 - 2014 Code Development Cycle-Group B (2013) Proposed Changes. Additionally, analysis statements for code changes which propose a new referenced standard will be updated to reflect the staff review of the standard for compliance with Section 3.6 of the Procedures.

PROPONENT CONTACT INFORMATION

For most of the code change proposals, an e-mail address for the proponent has been provided.

2012 - 2014 ICC CODE DEVELOPMENT SCHEDULE

(Updated December 12, 2012)

STEP IN CODE DEVELOPMENT CYCLE	DATE		
	2012 – Group A Codes IBC, IFGC, IMC, IPC, IPSDC	2013 – Group B Codes Admin, ICCPC, IEBC, IECC, IFC, IPMC, IRC, ISPSC, IWUIC, IZC	2014 – Group C Code IgCC
2012 EDITION OF I-CODES PUBLISHED	April 30, 2011		March 31, 2012
DEADLINE FOR RECEIPT OF APPLICATIONS FOR ALL CODE COMMITTEES	June 1, 2011 for the 2012/2013/2014 Cycle (updated to July 1 for IECC and IRC – Energy; August 1 for IgCC and ISPSC) June 2, 2014 for the 2015/2016/2017 Cycle. Call for committee to be posted in January/2014.		
DEADLINE FOR RECEIPT OF CODE CHANGE PROPOSALS	January 3, 2012	January 3, 2013	January 6, 2014
WEB POSTING OF “PROPOSED CHANGES TO THE I-CODES”	March 12, 2012	March 11, 2013	March 10, 2014
DISTRIBUTION DATE OF “PROPOSED CHANGES TO THE I-CODES” (CD only)	April 2, 2012	April 1, 2013	April 1, 2014
COMMITTEE ACTION HEARING (CAH)	April 29 – May 6, 2012 Sheraton Dallas Hotel Dallas, TX	April 21 – 30, 2013 Sheraton Dallas Hotel Dallas, TX	April 27 – May 4, 2014 Memphis Cook Convention Center Memphis, TN
WEB POSTING OF “REPORT OF THE COMMITTEE ACTION HEARING”	June 8, 2012	May 31, 2013	June 6, 2014
DISTRIBUTION DATE OF “REPORT OF THE COMMITTEE ACTION HEARING” (CD only)	June 29, 2012	June 21, 2013	June 27, 2014
DEADLINE FOR RECEIPT OF PUBLIC COMMENTS	August 1, 2012	July 15, 2013	July 16, 2014
WEB POSTING OF PUBLIC COMMENTS “PUBLIC COMMENT AGENDA”	September 10, 2012	August 28, 2013	August 27, 2014
DISTRIBUTION DATE OF “PUBLIC COMMENT AGENDA” (CD only)	October 1, 2012	September 16, 2013	September 17, 2014
PUBLIC COMMENT HEARING (PCH) ANNUAL CONFERENCE DATES NOTED BY AC	October 24 – 28, 2012 Oregon Convention Center Portland, OR AC: October 21 - 24	October 2 – 10, 2013 Atlantic City Convention Center Atlantic City, NJ AC: September 29 – October 2	October 1 – 7, 2014 Greater Fort Lauderdale Broward County Convention Center For Lauderdale, FL AC: September 28 – October 1

Notes:

- Be sure to review the document entitled “Group A, Group B and Group C Code Development Committee Responsibilities” posted at www.iccsafe.org/responsibilities which identifies committee responsibilities which are different than Group A, B and C codes which may impact the applicable code change cycle and resulting code change deadline. This document is also linked from the Public Code Change Proposal Form. As an example, throughout Chapter 9 of the IBC (a Group A code), there are numerous sections which include an “[F]” which indicates that the provisions of the section are maintained by the Fire Code Development Committee (a

Group B code).

- The International Green Construction Code (IgCC) and International Swimming Pool and Spa Code (ISPSC) were subjected to a full cycle of code development in 2011 resulting in 2012 editions published in March/2012.
- Group B “Admin” includes code change proposals submitted to Chapter 1 of all the I-Codes except the IECC, IgCC, IRC, ISPSC, and the ICCPC and the administrative update of referenced standards in all the 2012 I-Codes. Proposed changes to Chapter 1 of the IECC, IgCC, IRC, ISPSC and ICCPC will be considered by the applicable Code Development Committee.
- Final Action Hearing note: The dates indicated for the Final Action Hearings are based on an assumed start of the hearings on the Wednesday of the respective Annual Conference. Public comment volume may dictate that the Final Action Hearing on one or more of the codes be held on Monday afternoon (with the code completed in the Monday session) in order for the Final Action Agenda for all the codes to be completed in the time allotted. Be sure to consult the posted Final Action Hearing Schedule.
- A comprehensive review of the 2012 – 2014 code groupings will be performed no later than upon receipt of IgCC code change proposals in January/2014 with the potential for 2015 – 2017 code groupings to change. Any changes will be posted at that time. The 2015 – 2017 Cycle will begin with Group A code change proposals due January 5, 2015.
- This updated schedule utilizes the revised hearing terms noted in the cdp ACCESS report, as follows:

Old term

Code Development Hearing
Report of the Public Hearing
Final Action Agenda
Final Action Hearing

Revised term

Committee Action Hearing
Report of the Committee Action Hearing
Public Comment Agenda
Public Comment Hearing

cdp ACCESS Update

During the December/2012 winter meeting, the International Code Council Board of Directors approved the cdp ACCESS Steering Committee's final recommendations. The Board authorized staff to proceed with the initiative to increase participation in ICC's core function: Code Development.

The cdp ACCESS Steering Committee's final recommendations outline several key elements for expanding participation in the ICC Code Development Process, including:

- Online collaboration for stakeholders in the development of Code Change and Public Comment submittals as well as collaboration in preparation for participating at hearings.
- Online submittal of Code Change and Public Comment submittals utilizing a database of current I-Code text to facilitate the process.
- Establishing a two-week period following the Committee Action Hearing for online voting on assembly motions by all ICC Members. Successful assembly motions will continue to result in an automatic public comment. Committee recommendations remain as the initial motion for the Public Comment Hearing.
- Establishing a two-week period following the Public Comment Hearing for online voting by Governmental Members based on the actions that occurred on the Individual Consideration Agenda at the Public Comment Hearing. The online voting ballot will include the results from the Public Comment Hearing and access to video and other content of record from the hearing. The results will be added to the vote count from the Public Comment Hearing to determine the final disposition of the code change.

A flow chart has been created to illustrate the new process – see page xiii

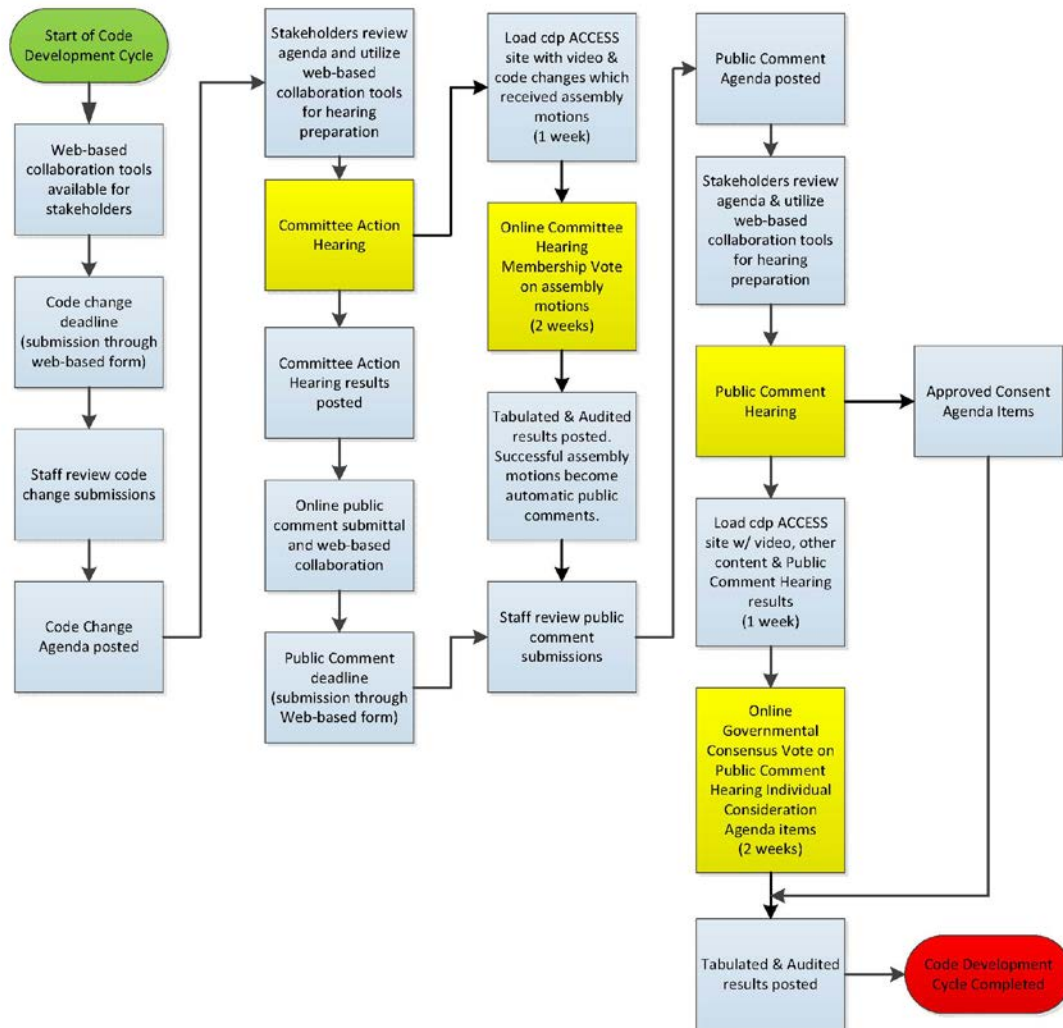

As outlined in the Steering Committee's reports, the required registration periods for in-person and online voting participants will be increased, and the new system will use state-of-the-art security technology to help preserve the integrity of ICC's governmental consensus Code Development Process. The in-person and online voting processes will maintain compliance with federal guidelines for consensus and accessibility.

Several steps will be taken over the next few months to prepare for testing online voting on a handful of code changes in October at the Public Comment Hearings, formerly called Final Action Hearings, in Atlantic City. Testing also will include submitting code changes and public comments online as well as collaboration tools. The 2014 cycle for the development of the 2015 *International Green Construction Code* will use the new cdp ACCESS online and in-person process. We anticipate that the system will go live on November 15, 2013 to support the 2014 cycle. cdp ACCESS will be online in 2015 for development of all the 2018 I-Codes

For additional information on cdp ACCESS, be sure to visit the website at:

cdp ACCESS Flow Chart

CP# 28-05 CODE DEVELOPMENT

Approved: 9/24/05

Revised: 12/6/12

CP # 28-05 is an update to ICC's *Code Development Process for the International Codes* dated May 15, 2004.

1.0 Introduction

- 1.1 **Purpose:** The purpose of this Council Policy is to prescribe the Rules of Procedure utilized in the continued development and maintenance of the International Codes (Codes).
- 1.2 **Objectives:** The ICC Code Development Process has the following objectives:
 - 1.2.1 The timely evaluation and recognition of technological developments pertaining to construction regulations.
 - 1.2.2 The open discussion of proposals by all parties desiring to participate.
 - 1.2.3 The final determination of Code text by public officials actively engaged in the administration, formulation or enforcement of laws, ordinances, rules or regulations relating to the public health, safety and welfare and by honorary members.
- 1.3 **Code Publication:** The ICC Board of Directors (ICC Board) shall determine the title and the general purpose and scope of each Code published by the ICC.
 - 1.3.1 **Code Correlation:** The provisions of all Codes shall be consistent with one another so that conflicts between the Codes do not occur. Where a given subject matter or code text could appear in more than one Code, the ICC Board shall determine which Code shall be the primary document, and therefore which code development committee shall be responsible for review and maintenance of the code text. Duplication of content or text between Codes shall be limited to the minimum extent necessary for practical usability of the Codes, as determined in accordance with Section 4.4.
- 1.4 **Process Maintenance:** The review and maintenance of the Code Development Process and these Rules of Procedure shall be by the ICC Board. The manner in which ICC codes are developed embodies core principles of the organization. One of those principles is that the final content of ICC codes is determined by a majority vote of the governmental and honorary members. It is the policy of the Board that there shall be no change to this principle without the affirmation of two-thirds of the governmental and honorary members responding.
- 1.5 **Secretariat:** The Chief Executive Officer shall assign a Secretariat for each of the Codes. All correspondence relating to code change proposals and public comments shall be addressed to the Secretariat.
- 1.6 **Recording:** Individuals requesting permission to record any meeting or hearing, or portion thereof, shall be required to provide the ICC with a release of responsibility disclaimer and shall acknowledge that ICC shall retain sole ownership of the recording, and that they have insurance coverage for liability and misuse of recording materials. Equipment and the process used to record shall, in the judgment of the ICC Secretariat, be conducted in a manner that is not disruptive to the meeting. The ICC shall not be responsible for equipment, personnel or any other provision necessary to accomplish the videotaping. An unedited copy of the recording shall be forwarded to ICC within 30 days of the meeting. Recordings shall not otherwise be copied, reproduced or distributed in any manner. Recordings shall be returned to ICC or destroyed upon the request of ICC.

2.0 Code Development Cycle

- 2.1 **Intent:** The code development cycle shall consist of the complete consideration of code change proposals in accordance with the procedures herein specified, commencing with the deadline for submission of code change proposals (see Section 3.5) and ending with publication of final action on the code change proposals (see Section 7.6).
- 2.2 **New Editions:** The ICC Board shall determine the schedule for publishing new editions of the Codes. Each new edition shall incorporate the results of the code development activity since the last edition.
- 2.3 **Supplements:** The results of code development activity between editions may be published.
- 2.4 **Emergency Action Procedures:**
 - 2.4.1 **Scope:** Emergency actions are limited to those issues representing an immediate threat to health and safety that warrant a more timely response than allowed by the Code Development Process schedule.
 - 2.4.2 **Initial Request:** A request for an emergency action shall be based upon perceived threats to health and safety and shall be reviewed by the ICC Codes and Standards Council for referral to the Board of Directors for action with their analysis and recommendation.
 - 2.4.3 **Board and Member Action:** In the event that the ICC Board determines that an emergency amendment to any Code or supplement thereto is warranted, the same may be adopted by the ICC Board. Such action shall require an affirmative vote of at least two-thirds of the ICC Board.

The ICC membership shall be notified within ten days after the ICC Boards' official action of any emergency amendment. At the next Annual Business Meeting, any emergency amendment shall be presented to the members for ratification by a majority of the ICC Governmental Member Representatives and Honorary Members present and voting.

All code revisions pursuant to these emergency procedures and the reasons for such corrective action shall be published as soon as practicable after ICC Board action. Such revisions shall be identified as an emergency amendment.

Emergency amendments to any Code shall not be considered as a retro-active requirement to the Code. Incorporation of the emergency amendment into the adopted Code shall be subjected to the process established by the adopting authority.

3.0 Submittal of Code Change Proposals

- 3.1 **Intent:** Any interested person, persons or group may submit a code change proposal which will be duly considered when in conformance to these Rules of Procedure.
- 3.2 **Withdrawal of Proposal:** A code change proposal may be withdrawn by the proponent (WP) at any time prior to Final Action Consideration of that proposal. A withdrawn code change proposal shall not be subject to a public hearing, motions, or Final Action Consideration.
- 3.3 **Form and Content of Code Change Submittals:** Each code change proposal shall be submitted separately and shall be complete in itself. Each submittal shall contain the following information:
 - 3.3.1 **Proponent:** Each code change proposal shall include the name, title, mailing address, telephone number, and email address of the proponent. Email addresses shall be published with the code change proposals unless the proponent otherwise requests on the submittal form.
 - 3.3.1.1 If a group, organization or committee submits a code change proposal, an individual with prime responsibility shall be indicated.
 - 3.3.1.2 If a proponent submits a code change on behalf of a client, group, organization or committee, the name and mailing address of the client, group, organization or committee shall be indicated.

- 3.3.2 Code Reference:** Each code change proposal shall relate to the applicable code sections(s) in the latest edition of the Code.
- 3.3.2.1** If more than one section in the Code is affected by a code change proposal, appropriate proposals shall be included for all such affected sections.
- 3.3.2.2** If more than one Code is affected by a code change proposal, appropriate proposals shall be included for all such affected Codes and appropriate cross referencing shall be included in the supporting information.
- 3.3.3 Multiple code change proposals to a code section.** A proponent shall not submit multiple code change proposals to the same code section. When a proponent submits multiple code change proposals to the same section, the proposals shall be considered as incomplete proposals and processed in accordance with Section 4.3. This restriction shall not apply to code change proposals that attempt to address differing subject matter within a code section.
- 3.3.4 Text Presentation:** The text proposal shall be presented in the specific wording desired with deletions shown struck out with a single line and additions shown underlined with a single line.
- 3.3.4.1** A charging statement shall indicate the referenced code section(s) and whether the proposal is intended to be an addition, a deletion or a revision to existing Code text.
- 3.3.4.2** Whenever practical, the existing wording of the text shall be preserved with only such deletions and additions as necessary to accomplish the desired change.
- 3.3.4.3** Each proposal shall be in proper code format and terminology.
- 3.3.4.4** Each proposal shall be complete and specific in the text to eliminate unnecessary confusion or misinterpretation.
- 3.3.4.5** The proposed text shall be in mandatory terms.
- 3.3.5 Supporting Information:** Each code change proposal shall include sufficient supporting information to indicate how the proposal is intended to affect the intent and application of the Code.
- 3.3.5.1 Purpose:** The proponent shall clearly state the purpose of the proposed code change (e.g. clarify the Code; revise outdated material; substitute new or revised material for current provisions of the Code; add new requirements to the Code; delete current requirements, etc.)
- 3.3.5.2 Reasons:** The proponent shall justify changing the current Code provisions, stating why the proposal is superior to the current provisions of the Code. Proposals which add or delete requirements shall be supported by a logical explanation which clearly shows why the current Code provisions are inadequate or overly restrictive, specifies the shortcomings of the current Code provisions and explains how such proposals will improve the Code.
- 3.3.5.3 Substantiation:** The proponent shall substantiate the proposed code change based on technical information and substantiation. Substantiation provided which is reviewed in accordance with Section 4.2 and determined as not germane to the technical issues addressed in the proposed code change may be identified as such. The proponent shall be notified that the proposal is considered an incomplete proposal in accordance with Section 4.3 and the proposal shall be held until the deficiencies are corrected. The proponent shall have the right to appeal this action in accordance with the policy of the ICC Board. The burden of providing substantiating material lies with the proponent of the code change proposal. All substantiating material published by ICC is material that has been provided by the proponent and in so publishing ICC makes no representations or warranties about its quality or accuracy.
- 3.3.5.4 Bibliography:** The proponent shall submit a bibliography of any substantiating material submitted with the code change proposal. The bibliography shall be published with the code change and the proponent shall make the substantiating materials available for review at the appropriate ICC office and during the public hearing.

3.3.5.5 Copyright Release: The proponent of code change proposals, floor modifications and public comments shall sign a copyright release reading: "I hereby grant and assign to ICC all rights in copyright I may have in any authorship contributions I make to ICC in connection with any proposal and public comment, in its original form submitted or revised form, including written and verbal modifications submitted in accordance Section 5.5.2. I understand that I will have no rights in any ICC publications that use such contributions in the form submitted by me or another similar form and certify that such contributions are not protected by the copyright of any other person or entity."

3.3.5.6 Cost Impact: The proponent shall indicate one of the following regarding the cost impact of the code change proposal: 1) the code change proposal will increase the cost of construction; or 2) the code change proposal will not increase the cost of construction. The proponent should submit information to support either assertion. Any such information will be considered by the code development committee. This information will be included in the bibliography of the published code change proposal.

3.4 Number: One copy of each code change proposal, two copies of each proposed new referenced standard and one copy of all substantiating information shall be submitted. Additional copies may be requested when determined necessary by the Secretariat to allow such information to be distributed to the code development committee. Where such additional copies are requested, it shall be the responsibility of the proponent to send such copies to the respective code development committee. A copy of the code change proposal in electronic form is preferred.

3.5 Submittal Deadline: Each code change proposal shall be received at the office of the Secretariat by the posted deadline. Such posting shall occur no later than 120 days prior to the code change deadline. The submitter of a proposed code change is responsible for the proper and timely receipt of all pertinent materials by the Secretariat.

3.6 Referenced Standards: In order for a standard to be considered for reference or to continue to be referenced by the Codes, a standard shall meet the following criteria:

3.6.1 Code References:

3.6.1.1 The standard, including title and date, and the manner in which it is to be utilized shall be specifically referenced in the Code text.

3.6.1.2 The need for the standard to be referenced shall be established.

3.6.2 Standard Content:

3.6.2.1 A standard or portions of a standard intended to be enforced shall be written in mandatory language.

3.6.2.2 The standard shall be appropriate for the subject covered.

3.6.2.3 All terms shall be defined when they deviate from an ordinarily accepted meaning or a dictionary definition.

3.6.2.4 The scope or application of a standard shall be clearly described.

3.6.2.5 The standard shall not have the effect of requiring proprietary materials.

3.6.2.6 The standard shall not prescribe a proprietary agency for quality control or testing.

3.6.2.7 The test standard shall describe, in detail, preparation of the test sample, sample selection or both.

3.6.2.8 The test standard shall prescribe the reporting format for the test results. The format shall identify the key performance criteria for the element(s) tested.

3.6.2.9 The measure of performance for which the test is conducted shall be clearly defined in either the test standard or in Code text.

3.6.2.10 The standard shall not state that its provisions shall govern whenever the referenced standard is in conflict with the requirements of the referencing Code.

3.6.2.11 The preface to the standard shall announce that the standard is promulgated according to a consensus procedure.

3.6.3 Standard Promulgation:

- 3.6.3.1** Code change proposals with corresponding changes to the code text which include a reference to a proposed new standard or a proposed update of an existing referenced shall comply with this section. The standard shall be completed and readily available prior to Final Action Consideration based on the cycle of code development which includes the proposed code change proposal. In order for a new standard to be considered for reference by the Code, such standard shall be submitted in at least a consensus draft form in accordance with Section 3.4. If a new standard is not submitted in at least draft form, the code change shall be considered incomplete and shall not be processed. Updating of standards without corresponding code text changes shall be accomplished administratively in accordance with Section 4.5.
- 3.6.3.2** The standard shall be developed and maintained through a consensus process such as ASTM or ANSI.

4.0 Processing of Proposals

- 4.1 Intent:** The processing of code change proposals is intended to ensure that each proposal complies with these Rules of Procedure and that the resulting published proposal accurately reflects that proponent's intent.
- 4.2 Review:** Upon receipt in the Secretariat's office, the code change proposals will be checked for compliance with these Rules of Procedure as to division, separation, number of copies, form, language, terminology, supporting statements and substantiating data. Where a code change proposal consists of multiple parts which fall under the maintenance responsibilities of different code committees, the Secretariat shall determine the code committee responsible for determining the committee action in accordance with Section 5.6.
- 4.3 Incomplete Proposals:** When a code change proposal is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the Secretariat shall notify the proponent of the specific deficiencies and the proposal shall be held until the deficiencies are corrected, with a final date set for receipt of a corrected submittal. If the Secretariat receives the corrected proposal after the final date, the proposal shall be held over until the next code development cycle. Where there are otherwise no deficiencies addressed by this section, a proposal that incorporates a new referenced standard shall be processed with an analysis of referenced standard's compliance with the criteria set forth in Section 3.6.
- 4.4 Editorial:** The Chief Executive Officer shall have the authority at all times to make editorial and format changes to the Code text, or any approved changes, consistent with the intent, provisions and style of the Code. An editorial or format change is a text change that does not affect the scope or application of the code requirements.
- 4.5 Updating Standards:**
 - 4.5.1 Standards referenced in the I-Codes:** The updating of standards referenced by the Codes shall be accomplished administratively by the Administrative code development committee in accordance with these full procedures except that the deadline for availability of the updated standard and receipt by the Secretariat shall be December 1 of the third year of each code cycle. The published version of the new edition of the Code which references the standard will refer to the updated edition of the standard. If the standard is not available by the deadline, the edition of the standard as referenced by the newly published Code shall revert back to the reference contained in the previous edition and an errata to the Code issued Multiple standards to be updated may be included in a single proposal.
- 4.6 Preparation:** All code change proposals in compliance with these procedures shall be prepared in a standard manner by the Secretariat and be assigned separate, distinct and consecutive numbers. The Secretariat shall coordinate related proposals submitted in accordance with Section 3.3.2 to facilitate the hearing process.
- 4.7 Publication:** All code change proposals shall be posted on the ICC website at least 30 days prior to the public hearing on those proposals and shall constitute the agenda for the public hearing. Code change proposals which have not been published shall not be considered.

5.0 Public Hearing

- 5.1 Intent:** The intent of the public hearing is to permit interested parties to present their views including the cost and benefits on the code change proposals on the published agenda. The code development committee will consider such comments as may be presented in the development of their action on the disposition of such proposals. At the conclusion of the code development committee deliberations, the committee action on each code change proposal shall be placed before the hearing assembly for consideration in accordance with Section 5.7.
- 5.2 Committee:** The Code Development Committees shall be appointed by the Board of Directors.
- 5.2.1 Chairman/Moderator:** The Chairman and Vice-Chairman shall be appointed by the Steering Committee on Councils from the appointed members of the committee. The ICC President shall appoint one or more Moderators who shall act as presiding officer for the public hearing.
- 5.2.2 Conflict of Interest:** A committee member shall withdraw from and take no part in those matters with which the committee member has an undisclosed financial, business or property interest. The committee member shall not participate in any committee discussion or any committee vote on the matter in which they have an undisclosed interest. A committee member who is a proponent of a proposal shall not participate in any committee discussion on the matter or any committee vote. Such committee member shall be permitted to participate in the floor discussion in accordance with Section 5.5 by stepping down from the dais.
- 5.2.3 Representation of Interest:** Committee members shall not represent themselves as official or unofficial representatives of the ICC except at regularly convened meetings of the committee.
- 5.2.4 Committee Composition:** The committee may consist of representation from multiple interests. A minimum of thirty-three and one-third percent (33.3%) of the committee members shall be regulators.
- 5.3 Date and Location:** The date and location of each public hearing shall be announced not less than 60 days prior to the date of the public hearing.
- 5.4 General Procedures:** *The Robert's Rules of Order* shall be the formal procedure for the conduct of the public hearing except as a specific provision of these Rules of Procedure may otherwise dictate. A quorum shall consist of a majority of the voting members of the committee.
- 5.4.1 Chair Voting:** The Chairman of the committee shall vote only when the vote cast will break a tie vote of the committee.
- 5.4.2 Open Meetings:** Public hearings of the Code Development Committees are open meetings. Any interested person may attend and participate in the Floor Discussion and Assembly Consideration portions of the hearing. Only eligible voters (see Section 5.7.4) are permitted to vote on Assembly Considerations. Only Code Development Committee members may participate in the Committee Action portion of the hearings (see Section 5.6). Participants shall not advocate a position on specific code changes with Committee Members other than through the methods provided in this policy.
- 5.4.3 Presentation of Material at the Public Hearing:** Information to be provided at the hearing shall be limited to verbal presentations and modifications submitted in accordance with Section 5.5.2. Each individual presenting information at the hearing shall state their name and affiliation, and shall identify any entities or individuals they are representing in connection with their testimony. Audio-visual presentations are not permitted. Substantiating material submitted in accordance with Section 3.3.4.4 and other material submitted in response to a code change proposal shall be located in a designated area in the hearing room and shall not be distributed to the code development committee at the public hearing.
- 5.4.4 Agenda Order:** The Secretariat shall publish an agenda for each public hearing, placing individual code change proposals in a logical order to facilitate the hearing. Any public hearing attendee may move to revise the agenda order as the first order of business at the public

hearing, or at any time during the hearing except while another proposal is being discussed. Preference shall be given to grouping like subjects together, and for moving items back to a later position on the agenda as opposed to moving items forward to an earlier position. A motion to revise the agenda order is subject to a 2/3 vote of those present and voting.

5.4.5 Reconsideration: There shall be no reconsideration of a proposed code change after it has been voted on by the committee in accordance with Section 5.6; or, in the case of assembly consideration, there shall be no reconsideration of a proposed code change after it has been voted on by the assembly in accordance with Section 5.7.

5.4.6 Time Limits: Time limits shall be established as part of the agenda for testimony on all proposed changes at the beginning of each hearing session. Each person requesting to testify on a change shall be given equal time. In the interest of time and fairness to all hearing participants, the Moderator shall have limited authority to modify time limitations on debate. The Moderator shall have the authority to adjust time limits as necessary in order to complete the hearing agenda.

5.4.6.1 Time Keeping: Keeping of time for testimony by an individual shall be by an automatic timing device. Remaining time shall be evident to the person testifying. Interruptions during testimony shall not be tolerated. The Moderator shall maintain appropriate decorum during all testimony.

5.4.6.2 Proponent Testimony: The Proponent is permitted to waive an initial statement. The Proponent shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where the code change proposal is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to be allotted additional time for rebuttal.

5.4.7 Points of Order: Any person participating in the public hearing may challenge a procedural ruling of the Moderator or the Chairman. A majority vote of the eligible voters as determined in Section 5.7.4 shall determine the decision.

5.5 Floor Discussion: The Moderator shall place each code change proposal before the hearing for discussion by identifying the proposal and by regulating discussion as follows:

5.5.1 Discussion Order:

1. *Proponents.* The Moderator shall begin by asking the proponent and then others in support of the proposal for their comments.
2. *Opponents.* After discussion by those in support of a proposal, those opposed hereto, if any, shall have the opportunity to present their views.
3. *Rebuttal in support.* Proponents shall then have the opportunity to rebut points raised by the opponents.
4. *Rerebuttal in opposition.* Opponents shall then have the opportunity to respond to the proponent's rebuttal.

5.5.2 Modifications: Modifications to proposals may be suggested from the floor by any person participating in the public hearing. The person proposing the modification is deemed to be the proponent of the modification.

5.5.2.1 Submission and Written Copies. All modifications must be written, unless determined by the Chairman to be either editorial or minor in nature. The modification proponent shall provide 20 copies to the Secretariat for distribution to the committee.

5.5.2.2 Criteria. The Chairman shall rule proposed modifications in or out of order before they are discussed on the floor. A proposed modification shall be ruled out of order if it:

1. is not legible, unless not required to be written in accordance with Section

- 5.5.2.1; or
2. changes the scope of the original proposal; or
3. is not readily understood to allow a proper assessment of its impact on the original proposal or the code.

The ruling of the Chairman on whether or not the modification is in or out of order shall be final and is not subject to a point of order in accordance with Section 5.4.7.

5.5.2.3 Testimony. When a modification is offered from the floor and ruled in order by the Chairman, a specific floor discussion on that modification is to commence in accordance with the procedures listed in Section 5.5.1.

5.6 Committee Action: Following the floor discussion of each code change proposal, one of the following motions shall be made and seconded by members of the committee.

1. Approve the code change proposal as submitted (AS) or
2. Approve the code change proposal as modified with specific modifications (AM), or
3. Disapprove the code change proposal (D)

Discussion on this motion shall be limited to Code Development Committee members. If a committee member proposes a modification which had not been proposed during floor discussion, the Chairman shall rule on the modification in accordance with Section 5.5.2.2 If a committee member raises a matter of issue, including a proposed modification, which has not been proposed or discussed during the floor discussion, the Moderator shall suspend the committee discussion and shall reopen the floor discussion for comments on the specific matter or issue. Upon receipt of all comments from the floor, the Moderator shall resume committee discussion.

The Code Development Committee shall vote on each motion with the majority dictating the committee's action. Committee action on each code change proposal shall be completed when one of the motions noted above has been approved. Each committee vote shall be supported by a reason.

The Code Development Committee shall maintain a record of its proceedings including the action on each code change proposal.

5.7 Assembly Consideration: At the conclusion of the committee's action on a code change proposal and before the next code change proposal is called to the floor, the Moderator shall ask for a motion from the public hearing attendees who may object to the committee's action. If a motion in accordance with Section 5.7.1 is not brought forward on the committee's action, the results of the public hearing shall be established by the committee's action. If a motion in accordance with Section 5.7.1 is brought forward and is sustained in accordance with Section 5.7.3, both the committee's action and the assemblies' action shall be reported as the results of the public hearing.

5.7.1 Floor Motion: Any attendee may raise an objection to the committee's action in which case the attendee will be able to make a motion to:

1. Approve the code change proposal as submitted from the floor (ASF), or
2. Approve the code change proposal as modified from the floor (AMF) with a specific modification that has been previously offered from the floor and ruled in order by the Chairman during floor discussion (see Section 5.5.2) or has been offered by a member of the Committee and ruled in order by the Chairman during committee discussion (see Section 5.6), or
3. Disapprove the code change proposal from the floor (DF).

5.7.2 Discussion: On receipt of a second to the floor motion, the Moderator shall place the motion before the assembly for a vote. No additional testimony shall be permitted.

5.7.3 Assembly Action: A successful assembly action shall be a majority vote of the votes cast by eligible voters (See 5.7.4).

5.7.4 Eligible Voters: All members of ICC in attendance at the public hearing shall be eligible to vote on floor motions. Each member is entitled to one vote, except that each Governmental Member

Voting Representative in attendance may vote on behalf of its Governmental Member. Code Development Committee members shall be eligible to vote on floor motions. Application, whether new or updated, for ICC membership must be received by the Code Council ten days prior to the commencement of the first day of the public hearing.

- 5.8 Report of the Public Hearing:** The results of the public hearing, including committee action and successful assembly action, shall be posted on the ICC website not less than 60 days prior to Final Action Consideration except as approved by the ICC Board.

6.0 Public Comments

- 6.1 Intent:** The public comment process gives attendees at the Final Action Hearing an opportunity to consider specific objections to the results of the public hearing and more thoughtfully prepare for the discussion for Final Action Consideration. The public comment process expedites the Final Action Consideration at the Final Action Hearing by limiting the items discussed to the following:

- 6.1.1** Consideration of items for which a public comment has been submitted; and
- 6.1.2** Consideration of items which received a successful assembly action at the public hearing.

- 6.2 Deadline:** The deadline for receipt of a public comment to the results of the public hearing shall be announced at the public hearing but shall not be less than 30 days from the availability of the report of the results of the public hearing (see Section 5.8).

- 6.3 Withdrawal of Public Comment:** A public comment may be withdrawn by the public commenter at any time prior to Final Action Consideration of that comment. A withdrawn public comment shall not be subject to Final Action Consideration. If the only public comment to a code change proposal is withdrawn by the public commenter prior to the vote on the consent agenda in accordance with Section 7.3.4, the proposal shall be considered as part of the consent agenda. If the only public comment to a code change proposal is withdrawn by the public commenter after the vote on the consent agenda in accordance with Section 7.3.4, the proposal shall continue as part of the individual consent agenda in accordance with Section 7.3.5, however the public comment shall not be subject to Final Action Consideration.

- 6.4 Form and Content of Public Comments:** Any interested person, persons, or group may submit a public comment to the results of the public hearing which will be considered when in conformance to these requirements. Each public comment to a code change proposal shall be submitted separately and shall be complete in itself. Each public comment shall contain the following information:

- 6.4.1 Public comment:** Each public comment shall include the name, title, mailing address, telephone number and email address of the public commenter. Email addresses shall be published with the public comments unless the commenter otherwise requests on submittal form.

If group, organization, or committee submits a public comment, an individual with prime responsibility shall be indicated. If a public comment is submitted on behalf a client, group, organization or committee, the name and mailing address of the client, group, organization or committee shall be indicated. The scope of the public comment shall be consistent with the scope of the original code change proposal, committee action or successful assembly action. Public comments which are determined as not within the scope of the code change proposal, committee action or successful assembly action shall be identified as such. The public commenter shall be notified that the public comment is considered an incomplete public comment in accordance with Section 6.5.1 and the public comment shall be held until the deficiencies are corrected. A copyright release in accordance with Section 3.3.4.5 shall be provided with the public comment.

- 6.4.2 Code Reference:** Each public comment shall include the code change proposal number and the results of the public hearing, including successful assembly actions, on the code change proposal to which the public comment is directed.

- 6.4.3 Multiple public comments to a code change proposal.** A proponent shall not submit multiple public comments to the same code change proposal. When a proponent submits multiple

public comments to the same code change proposal, the public comments shall be considered as incomplete public comments and processed in accordance with Section 6.5.1. This restriction shall not apply to public comments that attempt to address differing subject matter within a code section.

6.4.4 Desired Final Action: The public comment shall indicate the desired final action as one of the following:

1. Approve the code change proposal as submitted (AS), or
2. Approve the code change proposal as modified (AM) by one or more specific modifications published in the Results of the Public Hearing or published in a public comment, or
3. Disapprove the code change proposal (D)

6.4.5 Supporting Information: The public comment shall include in a statement containing a reason and justification for the desired final action on the code change proposal. Reasons and justification which are reviewed in accordance with Section 6.4 and determined as not germane to the technical issues addressed in the code change proposal or committee action may be identified as such. The public commenter shall be notified that the public comment is considered an incomplete public comment in accordance with Section 6.5.1 and the public comment shall be held until the deficiencies are corrected. The public commenter shall have the right to appeal this action in accordance with the policy of the ICC Board. A bibliography of any substantiating material submitted with a public comment shall be published with the public comment and the substantiating material shall be made available at the Final Action Hearing. All substantiating material published by ICC is material that has been provided by the proponent and in so publishing ICC makes no representations or warranties about its quality or accuracy.

6.4.6 Number: One copy of each public comment and one copy of all substantiating information shall be submitted. Additional copies may be requested when determined necessary by the Secretariat. A copy of the public comment in electronic form is preferred.

6.5 Review: The Secretariat shall be responsible for reviewing all submitted public comments from an editorial and technical viewpoint similar to the review of code change proposals (See Section 4.2).

6.5.1 Incomplete Public Comment: When a public comment is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the public comment shall not be processed. The Secretariat shall notify the public commenter of the specific deficiencies and the public comment shall be held until the deficiencies are corrected, or the public comment shall be returned to the public commenter with instructions to correct the deficiencies with a final date set for receipt of the corrected public comment.

6.5.2 Duplications: On receipt of duplicate or parallel public comments, the Secretariat may consolidate such public comments for Final Action Consideration. Each public commenter shall be notified of this action when it occurs.

6.5.3 Deadline: Public comments received by the Secretariat after the deadline set for receipt shall not be published and shall not be considered as part of the Final Action Consideration.

6.6 Publication: The public hearing results on code change proposals that have not been public commented and the code change proposals with public commented public hearing results and successful assembly actions shall constitute the Final Action Agenda. The Final Action Agenda shall be posted on the ICC website at least 30 days prior to Final Action consideration.

7.0 Final Action Consideration

7.1 Intent: The purpose of Final Action Consideration is to make a final determination of all code change proposals which have been considered in a code development cycle by a vote cast by eligible voters (see Section 7.4).

7.2 Agenda: The final action consent agenda shall be comprised of proposals which have neither an assembly action nor public comment. The agenda for public testimony and individual consideration shall be comprised of proposals which have a successful assembly action or public comment (see Sections

5.7 and 6.0).

7.3 Procedure: *The Robert's Rules of Order* shall be the formal procedure for the conduct of the Final Action Consideration except as these Rules of Procedure may otherwise dictate.

7.3.1 Open Meetings: Public hearings for Final Action Consideration are open meetings. Any interested person may attend and participate in the Floor Discussion.

7.3.2 Agenda Order: The Secretariat shall publish an agenda for Final Action Consideration, placing individual code change proposals and public comments in a logical order to facilitate the hearing. The proponents or opponents of any proposal or public comment may move to revise the agenda order as the first order of business at the public hearing, or at any time during the hearing except while another proposal is being discussed. Preference shall be given to grouping like subjects together and for moving items back to a later position on the agenda as opposed to moving items forward to an earlier position. A motion to revise the agenda order is subject to a 2/3 vote of those present and voting.

7.3.3 Presentation of Material at the Public Hearing: Information to be provided at the hearing shall be limited to verbal presentations. Each individual presenting information at the hearing shall state their name and affiliation, and shall identify any entities or individuals they are representing in connection with their testimony. Audio-visual presentations are not permitted. Substantiating material submitted in accordance with Section 6.4.4 and other material submitted in response to a code change proposal or public comment shall be located in a designated area in the hearing room.

7.3.4 Final Action Consent Agenda: The final action consent agenda (see Section 7.2) shall be placed before the assembly with a single motion for final action in accordance with the results of the public hearing. When the motion has been seconded, the vote shall be taken with no testimony being allowed. A simple majority (50% plus one) based on the number of votes cast by eligible voters shall decide the motion.

7.3.5 Individual Consideration Agenda: Upon completion of the final action consent vote, all proposed changes not on the final action consent agenda shall be placed before the assembly for individual consideration of each item (see Section 7.2).

7.3.6 Reconsideration: There shall be no reconsideration of a proposed code change after it has been voted on in accordance with Section 7.3.8.

7.3.7 Time Limits: Time limits shall be established as part of the agenda for testimony on all proposed changes at the beginning of each hearing session. Each person requesting to testify on a change shall be given equal time. In the interest of time and fairness to all hearing participants, the Moderator shall have limited authority to modify time limitations on debate. The Moderator shall have the authority to adjust time limits as necessary in order to complete the hearing agenda.

7.3.7.1 Time Keeping: Keeping of time for testimony by an individual shall be by an automatic timing device. Remaining time shall be evident to the person testifying. Interruptions during testimony shall not be tolerated. The Moderator shall maintain appropriate decorum during all testimony.

7.3.8 Discussion and Voting: Discussion and voting on proposals being individually considered shall be in accordance with the following procedures:

7.3.8.1 Allowable Final Action Motions: The only allowable motions for final action are Approval as Submitted, Approval as Modified by one or more modifications published in the Final Action Agenda, and Disapproval.

7.3.8.2 Initial Motion: The Code Development Committee action shall be the initial motion considered.

7.3.8.3 Motions for Modifications: Whenever a motion under consideration is for Approval as Submitted or Approval as Modified, a subsequent motion and second

for a modification published in the Final Action Agenda may be made (see Section 6.4.3). Each subsequent motion for modification, if any, shall be individually discussed and voted before returning to the main motion. A two-thirds majority based on the number of votes cast by eligible voters shall be required for a successful motion on all modifications.

7.3.8.4 Voting: After dispensing with all motions for modifications, if any, and upon completion of discussion on the main motion, the Moderator shall then ask for the vote on the main motion. If the motion fails to receive the majority required in Section 7.5, the Moderator shall ask for a new motion.

7.3.8.5 Subsequent Motion: If the initial motion is unsuccessful, a motion for one of the other allowable final actions shall be made (see Section 7.3.8.1) and dispensed with until a successful final action is achieved. If a successful final action is not achieved, Section 7.5.1 shall apply.

7.3.9 Proponent testimony: The Proponent of a public comment is permitted to waive an initial statement. The Proponent of the public comment shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where a public comment is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to waive an initial statement.

7.3.10 Points of Order: Any person participating in the public hearing may challenge a procedural ruling of the Moderator. A majority vote of the eligible voters as determined in Section 5.7.4 shall determine the decision.

7.4 Eligible voters: ICC Governmental Member Representatives and Honorary Members in attendance at the Final Action Hearing shall have one vote per eligible attendee on all International Codes. Applications for Governmental Membership must be received by the ICC by April 1 of the applicable year in order for its designated representatives to be eligible to vote at the Final Action Hearing. Applications, whether new or updated, for governmental member voting representative status must be received by the Code Council thirty (30) days prior to the commencement of the first day of the Final Action Hearing in order for any designated representative to be eligible to vote. An individual designated as a Governmental Member Voting Representative shall provide sufficient information to establish eligibility as defined in the ICC Bylaws. The Executive Committee of the ICC Board, in its discretion, shall have the authority to address questions related to eligibility. Decisions of the Executive Committee shall be final and not appealable pursuant to CP 1, other than claims of fraud or misrepresentation, supported by reasonably credible evidence, that were material to the outcome of the Final Action Hearing.

7.5 Majorities for Final Action: The required voting majority based on the number of votes cast of eligible voters shall be in accordance with the following table:

Committee Action (see note)	Desired Final Action		
	AS	AM	D
AS	Simple Majority	2/3 Majority	Simple Majority
AM	2/3 Majority	Simple Majority to sustain the Public Hearing Action or; 2/3 Majority on additional modifications and 2/3 on overall AM	Simple Majority
D	2/3 Majority	2/3 Majority	Simple Majority

7.5.1 Failure to Achieve Majority Vote: In the event that a code change proposal does not receive any of the required majorities for final action in Section 7.5, final action on the code change proposal in question shall be disapproval.

7.6 Publication: The Final action on all proposed code changes shall be published as soon as practicable after the determination of final action. The exact wording of any resulting text modifications shall be made available to any interested party.

8.0 Appeals

8.1 Right to Appeal: Any person may appeal an action or inaction in accordance with CP-1.

2013 ICC CODE DEVELOPMENT CYCLE CROSS INDEX OF PROPOSED CODE CHANGES

Some of the proposed code changes include sections that are outside of the scope of the chapters or the code listed in the table of 2012-2014 Staff Secretaries on page x. This is done in order to facilitate coordination among the International Codes which is one of the fundamental principles of the International Codes.

Listed in this cross index are proposed code changes that include sections of codes or codes other than those listed on page viii. For example, IEBC Section 804.4.5 is proposed for revision in code change F59-13 Part II, which is to be heard by the IFC Committee. This section of the IEBC is typically the responsibility of the IEBC Committee as listed in the table of 2012-2014 Staff Secretaries. It is therefore identified in this cross index. Another example is Section 605.11.3.2 of the International Fire Code. The International Fire Code is normally maintained by the IFC Committee, but Section 605.11.3.2 will be considered for revision in proposed code change RM96-13 which will be placed on the IFC Committee agenda. In some instances, there are other subsections that are revised by an identified code change that is not included in the cross index. For example, numerous sections in Chapter 9 of the International Building Code would be revised by the proposed changes to Chapter 9 of the IFC and all sections of the IECC – Residential Provisions have revisions to the duplicate section in Chapter 11 of the IRC as noted in each code change proposal. This was done to keep the cross index brief enough for easy reference.

This information is provided to assist users in locating all of the proposed code changes that would affect a certain section or chapter. For example, to find all of the proposed code changes that would affect Chapter 4 of the IECC-Commercial Provisions, review the proposed code changes in the portion of the monograph for the IECC-Commercial Code Development Committee (listed with a CE prefix) then review this cross reference for Chapter 4 of the IECC-Commercial for proposed code changes published in other code change groups. While care has been taken to be accurate, there may be some omissions in this list.

Letter prefix: Each proposed change number has a letter prefix that will identify where the proposal is published. The letter designations for proposed changes and the corresponding publications are as follows:

PREFIX	PROPOSED CHANGE GROUP (see monograph table of contents for location)
ADM	Administrative
E	International Building Code - Means of Egress
EB	International Existing Building Code
CE	International Energy Conservation Code – Commercial
RE	International Energy Conservation Code – Energy
F	International Fire Code

2013 GROUP B COMMITTEE ACTION HEARINGS SCHEDULE

April 21 – April 30, 2013

Sheraton Dallas Downtown Hotel

Unless noted by “Start no earlier than X am/pm,” each Code Committee will begin immediately upon completion of the hearings for the prior Committee. Thus the actual start times for the various Code Committees are tentative. The hearing volume is considerably higher than previous cycles. The schedule anticipates that the hearings will be completed by 3:00 pm on Tuesday, April 30th.

	Sunday April 21	Monday April 22	Tuesday April 23	Wednesday April 24	Thursday April 25
TRACK 1	Start 10 am ISPSC IRC – P End 10 pm	Start 8 am IRC – P IRC - M End 10 pm	Start 8 am IRC - M IFC (Start no earlier than 8 am) End 10 pm	Start 8 am IFC End 10 pm	Start 8 am IFC IRC - B (Start no earlier than 4 pm) End 10 pm
TRACK 2	Start 10 am IPMZC IEBC ADMIN End 10 pm	Start 8 am ADMIN IECC – R/ IRC – E (Start no earlier than 8 am) End 10 pm	Start 8 am IECC- R/ IRC – E End 10 pm	Start 8 am IECC – R/ IRC – E End 10 pm	Start 8 am IECC – R/ IRC – E IECC - C (Start no earlier than 1 pm) End 10 pm

	Friday April 26	Saturday April 27	Sunday April 28	Monday April 29	Tuesday April 30
TRACK 1	Start 8 am IRC - B End 10 pm	Start 8 am IRC - B End 10 pm	Start 8 am IRC – B End 10 pm	Start 8 am IRC – B End 10 pm	Start 8 am IRC – B Finish 3 pm
TRACK 2	Start 8 am IECC - C End 10 pm	Start 8 am IECC - C End 10 pm	Start 8 am IECC - C End 10 pm	Start 8 am IECC - C End 10 pm	Start 8 am IECC - C Finish 3 pm

Notes:

1. There are approximately 2000 code change items compared to approximately 1600 in 2012.
2. Hearing times may be modified at the discretion of the Chairman.
3. Breaks will be announced. Lunch and dinner breaks planned for each track.
4. Due to uncertainties in hearing progress, start times indicated as “Start no earlier than X am/pm” are conservatively estimated and are not intended to be scheduled hearing progress targets.

Codes: (be sure to consult the Cross Index of Proposed Code Changes for changes heard by a different committee)

ADMIN: Chapter 1 of all the International Codes except the following: IECC; IgCC; IRC; ISPSC; and ICC Performance Code (see individual code for changes to their respective Chapter 1). ADMIN also includes the administrative update to currently referenced standards in all the 2012 International Codes.

IEBC: Non-structural provisions in the International Existing Building Code

IECC – C: Commercial energy provisions in the International Energy Conservation Code (IECC) (agenda includes energy related changes to the ICC Performance Code)

IECC –R/IRC-E: Residential energy provisions of the IECC and Chapter 11 of the IRC

IFC: International Fire Code (agenda includes changes to the International Wildland-Urban Interface Code and ICC Performance Code)

IPMZC:	International Property Maintenance and Zoning Codes (no changes received to the IZC)
IRC – B:	Building provisions in Chapters 1 – 10 of the International Residential Code (IRC)
IRC – M:	Mechanical provisions in the IRC
IRC – P:	Plumbing provisions in the IRC
SPSC:	International Swimming Pool and Spa Code

2013 PROPOSED CHANGES TO THE ADMINISTRATIVE PROVISIONS

ADMINISTRATIVE PROVISIONS COMMITTEE

Richard Thomson, Chair, CPCA

Regional Representative
New York State Department of State
Division of Code Enforcement Administration
Finger Lakes North Regional Office
Rose, NY

Neville Pereira, PE – Vice Chair

Rep: ICC Los Angeles Basin & Orange
Empire
Chapters of ICC
Building Official
City of Temple City
La Canada, CA

Anthony W. Catana, AIA LEED AP

Director of Building Technology
Spiezle Architectural Group Inc.
Trenton, NJ

Dale Engebretson, CBO

Building Official
B&F Technical Code Services, Inc
Hoffman Estates, IL

Vernon W. Hodge, CBO

Technical and Code Development Specialist
State Building Code Official
Division of Building and Fire Regulations
Virginia Department of Housing and
Community Development
Richmond, VA

Scott F. Holm, CBO, M. Ed.

Building Inspector
University of Minnesota
Minneapolis, MN

Craig Johnson

Building Official
Culver City
Culver City, CA

Robert J. Klein, CBO

Chief Building Official
Town of Hilton Head Island
Hilton Head, SC

William G. McGinness

Director of Engineering
Homeland Vinyl Products Inc.
Birmingham, AL

Barry Mooneyham

Director of Permits and Inspections
Wake County Government
Raleigh, NC

Michael O'Brian, CFO, MIFireE

Fire Chief
Brighton Area Fire Authority
Brighton, MI

Ed Peaser, CBO

Plan Review Manager
City of Scottsdale
Scottsdale, AZ

Gary M. Rogers, CBO

President/CEO
GM Rogers & Sons Const. Services
Las Vegas, NV

TENTATIVE ORDER OF DISCUSSION 2013 PROPOSED CHANGES TO THE ADMINISTRATIVE PROVISIONS

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation **does not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some I-ADMIN code change proposals may not be included on this list, as they are being heard by other committees. Please consult the Cross Index of Proposed Changes.

PART I - IBC: [A] 101.2, ICCPC: [A] 102.1, IEBC: [A] 101.2, IFGC: [A] 101.2, IMC: [A] 101.2, IPC: [A] 101.2, IPSDC: [A] 101.2, IPMC: [A] 101.2, IWUIC: [A] 101.2, IZC: [A] 101.3;

PART II - IECC: C101.2;

PART III - IECC: R101.2;

PART IV - IRC: R101.2;

PART V - ISPSC: 101.2

THIS IS A 5 PART CODE CHANGE. PARTS I WILL BE HEARD BY THE ADMINISTRATIVE PROVISIONS COMMITTEE AS ONE CODE CHANGE. PART II WILL BE HEARD BY THE ENERGY CONSERVATION CODE-COMMERCIAL COMMITTEE. PART III WILL BE HEARD BY THE ENERGY CONSERVATION CODE-RESIDENTIAL COMMITTEE. PART IV WILL BE HEARD BY THE RESIDENTIAL CODE COMMITTEE. PART VI WILL BE HEARD BY THE SWIMMING POOL AND SPA CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

Proponent: Al Godwin, CBO, CPM, representing Aon Fire Protection Engineering Corporation.

PART I – IBC; ICCPC; IEBC; IFGC; IMC; IPC; IPSDC; IPMC; IWUIC; IZC

Revise the International Building Code as follows:

IBC [A] 101.2 Scope. The provisions of this code shall apply to the construction, *alteration*, relocation, enlargement, replacement, *repair*, equipment, use and occupancy, location, maintenance, removal and demolition of every building or structure or any appurtenances connected or attached to such buildings or structures. The provisions shall also apply to usage of the surrounding site and access to and from the building, structure or site, as necessary to achieve the purpose of this code.

Exception: Detached one- and two-family *dwelling*s and multiple single-family *dwelling*s (*townhouses*) not more than three *stories* above *grade plane* in height with a separate *means of egress* and their accessory structures shall comply with the *International Residential Code*.

Revise the International Code Council Performance Code as follows:

ICCPC [A] 102.1 Building. Part II of this code provides requirements for buildings and structures and includes provisions for structural strength, stability, sanitation, means of access and egress, light and ventilation, safety to life and protection of property from fire and, in general, to secure life and property from other hazards affecting the built environment. This code includes provisions for the use and occupancy of buildings, structures, facilities and premises, their alteration, repair, maintenance, removal, demolition, and the installation and maintenance of all amenities including, but not limited to, such services as the electrical, gas, mechanical, plumbing, energy conservation and building transportation systems. The provisions shall also apply to usage of the surrounding site and access to and from the building, structure or site, as necessary to achieve the purpose of this code.

Revise the International Existing Building Code as follows:

IEBC [A] 101.2 Scope. The provisions of the *International Existing Building Code* shall apply to the *repair, alteration, change of occupancy, addition* and relocation of existing buildings. The provisions shall also apply to usage of the surrounding site and access to and from the building, structure or site, as necessary to achieve the purpose of this code.

Revise the International Fuel Gas Code as follows:

IFGC [A] 101.2 Scope. This code shall apply to the installation of fuel-gas *pipng* systems, fuel gas appliances, gaseous hydrogen systems and related accessories in accordance with Section 101.2.1 through 101.2.5. The provisions shall also apply to usage of the surrounding site and access to and from the building, structure or site, as necessary to achieve the purpose of this code.

Exception: Detached one- and two-family dwellings and multiple single-family dwellings (townhouses) not more than three stories high with separate means of egress and their accessory structures shall comply with the *International Residential Code*.

Revise the International Mechanical Code as follows:

IMC [A] 101.2 Scope. This code shall regulate the design, installation, maintenance, *alteration* and inspection of mechanical systems that are permanently installed and utilized to provide control of environmental conditions and related processes within buildings. This code shall also regulate those mechanical systems, system components, *equipment* and appliances specifically addressed herein. The installation of fuel gas distribution piping and *equipment*, fuel gas-fired appliances and fuel gas-fired *appliance* venting systems shall be regulated by the *International Fuel Gas Code*. The provisions shall also apply to usage of the surrounding site and access to and from the building, structure or site, as necessary to achieve the purpose of this code.

Exception: Detached one- and two-family dwellings and multiple single-family dwellings (townhouses) not more than three stories high with separate means of egress and their accessory structures shall comply with the *International Residential Code*.

Revise the International Plumbing Code as follows:

IPC [A] 101.2 Scope. The provisions of this code shall apply to the erection, installation, alteration, repairs, relocation, replacement, addition to, use or maintenance of plumbing systems within this jurisdiction. This code shall also regulate nonflammable medical gas, inhalation anesthetic, vacuum piping, nonmedical oxygen systems and sanitary and condensate vacuum collection systems. The installation of fuel gas distribution piping and equipment, fuel-gas-fired water heaters and water heater venting systems shall be regulated by the *International Fuel Gas Code*. Provisions in the appendices shall not apply unless specifically adopted. The provisions shall also apply to usage of the surrounding site and access to and from the building, structure or site, as necessary to achieve the purpose of this code.

Exception: Detached one- and two-family dwellings and multiple single-family dwellings (townhouses) not more than three stories high with separate means of egress and their accessory structures shall comply with the *International Residential Code*.

Revise the International Private Sewage Disposal Code as follows:

IPSDS [A] 101.2 Scope. The provisions of this code shall apply to the installation and maintenance of private sewage disposal systems. The provisions shall also apply to usage of the surrounding site and access to and from the building, structure or site, as necessary to achieve the purpose of this code. Septic tank and effluent absorption systems or other treatment tank and effluent disposal systems shall be permitted where a public sewer is not available to the property served. Unless specifically approved, the *private sewage disposal system* of each building shall be entirely separate from and independent of any other building. The use of a common system or a system on a parcel other than the parcel where the structure is located shall be subject to the full requirements of this code as for systems serving public buildings.

Revise the International Property Maintenance Code as follows:

IPMC [A] 101.2 Scope. The provisions of this code shall apply to all existing residential and nonresidential structures and all existing *premises* and constitute minimum requirements and standards for *premises*, structures, equipment and facilities for light, *ventilation*, space, heating, sanitation, protection from the elements, life safety, safety from fire and other hazards, and for safe and sanitary maintenance; the responsibility of *owners*, *operators* and *occupants*; the *occupancy* of existing structures and *premises*, and for administration, enforcement and penalties. The provisions shall also apply to usage of the surrounding site and access to and from the building, structure or site, as necessary to achieve the purpose of this code.

Revise the International Wildland-Urban Interface Code as follows:

IWUIC [A] 101.2 Scope. The provisions of this code shall apply to the construction, alteration, ~~movement~~, relocation, enlargement, replacement, repair, maintenance and use any building or structure or any appurtenances connected or attached to such buildings or structures. The provisions shall also apply to usage of the surrounding site and access to and from the building, structure or site, as necessary to achieve the purpose of this code.

Buildings or conditions in existence at the time of the adoption of this code are allowed to have their use or occupancy continued, if such condition, use or occupancy was legal at the time of the adoption of this code, provided such continued use does not constitute a distinct danger to life or property.

Buildings or structures moved into or within the jurisdiction shall comply with the provisions of this code for new buildings or structures.

Revise the International Zoning Code as follows:

IZC [A] 101.3 Scope. The provisions of this code shall apply to the construction, addition, alteration, moving, repair and use of any building, structure, parcel of land or sign within a jurisdiction, except work located primarily in a public way, public utility towers and poles and public utilities unless specifically mentioned in this code. The provisions shall also apply to usage of the surrounding site and access to and from the building, structure or site, as necessary to achieve the purpose of this code.

Where there is conflict between a general requirement and a specific requirement, the specific requirement shall be applicable. Where, in any specific case, different sections of this code specify different requirements, the more restrictive shall govern.

In fulfilling these purposes, this ordinance is intended to benefit the public as a whole and not any specific person or class of persons. Although, through the implementation, administration and enforcement of this code, benefits and detriments will be enjoyed or suffered by specific individuals, such is merely a byproduct of the overall benefit to the whole community. Therefore, unintentional breaches of the obligations of administration and enforcement imposed on the jurisdiction hereby shall not be enforceable in tort.

If any portion of this code is held invalid for any reason, the remaining herein shall not be affected.

PART II – IECC-COMMERCIAL

Revise the International Energy Conservation Code-Commercial as follows:

IECC [A] C101.2 Scope. This code applies to *commercial buildings* and the buildings sites and associated systems and equipment. The provisions shall also apply to usage of the surrounding site and access to and from the building, structure or site, as necessary to achieve the purpose of this code.

PART III – IECC-RESIDENTIAL

Revise the International Energy Conservation Code-Residential as follows:

IECC [A] R101.2 Scope. This code applies to *residential buildings* and the buildings sites and associated systems and equipment. The provisions shall also apply to usage of the surrounding site and access to and from the building, structure or site, as necessary to achieve the purpose of this code.

PART IV – IRC

Revise the International Residential Code as follows:

IRC R101.2 Scope. The provisions of the *International Residential Code for One- and Two-family Dwellings* shall apply to the construction, *alteration*, movement, enlargement, replacement, repair, equipment, use and occupancy, location, removal and demolition of detached one- and two-family dwellings and townhouses not more than three stories above *grade plane* in height with a separate means of egress and their *accessory structures*. The provisions shall also apply to usage of the surrounding site and access to and from the building, structure or site, as necessary to achieve the purpose of this code.

Exceptions:

1. Live/work units complying with the requirements of Section 419 of the *International Building Code* shall be permitted to be built as one- and two-family *dwellings* or townhouses. Fire suppression required by Section 419.5 of the *International Building Code* when constructed under the *International Residential Code for One- and Two-family Dwellings* shall conform to Section P2904.
2. Owner-occupied lodging houses with five or fewer guestrooms shall be permitted to be constructed in accordance with the *International Residential Code for One- and Two-family Dwellings* when equipped with a fire sprinkler system in accordance with Section P2904.

PART V – ISPSC

Revise the International Swimming Pool and Spa Code as follows:

ISPSC 101.2 Scope. The provisions of this code shall apply to the construction, alteration, movement, renovation, replacement, repair and maintenance of *aquatic vessels*. The provisions shall also apply to usage of the surrounding site and access to and from the building, structure or site, as necessary to achieve the purpose of this code.

Reason: There are various provisions in all codes that deal with the site area, yet scoping provisions over the site are not provided. The purpose of this change is to identify that the site is also regulated by these codes.

The Fire Code, Section 101.2, item 3 already lists fire hazards on the “premise.” Thus, it recognizes site as part of the code.

Examples of site requirements in various codes:

Part I –

- IBC - Area increase, exterior wall fire rating, unlimited area yards, accessibility, means of egress to a public way, etc.
- ICCPC - Section 702.3 provides for access and movement on and around the site. Section 1701.2.5 deals with vegetation outside the building.
- IEBC - Area increase, accessibility, means of egress to a public way, etc.
- IFGC - Section 404.12 specifies the minimum burial depth of gas piping. Section 404.17.1 and 404.17.1, exception 3, prohibit plastic pipe from being installed under a slab unless certain conditions are met. Thus, a change in grade or the installation of a slab are items that affect the requirements for gas piping and should be regulated.
- IMC - Section 401.4, item 2, requires that air intake openings shall be separated from any hazardous or noxious contaminant source, such as vents, streets, alleys, parking lots and loading docks, unless openings are located not less than 25 feet vertically above such locations. As such, the installation of a parking lot near a ground level air intake opening would violate the intent and purpose of this code and should be regulated.

- IPC - Sections 1303, 1303.8, 1303.9.1, 1303.9.2, and 1303.9.3 all describe “site” draining, as well as, installation and design of gray water irrigation systems. Section 1303.8 specifically states “Private sewage disposal systems in compacted areas, such as parking lots and driveways, are prohibited. Surface water shall be diverted away from any soil absorption site on the same or neighboring lots.” As such, the installation of a parking lot and/or the change in site drainage should be regulated by this code.
- IPSDC - First Section 101.2 does not have any scoping language. It starts in by saying these systems are allowed. A scoping sentence is installed but may need more work. This was tried with code change ADM1-09/10 but may have been lost in the overall size of the change.
- Second, Section 401.3.2 specifies that the area for a “replacement system” is to be protected from becoming no longer suitable such as with the installation of a parking lot. Thus, the site needs to be protected.
- IPMC – Section 302 deals specifically with the surrounding site. Thus, the scoping for surrounding site would seem appropriate. IWUI - Section 101.2 needs some corrective language to match the other codes. Section 101.6 specifically states that maintenance of the landscape materials, vegetation and defensible space are to be maintained. These are all “site” issues. Thus, the scoping for surrounding site would seem appropriate.
- IZC - Section 103.3 requires the maintenance of “parcels” of land. Section 805.4 requires the maintenance of landscaping. And, the whole book is about setbacks.

Parts II and III –

- IECC – Commercial - Section C505.6 provides for outside lighting.
- IECC – Residential - “At this time there may not appear to be any exterior yard items that need protection. However, in case I missed something or there is a provision added in the future, it would be appropriate to have this provision.”

PART IV –

- IRC - Exterior wall rating, light and ventilation, emergency escape and rescue openings to a yard or court that opens to a public way

PART V –

- ISPSC - “The code addresses multiple issues outside of the actual pool such as fences, decks, access through buildings, etc.”

Cost Impact: This will not increase the cost of construction.

[A] 101.2-ADM (ALL CODES)-GODWIN

ADM2 – 13

PART I – IBC: 101.2

PART II – IRC: R101.2, R202

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE PROVISIONS COMMITTEE. PART II WILL BE HEARD BY THE RESIDENTIAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

Proponent: Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee and Virginia Building and Code Officials Association (bajnaic@chesterfield.gov)

PART I – IBC

Revise the International Building Code as follows:

IBC [A] 101.2 Scope. The provisions of this code shall apply to the construction, *alteration*, relocation, enlargement, replacement, *repair*, equipment, use and occupancy, location, maintenance, removal and demolition of every building or structure or any appurtenances connected or attached to such buildings or structures.

Exception: Detached one- and two-family *dwellings* and multiple single-family *dwellings* (*townhouses*) not more than three *stories* above *grade plane* in height with a separate *means of egress*, and their accessory structures not more than three stories above grade plane in height, shall comply with the *International Residential Code*.

PART II – IRC

Revise the International Residential Code as follows:

IRC SECTION R202 DEFINITIONS

ACCESSORY STRUCTURE. A structure ~~not greater than 3,000 square foot (279 m²) in floor area, and not over two stories in height, the use of which~~ that is customarily accessory to and incidental to that of the dwelling(s) and which is located on the same *lot*.

IRC R101.2 Scope. The provisions of the International Residential Code for One- and Two-family Dwellings shall apply to the construction, alteration, movement, enlargement, replacement, repair, equipment, use and occupancy, location, removal and demolition of detached one- and two-family dwellings and townhouses not more than three stories above grade plane in height with a separate means of egress and their accessory structures not more than three stories above grade plane in height.

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

After a thorough investigation on the history of the code change that introduced a 3,000 square foot limitation on accessory structure, the BCAC discovered that there was no technical justification provided by the original proponent to limit the size of an accessory structure. After some extensive discussion, the BCAC decided that specifying a limitation on the size of the accessory structure should be a decision left to the building official as determined by local zoning ordinances.

Cost Impact: None

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R101.2-RB-BAJNAI-BCAC

ADM3 – 13

IEBC [A] 101.2

Proponent: Jerry R. Tepe, FAIA, JRT•AIA ARCHITECT, representing The American Institute of Architects

Revise the International Existing Building Code as follows:

IEBC [A] 101.2 Scope. The provisions of the *International Existing Building Code* shall apply to the *repair, alteration, change of occupancy, addition and relocation of existing buildings.*

Exception: Detached one- and two-family dwellings and multiple single-family dwellings (townhouses) not more than three stories above grade plane in height with a separate means of egress and their accessory structures and not required to comply with the International Existing Building Code.

Reason: The IEBC was never intended to apply to one- and two-family dwellings and townhouses, yet there is often confusion due to the broad definition of existing buildings. The IEBC started with the requirements currently found in Chapter 34 of the IBC which obviously applies only to commercial buildings. The IRC does have an Appendix J which sets requirements for similar changes to these residential buildings. The intent of this change is to only clarify the scope of the IEBC and eliminate any confusion. The proposed language is taken from the IBC but does not specifically require compliance with the IRC as appendices are optional and must be adopted to be applicable.

Cost Impact: None.

ADM3-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

[A] 101.2-ADM (IEBC)-TEPE

ADM4 – 13

IMC: [A] 101.2

Proponent: Ed Flanagan and Mike Quiroz, Alaska District Council of Laborers, representing Tim Sharp, Business Mgr/Secretary-Treasurer

Revise the International Mechanical Code as follows:

IMC [A] 101.2 Scope. This code shall regulate the design, installation, maintenance, alteration, and inspection of mechanical systems, including system components, equipment, and appliances specifically addressed herein, within buildings. ~~This code shall also regulate those mechanical systems, system components, equipment, and appliances specifically addressed herein.~~ The installation of fuel gas distribution piping and equipment, fuel gas-fired appliances, and fuel gas-fired appliance venting systems within buildings shall be regulated by the International Residential Code. Exception: Detached one- and two-family dwellings and multiple single-family dwellings (townhouses) not more than three stories high with separate means of egress and their accessory structures shall comply with the International Residential Code.

Exception: Detached one- and two-family dwellings and multiple single-family dwellings (townhouses) not more than three stories high with separate means of egress and their accessory structures shall comply with the *International Residential Code*.

Reason: The proposal clarifies the scope and application of the Code to systems and parts thereof within buildings only. Some jurisdictions have cited the existing second sentence as a “catch all” which enables them to apply the Code to installation of items exterior to buildings such as the buried loop piping for ground source heat pump systems.

Cost Impact: Cost impact, if any, would be to reduce the cost of construction by allowing more open competition among contractors (both mechanical or specialty and general or utility) for installation of piping exterior to a building.

ADM4-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

101.2-ADM (IMC)-FLANAGAN-QUIROZ

ADM5 – 13

PART I - IBC: 202; IFC: 202; IPMC: [A] 102.2, [A] 102.3, [A] 103.2, [A] 104.2, [A] 105.6, [A] 106.2, [A] 106.3, [A] 106.4, [A] 106.5, [A] 107.1, [A] 107.3, [A] 107.4, [A] 107.5(New), [A] 108.1, [A] 108.1.2, [A] 108.1.3, [A] 108.1.5, [A] 108.2, [A] 108.3, [A] 108.4, [A] 108.4.1, [A] 108.5, [A] 108.6, [A] 109.1, [A] 109.3, [A] 109.5, [A] 110.1, [A] 110.2, [A] 110.4, [A] 111.2, [A] 111.5, [A] 111.6, [A] 111.7, [A] 111.8, [A] 112.3, [A] 112.4, 202

PART II – IRC: 202

Proponent: Karen Blake, representing International Municipal Lawyers Association

PART I – IBC; IFC; IPMC

Revise the International Building Code as follows:

IBC SECTION 202 DEFINITIONS

[A] OWNER. Any person, agent, operator, entity, firm or corporation having a any legal or equitable interest in the property; or recorded in the official records of the state, county or municipality as holding an interest or title to the property; or otherwise having possession or control of the property, including the guardian of the estate of any such person, and the executor or administrator of the estate of such person if ordered to take possession of real property by a court.

Revise the International Fire Code as follows:

IFC SECTION 202 GENERAL DEFINITIONS

[A] OWNER. ~~A corporation, firm, partnership, association, organization and any other group acting as a unit, or a person who has legal title to any structure or premises with or without accompanying actual possession thereof, and shall include the duly authorized agent or attorney, a purchaser, devisee, fiduciary and any person having a vested or contingent interest in the premises in question. Any person,~~ agent, operator, entity, firm or corporation having any legal or equitable interest in the property; or recorded in the official records of the state, county or municipality as holding an interest or title to the property; or otherwise having possession or control of the property, including the guardian of the estate of any such person, and the executor or administrator of the estate of such person if ordered to take possession of real property by a court.

Revise the International Property Maintenance Code as follows:

IPMC SECTION 202 GENERAL DEFINITIONS

~~**CONDEMN.** To adjudge unfit for occupancy.~~

DAYS. Calendar days.

[A] OWNER. Any person, agent, operator, entity, firm or corporation having a any legal or equitable interest in the property; or recorded in the official records of the state, county or municipality as holding an interest or title to the property; or otherwise having possession or control of the property, including the guardian of the estate of any such person, and the executor or administrator of the estate of such person if ordered to take possession of real property by a court.

IPMC SECTION 102 APPLICABILITY

IPMC [A] 102.2 Maintenance. Equipment, systems, devices and safeguards required by this code or a previous regulation or code under which the structure or *premises* was constructed, altered or repaired shall be maintained in a safe and good working order. No *owner, operator* or *occupant* shall cause any service, facility, equipment or utility which is required under this section to be removed from or shut off from or discontinued for any occupied dwelling, except for such temporary interruption as necessary while repairs or alterations are in progress where approved by the code official. The requirements of this code are not intended to provide the basis for removal or abrogation of fire protection and safety systems and devices in existing structures. Except as otherwise specified herein, the *owner* or the *owner's* designated agent shall be responsible for the maintenance of buildings, structures and *premises*.

IPMC [A] 102.3 Application of other codes. Repairs, additions or alterations to a structure, or changes of *occupancy*, shall be done in accordance with ~~the~~ locally adopted procedures and provisions of the *International Building Code, International Energy Conservation Code, International Fire Code, International Fuel Gas Code, International Mechanical Code, International Residential Code, International Plumbing Code* and NFPA 70. Nothing in this code shall be construed to cancel, modify or set aside any provision of the *International Zoning Code* or the jurisdiction's zoning ordinance.

IPMC SECTION 103 DEPARTMENT OF PROPERTY MAINTENANCE INSPECTION

IPMC [A] 103.2 Appointment and authority. The *code official* shall be appointed by the chief appointing authority of the jurisdiction and shall be authorized to carry out the provisions of this code without further local government action unless otherwise required by law.

IPMC SECTION 104 DUTIES AND POWERS OF THE CODE OFFICIAL

IPMC [A] 104.2 Inspections. The *code official* shall make all of the required inspections, or shall be permitted to accept reports of inspection by *approved* agencies or individuals. All reports of such inspections shall be in writing and be certified by a responsible officer of such *approved* agency or by the responsible individual. The *code official* is authorized to engage such expert opinion as deemed necessary to report upon unusual technical issues that arise, subject to the approval of the appointing authority.

IPMC SECTION 105 APPROVAL

IPMC [A] 105.6 Research reports. Supporting data, where necessary to assist in the approval of materials or assemblies not specifically provided for in this code, shall ~~consist of~~ be permitted to include valid research reports from *approved* sources.

IPMC SECTION 106 VIOLATIONS

IPMC [A] 106.2 ~~Notice of violation~~ Enforcement. The *code official* shall ~~serve a notice of violation or order in accordance with Section 107~~ enforce this code through any or all of the following methods:

1. By issuing a notice of violation or order under Section 107;
2. By filing suit for abatement;
3. By issuing civil penalties; or
4. By pursuing criminal sanctions.

IPMC [A] 106.3 Options for prosecution of violation. The code official shall proceed through the issuance of a notice of violation or through a citation in any of the following ways:

1. Any person failing to comply with ~~a notice of violation or order served in accordance with Section 407~~ this code, including the orders and directions of the code official, shall be deemed guilty of a misdemeanor or civil infraction as determined by the local municipality, and the violation shall be deemed a *strict liability offense*.
2. If the notice of violation is not complied with, the *code official* shall be permitted to institute the appropriate proceeding at law or in equity to restrain, correct or abate such violation, or to require the removal or termination of the unlawful *occupancy* of the structure in violation of the provisions of this code or of the order or direction made pursuant thereto.
3. Any civil action taken by the authority having jurisdiction ~~on such~~ to enforce this code on a premises shall be charged against the real estate upon which the structure is located and shall be a lien upon such real estate and in addition, constitute the personal liability jointly and severally of those responsible.

IPMC [A] 106.4 Violation penalties Separate offenses. ~~Any person who shall violate a provision of this code, or fail to comply therewith, or with any of the requirements thereof, shall be prosecuted within the limits provided by state or local laws.~~ Each day that a violation continues after due notice has been served shall be deemed a separate offense. For civil citations, separate citations shall not be necessary where so stated in the original notice.

IPMC [A] 106.5 Abatement of violation. The imposition of the penalties herein prescribed shall not preclude the legal officer of the jurisdiction from instituting appropriate action, including action to restrain, correct or abate a violation, or to prevent illegal *occupancy* of a building, structure or *premises*, or to stop an illegal act, conduct, business or utilization of the building, structure or *premises*.

IPMC SECTION 107 NOTICES AND ORDERS

IPMC [A] 107.1 Notice to person responsible. Whenever the *code official* determines that there has been a violation of this code or has grounds to believe that a violation has occurred, notice shall be given in the manner prescribed in Sections 107.2 and 107.3 to the person responsible for the violation as specified in this code. Notices for ~~condemnation~~ procedures shall also comply with Section 108.3. Failure to provide notice as required in this code does not relieve a person from civil or criminal liability for the violation, nor relieve them of responsibility for complying with this code or the orders and direction of the code official. Lack of notice to one of the responsible parties does not relieve others with notice of their obligation to comply with the code or the orders and direction of the code official.

IPMC [A] 107.3 Method of service. ~~Such notice shall be deemed to be properly served if a copy thereof is:~~ Notice shall be permitted to be served using any of the following methods:

1. Delivered personally;
2. Sent by certified or first-class mail addressed to the last known address; or
3. If the notice is returned showing that the letter was not delivered, a copy thereof shall be posted in a conspicuous place in or about the structure affected by such notice.

Such notice is effective upon actual receipt or three days after posting in the mail or after posting on the property.

IPMC [A] 107.4 Unauthorized tampering. Signs, tags or seals posted or affixed by the *code official* shall not be mutilated, destroyed or tampered with, or removed without authorization from the *code official* is unlawful and constitutes a violation of this code.

IPMC [A] 107.5 Penalties. Penalties for noncompliance with orders and notices shall be as set forth in Section 106.4.

(Renumber subsequent sections)

IPMC SECTION 108 UNSAFE STRUCTURES AND EQUIPMENT

IPMC [A] 108.1 General. When a structure or equipment is found by the *code official* to be unsafe, or when a structure is found unfit for human *occupancy*, or is found unlawful, such structure shall be ~~condemned~~ declared as such pursuant to the provisions of this code.

IPMC [A] 108.1.2 Unsafe equipment. Unsafe equipment includes, but is not limited to, any boiler, heating equipment, elevator, moving stairway, electrical wiring or device, flammable liquid containers or other equipment on the *premises* or within the structure which is in such disrepair or condition that such equipment is a hazard to life, health, property or safety of the public or *occupants* of the *premises* or structure.

IPMC [A] 108.1.3 Structure unfit for human occupancy. A structure is unfit for human *occupancy* whenever the *code official* finds that such structure is unsafe, unlawful or, because of the degree to which the structure is in disrepair or lacks maintenance, is insanitary, vermin ~~or rat~~ infested, contains filth and contamination, or lacks *ventilation*, illumination, sanitary or heating facilities or other essential equipment required by this code, or because the location of the structure constitutes a hazard to the *occupants* of the structure or to the public.

IPMC [A] 108.1.5 Dangerous *structure or premises*. For the purpose of this code, any structure or *premises* that has any or all of the conditions or defects described below shall be considered dangerous:

1. Any door, aisle, passageway, stairway, exit or other means of egress that does not conform to the *approved* building or fire code of the jurisdiction as related to the requirements for existing buildings.
2. The walking surface of any aisle, passageway, stairway, exit or other means of egress is so warped, worn loose, torn or otherwise unsafe as to not provide safe and adequate means of egress.
3. Any portion of a building, structure or appurtenance that has been damaged by fire, earthquake, wind, flood, *deterioration*, *neglect*, abandonment, vandalism or by any other cause to such an extent that it is likely to partially or completely collapse, or to become *detached* or dislodged.
4. Any portion of a building, or any member, appurtenance or ornamentation on the exterior thereof that is not of sufficient strength or stability, or is not so *anchored*, attached or fastened in place so as to be capable of resisting natural or artificial loads of one and one-half the original designed value.
5. The building or structure, or part of the building or structure, because of dilapidation, *deterioration*, decay, faulty construction, the removal or movement of some portion of the ground necessary for the support, or for any other reason, is likely to partially or completely collapse, or some portion of the foundation or underpinning of the building or structure is likely to fail or give way.
6. The building or structure, or any portion thereof, is clearly unsafe for its use and *occupancy*.
7. The building or structure is *neglected*, damaged, dilapidated, unsecured or abandoned ~~so as to become an attractive nuisance to~~ and not sufficiently secure to prevent children ~~who might play in from entering~~ the building or structure to their danger, becomes a harbor for vagrants, the homeless or criminals or immoral persons, or ~~enables not sufficiently secure to prevent~~ persons from entering ~~to resort to~~ the building or structure ~~for~~ and committing a nuisance or an unlawful act.
8. Any building or structure has been constructed, exists or is maintained in violation of any specific requirement or prohibition applicable to such building or structure provided by the *approved* building or fire code of the jurisdiction, or of any law or ordinance to such an extent as to present either a substantial risk of fire, building collapse or any other threat to life and safety.
9. A building or structure, used or intended to be used for dwelling purposes, because of inadequate maintenance, dilapidation, decay, damage, faulty construction or arrangement, inadequate light,

ventilation, mechanical or plumbing system, or otherwise, is determined by the *code official* to be unsanitary, unfit for human habitation or in such a condition that is likely to cause sickness or disease.

10. Any building or structure, because of a lack of sufficient or proper fire-resistance-rated construction, fire protection systems, electrical system, fuel connections, mechanical system, plumbing system or other cause, is determined by the *code official* to be a threat to life or health.
11. Any portion of a building remains on a site after the demolition or destruction of the building or structure or whenever any building or structure is abandoned so as to ~~constitute such building or portion thereof as an attractive nuisance or~~ become a hazard to the public or a nuisance.

IPMC [A] 108.2 Closing of vacant structures. If the structure is vacant and unfit for human habitation and *occupancy*, and is not in danger of structural collapse, the *code official* is authorized to post a placard ~~of condemnation~~ on the *premises* and order the structure closed up ~~so as not to be an attractive nuisance.~~ Upon failure of the *owner* to close up the *premises* within the time specified in the order, the *code official* shall cause the *premises* to be closed and secured through any available public agency or by contract or arrangement by private persons and the cost thereof shall be the personal responsibility of the owner and charged against the real estate upon which the structure is located and shall be a lien upon such real estate and shall be collected by any other legal resource.

IPMC [A] 108.3 Notice. Whenever the *code official* has ~~condemned~~ found a structure to be unfit for *occupancy* or a structure or equipment unsafe under the provisions of this section, notice shall be posted in a conspicuous place in or about the structure affected by such notice and served on the *owner* or the person or persons responsible for the structure or equipment in accordance with Section 107.3. Failure to receive the notice does not relieve the owner or person responsible from liability under this code, nor does that failure preclude the code official from acting to protect the public health and safety. If the notice pertains to equipment, it shall also be placed on the ~~condemned~~ unsafe equipment. The notice shall be in the form prescribed in Section 107.2.

IPMC [A] 108.4 Placarding. In addition to the procedures authorized in Section 108.2, when the code official has issued an unsafe abatement order, upon failure of the *owner* or person responsible to comply with the notice provisions within the time given, the *code official* shall post on the *premises* or on defective equipment a warning placard bearing the word "~~Condemned~~ DANGER – Unsafe/Unfit for Occupancy" and a statement of the penalties provided for occupying the *premises*, operating the equipment or removing the placard.

IPMC [A] 108.4.1 Placard removal. The *code official* shall remove the ~~condemnation~~ warning placard whenever the defect or defects upon which the ~~condemnation and placarding~~ action were based have been eliminated. Any person who defaces or removes a ~~condemnation~~ warning placard without the approval of the *code official* shall be subject to the penalties provided by this code.

IPMC [A] 108.5 Prohibited occupancy. Any occupied structure ~~condemned~~ found unsafe or unfit for human occupancy and placarded by the *code official* shall be vacated as ordered by the *code official*. ~~Any~~ It shall be unlawful for a person who shall to occupy a placarded *premises* or ~~shall to~~ operate placarded equipment, and any *owner* or any person responsible for the *premises* who ~~shall let~~ allow anyone to occupy a placarded *premises* or to operate placarded equipment shall be ~~liable for the penalties provided by a violation of~~ liable for the penalties provided by a violation of this code.

IPMC [A] 108.6 Abatement methods. The *owner*, *operator* or *occupant* of a building, *premises* or equipment deemed unsafe by the *code official* shall abate or cause to be abated or corrected such unsafe conditions either by repair, rehabilitation, demolition or other *approved* corrective action within the time and manner prescribed by the code official.

IPMC SECTION 109 EMERGENCY MEASURES

IPMC [A] 109.1 Imminent danger. When, in the opinion of the *code official*, there is *imminent danger* of failure or collapse of a building or structure which endangers life, or when any structure or part of a structure has fallen and life is endangered by the occupation of the structure, or when there is actual or potential danger to the building *occupants* or those in the proximity of any structure because of explosives, explosive fumes or vapors or the presence of toxic fumes, gases or materials, or operation of defective or dangerous equipment, the *code official* is hereby authorized and empowered to order and require the *occupants* to vacate the *premises* forthwith. The *code official* shall cause to be posted at each entrance to such structure a notice reading as follows: "This Structure Is Unsafe and Its Occupancy Has Been Prohibited by the Code Official." It shall be unlawful for any person to enter such structure except as directed by the Code Official for the purpose of securing the structure, making the required repairs, removing the hazardous condition or of demolishing the same.

IPMC [A] 109.3 Closing streets. When necessary for public safety, the *code official* shall be permitted to temporarily close structures and, as directed and authorized by the appointing authority or appropriate agency having jurisdiction, close, or order the authority having jurisdiction to close, sidewalks, streets, public ways and places adjacent to unsafe structures, and prohibit the same from being utilized.

IPMC [A] 109.5 Costs of emergency repairs. Costs incurred in the performance of emergency work ~~shall be paid by the jurisdiction~~ be the personal responsibility of the owner and responsible parties of the premises and constitute jointly and severally removal shall be charged against the real estate upon which the structure is located and shall be a lien upon such real estate. The legal counsel of the jurisdiction shall institute appropriate action against the *owner and responsible parties* of the *premises* where the unsafe structure is or was located for the recovery of such costs or through foreclosure of the lien or both.

IPMC SECTION 110 DEMOLITION

IPMC [A] 110.1 General. The *code official* shall order the *owner* of any *premises* upon which is located any structure, which in the *code official* judgment after review is so deteriorated or dilapidated or has become so out of repair as to be dangerous, unsafe, insanitary or otherwise unfit for human habitation or occupancy, ~~and such that it is unreasonable to repair the structure, to demolish and remove such structure; or if such structure is capable of being made safe by repairs, to repair and make safe and sanitary, or to board up and hold for future repair or to demolish and remove at the owner's option; or where there has been a cessation of normal construction of any structure for a period of more than two years~~ one year, the code official shall order any of the following remedies: the owner to shall demolish and remove such structure, or make the premises safe and sanitary or board up the structure until future repair. Boarding the building up for future repair shall not extend beyond one year, unless approved by the building official. If after one year the boarded structure has not been repaired or brought into compliance, the building official shall be permitted to order demolition.

IPMC [A] 110.2 Notices and orders. All notices and orders shall comply with Section 107. Failure to comply does not affect the code official's authority to act or relieve the owner or responsible party of their obligation to comply with this code, the code official's orders or to eliminate dangerous, unsafe, insanitary or conditions making a property unfit for human habitation or occupancy.

IPMC [A] 110.4 Salvage materials. When any structure has been ordered demolished and removed, the governing body or other designated officer under said contract or arrangement aforesaid shall have the right to identify and sell the salvage and valuable materials at the highest price obtainable in a commercially reasonable manner. The net proceeds of such sale, after deducting the expenses of such demolition and removal, shall be promptly remitted with a report of such sale or transaction, including the items of expense and the amounts deducted, for the person who is entitled thereto, subject to any order of a court. If such a surplus does not remain to be turned over, the report shall so state.

IPMC SECTION 111 MEANS OF APPEAL

IPMC [A] 111.2 Membership of board. The board of appeals shall consist of a minimum of three members who are qualified by experience and training to pass on matters pertaining to property maintenance and who are not employees of the jurisdiction. ~~The code official shall be an ex-officio member but shall have no vote on any matter before the board.~~ The board shall be appointed by the chief appointing authority, and shall serve staggered and overlapping terms.

IPMC [A] 111.5 Postponed hearing. When the full board is not present to hear an appeal, either ~~the appellant or the appellant's representative~~ party shall have the right to request a postponement of the hearing.

IPMC [A] 111.6 Board decision. ~~The board shall modify or reverse the decision of the code official only by a concurring vote of a majority of the total number of appointed board members. On appeal, the code official shall first produce evidence substantiating the decision, notice or order at issue. If the board determines the code official has met this burden, then the appealing party shall show why the decision, notice or order should be reverse or modified. On all issues, the appeal shall be denied unless a majority of the board votes to approve, reverse or modify. Orders to remove tenants or to demolish a building or structure shall be sustained by majority vote of those present and voting. The decision of the board shall be reduced to a writing containing facts supporting the board's decision to approve, reverse or modify the code official's decision and the board's reasoning.~~

IPMC [A] 111.7 Court review. ~~The code official and any person, whether or not a previous party of participating in~~ the appeal, shall have the right to apply to the appropriate court for a writ of certiorari to correct errors of law. Application for review shall be made in the manner and time required by law following the filing of the decision in the office of the chief administrative officer.

IPMC [A] 111.8 Stays of enforcement. Appeals of notice and orders (other than *Imminent Danger* notices—for example, stop work orders, and orders to vacate) shall stay the enforcement of the notice and order until the appeal is heard by the appeals board.

IPMC SECTION 112 STOP WORK ORDER

IPMC [A] 112.3 Written notice not required in emergencies. Where an emergency exists, the *code official* shall not be required to give a written notice prior to stopping the work.

IPMC [A] 112.4 Failure to comply. Any person who shall continue any work after having been served with a stop work order, except such work as that person is directed to perform to remove a violation or unsafe condition, ~~shall be liable to a fine of not less than [AMOUNT] dollars or more than [AMOUNT] dollars constitute a violation of this code, punishable as a misdemeanor offense.~~

PART II – IRC

Revise the International Residential Code as follows:

IRC SECTION R202 DEFINITIONS

OWNER. Any person, agent, operator, entity, firm or corporation having a any legal or equitable interest in the property; or recorded in the official records of the state, county or municipality as holding an interest or title to the property; or otherwise having possession or control of the property, including the guardian of the estate of any such person, and the executor or administrator of the estate of such person if ordered to take possession of real property by a court.

Reason: The intent of this proposal is to avoid lengthy and expensive litigation, during the administrative process and if a decision is challenged in an appeal. The reason for changing the definition of "Owner" is both for consistency between codes and to hold those with ownership interests responsible for maintaining the property that they legally possess (e.g., mortgage), but fail to maintain. Deleting references to "condemn" is important because the legal connotation implies that a property will be taken through eminent domain proceedings and demolished, when, in fact, it is merely uninhabitable and capable of being boarded-up for safety until repairs can be made.

IMLA members would be honored to propose suggested revisions to the International Code Council's International Property Maintenance this year, in an effort to synergize our organizations' efforts. We are hopeful that your organization would consider some of these suggestions that originate from court cases around the country so that communities can benefit from the experience of others. Municipal attorneys across the country assist building officials in carrying out their duties and are often asked to interpret and opine on code provisions as they apply in their local jurisdictions.

Our attempt at making these suggestions was for a two-fold purpose: to assist in language that might help communities avoid unnecessary litigation and to begin to develop a good relationship between our organizations that are naturally aligned to improve our communities.

We hope these comments will lead to further discussion of what may be necessary to make the best model code possible and we look forward to working with you in the future!

The International Municipal Lawyers Association (IMLA) is a non-profit, professional organization that has been an advocate and resource for local government attorneys since 1935. IMLA services as an international clearinghouse of legal information and cooperation on municipal legal matters. IMLA collects from and disseminates information to its membership across the United States and Canada and helps governmental officials prepare for litigation and develop new local laws.

Every year, IMLA's legal staff provides accurate, up-to-date information and valuable counsel to hundreds of requests from members. IMLA also provides a variety of services, publications and programs to help members who are facing legal challenges. For the past 77 years, IMLA has held cutting edge national conferences, including a Code Enforcement Conference, bringing local government attorneys together to network and propose solutions to common problems. It champions the development of fair and realistic legal solutions and provides its members with information about, and solutions to, the profusion of legal issues facing its membership today.

(cbaldassarra@rjagroup.com)

PART I – IBC; ICCPC; IFC; IFCG; IMC; IPC; IPSDC; IPMC

Revise the International Building Code as follows:

IBC [A] 101.3 Intent. The purpose of this code is to establish the minimum requirements to safeguard the public health, safety and general welfare through structural strength, *means of egress* facilities, stability, sanitation, adequate light and ventilation, energy conservation; to safeguard ~~and safety to~~ life and property from fire and other hazards attributed to the built environment; and, to safeguard ~~provide safety to~~ fire fighters and emergency responders during emergency operations.

Revise the International Code Council Performance Code as follows:

ICCPC [A] 101.2.2 Fire. Part III of this code establishes requirements necessary ~~to provide an acceptable level~~ to safeguard ~~of life safety and property protection~~ from the hazards of fire, explosion or dangerous conditions in all facilities, equipment and processes.

Revise the International Fire Code as follows:

IFC [A] 101.3 Intent. The purpose of this code is to establish the minimum requirements consistent with nationally recognized good practice for providing a reasonable level to safeguard ~~of life safety and property protection~~ from the hazards of fire, explosion or dangerous conditions in new and existing buildings, structures and premises, and to safeguard ~~provide safety to~~ fire fighters and emergency responders during emergency operations.

Revise the International Fuel Gas Code as follows:

IFGC [A] 101.4 Intent. The purpose of this code is to provide minimum standards to safeguard life ~~or limb~~, health, property and public welfare by regulating and controlling the design, construction, installation, quality of materials, location, operation and maintenance or use of fuel gas systems.

Revise the International Mechanical Code as follows:

IMC [A] 101.3 Intent. The purpose of this code is to provide minimum standards to safeguard life ~~or limb~~, health, property and public welfare by regulating and controlling the design, construction, installation, quality of materials, location, operation and maintenance or use of mechanical systems.

Revise the International Plumbing Code as follows:

IPC [A] 101.3 Intent. The purpose of this code is to provide minimum standards to safeguard life ~~or limb~~, health, property and public welfare by regulating and controlling the design, construction, installation, quality of materials, location, operation and maintenance or use of plumbing equipment and systems.

Revise the International Private Sewage Disposal Code as follows:

IPSDC [A] 101.6 Intent. The purpose of this code is to provide minimum standards to safeguard life ~~or limb~~, health, property and public welfare by regulating and controlling the design, construction, installation, quality of materials, location, operation and maintenance or use of *private sewage disposal systems*.

Revise the International Property Maintenance Code as follows:

IPMC [A] 101.2 Scope. The provisions of this code shall apply to all existing residential and nonresidential structures and all existing *premises* and constitute minimum requirements and standards for *premises*, structures, equipment and facilities for light, *ventilation*, space, heating, sanitation, protection from the elements, to safeguard life safety, ~~safety~~ from fire and other hazards, and for safe and sanitary maintenance; the responsibility of *owners, operators and occupants*; the *occupancy* of existing structures and *premises*, and for administration, enforcement and penalties.

PART II – IRC

Revise the International Residential Code as follows:

IRC R101.3 Intent. The purpose of this code is to establish minimum requirements to safeguard the public safety, health and general welfare through affordability, structural strength, means of egress facilities, stability, sanitation, light and ventilation, energy conservation and safety to life and property from fire and other hazards attributed to the built environment and to safeguard ~~provide safety to~~ fire fighters and emergency responders during emergency operations.

Reason: The intent of this change is to make a minor, but important, clarification of the intent of the code. The section covering the “intent” of the IBC is often used by attorneys and others outside of the code community as the basis for various legal actions. Therefore, it is important that this section reflects both the intention of the code community and the relative level of safety that is reasonably provided through these regulations.

The proposal includes changes that make the levels of intended “safety” the same to the reader by using the same term “safeguard” (used in the first phrase) in the other two phrases. While the language using the term “safeguard” is, perhaps, somewhat vague, it is better than suggesting absolute “safety” can be provided to any person or property through the provisions of the code. There is no intention to reduce the level of safety provided by the code with this change. All users and beneficiaries of the code will be better served through this clarification.

Cost Impact: This code change proposal will not affect the cost of construction.

Staff Analysis: The section on Intent are also found in IEBC 101.3, IWUIC 101.3, IZC 101.2, IECC C101.3, IECC R101.3 and IPSDC 101.3.

101.3-ADM (IBC)-BALDASSARRA

ADM7 – 13

R101.3

THIS WILL BE HEARD BY THE INTERNATIONAL RESIDENTIAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

Proponent: Matt Archer, Douglas County, CO representing Colorado Chapter Code Change Committee (marcher@douglas.co.us)

Revise the International Residential Code as follows:

IRC R101.3 Intent. The purpose of this code is to establish minimum requirements to safeguard the public safety, health and general welfare through affordability, structural strength, means of egress facilities, stability, sanitation, light and ventilation, energy conservation and safety to life and property from fire and other hazards attributed to the built environment ~~and to provide safety to fire fighters and emergency responders during emergency operations.~~

Reason: This section identifies two distinct goals of the IBC, IFC and IRC: to protect the public and their property, and to provide safety for fire fighters and emergency responders. Code requirements should be developed and enforced for the protection of everyone, and firefighters and responders will benefit from the same protections intended to serve other occupants, even in the case of an emergency. The code should not be developed to provide for a special protected class of persons exposed to hazards only in the case of an emergency. It is understandable that emergency responders should not be exposed to additional hazards that are not also present for the occupants and visitors to a residence, but they are not. The safety of the occupants of a residence and protection of their property should be declared as the clear intent of this Code. To single out firefighters and emergency responders, a class of persons highly trained and very aware of the potential hazards of their professions, is not appropriately included as a primary intent of this code.

Cost Impact: None

PART I – IBC; IEBC; IFC; IFGC; IMC; IPC; IPSDC; IPMC; IWUIC

Revise the International Building Code as follows:

IBC [A] 101.3 Intent. The purpose of this code is to establish the ~~minimum~~ the lowest allowable requirements to safeguard the public health, safety and general welfare through: structural strength, *means of egress* facilities, stability, sanitation, adequate light and ventilation, energy conservation; and safety to life and property from fire, wind, earthquake, radon and other hazards attributed to the built environment; and also to provide safety to fire fighters and emergency responders during emergency operations.

Revise the International Code Council Performance Code as follows:

ICCPC [A] 101.2.2 Fire. Part III of this code establishes requirements necessary to provide an acceptable level of life safety and property protection from the hazards of fire, wind, earthquake, radon, explosion or dangerous conditions in all facilities, equipment and processes.

Revise the International Existing Building Code as follows:

IEBC [A] 101.3 Intent. The intent of this code is to provide flexibility to permit the use of alternative approaches to achieve compliance with ~~minimum~~ the lowest allowable requirements to safeguard the public health, safety and welfare insofar as they are affected by the *repair, alteration, change of occupancy, addition* and relocation of *existing buildings*.

Revise the International Fire Code as follows:

IFC [A] 101.3 Intent. The purpose of this code is to establish the ~~minimum~~ the lowest allowable requirements consistent with nationally recognized good practice for providing a reasonable level of life safety and property protection from the hazards of fire, explosion or dangerous conditions in new and existing buildings, structures and premises; and also to provide safety to fire fighters and emergency responders during emergency operations.

Revise the International Fuel Gas Code as follows:

IFGC [A] 101.4 Intent. The purpose of this code is to provide ~~minimum~~ the lowest allowable standards to safeguard life or limb, health, property and public welfare by regulating and controlling the design, construction, installation, quality of materials, location, operation and maintenance or use of fuel gas systems.

Revise the International Mechanical Code as follows:

IMC [A] 101.3 Intent. The purpose of this code is to provide ~~minimum~~ the lowest allowable standards to safeguard life or limb, health, property and public welfare by regulating and controlling the design, construction, installation, quality of materials, location, operation and maintenance or use of mechanical systems.

Revise the International Plumbing Code as follows:

IPC [A] 101.3 Intent. The purpose of this code is to provide ~~minimum~~ the lowest allowable standards to safeguard life or limb, health, property and public welfare by regulating and controlling the design, construction, installation, quality of materials, location, operation and maintenance or use of plumbing equipment and systems.

Revise the International Private Sewage Disposal Code as follows:

IPSDC [A] 101.6 Intent. The purpose of this code is to provide ~~minimum~~ the lowest allowable standards to safeguard life or limb, health, property and public welfare by regulating and controlling the design, construction, installation, quality of materials, location, operation and maintenance or use of *private sewage disposal systems*.

Revise the International Property Maintenance Code as follows:

IPMC [A] 101.2 Scope. The provisions of this code shall apply to all existing residential and nonresidential structures and all existing *premises* and constitute ~~minimum~~ the lowest allowable requirements and standards for *premises*, structures, equipment and facilities for light, *ventilation*, space, heating, sanitation, protection from the elements, life safety, safety from fire, wind, earthquake, radon and other hazards, and for safe and sanitary maintenance; the responsibility of *owners, operators* and *occupants*; the *occupancy* of existing structures and *premises*, and for administration, enforcement and penalties.

IPMC [A] 101.3 Intent. This code shall be construed to secure its expressed intent, which is to ensure public health, safety and welfare insofar as they are affected by the continued *occupancy* and maintenance of structures and *premises*. Existing structures and *premises* that do not comply with these provisions shall be altered or repaired to provide a ~~minimum~~ the lowest allowable level of health and safety as required herein.

Revise the International Wildland-Urban Interface Code as follows:

IWUIC [A] 101.3 Objective. The objective of this code is to establish ~~minimum~~ the lowest allowable regulations consistent with nationally recognized good practice for the safeguarding of life and property. Regulations in this code are intended to mitigate the risk to life and structures from intrusion of fire from wildland fire exposures and fire exposures from adjacent structures and to mitigate structure fires from spreading to wildland fuels. The extent of this regulation is intended to be tiered commensurate with the relative level of hazard present.

The unrestricted use of property in *wildland-urban interface areas* is a potential threat to life and property from fire and resulting erosion. Safeguards to prevent the occurrence of fires and to provide adequate fire-protection facilities to control the spread of fire in *wildland-urban interface areas* shall be in accordance with this code.

This code shall supplement the jurisdiction's building and fire codes, if such codes have been adopted, to provide for special regulations to mitigate the fire- and life-safety hazards of the *wildland-urban interface areas*.

PART II – IRC

Revise the International Residential Code as follows:

R101.3 Intent. The purpose of this code is to establish ~~minimum~~ the lowest allowable requirements to safeguard the public safety, health and general welfare through: ~~affordability~~, structural strength, means of egress facilities, stability, sanitation, light and ventilation, energy conservation; and safety to life and property fire, wind, earthquake, radon and other hazards attributed to the built environment; and also to provide safety to fire fighters and emergency responders during emergency operations

PART III – ISPSC

Revise the International Swimming Pool and Spa Code as follows:

ISPSC 101.3 Intent. The purpose of this code is to provide ~~minimum~~ the lowest allowable standards to safeguard life or limb, health, property and public welfare by regulating and controlling the design, construction, installation, quality of materials, location and maintenance or use of *aquatic vessels*.

Reason:

- (a) “the lowest allowable” better reflects the reality that the code requirements are, in fact, too low for what the public expects and believes they are actually promised in a code compliant building. Unless the memory is jogged by this “up-front” language, both the public and code officials will presume (incorrectly) that the code delivers a top quality performer with exemplary safety and “end result.” Thus individuals and consumers of code compliant products may more directly and pro-actively *determine* the quality of performance that they both desire and also really have always expected (but incorrectly) was so.
- (b) “fire,” wind, earthquake, radon are the important circumstances with respect to property damage (insurance issues and claims) and both personal injury and life safety; and they therefore should be specifically called out in the text: equally important as “fire.”
- (c) ~~affordability~~ is deleted because it is too vague, non-specific, and not really applicable; since all other fixed factors in this residential code are *prescriptively* predicated on the lowest allowable requirements.

The term “affordable housing” has specific history, connotations and difficulties: see Wikipedia “Affordable Housing:” http://en.wikipedia.org/wiki/Affordable_housing

Location, land value, system development charges, as well as property tax structure also are important factors in determining affordability; which is often most simply represented as a certain percentage of homeowner income that can be apportioned off to housing. Thus “affordability” is not just the resultant of these residential (and mostly prescriptive) building code requirements – but the implication of this present “Intent” statement is that said “affordability” is determined, promised and guaranteed by these residential code requirements.

See also: IRC-14-3FIG. R301.2(2) SEISMIC DESIGN CATEGORIES SITE CLASS D.doc

Cost Impact: The code change proposal will not increase the cost of construction.

ADM9 – 13

IEBC: [A] 101.4, [A] 101.4.1(New)

Proponent: David S. Collins, FAIA, The Preview Group, Inc./The American Institute of Architects
(dcollins@preview-group.com)

Revise the International Existing Building Code as follows:

IEBC [A] 101.4 Applicability. This code shall establish minimum requirements for existing buildings and apply to the maintenance, repair, alteration, change of occupancy, addition and relocation of all existing buildings, regardless of occupancy, subject to the criteria of Sections 101.4.1 and 101.4.2 through 101.4.3.

IEBC [A] 101.4.1 Maintenance. Buildings and structures, and parts thereof, shall be maintained in a safe and sanitary condition. Devices or safeguards which are required by this code, the *International Building Code* and the *International Fire Code* shall be maintained in conformance with the code edition under which installed. The owner or the owner's designated agent shall be responsible for the maintenance of buildings and structures. To determine compliance with this subsection, the code official shall have the authority to require a building or structure to be reinspected. The requirements of this chapter shall not provide the basis for removal or abrogation of fire protection and safety systems and devices in existing structures.

(Renumber subsequent sections)

Reason: The language and scope of Chapter 34 included provisions for the maintenance of existing buildings:

3401.2 Maintenance.

Buildings and structures, and parts thereof, shall be maintained in a safe and sanitary condition. Devices or safeguards which are required by this code shall be maintained in conformance with the code edition under which installed. The owner or the owner's designated agent shall be responsible for the maintenance of buildings and structures. To determine compliance with this subsection, the building official shall have the authority to require a building or structure to be reinspected. The requirements of this chapter shall not provide the basis for removal or abrogation of fire protection and safety systems and devices in existing structures.

This change adds the same scope for maintenance to become part of the administrative provisions of the IEBC.

Cost Impact: The cost of providing ongoing maintenance of existing maintenance will reduce the cost to owners by preventing deterioration that cause higher costs of repairs.

	Assembly:	ASF	AMF	DF

[A] 101.4-ADM (IEBC)-COLLINS

ADM10 – 13

IEBC: [A] 101.4.2 (New), [A] 101.4.2.1 (New), [A] 101.4.2.2 (New)

Proponent: David S. Collins, FAIA, The Preview Group, Inc./The American Institute of Architects
(dcollins@preview-group.com)

Revise the International Existing Building Code as follows:

IEBC [A] 101.4.2 Certificate of Occupancy Renewal. The owner of a building that exceeds 25,000 sf. in aggregate floor area, or has multiple tenants, or includes a place of assembly shall be responsible to file for a renewal of the certificate of occupancy no less than every five years after the original certificate of occupancy is issued. Such renewal shall document in a written statement from the owner that the safety features of the building remain in proper working order as installed when the most current permit was issued, and maintenance requirements of the applicable codes have been performed and that required testing has been performed.

IEBC [A] 101.4.2.1 Documentation. In addition to the written statement, the owner shall submit records of inspection and testing of installation equipment and systems where this code or referenced standards require periodic inspections and testing. Documents shall include evidence of all inspections and testing listed in the applicable codes; the *International Fire Code*, the *Wildland-Urban Interface Code*, the *ICC Performance Code*, and *International Plumbing Code*.

IEBC [A] 101.4.2.2 Verification. As part of the written documentation, an owner may authorize a registered design professional to maintain the records and to prepare and submit the documents and application for renewal.

Reason: One of the difficulties with achieving the levels of performance anticipated in buildings is the ongoing maintenance of a building and its systems. Chapter 34 of the IBC has for years included a maintenance provision. With the deletion of Chapter 34 from the IBC we have submitted, in a separate code change, those same criteria to be added to the IEBC. With this change, as part of the Existing Building Code there will be a means by which owners can document measures they have taken to meet the requirements of the codes such as periodic inspections and testing.

The five-year period was taken from similar provision now found in the IFC for inspection of fire escapes. While these features of existing buildings are important and must be maintained to provide the expected level of safety, there are no means for the code official to know if that test has been performed. Often facilities undertake various small projects that are not monitored and this will allow for documentation of any elements that may have been modified over a period of time to be documented.

It is the intent that the responsibility for doing all work associated with the renewal will be the burden of the owner and that the application will simply provide the code official with a record of the buildings history and document what is being done to assure that the safety features of the building are maintained.

Cost Impact: This should lower the long term cost of construction.

ADM10-13

101.4.2 (NEW)-ADM (IEBC)-COLLINS

ADM11 – 13

IBC: [A] 101.4.7 (New), 202 (New), Chapter 35

Proponent: Anthony C. Apfelbeck, CBO, CFPS, City of Altamonte Springs Building/Fire Safety Division, representing self (ACApfelbeck@Altamonte.org)

Add new text to the International Building Code as follows:

IBC [A] 101.4.7 Performance based. The provisions of the ICC Performance Code for Buildings and Facilities shall apply to all buildings constructed or maintained utilizing a performance-based design.

Add new text to the International Building Code as follows:

IBC SECTION 202 DEFINITIONS

PERFORMANCE-BASED DESIGN. An engineering approach to design elements of a building based on agreed upon performance goals and objectives, engineering analysis and quantitative assessment of alternatives against the design goals and objectives utilizing accepted engineering tools, methodologies and performance criteria.

Add standard to IBC Chapter 35 as follows:

ICCPC-15 International Code Council Performance Code for Buildings and Facilities....101.4.7

Reason: Specifically referenced in the IBC are the ICC Gas, Mechanical, Plumbing, Property Maintenance, Fire, and Energy Codes. However, currently lacking from the referenced standards in the IBC model provisions is guidance for the code official on how to deal with a performance based design approach. The ICC promulgates the International Code Council Performance Code for Buildings and Facilities which is intended to provide the designer and user with specific guidance in dealing with performance based designs. Since the ICC promulgates a complete set of codes to regulate the built environment, it makes sense that the ICCPC be included within the basic referenced provisions in section 101.4.

In order to provide clarity to the end user, the definition of Performance-Based Design has been extracted from the ICCPC and included section 202 of the IBC.

Cost Impact: This code change will not increase the cost of construction.

ADM11-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

101.4.7 (NEW) #1-ADM (IBC)-APFELBECK

ADM12 – 13

IBC: [A] 101.4.7 (New), 202 (New)

Proponent: Anthony C. Apfelbeck, CBO, CFPS, City of Altamonte Springs Building/Fire Safety Division, representing self (ACApfelbeck@Altamonte.org)

Add new text to the International Building Code as follows:

IBC [A] 101.4.7 Wildland-Urban Interface. The provisions of the International Wildland-Urban Interface Code shall apply to all matters governing the design and construction of buildings within wildland-urban interface areas.

Add new text to the International Building Code as follows:

IBC SECTION 202 GENERAL DEFINITIONS

WILDLAND-URBAN INTERFACE AREA. That geographical area where structures and other human development meets or intermingles with wildland or vegetative fuels.

Reason: Specifically referenced in the IBC are the ICC Gas, Mechanical, Plumbing, Property Maintenance, Fire, and Energy Codes. However, currently lacking from the referenced standards in the IBC model provisions is guidance for the code official on how to deal with wild-land urban interface areas. The ICC promulgates the International Wildland-Urban Interface Code which is intended to provide the designer and user with specific guidance in dealing with structures constructed in wildland-urban interface area. Since the ICC promulgates a complete set of codes to regulate the built environment, it makes sense that the IWUIC be include within the basic referenced provisions in section 101.4.

In order to provide clarity to the end user, the definition of Wildland-Urban Interface Area has been extracted from the IWUIC and included section 202 of the IBC.

Cost Impact: This code change will increase the cost of construction.

ADM12-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

101.4.7 (NEW) #2-ADM (IBC)-APFELBECK

ADM13 – 13

IPMC: [A] 102.3

Proponent: David S. Collins, FAIA, The Preview Group, Inc., The American Institute of Architects
(dcollins@preview-group.com)

Revise the International Property Maintenance Code as follows:

IPMC [A] 102.3 Application of other codes. Repairs, additions or alterations to a structure, or changes of *occupancy*, shall be done in accordance with the procedures and provisions of the *International Building Code*, the International Existing Building Code, *International Energy Conservation Code*, *International Fire Code*, *International Fuel Gas Code*, *International Mechanical Code*, *International Residential Code*, *International Plumbing Code* and NFPA 70. Nothing in this code shall be construed to cancel, modify or set aside any provision of the *International Zoning Code*.

Reason : This is a correlative change. The membership deleted Chapter 34 from the IBC, and thus the reference to the IEBC as an alternative for compliance. The Property Maintenance Code should be permitted to use the IEBC for repairs and alterations.

Cost Impact: None

ADM13-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

102.3 (NEW)-ADM (IPMC)-COLLINS.doc

ADM14 – 13

IFC: [A] 102.3, [A] 102.3.1 (New), [A] 102.3.2 (New)

Proponent: Marc Sampson, Longmont Fire Department, CO, representing Fire Marshal's Association of Colorado

Revise the International Fire Code as follows:

IFC [A] 102.3 Change of use or occupancy. No change shall be made in the use or occupancy of any structure that would place the structure in a different division of the same group or occupancy or in a different group of occupancies, unless such structure is made to comply with the requirements of this code and the International Building Code.

IFC [A] 102.3.1 Less hazardous use. Subject to the approval of the fire code official, the use or occupancy of an existing structure shall be allowed to be changed and the structure is allowed to be occupied for purposes in other groups without conforming to all of the requirements of this code and the International Building Code for those groups, provided the new or proposed use is less hazardous, based on life and fire risk, than the existing use.

IFC [A] 102.3.2 Change in use or occupancy from the *International Residential Code*. For dwellings or townhouses constructed in compliance with the *International Residential Code*, no change shall be made in the use or occupancy of a building which would result in an occupancy regulated by this code unless such building is made to comply with the requirements of this code for the applicable occupancy classification.

REASON: Currently the code contains no provision on how to transition from an IRC structure to an IBC structure. The IBC and IFC are based on 'occupancy classifications' while the IRC is not.

These revisions are proposed to the IFC to clarify the application of the code when a building constructed under the IRC undergoes a change of use or occupancy which would now place the building under the regulation of the IFC. Since a dwelling constructed under the IRC is not constructed identically to a dwelling constructed under the IFC, it creates confusion as to how to make this transition.

The 2nd sentence of Section 102.3 is placed into a separate section creating Section 102.3.1. This section states the building official can allow a change of occupancy should not be hidden within the text, but in a standalone section.

Even though the text in IFC Section 102.3 does not show [B] in the margin, the current text is identical to the IBC and IEBC. Once the revisions are approved to the IBC, IEBC and IFC, all three codes will still contain the equivalent requirements and correlate.

Cost Impact: The code change will not increase the cost of construction.

ADM14-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

102.3.1 (NEW)-ADM (IFC)-SAMPSON

ADM15 – 13

IFC: 102.3.1 (New)

Proponent: Al Godwin, CBO, CPM, representing Aon Fire Protection Engineering Corporation.

Revise the International Fire Code as follows:

IFC [A] 102.3.1 Change of character. A change in occupancy, as defined in Section 202, with no change of occupancy classification, shall not be made to any structure that will subject the structure to any special provisions of the applicable *International Codes*, without approval of the *fire code official*. Compliance shall be only as necessary to meet the specific provisions and is not intended to require the entire building be brought into compliance.

Reason: This is a correlation with code change G231-12 which was approved as submitted last cycle. Currently, IFC Section 102.3 states:

“No change shall be made in the use or occupancy of any structure that would place the structure in a different division of the same group or occupancy or in a different group of occupancies, unless such structure is made to comply with the requirements of this code and the *International Building Code*.....”

But, what about change in occupancy that does not change division or group but does change the “level of activity” as specified in the definition of Change of Occupancy?

In the 2009/2010 code cycle, Code Change EB27-09/10 added “10. Ambulatory health care facilities” to IEBC Section 902.1 (now 1002.1) under the classification of “change of character. This section in the IEBC, along with The IEBC definition of Change of Use, in general verbiage, recognizes that there are changes of use that do not involve changing occupancy groups.

IEBC Section 1001.2 states:

“**1001.2 Change in occupancy with no change in occupancy classification.** A change in occupancy, as defined in Section 202, with no *change of occupancy* classification shall not be made to any structure that will subject the structure to any special provisions of the applicable *International Codes*, including the provisions of Sections 1002 through 1011, without the approval of the *code official*. A certificate of occupancy shall be issued where it has been determined that the requirements for the change in occupancy have been met.”

This proposal is to bring those provisions from IEBC Section 1001.2 over into the IFC.

As noted in the IEBC, it is possible to change a use without changing the occupancy classification. Some examples are as follows:

1. Group A-2 bar with an occupant load of 275 to a Group A-2 bar with an occupant load of 350. Increasing occupant loads is permitted under Section 1004.2.
2. Group B office to Group B Ambulatory Health Care
3. Group B office to Group B café
4. Group F-1 factory to a Group F-1 woodworking shop.
5. Group H-3 Oxidizing gases to Group H-3 Flammable solids
6. Group M retail to Group M retail of upholstered furniture
7. Group S-1 warehouse to Group S-1 tire warehouse over 20,000 cubic feet
8. Group S-1 warehouse to Group S-1 motor vehicle repair garage
9. Group R-2 apartment to Group R-2 Live/Work unit.

Each of these classifications has particular code provisions that would apply if the occupancy had been originally identified. Some items might be fire protection, alarms, fresh air, restroom facilities, accessibility, smoke barriers, etc. The IFC currently does not specifically address these changes since they do not change Groups or change Divisions within Groups.

When making a change of character, it is not necessary to totally re-evaluate the building. Only the new applicable provisions should be addressed.

For example:

Group A-2 bar with an occupant load of 275 to a Group A-2 bar with an occupant load of 350.

Items that might require review:

Means of egress – 1004.2, to the public way
Sprinklers – 903.2.1.2, only in this space
Alarms – 907.2.1, only in this space
Restrooms – Chapter 29

Fresh air – IMC
Accessibility – see Section 3411
If food – upgrade of interceptor provisions of the IPC

Items that might not require a new review:

Height and area
Exterior walls and openings

As this is a confusing issue, the code official will need to define what items of correction are appropriate. While the wording may be new, code officials have performed this service for years. This proposal just puts it in the code.

I thought about placing the provision in Chapter 11 for existing buildings but that would require moving Section 102.3 which is also existing buildings.

Costs: Since this provision is already being enforced in this manner, there should be no increase in costs of construction.

ADM15-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

102.3.1 (NEW)-F-GODWIN

ADM16 – 13

IFC: [A] 102.5

Proponent: Anthony C. Apfelbeck, CBO, CFPS, City of Altamonte Springs Building/Fire Safety Division, representing self. (ACApfelbeck@Altamonte.org); Steve Orłowski, representing National Association of Home Builders (NAHB) (sorłowski@nahb.org)

Revise the International Fire Code as follows:

IFC [A] 102.5 Application of residential code. Where structures are designed and constructed in accordance with the International Residential Code, the provisions of this code shall apply as follows:

1. Construction and design provisions: Provisions of this code pertaining to the exterior of the structure shall apply including, but not limited to, premises identification, fire apparatus access and water supplies. ~~Where interior or exterior systems or devices are installed, construction permits required by Section 105.7 of this code shall also apply.~~
2. Administrative and operational ~~and maintenance~~ provisions: All such provisions of this code shall apply.

Reason: The purpose of this code change is to address some of the controversy that has risen since the passage of a public comment on F3-07/08. The original purpose was to clear up the vagueness between the interaction between the IRC and the IFC and how they apply to one- and two- family dwellings and townhouses. The Fire Code Committee did not approve the original proposal which clearly stated that the IFC does not regulate the construction and design features of the structure built in accordance with the International Residential Code, but it does regulate the fire protections features leading up to the structure (such as premise identification, fire protection water supplies and fire apparatus access). A public comment was submitted and approved at the final action hearing which resulted in the current code text. Unfortunately, instead of clearing up where the scope of IFC ends and the scope of IRC begins, the current language has created more controversy over which code regulates the construction, design and maintenance of interior features in one- and two- family dwellings and townhouses.

One of the significant problems with the current language is found in the last sentence of the first application, regarding the construction permits required by section 105.7. All of the required construction permits that would apply to these types of structures, as indicated in this section, are already addressed within the scope of the International Residential Code. The concept of the IRC being a single source construction code is specifically stated within the commentary to R101.1 where it states that the intent of the IRC is to be a "stand-alone residential code that establishes minimum regulations for one- and two-family dwellings and townhouses." The IFC commentary to 102.5 further emphasizes this concept by stating "The IRC is designed and intended for use as a stand-alone code for the construction of detached one- and two-family dwellings and townhouses not more than three stories in height. As such, the construction of detached one- and two-family dwellings and townhouses *is regulated exclusively by the IRC and not subject to the provision of any other I-Codes*, other than to the extent specifically referenced. The intent of providing a stand-alone residential code is that there is no need for duplicative construction or permitting requirements within the I-Codes that would require a builder or homeowner to go out and get separate permits under the IRC and IFC for the same scope of work. Approval of this proposal will ensure the intent of the IRC scope, as a stand-alone construction document, is maintained while ensuring that the exterior fire protection features are still regulated under the scope of the IFC.

Another problem with the current language is the reference to all maintenance requirements of the IFC for IRC constructed structures. Prior to the approval of the public comment on F3-07/08, there was no specific language in the IFC that required maintenance for IRC structures in accordance with the IFC. Due to the language that was approved in F3-07/08 public comment, all of the maintenance provisions in the IFC should be being applied right now.

Looking over some of the maintenance requirements for fire alarm systems and carbon monoxide detectors it raises the questions, has the fire service been enforcing these provisions and if so how. In many states, once a one- and two family dwelling or townhouse receives its certificate of occupancy there is no more involvement with the building official. The IFC states that it is the fire official's responsibility to insure existing building meet the requirements of this code and that all buildings are maintained in accordance with its provisions? How many departments have requested entry to ensure that every existing one- and two- family dwelling is equipped with a carbon monoxide detector as required by the 2012 IFC? The current language of the IFC leaves the fire service open to liability if they are not enforcing the provisions of this code as it is written and adopted. Although some of the referenced standards in the IFC do not require maintenance on some of the system in a one-and two-family dwelling or townhouse, the inference is that maintenance is required since the term "maintenance" is utilized in 102.5 (2).

Cost Impact: The code change proposal will not increase the cost of construction.

ADM16-13

ADM17 – 13

IBC: [A] 102.6, [A] 102.6.1 (New), [A] 102.6.2 (New); IEBC: [A] 101.4.1 (New)

Proponent: David S. Collins, FAIA, The Preview Group, Inc./The American Institute of Architects
(dcollins@preview-group.com)

Revise the International Building Code as follows:

IBC [A] 102.6 Existing structures. The legal occupancy of any structure existing on the date of adoption of this code shall be permitted to continue without change, except as is specifically covered in this code, the International Existing Building Code, the International Property Maintenance Code or the International Fire Code, or as is deemed necessary by the building official for the general safety and welfare of the occupants and the public.

IBC [A] 102.6.1 Buildings not previously occupied. A building or portion of a building that has not been previously occupied or used for its intended purpose in accordance with the laws in existence at the time of its completion shall comply with the provisions of the International Building Code or International Residential Code, as applicable, for new construction or with any current permit for such occupancy.

IBC [A] 102.6.2 Buildings previously occupied. The legal occupancy of any building existing on the date of adoption of this code shall be permitted to continue without change, except as is specifically covered in this code, the International Fire Code, or the International Property Maintenance Code, or as is deemed necessary by the building official for the general safety and welfare of the occupants and the public.

Revise the International Existing Building Code as follows:

IEBC [A] 101.4 Applicability. This code shall apply to the *repair, alteration, change of occupancy, addition* and relocation of all *existing buildings*, regardless of occupancy, subject to the criteria of Sections 101.4.1 and 101.4.2.

IEBC [A] 101.4.1 Buildings not previously occupied. A building or portion of a building that has not been previously occupied or used for its intended purpose in accordance with the laws in existence at the time of its completion shall be permitted to comply with the provisions of the laws in existence at the time of its original permit unless such permit has expired. All subsequent permits shall comply with the International Building Code or International Residential Code, as applicable, for new construction ~~or with any current permit for such occupancy.~~

IEBC [A] 101.4.2 Buildings previously occupied. The legal occupancy of any building existing on the date of adoption of this code shall be permitted to continue without change, except as is specifically covered in this code, the *International Fire Code*, or the *International Property Maintenance Code*, or as is deemed necessary by the *code official* for the general safety and welfare of the occupants and the public.

Reason : The IBC does not now have specific statements regarding the conditions of buildings that have not been or have been previously occupied. The IEBC does include specific requirements for how changes in the code are to be applied. These provisions have been added here to provide the same coverage. In addition, vague language from IBC 102.6 has been removed as likely unenforceable, and certainly would leave an owner/developer/designer in the dark. Finally, the priority for existing permits has been made superior to the current language that says if a new code is adopted it should apply unless there is a permit, which was clumsy and confusing.

Cost Impact: None

Proponent: Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (Gregory.wilson2@fema.dhs.gov); Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net)

Revise the International Building Code and the International Existing Building Code as follows:

IBC [A] 104.2.1 (IEBC [A] 104.2.1) Determination of substantially improved or substantially damaged existing buildings and structures in flood hazard areas. For applications for reconstruction, rehabilitation, repair, alteration, addition or other improvement of existing buildings or structures located in flood hazard areas, the building official shall determine if the proposed work constitutes substantial improvement or repair of substantial damage. Applications determined to constitute substantial improvement or repair of substantial damage shall require all existing portions of the entire building or structure to meet the requirements of Section 1612 (of the International Building Code).

(Renumber subsequent sections in the IEBC)

Reason: This language is similar to R105.3.1.1, which has the building official making a finding with regard to the value of the proposed work and market value of the building. This change is also proposed for the International Existing Building Code. Application of the IBC Chapter 34 requirements for existing buildings in flood hazard areas depends on the definitions of the terms “substantial improvement” and “substantial damage.” The proposed new subsection under Section 104.2 describes what the building official does to determine whether work proposed for existing buildings meets those definitions. A number of code officials have suggested to FEMA that the simple presence of the definitions is insufficient to ensure that these determinations are made and it would be helpful if the building official's responsibilities clearly specified making these determinations.

FEMA published extensive guidance on substantial improvement and substantial damage, including a number of acceptable methods to estimate market value and project costs. Most jurisdictions require the applicant to provide an estimate of costs, which is already required by Section 105.3#5 to be included in the application.

Cost Impact: None. The proposal describes determining whether work meets definitions that are already in the IBC.

ADM20 – 13

IFC [A] 104.7.2

Proponent: Elley Klausbruckner, representing Klausbruckner & Associates Inc (ek@klausbruckner.com)

Revise the International Fire Code as follows:

IFC [A] 104.7.2 Technical assistance. To determine the acceptability of technologies, processes, products, facilities, materials and uses attending the design, operation or use of a building or premises subject to inspection by the *fire code official*, the *fire code official* is authorized to require the *owner* or agent to provide, without charge to the jurisdiction, a technical opinion and report. The opinion and report shall be prepared by a qualified engineer, specialist, laboratory or fire safety specialty organization acceptable to the *fire code official* and shall analyze the fire safety properties of the design, operation or use of the building or premises and the facilities and appurtenances situated thereon, to recommend necessary changes. The *fire code official* is authorized to require design submittals to be prepared by, and bear the stamp of, a registered design professional. The *fire code official* is authorized to require technical opinions and reports to be prepared by a registered design professional when the technical opinions and reports affect the building design or site construction, or safety systems.

Reason: Building construction and systems such as mechanical, etc. have to be designed by a design professional. The report addressing the requirements for some of these systems is the basis of their design. It is illogical to require the design to be prepared by a registered design professional but allow the report addressing the basis of the design be prepared by someone other than a registered design professional. Additionally if there are intentional acts of omission [or misleading information] in the report prepared by a registered design professional, the authority having jurisdiction can submit a complaint to the state board and the registered design professional can face disciplinary action [from fines, loss of reputation, etc. to having their license revoked]. There are no major repercussions to the preparer of these reports if they are not registered design professionals or if the Jurisdiction or state does not require educational or licensing requirements from the preparer. The added language will lend added support to the jurisdiction when a technical report is required if chosen to adopt this section as a local or state amendment.

NOTE: IFC Definition of Registered Design Professional - An individual who is registered or licensed to practice their respective design profession as defined by the statutory requirements of the professional registration laws of the state or jurisdiction in which the project is to be constructed.

Cost Impact: None

Proponent: Mike Metheny, City of Aspen Colorado, representing Colorado Chapter Code Change Committee

PART I – IBC; IEBC; IFC; IFGC; IMC; IPC; IPSDC; IPMC; IWUIC; IZC

Revise the International Building Code as follows:

IBC [A] 104.8 Liability. The building official, member of the board of appeals or employee charged with the enforcement of this code, while acting for the jurisdiction in good faith and without malice in the discharge of the duties required by this code or other pertinent law or ordinance, shall not thereby be civilly or criminally rendered liable personally and is hereby relieved from personal liability for any damage accruing to persons or property as a result of any act or by reason of an act or omission in the discharge of official duties.

IBC [A] 104.8.1 Legal defense. Any suit or criminal complaint instituted against an officer or employee because of an act performed by that officer or employee in the lawful discharge of duties and under the provisions of this code shall be defended by legal representative of the jurisdiction until the final termination of the proceedings. The building official or any subordinate shall not be liable for cost in any action, suit or proceeding that is instituted in pursuance of the provisions of this code.

Revise the International Existing Building Code as follows:

IEBC [A] 104.8 Liability. The code official, member of the Board of Appeals, or employee charged with the enforcement of this code, while acting for the jurisdiction in good faith and without malice in the discharge of the duties required by this code or other pertinent law or ordinance, shall not thereby be rendered civilly or criminally liable personally and is hereby relieved from personal liability for any damage accruing to persons or property as a result of any act or by reason of an act or omission in the discharge of official duties.

IEBC [A] 104.8.1 Legal defense. Any suit or criminal complaint instituted against an officer or employee because of an act performed by that officer or employee in the lawful discharge of duties and under the provisions of this code shall be defended by legal representative of the jurisdiction until the final termination of the proceedings. The code official or any subordinate shall not be liable for cost in any action, suit, or proceeding that is instituted in pursuance of the provisions of this code.

Revise the International Fire Code as follows:

IFC [A] 103.4 Liability. The fire code official, member of the board of appeals, officer or employee charged with the enforcement of this code, while acting for the jurisdiction, in good faith and without malice in the discharge of the duties required by this code or other pertinent law or ordinance, shall not thereby be rendered civilly or criminally liable personally, and is hereby relieved from all personal liability for any damage accruing to persons or property as a result of an act or by reason of an act or omission in the discharge of official duties.

IFC [A] 103.4.1 Legal defense. Any suit or criminal complaint instituted against any officer or employee because of an act performed by that officer or employee in the lawful discharge of duties and under the provisions of this code shall be defended by the legal representative of the jurisdiction until the final termination of the proceedings. The fire code official or any subordinate shall not be liable for costs in an action, suit or proceeding that is instituted in pursuance of the provisions of this code; and any officer of the department of fire prevention, acting in good faith and without malice, shall be free from liability for acts performed under any of its provisions or by reason of any act or omission in the performance of official duties in connection therewith.

Revise the International Fuel Gas Code as follows:

IFCG [A] 103.4 Liability. The code official, member of the board of appeals or employee charged with the enforcement of this code, while acting for the jurisdiction in good faith and without malice in the discharge of the duties required by this code or other pertinent law or ordinance, shall not thereby be rendered civilly or criminally liable personally, and is hereby relieved from all personal liability for any damage accruing to persons or property as a result of an act or by reason of an act or omission in the discharge of official duties.

IFGC [A] 103.4.1 Legal defense. Any suit or criminal complaint instituted against any officer or employee because of an act performed by that officer or employee in the lawful discharge of duties and under the provisions of this code shall be defended by the legal representative of the jurisdiction until the final termination of the proceedings. The code official or any subordinate shall not be liable for costs in an action, suit or proceeding that is instituted in pursuance of the provisions of this code.

Revise the International Mechanical Code as follows:

IMC [A] 103.4 Liability. The code official, member of the board of appeals or employee charged with the enforcement of this code, while acting for the jurisdiction in good faith and without malice in the discharge of the duties required by this code or other pertinent law or ordinance, shall not thereby be rendered civilly or criminally liable personally, and is hereby relieved from personal liability for any damage accruing to persons or property as a result of an act or by reason of an act or omission in the discharge of official duties.

IMC [A] 103.4.1 Legal defense. Any suit or criminal complaint instituted against any officer or employee because of an act performed by that officer or employee in the lawful discharge of duties and under the provisions of this code shall be defended by the legal representative of the jurisdiction until the final termination of the proceedings. The code official or any subordinate shall not be liable for costs in an action, suit or proceeding that is instituted in pursuance of the provisions of this code.

Revise the International Plumbing Code as follows:

IPC [A] 103.4 Liability. The code official, member of the board of appeals or employee charged with the enforcement of this code, while acting for the jurisdiction in good faith and without malice in the discharge of the duties required by this code or other pertinent law or ordinance, shall not thereby be rendered civilly or criminally liable personally, and is hereby relieved from all personal liability for any damage accruing to persons or property as a result of any act or by reason of an act or omission in the discharge of official duties.

IPC [A] 103.4.1 Legal defense. Any suit or criminal complaint instituted against any officer or employee because of an act performed by that officer or employee in the lawful discharge of duties and under the provisions of this code shall be defended by the legal representative of the jurisdiction until the final termination of the proceedings. The code official or any subordinate shall not be liable for costs in any action, suit or proceeding that is instituted in pursuance of the provisions of this code.

Revise the International Private Sewage Disposal Code as follows:

IPSDC [A] 103.4 Liability. The code official, member of the board of appeals or employee charged with the enforcement of this code, while acting for the jurisdiction in good faith and without malice in the discharge of the duties required by this code or other pertinent law or ordinance, shall not thereby be rendered civilly or criminally liable personally, and is hereby relieved from all personal liability for any damage accruing to persons or property as a result of any act or by reason of an act or omission in the discharge of official duties.

IPSDC [A] 103.4.1 Legal defense. Any suit or criminal complaint instituted against any officer or employee because of an act performed by that officer or employee in the lawful discharge of duties and under the provisions of this code shall be defended by the legal representative of the jurisdiction until the final termination of the proceedings. The code official or any subordinate shall not be liable for costs in any action, suit or proceeding that is instituted in pursuance of the provisions of this code.

Revise the International Property Maintenance Code as follows:

IPMC [A] 103.4 Liability. The code official, member of the board of appeals or employee charged with the enforcement of this code, while acting for the jurisdiction, in good faith and without malice in the discharge of the duties required by this code or other pertinent law or ordinance, shall not thereby be rendered civilly or criminally liable personally, and is hereby relieved from all personal liability for any damage accruing to persons or property as a result of an act or by reason of an act or omission in the discharge of official duties.

IPMC [A] 103.4.1 Legal defense. Any suit or criminal complaint instituted against any officer or employee because of an act performed by that officer or employee in the lawful discharge of duties and under the provisions of this code shall be defended by the legal representative of the jurisdiction until the final termination of the proceedings. The code official or any subordinate shall not be liable for costs in an action, suit or proceeding that is instituted in pursuance of the provisions of this code.

Revise the International Wildland-Urban Interface Code as follows:

IWUIC [A] 104.3 Liability of the code official. The code official, member of the board of appeals or employee charged with the enforcement of this code, acting in good faith and without malice in the discharge of the duties required by this code or other pertinent law or ordinance, shall not thereby be rendered civilly or criminally personally liable for damages that may accrue to persons or property as a result of an act or by reason of an act or omission in the discharge of such duties.

IWUIC [A] 104.3.1 Legal defense. A suit or criminal complaint brought against the code official or employee because of such act or omission performed by the code official or employee in the enforcement of any provision of such codes or other pertinent laws or ordinances implemented through the enforcement of this code or enforced by the code enforcement agency shall be defended by this jurisdiction until final termination of such proceedings, and any judgment resulting there from shall be assumed by this jurisdiction. The code enforcement agency or its parent jurisdiction shall not be held as assuming any liability by reason of the inspections authorized by this code or any permits or certificates issued under this code.

Revise the International Zoning Code as follows:

IZC [A] 104.7 Liability. The code official, or designee, charged with the enforcement of this code, acting in good faith and without malice in the discharge of the duties described in this code, shall not be personally civilly or criminally liable for any damage that may accrue to persons or property as a result of an act or by reason of an act or omission in the discharge of such duties.

IFGC [A] 104.7.1 Legal defense. A suit or criminal complaint brought against the code official or employee because such act or omission performed by the code official or employee in the enforcement of

any provision of such codes or other pertinent laws or ordinances implemented through the enforcement of this code or enforced by the enforcement agency shall be defended by the jurisdiction until final termination of such proceedings, and any judgment resulting therefrom shall be assumed by the jurisdiction.

This code shall not be construed to relieve from or lessen the responsibility of any person owning, operating or controlling any building or parcel of land for any damages to persons or property caused by defects, nor shall the enforcement agency or its jurisdiction be held as assuming any such liability by reason of the reviews or permits issued under this code

PART II – IRC

Revise the International Residential Code as follows:

IRC R104.8 Liability. The building official, member of the board of appeals or employee charged with the enforcement of this code, while acting for the jurisdiction in good faith and without malice in the discharge of the duties required by this code or other pertinent law or ordinance, shall not thereby be rendered civilly or criminally liable personally and is hereby relieved from personal liability for any damage accruing to persons or property as a result of any act or by reason of an act or omission in the discharge of official duties.

IRC R104.8.1 Legal defense. Any suit or criminal complaint instituted against an officer or employee because of an act performed by that officer or employee in the lawful discharge of duties and under the provisions of this code shall be defended by legal representative of the jurisdiction until the final termination of the proceedings. The building official or any subordinate shall not be liable for cost in any action, suit or proceeding that is instituted in pursuance of the provisions of this code.

PART III – ISPSC

Revise the International Swimming Pool and Spa Code as follows:

ISPSC 103.4 Liability. The *code official*, member of the board of appeals or employee charged with the enforcement of this code, while acting for the *jurisdiction* in good faith and without malice in the discharge of the duties required by this code or other pertinent law or ordinance, shall not thereby be rendered civilly or criminally liable personally and is hereby relieved from personal liability for any damage accruing to persons or property as a result of any act or by reason of an act or omission in the discharge of official duties.

ISPSC 103.4.1 Legal defense. Any suit or criminal complaint instituted against an officer or employee because of an act performed by that officer or employee in the lawful discharge of duties and under the provisions of this code shall be defended by legal representative of the jurisdiction until the final termination of the proceedings. The *code official* or any subordinate shall not be liable for cost in any action, suit or proceeding that is instituted in pursuance of the provisions of this code.

Reason: An Inspector in Colorado was charged with criminally negligent homicide as well as in a civil case as a result of a carbon monoxide poisoning that occurred in 2008. The inspector found that he was not afforded sovereign immunity for criminal charges even though he was acting in good faith and without malice in the discharge of the duties required by the codes. The jurisdiction was forced to go to City Council to request supplemental funding for his defense. The cost to the jurisdiction in defending the case was in excess of \$260,000. The criminal case was eventually dismissed based on a motion that the statute of limitations had run. The criminal case was dismissed on its merits. As code officials we need to know that immunity extends to both criminal and civil actions while discharging our duties and providing for public safety and welfare.

The addition of the title to split the requirements in two parts is for consistency with the IFC.

Cost Impact: This code change proposal will not increase the cost of construction.

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

PART I – IBC; ICCPC; IEBC; IFC; IFGC; IMC; IPC; IPSDC; IPMC; IWUIC; IZC

Revise the International Building Code as follows:

IBC SECTION 202 DEFINITIONS

IBC [A] REGISTERED DESIGN PROFESSIONAL IN RESPONSIBLE CHARGE. *A registered design professional engaged by the owner or the owner's authorized agent to review and coordinate certain aspects of the project, as determined by the building official, for compatibility with the design of the building or structure, including submittal documents prepared by others, deferred submittal documents and phased submittal documents.*

Revise the International Building Code as follows:

IBC [A] 104.10 Modifications. Wherever there are practical difficulties involved in carrying out the provisions of this code, the *building official* shall have the authority to grant modifications for individual cases, upon application of the owner or the owner's representative authorized agent, provided the *building official* shall first find that special individual reason makes the strict letter of this code impractical and the modification is in compliance with the intent and purpose of this code and that such modification does not lessen health, accessibility, life and fire safety, or structural requirements. The details of action granting modifications shall be recorded and entered in the files of the department of building safety.

IBC [A] 105.1 Required. Any owner or owner's authorized agent who intends to construct, enlarge, alter, repair, move, demolish, or change the occupancy of a building or structure, or to erect, install, enlarge, alter, repair, remove, convert or replace any electrical, gas, mechanical or plumbing system, the installation of which is regulated by this code, or to cause any such work to be done, shall first make application to the *building official* and obtain the required *permit*.

IBC [A] 106.1 Live loads posted. Where the live loads for which each floor or portion thereof of a commercial or industrial building is or has been designed to exceed 50 psf (2.40 kN/m²), such design live loads shall be conspicuously posted by the owner or the owner's authorized agent in that part of each story in which they apply, using durable signs. It shall be unlawful to remove or deface such notices.

IBC [A] 107.3.4 Design professional in responsible charge. When it is required that documents be prepared by a *registered design professional*, the *building official* shall be authorized to require the owner or the owner's authorized agent to engage and designate on the building *permit* application a *registered design professional* who shall act as the *registered design professional in responsible charge*. If the circumstances require, the owner or the owner's authorized agent shall designate a substitute registered design professional in responsible charge who shall perform the duties required of the original *registered design professional in responsible charge*. The building official shall be notified in writing by the owner or the owner's authorized agent if the *registered design professional in responsible charge* is changed or is unable to continue to perform the duties.

The *registered design professional in responsible charge* shall be responsible for reviewing and coordinating submittal documents prepared by others, including phased and deferred submittal items, for compatibility with the design of the building.

IBC [A] 110.1 General. Construction or work for which a permit is required shall be subject to inspection by the *building official* and such construction or work shall remain accessible and exposed for inspection purposes until *approved*. Approval as a result of an inspection shall not be construed to be an approval of a violation of the provisions of this code or of other ordinances of the jurisdiction. Inspections presuming to give authority to violate or cancel the provisions of this code or of other ordinances of the jurisdiction shall not be valid. It shall be the duty of the ~~permit applicant~~ owner or the owner's authorized agent to cause the work to remain accessible and exposed for inspection purposes. Neither the *building official* nor the jurisdiction shall be liable for expense entailed in the removal or replacement of any material required to allow inspection.

IBC [A] 115.2 Issuance. The stop work order shall be in writing and shall be given to the owner of the property involved, ~~or to the owner's~~ authorized agent, or ~~to the person doing the work~~. Upon issuance of a stop work order, the cited work shall immediately cease. The stop work order shall state the reason for the order, and the conditions under which the cited work will be permitted to resume.

Revise the International Building Code as follows:

IBC 901.5 Acceptance tests. Fire protection systems shall be tested in accordance with the requirements of this code and the *International Fire Code*. When required, the tests shall be conducted in the presence of the building official. Tests required by this code, the *International Fire Code* and the standards listed in this code shall be conducted at the expense of the owner or the owner's ~~representative~~

authorized agent. It shall be unlawful to occupy portions of a structure until the required fire protection systems within that portion of the structure have been tested and approved.

Revise the International Building Code as follows:

IBC 1004.3 (IFC [B] 1004.3) Posting of occupant load. Every room or space that is an assembly occupancy shall have the occupant load of the room or space posted in a conspicuous place, near the main exit or exit access doorway from the room or space. Posted signs shall be of an approved legible permanent design and shall be maintained by the owner or the owner's authorized agent.

Revise the International Building Code as follows:

IBC 1703.4.1 Research and investigation. Sufficient technical data shall be submitted to the *building official* to substantiate the proposed use of any material or assembly. If it is determined that the evidence submitted is satisfactory proof of performance for the use intended, the *building official* shall approve the use of the material or assembly subject to the requirements of this code. The costs, reports and investigations required under these provisions shall be paid by the ~~applicant~~ owner or the owner's authorized agent.

IBC 1703.6 Evaluation and follow-up inspection services. Where structural components or other items regulated by this code are not visible for *inspection* after completion of a prefabricated assembly, the ~~applicant~~ owner or the owner's authorized agent shall submit a report of each prefabricated assembly. The report shall indicate the complete details of the assembly, including a description of the assembly and its components, the basis upon which the assembly is being evaluated, test results and similar information and other data as necessary for the *building official* to determine conformance to this code. Such a report shall be *approved* by the *building official*.

IBC 1703.6.1 Follow-up inspection. The ~~applicant~~ owner or the owner's authorized agent shall provide for *special inspections* of fabricated items in accordance with Section 1704.2.5.

IBC 1704.2 Special Inspections. Where application is made for construction as described in this section, the owner or the *registered design professional in responsible charge* acting as the owner's authorized agent shall employ one or more *approved agencies* to perform inspections during construction on the types of work listed under Section 1705. These inspections are in addition to the inspections specified in Section 110.

Exceptions:

1. *Special inspections* are not required for construction of a minor nature or as warranted by conditions in the jurisdiction as *approved* by the *building official*.
2. Unless otherwise required by the *building official*, *special inspections* are not required for Group U occupancies that are accessory to a residential occupancy including, but not limited to, those listed in Section 312.1.
3. Special inspections are not required for portions of structures designed and constructed in accordance with the cold-formed steel light-frame construction provisions of Section 2211.7 or the conventional light-frame construction provisions of Section 2308.

IBC 1704.2.4 Report requirement. Special inspectors shall keep records of inspections. The special inspector shall furnish inspection reports to the *building official*, and to the *registered design professional in responsible charge*. Reports shall indicate that work inspected was or was not completed in conformance to *approved construction documents*. Discrepancies shall be brought to the immediate attention of the contractor for correction. If they are not corrected, the discrepancies shall be brought to the attention of the *building official* and to the *registered design professional in responsible charge* prior to the completion of that phase of the work. A final report documenting required *special inspections* and correction of any discrepancies noted in the inspections shall be submitted at a point in time agreed upon

prior to the start of work by the ~~applicant and~~ owner or the owner's authorized agent to the *building official*.

IBC 1707.1 General. In the absence of *approved* rules or other *approved* standards, the *building official* shall make, or cause to be made, the necessary tests and investigations; or the *building official* shall accept duly authenticated reports from *approved agencies* in respect to the quality and manner of use of new materials or assemblies as provided for in Section 104.11. The cost of all tests and other investigations required under the provisions of this code shall be borne by the ~~applicant~~ owner or the owner's authorized agent.

Revise the International Building Code as follows:

IBC 1803.6 Reporting. Where geotechnical investigations are required, a written report of the investigations shall be submitted to the *building official* by the owner or owner's authorized agent at the time of *permit* application. This geotechnical report shall include, but need not be limited to, the following information:

1. A plot showing the location of the soil investigations.
2. A complete record of the soil boring and penetration test logs and soil samples.
3. A record of the soil profile.
4. Elevation of the water table, if encountered.
5. Recommendations for foundation type and design criteria, including but not limited to: bearing capacity of natural or compacted soil; provisions to mitigate the effects of expansive soils; mitigation of the effects of liquefaction, differential settlement and varying soil strength; and the effects of adjacent loads.
6. Expected total and differential settlement.
7. Deep foundation information in accordance with Section 1803.5.5.
8. Special design and construction provisions for foundations of structures founded on expansive soils, as necessary.
9. Compacted fill material properties and testing in accordance with Section 1803.5.8.
10. Controlled low-strength material properties and testing in accordance with Section 1803.5.9.

Revise the International Building Code as follows:

IBC 3306.8 Repair, maintenance and removal. Pedestrian protection required by this chapter shall be maintained in place and kept in good order for the entire length of time pedestrians are subject to being endangered. The *owner* or the *owner's* authorized agent, upon the completion of the construction activity, shall immediately remove walkways, debris and other obstructions and leave such public property in as good a condition as it was before such work was commenced.

Revise the International Building Code as follows:

IBC 3401.2 Maintenance. Buildings and structures, and parts thereof, shall be maintained in a safe and sanitary condition. Devices or safeguards which are required by this code shall be maintained in conformance with the code edition under which installed. The owner or the owner's ~~designated~~ authorized agent shall be responsible for the maintenance of buildings and structures. To determine compliance with this subsection, the building official shall have the authority to require a building or structure to be reinspected. The requirements of this chapter shall not provide the basis for removal or abrogation of fire protection and safety systems and devices in existing structures.

Revise the International Building Code as follows:

IBC G104.1 Required. Any person, owner or owner's authorized agent who intends to conduct any development in a flood hazard area shall first make application to the *building official* and shall obtain the required *permit*.

Revise the International Building Code as follows:

IBC J106.1 Maximum slope. The slope of cut surfaces shall be no steeper than is safe for the intended use, and shall be no steeper than two units horizontal to one unit vertical (50-percent slope) unless the owner or the owner's authorized agent furnishes a geotechnical report justifying a steeper slope.

Exceptions:

1. A cut surface shall be permitted to be at a slope of 1.5 units horizontal to one unit vertical (67-percent slope) provided that all of the following are met:
 - 1.1. It is not intended to support structures or surcharges.
 - 1.2. It is adequately protected against erosion.
 - 1.3. It is no more than 8 feet (2438 mm) in height.
 - 1.4. It is approved by the building code official.
 - 1.5. Ground water is not encountered.
2. A cut surface in bedrock shall be permitted to be at a slope of one unit horizontal to one unit vertical (100-percent slope).

Revise the International Building Code as follows:

IBC K102.3 Maintenance. Electrical systems, equipment, materials and appurtenances, both existing and new, and parts thereof shall be maintained in proper operating condition in accordance with the original design and in a safe, hazard-free condition. Devices or safeguards that are required by this code shall be maintained in compliance with the code edition under which installed. The owner or the owner's ~~designated~~ authorized agent shall be responsible for the maintenance of the electrical systems and equipment. To determine compliance with this provision, the *building official* shall have the authority to require that the electrical systems and equipment be reinspected.

Revise the International Code Council Performance Code as follows:

ICCPC [A] 103.3.1 Building owner's or the owner's authorized agent responsibility.

ICCPC [A] 103.3.1.1 Design professional. The owner or the owner's authorized agent shall have the responsibility of retaining and furnishing the services of a design professional, who shall be in responsible charge of preparing and coordinating a complete and comprehensive set of design documents and other services required to prepare reports and other documents in accordance with this code. If the services required by this section are not provided, the use of this code is prohibited.

ICCPC [A] 103.3.1.2 Principal design professional. When the project requires the services of multiple design professionals, a principal design professional shall be retained and furnished, who shall have the contractual responsibility and authority over all required design professional disciplines to prepare and coordinate a complete and comprehensive set of design documents for the project.

ICCPC [A] 103.3.1.3 Peer review. The owner or the owner's authorized agent shall be responsible for retaining and furnishing the services of a design professional or recognized expert, who will perform as a peer reviewer, when required and approved by the code official. See Section 103.3.6.3 of this code.

ICCPC [A] 103.3.1.4 Costs. The costs of all special services, including contract review, when required by the code official, shall be borne by the owner or the owner's authorized agent.

ICCPC [A] 103.3.1.5 Document retention. The owner or the owner's authorized agent shall retain on the premises all documents and reports required by this code and make them available to the code official upon request.

ICCPC [A] 103.3.1.6 Maintenance. The owner or the owner's authorized agent is responsible to operate and maintain a building, structure or facility designed and built under this code in accordance with the bounding conditions and the operations and maintenance manual.

ICCPC [A] 103.3.1.7 Changes. The owner or the owner's authorized agent shall be responsible to ensure that any change to the facility, process or system does not increase the hazard level beyond that originally designed without approval and that all changes shall be documented in accordance with this code.

ICCPC [A] 103.3.1.8 Special expert. Where the scope of work is limited or focused in an area that does not require the services of a design professional or the special knowledge and skills associated with the practice of architecture or engineering, a special expert may be employed by the owner or the owner's authorized agent as the person in responsible charge of the limited or focused activity. It is the intent of this code that the individual shall possess the qualification characteristics required in Appendix D.

ICCPC [A] 103.3.1.9 Occupant requirements. The owner or the owner's authorized agent is responsible and accountable to ensure that all occupants and employees who are required to take certain actions or perform certain functions in accordance with a performance-based design possess the required knowledge and skills and are empowered to perform those actions.

ICCPC [A] 103.3.4.1.4 Deed restriction. Design features with bounding conditions that require continued maintenance or supervision by the owner or the owner's authorized agent throughout the life of the building, facility or process as conditions of compliance with the objectives of this code, shall be recorded as a deed restriction until released by the code official. When required by the code official, the deed restriction shall be modified to reflect specific changes.

ICCPC [A] 103.3.4.1.6 Emergency response capabilities. Design documentation shall clearly describe the level of response expected by emergency responders under the direct control of the owner or the owner's authorized agent. Emergency response capabilities, staffing levels, training requirements and equipment availability shall be documented as a bounding condition.

ICCPC [A] 103.3.4.2.3 Operations and maintenance manual. The operations and maintenance manual shall identify system and component commissioning requirements and the required interactions between these systems. The manual shall identify for the facility owner or the owner's authorized agent and the facility operator those actions that need to be performed on a regular basis to ensure that the components of the performance-based design are in place and operating properly. Furthermore, the operations and maintenance manual shall identify the restrictions or limitations placed upon the use and operation of the facility in order to stay within the bounding conditions of the performance-based design. The operations and maintenance manual shall be submitted at the time of the design documents submittal, unless the code official approves another time based upon the type of project and data needed for a composite review. The operations and maintenance manual shall address but not be limited to the following:

1. Description of critical systems.
2. Description of required system interactions.
3. Occupant responsibilities.
4. Occupant and staff training requirements.
5. Periodic operational requirements.
6. Periodic maintenance requirements.
7. Periodic testing requirements.
8. Limitations on facility operations (due to bounding conditions).
9. Report format for recording maintenance and operation data.
10. System and component commissioning requirements.

ICCPC [A] 103.3.8.3 Deed restrictions. Design features with bounding conditions determined by the design professional to require continued operation and maintenance by the owner or the owner's authorized agent throughout the life of the building as conditions of compliance with the objectives of this

code shall be recorded as a deed restriction as required by the code official until released by the code official.

ICCPC [A] 103.3.9.1.4 Revocation and renewal. Failure of the building owner or the owner's authorized agent to demonstrate to the code official that the building is being operated and maintained in compliance with Sections 103.3.1.6 and 103.3.9.1 is cause to revoke or not renew a certificate of occupancy.

ICCPC [A] 103.3.9.2.3 Revocation and renewal. Failure of the owner or the owner's authorized agent to demonstrate compliance with this section is cause to revoke or not renew the certificate of compliance.

ICCPC [A] 103.3.10 Maintenance.

ICCPC [A] 103.3.10.1 Owner's or the owner's authorized agent responsibility. The owner or the owner's authorized agent is responsible for maintaining the building or facility in accordance with the approved documents.

Revise the International Existing Building Code as follows:

IEBC [A] 104.6 Right of entry. Where it is necessary to make an inspection to enforce the provisions of this code, or where the *code official* has reasonable cause to believe that there exists in a structure or upon a premises a condition which is contrary to or in violation of this code which makes the structure or premises unsafe, *dangerous*, or hazardous, the *code official* is authorized to enter the structure or premises at reasonable times to inspect or to perform the duties imposed by this code, provided that if such structure or premises be occupied that credentials be presented to the occupant and entry requested. If such structure or premises be unoccupied, the *code official* shall first make a reasonable effort to locate the owner, the owner's authorized agent or other person having charge or control of the structure or premises and request entry. If entry is refused, the *code official* shall have recourse to the remedies provided by law to secure entry.

IEBC [A] 104.10 Modifications. Wherever there are practical difficulties involved in carrying out the provisions of this code, the *code official* shall have the authority to grant modifications for individual cases upon application of the owner or owner's authorized representative, provided the *code official* shall first find that special individual reason makes the strict letter of this code impractical and the modification is in compliance with the intent and purpose of this code, and that such modification does not lessen health, accessibility, life and fire safety, or structural requirements. The details of action granting modifications shall be recorded and entered in the files of the Department of Building Safety.

IEBC [A] 105.1 Required. Any owner or owner's authorized agent who intends to *repair*, add to, alter, relocate, demolish, or change the occupancy of a building or to *repair*, install, add, alter, remove, convert, or replace any electrical, gas, mechanical, or plumbing system, the installation of which is regulated by this code, or to cause any such work to be done, shall first make application to the *code official* and obtain the required permit.

IEBC [A] 106.6 Design professional in responsible charge. When it is required that documents be prepared by a registered design professional, the *code official* shall be authorized to require the owner or the owner's authorized agent to engage and designate on the building permit application a registered design professional who shall act as the *registered design professional in responsible charge*. If the circumstances require, the owner or the owner's authorized agent shall designate a substitute *registered design professional in responsible charge* who shall perform the duties required of the original *registered design professional in responsible charge*. The *code official* shall be notified in writing by the owner or the owner's authorized agent if the *registered design professional in responsible charge* is changed or is unable to continue to perform the duties. The *registered design professional in responsible charge* shall be responsible for reviewing and coordinating submittal documents prepared by others, including phased and deferred submittal items, for compatibility with the design of the building. Where structural observation is required, the inspection program shall name the individual or firms who are to perform structural observation and describe the stages of construction at which structural observation is to occur.

IEBC [A] 110.2 Certificate issued. After the *code official* inspects the building and finds no violations of the provisions of this code or other laws that are enforced by the Department of Building Safety, the *code official* shall issue a certificate of occupancy that shall contain the following:.

1. The building permit number.
2. The address of the structure.
3. The name and address of the owner or the owner's authorized agent.
4. A description of that portion of the structure for which the certificate is issued.
5. A statement that the described portion of the structure has been inspected for compliance with the requirements of this code for the occupancy and division of occupancy and the use for which the proposed occupancy is classified.
6. The name of the *code official*.
7. The edition of the code under which the permit was issued.
8. The use and occupancy in accordance with the provisions of the *International Building Code*.
9. The type of construction as defined in the *International Building Code*.
10. The design occupant load and any impact the *alteration* has on the design occupant load of the area not within the scope of the work.
11. If fire protection systems are provided, whether the fire protection systems are required.
12. Any special stipulations and conditions of the building permit.

IEBC [A] 111.3 Authority to disconnect service utilities. The *code official* shall have the authority to authorize disconnection of utility service to the building, structure or system regulated by this code and the referenced codes and standards in case of emergency where necessary to eliminate an immediate hazard to life or property or when such utility connection has been made without the approval required by Section 111.1 or 111.2. The *code official* shall notify the serving utility and, wherever possible, the owner or the owner's authorized agent and occupant of the building, structure or service system of the decision to disconnect prior to taking such action. If not notified prior to disconnecting, the owner or occupant of the building, structure or service system shall be notified in writing, as soon as practical thereafter.

IEBC [A] 114.2 Issuance. The stop work order shall be in writing and shall be given to the owner or the owner's authorized agent of the property involved ~~or to the owner's agent~~, or to the person doing the work. Upon issuance of a stop work order, the cited work shall immediately cease. The stop work order shall state the reason for the order and the conditions under which the cited work will be permitted to resume.

IEBC [A] 115.3 Notice. If an *unsafe* condition is found, the *code official* shall serve on the owner, the owner's authorized agent, or person in control of the structure a written notice that describes the condition deemed *unsafe* and specifies the required *repairs* or improvements to be made to abate the *unsafe* condition, or that requires the *unsafe* building to be demolished within a stipulated time. Such notice shall require the person thus notified to declare immediately to the *code official* acceptance or rejection of the terms of the order.

IEBC [A] 115.4 Method of service. Such notice shall be deemed properly served if a copy thereof is delivered to the owner or the owner's authorized agent personally; sent by certified or registered mail addressed to the owner or the owner's authorized agent at the last known address with the return receipt requested; or delivered in any other manner as prescribed by local law. If the certified or registered letter is returned showing that the letter was not delivered, a copy thereof shall be posted in a conspicuous place in or about the structure affected by such notice. Service of such notice in the foregoing manner upon the owner's authorized agent or upon the person responsible for the structure shall constitute service of notice upon the owner.

IEBC [A] 116.5 Costs of emergency repairs. Costs incurred in the performance of emergency work shall be paid by the jurisdiction. The legal counsel of the jurisdiction shall institute appropriate action against the owner of the premises or the owner's authorized agent where the unsafe structure is or was located for the recovery of such costs.

IEBC [A] 117.1 General. The *code official* shall order the owner of any premises or the owner's authorized agent upon which is located any structure that in the *code official's* judgment is so old, dilapidated, or has become so out of *repair* as to be *dangerous*, unsafe, insanitary, or otherwise unfit for human habitation or occupancy, and such that it is unreasonable to *repair* the structure, to demolish and remove such structure; or if such structure is capable of being made safe by *repairs*, to *repair* and make safe and sanitary or to demolish and remove at the owner's or the owner's authorized agent's option; or where there has been a cessation of normal construction of any structure for a period of more than two years, to demolish and remove such structure.

IEBC [A] 117.3 Failure to comply. If the owner or the owner's authorized agent of a premises fails to comply with a demolition order within the time prescribed, the *code official* shall cause the structure to be demolished and removed, either through an available public agency or by contract or arrangement with private persons, and the cost of such demolition and removal shall be charged against the real estate upon which the structure is located and shall be a lien upon such real estate.

Revise the International Fire Code as follows:

IFC [A] 104.3 Right of entry. Whenever it is necessary to make an inspection to enforce the provisions of this code, or whenever the *fire code official* has reasonable cause to believe that there exists in a building or upon any premises any conditions or violations of this code which make the building or premises unsafe, dangerous or hazardous, the *fire code official* shall have the authority to enter the building or premises at all reasonable times to inspect or to perform the duties imposed upon the *fire code official* by this code. If such building or premises is occupied, the *fire code official* shall present credentials to the occupant and request entry. If such building or premises is unoccupied, the *fire code official* shall first make a reasonable effort to locate the *owner*, the owner's authorized agent or other person having charge or control of the building or premises and request entry. If entry is refused, the *fire code official* has recourse to every remedy provided by law to secure entry.

IFC [A] 104.3.1 Warrant. When the *fire code official* has first obtained a proper inspection warrant or other remedy provided by law to secure entry, an *owner*, the owner's authorized agent or occupant or person having charge, care or control of the building or premises shall not fail or neglect, after proper request is made as herein provided, to permit entry therein by the *fire code official* for the purpose of inspection and examination pursuant to this code.

IFC [A] 104.7.2 Technical assistance. To determine the acceptability of technologies, processes, products, facilities, materials and uses attending the design, operation or use of a building or premises subject to inspection by the *fire code official*, the *fire code official* is authorized to require the *owner* or owner's authorized agent to provide, without charge to the jurisdiction, a technical opinion and report. The opinion and report shall be prepared by a qualified engineer, specialist, laboratory or fire safety specialty organization acceptable to the *fire code official* and shall analyze the fire safety properties of the design, operation or use of the building or premises and the facilities and appurtenances situated thereon, to recommend necessary changes. The *fire code official* is authorized to require design submittals to be prepared by, and bear the stamp of, a registered design professional.

IFC [A] 105.1.1 Permits required. Any property owner or owner's authorized agent who intends to conduct an operation or business, or install or modify systems and equipment which is regulated by this code, or to cause any such work to be done, shall first make application to the *fire code official* and obtain the required permit.

IFC [A] 109.2 Owner/occupant responsibility. Correction and abatement of violations of this code shall be the responsibility of the *owner* or the owner's authorized agent. If an occupant creates, or allows to be created, hazardous conditions in violation of this code, the occupant shall be held responsible for the abatement of such hazardous conditions.

IFC [A] 109.3.1 Service. A notice of violation issued pursuant to this code shall be served upon the *owner*, the owner's authorized agent, operator, occupant or other person responsible for the condition or violation, either by personal service, mail or by delivering the same to, and leaving it with, some person of responsibility upon the premises. For unattended or abandoned locations, a copy of such notice of violation shall be posted on the premises in a conspicuous place at or near the entrance to such premises and the notice of violation shall be mailed by certified mail with return receipt requested or a certificate of mailing, to the last known address of the *owner*, the owner's authorized agent, or occupant ~~or both~~.

IFC [A] 109.3.2 Compliance with orders and notices. A notice of violation issued or served as provided by this code shall be complied with by the *owner*, the owner's authorized agent, operator, occupant or other person responsible for the condition or violation to which the notice of violation pertains.

IFC [A] 110.4 Abatement. The *owner*, the owner's authorized agent, operator or occupant of a building or premises deemed unsafe by the *fire code official* shall abate or cause to be abated or corrected such unsafe conditions either by repair, rehabilitation, demolition or other *approved* corrective action.

IFC [A] 111.2 Issuance. A stop work order shall be in writing and shall be given to the *owner* of the property, or to the *owner's authorized agent*, or to the person doing the work. Upon issuance of a stop work order, the cited work shall immediately cease. The stop work order shall state the reason for the order, and the conditions under which the cited work is authorized to resume.

IFC [A] 112.1 Authority to disconnect service utilities. The *fire code official* shall have the authority to authorize disconnection of utility service to the building, structure or system in order to safely execute emergency operations or to eliminate an immediate hazard. The *fire code official* shall notify the serving utility and, whenever possible, the *owner* or the owner's authorized agent and occupant of the building, structure or service system of the decision to disconnect prior to taking such action if not notified prior to disconnection. The *owner*, the owner's authorized agent or occupant of the building, structure or service system shall be notified in writing as soon as practical thereafter.

Revise the International Fuel Gas Code as follows:

IFGC [A] 102.3 Maintenance. Installations, both existing and new, and parts thereof shall be maintained in proper operating condition in accordance with the original design and in a safe condition. Devices or safeguards which are required by this code shall be maintained in compliance with the code edition under which they were installed. The owner or the owner's authorized ~~designated~~ agent shall be responsible for maintenance of installations. To determine compliance with this provision, the code official shall have the authority to require an installation to be reinspected.

IFGC [A] 104.4 Right of entry. Whenever it is necessary to make an inspection to enforce the provisions of this code, or whenever the code official has reasonable cause to believe that there exists in a building or upon any premises any conditions or violations of this code that make the building or premises unsafe, dangerous or hazardous, the code official shall have the authority to enter the building or premises at all reasonable times to inspect or to perform the duties imposed upon the code official by this code. If such building or premises is occupied, the code official shall present credentials to the occupant and request entry. If such building or premises is unoccupied, the code official shall first make a reasonable effort to locate the owner, the owner's authorized agent or other person having charge or control of the building or premises and request entry. If entry is refused, the code official has recourse to every remedy provided by law to secure entry.

When the code official has first obtained a proper inspection warrant or other remedy provided by law to secure entry, an owner, the owner's authorized agent, ~~or~~ occupant or person having charge, care or control of the building or premises shall not fail or neglect, after proper request is made as herein provided, to promptly permit entry therein by the code official for the purpose of inspection and examination pursuant to this code.

IFGC [A] 105.1 Modifications. Whenever there are practical difficulties involved in carrying out the provisions of this code, the code official shall have the authority to grant modifications for individual

cases, upon application of the owner or owner's authorized agent representative, provided that the code official shall first find that special individual reason makes the strict letter of this code impractical and that such modification is in compliance with the intent and purpose of this code and does not lessen health, life and fire safety requirements. The details of action granting modifications shall be recorded and entered in the files of the Department of Inspection.

IFGC [A] 106.1 Where required. An owner, owner's authorized agent or contractor who desires to erect, install, enlarge, alter, repair, remove, convert or replace an installation regulated by this code, or to cause such work to be done, shall first make application to the code official and obtain the required permit for the work.

Exception: Where *appliance* and *equipment* replacements and repairs are required to be performed in an emergency situation, the permit application shall be submitted within the next working business day of the Department of Inspection.

IFGC [A] 106.3 Application for permit. Each application for a permit, with the required fee, shall be filed with the code official on a form furnished for that purpose and shall contain a general description of the proposed work and its location. The application shall be signed by the owner or an owner's authorized agent. The permit application shall indicate the proposed *occupancy* of all parts of the building and of that portion of the site or lot, if any, not covered by the building or structure and shall contain such other information required by the code official.

IFGC [A] 108.5 Stop work orders. Upon notice from the code official that work is being done contrary to the provisions of this code or in a dangerous or unsafe manner, such work shall immediately cease. Such notice shall be in writing and shall be given to the owner of the property, the owner's authorized agent, or the person doing the work. The notice shall state the conditions under which work is authorized to resume. Where an emergency exists, the code official shall not be required to give a written notice prior to stopping the work. Any person who shall continue any work on the system after having been served with a stop work order, except such work as that person is directed to perform to remove a violation or unsafe condition, shall be liable for a fine of not less than [AMOUNT] dollars or more than [AMOUNT] dollars.

IFGC [A] 108.7.2 Authority to disconnect service utilities. The code official shall have the authority to require disconnection of utility service to the building, structure or system regulated by the technical codes in case of emergency where necessary to eliminate an immediate hazard to life or property. The code official shall notify the serving utility, and wherever possible, the owner or the owner's authorized agent and occupant of the building, structure or service system of the decision to disconnect prior to taking such action. If not notified prior to disconnection, the owner or occupant of the building, structure or service system shall be notified in writing, as soon as practicable thereafter.

Revise the International Mechanical Code as follows:

IMC [A] 102.3 Maintenance. Mechanical systems, both existing and new, and parts thereof shall be maintained in proper operating condition in accordance with the original design and in a safe and sanitary condition. Devices or safeguards which are required by this code shall be maintained in compliance with the code edition under which they were installed. The owner or the owner's authorized designated agent shall be responsible for maintenance of mechanical systems. To determine compliance with this provision, the code official shall have the authority to require a mechanical system to be reinspected.

The inspection for maintenance of HVAC systems shall be done in accordance with ASHRAE/ACCA/ANSI Standard 180.

IMC [A] 104.4 Right of entry. Whenever it is necessary to make an inspection to enforce the provisions of this code, or whenever the code official has reasonable cause to believe that there exists in a building or upon any premises any conditions or violations of this code which make the building or premises unsafe, insanitary, dangerous or hazardous, the code official shall have the authority to enter the building or premises at all reasonable times to inspect or to perform the duties imposed upon the code official by this code. If such building or premises is occupied, the code official shall present credentials to the occupant and request entry. If such building or premises is unoccupied, the code official shall first make a

reasonable effort to locate the owner, the owner's authorized agent or other person having charge or control of the building or premises and request entry. If entry is refused, the code official has recourse to every remedy provided by law to secure entry.

When the code official has first obtained a proper inspection warrant or other remedy provided by law to secure entry, an owner, the owner's authorized agent or occupant or person having charge, care or control of the building or premises shall not fail or neglect, after proper request is made as herein provided, to promptly permit entry therein by the code official for the purpose of inspection and examination pursuant to this code.

IMC [A] 105.1 Modifications. Whenever there are practical difficulties involved in carrying out the provisions of this code, the code official shall have the authority to grant modifications for individual cases upon application of the owner or owner's authorized agent representative, provided that the code official shall first find that special individual reason makes the strict letter of this code impractical and the modification is in compliance with the intent and purpose of this code and does not lessen health, life and fire safety requirements. The details of action granting modifications shall be recorded and entered in the files of the mechanical inspection department.

IMC [A] 106.1 When required. An owner, owner's authorized agent or contractor who desires to erect, install, enlarge, alter, repair, remove, convert or replace a mechanical system, the installation of which is regulated by this code, or to cause such work to be done, shall first make application to the code official and obtain the required permit for the work.

Exception: Where *equipment* and *appliance* replacements or repairs must be performed in an emergency situation, the permit application shall be submitted within the next working business day of the department of mechanical inspection.

IMC [A] 106.3 Application for permit. Each application for a permit, with the required fee, shall be filed with the code official on a form furnished for that purpose and shall contain a general description of the proposed work and its location. The application shall be signed by the owner or ~~an~~ the owner's authorized agent. The permit application shall indicate the proposed *occupancy* of all parts of the building and of that portion of the site or lot, if any, not covered by the building or structure and shall contain such other information required by the code official.

IMC [A] 108.5 Stop work orders. Upon notice from the code official that mechanical work is being done contrary to the provisions of this code or in a dangerous or unsafe manner, such work shall immediately cease. Such notice shall be in writing and shall be given to the owner of the property, or to the owner's authorized agent, or to the person doing the work. The notice shall state the conditions under which work is authorized to resume. Where an emergency exists, the code official shall not be required to give a written notice prior to stopping the work. Any person who shall continue any work on the system after having been served with a stop work order, except such work as that person is directed to perform to remove a violation or unsafe condition, shall be liable for a fine of not less than [AMOUNT] dollars or more than [AMOUNT] dollars.

IMC [A] 108.7.2 Authority to order disconnection of energy sources. The code official shall have the authority to order disconnection of energy sources supplied to a building, structure or mechanical system regulated by this code, when it is determined that the mechanical system or any portion thereof has become hazardous or unsafe. Written notice of such order to disconnect service and the causes therefor shall be given within 24 hours to the owner, the owner's authorized agent and occupant of such building, structure or premises, provided, however, that in cases of immediate danger to life or property, such disconnection shall be made immediately without such notice. Where energy sources are provided by a public utility, the code official shall immediately notify the serving utility in writing of the issuance of such order to disconnect.

Revise the International Plumbing Code as follows:

IPC [A] 102.3 Maintenance. All plumbing systems, materials and appurtenances, both existing and new, and all parts thereof, shall be maintained in proper operating condition in accordance with the original design in a safe and sanitary condition. All devices or safeguards required by this code shall be maintained in compliance with the code edition under which they were installed.

The owner or the owner's authorized ~~designated~~ agent shall be responsible for maintenance of plumbing systems. To determine compliance with this provision, the code official shall have the authority to require any plumbing system to be reinspected.

IPC [A] 104.4 Right of entry. Whenever it is necessary to make an inspection to enforce the provisions of this code, or whenever the code official has reasonable cause to believe that there exists in any building or upon any premises any conditions or violations of this code that make the building or premises unsafe, insanitary, dangerous or hazardous, the code official shall have the authority to enter the building or premises at all reasonable times to inspect or to perform the duties imposed upon the code official by this code. If such building or premises is occupied, the code official shall present credentials to the occupant and request entry. If such building or premises is unoccupied, the code official shall first make a reasonable effort to locate the owner, the owner's authorized agent or other person having charge or control of the building or premises and request entry. If entry is refused, the code official shall have recourse to every remedy provided by law to secure entry.

When the code official shall have first obtained a proper inspection warrant or other remedy provided by law to secure entry, no owner, owner's authorized agent, or occupant or person having charge, care or control of any building or premises shall fail or neglect, after proper request is made as herein provided, to promptly permit entry therein by the code official for the purpose of inspection and examination pursuant to this code.

IPC [A] 105.1 Modifications. Whenever there are practical difficulties involved in carrying out the provisions of this code, the code official shall have the authority to grant modifications for individual cases, upon application of the owner or owner's ~~representative~~ authorized agent, provided the code official shall first find that special individual reason makes the strict letter of this code impractical and the modification conforms to the intent and purpose of this code and that such modification does not lessen health, life and fire safety requirements. The details of action granting modifications shall be recorded and entered in the files of the plumbing inspection department.

IPC [A] 106.1 When required. Any owner, owner's authorized agent or contractor who desires to construct, enlarge, alter, repair, move, demolish or change the *occupancy* of a building or structure, or to erect, install, enlarge, alter, repair, remove, convert or replace any plumbing system, the installation of which is regulated by this code, or to cause any such work to be done, shall first make application to the code official and obtain the required permit for the work.

IPC [A] 106.3 Application for permit. Each application for a permit, with the required fee, shall be filed with the code official on a form furnished for that purpose and shall contain a general description of the proposed work and its location. The application shall be signed by the owner or an owner's authorized agent. The permit application shall indicate the proposed *occupancy* of all parts of the building and of that portion of the site or lot, if any, not covered by the building or structure and shall contain such other information required by the code official.

IPC [A] 108.5 Stop work orders. Upon notice from the code official, work on any plumbing system that is being done contrary to the provisions of this code or in a dangerous or unsafe manner shall immediately cease. Such notice shall be in writing and shall be given to the owner of the property, or to the owner's authorized agent, or to the person doing the work. The notice shall state the conditions under which work is authorized to resume. Where an emergency exists, the code official shall not be required to give a written notice prior to stopping the work. Any person who shall continue any work in or about the structure after having been served with a stop work order, except such work as that person is directed to perform to remove a violation or unsafe condition, shall be liable to a fine of not less than [AMOUNT] dollars or more than [AMOUNT] dollars.

IPC [A] 108.7.2 Authority to disconnect service utilities. The code official shall have the authority to authorize disconnection of utility service to the building, structure or system regulated by the technical codes in case of an emergency, where necessary, to eliminate an immediate danger to life or property. Where possible, the owner or an owner's authorized agent and occupant of the building, structure or service system shall be notified of the decision to disconnect utility service prior to taking such action. If not notified prior to disconnecting, the owner, an owner's authorized agent or occupant of the building, structure or service systems shall be notified in writing, as soon as practical thereafter.

Revise the International Private Sewage Disposal Code as follows:

IPSDC [A] 102.5 Maintenance. *Private sewage disposal systems*, materials and appurtenances, both existing and new, and all parts thereof shall be maintained in proper operating condition in accordance with the original design in a safe and sanitary condition. Devices or safeguards that are required by this code shall be maintained in compliance with the code edition under which they were installed. The owner or the owner's authorized ~~designated~~ agent shall be responsible for maintenance of *private sewage disposal systems*. To determine compliance with this provision, the code official shall have the authority to require reinspection of any *private sewage disposal system*.

IPSDC [A] 104.4 Right of entry. Whenever it is necessary to make an inspection to enforce the provisions of this code, or whenever the code official has reasonable cause to believe that there exists in any building or upon any premises any conditions or violations of this code that make the building or premises unsafe, insanitary, dangerous or hazardous, the code official shall have the authority to enter the building or premises at all reasonable times to inspect or to perform the duties imposed on the code official by this code. If such building or premises is occupied, the code official shall present credentials to the occupant and request entry. If such building or premises is unoccupied, the code official shall first make a reasonable effort to locate the owner, the owner's authorized agent or other person having charge or control of the building or premises and request entry. If entry is refused, the code official has recourse to every remedy provided by law to secure entry.

When the code official shall have first obtained a proper inspection warrant or other remedy provided by law to secure entry, no owner, owner's authorized agent or occupant or person having charge, care or control of any building or premises shall fail or neglect, after proper request is made as herein provided, to promptly permit entry therein by the code official for the purpose of inspection and examination pursuant to this code.

IPSDC [A] 105.1 Modifications. Whenever there are practical difficulties involved in carrying out the provisions of this code, the code official shall have the authority to grant modifications for individual cases, upon application of the owner or owner's ~~representative~~ authorized agent provided that the code official shall first find that special individual reason makes the strict letter of this code impractical, the modification is in conformity with the intent and purpose of this code and such modification does not lessen health and fire- and life-safety requirements. The details of action granting modifications shall be recorded and entered in the files of the Private Sewage Disposal Inspection Department.

IPSDC [A] 108.5 Stop work orders. Upon notice from the code official, work on any *private sewage disposal system* that is being done contrary to the provisions of this code or in a dangerous or unsafe manner shall immediately cease. Such notice shall be in writing and shall be given to the owner of the property, to the owner's authorized agent or to the person doing the work. The notice shall state the conditions under which work is authorized to resume. Where an emergency exists, the code official shall not be required to give a written notice prior to stopping the work. Any person who shall continue any work on the system after having been served with a stop work order, except such work as that person is directed to perform to remove a violation or unsafe condition, shall be liable to a fine of not less than [AMOUNT] dollars or more than [AMOUNT] dollars.

IPSDC [A] 108.7.2 Authority to disconnect service utilities. The code official shall have the authority to authorize disconnection of utility service to the building, structure or system regulated by the technical codes in case of emergency, where necessary, to eliminate an immediate danger to life or property.

Where possible, the owner, the owner's authorized agent and occupant of the building, structure or service system shall be notified of the decision to disconnect utility service prior to taking such action. If not notified prior to disconnecting, the owner or occupant of the building, structure or service systems shall be notified in writing as soon as is practical thereafter.

Revise the International Property Maintenance Code as follows:

IPMC [A] 101.2 Scope. The provisions of this code shall apply to all existing residential and nonresidential structures and all existing *premises* and constitute minimum requirements and standards for *premises*, structures, equipment and facilities for light, *ventilation*, space, heating, sanitation, protection from the elements, life safety, safety from fire and other hazards, and for safe and sanitary maintenance; the responsibility of *owners*, an owner's authorized agent, *operators* and *occupants*; the *occupancy* of existing structures and *premises*, and for administration, enforcement and penalties.

IPMC [A] 102.2 Maintenance. Equipment, systems, devices and safeguards required by this code or a previous regulation or code under which the structure or *premises* was constructed, altered or repaired shall be maintained in good working order. No *owner*, owner's authorized agent, *operator* or *occupant* shall cause any service, facility, equipment or utility which is required under this section to be removed from or shut off from or discontinued for any occupied dwelling, except for such temporary interruption as necessary while repairs or alterations are in progress. The requirements of this code are not intended to provide the basis for removal or abrogation of fire protection and safety systems and devices in existing structures. Except as otherwise specified herein, the *owner* or the *owner's authorized designated agent* shall be responsible for the maintenance of buildings, structures and *premises*.

IPMC [A] 104.3 Right of entry. Where it is necessary to make an inspection to enforce the provisions of this code, or whenever the *code official* has reasonable cause to believe that there exists in a *structure* or upon a *premises* a condition in violation of this code, the *code official* is authorized to enter the structure or *premises* at reasonable times to inspect or perform the duties imposed by this code, provided that if such *structure* or *premises* is occupied the *code official* shall present credentials to the *occupant* and request entry. If such structure or *premises* is unoccupied, the *code official* shall first make a reasonable effort to locate the *owner*, the owner's authorized agent or other person having charge or control of the *structure* or *premises* and request entry. If entry is refused, the *code official* shall have recourse to the remedies provided by law to secure entry.

IPMC [A] 105.1 Modifications. Whenever there are practical difficulties involved in carrying out the provisions of this code, the *code official* shall have the authority to grant modifications for individual cases upon application of the *owner* or *owner's authorized agent representative*, provided the *code official* shall first find that special individual reason makes the strict letter of this code impractical and the modification is in compliance with the intent and purpose of this code and that such modification does not lessen health, life and fire safety requirements. The details of action granting modifications shall be recorded and entered in the department files.

IPMC [A] 107.2 Form. Such notice prescribed in Section 107.1 shall be in accordance with all of the following:

1. Be in writing.
2. Include a description of the real estate sufficient for identification.
3. Include a statement of the violation or violations and why the notice is being issued.
4. Include a correction order allowing a reasonable time to make the repairs and improvements required to bring the *dwelling unit* or structure into compliance with the provisions of this code.
5. Inform the property *owner* or the owner's authorized agent of the right to appeal.
6. Include a statement of the right to file a lien in accordance with Section 106.3.

IPMC [A] 107.6 Transfer of ownership. It shall be unlawful for the *owner* of any *dwelling unit* or structure who has received a compliance order or upon whom a notice of violation has been served to sell, transfer, mortgage, lease or otherwise dispose of such *dwelling unit* or structure to another until the

provisions of the compliance order or notice of violation have been complied with, or until such owner or the owner's authorized agent shall first furnish the grantee, transferee, mortgagee or lessee a true copy of any compliance order or notice of violation issued by the *code official* and shall furnish to the *code official* a signed and notarized statement from the grantee, transferee, mortgagee or lessee, acknowledging the receipt of such compliance order or notice of violation and fully accepting the responsibility without condition for making the corrections or repairs required by such compliance order or notice of violation.

IPMC [A] 108.2 Closing of vacant structures. If the structure is vacant and unfit for human habitation and *occupancy*, and is not in danger of structural collapse, the *code official* is authorized to post a placard of condemnation on the *premises* and order the structure closed up so as not to be an attractive nuisance. Upon failure of the owner or the owner's authorized agent to close up the *premises* within the time specified in the order, the *code official* shall cause the *premises* to be closed and secured through any available public agency or by contract or arrangement by private persons and the cost thereof shall be charged against the real estate upon which the structure is located and shall be a lien upon such real estate and may be collected by any other legal resource.

IPMC [A] 108.2.1 Authority to disconnect service utilities. The *code official* shall have the authority to authorize disconnection of utility service to the building, structure or system regulated by this code and the referenced codes and standards set forth in Section 102.7 in case of emergency where necessary to eliminate an immediate hazard to life or property or when such utility connection has been made without approval. The *code official* shall notify the serving utility and, whenever possible, the owner or the owner's authorized agent and *occupant* of the building, structure or service system of the decision to disconnect prior to taking such action. If not notified prior to disconnection the owner, the owner's authorized agent or *occupant* of the building structure or service system shall be notified in writing as soon as practical thereafter.

IPMC [A] 108.3 Notice. Whenever the *code official* has *condemned* a structure or equipment under the provisions of this section, notice shall be posted in a conspicuous place in or about the structure affected by such notice and served on the owner, the owner's authorized agent or the person or persons responsible for the structure or equipment in accordance with Section 107.3. If the notice pertains to equipment, it shall also be placed on the *condemned* equipment. The notice shall be in the form prescribed in Section 107.2.

IPMC [A] 108.4 Placarding. Upon failure of the owner or the owner's authorized agent or person responsible to comply with the notice provisions within the time given, the *code official* shall post on the *premises* or on defective equipment a placard bearing the word "Condemned" and a statement of the penalties provided for occupying the *premises*, operating the equipment or removing the placard.

IPMC [A] 108.5 Prohibited occupancy. Any occupied structure *condemned* and placarded by the *code official* shall be vacated as ordered by the *code official*. Any person who shall occupy a placarded *premises* or shall operate placarded equipment, and any owner, the owner's authorized agent or any person responsible for the *premises* who shall let anyone occupy a placarded *premises* or operate placarded equipment shall be liable for the penalties provided by this code.

IPMC [A] 108.6 Abatement methods. The owner, the owner's authorized agent, operator or *occupant* of a building, *premises* or equipment deemed unsafe by the *code official* shall abate or cause to be abated or corrected such unsafe conditions either by repair, rehabilitation, demolition or other *approved* corrective action.

IPMC [A] 109.5 Costs of emergency repairs. Costs incurred in the performance of emergency work shall be paid by the jurisdiction. The legal counsel of the jurisdiction shall institute appropriate action against the owner of the premises or the owner's authorized agent where the unsafe structure is or was located for the recovery of such costs.

IPMC [A] 110.1 General. The *code official* shall order the owner of any premises or the owner's authorized agent, upon which is located any structure, which in the *code official* judgment after review is

so deteriorated or dilapidated or has become so out of repair as to be dangerous, unsafe, insanitary or otherwise unfit for human habitation or occupancy, and such that it is unreasonable to repair the structure, to demolish and remove such structure; or if such structure is capable of being made safe by repairs, to repair and make safe and sanitary, or to board up and hold for future repair or to demolish and remove at the *owner's* option; or where there has been a cessation of normal construction of any structure for a period of more than two years, the *code official* shall order the *owner* or the owner's authorized agent to demolish and remove such structure, or board up until future repair. Boarding the building up for future repair shall not extend beyond one year, unless *approved* by the building official.

IPMC [A] 110.3 Failure to comply. If the *owner* of a *premises* or the owner's authorized agent, fails to comply with a demolition order within the time prescribed, the *code official* shall cause the structure to be demolished and removed, either through an available public agency or by contract or arrangement with private persons, and the cost of such demolition and removal shall be charged against the real estate upon which the structure is located and shall be a lien upon such real estate.

IPMC [A] 112.2 Issuance. A stop work order shall be in writing and shall be given to the *owner* of the property, to the *owner's* authorized agent, or to the person doing the work. Upon issuance of a stop work order, the cited work shall immediately cease. The stop work order shall state the reason for the order and the conditions under which the cited work is authorized to resume.

Revise the International Wildland-Urban Interface Code as follows:

IWUIC [A] 101.6 Maintenance. All buildings, structures, landscape materials, vegetation, *defensible space* or other devices or safeguards required by this code shall be maintained in conformance to the code edition under which installed. The owner or the owner's authorized designated agent shall be responsible for the maintenance of buildings, structures, landscape materials and vegetation.

IWUIC [A] 105.1 Practical difficulties. When there are practical difficulties involved in carrying out the provisions of this code, the code official is authorized to grant modifications for individual cases on application in writing by the owner or a duly owner's authorized ~~representative agent~~. The code official shall first find that a special individual reason makes enforcement of the strict letter of this code impractical, the modification is in conformance to the intent and purpose of this code, and the modification does not lessen any fire protection requirements or any degree of structural integrity. The details of any action granting modifications shall be recorded and entered into the files of the code enforcement agency.

IWUIC [A] 105.2 Technical assistance. To determine the acceptability of technologies, processes, products, facilities, materials and uses attending the design, operation or use of a building or premises subject to the inspection of the code official, the code official is authorized to require the owner, the owner's authorized agent, or the person in possession or control of the building or premises to provide, without charge to the jurisdiction, a technical opinion and report. The opinion and report shall be prepared by a qualified engineer, specialist, laboratory or fire safety specialty organization acceptable to the code official and the or the owner's authorized agent and shall analyze the fire safety of the design, operation or use of the building or premises, the facilities and appurtenances situated thereon and fuel management for purposes of establishing fire hazard severity to recommend necessary changes.

IWUIC [A] 109.2.2 Service of orders and notices. Orders and notices authorized or required by this code shall be given or served on the owner, the owner's authorized agent, operator, occupant or other person responsible for the condition or violation either by verbal notification, personal service, or delivering the same to, and leaving it with, a person of suitable age and discretion on the premises; or, if no such person is found on the premises, by affixing a copy thereof in a conspicuous place on the door to the entrance of said premises and by mailing a copy thereof to such person by registered or certified mail to the person's last known address.

Orders or notices that are given verbally shall be confirmed by service in writing as herein provided.

IWUIC [A] 109.3 Right of entry. Whenever necessary to make an inspection to enforce any of the provisions of this code, or whenever the code official has reasonable cause to believe that there exists in

any building or on any premises any condition that makes such building or premises unsafe, the code official is authorized to enter such building or premises at all reasonable times to inspect the same or to perform any duty authorized by this code, provided that if such building or premises is occupied, the code official shall first present proper credentials and request entry; and if such building or premises is unoccupied, the code official shall first make a reasonable effort to locate the owner, the owner's authorized agent, or other persons having charge or control of the building or premises and request entry. If such entry is refused, the code official shall have recourse to every remedy provided by law to secure entry. Owners, the owner's authorized agent, occupants or any other persons having charge, care or control of any building or premises, shall, after proper request is made as herein provided, promptly permit entry therein by the code official for the purpose of inspection and examination pursuant to this code.

IWUIC [A] 109.4.1 General compliance. Orders and notices issued or served as provided by this code shall be complied with by the owner, the owner's authorized agent, operator, occupant or other person responsible for the condition or violation to which the corrective order or notice pertains.

If the building or premises is not occupied, such corrective orders or notices shall be complied with by the owner or the owner's authorized agent.

IWUIC [A] 109.4.5.2 Notice. Where an unsafe condition is found, the code official shall serve on the owner, owner's authorized agent or person in control of the building, structure or premises, a written notice that describes the condition deemed unsafe and specifies the required repairs or improvements to be made to abate the unsafe condition, or that requires the unsafe structure to be demolished within a stipulated time. Such notice shall require the person thus notified, or their designee, to declare within a stipulated time to the code official acceptance or rejection of the terms of the order.

IWUIC [A] 109.4.5.2.1 Method of service. Such notice shall be deemed properly served if a copy thereof is (a) delivered to the owner or the owner's authorized agent personally; (b) sent by certified or registered mail addressed to the owner or the owner's authorized agent at the last known address with the return receipt requested; or (c) delivered in any other manner as prescribed by local law. If the certified or registered letter is returned showing that the letter was not delivered, a copy thereof shall be posted in a conspicuous place in or about the structure affected by such notice. Service of such notice in the foregoing manner upon the owner's authorized agent or upon the person responsible for the structure shall constitute service of notice upon the owner.

IWUIC [A] 109.4.5.3 Placarding. Upon failure of the owner, the owner's authorized agent, or person responsible to comply with the notice provisions within the time given, the code official shall post on the premises or on defective equipment a placard bearing the word "UNSAFE" and a statement of the penalties provided for occupying the premises, operating the equipment or removing the placard.

IWUIC [A] 109.4.5.4 Abatement. The owner, the owner's authorized agent, operator or occupant of a building, structure or premises deemed unsafe by the code official shall abate or correct or cause to be abated or corrected such unsafe conditions either by repair, rehabilitation, demolition or other *approved* corrective action.

IWUIC [A] 113.2 Authority to disconnect service utilities. The code official shall have the authority to authorize disconnection of utility service to the building, structure or system regulated by this code and the referenced codes and standards set forth in Section 102.4 in case of emergency where necessary to eliminate an immediate hazard to life or property or when such utility connection has been made without the release required by Section 113.1. The code official shall notify the serving utility and whenever possible the owner or the owner's authorized agent and occupant of the building, structure or service system of the decision to disconnect prior to taking such action if not notified prior to disconnection. The owner, the owner's authorized agent or occupant of the building, structure or service system shall be notified in writing as soon as practical thereafter.

IWUIC [A] 114.2 Issuance. The stop work order shall be in writing and shall be given to the owner of the property involved, to the owner's authorized agent or to the person doing the work. Upon issuance of a

stop work order, the cited work shall immediately cease. The stop work order shall state the reason for the order and the conditions under which the cited work will be permitted to resume.

Revise the International Zoning Code as follows:

IZC [A] 103.3 Maintenance. All buildings or uses, both existing and new, and all parts thereof, shall be maintained. The owner or owner's authorized agent shall be responsible for the maintenance of buildings and parcels of land. To determine compliance with this section, the code official shall be permitted to cause any structure or use to be inspected.

IZC [A] 107.7.3 Variance review criteria. The board of adjustment shall be permitted to approve, approve with conditions or deny a request for a variance. Each request for a variance shall be consistent with the following criteria:

1. Limitations on the use of the property due to physical, topographical and geologic features.
2. The grant of the variance will not grant any special privilege to the property owner or the owner's authorized agent.
3. The applicant can demonstrate that without a variance there can be no reasonable use of the property.
4. The grant of the variance is not based solely on economic reasons.
5. The necessity for the variance was not created by the property owner or the owner's authorized agent.
6. The variance requested is the minimum variance necessary to allow reasonable use of the property.
7. The grant of the variance will not be injurious to the public health, safety or welfare.
8. The property subject to the variance request possesses one or more unique characteristics generally not applicable to similarly situated properties.

IZC [A] 109.1 Hearings. Upon receipt of an application in proper form, the code official shall arrange to advertise the time and place of public hearing. Such advertisement shall be given by at least one publication in a newspaper of general circulation within the jurisdiction. Such notice shall state the nature of the request, the location of the property, and the time and place of hearing. Reasonable effort shall also be made to give notice by regular mail of the time and place of hearing to each surrounding property owner or the owner's authorized agent; the extent of the area to be notified shall be set by the code official. A notice of such hearing shall be posted in a conspicuous manner on the subject property.

PART II – IECC-COMMERCIAL

Revise the International Energy Conservation Code-Commercial as follows:

IECC C108.2 Issuance. The stop work order shall be in writing and shall be given to the owner of the property involved, or to the owner's authorized agent, or to the person doing the work. Upon issuance of a stop work order, the cited work shall immediately cease. The stop work order shall state the reason for the order, and the conditions under which the cited work will be permitted to resume.

PART III – IECC-RESIDENTIAL

Revise the International Energy Conservation Code-Residential as follows:

IECC R108.2 Issuance. The stop work order shall be in writing and shall be given to the owner of the property involved, or to the owner's authorized agent, or to the person doing the work. Upon issuance of a stop work order, the cited work shall immediately cease. The stop work order shall state the reason for the order, and the conditions under which the cited work will be permitted to resume.

PART IV – IRC

Revise the International Residential Code as follows:

IRC R104.6 Right of entry. Where it is necessary to make an inspection to enforce the provisions of this code, or where the *building official* has reasonable cause to believe that there exists in a structure or upon a premises a condition which is contrary to or in violation of this code which makes the structure or premises unsafe, dangerous or hazardous, the *building official* or designee is authorized to enter the structure or premises at reasonable times to inspect or to perform the duties imposed by this code, provided that if such structure or premises be occupied that credentials be presented to the occupant and entry requested. If such structure or premises be unoccupied, the *building official* shall first make a reasonable effort to locate the owner, the owner's authorized agent, or other person having charge or control of the structure or premises and request entry. If entry is refused, the *building official* shall have recourse to the remedies provided by law to secure entry.

IRC R105.1 Required. Any owner or owner's authorized agent who intends to construct, enlarge, alter, repair, move, demolish or change the occupancy of a building or structure, or to erect, install, enlarge, alter, repair, remove, convert or replace any electrical, gas, mechanical or plumbing system, the installation of which is regulated by this code, or to cause any such work to be done, shall first make application to the *building official* and obtain the required *permit*.

IRC R110.3 Certificate issued. After the *building official* inspects the building or structure and finds no violations of the provisions of this code or other laws that are enforced by the department of building safety, the *building official* shall issue a certificate of occupancy which shall contain the following:

1. The building *permit* number.
2. The address of the structure.
3. The name and address of the owner or the owner's authorized agent.
4. A description of that portion of the structure for which the certificate is issued.
5. A statement that the described portion of the structure has been inspected for compliance with the requirements of this code.
6. The name of the *building official*.
7. The edition of the code under which the *permit* was issued.
8. If an automatic sprinkler system is provided and whether the sprinkler system is required.
9. Any special stipulations and conditions of the building *permit*.

IRC R111.3 Authority to disconnect service utilities. The *building official* shall have the authority to authorize disconnection of utility service to the building, structure or system regulated by this code and the referenced codes and standards set forth in Section R102.4 in case of emergency where necessary to eliminate an immediate hazard to life or property or when such utility connection has been made without the approval required by Section R111.1 or R111.2. The *building official* shall notify the serving utility and whenever possible the owner or the owner's authorized agent and occupant of the building, structure or service system of the decision to disconnect prior to taking such action if not notified prior to disconnection. The owner, the owner's authorized agent, or occupant of the building, structure or service system shall be notified in writing as soon as practical thereafter.

IRC R114.1 Notice to owner or the owner's authorized agent. Upon notice from the *building official* that work on any building or structure is being prosecuted contrary to the provisions of this code or in an unsafe and dangerous manner, such work shall be immediately stopped. The stop work order shall be in writing and shall be given to the owner of the property involved, or to the owner's authorized agent or to the person doing the work and shall state the conditions under which work will be permitted to resume.

PART V – ISPSC

Revise the International Swimming Pool and Spa Code as follows:

ISPSC 102.3 Maintenance. All *aquatic vessel* and related mechanical, electrical and plumbing systems, both existing and new, and all parts thereof, shall be maintained in proper operating condition in accordance with the original design in a safe and sanitary condition. All devices or safeguards required by this code shall be maintained in compliance with the code edition under which they were installed.

The *owner* or the *owner's* authorized designated agent shall be responsible for maintenance of all systems. To determine compliance with this provision, the *code official* shall have the authority to require any system to be reinspected.

ISPSC 104.6 Right of entry. Where it is necessary to make an inspection to enforce the provisions of this code, or where the *code official* has reasonable cause to believe that there exists in a structure or upon a premises a condition which is contrary to or in violation of this code which makes the structure or premises unsafe, dangerous or hazardous, the *code official* is authorized to enter the structure or premises at reasonable times to inspect or to perform the duties imposed by this code, provided that if such structure or premises be occupied that credentials be presented to the occupant and entry requested. If such structure or premises is unoccupied, the *code official* shall first make a reasonable effort to locate the owner, the owner's authorized agent or other person having charge or control of the structure or premises and request entry. If entry is refused, the *code official* shall have recourse to the remedies provided by law to secure entry.

ISPSC 104.8 Modifications. Wherever there are practical difficulties involved in carrying out the provisions of this code, the *code official* shall have the authority to grant modifications for individual cases, upon application of the owner or owner's authorized agent ~~representative~~, provided the *code official* shall first find that special individual reason makes the strict letter of this code impractical and the modification is in compliance with the intent and purpose of this code and that such modification does not lessen sustainability, health, accessibility, life safety and structural requirements. The details of action granting modifications shall be recorded and entered in the files of the department of building safety.

ISPSC 105.1 When required. Any *owner*, or *owner's* authorized agent who desires to construct, enlarge, alter, *repair*, move, or demolish an *aquatic vessel* or to erect, install, enlarge, alter, repair, remove, convert or replace any system, the installation of which is regulated by this code, or to cause any such work to be done, shall first make application to the *code official* and obtain the required *permit* for the work.

ISPSC 105.2 Application for permit. Each application for a permit, with the required fee, shall be filed with the *code official* on a form furnished for that purpose and shall contain a general description of the proposed work and its location. The application shall be signed by the owner or ~~an~~ the owner's authorized agent. The permit application shall contain such other information required by the *code official*.

ISPSC 107.5 Stop work orders. Upon notice from the *code official*, work on any system that is being done contrary to the provisions of this code or in a dangerous or unsafe manner shall immediately cease. Such notice shall be in writing and shall be given to the owner of the property, or to the owner's authorized agent, or to the person doing the work. The notice shall state the conditions under which work is authorized to resume. Where an emergency exists, the *code official* shall not be required to give a written notice prior to stopping the work. Any person who shall continue any work in or about the structure after having been served with a stop work order, except such work as that person is directed to perform to remove a violation or unsafe condition, shall be liable to a fine of not less than [AMOUNT] dollars or more than [AMOUNT] dollars.

ISPSC 107.7.2 Authority to disconnect service utilities. The *code official* shall have the authority to authorize disconnection of utility service to the *aquatic vessel* regulated by the technical codes in case of an emergency, where necessary, to eliminate an immediate danger to life or property. Where possible, the owner or the owner's authorized agent and occupant of the building where the aquatic vessel is

located shall be notified of the decision to disconnect utility service prior to taking such action. If not notified prior to disconnecting, the owner or the owner's authorized agent or occupant of the building shall be notified in writing, as soon as practical thereafter.

Reason: The purpose for the proposal is to update the references to "applicant" and "owner" throughout the building code by changing them to the "owner or the owner's authorized agent" where it is warranted. In Section 110.1, "the permit applicant" is changed to "the owner or the owner's authorized agent" because the latter should be responsible to keep the work accessible and exposed for inspection. In Sections 1703.4.1 and 1707.1, "the applicant" is changed to "the owner or the owner's authorized agent" because the latter should be responsible for the costs of required tests, reports and investigations. In Sections 1703.6 and 1704.2.4, "the applicant" is changed to "the owner or the owner's authorized agent" because the latter should be responsible for submitting required reports to the building official. In Section 1703.6.1, the applicant" is changed to "the owner or the owner's authorized agent" for consistency with Section 1704.2 that requires the latter to employ the approved agencies. In Section 1803.6, the "owner or authorized agent" is changed to the "permit applicant" because it should be permissible for the latter to submit the geotechnical report with the other submittal documents at the time of permit application. The 2012 IBC contains additional references to "owner" but, based on the context in which they are used, it is not considered appropriate or useful to revise the language in conjunction with this proposal (e.g., from "the owner" to "the owner or the owner's authorized agent"). See Sections 101.4.4, 104.6, 111.2, 112.3, 116.3, 116.4, 402.3, 913.4, 1107.4-Exc. 1, 1607.7.4, 3108.2, 3307.1, 3412.4, 3412.4.1, G101.2, G105.6-Item 3, K103.1 and L101.3. The 2012 IBC contains additional references to "applicant" but, based on the context in which they are used, it is also not considered appropriate or useful to revise the language in conjunction with this proposal (e.g., from "the applicant" to "the owner or the owner's authorized agent"). See Sections 104.10.1-Item 5, 105.1.1, 105.3, 107.3.1, 109.3, 109.5, 1612.3.1, 1612.3.2, 1704.2.3, 1704.3, G103.3, G103.4, G103.5.1, G103.6, G104.2, G105.7-Item 5 and J104.1. All instances in the 2012 IBC of "applicant" and "owner," other than listed above, are included in this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

Staff analysis: This proposal for IBC indicate a correlative change throughout the code for the changes in Chapter 1. If this proposal is approved, similar revisions will be completed in the other chapters of the codes where the terms similar to "owner and owner's authorized agent".

PART I – IBC; IEBC; IFC; IFGC; IMC; IPC; IPSDC; IPMC; IWUIC

Revise the International Building Code as follows:

IBC [A] 104.11 Alternative materials, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material, design or method of construction shall be approved where the building official finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, at least the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability and safety. Where the alternative material, design or method of construction is not approved, the *building official* shall respond in writing, stating the reasons the alternative was not approved.

Revise the International Existing Building Code as follows:

IEBC [A] 104.11 Alternative materials, design and methods of construction, and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material, design, or method of construction shall be approved where the *code official* finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method, or work offered is, for the purpose intended, at least the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability, and safety. Where the alternative material, design or method of construction is not approved, the *code official* shall respond in writing, stating the reasons the alternative was not approved.

Revise the International Fire Code as follows:

IFC [A] 104.9 Alternative materials and methods. The provisions of this code are not intended to prevent the installation of any material or to prohibit any method of construction not specifically prescribed by this code, provided that any such alternative has been *approved*. The *fire code official* is authorized to approve an alternative material or method of construction where the *fire code official* finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, at least the equivalent of that prescribed in this code in quality, strength, effectiveness, *fire resistance*, durability and safety. Where the alternative material, design or method of construction is not approved, the *fire code official* shall respond in writing, stating the reasons the alternative was not approved.

Revise the International Fuel Gas Code as follows:

IFGC [A] 105.2 Alternative materials, methods, appliances and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any method of construction not specifically prescribed by this code, provided that any such alternative has been *approved*. An alternative material or method of construction shall be *approved* where the code official finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, at least the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability and safety. Where the alternative material, design or method of construction is not approved, the code official shall respond in writing, stating the reasons the alternative was not approved.

Revise the International Mechanical Code as follows:

IMC [A] 105.2 Alternative materials, methods, equipment and appliances. The provisions of this code are not intended to prevent the installation of any material or to prohibit any method of construction not specifically prescribed by this code, provided that any such alternative has been *approved*. An alternative material or method of construction shall be *approved* where the code official finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, at least the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability and safety. Where the alternative material, design or method of construction is not approved, the code official shall respond in writing, stating the reasons the alternative was not approved.

Revise the International Plumbing Code as follows:

IPC [A] 105.2 Alternative materials, methods and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any method of construction not specifically prescribed by this code, provided that any such alternative has been *approved*. An alternative material or method of construction shall be *approved* where the code official finds that the proposed alternative material, method or equipment complies with the intent of the provisions of this code and is at least the equivalent of that prescribed in this code. Where the alternative material, design or method of construction is not approved, the code official shall respond in writing, stating the reasons the alternative was not approved.

Revise the International Private Sewage Disposal Code as follows:

IPSDC [A] 105.2 Alternative materials, methods and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material or method of construction shall be approved where the code official finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, at least the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability and safety. Where the alternative material, design or method of construction is not approved, the code official shall respond in writing, stating the reasons the alternative was not approved.

Revise the International Property Maintenance Code as follows:

IPMC [A] 105.2 Alternative materials, methods and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any method of construction not specifically prescribed by this code, provided that any such alternative has been *approved*. An alternative material or method of construction shall be *approved* where the code official finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, at least the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability and safety. Where the alternative material,

design or method of construction is not approved, the *code official* shall respond in writing, stating the reasons the alternative was not approved.

Revise the International Wildland-Urban Interface Code as follows:

IWUIC [A] 105.3 Alternative materials or methods. The code official, in concurrence with approval from the *building official* and fire chief, is authorized to approve alternative materials or methods, provided that the code official finds that the proposed design, use or operation satisfactorily complies with the intent of this code and that the alternative is, for the purpose intended, at least equivalent to the level of quality, strength, effectiveness, fire resistance, durability and safety prescribed by this code. Approvals under the authority herein contained shall be subject to the approval of the *building official* whenever the alternate material or method involves matters regulated by the *International Building Code*.

The code official shall require that sufficient evidence or proof be submitted to substantiate any claims that may be made regarding its use. The details of any action granting approval of an alternate shall be recorded and entered in the files of the code enforcement agency. Where the alternative material, design or method of construction is not approved, the *code official* shall respond in writing, stating the reasons the alternative was not approved.

PART II – IRC

Revise the International Residential Code as follows:

IRC R104.11 Alternative materials, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been *approved*. An alternative material, design or method of construction shall be *approved* where the *building official* finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, at least the equivalent of that prescribed in this code. Compliance with the specific performance-based provisions of the International Codes in lieu of specific requirements of this code shall also be permitted as an alternate. Where the alternative material, design or method of construction is not approved, the *building official* shall respond in writing, stating the reasons the alternative was not approved.

PART III – ISPSC

Revise the International Swimming Pool and Spa Code as follows:

ISPSC 104.9 Alternative materials, methods and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any method of construction not specifically prescribed by this code, provided that any such alternative has been *approved*. An alternative material or method of construction shall be approved where the *code official* finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, at least the equivalent of that prescribed in this code in quality, strength, effectiveness, durability and safety. Where the alternative material, design or method of construction is not approved, the *code official* shall respond in writing, stating the reasons the alternative was not approved.

Reason: the language added is similar to that included at 105.3.1 when a permit application is rejected. This proposed change assumes that the non-approval of an alternative method is not the same as the non-approval of a permit, i.e., the permit application may have been approved but an alternative method might not be approved until a later date. However, the reasons for responding to the applicant in writing are the same, as noted in the Commentary to section 105.3.1: 'In order to ensure effective communication and due process of law, the reasons for denial of an application for a permit are required to be in writing. Further, the language is coordinated across all of the I-codes for consistency of enforcement.'

Cost Impact: This proposal will not increase the cost of construction.

PART I – IBC; IEBC; IFC; IFGC; IMC; IPC; IPSDC; IPMC; IWUIC

Add new text to the International Building Code as follows:

IBC [A] 104.12 Preliminary meeting. When requested by the permit applicant or the building official, the building official shall meet with the permit applicant prior to the application for a construction permit to discuss plans for the proposed work or change of occupancy in order to establish the specific applicability of the provisions of this code.

IBC [A] 104.13 Building evaluation. The building official is authorized to require an existing building to be investigated and evaluated by a registered design professional based on the circumstances agreed upon at the preliminary meeting. The design professional shall notify the building official where any potential nonconformance with the provisions of this code is identified.

Add new text to the International Existing Building Code as follows:

IEBC [A] 104.12 Preliminary meeting. When requested by the permit applicant or the code official, the code official shall meet with the permit applicant prior to the application for a construction permit to discuss plans for the proposed work or change of occupancy in order to establish the specific applicability of the provisions of this code.

IEBC [A] 104.13 Building evaluation. The code official is authorized to require an existing building to be investigated and evaluated by a registered design professional based on the circumstances agreed upon at the preliminary meeting. The design professional shall notify the code official where any potential nonconformance with the provisions of this code is identified.

Add new text to the International Fire Code as follows:

IFC [A] 104.12 Preliminary meeting. When requested by the permit applicant or the fire code official, the fire code official shall meet with the permit applicant prior to the application for a construction permit to discuss plans for the proposed work or change of occupancy in order to establish the specific applicability of the provisions of this code.

IFC [A] 104.13 Building evaluation. The fire code official is authorized to require an existing building to be investigated and evaluated by a registered design professional based on the circumstances agreed upon at the preliminary meeting. The design professional shall notify the fire code official where any potential nonconformance with the provisions of this code is identified.

Add new text to the International Fuel Gas Code as follows:

IFGC [A] 104.8 Preliminary meeting. When requested by the permit applicant or the code official, the code official shall meet with the permit applicant prior to the application for a construction permit to discuss plans for the proposed work or change of occupancy in order to establish the specific applicability of the provisions of this code.

IFGC [A] 104.9 Building evaluation. The code official is authorized to require an existing building to be investigated and evaluated by a registered design professional based on the circumstances agreed upon at the preliminary meeting. The design professional shall notify the code official where any potential nonconformance with the provisions of this code is identified.

Add new text to the International Mechanical Code as follows:

IMC [A] 104.8 Preliminary meeting. When requested by the permit applicant or the code official, the code official shall meet with the permit applicant prior to the application for a construction permit to discuss plans for the proposed work or change of occupancy in order to establish the specific applicability of the provisions of this code.

IMC [A] 104.9 Building evaluation. The code official is authorized to require an existing building to be investigated and evaluated by a registered design professional based on the circumstances agreed upon at the preliminary meeting. The design professional shall notify the code official where any potential nonconformance with the provisions of this code is identified.

Add new text to the International Plumbing Code as follows:

IPC [A] 104.8 Preliminary meeting. When requested by the permit applicant or the code official, the code official shall meet with the permit applicant prior to the application for a construction permit to discuss plans for the proposed work or change of occupancy in order to establish the specific applicability of the provisions of this code.

IPC [A] 104.9 Building evaluation. The code official is authorized to require an existing building to be investigated and evaluated by a registered design professional based on the circumstances agreed upon at the preliminary meeting. The design professional shall notify the code official where any potential nonconformance with the provisions of this code is identified.

Add new text to the International Private Sewage Disposal Code as follows:

IPSDC [A] 104.8 Preliminary meeting. When requested by the permit applicant or the code official, the code official shall meet with the permit applicant prior to the application for a construction permit to discuss plans for the proposed work or change of occupancy in order to establish the specific applicability of the provisions of this code.

IPSDC [A] 104.9 Building evaluation. The code official is authorized to require an existing building to be investigated and evaluated by a registered design professional based on the circumstances agreed upon at the preliminary meeting. The design professional shall notify the code official where any potential nonconformance with the provisions of this code is identified.

Add new text to the International Property Maintenance Code as follows:

IPMC [A] 104.7 Preliminary meeting. When requested by the permit applicant or the code official, the code official shall meet with the permit applicant prior to the application for a construction permit to discuss plans for the proposed work or change of occupancy in order to establish the specific applicability of the provisions of this code.

IPMC [A] 104.8 Building evaluation. The code official is authorized to require an existing building to be investigated and evaluated by a registered design professional based on the circumstances agreed upon at the preliminary meeting. The design professional shall notify the code official where any potential nonconformance with the provisions of this code is identified.

Add new text to the International Wildland-Urban Interface Code as follows:

IWUIC [A] 104.8 Preliminary meeting. When requested by the permit applicant or the code official, the code official shall meet with the permit applicant prior to the application for a construction permit to discuss plans for the proposed work or change of occupancy in order to establish the specific applicability of the provisions of this code.

IWUIC [A] 104.9 Building evaluation. The code official is authorized to require an existing building to be investigated and evaluated by a registered design professional based on the circumstances agreed upon at the preliminary meeting. The design professional shall notify the code official where any potential nonconformance with the provisions of this code is identified.

PART II – IRC

Add new text to the International Residential Code as follows:

IRC [A] R104.12 Preliminary meeting. When requested by the permit applicant or the building official, the building official shall meet with the permit applicant prior to the application for a construction permit to discuss plans for the proposed work or change of occupancy in order to establish the specific applicability of the provisions of this code.

IRC [A] R104.13 Building evaluation. The building official is authorized to require an existing building to be investigated and evaluated by a registered design professional based on the circumstances agreed upon at the preliminary meeting. The design professional shall notify the building official where any potential nonconformance with the provisions of this code is identified.

PART III – ISPSC

Add new text to the International Swimming Pool and Spa Code as follows:

ISPSC 104.13 Preliminary meeting. When requested by the permit applicant or the code official, the code official shall meet with the permit applicant prior to the application for a construction permit to discuss plans for the proposed work or change of occupancy in order to establish the specific applicability of the provisions of this code.

ISPSC 104.14 Building evaluation. The code official is authorized to require an existing building to be investigated and evaluated by a registered design professional based on the circumstances agreed upon at the preliminary meeting. The design professional shall notify the code official where any potential nonconformance with the provisions of this code is identified.

Reason: Several of the ICC codes have provisions for meetings prior to the processing of an application. Every building would benefit from the sharing of knowledge and expertise of the design team and the code official regarding the scope and circumstances surrounding a particular project.

Cost Impact: None

ADM24-13**PART I – IBC; IEBC; IFC; IFCG; IMC; IPC; IPSDC; IPMC; IWUIC**

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

PART III – ISPSC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

104.12 (NEW)-ADM (IBC)-COLLINS

ADM25 – 13

IFC: [A] 105.1.4 (New), [A] 105.1.5 (New)

Proponent: Anthony C. Apfelbeck, CBO, CFPS, City of Altamonte Springs Building/Fire Safety Division, representing self. (ACApfelbeck@Altamonte.org)

Add new text to the International Fire Code as follows:

IFC [A] 105.1.4 Emergency repairs. Where equipment replacement and repairs must be performed in an emergency situation, the permit application shall be submitted within the next working business day to the fire code official

IFC [A] 105.1.5 Repairs. Application or notice to the fire code official is not required for ordinary repairs to structures, equipment or systems. Such repairs shall not include the cutting away of any wall, partition or portion thereof, the removal or change of any required means of egress, or rearrangement of parts of a structure affecting the egress requirements; nor shall any repairs include addition to, alteration of, replace or relocation of any standpipe, fire protection water supply, automatic sprinkler system, fire alarm system or other work affecting fire protection or life safety.

Reason: The proposed Section 105.1.4 and 105.1.5 are identical to Sections 105.2.1 and 105.2.2 of the IBC with the exception that fire code official has replaced the term building official. This provision is needed in the IFC to address situations where emergency repairs and general repairs are required in addition to providing an allowance for ordinary repairs. The need in the IFC is similar to the need in the IBC. Both codes should match with similar provisions and direction to end users in dealing with these two types of issues.

Cost Impact: This code change will reduce the cost of construction. This change will cause both the IBC and IFC to match which will ease compliance and enforcement costs.

ADM25-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

105.1.5 (NEW)-ADM (IFC)-APFELBECK

IFC: [A] 105.1.4 (New), [A] 105.1.4.1 (New); **IFGC:** [A] 106.1.1 (New), [A] 106.1.2 (New); **IMC:** [A] 106.1.1 (New), [A] 106.1.2 (New); **IPC:** [A] 106.1.1 (New), [A] 106.1.2 (New); **IPSDC:** [A] 106.1.1 (New), [A] 106.1.2 (New)

Proponent: Anthony C. Apfelbeck, CBO, CFPS, City of Altamonte Springs Building/Fire Safety Division, representing self (ACApfelbeck@Altamonte.org)

Add new text to the International Fire Code as follows:

IFC [A] 105.1.4 Annual permit. In lieu of an individual construction permit for each alteration to an already approved system or equipment installation, the fire code official is authorized to issue an annual permit upon application therefor to any person, firm or corporation regularly employing one or more qualified tradespersons in the building, structure or on the premises owned or operated by the applicant for the permit.

IFC [A] 105.1.4.1 Annual permit records. The person to whom an annual permit is used shall keep a detailed record of alterations made under such annual permit. The fire code official shall have access to such records at all times or such records shall be filed with the fire code official as designated.

Revise the International Fuel Gas Code as follows:

IFGC [A] 106.1.1 Annual permit. In lieu of an individual construction permit for each alteration to an already approved system or equipment installation, the code official is authorized to issue an annual permit upon application therefor to any person, firm or corporation regularly employing one or more qualified tradespersons in the building, structure or on the premises owned or operated by the applicant for the permit.

IFGC [A] 106.1.2 Annual permit records. The person to whom an annual permit is used shall keep a detailed record of alterations made under such annual permit. The code official shall have access to such records at all times or such records shall be filed with the code official as designated.

Revise the International Mechanical Code as follows:

IMC [A] 106.1.1 Annual permit. In lieu of an individual construction permit for each alteration to an already approved system or equipment installation, the code official is authorized to issue an annual permit upon application therefor to any person, firm or corporation regularly employing one or more qualified tradespersons in the building, structure or on the premises owned or operated by the applicant for the permit.

IMC [A] 106.1.2 Annual permit records. The person to whom an annual permit is used shall keep a detailed record of alterations made under such annual permit. The code official shall have access to such records at all times or such records shall be filed with the code official as designated.

Revise the International Plumbing Code as follows:

IPC [A] 106.1.1 Annual permit. In lieu of an individual construction permit for each alteration to an already approved system or equipment installation, the code official is authorized to issue an annual permit upon application therefor to any person, firm or corporation regularly employing one or more qualified tradespersons in the building, structure or on the premises owned or operated by the applicant for the permit.

IPC [A] 106.1.2 Annual permit records. The person to whom an annual permit is used shall keep a detailed record of alterations made under such annual permit. The code official shall have access to such records at all times or such records shall be filed with the code official as designated.

Revise the International Private Sewage Disposal Code as follows:

IPSDC [A] 106.1.1 Annual permit. In lieu of an individual construction permit for each alteration to an already approved system or equipment installation, the code official is authorized to issue an annual permit upon application therefor to any person, firm or corporation regularly employing one or more qualified tradespersons in the building, structure or on the premises owned or operated by the applicant for the permit.

IPSDC [A] 106.1.2 Annual permit records. The person to whom an annual permit is used shall keep a detailed record of alterations made under such annual permit. The code official shall have access to such records at all times or such records shall be filed with the code official as designated.

Reason: This proposed language is identical to the current language in section 105.1.1 and 105.1.2 of the IBC with the exception that the title of the code official is changes and that the list of systems have been removed from the types of permits. There is similar language in the IEBC, Section 105.1.1 and 105.1.2. The need for this language in the IFC and other codes is similar to the justification for it being present in the IBC. If annual permits can be issued for MEP system upon approval of the Building Official, annual permits should be able to be issued for fire systems regulated by the IFC upon the approval of the Fire Official.

The idea for this proposal was originally brought up as an issue for the IFC and fire code officials. However, once it was identified that there is Permit section in the IFGC, IMC, IPC and IPSDC, it seemed appropriate to extend this proposal.

Cost Impact: This code change will reduce the cost of construction. In situations where the issuance of annual permit for fire protection systems is appropriate, there will be a direct cost saving to the contractor in avoiding the need for individual permits.

Staff analysis: Permit sections are also found in the IWUIC and Pool codes.

ADM26-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

105.1.4 (NEW)-ADM (IFC)-APFELBECK

ADM27 – 13

PART I – IBC: 105.2

PART II – IRC: R105.2

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE PROVISIONS COMMITTEE. PART II WILL BE HEARD BY THE RESIDENTIAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

Proponent: Rick Davidson, City of Maple Grove, representing Association of Minnesota Building Officials (rdavidson@maplegrovern.gov)

PART I – IBC

Revise the International Building Code as follows:

IBC [A] 105.2 Work exempt from permit. Exemptions from *permit* requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this jurisdiction. *Permits* shall not be required for the following:

Building:

1. One-story detached accessory structures ~~used as tool and storage sheds, playhouses and similar uses,~~ provided the floor area is not greater than 120 square feet (11 m²).
- 2 through 13 (No change to current text)

(Remainder of section not shown remains unchanged.)

PART II – IRC

Revise the International Residential Code as follows:

R105.2 Work exempt from permit. *Permits* shall not be required for the following. Exemption from *permit* requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this *jurisdiction*.

Building:

1. One-story detached ~~accessory structures used as tool and storage sheds, playhouses and similar uses,~~ provided the floor area does not exceed 200 square feet (18.58 m²).
- 2 through 10 (No change to current text)

(Remainder of section not shown remains unchanged.)

Reason: The term “used as tool and storage sheds, playhouses and similar uses” is proposed to be deleted because there now exists in the IRC a definition for “accessory structure”. It is unnecessary to further define the term in the rule as it only serves to add confusion. For example, a small outdoor screen room meets the definition of accessory structure but is it exempt from permits? It poses no more of a hazard than a playhouse or tool shed. It is better to let the definition provide direction.

ACCESSORY STRUCTURE. A structure not greater than 3,000 square feet (279 m²) in floor area, and not over two stories in height, the use of which is customarily accessory to and incidental to that of the dwelling(s) and which is located on the same lot.

Cost Impact: None

ADM27-13**PART I – IBC**

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R105.2 #2-RB-DAVIDSON

ADM28 – 13

IBC: [A] 105.2

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jen@jhatfieldandassociates.com)

Revise the International Building Code as follows:

IBC [A] 105.2 Work exempt from permit. Exemptions from *permit* requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this jurisdiction. *Permits* shall not be required for the following:

Building:

1 through 8 *(No change to text)*

~~9. Prefabricated swimming pools accessory to a Group R-3 occupancy that are less than 24 inches (610 mm) deep, are not greater than 5,000 gallons (18 925 L) and are installed entirely above ground.~~

10 through 13 *(No change to text)*

(No change to portions of section not shown)

Reason: The new International Swimming Pool & Spa Code (ISPSC) does not define nor exempt from permitting, prefabricated swimming pools. Rather, the exemption from permitting under the new ISPSC is based on whether or not the structure in question meets the definition of an aquatic vessel, which is defined in the ISPSC (and suggested for inclusion in the IBC definitions in a subsequent proposal). This new aquatic vessel definition eliminates the need for the exception listed under Section 105.2 and if it were to remain, it would conflict with the requirements found in the new ISPSC, which find that if a structure falls under the aquatic vessel definition, it requires a permit.

Cost Impact: The code change proposal will not increase the cost of construction.

ADM28-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

105.2-ADM (IBC)-HATFIELD

ADM29 – 13

IFC: [A] 105.4.2.2 (New)

Proponent: Anthony C. Apfelbeck, CBO, CFPS, City of Altamonte Springs Building/Fire Safety Division, representing self. (ACApfelbeck@Altamonte.org)

Add new text to the International Fire Code as follows:

IFC [A] 105.4.2.2 Site Plan. The construction documents submitted with the application for permit shall be accompanied by a site plan showing to scale the size and location of new construction and exiting structures on the site, distances to lot lines, fire apparatus access roads, and fire protection water supply locations. In the case of demolition, the site plan shall show construction to be demolished and the location and size of existing structures and construction that are to remain on the site or plot. The fire code official is authorized to waive or modify the requirement for a site plan when the application for permit is for alteration or repair or when otherwise warranted.

Reason: This proposed language is very similar to the current language in Section 107.2.5 of the IBC. However, this proposal has been modified to change the title of the official and change the information needed on the site plan to make the information specific to the fire code official's specific needs. This language is needed in the IFC for fire code official to be able to effectively review the construction plans for compliance with this code and referenced documents. There are numerous provisions in the IFC that need a site plan submitted in order for the fire code official to be able to determine compliance with the code.

Cost Impact: This code change proposal will increase the cost of construction. The only increased cost associated with this proposal will be the time and effort to create a site plan. However, in a vast majority of circumstances, a site plan will already have been completed. There will be some potential cost savings due to the fire official being able to identify code compliance issues on the site plan prior to observing those conditions in the field and mandating a field change.

ADM29-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

105.4.2.2 (NEW)-ADM (IFC)-APFELBECK

ADM30 – 13

PART I - IFC: [A] 105.4.5; IWUIC: [A] 108.10;

PART II - IECC: C103.4;

PART III - IECC: R103.4

THIS IS A 3 PART CODE CHANGE. PARTS I WILL BE HEARD BY THE ADMINISTRATIVE PROVISIONS COMMITTEE AS ONE CODE CHANGE. PART II WILL BE HEARD BY THE ENERGY CONSERVATION CODE-COMMERICAL COMMITTEE. PART III WILL BE HEARD BY THE ENERGY CONSERVATION CODE-RESIDENTIAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

Proponent: Anthony C. Apfelbeck, CBO, CFPS, City of Altamonte Springs Building/Fire Safety Division, representing self. (ACApfelbeck@Altamonte.org)

PART I –IFC; IWUIC

Revise the International Fire Code as follows:

IFC [A] 105.4.5 ~~Corrected documents~~ Amended construction documents. ~~Where field conditions necessitate any substantial change from the approved construction documents, the fire code official shall have the authority to require the corrected construction documents to be submitted for approval. Work shall be installed in accordance with the approved construction documents, and any changes made during construction that are not in compliance with the approved construction documents shall be resubmitted for approval as an amended set of construction documents.~~

Revise the International Wildland-Urban Interface Code as follows:

IWUIC [A] 108.10 Amended construction documents. Work shall be installed in accordance with the approved construction documents, and any changes made during construction that are not in compliance with the approved documents shall be resubmitted for approval as an amended set of construction documents.

PART II – IECC-COMMERCIAL

Revise the International Energy Conservation Code-Commercial as follows:

IECC C103.4 Amended construction documents. Work shall be installed in accordance with the approved construction documents, and any changes made during construction that are not in compliance with the approved construction documents shall be resubmitted for approval as an amended set of construction documents.

PART III – IECC-RESIDENTIAL

Revise the International Energy Conservation Code-Residential as follows:

IECC R103.4 Amended construction documents. Work shall be installed in accordance with the approved construction documents, and any changes made during construction that are not in compliance with the approved construction documents shall be resubmitted for approval as an amended set of construction documents.

Reason: The proposed language is from 107.4 in the IBC which better describes the intent of the section. This proposal correlates the IFC requirement with the IBC so users, contractors and designers are subject to the same code provision in both codes. There is no justification for differing language in the IFC as opposed to the IBC on this topic. The current language in IFC 105.4.5, to submit corrected documents, is too specific based on the sole fact of “when field conditions necessitate. . .” Clearly, this not the only reason that revised construction documents would be needed. As an example, the owner may choose to make a revision, a design

professional may value engineer a design or a contractor may change materials from the original approved construction documents. All of these items are reasons that necessitate an amended construction document submittal under the IBC but currently do not under the IFC. This proposal will match the IBC and IFC language is broad enough to addresses any condition that may cause the installation to not be in compliance with the approved construction documents.

Cost Impact: This proposal will not increase the cost of construction. The IBC already requires amended construction documents per this language.

Staff analysis: The proposed language is found in IBC Section 107.4, IEBC Section 106.4 and IRC Section R106.4.

105.4.5-ADM (IFC)-APFELBECK

ADM31 – 13

IFC: [A] 105.6.30 (New), [A] 105.6.39

THIS CHANGE WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Proponent: Chad P. Lawry, Deputy Fire Marshal, Vancouver Fire Department, representing Vancouver Fire Marshal's Office (chad.lawry@cityofvancouver.us)

Revise the International Fire Code as follows:

IFC [A] 105.6 Required operational permits. *(No change to text)*

IFC [A] 105.6.30 Motor fuel-dispensing facilities. An operational permit is required for the operation of automotive, marine and fleet motor fuel-dispensing facilities.

(Renumber subsequent sections)

~~IFC [A] 105.6.39 Repair garages and motor fuel-dispensing facilities.~~ An operational permit is required for the operation of repair garages ~~and automotive, marine and fleet motor fuel-dispensing facilities.~~

Reason: This is a simple division of a combined permit into two separate permits.

Currently the permit provides a perceived "authorization" for one or both regulated activities regardless of which specific activity triggered the permit at the time of the inspection. A permitted repair garage proprietor may believe that after the inspection they are allowed to dispense fuel without permits or inspections.

For example, we had a grocery store in Vancouver Washington with fuel dispensing that used their fire code permit for fuel dispensing to justify conducting automotive repair shop in violation of their certificate of occupancy and local zoning ordinances.

Cost Impact: None

Staff analysis: The section numbering choice is to maintain the alphabetic listing under the operational permits.

ADM31-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

105.6.39-ADM (IFC)-LAWRY

ADM32 – 13

IFC: [A] 105.7.9 (New)

THIS CHANGE WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azumiamia@yahoo.com)

Add new text to the International Fire Code as follows:

IFC [A] 105.7.9 Gates and barricades across fire apparatus access roads. A construction permit is required for the installation of or modification of a gate or barricade across a fire apparatus access road.

(Renumber subsequent sections)

Reason: The proposal requires that gates and barricades across fire access lanes require a construction permit. The permit is necessary to provide the fire code official the ability to review and ensure that access requirements are met.

Current code requirements for gates include method of locking/securing the gate or barricade in an approved manner, proper dimensions and opening width of the gate or barricade, and proper devices for operation of the gate or barricade.

Cost Impact: The code change proposal will increase the cost of construction if the jurisdiction requires a fee for the permit.

ADM32-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

105.7.9 (NEW)-ADM (IFC)-ZUBIA-FCAC

ADM33 – 13

IFC: [A] 105.7.11, [A] 105.7.12, [A] 105.7.13, [A] 105.7.14

THIS CHANGE WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Proponent: Anthony C. Apfelbeck, CBO, CFPS, City of Altamonte Springs Building/Fire Safety Division, representing self. (ACApfelbeck@Altamonte.org)

Revise the International Fire Code as follows:

IFC [A] 105.7.11 LP-gas. A construction permit is required for installation of or modification to an LP-gas system. Maintenance performed in accordance with this code is not considered a modification and does not require a permit.

IFC [A] 105.7.12 Private fire hydrants. A construction permit is required for the installation or modification of private fire hydrants. Maintenance performed in accordance with this code is not considered a modification and does not require a permit.

IFC [A] 105.7.13 Solar photovoltaic power systems. A construction permit is required to install or modify solar photovoltaic power systems. Maintenance performed in accordance with this code is not considered a modification and does not require a permit.

IFC [A] 105.7.14 Spraying or dipping. A construction permit is required to install or modify a spray room, dip tank or booth. Maintenance performed in accordance with this code is not considered a modification and does not require a permit.

Reason: The above subcategories of construction permits in 105.7 are the only ones that require a permit for modifications but do not have an exception for routine maintenance in accordance with the code. Other similar sections, such as those for standpipes, in 105.7.15, fire pumps in 105.7.7 and fire alarms in 105.7.6 already provide this exception. The inclusion of the proposed text will make the sections above consistent with the other subcategory language in 105.7.

Cost Impact: The code change proposal will not increase the cost of construction.

ADM33-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

105.7.11-ADM (IFC)-APFELBECK

ADM34 – 13

IFC [A] 105.7.12 (New)

THIS CHANGE WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Proponent: Ian Hardage, San Ramon Valley Fire Protection District (ihardage@srvfire.ca.gov) and Amber Anderson, Cosumnes CSD Fire Department (AmberAnderson@csdfire.com), representing California Fire Chiefs Association

Revise the International Fire Code as follows:

IFC [A] 105.7.12 Mechanical refrigeration. A construction permit is required for the installation of or modification to a mechanical refrigeration unit or system.

(Renumber subsequent sections)

Reason: Currently only an operational permit is required to operate a mechanical refrigeration unit or system regulated by Chapter 6. In order for these systems to be maintained and operated in compliance with Chapter 6, these units or systems must be compliant with Chapter 6 at time of installation. Not all requirements of IFC Chapter 6 are found in the IMC, ASHRAE 15, or IIAR 2. Specifically, IFC, Sections 606.5, 606.10.1.2, and 606.12.3 which provide fire code officials the opportunity to provide mechanical refrigeration system installation design criteria and or exceptions.

It is not uncommon for mechanical refrigeration systems to be installed, replaced or modified without fire department knowledge or input until they are found on an emergency call or during a facility inspection. Other systems sensitive to change such as stationary battery systems, compressed gases, hazardous materials, and flammable and combustible liquids require a construction permit as found in IFC Section 105.7. The same opportunity is needed for mechanical refrigeration systems.

Increases in construction costs would only occur if an authority having jurisdiction chose to implement a separate fee for permit. All other costs such as design drawings and construction of the system should already be included in the original design budget. We feel that any cost increase by an AHJ would likely be significantly less than any delays in construction or operation of the system when such system is determined to be non-compliant with codes and standards enforced by the fire code official at a time less than ideal for the customer such as at final inspection.

Cost Impact: The code proposal will increase the cost of construction.

ADM34-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

105.7.12 (NEW)-ADM (IFC)-ANDERSON-HARDAGE

ADM35 – 13

IFC: 105.7.13 (New)

THIS CHANGE WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Proponent: Bob D. Morgan, P.E., Fort Worth Fire Department, representing the Fire Advisory Board to the North Central Texas Council of Governments

Revise as follows:

IFC 105.7.13 Smoke control or exhaust systems. Construction permits are required for installation of or alteration to smoke control or exhaust systems. Maintenance performed in accordance with this code is not considered a modification and does not require a permit.

(Renummer subsequent sections)

Reason: Section 105.7.17 adds construction permit requirements for smoke control and exhaust systems, which are required fire protection systems by Chapter 9 of the fire code to ensure proper design and installation of such systems.

Cost Impact: The code change proposal will not increase the cost of construction.

ADM35-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

105.7.17 (NEW)-ADM (IFC)-MORGAN

ADM36 – 13

PART I - IEBC: [A] 106.1.3 (New), [A] 109.3.7 (New), [A] 109.3.8 (New), 602.4 (New), 602.4.1 (New);

PART II - IPMC: [A] 103.6 (New), [A] 103.7 (New), [A] 106.1 (New), 305.4 (New), 305.4.1 (New)

Proponent: Darryl Morris, Aerobiologist, Midwest Aerobiology Labs, Corp., representing self (Darryl@airspores.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE EXISTING BUILDING COMMITTEE AS ONE CODE CHANGE. PART II WILL BE HEARD BY THE PROPERTY MAINTENANCE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

PART I – IEBC

Add new text to the International Existing Building Code as follows:

IEBC SECTION 106 PERMITS

IEBC [A] 106.1.3 Permit Required. A permit is required for mold remediation, mold removal, mold cleanup, or other mold-related activities.

IEBC SECTION 109 INSPECTIONS

IEBC [A] 109.3.7 Municipality Required Mold Inspections. Mold inspection by a certified mold inspector shall be required in the following situations:

1. Before the sale of any foreclosed, vacant, and bank-owned properties; or
2. Where stagnant water or visible molds are evident.

IEBC [A] 109.3.8 Post Mold Removal Verification Inspection. A post-remediation verification inspection shall be performed by a certified mold inspector. The inspection shall verify that the remediation has been properly executed and that the area has been restored to a benign indoor environment.

(Renumber subsequent sections)

IEBC SECTION 602 BUILDING ELEMENTS AND MATERIALS

IEBC 602.4 Mold Cleaning Procedures. Where mold and moisture problem are identified, physical extraction or encapsulation of mold and their spores is required.

IEBC 602.4.1 Disposal of Stagnant Water. Moldy stagnant water drained from a crawl space or basement shall be disposed of in accordance with directions from the code official.

(Renumber subsequent sections)

PART II – IPMC

Add new text to the International Property Maintenance Code as follows:

IPMC SECTION 103
DEPARTMENT OF PROPERTY MAINTENANCE INSPECTION

IPMC [A] 103.6 Municipality Required Mold Inspections. Mold inspection by a certified mold inspector shall be required in the following situations:

1. Before the sale of any foreclosed, vacant, and bank-owned properties; or
2. Where stagnant water or visible molds are evident.

IPMC [A] 103.7 Post Mold Removal Verification Inspection. A post-remediation verification inspection shall be performed by a certified mold inspector. The inspection shall verify that the remediation has been properly executed and that the area has been restored to a benign indoor environment.

IPMC SECTION 106
PERMITS

IPMC [A] 106.1 Permit Required. A permit is required for mold remediation, mold removal, mold cleanup, or other mold-related activities.

IPMC SECTION 305
INTERIOR STRUCTURES

IPMC 305.4 Mold Cleaning Procedures. Where mold and moisture problem are identified, physical extraction or encapsulation of mold and their spores is required.

IPMC 305.4.1 Disposal of Stagnant Water. Moldy stagnant water drained from a crawl space or basement shall be disposed of in accordance with directions from the code official.

(Renumber subsequent sections)

Reason: Currently, there are no guidelines for mold removal and post mold removal verification. An enforceable code would provide code enforcers with the opportunity to determine if an indoor environment is sufficiently benign, and does not pose any serious health risk to themselves, current or future occupants.

Cost Impact: The code change proposal will not increase the cost of construction.

ADM36-13

PART I –IEBC

	Assembly:	ASF	AMF	DF

105 (NEW)-PM-MORRIS

ADM37 – 13

IEBC: 106.2.6 (New), Chapter 16

THIS CHANGE WILL BE HEARD BY THE EXISTING BUILDING CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Proponent: Rebecca Morley, representing National Center for Healthy Housing

Add new text to the International Existing Building Code as follows:

IEBC 106.2.6 Certifications and plans where painted surfaces are disturbed. Where a Group E, I-4, R-2, R-3 or R-4 occupancy was completed prior to 1978 and repair, alteration or addition being performed will result in the disturbance of painted surfaces, the contractor shall provide to the code official one of the following:

1. Copies of EPA or state renovation firm certification, renovator certification and a plan for compliance for renovations in accordance with 40 CFR 745 requirements for renovations.
2. Documentation from an approved test in accordance with 40 CFR 745.82(a)(1) or (2) that shows that the disturbed paint contains lead that is below specified levels.

Add the following standard to IEBC Chapter 16:

EPA **U.S. Environmental Protection Agency**

40 CFR 745 **Lead-Based Paint Poisoning Prevention in Certain Residential Structures – July 1, 2012**

Reason: Section 106 covers construction documents, and the specific provisions include fire protection drawings, means of egress, exterior wall envelope and site plans. This code change proposal, 106.2.6, adds a simple requirement that permit applicants include, with the other construction documents, evidence of compliance with health-protective requirements to protect children from lead poisoning during additions, alterations, and repairs to pre-1978 homes.

The purpose of this proposed code language is to incorporate protection from lead-based paint into the Code through the requirement for construction documents. Once the Code requires permit applicants to demonstrate up front their knowledge of, and plans to follow, the federal and state renovation rule requirements, the code official will be positioned to provide important oversight and leadership in preventing lead poisoning without even leaving the office. This oversight will help level the playing field between contractors who are complying with the rule and noncompliant entities who are under-pricing and undercutting their competitors. By merely asking an applicant for the missing documents, the code official can influence entities not following the law into compliance before the work even starts. In a few cases, these entities may be unaware of the regulations. Although these regulations have been in effect since April 2010, and have been adopted by 12 states, reported non-compliance is affecting the compliant contractor and continuing the problem of lead poisoning in the US.

The proposed “plan that indicates compliance with the federal disclosure and work practice requirements” can take different forms depending on what documents the builder is already using. Some builders who work on pre-1978 homes are already using a form to track their upfront assessments and another form for recordkeeping. Anyone working in pre-1978 homes should have an EPA or state certification for their firm, along with at least one individual renovator certification that the renovator received at the end of the required one-day training course. dispersal of lead before, during, and after work performed on a pre-1978 home. These requirements are already in effect in federal and state regulation.

The plan and certifications would only be needed for a structure likely to contain lead-based paint: a pre-1978 home. As noted under the exception, the requirement is waived if paint testing proves that the paint is not lead-based paint. A rebuttable presumption of lead’s presence allows the builder to demonstrate that lead is not present and obtain exemption from the requirements. EPA-approved tests include lead-based paint inspection or risk assessment, test kit used by a certified renovator, and collection of a lead-based paint chips for laboratory analysis.

Renovation of painted surfaces is a significant source of lead dust that poisons children. The dangers associated with lead poisoning are well-known: serious health effects, detrimental effects on cognitive and behavioral development, with serious personal and social consequences that may persist throughout their lifetime.

Multiple studies have demonstrated that lead dust is the major source of lead poisoning for young children. There is no safe level of lead exposure for children; lead affects intelligence even at very low levels.^{1,2,5,8,9} Indeed, the rate of IQ loss per 1 microgram of lead per deciliter of blood (µg/dL) is greatest at lead levels below 10 µg/dL. As a child’s BLL increases from 1 to 10 µg/dL, experts estimate a child may lose anywhere from 3.9 to 7.4 IQ points, but from 10 to 30 µg/dL the decrement is 2.5 to 3.0 IQ points. Low-level chronic exposure may have an even greater effect on IQ than a single instance of very high BLL.¹⁰

Research indicates that a five-point negative shift in IQ at the population level would increase the number of children with an “extremely low” IQ by 57%, substantially increasing the cost of special education programs.³ Considering the costs to the special education system alone, one study conservatively estimated that it costs \$38,000 over three years to educate a child with lead poisoning.¹¹ Low-level exposure to lead has also been linked to factors other than IQ that can further impact educational outcomes.

EBLLs are associated with Attention Deficit Hyperactivity Disorder (ADHD) and antisocial behavior, which in turn increase the likelihood of conduct disorder, criminal activity, and drug abuse.^{1,4} Each 1 µg/dL reduction in the average preschool blood lead level saves \$13.4 billion from the direct and indirect costs of crime.¹

Several recent studies have explored the specific effects of lead on educational outcomes. These studies show a strong relationship between slightly elevated blood lead levels in young children and decreased scores on end-of-grade tests in elementary school. While similar educational effects were documented for higher blood levels decades ago,¹² the recent studies confirm that the connection between blood lead and poor educational outcomes remains true for blood levels as low as 3-4 µg/dL. A more recent study of 57,000 North Carolina children found that children with a BLL as low as 4 µg/dL at three years of age were significantly more likely to be classified as learning-disabled than children with a BLL of 1 µg/dL.⁶

The consequences of lead exposure are clear. This code change proposal seeks to reduce the risk – and level the playing field among contractors working on pre-1978 properties.

The EPA 40 CFR 745 standard is available at <http://www.gpo.gov/fdsys/pkg/CFR-2012-title40-vol32/xml/CFR-2012-title40-vol32-part745.xml>.

106.2.6 (NEW)-ADM (IEBC)-MORLEY

ADM38 – 13

IFC: 106.3 (New), 113.2

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee
(cbaldassarra@rjagroup.com)

Add new text to the International Fire Code as follows:

IFC [A] 106.3 Periodic building fire safety inspections. In addition to any other inspections required or authorized by this code, all buildings shall be subjected to periodic building fire safety inspections in compliance with the requirements of Sections 106.3.1 through 106.3.6.

Exceptions: Periodic building fire safety inspections shall not be required in any of the following:

1. Buildings classified as Group U occupancies that are associated with Group R-3 occupancies.
2. Dwelling units in Group R-2 and Group R-3 occupancies.
3. Dwelling units constructed in accordance with the *International Residential Code*.

IFC [A] 106.3.1 Scope. The scope of periodic building fire safety inspections shall include the maintenance of safeguards as required by Section 107.1; the maintenance of the means of egress, fire-resistance-rated construction, and fire protection systems; storage arrangements, including hazardous material and combustible material storage; evidence of unlawful alterations; compliance with the fire safety and evacuation plan requirements of Chapter 4; recordkeeping, housekeeping and such other requirements as determined by the *fire code official*.

IFC [A] 106.3.2 Inspecting entity. Periodic building fire safety inspections required by Section 106.3 shall be conducted by the *fire code official*.

Exception: Where the *fire code official* determines that periodic fire safety inspections shall be conducted by an *approved third party*.

IFC [A] 106.3.3 Inspector qualifications. *Fire code officials* and *approved third parties* conducting periodic building fire safety inspections required by Section 106.3 shall, at a minimum, be certified through a recognized fire inspector certification program.

Exception: Where the building is subject to a building fire safety inspection program approved by the *fire code official*.

IFC [A] 106.3.4 Frequency of inspection. The minimum required frequency of periodic building fire safety inspections shall be determined by the *fire code official* based upon the *fire code official's* assessment of the risk or once every 5 years.

IFC [A] 106.3.5 Filings. Inspection reports for periodic building fire safety inspections conducted by an *approved third party* in accordance with Section 106.3.2 shall be submitted to the *fire code official* in accordance with the frequency of inspection schedule established by the *fire code official* in accordance with Section 106.3.4. The *fire code official* has the authority to prescribe the form and format of such report.

IFC [A] 106.3.6 Not a limitation on inspection authority. Periodic building fire safety inspections required by Section 106.3 shall not be construed to limit the *fire code official's* inspection authority pursuant to other sections of this code.

(Renumber subsequent sections)

Revise the International Fire Code as follows:

IFC [A] SECTION 113 FEES

IFC [A] 113.2 Schedule of permit fees. A fee for each permit, and fees associated with establishing a program to implement the requirement for periodic building fire safety inspections in accordance with Section 106.3, shall be paid as required, in accordance with the schedule as established by the applicable governing authority.

Reason: This proposed change is a result of the CTC's investigation of the area of study entitled "NIST Charleston Sofa Store Fire Recommendations". The scope of the activity is noted as:

Review the NIST and other investigative reports on the fire that occurred on the evening of June 18, 2007 in the Sofa Super Store in Charleston, South Carolina to identify issues that can be addressed by the International Codes.

In connection with their investigation, NIST analyzed the fire ground, consulted with other experts, and performed computer simulations of fire growth alternatives. Based on these analyses, NIST concluded that the following sequence of events is likely to have occurred. A fire began in packing material and discarded furniture outside an enclosed loading dock area. The fire spread to the loading dock, then into both the retail showroom and warehouse spaces. During the early stages of the fire in the two latter locations, the fire spread was slowed by the limited supply of fresh air. This under-ventilation led to generation of a large mass of pyrolyzed and only partially oxidized effluent. The smoke and combustible gases flowed into the interstitial space below the roof and above the suspended ceiling of the main retail showroom. As this space filled with unburned fuel, the hot smoke also seeped through the suspended ceiling into the main showroom and formed a hot smoke layer below the suspended ceiling. Up to this time, the extent of fire spread into the interstitial space was not visible to fire fighters in the store. If the fire spread had been visible to the fire fighters in the store, it would have provided a direct indication of a fire hazard in the showroom. Meanwhile, the fire at the back of the main showroom and the gas mixture below the suspended ceiling were both still fuel rich. When the front windows were broken out or vented, the inflow of additional air allowed the heat release rate of the fire to intensify rapidly and added air to the layer of unburned fuel below the suspended ceiling enabling the ignition of the unburned fuel/air mixture. The fire swept from the rear to the front of the main showroom extremely quickly, and then into the west and east showrooms. Nine fire fighters were killed in the Sofa Super Store fire. NIST developed eleven recommendations to help mitigate such future losses.

Recommendation 2 of the NIST report reads as follows:

"Model Building and Fire Code Enforcement: NIST recommends that all state and local jurisdictions implement aggressive and effective fire inspection and enforcement programs that address:

- a) all aspects of the building and fire codes;
- b) adequate documentation of building permits and alterations;
- c) means of fire protection systems inspection and detailed recordkeeping;
- d) frequency and rigor of fire inspections, including follow-up and auditing procedures; and
- e) guidelines for remedial requirements when inspections identify deviations from code provisions."

Following a review of recommendation 2 of the NIST report, a new section, 106.3, is proposed.

Section 106.3 requires that all buildings, with certain exceptions as listed in the section, be subjected to periodic building fire safety inspections in accordance with the requirements of Sections 106.3.1 through 106.3.6. The exception includes dwelling units in Group R-2 and Group R-3 occupancies, Group U occupancies associated with Group R-3 occupancies, and dwelling units constructed in accordance with the International Residential Code.

The purpose of requiring periodic building fire safety inspections is to help ensure that buildings are operated and maintained in accordance with the intent of the International Fire Code, as set forth in Section 101.3. There is little benefit to having an International Fire Code that includes periodic inspection, testing and maintenance requirements intended to ensure that a building is maintained in a safe condition unless there is a mechanism inherent in such code that provides the fire code official with reasonable assurances that they are being complied with. The 18th century phrase "a chain is only as strong as its weakest link" appropriately describes the reality of Building and Fire Codes being adopted in a jurisdiction, but not comprehensively enforced.

The NIST report offers several other recommendations that are not addressed in this proposal. The CTC has investigated all of the NIST recommendations and has, as deemed appropriate, submitted separate code changes in response. These separate code change proposals address the following: fire inspector, and fire plan examiner qualifications and certifications; detailed recordkeeping requirements; and required automatic sprinkler protection for existing Group F-1, M and S-1 occupancies that manufacture, store or sell upholstered furniture or mattresses that undergoing an Alteration 3 renovation. It is these proposals, coupled with the proposed requirement for a periodic building fire safety inspection, which will help fire code officials in their efforts to ensure that all buildings, not just buildings storing or selling upholstered furniture and mattresses, are constructed, operated and maintained in a manner that provides a prudent level of fire safety for building occupants and firefighters. The importance of fire prevention in the overall safety to building occupants and the protection of property cannot be overemphasized. It is interesting to note that the report "America Burning", a report published by the Federal Government in the early 1970's, recommended a "balance" of 50/50 between public fire department expenditures on suppression and fire prevention. This report can be found at <http://www.usfa.fema.gov/downloads/pdf/publications/fa-264.pdf>.

Section 106.3.1 defines the scope of periodic building fire safety inspections to include the maintenance of means of egress, fire-resistant-rated construction, and fire protection systems; evidence of unlawful alterations; compliance with the fire safety and evacuation plan required by Chapter 4 of the Fire Code; recordkeeping, housekeeping and such other requirements as determined by the fire code official.

Section 106.3.2 requires that periodic building fire safety inspections be conducted by the fire code official unless the fire code official determines that the inspection shall be conducted by an approved third party.

Section 106.3.2 acknowledges that the primary and preferred entity authorized to conduct periodic building fire safety inspections is the fire code official, but recognizes that certain jurisdictions may choose to require such inspection to be conducted by an approved third party. This section places no duty or liability on the fire code official to conduct periodic building fire safety inspections, it merely identifies them as the primary and preferred entity to do so.

Section 106.3.3 establishes qualifications for the inspector conducting periodic building fire safety inspections. Such inspector qualification requirement would not apply to buildings that are subjected to a building fire safety inspection program when approved by the fire code official. This section requires that inspectors conducting such inspections, at a minimum, be certified through a recognized fire inspector certification program. If the fire code officials choose to conduct periodic building fire safety inspections, they would be required to have such inspections conducted by individuals that meet this certification requirement. However, as previously stated, the fire code official has no duty or liability to conduct such inspections and therefore no obligation to employ certified inspectors. Approved third party individuals conducting such inspections, except as noted above, would be required to comply with this certification requirement. The section authorizes the fire code official to accept any recognized certification program for such fire inspectors.

Section 106.3.4 requires that the minimum frequency of periodic building fire safety inspections be determined by the fire code official based upon the fire code official's assessment of the risk or once every 5 years. As stated previously, certain buildings, as identified in Section 106.3, would not require periodic building fire safety inspections. For those buildings requiring periodic building fire safety inspections, 5 years was chosen as the maximum time to be allowed between such inspections, unless the fire code official's assessment of the building risk determines that a shorter or longer period should apply.

A building risk assessment would require that many factors be considered on a case-by-case basis, including but not limited to consideration of the building's occupancy Group; occupant load; building height and floor area; construction type and features; fire protection systems; layout and use of the building; size, type and configuration of the fuel load; vulnerability of the building occupants; history and severity of noncompliance with fire safety requirements; incidence of fire and other considerations relevant to the fire risk presented to building occupants and firefighters by such building.

Section 106.3.5 requires that inspection reports for periodic building fire safety inspections conducted by an approved third party be submitted to the fire code official in accordance with the frequency of inspection schedule established by the fire code official. This requirement would help the fire code official identify those buildings not in compliance with the periodic building fire safety inspection requirement. Fire code officials can then take appropriate enforcement action against such building owners to achieve compliance. The proposed change would also allow the fire code official to prescribe the form and format of such report, thereby facilitating its review.

Section 106.3.6 makes it clear that the periodic building fire safety inspection required by Section 106.3 does not limit the fire code official's authority to inspect a building under other provisions of the International Fire Code, including Section 104.3.

The proposed change to Section 113.2 would authorize the fire code official to establish fees associated with implementing a periodic building fire safety inspection program. Jurisdictions that act on this authority would help provide themselves with the economic resource they require to administer the program.

This proposal is submitted by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website:

<http://www.iccsafe.org/cs/CTC/Pages/default.aspx>. Since its inception in April/2005, the CTC has held twenty-five meetings - all open to the public. In 2012, three of the 25 face-to-face meetings were held. In addition to the CTC meetings, the CTC established Study Groups (SG) of interested parties for each of the areas of study. These SG's are responsible for reviewing the available information and making recommendations to the CTC. All totaled, the SG's held over 70 conference calls in 2012.

Cost Impact: This code change proposal will not increase the cost of construction.

106.3 (NEW)-ADM (IFC)-BALDASSARRA-CTC

ADM39 – 13

IFC: [A] 106.5 (New)

Proponent: Anthony C. Apfelbeck, CBO, CFPS, City of Altamonte Springs Building/Fire Safety Division, representing self. (ACApfelbeck@Altamonte.org)

Add new text to the International Fire Code as follows:

IFC [A] 106.5 Occupancy prohibited before approval. No building or structure shall be used or occupied, and no change in the existing occupancy classification of a building or structure or portion thereof shall be made until the fire code official has approved the use or occupancy.

Reason: This language is consistent with the language in the IBC section 111.1. This language is also similar to the language that currently exists in IFC 105.3.3 prohibiting occupancy prior to permit approval. However, this proposed code change clarifies that the fire code official has an important role in the approval of buildings prior to occupancy. Currently, the code does not clearly require the approval of the fire code official prior to occupancy. Ensuring compliance with this code, before the building is occupied, is of utmost importance in correcting dangerous conditions and ensuring fire protection systems are operational.

From a customer service standpoint, this language is also imperative. The owner, contractor and tenant should not be placed in a situation where a Certificate of Occupancy is issued, the building occupied and the fire code official comes along at a later date and requires corrections. There should be some basic assurance to the involved parties that occupancy of the building is tied to fire code official approval and fire code compliance. It is important to note that this language does not require an inspection unless the fire code official was of the opinion that an inspection should occur prior to occupancy.

Cost Impact: This code change proposal will not increase the cost of construction. Earlier intervention by the fire official in the occupancy approval process may actually reduce construction costs as code compliance issues should be identified earlier on in the job.

Staff analysis: This language is also found in IBC Section 111.1 and IEBC Section 110.1.

PART I – IBC; IEBC; IWUIC

Revise the International Building Code as follows:

IBC [A] 107.1 General. Submittal documents consisting of *construction documents*, statement of *special inspections*, geotechnical report, technical reports and other data shall be submitted in two or more sets with each *permit* application. The *construction documents* and technical reports shall be prepared by a *registered design professional* where required by the statutes of the jurisdiction in which the project is to be constructed. Where special conditions exist, the *building official* is authorized to require additional *construction documents* to be prepared by a *registered design professional*.

Exception: The *building official* is authorized to waive the submission of *construction documents* and other data not required to be prepared by a *registered design professional* if it is found that the nature of the work applied for is such that review of *construction documents* is not necessary to obtain compliance with this code.

Revise the International Existing Building Code as follows:

IEBC [A] 106.1 General. Submittal documents consisting of construction documents, special inspection and structural observation programs, investigation and evaluation reports, technical reports and other data shall be submitted in two or more sets with each application for a permit. The construction documents and technical reports shall be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed. Where special conditions exist, the *code official* is authorized to require additional construction documents to be prepared by a registered design professional.

Exception: The *code official* is authorized to waive the submission of construction documents and other data not required to be prepared by a registered design professional if it is found that the nature of the work applied for is such that reviewing of construction documents is not necessary to obtain compliance with this code.

Revise the International Wildland-Urban Interface Code as follows:

IWUIC [A] 108.1 General. Plans, engineering calculations, diagrams, technical reports and other data shall be submitted in at least two sets with each application for a permit. The construction documents and technical reports shall be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed. Where special conditions exist, the code official is authorized to require additional documents to be prepared by a registered design professional.

Exception: The code official is authorized to waive the requirements for submission of plans, calculations, construction inspection requirements and other data, if it is found that the nature of the work applied for is such that reviewing of plans is not necessary to obtain compliance with this code.

PART II – IECC-COMMERCIAL

Revise the International Energy Conservation Code-Commercial as follows:

IECC C103.1 General. Construction documents, technical reports and other supporting data shall be submitted in one or more sets with each application for a permit. The construction documents and technical reports shall be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed. Where special conditions exist, the *code official* is authorized to require necessary construction documents to be prepared by a registered design professional.

Exception: The *code official* is authorized to waive the requirements for construction documents or other supporting data if the *code official* determines they are not necessary to confirm compliance with this code.

PART III – IECC-RESIDENTIAL

Revise the International Energy Conservation Code-Residential as follows:

IECC R103.1 General. Construction documents, technical reports and other supporting data shall be submitted in one or more sets with each application for a permit. The construction documents and technical reports shall be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed. Where special conditions exist, the *code official* is authorized to require necessary construction documents to be prepared by a registered design professional.

Exception: The *code official* is authorized to waive the requirements for construction documents or other supporting data if the *code official* determines they are not necessary to confirm compliance with this code.

PART IV – IRC

Revise the International Residential Code as follows:

IRC R106.1 Submittal documents. Submittal documents consisting of *construction documents*, technical reports and other data shall be submitted in two or more sets with each application for a *permit*. The *construction documents and technical reports* shall be prepared by a registered *design professional* where required by the statutes of the *jurisdiction* in which the project is to be constructed. Where special conditions exist, the *building official* is authorized to require additional *construction documents* to be prepared by a registered *design professional*.

Exception: The *building official* is authorized to waive the submission of *construction documents* and other data not required to be prepared by a registered *design professional* if it is found that the nature of the work applied for is such that reviewing of *construction documents* is not necessary to obtain compliance with this code.

Reason: Building construction and systems such as mechanical, etc. have to be designed by a professional engineer. The report addressing the requirements for some of these systems is the basis of their design. It is illogical to require the design to be prepared by a registered design professional but not require the report addressing the basis of the design be prepared by a registered design professional. Additionally if there are intentional acts of omission [or misleading information] in the report prepared by a registered design professional, the authority having jurisdiction can submit a complaint to the state board and the registered design professional can face disciplinary action [from fines, loss of reputation, etc. to having their license revoked]. There are no major repercussions to the preparer of these reports if they are not registered design professionals or if the Jurisdiction or

state does not require educational or licensing requirements from the preparer. The added language will lend added support to the jurisdiction when a technical report is required if chosen to adopt this section as a local or state amendment.

NOTE: CBC Definition of Registered Design Professional - An individual who is registered or licensed to practice their respective design profession as defined by the statutory requirements of the professional registration laws of the state or jurisdiction in which the project is to be constructed.

Additional Verbal Reason: The cities and jurisdictions that prefer a registered design professional prepare these technical reports are facing opposition for political reasons since the language is not specific. This will also help reduce liability from the cities and jurisdictions since registered design professionals typically carry liability insurance.

Cost Impact: None

Proponent: Richard B. Crawford, Mercer Sign Consultants, representing the United States Sign Council (rcmercer@verizon.net or rick@ussc.org)

PART I – IBC; IEBC; IWUIC

Revise the International Building Code as follows:

IBC [A] 107.1 General. Submittal documents consisting of *construction documents*, statement of *special inspections*, geotechnical report and other data shall be submitted in two or more sets with each *permit* application. The *construction documents* shall be prepared by a *registered design professional* only where expressly required in legislation enacted by the statutes of the jurisdiction in which the project is to be constructed for the type of construction being proposed. Where special conditions exist, the *building official* is authorized to require additional *construction documents* to be prepared by a *registered design professional*.

Exception: The *building official* is authorized to waive the submission of *construction documents* and other data not required to be prepared by a *registered design professional* if it is found that the nature of the work applied for is such that review of *construction documents, including construction drawings prepared by a registered design professional,* is not necessary to obtain compliance with this code.

Revise the International Existing Building Code as follows:

IEBC [A] 106.1 General. Submittal documents consisting of construction documents, special inspection and structural observation programs, investigation and evaluation reports, and other data shall be submitted in two or more sets with each application for a permit. The construction documents shall be prepared by a registered design professional only where expressly required in legislation enacted by the statutes of the jurisdiction in which the project is to be constructed for the type of construction being proposed. Where special conditions exist, the *code official* is authorized to require additional construction documents to be prepared by a registered design professional.

Exception: The *code official* is authorized to waive the submission of construction documents and other data not required to be prepared by a registered design professional if it is found that the nature of the work applied for is such that reviewing of construction documents, including construction drawings prepared by a registered design professional, is not necessary to obtain compliance with this code.

Revise the International Wildland-Urban Interface Code as follows:

IWUIC [A] 108.1 General. Plans, engineering calculations, diagrams and other data shall be submitted in at least two sets with each application for a permit. The construction documents shall be prepared by a registered design professional only where expressly required in legislation enacted by

~~the statutes of the jurisdiction in which the project is to be constructed for the type of construction being proposed.~~ Where special conditions exist, the code official is authorized to require additional documents to be prepared by a registered design professional.

Exception: The code official is authorized to waive submission of plans, calculations, construction inspection requirements and other data, if it is found that the nature of the work applied for is such that reviewing of plans, including construction drawings prepared by a registered design professional, is not necessary to obtain compliance with this code.

PART II – IECC-COMMERCIAL

Revise the International Energy Conservation Code-Commercial as follows:

IECC C103.1 General. Construction documents and other supporting data shall be submitted in one or more sets with each application for a permit. The construction documents shall be prepared by a registered design professional only where expressly required in legislation enacted by the statutes of the jurisdiction in which the project is to be constructed for the type of construction being proposed. Where special conditions exist, the *code official* is authorized to require necessary construction documents to be prepared by a registered design professional.

Exception: The *code official* is authorized to waive the requirements for construction documents or other supporting data, including construction drawings prepared by a registered design professional, if the *code official* determines they are not necessary to confirm compliance with this code.

PART III – IECC-RESIDENTIAL

Revise the International Energy Conservation Code-Residential as follows:

IECC R103.1 General. Construction documents and other supporting data shall be submitted in one or more sets with each application for a permit. The construction documents shall be prepared by a registered design professional only where expressly required in legislation enacted by the statutes of the jurisdiction in which the project is to be constructed for the type of construction being proposed. Where special conditions exist, the *code official* is authorized to require necessary construction documents to be prepared by a registered design professional.

Exception: The *code official* is authorized to waive the requirements for construction documents or other supporting data, including construction drawings prepared by a registered design professional, if the *code official* determines they are not necessary to confirm compliance with this code.

PART IV – IRC

Revise the International Residential Code as follows:

IRC R106.1 Submittal documents. Submittal documents consisting of *construction documents*, and other data shall be submitted in two or more sets with each application for a *permit*. The *construction documents* shall be prepared by a registered *design professional* only where expressly required in legislation enacted by the statutes of the jurisdiction in which the project is to be constructed for the type of construction being proposed. Where special conditions exist, the *building official* is authorized to require additional *construction documents* to be prepared by a registered *design professional*.

Exception: The *building official* is authorized to waive the submission of *construction documents* and other data not required to be prepared by a registered *design professional* if it is found that the nature of the work applied for is such that reviewing of *construction documents, including construction drawings prepared by a registered design professional,* is not necessary to obtain compliance with this code.

Reason: A possible unforeseen consequence of the language in Section 106.1, over time, has been that jurisdictions are routinely demanding sealed construction documents (by a licensed engineer generally) for all types of work, including small and minor projects, as long as a construction or building permit is required for the work. Sealed plans are being required for repetitive, ordinary and minor construction projects.

Additional guidance for adopting jurisdictions and building officials would helpful in determining when sealed plans are required, and when they can be deemed unnecessary and will add to the cost of construction without a corresponding benefit to the public.

Although Section 106.1 contains an exception to the requirement that construction documents be sealed, building officials may be hesitant to waive the requirement without firm guidance in the Code itself. The suggested revision will permit a jurisdiction to expressly decide which types of construction projects will require documents prepared by a registered design professional, and which will not. Each jurisdiction can therefore tailor the requirements to local needs and concerns. It will also help avoid the potential waste of resources that may be created by a one-size-fits-all regulatory requirement.

The suggested revisions allows for more reasonable and rational code application in the jurisdictions that adopt the IBC. Not every project requires a sealed plan to further the goals of public safety.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Philip Brazil, P.E., S.E., Senior Structural Engineer, Reid Middleton, Inc., representing self

Add new text to the International Building Code as follows:

IBC [A] 107.1.1 Structural reports and certificates. Structural reports and certificates shall be submitted by the owner or the owner's authorized agent to the *building official* in accordance with Section 1704.5.

Reason: The purpose for this proposal is for correlation with a proposal that adds a new Section 1704.5 specifying submittals to the building official, which are typically related to the structural design of the building or structure, and are typically submitted during construction.

Note that separate proposals:

1. Transfer the requirements of Section 1705.12.1 to new Section 1704.5;
2. Add additional requirements for submittals that are related to structural steel;
3. Add additional requirements for submittals that are related to the welding of concrete reinforcement and anchor bolts;
4. Add additional requirements for submittals that are related to masonry; and
5. Change "the owner" to "the owner or the owner's authorized agent".

Cost Impact: The code change proposal will not increase the cost of construction.

ADM42-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

107.1.1 (NEW)-ADM (IBC)-BRAZIL

ADM43 – 13

PART I - IFC: [A] 107.2.1, [A] 107.3 (New),

PART II – IFC: 406.2, 408.5.2, 408.10.2, 507.5.2, 507.5.3, 604.3.2, 604.5.1.1, 604.5.2.1, 606.6, 606.15, 609.3.3.3, 703.1, 703.4, 901.6.2, 901.6.2.1, 904.5, 904.6, 904.7, 904.8, 904.9, 904.10, 907.8, 907.8.2, 907.8.5, 909.20.2, 912.6, 913.5, 913.5.2, 913.5.3, 1030.8, 2006.5.3.2.2, 2006.6.4, 2305.2.1, 2306.2.1.1, 2808.6, 5003.2.9, 5003.3.1.1, 5603.2, 5704.2.11.5.1, 5706.5.4.5, 5806.4.8.2; IBC [F] 904.5, 904.6, 904.7, 904.8, 904.9, 904.10

THIS IS A 2 PART CODE CHANGE. PARTS I WILL BE HEARD BY THE ADMINISTRATIVE PROVISIONS COMMITTEE. PART II WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee
(cbaldassarra@rjagroup.com)

PART I – Administration

Revise the International Fire Code as follows:

IFC [A] 107.2 Testing and operation. Equipment requiring periodic testing or operation to ensure maintenance shall be tested or operated as specified in this code.

~~**IFC [A] 107.2.1 Testing and inspection records.** Required test and inspection records shall be available to the *fire code official* at all times or such records as the *fire code official* designates shall be filed with the *fire code official*.~~

IFC [A] ~~107.2.2~~ 107.2.1 Reinspection and testing. *(No change to current text)*

IFC [A] 107.3 Recordkeeping. A record of the periodic inspections, tests, servicing, and other operations and maintenance shall be maintained on the premises or other *approved* location for a minimum of 3 years, or the interval where a different period of time is specified in this code or referenced standards. Records shall be made available for inspection by the *fire code official*, and a copy of the records shall be provided to the *fire code official* upon request.

The *fire code official* has the authority to prescribe the form and format of such recordkeeping. The *fire code official* has the authority to require that certain required records be filed with the *fire code official*.

(Renumber subsequent sections)

PART II – IFC

Revise the International Fire Code as follows:

IFC 406.2 Frequency. Employees shall receive training in the contents of fire safety and evacuation plans and their duties as part of new employee orientation and at least annually thereafter. Records of training shall be ~~kept and made available to the *fire code official* upon request~~ maintained.

IFC 408.5.2 Staff training. Employees shall be periodically instructed and kept informed of their duties and responsibilities under the plan. Records of instruction shall be maintained. Such instruction shall be reviewed by the staff at least every two months. A copy of the plan shall be readily available at all times within the facility.

IFC 408.10.2 Staff training. Employees shall be periodically instructed and kept informed of their duties and responsibilities under the plan. Records of instruction shall be maintained. Such instruction shall be reviewed by the staff at least every two months. A copy of the plan shall be readily available at all times within the facility.

Revise the International Fire Code as follows:

IFC 507.5.2 Inspection, testing and maintenance. Fire hydrant systems shall be subject to periodic tests as required by the *fire code official*. Fire hydrant systems shall be maintained in an operative condition at all times and shall be repaired where defective. Additions, repairs, *alterations* and servicing shall comply with *approved* standards. Records of tests and required maintenance shall be maintained.

IFC 507.5.3 Private fire service mains and water tanks. Private fire service mains and water tanks shall be periodically inspected, tested and maintained in accordance with NFPA 25 at the following intervals:

1. Private fire hydrants (all types): Inspection annually and after each operation; flow test and maintenance annually.
2. Fire service main piping: Inspection of exposed, annually; flow test every 5 years.
3. Fire service main piping strainers: Inspection and maintenance after each use.

Records of inspections, testing and maintenance shall be maintained.

Revise the International Fire Code as follows:

IFC 604.3.2 ~~Written record~~ Records. ~~Written records~~ Records of the inspection, testing and maintenance of emergency and standby power systems shall include the date of service, name of the servicing technician, a summary of conditions noted and a detailed description of any conditions requiring correction and what corrective action was taken. Such records shall be ~~kept on the premises served by the emergency or standby power system and be available for inspection by the fire code official~~ maintained.

IFC 604.5.1.1 Activation test record. ~~Records of tests shall be maintained on the premises for a minimum of three years and submitted to the fire code official upon request.~~ The record shall include the location of the emergency lighting tested, whether the unit passed or failed, the date of the test, and the person completing the test.

IFC 604.5.2.1 Power test record. ~~Records of tests shall be maintained on the premises for a minimum of three years and submitted to the fire code official upon request.~~ The record shall include the location of the emergency lighting tested, whether the unit passed or failed, the date of the test, and the person completing the test.

IFC 606.6 Testing of equipment. Refrigeration equipment and systems having a refrigerant circuit containing more than 220 pounds (100 kg) of Group A1 or 30 pounds (14 kg) of any other group refrigerant shall be subject to periodic testing in accordance with Section 606.6.1. ~~A written record of required testing~~ Records of tests shall be maintained on the premises. Tests of emergency devices or systems required by this chapter shall be conducted by persons trained and qualified in refrigeration systems.

IFC 606.15 Records. ~~A written record shall be kept of refrigerant quantities brought into and removed from the premises shall be maintained.~~ Such records shall be available to the fire code official.

IFC 609.3.3.3 Records. Records for inspections shall state the individual and company performing the inspection, a description of the inspection and when the inspection took place. Records for cleanings shall state the individual and company performing the cleaning and when the cleaning took place. Such records shall be completed after each inspection or cleaning, and maintained on the premises for a minimum of three years and be copied to the fire code official upon request.

Revise the International Fire Code as follows:

IFC 703.1 Maintenance. The required *fire-resistance rating* of fire-resistance-rated construction (including walls, firestops, shaft enclosures, partitions, *smoke barriers*, floors, fire-resistive coatings and sprayed fire-resistant materials applied to structural members and fire-resistant joint systems) shall be maintained. Such elements shall be visually inspected by the *owner* annually and properly repaired, restored or replaced when damaged, altered, breached or penetrated. Records of inspections and repairs shall be maintained. Where concealed, such elements shall not be required to be visually inspected by the *owner* unless the concealed space is accessible by the removal or movement of a panel, access door, ceiling tile or similar movable entry to the space. Openings made therein for the passage of pipes, electrical conduit, wires, ducts, air transfer openings and holes made for any reason shall be protected with *approved* methods capable of resisting the passage of smoke and fire. Openings through fire-resistance-rated assemblies shall be protected by self- or automatic- closing doors of *approved* construction meeting the fire protection requirements for the assembly.

IFC 703.4 Testing. Horizontal and vertical sliding and rolling fire doors shall be inspected and tested annually to confirm proper operation and full closure. ~~A written record~~ Records of inspections and testing shall be maintained and be available to the fire code official.

Revise the International Fire Code as follows:

IFC 901.6.2 Records. Records of all system inspections, tests and maintenance required by the referenced standards shall be maintained ~~on the premises for a minimum of three years and shall be copied to the fire code official upon request.~~

IFC 901.6.2.1 Records information. Initial records shall include the name of the installation contractor, type of components installed, manufacturer of the components, location and number of components installed per floor. Records shall also include the manufacturers' operation and maintenance instruction manuals. Such records shall be maintained ~~on the premises~~ for the life of the installation.

IFC 904.5 (IBC [F] 904.5) Wet-chemical systems. Wet-chemical extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with NFPA 17A and their listing. Records of inspections and testing shall be maintained.

IFC 904.6 (IBC [F] 904.6) Dry-chemical systems. Dry-chemical extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with NFPA 17 and their listing. Records of inspections and testing shall be maintained.

IFC 904.7 (IBC [F] 904.7) Foam systems. Foam-extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with NFPA 11 and NFPA 16 and their listing. Records of inspections and testing shall be maintained.

IFC 904.8 (IBC [F] 904.8) Carbon dioxide systems. Carbon dioxide extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with NFPA 12 and their listing. Records of inspections and testing shall be maintained.

IFC 904.9 (IBC [F] 904.9) Halon systems. Halogenated extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with NFPA 12A and their listing. Records of inspections and testing shall be maintained.

IFC 904.10 (IBC [F] 904.10) Clean-agent systems. Clean-agent fire-extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with NFPA 2001 and their listing. Records of inspections and testing shall be maintained.

IFC 907.8 Inspection, testing and maintenance. The maintenance and testing schedules and procedures for fire alarm and fire detection systems shall be in accordance with Sections 907.8.1 through 907.8.5 and NFPA 72. Records of inspection, testing and maintenance shall be maintained.

IFC 907.8.2 Testing. Testing shall be performed in accordance with the schedules in NFPA 72 or more frequently where required by the *fire code official*. Records of testing shall be maintained.

Exception: Devices or equipment that are inaccessible for safety considerations shall be tested during scheduled shutdowns where *approved* by the *fire code official*, but not less than every 18 months.

IFC 907.8.5 ~~Inspection, testing and maintenance~~ Maintenance, inspection and testing. The building owner shall be responsible to maintain the fire and life safety systems in an operable condition at all times. Service personnel shall meet the qualification requirements of NFPA 72 for ~~maintaining, inspecting and testing~~ inspection, testing and maintenance of such systems. ~~A written record~~ Records of inspection, testing and maintenance shall be maintained ~~and shall be made available to the fire code official.~~

IFC 909.20.2 ~~Written record~~ Records. ~~A written record~~ Records of smoke control system testing and maintenance shall be maintained ~~on the premises.~~ The ~~written~~ record shall include the date of the maintenance, identification of the servicing personnel and notification of any unsatisfactory condition and the corrective action taken, including parts replaced.

IFC 912.6 Inspection, testing and maintenance. All fire department connections shall be periodically inspected, tested and maintained in accordance with NFPA 25. Records of inspection, testing and maintenance shall be maintained.

IFC 913.5 Inspection, testing and maintenance. Fire pumps shall be inspected, tested and maintained in accordance with the requirements of this section and NFPA 25. Records of inspection, testing and maintenance shall be maintained.

IFC 913.5.2 Generator sets. Engine generator sets supplying emergency or standby power to fire pump assemblies shall be periodically tested in accordance with NFPA 110. Records of testing shall be maintained.

IFC 913.5.3 Transfer switches. Automatic transfer switches shall be periodically tested in accordance with NFPA 110. Records of testing shall be maintained.

Revise the International Fire Code as follows:

IFC 1030.8 Inspection, testing and maintenance. All two-way communication systems for *areas of refuge* shall be inspected and tested on a yearly basis to verify that all components are operational. When required, the tests shall be conducted in the presence of the *fire code official*. Records of inspection, testing and maintenance shall be maintained.

Revise the International Fire Code as follows:

IFC 2006.5.3.2.2 ~~Documentation~~ Records. The airport fueling-system operator shall maintain records of all training administered to its employees. ~~These records shall be made available to the fire code official on request.~~

IFC 2006.6.4 Testing. Emergency fuel shutoff devices shall be operationally tested at intervals not exceeding three months. The fueling-system operator shall maintain ~~suitable~~ testing records ~~of these tests.~~

Revise the International Fire Code as follows:

IFC 2305.2.1 Inspections. Flammable and *combustible liquid* fuel-dispensing and containment equipment shall be periodically inspected where required by the *fire code official* to verify that ~~it~~ the equipment is in proper working order and not subject to leakage. Records of inspections shall be maintained.

IFC 2306.2.1.1 Inventory control for underground tanks. Accurate daily inventory records shall be maintained and reconciled on underground fuel storage tanks for indication of possible leakage from tanks and piping. The records ~~shall be kept at the premises or made available for inspection by the fire code official within 24 hours of a written or verbal request~~ and shall include records for each product showing daily reconciliation between sales, use, receipts and inventory on hand. Where there is more than one system consisting of tanks serving separate pumps or dispensers for a product, the reconciliation shall be ascertained separately for each tank system. A consistent or accidental loss of product shall be immediately reported to the *fire code official*.

Revise the International Fire Code as follows:

IFC 2808.6 Static pile protection. Static piles shall be monitored by an *approved* means to measure temperatures within the static piles. Internal pile temperatures shall be monitored and recorded weekly. Such records shall be kept on file at the facility and made available for inspection maintained. An operational plan indicating procedures and schedules for the inspection, monitoring and restricting of excessive internal temperatures in static piles shall be submitted to the *fire code official* for review and approval.

Revise the International Fire Code as follows:

IFC 5003.2.9 Testing. The equipment, devices and systems listed in Section 5003.2.9.1 shall be tested at the time of installation and at one of the intervals listed in Section 5003.2.9.2. ~~Written~~ Records of the tests conducted or maintenance performed shall be maintained.

Exceptions:

1 through 5 (*No change to current text*)

IFC 5003.3.1.1 Records. ~~Accurate records shall be kept~~ Records of the unauthorized discharge of hazardous materials by the permittee shall be maintained.

Revise the International Fire Code as follows:

IFC 5603.2 Transaction record. The permittee shall maintain a record of all transactions involving receipt, removal, use or disposal of *explosive materials*. ~~Such a record~~ records shall be maintained for a period of five years, ~~and shall be furnished to the fire code official for inspection upon request.~~

Exception: Where only Division 1.4G (consumer fireworks) are handled, records need only be maintained for a period of three years.

Revise the International Fire Code as follows:

IFC 5704.2.11.5.1 Inventory control. Daily inventory records ~~shall be maintained~~ for underground storage tank systems shall be maintained.

IFC 5706.5.4.5 Commercial, industrial, governmental or manufacturing. Dispensing of Class II and III motor vehicle fuel from tank vehicles into the fuel tanks of motor vehicles located at commercial, industrial, governmental or manufacturing establishments is allowed where permitted, provided such dispensing operations are conducted in accordance with the following:

1 through 13 (*No change to current text*)

14. Persons responsible for dispensing operations shall be trained in the appropriate mitigating actions in the event of a fire, leak or spill. Training records shall be maintained by the dispensing company ~~and shall be made available to the fire code official upon request.~~

15 through 25 (No change to current text)

Revise the International Fire Code as follows:

IFC 5806.4.8.2 Corrosion protection. The vacuum jacket shall be protected by *approved* or *listed* corrosion-resistant materials or an engineered cathodic protection system. Where cathodic protection is utilized, an *approved* maintenance schedule shall be established. Exposed components shall be inspected at least twice a year. ~~Maintenance Records of maintenance and inspection events shall be recorded and those records shall be maintained on the premises for a minimum of three years and made available to the fire code official upon request.~~

Reason: This proposed change is a result of the CTC's investigation of the area of study entitled "NIST Charleston Sofa Store Fire Recommendations". The scope of the activity is noted as:

Review the NIST and other investigative reports on the fire that occurred on the evening of June 18, 2007 in the Sofa Super Store in Charleston, South Carolina to identify issues that can be addressed by the International Codes.

In connection with their investigation, NIST analyzed the fire ground, consulted with other experts, and performed computer simulations of fire growth alternatives. Based on these analyses, NIST concluded that the following sequence of events is likely to have occurred. A fire began in packing material and discarded furniture outside an enclosed loading dock area. The fire spread to the loading dock, then into both the retail showroom and warehouse spaces. During the early stages of the fire in the two latter locations, the fire spread was slowed by the limited supply of fresh air. This under-ventilation led to generation of a large mass of pyrolyzed and only partially oxidized effluent. The smoke and combustible gases flowed into the interstitial space below the roof and above the suspended ceiling of the main retail showroom. As this space filled with unburned fuel, the hot smoke also seeped through the suspended ceiling into the main showroom and formed a hot smoke layer below the suspended ceiling. Up to this time, the extent of fire spread into the interstitial space was not visible to fire fighters in the store. If the fire spread had been visible to the fire fighters in the store, it would have provided a direct indication of a fire hazard in the showroom. Meanwhile, the fire at the back of the main showroom and the gas mixture below the suspended ceiling were both still fuel rich. When the front windows were broken out or vented, the inflow of additional air allowed the heat release rate of the fire to intensify rapidly and added air to the layer of unburned fuel below the suspended ceiling enabling the ignition of the unburned fuel/air mixture. The fire swept from the rear to the front of the main showroom extremely quickly, and then into the west and east showrooms. Nine fire fighters were killed in the Sofa Super Store fire. NIST developed eleven recommendations to help mitigate such future losses.

Recommendation 2(c) of the NIST report recommended that that all state and local jurisdictions implement aggressive and effective fire inspection and enforcement programs that address detailed recordkeeping.

Following a review of recommendation 2(c) of the NIST report, changes are proposed to Section 107.2 and 49 other sections of the International Fire Code that address recordkeeping.

The proposed change to Section 107.2 accomplishes several things with regard to recordkeeping. Most significantly, it standardizes recordkeeping requirements for periodic inspection, testing, servicing and other operational and maintenance requirements of the International Fire Code.

The change to Section 107.2 would now make it clear that records must be maintained on the premises or other approved location and that copies of records must be provided to the fire code official upon request. The change would also make clear that records must be maintained for a period of not less than 3 years unless a different time interval were specified in the code or a referenced standard, and that the fire code official is authorized to prescribe the form and format of such records.

The changes proposed to the other sections of the International Fire Code are intended to make clear what records must be maintained.

This proposal is submitted by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>. Since its inception in April/2005, the CTC has held twenty-five meetings - all open to the public. In 2012, three of the 25 face-to face meetings were held. In addition to the CTC meetings, the CTC established Study Groups (SG) of interested parties for each of the areas of study. These SG's are responsible for reviewing the available information and making recommendations to the CTC. All totaled, the SG's held over 70 conference calls in 2012.

Cost Impact: The code change proposed will not increase the cost of construction.

Staff analysis: Recordkeeping of maintenance and inspections is also addressed in the ICCPC, IPC and IWUIC.

ADM43-13**PART I – Administration**

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IFC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

107.2.1-ADM (IFC)-BALDASSARRA-CTC

ADM44 – 13

IBC: [A] 107.2, [A] 107.2.6 (New)

Proponent: Jerry R. Tepe, FAIA, JRT•AIA ARCHITECT, representing The American Institute of Architects

Revise the International Building Code as follows:

IBC [A] 107.2 Construction documents. *Construction documents* shall be in accordance with Sections 107.2.1 through ~~107.2.5~~ 107.2.6.

IBC [A] 107.2.6 Structural. The *construction documents* shall provide the information specified in Section 1603.

Reason: Often the *construction document* requirements of Section 1603 for structural design are overlooked as they are only shown in Chapter 16 and not with the other *construction document* requirements found in Section 107. This places guidance in that section. An alternative approach would be to relocate the entire Section 1603 to Section 107. I do not suggest this as many engineers then would lose track of the requirements. It would also place them in an administrative section while they should remain the responsibility of the Structural Code Development Committee. There is no technical change proposed.

Cost Impact: None

ADM44-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

107.2.6 (NEW)-ADM (IBC)-TEPE

ADM45 – 13

IBC: [A] 107.2.5 (New)

Proponent: William E. Koffel, P.E., Koffel Associates, Inc., representing Firestop Contractors International Association (wkoffel@koffel.com)

Revise the International Building Code as follows:

IBC [A] 107.2.5 Penetrations and Joints. Where designs from approved sources for through-penetration or membrane penetration firestop systems and fire resistant joint systems are used, the design number for the listed systems, the assigned rating, the description of the listed systems, and the installation instructions for the listed systems shall be submitted to the building official prior to installation.

(Renumber remaining subsections)

Reason: The protection of penetrations and joints should be given the same level of attention as fire barriers and fire protection systems already receive within the Code. Construction documents typically identify fire barriers and the appropriate design number, ICC-ES Report, or other details allowing the code official to verify compliance with the Code. Fire protection system shop drawings are required by Paragraph 107.2.2. Recognizing that firestop systems are different than fire protection systems and shop drawings are typically not required for this work, the requested information has been limited to require the details regarding the listing of the systems. The language better describes information that is vital for all parties – architects, code officials, contractors, and maintenance personnel during the life cycle of the building. These Through Penetration Firestop Systems and Fire Resistant Joint Systems aren't systems without this documentation. With this documentation, inspectors can identify systems to be used.

The two significant changes between this Public Proposal and what was submitted last cycle are the information to be submitted has been specifically identified and the time at which the information needs to be submitted has been changed to prior to installation of the firestop system or joint system. Although one can argue that this would allow submission immediately prior to installation, and as such not provide the code official with adequate time for approval, the information is essential to proper inspection and approval of the system when it is installed. As such, the code official will have the necessary information for final approval.

The proposal should assist code officials in the performance of their duties by making sure the appropriate and necessary information is available to inspectors in the field. Without this information it is virtually impossible for a code official in the field to confirm that the correct system has been installed and that it has been installed properly. It is also anticipated that requiring such documentation and prior approval will result in earlier consideration regarding how to protect penetrations and joints, thereby reducing the need for as many engineering judgments as are currently being used due to poor planning and coordination.

Cost Impact: None

ADM45-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

107.2.5 (NEW)-ADM (IBC)-KOFFEL

ADM46 – 13

IBC: [A] 107.3.4.1, 202; IEBC: [A] 106.3.4, 202

Proponent: Maureen Traxler, City of Seattle, representing Seattle Department of Planning and Development (maureen.traxler@seattle.gov)

Revise the International Building Code as follows:

IBC [A] 107.3.4.1 Deferred submittals. ~~For the purposes of this section, deferred submittals are defined as those portions of the design that are not submitted at the time of the application and that are to be submitted to the *building official* within a specified period.~~

Deferral of any submittal items shall have the prior approval of the *building official*. The *registered design professional in responsible charge* shall list the deferred submittals on the *construction documents* for review by the *building official*.

Documents for deferred submittal items shall be submitted to the *registered design professional in responsible charge* who shall review them and forward them to the *building official* with a notation indicating that the deferred submittal documents have been reviewed and found to be in general conformance to the design of the building. The deferred submittal items shall not be installed until the deferred submittal documents have been *approved* by the *building official*.

Add new definition as follows:

IBC SECTION 202 DEFINITIONS

DEFERRED SUBMITTAL. Those portions of the design that are not submitted at the time of the application and that are to be submitted to the *building official* within a specified period.

Revise the International Existing Building Code as follows:

IEBC [A] 106.3.4 Deferred submittals. ~~For the purposes of this section, deferred submittals are defined as those portions of the design that are not submitted at the time of the application and that are to be submitted to the *code official* within a specified period.~~

Deferral of any submittal items shall have the prior approval of the *code official*. The *registered design professional in responsible charge* shall list the deferred submittals on the construction documents for review by the *code official*.

Submittal documents for deferred submittal items shall be submitted to the *registered design professional in responsible charge* who shall review them and forward them to the *code official* with a notation indicating that the deferred submittal documents have been reviewed and that they have been found to be in general conformance to the design of the building. The deferred submittal items shall not be installed until their deferred submittal documents have been approved by the *code official*.

Add new definition as follows:

IEBC SECTION 202 DEFINITIONS

DEFERRED SUBMITTAL. Those portions of the design that are not submitted at the time of the application and that are to be submitted to the *code official* within a specified period.

Reason: A definition of “deferred submittal” is buried in IBC Section 107.3.4.1 and IEBC 106.3.4. This proposal moves the definition to Section 202. The term is used at least two places in the code, so placing the definition in Chapter 2 will make it easier to find when applying those sections.

Cost Impact: None.

PART I – IBC; IEBC; IWUIC

Add new text to the International Building Code as follows:

IBC 107.6 Copyright protection. The *building official* shall establish procedures to prevent improper or unauthorized duplication, reuse, or dissemination to the public, of retained *construction documents* that contain copyrighted materials including building designs, floor plans, elevations, engineering designs, and other architectural features.

Add new text to the International Existing Building Code as follows:

IEBC 106.6 Copyright protection. The *building official* shall establish procedures to prevent improper or unauthorized duplication, reuse, or dissemination to the public, of retained *construction documents* that contain copyrighted materials including building designs, floor plans, elevations, engineering designs, and other architectural features.

(Renumber subsequent sections)

Add new text to the International Wildland-Urban Interface Code as follows:

IWUIC 108.9 Copyright protection. The *building official* shall establish procedures to prevent improper or unauthorized duplication, reuse, or dissemination to the public, of retained *construction documents* that contain copyrighted materials including building designs, floor plans, elevations, engineering designs, and other architectural features.

(Renumber subsequent sections)

PART II – IECC-COMMERCIAL

Add new text to the International Energy Conservation Code-Commercial as follows:

R106.6 Copyright protection. The *building official* shall establish procedures to prevent improper or unauthorized duplication, reuse, or dissemination to the public, of retained *construction documents* that contain copyrighted materials including building designs, floor plans, elevations, engineering designs, and other architectural features.

PART III – IECC-RESIDENTIAL

Add new text to the International Energy Conservation Code-Residential as follows:

R106.6 Copyright protection. The *building official* shall establish procedures to prevent improper or unauthorized duplication, reuse, or dissemination to the public, of retained *construction documents* that contain copyrighted materials including building designs, floor plans, elevations, engineering designs, and other architectural features.

PART IV – IRC

Add new text to the International Residential Code as follows:

IRC R106.6 Copyright protection. The *building official* shall establish procedures to prevent improper or unauthorized duplication, reuse, or dissemination to the public, of retained *construction documents* that contain copyrighted materials including building designs, floor plans, elevations, engineering designs, and other architectural features.

Reason: The code requires that construction documents be kept on file and generally available to the public. The code does not include safeguards to ensure that the building department at the least will honor the copyrighted works that are part and parcel of most projects. Local copy and print centers honor such copyright protection by declining to duplicate copyrighted works without permission of the author. It is not unreasonable to expect similar efforts by governmental agencies.

Cost Impact: None.

ADM48 – 13

IBC: [A] 108.2

Proponent: Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee
(bajnaic@chesterfield.gov)

Revise the International Building Code as follows:

IBC [A] SECTION 108 TEMPORARY STRUCTURES AND USES

IBC [A] 108.1 General. The *building official* is authorized to issue a *permit* for temporary structures and temporary uses. Such *permits* shall be limited as to time of service, but shall not be permitted for more than 180 days. The *building official* is authorized to grant extensions for demonstrated cause.

IBC [A] 108.2 Conformance. Temporary structures and uses shall comply with the requirements in Section 3103. ~~conform to the structural strength, fire safety, means of egress, accessibility, light, ventilation and sanitary requirements of this code as necessary to ensure public health, safety and general welfare.~~

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

The BCAC was asked during the Group A cycle to look at adding technical requirements for temporary structures in Section 3103. It was determined that there is sufficient language in the code. The problem was, the language was in the administrative section in Chapter 1. Therefore, this two part proposal is simply to move the language from Chapter 1 to Section 3103. The addition of the language to Section 3103 was under the Group A cycle and this removal of the language from Chapter 1 is under Group B cycle.

BCAC Proposal G190-12 shown below was approved in Portland which moved the existing 108.2 language to chapter 31 as they were technical requirements and did not belong in the administrative provisions. This proposal is a follow-up to that change and intends to delete the technical provisions from Chapter 1, leaving only the administrative requirement, which simply references the user to Chapter 31.

SECTION 3103 TEMPORARY STRUCTURES

3103.1 General. The provisions of Sections 3103.1 through 3103.4 shall apply to structures erected for a period of less than 180 days. Tents and other membrane structures erected for a period of less than 180 days shall comply with the *International Fire Code*. Those erected for a longer period of time shall comply with applicable sections of this code.

Add new section 3103.1.1 and re-number the existing 3103.1.1 as follows:

3103.1.1 Conformance. Temporary structures and uses shall conform to the structural strength, fire safety, means of egress, accessibility, light, ventilation and sanitary requirements of this code as necessary to ensure public health, safety and general welfare.

Cost Impact: This proposal will not increase the cost of construction.

Staff analysis: The current language in IBC Section 108.2 is also found in IEBC 107.2, IFGC 110.2, IMC 110.2, IPC 110.2, IPSCD 110.2, IWUIC 111.2 and IRC R107.2.

THIS IS A 2 PART CODE CHANGE. PARTS I WILL BE HEARD BY THE ADMINISTRATIVE PROVISIONS COMMITTEE AS ONE CODE CHANGE. PART II WILL BE HEARD BY THE RESIDENTIAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

Proponent: Jerry Anderson, City of Overland Park, Ks, representing self (jerry.anderson@opkansas.org)

PART I – IBC; IEBC; IWUIC

Revise the International Building Code as follows:

IBC [A] SECTION 111 CERTIFICATE OF OCCUPANCY

IBC [A] 111.1 Use and occupancy. No building or structure shall be used or occupied, and no change in the existing use or occupancy classification of a building or structure or portion thereof shall be made, until the *building official* has issued a certificate of occupancy therefor as provided herein. Issuance of a certificate of occupancy shall not be construed as an approval of a violation of the provisions of this code or of other ordinances of the jurisdiction.

Exception: Certificates of occupancy are not required for work exempt from *permits* under Section 105.2.

Revise the International Existing Building Code as follows:

IEBC [A] SECTION 110 CERTIFICATE OF OCCUPANCY

IEBC [A] 110.1 Altered area use and occupancy classification change. No altered area of a building and no relocated building shall be used or occupied, and no change in the existing use or occupancy classification of a building or portion thereof shall be made until the code official has issued a certificate of occupancy therefor as provided herein. Issuance of a certificate of occupancy shall not be construed as an approval of a violation of the provisions of this code or of other ordinances of the jurisdiction.

Revise the International Wildland-Urban Interface Code as follows:

IWUIC SECTION 110 CERTIFICATE OF COMPLETION

IWUIC [A] 110.1 General. No building, structure or premises shall be used or occupied, and no change in the existing use or occupancy classification of a building, structure, premise or portion thereof shall be made until the code official has issued a certificate of completion therefor as provided herein. The certificate of occupancy shall not be issued until the certificate of completion indicating that the project is in compliance with this code has been issued by the code official.

PART II – IRC

Revise the International Residential Code as follows:

IRC SECTION R110 CERTIFICATE OF OCCUPANCY

IRC R110.1 Use and occupancy. No building or structure shall be used or occupied, and no change in the existing use or occupancy classification of a building or structure or portion thereof shall be made until the *building official* has issued a certificate of occupancy therefor as provided herein. Issuance of a certificate of occupancy shall not be construed as an approval of a violation of the provisions of this code or of other ordinances of the *jurisdiction*. Certificates presuming to give authority to violate or cancel the provisions of this code or other ordinances of the *jurisdiction* shall not be valid.

Exceptions:

1. Certificates of occupancy are not required for work exempt from permits under Section R105.2.
2. Accessory buildings or structures.

IRC R110.2 Change in use. Changes in the character or use of an existing structure shall not be made except as specified in Sections 3408 and 3409 of the *International Building Code*.

Reason: The purpose of this code change is to clarify the intent of this code section as it pertains to existing buildings and structures. The current language implies that a new (revised) certificate of occupancy is required only if there is a change in the occupancy classification. I have inserted the word "use" to indicate that there cannot be change in the use of the building or structure regardless if there is a change occupancy classification.

Cost Impact: no cost associated with this change

Proponent: Rebecca Morley, representing National Center for Healthy Housing

PART I – IBC; ICCPC; IEBC; IFC; IFGC; IMC; IPC; IPSDC; IPMC; IZC

Revise the International Building Code as follows:

IBC SECTION 114 VIOLATIONS

IBC [A] 114.1 Unlawful acts. It shall be unlawful for any person, firm or corporation to erect, construct, alter, extend, repair, move, remove, demolish or occupy any building, structure or equipment regulated by this code, or cause same to be done, in conflict with or in violation of any of the provisions of this code or applicable state or federal law or regulation.

Revise the International Code Council Performance Code as follows:

ICCPC [A] 103.3.13 Violations.

ICCPC [A] 103.3.13.1 General Unlawful acts. It shall be unlawful for any person, firm or corporation to erect, construct, alter, extend, repair, move, remove, demolish or occupy any building, structure or facility regulated by this code, or cause same to be done, in conflict with or in violation of any of the provisions of this code or applicable state or federal law or regulation.

Revise the International Existing Building Code as follows:

IEBC SECTION 113 VIOLATIONS

IEBC [A] 113.1 Unlawful acts. It shall be unlawful for any person, firm or corporation to repair, alter, extend, add, move, remove, demolish or change the occupancy of any building or *equipment* regulated by this code or cause same to be done in conflict with or in violation of any of the provisions of this code or applicable state or federal law or regulation.

Revise the International Fire Code as follows:

IFC SECTION 109 VIOLATIONS

IFC [A] 109.1 Unlawful acts. It shall be unlawful for a person, firm or corporation to erect, construct, alter, repair, remove, demolish or utilize a building, occupancy, premises or system regulated by this code, or cause same to be done, in conflict with or in violation of any of the provisions of this code or applicable state or federal law or regulation.

Revise the International Fuel Gas Code as follows:

**IFGC SECTION 108
VIOLATIONS**

IFGC [A] 108.1 Unlawful acts. It shall be unlawful for a person, firm or corporation to erect, construct, alter, repair, remove, demolish or utilize an installation, or cause same to be done, in conflict with or in violation of any of the provisions of this code or applicable state or federal law or regulation.

Revise the International Mechanical Code as follows:

**IMC SECTION 108
VIOLATIONS**

IMC [A] 108.1 Unlawful acts. It shall be unlawful for a person, firm or corporation to erect, construct, alter, repair, remove, demolish or utilize a mechanical system, or cause same to be done, in conflict with or in violation of any of the provisions of this code or applicable state or federal law or regulation.

Revise the International Plumbing Code as follows:

**IPC SECTION 108
VIOLATIONS**

IPC [A] 108.1 Unlawful acts. It shall be unlawful for any person, firm or corporation to erect, construct, alter, repair, remove, demolish or utilize any plumbing system, or cause same to be done, in conflict with or in violation of any of the provisions of this code or applicable state or federal law or regulation.

Revise the International Private Sewage Disposal Code as follows:

**IPSDC SECTION 108
VIOLATIONS**

IPSDC [A] 108.1 Unlawful acts. It shall be unlawful for any person, firm or corporation to erect, construct, alter, repair, remove, demolish or use any *private sewage disposal system*, or cause same to be done, in conflict with or in violation of any of the provisions of this code or applicable state or federal law or regulation.

Revise the International Property Maintenance Code as follows:

**IPMC SECTION 106
VIOLATIONS**

IPMC [A] 106.1 Unlawful acts. It shall be unlawful for a person, firm or corporation to be in conflict with or in violation of any of the provisions of this code or applicable state or federal law or regulation.

Revise the International Zoning Code as follows:

**IZC SECTION 110
VIOLATIONS**

IZC [A] 110.1 Unlawful acts. It shall be unlawful for any person to erect, construct, enlarge, alter, repair, move, improve, remove, convert or demolish, equip, use, occupy, or maintain any building or land or cause or permit the same to be done in violation of this code or applicable state or federal law or regulation. When any building or parcel of land regulated by this code is being used contrary to this code, the code official shall be permitted to order such use discontinued and the structure, parcel of land, or portion thereof, vacated by notice served on any person causing such use to be continued. Such person

shall discontinue the use within the time prescribed by the code official after receipt of such notice to make the structure, parcel of land, or portion thereof, comply with the requirements of this code.

PART II – IRC

Revise the International Residential Code as follows:

IRC SECTION R113 VIOLATIONS

IRC R113.1 Unlawful acts. It shall be unlawful for any person, firm or corporation to erect, construct, alter, extend, repair, move, remove, demolish or occupy any building, structure or *equipment* regulated by this code, or cause same to be done, in conflict with or in violation of any of the provisions of this code or applicable state or federal law or regulation.

PART III – ISPSC

Revise the International Swimming Pool and Spa Code as follows:

ISPSC SECTION 107 VIOLATIONS

ISPSC 107.1 Unlawful acts. It shall be unlawful for any person, firm or corporation to erect, construct, alter, *repair*, remove, demolish or utilize any system, or cause same to be done, in conflict with or in violation of any of the provisions of this code or applicable state or federal law or regulation.

Reason: The purpose of this group of code changes is to clarify that the code requires compliance with all applicable laws and regulations in the course of conducting construction work. From a children's health perspective, making this change will enable the code official to cite and stop work that is conducted in violation of the federal and state lead renovation requirements, and thereby reduce the risk of childhood lead poisoning. More broadly, the code change will allow the code official to address violation of other local, state and federal policies intended to protect health that are not specifically covered in the code. In the case of the lead renovation rule, the code official will be positioned to help level the playing field between contractors who are complying with the rule and noncompliant entities who are under-pricing and undercutting their competitors. These provisions can prompt entities not following the law to comply before or after work is underway whether or not the work is covered by a building permit. Although the lead renovation regulations have been in effect since April 2010, and have been adopted by 12 states, reported non-compliance is affecting the compliant contractor and continuing the problem of lead poisoning in the US.

Cost Impact: This code change proposal will not increase the cost of construction since these federal/state requirements are already in effect.

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

PART I – IBC; IEBC; IFC; IFGC; IMC; IZC

Revise the International Building Code as follows:

IBC SECTION 202 DEFINITIONS

[A] ALTERATION. Any construction, retrofit or renovation to an *existing structure* other than *repair* or *addition* that requires a permit. Also, a change in a building, electrical, gas, mechanical or plumbing system that involves an extension, addition or change to the arrangement, type or purpose of the original installation that requires a permit.

Revise the International Existing Building Code as follows:

IEBC SECTION 202 DEFINITIONS

[A] ALTERATION. Any construction, retrofit or renovation to an existing structure other than a *repair* or *addition* that requires a permit. Also, a change in a building, electrical, gas, mechanical or plumbing system that involves an extension, addition or change to the arrangement, type or purpose of the original installation that requires a permit. Alterations are classified as Level 1, Level 2 or Level 3.

Revise the International Fire Code as follows:

IFC SECTION 202 DEFINITIONS

[A] ALTERATION. Any construction, retrofit or renovation to an *existing structure* other than *repair* or *addition* that requires a permit. Also, a change in a building, electrical, gas, mechanical or plumbing system that involves an extension, addition or change to the arrangement, type or purpose of the original installation that requires a permit.

Revise the International Fuel Gas Code as follows:

**IFGC SECTION 202
GENERAL DEFINITIONS**

[A] ALTERATION. A change in a system that involves an extension, addition or change to the arrangement, type or purpose of the original installation that requires a permit.

Revise the International Mechanical Code as follows:

**IMC SECTION 202
GENERAL DEFINITIONS**

[A] ALTERATION. A change in a ~~mechanical~~ system that involves ~~an~~ a retrofit, extension, addition or change to the arrangement, type or purpose of the original installation that requires a permit.

Revise the International Zoning Code as follows:

**IZC SECTION 202
GENERAL DEFINITIONS**

[A] ALTERATION. Any retrofit, change, addition or modification in construction, occupancy or use.

PART II – IECC-COMMERCIAL

Revise the International Energy Conservation Code-Commercial as follows:

**IECC SECTION C202
GENERAL DEFINITIONS**

ALTERATION. Any construction, retrofit or renovation to an existing structure other than repair or addition that requires a permit. Also, a change in a building, electrical, gas, mechanical or plumbing system that involves an extension, addition or change to the arrangement, type or purpose of the original installation that requires a permit.

PART III – IECC-RESIDENTIAL

Revise the International Energy Conservation Code-Residential as follows:

**IECC SECTION R202 (IRC N1101.9)
GENERAL DEFINITIONS**

ALTERATION. Any construction, retrofit or renovation to an existing structure other than repair or addition that requires a permit. Also, a change in a building, electrical, gas, mechanical or plumbing system that involves an extension, addition or change to the arrangement, type or purpose of the original installation that requires a permit.

PART IV – IRC

Revise the International Residential Code as follows:

**IRC SECTION R202
DEFINITIONS**

ALTERATION. Any construction, retrofit or renovation to an existing structure other than repair or addition that requires a *permit*. Also, a change in a building, electrical, gas, mechanical or plumbing system that

involves an extension, addition or change to the arrangement, type or purpose of the original installation that requires a *permit*.

PART V – ISPSC

Revise the International Swimming Pool and Spa Code as follows:

ISPSC SECTION 202 DEFINITIONS

ALTERATION. Any construction, retrofit or renovation to an *existing aquatic vessel* other than repair or addition that requires a permit. Also, a change in a building, electrical, gas, mechanical or plumbing system that involves an extension, addition or change to the arrangement, type or purpose of the original installation that requires a *permit*.

Reason:

PART I - This proposal expands definition of “alteration” to include retrofits and changes to energy systems for consistency with the 2012 International Energy Conservation Code (IECC). While the terms “construction” and “renovation” are not defined in the International Existing Buildings Code (IEBC) or other International Code Council (ICC) codes, they logically include mechanical, water heating, and lighting systems. Since this is not clearly spelled out, given some interpretations of the code these energy using systems might be excluded from IECC compliance when they should not be excluded. The suggested new sentence is intended to clarify the scope of the IECC with respect to alterations of such systems or their component parts and is consistent with the definition of “alteration” in the 2012 IECC. Because the term “retrofit” is used regularly to generally describe work done in existing buildings, its inclusion in the definition along with construction and renovation is intended to provide more clarity when trying to determine what is and is not covered by the IEBC with respect to work being done in and to existing buildings.

PART II, PART III, PART IV, and PART V –

A change in a mechanical system as currently described in the code is an appropriate target for compliance and alterations to such systems should meet the applicable provisions of the energy code. Plumbing, electrical (lighting), and other building systems also use energy and, if altered as defined in the code, they should be equally addressed as mechanical systems are in the current code. As an example, the extension of a potable hot water system to serve additional lavatories could involve additional hot water piping that should be insulated. Another example involves updating a lighting system arrangement with new fixtures and wiring. Such situations do not involve repairs or additions and are currently not subject to the provisions of the code when they should be. This proposal clarifies “alterations” to include changes to HVAC, service heating water, or lighting systems involving extension, addition, or change to arrangement, type, or purpose. This ensures that alterations, no matter what systems are involved, comply with the code. Approval of this change also ensures consistency between the IEBC as applied to alterations and the IECC. All three chapters in the IEBC applicable to alterations (7, 8 and 9) refer to the IECC and contain provisions applicable to other than mechanical systems. This change ensures consistency in scope between the IEBC and the IECC with respect to alterations.

There is a cost impact associated with this proposed change to the degree that the subject systems are not clearly covered in the current code and as a result alterations that should be subject to the energy code are not required to meet the energy code.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Deborah Taylor, Deborah F. Taylor Consulting, LLC, representing self
(taylor@dftconsultingny.com)

PART I – IBC; IEBC; IFC; IMC

Revise the International Building Code as follows:

IBC SECTION 202 DEFINITIONS

[A] ALTERATION. Any construction or renovation to an *existing structure* other than *repair* or *addition*. Also, a change in an electrical or mechanical system that involves an extension, addition or change to the arrangement, type or purpose of the original installation that requires a permit.

Revise the International Existing Building Code as follows:

IEBC SECTION 202 DEFINITIONS

[A] ALTERATION. Any construction or renovation to an existing structure other than a *repair* or *addition*. Also, a change in an electrical or mechanical system that involves an extension, addition or change to the arrangement, type or purpose of the original installation that requires a permit.
Alterations are classified as Level 1, Level 2 or Level 3.

Revise the International Fire Code as follows:

IFC SECTION 202 DEFINITIONS

[A] ALTERATION. Any construction or renovation to an *existing structure* other than *repair* or *addition*. Also, a change in an electrical or mechanical system that involves an extension, addition or change to the arrangement, type or purpose of the original installation that requires a permit.

Revise the International Mechanical Code as follows:

IMC SECTION 202 GENERAL DEFINITIONS

[A] ALTERATION. A change in a mechanical or electrical system that involves an extension, addition or change to the arrangement, type or purpose of the original installation.

PART II – IECC-COMMERCIAL

Revise the International Energy Conservation Code-Commercial as follows:

IECC SECTION C202 GENERAL DEFINITIONS

ALTERATION. Any construction or renovation to an existing structure other than repair or addition that requires a permit. Also, a change in a an electrical or mechanical system that involves an extension, addition or change to the arrangement, type or purpose of the original installation that requires a permit.

COMMISSIONING. A protocol included in the construction documents for mechanical and lighting systems, including controls, that establishes a process of testing, balancing, calibrating and adjusting the installed systems to ensure that they function according to approved construction documents.

LIGHTING POWER ALLOWANCE. The total input electrical power permitted by this code for lighting in a building, or part thereof as applicable.

LIGHTING POWER DENSITY. The ratio of lighting input power permitted by this code as a function of area served, measured in watts per square foot.

TOTAL CONNECTED LIGHTING POWER. A calculation of the lighting power capacity in a building, or part thereof, or design, performed in accordance with Section C405.5.1 of this code.

WORK. Proposed or actual construction that shall include demolition or installation of materials, equipment or systems related to creating, altering or removing a building, or part thereof.

PART III – IECC-RESIDENTIAL

Revise the International Energy Conservation Code-Residential as follows:

IECC SECTION R202 (IRC N1101.9) GENERAL DEFINITIONS

ALTERATION. Any construction or renovation to an existing structure other than repair or addition that requires a permit. Also, a change in a an electrical or mechanical system that involves an extension, addition or change to the arrangement, type or purpose of the original installation that requires a permit.

COMMISSIONING. A protocol included in the construction documents for mechanical and lighting systems, including controls, that establishes a process of testing, balancing, calibrating and adjusting the installed systems to ensure that they function according to approved construction documents.

LIGHTING POWER ALLOWANCE. The total input electrical power permitted by this code for lighting in a building, or part thereof as applicable.

LIGHTING POWER DENSITY. The ratio of lighting input power permitted by this code as a function of area served, measured in watts per square foot.

TOTAL CONNECTED LIGHTING POWER. A calculation of the lighting power capacity in a building, or part thereof, or design, performed in accordance with Section C405.5.1 of this code.

WORK. Proposed or actual construction that shall include demolition or installation of materials, equipment or systems related to creating, altering or removing a building, or part thereof.

PART IV – IRC

Revise the International Residential Code as follows:

IRC SECTION R202 DEFINITIONS

ALTERATION. Any construction, retrofit or renovation to an existing structure other than repair or addition that requires a *permit*. Also, a change in a an electrical or mechanical system that involves an extension, addition or change to the arrangement, type or purpose of the original installation that requires a *permit*.

PART V – ISPSC

Revise the International Swimming Pool and Spa Code as follows:

ISPSC SECTION 202 DEFINITIONS

ALTERATION. Any construction, retrofit or renovation to an existing aquatic vessel other than repair or addition that requires a permit. Also, a change in an electrical or mechanical system that involves an extension, addition or change to the arrangement, type or purpose of the original installation that requires a permit.

Reason: The definition for “alteration” needs to acknowledge electrical alterations as well. The added terms are already used in the code and required definition.

Cost Impact: This code change proposal will not increase the cost of construction.

Staff Analysis: The definition for Alteration also appears in the IFGC and IZC.

PART IV - IRC: R202

THIS IS A 4 PART CODE CHANGE. PARTS I WILL BE HEARD BY THE ADMINISTRATIVE PROVISIONS COMMITTEE AS ONE CODE CHANGE. PART II WILL BE HEARD BY THE ENERGY CONSERVATION CODE-COMMERCIAL COMMITTEE. PART III WILL BE HEARD BY THE ENERGY CONSERVATION CODE-RESIDENTIAL COMMITTEE. PART IV WILL BE HEARD BY THE RESIDENTIAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

PART I – IFC; IPMC; IWUIC

Revise the International Fire Code as follows:

IFC SECTION 202 DEFINITIONS

[A] **APPROVED.** Acceptable to the *fire code official* or authority having jurisdiction.

Revise the International Property Maintenance Code as follows:

IPMC SECTION 202 DEFINITIONS

[A] **APPROVED.** Acceptable to ~~Approved by~~ the *code official* or authority having jurisdiction.

Revise the International Wildland-Urban Interface Code as follows:

IWUICC SECTION 202 DEFINITIONS

[A] **APPROVED.** Acceptable to ~~Approval by~~ the code official ~~as the result of review, investigation or tests conducted by the code official or by reason of accepted principles or tests by national authorities, or technical or scientific organizations or authority having jurisdiction.~~

PART II – IECC-COMMERCIAL

Revise the International Energy Conservation Code-Commercial as follows:

IECC SECTION C202 GENERAL DEFINITIONS

APPROVED. Acceptable to ~~Approval by~~ the code official ~~as a result of investigation and tests conducted by him or her, or by reason of accepted principles or tests by nationally recognized organizations or authority having jurisdiction.~~

IECC C407.3 Performance-based compliance. Compliance based on total building performance requires that a proposed building (proposed design) be shown to have an annual energy cost that is less than or equal to the annual energy cost of the standard reference design. Energy prices shall be taken

from an approved source ~~approved by the code official~~, such as the Department of Energy, Energy Information Administration's State Energy Price and Expenditure Report. Code officials shall be permitted to require time-of-use pricing in energy cost calculations. Nondepletable energy collected off site shall be treated and priced the same as purchased energy. Energy from nondepletable energy sources collected on site shall be omitted from the annual energy cost of the proposed design.

Exception: Jurisdictions that require site energy (1 kWh = 3413 Btu) rather than energy cost as the metric of comparison.

PART III – IECC-RESIDENTIAL

Revise the International Energy Conservation Code-Residential as follows:

IECC R103.2 (IRC N1101.8) Information on construction documents. Construction documents shall be drawn to scale upon suitable material. Electronic media documents are permitted to be submitted when ~~approved by the code official~~. Construction documents shall be of sufficient clarity to indicate the location, nature and extent of the work proposed, and show in sufficient detail pertinent data and features of the building, systems and equipment as herein governed. Details shall include, but are not limited to, as applicable, insulation materials and their R-values; fenestration U-factors and SHGCs; area-weighted U-factor and SHGC calculations; mechanical system design criteria; mechanical and service water heating system and equipment types, sizes and efficiencies; economizer description; equipment and systems controls; fan motor horsepower (hp) and controls; duct sealing, duct and pipe insulation and location; lighting fixture schedule with wattage and control narrative; and air sealing details.

IECC SECTION R202 (IRC N1101.9) GENERAL DEFINITIONS

APPROVED. ~~Acceptable to Approval by the code official as a result of investigation and tests conducted by him or her, or by reason of accepted principles or tests by nationally recognized organizations or authority having jurisdiction.~~

PART IV – IRC

Revise the International Residential Code as follows:

IRC SECTION R202 DEFINITIONS

APPROVED. Acceptable to the building official or authority having jurisdiction.

Reason: Approved is an important word. "Approved" already incorporates the "by who" in the definition, repeating that is redundant. I-codes should be consistent.

Cost Impact: The code change proposal will not increase the cost of construction.

Staff analysis: The same phrase that is proposed to be modified in IECC Residential Section 103.2 is also found in IECC Commercial Section 103.2.

ADM53-13

PART I – IFC; IPMC; IWUIC

Public Hearing:	Committee:	AS	AM	D

PART I – IBC: 202; IFC: 202

PART II – IRC: R202

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE PROVISIONS COMMITTEE AS ONE CODE CHANGE. PART II WILL BE HEARD BY THE RESIDENTIAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

Proponent: Bob Eugene, representing UL LLC (Robert.Eugene@ul.com)

PART I – IBC; IFC

Revise the International Building Code as follows:

IBC SECTION 202 DEFINITIONS

[A] **APPROVED.** Acceptable to the code building official or authority having jurisdiction.

[A] **BUILDING CODE OFFICIAL.** The officer or other designated authority charged with the administration and enforcement of this code, or a duly authorized representative.

Revise the International Fire Code as follows:

IFC SECTION 202 DEFINITIONS

[A] **APPROVED.** Acceptable to the fire code official or other authority having jurisdiction.

[A] **BUILDING CODE OFFICIAL.** The officer or other designated authority charged with the administration and enforcement of the *International Building Code*, or a duly authorized representative.

PART II – IRC

Revise the International Residential Code as follows:

IRC SECTION R202 DEFINITIONS

APPROVED. Acceptable to the code building official or other authority having jurisdiction.

BUILDING CODE OFFICIAL. The officer or other designated authority charged with the administration and enforcement of this code.

Reason: This would make the definition consistent with other I-codes. Additionally, the code covers not only building, provisions but also energy conservation, mechanical, fuel gas, plumbing and electrical installations which may be under the jurisdiction of other AHJs.

Cost Impact: None

Staff analysis: If this proposal is approved, wherever “building official” is used in the text of the IBC, IFC and IRC, the term will be changed to “code official”. The term “fire code official” in the IFC will remain unchanged.

Proponent: Philip Brazil, P.E., Reid Middletonw, Inc., representing Washington Association of Building Officials, Technical Code Development (pbrazil@reidmiddleton.com)

PART I – IBC; IFC; IFCG; IMC; IPC; IPMC; IWUIC

Revise the International Building Code as follows:

IBC SECTION 202 DEFINITIONS

[A] APPROVED. Acceptable to the *building official* ~~or authority having jurisdiction.~~

[A] PERMIT. An official document or certificate issued by the ~~authority having jurisdiction which~~ building official that authorizes performance of a specified activity.

Revise the International Fire Code as follows:

IFC SECTION 202 DEFINITIONS

[A] APPROVED. Acceptable to the *fire code official*.

[A] PERMIT. An official document or certificate issued by the ~~authority having jurisdiction which~~ fire code official that authorizes performance of a specified activity.

Revise the International Fuel Gas Code as follows:

IFGC SECTION 202 DEFINITIONS

[A] APPROVED. Acceptable to the *code official* ~~or authority having jurisdiction.~~

Revise the International Mechanical Code as follows:

IMC SECTION 202 DEFINITIONS

[A] APPROVED. Acceptable to the *code official* ~~or authority having jurisdiction.~~

Revise the International Plumbing Code as follows:

**IPC SECTION 202
DEFINITIONS**

[A] APPROVED. ~~Acceptable to the code official or authority having jurisdiction.~~

Revise the International Property Maintenance Code as follows:

**IPMC SECTION 202
DEFINITIONS**

[A] APPROVED. ~~Acceptable to~~ Approved by the code official.

Revise the International Wildland-Urban Interface Code as follows:

**IWUICC SECTION 202
DEFINITIONS**

[A] APPROVED. ~~Acceptable to the code official Approval by the code official as the result of review, investigation or tests conducted by the code official or by reason of accepted principles or tests by national authorities, or technical or scientific organizations.~~

PART II – IECC-COMMERCIAL

Revise the International Energy Conservation Code-Commercial as follows:

**IECC SECTION C202
GENERAL DEFINITIONS**

APPROVED. ~~Acceptable to Approval by the code official as the result of investigation and tests conducted by him or her, or by reason of accepted principles or tests by national recognized organizations.~~

PART III – IECC-RESIDENTIAL

Revise the International Energy Conservation Code-Residential as follows:

**IECC SECTION R202 (IRC N1101.9)
GENERAL DEFINITIONS**

APPROVED. ~~Acceptable to Approval by the code official as the result of investigation and tests conducted by him or her, or by reason of accepted principles or tests by national recognized organizations.~~

PART IV – IRC

Revise the International Residential Code as follows:

**IRC SECTION R202
DEFINITIONS**

APPROVED. Acceptable to the *building official*.

PERMIT. An official document or certificate issued by the ~~authority having jurisdiction~~ building official that authorizes performance of a specified activity.

PART V – ISPSC

Revise the International Swimming Pool and Spa Code as follows:

ISPSC SECTION 202 DEFINITIONS

APPROVED. Acceptable to the *code official* ~~or authority having jurisdiction~~.

PERMIT. An official document or certificate issued by the ~~authority having jurisdiction~~ building official that authorizes performance of a specified activity.

Reason: The purpose for the proposal is to clarify the meaning of the definitions for “approved” and “permit” by specifying the building official rather than the “authority having jurisdiction.” The provisions of the building code consistently identify the building official as the official in charge of administration and enforcement of the building code. The only instances of “authority having jurisdiction” in the 2012 IBC are in this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

ADM56 – 13

IEBC: 202 (New)

THIS PROPSAL WILL BE HEARD BY THE EXISTING BUILDING CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IEBC COMMITTEE.

Proponent: Maureen Traxler, City of Seattle, representing Seattle Dept. of Planning & Development (Maureen.traxler@seattle.gov)

Add new definition to the International Existing Building Code as follows:

IEBC SECTION 202 DEFINITIONS

[A] APPROVED. Acceptable to the *code official* or authority having jurisdiction.

Reason: The term “approved” appears dozens of times in the IEBC but is not defined. The definition will eliminate dispute about who “approves” something—without the definition, it could be the code official, the design professional, or a testing laboratory. This definition, or one substantially the same, is used in the IBC, IMC, IFGC, IFC, IRC and IPC.

Cost Impact: This code change proposal will not increase the cost of construction.

ADM56-13

PART III - IECC: R202 (IRC N1101.9)(New).

THIS IS A 3 PART CODE CHANGE. PARTS I WILL BE HEARD BY THE ADMINISTRATIVE PROVISIONS COMMITTEE AS ONE CODE CHANGE. PART II WILL BE HEARD BY THE ENERGY CONSERVATION CODE-COMMERCIAL COMMITTEE. PART III WILL BE HEARD BY THE ENERGY CONSERVATION CODE-RESIDENTIAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

PART I – IBC; IFGC; IMC; IPC

Revise the International Building Code as follows:

IBC SECTION 202 DEFINITIONS

[A] APPROVED AGENCY. An established and recognized agency regularly engaged in conducting tests or furnishing inspection services, when such agency has been approved by the building official.

Revise the International Fuel Gas Code as follows:

IFGC SECTION 202 GENERAL DEFINITIONS

[A] APPROVED AGENCY. An established and recognized agency ~~that is approved by the code official~~ and regularly engaged in conducting tests or furnishing inspection services, when such agency has been approved by the code official.

Revise the International Mechanical Code as follows:

IMC SECTION 202 GENERAL DEFINITIONS

[A] APPROVED AGENCY. An established and recognized agency ~~that is approved by the code official~~ and regularly engaged in conducting tests or furnishing inspection services, when such agency has been approved by the code official.

Revise the International Plumbing Code as follows:

IPC SECTION 202 GENERAL DEFINITIONS

[A] APPROVED AGENCY. An established and recognized agency ~~that is approved by the code official~~ and regularly engaged in conducting tests or furnishing inspection services, when such agency has been approved by the code official.

PART II – IECC-COMMERCIAL

Add a new definition to the International Energy Conservation Code-Commercial as follows:

IECC SECTION C202 GENERAL DEFINITIONS

APPROVED AGENCY. An established and recognized agency regularly engaged in conducting tests or furnishing inspection services, when such agency has been approved by the code official.

PART III – IECC-RESIDENTIAL

Add a new definition to the International Energy Conservation Code-Residential as follows:

IECC SECTION R202 (IRC N1101.9) GENERAL DEFINITIONS

APPROVED AGENCY. An established and recognized agency regularly engaged in conducting tests or furnishing inspection services, when such agency has been approved by the code official.

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Reasons for this specific proposal:

Part I – These revisions are for consistency across codes with the defined term.

Part II and III - The term 'approved agency' is used in the IECC, but not defined. While the term is defined in the *International Building Code*, and therefore available for application to the IECC, the SEHPCAC believes that the definition should be included in the IECC so that it is readily available for code users and the term is consistently applied.

Cost Impact: This code change proposal will not increase the cost of construction.

Staff analysis: The term "Approved Agency" is currently defined in the IBC, IFGC, IMC, IPC, IRC, ISPC and IgCC. In the IBC, IPC, IMC and IPC, this definition is scoped to Administration. The term proposed for the IECC is the same as defined in the IRC and the ISPC.

THIS IS A 3 PART CODE CHANGE. PARTS I WILL BE HEARD BY THE ADMINISTRATIVE PROVISIONS COMMITTEE AS ONE CODE CHANGE. PART II WILL BE HEARD BY THE RESIDENTIAL CODE COMMITTEE. PART III WILL BE HEARD BY THE SWIMMING POOL AND SPA CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

Proponent: Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee (bajnaic@chesterfield.gov)

PART I – IBC; IEBC

Revise the International Building Code as follows:

IBC SECTION 202 DEFINITIONS

[A] REPAIR. The reconstruction or renewal of any part of an existing building ~~for the purpose of its maintenance.~~

Revise the International Existing Building Code as follows:

IEBC SECTION 202 DEFINITIONS

[A] REPAIR. The ~~restoration to good or sound condition~~ reconstruction or renewal of any part of an existing building ~~for the purpose of its maintenance.~~

PART II – IRC

Revise the International Residential Code as follows:

IRC SECTION R202 DEFINITIONS

REPAIR. The reconstruction or renewal of any part of an existing building ~~for the purpose of its maintenance.~~ For definitions applicable in Chapter 11, see Section N1101.9.

PART III – ISPSC

Revise the International Swimming Pool and Spa Code as follows:

ISPSC SECTION 202 DEFINITIONS

REPAIR. The ~~restoration to good or sound condition~~ reconstruction or renewal of any part of an existing aquatic vessel ~~for the purpose of its maintenance.~~

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the

BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

This proposal seeks to unify the definition of repair across the I code family. Currently there are several subtle variations between the definitions in the IBC, the IRC, the IEBC and the IECC where the word "repair" is defined. We are proposing to use the broadest possible definition of repair, that from the IECC, which removes the qualifying language "for the purpose of its maintenance" that is found in the IBC, IRC and IEBC definitions of repair. This change would properly put the categorization of work on existing buildings, which are: repair, alteration, addition or change of occupancy, into the technical body of the code not in a definition. Repair is defined in the body of each "I" code and should not rely on the maintenance restriction contained in the definition. What constitutes an "addition" is clear, both in conventional terms and as defined in the codes. A change of occupancy is well understood and easy to categorize. Alterations, while including the concept of renovation to existing conditions is generally thought of as making changes within the envelope of an existing building. This new definition will be consistent with the language in all of the "I" codes where the term repair is used.

Cost Impact: This proposal will not increase the cost of construction.

Staff analysis: The definition for Repair is also the both the commercial and residential portions of the IECC.

PART III - ISPSC: 202

THIS IS A 3 PART CODE CHANGE. PARTS I WILL BE HEARD BY THE ADMINISTRATIVE PROVISIONS COMMITTEE AS ONE CODE CHANGE. PART II WILL BE HEARD BY THE RESIDENTIAL CODE COMMITTEE. PART III WILL BE HEARD BY THE SWIMMING POOL AND SPA CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

PART I – IBC; IEBC

Revise the International Building Code as follows:

IBC SECTION 202 DEFINITIONS

[A] REPAIR. The reconstruction or renewal of any part of an existing building ~~for the purpose of its maintenance.~~

Revise the International Existing Building Code as follows:

IEBC SECTION 202 DEFINITIONS

[A] REPAIR. The ~~restoration to good or sound condition~~ reconstruction or renewal of any part of an existing building ~~for the purpose of its maintenance.~~

PART II – IRC

Revise the International Residential Code as follows:

IRC SECTION R202 DEFINITIONS

REPAIR. The reconstruction or renewal of any part of an existing building ~~for the purpose of its maintenance.~~ For definitions applicable in Chapter 11, see Section N1101.9.

PART III – ISPSC

Revise the International Swimming Pool and Spa Code as follows:

ISPSC SECTION 202 DEFINITIONS

REPAIR. The ~~restoration to good or sound condition~~ reconstruction or renewal of any part of an existing aquatic vessel ~~for the purpose of its maintenance.~~

Reason: This proposal expands definition of "repair" to include retrofits and changes to energy systems for consistency with the 2012 International Energy Conservation Code (IECC). The terms "good" and "sound" are not used in the ICC codes and are subjective. The wording "for the purpose of its maintenance" is a reason for the text but not relevant to a definition. Adding "restoration or renewal" clarifies the definition of this term and makes it consistent with the IBC definition. This is especially important in the IECC because this definition and the definition of alteration are key to determining which of Chapters 6, 7, 8, and/or 9 are applicable to the work being conducted. .

There is no cost impact other than ensuring that something not considered within the scope of the International Existing Buildings Code (IEBC) would now, through clarification, be considered.

Cost Impact: The code change proposal will increase the cost of construction in some buildings.

Staff analysis: The definition for Repair is also the both the commercial and residential portions of the IECC.

Proponent: Maureen Traxler, City of Seattle, representing Seattle Department of Planning and Development (maureen.traxler@seattle.gov)

PART I – IBC; IEBC

Revise the International Building Code as follows:

IBC SECTION 202 DEFINITIONS

[A] REPAIR. The reconstruction or renewal of any part of an existing building for the purpose of its maintenance or to correct damage.

Revise the International Existing Building Code as follows:

IEBC SECTION 202 DEFINITIONS

[A] REPAIR. The ~~restoration to good or sound condition~~ reconstruction or renewal of any part of an existing building for the purpose of its maintenance or to correct damage.

PART II – IECC-COMMERCIAL

Revise the International Energy Conservation Code-Commercial as follows:

IECC SECTION C202 GENERAL DEFINITIONS

REPAIR. The reconstruction or renewal of any part of an existing building for the purpose of its maintenance or to correct damage.

PART III – IECC-RESIDENTIAL

Revise the International Energy Conservation Code-Residential as follows:

IECC SECTION R202 (IRC N1101.9) GENERAL DEFINITIONS

REPAIR. The reconstruction or renewal of any part of an existing building for the purpose of its maintenance or to correct damage.

PART IV – IRC

Revise the International Residential Code as follows:

IRC SECTION R202 DEFINITIONS

REPAIR. The reconstruction or renewal of any part of an existing building for the purpose of its maintenance or to correct damage. For definitions applicable in Chapter 11, see Section N1101.9.

PART V – ISPSC

Revise the International Swimming Pool and Spa Code as follows:

ISPSC SECTION 202 DEFINITIONS

REPAIR. The ~~restoration to good or sound condition~~ reconstruction or renewal of any part of an existing aquatic vessel for the purpose of its maintenance or to correct damage.

Reason: We are proposing the definition be modified in each of the codes in which it appears. The identical definition appears in the IBC, IEBC, IRC and ISPSC--4 of the 6 ICC codes in which it appears. The IECC definition is "The reconstruction or renewal of any part of an existing building." Note that the term is not defined in the IFC, IMC, IFGC, IPC or IPSDC. The definition of 'repair' in the IGCC definition is identical except that it includes building sites as well as buildings, and can be addressed in Group C.

Limiting repairs to maintenance is not consistent with the use of the term in the codes. IBC Section 3405.1 and IEBC Section 404.1, Repairs, specifically state that repair includes correction of damage. "Work on nondamaged components that is necessary for the required *repair* of damaged components shall be considered part of the *repair* and shall not be subject to the requirements for *alterations* in this chapter." IEBC Section 606.2 deals with repairs to damaged buildings—explicitly including correction of damage, which in many cases would be more than "maintenance".

Another possible solution to this inconsistency would be to delete the phrase "for the purpose of its maintenance" as the term is defined in the IECC. However, adding damage to the existing definition more clearly distinguishes repairs from alterations.

Cost Impact: None.

ADM61 – 13

IRC: R202

THIS CHANGE WILL BE HEARD BY THE RESIDENTIAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

Proponent: Paul Armstrong, PE, CBO; Orange Empire Chapter – Code Committee, Orange Empire Chapter

Revise the International Residential Code as follows:

IRC SECTION R202 DEFINITIONS

IRC TOWNHOUSE. A single-family *dwelling unit* constructed in a group of three or more attached units in which each unit extends from the foundation to roof and with open space ~~a yard or public way~~ on at least two or more sides.

Reason: The purpose of this change is to coordinate the definitions of Townhouse between the IRC and IBC. The proposal intends to use the definition in the 2012 IBC in both codes. The current inconsistency found is a problem in determining the application of the codes. The example is a townhouse design using a court on one of the sides. The IBC in the Scope, Section 101.2, would refer the designer to the IRC for the design of the project but the IRC, based on its definition, would not be allowed whether the project meets all the other criteria or not. So the user is back to the IBC and its definition does allow the design of the project. However, there are no provisions specific for townhouses in the IBC. So the definition the IBC is really only useful for determining the application of the IRC or IBC and needs to be consistent between the two codes.

Definitions are vital in understanding the application of all codes. While differences can exist between codes in the ICC family of codes, those definitions that are used in determining the application of one code or another should be consistent.

Cost Impact: The code change proposal will not increase the cost of construction.

Staff Analysis: Townhouse is defined in the IBC and IRC.

ADM61-13

ADM62-13**IBC, IECC, IEBC, IFC, IFGC, IgCC, IMC, IPC, IPMC, IRC, and the ISPSC**

The following table provides a comprehensive list of all standards that the respective standards promulgators have indicated have been, or will be, updated from the listing in the 2012 Editions of the International Codes. According to Section 4.5.1 of ICC Council Policy #CP 28, Code Development Policy, the updating of standards referenced by the Codes shall be accomplished administratively by the Administrative code development committee. Therefore, referenced standards that are to be updated for the 2015 edition of any of the I-Codes are listed in this single code change proposal. Note that the table below indicates the change to the standard, and the code or codes in which each standard appears. The list includes standards that the promulgators have already updated or will have updated by December 1, 2014.

**4.5.1 Standards referenced in the I-Codes: The updating of standards referenced by the Codes shall be accomplished administratively by the Administrative code development committee in accordance with these full procedures except that the deadline for availability of the updated standard and receipt by the Secretariat shall be December 1 of the third year of each code cycle. The published version of the new edition of the Code which references the standard will refer to the updated edition of the standard. If the standard is not available by the deadline, the edition of the standard as referenced by the newly published Code shall revert back to the reference contained in the previous edition and an errata to the Code issued. Multiple standards to be updated may be included in a single proposal.*

A53/A 53M-07 <u>12</u>	Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless	IPC	IMC	IRC	IFGC				
A74-09 <u>12</u>	Specification for Cast Iron Soil Pipe and Fittings	IPC	IRC	IPSDC					
A82/A 2M-05a <u>07</u>	Specification for Steel Wire, Plain, for Concrete Reinforcement	IRC							
A106/A 106M-08 <u>11</u>	Specification for Seamless Carbon Steel Pipe for High-Temperature Service	IMC	IRC	IFGC					
A123/A 123M-02 <u>12</u>	Specification of Zinc (Hot-Dip Galvanized) Coating on Iron and Steel Products	IBC							
A126-04(2009)	Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings	IMC	IRC						
A153/A153M-05 <u>09</u>	Specification for Zinc Coating (Hot Dip) on Iron and Steel Hardware	IBC	IRC						
A182-40a- <u>12A</u>	Standard Specification for Forged or Rolled Alloy and Stainless Steel Pipe Flanges, Forged Fittings and Valves and Parts for High-Temperature Service	ISPSC							
A185/A 185M-06E01 <u>07</u>	Specification for Steel Welded Wire Reinforcement, Plain for Concrete	IBC							
A240/A 240M-09 <u>12</u>	Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet and Strip for Pressure Vessels and for General Applications	IBC	IRC	IPSPC					
A252-98(2007) <u>10</u>	Specification for Welded and Seamless Steel Pipe Piles	IBC							
A283/A 283M-03(2007) <u>12</u>	Specification for Low and Intermediate Tensile Strength Carbon Steel Plates	IBC							
A307-07b <u>10</u>	Specification for Carbon Steel Bolts and Studs, 60,000 psi Tensile Strength	IBC	IRC						
A312/A 312M-08a <u>12A</u>	Specification for Seamless, and Welded, and Heavily Cold Worked Austenitic Stainless Steel Pipes	IPC	IRC	ISPSC					

A377-03 2003(2008)e1*	Index of Specification for Ductile-Iron Pressure Pipe	IRC							
A403-40a 12	Standard Specification for Wrought Austenitic Stainless Steel Pipe Fittings	ISPSC							
A416/A 416M-06 12A	Specification for Steel Strand, Uncoated Seven-Wire for Prestressed Concrete	IBC							
A420/A 420M-07 10A	Specification for Piping Fittings of Wrought Carbon Steel and Alloy Steel for Low-Temperature Service	IMC							
A421/A 421M- 05 10	Specification for Uncoated Stress-Relieved Steel Wire for Prestressed Concrete	IBC							
A435/A 435M-90 (2007) 2012	Specification for Straight-Beam Ultrasonic Examination of Steel Plates	IBC							
A463M/A 463M-06 10	Specification for Steel Sheet, Aluminum-Coated, by the Hot Dip Process	IBC	IRC						
A480/A480M-06b 12	Specification for General Requirements for Flat-Rolled Stainless and Heat-/Resisting Steel Plate, Sheet and Strip	IBC							
A496-05 07	Specification for Steel Wire, Deformed for Concrete Reinforcement	IBC							
A497 A497M-06e04 07	Specification for Steel Welded Reinforcement Deformed for Concrete	IBC							
A510-08 11	Specification for General Requirements for Wire Rods and Coarse Round Wire, Carbon Steel, Alloy Steel	IBC	IRC						
A572/A 572M-07 12	Specification for High-Strength Low-Alloy Columbium-Vanadium Structural Steel	IBC							
A588/A 588M-05 40	Specification for High-Strength Low-Alloy Structural Steel with 50 ksi (345 Mpa) Minimum Yield Point, with Atmospheric Corrosion Resistance	IBC							
A615/A 615M-09 12	Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement	IBC	IRC						
A653/A 653M-08 11	Specification for Steel Sheet, Zinc-Coated Galvanized or Zinc-Iron Alloy-Coated Galvannealed by the Hot-Dip Process	IBC	IRC						
A690/690M-07(2012)	Standard Specification for High Strength Low-Alloy Nickel, Copper Phosphorus Steel H-Piles and Sheet Piling with Atmospheric Corrosion Resistance for Use in Marine Environments	IBC							
A706/A 706M-09B	Specification for Low-Alloy Steel Deformed and Plain Bars for Concrete Reinforcement	IBC	IRC						
A722/A 722M-07 12	Specification for Uncoated High-Strength Steel Bar for Prestressing Concrete	IBC							
A733-2003(2009)e1*	Specification for Welded and Seamless Carbon Steel and Austenitic Stainless Steel Pipe Nipples	IPC							
A755/A 755M-03(2008) 2011	Specification for Steel Sheet, Metallic-Coated by the Hot-Dip Process and Prepainted by the Coil-coating Process for Exterior Exposed Building Products	IBC	IRC						

A767/A 767M-05 09	Specification for Zinc-Coated (Galvanized) Steel Bars for Concrete Reinforcement	IBC							
A775/A 775M-07b	Specification for Steel Sheet, Metallic-Coated by the Hot-Dip Process and Prepainted by the Coil-coating Process for Exterior Exposed Building Products	IBC							
A778-01(2009)e1	Specification for Welded Unannealed Austenitic Stainless Steel Tubular Products	IPC	IRC						
A792/A 792M-08 10	Specification for Steel Sheet, 55% Aluminum-Zinc Alloy-Coated by the Hot-Dip Process	IBC	IRC						
A875/A 875M-06 10	Standard Specification for Steel Sheet Zinc-5%, Aluminum Alloy-Coated by the Hot-Dip Process	IBC	IRC						
A888-09 11	Specification for Hubless Cast Iron Soil Pipe and Fittings for Sanitary and Storm Drain, Waste, and Vent Piping Application	IPC	IPSDC	IRC					
A913/A 913M-07 11	Specification for High-Strength Low-Alloy Steel Shapes of Structural Quality, Produced by Quenching and Self-Tempering Process (QST)	IBC							
A924/A 924M-08a 2010a	Standard Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot Dip Process	IBC	IRC						
A951/A951M-06 11	Specification for Steel Wire Masonry Joint Reinforcement	IRC							
A992/A 992M-06a 11	Standard Specification for Structural Shapes	IBC							
A996/A 996M-2009b	Specification for Rail-Steel and Axle-Steel Deformed Bars for Concrete Reinforcement	IRC							
A1003/A 1003M-08 12	Standard Specification for Steel Sheet, Carbon, Metallic- and Nonmetallic-Coated for Cold-formed Framing Members	IRC							
A1008/A1008M-07 12	Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability, Solution Hardened and Bake Hardenable	IBC							
B42-02e04 10	Specification for Seamless Copper Pipe, Standard Sizes	IPC	IBC	IRC	IFC				
B43-98(2004) 09	Specification for Seamless Red Brass Pipe, Standard Sizes	IPC	IBC	IRC	IFC	IMC			
B68-02 11	Specification for Seamless Copper Tube, Bright Annealed	IBC	IFC	IMC					
B75-02 11	Specification for Seamless Copper Tube	IPC	IPSDC	IRC	IMC				
B88-03 09	Specification for Seamless Copper Water Tube	IPC	IBC	IPSDC	IRC	IMC	IFC	IPSPC	
B101-07 12	Specification for Lead-Coated Copper Sheet and Strip for Building Construction	IBC	IRC						
B135-08a 10	Specification for Seamless Brass Tube	IRC	IMC						
B152/B 152M-06a 09	Specification for Copper Sheet, Strip Plate and Rolled Bar	IPC							
B209-07 10	Specification for Aluminum and Aluminum-Alloy Steel and Plate	IBC	IRC						
B210-04 12	Specification for Aluminum and Aluminum-Alloy Drawn Seamless Tubes	IFGC							

B227-04 <u>10</u>	Specification for Hard-Drawn Copper-Clad Steel Wire	IRC							
B241/B 241M-02 <u>10</u>	Specification for Aluminum and Aluminum-Alloy, Seamless Pipe and Seamless Extruded Tube	IFGC							
B251-02e04 <u>10</u>	Specification for General Requirements for Wrought Seamless Copper and Copper-Alloy Tube	IPC	IPSDC	IBC	IFC	IRC	IMC		
B302-07 <u>12</u>	Specification for Threadless Copper Pipe, Standard Sizes	IPC	IRC	IMC					
B370-09 <u>12</u>	Specification for Cold-Rolled Copper Sheet and Strip for Building Construction	IBC	IRC						
B447-07 <u>12a</u>	Specification for Welded Copper Tube	IPC	IRC						
B633-07 <u>11</u>	Specification for Electrodeposited Coatings of Zinc on Iron and Steel	IRC							
B687-99(2005)e04 (2011)	Specification for Brass, Copper, and Chromium-Plated Pipe Nipples	IPC							
B695-04(2009)	Standard Specification for Coatings of Zinc Mechanically Deposited on Iron and Steel	IBC	IRC						
B813-00(2009) <u>10</u>	Specification for Liquid and Paste Fluxes for Soldering of Copper and Copper Alloy Tube	IPC	IPSDC	IRC	IMC				
B828-02(2010)	Practice for Making Capillary Joints by Soldering of Copper and Copper Alloy Tube and Fittings	IPC	IPSDC	IRC					
C4-04e04 (2009)	Specification for Clay Drain Tile and Perforated Clay Drain Tile	IPC	IPSDC	IRC					
C5-03 <u>10</u>	Specification for Quicklime for Structural Purposes	IBC	IRC						
C14-07 <u>11</u>	Specification for Nonreinforced Concrete Sewer, Storm Drain, and Culvert Pipe	IPC	IPSDC	IRC					
C22/C 22M-00(2005)e04 (2010)	Specification for Gypsum	IBC	IRC						
C27-98(2008)	Specification for Standard Classification of Fireclay and High-Alumina Refractory Brick	IBC	IRC						
C28/C 28M-00(2005) <u>10</u>	Specification for Gypsum Plasters	IBC	IRC						
C31/C 31M-08b <u>12</u>	Practice for Making and Curing Concrete Test Specimens in the Field	IBC							
C33/C33M-08 <u>11a</u>	Specification for Concrete Aggregates	IBC	IRC						
C34-03 <u>10</u>	Specification for Structural Clay Load-Bearing Wall Tile	IBC	IRC						
C35-01(2005)/C35M-1995(2009)	Specification for Inorganic Aggregates for Use in Gypsum Plaster	IBC	IRC						
C36/C 36M-03 Withdrawn Replaced	Specification for Gypsum Wallboard	IBC							
C37/C 37M-04 Withdrawn Replaced	Specification for Gypsum Lath	IBC							
C42/C 42M-04 <u>12</u>	Test Method for Obtaining and Testing Drilled Cores and Sawed Beams of Concrete	IBC							
C55-06e04 <u>2011</u>	Specification for Concrete Building Brick	IBC	IRC						
C56-05 <u>2010</u>	Specification for Structural Clay Non-Load-Bearing Tile	IBC							
C59/C 59M-00(2006)	Specification for Gypsum Casting Plaster and Molding Plaster	IBC	IRC						

C61/C 61M-00(2006) <u>(2011)</u>	Specification for Gypsum Keene's Cement	IBC	IRC						
C62-08 <u>12</u>	Specification for Building Brick (Solid Masonry Units Made From Clay or Shale)	IBC	IRC						
C67-08 <u>12</u>	Test Methods of Sampling and Testing Brick and Structural Clay Tile	IBC							
C73-05 <u>10</u>	Specification for Calcium Silicate Face Brick (Sand-Lime Brick)	IBC	IRC						
C76-08a <u>12a</u>	Specification for Reinforced Concrete Culvert, Storm Drain, and Sewer Pipe	IPC	IPSDC	IRC					
C90-08 <u>12</u>	Specification for Loadbearing Concrete Masonry Units	IBC	IRC	IECC					
C91-05 <u>12</u>	Specification for Masonry Cement	IBC	IRC						
C94/C 94M-09 <u>12</u>	Specification for Ready-Mixed Concrete	IBC	IRC						
C109/C 109M-05 <u>2001b</u>	Standard Test Method for Compressive Strength of Hydraulic Cement Mortars (Using 2-in. or [50-mm] Cube Specimens)	IBC							
C126-99(2005) <u>12</u>	Specification for Ceramic Glazed Structural Clay Facing Tile, Facing Brick, and Solid Masonry Units	IBC							
C129-06 <u>11</u>	Specification for Nonload-bearing Concrete Masonry Units	IBC	IRC						
C140-08a <u>2012a</u>	Test Method Sampling and Testing Concrete Masonry Units and Related Units	IBC	IRC						
C143/C 143M-08 <u>2010a</u>	Test Method for Slump of Hydraulic Cement Concrete	IRC							
C145-85 <i>Withdrawn Combined</i>	Specification for Solid-Load Bearing Concrete Masonry Units	IRC							
C150-07- <u>12</u>	Specification for Portland Cement	IBC	IRC						
C172/C172M-08 <u>10</u>	Practice for Sampling Freshly Mixed Concrete	IBC							
C199-84 (2005) <u>(2011)</u>	Test Method for Pier Test for Refractory Mortars	IBC	IRC						
C203-5a <u>(2012)</u>	Standard Test Methods for Breaking Load and Flexural Properties of Block-type Thermal Insulation	IRC							
C206-03(2009)	Specification for Finishing Hydrated Lime	IBC							
C207-06 <u>2011</u>	Specification for Hydrated Lime for Masonry Purposes	IBC	IRC						
C208-2008a <u>12</u>	Specification for Cellulosic Fiber Insulating Board	IBC	IRC						
C212-00(2006) <u>10</u>	Specification for Structural Clay Facing Tile	IBC							
C216-07a <u>12</u>	Specification for Facing Brick (Solid Masonry Units Made From Clay or Shale)	IBC	IRC						
C270-08a <u>12a</u>	Specification for Mortar for Unit Masonry	IBC	IRC						
C272-01(2007)/C272M-12	Standard Test Method for Water Absorption of Core Materials for Structural-Sandwich Constructions	IRC							
C273/C273M-07a <u>11</u>	Standard Test Method for Shear Properties of Sandwich Core Materials	IRC							

C296-00(2004) /C296M-00(2009)e1	Specification for Asbestos-Cement Pressure Pipe	IPC	IRC						
C315-07(2011)	Specification for Clay Flue Liners and Chimney Pots	IBC	IRC	IMC	IFGC				
C317/C 317M-00(2005) 2010	Specification for Gypsum Concrete	IBC							
C330-05/C330-2009	Specification for Lightweight Aggregates for Structural Concrete	IBC							
C331-05 /C331M-2010	Specification for Lightweight Aggregates for Concrete Masonry Units	IBC							
C406-06e01 /C406M-2010	Specification for Roofing Slate	IBC	IRC						
C411-05 11	Test Method for Hot-Surface Performance of High-Temperature Thermal Insulation	IRC	IMC						
C425-04(2009)	Specification for Compression Joints for Vitrified Clay Pipe and Fittings	IPC	IPSDC	IRC					
C428/C428M-05(200611)e1	Specification for Asbestos-Cement Nonpressure Sewer Pipe	IPC	IPSDC	IRC					
C443-05a 12	Specification for Joints for Concrete Pipe and Manholes, Using Rubber Gaskets	IPC	IPSDC	IRC					
C472-99(2004) (2009)	Specification for Standard Test Methods for Physical Testing of Gypsum, Gypsum Plasters and Gypsum Concrete	IBC							
C473-07 12	Test Methods for Physical Testing of Gypsum Panel Products	IBC							
C474-05 12	Test Methods for Joint Treatment Materials for Gypsum Board Construction	IBC							
C475/C 475M-02(2007) 12	Specification for Joint Compound and Joint Tape for Finishing Gypsum Wall-Board	IBC	IRC						
C476-08 10	Specification for Grout for Masonry	IRC							
C496/C496M-96 11	Standard Test Method for Splitting Tensile Strength of Cylindrical Concrete Specimens	IEBC							
C503-08a 10	Specification for Marble Dimension Stone (Exterior)	IBC							
C508/C508M-00(2004) (2009)e1	Specification for Asbestos-Cement Underdrain Pipe	IPC	IRC						
C514-04(2009)e1	Specification for Nails for the Application of Gypsum Board	IBC	IRC						
C516-08a	Specification for Vermiculite Loose Fill Thermal Insulation	IBC							
C518-04 10	Test Method for Steady-State Thermal Transmission Properties by Means of the Heat Flow Meter Apparatus	IBC	IECC						
C547-07e1 12	Specification for Mineral Fiber Pipe Insulation	IBC							
C549-06(2012)	Specification for Perlite Loose Fill Insulation	IBC							
C552-07 12b	Standard Specification for Cellular Glass Thermal Insulation	IBC	IRC						
C557-03(2009)e01	Specification for Adhesives for Fastening Gypsum Wallboard to Wood Framing	IBC	IRC						
C564-08 12	Specification for Rubber Gaskets for Cast Iron Soil Pipe and Fittings	IPC	IPSDC	IRC					

C568-08a <u>10</u>	Specification for Limestone Dimension Stone	IBC							
C578—08b12a	Standard Specification for Rigid, Cellular Polystyrene Thermal Insulation	IBC	IRC						
C587-04(2009)	Specification for Gypsum Veneer Plaster	IBC	IRC						
C595/C95M-08a <u>2012e1</u>	Specification for Blended Hydraulic Cements	IBC	IRC						
C615/C615M-03 <u>2011</u>	Specification for Granite Dimension Stone	IBC							
C616/C616M-08a <u>2010</u>	Specification for Quartz Dimension Stone	IBC							
C629-08 <u>2010</u>	Specification for Slate Dimension Stone	IBC							
C630/C 630M-03 <i>Withdrawn replaced by C1396/C1396M-11</i>	Specification for Water-Resistant Gypsum Backing Board	IBC	IRC						
C635/C635M-07 <u>12</u>	Specification for the Manufacturer, Performance, and Testing of Metal Suspension Systems for Acoustical Tile and Lay-In Panel Ceilings	IBC							
C645-08a <u>11A</u>	Specification for Nonstructural Steel Framing Members	IBC	IRC						
C652-09 <u>12</u>	Specification for Hollow Brick (Hollow Masonry Units Made from Clay or Shale)	IBC	IRC						
C685/C 685M-07 <u>11</u>	Specification for Concrete Made by Volumetric Batching and Continuous Mixing	IRC							
C700-07a <u>11</u>	Specification for Vitrified Clay Pipe, Extra Strength, Standard Strength, and Perforated	IPC	IPSDC	IRC					
C726-05e1 <u>12</u>	Standard Specification for Mineral Wool Roof Insulation Board	IBC							
C728-05(2010)	Standard Specification for Perlite Thermal Insulation Board	IBC	IRC						
C744-08 <u>11</u>	Specification for Prefaced Concrete and Calcium Silicate Masonry Units	IBC							
C754-08 <u>11</u>	Specification for Installation of Steel Framing Members to Receive Screw-Attached Gypsum Panel Products	IBC							
C836/C836M-06 <u>12</u>	Specification for High Solids Content, Cold Liquid-Applied Elastomeric Waterproofing Membrane for Use with Separate Wearing Course	IBC	IRC						
C840-08 <u>11</u>	Specification for Application and Finishing of Gypsum Board	IBC							
C841-03(2008)E1	Specification for Installation of Interior Lathing and Furring	IBC							
C842-05(2010)E1	Specification for Application of Interior Gypsum Plaster	IBC							
C843-99(2006) (2012)	Specification for Application of Gypsum Veneer Plaster	IBC	IRC						
C844-04(2010)	Specification for Application of Gypsum Base to Receive Gypsum Veneer Plaster	IBC	IRC						
C847-09 <u>12</u>	Specification for Metal Lath	IBC	IRC						
C887-05(2010)	Specification for Packaged, Dry, Combined Materials for Surface Bonding Mortar	IBC	IRC						

C897-05(2009)	Specification for Aggregate for Job-Mixed Portland Cement-Based Plasters	IBC	IRC						
C920-08 <u>11</u>	Standard Specification for Elastomeric Joint Sealants	IBC	IRC	IgCC					
C926-06 <u>12A</u>	Specification for Application of Portland Cement-Based Plaster	IBC	IRC						
C931/C 931M-04 <i>Withdrawn Replaced by C1396/C1396M-11</i>	Specification for Exterior Gypsum Soffit Board	IBC							
C932-06	Specification for Surface-Applied Bonding Compounds Agents for Exterior Plastering	IBC							
C933-07b <u>11</u>	Specification for Welded Wire Lath	IBC							
C946-91 (2001) <u>10</u>	Specification for Practice for Construction of Dry-stacked, Surface-Bonded Walls	IBC							
C954-07 <u>11</u>	Specification for Steel Drill Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Steel Studs from 0.033 inch (0.84 mm) to 0.112 inch (2.84 mm) in Thickness	IBC	IRC						
C955-09 <u>11C</u>	Standard Specification for Load-bearing Transverse and Axial Steel Studs, Runners Tracks, and Bracing or Bridging, for Screw Application of Gypsum Panel Products and Metal Plaster Bases	IBC	IRC						
C956-04(2010)	Specification for Installation of Cast-in-Place Reinforced Gypsum Concrete	IBC							
C957-06 <u>10</u>	Specification for High-Solids Content, Cold Liquid-Applied Elastomeric Waterproofing Membrane with Integral Wearing Surface	IBC	IRC						
C989/C989M-06 <u>12A</u>	Specification for Ground <u>Granulated Blast-Furnace Slag Cement</u> for Use in Concrete and Mortars	IBC							
C1007-08a- <u>11a</u>	Specification for Installation of Load Bearing (Transverse and Axial) Steel Studs and Related Accessories	IBC							
C1019-09 <u>11</u>	Test Method for Sampling and Testing Grout	IBC							
C1029-08 <u>10</u>	Specification for Spray-Applied Rigid Cellular Polyurethane Thermal Insulation	IBC	IRC						
C1032-06(2011)	Specification for Woven Wire Plaster Base	IBC	IRC						
C1047-09 <u>10A</u>	Specification for Accessories for Gypsum Wallboard and Gypsum Veneer Base	IBC	IRC						
C1053-00(2005) <u>(2010)</u>	Specification for Borosilicate Glass Pipe and Fittings for Drain, Waste, and Vent (DWV) Applications	IPC							

C1063-08 <u>12C</u>	Specification for Installation of Lathing and Furring to Receive Interior and Exterior Portland Cement-Based Plaster	IBC	IRC						
C1088-09	Specification for Thin Veneer Brick Units Made From Clay or Shale	IBC							
C1072-06 <u>11</u>	Standard Text Method for Measurement of Masonry Flexural Bond Strength	IBC							
C1107/C1107-08 <u>11</u>	Standard Specification for Packaged Dry, Hydraulic-Cement Grout (Nonshrink)	IRC							
C1116/C1116M-08a <u>10</u>	Standard Specification for Fiber - Reinforced Concrete and Shotcrete	IRC							
C1157-08a <u>11</u>	<u>Standard Performance Specification for Hydraulic Cement</u>	IBC							
C1167-03 <u>11</u>	Specification for Clay Roof Tiles	IBC	IRC						
C1173-08 <u>10</u>	Specification for Flexible Transition Couplings for Underground Piping Systems	IPC	IPSDC	IRC					
C1178/C 1178M-06 <u>11</u>	Specification for Coated Glass Mat Water-Resistant Gypsum Backing Panel	IBC	IRC						
C1186-08	Specification for Flat Nonasbestos Fiber Cement Sheets	IBC	IRC						
C1218/C1218M-99(2008)	Test Method for Water-Soluble Chloride in Mortar and Concrete	IBC							
C1240-05 <u>12</u>	Specification for Silica Fume Used in Cementitious Mixtures	IBC							
C1261-07 <u>10</u>	Specification for Firebox Brick for Residential Fireplaces	IBC	IRC						
C1277-08 <u>11</u>	Specification for Shielded Couplings Joining Hubless Cast Iron Soil Pipe and Fittings	IPC	IPSDC	IRC					
C1278/C1278M-07a(2011)	Specification for Fiber-Reinforced Gypsum Panels	IBC	IRC						
C1280-09 <u>12A</u>	Specification for Application of <u>Exterior Gypsum Panel Products for Use as Sheathing</u>	IBC							
C1283-07a <u>11</u>	Practice for Installing Clay Flue Lining	IBC	IRC						
C1288-99(2004)e1 <u>2010</u>	Standard Specification for Discrete Non-Asbestos Fiber-Cement Interior Substrate Sheets	IBC	IRC						
C1289—08- <u>12a</u>	Standard Specification for Faced Rigid Cellular Polyisocyanurate Thermal Insulation Board	IBC	IRC						
C1314-07 <u>11A</u>	Test Method for Compressive Strength of Masonry Prisms	IBC							

C1325-08b	Standard Specification for Non-Asbestos Fiber-Mat Reinforced Cement Interior Substrate Sheets Backer Units	IBC	IRC						
C1328/C1328M-05 12	Specification for Plastic (Stucco Cement)	IBC	IRC						
C1364-07 10B	Standard Specification for Architectural Cast Stone	IBC							
C1371-04A(2010)E1	Standard Test Method For Determination of Emittance of Materials Near Room Temperature Using Portable Emissometers	IECC	IgCC						
C1373/C1373--03 11	Standard Practice for Determination of Thermal Resistance of Attic Insulation Systems Under Simulated Winter Conditions	IECC							
C1396/1396M-06a 11	Specification for Gypsum Ceiling Board	IBC	IRC						
C1405-08 12	Standard Specification for Glazed Brick (Single Fired, Solid Brick Units)	IBC							
C1492-03(2009)	Standard Specification for Concrete Roof Tile	IBC	IRC						
C1513-04 12	Standard Specification for Concrete Roof Tile	IRC							
C1540-08 11	Specification for Heavy Duty Shielded Couplings Joining Hubless Cast Iron Soil Pipe and Fittings	IPC							
C1611/C 1611M-05-09BE1	Standard Test Method for Slump Flow of Self-Consolidating Concrete	IBC							
C1629/C1692M—06(2011)	Standard Classification for Abuse-Resistant Nondecorated Interior Gypsum Panel Products and Fiber-Reinforced Cement Panels	IBC							
C1658/C1658-06 12	Standard Specification for Glass Mat Gypsum Panels	IBC	IRC						
C1563-08	Standard Test Method for Gaskets for Use in Connection with Hub and Spigot Cast Iron Soil Pipe and Fittings for Sanitary Drain, Waste, Vent and Storm Piping Applications	IPC							
D25-99(2005)12	Specification for Round Timber Piles	IBC							
D56-05(2010)	Test Method for Flash Point by Tag Closed Tester	IBC							
D86-09 2011b	Test Method for Distillation of Petroleum Products at Atmospheric Pressure	IBC	IFC						
D92-05a 12	Test Method for Flash and Fire Points by Cleveland Open Cup Tester	IFC							
D93-08 11	Test Method for Flash Point by Pensky-Martens Closed Cup Tester	IBC	IFC	IMC					

D226/D226M-06_09	Specification for Asphalt-Saturated Organic Felt Used in Roofing and Waterproofing	IBC	IRC						
D227/D227M-03(2011)E1	Specification for Coal-Tar-Saturated Organic Felt Used in Roofing and Waterproofing	IBC	IRC						
D635-06_10	Test Method for Rate of Burning and/or Extent and Time of Burning of Self-Supporting Plastics in a Horizontal Position	IBC							
D1003-07_11e1	Standard Test Method for Haze and Luminous Transmittance of Transparent Plastics	IECC							
D1248-05_12	Specification for Polyethylene Plastics Extrusion Materials for Wire and Cable	IRC							
D1557-07_12	Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lb/ft ³ (2,700kN-m/m ³))	IBC							
D1593-09	Non-rigid vinyl chloride plastic <u>film and sheeting</u>	ISPSC							
D1621-04a_10	Standard Test Method for Compressive Properties Of Rigid Cellular Plastics	IRC							
D1623-03_09	Standard Test Method for Tensile and Tensile Adhesion Properties of Rigid Cellular Plastics	IRC							
D1693-08_12	Test Method for Environmental Stress-Cracking of Ethylene Plastics	IRC	IMC						
D1784-08_11	Specification for Rigid Poly (Vinyl Chloride) (PVC) Compounds and Chlorinated Poly (Vinyl Chloride) (CPVC) Compounds	IRC							
D1785-06_12	Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80 and 120	IPC	IMC	IRC	ISPSC				
D1863/D1863M-05(2011)E1	Specification for Mineral Aggregate Used on Built-Up Roofs	IBC	IRC						
D1869-95 (2005)e1 (2010)	Specification for Rubber Rings for Asbestos-Cement Pipe	IPC	IPSDC	IRC					
D1929-96(2001)e01-12	Test Method for Determining Ignition Properties <u>Temperature</u> of Plastics	IBC							
D1970/D1970M-09_11	Specification for Self-Adhering Polymer Modified Bituminous Sheet Materials Used as Steep Roof Underlayment for Ice Dam Protection	IBC	IRC						
D2126-04_09	Standard Test Method for Response of Rigid Cellular Plastics to Thermal and Humid Aging	IRC							
D2216-05_10	Test Method for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass	IBC							
D2235-04 (2011)	Specification for Solvent Cement for Acrylonitrile-Butadiene-Styrene (ABS) Plastic Pipe and Fittings	IPC	IPSDC	IMC	IRC				
D2239-03_12	Specification for Polyethylene (PE) Plastic Pipe (SIDR-PR) Based on Controlled Inside Diameter	IPC	IRC						

D2241-05 09	Specification for Poly (Vinyl Chloride) (PVC) Pressure-Rated Pipe (SDR-Series)	IPC	IRC	IMC	ISPSC				
D2412-02(2008) 11	Test Method for Determination of External Loading Characteristics of Plastic Pipe by Parallel-Plate Loading	IRC	IMC						
D2487-06e1 2011	Practice for Classification of Soils for Engineering Purposes (Unified Soil Classification System)	IBC							
D2513-08b 12	Specification for Thermoplastic Polyethylene (PE) Gas Pressure Pipe, Tubing, and Fittings	IRC	IMC	IFGC					
D2559-04 12A	Standard Specification for Adhesives for Structural Laminated Bonded Structural Wood Products for Use under Exterior (West Use) Exposure Conditions	IRC							
D2564-04e01 12	Specification for Solvent Cements for Poly (Vinyl Chloride) (PVC) Plastic Piping Systems	IPC	IPSDC	IRC	IMC				
D2626/D2626M-04(2012)E1	Specification for Asphalt-Saturated and Coated Organic Felt Base Sheet Used in Roofing	IBC	IRC						
D2661-08 11	Specification for Acrylonitrile-Butadiene-Styrene (ABS) Schedule 40 Plastic Drain, Waste, and Vent Pipe and Fittings	IPC	IPSDC	IRC					
D2665-09 12	Specification for Poly (Vinyl Chloride) (PVC) Plastic Drain, Waste, and Vent Pipe and Fittings	IPC	IPSDC	IRC					
D2672-96a(2003) (2009)	Specification for Joints for IPS PVC Pipe Using Solvent Cement	IPC	IRC	ISPSC					
D2683-04 10	Specification for Socket-Type Polyethylene Fittings for Outside Diameter-Controlled Polyethylene Pipe and Tubing	IPC	IRC	IMC					
D2729-03 11	Specification for Poly (Vinyl Chloride) (PVC) Sewer Pipe and Fittings	IRC	IPC	IPSDC					
D2737-03 12E1	Specification for Polyethylene (PE) Plastic Tubing	IPC	IRC						
D2822/D2822M-05(2011)E1	Specification for Asphalt Roof Cement, Asbestos Containing	IBC	IRC						
D2823/D2823M-05 (2011)E1	Specification for Asphalt Roof Coatings, Asbestos Containing	IBC	IRC						
D2824-06(2012)E1	Specification for Aluminum-Pigmented Asphalt Roof Coatings, Non-fibred, Asbestos Fibred, and Fibred without Asbestos	IRC	IBC						
D2837-08 11	Test Method for Obtaining Hydrostatic Design Basis for Thermoplastic Pipe Materials or Pressure Design Basis for Thermoplastic Pipe Products	IRC	IMC						
D2843-99(2004)e01 10	Test for Density of Smoke from the Burning or Decomposition of Plastics	IBC							
D2846/D 2846M-09BE1	Specification for Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Hot- and Cold-Water Distribution Systems	IPC	IRC	IMC	ISPSC				
D2855-96(2002) (2010)	Practice for Making Solvent-Cemented Joints with Poly (Vinyl Chloride) (PVC) Pipe and Fittings	IPC	IPSDC	IRC					
D2859-06 (2011)	Standard Test Method for Ignition Characteristics of Finished Textile Floor Covering Materials	IBC	IFC						
D2898-(04) 10	Standard Test Methods for Accelerated Weathering of Fire-	IBC	IRC	IWUIC					

	Retardant-Treated Wood for Fire Testing								
D2949-01a(2008) 10	Specification for 3.25-in. Outside Diameter Poly (Vinyl Chloride) (PVC) Plastic Drain, Waste, and Vent Pipe and Fittings	IPC	IPSDC	IRC					
D2974-07a-A	Standard Test Methods for Moisture, Ash and Organic Matter of Peat and other Organic Soils	IgCC							
D3035-08 12	Specification for Polyethylene (PE) Plastic Pipe (DR-PR) Based on Controlled Outside Diameter	IPC	IRC	IMC					
D3139-98(2005) 2011	Specification for Joints for Plastic Pressure Pipes Using Flexible Elastomeric Seals	IPC							
D3161/D3161M-09 12	Test Method for a Wind Resistance of Asphalt Shingles (Fan Induced Method)	IBC	IRC						
D3200-74(2005) 2012	Standard Specification and Test Method for Establishing Recommended Design Stresses for Round Timber Construction Poles	IBC							
D3201-08AE1	Test Method for Hygroscopic Properties of Fire-Retardant Wood and Wood-Based Products	IBC	IRC	IWUIC					
D3261-03 12	Specification for Butt Heat Fusion Polyethylene (PE) Plastic Fittings Plastic Pipe and Tubings	IMC	IPC						
D3278-1996(2004)e1 (2011)	Test Methods for Flash Point of Liquids by Small Scale Closed-Cup Apparatus	IBC	IFC	IMC					
D3311-08 11	Specification for Drain, Waste and Vent (DWV) Plastic Fittings Patterns	IPC	IRC						
D3350-08 12	Specification for Polyethylene Plastics Pipe and Fittings Materials	IRC	IMC						
D3462/3462M-09 10A	Specification for Asphalt Shingles Made From Glass Felt and Surfaced with Mineral Granules	IBC	IRC						
D3679-09 11	Specification for Rigid Poly (Vinyl Chloride) (PVC) Siding	IBC	IRC						
D3689-07	Test Methods for Deep Foundations Piles Under Static Axial Tensile Load	IBC							
D3737-08 09E1	Practice for Establishing Allowable Properties for Structural Glued Laminated Timber (Glulam)	IBC	IRC						
D3805/D3805M-97(2003)e1 (2009)	Standard Guide for Application of Aluminum-Pigmented Asphalt Roof Coatings	IBC							
D3909/D3909M-97b(2004) 2012e1	Specification for Asphalt Roll Roofing (Glass Felt) Surfaced with Mineral Granules	IBC	IRC	IWUIC					
D3957-06 09	Standard Practices for Establishing Stress Grades for Structural Members Used In Log Buildings	IBC	IRC						
D4022/D4022M-2007(2012)E1	Specification for Coal Tar Roof Cement, Asbestos Containing	IBC	IRC						
D4068-04 09	Specification for Chlorinated Polyethylene (CPE) Sheeting for Concealed Water-Containment Membrane	IPC	IRC						
D4272-08a 09	Test Method for Total Energy Impact of Plastic Films by Dart Drop	IBC							
D4318-05 10	Test Method for Liquid Limit, Plastic Limit, and Plasticity Index of Soils	IBC	IRC						
D4434/D4434M-09 12	Specification for Poly (Vinyl Chloride) Sheet Roofing	IBC	IRC						

D4479/D4479M-07(2012)E1	Specification for Asphalt Roof Coatings - Asbestos-Free	IBC	IRC						
D4551-96-(2008)e1 12	Specification for Poly (Vinyl Chloride) (PVC) Plastic Flexible Concealed Water-Containment Membrane	IPC	IRC						
D4586/D4586M-07(2012)E1	Specification for Asphalt Roof Cement, Asbestos-Free	IBC	IRC						
D4601/D4601M-08 042012E1	Specification for Asphalt-Coated Glass Fiber Base Sheet Used in Roofing	IBC	IRC						
D4637/D4637M-08 12	Specification for EPDM Sheet Used in Single-Ply Roof Membrane	IBC	IRC						
D4829-08a 11	Test Method for Expansion Index of Soils	IBC	IRC						
D4869/D4869M-05(2011)e01	Specification for Asphalt-Saturated (Organic Felt) Underlayment Used in Steep Slope Roofing	IBC	IRC						
D4897/D4897M-01(2009)	Specification for Asphalt-Coated Glass-Fiber Venting Base Sheet Used in Roofing	IBC	IRC						
D4945-08 12	Test Methods for High-Strain Dynamic Testing of Deep Foundations	IBC							
D5049-07a Withdrawn/no replacement	Specification for Reinforced CSM Polymeric Sheet Used in Roofing Membrane	IBC	IRC						
D5055-10 12	Specification for Establishing and Monitoring Structural Capacities of Prefabricated Wood I-Joists	IBC	IRC	IgCC					
D5197-09E1	Test Method for Determination of Formaldehyde and Other Carbonyl Compounds in Air (Active Sampler Methodology)	IgCC							
D5456-10 12	Standard Specification for Evaluation of Structural Composite Lumber Products	IBC	IRC	IgCC					
D5516-03 09	Test Method of Evaluating the Flexural Properties of Fire-Retardant Treated Softwood Plywood Exposed to the Elevated Temperatures	IBC	IRC						
D5643/D5643M-06 (2012)E1	Specification for Coal Tar Roof Cement, Asbestos-Free	IBC	IRC						
D5664-08 10	Test Methods for Evaluating the Effects of Fire-Retardant Treatments and Elevated Temperatures on Strength Properties of Fire-Retardant Treated Lumber	IBC	IRC						
D6162-2000a(2008)	Specification for Styrene Butadiene Styrene (SBS) Modified Bituminous Sheet Materials Using a Combination of Polyester and Glass Fiber Reinforcements	IBC	IRC						
D6164/D6164M-05e1 11	Specification for Styrene Butadiene Styrene (SBS) Modified Bituminous Sheet Materials Using Polyester Reinforcements	IBC	IRC						
D6222/D6222M-08 11	Specification for Atactic Polypropylene (APP) Modified Bituminous Sheet Materials Using Polyester Reinforcements	IBC	IRC						
D6223D6223M-02(2009)E1	Specification for Atactic Polypropylene (APP) Modified Bituminous Sheet Materials Using a Combination of Polyester and Glass Fiber Reinforcements	IBC	IRC						

D6662-09	Standard Specification for Polyolefin-Based <u>Plastic</u> Lumber Decking Boards	IWUIC							
D6694-08	Standard Specification for Liquid-applied Silicone Coating Used In Spray Polyurethane Foam Roofing Systems	IBC	IRC						
D6698-07 <u>12</u>	Standard Test Method for On-Line Measurement of Turbidity Below 5 NTU in Water	IgCC							
D6754/D6745M-02 <u>10</u>	Standard Specification for Ketone Ethylene Ester Based Sheet Roofing	IBC	IRC						
D6757-07	Standard Specification for Inorganic-Underlayment Felt Containing Inorganic Fibers used in Steep-Slope Roofing Products	IBC	IRC						
D6878-08e1/D6878-11A	Standard Specification for Thermoplastic Polyolefin Based Sheet Roofing	IBC	IRC						
D6886-14 <u>12</u>	Standard Methods for Determining the Biobased Content of Solid, Liquid, and Gaseous Samples Using Radiocarbon Analysis	IgCC							
D7032-08 <u>10a</u>	Standard Specification for Establishing Performance Ratings for Wood-Plastic Composite Deck Boards and Guardrail Systems (Guards or Handrails)	IRC	IWUIC						
D7158-08d/D7158M <u>2011</u>	Standard Test Method for Wind Resistance of Sealed Asphalt Shingles (Uplift Force/Uplift Resistance Method)	IBC	IRC						
E84-09 <u>2012c</u>	Test Method for Surface Burning Characteristics of Building Materials	IBC	IFC	IRC	IMC				
E96/E96M-05 <u>10</u>	Test Method for Water Vapor Transmission of Materials	IBC	IRC						
E108-07a <u>2011</u>	Test Methods for Fire Tests of Roof Coverings	IBC	IRC						
E119-2008a <u>2012a</u>	Standard Test Methods for Fire Tests of Building Construction and Materials	IBC	IRC	IMC	IWUIC				
E136-09 <u>2012</u>	Test Method for Behavior of Materials in a Vertical Tube Furnace at 750 Degrees C	IBC	IRC	IMC	IWUIC				
E519-00e1/E519M <u>2010</u>	Standard Test Method for Diagonal Tension (Shear) in Masonry Assemblages	IEBC							
E605-93(2006) (2011)	Test Method for Thickness and Density of Sprayed Fire-Resistive Material (SFRM) Applied to Structural Members	IBC							
E681-04 <u>2009</u>	Test Method for Concentration Limits of Flammability of Chemicals (Vapors and Gases)	IBC	IFC						
E736-00(2006) (2011)	Test Method for Cohesion/Adhesion of Sprayed Fire-Resistive Materials Applied to Structural Members	IBC							
E779—03 <u>10</u>	Standard Test Method for Determining Air Leakage Rate by Fan Pressurization	IECC	IgCC						
E814-08b <u>2011a</u>	Test Method of Fire Tests of Through-Penetration Firestops	IBC	IRC	IMC					
E970-08a <u>2010</u>	Test Method for Critical Radiant Flux of Exposed Attic Floor Insulation Using a Radiant Heat Energy Source	IBC	IRC

Reason: The CP 28 Code Development Policy, Section 4.5.1 requires the updating of referenced standards to be accomplished administratively, and be processed as a Code Change Proposal for consideration by the Administrative Code Change Committee. In September 2012, a letter was sent to each developer of standards that is referenced in the International Codes, asking them to provide ICC with a list of their standards in order to update to the current edition. Above is the list of the referenced standards that are to be updated based upon responses from standards developer.									
Public Hearing: Committee: AS AM D Assembly: ASF AMF DF									

PC1– 13

501.4 (New), 501.4.1 (New)

Proponent: Michael Mahoney, Federal Emergency Management Agency, representing the National Earthquake Hazards Reduction Program
(mike.mahoney@fema.dhs.gov)

Add text as follows:

501.4 Acceptable Methods. The following methods are considered acceptable methods to comply with Section 501.3.

501.4.1 Seismic Performance Assessment Methodology- Application of the seismic performance assessment methodology in FEMA P-58, including the Performance Assessment Calculation Tool (PACT) contained therein, shall be considered an *acceptable method* for compliance with the seismic provisions of Section 501.3 of this code.

Add new standards as follows:

CHAPTER 23

REFERENCED STANDARDS

FEMA P-58- January 2013, Seismic Performance Assessment of Buildings

Reason: This new method is being introduced to provide further guidance on performance based design for seismic loads. It introduces and is based on a new seismic performance assessment methodology developed for the Federal Emergency Management Agency (FEMA) under contract with the Applied Technology Council (ATC).

This document introduces a seismic performance assessment methodology as well as the basic building information, response quantities, fragilities, and consequence data that are used as inputs to the methodology. The procedures are probabilistic, uncertainties are explicitly considered, and performance is expressed as the probable consequences, in terms of human losses (deaths and serious injuries), direct economic losses (building repair or replacement costs), and indirect losses (repair time and unsafe placarding) resulting from building damage due to earthquake shaking. The methodology is general enough to be applied to any building type, regardless of age, construction or occupancy; however, basic data on structural and nonstructural damageability and consequence are necessary for its implementation. To allow for practical implementation of the methodology, this product also includes fragility and consequence data for most common structural systems and building occupancies, and an electronic *Performance Assessment Calculation Tool* (PACT) for performing the probabilistic computations and accumulation of losses.

Historically, direct references in this document to design standards have been avoided but as performance design standards emerge it is becoming more important to link these methods and standards with the performance code. Therefore it has been proposed to create a new section in Chapter 5 titled acceptable methods. This same structure could occur in all chapters as these performance based methods are developed and will give a clear quantitative way to comply with this code. Alternatively, at a minimum an appendix should be developed to house these methods so code users can more directly link to quantitative tools.

Appendix C – Structural Acceptable Methods

Section C101 Scope

C101.1 General. This appendix provides acceptable methods for compliance with Chapter 5 of this code.

C102 SEISMIC DESIGN.

C102.1 Seismic Performance Assessment Methodology. Application of the seismic performance assessment methodology in FEMA P-58, including the Performance Assessment Calculation Tool (PACT) contained therein, shall be considered an *acceptable method* for compliance with the seismic provisions of Chapter 5 of this code.

Section C103

REFERENCED STANDARDS

FEMA P-58- January 2013, Seismic Performance Assessment of Buildings

Cost Impact: Not applicable

Analysis: A review of the standard proposed for inclusion in the code FEMA P 58 – January 2013 titled Seismic Performance Assessment of Buildings , with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

APP F (NEW)-PC-MAHONEY.DOC

PC2-13

1501.2, 1501.3.1, 1501.3.2, 1501.4 (New)

Proponent (email): Ryan M. Colker, National Institute of Building Sciences representing National Institute of Building Sciences; Ryan Meres, Institute for Market Transformation, representing Institute for Market Transformation; Greg Towsley, Grundfos, representing Grundfos; Kurt Riesenberg, Spray Polyurethane Foam Alliance, representing Spray Polyurethane Foam Alliance (rcolker@nibs.org)

Revise as follows:

SECTION 1501 ENERGY EFFICIENCY

1501.1 Objective. To facilitate efficient use of energy.

1501.2 Functional statement. Buildings shall ~~have provisions ensuring~~ ensure efficient use of ~~nonrenewable~~ energy.

1501.3 Performance requirements.

1501.3.1 Energy performance indices. To provide for the efficient use of ~~depletable energy sources~~, the building envelope and all other building systems impacting energy use including but not limited to mechanical, plumbing and electrical shall be designed and constructed within stated parameters either individually or as a system. These parameters are called the energy performance indices. These indices are the amount of energy ~~from a depletable energy source passing through~~ entering a specified building envelope area or facility during a specified difference in internal and external temperature period of time. These indices are based on the geographic location and region of the country as well as the use of the building. Equivalent energy performance utilizing alternative energy conservation techniques is permitted. In some cases, for certain types of buildings, the local jurisdiction has the authority to choose not to specify energy performance indices.

~~1501.3.2 Temperature control.~~ ~~For buildings requiring a controlled temperature, the building design and construction shall take into account various factors. Normally, only insulation, types of windows and related building elements are considered when addressing energy conservation. However, to provide for the efficient use of energy, there are several other items that need to be taken into consideration, such as thermal resistance, solar radiation, air tightness and heat gain or loss from building services.~~

1501.4 Acceptable Methods. The following methods are considered acceptable methods to develop and demonstrate compliance with energy performance indices in Section 1501.3

1501.4.1 Development of indices. In determining the energy performance indices for a building or facility, the following factors shall be used by the authority having jurisdiction:

1. The principal purpose or function of the building or facility;
2. The length of time the building or facility is normally occupied by people;
3. The number of persons normally occupying, visiting, employed in or otherwise using the building, facility or portion of the building or facility
4. The energy use of similar buildings or systems based on occupancy and climate.

5. Anticipated energy use of a building or facility of the same classification in accordance with the latest edition of the *International Energy Conservation Code* or *International Green Construction Code*.
6. The energy use data characterizing a defined stock of buildings relevant to region and the building types being addressed shall be reviewed.

1501.4.2 Establishment of Indices. The energy performance indices shall be established in accordance with Section 1501.4.2.1 or 1501.4.2.2.

1501.4.2.1 Jurisdiction-wide indices. The adopting entity shall establish acceptable indices for all similar buildings covered under this code.

1501.4.2.2 Project-specific indices. The adopting entity shall establish acceptable indices for each individual building or facility to meet.

1501.4.3 Methodology for Compliance. Compliance with the energy indices shall comply with Section 1501.4.3.1 through 1501.4.3.9.

1501.4.3.1 Pre-Occupancy. The expected energy use of the building shall be less than or equal to that determined in accordance with Section 1501.4.1 and 1501.4.2.

1501.4.3.2 Energy Model. The design team shall develop a whole building energy model using software and parameters approved by the code official. ASHRAE 105 and ASHRAE 140 shall be approved methods used in the development of whole building energy models.

1501.4.3.3 Design Submittal. Results of the model and cut sheets of equipment and characteristics contained within the compliant model developed under Section 1501.4.3.2 shall be provided to the code official in accordance with Section 103.3.5. The design team shall determine the expected energy use of the building in accordance with ASHRAE 105.

1501.4.3.4 Permits and Inspections. Permits and inspections shall be based on matching the equipment and characteristics contained in the compliant model under Section 1501.4.3.2 and design report under Section 103.3.4.2.2 with the plan and on-site as required in Section 103.3.6 and Section 103.3.7.

1501.4.3.5 Verification of Compliance Documentation. The design team shall submit documentation verifying compliance with the established bounding conditions in accordance with Section 103.3.8.1.

1501.4.3.6 Issuance of Certificate. The code official is authorized to issue a "Conditional certificate of occupancy" in accordance with Section 103.3.9.1.3 for a time period determined sufficient to demonstrate achievement of the outcome requirement.

1501.4.3.7 Post-Occupancy. The actual energy use of the building shall not be greater than that determined in accordance with Section 1501.4.1 and 1501.4.2.

1501.4.3.8 Reporting of Energy Use. An annual report of energy use is required to be provided by the building owner to the code official in accordance with Section 103.3.10.2 and Section 103.3.10.3.

1501.4.3.9 Violations and Penalties. If the building's energy use as reported in accordance with Section 1501.4.3.8 is deemed noncompliant, the adopting entity is authorized to determine appropriate penalties in accordance with Section 103.2.10, Section 103.3.10.2, Section 103.3.10.3, and Section 103.3.12. The actual penalties shall be set by the jurisdiction in accordance with Section 103.3.13.4.

Add new standards as follows:

CHAPTER 23

REFERENCED STANDARDS

ASHRAE

American Society of Heating, Refrigerating and
Air-Conditioning Engineers, Inc. □ 1791 Tullie
Circle □ Atlanta, GA 30329-2305

ASHRAE 105-2007

Standard Methods of Expressing, and Comparing
Building Energy Performance

ASHRAE 140—2007

Standard Method of Test for the Evaluation of
Building Energy Analysis Computer Programs

Reason:

1. There is increasing interest in focusing on actual energy performance of buildings. This is in direct contrast to the current focus by energy codes on building and component design (primarily based on prescriptive requirements) with no requirements for ongoing performance and associated measurement and verification. They also have not generally looked at the building as a whole, other than the ability to adjudge a building based on how an energy simulation predicts it will perform against a clone of itself that is based on the prescriptive requirements.
2. The ICCPC is clear and serves as an appropriate code for inclusion of an outcome-based approach for energy. An approach consistent with the intent of the ICCPC is needed to foster the ability to look at the building as a whole, assess its anticipated performance in the design stage and then confirm delivery of an energy efficient building based on the actual energy use of the building.
3. Software and other tools exist that allow for the accurate modeling of building energy use to predict how a building will perform. Resources included within the ICCPC are §104.2.1: Approved methodologies, Appendix C: Individually Substantiated Design Method and Appendix E: Use of Computer Models. Guidance from the Department of Energy, ASHRAE Standard 105 and ASHRAE 140 and ComNet also may be used.
4. Data exist that provide a basis for accurately stipulating how buildings should perform (e.g. setting annual Energy Use Indices) including the Energy Information Administration Commercial Buildings Energy Consumption Survey and the U.S. Department of Energy/Environmental Protection Agency EnergyStar Program.
5. It is now feasible and more realistic to stipulate how buildings should be designed and constructed in order to yield a certain performance level and be evaluated for compliance with that level.
6. It is also now feasible and more appropriate to also assess how buildings actually perform against an established EUI.
7. The primary challenges currently identified for achievement of outcome-based energy performance include the methodology for setting outcomes, the role of code departments and others in monitoring and enforcing the outcome requirements, the fit within existing energy codes and standards, recourse for non-compliance, and contracting mechanisms for implementing such policies. This proposal is intended to establish optional, code-based criteria for establishment of an outcome-based methodology.
8. The proposal leaves open the opportunity to have post-occupancy compliance conducted by entities outside the code department.

Cost Impact: This code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code ASHRAE 105-2007, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013. The standard ASHRAE 140 -2007 is currently referenced in the IECC.

PC3-13

Section 1501.4 (New)

Proponent: Jim Edelson, representing New Buildings Institute
(jedelson@comcast.net)

Add text as follows:

1501.4 Acceptable Methods. The following methods are considered acceptable methods to satisfy the performance requirements in Section 1501.3.

1501.4.1 Outcome based compliance. The measurement of actual energy used to demonstrate compliance with Section 1501.3 shall be in accordance with Sections 1501.4.1.1 through 1501.4.1.4.

1501.4.1.1 Calculations. All energy usage shall be converted into units consistent with the energy units established by Section 1501.3.1.

1501.4.1.2 Certificate of Occupancy. Prior to the issuance of the certificate of occupancy and upon completion of construction, the *building* owner shall submit an operational plan to the *authority having jurisdiction* that includes the certification of the owner and an architect, engineer or general contractor under contract to the owner for monitoring and reporting energy use over a continuous 12-month period. The plan shall include the method for reporting actual energy use of the *building* in the format of the energy performance indices established by Section 1501.3.1.

1501.4.1.3 Occupancy. The metered, measured or billed energy use of the building shall be apportioned based on the occupancy period and square footage of the actual occupancy of the building during the 12-month period of monitoring energy use. Where multiple tenants or multiple occupancies exist, their tenancy or occupancy in the building shall be attested to by an affidavit signed by all building tenants indicating the time periods and square footage of the building portion occupied.

1501.4.1.4 Certificate of Acceptance. An application for Certificate of Acceptance is required to be filed with the *authority having jurisdiction* within 36 months of receiving a final Certificate of Occupancy. The application for the Certificate of Acceptance shall indicate that the owner and an architect, engineer or general contractor under contract to the owner have determined that the building has met the performance requirement established by Section 1501.3.1. Upon receipt of the completed application, a Certificate of Acceptance shall be provided to the building owner.

Reason: Since the first energy codes, compliance has not been based on actual building performance but rather on tried and true means of improving the performance of buildings: more insulation, better windows, better equipment, more efficient lighting, etc. This effectively made the goal of energy codes to create more efficient buildings rather than to create buildings that attain a certain level of efficiency. This current method of compliance leaves a whole range of factors that impact energy efficiency, from design to occupancy, unaddressed and unregulated by the code. In the design phase, these factors include orientation, system selection, passive characteristics, etc. In the occupancy phase, these factors include control strategies, occupant density, equipment maintenance, plug loads, etc.

The result is a misalignment between the energy codes and how buildings actually perform. Not only does this leave a large portion of building energy use unaddressed, it means that many very effective means of achieving energy efficiency, especially many new technologies, cannot be used to achieve code compliance. As technologies become more complex, and the 'unregulated' portions of building energy use increase, the traditional prescriptive-based energy codes will become less and less able to impact the actual energy performance of buildings. The significant increases in stringency contained in the 2012 version of the International Energy Conservation Code accelerated the pace at which this is occurring.

The ICC Performance Code is formulated around a concept of flexibility. Rather than prescribing the details that lead to a desired outcome, the ICCPC requires a desired performance – a desired outcome – and then provides flexibility as to how that outcome is reached. This makes it a natural fit for an approach to energy efficiency that uses actual outcomes rather than performance proxies (insulation levels, equipment efficiency, etc.) to demonstrate compliance.

In section 1501.3.1, the ICCPC already contains a mechanism that allows jurisdictions to set performance targets. This proposal adds a new section 1501.4 that allows projects to demonstrate compliance with those performance targets through the measurement of actual energy performance. The outcome-based compliance option relies upon actual measurement of the

performance of a building after it is occupied and fully operational. Only then can the owner be fully cognizant of the true energy costs and possibilities for management of the use and application of energy savings.

A certificate of occupancy is necessary to allow the building to be occupied despite the fact that outcome-based compliance has not been determined, and cannot be determined. Responsibility for monitoring and recording the energy used and energy produced by the building and the building site falls to the design team, including the owner, architect, engineer and even contractors. They are all part of the process of preparing an operational plan that indicates the measurement methodology and how they intend to comply with the performance target set in 1501.3.

Occupancy factors for the actual tenants are required to be factored into the calculation of energy consumption if there are multiple tenants in a building. With at least a full year of testing and evaluation of the building performance, the team can determine whether the results meet the anticipated goal. The compliance path sets a period of 36 months in which to demonstrate compliance. This 3-year period permits time to allow for the building to become as fully occupied as possible and to come up to speed with the operational features. This will also give the design team sufficient time to modify and adjust the various key elements of the building that are affecting the building's energy consumption.

Finally, there is documentation submitted to the jurisdiction for a certificate of acceptance. The design team provides the information that has been gathered in accordance with their procedures and it only requires that the documentation be entered into the building project record. The owner simply gets a Certificate of Acceptance indicating this step in the process has been completed. While this process provides only a promise that the building will perform, this is not different from the method of determining compliance with the computer simulation approach that is already in almost every energy code.

This proposal does not require that all buildings demonstrate compliance with the ICCPC by using actual energy outcomes. The permissive language only makes the proposed option available for those projects that desire it. It closes the gap between the code and actual energy outcomes, and brings the full range of factors that impact energy performance as an option into the ICCPC.

Cost Impact: There is no cost impact to this proposal.

1501.4 (NEW)-PC-EDELSON.DOC

PC4-13

1901.3.2, 1901.3.10

Proponent: Mark Watson, IntPE, Ecoglo International Ltd, representing Ecoglo International Ltd.
(mark.watson@ecoglo.com)

Revise as follows:

1901.3.2 Identification, ~~illumination~~ visibility and safety of means of egress. Means of egress shall be clearly identified, ~~provided with adequate illumination~~ be made adequately visible and be easy and safe to use.

1901.3.10 Maintenance of ~~illumination~~ visibility. Means of egress shall be maintained and operated in such a manner to ensure adequate ~~lighting~~ means for providing visibility to facilitate safe egress is available.

Reason: The use of the word "illumination" rather than "visibility" discourages the use of alternative solutions, which is contrary to the purpose of the ICC PC [Section 101.1 Purpose: "To provide appropriate health, safety, welfare, and social and economic value, while promoting innovative, flexible and responsive solutions that optimize the expenditure and consumption of resources."] Alternative solutions such as systems using electrical or photoluminescent path markings can make the means of egress adequately visible without illumination of the means of egress. Illumination infers the casting of light onto a surface or object. It depends on the properties of that object how much light (if any) is reflected or emitted to be detected by our eyes. "Visibility" requires that the object is detected by our visual system, and therefore is the critical performance indicator.

Cost Impact: The code change proposal will not increase the cost of construction.

TENTATIVE ORDER OF DISCUSSION 2013 PROPOSED CHANGES TO THE INTERNATIONAL EXISTING BUILDING CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation **does not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some IEBC code change proposals may not be included on this list, as they are being heard by other committees. Please consult the Cross Index of Proposed Changes.

Proponent: Jim Edelson, New Buildings Institute (jedelson@comcast.net), Ric Cochrane, National Trust for Historic Preservation, David Collins, The Preview Group, representing The American Institute of Architects

Delete and substitute as follows:

~~**[B] HISTORIC BUILDING.** Any building or structure that is listed in the State or National Register of Historic Places; designated as a historic property under local or state designation law or survey; certified as a contributing resource within a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Register of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places.~~

HISTORIC BUILDING. Any building or structure that is one or more of the following:

1. Listed, or certified as eligible for listing by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, in the National Register of Historic Places
2. Designated as historic under an applicable state or local law; or
3. Certified as a contributing resource within a National Register listed or locally designated historic district.

Reason: The current language for Historic Buildings in the IECC-Commercial, the IECC-Residential and the IEBC is confusing and does not clearly describe how buildings and districts are listed or determined to be eligible to be listed as historic. The definition in the IEBC contains no fewer than three semi-colons and nine uses of “or” in a single sentence. This makes the language very difficult to parse.

This proposal solves two problems. First, it remedies the confusion caused by the sheer complexity of the defining language by converting the running list of qualifications into a clearly delineated numbered list. Second, the proposal gives the language clarity and specificity as to how a building is officially determined to be eligible for the various lists of historic buildings. In accordance with the Code of Federal Regulations, Title 36, Chapter I, Part 63, determinations of eligibility for listing in the National Register of Historic Places are made by State Historic Preservation Offices in coordination with the Keeper of the National Register of Historic Places. This is an official process conducted in accordance with federal standards. This proposal aligns the code language with the language of this official process and removes any ambiguity as to who can make determinations of eligibility.

This proposal is one of four proposals in Cycle B to create a consistency for Historic Buildings across the I-codes. The other three proposals are being made to the IECC-Residential, the IECC-Commercial and the IPMC.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: PM2-13 and CE7-13 also propose a similar definition for Historic Building for the IPMC and IECC, respectively.

202-[B] HISTORIC BUILDING-EB-COCHRANE-COLLINS-EDELSON.doc

EB2 – 13

Chapter 3, 302 (NEW), 501.3

Proponent: Maureen Traxler, City of Seattle, representing Seattle Dept. of Planning & Development (Maureen.traxler@seattle.gov)

Revise as follows:

CHAPTER 3 PROVISIONS FOR ALL COMPLIANCE METHODS

SECTION 302 PROVISIONS FOR ALL COMPLIANCE METHODS

302.1 Applicability. The provisions of Section 302 apply to all alterations, repairs, additions, relocations of structures and changes of occupancy regardless of compliance method.

301.2 302.2 Additional codes. *Alterations, repairs, additions and changes of occupancy to, or relocation of, existing buildings and structures shall comply with the provisions for alterations, repairs, additions and changes of occupancy or relocation, respectively, in this code and the International Energy Conservation Code, International Fire Code, International Fuel Gas Code, International Mechanical Code, International Plumbing Code, International Property Maintenance Code, International Private Sewage Disposal Code, International Residential Code and NFPA 70. Where provisions of the other codes conflict with provisions of this code, the provisions of this code shall take precedence.*

302.3 Existing materials. Materials already in use in a building in compliance with requirements or approvals in effect at the time of their erection or installation shall be permitted to remain in use unless determined by the building official to be unsafe per Section 115. (IEBC 401.2.1)

302.4 New and replacement materials. Except as otherwise required or permitted by this code, materials permitted by the applicable code for new construction shall be used. Like materials shall be permitted for repairs and alterations, provided no hazard to life, health or property is created. Hazardous materials shall not be used where the code for new construction would not permit their use in buildings of similar occupancy, purpose and location. (IEBC 401.2.2)

302.5 501.3 Occupancy and use. When determining the appropriate application of the referenced sections of this code, the occupancy and use of a building shall be determined in accordance with Chapter 3 of the *International Building Code*.

Reason: Some provisions that should apply to all 3 compliance methods are located in chapters related to only one method. To accommodate these provisions, we propose that a new section be created in chapter 3, which is the only chapter, other than administrative chapters, that applies to all 3 compliance methods. All the provisions in the proposed Section 302 already exist in the IEBC, except the charging section. Since Chapter 4 was dealt with during the Group A Cycle the sections in Chapter 4 can not be deleted but instead are copied into Chapter 3. Section 302.3 is a duplication of Section 401.2.1 and Section 302.4 is a duplication of Section 401.2.2.

The intent of this proposal is to copy and relocate sections and renumber other chapters as necessary.

Cost Impact: This code change proposal will not increase the cost of construction.

EB2-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

CHAPTER 3-EB-TRAXLER.doc

EB3 – 13

301.1, 301.2, 302 (New), 302.1 (New), 302.1.1 (New), 303 (New), 705.1, Chapter 16

Proponent: David S. Collins, FAIA, The Preview Group, Inc. (dcollins@preview-group.com), The American Institute of Architects and Robert J Davidson, Davidson Code Concepts, LLC

Revise as follows:

CHAPTER 3 COMPLIANCE METHODS, APPLICABILITY AND MINIMUM REQUIREMENTS

301.1 General. The *repair, alteration, change of occupancy, addition* or relocation of all *existing buildings* shall comply with one of the methods listed in Sections 301.1.1 through 301.1.3 as selected by the applicant in addition to complying with the minimum requirements in Sections 302 and 303. Application of a method shall be the sole basis for assessing the compliance of work performed under a single permit unless otherwise approved by the *code official*. Sections 301.1.1 through 301.1.3 shall not be applied in combination with each other. Where this code requires consideration of the seismic force-resisting system of an existing building subject to *repair, alteration, change of occupancy, addition* or relocation of *existing buildings*, the seismic evaluation and design shall be based on Section 301.1.4 regardless of which compliance method is used.

Exception: Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code unless the building is undergoing more than a limited structural alteration as defined in Section 907.4.3. New structural members added as part of the *alteration* shall comply with the *International Building Code*. *Alterations of existing buildings in flood hazard areas* shall comply with Section 701.3.

SECTION 302 ADDITIONAL CODES AND REQUIREMENTS

301.2 Additional codes 302.1 General. *Alterations, repairs, additions and changes of occupancy* to, or relocation of, *existing buildings* and structures shall comply with the provisions for *alterations, repairs, additions and changes of occupancy* or relocation, respectively, in this code and the *International Energy Conservation Code, International Fire Code, International Fuel Gas Code, International Mechanical Code, International Plumbing Code, International Property Maintenance Code, International Private Sewage Disposal Code, International Residential Code* and NFPA 70. Where provisions of the other codes conflict with provisions of this code, the provisions of this code shall take precedence.

302.1.1 Accessibility. Level 1 alterations shall comply with the 2015 ANSI A117.1 to the extent of the altered element. Areas of an existing building that are outside the specific work area or otherwise unaffected by alterations Level 1, 2 or 3, that are required to be accessible by Chapter 7 shall comply with the 2003 ANSI A117.1.

Work performed under Level 2 and 3 alterations shall comply with the 2015 ANSI A117.1 and all spaces that change configuration as part of the alterations shall comply with the 2015 ANSI A117.1.

SECTION 303 EXISTING BUILDING MINIMUM REQUIREMENTS

303.1 Administration. Sections 303.1.1 through 303.1.4 shall set the scope, intent and administration of provisions related to minimum requirements that are applicable to existing buildings.

303.1.1 (IF 1101.1) Scope. The provisions of this Section shall apply to existing buildings constructed prior to the adoption of this code.

303.1.2 ([F] 1101.2) Intent. The intent of this Section is to provide a minimum degree of fire and life safety to persons occupying existing buildings by providing minimum construction requirements where such existing buildings do not comply with the minimum requirements of the International Building Code.

303.1.3 ([F] 1101.3) Permits. Permits for alterations necessary to conform with this Section shall be required as set forth in Sections 105.1.

303.1.4 ([F] 1101.4) Owner notification. When a building is found to be in noncompliance with this chapter, the code official shall duly notify the owner of the building. Upon receipt of such notice, the owner shall, subject to the following time limits, take necessary actions to comply with the provisions of this chapter.

303.1.4.1 ([F] 1101.4.1) Construction documents. Construction documents necessary to comply with this chapter shall be completed and submitted within a time schedule approved by the code official.

303.1.4.2 ([F] 1101.4.2) Completion of work. Work necessary to comply with this chapter shall be completed within a time schedule approved by the code official.

303.1.4.3 ([F] 1101.4.3) Extension of time. The code official is authorized to grant necessary extensions of time when it can be shown that the specified time periods are not physically practical or pose an undue hardship. The granting of an extension of time for compliance shall be based on the showing of good cause and subject to the filing of an acceptable systematic plan of correction with the code official.

303.2 ([F] SECTION 1103) Fire safety requirements for existing buildings. Minimum fire safety requirements for existing buildings shall be in provided in accordance with Sections 303.2.1 through 303.2.9.

303.2.1 ([F] 1103.1) Required construction. Existing buildings shall comply with not less than the minimum provisions specified in Table 303.2.1 and as further enumerated in Sections 303.2.2 through 303.2.9.

The provisions of this chapter shall not be construed to allow the elimination of fire protection systems or a reduction in the level of fire safety provided in buildings constructed in accordance with previously adopted codes.

Exception: Group U occupancies.

a. Existing buildings shall comply with the Sections identified as "Required" (R) based on occupancy classification or use, or both, whichever is applicable.

R = The building is required to comply.

303.2.2 (IF 1103.2) Emergency responder radio coverage in existing buildings. Existing buildings that do not have approved radio coverage for emergency responders within the building based upon the existing coverage levels of the public safety communication systems of the jurisdiction at the exterior of the building, shall be equipped with such coverage according to one of the following:

1. Whenever an existing wired communication system cannot be repaired or is being replaced, or where not approved in accordance with Section 510.1, Exception 1 of the *International Fire Code*.
2. Within a time frame established by the adopting authority.

Exception: Where it is determined by the fire code official that the radio coverage system is not needed.

303.2.3 (IF 1103.3) Elevator operation. Existing elevators with a travel distance of 25 feet (7620 mm) or more above or below the main floor or other level of a building and intended to serve the needs of emergency personnel for fire-fighting or rescue purposes shall be provided with emergency operation in accordance with ASME A17.3.

303.2.4 (IF 1103.4) Vertical openings. Interior vertical shafts, including but not limited to stairways, elevator hoistways, service and utility shafts, that connect two or more stories of a building, shall be enclosed or protected as specified in Sections 303.2.4.1 through 303.2.4.7.

303.2.4.1 (IF 1103.4.1) Group I occupancies. In Group I occupancies, interior vertical openings connecting two or more stories shall be protected with 1-hour fire-resistance-rated construction.

303.2.4.2 (IF 1103.4.2) Three to five stories. In other than Group I occupancies, interior vertical openings connecting three to five stories shall be protected by either 1-hour fire-resistance-rated construction or an automatic sprinkler system shall be installed throughout the building in accordance with Section 903.3.1.1 or 903.3.1.2 of the *International Building Code*.

Exceptions:

1. Vertical opening protection is not required for Group R-3 occupancies.
2. Vertical opening protection is not required for open parking garages and ramps.
3. Vertical opening protection for escalators shall be in accordance with Section 303.2.4.5, 303.2.4.6 or 303.2.4.7.

303.2.4.3 (IF) 1103.4.3 More than five stories. In other than Group I occupancies, interior vertical openings connecting more than five stories shall be protected by 1-hour fire-resistance-rated construction.

Exceptions:

1. Vertical opening protection is not required for Group R-3 occupancies.
2. Vertical opening protection is not required for open parking garages and ramps.
3. Vertical opening protection for escalators shall be in accordance with Section 303.2.4.5, 303.2.4.6 or 303.2.4.7.

303.2.4.4 (IF) 1103.4.4 Atriums and covered malls. In other than Group I occupancies, interior vertical openings in a covered mall building or a building with an atrium shall be protected by either 1-hour fire-resistance-rated construction or an automatic sprinkler system shall be installed throughout the building in accordance with Section 903.3.1.1 or 903.3.1.2 of the *International Building Code*.

Exceptions:

1. Vertical opening protection is not required for Group R-3 occupancies.
2. Vertical opening protection is not required for open parking garages and ramps.

303.2.4.5 (IF) 1103.4.5 Escalators in Group B and M occupancies. Escalators creating vertical openings connecting any number of stories shall be protected by either 1-hour fire-resistance-rated construction or an automatic sprinkler system in accordance with Section 903.3.1.1 of the *International Building Code* installed throughout the building, with a draft curtain and closely spaced sprinklers around the escalator opening.

303.2.4.6 (IF) 1103.4.6 Escalators connecting four or fewer stories. In other than Group B and M occupancies, escalators creating vertical openings connecting four or fewer stories shall be protected by either 1-hour fire-resistance-rated construction or an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 of the *International Building Code* shall be installed throughout the building, and a draft curtain with closely spaced sprinklers shall be installed around the escalator opening.

303.2.4.7 (IF) 1103.4.7 Escalators connecting more than four stories. In other than Group B and M occupancies, escalators creating vertical openings connecting five or more stories shall be protected by 1-hour fire-resistance-rated construction.

303.2.5 (IF) 1103.5) Sprinkler systems. An automatic sprinkler system shall be provided in existing buildings in accordance with Sections 303.2.5.1 and 303.2.5.2.

303.2.5.1 (IF) 1103.5.1 Pyroxylin plastics. An automatic sprinkler system shall be provided throughout existing buildings where cellulose nitrate film or pyroxylin plastics are manufactured, stored or handled in quantities exceeding 100 pounds (45 kg). Vaults located within buildings for the storage of raw pyroxylin shall be protected with an approved automatic sprinkler system capable of discharging 1.66 gallons per minute per square foot (68 L/min/m²) over the area of the vault.

303.2.5.2 (IF) 1103.5.2) Group I-2. An automatic sprinkler system shall be provided throughout existing Group I-2 fire areas. The sprinkler system shall be provided throughout the floor where the Group I-2 occupancy is located, and in all floors between the Group I-2 occupancy and the level of exit discharge.

303.2.6 (IF) 1103.6) Standpipes. Where required by Sections 303.2.6.1 or 303.2.6.2, standpipes shall be installed in accordance with Section 905 of the *International Building Code*. The code official is authorized to approve the installation of manual standpipe systems to achieve compliance with this Section where the responding fire department is capable of providing the required hose flow at the highest standpipe outlet.

303.2.6.1 (IF) 1103.6.1) Existing multiple-story buildings. Existing buildings with occupied floors located more than 50 feet (15 240 mm) above the lowest level of fire department access or more than 50 feet (15 240 mm) below the highest level of fire department access shall be equipped with standpipes.

303.2.6.2 (IF) 1103.6.2) Existing helistops and heliports. Existing buildings with a rooftop helistop or heliport located more than 30 feet (9144 mm) above the lowest level of fire department access to the roof level on which the helistop or heliport is located shall be equipped with standpipes in accordance with Section 905.3.6 of the *International Building Code*.

303.2.7 (IF) 1103.7) Fire alarm systems. An approved fire alarm system shall be installed in existing buildings and structures where required by Sections 303.2.7.1 through 303.2.7.7 and provide occupant notification in accordance with Section 907.6 of the *International Building Code* unless other requirements are provided by other Sections of this code.

Exception: Occupancies with an existing, previously approved fire alarm system.

303.2.7.1 (IF) 1103.7.1) Group E. A fire alarm system shall be installed in existing Group E occupancies in accordance with Section 907.2.3.

Exceptions:

1. A manual fire alarm system is not required in a building with a maximum area of 1,000 square feet (93 m²) that contains a single classroom and is located no closer than 50 feet (15 240 mm) from another building.
2. A manual fire alarm system is not required in Group E occupancies with an occupant load less than 50.

303.2.7.2 (IF) 1103.7.2) Group I-1. An automatic fire alarm system shall be installed in existing Group I-1 residential care/assisted living facilities in accordance with Section 907.2.6.1 of the *International Building Code*.

Exceptions:

1. Manual fire alarm boxes in resident or patient sleeping areas shall not be required at exits if located at all nurses' control stations or other constantly attended staff locations, provided such stations are visible and continuously accessible and that travel distances required in Section 907.5.2 of the *International Building Code* are not exceeded.
2. Where each sleeping room has a means of egress door opening directly to an exterior egress balcony that leads directly to the exits in accordance with Section 1019 of the *International Building Code*, and the building is not more than three stories in height.

303.2.7.3 (IF) 1103.7.3) Group I-2. An automatic fire alarm system shall be installed in existing Group I-2 occupancies in accordance with Section 907.2.6.2 of the *International Building Code*.

Exception: Manual fire alarm boxes in resident or patient sleeping areas shall not be required at exits if located at all nurses' control stations or other constantly attended staff locations, provided such stations are visible and continuously accessible and that travel distances required in Section 907.5.2.1 of the *International Building Code* are not exceeded.

303.2.7.4 (IF) 1103.7.4) Group I-3. An automatic and manual fire alarm system shall be installed in existing Group I-3 occupancies in accordance with Section 907.2.6.3 of the *International Building Code*.

303.2.7.5 (IF) 1103.7.5) Group R-1. A fire alarm system and smoke alarms shall be installed in existing Group R-1 occupancies in accordance with Sections 303.2.7.5.1 through 303.2.7.5.2.1.

303.2.7.5.1 (IF) 1103.7.5.1) Group R-1 hotel and motel manual fire alarm system. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.6 of the

International Building Code shall be installed in existing Group R-1 hotels and motels more than three stories or with more than 20 sleeping units.

Exceptions:

1. Buildings less than two stories in height where all sleeping units, attics and crawl spaces are separated by 1-hour fire-resistance-rated construction and each sleeping unit has direct access to a public way, egress court or yard.
2. Manual fire alarm boxes are not required throughout the building when the following conditions are met:
 - 2.1. The building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2 of the *International Building Code*;
 - 2.2. The notification appliances will activate upon sprinkler water flow; and
 - 2.3. At least one manual fire alarm box is installed at an approved location.

303.2.7.5.1.1 ([F] 1103.7.5.1.1) Group R-1 hotel and motel automatic smoke detection system. An automatic smoke detection system that activates the occupant notification system in accordance with Section 907.6 of the *International Building Code* shall be installed in existing Group R-1 hotels and motels throughout all interior corridors serving sleeping rooms not equipped with an approved, supervised sprinkler system installed in accordance with Section 903 of the *International Building Code*.

Exception: An automatic smoke detection system is not required in buildings that do not have interior corridors serving sleeping units and where each sleeping unit has a means of egress door opening directly to an exit or to an exterior exit access that leads directly to an exit.

303.2.7.5.2 ([F] 1103.7.5.2) Group R-1 boarding and rooming houses manual fire alarm system. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.6 of the *International Building Code* shall be installed in existing Group R-1 boarding and rooming houses.

Exception: Buildings less than two stories in height where all sleeping units, attics and crawl spaces are separated by 1-hour fire-resistance-rated construction and each sleeping unit has direct access to a public way, egress court or yard.

303.2.7.5.2.1 ([F] 1103.7.5.2.1) Group R-1 boarding and rooming houses automatic smoke detection system. An automatic smoke detection system that activates the occupant notification system in accordance with Section 907.6 of the *International Building Code* shall be installed in existing Group R-1 boarding and rooming houses throughout all interior corridors serving sleeping units not equipped with an approved, supervised sprinkler system installed in accordance with Section 903 of the *International Building Code*.

Exception: Buildings equipped with single-station smoke alarms meeting or exceeding the requirements of Section 907.2.11.1 of the *International Building Code* and where the fire alarm system includes at least one manual fire alarm box per floor arranged to initiate the alarm.

303.2.7.6 ([F] 1103.7.6) Group R-2. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.6 of the *International Building Code* shall be installed in existing Group R-2 occupancies more than three stories in height or with more than 16 dwelling or sleeping units.

Exceptions:

1. Where each living unit is separated from other contiguous living units by fire barriers having a fire-resistance rating of not less than 0.75 hour, and where each living unit has either its own independent exit or its own independent stairway or ramp discharging at grade.
2. A separate fire alarm system is not required in buildings that are equipped throughout with an approved supervised automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2 of the *International Building Code* and having a local alarm to notify all occupants.

3. A fire alarm system is not required in buildings that do not have interior corridors serving dwelling units and are protected by an approved automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2 of the *International Building Code*, provided that dwelling units either have a means of egress door opening directly to an exterior exit access that leads directly to the exits or are served by open-ended corridors designed in accordance with Section 1026.6, Exception 4 of the *International Building Code*.

303.2.7.7 (IF 1103.7.7) Group R-4. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.6 of the *International Building Code* shall be installed in existing Group R-4 residential care/assisted living facilities in accordance with Section 907.2.10.1 of the *International Building Code*.

Exceptions:

1. Where there are interconnected smoke alarms meeting the requirements of Section 907.2.11 of the *International Building Code* and there is at least one manual fire alarm box per floor arranged to continuously sound the smoke alarms.
2. Other manually activated, continuously sounding alarms approved by the code official.

303.2.8 (IF 1103.8) Single- and multiple-station smoke alarms. Single- and multiple-station smoke alarms shall be installed in existing Group I-1 and R occupancies in accordance with Sections 303.2.8.1 through 303.2.8.3.

303.2.8.1 (IF 1103.8.1) Where required. Existing Group I-1 and R occupancies shall be provided with single-station smoke alarms in accordance with Section 907.2.11 of the *International Building Code*, except as provided in Sections 303.2.8.2 or 303.2.8.3.

Exceptions:

1. Where the code that was in effect at the time of construction required smoke alarms and smoke alarms complying with those requirements are already provided.
2. Where smoke alarms have been installed in occupancies and dwellings that were not required to have them at the time of construction, additional smoke alarms shall not be required provided that the existing smoke alarms comply with requirements that were in effect at the time of installation.
3. Where smoke detectors connected to a fire alarm system have been installed as a substitute for smoke alarms.

303.2.8.2 (IF 1103.8.2) Interconnection. Where more than one smoke alarm is required to be installed within an individual dwelling or sleeping unit, the smoke alarms shall be interconnected in such a manner that the activation of one alarm will activate all of the alarms in the individual unit. Physical interconnection of smoke alarms shall not be required where listed wireless alarms are installed and all alarms sound upon activation of one alarm. The alarm shall be clearly audible in all bedrooms over background noise levels with all intervening doors closed.

Exceptions:

1. Interconnection is not required in buildings that are not undergoing alterations, repairs or construction of any kind.
2. Smoke alarms in existing areas are not required to be interconnected where alterations or repairs do not result in the removal of interior wall or ceiling finishes exposing the structure, unless there is an attic, crawl space or basement available which could provide access for interconnection without the removal of interior finishes.

303.2.8.3 (IF 1103.8.3) Power source. Single-station smoke alarms shall receive their primary power from the building wiring provided that such wiring is served from a commercial source and shall be equipped with a battery backup. Smoke alarms with integral strobes that are not equipped with battery backup shall be connected to an emergency electrical system. Smoke alarms shall emit a signal when the

batteries are low. Wiring shall be permanent and without a disconnecting switch other than as required for overcurrent protection.

Exceptions:

1. Smoke alarms are permitted to be solely battery operated in existing buildings where no construction is taking place.
2. Smoke alarms are permitted to be solely battery operated in buildings that are not served from a commercial power source.
3. Smoke alarms are permitted to be solely battery operated in existing areas of buildings undergoing alterations or repairs that do not result in the removal of interior walls or ceiling finishes exposing the structure, unless there is an attic, crawl space or basement available which could provide access for building wiring without the removal of interior finishes.

303.2.9 ([F] 1103.9) Carbon monoxide alarms. Existing Group I or R occupancies located in a building containing a fuel-burning appliance or a building which has an attached garage shall be equipped with single-station carbon monoxide alarms. The carbon monoxide alarms shall be listed as complying with UL 2034, and be installed and maintained in accordance with NFPA 720 and the manufacturer's instructions. An open parking garage, as defined in the International Building Code, or an enclosed parking garage ventilated in accordance with Section 404 of the *International Mechanical Code* shall not be deemed to be an attached garage.

Exception: Sleeping units or dwelling units which do not themselves contain a fuel-burning appliance or have an attached garage, but which are located in a building with a fuel-burning appliance or an attached garage, need not be equipped with single-station carbon monoxide alarms provided that:

1. The sleeping unit or dwelling unit is located more than one story above or below any story that contains a fuel-burning appliance or an attached garage;
2. The sleeping unit or dwelling unit is not connected by duct work or ventilation shafts to any room containing a fuel-burning appliance or to an attached garage; and
3. The building is provided with a common area carbon monoxide alarm system.

303.3 ([F] 1104.1). Means of egress. Means of egress in existing buildings shall comply with the minimum egress requirements when specified in Table 303.2.1 as further enumerated in Sections 303.3.1 through 303.3.23, and the building code that applied at the time of construction. Where the provisions of this chapter conflict with the building code that applied at the time of construction, the most restrictive provision shall apply. Existing buildings that were not required to comply with a building code at the time of construction shall comply with the minimum egress requirements when specified in Table 303.2.1 as further enumerated in Sections 303.3.1 through 303.3.23.

303.3.1 ([F] 1104.2) Elevators, escalators and moving walks. Elevators, escalators and moving walks shall not be used as a component of a required means of egress.

Exceptions:

1. Elevators used as an accessible means of egress where allowed by Section 1007.4 of the *International Building Code*.
2. Previously approved escalators and moving walks in existing buildings.

303.3.2 ([F] 1104.3) Exit sign illumination. Exit signs shall be internally or externally illuminated. The face of an exit sign illuminated from an external source shall have an intensity of not less than 5 footcandles (54 lux). Internally illuminated signs shall provide equivalent luminance and be listed for the purpose.

Exception: Approved self-luminous signs that provide evenly illuminated letters shall have a minimum luminance of 0.06 foot-lamberts (0.21 cd/m²).

303.3.3 ([F] 1104.4) Power source. here emergency illumination is required in Section 303.3.4, exit signs shall be visible under emergency illumination conditions.

Exception: Approved signs that provide continuous illumination independent of external power sources are not required to be connected to an emergency electrical system.

303.3.4 ([F] 1104.5) Illumination emergency power. The power supply shall normally be provided by the premises' electrical supply. In the event of power supply failure, illumination shall be automatically provided from an emergency system for the following occupancies where such occupancies require two or more means of egress:

1. Group A having 50 or more occupants.

Exception: Assembly occupancies used exclusively as a place of worship and having an occupant load of less than 300.

2. Group B buildings three or more stories in height, buildings with 100 or more occupants above or below a level of exit discharge serving the occupants or buildings with 1,000 or more total occupants.
3. Group E in interior stairs, corridors, windowless areas with student occupancy, shops and laboratories.
4. Group F having more than 100 occupants.

Exception: Buildings used only during daylight hours which are provided with windows for natural light in accordance with the International Building Code.

5. Group I.
6. Group M.

Exception: Buildings less than 3,000 square feet (279 m²) in gross sales area on one story only, excluding mezzanines.

7. Group R-1.

Exception: Where each sleeping unit has direct access to the outside of the building at grade.

8. Group R-2.

Exception: Where each dwelling unit or sleeping unit has direct access to the outside of the building at grade.

9. Group R-4.

Exception: Where each sleeping unit has direct access to the outside of the building at ground level.

303.3.4.1 ([F] 1104.5.1) Emergency power duration and installation. In other than Group I-2, the emergency power system shall provide power for not less than 60 minutes and consist of storage batteries, unit equipment or an on-site generator. In Group I-2, the emergency power system shall provide power for not less than 90 minutes and consist of storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with Section 1006.3 of the *international Building Code*.

303.3.5 ([F] 1104.6) Guards. Guards complying with this Section shall be provided at the open sides of means of egress that are more than 30 inches (762 mm) above the floor or grade below.

303.3.5.1 (IF 1104.6.1) Height of guards. Guards shall form a protective barrier not less than 42 inches (1067 mm) high.

Exceptions:

1. Existing guards on the open side of stairs shall be not less than 30 inches (760 mm) high.
2. Existing guards within dwelling units shall be not less than 36 inches (910 mm) high.
3. Existing guards in assembly seating areas.

303.3.5.2 (IF 1104.6.2) Opening limitations. Open guards shall have balusters or ornamental patterns such that a 6-inch-diameter (152 mm) sphere cannot pass through any opening up to a height of 34 inches (864 mm).

Exceptions:

1. At elevated walking surfaces for access to, and use of, electrical, mechanical or plumbing systems or equipment, guards shall have balusters or be of solid materials such that a sphere with a diameter of 21 inches (533 mm) cannot pass through any opening.
2. In occupancies in Group I-3, F, H or S, the clear distance between intermediate rails measured at right angles to the rails shall not exceed 21 inches (533 mm).
3. Approved existing open guards.

303.3.6 (IF 1104.7) Size of doors. The minimum width of each door opening shall be sufficient for the occupant load thereof and shall provide a clear width of not less than 28 inches (711 mm). Where this Section requires a minimum clear width of 28 inches (711 mm) and a door opening includes two door leaves without a mullion, one leaf shall provide a clear opening width of 28 inches (711 mm). The maximum width of a swinging door leaf shall be 48 inches (1219 mm) nominal. Means of egress doors in an occupancy in Group I-2 used for the movement of beds shall provide a clear width not less than 41.5 inches (1054 mm). The height of doors shall not be less than 80 inches (2032 mm).

Exceptions:

1. The minimum and maximum width shall not apply to door openings that are not part of the required means of egress in occupancies in Groups R-2 and R-3.
2. Door openings to storage closets less than 10 square feet (0.93 m²) in area shall not be limited by the minimum width.
3. Width of door leaves in revolving doors that comply with Section 1008.1.4.1 shall not be limited.
4. Door openings within a dwelling unit shall not be less than 78 inches (1981 mm) in height.
5. Exterior door openings in dwelling units, other than the required exit door, shall not be less than 76 inches (1930 mm) in height.
6. Exit access doors serving a room not larger than 70 square feet (6.5 m²) shall be not less than 24 inches (610 mm) in door width.

303.3.7 (IF 1104.8) Opening force for doors. The opening force for interior side-swinging doors without closers shall not exceed a 5-pound (22 N) force. For other side-swinging, sliding and folding doors, the door latch shall release when subjected to a force of not more than 15 pounds (66 N). The door shall be set in motion when subjected to a force not exceeding 30 pounds (133 N). The door shall swing to a full-open position when subjected to a force of not more than 50 pounds (222 N). Forces shall be applied to the latch side.

303.3.8 (IF 1104.9) Revolving doors. Revolving doors shall comply with the following:

1. A revolving door shall not be located within 10 feet (3048 mm) of the foot or top of stairs or escalators. A dispersal area shall be provided between the stairs or escalators and the revolving doors.
2. The revolutions per minute for a revolving door shall not exceed those shown in Table 303.3.8.
3. Each revolving door shall have a conforming side-hinged swinging door in the same wall as the revolving door and within 10 feet (3048 mm).

Exceptions:

1. A revolving door is permitted to be used without an adjacent swinging door for street-floor elevator lobbies provided a stairway, escalator or door from other parts of the building does not discharge through the lobby and the lobby does not have any occupancy or use other than as a means of travel between elevators and a street.
2. Existing revolving doors are permitted where the number of revolving doors does not exceed the number of swinging doors within 20 feet (6096 mm).

**303.3.8 TABLE ([F] 1104.9)
REVOLVING DOOR SPEEDS**

<u>INSIDE DIAMETER</u> <u>(feet-inches)</u>	<u>POWER-DRIVEN-TYPE</u> <u>SPEED CONTROL</u> <u>(rpm)</u>	<u>MANUAL-TYPE</u> <u>SPEED CONTROL</u> <u>(rpm)</u>
6-6	11	12
7-0	10	11
7-6	9	11
8-0	9	10
8-6	8	9
9-0	8	9
9-6	7	8
10-0	7	8

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

303.3.8.1 ([F] 1104.9.1) Egress component. A revolving door used as a component of a means of egress shall comply with Section 1104.9 and all of the following conditions:

1. Revolving doors shall not be given credit for more than 50 percent of the required egress capacity.
2. Each revolving door shall be credited with not more than a 50-person capacity.
3. Revolving doors shall be capable of being collapsed when a force of not more than 130 pounds (578 N) is applied within 3 inches (76 mm) of the outer edge of a wing.

303.3.9 ([F] 1104.10) Stair dimensions for existing stairs. Existing stairs in buildings shall be permitted to remain if the rise does not exceed 8 1/4 inches (210 mm) and the run is not less than 9 inches (229 mm). Existing stairs can be rebuilt.

Exception: Other stairs approved by the code official.

303.3.9.1 ([F] 1104.10.1) Dimensions for replacement stairs. The replacement of an existing *stairway* in a structure shall not be required to comply with the new *stairway* requirements of Section 1009 of the International Building Code where the existing space and construction will not allow a reduction in pitch or slope.

303.3.10 ([F] 1104.11) Winders. Existing winders shall be allowed to remain in use if they have a minimum tread depth of 6 inches (152 mm) and a minimum tread depth of 9 inches (229 mm) at a point 12 inches (305 mm) from the narrowest edge.

303.3.11 ([F] 1104.12) Circular stairways. Existing circular stairs shall be allowed to continue in use provided the minimum depth of tread is 10 inches (254 mm) and the smallest radius shall not be less than twice the width of the stairway.

303.3.12 ([F] 1104.13) Stairway handrails. Stairways shall have handrails on at least one side. Handrails shall be located so that all portions of the stairway width required for egress capacity are within 44 inches (1118 mm) of a handrail.

Exception: Aisle stairs provided with a center handrail are not required to have additional handrails.

303.3.12.1 (IF 1104.13.1) Height. Handrail height, measured above stair tread nosings, shall be uniform, not less than 30 inches (762 mm) and not more than 42 inches (1067 mm).

303.3.13 (IF 1104.14) Slope of ramps. Ramp runs utilized as part of a means of egress shall have a running slope not steeper than one unit vertical in 10 units horizontal (10-percent slope). The slope of other ramps shall not be steeper than one unit vertical in eight units horizontal (12.5-percent slope).

303.3.14 (IF 1104.15) Width of ramps. Existing ramps are permitted to have a minimum width of 30 inches (762 mm) but not less than the width required for the number of occupants served as determined by the *International Building Code*.

303.3.15 (IF 1104.16) Fire escape stairs. Fire escape stairs shall comply with Sections 303.3.15.1 through 303.15.7.

303.3.15.1 (IF 1104.16.1) Existing means of egress. Fire escape stairs shall be permitted in existing buildings but shall not constitute more than 50 percent of the required exit capacity.

303.3.15.2 (IF 1104.16.2) Protection of openings. Openings within 10 feet (3048 mm) of fire escape stairs shall be protected by opening protectives having a minimum $\frac{3}{4}$ -hour fire protection rating.

Exception: In buildings equipped throughout with an approved automatic sprinkler system, opening protection is not required.

303.3.15.3 (IF 1104.16.3) Dimensions. Fire escape stairs shall meet the minimum width, capacity, riser height and tread depth as specified in Section 303.3.9.

303.3.15.4 (IF 1104.16.4) Access. Access to a fire escape stair from a corridor shall not be through an intervening room. Access to a fire escape stair shall be from a door or window meeting the criteria of Section 1005.1 of the *International Building Code*. Access to a fire escape stair shall be directly to a balcony, landing or platform. These shall be no higher than the floor or window sill level and no lower than 8 inches (203 mm) below the floor level or 18 inches (457 mm) below the window sill.

303.3.15.5 (IF 1104.16.5) Materials and strength. Components of fire escape stairs shall be constructed of noncombustible materials. Fire escape stairs and balconies shall support the dead load plus a live load of not less than 100 pounds per square foot (4.78 kN/m²). Fire escape stairs and balconies shall be provided with a top and intermediate handrail on each side.

303.3.15.5.1 (IF 1104.16.5.1) Examination. Fire escape stairs and balconies shall be examined for structural adequacy and safety in accordance with Section 303.15.5 by a registered design professional or others acceptable to the fire code official every five years, or as required by the fire code official. An inspection report shall be submitted to the fire code official after such examination.

303.3.15.6 (IF 1104.16.6) Termination. The lowest balcony shall not be more than 18 feet (5486 mm) from the ground. Fire escape stairs shall extend to the ground or be provided with counterbalanced stairs reaching the ground.

Exception: For fire escape stairs serving 10 or fewer occupants, an approved fire escape ladder is allowed to serve as the termination.

303.3.15.7 (IF 1104.16.7) Maintenance. Fire escapes shall be kept clear and unobstructed at all times and shall be maintained in good working order.

303.3.16 (IF 1104.17) Corridors. Corridors serving an occupant load greater than 30 and the openings therein shall provide an effective barrier to resist the movement of smoke. Transoms, louvers, doors and other openings shall be kept closed or self-closing.

Exceptions:

1. Corridors in occupancies other than in Group H, which are equipped throughout with an approved automatic sprinkler system.
2. Patient room doors in corridors in occupancies in Group I-2 where smoke barriers are provided in accordance with the *International Building Code*.
3. Corridors in occupancies in Group E where each room utilized for instruction or assembly has at least one-half of the required means of egress doors opening directly to the exterior of the building at ground level.
4. Corridors that are in accordance with the *International Building Code*.

303.3.16.1 (IF) 1104.17.1) Corridor openings. Openings in corridor walls shall comply with the requirements of the *International Building Code*.

Exceptions:

1. Where 20-minute fire door assemblies are required, solid wood doors at least 1.75 inches (44 mm) thick or insulated steel doors are allowed.
2. Openings protected with fixed wire glass set in steel frames.
3. Openings covered with 0.5-inch (12.7 mm) gypsum wallboard or 0.75-inch (19.1 mm) plywood on the room side.
4. Opening protection is not required when the building is equipped throughout with an approved automatic sprinkler system.

303.3.16.2 (IF) 1104.17.2) Dead ends. Where more than one exit or exit access doorway is required, the exit access shall be arranged such that dead ends do not exceed the limits specified in Table 303.16.2.

Exception: A dead-end passageway or corridor shall not be limited in length where the length of the dead-end passageway or corridor is less than 2.5 times the least width of the dead-end passageway or corridor.

**303.3.16.2 TABLE (IF) 1104.17.2)
COMMON PATH, DEAD-END AND TRAVEL DISTANCE LIMITS (by occupancy)**

OCCUPANCY	COMMON PATH LIMIT		DEAD-END LIMIT		TRAVEL DISTANCE LIMIT	
	Unsprinklered (feet)	Sprinklered (feet)	Unsprinklered (feet)	Sprinklered (feet)	Unsprinklered (feet)	Sprinklered (feet)
Group A	20/75 ^a	20/75 ^a	20 ^b	20 ^b	200	250
Group B ⁱ	75	100	50	50	200	300
Group E	75	100	50	50	200	300

Group I-4 (Day care centers)	NR	NR	20	20	200	250
Group M (Covered or open mall)	75	100	50	50	200	400
Group M (Mercantile)	75	100	50	50	200	250
Group R-1 (Hotels)	75	75	50	50	200	250
Group R-2	75	125	50	50	200	250

(Apartments)						
Group R-3 (One- and two-family)	NR	NR	NR	NR	NR	NR
Group R-4 (Residential care/assisted living)	NR	NR	NR	NR	NR	NR
Group U	75	100	20	50	300	400

NR = No requirements.

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m².

- a. 20 feet for common path serving 50 or more persons; 75 feet for common path serving less than 50 persons.
- b. See Section 1028.9.5 for dead-end aisles in Group A occupancies.
- c. This dimension is for the total travel distance, assuming incremental portions have fully utilized their allowable maximums. For travel distance within the room, and from the room exit access door to the exit, see the appropriate occupancy chapter.
- d. See the International Building Code for special requirements on spacing of doors in aircraft hangars.
- e. Any patient sleeping room, or any suite that includes patient sleeping rooms, of more than 1,000 square feet shall have at least two exit access doors placed a distance apart equal to not less than one-third of the length of the maximum overall diagonal dimension of the patient sleeping room or suite to be served, measured in a straight line between exit access doors.
- f. Where a tenant space in Group B, S and U occupancies has an occupant load of not more than 30, the length of a common path of egress travel shall not be more than 100 feet.

303.3.17 ([F] 1104.18) Exit access travel distance. Exits shall be located so that the maximum length of exit access travel, measured from the most remote point to an approved exit along the natural and unobstructed path of egress travel, does not exceed the distances given in Table 301.3.12.15.2.

303.3.18 ([F] 1104.19) Common path of egress travel. The common path of egress travel shall not exceed the distances given in Table 301.3.12.15.2.

303.3.19 ([F] 1104.20) Stairway discharge identification. An interior exit stairway or ramp which continues below its level of exit discharge shall be arranged and marked to make the direction of egress to a public way readily identifiable.

Exception: Stairs that continue one-half story beyond their levels of exit discharge need not be provided with barriers where the exit discharge is obvious.

303.3.20 ([F] 1104.21) Exterior stairway protection. Exterior exit stairs shall be separated from the interior of the building as required in Section 1026.6 of the *International Building Code*. Openings shall be limited to those necessary for egress from normally occupied spaces.

Exceptions:

1. Separation from the interior of the building is not required for buildings that are two stories or less above grade where the level of exit discharge serving such occupancies is the first story above grade.
2. Separation from the interior of the building is not required where the exterior stairway is served by an exterior balcony that connects two remote exterior stairways or other approved exits, with a perimeter that is not less than 50 percent open. To be considered open, the opening shall be a minimum of 50 percent of the height of the enclosing wall, with the top of the opening not less than 7 feet (2134 mm) above the top of the balcony.
3. Separation from the interior of the building is not required for an exterior stairway located in a building or structure that is permitted to have unenclosed interior stairways in accordance with Section 1022 of the *International Building Code*.
4. Separation from the interior of the building is not required for exterior stairways connected to open-ended corridors, provided that:
 - 4.1. The building, including corridors and stairs, is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 of the *International Building Code*.
 - 4.2. The open-ended corridors comply with Section 1018.2 of the *International Building Code*.

- 4.3. The open-ended corridors are connected on each end to an exterior exit stairway complying with Section 1026 of the *International Building Code*.
- 4.4. At any location in an open-ended corridor where a change of direction exceeding 45 degrees (0.79 rad) occurs, a clear opening of not less than 35 square feet (3 m²) or an exterior stairway shall be provided. Where clear openings are provided, they shall be located so as to minimize the accumulation of smoke or toxic gases.

303.3.21 ([F] 1104.22) Minimum aisle width. The minimum clear width of aisles shall be:

- 1. Forty-two inches (1067 mm) for aisle stairs having seating on each side.

Exception: Thirty-six inches (914 mm) where the aisle serves less than 50 seats.

- 2. Thirty-six inches (914 mm) for stepped aisles having seating on only one side.

Exception: Thirty inches (760 mm) for catchment areas serving not more than 60 seats.

- 3. Twenty inches (508 mm) between a stepped aisle handrail or guard and seating when the aisle is subdivided by the handrail.

- 4. Forty-two inches (1067 mm) for level or ramped aisles having seating on both sides.

Exception: Thirty-six inches (914 mm) where the aisle serves less than 50 seats.

- 5. Thirty-six inches (914 mm) for level or ramped aisles having seating on only one side.

Exception: Thirty inches (760 mm) for catchment areas serving not more than 60 seats.

- 6. Twenty-three inches (584 mm) between a stepped stair handrail and seating where an aisle does not serve more than five rows on one side.

303.3.22 ([F] 1104.23) Stairway floor number signs. Existing stairs shall be marked in accordance with Section 1022.8 of the *International Building Code*.

303.3.23 ([F] 1104.24) Egress path markings. Existing high-rise buildings of Group A, B, E, I, M and R-1 occupancies shall be provided with luminous egress path markings in accordance with Section 1024 of the *International Building Code*.

Exception: Open, unenclosed stairwells in historic buildings designated as historic under a state or local historic preservation program.

303.4 ([F] 1105) Requirements for outdoor operations. Outdoor operations shall be in accordance with Section 303.4.1 through 303.4.1.2.

303.4.1 ([F] 1105.1) Tire storage yards. Existing tire storage yards shall be provided with fire apparatus access roads in accordance with Sections 1105.1.1 and 1105.1.2 of the *International Building Code*.

303.4.1.1 ([F] 1105.1.1) Access to piles. Access roadways shall be within 150 feet (45 720 mm) of any point in the storage yard where storage piles are located, at least 20 feet (6096 mm) from any storage pile.

303.4.1.2 ([F] 1105.1.2) Location within piles. Fire apparatus access roads shall be located within all pile clearances identified in Section 3405.4 and within all fire breaks required in Section 3405.5 of the *International Fire Code*.

705.1 General. An area being altered within a facility that is altered shall comply with the applicable provisions in Sections 705.1.1 through 705.1.14, and Chapter 11 of the International Building Code unless it is technically infeasible. Where compliance with this Section is technically infeasible, the alteration shall provide access to the maximum extent that is technically feasible. Accessibility for existing buildings shall be determined as required by Section 302.1.1.

Add new standards to Chapter 16 as follows:

NFPA National Fire Protection Association
1 Batterymarch Park
Quincy, MA 02169-7471

NFPA 720-09 Standard for the installation of carbon monoxide(co) detection and warning equipment

UL Underwriters Laboratories, Inc.
333 Pfingsten Road
Northbrook, IL 60062-2096

UL 2034-08 Single and Multiple Station Carbon Monoxide Alarms with revisions through February 2009

Reason: This proposal does several things which include the following:

1. Revises the chapter title to more clearly reflect the content of the chapter
2. Restructures the requirements to more clearly point out the additional code requirements and make room for the existing minimum requirements
3. Adds some clarity on the applicable accessibility provisions
4. Places the minimum existing requirements from the fire code in the IEBC.

Title Change. The new title will make it more clear that the chapter both explains applicability and provides minimum requirements that apply to all methods of compliance.

Restructuring. Currently the additional code reference is lost at the end of the chapter. This will provide more visibility to this requirement. This also provides a better structure for future requirements such as those proposed for accessibility. In addition, it is felt that the provisions from Chapter 11 of the IFC which represent minimum existing requirements for all buildings, as applicable, should be stand alone for clarity.

Accessibility. Significant changes are being developed in the 2015 Edition of ANSI A117.1 Standard. No existing buildings have been designed to meet these standards and would be considered inaccessible under the new standard despite having complied with the 2003 standard. For example, Section 705.1.1 provides an exception for bringing an entrance into compliance if there is an accessible entrance elsewhere. A fully complying entrance under the older A117.1 would no longer be considered accessible under the new standard. Similarly, 705.2 requires the accessible route to conform where alterations are made to a primary function. Fully compliant access routes under the 2003 standard will not conform to the 2011 standard because of the changes to the minimum clearances reflecting the changed clear floor space.

With this change those elements that were compliant with the 2009 standard would continue to be considered compliant after the 2015 standard is made mandatory. This philosophy has been used with the changes in the new 2010 ADA Standard. Any existing building that conformed to the older standard is considered compliant under the new standard.

Existing requirements from IFC. Currently the IEBC only includes requirements for when an existing building is being repaired, altered or is undergoing a change of occupancy. The IFC includes minimum requirements for existing buildings in Chapter 11 that are applicable to all buildings. This change duplicates those requirements and moves them into the requirements for compliance in Chapter 3 of the IEBC so that owners and designers are aware of the additional minimums that may be imposed on an existing building beyond those required for the work anticipated. The intent is that these changes remain under the purview of the IFC Code Development Committee and are simply placed here to provide clarity to the code user that additional requirements may apply to the building if these minimums are not already met.

Changes from the IFC are only due to duplicate provisions that are already a part of the IEBC. For reference only we have included the original IFC Section number parenthetically.

- Fire code official has been revised to code official to address the fact that the authority enforcing this code may not be a fire code official.
- New Section 303.1.3 is based on IFC Section [F] 1101.3 that indicates that permits must be obtained per Sections 105.6 and 105.7 of the IFC and the IBC. The two referenced IFC Sections are not requiring permits for alterations necessary to conform, but for occupancies or systems in a building. A correction is made in this change to reference the IEBC permit requirements and a companion change is being submitted to make the same change to the IFC.

Cost Impact: This code change proposal will not increase the cost of construction.

Analysis: The proposed referenced standards are already referenced in the *International Building Code*.

EB3-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

301.1-EB-COLLINS.doc

EB4 – 13

301.1

Proponent: Maureen Traxler, City of Seattle, representing Seattle Dept. of Planning & Development
(Maureen.traxler@seattle.gov)

Revise as follows:

301.1 General. The *repair, alteration, change of occupancy, addition* or relocation of all *existing buildings* shall comply with one of the methods listed in Sections 301.1.1 through 301.1.3 as selected by the applicant. ~~Application of a method shall be the sole basis for assessing the compliance of work performed under a single permit unless otherwise approved by the code official.~~ Sections 301.1.1 through 301.1.3 shall not be applied in combination with each other. Where this code requires consideration of the seismic force-resisting system of an *existing building* subject to *repair, alteration, change of occupancy, addition* or relocation of *existing buildings*, the seismic evaluation and design shall be based on Section 301.1.4 regardless of which compliance method is used.

Reason: This paragraph says the same thing 3 different ways in the first 3 sentences. The first sentence states that the applicant has to choose one of the 3 compliance methods. The second sentence again says that one of the three compliance methods must be used. Then, the third sentence states that only one compliance method can be used. There may be a slight different in emphasis in the three sentences, but all three aren't necessary. The second and third sentences both say that one and only method can be applied to a project. We prefer the third sentence because it states most clearly that more than one method cannot be applied to a project. If special circumstances arise, the code official has authority under Sections 104.10 and 104.11 to approve modifications and alternative methods of design.

Cost Impact: This code change proposal will not increase the cost of construction.

301.1-EB-TRAXLER.doc

EB5 – 13

504.1.1 (NEW)

Proponent: David S. Collins, FAIA, The Preview Group, Inc., representing The American Institute of Architects

Add new text as follows:

504.1 Scope. Level 2 *alterations* include the reconfiguration of space, the addition or elimination of any door or window, the reconfiguration or extension of any system, or the installation of any additional equipment.

504.1.1 Except where aisles required in Groups B and M, table seating per Sections 1017.3 and 1017.4 of the *International Building Code* or assembly seating per Section 1028 of the *International Building Code*, are reconfigured, the movement, addition or removal of furniture, movable partitions less than 5 feet 9 inches in height, or fixtures within a space shall not be considered reconfiguration of space.

Reason: Reconfiguration of a space can occur simply by movement of furniture. It isn't the intent of the IEBC to require that furniture rearrangement be included as an alteration, except where the IBC specifically limits aisles, table seating or assembly seating. By this change the rearrangement of furniture is not a trigger for application of the requirement for Level 2 Alterations.

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

504.1.1 (NEW)-EB-COLLINS.doc

EB6 – 13

505.1

Proponent: Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee

Revise as follows:

505.1 Scope. Level 3 *alterations* apply where the *work area* exceeds 50 percent of the aggregate ~~area of the building~~ building area of all stories in the building.

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

This is the BCAC's attempt to clarify the scoping provisions for level 3 alterations. Some code users claim that the differing phrases used relative to area within the IEBC is confusing when those phrases are not one of the defined phrases. The BCAC believes that concern can best be addressed by referring to the defined term/phrase "building area" instead of the currently used phrase "aggregate area of the building". Because the phrase "building area" is already defined, by embedding that phrase in the modified text, the concerns of confusion and lack of consistency will be eliminated without changing the original intent. The BCAC is also aware that the current language located within IEBC Sections 410.4, 410.6, and 410.8.9 would benefit from a change to mimic the language being proposed by this code change, but cannot propose those changes at this time because those sections are located within the Group A changes. It is the intent of the BCAC to propose corresponding changes to those sections in the next code change cycle.

Cost Impact: This code change proposal will not increase the cost of construction.

EB6-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

505.1-EB-BAJNAI-BCAC.doc

EB7 – 13

505.1

Proponent: David S. Collins, FAIA, The Preview Group, Inc., representing The American Institute of Architects

Revise as follows:

505.1 Scope. Level 3 *alterations* ~~apply~~ include the reconfiguration of space, where the ~~work~~ reconfigured area exceeds 50 percent of the aggregate area of the building, ~~and shall include the reconfiguration or extension of any system that serves more than 50 percent of the aggregate area of the building.~~

Reason: In a separate change the definition of "work area" is being removed from the IEBC because it's lack of specificity and the confusion it causes when used in this section. We have submitted a series of changes to provide the type of direction needed to make the code more effective. This language is proposed to provide the needed guidance in Section 505.1 for what is within the scope of a Level 3 alteration.

Cost Impact: There is no cost impact associated with this change.

EB7-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

505.1-EB-COLLINS.doc

EB8 – 13

602.3 (New)

Proponent: Rebecca Morley, National Center for Healthy Housing

Add new text as follows:

602.3 Moisture and Mold. Surfaces such as but not limited to wood, textiles, paint, cellulose insulation, and paper, including paper-faced gypsum board, shall have no signs of excessive moisture after the material has been repaired. Materials that are discolored or deteriorated by mold or mildew shall be cleaned, dried and repaired and the underlying cause shall be determined and corrected. If the material is structurally unsound it shall be removed and replaced and the underlying cause shall be determined and corrected.

Reason: Mold typically grows in buildings affected by water damage. According to the Institute of Medicine of the National Academies' *Damp Indoor Spaces and Health* (2004), mold and damp indoor environments are associated with asthma symptoms in sensitized persons, coughing, wheezing, and upper respiratory tract symptoms. See www.nap.edu/books/0309091934/html/

In December 2007, the National Center for Healthy Housing (NCHH) and the U.S. Centers for Disease Control and Prevention (CDC) convened an Expert Panel consistent with National Institute of Health guidelines to assess the effectiveness of various interventions to make homes healthier and safer. NCHH and CDC published the report of the experts in January 2009. See www.nchh.org/LinkClick.aspx?fileticket=2lvaEDNBldU%3d&tabid=229 for the full report.

The Expert Panel reviewed five peer-reviewed research studies on the issue of mold and allergens and concluded that "when implemented together, eliminating moisture intrusion and leaks and removal of moldy items were found to be effective in reducing asthma triggers and reducing exposures." Other provisions of the IPMC address eliminating moisture intrusion. But no provisions require action on building materials with chronic moisture issues including those materials that have failed beyond repair.

This proposal implements the Expert Panel's recommendation while providing flexibility in response to actual conditions – repair for reparable material, replacement for failed material. To ensure the health of the building's occupants, mitigation of moisture problems must be a part of the code.

Cost Impact: This code change proposal will increase the cost of maintenance.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

602.1-EB-MORLEY.doc

EB9 – 13

602.3, 702.4 (NEW), 702.5 (NEW)

Proponent: Carl Baldassarra, P.E., Chair, ICC Code Technology Committee
(cbaldassarra@rjagroup.com)

Revise as follows:

602.3 Glazing in hazardous locations. Replacement glazing shall be as required for new installations. Replacement glazing in hazardous locations shall comply with the safety glazing requirements of the *International Building Code* or *International Residential Code* as applicable.

Exception: Glass block walls, louvered windows, and jalousies repaired with like materials.

Add new text as follows:

702.4 Window opening control devices. In Group R-2 or R-3 buildings containing dwelling units, window opening control devices complying with ASTM F2090 shall be installed where an existing window is replaced and where all the following apply to the replacement window:

1. The window is operable;
2. The window replacement includes replacement of the sash and the frame;
3. The top of the sill of the window opening is at a height less than 36 inches (915 mm) above the finished floor;
4. The window will permit openings that will allow passage of a 4-inch diameter (102 mm) sphere when the window is in its largest opened position; and
5. The vertical distance from the top of the sill of the window opening to the finished grade or other surface below, on the exterior of the building, is greater than 72 inches (1829 mm).

The window opening control device, after operation to release the control device allowing the window to fully open, shall not reduce the minimum net clear opening area of the window unit to less than the area required by the *International Building Code*.

Exceptions:

1. Operable windows where the top of the sill of the window opening is located more than 75 feet (22.86 m) above the finished grade or other surface below, on the exterior of the room, space or building, and that are provided with window fall prevention devices that comply with ASTM F 2006.
2. Operable windows with openings that are provided with window fall prevention devices that comply with ASTM F2090.

702.5 Emergency Escape and Rescue Openings. Where windows are required to provide emergency escape and rescue openings in Group R-2 and R-3 occupancies, replacement windows shall be exempt from the requirements of Sections 1029.2, 1029.3 and 1029.5 of the *International Building Code* provided the replacement window meets the following conditions:

1. The replacement window is the manufacturer's largest standard size window that will fit within the existing frame or existing rough opening. The replacement window shall be permitted to be of the same operating style as the existing window or a style that provides for an equal or greater window opening area than the existing window.
2. The replacement of the window is not part of a change of occupancy.

Reason: This proposed change is a result of the CTC's investigation of the area of study entitled "Child Window Safety". The scope of the activity is noted as:

To evaluate the necessity of developing code proposals for the inclusion of requirements dealing with the conditions, circumstances and devices for window safety which could reduce the number of falls by children to surfaces below.

The purpose of this proposal is to coordinate the repair and alteration provisions of the IEBC with the changes approved to the IBC/IEBC in the 2012 Group A cycle. Code changes G225-12 and G227-12 were approved as modified by public comment to revise Section 3407 of the IBC (IEBC Section 406 – see below). In addition, Code change G201-12 last cycle removed the existing building provisions from Chapter 34 of the IBC in favor of a reference to the IEBC. This action was subsequently affirmed by the ICC Board as this was a code change related to I-Code scoping.

The IEBC includes 3 compliance methods for existing buildings:

- Prescriptive compliance per Chapter 4
- Work area compliance per Chapters 5 – 13
- Performance compliance per Chapter 14

As noted above, the prescriptive compliance provisions of Chapter 4 have been updated based on the approved code changes noted. Since there are no specific performance provisions in Chapter 14 for windows, this leaves the work area method of Chapters 5 – 13 in need of correlation. The correlation is as follows:

- Chapter 6 Repairs. The approved provisions in Chapter 4 of the IEBC only apply where the entire window is removed. As such, the provisions are not applicable to routine repairs such as the repair of a pane of broken glass. The revised text of Section 602.3 stipulates that only the glazing is required to comply with new construction requirements.
- Chapter 7 Alteration Level 1. In accordance with Section 503, an Alteration Level 1 is one where there is a removal or replacement of existing elements. This of and by itself may not be a complete replacement of the window frame and glass. As such, the proposed new text in Section 702.4 triggers the application of the provisions where “an existing window is replaced”.
- Chapter 8 Alteration Level 2. This code change does not include language specifically dealing with Alteration Level 2 as the provisions proposed in Chapter 7 cover Level 2 alterations by virtue of the text of Section 801.2 which requires Level 2 alterations to comply with the requirements of Chapter 7 for Level 1.
- Chapter 9 Alteration Level 3. Similar to Chapter 8 noted above, this code change does not include language specifically dealing with Alteration Level 3 as the provisions proposed in Chapter 7 cover Level 3 alterations by virtue of the text of Section 901.2 which requires Level 3 alterations to comply with the requirements of Chapters 7 and 8.

For reference, the approved IEBC text is as follows:

IEBC SECTION 406 GLASS REPLACEMENT AND REPLACEMENT WINDOWS

406.1 Replacement glass. *The installation or replacement of glass shall be as required for new installations.*

406.2 Replacement Window Opening Control Devices. *In Group R-2 or R-3 buildings containing dwelling units, window opening control devices complying with ASTM F2090 shall be installed where an existing window is replaced and where all the following apply to the replacement window:*

1. *The window is operable;*
2. *The window replacement includes replacement of the sash and the frame;*
3. *The top of the sill of the window opening is at a height less than 36 inches (915 mm) above the finished floor;*
4. *The window will permit openings that will allow passage of a 4-inch diameter (102 mm) sphere when the window is in its largest opened position; and*
5. *The vertical distance from the top of the sill of the window opening to the finished grade or other surface below, on the exterior of the building, is greater than 72 inches (1829 mm).*

The window opening control device, after operation to release the control device allowing the window to fully open, shall not reduce the minimum net clear opening area of the window unit to less than the area required by Section 1029.2.

Exceptions:

1. *Operable windows where the top of the sill of the window opening is located more than 75 feet (22.86 m) above the finished grade or other surface below, on the exterior of the room, space or building, and that are provided with window fall prevention devices that comply with ASTM F 2006.*
2. *Operable windows with openings that are provided with window fall prevention devices that comply with ASTM F2090.*

406.3 Replacement Window Emergency Escape and Rescue Openings. *Where windows are required to provide emergency escape and rescue openings in Group R-2 and R-3 occupancies, replacement windows shall be exempt from the requirements of Sections 1029.2, 1029.3 and 1029.5 provided the replacement window meets the following conditions:*

1. *The replacement window is the manufacturer's largest standard size window that will fit within the existing frame or existing rough opening. The replacement window shall be permitted to be of the same operating style as the existing window or a style that provides for an equal or greater window opening area than the existing window.*
2. *The replacement of the window is not part of a change of occupancy.*

This proposal is submitted by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as “areas of study”. Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website:

<http://www.iccsafe.org/cs/CTC/Pages/default.aspx>. Since its inception in April/2005, the CTC has held twenty-five meetings - all open to the public. In 2012, three of the 25 face-to face meetings were held. In addition to the CTC meetings, the CTC established Study Groups (SG) of interested parties for each of the areas of study. These SG's are responsible for reviewing the available information and making recommendations to the CTC. All totaled, the SG's held over 70 conference calls in 2012.

Cost Impact: This code change proposal will not increase the cost of construction.

EB10 – 13

603.1, 604.1, 605.1, 703.1, 704.1

Proponent: Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee

Revise as follows:

603.1 General. Repairs shall be done in a manner that maintains the level of fire protection provided before the repair was undertaken.

604.1 General. Repairs shall be done in a manner that maintains the level of protection provided for the means of egress before the repair was undertaken.

605.1 General. Repairs shall be done in a manner that maintains the level of accessibility provided before the repair was undertaken.

703.1 General. Alterations shall be done in a manner that maintains the level of fire protection provided before the alteration was undertaken.

704.1 General. Alterations shall be done in a manner that maintains the level of protection provided for the means of egress before the alteration was undertaken.

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

The current text is missing the language that tells users of the code to what level the various subjects are to be maintained. The intent that a modification should not make a condition worse than before the work started is clear. That concept is stated in IEBC sections 603.1, 604.1, 605.1, 703.1 and 704.1. By adding the proposed text to each section, that original intent is not only made clearer, it is done so in a consistent manner.

Cost Impact: This code change proposal will not increase the cost of construction.

603.1-EB-BAJNAI-BCAC.doc

EB11 – 13

603.2(New)

Proponent: Andy Williams, Metal Construction Association

Add new text as follows:

603.2 Roof Assembly Fire Classification. Repairs made to roof coverings shall not reduce the fire classification that was required when originally installed.

Exception: Change of occupancy for historic buildings shall comply with Section 1205.5

Reason: The text is to clarify that the roof covering is required to comply with the fire classification mandated by the IBC or the IRC under which the roof covering was initially installed. For repairs to a roof covering, the repairs are required to maintain the roof covering fire classification required by the IRC when the roof covering was initially installed.

The exception is necessary since the IEBC provides a variance for historic buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

XXX-EB-JONES.doc

EB13 – 13

610 (NEW)

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

SECTION 610

ENERGY EFFICIENCY

610.1 General. Repairs to the building thermal envelope, mechanical systems, water heating systems, electrical systems or lighting systems shall meet the International Energy Conservation Code where the provisions therein are directly applicable to the repair(s) being undertaken.

Reason: This proposal requires equipment installed during repairs to meet the provisions of the International Energy Conservation Code (IECC) and insulation to be upgraded to current 2012 IECC requirements when structural components are exposed.

Forty percent of U.S. energy use and seventy percent of U.S. electrical use are associated with existing buildings. As such, existing buildings represent a significant opportunity to save energy, reduce operating costs, and enhance the environment. Section 610 of the International Existing Buildings Code (IEBC) currently provides no guidance on energy efficiency, nor does it reference the 2012 IECC. However, there are instances in which repairs can and should include consideration of energy efficiency. For instance, a storm could damage skylights or a glazed storefront necessitating repair of the fenestration assemblies or a flooding event could necessitate the repair of dampers associated with a duct system.

Those situations would likely result in the removal of the damaged fenestration or dampers and their replacement to address "the restoration to good or sound condition of those parts of the building for the purpose of maintenance". Section 502.1 further clarifies that such replacement of damaged materials would be considered a repair. It is recognized that not all repairs should or could comply with the IECC, such as normal repairs to HVAC equipment, electrical systems or building envelope assemblies. To address those situations the proposed text clarifies that the provision in the IECC must be directly applicable to the repair. So for instance patching a masonry wall, repairing or replacing siding, fixing an electrical lighting control problem or repairing a boiler or chiller that has stopped working would not be impacted since there are no specific provisions in the IECC that are directly applicable to those situations.

There will be an increase in cost to the degree that repairs that previously were not required to meet the energy code will now be required to meet the energy code.

Cost Impact: The code change proposal will increase the cost of construction in some buildings.

610 (NEW)-EB-WILLIAMS.doc

EB14 – 13

702.1, 702.2, 702.3

Proponent: Jerry R. Tepe, FAIA, JRT•AIA Architect, representing American Institute of Architects

Delete without substitution as follows:

~~**702.1 Interior finishes.** All newly installed interior wall and ceiling finishes shall comply with Chapter 8 of the *International Building Code*.~~

~~**702.2 Interior floor finish.** New interior floor finish, including new carpeting used as an interior floor finish material, shall comply with Section 804 of the *International Building Code*.~~

~~**702.3 Interior trim.** All newly installed interior trim materials shall comply with Section 806 of the *International Building Code*.~~

Reason: I realize these sections were just added in 2009, but they are repetitive of the following section which already requires all new work to comply with the *International Building Code*. It becomes confusing when single requirements are individually repeated for compliance and can lead to a misconception that other items are not required to comply. The code does not need to be filled with repetitive, duplicate requirements.

Cost Impact: This code change proposal will not increase the cost of construction.

702.1-EB-TEPE.doc

EB15 – 13

702.4 (NEW), 702.5 (NEW)

Proponent: Jeff Inks, Window & Door Manufacturers Association (jinks@wdma.com)

Revise as follows:

702.1 Interior finishes. All newly installed interior wall and ceiling finishes shall comply with Chapter 8 of the *International Building Code*.

702.2 Interior floor finish. New interior floor finish, including new carpeting used as an interior floor finish material, shall comply with Section 804 of the *International Building Code*.

702.3 Interior trim. All newly installed interior trim materials shall comply with Section 806 of the *International Building Code*.

702.4 Window opening control devices. In Group R-2 or R-3 buildings containing dwelling units and one- and two-family dwellings and townhouses regulated by the *International Residential Code*, window opening control devices complying with ASTM F2090 shall be installed where an existing window is replaced and where all the following apply to the replacement window:

1. The window is operable;
2. The window replacement includes replacement of the sash and the frame;
3. The top of the sill of the window opening is at a height less than 36 inches (915 mm) above the finished floor;
4. The window will permit openings that will allow passage of a 4-inch diameter (102 mm) sphere when the window is in its largest opened position; and
5. The vertical distance from the top of the sill of the window opening to the finished grade or other surface below, on the exterior of the building, is greater than 72 inches (1829 mm).

The window opening control device, after operation to release the control device allowing the window to fully open, shall not reduce the minimum net clear opening area of the window unit to less than the area required by the International Building Code.

Exceptions:

1. Operable windows where the top of the sill of the window opening is located more than 75 feet (22.86 m) above the finished grade or other surface below, on the exterior of the room, space or building, and that are provided with window fall prevention devices that comply with ASTM F 2006.
2. Operable windows with openings that are provided with window fall prevention devices that comply with ASTM F2090.

702.5 Emergency escape and rescue openings. Where windows are required to provide emergency escape and rescue openings in Group R-2 and R-3 occupancies and one- and two-family dwellings and townhouses regulated by the *International Residential Code*, replacement windows shall be exempt from the requirements of Sections 1029.2, 1029.3 and 1029.5 of the *International Building Code* and Sections R310.1.1, R310.1.2, R310.1.3 and R310.2 of the *International Residential Code* accordingly provided the replacement window meets the following conditions:

1. The replacement window is the manufacturer's largest standard size window that will fit within the existing frame or existing rough opening. The replacement window shall be permitted to be of the same operating style as the existing window or a style that provides for an equal or greater window opening area than the existing window.
2. The replacement of the window is not part of a change of occupancy.

Window opening control devices complying with ASTM F 2090 shall be permitted for use on windows required to provide *emergency escape and rescue openings*.

Reason: The intent of this proposal is to ensure window replacements meet the requirements for new construction for window fall protection and emergency escape and rescue openings when practical and avoid discouraging or preventing the replacement of windows when it is not -- provided there is no reduction in existing safety.

With respect to the proposed provisions for window opening control devices on replacement windows, they are intended to ensure window fall protection is provided where required for new construction when windows, including sash and frame, are replaced. The proposed WOCD provisions have already been approved for Chap. 4 of the IEBC (during the Group A proceedings) and are also being proposed for IRC Appendix J by us and the ICC CTC.

With respect to the proposed emergency escape and rescue opening provisions, they are based on Minnesota's residential code which actually (and effectively) incorporates them into the main body of the code in Chapter 3, under Section 310.1. The same provisions have also already been approved for Chap. 4 of the IEBC (during the Group A proceedings) and we, as well as the ICC CTC are also proposing the same provisions for IRC Appendix J (in addition to this proposal for the IEBC). Most importantly, it's important to note that the provisions do not allow for any decrease in safety and will help ensure improvements in safety can be made.

More specifically, the intent of this proposal is to ensure that the IRC does not discourage or prevent improvements in emergency escape and rescue openings, especially for fire safety, in older residential occupancies by requiring replacement windows to meet all of the provisions of Section 310 when doing so can only be accomplished by increasing the size of the rough opening or altering the interior wall.

Because many of these older buildings were constructed under codes that did not include the same emergency escape and rescue opening provisions that the IBC or IRC now require for new construction, the only way to fully meet all of the requirements of IBC Section 1029 or IRC Section 310 for new construction if required when windows are replaced, is to enlarge the rough opening and/or make significant alterations to the interior wall in order to accommodate any increase in window size or lowering of a sill.

At the very least, the significant cost and design challenges of altering the rough opening or interior wall can discourage or prevent window replacement and at worst can discourage or prevent the replacement of older windows that are harder to operate or inoperable all together because of their age or poor maintenance and, that are significantly less energy efficient. When that happens, improvements to safety as well as to energy efficiency are needlessly compromised.

Furthermore and on the whole, while some bedroom windows in older homes may not provide the full clear opening that is required for new construction or may have a sill height above 44 inches, they nonetheless still provide a viable emergency and escape rescue opening which is the primary intent of the code. Replacement of these windows with the same type of operating window or other type that can provide an equal or greater clear opening than the existing window -- even if they do not fully meet the clear opening or sill height requirements of IBC Section 1029 or IRC Section 310 accordingly -- is always an improvement in safety, especially when a replacement opening can provide a larger clear opening than the existing window. Such improvements in safety should not be discouraged or prevented by overly onerous requirements for replacement windows.

This proposal will help ensure that doesn't happen by providing limited exceptions to the requirements of IBC Section 1029 and IRC Section 310 accordingly that can only be applied when certain conditions are met and that as already noted, will not result in a decrease in safety.

The requirements for new construction that emergency escape and rescue openings be provided as well as the operational requirements of IBC Section 1029 and IRC Section 310 respectively are maintained and still applicable to replacement windows.

Cost Impact: This code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

702.4 (NEW)-EB-INKS.doc

EB16 – 13

705 (NEW)

Proponent: Rebecca Morley, National Center for Healthy Housing

Add new text as follows:

SECTION 705 **CARBON MONOXIDE ALARMS**

705.1 General. Carbon monoxide alarms shall be installed in existing Group I or R occupancies in accordance with Section 1103.9 of the *International Fire Code*.

Reason: Carbon monoxide (CO) is an odorless, tasteless, invisible gas that kills more than 300 people in homes each year. Thousands more are admitted to the hospital with carbon monoxide poisoning. This is a serious issue that affects people nationwide in all regions of the country. The International Residential Code requires CO alarms for residences with fuel-fired appliances or attached garages. This change would make the IEBC consistent with the IRC.

The following states have required CO alarms in existing residences: Alaska, California, Colorado, Illinois, Massachusetts, Michigan, Minnesota, Montana, New Jersey, New York, North Carolina, Oklahoma, Oregon, Rhode Island, Vermont and Wisconsin. Deaths from CO are spread throughout the country as residents unwittingly use dangerous methods to stay warm in unusually cold weather.

Cost Impact: Yes, this code change proposal will increase the cost of property maintenance. A carbon monoxide alarm typically costs approximately \$25.

EB17 – 13

705.1, 905.1, 905.4 (NEW), 905.4.1 (NEW), 1005.2 (NEW), 1105 (NEW)

Proponent: Gene Boecker, Code Consultants, Inc., representing self

705.1 General. A *facility* that is altered shall comply with the applicable provisions in Sections 705.1.1 through 705.1.14, and Chapter 11 of the *International Building Code* unless it is *technically infeasible*. Where compliance with this section is *technically infeasible*, the alteration shall provide access to the maximum extent that is technically feasible. A *facility* that is constructed or altered to be accessible shall be maintained accessible during occupancy. A facility shall not be altered such that the existing accessible means of egress is reduced.

Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 705.2.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be added ~~provided~~ in existing buildings undergoing less than a level 3 alteration.
3. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing *facilities* undergoing less than a Level 3 alteration.
4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units.

905.1 General. The means of egress shall comply with the requirements of Section 805 except as specifically required in Sections 905.2 and ~~905.3~~ through 905.4.

905.4 Accessible means of egress. Not less than one accessible means of egress shall be provided in accordance with Section 905.4.1 and Section 1007 of the International Building Code in alterations affecting an area containing a primary function and in additions.

Exceptions:

1. Level 1 and Level 2 alterations.
2. Historic buildings.
3. Accessible means of egress is not required to exceed 20 percent of the costs of the alterations including any costs associated with compliance for Section 410.7. Where the costs to provide accessibility cannot accommodate compliance with both this Section and Section 410.7, Section 410.7 shall take precedence.
4. Alterations limited solely to windows, hardware, operating controls, electrical outlets and signs.
5. Alterations limited solely to mechanical systems, electrical systems, installation or alteration of fire protection systems and abatement of hazardous materials.
6. Alterations undertaken for the primary purpose of increasing the accessibility of a facility.
7. Altered areas limited to Type B dwelling and sleeping units

905.4.1 Means of egress through an existing building. Where the accessible means of egress from an portion of a building being alteration or addition requires occupants to egress through portions of existing building, compliance with Section 1007 of the International Building Code is required through the existing building, unless technically infeasible. Where compliance with this provision is technically infeasible, the accessible means of egress through the existing building shall provide access to the maximum extent technically feasible.

1005.2 Accessible means of egress. Where a change of occupancy includes a Level 3 Alteration to an area containing a primary function, at least one accessible means of egress shall be provided in compliance with Section 905.

SECTION 1105 **MEANS OF EGRESS**

1105.1 General. The means of egress shall comply with the requirements of Section 905.4.1 and Chapter 10 of the *International Building Code*.

Reason: During last code change cycle, a proposal similar to this was presented. The committee felt it was too confusing and that it did not address the concept of disproportionate cost effectively. This proposal seeks to address those issues more clearly. Where possible the language was changed to be uniform among the various codes and sections.

Common sense should dictate that where major alterations occur consideration for at least one accessible means of egress should be provided. Additionally, the simple idea that an accessible means of egress should be intentionally denied to a segment of the population does not seem appropriate. As the codes now stand, a building can be completely gutted with only the facades remaining and no accessible means of egress must be provided.

It is important to remember that the new construction requirements in the IBC only require a maximum of two accessible means of egress as noted in Section 1007.1 (assuming travel distance compliance is accommodated).

With the deletion of Chapter 34 from the IBC it is incumbent on the IEBC to address these issues.

705.1: A change was made to the second exception to indicate that means of egress requirements for existing building are not required for lesser alterations, similar to exception #3.

905.1: A change is made to address the added section.

905.4: A new section is added to specifically address accessible means of egress. Rather than the blanket statement in Section 1007.1 of the building code, this section will address the scope and extent of work necessary to address accessible means of egress for existing buildings. It directs the code user to Section 1007 for the technical requirements when an accessible means of egress is necessary as well as clearly delineate that when an alteration occurs affecting an area containing a primary function, an accessible means of egress must be provided. The threshold is limited to alterations affecting a primary function because that threshold relates to the importance of changes to an area and is understood due to its relationship with the Federal accessibility regulations for the past 20 years. The intent is to provide at least one accessible means of egress.

905.4, exception #1: Alterations with some magnitude should address accessible means of egress; if the alteration is relatively small then there is reason to limit the requirement. Even if the accessible means of egress would not be a disproportionate cost (exception #2), in small alterations the area required to create the accessible means of egress may be disproportionate to the space allowed for the alteration. If so, it may "steal" too much space from an otherwise small area and would not be appropriate.

905.4, exception #2: The exception makes it clear that an accessible means of egress is not required for alterations to historic buildings. To do so, may alter the historic character. While an accessible means of egress should be provided wherever possible, the exception recognizes that in historic buildings the ability to make the necessary changes to comply may be detrimental to the historic integrity.

905.4, exception #3: Existing buildings come in all shapes and sizes and the work proposed for creating an accessible means of egress can be a small part or major portion of the effort. This exception identifies that and uses the same 20% rule for the accessible route relative to the primary use area. The exception also clarifies that where funds cannot provide the accessible route and an accessible means of egress, it is more important to provide the accessible route. This maintains consistency with the Federal requirements for alterations affecting an area containing a primary function.

905.4, exceptions #4, #5, #6, #7: These are the same as exceptions #2, #3, #4 and #5 in Section 705.2 for alterations affecting an area containing a primary function. These are included here for consistency.

905.4.1: If an addition is designed such that the means of egress must enter the existing building then the general rule is that the egress design in the existing building must meet the requirements for egress as it passes through the existing building. This is simply the continuation of the means of egress from the addition for egress width, panic hardware (as applicable) and similar concerns. The same should be true for the design of the accessible means of egress. If one of the accessible egress paths leads through the existing building, it too needs to meet/continue the level of protection as designed in the addition. The limitation to this is that if the effort to make the existing means of egress accessible is "technically infeasible" then work should be done to what is possible. One example of this may be making sure that the slopes along the egress path in the existing building's corridor are proper even if the width cannot be altered to allow the proper maneuverability approach to the exit door.

1005.2: A change of occupancy by itself is not sufficient to trigger the requirement for an accessible means of egress. However, if a change in occupancy also includes a Level 3 Alteration, then it should be subject to the same requirements as any other Level 3 Alteration. This provision is added as a clarification to that effect.

1105.1: Chapter 11 (Additions) does not address means of egress specifically. A reference to compliance with the means of egress provisions in Chapter 10 of the IBC is included. This is similar to the first sentence in Section 402.1 which requires additions to comply with the requirements of the IBC for new construction but more specific as is done for the "non-prescriptive" methods. The added language is inserted before the accessibility section to make it consistent with its placement in other chapters.

The codes identify the minimums necessary for life safety. These proposed changes provide the disabled community with similar levels of life safety to the general public and still sets reasonable thresholds based on the extent of work for the project. With the adoption of the new 2010 ADA Standards for Accessible Design, it is clear that the IBC will set the standard for accessible means of egress. This organization has a responsibility to act in the best interests of the general public in all its diversity. Where major changes are proposed to an existing building due to a large alteration or an addition, it should be the desire of the ICC to incorporate appropriate accessible means of egress where possible.

Cost Impact: The code change proposal will increase the cost of construction in many situations but may have no effect in others.

Cost Impact Discussion: It is not easy to address what costs could be affecting this due to the myriad possible configurations for a building. A building that is a single story at grade may have no additional cost. Because an accessible entrance would be required, it would function as the accessible means of egress. Hence, a single story building with a total internal renovation may be unaffected cost-wise by this proposal.

The main costs are those involving an elevator of adequate size on emergency standby power and a two-way communications system. If the elevator is too small, the costs to alter that would be disproportionate and it would not be required according to IEBC Section 905.4, exception #3.

At the opposite end of the spectrum could be a nine story high-rise building that is being gutted on five floors. It would be required to have an accessible route to the upper floors. The IFC would require the emergency power for fire fighter operation so that cost for that part of the accessible means of egress is covered. In that situation only the two-way communication systems costs would apply.

Buildings without elevators would likely similarly fall into the category of disproportionate costs since the addition of an elevator can be costly. Moreover, the accessible means of egress is tied into alterations that affect an area containing a primary function. This already has accessibility requirements for access such as toilet room and accessible route renovations. If the costs to add an elevator are within the 20 percent cap but the cost to add emergency standby power would be beyond the 20 percent, the exceptions in IEBC Section 905.4, exception #3 make it clear that the costs for access take precedence over the costs for egress and that combined they are not required to exceed the 20 percent figure.

In many cases the 20 percent cap will be met by the required access features and there may be no funds remaining for an accessible egress. The important thing is that we should recognize the need to provide a means of egress for all of the occupants within the building to the greatest extent possible. No definitive numbers can be provided because the variations are so many. This discussion attempts to address only the possibilities.

1007.1 #1-E-BOECKER.doc

EB18 – 13

705.1.6

Proponent: Carl Baldassarra, P.E., Chair, ICC Code Technology Committee

Delete without substitution as follows:

705.1.6 Performance areas. ~~Where it is technically infeasible to alter performance areas to be on an accessible route, at least one of each type of performance area shall be made accessible.~~

Reason: The exception for performance area does not make a lot of sense because there are typically not multiple performance areas of the same type. If access to the stage or pit is technically infeasible, how would you do even one? A correlative proposal was also been proposed and approved for IBC 3411.8.6 and IEBC 410.8.6.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>. Since its inception in April/2005, the CTC has held twenty five meetings - all open to the public.

Cost Impact: This code change proposal will not increase the cost of construction.

EB19 – 13

705.1.8, 806.3

Proponent: Carl Baldassarra, P.E., Chair, ICC Code Technology Committee

Revise as follows:

705.1.8 Accessible dwelling or sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for Accessible units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered.

Revise as follows:

806.3 Accessible dwelling units and sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Accessible units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of spaces being added.

Reason: Alarms are required to be altered only when the system is being altered. The language in IEBC should be deleted to be consistent with this revision previously made to IBC 3411.8.7. (ADA 223.1.1 & 224.1.1)

IBC 3411.8.7 (IEBC [B] 410.8.7) Accessible dwelling or sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 *dwelling or sleeping units* are being altered or added, the requirements of Section 1107 for *Accessible* units apply only to the quantity of spaces being altered or added.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". 705.1.8-EB-BALDASSARRA-CTC.doc

EB20 – 13

705.1.10

Proponent: Carl Baldassarra, P.E., Chair, ICC Code Technology Committee

Revise as follows:

705.1.10 Toilet rooms. Where it is *technically infeasible* to alter existing toilet and bathing rooms to be *accessible*, an *accessible* family or assisted-use toilet or bathing room constructed in accordance with Section 1109.2.1 of the International Building Code is permitted. The family or assisted-use toilet or bathing room shall be located on the same floor and in the same area as the existing toilet or bathing rooms. At the inaccessible toilet and bathing rooms, directional signs indicating the location of the nearest family or assisted-use toilet room or bathing room shall be provided. These directional signs shall include the International Symbol of Accessibility and sign characters shall meet the visual character requirements in accordance with ICC A117.1.

Reason: This proposal will coordinate with ADA 216.8. The intent of this proposal is to add directional signage requirements for family/assisted-use bathrooms when the existing bathrooms are not fully accessible. The same proposal was made and approved for IBC Section 3411.8.11/IEBC 410.8.11.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>. Since its inception in April/2005, the CTC has held twenty five meetings - all open to the public.

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

705.1.10-EB-BALDASSARRA-CTC.doc

EB21 – 13

705.1, 705.1.15 (NEW)

Proponent: Carl Baldassarra, P.E., Chair, ICC Code Technology Committee
(cbaldassarra@rjagroup.com)

Revise as follows:

705.1 General. A *facility* that is altered shall comply with the applicable provisions in Sections 705.1.1 through ~~705.1.14~~ 705.1.15, and Chapter 11 of the *International Building Code* unless it is *technically infeasible*. Where compliance with this section is *technically infeasible*, the alteration shall provide access to the maximum extent that is technically feasible.

A *facility* that is constructed or altered to be accessible shall be maintained accessible during occupancy.

Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 705.2.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing *facilities*.
3. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing *facilities* undergoing less than a Level 3 *alteration*.
4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units.

705.1.15 Amusement rides. Where the structural or operational characteristics of an amusement ride are altered to the extent that the amusement ride's performance differs from that specified by the manufacturer or the original design, the amusement ride shall comply with requirements for new construction in the International Building Code, Section 1110.4.7.

Reason: The accessibility requirements for new construction for Amusement rides have been proposed to the IBC as part of a coordination effort with the 2010 ADA Standard for Accessible Design and 2009 ICC A117.1 Chapter 11, Recreation. The overall intent is to provide access to recreational facilities so that persons with mobility impairments can participate to the best of their ability. The requirements are not intended to change any essential aspects of that recreational activity.

The intent of this public comment is to match the provisions for existing amusement rides proposed and approved for IBC Chapter 34 and IEBC Chapter 4. This way the provisions for existing buildings will be consistent between Chapter 4 and 7 of the IEBC. Technical criteria can be found in the 2009 edition of the ICC A117.1, Section 1102 and includes accessible routes, load and unload areas, wheelchair spaces on rides, seats for transfer, and transfer devices.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>. Since its inception in April/2005, the CTC has held twenty five meetings - all open to the public.

Cost Impact: This code change proposal will not increase the cost of construction. This will be required by the 2010 ADA Standard for Accessible Design.

EB21-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

705.1-EB-BALDASSARRA-CTC.doc

EB22 – 13

705.2

Proponent: Hope Reed, New Mexico Governor's Commission on Disability (hope.reed@state.nm.us)

Revise as follows:

705.2 Alterations affecting an area containing a primary function. Where an *alteration* affects the accessibility to a, or contains an area of, *primary function*, the route to the *primary function* area shall be accessible. The accessible route to the *primary function* area shall include toilet facilities ~~or~~ and drinking fountains serving the area of *primary function*.

Exceptions:

1. The costs of providing the accessible route are not required to exceed 20 percent of the costs of the alterations affecting the area of *primary function*.

(Portions of text not shown remain unchanged)

Reason: See this same change for IEBC 410.7 and IBC 3411.7

Modify one word to comply with **2010 ADA Standards** section 35.151(b)(4) Path of travel, and comply with **2010 ADA**

Standards section 36.403(a)(1) Path of travel.

People with disabilities need bathroom renovations and drinking fountain renovations along the "Path of Travel." When there is a choice, the easier solution is to change just the drinking fountains and look no further. The restroom renovations can be ignored. This does not benefit people with disabilities.

Those old restrooms need to be fixed and when full accessibility is not possible, some attempt at accessibility will provide a benefit to many. Widening the restroom door, installing a raised toilet, installing grab bars, and removing toilet partitions can be easy access renovations to comply with the intent of **2010 ADA**. Restroom and drinking fountain renovations need to be considered on an equal basis to comply with IEBC 705.1 where it states, "*alterations* shall provide access to the maximum extent that is technically feasible."

Cost Impact: The cost will not exceed 20% of the cost for the alteration as stated in IEBC 705.2 Exception 1. Renovations should include equal consideration of both restroom renovations and drinking fountain renovations.

The IEBC needs to help building code officials bring alteration projects closer to the 20% dollar amount. Restroom and drinking fountain renovations need to be considered on an equal basis to comply with IEBC 705.1 where it states, "*alterations* shall provide access to the maximum extent that is technically feasible."

705.2-EB-REED.doc

EB23 – 13

202, 706 (NEW)

Proponent: Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee

Add new definitions as follows:

SECTION 202

GENERAL DEFINITIONS

REROOFING. The process of recovering or replacing an existing roof covering. See “Roof recover” and “Roof replacement.”

ROOF RECOVER. The process of installing an additional roof covering over a prepared existing roof covering without removing the existing roof covering.

ROOF REPAIR. Reconstruction or renewal of any part of an existing roof for the purposes of its maintenance.

ROOF REPLACEMENT. The process of removing the existing roof covering, repairing any damaged substrate and installing a new roof covering.

Add new text as follows:

SECTION 706

REROOFING

706.1 General. Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15 of the International Building Code.

Exception: Reroofing shall not be required to meet the minimum design slope requirement of one-quarter unit vertical in 12 units horizontal (2-percent slope) in Section 1507 of the International Building Code for roofs that provide positive roof drainage.

706.2 Structural and construction loads. Structural roof components shall be capable of supporting the roof-covering system and the material and equipment loads that will be encountered during installation of the system.

706.3 Recovering versus replacement. New roof coverings shall not be installed without first removing all existing layers of roof coverings down to the roof deck where any of the following conditions occur:

- 1. Where the existing roof or roof covering is water soaked or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing.**
- 2. Where the existing roof covering is wood shake, slate, clay, cement or asbestos-cement tile.**
- 3. Where the existing roof has two or more applications of any type of roof covering.**

Exceptions:

- 1. Complete and separate roofing systems, such as standing-seam metal roof systems, that are designed to transmit the roof loads directly to the building's structural system and that do not rely on existing roofs and roof coverings for support, shall not require the removal of existing roof coverings.**
- 2. Metal panel, metal shingle and concrete and clay tile roof coverings shall be permitted to be installed over existing wood shake roofs when applied in accordance with Section 706.4.**

3. The application of a new protective coating over an existing spray polyurethane foam roofing system shall be permitted without tear-off of existing roof coverings.
4. Where the existing roof assembly includes an ice barrier membrane that is adhered to the roof deck, the existing ice barrier membrane shall be permitted to remain in place and covered with an additional layer of ice barrier membrane in accordance with Section 1507 of the International Building Code.

706.4 Roof recovering. Where the application of a new roof covering over wood shingle or shake roofs creates a combustible concealed space, the entire existing surface shall be covered with gypsum board, mineral fiber, glass fiber or other approved materials securely fastened in place.

706.5 Reinstallation of materials. Existing slate, clay or cement tile shall be permitted for reinstallation, except that damaged, cracked or broken slate or tile shall not be reinstalled. Existing vent flashing, metal edgings, drain outlets, collars and metal counterflashings shall not be reinstalled where rusted, damaged or deteriorated. Aggregate surfacing materials shall not be reinstalled.

706.6 Flashings. Flashings shall be reconstructed in accordance with approved manufacturer's installation instructions. Metal flashing to which bituminous materials are to be adhered shall be primed prior to installation.

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

1. This language is copied from Section 1510 of the International Building Code and should be in the IEBC. Reroofing occurs on existing buildings.
2. The provisions for reroofing should be in the existing building code.

Cost Impact: This code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

803.1-EB-COLLINS.doc

EB25 – 13

803.3, 803.3.1, 803.3.2

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Healthcare (John.Williams@DOH.WA.GOV) and Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee (cbaldassarra@rjagroup.com)

Revise as follows:

~~803.3 Smoke barriers. Smoke barriers in Group I-2 occupancies shall be installed where required by Sections 803.3.1 and 803.3.2~~

~~803.3.1 Compartmentation.~~ **803.3 Smoke Compartments.** In Group I-2 occupancies where the work area is on a story used for sleeping rooms for more than 30 patients, the story shall be divided into not less than two compartments by smoke barrier walls complying with Section 803.3.2 such that each compartment does not exceed 22,500 square feet (2093 m²) and the travel distance from any point to reach a door in the required smoke barrier shall not exceed 200 feet (60 960 mm). in accordance with Section 407.5 of the International Building Code as required for new construction.

Exception. Where neither the length nor the width of the smoke compartment exceeds 150 feet (45 720 mm), the travel distance to reach the smoke barrier door shall not be limited.

~~803.3.2 Fire-resistance rating. The smoke barriers shall be fire resistance rated for 30 minutes and constructed in accordance with the International Building Code.~~

Reason: This proposed change is a joint proposal from the ICC Ad Hoc Committee on Healthcare (AHC) and the Code Technology Committee (CTC). The scope of the AHC deals with Group I-2 hospitals (now Group I-2 Condition 2 as a result of approved code change G257-12) and the scope of the CTC's investigation of the area of study entitled "Care Facilities" addresses Group I-1 and Group I-2 Condition 1 (nursing homes).

Group I-2 hospitals and nursing homes are a unique environment which employ the defend in place strategy. When such an occupancy undergoes a substantial alteration, which is the case with a Level 2 Alteration where the space can be entirely configured, such work areas should be provided with a higher degree of fire safety. With a reference to Section 407.5 of the IBC, the current IEBC compartment size provisions (maximum 22,500 square feet in area and maximum 200 of travel) are maintained. In addition, by virtue of a reference to the IBC, a higher level of fire safety will be provided, as follows:

- The travel distance within the compartment will be limited to 200 feet while the current IEBC provides an exception which literally allows unlimited travel as a function of the physical size of the space.
- The smoke barrier rating will not be permitted to be reduced to 30 minutes, but rather will be required to meet the new construction requirements of the IBC which require a one hour rating.

This is a joint proposal submitted by the ICC Ad Hoc Committee for Healthcare and the ICC Code Technology Committee.

The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering, a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: <http://www.iccsafe.org/cs/AHC/Pages/default.aspx>.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. This proposal is submitted by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>. Since its inception in April/2005, the CTC has held twenty-five meetings - all open to the public. In 2012, three of the 25 face-to-face meetings were held. In addition to the CTC meetings, the CTC established Study Groups (SG) of interested parties for each of the areas of study. These SG's are responsible for reviewing the available information and making recommendations to the CTC. All totaled, the SG's held over 70 conference calls in 2012.

Cost Impact: The code change proposal will not increase the cost of construction.

EB25-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

803.3-EB-BALDASSARRA-WILLIAMS-ADHOC.doc

EB26 – 13

803.6 (NEW)

Proponent: Robert J. Davidson, Davidson Code Concepts, LLC, representing self (rjd@davidsoncodeconcepts.com) and David S. Collins, FAIA, The Preview Group, Inc. (dcollins@preview-group.com), representing The American Institute of Architects

Add new text as follows:

803.6 Fire-resistance ratings. Where approved by the code official, buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 of the *International Building Code* has been added, and the building is now sprinklered throughout, the required fire-resistance ratings of building elements and materials shall be permitted to meet the requirements of the current building code. The building is required to meet the other applicable fire protection requirements of Chapter 9 of the *International Building Code*.

Plans, investigation and evaluation reports, and other data shall be submitted indicating which building elements and materials the applicant is requesting the code official to review and approve for determination of applying the current building code fire-resistance ratings. Any special construction features, conditions of occupancy, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building that impact required fire-resistance ratings shall be identified in the evaluation reports submitted.

Reason: The topic of allowing the ability to apply sprinkler protection trade-offs that exist in the current code has been a matter of discussion in the code development arena for some time. How to apply the allowance for a potential reduction in fire-resistance ratings and in what code they belong have been discussed without a consensus.

The concept is that once a building without sprinkler protection has been sprinklered throughout, whether due to renovations or retroactive code application, the designer should be permitted to allow the same fire resistance rating provisions for new construction in an existing sprinklered building. The issue is how to provide for that application of code and ensure a proper review by the building code official is performed to ensure there are no impediments to granting an approval that may result in the reduction of existing levels of protection.

This proposal attempts to provide for that process by adding a new section to the IEBC under Section 806 Building Elements and Materials. The suggested language provides that once an existing building is sprinklered throughout and meets the other fire protection requirements of Chapter 9 of the IBC, plans, investigation and evaluation reports, and other data can be submitted seeking approval of the code official for the assignment of the new fire-resistance ratings which might me a reduction, or potentially an increase.

The suggested language also requires that any special construction features, conditions of occupancy, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building that impact required fire-resistance ratings shall be identified in the evaluation reports submitted. This is to ensure special conditions are identified that may prevent a reduction in fire-resistance ratings.

Cost Impact: This code change proposal will not increase the cost of construction.

EB26-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

803.6 (NEW)-EB-DAVIDSON.doc

EB27 – 13

804.2.1

Proponent: Jeffrey M. Hugo, CBO, National Fire Sprinkler Association (hugo@nfsa.org)

Revise as follows:

804.2.1 High-rise buildings. In high-rise buildings, work areas ~~that have exits or corridors shared by more than one tenant or that have exits or corridors serving an occupant load greater than 30~~ shall be provided with automatic sprinkler protection ~~in~~ throughout the entire *work area* where the *work area* is located on a floor that has ~~a sufficient sprinkler water supply system from an existing standpipe or a sprinkler riser serving that floor.~~

Reason: This change would require a tenant doing Level 2 or 3 alterations to connect to the existing standpipe/sprinkler riser and install fire sprinklers throughout the work area. Currently, the IEBC only requires fire sprinklers when multiple tenants are in the same work area, use the same corridors or when the corridor exceeds 30 occupants.

Cost Impact: This code change proposal will not increase the cost of construction.

EB27-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

804.2.1-EB-HUGO.doc

EB28 – 13

804.2.1.1

Proponent: Jeffrey M. Hugo, CBO, National Fire Sprinkler Association (hugo@nfsa.org)

Revise as follows:

804.2.1.1 Supplemental automatic sprinkler system requirements. Where the *work area* on any floor exceeds 50 percent of that floor area, Section 804.2.1 shall apply to the entire floor on which the *work area* is located.

Exception: Occupied ~~T~~tenant spaces that are entirely outside the *work area*.

Reason: When the entire floor is sprinklered according to this section, a tenant space that is entirely outside the work area is exempt from retrofitting the space with fire sprinklers. Requiring a tenant that is outside the work scope to install fire sprinklers could bear undue financial burdens and disruptions. However, if the adjacent tenant space(s) are vacant or unoccupied during the Level 2 or 3 alterations, then the exception should not apply.

Cost Impact: This code change proposal will not increase the cost of construction.

EB28-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

804.2.1.1-EB-HUGO.doc

EB29 – 13

804.2.2

Proponent: Dave Frable, U.S. General Services Administration Public Buildings Service
(dave.frable@gsa.gov)

Revise as follows:

804.2.2 Groups A, B, E, F-1, H, I, M, R-1, R-2, R-4, S-1 and S-2. In buildings with occupancies in Groups A, B, E, F-1, H, I, M, R-1, R-2, R-4, S-1 and S-2, work areas that have exits or corridors shared by more than one tenant or that have exits or corridors serving an occupant load greater than 30 shall be provided with automatic sprinkler protection where all of the following conditions occur:

1. The *work area* is required to be provided with automatic sprinkler protection in accordance with the *International Building Code* as applicable to new construction; and
2. The *work area* exceeds 50 percent of the floor area.

Exceptions:

1. Work areas in Group R occupancies three stories or less in height.
2. If the building does not have sufficient municipal water supply for design and installation of a fire sprinkler system available ~~to the floor without installation of a new fire pump, at the site~~ work areas shall be protected by an automatic smoke detection system throughout all occupiable spaces other than sleeping units or individual dwelling units that activates the occupant notification system in accordance with Sections 907.4, 907.5 and 907.6 of the *International Building Code*.

Reason: The intent of this code change is to attempt to address a concern that the municipal water supply must be available at the floor where the work area is located without the installation of a new fire pump. This code change revises the subject text such that if a municipal water supply is available at the building site, and the work area exceeds 50% of the floor area, the installation of a new fire pump if needed to supplement the necessary flow and pressure for the sprinkler system should not be the deciding factor to address the need to increase the current degree of public safety in existing buildings.

Cost Impact: This code change proposal will increase the cost of construction.

EB29-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

804.2.2-EB-FRABLE.doc

EB30 – 13

804.2.3

Proponent: Dave Frable, U.S. General Services Administration, Public Buildings Service
(dave.frable@gsa.gov)

Revise as follows:

804.2.3 Windowless stories. Work located in a windowless story, as determined in accordance with the *International Building Code*, shall be sprinklered where the *work area* is required to be sprinklered under the provisions of the *International Building Code* for newly constructed buildings and the building has a sufficient municipal water supply ~~without installation of a new fire pump~~ for design and installation of a fire sprinkler system available at the site.

Reason: The intent of this code change is to attempt to address a concern that the municipal water supply must be available at the floor where the work area is located without the installation of a new fire pump. This code change revises the subject text such that if a municipal water supply is available at the building site, and the work area exceeds 50% of the floor area, the installation of a new fire pump if needed to supplement the necessary flow and pressure for the sprinkler system should not be the deciding factor to address the need to increase the current degree of public safety in existing windowless buildings.

Cost Impact: This code change proposal will increase the cost of construction.

Proponent: Jeffrey M. Hugo, CBO, National Fire Sprinkler Association (hugo@nfsa.org)

Revise as follows:

804.2.3 Windowless stories. Work located in a windowless story, as determined in accordance with the *International Building Code*, shall be sprinklered where the *work area* is required to be sprinklered under the provisions of the *International Building Code* for newly constructed buildings and the building has a sufficient municipal water supply ~~without installation of a new fire pump.~~ for design of an automatic sprinkler system.

804.2.4 Other required automatic sprinkler systems. In buildings and areas listed in Table 903.2.11.6 of the *International Building Code*, *work areas* that have exits or corridors shared by more than one tenant or that have exits or corridors serving an occupant load greater than 30 shall be provided with an automatic sprinkler system under the following conditions:

1. The *work area* is required to be provided with an automatic sprinkler system in accordance with the *International Building Code* applicable to new construction; and
2. The building has sufficient municipal water supply for design of an automatic sprinkler system, ~~available to the floor without installation of a new fire pump.~~

Reason: The judgment on whether to use a fire pump or not can be easily altered due to the cost and providing the space by the design professional or the building owner. A building owner and the design professional sometimes cannot see the need for a sprinkler system and by the current language have an easy way out of providing an essential life safety operation. Having a sprinkler system in an existing building will provide a higher level of safety for the occupants and fire fighters. The IEBC doesn't incorporate all the safety measures as a new building in the IBC, meaning, many of the active and passive measures are eliminated in the IEBC for architectural, structural, aesthetic, and economic reasons.

This section covers a broad range of occupancies and already provides economic relief to structures outside of a municipal water system, saving several thousands of dollars in extending a water main and/or adding water storage tanks. By giving the owner another choice to eliminate a fire sprinkler system and saving more money, could cost in lives and property down the road. The code official has to rely on the word of the owner on the necessity of a fire pump in the current language. The truth is by adding a fire sprinkler system it will usually pay for itself in a range of 7-10+ years by insurance premium discounts, tax depreciation, business downtime in the event of a fire, and potential litigation in the event of death and injuries.

The necessity of a fire pump only comes into the equation when the hydraulic calculations are performed. In many cases pipe sizes and design will determine whether or not a fire pump is needed. For example, if a building owner has sufficient water supply at the street, but decides that he/she wants all 1 inch pipe for all four stories a fire pump would be needed. In this case water pressure is crucial and a fire pump would add the additional pressure. Anyone will tell you the owner is being unreasonable and this is the crux for removing the proposed language out of this section.

The code official needs this language out to insure the safety of lives and property in their jurisdiction and basing a life safety system solely on an economic decision is unwise. The current language is a loophole for dishonesty and a code official does not need any more of this in their day to day lives.

Cost Impact: This code change proposal will not increase the cost of construction.

EB32 – 13

804.2.4

Proponent: Dave Frable, U.S. General Services Administration Public Buildings Service
(dave.frable@gsa.gov)

Revise as follows:

804.2.4 Other required automatic sprinkler systems. In buildings and areas listed in Table 903.2.11.6 of the *International Building Code*, *work areas* that have exits or corridors shared by more than one tenant or that have exits or corridors serving an occupant load greater than 30 shall be provided with an automatic sprinkler system under the following conditions:

1. The *work area* is required to be provided with an automatic sprinkler system in accordance with the *International Building Code* applicable to new construction; and
2. The building has sufficient municipal water supply for design and installation of an automatic sprinkler system available ~~to the floor without installation of a new fire pump.~~ at the site.

Reason: The intent of this code change is to attempt to address a concern that the municipal water supply must be available at the floor where the work area is located without the installation of a new fire pump. This code change revises the subject text such that if a municipal water supply is available at the building site, and the work area exceeds 50% of the floor area, the installation of a new fire pump if needed to supplement the necessary flow and pressure for the sprinkler system should not be the deciding factor to address the need to increase the current degree of public safety in existing buildings.

Cost Impact: This code change proposal will increase the cost of construction.

EB32-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

804.2.4-EB-FRABLE.doc

EB33 – 13

804.4.1.3

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Healthcare (John.Williams@DOH.WA.GOV) and Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee (cbaldassarra@rjagroup.com)

Revise as follows:

804.4.1 Occupancy requirements. A fire alarm system shall be installed in accordance with Sections 804.4.1.1 through 804.4.1.7. Existing alarm-notification appliances shall be automatically activated throughout the building. Where the building is not equipped with a fire alarm system, alarm-notification appliances within the *work area* shall be provided and automatically activated.

Exceptions:

1. Occupancies with an existing, previously approved fire alarm system.
2. Where selective notification is permitted, alarm notification appliances shall be automatically activated in the areas selected.

804.4.1.3 Group I-2. A fire alarm system shall be installed in work areas of Group I-2 occupancies as required by the International Fire Code for ~~existing~~ new Group I-2 occupancies.

Reason: This proposed change is a joint proposal from the ICC Ad Hoc Committee on Healthcare (AHC) and the Code Technology Committee (CTC). The scope of the AHC deals with Group I-2 hospitals (now Group I-2 Condition 2 as a result of approved code change G257-12) and the scope of the CTC's investigation of the area of study entitled "Care Facilities" addresses Group I-1 and Group I-2 Condition 1 (nursing homes).

This section in the IEBC refers you to the IFC for fire alarm requirements in existing buildings undergoing a Level 2 Alteration. Section 1103.7.3 of the IFC refers back to the new construction requirements of Section 907.2.6.2. This proposal removes the circuitous references by stipulating that the fire alarm system needs to be installed as required for new construction.

This is a joint proposal submitted by the ICC Ad Hoc Committee for Healthcare and the ICC Code Technology Committee.

The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering, a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: <http://www.iccsafe.org/cs/AHC/Pages/default.aspx>.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. This proposal is submitted by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>. Since its inception in April/2005, the CTC has held twenty-five meetings - all open to the public. In 2012, three of the 25 face-to-face meetings were held. In addition to the CTC meetings, the CTC established Study Groups (SG) of interested parties for each of the areas of study. These SG's are responsible for reviewing the available information and making recommendations to the CTC. All totaled, the SG's held over 70 conference calls in 2012.

Cost Impact: This code change proposal will not increase the cost of construction.

804.4.1.3-EB-BALDASSARRA-WILLIAMS-ADHOC.doc

EB34 – 13

805.3.1.1

Proponent: Maureen Traxler, City of Seattle, representing Seattle Dept. of Planning & Development
(Maureen.traxler@seattle.gov)

Revise as follows:

805.3.1.1 Single-exit buildings. Only one exit is required from buildings and spaces of the following occupancies:

1. In Group A, B, E, F, M, U and S occupancies, a single exit is permitted in the story at the level of exit discharge when the occupant load of the story does not exceed 50 and the exit access travel distance does not exceed 75 feet (22 860 mm).
2. Group B, F-2, and S-2 occupancies not more than two stories in height that are not greater than 3,500 square feet per floor (326 m²), when the exit access travel distance does not exceed 75 feet (22 860 mm). The minimum fire-resistance rating of the exit enclosure and of the opening protection shall be 1 hour.
3. Open parking structures where vehicles are mechanically parked.
4. In Group R-4 occupancies ~~community residences for the developmentally disabled~~, the maximum occupant load excluding staff is 12.

(Portions to text not shown remain unchanged)

Reason: The term “community residence for the developmentally disabled” is a term not used by many jurisdictions. Group R-4 seems to be the term used in the International Codes that most closely resembles it. Community residences are defined in part by the State of New Jersey as providing “residential services for up to 16 developmentally disabled persons, including group homes, supervised apartments, and supportive living”; Group R-4 is defined in the IBC as “...buildings, structures or portions thereof for more than five but not more than 16 persons, excluding staff, who reside on a 24-hour basis in a supervised residential environment and receive *custodial care*...” Examples of R-4 occupancies include assisted living facilities, group homes, and residential board and custodial care facilities.

Cost Impact: The code change proposal will not increase the cost of construction.

EB34-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

805.3.1.1-EB-TRAXLER.doc

EB35 – 13

805.3.1.1

Proponent: Steve Thomas, Colorado Code Consulting, LLC (sthomas@coloradocode.net)

Revise as follows:

805.3.1.1 Single-exit buildings. Only one exit is required from buildings and spaces of the following occupancies:

1. In Group A, B, E, F, M, U and S occupancies, a single exit is permitted in the story at the level of exit discharge when the occupant load of the story does not exceed 50 and the exit access travel distance does not exceed 75 feet (22 860 mm).
2. Group B, F-2, and S-2 occupancies not more than two stories in height that are not greater than 3,500 square feet per floor (326 m²), when the exit access travel distance does not exceed 75 feet (22 860 mm). The minimum fire-resistance rating of the exit enclosure and of the opening protection shall be 1 hour.
3. Open parking structures where vehicles are mechanically parked.
4. In community residences for the developmentally disabled, the maximum occupant load excluding staff is 12.
5. Groups R-1 and R-2 not more than ~~two~~ three stories in height, when there are not more than four dwelling units per floor and the exit access travel distance does not exceed ~~50 125 feet (15 240 mm)~~ 38,100 mm. The minimum fire-resistance rating of the exit enclosure and of the opening protection shall be 1 hour. Each dwelling unit shall be provided with emergency escape and rescue openings in accordance with Section 1029 of the International Building Code.

(Portions of text not shown remain unchanged)

Reason: This change is intended to create consistency between the IEBC and the IBC. The travel distances for Group R-2 occupancies in Table 1021.2(1) were changed in the 2012 IBC. This change is consistent with that change. It eliminates any potential conflicts between the codes. We have also added the requirement for emergency escape and rescue openings to the section to be consistent with the footnote a of IBC Table 1021.2(1) for consistency as well.

Cost Impact: The code change proposal will not increase the cost of construction. It will reduce the cost of construction.

EB35-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

805.3.1.1-EB-THOMAS

EB36 – 13

805.3.1.2

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Healthcare
(John.Williams@DOH.WA.GOV)

Revise as follows:

805.3.1.2 Fire escapes required. For other than Group I-2 Condition 2, where ~~When~~ more than one exit is required, an existing or newly constructed fire escape complying with Section 805.3.1.2.1 shall be accepted as providing one of the required means of egress.

Reason: Based on the approval as modified of code change G257-12, Group I-2 hospitals are now classified as Group I-2, Condition 2. Where a Level 2 Alteration occurs, this proposal is intended to limit the use of fire escapes to all occupancies other than hospitals. Hospitals are a unique environment which employ the defend in place strategy which is one for which the use of a fire escape is neither practical nor appropriate. The minimum number of exits from such facilities needs to be held to the highest possible standard – that of new construction as stipulated in Section 805.3.1.

This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering, a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: <http://www.iccsafe.org/cs/AHC/Pages/default.aspx>.

Cost Impact: The code change proposal will not increase the cost of construction.

EB36-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

805.3.1.2-EB-WILLIAMS-ADHOC

EB37 – 13

805.5.2

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Healthcare (John.Williams@DOH.WA.GOV) and Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee (cbaldassarra@rjagroup.com)

Revise as follows:

805.5.2 Transoms. In all buildings of Group I-1, Group I-2, R-1 and R-2 occupancy, all transoms in corridor walls in work areas shall either be glazed with 1/4-inch (6.4 mm) wired glass set in metal frames or other glazing assemblies having a fire protection rating as required for the door and permanently secured in the closed position or sealed with materials consistent with the corridor construction.

Reason: This proposed change is a joint proposal from the ICC Ad Hoc Committee on Healthcare (AHC) and the Code Technology Committee (CTC). The scope of the AHC deals with Group I-2 hospitals (now Group I-2 Condition 2 as a result of approved code change G257-12) and the scope of the CTC's investigation of the area of study entitled "Care Facilities" addresses Group I-1 and Group I-2 Condition 1 (nursing homes).

Hospitals and nursing homes are a unique environment which employ the defend in place strategy which is one for which the means of egress and relocation of individuals from one smoke compartment another is of critical importance. Where a Level 2 Alteration occurs, resulting in a reconfiguration of the work area, the corridors provide a critical passageway which needs to be held to the highest possible standard while at the same time acknowledging practical construction limitations. The current code acknowledges this for Groups I-1, R-1 and R-2 occupancies where the occupants may be sleeping. This code change provides the same level of protection for Group I-2.

This is a joint proposal submitted by the ICC Ad Hoc Committee for Healthcare and the ICC Code Technology Committee.

The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering, a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: <http://www.iccsafe.org/cs/AHC/Pages/default.aspx>.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. This proposal is submitted by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. 805.5.2-EB-BALDASSARRA-WILLIAMS-ADHOC

EB38 – 13

805.6

Proponent: Gerald Anderson, City of Overland Park, Kansas (jerry.anderson@opkansas.org)

Revise as follows:

805.6 Dead-end corridors. Dead-end corridors in any *work area* created as a result of the alteration shall not exceed ~~35~~ 20 feet (6096 mm). Existing dead-end corridors in any work area shall not exceed 35 feet (10 670 mm).

Exceptions:

1. Where dead-end corridors of greater length are permitted by the *International Building Code*.
2. In other than Group A and H occupancies, the maximum length of an existing dead-end corridor shall be 50 feet (15 240 mm) in buildings equipped throughout with an automatic fire alarm system installed in accordance with the *International Building Code*.
3. In other than Group A and H occupancies, the maximum length of an existing dead-end corridor shall be 70 feet (21 356 mm) in buildings equipped throughout with an automatic sprinkler system installed in accordance with the *International Building Code*.
4. In other than Group A and H occupancies, the maximum length of an existing, newly constructed, or extended dead-end corridor shall not exceed 50 feet (15 240 mm) on floors equipped with an automatic sprinkler system installed in accordance with the *International Building Code*.

Reason: The intent of the code change is to make the base requirement for the allowable length of a dead-end corridor to be the same as the International Building code. The IBC limits dead-end corridors to 20 feet. The new wording will continue to make allowances for existing situations where existing dead-end corridor are found to be 35 feet length or less in length. It seems terribly inconsistent to require dead-end corridors on new construction be limited to 20 feet, and then yet allow for an alteration with a 35 foot dead end corridor.

Cost Impact: The code change proposal will not increase the cost of construction.

EB39 – 13

805.10 (NEW), 805.10.1 (NEW), 805.10.2 (NEW)

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care and Carl Baldassarra, Code Technologies Committee

Add new text as follows:

805.10 Refuge areas. Where alterations affect the configuration of an area utilized as a refuge areas, the capacity of the refuge area shall not be reduced below that required in Section 805.10.1 and 805.10.2.

805.10.1 Smoke compartments. In Group I-2 occupancies, the required capacity of the refuge areas for smoke compartments in accordance with Section 407.5.1 and 408.6.2 of the *International Building Code* shall be maintained.

805.10.2 Horizontal exits. The required capacity of the refuge area for horizontal exits in accordance with Section 1025.4 of the *International Building Code* shall be maintained.

Reason: When a space in a Group I-2 facility is being altered the designer needs to check that an alteration does not conflict with the area being used as a refuge area from an adjacent compartment. There was a correlative change proposed and accepted for IBC Chapter 34/IEBC Chapter 4.

This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering, a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: <http://www.iccsafe.org/cs/AHC/Pages/default.aspx>.

This proposal is being co-sponsored by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>. Since its inception in April/2005, the CTC has held twenty five meetings - all open to the public.

Cost Impact: This code change proposal will not increase the cost of construction.

805.10 (NEW)-EB-BALDASSARRA-WILLIAMS-ADHOC.doc

EB40 – 13

805.10 (NEW), 805.10.1 (NEW), 805.10.2 (NEW)

Proponent: Robert J Davidson, Davidson Code Concepts, LLC, representing self
(rjd@davidsoncodeconcepts.com)

Add new text as follows:

805.10 Refuge areas. Where alterations affect the configuration of an area utilized as a refuge areas, the capacity of the refuge area shall not be reduced below that required in Section 805.10.1 and 805.10.2.

805.10.1 Smoke compartments. In Group I-3 occupancies, the required capacity of the refuge areas for smoke compartments in accordance with Section 407.5.1 and 408.6.2 of the International Building Code shall be maintained.

805.10.2 Horizontal exits. The required capacity of the refuge area for horizontal exits in accordance with Section 1025.4 of the International Building Code shall be maintained.

Reason: When a jail is being altered the designer needs to check that an alteration does not conflict with the area being used as a refuge area from an adjacent compartment. The intent is to mirror the language proposed by the Adhoc Health Care for hospitals for consistency in protection.

Cost Impact: This code change proposal will not increase the cost of construction.

EB40-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

805.10 (NEW)-EB-DAVIDSON.doc

EB41 – 13

805.10 (NEW), 805.10.1 (NEW), 808.10.2 (NEW)

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Healthcare

Revise as follows:

IEBC 805.10 Refuge areas. Where alterations affect the configuration of an area utilized as a refuge areas, the capacity of the refuge area shall not be reduced below that required in Section 805.10.1 and 805.10.2.

IEBC 805.10.1 Ambulatory care. In ambulatory care facilities required to be separated by Section 422.2 of the International Building Code, the required capacity of the refuge areas for smoke compartments in accordance with Section 422.4 of the International Building Code shall be maintained.

IEBC 805.10.2 Horizontal exits. The required capacity of the refuge area for horizontal exits in accordance with Section 1025.4 of the International Building Code shall be maintained.

Reason: The provisions to separate Ambulatory Care facilities with four or more persons may not be capable of self-preservation is fairly new in the code. However, when a different tenant in the building makes alterations, it needs to be verified that the areas of refuge are maintained. The intent is to mirror the language proposed by the Adhoc Health Care for hospitals.

This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering, a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: <http://www.iccsafe.org/cs/AHC/Pages/default.aspx>.

EB43 – 13

806.3, 806.4, 806.5, 906.2

Proponent: Carl Baldassarra, P.E., Chair, ICC Code Technology Committee

Revise as follows:

806.3 1105.2 Accessible dwelling units and sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for accessible units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of spaces being added.

806.4 1105.3 Type A dwelling or sleeping units. Where more than 20 Group R-2 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type A units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being added.

806.5 1105.4 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type B units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being added.

906.2 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered ~~or added~~, the requirements of Section 1107 of the *International Building Code* for Type B units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered ~~or added~~.

Reason: The intent of this change is to clarify when Accessible, Type A and Type B units are required in alterations and additions.

Units being added within an existing structure are considered an alteration; therefore, Accessible and Type A units that are added as part of a renovation are adequately addressed in Section 705.1.8 and 705.1.9, and the language in 806.3 and 806.4 is not needed.

Additions adjacent to or above a building must comply with new construction. Therefore, Section 806.3, 806.4 and 806.5 should be relocated to Section 1105. This clarifies that just the addition is considered for the number of units, not the addition plus the number of existing units. Section 705.1.14, Extent of application, would allow for a situation where Accessible and Type A units were provided in sufficient numbers, including the addition, in the existing building.

Type B units are currently required in existing building undergoing a Level 3 alteration, with or without a change of occupancy. This requirement will remain the same (see Section 705.1, Exception 3, Section 906.2 and the exception to Section 1012.8).

For reference these are the related sections with revisions included.

Level I Alterations

705.1 General. A facility that is altered shall comply with the applicable provisions in Sections 705.1.1 through 705.1.14, and Chapter 11 of the *International Building Code* unless it is *technically infeasible*. Where compliance with this section is *technically infeasible*, the alteration shall provide access to the maximum extent that is technically feasible. A facility that is constructed or altered to be accessible shall be maintained accessible during occupancy.

Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 705.2.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing facilities.
3. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing facilities undergoing less than a Level 3 alteration.
4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units.

705.1.8 Accessible dwelling or sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for accessible units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered.

705.1.9 Type A dwelling or sleeping units. Where more than 20 Group R-2 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for Type A units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered.

Level II Alterations

806.1 General. A building, *facility*, or element that is altered shall comply with this section and Section 705.

Level III Alterations

906.1 General. A building, *facility* or element that is altered shall comply with this section and Sections 705 and 806.

906.2 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered or added, the requirements of Section 1107 of the *International Building Code* for Type B units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered or added.

Change of Occupancy

1006.1 General. Accessibility in portions of buildings undergoing a *change of occupancy* classification shall comply with Section 1012.8.

1012.8 Accessibility. *Existing buildings* that undergo a change of group or occupancy classification shall comply with this section.

Exception: Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing buildings and facilities undergoing a *change of occupancy* in conjunction with less than a Level 3 *alteration*.

Additions

1105.1 Minimum requirements. Accessibility provisions for new construction shall apply to additions. An addition that affects the accessibility to, or contains an area of, *primary function* shall comply with the requirements of Sections 705, 806 and 906, as applicable.

1105.2 806.3 Accessible dwelling units and sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for accessible units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being added.

1105.3 806.4 Type A dwelling or sleeping units. Where more than 20 Group R-2 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type A units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being added.

1105.4 806.5 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type B units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being added.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>. Since its inception in April/2005, the CTC has held twenty five meetings - all open to the public.

Cost Impact: This code change proposal will not increase the cost of construction.

EB43-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

906.2-EB-BALDASSARRA-CTC.doc

EB44 – 13

808.1

Proponent: Gerald Anderson, City of Overland Park, Kansas (jerry.anderson@opkansas.org)

Revise as follows:

808.1 New installations. All newly installed electrical equipment and wiring relating to work done in any *work area* shall comply with ~~the materials and methods requirements of Chapter 7.~~

Exception: ~~Electrical equipment and wiring in newly installed partitions and ceilings shall comply with all applicable requirements of NFPA 70~~ except as provided for in Section 808.3.

Reason: There are no requirements pertaining to electrical equipment and wiring in Chapter 7 thus it is inappropriate to refer back to chapter 7. Reference is made to Section 808.3 to make it clear that the requirements found in NFPA 70 would not override the special provisions related to residential occupancies.

Cost Impact: The code change proposal will not increase the cost of construction.

EB44-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

808.1-EB-ANDERSON

EB45 – 13

901.2, 903.2.1, 903.3

Proponent: David S. Collins, FAIA, The Preview Group, Inc., representing The American Institute of Architects

Revise as follows:

901.2 Compliance. In addition to the provisions of this chapter, work shall comply with all of the requirements of Chapters 7 and 8. The requirements of Sections 803, 804 and 805 shall apply ~~within all work areas~~ to all Level 3 alteration work per Section 505.1, whether or not they include exits and corridors shared by more than one tenant and regardless of the occupant load.

Exception: Buildings in which the reconfiguration of space affecting exits or shared egress access is exclusively the result of compliance with the accessibility requirements of Section 705.2 shall not be required to comply with this chapter.

903.2.1 Separation required. Where the ~~work area~~ Level 3 alteration work is in any attached dwelling unit in Group R-3 or any multiple single-family dwelling (townhouse), walls separating the dwelling units that are not continuous from the foundation to the underside of the roof sheathing shall be constructed to provide a continuous fire separation using construction materials consistent with the existing wall or complying with the requirements for new structures. All work shall be performed on the side of the dwelling unit wall that is part of the *work area*.

Exception: Where *alterations* or *repairs* do not result in the removal of wall or ceiling finishes exposing the structure, walls are not required to be continuous through concealed floor spaces.

903.3 Interior finish. Interior finish in exits serving the ~~work area~~ Level 3 alterations shall comply with Section 803.4 between the highest floor on which there is ~~a work area~~ an alteration to the floor of exit discharge.

Reason: This change is part of the package of changes to help clarify how alteration work is described and within what limitations they are to be applied. Section 505.1 will include the limitations for the 50 percent reconfiguration of space, along with the reconfiguration or extension of systems that serve more than 50 percent of the space in a building.

Cost Impact: The code change proposal will not increase the cost of construction. This will lower the cost of construction by eliminating confusion.

EB45-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

901.2-EB-COLLINS.doc

EB46 – 13

902.2, 902.2.1

Proponent: Carl Baldassarra, P.E., Chair, ICC Code Technology Committee

Revise as follows:

902.2 Boiler and furnace equipment rooms. Boiler and furnace equipment rooms adjacent to or within Groups I-1, I-2, I-4, R-1, R-2 and R-4 occupancies ~~the following facilities shall be enclosed by 1-hour fire-resistance-rated construction: day nurseries, children's shelter facilities, residential childcare facilities, and similar facilities with children below the age of 21/2 years or that are classified as Group I-2 occupancies, shelter facilities, residences for the developmentally disabled, group homes, teaching family homes, transitional living homes, rooming and boarding houses, hotels, and multiple dwellings.~~

Exceptions:

1. ~~Furnace and Steam boiler equipment of low-pressure type, operating at pressures of 15 pounds per square inch gauge (psig) (103.4 KPa) or less for steam equipment or is not required to be enclosed.~~
2. ~~Hot water boilers operating at pressures of 170 psig (1171 KPa) or less for hot water equipment, when installed in accordance with manufacturer recommendations are not required to be enclosed.~~
3. ~~2- Furnace and boiler equipment of residential R-3 type with 200,000 400,000 British thermal units (Btu) (2.11 4.22 x 10⁸ J) per hour input rating or less is not required to be enclosed.~~
4. ~~3- Furnace rooms protected with automatic sprinkler protection fire-extinguishing system are not required to be enclosed.~~

902.2.1 Emergency controls. Emergency controls for boilers and furnace equipment shall be provided in accordance with the *International Mechanical Code* in all buildings classified as day nurseries, children's shelter facilities, residential childcare facilities, and similar facilities with children below the age of 21/2 years or that are classified as Group I-2 occupancies, and in group homes, teaching family homes, and supervised transitional living homes in accordance with the following:

1. ~~Emergency shutoff switches for furnaces and boilers in basements shall be located at the top of the stairs leading to the basement; and~~
2. ~~Emergency shutoff switches for furnaces and boilers in other enclosed rooms shall be located outside of such room.~~

Reason: The list of occupancies is outdated and unclear in both Section 902.2 and 902.2.1. The exceptions in 902.2 should be consistent with IBC Table 508.2.5 for new construction, not have a much lower threshold for renovations versus new. The remainder of the revisions is a clarification of the existing language. Emergency controls for boilers and furnace equipment is never required in the IMC, so Section 902.2.1 should be deleted.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>. Since its inception in April/2005, the CTC has held twenty five meetings - all open to the public.

Cost Impact: This code change proposal will not increase the cost of construction.

EB46-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

902.2-EB-BALDASSARRA-CTC.doc

EB47 – 13

904.1, 904.1.1

Proponent: Dave Fable, U.S. General Services Administration, Public Buildings Service
(dave.fable@gsa.gov)

Revise as follows:

904.1 Automatic sprinkler systems. ~~Automatic sprinkler systems~~ An automatic sprinkler system shall be provided in ~~all work areas~~ a work area when required by Section 804.2 or this section.

904.1.1 High-rise buildings. ~~In high-rise buildings, work areas shall be provided with automatic sprinkler protection where the building has a sufficient municipal water supply system to the site. Where the work area exceeds 50 percent of floor area, sprinklers shall be provided in the specified areas where sufficient municipal water supply for design and installation of a fire sprinkler system is available at the site. An automatic sprinkler system shall be provided in work areas when the high-rise building has a sufficient municipal water supply for the design and installation of an automatic sprinkler system at the site.~~

Reason: The intent of this code change is to attempt to simplify and provide some clarification to Section 904.1 and 904.1.1. Currently, the text as written is confusing for sprinkler protection in Level 3 alterations.

Cost Impact: This code change proposal will increase the cost of construction.

EB47-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

904.1-EB-FRABLE.doc

EB48 – 13

904.1.3 (NEW)

Proponent: Carl Baldassarra, P.E., Chair, ICC Code Technology Committee

Revise as follows:

904.1 Automatic sprinkler systems. Automatic sprinkler systems shall be provided in all *work areas* when required by Section 804.2 or this section.

904.1.1 High-rise buildings. In high-rise buildings, work areas shall be provided with automatic sprinkler protection where the building has a sufficient municipal water supply system to the site. Where the *work area* exceeds 50 percent of floor area, sprinklers shall be provided in the specified areas where sufficient municipal water supply for design and installation of a fire sprinkler system is available at the site.

904.1.2 Rubbish and linen chutes. Rubbish and linen chutes located in the *work area* shall be provided with automatic sprinkler system protection or an approved automatic fire-extinguishing system where protection of the rubbish and linen chute would be required under the provisions of the International Building Code for new construction.

904.1.3 Upholstered furniture or mattresses. *Work areas* shall be provided with automatic sprinkler protection in accordance with the *International Building Code* where any of the following conditions exist:

1. A Group F-1 occupancy used for the manufacture of upholstered furniture or mattresses exceeds 2,500 square feet (232 m²).
2. A Group M occupancy used for the display and sale of upholstered furniture or mattresses exceeds 5,000 square feet (464 m²).
3. A Group S-1 occupancy used for the storage of upholstered furniture or mattresses exceeds 2,500 square feet (232 m²).

Exception: Where an automatic sprinkler system is required by items 1, 2 or 3 and where the building does not have sufficient municipal water supply for the design and installation of an automatic sprinkler system available to the floor without installation of a new fire pump, *work areas* shall be protected by an automatic smoke detection system throughout all occupiable spaces. The automatic smoke detection system shall activate the occupant notification system in accordance with Sections 907.4, 907.5 and 907.6 of the *International Building Code*.

Reason: This proposed change is a result of the CTC's investigation of the area of study entitled "NIST Charleston Sofa Store Fire Recommendations". The scope of the activity is noted as:

"Review the NIST and other investigative reports on the fire that occurred on the evening of June 18, 2007 in the Sofa Super Store in Charleston, South Carolina to identify issues that can be addressed by the International Codes."

In connection with their investigation, NIST analyzed the fire ground, consulted with other experts, and performed computer simulations of fire growth alternatives. Based on these analyses, NIST concluded that the following sequence of events is likely to have occurred. A fire began in packing material and discarded furniture outside an enclosed loading dock area. The fire spread to the loading dock, then into both the retail showroom and warehouse spaces. During the early stages of the fire in the two latter locations, the fire spread was slowed by the limited supply of fresh air. This under-ventilation led to generation of a large mass of pyrolyzed and only partially oxidized effluent. The smoke and combustible gases flowed into the interstitial space below the roof and above the suspended ceiling of the main retail showroom. As this space filled with unburned fuel, the hot smoke also seeped through the suspended ceiling into the main showroom and formed a hot smoke layer below the suspended ceiling. Up to this time, the extent of fire spread into the interstitial space was not visible to fire fighters in the store. If the fire spread had been visible to the fire fighters in the store, it would have provided a direct indication of a fire hazard in the showroom. Meanwhile, the fire at the back of the main showroom and the gas mixture below the suspended ceiling were both still fuel rich. When the front windows were broken out or vented, the inflow of additional air allowed the heat release rate of the fire to intensify rapidly and added air to the layer of unburned fuel below the suspended ceiling enabling the ignition of the unburned fuel/air mixture. The fire swept from the rear to the front of the main showroom extremely quickly, and then into the west and east showrooms. Nine fire fighters were killed in the Sofa Super Store fire. NIST developed eleven recommendations to help mitigate such future losses.

Recommendation 4 of the NIST report reads as follows:

"NIST recommends that model codes require sprinkler systems and that state and local authorities adopt and aggressively enforce this provision:

- a) for all new commercial retail furniture stores regardless of size; and
- b) for existing retail furniture stores with any single display area of greater than 190 m² (2000 ft²).

An installed fire sprinkler system that complied with a national standard such as NFPA 13 [3] would have activated and would have controlled the fire growth. If the showrooms had been divided into smaller areas with fire barriers, the compartmentation would have slowed the spread of the fire as well."

Following a review of recommendation 4 of the NIST report, a new section, 904.1.3, is proposed to be added to the International Existing Building Code addressing Level 3 alterations. This new language would ensure that occupancies used for the merchandizing, storage or manufacture of upholstered furniture or mattresses have fire protection installed when the space occupied for these purposes undergo a Level 3 alteration.

Most of the targeted occupancies would already require the installation of automatic fire sprinkler systems if a Level 2 Alteration occurred, and Section 901.2 of the IEBC points to Chapters 7 and 8 as required to be complied with in such circumstance.

However, Chapter 8, specifically Section 804.2.2 as shown below, requires compliance when there are shared tenant egress paths or occupant loads of 30 or greater.

804.2.2 Groups A, B, E, F-1, H, I, M, R-1, R-2, R-4, S-1 and S-2. In buildings with occupancies in Groups A, B, E, F-1, H, I, M, R-1, R-2, R-4, S-1 and S-2, work areas that have exits or corridors shared by more than one tenant or that have exits or corridors serving an occupant load greater than 30 shall be provided with automatic sprinkler protection where all of the following conditions occur:

1. The work area is required to be provided with automatic sprinkler protection in accordance with the *International Building Code* as applicable to new construction; and
2. The work area exceeds 50 percent of the floor area.

Exceptions:

1. Work areas in Group R occupancies three stories or less in height.
2. If the building does not have sufficient municipal water supply for design of a fire sprinkler system available to the floor without installation of a new fire pump, work areas shall be protected by an automatic smoke detection system throughout all occupiable spaces other than sleeping units or individual dwelling units that activates the occupant notification system in accordance with Sections 907.4, 907.5 and 907.6 of the *International Building Code*.

This proposal defers to the square footage thresholds found in Chapter 9 of the International Building Code once the work area reaches a Level 3 threshold. In reality, the impact is minimal as far as added occupancies that would be covered by this provision. What it does is eliminate a more complicated determination for identifying the requirement for providing the protection levels. The S-1 occupancies and the storage areas of the F-1 would be covered by Chapter 32 (High-Piled Combustible Storage) of the IFC, where the threshold to provide automatic sprinkler protection is currently 2500 ft².

OCCUPANT LOAD COMPARISON WITH SUGGESTED THRESHOLDS

(Section 804.2.2 applies to multitenant shared egress paths or with occupant load of 30 or greater)

Using IBC Table 1004.1.2

F-1	Factor 100 ft ² gross per person	2500 ft ² =25 person
M	Factor 30 ft ² /60 ft ² (display areas)	5000 ft ² = 167/83 persons
S-1	Factor 500 ft ² gross per person	2500 ft ² = 5* persons

*IFC **TABLE 3206.2 GENERAL FIRE PROTECTION AND LIFE SAFETY REQUIREMENTS** already requires automatic sprinkler protection for high-piled storage areas over 2500 ft².

Based upon the above analysis, there will be a cost increase for only a minimal subset of the affected occupancies.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. This proposal is submitted by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>. Since its inception in April/2005, the CTC has held twenty-five meetings - all open to the public. In 2012, three of the 25 face-to face meetings were held. In addition to the CTC meetings, the CTC established Study Groups (SG) of interested parties for each of the areas of study. These SG's are responsible for reviewing the available information and making recommendations to the CTC. All totaled, the SG's held over 70 conference calls in 2012.

Cost Impact: This code change proposal will increase the cost of construction.

EB48-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

904.1.3 (NEW)-EB-BALDASSARRA-CTC.doc

EB49 – 13

904.2

Proponent: Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee

Revise as follows:

904.2 Fire alarm and detection systems. Fire alarm and detection systems ~~complying with Sections 804.4.1 and 804.4.3~~ shall be provided ~~throughout the building~~ in accordance with Section 907 of the International Building Code as required for new construction.

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

The reference back to Section 804.4.1 through 804.4.3 misses critical upgrades of alarm systems for other occupancies. The intent of this proposal is to eliminate the reference to Chapter 8 of the IEBC because the reference creates confusion. Section 904.2.1 implies that an alarm system for all occupancies in accordance with the IBC would be required, however the reference to Section 804.4 implies that only those occupancies found in Section 804.4 are required to have them installed. Section 804.4 does not cover the fire alarm requirements for all occupancies in the IBC. An alteration level 3 to an existing A occupancy is a significant change to more than 50% of the area of a building and an alarm system would not be required with the current reference to Section 804.4 left in the code.

Cost Impact: This code change proposal will increase the cost of construction.

EB49-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

904.2-EB-BAJNAI-BCAC.doc

EB50 – 13

906.2

Proponent: Ron Nickson, National Multi Housing Council (NMHC) (rnickson@nhmc.org), Steve Orlowski, National Association of Home Builders (NAHB) (sorlowski@nahb.org)

Revise as follows:

906.2 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered or added, the requirements of Section 1107 of the *International Building Code* for Type B units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered or added.

Exception: Group I-1, I-2, R-2, R-3 and R-4 dwelling or sleeping units where the first certificate of occupancy was issued before March 15, 1991 are not required to provide Type B dwelling or sleeping units.

Reason: The purpose of this code change is to revise the provisions of the existing building code to be in line with the provisions of FHA, which state “*The design requirements apply to buildings built for first occupancy after March 13, 1991, which fall under the definition of “covered multifamily dwellings.”*” Too often existing building owners who submit plans to alter an existing residential building which was built before the FHA guidelines went into effect are told that they must comply with the accessible requirements for new buildings. This exception brings the IEBC in line with federal guidelines.

Cost Impact: This code change proposal will not increase the cost of construction.

EB50-13

	Assembly:	ASF	AMF	DF

906.2-EB-NICKSON-ORLOWSKI.doc

EB51 – 13

908.2 (NEW)

Proponent: Jim Edelson, New Buildings Institute (jedelson@comcast.net), Ric Cochrane, National Trust for Historic Preservation, David Collins, The Preview Group, representing The American Institute of Architects

Add new text as follows:

908.2 Requirements for underperforming nonresidential existing buildings. Nonresidential *existing buildings* undergoing *Level 3 alterations* that cannot demonstrate an Energy Star score of 26 or greater, or a source EUI equal to or greater than the source EUI in Table 908.2 and calculated in accordance with Section 908.2.1, shall meet the requirements of no less than two of the following:

1. Comply with “Walls, Above Grade” requirements of Table C402.1.2 of the *International Energy Conservation Code*
2. Comply with “Roofs” requirements of Table C402.1.2 of the *International Energy Conservation Code*
3. Comply with Table C402.3 of the *International Energy Conservation Code*
4. Where the *building* meets the conditions of Section C402.3.2, comply with Section C402.3.2 of the *International Energy Conservation Code* without exceptions
5. Comply with Section C402.4.1.2.3 of the *International Energy Conservation Code*
6. Comply with Section C403.2.7 of the *International Energy Conservation Code*
7. Where the *building* meets the conditions of Section C403.4.6, comply with Section C403.4.6 of the *International Energy Conservation Code* without exceptions
8. Comply with Sections C405.2 and C405.3 of the *International Energy Conservation Code*
9. Comply with Section C406 of the *International Energy Conservation Code*

TABLE 908.2

a. Climate zones as determined in accordance with Section C301 of the International Energy Conservation Code.

908.2.1 Calculation of Source EUI (sEUI). The sEUI shall be based on any 12 continuous months of energy use data for the whole *building* from the 24 month period immediately prior to the permit application. The annual sEUI for electric energy shall be calculated by converting energy use at the *building* to kBtu's and multiplying by the conversion factor in Table 908.2.1(1) based on the geographical location of the *building*. The annual sEUI for fossil fuels shall be calculated by converting energy use at the *building* to kBtu's and multiplying by the conversion factors in Table 908.2.1(2). The annual sEUI for

district cooling shall be calculated by converting energy use at the *building* to kBtu's, multiplying by 0.33, and then multiplying by the conversion factor in Table 908.2.1(1) based on the geographical location of the *building*. The annual sEUI for district heating shall be calculated by converting energy use at the *building* to kBtu's and multiplying by 1.35 for hot water and 1.45 for steam. The annual sEUI for all other energy shall be calculated by converting energy use at the *building* to kBtu's and multiplying by 1.1. Where a *building* has multiple use types from Table 908.2, the maximum allowable energy use shall be based on the total gross floor area of each use type in relation to the total gross floor area of all use types within the *building*.

Reason: According to the Urban Land Institute, New Construction and Major Renovations account for only 1-2% of the building stock in a typical year. For the larger population of existing buildings, energy codes' primary means of improving energy efficiency are through alterations. However, as current energy codes are formulated, the scope of that impact is generally limited to the scope of the alteration. Energy code requirements generally apply only to the alterations and not to the whole building. This misses a tremendous opportunity for the energy code to improve the energy efficiency of the whole building stock.

Bearing in mind the dangers of unintended consequences, the proposal narrowly targets its new code requirements for existing buildings, and the proposal is built on four principles:

- Requirements should focus on the largest class of alterations to reduce the possibility of discouraging alterations.
- Many existing buildings perform quite well, so requirements should focus on poorly performing buildings rather than indiscriminately targeting all buildings.

- Existing buildings encompass wildly variable features and conditions, so requirements should have a built-in flexibility to respond to this reality.
- As this represents new ground in codes, requirements should leverage existing code mechanisms, code language and code requirements as much as possible.

The International Existing Building Code provides an appropriate location and a suitable code structure for adding code provisions to affect improved energy use in existing buildings. The IEBC creates three classes of Alterations (I, II and III). This proposal creates a trigger only for the most extensive Level III alterations. The trigger itself is based on the actual energy performance of the building undergoing the extensive alteration, and is set so that only the worst performing buildings are affected. In this way, the requirements affect only buildings that are both undergoing extensive alterations and are poor energy performers. This approach maximizes the effectiveness of the requirements relative to the effort required from both building owners and code officials.

The Level III projects that fall below the performance threshold would then choose two measures from an extensive list of options. This list leverages code requirements already found in the International Energy Conservation Code (IECC) and so will be familiar to contractors and code officials. The list represents a full range of options affecting every part of the building so that projects can choose actions that are appropriate and cost effective for that particular building's particular circumstances. Flexibility of this type is fundamental in writing code provisions that seek to have a greater impact on a jurisdiction's existing building stock.

The performance threshold is based on the 2003 Commercial Building Energy Consumption Survey (the same dataset that serves as the basis for commercial building Energy Star Scores and the targets for existing buildings in ASHRAE Standard 100). Based on either the table of values or an Energy Star Score threshold of 26, the requirements will only kick in for a building that would have fallen in the worst performing quartile of the building stock in that building survey. This is the worst 25% of the buildings around a decade ago, effectively making these requirements only apply to buildings that can be reasonably considered "energy hogs." CBECS is a nationwide survey conducted by the Energy Information Administration, so climate zone diversity for the table was created using the same, nationally vetted process used to create the performance targets for existing buildings proposed for ASHRAE Standard 100.

The target EUIs in the proposal are presented in source kBtu units because the only EUI metric in an I-Code, the 2012 IgCC, uses the same source kBtu metric. The calculation language and conversion factors for source energy are taken directly from the IgCC to maintain their meaning, but the code language has been slightly edited for greater clarity. Likewise, the same electricity energy conversion factors are used in the IgCC and these were derived from EPA eGrid data (2007 version 1.1, 2005 data; EPA eGrid regional gross grid loss factors; EIA Table 8.4a (Sum tables 8.4 band 8.4c) and Table 8.2c (Breakout of Table 8.2b), 2005 data).

The performance thresholds in the table are based on the 2003 Commercial Building Energy Consumption Survey (the same dataset that serves as the basis for commercial building Energy Star Scores and the targets for existing buildings in ASHRAE Standard 100). Based on either the table of values or an Energy Star Score threshold of 26, the requirements will only kick in for a buildings that fall in the worst performing quartile of the building stock in that building survey, effectively making these requirements only apply to buildings that can be reasonably considered "energy hogs." CBECS is a national survey, so the climate zone diversity for the table was created using the same, nationally vetted process used to create the performance targets for existing buildings pending in ASHRAE Standard 100. The target EUIs are expressed in source kBtu units because the only EUI metric in an I-Code, the IgCC, uses source kBtu. The calculation language and conversion factors for source energy is also taken directly from the IgCC with minor edits for clarity.

The compliance options all refer to provisions from the 2012 IECC and apply to a broad variety of energy aspects within a building. This allows projects to select the most appropriate compliance option for the specifics of that project's alteration.

- Option 1 would require compliance with the "Above Wall" insulation requirements of the IECC.
- Option 2 would require compliance with the "Roof" insulation requirements of the IECC.
- Option 3 would require compliance with the fenestration performance requirements of the IECC.
- Option 4 would require compliance with the daylighting control requirements of the IECC for top lit spaces that meet the conditions of the provision.
- Option 5 would require compliance with the infiltration requirements of the IECC through the air leakage testing requirement.
- Option 6 would require compliance with the duct insulation and sealing requirements of the IECC.
- Option 7 would require compliance with the service hot water heat recovery requirements of the IECC for buildings that meet the conditions of the provision
- Option 8 would require compliance with all of the lighting control requirements of the IECC.
- Option 9 would require compliance with one of the "Additional Efficiency Package Options" (Efficient HVAC performance, Efficient Lighting System, Onsite Renewable Energy Supply) of the IECC

Current energy codes have a limited means of impacting the energy performance of the vast majority of buildings in the existing building stock. This proposed addition will create a new application point for IECC provisions in the IEBC when a building undergoes an extensive alteration. And it will limit the new requirements only to those buildings which are both wasting the most energy and presenting the largest opportunity to achieve savings, while not at all impacting buildings that are undergoing minor renovations or that already have some modest level of energy performance.

Cost Impact: This code change proposal will not increase the cost of construction.

Analysis: PM12-13 also proposes a similar requirements for the IPMC.

Proponent: Gerald Anderson, City of Overland Park, Kansas representing self
(jerry.anderson@opkansas.org)

Revise as follows:

SECTION 202 GENERAL DEFINITIONS

CHANGE OF OCCUPANCY. A change in the ~~purpose or level of activity within a building that involves a change in application of the requirements of this code~~ use of the building or a portion a building. A change of occupancy shall include any change of occupancy classification, any change from one group to another group within an occupancy classification or any change in an allowable use within a given group for a specific occupancy classification.

Revise as follows:

1001.1 Scope. The provisions of this chapter shall apply where a *change of occupancy* occurs, as defined in Section 202, ~~including:~~

- ~~1. Where the occupancy classification is not changed; or~~
- ~~2. Where there is a change in occupancy classification of the occupancy group designations changes~~

1001.2 Change in occupancy with no change of occupancy classification. A change in occupancy, as defined in Section 202, ~~with no change of occupancy classification~~ use shall not be made to any structure that will subject the structure to any special provisions of the applicable ~~International Codes~~, including the provisions of Sections 1002 through 1011, without the approval of the *code official*. A certificate of occupancy shall be issued where it has been determined that the requirements for the change in occupancy have been met.

1001.2.1 ~~Repair and alteration~~ Change in Occupancy with no change of occupancy classification. Any ~~repair or alteration~~ work undertaken in connection with a change of occupancy ~~in use~~ that does not involve a *change of occupancy* classification or a change to another group within a given occupancy classification shall conform to the applicable requirements for the work as classified in Chapter 4 and to the requirements of Section 1002 through 1011.

Exception: As modified in Section 1205 for *historic buildings*.

~~1001.3~~ 1001.2.2 Change of occupancy classification. Where the occupancy classification of a building changes, the provisions of Sections 1002 through 1012 shall apply. This includes a *change of occupancy* classification within a group as well as a *change of occupancy* classification from one group to a different group.

~~1001.3.1~~ 1001.2.2.1 Partial change of occupancy classification. Where a portion of an *existing building* is changed to a new occupancy classification, Section 1012 shall apply.

Reason: The purpose of the code change is to bring the IEBC definition for a change in occupancy more in line with the IBC definition for a change in occupancy. The additional portions of the code change clarify the intent of the code.

Definition: The definition for a change in occupancy should include all things that would constitute a change in occupancy. The IBC uses the words "use, groups and occupancy classification. For consistency and clarity it is important to stick with language used in the building code thus I changed out the word purpose with use. Example: Occupancy classifications are A,B,H,R,I,M,S & U. The different occupancy classifications can be divided into Groups, i.e. A-1, A-2, A-3 etc. and within the various groups there are examples of allowed uses for a particular group. Such as under group A-3, we find are art galleries, dance halls, & bowling alleys.

Some other reasons for changing the definition: The words "level of activity" is vague. It would also appear that a change in occupancy is somehow dependent on whether there are other code requirements for the new occupancy. A change in occupancy

should be a yes or no question. If the answer is yes then one proceeds to determine what new code provisions are applicable if any.

Section 1001.1 Scope. The stricken language is no longer necessary because the bullets points have been included in the definition. With the proposed language, I am trying to make a simple statement that the use of a building cannot be changed without the approval of the code official.

Section 1001.2 > The current language is vague. It appears that the existing language is trying to address a change in use. I have inserted the word use in order to make it clear as to what the code is trying to address. It is not necessary to speak to the special provisions of the applicable International codes whatever they are. A change in use is not dependent on special provisions of the code.

Section 1001.2.1, The current language is confusing and is in conflict with 1001.3. With the new wording, I am clarify that when there is a change of use that does not involve a change in occupancy classification or a change from one group to another in a given occupancy classification the code then refers one back to chapter 4 and sections 1002 through 1011. . It is not necessary to talk about "repair and alteration" for that is not the subject. The subject matter is change in occupancy which has resulted from a change in use.

I have renumbered the existing sections 1001.3 and 1001.3.1 making them subsections of 1001.2. All of the sections are addressing different types of occupancy change so it seems more appropriate to have one section with various subsections.

Cost Impact: This code change proposal will not increase the cost of construction.

Proponent: Robert J Davidson, Davidson Code Concepts, LLC, representing self
(rjd@davidsoncodeconcepts.com)

Revise as follows:

1001.1 Scope. The provisions of this chapter shall apply where a change of occupancy occurs, as defined in Section 202, including:

1. Where the occupancy classification is not changed; ~~or~~
2. Where there is a change in occupancy classification or the occupancy group designation changes; or
3. Where there is a change in use or occupancy with a fire protection threshold requirement in Chapter 9 of the *International Building Code*.

1001.2 Change in occupancy with no change of occupancy classification. A change in occupancy, as defined in Section 202, with no *change of occupancy* classification or where there is a change in use or occupancy with a fire protection threshold requirement in Chapter 9 of the *International Building Code* shall not be made to any structure that will subject the structure to any special provisions of the applicable *International Codes*, including the provisions of Sections 1002 through 1011, without the approval of the *code official*. A certificate of occupancy shall be issued where it has been determined that the requirements for the change in occupancy have been met.

1004.1 General. Fire protection requirements of Section 1012 shall apply where a building or portions thereof undergo a *change of occupancy* classification or where there is a change in use or occupancy with a fire protection threshold requirement in Chapter 9 of the *International Building Code*.

1012.1 General. The provisions of this section shall apply to buildings or portions thereof undergoing a change of occupancy classification. This includes a change of occupancy classification within a group as well as a change of occupancy classification from one group to a different group or where there is a change in use or occupancy with a fire protection threshold requirement in Chapter 9 of the *International Building Code*. Such buildings shall also comply with Sections 1002 through 1011. The application of requirements for the change of occupancy shall be as set forth in Sections 1012.1.1 through 1012.1.4. A *change of occupancy*, as defined in Section 202, without a corresponding change of occupancy classification shall comply with Section 1001.2.

1012.1.1 Compliance with Chapter 9. The requirements of Chapter 9 shall be applicable throughout the building for the new occupancy classification based on the separation conditions set forth in Sections 1012.1.1.1 and 1012.1.1.2.

1012.1.1.1 Change of occupancy classification without separation. Where a portion of an *existing building* is changed to a new occupancy classification or where there is a change in use or occupancy with a fire protection threshold requirement in Chapter 9 of the *International Building Code* and that portion is not separated from the remainder of the building with fire barriers having a fire-resistance rating as required in the *International Building Code* for the separate occupancy, the entire building shall comply with all of the requirements of Chapter 9 applied throughout the building for the most restrictive occupancy classification in the building and with the requirements of this chapter.

1012.1.1.2 Change of occupancy classification with separation. Where a portion of an *existing building* that is changed to a new occupancy classification or where there is a change in use or occupancy with a fire protection threshold requirement in Chapter 9 of the *International Building Code* and that portion is separated from the remainder of the building with fire barriers having a fire-resistance rating as required in the *International Building Code* for the separate occupancy, that portion shall comply with

all of the requirements of Chapter 9 for the new occupancy classification and with the requirements of this chapter.

1012.2 Fire protection systems. Fire protection systems shall be provided in accordance with Sections 1012.2.1 and 1012.2.2.

1012.2.1 Fire sprinkler system. Where a change in occupancy classification occurs or where there is a change in use or occupancy with a fire protection threshold requirement in Chapter 9 of the *International Building Code* that requires an automatic fire sprinkler system to be provided based on the new occupancy in accordance with Chapter 9 of the *International Building Code*, such system shall be provided throughout the area where the *change of occupancy* occurs.

1012.2.2 Fire alarm and detection system. Where a change in occupancy classification occurs or where there is a change in use or occupancy with a fire protection threshold requirement in Chapter 9 of the *International Building Code* that requires a fire alarm and detection system to be provided based on the new occupancy in accordance with Chapter 9 of the *International Building Code*, such system shall be provided throughout the area where the *change of occupancy* occurs. Existing alarm notification appliances shall be automatically activated throughout the building. Where the building is not equipped with a fire alarm system, alarm notification appliances shall be provided throughout the area where the *change of occupancy* occurs and shall be automatically activated.

Reason: This proposed change is a result of the NIST analysis and report on the Charleston Sofa Store Fire.

Recommendation 4 of the NIST report reads as follows:

"NIST recommends that model codes require sprinkler systems and that state and local authorities adopt and aggressively enforce this provision:

- a) for all new commercial retail furniture stores regardless of size; and
- b) for existing retail furniture stores with any single display area of greater than 190 m² (2000 ft²).

An installed fire sprinkler system that complied with a national standard such as NFPA 13 [3] would have activated and would have controlled the fire growth. If the showrooms had been divided into smaller areas with fire barriers, the compartmentation would have slowed the spread of the fire as well."

Upon investigation of recommendation 4 of the NIST report, a review of where in the family of I codes to put requirements for upgrading to automatic sprinkler protection for occupancies manufacturing, storing or merchandizing upholstered furniture and mattresses occurred. During this review it was noted that the International Existing Building Code applies the concept of "change of occupancy" broadly and not only to capture a change in the Group, but a change in the occupancy classification with a change in the Group, (see the classification breakdowns under each Group in Chapter 3 of the International Building Code).

The definition for Change of Occupancy drills down to a change "in the purpose of level of activity" for applying more current requirements of the IEBC and the IBC.

CHANGE OF OCCUPANCY. A change in the purpose or level of activity within a building that involves a change in application of the requirements of this code.

SECTION 1001 GENERAL

1001.1 Scope. The provisions of this chapter shall apply where a change of occupancy occurs, as defined in Section 202, including:

1. Where the occupancy classification is not changed; or
2. Where there is a change in occupancy classification or the occupancy group designation changes.

SECTION 1012 CHANGE OF OCCUPANCY CLASSIFICATION

1012.1 General. The provisions of this section shall apply to buildings or portions thereof undergoing a change of occupancy classification. This includes a change of occupancy classification within a group as well as a change of occupancy classification from one group to a different group.

What I noted was that when applying principals of fire protection, Chapter 9 of the International Building Code has use and levels of activity breakdowns separate and, in some cases, distinct from the occupancy classifications found in Chapter 3 of the International Building Code. In many cases these breakdowns are more significant than those found in Chapter 3 of the International Building Code.

What this proposal does is to suggest the insertion of language into Chapter 10 of the International Existing Building Code that would provide for capturing the fire protection thresholds found in Chapter 9 of the International Building Code as additional, and in many cases more accurate, triggers for the installation of fire protection systems and devices when a change of use or occupancy occurs within an existing building.

Cost Impact: This code change proposal will increase the cost of construction.

EB53-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1001.1-EB-DAVIDSON.doc

EB54 – 13

1002.1

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Healthcare (John.Williams@DOH.WA.GOV) and Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee (cbaldassarra@rjagroup.com)

Revise as follows:

1002.1 Compliance with the building code. Where the character or use of an existing building or part of an existing building is changed to one of the following special use or occupancy categories as defined in the International Building Code, the building shall comply with all of the applicable requirements of the International Building Code:

1. – 10. *(No change text)*

11. Group I-2 occupancies

Reason: This proposed change is a joint proposal from the ICC Ad Hoc Committee on Healthcare (AHC) and the Code Technology Committee (CTC). The scope of the AHC deals with Group I-2 hospitals (now Group I-2 Condition 2 as a result of approved code change G257-12) and the scope of the CTC's investigation of the area of study entitled "Care Facilities" addresses Group I-1 and Group I-2 Condition 1 (nursing homes).

Ambulatory care facilities, Item 10, was added via code change EB27-09/10 following the inclusion of ambulatory care provisions in Chapter 4 of the 2009 IBC due to the unique nature of such facilities which require added protection features such as separation into smoke compartments. Similarly, Chapter 4 of the IBC requires enhanced fire protection features for Group I-2 which includes hospitals and nursing homes. Where a change in occupancy occurs, resulting in a Group I-2 classification, the new construction features must be employed to provide the requisite fire protection features.

This is a joint proposal submitted by the ICC Ad Hoc Committee for Healthcare and the ICC Code Technology Committee.

The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering, a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: <http://www.iccsafe.org/cs/AHC/Pages/default.aspx>.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. This proposal is submitted by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>. Since its inception in April/2005, the CTC has held twenty-five meetings - all open to the public. In 2012, three of the 25 face-to face meetings were held. In addition to the CTC meetings, the CTC established Study Groups (SG) of interested parties for each of the areas of study. These SG's are responsible for reviewing the available information and making recommendations to the CTC. All totaled, the SG's held over 70 conference calls in 2012.

Cost Impact: This code change proposal will not increase the cost of construction.

1009.1-EB-TRAXLER.doc

EB56 – 13

1011 (NEW)

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Add new text as follows:

SECTION 1011 **ENERGY EFFICIENCY**

1011.1 Increased demand. *Where the occupancy of an existing building or part of an existing building is changed such that the new occupancy results in an increase in the installed capacity of the building electrical or energy system from non-renewable sources the new occupancy shall comply with the International Energy Conservation Code.*

Reason: This proposal requires the building to meet the provisions of the 2012 International Energy Conservation Code (IECC) when there any change in occupancy resulting in increased demand for energy or power.

Forty percent of U.S. energy use and seventy percent of U.S. electrical use are associated with existing buildings. As such, existing buildings represent a significant opportunity to save energy, reduce operating costs, and enhance the environment. A portion of the total number of existing buildings undergoes a change in occupancy each year. Health and life safety codes currently address those changes in occupancy such that the resultant building after the occupancy change provides the necessary capabilities to protect the public health and safety. A review of Chapter 10 of the International Existing Buildings Code (IEBC) on changes in occupancy does not include a consideration of energy efficiency. The IEBC must appropriately address the opportunity to increase energy efficiency in existing buildings. One way to address this is when a change in use would result in an increase in energy use of the building between the pre- and post-occupancy change situation. This is consistent with, for instance, Section 1010 on plumbing, in which a change in occupancy that results in an increased demand for water triggers a requirement to meet the International Plumbing Code.

Consider the change in use from a storage warehouse to retail space, a portion of an office building to food service, or any other number of situations in which the energy use of the building or spaces associated with the change in occupancy will be increased. There currently is no way in the IEBC to address those situations, presenting a lost opportunity and even a way to circumvent the 2012 IECC, which does address this issue. Section C101.4.4 of the IECC clearly requires that spaces undergoing a change in occupancy that results in an increased demand for energy must comply with the IECC. This change ensures consistency between the IEBC and the IECC on this issue.

The proposed change addresses this by offering two options through which compliance can be achieved. One is to bring the building after the occupancy change up to the 2012 IECC, and the other is to accomplish the change with no increase in connected load thereby negating the need to address IECC compliance. This change will not undermine renovations to existing buildings. If a change of occupancy is considered a renovation then there are already a number of provisions in Chapter 10 of the IEBC applicable to renovated buildings such that application of the IECC where there is an increase in energy load should not pose a problem. If it were a problem, it is presumed the provisions in Section C101.4.4 would not appear in the IECC. It would also not be considered a way to impose the IECC on retrofits, alterations, renovations or repairs to existing building because those terms have specific definitions as does the specific subject of Chapter 10 and this code change – a change in occupancy. Clearly if located in Chapter 10 as proposed and specifically applied to a change in occupancy as specifically defined in the IEBC it would be unlikely that this would cause the incorrect application of the IECC to a retrofit, repair or renovation.

There will be an increase in cost to the degree that changes in occupancy that previously were not required to meet the energy code will now be required to meet the energy code.

Cost Impact: The code change proposal will increase the cost of construction in some buildings.

EB56-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1011 (NEW)-EB-WILLIAMS.doc

EB57 – 13

1012.2.1.1 (NEW)

Proponent: Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee

Add new text as follows:

1012.2.1 Fire sprinkler system. Where a change in occupancy classification occurs that requires an automatic fire sprinkler system to be provided based on the new occupancy in accordance with Chapter 9 of the International Building Code, such system shall be provided throughout the area where the change of occupancy occurs.

1012.2.1.1 Fire sprinkler system Group A occupancy. Where the new occupancy classification requiring an automatic sprinkler system is Group A-1, A-2, A-3 or A-4, an automatic sprinkler system shall be provided throughout the area where the Group A-1, A-2, A-3 or A-4 occupancy is located, and throughout all floors from the Group A occupancy to, and including, the nearest level of exit discharge serving the Group A occupancy.

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

In almost all cases where Chapter 9 of the IBC specifies the need for a fire suppression system it is due to the inherent fire hazard of the use itself, thus justifying the protection only within the changed area. The exception to that rule is in the Assembly Groups. The trigger for the Assembly Groups A-1, A-2, A-3 and A-4 is the occupant load and it is clear from the expanded requirements found in IBC Section 903.2.1, the protection is to also include the intervening spaces and floors so their egress path is not compromised by a fire located in those areas. We feel that the IEBC should also reflect that intent by adding this new subsection.

Cost Impact: This code change proposal will increase the cost of construction.

EB57-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1012.2.1.1 (NEW)-EB-BAJNAI-BCAC.doc

EB58 – 13

1012.2.2

Proponent: Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee

Revise as follows:

1012.2.2 Fire alarm and detection system. Where a change in occupancy classification occurs that requires a fire alarm and detection system to be provided based on the new occupancy in accordance with Chapter 9 of the *International Building Code*, such system shall be provided throughout the area where the change of occupancy occurs. Existing alarm notification appliances shall be automatically activated throughout the building. Where the building is not equipped with a fire alarm system, alarm notification appliances shall be provided throughout the area where the *change of occupancy occurs* ~~and shall be automatically activated.~~ in accordance with Section 907 of the *International Building Code* as required for new construction.

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

In almost all cases where Chapter 9 of the IBC specifies the need for a fire alarm and detection system it is due to the inherent fire hazard of the use. The level of hazard often warrants the notification be provided to all levels of the building even if the detection appliances are not required throughout the building. Section 907 of the IBC identifies when it is appropriate for everyone in the building to hear/see the notification and we believe that same insight is appropriate for existing buildings. Unlike a fire sprinkler system where placing the system in the area will effectively abate the fire hazard, that abatement does not take place with a fire alarm system. The value of the system is diminished without some notification throughout when the fire occurs in an area that is not occupied. Even though this will increase the costs to a change in occupancy project, it is a good compromise when considering the additional safety provided by the additional notification as would be required for new construction.

Cost Impact: This code change proposal will increase the cost of construction.

1012.2.2-EB-BAJNAI-BCAC.doc

EB59 – 13

1012.5.1

Proponent: Gene Boecker, Code Consultants, Inc., representing self

Revise as follows:

1012.5.1 Height and area for change to higher hazard category. When a change of occupancy classification is made to a higher hazard category as shown in Table 1012.5, heights and areas of buildings and structures shall comply with the requirements of Chapter 5 of the *International Building Code* for the new occupancy classification.

Exceptions:

1. In other than Groups H, F-1 and S-1, in lieu of fire walls, use of fire barriers having a fire-resistance rating of not less than that specified in Table 706.4 of the *International Building Code*, constructed in accordance with Section 707 of the *International Building Code*, shall be permitted to meet area limitations required for the new occupancy in buildings protected throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 of the *International Fire Code*.
2. Regardless of height, for high-rise buildings, the type of construction reduction specified in Section 403.2.1 of the *International Building Code* is permitted. This shall include the reduction for columns. The high rise building is required to be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 of the *International Building Code*.

Reason: When the International Building Code changed to disallow the reduction of ratings on columns for high-rise buildings, it created a problem for existing buildings which had previously used the allowed reduction. This provision in the IEBC does not recognize those previously complying buildings. To meet the requirements as currently written, any change in occupancy from an office to a retail area would require a complete upgrade in the fire-resistance rating for all the columns in the entire building. This is excessive for small changes in occupancy and often impractical.

The revised language makes it clear that if the building is protected throughout with an automatic fire sprinkler system, designed to meet NFPA 13 (not 13R), then the column ratings can be what was allowed prior to the code change to the IBC. Additions will need to meet the requirements for new construction, but a change in occupancy of this type should not require the entire building to fall into non-compliance when it was fully compliant when it was built as little as five years ago.

Cost Impact: This code change proposal will not increase the cost of construction.

EB59-13

	Assembly:	ASF	AMF	DF

1012.5.1-EB-BOECKER.doc

EB60 – 13

1204.1.1

Proponent: Carl Baldassarra, P.E., Chair, ICC Code Technology Committee

Revise as follows:

1204.1.1 Site arrival points. At least one ~~main entrance shall be accessible~~ route from a site arrival point to an accessible entrance shall be provided.

Reason: For historical buildings, the requirement for the accessible routes from the site arrival point to the accessible entrance should read the same in IBC and IEBC. The current text in IEBC 1204.1.1 does not address where the route should be provided. The IBC text is as follows:

IBC 3411.9.1 (IEBC [B] 410.9.1) Site arrival points. At least one *accessible* route from a site arrival point to an *accessible* entrance shall be provided.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as “areas of study”. Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>. Since its inception in April/2005, the CTC has held twenty five meetings - all open to the public.

Cost Impact: This code change proposal will not increase the cost of construction.

EB61 – 13

1205.5, 1205.9, Chapter 16

Proponent: Marcelo M. Hirschler, GBH International (gbhint@aol.com)

Revise as follows:

1205.5 Roof covering. Regardless of occupancy or use group, roof-covering materials not less than Class C, when tested in accordance with ASTM E 108 or UL 790, shall be permitted where a fire-retardant roof covering is required.

1205.9 Finishes. Where interior finish materials are required to have a flame spread index of Class C or better, when tested in accordance with ASTM E84 or UL 723, existing nonconforming materials shall be surfaced with approved fire-retardant paint or finish.

Add new standards to Chapter 16 as follows:

ASTM

E84-12c Standard Test Method for Surface Burning Characteristics of Building Materials
E108-11 Standard Test Methods for Fire Tests of Roof Coverings

UL Underwriters Laboratories, Inc.
333 Pfingsten Road
Northbrook, IL 60062-2096

UL 723-2008 Standard for Test for Surface Burning Characteristics of Building Materials
UL 790-2004 Standard Test Methods for Fire Tests of Roof Coverings with revisions through October 2008

Reason: This is basically simple clarification, to avoid confusion between Class C for roof coverings (Section 1205.5) and Class C for flame spread index (Section 1205.9). It adds the same ASTM and UL standards contained in the IBC for the applications.

Cost Impact: This code change proposal will not increase the cost of construction.

Analysis: All of the proposed referenced standards are already referenced in the *International Building Code*.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1205.5-EB-HIRSCHLER.doc

EB62 – 13

202 (NEW), 1301.1

Proponent: Carl Baldassarra, P.E., Chair, ICC Code Technology Committee

Add new definition as follows:

SECTION 202 GENERAL DEFINITIONS

RELOCATABLE BUILDING. A partially or completely assembled building constructed and designed to be reused multiple times and transported to different building sites.

Revise as follows:

1301.1 Scope. This chapter provides requirements for relocated or moved structures, including relocatable buildings as defined in Chapter 2.

Reason: This proposed change is a result of the CTC's investigation of the area of study entitled "Relocatable Modular Buildings". The scope of the activity is noted as:

Identify issues related to the administration, installation and relocation of relocatable modular buildings. Relocatable modular buildings present challenges to code enforcement due to the units be originally built to a specified code and then relocated to a new site which dictates that compliance for the new site be evaluated.

The IEBC includes 3 compliance methods for existing buildings:

- Prescriptive compliance per Chapter 4.
- Work area compliance per Chapters 5 – 13
- Performance compliance per Chapter 14

Code change G201-12 last cycle removed the existing building provisions from Chapter 34 of the IBC in favor of a reference to the IEBC. This action was subsequently affirmed by the ICC Board as this was a code change related to I-Code scoping. The end result is that all existing buildings are now uniquely covered by the IEBC. Since Chapter 14 does not address moved buildings, the end result is that the IEBC allows 2 alternatives when dealing with relocated or moved buildings:

- Prescriptive compliance. Section 409 requires moved buildings to comply with new construction requirements
- Work area compliance. Chapter 13 provides the requirements by which to analyze a moved structure to ensure its safety without requiring compliance with all the requirements for new construction.

The purpose of this proposal is effectively editorial. It clarifies that relocatable buildings, as defined, fall under the provisions of Chapter 13. The definition has been distilled from industry publications and definitions found in state statutes that govern modular (industrialized) buildings. This definition was also approved in the 2012 IGCC.

Unlike site-built buildings, which are typically intended to remain on their original site for the life of the building, relocatable modular buildings are designed and intended for relocation, reuse and/or repurposing. Many states have statutes that govern the building and relocating of relocatable modular buildings. For those that do not have state mandated requirements, much confusion and inconsistency exists about the requirements for relocatable modular buildings as existing buildings.

The Modular Building Institute (MBI) (www.modular.org) estimates that there are over 600,000 code compliant relocatable buildings in use in North America today. While it is impossible to determine the exact amount owned by the public at large, MBI estimates that public school districts across North America collectively own and operate about 180,000 relocatable classrooms with the industry owning and leasing an additional 120,000. Additionally, the industry owns and leases approximately 280,000 relocatable buildings for various other business occupancies, including construction site offices and temporary sales offices.

This proposal is submitted by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website:

<http://www.iccsafe.org/cs/CTC/Pages/default.aspx>. Since its inception in April/2005, the CTC has held twenty-five meetings - all open to the public. In 2012, three of the 25 face-to-face meetings were held. In addition to the CTC meetings, the CTC established Study Groups (SG) of interested parties for each of the areas of study. These SG's are responsible for reviewing the available information and making recommendations to the CTC. All totaled, the SG's held over 70 conference calls in 2012.

Cost Impact: This code change proposal will not increase the cost of construction.

EB63 – 13

602.1.1 (New), 702.1.1 (New), 1202.2.1 (New), Chapter 16

Proponent: Rebecca Morley, National Center for Healthy Housing

Add new text as follows:

SECTION 602 BUILDING ELEMENTS AND MATERIALS

602.1 Existing building materials. Materials already in use in a building in compliance with requirements or approvals in effect at the time of their erection or installation shall be permitted to remain in use unless determined by the *code official* to render the building or structure unsafe or *dangerous* as defined in Chapter 2.

602.1.1 Disturbance of existing painted surfaces. In any Group E, I-4, R-2, R-3, R-4 occupancies completed prior to 1978, where repairs disturb painted surfaces, the work shall comply with the information distribution, certification and work practice requirements of 40 CFR 745 for renovations.

Exception: Where documentation is provided from an approved test in accordance with 40 CFR 745.82(a)(1) or (2) that proves that the disturbed paint contains lead levels below specified levels, the work is not required to comply with this section.

SECTION 702 BUILDING ELEMENTS AND MATERIALS

702.1 Interior finishes. All newly installed interior wall and ceiling finishes shall comply with Chapter 8 of the *International Building Code*.

702.1.1 Disturbance of existing painted surfaces. In any Group E, I-4, R-2, R-3, R-4 occupancies completed prior to 1978, where alterations disturb painted surfaces, the work shall comply with the information distribution, certification and work practice requirements of 40 CFR 745 for renovations.

Exception: Where documentation is provided from an approved test in accordance with 40 CFR 745.82(a)(1) or (2) that proves that the disturbed paint contains lead levels below specified levels, the work is not required to comply with this section.

SECTION 1202 REPAIRS

1202.1 General. Repairs to any portion of an *historic building* or structure shall be permitted with original or like materials and original methods of construction, subject to the provisions of this chapter. Hazardous materials, such as asbestos and lead-based paint, shall not be used where the code for new construction would not permit their use in buildings of similar occupancy, purpose and location.

1202.2.1 Disturbance of existing painted surfaces. In any Group E, I-4, R-2, R-3, R-4 occupancies, where repairs disturb painted surfaces, the work shall comply with the information distribution, certification and work practice requirements of 40 CFR 745 for renovations.

Exception: Where documentation is provided from an approved test in accordance with 40 CFR 745.82(a)(1) or (2) that proves that the disturbed paint contains lead levels below specified levels, the work is not required to comply with this section.

Add the following standard to Chapter 16:

40 CFR 745 - July 1, 2012 Lead-Based Paint Poisoning Prevention in Certain Residential Structures

Reason: The purpose of this proposed code language is to incorporate protection from lead-based paint into the Code's requirements. These requirements are already law in every state through the Environmental Protection Agency's Renovation Repair and Painting Rule, which governs work with paint that may contain lead-based paint in order to prevent childhood lead poisoning. These regulations have been in effect since April 2010, and have been adopted by 12 states.

Renovation of painted surfaces is a significant source of lead dust that poisons children. The dangers associated with lead poisoning are well-known: serious health effects, detrimental effects on cognitive and behavioral development, with serious personal and social consequences that may persist throughout their lifetime.

Multiple studies have demonstrated that lead dust is the major source of lead poisoning for young children. There is no safe level of lead exposure for children; lead affects intelligence even at very low levels.^{1,2,5,8,9} Indeed, the rate of IQ loss per 1 microgram of lead per deciliter of blood ($\mu\text{g}/\text{dL}$) is greatest at lead levels below 10 $\mu\text{g}/\text{dL}$. As a child's BLL increases from 1 to 10 $\mu\text{g}/\text{dL}$, experts estimate a child may lose anywhere from 3.9 to 7.4 IQ points, but from 10 to 30 $\mu\text{g}/\text{dL}$ the decrement is 2.5 to 3.0 IQ points. Low-level chronic exposure may have an even greater effect on IQ than a single instance of very high BLL.¹⁰

Research indicates that a five-point negative shift in IQ at the population level would increase the number of children with an "extremely low" IQ by 57%, substantially increasing the cost of special education programs.³ Considering the costs to the special education system alone, one study conservatively estimated that it costs \$38,000 over three years to educate a child with lead poisoning.¹¹ Low-level exposure to lead has also been linked to factors other than IQ that can further impact educational outcomes. EBLLs are associated with Attention Deficit Hyperactivity Disorder (ADHD) and antisocial behavior, which in turn increase the likelihood of conduct disorder, criminal activity, and drug abuse.^{1,4} Each 1 $\mu\text{g}/\text{dL}$ reduction in the average preschool blood lead level saves \$13.4 billion from the direct and indirect costs of crime.¹

Several recent studies have explored the specific effects of lead on educational outcomes. These studies show a strong relationship between slightly elevated blood lead levels in young children and decreased scores on end-of-grade tests in elementary school. While similar educational effects were documented for higher blood levels decades ago,¹² the recent studies confirm that the connection between blood lead and poor educational outcomes remains true for blood levels as low as 3-4 $\mu\text{g}/\text{dL}$. A more recent study of 57,000 North Carolina children found that children with a BLL as low as 4 $\mu\text{g}/\text{dL}$ at three years of age were significantly more likely to be classified as learning-disabled than children with a BLL of 1 $\mu\text{g}/\text{dL}$.⁶

The consequences of lead exposure are clear. This code change proposal seeks to reduce the risk.

The additions to Sections 602, 702, and 1202 add health-protective requirements to protect children from lead poisoning by preventing the dispersal of lead before, during, and after work performed on a pre-1978 home. The information distribution, certification, and lead safe practices requirements are already in effect in federal and state regulation. This change would only affect structures likely to contain lead-based paint: pre-1978 homes. As noted under the exception, the requirement is waived if paint testing proves that the paint is not lead-based paint. A rebuttable presumption of lead's presence allows the builder to demonstrate that lead is not present and obtain exemption from the requirements. EPA-approved tests include lead-based paint inspection or risk assessment, test kit used by a certified renovator, and collection of a lead-based paint chips for laboratory analysis.

The EPA 40 CFR 745 standard is available at <http://www.gpo.gov/fdsys/pkg/CFR-2012-title40-vol32/xml/CFR-2012-title40-vol32-part745.xml>.

TENTATIVE ORDER OF DISCUSSION

2013 PROPOSED CHANGES TO THE

INTERNATIONAL ENERGY CONSERVATION CODE – COMMERCIAL

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation **does not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Please consult the Cross Index of Proposed Changes.

Proponent: Deborah Taylor, RA, LEED AP, Deborah F. Taylor Consulting, LLC, representing self (taylor@dftconsultingny.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C101.2 Scope. This code applies to *commercial buildings and residential buildings*, and the building sites and associated systems and equipment. Commercial buildings shall meet the requirements of the commercial provisions of this code, designated with a prefix "C". Residential buildings shall meet the requirements of the residential provisions of this code, designated with a prefix "R". Provisions without a designation "C" or "R" apply to all buildings.

C101.3 Intent. This code shall regulate the design and construction of buildings for the effective use and conservation of energy over the useful life of each building. ~~This code is intended to provide flexibility to permit the use of innovative approaches and techniques to achieve this objective.~~ This code is not intended to abridge safety, health or environmental requirements contained in other applicable codes or ordinances.

C101.3.1 Alternate materials, systems, approaches or techniques. This code is intended to provide flexibility to permit the use of innovative materials, systems, approaches or techniques to achieve this objective, provided such alternate proposals are approved by the code official.

C101.3.2 Above-code programs. The code official or other authority having jurisdiction shall be permitted to deem a national, state or local energy efficiency program to exceed the energy efficiency required by this code. Buildings approved in writing by such an energy efficiency program shall be considered in compliance with this code. The requirements identified as «mandatory» in Chapters C4 and R4 shall be met.

~~**C101.4.2 Historic buildings.** Any building or structure that is listed in the State or National Register of Historic Places; designated as a historic property under local or state designation law or survey; certified as a contributing resource with a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Registers of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, are exempt from this code.~~

C101.4.3 C101.4.2 Additions, alterations, renovations or repairs. Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. ~~Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems.~~ An addition shall be deemed to

comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.

Exception: The following need not comply provided the energy use of the building is not increased:

1. Storm windows installed over existing fenestration.
2. Glass only replacements in an existing sash and frame.
3. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.
4. Construction where the existing roof, wall or floor cavity is not exposed.
5. Reroofing for roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.
6. Replacement of existing doors that separate *conditioned space* from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a *conditioned space* from the exterior shall not be removed.
7. Alterations that replace less than 50 percent of the luminaires in a space less than 5000 square feet, provided that such alterations do not increase the installed interior lighting power.
8. Alterations that replace only the bulb lamp and ballast within the existing luminaires in a space provided that the *alteration* does not increase the installed interior lighting power.

C101.4.4 C101.4.3 Change in occupancy or use. Spaces undergoing a change in occupancy that would result in an increase in demand for either fossil fuel or electrical energy shall comply with this code. Where the use in a space changes from one use in Table C405.5.2(1) or (2) to another use in Table C405.5.2(1) or (2), the installed lighting wattage shall comply with Section C405.5.

C101.4.5 C101.4.4 Change in space conditioning. Any nonconditioned space that is altered to become *conditioned space* shall be required to be brought into full compliance with this code.

C101.4.6 C101.4.5 Mixed occupancy. Where a building includes both *residential* and *commercial* occupancies, each occupancy shall be separately considered and meet the applicable provisions of IECC—Commercial Provisions or IECC—Residential Provisions.

C101.4.6 Exempt buildings or work. The following buildings or portions thereof shall be exempt from this code:

C101.4.6.1 Historic buildings. Any building or structure that is listed in the State or National Register of Historic Places; designated as a historic property under local or state designation law or survey; certified as a contributing resource with a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Registers of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, is exempt from this code.

C101.4.6.2 Certain additions, alterations, renovations or repairs. Additions, alterations, renovations or repairs, to the extent that compliance with this code would create an unsafe or hazardous condition or overload existing building systems, and for which there is not a feasible compliant alternative, shall be exempt from this code.

C101.4.6.3 Envelope assemblies of low-energy buildings. The following buildings, or portions thereof, separated from the remainder of the building by *building thermal envelope* assemblies complying with this code, shall be exempt from the *building thermal envelope* provisions of this code:

1. Those with a peak design rate of energy usage less than 3.4. Btu/h /ft² (10.7 W/m²) or 1.0 watt/ft² (10.7 W/m²) of floor area for space conditioning purposes.

2. Those that do not contain conditioned space.

C101.5 Compliance. Residential buildings shall meet the provisions of IECC-Residential Provisions. Commercial buildings shall meet the provisions of IECC-Commercial Provisions.

C101.5 Compliance materials. The code official shall be permitted to approve specific computer software, worksheets, compliance manuals and other similar materials that meet the intent of this code.

C101.5.1 Compliance materials. ~~The code official shall be permitted to approve specific computer software, worksheets, compliance manuals and other similar materials that meet the intent of this code.~~

SECTION C102

ALTERNATE MATERIALS — METHOD OF CONSTRUCTION, DESIGN OR INSULATING SYSTEMS

C102.1 General. ~~This code is not intended to prevent the use of any material, method of construction, design or insulating system not specifically prescribed herein, provided that such construction, design or insulating system has been approved by the code official as meeting the intent of this code.~~

C102.1.1 Above code programs. ~~The code official or other authority having jurisdiction shall be permitted to deem a national, state or local energy efficiency program to exceed the energy efficiency required by this code. Buildings approved in writing by such an energy efficiency program shall be considered in compliance with this code. The requirements identified as "mandatory" in Chapter 4 shall be met.~~

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R101.2 Scope. This code applies to *residential buildings* and commercial buildings the buildings sites and associated systems and equipment. Commercial buildings shall meet the requirements of the commercial provisions of this code, designated with a prefix "C". Residential buildings shall meet the requirements of the residential provisions of this code, designated with a prefix "R". Provisions without a designation "C" or "R" apply to all buildings.

R101.3 (N1101.2) Intent. This code shall regulate the design and construction of buildings for the effective use and conservation of energy over the useful life of each building. ~~This code is intended to provide flexibility to permit the use of innovative approaches and techniques to achieve this objective.~~ This code is not intended to abridge safety, health or environmental requirements contained in other applicable codes or ordinances.

R101.3.1 (N1101.2.1) Alternate materials, systems, approaches or techniques. This code is intended to provide flexibility to permit the use of innovative materials, systems, approaches or techniques to achieve this objective, provided such alternate proposals are approved by the code official.

R101.3.2 (N1101.2.2) Above-code programs. The code official or other authority having jurisdiction shall be permitted to deem a national, state or local energy efficiency program to exceed the energy efficiency required by this code. Buildings approved in writing by such an energy efficiency program shall be considered in compliance with this code. The requirements identified as «mandatory» in Chapters C4 and R4 shall be met.

R101.4.2 Historic buildings. ~~Any building or structure that is listed in the State or National Register of Historic Places; designated as a historic property under local or state designation law or survey; certified as a contributing resource with a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Registers of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, are exempt from this code.~~

~~R101.4.3 (N1101.3)~~ R101.4.2 Additions, alterations, renovations or repairs. Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. ~~Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems.~~ An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.

Exception: The following need not comply provided the energy use of the building is not increased:

1. Storm windows installed over existing fenestration.
2. Glass only replacements in an existing sash and frame.
3. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.
4. Construction where the existing roof, wall or floor cavity is not exposed.
5. Reroofing for roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.
6. Replacement of existing doors that separate *conditioned space* from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a *conditioned space* from the exterior shall not be removed.
7. Alterations that replace less than 50 percent of the luminaires in a space less than 5000 square feet, provided that such alterations do not increase the installed interior lighting power.
8. Alterations that replace only the ~~bulb~~ lamp and ballast within the existing luminaires in a space provided that the *alteration* does not increase the installed interior lighting power.

~~R101.4.4~~ R101.4.3 Change in occupancy or use. Spaces undergoing a change in occupancy that would result in an increase in demand for either fossil fuel or electrical energy shall comply with this code. Where the use in a space changes from one use in Table C405.5.2(1) or (2) to another use in Table C405.5.2(1) or (2), the installed lighting wattage shall comply with Section C405.5.

~~R101.4.5 (N1101.4)~~ R101.4.4 Change in space conditioning. Any nonconditioned space that is altered to become *conditioned space* shall be required to be brought into full compliance with this code.

~~R101.4.6~~ R101.4.5 Mixed occupancy. Where a building includes both *residential* and *commercial* occupancies, each occupancy shall be separately considered and meet the applicable provisions of IECC—Commercial Provisions or IECC—Residential Provisions.

R101.4.6 Exempt buildings or work. The following buildings or portions thereof shall be exempt from this code:

R101.4.6.1 Historic buildings. Any building or structure that is listed in the State or National Register of Historic Places; designated as a historic property under local or state designation law or survey; certified as a contributing resource with a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Registers of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, is exempt from this code.

R101.4.6.2 Certain additions, alterations, renovations or repairs. Additions, alterations, renovations or repairs, to the extent that compliance with this code would create an unsafe or hazardous condition or overload existing building systems, and for which there is not a feasible compliant alternative, shall be exempt from this code.

R101.4.6.3 Envelope assemblies of low-energy buildings. The following buildings, or portions thereof, separated from the remainder of the building by *building thermal envelope* assemblies complying with this code, shall be exempt from the *building thermal envelope* provisions of this code:

1. Those with a peak design rate of energy usage less than 3.4. Btu/h /ft² (10.7 W/m²) or 1.0 watt/ft² (10.7 W/m²) of floor area for space conditioning purposes.
2. Those that do not contain *conditioned space*.

R101.5 Compliance. Residential buildings shall meet the provisions of IECC-Residential Provisions. Commercial buildings shall meet the provisions of IECC-Commercial Provisions.

R101.5 (N1101.5) Compliance materials. The *code official* shall be permitted to approve specific computer software, worksheets, compliance manuals and other similar materials that meet the intent of this code.

R101.5.1 (N1101.5) Compliance materials. The *code official* shall be permitted to approve specific computer software, worksheets, compliance manuals and other similar materials that meet the intent of this code.

SECTION R102

~~ALTERNATE MATERIALS — METHOD OF CONSTRUCTION, DESIGN OR INSULATING SYSTEMS~~

R102.1 General. This code is not intended to prevent the use of any material, method of construction, design or insulating system not specifically prescribed herein, provided that such construction, design or insulating system has been *approved* by the *code official* as meeting the intent of this code.

R102.1.1 (N1101.7) Above code programs. The *code official* or other authority having jurisdiction shall be permitted to deem a national, state or local energy efficiency program to exceed the energy efficiency required by this code. Buildings *approved* in writing by such an energy efficiency program shall be considered in compliance with this code. The requirements identified as “mandatory” in Chapter 4 shall be met.

Reason: This proposed change reorganizes Section 101 to provide greater clarity regarding intent and flexibility, applicability and exemptions, and compliance materials, all as part of the Scope and General Requirements section. This will help both the code official and the registered design professional to understand how these important concepts apply.

Cost Impact: The code change proposal will not increase the cost of construction. It clarifies a framework for the energy code and does not affect either design or construction.

CE1-13

PART I – IECC-COMMERCIAL PROVISIONS

C101.3, R101.3 (N1101.2)

Proponent: William W Stewart, FAIA, PE, representing self (codedoc@sbcglobal.net)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C101.3 Intent. This code shall regulate the design and construction of buildings for the ~~effective~~ use and conservation of energy over the ~~useful~~ life of each building. This code is intended to provide flexibility to permit the use of innovative approaches and techniques to achieve this objective. This code is not intended to abridge safety, health or environmental requirements contained in other applicable codes or ordinances.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R101.3 (N1101.2) Intent. This code shall regulate the design and construction of buildings for the ~~effective~~ use and conservation of energy over the ~~useful~~ life of each building. This code is intended to provide flexibility to permit the use of innovative approaches and techniques to achieve this objective. This code is not intended to abridge safety, health or environmental requirements contained in other applicable codes or ordinances.

Reason: The deleted words are subjective and add nothing to the code. The “effective” use of energy is neither definable or enforceable. What is effective to some is not effective to others. No where in the code is the “useful” life of a building defined and it depends of the needs of the occupant. Is a building designed with cutting edge technology no longer useful when a higher level if technology is applied to newer buildings? Additionally, a remodeled building could have a longer “useful” life than anticipated by the original owner. As revised, the code would be understandable and enforceable.

Cost Impact: The code change will not increase the cost of construction.

THIS IS A 3 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE, PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART III WILL BE HEARD BY THE EXISTING BUILDING CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Delete without substitution as follows:

~~**C101.4.3 Additions, alterations, renovations or repairs.** Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.~~

~~**Exception:** The following need not comply provided the energy use of the building is not increased:~~

- ~~1. Storm windows installed over existing fenestration.~~
- ~~2. Glass-only replacements in an existing sash and frame.~~
- ~~3. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.~~
- ~~4. Construction where the existing roof, wall or floor cavity is not exposed.~~
- ~~5. Reroofing for roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.~~
- ~~6. Replacement of existing doors that separate *conditioned space* from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a *conditioned space* from the exterior shall not be removed.~~
- ~~7. Alterations that replace less than 50 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.~~
- ~~8. Alterations that replace only the bulb and ballast within the existing luminaires in a space provided that the *alteration* does not increase the installed interior lighting power.~~

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

~~**R101.4.3 (N1101.4.3) Additions, alterations, renovations or repairs.** Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.~~

~~**Exception:** The following need not comply provided the energy use of the building is not increased:~~

1. ~~Storm windows installed over existing fenestration.~~
2. ~~Glass only replacements in an existing sash and frame.~~
3. ~~Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.~~
4. ~~Construction where the existing roof, wall or floor cavity is not exposed.~~
5. ~~Reroofing for roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.~~
6. ~~Replacement of existing doors that separate *conditioned space* from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a *conditioned space* from the exterior shall not be removed.~~
7. ~~Alterations that replace less than 50 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.~~
8. ~~Alterations that replace only the bulb and ballast within the existing luminaires in a space provided that the *alteration* does not increase the installed interior lighting power.~~

PART III – IEBC

Delete and substitute as follows:

707.1 Minimum requirements. ~~Level 1 alterations to existing buildings or structures are permitted without requiring the entire building or structure to comply with the energy requirements of the *International Energy Conservation Code* or *International Residential Code*. The alterations shall conform to the energy requirements of the *International Energy Conservation Code* or *International Residential Code* as they relate to new construction only.~~

707.1 Minimum requirements. Alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of the *International Energy Conservation Code* as they relate to new construction without requiring the unaltered portions of the existing building or building system to comply with this code. Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.

Exception: The following need not comply provided the energy use of the building is not increased:

1. Storm windows installed over existing fenestration.
2. Glass only replacements in an existing sash and frame.
3. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.
4. Construction where the existing roof, wall or floor cavity is not exposed.
5. Reroofing for roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.
6. Replacement of existing doors that separate *conditioned space* from the exterior shall not require the installation of a vestibule or revolving door. An existing vestibule that separates a *conditioned space* from the exterior shall not be removed.
7. Alterations that replace less than 50 percent of the luminaires in a space, where such alterations do not increase the installed interior lighting power.
8. Alterations that replace only the bulb and ballast within the existing luminaires in a space where the *alteration* does not increase the installed interior lighting power.

Delete and substitute as follows:

811.1 Minimum requirements. ~~Level 2 alterations to existing buildings or structures are permitted without requiring the entire building or structure to comply with the energy requirements of the~~

~~International Energy Conservation Code or International Residential Code. The alterations shall conform to the energy requirements of the International Energy Conservation Code or International Residential Code as they relate to new construction only.~~

811.1 Minimum requirements. A building, building system, or portion thereof that is altered shall comply with Section 707.

Reason: The requirements referenced in this code section are issues that deal with existing buildings. As such, the requirements should be listed in the IEBC. If it is felt that the requirements need to remain as part of the IECC, then it is requested that the requirements be listed/referenced under both the IECC as well as the IEBC, as is commonly done throughout the ICC suite of codes. Having the same language in multiple ICC codes is commonly done throughout the ICC suites for issues such as fire dampers, etc. For example, review IBC 717.5 and IMC 607.5

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IECC – COMMERCIAL PROVISIONS

Delete without substitution as follows:

~~C101.4.1 Existing buildings.~~ Except as specified in this chapter, this code shall not be used to require the removal, ~~alteration~~ or abandonment of, nor prevent the continued use and maintenance of, an existing building or building system lawfully in existence at the time of adoption of this code.

~~C101.4.2 Historic buildings.~~ Any building or structure that is listed in the State or National Register of Historic Places; designated as a historic property under local or state designation law or survey; certified as a contributing resource with a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Registers of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, are exempt from this code.

~~C101.4.3 Additions, alterations, renovations or repairs.~~ Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.

Exception: The following need not comply provided the energy use of the building is not increased:

- ~~1. Storm windows installed over existing fenestration.~~
- ~~2. Glass only replacements in an existing sash and frame.~~
- ~~3. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.~~
- ~~4. Construction where the existing roof, wall or floor cavity is not exposed.~~
- ~~5. Reroofing for roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.~~
- ~~6. Replacement of existing doors that separate conditioned space from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a conditioned space from the exterior shall not be removed.~~
- ~~7. Alterations that replace less than 50 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.~~
- ~~8. Alterations that replace only the bulb and ballast within the existing luminaires in a space provided that the alteration does not increase the installed interior lighting power.~~

~~C101.4.4 Change in occupancy or use.~~ Spaces undergoing a change in occupancy that would result in an increase in demand for either fossil fuel or electrical energy shall comply with this code. Where the use

in a space changes from one use in Table C405.5.2(1) or (2) to another use in Table C405.5.2(1) or (2), the installed lighting wattage shall comply with Section C405.5.

~~C101.4.5 Change in space conditioning.~~ Any nonconditioned space that is altered to become *conditioned space* shall be required to be brought into full compliance with this code.

Delete without substitution as follows:

~~C401.2.1 Application to existing buildings.~~ Additions, alterations and repairs to existing buildings shall comply with one of the following:

- ~~1. Sections C402, C403, C404 and C405; or~~
- ~~2. ANSI/ASHRAE/IESNA 90.1.~~

Add new text as follows:

CHAPTER 5 CE **EXISTING BUILDINGS**

SECTION C501 **GENERAL**

C501.1 Scope. The provisions of this chapter shall control the *alteration, repair, addition* and change of occupancy of existing buildings and structures.

C501.2 Existing buildings. Except as specified in this chapter, this code shall not be used to require the removal, *alteration* or abandonment of, nor prevent the continued use and maintenance of, an existing building or building system lawfully in existence at the time of adoption of this code.

C501.3 Maintenance. Buildings and structures, and parts thereof, shall be maintained in a safe and sanitary condition. Devices or and systems which are required by this code shall be maintained in conformance with the code edition under which installed. The owner or the owner's designated agent shall be responsible for the maintenance of buildings and structures. The requirements of this chapter shall not provide the basis for removal or abrogation of energy conservation, fire protection and safety systems and devices in existing structures.

C501.4 Compliance. *Alterations, repairs, additions* and changes of occupancy to, or relocation of, existing buildings and structures shall comply with the provisions for *alterations, repairs, additions* and changes of occupancy or relocation, respectively, in the *International Building Code, International Fire Code, International Fuel Gas Code, International Mechanical Code, International Plumbing Code, International Property Maintenance Code, International Private Sewage Disposal Code* and NFPA 70.

C501.5 New and replacement materials. Except as otherwise required or permitted by this code, materials permitted by the applicable code for new construction shall be used. Like materials shall be permitted for repairs, provided no hazard to life, health or property is created. Hazardous materials shall not be used where the code for new construction would not permit their use in buildings of similar occupancy, purpose and location.

C501.6 Historic buildings. *Historic buildings* are exempt from this code.

SECTION C502 **ADDITIONS**

C502.1 General. Additions to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion of the existing building or building system to comply with this code. Additions shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with

this code if the addition alone complies or if the existing building and addition comply with this code as a single building.

Additions complying with ANSI/ASHRAE/IESNA 90.1. need not comply with Sections C402, C403, C404 and C405.

SECTION C503 **ALTERATIONS**

C503.1 General Alterations to any building or structure shall comply with the requirements of the code for new construction. Alterations shall be such that the existing building or structure is no less conforming with the provisions of this code than the existing building or structure was prior to the alteration. Alterations to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portions of the existing building or building system to comply with this code. Alterations shall not create an unsafe or hazardous condition or overload existing building systems.

Alterations complying with ANSI/ASHRAE/IESNA 90.1. need not comply with Sections C402, C403, C404 and C405.

Exception: The following alterations need not comply with the requirements for new construction provided the energy use of the building is not increased:

1. Storm windows installed over existing fenestration.
2. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.
3. Construction where the existing roof, wall or floor cavity is not exposed.
4. Alterations that replace less than 50 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.

C503.2 Change in space conditioning. Any nonconditioned or low energy space that is altered to become *conditioned space* shall be required to be brought into full compliance with this code.

SECTION C504 **REPAIRS**

C504.1 General. Buildings and structures, and parts thereof, shall be repaired in compliance with Section C501.3 and this section. Work on nondamaged components that is necessary for the required *repair* of damaged components shall be considered part of the *repair* and shall not be subject to the requirements for *alterations* in this chapter. Routine maintenance required by Section C501.3, ordinary repairs exempt from *permit*, and abatement of wear due to normal service conditions shall not be subject to the requirements for *repairs* in this section.

Where a building was constructed to comply with ANSI/ASHRAE/IESNA 90.1. repairs shall comply with the standard and need not comply with Sections C402, C403, C404 and C405.

C504.2 Application. For the purposes of this code, the following shall be considered repairs.

1. Glass only replacements in an existing sash and frame.
2. Roof repairs where neither the sheathing nor the insulation is exposed.
3. Replacement of existing doors that separate conditioned space from the exterior shall not require the installation of a vestibule or revolving door, provided however that an existing vestibule that separates a conditioned space from the exterior shall not be removed.
4. Repairs where only the bulb and/or ballast within the existing luminaires in a space are replaced provided that the replacement does not increase the installed interior lighting power.

SECTION C505
CHANGE OF OCCUPANCY OR USE

C505.1 General. Spaces undergoing a change in occupancy that would result in an increase in demand for either fossil fuel or electrical energy shall comply with this code. Where the use in a space changes from one use in Table C405.5.2(1) or C405.5.2 (2) to another use in Table C405.5.2(1) or C405.5.2 (2), the installed lighting wattage shall comply with Section C405.5.

Add new definitions as follows:

HISTORIC BUILDINGS. Buildings that are listed in or eligible for listing in the National Register of Historic Places, or designated as historic under an appropriate state or local law.

REPAIR. The reconstruction or renewal of any part of an existing building for the purpose of its maintenance.

PART II – IECC – RESIDENTIAL PROVISIONS

Revise as follows:

R101.4 Applicability. Where, in any specific case, different sections of this code specify different materials, methods of construction or other requirements, the most restrictive shall govern. Where there is a conflict between a general requirement and a specific requirement, the specific requirement shall govern.

~~**R101.4.1 Existing buildings.** Except as specified in this chapter, this code shall not be used to require the removal, alteration or abandonment of, nor prevent the continued use and maintenance of, an existing building or building system lawfully in existence at the time of adoption of this code.~~

~~**R101.4.2 Historic buildings.** Any building or structure that is listed in the State or National Register of Historic Places; designated as a historic property under local or state designation law or survey; certified as a contributing resource with a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Registers of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, are exempt from this code.~~

~~**R101.4.3 (N1101.3) Additions, alterations, renovations or repairs.** Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.~~

~~**Exception:** The following need not comply provided the energy use of the building is not increased:~~

- ~~1. Storm windows installed over existing fenestration.~~
- ~~2. Glass only replacements in an existing sash and frame.~~
- ~~3. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.~~
- ~~4. Construction where the existing roof, wall or floor cavity is not exposed.~~
- ~~5. Reroofing for roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.~~

6. ~~Replacement of existing doors that separate conditioned space from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a conditioned space from the exterior shall not be removed,~~
7. ~~Alterations that replace less than 50 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.~~
8. ~~Alterations that replace only the bulb and ballast within the existing luminaires in a space provided that the alteration does not increase the installed interior lighting power.~~

~~R101.4.4 Change in occupancy or use.~~ Spaces undergoing a change in occupancy that would result in an increase in demand for either fossil fuel or electrical energy shall comply with this code.

~~R101.4.5 (N1101.4) Change in space conditioning.~~ Any nonconditioned space that is altered to become conditioned space shall be required to be brought into full compliance with this code.

~~R101.4.6 R101.4.1 Mixed occupancy.~~ Where a building includes both *residential* and *commercial* occupancies, each occupancy shall be separately considered and meet the applicable provisions of the IECC—Commercial and Residential Provisions.

Delete without substitution as follows:

~~R402.3.6 (N1102.3.6) Replacement fenestration.~~ Where some or all of an existing fenestration unit is replaced with a new fenestration product, including sash and glazing, the replacement fenestration unit shall meet the applicable requirements for *U*-factor and SHGC in Table R402.1.1.

Add new text as follows:

CHAPTER 5 (RE) **EXISTING BUILDINGS**

SECTION R501 (N1106) **GENERAL**

R501.1 (N1106.1) Scope. The provisions of this chapter shall control the *alteration, repair, addition and change of occupancy of existing buildings and structures.*

R501.2 (N1106.2) Existing buildings. Except as specified in this chapter, this code shall not be used to require the removal, *alteration* or abandonment of, nor prevent the continued use and maintenance of, an existing building or building system lawfully in existence at the time of adoption of this code.

R501.3 (N1106.3) Maintenance. Buildings and structures, and parts thereof, shall be maintained in a safe and sanitary condition. Devices or and systems which are required by this code shall be maintained in conformance with the code edition under which installed. The owner or the owner's designated agent shall be responsible for the maintenance of buildings and structures. The requirements of this chapter shall not provide the basis for removal or abrogation of energy conservation, fire protection and safety systems and devices in existing structures.

R501.4 (N1106.4) Compliance. *Alterations, repairs, additions and changes of occupancy to, or relocation of, existing buildings and structures shall comply with the provisions for alterations, repairs, additions and changes of occupancy or relocation, respectively, in the International Residential Code, International Building Code, International Fire Code, International Fuel Gas Code, International Mechanical Code, International Plumbing Code, International Property Maintenance Code, International Private Sewage Disposal Code and NFPA 70.*

R501.5 (N1106.5) New and replacement materials. Except as otherwise required or permitted by this code, materials permitted by the applicable code for new construction shall be used. Like materials shall be permitted for repairs, provided no hazard to life, health or property is created. Hazardous materials

shall not be used where the code for new construction would not permit their use in buildings of similar occupancy, purpose and location.

R501.6 (N1106.6) Historic buildings. *Historic buildings* are exempt from this code.

SECTION R502 (N1107) **ADDITIONS**

R502.1 (N1107.1) General. Additions to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion of the existing building or building system to comply with this code. Additions shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.

SECTION R503 (N1108) **ALTERATIONS**

R503.1 (N1108.1) Alterations. Alterations to any building or structure shall comply with the requirements of the code for new construction. Alterations shall be such that the existing building or structure is no less conforming with the provisions of this code than the existing building or structure was prior to the alteration. Alterations to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portions of the existing building or building system to comply with this code. Alterations shall not create an unsafe or hazardous condition or overload existing building systems.

Exception: The following alterations need not comply with the requirements for new construction provided the energy use of the building is not increased:

1. Storm windows installed over existing fenestration.
2. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.
3. Construction where the existing roof, wall or floor cavity is not exposed.
4. Alterations that replace less than 50 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.

R503.2 (N1108.2) Change in space conditioning. Any nonconditioned or low energy space that is altered to become conditioned space shall be required to be brought into full compliance with this code.

R503.3. (N1108.3) Replacement fenestration . Where some or all of an existing fenestration unit is replaced with a new fenestration product, including sash and glazing, the replacement fenestration unit shall meet the applicable requirements for U-factor and SHGC in Table R402.1.1.

SECTION R504 (N1109) **REPAIRS**

R504.1 (N1109.1) General. Buildings and structures, and parts thereof, shall be repaired in compliance with Section C501.3 and this section. Work on nondamaged components that is necessary for the required repair of damaged components shall be considered part of the repair and shall not be subject to the requirements for alterations in this chapter. Routine maintenance required by Section C501.3, ordinary repairs exempt from permit, and abatement of wear due to normal service conditions shall not be subject to the requirements for repairs in this section.

R504.2 (N1109.2) Application. For the purposes of this code, the following shall be considered repairs.

1. Glass only replacements in an existing sash and frame.

2. Roof repairs where neither the sheathing nor the insulation is exposed.
3. Repairs where only the bulb and/or ballast within the existing luminaires in a space are replaced provided that the replacement does not increase the installed interior lighting power.

SECTION R505 (N1110) **CHANGE OF OCCUPANCY OR USE**

R505.1 (N1110.1) General. Spaces undergoing a change in occupancy that would result in an increase in demand for either fossil fuel or electrical energy shall comply with this code.

Add new definitions as follows:

HISTORIC BUILDINGS. Buildings that are listed in or eligible for listing in the National Register of Historic Places, or designated as historic under an appropriate state or local law.

REPAIR. The reconstruction or renewal of any part of an existing building for the purpose of its maintenance.

Reason: (PART I) This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The primary purpose of this proposal is to move the regulation of existing buildings under the IECC out of Chapter 1 and into its own Chapter. Chapter 1 should be reserved for administrative provisions of the code and not the technical standards applicable to renovating or expanding existing buildings. For the Commercial IECC there are additional provisions for existing buildings found in Section C401.2.1. Therefore the primary purpose is editorial. But the purpose is also forward looking. The vast majority of our building stock is existing. If more energy savings is to be found, a significant route is the upgrade of existing buildings. This change anticipates a growth in detail of such provisions, and the SEHPCAC feels that having a distinct existing buildings chapter will better accommodate the growth of such standards.

The committee used the general format of Chapter 34 of the IBC. It compared existing language in the IBC with that in the IECC and either chose language from one code or the other, or occasionally melded the two codes. The following table lists for each new section the source of the text.

Proposed Chapter Sections	Source code and Section
C501.1 Scope	IBC 3401.1
C501.2 Existing Buildings	IECC C101.4.1
C501.3 Maintenance	IBC 3401.2
C501.4 Compliance	IBC 3401.3
C501.5 New and replacement materials	IBC 3401.4
C501.6 Historic buildings	IECC C101.4.2
C502, Additions	IECC C101.4.3
C502.1 General	
C502.1 – General exception	IECC C401.2.1
C503 Alterations	IBC 3404.1 and IECC
C503.1 General	CC101.4.3
C503.2 Change in space conditioning	IECC 101.4.5
C504 Repairs	IBC 3405.1
C504.1 General	IECC C101.4.3
C504.2 Application	IECC C101.4.3
C505 Change of Occupancy or Use	IECC C101.4.4
C505.1 General	

The proposal does simplify the language of the historic building section to a simple exemption, but at the same time proposes a definition Historic Buildings to be added to the IECC. Most of the current text of Section C101.4.2 is actually definition. The Committee noted that there is a difference between the definitions of historic buildings in the IBC versus the IEBC. It chose the IBC version, for consistency with the lead code. The IRC does not define historic buildings.

Another substantive change – or perhaps clarification is regarding a potential of a low energy space becoming a fully conditioned space. The current text of the IECC does not address such a conversion. This proposal treats such changes the same as that of creating a conditioned space from a non-conditioned space.

Section C101.4.3 includes a list of 8 actions which are exempt from compliance with the code. Since C101.4.3 addresses all three actions (additions, alterations and repairs) it is unclear where the 8 exceptions applies. The Committee reviewed each and felt that 4 belonged in the alteration section and 4 in the repairs section.

Finally the provisions currently found in Section 401.2.1 allowing the use of ASHRAE 90.1 is translated into an alternate compliance path, for additions in Section C502. The assumption is that the design of an addition can comply with the IECC or the ASHRAE 90.1 regardless of the requirements applied to the original building. For Alterations a similar exception is provided allowing use of either IECC or ASHRAE 90.1. These are simply shown as text allowing alternate compliance and not exception. The term exception implies a lesser standard; ASHRAE 90.1 should not be viewed as a lesser standard. However for repairs, the proposal only allows use of ASHRAE 90.1 for repairs if the original design was per ASHRAE 90.1.

(PART II): This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

See the Reason statement for Part I of this proposal.

When the IECC was divided into two parallel documents, the provisions for existing buildings were copied nearly word for word into both C104 and R104. Therefore the IECC residential proposal mirrors the IECC Commercial proposal with 3 distinct differences.

1. ASHRAE 90.1 is not address as the standard is not applicable to 'residential' buildings.
2. Section R402.3.6 on replacement fenestration is added as it only applies to residential.
3. What is Item 3 in Section C504.2 does not appear in the residential version. This Item addresses maintaining door vestibules and/or revolving doors where such doors separate conditioned from non-conditioned space. Vestibules are a requirement in the IECC Commercial new construction provisions – but are not found in the residential. Therefore requiring maintenance under the residential provisions is inappropriate.

Cost Impact: The code change proposal will not increase the cost of construction. The proposal is an editorial relocation of existing text. There will be no impact on the cost of construction.

CHAPTER 5 (NEW)-EC-THOMPSON-SEHPCAC

CE5 – 13

C202, C101.4.3, C409 (NEW)

Proponent: Eric Makela, Britt/Makela Group, Inc., representing Northwest Energy Codes Group (eric@brittmakela.com)

Delete and substitute as follows:

~~C101.4.3 Additions, alterations, renovations or repairs.~~ ~~Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.~~

~~Exception:~~ ~~The following need not comply provided the energy use of the building is not increased:~~

- ~~1. Storm windows installed over existing fenestration.~~
- ~~2. Glass only replacements in an existing sash and frame.~~
- ~~3. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.~~
- ~~4. Construction where the existing roof, wall or floor cavity is not exposed.~~
- ~~5. Reroofing for roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.~~
- ~~6. Replacement of existing doors that separate *conditioned space* from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a *conditioned space* from the exterior shall not be removed.~~
- ~~7. Alterations that replace less than 50 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.~~
- ~~8. Alterations that replace only the bulb and ballast within the existing luminaires in a space provided that the *alteration* does not increase the installed interior lighting power.~~

C101.4.3 Additions, alterations, or repairs. Additions, alterations, or repairs to an existing building, building system or portion thereof shall comply with Section C409.

Add new text as follows:

SECTION C409

ADDITIONS, ALTERATIONS, OR REPAIRS

C409.1 Scope. The provisions of this chapter shall control the *alteration, repair, and addition* of existing buildings and structures for compliance with the *International Energy Conservation Code*.

C409.2 Existing buildings. Except as specified in this chapter, this code shall not be used to require the removal, *alteration*, or abandonment of, nor prevent the continued use and maintenance of, an existing building or building system lawfully in existence at the time of adoption of this code.

C409.3 Maintenance. Buildings and structures, and parts thereof, shall be maintained in a safe and sanitary condition. Devices and/or systems which are required by this code shall be maintained in conformance with the code edition under which installed. The owner or the owner's designated agent shall be responsible for the maintenance of buildings and structures. The requirements of this chapter shall not provide the basis for removal or abrogation of energy conservation, fire protection and safety systems and devices in existing structures.

C409.4 Additions, alterations, or repairs. Additions, alterations, or repairs to an existing building, building system, or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portions of the existing building or building supply system to comply with this code. Additions, alterations, or repairs shall not create an unsafe or hazardous condition or overload existing building systems.

C409.4.1 Additions. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply as a single building. Additions shall comply with Section C409.4.1.1.

Exception: Additions complying with ANSI/ASHRAE/IESNA 90.1. need not comply with Sections C402, C403, C404, and C405.

C409.4.1.1 Prescriptive compliance. Additions shall comply with Sections C409.4.1.1.1 through C409.4.1.1.5.

C409.4.1.1.1 Building envelope. New building envelope assemblies that are part of the addition shall comply with Sections C402.1 through C402.4.

C409.4.1.1.1.1 Vertical Fenestration. New vertical fenestration area that results in a total building fenestration area less than or equal to that specified in Section C402.3.1 shall comply with Section C402.3. Additions with vertical fenestration that results in a total building fenestration area greater than C402.4.1 shall comply with Section C402.3.1.1 for the addition only. Additions that result in a total building vertical glass area exceeding that specified in Section C402.3.1.1 shall comply with Section C407 or ASHRAE 90.1.

C409.4.1.1.1.2 Skylight area. New skylight area that results in a total building fenestration area less than or equal to that specified in Section C402.3.1 shall comply with Section C402.3. Additions with skylight area that result in a total building skylight area greater than C402.3 shall comply with Section C402.3.1.2 for the addition only. Additions that result in a total building skylight area exceeding that specified in Section C402.3.1.2 shall comply with Section C407 or ASHRAE 90.1.

C409.4.1.1.2 Building mechanical systems. New mechanical systems and equipment serving the building heating, cooling or ventilation needs, that are part of the addition, shall comply with Section C403.

C409.4.1.1.3 Service water heating systems. New service water-heating equipment, controls and service water heating piping shall comply with Section C404.

C409.4.1.1.4 Pools and inground permanently installed spas. New pools and inground permanently installed spas shall comply with Section C404.7.

C409.4.1.1.5 Electrical power and lighting systems. New lighting systems that are installed as part of the addition shall comply with Section C405.

C409.4.1.1.5.1 Interior lighting power. The total interior lighting power for the addition shall comply with Section C405.5.2 for the addition alone or if the existing building and the addition complies as a single building.

C409.4.1.1.5.2 Exterior lighting power. The total exterior lighting power for the addition shall comply with Section C405.6.2 for the addition alone or if the existing building and the addition complies as a single building.

C409.4.2 Alterations. Alterations to existing buildings shall comply with Section C409.4.2.1 through C409.4.2.4. Alterations shall be such that the existing building or structure is no less complying with the provisions of this code than the existing building or structure was prior to the alteration.

Exception: Alterations complying with ANSI/ASHRAE/IESNA 90.1. need not comply with Sections C402, C403, C404, and C405.

C409.4.2.1 Building envelope. New building envelope assemblies that are part of the alteration shall comply with Sections C402.1 through C402.4.

C409.4.2.1.1 Vertical Fenestration. The addition of vertical fenestration that results in a total building fenestration area less than or equal to that specified in Section C402.3.1 shall comply with Section C402.3. The addition of vertical fenestration that results in a total building fenestration area greater than C402.4.1 shall comply with Section C405.2.2.3.2 for the space adjacent to the new fenestration only. Alterations that result in a total building vertical glass area exceeding that specified in Section C402.3.1.1 shall comply with Section C407 or ASHRAE 90.1.

C409.4.2.1.2 Skylight area. The addition of skylight area that results in a total building skylight area less than or equal to that specified in Section C402.3.1 shall comply with Section C402.3. The addition of skylight area that results in a total building skylight area greater than C402.3 shall comply with Section C402.3.1.2 for the space adjacent to the new skylights. Alterations that result in a total building skylight area exceeding that specified in Section C402.3.1.2 shall comply with Section C407 or ASHRAE 90.1.

Exceptions: The following building envelope alterations are exempt from Section C409.4.2.1.

1. Storm windows installed over existing fenestration.
2. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.
3. Construction where the existing roof, wall or floor cavity is not exposed.

C409.4.2.2 Heating and cooling systems. New heating, cooling, and duct systems that are part of the alteration shall comply with Sections C403.

C409.4.2.2.1 Economizers. New cooling systems that are part of alteration shall comply with section C403.3.1 or C403.4.1.

C409.4.2.3 Service hot water systems. New service hot water systems that are part of the alteration shall comply with Section C404.

C409.4.2.4 Lighting. New lighting systems that are part of the alteration shall comply with Section C405.

Exceptions.

1. Alterations that replace less than 10 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.
2. Alterations that replace on the bulb and ballast within the existing luminaires in a space provided that the alteration does not increase the installed interior lighting power.

C409.4.3 Repairs. Buildings and structures, and parts thereof, shall be repaired in compliance with Section C409.3 and this section. Work on nondamaged components that is necessary for the required repair of damaged components shall be considered part of the repair and shall not be subject to the requirements for alterations in this chapter. Routine maintenance required by Section C409.3, ordinary repairs exempt from permit, and abatement of wear due to normal service conditions shall not be subject to the requirements for repairs in this section. Where a building was constructed to comply with ANSI/ASHRAE/IESNA 90.1, repairs shall comply with the standard and need not comply with Sections C402, C403, C404 and C405.

Exceptions: The following alterations are exempt from Section C409.4.3.

1. Glass only replacements in an existing sash and frame this is a repair.
2. Reroofing for roofs where neither the sheathing nor the insulation is exposed this is a repair.

Revise definition as follows:

IECC SECTION C202 GENERAL DEFINITIONS

REPAIR. The reconstruction or renewal of any part of an existing building for the purpose of its maintenance.

Reason: The commercial provisions of the 2012 IECC require that additions, alterations, renovations, or repairs comply with the provisions of the energy code without providing a clear “roadmap” on the specific requirements that apply to these projects. The goal of this code change proposal is to provide clear direction to the code user on what provisions must be complied with based on the type of project. Increasing the clarity of the code will increase the compliance rate and result in increased energy savings for these projects.

This proposal places all of the requirements for additions, alterations, renovations, and repairs into a new section in the commercial provisions of the IECC and builds off the work conducted by the ICC SEHPCAC in the development of their existing building proposal. The additions portion of the proposal provides direction on what options are available for demonstrating compliance for projects up to 30% window to wall ratio and for those projects up to 40% window to wall ratio. References into the code are also provided when HVAC, water heating, and lighting systems are included in the project. The alteration portion of the proposal provides clear guidance on how to address alterations that increase fenestration area for the building that exceeds the prescriptive fenestration limits for the building as defined in the code. Exceptions currently included in Section C101.4.3 of the 2012 IECC have been moved into this new section and linked to the applicable references to the building envelope, HVAC, or lighting section. Repairs have been clearly identified and essentially exempted from the requirements of the IECC if they fall within certain defined parameters.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Randall R. Dahmen, P.E., Licensed Wisconsin Commercial Building Inspector, representing self

THIS IS A 3 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE, PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART III WILL BE HEARD BY THE EXISTING BUILDING CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Delete without substitution as follows:

~~**C101.4.2 Historic buildings.** Any building or structure that is listed in the State or National Register of Historic Places; designated as a historic property under local or state designation law or survey; certified as a contributing resource with a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Registers of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, are exempt from this code.~~

PART II – IECC-RESIDENTIAL PROVISIONS

Delete without substitution as follows:

~~**R101.4.2 (N1101.3) Historic buildings.** Any building or structure that is listed in the State or National Register of Historic Places; designated as a historic property under local or state designation law or survey; certified as a contributing resource with a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Registers of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, are exempt from this code.~~

PART III – IEBC

Add new text as follows:

SECTION 1207 **ENERGY CONSERVATION**

1207.1 Historic buildings. Any building or structure that is listed in the State or National Register of Historic Places; designated as a historic property under local or state designation law or survey; certified as a contributing resource with a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Registers of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, are exempt from the IECC.

Reason: The requirements referenced in this code section are issues that deal with existing buildings, specifically, historic buildings. As such, the requirements should be listed in the IEBC. If it is felt that the requirements need to remain as part of the IECC, then it is requested that the requirements be listed/referenced under both the IECC as well as the IEBC, as is commonly done throughout the ICC suite of codes. Having the same language in multiple ICC codes is commonly done throughout the ICC suites for issues such as fire dampers, etc. For example, review IBC 717.5 and IMC 607.5

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C101.4.2 Historic buildings. Any building or structure that is listed in the State or National Register of Historic Places; designated as a historic property under local or state designation law or survey; certified as a contributing resource with a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Registers of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, are exempt from this code. The provisions of this code relating to the construction, repair, alteration, restoration and movement of structures, and change of occupancy shall not be mandatory for historic buildings. No provision of this code shall be used to require the alteration of an historic building.

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

HISTORIC BUILDING. Any building or structure that is one or more of the following:

1. Listed, or certified as eligible for listing by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, in the National Register of Historic Places
2. Designated as historic under an applicable state or local law; or
3. Certified as a contributing resource within a National Register listed or locally designated historic district.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R101.4.2 Historic buildings. Any building or structure that is listed in the State or National Register of Historic Places; designated as a historic property under local or state designation law or survey; certified as a contributing resource with a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Registers of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, are exempt from this code. The provisions of this code relating to the construction, repair, alteration, restoration and movement of structures, and change of occupancy shall not be mandatory for historic buildings. No provision of this code shall be used to require the alteration of an historic building.

Add new definition as follows:

SECTION R202 (N1101.9) GENERAL DEFINITIONS

HISTORIC BUILDING. Any building or structure that is one or more of the following:

1. Listed, or certified as eligible for listing by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, in the National Register of Historic Places
2. Designated as historic under an applicable state or local law; or
3. Certified as a contributing resource within a National Register listed or locally designated historic district.

Reason: The current language for Historic Buildings in the IECC-Commercial, the IECC-Residential and the IEBC is confusing, inconsistent with I-Code conventions for definitions, and does not clearly describe how buildings and districts are listed or determined to be eligible to be listed as historic. The charging language in C101.4.2 contains no fewer than three semi-colons and nine instances of the word "or". This makes the language very difficult to parse. The sentence structure in the current language that addresses eligibility is confusing and obfuscates who does the determinations.

The IECC mixes the definition of "historic building" with the charging language for historic buildings. Not only does this further make the charging language difficult to understand, it makes the language inconsistent with the way the I-Codes deal with definitions. Generally, the I-Codes keep definitions out of the code language and gather all definitions together into a definitions section.

Finally, the language does not align with how buildings and districts are officially designated by the governing authorities as eligible for listing as historic.

This proposal solves these three problems. First, it moves the definition of an historic building to the definitions sections in the IECC and edits the charging language of C101.4.2 to simply refer to that definition. It remedies the confusion caused by the sheer complexity of the defining language by converting the running list of qualifications into a clearly delineated numbered list. Finally, the proposal gives the language clarity and specificity as to how a building is officially determined to be eligible for the various lists of historic buildings. In accordance with the Code of Federal Regulations, Title 36, Chapter I, Part 63, determinations of eligibility for listing in the National Register of Historic Places are made by State Historic Preservation Offices in coordination with the Keeper of the National Register of Historic Places. This is an official process conducted in accordance with federal standards. This proposal aligns the code language with the language of this official process and removes any ambiguity as to who can make determinations of eligibility.

The charging language in the IECC also creates a rather large loophole. Historic buildings as defined by Section C101.4.1 are exempted completely from the code in its entirety. This means that no work being done on an historic building has to comply with the IECC at all - not alterations, not changes of use, not even additions. The definition of "historic building" is rather broad. It includes buildings that are certified as contributing to a local, state or national historic district. These are buildings that generally do not have enough historical significance/character to merit designation on their own, but do have enough to help define the overall significance/character of a district. Yet they are completely exempted from the energy code.

Buildings with historic significance may have social and aesthetic values, and the energy code should not be written in a way that will degrade these values. But rather than wholly exempting historic buildings like the current language in the IECC does, other I-Codes, especially the IBC and IFC, have balanced the protection of historic buildings with the intended goals of the codes. The IECC should follow this example and balance the competing values of historic preservation and energy conservation, rather than granting a wholesale exemption to historic buildings.

This proposal narrows the historic building loophole by eliminating the most egregious part, the exemption for additions to historic buildings. Additions to historic buildings are new construction, and in this case there is no historic character or historic fabric to protect. This change will make additions subject to the provisions of the IECC. However, it ensures that only the addition is subject to the IECC and exempts the historic building itself from any requirements that might be triggered by the addition.

This proposal is one of four proposals in Cycle B to create this consistency for Historic Buildings across the I-codes. The other three proposals are being made to the IECC-Commercial, the IEBC and the IPMC.

Cost Impact: The code change proposal will not increase the cost of construction.

Note: The term 'historic building' currently defined in the IBC, IEBC and IgCC. The definition in the IBC and IgCC is:

Historic buildings. Buildings that are listed in or eligible for listing in the National Register of Historic Places, or designated as historic under an appropriate state or local law.

The definition in the IEBC is:

Historical Building. Any building or structure that is listed in the State or National Register of Historic Places: designated as a historic property under local or state designation law or survey; certified as a contributing resource within a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Register of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places.

These proponents have submitted proposals to add this definition to the *International Property Maintenance Code* (PM2-13) and to the *International Existing Buildings Code* (EB1-13)

Proponent: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development (WABO TCD) (lkranz@bellevuewa.gov)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C101.4.2 Historic buildings. Any buildings or structures that is are listed in the state or national register of historic places; designated as a historic property under local or state designation law or survey; certified as a contributing resource with a national register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the national or state registers of historic places either individually or as a contributing building to a historic district by the state historic preservation officer or the keeper of the national register of historic places, are exempt from this code. Alterations and repairs to *historic buildings* shall comply with this code to the extent that such compliance does not compromise the historic nature and function of the building.

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

HISTORIC BUILDING. Any building or structure that is:

1. Listed in the State or National Register of Historic Places
2. Designated as a historic property under local or state designation law or survey
3. Certified as a contributing resource within a National or State Register listed or locally designated historic district, or
4. Determined or certified by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places to be eligible to be listed in the State or National Register of Historic Places either individually or as a contributing resource in an historic district.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R101.4.2 Historic buildings. Any building or structure that is listed in the State or National Register of Historic Places; designated as a historic property under local or state designation law or survey; certified as a contributing resource with a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Registers of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, are exempt from this code. Alterations and repairs to *historic buildings* shall comply with this code to the extent that such compliance does not compromise the historic nature and function of the building.

Add new definition as follows:

**SECTION R202 (N1101.9)
GENERAL DEFINITIONS**

HISTORIC BUILDING. Any building or structure that is:

1. Listed in the State or National Register of Historic Places
2. Designated as a historic property under local or state designation law or survey
3. Certified as a contributing resource within a National or State Register listed or locally designated historic district, or
4. Determined or certified by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places to be eligible to be listed in the State or National Register of Historic Places either individually or as a contributing resource in an historic district.

Reason: The existing requirement exempts historic buildings from all energy efficiency requirements, even those that do not impact the historic value of the building at all, such as lighting controls, attic insulation, or mechanical equipment efficiency. This modification requires energy efficiency measures only where they will leave the historic value of the building undisturbed.

Cost Impact: The code change proposal will increase the cost of construction.

Note: The term 'historic building' currently defined in the IBC, IEBC and IgCC. The definition in the IBC and IgCC is:

Historic buildings. Buildings that are listed in or eligible for listing in the National Register of Historic Places, or designated as historic under an appropriate state or local law.

The definition in the IEBC is:

Historical Building. Any building or structure that is listed in the State or National Register of Historic Places: designated as a historic property under local or state designation law or survey; certified as a contributing resource within a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Register of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places.

In addition to this proposal, definitions of historic building are proposed in CE7-13, CE9-13 being heard by this committee, PM2-13 being heard by the Property Maintenance Committee and EB1-13 being heard by the Existing Buildings Committee..

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C101.4.2 Historic buildings. ~~Any building or structure that is listed in the State or National Register of Historic Places; designated as a historic property under local or state designation law or survey; certified as a contributing resource with a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Registers of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, are exempt from this code. Historic buildings shall comply with the provisions of this code with the following exceptions, provided that these exceptions shall not apply to any addition to an *historic building* that has not itself been designated an *historic building*. No provision of this code shall be used to require the *alteration of an historic building*.~~

Exceptions:

1. The provisions of Sections C402.
2. The provisions of C405.6.
3. Any portion of an energy system contained within a listed or designated interior.
4. Any provision of this code if the local, state, or federal historic commission having authority deems that compliance with such provision is not feasible or would undermine the historic integrity of the *historic building*.

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

HISTORIC BUILDING. Any building or structure that is one or more of the following:

1. Listed, or certified as eligible for listing by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, in the National Register of Historic Places
2. Designated as historic under an applicable state or local law; or
3. Certified as a contributing resource within a National Register listed or locally designated historic district.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R101.4.2 Historic buildings. ~~Any building or structure that is listed in the State or National Register of Historic Places; designated as a historic property under local or state designation law or survey; certified as a contributing resource with a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Registers of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, are exempt from this~~

~~code. Historic buildings shall comply with the provisions of this code with the following exceptions, provided that these exceptions shall not apply to any addition to an *historic building* that has not itself been designated an *historic building*. No provision of this code shall be used to require the *alteration* of an *historic building*.~~

Add new definition as follows:

HISTORIC BUILDING. Any building or structure that is one or more of the following:

1. Listed, or certified as eligible for listing by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, in the National Register of Historic Places
2. Designated as historic under an applicable state or local law; or
3. Certified as a contributing resource within a National Register listed or locally designated historic district.

Reason: This proposal follows a joint proposal by the New Buildings Institute, the National Trust for Historic Preservation, and the American Institute of Architects in two matters. First, it adjusts the structure of the provision on historic buildings to be more in line with standard code syntax by adding a definition of "Historic Building", and then deleting the definitional language from the charging provision. Second, it removes additions to historic buildings from the exemption to the energy code.

In addition, this language narrows the exemptions for Historic Buildings from the current blanket exemption to a narrower set of exemptions. There are many reasons to narrow the exemptions.

The current blanket exemption does not have the nuance that one would expect of a code, in which specific exemptions are made for clear and justifiable reasons; consequently, the exemption leads to some very counter-intuitive results. For example, is there any reason that water-heating equipment in historic commercial buildings could not or should not meet the performance standards of Table 504.2, or the requirements for temperature controls for such equipment as per 504.3, or the requirements for pipe insulation as per 504.5? The current language exempts historic properties from every one of these requirements. In fact, is there any reason why Section 504, for service water heating, should not pertain in its entirety to historic commercial buildings? Similarly, what is the justification for exempting historic residential buildings from the requirements on snow melt system controls as per 403.8, or from the requirements for energy-conserving measures for pools, as per 403.9?

Clearly a more careful consideration of the justifiable exemptions for historic buildings is in order. The attached proposal takes the approach that historic buildings can and should comply with the provisions of the energy code for interior energy systems, including lighting, hot water, and mechanical systems, while exempting such systems that are within landmarked interiors and in the event that any provision of the code would undermine the historic integrity of the building in the opinion of a local, state or federal historic commission. These exemptions should cover any unforeseen eventualities in which the provisions of the energy code governing interior energy systems could result in a conflict with the maintenance of the historic fabric.

In addition, given the complexities of the building envelope and exterior lighting provisions as they pertain to historic properties, this proposal takes the approach that, for now, historic buildings should continue to be exempted from the envelope and exterior lighting provisions in their entirety. Here, too, however, a more nuanced approach is warranted. For example, is there any reason that the flat roof of a historic building should be exempted from the energy code's requirements for insulation or that the parking lot on a historic property should be exempted from the lighting power provisions? We need to spark a national dialogue on this subject with experts analyzing each section of the envelope and exterior lighting provision of the code and determining which of them would necessitate an exemption for historic properties.

Finally, this proposal requires that additions to historic buildings comply with the energy code in its entirety, unless such addition has itself been deemed historic, as in a 1920's colonial addition to a 17th Century building. That is because additions to historic buildings are not themselves historic and do not deserve special treatment under the code.

Narrowing the exemptions for historic properties serves at least three important purposes. The first is the direct impact on energy use and greenhouse gas emissions. Given the size of landmarked districts, the area of impacted can be quite large. For example, in Manhattan 25% of all lots are either individual landmarks or landmarked districts and some of the individual landmarks, such as the Empire State Building or the Woolworth Building, are enormous skyscrapers. Exempting all such properties from all aspects of the energy code will significantly impede citywide progress on energy efficiency. Moreover, the recent renovation of the Empire State Building has provided a great example of a historic property that has achieved exemplary energy performance through energy retrofits without undermining its historic qualities.

The second is preserving the value of historic properties. One benefit of the energy code is that, as buildings undergo their natural renovation cycles, they are continually upgraded in terms of their energy performance because any new energy system, such as new lights or boilers, need to meet the provisions of the energy code. If historic properties are exempted from such requirements, their systems will become increasingly outmoded and expensive to run, making such properties less desirable in the real estate market.

Finally, a narrowing of the exemptions will help preserve the natural alliance between historic preservation and sustainability. Because of the embodied energy in historic buildings and the many environmental impacts of demolition and construction, saving existing buildings is generally a more sustainable approach. However, exempting historic buildings from all aspects of the energy code could lead to an unnecessary collision between these two agendas, since with the exemption in place the expansion of historic districts and the creation of new historic landmarks will be seen as detrimental to progress in energy efficiency.

Cost Impact: The code change proposal will increase the cost of construction.

Note: The term 'historic building' currently defined in the IBC, IEBC and IgCC. The definition in the IBC and IgCC is:

Historic buildings. Buildings that are listed in or eligible for listing in the National Register of Historic Places, or designated as historic under an appropriate state or local law.

The definition in the IEBC is:

Historical Building. Any building or structure that is listed in the State or National Register of Historic Places; designated as a historic property under local or state designation law or survey; certified as a contributing resource within a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Register of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places.

In addition to this proposal, definitions of historic building are proposed in CE7-13, CE8-13 being heard by this committee, PM2-13 being heard by the Property Maintenance Committee and EB1-13 being heard by the Existing Buildings Committee..

CE10 – 13

C101.4.2, R101.4.2

Proponent: Al Godwin, CBO, CPM, Aon Fire Protection Engineering (al.godwin@aon.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C101.4.2 Historic buildings. Any building or structure that is listed in the State or National Register of Historic Places; designated as a historic property under local or state designation law or survey; certified as a contributing resource with a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Registers of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, ~~are exempt from~~ shall comply with all of the provisions of this code.

Exception: Whenever a provision or provisions of this code shall invalidate or jeopardize the historical designation or listing, that provision or provisions shall be permitted to be exempted.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R101.4.2 Historic buildings. Any building or structure that is listed in the State or National Register of Historic Places; designated as a historic property under local or state designation law or survey; certified as a contributing resource with a National Register listed or locally designated historic district; or with an opinion or certification that the property is eligible to be listed on the National or State Registers of Historic Places either individually or as a contributing building to a historic district by the State Historic Preservation Officer or the Keeper of the National Register of Historic Places, ~~are exempt from~~ shall comply with all of the provisions of this code.

Exception: Whenever a provision or provisions of this code shall invalidate or jeopardize the historical designation or listing, that provision or provisions shall be permitted to be exempted.

Reason: There is no reason why historical buildings cannot install energy efficient electrical, plumbing, HVAC, etc. There is no justification for total blanket exemption.

Critical historical areas might include the exterior envelope (the outside look), 1st floor entry lobby and perhaps most of the first floor inclusive of specific light fixtures, elevator lobbies on other floors but not the entire building. New lay-in ceilings and lighting on other than the 1st floor usually have no historical significance at all.

Cost Impact: The code change proposal will increase the cost of construction.

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C101.4.3 Additions, alterations, renovations or repairs. Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.

Exception: The following need not comply provided the energy use of the building in not increased.

1. Storm windows installed over existing fenestration.
2. Glass only replacements in an existing sash and frame.
3. Existing single pane fenestration assemblies with surface applied window film to reduce solar heat gain.
3. 4. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.
4. 5. Construction where the existing roof, wall or floor cavity is not exposed.
5. 6. Reroofing for roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.
6. 7. Replacement of existing doors that separate conditioned space from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a conditioned space from the exterior shall not be removed.
7. 8. Alterations that replace less than 50 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.
8. 9. Alterations that replace only the bulb and ballast within the existing luminaires in a space provided that the alteration does not increase the installed interior lighting power.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R101.4.3 (N1101.3) Additions, alterations, renovations or repairs. Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.

Exception: The following need not comply provided the energy use of the building is not increased.

1. Storm windows installed over existing fenestration.
2. Glass only replacements in an existing sash and frame.
3. Existing single pane fenestration assemblies with surface applied window film to reduce solar heat gain.
3. 4. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.
4. 5. Construction where the existing roof, wall or floor cavity is not exposed.
5. 6. Reroofing for roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.
6. 7. Replacement of existing doors that separate conditioned space from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a conditioned space from the exterior shall not be removed.
7. 8. Alterations that replace less than 50 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.
8. 9. Alterations that replace only the bulb and ballast within the existing luminaires in a space provided that the alteration does not increase the installed interior lighting power.

Reason: The IECC Section C401.2.1 requires compliance with Sections C402, C403, and C405 for existing buildings that are undergoing alternations and repairs. However, this section of the code (C 101.4.3) clarifies that certain features of the existing building are exempt from the requirements of the IECC.

Surface applied window film to existing fenestration has been added to the list because it can enhance the performance of existing single pane fenestration products for protection from injuries and property damage due to broken glass, reduces ultraviolet transmittance and glare, and improves performance when impacted. The foremost benefit of applied window film to existing windows is reduced solar heat gain and reduced energy use.

Without this addition to the list of exceptions, the code could be interpreted to unnecessarily require replacements of all existing windows to be with new materials and systems as for new construction.

This provision does not change the requirement for new windows when it is cost effective or otherwise desirable for older windows to be totally replaced. However, on some projects for additions, alternations, renovations or repairs simply and inexpensively improving the performance of the existing windows that are still fully functional can contribute to improved and more efficient total building energy use. Not recognizing this alternative to total window replacement in the code can also be a disincentive to make other needed improvements due to the cost of total replacement.

Buildings account for 16 percent of the world's energy consumption, and nearly 40 percent of this total is consumed by the United States. While roughly two percent of commercial floorspace is newly constructed each year, and a comparable amount renovated, the majority of opportunities to improve efficiency over the next several decades will be in existing building stock. Improving the energy efficiency of existing buildings through retrofitting and other measures will create a high-volume, low-cost approach to reducing energy use and greenhouse gas emissions.

Building owners must decide where to rank efficiency projects within a list of competing priorities—social, financial and environmental. Improving energy efficiency through retrofitting existing buildings certainly benefits the environment; however, it also benefits building owners from a cost standpoint. Allowing building owners to have the option to use window film on existing fenestration in order to improve the energy efficiency will create an incentive for reducing energy consumption and greenhouse emissions.

Cost Impact: The proposal will not increase the cost of construction.

C101.4.3-EC-LOVELL

CE12 – 13

C101.4.3, C202 (NEW)

Proponent: Shirley Ellis, Energy Systems Laboratory, Texas A&M Engineering Experiment Station, Texas A&M University System (shirleyellis@tamu.edu)

Revise as follows:

C101.4.3 Additions, alterations, renovations or repairs. Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.

Exception: The following need not comply provided the energy use of the building is not increased:

1. Storm windows installed over existing fenestration.
2. Glass only replacements in an existing sash and frame.
3. Replacement of existing *fenestration*, provided, however, that the area of the replacement *fenestration* does not exceed 25 percent of the total *fenestration area* of an existing building and that the *U-factor* and *SHGC* will be equal to or lower than before the *fenestration* replacement.
- 3 4. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.
45. Construction where the existing roof, wall or floor cavity is not exposed.
56. Reroofing for roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.
67. Replacement of existing doors that separate *conditioned space* from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a *conditioned space* from the exterior shall not be removed.
78. Alterations that replace less than 50 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.
89. Alterations that replace only the bulb and ballast within the existing luminaires in a space provided that the *alteration* does not increase the installed interior lighting power.

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

FENESTRATION AREA. The total area of the fenestration measured using the rough opening and including the glazing, sash, and frame. For doors where the glazed vision area is less than 50 percent of the door area, the fenestration area is the glazed vision area. For all other doors, the fenestration area is the door area, using the rough opening and including the frame.

Reason: Currently when a portion of the fenestration in a store-front or curtain wall building is damaged the IECC requires the replacement fenestration to meet the requirements of the current code. Often times this requires additional construction to the undamaged portions of the fenestration to ensure the code compliant replacement is compatible.

This code change will allow replacement of damaged fenestration in existing buildings to be replaced without requiring the fenestration to meet the current U-factor and SHGC requirements when falling within certain parameters.

The damaged area needing replacement must not exceed 25% of the total fenestration of the building and it must be equal or better than currently installed.

Cost Impact: The code change proposal will not increase the cost of construction.

CE12-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C101.4.3-EC-ELLIS.doc

CE13 – 13

C101.4.3, C101.4.3.1, 202 (NEW)

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

C101.4.3 Additions, alterations, renovations or repairs. Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.

Exception: The following need not comply provided the energy use of the building is not increased:

1. Storm windows installed over existing fenestration.
2. Glass only replacements in an existing sash and frame.
3. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.
4. Construction where the existing roof, wall or floor cavity is not exposed.
- ~~5. Reroofing of roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.~~
- 6 5. Replacement of existing doors that separate *conditioned space* from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a *conditioned space* from the exterior shall not be removed,
- ~~7~~ 6. Alterations that replace less than 50 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.
- ~~8~~ 7. Alterations that replace only the bulb and ballast within the existing luminaires in a space provided that the *alteration* does not increase the installed interior lighting power.

C101.4.3.1 Insulation requirements for roof covering replacements. For roof covering replacement on an existing building where the insulation is entirely above the deck and where the roof slope is less than two units vertical in 12 units horizontal, the insulation shall conform to the energy conservation requirements as specified in Table C402.2.

Exception: Where the required R-value cannot be provided due to thickness limitations presented by existing rooftop conditions, including roof drainage, heating, ventilation and air-conditioning equipment, low door or glazing heights, parapet heights, proper roof flashing heights, the maximum thickness of insulation compatible with the available space and existing uses shall be installed.

Add new definition as follows:

ROOF COVERING REPLACEMENT. An alteration consisting of the removal of the existing roof covering, and installation of a new roof covering.

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The prescriptive envelope requirement for re-roofing of low-slope roofs under the 2012 IECC is confusing and does not appropriately address the technical concerns that often arise during these projects. This proposed change would clarify existing requirements under the IECC, but would not add any new requirements. Also, this proposal is very similar to language adopted on October 31, 2011 by the International Code Council (ICC) as part of the International Green Construction Code (IgCC), Section 1003.3.11 (Code Change #GG722-11).

Application of the 2012 IECC to roof alterations is partly determined by interpretation of Section C101.4.3 (Additions, alterations, renovations or repairs) and exception #5 of that section. The ambiguities in this section and exception, as applied to low-slope roofs with insulation entirely above deck, have created an opportunity for intentional and unintentional misinterpretation. For instance, it is common practice to use a cover board or slip sheet between the primary insulation layer and the roof membrane. If these materials are left in place during the roof replacement process, then the insulation would not be "exposed" and compliance with the IECC as it applies to roof alterations could be avoided.

Cost Impact: This code change proposal will not increase the cost of construction. The proposal clarifies roof recovering. To the extent that even these elements were not being addressed by roof recovering's in the past

Note: While the other International Codes do not defined "roof covering replacement" the IgCC does define 'roof replacement' as follows:

ROOF REPLACEMENT. The process of removing the existing roof covering, repairing any substrate and installing a new roof covering.

	Assembly:	ASF	AMF	DF

C101.4.3-EC-THOMPSON-SEHPCAC.doc

CE14 – 13

C101.4.3

Proponent: Michael A. Anthony, P.E., University of Michigan, Kevin Folsom, Dallas Theological Seminary, Larry Spielvogel, L. G. Spielvogel, Inc.

Revise as follows:

C101.4.3 Additions, alterations, renovations or repairs. Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.

Exception: The following need not comply provided the energy use of the building is not increased:

1. Storm windows installed over existing fenestration.
2. Glass only replacements in an existing sash and frame.
3. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.
4. Construction where the existing roof, wall or floor cavity is not exposed.
5. Reroofing for roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.
 - 5.1. Roofs without insulation in the cavity and where equipment covers more than 10 percent of the roof area
 - 5.2. Roofs without insulation in the cavity and where a repaired area is less than 100 square feet.
6. Replacement of existing doors that separate *conditioned space* from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a *conditioned space* from the exterior shall not be removed,
7. Alterations that replace less than 50 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.
8. Alterations that replace only the bulb and ballast within the existing luminaires in a space provided that the *alteration* does not increase the installed interior lighting power.

Reason: Our industry supports all energy conservation efforts but they have to be practical. We need to put a softer edge on the re-insulation requirement however. Often when a roof leak is "repaired" the existing damaged membrane may be removed (exposing the insulation) and wet insulation may be replaced. This might be less than 100 sq. feet. Adding additional insulation thickness (maybe up to twice the thickness) not only adds to the complexity without making any measurable or meaningful improvement in the thermal performance of the building. The net result of this section would be a patch and the wet insulation would be left in place.

Without an exception of this nature, Owners would be required to do the equivalent of updating an entire window just because the glass was broken.

Cost Impact: Granting Owners more scalable options regarding insulating programs over time generally reduces costs though, admittedly, cost impact is site specific.

C101.4.3, C202 (NEW), C402.2.1.1, R101.4.3 (IRC N1101.3), R202 (NEW) (IRC N1101.9 (NEW))

Proponents: Michael D. Fischer, Kellen Company, representing Center for the Polyurethanes Industry (mfischer@kellencompany.com); Michael D. Fischer, Kellen Company, representing Polyisocyanurate Insulation Manufacturers Association; Brian Dean, ICF International, representing Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; and Bill Prindle, Energy Efficient Codes Coalition.

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C101.4.3 Additions, alterations, renovations or repairs. Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.

Exception: The following need not comply provided the energy use of the building is not increased:

1. Storm windows installed over existing fenestration.
2. Glass only replacements in an existing sash and frame.
3. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.
4. Construction where the existing roof, wall or floor cavity is not exposed.
5. ~~Reroofing for roofs where neither the sheathing nor the insulation is exposed.~~ Roof recover or roof repair.
6. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.
67. Replacement of existing doors that separate *conditioned space* from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a *conditioned space* from the exterior shall not be removed,
78. Alterations that replace less than 50 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.
89. Alterations that replace only the bulb and ballast within the existing luminaires in a space provided that the *alteration* does not increase the installed interior lighting power.

Add new text as follows:

C402.2.1.1 Roof replacement. For roof replacements, where the existing roof assembly is part of the building thermal envelope and contains insulation entirely above deck, roof replacement shall include compliance with the requirements of Table C402.1.2 or Table C402.2.

Add new definitions as follows:

SECTION C202 GENERAL DEFINITIONS

[B] REROOFING. The process of recovering or replacing an existing *roof covering*. See “Roof recover” and “Roof replacement.”

[B] ROOF RECOVER. The process of installing an additional *roof covering* over a prepared existing *roof covering* without removing the existing *roof covering*.

[B] ROOF REPAIR. Reconstruction or renewal of any part of an existing roof for the purposes of its maintenance.

[B] ROOF REPLACEMENT. The process of removing the existing *roof covering*, repairing any damaged substrate and installing a new *roof covering*.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R101.4.3 (N1101.3) Additions, alterations, renovations or repairs. Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.

Exception: The following need not comply provided the energy use of the building is not increased:

1. Storm windows installed over existing fenestration.
2. Glass only replacements in an existing sash and frame.
3. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.
4. Construction where the existing roof, wall or floor cavity is not exposed.
5. ~~Reroofing for roofs where neither the sheathing nor the insulation is exposed.~~ Roof recover or roof repair.
6. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.
67. Replacement of existing doors that separate *conditioned space* from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a *conditioned space* from the exterior shall not be removed,
78. Alterations that replace less than 50 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.
89. Alterations that replace only the bulb and ballast within the existing luminaires in a space provided that the *alteration* does not increase the installed interior lighting power.

Add new definitions as follows:

SECTION R202 (N1101.9) GENERAL DEFINITIONS

[B] REROOFING. The process of recovering or replacing an existing *roof covering*. See “Roof recover” and “Roof replacement.”

[B] ROOF RECOVER. The process of installing an additional *roof covering* over a prepared existing *roof covering* without removing the existing *roof covering*.

[B] ROOF REPAIR. Reconstruction or renewal of any part of an existing roof for the purposes of its maintenance.

[B] ROOF REPLACEMENT. The process of removing the existing *roof covering*, repairing any damaged substrate and installing a new *roof covering*.

Reason: Fischer (Part I) The current requirements that govern envelope performance requirements during reroofing do not utilize definitions contained in the building codes. The use of the term reroofing in and of itself is overly broad and subject to confusion. Roof replacement, which is the specific condition intended for envelope compliance, provides an important opportunity to decrease building energy use in US buildings. This proposal provides needed clarity to ensure that buildings are evaluated for compliance to current energy code requirements when the roof is replaced. The proposal also improves the exception to ensure that roof repair and recover projects are clearly not intended to bear additional expense that could be burdensome.

Fischer (Part II) The exceptions to applicability of the IECC for reroofing are unclear, and include confusing language. This proposal includes definitions used in the roofing chapter of the IBC in order to better scope the appropriate exceptions to the envelope requirements in the IECC.

The proposed language clarifies that roof replacement triggers the envelope requirements, but only when the roof assembly is part of the thermal envelope and the insulation is entirely above the roof deck. If the insulation is located within an attic cavity, roof replacement itself does not trigger insulation upgrades. The proposal also makes it clear that recover and repairs are not intended to trigger energy upgrades, while ensuring that the opportunity to add roof insulation when the roof is replaced is not missed.

Reason: Dean, Harris, Misuriello, Prindle, Stone: The purpose of this code change is to clarify code requirements related to roofs on existing buildings by distinguishing between roof repairs, roof recovering, and roof replacement. The proposal creates new definitions for each of these actions (Chapter 2), clarifies that repair and recover are exceptions to the code (section C101.4.3), and clarifies that when certain roof replacements occur (new section C402.2.1.1), that the roof must meet the roof insulation requirements in Table C402.1.2 or C402.2.

While the code generally requires additions, alterations, renovations or repairs to comply with the code, the specific application in many instances may not be entirely clear or consistently interpreted and enforced. Roof replacements are a good example of this issue. This code proposal is intended to resolve any interpretation issues related to roof replacement and ensure that proper insulation is installed when the opportunity is presented. It is important that opportunities to improve the efficiency of existing buildings are seized when presented and the replacement of roofs is one such important opportunity.

Cost Impact: The code change proposal will not increase the cost of construction.

Note: The four proposed definitions are terms defined in the IBC, the term 'roof replacement' is also found in the IgCC. The definitions found in the other codes are the same as proposed here.

C101.4.3-EC-FISCHER-DEAN-HARRIS-MISURIELLO- PRINDLE-STONE.doc

CE16 – 13

C101.4.3, R101.4.3 (N1101.3)

Proponent: Tim Manz, City of Blaine, MN, representing the Association of Minnesota Building Officials (tmanz@ci.blaine.mn.us)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C101.4.3 Additions, alterations, renovations or repairs. Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building. Attic insulation shall not be installed unless accessible attic bypasses have been sealed. An attic bypass is any air passageway between a conditioned space and an unconditioned attic.

Exception: The following need not comply provided the energy use of the building is not increased:

1. Storm windows installed over existing fenestration.
2. Glass only replacements in an existing sash and frame.
3. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.
4. Construction where the existing roof, wall or floor cavity is not exposed.
5. Reroofing for roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.
6. Replacement of existing doors that separate *conditioned space* from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a *conditioned space* from the exterior shall not be removed.
7. Alterations that replace less than 50 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.
8. Alterations that replace only the bulb and ballast within the existing luminaires in a space provided that the *alteration* does not increase the installed interior lighting power.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R101.4.3 (N1101.3) Additions, alterations, renovations or repairs. Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building. Attic insulation shall not be installed unless accessible attic bypasses have been sealed. An attic bypass is any air passageway between a conditioned space and an unconditioned attic.

Exception: The following need not comply provided the energy use of the building is not increased:

1. Storm windows installed over existing fenestration.
2. Glass only replacements in an existing sash and frame.
3. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.
4. Construction where the existing roof, wall or floor cavity is not exposed.
5. Reroofing for roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.
6. Replacement of existing doors that separate *conditioned space* from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a *conditioned space* from the exterior shall not be removed,
7. Alterations that replace less than 50 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.
8. Alterations that replace only the bulb and ballast within the existing luminaires in a space provided that the *alteration* does not increase the installed interior lighting power.

Reason: This has been a requirement in the Minnesota Residential Energy Code for many years, and the cost/benefit of this provision has already been proven as reasonable by its previous adoption into the Minnesota code. The practice of sealing accessible attic bypasses prior to adding additional insulation is highly cost effective as proven by weatherizing 18,000 homes in Minnesota in the past 2 years.

Cost Impact: The code change proposal will increase the cost of construction.

CE16-13

PART I – IECC-COMMERCIAL PROVISIONS

C101.4.3-EC-MANZ.doc

CE17 – 13

C101.4.3.2 (NEW)

Proponent: Tim Nogler, Washington State Building Code Council (tim.nogler@des.wa.gov)

Add new text as follows:

C101.4.3.2 Mechanical systems: Those parts of mechanical systems which are altered or replaced shall comply with Section C403. Additions or alterations shall not be made to an existing mechanical system that will cause the existing mechanical system to become out of compliance with this code. New mechanical systems in existing buildings, including packaged unitary equipment and packaged split systems, shall comply with Section C403.

Exception: Alternate designs that are not in full compliance with this code are permitted where the code official determines that existing building or occupancy constraints make full compliance impractical or where full compliance would be economically impractical.

Existing equipment currently in use is permitted to be relocated within the same floor or same tenant space if removed and reinstalled within the same permit.

Reason: The 2012 IECC does not specifically address mechanical system alterations. This Proposal clarifies that new or altered mechanical systems must comply with the energy code, and provides the Code Official with discretionary authority to approve departures from this requirement where it doesn't make sense for the project.

Cost Impact: The code change proposal will increase the cost of construction.

CE17-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C101.4.3.2 (NEW)-EC-NOGLER.doc

CE18 – 13

C101.4.3, C101.4.3.1 (NEW)

Proponent: Tim Nogler, Washington State Building Code Council (tim.nogler@des.wa.gov)

Revise as follows:

C101.4.3 Additions, alterations, renovations or repairs. Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.

Exception: The following need not comply provided the energy use of the building is not increased:

1. Storm windows installed over existing fenestration.
2. Glass only replacements in an existing sash and frame.
3. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are insulated to full depth with insulation having a minimum nominal value of R-3.0 per inch installed per Section C402.
4. Construction where the existing roof, wall or floor cavity is not exposed.
5. Reroofing for roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.
6. Replacement of existing doors that separate *conditioned space* from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a *conditioned space* from the exterior shall not be removed.
7. Alterations that replace less than ~~50~~ 60 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.
8. Alterations that replace only the bulb and ballast within the existing luminaires in a space provided that the *alteration* does not increase the installed interior lighting power.

C101.4.3.1 Lighting and motors. Alterations that replace 60 percent or more of the luminaires in a space enclosed by walls or ceiling-height partitions shall comply with Sections C405. Where less than 60 percent of the fixtures in a space enclosed by walls or ceiling-height partitions are new, the installed lighting wattage shall be maintained or reduced.

Where new wiring is being installed to serve added fixtures and/or fixtures are being relocated to a new circuit, controls shall comply with Sections C405.2.1, C405.2.2.3, C405.2.3, and as applicable C408.3. In addition, office areas less than 300 square feet enclosed by walls or ceiling-height partitions, and all meeting and conference rooms, and all school classrooms, shall be equipped with occupancy sensors that comply with Section C405.2.2 and C408.3.. Where a new lighting panel (or a moved lighting panel) with all new raceway and conductor wiring from the panel to the fixtures is being installed, controls shall also comply with the other requirements in Sections C405.2.2 and C408.3.

Where new walls or ceiling-height partitions are added to an existing space and create a new enclosed space, but the lighting fixtures are not being changed, other than being relocated, the new enclosed space shall have controls that comply with Sections C405.2.1, C 405.2.2, C405.2.3 and C408.3. Those motors which are altered or replaced shall comply with Section C403.2.13.

Reason: These rules provide thresholds for alterations to upgrade lighting efficiency and controls as tenant improvements take place within existing buildings. This takes advantage of interior construction projects to gradually upgrade the overall lighting efficiency. The rules are summarized as follows:

Where 60% of the light fixtures are replaced in any one space, the space must comply with the interior lighting power density (LPD) requirements.

Where light fixtures are being re-circuited or new fixtures are added, the controls for those circuits must meet:

- Manual lighting controls
- Daylight zone controls
- Specific application controls
- Lighting systems functional testing
- Occupancy sensors for offices, classrooms and conference rooms

Where a lighting panel is new or relocated, and has new raceway and wiring to the fixtures:

- Time switch controls, daylight zone controls, and occupancy sensor controls are required per C405.2.2.

Where a space is being enclosed by new partitions

- Full lighting controls are required as they are for new construction.

New or altered motors must meet NEMA Standard MG-1, and fan motors smaller than 1 hp in series terminal units must be ECM motors or have 65% efficiency per NEMA Standard MG-1 at full load.

Cost Impact: The code change proposal will increase the cost of construction.

Proponent: Randall R. Dahmen, P.E., Licensed Wisconsin Commercial Building Inspector, representing self

THIS IS A 3 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE, PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART III WILL BE HEARD BY THE EXISTING BUILDING CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Delete without substitution as follows:

~~**C101.4.4 Change in occupancy or use.** Spaces undergoing a change in occupancy that would result in an increase in demand for either fossil fuel or electrical energy shall comply with this code. Where the use in a space changes from one use in Table C405.5.2(1) or (2) to another use in Table C405.5.2(1) or (2), the installed lighting wattage shall comply with Section C405.5.~~

~~**C101.4.5 Change in space conditioning.** Any nonconditioned space that is altered to become conditioned space shall be required to be brought into full compliance with this code.~~

~~**C101.4.6 Mixed occupancy.** Where a building includes both residential and commercial occupancies, each occupancy shall be separately considered and meet the applicable provisions of IECC—Commercial Provisions or IECC—Residential Provisions.~~

PART II – IECC-RESIDENTIAL PROVISIONS

Delete without substitution as follows:

~~**R101.4.4 Change in occupancy or use.** Spaces undergoing a change in occupancy that would result in an increase in demand for either fossil fuel or electrical energy shall comply with this code.~~

~~**R101.4.5 (N1101.4) Change in space conditioning.** Any nonconditioned space that is altered to become conditioned space shall be required to be brought into full compliance with this code.~~

~~**R101.4.6 Mixed occupancy.** Where a building includes both residential and commercial occupancies, each occupancy shall be separately considered and meet the applicable provisions of the IECC—Commercial and Residential Provisions.~~

PART III – IEBC

Add new text as follows:

1001.3.1.1 Change in occupancy or use. Spaces undergoing a change in occupancy that would result in an increase in demand for either fossil fuel or electrical energy shall comply with the *International Energy Conservation Code*.

1001.3.1.2 Change in space conditioning. Any nonconditioned space that is altered to become conditioned space shall be required to be brought into full compliance with the *International Energy Conservation Code*.

1001.3.1.3 Mixed occupancy. Where a building changes use between either *residential* and *commercial* occupancies, each occupancy shall be separately considered and meet the applicable provisions of the *International Energy Conservation Code—Commercial and Residential Provisions*.

Reason: The requirements referenced in this code section are issues that deal with existing buildings. As such, the requirements should be listed in the IEBC. If it is felt that the requirements need to remain as part of the IECC, then it is requested that the requirements be listed/referenced under both the IECC as well as the IEBC, as is commonly done throughout the ICC suite of codes. Having the same language in multiple ICC codes is commonly done throughout the ICC suites for issues such as fire dampers, etc. For example, review IBC 717.5 and IMC 607.5

Cost Impact: The code change proposal will not increase the cost of construction.

CE20 – 13

C101.4.4, C101.4.5, R101.4.4, R101.4.5 (IRC N1101.4)

Proponent: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development (WABO TCD) (lkranz@bellevuewa.gov)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C101.4.4 Change in occupancy or use. Spaces undergoing a change in occupancy ~~that would result in an increase in demand for either fossil fuel or electrical energy from an F, S or U occupancy to an occupancy other than F, S or U~~ shall comply with this code. Any space that is converted to a dwelling unit or portion thereof, from another use or occupancy shall comply with this code. Where the use in a space changes from one use in Table C405.5.2(1) or (2) to another use in Table C405.5.2(1) or (2), the installed lighting wattage shall comply with Section C405.5.

Exception: Where the component performance building envelope option in Section C402.1.3 is used to comply with this section, the Proposed UA is permitted to be up to 110 percent of the Target UA. Where the total building performance option in Section C407 is used to comply with this section, the annual energy consumption of the proposed design is permitted to be 110 percent of the annual energy consumption otherwise allowed by Section C407.3 and Section C401.2 (3).

C101.4.5 Change in space conditioning. Any nonconditioned space that is altered to become *conditioned space* shall be required to be brought into full compliance with this code.

Exception: Where the component performance building envelope option in Section C402.1.3 is used to comply with this section, the Proposed UA is permitted to be up to 110 percent of the Target UA. Where the total building performance option in Section C407 is used to comply with this section, the annual energy consumption of the proposed design is permitted to be 110 percent of the annual energy consumption otherwise allowed by Section C407.3 and Section C401.2 (3).

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R101.4.4 Change in occupancy or use. Spaces undergoing a change in occupancy ~~that would result in an increase in demand for either fossil fuel or electrical energy from an F, S or U occupancy to an occupancy other than F, S or U~~ shall comply with this code. Any space that is converted to a dwelling unit or portion thereof, from another use or occupancy shall comply with this code.

Exception: Where the component performance building envelope option in Section C402.1.3 is used to comply with this section, the Proposed UA is permitted to be up to 110 percent of the Target UA. Where the total building performance option in Section C407 is used to comply with this section, the annual energy consumption of the proposed design is permitted to be 110 percent of the annual energy consumption otherwise allowed by Section C407.3 and Section C401.2 (3).

R101.4.5 (N1101.4) Change in space conditioning. Any nonconditioned space that is altered to become *conditioned space* shall be required to be brought into full compliance with this code.

Exception: Where the component performance building envelope option in Section C402.1.3 is used to comply with this section, the Proposed UA is permitted to be up to 110 percent of the Target UA. Where the total building performance option in Section C407 is used to comply with this section, the annual energy consumption of the proposed design is permitted to be 110 percent of the annual energy consumption otherwise allowed by Section C407.3 and Section C401.2 (3).

Reason: The existing IECC phrase “Spaces undergoing a change in occupancy that would result in an increase in demand for either fossil fuel or electrical energy...” (from Section C101.4.4) does not reference a standard for predicting energy demand, even in the Commentary, and could be subject to widely different interpretations. Storage, utility and industrial buildings are the most likely building types to have substantially deficient envelopes, and therefore this amendment replaces the current code language with a more straightforward requirement to bring any of those building types up to code when converting them to other uses.

The exceptions appended to both C101.4.4 and C101.4.5 are included to recognize the fact that converting an existing building to full compliance with current energy code is extremely difficult and costly. Conditions such as slab edges, structural thermal bridges, and window configurations cannot be practically remedied in many cases. Therefore, we propose an alternate compliance path allowing either a 10% higher envelope UxA value or a 10% higher Total Building Performance value. This will result in the preservation and adaptive reuse of more existing buildings, which itself is a significant energy conservation measure.

Note that the first sentence in each exception should be deleted if a separate proposal for a “component performance” building envelope U-value trade-off option is not approved.

Cost Impact: The code change proposal will not increase the cost of construction, it will decrease the cost.

C101.4.7 (NEW)

Proponent: John R. Norris, P.E., Fibrebond Corporation, representing self (bob.norris@fibrebond.com)

Add new text as follows:

C101.4.7 Exempt buildings. Buildings exempt from the provisions of the *International Energy Conservation Code*, include buildings designed for purposes other than general space comfort conditioning. Any building where heating or cooling systems are provided which are designed for purposes other than general space comfort conditioning. Buildings included in this exemption include:

1. Electrical equipment switching buildings which provide space conditioning for equipment only and in which no operators work on a regular and are less 1,000 square feet.

Reason: Additional insulation in these buildings will increase the amount of heat retained, thus making the air-conditioner run more often. It is not practical to comply with the *International Energy Conservation Code* envelope requirements.

Cost Impact: The code change proposed will not increase the cost of construction it will decrease the construction cost by as much as \$11.30 per square foot depending on the Climate Zone. In addition there will be a monthly savings based on energy consumption. Actual savings will vary by Climate Zone. The useable area of the building is reduced by about 9% and larger buildings may be required to maintain clearances for equipment.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C101.4.7 (NEW)-EC-NORRIS.doc

CE22 – 13

C101.5.1, R101.5.1 (N1101.5)

Proponent: Brian Dean, ICF International, representing Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; and Bill Prindle, Energy Efficient Codes Coalition.

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C101.5.1 Compliance materials. The *code official* shall be permitted to approve specific computer software, worksheets, compliance manuals and other similar materials that demonstrate compliance with ~~meet the intent~~ requirements of this code.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R101.5.1 (N1101.5) Compliance materials. The *code official* shall be permitted to approve specific computer software, worksheets, compliance manuals and other similar materials that demonstrate compliance with ~~meet the intent~~ requirements of this code.

Reason: The purpose of this code change is to clarify the code. Specifically, this proposal improves sections C101.5.1 and R101.5.1 by changing the reference from the “intent” to the “requirements” of the code and refocuses compliance materials on demonstrating compliance. As a result of this improved language, in order to be approved, compliance materials such as computer software or worksheets must be designed to demonstrate that a project meets the *requirements* of the IECC, not simply the “intent” of the IECC.

The current code language is vague because of the reference to the “intent” of the code. Presumably this is a reference to Sections C101.5.1 and R101.3, which provides no guidance as to specific compliance requirements. Alternately, some may claim that this language permits a subjective interpretation of “intent” by the authority enforcing the IECC. Neither interpretation is a suitable substitute for the specific requirements of the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Delete without substitution as follows:

C101.5.2 Low energy buildings. The following buildings, or portions thereof, separated from the remainder of the building by *building thermal envelope* assemblies complying with this code shall be exempt from the *building thermal envelope* provisions of this code:

1. ~~Those with a peak design rate of energy usage less than 3.4 Btu/h ft² (10.7 W/m²) or 1.0 watt/ft² (10.7 W/m²) of floor area for space conditioning purposes.~~
2. ~~Those that do not contain conditioned space.~~

Revise as follows:

C402.1 General (Prescriptive). The building thermal envelope shall comply with Section C402.1.1. Section C402.1.2 shall be permitted as an alternative to the *R*-values specified in Section C402.1.1.

Exception: The following low energy buildings, or portions thereof, separated from the remainder of the building by *building thermal envelope* assemblies complying with this section shall be exempt from the *building thermal envelope* provisions of Section C402.

1. Those with a peak design rate of energy usage less than 3.4 Btu/h ft² (10.7 W/m²) or 1.0 watt/ft² (10.7 W/m²) of floor area for space conditioning purposes.
2. Those that do not contain conditioned space.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R101.5.2 (N1101.6) Low energy buildings. The following buildings, or portions thereof, separated from the remainder of the building by *building thermal envelope* assemblies complying with this code shall be exempt from the *building thermal envelope* provisions of this code:

1. ~~Those with a peak design rate of energy usage less than 3.4 Btu/h ft² (10.7 W/m²) or 1.0 watt/ft² (10.7 W/m²) of floor area for space conditioning purposes.~~
2. ~~Those that do not contain conditioned space.~~

Revise as follows:

R402.1 (N1102.1) General (Prescriptive). The building thermal envelope shall meet the requirements of Sections R402.1.1 through R402.1.4.

Exception: The following low energy buildings, or portions thereof, separated from the remainder of the building by *building thermal envelope* assemblies complying with this section shall be exempt from the *building thermal envelope* provisions of Section R402.

1. Those with a peak design rate of energy usage less than 3.4 Btu/h ft² (10.7 W/m²) or 1.0 watt/ft² (10.7 W/m²) of floor area for space conditioning purposes.
2. Those that do not contain *conditioned space*.

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The proposal moves an existing exception found in each Administration chapter to the building thermal envelop provisions in C402 and R402. Chapter 1 should not be the location of specific code requirements nor exceptions to such requirements. Chapter 1 will be the location where exceptions to the scope of the code are provided. However such is not the case with these exceptions. These exceptions are for only the envelope and these buildings still need to comply with the requirements for lighting and HVAC systems.

Locating the exceptions at the beginning of the building envelope provisions places the exception immediately with the relevant requirements. This location does reduce the potential for people to interpret that low energy buildings are exempt from the code.

The proposed text is reworded slightly to reflect its location as an exception with Section 402. The change is editorial.

Cost Impact: This code change proposal will not increase the cost of construction. This is editorial in nature.

C101.5.2-EC-THOMPSON-SEHPCAC.doc

CE24 – 13

C101.5.2, C202 (NEW)

Proponent: Vickie Lovell, InterCode Inc., representing National Greenhouse Manufacturers Association (vickie@intercodeinc.com)

Revise as follows:

C101.5.2 Low energy buildings. The following buildings, or portions thereof, separated from the remainder of the building by *building thermal envelope* assemblies complying with this code shall be exempt from the *building thermal envelope* provisions of this code:

1. Those with a peak design rate of energy usage less than 3.4 Btu/h · ft² (10.7 W/m²) or 1.0 watt/ft² (10.7 W/m²) of floor area for space conditioning purposes.
2. Those that do not contain *conditioned space*.
3. Greenhouses.

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

GREENHOUSE. A structure or a separate area of a building that maintains a specialized environment essential for the cultivation, protection or maintenance of plants.

Reason: (for 101.5.2) Energy codes and standards have historically applied to buildings intended primarily for human occupancy and use. There are structures, buildings and space uses where strict application of the code poses increasing challenges. All types of agricultural buildings including barns, livestock shelters, sheds, and stables are unique structures in design, construction and operation and different from other commercial buildings in terms of internal loads, schedules, and building usage. Included in those types of structures are greenhouses and separated portions of buildings whose primary function is the cultivation, protection or maintenance of plants.

This proposal exempts greenhouses or separated portions of buildings whose primary function is the cultivation, protection or maintenance of plants from the building thermal envelope of the International Energy Conservation Code. This code change is intended to provide clarity to what the code already says about greenhouses, and what parts of the energy code should be required for compliance.

Strict application of the building envelope provisions of the code in greenhouses is cost prohibitive. Compliance with the building thermal envelope for greenhouses may actually be counterproductive, even detrimental to plant growth, since most plants require controlling the available natural light and highly specialized temperature-controlled conditions. Arbitrarily changing growing conditions can result in reduced output for greenhouse growers, and will have serious negative consequences to the US agricultural/horticultural/floricultural economy. Therefore, this topic merits thoughtful consideration of the implications and ramifications of requiring greenhouses to comply with the entirety of the IECC.

Although the current title of section C101.5.2 is somewhat narrow in scope, it provides for some exemptions to the building thermal envelope provisions in the code. The current provisions in Section C101.5.2 would exempt such buildings from the thermal envelope provisions in the code if they did not contain conditioned space (room or space within the building that is being heated or cooled) or the peak design rate of energy use was less than 1 watt per square foot for space conditioning purposes. However, some greenhouses do contain conditioned space that exceeds the stated peak connected load. In reality, the whole point of a greenhouse is to control a unique environment for the cultivation, protection or maintenance of plants, and such environment is not intended to maintain suitable conditions specifically for human occupancy. Currently such buildings are not exempt from the building thermal envelope provisions of the code. But greenhouses should be exempt.

Other requirements of the IECC and the IBC would still apply to Group U greenhouses. All other building code requirements would still apply for structural, fire, egress, accessibility for such cases where a greenhouse is also used as a retail business, such as garden centers and retail stores that sell plants to the public. This exemption is NOT intended to apply to retail businesses who may display plants and flowers in regular buildings that are not intended to be greenhouses and are environmentally controlled as retail spaces. This would not apply to office buildings and atriums where plants are displayed for aesthetical purpose. But it could capture botanical gardens which also maintain a specialized environment. In such businesses, the plants may be able to survive in the ambient temperature without specifically managing their growing conditions and environment. The proposed definition makes it clear that it is a unique climate controlled environment that defines a greenhouse or similar facility.

Some universities maintain greenhouses for research and studies in horticulture and should be exempt. In these cases, the IBC building, fire structural and other such requirements for mercantile, business and education still apply if the greenhouse is permitted as a Group B, E or M use or occupancy. These IBC provisions based on occupancy are primarily for the comfort and/or protection of people, and appropriately should apply. All Group U provisions of the IBC would still apply. Additionally, the IECC requirements for HVAC would still apply.

The proposed language is based on a current exemption used in the energy code of the State of Wisconsin. A NY Department of State Codes Division opinion on this topic considers all buildings used primarily for agricultural purposes as commercial

processes and do not need to comply with the energy codes of the state based upon an ASHRAE 90.1 exemption. This included any greenhouse whether built on a commercial or residential building property site since the greenhouse is not designed for occupancy and falls under their view of a “commercial processes”.

The initiatives to make this industry more energy efficient and sustainable are in motion. The USDA and other federal agencies and private organizations are making huge strides in helping growers be more energy efficient and sustainable by using soil amendments, reducing runoff from irrigation, using appropriate methods of reducing energy consumption, using improved pest management methods, reducing potable water or other natural surface or subsurface water resources, reducing waste, and promoting organic growing.

The current IECC requirements that reduce energy use for other aspects of greenhouses are appropriate EXCEPT the requirements that impede or inhibit the growth of plants, which is the primary function of a greenhouse.

(Section 202) The word “greenhouse” conjures up diverse images as to what a greenhouse might look like including the numerous ways plants are cultivated, marketed and sold. However, this definition captures the primary purpose of a greenhouse, which is to create unique environmental conditions inside a structure or a separated portion of a building that are ESSENTIAL for the cultivation, protection or maintenance of plants. This proposed definition is intended to exclude a retail business owner that brings plants indoors temporarily for display or seasonal promotions.

That environment includes control of the available natural or artificial light, managing the temperature and humidity, dispersing and managing water and controlling the growing medium regardless of the outside climate conditions. If that specific environment is not maintained, the plants cannot survive.

Previous code discussions regarding greenhouses have often bogged down because the focus gets shifted to whom or how the plants are being marketed and sold, public access or not, and other conditions. However, that information is irrelevant to this definition. The proposed definition makes it clear that **the primary descriptive feature of a greenhouse is the unique environment that must be maintained in order for the plants inside the greenhouse to survive.**

Cost Impact: This code change proposal will not increase the cost of construction.

CE24-13

C202-GREENHOUSE (NEW)-EC-LOVELL.doc

CE25 – 13

C101.5.2

Proponent: Eric Makela, Britt/Makela Group, Inc., representing Northwest Energy Codes Group (eric@brittmakela.com)

Revise as follows:

C101.5.2 Low energy buildings. The following buildings, or portions thereof, separated from the remainder of the building by *building thermal envelope* assemblies complying with this code shall be exempt from the *building thermal envelope* provisions of this code:

1. Those with a peak design rate of energy usage less than 3.4 Btu/h – ft² (10.7 W/m²) or 1.0 watt/ft² (10.7 W/m²) or floor area for space conditioning purposes.
2. Those that do not contain conditioned space.
3. Agricultural buildings.

Reason: The purpose of this proposal is to ensure that buildings or portions of buildings used for agricultural purposes are exempt from the code when appropriate and likewise have to comply with appropriate provisions of the code. Energy codes and standards have historically applied to buildings intended primarily for human occupancy and use. There continue to be building and space uses where strict application of the code poses increasing challenges and can take considerable administrative time. One of those is agricultural use buildings. Through this code change it is hoped that additional clarity can be provided for agricultural use buildings as to when they are or are not required to meet the code. It is important to note that the current language in the parent section C101.5.2 limits such exemptions to only the building thermal envelope provisions in the code. Any HVAC, service water heating and/or lighting systems in such buildings would still be required to meet the provisions of the code.

Agricultural buildings such as barns, livestock shelters, sheds, and stables are commercial buildings as defined in the code but are much different in design, construction, and operation from other commercial buildings in terms of internal loads, schedules, and building usage. The current provisions in Section C101.5.2 would exempt such buildings from the thermal envelope provisions in the code if they did not contain conditioned space (room or space within the building that is being heated or cooled) or the peak design rate of energy use was less than 1 watt per square foot for space conditioning purposes. What about buildings that do contain conditioned space that exceed the stated peak connected load but that require such conditioning for other than human comfort conditions? Currently such buildings are not exempt from the building thermal envelope provisions of the code and should be if for no other reason than to specifically state the applicability of the code to these buildings and in so doing eliminate the situation where other buildings that should comply are being exempted.

Cost Impact: The code change proposal will not increase the cost of construction.

CE25-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C101.5.2-EC-MAKELA.doc

CE26 – 13

C101.5.2.1 (NEW), C202 (NEW), C402.1.3 (NEW)

Proponent: Tim Nogler, Washington State, representing Washington State Building Code Council
(tim.nogler@des.wa.gov)

Add new text as follows:

C101.5.2.1 Semi-heated spaces. A semi-heated space shall meet all of the building thermal envelope requirements, except that insulation is not required for opaque wall assemblies. Component performance calculations involving semi-heated spaces shall calculate fully insulated opaque walls for the Target UA calculation, and Total Building Performance calculations involving semi-heated spaces shall calculate fully insulated opaque walls for the Standard Reference Design.

C402.1.3 Semi-heated spaces. All spaces shall comply with the requirements in Section C402 unless the spaces meet the definition for semi-heated spaces. For semi-heated spaces, the building envelope shall comply with the same requirements as that for conditioned spaces in Section C402. Semi-heated spaces shall be calculated separately from other conditioned spaces for compliance purposes. Building envelope assemblies separating conditioned space from semi-heated space shall comply with exterior envelope insulation requirements. When choosing the un-insulated wall option, the wall shall not be included in Component Performance Building Envelope Option calculation.

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

SEMI-HEATED SPACE : An enclosed space within a building, including adjacent connected spaces separated by an un-insulated component, including, but not limited to basements, utility rooms, garages, corridors, which:

1. Is heated but not cooled, and has a maximum heating system output capacity of 3.4 Btu/(h-ft²) but not greater than 8 Btu/(h ft²)
2. Is not a cold storage space or frozen storage space.

Reason: This proposal supplements the concept of “low energy buildings” with a separate category of “semi-heated spaces.” Semi-heated spaces allow just enough heat for freeze protection, and are exempt from wall insulation only, while low-energy buildings are exempt from all thermal envelope requirements.

The effect of this proposal is that buildings with less than 1 watt per SF of heating will still be considered as unheated and require no thermal envelope protection at all, while those with 1 – 2 watts per SF of heating (semi-heated spaces) require no opaque wall insulation, but require all other components such as roof, slab and windows to meet code requirements.

This has been an important concept in the Washington State energy code for many years, allowing less expensive construction for buildings such as warehouses and water treatment plants that are only heated enough for freeze protection. When such buildings are converted to conditioned space at a future point in their lives, it is relatively easy to add the wall insulation, and all the other building envelope components are already code-compliant.

Note that references to the “component performance” option and “target UA calculations” coordinates with the proposal to add those building envelope compliance options.

Cost Impact: The code change proposal will not increase the cost of construction.

CE26-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C101.5.2.1 (NEW)-EC-NOGLER.doc

CE27 – 13

C101.5.3 (NEW)

Proponent: Eric Makela, Britt/Makela Group, Inc., representing Northwest Energy Codes Group (eric@brittmakela.com)

Add new text as follows:

C101.5.3 Equipment buildings. Buildings that comply with all of the following shall be exempt from the *building thermal envelope* provisions of this code:

1. Are separate buildings with floor area no more than 500 square feet (50 m²).
2. Are intended to house electronic equipment with installed equipment power totaling at least 7 watts per square foot and not intended for human occupancy.
3. Have heating system capacity is no greater than 5 kW (17,000 Btu/hr) and heating thermostat setpoint is restricted to no more than 50°F (10°C).
4. Have an average wall and roof U-factor less than 0.120 in climate zones 1-5 and less than 0.200 in climate zones 6 through 8.
5. Comply with the roof solar reflectance and thermal emittance provisions for Climate Zone 1.

Reason: The application of energy codes and standards to buildings not intended primarily for human occupancy and use continue to pose increasing challenges to the strict application of the code. Equipment buildings, shelters, or sheds are installed to protect electronic equipment from the weather and provide primarily cooling conditioning. Heating is installed for emergency backup operation and is typically limited to 40°F or less by a setpoint. Due to the high density of electronic equipment installed, heat is rarely needed and cooling predominates. In this situation, less insulation is actually desirable from an annual energy use standpoint. This exemption is limited to stand alone equipment buildings no more than 500 square feet in area. Simplified insulation requirements that apply to an average of the roof and wall insulation are provided. This type of building is often made with 3" concrete, internal foam insulation, and a plywood interior with similar construction for roof and walls. To reduce insulation requirements, the ASHRAE 90.1 option may be pursued, as the building would qualify as a semi-heated space. The U-factors required for semi-heated spaces and available in standard construction are listed below, along with the U-factors required in the proposal. The proposed requirements can be met by readily available concrete, wood, or steel frame construction.

Target U-Factors for Equipment Shelters	U-factor
<i>Semi-heated U-factors from ASHRAE 90.1-2010</i>	
CZ-1 Semi-heated average wall/roof U-factor	0.251
CZ-5 Semi-heated average wall/roof U-factor	0.097
CZ-8 Semi-heated average wall/roof U-factor	0.087
<i>Wall U-factors based on Appendix A, ASHRAE 90.1-2010</i>	
Industry Standard: 3" Concrete with R-10	0.114
Metal studs, R-13, no continuous insulation	0.113
Wood studs, R-11, no continuous insulation	0.096
3" Concrete with R-5 insulation	0.195
Metal studs, R-6 insulation, no continuous insulation	0.184
<i>Proposed Equipment Shelter Average Wall & Roof U-factor</i>	
Climate Zone 1-5; Average U-factor shall be less than	0.200
Climate Zone 6-8; Average U-factor shall be less than	0.120

The basis of the exemption is that there is significant equipment installed that needs cooling most of the year. In this situation, less insulation reduces annual energy cost because it allows for beneficial heat loss. At around 7 watts per square foot of equipment load, the heat loss is offset by the equipment load, with the proposed insulation resulting in very little heating load. It is important to note that this exemption applies to the building thermal envelope provisions only. Any HVAC, service water heating, and/or lighting systems in such buildings would still be required to meet the provisions of the code. Through this code change it is hoped that additional clarity can be provided for equipment buildings as to when they are or are not required to meet the building thermal envelope provisions of the code.

Cost Impact: The code change proposal will not increase the cost of construction.

C102.1, R102.1

Proponent: (Part I) Brian Dean, ICF International, representing Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; Bill Prindle, Energy Efficient Codes Coalition; and Don Vigneau, Northeast Energy Efficiency Partnerships **(Part II)** Brian Dean, ICF International, representing Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; and Bill Prindle, Energy Efficient Codes Coalition.

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C102.1 General. This code is not intended to prevent the use of any material, method of construction, design or insulating system not specifically prescribed herein, provided that such construction, design or insulating system has been *approved* by the *code official* as meeting the ~~intent~~ requirements of this code.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R102.1 General. This code is not intended to prevent the use of any material, method of construction, design or insulating system not specifically prescribed herein, provided that such construction, design or insulating system has been *approved* by the *code official* as meeting the ~~intent~~ requirements of this code.

Reason: The purpose of this code change is to clarify the code. This proposal removes uncertainty from the IECC by clarifying that alternative materials, methods of construction, designs, or systems still must meet the actual requirements, not just the “intent” of the IECC.

The current code language is vague because of the reference to the “intent” of the code. Presumably this is a reference to Section R101.3, which provides no guidance as to specific compliance requirements. Alternately, some may claim that this language permits a subjective interpretation of “intent” by the authority enforcing the IECC. Neither interpretation is a suitable substitute for the specific requirements of the code.

The current language may be viewed by some as creating a loophole that allows a code user to avoid meeting the requirements of the IECC while claiming that a product or system meets a subjective interpretation of the IECC’s “intent.” The lack of specificity places the code official in a difficult, and potentially risky position of making judgments based on a subjective interpretation of the code’s “intent.”

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C102.1 General. ~~This code is not intended to prevent the use of any material, method of construction, design or insulating system not specifically prescribed herein, provided that such construction, design or insulating system has been approved by the code official as meeting the intent of this code. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material, design or method of construction shall be approved where the code official finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, at least the equivalent of that prescribed in this code.~~

C102.1.1 Above-code Alternate programs. The code official or other authority having jurisdiction shall be permitted to deem a national, state or local energy efficiency program to meet or exceed the energy efficiency required by this code. Buildings *approved* in writing by such an energy efficiency program shall be considered in compliance with this code. ~~The requirements identified as “mandatory” in Chapter 4 shall be met.~~

C102.1.2 Accredited programs and designs. The code official or other authority having jurisdiction shall be permitted to accept alternative national programs and designs that have received accreditation by an independent accreditation body. The independent accreditation body shall certify programs or designs as meeting or exceeding the energy efficiency required by this code. Buildings and designs that have received approval in writing and are verified by an approved party shall be considered in compliance with this code.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R102.1 General. ~~This code is not intended to prevent the use of any material, method of construction, design or insulating system not specifically prescribed herein, provided that such construction, design or insulating system has been approved by the code official as meeting the intent of this code. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material, design or method of construction shall be approved where the code official finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, at least the equivalent of that prescribed in this code.~~

R102.1.1 (N1101.7) Above-code Alternate programs. The code official or other authority having jurisdiction shall be permitted to deem a national, state or local energy efficiency program to meet or exceed the energy efficiency required by this code. Buildings *approved* in writing by such an energy efficiency program shall be considered in compliance with this code. ~~The requirements identified as “mandatory” in Chapter 4 shall be met.~~

R102.1.2 Accredited programs and designs. The code official or other authority having jurisdiction shall be permitted to accept alternative national programs and designs that have received accreditation by an independent accreditation body. The independent accreditation body shall certify programs or designs as meeting or exceeding the energy efficiency required by this code. Buildings and designs that have received approval in writing and are verified by an approved party shall be considered in compliance with this code.

Reason: The last section is most important. It sets the stage for accrediting programs outside the code as at least as good as code. Some programs, such as RESNET's HERS are currently too proprietary to name in the code; however, they might be accredited, perhaps with restrictions, then that existing infrastructure can help deliver efficient homes. Just as important, there will be a variety of good programs that can help deliver energy efficiency. Some local, some national, some public, some private, some focused on specific types of homes, others broad; all can help. The code official does not have time to look at all the individual programs. We need a mechanism to accredit those programs or their energy efficient designs, This is a way to help deliver verified energy efficiency where this is acceptable to the code official. Code officials need a chance to catch their breath.

The "General" section lifts code text from the IRC to better describe the flexibility in the IECC.

In the middle section above, the IECC is made consistent with the I-code concept of potentially approving an alternative that is at least as good as the code, "meet or exceed", as in this change. It makes no sense to meet an alternative then go back and say to meet the code too, so the "mandatory" sentence was removed.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

C102.1-EC-CONNER.doc

CE30 – 13

C102.1.1, R102.1.1 (IRC N1101.7)

Proponent: (Part I) Brian Dean, ICF International, representing Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; Bill Prindle, Energy Efficient Codes Coalition; and Don Vigneau, Northeast Energy Efficiency Partnerships **(Part II)** Brian Dean, ICF International, representing Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; and Bill Prindle, Energy Efficient Codes Coalition.

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C102.1.1 Above code programs. The ~~code official or other~~ authority having jurisdiction shall be permitted to deem a national, state or local energy efficiency program to exceed the energy efficiency required by this code. Buildings *approved* in writing by such an energy efficiency program shall be considered in compliance with this code. The requirements identified as “mandatory” in Chapter 4 shall be met.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R102.1.1 (N1101.7) Above code programs. The ~~code official or other~~ authority having jurisdiction shall be permitted to deem a national, state or local energy efficiency program to exceed the energy efficiency required by this code. Buildings *approved* in writing by such an energy efficiency program shall be considered in compliance with this code. The requirements identified as “mandatory” in Chapter 4 shall be met.

Reason: The purpose of the proposed code change is to clarify the code -- this proposal clarifies that only the “authority having jurisdiction” can determine whether an alternative program qualifies as an “above code program” that can be used to demonstrate compliance with the IECC.

Since section C102.1.1 allows buildings to opt out of local energy code compliance and enforcement (except as to mandatory measures) where they are approved by an “above code program,” there should be a high standard for such programs and such programs should only be approved by the authority having jurisdiction.

- In some jurisdictions, the code official will be the “authority having jurisdiction”, so this proposal will not take that authority away from the code official.
- For jurisdictions in which the state or locality is the authority having jurisdiction (and not the individual code official), this proposal will ensure that only the proper authority makes the decision whether an alternative program meets or exceeds the IECC's requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

CE31 – 13

C102.1.1, R102.1.1 (IRC N1101.7)

Proponent: Don Surrena, CBO, National Association of Home Builders (NAHB) (dsurrena@nahb.org) and Craig Conner, Building Quality, representing self (craig.conner@mac.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C102.1.1 Above code programs. The *code official* or other authority having jurisdiction shall be permitted to deem a national, state or local energy efficiency program to exceed the energy efficiency required by this code. Buildings *approved* in writing by such an energy efficiency program shall be considered in compliance with this code. ~~The requirements identified as “mandatory” in Chapter 4 shall be met.~~

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R102.1.1 (N1101.7) Above code programs. The *code official* or other authority having jurisdiction shall be permitted to deem a national, state or local energy efficiency program to exceed the energy efficiency required by this code. Buildings *approved* in writing by such an energy efficiency program shall be considered in compliance with this code. ~~The requirements identified as “mandatory” in Chapter 4 shall be met.~~

Reason: (Surrena): The key element of an above code program is that it must meet or exceed the energy efficiency requirements of the IECC. Requiring such a program to also meet the detailed prescriptive requirements labeled as “mandatory” in the IECC defeats the purpose of performance based above code program. This code change proposal will allow flexibility in the methodology used for any above code program to meet or exceed the minimum energy efficiency requirements of the IECC.

(Conner): This change corrects the erroneous use of the term “*mandatory*”. This moves the specification of what can be traded off with the performance approach into the code text about the performance approach, rather than spreading that information throughout the code, as was in energy codes prior to 2006.

The word “*shall*” and the concept of “*mandatory*” is woven throughout the I-codes. It is important that the energy code use “*shall*” correctly. The IRC definition is

SHALL. *The term, when used in this code, is construed to mean “mandatory”.*

Cost Impact: The code change proposal will not increase the cost of construction.

C102.1.1, R102.1.1, (N1101.7)

Proponent: (Part I) Brian Dean, ICF International, representing Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; Bill Prindle, Energy Efficient Codes Coalition; and Don Vigneau, Northeast Energy Efficiency Partnerships **(Part II)** Brian Dean, ICF International, representing Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; and Bill Prindle, Energy Efficient Codes Coalition

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C102.1.1 Above code programs. The *code official* or other authority having jurisdiction shall be permitted to ~~deem~~ approve a national, state or local energy efficiency program as an additional method of demonstrating compliance with this code, provided that:

1. The program is administered by a party who is independent from the parties involved in the construction or ownership of the *building*;
2. A review of all program requirements is conducted;
3. Documentation and analysis shows that the requirements of this program ~~to meet or exceed all of~~ the energy efficiency requirements of required by this code; and
4. Program compliance is verified by a party who is independent from the parties involved in the construction or ownership of the *building*.

Buildings *approved* in writing by such an energy efficiency program shall be considered in compliance with this code. Under such a program, the requirements identified as “mandatory” in Chapter 4 shall be met.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R102.1.1 (N1101.7) Above code programs. The *code official* or other authority having jurisdiction shall be permitted to ~~deem~~ approve a national, state or local energy efficiency program as an additional method of demonstrating compliance with this code, provided that:

1. The program is administered by a party who is independent from the parties involved in the construction or ownership of the *building*;
2. A review of all program requirements is conducted;
3. Documentation and analysis shows that the requirements of this program ~~to meet or exceed all of~~ the energy efficiency requirements of required by this code; and
4. Program compliance is verified by a party who is independent from the parties involved in the construction or ownership of the *building*.

Buildings *approved* in writing by such an energy efficiency program shall be considered in compliance with this code. Under such a program, the requirements identified as “mandatory” in Chapter 4 shall be met.

Reason: The purpose of the proposed code change is to establish new requirements for above code programs and to otherwise clarify the code. This proposal outlines specific criteria that must be applied in the determination of whether an alternative program is an “above code program” that may be allowed as a substitute for IECC compliance and code official enforcement.

Since section C102.1.1 allows buildings to opt out of local energy code compliance and enforcement (except as to mandatory measures) where they are approved by an “above code program,” there should be a high standard for such programs. The proposed changes ensure that any alternative program will have the following crucial elements:

- Third-party administration of the alternative program
- Requirements that meet or exceed the IECC requirements
- Documentation and analysis to support equivalence
- Independent verification of compliance

By contrast, the current language of section C102.1.1 gives no guidance to the authority having jurisdiction regarding how to determine whether a program is “above code” and should qualify as acceptable as an alternative compliance path. Given the recent flood of programs around the country that claim to be “above-code” and/or “green,” it is important that the IECC set the ground rules for how jurisdictions should evaluate these programs as alternatives to traditional code compliance and enforcement.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Don Surrena, CBO, National Association of Home Builders (NAHB) (dsurrena@nahb.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

SECTION C102

ALTERNATE MATERIALS METHOD OF CONSTRUCTION, DESIGN OR INSULATING SYSTEMS APPLICABILITY - DUTIES AND POWERS OF THE BUILDING OFFICIAL

C102.1.1 Alternative materials, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material, design or method of construction shall be approved where the building official finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, at least the equivalent of that prescribed in this code. Compliance with the specific performance-based provisions of the International Codes in lieu of specific requirements of this code shall also be permitted as an alternate.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

SECTION R102

ALTERNATE MATERIALS — METHOD OF CONSTRUCTION, DESIGN OR INSULATING SYSTEMS APPLICABILITY - DUTIES AND POWERS OF THE BUILDING OFFICIAL

R102.1.1 Alternative materials, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material, design or method of construction shall be approved where the building official finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, at least the equivalent of that prescribed in this code. Compliance with the specific performance-based provisions of the International Codes in lieu of specific requirements of this code shall also be permitted as an alternate.

Reason: The proposed new Section R102.1.1 is the exact same language used in IRC Section 104.11, IBC Section 104.11, IFC Section 104.9, IMC Section 105.2, IPC Section 105.2, and IFGC Section 105.2 and this code change proposal is needed to correlate and be consistent with the other I-Codes.

Cost Impact: The code change proposal will not increase the cost of construction.

CE34 – 13

C102.1.1 (NEW), Chapter 5 (NEW), R102.1.1 (NEW), Chapter 5

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C102.1.1 ICC 700 option. Buildings with a certificate of compliance stating the building complies with the ICC 700 Chapter 7 energy efficiency requirements at the Bronze level or above according to Table 303 of ICC 700 shall be considered in compliance with this code. The certificate of compliance shall be from an approved or accredited source.

Add new standard to Chapter 5 as follows:

ICC

ICC 700 National Green Building Standard

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R102.1.1 ICC 700 option. Buildings with a certificate of compliance stating the building complies with the ICC 700 Chapter 7 energy efficiency requirements at the Bronze level or above according to Table 303 of ICC 700 shall be considered in compliance with this code. The certificate of compliance shall be from an approved or accredited source.

Add new standard to Chapter 5 as follows:

ICC

ICC 700 National Green Building Standard

Reason: ICC 700 was built around the I-code family. For example, most of the requirements in the IECC are simply mandates (without points) in ICC 700. The 2012 ICC 700 version the “bronze” level equivalent to the 2012 IECC. With the verification, training, and other support already available and in use, ICC 700 could become one way of showing IECC compliance. Although the ICC 700 user would usually choose to go beyond the energy chapter, that would not be required to comply with the IECC.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Deborah Taylor, RA, LEED AP, Deborah F. Taylor Consulting, LLC, representing self (taylor@dftconsultingny.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C103.2 Information on construction documents. Construction documents shall be drawn to scale upon suitable material. Electronic media documents are permitted to be submitted when approved by the *code official*. Construction documents shall be of sufficient clarity to indicate the location, nature and extent of the work proposed, and show in sufficient detail pertinent data and features of the building systems and equipment as herein governed. Details shall include, but are not limited to, as applicable, insulation materials and their R-values; fenestration U-factors and SHGCs; area-weighted U-factor and SHGC calculations; mechanical system design criteria; mechanical and service water heating system and equipment types, sizes and efficiencies; economizer description; equipment and systems controls; fan motor horsepower (hp) and controls; duct sealing, duct and pipe insulation and location; lighting fixture schedule with wattage and control narrative; and air sealing details. required for a building permit shall include a statement by one or more registered design professionals that the project design complies with or is exempt from this code, an *energy analysis* for the building design based on the chosen compliance strategy, the design itself, utilizing the specific energy values indicated by the *energy analysis*, a commissioning plan for mechanical and electrical systems where required and a description of the progress, commissioning and final inspections and tests required by this code for the project. Electronic media documents are permitted to be submitted when approved by the *code official*.

Exception: Project designs that are entirely exempt in accordance with this code are not required to provide either the *energy analysis*, supporting design documentation, commissioning plan or inspections listing required by this code.

C103.2.1 Registered design professional statement of compliance or exemption. Construction documents submitted for a building permit shall include a statement by at least one registered design professional that the project design complies with or is exempt from this code. If the project design is exempt or partially exempt from this code, the citation shall be provided that allows the exemption.

C103.2.1.1 Statements of compliance or exemption. The statement of compliance shall read as follows: "To the best of my knowledge, belief and professional judgment, all work under this application is in compliance with this code." The statement of exemption shall read as follows: "To the best of my knowledge, belief and professional judgment, all work under this application is exempt from this code in accordance with Section . If the proposed work is partially exempt, the registered design professional

shall use the statement of compliance and note the exempted work, providing the code citation allowing the exemption.

C103.2.1.2 Responsible registered design professional. If the project design team utilizes no energy trade-offs among design disciplines, each registered design professional of record may sign a statement of compliance with this code for the respective discipline. If the project design team utilizes energy trade-offs among design disciplines, at least one registered design professional shall sign the statement of compliance with this code for the entire project, including all disciplines.

C103.2.2 Energy analysis. The construction documents shall include an *energy analysis* showing the strategy for determining project design compliance with this code, and shall indicate the specific values for each unit of material, equipment and system that such analysis indicates must be met in the completed construction. The *code official* may require that the registered design professional show the values determined by the energy analysis in a table indicating, for each material, system or equipment type, the item, its required energy value, the citation from this code and the drawing reference where the item is drawn or described.

C103.2.2.1 Prescriptive approach. If the compliance strategy uses the prescriptive approach in conjunction with the mandatory requirements, such values will be derived from provisions referenced in either Section C401.2-1 or Section C401.2-2, or from provisions referenced in Section R401.2.

C103.2.2.2 Performance approach. If the compliance strategy uses the performance approach in conjunction with the mandatory requirements, such values will be derived from provisions referenced in either Section C401.2-1 or Section C401.2-3, or from provisions referenced in Section R405.

C103.2.3 Supporting design documentation. The construction documents shall indicate materials, systems and equipment for the proposed design as identified in the *energy analysis*, and shall specify the energy values determined by the analysis. Construction documents shall be fully coordinated and of sufficient clarity to indicate the location, nature and extent of the work proposed, and show in sufficient detail pertinent data and features of the building, materials, systems and equipment as herein governed. Details shall include as applicable, but are not limited to, envelope assembly U-factors; insulation materials and their R-values; fenestration areas, U-factors and SHGCs; area-weighted U-factor and SHGC calculations; mechanical system design criteria; mechanical and service water heating system and equipment types, sizes and efficiencies; economizer description; equipment and systems controls; fan motor horsepower (hp) and controls; duct sealing, duct and pipe insulation and location; lighting fixture schedule with input wattage, ballast type and control narrative; lighting power densities; and air sealing details for the *building thermal envelope* and penetrations through it.

C103.2.4 Commissioning plan. Where applicable, a commissioning plan shall be provided in the construction documents in accordance with Section C408. Construction document notes shall clearly indicate provisions for commissioning and completion requirements in accordance with such section. Copies of all documentation shall be made available to the *code official* upon request in accordance with Sections C408.2.4 and C408.2.5.

C103.2.5 Listing and description of required inspections and testing. The construction documents shall include a listing of the applicable progress, commissioning and final inspections and testing required by this code, when and how often each should be required in the project schedule, whether and what percentage of sampling will be permitted, applicable reference standards and the citation for the inspection or test.

C103.3 Examination of documents. The *code official* shall examine or cause to be examined the accompanying construction documents and shall ascertain whether the proposed construction indicated and described is in accordance with the requirements of this code and other pertinent laws or ordinances.

C104.2 Required approvals. Required inspections and testing shall be as provided in the *approved* construction documents, in accordance with Section C103.2.5. Work shall not be done beyond the point

indicated in each successive inspection without first obtaining the approval of the *code official*. The *code official*, upon notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or notify the permit holder or his or her agent wherein the same fails to comply with this code. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the *code official*.

C104.8 Approval. After the prescribed tests and inspections indicate that the work complies in all respects with this code as described in the *approved energy analysis*, a notice of approval shall be issued by the *code official*.

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

ENERGY ANALYSIS. An analysis of this code as it affects a proposed building design, using the prescriptive or performance approach in conjunction with mandatory values, that results in the required values for each energy-related material, equipment or system in the construction. The energy analysis identifies whether the design team is using the International Energy Conservation Code or ANSI/ASHRAE/IESNA Standard 90.1 for compliance and, if applicable, where trade-offs are used.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R103.2 (N1101.8) Information on construction documents. Construction documents ~~shall be drawn to scale upon suitable material. Electronic media documents are permitted to be submitted when approved by the *code official*. Construction documents shall be of sufficient clarity to indicate the location, nature and extent of the work proposed, and show in sufficient detail pertinent data and features of the building systems and equipment as herein governed. Details shall include, but are not limited to, as applicable, insulation materials and their R-values; fenestration U-factors and SHGCs; area-weighted U-factor and SHGC calculations; mechanical system design criteria; mechanical and service water heating system and equipment types, sizes and efficiencies; economizer description; equipment and systems controls; fan motor horsepower (hp) and controls; duct sealing, duct and pipe insulation and location; lighting fixture schedule with wattage and control narrative; and air sealing details.~~ required for a building permit shall include a statement by one or more registered design professionals that the project design complies with or is exempt from this code, an *energy analysis* for the building design based on the chosen compliance strategy, the design itself, utilizing the specific energy values indicated by the *energy analysis*, a commissioning plan for mechanical and electrical systems where required and a description of the progress, commissioning and final inspections and tests required by this code for the project. Electronic media documents are permitted to be submitted when approved by the *code official*.

Exception: Project designs that are entirely exempt in accordance with this code are not required to provide either the *energy analysis*, supporting design documentation, commissioning plan or inspections listing required by this code.

R103.2.1 (N1101.8.1) Registered design professional statement of compliance or exemption.

Construction documents submitted for a building permit shall include a statement by at least one registered design professional that the project design complies with or is exempt from this code. If the project design is exempt or partially exempt from this code, the citation shall be provided that allows the exemption.

R103.2.1.1 (N1101.8.1.1) Statements of compliance or exemption. The statement of compliance shall read as follows: "To the best of my knowledge, belief and professional judgment, all work under this application is in compliance with this code." The statement of exemption shall read as follows: "To the best of my knowledge, belief and professional judgment, all work under this application is exempt from this code in accordance with Section . If the proposed work is partially exempt, the registered design

professional shall use the statement of compliance and note the exempted work, providing the code citation allowing the exemption.

R103.2.1.2 (N1101.8.1.2) Responsible registered design professional. If the project design team utilizes no energy trade-offs among design disciplines, each registered design professional of record may sign a statement of compliance with this code for the respective discipline. If the project design team utilizes energy trade-offs among design disciplines, at least one registered design professional shall sign the statement of compliance with this code for the entire project, including all disciplines.

R103.2.2 (N1101.8.2) Energy analysis. The construction documents shall include an *energy analysis* showing the strategy for determining project design compliance with this code, and shall indicate the specific values for each unit of material, equipment and system that such analysis indicates must be met in the completed construction. The *code official* may require that the registered design professional show the values determined by the energy analysis in a table indicating, for each material, system or equipment type, the item, its required energy value, the citation from this code and the drawing reference where the item is drawn or described.

R103.2.2.1 (N1101.8.2.1) (Prescriptive approach). If the compliance strategy uses the prescriptive approach in conjunction with the mandatory requirements, such values will be derived from provisions referenced in either Section C401.2-1 or Section C401.2-2, or from provisions referenced in Section R401.2.

R103.2.2.2 (N1101.8.2.2) Performance approach. If the compliance strategy uses the performance approach in conjunction with the mandatory requirements, such values will be derived from provisions referenced in either Section C401.2-1 or Section C401.2-3, or from provisions referenced in Section R405.

R103.2.3 (N1101.8.3) Supporting design documentation. The construction documents shall indicate materials, systems and equipment for the proposed design as identified in the *energy analysis*, and shall specify the energy values determined by the analysis. Construction documents shall be fully coordinated and of sufficient clarity to indicate the location, nature and extent of the work proposed, and show in sufficient detail pertinent data and features of the building, materials, systems and equipment as herein governed. Details shall include as applicable, but are not limited to, envelope assembly U-factors; insulation materials and their R-values; fenestration areas, U-factors and SHGCs; area-weighted U-factor and SHGC calculations; mechanical system design criteria; mechanical and service water heating system and equipment types, sizes and efficiencies; economizer description; equipment and systems controls; fan motor horsepower (hp) and controls; duct sealing, duct and pipe insulation and location; lighting fixture schedule with input wattage, ballast type and control narrative; lighting power densities; and air sealing details for the *building thermal envelope* and penetrations through it.

R103.2.4 (N1101.8.4) Commissioning plan. Where applicable, a commissioning plan shall be provided in the construction documents in accordance with Section C408. Construction document notes shall clearly indicate provisions for commissioning and completion requirements in accordance with such section. Copies of all documentation shall be made available to the *code official* upon request in accordance with Sections C408.2.4 and C408.2.5.

R103.2.5 (N1101.8.5) Listing and description of required inspections and testing. The construction documents shall include a listing of the applicable progress, commissioning and final inspections and testing required by this code, when and how often each should be required in the project schedule, whether and what percentage of sampling will be permitted, applicable reference standards and the citation for the inspection or test.

R103.3 Examination of documents. The code official shall examine or cause to be examined the accompanying construction documents and shall ascertain whether the proposed construction indicated and described is in accordance with the requirements of this code and other pertinent laws or ordinances.

R104.2 Required approvals. Required inspections and testing shall be as provided in the *approved* construction documents, in accordance with Section C103.2.5. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the *code official*. The *code official*, upon notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or notify the permit holder or his or her agent wherein the same fails to comply with this code. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the *code official*.

R104.8 Approval. After the prescribed tests and inspections indicate that the work complies in all respects with this code as described in the *approved energy analysis*, a notice of approval shall be issued by the *code official*.

Add new definition as follows:

**SECTION R202 (N1101.9)
GENERAL DEFINITIONS**

ENERGY ANALYSIS. An analysis of this code as it affects a proposed building design, using the prescriptive or performance approach in conjunction with mandatory values, that results in the required values for each energy-related material, equipment or system in the construction. The energy analysis identifies whether the design team is using the International Energy Conservation Code or ANSI/ASHRAE/IESNA Standard 90.1 for compliance and, if applicable, where trade-offs are used.

Reason: The text added by this proposal establishes a protocol for what is required of the registered design professional to show compliance. This protocol identifies compliance or exemption; how the energy values were derived, what code or standard is being used and whether the prescriptive or performance path is being followed; what is required in construction documents to show that the appropriate values are being specified for construction; and the commissioning and inspections program by which the construction will be inspected, tested and evaluated. In addition, it provides guidance on how to state compliance when there are trade-offs among the envelope, mechanical and electrical systems.

Cost Impact: The code change proposal will not increase the cost of construction. Registered design professionals should already be providing the information required herein in some format; this proposal articulates the compliance process and sets a standard for code officials to evaluate.

C103.2-EC-TAYLOR.doc

CE36 – 13

C103.2

Proponent: Dr. Thomas D. Culp, Birch Point Consulting LLC, representing the Glazing Industry Code Committee (culp@birchpointconsulting.com)

Revise as follows:

C103.2 Information on construction documents. Construction documents shall be drawn to scale upon suitable material. Electronic media documents are permitted to be submitted when *approved* by the *code official*. Construction documents shall be of sufficient clarity to indicate the location, nature and extent of the work proposed, and show in sufficient detail pertinent data and features of the building, systems and equipment as herein governed. Details shall include, but are not limited to, as applicable:

1. Insulation materials and their *R*-values;
2. Fenestration *U*-factors and SHGCs;
3. Area-weighted *U*-factor and SHGC calculations;
4. Mechanical system design criteria;
5. Mechanical and service water heating system and equipment types, sizes and efficiencies;
6. Economizer description;
7. Equipment and systems controls;
8. Fan motor horsepower (hp) and controls;
9. Duct sealing, duct and pipe insulation and location;
10. Lighting fixture schedule with wattage and control narrative;
11. Location of *daylight zones* on floor plans; and
12. Air sealing details.

Reason: This proposal serves two purposes. First, this will help code enforcement by reformatting this section as a clear list rather than a cluttered paragraph, and also adding a requirement to show the location of daylight zones on floor plans, which will aid enforcement when daylight zones are used in sections C402.3.1-C402.3.3 (window and skylight area and properties), C405.2.2.3 (daylight controls), and C406.3 (efficient lighting path).

Second, this will encourage the architect to consider daylighting geometry earlier in the design process. While this is already good practice amongst leading architects, it is still common that by the time a lighting / daylighting designer is engaged on a project, the envelope geometry and properties have already been locked in, and are difficult and expensive to change. This change will help bring consideration of daylight zones earlier into the process.

Cost Impact: The code change proposal will not increase the cost of construction.

CE37 – 13

C103.2.1 (NEW), R103.2.1 (NEW)

Proponent: Robby Schwarz, EnergyLogic, Inc., (robby@nrglogic.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Add new text as follows:

C103.2.1. Thermal envelope definition. The building's thermal envelope shall be defined on the construction documents as the alignment of the air barrier and insulation systems separating conditioned space from unconditioned space. Where it is not possible to define the alignment of the air barrier and thermal barrier systems on the construction documents inspection shall determine success of accomplishing this requirement.

PART II – IECC-RESIDENTIAL PROVISIONS

Add new text as follows:

R103.2.1. Thermal envelope definition. The building's thermal envelope shall be defined on the construction documents as the alignment of the air barrier and insulation systems separating conditioned space from unconditioned space. Where it is not possible to define the alignment of the air barrier and thermal barrier systems on the construction documents inspection shall determine success of accomplishing this requirement.

Reason: The single most important energy and performance aspect of the home is the buildings thermal envelope and the alignment of the air barrier and thermal barrier systems. It is crucial that the design professional demonstrate an understanding of location of the thermal envelope and that they make an effort to draw its location so that the construction personnel can successfully implement the construction of the building in accordance with the code and the specifications that have been drawn. The air sealing details help make this possible but understanding where the details will be implemented helps ensure better implementation and enforcement.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C103.3 Examination of documents. The *code official* shall examine or cause to be examined the accompanying construction documents and shall ascertain whether the construction indicated and described is in accordance with the requirements of this code and other pertinent laws or ordinances. In causing the documents to be examined to verify compliance with this code, the *code official* shall be permitted to utilize a registered design professional or other *approved* entity not affiliated with the *building* design or construction in conducting the review of the plans and specifications for compliance with the code.

~~**C104.1 General.** Construction or work for which a permit is required shall be subject to inspection by the *code official*.~~

C104.1 General. Construction or work for which a permit is required shall be subject to inspection by the *code official* or his designated agent, and such construction or work shall remain accessible and exposed for inspection purposes until *approved*. Approved as a result of an inspection shall not be construed to be an approval of a violation of the provisions of this code or of other ordinances of the jurisdiction. Inspections presuming to give authority to violate or cancel the provisions of this code or of other ordinances of the jurisdiction shall not be valid. It shall be the duty of the permit applicant to cause the work to remain accessible and exposed for inspection purposes. Neither the *code official* nor the jurisdiction shall be liable for expense entailed in the removal or replacement of any material, product, system or building component required to allow inspection to validate compliance with this code.

~~**C104.2 Required approvals.** Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the *code official*. The *code official*, upon notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or notify the permit holder or his or her agent wherein the same fails to comply with this code. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the *code official*.~~

C104.2 Preliminary Inspection. Before issuing a permit, the *code official* is authorized to examine or cause to be examined the *building site*, and in the case of work to or on an existing building the *building*, for which an application has been filed.

~~**C104.3 Final inspection.** The building shall have a final inspection and not be occupied until *approved*.~~

C104.3 Required inspections. The *code official* or his designated agent, upon notification, shall make the inspections set forth in Sections C104.3.1 through C104.3.6.

C104.3.1 Footing and foundation inspection. Inspections associated with footings and foundations shall be made before backfilling and shall verify compliance with the code as to R-value, location, thickness, depth of burial and protection of insulation as required by the code and *approved plans and specifications* for:

1. Basement or crawl space walls having insulation applied exterior to or integral with the walls
2. Slabs on grade
3. Buried duct systems associated with HVAC systems
4. Piping systems associated with HVAC or service hot water systems
5. Freeze protection/snow melt systems.

C104.3.2 Framing and rough-in inspection. Inspections at framing and rough-in shall be made before application of interior finish and shall verify compliance with the code as to types of insulation and corresponding R-values and their correct location and proper installation, fenestration thermal properties (U-factor, SHGC and VT) and proper installation of fenestration, and air leakage controls as required by the code and *approved plans and specifications* for:

1. Opaque walls and wall assemblies
2. Floors and floor assemblies
3. Roof/ceilings and roof/ceiling assemblies
4. Fenestration
5. Required vestibules

C104.3.3 Plumbing rough-in inspection. Inspections at plumbing rough-in shall verify compliance as required by the code and *approved plans and specifications* for:

1. The R-value, location, thickness, depth of burial and protection of insulation on hot water piping
2. The existence of required temperature controls on potable hot water systems
3. The installation of automatic time switches on circulating hot water systems or heat trace
4. The installation of heat traps on hot water storage tanks associated with non-circulating systems.

C104.3.4 Mechanical rough-in inspection. Inspections at mechanical rough-in shall verify compliance as required by the code and *approved plans and specifications* for:

1. Installed HVAC equipment type, efficiency and size
2. Installation of gravity and motorized dampers where required and leakage rates of the dampers
3. Installation of required demand control ventilation
4. Required insulation type, R-value, thickness and proper installation of insulation for ducts, plenums and piping associated with the HVAC system
5. Sealing and any required leakage testing of ducts and plenums
6. Installation of required economizers and associated controls
7. Installation of required temperature, humidity and zone controls
8. Required sizing of HVAC system fans and motors
9. Required energy recovery capability
10. Existence of a means to balance HVAC systems
11. Installation of required controls for HVAC and hydronic systems
12. Required limitations on hot gas bypass for cooling systems
13. Installation of radiant heating systems where not allowed

C104.3.5 Electrical rough-in inspection. Inspections at electrical rough-in shall verify compliance as required by the code and *approved plans and specifications* for:

1. Proper installation of all required lighting controls
2. Installation of all lighting system components (fixtures and lamps)
3. Installation of individual electric meters for each dwelling unit in multi-family residential buildings.

C104.3.6 Final inspection. The *building* shall have a final inspection and shall not be occupied until *approved*. The final inspection shall include verification of the installation of all required *building* controls and their proper operation as well as documentation verifying the activities associated with required *building commissioning* have been conducted and the findings of non-compliance corrected. *Buildings*, or portions thereof, shall not be considered for a final inspection until the *code official* has received a letter of transmittal from the building owner acknowledging that the building owner has received the Preliminary Commissioning Report as required in Section C408.2.4.

~~**C104.5 Approved inspection agencies.** The *code official* is authorized to accept reports of *approved* inspection agencies, provided such agencies satisfy the requirements as to qualifications and reliability.~~

C104.5 Approved Inspection agencies. The *code official* is authorized to accept reports of third party inspection agencies not affiliated with the *building* design or construction, provided such agencies are *approved* as to qualifications and reliability relevant to the building components and systems they are inspecting.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R103.3 Examination of documents. The *code official* shall examine or cause to be examined the accompanying construction documents and shall ascertain whether the construction indicated and described is in accordance with the requirements of this code and other pertinent laws or ordinances. *In causing the documents to be examined to verify compliance with this code, the *code official* shall be permitted to utilize a registered design professional or other *approved* entity not affiliated with the *building* design or construction in conducting the review of the plans and specifications for compliance with the code.*

~~**R104.1 General.** Construction or work for which a permit is required shall be subject to inspection by the *code official*.~~

R104.1 General. Construction or work for which a permit is required shall be subject to inspection by the *code official* or his designated agent, and such construction or work shall remain accessible and exposed for inspection purposes until *approved*. *Approved* as a result of an inspection shall not be construed to be an approval of a violation of the provisions of this code or of other ordinances of the jurisdiction. Inspections presuming to give authority to violate or cancel the provisions of this code or of other ordinances of the jurisdiction shall not be valid. It shall be the duty of the permit applicant to cause the work to remain accessible and exposed for inspection purposes. Neither the *code official* nor the jurisdiction shall be liable for expense entailed in the removal or replacement of any material, product, system or building component required to allow inspection to validate compliance with this code.

~~**R104.2 Required approvals.** Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the *code official*. The *code official*, upon notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or notify the permit holder or his or her agent wherein the same fails to comply with this code. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the *code official*.~~

R104.2 Preliminary Inspection. Before issuing a permit, the *code official* is authorized to examine or cause to be examined the *building site*, and in the case of work to or on an existing building the *building*, for which an application has been filed.

~~**R104.3 Final inspection.** The building shall have a final inspection and not be occupied until *approved*.~~

R104.3 Required inspections. The *code official* or his designated agent, upon notification, shall make the inspections set forth in Sections R104.3.1 through R104.3.6.

R104.3.1 Footing and foundation inspection. Inspections associated with footings and foundations shall be made before backfilling and shall verify compliance with the code as to R-value, location, thickness, depth of burial and protection of insulation as required by the code and *approved* plans and specifications for:

1. Basement or crawl space walls having insulation applied exterior to or integral with the walls
2. Slabs on grade
3. Buried duct systems associated with HVAC systems
4. Piping systems associated with HVAC or service hot water systems
5. Freeze protection/snow melt systems .

R104.3.2 Framing and rough-in inspection. Inspections at framing and rough-in shall be made before application of interior finish and shall verify compliance with the code as to types of insulation and corresponding R-values and their correct location and proper installation, fenestration thermal properties (U-factor and SHGC) and proper installation of fenestration, and air leakage controls as required by the code and approved plans and specifications for:

1. Opaque walls and wall assemblies
2. Floors and floor assemblies
3. Roof/ceilings and roof/ceiling assemblies
4. Fenestration

R104.3.3 Plumbing rough-in inspection. Inspections at plumbing rough-in shall verify compliance as required by the code and *approved* plans and specifications for:

1. The R-value, location, thickness, depth of burial and protection of insulation on hot water piping
2. The installation of automatic or manual switches on circulating hot water systems

R104.3.4 Mechanical rough-in inspection. Inspections at mechanical rough-in shall verify compliance as required by the code and *approved* plans and specifications for:

1. Installed HVAC equipment type, efficiency and size
2. Installation of require programmable thermostats
3. Required heat pump supplementary heat controls
4. Installation of automatic or gravity dampers on outdoor air intakes and exhausts
5. Required insulation type, R-value, thickness and proper installation of insulation for ducts, air handlers and piping associated with the HVAC system
6. Sealing and any required leakage testing of ducts and plenums
7. Required sealing of and manufacturer's designation for air handlers
8. Required whole house ventilation and minimum fan efficacy

Exception: Systems serving multiple dwelling units shall be inspected in accordance with Section C104.3.4.

R104.3.6 Final inspection. The *building* shall have a final inspection and shall not be occupied until *approved*. The final inspection shall include verification of the installation of all required *building* systems, equipment and controls and their proper operation and the required number of high-efficacy lamps and fixtures.

R104.5 Approved inspection agencies. ~~The code official is authorized to accept reports of approved inspection agencies, provided such agencies satisfy the requirements as to qualifications and reliability.~~

R104.5 Approved Inspection agencies. The *code official* is authorized to accept reports of third party inspection agencies not affiliated with the *building* design or construction, provided such agencies are

approved as to qualifications and reliability relevant to the building components and systems they are inspecting.

Reason: This proposal improves and enhances the details governing inspections of construction and examination of documents associated with compliance verification.

The current provisions of Sections R 103.1 and C103.3 require the code official to examine the construction documents to verify compliance with the code. Those provisions also allow the code official to delegate that authority to another party (e.g., cause to be examined) but are not specific as to the qualifications of that party. Depending on the type and size of a residential or commercial building, the plans and specifications can be very complex and an appropriate level of review challenging for a jurisdiction that may not see many large commercial projects in a given year and/or have a unique or large residential building. Currently there is no specificity in the code about the qualifications of any third party reviewer, so the permittee could argue against the imposition of a registered design professional requirement by the jurisdiction. The proposed language makes it clear that, should the code official decide to delegate their authority to another party, such third party must be approved (a defined term in the code) by the code official; something very important because that party is acting on behalf of the code official.

The current provisions of Sections R104 and C104 covering inspections are not as specific as they could be with respect to energy efficiency. The proposed revisions to Sections R104 and C104, which are consistent with Section 109 of the International Existing Building Code (IEBC), provide the required detail to better ensure compliance with the code and through compliance delivery of the energy efficiency potential associated with the provisions of the code. It is important to point out that the provisions currently in Sections R104 and C104 are not being eliminated but instead enhanced.

- Sections R104.1 and C104.1 in the current code remain the same but have been enhanced to provide the additional detail provided in Section 109.1 of the IEBC, which is equally relevant to the IECC. In addition an allowance for the code official to have a designated agent conduct inspections has been added to recognize the ability for the code official should they so choose have a designated entity act on their behalf in conducting required inspections.
- New Sections R104.2 and C104.2 are added to the code and covers the issue of preliminary approvals. This provision appears for instance in the IEBC (109.2) and appears equally relevant to the IECC Residential and the IECC Commercial provisions.
- Sections R104.3 and C104.3 currently address a final inspection. There are, however, no provisions in the IECC that address the inspections that are necessary during the course of construction to ensure compliance with the IECC. The proposed Sections R104.3 and C104.3 include a provision for a final inspection but, as is the case in other ICC codes such as the IEBC (109), includes a number of other code-relevant inspections detailing by name what is to be assessed for compliance during key stages of construction. Having this direction, and notification to designers, builders and contractors via publication in the code, is intended to foster increased compliance with the IECC. Note also, as covered in the revisions to Sections R104.1 and C104.1, the code official can also have a designated agent conduct these inspections.
- Sections R104.5 and C104.5 as currently worded are circular in nature. They provide the code official certain authorization to accept reports from approved inspection agencies. The definition of the term approved is such that the end result of this criterion is that the code official is authorizing something based on his authority to authorize it. The proposed revisions provide the additional detail needed as to how approval of such third parties is to be addressed and the general criteria upon which they would be evaluated for acceptability.

Cost Impact: The code change proposal does not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C104.1.1 Approved inspection agencies. The *code official* is authorized to accept reports of *approved* inspection agencies, including *approved* commissioning agencies, provided such agencies satisfy the requirements as to qualifications and reliability.

C104.2.1 Inspection requests. It shall be the duty of the holder of the permit or the holder's duly authorized agent to notify the *code official* when work is ready for inspection. It shall be the duty of the permit holder to provide access to and means for inspections of such work that are required by this code.

C104.2.2 Reinspection and testing. Where any work or installation does not pass an initial test or inspection, the necessary corrections shall be made so as to achieve compliance with this code. The work or installation shall then be resubmitted to the *code official* for inspection and testing.

C104.3 C104.2.3 Final inspection. The building shall have a final inspection and not be occupied until approved.

C104.3 Notice of approval. After the prescribed tests and inspections, including but not limited to applicable commissioning tests and inspections as prescribed in Section C408, indicate that work complies in all respects with this code, and required documentation, including but not limited to the final commissioning report, has been accepted by the *code official*, a notice of approval shall be issued by the *code official*.

C104.3.1 Revocation. The *code official* is authorized to suspend or revoke in writing a notice of approval issued under the provisions of this code wherever the certificate has been issued in error, or on the basis of incorrect information supplied, or where it is determined that the building or structure, premise, or portion thereof is in violation of any ordinance or regulation or any of the provisions of this code.

C104.4 C104.3.2 Reinspection. A building shall be reinspected when determined necessary by the *code official*.

C104.5 Approved inspection agencies. The *code official* is authorized to accept reports of *approved* inspection agencies, provided such agencies satisfy the requirements as to qualifications and reliability.

C104.6 Inspection requests. It shall be the duty of the holder of the permit or their duly authorized agent to notify the *code official* when work is ready for inspection. It shall be the duty of the permit holder to provide access to and means for inspections of such work that are required by this code.

~~C104.7 Reinspection and testing.~~ Where any work or installation does not pass an initial test or inspection, the necessary corrections shall be made so as to achieve compliance with this code. The work or installation shall then be resubmitted to the *code official* for inspection and testing.

~~C104.8 Approval.~~ After the prescribed tests and inspections indicate that the work complies in all respects with this code, a notice of approval shall be issued by the *code official*.

~~C104.8.1 Revocation.~~ The *code official* is authorized to, in writing, suspend or revoke a notice of approval issued under the provisions of this code wherever the certificate is issued in error, or on the basis of incorrect information supplied, or where it is determined that the building or structure, premise, or portion thereof is in violation of any ordinance or regulation or any of the provisions of this code.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R104.1.1 Approved inspection agencies. The *code official* is authorized to accept reports of *approved* inspection agencies, including *approved* commissioning agencies, provided such agencies satisfy the requirements as to qualifications and reliability.

R104.2.1 Inspection requests. It shall be the duty of the holder of the permit or the holder's duly authorized agent to notify the *code official* when work is ready for inspection. It shall be the duty of the permit holder to provide access to and means for inspections of such work that are required by this code.

R104.2.2 Reinspection and testing. Where any work or installation does not pass an initial test or inspection, the necessary corrections shall be made so as to achieve compliance with this code. The work or installation shall then be resubmitted to the *code official* for inspection and testing.

R104.3 R104.2.3 Final inspection. The building shall have a final inspection and not be occupied until approved.

R104.3 Notice of approval. After the prescribed tests and inspections, including but not limited to applicable commissioning tests and inspections as prescribed in Section C408, indicate that work complies in all respects with this code, and required documentation, including but not limited to the final commissioning report, has been accepted by the *code official*, a notice of approval shall be issued by the *code official*.

R104.3.1 Revocation. The *code official* is authorized to suspend or revoke in writing a notice of approval issued under the provisions of this code wherever the certificate has been issued in error, or on the basis of incorrect information supplied, or where it is determined that the building or structure, premise, or portion thereof is in violation of any ordinance or regulation or any of the provisions of this code.

R104.4 R104.3.2 Reinspection. A building shall be reinspected when determined necessary by the *code official*.

~~R104.5 Approved inspection agencies.~~ The *code official* is authorized to accept reports of *approved* inspection agencies, provided such agencies satisfy the requirements as to qualifications and reliability.

~~R104.6 Inspection requests.~~ It shall be the duty of the holder of the permit or their duly authorized agent to notify the *code official* when work is ready for inspection. It shall be the duty of the permit holder to provide access to and means for inspections of such work that are required by this code.

~~R104.7 Reinspection and testing.~~ Where any work or installation does not pass an initial test or inspection, the necessary corrections shall be made so as to achieve compliance with this code. The work or installation shall then be resubmitted to the *code official* for inspection and testing.

~~**R104.8 Approval.** After the prescribed tests and inspections indicate that the work complies in all respects with this code, a notice of approval shall be issued by the code official.~~

~~**R104.8.1 Revocation.** The code official is authorized to, in writing, suspend or revoke a notice of approval issued under the provisions of this code wherever the certificate is issued in error, or on the basis of incorrect information supplied, or where it is determined that the building or structure, premise, or portion thereof is in violation of any ordinance or regulation or any of the provisions of this code.~~

Reason: The proposal better organizes this section and eliminates redundancy.

Cost Impact: The code change proposal will not increase the cost of construction.

CE39-13

PART I – IECC-COMMERCIAL PROVISIONS

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C104.1.1 (NEW)-EC-TAYLOR.doc

CE40 – 13

C104.3.1 (NEW), R104.3.1 (NEW)

Proponent: Hope Medina, Cherry Hills Village, representing self (hmedina@coloradocode.net)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Add new text as follows:

C104.3.1 Energy Inspections. Requirements of this code shall pass inspection prior to issuance of a certificate of occupancy for the building. Inspections shall be performed by the code official or a third party approved by the code official.

PART II – IECC-RESIDENTIAL PROVISIONS

Add new text as follows:

R104.3.1 Energy Inspections. Requirements of this code shall pass inspection prior to issuance of a certificate of occupancy for the building. Inspections shall be performed by the code official or a third party approved by the code official.

Reason: We are requiring for more energy efficient buildings to be built, but we do not require for any type of energy inspections to be performed. With the Federal government's energy mandates that our current building practices must increase energy conservation we are needing alter our current point of view. Section 110.3 of the IBC and section 109 of the IRC state that certain inspections are required to be done prior to obtaining a Certificate of Occupancy. Currently there are no energy code requirements listed that must be verified, but they are tied to many financial requirements, utility incentives, and local, state, and federal tax credits or incentives. There becomes a time when we can no longer over look this omission, and jump into the fire to start requiring that energy inspections be performed.

An example of a current issue is as follows. A construction services company is designing and constructing a green community affordable senior living facilities as a 2 phase project. The jurisdiction it was being built in does not perform plan reviews or inspections under the IECC. The two buildings were designed under the 2006 International Codes. With current lending requirements they were not able to obtain financing for the entire project under one loan. The project was split into two phases with two different financial loans procured. When submitting the second phase for finance they were informed that the money loaned is requiring for the building to be energy star certified. Due to the jurisdiction not performing energy plan reviews or inspections it may cost the builder it's financing or increase their budget to become compliant.

Cost Impact: This code change will not increase the cost of construction.

C104.5, C104.5.1 (NEW), C202 (NEW), R104.5, R104.5.1 (NEW), R202 (NEW) (IRC N1101.9 (NEW))

Proponent: Brian Dean, ICF International, representing Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; Bill Prindle, Energy Efficient Codes Coalition; and Don Vigneau, Northeast Energy Efficiency Partnerships

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C104.5 Approved inspection agencies. ~~The code official is authorized to accept reports of approved inspection agencies, provided such agencies satisfy the requirements as to qualifications and reliability.~~ or other authority having jurisdiction shall be permitted to designate an *approved agency* to determine compliance with any, some or all requirements of this code. Such *approved agency* shall:

1. Administer all necessary tests, review all relevant construction documents, and conduct all required inspections related to any code requirement where such agency is providing certification of compliance.
2. Produce a written report addressing all tests, inspections, review and analysis conducted and certifying compliance with such specific requirements of this code.

C104.5.1 Standard for approved agencies. An *approved agency* shall be *approved* after the *code official* or other authority having jurisdiction has determined that the agency meets the applicable requirements. An *approved agency* shall provide all of the information necessary to make such a determination. An *approved agency* shall:

1. Be objective, competent and independent from all interested parties, including all contractors responsible for the work being inspected, and disclose possible conflicts of interest so that objectivity can be confirmed.
2. Have adequate equipment to perform any required test or inspections.
3. Employ experienced personnel educated and qualified to conduct the necessary review, tests, inspections and other actions to determine compliance.

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

APPROVED AGENCY. An established and recognized agency regularly engaged in conducting tests or furnishing inspection services, when such agency has been *approved*.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R104.5 Approved inspection agencies. ~~The code official is authorized to accept reports of approved inspection agencies, provided such agencies satisfy the requirements as to qualifications and reliability.~~

or other authority having jurisdiction shall be permitted to designate an *approved agency* to determine compliance with any, some or all requirements of this code. Such *approved agency* shall:

1. Administer all necessary tests, review all relevant construction documents, and conduct all required inspections related to any code requirement where such agency is providing certification of compliance.
2. Produce a written report addressing all tests, inspections, review and analysis conducted and certifying compliance with such specific requirements of this code.

R104.5.1 Standard for approved agencies. An *approved agency* shall be *approved* after the *code official* or other authority having jurisdiction has determined that the agency meets the applicable requirements. An *approved agency* shall provide all of the information necessary to make such a determination. An *approved agency* shall:

1. Be objective, competent and independent from all interested parties, including all contractors responsible for the work being inspected, and disclose possible conflicts of interest so that objectivity can be confirmed.
2. Have adequate equipment to perform any required test or inspections.
3. Employ experienced personnel educated and qualified to conduct the necessary review, tests, inspections and other actions to determine compliance.

Add new definition as follows:

SECTION R202 (N1101.9) GENERAL DEFINITIONS

APPROVED AGENCY. An established and recognized agency regularly engaged in conducting tests or furnishing inspection services, when such agency has been *approved*.

Reason: The purpose of the proposed code change is to establish new requirements for *approved agencies* and to otherwise clarify the code -- this proposal will improve the potential for approved agencies to assist in code compliance and enforcement efforts. The proposal imports the definition of "approved agency" from the 2012 *IBC* into the *IECC*, clarifies the role of approved agencies in verifying aspects of energy code compliance and establishes standards for such agencies to be approved. The *IECC* currently does not give enough direction about the role of such approved agencies or the minimum requirements for these entities. This proposal improves the code by outlining the requirements for approved agencies, including:

- Third-party administration of the verification activities
- Quality and reliability of the approved agency
- Written reports of code compliance

These requirements are all common-sense and already may be employed by jurisdictions that delegate testing or inspection authority to third parties. We believe that it makes sense to include these requirements in the *IECC* so that jurisdictions can apply more uniform criteria to approved agencies, and so that third parties can better tailor their compliance and enforcement programs to meet the expectations of the state or locality.

Cost Impact: The code change proposal will not increase the cost of construction.

Note: The term 'approved agency' is defined in other International Codes including *IBC*, *IRC*, *IMC*, *IPC* and *IgCC*. The definition proposed here is the same as that found in these other code.

C104.5-EC-DEAN-HARRIS-MISURIELLO-PRINDLE-STONE-VIGNEAU.doc

CE42 – 13

C106.1.2, C106.2

Proponent: Shirley Ellis, Energy Systems Laboratory, Texas A&M Engineering Experiment Station, Texas A&M University System (shirleyellis@tamu.edu)

Revise as follows:

C106.1.2 Provisions in referenced codes and standards. Where the extent of the reference to a referenced code or standard includes subject matter that is within the scope of this code, the provisions of this code, as applicable, shall take precedence over the provisions in the referenced code or standard.

Exception. Where using ANSI/ASHRAE/IESNA 90.1 as a compliance path as allowed in Section C401.2 Item 1 or Section C401.2.1 Item 2.

~~**C106.2 Conflicting requirements.** Where the provisions of this code and the referenced standards conflict, the provisions of this code shall take precedence.~~

Reason: Adding the exception to C106.1.2 clarifies the intent in Section C401.2 that commercial buildings shall comply with either ANSI/ASHRAE/IESNA 90.1 in its entirety or the requirements of the IECC Sections in its entirety.

Section C106.2 is unnecessary as it simply restates the requirements in C106.1.1 and C106.1.2 and adds confusion in which section to cite.

Cost Impact: The code change proposal will not increase the cost of construction.

CE42-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C106.1.2-EC-ELLIS.doc

CE43 – 13

C106.2, R106.2

Proponent: Deborah Taylor, RA, LEED AP, Deborah F. Taylor Consulting, LLC, representing self
(taylor@dftconsultingny.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Delete without substitution as follows:

~~**C106.2 Conflicting requirements.** Where the provisions of this code and the referenced standards conflict, the provisions of this code shall take precedence.~~

PART II – IECC-RESIDENTIAL PROVISIONS

Delete without substitution as follows:

~~**R106.2 Conflicting requirements.** Where the provisions of this code and the referenced standards conflict, the provisions of this code shall take precedence.~~

Reason: Section C106.2 is redundant of Section C106.1.1.

Cost Impact: The code change proposal will not increase the cost of construction.

CE44 – 13

C108.4, R108.4

Proponent: Shirley Ellis, Energy Systems Laboratory, Texas A&M Engineering Experiment Station, Texas A&M University System (shirleyellis@tamu.edu)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C108.4 Failure to comply. Any person who shall continue any work after having been served with a stop work order, except such work as that person is directed to perform to remove a violation or unsafe condition, shall be liable to a fine ~~of not less than [AMOUNT] dollars or more than [AMOUNT] dollars~~ as set by the applicable governing authority.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R108.4 Failure to comply. Any person who shall continue any work after having been served with a stop work order, except such work as that person is directed to perform to remove a violation or unsafe condition, shall be liable to a fine ~~of not less than [AMOUNT] dollars or more than [AMOUNT] dollars~~ as set by the applicable governing authority.

Reason: Codes are adopted in various ways by varying entities, federal agencies, states, counties, or municipalities. Often one level of government will adopt the code, while the enforcement is at a different level. Some of the adopting entities do not have the means to insert a specific fine amount, in some instances the enforcement may be by several entities that have fine amounts that vary and in some cases the fine amount may unknown to the adopting agency.

This proposal will also eliminate the need to amend the code ordinance when the fine structure is revised. This change allows the code to be adopted without relying on the amount to be determined at the time of adoption.

Cost Impact: The code change proposal will not increase the cost of construction.

C108.4-EC-ELLIS.doc

CE45 – 13

C202

Proponent: Shaunna Mozingo, City of Cherry Hills Village, representing Colorado Chapter of ICC, Inc (smozingo@coloradocode.net)

Revise as follows:

SECTION C202 GENERAL DEFINITIONS

ABOVE-GRADE WALL. A wall more than ~~50~~ 15 percent above grade ~~and enclosing conditioned space~~. This includes between-floor spandrels, peripheral edges of floors, roof and basement knee walls, dormer walls, gable end walls, walls enclosing a mansard roof and skylight shafts.

BASEMENT WALL. A wall ~~50~~ 85 percent or more below grade ~~and enclosing conditioned space~~.

Reason: These original definitions actually belonged only in the residential portion of the Energy Code. Sections C402.2.2.1 and 402.2.2.2 clarify that for a commercial building an above grade wall is 15% or more above grade and below grade walls are 85% or more below grade. There is a big difference between the 50% and the 15% for above grade walls as well as the 50% and the 85% for below grade walls. It shouldn't matter if the space is conditioned or not, the requirements will apply differently to those walls depending on the conditioning but the definition shouldn't call out an above or below grade wall based on whether it is conditioned or not. The existing definitions came over from the residential code and were always in the definition section of the IECC, making it seem like they applied to both residential and commercial but in fact the afore mentioned commercial wall clarifications have always been in Chapter 5 of the IECC, making the definition in Chapter 2 a matter of confusion for the code user.

When the IECC was split up and new chapters 1-3 were created for both the residential and the commercial portions of the code some things were brought over into the commercial chapters that belonged only to residential and vice versa. It becomes necessary now to clean up these very separate and distinct chapters so that those who may be new to the energy code and were not aware of the previous combined versions of chapters 1-3 will not be confused by things that were brought forward by mistake.

Cost Impact: This code change proposal will not increase the cost of construction.

C202-ABOVE GRADE WALL-EC-MOZINGO.doc

CE46 – 13

C202, R202 (IRC N1101.9)

Proponent: Robby Schwarz, EnergyLogic, Inc., (robby@nrglogic.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

Part I – IECC - COMMERCIAL

Revise definition as follows:

SECTION C202 GENERAL DEFINITIONS

AIR BARRIER. Material(s) assembled and joined together to provide a barrier to air leakage through the building envelope between conditioned space and unconditioned space, including necessary sealing to block air flow at edges and seams and adequate support to resist positive and negative pressures without displacement or damage. An air barrier may be a single material or a combination of materials that are in continuous alignment throughout the 3D structure of the air barrier and the thermal barrier of the building. The air barrier system is constructed of materials that are impermeable to the movement of air and are strong and durable to perform throughout the serviceable life of the building. An interior and exterior continuous air barrier system is utilized and installed in alignment with all fibrous cavity insulation systems. i.e. six sided encapsulation is walls and floor systems.

Part II – IECC - RESIDENTIAL

Revise definition as follows:

SECTION R202 (N1101.9) GENERAL DEFINITIONS

AIR BARRIER. Material(s) assembled and joined together to provide a barrier to air leakage through the building envelope between conditioned space and unconditioned space, including necessary sealing to block air flow at edges and seams and adequate support to resist positive and negative pressures without displacement or damage. An air barrier may be a single material or a combination of materials that are in continuous alignment throughout the 3D structure of the air barrier and the thermal barrier of the building. The air barrier system is constructed of materials that are impermeable to the movement of air and are strong and durable to perform throughout the serviceable life of the building. An interior and exterior continuous air barrier system is utilized and installed in alignment with all fibrous cavity insulation systems. i.e. six sided encapsulation is walls and floor systems.

Reason: The air barrier system is a crucial element of the buildings structure in creation of efficient homes. If they it is not clearly defined then identification, implementation, and enforcement of the energy code will continue to be ambiguous. The language here is intended clarify what is meant by the term so that implementation and enforcement of the code is less ambiguous.

Cost Impact: This code change proposal will not increase the cost of construction.

C202-AIR BARRIER-EC-SCHWARZ.doc

CE47 – 13

C202, R202 (IRC N1101.9), IRC 202

Proponent: Ellen Eggerton, representing Virginia Building and Code Officials Association

THIS IS A 3 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE. PART III WILL BE HEARD BY THE IRC BUILDING CODE DEVELOPMENT COMMITTEE.

PART I - IECC – COMMERCIAL PROVISIONS

Revise definition as follows:

SECTION C202 GENERAL DEFINITIONS

BUILDING THERMAL ENVELOPE. The basement walls, exterior walls, floor, roof, and any other building elements that enclose *conditioned space* or provide a boundary between *conditioned space* and exempt or unconditioned space. An unconditioned space shall include those buildings or spaces, adjacent to a *conditioned space*, that are not heated or cooled due to periods of non-occupancy, such as an adjacent townhouse.

PART II - IECC – RESIDENTIAL PROVISIONS

Revise definition as follows:

SECTION R202 GENERAL DEFINITIONS

BUILDING THERMAL ENVELOPE. The basement walls, exterior walls, floor, roof, and any other building elements that enclose *conditioned space* or provide a boundary between *conditioned space* and exempt or unconditioned space. An unconditioned space shall include those buildings or spaces, adjacent to a *conditioned space*, that are not heated or cooled due to periods of non-occupancy, such as an adjacent townhouse.

PART III – IRC

Revise definition as follows:

SECTION 202 GENERAL DEFINITIONS

BUILDING THERMAL ENVELOPE. The basement walls, exterior walls, floor, roof, and any other building elements that enclose *conditioned space* or provide a boundary between *conditioned space* and exempt or unconditioned space. An unconditioned space shall include those buildings or spaces, adjacent to a *conditioned space*, that are not heated or cooled due to periods of non-occupancy, such as an adjacent townhouse.

Reason: The proposed change is intended to ensure that the thermal envelope boundary will include the separation between a conditioned space and those spaces which have a reasonable expectation of being unoccupied (and therefore unconditioned) for a significant albeit temporary period of time. Typical residential building example is an occupied townhouse that is adjacent to an unoccupied townhouse. If the common wall between the townhouses is uninsulated, there will be unnecessary heat transfer across that boundary. The proposal will prevent this situation from developing.

Cost Impact: There may be cost impacts of this proposal, but they are difficult to gage. Townhouses required "rated" separations which may include insulating materials that could also satisfy the wall R-value requirement. Common townhouse construction practice is to build a stud wall on the inside of the rated wall, which could be filled with materials with the required R-value.

Proponent: Greg Towsley, LEED AP BD+C Grundfos representing Grundfos (gtowsley@grundfos.com)

PART I – IECC-COMMERCIAL PROVISIONS

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

CIRCULATING HOT WATER SYSTEM. A specifically designed water distribution system where one or more pumps are operated in the service hot water piping to circulate heated water from the water-heating equipment to fixtures and back to the water-heating equipment.

PART II – IPC

Add new definition as follows:

SECTION 202 GENERAL DEFINITIONS

CIRCULATING HOT WATER SYSTEM. A specifically designed water distribution system where one or more pumps are operated in the service hot water piping to circulate heated water from the water-heating equipment to fixtures and back to the water-heating equipment.

PART III – IECC-RESIDENTIAL PROVISIONS

Add new definition as follows:

SECTION R202 (N1101.9) GENERAL DEFINITIONS

CIRCULATING HOT WATER SYSTEM. A specifically designed water distribution system where one or more pumps are operated in the service hot water piping to circulate heated water from the water-heating equipment to fixtures and back to the water-heating equipment.

Reason: A definition of a “circulating hot water system” does not exist in the code, yet it is referenced in the IRC and other ICC codes. This definition brings clarity to how a “circulating hot water system” should be designed and operated. In the codes and sections where “circulating hot water system” is used, this definition would also reduce the probability of confusion between hot water systems used for space heating or tempered water. Currently, the only place that the term CIRCULATING HOT WATER SYSTEM shows up in the code is IECC Section C404.6, IPC [E] 607.2.1 and IECC Section R403.4.1 (IRC N1103.4.1). Other proposals by other proponents will most likely be adding language that uses this term so it is important to have the term defined.

As referenced in CHAPTER 50 - SERVICE WATER HEATING of *ASHRAE Handbook-HVAC Applications* (2011, American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc.), “Some recirculation-loop systems...are equipped with circulating pumps to force water through the piping and back to the water heater, thus keeping water in the piping hot.” Adding this definition in the code will be consistent with industry’s understanding.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

THIS IS A 3 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE, PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART III WILL BE HEARD BY THE IRC BUILDING CODE DEVELOPMENT COMMITTEE.

PART I – IECC – COMMERCIAL PROVISIONS

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

CLIMATE ZONE. A geographical region that has-been assigned climatic criteria as specified in this code.

PART II – IECC – RESIDENTIAL PROVISIONS

Add new definition as follows:

SECTION R202 (N1101.9) GENERAL DEFINITIONS

CLIMATE ZONE. A geographical region that has-been assigned climatic criteria as specified in this code.

PART III – IRC

Add new definition as follows:

SECTION 202 GENERAL DEFINITIONS

CLIMATE ZONE. A geographical region that has-been assigned climatic criteria as specified in this code.

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Reasons for this specific proposal:

There are increasing numbers of proposals in which the term 'climate zone' is used in the proposed code text. This has primarily occurred in the *International Building Code* and the *International Green Construction Code*. In 2012 at least 8 proposals heard in Dallas included the term. The Code Development Committees generally tried to make sure that each approved action included that it was Climate Zones as established in the IECC.

The SEHPCAC submitted public comments to G147-12 and G149-12 to remove individual references in the text of the IBC stating that Climate Zones 'as established in the IECC' and proposed the inclusion in Chapter 2 of the IBC the following definition of Climate Zone.

CLIMATE ZONE. A geographic region that have been assigned climatic criteria as specified in Chapters 3CE and 3RE of the *International Energy Conservation Code*.

The public comments were approved by the membership and the definition is established in the IBC.

The proposed definition for the IECC is a further simplification of the version in the IBC as the extended reference isn't needed. The SEHPCAC reviewed the other codes which are part of Group B. Only the International Residential Code uses the term Climate Zone. This is addressed in Part III of this proposal. The intent of the public comments to the IBC was to simplify the reference each time Climate Zone is used to those zones 'defined' in the IECC. The issue is that 'Climate Zones' are established in the IECC, but there is no definition.

In Cycle C, the SEHPCAC will submit a code change to the IgCC to add a definition of Climate Zone. This will allow all future references to Climate Zone to be simple and not have to say "as established in the International Energy Conservation Code.

Cost Impact: This code change proposal will not increase the cost of construction.

PART I – IECC – COMMERICAL PROVISIONS

Delete and substitute as follows:

SECTION C202 GENERAL DEFINITIONS

~~**CONDITIONED SPACE.** An area or room within a building being heated or cooled, containing uninsulated ducts, or with a fixed opening directly into an adjacent conditioned space.~~

CONDITIONED SPACE. An area, room or space that is enclosed within the building thermal envelope and that is directly heated or cooled or that is indirectly heated or cooled. Spaces are indirectly heated or cooled where they communicate thru openings with conditioned spaces, where they are separated from conditioned spaces by un-insulated walls, floors or ceilings, or where they contain un-insulated ducts, piping or other sources of heating or cooling.

PART II – IECC RESIDENTIAL PROVISIONS

Delete and substitute as follows:

SECTION R202 (N1101.9) GENERAL DEFINITIONS

~~**CONDITIONED SPACE.** For energy purposes, space within a building that is provided with heating and/or cooling equipment or systems capable of maintaining, through design or heat loss/gain, 50°F (10°C) during the heating season and 85°F (29°C) during the cooling season, or communicates directly with a conditioned space. For mechanical purposes, an area, room or space being heated or cooled by any equipment or appliance.~~

CONDITIONED SPACE. An area, room or space that is enclosed within the building thermal envelope and that is directly heated or cooled or that is indirectly heated or cooled. Spaces are indirectly heated or cooled where they communicate thru openings with conditioned spaces, where they are separated from conditioned spaces by un-insulated walls, floors or ceilings, or where they contain un-insulated ducts, piping or other sources of heating or cooling.

Reason: (Mozingo) Currently the definition for conditioned space differs in each code. The proposed change to the definition would bring the IECC and IRC in line with what was approved in Group A for the 2015 IMC as proposal M2-12. This proposal shows the modifications that were made by the committee and then went on to the consent agenda as there were no public comments received. This proposed change is similar to the definition in ASHRAE 90.1 – 2010.

(Ursenbach) (Part I) Confusion exists between the definitions in the IMC, IRC and IECC. The IECC attempts to define how a space may be indirectly conditioned; however, further clarification is needed. The definition for conditioned space as proposed above is the definition approved in the Group A hearings for the IMC under M2-12. This proposed change is similar to the definition in ASHRAE 90.1 – 2010. **(Part II)** Confusion exists between the definitions in the IMC, IRC and IECC. The IECC attempts to define how a space may be indirectly conditioned; however, further clarification is needed. The definition for conditioned space as proposed above is the definition approved for the IMC in the Group A hearings under M2-12. This proposed change is similar to the definition in ASHRAE 90.1 – 2010.

Cost Impact: This code change proposal will not increase the cost of construction.

C202-CONDITIONED SPACE-EC-MOZINGO-URSENBACH.doc

CE52 – 13

C202 (NEW), R202 (NEW) (IRC N1101.9 (NEW))

Proponent: Jay Crandell, ARES Consulting, representing American Chemistry Council- Foam Sheathing Committee (jcrandell@aresconsulting.biz Eric Makela, Britt/Makela Group, Inc., representing Northwest Energy Codes Group (Eric@BrittMakela.com), Steve Ferguson, ASHRAE (sferguson@ashrae.org), Theresa A. Weston, PhD., DuPont Building Innovations (theresa.a.weston@usa.dupont.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC – COMMERICAL PROVISIONS

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

CONTINUOUS INSULATION (ci): Insulating material that is continuous across all structural members without thermal bridges other than fasteners and service openings. It is installed on the interior or exterior or is integral to any opaque surface of the building envelope.

PART II – IECC – RESIDENTIAL PROVISIONS

Add new definition as follows:

SECTION R202 (N1101.9) GENERAL DEFINITIONS

CONTINUOUS INSULATION (ci): Insulating material that is continuous across all structural members without thermal bridges other than fasteners and service openings. It is installed on the interior or exterior or is integral to any opaque surface of the building envelope.

Reason: (Crandell) This proposal provides a needed definition for continuous insulation (a term presently used in the IRC and IECC). The proposed definition is from the 2010 edition of ASHRAE 90.1 and provides an effective definition that is inclusive of all types of continuous insulation materials, including spray foam, insulated siding, foam sheathing, and others.

(Makela) The term continuous insulation was introduced to the commercial provisions of the IECC in 2006. Unfortunately, the term has never been defined in the code. Since its introduction into the code, questions have arisen concerning what is and is not considered continuous insulation. For example, if furring strips are installed on a mass wall and insulation is installed between the furring strips over the face of the wall, is this considered continuous insulation or insulation installed in the cavity? This proposal provides a reasonable definition for continuous insulation that doesn't prohibit different types of materials from being used. The definition uses the term "Insulating material" which can be a variety of products including wood. The R-value requirements for walls in Table C402.2 provides the minimum R-values for the insulating material and as long as the material can be demonstrated to meet the minimum R-value it can be considered an insulating material. The key to maintaining the effectiveness of continuous insulation is to reduce or eliminate thermal bridging, which this definition achieves.

(Ferguson) In table C402.2, the term continuous insulation has been added, though it is undefined. This adds a definition for the term which is identical to the already existing definition in ANSI/ASHRAE/IES Standard 90.1-2010

(Weston) This proposal adds a definition for continuous insulation. Continuous insulation is used within the code, but the definition is missing. The proposed definition is consistent with that in ASHRAE 90.1

Cost Impact: This code change proposal will not increase the cost of construction.

CE52-13

CE53 – 13

C202

Proponent: Tim Manz, City of Blaine, MN, representing Association of Minnesota Building Officials
(tmanz@ci.blaine.mn.us)

Revise definition as follows:

SECTION C202 GENERAL DEFINITIONS

INFILTRATION. The uncontrolled inward air leakage into a building caused by the pressure effects of wind ~~or~~ The effect of differences in the indoor and outdoor air density or both, or imbalance between supply and exhaust air systems.

Reason: The imbalance between supply and exhaust air systems can be a major contributor to air infiltration into a building. The reason for this proposed code change is to include this imbalance as a part of the definition, which is already contained in the definitions in the current Minnesota Commercial Energy Code that adopts ASHRAE Standard 90.1-2004.

Cost Impact: This code change proposal will not increase the cost of construction.

CE53-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C202-INFILTRATION-EC-MANZ.doc

CE54 – 13

C202 (New)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Add new definitions as follows:

SECTION C202 GENERAL DEFINITIONS

LINER SYSTEM (Ls). A continuous vapor barrier liner membrane is installed below the purlins and uninterrupted by framing members. Uncompressed, unfaced insulation rests on top of the liner membrane between the purlins. For multilayer installations, the last *rated R-value of insulation* is for unfaced insulation draped over purlins and then compressed when the metal roof panels are attached.

FILLED CAVITY (FC). The first *rated R-value of insulation* represents faced or unfaced insulation installed between the purlins. The second *rated R-value of insulation* represents unfaced insulation installed above the first layer, perpendicular to the purlins and compressed when the metal roof panels are attached. A supporting structure retains the bottom of the first layer at the prescribed depth required for the full thickness of insulation.

Reason: Liner systems and filled cavity metal building roof assemblies can be used for compliance with the Opaque assemblies in table C402.2. This adds definitions for the terms, which are identical to the already existing definition in ANSI/ASHRAE/IES Standard 90.1-2010

Cost Impact: The code change proposal will not increase the cost of construction.

CE54-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C202-LINEAR SYSTEM (Ls) (NEW)-EC-FERGUSON.doc

CE55 – 13

C202 (New)

Proponent: Steve Ferguson, ASHRAE (sferguson@ashrae.org), Amanda Hickman, InterCode Incorporated, representing AMCA International (amanda@intercodeinc.com)

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

POWERED ROOF/WALL VENTILATORS. A fan consisting of a centrifugal or axial impeller with an integral driver in a weather-resistant housing and with a base designed to fit, usually by means of a curb, over a wall or roof opening.

Reason: This is a companion proposal to the Fan Efficiency Grade (FEG) proposal submitted by AMCA International. Adding this definition for powered roof/wall ventilators to the code will help to clarify this term, which occurs in the list of proposed exceptions to the FEG proposal.

The language was taken from ANSI/AMCA Standard 99-10 *Standards Handbook*, and identical language was used in the ASHRAE 90.1-2010 Addendum u, which added a fan efficiency requirement and which is expected to be in the 2013 version of the Standard.

It is only relevant IF the FEG proposal is approved for addition into the IECC.

Cost Impact: The code change proposal will not increase the cost of construction.

CE55-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C202-POWERED ROOF-WALL VENTILATORS-EC-FERGUSON-HICKMAN.doc

CE56 – 13

C202 (NEW)

Proponent: Mark S. Graham, National Roofing Contractors Association (mgraham@nrca.net)

Add new definitions as follows:

SECTION C202 GENERAL DEFINITIONS

REROOFING. The process of recovering or replacing an existing roof covering.

ROOF RECOVER. The process of installing an additional roof covering over an existing roof covering without removing the existing roof covering.

ROOF REPAIR. Reconstruction or renewal of any part of an existing roof for the purpose of its maintenance.

ROOF REPLACEMENT. The process of removing the existing roof covering, repairing any damaged substrate and installing a new roof covering.

Reason: This code change proposal is intended to clarify the Code's intent by defining specific roofing-related terms.

The term "reroofing" is not currently defined in the I-codes. The definition proposed here is taken from IBC Section 1510-Reroofing.

The terms and definitions for "roof recover", "roof repair" and "roof replacement" are taken from IBC Section 202-Definitions and are consistent with those understood by the roofing industry.

Cost Impact: The code change proposal will not increase the cost of construction.

CE56-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C202-REROOFING (NEW)-EC-GRAHAM.doc

CE57 – 13

C202 (NEW)

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

ROOFTOP MONITOR. A raised section of a roof containing vertical fenestration along one or more sides.

Reason: There is currently no definition of rooftop monitor, yet the term is used in Section C402.3.2.1 (4). This proposal provides a definition of the term "Rooftop Monitor" as used in Section C402.3.2.1 (4). A definition of rooftop monitor is needed to clarify the intent and ensure uniform application of the exception.

Cost Impact: This code change proposal will not increase the cost of construction.

CE57-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C202-ROOFTOP MONITOR (NEW)-EC-WILLIAMS.doc

CE58 – 13

C202, R202 (IRC N1101.9)

Proponent: Jeff Inks, Window & Door Manufacturers Association (jinks@wdma.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC – COMMERCIAL PROVISIONS

Revise definition as follows:

SECTION C202 GENERAL DEFINITIONS

SKYLIGHT AND SLOPED GLAZING. Glass or other transparent or translucent glazing material installed at a slope of ~~less than 60 degrees (1.05 rad) from horizontal~~ 15 degrees (0.26 rad) or more from vertical. Glazing material in skylights, including unit skylights, tubular daylighting devices, solariums, sunrooms, roofs and sloped walls is included in this definition.

PART II – IECC – RESIDENTIAL PROVISIONS

SECTION R202 GENERAL DEFINITIONS

Revise definition as follows:

SKYLIGHT AND SLOPED GLAZING. Glass or other transparent or translucent glazing material installed at a slope of ~~less than 60 degrees (1.05 rad) from horizontal~~ 15 degrees (0.26 rad) or more from vertical. Glazing material in skylights, including unit skylights, tubular daylighting devices, solariums, sunrooms, roofs and sloped walls is included in this definition.

Reason: The definitions for skylights and sloped glazing were amended during the last code cycle to align with the definitions in ASHRAE 90.1 and not because of technical substantiation with respect to improvements in energy efficiency justifying the change. The definitions now conflict with the definitions for skylights and sloped glazing in the IBC and IRC. Given the IECC is an I-code and should there include definitions that are consistent with other I-codes, and that the alignment with ASHRAE 90.1 was not based on technical substantiation with respect to improvements in energy efficiency, the definitions for skylights and sloped glazing should be consistent with the definitions for them in the IBC and IRC. This proposal corrects that inconsistency.

Cost Impact: This code change proposal will not increase the cost of construction.

CE58-13

PART I – IECC – COMMERCIAL PROVISIONS

CE59 – 13

C202, R202 (IRC N1101.9)

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

SECTION C202 GENERAL DEFINITIONS

Revise definitions as follows:

FENESTRATION VERTICAL FENESTRATION. ~~Skylights, roof windows, vertical w-~~Windows (fixed or movable), opaque doors, glazed doors, glazed block and combination opaque/glazed doors composed of: ~~Fenestration includes products with glass and nonglass or other transparent or translucent glazing materials and installed at a slope of at least 60 degrees from horizontal.~~

SKYLIGHT SKYLIGHT. Glass or other transparent or translucent glazing material installed with a slope of less than 60 degrees (1.05 rad) from horizontal. ~~Glazing material in skylights, including unit skylights, solariums, sunrooms, roofs and sloped walls is included in this definition.~~

PART II – IECC-RESIDENTIAL PROVISIONS

Revise definitions as follows:

SECTION R202 (N1101.9) GENERAL DEFINITIONS

FENESTRATION. VERTICAL FENESTRATION. ~~Skylights, roof windows, vertical w-~~Windows (fixed or movable), opaque doors, glazed doors, glazed block and combination opaque/glazed doors composed of: ~~Fenestration includes products with glass and nonglass or other transparent or translucent glazing materials and installed at a slope of at least 60 degrees (1.05 rad) from horizontal.~~

SKYLIGHT SKYLIGHT. Glass or other transparent or translucent glazing material installed with a slope of less than 60 degrees from horizontal. ~~Glazing material in skylights, including unit skylights, solariums, sunrooms, roofs and sloped walls is included in this definition.~~

Reason: The code currently has no thermal provisions (U-factor or SHGC) for any fenestration material or product installed at an angle of greater than 0 up to and including 30 degrees from vertical. This proposal clarifies the application of thermal provisions (U-factor or SHGC) for fenestration materials or products installed at an angle greater than 0 up to and including 30 degrees from vertical.

There are a number of commercial and residential building designs in which sloped glazing is used, and as such is clearly not vertical but in addition does not meet the greater than 30 degrees from vertical (at least 60 degrees from horizontal) criterion to consider it a skylight. While it may be inferred that vertical fenestration is intended to include all fenestration other than skylights, technically the code does not apply to the fenestration in question. Vertical fenestration is used in Sections C402.3.1, C402.3.1.1, C402.3.3, C402.3.3.1, C402.3.3.2, R402.5 and Table C402.3. This loophole needs to be corrected and rather than change the term in the code from vertical fenestration to some other term, it is considered more appropriate to define what is intended when using the term "vertical fenestration" even though it is not truly vertical. Another change makes it clear that fenestration can be either glass **or** nonglass glazing materials and does not need to include both glass **and** nonglass glazing materials. The last sentence in the current definition of skylight can be deleted because the terms for the products are added to the previous sentence and it is not necessary to indicate the location of the skylights as they will always be in a roof or wall assembly. The focus of both definitions is simply the angle of the fenestration as installed.

Cost Impact: This code change proposal will not increase the cost of construction.

Note: The IBC, IRC and the igCC have two defined terms related to skylights. They are 'skylights and sloped glazing' and 'skylight unit' as follows

SKYLIGHT, UNIT. A factory-assembled, glazed fenestration unit, containing one panel of glazing material that allows for natural lighting through and opening in the roof assembly while preserving the weather-resistant barrier of the roof.

SKYLIGHTS AND SLOPED GLAZING. Glass or other transparent or translucent glazing material installed at a slope of 15 degrees (0.26 rad) or more from vertical. Glazing materials in skylights, including unit skylights, solariums, sunrooms, roofs and sloped walls, are included in this definition.

CE63 – 13

C303.1.1, R303.1.1 (IRC N1101.12.1)

Proponent: Matt Dobson, Vinyl Siding Institute (mdobson@vinylsiding.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C303.1.1 Building thermal envelope insulation. An *R*-value identification mark shall be applied by the manufacturer to each piece of *building thermal envelope* insulation 12 inches (305 mm) or greater in width. Alternately, the insulation installers shall provide a certification listing the type, manufacturer and *R*-value of insulation installed in each element of the *building thermal envelope*. For blown or sprayed insulation (fiberglass and cellulose), the initial installed thickness, settled thickness, settled *R*-value, installed density, coverage area and number of bags installed shall be *listed* on the certification. For sprayed polyurethane foam (SPF) insulation, the installed thickness of the areas covered and *R*-value of installed thickness shall be *listed* on the certification. For insulated siding the *R*-value shall be labeled on the product's package and shall be *listed* on the certification. The insulation installer shall sign, date and post the certification in a conspicuous location on the job site.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R303.1.1 (N1101.12.1) Building thermal envelope insulation. An *R*-value identification mark shall be applied by the manufacturer to each piece of *building thermal envelope* insulation 12 inches (305 mm) or greater in width. Alternately, the insulation installers shall provide a certification listing the type, manufacturer and *R*-value of insulation installed in each element of the *building thermal envelope*. For blown or sprayed insulation (fiberglass and cellulose), the initial installed thickness, settled thickness, settled *R*-value, installed density, coverage area and number of bags installed shall be *listed* on the certification. For sprayed polyurethane foam (SPF) insulation, the installed thickness of the areas covered and *R*-value of installed thickness shall be *listed* on the certification. For insulated siding the *R*-value shall be labeled on the product's package and shall be *listed* on the certification. The insulation installer shall sign, date and post the certification in a conspicuous location on the job site.

Reason: This change will help building officials and energy specialists/raters identify insulated siding, including its specified *R*-value based on ASTM C1363 testing. Currently, labeling or identification marks are not specified for insulated siding, but have been developed and established since the publication of the last energy code. For more information, go to www.insulatedsiding.info.

Cost Impact: The code change proposal will have minimal cost impact as many insulated siding products are on the market and are certified and labeled in the way.

For sprayed polyurethane foam (SPF) insulation, the installed thickness of the areas covered and *R*-value of installed thickness shall be listed on the certification.~~ The insulation installer shall sign, date and post the certification in a conspicuous location on the job site.

C303.1.1.1 Blown or sprayed fiberglass and cellulose insulation. For blown or sprayed fiberglass and cellulose insulation the initial installed thickness, settled thickness, settled *R*-value, installed density, coverage area and number of bags installed shall be *listed* on the certification.

C303.1.1.2 Sprayed polyurethane foam insulation. For sprayed polyurethane foam (SPF) insulation the installed thickness of the areas covered and *R*-value of installed thickness shall be *listed* on the certification.

C303.1.1.3 Reflective insulation. Reflective insulation shall be labeled with the number of reflective sheets and the number and thickness of the enclosed air spaces to attain the product *R*-value as determined in accordance with ASTM C1224.

Add new definitions as follows:

ENCLOSED AIR SPACE. An unventilated cavity between two continuous surfaces (sheets) with a continuous border of building components.

REFLECTIVE INSULATION. An assembly with one or more surfaces with emittance of 0.1 or less with at least one low emittance surface that faces an enclosed air space.

Add new standard to Chapter 5 as follows:

ASTM

C1224-11 Standard Specifications for Reflective Insulation for Building Applications

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R303.1.1 (N1101.12.1) Building thermal envelope insulation. An *R* value identification mark shall be applied by the manufacturer to each piece of *building thermal envelope* insulation 12 inches (305 mm) or greater in width. Alternately, the insulation installers shall provide a certification listing the type, manufacturer and *R*-value of insulation installed in each element of the *building thermal envelope*. ~~For blown or sprayed insulation (fiberglass and cellulose), the initial installed thickness, settled thickness, settled *R*-value, installed density, coverage area and number of bags installed shall be listed on the certification. For sprayed polyurethane foam (SPF) insulation, the installed thickness of the areas covered and *R*-value of installed thickness shall be listed on the certification.~~ The insulation installer shall sign, date and post the certification in a conspicuous location on the job site.

R303.1.1.1 (N1101.12.1.1) Blown or sprayed fiberglass and cellulose insulation. For blown or sprayed fiberglass and cellulose insulation the initial installed thickness, settled thickness, settled *R*-value, installed density, coverage area and number of bags installed shall be *listed* on the certification.

R303.1.1.2 (N1101.12.1.2) Sprayed polyurethane foam insulation. For sprayed polyurethane foam (SPF) insulation the installed thickness of the areas covered and *R*-value of installed thickness shall be *listed* on the certification.

R303.1.1.3 (N1101.12.1.3) Reflective insulation. Reflective insulation shall be labeled with the number of reflective sheets and the number and thickness of the enclosed air spaces to attain the product *R*-value as determined in accordance with ASTM C1224.

Add new definitions as follows:

ENCLOSED AIR SPACE. An unventilated cavity between two continuous surfaces (sheets) with a continuous border of building components.

REFLECTIVE INSULATION. An assembly with one or more surfaces with emittance of 0.1 or less with at least one low emittance surface that faces an enclosed air space.

Add new standard to Chapter 5 as follows:

ASTM

C1224-11 Standard Specifications for Reflective Insulation for Building Applications

Reason: The section at present incorporates requirements that are specific to blown or sprayed fiberglass and cellulose insulation and to sprayed polyurethane foam insulation together with general requirements for building thermal envelope insulation materials. This proposal separates the generic and specific requirements.

The proposal also adds specific requirements similar to those for the other insulation materials (as well as appropriate definitions) for a type of material that has been in the market place for over 20 years and has had nationwide distribution and installation, namely reflective insulation. These products are well established and have two associated ASTM Standards, namely ASTM C727, Standard Practice for Installation and Use of Reflective Insulation in Building Constructions, and ASTM C1224, Standard Specification for Reflective Insulation for Building Applications. ASTM C1224 should be included in the IECC to provide the appropriate product specifications for reflective insulations.

ASTM C1224 can be viewed at: <http://reflectixinc.com/literature/securedpdfs/C1224.pdf>.

The products are currently included in the following state codes:

- FL – 2007 Florida Building Code, Section 719.1; 719.2.1 & Table 13-C1.2.3 & ASTM References Subchapter 13-3 (C1224)
- FL – 2010 Florida Building Code, Table 303.2 (ASTM Standards)
- MN - Thermal Insulation Standards, Section 7641.0130, Subpart 7

The purpose of this proposal is to incorporate into the IECC language that clarifies the pertinent requirements regarding reflective insulation *R*-values that are based on ASTM standards and shall be listed on certifications.

A companion proposal is being provided for section C303.

Cost Impact: This code change proposal will not increase the cost of construction.

Note: The two terms defined in this proposal are not found in other International Codes. However, the IBC does define 'reflective plastic core foil insulation' as follows:

REFLECTIVE PLASTIC CORE FOIL INSULATION. An insulation material packaged in rolls, that is less than 0.5 inches thick, with at least one exterior low emittance surface (0.1 or less) and a core material containing voids or cells.

Analysis: A review of the standard proposed for inclusion in the code, C1224-2011 Standard Specifications for Reflective Insulation for Building Applications, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

CE65 – 13

C303.1.3, Chapter 5, R303.1.3 (IRC N1101.12.3), Chapter 5

Proponent: Joseph R. Hetzel, P.E., Thomas Associates, Inc., representing the Door & Access Systems Manufacturers Association (DASMA) International (jhetzel@thomasamc.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C303.1.3 Fenestration product rating. U-factors of fenestration products (windows, doors and skylights) shall be determined in accordance with NFRC 100 ~~by an accredited, independent laboratory, and labeled and certified by the manufacturer.~~

Exception: Where required, garage door U-factors shall be determined in accordance with either NFRC 100 or ANSI/DASMA 105.

U-factors shall be determined by an accredited, independent laboratory, and labeled and certified by the manufacturer. Products lacking such a labeled U-factor shall be assigned a default U-factor from Table C303.1.3(1) or C303.1.3(2). The solar heat gain coefficient (SHGC) and *visible transmittance* (VT) of glazed fenestration products (windows, glazed doors and skylights) shall be determined in accordance with NFRC 200 by an accredited, independent laboratory, and labeled and certified by the manufacturer. Products lacking such a labeled SHGC or VT shall be assigned a default SHGC or VT from Table C303.1.3(3).

Add new standard to Chapter 5 as follows:

DASMA

ANSI/DASMA 105-2004 Test Method for Thermal Transmittance and Air Infiltration of Garage Doors

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R303.1.3 (N1101.12.3) Fenestration product rating. U-factors of fenestration products (windows, doors and skylights) shall be determined in accordance with NFRC 100 ~~by an accredited, independent laboratory, and labeled and certified by the manufacturer.~~

Exception: Where required, garage door U-factors shall be determined in accordance with either NFRC 100 or ANSI/DASMA 105.

U-factors shall be determined by an accredited, independent laboratory, and labeled and certified by the manufacturer. Products lacking such a labeled U-factor shall be assigned a default U-factor from Table R303.1.3(1) or R303.1.3(2). The solar heat gain coefficient (SHGC) and *visible transmittance* (VT) of glazed fenestration products (windows, glazed doors and skylights) shall be determined in accordance with NFRC 200 by an accredited, independent laboratory, and labeled and certified by the manufacturer. Products lacking such a labeled SHGC or VT shall be assigned a default SHGC or VT from Table R303.1.3(3).

Add new standard to Chapter 5 as follows:

DASMA

ANSI/DASMA 105-2004 Test Method for Thermal Transmittance and Air Infiltration of Garage Doors

Reason: Although NFRC 100 has been updated to include procedures for garage doors, there are instances where companies do not and cannot manufacture the 7' by 7' door size required to validate the NFRC 100 simulation by testing to NFRC 102. Research has shown that garage doors tested to ANSI/DASMA 105 result in U-factor values comparable to NFRC 100/NFRC 102. "Where required" indicates that the Exception only applies where garage doors are affected by conditioned space since there may be detached, non-conditioned structures where U-factor is not needed. We have separated the laboratory and labeling/certifying information since it applies to all doors including garage doors.

Cost Impact: The code change proposal will not increase the cost of construction.

C301.4 (NEW), R301.4 (NEW) (IRC N1101.10.3 (NEW)), R406 (NEW) (IRC N1106 (NEW))

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com), Agustin Mujica, Levitt Homes, Puerto Rico

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Add new text as follows:

C301.4 Tropical climate zone. The tropical climate zone shall be defined as:

1. Hawaii, Puerto Rico, Guam, American Samoa, U.S. Virgin Islands, Commonwealth of Northern Mariana Islands, and
2. Islands in the area between the Tropic of Cancer and the Tropic of Capricorn

PART II – IECC-RESIDENTIAL PROVISIONS

Add new text as follows:

R301.4 (N1101.10.3) Tropical climate zone. The tropical climate zone shall be defined as:

1. Hawaii, Puerto Rico, Guam, American Samoa, U.S. Virgin Islands, Commonwealth of Northern Mariana Islands, and
2. Islands in the area between the Tropic of Cancer and the Tropic of Capricorn.

R406. (N1106) Tropic zone option. *Residential buildings* in the tropical zone shall be deemed to comply with this Chapter where the following conditions are met:

1. Not more than one half of the *occupied space* is air conditioned.
2. The *occupied space* is not heated.
3. Solar, wind, or other renewable energy source supplies at least 80 percent of the energy for service water heating.
4. Glazing in *conditioned space* has a *solar heat gain coefficient* of less than or equal to 0.40, or has an overhang with a projection factor equal to or greater than 0.30.
5. Permanently installed lighting is in accordance with Section R404.
6. The exterior roof surface complies with one of the options in Table C402.2.1.1, or the roof has insulation with an *R-value* of R-15 or greater. If present, attics above the insulation are vented and attics below the insulation are unvented.
7. Roof surfaces have a minimum slope of one quarter inch per foot of run. The finished roof does not have water accumulation areas.
8. Operable fenestration provides ventilation area equal to a minimum of 14% of the floor area in each room. Alternatively, equivalent ventilation is provided by a ventilation fan.
9. Bedrooms with walls facing two different directions have operable fenestration facing two directions.
10. Interior doors to bedrooms are capable of being secured in the open position.
11. A ceiling fan or ceiling fan rough-in is provided for bedrooms and the largest non-bedroom space.

Reason: This creates a Chapter 4 alternative for residences in the tropical climates as a new section. Tropical areas are quite different from the US mainland in climate, construction techniques, traditional construction, and energy prices. The IECC treats tropical climates as if they were simply a southern extension of the US mainland. Traditional residences, especially the less expensive residences, have evolved inexpensive ways to work with the tropical climates to provide comfortable interior spaces

without the need for substantial space conditioning. Tropical electrical prices, usually over 20 cents per kWh, provide a substantial incentive for energy conservation. Solar water heating works particularly well in tropical climates.

This proposed change is meant to add a simple option for a newly defined climate zone, the "tropical zone". The area between the Tropic of Cancer and the Tropic of Capricorn is the area between 23.5° northern and southern latitude of the equator. A zone that recognizes the unusually constant and unique climate of this region would help make the ICC Codes more of an "international code".

Traditional construction, especially with solar water heating, is usually more energy efficient than the construction style assumed in the IECC, as is shown by an analysis done for Puerto Rico.¹ Using energy efficient versions of traditional construction saves more energy and is much more cost-effective than pushing those in tropical climates to adopt mainland construction practices. Traditional tropical construction focuses on greatly reducing or eliminating the need for space conditioning by making a living space that is comfortable without space conditioning.

The requirements proposed here are based on informal conversations with those who live in tropical regions. The proponent does not live in the proposed tropical zone and will continue to solicit the input of those who do. Some items were taken from energy codes proposed or in place in the tropical regions. This is not intended as a replacement for existing topical codes, such as the energy codes recently adopted in Hawaii and Puerto Rico. This is meant as a simple climate-appropriate alternative for tropical climates.

Reason by item:

#1 Air conditioning only a portion of the residence is common in some residences and saves energy compared to air conditioning the whole occupied space.

#2 Heating is seldom needed.

#3 Consistently warm temperatures and high power costs make solar water heating very attractive. Solar water heating is widely used. Water heating is often 35% or more of the residential energy use.^{1,2} Substantial energy savings come from solar water heating.

#4 Limiting solar gains and providing ventilation is the energy focus for windows. Window U-factor has little impact. Window air tightness is of little value when the important feature of the windows is their ability to be operable and provide ventilation.

#5 High efficiency lighting makes sense with tropical energy prices.

#6 This references the "cool roof" provisions. This is similar to an option in Hawaii's code and the Puerto Rico Energy Center's analysis. Insulation is less valuable in mild climates where the outside temperature is often comfortable as an inside temperature.

#7 Even flat roofs need to drain.

#8 Ventilation provided by tropical winds makes occupied spaces more comfortable. 14% is an option for unconditioned residences in Hawaii's new energy code.

#9 When bedroom walls facing two directions are available, ventilation on both walls will be more effective.

#10 Interior doors should not block bedroom ventilation. This is similar to Hawaii's new energy code and recommended by the Puerto Rico Energy Center.

#11 Ceiling fans increase comfort without conditioning the air. This is similar to Hawaii's new energy code and recommended by the Puerto Rico Energy Center.

1. "Energy Modeling of Low Income Residencies" by C. G. Morales & A. J. Malavé

<http://library.witpress.com/pages/PaperInfo.asp?PaperID=22547>

The paper above is not free. The proponents will send a Puerto Rico Energy Center presentation done for DOE that summarizes that work to anyone who requests this by email.

2. Typical Hawaiian energy use for hot water: <http://www.hawaiienergy.com/16/water-heating>

Cost Impact: The code change proposal will not increase the cost of construction.

CE67 – 13

C303.1.4.1 (NEW), Chapter 5, R303.1.4.1 (N1101.12.4) (NEW), Chapter 5

Proponent: Matt Dobson, Vinyl Siding Institute (mdobson@vinylsiding.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Add new text as follows:

C303.1.4 Insulation product rating. The thermal resistance (*R*-value) of insulation shall be determined in accordance with the U.S. Federal Trade Commission *R*-value rule (CFR Title 16, Part 460) in units of $\text{h} \cdot \text{ft}^2 \cdot ^\circ\text{F}/\text{Btu}$ at a mean temperature of 75°F (24°C).

C303.1.4.1 Insulated siding. The thermal resistance (*R*-value) of insulated siding shall be determined in accordance with ASTM C1363. Installation for testing shall be in accordance with the manufacturer's installation instructions.

Add new standard to Chapter 5 as follows:

ASTM

C1363 Standard Test Method for Thermal Performance of Building Materials and Envelope Assemblies by Means of a Hot Box Apparatus

PART II – IECC-RESIDENTIAL PROVISIONS

Add new text as follows:

R303.1.4 (N1101.12.4) Insulation product rating. The thermal resistance (*R*-value) of insulation shall be determined in accordance with the U.S. Federal Trade Commission *R*-value rule (CFR Title 16, Part 460) in units of $\text{h} \cdot \text{ft}^2 \cdot ^\circ\text{F}/\text{Btu}$ at a mean temperature of 75°F (24°C).

R303.1.4.1 (N1101.12.4.1) Insulated siding. The thermal resistance (*R*-value) of insulated siding shall be determined in accordance with ASTM C1363. Installation for testing shall be in accordance with the manufacturer's installation instructions.

Add new standard to Chapter 5 as follows:

ASTM

C1363 Standard Test Method for Thermal Performance of Building Materials and Envelope Assemblies by Means of a Hot Box Apparatus

Reason: This additional requirement is necessary so that the testing protocol is spelled out clearly as the valid method for testing of *R*-value for insulated siding.

The Federal Trade Commission agrees that ASTM C1363 is the appropriate test method for insulated siding and further supported specific protocol as a part of ASTM C1363, established in ASTM D7793, is in the spirit of the home insulation rule.

Without adding this information to the energy code, manufacturers could try to enter the home insulation/insulated siding marketplace with product that has not been tested appropriately for *R*-value. This addition will ensure that proper, close to field condition testing, is required for any type of insulated siding to qualify as home insulation and in the energy code. This will ultimately result in a manufacturer compliance requirement and create easy enforcement for the building official and energy specialists. It will also further ensure that insulated siding's determined *R*-value will be legitimate in determining energy performance calculations and consumer confidence that it will provide specific energy performance.

This is a photo of a test chamber and insulated siding being tested to ASTM C1363.

Cost Impact: The code change proposal will have minimal cost impact as many insulated siding products are on the market and are certified and labeled in the way.

CE67-13

CE68 – 13

C303.1.4, R303.1.4 (IRC N1101.12.4)

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Delete without substitution as follows:

~~**C303.1.4 Insulation product rating.** The thermal resistance (R-value) of insulation shall be determined in accordance with the U.S. Federal Trade Commission R-value rule (CFR Title 16, Part 460) in units of $\text{h ft}^2\text{°F/Btu}$ at a mean temperature of 75°F (24°C).~~

PART II – IECC-RESIDENTIAL PROVISIONS

Delete without substitution as follows:

~~**R303.1.4 (N1101.12.4) Insulation product rating.** The thermal resistance (R-value) of insulation shall be determined in accordance with the U.S. Federal Trade Commission R-value rule (CFR Title 16, Part 460) in units of $\text{h ft}^2\text{°F/Btu}$ at a mean temperature of 75°F (24°C).~~

Reason: These references were judged non-compliant with CP-28 by ICC staff in the year they were brought into the code. The IECC does not need to repeat Federal law. The code official is not responsible for enforcing the FTC requirements on the insulation manufacturers. When Federal law changes the reference will be out of date.

Cost Impact: This code change proposal will not increase the cost of construction.

CE68-13

PART I – IECC-COMMERCIAL PROVISIONS

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IECC-RESIDENTIAL PROVISIONS

Public Hearing:	Committee:	AS	AM	D

C303.1.4-EC-CONNER.doc

CE69 – 13

C401.1

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C401.1 Scope. The ~~provisions requirements contained~~ in this chapter are applicable to commercial buildings and their *building sites* ~~or portions of commercial buildings~~.

Reason: This proposal includes building sites in the scope of the IECC (consistent with C101.2). The other ICC codes use the terminology “provisions in this chapter....” The code was revised during the last code development cycle to clarify that building sites associated with the building are included due to the scope of the provisions in the lighting chapter. There is no need to include “or portions of commercial buildings” because that higher level scope is covered in Chapter 1.

Cost Impact: The code change proposal will not increase the cost of construction.

CE69-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C401.1-EC-WILLIAMS.doc

CE70 – 13

C401.2, C401.2.1

Proponent: Larry Spielvogel, PE, FASHRAE, representing self

Revise as follows:

C401.1 Scope. The requirements contained in this chapter are applicable to commercial buildings, or portions of commercial buildings.

C401.2 Application. Commercial buildings shall comply with one of the following:

- ~~1. The requirements of ANSI/ASHRAE/IESNA 90.1.~~
2. 1. The requirements of Sections C402, C403, C404 and C405. In addition, commercial buildings shall comply with either Section C406.2, C406.3 or C406.4.
3. 2. The requirements of Section C407, C402.4, C403.2, C404, C405.2, C405.3, C405.4, C405.6 and C405.7. The building energy cost shall be equal to or less than 85 percent of the standard reference design building.

C401.2.1 Application to existing buildings. Additions, alterations and repairs to existing buildings shall comply with one of the following:

1. Sections C402, C403, C404 and C405; or
- ~~2. ANSI/ASHRAE/IESNA 90.1.~~

Reason: The purpose of this code change is to delete the current option that exists to use ASHRAE 90.1 in lieu of all of the requirements in Chapter 4 of the Commercial Provisions in the IECC. This code change will make the IECC simpler, less expensive to use, easier to learn, and will prevent people from using ASHRAE 90.1 to get around the provisions of IECC Chapter 4 and other I Codes, such as the IMC.

1. ASHRAE 90.1-2013 Is Not and Will Not Be Available. Just like in previous code cycles, ASHRAE is not likely to publish an ANSI approved version of 90.1-2013 until just before or during the Final Action Hearings in Atlantic City in October 2013. Thus, it is not possible to see even a working draft of 90.1-2013 by the Committee Action Hearing in Dallas in April, and it may not even be possible to see the final published and ANSI approved 90.1 before the Final Action Hearings in October.

Therefore, any proposal to allow ASHRAE 90.1-2013 or even a working draft to be used by anyone in lieu of all of the specific requirements in IECC Chapter 4 is just not fair or equitable. ASHRAE must follow the ICC rules, just like all other consensus documents that are referenced, by providing ANSI approved and published copies well before the hearings. Otherwise, it is not possible for the IECC Committee or the ICC Members and the public to adequately review, comment, and testify on the content and provisions of the specific version of ASHRAE 90.1 that will be adopted.

2. ASHRAE 90.1 Circumvents IECC Requirements. The current option to use the less stringent ASHRAE 90.1 in lieu of all of the requirements in IECC Chapter 4 provides any user with multiple ways to circumvent many of the IECC and other I Code requirements. Thus, compliance with ASHRAE 90.1 can be less stringent than with IECC Chapter 4 compliance. It will not be possible for anyone to know until after all changes are made and adopted at the Final Action Hearings whether ASHRAE 90.1 is at least as stringent as Chapter 4 of the IECC. If 90.1 is not at least as stringent as Chapter 4, then you will allow these less stringent requirements in 90.1 to be used at will, defeating the purpose of having an energy code.

At least some of the lighting provisions in ASHRAE 90.1 (as yet unknown) are likely to be less stringent than those in C405.5.2(1) and (2) of IECC. ASHRAE 90.1 also allows additional lighting power allowances in that can be much higher than those in the footnotes to IECC Table C405.5.2(2). The IECC should not allow people to unilaterally circumvent IECC voted and adopted lighting power allowances without justification and public hearings. As another example, IECC C402.4.5.1 and C402.4.5.2 require the use of the 2010 AMCA standard 500D for dampers in Chapter 4, while ASHRAE 90.1-2010 requires the use of the 2007 AMCA Standard 500D in Section 12, and then only for damper leakage, while IECC requires AMCA 500-D-2010 for both damper leakage and for stairway and shaft vents. Thus, the option to use ASHRAE 90.1 circumvents the IECC required use of the current 2010 AMCA damper standard and ASHRAE 90.1 does not require its use in as many places as does the IECC.

3. ASHRAE 90.1 Is Unenforceable. ASHRAE 90.1 is unenforceable because the requirements are so numerous and so complex that most code officials do not have and cannot readily or economically get the extensive training and experience to be able to understand and enforce the ASHRAE 90.1 requirements. ASHRAE 90.1 has many more requirements than the IECC. The 2012 IECC is 89 pages, while 90.1-2010 is already 228 pages, with over 100 more new addenda to be included in the 2013 edition. The ASHRAE 90.1-2010 User's Manual is another 469 pages long. There are almost no local training courses or training programs on ASHRAE 90.1 at the many locations and jurisdictions where the IECC is adopted that are specifically for code officials. At best, there may be a dozen or so competent and comprehensive training programs on ASHRAE 90.1 each year in the entire country, mostly in a few major cities, and none of those is specifically for code officials. Learning and completely understanding ASHRAE 90.1 is also difficult even for most practicing architects, engineers, and contractors, making it difficult for them to comply, thus imposing an even greater burden on code officials to verify compliance.

Even the ASHRAE 90.1 committee itself has difficulty writing and understanding the standard, since they issue hundreds of addenda, errata, formal interpretations, and informal interpretations every year in attempts to change or clarify their intent and rectify their own numerous errors. The one-year-old addenda for ASHRAE 90.1-2010 is 44 pages long and many more pages are coming. So far, ASHRAE has issued 14 errata sheets to 90.1-2010. The addenda to 90.1-2007 that were incorporated into 90.1-2010 are designated from a to dr. The addenda so far to 90.1-2010 that will be incorporated into 90.1-2013 are designated from a to cr. Thus, the criteria, requirements, and corrections for ASHRAE 90.1 change almost weekly. Nor are the changes from the prior edition clearly marked by ASHRAE, as they are in the IECC, so the reader can readily see the changes and deletions. Which of these many documents and provisions are to be applied and enforced for any specific permit application on any specific day?

4. ASHRAE 90.1 is Not Coordinated. The IECC is carefully coordinated with the other International Codes, and ASHRAE 90.1 is not. This results in conflicts and contradictions. For example, just Chapter 4 of the IECC has at least eleven references to and requirements for compliance with the other International Codes, while ASHRAE 90.1 has not one. While some of the provisions in IECC are similar to ASHRAE 90.1, ASHRAE 90.1 has many more requirements and exceptions that do not exist in the IECC, providing more latitude and less stringency for users than in the IECC and other I Codes.

5. ASHRAE 90.1 is Not Unified. Providing the option to use ASHRAE 90.1 in lieu of IECC Chapter 4 diverts efforts from pursuing a unified and comprehensive set of International Codes. The option to use ASHRAE 90.1 in lieu of IECC Chapter 4 provides an unsupervised and unmonitored path for special and vested interests to include their provisions in ASHRAE 90.1 that would never be accepted in the IECC. For example, ASHRAE does not hold any public hearings on any changes to or on the entire standard. Thus, the “back door” to ASHRAE 90.1 opens wider than that for the IECC, especially since so many of the ASHRAE 90.1 voting members work for or represent special interests, so they can pursue those interests from the inside. For example, a significant percentage of the members of the ASHRAE 90.1 Mechanical Subcommittee are employed by manufacturers of heating, air conditioning, and water heating equipment, or by their trade associations. Most of the other voting members of the ASHRAE 90.1 Committee do not know enough to debate and vote intelligently on those issues, which are then adopted and included in the Standard. As another example, the majority of the voting members of the ASHRAE 90.1 Committee know little or nothing about lighting, so there is a great tendency to “rubber stamp” recommendations that come from the Lighting Subcommittee. Accordingly, many provisions in ASHRAE 90.1 diverge from those in IECC.

6. ASHRAE 90.1 Copies Unavailable. ASHRAE does not normally offer and provide free copies of 90.1 (\$125 per copy last year plus another \$99 for the User's Manual) to code officials. Very few code jurisdictions have budgets to purchase copies of the ASHRAE documents for each plan checker and inspector; much less the estimated thousands of dollars per user to purchase the many mandatory ASHRAE references (beyond those in the IECC) needed to determine compliance. Few code jurisdictions, and similarly few architectural, engineering, or construction firms have the sophisticated software, training, and experience, much less the time and computers required to run and check the 90.1 Section 11 Energy Cost Budget (ECB) Method calculations allowed by ASHRAE 90.1 for further compliance options.

7. The Use of ASHRAE 90.1 is Not Precluded. Most, if not all relevant provisions of ASHRAE 90.1 can still be used at the discretion of the user, so long as they are at least as stringent as Chapter 4 of IECC. People who wish to comply with ASHRAE 90.1 for any other reasons, such as, but not limited to LEED® certification can still easily do so, provided they also meet the requirements of Chapter 4 of IECC.

Cost Impact: This code change proposal will not increase the cost of construction. There will be a very substantial cost savings since code officials and users of the IECC will not have to buy additional standards and references or spend the time and pay for additional training. The provisions proposed in this code change for deletion are simply optional already in the IECC, and no other provisions in the IECC will be changed or affected.

C401.2-EC-SPIELVOGEL.doc

CE71 – 13

C401.2, C406

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

Revise as follows:

C401.2 Application. Commercial buildings shall comply with one of the following:

1. The requirements of ANSI/ASHRAE/IESNA 90.1.
2. The requirements of Sections C402, C403, C404 and C405. ~~In addition, commercial buildings shall comply with either Section C406.2, C406.3 or C406.4.~~
3. The requirements of Section C407, C402.4, C403.2, C404, C405.2, C405.3, C405.4, C405.6 and C405.7. The building energy cost shall be equal to or less than ~~85~~ 90 percent of the standard reference design building.

Delete without substitution as follows:

SECTION C406

~~ADDITIONAL EFFICIENCY PACKAGE OPTIONS~~

Reason: Stringency increases in the energy codes don't necessarily mean energy savings. Parts of the energy code are usually ignored. The sections eliminated here were added primarily to increase stringency, not because they solve a problem.

Most parts of Section C406 are problematic. As the Federally required equipment efficiency changes, the heating and cooling equipment in Section C406.2 will become out of date. As Federal minimum equipment efficiency requirements change the tables in Section 406.2 will become out of date; for example, the minimum air conditioner and heat pump efficiencies just changed. The minimum furnace efficiencies are expected to change in the next few years. Efficiencies sufficiently above the Federal requirements to be in that table may not even be available for some types of equipment. The solar renewable option in C406.4 will be difficult in dense urban settings, for example when buildings shade other buildings, or worse, when future buildings end up shading existing buildings where the renewables were dependent on sunshine. If efficient equipment is unavailable and renewables are impractical due to shading, the only remaining option is a lower lighting power density (LPD) in Section C406.3. The LPDs could be quite a challenge-- most required LPDs in Section C406.3 are more restrictive than ASHRAE's green standard (ASHRAE 189.1).

The goal of Section C406 was to reduce energy use by 5%. The 85% factor in Section C401.2 includes that 5%, so it is increased to 90% by this change to align it with the deletion of Section C406.

The IECC is changing too fast and becoming too complicated. We need to let code enforcement and those using the code catch up. The code complexity has outpaced the code enforcement community's ability to absorb more and more requirements. At some point we have to ask what is the contribution to energy efficiency for requirements that are not implemented? Or worse, what is the contribution for requirements that alienate potential users of the energy code to the point that they don't enforce, or even adopt, the IECC?

Cost Impact: The code change proposal will not increase the cost of construction.

CE71-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C401.2-EC-CONNER

CE72 – 13

C401.2

Proponent: Mark Nowak, M. Nowak Consulting, LLC, representing Steel Framing Alliance

Revise as follows:

C401.2 Application. Commercial buildings shall comply with one of the following:

1. The requirements of ANSI/ASHRAE/IESNA 90.1.
2. ~~The requirements of Sections C402, C403, C404 and C405. In addition, commercial buildings shall comply with either Section C406.2, C406.3 or C406.4.~~
- 3 2. The requirements of Section C407, C402.4, C403.2, C404, C405.2, C405.3, C405.4, C405.6 and C405.7. The building energy cost shall be equal to or less than 85 percent of the standard reference design building.

Exception: Buildings 25,000 gross square feet and less in floor area shall be permitted to comply with the same approach as for existing buildings and alterations in Section C401.2.1 and either Section C406.2, C406.3 or C406.4.

Reason: In order to reach the ultimate goal of net zero energy buildings, it will be necessary to move toward a code that is 100% performance oriented. The proposal will require designers to look at the most cost-effective ways to meet the code rather than rely on prescriptive solutions that offer less and less benefit at substantial cost to the owner and consumer. This proposal will also facilitate future improvements to the code for larger buildings. As cost effectiveness continues to be a difficult concept to address with any sort of consensus, this proposal will shift the debate toward the overall energy savings goal rather than continued debate over a range of individual components.

The proposal also recognizes that some smaller buildings, including multifamily buildings, are not as complex as larger buildings and thus retains alternative compliance paths for these building types.

Cost Impact: This proposal will not increase the cost of construction

C401.2-EC-NOWAK.doc

CE73 – 13

C202 (New), C401.2, C407.1, C407.3, C407.4 through C407.6.2

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C401.2 Application. Commercial buildings shall comply with one of the following:

1. The requirements of ANSI/ASHRAE/IESNA 90.1.
2. The requirements of Sections C402, C403, C404 and C405. In addition, commercial buildings shall comply with either Section C406.2, C406.3 or C406.4.
3. The requirements of Section C402.4, C403.2, C404, C405.2, C405.3, C405.4, C405.6 C405.7 and C407. The building energy cost shall be equal to or less than 85 percent of the standard reference design building.

C407.1 Scope. This section establishes criteria for compliance using total expected building performance of a proposed building design in terms of regulated energy use. The following systems and loads shall be included in determining the total building performance: heating systems, cooling systems, service water heating, fan systems, lighting power, receptacle loads and process loads.

C407.3 Performance-based compliance. Compliance based on total building performance requires that a proposed building (*proposed design*) be shown to have an annual energy cost that is less than or equal to the annual energy cost of the *standard reference design*. Energy prices shall be taken from a source approved by the code official, such as the Department of Energy, Energy Information Administration's *State Energy Price and Expenditure Report*. Code officials shall be permitted to require time-of-use pricing in energy cost calculations. Nondepletable energy collected off site shall be treated and priced the same as purchased energy. Energy from nondepletable energy sources collected on site shall be omitted from the annual energy cost of the *proposed design*.

Exception: Jurisdictions that require site energy (1 kWh = 3413 Btu) rather than energy cost as the metric of comparison.

C407.3 Performance-based compliance. Total building performance shall be calculated and documented by a *registered design professional* in accordance with Appendix G of ANSI/ASHRAE/IESNA 90.1, and shall show a minimum a performance percentage improvement of 26 percent of *regulated energy use* when calculated in accordance with Section G.1.2 of Appendix G. Energy that is not *regulated energy use* shall be subtracted from both the *proposed design* and the baseline building after building performance simulations are completed, but prior to calculating the percentage improvement.

Add new definition as follows:

**SECTION C202
GENERAL DEFINITIONS**

REGULATED ENERGY USE. Energy used for HVAC, lighting, service water heating, motors, transformers and other building systems, equipment, components, and processes with requirements prescribed in this code.

Reason: The target of 26% improvement in proposed section C407.3 above will change based on the final development of 90.1-2013 Appendix G. The percentage is intended to represent the improvement from the Appendix G baseline to the 90.1-2013 requirements. The percentage improvement required to satisfy the performance path is under development in the ASHRAE committees and is expected to be ready before the final 2015 IECC code hearings. The final percentage improvement required could range from 45% if the Appendix G baseline is set at 90.1-2004 levels (as currently proposed by SSPC 90.1) to 0% if the Appendix G baseline is set at 90.1-2013 levels.

This proposal intends to create in the IECC a singular performance path to compliance, and require compliance be based on a set reduction in energy cost for the proposed design over the standard design building.

Since the first energy codes and standards were published almost 40 years ago, there has always been a path to compliance that recognizes the ability for a building design to meet the intent of the energy code or standard without necessarily meeting each and every minimum prescriptive requirement. This path in the energy codes continues the concept embodied in the long-standing building code provision entitled "alternative methods and materials." In short, the intent is to allow a designer to show that their building as designed will perform at or better than if it was just designed to meet the minimum code provisions.

While energy codes and standards provide criteria for HVAC, service water heating systems, and lighting systems on an independent basis with each provision having to be satisfied, it is understandable that one may wish to modify the design of prescriptive items and make up for increased energy use by increasing efficiency elsewhere in the building. For instance, one might want to provide fenestration that does not meet the prescriptive minimum code while at the same time implementing a reduction in connected lighting power below that allowed in the code. The intent is to allow the degree to which one building component or system does not meet minimum to be "traded off" against the degree to which one or more others exceed the minimum. This provision allows consideration of the building as a whole, recognizing that energy use and associated operating costs of a building occur "at the meter" and are the result of many interactions between the structure and the systems that provide the myriad of services in the building.

Although the concept of "equal or better" performance of the actual building design seems to indicate code compliance, it is not that simple. For most commercial buildings, such calculations require computer simulation by well-versed professionals along with a number of directions to ensure accurate results and minimization of gaming. Initially energy codes and standards had a singular set of criteria that were followed when conducting such building performance analysis. Since ASHRAE Standard 90 and the MEC (now the IECC) were maintained by different entities, the criteria associated with this compliance path digressed, in part because of the amount of time and effort stakeholders and others expended to update, maintain, and enhance the building performance approach. ASHRAE 90.1 has had and continues to have a long-standing focus on this path to compliance and is a referenced compliance path

to the IECC pursuant to C401.2 (1). This raises the question—why have two separate processes focused on the same complex problem when it is simpler to rely on one?

It is for the following reasons that this change is proposed:

- Annual energy analysis and simulation is complicated and the governing rules more likely to improve if all interested and affected parties (e.g., design professionals) can focus their efforts on one approach.
- Code officials receiving compliance documentation associated with this path will have a uniform and singular set of inputs and outputs to get comfortable with in addition to knowing all results they receive are developed with the same identical “black box.”
- Those with expertise in building energy modeling are heavily involved in development and updating of ASHRAE Standard 90.1, putting in easily a man-year of labor each year to keep the provisions in the standard current.

There is a possible reduction in construction cost and the costs associated with plan review and approval associated with this proposed change. Designers will have a single robust and technically supported approach to use for building performance, which should streamline their efforts. Similarly, code officials and plan reviewers will have a singular and uniform type of documentation to review.

Cost Impact: The code change proposal will not increase the cost of construction it may reduce the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C401.2-EC-WILLIAMS.doc

CE74 – 13

C401.2, C401.2.1, Chapter 5

Proponent: Michael A. Anthony, P.E., University of Michigan, representing US Education Facilities Industry – APPA.ORG – Leadership in Education

Revise as follows:

C401.2 Application. Commercial buildings shall comply with one of the following:

1. The requirements of ANSI/ASHRAE/IESNA 90.1.
2. The requirements of Sections 502, 503, 504 and 505. In addition, commercial buildings shall comply with either Section 506.2, 506.3 or 506.4.
3. The requirements of Section 507, 502.4, 503.2, 504, 505.2, 505.3, 505.4, 505.6 and 505.7. The building energy cost shall be equal to or less than 85 percent of the standard reference design building.
4. The requirements of ISO 50001.

401.2.1 Application to existing buildings. Additions, alterations and repairs to existing buildings shall comply with one of the following:

1. Sections 502, 503, 504 and 505; or
2. ANSI/ASHRAE/IESNA 90.1.
3. The requirements of ISO 50001.

Add new standard to Chapter 5 as follows:

ISO

50001-2011 Energy management systems – Requirements with guidance for use.

Reason: The US education facilities industry believes that a performance standard such as ISO 50001 is a more economical and faster path to meet our industry's energy conservation goals for the following reasons:

1. ISO 50001 provides a flexible template for states and local jurisdiction to implement local energy conservation programs that are most effective for their climates, risk aggregations and economy. For example, Section 4.4.4 of ISO 50001 states:

"The organization shall establish an energy baseline(s) using the information from the initial energy review, considering a data period suitable to the organization's energy use and consumption. Change in energy performance shall be measured against the energy baseline(s)"

2. The US Department of Energy (DOE) supports the ISO 50001 Standard as a proven approach for U.S. industrial and commercial facilities to plan, manage, measure, and continually improve energy performance.

Note to Committee: release of restricted copies of ISO 50001 for committee examination is in process

Cost Impact: The code change proposal will not increase the cost of construction. Lower cost because local jurisdictions will be able to a) establish their own baselines, and b) scale into energy conservation measures as technical and budget conditions allow as long as they meet established goals.

Analysis: A review of the standard proposed for inclusion in the code, ISO 50001-2011 Energy management systems – Requirements with guidance for use, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

CE74-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C401.2-EC-ANTHONY

CE75 – 13

C401.2.2 (NEW)

Proponent: Brian Dean, ICF International, representing Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; Bill Prindle, Energy Efficient Codes Coalition; and Don Vigneau, Northeast Energy Efficiency Partnerships.

Add new text as follows:

C401.2.2 Application to replacement fenestration products. Where some or all of an existing fenestration unit is replaced with a new fenestration product, including sash and glazing, the replacement fenestration unit shall meet the applicable requirements for *U-factor* and *SHGC* in Table C402.3.

Exception: An area-weighted average of the *U-factor* of replacement fenestration products being installed in the building for each fenestration product category listed in Table C402.3 shall be permitted to satisfy the *U-factor* requirements for each fenestration product category listed in Table C402.3. Individual fenestration products from different product categories listed in Table C402.3 shall not be combined in calculating the area-weighted average *U-factor*.

Reason: The purpose of this code change is to create a new code section to clarify that whenever an entire new fenestration product or assembly replaces some or all of an existing fenestration product (typically in the remodeling or modernizing of an existing building), the new fenestration product must meet the U-factor and SHGC requirements of the fenestration table. Section C401.2.1 of the 2012 IECC already requires that additions, alterations and repairs comply with C402 (thermal building envelope) – as a result this proposal does not add any additional requirements. However, this proposal will further clarify the application of the requirements, increase effective enforcement, and reduce the likelihood of confusion and differing interpretations:

- This proposed commercial fenestration requirement is identical to the residential requirement in Section R402.3.6. This specific requirement has been in the residential chapter of the IECC since at least the 2000 IECC. The exception adds additional flexibility by allowing the U-factor requirement to be satisfied on a weighted average basis by product category consistent with the current area-weighting approach to U-factor in section C402.3.4.
- Existing buildings represent one of the greatest untapped sources of energy efficiency, yet there are few ways to effectively require improvements to these buildings. This section does not mandate the replacement of windows; however, if windows are going to be replaced, the code should expressly require that the replacement windows achieve the same efficiency level as windows in newly constructed buildings.
- There is no valid reason why replacement windows cannot meet the same thermal efficiency requirements as windows installed in new buildings, so there is no reason to have separate requirements for them.
- Common repairs to damaged windows, such as the replacement of a broken pane of glass, would not be covered under C401.2.2.

Cost Impact: The code change proposal will not increase the cost of construction.

C401.3 (NEW), C401.3.1 (NEW), C401.3.2 (NEW), C401.3.3 (NEW)

Proponent: Tim Manz, City of Blaine, MN, representing the Association of Minnesota Building Officials (tmanz@ci.blaine.mn.us)

Add new text as follows:

C401.3 Additional requirements for inflated structures. Inflated structures with heating equipment installed shall be in accordance with this section.

C401.3.1 Envelope requirements. Foundation walls and slab-on-grade floors shall meet the requirements for conditioned spaces.

C401.3.2 Membrane insulation. Membranes shall have a minimum insulation value of R-12.

Exception: Inflated structures that are designed to deflate during the summer months.

C401.3.3 Air pressure controls. Structure air pressure shall have capacity to be controlled both manually and automatically with respect to outdoor wind speed.

Reason: These provisions have been in the Minnesota Commercial Energy Code for many years and are necessary to address inflated structures that are used in northern climates, especially during the winter months. A minimum insulation value of R-12 is reasonable when a heating system is installed to ensure that energy is conserved. based on a report completed for the Minnesota Department of Commerce, State Energy Office, in May 2002 titled "Energy Conservation Strategies for Air Supported Structures."

Cost Impact: The code change proposal will increase the cost of construction.

C401.3 (NEW)-EC-MANZ.doc

CE77 – 13

C402.1, C402.1.1, C402.1.1

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

C402.1 General (Prescriptive). ~~The building thermal envelope shall comply with Section C402.1.1. Section C402.1.2 shall be permitted as an alternative to the *R*-values specified in Section C402.1.1. Building thermal envelope assemblies for buildings that are intended to comply with the code on a prescriptive basis, in accordance with the compliance path described in Item 2 of Section C401.2, shall comply with the following:~~

1. The opaque portions of the building thermal envelope shall comply with the specific insulation requirements of Section C402.2 and the thermal requirements of either the *R*-value based method of Section C402.1.1 or the *U*-, *C*- and *F*-factor based method of Section C402.1.2;
2. Fenestration in building envelope assemblies shall comply with Section C402.3; and
3. Air leakage of building envelope assemblies shall comply with Section C402.4.

Alternatively, where buildings have a vertical fenestration area or skylight area that exceeds that allowed in Section C402.3, the building and the building thermal envelope shall comply with Section C401.2 Item 1 or Section C401.2 Item 3.

C402.1.1 Insulation and fenestration criteria. Insulation component *R*-value-based method. ~~The building thermal envelope shall meet the requirements of Tables C402.2 and C402.3~~ For opaque portions of the building thermal envelope intended to comply on an insulation component *R*-value-basis, the *R*-values for insulation in framing cavities, and for continuous insulation, shall be not less than that specified in Table C402.2, based on the climate zone specified in Chapter 3. Commercial buildings or portions of commercial buildings enclosing Group R occupancies shall use the *R*-values from the “Group R” column of Table C402.2. Commercial buildings or portions of commercial buildings enclosing occupancies other than Group R shall use the *R*-values from the “All other” column of Table C402.2. Buildings with a vertical fenestration area or skylight area that exceeds that allowed in Table C402.3 shall comply with the building envelope provisions of ANSI/ASHRAE/IESNA 90.1.

C402.1.2 *U*-factor alternative. Assembly *U*-factor, *C*-factor and *F*-factor-based method. ~~An assembly with a *U*-factor, *C*-factor, or *F*-factor equal or less than that specified in Table C402.1.2 shall be permitted as an alternative to the *R*-values in Table C402.2. Building thermal envelope opaque assemblies intended to comply on an assembly *U*-factor, *C*-factor or *F*-factor basis shall have a *U*-factor, *C*-factor, or *F*-factor that is not greater than that specified in Table C402.1.2. Commercial buildings or portions of commercial buildings enclosing Group R occupancies shall use the *U*-factor, *C*-factor, or *F*-factor from the “Group R” column of Table C402.1.2. Commercial buildings or portions of commercial buildings enclosing occupancies other than Group R shall use the *U*-factor, *C*-factor or *F*-factor from the “All other” column of Table C402.1.2.~~

Reason: This proposal is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Reasons for this proposal are as follows:

- a) This proposal is intended to clarify the use and application of the codes prescriptive building thermal envelope provisions and does not contain changes to the technical requirements of the code.
- b) These sections are proposed to be revised to *clarify* that fact that the code contains both *insulation component R-value* and *assembly U-/C-/F-factor* methods, either of which can be used to comply with the code's prescriptive building thermal

envelope provisions, and that they both methods are equally valid and independently useable. These proposed revisions are also intended to clarify the application of both of these available methods.

- c) The reference to Section C401.2, Item 2, in the first sentence of this proposal is intended to tie to the general scoping provisions of Chapter 4 and, in particular, the prescriptive IECC path.) Section C401.2 clearly indicates that Section C402 is applicable only in the compliance path outlined in Item 2 and is *not* applicable to the compliance paths outlined in Items 1 and 3.
- d) The intent of the code is that the method described in Section C402.1.1 is applicable to insulation components, while the method described in Section C402.1.2 is intended to apply to entire assemblies. As currently written, however, there is unnecessary interaction between the two prescriptive building thermal envelope methods/sections and the tables that they reference. This clouds their application. It also makes the *U*-factor method in particular extremely difficult to decipher and apply.

For example, the verbiage as written in Section C402.1.1 gives the appearance that the insulation layers are mandatory. In reality, however, these "prescriptive" R-values are only one of many possible wall combinations. This creates confusion in building community: they feel that the R-values are required and there is not an option.

In many scenarios it becomes critical that the availability of these options is communicated effectively by the code. For example, most seismically active locations (Oregon, WA, ID, MT) utilize 6" stud construction for low rise commercial construction. The walls under Table C402.1.2, however, are for 4" stud construction, which is uncommon in all but high-rise construction in these regions. It becomes critical, therefore, that the requirements related to Table C402.2 be readily understood and useable.

- e) This proposal takes the references to the U-factor method out of the R-value method provisions of Section C402.1.1 and moves them to a more appropriate location: to the general building envelope provisions of Section 402.1.
- f) Although current text indicates that the U-factor method is an alternative in Section C402.1.1, the current text of Section C402.1.1 appears to presents another alternative: to comply with the prescriptive building envelope provisions of ASHRAE 90.1. This alternative is presented in the last sentence of the current text of Section C402.1.1. However, Section C401.2 clearly indicates that Section C402 is applicable only to the prescriptive compliance path outlined in Item 2 to Section C401.2. This proposal, therefore, moves the text referencing ASHRAE 90.1 from the last sentence of Section C402.1.1 to the general prescriptive provisions of Section C402.1 but, instead of directly referencing ASHRAE 90.1, the proposed language now references the ASHRAE 90.1 compliance path of Item 1 to Section C401.2 and the IECC performance path of Item 3 to Section C401.2. The SEHPCAC has been advised by the original proponents of Sections C401.2 and C402.1.1 that the intent is that these compliance paths outlined in Items 1, 2 and 3 to Section C401.2 be used separately and should not be mixed and matched. This change clarifies that by essentially sending the user to ASHRAE 90.1 or the IECC performance path whenever the IECC prescriptive building envelope provisions of Section C402 are not satisfied. Specifically, high glass buildings (buildings with over 30% vertical fenestration area) do not comply with Section C402.3 (or, more specifically, subsection C402.3.1) and, as such, are directed by the proposed language to Item 1 or 3 of Section C401.2.

In reality, the proposed language in the last sentence to Section C402.1 is unnecessary. Any reference to ASHRAE 90.1 for prescriptive building thermal envelope requirements should be deleted from Section C402.1 because Section C401.2 already puts forth the three available commercial energy compliance paths and adequately covers the ASHRAE 90.1 alternative issue. Thus, references to ASHRAE 90.1 or other alternative energy compliance paths in Sections C402.1 or C402.1.1 only serve to add confusion. However, in the spirit of this code change, which is to reorganize and clarify, not to raise questions regarding intent, the language addressing these issues was simply moved from Section C402.1.1 to Section C402.1 and modified. Thus the tie to ASHRAE 90.1 remains in Section C402 but is clarified. So as not to jeopardize the success of this proposal, the SEHPCAC has also created a separate proposal to delete the existing reference to ASHRAE 90.1 in Section C402.1.1.

- g) The general provisions of Section C402.1 have been revised to clearly indicate the requirements in Section C402 that are specifically applicable to the R-value method of Section C402.1.1, the U-factor method of Section C402.1.2, and the ASHRAE 90.1 building envelope alternative method. Where a provision is applicable to all methods/alternatives, the information now appears in the general provisions of Section C402.1. Where a provision applies to only one method, the provision is referenced in the body of the provisions for that specific method.
- h) This proposal revises the section titles, as well as the text of the indicated sections, to clarify that the R-value method applies to individual insulation components, while the U-factor method applies to entire assemblies. Furthermore, typical I-Code format conventions require that code text stand on their own without the aid of the title. These revisions achieve that. That said, the use of the code is simplified wherever section titles are accurate, and this gives further justification to the proposed title revisions.
- i) As *R*-values are minimum values and *U*-factors are maximum values, these sections have been revised to clearly indicate this and eliminate unintended misapplication of the tables. Note that many users incorrectly assumed that both tables contained minimum values.

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

Cost Impact: This code change proposal will not increase the cost of construction. This proposal is a clarification and, as such, will not increase the cost of construction.

- Use of opaque assembly *U*-factors, *C*-factors, and *F*-factors from ANSI/ASHRAE/IESNA 90.1 Appendix A shall be permitted, provided the construction complies with the applicable construction details from ANSI/ASHRAE/IESNA 90.1 Appendix A.
- Where heated slabs are below grade, below-grade walls shall comply with the *F*-factor requirements for heated slabs.
- Roll-up or sliding doors shall have a maximum *U* factor of 0.21 or minimum *R*-4.75

C402.2 Specific insulation requirements (Prescriptive). ~~Opaque assemblies shall comply with Table C402.2.~~ Where two or more layers of continuous insulation board are used in a construction assembly, the continuous insulation boards shall be installed in accordance with Section C303.2. If the continuous insulation board manufacturer's installation instructions do not address installation of two or more layers, the edge joints between each layer of continuous insulation boards shall be staggered.

TABLE C402.2
OPAQUE THERMAL ENVELOPE REQUIREMENTS^a

C402.2.1 Roof assembly. ~~The minimum thermal resistance (*R*-value) of the insulating material installed either between the roof framing or continuously on the roof assembly shall be as specified in Table C402.2, based on construction materials used in the roof assembly.~~ Roof assemblies shall meet the requirements of Table 402.1. Skylight curbs shall be insulated to the level of roofs with insulation entirely above deck or R-5, whichever is less.

Exceptions:

1. Continuously insulated roof assemblies where the thickness of insulation varies 1 inch (25 mm) or less and where the area-weighted *U*-factor is equivalent to the same assembly ~~with the *R*-value specified in Table C402.2~~ C402.1.
2. Unit skylight curbs included as a component of an NFRC 100 rated assembly shall not be required to be insulated.

Insulation installed on a suspended ceiling with removable ceiling tiles shall not be considered part of the minimum thermal resistance of the roof insulation.

C402.2.3 Thermal resistance of Above-grade walls. ~~The minimum thermal resistance (*R*-value) of the insulating materials installed in the wall cavity between the framing members and continuously on the walls shall be as specified in Table C402.2, based on framing type and construction materials used in the wall assembly.~~ The *R*-value of Above-grade walls shall meet the requirements of Table 402.1. Integral insulation installed in concrete masonry units (CMU) shall not be used in determining compliance with ~~Table C402.2~~ C402.1.

"Mass walls" shall include walls weighing not less than:

1. 35 psf (170 kg/m²) of wall surface area; or
2. 25 psf (120 kg/m²) of wall surface area if the material weight is not more than 120 pounds per cubic foot (pcf) (1900 kg/m³).

C402.2.4 Thermal resistance of Below-grade walls. ~~The minimum thermal resistance (*R*-value) of the insulating material installed in, or continuously on, the below-grade walls shall be as specified in Table C402.2, and Below-grade walls shall meet the requirements of Table 402.1.~~ Insulation required to comply with Table 402.1 shall extend to a depth of 10 feet (3048 mm) below the outside finished ground level, or to the level of the floor, whichever is less.

C402.2.5 Floors over outdoor air or unconditioned space. ~~The minimum thermal resistance (*R*-value) of the insulating material installed either between the floor framing or continuously on the floor assembly shall be as specified in Table C402.2, based on construction materials used in the floor assembly.~~ Floors over outdoor or unconditioned space shall meet the requirements of Table 402.1.

"Mass floors" shall include floors weighing not less than:

1. 35 psf (170 kg/m²) of floor surface area; or
2. 25 psf (120 kg/m²) of floor surface area if the material weight is not more than 12 pcf (1,900 kg/m³).

C402.2.6 Slabs on grade. Where the slab on grade is in contact with the ground, the ~~minimum thermal resistance (R-value) of the insulation around the perimeter of unheated or heated slab-on-grade floors shall be as specified in Table C402.2. The slab shall meet the requirements of Table 402.1.~~ Insulation required to comply with Table 402.1 shall be placed on the outside of the foundation or on the inside of the foundation wall. The insulation shall extend downward from the top of the slab for a minimum distance as shown in the table or to the top of the footing, whichever is less, or downward to at least the bottom of the slab and then horizontally to the interior or exterior for the total distance shown in the table. Insulation extending away from the building shall be protected by pavement or by a minimum of 10 inches (254 mm) of soil.

Exception: Where the slab-on-grade floor is greater than 24 inches (61 mm) below the finished exterior grade, perimeter insulation is not required.

C407.5.1 Building specifications. The *standard reference design* and *proposed design* shall be configured and analyzed as specified by Table C407.5.1(1). Table C407.5.1(1) shall include by reference all notes contained in ~~Table C402.2~~ C402.1.

TABLE C407.5.1(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT CHARACTERISTICS	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Roofs	Type: Insulation entirely above deck Gross area: same as proposed U-factor: from Table C402.1.2 <u>C402.1</u> Solar absorptance: 0.75 Emittance: 0.90	As proposed As proposed As proposed As proposed As proposed
Walls, above-grade	Type: Mass wall if proposed wall is mass; otherwise steel-framed wall Gross area: same as proposed U-factor: from Table C402.1.2 <u>C402.1</u> Solar absorptance: 0.75 Emittance: 0.90	As proposed As proposed As proposed As proposed As proposed
Walls, below-grade	Type: Mass wall Gross area: same as proposed U-Factor: from Table C402.1.2 <u>C402.1</u> with insulation layer on interior side of walls	As proposed As proposed As proposed
Floors, above-grade	Type: joist/framed floor Gross area: same as proposed U-factor: from Table C402.1.2 <u>C402.1</u>	As proposed As proposed As proposed
Floors, slab-on-grade	Type: Unheated F-factor: from Table C402.1.2 <u>C402.1</u>	As proposed As proposed
Doors	Type: Swinging Area: Same as proposed U-factor: from Table C402.2 <u>C402.1</u>	As proposed As proposed As proposed

(Portions of Table not shown remain unchanged)

Reason: This proposal eliminates the compliance path based on R-values and leaves only the U factor alternative. In practice, the Opaque Thermal Envelope Requirements (R values) in existing Table C 402.2 are used as default values in early project cost estimating. Given these values are far from optimal or cost effective solutions, they introduce a bias against major groups of building materials. A far better approach would be a total building simulation or component U factor approach independent of materials. This proposal is a move toward a material-neutral code.

Cost Impact: The code change proposal will not increase the cost of construction.

CE79 – 13

C402.1.1, Table C402.2

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

C402.1.1 Insulation and fenestration criteria. The building thermal envelope shall meet the requirements of Tables ~~C402.2~~ C402.1.1 and C402.3 based on the climate zone specified in Chapter 3. Commercial buildings or portions of commercial buildings enclosing Group R occupancies shall use the *R*-values from the “Group R” column of Table ~~C402.2~~ C402.1.1. Commercial buildings or portions of commercial buildings enclosing occupancies other than Group R shall use the *R*-values from the “All other” column of Table ~~C402.2~~ C402.1.2. Buildings with a vertical fenestration area or skylight area that exceeds that allowed in Table C402.3 shall comply with the building envelope provisions of ANSI/ASHRAE/IESNA 90.1.

TABLE ~~C402.2~~ C402.1.1
OPAQUE THERMAL ENVELOPE REQUIREMENTS^a

(Portions of Table not shown remains unchanged.)

Reason: This proposal is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

This proposal is intended to clarify the use and application of the codes prescriptive building thermal envelope provisions and does not contain changes to the technical requirements of the code. Detailed reasons are as follows:

- The current numbering of Table C402.2 adds confusion to the application of the codes prescriptive building thermal envelope *R*-value method.
- This proposal changes the numbering of Table C402.2 to Table C402.1.1 to coordinate with number of the primary and initial section that references it: Section C402.1.1 (which references the table three times).
- Due to the existing numbering anomaly, Table C402.2 is currently located in the code AFTER the table for the U-factor method referenced in Section C402.1.2 (which, by the way, appropriately references a table of the same number: Table C402.1.2). Code officials tell us that many architects, engineers, and contractors are confused by the order and incorrectly conclude that the only way to comply is to have the continuous insulation, regardless of the U-value of the assembly.

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

Cost Impact: This code change proposal will not increase the cost of construction. This proposal is a clarification and, as such, will not increase the cost of construction.

CE79-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.1.1 #2-EC-THOMPSON-SEHPCAC.doc

CE80 – 13

C402.1.1

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov); Jeff Inks, Window & Door Manufacturers Association (jinks@wdma.com)

Revise as follows:

C402.1.1 Insulation and fenestration criteria. The *building thermal envelope* shall meet the requirements of Tables C402.2 and C402.3, based on the climate zone specified in Chapter 3. Commercial buildings or portions of commercial buildings enclosing Group R occupancies shall use the *R*-values from the “Group R” column of Table C402.2. Commercial buildings or portions of commercial buildings enclosing occupancies other than Group R shall use the *R*-values from the “All other” column of Table C402.2. ~~Buildings with a vertical fenestration area or skylight area that exceeds that allowed in Table C402.3 shall comply with the building envelope provisions of ANSI/ASHRAE/IESNA 90.1.~~

Reason: Thompson: This proposal is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Reasons for this proposal are as follows: The last sentence of Section C402.1.1 was intended to prohibit buildings with vertical fenestration or skylight area that exceeds that allowed by Section C402.3 from using the IECC prescriptive envelope provisions. It was also intended to send the user to alternative compliance paths where they exceed the vertical fenestration or skylight area allowed by Section C402.3. However, as written, the language appears to allow ASHRAE 90.1 building envelope prescriptive provisions to be mixed with other IECC prescriptive path requirements. That is not the intent. This proposal deletes the last sentence of Section C402.1.1 to add clarity and ensure that only one of three paths available in Section C402.1 are applied to each building and that these available energy compliance paths are not mixed and matched.

Note that, though this proposed change was also submitted by the SEHPCAC as a part of a larger package of related proposals, in the event that the larger proposal might fail, it was considered important enough to also be considered independently.

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

Inks: This provision needs to be removed as the building envelope provisions of ASHRAE 90.1 are too inconsistent with the envelope provisions of the IECC especially for vertical fenestration. Allowing an increase in fenestration area under the prescriptive path by way of ASHRAE 90.1 works for non-metal fenestration products as the U-factor requirements in ASHRAE 90.1 are more stringent for them than the IECC. However, that is not the case for nearly all other fixed and operable metal framed products in zones 2-8 for which the U-factor requirements in ASHRAE 90.1 are far less stringent than those in the IECC meaning that as the fenestration area of metal framed products increases, the thermal performance requirements for them decreases. That should not be permitted. If the intent of IECC is to allow the fenestration area under the prescriptive path to exceed that which is allowed under Section C402.3.1, then it should be expressly permitted in the IECC where the intent of IECC can be maintained and not compromised by allowing a decrease in the energy efficiency requirements when the fenestration area exceeds 30%.

Cost Impact: This code change proposal will not increase the cost of construction. This proposal is a clarification and, as such, will not increase the cost of construction.

CE80-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.1.1-EC-THOMPSON-SEHPCAC-INKS.doc

CE81 – 13

C402.1.1

Proponent: Brian Dean,, ICF, International, representing Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; Bill Prindle, Energy Efficient Codes Coalition; and Don Vigneau, Northeast Energy Efficiency Partnerships.

Revise as follows:

C402.1.1 Insulation and fenestration criteria. The *building thermal envelope* shall meet the requirements of Sections C402.2 and C402.3, including Tables C402.2 and C402.3 based on the climate zone specified in Chapter 3. Commercial buildings or portions of commercial buildings enclosing Group R occupancies shall use the *R*-values from the “Group R” column of Table C402.2. Commercial buildings or portions of commercial buildings enclosing occupancies other than Group R shall use the *R*-values from the “All other” column of Table C402.2. Buildings with a vertical fenestration area or skylight area that exceeds that allowed in Table by Section C402.3.1 shall use one of the other compliance methods specified in Section C401.2 ~~comply with the building envelope provisions of ANSI/ASHRAE/IESNA 90.1.~~

Reason: The purpose of the proposed code change is to clarify that commercial buildings built to the prescriptive option under Section 402 must meet all the requirements of the insulation and fenestration sections, and not just the prescriptive tables. We are not aware of any widespread misapplication of these requirements, but it is important to refine code language wherever there is any potential ambiguity. The revision above will ensure that the opaque envelope components meet the requirements of the prescriptive *R*-value or *U*-factor table, as well as all of the specific requirements as to the proper installation of insulation components. Likewise, the revisions will ensure that fenestration meets all of the associated requirements outlined in Section C402.3, and not just the prescriptive *U*-factor and SHGC requirements in Table C402.3.

In addition, the proposal correctly points buildings with more than the maximum allowed prescriptive fenestration area to the two other compliance methods available under section C401.2 – the performance path under section C407 and *ASHRAE 90.1*. The current language incorrectly suggests that compliance can be achieved only through the provisions of *ASHRAE 90.1*.

Cost Impact: The code change proposal will not increase the cost of construction.

C402.1.1, C402.1.2, C402.2.4

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

C402.1.1 Insulation and fenestration criteria. The building thermal envelope shall meet the requirements of Tables C402.2 and C402.3, based on the climate zone specified in Chapter 3. Commercial buildings or portions of commercial buildings enclosing Group R occupancies shall use the *R*-values from the “Group R” column of Table C402.2. Commercial buildings or portions of commercial buildings enclosing occupancies other than Group R shall use the *R*-values from the “All other” column of Table C402.2. Buildings with a vertical fenestration area or skylight area that exceeds that allowed in Table C402.3 shall comply with the building envelope provisions of ANSI/ASHRAE/IESNA 90.1. The thermal resistance or *R*-value of the insulating material installed in, or continuously on, below grade exterior walls of the building envelope required in accordance with Table C402.2 shall extend to a depth of 10 feet (3048 mm) below the outside finished ground level, or to the level of the lowest floor, whichever is less.

C402.1.2 *U*-factor alternative. An assembly with a *U*-factor, *C*-factor, or *F*-factor equal or less than that specified in Table C402.1.2 shall be permitted as an alternative to the *R*-values in Table C402.2. Commercial buildings or portions of commercial buildings enclosing Group R occupancies shall use the *U*-factor, *C*-factor, or *F*-factor from the “Group R” column of Table C402.1.2. Commercial buildings or portions of commercial buildings enclosing occupancies other than Group R shall use the *U*-factor, *C*-factor or *F*-factor from the “All other” column of Table C402.1.2. The *C*-factor for the below grade exterior walls of the building envelope, as required in accordance with Table C402.1.2, shall extend to a depth of 10 feet (3048 mm) below the outside finished ground level, or to the level of the lowest floor, whichever is less.

~~**C402.2.4 Thermal resistance of below grade walls.** The minimum thermal resistance (*R*-value) of the insulating material installed in, or continuously on, the below grade walls shall be as specified in Table C402.2, and shall extend to a depth of 10 feet (3048 mm) below the outside finished ground level, or to the level of the lowest floor, whichever is less.~~

Reason: This proposal is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

This proposal is intended to clarify the use and application of the codes prescriptive building thermal envelope provisions and does not contain changes to the technical requirements of the code. Detailed reasons are as follows:

This proposal moves and clarifies, but does not delete the provisions of Section C402.2.4 of the 2012 IECC.

As originally written, Section C402.2.4 requires that both the *R*-value and the *U*-factor methods of Sections C402.1.1 and C402.1.2 comply with the *R*-values for above grade wall insulation indicated in Table C402.2. However, only *R*-values are listed in Table R402.2. It does not make sense to require the *U*-factors method of Table R401.1.1, which contains values for below grade insulation, to also comply with the *R*-value method for below grade insulation. Section C402.2.4 is really intended to require that the thermal properties required for below-grade walls under either method extend at least 10 feet below grade or to the floor level, whichever is less. This proposal clarifies that by adding footnotes to the tables associated with both of these methods. It is only by the application of these tables that this information becomes relevant. Where these requirements are currently located they become disconnected and their application to the tables becomes unclear and unlikely.

Note that the *R*-values in Table C402.2 are based on analysis of the insulation components only. Although a wall without any insulation would have an *R*-value of 0, it has a *C*-factor of 0.1140. This is because the *U*-values for walls in Table C402.1.2 are based on the impact of all components of the building envelope assembly, not just the insulation components. The values in Table C402.1.2 consider the impact of all materials that compose each building envelope assembly, including whether block, wood stud, metal stud, solid concrete or other materials are used, and the amount of and location of the insulation components. Because Tables C402.1.2 and C402.2 evaluate thermal properties in different

ways, it is important that the thermal resistance of below grade walls are addressed in a manner that consistent with the manner that they are addressed in each table. This proposal accomplishes that goal and preserves the potential application of each table to below grade walls.

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

Cost Impact: This code change proposal will not increase the cost of construction. This proposal is a clarification and, as such, will not increase the cost of construction.

CE83 – 13

C402.1.2

Proponent: Deborah Taylor, RA, LEED AP, Deborah F. Taylor Consulting, LLC, representing self
(taylor@dftconsultingny.com)

Revise as follows:

C402.1.2 U-factor alternative. An assembly with a U-factor, C-factor, or F-factor equal to or less than that specified in Table C402.1.2 shall be permitted as an alternative to the R-value in Table C402.2.

Commercial buildings or portions of commercial buildings enclosing Group R occupancies shall use the U-factor, C-factor, or F-factor from the "Group R" column of Table C402.1.2. Commercial buildings or portions of commercial buildings enclosing occupancies other than Group R shall use the U-factor, C-factor or F-factor from the "All other" column of Table C402.1.2. All U-factor and C-factor calculations shall take into account as applicable exposed edges of floor slabs.

Reason: Slab edges are a location for heat loss and are frequently omitted from calculations.

Cost Impact: The change proposal will not increase the cost of construction. It adds no new energy requirement.

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Add new text as follows:

SECTION C202 GENERAL DEFINITIONS

C402.1.2.1 Airspace U-factor. Where the U-factor of an airspace enclosed within an assembly is used as part of the calculation of the assembly U-factor, the airspace shall be constructed as an *ideal airspace*. The thermal resistance of the air-space shall be determined in accordance with the ASHRAE *Handbook of Fundamentals* or tested in accordance with Section C303.1.4 for the applicable direction of heat flow. Where the air-space is not constructed as an *ideal airspace*, thermal resistance of the air-space shall not be included in the assembly U-factor.

Add new definition as follows:

IDEAL AIRSPACE. An airspace contained within a cavity of a field-built assembly that, where used to contribute to thermal resistance of the assembly, is bounded on all sides by solid materials with joints and gaps between bounding materials or holes in bounding materials sealed to prevent air movement into or out of the airspace.

PART II – IECC-RESIDENTIAL PROVISIONS

SECTION R202 (N1101.9) GENERAL DEFINITIONS

Revise as follows:

R402.1.3.1 (N1102.1.3.1) Airspace U-factor. Where the U-factor of an airspace enclosed within an assembly is used as part of the calculation of the assembly U-factor, the airspace shall be constructed as an *ideal airspace*. The thermal resistance of the air-space shall be determined in accordance with the ASHRAE *Handbook of Fundamentals* or tested in accordance with Section R303.1.4 for the applicable direction of heat flow. Where the air-space is not constructed as an *ideal airspace*, thermal resistance of the air-space shall not be included in the assembly U-factor.

R402.1.4 (N1102.1.4) Total UA alternative. If the total *building thermal envelope* UA (sum of U-factor times assembly area) is less than or equal to the total UA resulting from using the U-factors in Table R402.1.3 (multiplied by the same assembly area as in the proposed building), the building shall be considered in compliance with Table R402.1.1. The UA calculation shall be done using a method consistent with the ASHRAE *Handbook of Fundamentals* and shall include the thermal bridging effects of framing materials. The U-factor contribution of airspaces enclosed within an assembly shall comply with Section R402.1.3.1. The SHGC requirements shall be met in addition to UA compliance.

Add new definition as follows:

IDEAL AIRSPACE. An airspace contained within a cavity of a field-built assembly that, where used to contribute to thermal resistance of the assembly, is bounded on all sides by solid materials with joints and gaps between bounding materials or holes in bounding materials sealed to prevent air movement into or out of the airspace.

Reason: The ASHRAE Handbook of Fundamentals, Chapter 26, Table 3 lists the allowable thermal properties for airspaces in a variety of configurations. Footnote b to this table says in part "... Values apply for ideal conditions (i.e., air spaces of uniform thickness bounded by plane, smooth, parallel surfaces with no air leakage to or from the space)..". This concern is unique to the use of an air-space for thermal resistance for a number of reasons. First, an air-space creates a path of least resistance for any air infiltration and this makes air-space thermal performance particularly susceptible to loss of thermal performance due to air infiltration. The test basis and analytical basis of these airspace thermal values are based on ideal conditions or an "ideal airspace" that, most importantly, allows for no air leakage to or from the airspace. In essence, a field-built air-space is intended to trap air as well as sealed or manufactured mass insulation products that provide at least some resistance to air-movement. Furthermore, air-space thermal performance is dynamic, dependent on both heat flow direction and temperature difference. As such, use of the ASHRAE Fundamentals values for thermal resistance of airspaces requires the user to use boundary conditions similar to those used to establish the thermal values. Alternatively, the performance of non-ideal air spaces which allow some amount of air-leakage into or out of the airspace must have reduced (non-ideal) thermal performance qualified by appropriate testing with representative boundary conditions. Unfortunately, such a standardized test method does not currently exist. Without this proposal to provide clear enforceable language consistent the technical basis of airspace thermal performance, use of air-space thermal properties will continue to be determined based on ideal conditions that are often far from those actually provided in practice, resulting in performance that can be, in worst case, as little as 15% of that claimed based on ideal airspace conditions (refer to independent lab test data reported at <http://fsc.americanchemistry.com/Energy-Code/Energy-Code-Compliance.pdf>) .

Cost Impact: The code change proposal will not increase the cost of construction.

CE84-13

PART I – IECC-COMMERCIAL PROVISIONS

C402.1.2.1 (NEW)-EC-CRANDELL.doc

CE85 – 13

C402.1.2.1 (NEW), Table C402.2.3 (NEW)

Proponent: Mark Nowak, M. Nowak Consulting LLC, representing Steel Framing Alliance

Add new text as follows:

C402.1.2.1 Thermal resistance of cold-formed steel walls. U-factors of walls with cold-formed steel studs shall be permitted to be determined in accordance with Equation 4-X:

$$U = 1/[R_s + (R_{ins} \times F_c)] \quad \text{Equation 4-x}$$

Where:

R_s = The cumulative R-value of the wall components along the path of heat transfer, excluding the cavity insulation and steel studs.

R_{ins} = The R-value of the cavity insulation.

F_c = The correction factor from Table 402.2.3

TABLE C402.2.3
 F_c VALUES FOR STEEL STUD WALL ASSEMBLIES

<u>Nominal stud depth</u> <u>(inches)</u>	<u>Spacing of framing</u> <u>(inches)</u>	<u>Cavity R-Value</u>	<u>Correction factor</u> <u>(F_c)</u>
<u>3-1/2</u>	<u>16</u>	<u>13</u>	<u>0.46</u>
		<u>15</u>	<u>0.43</u>
<u>3-1/2</u>	<u>24</u>	<u>13</u>	<u>0.55</u>
		<u>15</u>	<u>0.52</u>
<u>6</u>	<u>16</u>	<u>19</u>	<u>0.37</u>
		<u>21</u>	<u>0.35</u>
<u>6</u>	<u>24</u>	<u>19</u>	<u>0.45</u>
		<u>21</u>	<u>0.43</u>
<u>8</u>	<u>16</u>	<u>25</u>	<u>0.31</u>
<u>8</u>	<u>24</u>	<u>25</u>	<u>0.38</u>

Reason: This proposal addresses a gap in the code in regard to calculating U-factors for steel stud wall assemblies. The proposed equation and correction factors are the same as those in the 2003 IECC residential section. They were removed in favor of simplistic prescriptive solutions in the 2004 and later editions. The code has lacked direction in the commercial section for determining U factors of cold-formed steel assemblies. Although the 2003 edition only contained this equation in the residential section, the assumptions underlying the methodology are equally applicable to commercial buildings. The same calculation procedure is recognized in ASHRAE 90.2. It is also the same methodology used by the ASHRAE 90.1 envelope subcommittee in developing the U factor tables in Appendix Table A.3.3 (Assembly U-Factors for Steel-Framed Walls) for non-residential buildings. Inclusion of the equation and correction factors in this section of the IECC will provide users with a calculation method without the need to refer to additional references for U-factors of conventional C-shaped steel stud walls. It will enable calculations with varying levels of cavity and continuous insulation for compliance with the envelope requirements in Section C402.

Cost Impact: The code change proposal will not increase the cost of construction.

CE85-13

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

C402.1.2.1 (NEW)-EC-NOWAK.doc

CE86 – 13

C402.1, C402.1.3 (NEW)

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

Revise as follows:

C402.1 General (Prescriptive). The building thermal envelope shall comply with Section C402.1.1. Section C402.1.2 or Section C402.1.3 shall be permitted as an alternative to the *R*-values specified in Section C402.1.1.

C402.1.3 Total UA alternative. Proposed buildings with a total building UA equal or less than the code-target total building UA shall be considered in compliance with Section C402.1. The UA for each assembly is the area or perimeter of that assembly times the applicable U-factor, C-factor or F-factor for that assembly. The building total UA is the sum of UAs for the assemblies. The area or perimeter for each assembly shall be as proposed. The code-target U-factor, C-factor or F-factor shall be the applicable value from Tables C402.1.2 and C402.3. The proposed building U-factor, C-factor or F-factor shall be that of the proposed assembly.

The code-target *U*-factors for skylight areas greater than 3 percent of the roof and above-grade wall fenestration areas greater than 30 percent shall be the *U*-factors of the surrounding opaque assembly.

C402.3.4 Area-weighted SHGC. An area-weighted average of fenestration products more than 50-percent glazed shall be permitted to satisfy the SHGC requirements.

Reason: The commercial IECC does not specifically allow a UA tradeoff. This UA tradeoff similar to the residential UA tradeoff in Section R402.1.4 in the residential IECC. This change explicitly allows an area-weighted average of fenestration SHGC as is currently allowing for residential in Section R402.3.2.

Cost Impact: The code change proposal will not increase the cost of construction.

CE86-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.1-EC-CONNER

CE87 – 13

C402.1, C402.1.3 (NEW), C402.3.4 (NEW)

Proponent: Eric Makela, Britt/Makela Group, Inc., representing Northwest Energy Codes Group (eric@brittmakela.com)

Revise as follows:

C402.1 General (Prescriptive). The building thermal envelope shall comply with Section C402.1.1, Section C402.1.2, or Section C402.1.3 shall be permitted as an alternative to the *R*-values specified in Section C402.1.1.

C402.1.3 Total UA alternative. Proposed buildings with a total building UA equal to or less than the code-target total building UA shall be considered in compliance with Section C402.1. The UA for each assembly is the area or perimeter of that assembly times the applicable U-factor, C-factor, or F-factor for that assembly. The building total UA is the sum of UAs for the assemblies. Proposed fenestration and skylights shall be subject to limits under Section C402.3.1. The area or perimeter for each assembly shall be as proposed. The code-target U-factor, C-factor, or F-factor shall be the applicable value from Tables C402.1.2 and C402.3. The proposed building U-factor, C-factor, or F-factor shall be that of the proposed assembly and shall be calculated in accordance with the ASHRAE Fundamentals Handbook, from ANSI/ASHRAE/IESNA 90.1 Appendix A, or results of laboratory measurements according to acceptable methods of test. Use of opaque assembly U-factors, C-factors, and F-factors from ANSI/ASHRAE/IESNA 90.1 Appendix A shall be permitted for the proposed assemblies, provided that the construction complies with the applicable construction details from ANSI/ASHRAE/IESNA 90.1 Appendix A.

The code-target U-factors for skylight areas greater than 3 percent of the roof and above-grade wall fenestration areas greater than 30 percent shall be the U-factors of the surrounding opaque assembly.

C402.3.4 Area-weighted SHGC. An area weighted SHGC shall be permitted to satisfy SHGC requirements.

Reason: The proposed UA approach allows for a design heat loss rate UA approach and solar heat gain coefficient rate (SHGC) area weighted average approach to demonstrate compliance with the IECC. Currently there are no prescriptive trade-off options within the IECC for the commercial envelope. The code user can either comply with Table C402.1.2, Opaque Thermal Envelope Assembly Requirements (U-factor table), or Table C402.2 Opaque Thermal Envelope Requirements (R-value Table). The only option for flexibility is by using Section C407 Total Building Performance requirements or using an ASHRAE approach. The DOE-developed COMCheck software tool is available but this is not specifically referenced in the IECC and is allowed under C102 Alternate Materials – Method of Construction, Design, or Insulating Systems. This is the most widely used energy code compliance software in the country but is dependent on continued funding from the U.S. Department of Energy to upgrade and maintain the software.

The UA option is modeled after Section R402.1.4 Total UA Alternative in the residential provisions of the IECC. The language has been enhanced to provide more guidance for the code user on how to perform the code-target budget calculations and the proposed UA calculation. This type of calculation will allow the user flexibility without decreasing the stringency of the code. The concept has been and is currently being used in Washington State as part of their commercial building energy code.

Cost Impact: The code change proposal will not increase the cost of construction. It offers an alternative method to comply with the IECC that may actually reduce the first cost of compliance with the code because of envelope optimization.

CE87-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.1-EC-MAKELA.doc

CE88 – 13

C402.1, C402.1.3 (NEW)

Proponent: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development (WABO TCD) (lkranz@bellevuewa.gov)

Revise as follows:

C402.1 General (Prescriptive). The building thermal envelope shall comply with Section C402.1.1. Section C402.1.2 or Section C402.1.3 shall be permitted as an alternative to the R-values specified in Section C402.1.1.

C402.1.3 Component performance alternative. Building envelope values and fenestration areas determined in accordance with Equation 4-3 shall be permitted in lieu of compliance with the U-factors, F-factors and C-factors in Tables C402.1.2 and C402.3 and the maximum allowable fenestration areas in Section C402.3.1.

$$(UA \text{ Sum}) + (FL \text{ Sum}) + (CA \text{ Sum}) + (XVG) + (XSky) \leq \text{Zero.} \quad \textbf{(Equation 4-3)}$$

Where:

UA Sum = Sum of the (UA Dif) values for each assembly that comprises a portion of the building thermal envelope.

UA Dif = (UA Proposed) – (UA Table).

UA Table = (Maximum allowable U-factor specified in Table C402.1.2 or Table C402.3) x (Area).

UA Proposed = (Proposed U-value) x (Area).

FL Sum = Sum of the (FL Dif) values for each slab on grade assembly that comprises a portion of the building thermal envelope.

FL Dif = (FL Proposed) – (FL Table).

FL Table = (Maximum allowable F-factor specified in Table C402.1.2) x (Perimeter length).

FL Proposed = (Proposed F-value) x (Perimeter length) .

CA Sum = Sum of the (CA Dif) values for each below-grade wall assembly that comprises a portion of the building thermal envelope.

CA Dif = (CA Proposed) – (CA Table).

CA Table = (Maximum allowable C-factor specified in Table C402.1.2) x (area).

CA Proposed = (Proposed C-value) x (area).

XVG (Excess Vertical Glazing Value) = (XVGArea x UVG) – (XVGArea x UWall), but not less than zero.

XVGArea (Excess Vertical Glazing Area) = (Proposed Vertical Glazing Area) – (Allowable Vertical Glazing Area determined in accordance with Section C402.3.1).

UA Wall = Sum of the (UA Proposed) values for each opaque assembly comprising a portion of the exterior wall.

UWall = UA Wall / total opaque exterior wall area.

UA VG = Sum of the (UA Proposed) values for each vertical glazing assembly.

UVG = UA VG / total vertical glazing area.

XSky (Excess Skylight Value) = (XSArea x USky) – (XSArea x U Roof), but not less than zero.

XSArea (Excess Skylight Area) = (Proposed Skylight Area) – (Allowable Skylight Area determined in accordance with Section C402.3.1).

UA Roof = Sum of the (UA Proposed) values for each opaque assembly comprising a portion of a roof.

URoof = UA Roof / total opaque roof area.

UA Sky = Sum of the (UA Proposed) values for each skylight assembly.

$$USky = UA_{Sky} / \text{total skylight area.}$$

Reason: This proposal provides an Alternative component performance path for commercial buildings parallel to the "Total UA Alternative" for residential buildings in Section R402.1.4, but accounting for slab edge F-factors, basement wall C-Factors, and fenestration areas in excess of the code limits.

This optional path provides significant additional flexibility for design teams, allowing them to trade off the U values of various building envelope components, without having to do a full Total Building Performance computation. The calculation can be done by an architect or engineer using a simple calculator. It is variation of a widely-used method in the Washington State code, and results in lower overall costs and more design freedom without any sacrifice of energy conservation.

The formula allows various envelope components to be traded off against each other, provided that the overall calculated building heat loss of the proposed design is no greater than a code-compliant design. Thus, greater window area might be acceptable with lower window U-values, or wall insulation might be reduced in certain areas while roof insulation is increased.

The five principal factors in the equation are:

- (UA Sum) The sum of the U-value for each envelope assembly times its area.
- (FL Sum) The sum of the F-value for each slab edge assembly times its length.
- (CA Sum) The sum of the C-value for each basement wall assembly times its area.
- (XSky) Additional amount for skylight area in excess of code maximum – Substitutes the average roof U-value for the average skylight U-value in the base case for the excess skylight area.
- (XVG) Additional amount for vertical glazing area in excess of maximum – Substitutes the average wall U-value for the average vertical glazing U-value in the base case for the excess vertical glazing area

Cost Impact: The code change proposal will not increase the cost of construction.

(Footnotes not shown remain unchanged.)

Reason: The purpose of this proposed code change is to update and increase the stringency of the opaque thermal envelope insulation tables in the *IECC* based on the values in *ANSI/ASHRAE/IES Addendum bb to ANSI/ASHRAE/IES Standard 90.1-2010* (approved in 2012). Specifically, where *IECC* values remain more stringent and energy efficient, the proposal retains the *IECC* values. Where the *ASHRAE* values are more stringent and energy efficient, those values have replaced the current *IECC* values. Since *ASHRAE 90.1* and the *IECC* use similar approaches to opaque envelope criteria, *ASHRAE 90.1* is an option for compliance under the *IECC*, and *ASHRAE 90.1* is the federal baseline commercial energy code standard, it is reasonable at this time to update *IECC* values to reflect improved *ASHRAE* values in the absence of a separate comprehensive analysis of opaque envelope values. However, where the *IECC* remains more stringent, *IECC* values should be retained to avoid backsliding and reductions in energy efficiency, in order to keep the *IECC* a premier commercial energy code.

Cost Impact: The code change proposal will increase the cost of construction.

- Use of opaque assembly *U*-factors, *C*-factors, and *F*-factors from ANSI/ASHRAE/IESNA 90.1 Appendix A shall be permitted, provided the construction complies with the applicable construction details from ANSI/ASHRAE/IESNA 90.1 Appendix A.
- Where heated slabs are below grade, below-grade walls shall comply with the *F*-factor requirements for heated slabs.
- R-5.7ci is allowed to be substituted with concrete block walls complying with ASTM C 90, ungrouted or partially grouted at 32 inches or less on center vertically and 48 inches or less on center horizontally, with ungrouted cores filled with materials having a maximum thermal conductivity of 0.44 Btu-in/h-f °F.

For SI: 1 inch = 25.4 mm. ci = Continuous insulation. NR = No requirement.

LS = *Liner System*—*Liner systems* shall have a minimum R-3 thermal spacer block between the purlins and the metal roof panels is required, unless compliance is shown by the overall assembly U-factor. A continuous membrane installed below the purlins and uninterrupted by framing members. Uncompressed, unfaced insulation rests on top of the membrane between the purlins.

FC = *Filled Cavity*—*Filled Cavity* assemblies shall have a minimum R-5 thermal spacer block between the purlins and the metal roof panels is required, unless compliance is shown by the overall assembly U-factor

- Assembly descriptions can be found in ANSI/ASHRAE/IESNA 90.1 Appendix A.
- Where using *R*-value compliance method, a thermal spacer block shall be provided, otherwise use the *U*-factor compliance method in Table C402.1.2
- R-5.7ci is allowed to be substituted with concrete block walls complying with ASTM C 90, ungrouted or partially grouted at 32 inches or less on center vertically and 48 inches or less on center horizontally, with ungrouted cores filled with materials having a maximum thermal conductivity of 0.44 Btu-in/h-f °F.
- Where heated slabs are below grade, below-grade walls shall comply with the exterior insulation requirements for heated slabs.
- Steel floor joist systems shall be insulated to R-38.

Reason: This proposal will make the fenestration requirements consistent with those published in addendum bb to ANSI/ASHRAE/IES Standard 90.1. This addendum was a result of much investigations into the cost effectiveness of various assembly types. There was also additional research done for different types of metal building assemblies. This proposal incorporates corrections to the current IECC for those building types.

Cost Impact: The code change proposal will increase the cost of construction.

(Portions of Table not shown remain unchanged)

Reason: This proposal modifies the thermal envelope requirements for above-deck roof insulation to be consistent with the recently revised ASHRAE 90.1 Addendum bb. The change is necessary to ensure that the IECC is at least as efficient as 90.1

Cost Impact: The code change proposal will increase the cost of construction. This proposal will increase the initial cost of construction, but will result in reduced energy costs that will result in a short payback.

(Portions of Table not shown remain unchanged)

Reason: During the development of the ANSI/ASHRAE/IES 90.1-2013, "Energy Standard for Buildings except Low-Rise Residential Buildings", there was significant debate regarding the U-Factor associated with the thermal performance of the R-19 + R-11Ls (Liner System). The debate focused on the proposed 0.035 U-Factor for the Liner System, and related to the accuracy of this value due to the variability of the test methodology and the range of data supplied to the committee for this system. Specifically:

- The initial 0.035 U-factor was adopted for this Liner Systems based upon a single test report generated in 2007.
- In 2010 the R-19+R-11 Liner System was retested by an accredited testing laboratory, and a U-Factor of 0.039 was achieved. (a copy of the test report is attached)
- Based upon the range of values provided to the 90.1 Envelope Committee, and their understanding of the variability for this type of thermal testing, the Committee decided to adjust the U-factor being shown for the R-19+R-11 Ls from 0.035 to 0.037.

Our request to change the Metal Building Roof U-Factor being shown for the R-19+R11 Ls from 0.035 to 0.37 in Table C402.1.2 of the 2015 edition of the IECC is necessary to prevent the confusion that will arise if the U-Value assembly requirements do not agree between IECC and ASHRAE. Please keep in mind the following:

- Footnote "a" in IECC tables C402.1.2 and C402.2 references the assemblies shown in the 90.1, Table A.
- In 90.1-2013, Table A2.3 will show the U-Value for the R-19+R-11Liner Systems as 0.037
- If IECC - 2015 is not changed, it will require a U-Value of 0.035 for Climate Zones, 1 (Group R), 2, 3, 4 and 5, and there will not be a corresponding U-Value in 90.1 -Table A.
- As such, by default, the user will be driven to the next lower U-Value in the table, a far more expensive system and one that far exceeds the needs of the project.
- This request to change the U-Value for the Liner System from 0.035 to 0.037, should essentially be considered "editorial", as the same insulation levels are being specified.

Cost Impact: This code change proposal will not increase the cost of construction. There should be no cost impact, this is strictly an editorial change.

For SI: 1 inch = 25.4 mm. ci = Continuous insulation. NR = No requirement.

LS = Liner System – A continuous membrane installed below the purlins and uninterrupted by framing members. Uncompressed, unfaced insulation rests on top of the membrane between the purlins. Liner systems shall have a minimum R-3 thermal spacer block between the purlins and the metal roof panels as required, unless compliance is shown by the overall assembly U-factor

FC = Filled Cavity – Filled Cavity assemblies shall have a minimum R-5 thermal spacer block between the purlins and the metal roof panels as required, unless compliance is shown by the overall assembly U-factor

a. Assembly descriptions can be found in ANSI/ASHRAE/IESNA 90.1 Appendix A.

b. ~~Where using R-value compliance method, a thermal spacer block shall be provided, otherwise use the U-factor compliance method in Table C402.1.2~~

(Portions of Table not shown remain unchanged)

Reason: We propose to update the roof and wall insulation requirements in the U-factor tables and corresponding R-values for consistency with the majority of the values and options found in ANSI/ASHRAE/IES 90.1-2013, "Energy Standard for Buildings Except Low-Rise Residential Buildings". Additionally, the table footnotes are proposed to be expanded to include the construction descriptions for Liner Systems and Filled Cavity assemblies.

The U-factors and R-values for roofs we propose are exactly the same as ANSI/ASHRAE/IES 90.1-2013. For walls we propose something slightly different than what was approved for 90.1-2013, but only in Climate Zones 4, 5 and 7. The values chosen for our proposal are more reasonable for metal building construction in comparison to the required performance of the other forms of construction in the tables. The values we selected also make for better transitions of the requirements from climate-zone to climate-zone, where the ASHRAE 90.1-2013 values have large jumps in the requirements between climate zones in these areas.

The reason for the large jumps in ASHRAE 90.1 was primarily due to the lack of available assemblies at the time the standard was written. By smoothing the transition for requirements between the three climate zones it provides for reasonable stringency levels and will provide for better design flexibility and alternate or innovative materials to be used.

Finally, we propose to delete the specific reference to "R-5" for the thermal spacer block requirement in Table C402.2 because the Liner System and Filled Cavity roof types utilize different thermal blocks, so a single note no longer applies. The new table footnotes contain the appropriate thermal spacer blocks for each system.

Cost Impact: The proposal will not increase the cost of construction.

CE93-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.1.2T-EC-WALKER.doc

CE94 – 13

Table C402.1.2

Proponent: Martha G. VanGeem, representing Masonry Alliance for Codes and Standards

Revise as follows:

TABLE C402.1.2
OPAQUE THERMAL ENVELOPE ASSEMBLY REQUIREMENTS^a

CLIMATE ZONE	1		2		3		4 EXCEPT MARINE		5 AND MARINE 4		6		7		8	
	All other	Group R	All other	Group R	All other	Group R	All other	Group R	All other	Group R	All other	Group R	All other	Group R	All other	Group R
Walls, Above Grade

(Portions of Table not shown remain unchanged)

Reason: According to Section 402.1 of the IECC, the criteria are the R-values specified in Section 402.1.1. The U-factors in Section 402.1.2 are an alternate compliance path. IECC Section 402.1.1 states that the R-values are in Tables C402.2 and C402.3. Therefore, the values in Table 402.2 are the main requirements and Table C402.1.2 lists alternates that should correspond to values in Table C402.2. Most of the mass wall criteria in both of these tables, C402.2 and C402.1.2, are based on the criteria in *ASHRAE/IES Standard 90.1-2010*.

In the last edition of the IECC, errors were introduced into Table C402.1.2 for Climate Zones 1, 2, 3, 6, and 7 for "Mass Walls, Above Grade." (Corrections to values in Climate Zone 5 are submitted in a separate proposal.)

- For Climate Zone 6, in the governing criteria table C402.2, the requirement is R-13.3ci for the row for "Mass Walls, Above Grade" and the column "Climate Zone 6, All Other."

According to *ASHRAE/IES Standard 90.1-2010*, Table 5.5-6, the U-factor that corresponds to an R-value of R-13.3ci is 0.080, not 0.078.

- For Climate Zone 7, the corresponding U-factor for R-15.2ci is 0.071 not 0.061. This is shown in Table 5.5-7 of *ASHRAE 90.1-2010*. This is also demonstrated by the U-factor for Climate Zone 6 "Group R", which also has a requirement for R-15.2ci in Table 402.2 and a U-factor of 0.071 in Table 402.1.2 as shown above.

- For Climate Zone 3 "All other", the corresponding U-factor for R-7.6ci is 0.123, not 0.110. This is shown in Table 5.5-3 for Climate Zone 3 of *ASHRAE 90.1-2010*. This is also demonstrated by the U-factor for Climate Zone 2 "Group R", which also has a requirement for R-7.6ci in Table 402.2 and a U-factor of 0.123 in Table 402.1.2 as shown above.

- For Climate Zones 1 "All other" and "Group R" as well as Climate Zone 2 "All other," the corresponding U-factor for R-5.7ci is 0.151, not 0.142. This is shown in Tables 5.5-1 and 5.5-2 of *ASHRAE 90.1-2010*.

Correcting these U-factors will make the IECC less confusing and thereby simplify it and increase its use.

Therefore, the U-factors should be changed as shown in Table 402.1.2 for the row for "Mass Walls, Above Grade" for the Climate Zones 1, 2, 3, 6, and 7 to correct these errors.

Cost Impact: This code change proposal will not increase the cost of construction.

C402.1.2T #1-EC-VANGHEEM.doc

CE95 – 13

Table C402.1.2

Proponent: Martha G. VanGeem, representing Masonry Alliance for Codes and Standards

Revise as follows:

TABLE C402.1.2
OPAQUE THERMAL ENVELOPE ASSEMBLY REQUIREMENTS^a

CLIMATE ZONE	1		2		3		4 EXCEPT MARINE		5 AND MARINE 4		6		7		8	
	All other	Group R	All other	Group R	All other	Group R	All other	Group R	All other	Group R	All other	Group R	All other	Group R	All other	Group R
Walls, Above Grade																
Mass	U-0.142	U-0.142	U-0.142	U-0.123	U-0.110	U-0.104	U-0.104	U-0.090	<u>U-0.078</u> <u>U-0.090</u>	<u>U-0.078</u> <u>U-0.080</u>	U-0.078	U-0.071	U-0.061	U-0.061	U-0.061	U-0.061

(Portions of Table not shown remain unchanged)

Reason: According to Section 402.1 of the IECC, the criteria are the R-values specified in Section 402.1.1. The U-factors in Section 402.1.2 are an alternate compliance path. IECC Section 402.1.1 states that the R-values are in Tables C402.2 and C402.3. Therefore, the values in Table 402.2 are the main requirements and Table C402.1.2 lists alternates that should correspond to values in Table C402.2.

In the last edition of the IECC, errors were introduced into Table C402.1.2 for Climate Zones 5 and Marine 4 for "Mass Walls, Above Grade." In the governing criteria table C402.2, the requirement is R-11.4ci for the row for "Mass Walls, Above Grade" and the column "Climate Zones 5 and Marine 4, All Other." This is the same criteria as for one cell to the left, "Mass Walls, Above Grade" and the column "Climate Zones 4 except Marine, Group R." The U-factor that corresponds to an R-value of R-11.4ci is 0.090, not 0.078, as indicated by the value in "Climate Zones 4 except Marine, Group R."

Most of the mass wall criteria in both of these tables, C402.2 and C402.1.2, are based on the criteria in *ASHRAE/IES Standard 90.1-2010*. For "All other," the corresponding R-value in *90.1-2010* for nonresidential in Table 5.5-5 for Climate Zone 5 on page 30 is R-11.4ci and the corresponding U-factor is 0.90. Therefore the U-factor in C402.1.2 for "All other" should be 0.090 for mass walls in "Climate Zones 5 and Marine 4". In addition, for "Group R," the corresponding R-value in *90.1-2010* in Table 5.5-5 for Climate Zone 5 on page 30 is R-13.3ci and the corresponding U-factor is 0.80. Therefore the U-factor in C402.1.2 for "Group R" should be 0.080. These values will remain the same in *90.1-2013*. Correcting these U-factors will make the IECC less confusing and thereby simplify it and increase its use.

Therefore, in Table 402.1.2 for the row for "Mass Walls, Above Grade" and the column "Climate Zones 5 and Marine 4," the U-factor should be changed to 0.090 for "All other" and the U-factor should be changed to 0.080 for "Group R" to correct these errors.

Cost Impact: This code change proposal will not increase the cost of construction.

(Portions of Table not shown remain unchanged)

For SI: 1 inch = 25.4 mm ci = Continuous insulation. NR = No requirement.

LS = Liner System- A continuous membrane installed below the purlins and uninterrupted by framing members. Uncompressed, un-faced insulation rests on top of the membrane between the purlins.

- Assembly descriptions can be found in ASHRAE 90.1 Appendix A.
- Where using R-value compliance method, a thermal spacer block is required, otherwise use the U-factor compliance method in Table C402.1.2.

- c. R-5.7 ci is allowed to be substituted with concrete block walls complying with ASTM C 90, ungrouted or partially grouted at 32 inches or less on center vertically and 48 inches or less on center horizontally, with ungrouted cores filled with materials having a maximum thermal conductivity of 0.44 Btu-in./h-² F.
- d. Where heated slabs are below grade, below-grade walls shall comply with the exterior insulation requirements for heated slabs.
- e. Steel floor joist systems shall be insulated to R-38.
- a. "Mass floors" shall include floors weighing not less than:
 - 1. 35 psf (170 kg/m²) of floor surface area; or
 - 2. 25 psf (120 kg/m²) of floor surface area where the material weight is not more than 12 pounds per cubic foot (pcf) (1900 kg/m³).

C402.2.5 Floors over outdoor air or unconditioned space. The thermal properties (component *R*-values or assembly *U*-, *C*- or *F*-factors) ~~resistance (*R*-value) of the insulating material installed either between the floor framing or continuously on the floor assembly~~ of floor assemblies over outdoor air or unconditioned space shall be as specified in Table C402.1.2 or C402.2, based on the construction materials used in the floor assembly.

~~"Mass floors" shall include floors weighing not less than:~~

- ~~1. 35 psf (170 kg/m²) of floor surface area; or~~
- ~~2. 25 psf (120 kg/m²) of floor surface area if the material weight is not more than 12 pcf (1,900 kg/m³).~~

Reason: This public comment is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 2 open meetings and over 15 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

This proposal is intended to clarify the use and application of the codes prescriptive building thermal envelope provisions and does not contain changes to the technical requirements of the code. Detailed reasons for this proposal are as follows:

- a) This proposal moves and clarifies, but does not delete the requirements of Section C402.2.5 of the 2012 IECC.
- b) In the I-Codes, text should not rely on section titles for application. Therefore, the information in the title was added to the code text.
- c) The first sentence in Section C402.2.5 is revised to clarify that the provisions for floors over outdoor air or unconditioned space are also applicable to the assembly *U*-, *C*- and *F*-factors of Table C402.1.2.
- d) The original language of Section C402.2.4 did not clearly indicate what the "mass floor" requirements were relevant or related to. These requirements are more appropriately and clearly applied as footnotes to Tables C402.1.2 and C402.2. By moving the information to the appropriate tables, unintentional non compliance will decrease (compliance will increase).

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

Cost Impact: This code change proposal will not increase the cost of construction. This proposal is a clarification and, as such, will not increase the cost of construction.

(Portions of Table not shown remain unchanged.)

Reason: This proposal is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code

content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

This proposal is intended to correct anomalies in these tables and present additional options to increase the usability and effectiveness of the codes prescriptive building envelope requirements. Detailed reasons for this proposal are as follows:

1) Table C402.1.2

- a. In Table C402.1.2, some of the U-factors in CZ7 seem to be disjointed without reason. In the both the "Group R" and the "All Other" cells in CZ7, wood stud walls and steel stud walls have identical values except that the "All Other" cell for steel studs differs significantly. It seems reasonable to simply make all four cells values identical. Preliminary PNNL modeling has shown that merging U-factors to one performance level for all materials for building envelopes is an effective strategy for gaining more efficiency in codes. Certainly, it meets the intent of the cost effectiveness mandate from the Energy Act.
- b. In Table C402.1.2, the U-factors for both wood stud and steel stud walls are disjointed to an even greater extent than those in CZ7 or CZ8. The SEHPCAC believes that bringing these U-factors into closer alignment with each other and with adjacent climate zones makes this code more enforceable, more readily achieved and more understandable. In achieving those objectives, the SEHPCAC believes that the biggest goal, adoptability, is also achieved. Any efficiency improvement is unimportant if the model code in which it is embodied is never adopted.
- c. In the CZ8 columns of Table C402.1.2, U-factors were used that were simply in line with the descending values for the cells in CZ 1-7.

2) Table C402.2

- a. For Table C402.2 this proposal provides "cavity only" insulation options for each climate zone entry in the "Wood Framed and Other" row. This is proposed in order to provide a practical solution for energy efficiency with which builders are familiar and that they can readily execute to a satisfactory level. Buy "cavity only," it is meant that the insulation will be placed only in the cavities between studs and that c.i. (continuous insulation, such as foam insulation sheathing applied on the exterior side of studs) is not required in association with it. These "cavity only" options make compliance with, and effectiveness of, the code more likely by offering choices to designers and builders that are readily implementable.

Please note that the cavity only insulation option is just that: it is an option. As the existing cavity plus continuous insulation (ci) options also remain in place, the cavity only options do not necessarily increase costs, they simply provide added flexibility.

Also note that the cavity only option R-values, as minimum values, do not preclude the use of insulation with higher R-values where insulation materials are not readily available in the exact R-values provided in the Table. This is intentional. R-values differ for various insulation types and this puts all types on a level playing field. The R-values proposed for cavity only insulation Table C402.2 are derived from the U-factors for equivalent building envelope assemblies in Table C402.1.2.

Design professionals and builders have asked ICC, Code Trainers, and other professionals "what is the option in wood framed walls for cavity only insulation." This addition provides that design flexibility and information to builders to understand the cavity only insulation requirements option. The third R-value listed in the row for wood framed wall climate zone 6 – 8, is a calculated value and may not represent thermal insulation products available off the shelf at building supply centers. Achieving the R-value in a cavity only installation may require a mix of insulation materials to achieve these values.

- b. Beginning with Climate Zones 5 and Marine 4, the second option in each cell in the "Wood Framed and Other" row has been restored to "cavity-only". In CZ5-M4, the residential cell R-values were made similar to the "All Other" cell because the U-factor values in Table C402.1.2 are the same for the corresponding table entries.
- c. The R-values in both cells of Climate Zone 6 in the "Wood Framed and Other" row were revised to reflect equivalency calculations, as performed by the American Wood Council, that were based on U-factors for corresponding entries in Table C402.1.2.

Below is the summary page of the Excel spreadsheet used to determine R-value equivalents to U-factor inputs. This is the system by which the R-values in Table C402.2 were determined from the U-factors in Table C402.1.2.

U-factor to R-value equivalency spreadsheet

Material	R	Framing Factor	25%

Drop (8")	1"	0.79	0.083	0.078	0.073	0.064	0.061	0.059	0.056	0.054
Bevel (8", lapped)	1/2"	0.81	0.083	0.077	0.073	0.064	0.061	0.059	0.056	0.054
Bevel (10", lapped)	3/4"	1.05	0.081	0.076	0.072	0.063	0.060	0.058	0.055	0.053

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

Cost Impact: Where the U-factors in the table are proposed to be decreased, this proposal may increase the cost of construction. Where cavity only insulation options have been provided, this proposal may decrease the cost of construction in certain applications.

For SI: 1 inch = 25.4 mm. ci = Continuous insulation. NR = No requirement.

LS = Liner System—A continuous membrane installed below the purlins and uninterrupted by framing members. Uncompressed, unfaced insulation rests on top of the membrane between the purlins.

a. Assembly descriptions can be found in ANSI/ASHRAE/IESNA Appendix A.

b. Where using *R*-value compliance method, a thermal spacer block shall be provided, otherwise use the *U*-factor compliance method in Table C402.1.2.

c. R-5.7ci is allowed to be substituted with concrete block walls complying with ASTM C 90, ungrouted or partially grouted at 32 inches or less on center vertically and 48 inches or less on center horizontally, with ungrouted cores filled with materials having a maximum thermal conductivity of 0.44 Btu-in/h-² °F.

d. Where heated slabs are below grade, below-grade walls shall comply with the exterior insulation requirements for heated slabs.

e. Steel floor joist systems shall be insulated to R-38.

(Portions of Table not shown remain unchanged)

Reason: The above-grade wall *U*-factors and the insulation requirements in Tables C402.1.2 and C402.2 are much more stringent for wood framed walls than the other framing types in Climate Zones 1-3. This proposal brings wood frame walls to levels that are within the range of the other wall types.

The code must be product neutral and not favor one product over the others. The provision of the 2012 IECC require much lower *U*-factors and greater *R*-values in Climate Zones 1-3 for above grade wood framed walls than for the other three types of walls. Codes should not unfairly provide one framing product with an advantage over another. If the goal of the IECC is to save energy, then the code should be "blind" to material types when setting performance levels.

In addition, the amount of energy saved in requiring commercial and multi-family buildings to meet a *U*-factor of 0.064 as opposed to the proposed *U*-factor of 0.087 is minimal in these warmer climate zones. When the additional cost of construction is compared to the energy savings, the provision to build at the 0.064 *U*-level is not cost effective.

Table 1 shows a *U*-factor calculation using standard *R*-values. A 7/8-inch stucco *R*-value is used instead of single-coat stucco, as is recommended when applied to wood structural panels. The 7/16-inch sheathing is used in this system as it is a typical exterior sheathing thickness for wood frame commercial walls.

This proposal works to correct those discrepancies between framing materials while bringing the Commercial IECC in-line with the Residential IECC.

We ask the support of the committee for this proposal.

Table 1. U-Factor Calculations Climate Zones 1-3, 2x4 Wood Framed Walls

Wall Thermal Resistance by Component	2x4 Wall - R13		
	R-Value Studs	R-Value Cavity	Assembly Value
Outside Air Film	0.17		
Stucco 7/8" (3-Coat)	0.18		
Continuous Insulation	0		
Wood Structural Panel Sheathing (7/16")	0.62		
Stud/Cavity Insulation	4.375	13	
Interior Gypsum	0.56		
Inside Air Film	0.68		
Studs at 16" o.c.	25%	75%	
Total Wall R-Value	6.59	15.21	11.46
Total Wall U-Factor	0.152	0.066	0.0873

Cost Impact: The code change proposal will not increase the cost of construction.

For SI: 1 inch = 25.4 mm. ci = Continuous insulation. NR = No requirement.

LS = Liner System—A continuous membrane installed below the purlins and uninterrupted by framing members. Uncompressed, unfaced insulation rests on top of the membrane between the purlins.

a. Assembly descriptions can be found in ANSI/ASHRAE/IESNA Appendix A.

b. Where using R-value compliance method, a thermal spacer block shall be provided, otherwise use the U-factor compliance method in Table C402.1.2.

c. R-5.7ci is allowed to be substituted with concrete block walls complying with ASTM C 90, ungrouted or partially grouted at 32 inches or less on center vertically and 48 inches or less on center horizontally, with ungrouted cores filled with materials having a maximum thermal conductivity of 0.44 Btu-in/h-°F.

d. Where heated slabs are below grade, below-grade walls shall comply with the exterior insulation requirements for heated slabs.

e. Steel floor joist systems shall be insulated to R-38.

(Portions of Table not shown remain unchanged)

Reason: The above-grade wall *U*-factors and the insulation requirements in Tables C402.1.2 and C402.2 are much more stringent for wood framed walls than the other framing types in Climate Zones 6-8. This proposal brings wood frame walls to levels that are within the range of the other wall types as well as levels that are similar to those found in the residential energy code.

The code must be product neutral and not favor one product over the others. The provision of the 2012 IECC require lower *U*-factors and greater *R*-values in Climate Zones 6-8 for above grade wood framed walls than for the other three types of walls. Codes should not unfairly provide one framing product with an advantage over the other. Since the goal of the IECC is to save energy, it should be "blind" to framing material types when setting performance levels. This proposal works to correct those irregularities between framing materials.

Table 1 shows the *U*-factor calculations for 2x6 and 2x4 walls using a combination of continuous insulation and cavity insulation for Climate Zone 6. The 2x6 wall system uses R18 cavity insulation with R3 continuous insulation and the 2x4 systems incorporates R13 cavity with R6.5 continuous insulation. Both systems result in a *U*-factor of 0.056.

Table 2 shows a calculation for a 2x6 wall system using R24 cavity insulation. The system also incorporates 7/8-inch stucco which is recommended for direct applications to wood structural panels. The 7/16-inch sheathing is used in this system as it is a typical exterior sheathing thickness for wood frame commercial walls. This system results in a *U*-factor of 0.056 and is equivalent to the two systems found in Table 1.

Table 3 shows the *U*-factor calculations for 2x6 and 2x4 walls using a combination of continuous insulation and cavity insulation for Climate Zones 7-8. The 2x6 wall system uses R20 cavity insulation with R5 continuous insulation and the 2x4 systems incorporates R13 cavity with R10 continuous insulation. Both systems result in a *U*-factor of 0.047.

Table 4 shows a calculation for a 2x8 wall system using R28 cavity insulation. A 7/8-inch stucco *R*-value is used as is typical when applied to wood structural panels. The 7/16-inch sheathing is used in this system as it is a typical exterior sheathing thickness for wood frame commercial walls. This system results in a *U*-factor of 0.047 and is equivalent to the two systems found in Table 3.

We ask the support of the committee for this proposal.

- Where heated slabs are below grade, below-grade walls shall comply with the *F*-factor requirements for heated slabs.

(Portions of Table not shown remain unchanged)

Reason: This proposal is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The IECC F-factors are outdated and need to be improved. The F-factors for heated slabs in Table C402.1.2 are proposed to be revised to align with those in Tables 5.5-1 through 5.5-8 of ASHRAE 90.1-2010.

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

Cost Impact: This code change proposal will not increase the cost of construction. As the maximum F-values are revised higher, which means that less insulation is required, this proposal will decrease the cost of construction.

- Use of opaque assembly *U*-factors, *C*-factors, and *F*-factors from ASHRAE 90.1 Appendix A shall be permitted provided the construction complies with the applicable construction details from ASHRAE 90.1 Appendix A.
- Where heated slabs are below grade, below-grade walls shall comply with the *F*-factor requirements for heated slabs.
- Evidence of compliance with the *F*-factors indicated in the table for heated slabs shall be demonstrated by the application of the unheated slab *F*-factors and *R*-values derived from ASHRAE 90.1 Appendix A.
- These *C*-, *F*- and *U*-factors are based on assemblies that are not required to contain insulation.

(Portions of Table not shown remain unchanged)

Reason: This proposal is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

This proposal does not contain technical changes. Its purpose is to clarify the intent and application of the code provisions.

Detailed reasons for this proposal are as follows:

- Reason for footnote c: Footnote c is necessary because the heated slab *F*-factor values in Table C402.1.2 do not match those in ASHRAE 90.1. ASHRAE 90.1 Appendix A values in Table A6.3, Assembly *F*-Factors for Slab on Grade Floors, reflect much higher *F*-factors for heated slabs with a specific *R*-value, as opposed to unheated slabs with the same *R*-value. Heated slabs lose more energy due to the input of heat directly into the slab. Therefore, more insulation is needed in a heated slab to provide the

same resistance to heat loss (and therefore the same heat loss rate). IECC 2012 Table C402.1.2 heated slab F-factor values are closer to the unheated slab values in ASHRAE Appendix A. This proposal corrects Table C402.1.2 heated-slab f-factors to align with 90.1 Appendix A. If using the 2012 Table 402.1.2, correlating the IECC F-factor to an equivalent R-value via ASHRAE Appendix A, would require significantly more insulation than the IECC prescriptive R-value. Example: Heated slab in Climate Zone 3, per C402.1.2 requires an F-factor of F-0.70, or a prescriptive R-10 for 24" below. In the 90.1-2010 Appendix A tables, an equivalent to F-0.70 for heated slabs would require R-20 for 48" below, doubling the prescriptive IECC R-value and depth. The existing C402.12 F-factors for Climate Zones 5 and higher correlate to ASHRAE Appendix A insulation levels that prohibit the use of slab edge insulation; only a fully insulated slab can meet the F-0.58 or lower (derived from Table C402.1.2 and correlated to 90.1). Whereas the most restrictive slab edge R-value via IECC prescriptive tables is R-20 for 48" below. ASHRAE's best slab edge F-factor is for R-30 for 48" below (only F-0.659).

- b. Footnote "d" has been added to clarify that all specific C-, F- and U-factors that are followed by the "d" superscript are factors for assemblies that do not contain insulation. Note that Table C402.2 indicates "NR" (Not Required) for all equivalent applications. This will save time for users by not requiring them to go to ASHRAE 90.1 Appendix A to verify for themselves that the end result is that no insulation is required in these scenarios.

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

Cost Impact: This code change proposal will not increase the cost of construction. This proposal is a clarification and, as such, will not increase the cost of construction.

For SI: 1 inch = 25.4 mm ci = Continuous insulation. NR = No requirement.

LS = Liner System- A continuous membrane installed below the purlins and uninterrupted by framing members. Uncompressed, un-faced insulation rests on top of the membrane between the purlins.

- a. Assembly descriptions can be found in ASHRAE 90.1 Appendix A. "Attic and other" is attic insulation and all other types of roof insulation other than above deck or metal building insulation.
- b. Buildings that incorporate a metal skin and steel-framed structural system wherein the insulation is often compressed between the skin and framing members. Where using the R-value compliance method, a thermal spacer block is required between the skin and framing members, otherwise use the assembly U-factor compliance method in Section C402.1.2 and Table C402.1.2.
- c. R-5.7 ci is allowed to be substituted with concrete block walls complying with ASTM C 90, ungrouted or partially grouted at 32 inches or less on center vertically and 48 inches or less on center horizontally, with ungrouted cores filled with materials having a maximum thermal conductivity of 0.44 Btu-in./h-² F.
- d. Where heated slabs are below grade, below-grade walls shall comply with the F-factor requirements for heated slabs.
- e. Wood light framed walls and all other wall systems except mass walls, metal building walls and metal framed walls.
- f. Light framed walls where the insulation, other than continuous insulation, is installed in the cavity between metal framing members.

Reason: This proposal is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

This proposal clarifies the code and increases its usability with regard to Tables C402.1.2 and C402.2 and the code's prescriptive building thermal envelope provisions. It does not contain technical changes. Most of these changes clarify the relationship between the tables and ASHRAE 90.1 Appendix A, eliminate the need to go to ASHRAE Appendix A, or add missing information regarding how ASHRAE 90.1 Appendix A is to be used when it is necessary to use it. An effort was also made to coordinate the footnotes between Tables C402.1.2 and C402.2.

Detailed reasons for this proposal are as follows:

1) Table C402.1.2:

- a. Revised Footnote a: The existing language indicates that ASHRAE 90.1 Appendix A is permitted to be used, but it does not state what it is to be used for. This proposal clarifies that the purpose is to "show evidence of compliance with this table" and that the design must then also comply with Appendix A "insulation component thermal requirements."
- b. Footnote b: unchanged
- c. Proposed new Footnote c: This new footnote indicates what "Attic and other" is intended to apply to as used in the table, which is "insulation other than above deck or metal building insulation." Members of SEHPCAC subgroup working on this proposal verified this information with Steve Ferguson of ASHRAE. This information is necessary as building officials have reported that many users call and ask what "Attic and other" is.
- d. Proposed new Footnote d: This footnote describes what the term "Metal buildings" is intended to mean as used in the table. Previously it was necessary to go to ASHRAE 90.1 for this information, making the use of the table cumbersome and incomplete. This description is based upon the ASHRAE 90.1 description.
- e. New Footnote e: This new footnote clarifies that the term "Wood framed and other," as used in the table, "are wood framed walls and all other wall systems except mass walls, metal building walls and metal framed walls." There is much confusion in the field as to how this term is to be interpreted.
- f. Proposed new Footnote f: This new footnote describes what the term "Metal framed walls" is intended to mean as used in the table. Previously it was necessary to go to ASHRAE 90.1 for this information, making the use of the table cumbersome and incomplete. This description is based upon the ASHRAE 90.1 description.

2) Table C402.2:

- a. Revised Footnote a: Rather than forcing the user to go to ASHRAE 90.1 for a description of assemblies, the footnotes have been revised to include the necessary descriptions. Footnote a in particular now describes the term "Attic and other" as used in the table, which is "insulation other than above deck or metal building insulation." Members of SEHPCAC subgroup working on this proposal verified this information with Steve Ferguson of ASHRAE. This information is needed as building officials have reported that many users call and ask what "Attic and other" is.
- b. Revised Footnote b: In addition to retaining the information related to "spacer blocks," this footnote now also describes what the term "Metal buildings" is intended to mean as used in the table. Previously it was necessary to go to ASHRAE 90.1 for this information, making the use of the table cumbersome and incomplete. This description is based upon the ASHRAE 90.1 description.
- c. Footnote c: unchanged
- d. Footnote d: unchanged

- e. New Footnote e: Identical to proposed Footnote e to Table C402.1.2, this new footnote clarifies that the term “Wood framed and other,” as used in the table, “are wood framed walls and all other wall systems except mass walls, metal building walls and metal framed walls.” There is much confusion in the field as to how this term is to be interpreted.
- f. Proposed new Footnote f: Identical to proposed Footnote f to Table C402.1.2, this new footnote describes what the term “Metal framed walls” is intended to mean as used in the table. Previously it was necessary to go to ASHRAE 90.1 for this information, making the use of the table cumbersome and incomplete. This description is based upon the ASHRAE 90.1 description.
- g. Note that, although some of the new footnotes proposed are definitions, and definitions typically belong in Chapter 2, since these definitions pertain only to the these terms as used in this table (they are not used elsewhere in the code), their proper place is as footnotes to the table.

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

Cost Impact: This code change proposal will not increase the cost of construction. This proposal is a clarification and, as such, will not increase the cost of construction.

C402.1.1, C402.1.2, C402.2.7, Table C402.1.2, Table C402.2

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

C402.1.1 Insulation and fenestration criteria. ~~The Building thermal envelope~~ opaque assemblies shall meet the requirements of Tables C402.2 and C402.3 based on the climate zone specified in Chapter 3. Commercial buildings or portions of commercial buildings enclosing Group R occupancies shall use the *R*-values from the “Group R” column of Table C402.2. Commercial buildings or portions of commercial buildings enclosing occupancies other than Group R shall use the *R*-values from the “All other” column of Table C402.2. Buildings with a vertical fenestration area or skylight area that exceeds that allowed in Table C402.3 shall comply with the building envelope provisions of ANSI/ASHRAE/IESNA 90.1. Doors having less than 50 percent glass area shall be considered opaque doors. Opaque swinging doors shall comply with Table C402.1.2 and opaque roll-up or sliding doors shall comply with Table C402.1.1.

C402.1.2 U-factor alternative. An opaque assembly with a *U*-factor, *C*-factor, or *F*-factor equal or less than that specified in Table C402.1.2 shall be permitted as an alternative to the *R*-values in Table C402.2. Commercial buildings or portions of commercial buildings enclosing Group R occupancies shall use the *U*-factor, *C*-factor, or *F*-factor from the “Group R” column of Table C402.1.2. Commercial buildings or portions of commercial buildings enclosing occupancies other than Group R shall use the *U*-factor, *C*-factor or *F*-factor from the “All other” column of Table C402.1.2. Doors having less than 50 percent glass area shall be considered opaque doors. Opaque swinging doors shall comply with Table C402.1.2 and opaque roll-up or sliding doors shall comply with Table C402.1.1.

~~C402.2.7 Opaque doors.~~ ~~Opaque doors (doors having less than 50 percent glass area) shall meet the applicable requirements for doors as specified in Table C402.2 and be considered as part of the gross area of above-grade walls that are part of the building envelope.~~

(Portions of Table not shown remain unchanged)

Reason: This proposal is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Reasons for this proposal are as follows:

- a) This proposal is intended to clarify the use and application of the codes prescriptive building thermal envelope provisions and does not contain changes to the technical requirements of the code.
- b) The information related to opaque doors in the code is confusing. Doors are only found in Table C402.2 which is supposed to be the table addressing R values. But R-values are only provided for roll-up and sliding doors, but not for swinging doors. For swinging doors it provides a U-factor. U-factors are commonly listed in Table C402.1.2, but this latter table has no provisions for doors.
- c) This proposal moves the U-factor information for swinging doors to the U-factor table, but leaves the R-values for Roll-up or sliding doors in the R-value table (C402.2). It also and adds language to the text of Sections C402.1.1 and C402.1.2 that directs users from one table to the other for the information related to opaque doors that is not contained in each respective table. (i.e., Section C402.1.1 is revised to direct users to Table C402.1.2 for opaque swinging door thermal information and Section C402.1.2 has been revised to direct users to Table C402.2 for opaque roll-up or sliding door thermal requirements.
- d) The opaque door requirements of existing Section C402.2.7 of the 2012 IECC are directly related to the application of Sections C402.1.1 and C402.1.2 and their associated tables. The current scenario, however, is disjointed as there is no direct connection in Sections C402.1.1 or C402.1.2 to Section C402.2.7. Therefore, users are often unaware of the connection. As a result of the current disjointed arrangement of the opaque door provisions, Section C402.7 tends to be overlooked. This proposal clarifies the relationship by moving (not deleting) the information related to opaque doors from Section C402.2.7 directly into the sections they are related to: Sections C402.1.1 and C402.1.2.
- e) With the R-value and U-factor information relegated to the proper tables by this proposal, it clears the way for the titles to be revised to clearly indicate their proper application. The existing text titles do not indicate a) which method they are associated with or b) whether the values in the tables are intended to be applied as maximum or minimum values. Furthermore, while Table 402.1.2 appropriately indicates that it applies to assemblies, Table C402.2 does not indicate whether it is applicable to entire assemblies or to insulation components. Therefore, this proposal:
 - a. Revises the title of Table C402.1.2 to indicate that it contains maximum requirements, while the title of Table C402.2 is revised to indicate that it contains minimum requirements. This information differs for each table, is not intuitive to all users (many users incorrectly assume both tables contain maximum values) and is critical to the proper application of these tables.
 - b. Adds "R-VALUE METHOD" to the title of Table C402.2 and "U-FACTOR METHOD" to the title of Table C402.1.2. This reinforces the proper application of the tables with their respective methods. Note that existing Footnote "b" to Table C402.2 describes these methods in exactly this way.
 - c. Adds the words "insulation component" to the title of Table C402.2 in order to further clarify its application. Once again, unlike Table 401.1.2, Table C402.2 is not applicable to entire assemblies.

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

Cost Impact: This code change proposal will not increase the cost of construction. This proposal is a clarification and, as such, will not increase the cost of construction.

C402.1.1 #3-EC-THOMPSON-SEHPCAC.doc

CE104 – 13

Table C402.1.2, Chapter 5

Proponent: Mark Nowak, M. Nowak Consulting LLC, representing Steel Framing Alliance

Revise as follows:

TABLE C402.1.2
OPAGUE THERMAL ENVELOPE ASSEMBLY REQUIREMENTS^{a, b}

- a. Use of Opaque assembly U-factors, C-factors, and F-factors from ANSI/ASHRAE/IESNA 90.1 Appendix A shall be permitted, provided the construction, excluding the cladding system on walls, complies with the appropriate construction details from ANSI/ASHRAE/IESNA 90.1 Appendix A.
- b. Opaque assembly U-factors based on designs tested in accordance with ASTM C1363 shall be permitted. Modifications to the test results shall be permitted based on the addition or subtraction of building components on the exterior of the framing of the original tested design.
- b- c. Where heated slabs are below grade, below-grade walls shall comply with the F-factor requirements for heated slabs.

(Portions of Table not shown remain unchanged)

Add new standard to Chapter 5 as follows:

ASTM

ASTM C 1363-11 Standard Test Method for Thermal Performance of Building Materials and Envelope Assemblies by Means of a Hot Box Apparatus

Reason: This proposal accomplishes three objectives. First it clarifies that one can use the ASHRAE 90.1 Appendix A U-Factors for compliance even if the siding system differs from the stucco siding system assumed in 90.1. The R-value of stucco is insignificant (approximately R 0.08) and choice of other siding should not disallow use of the 90.1 Appendix tables. For many assemblies, 90.1 is the only source of U-factors. This proposal will broaden their use without any significant impact on energy use.

Second, this proposal recognizes results of hot box laboratory tests conducted in accordance with ASTM C1363 for compliance with the code. Tested assemblies represent the best available data for assemblies and they should be recognized as acceptable for compliance.

Third, the proposal recognizes that hot box tests are costly and time consuming and it is not feasible or necessary to test every possible configuration but only the base assembly. A base assembly consists of the wall framing and cavity insulation with or without interior gypsum board or exterior sheathing. The U-factor of assemblies that differ from the base assembly in terms of different claddings, exterior continuous insulation, and sheathings can be calculated by adding or subtracting component R-values as long as changes are not made to the framing factor or the R-value of the cavity insulation.

The proposed test standard can be viewed by the committee through the ASTM website set up specifically to facilitate review of proposals to the ICC codes.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASTM C 1363-2011 Standard Test Method for Thermal Performance of Building Materials and Envelope Assemblies by Means of a Hot Box Apparatus, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

	Assembly:	ASF	AMF	DF

C402.1.2T-EC-NOWAK.doc

CE105 – 13

C402.2, C402.2.1 (NEW)

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

C402.2 Specific building thermal envelope insulation requirements (Prescriptive). ~~Opaque assemblies shall comply with Table C402.2.~~ Insulation in building thermal envelope opaque assemblies shall comply with Sections C402.2.1 through C402.2.8 and Table C402.2.

C402.2.1. Multiple layers of continuous insulation board. Where two or more layers of continuous insulation board are used in a construction assembly, the continuous insulation boards shall be installed in accordance with Section C303.2. If the continuous insulation board manufacturer's installation instructions do not address installation of two or more layers, the edge joints between each layer of continuous insulation boards shall be staggered.

Reason: This proposal is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Reasons for this proposal are as follows:

- a) This proposal clarifies the application of these sections and makes no technical changes.
- b) The intent of the code is that the provisions of Section C402.2 and its subsections are to apply to both of the code's prescriptive building thermal envelope methods (the R-value and U-factor methods), not just the R-value method indicated in the existing text by its reference solely to Table C402.2.
- c) In addition, this proposal breaks out the specific requirement for continuous insulation into a separate subsection, which agrees conceptually with the format of the other current subsections of Section C402.2.

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

Cost Impact: The code change proposal will not increase the cost of construction. This proposal is a clarification and, as such, will not increase the cost of construction.

(Portions of Table not shown remain unchanged)

For SI: 1 inch = 25.4 mm ci = Continuous insulation. NR = No requirement.

LS = Liner System- A continuous membrane installed below the purlins and uninterrupted by framing members. Uncompressed, un-faced insulation rests on top of the membrane between the purlins.

- Assembly descriptions can be found in ASHRAE 90.1 Appendix A.
- Where using R-value compliance method, a thermal spacer block shall be provided, otherwise use the U-factor compliance method in Table C402.1.2.
- R-5.7 ci is allowed to be substituted with concrete block walls complying with ASTM C 90, ungrouted or partially grouted at 32 inches or less on center vertically and 48 inches or less on center horizontally, with ungrouted cores filled with materials having a maximum thermal conductivity of 0.44 Btu-in/h- f^2 °F.
- Where heated slabs are below grade, below-grade walls shall comply with the exterior insulation requirements for heated slabs.
- Steel floor joist systems shall be insulated to R-38.
- The R-value of integral insulation installed in concrete masonry units shall not be used in determining compliance with Table C402.2.
- "Mass walls" shall include walls weighing not less than:
 - 35 psf (170 kg/m²) of wall surface area; or
 - 25 psf (120 kg/m²) of wall surface area where the material weight is not more than 120 pounds per cubic foot (pcf) (1900 kg/m³).

C402.2.3 Thermal resistance of above-grade walls. The minimum thermal resistance (*R*-value) of the insulating materials installed in the wall cavity between the framing members and continuously on the walls shall be as specified in Table C402.2, based on framing type and construction materials used in the wall assembly. The *R*-value of integral insulation installed in concrete masonry units (CMU) shall not be used in determining compliance with Table C402.2.

"Mass walls" shall include walls weighing not less than:

1. 35 psf (170 kg/m²) of wall surface area; or
2. 25 psf (120 kg/m²) of wall surface area if the material weight is not more than 120 pounds per cubic foot (pcf) (1900 kg/m³).

Reason: This proposal is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

This proposal is intended to clarify the use and application of the codes prescriptive building thermal envelope provisions and does not contain changes to the technical requirements of the code. Detailed reasons are as follows:

- a) The first sentence in Section C402.2.3 is unnecessary as it is redundant with the requirements of Section C402.1.1 and Table C402.2. It appears to be there only to tie these provisions to Section C402.1.1. Thus, it is better to simply relocate these provisions in Section C402.1.1. The current scenario also creates a condition wherein these redundant requirements could unintentionally diverge in the future.
- b) The second sentence and the "Mass wall" criteria in Section C402.2.3 are directly related to Table C402.1.1 and, therefore, are more appropriately located as footnotes to the table. While using the table in its current form (without these proposed footnotes), it is difficult to tell that these provisions are relevant to it.
- c) As currently organized, it is not apparent to users as they apply Tables C402.1.1 and C402.2 that Section C402.2.3 is applicable to the tables. This change makes the application more obvious and, therefore, will increase compliance.
- d) Note that the requirements of Section C402.2.3 are being moved, not deleted.
- e) Note that the provisions of C402.2.3 that are being moved are not requirements, they simply indicate how the term "mass walls" is intended to be applied in the tables.

The SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

Cost Impact: The code change proposal will not increase the cost of construction. This proposal is a clarification and, as such, will not increase the cost of construction.

CE106-13

C402.2T-EC-THOMPSON-SEHPCAC

CE107 – 13

Table C402.2

Proponent: Mark Nowak, M. Nowak Consulting, LLC, representing Steel Framing Alliance

Revise as follows:

TABLE C402.2
OPAQUE THERMAL ENVELOPE REQUIREMENTS^a

Climate Zone	1		2	
	All other	Group R	All other	Group R
Walls, Above Grade				
Metal Framed	R-13+5ci	R-13+5ci	R-13+5ci	R-13+7.5ci
Wood framed and other	R-13+3.8 or R-20	R-13+3.8 or R-20	R-13+3.8 or R-20	R-13+3.8 or R-20

(Portions of Table not shown remain unchanged)

Reason: The addition of continuous insulation for Climate Zones 1 and 2 in the 2009 and 2012 code resulted in significant construction costs but little energy savings. Further, in these warmer climates, the embodied energy to manufacture and ship the continuous insulation requires years of the annual projected savings before any real energy savings occurs. Energy conservation could be better accomplished in other areas of the building where more energy could be conserved for each dollar invested.

Following is an analysis of Group R construction that was conducted in various cities from Climate Zones 1 and 2. The data shows the costs and benefits associated with specifying a metal framed wall with and without continuous insulation. The selected cities are the representative cities developed by the US Department of Energy's Pacific Northwest National Laboratory (PNNL) for these respective climate zones. Based on this analysis, which shows simple paybacks from 30 to 102 years, there is not sufficient justification to retain the insulation requirements at the current levels.

Climate zone	City	Building energy use with R-13 exterior walls (kWh)	Building energy use with R13+5 exterior walls (kWh)	Building Energy with R13+7.5 (kWh)	Annual energy savings with addition of continuous insulation (kWh)/\$	Cost of continuous insulation per building (\$)	Payback in years
1	Miami	373033	371739	-	1294/\$138	14032	102
2	Houston	389323	-	384992	4331/\$537	16533	31
2	Phoenix	384175	-	380105	4070/\$472	16533	35

Table Notes: Energy use was determined through simulations with Energy Gauge Summit V4.10 for a four story 32 unit multi-family apartment based on minimum prescriptive and equipment requirements in the 2012 IECC. Energy costs are as reported year end 2011 by USEIA for the largest utility providers in each city. Insulation costs are national averages from Craftsman Estimator 2007 adjusted for inflation and contractor overhead and profit.

In addition to the lengthy payback periods in these climate zones, the consideration of embodied energy needs to be addressed. The table below shows the embodied energy impact on the overall payback period. In Phoenix and Houston, it will take approximately 7 years before any overall energy will be saved compared to a wall without continuous insulation. The payback for embodied energy increases to 15 years in Miami. When added to the payback for first costs, this will put the overall payback period between 42 and 117 years for the cities in these climate zones, well outside accepted norms.

Climate zone	City	Embodied energy for R-5 continuous insulation (kWh)	Embodied energy for R-7.5 continuous insulation (kWh)	Annual energy savings with addition of continuous insulation (kWh)	Years to payback embodied energy
1	Miami	19388	-	1294	15
2	Houston	-	29030	4331	6.7
2	Phoenix	-	29030	4070	7.1

Table notes: Embodied energy information based on 1.87 kWh per SF or R-5 insulation. Source of embodied energy data extracted from Environmental Building News (Wilson 2010 downloaded from <http://www2.buildinggreen.com/blogs/avoiding-global-warming-impact-insulation> on December 4, 2012)

Cost Impact: The code change proposal will not increase the cost of construction.

C402.2T-EC-NOWAK.doc

CE108 – 13

Table C402.2

Proponent: Larry Williams, Steel Framing Industry Association

Revise as follows:

Table C402.2
Opaque thermal Envelope requirements

Climate Zone	3	
	All other	Group R
	Walls, above grade	
Metal Framed	R-13+7.5ci	R-13+7.5ci
Wood framed and other	R-13+3.8 or R-20	R-13+3.8 or R-20

(Portions of Table not shown remain unchanged)

Reason: The addition of continuous insulation for Climate Zone 3 in 2009 and its further increase in the 2012 code resulted in significant construction costs but little energy savings. Further, the embodied energy to manufacture and ship the continuous insulation requires years of the annual projected savings before any real energy savings occurs. Energy conservation could be better accomplished in other areas of the building where more energy could be conserved for each dollar invested.

Following is an analysis of Group R construction that was conducted in various cities from Climate Zone 3. The data shows the costs and benefits associated with specifying a metal framed wall with and without continuous insulation. The selected cities are the representative cities developed by the US Department of Energy's Pacific Northwest National Laboratory (PNNL) for this climate zone. Based on this analysis, which shows simple paybacks from 23 to 25-1/2 years, there is not sufficient justification to retain the insulation requirements at the current levels.

Climate zone	City	Building energy use with R-13 exterior walls (kWh)	Building Energy with R13+7.5 (kWh)	Annual energy savings with addition of continuous insulation (kWh)/\$	Cost of continuous insulation per building (\$)	Payback in years
3	El Paso	399359	393888	5471/\$649	16533	25.5
3	San Francisco	355492	351170	4322/\$662	16533	25
3	Memphis	439907	432413	7494/\$718	16533	23

Table Notes: Energy use was determined through simulations with Energy Gauge Summit V4.10 for a four story 32 unit multi-family apartment based on minimum prescriptive and equipment requirements in the 2012 IECC. Energy costs are as reported year end 2011 by US EIA for the largest utility providers in each city. Insulation costs are national averages from Craftsman Estimator 2007 adjusted for inflation and contractor overhead and profit.

In addition to the lengthy payback period in these climate zones for first costs, the consideration of embodied energy needs to be addressed. The table below shows the embodied energy payback periods. The embodied energy increases payback by approximately 4 to just under 7 additional years. When added to the payback for first costs, this will put the overall payback period between approximately 27 and 32 years, well outside accepted norms.

Climate zone	City	Embodied energy for R-7.5 continuous insulation (kWh)	Annual energy savings with addition of continuous insulation (kWh)	Years to payback embodied energy
--------------	------	---	--	----------------------------------

1	<i>El Paso</i>	29030	5471	5.3
2	<i>San Francisco</i>	29030	4322	6.7
2	<i>Memphis</i>	29030	7494	3.9

Table notes: Embodied energy information based on 1.87 kWh per SF of R-5 insulation. Source of embodied energy data extracted from Environmental Building News (Wilson 2010, downloaded from <http://www2.buildinggreen.com/blogs/avoiding-global-warming-impact-insulation> on December 4, 2012)

Cost Impact: The code change proposal will not increase the cost of construction.

Table C402.2

Proponent: Robert A. Zabcik, NCI Building Systems, representing self

Revise as follows:

**TABLE C402.2
OPAQUE THERMAL ENVELOPE REQUIREMENTS^a**

CLIMATE ZONE	1		2		3		4 EXCEPT MARINE	
	All Other	Group R	All Other	Group R	All Other	Group R	All Other	Group R
ROOFS								
Insulation entirely above deck	R-20ci	R-20ci	R-20ci	R-20ci	R-20ci	R-20ci	R-25ci	R-25ci
Metal Buildings (with R-5 thermal blocks) ^{a,b}	R-19 + R-11 LS	R-19 + R-11 LS	R-19 + R-11 LS	R-19 + R-11 LS	R-19 + R-11 LS	R-19 + R-11 LS	R-19 + R-11 LS	R-19 + R-11 LS
Attic and other	R-38	R-38	R-38	R-38	R-38	R-38	R-38	R-38

(Portions of Table not shown remain unchanged)

For SI: 1 inch = 25.4 mm. ci = Continuous insulation. NR = No requirement.

LS = Liner System—A continuous membrane installed below the purlins and uninterrupted by framing members. Uncompressed, unfaced insulation rests on top of the membrane between the purlins.

a. Assembly descriptions can be found in ANSI/ASHRAE/IESNA Appendix A.

b. Where using *R*-value compliance method, a thermal spacer block shall be provided, otherwise use the *U*-factor compliance method in Table C402.1.2.

Reason: The purpose of this proposal is to correct an error. The requirement of R-5 thermal blocks for the referenced assemblies is not correct. According to Appendix A of ASHRAE 90.1-2010 (as referenced in footnote a and as qualified in Chapter 5 of the Commercial Provisions of IECC) the reference liner system has a minimum R-3.5 thermal block. Rather than change the table to reflect R-3.5, it is proposed to eliminate the statement completely since the thermal block requirement is very clearly stated in the 90.1 Appendix already. To repeat the requirement in this table further introduces a maintenance issue, especially considering the fact that many state codes incorporate this table verbatim. This has caused a problem in the North Carolina energy code, for instance. For convenience, the pertinent ASHRAE 90.1 Appendix A passage is repeated below and the R factor requirement bolded:

A2.3.2.4 Liner System (Ls). A continuous vapor barrier liner is installed below the purlins and uninterrupted by framing members. Uncompressed, unfaced insulation rests on top of the liner between the purlins. For multilayer installations, the first *rated R-Value of insulation* is for unfaced insulation draped over purlins and then compressed when the metal *roof* panels are attached. A minimum **R-3.5** thermal spacer block between the purlins and the metal *roof* panels is required when specified in Table A2.3.

Cost Impact: The code change proposal will not increase the cost of construction. This to correct an error.

Wood framed and other	R-13 + R-3.8ci or R-20	R-13 + R-3.8ci or R-20	R-13 + R-3.8ci or R-20	R-13 + R-3.8ci or R-20	R-13 + R-3.8ci or R-20	R-13 + R-3.8ci or R-20	R-13 + R-3.8ci or R-20	R-13 + R-3.8ci or R-20	R-13 + R-3.8ci or R-20	R-13 + R-3.8ci or R-20	R13 + R7.5ci or R20 + R3.8ci	R13 + R7.5ci or R20 + R3.8ci	R13 + R7.5ci or R20 + R3.8ci	R13 + R7.5ci or R20 + R3.8ci	R13 + R15.6ci or R20 + R10ci	R13 + R15.6ci or R20 + R10ci

For SI: 1 inch = 25.4 mm. ci = Continuous insulation. NR = No requirement.

LS = Liner System—A continuous membrane installed below the purlins and uninterrupted by framing members. Uncompressed, unfaced insulation rests on top of the membrane between the purlins.

- Assembly descriptions can be found in ANSI/ASHRAE/IESNA Appendix A.
- Where using *R*-value compliance method, a thermal spacer block shall be provided, otherwise use the *U*-factor compliance method in Table C402.1.2.
- R*-5.7ci is allowed to be substituted with concrete block walls complying with ASTM C 90, ungrouted or partially grouted at 32 inches or less on center vertically and 48 inches or less on center horizontally, with ungrouted cores filled with materials having a maximum thermal conductivity of 0.44 Btu-in/h-^{ft} °F.
- Where heated slabs are below grade, below-grade walls shall comply with the exterior insulation requirements for heated slabs.
- Steel floor joist systems shall be insulated to R-38.

(Portions of Table not shown remain unchanged)

Reason: The above-grade wall *U*-factors and the insulation requirements for Climate Zone 5 and Marine 4 in Tables C402.1.2 and C402.2 are in alignment, except for the *R*-value requirements for Group R buildings. This proposal simply brings those insulation values into alignment with the other *R*-values and *U*-factors for the climate zone. Since each of the

other climate zones have consistent wood frame wall *R*-values and *U*-factors for “Group R” buildings and “All Other” buildings, it only makes sense to correct the inconsistency found in this cell in Table C402.2.

Cost Impact: The code change proposal will not increase the cost of construction.

C402.2.1, C402.2.1.1 (NEW), C402.2.1.2 (NEW), C402.2.1.3

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

C402.2.1 Roof assembly insulation. Roof insulation shall comply with Sections C402.2.1.1, C402.2.1.2 and C402.2.1.3.

C402.2.1.1 Variations in continuous roof insulation thickness. ~~The minimum thermal resistance (*R*-value) of the insulating material installed either between the roof framing or continuously on the roof assembly shall be as specified in Table C402.2, based on construction materials used in the roof assembly. Where the thickness of continuous above deck roof insulation varies by 1 inch (25 mm) or less:~~

- ~~1. For designs intended to comply with Section C402.1.1, the area-weighted *R*-value shall be not less than the *R*-value specified in Table C402.2, or~~
- ~~2. For designs intended to comply with Section C402.1.2, the area-weighted *U*-factor shall not be greater than the *U*-factor specified in Table C402.1.2.~~

C402.2.1.2 Insulation at skylight curbs. Skylight curbs shall be insulated to not less than the level of required for roofs with insulation entirely above deck or *R*-5, whichever is less.

Exceptions:

- ~~1. Continuously insulated roof assemblies where the thickness of insulation varies 1 inch (25 mm) or less and where the area-weighted *U*-factor is equivalent to the same assembly with the *R*-value specified in Table C402.2.~~
- ~~2. 1. Unit skylight curbs included as a component of an NFRC 100 rated assembly shall not be required to be insulated.~~

C402.2.1.3 Suspended ceiling insulation. Insulation installed on a suspended ceiling with removable ceiling tiles shall not be considered part of the minimum thermal resistance of the roof insulation.

Reason: This public comment is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 2 open meetings and over 15 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

This proposal seeks to clarify the code's provisions related to roof insulation by essentially breaking the provisions out into 3 separate subsections. This proposal makes no technical changes. Detailed reasons are as follows:

- a) The first sentence in the original provision was removed as it was redundant with information already contained in Section C402.1.1. This information appeared to be repeated in Section C402.2.1 of the 2012 IECC solely to facilitate the application of Exception 1. However, it is not an exception. It is an alternative requirement. As such, it was reconfigured as Item 2 to proposed new Section C402.2.1.1.
- b) The main/parent section title was revised to include the word "insulation" and delete the word "assembly," which is more indicative of what this section is applicable to.
- c) The area weighting provisions were broken out into their own subsection and the language was revised so that the concept can now be applied to both the *R*-value and *U*-factor methods in Tables C402.1.1 and C402.1.2. Formerly, these provisions only applied to Table C402.2.
- d) The skylight insulation component was broken out to add clarity.
- e) The suspended ceiling insulation component was broken out to add clarity.

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

Cost Impact: The code change proposal will not increase the cost of construction. This proposal is a clarification and, as such, will not increase the cost of construction.

C402.2.1-EC-THOMPSON-SEHPCAC

CE113 – 13

C402.2.1

Proponent: Mark S. Graham, National Roofing Contractors Association (mgraham@nrca.net)

Revise as follows:

C402.2.1 Roof assembly. The minimum thermal resistance (*R*-value) of the insulating material installed either between the roof framing or continuously on the roof assembly shall be as specified in Table C402.2, based on construction materials used in the roof assembly. Where continuous insulation boards are used with insulation entirely above deck, the insulation boards shall be installed in two or more layers with the insulation board joints staggered and offset between each layer. Skylight curbs shall be insulated to the level of roofs with insulation entirely above deck or R-5, whichever is less.

Exceptions:

1. Continuously insulated roof assemblies where the thickness of insulation varies 1 inch (25 mm) or less and where the area-weighted *U*-factor is equivalent to the same assembly with the *R*-value specified in Table C402.2.
2. Unit skylight curbs included as a component of an NFRC 100 rated assembly shall not be required to be insulated.

Insulation installed on a suspended ceiling with removable ceiling tiles shall not be considered part of the minimum thermal resistance of the roof insulation.

Reason: This code change proposal is intended to add a requirement for insulation boards used in roof assemblies in insulation above deck configurations to be installed in two or more layers allowing for staggering and offsetting the board joints. This installation method will improve the effective thermal performance of the roof assembly by effectively reducing heat loss through the board joints.

Cost Impact: This code change proposal will not increase the cost of construction.

C402.2.1 #1-EC-GRAHAM.doc

CE114 – 13

C402.2.1

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C402.2.1 Roof assembly. The minimum thermal resistance (*R*-value) of the insulating material installed either between the roof framing or continuously on the roof assembly shall be as specified in Table C402.2, based on construction materials used in the roof assembly. Skylight curbs shall be insulated to the level of roofs with insulation entirely above deck or R-5, whichever is less.

Exceptions:

1. Continuously insulated roof assemblies where the thickness of insulation varies 1 inch (25 mm) or less and where the area-weighted *U*-factor is equivalent to the same assembly with the *R*-value specified in Table C402.2.
2. Unit skylight curbs included as a component of ~~an NFRC 100 rated assembly~~ a skylight listed and labeled in accordance with NFRC 100 shall not be required to be insulated.

Insulation installed on a suspended ceiling with removable ceiling tiles shall not be considered part of the minimum thermal resistance of the roof insulation.

Reason: The term “rated” is generally understood but the correct presentation of the criterion is that the assembly be listed and labeled in accordance with NFRC 100. This proposal clarifies when a skylight curb can be exempted from meeting the requirements for insulating the curb.

Cost Impact: The code change proposal will not increase the cost of construction.

CE114-13

Public Hearing:	Committee:	AS	AM	D

C402.2.1-EC-WILLIAMS.doc

CE115 – 13

C402.2.1

Proponent: Mark S. Graham, National Roofing Contractors Association (mgraham@nrca.net)

Revise as follows:

C402.2.1 Roof assembly. The minimum thermal resistance (*R*-value) of the insulating material installed either between the roof framing or continuously on the roof assembly shall be as specified in Table C402.2, based on construction materials used in the roof assembly. Skylight curbs shall be insulated to the level of roofs with insulation entirely above deck or R-5, whichever is less.

Exceptions:

1. Continuously insulated roof assemblies where the thickness of insulation varies 1 inch (25 mm) or less and where the area-weighted *U*-factor is equivalent to the same assembly with the *R*-value specified in Table C402.2.
2. Where tapered insulation is used with insulation entirely above deck, the *R*-value where the insulation thickness varies 1 inch (25 mm) or less from the minimum thickness of tapered insulation shall comply with the *R*-value specified in Table C402.2
- ~~2~~ 3. Unit skylight curbs included as a component of an NFRC 100 rated assembly shall not be required to be insulated.

Insulation installed on a suspended ceiling with removable ceiling tiles shall not be considered part of the minimum thermal resistance of the roof insulation.

Reason: This code change proposal is intended to clarify the Code's intent how *R*-value is determined when using slope-to-drain tapered insulation systems in roof assemblies using the insulation entire above deck configuration. The 2012 IECC Code and Commentary indicates Exception 1 is intended to address tapered insulation systems in insulation entire above deck configurations. The Commentary's text on this specific topic is as follows:

"The exception to this section permits a roof that is "continuously insulated" to have areas that do not meet the required *R*-values, provided that the area weighted values are equivalent to the specified insulation values. This type of insulation referred to as a tapered installation is where the roof insulation thickness varies to provide slope for drainage. Therefore, while one section may have less insulation due to this slope, other portions of the roof would be above the values required. Therefore, in this situation the weighted average of the insulation would meet the required values even though some portions may be less than that specified in Table C402.2. When applying the exception, it is important to notice that the variation in insulation thickness is limited to 1 inch (25 mm). This limitation on the thickness variation will help ensure more consistent insulation coverage and also reduce the number of roofs that qualify to use this exception.

This 1-inch (25 mm) limitation does not prevent the provisions from being applied to roofs that have a greater variation; it simply does not allow additional thickness to be factored into the average insulation values. Where the variation exceeds 1 inch (25 mm), it would be permissible to go to the thinnest spot and measure the *R*-value at that point (for the example call this Point "a"). Then go to a point that is 1 inch (25 mm) thicker than Point "a" and measure the *R*-value there (for the example, call this Point "b"). The remaining portions of the roof that are thicker than that additional 1-inch (25 mm) portion (Point "b") would simply be assumed to have the same *R*-value that Point "b" had. All portions of the roof that meet or exceed the Point "b" *R*-value would simply use the Point "b" *R*-value when determining the area weighted *U*-factor for the roof."

Simply put, this is confusing.

The proposed new Exception 2 is an attempt to provide clearer, more concise wording addressing tapered insulation systems in roof assemblies using the insulation entire above deck configuration.

This proposal keeps the existing Exception 1 intact as it may apply to situations other than tapered insulation systems in roof assemblies using the insulation entire above deck configuration.

Cost Impact: The code change proposal will not increase the cost of construction.

CE115-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.2.1 #2-EC-GRAHAM.doc

CE116 – 13

C402.2.1.1

Proponent: Amy Dickie, Global Cool Cities Alliance (amy@globalcoolcities.org)

Revise as follows:

C402.2.1.1 Roof solar reflectance and thermal emittance. Low-sloped roofs, with a slope less than 2 units vertical in 12 horizontal, directly above cooled *conditioned spaces* in Climate Zones 1, 2, ~~and 3~~, 4a and 4b, shall comply with one or more of the options in Table C402.2.1.1.

(Portions of text not shown remains unchanged)

Reason: Cool roofs are cost effective in climate zones 4a and 4b. Currently, the cool roof provision applies only to climate zones 1 through 3. This proposal expands the cool roof provision to climate zones 4a and 4b, where there is overwhelming evidence that cool roofs provide consistent and significant energy savings and energy cost savings.

Roofs that have a high solar reflectance and high thermal emittance (cool roofs) stay cooler in the sun. Cool roofs will have multiple benefits in climate zones 4a and 4b.

- Switching to cool roofs across climate zones 4a and 4b generates energy savings and energy cost savings.
- Cool roofs help reduce peak load in IECC climate zones 4a and 4b.
- The benefits of cool roofs have been proven beneficial in major metropolitan areas within climate zones 4a and 4b. Several major cities in climate zone 4 have adopted the use of cool roofs on commercial, low-sloped roofs into law.
- Cool roofs provide a cooler environment for roof equipment, thus enabling better performance for rooftop equipment.
- In many cases roof construction can have a cool roof option with zero price premium. Some cool roofs have small price premiums.
- Cool roofs have many important co-benefits. For example, a large number of cool roofs will reduce the summer air temperature in cities and therefore improve resiliency of urban populations to heat events.

The following technical analyses and substantiating information supports this proposal.

1) Switching to cool roofs across IECC Climate Zones 4a and 4b generates energy savings and energy cost savings.

- a. Cool roofs have a positive net energy savings in most parts of the country (Figure 1) and net energy cost savings in most parts of the country (Figure 2).¹

Figure 1: Cooling energy savings and heating energy penalty for commercial buildings with low-sloped roofs that have installed cool roofs. Calculations are based on increasing the aged solar reflectance of the roof to 0.55 from 0.20. Data from Levinson and Akbari (2010). Btu conversions added by GCCA. Annual net energy savings = annual cooling energy savings – heating energy penalty. *Values for other climate zones are available in the Levinson and Akbari (2010) paper.*

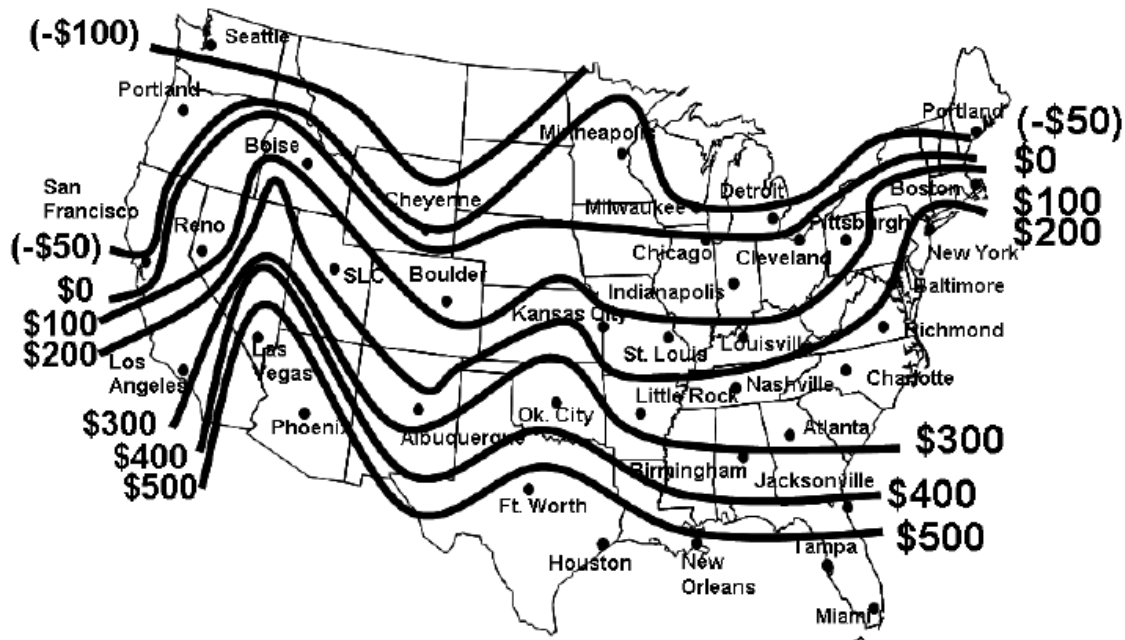

DOE benchmark city	State	Climate Zone	new office annual cooling-energy savings (Btu/m ²)	new office annual heating-energy penalty (Btu/m ²)	new office annual net energy savings (Btu/m ²)
Baltimore	MD	4A	7,034	4,766	2,268
Albuquerque	NM	4B	10,084	4,714	5,370

Figure 2: Net energy cost savings for commercial buildings with low-sloped roofs that have installed cool roofs. Calculations are based on increasing the aged solar reflectance of the roof to 0.55 from 0.20. Data from Levinson and Akbari (2010) with updated energy prices from EIA 2010. *Values for other climate zones are available upon request by e-mail.*

DOE benchmark cities	State	Climate Zone	new office annual energy-cost saving (\$/ft ²)	new retail annual energy-cost saving (\$/ft ²)
Baltimore	MD	4A	\$ 0.01	\$ 0.02
Albuquerque	NM	4B	\$ 0.02	\$ 0.03

- b. The breakeven line for cool roofs is well north of climate zones 4a and 4b.

Figure 3: Net Annual Energy Cost Savings for a reflective roof versus a non-reflective roof (dollars per 20,000 square foot roof area) for low-sloped commercial buildings. Calculations were made using the DOE Cool Roof Calculator.²

- 2) **Cool roofs help reduce peak load in IECC Climate Zones 4a and 4b.**
 - a. According to a recent study, peak energy savings from cool roofs are significant in all climate zones.³
 - b. According to an analysis conducted for the Environmental Protection Agency⁴, adopting cool roofs across 11 metropolitan areas generates peak energy savings for all of them. The three cities included in the study from climate zone 4a had peak annual energy savings from commercial buildings as follows:
New York – 95 MW
Philadelphia – 49 MW
DC/Baltimore – 31 MW
- 3) **The benefits of cool roofs have been proven beneficial in major metropolitan areas within climate zones 4a and 4b. Several major cities in climate zone 4 have adopted the use of cool roofs on commercial, low-sloped roofs into law.**
 - a. A study that analyzed temperature data collected from three different roof surface treatments in Long Island City, Queens, New York found that the white roof surfaces did not show any “winter heating penalty” relative to the black roofs, and found that white roofs generate an energy cost savings of approximately \$200 per year.⁵
 - b. A study which analyzed the building energy impacts of the use of light colored roofs across the US found net energy cost savings for commercial buildings in all eleven of the metropolitan areas it analyzed.⁶ GCCA updated this analysis using EIA electricity and natural gas data from 2010. See Figure 4, below.
Figure 4: Annual energy savings and energy cost savings per 1,000 square feet of roof area of air conditioned commercial buildings resulting from the application of light colored roofs. Building energy data from Konopacki et al. Energy cost data from EIA 2010.

Metropolitan Area	Annual Savings on Commercial Buildings					
	Climate Zone	electricity (kWh)	gas (therms)	electricity savings (\$)	heating energy penalty (\$)	net energy savings (\$)
Atlanta	3A	239	-6	21.65	-6.57	15.08
Chicago	5A	228	-15	20.25	-13.14	7.11
Los Angeles	3B	350	-3	45.85	-2.49	43.36
Dallas / Fort Worth	3A	224	-4	20.59	-3.16	17.43
Houston	2A	261	-2	23.99	-1.58	22.41
Miami/ Ft. Lauderdale	1A	340	0	33.18	0	33.18
New Orleans	2A	287	-2	24.4	-1.97	22.43
New York	4A	211	-9	34.41	-9.79	24.62
Philadelphia	4A	232	-14	23.43	-14.66	8.77
Phoenix	2B	409	-2	38.73	-2.14	36.59
DC/Baltimore	4A	221	-9	29.66	-11.03	18.63

c. New York, Philadelphia, and Washington DC all require cool roofs. All of these cities are in climate zone 4. In all cases, these ordinances were adopted in an effort to generate building energy savings and mitigate the urban heat island.

- As of January 2012, New York City requires cool roofs on new and replacement low-sloped roofs (Local Laws of the City of New York for the Year 2011, #21). Roofs must have a minimum initial reflectance of 0.7 and initial thermal emittance of 0.75 or an SRI of 78.
- Washington DC's Construction Code of 2008 for commercial buildings includes a provision on cool roofs in Chapter 15A. Low-sloped roofs are required to have a minimum initial SRI of 78 or comply with Energy Star. In December 2012, the Washington DC Department of Consumer and Regulatory Affairs and the Construction Codes Coordinating Board published a proposed rulemaking to adopt IECC 2012 section C402.2.1.1 with an amendment to include climate zone 4.
- In April, 2010, the City of Philadelphia issued an ordinance (#090923) that all low-sloped roofs on new buildings and additions to existing buildings be Energy Star rated as highly reflective.

4) Cool roofs provide a cooler environment for roof equipment

a. Cool roofs lead to less thermal expansion due to their cooler temperatures.⁷

Figure 5: White and black roof temperatures on a building in New York City through the summer of 2011.⁷

5) In many cases roof construction can have a cool roof option with zero price premium. Some cool roofs have small price premiums.

a. As with most construction materials, pricing can vary by market. According to EPA's Cool Roof website states, the cost premium for cool roofs versus conventional roofing materials ranges from zero to 5 or 10 cents per square foot for most products.⁸

6) Cool roofs provide co-benefits beyond building energy efficiency

a. Cool roofs help reduce ambient air temperatures, which in turn lower the incidences of smog formation.⁹

Figure 6 shows that as the surface temperature at Baltimore Washington International Airport (x-axis) rises, peak 8-hour ozone concentrations (y-axis) rise at an accelerated pace. Plots above horizontal red line indicate readings that exceeded the EPA compliance standard.

Figure 6: Maximum surface temperature at BWI versus peak 8-hour ozone concentrations

- b. Cool roofs improve resiliency of urban populations to heat events.

A report for the Environmental Protection Agency studied the estimated mortality attributed to actual extreme heat events in Detroit, Philadelphia, Los Angeles, and New Orleans. Scenarios where the cities had higher albedos (10% improvements and 20% improvements) and greater vegetative cover suggest reductions in mortality during extreme heat events when cool surfaces are used to reduce urban temperatures. The paper models three multi-day heat events in Philadelphia (Climate Zone 4a) and estimated a reduction in mortality of approximately 5.5% as a result of a 10% improvement in urban reflectivity.¹⁰

	Assembly:	ASF	AMF	DF

C402.2.1.1-EC-DICKIE.doc

CE117 – 13

C402.1, C402.1.1, Table C402.2.1.1

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

C402.1 General (Prescriptive). The building thermal envelope shall comply with Sections C402.1.1 and C402.3. Section C402.1.2 shall be permitted as an alternative to the *R*-values specified in Section C402.1.1.

~~C402.2.1.1~~ C402.3 Roof solar reflectance and thermal emittance. Low-sloped roofs, with a slope less than 2 units vertical in 12 horizontal, directly above cooled *conditioned spaces* in Climate Zones 1, 2, and 3 shall comply with one or more of the options in Table ~~C402.2.1.1~~ C402.3.

Exceptions: The following roofs and portions of roofs are exempt from the requirements in Table C402.2.1.1:

1. Portions of roofs that include or are covered by:
 - 1.1. Photovoltaic systems or components.
 - 1.2. Solar air or water heating systems or components.
 - 1.3. Roof gardens or landscaped roofs.
 - 1.4. Above-roof decks or walkways.
 - 1.5. Skylights.
 - 1.6. HVAC systems, components, and other opaque objects mounted above the roof.
2. Portions of roofs shaded during the peak sun angle on the summer solstice by permanent features of the building, or by permanent features of adjacent buildings.
3. Portions of roofs that are ballasted with a minimum stone ballast of 17 pounds per square foot (psf) (74kg/m²) or 23 psf (117 kg/m²) pavers.
4. Roofs where a minimum of 75 percent of the roof area meets a minimum

**TABLE ~~C402.2.1.1~~ C402.3
MINIMUM ROOF REFLECTANCE AND EMITTANCE OPTIONS^a**

(Portions of Table not shown remain unchanged)

Reason: This proposal is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Reasons for this proposal are as follows:

This section is currently located incorrectly under parent section C402.2, which addresses insulation. This section has nothing to do with insulation. Therefore, this proposal renumbers the section, relocating it in a manner that separates it from the insulation requirements. The table referenced in this section is also proposed to be renumbered to coordinate with the revised section number.

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

Cost Impact: This code change proposal will not increase the cost of construction. This proposal is a clarification and, as such, will not increase the cost of construction.

CE117-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

CE118 – 13

C202 (NEW), C402.2.1.1

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C402.2.1.1 Roof solar reflectance and thermal emittance. Low sloped roofs, ~~with a slope less than 2 units vertical in 12 units horizontal~~, directly above cooled conditioned spaces in Climate Zones 1, 2, and 3 shall comply with one or more of the options in Table C402.2.1.1.

Exceptions: The following roofs and portions of roofs are exempt from the requirements in Table C402.2.1.1:

1. Portions of roofs that include or are covered by:
 - 1.1. Photovoltaic systems or components.
 - 1.2. Solar air or water heating systems or components.
 - 1.3. Roof gardens or landscaped roofs.
 - 1.4. Above-roof decks or walkways.
 - 1.5. Skylights.
 - 1.6. HVAC systems, components, and other opaque objects mounted above the roof.
2. Portions of roofs shaded during the peak sun angle on the summer solstice by permanent features of the building, or by permanent features of adjacent buildings.
3. Portions of roofs that are ballasted with a minimum stone ballast of 17 pounds per square foot (psf) (74 kg/m²) or 23 psf (117 kg/m²) pavers.
4. Roofs where a minimum of 75 percent of the roof area meets a minimum of one of the exceptions above.

Add new definition as follows:

LOW SLOPED ROOF. A roof having a slope less than 2 units vertical in 12 units horizontal.

Reason: This proposal simplifies criteria for low sloped roofs by adding a definition for the term “low slope roof.” The current code text includes within it a definition that might be better placed in the definitions section of the code. Alternatively, if this is the only place the term is used, the need for a definition is moot if the text is then revised as “Roofs with a slope less than 2 units vertical in 12 units horizontal directly above....”

Cost Impact: The code change proposal will not increase the cost of construction.

CE118-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.2.1.1-EC-WILLIAMS.doc

CE119 – 13

Table C402.2.1.1, Chapter 5

Proponent: Sherry Hao, Energy Solutions, representing Cool Roof Rating Council
(sherry@coolroofs.org)

Revise as follows:

TABLE C402.2.1.1 MINIMUM ROOF REFLECTANCE AND EMITTANCE OPTIONS^a

- b. Solar reflectance tested in accordance with ASTM C1549, ASTM E903, or ASTM E1918, or the CRRC-1 Standard.
- c. Thermal emittance tested in accordance with ASTM C1371, or ASTM E408, or the CRRC-1 Standard.

(Portions of Table not shown remain unchanged)

Add new standard to Chapter 5 as follows:

CRRC Cool Roof Rating Council
 1610 Harrison Street
 Oakland, CA 94612

CRRC-1-12 CRRC-1 Standard

Reason: The Cool Roof Rating Council is recommending that another choice be integrated into the IECC. In this case the CRRC-1 Standard.

The Cool Roof Rating Council was created in 1998 to develop accurate and credible methods for evaluating and labeling the solar reflectance and thermal emittance (radiative properties) of roofing products and to disseminate the information to all interested parties. The CRRC is incorporated as a non-profit educational organization for the following purposes:

- To implement and communicate fair, accurate, and credible radiative energy performance rating systems for roof surfaces.
- To support research into energy related radiative properties of roofing surfaces, including durability of those properties.
- To provide education and objective support to parties interested in understanding and comparing various roofing options.

The CRRC-1 Standard is a testing standard that has many features which are attractive to roof product manufacturers which are beyond the ASTM standards already cited in this these provisions. This document:

- Defines and covers both initial and aged testing requirements
- Covers variegated, granular coated, and custom colored roof products
- Specifies roof product specimen preparation
- Addresses how to handle specimens which may be uncharacteristically damaged during testing
- Specifies the minimum contents of a testing report

This is not a proprietary document, as it is material neutral. This document is not specifically tied to the Cool Roof Rating Council "Product Rating Program", but is designed to be independent of that program or any others.

This code change proposal does not attempt to remove the existing ASTM standards as industry in past code hearings has indicated that it wishes to retain those options currently available to them.

The standard is available at no charge at <http://www.coolroofs.org> for viewing or downloading.

Cost Impact: The code change proposal will not increase the cost of construction. None know.

Analysis: A review of the standard proposed for inclusion in the code, CRRC-1-2012 – CRRC-1 Standard, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

CE119-13

	Assembly:	ASF	AMF	DF

C402.2.1.1T-EC-HAO

CE120 – 13

Table C402.2.1.1, Chapter 5

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

TABLE C402.2.1.1 MINIMUM ROOF REFLECTANCE AND EMITTANCE OPTIONS^a

Three-year aged solar reflectance ^b of 0.55 and three-year aged thermal emittance ^c of 0.75
Initial solar reflectance^b of 0.70 and initial thermal emittance^c of 0.75
Three-year aged solar reflectance index^d of 64
Initial solar reflectance^d of 82

- a. [delete foot note a and renumber subsequent footnotes as a, b and c]
b. Solar reflectance tested in accordance with ASTM C 1549, ASTM E 903 or ASTM E 1918 CRRC-1 Standard.
c. Thermal emittance tested in accordance with ASTM C 1371 or ASTM E 408 CRRC-1 Standard.
d. Solar reflectance index (SRI) shall be determined in accordance with ASTM C 1980 using a convection coefficient of 2.1 Btu/h x ft² x F. Calculation of aged SRI shall be based on aged testing values of solar reflectance and emittance. Calculation of initial SRI shall be based on initial tested values of solar reflectance and thermal emittance. ~~three-year aged solar reflectance and three-year aged thermal emittance testing in accordance with CRRC-1 Standard.~~

Add new standard to Chapter 5 as follows:

CRRC Cool Roof Rating Council
 1610 Harrison Street
 Oakland, CA 94612

CRRC-1-12 CRRC-1 Standard

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, has been revised with respect to certain HVAC equipment efficiency criteria. The change ensures continued consistency between the IECC and standard 90.1-2010.

ASHRAE SSPC 90.1 also chose to adopt the CRRC-1 Standard as the document for testing roofing products. This testing standard has many features which are attractive to roof product manufacturers which are beyond the ASTM standards already cited in this these provisions. This document:

- Defines and covers both initial and aged testing requirements
- Covers variegated, granular coated, and custom colored roof products
- Specifies roof product specimen preparation
- Addresses how to handle specimens which may be uncharacteristically damaged during testing
- Specifies the minimum contents of a testing report

This is not a proprietary document, as it is material neutral. This document is not specifically tied to the Cool Roof Rating Council "Product Rating Program", but is designed to be independent of that program or any others. The standard is available at no charge at <http://www.coolroofs.org> for viewing or downloading.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, CRRC-1-2012 – CRRC-1 Standard, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

CE120-13

Public Hearing:	Committee:	AS	AM	D

C402.2.1.1T-EC-FERGUSON.doc

CE121 – 13

Table C402.2.1.1, C402.1.1.1 (NEW), Chapter 5

Proponent: Robert A. Zabcik, P.E., NCI Building Systems, Inc., representing Cool Metal Roofing Coalition

Revise as follows:

**TABLE C402.2.1.1
MINIMUM ROOF REFLECTANCE AND EMITTANCE OPTIONS^a**

Three-year aged solar reflectance ^b of 0.55 and three-year aged thermal emittance ^c of 0.75
Initial solar reflectance^b of 0.70 and initial thermal emittance^c of 0.75
Three-year-aged solar reflectance index ^d of 64
Initial solar reflectance index^d of 82

- a. The use of area-weighted averages to meet these requirements shall be permitted. ~~Materials lacking initial tested values for either solar reflectance or thermal emittance, shall be assigned both an initial solar reflectance of 0.10 and an initial thermal emittance of 0.90. Materials lacking three-year aged tested values for either solar reflectance or thermal emittance shall be assigned both a three-year aged solar reflectance in accordance with Section C402.2.1.1.1 of 0.10 and a three-year aged thermal emittance of 0.90.~~
- b. ~~Aged~~ Solar reflectance tested in accordance with ~~CRRC-1~~ASTM C 1549, ASTM E 903 or ASTM E 1918.
- c. ~~Aged~~ Thermal emittance tested in accordance with ~~CRRC-1~~ASTM C 1371 or ASTM E 408.
- d. Solar reflectance index (SRI) shall be determined in accordance with ASTM E 1980 using a convection coefficient of 2.1 Btu/h x ft² x °F (12W/m² x K). Calculation of aged SRI shall be based on aged tested values of solar reflectance and thermal emittance. Calculation of initial SRI shall be based on initial tested values of solar reflectance and thermal emittance.

C402.2.1.1.1 Aged roof solar reflectance. Where an aged solar reflectance required by Section C402.2.1.1 is not available, it shall be determined in accordance with Equation 4-X.

$$R_{\text{aged}} = [0.2 + 0.7(R_{\text{initial}} - 0.2)] \quad (\text{Equation 4-X})$$

where:

R_{aged} = The aged solar reflectance

R_{initial} = The initial solar reflectance determined in accordance with CRRC-1

Add new standard to Chapter 5 as follows:

CRRC Cool Roof Rating Council
1610 Harrison St
Oakland, CA 94612

CRRC-1 2012 Cool Roof Rating Council, CRRC-1 Standard

Reason: The use of initial values for compliance with solar reflectance (SR) and thermal emittance (TE) requirements as opposed to three-year aged values is not representative of real-world conditions. Weathering of most roofing materials greatly changes the SR and to a lesser degree, the TE, as documented by Lawrence Berkeley and Oak Ridge National Laboratories. The California Energy Commission (CEC) Title 24 Building Energy Efficiency Standards has addressed this issue very effectively since 2005. By requiring 3-year aged SR and TE values, a more realistic SRI is obtained; one that represents the performance of the roofing material during the life of the material rather than at the time of installation. The Cool Roof Rating Council (CRRC) has simultaneously developed the CRRC-1 standard to rigorously qualify the test procedures used to measure SR and TE, as well as the aging process. Thus, referencing the CRRC-1 standard is much more thorough than simply referencing the ASTM test methods used to measure SR and TE directly. The CRRC has recently been ANSI accredited to develop standards, further adding credibility.

The CRRC-1 standard uses the same test methods as the 2012 IECC, with the exception of ASTM E 408, which measures direct normal TE using a handheld device. (ASTM C 1371 measures the TE averaged over a hemisphere and the two methods can yield greatly different results.) Energy Star has recently dropped ASTM E408 as well. Furthermore, the test procedures are further qualified to ensure consistency across all tested roofing products, including variegated products such as granule coated shingles. The aging process has absolutely no qualification as currently specified in the IECC. The CRRC-1 Standard very effectively addresses this gap as well by specifying multiple test farms sites and accrediting labs to age and test specimens for SR and TE. It also outlines a color family program that allows manufacturers of colored products to group and test their products in representative

lots. The downside is that the aging process takes three years. However, the CEC has included the aging formula presented in proposed new Section C402.2.1.1.1 since 2005 to predict aged values, which is also introduced in this proposal to provide values to use before testing is completed. This formula is based on a curve fit of the CRRC dataset and provides aged values of SR with conservatism and accuracy.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, CRRC-1-2012 – CRRC-1 Standard, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

C402.2.1.1, C402.2.1.1.1 (NEW), C402.2.1.2 (NEW), Chapter 5

Proponent: Amy Dickie, Global Cool Cities Alliance (amy@globalcoolcities.org), Craig Conner, Building Quality, representing self (craig.conner@mac.com)

Delete and substitute as follows:

~~C402.2.1.1 Roof solar reflectance and thermal emittance.~~ ~~Low-sloped roofs, with a slope less than 2 units vertical in 12 horizontal, directly above cooled conditioned spaces in Climate Zones 1, 2, and 3 shall comply with one or more of the options in Table C402.2.1.1.~~

~~Exceptions:~~ ~~The following roofs and portions of roofs are exempt from the requirements in Table C402.2.1.1:~~

- ~~1. Portions of roofs that include or are covered by:~~
 - ~~1.1. Photovoltaic systems or components.~~
 - ~~1.2. Solar air or water heating systems or components.~~
 - ~~1.3. Roof gardens or landscaped roofs.~~
 - ~~1.4. Above-roof decks or walkways.~~
 - ~~1.5. Skylights.~~
 - ~~1.6. HVAC systems, components, and other opaque objects mounted above the roof.~~
- ~~2. Portions of roofs shaded during the peak sun angle on the summer solstice by permanent features of the building, or by permanent features of adjacent buildings.~~
- ~~3. Portions of roofs that are ballasted with a minimum stone ballast of 17 pounds per square foot (psf) (74 kg/m²) or 23 psf (117 kg/m²) pavers.~~
- ~~4. Roofs where a minimum of 75 percent of the roof area meets a minimum of one of the exceptions above.~~

C402.2.1.1 Roof solar reflectance and thermal emittance. In climate zones 1, 2 and 3, roofs with a slope less than or equal to 2 units vertical in 12 units horizontal that are located directly above cooled conditions spaces shall have an average aged solar reflectance of not less than 0.55 and an average aged thermal emittance of not less than 0.75.

Exceptions: The following roofs and portions of roofs are exempt from the requirements in this Section:

1. Portions of the roof that include or are covered by the following:
 - 1.1. Photovoltaic systems or components
 - 1.2. Solar air or water heating systems or components
 - 1.3. Roof gardens or landscaped roofs
 - 1.4. Above-roof decks or walkways
 - 1.5. Skylights
 - 1.6. HVAC systems, components, and other opaque objects mounted above the roof.
2. Portions of the roof shaded during the peak sun angle on the summer solstice by permanent features of the building, or by permanent features of adjacent buildings.
3. Portions of roofs that are ballasted with a minimum stone ballast of 17 pounds per square foot (lb/ft²) [74 kg/m²] or 23 psf (lb/ft²) [117 kg/m²] pavers.
4. Roofs where a minimum of 75 percent of the roof area meets one or more of the exceptions above.

C402.2.1.1.1 Alternative Compliance Pathways. Roofs or portions of roofs that comply with one or more of the following also shall be in compliance with C402.2.1.1.

1. An aged solar reflectance index of not less than 64.

2. An initial solar reflectance of not less than 0.70 and an initial thermal emittance of not less than 0.75.
3. An initial solar reflectance index of not less than 82.

C402.2.1.2 Roof testing. Roof product solar reflectance and thermal emittance shall be determined as follows:

1. The initial and aged solar reflectances and initial and aged thermal emittances of the roofing product shall be measured in accordance with the ANSI/CRRC-1 Standard.
2. Initial and aged values of solar reflectance index (SRI) shall be determined in accordance with ASTM E 1980 using a medium wind speed convective coefficient of 2.1 BTU/(h · ft² · °F) [12 W/(m² · K)]. Calculation of aged SRI shall be based on aged tested values of solar reflectance and thermal emittance. Calculation of initial SRI shall be based on initial tested values of solar reflectance and thermal emittance.
3. Materials lacking initial tested values for either solar reflectance or thermal emittance shall be assigned both an initial solar reflectance of 0.10 and an initial thermal emittance of 0.90. Materials lacking aged tested values for either solar reflectance or thermal emittance shall be assigned both an aged solar reflectance of 0.10 and an aged thermal emittance of 0.90.

Add new standard to Chapter 5 as follows:

CRRC Cool Roof Rating Council
1610 Harrison Street
Oakland, CA 94612

CRRC-1-12 – CRRC-1 Standard

Reason: The 2012 IECC is the first I-code to contain substantive language for 'cool roofs'. This proposal makes technical corrections, reformat, and adds clarity to the language in Section C402.2.1.1, and adds a reference to the CRRC standard. Descriptions of specific changes and the reasons for each are described below.

- 1) Problem: The definition for low-sloped roofs is inconsistent with other major codes and standards, including ASHRAE and California's Title 24.
 Solution: Change the definition of low-sloped roofs from a rise to run ratio of less than 2:12 to a rise to run ratio of less than or equal to 2:12. This change makes the definition of low-sloped roofs consistent with other codes (e.g. ASHRAE 90.1 and California's Title 24).
- 2) Problem: The code does not make clear which performance metric is preferred.
 Solution: Reformat the code to state primary rating option (aged solar reflectance and aged thermal emittance) in the body of the code and the other rating options as exceptions. Note that although this change alters the format of the code, it has no influence on the stringency of the code.
- 3) Problem: The "three-year" specification is redundant to "aged". Further, future versions of the CRRC-1 Standard may allow a different time period for aged testing.
 Solution: Remove the specification of "three-year" from the notation of aged reflectivity and aged emissivity values because the duration of the aging is explicit in the CRRC Standard, and should be changed as the standard evolves.
- 4) Problem: Important definitions and requirements for roof testing are included in footnotes and are therefore confusing and difficult to follow.
 Solution: Move the footnotes that pertain to the testing requirements into a new section (Section C402.2.1.3), titled "Roof Testing". This change moves important definitions and requirements out of the footnotes, thus providing a cleaner format for the code.
- 5) Problem: The ANSI approval for the CRRC-1 Standard as a consensus standard had not been received at the time of the final action hearing of the last code cycle. Therefore, the code does not reference the most appropriate industry standard for roof testing and aging.
 Solution: The CRRC-1 Standard is now an ANSI approved consensus standard. This code change references what most stakeholders consider to be the most appropriate standard, which now complies with ICC CP-28.

Cost Impact: The codec change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, CRRC-1-2012 – CRRC-1 Standard, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

C402.2.1.1(NEW)-EC-CONNER-DICKIE.doc

CE123 – 13

C202, C402.2.2, C402.2.2.1, C402.2.2

Proponent: Brian Dean, ICF International, representing Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; Bill Prindle, Energy Efficient Codes Coalition; and Don Vigneau, Northeast Energy Efficiency Partnerships.

Delete without substitution as follows:

SECTION C202 GENERAL DEFINITIONS

~~**C402.2.2 Classification of walls.** Walls associated with the building envelope shall be classified in accordance with Section C402.2.2.1 or C402.2.2.2.~~

~~**C402.2.2.1 Above-grade walls.** Above-grade walls are those walls covered by Section C402.2.3 on the exterior of the building and completely above grade or walls that are more than 15 percent above grade.~~

~~**C402.2.2.2 Below-grade walls.** Below-grade walls covered by Section C402.2.4 are basement or first-story walls associated with the exterior of the building that are at least 85 percent below grade.~~

Revise definitions as follows:

~~**BASEMENT WALL.** A wall 50 percent or more below grade and enclosing *conditioned space*.~~

ABOVE-GRADE WALL. The walls on the exterior of the building and completely above grade or walls that are more than 15 percent above grade.

BELOW-GRADE WALL. The basement or first-story walls associated with the exterior of the building that are at least 85 percent below grade.

Reason: The purpose of this code change is to clarify the code. First, this proposal moves definitions of “above-grade walls” and “below-grade walls” from chapter four to chapter two, where general definitions, such as these, more appropriately belong. The proposal also eliminates the definition of “basement wall” as unnecessary, inconsistent, and potentially confusing in the commercial energy code.

Cost Impact: The code change proposal will not increase the cost of construction.

Delete without substitution as follows:

~~**C402.2.2 Classification of walls.** Walls associated with the building envelope shall be classified in accordance with Section C402.2.2.1 or C402.2.2.2.~~

~~**C402.2.2.1 Above-grade walls.** Above-grade walls are those walls covered by Section C402.2.3 on the exterior of the building and completely above grade or walls that are more than 15 percent above grade.~~

~~**C402.2.2.2 Below-grade walls.** Below-grade walls covered by Section C402.2.4 are basement or first-story walls associated with the exterior of the building that are at least 85 percent below grade.~~

Add new definitions as follows:

SECTION C202 GENERAL DEFINITIONS

WALL, ABOVE-GRADE. A wall associated with the *building thermal envelope* that is more than 15 percent above grade and is on the exterior of the building or any wall that is associated with the *building thermal envelope* that is not on the exterior of the building.

WALL, BELOW-GRADE. A wall associated with the basement or first story of the building that is part of the *building thermal envelope* , is at least 85 percent below grade and is on the exterior of the building.

Reason: In order to clarify and simplify the code, this proposal replaces the current text indicating how to determine a wall classification with a formal definition of each wall type

Section C402.2.2 contains only definitions that are more appropriately located in Section C202. Application of the current Sections C402.2.3 (above grade walls) and C402.2.4 (below grade walls) are clear as to requirements and can be readily and more easily applied by locating the definitions of those terms in the definitions section as opposed to another section of the code.

The current code provisions are technically incorrect. They refer to the building envelope (not the defined term building thermal envelope) and the exterior of the building. This omits any wall that is an interior wall that is part of the building thermal envelope, which is where the heat transfer occurs that the code is intending to address. Examples of this are a stairway wall separating an unconditioned basement from a conditioned first floor or a wall separating a conditioned basement from a vented crawl space. A strict application of the current code would eliminate such walls from having to be insulated because they are neither on the building exterior nor associated with the building envelope. The proposed definitions, therefore, cover all possible walls that could be part of the building thermal envelope (those bounded completely or partially by earth, those exposed to the outdoor elements and not bounded by earth, and those separating conditioned from unconditioned or exempt spaces regardless of location in relation to grade) in a clearer manner.

Cost Impact: The code change proposal will not increase the cost of construction.

C402.2.2-EC-WILLIAMS.doc

CE125 – 13

Table C402.2, C402.2.2, C402.2.2.1, C402.2.2.2, C402.2.3, C402.2.4

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

~~C402.2.2 Classification of walls.~~ Walls associated with the building envelope shall be classified in accordance with Section C402.2.2.1 or C402.2.2.2.

~~C402.2.2.1 Above-grade walls.~~ Above-grade walls are those walls covered by Section C402.2.3 on the exterior of the building and completely above grade or walls that are more than 15 percent above grade.

~~C402.2.2.2 Below-grade walls.~~ Below-grade walls covered by Section C402.2.4 are basement or first-story walls associated with the exterior of the building that are at least 85 percent below grade.

C402.2.3 Thermal resistance of above-grade walls more than 15 percent above grade. For exterior walls that are completely above grade or are more than 15 percent above grade, the minimum thermal resistance (*R*-value) of the insulating materials installed in the wall cavity between the framing members and continuously on the walls shall be as specified in Table C402.2, based on framing type and construction materials used in the wall assembly. The *R*-value of integral insulation installed in concrete masonry units (CMU) shall not be used in determining compliance with Table C402.2.

"Mass walls" shall include walls weighing not less than:

1. 35 psf (170 kg/m²) of wall surface area; or
2. 25 psf (120 kg/m²) of wall surface area if the material weight is not more than 120 pounds per cubic foot (pcf) (1900 kg/m³).

C402.2.4 Thermal resistance of below-grade walls at least 85 percent below grade. For exterior walls that are at least 85 percent below grade, the minimum thermal resistance (*R*-value) of the insulating material installed in, or continuously on, the below-grade walls shall be as specified in Table C402.2, and shall extend to a depth of 10 feet (3048 mm) below the outside finished ground level, or to the level of the floor, whichever is less.

For SI: 1 inch = 25.4 mm ci = Continuous insulation. NR = No requirement.

LS = Liner System- A continuous membrane installed below the purlins and uninterrupted by framing members. Uncompressed, un-faced insulation rests on top of the membrane between the purlins.

- Assembly descriptions can be found in ASHRAE 90.1 Appendix A.
- Where using R-value compliance method, a thermal spacer block is required, otherwise use the U-factor compliance method in Table C402.1.2.
- R-5.7 ci is allowed to be substituted with concrete block walls complying with ASTM C 90, ungrouted or partially grouted at 32 inches or less on center vertically and 48 inches or less on center horizontally, with ungrouted cores filled with materials having a maximum thermal conductivity of 0.44 Btu-in/h-^f°F.

- d. Where heated slabs are below grade, below-grade walls shall comply with the exterior insulation requirements for heated slabs.
- e. Steel floor joist systems shall to be insulated to R-38.

Reason: This proposal is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Reasons for this proposal are as follows:

This proposal moves and clarifies, but does not delete the requirements of existing Sections C402.2.2, C402.2.2.1 and C402.2.2.2 of the 2012 IECC.

The code currently has definitions in Chapter 2 for "above-grade" and "basement walls" which conflict with Sections C402.2.1 and C402.2.1, which are also essentially definitions. Furthermore, as Sections 402.2.1 and C402.2.2 are not referenced in C402.2.3 and C402.2.4, it is not immediately clear which definitions apply to Sections C402.2.3 and C402.2.4. To eliminate this confusion and add clarity, we propose that the technically important content from Sections C402.2.1 and C402.2.2 (i.e., percentages above or below grade) be moved into Sections C402.2.3 and C402.2.4, respectively, and that the terms "above grade" and "basement" or "below grade" walls be eliminated. In this manner, confusion is eliminated with other code sections that rely on the Chapter 2 definitions.

Note that the SEHPCAC also submitted a separate proposal to delete Section C402.2.4. This proposal works whether or not that proposal is successful. The committee's preference is that both proposals be approved, resulting in the deletion of Section C402.2.4 and the approval of all other provisions in this proposal.

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

Cost Impact: The code change proposal will not increase the cost of construction. This proposal is a clarification and, as such, will not increase the cost of construction.

Public Hearing: Committee:	AS	AM	D
Assembly:	ASF	AMF	DF

C402.2.2-EC-THOMPSON-SEHPCAC

CE126 – 13

C402.2.3

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C402.2.3 Thermal resistance of above-grade walls. The minimum thermal resistance (R-value) of the insulating materials installed in the wall cavity between the framing members, where required, and continuously on the walls, where required, shall be as specified in Table C402.2, based on framing type and construction materials used in the wall assembly. The R-value of integral insulation installed in concrete masonry units (CMU) shall not be used in determining compliance with Table 402.2.

“Mass walls” shall include walls weighing not less than:

1. 35 psf (170 kg/m²) of wall surface area; or
2. 25 psf (120 kg/m²) of wall surface area if the material weight is not more than 120 pounds per cubic foot (pcf) (1900 kg/m³).

Reason: This proposal clarifies the provisions in the code related to above-grade walls. The current code indicates that the insulation is to be applied between framing members and continuously on the wall. This is never the case for mass walls where only continuous insulation is to be applied and for wood framed walls in some climate zones continuous insulation may not be required to be applied, depending on the insulation option chosen in Table C402.2. Adding the words “where required” allows for cases where either but not both are required or where both are required.

Cost Impact: The code change proposal will not increase the cost of construction.

C402.2.3-EC-WILLIAMS.doc

CE127 – 13

C402.2.3, R402.2.5 (IRC N1102.2.5)

Proponent: James D. Katsaros, PhD, DuPont Building Innovations (james.d.katsaros@dupont.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C402.2.3 Thermal resistance of above-grade walls. The minimum thermal resistance (*R*-value) of the insulating materials installed in the wall cavity between the framing members and continuously on the walls shall be as specified in Table C402.2, based on framing type and construction materials used in the wall assembly. The *R*-value of integral insulation installed in concrete masonry units (CMU) shall not be used in determining compliance with Table C402.2.

“Mass Walls” shall include walls weighing not less than:

1. 35 psf (170 kg/m²) of wall surface areas; ~~or~~
2. 25 psf (120 kg/m²) of wall surface area if the material weight is not more than 120 pound per cubic foot (pcf) (1900 kg/m³), or
3. Having a heat capacity greater than or equal to 6 BTU/ft²×°F [123 kJ/m²× K].

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R402.2.5 (N1102.2.5) Mass Walls. Mass walls for the purpose of this chapter shall be considered above-grade walls of concrete block, concrete, insulated concrete form (ICF), masonry cavity, brick (other than brick veneer), earth (adobe, compressed earth block, rammed earth) and solid timber/logs, or any other walls having a heat capacity greater than or equal to 6 BTU/ft²×°F [123 kJ/m²× K].

Reason: This proposal adds a heat capacity provision to mass wall definition to be consistent with IRC definition

Cost Impact: This code change proposal will not increase the cost of construction.

CE127-13

PART I – IECC-COMMERCIAL PROVISIONS

C402.2.3-EC-KATSARAS.doc

CE128 – 13

C402.2.4

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C402.2.4 Thermal resistance of below-grade walls. The minimum thermal resistance (R-value) of the insulating materials installed ~~in, or~~ continuously within or on the below-grade walls shall be as specified in Table C402.2 and shall extend to a depth of not less than 10 feet (3048 mm) below the outside finish ground level, or to the level of the floor of the conditioned space enclosed by the below-grade wall, whichever is less.

Reason: This proposal clarifies where and how insulation is to be installed on below-grade walls. The term “installed in or continuously on” is potentially confusing in that it infers that the insulation could be inside the wall but not necessarily continuous. The proposal also clarifies where the ‘depth of burial’ measurements are to be made.

Where insulation is required, the current code requires it to be continuous insulation. The term “installed in, or” is potentially confusing in that it infers that the insulation could be inside the wall but not necessarily continuous. The proposed change ensures that regardless of the location of the insulation, the insulation that is applied must be continuous as provided in Table C402.2. As a minimum code, it is more appropriate to state measurements such as depth of burial as minimums that can be exceeded rather than a single “one length only” criterion. The term “floor” can be clarified further to indicate what floor is being considered. For instance, a wall separating an unconditioned crawl space from a conditioned basement or below-grade room could be a below-grade wall bounded by two floors (one in the conditioned space and the grade in the crawl space). The proposed text ensures there is no confusion as to what floor the insulation depth is to be measured.

Cost Impact: The code change proposal will not increase the cost of construction.

CE128-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.2.4-EC-WILLIAMS.doc

CE129 – 13

C402.2.5

Proponent: Joseph Lstiburek, Building Science Corporation, representing self

Delete and substitute as follows:

~~**C402.2.5 Floors over outdoor air or unconditioned space.** The minimum thermal resistance (*R*-value) of the insulating material installed either between the floor framing or continuously on the floor assembly shall be as specified in Table C402.2, based on construction materials used in the floor assembly.~~

~~“Mass floors” shall include floors weighing not less than:~~

- ~~1. 35 psf (170 kg/m²) of floor surface area; or~~
- ~~2. 25 psf (120 kg/m²) of floor surface area if the material weight is not more than 12 pcf (1,900 kg/m³).~~

C402.2.5 Floors. Floor framing cavity insulation or structural slab insulation shall be installed to maintain permanent contact with the underside of the subfloor decking or structural slabs.

Exception: The floor framing cavity insulation or structural slab insulation shall be permitted to be in contact with the topside of sheathing or continuous insulation installed on the bottom side of floor framing when combined with insulation that meets or exceeds the minimum Metal framed or Wood framed and other Walls, Above Grade, R-value in Table C402.1.2 and extends from the bottom to the top of all perimeter floor framing or floor assembly members.

Reason: Requiring insulation in floors to be in direct contact with the underside of subfloor decking or structural slabs is one insulating option. Another option is to have an airspace between the floor sheathing and structural slabs and the top of the cavity insulation where this cavity insulation is in direct contact with the topside of sheathing or continuous insulation installed on the underside of the floor framing and is combined with perimeter insulation that meets or exceeds the R-value requirements for walls. This second option leads to fewer cold spots yet does not change the heat loss as long as the cavity insulation is in direct contact with a sheathing below it or continuous insulation below it. It also facilitates services to be enclosed within the thermal envelope. Examples of these configurations are illustrated below:

Cost Impact: This code change proposal will not increase the cost of construction. This proposal will not raise the cost of construction.

CE129-13

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

C402.2.5-EC-LSTIBUREK.doc

CE130 – 13

C402.2.5

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C402.2.5 Floors ~~over outdoor air or unconditioned space~~. The minimum thermal resistance (R-value) of the insulating materials installed either between the floor framing or continuously on the floor assembly shall be as specified in Table C402.2, based on construction materials used in the floor assembly. Insulation applied on the underside of the floor assembly facing outdoor air or unconditioned space shall be installed to maintain permanent contact with the underside of the floor assembly.

Exception: Insulation applied to the underside of concrete floor slabs shall be permitted an air space of not more than 1 inch where it turns up and is in contact with the underside of the floor under walls associated with the *building thermal envelope*.

Reason: There is no need to indicate in the title anything other than floors because the overall focus of Section 402 is the building thermal envelope, which as defined eliminates the need to further specify any particular conditions associated with the floor. In addition Table C402.2 to which this section refers for insulation provisions refers simply to “floors”. The provisions in R402.2.5 are equally applicable to floor assemblies in commercial buildings where insulation batts for instance may be installed in a floor framing assembly. The need to eliminate a space between the insulation and the underside of the floor is equally applicable in commercial buildings, many of which use the same construction practices as residential buildings. The situation where concrete floor decks may need an air space to address moisture control is covered through an exception that is intended to permit such space but also ensure the insulation is in contact with the floor deck under walls associated with the building thermal envelope so as to cut off any “short circuit” around the floor insulation at the perimeter of the floor deck. This proposal ensures that insulation applied in floors over outside air or unconditioned spaces is in contact with the underside of the floor deck above.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.2.5-EC-WILLIAMS.doc

CE131 – 13

C402.2.6

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

C402.2.6 Slabs-on-grade perimeter insulation. Where the slab-on-grade is in contact with the ground, the minimum thermal resistance (*R*-value) of the insulation around the perimeter of unheated or heated slab-on-grade floors designed in accordance with the *R*-value method of Section C402.1.2 shall be as specified in Table C402.2. The insulation shall be placed on the outside of the foundation or on the inside of the foundation wall. The insulation shall extend downward from the top of the slab for a minimum distance as shown in the table or to the top of the footing, whichever is less, or downward to at least the bottom of the slab and then horizontally to the interior or exterior for the total distance shown in the table. Insulation extending away from the building shall be protected by pavement or by a minimum of 10 inches (254 mm) of soil.

Exception: Where the slab-on-grade floor is greater than 24 inches (61 mm) below the finished exterior grade, perimeter insulation is not required.

Reason: This public comment is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 2 open meetings and over 15 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The title of this section is proposed to be revised to clarify that:

- a) Section C402.2.6 applies only to the perimeter insulation associated with slab-on-grade construction. This section does not apply to the insulation installed within or immediately above or below and in contact with the slab-on-grade construction.
- b) Section C402.2.6 applies only to the *R*-value method in Section C402.1.1. It does not apply to the *U*-, *C*- and *F*-factor method in Section C402.1.2. (Note the ASHRAE 90.1 prescriptive tables referenced by Table C402.1.2 contain their own perimeter insulation requirements and are not reliant on Table C402.2.)

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals

Cost Impact: The code change proposal will not increase the cost of construction. This proposal is a clarification and, as such, will not increase the cost of construction.

CE131-13

	Assembly:	ASF	AMF	DF

C402.2.6-EC-THOMPSON-SEHPCAC

CE132 – 13

C402.2.7, C402.3

Proponent: Joseph R. Hetzel, P.E., Thomas Associates, Inc., representing the Door & Access Systems Manufacturers Association (DASMA) International (jhetzel@thomasamc.com)

Revise as follows:

C402.2.7 Opaque doors. Opaque doors (doors having less than 50 percent glass area) shall meet the applicable requirements for doors as specified in Table C402.2 and be considered as part of the gross area of above-grade walls that are part of the building envelope.

Exception: Non-swinging doors intended for vehicular access and material transportation, with a minimum opening rate of 32 inches per second, shall have a U-factor not greater than 1.2.

C402.3 Fenestration (Prescriptive). Fenestration shall comply with Table C402.3. Automatic daylighting controls specified by this section shall comply with Section C405.2.2.3.2.

Exception: Non-swinging doors intended for vehicular access and material transportation, with a minimum opening rate of 32 inches per second, shall have a U-factor not greater than 1.2.

Reason: The Exceptions refer to door products known as "high speed doors". They are typically automatically controlled, non-swinging doors, and are commonly used in conjunction with vehicular traffic or transportation of materials and are not generally intended for pedestrian traffic. Sizes typically range from 8x8 to 12x12. When high speed doors are used in a building exterior envelope, the primary purposes are for environmental control and/or building security.

High speed door panels or curtains are usually made of a thin layer of vinyl, fabric, rubber or composite material. Materials can be opaque, translucent or a combination thereof.

The assemblies are constructed of flexible materials at the perimeter to provide sealing against air leakage but yet to allow variations in contact between door panels/curtains and jamb construction to maximize the effectiveness of continual high speed operation. Thus, high speed doors cannot comply with prescriptive U-factor requirements. The high speed nature of these doors provides for minimizing of "air exchange", a valuable and predominant characteristic of minimizing overall energy losses through a door opening.

A maximum U-factor value of 1.2 was validated by a 1.17 value obtained via a March 2012 DASMA-sponsored test on a representative 8'x8' high speed door product.

Cost Impact: The code change proposal will not increase the cost of construction.

C402.2.7-EC-HETZEL.doc

CE133 – 13

C202 (NEW), C402.2.7

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

~~C402.2.7~~ C402.3.5 Opaque dDoors. *Opaque doors (having less than 50% glass area)* shall meet the applicable requirements for doors as specified in Table C402.2 and be considered part of the gross area of above-grade walls that are part of the building *thermal* envelope. All other doors shall meet the provisions of Section C402.3.3 for vertical fenestration.

Add a definition as follows:

OPAQUE DOORS. Doors that are at least 50 percent opaque in surface area.

Reason: As currently defined, doors are considered fenestration regardless of the percentage of glazing they contain. As such, users of the code would logically begin to look for and address the requirements for doors in the fenestration section of the code. Instead the provisions for opaque doors (those with less than 50% glass area) are located in Section C402.2.7 covering opaque assemblies. One could conclude from a review of this provision in the opaque section of the code that any door with at least 50-percent glass area must be fenestration. This proposal **clarifies** when doors are considered part of the opaque wall and subject to thermal requirements for the wall, and when doors are fenestration and subject to those requirements.

Relocation of the door provisions to the fenestration section of the code is appropriate, and from there doors that are opaque can be correctly referred back to the sections of the code addressing opaque assemblies and components. Note also the term glass area technically precludes consideration of other non-opaque materials. The proposed code change addresses this by using opaque area as the metric.

Cost Impact: The code change proposal does not increase the cost of construction.

C402.2.7-EC-WILLIAMS.doc

CE134 – 13

C202 (NEW), C402.2.8

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C402.2.8 Insulation of radiant heating systems. Radiant heating system panels, and their associated components U-bends and headers, designed for sensible heating of an indoor space through heat transfer from the thermally effective panel surfaces to the occupants or indoor space or thermal radiation and natural convection and the bottom surfaces of floor structures incorporating radiant heating that are installed in interior or exterior assemblies shall be insulated with a minimum of R-3.5 (0.62 m²/K × W) on all surfaces not facing the space being heated. Radiant heating system panels that are installed in the building thermal envelope shall be separated from the exterior of the building or unconditioned or exempt spaces by not less than the R-value of insulation installed in the opaque assembly in which they are installed or the assembly shall comply with Section C402.1.2.

Exception: Heated slabs on grade insulated in accordance with Section C402.2.6.

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

RADIANT HEATING SYSTEM. A heating system that transfers heat to objects and surfaces within a conditioned space primarily by infrared radiation.

Reason: This proposal clarifies that panels installed in building thermal envelope assemblies must be insulated in accordance with the requirements of the assembly in which they are installed. It also requires insulation of R-3.5 on the non-radiant surface when installed in interior assemblies and refer to the other applicable sections of the code for heated slab insulation. The objective of this proposal is to clarify language as radiant systems can be embedded in floor slabs or can be separate panels applied within wall or roof/ceiling assemblies.

In training sessions on the IECC conducted by the DOE Building Energy Codes Program it regularly comes up that the current provision in Section C402.2.8 conflicts with an R-5 requirement in the International Mechanical Code and the insulation requirements in the IECC for heated slabs. As heated slabs are different than radiant heating system panels and are already addressed in Section C402.2.8 the new exception is intended to address any confusion. Beyond heated slabs on grade, what remains are such systems and panels located within the building thermal envelope or within assemblies that are associated with the building interior but not the building thermal envelope. The proposed change clarifies that Section C402.2.7 applies to those conditions. It also clears up an interpretation issue. On the one hand, the current language can be interpreted to allow only R-3.5 on the back of a radiant panel installed within an exterior wall. On the other hand, the section could be interpreted to mean the radiant panel requires a minimum of R-3.5 no matter where installed, but does not relieve the requirement to provide the required insulation in an opaque wall assembly pursuant to the applicable provisions in Section C402.2. The proposed language makes it clear that the full insulation is required in the opaque wall where associated with the building thermal envelope. The intent of the building thermal envelope provisions is to minimize the heating loads on the building. It is not appropriate to reduce the required amount of insulation in an envelope assembly at the very location of such a heating system where a higher temperature difference occurs. In interior assemblies, the effectiveness of the radiant heating system is improved if heat loss to interior plenums or wall cavities is reduced. If the radiant system/panels cannot be located on an interior assembly and the satisfaction of the insulation level in an assembly associated with the building thermal envelope is challenging, then the option remains to use Section C402.1.2. The lengthy definitions of radiant heat embedded in the section are removed and a definition consistent with that in ANSI/ASHRAE/IES Standard 90.1-2010 for radiant heating systems is added to the IECC definitions.

If the current section is interpreted to require minimum insulation on radiant panels but not reduce any requirement for exterior wall insulation there will be no cost impact. Based on the interpretation that only R-3.5 is required for a radiant panel in an exterior wall, there may be a cost impact if the designer chooses to install such systems in building thermal envelope assemblies as opposed to other available interior assemblies. Additional cost could be incurred if providing the required insulation in a wall assembly where above the level of the currently required R-3.5. Where heaters are installed in exterior ceilings under an attic, there is very minimal additional cost to maintain the full attic insulation depth over the radiant panel. In actual practice, exterior wall installation is rare, as radiant heaters on the perimeter are typically installed inside the interior wall finish material. When installed in building thermal envelope assemblies, there is no reason why insulation equal to the same level as the remainder of the envelope assembly should not be required as the required level of insulation has been previously shown to be cost effective. Insulation adjacent to radiant panels will have a shorter payback due to the high temperature of the radiant panel compared to the space temperature that in turn increases the heat loss through the insulation.

Cost Impact: The code change proposal will increase the cost of construction in some buildings.

Note: The term 'radiant heating system' is not defined in other International Codes. However the term 'radiant heater' is defined in the IMC as follows:

RADIANT HEATER. A Heater designed to transfer heat primarily by direct radiation.

C402.2.8-EC-WILLIAMS.doc

CE135 – 13

C202 (NEW), C402.2.9 (NEW), Table C402.2.9 (NEW)

Proponent: Tim Nogler, Washington State Building Code Council (tim.nogler@des.wa.gov)

Add new text as follows:

C402.2.9 Continuous insulation equivalent. Roof, wall and floor assemblies required by Table C402.2 to include continuous insulation are permitted to utilize the alternate nominal R-values listed in Table C402.2.9, in compliance with the following:

1. The cross-sectional area of metal penetrations of otherwise continuous insulation, as measured in the plane of the surface, is equal to or greater than 0.04 percent, but less than 0.08 percent, of the opaque surface area of the assembly.
2. The metal penetrations of otherwise continuous insulation are isolated or discontinuous. No continuous metal elements penetrate the otherwise continuous portion of the insulation.
3. Construction drawings shall contain details showing the locations and dimensions of all the metal penetrations of otherwise continuous insulation. In addition, calculations shall be provided showing the ratio of the cross-sectional area of metal penetrations of otherwise continuous insulation to the overall opaque wall area.

TABLE C402.2.9
CONTINUOUS INSULATION REQUIREMENTS

<u>Assemblies with continuous insulation</u>	<u>Alternate option for assemblies with metal penetrations greater than 0.04% but less than 0.08% of assembly surface</u>
<u>R-11.4ci</u>	<u>R-14.3</u>
<u>R-13.3ci</u>	<u>R-16.6</u>
<u>R-15.2ci</u>	<u>R-19.0</u>
<u>R-30ci</u>	<u>R-38</u>
<u>R-38ci</u>	<u>R-48</u>
<u>R-13 + R7.5ci</u>	<u>R-13 + R9.4</u>
<u>R-13 + R10ci</u>	<u>R-13 + R12.5</u>
<u>R-13 + R12.5ci</u>	<u>R-13 + R15.6</u>
<u>R-13 + R13ci</u>	<u>R-13 + R16.3</u>
<u>R-19 + R8.5ci</u>	<u>R-19 + R10.6</u>
<u>R-19 + R14ci</u>	<u>R-19 + R17.5</u>
<u>R-19 + R16ci</u>	<u>R-19 + R20</u>
<u>R-20 + R3.8ci</u>	<u>R-20 + R4.8</u>
<u>R-21 + R5ci</u>	<u>R-21 + R6.3</u>

Add new definition as follows:

CONTINUOUS INSULATION (ci): Insulation that is continuous across all structural members without thermal bridges, other than service openings and penetrations by metal fasteners with a cross-sectional area, as measured in the plane of the surface, of less than 0.04 percent of the opaque surface area of the assembly. The insulation is installed on the interior or exterior or is integral to any opaque surface of the building envelope.

Reason: This code change confronts the problem of thermal bridging, and ensures that the full intended insulating value of continuous insulation is achieved.

The proposed new Section 402.2.9 and Table C402.2.9 clarify the definition of "continuous insulation" by setting a maximum allowable ratio of metal penetrations, and provide an alternate path for insulation that is penetrated by heavier fasteners. It is based on a 2011 ASHRAE research project by Morrison Hershfield (RP-1365) providing measured values for thermal performance of penetrations through continuous insulation. A similar modifying factor has been in use in Seattle and Washington State for several years.

Cost Impact: The code change proposal will not increase the cost of construction.

C402.3, C402.3.4 (NEW), Table C402.3.4 (NEW), Table C407.5.1(1)

Proponent: Brian Dean, ICF International, representing Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; Bill Prindle, Energy Efficient Codes Coalition; and Don Vigneau, Northeast Energy Efficiency Partnerships.

Revise as follows:

C402.3 Fenestration (Prescriptive). Fenestration shall comply with this section, including the prescriptive values in Table C402.3 and Table C402.3.4. Automatic daylighting controls specified by this section shall comply with Section C405.2.2.3.2.

C402.3.4 Minimum VT. The minimum visible transmittance (VT) for vertical fenestration and skylights in all climate zones shall be as specified in Table C402.3.4.

Exception: Buildings where the vertical fenestration products collectively have an area-weighted average VT equal to or greater than the alternative minimum VT (VT_{alt}) calculated in accordance with Equation C4-3.

$$VT_{alt} = 0.11/FWR \quad \text{(Equation C4-3)}$$

where:

FWR = Fenestration to Wall Ratio which shall be equal to the actual fenestration area of the proposed building divided by the gross above-grade wall area (expressed as a decimal), but shall not exceed the maximum fenestration area as a percent of gross above-grade wall area allowed in Section C402.3.1.

**TABLE C402.3.4
FENESTRATION MINIMUM VT**

FENESTRATION TYPE	MINIMUM VT
All Climate Zones	
Vertical Fenestration:	
Fixed	0.42
Operable	0.32
Curtain wall/storefront	0.46
Glazed entrance doors	0.17
Skylights	0.49

C402.3.4 C402.3.5 Area-weighted average U-factor and VT. An area-weighted average shall be permitted to satisfy the U-factor requirements for each fenestration product category listed in Table C402.3 and the VT requirements for each fenestration product category listed in Table C402.3.4. Individual fenestration products from different fenestration product categories listed in Table C402.3 or Table C402.3.4 shall not be combined in calculating area-weighted average U-factor or VT, respectively.

TABLE C407.5.1(1)

Reason: The purpose of this proposal is to establish minimum visible transmittance (VT) requirements for commercial fenestration in the *IECC*. This proposal will establish in the *IECC* the same level of minimum VT performance criteria that have been approved and will take effect under California's most recently-revised building energy code, Title 24 *Building Energy Efficiency Standards*, starting in January 2014. The proposal also contains certain provisions, such as weighted averaging and an alternative compliance option based on an equation reflecting fenestration to wall ratio, that were adopted by California to provide flexibility in compliance approaches.

It is well understood that windows are the source of significant solar heat gain, particularly in commercial structures, which have significant internal and external heat gains. Even in colder climates, cooling energy use is typically the most significant load for commercial structures. Due to this fact, most commercial energy codes, including the *IECC*, have appropriately focused on establishing low SHGCs to reduce air conditioning loads, resulting in lower peak energy use and lower electrical peak demand (note that we have another proposal to lower SHGCs in climate zones 4 – 6). Traditional solutions to blocking solar gain sacrificed visible light by allowing the use of dark glazing because of limited glazing options that were available at the time; however, because of technological improvements over the last decade, windows with low SHGC and high VT are now widely available. Thus, this proposal is intended to ensure that reasonable levels of natural light are also available inside the building (or at least that the building capture energy savings associated with such levels) by establishing a minimum VT performance requirement.

Historically, model building codes have required minimum glazing area for these and other reasons. The International Building Code, for example, in Section 1205.2, requires a minimum net glazed area of at least 8% of the floor area of the room served. This is to ensure, among other things, that natural light is provided to spaces intended for human occupancy. However, these values

were set based primarily on clear glass, with much higher VTs. In fact, given much lower VTs for fenestration in many commercial buildings, there was a significant debate in the 2012 IECC code cycle over perceived problems to reducing maximum glazing area to 30% in the prescriptive path based on the perceived need for more glazing for daylighting. As our nation's energy codes continue to move to implement criteria for reducing unwanted solar heat gain, setting reasonable VT minimums is a simple measure that will ensure that windows perform as intended to provide natural light, while at the same time reduce solar gain. Ideally, energy codes should establish balanced criteria to address SHGC and VT that are designed to ensure that only the part of the sun's energy useful for daylighting enters the building. This proposal is an effort in that direction.

Achieving this balanced glazing performance (between low SHGC and high VT) was a driving force behind California's implementation of minimum VT requirements (at the same time, California set low SHGC requirements statewide). In 2009, California commissioned a series of Codes and Standards Enhancement Initiative ("CASE") studies to identify opportunities for improvements and efficiency in its Title 24 Building Energy Efficiency Standards. One such CASE Study, entitled "Nonresidential and High-Rise Residential Fenestration Requirements," evaluated and substantiated the establishment of a minimum VT requirement, along with a related CASE Study on daylighting. The California CASE Studies concluded that setting a prescriptive minimum VT ensures maximum natural lighting and minimum artificial lighting for the energy baseline, and it is the simplest and most effective metric in the context of a prescriptive compliance approach.

The CASE Studies found that the more visible light that is provided through fenestration, the more likely internal electric lighting and resulting electric loads are reduced at peak times during the day, which provides a series of benefits beyond the obvious lighting electricity reductions, such as reduced cooling loads due to lower internal heat generated from lighting and, therefore, reduced cooling energy use to offset the lighting heat load and associated lower peak demand. The CASE study authors also found that "the VT requirement is predicted to give occupants a better connection to the outdoors, which has been shown to improve occupant comfort and productivity" (CASE Study, Nonresidential and High-Rise Residential Fenestration Requirements, page 10, note e). The California Energy Commission used the results of these CASE Studies and several months of stakeholder review and comments and staff workshops that followed to further develop, refine and adopt new Title 24 Building Energy Efficiency Standards with minimum prescriptive VT requirements. Starting January 2014, all new nonresidential and high-rise residential buildings and hotels/motels in California must meet or exceed the minimum VT requirements in this proposal.

The ideal type of glazing technology capable of meeting the VT requirements in this proposal is referred to by some in the industry as "triple-silver" low SHGC low-e glazing. Triple-silver coatings in a double-pane insulating glass unit provide excellent solar heat gain reduction without losing nearly as much visible light as other glazing types or shading approaches. A triple-silver coating is produced by multiple glazing manufacturers for both residential and nonresidential applications, and is widely available from commercial and residential fenestration manufacturers and contractors across the country. The benefit of a product like triple-silver low-e glazing is that it represents the best available combination of low SHGC, low U-factor and high VT at roughly the same cost to the user as glazing with a low SHGC and low VT. In other words, the visible light benefits can be obtained at little or no additional cost. The minimum VT requirements in this proposal will ensure that the IECC calls for the right glazing choice at the time the windows are installed. Even if controls and other techniques are not implemented at initial construction to maximize daylighting benefit, the minimum VT will still provide benefits. A minimum reasonable VT presents a greater opportunity for effective future retrofits of controls and other techniques, as well as increasing the likelihood of voluntary non-automatic lighting reduction by occupants.

The life-cycle costing analysis used by California in its CASE Studies substantiated that "double-pane triple-silver low-e coated glazing was the most cost-effective choice for a statewide fenestration standard" (CASE Study, Nonresidential and High-Rise Residential Fenestration Requirements, page 33).

The following graphic from the Efficient Window Collaborative's website compares and contrasts the solar heat gain reduction and visible light transmitting characteristics of various glazing types. As you can see from this graphic, double-pane, low solar gain (triple-silver) low-e glazing (the eighth option on the list) provides the best combination of low SHGC and high VT of standard glazing types. Note that the values in the graphic are for glass only without the frame – actual SHGCs and VTs for code compliance include the effects of frames, which will typically reduce both the SHGC and VT by at least 10%.

Benefits: Increased Light & View

Daylight and view are two of the fundamental attributes of a window. Unfortunately, windows can also be the source of significant solar heat gain during times when it is unwanted. Traditional solutions to reducing solar heat gain such as tinted glazing or shades mean that the amount of light is reduced as well. New glazings with low-solar-gain Low-E (spectrally selective) coatings can provide better solar heat gain reduction than tinted glass, with a minimal loss of visible light. This also means that views can be clearer and unobstructed.

Note: All values are for glass only without frame. Source: Residential Windows by Carmody, Sekowitz, Arasteh and Hesong.

Verifying fenestration VT for code compliance will not add to cost or complexity. VT is simply another number to check that is already listed on the NFRC label, along with U-factor and SHGC. Also, *IECC* Table C303.1.3(3) already includes default VT values for products without NFRC ratings.

During California's most recent code adoption process, some commenters were concerned about glare being a problem associated with a minimum VT requirement. There was much evidence presented (by the California CASE Study authors and others) that refuted any suggestion that higher VTs lead to increased glare. Instead, it was shown that glare could be present regardless of a fenestration product's VT rating, and it is something best addressed through design, not VT.

Other options California considered for establishing minimum visible light criteria included effective aperture (EA) and light-to-solar gain ratio (referred to as LSG or VT/SHGC). California dismissed those as less effective alternatives, and we agree. Focusing first on EA, most daylighting experts agree that EA is overly complicated and unnecessary. The EA approach analyzed in California uncovered a technical loophole and energy penalty that made EA inferior to VT or VT/SHGC. The CASE Study noted "the reason that the EA approach is an energy penalty is that it results in low VTs at crucial WWRs" (CASE Study, Nonresidential and High-Rise Residential Fenestration Requirements, page 37). (Crucial WWRs, or window-to-wall ratios, are ones at or near 30%.) The CASE Study found that the EA penalty could be minimized by adding the complexity of more rules to the code, but such complexity would have been contrary to California's stated goal of simplification. An EA approach also would be contrary to the simplification improvements that the *IECC* has achieved over past cycles.

The second analyzed option of an LSG or VT/SHGC ratio would satisfy a simplification goal, because it relies on two readily available window performance metrics (VT and SHGC), but the same benefits with less complexity can be accomplished by simply setting a minimum VT. Those who supported the VT/SHGC approach in California seemed more interested in adopting the extremely weak 1.1 ratio that is presently required in limited applications in the *IECC* (Section C402.3.1.1(3)), as opposed to any particular reason why the LSG ratio approach would be better than simply setting a minimum VT. The problem with 1.1 VT/SHGC ratio is that it is not a particularly robust or effective target. If a VT/SHGC or LSG ratio approach were implemented in the *IECC*, the ratio would need to be much higher than 1.1 to achieve the same level of performance that California adopted. As an example, using a triple-silver low SHGC low-e glass that is available in today's market as a reference point, the VT/SHGC ratio would exceed 2.0.

To allow flexibility and a greater array of products to qualify, while preserving the core of the VT requirement and associated daylighting savings, several allowances are included in this proposal to match what was adopted in California. First and foremost, in California and in this proposal, the minimum VT is established as the prescriptive path energy baseline for the performance path. The prescriptive VT can be traded away in the performance path, so long as comparable energy savings are provided. Any glazing or combination of measures that deliver equivalent savings would be allowed, which provides the greatest flexibility. Also, as in California, this proposal allows the minimum VT requirements to be met on an area-weighted average basis, which permits some glass not to meet the minimum, so long as the glass meets the minimum on average. Lastly, this proposal includes as an exception, California's equation approach, as an alternative to the prescriptive VT values as a way to provide additional flexibility for buildings

with higher glazing areas (Alternative Minimum VT = 0.11/FWR). California viewed this equation as a temporary option that likely will be removed in the next Title 24 rulemaking cycle.

It is also worth noting that the minimum prescriptive VT values that California's CASE Study initially substantiated and recommended were considerably more stringent than the values that were ultimately adopted and are being proposed here. The California Energy Commission Staff took into consideration several factors and comments throughout its rulemaking process, and the minimum prescriptive values and approaches ultimately settled upon in California were found to be sufficient for a reasonable group of products to qualify while still providing the daylighting benefits and savings that California set out to achieve.

While we too would have constructed a more stringent set of requirements if we were starting from scratch, we believe that adopting this fully-developed and soon-to-be-implemented approach from California, with its already built-in compromises, would be the best course to make real progress at this point on a national basis and hopefully garner additional support and avoid controversy. On balance, we think that additional refinements would best be considered in future code cycles.

In summary, adoption of the minimum VT requirements in this proposal will ensure that fenestration capable of meeting the IECC's insulating and solar gain performance requirements will not needlessly sacrifice visible light. The level of performance in this proposal can be met cost-effectively by existing readily available glazing technology. These proposed performance values will establish in the IECC the appropriate technology targets for high performance glazing that will generate significant cooling, heating and lighting energy savings.

C202 (NEW), C402.3, C402.3.1.1, C402.3.1.2, C402.3.2.1, C402.3.3.3, C402.3.3.4, Table C406.3, C408.3.1

Proponent: Jack Bailey, One Lux Studio, representing International Association of Lighting Designers (jbailey@oneluxstudio.com)

Revise as follows:

C402.3 Fenestration (Prescriptive). Fenestration shall comply with Table C402.3. ~~Automatic daylighting controls specified by this section shall comply with Section C405.2.2.3.2.~~ Daylight responsive controls shall comply this section and Section C405.2.2.3.2.

C402.3.1.1 Increased vertical fenestration area with ~~daylighting controls~~ daylight responsive controls. In Climate Zones I through 6, a maximum of 40 percent of the gross above-grade wall area shall be permitted to be vertical fenestration, provided:

1. No less than 50 percent of the conditioned floor area is within a daylight zone;
2. ~~Automatic daylighting controls~~ Daylight responsive controls are installed in daylight zones; and
3. Visible transmittance (VT) of vertical fenestration is greater than or equal to 1.1 times solar heat gain coefficient (SHGC).

Exception: Fenestration that is outside the scope of NFRC 200 is not required to comply with Item 3.

C402.3.1.2 Increased skylight area with ~~daylighting controls~~ daylight responsive controls. The skylight area shall be permitted to be a maximum of 5 percent of the roof area provided ~~automatic daylighting controls~~ daylight responsive controls are installed in daylight zones under skylights.

C402.3.2.1 Lighting controls in daylight zones under skylights. ~~All lighting in the daylight zone shall be controlled by multilevel lighting controls that comply with Section C405.2.2.3.3.~~ Daylight responsive controls shall be provided to control the electric lights within daylight zones under skylights.

Exception: Skylights above daylight zones of enclosed spaces are not required in:

1. ~~Buildings in Climate Zones 6 through 8.~~
2. ~~Spaces where the designed general lighting power densities are less than 0.5 W/ft² (5.4 W/m²).~~
3. ~~Areas where it is documented that existing structures or natural objects block direct beam sunlight on at least half of the roof over the enclosed area for more than 1,500 daytime hours per year between 8 am and 4 pm.~~
4. ~~Spaces where the daylight zone under rooftop monitors is greater than 50 percent of the enclosed space floor area.~~

C402.3.3.3 Increased skylight SHGC. In Climate Zones 1 through 6, skylights shall be permitted a maximum SHGC of 0.60 where located above daylight zones provided with ~~automated daylighting controls~~ daylight responsive controls.

C402.3.3.4 Increased skylight U-factor. Where skylights are installed above daylight zones provided with ~~automated daylighting controls~~ daylight responsive controls, a maximum U-factor of 0.9 shall be permitted in Climate Zones 1 through 3; and a maximum U-factor of 0.75 shall be permitted in Climate Zones 4 through 8.

TABLE C406.3
REDUCED INTERIOR LIGHTING POWER

(Portions of Table not shown remain unchanged)

- a. In cases where both a general building area type and a more specific building area type are listed, the more specific building area type shall apply.
- b. First LPD value applies if no less than 30 percent of conditioned floor area is in daylight zones. ~~Automatic daylighting controls~~ Daylight responsive controls shall be installed in daylight zones and shall meet the requirements of Section C405.2.2.3. In all other cases, second LPD value applies.
- c. No less than 70 percent of the floor area shall be in the daylight zone. Automatic daylighting controls shall be installed in daylight zones and shall meet the requirements of Section 405.2.2.3.

C408.3.1 Functional testing. Testing shall ensure that control hardware and software are calibrated, adjusted, programmed and in proper working condition in accordance with the construction documents and manufacturer's installation instructions. The construction documents shall state the party who will conduct the required functional testing. Where required by the code official, an approved party independent from the design or construction of the project shall be responsible for the functional testing and shall provide documentation to the code official certifying that the installed lighting controls meet the provisions of Section C405.

Where occupant sensors, time switches, programmable schedule controls, photosensors or ~~daylighting controls~~ daylight responsive controls are installed, the following procedures shall be performed:

1. Confirm that the placement, sensitivity and time-out adjustments for occupant sensors yield acceptable performance.
2. Confirm that the time switches and programmable schedule controls are programmed to turn the lights off.
3. Confirm that the placement and sensitivity adjustments of ~~photosensor~~ daylight responsive controls reduce electric light based on the amount of usable daylight in the space as specified.

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

DAYLIGHT RESPONSIVE CONTROL. A device or system that provides automatic control of electric light levels based on the amount of daylight in a space.

Reason: The terms "daylighting controls", "automatic daylighting controls", "automated daylighting controls" and "photosensor controls" are used interchangeably throughout the code but not defined. These terms are misleading because the controls they are describing do not control daylight, but rather they control electric lights in response to daylight. "Daylight responsive controls" is proposed to replace all of these terms.

The exceptions to C402.3.2.1 do not make any sense, as they are exceptions to the skylight requirement in the code, but Section C402.3.2.1 refers to daylighting controls, not skylights. The exact same list of exceptions appears under C402.3.2. We believe that including these exceptions under C402.3.2.1 was an unintentional oversight.

Cost Impact: The code change proposal will not increase the cost of construction.

C402.3-EC-BAILEY

CE138 – 13

C402.3.1.1, C402.3.2

Proponent: Brian Dean, ICF International, representing Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; Bill Prindle, Energy Efficient Codes Coalition; and Don Vigneau, Northeast Energy Efficiency Partnerships.

Revise as follows:

C402.3.1.1 Increased vertical fenestration area with daylighting controls. In Climate Zones 1 through 6, a maximum of 40 percent of the gross above-grade wall area shall be permitted to be vertical fenestration, provided:

1. No less than 50 percent of the conditioned floor area is within a daylight zone; and
2. Automatic daylighting controls are installed in daylight zones; and
3. ~~Visible transmittance (VT) of vertical fenestration is greater than or equal to 1.1 times solar heat gain coefficient (SHGC).~~

Exception: ~~Fenestration that is outside the scope of NFRC 200 is not required to comply with Item 3.~~

C402.3.2 Minimum skylight fenestration area. In an enclosed space greater than 10,000 square feet (929 m²), directly under a roof with ceiling heights greater than 15 feet (4572 mm), and used as an office, lobby, atrium, concourse, corridor, storage, gymnasium/exercise center, convention center, automotive service, manufacturing, non-refrigerated warehouse, retail store, distribution/sorting area, transportation, or workshop, the total daylight zone under skylights shall be not less than half the floor area and shall provide a minimum skylight area to daylight zone under skylights of either:

1. Not less than 3 percent ~~with a skylight VT of at least 0.40;~~ or
2. Provide a minimum skylight effective aperture of at least 1 percent determined in accordance with Equation C4-1.

Reason: The purpose of the proposed code change is to eliminate potentially unnecessary and inconsistent code provisions. The proposal is intended as a clean-up companion proposal to a separate proposal that would establish minimum VT performance requirements for fenestration under the IECC commercial energy efficiency chapter. If the companion proposal is adopted, this proposal would be useful to delete the VT references in these code sections because they would no longer be necessary and could be confusing. For example, the minimum VT for skylights in the companion minimum VT proposal is higher than the VT specified in section C402.3.2. Similarly, the VT/SHGC ratio referenced in section C402.3.1.1 will be unnecessary if the minimum VTs are adopted as proposed in the companion proposal, since the resulting VT/SHGC ratios from the VT minimums can be expected to be substantially higher.

Cost Impact: The code change proposal will not increase the cost of construction.

CE139 – 13

C402.3, C402.3.1.1, C402.3.1.2

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C402.3 Fenestration (Prescriptive). Fenestration shall comply with Table C402.3. ~~Automatic daylighting controls specified by this section shall comply with Section C405.2.2.3.2.~~

C402.3.1.1 Increased vertical fenestration area with daylighting controls. In Climate Zones 1 through 6, a maximum of 40 percent of the gross above-grade wall area shall be permitted to be vertical fenestration, provided:

1. No less than 50 percent of the conditioned floor area is within a daylight zone;
2. Automatic daylighting controls complying with Section C405.2.2.3.2 are installed in daylight zones; and
3. Visible transmittance (VT) of vertical fenestration is greater than or equal to 1.1 times solar heat gain coefficient (SHGC).

Exception: Fenestration that is outside the scope of NFRC 200 is not required to comply with Item 3.

C402.3.1.2 Increased skylight area with daylighting controls. The skylight area shall be permitted to be a maximum of 5 percent of the roof area provided automatic daylighting controls complying with Section C405.2.2.3.2 are installed in daylight zones under the skylights.

Reason: This proposal clarifies daylighting control provisions associated with fenestration and increased skylight area and locate in a more appropriate subsection. The objective of this proposal is to clarify the code to foster implementation and compliance verification.

The primary purpose of the parent Section C402.3 is to introduce the provisions of the code related to fenestration. It is later on in the section that the issue of skylights and an increased skylight area allowance are addressed and the controls provisions then become relevant. The proposal simply locates the relevant daylighting control provisions in the code where they are specifically relevant.

Cost Impact: The code change proposal will not increase the cost of construction.

C402.3, Table C402.3

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

C402.3 Fenestration (Prescriptive). Fenestration shall comply with Sections C402.3 through C402.3.4 and Table C402.3. Automatic daylighting controls specified by this section shall comply with Section C405.2.2.3.2.

TABLE C402.3 BUILDING ENVELOPE FENESTRATION MAXIMUM U-FACTOR AND SHGC REQUIREMENTS: FENESTRATION

(Portions of Table not shown remain unchanged)

Reason: This proposal is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The following revisions are proposed to clarify the application of Table C402.3::

- a) The word "maximum" is proposed to be added to the title of Table C402.3. Previously, many users incorrectly assumed that these were minimum values.
- b) References to "Sections C402.3 through C402.3.4" were added to the text of Section C402.3 to clarify that these sections must be complied with in addition to the currently referenced Table C402.3 in order to satisfy the codes prescriptive fenestration requirements.

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

Cost Impact: This proposal is a clarification and, as such, will not increase the cost of construction. This code change proposal will not increase the cost of construction.

CE140-13

Table C402.3

Proponent: Brian Dean, ICF International, representing Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; Bill Prindle, Energy Efficient Codes Coalition; and Don Vigneau, Northeast Energy Efficiency Partnerships.

Revise as follows:

**TABLE C402.3
BUILDING ENVELOPE REQUIREMENTS: FENESTRATION**

CLIMATE ZONE	1	2	3	4 EXCEPT MARINE	5 AND MARINE 4	6	7	8
Vertical fenestration								
U-factor								
Fixed fenestration	0.50	0.50	0.46 0.38	0.38	0.38 0.36	0.36	0.29	0.29
Operable fenestration	0.65	0.65	0.60 0.45	0.45	0.45 0.43	0.43	0.37	0.37
Entrance doors	1.10	0.83	0.77	0.77	0.77	0.77	0.77	0.77

(Portions of Table not shown remain unchanged)

Reason: The purpose of the proposed code change is to improve the efficiency of commercial vertical windows in climate zones 3 and 5 by lowering U-factors to the same level as the U-factors in climate zones 4 and 6 respectively. The proposal also simplifies the code requirements for design professionals, manufacturers, and suppliers.

- The changes in U-factors are based on existing U-factor values in the 2012 IECC. These U-factors are reasonable and currently applicable to commercial buildings in climate zones 4 and 6. The proposal simply spreads the values from one climate zone to the next, applying the same U-factor across 2 climate zones.
- This proposal essentially combines climate zones 3-4 and 5-6 for purposes of U-factor requirements. This will produce economies of scale and lower costs for manufacturers, suppliers, and ultimately consumers.
- The lower U-factors in climate zones 3 and 5 will provide greater insulating value resulting in energy savings and comfort. For example, our initial estimate of savings based on US DOE's EnergyPlus office reference buildings and an assumption of 30% fenestration area is in the neighborhood of 1% heating, cooling and hot water energy costs for each zone.
- Improvement in window performance, even incrementally, is particularly important in commercial buildings because of the large amounts of glass used in such buildings.

Cost Impact: The code change proposal will increase the cost of construction.

SHGC								
Orientation ^a	<u>SEW</u>	<u>N</u>	<u>SEW</u>	<u>N</u>	<u>SEW</u>	<u>N</u>	<u>SEW</u>	<u>N</u>
SHGC PF < 0.2	0.25	<u>0.33</u>	0.25	<u>0.33</u>	0.25	<u>0.33</u>	0.40	<u>0.53</u>
0.2 ≤ PF < 0.5	<u>0.30</u>	<u>0.37</u>	<u>0.30</u>	<u>0.37</u>	<u>0.30</u>	<u>0.37</u>	<u>0.48</u>	<u>0.58</u>
PF ≥ 0.5	<u>0.40</u>	<u>0.40</u>	<u>0.40</u>	<u>0.40</u>	<u>0.40</u>	<u>0.40</u>	<u>0.64</u>	<u>0.64</u>
Skylights								
U-factor	0.75	0.65	0.55	0.50	0.50	0.50	0.50	0.50
SHGC	0.35	0.35	0.35	0.40	0.40	0.40	NR	NR

NR = No requirement.

a. "N" indicates vertical fenestration oriented within 45 degrees of true north. "SEW" indicates orientations other than "N." For buildings in the southern hemisphere, reverse south and north. Buildings located at less than 23.5 degrees latitude shall use SEW for all orientations.

C402.3.3 Maximum U-factor and SHGC. For vertical fenestration, the maximum *U*-factor and solar heat gain coefficient (SHGC) shall be as specified in Table C402.3, based on the window projection factor and orientation. For skylights, the maximum *U*-factor and solar heat gain coefficient (SHGC) shall be as specified in Table C402.3.

The window projection factor shall be determined in accordance with Equation 4-2.

$$PF = A/B$$

(Equation 4-2)

where:

PF = Projection factor (decimal).

A = Distance measured horizontally from the furthest continuous extremity of any overhang, eave, or permanently attached shading device to the vertical surface of the glazing.

B = Distance measured vertically from the bottom of the glazing to the underside of the overhang, eave, or permanently attached shading device.

Where different windows or glass doors have different *PF* values, they shall each be evaluated separately.

C402.3.3.1 SHGC adjustment. Where the fenestration projection factor for a specific vertical fenestration product is greater than or equal to 0.2, the required maximum SHGC from Table C402.3 shall be adjusted by multiplying the required maximum SHGC by the multiplier specified in Table C402.3.3.1 corresponding with the orientation of the fenestration product and the projection factor.

**TABLE C402.3.3.1
SHGC ADJUSTMENT MULTIPLIERS**

PROJECTION FACTOR	ORIENTED WITHIN 45 DEGREES OF TRUE NORTH	ALL OTHER ORIENTATION
$0.2 \leq PF < 0.5$	1.1	1.2
$PF \leq 0.5$	1.2	1.6

Reason:

(Thompson): This proposal is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

This proposal moves and clarifies, but does not delete requirements that are currently contained in Section C402.3.3.1 and Table C402.3.3.1 of the 2012 IECC.

The purpose of this proposal is twofold: correct a technical error in the SHGC shading adjustment, and increase the enforceability and usability of the vertical fenestration requirements.

Technical Correction

During review of the 2012 IECC, a technical error was identified in the way the multipliers of the new Table C402.3.3.1 are applied to adjust the SHGC based on shading projections and orientation. When used, Table C402.3.3.1 illogically allows a higher SHGC on the west side of a building than on the north side. For example, with a 3 ft overhang above 6 ft tall glazing on a building in zone 3, this would require a max SHGC of 0.30 on the north where solar loads are low, yet would allow 0.40 SHGC on the west where solar impact on energy efficiency is more critical. The source of the problem is as follows. The multipliers are indirectly based on a similar SHGC adjustment in ASHRAE 90.1, which in turn was based on a technical paper using DOE2 simulations in 12 cities across various climate zones and latitudes (E.P. Kolderup and C.N. Eley Jr, "Evaluating the Impact of Overhangs and Sides", ACEEE Summer Study on Energy Efficiency in Buildings, 1992). ASHRAE 90.1 determined that the multipliers could be grouped into two sets of multipliers: one for the south, east, and west (SEW) orientations, and one for the north (N) orientation. At the same time, this was meant to be used together with two sets of SHGC base criteria: one number for the overall building, and a separate number for the north side. This recognized the difference in the solar performance of the north side, and also avoided the technical problem now identified in the 2012 IECC with how the shading adjustments are used.

This was the case in ASHRAE 90.1-2004, but unfortunately, this technical rationale may have been forgotten and both ASHRAE 90.1 and IECC have deviated from this since then. The 2009 IECC avoided the multiplication problem by simply listing the required SHGC for different shading levels (projection factor PF), but did not address the difference between north and the other sides. On the other hand, ASHRAE 90.1-2007 and 2010 kept the different shading factors for SEW and N, but dropped the different baseline SHGC for the north in an effort to simplify – and as a result, they now contain the same technical error as 2012 IECC. This proposal aims to correct the error for the IECC, and the issue will also be raised at ASHRAE 90.1.

This proposal restores the basic format of the 2009 IECC where the required SHGC is directly listed for the appropriate climate zone and projection factor, but also reinstates the different SHGC criteria for the north side. While adding some rows, this table format improves usability and enforcement by allowing the required SHGC to be simply read from the main fenestration table instead of involving a separate table and calculation. There is no change in the 2012 baseline SHGC criteria, but the SEW multipliers are applied to directly show the adjusted SHGC for different shading levels ($0.2 \leq PF < 0.5$ and $PF \geq 0.5$) for the SEW orientations. Then, matching the adjusted SHGC requirement for N and SEW orientations for this high PF well shaded window, the SHGC requirements for the north side are then calculated at $0.2 \leq PF < 0.5$ and $PF < 0.2$ using the same multipliers. This ensures consistency, corrects the technical error of requiring higher SHGC on the west than on the north, and also accounts for the different solar performance of northern orientations.

Additionally, the footnote is added to clarify what to do if located in the southern hemisphere or near the equator. The northern multipliers do not apply well between the Tropics of Cancer and Capricorn (23.5 degrees latitude), and the SEW multipliers are more appropriate for all orientations. (Think of it this way: there is no difference between north and south in terms of the sun when standing at the equator.)

Improved Usability and Enforcement

In addition to correcting the technical error, a very important aspect of this proposal is to improve usability and enforcement of the code. Concerns have been expressed about the increased complexity for enforcement with the format of the 2012 IECC, as compared to the 2009 and 2006 IECC. Rather than simply looking up the maximum SHGC for a given projection factor on the main prescriptive table, the 2012IECC forces extra unnecessary steps on the user, referring to a separate table and requiring additional calculations. This increases both the workload and potential for error in code compliance checks. This proposal simplifies the process by allowing the code official to simply look up the required SHGC on the main fenestration table, similar to the 2006 and 2009 IECC. This simplifies enforcement and compliance, makes it easy to determine the baseline value in performance path calculations, and improves overall usability of the code. Also, while SHGC requirements for the northern orientation have been added to make this section technically correct, this does not necessarily add complexity – users can still simply comply with one glass type and SHGC by meeting the main SHGC requirement for the SEW orientation (which is lower or equal to the N requirement in all cases).

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

(Culp): The purpose of this proposal is twofold: correct a technical error in the SHGC shading adjustment, and increase the enforceability and usability of the vertical fenestration requirements.

Technical Correction

During review of the 2012 IECC, a technical error was identified in the way the multipliers of the new Table C402.3.3.1 are applied to adjust the SHGC based on shading projections and orientation. When used, Table C402.3.3.1 illogically allows a higher SHGC on the west side of a building than on the north side. For example, with a 3 ft overhang above 6 ft tall glazing on a building in zone 3, this would require a max SHGC of 0.30 on the north where solar loads are low, yet would allow 0.40 SHGC on the west where solar impact on energy efficiency is more critical. The source of the problem is as follows. The multipliers are indirectly based on a similar SHGC adjustment in ASHRAE 90.1, which in turn was based on a technical paper using DOE2 simulations in 12 cities across various climate zones and latitudes (E.P. Kolderup and C.N. Eley Jr, "Evaluating the Impact of Overhangs and Sides", ACEEE Summer Study on Energy Efficiency in Buildings, 1992). ASHRAE 90.1 determined that the multipliers could be grouped into two sets of multipliers: one for the south, east, and west (SEW) orientations, and one for the north (N) orientation. At the same time, this was meant to be used together with two sets of SHGC base criteria: one number for the overall building, and a separate number for the north side. This recognized the difference in the solar performance of the north side, and also avoided the technical problem now identified in the 2012 IECC with how the shading adjustments are used.

This was the case in ASHRAE 90.1-2004, but unfortunately, this technical rationale may have been forgotten and both ASHRAE 90.1 and IECC have deviated from this since then. The 2009 IECC avoided the multiplication problem by simply listing the required SHGC for different shading levels (projection factor PF), but did not address the difference between north and the other sides. On the other hand, ASHRAE 90.1-2007 and 2010 kept the different shading factors for SEW and N, but dropped the different baseline SHGC for

the north in an effort to simplify – and as a result, they now contain the same technical error as 2012 IECC. This proposal aims to correct the error for the IECC, and the issue will also be raised at ASHRAE 90.1.

This proposal restores the basic format of the 2009 IECC where the required SHGC is directly listed for the appropriate climate zone and projection factor, but also reinstates the different SHGC criteria for the north side. While adding some rows, this table format improves usability and enforcement by allowing the required SHGC to be simply read from the main fenestration table instead of involving a separate table and calculation. There is no change in the 2012 baseline SHGC criteria, but the SEW multipliers are applied to directly show the adjusted SHGC for different shading levels ($0.2 \leq PF < 0.5$ and $PF \geq 0.5$) for the SEW orientations. Then, matching the adjusted SHGC requirement for N and SEW orientations for this high PF well shaded window, the SHGC requirements for the north side are then calculated at $0.2 \leq PF < 0.5$ and $PF < 0.2$ using the same multipliers. This ensures consistency, corrects the technical error of requiring higher SHGC on the west than on the north, and also accounts for the different solar performance of north orientations.

Additionally, the footnote is added to clarify what to do if located in the southern hemisphere or near the equator. The northern multipliers do not apply well between the Tropics of Cancer and Capricorn (23.5 degrees latitude), and the SEW multipliers are more appropriate for all orientations. (Think of it this way: there is no difference between north and south in terms of the sun when standing at the equator.)

Improved Usability and Enforcement

In addition to correcting the technical error, a very important aspect of this proposal is to improve usability and enforcement of the code. Concerns have been expressed about the increased complexity for enforcement with the format of the 2012 IECC, as compared to the 2009 and 2006 IECC. Rather than simply looking up the maximum SHGC for a given projection factor on the main prescriptive table, the 2012 IECC forces extra unnecessary steps on the user, referring to a separate table and requiring additional calculations. This increases both the workload and potential for error in code compliance checks. This proposal simplifies the process by allowing the code official to simply look up the required SHGC on the main fenestration table, similar to the 2006 and 2009 IECC. This simplifies enforcement and compliance, makes it easy to determine the baseline value in performance path calculations, and improves overall usability of the code. Also, while SHGC requirements for the north orientation have been added to make this section technically correct, this does not necessarily add complexity – users can still simply comply with one glass type and SHGC by meeting the main SHGC requirement for the SEW orientation (which is lower or equal to the N requirement in all cases).

Cost Impact: The code change proposal will not increase the cost of construction. This proposal is cost neutral as it is an optional trade-off only.

CE143 – 13

C202 (NEW), Table C402.3

Proponent: Shaunna Mozingo, City of Cherry Hills Village, Colorado Code Consulting, representing self. (smozingo@coloradocode.net)

Revise as follows:

TABLE C402.3 BUILDING ENVELOPE REQUIREMENTS: FENESTRATION								
Climate Zone	1	2	3	4 except Marine	5 and Marine 4	6	7	8
Vertical Fenestration								
U-factor								
<u>Nonmetal framing (all)</u>	0.50	0.40	0.35	0.35	0.32	0.32	0.29	0.29
<u>Fixed fenestration Metal framing, fixed</u>	0.50	0.50	0.46	0.38	0.38	0.36	0.29	0.29
<u>Operable fenestration Metal framing, operable</u>	0.65	0.65	0.60	0.45	0.45	0.43	0.37	0.37
<u>Metal framing, entrance doors</u>	1.10	0.83	0.77	0.77	0.77	0.77	0.77	0.77
SHGC (all frame types)								

(Portions of Table not shown remain unchanged)

Add new definitions as follows:

SECTION C202 GENERAL DEFINITIONS

FENESTRATION, METAL FRAMING. Fenestration products using metal framing with or without thermal breaks.

FENESTRATION, NONMETAL FRAMING. Fenestration products using framing materials other than metal, with or without metal reinforcement or cladding.

FENESTRATION, FIXED. Vertical fenestration other than *operable fenestration* and *entrance doors* including, but not limited to, curtain wall, storefront, window walls, fixed windows, and picture windows.

FENESTRATION, OPERABLE. Vertical fenestration that opens, except *entrance doors*.

Reason: While I understand the reason the proponent of the table change submitted it for the 2012 IECC to go from windows classified by framing type to windows classified by whether they are fixed or operable, I definitely disagreed with it then and do so even more now that I have had to work with it as a code requirement. Code users are not looking for something as simple as fixed/operable as much as they are the types of framing because that is what we use everywhere else in this code. We have been taught that there is a real difference in metal framing verses all other types of window frames, and that we need to pay attention to the U-factors we are seeing. Now when we take away that framing issue and just say fixed/operable, it looks like framing type no longer matters, so we will go back to not verifying, going backwards in compliance as well as efficiency.

In reality, what is on paper and what happens in the field are two very different things. I am very much for energy efficiency. I have been saying for years that commercial windows are the least complied with requirement of the energy code because they don't usually have the handy labels on the windows and so few take the time to verify NFRC compliant certification. Very few will hold up a Certificate of Occupancy based on a U-Factor not being verified. I know what is being enforced in a lot of jurisdictions, and I know that if we make it sound like all windows are created equal then the code officials will go back to their way of not worrying about it, and all of our hard work on educating them will have gone out the "metal framed window". A very large number of

jurisdictions across the U.S. do absolutely nothing for verifying commercial windows other than seeing that something is listed on ComCheck, and then only half of those make sure that the U-Factor on ComCheck is within in the correct range for the type of framing. Many designers put the U-Factor in as the last item on a ComCheck and put whatever value will get it to pass, knowing full well that the jurisdiction will not verify it at plan review, and if they do, it won't get verified in the field. Ask NFRC how many certificates actually get requested.

The definition of U-Factor doesn't do enough to let the user know that we are not dealing with just center of glass here. It's the entire assembly that gets calculated together to create the U-Factor for this code. The code language in Chapter 3 states that U-Factor is calculated in accordance with NFRC 100. But there are hundreds of referenced standards and testing items in the codes, and I can absolutely tell you that the code official doesn't own them all or read them all, and many will not know or understand that NFRC 100 is for the whole assembly, glass and framing. They need something simple that lets them know that the framing materials matter when it comes to U-Factor, and by taking the table and converting it from framing materials to just fixed/operable, that one piece of information went away.

The default tables in Chapter 3 are based on framing materials and we are taught to figure out what the framing material is so that we can determine a conservative U-Factor and SHGC in the absence of a label or certification. We would need to change the default tables to match the table in Chapters C and R 4 if we are going to keep this new way of determining these values. But you can see by looking in these default tables that framing does matter, and not all windows should be treated as equal.

You can absolutely get a metal framed window to meet the same U-Factor of a window of different framing; it will just cost a lot more. There are structural reasons where metal framed windows are required and in these instances we will be forcing higher costs on the owner because these metal windows will cost a lot more in order to get these lower U-Factors out of them.

What has been proposed here is not exactly the same format as 2009 IECC but is consistent with the format of ASHRAE 90.1-2013. It makes the table a little cleaner than 2009 IECC, putting some of the language in the definitions. But it also uses metal fixed and metal operable, as opposed to metal curtain wall / storefront and metal all other. The main reason ASHRAE did this was because fixed punched opening windows (e.g. strip windows and picture windows) now fall under the more stringent fixed category, as opposed to the less stringent "all other" category, which was really intended to cover operable windows.

For nonmetal U-factors, I used the 2012 residential U-factors, except there is a question about zone 7-8. The residential chapter has 0.32, but the commercial chapter has 0.29 for metal framed fixed products. I chose not to take the nonmetal values from the residential values because it would have made the nonmetal values less stringent than the metal values, which currently requires triple glazing. So I adjusted them to 0.29 on the rationale of staying at least as stringent.

Cost Impact: These glazing values are already realized in the residential portion of the code but if just dealing with commercial buildings, there will be an increase in cost for the more efficient non-metal framed windows because the values were brought up to match those in the residential section.

NR = No requirement.

a. Performance class determined in accordance with AAMA/WDMA/CSA 101/I.S.2/A440.

Add new definitions as follows:

SECTION C202 GENERAL DEFINITIONS

FENESTRATION, FIXED. Vertical fenestration other than *operable fenestration* and *entrance doors* including, but not limited to, curtain wall, storefront, window walls, fixed windows, and picture windows.

FENESTRATION, OPERABLE. Vertical fenestration that opens, except *entrance doors*.

Reason: The purpose of this proposal is twofold: (1) correct a *decrease* in energy efficiency that inadvertently occurred when the table format was changed in the last cycle, and (2) restore the distinction for different product types used in the diverse range of commercial buildings. First, when the table format was changed at the final action hearings last cycle, it was to establish much more stringent U-factors that could still be achieved by structural metal framed windows, albeit at significantly higher cost, while simplifying the window types down to just fixed vs. operable windows. However, while this was focused on metal framed products that make up 91% of commercial fenestration because of structural and durability performance, this neglected to account for nonmetal residential-style windows that are used in multifamily and light commercial buildings that also fall under the commercial code. For those buildings that would have used these products anyway, the U-factor actually *increased* by 9 - 41% compared to the 2012 residential values (e.g. in zone 5, the U-factor was increased from 0.32 up to 0.38 for fixed windows and 0.45 for operable windows). This resulted in free trade-off credit for something that was going to be done anyway, increasing the overall energy use in these types of buildings.

Second, since first introduced by the New Buildings Institute in 2004, the commercial fenestration requirements have made a distinction between residential-style windows going into multifamily and light commercial buildings, and heavier commercial windows used for structural and durability purposes. This established a fair playing field in that the architect will select the window and framing type based on many building performance considerations, and then each category set an overall U-factor (whole assembly, glazing plus framing) appropriate for that product type that ensures each product uses a comparable energy efficient glazing

package. In other words, make each product type have to use similar energy efficiency measures (low-e, argon, better spacers, etc) to meet the requirement. However, as it stands without that distinction, the current table not only favors less structural products, but also, lighter residential-style windows can get away with a less efficient glazing package.

The 2006 and 2009 IECC used the simplest distinction – metal and nonmetal framed products. This was simple to understand and simple for code enforcement. However, some groups have voiced concerns that using metal vs. nonmetal fenestration frame categories is not “material neutral”. We do not agree with those statements, in that there are specific technical reasons for having separate frame categories, and there is nothing inherently wrong with having separate requirements based on material. Material-based requirements are common throughout the I-codes (e.g. wood, metal, and mass wall requirements).

Nonetheless, in a positive effort to address these concerns, we offer this option that does not use metal vs. nonmetal frame categories, yet preserves the original reason for having separate metal vs. nonmetal categories – structural performance. This proposal uses the “R” performance class from the North American Fenestration Standard (AAMA/WDMA/CSA 101/I.S.2/A440) to set U-factors for the residential-style windows, and then uses the existing U-factors for all other products (performance classes LC, CW, and AW, as well as products outside the scope of AAMA/WDMA/CSA 101/I.S.2/A440 such as curtain wall and storefront). R stands for residential, LC for light commercial, CW for commercial window, and AW for architectural window, with increasing test requirements for each class. This performance class data is already available to the code official in that AAMA/WDMA/CSA 101/I.S.2/A440 testing is already required by the IBC, and for air leakage in the IECC. AAMA/WDMA/CSA 101/I.S.2/A440 testing, which is for the whole product including both framing and glazing, will also help reinforce that the U-factors are not just center-of-glass but must account for the whole product.

The U-factors in the Performance Class R category were taken from the 2012 IECC residential code, except modified to 0.29 in zones 7-8 where the commercial code is already more stringent. This restores the distinction and level playing field for different products while also correcting the decrease in the stringency that occurred last cycle for residential-style products.

Cost Impact: This proposal will increase the cost of construction relative to the current commercial code, but not relative to residential-style windows already established by the residential code for zones 1-6.

Table C402.3

Proponent: Brian Dean, ICF International, representing Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; Bill Prindle, Energy Efficient Codes Coalition; and Don Vigneau, Northeast Energy Efficiency Partnerships.

Revise as follows:

**TABLE C402.3
BUILDING ENVELOPE REQUIREMENTS: FENESTRATION**

CLIMATE ZONE	1	2	3	4 EXCEPT MARINE	5 AND MARINE 4	6	7	8
Vertical fenestration								
SHGC								
SHGC	0.25	0.25	0.25	0.40 <u>0.25</u>	0.40 <u>0.25</u>	0.40 <u>0.25</u>	0.45	0.45

(Portions of Table not shown remain unchanged)

Reason: The purpose of the proposed code change is to strengthen the SHGC requirement for vertical fenestration in climate zones 4 - 6 from 0.40 to 0.25, thereby increasing the energy efficiency of vertical fenestration in these climates.

Low solar heat gain fenestration is even more critical for commercial buildings than residential buildings in all climate zones because commercial buildings tend to be internal heat load dominated, and require cooling during far more hours. Recognizing this fact, the code currently requires some degree of solar control in commercial buildings in all climate zones, by requiring an SHGC of 0.45 or less even in climate zones 7 - 8, 0.40 or less in climate zones 4 – 6; and 0.25 or less in climate zones 1 - 3. When the 0.40 maximum was established for climate zones 4 - 6, a consideration that may have justified the higher SHGC was the reduction in visible light that came with lower SHGC glazing at that time. However, this issue has since been addressed with the introduction of low SHGC glass with much higher visible light transmission resulting from optimizing control of solar gain outside of the visible light spectrum. As a result, lower SHGCs have already been established for homes in climate zones 1 -3 (dropping from 0.40 SHGC in the 2006 IECC to 0.25 in the 2012 IECC). A similar benefit can be captured for commercial buildings in climate zones 4 – 6 by setting the maximum SHGC at 0.25 for these climate zones. The level of solar heat gain, whether 0.40 or 0.25, is simply a choice of low-e coatings and does not involve significant increases in cost; there is no good reason not to capture the benefit of reducing the requirement to 0.25. The Efficient Windows Collaborative (“EWC”) shows how low solar gain, low U-factor and high visible light can now be achieved with improved glazings (see the graphic from their website below; note that these are glass-only values; since NFRC ratings also factor in frames, the reported SHGC and VT can be expected to be at least 10% lower):

Benefits: Increased Light & View

Daylight and view are two of the fundamental attributes of a window. Unfortunately, windows can also be the source of significant solar heat gain during times when it is unwanted. Traditional solutions to reducing solar heat gain such as tinted glazing or shades mean that the amount of light is reduced as well. New glazings with low-solar-gain Low-E ([spectrally selective](#)) coatings can provide better solar heat gain reduction than tinted glass, with a minimal loss of [visible light](#). This also means that views can be clearer and unobstructed.

It is well documented that buildings (which account for over 70% of the electricity used in the United States) have the greatest potential for reducing both energy use and particularly peak electricity use. Peak electricity use is driven by air conditioning load, which is, in large part, driven by summer solar gain. Lower SHGC windows will translate into substantial energy cost savings for building owners and a reduced need for utilities to build additional peak generating plants. For example, based on US DOE's EnergyPlus office reference buildings and an assumption of 30% fenestration area, we estimate a net energy savings (heating, cooling and hot water) for this proposed reduction in maximum SHGC to 0.25 ranging between 2% and 5% depending on the climate zone.

In addition, lower SHGCs will result in smaller cooling equipment for such buildings, easily offsetting any cost increase, thereby reducing first cost as well. Reducing SHGC will provide savings to all consumers, and not just the owners or operators of buildings. Lower SHGCs also produce increased summer comfort, as also illustrated by the EWC on its website. According to EWC:

In summer, strong direct sunlight strikes people and interior surfaces, creating overheating and discomfort. Windows with low [solar heat gain coefficients](#) will reduce the solar radiation coming through the glass and associated discomfort. Low solar heat gain low-E glass (spectrally selective) reduces heat gain while still providing sufficient light and view.

Source: Lawrence Berkeley National Laboratory (Lyons and Arasteh).

For all of these reasons, reducing the SHGC prescriptive requirement to 0.25 in climate zones 4 – 6 is justified in order to reduce energy use and electrical peak demand in commercial buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

CE146 – 13

C402.3.2

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C402.3.2 Minimum skylight fenestration area. In an enclosed space greater than ~~40,000~~ 2,000 square feet (~~929~~ 185 m²), directly under a roof with ceiling heights greater than 15 feet (4572 mm), and used as an office, lobby, atrium, concourse, corridor, storage, gymnasium/exercise center, convention center, automotive service, manufacturing, non-refrigerated warehouse, retail store, distribution/sorting area, transportation, or workshop, the total daylight zone under skylights shall be not less than half the floor area and shall provide a minimum skylight area to daylight zone under skylights of either:

1. Not less than 3 percent with a skylight VT of at least 0.40; or
2. Provide a minimum skylight effective aperture of at least 1 percent determined in accordance with Equation 4-1.

$$\text{Skylight Effective Aperature} = \frac{0.85 \times \text{Skylight Area} \times \text{Skylight VT} \times \text{WF}}{\text{Daylight zone under skylight}} \quad \text{(Equation 4-1)}$$

where:

- Skylight area = Total fenestration area of skylights.
Skylight VT = Area weighted average visible transmittance of skylights.
WF = Area weighted average well factor, where well factor is 0.9 if light well depth is less than 2 feet (610 mm), or 0.7 if light well depth is 2 feet (610 mm) or greater.
Light well depth = Measure vertically from the underside of the lowest point of the skylight glazing to the ceiling plane under the skylight.

Exception: Skylights above daylight zones of enclosed spaces are not required in:

1. Buildings in climate zones 6 through 8
2. Spaces where the designed *general lighting* power densities are less than 0.5 W/ft² (5.4 W/m²)
3. Areas where it is documented that existing structures or natural objects block direct beam sunlight on at least half of the roof over the enclosed area for more than 1,500 daytime hours per year between 8 am and 4 pm.
4. Spaces where the daylight zone under rooftop monitors is greater than 50 percent of the enclosed space floor area.

Reason: The use of skylights for daylighting has been shown to be cost effective, and the major portion of the cost is the skylights. This proposal reduces the area threshold for daylighting control requirements in skylit areas to 2,000 square feet. Because the skylight cost is proportional to area, having a high threshold for the skylight daylighting requirement only makes sense if the individual zone control cost is high. The code change proposal reflects the fact that in new construction, the zone control cost is relatively low and a smaller threshold is justified.

A single skylight in a space at the limiting ceiling height of 15 feet creates a daylight area slightly larger than 1,000 ft². Since the requirement is that half the qualifying area receiving skylights and daylight control, then a threshold of 2000 square feet for this requirement is logical if the cost of the skylights can be shown to be cost effective.

An analysis conducted in conjunction with this proposal shows that installing this skylight and the associated daylighting controls within such a space is cost effective. This reduced threshold is mainly due to the reduction in cost of daylighting controls and the reduction of thermal losses and gains through skylights due to improved envelope requirements. The code change proposal reflects the fact that in new construction, the zone control cost is relatively low and a smaller threshold is justified. The lower threshold will add daylighting in smaller, high ceiling spaces that were previously not required to have skylights.

There is a cost increase associated with this proposed change because skylights and controls would be required in areas they are not required under the current code. A cost-effectiveness analysis of the savings resulting from skylight daylighting control shows that such control and skylights are cost effective for a daylit space of 1,000 ft². In the cost effectiveness analysis the

additional skylights and controls had a simple payback ranging from 12.0 to 17.1 years. Based on a skylight life of 40 years, a discounted cost effective payback threshold is 21.8 years. The simple paybacks for all of the additional skylights and controls required under this proposal are well below this cost effective threshold.

Cost Impact: The code change proposal will increase the cost of construction.

C402.3.2 #1-EC-WILLIAMS rev.doc

CE147 – 13

C402.3.2

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C402.3.2 Minimum skylight fenestration area. In an enclosed space greater than 40,000 ~~2,500~~ square feet (~~929 m²~~), directly under a roof with ceiling heights greater than 15 feet (4572 mm), and used as an office, lobby, atrium, concourse, corridor, storage, gymnasium/exercise center, playing area, gymnasium seating, convention center, automotive service, manufacturing, non-refrigerated warehouse, retail store, library reading and stack areas, distribution/sorting area, transportation, or workshop, the total daylight zone under skylights shall be not less than half the floor area and shall provide a minimum skylight area to daylight zone under skylights of either:

1. Not less than 3 percent with a skylight VT of at least 0.40; or
2. Provide a minimum skylight effective aperture of at least 1 percent determined in accordance with Equation 4-1.

$$\text{Skylight Effective Aperture} = \frac{0.85 \times \text{Skylight Area} \times \text{Skylight VT} \times \text{WF}}{\text{Daylight zone under skylight}} \quad (\text{Equation 4-1})$$

where:

- Skylight area = Total fenestration area of skylights.
Skylight VT = Area weighted average visible transmittance of skylights.
WF = Area weighted average well factor, where well factor is 0.9 if light well depth is less than 2 feet (610 mm), or 0.7 if light well depth is 2 feet (610 mm) or greater.
Light well depth = Measure vertically from the underside of the lowest point of the skylight glazing to the ceiling plane under the skylight.

Exception: Skylights above daylight zones of enclosed spaces are not required in:

1. Buildings in climate zones 6 through 8
2. ~~Spaces where the designed general lighting power densities are less than 0.5 W/ft² (5.4 W/m²)~~
3. Areas where it is documented that existing structures or natural objects block direct beam sunlight on at least half of the roof over the enclosed area for more than 1,500 daytime hours per year between 8 am and 4 pm.
4. Spaces where the daylight zone under rooftop monitors is greater than 50 percent of the enclosed space floor area.
5. Spaces where 90 percent of the skylight area is shaded on June 21 in the Northern Hemisphere (December 21 in the Southern Hemisphere) at noon by permanent architectural features of the building.
6. Spaces where the total area minus the daylight zones area adjacent to vertical fenestration is less than 2,500 square feet, and where the lighting is automatically controlled in accordance with Section C405.2.2.3.2.

Reason: The current toplighting requirements in the IECC are based on ANSI/ASHRAE/IES Standard 90.1-2010. Additional revisions are being made to 90.1 in addendum bv. This proposal will make the next version of the IECC consistent with 90.1-2013 for toplighting requirements.

Cost Impact: The code change proposal will increase the cost of construction for spaces between 2,500 ft² and 10,000 ft.

C402.3.2 #1-EC-FERGUSON.doc

CE148 – 13

C402.3.2

Proponent: Dr. Thomas D. Culp, Birch Point Consulting LLC, representing the Glazing Industry Code Committee (culp@birchpointconsulting.com)

Revise as follows:

C402.3.2 Minimum skylight fenestration area. In an enclosed space greater than ~~40,000~~ 2,500 square feet (~~929~~ 232 m²), directly under a roof with ceiling heights greater than 15 feet (4572 mm), and used as an office, lobby, atrium, concourse, corridor, storage, gymnasium/exercise center, convention center, automotive service, manufacturing, nonrefrigerated warehouse, retail store, distribution/sorting area, transportation, or workshop, the total daylight zone under skylights shall be not less than half the floor area and shall provide a minimum skylight area to daylight zone under skylights of either:

1. Not less than 3 percent with a skylight VT of at least 0.40; or
2. Provide a minimum skylight effective aperture of at least 1 percent determined in accordance with Equation 4-1.

$$\text{Skylight Effective Aperture} = \frac{0.85 \times \text{Skylight Area} \times \text{Skylight VT} \times \text{WF}}{\text{Daylight zone under skylight}} \quad \text{(Equation 4-1)}$$

where:

- Skylight area = Total fenestration area of skylights.
Skylight VT = Area weighted average visible transmittance of skylights.
WF = Area weighted average well factor, where well factor is 0.9 if light well depth is less than 2 feet (610 mm), or 0.7 if light well depth is 2 feet (610 mm) or greater.
Light well depth = Measure vertically from the underside of the lowest point of the skylight glazing to the ceiling plane under the skylight.

Exception: Skylights above daylight zones of enclosed spaces are not required in:

1. Buildings in climate zones 6 through 8.
2. Spaces where the designed *general lighting* power densities are less than 0.5 W/ft² (5.4 W/m²).
3. Areas where it is documented that existing structures or natural objects block direct beam sunlight on at least half of the roof over the enclosed area for more than 1,500 daytime hours per year between 8 am and 4 pm.
4. Spaces where the daylight zone under the rooftop monitors is greater than 50 percent of the enclosed space floor area.
5. Spaces where the total area minus the area of daylight zones adjacent to vertical fenestration is less than 2,500 square feet (929 232 m²), and where the lighting is controlled according to Section C405.2.2.3.2.

Reason: Separate analyses for ASHRAE 90.1 and California Title 24 have shown toplighting of larger open spaces to provide very cost effective energy savings, and that the size threshold may be significantly reduced from the current 10,000 ft². 2008 Title 24 uses an 8,000 ft² threshold, and will use 5,000 ft² in the 2013 standard. ASHRAE 90.1-2010 has already been at 5,000 ft², and following a new cost effectiveness analysis by Pacific Northwest National Laboratory, is now lowering it further to 2,500 ft². At the time this proposal was submitted in Dec 2012, addendum "bv" received no negative comments on the threshold, and was moving forward to the ASHRAE and IES boards for final publication. Some had expressed concern about smaller retail spaces that might be triggered by the 2,500 ft² threshold, but it was noted that these types of retail spaces rarely have ceiling heights over 15 ft, and would therefore be exempt. (Also, toplighting is ideal for the retail spaces that do have taller ceiling heights over 15 ft, such as grocery stores and larger retail.) As such, this proposal lowers the threshold and also adds an exception to be consistent with ASHRAE 90.1 addendum "bv".

Cost Impact: The code change proposal will increase the cost of construction.

CE148-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.3.2-EC-CULP.doc

CE149 – 13

C402.3.2

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C402.3.2 Minimum skylight fenestration area. In an enclosed space greater than 10,000 square feet (929 m²) in floor area directly under a roof with a not less than 75 percent of ceiling area with heights greater than 15 feet (4572 mm), and used as an office, lobby, atrium, concourse, corridor, storage space, gymnasium/exercise center, convention center, automotive service area, space where manufacturing occurs, non-refrigerated warehouse, retail store, distribution/sorting area, transportation depot, or workshop, the total daylight zone under skylights shall be not less than half the floor area and shall provide a minimum skylight area to daylight zone under skylights of either

1. A minimum skylight area to daylight zone under skylights of not less than 3 percent with a skylight where all skylights have a VT of at least 0.40 when tested in accordance with NFRC 202, or
2. A provide minimum skylight effective aperture of at least 1 percent as determined in accordance with Equation 4-1.

$$\text{Skylight Effective Aperture} = \frac{0.85 \times \text{Skylight Area} \times \text{Skylight VT} \times \text{WF}}{\text{Daylight zone under skylight}}$$

(Equation 4-1)

where:

Skylight area = Total fenestration area of skylights.

Skylight VT = Area weighted average visible transmittance of skylights.

WF = Area weighted average well factor, where well factor is 0.9 if light well depth is less than 2 feet (610 mm), or 0.7 if light well depth is 2 feet (610 mm) or greater.

Light well depth = Measure vertically from the underside of the lowest point of the skylight glazing to the ceiling plane under the skylight.

Exception: Skylights above daylight zones of enclosed spaces are not required in:

1. Buildings in climate zones 6 through 8.
2. Spaces where the designed *general lighting* power densities are less than 0.5 W/ft² (5.4 W/m²).
3. Areas where it is documented that existing structures or natural objects block direct beam sunlight on at least half of the roof over the enclosed area for more than 1,500 daytime hours per year between 8 am and 4 pm.
4. Spaces where the daylight zone under rooftop monitors is greater than 50 percent of the enclosed space floor area.

Reason: This proposal clarifies the language pertaining to requiring skylights in roofs covering areas greater than 10,000 ft². The objective of this proposal is to clarify the code to foster implementation and compliance verification.

By definition skylights are fenestration such that the use of the term fenestration with skylights is redundant. The intent is to address ceilings with variable heights and the proposed revision does that by indicating the requirement applies when more than 75% of ceiling area is above 15 feet. Some of the subject spaces referenced are not technically spaces or areas so the language has been enhanced to convey the intent. Simplification is achieved by making items 1 and 2 parallel construction with reference to the charging section. While VT is defined, there is no referenced test method. NFRC 202 provides a uniform test method by which VT can be objectively determined and should be referenced to enhance uniformity of application and implementation of and compliance verification with the code.

Cost Impact: The code change proposal will not increase the cost of construction. There is no cost impact associated with this proposed change because the current code requires daylighting control.

C402.3.2 #2-EC-WILLIAMS.doc

CE150 – 13

C402.3.2

Proponent: Jack Bailey, One Lux Studio, representing International Association of Lighting Designers (jbailey@oneluxstudio.com)

Revise as follows:

C402.3.2 Minimum skylight fenestration area. In an enclosed space greater than 10,000 square feet (929 m²) directly under a roof with ceiling heights greater than 15 feet (4572 mm), and used as an office, lobby, atrium, concourse, corridor, storage, gymnasium/exercise center, convention center, automotive service, manufacturing, nonrefrigerated warehouse, retail store, distribution/sorting area, transportation, or workshop, the total daylight zone under skylights shall be not less than half the floor area and fenestration shall be configured so that either: ~~and shall provide a minimum skylight area to daylight zone under skylights of either:~~

1. The skylight area divided by the daylight zone area is not less than 3 percent with a skylight VT of at least 0.40; or
2. Provide a minimum skylight effective aperture of at least 4 1.2 percent determined in accordance with Equation 4-1.

$$\text{Skylight Effective Aperture} = \frac{0.85 \times \text{Skylight Area} \times \text{Skylight VT} \times \text{WF}}{\text{Daylight zone under skylight}} \quad (\text{Equation 4-1})$$

where:

Skylight area = Total fenestration area of skylights.
Skylight VT = Area weighted average visible transmittance of skylights.
~~WF = Area weighted average well factor, where well factor is 0.9 if light well depth is less than 2 feet (610 mm), or 0.7 if light well depth is 2 feet (610 mm) or greater.~~
~~Light well depth = Measure vertically from the underside of the lowest point of the skylight glazing to the ceiling plane under the skylight.~~

Exception: ~~Skylights above daylight zones of enclosed spaces~~ are not required in:

1. Buildings in climate zones 6 through 8.
2. Spaces where the designed *general lighting* power densities are less than 0.5 W/ft² (5.4 W/m²).
3. Areas where it is documented that existing structures or natural objects block direct beam sunlight on at least half of the roof over the enclosed area for more than 1,500 daytime hours per year between 8 am and 4 pm.
4. Spaces where the daylight zone under rooftop monitors is greater than 50 percent of the enclosed space floor area.

Reason: The well factor calculation adds complexity without significantly improving the accuracy of the analysis. The minimum skylight effective aperture is increased from 1.0 percent to 1.2 percent so that similar results are obtained regardless of whether option 1 or option 2 is followed.

The language in the exception is confusing, and the proposed change is editorial.

Cost Impact: The code change proposal will not increase the cost of construction.

CE150-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

CE151 – 13

C202 (NEW), C402.3.2.1

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C402.3.2.1 Lighting controls in daylight zones under skylights. All lighting in the daylight zone shall be controlled by multilevel lighting controls that comply with Section C405.2.2.3.3.

Exception: Skylights above daylight zones of enclosed spaces are not required in:

1. Buildings in Climate Zones 6 through 8
2. Spaces where the designed *general lighting* power densities are less than 0.5 W/ft² (5.4 W/m²).
3. Areas where it is documented that existing structures or natural objects block direct beam sunlight on at least half of the roof over the enclosed area for more than 1,500 daytime hours per year between 8 am and 4 pm.
4. Spaces where the daylight zone under *rooftop monitors* is greater than 50 percent of the enclosed space floor area.

Revise definitions as follows:

SECTION C202 GENERAL DEFINITIONS

ROOF MONITOR. That part of a *building* that projects above the plane of the *roof* and whose walls contain *vertical fenestration* for lighting the interior.

DAYLIGHT ZONE.

1. **Under skylights.** The area under skylights whose horizontal dimension, in each direction, is equal to the skylight dimension in that direction plus either the floor-to-ceiling height or the dimension to a ceiling height opaque partition, or one-half the distance to adjacent skylights or vertical fenestration, whichever is least.
2. **Adjacent to vertical fenestration.** The area adjacent to vertical fenestration which receives daylight through the fenestration. For purposes of this definition and unless more detailed analysis is provided, the daylight zone depth is assumed to extend into the space a distance of 15 feet (4572 mm) or to the nearest ceiling height opaque partition, whichever is less. The daylight zone width is assumed to be the width of the window plus 2 feet (610 mm) on each side, or the window width plus the distance to an opaque partition, or the window width plus one-half the distance to adjacent skylight or vertical fenestration, whichever is least.
3. **Under roof monitors.** The combined area under each *roof monitor* without double counting overlapping areas from multiple roof monitors. It is the product of the daylight area width under *roof monitors* and the daylight area depth under *roof monitors*. The daylight area width under *roof monitors* is the width of the *vertical fenestration* above the ceiling level plus on each side, the smallest of: 2 feet (0.6m), or the distance to any 60 inch (1525 mm) or higher vertical obstruction or the distance to the edge of any primary sidelighted area. The daylight area depth under *roof monitors* is the smallest of the following horizontal distances inward from the bottom edge of the *vertical fenestration*, the monitor sill height, (the vertical distance from the floor to the bottom edge of the monitor glazing), or the distance to the edge of any primary sidelighted area or, the distance to the front face of any vertical obstruction where any part of the obstruction is farther away than the difference between the height of the obstruction and the monitor sill height.

Reason: The term "rooftop monitor" is currently used in the IECC, but it's not defined. There is some ambiguity about the term and the definition. This proposal makes the terminology and definition consistent with ANSI/ASHRAE/IES Standard 90.1 by using the

term roof monitor, and adding a definition for the term. It also adds a definition for the daylight zone under a roof monitor which is used in daylighting proposals.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.3.2 #2-EC-FERGUSON.doc

CE152 – 13

C402.3.3 (NEW)

Proponent: Dr. Thomas D. Culp, Birch Point Consulting LLC, representing the Glazing Industry Code Committee (culp@birchpointconsulting.com)

Add new text as follows:

C402.3.3 Daylight zones. In *buildings* not greater than two stories above grade plane, not less than 10 percent of the net floor area shall be located within a *daylight zone*. In *buildings* three or more stories above grade plane, not less than 5 percent of the net floor area shall be located within a *daylight zone*.

Exception: Daylighting in accordance with this section is not required in the following spaces:

1. Auditoriums, places of religious worship, theaters, museums, mercantile occupancies with less than 10,000 square feet of net floor area, and refrigerated warehouses.
2. Existing buildings undergoing *alteration*, *repair*, relocation, or a change of occupancy.
3. *Buildings* where the total daylight potential (TDP) calculated in accordance with Section 808.3 of the *International Green Construction Code* is less than 0.5.

Reason: This proposal would require a minimum daylight area similar in concept to the 2012 International Green Construction Code, but at much less aggressive level (only 1/5 of the IgCC) and with a simplified approach. For comparison, the IgCC requires 50% of the net floor area to be in daylight zones for 1-2 story buildings, and 25% for 3+ story buildings. On the other hand, this proposal is meant to only be a simple base level requirement to ensure that building designers address daylighting and glazing layout, while being easy enough to provide flexibility for different space and building types, and not require any gross changes in building geometry. Exceptions are included for spaces where daylighting would interfere with the function of the space, provide little benefit, or not be feasible.

Cost Impact: This proposal will not increase the cost of construction for most buildings and will help improve layout and use of glazing that would have been installed anyway, but this will increase the cost of construction in some buildings where there would have been insufficient fenestration and daylighting.

C402.3.3 (NEW)-EC-CULP.doc

CE153 – 13

C402.3.2.2

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C402.3.2.2 Haze factor. Skylights in office, storage, automotive, service, manufacturing, non-refrigerated warehouse, retail store and distribution/sorting area spaces shall have a glazing materials or diffuser with a ~~measured~~ haze factor greater than 90 percent when tested in accordance with Procedure A of ASTM D 1003.

Exception: Skylights ~~designed~~ installed to exclude direct sunlight entering the occupied space by use of fixed or automated baffles, or the geometry of skylight and light well ~~need not comply with Section C402.3.2.2.~~

Reason: This proposal clarifies the testing requirements for fenestration haze factor to reference Procedure A of ASTM D 1003 or other ASTM standards as applicable.

The requirement for testing in the code eliminates the need to use the term “measured,” and could provide additional confusion should a user of the code interpret that as allowing post-installation measurement of haze factor in accordance with the standard. ASTM D 1003 has multiple procedures. Procedure A (hazemeter) test values are normally slightly higher and less variable than Procedure B (spectrophotometer) test values. Where the code indicates a singular criterion (90%) a singular test procedure should be specifically referenced. If there are two test procedures that yield different results for the same metric then the code should provide a separate criterion for each procedure (e.g. 90% when tested per procedure A and a TBD equivalent percentage when tested per procedure B). Also replacing “designed” with “installed” provides clarification as a skylight can be “designed” in the factory where the installation conditions in the exception may not be known. Those conditions are related to the installation of the skylight within the building and are more appropriately referenced in the code.

Cost Impact: The code change proposal will not increase the cost of construction.

CE153-13

	Assembly:	ASF	AMF	DF

C402.3.2.2-EC-WILLIAMS.doc

CE154 – 13

C402.3.2.2

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

C402.3.2.2 Haze factor. Skylights in office, storage, automotive service, manufacturing, nonrefrigerated warehouse, retail store, and distribution/sorting area spaces shall have a glazing material or diffuser with a measured haze factor greater than 90 percent when tested in accordance with the procedures contained in ASTM D 1003.

Exception: Skylights designed to exclude direct sunlight entering the occupied space by the use of fixed or automated baffles, or the geometry of skylight and light well need not comply with Section C402.3.2.2.

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

ASTM D 1003 has the title of "Standard Test Method for Haze and Luminous Transmittance of Transparent Plastics." However the standard actually contains test methods and procedures for all transparent materials and isn't limited in application to plastics. As it is up to ASTM to name their standard and it can't be changed in the ICC process, this proposal is intended to try to clarify that the standard is used for the procedures, and not limited to the material contained in the title.

Cost Impact: This code change proposal will not increase the cost of construction. The proposal is editorial in nature and will not affect the cost of construction.

CE154-13

Public Hearing:	Committee:	AS	AM	D

C402.3.2.2-EC-THOMPSON-SEHPCAC.doc

CE155 – 13

C402.3.3

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C402.3.3 Maximum U-factor and SHGC. ~~For vertical fenestration, the~~ The maximum U-factor and solar heat gain coefficient (SHGC) for fenestration shall be as specified in Table C402.3, ~~based on the window projection factor. For skylights, the maximum U-factor and solar heat gain coefficient (SHGC) shall be as specified in Table C402.3.~~

The window projection factor shall be determined in accordance with Equation 4-2.

$$PF = A/B \quad \text{(Equation 4-2)}$$

where:

PF = Projection factor (decimal).

A = Distance measured horizontally from the furthest continuous extremity of any overhang, eave, or permanently attached shading device to the vertical surface of the glazing.

B = Distance measured vertically from the bottom of the glazing to the underside of the overhang, eave, or permanently attached shading device.

Where different windows or glass doors have different *PF* values, they shall each be evaluated separately.

Reason: This proposal clarifies the provisions in the code related to maximum U-factor and SHGC, to increase simplicity of the code.

The opening section (parent) need only state the scope and criteria and then when consulting Table C402.3 as required the application of the provisions as to which type of fenestration (vertical or skylight) become obvious. The relevance of text beyond the first paragraph of Section C402.3.3 does not become apparent until after Table C402.3.3.1 and should be relocated after that table where it relates to the *PF* term used in that table.

Cost Impact: The code change proposal will not increase the cost of construction.

CE155-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.3.3-EC-WILLIAMS.doc

CE156 – 13

C402.3.3, C402.3.3.1

Proponent: Brian Dean, ICF International, representing Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; Bill Prindle, Energy Efficient Codes Coalition; and Don Vigneau, Northeast Energy Efficiency Partnerships.

Revise as follows:

C402.3.3 Maximum U-factor and SHGC. For vertical fenestration, the maximum U-factor and solar heat gain coefficient (SHGC) shall be as specified in Table C402.3, based on the climate zone, type of vertical fenestration and, for SHGC, adjusted where necessary for window projection factor. For skylights, the maximum U-factor and solar heat gain coefficient (SHGC) shall be as specified in Table C402.3 by climate zone.

~~The window projection factor shall be determined in accordance with Equation C4-2.~~

~~$PF = A/B$ (Equation C4-2)~~

~~where:~~

~~PF = Projection factor (decimal).~~

~~A = Distance measured horizontally from the furthest continuous extremity of any overhang, eave, or permanently attached shading device to the vertical surface of the glazing.~~

~~B = Distance measured vertically from the bottom of the glazing to the underside of the overhang, eave, or permanently attached shading device.~~

~~Where different windows or glass doors have different PF values, they shall each be evaluated separately.~~

C402.3.3.1 SHGC adjustment. Where the fenestration projection factor for a specific vertical fenestration product is greater than or equal to 0.2, the ~~required~~ maximum SHGC from Table C402.3 shall be adjusted by multiplying the required maximum SHGC by the adjustment multiplier specified in Table C402.3.3.1 corresponding with the orientation of the fenestration product and the projection factor for each fenestration product.

TABLE C402.3.3.1
SHGC ADJUSTMENT FOR PROJECTION FACTOR MULTIPLIERS

PROJECTION FACTOR	ORIENTED WITHIN 45 DEGREES OF TRUE NORTH SHGC ADJUSTMENT MULTIPLIER	ALL OTHER ORIENTATION
$0.2 \leq PF < 0.5$	1.1 1.2	1.2
$PF \geq 0.5$	1.2 1.6	1.6

The projection factor for each vertical fenestration product shall be determined in accordance with Equation C4-2.

$PF = A/B$ (Equation C4-2)

where:

PF = Projection factor (decimal).

A = Distance measured horizontally from the furthest continuous extremity of any overhang, eave, or permanently attached shading device to the vertical surface of the glazing.

B = Distance measured vertically from the bottom of the glazing to the underside of the overhang, eave, or permanently attached shading device.

Where different windows or glass doors have different PF values, they shall each be evaluated separately.

Reason: The purpose of this proposal is to simplify and improve the code in how it addresses the prescriptive U-factor and SHGC requirements for fenestration and the effects of projection factor by:

- cleaning up, clarifying and making the language more specific;
- moving the projection factor methodology and equation to a more appropriate place in the IECC (in the section that establishes an adjustment for projection factor);
- eliminating the need to calculate the projection factor for each window for buildings with little (<0.20) or no projection factor and which do not qualify for an SHGC adjustment; and
- applying a uniform projection factor multiplier to SHGC requirements, regardless of the orientation of the fenestration.

The current IECC applies a different SHGC multiplier to fenestration oriented within 45 degrees of true north as opposed to all other fenestration. While the multipliers yield mathematically correct results based on the current approach in *ASHRAE 90.1*, some code users have expressed concern that windows facing north should not be required to meet a lower SHGC number than windows facing other directions. This proposal eliminates this concern, while simplifying the code, by moving to a single multiplier for all orientations. At the same time, by retaining the multiplier approach, this proposal allows for an automatic adjustment in the event the underlying SHGC values are modified in the future.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.3.3-EC-DEAN-HARRIS-MISURIELLO-PRINDLE-STONE-VIGNEAU.doc

CE157 – 13

C402.3.3.1, Table C402.3.3.1, C402.3.3.2 (NEW)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C402.3.3.1 SHGC adjustment. Where the fenestration projection factor for a specific vertical fenestration product is greater than or equal to 0.2, the required maximum SHGC from Table C402.3 shall be adjusted by multiplying the required maximum SHGC by the multiplier specified in Table C402.3.3.1 corresponding with the orientation of the fenestration product and the projection factor

C402.3.3.1 SHGC of vertical fenestration. Vertical *fenestration* shall have an *SHGC* not greater than that specified in Table C402.3. *Dynamic glazing* shall be considered separately from other vertical *fenestration*, and area weighted averaging with other vertical *fenestration* that is not *dynamic glazing* shall not be permitted.

Exceptions. Vertical *fenestration* that complies with all of the following:

1. The *fenestration* located on the first floor above grade. The first floor is no greater than 20 feet in height above grade.
2. The *fenestration* has a permanent projection factor with a PF greater than 0.5, and
3. The *fenestration* is no greater than 75 percent of the gross wall area.

C402.3.3.1.1 SHGC reduction for permanent shading. The required SHGC shall be reduced by using the multipliers in Table 402.3.3.1 if the vertical *fenestration* is shaded by opaque permanent projections in accordance with one of the following methods:

1. Open louvers provided that no sun penetrates the louvers during the peak sun angle on June 21 in the Northern Hemisphere (December 21 in the Southern Hemisphere).
2. The PF used in the SHGC calculation shall be reduced by multiplying it by a O_s , determined by Equation 4-x, if permanent projections shade vertical *fenestration*.

$$O_s = (A_i \times O_i) + (A_f \times O_f) \quad \text{Equation 4-x}$$

Where

O_s = percent opacity of the shading device

A_i = percent of the area of the shading device that is a partially opaque infill

O_i = percent opacity of the infill—for glass $O_i = (100\% - T_s)$, where T_s is the solar transmittance as determined in accordance with NFRC 300; for perforated or decorative metal panels

O_f = percentage of solid material

A_f = percent of the area of the shading device that represents the framing members

O_f = percent opacity of the framing members; Where solid, $O_f = 100\%$

TABLE C402.3.3.1
SHGC ADJUSTMENT MULTIPLIERS

PROJECTION FACTOR	ORIENTED WITHIN 45 DEGREES OF TRUE NORTH	ALL OTHER ORIENTATION
$0.2 \leq PF < 0.5$	1.1	1.2

PF ≥ 0.5	1.2	1.6
----------	-----	-----

TABLE 402.3.3.1
SHGC Multipliers for Permanent Projections

Projection Factor	SHGC Multiplier (All Other Orientations)	SHGC Multiplier (North-Oriented)
0–0.10	1.00	1.00
>0.10–0.20	0.91	0.95
>0.20–0.30	0.82	0.91
>0.30–0.40	0.74	0.87
>0.40–0.50	0.67	0.84
>0.50–0.60	0.61	0.81
>0.60–0.70	0.56	0.78
>0.70–0.80	0.51	0.76
>0.80–0.90	0.47	0.75
>0.90–1.00	0.44	0.73

C402.3.3.2 Fenestration orientation. The vertical fenestration shall comply with either Equation 4-y or 4-z

$$A_W \leq (A_T)/4 \text{ and } A_E \leq (A_T)/4 \quad \text{Equation 4-y}$$

$$A_W \times SHGC_W \leq (A_T \times SHGC_C)/4 \text{ and } A_E \times SHGC_E \leq (A_T \times SHGC_C)/4 \quad \text{Equation 4-z}$$

Where

A_W = west oriented vertical *fenestration area* (oriented within 45 degrees of true west to the south and within 22.5 degrees of true west to the north in the northern hemisphere; oriented within 45 degrees of true west to the north and within 22.5 degrees of true west to the south in the southern hemisphere)

A_E = east oriented vertical *fenestration area* (oriented within 45 degrees of true east to the south and within 22.5 degrees of true east to the north in the northern hemisphere; oriented within 45 degrees of true east to the north and within 22.5 degrees of true east to the south in the southern hemisphere)

A_T = total vertical *fenestration area*

$SHGC_C$ = the *SHGC* criteria in Table C402.3 for each climate zone

$SHGC_E$ = the *SHGC* for east-oriented *fenestration* that complies with Section C402.3.3.1

$SHGC_W$ = the *SHGC* for west-oriented *fenestration* that complies with Section C402.3.3.1

Reason: This revision to the building/fenestration orientation requirements provides more specific requirements for east and west facing fenestration while also providing more flexibility for complying. Analyses indicate that east and west facing fenestration increases building energy consumption compared to north and south facing glazing in all climates. The criteria can be met by limiting fenestration area, changing the fenestration SHGC, or orienting the building so that the long axis is in the east-west direction. A number of exceptions are provided. New exceptions include one for buildings with less than 20% fenestration on the east and west facades and one for buildings in Climate Zone 8. The definitions for the areas east and west oriented fenestration have also been further refined. This is consistent with addendum bw to ANSI/ASHRAE/IES Standard 90.1

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.3.3.1-EC-FERGUSON.doc

CE158 – 13

C402.3.3.2

Proponent: Brian Dean, ICF International, representing Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; Bill Prindle, Energy Efficient Codes Coalition; and Don Vigneau, Northeast Energy Efficiency Partnerships.

Delete without substitution as follows:

~~**C402.3.3.2 Increased vertical fenestration SHGC.** In Climate Zones 1, 2 and 3, vertical fenestration entirely located not less than 6 feet (1729 mm) above the finished floor shall be permitted a maximum SHGC of 0.40.~~

Reason: The purpose of the proposed code change is to eliminate an exception to the fenestration SHGC requirement because it does not produce equivalent energy savings. In climate zones 1-3, low-SHGC fenestration is crucial for lowering energy use and peak electric demand. If there are to be any exceptions from this requirement, the exceptions should result in energy savings that will meet or exceed the savings that would have resulted from using 0.25 SHGC windows.

The current language does not meet this hurdle. It carves out an exception for fenestration located more than 6 feet above the finished floor. However, the exception does not require higher-VT fenestration, or clarify whether the windows must be part of a daylight area, or require the installation of automatic daylighting controls that possibly could offset at least some of the resulting increase in energy use. The language simply increases the maximum SHGC allowed by 60% with no requirement for any offset. Solar heat gain and the associated peak electricity use of commercial buildings are too important to carve out unnecessary exemptions like C402.3.3.2.

Presumably this exception was created to help with daylighting on the theory that a higher SHGC was necessary for more daylighting. We too are in favor of improving daylighting. However, we do not believe it is necessary to sacrifice solar heat gain reduction to obtain adequate visible light. Substantial VT can be achieved while still meeting the SHGC requirements. We have submitted a companion proposal for a minimum VT, which will do just that.

Moreover, eliminating this exception will also improve the clarity and usability of the code because it is an extremely specific exception that only adds unnecessary complexity to the code.

Cost Impact: The code change proposal will not increase the cost of construction.

C402.3.3.2-EC-DEAN-HARRIS-MISURIELLO-PRINDLE-STONE-VIGNEAU.doc

CE159 – 13

C402.3.3.5

Proponent: Brian Dean, ICF International, representing Energy Efficient Codes Coalition; Jeff Harris, Alliance to Save Energy; Bill Prindle, Energy Efficient Codes Coalition; ; Harry Misuriello, American Council for an Energy-Efficient Economy; and Don Vigneau, Northeast Energy Efficiency Partnerships.

Revise as follows:

C402.3.3.5 Dynamic Glazing. For compliance with Section C402.3.3, the SHGC for dynamic glazing products shall be determined using the manufacturer's average of the product's lowest-rated and highest SHGC value from the product's label, and the VT/SHGC ratio shall be determined using the maximum VT and maximum SHGC using the average of the product's lowest and highest VT value from the product's label. Dynamic glazing shall be considered separately from other fenestration, and area-weighted averaging with other fenestration that is not dynamic glazing shall not be permitted.

Reason: The purpose of the proposed code change is to correct how the SHGC and VT are determined for dynamic glazing to reflect that there is no guarantee that dynamic glazing will be operated to minimize either SHGC or VT. Current dynamic glazing assumptions in the IECC are physically impossible and are inconsistent with fenestration product labels. Dynamic glazing products are labeled based on both the "on/open" setting and the "off/closed" setting (there are also variable products with ranges of performance). In one of these settings the product blocks solar heat gain, thereby also reducing visible light. In the other setting, the product blocks less solar heat gain and allows more visible light to pass through the glass. These two conditions do not overlap – either the product is "on" or "off" at any given time during the day. The current definition would suggest that windows are optimally operated to block the maximum solar heat gain throughout the day, which would clearly not allow for visible light to be at the maximum during the day. However, the current language in Section C402.3.3.5 awards the code user the best-case efficiency for SHGC, as well as the best-case VT level, even though the two conditions cannot take place at the same time.

This proposal corrects the inconsistency in the code by averaging the lowest and highest rated values for SHGC and VT, reflecting the fact that there is no guarantee whether the product will be maximizing SHGC or maximizing VT. It does not make sense to assume that the product would be "on" for 24 hours for purposes of calculating SHGC, but "off" for 24 hours for purposes of calculating the VT. This proposal takes the average of the two sets of "best case" assumptions.

Cost Impact: The code change proposal will not increase the cost of construction.

CE160 – 13

C402.3.3.5, R402.3.3 (NEW) (IRC N1102.3.3 (NEW))

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C402.3.3.5 Dynamic glazing. For compliance with Section C402.3.3, the SHGC for dynamic glazing shall be determined using the manufacturer's lowest-rated SHGC, and the VT/SHGC ratio shall be determined using the maximum VT and maximum SHGC. Where the range of values that dynamic glazing can achieve includes the required value for SHGC, U-factor, VT, or VT/SHGC for the glazing and the dynamic glazing is automatically controlled, the dynamic glazing shall be deemed to meet that requirement. Dynamic glazing shall be considered separately from other fenestration, and area-weighted averaging with other fenestration that is not dynamic glazing shall not be permitted.

PART II – IECC-RESIDENTIAL PROVISIONS

Add new text as follows:

R402.3.3 (N1102.3.3) Dynamic glazing. Where the range of values that dynamic glazing can achieve includes the required value for SHGC or U-factor for the glazing and the dynamic glazing is automatically controlled, the dynamic glazing shall be deemed to meet that requirement.

Reason: Dynamic glazing has the potential to become a variable opening that changes quickly, as if we could switch out the glazing in a very short time. Dynamic glazing which can switch its characteristics to respond to the situation could be valuable, a variable characteristic is likely to be much more valuable than any particular single value. The biggest concern in the code world should be to get out of its way and let it behave intelligently.

Dynamic glazing costs significantly more than regular glazing. It will not be purchased simply to get around the energy code. Another option, not presented above, would be simply to not regulate the characteristics that can be automatically controlled. The code could presume that the buyer of such a product is very motivated to make it work well and not over regulate the product.

In any case the code should not get in the way of a product that can change literally as fast as the weather.

Cost Impact: The code change proposal will not increase the cost of construction.

CE161 – 13

C402.3.3.5, R402.3.2 (IRC N1102.3.2)

Proponent: Dr. Helen Sanders, SAGE Electrochromics Inc. (helen.sanders@sageglass.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C402.3.3.5 Dynamic glazing. ~~For compliance with Section C402.3.3, the SHGC for *dynamic glazing* shall be determined using the manufacturer's lowest-rated SHGC, and the VT/SHGC ratio shall be determined using the maximum VT and maximum SHGC. *Dynamic glazing* shall be permitted to satisfy the SHGC and VT requirements of Table C402.3 and Section C402.3.1.1 provided the ratio of the higher to lower labeled SHGC is greater than or equal to 3, and the *dynamic glazing* is automatically controlled to modulate the amount of solar gain into the space in multiple steps. *Dynamic glazing* shall be considered separately from other fenestration, and area-weighted averaging with other fenestration that is not *dynamic glazing* shall not be permitted.~~

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R402.3.2 (N1102.3.2) Glazed fenestration SHGC. An area-weighted average of fenestration products more than 50-percent glazed shall be permitted to satisfy the SHGC requirements.

Dynamic glazing shall be permitted to satisfy the SHGC requirements of Table R402.3.3 provided the ratio of the higher to lower labeled SHGC is greater than or equal to 3, and the *dynamic glazing* is automatically controlled to modulate the amount of solar gain into the space in multiple steps. *Dynamic glazing* shall be considered separately from other fenestration, and area-weighted averaging with other fenestration that is not *dynamic glazing* shall not be permitted.

Reason: (Part I) Last cycle, the commercial IECC clarified how to deal with code compliance for dynamic glazing, and dynamic glazing is also now addressed in the IgCC, ASHRAE 90.1, ASHRAE 189.1, and the new 2013 California Title 24 standards. This was important in that dynamic glazing offers the unique ability to reversibly change properties such as SHGC and VT to optimize energy performance, daylighting, and glare based on changing situations during the day, and over different seasons. As such, dynamic glazing represents a key technology on the route to zero energy buildings, and has been strongly supported by the U.S. Department of Energy, Lawrence Berkeley National Laboratory, and the National Renewable Energy Laboratory.

However, to provide additional assurances that the dynamic glazing delivers the maximum energy savings, this proposal strengthens the requirement by only allowing compliance if the dynamic glazing has a certain dynamic range (ratio of the high to low SHGC greater than 3) and is automatically controlled in multiple steps. The minimum dynamic range prevents a loophole for products claiming dynamic properties that do not really have a significant energy impact. Also, with a minimum SHGC dynamic ratio of 3, the current language about using the lowest rated SHGC for compliance is no longer needed ... the highest SHGC in any double glazing is perhaps 0.60, so the lowest SHGC would have to be < 0.20, which is already lower than the lowest 0.25 SHGC requirement. Furthermore, although the dynamic range is specified as a SHGC ratio, this also ensures a good dynamic range for VT, which will be higher than the SHGC ratio. (Typical products commonly have SHGC range from <0.10 to >0.40, and VT range from <0.04 to >0.50.)

Finally, the dynamic glazing must be properly controlled in order to optimize energy performance. Dynamic glazing is almost always already sold as a system integrated with automatic controls, but this proposal clarifies that the dynamic glazing must be automatically controlled in multiple steps, and not rely on manual adjustment by occupants.

(Part II) Dynamic glazing is currently defined and addressed in the commercial IECC, as well as the IgCC, ASHRAE 90.1, ASHRAE 189.1, and the new 2013 California Title 24 standards. However, the residential IECC does not currently address how to deal with compliance of dynamic glazing. Dynamic glazing is unique in that it has the ability to reversibly change properties such as SHGC and VT. This allows the glazing to be controlled optimize energy performance, daylighting, and glare based on changing situations during the day, and over different seasons. For example, unlike traditional glazing with fixed properties, dynamic glazing can be operated in a lower SHGC state during summer to reduce cooling loads, and a higher SHGC state during winter to reduce heating loads.

As such, dynamic glazing represents a key technology on the route to zero energy buildings, and has been strongly supported by the U.S. Department of Energy, Lawrence Berkeley National Laboratory, and the National Renewable Energy Laboratory. Dynamic glazing has been available on the market for 10 years now, and manufacturing expansions have come on line in 2012 to provide larger pane sizes at higher volumes and lower prices to allow broader application. Not only should its use be encouraged, but barriers to its use must be removed. Specifically, the NFRC label for dynamic glazing which has been in place for a number of years, lists two values for SHGC, representing the range over which the SHGC varies. It is not clear how this label should be used to determine compliance with maximum or minimum SHGC requirements, and direction must be given to aid enforcement by the building code official.

Because of the ability of dynamic glazing to optimize solar gain and energy efficiency, the commercial IECC already allows compliance with SHGC requirements by simply saying to use the lower labeled SHGC value, and to treat dynamic glazing separately from other fenestration in the building (no mixing in area-weighted averages). To provide additional assurances of proper performance, this proposal provides a stronger requirement by only allowing compliance if the dynamic glazing has a certain dynamic range (ratio of the high to low SHGC greater than 3) and is automatically controlled in multiple steps. First, the minimum dynamic range prevents a loophole for products claiming dynamic properties that do not really have a significant energy impact. The minimum SHGC dynamic ratio of 3 will also more than ensure compliance with the lowest rated SHGC ... the highest SHGC in any double glazing is perhaps 0.60, so the lowest SHGC would have to be < 0.20, which is already lower than the lowest 0.25 SHGC requirement. (In practice, typical products commonly have SHGC range from <0.10 to 0.40.) Second, the dynamic glazing must be properly controlled in order to optimize energy performance. Automatic controls are especially important in a residential home or apartment, where the occupant may not be home to manually adjust the glazing. A separate proposal is also being submitted to the commercial IECC to strengthen those requirements in a similar manner.

Cost Impact: The code change proposal will not increase the cost of construction. The large majority of dynamic glazing is already sold with automatic control systems.

PART I AND II TEMPLATE.doc

CE162 – 13

C402.3.3.5

Proponent: Garrett Stone, Brickfield, Burchette, Ritts & Stone, P.C

Revise as follows:

C402.3.3.5 Dynamic Glazing. For compliance with Section C402.3.3, the SHGC for dynamic glazing products shall be determined using the ~~manufacturer's lowest-rated SHGC value on the product label,~~ and the VT/~~SHGC ratio~~ shall be determined using the ~~maximum VT and maximum value on the product label that corresponds with the product's lowest SHGC.~~ Dynamic glazing shall be considered separately from other fenestration, and area-weighted averaging with other fenestration that is not dynamic glazing shall not be permitted.

Reason: The purpose of the proposed code change is to modify how VT is determined for dynamic glazing. The current dynamic glazing assumptions in the IECC are physically impossible and are inconsistent with fenestration product values. Dynamic glazing products are typically labeled at NFRC based on both the "on/open" setting and the "off/closed" setting (there are also variable products with ranges of performance). In one of these settings the product blocks solar heat gain, thereby also reducing visible light. In the other setting, the product blocks less solar heat gain and allows more visible light to pass through the glass. These two conditions do not overlap – either the product is "on" or "off" at any given time during the day. The current definition would suggest that windows are optimally operated to block the maximum solar heat gain throughout the day, which would clearly not allow for visible light to be at the maximum during the day. However, the current language in Section C402.3.3.5 awards the dynamic glazing user the best-case efficiency for SHGC, as well as the best-case VT level, even though the two conditions cannot take place at the same time.

This proposal clarifies that the efficiency rating for dynamic glazing will be based on the lowest SHGC on the label as per the current code language, and then requires using the VT rating that corresponds with that same setting. In other words, the above amendment gives the product the best possible rating (from an SHGC perspective) that is also consistent with its label.

Cost Impact: The code change proposal will not increase the cost of construction.

C402.3.3.5-EC-STONE.doc

CE163 – 13

C402.3.4

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C402.3.4 Area weighted U-factor. An area-weighted average U-factor shall be permitted to satisfy the U-factor requirements ~~for each fenestration product category listed in Table C402.3~~ separately for fixed fenestration, operable fenestration and entrance doors. Individual fenestration products from different fenestration product categories listed in Table C402.3 shall not be combined in calculating area-weighted U-factor.

Reason: This proposal clarifies the provisions in the code related to area weighted U-factor, to simplify the code.

Cost Impact: The code change proposal will not increase the cost of construction.

CE163-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.3.4-EC-WILLIAMS.doc

CE164 – 13

C402.4, C402.4.1.2, C402.4.1.2.3

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C402.4 Air leakage (Mandatory). The thermal envelope of buildings shall comply with Sections C402.4.1 through C402.4.8. Alternatively the building thermal envelope shall be permitted to be tested in accordance with ASTM E779 at a pressure differential of 0.3 inches water gauge, or an equivalent method approved by the code official, and deemed to comply with the provisions of this section when the tested air leakage rate of the building thermal envelope does not exceed 0.40 cfm/ft². Where compliance is based on such testing the building shall also comply with Sections C402.4.5, 402.4.6 and 402.4.7.

C402.4.1.2 Air barrier compliance options. A continuous air barrier for the opaque portions of the building thermal envelope shall comply with Section C402.4.1.2.1, or C402.4.1.2.2. ~~or C402.4.1.2.3.~~

~~**C402.4.1.2.3 Building test.** The completed building shall be tested and the air leakage rate of the building envelope shall not exceed 0.40 cfm/ft² at a pressure differential of 0.3 inches water gauge (2.0 L/s · m² at 75 Pa) in accordance with ASTM E 779 or an equivalent method approved by the code official.~~

Reason: This proposal clarifies the language pertaining to the sealing of penetrations in the building thermal envelope associated with continuous air barriers so that all three compliance options associated with air barriers are equivalent. The current code lists three options for meeting the provisions of the opaque building envelope. The first two that deal with the opaque components are valid and allow compliance based on either the materials used or the assemblies of the envelope. The test is also a valid way of addressing air leakage on a performance basis. Unfortunately, a whole building test includes fenestration such that the test cannot address only opaque sections of the envelope as is the case with the other two options. All three options should be comparable and have the same scope. For this reason the text has been more appropriately rearranged. One approach prescriptively addresses the particular components of the building thermal envelope and their construction and installation as well as individual air leakage properties. The other provides a performance oriented approach that is based on the testing currently allowed, since all possible means of air leakage through the envelope are measured

Cost Impact: The code change proposal will not increase the cost of construction.

CE164-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.4-EC-WILLIAMS.doc

CE165 – 13

C402.4

Proponent: Mark S. Graham, National Roofing Contractors Association (mgramham@nrca.net)

Revise as follows:

C402.4 Air leakage (Mandatory). The thermal envelope of buildings shall comply with Sections C402.4.1 through C402.4.8.

Exception: The provisions of this section shall not be required for roof repairs, roof recovering and roof replacement where the alterations, renovations or repairs to the building do not also include alterations, renovations or repairs to the remainder of the building envelope.

Reason: This code change proposal is intended to clarify the Code's intent regarding when air barriers are and are not required as components of buildings' thermal envelopes.

In existing buildings that do not currently include an air barrier in the building's thermal envelope, it can be interpreted the addition of an air retarder is required in roof repair, roof recover or roof replacement projects where the project's scope does not otherwise require alterations, renovations or repairs to the remainder of the building's thermal envelope. In these situations, the addition of an air retarder to the roof assembly only will do little to and be ineffective in improving the building envelope's overall air leakage performance.

This Exception provides clarity by specifically indicating an air retarder is not required for roof repairs, roof recovering or roof replacement where the scope of the project does not also include alterations, renovations or repairs to the remainder of the building envelope.

Cost Impact: The code change proposal will not increase the cost of construction.

CE165-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.4-EC-GRAHAM.doc

CE166 – 13

C402.4.1

Proponent: Theresa A. Weston, PhD., DuPont Building Innovations
(theresa.a.weston@usa.dupont.com)

Revise as follows:

C402.4.1 Air barriers. A continuous air barrier shall be provided throughout the building thermal envelope. The air barriers shall be permitted to be located on the inside or outside of the building envelope, located within the assemblies composing the envelope, or any combination thereof. The air barrier shall comply with Sections C402.4.1.1 and C402.4.1.2.

~~**Exception:** Air barriers are not required in buildings located in Climate Zones 1, 2 and 3.~~

Reason: This proposal deletes the exception for air barriers in Climate Zones 1, 2 and 3. Air barrier use is important to the energy efficiency, moisture performance and comfort in all climate zones and therefore should be included for all climate zones. This change would also make the provisions within the IECC more consistent with both ASHRAE 90.1 and the IgCC.

Cost Impact: The code change proposal will increase the cost of construction in zones 1, 2 and 3.

CE166-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.4.1-EC-WESTON.doc

CE167 – 13

C402.4.1.1, C402.4.2

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C402.4.1.1 Air barrier construction. The *continuous air barrier* shall be constructed to comply with the following:

1. The air barrier shall be continuous for all assemblies that are the thermal envelope of the building and across the joints and assemblies.
2. Air barrier joints and seams shall be sealed, including sealing transitions in places and changes in materials. Air barrier penetrations shall be sealed in accordance with Section C402.4.2. The joints and seals shall be securely installed in or on the joint for its entire length so as not to dislodge, loosen or otherwise impair its ability to resist positive and negative pressure from wind, stack effect and mechanical ventilation.
3. Penetrations of the air barrier shall be caulked, gasketed or otherwise sealed in a manner compatible with the construction materials and location. Joints and seals associated with penetrations shall be sealed in the same manner or taped or covered with moisture vapor-permeable wrapping material. Sealing materials shall be appropriate to the construction materials being sealed and shall be securely installed around the penetration so as not to dislodge, loosen or otherwise impair its ability to resist positive and negative pressure from wind, stack effect and mechanical ventilation
3. 4. Recessed lighting fixtures shall comply with Section C404.2.8. Where similar objects are installed which penetrate the air barrier, provisions shall be made to maintain the integrity of the air barrier.

Exception: Buildings that comply with Section C402.4.1.2.3 are not required to comply with Items 1 and 43.

~~C402.4.2 Air barrier penetrations.~~ ~~Penetrations of the air barrier and paths of air leakage shall be caulked, gasketed or otherwise sealed in a manner compatible with the construction materials and location. Joints and seals shall be sealed in the same manner or taped or covered with moisture vapor-permeable wrapping material. Sealing materials shall be appropriate to the construction materials being sealed. The joints and seals shall be securely installed in or on the joint for its entire length so as not to dislodge, loosen or otherwise impair its ability to resist positive and negative pressure from wind, stack effect and mechanical ventilation.~~

Reason: This proposal clarifies the language pertaining to the sealing of penetrations in the building envelope. The objective of the proposal is to increase the simplicity of the code.

The provisions of C402.4.2 are currently out of place. They have the same standing in the order of the code as C402.4.1 yet are actually a component of the air barrier provisions. They are more appropriately located as a part of the code text addressing air barrier construction. In addition, the present item 2 is duplicated by C402.4.2 to a large degree so the text has been revised to focus on penetrations.

Cost Impact: The code change proposal will not increase the cost of construction.

CE167-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.4.2-EC-WILLIAMS.doc

CE168 – 13

C402.4.1.2, C402.4.1.2.1, C402.4.1.2.2, C402.4.1.2.3

Proponent: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development (WABO TCD) (lkranz@bellevuewa.gov)

Revise as follows:

C402.4.1.2 Air barrier testing compliance options. A continuous air barrier for the building envelope shall comply with Section C402.4.1.2.1, C402.4.1.2.2, or C402.4.1.2.3.

C402.4.1.2.1 Materials. Materials with an air permeability no greater than 0.004 cfm/ft^2 ($0.02 \text{ L/s} \cdot \text{m}^2$) under a pressure differential of 0.3 inches water gauge (w.g.) (75 Pa) when tested in accordance with ASTM E 2178 shall comply with this section. Materials in Items 1 through 15 shall be deemed to comply with this section provided joints are sealed and materials are installed as air barriers in accordance with the manufacturer's instructions.

1. Plywood with a thickness of not less than 3/8 inch (10 mm).
2. Oriented strand board having a thickness of not less than 3/8 inch (10 mm).
3. Extruded polystyrene insulation board having a thickness of not less than 1/2 inch (12 mm).
4. Foil-back polyisocyanurate insulation board having a thickness of not less than 1/2 inch (12 mm).
5. Closed cell spray foam a minimum density of 1.5 pcf (2.4 kg/m^3) having a thickness of not less than 1 1/2 inches (38 mm).
6. Open cell spray foam with a density between 0.4 and 1.5 pcf (0.6 and 2.4 kg/m^3) and having a thickness of not less than 4.5 inches (113 mm).
7. Exterior or interior gypsum board having a thickness of not less than 1/2 inch (12 mm).
8. Cement board having a thickness of not less than 1/2 inch (12 mm).
9. Built up roofing membrane.
10. Modified bituminous roof membrane.
11. Fully adhered single-ply roof membrane.
12. A Portland cement/sand parge, or gypsum plaster having a thickness of not less than 5/8 inch (16 mm).
13. Cast-in-place and precast concrete.
14. Fully grouted concrete block masonry.
15. Sheet steel or aluminum.

C402.4.1.2.2 Assemblies. Assemblies of materials and components with an average air leakage not to exceed 0.04 cfm/ft^2 ($0.2 \text{ L/s} \cdot \text{m}^2$) under a pressure differential of 0.3 inches of water gauge (w.g.) (75 Pa) when tested in accordance with ASTM E 2357, ASTM E 1677 or ASTM E 283 shall comply with this section. Assemblies listed in Items 1 and 2 shall be deemed to comply provided joints are sealed and requirements of Section C402.4.1.1 are met.

1. Concrete masonry walls coated with one application either of block filler and two applications of a paint or sealer coating;
2. A Portland cement/sand parge, stucco or plaster minimum 1/2 inch (12 mm) in thickness.

C402.4.1.2.3 Building test. The completed building shall be tested and the air leakage rate of the building envelope shall not exceed 0.40 cfm/ft^2 at a pressure differential of 0.3 inches water gauge ($2.0 \text{ L/s} \cdot \text{m}^2$ at 75 Pa) in accordance with ASTM E 779 or an equivalent method approved by the code official. A report that includes the tested surface area, floor area, air by volume, stories above grade, and leakage rates shall be submitted to code official and the building owner. Where the tested rate exceeds 0.40 cfm/ft^2 , a visual inspection of the air barrier shall be conducted and any leaks noted shall be sealed to the extent practicable. An additional report identifying the corrective actions taken to seal air leaks shall be submitted to the code official and the building owner, and shall be deemed to satisfy the requirements of this section.

Reason: This proposed amendment requires air barrier testing for building envelopes.

Air leakage through building envelopes wastes significant HVAC energy, and provides a pathway for moisture intrusion into building envelope assemblies. Losses of 30% of conditioned air through uncontrolled air leakage are frequently reported, and mechanical systems must be oversized to accommodate this risk. Air barrier testing greatly reduces loss of conditioned air, providing the best energy savings returns per dollar invested of any technology.

The lists of air barrier materials and assemblies in the 2009 code include common materials such as gypsum board and plywood that in practice qualify almost any contemporary building to meet the code requirements. However, the materials and assemblies themselves are not the main source of air barrier leakage problems – instead, most leakage occurs in the transitions between various materials. Field testing is the only method, short of continuous third-party inspection, that a continuous air barrier can be ensured. Seattle's experience, after mandating that air barriers be tested during this current code cycle (but not requiring that air barriers must meet the test standard) is that all buildings have passed the test.

The proposal eliminates most of the text between C402.4.1.2 and C402.4.1.2.3.1. However with the legislative format it is a little confusing. The net result of this proposal is Section D402.4.1.2 would read as follows:

C402.4.1.2 Air barrier testing. A continuous air barrier for the building envelope shall be tested and the air leakage rate of the *building envelope* shall not exceed 0.40 cfm/ft² at a pressure differential of 0.3 inches water gauge (2.0 L/s · m² at 75 Pa) in accordance with ASTM E 779 or an equivalent method approved by the code official. A report that includes the tested surface area, floor area, air by volume, stories above grade, and leakage rates shall be submitted to code official and the building owner. Where the tested rate exceeds 0.40 cfm/ft², a visual inspection of the air barrier shall be conducted and any leaks noted shall be sealed to the extent practicable. An additional report identifying the corrective actions taken to seal air leaks shall be submitted to the code official and the building owner, and shall be deemed to satisfy the requirements of this section.

Cost Impact: The code change proposal will increase the cost of construction.

- ~~13. Cast in-place and precast concrete.~~
- ~~14. Fully grouted concrete block masonry.~~
- ~~15. Sheet steel or aluminum.~~

C402.4.1.2.2 Assemblies. ~~Assemblies of materials and components with an average air leakage not to exceed 0.04 cfm/ft² (0.2 L/s—m²) under a pressure differential of 0.3 inches of water gauge (w.g.) (75 Pa) when tested in accordance with ASTM E 2357, ASTM E 1677 or ASTM E 283 shall comply with this section. Assemblies listed in Items 1 and 2 shall be deemed to comply provided joints are sealed and requirements of Section C402.4.1.1 are met.~~

- ~~1. Concrete masonry walls coated with one application either of block filler and two applications of a paint or sealer coating;~~
- ~~2. A Portland cement/sand parge, stucco or plaster minimum 1/2 inch (12 mm) in thickness.~~

C402.4.1.2.3 Building test C402.4.1.2.1 Whole building pressurization testing. ~~The completed building shall be tested and the air leakage rate of the *building envelope* shall not exceed 0.40 cfm/ft² at a pressure differential of 0.3 inches water gauge (2.0 L/s—m² at 75 Pa) in accordance with ASTM E 779 or an equivalent method approved by the code official. Compliance of the *continuous air barrier* shall be verified via testing in accordance with ASTM E779 or an equivalent test method approved by the *code official*. The air leakage rate shall not exceed 0.40 cfm/ft² of conditioned floor area under a pressure differential of 0.3 in. water (75 Pa).~~

C402.4.1.2.2 Continuous air barrier commissioning. The registered design professional shall provide evidence of continuous air barrier commissioning that shall include:

1. Clear identification of continuous air barrier components specified for the project and identified on approved construction documents
2. Review of planned construction details to ensure continuity of the air barrier over the entire building thermal envelope.
3. A field inspection checklist clearly showing requirements necessary for proper installation of the continuous air barrier.
4. Witnessing and reporting on any continuous air barrier testing specified by the owner.
5. Periodic field inspections over the course of project construction to ensure compliance with all continuous air barrier requirements including, but not limited to, proper material handling and storage, use of approved materials and approved substitutes, proper material and surface preparation, air barrier continuity at all building thermal envelope penetrations and other requirements as necessary to achieving the performance objective of the continuous air barrier.
6. A final commissioning report provided to the building owner and code official demonstrating compliance with the continuous air barrier requirements.

Reason: Buildings typically last for around 100 years. Unlike mechanical systems, the building envelope provisions may be in place for the life of the building and may not be replaced. That is why envelope provisions in new construction are so critically important. However, one of most important variables in envelope performance is not sufficiently addressed by the code – envelope air leakage.

Currently the code has multiple means of code compliance related to air leakage, relying on the tested performance of materials and assemblies and allowing for whole-building testing. But whole-building air leakage is not about the materials used. It is not about the assemblies employed. Instead, it is about how well all of the materials and assemblies go together.

Fortunately for the past few code cycles the energy code has increasingly prioritized reduction of uncontrolled air leakage – in duct work and through building envelopes. This is due in part to the growing recognition of the energy penalties associated with unwanted air leakage. Fortunately, the building industry also has continued to innovate and develop an array of product offerings specifically designed to help reduce air leakage, as well as develop improved, low-cost techniques for measuring air leakage on site.

This code proposal prioritizes control and measurement of envelope air leakage. It requires testing of small buildings and allows for commissioning of the continuous air barriers already required by the code.

The proposed language follows similar language from ASHRAE Guideline 0, NIBS Guideline 3 and Army Corp of Engineers Test Protocol for Building Envelopes. It aims to ensure that buildings actually meet the air leakage requirements of the code, regardless of the materials, systems or assemblies employed. It is based on the fundamental understanding that durable, long-term energy performance of a building actually requires proven compliance with the continuous air barrier objectives and air leakage requirements.

Uncontrolled air leakage is a significant contributor to moisture, comfort and energy problems in building envelopes. Moisture problems can cause mold and rot, can weaken the integrity of exterior walls, can degrade the performance of certain insulations, and can lead to poor indoor temperature, humidity and air quality control. Well-installed air barriers in commercial and industrial buildings are estimated to reduce air leakage by up to 83 percent, save on gas bills by more than 40 percent and cut down on electrical consumption as much as 25 percent, according to simulations by the National Institute of Standards and Technology (NIST).

This proposal is intended to target improved code compliance. Over 85 percent of the commercial buildings we build are less than 25,000 square feet in size. Buildings of this size can easily be tested to determine actual air leakage. Over the past two decades, the number of qualified air leakage testing professionals has grown to be able to address this need. If the code says “have envelope air leakage less than x” – then we can now easily measure it to ensure compliance. Whole-building testing is currently required for all US General Services Administration and Army Corps of Engineers projects.

This proposal is intended to be flexible. Some buildings can be harder to test. When buildings get over 10 stories in height or over 25,000 square feet, the code needs some other ways to ensure that a code-compliant continuous air barrier is in place and ready to perform to meet the requirements of the code. This proposal allows for the option to either test or commission the installation of the continuous air barrier on the building. This second option is being employed more and more as the recognition of the importance of air barrier commissioning grows. In the absence of testing, on-site quality assurance of air barrier insulation is essential regardless of the materials and assemblies used.

The new commissioning alternative for demonstrating compliance is in line with other policy objectives of the ICC. As a compliance option for continuous air barrier performance, commissioning offers both flexibility and firmer assurances that building envelopes will perform as intended over the useful life of the building.

“The term commissioning comes from ship builders that “commission” their ships to ensure that they are ready for service prior to the ships initial voyage and then are routinely inspected or “retrocommissioned” during their service life to maintain their performance.

An important yet underused path to energy savings, greenhouse gas emission reductions and overall building performance is through the commissioning of new buildings and the retrocommissioning of existing stock. In recent years commissioning has found its way into voluntary rating systems like LEED and, more recently, it has been included in the *International Green Construction Code*™ (IgCC™) and CALGreen building codes, and standards such as ASHRAE

189.1, which is helping to move it into the mainstream of construction practices.” Source: ICC G4-2012 Guideline for Commissioning

Envelope air tightness fundamentally is not about materials or assemblies. It is a performance objective. The code needs to improve the enabling structures to provide building inspectors, as well as owners and occupants, assurance of air barrier performance. This proposal offers two proven techniques for actually ensuring compliance with the code, as well as ensuring meeting the code’s stated intent:

R101.3 Intent. This code shall regulate the design and construction of buildings for the ***effective use and conservation of energy over the useful life of each building***. This code is intended to provide flexibility to permit the use of innovative approaches and techniques to achieve this objective. This code is not intended to abridge safety, health or environmental requirements contained in other applicable codes or ordinances. Source: 2012 IECC. (emphasis added)

Cost Impact: The code change proposal will not increase the cost of construction.

C402.4.1.2-EC-EDELSON-MATHIS.doc

CE170 – 13

C402.4.1.2.1, C402.4.1.2.2

Proponent: Theresa A. Weston, PhD., DuPont Building Innovations
(theresa.a.weston@usa.dupont.com)

Revise as follows:

C402.4.1.2 Air barrier compliance options. A continuous air barrier for the opaque building envelope shall comply with Section C402.4.1.2.1, C402.4.1.2.2, or C402.4.1.2.3.

C402.4.1.2.1 Materials. Materials with an air permeability no greater than 0.004 cfm/ft² (0.02 L/s · m²) under a pressure differential of 0.3 inches water gauge (w.g.) (75 Pa) when tested in accordance with ASTM E 2178 shall comply with this section. ~~Materials in Items 1 through 15 shall be deemed to comply with this section provided joints are sealed and materials are installed as air barriers in accordance with the manufacturer's instructions.~~

- ~~1. Plywood with a thickness of not less than 3/8 inch (10 mm).~~
- ~~2. Oriented strand board having a thickness of not less than 3/8 inch (10 mm).~~
- ~~3. Extruded polystyrene insulation board having a thickness of not less than 1/2 inch (12 mm).~~
- ~~4. Foil back polyisocyanurate insulation board having a thickness of not less than 1/2 inch (12 mm).~~
- ~~5. Closed cell spray foam a minimum density of 1.5 pcf (2.4 kg/m³) having a thickness of not less than 1 1/2 inches (36 mm).~~
- ~~6. Open cell spray foam with a density between 0.4 and 1.5 pcf (0.6 and 2.4 kg/m³) and having a thickness of not less than 4.5 inches (113 mm).~~
- ~~7. Exterior or interior gypsum board having a thickness of not less than 1/2 inch (12 mm).~~
- ~~8. Cement board having a thickness of not less than 1/2 inch (12 mm).~~
- ~~9. Built up roofing membrane.~~
- ~~10. Modified bituminous roof membrane.~~
- ~~11. Fully adhered single ply roof membrane.~~
- ~~12. A Portland cement/sand parge, or gypsum plaster having a thickness of not less than 5/8 inch (16 mm).~~
- ~~13. Cast in place and precast concrete.~~
- ~~14. Fully grouted concrete block masonry.~~
- ~~15. Sheet steel or aluminum.~~

C402.4.1.2.2 Assemblies. Assemblies of materials and components with an average air leakage not to exceed 0.04 cfm/ft² (0.2 L/s · m²) under a pressure differential of 0.3 inches of water gauge (w.g.) (75 Pa) when tested in accordance with ASTM E 2357, ASTM E 1677 or ASTM E 283 shall comply with this section. ~~Assemblies listed in Items 1 and 2 shall be deemed to comply provided joints are sealed and requirements of Section C402.4.1.1 are met.~~

- ~~1. Concrete masonry walls coated with one application either of block filler and two applications of a paint or sealer coating;~~
- ~~2. A Portland cement/sand parge, stucco or plaster minimum 1/2 inch (12 mm) in thickness.~~

Reason: This proposal deletes the "laundry lists" of generic materials and assemblies deemed to comply with the air barrier requirements. As there is a performance criteria and test method specified in the code for air barrier materials this list potentially confuses this requirement because the code would also allow any materials equivalent to this list. The list itself contains unspecified materials so that checking compliance would be difficult. Such deemed to comply lists are better suited for a commentary rather than in the code itself.

Cost Impact: The code change proposal will not increase the cost of construction.

C402.4.1.2.1-EC-WESTON.doc

CE171 – 13

C402.4.1.2

Proponent: Tim M. Mattox, Tremco, Inc. (tmattox@tremcoinc.com)

Revise as follows:

C402.4.1.2 Air barrier compliance options. A continuous air barrier for the opaque building envelope shall comply with Section C402.4.1.2.1, C402.4.1.2.2, ~~or~~ and C402.4.1.2.3.

Reason: The intention of this code section is to identify proper steps are taken to ensure the installation of an effective air barrier. In current form, this code section provides for options to choose a proper material (402.4.1.2.1), or to choose a properly tested assembly (402.4.1.2.2), or to test the application of the material/assembly once applied in a building (402.4.1.2.3). Ultimately the goal is to pass the third option, but for the design phase of a project it is difficult to know if a material or an assembly that has not been tested to the first two options would have a chance at passing the third option. Once a building is constructed, it becomes very costly to fix the problem if an underperforming material and application is selected. The requirements for this section should establish that air barrier compliance should be based on a material and application that has successfully met the requirements of Sections 402.4.1.2.1 and 402.4.1.2.2, and that the end result should meet the requirements of 402.4.1.2.3.

This code change proposal intends to clarify that an effective air barrier system needs to utilize the proper materials, be tested as an assembly to ensure the design can effectively prevent air leakage with some durability, and that the systems have been installed properly.

Cost Impact: While there may be an increase in the cost of construction, proper materials, design, and installation will ultimately reduce cost and use of energy. Proper sequencing will help to ensure the end result is achieved while mitigating costly repair work.

CE171-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.4.1.2-EC-MATTOX.doc

CE172 – 13

C402.4.1.2.1

Proponent: Tim M. Mattox, Tremco, Inc.(tmattox@tremcoinc.com)

Revise as follows:

C402.4.1.2.1 Materials. Materials with an air permeability no greater than 0.004 cfm/ft² (0.02 L/s • m²) under a pressure differential of 0.3 inches water gauge (w.g.) (75 Pa) when tested in accordance with ASTM E 2178 shall comply with this section. Materials in Items 1 through 15 shall be deemed to comply with this section provided joints and penetrations are sealed in accordance with Section C402.4.2 and materials are installed as air barriers in accordance with the manufacturer's instructions.

1. Plywood with a thickness of not less than $\frac{3}{8}$ inch (10 mm).
2. Oriented strand board having a thickness of not less than $\frac{3}{8}$ inch (10 mm).
3. Extruded polystyrene insulation board having a thickness of not less than $\frac{1}{2}$ inch (12 mm).
4. Foil-back polyisocyanurate insulation board having a thickness of not less than $\frac{1}{2}$ inch (12 mm).
5. Closed cell spray foam a minimum density of 1.5 pcf (2.4 kg/m³) having a thickness of not less than $1\frac{1}{2}$ inches (36 mm).
6. Open cell spray foam with a density between 0.4 and 1.5 pcf (0.6 and 2.4 kg/m³) and having a thickness of not less than 4.5 inches (113 mm).
7. Exterior or interior gypsum board having a thickness of not less than $\frac{1}{2}$ inch (12 mm).
8. Cement board having a thickness of not less than $\frac{1}{2}$ inch (12 mm).
9. Built up roofing membrane.
10. Modified bituminous roof membrane.
11. Fully adhered single-ply roof membrane.
12. A Portland cement/sand parge, or gypsum plaster having a thickness of not less than $\frac{5}{8}$ inch (16 mm).
13. Cast-in-place and precast concrete.
14. Fully grouted concrete block masonry.
15. Sheet steel or aluminum.

Reason: The first change adds penetrations to the building elements that need to be properly installed in the “deemed to comply” solutions. This is consistent with the remainder of Section C402. The second change references existing language for proper treatment of joints and penetrations in air barriers.

The addition of the specific reference to penetrations simply reflects the current intent and it ensures any breach of the air barrier membrane is restored.

Cost Impact: This code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

C402.4.1.2.1-EC-MATTOX.doc

CE173 – 13

C402.4.1.2.1

Proponent: Charles Clark, Brick Industry Association, representing Masonry Alliance for Codes and Standards (ccclark@bia.org)

Revise as follows:

402.4.1.2.1 Materials. Materials with an air permeability no greater than 0.004 cfm/ft² (0.02 L/s·m²) under a pressure differential of 0.3 in. water (w.g.)(75 Pa) when tested in accordance with ASTM E2178 shall comply with this section. Materials in items 1 through ~~45~~ 16 shall be deemed to comply with this section provided joints are sealed and materials are installed as air barriers in accordance with the manufacturer's instructions.

16. Solid or fully grouted masonry constructed of clay or shale masonry units.

(Portions of text not shown remain unchanged)

Reason: Testing will show that fully grouted masonry constructed of clay or shale masonry units can meet the IECC requirements to be a material deemed-to-comply as an air barrier. This research is being conducted at the National Brick Research Center and will be available in time for consideration at the ICC Committee Hearings.

Cost Impact: This code change will not increase the cost of construction.

CE173-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.4.1.2.1-EC-CLARK.doc

CE174 – 13

C402.4.1.2.2

Proponent: Tim M. Mattox, Tremco, Inc. (tmattox@tremcoinc.com)

Revise as follows:

C402.4.1.2.2 Assemblies. Assemblies of materials and components with an average air leakage not to exceed 0.04 cfm/ft² (0.2 L/s • m²) under a pressure differential of 0.3 inches of water gauge (w.g.)(75 Pa) when tested in accordance with ASTM E 2357, ~~or ASTM E 1677 or ASTM E 283~~ shall comply with this section. Assemblies listed in Items 1 and 2 shall be deemed to comply provided joints are sealed and requirements of Section C402.4.1.1 are met.

1. Concrete masonry walls coated with one application either of block filler and two applications of a paint or sealer coating;
2. A Portland cement/sand parge, stucco or plaster minimum 1/2 inch (12 mm) in thickness.

Reason: An ASTM E2357 test prescribes running an ASTM E283 test twice during the course of testing - once before a wind conditioning sequence and once afterward. The E2357 test method also addresses the measurement of air leakage over a range of pressure differences and not just at 75 Pa, although the standard indicates that the air leakage rate of an assembly is reported as the leakage measured at a 75 Pa pressure differential. Allowing ASTM E283 by itself as an option to ASTM E2357 is a redundancy, except it leaves out the critical step of understanding how well a system accommodates movement. This is important to understand because movement will be realized as soon as a structure is erected and will endure for the life of a building. This revision also makes the text consistent with Normative Appendix B, subsection b of ASHRAE 189.1.

NFRC 400-2010 states the following when referencing ASTM E283 as a standard for measuring air leakage under test criteria note to item H:

"This procedure references the use of ASTM E283 as the only method for measuring individual product air leakage rates. ASTM E283 is a laboratory test method that has been used for many years to measure air leakage rates under controlled conditions. Because this test method measures air leakage rates at only one pressure differential, it is best used to compare the relative performance of fenestration products. It does not directly provide information on how a product will perform in a specific building application at field conditions."

Cost Impact: This change may have an effect on the cost of construction. ASTM E2357 is a more thorough test, having greater duration and greater cost than simply testing to ASTM E283, but the added benefit of installing more durable systems is likely to reduce costs of operation over time.

CE174-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.4.1.2.2-EC-MATTOX.doc

CE175 – 13

C402.4.1.2.2

Proponent: Charles Clark, Brick Industry Association, representing Masonry Alliance for Codes and Standards (ccclark@bia.org)

Revise as follows:

402.4.1.2.2 Assemblies. Assemblies of materials and components with an average air leakage not to exceed 0.04 cfm/ft² (0.2 L/s·m²) under a pressure differential of 0.3 inches of water gauge (w.g.) (75 Pa) when tested in accordance with ASTM E 2357, ASTM E 1677 or ASTM E 283 shall comply with this section. Assemblies listed in items 1 ~~and 2~~ through 3 shall be deemed to comply provided joints are sealed and requirements of Section 402.4.1.1 are met.

1. Concrete masonry walls coated with either one application ~~either~~ of block filler or ~~and~~ two applications of a paint or sealer coating;
2. Masonry walls constructed of clay or shale masonry units with a nominal width of 4-inches or more;
3. ~~2-~~ A Portland cement/sand parge, stucco or plaster minimum ½ inch (12 mm) in thickness.

Reason: This code change proposal modifies or adds text to the air barrier assembly section in two ways. It corrects the current requirement for a concrete masonry wall assembly to comply as an air barrier. And it adds an assembly option for masonry walls constructed of clay or shale masonry units.

The current text for concrete masonry walls is incorrectly worded. As was substantiated by testing submitted with code change proposal EC 146-09/10, a concrete masonry wall assembly is able to comply as an air barrier when EITHER (not both) of the following are applied:

- 1) One application of block filler, or
- 2) Two applications of a paint or sealer coating.

Testing to support both of these methods of compliance was previously submitted with EC146-09/10 and can be downloaded at the following URL: www.ncma.org/resources/design/Research%20Reports/MR36.pdf.

This code change proposal also adds an option for masonry construction made from clay or shale masonry units to qualify as an air barrier. Testing will show that masonry constructed of clay or shale masonry units can meet the IECC requirements to be an assembly deemed-to-comply as an air barrier. This research is being conducted at the National Brick Research Center and will be available in time for consideration at the ICC Committee Hearings.

Cost Impact: This code change proposal will not increase the cost of construction.

CE175-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.4.1.2.2-EC-CLARK.doc

CE176 – 13

C402.4.1.2.2

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

Revise as follows:

C402.4.1.2.2 Assemblies. Assemblies of materials and components with an average air leakage not to exceed 0.04 cfm/ft² (0.2 L/s · m²) under a pressure differential of 0.3 inches of water gauge (w.g.)(75 Pa) when tested in accordance with ASTM E 2357, ASTM E 1677 or ASTM E 283 shall comply with this section. Assemblies listed in Items 1 and 2 shall be deemed to comply provided joints are sealed and requirements of Section C402.4.1.1 are met.

- ~~1. Concrete masonry walls coated with one application either of block filler and two applications of a paint or sealer coating;~~
- ~~2. A Portland cement/sand parge, stucco or plaster minimum ¹/₂ inch (12 mm) in thickness.~~

Reason: This list is incomplete as common assemblies that could meet the requirement, or the incomplete list should be deleted. For example, the list should include ICF, a spray foam 1" or more, SIPS, and usually a high-density cellulose. No list is better than an incomplete list.

Cost Impact: The code change proposal will not increase the cost of construction.

CE176-13

C402.4.1.2 (NEW), R402.1.2 (NEW), (IRC N1102.4.1.2 (NEW))

Proponent: Brent Ursenbach, Salt Lake County representing Utah Chapter ICC and Utah Association of Plumbing and Mechanical Officials Chapter ICC (bursenbach@slco.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Add new text as follows:

C 402.4.1.2 Combustion air openings. In climate zones 3 through 8, where open combustion air ducts provide combustion air to open combustion space conditioning fuel burning appliances, the appliances and combustion air opening shall be located outside the *building thermal envelope* or enclosed in a room, isolated from inside the thermal envelope. Such rooms shall be sealed and insulated in accordance with the envelope requirements of Table C402.1.2 or C402.2, where the walls shall meet a minimum of the below-grade wall R-value requirement. The door into the room shall be fully gasketed and any water lines and ducts in the room insulated in accordance with Section C403. The combustion air duct shall be insulated where it passes through conditioned space to a minimum of R-8.

Exceptions:

1. Direct vent appliances with both intake and exhaust pipes installed continuous to the outside.
2. Fireplaces and stoves complying with Sections 901, 902, 903, 904, and 905 of the *International Mechanical Code*, and Section 2111.13 of the *International Building Code*.

PART II – IECC-RESIDENTIAL PROVISIONS

Add new text as follows:

R402.4.1.2 (N1102.4.1.2) Combustion air openings. In climate zones 3 through 8, where open combustion air ducts provide combustion air to open combustion fuel burning appliances, the appliances and combustion air opening shall be located outside the *building thermal envelope* or enclosed in a room, isolated from inside the thermal envelope. Such rooms shall be sealed and insulated in accordance with the envelope requirements of Table R402.1.1, where the walls shall meet a minimum of the basement wall R-value requirement. The door into the room shall be fully gasketed and any water lines and ducts in the room insulated in accordance with Section R403. The combustion air duct shall be insulated where it passes through conditioned space to a minimum of R-8.

Exceptions:

1. Direct vent appliances with both intake and exhaust pipes installed continuous to the outside.
2. Fireplaces and stoves complying with Section 402.4.2 and Section R1006 of the *International Residential Code*.

Reason: (Part I) The entire section C402.4 Air leakage- is of little value when a combustion air duct is installed, open to the conditioned space, virtually placing a large hole through the thermal envelope. The building testing option for leakage in C402.4.1.2.3 cannot be accomplished with a combustion air opening inside the thermal envelope. Testers regularly block these opening as this is the only way they can pressurize the building; only to be opened after the test is completed. Ideally, direct vent, sealed combustion appliances solve the problem. Where less efficient, open combustion fuel burning appliances are used, it is reasonable and proper to isolate the appliances and the required combustion air from inside the thermal envelope.

(Part II) The entire section N1102.4 Air leakage- is of little value when a combustion air duct is installed, open to the conditioned space, virtually placing a large hole through the thermal envelope. Blower door testing as now required by the code cannot be accomplished with a combustion air opening inside the thermal envelope. Testers regularly block these opening as this is the only

way they can pressurize the home; only to be opened after the test is completed. Ideally, direct vent, sealed combustion appliances solve the problem. Where less efficient, open combustion fuel burning appliances are used, it is reasonable and proper to isolate the appliances and the required combustion air from inside the thermal envelope.

Cost Impact: The code change proposal will increase the cost of construction, while it will reduce the energy consumption and cost throughout the life of the home.

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C402.4.2 Air barrier penetrations. Penetrations of the air barrier and paths of air leakage shall be caulked, gasketed or otherwise sealed in a manner compatible with the construction materials and location. Joints and seals shall be sealed in the same manner or taped or covered with a moisture vapor-permeable wrapping material. Sealing materials shall be appropriate to the construction materials being sealed. The joints and seals shall be securely installed in or on the joint for its entire length so as not to dislodge, loosen or otherwise impair its ability to resist positive and negative pressure from wind, stack effect and mechanical ventilation.

Exception:

1. Penetrations of the air barrier for automatic sprinkler systems installed according to the International Building Code or the International Fire Code.

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

**TABLE R402.4.1.1 (N1102.4.1.1)
AIR BARRIER AND INSULATION INSTALLATION**

COMPONENT	CRITERIA ^a
Automatic sprinkler systems	Penetrations of the building envelope for <i>automatic</i> sprinkler systems installed according to the <i>International Residential Code</i> , <i>International Building Code</i> and <i>International Fire Code</i> are exempt from being sealed.
Air barrier and thermal barrier	A continuous air barrier shall be installed in the building envelope. Exterior thermal envelope contains a continuous air barrier. Breaks or joints in the air barrier shall be sealed. Air-permeable insulation shall not be used as a sealing material.
Ceiling/attic	The air barrier in any dropped ceiling/soffit shall be aligned with the insulation and any gaps in the air barrier sealed. Access openings, drop down stair or knee wall doors to unconditioned attic spaces shall be sealed.
Walls	Corners and headers shall be insulated and the junction of the foundation and sill plate shall be sealed. The junction of the top plate and top of exterior walls shall be sealed. Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and continuous alignment with the air barrier.

	Knee walls shall be sealed.
Windows, skylights and doors	The space between window/door jambs and framing and skylights and framing shall be sealed.
Rim joists	Rim joists shall be insulated and include the air barrier.
Floors (including above-garage and cantilevered floors)	Insulation shall be installed to maintain permanent contact with underside of subfloor decking. The air barrier shall be installed at any exposed edge of insulation.
Crawl space walls	Where provided in lieu of floor insulation, insulation shall be permanently attached to the crawlspace walls. Exposed earth in unvented crawl spaces shall be covered with a Class I vapor retarder with overlapping joints taped.
Shafts, penetrations	Duct shafts, utility penetrations, and flue shafts opening to exterior or unconditioned space shall be sealed.
Narrow cavities	Batts in narrow cavities shall be cut to fit, or narrow cavities shall be filled by insulation that on installation readily conforms to the available cavity space.
Garage separation	Air sealing shall be provided between the garage and conditioned spaces.
Recessed lighting	Recessed light fixtures installed in the building thermal envelope shall be air tight, IC rated, and sealed to the drywall.
Plumbing and wiring	Batt insulation shall be cut neatly to fit around wiring and plumbing in exterior walls, or insulation that on installation readily conforms to available space shall extend behind piping and wiring.
Shower/tub on exterior wall	Exterior walls adjacent to showers and tubs shall be insulated and the air barrier installed separating them from the showers and tubs.
Electrical/phone box on exterior walls	The air barrier shall be installed behind electrical or communication boxes or air sealed boxes shall be installed.
HVAC register boots	HVAC register boots that penetrate building thermal envelope shall be sealed to the subfloor or drywall.
Fireplace	An air barrier shall be installed on fireplace walls. Fireplaces shall have gasketed doors.

a. In addition, inspection of log walls shall be in accordance with the provisions of ICC-400.

Reason: (Part I) This proposal seeks to exempt fire sprinkler systems, specifically pendent sprinklers (and other similar sprinklers), that penetrate the typical building envelope at the ceilings by adding an exception.

Section C402.4.2 of the 2012 IECC states that the penetrations in the air barrier shall be caulked, gasketed or otherwise sealed in a manner compatible with the construction materials and location. Caulking the sprinkler, escutcheon, or cover plate could delay, cease or interrupt the flow of the fire sprinkler. In cases when a concealed pendent fire sprinkler is used, the caulk may adhere to the cover plate to the ceiling material and severely delay the fast response of the sprinkler.

Caulked Concealed

The same IECC section above, also states that the “sealing materials shall be appropriate to the construction materials being sealed”. Caulk and other sealants are never compatible with the sprinklers, escutcheons and cover plates. In fact, some caulks and sealants are chemically incompatible with certain piping and the pipe manufacturers shall be consulted prior to applying any material.

The fire sprinkler, escutcheon and cover plate are designed to fit together without any adhesive. Escutcheons and cover plates can have gaps or spaces that are required to meet certain specification tolerances for activation of the sprinkler, but in most cases the escutcheons and cover plates should fit tightly to the wall or ceiling.

Furthermore, the intent of the IECC (Section C101.3) is not “intended to abridge safety, health or environmental requirements contained in other applicable codes or ordinances.” When fire sprinklers are installed or required by other codes such as the IBC, they are installed according to those referenced standards. Fire sprinklers are installed by NFPA 13 (Standard for the Installation of Sprinkler Systems), NFPA 13R (Standard for the Installation of Sprinkler Systems in Residential Occupancies Up to and Including Four Stories in Height) and NFPA 13D (Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes) along with IRC Section P2904.

These codes and standards require that all fire sprinklers, escutcheons and cover plates be listed and installed according to that listing. The testing and listing process (of fire sprinklers, escutcheons, and cover plates) does not take into account any additional field applied materials on the sprinkler, escutcheon and cover plate, such as: paint, caulk, drywall compound, and other construction materials. This prohibition is not only reiterated, but is enforced by NFPA 13 and NFPA 25 (Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems) as both of these standards require full replacement of the affected components when found. When a fire sprinkler is properly installed, the escutcheon and/or cover plate should adequately seal the penetration.

(Part II) This proposal seeks to exempt fire sprinkler systems, specifically pendent sprinklers (and other similar sprinklers), which penetrate the typical building envelope at the ceilings by adding a new automatic sprinkler systems row in the component and criteria columns of Table R402.4.1.1.

NFSA fire sprinkler contractors are reporting that local authorities and building owners are caulking fire sprinklers in order to pass the air leakage testing. Caulking the sprinkler, escutcheon, or cover plate could delay, cease or interrupt the flow of the fire sprinkler. In cases when a concealed pendent fire sprinkler is used, the caulk may adhere to the cover plate to the ceiling material and severely delay the fast response of the sprinkler.

Caulk and other sealants are never compatible with the sprinklers, escutcheons and cover plates. In fact, some caulks and sealants are chemically incompatible with certain piping and the pipe manufacturers shall be consulted prior to applying any material.

The fire sprinkler, escutcheon and cover plate are designed to fit together without any adhesive. Escutcheons and cover plates can have gaps or spaces that are required to meet certain specification tolerances for activation of the sprinkler, but in most cases the escutcheons and cover plates should fit tightly to the wall or ceiling.

The intent of the IECC (Section R101.3) is not “intended to abridge safety, health or environmental requirements contained in other applicable codes or ordinances.” When fire sprinklers are installed or required by other codes such as the IBC, they are installed according to those referenced standards. Fire sprinklers are installed by NFPA 13 (Standard for the Installation of Sprinkler Systems), NFPA 13R (Standard for the Installation of Sprinkler Systems in Residential Occupancies Up to and Including Four Stories in Height) and NFPA 13D (Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes) along with IRC Section P2904.

These codes and standards require that all fire sprinklers, escutcheons and cover plates be listed and installed according to that listing. The testing and listing process (of fire sprinklers, escutcheons, and cover plates) does not take into account any additional field applied materials on the sprinkler, escutcheon and cover plate, such as: paint, caulk, drywall compound, and other construction materials. This prohibition is not only reiterated, but is enforced by NFPA 13 and NFPA 25 (Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems) as both of these standards require full replacement of the affected components when found. When a fire sprinkler is properly installed, the escutcheon and/or cover plate should adequately seal the penetration.

Cost Impact: The code change proposal will not increase the cost of construction.

C402.4.2-EC-HUGO. doc

CE180 – 13

Table C402.4.3

Proponent: Jeff Inks, Window & Door Manufacturers Association (jinks@wdma.com)

Revise as follows:

**TABLE C402.4.3
MAXIMUM AIR INFILTRATION RATE
FOR FENESTRATION ASSEMBLIES**

FENESTRATION ASSEMBLY	MAXIMUM RATE (CFM/FT ²)	TEST PROCEDURE
Fixed windows	0.20 ^a	AAMA/WDMA/ CSA101/I.S.2/A440 or NFRC 400
Operable windows	0.30	
Sliding doors	0.20^a 0.30	
Swinging doors	0.20^a 0.50	
Skylights — with condensation weepage openings	0.30	
Skylights — all others	0.20 ^a	

(Portions of Table not shown remain unchanged)

For SI: 1 cubic foot per minute = 0.47L/s, 1 square foot = 0.093 m².

a. — The maximum rate for windows, sliding and swinging doors, and skylights is permitted to be 0.3 cfm per square foot of fenestration or door area when tested in accordance with AAMA/WDMA/CSA101/I.S.2/A440 at 6.24 psf (300 Pa).

Reason: During the last code development cycle as part of the comprehensive commercial revisions included in EC-147-09/10, air infiltration rates for windows, skylights, sliding doors and swinging doors were arbitrarily lowered without sound technical justification. Rather the only substantiation that was cited was debatable modeling which was said to show such reductions in air infiltration rates may improve performance by 1-2% in some types of commercial buildings and was not sufficiently comprehensive to justify lowering the rates to 0.20 cfm, especially for all types of commercial construction covered by the IECC. Other modeling can show gains are far less 1-2%.

Regardless of what modeling is used, the energy efficiency gains in the envelope and overall building efficiency as a result of the reduced rates are minimal at best and need to be more thoughtfully weighed against the negative impacts that result from them, primarily for operable fenestration which is the focus of this proposal. These include added costs to production, testing, and labeling for all products, increase in operational force (especially sliding fenestration products) which impairs operability for all users (and adds difficulty in meeting accessibility requirements) because of the additional sealing that would be required. In addition, the values also conflict with the values in AAMA/WDMA/CSA 101/I.S.2/A440.

In addition, if there are concerns that air infiltration rates for operable fenestration need to be made more stringent, they should be addressed in AAMA/WDMA/CSA 101/I.S.2/A440 and not in the body of the IECC.

For these reasons coupled with the minimal gains in building efficiency that may be achieved, we believe the reduction in air infiltration rates for operable fenestration is unjustified and unnecessary and that the rates should therefore be returned as proposed. It should be noted that this proposal maintains the air infiltration rate of 0.20 cfm for fixed windows.

Cost Impact: This code change proposal will not increase the cost of construction. This code change proposal will decrease the cost of construction.

C402.4.3-EC-INKS.doc

CE181 – 13

C402.4.3, Table C402.4.3

Proponent: Joseph R. Hetzel, P.E., Thomas Associates, Inc., representing the Door & Access Systems Manufacturers Association (DASMA) International (jhetzel@thomasamc.com)

Revise as follows:

C402.4.3 Air leakage of fenestration. The air leakage of fenestration assemblies shall meet the provisions of Table C402.4.3. Testing shall be in accordance with the applicable reference test standard in Table C402.4.3 by an accredited, independent testing laboratory and *labeled* by the manufacturer.

Exceptions:

1. Field-fabricated fenestration assemblies that are sealed in accordance with Section C402.4.1.
2. Fenestration in buildings that comply with Section C402.4.1.2.3 are not required to meet the air leakage requirements in Table C402.4.3.
3. Metal coiling doors in semi-heated spaces in climate zones 1 through 6 are not required to meet the air leakage requirements in Table C402.4.3.

TABLE C402.4.3
MAXIMUM AIR INFILTRATION LEAKAGE RATE
FOR FENESTRATION ASSEMBLIES

FENESTRATION ASSEMBLY	MAXIMUM RATE (CFM/FT ²)	TEST PROCEDURE
Windows	0.20 ^a	AAMA/WDMA/ CSA101/I.S.2/A440 or NFRC 400
Sliding doors	0.20 ^a	
Swinging doors	0.20 ^a	
Skylights - with condensation weepage openings	0.30	
Skylights - all other	0.20 ^a	
Curtain walls	0.06	NFRC 400 or ASTM E 283 at 1.57 psf (75 Pa)
Storefront glazing	0.06	
Commercial glazed swinging entrance doors	0.06	
Revolving doors	1.00	
Garage doors	0.40	ANSI/DASMA 105, NFRC 400, or ASTM E 283 at 1.57 psf (75 Pa)
Rolling doors	4.00	

For SI: 1 cubic foot per minute = 0.47 L/s, 1 square foot = 0.093 m²

- a. The maximum rate for windows, sliding and swinging doors, and skylights is permitted to be 0.3 cfm per square foot of fenestration or door area when tested in accordance with AAMA/WDMA/CSA101/I.S.2/A440 at 6.24 psf (300 Pa).

Reason: Rolling doors do not meet air leakage requirements, because their interlocking slat design is not intended for air leakage control. Such doors are typically used in semi-heated spaces, because they are associated with applications such as parking, storage and warehousing. The Exception is proposed to match similar language currently in ASHRAE 90.1. The proposed Table heading revision is editorial, for consistency with the language in C402.4.3.

Cost Impact: The code change proposal will not increase the cost of construction.

CE182 – 13

Table C402.4.3

Proponent: Joseph R. Hetzel, P.E., Thomas Associates, Inc., representing the Door & Access Systems Manufacturers Association (DASMA) International (jhetzel@thomasamc.com)

Revise as follows:

**TABLE C402.4.3
MAXIMUM AIR INFILTRATION RATE
FOR FENESTRATION ASSEMBLIES**

FENESTRATION ASSEMBLY	MAXIMUM RATE (CFM/FT ²)	TEST PROCEDURE
Windows	0.20 ^a	AAMA/WDMA/ CSA101/I.S.2/A440 or NFRC 400
Sliding doors	0.20 ^a	
Swinging doors	0.20 ^a	
Skylights - with condensation weepage openings	0.30	
Skylights - all other	0.20 ^a	
Curtain walls	0.06	NFRC 400 or ASTM E 283 at 1.57 psf (75 Pa)
Storefront glazing	0.06	
Commercial glazed swinging entrance doors	0.06	
Revolving doors	1.00	
Garage doors	0.40	ANSI/DASMA 105, NFRC 400, or ASTM E 283 at 1.57 psf (75 Pa)
Rolling doors	1.00	
High speed doors ^b	1.30	

For SI: 1 cubic foot per minute = 0.47 L/s, 1 square foot = 0.093 m²

- The maximum rate for windows, sliding and swinging doors, and skylights is permitted to be 0.3 cfm per square foot of fenestration or door area when tested in accordance with AAMA/WDMA/CSA101/I.S.2/A440 at 6.24 psf (300 Pa).
- A non-swinging door intended for vehicular access and material transportation, with a minimum opening rate of 32 inches per second

Reason: "High speed doors" are typically automatically controlled, non-swinging doors, and are commonly used in conjunction with vehicular traffic or transportation of materials and are not generally intended for pedestrian traffic. Sizes typically range from 8x8 to 12x12. When high speed doors are used in a building exterior envelope, the primary purposes are for environmental control and/or building security.

High speed door panels or curtains are usually made of a thin layer of vinyl, fabric, rubber or composite material. Materials can be opaque, translucent or a combination thereof.

The assemblies are constructed of flexible materials at the perimeter to provide sealing against air leakage but yet to allow variations in contact between door panels/curtains and jamb construction to maximize the effectiveness of continual high speed operation. Thus, high speed doors cannot comply with prescriptive air leakage requirements for any current fenestration assembly type in Table C402.4.3. The high speed nature of these doors provides for minimizing of "air exchange", a valuable and predominant characteristic of minimizing overall energy losses through a door opening.

An air leakage value of 1.30 cfm/sf is recommended for a high speed door based on a tested value of 1.26 obtained via a March 2012 DASMA-sponsored test on a representative 8'x8' high speed door product.

Cost Impact: This code change proposal will not increase the cost of construction.

CE182-13

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

C402.4.3T-EC-HETZEL.doc

CE183 – 13

C402.4.4

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C402.4.4 Doors and access openings to shafts, chutes, stairways, and elevator lobbies. Doors and access openings from conditioned space to shafts, chutes, stairways and elevator lobbies not within the scope of the fenestration assemblies covered in Section C402.4.3 shall ~~either meet the requirements of Section C402.4.3 or~~ be gasketed, weatherstripped or sealed.

Exception: Door openings required to comply with Section 715 ~~or 715.4~~ of the *International Building Code*; or doors and door openings required to comply with UL 1784 by the International Building Code ~~to comply with UL 1784 shall not be required to comply with Section C402.4.4.~~

Reason: This proposal clarifies the components covered in the section on doors and access openings to shafts, chutes, stairways, and elevator lobbies are subject to air leakage provisions as components of the building thermal envelope, and provides a distinction between these doors and other doors that are already covered within the scope of fenestration assemblies. The objective of this proposal is to clarify the code to foster implementation and compliance verification.

Some doors are covered by Section C402.4.3 and the intent of the code should be that doors within the scope of fenestration that can be tested and listed *should* be tested and listed in accordance with and meet the provisions of Section C402.4.3. This leaves those doors that cannot be so tested and listed subject to the caulking and sealing criterion. This clarification is needed because the current code allows some doors that could (and should) be assessed as meeting the provisions of Section C402.4.3 through testing and listing only required to be “caulked or sealed.” The exception is revised to provide clarification and to eliminate the ending statement—an exception by definition means something is not required to comply.

Cost Impact: The code change proposal does not increase the cost of construction.

CE183-13

C402.4.4-EC-WILLIAMS.doc

CE184 – 13

C402.4.4, C402.4.5, C402.4.5.1, C402.4.5.2, C403.2.4.4 (NEW)

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

~~C402.4.4 Doors and access openings to shafts, chutes, stairways, and elevator lobbies.~~ Doors and access openings from conditioned space to shafts, chutes stairways and elevator lobbies shall either meet the requirements of Section C402.4.3 or shall be gasketed, weatherstripped or sealed.

~~Exception:~~ Door openings required to comply with Section 715 or 715.4 of the *International Building Code*; or doors and door openings required by the *International Building Code* to comply with UL 1784 shall not be required to comply with Section C402.4.4.

C402.4.5 Air intakes, exhaust openings, stairways and shafts. Stairway enclosures and elevator shaft vents and other outdoor air intakes and exhaust openings integral to the building envelope shall be provided with dampers in accordance with Sections C402.4.5.1 and C402.4.5.2 C403.2.4.4.

~~C402.4.5.1 Stairway and shaft vents.~~ Stairway and shaft vents shall be provided with Class I motorized dampers with a maximum leakage rate of 4 cfm/ft² (20.3 L/s • m²) at 1.0 inch water gauge (w.g.) (249 Pa) when tested in accordance with AMCA 500D.

~~Stairway and shaft vent dampers shall be installed with controls so that they are capable of automatically opening upon:~~

- ~~1. The activation of any fire alarm initiating device of the building's fire alarm system; or~~
- ~~2. The interruption of power to the damper.~~

C402.4.5.2 Outdoor air intakes and exhausts. Outdoor air supply and exhaust openings shall be provided with Class IA motorized dampers with a maximum leakage rate of 4 cfm/ft² (20.3 L/s • m²) at 1.0 inch water gauge (w.g.) (249 Pa) when tested in accordance with AMCA 500D.

Exceptions:

- ~~1. Gravity (nonmotorized) dampers having a maximum leakage rate of 20 cfm/ft² (101.6 L/s • m²) at 1.0 inch water gauge (w.g.) (249 Pa) when tested in accordance with AMCA 500D are permitted to be used as follows:~~
 - ~~1.1 In buildings for exhaust and relief dampers.~~
 - ~~1.2 In buildings less than three stories in height above grade.~~
 - ~~1.3 For ventilation air intakes and exhaust and relief dampers in buildings of any height located in Climate Zones 1, 2 and 3.~~
 - ~~1.4 Where the design outdoor air intake or exhaust capacity does not exceed 300 cfm (141 L/s).~~~~Gravity (nonmotorized) dampers for ventilation air intakes shall be protected from direct exposure to wind.~~
- ~~2. Dampers smaller than 24 inches (610 mm) in either dimension shall be permitted to have a leakage of 40 cfm/ft² (203.2 L/s • m²) at 1.0 inch water gauge (w.g.) (249 Pa) when tested in accordance with AMCA 500D.~~

C403.2.4.4 Shutoff dampers. Outdoor air intake and exhaust openings and stairway and shaft vents shall be provided with Class 1 motorized dampers having a maximum air leakage rate of 4 cfm/ft² of damper surface area at 1.0 inch water gauge when tested in accordance with AMCA 500D.

Outdoor air intake and exhaust dampers shall be installed with automatic controls configured to close when the systems or spaces served are not in use or during unoccupied period warm-up and setback operation unless the systems served require outdoor or exhaust air in accordance with the *International Mechanical Code* or the dampers are opened to provide intentional economizer cooling.

Stairway and shaft vent dampers shall be installed with automatic controls configured to open upon the activation of any fire alarm initiating device of the building's fire alarm system or the interruption of power to the damper.

Exceptions: Gravity (non-motorized) dampers shall be permitted to be used as follows:

1. In buildings less than three stories in height above grade plane.
2. In buildings of any height in climate zones 1, 2 or 3.
3. Where the design exhaust capacity is not greater than 300 cfm.

All gravity (non-motorized) dampers shall have a maximum air leakage rate of 20 cfm/ft² where not less than 24 inches in either dimension and 40 cfm/ft² where less than 24 inches in either dimension. The rate of air leakage shall be determined at 1.0 inch water gauge when tested in accordance with AMCA 500D.

Reason: This proposal consolidates all provisions associated with leakage rates, sealing, dampers, etc. of mechanical system openings, vents, grills, etc. for air intakes, exhaust openings, stairways and shafts in one place in the code. The objective of this proposal is to clarify the code to foster implementation and compliance verification.

Currently shutoff dampers are covered in two places (envelope and mechanical) and based on experiences with energy code trainings is causing confusion. There is also a conflict in the current code where exhaust and relief dampers are allowed to be gravity dampers no matter the building height in Section C402.4.5.2 and per Section C403.2.4.4 only up to three stories in height in the mechanical section in Climate Zones 4-8. Because all exhaust and relief dampers are associated with mechanical systems, the more stringent requirement in the mechanical section is retained. Locating all the provisions in one place will eliminate this confusion and current and potential future conflicts. It is important to note that the code change does not change the technical content of the current code (other than addressing the above mentioned conflict) and simply places all the requirements in one better organized location in the code, noting Section 402.4.5 is retained in the envelope section of the code and refers the user to Section 403.2.4.4 where all damper provisions would be located.

A summary of the current code provisions in C402.4.5 and C403.2.4.4 finds the following:

- Stairway enclosures and elevator shaft vents need to have motorized dampers with 4.0 or less leakage and have controls allowing the dampers to automatically open with a fire alarm or power interruption.
- Outdoor air and exhaust openings integral to the building envelope need to have the same motorized damper leakage rate but in some cases these openings can be provided with gravity (non-motorized) dampers meeting certain leakage limits.
- Outdoor air supply and exhaust ducts need to have motorized dampers but no leakage limit is provided and gravity dampers are allowed in some cases.

The proposed code change contains all those provisions so the outcome from following the current code and the code change proposal above is the same, except where the current code provisions conflict, in which case the more specific or stringent has been applied in the code change proposal.

Cost Impact: The code change proposal does not increase the cost of construction.

C402.4.5-EC-WILLIAMS.doc

CE185 – 13

C402.4.5, C402.4.5.1, C402.4.5.2, C403.2.4.4, C403.3.1.1.5 (New)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C402.4.5 Air intakes, exhaust openings, stairways and shafts. Stairway enclosures and elevator shaft vents and other outdoor air intakes and exhaust openings integral to the building envelope shall be provided with dampers in accordance with Section C403.2.4.4, ~~s C402.4.5.1 and C402.4.5.2.~~

C403.2.4.4 Shutoff dampers, controls. ~~Both outdoor air supply and exhaust ducts shall be equipped with motorized dampers that will automatically shut when the systems or spaces served are not in use.~~

Exceptions:

- ~~1. Gravity dampers shall be permitted in buildings less than three stories in height.~~
- ~~2. Gravity dampers shall be permitted for buildings of any height located in Climate Zones 1, 2 and 3.~~
- ~~3. Gravity dampers shall be permitted for outside air intake or exhaust airflows of 300 cfm (0.14 m³/s) or less.~~

Stairway and shaft vent shutoff dampers shall comply with Section C403.2.4.4.1 and outdoor air intakes and exhausts shall comply with Section C403.2.4.4.2.

~~C402.4.5.1~~ C403.2.4.4.1 Stairway and shaft vent shutoff dampers. Stairway and shaft vents shall be provided with Class I motorized dampers with a maximum leakage rate of 4 cfm/ft² (20.3 L/s · m²) at 1.0 inch water gauge (w.g.) (249 Pa) when tested in accordance with AMCA 500D. Stairway and shaft vent dampers shall be installed with controls so that they are capable of automatically opening upon:

1. The activation of any fire alarm initiating device of the building's fire alarm system; or
2. The interruption of power to the damper.

~~C402.4.5.2~~ C403.2.4.4.2 Outdoor air intakes and exhausts. Outdoor air supply and exhaust openings in the building envelope, ducts, or equipment shall be provided with Class 1 ~~IA~~ motorized dampers with a maximum leakage rate of 4 cfm/ft² (20.3 L/s · m²) at 1.0 inch water gauge (w.g.) (249 Pa) when tested in accordance with AMCA 500D. Outdoor air supply and exhaust motorized dampers shall be configured to automatically shut when the systems or spaces served are not in use.

Exceptions:

1. Gravity (nonmotorized) dampers having a maximum leakage rate of 20 cfm/ft² (101.6 L/s · m²) at 1.0 inch water gauge (w.g.) (249 Pa) when tested in accordance with AMCA 500D are permitted to be used as follows:
 - 1.1. In buildings less than three stories in height above grade plane for exhaust and relief dampers.
 - 1.2. ~~In buildings less than three stories in height above grade.~~
 - 1.3. ~~For ventilation air intakes and exhaust and relief dampers in buildings of any height located in Climate Zones 1, 2 and 3.~~
 - 1.4. 1.3. Where the design outdoor air intake or exhaust capacity does not exceed 300 cfm (141 L/s).

Gravity (nonmotorized) dampers for ventilation air intakes shall be protected from direct exposure to wind.

2. Gravity (nonmotorized) dampers smaller than 24 inches (610 mm) in either dimension shall be permitted to have a leakage of 40 cfm/ft² (203.2 L/s • m²) at 1.0 inch water gauge (w.g.) (249 Pa) when tested in accordance with AMCA 500D.
3. Dampers are not required for:
 - 3.1. Ventilation or exhaust systems serving unconditioned spaces.
 - 3.2. Exhaust systems serving Type 1 kitchen exhaust hoods.

C403.3.1.1.5 Dampers. Exhaust/relief, and *outdoor air* dampers shall comply with Section C403.2.4.4.1 outdoor air intakes and exhausts.

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, has been revised. The change ensures continued consistency between the IECC and standard 90.1-2010. Currently the damper class associated with 4.0 cfm/ft² leakage is Class 1 (not Class 1A – which is a 3.0 leakage rate) such that all dampers have the same classification and leakage rate provision. Damper provisions have been consolidated into the mechanical section to avoid inconsistency or confusion and are referenced from the envelope section.

Cost Impact: The code change proposal will not increase the cost of construction.

C402.4.5-EC-FERGUSON.doc

CE186 – 13

C402.4.5.1

Proponent: Amanda Hickman, Intercode Incorporated, representing AMCA International
(Amanda@intercodeinc.com)

Revise as follows:

C402.4.5.1 Stairway and shaft vents. Stairway and shaft vents shall be provided with Class I motorized dampers. Dampers shall have with a maximum leakage rate of 4 cfm/ft² (20.3 L/s • m²) at 1.0 inch water gauge (w.g.) (249 Pa) and shall be labeled by an approved agency when tested in accordance with AMCA 500D for such purpose.

Stairway and shaft vent dampers shall be installed with controls so that they are capable of automatically opening upon:

1. The activation of any fire alarm initiating device of the building's fire alarm system; or
2. The interruption of power to the damper.

Reason: This change will make enforcement faster and easier. Applying sealed (low-leakage) dampers in the building envelope will save energy and will be more easily enforced because of the presence of a certification label.

The requirement for labeling dampers is already required in the International Building Code for fire and smoke dampers. However, there is no such labeling requirement for sealed low leakage dampers that indicates the certified air leakage rating verified by an approved third party agency. This is an important tool for designers and inspectors to ensure that the appropriate equipment is specified and installed.

There is no significant cost increase since the majority of damper manufacturers already have their products certified, and are already providing labels for other types of dampers. There may be some small increase in the cost of dampers for a manufacturer who are not already voluntarily participating in a certified ratings program.

Cost Impact: The code change proposal will increase the cost of construction. This proposal could minimally increase the cost of construction.

CE186-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.4.5-EC-HICKMAN.doc

CE187 – 13

C402.4.5.2

Proponent: Amanda Hickman, InterCode Incorporated, representing AMCA International

Revise as follows:

C402.4.5.2 Outdoor air intakes and exhausts. *Outdoor air* supply and exhaust openings shall be provided with Class IA ~~l~~ motorized dampers with a maximum leakage rate of 4 cfm/ft² (20.3 L/s • m²) at 1.0 inch water gauge (w.g.) (249 Pa) when tested in accordance with AMCA 500D.

Exceptions:

1. Gravity (nonmotorized) dampers having a maximum leakage rate of 20 cfm/ft² (101.6 L/s • m²) at 1.0 inch water gauge (w.g.) (249 Pa) when tested in accordance with AMCA 500D are permitted to be used as follows:
 - 1.1. In buildings for exhaust and relief dampers.
 - 1.2. In buildings less than three stories in height above grade.
 - 1.3. For ventilation air intakes and exhaust and relief dampers in buildings of any height located in Climate Zones 1, 2 and 3.
 - 1.4. Where the design *outdoor air* intake or exhaust capacity does not exceed 300 cfm (141 L/s).Gravity (nonmotorized) dampers for ventilation air intakes shall be protected from direct exposure to wind.
2. Dampers smaller than 24 inches (610 mm) in either dimension shall be permitted to have a leakage of 40 cfm/ft² (203.2 L/s • m²) at 1.0 inch water gauge (w.g.) (249 Pa) when tested in accordance with AMCA 500D.

Reason: This change is an editorial correction. The leakage specification of 4 cfm/ft² pertains to Class I, not Class IA, so the "A" needs to be dropped. Class 1A has a maximum leakage rate of 3 cfm/ft².

Cost Impact: This proposal will not increase the cost of construction.

CE187-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.4.5.2#1-EC-HICKMAN.doc

CE188 – 13

C402.4.5.2

Proponent: Amanda Hickman, InterCode Incorporated, representing AMCA International
(amanda@intercodeinc.com)

Revise as follows:

C402.4.5.2 Outdoor air intakes and exhausts. *Outdoor air* supply and exhaust openings shall be provided with Class IA motorized dampers. ~~The dampers shall have with a maximum leakage rate of 4 cfm/ft² (20.3 L/s · m²) at 1.0 inch water gauge (w.g.) (249 Pa) and shall be labeled by an approved agency~~ when tested in accordance with AMCA 500D for such purpose.

Reason: This change will make enforcement faster and easier. Applying sealed (low-leakage) dampers in the building envelope saves energy and is more easily enforced because of the presence of a certification label.

Cost Impact: The code change proposal could slightly increase the cost of construction.

CE188-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.4.5.2#2-EC-HICKMAN.doc

CE189 – 13

C402.4.5.2

Proponent: Amanda Hickman, InterCode Incorporation, representing AMCA International
(amanda@intercodeinc.com)

Revise as follows:

C402.4.5.2 Outdoor air intakes and exhausts. *Outdoor air* supply and exhaust openings shall be provided with Class IA motorized dampers with a maximum leakage rate of 4 cfm/ft² (20.3 L/s · m²) at 1.0 inch water gauge (w.g.) (249 Pa) when tested in accordance with AMCA 500D.

Exceptions:

1. Gravity (nonmotorized) dampers having a maximum leakage rate of 20 cfm/ft² (101.6 L/s · m²) at 1.0 inch water gauge (w.g.) (249 Pa) when tested in accordance with AMCA 500D are permitted to be used as follows:
 - 1.1. In buildings for exhaust and relief dampers.
 - 1.2. In buildings less than three stories in height above grade.
 - 1.3. For ventilation air intakes and exhaust and relief dampers in buildings of any height located in Climate Zones 1, 2 and 3.
 - 1.4. Where the design *outdoor air* intake or exhaust capacity does not exceed 300 cfm (141 L/s).
Gravity (nonmotorized) dampers for ventilation air intakes shall be protected from direct exposure to wind.
2. ~~Dampers smaller than 24 inches (610 mm) in either dimension shall be permitted to have a leakage of 40 cfm/ft² (203.2 L/s · m²) at 1.0 inch water gauge (w.g.) (249 Pa) when tested in accordance with AMCA 500D.~~

Reason: Exception #2 is unnecessary and probably confusing to some code users considering the charging statement. All damper manufacturers already make low-cost backdraft dampers that easily meet the leakage rate of 4 cfm/sq ft at 1 in. w.wg. as required in C402.4.5.2. This change will save energy while not increasing cost.

Cost Impact: The code change proposal will not increase the cost of construction.

CE189-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.4.5.2#3-EC-HICKMAN.doc

CE190 – 13

C402.4.7

Proponent: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development (WABO TCD) (lkranz@bellevuewa.gov)

Revise as follows:

C402.4.7 Vestibules. All building entrances shall be protected with an enclosed vestibule, with all doors opening into and out of the vestibule equipped with self-closing devices. Vestibules shall be designed so that in passing through the vestibule it is not necessary for the interior and exterior doors to open at the same time. The installation of one or more revolving doors in the building entrance shall not eliminate the requirement that a vestibule be provided on any doors adjacent to revolving doors.

The exterior envelope of conditioned vestibules shall comply with the requirements for a conditioned space. Either the interior or exterior of unconditioned vestibules shall comply with building envelope requirements. The building lobby shall not be considered a vestibule.

Exceptions:

1. Buildings in Climate Zones 1 and 2.
2. Doors not intended to be used by the public, such as doors to mechanical or electrical equipment rooms, or intended solely for employee use.
3. Doors opening directly from a *sleeping unit* or dwelling unit.
4. Doors that open directly from an atmospherically-separated space less than 3,000 square feet (298 m²) in area that is not used as the entrance to areas of the building larger than 3000 square feet.
5. Revolving doors.
6. Doors used primarily to facilitate vehicular movement or material handling and adjacent personnel doors.
7. Building entrances in buildings that are less than four stories above grade and less than 10,000 square feet in area.

Reason: This change clarifies the requirements for continuity of the building thermal envelope at vestibules (and that only the inner wall or the outer wall of the vestibule must comply). Exception 4 adds a phrase that is necessary to clarify that the exception does not apply to lobbies and similar building entrances. Exception 7 adds a new exception for very small buildings, because the vestibule could impose a disproportionate burden for them.

Cost Impact: The code change proposal will not increase the cost of construction.

CE190-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.4.7-EC-KRANZ.doc

CE191 – 13

C402.4.7

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C402.4.7 Vestibules. All building entrances shall be protected with an enclosed vestibule, with all doors opening into and out of the vestibule equipped with self-closing devices. Vestibules shall be designed so that in passing through the vestibule it is not necessary for the interior and exterior doors to open at the same time. The installation of one or more revolving doors in the building entrance shall not eliminate the requirement that a vestibule be provided on any doors adjacent to revolving doors.

Exceptions:

1. Buildings in Climate Zones 1 and 2.
2. Doors not intended to be used regularly to gain access to the building by the public, such as doors to mechanical or electrical equipment rooms, or doors intended solely for emergency egress employee use.
3. Doors opening directly from a *sleeping unit* or dwelling unit.
4. Doors ~~that open directly from a space in buildings less than 3,000~~ 1,000 square feet (~~298~~ 100 m²) in area.
5. Revolving doors.
6. Doors used primarily to facilitate vehicular movement or material handling and adjacent personnel doors.

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, does not match the exceptions that are shown in the IECC. The current vestibule requirements are similar, but additional work has been done by SSPC 90.1. This change ensures continued consistency between the IECC and standard 90.1-2010.

Cost Impact: The code change proposal will increase the cost of construction for buildings that now need vestibules that previously did not need them.

CE191-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.4.7-EC-FERGUSON.doc

CE192 – 13

C202 (NEW), C402.4.7, Chapter 5

Proponent: Amanda Hickman, InterCode Incorporated, representing AMCA International (amanda@intercodeinc.com)

Revise as follows:

C402.4.7 Vestibules. All building entrances shall be protected with an enclosed vestibule, with all doors opening into and out of the vestibule equipped with self-closing devices. Vestibules shall be designed so that in passing through the vestibule it is not necessary for the interior and exterior doors to open at the same time. The installation of one or more revolving doors in the building entrance shall not eliminate the requirement that a vestibule be provided on any doors adjacent to revolving doors.

Exceptions: Vestibules are not required for the following:

1. Buildings in Climate Zones 1 and 2.
2. Doors not intended to be used by the public, such as doors to mechanical or electrical equipment rooms, or intended solely for employee use.
3. Doors opening directly from a *sleeping unit* or dwelling unit.
4. Doors that open directly from a space less than 3,000 square feet (298 m2) in area.
5. Revolving doors.
6. Doors that have an installed air curtain that has been tested in accordance with ANSI/AMCA 220. Air curtains shall be controlled with the opening and closing of the door.

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

AIR CURTAIN. A device that generates and discharges a laminar air stream installed at the building entrance intended to prevent the infiltration of external, unconditioned air into the conditioned spaces, or the loss of interior, conditioned air to the outside.

Add new standard to Chapter 5 as follows:

AMCA

220-05 Laboratory Methods of Testing Air Curtain Units for Aerodynamic Performance Rating.

Reason: This code change will allow an air curtain to be used as a low cost, low maintenance alternative to a vestibule, thereby saving valuable floor space and creating an invisible, energy saving barrier when the door is open. An air curtain's base function requires nothing more than ambient air. Air curtains can save from 1-10% of the building energy use, depending on climate zone, building size, wind exposure and traffic volume. On average, an air curtain saves 60 - 80% of the energy lost through an open unprotected doorway, while consuming as little as 7.5% of that energy to operate. They require minimal annual maintenance (such as cleaning or vacuuming) and have a life expectancy of 15 to 25 years.

Air curtains installed on the interior of a building provides a coherent sheet of air created by an air stream and the surrounding entrained air. This sheet of air is able to bend and resist thermal exchange over an opening by way of support from the building's interior pressure and the stability created as the air stream meets a return grill or splits when it meets a surface, such as a floor, or another air stream.

An additional benefit of using an air curtain is a cleaner environment. They prevent the infiltration of dirt, fumes and debris and repel flying insects. They are approved for use in the food service industry as a means of insect control for customer entry doors, kitchen service, and delivery doors. They also have less of a propensity to be unintentional defeated like a vestibule, by common situations such as high traffic or being held open for egress.

Numerous studies have been published that evaluate the effectiveness of air curtains. When compared to that of a vestibule, air curtains consistently outperform vestibules in energy savings. Recent studies take advantage of current technology to evaluate the air curtains efficiencies and effectiveness.

Cost Impact: The code change proposal will not increase the cost of construction. It will decrease the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, AMCA 220-05 Laboratory Methods of Testing Air Curtain Units for Aerodynamic Performance Rating, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

Note: The term 'air curtain' is currently defined in the IgCC. The definition is the same as proposed here.

CE192-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.4.7-EC-HICKMAN.doc

CE193 – 13

C402.4.8

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C402.4.8 Recessed lighting. Recessed luminaires installed in the building thermal envelope shall be:
~~sealed to limit air leakage between conditioned and unconditioned spaces. All recessed luminaires shall be~~

1. IC-rated, and
2. ~~L~~labeled as having an air leakage rate of not more than 2.0 cfm when tested in accordance with ASTM D E 283 at a 1.57 psf pressure differential, ~~and. All recessed luminaires shall be s~~
3. Sealed with gasket or caulk between the housing and interior wall or ceiling covering.

Reason: The location in the building thermal envelope defines by default the reason for the requirement (i.e. to limit air leakage). This proposal clarifies the language for sealing recessed lighting that is located in the building thermal envelope. The current language could be interpreted to require gasketing or caulking recessed fixtures even when not installed in the thermal envelope, even though there is no reason for this requirement. The objective of this proposal is to clarify the code to foster implementation and compliance verification.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

C402.4.8-EC-WILLIAMS.doc

CE194 – 13

C402 (NEW), C402.1, C402.5 (NEW), C403.1, C403.5 (NEW), C403.6, C405.1, C405.10 (NEW)

Proponent: Tim Nogler, Washington Building Code Council (tim.nogler@des.wa.gov)

Revise as follows:

C402.1 General (Prescriptive). The building thermal envelope shall comply with Section C402.1.1. Section C402.1.2 shall be permitted as an alternative to the *R*-values specified in Section C402.1.1. Walk-in coolers, walk-in freezers, refrigerated warehouse coolers and refrigerated warehouse freezers shall comply with Section C402.5.

C402.5 Walk-in coolers, walk-in freezers, refrigerated warehouse coolers and refrigerated warehouse freezers. Walk-in coolers, walk-in freezers, refrigerated warehouse coolers and refrigerated warehouse freezers shall comply with all of the following:

1. Be equipped with automatic door closers that firmly close walk-in doors that have been closed to within 1 inch of full closure.

Exception: Automatic closers are not required for doors wider than 3 feet 9 inches or taller than 7 feet.

2. Doorways shall have strip doors, curtains, spring-hinged doors, or other method of minimizing infiltration when doors are open.
3. Walk-in coolers and refrigerated warehouse coolers shall contain wall, ceiling, and door insulation of not less than R-25 and walk-in freezers and refrigerated warehouse freezers shall contain wall, ceiling, and door insulation of not less than R-32.

Exception: Glazed portions of doors or structural members need not be insulated.

4. Walk-in freezers shall contain floor insulation of not less than R-28.
5. Transparent reach-in doors for walk-in freezers and windows in walk-in freezer doors shall be of triple-pane glass, either filled with inert gas or with heat-reflective treated glass.
6. Windows and transparent reach-in doors for walk-in coolers doors shall be of double-pane or triple-pane, inert gas-filled, heat-reflective treated glass.

C403.1 General. Mechanical systems and equipment serving the building heating, cooling, or ventilating needs shall comply with Section C403.2 (referred to as the mandatory provisions) and either:

1. Section C403.3 (Simple systems); or
2. Section C403.4 (Complex systems).

Walk-in coolers, walk-in freezers, refrigerated warehouse coolers and refrigerated warehouse freezers shall comply with Section C403.5.

C403.5 Walk-in coolers, walk-in freezers, refrigerated warehouse coolers and refrigerated warehouse freezers. Walk-in coolers, walk-in freezers, refrigerated warehouse coolers and refrigerated warehouse freezers shall comply with all of the following:

1. Evaporator fan motors that are less than 1 horsepower and less than 460 volts shall use electronically commutated motors, brushless direct current motors, or 3-phase motors.

2. Condenser fan motors that are less than 1 horsepower shall use electronically commutated motors, permanent split capacitor-type motors or 3-phase motors.
3. Where anti-sweat heaters without anti-sweat heater controls are provided, they shall have a total door rail, glass, and frame heater power draw of not more than 7.1 Watts per square foot of door opening for walk-in freezers, and 3.0 Watts per square foot of door opening for walk-in coolers.
4. Where anti-sweat heater controls are provided, they shall reduce the energy use of the anti-sweat heater as a function of the relative humidity in the air outside the door or to the condensation on the inner glass pane.

C405.1 General (Mandatory). This section covers lighting system controls, the connection of ballasts, the maximum lighting power for interior applications, electrical energy consumption, and minimum acceptable lighting equipment for exterior applications.

Exception: Dwelling units within commercial buildings shall not be required to comply with Sections C405.2 through C405.5 provided that not less than 75 percent of the permanently installed light fixtures, other than low voltage lighting, shall be fitted for, and contain only, high efficacy lamps. Walk-in coolers, walk-in freezers, refrigerated warehouse coolers and refrigerated warehouse freezers shall comply with Section C405.10.

C405.10 Walk-in coolers, walk-in freezers, refrigerated warehouse coolers and refrigerated warehouse freezers. Lights in walk-in coolers, walk-in freezers, refrigerated warehouse coolers and refrigerated warehouse freezers shall either use light sources with an efficacy of not less than 40 lumens per Watt, including ballast losses, or shall use light sources with an efficacy of not less than 40 lumens per Watt, including ballast losses, in conjunction with a device that turns off the lights within 15 minutes when the space is not occupied.

Add new definitions as follows:

SECTION C202 GENERAL DEFINITIONS

REFRIGERATED WAREHOUSE COOLER. An enclosed storage space capable of being refrigerated to temperatures above 32°F that can be walked into and has a total chilled storage area of not less than 3,000 square feet.

REFRIGERATED WAREHOUSE FREEZER: An enclosed storage space capable of being refrigerated to temperatures at or below 32°F that can be walked into and has a total chilled storage area of not less than 3,000 square feet.

WALK-IN COOLER. An enclosed storage space capable of being refrigerated to temperatures above 32°F that can be walked into and has a total chilled storage area of less than 3,000 square feet.

WALK-IN FREEZER: An enclosed storage space capable of being refrigerated to temperatures at or below 32°F that can be walked into and has a total chilled storage area of less than 3,000 square feet.

Reason: Refrigeration is one of the largest unregulated electrical loads in buildings. This proposal provides basic minimum performance levels for walk-in coolers and freezers, and for refrigerated warehouse coolers and refrigerated warehouse freezers. The national model code should set a minimum performance for these significant energy using systems. This proposal is based on industry standard practice.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C402.1-EC-NOGLER.doc

CE195 – 13

C403.1, C403.2, C403.2.3, Table C403.2.3(7), Table C403.2.3(8), Table C403.2.3(9), C403.2.3.1, C403.2.3.2, C403.2.4, C403.2.5.1, C403.2.10, C403.2.10.1, C403.2.10.2, Table C403.2.10.1(1), Table C403.2.10.1(2), C403.3, C403.3.2, C403.4 thru C403.4.6, C403.4.1.3, C403.4.7, C406.2, Table C406.2(6), Table C406.2(7), Chapter 5

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C403.1 General. Mechanical systems and equipment serving all or a portion of the building heating, cooling or ventilating needs that are unitary or packaged in nature and serving a single zone and controlled by a single thermostat in the zone served, or are two-pipe heating only systems serving one or more zones, shall comply with Sections 403.2 (referred to as the mandatory provisions) and either:

- 1- ~~Section C403.3 (Simple systems prescriptive provisions); or~~
- 2- ~~Section C403.4 (Complex systems)~~ All other mechanical systems or equipment shall meet the provisions of Section 6 of ANSI/ASHRAE/IES Standard 90.1.

C403.2 Mechanical systems and equipment ~~Provisions applicable to all mechanical systems (Mandatory).~~ Mechanical systems and equipment serving the building heating, cooling or ventilating needs shall comply with Sections C403.2.1 through C403.2.11.

C403.2.3 HVAC equipment performance requirements. Equipment shall meet the minimum efficiency requirements of Tables C403.2.3(1), C403.2.3(2), C403.2.3(3), C403.2.3(4), C403.2.3(5), and C403.2.3(6), C403.2.3(7) and C403.2.3(8) when tested and rated in accordance with the applicable test procedure. ~~Plate-type liquid-to-liquid heat exchangers shall meet the minimum requirements of Table C403.2.3(9).~~ The efficiency shall be verified through certification under an *approved* certification program or, if no certification program exists, the equipment efficiency ratings shall be supported by data furnished by the manufacturer. Where multiple rating conditions or performance requirements are provided, the equipment shall satisfy all stated requirements. Where components, such as indoor or outdoor coils from different manufacturers are used, calculations and supporting data shall be furnished by the designer that demonstrates that the combined efficiency of the specified components meets the requirements herein.

~~TABLE C403.2.3(7)~~
~~MINIMUM EFFICIENCY REQUIREMENTS:~~
~~WATER CHILLING PACKAGES^a~~

~~TABLE C403.2.3(8)~~
~~MINIMUM EFFICIENCY REQUIREMENTS:~~
~~HEAT REJECTION EQUIPMENT~~

~~TABLE C403.2.3(9)~~
~~HEAT TRANSFER EQUIPMENT~~

C403.2.3.1 Water-cooled centrifugal chilling packages. Equipment not designed for operation at AHRI Standard 550/590 test conditions of 44°F (7°C) leaving chilled water temperature and 85°F (29°C) entering condenser water temperature with 3 gpm/ton (0.054 l/s - kW) condenser water flow shall have maximum full-load kW/ton and *NPLV* ratings adjusted using Equations 4-3 and 4-4.

~~Adjusted minimum full-load COP ratings =~~
~~—(Full-load COP from Table 6.8.1C of AHRI~~

$$\frac{\text{Standard 550/590}}{\text{Adjusted minimum NPLV rating}} \times K_{adj} \quad \text{(Equation 4-3)}$$

$$\frac{\text{Adjusted minimum NPLV rating}}{\text{(IPLV from Table 6.8.1C of AHRI Standard 550/590)} \times K_{adj}} \quad \text{(Equation 4-4)}$$

where:

$$K_{adj} = A \times B$$

$$A = 0.0000015318 \times (\text{LIFT})^4 - 0.000202076 \times (\text{LIFT})^3 + 0.0101800 \times (\text{LIFT})^2 - 0.264958 \times \text{LIFT} + 3.930196$$

$$B = 0.0027 \times L_{vg}^{\text{Evap}} (\text{°C}) + 0.982$$

$$\text{LIFT} = L_{vg}^{\text{Cond}} - L_{vg}^{\text{Evap}}$$

$$L_{vg}^{\text{Cond}} = \text{Full load condenser leaving water temperature (°C)}$$

$$L_{vg}^{\text{Evap}} = \text{Full load leaving evaporator temperature (°C)}$$

SI units shall be used in the K_{adj} equation.

The adjusted full-load and *NPLV* values shall only be applicable for centrifugal chillers meeting all of the following full-load design ranges:

1. The leaving evaporator fluid temperature is not less than 36°F (2.2°C).
2. The leaving condenser fluid temperature is not greater than 115°F (46.1°C).
3. LIFT is not less than 20°F (11.1 °C) and not greater than 80°F (44.4°C).

Exception: Centrifugal chillers designed to operate outside of these ranges need not comply with this code.

C403.2.3.2 Positive displacement (air- and water-cooled) chilling packages. Equipment with a leaving fluid temperature higher than 32°F (0°C), shall meet the requirements of Table C403.2.3(7) when tested or certified with water at standard rating conditions, in accordance with the referenced test procedure.

C403.2.4 HVAC system controls. Each heating and cooling system shall be provided with thermostatic controls as specified in Section C403.2.4.1, C403.2.4.2, C403.2.4.3, and C403.2.4.4, C403.4.1, C403.4.2, C403.4.3 or C403.4.4.

C403.2.5.1 Demand controlled ventilation. Demand control ventilation (DCV) shall be provided for spaces larger than 500 square feet (50 m²) and with an average occupant load of 25 people per 1000 square feet (93 m²) of floor area (as established in Table 403.3 of the *International Mechanical Code*) and served by systems with one or more of the following:

1. An air-side economizer;
2. Automatic modulating control of the outdoor air damper; or
3. A design outdoor airflow greater than 3,000 cfm (1400 L/s).

Exception: Demand control ventilation is not required for systems and spaces as follows:

1. Systems with energy recovery complying with Section C403.2.6.
2. Multiple-zone systems without direct digital control of individual zones communicating with a central control panel.
3. System with a design outdoor airflow less than 1,200 cfm (600 L/s).

4. Spaces where the supply airflow rate minus any makeup or outgoing transfer air requirement is less than 1,200 cfm (600 L/s).
5. Ventilation provided for process loads only.

C403.2.10 Air system design and control. Each HVAC system having a total fan system motor nameplate horsepower (hp) exceeding 5 horsepower (hp) (3.7 kW) shall meet the provisions of Sections C403.2.10.1 through C403.2.10.2 at fan system design conditions shall not exceed the allowable have a maximum fan system motor nameplate hp of 0.0011 X CFMs, where CFMs is the maximum design supply airflow rate to conditioned spaces served by the system in cubic feet per minute. (Option 1) or fan system bhp (Option 2) as shown in Table C403.2.10.1(1). This includes supply fans, and return/relief fans, and fan-powered terminal units associated with systems providing heating or cooling capability. ~~Single zone variable air volume systems shall comply with the constant volume fan power limitation.~~

Exception:

1. Hospital, vivarium and laboratory systems that utilize flow control devices on exhaust and/or return to maintain space pressure relationships necessary for occupant health and safety or environmental control shall be permitted to use variable volume fan power limitation.
2. Individual exhaust fans with motor nameplate horsepower of 1 hp or less.

C403.2.10.1 Allowable fan floor horsepower. ~~Each HVAC system at fan system design conditions shall not exceed the allowable fan system motor nameplate hp (Option 1) or fan system bhp (Option 2) as shown in Table C403.2.10.1(1). This includes supply fans, return/relief fans, and fan-powered terminal units associated with systems providing heating or cooling capability. Single zone variable air volume systems shall comply with the constant volume fan power limitation.~~

~~—Exception:~~ The following fan systems are exempt from allowable fan floor horsepower requirement:

1. Hospital, vivarium and laboratory systems that utilize flow control devices on exhaust and/or return to maintain space pressure relationships necessary for occupant health and safety or environmental control shall be permitted to use variable volume fan power limitation.
2. Individual exhaust fans with motor nameplate horsepower of 1 hp or less.

C403.2.10.2 Motor nameplate horsepower. For each fan, the selected fan motor shall be no larger than the first available motor size greater than the brake horsepower (bhp). The fan brake horsepower (bhp) shall be indicated on the design documents to allow for compliance verification by the ~~code official.~~

Exceptions:

1. For fans less than 6 bhp (4413 W), where the first available motor larger than the brake horsepower has a nameplate rating within 50 percent of the bhp, selection of the next larger nameplate motor size is allowed.
2. For fans 6 bhp (4413 W) and larger, where the first available motor larger than the bhp has a nameplate rating within 30 percent of the bhp, selection of the next larger nameplate motor size is allowed.

**TABLE C403.2.10.1(1)
FAN POWER LIMITATION**

**TABLE C403.2.10.1(2)
FAN POWER LIMITATION PRESSURE DROP ADJUSTMENT**

C403.3 Simple HVAC systems and equipment (Prescriptive). This section applies to buildings served by unitary or packaged HVAC equipment listed in Tables C403.2.3(1) through C403.2.3(8), each serving one zone and controlled by a single thermostat in the zone served. It also applies to two-pipe heating systems serving one or more zones, where no cooling system is installed.

C403.3 Mechanical systems and equipment (Prescriptive). Mechanical systems and equipment serving the building heating, cooling and ventilation needs shall comply with Sections C403.3.1 and C403.3.2.

C403.3.2 Hydronic systems controls. Hydronic heating systems comprised of multiple-packaged boilers and designed to deliver conditioned water or steam into a common distribution system shall include automatic controls capable of sequencing operation of the boilers and to automatically reduce flow through the boiler plant when another boiler is shut down. Hydronic heating systems comprised of a single boiler having an input design capacity over 500,000 Btu/h (146,550W) shall include either a multi-staging or modulating burner.

Hydronic systems of at least 300,000 Btu/h (87,930 W) design output capacity supplying heated and chilled water to comfort conditioning systems shall be designed for variable fluid flow with control valves designed to modulate or step down, and close, as a function of load and include controls that meet the requirements of Sections C403.4.3:

1. Automatically reset the supply water temperatures using zone-return water temperature, building-return water temperature, zone loads, or outside air temperature as an indicator of building heating demand. The temperature shall be capable of being reset by at least 25 percent of the design supply-to-return water temperature difference; and
2. Reduce system pump flow by at least 50 percent of design flow rate utilizing adjustable speed drive(s) on pump(s), or multiple-staged pumps where at least one-half of the total pump horsepower is capable of being automatically turned off.

C403.4.1.3 C403.3.1.1.5 Integrated economizer control. Economizer systems shall be integrated with the mechanical cooling system and be capable of providing partial cooling even where additional mechanical cooling is required to meet the remainder of the cooling load.

Exceptions:

1. Direct expansion systems that include controls that reduce the quantity of outdoor air required to prevent coil frosting at the lowest step of compressor unloading, provided this lowest step is no greater than 25 percent of the total system capacity.
2. Individual direct expansion units that have a rated cooling capacity less than 54,000 Btu/h (15 827 W) and use nonintegrated economizer controls that preclude simultaneous operation of the economizer and mechanical cooling.

C403.4 Complex HVAC systems and equipment. (Prescriptive). This section applies to buildings served by HVAC equipment and systems not covered in Section C403.3.

C403.4.1 Economizers. Economizers shall comply with Sections C403.4.1.1 through C403.4.1.4.

C403.4.1.1 Design capacity. Water economizer systems shall be capable of cooling supply air by indirect evaporation and providing up to 100 percent of the expected system cooling load at outdoor air temperatures of 50°F dry bulb (10°C dry bulb)/45°F wet bulb (7.2°C wet bulb) and below.

Exception: Systems in which a water economizer is used and where dehumidification requirements cannot be met using outdoor air temperatures of 50°F dry bulb (10°C dry bulb)/45°F wet bulb (7.2°C wet bulb) shall satisfy 100 percent of the expected system cooling load at 45°F dry bulb (7.2°C dry bulb)/40°F wet bulb (4.5°C wet bulb).

C403.4.1.2 Maximum pressure drop. Precooling coils and water-to-water heat exchangers used as part of a water economizer system shall either have a water-side pressure drop of less than 15 feet (4572 mm) of water or a secondary loop shall be created so that the coil or heat exchanger pressure drop is not seen by the circulating pumps when the system is in the normal cooling (noneconomizer) mode.

C403.4.1.3 Integrated economizer control. Economizer systems shall be integrated with the mechanical cooling system and be capable of providing partial cooling even where additional mechanical cooling is required to meet the remainder of the cooling load.

Exceptions:

1. Direct expansion systems that include controls that reduce the quantity of *outdoor air* required to prevent coil frosting at the lowest step of compressor unloading, provided this lowest step is no greater than 25 percent of the total system capacity.
2. Individual direct expansion units that have a rated cooling capacity less than 54,000 Btu/h (15,827 W) and use nonintegrated economizer controls that preclude simultaneous operation of the economizer and mechanical cooling.

C403.4.1.4 Economizer heating system impact. HVAC system design and economizer controls shall be such that economizer operation does not increase the building heating energy use during normal operation.

Exception: Economizers on VAV systems that cause zone level heating to increase due to a reduction in supply air temperature.

C403.4.2 Variable air volume (VAV) fan control. Individual VAV fans with motors of 7.5 horsepower (5.6 kW) or greater shall be:

1. Driven by a mechanical or electrical variable speed drive;
2. Driven by a vane axial fan with variable pitch blades; or
3. The fan shall have controls or devices that will result in fan motor demand of no more than 30 percent of their design wattage at 50 percent of design airflow when static pressure set point equals one-third of the total design static pressure, based on manufacturer's certified fan data.

C403.4.2.1 Static pressure sensor location. Static pressure sensors used to control VAV fans shall be placed in a position such that the controller setpoint is no greater than one-third the total design fan static pressure, except for systems with zone reset control complying with Section C403.4.2.2. For sensors installed down-stream of major duct splits, at least one sensor shall be located on each major branch to ensure that static pressure can be maintained in each branch.

C403.4.2.2 Set points for direct digital control. For systems with direct digital control of individual zone boxes reporting to the central control panel, the static pressure set point shall be reset based on the zone requiring the most pressure, i.e., the set point is reset lower until one zone damper is nearly wide open.

C403.4.3 Hydronic systems controls. The heating of fluids that have been previously mechanically cooled and the cooling of fluids that have been previously mechanically heated shall be limited in accordance with Sections C403.4.3.1 through C403.4.3.3. Hydronic heating systems comprised of multiple packaged boilers and designed to deliver conditioned water or steam into a common distribution system shall include automatic controls capable of sequencing operation of the boilers. Hydronic heating systems comprised of a single boiler and greater than 500,000 Btu/h (146,550 W) input design capacity shall include either a multistaged or modulating burner.

C403.4.3.1 Three-pipe system. Hydronic systems that use a common return system for both hot water and chilled water are prohibited.

C403.4.3.2 Two-pipe changeover system. Systems that use a common distribution system to supply both heated and chilled water shall be designed to allow a dead band between changeover from one mode to the other of at least 15°F (8.3°C) outside air temperatures; be designed to and provided with controls that will allow operation in one mode for at least 4 hours before changing over to the other mode; and be provided with controls that allow heating and cooling supply temperatures at the changeover point to be no more than 30°F (16.7°C) apart.

C403.4.3.3 Hydronic (water loop) heat pump systems. Hydronic heat pump systems shall comply with Sections C403.4.3.3.1 through C403.4.3.3.3.

C403.4.3.3.1 Temperature dead band. Hydronic heat pumps connected to a common heat pump water loop with central devices for heat rejection and heat addition shall have controls that are capable of providing a heat pump water supply temperature dead band of at least 20°F (11.1°C) between initiation of heat rejection and heat addition by the central devices.

Exception: Where a system loop temperature optimization controller is installed and can determine the most efficient operating temperature based on realtime conditions of demand and capacity, dead bands of less than 20°F (11°C) shall be permitted.

C403.4.3.3.2 Heat rejection. Heat rejection equipment shall comply with Sections C403.4.3.3.2.1 and C403.4.3.3.2.2.

Exception: Where it can be demonstrated that a heat pump system will be required to reject heat throughout the year.

C403.4.3.3.2.1 Climate Zones 3 and 4. For Climate Zones 3 and 4:

1. If a closed-circuit cooling tower is used directly in the heat pump loop, either an automatic valve shall be installed to bypass all but a minimal flow of water around the tower, or lower leakage positive closure dampers shall be provided.
2. If an open-circuit tower is used directly in the heat pump loop, an automatic valve shall be installed to bypass all heat pump water flow around the tower.
3. If an open- or closed-circuit cooling tower is used in conjunction with a separate heat exchanger to isolate the cooling tower from the heat pump loop, then heat loss shall be controlled by shutting down the circulation pump on the cooling tower loop.

C403.4.3.3.2.2 Climate Zones 5 through 8. For Climate Zones 5 through 8, if an open- or closed-circuit cooling tower is used, then a separate heat exchanger shall be provided to isolate the cooling tower from the heat pump loop, and heat loss shall be controlled by shutting down the circulation pump on the cooling tower loop and providing an automatic valve to stop the flow of fluid.

C403.4.3.3.3 Two position valve. Each hydronic heat pump on the hydronic system having a total pump system power exceeding 10 horsepower (hp) (7.5 kW) shall have a two-position valve.

C403.4.3.4 Part load controls. Hydronic systems greater than or equal to 300,000 Btu/h (87 930 W) in design output capacity supplying heated or chilled water to comfort conditioning systems shall include controls that have the capability to:

1. Automatically reset the supply water temperatures using zone return water temperature, building return water temperature, or outside air temperature as an indicator of building heating or cooling demand. The temperature shall be capable of being reset by at least 25 percent of the design supply to return water temperature difference; or
2. Reduce system pump flow by at least 50 percent of design flow rate utilizing adjustable speed drive(s) on pump(s), or multiple staged pumps where at least one-half of the total pump horsepower is capable of being automatically turned off or control valves designed to modulate or step down, and close, as a function of load, or other approved means.

C403.4.3.5 Pump isolation. Chilled water plants including more than one chiller shall have the capability to reduce flow automatically through the chiller plant when a chiller is shut down. Chillers piped in series for the purpose of increased temperature differential shall be considered as one chiller.

Boiler plants including more than one boiler shall have the capability to reduce flow automatically through the boiler plant when a boiler is shut down.

C403.4.4 Heat rejection equipment fan speed control. Each fan powered by a motor of 7.5 hp (5.6 kW) or larger shall have the capability to operate that fan at two-thirds of full speed or less, and shall have controls that automatically change the fan speed to control the leaving fluid temperature or condensing temperature/pressure of the heat rejection device.

Exception: Factory-installed heat rejection devices within HVAC equipment tested and rated in accordance with Tables C403.2.3(6) and C403.2.3(7).

C403.4.5 Requirements for complex mechanical systems serving multiple zones. Sections C403.4.5.1 through C403.4.5.4 shall apply to complex mechanical systems serving multiple zones. Supply air systems serving multiple zones shall be VAV systems which, during periods of occupancy, are designed and capable of being controlled to reduce primary air supply to each zone to one of the following before reheating, recooling or mixing takes place:

1. Thirty percent of the maximum supply air to each zone.
2. Three hundred cfm (142 L/s) or less where the maximum flow rate is less than 10 percent of the total fan system supply airflow rate.
3. The minimum ventilation requirements of Chapter 4 of the *International Mechanical Code*.

Exception: The following define where individual zones or where entire air distribution systems are exempted from the requirement for VAV control:

1. Zones where special pressurization relationships or cross-contamination requirements are such that VAV systems are impractical.
2. Zones or supply air systems where at least 75 percent of the energy for reheating or for providing warm air in mixing systems is provided from a site-recovered or site-solar energy source.
3. Zones where special humidity levels are required to satisfy process needs.
4. Zones with a peak supply air quantity of 300 cfm (142 L/s) or less and where the flow rate is less than 10 percent of the total fan system supply airflow rate.
5. Zones where the volume of air to be reheated, recoolled or mixed is no greater than the volume of outside air required to meet the minimum ventilation requirements of Chapter 4 of the *International Mechanical Code*.
6. Zones or supply air systems with thermostatic and humidistatic controls capable of operating in sequence the supply of heating and cooling energy to the zones and which are capable of preventing reheating, recooling, mixing or simultaneous supply of air that has been previously cooled, either mechanically or through the use of economizer systems, and air that has been previously mechanically heated.

C403.4.5.1 Single duct variable air volume (VAV) systems, terminal devices. Single duct VAV systems shall use terminal devices capable of reducing the supply of primary supply air before reheating or recooling takes place.

C403.4.5.2 Dual duct and mixing VAV systems, terminal devices. Systems that have one warm air duct and one cool air duct shall use terminal devices which are capable of reducing the flow from one duct to a minimum before mixing of air from the other duct takes place.

C403.4.5.3 Single fan dual duct and mixing VAV systems, economizers. Individual dual duct or mixing heating and cooling systems with a single fan and with total capacities greater than 90,000 Btu/h [(26 375 W) 7.5 tons] shall not be equipped with air economizers.

C403.4.5.4 Supply-air temperature reset controls. Multiple zone HVAC systems shall include controls that automatically reset the supply air temperature in response to representative building loads, or to outdoor air temperature. The controls shall be capable of resetting the supply air temperature at least 25 percent of the difference between the design supply air temperature and the design room air temperature.

Exceptions:

- ~~1. Systems that prevent reheating, recooling or mixing of heated and cooled supply air.~~
- ~~2. Seventy five percent of the energy for reheating is from site recovered or site solar energy sources.~~
- ~~3. Zones with peak supply air quantities of 300 cfm (142 L/s) or less.~~

C403.4.6 Heat recovery for service water heating. ~~Condenser heat recovery shall be installed for heating or reheating of service hot water provided the facility operates 24 hours a day, the total installed heat capacity of water-cooled systems exceeds 6,000,000 Btu/hr (1 758 600 W) of heat rejection, and the design service water heating load exceeds 1,000,000 Btu/h (293 100 W).~~

~~The required heat recovery system shall have the capacity to provide the smaller of:~~

- ~~1. Sixty percent of the peak heat rejection load at design conditions; or~~
- ~~2. The preheating required to raise the peak service hot water draw to 85°F (29°C).~~

Exceptions:

- ~~1. Facilities that employ condenser heat recovery for space heating or reheat purposes with a heat recovery design exceeding 30 percent of the peak water-cooled condenser load at design conditions.~~
- ~~2. Facilities that provide 60 percent of their service water heating from site solar or site recovered energy or from other sources.~~

C403.4.7 C403.3.2 Hot gas bypass limitation. Cooling systems shall not use hot gas bypass or other evaporator pressure control systems unless the system is designed with multiple steps of unloading or continuous capacity modulation. The capacity of the hot gas bypass shall be limited as indicated in Table C403.4.7

Exception: Unitary packaged systems with cooling capacities not greater than 90,000 Btu/h (26 379 W).

**TABLE C403.4.7 C403.3.2
MAXIMUM HOT GAS BYPASS CAPACITY**

RATED CAPACITY	MAXIMUM HOT GAS BYPASS CAPACITY (% of total capacity)
≤ 240,000 Btu/h	50
> 240,000 Btu/h	25

For SI: 1 British thermal unit per hour = 0.2931 W.

C406.2 Efficient HVAC performance. For systems required by Sections 403.1 to meet provisions of Sections C403.2 (mandatory provisions) and C403.3 (prescriptive provisions), equipment shall meet the minimum efficiency requirements of Tables C406.2.(1) through C406.2(7 5) in addition to the requirements in Section C403. This section shall only be used where the equipment efficiencies in Tables C406.2(1) through C406.2(7 5) are greater than the equipment efficiencies listed in Table C403.2.3(1) through 403.2.3(7 6) for the equipment type.

For systems required by Sections 403.1 to meet provisions of Section 6 of ANSI/ASHRAE/IES Standard 90.1 heating and cooling equipment shall have a rated efficiency 10% greater than required by Section 6 of ANSI/ASHRAE/IES Standard 90.1.

~~ATC 105 (00) — Acceptance Test Code for Water Cooling Tower~~
~~STD 201—09 — Standard for Certification of Water Cooling Towers Thermal Performances~~

Reason: The code change retains all the provisions of Section C403 of the 2012 IECC as applicable to simple HVAC systems and equipment as currently defined in the IECC, with some minor modifications for hydronic systems. Note that a significant majority of the commercial buildings constructed in the United States are on the order of 20,000 square feet or less in floor area and would likely be covered by these resultant provisions for simple systems and equipment.

The provisions for complex (e.g. non-simple) HVAC systems are updated and maintained by ASHRAE on a regular and ongoing basis. It seems duplicative and time consuming to try and keep the provisions of the IECC for such equipment and systems consistent with Standard 90.1, when so much effort is spent in SSPC 90.1 updating and maintaining these provisions. A review of the past few code development cycles finds very few changes were submitted to the provisions for complex systems other than to keep the IECC consistent with the provisions in Standard 90.1.

While there may be an advantage in having the provisions for complex systems provided directly in the IECC to foster their availability, such complex systems will have a registered design professional or engineer involved in the design and construction who should be providing sealed plans and specifications. Given the recent emphasis on the availability of resources for state and local code compliance verification efforts it seems reasonable to rely on Standard 90.1 for the criteria for such systems and equipment and the engineers and design professionals that would be involved in their implementation and compliance verification via their professional credentials.

An important note is that this is not a return to the prior "mix and match" approach of allowing developers to meet one section (e.g., envelope) in the IECC and another (say lighting) in ASHRAE 90.1. This is a clear referral and not an optional choice. Simple HVAC system provisions are in the IECC and the complex system requirements in ASHRAE 90.1 are included by reference. There is always the option of using ASHRAE 90.1 for the entire compliance path under section 401.2 or 401.2.1, but in either case, complex HVAC systems would be subject to requirements in ASHRAE 90.1.

This change will greatly simplify the code and as noted above continue to provide criteria for more complex systems through a singular process. Details to foster an understanding of this code change are provided below and correspond to each of the ten specific actions needed to implement this change and further simplify the provisions in the ICC for HVAC systems and equipment.

1. The proposed changes to C403.1 are intended to bring forward the scope of C403.3 for simple systems to the beginning of C403 to provide the necessary outline and structure for the resultant C403. Section C403.1 now clearly indicates what is covered by the building mechanical system provisions, what constitutes a simple HVAC system and equipment, and that such systems and equipment would need to comply with the provisions of the IECC and those that are not would now be required to comply with ANSI/ASHRAE/IES Standard 90.1 as currently referenced in the IECC. This eliminates the need to maintain separate and parallel provisions for other than simple systems in the IECC that are maintained in Standard 90.1.
2. The title of C403.2 requires revision to ensure the correct organization of the provisions of C403. Section C403.1 now establishes the scope of the provisions for simple HVAC systems and equipment. The sections after C403.1 apply to mechanical systems and equipment and are either mandatory (C403.2) or prescriptive (C403.3). If HVAC systems and equipment are not simple, as defined in C403.1, then the provisions of Standard 90.1 apply.
3. The scope of C403 as simple HVAC systems and equipment covering only unitary or packaged cooling equipment eliminates the relevance of Tables C403.2.3(7), and C403.2.3(8) which apply to equipment associated with complex systems as defined in the IECC now (e.g. non-simple). These same provisions are provided in Standard 90.1 and need not be provided here. By referencing Standard 90.1, it is unnecessary for IECC to undergo several code changes in order to keep the code consistent with Standard 90.1.
4. Sections C403.2.3.1 and C403.2.3.2 apply to water chilling packages that are associated with systems other than those covered by Section C403 pursuant to this change (e.g. non-simple systems that are now covered by Standard 90.1).

5. Sections C403.4.1 through C403.4.4 are deleted through this code change as discussed above and no longer need to be referenced. The provisions of C403.2.4.1 through C403.2.4.4 apply to simple HVAC systems and equipment and should be retained as currently presented.
6. Exception 2 to C403.2.5.1 would not be applicable to the scope of C403 as proposed herein (simple systems) because simple HVAC systems and equipment are limited to serving a singular zone and this exception applies to multiple zone systems.
7. In now applying to simple systems the provisions in C403.2.10.1 for fan system brake horsepower are no longer applicable and would be addressed in Standard 90.1. Table C403.2.10.1(1) can be deleted as the one remaining set of provisions is better presented in a textual rather than tabular form. Table C403.2.10.1(2) is deleted as it is only applicable to the brake horsepower path which is no longer present for the simplified path. What remains is a set of provisions for air system fan horsepower that can be stated in a singular section through modification to C403.2.10. The title of C403.2.10 is revised so it does not contain now nor would it contain any provisions on air system control.
8. With the movement of the current provisions of C403.3 to C403.1 to address the scope of C403 at the beginning of the section, the current performance provisions in C403.3 for simple systems need an appropriate introductory section.
9. The current hydronic system control provisions in Section C403.3.2 are modified for consistency with the scope of the proposed Section C403 and do not apply to chilled water systems. In addition, Section C403.4 would be deleted in deference to Standard 90.1 for complex (e.g. non-simple) HVAC systems and equipment as discussed above. The controls provisions now in Section C403.4 are brought forward as applicable to simple HVAC systems and equipment. The provisions applicable to hydronic systems covered by the new Section C403.3 (heating only systems) are Sections C403.4.3.4 and the second paragraph of Section C403.4.3.5, both of which are included in the code change above as new text to Section C403.3.2 on hydronic systems. There are minor modifications to improve pumping efficiency by requiring variable flow on smaller systems without variable speed drives being required.
10. The economizer integration requirements are currently located in C403.4.1.3 for complex systems and are applicable to simple systems as defined pursuant to this code change. As a consequence they need to be retained in the IECC and are proposed to be moved so they are retained for simple systems.
11. Unneeded complex system sections and tables are deleted. ASHRAE 90.1 becomes the reference for these systems.
12. Hot gas bypass restrictions are retained, as they apply to some larger simple systems.
13. The HVAC option in C406.2 needs to be adjusted to accommodate the reference to Standard 90.1 for complex systems. As proposed, Section C403 provides specific criteria within the IECC for simple mechanical systems and then defers to Standard 90.1 for complex systems in lieu of providing specific criteria within the IECC for complex systems. The provisions of C406.2 as written would and should continue to be applied over and above the specific criteria within the IECC. In now referencing Standard 90.1 for complex systems, a parallel option must also exist for those buildings that would comply using the specific criteria within the IECC but in the case of mechanical systems would defer to Standard 90.1.
14. High efficiency chiller tables are no longer required, as the high efficiency chiller option is indexed to ASHRAE 90.1.
15. Several reference standards are no longer required.

Any cost impact would be attributable to the loss of the provisions in Section C403.4 for complex HVAC systems and the impact of requiring compliance with ANSI/ASHRAE/IES Standard 90.1 alone on any particular system design. A comparison of the provisions in Section C403.4 and Standard 90.1 would have to be conducted and applied to each design to determine if there are any specific increases or decreases in first cost and life cycle costs. There should be little cost difference between the current complex provisions and the 90.1 complex provisions if the trend for ASHRAE 90.1 proposals to be incorporated into IECC continues. ASHRAE 90.1 proposals typically go through a cost effectiveness vetting as they are released for public comment and incorporation into standard 90.1, so any differences with increased cost would be cost effective.

Cost Impact: There is no significant impact on construction cost.

C403.1-EC-WILLIAMS.doc

CE196 – 13

C403.2.1

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C403.2.1 Calculation of heating and cooling loads. Design loads associated with heating, ventilating and air conditioning of the building shall be determined in accordance with the procedures described in ANSI/ASHRAE/ACCA Standard 183 or by an *approved* equivalent computational procedure using the design parameters specified in Chapter 3. ~~The design loads shall account for the building envelope, lighting, ventilation and occupancy loads based on the project design.~~ Heating and cooling loads shall be adjusted to account for load reductions that are achieved where energy recovery systems are utilized in the HVAC system in accordance with the ASHRAE HVAC Systems and Equipment Handbook. ~~Alternatively, design loads shall be determined by an approved equivalent computational procedure using the design parameters specified in Chapter 3.~~

Reason: ASHRAE 183 provides the relevant details on how to calculate the loads. The “loads” are specified as associated with HVAC. This proposal simplifies the language requiring heating and cooling load calculations to simply reference ASHRAE 183. The objective of this proposal is to simplify the code to foster implementation and compliance verification.

Cost Impact: The code change proposal will not increase the cost of construction.

C403.2.1-EC-WILLIAMS.doc

CE197 – 13

C403.2.1

Proponent: Richard J. Davis, The Evergreen State College, Kevin Folsom, Dallas Theological Institute, representing APPA, Leadership in Education Facilities, Standards and Codes Council.

Revise as follows:

C403.2.1 Calculation of heating and cooling loads. Design loads shall be determined in accordance with the procedures described in ANSI/ASHRAE/ACCA Standard 183. The design loads shall account for occupant movement, the comfort for those moving between spaces, the building envelope, lighting, ventilation and occupancy loads based on the project design. Heating and cooling loads shall be adjusted to account for load reductions that are achieved where energy recovery systems are utilized in the HVAC system in accordance with the *ASHRAE HVAC Systems and Equipment Handbook*. Alternatively, design loads shall be determined by an *approved* equivalent computation procedure, using the design parameters specified in Chapter 3.

Reason: When older buildings or portions of buildings have different interior temperatures from new buildings or spaces, facility managers must address the perception that there is something wrong with the newer facility. Widely differing temperature classroom and public space set- points are not acceptable to our students and faculty.

Cost Impact: Unknown. Site specific.

C403.2.1-EC-DAVIS.doc

CE198 – 13

C403.2.2

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C403.2.2 Equipment and system sizing. The output capacity of heating and cooling equipment ~~and systems~~ shall not exceed the loads calculated in accordance with Section C403.2.1. A single piece of equipment providing both heating and cooling shall satisfy this provision for one function with the capacity for the other function as small as possible, within available equipment options.

Exceptions:

1. Required standby equipment and systems provided with controls and devices that allow such systems or equipment to operate automatically only when the primary equipment is not operating.
2. Multiple units of the same equipment type with combined capacities exceeding the design load and provided with controls that have the capability to sequence the operation of each unit based on load.

Reason: This proposal clarifies intent that the provisions are written to apply to the output capacity of the equipment that provides heating or cooling functions.

While not defined, there is a distinct difference between systems and equipment. The equipment refers to the piece of equipment (or the appliance) that converts delivered energy into heating or cooling capability. The system is much broader in scope and includes not only the equipment but the distribution system, controls, etc. The design loads in Section C403.2.1 will cover the distribution system loads such that the loads in question and the point of comparison with size occurs at the output to the equipment.

Cost Impact: The code change proposal will not increase the cost of construction.

(Portions of Table not shown remain unchanged)

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings

and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The requirements in these three columns would not be applicable to any new building designed and constructed under the 2015 IECC.

Cost Impact: The code change proposal will not increase the cost of construction. The proposal is editorial in nature and will not affect the cost of construction.

Room air conditioner casement-slider	All capacities	—	9.5 EER	9.5 EER	

For SI: 1 British thermal unit per hour = 0.2931 W, °C = [(°F) - 32]/1.8.

"Cap" = The rated cooling capacity of the project in Btu/h. If the unit's capacity is less than 7000 Btu/h, use 7000 Btu/h in the calculation. If the unit's capacity is greater than 15,000 Btu/h, use 15,000 Btu/h in the calculations

- Chapter 5 of the referenced standard contains a complete specification of the referenced test procedure, including the referenced year version of the test procedure.
- Replacement unit shall be factory labeled as follows: "MANUFACTURED FOR REPLACEMENT APPLICATIONS ONLY: NOT TO BE INSTALLED IN NEW CONSTRUCTION PROJECTS." Replacement efficiencies apply only to units with existing sleeves less than 16 inches (406 mm) in height and less than 42 inches (1067 mm) in width.

TABLE C403.2.3(8)
MINIMUM EFFICIENCY REQUIREMENTS:
HEAT REJECTION EQUIPMENT

EQUIPMENT TYPE^a	TOTAL SYSTEM HEAT REJECTION CAPACITY AT RATED CONDITIONS	SUBCATEGORY OR RATING CONDITIONⁱ	PERFORMANCE REQUIRED^{b, c, d, g, h}	TEST PROCEDURE^{e, f}

Centrifugal closed circuit cooling towers	All	102°F Entering Water 90°F Leaving Water 75°F Entering wb	≥ 7.0 gpm/hp	CTI ATC-105S and CTI STD-201
Propeller or axial fan <u>evaporative condensers</u>	<u>All</u>	<u>Ammonia Test Fluid</u> <u>140°F entering gas temperature</u> <u>96.3°F condensing temperature 75°F entering wb</u>	<u>≥ 134,000 Btu/h·hp</u>	<u>CTI ATC-106</u>
<u>Centrifugal fan evaporative condensers</u>	<u>All</u>	<u>Ammonia Test Fluid</u> <u>140°F entering gas temperature</u> <u>96.3°F condensing temperature</u> <u>75°F entering wb</u>	<u>≥ 110,000 Btu/h·hp</u>	<u>CTI ATC-106</u>
<u>Propeller or axial fan evaporative condensers</u>	<u>All</u>	<u>R-507A Test Fluid</u> <u>165°F entering gas temperature</u> <u>105°F condensing temperature</u> <u>75°F entering wb</u>	<u>≥ 157,000 Btu/h·hp</u>	<u>CTI ATC-106</u>
<u>Centrifugal fan evaporative condensers</u>	<u>All</u>	<u>R-507A Test Fluid</u> <u>165°F entering gas temperature</u> <u>105°F condensing temperature</u> <u>75°F entering wb</u>	<u>≥ 135,000 Btu/h·hp</u>	<u>CTI ATC-106</u>
Air-cooled condensers	All	125°F Condensing Temperature R-22 Test Fluid 190°F Entering Gas Temperature 15°F Subcooling 95°F Entering db	≥ 176,000 Btu/h·hp	ARI 460

For SI: °C = [(°F)-32]/1.8, L/s · kW = (gpm/hp)/(11.83), COP = (Btu/h · hp)/(2550.7)

db = dry bulb temperature, °F, wb = wet bulb temperature, °F.

- a. The efficiencies and test procedures for both open and closed circuit cooling towers are not applicable to hybrid cooling towers that contain a combination of wet and dry heat exchange sections.
- b. For purposes of this table, open circuit cooling tower performance is defined as the water flow rating of the tower at the thermal rating condition listed in Table 403.2.3(8) divided by the fan nameplate rated motor power.
- c. For purposes of this table, closed circuit cooling tower performance is defined as the water flow rating of the tower at the thermal rating condition listed in Table 403.2.3(8) divided by the sum of the fan nameplate rated motor power and the spray pump nameplate rated motor power.
- d. For purposes of this table, air-cooled condenser performance is defined as the heat rejected from the refrigerant divided by the fan nameplate rated motor power.
- e. Chapter 6 of the referenced standard contains a complete specification of the referenced test procedure, including the referenced year version of the test procedure. The certification requirements do not apply to field erected cooling towers.
- f. If a certification program exists for a covered product, and it includes provisions for verification and challenge of equipment efficiency ratings, then the product shall be listed in the certification program, or, if a certification program exists for a covered product, and it includes provisions for verification and challenge of equipment efficiency ratings, but the product is not listed in the existing certification program, the ratings shall be verified by an independent laboratory test report.
- g. All cooling towers shall comply with the minimum efficiency listed in the table for that specific type of tower with the capacity effect of any project specific accessories and / or options included in the capacity of the cooling tower
- h. For purposes of this table, evaporative condenser performance is defined as the heat rejected at the specified rating condition in the table divided by the sum of the fan motor nameplate power and the integral spray pump nameplate power
- i. Requirements for evaporative condensers are listed with ammonia (R-717) and R-507A as test fluids in the table. Evaporative condensers intended for use with halocarbon refrigerants other than R-507A shall meet the minimum efficiency requirements listed above with R-507A as the test fluid.

Add new standards as follows:

CTI

ATC 105S-11 Acceptance Test Code for Closed Circuit Cooling Towers

ATC 106-11 Acceptance Test Code for Mechanical Draft Evaporative Vapor Condensers

Reason: For consistency with Standard 90.1. This proposal contains all of the increased equipment efficiency requirements found in standard 90.1. As that standard is an alternative path to compliance with the IECC and there is a desire to maintain equivalency of the IECC with 90.1.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, CTI -ATC 105S-2011 Acceptance Test Code for Closed Circuit Cooling Towers, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

A review of the standard proposed for inclusion in the code, CTI-ATC 106-2011 Acceptance Test Code for Mechanical Draft Evaporative Vapor Condensers, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

	≥65,000 Btu/h and < 240,000 Btu/h	2.10 / 1.99	
	≥240,000 Btu/h	2.05 / 1.94	

- a. Net sensible cooling capacity: The total gross cooling capacity less the latent cooling less the energy to the air movement system. (Total Gross – latent – Fan Power)
- b. Sensible coefficient of performance (SCOP-127): a ratio calculated by dividing the net sensible cooling capacity in watts by the total power input in watts (excluding re-heaters and humidifiers) at conditions defined in ASHRAE Standard 127. The net sensible cooling capacity is the gross sensible capacity minus the energy dissipated into the cooled space by the fan system.

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

COMPUTER ROOM. A room whose primary function is to house equipment for the processing and storage of electronic data and that has a design electronic data equipment power density exceeding 20 watts/ft² of conditioned floor area.

Add new standard to Chapter 5 as follows:

ASHRAE

127-07 Method of Testing for Raising Computer and Data Processing Room Unitary Air Conditioners

Reason: Computer rooms, due to the unique nature of the space, have a significant level of internal heat generation that must be addressed to ensure the equipment therein functions properly. This generally “trumps” any consideration of the sensible or latent

loads associated with the people in the space. The cooling equipment that addresses the loads associated with these spaces operates differently and responds to different loads and schedules. This necessitates the efficiency of such equipment be addressed differently than more traditional cooling equipment. ANSI/ASHRAE Standard 127 has been developed for use in measuring and expressing the performance of this equipment for this particular and unique application. This equipment is currently addressed by ASHRAE/IES 90.1-2010, which is adopted as an alternative means of compliance with the IECC. This proposed change addresses the need to cover this unique energy efficiency opportunity in a manner consistent with 90.1-2010. Without this change the IECC Commercial Provisions could not be deemed equivalent to 90.1-2010 or subsequent editions of 90.1 that retain these provisions. More importantly if this change is not approved then the equipment efficiency provisions currently in the IECC would continue to be applied to equipment serving such spaces inappropriately

Cost Impact: The code change proposal will increase the cost of construction as there were previously no requirements for this equipment.

Analysis: A review of the standard proposed for inclusion in the code, ASHRAE 127-2007 Method of Testing for Raining Computer and Data Processing Room Unitary Air Conditioners, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

C403.2.3(9)T-EC-FERGUSON.doc

CE202 – 13

C403.2.3.1

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C403.2.3.1 Water-cooled centrifugal chilling packages. Equipment not designed for operation at AHRI Standard 550/590 test conditions of 44°F (7°C) leaving chilled-water temperature and 85°F (29°C) entering condenser water temperature with 3 gpm/ton (0.054 l/s · kW) condenser water flow shall have maximum full-load kW/ton and *NPLV* ratings adjusted using Equations 4-3 and 4-4.

Adjusted minimum full-load COP ratings = (Full-load COP from Table 6.8.1C of AHRI 550/590) × K_{adj}
(Equation 4-3)

Adjusted minimum *NPLV* rating = (IPLV from Table 6.8.1C of AHRI 550/590) × K_{adj} (Equation 4-4)

where:

$$\begin{aligned} K_{adj} &= A \times B \\ A &= 0.0000015318 \times (\text{LIFT})^4 - 0.000202076 \times (\text{LIFT})^3 + 0.0101800 \times (\text{LIFT})^2 - 0.264958 \times \\ &\quad \text{LIFT} + 3.930196 \\ B &= 0.0027 \times L_{vg}^{\text{Evap}} (\text{°C}) + 0.982 \\ \text{LIFT} &= L_{vg}^{\text{Cond}} - L_{vg}^{\text{Evap}} \\ L_{vg}^{\text{Cond}} &= \text{Full-load condenser leaving water temperature (°C)} \\ L_{vg}^{\text{Evap}} &= \text{Full-load leaving evaporator temperature (°C)} \end{aligned}$$

SI units shall be used in the K_{adj} equation.

The adjusted full-load and *NPLV* values shall only be applicable for centrifugal chillers meeting all of the following full-load design ranges:

1. The leaving evaporator fluid temperature is not less than 36°F (2.2°C).
2. The leaving condenser fluid temperature is not greater than 115°F (46.1°C).
3. LIFT is not less than 20°F (11.1 °C) and not greater than 80°F (44.4°C).

Exception: Centrifugal chillers designed to operate outside of ~~these~~ the temperature and flow ranges specified in this section need not meet the minimum efficiency requirements in Table C403.2.3(7) ~~need not comply with this code.~~

Reason: This proposal clarifies the code with respect to the type of systems that need not comply with the requirements. The ranges in question (temperature and flow) should be stated to eliminate any confusion as to what “these” refers. The result of the exception is more explicitly stated to refer to the minimum efficiency requirements in Table C403.2.3(7), as there are other requirements of “this code” related to the chiller that still apply, such as part load controls.

Cost Impact: The code change proposal will not increase the cost of construction.

C403.2.3.1-EC-WILLIAMS.doc

CE203 – 13

C403.2.3.1, C403.2.3.2, Table C403.2.3(7)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C403.2.3.1 Water-cooled centrifugal chilling packages. Equipment not designed for operation at AHRI Standard 550/590 test conditions of 44°F (7°C) leaving chilled-water temperature and 2.4 gpm/ton evaporator fluid flow and 85°F (29°C) entering condenser water temperature with 3 gpm/ton (0.054 l/s • kW) condenser water flow shall have maximum full-load kW/ton (FL) and ~~NPLV~~ part load ratings requirements adjusted using Equations 4-3 and 4-4.

~~Adjusted minimum full-load COP ratings = (Full-load COP from Table 6.8.1C of AHRI Standard 550/590) × K_{adj}~~

$$FL_{adj} = FL / K_{adj}$$

~~Adjusted minimum NPLV rating = (IPLV from Table 6.8.1C of AHRI Standard 550/590) × K_{adj}~~

$$PLV_{adj} = IPLV / K_{adj}$$

Equation 4-4)

where:

$$K_{adj} = A \times B$$

$$A = 0.0000015318 \times (LIFT)^4 - 0.000202076 \times (LIFT)^3 + 0.0101800 \times (LIFT)^2 - 0.264958 \times LIFT + 3.930196$$

$$B = 0.0027 \times L_{vg}^{Evap} (°C) + 0.982$$

$$LIFT = L_{vg}^{Cond} - L_{vg}^{Evap}$$

$$L_{vg}^{Cond} = \text{Full-load condenser leaving water temperature (°C)}$$

$$L_{vg}^{Evap} = \text{Full-load leaving evaporator temperature (°C)}$$

~~SI units shall be used in the K_{adj} equation.~~

~~The adjusted full-load and NPLV values shall only be applicable for centrifugal chillers meeting all of the following full-load design ranges:~~

- ~~1. The leaving evaporator fluid temperature is not less than 36°F (2.2°C).~~
- ~~2. The leaving condenser fluid temperature is not greater than 115°F (46.1°C).~~
- ~~3. LIFT is not less than 20°F (11.1 °C) and not greater than 80°F (44.4°C).~~

~~**Exception:** Centrifugal chillers designed to operate outside of these ranges need not comply with this code.~~

FL = full-load kW/Ton value from Table C403.2.3(7)

FL_{adj} = maximum full-load kW/Ton rating, adjusted for non-standard conditions

IPLV = IPLV value from Table C403.2.3(7)

PLV_{adj} = maximum NPLV rating, adjusted for non-standard conditions

$$A = 0.00000014592 \times (LIFT)^4 - 0.0000346496 \times (LIFT)^3 + 0.00314196 \times (LIFT)^2 - 0.147199 \times (LIFT) + 3.9302$$

$$B = 0.0015 \times L_{vg}^{Evap} + 0.934$$

$$LIFT = L_{vg}^{Cond} - L_{vg}^{Evap}$$

$$L_{vg}^{Cond} = \text{Full-load condenser leaving fluid temperature (°F)}$$

LvgEvap = Full-load evaporator leaving temperature (°F)

The FL_{adj} and PLV_{adj} values are only applicable for centrifugal chillers meeting all of the following full-load design ranges:

- Minimum Evaporator Leaving Temperature:36°F
- Maximum Condenser Leaving Temperature:115°F
- 20°F ≤ LIFT ≤ 80°F

C403.2.3.2 Positive displacement (air- and water-cooled) chilling packages. Equipment with a leaving fluid temperature higher than 32°F (0°C) and water-cooled positive displacement chilling packages with a condenser leaving fluid temperature below 115°F, shall meet the requirements of Table C403.2.3(7) when tested or certified with water at standard rating conditions, in accordance with the referenced test procedure.

TABLE C403.2.3(7)
MINIMUM EFFICIENCY REQUIREMENTS:

<u>Absorption, Single Effect</u>	<u>Capacities</u>					
<u>Absorption Double-Effect, Indirect-Fired</u>	<u>All Capacities</u>	<u>COP</u>	<u>≥1.000 FL</u> <u>≥1.050 IPLV</u>	<u>NA^d</u>	<u>≥1.000 FL</u> <u>≥1.050 IPLV</u>	<u>NA^d</u>
<u>Absorption Double-Effect, Direct-Fired</u>	<u>All Capacities</u>	<u>COP</u>	<u>≥1.000 FL</u> <u>≥1.000 IPLV</u>	<u>NA^d</u>	<u>≥1.000 FL</u> <u>≥1.000 IPLV</u>	<u>NA^d</u>

^aThe requirements for centrifugal chiller shall be adjusted for non-standard rating conditions per C403.2.3.1 and are only applicable for the range of conditions listed in C403.2.3.1. The requirements for air-cooled, water-cooled positive displacement and absorption chillers are at standard rating conditions defined in the reference test procedure.

^bBoth the full load and IPLV requirements must be met or exceeded to comply with this standard. When there is a Path B, compliance can be with either Path A or Path B for any application.

^cNA means the requirements are not applicable for Path B and only Path A can be used for compliance.

^eFL is the full load performance requirements and IPLV is for the part load performance requirements

Reason: For consistency with Standard 90.1. This proposal makes changes to the requirements for air and water cooled chillers as defined in section C403.2.3.1 and the efficiency requirements listed in table C403.2.3(7). This change is a continuation of the efficiency improvements that were implemented in 2010 by further improving the efficiency requirements. In 90.1-2010 a Path B was added for part load intensive water cooled chillers. This change also expands the Path B by adding requirements to include air cooled chillers. Also as part of this change, efforts were made to bring the efficiency requirements for water cooled positive displacement and centrifugal chillers together while considering the available technology, and that chillers can be applied at other application conditions where one technology may better suited than the other. The new efficiency requirements will go into effect on 1/1/2015.

The proposal was develop thru a working team of the AHRI chiller section and a unanimous vote was obtained on the proposal.

Cost Impact: The code change proposal will increase the cost of construction.

CE203-13

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

C403.2.3-EC-FERGUSON.doc

CE204 – 13

C403.2.4.1.2, C403.2.4.1.3 (NEW)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C403.2.4.1.2 C403.2.4.2 Set point overlap restriction Deadband. Where used to control both heating and cooling, zone thermostatic controls shall be capable of providing ~~provide~~ a temperature range or deadband of at least 5°F (2.8°C) within which the supply of heating and cooling energy to the zone is ~~capable of being~~ shut off or reduced to a minimum.

Exceptions:

1. Thermostats requiring manual changeover between heating and cooling modes.
2. Occupancies or applications requiring precision in indoor temperature control as approved by the code official.

C403.2.4.1.3 Setpoint overlap restriction. Where a zone has a separate heating and a separate cooling thermostatic control located within the zone, a limit switch, mechanical stop, or direct digital control system with software programming shall be provided with the capability to prevent the heating setpoint from exceeding the cooling setpoint and to maintain a deadband in accordance with Section C403.2.4.1.2.

Reason: The text in current Section C403.2.4.2 entitled set point overlap restriction is really focused on deadband and is virtually identical to Section 6.3.4.1.2 of ASHRAE/IES Standard 90.1-2010. For consistency this provision is being renamed deadband and included in a new subsection to C403.2.4.1 on thermostatic controls. In addition ASHRAE/IES Standard 90.1-2010 has a provision to address a different situation wherein a zone has a separate heating and a separate cooling system and a separate thermostat for each one. This situation is not addressed in the IECC and needs to be to prevent a situation where both systems could be operational at the same time. These changes will help make the IECC consistent with ASHRAE/IES 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions.

Cost Impact: The code change proposal will not increase the cost of construction.

CE204-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C403.2.4.1.2-EC-FERGUSON.doc

CE205 – 13

C403.2.4.5 (NEW)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Add new text as follows:

C403.2.4.5 Zone isolation. HVAC systems serving zones that are over 25,000 square feet in floor area or that span more than one floor and designed to operate or be occupied non-simultaneously shall be divided into isolation areas. Each isolation area shall be equipped with isolation devices and controls configured to automatically shut off the supply of conditioned air and outdoor air to and exhaust air from the isolation area. Each isolation area shall be controlled independently by a device meeting the requirements of Section C403.2.4.3.2. Central systems and plants shall be provided with controls and devices that will allow system and equipment operation for any length of time while serving only the smallest isolation area served by the system or plant.

Exceptions:

1. Exhaust air and outdoor air connections to isolation areas when the fan system to which they connect does not exceed 5000 cfm.
2. Exhaust airflow from a single isolation area of less than 10 percent of the design airflow of the exhaust system to which it connects.
3. Isolation areas intended to operate continuously or intended to be inoperative only when all other isolation areas in a zone are inoperative.

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the commercial provisions of the IECC, has a provision to provide the ability to create isolation areas within zones under certain circumstances in order to allow for additional reductions in energy use and operating costs. This situation is not addressed in the IECC and should be to ensure technical compatibility between both documents.

Cost Impact: The code change proposal will increase the cost of construction.

CE205-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C403.2.4.5 (NEW)-EC-FERGUSON.doc

CE206 – 13

C403.2.4.5

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C403.2.4.5 Snow melt system controls. Snow – and ice-melting systems, ~~supplied through energy service to the building,~~ shall include automatic controls capable of shutting off the system when the pavement temperature is above 50°F and no precipitation is falling and an automatic or manual control that will allow shutoff when the outdoor temperature is above 40°F ~~so that the potential for snow or ice accumulation is negligible.~~

Reason: Because the energy for snow and ice-melting systems could come from an energy service other than the energy service for the building, the revision is needed to ensure all energy use for snow melting is covered. This proposal ensures that all snow melting systems are covered by the code. The language at the end of the last sentence being removed is not needed as it is not necessary to explain the intent of the provisions in the code.

Cost Impact: The code change proposal will not increase the cost of construction.

CE206-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C403.2.4.5-EC-WILLIAMS.doc

CE207 – 13

C403.2.4.5

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

C403.2.4.5 Snow melt system controls. Snow- and ice-melting systems, supplied through energy service to the building, shall include automatic controls capable of shutting off the system when the pavement temperature is above 50°F (10°C) and no precipitation is falling and an automatic or manual control that will allow shutoff when the outdoor temperature is above 40°F (4°C) ~~so that the potential for snow or ice accumulation is negligible.~~

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The text proposed for deletion expresses the intent of the provision, but is in itself unenforceable. The balance of the section adequately describes prescriptive requirements for a snowmelt system. As the prescriptive requirements are clear, there is no need for an 'intent' or 'performance' statement. What might be considered a negligible snow accumulation is Aspen might be considered a blizzard in Key West.

Cost Impact: The code change proposal will not increase the cost of construction. The proposal is editorial in nature and will not affect the cost of construction.

CE207-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C403.2.4.5-EC-THOMPSON-SEHPCAC

CE208 – 13

C403.2.4.5, C403.2.4.6 (NEW)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C403.2.4.5 Snow and ice melt system controls. ~~Snow- and ice-melting systems, supplied through energy service to the building,~~ shall include automatic controls capable of shutting off the system when the pavement temperature is above 50°F and no precipitation is falling and an automatic or manual control that will allow shutoff when the outdoor temperature is above 40°F ~~so that the potential for snow or ice accumulation is negligible.~~

C403.2.4.6 Freeze protection system controls. Freeze protection systems, such as heat tracing of outdoor piping and heat exchangers, including self-regulating heat tracing, shall include automatic controls configured to shut off the systems when outdoor air temperatures are above 40°F or when the conditions of the protected fluid will prevent freezing.

Reason: For consistency with ASHRAE/IES 90.1-2010. Section 6.4.3.8 of that document contains provisions for freeze protection systems. As that standard is an alternative path to compliance with the IECC and there is a desire to maintain equivalency of the IECC with 90.1 the issue of energy use for freeze protection systems must also be addressed in the IECC. The provisions associated with snow and ice melting systems are in the IECC but are not the same as those in 90.1. Since the energy for snow and ice melting systems could come from service other than to the building the revision is needed to ensure all energy use for snow melting is covered. The language at the end of the last sentence, while in 90.1, is suggested for deletion because it not necessary to explain the intent of the provisions in the code.

Cost Impact: The code change proposal will not increase the cost of construction.

C403.2.4.5-EC-FERGUSON.doc

CE209 – 13

C403.2.4.6 (NEW)

Proponent: Eric Makela, Britt/Makela Group, Inc., representing Northwest Energy Codes Group (eric@brittmakela.com), Jim Edelson, New Buildings Institute

Add new text as follows:

C403.2.4.6 Economizer fault detection and diagnostics (FDD). Air-cooled unitary direct-expansion units listed in Tables C403.2.3(1) through (3) and variable refrigerant flow (VRF) units that are equipped with an economizer in accordance with Section C403.3 or Section C403.4 shall include a fault detection and diagnostics (FDD) system complying with all of the following:

1. The following temperature sensors shall be permanently installed to monitor system operation:
 - 1.1. Outside air,
 - 1.2. Supply air,
 - 1.3. Return air;
2. Temperature sensors shall have an accuracy of $\pm 2^{\circ}\text{F}$ over the range of 40°F to 80°F ;
3. Refrigerant pressure sensor, where used, shall have an accuracy of ± 3 percent of full scale;
4. The unit controller shall be capable of providing system status by indicating the following:
 - 4.1. Free cooling available.
 - 4.2. Economizer enabled.
 - 4.3. Compressor enabled.
 - 4.4. Heating enabled.
 - 4.5. Mixed air low limit cycle active.
 - 4.6. The current value of each sensor.
5. The unit controller shall be capable of manually initiating each operating mode so that the operation of compressors, economizers, fans, and heating system can be independently tested and verified;
6. The unit shall be capable of reporting faults to a fault management application accessible by day-to-day operating or service personnel, or annunciated locally on zone thermostats; and
7. The FDD system shall be capable of detecting the following faults:
 - 7.1. Air temperature sensor failure/fault.
 - 7.2. Not economizing when the unit should be economizing.
 - 7.3. Economizing when the unit should not be economizing.
 - 7.4. Damper not modulating.
 - 7.5. Excess outdoor air.

Reason: Commercial HVAC systems have been shown to have problems with economizer function, control, and performance in field studies and utility-sponsored maintenance programs. This results in reduced energy efficiency and potential energy savings from the economizer with fan-only operation. The proposed FDD specifications have been standardized in California Title 24-2013.

Major HVAC original equipment manufacturer representatives played a major role in the Title 24 process that developed this measure. They supported the decision to propose the RTU FDD as a Mandatory Measure, rather than a Prescription Option in Title 24. The manufacturer's participants recognized the importance of this technical issue and stated that the industry would be ready by January 2014, the 2013 Title 24 implementation date, to meet the mandatory FDD requirements. A key factor for industry support was that the proposed FDD functions could be implemented on approximately 70% of RTUs sold that are electromechanically controlled, along with higher tier equipment that is microprocessor controlled.

The link to the cost-effectiveness analysis of the Title 24 FDD Mandatory Measure is noted here. The specific FDD reference material is found in three separate places in the document: Pgs. 13-18, 31-45, Appendix B pg. 118-131.

http://www.energy.ca.gov/title24/2013standards/prerulemaking/documents/2011-04-27_workshop/review/2013_CASE_NR7_HVAC_Controls_and_Economizing_2011_04_20.pdf

Cost and benefit documentation is found in the Li and Braun (2007. Economic Evaluation of Benefits Associated with Automated Fault Detection and Diagnosis in Rooftop Air Conditioners. *ASHRAE Transactions* 113(2).) report, which states "Automated FDD reduces service costs due to reduced preventive maintenance inspections, fault prevention, lower-cost FDD, better scheduling of multiple service activities, and shifting service to low season."

Cost Impact: The code change proposal will increase the cost of construction but the increased level of efficiency over the life of the equipment will exceed the initial first cost.

C403.2.4.6 (NEW)-EC-EDELSON-MAKELA.doc

CE210 – 13

C403.2.5.1

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C403.2.5.1 Demand controlled ventilation. Demand control ventilation (DCV) shall be provided for spaces larger than ~~500~~ 200 square feet (~~50~~ 20 m²) and with a design ~~an average~~ occupant load of not less than 25 people per 1000 square feet (93 m²) of floor area (as established in Table 403.3 of the *International Mechanical Code*) and served by systems with one or more of the following:

1. An air-side economizer;
2. Automatic modulating control of the outdoor air damper; or
3. A design outdoor airflow greater than 3,000 cfm (1400 L/s).

Exception: Demand control ventilation is not required for systems and spaces as follows:

1. Systems with energy recovery complying with Section C403.2.6.
- ~~2. Multiple zone systems without direct digital control of individual zones communicating with a central control panel.~~
- ~~3. 2.~~ System with a design outdoor airflow less than ~~1,200~~ 100 cfm (~~600~~ 50 L/s).
- ~~4. 3.~~ Spaces where the supply space outside airflow rate minus any makeup or outgoing transfer air exhausted from other spaces requirement is less than ~~1,200~~ 50 cfm (~~600~~ 25 L/s).
- ~~5. 4.~~ Ventilation provided for process loads only.

Reason: This proposal reduces thresholds associated with space size and design occupant density at which demand controlled ventilation (DCV) is required.

DCV reduces the amount of energy needed to ventilate and condition spaces with high-density occupancy because it allows the mechanical system to modulate ventilation based on occupant load, rather than always providing ventilation based on full design occupancy. In the time since the provisions for DCV were first included in the IECC, the cost for DCV has been reduced. DCV is now cost effective in smaller spaces than are covered in the current code.

DCV in smaller spaces can also be achieved with lower cost occupancy sensors, allowing fans on single zone systems to cycle or closing zone boxes on VAV systems when spaces are unoccupied.

The exception for multiple zone systems without DDC is removed for three reasons: (1) almost all multiple zone systems installed today have DDC control, (2) it is possible to provide DCV controls at the zone level without DDC, and (3) there are significant savings from ventilation control for zones in multiple zone systems due to high minimum airflow requirements under the International Mechanical Code in high density spaces.

The cost increase associated with this code change is limited to spaces from 201 to 500 ft² in floor area that are not subject to the exceptions because those spaces currently do not require DCV and, pursuant to this code change, would now need DCV. A detailed cost analysis conducted in support of similar provisions in California Title 24 (the California Energy Code) indicated that DCV was cost effective down to spaces 150 ft² in floor area. The cost effectiveness was shown for spaces supplied by VAV systems that were vacant on average 2 hours per weekday and for constant volume systems that were vacant on average 4 hours per weekday. This analysis was for relatively mild climates. In colder or warmer climates, more energy is used for heating or cooling ventilation air, so if the technology was cost effective in California, it will have greater savings and better cost effectiveness in colder or warmer climates. The incorporation of occupancy sensors into DCV controls and requirements for lighting occupancy sensors in most high-density spaces has also resulted in reduced incremental cost. As a result, occupancy sensor based DCV is cost effective in smaller spaces.

Cost Impact: The code change proposal will increase the cost of construction in some buildings.

CE210-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

CE211 – 13

C403.2.5.2 (NEW)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Add new text as follows:

C403.2.5.2 Enclosed parking garage ventilation controls. Enclosed parking garages used for storing or handling automobiles operating under their own power shall employ contamination sensing devices and automatic controls configured to stage fans or modulate fan average airflow rates to 50 percent or less of design capacity or intermittently operate fans less than 20 percent of the occupied time or as required to maintain acceptable contaminant levels in accordance with IMC provisions. Failure of contamination sensing devices shall cause the exhaust fans to operate continuously at design airflow.

Exceptions:

1. Garages with total exhaust capacity less than 22,500 cfm (10,600 L/s) with ventilation systems that do not utilize heating or mechanical cooling.
2. Garages that have a garage area to ventilation system motor nameplate power ratio that exceeds 1125 cfm/hp (710 L/s/kW) and do not utilize heating or mechanical cooling.

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, has requirements for ventilation optimization control on parking ventilation systems that are not included in the IECC. These provisions provide significant energy savings. The change ensures continued consistency between the IECC and standard 90.1-2010 and provides significant energy savings in IECC.

Cost Impact: This code change proposal will increase the cost of construction when controls are now required.

CE211-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C403.2.5.2 (NEW)-EC-FERGUSON.doc

CE212 – 13

C403.2.6

Proponent: Tim Manz, City of Blaine, MN, representing the Association of Minnesota Building Officials (tmanz@ci.blaine.mn.us)

Revise as follows:

C403.2.6 Energy recovery ventilation systems. Where the supply airflow rate of a fan system exceeds the values specified in Table C403.2.6, the system shall include an energy recovery system. The energy recovery system shall have the capability to provide a change in the enthalpy of the outdoor air supply of not less than 50 percent of the difference between the outdoor air and return air enthalpies, at design conditions. Where an air economizer is required, the energy recovery system shall include a bypass or controls which permit operation of the economizer as required by Section C403.4

Exception: An energy recovery ventilation system shall not be required in any of the following conditions:

1. Where energy recovery systems are prohibited by the *International Mechanical Code*.
2. Laboratory fume hood systems that include at least one of the following features:
 - 2.1. Variable-air-volume hood exhaust and room supply systems capable of reducing exhaust and makeup air volume to 50 percent or less of design values except when higher volumes are required to maintain safe operating conditions.
 - 2.2. Direct makeup (auxiliary) air supply equal to at least 75 percent of the exhaust rate, heated no warmer than 2°F (1.1°C) above room setpoint, cooled to no cooler than 3°F (1.7°C) below room setpoint, no humidification added, and no simultaneous heating and cooling used for dehumidification control.
3. Systems serving spaces that are heated to less than 60°F (15.5°C) and are not cooled.
4. Where more than 60 percent of the outdoor heating energy is provided from site-recovered or site solar energy.
5. Heating energy recovery in Climate Zones 1 and 2.
6. Cooling energy recovery in Climate Zones 3C, 4C, 5B, 5C, 6B, 7 and 8.
7. Systems requiring dehumidification that employ energy recovery in series with the cooling coil.
8. Where the largest source of air exhausted at a single location at the building exterior is less than 75 percent of the design *outdoor air* flow rate.
9. Systems expected to operate less than 20 hours per week at the *outdoor air* percentage covered by Table C403.2.6
10. Systems exhausting toxic, flammable, paint, or corrosive fumes or dust.
11. Commercial kitchen hoods used for collecting and removing grease vapors and smoke.

Reason: Public health, safety and welfare takes precedence over reducing energy consumption, and the revision to Item 2.1 recognizes that with laboratory fume hoods. Additional exceptions 10 and 11 identify systems where energy recovery should not be used because what is being exhausted could be detrimental or destructive to any energy recovery equipment. All of these provisions are contained in the current Minnesota Commercial Energy Code.

Cost Impact: The code change proposal will increase the cost of construction.

(Portions of Table not shown remain unchanged)

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Reasons for this specific proposal:

There are no listings of a climate zone 1B in Table C301.1 and Climate Zone 1B does not appear in Figure C301.1. Therefore the SEHPCAC believes that the zone should not be included in the regulations.

Please note that the table has been editorially revised to properly align the information in the Climate Zone column with the Equation and Description Columns.

Cost Impact: The code change proposal will not increase the cost of construction. The change is editorial in nature and will not affect construction costs.

CE213-13

C403.2.6-EC-THOMPSON-SEHPCAC

CE214 – 13

Table C403.2.6

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

**TABLE C403.2.6
ENERGY RECOVERY REQUIREMENT**

CLIMATE ZONE	PERCENT (%) OUTDOOR AIR AT FULL DESIGN AIRFLOW RATE							
	<u>≥10% and <20%</u>	<u>≥20% and <30%</u>	≥ 30% and < 40%	≥ 40% and < 50%	≥ 50% and < 60%	≥ 60% and < 70%	≥ 70% and < 80%	≥ 80%
	DESIGN SUPPLY FAN AIRFLOW RATE (cfm)							
3B, 3C, 4B, 4C, 5B	<u>NR</u>	<u>NR</u>	NR	NR	NR	NR	≥5000 <u>NR</u>	≥5000 <u>NR</u>
1B, 2B, 5C	<u>NR</u>	<u>NR</u>	NR	NR	≥26000	≥12000	≥5000	≥4000
6B	<u>≥28000</u>	<u>≥26500</u>	≥11000	≥5500	≥4500	≥3500	≥2500	≥1500
1A, 2A, 3A, 4A, 5A, 6A	<u>≥26000</u>	<u>≥16000</u>	≥5500	≥4500	≥3500	≥2000	≥1000	> 0
7, 8	<u>≥4500</u>	<u>≥4000</u>	≥2500	≥1000	> 0	> 0	> 0	> 0

NR = not required

Reason: This proposal revises the requirements for the use of exhaust air energy recovery as defined in table C403.2.6

The current table requires energy recovery as a function of the percent outdoor air and design supply fan airflow. The current table defines requirements for energy recover for outdoor air ventilation rates above 30%. Many buildings operate with ventilation rates below 30%. Typical buildings in this category include offices, motels, hotels, grocery, and warehouses which represent a significant part of the market. Therefore by extending the table down we can save additional energy on these buildings where economically justified. SSPC 90.1 ran full 8760 hr simulation runs for building office, school and retail applications down to 10% outdoor air and then selected least restrictive cfm values for the table based on the 2010 scalar ratio methodology using a design life of 15 years. This results in additional requirements for energy recovery on larger systems in zones 1A, 2A, 3A, 4A, 5A, 6A, 7 and 8. These zones represent 30.8% of the market.

In addition to the changes to extend the table down low percent outdoor air ventilation rates, this also proposes to modify the requirements for zone 3B, 3C, 4B, 4C and 5B as they are not economical justified and have scalar values of 20.3 yrs up to infinity. We have received feedback that other studies have also confirmed that these values are not cost effective and it is felt these values need to be corrected.

The change ensures continued consistency between the IECC and Standard 90.1.

Cost Impact: The code change proposal will not increase the cost of construction.

C403.2.7

Proponent: Ron Burton, PTW Advisors, LLC, representing BOMA International
(ronburton@ptwadvisors.com)

Revise as follows:

C403.2.7 Duct and plenum insulation and sealing. All supply and return air ducts and plenums shall be insulated with a minimum of R-6 insulation where located in unconditioned spaces and a minimum of R-8 insulation where located outside the building. Where located within a building envelope assembly, the duct or plenum shall be separated from the building exterior or unconditioned or exempt spaces by minimum of R-8 insulation.

Exceptions:

1. Where located within equipment
2. Where the design temperature difference between the interior and exterior of the duct or plenum does not exceed 15° F (8°C).

All ducts, air handlers and filter boxes shall be sealed. Joints and seams shall comply with Section 603.9 of the *International Mechanical Code*.

Exception: Ducts and plenums located completely inside the building thermal envelope

Reason: To provide an exception to not require insulation on ducts and plenums, when the ducts and plenums are completely inside the building thermal envelope. This is the same as the provision already allowed in the residential portion of the code. Heat loss or gain from the ducts and plenums inside the conditioned space is only released to the conditioned area and thus does not have an impact on energy use.

Cost Impact: This code change proposal will not increase the cost of construction. The change will have a cost savings by exempting the required insulation on ducts and plenums.

CE215-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C403.2.7-EC-BURTON.doc

CE216 – 13

C403.2.7

Proponent: Mark Terzigni, Sheet Metal and Air Conditioning Contractors' National Association (SMACNA) (mterzigni@smacna.org)

Revise as follows:

C403.2.7 Duct and plenum insulation. ~~and sealing.~~ All supply and return air ducts and plenums shall be insulated with a minimum of R-6 insulation where located in unconditioned spaces and a minimum of R-8 insulation where located outside the building. Where located within a building envelope assembly, the duct or plenum shall be separated from the building exterior or unconditioned or exempt spaces by a minimum of R-8 insulation.

Exceptions:

1. Where located within equipment
2. Where the design temperature difference between the interior and exterior of the duct or plenum does not exceed 15°F (8 °C).

~~All ducts, air handlers and filter boxes shall be sealed. Joints and seams shall comply with Section 603.9 of the International Mechanical Code.~~

Reason: "Air handlers" should not be addressed under ducts and plenums. All sealing concerns should be addressed in the next section proposed C403.2.8 "insulation and sealing" are two distinct topics and should not be lumped together.

Cost Impact: This code change proposal will not increase the cost of construction.

CE216-13

	Assembly:	ASF	AMF	DF

C403.2.7-EC-TERZIGNI.doc

CE217 – 13

C403.2.7

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C403.2.7 Duct and plenum insulation and sealing. All supply and return air ducts and plenums shall be insulated with a minimum of R-6 insulation where located in unconditioned spaces and ~~a minimum of R-8 insulation~~ where located outside the building with a minimum of R-8 insulation in climate zones 1 through 4 and a minimum of R-12 insulation in climate zones 5 through 8. Where located within a building envelope assembly, the duct or plenum shall be separated from the building exterior or unconditioned or exempt spaces by a minimum of R-8 insulation in climate zones 1 through 4 and a minimum of R-12 insulation in climate zones 5 through 8.

Exceptions:

1. Where located within equipment.
2. Where the design temperature difference between the interior and exterior of the duct or plenum does not exceed 15°F (8°C).

All ducts, air handlers and filter boxes shall be sealed. Joints and seams shall comply with Section 603.9 of the *International Mechanical Code*.

Reason: This proposal reduces the energy loss associated with duct systems, such as those in cold climates, by increasing the level of insulation required on ducts and plenums where it is cost effective.

Exterior ducts and plenums (i.e. those not totally inside the building conditioned space) in colder climate zones are subject to a higher heat loss and consequent higher use of energy due to a greater temperature difference across the duct or plenum surface. As the cost of energy increases and the need to reduce building energy use becomes more acute, enhancements to the energy code are necessary. Such ducts and plenums will benefit from improved insulation because the added insulation will reduce heat loss and allow more of the heat provided by the HVAC equipment to be delivered to the space. In some cases the added insulation will also allow reduced heating equipment size.

There is a cost impact associated with this proposed change since more insulation will be required on some ductwork in climate zones 5-8. A cost effectiveness analysis was completed. In this analysis it was found that for the additional duct insulation the simple payback was 11.2 years or less. Based on insulation life of 24 years, a discounted cost effective payback threshold is 14.2 years. The simple paybacks for all of the additional insulation required under this proposal are well below this cost effective threshold.

C403.2.7-EC-WILLIAMS.doc

CE218 – 13

C403.2.7

Proponent: Tim Manz, City of Blaine, MN, representing the Association of Minnesota Building Officials (tmanz@ci.blaine.mn.us)

Revise as follows:

C403.2.7 Duct and plenum insulation and sealing. Insulation shall be protected from damage, including that due to sunlight, moisture, equipment maintenance and wind. Insulation exposed to weather shall be suitable for outdoor service and shall be protected by aluminum, sheet metal, painted canvas, plastic cover or other similar materials approved by the code official. Cellular foam insulation shall be protected as above or painted with a coating that is water retardant and provides shielding from solar radiation that can cause degradation of the material. All supply, and, return, exhaust and relief air ducts and plenums shall be insulated with a minimum of R-6 insulation where located in unconditioned spaces and a minimum of R-8 insulation where located outside the building. Where located within a building envelope assembly, the duct or plenum shall be separated from the building exterior or unconditioned or exempt spaces by a minimum of R-8 insulation.

Exceptions:

1. Where located within equipment.
2. Where the design temperature difference between the interior and exterior of the duct or plenum does not exceed 15°F (8°C).

All ducts, air handlers and filter boxes shall be sealed. Joints and seams shall comply with Section 603.9 of the *International Mechanical Code*.

Reason: This proposed amendment incorporates language from the current Minnesota Commercial Energy Code, along with provisions from ASHRAE Standard 90.1-2010 that explain in detail the requirements necessary to protect ducts from physical damage and from other sources of damage, such as moisture and weather-related elements. These changes are necessary so that the insulation protection provides energy efficient and durable systems that are not likely to deteriorate due to the formation of condensation on the interior or exterior of the ducts or plenums.

Cost Impact: The code change proposal will increase the cost of construction.

CE218-13

C403.2.7

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

Revise as follows:

C403.2.7 Duct and plenum insulation and sealing. All supply and return air ducts and plenums shall be insulated with a minimum of R-6 insulation where located in unconditioned spaces and a minimum of R-8 insulation where located outside the building. Where located within a building envelope assembly, the duct or plenum shall be separated from the building exterior or unconditioned or exempt spaces by a minimum of R-8 insulation.

Exceptions:

1. Where located within equipment.
2. Where the design temperature difference between the interior and exterior of the duct or plenum does not exceed 15°F (8°C).

All ducts, air handlers and filter boxes shall be sealed. Air handlers 3000 cfm or less shall have a manufacturer's designation for an air leakage of no more than 2 percent of the design air flow rate when tested in accordance with ASHRAE 193.

Joints and seams shall comply with Section 603.9 of the *International Mechanical Code*.

Reason: This adds the same airtight air handler requirement as is in residential. The standard is already in use in the industry. The requirement is limited to air handlers of 3000 cfm or less because that is the limit of the ASHRAE 193 test. Having a manufacturer's designation of a certain leakage or less makes inspection much simpler.

Cost Impact: The code change proposal will not increase the cost of construction.

C403.2.7-EC-CONNER.doc

CE220 – 13

C403.2.7 (NEW), Table C403.2.7 (NEW)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Add new text as follows:

C403.2.7 Kitchen exhaust systems. Replacement air introduced directly into the exhaust hood cavity shall not exceed 10 percent of the hood exhaust airflow rate. Conditioned supply air delivered to any space containing a kitchen hood shall not exceed the greater of the ventilation rate required to meet the space heating or cooling load or the hood exhaust flow minus the available transfer air from adjacent space where available transfer air is considered that portion of outdoor ventilation air not required to satisfy other exhaust needs, such as restrooms, and not required to maintain pressurization of adjacent spaces.

When total kitchen hood exhaust airflow rate is greater than 5,000 cfm each hood shall have a maximum exhaust rate in accordance with Table C403.2.7 and shall meet one of the following:

1. At least 50 percent of all replacement air is transfer air that would otherwise be exhausted.
2. Demand ventilation systems on at least 75 percent of the exhaust air that are capable of at least 50 percent reduction in exhaust and replacement air system airflow rates, including controls necessary to modulate airflow in response to appliance operation and to maintain full capture and containment of smoke, effluent and combustion products during cooking and idle.
3. Listed energy recovery devices with a sensible heat recovery effectiveness of at least 40 percent on at least 50 percent of the total exhaust airflow.

When a single hood, or hood section, is installed over appliances with different duty ratings, then the maximum allowable flow rate for the hood or hood section shall be based on the requirements for the highest appliance duty rating under the hood or hood section.

Exception: When at least 75 percent of all the replacement air is transfer air that would otherwise be exhausted

TABLE C403.2.7
MAXIMUM NET EXHAUST FLOW RATE, CFM PER LINEAR FOOT OF HOOD LENGTH

<u>Type of Hood</u>	<u>Light Duty Equipment</u>	<u>Medium Duty Equipment</u>	<u>Heavy Duty Equipment</u>	<u>Extra Heavy Duty Equipment</u>
<u>Wall-mounted canopy</u>	<u>140</u>	<u>210</u>	<u>280</u>	<u>385</u>
<u>Single island</u>	<u>280</u>	<u>350</u>	<u>420</u>	<u>490</u>
<u>Double island (per side)</u>	<u>175</u>	<u>210</u>	<u>280</u>	<u>385</u>
<u>Eyebrow</u>	<u>175</u>	<u>175</u>	<u>Not allowed</u>	<u>Not allowed</u>
<u>Backshelf/Pass-over</u>	<u>210</u>	<u>210</u>	<u>280</u>	<u>Not allowed</u>

Reason: For consistency with Standard 90.1-2010. Considering that the IECC Commercial Provisions are intended to be technically compatible with that standard to facilitate adoption and implementation, ASHRAE is interested in keeping 2012 IECC Commercial Provisions aligned with ANSI/ASHRAE/IESNA Standard 90.1-2010.

The proposal basically outlaws "short-circuit" hoods.

Research and California Energy Commission has shown that direct supply of makeup air, in excess of 10% of hood exhaust airflow, into the hood cavity significantly deteriorates the Capture and Containment (C&C) performance of hoods. This research has also demonstrated that short-circuit hoods waste energy and degrade kitchen environment and hygiene. If we assume a generic baseline C&C rate for a cooking process, studies show the exhaust rates for short-circuit hoods generally exceed those for exhaust-only hoods by at least the amount of air short-circuited, thus decreasing performance and increasing energy consumption.

Engineers are often in the habit of simply providing makeup air units in kitchens to provide makeup air equal to the exhaust flow rate even when "free" transfer air is available from adjacent spaces. Adding makeup air when transfer air is available is a wasteful design

practice and should be prohibited. Using available transfer air saves energy and reduces the first cost of the makeup unit and exhaust system in the adjacent spaces. It simply requires some engineering and coordination to provide a path for the transfer air. The proposed change is also intended to get rid of a wasteful common practice: specifying excessive exhaust airflow by selecting hoods that are not listed or have not been subjected to a recognized performance test. The exhaust airflow flow rates in Table C403.2.7 are 30% below the minimum airflow rates in ASHRAE Standard 154-2003.

ASHRAE Research Project 1202 shows that hoods listed per UL Standard 710 and/or are engineered and tested per ASTM/ANSI 1704 have exhaust rates that are at least 30% less than the exhaust airflow requirements for unlisted or untested hoods. The intent is to conserve energy through the use of engineered hoods or performance based hoods that have been validated based on consensus standard test methods it should be noted that ASHRAE research has not demonstrated that exhaust rate reductions substantially beyond the 30% can or should be recommended at this time. This requirement should not increase first cost and in many cases will reduce first cost through downsizing of exhaust, supply and cooling equipment.

The 5,000 CFM threshold recognizes small restaurants. In addition makeup air can be fully conditioned. As a result there are now cost effective opportunities to reduce energy with demand ventilation systems or energy recovery devices.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Mark Terzigni, Sheet Metal and Air Conditioning Contractors' National Association (SMACNA) (mterzigni@smacna.org)

Delete and substitute as follows:

~~C403.2.7.1 Duct construction.~~ Ductwork shall be constructed and erected in accordance with the *International Mechanical Code*.

~~C403.2.7.1.1 Low-pressure duct systems.~~ All longitudinal and transverse joints, seams and connections of supply and return ducts operating at a static pressure less than or equal to 2 inches water gauge (w.g.) (500 Pa) shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic plus embedded fabric systems or tapes installed in accordance with the manufacturer's installation instructions. Pressure classifications specific to the duct system shall be clearly indicated on the construction documents in accordance with the *International Mechanical Code*.

Exception: Continuously welded and locking type longitudinal joints and seams on ducts operating at static pressures less than 2 inches water gauge (w.g.) (500 Pa) pressure classification.

~~C403.2.7.1.2 Medium-pressure duct systems.~~ All ducts and plenums designed to operate at a static pressure greater than 2 inches water gauge (w.g.) (500 Pa) but less than 3 inches w.g. (750 Pa) shall be insulated and sealed in accordance with Section C403.2.7. Pressure classifications specific to the duct system shall be clearly indicated on the construction documents in accordance with the *International Mechanical Code*.

~~C403.2.7.1.3 High-pressure duct systems.~~ Ducts designed to operate at static pressures in excess of 3 inches water gauge (w.g.) (750 Pa) shall be insulated and sealed in accordance with Section C403.2.7. In addition, ducts and plenums shall be leak-tested in accordance with the SMACNA *HVAC Air Duct Leakage Test Manual* with the rate of air leakage (CL) less than or equal to 6.0 as determined in accordance with Equation 4-5.

$$CL = F/P^{0.65} \text{ (Equation 4-5)}$$

where:

F = The measured leakage rate in cfm per 100 square feet of duct surface.

P = The static pressure of the test.

Documentation shall be furnished by the designer demonstrating that representative sections totaling at least 25 percent of the duct area have been tested and that all tested sections meet the requirements of this section.

C403.2.8 Duct construction Ductwork shall be constructed and erected in accordance with the *International Mechanical Code*

C403.2.8.1 Sealing requirements. Ductwork shall meet Seal Class A as defined below

Seal Class A requires that all joints, seams, and penetrations be sealed.

Exceptions:

1. Joints, seams, and penetrations where sealing would void listings, warranties, or inhibit proper use of the device.
2. Spiral seams.
3. Joints, seams, and penetrations sealed by gaskets.
4. Sheet metal screws.
5. Continuously welded seams.
6. Ductwork exposed to view and located in conditioned space.

Sealants shall comply with the *International Mechanical Code*.

C403.2.8.2 Duct air leakage testing. Ductwork shall be leak tested in accordance with *SMACNA HVAC Air Duct Leakage Test Manual* with the following requirements:

20 percent of the ductwork, based on surface area, shall be tested for air leakage. If the tested sections pass, the testing concludes.

If the tested sections fail, the deficiencies shall be corrected, and an additional 20 percent of the ductwork, based on surface area, shall be tested for air leakage. If the tested sections pass the testing concludes.

If the additional tested sections fail, the deficiencies shall be corrected, and the remainder of the ductwork shall be tested for air leakage and any deficiencies shall be corrected.

The acceptable rate of air leakage shall be determined in accordance with Equation 4-5

$$F = C_L \times P^{0.65} \quad \text{(Equation 4-5)}$$

where:

F = the measured leakage rate in cfm per 100 square feet of duct surface.

C_L = the leakage class which is less than or equal to 4 cfm per 100 square feet of duct surface area @ 1 in. w.g.

P = the static pressure of the test (in. w.g.) which cannot exceed the lowest designed operating pressure of any portion of the tested section

Exceptions: Leakage testing in accordance with this section is not required for the following:

1. Ductwork that is located in conditioned space
2. Ductwork subject to other leakage tests in accordance with the *International Mechanical Code*, *International Building Code* or *International Fire Code*
3. Exhaust ductwork used for any application other than odor removal

Reason: The above proposal properly addresses duct air leakage testing in a practical and beneficial manner.

1. Allows duct at any pressure to be leak tested
2. Reduces the allowable leakage from class 6 to class 4 – 33% reduction
3. Requires that essentially all duct be sealed to the most stringent seal class “a”
4. Provides direction if there is a test failure and requires remediation
5. Requires additional testing, up to 100% of the duct when warranted, which balances cost and effectiveness
6. Reduces energy usage without excessive requirements
7. This is a significant improvement over the existing requirements

Cost Impact: The code change proposal may increase the cost of construction depending on the specific project. SMACNA believes that this approach is the best balance between cost and reducing energy consumption.

C403.2.7.1-EC-TERZIGNI.doc

CE222 – 13

C403.2.7.1.1

Proponent: Vickie Lovell InterCode Inc. representing DuctMate Industries (vickie@intercodeinc.com)

Revise as follows:

C403.2.7.1.1 Low-pressure duct systems. All longitudinal and transverse joints, seams and connections of supply and return ducts operating at a static pressure less than or equal to 2 inches water gauge (w.g.) (500 Pa) shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus embedded- fabric systems or tapes installed in accordance with the manufacturer's installation instructions. Pressure classifications specific to the duct system shall be clearly indicated on the construction documents in accordance with the *International Mechanical Code*.

Exception: ~~Continuously welded and locking type longitudinal joints and seams on ducts operating at static pressures less than 2 inches water gauge (w.g.) (500 Pa) pressure classification.~~ For ducts having a static pressure classification of less than 2 inches of water column (500 Pa), additional closure systems shall not be required for continuously welded joints and seams and locking-type joints and seams of other than the snap-lock and button-lock types.

Reason: This proposed text is derived from a revision to the International Mechanical Code that was proposed by the PMG Code Action Committee in M151-12 and was approved by the voting membership in Portland for the 2015 IMC.

Unless sealant or a gasket is used, snap-lock and button-lock type seams will leak significantly. The current exception attempted to prevent unnecessary sealing for joints and seams that leak very little or not at all, but it went too far by including all locking type joints and seams. Some locking joints are leak proof such as mechanically folded seams used for spiral seam duct, but this is not true for all locking joints.

The purpose of this code change is to create consistency between the IMC and the IECC.

Cost Impact: The code change proposal will not increase the cost of construction.

CE222-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C403.2.7.1.1-EC-LOVELL.doc

CE223 – 13

C403.2.7.1.1

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C403.2.7.1.1 Low-pressure duct systems. All longitudinal and transverse joints, seams and connections of supply and return ducts operating at a static pressure less than or equal to 2 inches water gauge shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems or tapes installed in accordance with the manufacturer's installation instructions. Pressure classifications specific to the duct system shall be clearly indicated on the construction documents in accordance with the *International Mechanical Code*.

Exception: ~~Continuously welded and locking-type longitudinal joints and seams need not be sealed as specified in this section on ducts operating at static pressures less than 2 inches water gauge (w.g.) (500 Pa) pressure classification.~~

Reason: This proposal clarifies that locked joint construction methods for duct systems meet the code for longitudinal seams. The requirement clearly allows welded longitudinal seams to be acceptable, so that is not needed in the exception. As currently stated in the exception, it might be interpreted that the longitudinal seam must be both welded and locking. That is clearly not the intent, as welding and locking together are not typical duct sealing approaches.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C403.2.7.1.1-EC-WILLIAMS.doc

CE224 – 13

C403.2.7.1.1

Proponent: Amanda Hickman, InterCode Inc. representing DuctMate Industries
(amanda@intercodeinc.com)

Revise as follows:

C403.2.7.1.1 Low-pressure duct systems. All longitudinal and transverse joints, seams and connections of supply and return ducts operating at a static pressure less than or equal to 2 inches water gauge (w.g.) (500 Pa) shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus embedded- fabric systems or tapes installed in accordance with the manufacturer's installation instructions. Pressure classifications specific to the duct system shall be clearly indicated on the construction documents in accordance with the *International Mechanical Code*.

~~**Exception:** Continuously welded and locking type longitudinal joints and seams on ducts operating at static pressures less than 2 inches water gauge (w.g.) (500 Pa) pressure classification.~~

Reason: The requirements for low pressure duct sealing were clarified in the International Mechanical Code in M151-12 (proposed by the PMG Code Action Committee). M151-12 was approved by the voting membership in Portland for the 2015 IMC.

Currently, low pressure duct sealing is addressed in the IMC, two places in the IECC, and in the IRC. Identical language in the IECC is not necessary since it defers to the IMC and the IRC (for residential mechanical).

If the code sections in the IMC, IRC, and IECC are not maintained cycle after cycle, inconsistencies can develop between the sections. It is more efficient to simply eliminate the sections altogether in the IECC since they are redundant.

A similar proposal is being submitted to the 2015 IECC residential chapter for consistency.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

C403.2.7.1.3-EC-WILLIAMS.doc

CE226 – 13

403.2.7.1.3

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferugson@ashrae.org)

Revise as follows:

C403.2.7.1.3 High-pressure duct systems. All ducts and plenums designed to operate at static pressures in excess of 3 inches water gauge (750 Pa) shall be insulated and sealed in accordance with Section C403.2.7. In addition, ducts and plenums shall be leak tested in accordance with the SMACNA HVAC Air Duct Leakage Test Manual with the rate of air leakage (CL) less than or equal to ~~6.0~~ 4.0 as determined in accordance with Equation 4-5.

$$CL = F/P^{0.65} \quad \text{(Equation 4-5)}$$

where:

F = The measured leakage rate in cfm per 100 square feet of duct surface.

P = The static pressure of the test.

Documentation shall be furnished by the designer demonstrating that representative sections totaling at least 25 percent of the duct system area have been tested and that all tested sections meet the requirements of this section.

Reason: Consistency with the provisions in Section C403.2.7.1.2. In addition ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, has been revised to limit the air leakage rate to 4.0. The change ensures continued consistency between the IECC and standard 90.1-2010.

Cost Impact: The code change proposal will not increase the cost of construction.

CE227 – 13

C403.2.8 (NEW)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Add new text as follows:

C403.2.8 Laboratory exhaust systems. Buildings with laboratory exhaust systems having a total exhaust rate greater than 5,000 cfm shall be provided with at least one of the following:

1. A VAV laboratory exhaust and room supply system capable of reducing exhaust and makeup air flow rates to the minimum required in the *International Mechanical Code*
2. A VAV laboratory exhaust and room supply system capable of reducing exhaust and makeup air flow rates by at least 50 percent of design condition.
3. A heat recovery system to precondition makeup air from laboratory exhaust with at least a 50 percent sensible recovery effectiveness.
- 3.4. Direct makeup (auxiliary) air supply equal to at least 75 percent of the exhaust air flow rate that is not heated above room setpoint or cooled below room setpoint and does not utilize non-adiabatic humidification.

Reason: For consistency with Standard 90.1-2010. Considering that the IECC Commercial Provisions are intended to be technically compatible with that standard to facilitate adoption and implementation, ASHRAE is interested in keeping 2012 IECC Commercial Provisions aligned with ANSI/ASHRAE/IES Standard 90.1-2010.

Cost Impact: The code change proposal will not increase the cost of construction.

CE227-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C403.2.8 (NEW)-EC-FERGUSON.doc

CE228 – 13

C403.2.8.1

Proponent: Tim Manz, City of Blaine, MN, representing the Association of Minnesota Building Officials (tmanz@ci.blaine.mn.us)

Revise as follows:

C403.2.8.1 Protection of piping insulation. Piping insulation ~~exposed to weather~~ shall be protected from damage, including that due to sunlight, moisture, equipment maintenance and wind, and shall provide shielding from solar radiation that can cause degradation of the material. Adhesive tape shall not be permitted. In addition, piping insulation shall comply with the following:

1. Insulation exposed to weather shall be suitable for outdoor service and shall be protected by aluminum, sheet metal, painted canvas, plastic cover or other similar materials approved by the code official. Cellular foam insulation shall be protected as above or painted with a coating that is water retardant and provides shielding from solar radiation that can cause degradation of the material.
2. Insulation covering chilled-water piping or refrigerant suction piping located outside the conditioned space shall include a vapor retardant located outside the insulation ,or the insulation shall be installed at a thickness that qualifies as a Class I or Class II vapor retarder.

Reason: The proposed code change incorporates language from ASHRAE Standard 90.1-2010 that specifies protection for piping insulation where it is subject to damage, whether inside or outside the building. These changes are necessary to ensure that the pipe insulation and vapor retarder are maintained throughout the life of the system and are not destroyed prematurely by water or moisture intrusion which may deteriorate the insulation and/or vapor retarder. This results in energy efficient and durable piping systems.

Cost Impact: The code change proposal will increase the cost of construction.

CE230 – 13

C403.2.8.2 (NEW), R403.3.2 (NEW) (IRC N1103.2 (NEW))

Proponent: Howard Ahern, Airex Mfg., representing self (howard.ahern@airexmfg.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Add new text as follows:

C403.2.8.2 Chilled water and refrigerant suction piping. Insulation covering chilled water piping and refrigerant suction piping located outside the conditioned space shall include a Class I or Class II vapor retarding facing located outside the insulation. Piping insulation protection shall be removable and reusable. Piping insulation shall be in accordance with Section C403.2.8.1.

PART II – IECC-RESIDENTIAL PROVISIONS

Add new text as follows:

R403.3.2 (N1103.3.2) Refrigerant suction piping. Insulation covering refrigerant suction piping located outside the conditioned space shall include a Class I or Class II vapor-retardant facing located on the outside of the insulation. Piping insulation protection shall be removable and reusable. Piping insulation shall be in accordance with Section R403.3.

Reason: The use of Vapor Retarders with suction line pipe insulation has been a requirement of the ASHRAE 90.1 Standard going back to 2004. This code change is needed need to specify requirements for Chilled water and refrigerant suction piping. This change will ensure steady, long-term thermal performance, and prevent the transference of moisture. Preventing moisture exchange will help prevent Wet insulation and maintain system integrity, sustainability, and energy savings of the insulation. Preventing moisture transference will also help prevent the growth of mold.

All AC units require periodic maintenance. The frequency varies with how hard the unit operates, exterior temperature, preventive maintenance program, and many others. In every occasion, maintenance provides an excuse for the suction line insulation to be touched and or removed. Pipe insulation removal from suction lines often results in damage to the insulation itself requiring replacement.

Protection for the suction piping insulation therefore need to be removable and reusable. This will help insure system integrity and sustainability of the pipe insulation, reducing replacement.

Cost Impact: This code change will increase cost; For the vapor retarders only and not will not increase cost in those jurisdictions that use ASHRAE Standard 90.1 as vapor retarders has been part of ASHRAE Standard 90.1 since 2004.

C403.2.10, C403.2.10.1, Table C403.2.10.1(1), Table C403.2.10.1(2)

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

Delete without substitution as follows:

~~C403.2.10 Air system design and control.~~ Each HVAC system having a total fan system motor nameplate horsepower (hp) exceeding 5 horsepower (hp) (3.7 kW) shall meet the provisions of Sections C403.2.10.1 through C403.2.10.2.

~~C403.2.10.1 Allowable fan floor horsepower.~~ Each HVAC system at fan system design conditions shall not exceed the allowable fan system motor nameplate hp (Option 1) or fan system bhp (Option 2) as shown in Table C403.2.10.1(1). This includes supply fans, return/relief fans, and fan-powered terminal units associated with systems providing heating or cooling capability. Single zone variable-air-volume systems shall comply with the constant volume fan power limitation.

~~Exception:~~ The following fan systems are exempt from allowable fan floor horsepower requirement.

- ~~1. Hospital, vivarium and laboratory systems that utilize flow control devices on exhaust and/or return to maintain space pressure relationships necessary for occupant health and safety or environmental control shall be permitted to use variable volume fan power limitation.~~
- ~~2. Individual exhaust fans with motor nameplate horsepower of 1 hp or less.~~

~~C403.2.10.2 Motor nameplate horsepower.~~ For each fan, the selected fan motor shall be no larger than the first available motor size greater than the brake horsepower (bhp). The fan brake horsepower (bhp) shall be indicated on the design documents to allow for compliance verification by the code official.

~~Exceptions:~~

- ~~1. For fans less than 6 bhp (4413 W), where the first available motor larger than the brake horsepower has a nameplate rating within 50 percent of the bhp, selection of the next larger nameplate motor size is allowed.~~
- ~~2. For fans 6 bhp (4413 W) and larger, where the first available motor larger than the bhp has a nameplate rating within 30 percent of the bhp, selection of the next larger nameplate motor size is allowed.~~

**TABLE C403.2.10.1(1)
FAN POWER LIMITATION**

**TABLE C403.2.10.1(2)
FAN POWER LIMITATION PRESSURE DROP ADJUSTMENT**

Reason: Checking the fan horsepower is impractical. This part of the code is seldom enforced, or even taught in class.

Cost Impact: The code change proposal will not increase the cost of construction.

CE231-13

C403.2.10-EC-CONNER.doc

CE232 – 13

C403.2.10, C403.2.10.3 (NEW)

Proponent: Michael Ivanovich, AMCA International (mivanovich@amca.org)

Revise as follows:

C403.2.10 Air system design and control. Each HVAC system having a total fan system motor nameplate horsepower (hp) exceeding 5 horsepower (hp) (3.7 kW) shall meet the provisions of Sections C403.2.10.1 through ~~C403.2.10.2~~ C403.2.10.3.

C403.2.10.3 Fan efficiency verification. The efficiency of fans shall be verified through certification under an approved certification program or, where no certification program exists, the fan efficiency ratings shall be supported by data furnished by the manufacturer.

Reason: The energy usage of fans is under increasing scrutiny by designers, building owners, commissioning agents, code enforcement professionals, federal agencies, and other code users. This code change proposal requires fan manufacturers to provide relevant information related to the energy efficient performance of their products. The proposed language has been extracted from the IECC section on HVAC equipment in Section C403.2.3 as an equipment performance requirement. It is applicable to fan products.

Cost Impact: The code change proposal will not increase the cost of construction.

C403.2.10-EC-IVANOVICH.doc

CE233 – 13

C202 (NEW), C403.2.10, C403.2.10.3 (NEW), Chapter 5

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C403.2.10 Air system design and control. Each HVAC system having a total fan system motor nameplate horsepower (hp) exceeding 5 horsepower (hp) (3.7 kW) shall meet the provisions of Sections C403.2.10.1 through ~~C403.2.10.2~~ C403.2.10.3.

C403.2.10.3 Fan efficiency. Fans shall have a *fan efficiency grade* (FEG) of at least 67 when determined in accordance with AMCA 205 by an *approved*, independent testing laboratory. In addition the total efficiency of the fan at the design point of operation shall be within 15 percentage points of the maximum total efficiency of the fan.

Exceptions:

1. Single fans with a motor nameplate horsepower of 5 hp or less, unless Exception 2 applies.
2. Multiple fans in series or parallel (e.g. fan arrays) that have a combined motor *nameplate horsepower* of 5 hp or less and are operated as the functional equivalent of a single fan.
3. Fans that are part of equipment covered under Section C403.2.3.
4. Fans included in an equipment package certified by an *approved agency* for air or energy performance.
5. Powered wall/roof ventilators.
6. Fans outside the scope of AMCA 205.
7. Fans that are intended to operate during only emergency conditions.

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

FAN EFFICIENCY GRADE (FEG). A numerical rating identifier that specifies the fan's aerodynamic ability to convert shaft power, or impeller power in the case of a direct driven fan, to air power. FEGs are based on fan peak (optimum) energy efficiency that indicates the quality of the fan energy usage and the potential for minimizing the fan energy usage.

Add new standard to Chapter 5 as follows:

AMCA

205-12 Energy Efficiency Classification for Fans

Reason: ASHRAE/IES Standard 90.1, which is adopted by reference as an alternative to the IECC Commercial Provisions, has been revised to address the minimum efficiency of air system fans. The change ensures continued consistency between the IECC Commercial Provisions and standard 90.1.

The IECC Commercial Provisions do not currently have any provisions for fan efficiency. It is important and appropriate for the IECC Commercial Provisions to address this issue. The Section C 403.2.10 of the IECC Commercial Provisions addresses air system design and control and should be updated to include the criteria from standard 90.1-2010 as enhanced by this addendum in order to retain technical compatibility between the IECC Commercial Provisions and standard 90.1.

Fan power limits have been in the code for some time. These limits place restrictions on the design of systems and the amount of fan energy utilized. However the code has not had a requirement for a minimum fan efficiency. A fan efficiency metric was developed with fans being classified based on fan efficiency grades. This system is designated in AMCA 205-12.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, AMCA 205-2012 Energy Efficiency Classification for Fans,

with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

Note: The term 'fan efficiency grade' is currently defined in the IgCC. The wording of this proposal is identical to the IgCC definition.

	Assembly:	ASF	AMF	DF

C403.2.10-EC-FERGUSON.doc

CE234 – 13

C202 (NEW), C403.2.10, C403.2.10.3 (NEW), Chapter 5

Proponent: Amanda Hickman, InterCode Incorporated, representing AMCA International (amanda@intercodeinc.com)

Revise as follows:

C403.2.10 Air system design and control. Each HVAC system having a total fan system motor nameplate horsepower (hp) exceeding 5 horsepower (hp) (3.7 kW) shall meet the provisions of Sections C403.2.10.1 through ~~C403.2.10.2~~ C403.2.10.3.

C403.2.10.3 Fan efficiency. Fans shall have a fan efficiency grade (FEG) of at least 67 when determined in accordance with AMCA 205 by an approved, independent testing laboratory and labeled by the manufacturer. The total efficiency of the fan at the design point of operation shall be within 15 percentage points of the maximum total efficiency of the fan.

Exceptions: The following fans are not required to have a fan efficiency grade:

1. Fans of 5 hp or less as follows:
 - 1.1 Single fan with a motor nameplate horsepower of 5 hp or less, unless Exception 1.2 applies.
 - 1.2 Multiple fans in series or parallel that have a combined motor nameplate horsepower of 5 hp or less and are operated as the functional equivalent of a single fan.
2. Fans that are part of equipment covered under Section C403.2.3.
3. Fans included in an equipment package certified by an *approved agency* for air or energy performance.
4. Powered wall/roof ventilators.
5. Fans outside the scope of AMCA 205.
6. Fans that are intended to operate only during emergency conditions.

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

FAN EFFICIENCY GRADE (FEG). A numerical rating identifier that specifies the fan's aerodynamic ability to convert shaft power, or impeller power in the case of a direct driven fan, to air power. FEGs are based on fan peak (optimum) energy efficiency that indicates the quality of the fan energy usage and the potential for minimizing the fan energy usage.

Add new standard to Chapter 5 as follows:

AMCA

AMCA 205-12 Energy Efficiency Classification for Fans

Reason: The IECC Commercial Provisions do not currently have any provisions for fan efficiency. ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, has been revised to address the minimum efficiency of air system fans.

C403.2.10 of the IECC Commercial Provisions addresses air system design and control and should be updated to include the criteria from ASHRAE Standard 90.1-2010 as enhanced by this addendum in order to retain technical compatibility between the IECC Commercial Provisions and standard 90.1. This change ensures continued consistency between the two documents.

Certified FEG ratings are calculated from test data taken during fan air-performance tests as part of routine participation in routine certified ratings program administered by AMCA International. Certified FEG ratings will not create a burden to designers and will not significantly increase cost of construction because dozens of fan manufacturers have already certified FEG ratings for hundreds of fan models.

Careful consideration has been given to the exceptions which are intended to provide relief for fans in certified packaged equipment, and fan types and sizes that do not easily conform to AMCA 205, or which, by virtue of their operating pressure, could lead to unwarranted incremental costs.

Cost Impact: The code change proposal will not significantly increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, AMCA 205-2012 Energy Efficiency Classification for Fans, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

Note: The term 'fan efficiency grade' is currently defined in the IgCC. The wording of this proposal is identical to the IgCC definition.

	Assembly:	ASF	AMF	DF

C403.2.10.3 (NEW)-EC-HICKMAN.doc

CE235 – 13

C403.2.10.1

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C403.2.10.1 Allowable fan floor horsepower. Each HVAC system at fan system design conditions shall not exceed the allowable *fan system motor nameplate hp* (Option 1) or *fan system bhp* (Option 2) as shown in Table C403.2.10.1(1). This includes supply fans, exhaust fans, return/relief fans, and fan-powered terminal units associated with systems providing heating or cooling capability. Single zone variable-air-volume systems shall comply with the constant volume fan power limitation.

Exceptions: ~~The following fan systems are exempt from allowable fan floor horsepower requirement.~~

1. Hospital, vivarium and laboratory systems that utilize flow control devices on exhaust and/or return to maintain space pressure relationships necessary for occupant health and safety or environmental control shall be permitted to use variable volume fan power limitation.
2. Individual exhaust fans with motor nameplate horsepower of 1 hp or less2. Individual exhaust fans with motor nameplate horsepower of 1 hp or less are exempt from the allowable fan horsepower requirement.

Reason: This proposal involves editorial clarification and simplification of provisions for allowable fan horsepower. The proposal inserts the words "exhaust fans" that are missing from C403.2.10.1, even though exception 2 is for exhaust fans and the definition for *fan system motor nameplate hp* referred to in the section include exhaust fans. The parent section is clear as to scope (fan horsepower) however the two exceptions have different basis. The first exception allows use of the less strict variable fan formula from the table for certain constant volume systems, while what is covered in the second exemption is a blanket exemption. It is appropriate to delete the introductory reason and provide the extent of exception separately for each exception. The term "floor" does not appear to be appropriate within the context of this section. The intent is to limit fan horsepower so the term floor is removed.

Cost Impact: The code change proposal does not increase the cost of construction.

	Assembly:	ASF	AMF	DF

C403.2.10.1-EC-WILLIAMS.doc

CE236 – 13

Table C403.2.10.1(2)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

TABLE C403.2.10.1(2)
FAN POWER LIMITATION PRESSURE DROP ADJUSTMENT

DEVICE	ADJUSTMENT
Credits	
Fully ducted return and/or exhaust air systems	0.5 inch w.c. (2.15 in w.c. for laboratory and vivarium systems)
Return and/or exhaust air flow control devices	0.5 inch w.c.
Exhaust filters, scrubbers, or other exhaust treatment.	The pressure drop of device calculated at fan system design condition
Particulate filtration credit: MERV 9 thru 12	0.5 inch w.c.
Particulate filtration credit: MERV 13 thru 15	0.9 inch. w.c.
Particulate filtration credit: MERV 16 and greater and electronically enhanced filters	Pressure drop calculated at 2x clean filter pressure drop at fan system design condition.
Carbon and other gas-phase air cleaners	Clean filter pressure drop at fan system design condition.
Biosafety cabinet	Pressure drop of device at fan system design condition.
Energy recovery device, other than coil runaround loop	(2.2 x energy recovery effectiveness) – 0.5 inch w.c. for each airstream
Coil runaround loop	0.6 inch w.c. for each airstream
Evaporative humidifier/cooler in series with another cooling coil	Pressure drop of device at fan system design conditions
Sound attenuation section (<u>fans serving spaces with design background noise goals below NC35</u>)	0.15 inch w.c.
Exhaust system serving fume hoods	0.35 inch w.c.
Laboratory and vivarium exhaust systems in high-rise buildings	0.25 inch w.c./100 feet of vertical duct exceeding 75 feet
<u>Deductions</u>	
<u>Systems without central cooling device</u>	<u>- 0.6 in. w.c.</u>
<u>Systems without central heating device</u>	<u>- 0.3 in. w.c.</u>
<u>Systems with central electric resistance heat</u>	<u>- 0.2 in. w.c.</u>

w.c. = water column

For SI: 1 inch w.c. = 249 Pa, 1 inch = 25.4 mm.

Reason: This proposal does the following:

1. Adds a requirement that the sound attenuation credit is only available if there are background noise criteria requirements.
2. Adds a deduction for systems without any central heating or cooling device. Since the base level fan power allowances include the assumption that those components are present, the deduction is warranted for those systems that do not include those component.
3. Adds a deduction for systems with electric resistance heating. Since the base level fan power allowances include the assumption that hydronic heating coils are present, systems with electric resistance heating coils that have less pressure drop do not need the full allowance assumed in the base level.

The change ensures continued consistency between the IECC and standard 90.1-2010.

Cost Impact: The code change proposal will not increase the cost of construction.

CE236-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C403.2.10.1(2)T-EC-FERGUSON.doc

CE237 – 13

C403.2.10.2

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C403.2.10.2 Motor nameplate horsepower. For each fan, the fan brake horse power shall be indicated on the construction documents and the selected motor shall be no larger than the first available motor size greater than the following: brake horsepower. ~~The fan brake horse power shall be indicated on the design documents to allow for compliance verification by the code official.~~

Exceptions:

1. For fans less than 6 bhp (4413 W), ~~where the first available motor larger than the brake horsepower has a nameplate rating within 50 percent of the bhp, selection of the next larger nameplate motor size is allowed.~~ 1.5 times the fan brake horsepower
2. For fans 6 bhp (4413 W) and larger, ~~where the first available motor larger than the bhp has a nameplate rating within 30 percent of the bhp, selection of the next larger nameplate motor size is allowed.~~ 1.3 times the fan brake horsepower.

Reason: This proposal simplifies provisions for motor nameplate horsepower by replacing complicated exceptions with positive statements of what is required. The complex exceptions are replaced with a positive statement of what is required. This will reduce confusion over the maximum horsepower requirement and foster implementation and compliance verification.

Cost Impact: The code change proposal will not increase the cost of construction.

CE237-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C403.2.10.2-EC-WILLIAMS.doc

CE238 – 13

C403.2.10.2

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C403.2.10.2 Motor nameplate horsepower. For each fan, the selected fan motor shall be no larger than the first available motor size greater than the brake horsepower (bhp). The fan brake horsepower (bhp) shall be indicated on the design documents to allow for compliance verification by the *code official*.

Exceptions:

1. For fans less than 6 bhp (4413 W), where the first available motor larger than the brake horsepower has a nameplate rating within 50 percent of the bhp, selection of the next larger nameplate motor size is allowed.
2. For fans 6 bhp (4413 W) and larger, where the first available motor larger than the bhp has a nameplate rating within 30 percent of the bhp, selection of the next larger nameplate motor size is allowed.
3. Systems complying with Section C403.2.10.1 *fan system motor nameplate hp* (Option 1).

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, has been revised to eliminate unnecessary documentation of fan bhp in certain cases. The change ensures continued consistency between the IECC Commercial Provisions and standard 90.1-2010.

Cost Impact: The code change proposal will not increase the cost of construction.
