<u>SOC.SC.I</u>	<u>Service Over Counter</u>	<u>Self Contained</u>	<u>Ice Cream</u>	<u>$1.76 \times TDA + 0.36$</u>	
<u>HCS.SC.I</u>	<u>Horizontal Solid Door</u>	<u>Self Contained</u>	<u>Ice Cream</u>	<u>$0.38 \times V + 0.88$</u>	

^aV = Volume of the case, as measured in accordance with Appendix C of AHRI 1200.

^bTDA = Total display area of the case, as measured in accordance with Appendix D of AHRI 1200.

^cEquipment class designations consist of a combination (in sequential order separated by periods(AAA).(BB).(C)) of:

(AAA) An equipment family code where:

VOP=vertical open

SVO=semivertical open

HZO=horizontal open,

VCT=vertical transparent doors

VCS=vertical solid doors

HCT=horizontal transparent doors

HCS=horizontal solid doors

SOC=service over counter

(BB) An operating mode code, either

RC=remote condensing, or

SC=self-contained).

(C) A rating temperature code, either:

M=medium temperature (38 °F)

L=low temperature (0 °F), or

I=ice-cream temperature (15 °F).

For example, "VOP.RC.M" refers to the "vertical open, remote condensing, medium temperature" equipment class.

Add new standards to Chapter 5 as follows:

AHRI

1200-10 Performance Rating of Commercial Refrigerated Display Merchandisers and Storage Cabinets.

AHAM

HRF-1 2007 Energy, Performance and Capacity of Household Refrigerators, Refrigerator-Freezers and Freezers

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, has been revised to address energy efficiency opportunities available from commercial refrigeration and freezing equipment. In

buildings where such equipment is located it contributes to the energy use of the building and now that there is a test procedure for efficiency of this equipment and minimum efficiencies are in standard 90.1-2010 it seems reasonable to include them in the IECC, noting this type of equipment is addressed in the IMC as to health and life safety. The change ensures continued consistency between the IECC and standard 90.1-2010.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, AHRI 1200-2010 Performance Rating of Commercial Refrigerated Display Merchandisers and Storage Cabinets, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

A review of the standard proposed for inclusion in the code, AHAM-HRF-1-2007 Energy, Performance and Capacity of Household Refrigerators, Refrigerator-Freezers and Freezers, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

C403.2.12 (NEW) #1-EC-FERGUSON.doc

CE240 – 13

C202 (NEW), C403.2.12 (NEW), C403.2.13 (NEW), C403.5 (NEW), C403.5.1 (NEW), C403.5.2 (NEW)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Add new text as follows:

C403.2.12 Walk-in Coolers and Walk-in Freezers. Site assembled or site constructed *walk-in coolers* and *walk-in freezers* shall comply with the following:

1. Automatic door closers shall be provided that fully close walk-in doors that have been closed to within 1 inch of full closure.

Exception: Closers are not required for doors over 3 feet 9 inches wide or 7 feet tall.

2. Doorways shall be provided with strip doors, curtains, spring-hinged doors, or other method of minimizing infiltration when the doors are open.
3. Walls shall be provided with insulation having a thermal resistance of not less than R-25, ceilings shall be provided with insulation having a thermal resistance of not less than R-25 and doors of *walk-in coolers* and *walk-in freezers* shall be provided with insulation having a thermal resistance of not less than R-32.

Exception: Insulation is not required for glazed portions of doors or at structural members associated with the walls, ceiling or door frame.

4. The floor of *walk-in freezers* shall be provided with insulation having a thermal resistance of not less than R-28.
5. Evaporator fan motors that are less than 1 horsepower and less than 460 volts shall be electronically commutated motors or 3-phase motors.
6. Light sources shall have an efficacy of not less than 40 lumens per Watt, including any ballast losses or shall be provided with a device that automatically turns off the lights within 15 minutes of when the *walk-in cooler* or *walk-in freezer* was last occupied.
7. Transparent reach-in doors for and windows in opaque *walk-in freezer* doors shall be provided with triple-pane glass having the interstitial spaces filled with inert gas or provided with heat-reflective treated glass.
8. Transparent reach-in doors for and windows in opaque *walk-in cooler* doors shall be double-pane heat-reflective treated glass having the interstitial space gas filled;
9. Anti-sweat heaters that are not provided with anti-sweat heater controls shall have a total door rail, glass, and frame heater power draw not greater than 7.1 Watts per square foot of door opening for *walk-in freezers*, and not greater than 3.0 Watts per square foot of door opening for *walk-in coolers*.
10. Anti-sweat heater controls shall be capable of reducing the energy use of the anti-sweat heater as a function of the relative humidity in the air outside the door or to the condensation on the inner glass pane.

11. Condenser fan motors that are less than 1 horsepower in capacity shall be of the electronically commutated or permanent split capacitor-type or shall be 3-phase motors.

Exception: Fan motors in *walk-in coolers* and *walk-in freezers* combined in a single enclosure greater than 3,000 square feet in floor area are exempt.

C403.2.13 Refrigerated display cases. Site assembled or site constructed refrigerated display cases shall comply with the following:

1. Lighting in refrigerated display cases and glass doors installed on walk-in coolers and freezers shall be controlled by one of the following:
 - 1.1 Automatic time switch controls to turn off lights during non-business hours. Timed overrides for display cases or walk-in coolers and freezers may be used to turn the lights on for up to one hour and shall automatically time out to turn the lights off.
 - 1.2 Motion sensor controls on each display case or walk-in door section that reduce lighting power by at least 50 percent within 3 minutes after the area within the sensor range is vacated. how about is 'unoccupied' as you have used in other proposals.
2. All low temperature display cases shall incorporate temperature based defrost termination control with a time limit default. The defrost cycle shall terminate first on an upper temperature limit breach and second upon a time limit breach.
3. Anti-sweat heater controls shall reduce the energy use of the anti-sweat heater as a function of the relative humidity in the air outside the door or to the condensation on the inner glass pane.

C403.5 Refrigeration systems Refrigerated display cases, *walk-in coolers* or *walk-in freezers* that are served by remote compressors and remote condensers not located in a *condensing unit*, shall meet the requirements of Section C403.5 and C403.5.2.

Exception: Systems where the working fluid in the refrigeration cycle goes through both subcritical and supercritical states (transcritical) or systems that use ammonia refrigerant are exempt.

C403.5.1 Condensers serving refrigeration systems. Fan-powered condensers shall comply with the following:

1. The design *saturated condensing temperatures* for air-cooled condensers shall not exceed the design dry bulb temperature plus 10°F for *low temperature refrigeration systems*, and the design dry bulb temperature plus 15°F for *medium temperature refrigeration systems* where the *saturated condensing temperature* for blend refrigerants shall be determined using the average of liquid and vapor temperatures as converted from the condenser drain pressure
2. Condenser fan motors that are less than 1 horsepower shall use electronically commutated motors, permanent split capacitor-type motors or 3-phase motors.
3. All condenser fans for air-cooled condensers, evaporatively cooled condensers, air or water cooled fluid coolers or cooling towers shall reduce fan motor demand to no more than 30% of design wattage at 50% of design air volume, and incorporate one of the following continuous variable speed fan control approaches:
 - 3.1 Refrigeration system condenser control for air-cooled condensers shall use variable setpoint control logic to reset the condensing temperature setpoint in response to ambient drybulb temperature.

3.2 Refrigeration system condenser control for evaporatively cooled condensers shall use variable setpoint control logic to reset the condensing temperature setpoint in response to ambient wetbulb temperature.

4. Multiple fan condensers shall be controlled in unison.

5. The minimum condensing temperature setpoint shall be no greater than 70°F.

C403.5.2 Compressor systems. Refrigeration compressor systems shall comply with the following:

1. Compressors and multiple-compressor systems suction groups shall include control systems that use floating suction pressure control logic to reset the target suction pressure temperature based on the temperature requirements of the attached refrigeration display cases or walk-ins.

Exception. Controls are not required for the following:

1. Single compressor systems that do not have variable capacity capability.
2. Suction groups that have a design saturated suction temperature of 30°F or higher, suction groups that comprise the high stage of a two-stage or cascade system or suction groups that primarily serve chillers for secondary cooling fluids.
2. Liquid sub-cooling shall be provided for all low temperature compressor systems with a design cooling capacity equal to or greater than 100,000 Btu/hr with a design saturated suction temperature of -10°F or lower. The sub-cooled liquid temperature shall be controlled at a maximum temperature setpoint t of 50°F at the exit of the sub-cooler using either compressor economizer (inter-stage) ports or a separate compressor suction group operating at a saturated suction temperature of 18°F or higher.
- 2.1 Insulation for liquid lines with a fluid operating temperature less than 60°F are shall comply with Table C403.2.8.
3. All compressors that incorporate internal or external crankcase heaters shall provide a means to cycle the heaters off during compressor operation.

Add new definitions as follows:

SECTION C202 GENERAL DEFINITIONS

BUBBLE POINT. The refrigerant liquid saturation temperature at a specified pressure

CONDENSING UNIT. A factory-made assembly of refrigeration components designed to compress and liquefy a specific refrigerant. The unit consists of one or more refrigerant compressors, refrigerant condensers (air-cooled, evaporatively – cooled, and/or water-cooled), condenser fans and motors (where used) and factory-supplied accessories.

REFRIGERANT DEW POINT. The refrigerant vapor saturation temperature at a specified pressure.

REFRIGERATION SYSTEM, LOW TEMPERATURE. Systems for maintaining food product in a frozen state in refrigeration applications.

REFRIGERATION SYSTEM, MEDIUM TEMPERATURE. Systems for maintaining food product above freezing in refrigeration applications.

SATURATED CONDENSING TEMPERATURE. The saturation temperature corresponding to the measured refrigerant pressure at the condenser inlet for single component and azeotropic refrigerants.

and the arithmetic average of the dew point and *bubble point* temperatures corresponding to the refrigerant pressure at the condenser entrance for zeotropic refrigerants.

WALK-IN COOLER. An enclosed storage space less than 3,000 square feet in floor area, designed to maintain the space warmer than 32°F but cooler than 55°F that has a ceiling height of not less than 7 feet

WALK-IN FREEZER. An enclosed storage space less than 3,000 square feet in floor area, designed to maintain the space at no greater than 32°F that has a ceiling height of not less than 7 feet

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, has been revised to address the energy efficiency associated with refrigeration systems and coolers. These systems and equipment are prevalent in many building types and should be addressed in the IECC because they represent an opportunity to save additional energy. The change ensures continued consistency between the IECC and standard 90.1.

Cost Impact: The code change proposal will increase the cost of construction.

C403.2.12 (NEW) #2-EC-FERGUSON.doc

CE241 – 13

C403.1, C403.3, C403.3.1.1 (NEW), C403.1.1.1, C403.3.3.1.1.2, C403.3.1.2 (NEW), C403.3.1.1.3, Table C403.3.1.1(1), Table C403.3.1.1.3(2), C403.3.1.1.4, C403.3.1.4 (NEW), C403.3.1.4.1 (NEW), C403.3.1.4.2 (NEW), C403.3.2, C403.4 through C403.4.3.5

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

C403.1 General. Mechanical systems and equipment serving the building heating, cooling or ventilating needs shall comply with Section C403.2 (referred to as the mandatory provisions) and ~~either:~~ shall comply with Sections C403.3 and C403.4 based on the equipment and systems provided.

- ~~1. Section C403.3 (Simple systems); or~~
- ~~2. Section C403.4 (Complex systems).~~

C403.3 Simple HVAC systems and equipment Economizers (Prescriptive). This section applies to buildings served by unitary or packaged HVAC equipment listed in Tables C403.2.3(1) through C403.2.3(8). ~~each serving one zone and controlled by a single thermostat in the zone served. It also applies to two-pipe heating systems serving one or more zones, where no cooling system is installed~~

C403.3.1 Economizers. Each cooling system that has a fan shall include either an air or water economizer meeting the requirements of Sections C403.3.1.1 through C403.3.1.1.4.

Exception: Economizers are not required for the systems listed below.

1. Individual fan-cooling units with a supply capacity less than the minimum listed in Table C403.3.1(1).
2. Where more than 25 percent of the air designed to be supplied by the system is to spaces that are designed to be humidified above 35°F (1.7 °C) dew-point temperature to satisfy process needs.
3. Systems that serve *residential* spaces where the system capacity is less than five times the requirement listed in Table C403.3.1(1).
4. Systems expected to operate less than 20 hours per week.
5. Where the use of *outdoor air* for cooling will affect supermarket open refrigerated casework systems.
6. Where the cooling *efficiency* meets or exceeds the *efficiency* requirements in Table C403.3.1(2).

C403.3.1.1 Integrated economizer control. Economizer systems shall be integrated with the mechanical cooling system and be capable of providing partial cooling even where additional mechanical cooling is required to meet the remainder of the cooling load.

Exceptions:

1. Direct expansion systems that include controls that reduce the quantity of *outdoor air* required to prevent coil frosting at the lowest step of compressor unloading, provided this lowest step is no greater than 25 percent of the total system capacity.
2. Individual direct expansion units that have a rated cooling capacity less than 54,000 Btu/h (15 827 W) and use nonintegrated economizer controls that preclude simultaneous operation of the economizer and mechanical cooling.

C403.3.1.2 Economizer heating system impact. HVAC system design and economizer controls shall be such that economizer operation does not increase the building heating energy use during normal operation.

Exception: Economizers on VAV systems that cause *zone* level heating to increase due to a reduction in supply air temperature.

**TABLE C403.3.1(1)
ECONOMIZER REQUIREMENTS**

CLIMATE ZONES	ECONOMIZER REQUIREMENT
1A, 1B	No requirement
2A, 2B, 3A, 3B, 3C, 4A, 4B, 4C, 5A, 5B, 5C, 6A, 6B, 7, 8	Economizers on all cooling systems ≥ 33,000 Btu/h ^a

For SI: 1 British thermal unit per hour = 0.2931 W.

- a. The total capacity of all systems without economizers shall not exceed 300,000 Btu/h per *building*, or 20 percent of its air economizer capacity, whichever is greater.

**TABLE C403.3.1(2)
EQUIPMENT EFFICIENCY
PERFORMANCE EXCEPTION FOR ECONOMIZERS**

CLIMATE ZONES	COOLING EQUIPMENT PERFORMANCE IMPROVEMENT (EER OR IPLV)
2B	10% Efficiency Improvement
3B	15% Efficiency Improvement
4B	20% Efficiency Improvement

C403.3.1.1.4 C403.3.1.3 Air economizers. Air economizers shall comply with Sections C403.3.1.1.4 through C403.3.1.1.4. C403.3.1.3.1 through C403.3.1.3.4.

C403.3.1.1.4 C403.3.1.3.1 Design capacity. Air economizer systems shall be capable of modulating *outdoor air* and return air dampers to provide up to 100 percent of the design supply air quantity as *outdoor air* for cooling.

C403.3.1.1.2 C403.3.1.3.2 Control signal. Economizer dampers shall be capable of being sequenced with the mechanical cooling equipment and shall not be controlled by only mixed air temperature.

Exception: The use of mixed air temperature limit control shall be permitted for systems controlled from space temperature (such as single-*zone* systems).

C403.3.1.1.3. C403.3.1.3.3 High-limit shutoff. Air economizers shall be capable of automatically reducing *outdoor air* intake to the design minimum *outdoor air* quantity when *outdoor air* intake will no longer reduce cooling energy usage. High-limit shutoff control types for specific climates shall be chosen from Table C403.3.1.1.3(1) C403.3.1.3.3(1). High-limit shutoff control settings for these control types shall be those specified in Table C403.3.1.1(2) C403.3.1.3.3(2).

TABLE C403.3.1.1(1) C403.3.1.3.3(1)
HIGH-LIMIT SHUTOFF CONTROL OPTIONS FOR AIR ECONOMIZERS

CLIMATE ZONES	ALLOWED CONTROL TYPES	PROHIBITED CONTROL TYPES
1B, 2B, 3B, 3C, 4B, 4C, 5B, 5C, 6B, 7, 8	Fixed dry bulb Differential dry bulb Electronic enthalpy ^a Differential enthalpy Dew-point and dry-bulb temperatures	Fixed enthalpy
1A, 2A, 3A, 4A	Fixed dry bulb Fixed enthalpy Electronic enthalpy ^a Differential enthalpy Dew-point and dry-bulb temperatures	Differential dry bulb
All other climates	Fixed dry bulb Differential dry bulb Fixed enthalpy Electronic enthalpy ^a Differential enthalpy Dew-point and dry-bulb temperatures	—

- a. Electronic enthalpy controllers are devices that use a combination of humidity and dry-bulb temperature in their switching algorithm.

TABLE C403.3.1.1.3(2) C403.3.1.3.3(2)
HIGH-LIMIT SHUTOFF CONTROL SETTING FOR AIR ECONOMIZERS

DEVICE TYPE	CLIMATE ZONE	REQUIRED HIGH LIMIT (ECONOMIZER OFF WHEN):	
		EQUATION	DESCRIPTION
Fixed dry bulb	1B, 2B, 3B, 3C, 4B, 4C, 5B, 5C, 6B, 7, 8	$T_{OA} > 75^{\circ}\text{F}$	Outdoor air temperature exceeds 75°F
	5A, 6A, 7A	$T_{OA} > 70^{\circ}\text{F}$	Outdoor air temperature exceeds 70°F
	All other zones	$T_{OA} > 65^{\circ}\text{F}$	Outdoor air temperature exceeds 65°F
Differential dry bulb	1B, 2B, 3B, 3C, 4B, 4C, 5A, 5B, 5C, 6A, 6B, 7, 8	$T_{OA} > T_{RA}$	Outdoor air temperature exceeds return air temperature
Fixed enthalpy	All	$h_{OA} > 28 \text{ Btu/lb}^a$	Outdoor air enthalpy exceeds 28 Btu/lb of dry air ^a
Electronic Enthalpy	All	$(T_{OA}, RH_{OA}) > A$	Outdoor air temperature/RH exceeds the "A" setpoint curve ^b
Differential enthalpy	All	$h_{OA} > h_{RA}$	Outdoor air enthalpy exceeds return air enthalpy
Dew-point and dry bulb temperatures	All	$DP_{OA} > 55^{\circ}\text{F}$ or $T_{OA} > 75^{\circ}\text{F}$	Outdoor air dry bulb exceeds 75°F or outside dew point exceeds 55°F (65 gr/lb)

For SI: °C = (°F - 32) × 5/9, 1 Btu/lb = 2.33 kJ/kg.

- a. At altitudes substantially different than sea level, the Fixed Enthalpy limit shall be set to the enthalpy value at 75°F and 50-percent relative humidity. As an example, at approximately 6,000 feet elevation the fixed enthalpy limit is approximately 30.7 Btu/lb.
- b. Setpoint "A" corresponds to a curve on the psychrometric chart that goes through a point at approximately 75°F and 40-percent relative humidity and is nearly parallel to dry-bulb lines at low humidity levels and nearly parallel to enthalpy lines at high humidity levels.

C403.3.1.1.4 C403.3.1.3.4 Relief of excess outdoor air. Systems shall be capable of relieving excess *outdoor air* during air economizer operation to prevent over-pressurizing the building. The relief air outlet shall be located to avoid recirculation into the building.

C403.3.1.4 Water-side economizers. Water-side economizers shall comply with Sections C403.3.1.4.1 through C403.3.1.4.2

C403.3.1.4.1 Design capacity. Water economizer systems shall be capable of cooling supply air by indirect evaporation and providing up to 100 percent of the expected system cooling load at *outdoor air* temperatures of 50°F dry bulb (10°C dry bulb)/45°F wet bulb (7.2°C wet bulb) and below.

Exception: Systems in which a water economizer is used and where dehumidification requirements cannot be met using outdoor air temperatures of 50°F dry bulb (10°C dry bulb)/45°F wet bulb (7.2°C wet bulb) shall satisfy 100 percent of the expected system cooling load at 45°F dry bulb (7.2°C dry bulb)/40°F wet bulb (4.5°C wet bulb).

C403.3.1.4.2 Maximum pressure drop. Precooling coils and water-to-water heat exchangers used as part of a water economizer system shall either have a water-side pressure drop of less than 15 feet (4572 mm) of water or a secondary loop shall be created so that the coil or heat exchanger pressure drop is not seen by the circulating pumps when the system is in the normal cooling (noneconomizer) mode.

C403.3.2 Hydronic system controls. Hydronic systems of at least 300,000 Btu/h (87 930 W) design output capacity supplying heated and chilled water to comfort conditioning systems shall include controls that meet the requirements of Section C403.4.3.

C403.4 Complex Hydronic and multi-zone HVAC system controls and equipment. (Prescriptive). This section applies to buildings served by HVAC equipment and systems not covered in Section C403.3. Hydronic and multi-zone HVAC system controls and equipment shall comply with this section.

C403.4.1 Economizers. Economizers shall comply with Sections C403.4.1.1 through C403.4.1.4.

C403.4.1.1 Design capacity. Water economizer systems shall be capable of cooling supply air by indirect evaporation and providing up to 100 percent of the expected system cooling load at *outdoor air* temperatures of 50°F dry bulb (10°C dry bulb)/45°F wet bulb (7.2°C wet bulb) and below.

Exception: Systems in which a water economizer is used and where dehumidification requirements cannot be met using outdoor air temperatures of 50°F dry bulb (10°C dry bulb)/45°F wet bulb (7.2°C wet bulb) shall satisfy 100 percent of the expected system cooling load at 45°F dry bulb (7.2°C dry bulb)/40°F wet bulb (4.5°C wet bulb).

C403.4.1.2 Maximum pressure drop. Precooling coils and water-to-water heat exchangers used as part of a water economizer system shall either have a water-side pressure drop of less than 15 feet (4572 mm) of water or a secondary loop shall be created so that the coil or heat exchanger pressure drop is not seen by the circulating pumps when the system is in the normal cooling (noneconomizer) mode.

C403.4.1.3 Integrated economizer control. Economizer systems shall be integrated with the mechanical cooling system and be capable of providing partial cooling even where additional mechanical cooling is required to meet the remainder of the cooling load.

Exceptions:

1. Direct expansion systems that include controls that reduce the quantity of *outdoor air* required to prevent coil frosting at the lowest step of compressor unloading, provided this lowest step is no greater than 25 percent of the total system capacity.

- ~~2. Individual direct expansion units that have a rated cooling capacity less than 54,000 Btu/h (15 827 W) and use nonintegrated economizer controls that preclude simultaneous operation of the economizer and mechanical cooling.~~

~~C403.4.1.4 Economizer heating system impact.~~ HVAC system design and economizer controls shall be such that economizer operation does not increase the building heating energy use during normal operation.

~~Exception:~~ Economizers on VAV systems that cause zone level heating to increase due to a reduction in supply air temperature.

~~C403.4.2~~ C403.4.1 Variable air volume (VAV) fan control. Individual VAV fans with motors of 7.5 horsepower (5.6 kW) or greater shall be:

1. Driven by a mechanical or electrical variable speed drive;
2. Driven by a vane-axial fan with variable-pitch blades; or
3. The fan shall have controls or devices that will result in fan motor demand of no more than 30 percent of their design wattage at 50 percent of design airflow when static pressure set point equals one-third of the total design static pressure, based on manufacturer's certified fan data.

~~C403.4.2.1~~ C403.4.1.1 Static pressure sensor location. Static pressure sensors used to control VAV fans shall be placed in a position such that the controller setpoint is no greater than one-third the total design fan static pressure, except for systems with zone reset control complying with Section C403.4.2.2. For sensors installed down-stream of major duct splits, at least one sensor shall be located on each major branch to ensure that static pressure can be maintained in each branch.

~~C403.4.2.2~~ C403.4.1.2 Set points for direct digital control. For systems with direct digital control of individual zone boxes reporting to the central control panel, the static pressure set point shall be reset based on the zone requiring the most pressure, i.e., the set point is reset lower until one zone damper is nearly wide open.

~~C403.4.3~~ C403.4.2 Hydronic systems controls. The heating of fluids that have been previously mechanically cooled and the cooling of fluids that have been previously mechanically heated shall be limited in accordance with Sections ~~C403.4.3.1 through C403.4.3.3~~ C403.4.2.1 through C403.4.2.3. Hydronic heating systems comprised of multiple-packaged boilers and designed to deliver conditioned water or steam into a common distribution system shall include automatic controls capable of sequencing operation of the boilers. Hydronic heating systems comprised of a single boiler and greater than 500,000 Btu/h (146 550 W) input design capacity shall include either a multistaged or modulating burner.

~~C403.4.3.1~~ C403.4.2.1 Three-pipe system. Hydronic systems that use a common return system for both hot water and chilled water are prohibited.

~~C403.4.3.2~~ C403.4.2.2 Two-pipe changeover system. Systems that use a common distribution system to supply both heated and chilled water shall be designed to allow a dead band between changeover from one mode to the other of at least 15°F (8.3°C) outside air temperatures; be designed to and provided with controls that will allow operation in one mode for at least 4 hours before changing over to the other mode; and be provided with controls that allow heating and cooling supply temperatures at the changeover point to be no more than 30°F (16.7°C) apart.

~~C403.4.3.3~~ C403.4.2.3 Hydronic (water loop) heat pump systems. Hydronic heat pump systems shall comply with Sections ~~C403.4.3.3.1 C403.4.2.3.1, through C403.4.3.3.3~~ C403.4.2.3.2.

~~C403.4.3.3.1~~ C403.4.2.3.1 Temperature dead band. Hydronic heat pumps connected to a common heat pump water loop with central devices for heat rejection and heat addition shall have controls that are

capable of providing a heat pump water supply temperature dead band of at least 20°F (11.1°C) between initiation of heat rejection and heat addition by the central devices.

Exception: Where a system loop temperature optimization controller is installed and can determine the most efficient operating temperature based on realtime conditions of demand and capacity, dead bands of less than 20°F (11°C) shall be permitted.

~~C403.4.3.3.2~~ C403.4.2.3.2 Heat rejection. Heat rejection equipment shall comply with Sections ~~C403.4.3.3.2.1 and C403.4.3.3.2.2.~~ C403.4.2.3.2.1 and C403.4.2.3.2.2

Exception: Where it can be demonstrated that a heat pump system will be required to reject heat throughout the year.

~~C403.4.3.3.2.1~~ C403.4.2.3.2.1 Climate Zones 3 and 4. For climate zones 3 and 4:

1. If a closed-circuit cooling tower is used directly in the heat pump loop, either an automatic valve shall be installed to bypass all but a minimal flow of water around the tower, or lower leakage positive closure dampers shall be provided.
2. If an open-circuit tower is used directly in the heat pump loop, an automatic valve shall be installed to bypass all heat pump water flow around the tower.
3. If an open- or closed-circuit cooling tower is used in conjunction with a separate heat exchanger to isolate the cooling tower from the heat pump loop, then heat loss shall be controlled by shutting down the circulation pump on the cooling tower loop.

~~C403.4.3.3.2.2~~ C403.4.2.3.2.2 Climate Zones 5 through 8. For Climate Zones 5 through 8, if an open- or closed-circuit cooling tower is used, then a separate heat exchanger shall be provided to isolate the cooling tower from the heat pump loop, and heat loss shall be controlled by shutting down the circulation pump on the cooling tower loop and providing an automatic valve to stop the flow of fluid.

~~C403.4.3.3.3~~ C403.4.2.3.3. Two position valve. Each hydronic heat pump on the hydronic system having a total pump system power exceeding 10 horsepower (hp) (7.5 kW) shall have a two-position valve.

~~C403.4.3.4~~ C403.4.3.3 Part load controls. Hydronic systems greater than or equal to 300,000 Btu/h (87 930 W) in design output capacity supplying heated or chilled water to comfort conditioning systems shall include controls that have the capability to:

1. Automatically reset the supply-water temperatures using zone-return water temperature, building-return water temperature, or outside air temperature as an indicator of building heating or cooling demand. The temperature shall be capable of being reset by at least 25 percent of the design supply-to-return water temperature difference; or
2. Reduce system pump flow by at least 50 percent of design flow rate utilizing adjustable speed drive(s) on pump(s), or multiple-staged pumps where at least one-half of the total pump horsepower is capable of being automatically turned off or control valves designed to modulate or step down, and close, as a function of load, or other *approved* means.

~~C403.4.3.5~~ C403.4.3.4 Pump isolation. Chilled water plants including more than one chiller shall have the capability to reduce flow automatically through the chiller plant when a chiller is shut down. Chillers piped in series for the purpose of increased temperature differential shall be considered as one chiller.

Boiler plants including more than one boiler shall have the capability to reduce flow automatically through the boiler plant when a boiler is shut down.

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings

and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Reasons for this specific proposal:

2012C has multiple conflicts:

- a. Air economizer only applied to simple systems.
- b. Water systems and references to "cooling" within the Simple System language (C403.3.1)
- c. Directing language that should apply to all economizer types was only under Complex (Integrated economizer, economizer control, relief of outdoor air). This language moved to Section 403.3.1 (basic economizer requirements, which requires either air or water economizers).
- d. Section C403.3.2, Hydronic system controls (under Simple Systems) references "chilled water", which is not a simple system. This same language is duplicated under Section C403.4.3.4 (Part Load controls). All hydronic controls are combined under this proposal to be under the retitled Section "C403.4 Complex Hydronic and multi-zone HVAC systems controls and equipment. (Prescriptive)". Any special multi-zone or hydronic requirements (formerly complex system) are under this section.
- e. A complex system could have air and water economizers. Where exceptions apply becomes a complicated process.
- f. Language in Section 403.3 (simple systems), includes references to Tables C403.2.3(1) through C403.2.3(8), which includes all equipment, including centrifugal chillers and cooling towers (always part of a complex system).

Complex and simple systems do not have a use in the IECC. These systems have no definitions. There are no other references to these systems anywhere else in the IECC. The need for these divisions in the IECC is no longer necessary and only leads to confusion and/or conflicting code requirements as noted in this proposal.

The intent of this proposal is to do the following:

1. An Economizer section with general requirements for all economizers in the same location. Requirements for Air and Water economizers are outlined. Exceptions are the same for either economizer type.
2. Complex Systems becomes a general prescriptive section for hydronic and multiple zone systems and the control of these systems.

A key element to making the revised provisions work, is revision to Section 403.1. As it stands in the 2012 code, Section 403.1 has a serious flaw that allows you to pick and choose a compliance path by saying "use either simple or complex" path requirements. The language is an "either A or B". It does not have a path to use both simple and complex when you have a building with both equipment types. It also allows cherry-picking of a path.

Section 403.1 does NOT require that a chilled water systems use the complex system Section 403.4 control/pump requirements. It can pick the Section 403.3 simple system path. A building can install an air economizer on a 100 ton (chilled water) VAV rooftop and not have to meet ANY of the requirements of Section 403.4 for VAV systems... And since an air economizer is included with most every VAV rooftop, that creates a gaping hole in code. And very little applies code will apply to a boiler or chiller you may have on the site.

Cost Impact: The 2012 code was flawed and the result would be inconsistent application of the economizer provisions. Because the 2012 does state specifically that an economize is required for complex systems, this could be viewed as an increase to the cost of construction. However since the energy savings envisioned by the balance of the HVAC requirements would not be realized without an installed economizer, most systems would be provided with one (or more) anyway.

C403.1-EC-THOMPSON-SEHPCAC

CE242 – 13

C403.3.1, C403.4.1, C403.4.1.1

Proponent: Shirley Ellis, Energy Systems Laboratory, Texas A&M Engineering Experiment Station (shirleyellis@tamu.edu)

Revise as follows:

C403.3.1 Economizers. Each cooling system that has a fan shall include either an air or water economizer meeting the requirements of Sections C403.3.1.1 ~~through C403.3.1.1.4~~ or a water economizer meeting the requirements of Section C403.4.1.1.

Exception: Economizers are not required for the systems listed below.

1. Individual fan-cooling units with a supply capacity less than the minimum listed in Table C403.3.1(1).
2. Where more than 25 percent of the air designed to be supplied by the system is to spaces that are designed to be humidified above 35°F (1.7 °C) dew-point temperature to satisfy process needs.
3. Systems that serve *residential* spaces where the system capacity is less than five times the requirement listed in Table C403.3.1(1).
4. Systems expected to operate less than 20 hours per week.
5. Where the use of *outdoor air* for cooling will affect supermarket open refrigerated casework systems.
6. Where the cooling *efficiency* meets or exceeds the *efficiency* requirements in Table C403.3.1(2).

C403.4.1. Economizers. ~~Economizers shall comply with Sections C403.4.1.1 through C403.4.1.4.~~ Each cooling system that has a fan shall include either an air or water economizer meeting the requirements of Section C403.3.1.1 or a water economizer meeting the requirements of Section C403.4.1.1.

C403.4.1.1 Water economizers. Water economizer systems shall comply with Sections C403.4.1.1.1 through C403.4.1.1.4 .

Exception: Systems in which a water economizer is used and where dehumidification requirements cannot be met using outdoor air temperatures of 50°F dry bulb (10°C dry bulb)/45°F wet bulb (7.2°C wet bulb) shall satisfy 100 percent of the expected system cooling load at 45°F dry bulb (7.2°C dry bulb)/40°F wet bulb (4.5°C wet bulb).

C403.4.1.1 C403.4.1.1.1 Design capacity. Water economizer systems shall be capable of cooling supply air by indirect evaporation and providing up to 100 percent of the expected system cooling load at *outdoor air* temperatures of 50°F dry bulb (10°C dry bulb)/45°F wet bulb(7.2°C wet bulb) and below.

Exception: ~~Systems in which a water economizer is used and where dehumidification requirements cannot be met using outdoor air temperatures of 50°F dry bulb (10°C dry bulb)/45°F wet bulb (7.2°C wet bulb) shall satisfy 100 percent of the expected system cooling load at 45°F dry bulb (7.2°C dry bulb)/40°F wet bulb (4.5°C wet bulb).~~

C403.4.1.2 C403.4.1.1.2 Maximum pressure drop. (No change to text)

C403.4.1.3 C403.4.1.1.3 Integrated economizer control (No change to text)

C403.4.1.4 C403.4.1.1.4 Economizer heating system impact. (No change to text)

Table C407.5.1(1)
Specifications for the Standard Reference and Proposed Designs

Cooling systems	Fuel Type: same as proposed design	As proposed
	Equipment type ^c : from Tables C407.5.1(2) and C407.5.1(3)	As proposed
	Efficiency: from Tables C403.2.3(1), C403.2.3(2) and C403.2.3(3)	As proposed
	Capacity ^b : sized proportionally to the capacities in the proposed design based on sizing runs, and shall be established such that no smaller number of unmet cooling load hours and no larger cooling capacity safety factors are provided than in the proposed design.	As proposed
	Economizer ^d : same as proposed, in accordance with Sections <u>C403.3.1</u> or C403.4.1	As proposed

- d. If an economizer is required in accordance with Table C403.3.1(1), and if no economizer exists or is specified in the proposed design, then a supply air economizer shall be provided in accordance with Section ~~C403.4.1~~ C403.3.1.1.

(Portions of Table not shown remain unchanged)

Reason: The 2012 IECC addresses air or water economizers for simple HVAC systems, but only water economizer systems for Complex HVAC systems. In addition, all the requirements for design capacity, control signals, high-limit shutoff and relief of excess outdoor air for air economizers is currently contained in the simple HVAC systems with no cross reference in the complex HVAC system section.

This proposal contains no new language, the change proposed to requirements for air economizers in the section for simple HVAC systems and the requirements for water economizers in the complex HVAC systems and cross reference the two. It also adds a reference for air economizers to the Total Building Performance Specification Table C407.5.1(1)

The change to Table C407.5.1(1) footnote d is to correct the Section reference to Air economizers.

Cost Impact: This code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

C403.3.1-EC-ELLIS.doc

CE243 – 13

C403.3.1, Table C403.3.1(1)

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

C403.3 Simple HVAC systems and equipment (Prescriptive). This section applies to buildings served by unitary or packaged HVAC equipment listed in Tables C403.2.3(1) through C403.2.3(8), each serving one *zone* and controlled by a single thermostat in the *zone* served. It also applies to two-pipe heating systems serving one or more *zones*, where no cooling system is installed.

C403.3.1 Economizers. Each cooling system that has a fan shall include either an air or water economizer meeting the requirements of Sections C403.3.1.1 through C403.3.1.1.4.

Exception: Economizers are not required for the systems listed below.

- ~~1. Individual fan-cooling units with a supply capacity less than the minimum listed in Table C403.3.1(1).~~
- ~~1. In cooling systems for buildings located in climate zones 1A and 1B.~~
- ~~2. In climate zones other than 1A and 1B, where individual cooling units have a capacity of less than 33,000 Btu/h. The total supply capacity of all fan-cooling units not provide with economizers shall not exceed 20 percent of the total supply capacity of all fan-cooling units in the building nor 300,000 Btu/h, whichever is greater.~~
- ~~2. 3. Where more than 25 percent of the air designed to be supplied by the system is to spaces that are designed to be humidified above 35°F (1.7 °C) dew-point temperature to satisfy process needs.~~
- ~~3. 4. Systems that serve residential spaces where the system capacity is less than five times the requirement listed in Table C403.3.1(1).~~
- ~~4. 5. Systems expected to operate less than 20 hours per week.~~
- ~~5. 6. Where the use of outdoor air for cooling will affect supermarket open refrigerated casework systems.~~
- ~~6. 7. Where the cooling efficiency meets or exceeds the efficiency requirements in Table C403.3.1(2).~~

TABLE C403.3.1(1)
ECONOMIZER REQUIREMENTS

CLIMATE ZONES	ECONOMIZER REQUIREMENT
1A, 1B	No requirement
2A, 2B, 3A, 3B, 3C, 4A, 4B, 4C, 5A, 5B, 5C, 6A, 6B, 7, 8	Economizers on all cooling systems \geq 33,000 Btu/h ^a

For SI: 1 British thermal unit per hour = 0.2931 W.

- a. ~~The total capacity of all systems without economizers shall not exceed 300,000 Btu/h per building, or 20 percent of its air economizer capacity, whichever is greater.~~

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Reasons for this specific proposal:

The interaction between exception #1 and Table C403.3.1(1) is unclear. The exception states where economizers are not to be required, but the table appears to be a listing of economizer requirements. The intent is unclear as written. The proposal replaces

the table with 2 exceptions which are clearly exceptions from an economizer requirement. The first exception addresses climate zones 1A and 1B where no economizers are required regardless of the system capacity. The second exception addresses the other climate zones currently covered by the last line of the table and the footnote. Similar revision was made to the Massachusetts Stretch Code to address the confusion of this section and table.

The same format occurs in a parallel section in the IgCC. If this proposal is successful, the SEHPCAC will submit a companion proposal in 2014 for the IgCC.

Cost Impact: The code change proposal will not increase the cost of construction. The proposal is editorial in nature and will have no impact on the cost of construction.

C403.3.1, Table C403.3.1(1)

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

C403.3.1 Economizers. Each cooling system that has a fan shall include either an air or water economizer meeting the requirements of Sections C403.3.1.1 through C403.3.1.1.4.

Exception: Economizers are not required for the systems listed below.

1. Individual fan-cooling units with a supply capacity less than the minimum listed in Table C403.3.1(1).
2. Where more than 25 percent of the air designed to be supplied by the system is to spaces that are designed to be humidified above 35°F (1.7 °C) dew-point temperature to satisfy process needs.
3. Systems that serve *residential* spaces where the system capacity is less than five times the requirement listed in Table C403.3.1(1).4. Systems expected to operate less than 20 hours per week.
5. Where the use of *outdoor air* for cooling will affect supermarket open refrigerated casework systems.
6. Where the cooling *efficiency* meets or exceeds the *efficiency* requirements in Table C403.3.1(2).
7. Systems under 110,000 Btu/h total cooling capacity that utilize multiple stage cooling capacity control and multiple speed fan control.

TABLE C403.3.1(1)
ECONOMIZER REQUIREMENTS

CLIMATE ZONES	ECONOMIZER REQUIREMENT
1A, 1B	No requirement
2A, 2B, 3A, 3B, 3C, 4A, 4B, 4C, 5A, 5B, 5C, 6A, 6B, 7, 8	Economizers on all cooling systems ≥ 33,000 <u>≥ 54,000</u> Btu/h ^a

For SI: 1 British thermal unit per hour = 0.2931 W.

- a. The total capacity of all systems without economizers shall not exceed 300,000 Btu/h per *building*, or 20 percent of its air economizer capacity, whichever is greater.

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Reasons for this specific proposal:

The current trigger values for economizers are in conflict with current ASHRAE Standard 90.1. The modification to the 2012 IECC was based on the Green standard 189.1 additional energy measures; prescriptive requirements should not come from an optional code or standard. ASHRAE 90.1 reduced their trigger to 54,000 Btu/h in the 2010 version and is not decreasing the trigger in any addenda for the 2013 version. Intent is to align the code and standard. For 2013, California Title 24 revisited economizers and did not drop their trigger value below 54,000 Btu/h. No other mandatory code or standard has reduced below 54,000 Btu/h.

The first part of this proposal recommends matching Table C403.3.1(1) to the trigger to other codes and standards.

The second part of this proposal allows for one additional exception: small units (under 110,000 Btu/h) are not required to have an economizer if the units have multiple speed fans and multiple stage cooling capacity.

For this proposal, the efficiency measure is similar to a prescriptive requirement that California added for small units. We are proposing an exception to economizers for small units. As part of the 2013 California Title 24 proposals, multiple stage compressor

and fan control for small HVAC units (under the current 110,000 Btu/h trigger for multiple speed fans) was economically viable as a prescriptive measure and was included in Title 24.

http://www.energy.ca.gov/title24/2013standards/prerulemaking/documents/current/Reports/Nonresidential/HVAC/2013_CASE_NR_Fan_Control_Integrated_Economizers_Sept_2011.pdf has the complete report. Taylor Engineering performed the energy modeling. They report a possible 2-year payback for addition of multi-speed compressor & fan.

Per cost figures furnished to California by Dick Lord of Carrier, this proposed exception would be less than or equal to the cost of an economizer. So there is no cost impact.

Oregon BCD energy modeling used the Taylor Engineering baseline concept. We looked at the same building with these small HVAC units. We compared a building without economizers (not required in California for the HVAC size range) with the same units with economizer and with just the multi-speed configuration. Adding multi-speed configuration saves nearly 4-times more energy than adding an economizer.

So the proposed exception not only has an equal or lower cost, it will save a greater amount of energy.

Additional study performed by PNNL of economizers and other measures for small packaged HVAC equipment provides additional insight. PNNL Study #PNNL-20995 (http://www.pnnl.gov/main/publications/external/technical_reports/PNNL-20955.pdf), even though relative to retrofit of existing equipment, gives insight on the relative effectiveness of economizers, multi-speed control and Demand Control Ventilation (DCV). Multi-speed control is a more effective conservation measure than an economizer. See page 37:

- Multi-speed fan control and DCV are the two control strategies that contribute most to the HVAC energy savings.

Specifically, multi-speed fan control dominates the impact in a small number of cases, including all four building types in Miami and the small office building in Houston, Phoenix and Los Angeles. DCV dominates the impact for all other cases. The multi-speed fan contribution to savings can be negative in cold climates (e.g. Duluth and Fairbanks for all building types).

- Adding an air-side economizer after multi-speed fan control does not have a large impact on HVAC energy savings except for a few cases, such as the small office building in Los Angeles. In comparison with a nonintegrated economizer, the integrating economizer has negligible impact on HVAC energy savings.

Overall, this proposal provides both alignment with other standards and codes and is an improvement in energy conservation for anyone taking the new exception path.

So we are basing a request for modifying the levels on additional analysis conducted by Oregon Building Codes Division.

The analysis methods referenced for this proposal use the same energy models developed by ASHRAE and the Department of Energy (PNNL) for the Final Determination of ASHRAE 90.1-2010 in the Federal Register. We used the US DOE prototype energy model files and EnergyPlus software. NO new models were used; the simulation software was the same. Weighting of building types was the same as used by PNNL. Only buildings from the 90.1 determination that have packaged HVAC units in this size range were considered (not office buildings with VAV units). See these studies by PNNL for the analysis:

1. For the description for the modeling method
http://www.energycodes.gov/sites/default/files/documents/BECF_Energy_Cost_Savings_STD2010_May2011_v00.pdf
2. The DOE certification of 90.1-2010 (references the linked PNNL-20405 above)
http://www.energycodes.gov/sites/default/files/documents/BECF_FinalQuantitativeAnalysisReport901-2010Determination_Oct2011_v00.pdf

The national weighted-average annual energy savings per economizer for systems between 33,000 Btu/h and 110,000 Btu/h is \$41 per year per economizer. Using a first cost of \$750/economizer (including installation, set-up, initial testing) and a 15-year life cycle, economizers never provide a return on the cost premium, much less recover the cost of maintenance. On the basis of these models, we feel the trigger levels should be re-examined. Weighting of life cycle costs were based on EIA national average utility costs, 15-year life cycle and 3% discount rate for the \$750 average first cost and \$50/year for maintenance.

The table below is the raw data of savings per economizer by building type and climate zone. Weighting used the same data from the DOE/PNNL studies. Green highlights show over \$85/year, which might cover first costs and maintenance.

ANNUAL SAVINGS PER ECONOMIZER (RAW DATA)														
BUILDING PROTOTYPE/ CLIMATE ZONE	2A	2B	3A	3B	3C	4A	4B	4C	5A	5B	6A	6B	7	8
Fast Food Restaurant					\$ 65		\$ 135	\$ 94		\$ 87		\$ 82	\$ 69	\$ 38
Small Hotel	\$ 109	\$ 123	\$ 128	\$ 108		\$ 85		\$ 80	\$ 80	\$ 67	\$ 82		\$ 63	
Strip Mall Retail	\$ 18	\$ 26	\$ 16	\$ 41	\$ 76	\$ 22	\$ 32	\$ 75	\$ 29	\$ 50	\$ 54	\$ 58	\$ 37	\$ 31
Strip Mall Office	\$ 18	\$ 4	\$ 11	\$ 23		\$ 26	\$ 34	\$ 33	\$ 25	\$ 29	\$ 35	\$ 32	\$ 28	\$ 23
Warehouse	\$ 11	\$ (14)	\$ 9	\$ 10		\$ 0	\$ (1)	\$ (3)		\$ (2)	\$ (3)	\$ (4)		\$ (3)
Stand Alone Retail	\$ 76	\$ 99	\$ 96	\$ 105	\$ 210	\$ 102	\$ 152	\$ 130	\$ 99	\$ 122	\$ 123	\$ 134	\$ 126	\$ 119
Primary School	\$ 31	\$ 35	\$ 31	\$ 39	\$ 105	\$ 42	\$ 57	\$ 48	\$ 41	\$ 49	\$ 42	\$ 135	\$ 160	\$ 163

When looking at the Life Cycle Costs by building type, there is not a return on investment. And this simulation considers a perfectly functioning economizer. If the weighting were to include a factor for non-functioning economizers, becomes difficult to justify any economizer below 110,000 Btu/h.

WEIGHTED LIFE CYCLE COST BY BUILDING TYPE							
BUILDING TYPE	FAST FOOD	SMALL HOTEL	STRIP MALL	SMALL OFFICE	WAREHOUSE	STAND-ALONE RETAIL	PRIMARY SCHOOL
WEIGHTED LCC	(\$288)	(\$201)	(\$1,014)	(\$1,097)	(\$1,286)	(\$128)	(\$875)

Buildings are more efficient due to improvements in the codes. Contributing reasons why these systems no longer viable at the current triggers:

1. Improvements to the building envelope: glazing improvements reduce solar gain; envelope insulation delays thermal conductivity gains.
2. Reduced lighting power: 30-45% reductions from 2006 levels.
3. Equipment efficiency improvements: 30% increase in SEER requirement for 60,000 Btu/h (5-ton) units and smaller.

With less cooling required during the year (the building is more efficient), there is a smaller "pool of energy use" to reduce with this measure. And because of the improved building characteristics, there are fewer hours where cooling needs overlap with outdoor conditions suitable for economizer operation. An economizer on units in this size range has little chance of paying back its cost premium during the life cycle of the unit. The effects of code improvements over the years could not be analyzed without a full energy model. And the DOE/PNNL files are among the best available and are used by DOE for analyzing 90.1.

The current 33,000 Btu/h trigger (thru 110,000 Btu/h) only returns its cost over the life of the equipment when there are either high load conditions (computer closets) or nearly continuous operation (18-24 hours per day, 7-days per week). And positive returns are only found in a few climate zones, not on a national weighting by building type. The 33,000 Btu/h figure should only remain if there are exceptions for smaller units with operating hours of under 112 hours per week (above the 20 hour per week exception already in code) or if there are high internal loads. But this is difficult to put into enforceable code language.

We propose to match the current 90.1-2010 level of 54,000 Btu/h; 90.1 is not considering any further revisions below this level. The weighted average economizer savings increases slightly closer to a level where it might pay back.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C403.3.1 Economizers. Each cooling system that has a fan shall include either an air or water economizer meeting the requirements of Sections C403.3.1.1 through ~~C403.3.1.4.4~~ C403.3.1.1.5.

Exception: Economizers are not required for the systems listed below.

1. Individual fan-cooling units with a supply capacity less than the minimum listed in Table C403.3.1(1).
2. Where more than 25 percent of the air designed to be supplied by the system is to spaces that are designed to be humidified above 35°F (1.7 °C) dew-point temperature to satisfy process needs.
3. Systems that serve residential spaces where the system capacity is less than five times the requirement listed in Table C403.3.1(1).
4. Systems expected to operate less than 20 hours per week.
5. Where the use of outdoor air for cooling will affect supermarket open refrigerated casework systems.
6. Where the cooling efficiency meets or exceeds the efficiency requirements in Table C403.3.1(2).
7. Systems that include a heat recovery system in accordance with Section C403.4.6.
8. Systems that serve spaces whose sensible cooling load at design conditions, excluding transmission and infiltration loads, is not more than the transmission and infiltration losses at an outdoor temperature of 60°F.

**TABLE C403.3.1(1)
ECONOMIZER REQUIREMENTS**

CLIMATE ZONES	ECONOMIZER REQUIREMENT
1A, 1B	No requirement
2A, 2B, 3A, 3B, 3C, 4A, 4B, 4C, 5A, 5B, 5C, 6A, 6B, 7, 8	Economizers on all cooling systems ≥ 33,000 <u>54,000</u> Btu/h ^a

For SI: 1 British thermal unit per hour = 0.2931 W.

- a. The total capacity of all systems without economizers shall not exceed 300,000 Btu/h per *building*, or 20 percent of its air economizer capacity, whichever is greater.

C403.3.1.1.4 Dampers. Return, exhaust/relief, and outdoor air dampers shall in accordance with Section C402.4.5.2

C403.3.1.1.5 Relief of excess outdoor air. Systems shall be capable of relieving excess outdoor air during air economizer operation to prevent over-pressurizing the building. The relief air outlet shall be located to avoid recirculation into the building.

TABLE C403.3.1.1.3(2)
HIGH-LIMIT SHUTOFF CONTROL SETTING FOR AIR ECONOMIZERS

DEVICE TYPE	CLIMATE ZONE	REQUIRED HIGH LIMIT (ECONOMIZER OFF WHEN):	
		EQUATION	DESCRIPTION
Fixed dry bulb	1B, 2B, 3B, 3C, 4B, 4C, 5A, 5B, 5C, 6A, 6B, 7, 8	$T_{OA} > 75^{\circ}\text{F}$	Outdoor air temperature exceeds 75°F
	5A, 6A, 7A	$T_{OA} > 70^{\circ}\text{F}$	Outdoor air temperature exceeds 70°F
	All other zones	$T_{OA} \geq 65^{\circ}\text{F}$	Outdoor air temperature exceeds 65°F
Differential dry bulb	1B, 2B, 3B, 3C, 4B, 4C, 5A, 5B, 5C, 6A, 6B, 7, 8	$T_{OA} > T_{RA}$	Outdoor air temperature exceeds return air temperature
Fixed enthalpy	All <u>2A, 3A, 4A, 5A, 6A</u>	$h_{OA} > 28 \text{ Btu/lb}^a$	Outdoor air enthalpy exceeds 28 Btu/lb of dry air ^a
Electronic Enthalpy	All	$(T_{OA}, RH_{OA}) > A$	Outdoor air temperature/RH exceeds the "A" setpoint curve ^b
Differential enthalpy	All	$h_{OA} > h_{RA}$	Outdoor air enthalpy exceeds return air enthalpy
Dew-point and dry bulb temperatures	All	$DP_{OA} > 55^{\circ}\text{F}$ or $T_{OA} > 75^{\circ}\text{F}$	Outdoor air dry bulb exceeds 75°F or outside dew point exceeds 55°F (65 gr/lb)

For SI: °C = (°F - 32) × ⁵/9, 1 Btu/lb = 2.33 kJ/kg.

- At altitudes substantially different than sea level, the Fixed Enthalpy limit shall be set to the enthalpy value at 75°F and 50-percent relative humidity. As an example, at approximately 6,000 feet elevation the fixed enthalpy limit is approximately 30.7 Btu/lb.
- Setpoint "A" corresponds to a curve on the psychrometric chart that goes through a point at approximately 75°F and 40-percent relative humidity and is nearly parallel to dry-bulb lines at low humidity levels and nearly parallel to enthalpy lines at high humidity levels.

C403.3.1.2 Water economizers. Water economizers shall comply with Sections C403.3.1.2.1 through C403.3.1.2.2.

C403.3.1.2.1 Design capacity. Water economizer systems shall be capable of cooling supply air by indirect evaporation and providing up to 100 percent of the expected system cooling load at outdoor air temperatures not greater than 50°F dry bulb/45°F wet bulb.

Exceptions:

- Systems primarily serving computer rooms in which 100 percent of the expected system cooling load at 40°F dry bulb/35°F wet bulb is met with evaporative water economizers.
- Systems primarily serving computer rooms with dry cooler water economizers which satisfy 100 percent of the expected system cooling load at 35°F dry bulb.
- Systems where dehumidification requirements cannot be met using outdoor air temperatures of 50°F dry bulb/45°F wet bulb and where 100 percent of the expected system cooling load at 45°F(7°C) dry bulb/40°F (4°C) wet bulb is met with evaporative water economizers.

C403.3.1.2.2 Maximum pressure drop. Precooling coils and water-to-water heat exchangers used as part of a water economizer system shall either have a water-side pressure drop of less than 15 feet of water (45 kPa) or a secondary loop shall be created so that the coil or heat exchanger pressure drop is not seen by the circulating pumps when the system is in the normal cooling (non-economizer) mode.

Reason: This proposal makes the air economizer requirements consistent with ANSI/ASHRAE/IES Standard 90.1. Quite a bit of collaboration has gone into this proposal to achieve consensus, and is a result of many years of research investigating the cost effectiveness of economizer use in each climate zone.

In addition, new requirements for water economizers are being added.

Cost Impact: The code change proposal will not increase the cost of construction.

C202 (NEW), Table C403.3.1.1.3(1)

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

TABLE C403.3.1.1.3(1)
HIGH-LIMIT SHUTOFF CONTROL OPTIONS FOR AIR ECONOMIZERS

CLIMATE ZONES	ALLOWED CONTROL TYPES	PROHIBITED CONTROL TYPES
1B, 2B, 3B, 3C, 4B, 4C, 5B, 5C, 6B, 7, 8	Fixed dry bulb Differential dry bulb Electronic enthalpy ^a Differential enthalpy Dew-point and dry-bulb temperatures	Fixed enthalpy
1A, 2A, 3A, 4A	Fixed dry bulb Fixed enthalpy Electronic enthalpy ^a Differential enthalpy Dew-point and dry-bulb temperatures	Differential dry bulb
All other climates	Fixed dry bulb Differential dry bulb Fixed enthalpy Electronic enthalpy ^a Differential enthalpy Dew-point and dry-bulb temperatures	—

a. Electronic enthalpy controllers are devices that use a combination of humidity and dry-bulb temperature in their switching algorithm.

Add new definition as follows:

SECTION C202 **GENERAL DEFINITIONS**

ELECTRONIC ENTHALPY CONTROLLER. A device that uses a combination of humidity and dry bulb temperature in its switching algorithm.

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The footnote is a definition of a device. It provides no information that enhances the enforcement of the table other than defining one of the pieces of equipment. Chapter 2 is the preferred location for definitions. If this is approved, the SEHPCAC will submit a companion code change in 2014 to address parallel provisions in the IgCC.

Cost Impact: The code change proposal will not increase the cost of construction.

CE246-13

CE247 – 13

C403.3.1.1, C403.3.1.1.5 (NEW)

Proponent: Amanda Hickman, InterCode Incorporated, representing AMCA International
(amanda@intercodeinc.com)

Revise as follows:

C403.3.1.1 Air economizers. Air economizers shall comply with Sections C403.3.1.1.1 through ~~C403.3.1.1.4~~ C403.3.1.1.5.

C403.3.1.1.5 Economizer dampers. Dampers used in economizers shall comply with the requirements of Section C402.4.5.2.

Reason: This change will ensure that economizer intake dampers are low-leakage, and that the low-leakage ratings are certified to ensure the design intent and energy savings. Having them labeled will also make this provision easier to enforce.

This is a companion change to the proposal we submitted to C402.4.5.2 Outdoor air intakes and exhausts.

Cost Impact: The code change proposal will not increase the cost of construction.

C403.4.1-EC-ANDERSON.doc

CE ~~249~~ – 13
C403.4.1, Table C403.4.1(NEW)

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C403.4.1 Economizers. ~~Economizers shall comply with~~ Each cooling system shall include either an air economizer in compliance with Section C403.3.1.1 or water economizer in compliance with Sections C403.4.1.1 through C403.4.1.4.

Exceptions: Economizers are not required for the systems listed below.

1. Individual fan-cooling units with a supply capacity less than the minimum listed in Table C403.3.1(1) that either:
 - 1.1. Have direct expansion cooling coils, or
 - 1.2. Where the total chilled water system capacity less the capacity of fan units with air economizers is less than the minimum listed in Table C403.4.1.
2. Chilled-water cooling systems that are passive (without a fan) or use induction where the total chilled water system capacity less the capacity of fan units with air economizers is less than the minimum listed in Table C403.4.1.
3. Individual cooling units that are in compliance with exceptions 2 through 6 to economizers under Section C403.3.1.

TABLE C403.4.1

MINIMUM CHILLED WATER SYSTEM COOLING CAPACITY FOR DETERMINING ECONOMIZER COOLING REQUIREMENTS
~~Minimum Chilled Water System Cooling Capacity~~
~~for Determining Economizer Cooling Requirements~~

Climate Zones (Cooling)	Total Chilled Water System Capacity Less Capacity of Cooling Units with Air Economizers	
	Local Water-Cooled Chilled Water Systems	Air-cooled Chilled Water Systems or District Chilled Water Systems
1a	No economizer requirement	No economizer requirement
1b, 2a, 2b	960,000 Btu/h (280 kW)	1,250,000 Btu/h (365 kW)
3a, 3b, 3c, 4a, 4b, 4c	720,000 Btu/h (210 kW)	940,000 Btu/h (275 kW)
5a, 5b, 5c, 6a, 6b, 7, 8	1,320,000 Btu/h (385 kW)	1,720,000 Btu/h (505 kW)

Reason: This proposal improves cooling efficiency by requiring a water-side economizer for non-fan systems (e.g. radiant cooling, passive chilled beam systems), and for systems with small individual fan systems served by chilled water systems at least 50 tons in size. Such systems include fan coil units, radiant cooling systems, and chilled beam cooling systems.

During part-load cooling situations, cooling towers can be used to provide chilled water to meet cooling load. This technology can apply to small individual fan systems served by chilled water and to non-fan systems such as radiant cooling and passive chilled beam systems. There are a number of approaches to meeting the proposed requirements: (1) a separate closed circuit cooling tower (evaporative fluid cooler) that pre-cools chilled water return before it enters the chiller that is sized to meet the requirements of section C403.4.1.1, (2) an integrated operation with return chilled water precooled by the chiller tower and then completely cooled by the chiller, or (3) an either/or approach, where the chilled water is generated by the tower until load can no longer be met and then only the chiller is used. To analyze cost effectiveness, option 1 was analyzed, as it is most straightforward, and has clearly defined cost boundaries.

There is a cost impact associated with this proposed change since a heat exchanger or more expensive closed-circuit cooling tower and additional pipes, pumps, and controls will typically be required. A cost effectiveness analysis found that with reduced chiller operation the requirement for the waterside economizer was cost effective. Based on a system life of 22 years, a discounted cost effective payback threshold is 13.1 years. The simple paybacks in all of the climate zones where waterside economizers would be required under this proposal are well below this cost effective threshold.

C403.4.1-EC-WILLIAMS.doc

CE250 – 13

C403.4.1.3, Table C403.4.1.3 (NEW), C403.4.2.1 (NEW), Table C403.4.2.1 (NEW), C403.4.2.1, C403.4.2.2, C403.4.7

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C403.4.1.3 Integrated economizer control. Economizer systems shall be integrated with the mechanical cooling system and be capable of providing partial cooling even where additional mechanical cooling is required to meet the remainder of the cooling load. Controls shall not be capable of creating a false load the mechanical cooling systems by limiting or disabling the economizer or any other means, such as hot gas bypass except at the lowest stage of mechanical cooling.

Units that include an air economizer shall comply with the following:

1. Unit controls shall have the mechanical cooling capacity control interlocked with the air economizer controls such that the outdoor air damper is at the 100 percent open position when *mechanical cooling* is on and the outdoor air damper does not begin to close to prevent coil freezing due to minimum compressor run time until the leaving air temperature is less than 45°F.
2. DX units that control 75,000 Btu/h or greater of rated capacity of the capacity of the mechanical cooling directly based on occupied space temperature shall have no fewer than 2 stages of mechanical cooling capacity
3. All other DX units including those that control space temperature by modulating the airflow to the space shall be in accordance with Table C403.4.1.3

Exceptions:

- ~~1. Direct expansion systems that include controls that reduce the quantity of *outdoor air* required to prevent coil frosting at the lowest step of compressor unloading, provided this lowest step is no greater than 25 percent of the total system capacity.~~
- ~~2. Individual direct expansion units that have a rated cooling capacity less than 54,000 Btu/h (15 827 W) and use nonintegrated economizer controls that preclude simultaneous operation of the economizer and mechanical cooling.~~

TABLE C403.4.1.3
DX COOLING STATESTAGE REQUIREMENTS FOR MODULATING AIRFLOW UNITS

<u>Rating Capacity</u>	<u>Minimum Number of Mechanical Cooling Stages</u>	<u>Minimum Compressor Displacement^a</u>
<u>≥65,000 Btu/h and <240,000 Btu/h</u>	<u>3 stages</u>	<u>≤35% of full Load</u>
<u>≥240,000 Btu/h</u>	<u>4 stages</u>	<u>≤25% full load</u>

- a. For *mechanical cooling* stage control that does not use variable compressor displacement the percent displacement shall be equivalent to the mechanical cooling capacity reduction evaluated at the full load rating conditions for the compressor.

C403.4.2 Variable air volume (VAV) fan control. Individual VAV fans with motors of 7.5 horsepower (5.6 kW) or greater shall be:

- ~~1. Driven by a mechanical or electrical variable speed drive;~~
- ~~2. Driven by a vane axial fan with variable pitch blades; or~~

3. ~~The fan shall have controls or devices that will result in fan motor demand of no more than 30 percent of their design wattage at 50 percent of design airflow when static pressure set point equals one-third of the total design static pressure, based on manufacturer's certified fan data~~

C403.4.2.1 Fan airflow control Each cooling system listed in Table C403.4.2.1 shall be designed to vary the indoor fan airflow as a function of load and shall comply with the following requirements.

1. DX and chilled water cooling units that control the capacity of the mechanical cooling directly based on space temperature shall have no fewer than 2 stages of fan control. Low or minimum speed shall not exceed 66 percent of full speed. At low or minimum speed the fan system shall draw no more than 40 percent of the fan power at full fan speed. Low or minimum speed shall be used during periods of low cooling load and ventilation only operation.
2. All other units including DX cooling units and chilled water units that control the space temperature by modulating the airflow to the space shall have modulating fan control. Minimum speed shall not exceed 50 percent of full speed. At minimum speed the fan system shall draw no more than 30 percent of the power at full fan speed. Low or minimum speed shall be used during periods of low cooling load and ventilation only operation.
3. Units that include an airside economizer to meet the requirements of Section C403.3.1 shall have no fewer than of 2 speeds of fan control during economizer operation

Exceptions:

1. Modulating fan control is not required for chilled water and evaporative cooling units with fan motors of less than 1 HP where the units are not used to provide *ventilation air* and the indoor fan cycles with the load.
2. Where the volume of outdoor air required to meet the *ventilation* requirements of the *International Mechanical Code* at low speed exceeds the air that would be delivered at the speed defined in Section C403.4.2 then the minimum speed shall be selected to provide the required *ventilation air*.

**TABLE C403.4.2.1
EFFECTIVE DATES FOR FAN CONTROL**

<u>Cooling System Type</u>	<u>Fan Motor Size</u>	<u>Mechanical Cooling Capacity</u>
<u>DX Cooling</u>	<u>any</u>	<u>≥75,000 Btu/h (before 1/1/2016)</u>
		<u>≥65,000 Btu/h (after 1/1/2016)</u>
<u>Chilled Water and Evaporative cooling</u>	<u>≥5 HP</u>	<u>Any</u>
	<u>≥1/4 HP</u>	<u>Any</u>

~~C403.4.2.1~~ C403.2.2 VAV Static pressure sensor location. Static pressure sensors used to control VAV fans shall be placed in a position such that the controller setpoint is no greater than one-third the total design fan static pressure, except for systems with *zone* reset control complying with Section C403.4.2.2. For sensors installed down-stream of major duct splits, at least one sensor shall be located on each major branch to ensure that static pressure can be maintained in each branch.

~~C403.4.2.2~~ C403.4.2.3 VAV Set points for direct digital control. For systems with direct digital control of individual *zone* boxes reporting to the central control panel, the static pressure set point shall be reset based on the *zone* requiring the most pressure, i.e., the set point is reset lower until one *zone* damper is nearly wide open.

C403.4.7 Hot gas bypass limitation. Cooling systems shall not use hot gas bypass or other evaporator pressure control systems unless the system is designed with multiple steps of unloading or continuous capacity modulation. The capacity of the hot gas bypass shall be limited as indicated in Table C403.4.7 as limited by Section C403.4.1.3

Exception: Unitary packaged systems with cooling capacities not greater than 90,000 Btu/h (26 379 W).

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, does not contain the exceptions that are shown in the IECC. Those exceptions were in standard 90.1-2007 but were removed in standard 90.1-2010. The change ensures continued consistency between the IECC and standard 90.1-2010.

Cost Impact: The code change proposal will increase the cost of construction.

CE250-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C403.4.1.3-EC-FERGUSON.doc

CE251 – 13

C403.4.2.1, C403.4.2.2

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C403.4.2.1 Static pressure sensor location. Static pressure sensors used to control VAV fans shall be placed in a position located such that the controller setpoint is no greater than one-third the total design fan static pressure, except for systems with zone reset control complying with Section C403.4.2.2-1.2 inches w.c. For sensors Where this results in one or more sensors being installed located down-stream of major duct splits, at least one sensor shall be located on each major branch to ensure that static pressure can be maintained in each branch.

C403.4.2.2 Set points for direct digital control. For systems with direct digital control of individual ~~zone boxes~~ zones reporting to the central control panel, the static pressure set point shall be reset based on the zone requiring the most pressure, i.e., the set point is reset lower until one *zone* damper is nearly wide open. The direct digital controls shall be capable of monitoring zone damper positions; or shall have an alternative method of indicating the need for static pressure which is capable of all of the following:

1. Automatically detecting any zone which excessively drives the reset logic;
2. Generating an alarm to the system operational location; and
3. Allowing an operator to readily remove one or more zones from the reset algorithm.

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, has been revised with respect to controls for certain aspects of HVAC systems. The change ensures continued consistency between the IECC and standard 90.1-2010.

Cost Impact: The code change proposal will increase the cost of construction where controls will now be required.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C403.4.2.1-EC-FERGUSON.doc

CE252 – 13

C403.4.3.3.2, C403.4.3.3.2.1, C403.4.3.3.2.2

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C403.4.3.3.2 Heat rejection. For heat pump systems ~~Heat rejection equipment shall comply with Sections C403.4.3.3.2.1 and C403.4.3.3.2.2. in Climate Zones 3 through 8:~~

1. Where a closed-circuit cooling tower is used directly in the heat pump loop, one of the following shall be provided:
 - 1.1 An automatic valve capable of providing a bypass to all but a minimal flow of water around the tower; or
 - 1.2 Low leakage positive closure dampers.
2. Where an open-circuit tower is used directly in the heat pump loop, an automatic valve shall be installed capable of providing a bypass of all heat pump water flow around the tower.
3. Where an open-circuit cooling tower is used in conjunction with a separate heat exchanger to isolate the cooling tower from the heat pump loop, then heat loss shall be capable of being controlled by shutting down the circulation pump on the cooling tower loop.

Exception: Where it can be demonstrated that a heat pump system will be required to reject heat throughout the year.

~~C403.4.3.3.2.1 Climate Zones 3 and 4.~~ For Climate Zones 3 and 4:

1. ~~If a closed-circuit cooling tower is used directly in the heat pump loop, either an automatic valve shall be installed to bypass all but a minimal flow of water around the tower, or lower leakage positive closure dampers shall be provided.~~
2. ~~If an open-circuit tower is used directly in the heat pump loop, an automatic valve shall be installed to bypass all heat pump water flow around the tower.~~
3. ~~If an open- or closed-circuit cooling tower is used in conjunction with a separate heat exchanger to isolate the cooling tower from the heat pump loop, then heat loss shall be controlled by shutting down the circulation pump on the cooling tower loop.~~

~~C403.4.3.3.2.2 Climate Zones 5 through 8.~~ For Climate Zones 5 through 8, if an open- or closed-circuit cooling tower is used, then a separate heat exchanger shall be provided to isolate the cooling tower from the heat pump loop, and heat loss shall be controlled by shutting down the circulation pump on the cooling tower loop and providing an automatic valve to stop the flow of fluid.

Reason: For consistency with ASHRAE/IES 90.1-2010. . As that standard is an alternative path to compliance with the IECC and there is a desire to maintain equivalency of the IECC with 90.1 the issue of energy use for freeze protection systems must also be addressed in the IECC. These requirements for heat pump heat loss have been in 90.1 for a few years. This change will bring the requirements in line with 90.1.

Cost Impact: The code change proposal will not increase the cost of construction.

CE252-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C403.4.3.3.2-EC-FERGUSON.doc

CE253 – 13

C403.4.3.4

Proponent: Eric Makela, Britt/Makela Group, Inc., representing Northwest Energy Codes Group (eric@brittmakela.com)

Revise as follows:

C403.4.3.4 Part load controls. Hydronic systems greater than or equal to ~~300,000~~ 500,000 Btu/h (87 930W) in design output capacity supplying heated or chilled water to comfort conditioning systems shall include controls that have the capability to:

1. Automatically reset the supply-water temperatures in response to varying building heating and cooling demand using: coil valve position, zone-return water temperature, building-return water temperature, or out-side air temperature as an indicator of building heating or cooling demand. The temperature shall be capable of being reset by at least 25 percent of the design supply-to-return water temperature difference; ~~or and~~
2. Automatically vary fluid flow for hydronic systems with a combined motor capacity of 10 hp (7.5 kW) or larger with three or more ~~Reduce systems pump flow by at least 50 percent of design flow rate utilizing adjustable speed drive(s) on pump(s), or multiple staged pumps where at least one-half of the total pump horsepower is capable of being automatically turned off or~~ control valves or other devices by reducing the system design flow rate by at least 50 percent by designed valves that modulate or step open down, and close, or pumps that modulate or turn on and off as a function of load or other approved means; and
3. Automatically vary pump flow on chilled water systems and heat rejection loops serving water cooled unitary air-conditioners with a combined motor capacity of 10 hp (7.5 kW) or larger by reducing system pump design flow by at least 50 percent of design flow rate utilizing adjustable speed drive(s) on pump(s), or multiple-staged pumps where at least one-half of the total pump horsepower is capable of being automatically turned off or control valves designed to modulate or step down, and close, as a function of load, or other approved means. Pump flow shall be controlled to maintain one control valve nearly wide open or to satisfy the minimum differential pressure.

Exceptions:

1. Supply-water temperature reset for chilled water systems supplied by offsite district chilled water or chilled water from ice storage systems.
2. Minimum flow rates other than 50 percent as required by the equipment manufacturer for proper operation of equipment where using flow bypass or end-of-line 3-way valves.
3. Variable pump flow on dedicated equipment circulation pumps where configured in primary / secondary design to meet minimum flow requirements required by the equipment manufacturer for proper operation of equipment,

Reason: It's recommended this code section is revised for the following reasons:

Increase Hydronic System Capacity Threshold: This proposal recommends the current 300,000 Btu/h (25 tons) hydronic system capacity threshold is increased to 500,000 Btu/h (42 tons). As shown in the table below, these capacities represent small building sizes (~ 20,000 sqft) which generally are not served by hydronic heating and cooling systems. For example, a hydronic system serving the minimum capacity would have a circulation pump of only 1 or 2 HP. Supply water temperature reset has small energy benefits on small hydronic systems relative to the added control costs and complexity. The 500,000 Btu/h capacity also aligns with boilers requiring a multistage or modulating burner controls, see section C403.4.3.

Hyrdonic System Capacity Btu/h	Equivalent Capacity in Tons	Estimate of Building Size - Sqft		
		Eff Bldg	Std Bldg	Less Eff Bldg
		20 Btuh / Sqft	25 Btuh / Sqft	30 Btuh / Sqft
300,000	25.0	15,000	12,000	10,000
500,000	41.7	25,000	20,000	16,667
750,000	62.5	37,500	30,000	25,000
1,000,000	83.3	50,000	40,000	33,333

Requirements Additive and Not Mutually Exclusive: The requirements shouldn't exclude one another, but should add to each other. As currently written only one of the following control requirements need to be implemented. With the revised code language and added exceptions, all three of the following control requirements should be implemented.

- Supply Water Temperature Reset
- Variable Flow Control
- Variable or Stepped Pumping

Variable flow control (requirement 2) in hydronic systems is needed in order to implement variable or stepped pumping (requirement 3). Therefore requirement 2 is defined prior to requirement 3. Requirement 2 applies to all other hydronic systems since 2-way valve control is less expensive than 3-way valve control. This requirement also aligns with section C403.3.3.3, which requires 2-way valve control on heat pump hydronic systems.

Cooling System Variable Flow or Stepped Pumping: Cooling systems with pump capacity 10hp or greater should have variable flow using variable speed drives or stepped pumping. Allowing cooling pumps to vary flow and ride the pump curve should not be allowed on larger pumping systems. Heating only hydronic systems of any size are excluded from this requirement since pump inefficiencies are recaptured as a heat source in the hydronic heating system. A cost effective analysis, as shown in the table below, indicates cooling systems with a pump capacity of 10HP to be cost effective. The analysis assumes an average pump run time of 2000 hours. This is thought to be a conservative chilled water pump run time from a national prospective. This analysis only accounts for pump motor energy savings and doesn't account for the reduced heat rejected from the cooling pump into the chilled water system.

Cost Impact: The code change proposal will increase the cost of construction.

CE254 – 13

C202 (NEW), C403.4.3.5 (NEW), Table C403.4.3.5 (NEW)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Add new text as follows:

C403.4.3.5 Boiler Turndown. Boiler systems with design input of greater than 1,000,000 Btu/h shall comply with the turndown ratio specified in Table 403.4.3.5.

The system turndown requirement shall be met through the use of multiple single input boilers, one or more *modulating boilers* or a combination of single input and modulating boilers.

**TABLE 403.4.3.5
BOILER TURNDOWN**

<u>Boiler System Design Input (Btu/h)</u>	<u>Minimum Turndown Ratio</u>
<u>≥ 1,000,000 and less than or equal to 5,000,000</u>	<u>3 to 1</u>
<u>> 5,000,000 and less than or equal to 10,000,000</u>	<u>4 to 1</u>
<u>> 10,000,000</u>	<u>5 to 1</u>

Add new definitions as follows:

SECTION C202 GENERAL DEFINITIONS

BOILER, MODULATING. A boiler that is capable of more than a single firing rate in response to a varying temperature or heating load.

BOILER SYSTEM. One or more boilers, their piping and controls that work together to supply steam or hot water to heat output devices remote from the boiler.

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, has been revised to include boiler turndown requirements for boilers larger than 1,000,000 Btu/h. These requirements are in addition to the efficiency requirements in TABLE C403.2.8. The change ensures continued consistency between the IECC and Standard 90.1-2010.

Cost Impact: The code change proposal will increase the cost of construction.

C403.4.4, C403.4.4.1 (NEW), C403.4.4.2 (NEW), C403.4.4.2.1 (NEW), C403.4.4.2.2 (NEW), C403.4.4.3, C403.4.4.4 (NEW)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C403.4.4 Heat rejection equipment fan speed control. Each fan powered by a motor of 7.5 hp (5.6 kW) or larger shall have the capability to operate that fan at two-thirds of full speed or less, and shall have controls that automatically change the fan speed to control the leaving fluid temperature or condensing temperature/pressure of the heat rejection device.

Exception: Factory-installed heat rejection devices within HVAC equipment tested and rated in accordance with Tables C403.2.3(6) and C403.2.3(7).

C403.4.4.1 General. Heat rejection equipment such as air-cooled condensers, dry coolers, open-circuit cooling towers, closed-circuit cooling towers, and evaporative condensers used for comfort cooling applications shall comply with this section.

Exception: Heat rejection devices whose energy usage is included in the equipment efficiency ratings listed in Tables C403.2.3 (6) and C403.2.3 (7).

C403.4.4.2 Fan speed control. The fan speed shall be controlled as follows:

C403.4.4.2.1 Fan motors at least 7.5 hp. Each fan powered by a motor of 7.5 hp (5.6 kW) or larger shall have the capability to operate that fan at two-thirds of full speed or less, and shall have controls that automatically change the fan speed to control the leaving fluid temperature or condensing temperature/pressure of the heat rejection device.

Exceptions: The following fan motors over 7.5 hp are exempt:

1. Condenser fans serving multiple refrigerant circuits.
2. Condenser fans serving flooded condensers.
3. Installations located in climate zones 1 and 2.

C403.4.4.2.2 Multiple cell heat rejection equipment. Multiple cell heat rejection equipment with variable speed fan drives shall:

1. Be controlled to operate the maximum number of fans allowed that comply with the manufacturer's requirements for all system components, and
2. Be controlled so all fans can operate at the same fan speed required for the instantaneous cooling duty as opposed to staged (on/off) operation.

Minimum fan speed shall be the minimum allowable speed of the fan drive system in accordance with the manufacturer's recommendations.

C403.4.4.3 Limitation on centrifugal fan open-circuit cooling towers. Centrifugal fan open-circuit cooling towers with a combined rated capacity of 1100 gpm or greater at 95°F condenser water return, 85°F condenser water supply, and 75°F outdoor air wet-bulb temperature shall meet the energy efficiency requirement for axial fan open-circuit cooling towers listed in Table C403.2.3(8).

Exception: Centrifugal open-circuit cooling towers that designed with inlet or discharge ducts or require external sound attenuation.

C403.4.4.4 Tower flow turndown. Open circuit cooling towers used on water cooled chiller systems that are configured with multiple or variable speed condenser water pumps shall be designed so that all open circuit cooling tower cells can be run in parallel with the larger of the flow that is produced by the smallest pump at its minimum expected flow rate or at 50 percent of the design flow for the cell.

Reason: ASHRAE/IES Standard 90.1, which is adopted by reference as an alternative to the IECC Commercial Provisions, has been revised to enhance the provisions applicable to cooling tower controls and supports further reductions in energy use. The change ensures continued consistency between the IECC and 90.1.

Cost Impact: The code change proposal will increase the cost of construction.

C403.4.4-EC-FERGUSON.doc

CE256– 13

C403.4.5

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C403.4.5 Requirements for complex mechanical systems serving multiple zones. Sections C403.4.5.1 through C403.4.5.3 shall apply to complex mechanical systems serving multiple zones. Supply air systems serving multiple zones shall be VAV systems which, during periods of occupancy, are designed and capable of being controlled to reduce primary air supply to each *zone* to one of the following before reheating, recooling or mixing takes place:

1. Thirty percent of the maximum supply air to each *zone*.
2. Three hundred cfm (142 L/s) or less where the maximum flow rate is less than 10 percent of the total fan system supply airflow rate.
3. The minimum ventilation requirements of Chapter 4 of the *International Mechanical Code*.
4. Any higher rate that can be demonstrated to reduce overall system annual energy use by offsetting reheat/recool energy losses through a reduction in *outdoor air* intake for the system, as approved by the code official.

Exception: The following define where individual *zones* or where entire air distribution systems are exempted from the requirement for VAV control:

1. *Zones* where special pressurization relationships or cross-contamination requirements are such that VAV systems are impractical.
2. *Zones* or supply air systems where at least 75 percent of the energy for reheating or for providing warm air in mixing systems is provided from a site-recovered or site-solar energy source.
3. *Zones* where special humidity levels are required to satisfy process needs.
4. *Zones* with a peak supply air quantity of 300 cfm (142 L/s) or less and where the flow rate is less than 10 percent of the total fan system supply airflow rate.
5. *Zones* where the volume of air to be reheated, recoolled or mixed is no greater than the volume of outside air required to meet the minimum ventilation requirements of Chapter 4 of the *International Mechanical Code*.
6. *Zones* or supply air systems with thermostatic and humidistatic controls capable of operating in sequence the supply of heating and cooling energy to the *zones* and which are capable of preventing reheating, recooling, mixing or simultaneous supply of air that has been previously cooled, either mechanically or through the use of economizer systems, and air that has been previously mechanically heated.

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, contains an important exception to zone minimum airflow that is not included in the IECC. The exception is important to allow optimization of multi-zone system ventilation, and saves significant energy nationally. The change ensures continued consistency between the IECC and standard 90.1-2010.

Cost Impact: The code change proposal will not increase the cost of construction.

C403.4.5 #1-EC-FERGUSON.doc

CE257 – 13

C403.4.5

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferuson@ashrae.org)

Revise as follows:

C403.4.5 Requirements for complex mechanical systems serving multiple zones. Sections C403.4.5.1 through C403.4.5.3 shall apply to complex mechanical systems serving multiple zones. Supply air systems serving multiple zones shall be VAV systems which, during periods of occupancy, are designed and capable of being controlled to reduce primary air supply to each *zone* to one of the following before reheating, recooling or mixing takes place:

1. Thirty percent of the maximum supply air to each *zone*.
2. Three hundred cfm (142 L/s) or less where the maximum flow rate is less than 10 percent of the total fan system supply airflow rate.
3. The minimum ventilation requirements of Chapter 4 of the *International Mechanical Code*.
4. Any higher rate that can be demonstrated to reduce overall system annual energy use by offsetting reheat/recool energy losses through a reduction in *outdoor air* intake for the system, as approved by the code official.
5. The air flow rate required to comply with applicable codes or accreditation standards, such as pressure relationships or minimum air change rates.

Exception: The following define where individual *zones* or where entire air distribution systems are exempted from the requirement for VAV control:

- ~~1. Zones where special pressurization relationships or cross-contamination requirements are such that VAV systems are impractical.~~
- ~~2. 1. Zones or supply air systems where at least 75 percent of the energy for reheating or for providing warm air in mixing systems is provided from a site-recovered or site-solar energy source.~~
- ~~3. 2. Zones where special humidity levels are required to satisfy process needs.~~
- ~~4. 3. Zones with a peak supply air quantity of 300 cfm (142 L/s) or less and where the flow rate is less than 10 percent of the total fan system supply airflow rate.~~
- ~~5. 4. Zones where the volume of air to be reheated, recooling or mixed is no greater than the volume of outside air required to meet the minimum ventilation requirements of Chapter 4 of the *International Mechanical Code*.~~
- ~~6. 5. Zones or supply air systems with thermostatic and humidistatic controls capable of operating in sequence the supply of heating and cooling energy to the *zones* and which are capable of preventing reheating, recooling, mixing or simultaneous supply of air that has been previously cooled, either mechanically or through the use of economizer systems, and air that has been previously mechanically heated.~~

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, contains an important exception to zone minimum airflow that is not included in the IECC. The exception is important to allow optimization of multi-zone system ventilation, and saves significant energy nationally. The change ensures continued consistency between the IECC and standard 90.1-2010.

C403.4.5 #2-EC-FERGUSON.doc

CE258 – 13

C403.4.5.4 (NEW)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Add new text as follows:

C403.4.5.4 Fractional HP fan motors. Motors for fans that are 1/12 HP or greater and less than 1 HP shall be electronically-commutated motors or shall have a minimum motor efficiency of 70 percent rated in accordance with DOE 10 CFR 431 . These motors shall also have the means to adjust motor speed for either balancing or remote control. The use of belt-driven fans to sheave adjustments for airflow balancing in lieu of a varying motor speed shall be permitted.

Exception Motors in the airstream within fan-coils and terminal units that only provide heating to the space served.

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, contains an important exception to zone minimum airflow that is not included in the IECC. Research conducted by the California Energy Commission and others indicates that Electronically Commutated Motors (ECM) are more efficient and are cost effective compared to standard (e.g. PSC) motors in applications where the fan runs many hours per day (e.g. toilet exhaust fans, series fan-powered VAV boxes, and fan-coil units) other than those in the airstream that operate only when heating a space since the motor in that case behave essentially as an electric resistance heater. ECMs also reduce energy because their speed can be adjusted for balancing rather than throttling dampers. (ECMs can also be used for variable speed capacity control but that is not a requirement of this section.). The change ensures continued consistency between the IECC and standard 90.1-2010.

Cost Impact: The code change proposal will increase the cost of construction.

CE258-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C403.4.5.4 (NEW)-EC-FERGUSON.doc

CE259 – 13

C403.4.5.5 (NEW)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Add new text as follows:

C403.4.5.5 Multiple-zone VAV system ventilation optimization control. Multiple-zone VAV systems with direct digital control of individual zone boxes reporting to a central control panel shall have automatic controls configured to reduce outdoor air intake flow below design rates in response to changes in *system ventilation efficiency (E_v)* as defined by the *International Mechanical Code*.

Exceptions:

1. VAV systems with zonal transfer fans that recirculate air from other zones without directly mixing it with outdoor air, dual-duct dual-fan VAV systems, and VAV systems with fan-powered terminal units.
2. Systems having exhaust air energy recovery complying with Section C403.2.6.
3. Systems where total design exhaust airflow is more than 70 percent of total design outdoor air intake flow requirements.

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, has requirements for ventilation optimization control on VAV systems that are not included in the IECC. These provisions provide significant energy savings. The change ensures continued consistency between the IECC and standard 90.1-2010 and provides significant energy savings in IECC.

Cost Impact: The code change proposal will increase the cost of construction.

CE259-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C403.4.5.5 (NEW)-EC-FERGUSON.doc

CE260 – 13

C403.4.8 (New)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Add new text as follows:

C403.4.8 Window switch controls. Any conditioned space with operable wall or roof openings to the outdoors shall be provided with controls that, when any such opening is open:

1. Disable mechanical heating or reset the heating set point to 55°F or lower.
2. Disable mechanical cooling or reset the cooling set point to 90°F or greater unless the outside air temperature is below the conditioned space temperature

Exceptions: These controls are not required for:

1. Building entries with automatic closing devices
2. Any space without a thermostat
3. Alterations to existing buildings

Reason: When a space with operable windows has non-integrated mechanical heating and cooling, it is likely that annual HVAC energy will be increased when compared to the same space without operable windows. This can be attributed to operable windows being left open when conditions are not favorable, resulting in high infiltration loads on the HVAC system. There are many reasons why windows are opened when conditions are not favorable:

1. Occupant wants more fresh air and is inconsiderate or unaware of the energy penalty of opening the window when indoor/outdoor conditions are not favorable. This is particularly likely when the HVAC system has sufficient capacity to maintain the space indoor temperature at setpoint despite the increased infiltration load.
2. Occupant does not have sufficient information regarding the indoor air temperature, outdoor air temperature, or HVAC mode of operation to properly determine if opening the window will reduce or increase energy use.
3. Occupant opened the window during favorable conditions, but left the room while the window was open. During their time away from the space, the conditions transitioned to unfavorable.

The intent of this measure is to reduce unnecessary use of energy for heating or cooling of additional un-tempered air if an operable window is left open outside of times when it is beneficial to leave it open. This is accomplished with a simple mechanical switch that integrates the HVAC system operation with operable window position.

The change ensures continued consistency between the IECC and Standard 90.1-2010.

Cost Impact: The code change proposal will increase the cost of construction .

CE260-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C403.4.8-EC-FERGUSON.doc

CE261 – 13

C403.4.8 (NEW)

Proponent: Eric Makela, Britt/Makela Group, Inc., representing Northwest Energy Codes Group (eric@brittmakela.com)

Add new text as follows:

C403.4.8 Limitation of air-cooled cooling. Buildings with more than 3,600,000 Btu/h (300 tons, 85 kW) total cooling capacity supplied by chilled water shall not have more than 1,200,000 Btu/h (100 tons, 30 kW) provided by air-cooled chillers.

Exceptions:

1. Where the water quality at the building site fails to meet manufacturer's specifications for the use of water-cooled chillers as approved by the code official.
2. Where chillers are used to charge a thermal energy storage system with a design temperature of less than 40°F (4°C).
3. Air-cooled chillers with IPLV ratings 12 percent greater than efficiencies required by Section C403.2.3 or Section C406.2, whichever is used.

Reason: The goal of this proposal is to require buildings with 300 tons or greater peak cooling load to have no more than 100 tons served by air-cooled systems. Include exceptions for high-efficiency air-cooled systems and systems with thermal storage.

Water-cooled chillers are significantly more efficient than air-cooled chillers, using about 30 percent less energy. Once cooling capacity reaches a certain size, it is reasonable to install the more complex water-cooled chiller equipment. The code change proposal limits the capacity of air-cooled chillers in larger chilled water plants.

This proposal places a limit on capacity of less efficient equipment in the prescriptive path. As such it does not limit the ability to use such equipment, as the reasonable and cost effective efficiency gains in this proposal can be made up through trade off in the performance path in other energy using areas of the building if there is a desire or need to install air-cooled equipment above the prescriptive capacity limits.

Where an air cooled chiller is desired, exception 3 allows higher efficiency units to be used. A review of available equipment shows that at least two manufacturers have equipment that can meet the 12% greater IPLV required in the exception for all sizes and a third manufacturer meets that threshold for half the available models.

There would be a cost increase associated with this code change for buildings with chiller plants larger than 300 tons in capacity that are not subject to the exceptions because those buildings currently do not require more complex water-cooled systems. A detailed cost analysis conducted in support of similar provisions for the 2005 version of California Title 24 (the California energy code) found that this requirement was cost effective. In this analysis, the limitation was cost effective in San Francisco, a climate with one of the lowest national ratios of total cooling use to cooling design temperature. If the Net Present Value results for Fresno are de-rated to 40% to account for larger cooling tower sizing and higher airflows in humid climates due to higher wet bulb design temperatures, they would be still be cost effective in moist climates like Houston, Memphis, and Miami.

Cost Impact: The code change proposal will increase the cost of construction.

CE262-13

Table C404.2, C404.2.1 (New)

Proponent: Steve Ferguson representing the American Society of Heating, Refrigerating, and Air-Conditioning Engineers (sferguson@ashrae.org)

Revise as follows:

**TABLE C404.2
MINIMUM PERFORMANCE OF WATER-HEATING EQUIPMENT**

EQUIPMENT TYPE	SIZE CATEGORY (input)	SUBCATEGORY OR RATING CONDITION	PERFORMANCE REQUIRED ^{a,b}	TEST PROCEDURE
Water heaters, electric	$\leq 12 \text{ kW}^d$	Resistance	0.97 - 0.00 132 V, EF	DOE 10 CFR Part 430
	$> 12 \text{ kW}$	Resistance	$1.73 V + 155 \text{ SL, Btu/h}$ $(0.3 + 27/V_m), \text{ %/h}$	ANSI Z21.10.3
	$\leq 24 \text{ amps and}$ $\leq 250 \text{ volts}$	Heat pump	0.93 - 0.00 132 V, EF	DOE 10 CFR Part 430
Storage water heaters, oil	$\leq 105,000 \text{ Btu/h}$	$\geq 20 \text{ gal}$	0.59 - 0.0019 V, EF	DOE 10 CFR Part 430
	$\geq 105,000 \text{ Btu/h}$	$< 4,000 \text{ Btu/h/gal}$	$78\% \text{ } 80\% E_t$ $(Q/800 + 110\sqrt{V})\text{SL, Btu/h}$	ANSI Z21.10.3
Heat pump pool heaters	All	50°F dry bulb and 44.2°F wet bulb outdoor air and 80.0°F entering water	4.0 COP	AHRI 1160

b. Standby loss (SL) is the maximum Btu/h based on a nominal 70°F temperature difference between stored water and ambient requirements. In the SL equation, Q is the nameplate input rate in Btu/h. and In the SL equations for electric water heaters, V is the rated volume in gallons and V_m is the measured volume in gallons. In the SL equation for oil and gas water heaters and boilers, V is the rated volume in gallons.

d. Electric water heaters with an input rating of 12kW or less that are designed to heat water to temperatures of 180°F or greater shall comply with the requirements for electric water heaters that have an input rating greater than 12kW.

(Portions of Table not shown remain unchanged)

C402.2.1 High input-rated service water heating systems. This section shall apply only to gas fired water heating equipment installed in new buildings. Where a singular piece of water heating equipment serves the entire building and the input rating of the equipment is 1,000,000 Btu/h (293 kW) or greater, such equipment shall have a thermal efficiency, E_t , of not less than 90 percent. Where multiple pieces of water heating equipment serve the building and the combined input rating of the water heating equipment is 1,000,000 Btu/h (293 kW) or greater, the combined input-capacity-weighted-average thermal efficiency, E_t , shall be not less than 90 percent.

Exceptions:

1. Where 25 percent of the annual *service water heating* requirement is provided by site-solar or site-recovered energy, the minimum thermal efficiency requirements of this section shall not apply.
2. The input rating of water heaters installed in individual dwelling units shall not be required to be included in the total input rating of *service water heating* equipment for a building.
3. The input rating of water heaters with an input rating of not greater than 100,000 Btu/h (29.3 kW) shall not be required to be included in the total input rating of *service water heating* equipment for a building.

Reason: This proposal adds requirement for the use of gas condensing service water heaters in newly constructed buildings. Additionally, the proposed addendum makes several changes to Table C404.2 to reflect current Federal energy regulations for electric water heaters, to match the requirements of the newest edition ASHRAE 146 heat pump pool heater standard and to increase the minimum efficiency for certain oil storage water heaters from 78 to 80 percent. This makes the IECC consistent with 90.1.

Cost Impact: This code change proposal will increase the cost of construction.

CE262-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C404.6(NEW)-EC-FERGUSON.DOC

CE263-13

Table C404.2

Proponent: Jennifer. Hatfield, J. Hatfield & Associates, PL representing Association of Pool & Spa Professionals (APSP) (jhatfield@apsp.org)

Revise as follows:

TABLE C404.2
MINIMUM PERFORMANCE OF WATER-HEATING EQUIPMENT

EQUIPMENT TYPE	SIZE CATEGORY (input)	SUBCATEGORY OR RATING CONDITION	PERFORMANCE REQUIRED ^{a,b}	TEST PROCEDURE
Pool heaters, gas and oil	All	--	78 <u>82</u> % E_t	ASHRAE 146

(Portions of Table not shown remain unchanged)

Reason: Per federal Department of Energy requirements, the minimum efficiency level for pool gas heaters went from 78% to 82%, effective April 2013. This change ensures consistency with federal requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

CE263-13

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

404.2T-EC-HATFIELD.DOC

CE264 – 13

C404.2

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C404.2 Service water-heating equipment performance. Water-heating equipment and hot water storage tanks shall meet the requirements of Table C404.2. The efficiency shall be verified through data furnished by the manufacturer of the equipment or through certification under an *approved* certification program. Water heating equipment also intended to be used to provide space heating shall meet the applicable provisions of Table C404.2.

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, has a provision to address the efficiency of equipment used to provide both space heating and service water heating functions. This situation is not addressed in the IECC and needs to be to ensure consistency between standard 90.1-2010 and the IECC.

Cost Impact: The code change proposal will increase the cost of construction.

CE264-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C404.2 (NEW)-EC-FERGUSON.DOC

CE266-13

C404.3

Proponent: Gary Klein, Affiliated International Management, LLC, representing self,
(gary@aim4sustainability.com)

Revise as follows:

C404.3 Temperature controls. ~~Service water heating equipment shall be provided with controls to allow a setpoint of 110°F (43°C) for equipment serving dwelling units and 90°F (32°C) for equipment serving other occupancies.~~ The outlet temperature of lavatories in public facility rest rooms shall be limited to 110°F (43°C).

Reason: While there may be some energy saving reasons for having controls on service water heating equipment that limit the output temperature of the water, the temperatures chosen are right in the "sweet spot" that enables pathogens, such as Legionella, to multiply exceedingly. These provisions encourage unsafe hot water distribution systems and should be removed.

Cost impact: The code change proposal will not increase the cost of construction.

CE266-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C404.3 #2-EC-KLEIN

CE267-13

C404.3

Proponent: Gary Klein, Affiliated International Management, LLC, representing self,
(gary@aim4sustainability.com)

Revise as follows:

C404.3 Temperature controls. Service water-heating equipment shall be provided with controls to allow a setpoint of 110°F (43°C) for equipment serving dwelling units and 90°F (32°C) for equipment serving other occupancies. ~~The outlet temperature of lavatories in public facility rest rooms shall be limited to 110°F (43°C).~~

Reason: The International Plumbing Code already has the requirement for limiting the temperature of water discharged from “public” lavatory fixture fitting (See IPC Section 416.5 below). This is more a safety issue than it is an energy savings issue. The plumbing code also requires that the temperature of the water be controlled by a temperature limited device (a thermostatic mixing valve) that complies with ASSE 1070 or CSA B125.3. Simply setting a water heater thermostat to 110F is not an acceptable method for controlling temperature at the lavatory outlet. Having this temperature requirement in this section of the IECC implies that setting a water heater thermostat to control the water temperature for the public lavatories is acceptable which is not the case!

Also, there is some confusion about what constitutes a “public facility restroom” – it is not a defined term. The plumbing code has been dealing with the right way to specify what lavatories need the temperature control. Let the plumbing code continue to deal with the intricacies of this requirement and remove this sentence from the IECC so that conflicts do not occur.

2012 IPC Section 416.5 for reference:

416.5 Tempered water for public hand-washing facilities. *Tempered water* shall be delivered from lavatories and group wash fixtures located in public toilet facilities provided for customers, patrons and visitors. *Tempered water* shall be delivered through an *approved* water-temperature limiting device that conforms to ASSE 1070 or CSA B125.3.

Cost impact: The code change proposal will not increase the cost of construction.

CE267-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C404.3 #1-EC-KLEIN

CE268-13

C404.3, C404.5, C404.6

Proponent: Jennifer. Hatfield, J. Hatfield & Associates, PL representing Association of Pool & Spa Professionals (APSP) (jhatfield@apsp.org)

Revise as follows:

C404.3 Temperature controls. Service water-heating equipment shall be provided with controls to allow a setpoint of 110°F (43°C) for equipment serving dwelling units and 90°F (32°C) for equipment serving other occupancies. The outlet temperature of lavatories in public facility rest rooms shall be limited to 110°F (43°C). This section shall not apply to pool heaters.

C404.5 Pipe insulation. For automatic-circulating hot water and heat-traced systems, piping shall be insulated with not less than 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h × ft² × °F (1.53 W per 25 mm/m² × K). The first 8 feet (2438 mm) of piping in non-hot water-supply temperature maintenance systems served by equipment without integral heat traps shall be insulated with 0.5 inch (12.7 mm) of material having a conductivity not exceeding 0.27 Btu per inch/h × ft² × °F (1.53 W per 25 mm/m² × K). This section shall not apply to piping associated with pool heaters.

Exception: Heat-traced piping systems shall meet the insulation thickness requirements per the manufacturer's installation instructions. Untraced piping within a heat traced system shall be insulated with not less than 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h × ft² × °F (1.53 W per 25 mm/m² × K).

C404.6 Hot water system controls. Circulating hot water system pumps or heat trace shall be arranged to be turned off either automatically or manually when there is limited hot water demand. Ready access shall be provided to the operating controls. This section shall not apply to pool heaters.

Reason: The requirements of these sections were never intended to apply to pool heaters. But pool heaters, by the fact that they are indicated in Table C404.2 SERVICE WATER HEATING EQUIPMENT, are service water heating equipment. Pool heaters operate at different temperatures and the temperatures maximums are covered by the International Swimming Pool and Spa Code. Insulating pool piping to these requirements is futile as the pool itself radiates far more heat than the piping loses. Controls for pool pumps (circulating pumps) are already regulated by the International Swimming Pool and Spa Code. The added lines of text in these sections solves the problems.

Cost impact: The code change proposal will not increase the cost of construction.

CE268-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C404.3-EC-HATFIELD.DOC

CE269-13

C404.3 (NEW)

Proponent: Tim Nogler, Washington State Building Code Council (tim.nogler@des.wa.gov)

Add new text as follows:

C404.3 Hot water meters required. In buildings of Group R2 occupancy having apartments that are served by a centralized service hot water system for the building, the hot water service pipe to each apartment shall have a water meter. Such water meters shall meet the technical requirements for customer billing purposes. The meters shall not be required to be located within the apartments.

Reason: The purpose of this proposal is to save energy. Apartment residents use less hot water when they are individually billed for their usage.

Cost Impact: The code change proposal will increase the cost of construction.

Proponent: Steve Ferguson representing the American Society of Heating, Refrigerating, and Air-Conditioning Engineers (sferguson@ashrae.org)

PART I-IECC-COMMERCIAL PROVISIONS

Delete and substitute as follows:

C404.5 Pipe insulation. For Automatic-circulating hot water and heat-traced systems, piping shall be insulated with not less than 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h \times ft² \times °F (1.53 W per 25 mm/m² \times K). The first 8 feet (2438 mm) of piping in non-hot water supply temperature maintenance systems served by equipment without integral heat traps shall be insulated with 0.5 inch (12.7 mm) of material having a conductivity not exceeding 0.27 Btu per inch/h \times ft² \times °F (1.53 W per 25 mm/m² \times K).

Exception: Heat-traced piping systems shall meet the insulation thickness requirements per the manufacturer's installation instructions. untraced piping within a heat traced system shall be insulated with not less than 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h \times ft² \times °F (1.53 W per 25 mm/m² \times K).

C404.5 Pipe insulation. Piping in circulating hot water systems and heat-trace temperature maintenance systems shall be insulated in accordance with Table C403.2.8. In hot water systems that have a storage tank and that do not have a circulating hot water system, the first 8 feet (2438 mm) of outlet water piping connecting to a storage water heater or a hot water storage tank shall be insulated in accordance with Table C403.2.8. The pipe between the inlet of a storage tank and a heat trap shall be insulated in accordance with Table C403.2.8.

PART II - IPC

[E] 607.5 Pipe insulation. Hot water piping in automatic temperature maintenance systems shall be insulated with 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h \times ft² \times °F (1.53 W per 25 mm/m² \times K). The first 8 feet (2438 mm) of hot water piping from a hot water source that does not have heat traps shall be insulated with 0.5 inch (12.7 mm) of material having a conductivity not exceeding 0.27 Btu per inch/h \times ft² \times °F (1.53 W per 25 mm/m² \times K). Piping in circulating hot water systems and heat-trace temperature maintenance systems shall be insulated in accordance with Table C403.2.8 of the *International Energy Conservation Code*. In hot water systems that have a storage tank and that do not have a circulating hot water system, the first 8 feet (2438 mm) of outlet water piping connecting to a storage water heater or a hot water storage tank shall be insulated in accordance with Table C403.2.8 of the *International Energy Conservation Code*. The pipe between the inlet of a storage tank and a heat trap shall be insulated in accordance with Table C403.2.8 of the *International Energy Conservation Code*. This section shall not apply to the piping in Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane. Piping in circulating hot water systems and heat-trace temperature maintenance systems in Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane shall be insulated in accordance with R403.4.2 of the *International Energy Conservation Code*.

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, references the HVAC piping insulation provisions. The 2012 IECC Commercial Provisions have separate insulation requirements for service water heating piping. It seems logical that the heat loss of the pipe under identical conditions regardless of whether

supplying potable water or water for HVAC applications would be the same and should be addressed in the same manner. This situation should be addressed in the IECC to ensure consistency between standard 90.1-2010 and the IECC.

Cost Impact: This code change proposal will increase the cost of construction where pipe insulation > 1 inch wall thickness is required.

THIS IS A 2 PART CODE CHANGE PROPOSAL. PARTS I AND II WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AS TWO SEPARATE CODE CHANGES.

Proponent: Gary Klein, Affiliated International Management, LLC, representing self, gary@aim4sustainability.com

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C404.5 Pipe Insulation of piping. For automatic-circulating hot water and heat-traced systems, piping shall be insulated with not less than 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h • ft² • °F (1.53 W per 25 mm/m² • K). The first 8 feet (2438 mm) of piping in non-hot water supply temperature maintenance systems served by equipment without integral heat traps shall be insulated with 0.5 inch (12.7 mm) of material having a conductivity not exceeding 0.27 Btu per inch/h • ft² • °F (1.53 W per 25 mm/m² • K). Piping to the inlet of a water heater and piping conveying water heated by a water heater shall be insulated in accordance with Sections C404.5.1, C404.5.2 and C404.5.2.3. Where tubular pipe insulation is used for insulating piping, the thermal conductivity, k, of such insulation shall be not greater than 0.28 Btu per inch/h • ft² • °F [0.40 W/(m • K)] for water temperatures less than or equal to 140°F (60°C) and not greater than 0.29 Btu per inch/h • ft² • °F [0.42 W/(m • K)] for water temperatures greater than 140°F (60°C) and less than or equal to 200°F (93.3°C). Tubular pipe insulation shall be installed in accordance with the insulation manufacturer's instructions. Pipe insulation shall be continuous except where the piping passes through a framing member. The minimum insulation thickness requirements of this section shall not supersede any greater insulation thickness requirements necessary for the protection of piping from freezing temperatures or the protection of personnel against external surface temperatures on the insulation. This section shall not be construed as requiring insulation on the following:

Exception: Heat-traced piping systems shall meet the insulation thickness requirements per the manufacturer's installation instructions. Untraced piping within a heat traced system shall be insulated with not less than 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h • ft² • °F (1.53 W per 25 mm/m² • K).

1. The tubing from the connection at the termination of the fixture supply piping to a fixture fitting or a water consuming appliance.
2. Valves, pumps, strainers and threaded unions in piping that is 1 inch or less in nominal diameter
3. Piping from user-controlled shower and bath mixing valves to the water outlets.
4. Cold water piping of a demand recirculation water system.
5. Tubing from a hot drinking-water heating unit to the water outlet.
6. Piping at locations where a vertical support of the piping is installed.

C404.5.1 Circulating system piping and heat-traced piping. Heated water circulation system piping shall be insulated in accordance with Table C404.5.1. Piping that is heat-traced to maintain heated water temperature shall be insulated in accordance with Table C404.5.1 or shall have insulation thickness in accordance with the heat tracing manufacturer's requirements. Untraced piping within a heat-traced system shall be insulated in accordance with Table C404.5.1.

TABLE C404.5.1

MINIMUM TUBULAR PIPE INSULATION WALL THICKNESS

NOMINAL PIPE OR TUBE DIAMETER (inches)	MINIMUM INSULATION WALL THICKNESS (inches)	
	≤140 °F WATER TEMPERATURE	>140 °F to 200°F WATER TEMPERATURE
≤3/8	3/8	3/8
> 3/8 to <3/4	1/2	1/2
≥ 3/4 to <1	3/4	1
≥1 to <1 1/2	1	1 1/2
≥1 1/2 to <4	1 1/2	2
≥4 to <8	1 1/2	2
≥8	1 1/2	2

For SI: 1 inch = 25.4 mm, °C= [(°F – 32)/1.8]

C404.5.2 Inlet piping connecting to water heaters and storage tanks. Where a water heater or a heated water storage tank is not equipped with integral heat traps, the inlet piping within 8 feet (2438 mm) of piping length of the water heater or storage tank shall be insulated in accordance with Table C404.5.1. This requirement shall not supersede the water heater manufacturer's requirements for a greater insulation thickness on the inlet piping.

Exceptions:

1. Inlet piping or tubing to a water heater serving only *plumbing fixtures* or *plumbing appliances* that are within 8 feet (2438 mm) piping length of the water heater shall not be required to be insulated.
2. Valves, pumps, strainers and threaded unions in water heater or heated water storage inlet piping that is 1 inch (25.4 mm) nominal diameter or less shall not be required to be insulated.

C404.5.3 Other heated water piping. Piping conveying heated water that is not addressed by Sections C404.5.1 and C404.5.2 shall have insulation with a wall thickness of not less than that indicated in Table C404.5.1.

Exceptions:

1. Outlet piping or tubing from a water heater serving only *plumbing fixtures* or *plumbing appliances* that are within 8 feet (2438 mm) piping length of the water heater shall not be required to be insulated.
2. Piping or tubing that is completely surrounded by not less than 1 inch (25.4 mm) thickness of building thermal envelope insulation in walls, attics and crawl spaces shall not be required to be insulated with tubular pipe insulation provided that the piping or tubing is 1 inch (25.4 mm) nominal diameter or smaller.

Add new definition as follows:

WATER HEATER. Any heating appliance or equipment that heats potable water and supplies such water to the potable hot water distribution system.

PART II-IPC

Revise as follows:

[E] 607.5 Pipe Insulation of piping. Hot water piping in automatic temperature maintenance systems shall be insulated with not less than 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h • ft² • °F (1.53 W per 25 mm/m² • K). The first 8 feet (2438 mm) of hot water piping from a hot water source that does not have heat traps shall be insulated with 0.5 inch (12.7 mm) of material having a conductivity not exceeding 0.27 Btu per inch/h • ft² • °F (1.53 W per 25 mm/m² • K). For other than Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane, piping to the inlet of a water heater and piping conveying water heated by a water heater shall be insulated in accordance with Sections C404.5 through C404.5.3 of the *International Energy Conservation Code*. For Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane, piping to the inlet of a water heater and piping conveying water heated by a water heater shall be insulated in accordance with Section R403.4.2 of the *International Energy Conservation Code*.

Reason: This section has generated a lot of questions over the many years since it was put into the IECC. Some people believe that this section requires all hot water piping to have 1 inch insulation. Others believe that this section only requires that hot water circulating system piping (or heat traced piping) have 1 inch of insulation. Another question that arises is what is meant by "hot water" as there is not a definition of such in the IECC. Other questions that arise are "Is the insulation required to be continuous along the piping?" and "Should really small piping and tubing be insulated?" The exception really isn't an exception but requirements for heat-traced systems.

There is no other place in the Commercial Provisions of the IECC that covers the insulation of Service Water Heating piping. This subject is important! In summary, the language in this section is a mess and the words do not clearly state the intended requirements. Let's stop dancing around this important aspect of lessening energy consumption.

The proposed revisions and why:

C404.5

The intent of the struck-out language can be found in new sections C404.5.1 and C404.5.2. The new language for this struck language is discussed later in this reason statement.

The phrase "water heated by a water heater" was used instead of "hot water" because the IECC does not have a definition for hot water. Code users could refer to the definition found in the IRC and the IPC for hot water which says water of a temperature 110F or greater. But what about tempered water (IPC definition of 85F to 110F)? Keep in mind that ASHRAE 90.1-2007 only requires insulation of service water piping conveying water of 105F or greater. It doesn't seem reasonable to say only "hot water" (as defined by the IPC). If necessary, the committee could request a public comment to amend this section to indicate that the section only covers water 105F and greater.

The statement about protection of personnel from external insulation temperatures and freezing conditions is really common sense but it is added for clarity. It also serves as a reminder for the designer to consider these important issues.

The language "The insulation shall be continuous along the piping." was added to answer the obvious and most often asked question. But keep in mind that this requirement could have serious structural implications when piping is routed through light frame construction members (wood studs and joist, metal studs and solid web joists). The holes to accommodate the piping diameter and insulation could become quite large and in some cases, making piping installation very difficult to perform unless soffits and chases are added and wall thicknesses are increased. Again, the committee could express its opinion on this issue by requesting that a public comment for *not* having insulation be continuous through wood studs and joist/metal studs and solid web joists. Either way, this question needs to be answered in a definitive manner.

The list of items where pipe insulation is not required is almost common sense but still, these items need to be stated to avoid confusion and possible misinterpretations by the code officials. Insulating valves is time consuming and if the right type of valve is not used, insulating is almost impossible (think ball valve without a raised handle). A few uninsulated valves in the system are not going to lose a lot of heat. Pumps are also difficult to insulate and in some cases, insulation might cause overheating of the pump motor. Threaded unions usually only occur in smaller diameter piping systems and are time consuming to insulate. Again, a small amount of heat loss compared to the entire system. Piping or tubing from a small tankless water heater serving one sink is too small to easily insulate. The heat loss is negligible.

C404.5.1

The first sentence of this section is saying exactly what the first struck out sentence in C404.5 says. The second sentence picks up the intent of the requirement in the first sentence of the struck out exception.

C404.5.2

The first sentence picks up the intent of the second sentence of struck-out language in C404.5. If a water heater (or heated water storage tank) does not have integral heat traps, there will be standby heat losses from convection of the heated water into the water inlet and outlet piping of the storage water heater or heated water storage tank. Insulating the inlet and outlet piping for 8 feet mitigates this heat loss. But it is not necessary to include the outlet piping in this section because new Section C404.5.3 requires insulating all other piping (which would include the heater or storage tank outlet piping). If the water (or heated water storage tank) serves a circulating system, then there is no convection of heat water into the piping connected to the heater and storage tank--the water is circulating and Section C404.5.1 takes care of the insulating requirement.

The statement about the water heater manufacturer's insulation thickness requirements is necessary because energy compliance listing for the water heater could require that the inlet and outlet piping be insulated with a thickness greater than ½ inch. And this section should not apply to tankless water heaters as they do not have storage that leads to standby heat losses.

C404.5.3

This section covers the insulation requirements for all other heated water piping that isn't addressed in the two preceding sections. The table of insulation thicknesses mirrors what is required by ASHRAE 90.1-2007 except an entry was added for 3/8 inch pipe or tubing. Some people would like to have the insulation thickness be 1 inch for all piping for "simplicity". But what they fail to realize is that such a requirement would make the installation of smaller piping near or at the ends (outlets) of the system very difficult to accomplish. For example, imagine trying to install 1/2 inch copper (or PEX) tubing (now 2 5/8 inch diameter with the required insulation) in a 3 1/2 inch deep wall cavity with other piping crossing over. Or making that large diameter pass through wood or light frame steel members for a 3 1/2 inch deep wall cavity. While 1/2 inch insulation thickness on 1/2 inch tubing is still a challenge to install, it is easier. Ideally, many fixtures could be installed using 3/8 inch tubing (only about 1 1/4 inch diameter with the required insulation) inside 3 1/2 inch wall cavities. Let's be reasonable and in touch with how buildings are constructed.

Part II – IPC

Section 607.5 did not read exactly the same way as the IECC section (C404.5) that drives this section although the intent was the same. The proposal changes Section 607.5 makes the section read exactly the same way as proposed changes to C404.5. Also, because the IPC covers plumbing for Group R2, R3, R4 occupancies that are 3 stories or less above grade plane, Section 607.5 must have a statement to *exclude* those occupancies because there are different IECC requirements (the Residential provisions of IECC) for those occupancies.

Cost impact: None

THIS IS A 2 PART CODE CHANGE PROPOSAL. PARTS I AND II WILL BE HEARD BY THE IECC COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AS 2 SEPARATE CODE CHANGES.

Proponent: Tim Manz, City of Blaine, MN, representing the Association of Minnesota Building Officials (tmanz@ci.blaine.mn.us)

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C404.5 Pipe insulation. Insulation in accordance with Table C403.2.8 shall applied to the following:

1. Supply and return piping of a hot water recirculating system connected to a storage water heater or a hot water storage tank.
2. A minimum of eight feet (2438 mm) of outlet piping that begins at a storage water heater or a hot water storage tank that does not serve a hot water recirculating system.
2. Inlet piping between a heat trap and a storage water heater or a hot water storage tank that does not serve a hot water recirculating system.
3. Piping heated by heat trace or impedance methods.
5. Piping where the potential for condensation on the outside of the piping exists and the water temperature in the piping is not less than 40 °F and not greater than 60°F.

~~For automatic-circulating hot water and heat-traced systems, piping shall be insulated with not less than 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h × ft² × °F (1.53 W per 25 mm/m² × K). The first 8 feet (2438 mm) of piping in non-hotwater-supply temperature maintenance systems served by equipment without integral heat traps shall be insulated with 0.5 inch (12.7 mm) of material having a conductivity not exceeding 0.27 Btu per inch/h × ft² × °F (1.53 W per 25 mm/m² × K).~~

Exception: ~~Heat-traced piping systems shall meet the insulation thickness requirements per the manufacturer's installation instructions. Untraced piping within a heat traced system shall be insulated with not less than 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h × ft² × °F (1.53 W per 25 mm/m² × K).~~

PART II-IPC

Revise as follows:

[E] 607.5 Pipe insulation. This section shall not apply to Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane. Insulation in accordance with Table C403.2.8 shall applied to the following:

1. Supply and return piping of a hot water recirculating system connected to a storage water heater or a hot water storage tank.
2. A minimum of eight feet (2438 mm) of outlet piping that begins at a storage water heater or a hot water storage tank that does not serve a hot water recirculating system.

2. Inlet piping between a heat trap and a storage water heater or a hot water storage tank that does not serve a hot water recirculating system.
4. Piping heated by heat trace or impedance methods.
5. Piping where the potential for condensation on the outside of the piping exists and the water temperature in the piping is not less than 40 °F and not greater than 60°F.

~~Hot water piping in automatic temperature maintenance systems shall be insulated with 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h • ft² • °F (1.53 W per 25 mm/m² • K). The first 8 feet (2438 mm) of hot water piping from a hot water source that does not have heat traps shall be insulated with 0.5 inch (12.7 mm) of material having a conductivity not exceeding 0.27 Btu per inch/h • ft² • °F (1.53 W per 25 mm/ m² • K).~~

Reason: This proposed code change incorporates language from the Minnesota Commercial Energy Code that specifies pipe insulation requirements for service water heating equipment and related piping. This standard provides better clarity than the provisions in IECC Section C404.5. This language is necessary because it results in energy efficient piping systems that may otherwise not be required to have pipe insulation due to the ambiguity in this section.

Cost Impact: This code change proposal will not increase the cost of construction.

PART I — IECC-COMMERCIAL PROVISIONS

Delete and substitute as follows:

C404.5 Pipe insulation. For automatic-circulating hot water and heat-traced systems, piping shall be insulated with not less than 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h \times ft² \times °F (1.53 W per 25 mm/m² \times K). The first 8 feet (2438 mm) of piping in non-hotwater-supply temperature maintenance systems served by equipment without integral heat traps shall be insulated with 0.5 inch (12.7 mm) of material having a conductivity not exceeding 0.27 Btu per inch/h \times ft² \times °F (1.53 W per 25 mm/m² \times K).

Exception: Heat-traced piping systems shall meet the insulation thickness requirements per the manufacturer's installation instructions. Untraced piping within a heat traced system shall be insulated with not less than 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h \times ft² \times °F (1.53 W per 25 mm/m² \times K).

C404.5 Pipe Insulation. Circulating hot water system piping shall be insulated with not less than 1 inch (25.4 mm) of insulation. Other heated water piping in distribution systems that have a circulating hot water system shall be insulated with not less than 0.5 inch (12.7 mm) of insulation. Heat-trace temperature maintenance system piping shall be insulated in accordance with the heat trace manufacturer's instructions. Other heated water piping in distribution systems that have a heat trace temperature maintenance system shall be insulated with not less than 1 inch (25 mm) of insulation. Other than the insulation in accordance with the heat trace manufacturer instructions, the insulation required by this section shall have a thermal conductivity, k , not exceeding 0.27 Btu per inch/h \bullet ft² \bullet °F (140 W/meter/K).

Exceptions: The following piping shall not be required to be insulated in accordance with this section:

1. Piping within 1 foot (304.8mm) of the outlet end termination of a fixture supply.
2. The portion of piping that passes through a framing member.
3. Piping that is surrounded by at least 1 inch (25.4 mm) thickness of building thermal envelope insulation.

PART II-IPC

Delete and substitute as follows:

[E] 607.5 Pipe insulation. Hot water piping in automatic temperature maintenance systems shall be insulated with 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h \times ft² \times °F (1.53 W per 25 mm/m² \times K). The first 8 feet (2438 mm) of hot water piping from a hot water source that does not have heat traps shall be insulated with 0.5 inch (12.7 mm) of material having a conductivity not exceeding 0.27 Btu per inch/h \times ft² \times °F (1.53 W per 25 mm/m² \times K). For other than Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane, insulation of heated water piping shall be in accordance with Section 607.5.1.

[E] 607.5.1 Pipe insulation, other than low rise Group R2, R3 and R4. This section shall apply to other than Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane. Circulating hot water system piping shall be insulated with not less than 1 inch (25.4 mm) of insulation. Other heated water piping in distribution systems that have a circulating hot water system shall be insulated with not less than 0.5 inch (12.7 mm) of insulation. Heat-trace temperature maintenance system piping shall be insulated in accordance with the heat trace manufacturer's instructions. Other heated water piping in distribution systems that have a heat trace temperature maintenance system shall be insulated with not less than 1 inch (25 mm) of insulation. Other than the insulation in accordance with the heat trace manufacturer, the insulation required by this section shall have a thermal conductivity, k , not exceeding 0.27 Btu per inch/h • ft² • °F (140 W/meter/K).

Exceptions: The following piping shall not be required to be insulated in accordance with this section:

1. Piping within 1 foot (304.8 mm) of the termination of a fixture supply.
2. The portion of piping that passes through a framing member.
3. Piping that is surrounded by at least 1 inch thickness of building thermal envelope insulation.

PART III—IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R403.4.2 (N1103.4.2) Hot Heated water pipe insulation (Prescriptive). Piping conveying heated water from a water heater to the termination of fixture supplies shall be insulated with insulation having a for hot water pipe with a minimum thermal resistance (R -value) of not less than R-3. shall be applied to the following:

1. Piping larger than 3/4 inch nominal diameter.
2. Piping serving more than one dwelling unit.
3. Piping from the water heater to kitchen outlets.
4. Piping located outside the conditioned space.
5. Piping from the water heater to a distribution manifold.
6. Piping located under a floor slab.
7. Buried piping.
8. Supply and return piping in recirculation systems other than demand recirculation systems.
9. Piping with run lengths greater than the maximum run lengths for the nominal pipe diameter given in Table R403.4.2.

All remaining piping shall be insulated to at least R-3 or meet the run length requirements of Table R403.4.2.

Exceptions: The following piping shall not be required to be insulated in accordance with this section:

1. Piping within 1 foot (304.8 mm) of the termination of a fixture supply.
2. The portion of piping that passes through a framing member.
3. Piping that is surrounded by at least 1 inch thickness of building thermal envelope insulation.

**TABLE R403.4.2 (IRC N1103.4.2)
MAXIMUM RUN LENGTH (feet)^a**

Nominal Pipe Diameter of Largest Diameter Pipe in the Run (inch)	3/8	1/2	3/4	> 3/4
Maximum Run Length	30	20	10	5

For SI: 1 inch = 25.4 mm, 1 foot 304.8 mm.

a. Total length of all piping from the distribution manifold or the recirculation loop to a point of use.

PART IV-IPC

Revise as follows:

[E] 607.5 Pipe insulation. In Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane, insulation of heated water piping shall be in accordance with Section 607.5.1. For all other occupancies, hot water piping in automatic temperature maintenance systems shall be insulated with 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h × ft² × °F (1.53 W per 25 mm/m² × K). The first 8 feet (2438 mm) of hot water piping from a *hot water* source that does not have heat traps shall be insulated with 0.5 inch (12.7 mm) of material having a conductivity not exceeding 0.27 Btu per inch/h × ft² × °F (1.53 W per 25 mm/m² × K).

[E] 607.5.1 Pipe insulation, low rise Groups R2, R3 and R4. This section shall apply to Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane. Piping conveying heated water from a water heater to the termination of fixture supplies shall be insulated with insulation having a thermal resistance (*R-value*) of not less than R-3.

Exceptions: The following piping shall not be required to be insulated in accordance with this section:

1. Piping within 1 foot (304.8 mm) of the termination of a fixture supply.
2. The portion of piping that passes through a framing member.
3. Piping that is surrounded by at least 1 inch thickness of building thermal envelope insulation.

Parts I & II Reason: The provisions in the IPC, which are based on section C404.5 in the IECC are not the same. As a consequence, the requirement to insulate the first 8 feet of piping became unclear when the 2012 IPC added recirculation systems and heat trace as sources of hot water (in addition to *Water Heaters*). To avoid confusion and misinterpretation, the IPC and IECC should be correlated on pipe insulation.

The intent of this proposal is to make the provisions in the IPC identical to those in the IECC, and require pipe insulation on all heated water piping. The provisions are now more clear, easier to inspect and enforce.

Parts III & IV Reason: The 2012 edition of the IECC added Section R403.4.2 on hot water pipe insulation, containing a list of 9 factors or locations that require pipe to be insulated to R-3. After the list of 9 locations, the section goes on to say "All remaining piping shall be insulated to at least R-3 or meet the run length requirements..." This section as it is printed in the 2012 IECC essentially requires that all hot water piping be insulated to R-3 unless a given diameter of piping meets the maximum run length requirements of the table. The current section provides far more language and complexity than is necessary, making compliance and enforcement difficult.

The proposed code change simplifies the language making it easier for compliance by plumbing trades and enforcement by code officials; while still retaining the intent of the 2012 language.

The same provisions need to be correlated with Section 607.5 in the IPC. Section 607.5 of the IPC currently correlates with only the commercial provisions of the IECC. The new Section 607.5.1 is identical to the requirements of what is proposed for Section R403.4.2 making the language of the IPC section appropriate for Group R2, R3 and R4 occupancies. For example, under the 2012 codes, a 3 story apartment complex would fall under the residential provisions of the IECC, and also governed by the IPC, and the heated water piping requirements of the two codes are in conflict. If all parts of this proposal is approved, the conflict will be eliminated. (Note that if Parts II & IV of this proposal is approved, the section IPC section number for Part IV will automatically be renumbered to 607.5.2).

Given the 2012 code provisions, we estimate that this change will result in an increase cost of construction of about 20 percent or \$27-\$65. This direct cost is offset by the reduced cost of trying to figure out what piping needed to be insulated and to the extra cost of inspection due to a complicated code provision.

¹ Klein, Gary, "Cost Estimation for Materials and Installation of Hot Water Piping Insulation," prepared for Pacific Northwest National Laboratory, June 2012, accessible at <<http://bc3.pnnl.gov/wiki/index.php/Downloads>>.

Reason: The provisions in the IPC, which are based on this section in the IECC are not the same. As a consequence, the requirement to insulate the first 8 feet of piping became unclear when the 2012 IPC added recirculation systems and heat trace as sources of hot water (in addition to *Water Heaters*). To avoid confusion and misinterpretation, the IPC and IECC should be correlated on pipe insulation.

The intent of this proposal is to make the provisions in the IPC identical to those in the IECC, and require pipe insulation on all heated water piping. The provisions are now more clear, easier to inspect and enforce.

Cost Impact: This code change proposal will increase the cost of construction only for builders that may have used the “maximum run length” exception and only for hot water piping that was subject to that exception. A recent estimate¹ of the cost of insulating hot water piping with R-3 foam insulation is \$1.10 to \$1.50 per linear foot, including labor, materials, and profit for the plumbing subcontractor. The cost of insulating all hot water piping in a 2400 ft² home was estimated by the same study to be \$135 to \$325, depending on building configuration. It should be noted that these estimates are based on insulation of *all* hot water piping in the home.

Proponent: Gary Klein, Affiliated International Management, LLC, representing self,
gary@aim4sustainability.com

Add new text as follows:

C404.5 Efficient heated water supply piping. Heated water supply piping shall be in accordance with Section C404.5.1 or Section C404.5.2. The flow rate through ¼ inch piping shall not exceed 0.5 gpm (1.9 Lpm). The flow rate through 5/16 inch piping shall not exceed 1 gpm (3.8 Lpm). The flow rate through 3/8 inch piping shall not exceed 1.5 gpm (5.7 Lpm).

C404.5.1 Maximum allowable pipe length method. The maximum allowable piping length from the nearest source of heated water to the termination of the fixture supply pipe for *plumbing fixtures* and *plumbing appliances* shall be in accordance with the maximum piping length column in Table C404.5.1. Where the piping contains more than one size of pipe, the largest size of pipe within the piping shall be used for determining the maximum allowable length of the piping in Table C404.5.1.

**TABLE C404.5.1
PIPING VOLUME AND MAXIMUM PIPING LENGTHS**

NOMINAL PIPE SIZE (inch)	VOLUME (liquid ounces per foot length)	MAXIMUM PIPING LENGTH (feet)	
		WATER FROM A WATER HEATER	WATER FROM A RECIRCULATION LOOP OR HEAT TRACED PIPE
1/4	0.33	50	50
5/16	0.5	50	48
3/8	0.75	50	32
1/2	1.5	43	16
5/8	2	32	12
3/4	3	21	8
7/8	4	16	6
1	5	13	5
1 ¼	8	8	3
1 ½	11	6	2
2 or larger	18	4	1

1 Gallon = 128 ounces. For SI: 1 inch=25.4 mm, 1 foot = 304.8 mm, 1 liquid ounce = 0.030 L

C404.5.2 Maximum allowable pipe volume method. The water volume in the piping shall be calculated in accordance with Section C404.5.2.1. The maximum volume from the nearest source of heated water to the termination of the fixture supply pipe for a *plumbing fixture* or *plumbing appliance* shall be 0.5 gallon (1.89 L) where the source of heated water is a water heater; and 0.19 gallon (0.7 L) where the source of heated water is a recirculating system or heat-traced piping.

C404.5.2.1 Water volume determination. The volume shall be the sum of the internal volumes of pipe, fittings, valves, meters and manifolds between the nearest source of heated water and the termination of the fixture supply pipe. The volume in the piping shall be determined from the volume column in Table C404.5.1. The volume contained within fixture shut off valves, within flexible water supply connectors to a fixture fitting and within a fixture fitting shall not be included in the water volume determination. Where heated water is supplied by a recirculating system or

heat-traced piping, the volume shall include the portion of the fitting on the branch pipe that supplies water to the fixture.

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

WATER HEATER. Any heating appliance or equipment that heats potable water and supplies such water to the potable hot water distribution system.

Reason: This change speeds hot water to the user, saves energy and water, and potentially lowers construction costs. All these are accomplished by limiting the volume of water in the pipes.

We have all have turned on the hot water and waited for it to get hot. While we wait water runs down the drain, wasting clean water. While we wait, our time is wasted. When we are done there is still hot water in the pipes, water which cools thereby wasting as much energy as it took to heat the water in the pipes. Pipes with larger volumes take longer to fill, waste more and are potentially more expensive to build.

This proposal remedies the problems above by reducing the water volume between the source of heated water and the use. The first method (Section R403.4.2.1) requires no calculation; it limits the water volume in the pipes by limiting the pipe length. The second option (Section R403.4.2.1) requires a calculation of volume in the pipes, but provides a table that translates the pipe length into a volume (columns 1 and 2); and provides quick options for different pipe assumptions in columns 3 and 4.

In simple form, cutting the volume in half: cuts the wait time in half, cuts the clean water wasted down the drain in half, cuts the energy loss while water goes through the pipes in half, and cuts the loss of energy from hot water left in the pipes after use in half.

Why is the maximum volumes 0.5 gallon when the source of heated water is a water heater? So that following standard practice for plumbing engineers and meeting the minimum requirements in the energy code will be aligned. At present, they are not, with the result that hot water delivery times are greater than 30 seconds after the tap is opened; unacceptable performance according to the American Society of Plumbing Engineers.

The American Society of Plumbing Engineers (ASPE) provides plumbing engineers with the guidance for hot water distribution system design as shown in Figure 1. I believe that the minimum energy code should have at least marginal performance at typical actual flow rates. These actual flow rates generally range from 1-2 gpm for private lavatory faucets, showerheads, dishwashers and washing machines. This is true even though faucets are allowed to be 2.2 gpm @ 60 psi and showerheads 2.5 gpm @80 psi. The reason for actual flow rates being lower than rated flow rates is due to the fact that the pressure in the building is often less than the rated pressure. With fixed orifice aerators, common in minimally legal faucets and showerheads, the flow rate drops off rather rapidly as the pressure decreases.

It makes sense to me that the minimum code should provide for at least marginal performance in buildings that are supplied with low pressure. This means that we need to be sure that the time-to-tap is still reasonable even when flow rates are at the lower end of the typical range; that is close to 1 gpm. According to ASPE, marginal performance would mean that hot water needs to arrive in no longer than 30 seconds after the tap is opened. Figure 2 shows that this will be true when the volume of water between the source and the use does not exceed 0.5 gallon.

Figure 1 ASPE Time-to-Tap Performance Criteria

	Acceptable Performance	1 – 10 seconds
	Marginal Performance	11 – 30 seconds
	Unacceptable Performance	31+ seconds

Source: Domestic Water Heating Design Manual – 2nd Edition, ASPE, 2003, page 234

Figure 2 Converting Flow Rate and Pipe Volume to Time-to-Tap

Volume in the Pipe		Minimum Time-to-Tap (seconds) at Selected Flow Rates					
Gallons	Ounces	0.25 gpm	0.5 gpm	1 gpm	1.5 gpm	2 gpm	2.5 gpm
0.02	2	4	1.9	0.9	0.6	0.5	0.4
0.03	4	8	4	1.9	1.3	0.9	0.8
0.06	8	15	8	4	2.5	1.9	1.5
0.13	16	30	15	8	5	4	3
0.19	24	45	23	11	8	6	5
0.25	32	60	30	15	10	8	6
0.50	64	120	60	30	20	15	12
1.00	128	240	120	60	40	30	24

Why is the maximum volume 0.19 gallon when the source of heated water is a circulation loop or heat-traced pipe? In exchange for the flexibility in the location of the water heater relative to the plumbing fixtures and plumbing appliances, the allowable volume that will be wasted has been reduced and the time-to-tap improved so that it will almost always fall into ASPE's range for Acceptable Performance.

The definition proposed is used in both the IPC and the IRC.

For more information and background on issues related to hot water distribution and for a more detailed analysis in support of this proposal please go to <http://www.aim4sustainability.com> Follow the link on the home page to Codes.

Cost impact: There are several ways to meet the requirements of this proposal, many of which cost less than current piping practices. I would recommend that builders and developers select one of the less expensive methods.

Proponent: Gary Klein, Affiliated International Management, LLC, representing self, (gary@aim4sustainability.com)

Add new text as follows:

C404.5 Efficient heated water supply piping. Heated water supply piping shall be in accordance with Section C404.5.1 or Section C404.5.2. The flow rate through ¼ inch piping shall not exceed 0.5 gpm (1.9 Lpm). The flow rate through 5/16 inch piping shall not exceed 1 gpm (3.8 Lpm). The flow rate through 3/8 inch piping shall not exceed 1.5 gpm (5.7 Lpm).

C404.5.1 Maximum allowable pipe length method. The maximum piping length from the nearest source of heated water to the termination of the fixture supply pipe for a public lavatory faucet shall be in accordance with the maximum piping length column in Table C404.5.1. Where the piping contains more than one size of pipe, the largest size of pipe within the piping shall be used for determining the maximum allowable length of the piping in Table C404.5.1.

**TABLE C404.5.1
PIPING VOLUME AND MAXIMUM PIPING LENGTHS**

NOMINAL PIPE SIZE (inch)	VOLUME (liquid ounces per foot length)	MAXIMUM PIPING LENGTH (feet)
		LAVATORY FAUCETS— PUBLIC
1/4	0.33	6
5/16	0.5	4
3/8	0.75	3
1/2	1.5	2
5/8	2	1
3/4	3	0.5
7/8	4	0.5
1	5	0.5
1 ¼	8	0.5
1 ½	11	0.5
2 or larger	18	0.5

For SI: 1 inch=25.4 mm, 1 foot = 304.8 mm, 1 liquid ounce = 0.030 L

C404.5.2 Maximum allowable pipe volume method. The maximum piping volume from the nearest source of heated water to the termination of the fixture supply pipe for a public lavatory faucet shall be 2 ounces (0.06 L). The water volume in the piping shall be calculated in accordance with Section C404.5.2.1.

C404.5.2.1 Water volume determination. The volume shall be the sum of the internal volumes of pipe, fittings, valves, meters and manifolds between the nearest source of heated water and the termination of the fixture supply pipe. The volume in the piping shall be determined from the volume column in Table C404.5.1. The volume contained within fixture shut off valves, within flexible water supply connectors to a fixture fitting and within a fixture fitting shall not be included in the water volume determination. Where heated water is supplied by a recirculating system or heat-traced piping, the volume shall include the portion of the fitting on the branch pipe that supplies water to the fixture.

Add new definition as follows:

**SECTION C202
GENERAL DEFINITIONS**

WATER HEATER. Any heating appliance or equipment that heats potable water and supplies such water to the potable hot water distribution system.

Reason: The problem of heated water taking an excessively long time to arrive at lavatory faucets in public restrooms is well known. The length of time the faucets are used during each hand washing event is very short, often around 5 seconds. Federal law requires low flow rate or small, metered volumes for the faucets in these applications. Health codes expect heated water for washing hands in these applications. The dilemma is that the volume of not-hot water in the piping from the source of hot water to the faucets is much too large for the heated water to arrive in a timely fashion; even at the 50-foot limit currently required in the 2012 IPC.

Supporting this proposal will correlate the IECC with Federal law and local health codes by providing heated water for hand washing in a timely matter.

The delivery of hot water to public lavatory faucets needs to be considered separately because of potential health issues. The events are short and the flow rates are low. Table 1 shows the time-to-tap performance based on the requirements in the proposal. The 0.25 and 0.5 gpm columns are typical of the flow rates for public lavatory faucets. The volume in the pipe was chosen so that heated water would arrive in the first part of the hot water event so that every person who uses the public lavatory will have the benefits of hot water.

Table 1 Time-to-Tap Performance when the Volume in the Piping from the Source to the Use is 2 ounces

Volume in the Pipe (ounces)	Minimum Time-to-Tap (seconds) at Selected Flow Rates					
	0.25 gpm	0.5 gpm	1 gpm	1.5 gpm	2 gpm	2.5 gpm
2	3.8	1.9	0.9	0.6	0.5	0.4

The energy savings comes from not losing the heat from the water as it tries to arrive at the faucets.

For more information and background on issues related to hot water distribution please read the 4-part series at:

http://www.allianceforwaterefficiency.org/Residential_Hot_Water_Distribution_System_Introduction.aspx

Cost impact: There are several ways to meet the requirements of this proposal, some of which cost less than current heated water system practices. I would recommend that builders and developers select one of the less expensive methods.

CE276-13

C404.5 (NEW), Table C404.5 (NEW)

Proponent: Gary Klein, Affiliated International Management, LLC, representing self,
(gary@aim4sustainability.com)

Add new text as follows:

C404.5 Fixture supply piping size for conveying heated water. The fixture supply piping conveying heated water to fixture fittings or appliances shall be sized in accordance with Table C404.5. The maximum length of such fixture supply piping shall be 50 feet (1270 mm). The heated water fixture supply piping and the cold water fixture supply piping to a plumbing fixture or a plumbing appliance shall be the same nominal size. The fixture supply piping sizes of this section shall supercede the minimum fixture supply pipe sizing in Section 604.5 of the *International Plumbing Code*.

**TABLE C404.5
FIXTURE SUPPLY PIPING SIZE
FOR CONVEYING HEATED WATER**

FLOW RATE (gpm)	NOMINAL PIPING OR TUBING SIZE (inches)
≤ 0.5	1/4
>0.5 to ≤1.0	5/16
>1.0 to ≤1.5	3/8

For SI: 1 gallon per minute = 3.875 L/m, 1 inch = 25.4 mm

Reason: The purpose of this code change is to ensure that the minimum diameter of the tubing on a fixture supply is safely (pressure drop and velocity) matched to the flow rate of the fixture to which it is connected.

Enabling smaller diameter tubing is important to energy efficiency because it reduces the volume in the fixture supply, which reduces the temperature drop during the use periods and the energy that is lost when the water in the piping cools down. It also has the benefit of reducing the time it takes for hot water to arrive.

As plumbing fixture and appliance flow rates get lower, as long as the maximum flow rate is selected properly, the physics clearly indicates that there will be no pressure loss or velocity problems if smaller diameter tubing is allowed. Calculations were performed using the same formula used by plumbing engineers to design hot water distribution systems to determine the combinations of flow rates and diameters shown in the table. In order to ensure that a piping system will work properly for heated water with a limit of 50 feet of developed length, the maximum developed length was capped at 50 feet for the analysis done to support this code change. The pressure drop was limited to 5 psi and the velocity was limited to 4 feet per second. PEX, CPVC and copper Types K, L, and M were evaluated. In order to make it simple to inspect, the maximum flow rate for each nominal diameter was chosen so that the worst performing material still met the criteria.

Cost impact: The code change proposal will not increase the cost of construction.

CE276-13

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

C404.5 #1 (NEW)-EC-KLEIN

CE277-13

C404.5.1 (NEW)

Proponent: Howard Ahern representing Airex Mfg. (howard.ahern@airexmfg.com)

Add new text as follows:

C404.5.1 Water heater piping insulation protection. Exposed water piping that is insulated and that is connected to a water heater shall have the insulation protected from damage by a removable and reusable covering. The covering shall extend for not less than 5 feet (1524 mm) from the water heater. The covering shall not be adhesive tape.

Reason. This code change is needed to insure integrity of the water heater piping insulation. Pipe insulation is often silt open to install over water heating piping, the slits often stay open or adhesive used to glue slit close degrade and slits open wasting energy and money. Removable and reusable covering will insure pipe insulation slits are closed to save energy. This change will ensure steady, long-term thermal performance and maintain system integrity, sustainability, of the insulation saving energy.

Water Heating equipment require periodic maintenance. The frequency varies with how hard the unit operates, exterior temperature, preventive maintenance program, and many others. In every occasion, maintenance provides an excuse for the piping insulation to be touched and or removed. Pipe insulation removal often results in damage to the insulation itself requiring replacement.

Protection for piping insulation therefore needs to be removable and reusable. This will help insure system integrity and sustainability of the pipe insulation, reducing replacement.

Cost Impact: The code change proposal will increase the cost of construction.

THIS IS A 2 PART CODE CHANGE PROPOSAL. PARTS I AND II WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C404.6 Hot water temperature maintenance system controls. For hot water distribution system circulating hot water system pumps or and heat trace, the pumps and heat trace shall be arranged to be turned off either automatically or manually when there is limited not hot water demand. Operating controls shall be readily accessible .

C404.7.1 Storage tank hot water circulation systems. Circulating pumps intended to maintain storage tank water temperature shall have controls that will limit operation of the pump from heating cycle start up to not greater than 5 minutes after the end of the cycle. Ready access shall be provided to the operating controls.

PART II-IPC

Revise as follows:

[E] 607.2.1 Hot water temperature maintenance system controls. Automatic For hot water distribution system circulating hot water system pumps or and heat trace, the pumps and heat trace shall be arranged to be conveniently turned off either automatically or manually when there hot water system is not in operation. is limited not hot water demand. Ready access shall be provided to the operating controls. This section and Section 607.2.1.1 shall not apply to hot water temperature maintenance system controls in Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane. Hot water temperature maintenance system controls in Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane shall be in accordance with Section R403.4.1 of the International Energy Conservation Code.

[E] 607.2.1.1 Storage tank hot water circulation systems. Circulating pumps intended to maintain storage tank water temperature shall have controls that will limit operation of the pump from heating cycle start up to not greater than 5 minutes after the end of the cycle. Ready access shall be provided to the operating controls.

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the criteria of the IECC Commercial Provisions, has a provision to circulating system pump controls. This situation is not addressed in the IECC and needs to be to ensure consistency between standard 90.1-2010 and the IECC.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Gary Klein, Affiliated International Management, LLC, representing self, (gary@aim4sustainability.com)

PART I-IECC-COMMERCIAL PROVISIONS

Revise as follows:

C404.6 ~~Circulating hot~~ Heated water circulating and temperature maintenance systems controls (Mandatory). ~~Circulating hot water systems shall be provided with an automatic or readily accessible manual switch that can turn off the hot water circulating pump when the system is not in use~~ Heated water circulation systems shall be in accordance with Section C404.6.1. Heat trace temperature maintenance systems shall be in accordance with Section C404.6.2. Automatic controls, temperature sensors and pumps shall be accessible. Manual controls shall be readily accessible.

C404.6.1 Circulation systems. Heated water circulation systems shall be provided with a circulation pump. The system return pipe shall be a dedicated return pipe or a cold water supply pipe. Gravity and thermo-syphon circulation systems shall be prohibited. Circulation system pump controls shall be demand activated. The controls shall start the pump upon sensing the presence of a user of a fixture or appliance, receiving a signal from the action of an action of a user of a fixture or appliance or sensing the flow of heated water to a fixture or appliance. The controls shall limit the water temperature increase in the return water piping to not more than 10°F (5.6 °C) greater than the initial temperature of the water in the return piping and shall limit the return water temperature to 102°F (38.9°C).

C404.6.2 Heat trace systems. Electric heat trace systems shall comply with IEEE 515.1. Controls for such systems shall be able to automatically adjust the energy input to the heat tracing to maintain the desired water temperature in the piping in accordance with the times when heated water is used in the occupancy.

Add new standard to Chapter 5 as follows:

IEEE The Institute of Electrical and Electronic Engineers, Inc.
3 Park Avenue
New York, NY 1016-5997

515.1-2012 IEEE Standard for the Testing, Design, Installation, and Maintenance of
Electrical Resistance Trace Heating for Commercial Applications

PART II-IPC

Revise as follows:

[E] 607.2.1 ~~Hot~~ Heated water circulation and temperature maintenance systems controls. For Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane, automatic circulating hot water systems pumps or heat trace shall be arranged to be provided with a conveniently turned off, automatically or manually switch having ready access or an automatic switch, that can turn off

~~when the hot water circulating pump when the system is not in use operation. Heated water circulation and temperature maintenance systems for other than Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane shall be in accordance with Section 607.2.1.1.~~

[E] 607.2.1.1 For other than Group R2, R3 and R4 occupancies 3 stories or less. This section shall apply to other than Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane. Heated water circulation systems shall be in accordance with Section 607.2.1.1.1. Heat trace temperature maintenance systems shall be in accordance with Section 607.2.1.1.2. Access to automatic controls, temperature sensors and pumps shall be provided. Ready access to manual controls shall be provided.

[E] 607.2.1.1.1 Circulation systems. Heated water circulation systems shall be provided with a circulation pump. The system return pipe shall be a dedicated return pipe or a cold water supply pipe. Gravity and thermo-syphon circulation systems shall be prohibited. Circulation system pump controls shall be demand activated. The controls shall start the pump upon sensing the presence of a user of a fixture or appliance, receiving a signal from the action of an action of a user of a fixture or appliance or sensing the flow of heated water to a fixture or appliance. The controls shall limit the water temperature increase in the return water piping to not more than 10°F (5.6 °C) greater than the initial temperature of the water in the return piping and shall limit the return water temperature to 102°F (38.9°C).

[E] 607.2.1.1.2 Heat trace systems. Electric heat trace systems shall comply with IEEE 515.1. Controls for such systems shall be able to automatically adjust the energy input to the heat tracing to maintain the desired water temperature in the piping in accordance with the times when heated water is used in the occupancy.

Add new standard to Chapter 14 as follows:

The Institute of Electrical and Electronic Engineers, Inc.
3 Park Avenue
New York, NY 1016-5997

IEEE

515.1-2012 IEEE Standard for the Testing, Design, Installation, and Maintenance of
Electrical Resistance Trace Heating for Commercial Applications

Reason: There are 2 primary reasons for this proposed change. 1) Correlate the language in the IECC and the IPC; 2) Clarify the requirements for heated water circulation systems and for heat trace systems, if they are installed. The proposed changes do not require the use of circulation or heat trace.

The current code language is not the same in the IECC and the IPC. It should be.

The current language allows for continuously operating circulation pumps, which creates inefficiency in the hot water distribution system. It also does not address the use of heat trace in both codes and there is currently no requirement that the heat trace be suitable for the application. The consequence is that water heating energy consumption is increased.

Figure 1 shows that demand activated circulation is significantly more energy efficient than any other type of heated water circulation system. The annual energy needed to keep the loop hot with water heated electrically or with natural gas are shown separately from the energy needed for the pump. The majority of the energy is lost in keeping the water in the loop at the desired temperature (all of it if there is a gravity loop). A small loop, 100 feet including the supply and the return was analyzed. The savings ranges from 87.5 percent when compared to a recirculation system that runs only 2-hours per day to 99 percent when compared to a recirculation system that runs only 24-hours per day. The operating costs and savings remain proportional as the length of the circulation loop and the flow rate of the pump increase.

Figure 1 Annual Energy Requirements for Demand Activated Circulation and Standard Recirculation

	Standard Recirculation						Demand Activated Circulation
	Daily Hours of Operation						
	24	12	8	6	4	2	0.25
Loop Heat Losses							

Natural Gas (therms)	292	146	97	73	49	24	3
Electric (kWh)	6,388	3,194	2,129	1,597	1,065	532	67
Pump Energy (kWh)	438	219	146	110	73	37	8

Figure 2 shows the differences in run-time at the water heater (or boiler) between a continuously pumped recirculation loop and one that has a demand activated pump control. Blank space (white) means the water heater was off. Red means some percent of run-time between zero and continuous. Pink means the water heater or boiler was running continuously. The test results come from studies done by Southern California Gas Company on a sample of more than 300 multi-family buildings with central water heaters and recirculation systems. Most systems tested were built before insulation was required on hot water recirculation loops. Savings ranged from 10-30 percent of the water heating energy use and 84 percent of the pump electricity use. The costs for installing the retrofit were paid back in just about one year. In new construction, the marginal costs would be recovered in just a few months

Figure 2 Run-time of Water Heater with Two Different Pump Controls

Why is demand-activated circulation such an efficient strategy? The 2012 IECC, IPC and IRC require that the hot water piping in automatic temperature maintenance systems in new buildings be insulated with pipe insulation. This means the water in the circulation loop will stay hot for a very long time – up to 45 minutes for ¾ inch nominal pipe up to 2 hours for 2-inch nominal pipe – even if the circulating pump is shut off. If this is the case, why run the pump when the water is still hot? Why run the pump when no one is in the building or when no one is demanding hot water? The only time it makes sense to run the pump is shortly before hot water is needed: hence the requirement that the pump be controlled on-demand.

The requirements for heat trace are partly to ensure that the systems can be operated in the most energy efficient manner consistent with providing heated water to the occupancy. The reference standards are included to ensure that installed systems are safe for the intended application. The energy consequences of using heat trace are very reasonable. Figure 3 presents the energy requirements for a heat trace system with the same hot water supply piping as the circulation systems shown in Figure 1. The energy requirements of keeping the trunk line hot – the same as keeping the supply portion of the loop hot in a circulating system – are 701 kWh per year, assuming 12 hours at high temp (115F) and 12 hours at economy temp (105F). This is equivalent to operating the loop about 3 hours per day, but with hot water available 24/7 in the supply trunk! This is a significant savings when water heating is done electrically or with a similarly expensive fuel. If the branches are also traced, we can deliver heated water even more quickly to the fixtures using only 1,682 kWh per year, which is the same energy as running the loop a little more than 6 hours a day.

Figure 3. Annual Energy Needed for Electric Heat Trace Systems

Heat Trace			
	(kWh per year)		
	Trunk	Br	T-Br
Supply Heat Losses			
High Temp	394	552	946
Economy Temp	307	429	736
Total Electricity	701	981	1,682

Cost impact: The proposal does not require either circulation or heat trace; however if either is selected, it clarifies the requirements for installation. Most recirculation systems today are installed with some form of control, usually a timer, a bandwidth thermostat (aquastat) or both. Some come with more sophisticated controls, such as programmable or are connected to an energy

management system. In some cases, switching from these control strategies to demand activated controls will cost less. In other cases, the demand-activated controls will cost more.

Analysis: A review of the standards proposed for inclusion in the code, CSA 22.2 No. 130 and UL 515 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1 2013.

Proponent: Greg Towsley, Grundfos, representing self (gtowsley@grundfos.com)

PART I - IECC-COMMERCIAL PROVISIONS

Revise as follows:

C404.6 Hot Heated water system controls. Circulating hot water system pumps or heat trace water temperature maintenance systems shall be controlled in accordance with Sections C404.6.1 and C406.6.2, arranged to be turned off either automatically or manually when there is limited hot water demand. Ready access shall be provided to the operating controls. Automatic controls, temperature sensors, and pumps shall be accessible. Manual controls shall be readily accessible. Heated water circulation systems without controls such as gravity and thermo-syphon circulation systems, shall be prohibited. Continuous operation of pumps in heated water circulation systems shall be prohibited.

C404.6.1 Circulation pumps. Controls for circulating hot water system pumps shall start the pump based on the identification of a demand for heated water within the occupancy. The controls shall automatically turn off the pump when the water in the circulation loop is at the desired temperature and when there is no demand for hot water.

C404.6.2 Heat trace. Heat trace controls shall automatically adjust the energy input to the piping to maintain the desired water temperature in the piping system. The controls shall adjust the energy input to the heat tracing when the controls identify demand for heated water.

PART II - IPC

Revise as follows:

[E] 607.2.1 Hot water system controls. Automatic Circulating hot water system pumps or and heat trace water temperature maintenance systems shall be controlled in accordance with Sections 607.2.1.1 and 607.2.1.2, arranged to be turned off automatically or manually when there is limited hot water demand. Ready access shall be provided to the operating controls. Access shall be provided to automatic controls, temperature sensors, and pumps. Ready access shall be provided to manual controls. Hot water circulation systems without controls such as gravity and thermo-syphon circulation systems, shall be prohibited. Continuous operation of pumps in hot water circulation systems shall be prohibited.

[E] 607.2.1.1 Circulation pumps. Controls for circulating hot water system pumps shall start the pump based on the identification of a demand for heated water within the occupancy. The controls shall automatically turn off the pump when the water in the circulation loop is at the desired temperature and when there is no demand for hot water.

[E] 607.2.1.2 Heat trace. Heat trace controls shall automatically adjust the energy input to the piping to maintain the desired water temperature in the piping system. The controls shall adjust the energy input to the heat tracing when the controls identify demand for heated water.

PART III – IECC – RESIDENTIAL PROVISIONS

Revise as follows:

R403.4.1 (N1103.4.1) Circulating hot water systems (Mandatory). Circulating hot water systems and heat trace water temperature maintenance systems shall be controlled in accordance with Sections R403.4.1.1 and R403.4.1.2, provided with an automatic or readily accessible manual switch that can turn off the hot water circulating pump when the system is not in use. Automatic controls, temperature sensors, and pumps shall be accessible. Manual controls shall be readily accessible. Hot water circulation systems without controls such as gravity and thermo-syphon circulation systems, shall be prohibited. Continuous operation of pumps in hot water circulation systems shall be prohibited.

R403.4.1.1 (N1103.4.1.1) Circulation pumps. Controls for circulating hot water system pumps shall start the pump based on the identification of a demand for hot water within the occupancy. The controls shall automatically turn off the pump when the water in the circulation loop is at the desired temperature and when there is no demand for hot water.

R403.4.1.2 (N1103.4.1.2) Heat trace. Heat trace controls shall automatically adjust the energy input to the piping to maintain the desired water temperature in the piping system. The controls shall adjust the energy input to the heat tracing when the controls identify demand for heated water.

Reason: The current code text allows for the use of continuously operating circulation pumps in a hot water system. With no limitation of prohibiting pumps that operate continuously, this control methodology is not energy efficient, even when there is no need for hot water or there is ample hot water available in the system.

Energy can be saved with circulating hot water systems by operating the pump only when there is a demand for hot water. In addition, the pump does not need to operate when the hot water system is capable of providing the hot water at the desired temperature.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IECC-COMMERCIAL PROVISIONS

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART III– IECC-RESIDENTIAL PROVISIONS

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C404.6-EC-TOWSLEY.DOC

CE281-13

IPC [E]607.2.1, IPC [E]607.2.1.1 (New), IPC [E]607.2.1.2 (New)

Proponent: Gary Klein, Affiliated International Management, LLC, representing self,
gary@aim4sustainability.com

Revise as follows:

[E] 607.2.1 ~~Hot water system~~ Controls for circulating systems and heat trace. The controls for automatic heated water circulating hot water system pumps ~~or and~~ heat trace for maintaining heated water temperature shall be in accordance with Sections 607.2.1.1 and 607.2.1.2, ~~arranged to be conveniently turned off, automatically or manually, when the hot water system is not in operation.~~

[E] 607.2.1.1 Controls in R2, R3 and R4 occupancies. In Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade, the controls for hot water circulating system pumps shall be provided with an automatic or manual switch that can turn off the hot water circulating pump when the system is not in use. *Ready access* shall be provided to manual switches.

[E] 607.2.1.2 Controls in all other occupancies. In occupancies not covered by Section 607.2.1.1, circulating hot water pumps or heat trace shall be arranged to be turned off either automatically or manually when there is limited hot water demand. *Ready access* shall be provided to the operating controls.

Reason: The proposal is strictly logistical – no new requirements are being added. The IECC has slightly different language for residential and commercial requirements for controls for heated water circulation system pumps and heat tracing. The current section in the IPC only reflects the IECC requirements for commercial buildings. But remember, the IPC covers buildings that the IECC considers to be residential buildings. The different needs for residential buildings needs to be called out in the IPC. These requirements, IPC 607.2.1.1 and IPC 607.2.1.2, are coming from IECC Sections C404.6 and R403.4.1, respectively. The IPC needs to be revised to handle the requirements separately. Although the current language of the two sections is similar, it is anticipated that other code change proposals in this cycle and in future cycles will cause significant difference between the commercial and residential provisions for this subject in the IECC. The IPC needs to be aligned to handle this event. Another intent of this code change is to indicate that the technical requirements of Sections 607.2.1.1 and 607.2.1.2 be identical to those in the IECC.

Cost Impact: The code change proposal will not increase the cost of construction.

IPC [E]607.2.1-EC-KLEIN

CE282-13

C404.7 (NEW), IPC Chapter 2, IPC [E]607.2.1.1 (NEW)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PARTS I AND TWO WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

Proponent: Gary Klein, Affiliated International Management, LLC, representing self, (gary@aim4sustainability.com)

PART I – IECC-COMMERCIAL PROVISIONS

Add new text as follows:

C404.7 Demand recirculation controls. A water distribution system having one or more recirculation pumps that pump water from a heated water supply pipe back to the heated water source through a cold water supply pipe shall be a *demand recirculation water system*. Pumps shall have controls that comply with both of the following:

1. The control shall start the pump upon receiving a signal from the action of a user of a fixture or appliance, sensing the presence of a user of a fixture or sensing the flow of hot or tempered water to a fixture fitting or appliance.
2. The control shall limit the water temperature increase in the cold water piping to not more than 10°F (5.6 °C) greater than the initial temperature of the water in the piping and limits the temperature entering the cold water piping to 102°F (38.9 °C).

PART II-IPC

Add new text as follows:

[E] 607.2.1.1 Demand recirculation controls. A water distribution system having one or more recirculation pumps that pump water from a heated water supply pipe back to the heated water source through a cold water supply pipe shall be a *demand recirculation water system*. Pumps shall have controls that comply with both of the following:

1. The control shall start the pump upon receiving a signal from the action of a user of a fixture or appliance, sensing the presence of a user of a fixture or sensing the flow of hot or tempered water to a fixture fitting or appliance.
2. The control shall limit the water temperature increase in the cold water piping to not more than 10°F (5.6 °C) greater than the initial temperature of the water in the piping and limits the temperature entering the cold water piping to 102°F (38.9 °C).

Add definition as follows:

DEMAND RECIRCULATION WATER SYSTEM. A water distribution system where one more pumps prime the service hot water piping with heated water upon demand for hot water.

Reason: The purpose of this code change proposal is to clarify the requirements for installing circulation pumps in applications that use a cold water supply pipe to circulate the water back to the water heater. Demand recirculation water systems are significantly more energy efficient than other recirculation systems and are inherently safer when the cold water supply is used as the return.

Figure 1 shows that demand activated circulation is significantly more energy efficient than any other type of heated water circulation system. The annual energy needed to keep the loop hot with water heated electrically or with natural gas are shown separately from the energy needed for the pump. The majority of the energy is lost in keeping the water in the loop at the desired temperature (all of it if there is a gravity loop). A small loop, 100 feet including the supply and the return was analyzed. The savings ranges from 87.5 percent when compared to a recirculation system that runs only 2-hours per day to 99 percent when compared to

a recirculation system that runs only 24-hours per day. The operating costs and savings remain proportional as the length of the circulation loop and the flow rate of the pump increase.

Figure 1 Annual Energy Requirements for Demand Activated Circulation and Standard Recirculation

	Standard Recirculation						Demand Activated Circulation
	Daily Hours of Operation						
	24	12	8	6	4	2	0.25
Loop Heat Losses							
Natural Gas (therms)	292	146	97	73	49	24	3
Electric (kWh)	6,388	3,194	2,129	1,597	1,065	532	67
Pump Energy (kWh)	438	219	146	110	73	37	8

The inherently better safety comes from the fact that the controls specified for demand recirculation water systems limit the flow of water from the hot water supply into the cold water supply to only minutes a day and because they limit the temperature of the water that is allowed to go into the cold water supply. There are five other control strategies for heated water recirculation systems (thermosiphon (gravity), continuous pumping, timer controlled, bandwidth temperature sensor (aquastat) controlled and a combination of timer and bandwidth temperature sensor (aquastat) controlled and none of them has the ability to meet these stringent requirements.

The requirements of this section should be identical in both the IECC and the IPC, since the language for the controls does not depend on occupancy

For more information and background on issues related to hot water distribution and for a more detailed analysis in support of this proposal please go to <http://www.aim4sustainability.com>. Follow the link on the home page to Codes.

Cost impact: This proposal will not increase the cost of construction, as it does not require the use of demand recirculation water systems. In addition, the ability to use cold-water supply piping as a return pipe may reduce the cost of installing a circulation loop.

PART I IECC-COMMERCIAL PROVISIONS

Revise as follows:

C404.7 Drain water heat recovery units. Drain water heat recovery units shall comply with CSA 55.2. Potable water-side pressure loss shall be less than 10 psi at maximum design flow. For Group R occupancies, the efficiency of drain water heat recovery unit efficiency shall be in accordance with CSA 55.1.

TABLE C407.5.1(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Service water heating ^{f,g,h,i}	Fuel type: same as proposed Efficiency: in accordance with Table C404.2 Capacity: same as proposed Where a service water hot water system does not exist or is not specified in the proposed design, a service hot water heating shall not be modeled.	As proposed <u>For Group R, as proposed multiplied by SWHF</u> <u>For other than Group R, as proposed multiplied by efficiency as provided by the manufacturer of the DWHR unit.</u> As proposed

(Portions of Table not shown remain unchanged)

j. SWHF means service water heat recovery factor. DWHR means drain water heat recovery. The SWHF shall be applied as follows:

$$= (1 - (\text{DWHR unit efficiency} \times 0.36))$$

where potable water from the DWHR unit supplies not less than 1 shower and not greater than 2 showers, of which the drain water from the same showers flows through the DWHR unit.

$$= (1 - (\text{DWHR unit efficiency} \times 0.33))$$

where potable water from the DWHR unit supplies not less than 3 showers and not greater than 4 showers, of which the drain water from the same showers flows through the DWHR unit.

$$= (1 - (\text{DWHR unit efficiency} \times 0.26))$$

where potable water from the DWHR unit supplies not less than 5 showers and not greater than 6 showers, of which the drain water from the same showers flows through the DWHR unit.

= 1.0
where the other conditions are not met.

Add new standards to Chapter 5 as follows:

CSA

CSA 55.1-2012 Test method for measuring efficiency and pressure loss of drain water heat recovery units

CSA 55.2-2012 Drain water heat recovery units

PART II IECC-RESIDENTIAL PROVISIONS

Add new text as follows:

R403.4.3 (N1103.4.3) Drain water heat recovery units. Drain water heat recovery units shall comply with CSA 55.2. Drain water heat recovery units shall be in accordance with CSA 55.1. Potable water-side pressure loss of drain water heat recovery units shall be less than 3 psi (20.7 kPa) for individual units connected to one or two showers. Potable water-side pressure loss of drain water heat recovery units shall be less than 2 psi (13.8 kPa) for individual units connected to three or more showers.

Add new standards to Chapter 5 as follows:

CSA

CSA 55.1-2012 Test method for measuring efficiency and pressure loss of drain water heat recovery units

CSA 55.2-2012 Drain water heat recovery units

PART III IRC-P

Add new text as follows:

P2903.11 Drain water heat recovery units. Drain water heat recovery units shall be in accordance with Section N1103.4.3

Reason: There are two reasons for this proposal. 1) To enable developers to take credit for efficiency improvements due to the use of drain water heat recovery devices in the performance calculations in the energy code; and 2) to make comparisons of the efficiency of different units based on an existing standard.

Drain water heat recovery (DWHR) works particularly well where heated water flows down the drain at the same time as water flows in that needs to be heated; this "coincident flow" occurs in occupancies with showering and lavatory use. Performance of a DWHR unit is characterized by both efficiency and pressure loss. It is important to ensure that DWHR devices do not impose large pressure losses in the piping in order to minimize the impact on water flow in the building. Given the available DWHR efficiencies, savings are typically 10% to 35% of the energy used for heating water. Over 25,000 drain water heat recovery units have been installed in homes in Canada and the United States.

This change adds two standards for drain water heat recovery units (DWHR units). Drain water heat recovery is often a cost effective way to add to energy efficiency by recapturing hot water energy that is literally "going down the drain". The proposed standards have already been in use by designers for 10 years and the resulting ratings are in use by a variety of energy efficiency programs. Commercial (i.e. non multi-unit residential) applications are engineered systems while multi-unit residential applications are non-engineered and straightforward.

CSA B55.2 standard is for fabrication and material quality of DWHR units. The CSA B55.1 standard is for testing and labeling of DWHR units efficiency and pressure loss at 2.5gpm (9.5lpm). These existing standards were developed through a consensus process by the Canadian Standards Association and are referenced by the Ontario Building Code.

A typical drain water heat recovery unit is shown below:

POWER-PIPE®

Drain Water Heat Recovery Systems

Reduce Operating Costs for Multi-Unit Residential Buildings

Cost-Effective Green Energy Technology

- The Power-Pipe® is **proven, practical, affordable** and in use today saving energy for thousands of residential suites.
- **Water heating is typically the second highest energy cost** in multi-unit residential buildings; in fact it can even be the highest energy cost.
- As building envelopes have become more efficient in recent years water heating has become an even larger portion of the remaining energy costs.
- Much of the drain water leaving a residential building carries with it valuable and recoverable heat energy.
- The all copper Power-Pipe is a double-wall heat exchanger that can **reduce water heating costs by 20-40%** by recovering heat energy from drain (waste) water in multi-residential building drain (waste) stacks.
- The patented and patent pending Power-Pipe design is the only heat exchanger that efficiently allows for up to 4 apartment suites to be plumbed without noticeable loss in water pressure... in fact this results in a **2 to 4 times faster payback** than other heat exchangers.
- The Power-Pipe is very **simple to specify and install** and its savings typically translate to a **3 to 4 year simple payback**; even faster with government or utility incentives.

Detail for buildings with central water heating:

© 2008 RenewABILITY Energy Inc.

© 2008 RenewABILITY Energy Inc.

How It Works

- 1 As drain water falls down any vertical drain stack it clings to the inner wall, rather than going down the middle of the pipe. This results in a quickly falling thin film.
- 2 The energy (heat) from this falling film of drain water is easily and efficiently transferred through the copper to the fresh cold water which is flowing around the drain pipe in the outer coils.
- 3 Cold fresh water is plumbed into the bottom of the Power-Pipe from the main cold water riser.
- 4 Power-Pipe heated water is then plumbed to either:
 - the cold side of up to 4 showers, for buildings with central water heating, thereby reducing hot water demand
 - the cold side of the shower and water heater, for buildings with in-suite water heaters

877-606-5559
www.renewability.com

Advantages of the Power-Pipe®

- The Power-Pipe® is **very simple to install** during new construction and it integrates with any plumbing system
- The Power-Pipe **can be retrofit** in buildings where there is access to the drain stacks and fresh water lines
- Maintenance-free, 50+ year life
- The Power-Pipe will increase effective hot water capacity, thereby reducing the risk of running out of hot water
- **Quality** is never compromised; the coils of every Power-Pipe unit consist of 100% Type L or heavier copper tube
- The Power-Pipe also provides significant cost-effective **reductions in green house gases** as a result of reduced primary energy demand
- The performance of the Power-Pipe has been **verified by the Canadian Government** (Ministry of Natural Resources Canada and the University of Waterloo) in independent third-party testing
- The Power-Pipe will **assist in obtaining LEED Certification** (and similar programs) for your building
- Many Governments and Utilities also offer **financial incentives** resulting in a quicker payback
- The Power-Pipe is the most proven, most used drain water heat recovery technology; many building designers have been specifying the Power-Pipe as a standard in their buildings for many years now, there are now thousands of suites in which Power-Pipes are saving money and energy daily.

R405.5.2(1)T-EC-VANDECKER.DOC

CE284-13

C404.8 (NEW), C408.1, C408.2, C408.2.3.2, C408.2.4, C408.2.4.1, C408.2.5.2, C408.2.5.4

Proponent: Jeremiah Williams / U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C404.8 Service water heating systems commissioning and completion requirements. *Service water heating systems, swimming pool water heating systems, spa water heating systems and the controls for those systems shall be commissioned and completed in accordance with Section C408.2.*

C408.1 General. This section covers the commissioning of the building mechanical systems in Section C403, service water heating systems in Section C404, and electrical power and lighting systems in Section C405.

C408.2 Mechanical systems and service water heating systems commissioning and completion requirements. Prior to passing the final mechanical and plumbing inspections, the *registered design professional* shall provide evidence of mechanical systems and service water heating systems *commissioning* and completion in accordance with the provisions of this section. Construction document notes shall clearly indicate provisions for *commissioning* and completion requirements in accordance with this section and are permitted to refer to specifications for further requirements. Copies of all documentation shall be given to the owner and made available to the *code official* upon request in accordance with Sections C408.2.4 and C408.2.5.

Exception: The following systems are exempt from the commissioning requirements:

1. Mechanical systems and service water heating systems in buildings where the total ~~mechanical~~-equipment capacity is less than 480,000 Btu/h (140 690 W) cooling capacity and 600,000 Btu/h (175 860 W) combined service water heating and space heating capacity.
2. Systems included in Section C403.3 that serve dwelling units and sleeping units in hotels, motels, boarding houses or similar units.

C408.2.3.2 Controls. HVAC and service water heating control systems shall be tested to document that control devices, components, equipment, and systems are calibrated, adjusted and operate in accordance with approved plans and specifications. Sequences of operation shall be functionally tested to document they operate in accordance with *approved* plans and specifications.

C408.2.4 Preliminary commissioning report. A preliminary report of commissioning test procedures and results shall be completed and certified by the *registered design professional* or *approved agency* and provided to the building owner. The report shall be organized with mechanical and service hot water findings in separate sections to allow independent review. The report shall be identified as "Preliminary Commissioning Report" and shall identify:

1. Itemization of deficiencies found during testing required by this section that have not been corrected at the time of report preparation.
2. Deferred tests that cannot be performed at the time of report preparation because of climatic conditions.
3. Climatic conditions required for performance of the deferred tests.

C408.2.4.1 Acceptance of report. *Buildings*, or portions thereof, shall not pass the final mechanical and plumbing inspections, until such time as the *code official* has received a letter of transmittal from the *building* owner acknowledging that the *building* owner has received the Preliminary Commissioning Report.

C408.2.5.2 Manuals. An operating and maintenance manual shall be provided and include all of the following:

1. Submittal data stating equipment size and selected options for each piece of equipment requiring maintenance.
2. Manufacturer's operation manuals and maintenance manuals for each piece of equipment requiring maintenance, except equipment not furnished as part of the project. Required routine maintenance actions shall be clearly identified.
3. Name and address of at least one service agency.
4. HVAC and service hot water controls system maintenance and calibration information, including wiring diagrams, schematics, and control sequence descriptions. Desired or field-determined setpoints shall be permanently recorded on control drawings at control devices or, for digital control systems, in system programming instructions.
5. A narrative of how each system is intended to operate, including recommended setpoints.

C408.2.5.4 Final commissioning report. A report of test procedures and results identified as "Final Commissioning Report" shall be delivered to the building owner ~~and shall include.~~ The report shall be organized with mechanical system and service hot water system findings in separate sections to allow independent review. The report shall include the following:

1. Results of functional performance tests.
2. Disposition of deficiencies found during testing, including details of corrective measures used or proposed.
3. Functional performance test procedures used during the commissioning process including measurable criteria for test acceptance, provided herein for repeatability.

Exception: Deferred tests which cannot be performed at the time of report preparation due to climatic conditions.

Reason: This proposal increases HVAC commissioning scope to also include the building service water heating systems.

The value of commissioning a commercial building has been documented and was included for mechanical and lighting systems during the prior code development cycle as a new Section C408 in the IECC. Those provisions are intended to ensure that the building has been "tuned" prior to occupancy to make sure it is properly operating and capable of continuing to operate properly. Many hot water systems have recirculation or heat trace systems that need to be checked to verify that time or other controls are in place to avoid excessive unoccupied piping heat loss. This extends the value and validity of the code provisions because there is little value in requiring something be provided in a building if it is not properly installed and ready to perform its intended function.

The commissioning of the service hot water system is the next logical step in enhancing the value of the IECC. As noted above, there is no reason to add something to the code if there is no review process to make sure it is properly installed and can perform its intended function.

The proposed change expands the scope of mechanical commissioning to include service hot water systems. For buildings not exempt from commissioning, service hot water and mechanical systems are often integrated and the controls and commissioning are likely to be completed by the same parties. For integral tank temperature controls, the commissioning authority can design appropriate simple testing such as a spot check of delivered water temperature to ensure proper control operation. The provisions require that the preliminary and final commissioning reports be organized so that mechanical and service hot water results are separate and can be independently reviewed. This will allow mechanical and plumbing inspectors to separately review the results where appropriate.

There is a cost impact associated with this proposed change to the degree that the commissioning activity is currently not being performed and would have to be performed and documented in the proposed change. The cost would be modest, as it could be accomplished by the same staff completing the mechanical commissioning and would be included in the same commissioning report. There should also be a decrease in costs because such commissioning reduces the burden on state and local government to ensure and document compliance with the code. Without commissioning to ensure the code-required controls and other systems are in place, the cost effectiveness of other energy code provisions is in jeopardy. A study of 643 commissioned building in 26 states found that new building commissioning had a median payback of 4.2 years.

C202, C405.1, R202 (IRC N1109.1) R404.1 (IRC N1104.1)

Proponent: Deborah Frankhouser, Four Point Lighting Design, representing the International Association of Lighting Designers (deborah@fourpointlighting.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE COMMERCIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE.

PART I – IECC-COMMERCIAL PROVISIONS

Revise as follows:

C405.1 General (Mandatory). This section covers lighting system controls, the connection of ballasts, the maximum lighting power for interior applications, electrical energy consumption, and minimum acceptable lighting equipment for exterior applications.

Exception: Dwelling units within commercial buildings shall not be required to comply with Sections C405.2 through C405.5 provided that they comply with Section R404.1. ~~not less than 75 percent of the permanently installed light fixtures, other than low voltage lighting, shall be fitted for, and contain only, high efficacy lamps.~~

Delete definition without substitution as follows:

SECTION C202 GENERAL DEFINITIONS

~~**HIGH-EFFICACY LAMPS.** Compact fluorescent lamps, T-8 or smaller diameter fluorescent lamps, or lamps with a minimum efficacy of:~~

- ~~1. 60 lumens per watt for lamps over 40 watts,~~
- ~~2. 50 lumens per watt for lamps over 15 watts to 40 watts,~~
- ~~3. 40 lumens per watt for lamps 15 watts or less.~~

PART II – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R404.1 (N1104.1) Lighting equipment (Mandatory). ~~A minimum of 75 percent of the lamps in permanently installed lighting fixtures shall be high-efficacy lamps or a minimum of 75 percent of the permanently installed lighting fixtures shall contain only high-efficacy lamps. All permanently installed lighting shall be high efficiency luminaires.~~

Exception: Low-voltage lighting shall not be required to use high-efficiency lamps.

1. Luminaires that utilize lamps that operate at less than 25 volts if separately controlled by a dimmer or an automatic control device and controlled separately from high-efficiency luminaires.
2. Up to 50 percent of the luminaires not qualifying for Exception 1 shall be permitted to be other than high-efficiency luminaires if they are controlled by a dimmer or automatic control device. High- efficiency luminaires shall be controlled separately from non high-efficiency luminaires.

Revise definition as follows:

SECTION R202 (N1101.9) GENERAL DEFINITIONS

HIGH-EFFICIENCY EFFICACY LAMPS LUMINAIRES. Luminaires containing only compact fluorescent lamps, T-8 or smaller diameter fluorescent lamps with electronic ballasts, or lamps or light emitting diodes (LED's) with a minimum efficacy of:

- 1.60 lumens per watt for lamps over 40 watts,
- 2.50 lumens per watt for lamps over 15 watts to 40 watts,
- 3.40 lumens per watt for lamps 15 watts or less.

Reason: (Part I) The exception to C405.1 establishes a different standard for lighting efficiency in dwellings from Section R404.1. Section C405.1 is a luminaire-based standard, whereas Section R404.1 is a lamp-based standard. There is no reason for the code to set an efficiency standard for lighting within dwelling units in multi-family buildings that is different from the standard for lighting in detached houses. Residential lighting is the same regardless of the building it is located in.

(Part II):

1. Increases the overall requirement for high-efficiency luminaires from 75% to 100% with certain exceptions designed to save energy and provide maximum flexibility to designers, owners and code officials.
2. Changes the Chapter 2 definitions from *high efficacy lamps* to *high efficiency luminaires* as determined by lamp efficacy. This means owners, designers, and building code officials would count luminaires (light fixtures) vs. counting light bulbs to determine the amount of high or low efficient lighting on a project. Luminaires often have multiple lamps, making counting more cumbersome for both the owner/designer as well as the code official. By counting luminaires, the code official simply has to identify lamp type, but doesn't have to count individual lamps within each luminaire.
3. Allows for an optional and more flexible energy savings approach for owners and designers by allowing up to 50% low efficiency luminaires as long as lighting controls are used to reduce or turn off the low efficiency luminaires.

The current code requires 75% of lighting to be *high-efficacy*. However, there is a high amount of dissatisfaction with compact fluorescents because of their poor color, noise, incompatibility with dimming, and mercury content. (Reference, Dept. of Energy's "Compact Fluorescent Lighting in America: Lessons Learned on the Way to Market," prepared by Pacific Northwest National Laboratory, June 2006) LED technology is still emerging and many of the inexpensive LED's continue to have poor color and incompatibility with dimming.

The most efficient light is the one that is off. The current code does not use lighting controls as a means of energy savings. Regardless of efficacy, light sources achieve maximum energy savings when they are off or reduced to the minimum required by the task. For 120 volt incandescent/halogen sources, dimming reduces energy use, increases lamp life, and dimmers are inexpensive. Automatic controls turn lighting off when not being used. (See reference documentation listed below.)

Cost implications: In most cases, the required high efficiency Fluorescent and LED light fixtures are more expensive than their low efficiency 120 volt incandescent equivalents simply because fluorescent and LED have additional required components such as ballasts and drivers. Dimmers vary significantly in cost, but a 120v incandescent dimmer can be purchased for as little as \$15. When installed with the less expensive 120v incandescent lighting, this combination can be less expensive than purchasing many fluorescent or LED versions controlled by a switch. There are many options for owners and adding dimmers does not necessarily equal adding dollars when comparing low efficiency and high efficiency luminaires. Also, in residential, dimming is important for reasons other than energy savings and dimming fluorescent and LED sources can significantly increase dimming costs.

Residential is not commercial. In residences, it is very common for decorative lighting to be the main lighting source in a room. Decorative chandeliers are often only available in 120v incandescent medium or candelabra based sockets. Often times these chandeliers exceed the current allowance (25%) even when using high efficacy light sources for other types of architectural lighting such as down lights, task lighting, etc. These fixtures do not qualify for the Low Voltage Exception currently in the code. The proposed Exception 2 gives a greater allowance for 120v incandescent/halogen luminaires than the current code allows to accommodate these decorative products, but encourages energy savings through the use of controls.

4. Clarifies the low voltage lighting exception currently in the code and adds stringency by requiring lighting controls as an energy savings approach for these light fixture types. The current code allows for the use of low voltage with no limits. They are lower in VOLTAGE not WATTAGE. Adding controls will increase the overall energy efficiency of these products.

References

Several reports document savings from using controls residentially, such as:

C405.1-EC-FRANKHOUSER.doc

CE286 – 13

C405.1, C405.8 (NEW)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C405.1 General (Mandatory). This section covers lighting system controls, the connection of ballasts, the maximum lighting power for interior applications, electrical energy consumption, controls for electric receptacles, and minimum acceptable lighting equipment for exterior applications.

Exception: Dwelling units within commercial buildings shall not be required to comply with Sections C405.2 through C405.5 provided that not less than 75 percent of the permanently installed light fixtures, other than low voltage lighting, shall be fitted for, and contain only, high efficacy lamps.

C405.8 Automatic receptacle control. Automatic controls shall be provided for at least 50 percent of the 125 volt 15- and 20-Ampere receptacles in private offices, computer classrooms and individual workstations and receptacles associated with branch circuit feeds that are installed to supply electrical power to modular furniture in such spaces. These receptacles shall be labeled "Automatic Control Receptacle". The automatic controls shall:

1. Be capable of operating on a scheduled basis using a time-of-day operated control device that will turn receptacles off at specific programmed times and provide for an independent program schedule for areas not larger than 25,000 square feet but not larger than one floor, or
2. Be an occupant sensor that is capable of turning receptacles off within 30 minutes of all occupants leaving a space, or
3. Be capable of providing a signal to another control or alarm system that indicates the area is unoccupied.

Exceptions: Automatic receptacle controls need not be provided for:

1. Receptacles specifically designated for equipment requiring 24 hour operation.
2. Spaces where an automatic shutoff would endanger the safety or security of the room or building occupants.

Reason: Energy is used in supplying power to receptacles in offices, computer classrooms, individual work stations and modular furniture in such spaces. As with occupancy sensors that can reduce energy use associated with lighting and mechanical ventilation, the equipment supported by electrical receptacles is also subject to use and non-use based on occupancy. ASHRAE/IES Standard 90.1, which is adopted by reference in the IECC Commercial Provisions, contains provisions to provide for at least half of the electrical receptacles in certain spaces to have automatic controls as enhanced by addendum v to the standard. This change ensures consistency between the IECC Commercial Provisions and the latest criteria in standard 90.1.

Cost Impact: The code change proposal will increase the cost of construction.

C202 (NEW), C405.2, C405.2.1, C405.2.1.1, C405.2.2, C405.2.2.1, C405.2.1.1, C405.2.1.2, C405.2.2, C405.2.2.1, C405.2.2.3, C405.2.2.3.1, C405.2.2.3.2, C405.2.2.3.3, C405.2.3, C405.2.4

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

C405.2 Lighting Controls (Mandatory). Lighting systems shall be provided with controls as specified in Sections C405.2.1, C405.2.2, C405.2.3, and C405.2.4, and C405.2.5.

Exceptions: Lighting controls are not required for the following:

1. Areas designated as security or emergency areas that are required to be continuously lighted;
2. Stairways and corridors; and
3. Emergency egress lighting that is normally off.

~~**C405.2.1 Manual lighting controls.** All buildings shall include manual lighting controls that meet the requirements of Sections C405.2.1.1 and C405.2.1.2.~~

~~**C405.2.2.2 C405.2.1 Occupant sensors sensor controls.** *Occupant sensors sensor controls* shall be installed in all classrooms, conference/meeting rooms, employee lunch and break rooms, private offices, restrooms, storage rooms and janitorial closets, and other spaces 300 square feet (28 m²) or less that are enclosed by floor-to-ceiling height partitions. These automatic control devices shall be installed to~~

~~**C405.2.1.1 Occupant sensor control function.** Occupant sensor controls shall comply with the following:~~

- ~~1. Automatically turn off lights within 30 minutes of all occupants leaving the space; and~~
- ~~2. Shall either be manual on or shall be controlled to automatically turn the lighting on to not more than 50 percent power; and~~
- ~~3. Shall incorporate a *manual control* to allow occupants to turn lights off.~~

~~**Exception:** Full automatic-on controls shall be permitted to control lighting in public corridors, stairways, restrooms, primary building entrance areas and lobbies, and areas where manual-on operation would endanger the safety or security of the room or building occupants~~

~~**C405.2.1.1 Interior lighting controls.** Each area enclosed by walls or floor-to-ceiling partitions shall have at least one manual control for the lighting serving that area. The required controls shall be located within the area served by the controls or be a remote switch that identifies the lights served and indicates their status.~~

~~**Exceptions:**~~

- ~~1. Areas designated as security or emergency areas that need to be continuously lighted.~~
- ~~2. Lighting in stairways or corridors that are elements of the means of egress.~~

~~**C405.2.2 Additional lighting Time switch controls.** Each area that is required to have a manual control shall also have controls that meet the requirements of Sections C405.2.2.1, C405.2.2.2 and C405.2.2.3. Each area of the building that is not provided with *occupant sensor controls* complying with Section C405.2.1.1 shall be provided with *time switch controls* complying with Section C405.2.2.1.~~

Exceptions: Where a *manual control* provides light reduction in accordance with Section C405.2.2.2, automatic controls additional lighting controls need not be provided shall not be required for the following:

1. *Sleeping units.*
2. Spaces where patient care is directly provided.
3. Spaces where an automatic shutoff would endanger occupant safety or security.
4. Lighting intended for continuous operation.

C405.2.2.1 Automatic Time switch control devices function. ~~Automatic time switch controls shall be installed to control lighting in all areas of the building. Each space provided with *time switch controls* shall also be provided with a *manual control* for light reduction in accordance with Section C405.2.2.2. *Time switch controls* shall include an override switching device that complies with the following:~~

Exceptions:

- ~~1. Emergency egress lighting does not need to be controlled by an automatic time switch.~~
- ~~2. Lighting in spaces controlled by occupancy sensors does not need to be controlled by automatic time switch controls.~~

~~The automatic time switch control device shall include an override switching device that complies with the following:~~

- ~~1. The override switch shall be a *manual control* in a readily accessible location;~~
- ~~2. The override switch shall be located where the lights controlled by the switch are visible; or the switch shall provide a mechanism which announces the area controlled by the switch;~~
- ~~3. The override switch shall permit manual operation;~~
- ~~2.4. The override switch, when initiated, shall permit the controlled lighting to remain on for a maximum duration of 2 hours; and~~
3. Any individual override switch shall control the lighting for a maximum area of 5,000 square feet (465 m²).

Exceptions:

1. Within malls, arcades, auditoriums, single tenant retail spaces, industrial facilities and arenas:
 - ~~4. 1.1.~~ The time limit shall be permitted to exceed 2 hours provided the override switch is a captive key device; and
 - ~~2. 1.2.~~ The area controlled by the override switch is permitted to exceed 5,000 square feet (465 m²), but shall not exceed 20,000 square feet (1860 m²).
2. Where provided with *manual control*, the following areas are not required to have light reduction control:
 - 2.1. Spaces that have only one luminaire with a rated power of less than 100 watts;
 - 2.2. Spaces that use less than 0.6 watts per square foot (6.5 W/m²); and
 - 2.3. Corridors, equipment rooms, public lobbies, electrical or mechanical rooms.

C405.2.1.2 C405.2.2.2 Light reduction controls. ~~Each area that is required to have a manual control shall also allow the occupant to~~ Spaces required to have light reduction controls shall have a *manual control* that allows the occupant to reduce the connected lighting load in a reasonably uniform pattern by at least 50 percent. Lighting reduction shall be achieved by one of the following or other *approved* methods:

1. Controlling all lamps or luminaires;
2. Dual switching of alternate rows of luminaires, alternate luminaires, or alternate lamps;
3. Switching the middle lamp luminaires independently of the outer lamps; or
4. Switching each luminaire or each lamp.

Exception: ~~Light reduction controls need not be provided in the following areas and spaces:~~ are not required in daylight zones with *daylight responsive controls* complying with C405.3.2.

- ~~1. Areas that have only one luminaire, with rated power less than 100 watts.~~
- ~~2. Areas that are controlled by an occupant-sensing device.~~
- ~~3. Corridors, equipment rooms, storerooms, restrooms, public lobbies, electrical or mechanical rooms.~~
- ~~4. Sleeping unit (see Section C405.2.3).~~
- ~~5. Spaces that use less than 0.6 watts per square foot (6.5 W/m²).~~
- ~~6. Daylight spaces complying with Section C405.2.2.3.2.~~

C405.2.2.3 Manual controls. Manual controls for lights shall meet the following requirements:

1. Shall be readily accessible to occupants; and
2. Shall be located where the controlled lights are visible; or the control shall identify the area served by the lights and indicate their status.

~~C405.2.2.3~~ C405.3 Daylight zone control. *(Portions of text not shown remains unchanged)*

~~C405.2.2.3.1~~ C405.3.1 Manual daylight controls. *(Portions of text not shown remains unchanged)*

~~C405.2.2.3.2~~ Automatic daylight controls. C405.3.2 Daylight responsive controls. *(Portions of text not shown remains unchanged)*

~~C405.2.2.3.3~~ C405.3.3 Multi-level lighting controls. *(Portions of text not shown remains unchanged)*

~~C405.2.3~~ C405.2.4 Specific application controls. *(Portions of text not shown remains unchanged)*

~~C405.2.4~~ C405.2.5 Exterior lighting controls. *(Portions of text not shown remains unchanged)*

Add new definitions as follows:

SECTION C202 GENERAL DEFINITIONS

TIME SWITCH CONTROL. An automatic control device or system that controls lighting or other loads, including switching off, based on time schedules.

OCCUPANT SENSOR CONTROL. An automatic control device or system that detects the presence or absence of people within an area and causes lighting, equipment, or appliances to be regulated accordingly.

DAYLIGHT RESPONSIVE CONTROL. A device or system that provides automatic control of electric light levels based on the amount of daylight in a space.

Reason: This public comment is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 2 open meetings and over 15 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Reasons for this proposal are as follows:

Overview:

This proposal reorganizes, but does not delete requirements related to lighting controls in the 2012 IECC.

Section C405.2 of the 2012 IgCC is confusing. It puts information that is often irrelevant first, and surprises with essential and relevant information only after one has suffered through trying to decipher what the implications of the irrelevant information might be. Section C405.2 also contains redundant information and the relationship of various

subsections of C405.2 to one another is often unclear and ambiguous. This proposal reorganizes Section C405.2 to provide the clarity that is necessary for its proper application and enforcement. This proposal is a reorganization only and does not contain technical changes or increases or decreases in stringency.

Section C405.2:

According to the IBC, all interior stairways and corridors are elements of the means of egress. The original intent of this language may have been to exempt corridors and stairways which are part of an exit as defined by the IBC, but the way the code is currently written it also exempts exit access and exit discharge components, i.e. the entire building. Exceptions 1 and 2 are moved here from deleted former Section C405.2.1.1.

Proposed Exception 3 to Section C405.2:

"Emergency egress lighting that is normally off" does not seem to be exempt from controls requirements in the current code, but it needs to be.

Section C405.2.1.1:

This proposal deletes existing Section C405.2.1.1 and replaces it with new text. The way the code is currently structured most users probably would not realize that a manual switch is always required, even with automatic-on occupant sensors. This clarifies the fact that a manual switch is always required.

Exception to Proposed Section C405.1.1:

Former Section C405.2.2 is proposed to be moved and split into two sections: Sections C405.2.1 and C405.2.1.1. The requirements under proposed new Section C405.2.1.1 have been itemized for clarity. Note that the requirement for occupant sensor controls in "other spaces 300 square feet or less" is extremely broad and will encompass all of the lighting on smaller projects. For example, this is applicable to sleeping units, dwelling units, etc. Whether or not this was the original intention, this is how the code currently reads, and this proposal is intended to provide clarity, it is not intended to make technical changes.

Exception 1 to Section C405.2.2:

Note that the current code does not offer an exception for dwelling units. Dwelling units that are not exempt from all of 405.2 are required to comply with the requirements for automatic controls and light reduction controls.

Exception 4 to Section C405.2.2:

The exception that is currently in the code is for "lighting" that is intended for continuous operation, not for "spaces". This is an important distinction, because it allows light fixtures that are intended for night lighting of unoccupied spaces to be left off the automatic control system (like retail stores for security reasons, where select lights might be left on all night long).

The current code does not offer a blanket exemption for continuously operational emergency egress "night" lighting. Under current code, all emergency egress lighting that is not located in a corridor or stairwell must have a manual control device for override, even though it does not need to be automatically controlled.

Exception 2 to Section C405.2.1 and Section C405.2.1.2:

This exception is derived from 2012 IECC Section C405.2.1.2, which this proposal deletes. Storerooms and restrooms should not be in this list because they are required to be provided with occupant sensor controls.

Sections C405.2.1.1, C405.2.2.1 and C405.2.2.3:

This new section is a combination of the requirements in existing Sections C405.2.1.1 and C405.2.2.1 that pertain to manual controls. Therefore, existing Section C405.2.1.1 is proposed to be deleted and Section C405.2.2.1 is proposed to be revised. Existing Section C405.2.2.3 is not replaced, it is renumbered, as are all affected subsequent sections.

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

Cost Impact: The code change proposal will not increase the cost of construction. This proposal is a clarification and, as such, will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.2-EC-THOMPSON-SEHPCAC

CE288 – 13

C202 (NEW), C405.2, C405.2.1, C405.2.1, C405.2.1.1, C405.2.2, C405.2.2.1, C405.2.2.2, C405.2.2.3 (NEW)

Proponent: Don Iverson, National Electrical Manufacturers Association (don.iverson@nema.org)

Revise as follows:

C405.2 Lighting controls (Mandatory). Lighting systems shall be provided with controls as specified in Sections C405.2.1, C405.2.2, C405.2.3, and C405.2.4, and C405.2.5.

Exceptions: Lighting controls are not required for the following:

1. Areas designated as security or emergency areas that are required to be continuously lighted;
2. Stairways and corridors.
3. Emergency egress lighting that is normally off.

C405.2.1 Manual lighting controls. All buildings shall include manual lighting controls that meet the requirements of Sections C405.2.1.1 and C405.2.1.2.

C405.2.2.2 Occupancy sensors. C405.2.1 Occupant sensor controls. Occupancy sensors Occupant sensor controls shall be installed in all classrooms, conference/meeting rooms, employee lunch and break rooms, private offices, restrooms, storage rooms and janitorial closets, and other spaces 300 square feet (28 m²) or less enclosed by floor-to-ceiling height partitions. ~~These automatic control devices shall be installed to~~

C405.2.1.1 Occupant sensor control function. Occupant sensor controls shall comply with all of the following:

1. Automatically turn off lights within 30 minutes of all occupants leaving the space; and
2. Shall either be manual on or shall be controlled to automatically turn the lighting on to not more than 50 percent power.
3. Shall incorporate a *manual* control to allow users to turn lights off.

Exception: Full automatic-on controls shall be permitted to control lighting in public corridors, stairways, restrooms, primary building entrance areas and lobbies, and areas where manual-on operation would endanger the safety or security of the room or building occupants

~~**C405.2.1.1 Interior lighting controls.** Each area enclosed by walls or floor-to-ceiling partitions shall have at least one manual control for the lighting serving that area. The required controls shall be located within the area served by the controls or be a remote switch that identifies the lights served and indicates their status.~~

Exceptions:

1. ~~Areas designated as security or emergency areas that need to be continuously lighted.~~
2. ~~Lighting in stairways or corridors that are elements of the means of egress.~~

~~**C405.2.2 Additional lighting Time switch controls.** Each area that is required to have a manual control shall also have controls that meet the requirements of Sections C405.2.2.1, C405.2.2.2 and C405.2.2.3.~~
Each area of the building that is not provided with *occupant sensor controls* complying with Section C405.2.1.1 shall be provided with *time switch controls* complying with Section C405.2.2.1.

Exceptions: Where a *manual* control provides light reduction in accordance with Section 405.2.2.2, additional lighting controls need not be provided shall not be required for the following:

1. *Sleeping units.*
2. Spaces where patient care is directly provided.
3. Spaces where an automatic shutoff would endanger occupant safety or security.
4. Lighting intended for continuous operation.

C405.2.2.1 Automatic Time switch control devices function. Automatic time switch controls shall be installed to control lighting in all areas of the building. Each space provided with *time switch controls* shall also be provided with a *manual control* for light reduction in accordance with Section 405.2.2.2. *Time switch controls* shall include an override switching device that complies with the following:

Exceptions:

1. Emergency egress lighting does not need to be controlled by an automatic time switch.
2. Lighting in spaces controlled by occupancy sensors does not need to be controlled by automatic time switch controls.

The automatic time switch control device shall include an override switching device that complies with the following:

1. The override switch shall be ~~in a readily accessible location; a *manual control*.~~
2. ~~The override switch shall be located where the lights controlled by the switch are visible; or the switch shall provide a mechanism which announces the area controlled by the switch;~~
3. ~~The override switch shall permit manual operation;~~
4. 2. The override switch, when initiated, shall permit the controlled lighting to remain on for a maximum duration of 2 hours; and
5. 3. Any individual override switch shall control the lighting for a maximum area of 5,000 square feet (465 m²).

Exceptions:

1. Within malls, arcades, auditoriums, single tenant retail spaces, industrial facilities and arenas:
 1. ~~1.1.~~ The time limit shall be permitted to exceed 2 hours provided the override switch is a captive key device; and
 2. ~~1.2.~~ The area controlled by the override switch is permitted to exceed 5,000 square feet (465 m²), but shall not exceed 20,000 square feet (1860 m²).
2. Where provided with *manual control*, the following areas are not required to have light reduction control:
 - 2.1. Spaces that have only one luminaire, with rated power less than 100 watts;
 - 2.2. Spaces that use less than 0.6 watts per square foot (6.5 W/m²); and
 - 2.3. Corridors, equipment rooms, public lobbies, electrical or mechanical rooms.

C405.2.1.2 C405.2.2.2 Light reduction controls. ~~Each area that is required to have a manual control shall also allow the occupant~~ Spaces required to have light reduction controls shall have a *manual control* that allows the occupant to reduce the connected lighting load in a reasonably uniform pattern by at least 50 percent. Lighting reduction shall be achieved by one of the following or other *approved* methods:

1. Controlling all lamps or luminaires;
2. Dual switching of alternate rows of luminaires, alternate luminaires, or alternate lamps;
3. Switching the middle lamp luminaires independently of the outer lamps; or
4. Switching each luminaire or each lamp.

Exception: Light reduction controls need not be provided in the following areas and spaces: are not required in daylight zones with daylight responsive controls complying with C405.3.2.

- ~~1. Areas that have only one luminaire, with rated power less than 100 watts.~~
- ~~2. Areas that are controlled by an occupant sensing device.~~
- ~~3. Corridors, equipment rooms, storerooms, restrooms, public lobbies, electrical or mechanical rooms.~~
- ~~4. Sleeping unit (see Section C405.2.3).~~
- ~~5. Spaces that use less than 0.6 watts per square foot (6.5 W/m²).~~
- ~~6. Daylight spaces complying with Section C405.2.2.3.2.~~

C405.2.2.3 Manual controls. Manual controls for lights shall comply with the following:

1. Controls shall be readily accessible to occupants; and
2. Controls shall be located where the controlled lights are visible; or the control shall identify the area served by the lights and indicate their status.

~~C405.2.2.3~~ **C405.3 Daylight zone control.** *(Portions of text not shown remains unchanged)*

~~C405.2.2.3.1~~ **C405.3.1 Manual daylight controls.** *(Portions of text not shown remains unchanged)*

~~C405.2.2.3.2~~ **Automatic daylight controls.** **C405.3.2 Daylight responsive controls.** *(Portions of text not shown remains unchanged)*

~~C405.2.2.3.3~~ **C405.3.3 Multi-level lighting controls.** *(Portions of text not shown remains unchanged)*

~~C405.2.3~~ **C405.2.4 Specific application controls.** *(Portions of text not shown remains unchanged)*

~~C405.2.4~~ **C405.2.5 Exterior lighting controls.** *(Portions of text not shown remains unchanged)*

Add new definitions as follows:

SECTION C202 GENERAL DEFINITIONS

TIME SWITCH CONTROL. An automatic control device or system that controls lighting or other loads, including switching off, based on time schedules.

OCCUPANT SENSOR CONTROL. An automatic control device or system that detects the presence or absence of people within an area and causes lighting, equipment, or appliances to be regulated accordingly.

DAYLIGHT RESPONSIVE CONTROL. A device or system that provides automatic control of electric light levels based on the amount of daylight in a space.

Reason:

1. An extensive reorganization of C405.2 is proposed to improve readability and clarify use cases
2. For C405.2 Exceptions:
 - a. According to the IBC, all interior stairways and corridors are elements of the means of egress. The original intent of this language may have been to exempt corridors and stairways which are part of an exit as defined by the IBC, but the way the code is currently written it also exempts exit access and exit discharge components, i.e. the entire building. Exceptions 1 and 2 are moved here from deleted former Section C405.2.1.1.
 - b. Emergency egress lighting does not seem to be exempt from controls requirements in the current code, but it needs to be.
3. For C405.2.1.1.3: The way the code is currently structured most users probably would not realize that a manual switch is always required, even with automatic-on occupancy sensors.
4. Former Section C405.2.2 is proposed to be moved and split into two sections: Sections C405.2.1 and C405.2.1.1. The requirements under proposed new Section C405.2.1.1 have been itemized for clarity. Note that the requirement for occupant

sensor controls in “other spaces 300 square feet or less” is extremely broad and will encompass all of the lighting on smaller projects. For example, this is applicable to sleeping units, dwelling units, etc.

5. For C405.2.2 Exceptions:
 - a. The current code does not offer an exception for dwelling units. Dwelling units that are not exempt from all of 405.2 are required to comply with the requirements for automatic controls and light reduction controls.
 - b. The exception that is currently in the code is for “lighting” that is intended for continuous operation, not for “spaces”. This is an important distinction, because it allows light fixtures that are intended for night lighting of unoccupied spaces to be left off the automatic control system (like retail stores for security reasons, where select lights might be left on all night long. The current code does not offer a blanket exemption for continuously operational emergency egress “night” lighting. Under current code, all emergency egress lighting that is not located in a corridor or stairwell must have a manual control device for override, even though it does not need to be automatically controlled.
6. For C405.2.2.1 Exceptions: Exception 2 is derived from 2012 IECC Section C405.2.1.2, which this proposal deletes. Storerooms and restrooms should not be in this list because they are required to be provided with occupant sensor controls
7. For C405.2.2.3 Manual Controls, these additions Refer to C405.2.1.1 and C405.2.2.1 in these two sections.

Cost Impact: This code change proposal will not increase the cost of construction.

CE288-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.2-EC-IVERSON.doc

CE289 – 13

C405.2.1.1

Proponent: Jack Bailey, One Lux Studio, representing International Association of Lighting Designers
(jbailey@oneluxstudio.com)

Revise as follows:

C405.2.1.1 Interior lighting controls. Each area enclosed by walls or floor-to-ceiling partitions shall have at least one manual control for the lighting serving that area. The required controls shall be located within the area served by the controls or be a remote switch that identifies the lights served and indicates their status.

Exceptions:

1. Areas designated as security or emergency areas that need to be continuously lighted.
2. Lighting in stairways or corridors that are exits or exit discharge ~~elements of the means of egress.~~

Reason: According to the IBC 2012, all interior stairways and corridors are elements of the means of egress (most are exit access components). This makes the current code language redundant and confusing.

Most users of the code interpret this exception to apply only to stairways and corridors that are part of exits, and this was probably the original intention of the language. Interior exit discharge elements are unusual, but are allowed by IBC 2012 Section 1027.1.

The proposed change will make this section of the code technically correct and consistent with other ICC family codes.

Cost Impact: This code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.2.1.1-EC-BAILEY.doc

CE290 – 13

C405.2.2

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C405.2.2 Additional lighting controls. Each area that is required to have a manual control shall also have controls that meet the requirements of Sections C405.2.2.1, C405.2.2.2 and C405.2.2.3.

Exception: Additional lighting controls need not be provided in the following spaces:

1. *Sleeping units.*
2. Spaces where patient care is directly provided.
3. Spaces where an automatic shutoff would endanger occupant safety or security.
4. Lighting intended for continuous operation
5. Shop and laboratory classrooms.

Reason: Currently, lighting controls are required in shop and laboratory classrooms. These spaces are similar to spaces where patient care is directly provided, however there are instances (in a classroom setting) where lighting controls are not needed, but no patient care is being provided. This exception is consistent with ANSI/ASHRAE/IES Standard 90.1.

Cost Impact: The code change proposal will increase the cost of construction.

CE290-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.2.2-EC-FERGUSON.doc

CE291 – 13

C405.2.2.1

Proponent: Tim Nogler, Washington State Building Code Council (tim.nogler@des.wa.gov)

Revise as follows:

C405.2.2.1 Automatic time switch controls devices. Automatic time switch controls shall be installed to control lighting in all areas of the building.

Exceptions:

1. Emergency egress lighting does not need to be controlled by an automatic time switch.
2. Lighting in spaces controlled by occupancy sensors does not need to be controlled by automatic time switch controls.

~~The~~ Automatic time switch controls ~~device~~ shall comply with the following:

1. Have a minimum 7 day clock;
2. Be capable of being set for 7 different day types per week;
3. Incorporate an automatic holiday "shut-off" feature, which turns off all controlled lighting loads for at least 24 hours and then resumes normally scheduled operations.
4. Have program back-up capabilities, which prevent the loss of program and time settings for at least 10 hours, if power is interrupted; and
5. Include an override switch ~~device~~ that complies with the following:
 - 5.1. The override switch shall be in a readily accessible location;
 - 5.2. The override switch shall be located where the lights controlled by the switch are visible; or the switch shall provide a mechanism which announces the area controlled by the switch;
 - 5.3. The override switch shall permit manual operation;
 - 5.4. The override switch, when initiated, shall permit the controlled lighting to remain on for a maximum of 2 hours; and
 - 5.5. Any individual override switch shall control the lighting for a maximum area of 5,000 square feet (465 m²).

Exception: Within malls, arcades, auditoriums, single tenant retail spaces, industrial facilities and arenas:

1. The time limit shall be permitted to exceed 2 hours provided the override switch is a captive key device; and
2. The area controlled by the override switch is permitted to exceed 5,000 square feet (465 m²), but shall not exceed 20,000 square feet (1860 m²).

Reason: These additional details clarify that a 7-day clock and holiday override features are required. This prevents lights from automatically turning on during weekends and holidays if not needed, and allows customization for unique schedules that require lighting earlier or later than usual on certain days, without keeping lights on for those extra hours on the other days of the week. The word "devices" is unnecessary and deleted for consistency in the language.

Washington State's experience has been that the power-loss memory feature is invaluable in restoring normal operations after a brief power interruption, at little extra cost.

Cost Impact: The code change proposal will increase the cost of construction.

CE291-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.2.2.1-EC-NOGLER.doc

CE292 – 13

C405.2.2.2

Proponent: Tim Nogler, Washington State Building Code Council (tim.nogler@des.wa.gov)

Revise as follows:

C405.2.2.2 Occupancy sensors. Occupancy sensors shall be installed in all classrooms, conference/meeting rooms, employee lunch and break rooms, private offices, restrooms, warehouse spaces, storage rooms and janitorial closets, and other spaces 300 square feet (28 m²) or less enclosed by floor-to-ceiling height partitions. These automatic control devices shall be installed to automatically turn off lights within 30 minutes of all occupants leaving the space, and shall either be manual on or shall be controlled to automatically turn the lighting on to not more than 50 percent power.

Exception: Full automatic-on controls shall be permitted to control lighting in public corridors, stairways, restrooms, primary building entrance areas and lobbies, and areas where manual-on operation would endanger the safety or security of the room or building occupants

Reason: This provision adds warehouses to the list of areas requiring occupancy sensors for lighting control. Since most areas in a warehouse are unoccupied most of the time, while other spaces are in use, the savings on lighting energy are substantial. This has been an integral part of the Washington State Energy Code for many years.

Cost Impact: The code change proposal will increase the cost of construction.

CE292-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.2.2.2-EC-NOGLER.doc

CE293 – 13

C405.2.2.2, C405.2.2.2.1 (NEW), C405.2.2.2.2 (NEW)

Proponent: Glenn Heinmiller, Lam Partners, representing International Association of Lighting Designers, (glenn@lampartners.com). James Edelson, New Buildings Institute.

Revise as follows:

C405.2.2.2 Occupancy sensors controls. Occupancy sensors shall be installed to control lights in accordance with C405.2.2.2.1 and C405.2.2.2.2. These automatic control devices shall be installed to automatically turn off lights within 30 minutes of all occupants leaving the space, and shall either be manual-on or shall be controlled to automatically turn the lighting on to not more than 50 percent power.

Exception: Full automatic-on controls shall be permitted to control lighting in:

1. Public corridors,
2. Stairways,
3. Restrooms,
4. Primary building entrance areas and lobbies,
5. Parking garages,
6. Warehouses,
7. Areas where manual-on operation would endanger the safety or security of the room or building occupants.

C405.2.2.2.1. Occupancy sensors for 100 percent load control. Occupancy sensors shall be installed to control 100 percent of the connected lighting load in:

1. Classrooms/lecture/training rooms,
2. Conference/meeting ~~rooms~~/multi-purpose rooms,
3. Copy/print rooms,
4. Lounges,
5. Employee lunch and-break rooms,
6. Private offices,
7. Restrooms,
8. Storage rooms, ~~and~~
9. Janitorial closets,
10. Laboratory classrooms,
11. Locker rooms,
12. Other spaces 300 square feet (28 m²) or less enclosed by floor-to-ceiling height partitions.

C405.2.2.2.2. Occupancy sensors for 50 percent load control. Occupancy sensors shall be installed to control not less than 50 percent of the connected lighting load in:

1. Enclosed stairways,
2. Parking garages,
3. Warehouses.

Reason: Occupancy sensors are the automatic control type that leads to the most energy savings. This proposal requires the use of occupancy sensors in certain additional space types where occupancy sensors can be used effectively. The space type names are consistent with the space type names used for determination of lighting power density. The phrase "to control lights" is added to make it clear that the sensors not only have to be installed, but have to function. The section has been reformatted in list format for clarity.

Cost Impact: This code change proposal will increase the cost of construction if occupancy sensors would not already be specified for the space types not currently in the code.

CE294 – 13

C202, Figure C405.1 (NEW), Figure C405.2 (NEW), C405.2.2.3, C405.2.2.3.1 (NEW), C405.2.2.3.2 (NEW), C405.2.2.3.3 (NEW), Figure C405.3 (NEW), Figure C405.4 (NEW)

Proponent: Jack Bailey, One Lux Studio, representing International Association of Lighting Designers (jbailey@oneluxstudio.com), Jim Edelson, New Buildings Institute (jim@newbuildings.org)

Revise as follows:

~~C405.2.2.3 Daylight zone control.~~ ~~Daylight zones shall be designed such that lights in the daylight zone are controlled independently of general area lighting and are controlled in accordance with either Section C405.2.2.3.1 or Section C405.2.2.3.2. Each daylight control zone shall not exceed 2,500 square feet (232 m²). Contiguous daylight zones adjacent to vertical fenestration are allowed to be controlled by a single controlling device provided that they do not include zones facing more than two adjacent cardinal orientations (i.e., north, east, south, west). Daylight zones under skylights more than 15 feet (4572 mm) from the perimeter shall be controlled separately from daylight zones adjacent to vertical fenestration.~~

~~**Exception:** Daylight zones enclosed by walls or ceiling-height partitions and containing two or fewer light fixtures are not required to have a separate switch for general area lighting.~~

C405.2.2.3 Daylight responsive controls. Daylight responsive controls complying with Section C405.2.2.3.1 shall be provided to control the electric lights within *daylight zones* in the following spaces:

1. Spaces with a total of more than 150 watts of *general lighting* within sidelight *daylight zones* complying with Section C405.2.2.3.2. *General lighting* does not include lighting that is required to have specific application control in accordance with Section C405.2.3.
2. Spaces with a total of more than 150 watts of *general lighting* within toplight *daylight zones* complying with Section C405.2.2.3.3.

Exceptions: Daylight responsive controls are not required for the following:

1. Spaces in health care facilities where patient care is directly provided.
2. Dwelling units and sleeping units.
3. Lighting that is required to have specific application control in accordance with Section C405.2.3.

C405.2.2.3.1 Daylight responsive control function. Where required, *daylight responsive controls* shall be provided within each space for control of lights in that space and shall comply with all of the following:

1. Lights in toplight *daylight zones* in accordance with Section C405.2.2.3.3 shall be controlled independently of lights in sidelight *daylight zones* in accordance with Section C405.2.2.3.2;
2. *Daylight responsive controls* within each space shall be configured so that they can be calibrated from within that space by authorized personnel;
3. Calibration mechanisms shall be *readily accessible*;
4. When located in offices, classrooms, laboratories, and library reading rooms, *daylight responsive controls* shall dim lights continuously from full light output to 10 percent of full light output or lower;
5. *Daylight responsive controls* shall be capable of a complete shut off of all controlled lights; and
6. Lights in sidelight *daylight zones* in accordance with Section C405.2.2.3.2 facing different cardinal orientations (i.e. within 45 degrees of due north, east, south, west) shall be controlled independently of each other.

Exception: Up to 150 watts of lighting in each space is permitted to be controlled together with lighting in a daylight zone facing a different cardinal orientation.

C405.2.2.3.2 Sidelight daylight zone. The sidelight *daylight zone* is the floor area adjacent to vertical *fenestration* which complies with all of the following:

1. Where the *fenestration* is located in a wall, the *daylight zone* shall extend laterally to the nearest full height wall, or up to 1.0 times the height from the floor to the top of the *fenestration*, and longitudinally from the edge of the fenestration to the nearest full height wall, or up to 2 feet (610 mm), whichever is less, as indicated in Figure C405.1;
2. Where the *fenestration* is located in a rooftop monitor, the *daylight zone* shall extend laterally to the nearest obstruction that is taller than 0.7 times the ceiling height, or up to 1.0 times the height from the floor to the bottom of the *fenestration*, whichever is less, and longitudinally from the edge of the *fenestration* to the nearest obstruction that is taller than 0.7 times the ceiling height, or up to 0.25 times the height from the floor to the bottom of the *fenestration*, whichever is less, as indicated in Figures C405.2 and C405.3;
3. The area of the *fenestration* is at least 24 square feet;
4. The distance from the *fenestration* to any building or geological formation which would block access to daylight is greater than the height from the bottom of the *fenestration* to the top of the building or geologic formation; and
5. Where located in existing buildings, the *visible transmittance* of the *fenestration* is no less than 0.25.

C405.2.2.3.3 Toplight daylight zone. The topline *daylight zone* is the floor area underneath a roof *fenestration* assembly which complies with all of the following:

1. The *daylight zone* shall extend laterally and longitudinally beyond the edge of the roof *fenestration* assembly to the nearest obstruction that is taller than 0.7 times the ceiling height, or up to 0.7 times the ceiling height, whichever is less, as indicated in Figure C405.4;
2. No building or geological formation blocks direct sunlight from hitting the roof *fenestration* assembly at the peak solar angle on the summer solstice; and
3. Where located in existing buildings, the product of the *visible transmittance* of the roof *fenestration* assembly and the area of the rough opening of the roof fenestration assembly, divided by the area of the daylight zone is no less than 0.008.

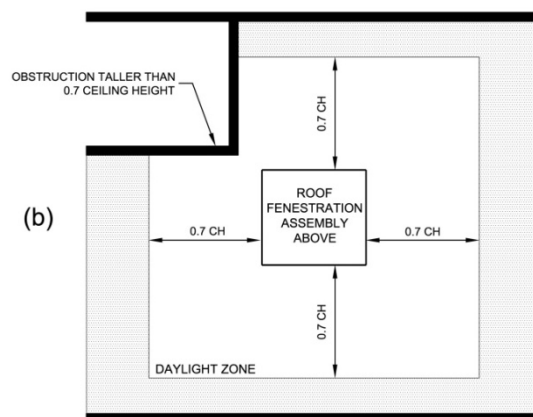

FIGURE C405.4
DAYLIGHT ZONE UNDER A ROOF FENESTRATION ASSEMBLY

Revise definitions as follows:

SECTION C202 GENERAL DEFINITIONS

DAYLIGHT RESPONSIVE CONTROL. A device or system that provides automatic control of electric light levels based on the amount of daylight in a space.

DAYLIGHT ZONE. That portion of a building's interior floor area that is illuminated by natural light.

- ~~1. **Under skylights.** The area under skylights whose horizontal dimension, in each direction, is equal to the skylight dimension in that direction plus either the floor-to-ceiling height or the dimension to a ceiling height opaque partition, or one-half the distance to adjacent skylights or vertical fenestration, whichever is least.~~
- ~~2. **Adjacent to vertical fenestration.** The area adjacent to vertical fenestration which receives daylight through the fenestration. For purposes of this definition and unless more detailed analysis is provided, the daylight zone depth is assumed to extend into the space a distance of 15 feet (4572 mm) or to the nearest ceiling height opaque partition, whichever is less. The daylight zone width is assumed to be the width of the window plus 2 feet (610 mm) on each side, or the window width plus the distance to an opaque partition, or the window width plus one-half the distance to adjacent skylight or vertical fenestration, whichever is least.~~

Reason: This proposal would replace the provisions in the code related to control of electric lights in daylight zones. It would not alter any of the envelope provisions in the code, nor would it set any minimum requirements for fenestration. The proposed changes are needed for two reasons:

1. The existing IECC code language is technically inadequate and confusing, and
2. There is a tremendous untapped potential for energy savings in buildings just by turning off electric lights in daylit spaces.

Inadequate and Confusing Language in 2012 IECC

1. The code describes all sidelight daylight zones as being 15 feet deep, regardless of whether the window is 5 feet high or 50 feet high. Lighting controls will not function properly if the daylight zone size is wrong, and the 15 foot depth requirement in the current code is actually an impediment to successful implementation of daylight responsive controls. New definitions that are based on the geometry of the building are proposed, and diagrams are provided to make the code easier to use. The proposed diagrams are modified slightly from the diagrams published in the 2012 IGCC, and if this proposal is approved these modifications should be proposed for the IGCC diagrams as well.
2. The code provides no clear guidance about the daylight zone associated with a rooftop monitor. This proposal clearly describes the daylight zone associated with rooftop monitors.
3. Small windows, windows with low-VT glass, and windows which are overshadowed by adjacent buildings are common in urban areas with older building stock. Daylight responsive controls should not be required in situations where they will be ineffective. The current code does not provide exceptions for these situations, but the proposed language does.
4. The code requires that separate control be provided for lights in each daylight zone. On facades where windows are spaced more than 4 feet apart, each window establishes a separate daylight zone, and hence a separate lighting control zone. This adds unnecessary cost and complexity to the lighting controls. The proposed daylight responsive control requirements in Section 405.2.2.3.1 resolve this issue and clarify which lights can be grouped together for control in a more sensible way.
5. The code allows step-switching in offices, laboratories, classrooms, and reading rooms, where we know this is objectionable to occupants. This proposal would require dimming in those areas, while still allowing less costly switching systems to be used in other areas.
6. The code is not specific enough about how daylight responsive controls should be required to function. An owner, developer, designer, or builder who looks for the lowest first-cost solution that meets the current code will likely end up with a lighting control system that doesn't work. The proposed Section 405.2.2.3.1 would establish minimum requirements for these systems to function properly. The code is not a design guideline, but it should prevent obvious shortcuts which subvert the intent of the code.

Additional Energy Savings from Daylight Responsive Controls

The IECC requires that daylight responsive controls only be provided in buildings following the prescriptive path which fail to meet certain fenestration requirements. This is obviously a very limited requirement, as most lighting installations are completed as part of alterations to existing buildings that do not include envelope alterations.

This proposal would require that daylight responsive controls be provided whenever more than 150 watts of lighting is installed in an area which receives effective daylight. Necessary exceptions are included for lighting in dwelling units, sleeping units, health care, etc. The 150 watt threshold was found to be cost effective by PNNL and HMG in research done to support the ASHRAE 90.1 Committee. If approved, this proposal would align the stringency of the lighting control requirements in the IECC with those of ASHRAE / ANSI / IESNA Standard 90.1 – 2013, but would still leave the IECC less stringent than California Title 24 – 2013.

Lighting in commercial buildings is responsible for 38% of electricity consumption in commercial buildings nationally. As a portion total energy use, lighting is the largest individual use of energy, accounting for one fifth (20%) of the combined energy total. This occurs despite the fact that many buildings have ample access to a free light source – daylight. A recent meta-analysis report

on lighting controls in commercial buildings (Lighting Controls in Commercial Buildings, Williams, Atkins et al, 2012) estimated a 28% average lighting energy savings potential for buildings that incorporated daylighting strategies.

Guidelines published by NBI (<http://patternguide.advancedbuildings.net>) show that there are multiple ways to provide high quality daylight in most buildings. In addition to many energy code entities, almost every voluntary rating system has been increasing their reliance on daylighting to reduce energy consumption in commercial buildings. This proposal ensures that the IECC incorporates the energy saving priority that if sufficient daylight is available, then controls should be included to turn off the electric lights.

Cost Impact: The code change proposal will increase the cost of construction.

C405.2.2.3 (NEW)-EC-BAILEY-EDELSON

CE295 – 13

C405.2.2.3, C405.2.2.3.1

Proponent: Tim Nogler, Washington State Building Code Council (tim.nogler@des.wa.gov)

Revise as follows:

C405.2.2.3 Daylight zone control. Daylight zones shall be designed such that lights in the daylight zone are controlled independently of general area lighting and are controlled in accordance with either ~~Section C405.2.2.3.1~~ or Section C405.2.2.3.2. Each daylight control zone shall not exceed 2,500 square feet (232 m²). Contiguous daylight zones adjacent to vertical fenestration are allowed to be controlled by a single controlling device provided that they do not include zones facing more than two adjacent cardinal orientations (i.e., north, east, south, west). Daylight zones under skylights more than 15 feet (4572 mm) from the perimeter shall be controlled separately from daylight zones adjacent to vertical fenestration. The controls shall:

1. Control only luminaires within the daylit area.
2. Incorporate time-delay circuits to prevent cycling of light level changes of less than three minutes.

Exception: Daylight zones enclosed by walls or ceiling height partitions and containing two or fewer light fixtures are not required to have a separate switch for general area lighting.

~~**C405.2.2.3.1 Manual daylighting controls.** Manual controls shall be installed in daylight zones unless automatic controls are installed in accordance with Section C405.2.2.3.2.~~

Reason: This proposal mandates the use of daylight controls in daylight zones.

Daylighting cannot save any energy unless the presence of daylight can automatically turn lights off, and the absence of light can turn them back on again. Time clocks, even when set to track daylight hours, cannot accommodate variables such as cloud cover or use of blinds, and thus are likely to be overridden.

The two additional requirements are added based on Washington State's experience with this requirement.

Cost Impact: The code change proposal will increase the cost of construction.

C405.2.2.3-EC-NOGLER.doc

CE296 – 13

C405.2.2.3, C405.2.2.3.1, C405.2.2.3.2

Proponent: Duane Jonlin, City of Seattle, representing City of Seattle, Department of Planning and Development (duane.jonlin@seattle.gov)

Revise as follows:

C405.2.2.3 Daylight zone control. Daylight zones shall be designed such that lights in the daylight zone are controlled independently of general area lighting and are controlled in accordance with ~~either Section C405.2.2.3.1 or Section C405.2.2.3.2.~~ Each daylight control zone shall not exceed 2,500 square feet (232 m²). Contiguous daylight zones adjacent to vertical fenestration are allowed to be controlled by a single controlling device provided that they do not include zones facing more than two adjacent cardinal orientations (i.e., north, east, south, west). Daylight zones under skylights more than 15 feet (4572 mm) from the perimeter shall be controlled separately from daylight zones adjacent to vertical fenestration. The daylight controls shall:

1. Control only luminaires within the daylit area.
2. Incorporate time-delay circuits to prevent cycling of light level changes of less than three minutes.

Exceptions:

- Daylight zones enclosed by walls or ceiling height partitions and containing two or fewer light fixtures are not required to have a separate switch for general area lighting.
- In restaurant and mercantile occupancies, light fixtures located less than 10 feet horizontally from vertical fenestration are not required to be controlled by daylight sensors where the fenestration adjoins a sidewalk or other outdoor pedestrian area.

~~**C405.2.2.3.1 Manual daylighting controls.** Manual controls shall be installed in daylight zones unless automatic controls are installed in accordance with Section C405.2.2.3.2.~~

~~**C405.2.2.3.2**~~ **C405.2.2.3.1 Automatic daylighting controls.** Set-point and other controls for calibrating the lighting control device shall be readily accessible.

Daylighting controls device shall be capable of automatically reducing the lighting power in response to available daylight by either one of the following methods:

- Continuous dimming using dimming ballasts and daylight-sensing automatic controls that are capable of reducing the power of general lighting in the daylit zone continuously to less than ~~35~~20 percent of rated power at maximum light output.
- Stepped dimming using multi-level switching and daylight-sensing controls that are capable of reducing lighting power automatically. The system shall provide a minimum of two control channels per zone and be installed in a manner such that at least one control step is between 50 percent and 70 percent of design lighting power and another control step is no greater than 35 percent of design power, and the system is capable of automatically turning the system off.

Reason: Daylighting doesn't save energy unless lights are turned down or off when daylight is strong enough. Reliance on staff or occupants to manually switch off the perimeter lights when the room is bright enough is not an effective strategy.

Exception #2: Retail and restaurant occupancies need passers-by to see that the business is open. If perimeter lights turn off during bright sun conditions, the interior can appear to be dark and unoccupied from the outside.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C405.2.2.3.2 Automatic daylighting controls for sidelighting. Automatic daylighting controls for sidelighting shall be capable of automatically reducing the lighting power in response to available daylight by either one of the following methods: ~~Set-point and other controls for calibrating the lighting control device shall be readily accessible.~~

~~Daylighting controls device shall be capable of automatically reducing the lighting power in response to available daylight by either one of the following methods:~~

- ~~1. Continuous dimming using dimming ballasts and daylight-sensing automatic controls that are capable of reducing the power of general lighting in the daylight zone continuously to less than 35 percent of rated power at maximum light output.~~
- ~~2. Stepped dimming using multi-level switching and daylight-sensing controls that are capable of reducing lighting power automatically. The system shall provide a minimum of two control channels per zone and be installed in a manner such that at least one control step is between 50 percent and 70 percent of design lighting power and another control step is no greater than 35 percent of design power.~~
1. In any space where the combined input power of all general lighting completely or partially within the *primary sidelighted areas* is 150W or greater, the general lighting in the *primary sidelighted areas* shall be controlled by photocontrols.
2. In any space where the combined input power of all general lighting completely or partially within the *primary* and *secondary sidelighted areas* is 300W or greater the general lighting in the *primary sidelighted areas* and *secondary sidelighted areas* shall be controlled by photocontrols.

Exceptions:

1. *Primary sidelighted areas* where the top of the existing adjacent structures are twice as high above the windows as their distance away from the windows
2. Sidelighted areas where the total glazing area is less than 20 square feet
3. Retail spaces
3. The control system shall have the following characteristics:
 1. The calibration adjustments shall be readily accessible;
 2. At a minimum, general lighting in the *secondary sidelighted area* shall be controlled independently of the general lighting in the *primary sidelighted area*;
 3. The photocontrol shall reduce electric lighting in response to available daylight using continuous dimming or with at least one control point between 50 percent and 70 percent of design lighting power, a second control point between 20 percent and 40 percent of design lighting power, and a third control point that turns off all the controlled lighting.

C405.2.2.3.3 Automatic Daylighting Controls for Toplighting. In any space where the combined input power for all general lighting completely or partially within *daylight areas under skylights* and *daylight areas under roof monitors* is 150W or greater, general lighting in the daylight area shall be controlled by photocontrols having the following characteristics:

1. The calibration adjustments shall be readily accessible;

2. The photocontrol shall reduce electric lighting in response to available daylight using continuous dimming or with at least one control point that is between 50 percent and 70 percent of design lighting power, a second control point between 20 percent and 40 percent of design lighting power, and a third control point that turns off all the controlled lighting; and
3. General lighting in overlapping toplighted and sidelighted daylight areas shall be controlled together with general lighting in the *daylight area under skylights* or *daylight areas under roof monitors*.

Exceptions:

1. *Daylight areas under skylights* where it is documented that existing adjacent structures or natural objects block direct beam sunlight for more than 1500 daytime hours per year between 8 a.m. and 4 p.m.
2. Daylight areas where the skylight visible transmittance (VT) is less than 0.4.
3. Spaces within buildings in climate zone 8 where the input power of the general lighting within daylight areas is less than 200W.

Add new definitions as follows:

**SECTION C202
GENERAL DEFINITIONS**

DAYLIGHT AREA UNDER SKYLIGHTS. The *daylight area under skylights* is the combined daylight area under each skylight within a *space*. The daylight area under each skylight is bounded by the opening beneath the skylight, plus horizontally in each direction, the smaller of:

1. 70 percent of the ceiling height ($0.7 \times CH$), or
2. The distance to the front face of any opaque vertical obstruction where any part of the obstruction is farther away than 70 percent of the distance between the top of the obstruction and the ceiling ($0.7 \times [CH - OH]$), where CH = the height of the ceiling at the lowest edge of the skylight, and OH = the height to the top of the obstruction.

DAYLIGHT AREA UNDER ROOF MONITORS. The daylight area under roof monitors is the combined daylight area under each roof monitor within each space. The daylight area under each roof monitor is the product of

1. The width of the vertical fenestration above the ceiling level plus on each side, the smallest of the following:

- 1.1 2 feet;
- 1.2. The distance to any 60 in or higher vertical obstruction or;
- 1.3. The distance to the edge of any *primary sidelighted area*.

and

2. The smaller of the following horizontal distances inward from the bottom edge of the vertical fenestration:

- 2.1 The monitor sill height, MSH, (the vertical distance from the floor to the bottom edge of the monitor glazing), or
- 2.2 The distance to the front face of any opaque vertical obstruction where any part of the obstruction is farther away than the difference between the height of the obstruction and the monitor sill height (MSH-OH).

PRIMARY SIDELIGHTED AREA. The total primary sidelighted area is the combined primary sidelighted area within each space. Each primary sidelighted area is directly adjacent to vertical fenestration below the ceiling..

1. The primary sidelighted area width is the width of the vertical fenestration plus, on each side, the smaller of:

1.1 One half of the vertical fenestration head height (head height is the distance from the floor to the top of the glazing), or

1.2 The distance to any 5 feet or higher opaque vertical obstruction.

2. The primary sidelighted area depth is the horizontal distance perpendicular to the vertical fenestration which is the smaller of:

2.1. One vertical fenestration head height, or

2.2. The distance to any 5 feet or higher opaque vertical obstruction.

SECONDARY SIDELIGHTED AREA. The total secondary sidelighted area is the combined secondary sidelighted area within a space. Each secondary sidelighted area is directly adjacent to a *primary sidelighted area*.

1. The secondary sidelighted area width is the width of the vertical fenestration plus, on each side, the smaller of:

1.1 One half of the vertical fenestration head height, or

1.2 The distance to any 5 feet or higher opaque vertical obstruction.

2. The secondary sidelighted area depth is the horizontal distance perpendicular to the vertical fenestration which begins at the edge of the *primary sidelighted area* depth and ends at the smaller of:

2.1. One vertical fenestration head height, or

2.2. The distance to any 5 feet or higher opaque vertical obstruction.

Where the adjacent *primary sidelighted area* ends at a 5 feet or higher opaque vertical obstruction, there is no secondary sidelighted area beyond such obstruction.

Reason: This proposal adds daylighting control requirements that are consistent with the published requirements in addendum ay to ANSI/ASHRAE/IES Standard 90.1. Specifically, the revision changes the thresholds for applying daylighting controls to a wattage controlled basis that allows straightforward application and easy enforcement of the requirements. The requirement applies to more spaces in a building for additional energy savings, simplifies the delineation of daylight zones, and clarifies area calculations. These revisions are based on an extensive cost effectiveness analysis.

Cost Impact: The code change proposal will increase the cost of construction.

	Assembly:	ASF	AMF	DF

C405.2.2.3.2-EC-FERGUSON.doc

CE298 – 13

C405.2.2.3.2

Proponent: Tim Nogler, Washington State Building Code Council (tim.nogler@des.wa.gov)

Revise as follows:

C405.2.2.3.2 Automatic daylighting controls. Set-point and other controls for calibrating the lighting control device shall be readily accessible.

Daylighting controls device shall be capable of automatically reducing the lighting power in response to available daylight by either one of the following methods:

1. Continuous dimming using dimming ballasts and daylight-sensing automatic controls that are capable of reducing the power of general lighting in the daylit zone continuously to less than ~~35~~ 20 percent of rated power at maximum light output.
2. Stepped dimming using multi-level switching and daylight-sensing controls that are capable of reducing lighting power automatically. The system shall provide a minimum of two control channels per zone and be installed in a manner such that at least one control step is between 50 percent and 70 percent of design lighting power and another control step is no greater than 35 percent of design power, and the system is capable of automatically turning the system off.

Reason: Ballasts capable of dimming to less than 20% of rated power are now commonly available, and such ballasts provide a much more subtle shift from the lowest setting to completely off. There is no reason for fixtures to remain on, even at low power, when daylight is filling the room. Allowing a full-off setting will mean that many fixtures will not turn on at all during summer hours, saving both lighting energy and cooling energy.

Cost Impact: The code change proposal will not increase the cost of construction.

CE299 – 13

C405.2.3

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C405.2.3 Specific application controls. Specific application controls shall be provided for the following:

1. Display and accent light shall be controlled by a dedicated control which is independent of the controls for other lighting within the room or space
2. Lighting in cases used for display case purposes shall be controlled by a dedicated control which is independent of the controls for other lighting within the room or space.
3. Hotel and motel sleeping units and guest suites shall have a master control device at the main room entry that controls all permanently installed luminaires and switched receptacles that is capable of switching off all installed luminaires and switched receptacles within 20 minutes after all occupants leave the room.

Exception: Lighting and switched receptacles controlled by captive key systems.

4. Supplemental task lighting, including permanently installed under-shelf or under-cabinet lighting, shall have a control device integral to the luminaires or be controlled by a wall-mounted control device provided the control device is readily accessible.
5. Lighting for nonvisual applications, such as plant growth and food warming, shall be controlled by a dedicated control which is independent of the controls for other lighting within the room or space.
6. Lighting equipment that is for sale or for demonstrations in lighting education shall be controlled by a dedicated control which is independent of the controls for other lighting within the room or space.

Reason: For consistency with ASHRAE/IES 90.1. These revisions introduce automatic lighting control to guestroom type spaces for additional energy savings and allow captive key systems that provide similar savings control to also comply.

Cost Impact: The code change proposal will increase the cost of construction when lighting controls are required in parking garages.

CE299-13

C405.2.3-EC-MOLDOVEANU.doc

CE301 – 13

C405.2.3

Proponent: Tim Nogler, Washington State Building Code Council (tim.nogler@des.wa.gov)

Revise as follows:

C405.2.3 Specific application controls. Specific application controls shall be provided for the following:

1. Display and accent light shall be controlled by a dedicated control which is independent of the controls for other lighting within the room or space.
2. Lighting in cases used for display case purposes shall be controlled by a dedicated control which is independent of the controls for other lighting within the room or space.
3. Hotel and motel sleeping units and guest suites shall have a master control device at the main room entry that controls all permanently installed luminaires and switched receptacles.
4. Supplemental task lighting, including permanently installed under-shelf or under-cabinet lighting, shall have a control device integral to the luminaires or be controlled by a wall-mounted control device provided the control device is readily accessible.
5. Lighting for nonvisual applications, such as plant growth and food warming, shall be controlled by a dedicated control which is independent of the controls for other lighting within the room or space.
6. Lighting equipment that is for sale or for demonstrations in lighting education shall be controlled by a dedicated control which is independent of the controls for other lighting within the room or space.
7. Luminaires serving the *exit* access and providing the means of egress illumination required by Section 1006.1 of the *International Building Code*, including luminaires that function as both normal and emergency means of egress illumination, shall be controlled by a combination of listed emergency relays and occupancy sensors, or a signal from another building control system, that automatically turns off the lighting when the areas served by that illumination are unoccupied.

Exception. Means of egress illumination serving the *exit* access that does not exceed 0.05 watts per square foot of building area is exempt from this requirement.

Reason: This provision requires the egress lighting in the *exit* access (only) to be controlled either by occupancy sensors or the building automatic time clock system, so that those lights will turn off along with all of the other general area lighting when the floor is unoccupied. These lights will still turn on with emergency power when normal power is lost.

The egress lighting governed by this rule typically consists of fixtures that do double duty as normal and emergency lighting. An exception is provided to allow a small number of fixtures to remain on 24/7 where needed to prevent total blackout.

Cost Impact: The code change proposal will increase the cost of construction.

CE302 – 13

C405.2.3

Proponent: Duane Jonlin, City of Seattle, representing City of Seattle Department of Planning and Development (duane.jonlin@seattle.gov)

Revise as follows:

C405.2.3 Specific application controls. Specific application controls shall be provided for the following:

1. Display and accent light shall be controlled by a dedicated control which is independent of the controls for other lighting within the room or space.
2. Lighting in cases used for display case purposes shall be controlled by a dedicated control which is independent of the controls for other lighting within the room or space.
3. Hotel and motel sleeping units and guest suites shall have a master control device at the main room entry that controls all permanently installed luminaires and switched receptacles.
4. Supplemental task lighting, including permanently installed under-shelf or under-cabinet lighting, shall have a control device integral to the luminaires or be controlled by a wall-mounted control device provided the control device is readily accessible.
5. Lighting for nonvisual applications, such as plant growth and food warming, shall be controlled by a dedicated control which is independent of the controls for other lighting within the room or space.
6. Lighting equipment that is for sale or for demonstrations in lighting education shall be controlled by a dedicated control which is independent of the controls for other lighting within the room or space.
7. Each stairway shall have one or more control devices to automatically reduce lighting power by not less than 50 percent when no occupants have been detected in the stairway for a period not exceeding 30 minutes, and restore lighting to full power when occupants enter the stairway. All portions of stairways shall remain illuminated to at least 1 footcandle (11 lux) at the walking surface when the lighting power is reduced.
8. Lighting in parking garages shall have one or more control devices to automatically reduce lighting power in any one controlled zone by not less than 50 percent when no occupants have been detected in that zone for a period not exceeding 30 minutes, and restore lighting to full power when occupants enter or approach the zone. Each lighting zone controlled by occupancy sensors shall be no larger than 7,200 square feet. Pedestrian occupancy sensors controlling any lighting zone are permitted to be configured to detect pedestrians no more than 30 feet outside of that zone. Vehicle occupancy sensors controlling any lighting zone are permitted to be configured to detect vehicles no more than 60 feet outside of that zone.

Reason: This provision allows stairs enclosures and parking garages lighting energy use to be reduced by half when unoccupied, then come back to full brightness when occupants enter those spaces. It provides a balance between safety, security and energy use. These measures are currently in force in Seattle.

Cost Impact: The code change proposal will increase the cost of construction.

C405.2.3-EC-JONLIN.doc

CE303 – 13

C405.2.4

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Delete and substitute as follows:

~~**C405.2.4 Exterior lighting controls.** Lighting not designated for dusk-to-dawn operation shall be controlled by either a combination of a photosensor and a time switch, or an astronomical time switch. Lighting designated for dusk-to-dawn operation shall be controlled by an astronomical time switch or photosensor. All time switches shall be capable of retaining programming and the time setting during loss of power for a period of at least 10 hours.~~

C405.2.4 Exterior lighting controls. Exterior lighting shall be controlled by either an astronomical time switch or a photo sensor and a time switch. Time switches shall be capable of retaining programming and the time setting for at least 10 hours without power.

Exception: Lighting designed for dusk to dawn operation shall be permitted to have a photo sensor without a time switch.

Reason: This proposal simplifies the provisions covering exterior lighting controls in the code, to foster the ability to implement and verify compliance with the code.

Cost Impact: The code change proposal will not increase the cost of construction.

CE303-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.2.4 (NEW)-EC-WILLIAMS.doc

CE304 – 13

C405.2.4

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Delete and substitute as follows:

~~C405.2.4 Exterior lighting controls.~~ ~~Lighting not designated for dusk-to-dawn operation shall be controlled by either a combination of a photosensor and a time switch, or an astronomical time switch. Lighting designated for dusk-to-dawn operation shall be controlled by an astronomical time switch or photosensor. All time switches shall be capable of retaining programming and the time setting during loss of power for a period of at least 10 hours~~

C405.2.4 Exterior lighting controls. Lighting for exterior applications other than emergency lighting that is intended to be automatically off during building operation, lighting specifically required to meet health and life safety requirements or decorative gas lighting systems shall:

1. Be provided with a control that automatically turns off the lighting as a function of available daylight.
2. Where lighting the building façade or landscape the lighting shall have controls that automatically shut off the lighting as a function of dawn/dusk and a set opening and closing time.
3. Where not covered in Item 2 the lighting shall have controls configured to automatically reduce the connected lighting power by at least 30 percent from no later than 12 midnight to 6 a.m. or from one hour after business closing to one hour before business opening or during any period when no activity has been detected for a time of no longer than 15 minutes.

All time switches shall be able to retain programming and the time setting during loss of power for a period of at least ten hours.

Exception: Lighting for covered vehicle entrances or exits from buildings or parking structures where required for safety, security, or eye adaptation.

Reason: For consistency with ASHRAE/IES 90.1-2010. Section 9.4.1.7 of that document contains provisions for exterior lighting controls that differ from those in Section C405.2.4 of the IECC Commercial Provisions. As that standard is an alternative path to compliance with the IECC and there is a desire to maintain equivalency of the IECC with 90.1 this change is needed.

Cost Impact: The code change proposal will not increase the cost of construction.

CE304-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.2.4-EC-FERGUSON.doc

CE305 – 13

C405.2.5 (NEW)

Proponent: Tim Nogler, Washington State Building Code Council (tim.nogler@des.wa.gov)

Add new text as follows:

C405.2.5 Area controls. The maximum lighting power controlled from a single switch or automatic control shall not exceed that which is provided by a 20 ampere circuit loaded to not more than 80 percent. Where a master control is provided, individual switches shall retain the capability to function independently. Circuit breakers shall not be used as the sole means of switching.

Exception: Areas less than 5 percent of the floor area of a story for stories over 100,000 square feet in area need not comply with this section.

Reason: This code provision limits the area controlled by a single switch or a single occupancy sensor. At typical office lighting levels, the maximum area would be about 1,900 SF. A lone office worker in on a Saturday shouldn't have to turn on lights for the entire floor.

The exception allows factories and warehouses to be subdivided into larger lighting areas.

Cost Impact: The code change proposal will increase the cost of construction.

CE305-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.2.5 (NEW)-EC-NOGLER.doc

CE306 – 13

C405.2.5 (NEW)

Proponent: Eric Makela, Britt/Makela Group, Inc., representing Northwest Energy Codes Group
(eric@brittmakela.com)

Add new text as follows:

C405.2.5 Lighting in refrigerated display cases and walk-in coolers. Lighting in refrigerated display cases, and lights on glass doors installed on walk-in coolers and freezers shall be controlled by one of the following:

1. Automatic time switch controls to turn off lights during non-business hours.
2. Motion sensor controls on each case that reduce display case lighting power by not less than 50 percent within 30 minutes after the area near the case is vacated

Reason: The proposal reduces energy waste by reducing the power level of display lights in refrigerated display cases and glass doors in walk-in coolers during non-business hours and when the nearby area is not in use. Providing automatic controls ensures that lights not in use are automatically reduced in power by at least 50%. Reducing unnecessary lighting of refrigerated areas reduces energy used both for lighting and for the additional cooling load from added heat source. The language for the proposal is adapted from California Title 24-2013.

Cost Impact: The code change proposal will increase the cost of construction but will reduce the overall operating cost of the display case offsetting the first cost of the control.

CE306-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.2.5 (NEW)-EC-MAKELA.doc

CE307 – 13

C405.2.5 (New)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Add new text as follows:

C405.2.5 Lighting controls in parking garages. Parking garages shall comply with the provisions of Section C405.2.1 and C405.2.2. Lighting shall be provided with controls which are capable of automatically reducing the power supplied to each luminaire by not less than 30 percent after 30 minutes of inactivity in an area not greater than 36,000 square feet. Lighting for covered vehicle entrances to and exits from the garage shall be separately controlled and comply with of Section C405.2.4.

Luminaires within 20 feet of any perimeter wall that has a net opening to wall area ratio of at least 40 open and no exterior obstructions within 20 feet of the wall shall be provided with controls that will automatically adjust the lighting in response to available daylight.

Exceptions: Controls are not required for the following:

1. High-intensity discharge lamps not greater than 150 watts
2. induction lamps
3. Luminaires that illuminate daylight transitions zones without parking
4. Luminaires that illuminate ramps without parking.
5. Luminaires proximate to exterior walls.

Reason: For consistency with ASHRAE/IES 90.1-2010. Section 9.4.1.3 of that document contains provisions for lighting controls in parking garages and no such provisions exist in the IECC Commercial Provisions. As that standard is an alternative path to compliance with the IECC and there is a desire to maintain equivalency of the IECC with 90.1 this change is needed.

Cost Impact: The code change proposal will increase the cost of construction when lighting controls are required in parking garages.

CE307-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.2.5 (NEW)-EC-FERGUSON.doc

CE308 – 13

C405.3

Proponent: Glenn Heinmiller, Lam Partners, representing International Association of Lighting Designers (glenn@lampartners.com)

Delete without substitution as follows:

~~C405.3 Tandem wiring (Mandatory).~~ ~~The following luminaires located within the same area shall be tandem wired:~~

- ~~1. Fluorescent luminaires equipped with one, three or odd-numbered lamp configurations, that are recess-mounted within 10 feet (3048 mm) center-to-center of each other.~~
- ~~2. Fluorescent luminaires equipped with one, three or any odd-numbered lamp configuration that are pendant or surface-mounted within 1 foot (305 mm) edge-to-edge of each other.~~

Exceptions:

- ~~1. Where electronic high-frequency ballasts are used.~~
- ~~2. Luminaires on emergency circuits.~~
- ~~3. Luminaires with no available pair in the same area.~~

Reason: Simplify the code by removing an obsolete provision. This provision refers to obsolete magnetic ballast technology and no longer serves any purpose. Electronic ballasts are now used for all fluorescent luminaires, and since luminaires with electronic ballasts are exempt, then this provision would never apply and is pointless. It was removed from the 2010 version of Standard 90.1 for these reasons.

Cost Impact: The code change proposal will not increase the cost of construction.

CE308-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.3-EC-HEINMILLER.doc

CE309 – 13

C405.5.1

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C405.5.1 Total connected interior lighting power. The total connected interior lighting power (~~watts~~) shall be ~~the sum of the watts of all interior lighting equipment as determined in accordance with Sections C405.5.1.1 through C405.5.1.4~~ determined in accordance with Equation 4-6.

$$TCLP = [SL + LV + LTPB + Other]$$

(Equation 4-6)

where:

TCLP = total connected lighting power (watts)

SL = labeled wattage of luminaires for screw in lamps

LV = wattage of the transformer supplying low-voltage lighting

LTPB = wattage of line-voltage lighting tracks and plug-in busways as the specified wattage of the luminaires but at least 30 W/lin. ft. (100 W/lin m), or the wattage limit of the system's circuit breaker, or the wattage limit of other permanent current limiting devices on the system

Other = the wattage of all other luminaires and lighting sources not covered above and associated with interior lighting verified by data supplied by the manufacturer or other approved sources.

Exceptions:

1. The connected power associated with the following lighting equipment is not included in calculating total connected lighting power.
 - 1.1. Professional sports arena playing field lighting.
 - 1.2. *Sleeping unit* lighting in hotels, motels, boarding houses or similar buildings.
 - 1.3. Emergency lighting automatically off during normal building operation.
 - 1.4. Lighting in spaces specifically designed for use by occupants with special lighting needs including the visually impaired visual impairment and other medical and age-related issues.
 - 1.5. Lighting in interior spaces that have been specifically designated as a registered interior historic landmark.
 - 1.6. Casino gaming areas.
2. Lighting equipment used for the following shall be exempt provided that it is in addition to general lighting and is controlled by an independent control device:
 - 2.1. Task lighting for medical and dental purposes.
 - 2.2. Display lighting for exhibits in galleries, museums and monuments.
3. Lighting for theatrical purposes, including performance, stage, film production and video production.
4. Lighting for photographic processes.
5. Lighting integral to equipment or instrumentation and is installed by the manufacturer.
6. Task lighting for plant growth or maintenance.
7. Advertising signage or directional signage.
8. In restaurant buildings and areas, lighting for food warming or integral to food preparation equipment.
9. Lighting equipment that is for sale.
10. Lighting demonstration equipment in lighting education facilities.
11. Lighting *approved* because of safety or emergency considerations, inclusive of exit lights.
12. Lighting integral to both open and glass-enclosed refrigerator and freezer cases.

13. Lighting in retail display windows, provided the display area is enclosed by ceiling-height partitions.
14. Furniture mounted supplemental task lighting that is controlled by automatic shutoff.

Reason: The provisions in Section C405.5.1 deal with the determination of a value for the actual connected interior lighting power in a building that is more appropriately addressed as an equation. This proposal simplifies the provisions associated with connected interior lighting power to present as an equation what is now text that guides how the connected lighting power is calculated. The objective of this proposal is to simplify the code to foster implementation and compliance verification.

Cost Impact: The code change proposal does not increase the cost of construction.

Proponent: Glenn Heinmiller, Lam Partners, representing International Association of Lighting Designers (glenn@lampartners.com)

Revise as follows:

C405.5.1 Total connected interior lighting power. The total connected interior lighting power (watts) shall be the sum of the watts of all interior lighting equipment as determined in accordance with Sections C405.5.1.1 through C405.5.1.4.

Exceptions:

1. The connected power associated with the following lighting equipment is not included in calculating total connected lighting power.
 - 1.1. Professional sports arena playing field lighting.
 - 1.2. Sleeping unit lighting in hotels, motels, boarding houses or similar buildings, provided that the lighting complies with Section R404.1.
 - 1.3. Emergency lighting automatically off during normal building operation.
 - 1.4. Lighting in spaces specifically designed for use by occupants with special lighting needs including the visually impaired visual impairment and other medical and age-related issues.
 - 1.5. Lighting in interior spaces that have been specifically designated as a registered interior historic landmark.
 - 1.6. Casino gaming areas.
 - 1.7. Mirror lighting in dressing rooms.

(Portions of text not shown remains unchanged)

C405.5.3 Additional interior lighting power. Where using the Space-by-Space Method, an increase in the interior lighting power allowance is permitted for specific lighting functions. Additional power shall be permitted only where the specified lighting is installed and automatically controlled, separately from the general lighting, to be turned off during nonbusiness hours. This additional power shall be used only for the specified luminaires and shall not be used for any other purpose. An increase in the interior lighting power allowance is permitted in the following cases:

1. For spaces in which lighting is specified to be installed in addition to the general lighting for the purpose of decorative appearance or for highlighting art or exhibits, provided that the additional lighting power shall not exceed 1.0 W/ft² of such spaces.

(Portions of Table not shown remain unchanged)

Reason: The purpose of this change is to adjust the lighting power density allowances to the best available values. "Best" means values and methodology for determining allowances that will lead to high energy-efficiency while still allowing high-quality lighting and sufficient light levels. We believe that the best source for these values are the models maintained by Pacific Northwest National Lab (PNNL) for the DOE in support of ASHRAE/IES Standard 90.1 development. Recently the models were updated to account for some changes in recommended light levels in the new Lighting Handbook, 10th Edition from the Illuminating Engineering Society (IES). Additionally several new space types were added and some space types renamed or removed for clarity. Also, the Building Area Method values were based on a larger data set with 56% additional representative buildings.

Additional explanation of proposed changes by section:

Exception 1.2 to C405.5.1, (Sleeping Unit exception to lighting power limits)

Sleeping Units should be subject to the same requirements as Dwelling Units and residential buildings covered by Chapter 4 [RE].

Add exception for Mirror Lighting in Dressing Rooms.

Because this exception is in Standard 90.1, we assume that the LPD for Dressing/Fitting Room space types was developed with mirror lighting excluded. Without this exception the LPD limit for Dressing Rooms would be too low.

Add "Additional Interior Lighting Power" section.

This provision is an integral part of the space-by-space method. IECC-2012 already includes the additional power for retail as a footnote to the LPD table. The proposal adds the special allowance for decorative lighting and lighting for art and exhibits. IECC-2012 is missing this allowance, which is why some of the LPD values in IECC-2012 for some space types are higher than 90.1-2010. This allowance is a "use it or lose it" addition that can only be used for certain types of lighting. This provision gives the designer more flexibility but should not result in significant increase or decrease in stringency. The proposed new space-by-space LPD values were developed with the understanding that this additional allowance is available to the designer. The LPDs would not be valid for many space types without this additional allowance.

Revise Building Area Method LPDs (Table C405.5.2(1))

As mentioned above, these proposed values are from current PNNL models. These values were published in the public review draft of Addendum "co" to ASHRAE/IES Standard 90.1.

Revise Space-by-space Method LPDs (Table C405.5.2(2))

As mentioned above, these proposed values and space types are from current PNNL models. These values were published in the public review draft of Addendum "bh" to ASHRAE/IES Standard 90.1. The formatting and the ordering of space types that is in the IECC-2012 table were changed as little as possible. In order to accommodate the new space types, and the renaming or removal of a few space types, some rearrangement was necessary.

Cost Impact: The code change proposal will not increase the cost of construction.

SPACE-BY-SPACE METHOD

COMMON SPACE-BY-SPACE TYPES	LPD (w/ft ²)
Atrium — First 40 feet in height	0.03 per ft. ht.
Atrium — Above 40 feet in height	0.02 per ft. ht.
Audience/seating area — permanent	
— For auditorium	0.9
— For performing arts theater	2.6
— For motion picture theater	1.2
— Classroom/lecture/training	1.30
— Conference/meeting/multipurpose	1.2
— Corridor/transition	0.7
Dining area	
— Bar/lounge/leisure dining	1.40
— Family dining area	1.40
Dressing/fitting room performing arts theater	1.1
Electrical/mechanical	1.10
Food preparation	1.20
Laboratory for classrooms	1.3
Laboratory for medical/industrial/research	1.8
Lobby	1.10
Lobby for performing arts theater	3.3
Lobby for motion picture theater	1.0
Locker room	0.80
Lounge recreation	0.8
Office — enclosed	1.1
Office — open plan	1.0
Restroom	1.0
Sales area	1.6 ^a

COMMON SPACE-BY-SPACE TYPES	LPD (w/ft²)
Stairway	0.70
Storage	0.8
Workshop	1.60
Courthouse/police station/penitentiary	
— Courtroom	1.90
— Confinement cells	1.1
— Judge chambers	1.30
— Penitentiary audience seating	0.5
— Penitentiary classroom	1.3
— Penitentiary dining	1.1
BUILDING SPECIFIC SPACE-BY-SPACE TYPES	
Automotive — service/repair	0.70
Bank/office — banking activity area	1.5
Dormitory living quarters	1.10
Gymnasium/fitness center	
— Fitness area	0.9
— Gymnasium audience/seating	0.40
— Playing area	1.40
Healthcare clinic/hospital	
— Corridors/transition	1.00
— Exam/treatment	1.70
— Emergency	2.70

—Court sports area—Class 1	3.0
—Ring sports area	2.7
Transportation	
—Air/train/bus baggage area	1.00
—Airport concourse	0.60
—Terminal—ticket counter	1.50
Warehouse	
—Fine material storage	1.40
—Medium/bulky material	0.60

For SI: 1 foot = 304.8 mm, 1 watt per square foot = 11 W/m².

- a. Where lighting equipment is specified to be installed to highlight specific merchandise in addition to lighting equipment specified for general lighting and is switched or dimmed on circuits different from the circuits for general lighting, the smaller of the actual wattage of the lighting equipment installed specifically for merchandise, or additional lighting power as determined below shall be added to the interior lighting power determined in accordance with this line item:

Calculate the additional lighting power as follows:

$$\text{Additional Interior Lighting Power Allowance} = 500 \text{ watts} + (\text{Retail Area 1} \times 0.6 \text{ W/ft}^2) + (\text{Retail Area 2} \times 0.6 \text{ W/ft}^2) + (\text{Retail Area 3} \times 1.4 \text{ W/ft}^2) + (\text{Retail Area 4} \times 2.5 \text{ W/ft}^2).$$

where:

Retail Area 1 ——— = The floor area for all products not listed in Retail Area 2, 3 or 4.

Retail Area 2 —=The floor area used for the sale of vehicles, sporting goods and small electronics.
 Retail Area 3 —=The floor area used for the sale of furniture, clothing, cosmetics and artwork.
 Retail Area 4 —=The floor area used for the sale of jewelry, crystal and china.

Exception: Other merchandise categories are permitted to be included in Retail Areas 2 through 4 above, provided that justification documenting the need for additional lighting power based on visual inspection, contrast, or other critical display is approved by the authority having jurisdiction.

Table C405.5.2(2) Lighting Power Density Allowances Using the Space-by-Space Method		
Common Space Types¹	LPD watts/sq.ft	RCR Threshold
Audience Seating Area		
... in an auditorium	0.63	6

Warehouse - Storage Area		
...for medium to bulky, palletized items	0.58	4
... for smaller, hand-carried items ⁵	0.95	6
5 - sometimes referred to as a 'Picking Area'.		

Reason: This proposal modifies the Space-by-space lighting power density (LPD) table:

1. LPDs have been adjusted to account for changes to recommended light levels as published in the new, 10th Edition of the IES Lighting Handbook. Some values have gone up while others have gone down. As an average, the changed LPDs dropped 6%.
2. Three new space types have been added in response to user requests: (i) Copy/Print Rooms, (ii) Loading Docks, Interior and (iii) Computer rooms.
3. Also in response to user requests, new space types for Assisted Living Facilities were added including corridor, dining area, lobby, restroom, chapel and recreation room. In all cases these modified LPDs are restricted to those spaces that are used primarily by the residents.
4. Some space types were renamed for consistency.
5. Some table footnotes were added to provide more specific direction.

Cost Impact: The code change proposal will increase the cost of construction.

CE311-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.5.2-EC-FERGUSON.doc

CE312 – 13

C405.5.1

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C405.5.1 Total connected interior lighting power. The total connected interior lighting power (watts) shall be the sum of the watts of all interior lighting equipment as determined in accordance with Sections C405.5.1.1 through C405.5.1.4

Exceptions:

1. The connected power associated with the following lighting equipment is not included in calculating total connected lighting power.
 - 1.1. Professional sports arena playing field lighting.
 - 1.2. Lighting in ~~sleeping units~~ ~~lighting in hotels, motels, boarding houses or similar buildings.~~
 - 1.3. Emergency lighting automatically off during normal building operation.
 - 1.4. Lighting in spaces specifically designed for use by occupants with special lighting needs including the visually impaired visual impairment and other medical and age-related issues.
 - 1.5. Lighting in interior spaces that have been specifically designated as a registered interior historic landmark.
 - 1.6. Casino gaming areas.
2. Lighting equipment used for the following shall be exempt provided that it is in addition to general lighting and is controlled by an independent control device:
 - 2.1. Task lighting for medical and dental purposes.
 - 2.2. Display lighting for exhibits in galleries, museums and monuments.
3. Lighting for theatrical purposes, including performance, stage, film production and video production.
4. Lighting for photographic processes.
5. Lighting integral to equipment or instrumentation and is installed by the manufacturer.
6. Task lighting for plant growth or maintenance.
7. Advertising signage or directional signage.
8. In restaurant buildings and areas, lighting for food warming or integral to food preparation equipment.
9. Lighting equipment that is for sale.
10. Lighting demonstration equipment in lighting education facilities.
11. Lighting *approved* because of safety or emergency considerations, inclusive of exit lights.
12. Lighting integral to both open and glass-enclosed refrigerator and freezer cases.
13. Lighting in retail display windows, provided the display area is enclosed by ceiling-height partitions.
14. Furniture mounted supplemental task lighting that is controlled by automatic shutoff.

Reason: This proposal simplifies the exception to the interior lighting power in sleeping units. The definition of sleeping unit is such that there is no further need to delineate the building type in which the sleeping unit is located. In fact, the delineation suggests there are others that are not "similar" to hotels, motels, and boarding houses where the exception would not apply (e.g., dormitories).

Cost Impact: The code change proposal does not increase the cost of construction.

CE312-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.5.1 #2-EC-WILLIAMS.doc

CE313 – 13

C405.5.1

Proponent: Vickie Lovell, InterCode Inc., representing the National Greenhouse Manufacturers Association (Vickie@intercodeinc.com)

Revise as follows:

C405.5.1 Total connected interior lighting power. The total connected interior lighting power (watts) shall be the sum of the watts of all interior lighting equipment as determined in accordance with Sections C405.5.1.1 through C405.5.1.4.

Exceptions:

1. The connected power associated with the following lighting equipment is not included in calculating total connected lighting power.
 - 1.1. Professional sports arena playing field lighting.
 - 1.2. *Sleeping unit* lighting in hotels, motels, boarding houses or similar buildings.
 - 1.3. Emergency lighting automatically off during normal building operation.
 - 1.4. Lighting in spaces specifically designed for use by occupants with special lighting needs including the visually impaired visual impairment and other medical and age-related issues.
 - 1.5. Lighting in interior spaces that have been specifically designated as a registered interior historic landmark.
 - 1.6. Casino gaming areas.
2. Lighting equipment used for the following shall be exempt provided that it is in addition to general lighting and is controlled by an independent control device:
 - 2.1. Task lighting for medical and dental purposes.
 - 2.2. Display lighting for exhibits in galleries, museums and monuments.
3. Lighting for theatrical purposes, including performance, stage, film production and video production.
4. Lighting for photographic processes.
5. Lighting integral to equipment or instrumentation and is installed by the manufacturer.
6. ~~Task~~ Lighting for plant growth or maintenance.
7. Advertising signage or directional signage.
8. In restaurant buildings and areas, lighting for food warming or integral to food preparation equipment.
9. Lighting equipment that is for sale.
10. Lighting demonstration equipment in lighting education facilities.
11. Lighting *approved* because of safety or emergency considerations, inclusive of exit lights.
12. Lighting integral to both open and glass-enclosed refrigerator and freezer cases.
13. Lighting in retail display windows, provided the display area is enclosed by ceiling-height partitions.
14. Furniture mounted supplemental task lighting that is controlled by automatic shutoff.

Reason: "Task" in Webster's Dictionary is defined as a "usually assigned piece of work often to be finished within a certain time", or "something hard or unpleasant that has to be done", neither of which can be applied to plant growth or maintenance. Webster's dictionary doesn't contain the phrase "task lighting" and there is no definition in the code. The application of this section of the code as written to any specific lighting in a greenhouse is completely subjective, and inconsistent.

"Lighting for plant growth or maintenance" is adequate to describe the type of lighting that is exempt from the lighting requirements of this code.

Cost Impact: The code change proposal will not increase the cost of construction.

CE313-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.5.1-EC-LOVELL.doc

CE314 – 13

C405.5.1

Proponent: Glenn Heinmiller, Lam Partners, representing International Association of Lighting Designers (glenn@lampartners.com)

Revise as follows:

C405.5.1 Total connected interior lighting power. The total connected interior lighting power (watts) shall be the sum of the watts of all interior lighting equipment as determined in accordance with Sections C405.5.1.1 through C405.5.1.4.

Exceptions:

- 11. Lighting *approved* because of safety or emergency considerations, ~~inclusive of exit lights.~~
- 15. Exit signs.

(Portions of text not shown remains unchanged)

Reason: This change provides clarification to the code.

"Exit lights" is not an industry standard term and it is not clear what it means. It was likely meant to indicate exit signs, which should be a separate exception. Exit signs are a separate exception in Standard 90.1.

Cost Impact: The code change proposal will not increase the cost of construction.

CE314-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.5.1 #2-EC-HEINMILLER.doc

CE315 – 13

C405.5.1.4

Proponent: Tim Nogler, Washington State Building Code Council (tim.nogler@des.wa.gov)

Revise as follows:

C405.5.1.4 Line-voltage lighting track and plug-in busway. The wattage for line-voltage lighting tracks and plug-in busways shall be:

1. The specified wattage of the luminaires included in the system with a minimum of ~~30~~ 50 W/lin ft. (~~98~~ 162 W/lin. m);
2. The wattage limit of the system's circuit breaker; or
3. The wattage limit of other permanent current limiting devices on the system.

Reason: A recent study has shown that track lighting is typically loaded with 50 Watts per lineal foot, much more than the 30 W/LF in the current code.

Cost Impact: The code change proposal will increase the cost of construction.

CE315-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.5.1.4-EC-NOGLER.doc

CE316 – 13

C405.5.2.1 (NEW), C405.5.2.2 (NEW), Table C405.5.2(2)

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

C405.5.2 Interior lighting power. The total interior lighting power allowance (watts) is determined according to Table C405.5.2(1) using the Building Area Method, or Table C405.5.2(2) using the Space-by-Space Method, for all areas of the building covered in this permit.

C405.5.2.1 Building area method. For the Building Area Method, the interior lighting power allowance is the floor area for each building area type listed in Table C405.5.2(1) times the value from Table C405.5.2(1) for that area. For the purposes of this method, an “area” shall be defined as all contiguous spaces that accommodate or are associated with a single building area type as listed in Table C405.5.2(1). Where this method is used to calculate the total interior lighting power for an entire building, each building area type shall be treated as a separate area.

C405.5.2.2 Space by space method. For the Space-by-Space Method, the interior lighting power allowance is determined by multiplying the floor area of each space times the value for the space type in Table C405.5.2(2) that most closely represents the proposed use of the space, and then summing the lighting power allowances for all spaces. Tradeoffs among spaces are permitted.

Exception: Additional lighting installed to highlight specific merchandise is permitted in accordance with the following:

1. The highlight lighting is switched or dimmed on circuits different from the circuits for general lighting.
2. The allowed lighting power shall be the smaller of the following:
 - 2.1. The actual wattage of the lighting equipment installed specifically for the merchandise;
or
 - 2.2. The additional lighting determined in accordance with Equation 4-7.

$$\text{ARSA} = 500 \text{ watts} + (\text{Retail Area 1} \times 0.6 \text{ W/ft}^2) + (\text{Retail Area 2} \times 0.6 \text{ W/ft}^2) + (\text{Retail Area 3} \times 1.4 \text{ W/ft}^2) + (\text{Retail Area 4} \times 2.5 \text{ W/ft}^2). \quad \text{(Equation 4-7)}$$

where:

ARSA = Additional interior retail sale lighting power allowance

Retail Area 1 = The floor area for all products not listed in Retail Area 2, 3 or 4.

Retail Area 2 = The floor area used for the sale of vehicles, sporting goods and small electronics.

Retail Area 3 = The floor area used for the sale of furniture, clothing, cosmetics and artwork.

Retail Area 4 = The floor area used for the sale of jewelry, crystal and china

Other merchandise categories are permitted to be included in Retail Areas 2 through 4 above, provided that justification documenting the need for additional lighting power based on visual inspection, contrast, or other critical display is *approved* by the code official.

3. The additional power determined in Item 2, shall be added to the interior lighting power determined for sales areas in Table C 405.5.2(2)

TABLE C405.5.2(2) INTERIOR LIGHTING POWER ALLOWANCES: SPACE-BY-SPACE METHOD

(Portions of Table not shown remain unchanged)

- a. Where lighting equipment is specified to be installed to highlight specific merchandise in addition to lighting equipment specified for general lighting and is switched or dimmed on circuits different from the circuits for general lighting, the smaller of the actual wattage of the lighting equipment installed specifically for merchandise, or additional lighting power as determined below shall be added to the interior lighting power determined in accordance with this line item.

Calculate the additional lighting power as follows:

Additional Interior Lighting Power Allowance = 500 watts + (Retail Area 1 × 0.6 W/ft²) + (Retail Area 2 × 0.6 W/ft²) + (Retail Area 3 × 1.4 W/ft²) + (Retail Area 4 × 2.5 W/ft²).

where:

Retail Area 1 = The floor area for all products not listed in Retail Area 2, 3 or 4.

Retail Area 2 = The floor area used for the sale of vehicles, sporting goods and small electronics.

Retail Area 3 = The floor area used for the sale of furniture, clothing, cosmetics and artwork.

Retail Area 4 = The floor area used for the sale of jewelry, crystal and china

Exception: Other merchandise categories are permitted to be included in Retail Areas 2 through 4 above, provided that justification documenting the need for additional lighting power based on visual inspection, contrast, or other critical display is approved by the authority having jurisdiction.

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

: The existing footnote a is an exception to the table. It is unusual in its format and distinctly different in its format from the typical format of International Codes. The footnote is a very important allowance for retail sales establishments. The footnote is also unusual in that it contains an equation as well as an exception to the equation.

The proposal does 3 things:

1. It moves the retail lighting exception from being a footnote at the end of a long table to a more prominent position in the text of the code directing the code users to the tables.
2. It reformats the provision into a series of items which more clearly specify the requirements and limits of the exception. It allows the equation to be numbered as all equations in the IECC are numbered.
3. It replaces the 'exception within the exception' to being a portion of the criteria – and properly identifies the code official as the person who will approve the additional display lighting.

Cost Impact: The code change proposal will not increase the cost of construction. The proposal is editorial in nature and will not affect the cost of construction.

CE316-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.5.2.1 (NEW)-EC-THOMPSON-SEHPCAC

CE317 – 13

C405.5.3 (New), Table C405.5.2(2)

Proponent: Glenn Heinmiller, Lam Partners, representing International Association of Lighting Designers (glenn@lampartners.com)

Revise as follows:

C405.5.3 Additional interior lighting power. Where using the Space-by-Space Method, an increase in the interior lighting power allowance is permitted for specific lighting functions. Additional power shall be permitted only where the specified lighting is installed and automatically controlled, separately from the general lighting, to be turned off during nonbusiness hours. This additional power shall be used only for the specified luminaires and shall not be used for any other purpose. An increase in the interior lighting power allowance is permitted in the following case:

1. For lighting equipment to be installed in sales areas specifically to highlight merchandise, the additional lighting power shall be determined in accordance with Equation 4-X

$$\text{Additional Interior Lighting Power Allowance} = 500 \text{ watts} + (\text{Retail Area 1} \times 0.6 \text{ W/ft}^2) + (\text{Retail Area 2} \times 0.6 \text{ W/ft}^2) + (\text{Retail Area 3} \times 1.4 \text{ W/ft}^2) + (\text{Retail Area 4} \times 2.5 \text{ W/ft}^2). \quad \text{Equation 4-x}$$

where:

Retail Area 1 = The floor area for all products not listed in Retail Area 2, 3 or 4.

Retail Area 2 = The floor area used for the sale of vehicles, sporting goods and small electronics.

Retail Area 3 = The floor area used for the sale of furniture, clothing, cosmetics and artwork.

Retail Area 4 = The floor area used for the sale of jewelry, crystal and china.

Exception: Other merchandise categories are permitted to be included in Retail Areas 2 through 4 above, provided that justification documenting the need for additional lighting power based on visual inspection, contrast, or other critical display is *approved* by the code official.

TABLE C405.5.2(2)
INTERIOR LIGHTING POWER ALLOWANCES:
SPACE-BY-SPACE METHOD

(Portions of table not shown remain unchanged)

- a. Where lighting equipment is specified to be installed to highlight specific merchandise in addition to lighting equipment specified for general lighting and is switched or dimmed on circuits different from the circuits for general lighting, the smaller of the actual wattage of the lighting equipment installed specifically for merchandise, or additional lighting power as determined below shall be added to the interior lighting power determined in accordance with this line item.

Calculate the additional lighting power as follows:

$$\text{Additional Interior Lighting Power Allowance} = 500 \text{ watts} + (\text{Retail Area 1} \times 0.6 \text{ W/ft}^2) + (\text{Retail Area 2} \times 0.6 \text{ W/ft}^2) + (\text{Retail Area 3} \times 1.4 \text{ W/ft}^2) + (\text{Retail Area 4} \times 2.5 \text{ W/ft}^2).$$

where:

Retail Area 1 = The floor area for all products not listed in Retail Area 2, 3 or 4.

Retail Area 2 = The floor area used for the sale of vehicles, sporting goods and small electronics.

Retail Area 3 = The floor area used for the sale of furniture, clothing, cosmetics and artwork.

Retail Area 4 = The floor area used for the sale of jewelry, crystal and china.

Exception: Other merchandise categories are permitted to be included in Retail Areas 2 through 4 above, provided that justification documenting the need for additional lighting power based on visual inspection, contrast, or other critical display is *approved* by the authority having jurisdiction.

Reason: Adds clarity to the code. The provision is too lengthy for a footnote. Formula has been properly listed. "Authority having jurisdiction" changed to "code official".

Cost Impact: The code change proposal will not increase the cost of construction.

C405.5.3 (NEW)-EC-HEINMILLER rev.doc

CE318 – 13

C405.6

Proponent: Tim Nogler, Washington State Building Code Council (tim.nogler@des.wa.gov)

Revise as follows:

C405.6 Exterior lighting (Mandatory). Where the power for exterior lighting is supplied through the energy service to the building, all exterior lighting, ~~other than low-voltage landscape lighting,~~ shall comply with Sections C405.6.1 and C405.6.2.

Exception: Where *approved* because of historical, safety, signage or emergency considerations.

Reason: There is no reason that low-voltage landscape lighting should be excluded from the total exterior lighting power allowance. In many applications, the contribution of multiple low-voltage fixtures is substantial.

Cost Impact: The code change proposal will not increase the cost of construction.

CE318-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.6-EC-NOGLER.doc

CE319 – 13

C405.6, C405.6.1, C405.6.2

Proponent: Glenn Heinmiller, Lam Partners, International Association of Lighting Designers
(glenn@lampartners.com)

Revise as follows:

C405.6 Exterior lighting (Mandatory). Where the power for exterior lighting is supplied through the energy service to the building, all exterior lighting, ~~other than low-voltage landscape lighting~~, shall comply with Sections ~~C405.6.1 and~~ C405.6.2.

Exception: Where *approved* because of historical, safety, signage or emergency considerations.

~~**C405.6.1 Exterior building grounds lighting.** All exterior building grounds luminaires that operate at greater than 100 watts shall contain lamps having a minimum efficacy of 60 lumens per watt unless the luminaire is controlled by a motion sensor or qualifies for one of the exceptions under Section C405.6.2.~~

C405.6.2 Exterior building lighting power. The total exterior lighting power allowance for all exterior building applications is the sum of the base site allowance plus the individual allowances for areas that are to be illuminated and are permitted in Table C405.6.2(2) for the applicable lighting zone. Tradeoffs are allowed only among exterior lighting applications listed in Table C405.6.2(2), Tradable Surfaces section. The lighting zone for the building exterior is determined from Table C405.6.2(1) unless otherwise specified by the local jurisdiction. ~~Exterior lighting for all applications (except those included in the exceptions to Section C405.6.2) shall comply with the requirements of Section C405.6.1.~~

Exception: Lighting used for the following exterior applications is exempt where equipped with a control device independent of the control of the nonexempt lighting:

1. Specialized signal, directional and marker lighting associated with transportation;
2. Advertising signage or directional signage;
3. Integral to equipment or instrumentation and is installed by its manufacturer;
4. Theatrical purposes, including performance, stage, film production and video production;
5. Athletic playing areas;
6. Temporary lighting;
7. Industrial production, material handling, transportation sites and associated storage areas;
8. Theme elements in theme/amusement parks; and
9. Used to highlight features of public monuments and registered historic landmark structures or buildings.

Reason: Simplify the code without reducing stringency.

C405.6 -The exemption of "low-voltage landscape lighting" makes no sense and adds unnecessary complexity. This exemption is not in Standard 90.1.

C405.6.1 This is an obsolete and redundant provision that should have been removed from IECC when the lighting power density method was introduced for exterior lighting. The provision adds no value to the code and increases complexity.

Cost Impact: The code change proposal will not increase the cost of construction.

CE319-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.6-EC-HEINMILLER.doc

CE320 – 13

Table C405.6.2(1)

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

TABLE C405.6.2(1)
EXTERIOR LIGHTING ZONES

LIGHTING ZONE	DESCRIPTION
1	Developed areas of national parks, state parks, forest land, and rural areas
2	Areas predominantly consisting of residential zoning, neighborhood business districts, light industrial with limited nighttime use and residential mixed use areas
3	All other areas <u>not classified as lighting zone 1, 2 or 4.</u>
4	High-activity commercial districts in major metropolitan areas as designated by the local land use planning authority

Reason: This proposal clarifies the exterior lighting zone requirements to indicate that Zone 3 includes all areas that are not classified as lighting Zone 1, 2, or 4. The new language clarifies the meaning of "other areas." The objective of this proposal is to clarify the code to foster implementation and compliance verification.

Cost Impact: The code change proposal will not increase the cost of construction.

CE320-13

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

C405.6.2(1)T-EC-WILLIAMS.doc

CE321 – 13

Table C405.6.2(2)

Proponent: Jack Bailey, One Lux Studio, representing International Association of Lighting Designers
(jbailey@oneluxstudio.com)

Revise as follows:

TABLE C405.6.2(2)
INDIVIDUAL LIGHTING POWER ALLOWANCES FOR BUILDING EXTERIORS

		LIGHTING ZONES			
		Zone 1	Zone 2	Zone 3	Zone 4
Base Site Allowance (Base allowance is usable in tradable or nontradable surfaces.)		500 W	600 W	750 W	1300 W
Tradable Surfaces (Lighting power densities for uncovered parking areas, building grounds, building entrances and exits, canopies and overhangs and outdoor sales areas are tradable.)	Uncovered Parking Areas				
	Parking areas and drives	0.04 W/ft ²	0.06 W/ft ²	0.10 W/ft ²	0.13 W/ft ²
	Building Grounds				
	Walkways less than 10 feet wide	0.7 W/linear foot	0.7 W/linear foot	0.8 W/linear foot	1.0 W/linear foot
	Walkways 10 feet wide or greater, plaza areas special feature areas	0.14 W/ft ²	0.14 W/ft ²	0.16 W/ft ²	0.2 W/ft ²
	Stairways	0.75 W/ft ²	1.0 W/ft ²	1.0 W/ft ²	1.0 W/ft ²
	Pedestrian tunnels	0.15 W/ft ²	0.15 W/ft ²	0.2 W/ft ²	0.3 W/ft ²
	Building Entrances and Exits				
	Main entries	20 W/linear foot of door width	20 W/linear foot of door width	30 W/linear foot of door width	30 W/linear foot of door width
	Other doors	20 W/linear foot of door width	20 W/linear foot of door width	20 W/linear foot of door width	20 W/linear foot of door width
	Entry canopies	0.25 W/ft ²	0.25 W/ft ²	0.4 W/ft ²	0.4 W/ft ²
	Sales Canopies				
	Free-standing and attached	0.6 W/ft ²	0.6 W/ft ²	0.8 W/ft ²	1.0 W/ft ²
	Outdoor Sales				
	Open areas (including vehicle sales lots)	0.25 W/ft ²	0.25 W/ft ²	0.5 W/ft ²	0.7 W/ft ²

	Street frontage for vehicle sales lots in addition to "open area" allowance	No allowance	10 W/linear foot	10 W/linear foot	30 W/linear foot
Nontradable Surfaces (Lighting power density calculations for the following applications can be used only for the specific application and cannot be traded between surfaces or with other exterior lighting. The following allowances are in addition to any allowance otherwise permitted in the "Tradable Surfaces" section of this table.)	Building facades	No allowance	0.1 W/ft ² for each illuminated wall or surface or 2.5 W/linear foot for each illuminated wall or surface length <u>0.075 W/ft² of gross above-grade wall area</u>	0.15 W/ft ² for each illuminated wall or surface or 3.75 W/linear foot for each illuminated wall or surface length <u>0.113 W/ft² of gross above-grade wall area</u>	0.2 W/ft ² for each illuminated wall or surface or 5.0 W/linear foot for each illuminated wall or surface length <u>0.15 W/ft² of gross above-grade wall area</u>
	Automated teller machines and night depositories	270 W per location plus 90 W per additional ATM per location	270 W per location plus 90 W per additional ATM per location	270 W per location plus 90 W per additional ATM per location	270 W per location plus 90 W per additional ATM per location
	Entrances and gatehouse inspection stations at guarded facilities	0.75 W/ft ² of covered and uncovered area	0.75 W/ft ² of covered and uncovered area	0.75 W/ft ² of covered and uncovered area	0.75 W/ft ² of covered and uncovered area
	Loading areas for law enforcement, fire, ambulance and other emergency service vehicles	0.5 W/ft ² of covered and uncovered area	0.5 W/ft ² of covered and uncovered area	0.5 W/ft ² of covered and uncovered area	0.5 W/ft ² of covered and uncovered area
	Drive-up windows/doors	400 W per drive-through	400 W per drive-through	400 W per drive-through	400 W per drive-through
	Parking near 24-hour retail entrances	800 W per main entry	800 W per main entry	800 W per main entry	800 W per main entry

For SI: 1 foot = 304.8 mm, 1 watt per square foot = W/0.0929 m².

Reason:

How do you calculate the area of illuminated wall or surface? This sounds straightforward, but in many cases it is not. Consider the following examples:

1. Low wattage uplights are installed at the bottom of a 20-story building. By the time the light gets to the third or fourth floor it is not perceptible. What is the illuminated wall area? The entire 20-story façade, since some infinitesimally small amount of light reaches the top? Or only that portion of the façade that receives perceptible light? Perceptible to whom - the code official or the designer?
2. Lighting is proposed for the TV antenna at the top of a high-rise building (antennas are common on very tall buildings like the Freedom Tower in New York City). The antenna is an open space frame. How do you calculate the surface area?
3. Lights are integrated into a building façade to light directly out away from the building (this is common on casinos). No building façade surface area is illuminated. What is the lighting power allowance? Does the code only allow illumination of building surfaces, but not direct-view lighting applications?

In all of these examples the code is unclear and unenforceable.

This proposal would substitute the term "gross above-grade wall area" instead of "illuminated wall or surface area". "Gross above-grade wall area" already has to be determined to show compliance with the fenestration provisions in C402.3 and is a much more readily understood term.

To avoid making the code less efficient, lower W/ft² values are proposed for Table C405.6.2. These values are 75% of current code values, which means that a building which has lighting on 75% of its' above-grade wall area will get the same allowance as

under current code. A building which has less than 75% of its' façade lighted will get a larger allowance than under current code, and a building which has more than 75% of its' façade lighted will get a smaller allowance than under current code.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.6.2(2)T-EC-BAILEY.doc

CE322 – 13

C405.7

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C405.7 Electrical energy consumption (mandatory). ~~In buildings having individual~~ Every dwelling units, ~~provisions shall be made to determine the electrical energy consumed by each tenant by separately metering individual dwelling units in Use Group R-2 buildings shall have a separate electrical meter.~~

Reason: This proposal simplifies the electrical metering requirements to indicate that the dwelling units in Use Group R-2 buildings must be separately metered. The intent is to apply to R-2 buildings and there is no need to indicate in the code the reason for the criterion; only what is required. This will simplify the code to foster implementation and compliance verification.

Cost Impact: The code change proposal does not increase the cost of construction.

CE322-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.7-EC-WILLIAMS.doc

CE323 – 13

C405.7, C405.7.1 (NEW), C405.7.2 (NEW)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C405.7 Electrical energy consumption (Mandatory). ~~In buildings having individual dwelling units, provisions shall be made to determine the electrical energy consumed by each tenant by separately metering individual dwelling units. Meters, metering devices or other provisions shall be installed capable of determining the electrical energy consumed by and within the building in accordance with this section.~~

C405.7.1 Multi-family residential buildings. In buildings having individual dwelling units, provisions shall be made to determine the electrical energy consumed within each dwelling unit by separately metering individual dwelling units.

C405.7.2 Buildings other than multi-family residential buildings. Metering devices capable of measuring electrical energy use shall be provided for the total electrical energy system, HVAC systems, interior lighting systems, exterior lighting systems and receptacle circuits in each building and, for other than shared systems, each separate tenancy within the building. The measurement devices shall have the capability to record electrical energy use at least every 15 minutes and report that use on at least an hourly, daily, monthly and annual basis and retain the recorded data at least 36 months.

Exceptions: Metering devices are not required for the following spaces and systems:

1. Buildings less than 10,000 square feet in net floor area.
2. Individual tenant spaces less than 5,000 square feet in net floor area.
3. Dwelling units
4. Residential buildings with less than 10,000 square feet of common area.
5. Critical and equipment branches covered in the Article 517 of NFPA 70

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, has been revised with respect to energy metering. The change ensures continued consistency between the IECC and standard 90.1-2010. It retains the current provisions in the IECC for multi-family residential buildings and then includes electrical metering provisions for other building types and occupancies.

Cost Impact: The code change proposal will increase the cost of construction when monitoring devices are required.

CE323-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.7-EC-FERGUSON.doc

CE324 – 13

C405.8 (NEW), C405.8.1 (NEW), Table C405.8.1 (NEW), Chapter 5

Proponent: Jim Edelson, New Buildings Institute (jedelson@comcast.net)

Add new text as follows:

C405.8 Energy distribution design and load type segregation (mandatory). Energy distribution systems within, on or adjacent to and serving a building shall be designed such that each circuit or panel supplies only one end-use category listed in Table 405.8.1. The end-use category served by each distribution system shall be clearly designated on the energy distribution system with the load served, and adequate space shall be provided for installation of energy measurement equipment or other data collection devices to measure their energy use. The energy distribution system shall be designed to facilitate the collection of data for each of the load types.

Exceptions:

1. Not more than 5 percent of the segregated load for each of the categories listed in Table 405.8.1 is permitted to be from a load not within that category.
2. Critical and Equipment Branches of Article 517 of NFPA 70 are not required to meet the requirements of this section.
3. Buildings where the load types in listed in Table 405.8.1 are measured separately through the installation of equipment in accordance with Section C405.8.1 are not required to meet the requirements of this section.
4. Individual tenant spaces having a floor area not greater than 2500 square feet and equipped with one or more source meters in accordance with Section C405.8.1 are not required to meet the requirements of this section.

**TABLE 405.8.1
ENERGY USE CATEGORIES**

<u>Load Category</u>	<u>Description of energy use</u>
<u>Total HVAC system</u>	<u>Heating, cooling and ventilation including, but not limited to fans, pumps, boilers, chillers and water heating. Energy used by 120 volt equipment, or 208/120 volt equipment that is located in a building where the main service is 480/277 volt power, is permitted to be excluded from Total HVAC system.</u>
<u>Interior lighting</u>	<u>Lighting systems located within the <i>building</i>.</u>
<u>Exterior lighting</u>	<u>Lighting systems located on the <i>building site</i> but not within the <i>building</i>.</u>
<u>Plug loads</u>	<u>Devices, appliances and equipment connected to convenience receptacle outlets</u>
<u>Process loads</u>	<u>Any single load not included in a HVAC, lighting, or plug load category that exceeds 5 percent of the peak connected load of the whole building including, but not limited to data centers, manufacturing equipment and commercial kitchens.</u>
<u>Building operations and other miscellaneous loads</u>	<u>The remaining loads not included elsewhere in this table including, but not limited to, vertical transportation systems, automatic doors, motorized shading systems, ornamental fountains, ornamental fireplaces, swimming pools, in-ground spas, and snow-melt systems.</u>

C405.8.1 Meters. Meters and other measurement devices shall be configured to automatically communicate energy data to a data acquisition system. Lighting, HVAC, or other building systems that can monitor their energy consumption are permitted instead of meters. The meters, measurement devices, or building systems that monitor their energy consumption shall have a tested accuracy of +/-5 percent.

Add new standard to Chapter 5 as follows:

NFPA

70-11 National Electrical Code

Reason: Measurement of the energy consumption of the different kinds of loads in a building is a powerful diagnostic and benchmarking tool. The diagnostic value of segregated loads is being demonstrated in a growing number of energy modeling and management tools.

Segregating loads at the circuit and panel level provides the significant advantage that it makes the load types capable of being easily and less expensively metered or measured in the future. Through segregating the loads in the building's energy distribution infrastructure, the primary load types of a building can be monitored with only a handful of measurement devices. Permanent measurement or metering devices can be added later, or temporary devices can be installed for a short period of diagnostics and/or benchmarking.

For example, a campus of buildings in Seattle had plans for two nearly identical buildings, one mostly constructed and the other in the design phase. There was a desire for more information about the plug loads in the buildings, so the decision was made to sub-meter just that load type. The first building's energy distribution infrastructure had been designed without load-type segregation in mind, so measuring just the plug loads would have required 104 sub-meters. Since the other building was still in the design phase, its energy infrastructure was designed so that the plug loads would be segregated from the other building loads resulting in the need for only 4 sub-meters. The change in design to the system resulted in a minimal cost impact, but the reduction in the number of meters required resulted in significant cost savings.

Cost Impact: The code change proposal will not increase the cost of construction.

CE324-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405.8 (NEW)-EC-EDELSON.doc

CE325 – 13

C405.8 (NEW)

Proponent: Andrei Moldoveanu, National Electrical Manufacturers Association (NEMA) (and_moldoveanu@nema.org), Jim Edelson, New Buildings Institute (NBI) (jedelson@comcast.net)

Add new text as follows:

C405.8 Energy monitoring (Mandatory). Buildings with a gross conditioned floor area over 25,000 square feet shall comply with Sections C405.8.1 through C405.8.5. Buildings shall be equipped to measure, monitor, record and report energy consumption data for each energy source and end use category.

Exception: Individual tenant spaces are not required to comply with this section provided the space has its own utility services and meters and provided it has less than 5000 square feet of conditioned floor area.

C405.8.1 Energy type metering. For each energy type listed in Table 405.8.1, meters, or other measurement devices, shall collect energy data for the whole building.

Exceptions:

1. Energy type metering is not required where end-use metering, as described in Section C405.8.3, for an energy type accounts for all usage of that energy type within a building, and the data acquisition system totals the energy delivered to the building or separately-metered portion of the building.
2. Solid fuels including but not limited to, coal, firewood or wood pellets that are delivered via mobile transportation do not require metering.

TABLE 405.8.1
ENERGY TYPE CATEGORIES

Type category	Description of energy type
Electrical Energy	Electrical energy supplied to the building or building site..
Gas and liquid fuel supply energy	Gas and liquid fuel supplied to the building or building site..
District Energy	This category shall include all net energy extracted from district steam systems, district chilled water loops, district hot water systems, or other energy sources serving multiple buildings, and supplied to the building or building site.
On-site renewable energy	This category shall include all energy generated from <i>on-site renewable energy</i> and supplied to the building or building site.

C405.8.2 End-use metering. Meters or other measurement devices shall be provided to collect energy use data for each end-use category listed in Table 405.8.2. These meters shall collect data for the whole building or for each separately metered portion of the building where permitted by the Exception to Section C405.8. Where multiple meters are used to measure any end-use category, the data acquisition system shall total all of the energy used by that category.

Exceptions:

1. HVAC and water heating equipment serving only an individual dwelling unit does not require end-use metering.
2. End-use metering is not required for fire pumps, stairwell pressurization fans or any system that operates only during testing or emergency.

- 3.. End use metering is not required for an individual tenant space having a floor area not greater than 2500 square feet where a dedicated source meter complying with Section C405.8.3 is provided.
4. Not more than 5 percent of the measured load for each of the categories listed in Table 405.8.2 is permitted to be from a load not within that category.

TABLE 405.8.2
ENERGY USE CATEGORIES

<u>Load Category</u>	<u>Description of energy use</u>
<u>Total HVAC system</u>	<u>Heating, cooling and ventilation including, but not limited to fans, pumps, boilers, chillers and water heating. Energy used by 120 volt equipment, or by 208/120 volt equipment that is located in a building where the main service is 480/277 volt power, is permitted to be excluded from Total HVAC system energy use.</u>
<u>Interior lighting</u>	<u>Lighting systems located within the <i>building</i>.</u>
<u>Exterior lighting</u>	<u>Lighting systems located on the <i>building site</i> but not within the <i>building</i>.</u>
<u>Plug loads</u>	<u>Devices, appliances and equipment connected to convenience receptacle outlets</u>
<u>Process loads</u>	<u>Any single load that is not included in a HVAC, lighting, or plug load category and that exceeds 5 percent of the peak connected load of the whole building including, but not limited to data centers, manufacturing equipment and commercial kitchens.</u>
<u>Building operations and other miscellaneous loads</u>	<u>The remaining loads not included elsewhere in this table including, but not limited to, vertical transportation systems, automatic doors, motorized shading systems, ornamental fountains, ornamental fireplaces, swimming pools, in-ground spas, and snow-melt systems.</u>

C405.8.3 Meters. Meters and other measurement devices required by Section C405.8 shall be configured to automatically communicate energy data to a data acquisition system. Lighting, HVAC, or other building systems that can monitor their energy consumption are permitted instead of meters. The meters, measurement devices, or building systems that monitor their energy consumption shall have a tested accuracy of +/-5 percent or better. All required metering systems and equipment shall provide at least hourly data that is fully integrated into a data acquisition and display system in accordance with Section C405.8.4 and Section C405.8.5.

C405.8.4 Data acquisition system. A data acquisition system shall have the capability to store the data from the required meters and other sensing devices for a minimum of 36 months. For each energy supply and end use category required by Sections C405.8.2 and C405.8.3, it shall provide real-time energy consumption data and logged data for any hour, day, month or year.

C405.8.5 Graphical energy report. For each building subject to Sections C405.8.1 and C405.8.2, a permanent and readily accessible reporting mechanism shall be provided in the building that is accessible by building operation and management personnel. The reporting mechanism shall be capable of graphically displaying the energy consumption for each end-use category specified in Section C405.8.2 by the hour, day, month and year for the previous 36 months.

Reason: This proposal saves energy by providing actionable and timely energy consumption data to building owners and operators. For large buildings, this data is further broken out by the major sub-systems (HVAC, lighting, process loads, and plug loads). Estimates in available literature of the energy savings to be expected from metering and monitoring systems vary from 2% to 15%. The effectiveness of each system depends on owners and facility managers observing and acting upon the data provided. Additionally, the 2013 versions of ASHRAE Std. 90.1 and California Title 24 will be requiring energy monitoring.

Cost Impact: The code change proposal will not increase the cost of construction.

CE325-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF
C405.8 (NEW)-EC-EDELSON-MOLDOVEANU.doc				

CE326 – 13

C405.8 (NEW)

Proponent: Wayne Stoppelmoor, Schneider Electric (wayne.stoppelmoor@schneider-electric.com)

Add new text as follows:

C405.8 Energy monitoring (Mandatory). Buildings with a gross conditioned floor area over 25,000 square feet shall comply with Section C405.8.1 through C405.8.5. Buildings shall be equipped to measure, monitor, record and report energy consumption data for each end-use category required by Section C405.8.2.

Exception: Individual tenant spaces are not required to comply with this section provided the space has its own utility services and meters and has less than 5,000 square feet of conditioned floor area.

C405.8.1 Electrical energy metering. For electrical energy, including all electrical energy supplied to the building and its associated site, including but limited to site lighting, parking, recreational facilities, and other areas that serve the building and its occupants, meters or other measurement devices shall be provided to collect energy consumption data for each end-use category required by Section C405.8.2.

C405.8.2 End-use metering categories. Meters or other measurement devices shall be provided to collect energy use data for each end-use category listed in Table 405.8.1. These meters shall have the capability to collect energy consumption data for the whole building or for each separately metered portion of the building. Where multiple meters are used to measure any end-use category, the data acquisition system shall total all of the energy used by that category. Not more than 5 percent of the measured load for each of the end-use categories listed in Table 405.8.1 is permitted to be from a load not within that category.

Exceptions:

1. HVAC and water heating equipment serving only an individual dwelling unit does not require end-use metering.
2. End-use metering is not required for fire pumps, stairwell pressurization fans or any system that operates only during testing or emergency.
3. End-use metering is not required for an individual tenant space having a floor area not greater than 2,500 square feet where a dedicated source meter complying with Section C405.8.3 is provided.

**TABLE 405.8.1
ENERGY USE CATEGORIES**

Load Category	Description of energy use
<u>Total HVAC system</u>	<u>Heating, cooling and ventilation including, but not limited to fans, pumps, boilers, chillers and water heating. Energy used by 120 volt equipment, or by 208/120 volt equipment that is located in a building where the main service is 480/277 volt power, is permitted to be excluded from Total HVAC system energy use.</u>
<u>Interior lighting</u>	<u>Lighting systems located within the building.</u>
<u>Exterior lighting</u>	<u>Lighting systems located on the building site but not within the building.</u>
<u>Plug loads</u>	<u>Devices, appliances and equipment connected to convenience receptacle outlets</u>
<u>Process loads</u>	<u>Any single load that is not included in a HVAC, lighting, or plug load category and that exceeds 5 percent of the peak connected load of the whole building including, but not limited to data centers, manufacturing equipment and commercial kitchens.</u>
<u>Building operations and other miscellaneous loads</u>	<u>The remaining loads not included elsewhere in this table including, but not limited to, vertical transportation systems, automatic doors, motorized shading systems, ornamental fountains, ornamental fireplaces, swimming pools, in-ground spas, and snow-melt systems.</u>

C405.8.3 Meters. Meters or other measurement devices required by this section shall be configured to automatically communicate energy consumption data to the data acquisition system required by Section C405.8.4. Source meters shall be allowed to be any digital-type meter. Lighting, HVAC, or other building systems that can monitor their energy consumption shall be permitted instead of meters. Current sensors shall be permitted, provided that they have a tested accuracy of +/-2 percent. Required metering systems and equipment shall have the capability to provide at least hourly data that is fully integrated into the data acquisition system and graphical energy report in accordance with Sections C405.8.4 and C405.8.5.

C405.8.4 Data acquisition system. A data acquisition system shall have the capability to store the data from the required meters and other sensing devices for a minimum of 36 months. The data acquisition system shall have the capability to store real-time energy consumption data and provide hourly, daily, monthly, and yearly logged data for each end-use category required by Section C405.8.2.

C405.8.5 Graphical energy report. A permanent and readily accessible reporting mechanism shall be provided in the building that is accessible by building operation and management personnel. The reporting mechanism shall have the capability to graphically provide the energy consumption for each end-use category required by Section C405.8.2 at least every hour, day, month and year for the previous 36 months.

Reason: This proposal saves energy by providing actionable and timely energy consumption data to building owners and operators. For large buildings, this data is further broken out by the major sub-systems (HVAC, lighting, process loads, and plug loads). Estimates in available literature of the energy savings to be expected from metering and monitoring systems vary from 2% to 15%. The effectiveness of each system depends on owners and facility managers observing and acting upon the data provided. Additionally, the 2013 version of ASHRAE Std. 90.1 and several state energy codes will be requiring energy monitoring.

Cost Impact: This requirement will cause a modest increase to the cost of construction. However, such increase in cost will be recovered in a short period of time due to the decreased energy consumed in the building.

C405.8 (NEW)-EC-STOPPELMOOR.doc

CE327 – 13

C405.8 (NEW)

Proponent: Andrei Moldoveanu, National Electrical Manufacturers Association (NEMA) (and_moldoveanu@nema.org), Jim Edelson, New Buildings Institute (NBI)

Revise as follows:

C405.8 Energy Monitoring (Mandatory). Buildings with a gross conditioned floor area over 25,000 ft² shall comply with Sections C405.8.1 through C405.8.6. Buildings shall be equipped to measure, monitor, record and report energy consumption data for each energy source and end use category.

Exception: Tenant spaces within buildings if the tenant space has its own utility services and utility meters and is less than 5,000 square feet gross conditioned floor area.

C405.8.1 Alternate metering methods. Where approved by the building official, energy use metering systems may differ from those required by this section, provided that they are permanently installed and that the source energy measurement, end use category energy measurement, data storage and report have similar accuracy to and are at least as effective in communicating actionable energy use information to the building management and users, as those required by this section.

C405.8.2 Energy type metering. For each energy type listed in sections C405.8.2.1 through C405.8.2.4, meters shall collect data for the whole building.

Exceptions:

1. Energy type metering is not required where end-use metering, as describe in section C405.8.3, for an energy type accounts for all usage of that energy type within a building, and the data acquisition system totals the energy delivered to the building or separately-metered portion of the building.
2. Solid fuels such as coal, firewood or wood pellets that are delivered via mobile transportation do not require metering.
3. Up to 5 percent of the measured load for each of the categories described in sections C405.8.3.1 through C405.8.3.3 shall be allowed to be from any other loads.

C405.8.2.1 Electrical energy. This category shall include all electrical energy supplied to the building.

C405.8.2.2 Gas and liquid fuel supply energy. This category shall include all natural gas, fuel oil, propane and other gas or liquid fuel energy supplied to the building.

C405.8.2.3 District energy. This category shall include all net energy extracted from district steam systems, district chilled water loops, district hot water systems, or other energy sources serving multiple buildings, and supplied to the building.

C405.8.2.4 Site-generated renewable energy. This category shall include all energy generated from on-site solar, wind, geothermal, tidal or other natural sources, and supplied to the building.

C405.8.3 End-use metering. Meters shall be provided to collect energy use data for each end-use category listed in sections C405.8.3.1 through C405.8.3.5. These meters shall collect data for the whole building or for each separately metered portion of the building where permitted by the Exception to Section C405.8. Multiple meters may be used for any end-use category, provided that the data acquisition system totals all of the energy used by that category.

Exceptions:

1. HVAC and water heating equipment serving only an individual dwelling unit does not require end-use metering.
2. Separate metering is not required for fire pumps, stairwell pressurization fans or other life safety systems that operate only during testing or emergency.
3. End use metering is not required for individual tenant spaces not exceeding 2,500 square feet in floor area when a dedicated source meter meeting the requirements of Section C405.8.4 is provided for the tenant space.

C405.8.3.1 HVAC system total energy use. This category shall include all energy used to heat, cool, and provide ventilation to the building including, but not limited to, fans, pumps, boiler energy, chiller energy and hot water.

Exceptions:

1. All 120 volt equipment.
2. 208/120 volt equipment in a building where the main service is 480/277 volt power.

C405.8.3.2 Interior lighting system total energy use. This category shall include all interior lighting.

C405.8.3.3 Exterior lighting system total energy use. This category shall include all exterior lighting that is powered through the energy service to the building.

C405.8.3.4 Plug loads. This category shall include all energy use by devices, appliances and equipment connected to convenience receptacle outlets.

C405.8.3.5 Process loads. Process or other loads not covered in C405.8.3.1 through C405.8.3.3 that exceed 5% of the total energy use of the whole building.

C405.8.4 Meters. Meters and other measurement devices required by Section C405.8 shall be configured to automatically communicate energy data to a data acquisition system. Source meters may be any digital-type meters. Current sensors or flow meters are allowed for end use metering, provided that they have a tested accuracy of +/-2 percent. All required metering systems and equipment shall provide at least hourly data that is fully integrated into the data acquisition and display system per the requirements of Section C405.8.

C405.8.5 Data acquisition system. A data acquisition system shall store the data from the required meters and other sensing devices for a minimum of 36 months. For each energy supply and end use category required by C405.8.2 and C405.8.3, it shall provide real-time energy consumption data and logged data for any hour, day, month or year.

C405.8.6 Graphical energy report. For each building subject to Section C405.8.2 and C405.8.3, a permanent and readily accessible reporting mechanism shall be provided in the building that is accessible by building operation and management personnel. The reporting mechanism shall be capable of graphically displaying the energy consumption for each end-use category specified in C405.8.3 by the hour, day, month and year for the previous 36 months.

Reason: This proposal saves energy by providing actionable and timely energy consumption data to building owners and operators. For large buildings, this data is further broken out by the major sub-systems (HVAC, lighting, process loads, and plug loads). Estimates in available literature of the energy savings to be expected from metering and monitoring systems vary from 2% to 15%. The effectiveness of each system depends on owners and facility managers observing and acting upon the data provided. Additionally, the 2013 version of ASHRAE Std. 90.1 and several state energy codes will be requiring energy monitoring.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

CE328 – 13

C405.8 (NEW), C405.8.1 (NEW), C405.8.2 (NEW)

Proponent: Jim Edelson, New Buildings Institute (jedelson@comcast.net), Eric Makela, Britt/Makela Group, Inc., representing Northwest Energy Codes Group (eric@brittmakela.com)

Add new text as follows:

C405.8 Requirements for solar-ready energy systems (Mandatory). In climates zones 1 through 6, infrastructure shall be provided within the building and space shall be allocated on the roof for future installation of on-site renewable energy systems. The infrastructure and allocated roof space shall be capable of accommodating an energy system with a minimum rating of 3.7 W/ft² or 13 Btu/h·ft² (40 W/m²) multiplied by the total roof area in square feet (m²) and shall comply with Section C405.8.2. Compliance with this section shall be documented as specified in Section C405.8.1.

Exceptions:

1. The portion of the total roof area shaded during the peak sun angle on the summer solstice by natural objects, permanent features of the building or by permanent features of adjacent buildings can be excluded from the total roof area for the purposes of this section.
2. Buildings incorporating an on-site renewable energy systems with a minimum rating of 3.7 W/ft² or 13 Btu/h·ft² (40 W/m²) multiplied by the total roof area in square feet (m²) do not have to meet the requirements of this section.
3. Buildings with four or more stories do not have to meet the requirements of this section.
4. Additions, alterations and repairs to existing buildings do not have to meet the requirements of this section.

C405.8.1 Documentation. Construction documents shall show allocated space and pathways for installation of on-site solar energy systems and associated infrastructure. Documents shall indicate a pathway for one of the following:

1. A pathway for routing of conduit from the roof or alternate reserved space to the main electrical service panel.
2. A pathway for routing of plumbing from the roof or alternate reserved space to the water-heating system.

C405.8.2 Building service for renewable systems. For solar electric the main electrical service panel shall have a minimum busbar rating sufficient to accommodate the power supply from the system and shall have a reserved space to allow for the installation of a double pole circuit breaker for a future solar electric installation. The reserved space shall be positioned at the opposite (load) end from the input feeder location or main circuit location and shall be permanently labeled with "For Solar Electric".

Reason: This proposal provides for the option of installing a future on-site renewable energy system. Design alternatives for renewable systems are generally most plentiful and at the lowest cost at the time of new construction. As the cost of solar energy systems continues to fall, a building's value can be enhanced by providing for the future installation of on-site renewable systems if they are not installed at the time of new construction.

The technical requirements in the proposal are based on values from Title 24 and ASHRAE 189.1 - 2008. The 3-story limitation in this proposal matches the broadest height exclusion in Title 24. The climate zone limits generally follow the annual insolation level of 4 kwh per square meter (source: NREL Flat Plate PV Solar Radiation map). The minimum equipment size ratings are based on ASHRAE 189.1.

The 2011 CASE study for the Title 24 solar-ready measure states: "The proposed code change does not require equipment installation nor does it have any incremental maintenance costs. The only costs associated with the measure are design costs. Initially designers will need to familiarize themselves with the solar-ready requirement, but over time design will become streamlined and the costs will be minimal.

Cost savings from retrofits will result when photovoltaic or solar water heating equipment is easily interconnected with the building electrical or plumbing systems. Installing PV or SWH systems on solar-ready buildings (as defined in the recommended code language) could reduce the installed cost of the system by as much as 10 percent."

Cost Impact: The code change proposal will not increase the cost of construction.

C405.8 (NEW)-EC-EDELSON-MAKELA.doc

CE329 – 13

C405.8 (NEW), Table C405.8 (NEW)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C405.8 Electrical transformers (Mandatory). Electric transformers shall meet the minimum efficiency requirements of Table C405.8 as tested and rated in accordance with the test procedure listed in DOE 10 CFR 431. The efficiency shall be verified through certification under an approved certification program or, where no certification program exists, the equipment efficiency ratings shall be supported by data furnished by the transformer manufacturer.

Exceptions: The following transformers are exempt:

1. Transformers that meet the Energy Policy Act of 2005 exclusions based on the DOE 10 CFR 431 definition of special purpose applications.
2. Transformers that meet the Energy Policy Act of 2005 exclusions that are not to be used in general purpose applications based on information provided in DOE 10 CFR 431
3. Transformers that meet the Energy Policy Act of 2005 exclusions with multiple voltage taps where the highest tap is at least 20 percent more than the lowest tap.
4. Drive transformers
5. Rectifier transformers
6. Auto-transformers
7. Uninterruptible power system transformers
8. Impedance transformers
9. Regulating transformers
10. Sealed and nonventilating transformers
11. Machine tool transformer
12. Welding transformer
13. Grounding transformer
15. Testing transformer

TABLE C405.8
Minimum Nominal Efficiency Levels for 10 CFR 431 Low Voltage Dry-Type Distribution Transformers

Single Phase Transformers		Three Phase Transformers	
kVA^a	Efficiency (%)^b	kVA^a	Efficiency (%)^b
15	97.7	15	97.0
25	98.0	30	97.5
37.5	98.2	45	97.7
50	98.3	75	98.0
75	98.5	112.5	98.2
100	98.6	150	98.3
167	98.7	225	98.5
250	98.8	300	98.6
333	98.9	500	98.7
		750	98.8
		1000	98.9

a. kiloVolt-Amp rating.

b. Nominal efficiencies shall be established in accordance with the DOE 10 CFR 431 test procedure for low voltage dry-type transformers.

Add new definitions as follows:

LOW VOLTAGE DRY-TYPE DISTRIBUTION TRANSFORMER: A transformer that is air-cooled, does not use oil as a coolant, has an input voltage less than or equal to 600 Volts, and is rated for operation at a frequency of 60 Hertz

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, has been revised with respect to electric low-voltage dry-type transformer efficiency provisions, an issue that is not currently addressed in the IECC Commercial Provisions. The change ensures continued consistency between the IECC and standard 90.1-2010/2013 and addresses an important component associated with improving building energy efficiency.

Cost Impact: The code change proposal will increase the cost of construction.

C405.8 (NEW)-EC-FERGUSON.doc

CE330 – 13

C202 (NEW), C405.8 (NEW)

Proponent: Duane Jonlin, City of Seattle representing City of Seattle Department of Planning and Development (duane.jonlin@seattle.gov)

Add new text as follows:

C405.8 Controlled receptacles. At least 50 percent of all 125 volt 15- and 20-ampere receptacles installed in private offices, open offices or classrooms, including those installed in modular partitions and modular office workstation systems, shall be controlled receptacle circuits. In rooms larger than 200 square feet, a controlled receptacle shall be located within 12 inches of each uncontrolled receptacle. Controlled receptacles shall be visibly differentiated from standard receptacles and shall be controlled by one of the following automatic control devices:

1. An occupant sensor that turns receptacle power off when no occupants have been detected for 30 minutes, or
2. 2. A time-of-day operated control device that turns receptacle power off at specific programmed times and can be programmed separately for each day of the week. An independent program schedule shall be provided for areas no larger than 25,000 square feet but not more than one floor. The device shall be capable of being overridden for periods of up to two hours by a timer accessible to occupants. Any individual override switch shall control the controlled receptacles for a maximum area of 5,000 square feet (465 m²). Override switches for controlled receptacles are permitted to control the lighting for the same area.

Exception: Receptacles designated for specific equipment requiring 24-hour operation, for building maintenance functions or for safety or security equipment are not required to be controlled by an automatic control device and are not required to be located adjacent to a controlled receptacle.

Add new definitions as follows:

SECTION C202 GENERAL DEFINITIONS

AUTOMATIC CONTROL DEVICE. A device capable of automatically turning loads off and on without manual intervention.

CONTROLLED RECEPTACLE. An electrical receptacle that is controlled by an automatic control device.

Reason: Office equipment represents approximately 20 % of commercial building electrical use, and the trend is for this use to increase over time. This proposal would make two sets of receptacles available to occupants, so that continuous power is available for equipment that requires it, while other elements such as monitors, desk lamps and copy machines can be automatically shut down during night and weekend hours. Studies done for the California Energy Commission demonstrate that the potential energy savings from such control systems are substantial, with simple paybacks between 3 and 8 years for large offices.

Cost Impact: The code change proposal will increase the cost of construction.

^a Average full load efficiencies shall be established in accordance with 10 CFR 431.

Add new definitions as follows:

GENERAL PURPOSE ELECTRIC MOTOR (SUBTYPE I): A motor which is designed in standard ratings with either:

1. Standard operating characteristics and standard mechanical construction for use under usual service conditions, such as those specified in NEMA MG1, paragraph 14.02, "Usual Service Conditions," and without restriction to a particular application or type of application; or
2. Standard operating characteristics or standard mechanical construction for use under unusual service conditions, such as those specified in NEMA MG1, paragraph 14.03, "Unusual Service Conditions," or for a particular type of application, and which can be used in most general purpose applications.

General purpose electric motors (subtype I) are constructed in NEMA T-frame sizes, or IEC metric equivalent, starting at 143T.

GENERAL PURPOSE ELECTRIC MOTOR (SUBTYPE II). A motor incorporating the design elements of a general purpose electric motor (subtype I) that is configured as one of the following:

1. A U-frame motor
2. A Design C motor
3. A close-coupled pump motor
4. A footless motor
5. A vertical, solid-shaft, normal-thrust motor (as tested in a horizontal configuration)
6. An 8-pole motor (900 rpm)
7. A polyphase motor with voltage of not more than 600 volts (other than 230 or 460 volts)

SMALL ELECTRIC MOTOR. A general purpose, alternating current, single speed induction motor.

Add new standard to Chapter 5 as follows:

DOE

10 CFR 431 Subpart B, App B, Uniform Test Method for Measuring Nominal Full Load Efficiency of Electric Motors.

NEMA National Electrical Manufacturers Association
 1300 North 17th Street, Suite 1752
 Rosslyn, VA 22209

MG1-2011 Motors and Generators.

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, has been revised with respect to electric motor efficiency provisions, an issue not currently addressed in the IECC Commercial Provisions. The change ensures continued consistency between the IECC and standard 90.1-2010 and addresses an important component associated with improving building energy efficiency.

Cost Impact: The code change proposal will increase the cost of construction.

CE331-13

Public Hearing:	Committee:	AS	AM	D

C405.8-EC-FERGUSON.doc

CE332 – 13

C405.8 (NEW), C405.8.1 (NEW)

Proponent: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development (WABO TCD)

Add new text as follows:

C405.8 Variable speed escalators and moving walks. Escalators and moving walks shall be capable of reducing their operating speed to no more than 15 feet per minute when no passengers have been detected for a period of time not exceeding three times the amount of time required to transfer a passenger between landings.

Exception: A power factor controller that reduces operating voltage in response to light loading conditions is permitted to be provided in place of the variable speed function.

C405.8.1 Regenerative drive. An escalator designed either for one-way down operation only or for reversible operation shall have a variable frequency regenerative drive that supplies electrical energy to the building electrical system when the escalator is loaded with passengers whose combined weight exceeds 750 pounds.

Reason: This proposal will result in reduced energy use and longer equipment life due to reduced wear and tear during the hours on standby mode or light loading conditions. These escalator controls have been standard in Canada, Europe and most of Asia for many years. The 2010 ANSI/ASME A17.1 safety standard for elevators and escalators now allows use of escalators and moving walks with “sleep mode” for reducing speed during unoccupied periods and provides for their safe operation. Sensors detect approaching passengers and bring the escalator or walk up to full speed before the passenger steps on. The 750-pound threshold for activation of the regenerative drive is derived from the 5-passenger threshold mentioned in manufacturers’ literature (5 passengers x 150# = 750).

Energy savings:

The energy consumed by a typical pair of escalators is approximately 24,000 – 36,000 kWh per year, and the predicted energy savings ranges between 25% and 60%. The higher figure applies to escalators that have bursts of usage at wide intervals, as occurs with performing arts or transportation facilities. The lower figure would apply where usage is scattered throughout the day, as in shopping malls or office buildings. Annual savings per pair of escalators would equate to an energy cost savings of \$600 - \$2,140. The installed cost of escalators would typically increase by 1% - 4%, although one major manufacturer now includes these capabilities as standard for all escalators.

Cost Impact: The code change proposal will increase the cost of construction.

	Assembly:	ASF	AMF	DF

C405.8-EC-KRANZ.doc

CE333 – 13

C405 (NEW), C405.1 (NEW), C405.2 (NEW), Chapter 5

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Add new text as follows:

C405 Vertical and horizontal transportation systems and equipment. Vertical and horizontal transportation systems and equipment shall comply with this section.

C405.1 Elevator cabs. For the luminaires in each elevator cab, not including signals and displays, the sum of the lumens divided by the sum of the watts shall be no less than 35 lumens per watt. Ventilation fans in elevators that do not have their own air conditioning system shall not consume more than 0.33 watts/cfm at the maximum rated speed of the fan. Controls shall be provided that will de-energize ventilation fans and lighting systems when the elevator is stopped, unoccupied and with its doors closed for over 15 minutes.

C405.2 Escalators and moving walks. Escalators and moving walks shall comply with ASME A17.1/CSA B44 and shall have automatic controls configured to reduce speed to the minimum permitted speed in accordance with ASME A17.1/CSA B44 or applicable local code when not conveying passengers.

Add new standard to Chapter 5 as follows:

ASME

ASME/A17.1/CSA B44-2010 Safety Code for Elevators and Escalators

Reason: Energy is used in lighting and ventilating elevators when in operation and when not in operation. ASHRAE/IES Standard 90.1-2010, which is adopted by reference in the IECC Commercial Provisions, contains provisions to reduce the amount of energy used by elevators. This change ensures consistency between the IECC Commercial Provisions and standard 90.1 and owners/developers who choose to comply with standard 90.1 via the IECC are afforded this opportunity to save energy and reduce their operating costs.

Cost Impact: The code change proposal will increase the cost of construction if controls for ventilation on fans and systems are required.

	Assembly:	ASF	AMF	DF

C405 (NEW) #1-EC-FERGUSON.doc

CE334 – 13

C405 (NEW), Chapter 5

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Add new text as follows:

C405 Escalators and moving walks. Escalators and moving walks shall comply with ASME A17.1/CSA B44 and shall have the capability to automatically reduce to the minimum permitted speed in ASME A17.1/CSA B44 when not conveying passengers.

Add new standard to Chapter 5 as follows:

ASME

ASME/A17.1/CSA B44-2010 Safety Code for Elevators and Escalators

Reason: ASHRAE/IES Standard 90.1-2010, which is adopted by reference as an alternative to the IECC Commercial Provisions, has been revised to address energy efficiency opportunities available through automatic reduction in rate of travel when not being used. The change ensures continued consistency between the IECC and standard 90.1-2010 and through reference to ASME A17.1/CSA B44, which is adopted by reference in the IBC, ensures consistency within the ICC International Codes.

Cost Impact: The code change proposal will increase the cost of construction.

CE334-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C405 (NEW) #2-EC-FERGUSON.doc

CE335 – 13

C406.1, C406.2, C406.3, C406.3.1

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C406.1 Requirements. Buildings shall comply with at least one of the following:

1. ~~More efficient HVAC equipment performance~~ in accordance with Section C406.2.
2. ~~Reduced efficient lighting power density system~~ in accordance with Section C406.3.
3. On-site supply of renewable energy in accordance with Section C406.4.

C406.2 ~~More efficient HVAC performance equipment~~. Equipment shall meet the minimum efficiency requirements of Tables C406.2.(1) through C406.2(7) in addition to the requirements in Section C403. This section shall only be used where the equipment efficiencies in Tables C406.2(1) through C406.2(7) are greater than the equipment efficiencies listed in Table C403.2.3(1) through 403.2.3(7) for the equipment type.

C406.3 ~~Efficient lighting system~~ Reduced lighting power density. ~~Whole building lighting power density (Watts/sf) shall comply with the requirements of Section C406.3.1.~~

C406.3.1 ~~Reduced lighting power density~~. The total interior lighting power (watts) of the building shall ~~be determined not exceed by using the reduced whole building interior lighting power in the sum of the results from multiplying the appropriate values in Table C406.3 times by the floor area for the each building area types. For the purposes of this option the determination of areas and their application to each building type shall be in accordance with Section C405.5.2.~~

Reason: This proposal simplifies and clarifies the provisions associated with additional energy efficiency options packages. The objective of this proposal is to clarify and simplify the code to foster implementation and compliance verification. The intent of the HVAC package option is to install more efficient HVAC equipment than provided for in the minimum code. The intent of the lighting package option is to reduce the allowable LPD in Table C405.5.2(1) by a set amount. The proposed revisions convey more clearly what is intended. There are provisions in Section C405.5.2 affecting the calculation that still apply and should be referenced to ensure the code is consistent between the base code and this package option with respect to how the floor area for each building or building type is determined and applied.

Cost Impact: The code change proposal will not increase the cost of construction.

CE335-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C406.1-EC-WILLIAMS.doc

CE336 – 13

C406.1.1 (NEW)

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

SECTION C406

ADDITIONAL EFFICIENCY PACKAGE OPTIONS

C406.1 Requirements. Buildings shall comply with at least one of the following:

1. Efficient HVAC Performance in accordance with Section C406.2.
2. Efficient Lighting System in accordance with Section C406.3.
3. On-Site Supply of Renewable Energy in accordance with Section C406.4.

C406.1.1. Tenant spaces. Except where an entire building is in compliance with Section C406.4, individual tenant spaces shall comply with either Section C406.2 or Section C406.3. ~~unless documentation can be provided that demonstrates compliance with Section C406.4 for the entire building~~

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The proposal is a reformat of the second paragraph to clarify how it should be applied. The phrasing 'unless documentation can be provided that demonstrates compliance' is unnecessary language within an International Code. Such phrases are redundant with the purposes and intent of Chapter C1 – Administration. All code compliance is documented by submitted plans and inspections. The intent of this section is to allow tenant spaces to be evaluated or approved on a space by space basis unless the building has already found to comply.

Cost Impact: The code change proposal will not increase the cost of construction. The proposal is editorial in nature and will not affect the cost of construction.

Proponent: Eric Makela, Britt/Makela Group, Inc., representing Northwest Energy Codes Group (eric@brittmakela.com), Jim Edelson, New Buildings Institute

Revise as follows:

C406.1 Requirements. Buildings shall comply with at least one of the following:

1. More efficient HVAC equipment performance in accordance with Section C406.2.
2. Reduced efficient lighting power density system in accordance with Section C406.3.
3. Enhanced lighting controls in accordance with Section C406.4
4. On-site supply of renewable energy in accordance with Section C406.5.
5. Provision of a dedicated outdoor air system for certain HVAC equipment in accordance with Section C406.6.
6. High efficiency service water heating in accordance with Section C406.8.

C406.2. More efficient HVAC equipment performance. Equipment shall exceed the minimum efficiency requirements listed in Tables C403.2.3(1) through 403.2.3(7) by 10 percent in addition to the requirements of Section C403. Where multiple performance requirements are provided, the equipment shall exceed all requirements by 10 percent. *Variable refrigerant flow systems* shall exceed the energy efficiency provisions of ANSI/ASHRAE/IES 90.1 by 10 percent. Equipment not listed in Tables C403.2.3(1) through 403.2.3(7) shall be limited to 10 percent of the total building system capacity.

Warm air unit heaters, gas fired	All capacities	Maximum capacity	90% E_c	ANSI Z83.8
Warm air unit heaters, oil fired	All capacities	Maximum capacity	90% E_c	UL 731

For SI: 1 British thermal unit per hour = 0.2931 W.

E_t = Thermal efficiency. E_c = Combustion efficiency (100 percent less flue losses).

a. Efficient furnace fan: Fossil fuel furnaces in climate zones 3 to 8 shall have a furnace electricity ratio not greater than 2 percent and shall include a manufacturer's designation of the furnace electricity ratio.

b. Units shall also include an IID (intermittent ignition device), have jacket losses not exceeding 0.75 percent of the input rating, and have either power venting or a flue damper. A vent damper is an acceptable alternative to a flue damper for those furnaces where combustion air is drawn from the conditioned space.

c. Where there are two ratings for units not covered by NAECA (3-phase power or cooling capacity greater than or equal to 65,000 Btu/h [19 kW]), units shall be permitted to comply with either rating.

TABLE C406.2(5)

Water-cooled electrically operated, positive displacement	< 75 tons	kw/ton	0.780	0.630	0.800	0.600	AHRI 550/590 ^f
	≥ 75 tons and < 150 tons	kw/ton	0.775	0.615	0.790	0.586	
	≥ 150 tons and < 300 tons	kw/ton	0.680	0.580	0.718	0.540	
	≥ 300 tons	kw/ton	0.620	0.540	0.639	0.490	
Water-cooled electrically operated, centrifugal ^d	< 150 tons	kw/ton	0.634	0.596	0.639	0.450	AHRI 550/590 ^f
	≥ 150 tons and < 300 tons	kw/ton	0.634	0.596	0.639	0.450	
	≥ 300 tons and < 600 tons	kw/ton	0.576	0.549	0.600	0.400	
	≥ 600 tons	kw/ton	0.570	0.539	0.590	0.400	
Air-cooled absorption single effect ^e	All capacities	COP	0.600	NR	NA	NA	AHRI 560
Water-cooled absorption single effect ^e	All capacities	COP	0.700	NR	NA	NA	
Absorption double effect indirect-fired	All capacities	COP	1.000	1.050	NA	NA	
Absorption double effect direct-fired	All capacities	COP	1.000	1.000	NA	NA	

For SI: 1 Ton = 3516 W.

NA = Not applicable and cannot be used for compliance. NR = No minimum requirements.

a. Compliance with this standard can be obtained by meeting the minimum requirements of Path A or Path B. However both the full load and IPLV shall be met to fulfill the requirements of Path A and Path B.

b. Chapter 6 of the referenced standard contains a complete specification of the referenced test procedure, including the referenced year version of the test procedure.

c. Path B is intended for applications with significant operating time at part load. All Path B machines shall be equipped with demand limiting capable controls.

d. The chiller equipment requirements do not apply for chillers used in low-temperature applications where the design leaving fluid temperature is greater than 40°F.

e. Only allowed to be used in heat recovery applications.

f. Packages that are not designed for operation at ARI Standard 550/590 test conditions (and, thus, cannot be tested to meet the requirements of Table C-3) of 44°F leaving chilled-water temperature and 85°F entering condenser-water temperature with 3 gpm/ton condenser-water flow shall have maximum full-load kW/ton and NPLV ratings adjusted using the following equation:

— Adjusted maximum full load kW/ton rating = (full load kW/ton from Table C-3)/ K_{adj}

— Adjusted maximum NPLV rating = (IPLV from Table C-3)/ K_{adj}

—where:

$$K_{adj} = 6.174722 - 0.303668(X) + 0.00629466(X)^2 - 0.000045780(X)^3$$

$$X = DT_{std} + LIFT \text{ (°F)}$$

$$DT_{std} = [(24 + (\text{full load kW/ton from Table C-3}) \times 6.83)] / \text{flow (°F)}$$

$$\text{Flow} = \text{condenser water flow (gpm)} / \text{cooling full load capacity (tons)}$$

$$LIFT = CEWT - CLWT \text{ (°F)}$$

$$CEWT = \text{full load entering condenser water temperature (°F)}$$

$$CLWT = \text{full load leaving chilled water temperature (°F)}$$

—The adjusted full load and *NPLV* values are only applicable over the following full load design ranges:

—Minimum leaving chilled water temperature: 38°F

—Maximum condenser entering water temperature: 102°F

—Condenser water flow: 1 to 6 gpm/ton

$$X \geq 39^\circ\text{F and } \leq 60^\circ\text{F}$$

TABLE C406.2(7)
ABSORPTION CHILLERS—EFFICIENCY REQUIREMENTS

EQUIPMENT TYPE	MINIMUM EFFICIENCY FULL LOAD COP (IPLV)
Air cooled, single effect	0.60, allowed only in heat recovery applications
Water cooled, single effect	0.70, allowed only in heat recovery applications
Double effect—direct fired	1.0 (1.05)
Double effect—indirect fired	1.20

C406.3 Reduced lighting power density. The total interior lighting power (watts) of the building shall be determined by using 90 percent of the lighting power values in Table C405.5.2(1)~~the reduced whole building interior lighting power in Table C406.3 times the floor area of the building types or by using 90 percent of the interior lighting power allowance calculated by the Space by Space method in section C405.5.2.~~

C406.4 Enhanced digital lighting controls. Interior lighting in the building shall have the following enhanced lighting controls which shall be located, scheduled, and operated in accordance with Section C405.2.2.

1. Luminaires shall be capable of continuous dimming.
2. Luminaires shall be capable of being addressed individually. Where individual addressability is not available for the luminaire class type, a controlled group of no more than 4 luminaires shall be allowed.
3. No more than 8 luminaires shall be controlled together in a *daylight zone*.
4. Fixtures shall be controlled through a digital control system that includes the following function:
 - 1.1. Control reconfiguration based on digital addressability
 - 1.2. Load shedding
 - 1.3. Individual user control of overhead general illumination in open offices
 - 1.4. Occupancy sensors shall be capable of being reconfigured through the digital control system.
5. Construction documents shall include submittal of a Sequence of Operations, including a specification outlining each of the functions in Item 4 of Section C406.4.
6. Functional testing of lighting controls shall comply with Section 408.

~~C406.4~~ **C406.5 On-site renewable energy** Total minimum ratings of on-site renewable energy systems shall comply with one of the following:

1. Provide not less than 1.75 btu's, or not less than 0.50 watts, per square foot of conditioned floor area.

2. Provide not less than 3 percent of the energy used within the building for building mechanical and service water heating equipment and lighting regulated in Chapter 4;

C406.6 Dedicated outdoor air system. Buildings covered by Section C403.4 shall be equipped with an independent ventilation system designed to provide no less than the minimum 100 percent outdoor air to each individual occupied space as specified by the *International Mechanical Code*, to each individual occupied space. The ventilation system shall be capable of total energy recovery. The HVAC system shall include supply-air temperature controls that automatically reset the supply-air temperature in response to representative building loads, or to outdoor air temperatures. The controls shall reset the supply air temperature at least 25 percent of the difference between the design supply-air temperature and the design room air temperature.

C406.7 Reduced energy use in service water heating. Buildings shall be of the following types to use this compliance method:

1. Group R-1, Boarding houses, Hotels or motels;
2. Group I-2, Hospitals, mental hospitals, and nursing homes;
3. Group A-2, Restaurants and Banquet halls or buildings containing food preparation areas;
4. Group F, Laundries;
5. Group R-2 Buildings with residential occupancies;
6. Group A-3 Health clubs and spas; or
7. Buildings showing a service hot water load of 10 percent or more of total building energy loads as shown with an energy analysis as described in Section C407.

C406.7.1 Load fraction. The building service water heating system shall have one or more of the following that are sized to provide at least 60 percent of hot water requirements, or sized to provide 100 percent of hot water requirements if the building must otherwise comply with Section C403.4.6:

1. Waste heat recovery from service hot water, heat recovery chillers, building equipment, process equipment, or a combined heat and power system.
2. Solar water heating systems.

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

VARIABLE REFRIGERANT FLOW SYSTEM. An engineered direct expansion (DX) refrigerant system that incorporates a common condensing unit, at least one variable capacity compressor, a distributed refrigerant piping network to multiple indoor fan heating and cooling units each capable of individual zone temperature control, through integral zone temperature control devices and common communications network. Variable refrigerant flow utilizes three or more steps of control on common inter-connecting piping.

Reason: This proposal increases the number of optional packages in the IECC from three to six for compliance with Section C406, in addition to the modeling options available both in Section 507 of the IECC and the Energy Cost Budget method of ASHRAE 90.1. The purpose of this section is to provide flexibility for compliance, and to recognize that all buildings may not be able to meet higher levels of efficiency in today's prescriptive model codes without providing options. The specifications included in the six approximately equal energy packages were based on preliminary modeling done by New Buildings Institute.

HVAC

The equipment tables have been removed and replaced with a requirement for a 10% increase in efficiency over the base requirements. This will ensure that the HVAC equipment efficiency levels contained in this section provide the necessary energy savings over equipment efficiencies contained in Section C403. This will allow the base efficiencies to be increased in future code cycles without needing to make corresponding changes to Section C406. The proposed option limits the use of heating and cooling equipment not listed in the C403 tables to no more than 10% of the total building capacity. This would allow some systems, e.g. electric resistance heat, to be used in a limited capacity for the proposed project and still allow the code user to use this option. Under the 2012 IECC all systems must comply with the equipment efficiency requirements.

LPD

The LPD tables have been removed and replaced with a requirement for a 10% increase in efficiency over the base requirements for whole building or space-by-space. This will ensure that the LPD levels contained in this section provide the necessary energy

savings over the LPDs contained in Section C405. This will allow the base efficiencies to be increased in future code cycles without needing to make corresponding changes to Section C406. The 2012 IECC Additional Package Options only allowed whole building LPDs to be used. This proposal allows the use of space-by-space LPDs to provide more flexibility to the code user thereby increasing the viability of this option. The values proposed in this section are similar to those included as part of ASHRAE Standard 189.1.

The renewable option has not been modified from the 2012 IECC and provides three straightforward compliance approaches: electricity generation, thermal collection, and a calculation method for any type or combination of energy production. A path to include purchase of renewable power or credits was carefully considered, but not included based on concerns regarding verification and permanence of the transaction after the certificate of occupancy has been issued.

The Dedicated Outdoor Air System package is based on technical specifications from the 50% Technical Support Documents of the Pacific Northwest National Lab. The measure requires that adequate quantity of outside air is delivered separately to spaces in the buildings while employing 100% energy recovery. This reduces the need for excess outdoor air or supply air, and uses less energy for terminal reheating.

The Enhanced Lighting Controls Package provides a non-LPD lighting alternative package requires a digital control system to allow continuous dimming and a significant level of controllability on individual luminaires, or groups of no more than eight luminaires.

The Service Water Heating Package language is modified from similar language in the IgCC and the 2012 North Carolina commercial code. The requirements for use of waste energy to heat service hot water are in excess of what is otherwise required in Section C403 of the IECC, when applicable. Solar thermal water heating systems may also be used. This package is independent of the package offered in Section C406.5 since only one package is required for compliance with Section 406 in total.

Cost Impact: The code change proposal will not increase the cost of construction.

CE338 – 13

Table C406.2(5)

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

TABLE C406.2(5)
BOILER EFFICIENCY REQUIREMENTS

EQUIPMENT TYPE	FUEL	SIZE CATEGORY	TEST PROCEEDURE	MINIMUM EFFICIENCY
Steam	Gas	< 300,000 Btu/h	DOE 10 CFR Part 430	83% AFUE
		> 300,000 Btu/h and > 2.5 m Btu/h	DOE 10 CFR Part 431	81% E_t
		>2.5 m Btu/h		82% E_c
	Oil	< 300,000 Btu/h	DOE 10 CFR Part 430	85% AFUE
		> 300,000 Btu/h and > 2.5 m Btu/h	DOE 10 CFR Part 431	83% E_t
		>2.5 m Btu/h		84% E_c
Hot water	Gas	< 300,000 Btu/h	DOE 10 CFR Part 430	97% <u>94%</u> AFUE
		> 300,000 Btu/h and > 2.5 m Btu/h	DOE 10 CFR Part 431	97% <u>89%</u> E_t
		>2.5 m Btu/h		94% <u>91%</u> E_c
	Oil	< 300,000 Btu/h	DOE 10 CFR Part 430	90% AFUE
		> 300,000 Btu/h and > 2.5 m Btu/h	DOE 10 CFR Part 431	88% E_t
		>2.5 m Btu/h		87% E_c

For SI: 1 British thermal unit per hour = 0.2931 W.

E_t = Thermal efficiency. E_c = Combustion efficiency (100 percent less flue losses).

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Reasons for this specific proposal:

This table was originally intended to match the State of Massachusetts Stretch Code values. State of Massachusetts modified their boiler figures below even the AEDG levels due to push-back and local study. MA. went with ASHRAE 189.1 levels. State of NY is following this same path and using the MA. efficiency figures for their adoption of 2012 IECC.

This proposal does not reduce the intended efficiency levels for Section 406: the levels will remain at least 10% over the current federal minimum efficiency standards through 2018.

There are no updates at the EERE or ASHRAE web sites available to show that federal minimum efficiency levels will change for this equipment prior to the release of the 2018 IECC. Some sources point to possible updates in 2020 for some boiler types, but unable to confirm at EERE (US DOE) or via Federal Register. Unlike residential furnaces (effective May 1, 2013), residential (under 300 MBH) boilers efficiencies were not updated in the latest ASHRAE 90.1

The proposal is to correct the tables to a useable and adoptable set of figures. Boiler efficiencies raise nearly 20% above federal minimums. Intent of Section C406 was for an average 10% efficiency increase. Gas-fired hot water boilers singled out for much higher efficiency improvement than oil-fired or steam boilers.

Boilers at these efficiencies are nearly non-existent. The I-B-R listed equipment can be found at the following link (<http://www.ahridirectory.org/ahridirectory/pages/cblr/defaultSearch.aspx>) and the table can list all units by efficiency. An Excel file with efficiencies can be exported for review. Old I=B=R certification listings no longer available at AHRI web site. (Can furnish as an attachment).

NOTATION TO INCLUDED DOCUMENTS:

- I=B=R listing & Massachusetts Stretch code supplement.
- For the 97% AFUE, there are only 7 boilers manufactured listed at this efficiency, by only 5 manufacturers that can prove efficiency (Energy Star). Need to list standard for testing/proof of ratings: big issue with "claims" of efficiency. http://www.energystar.gov/index.cfm?fuseaction=find_a_product.showProductGroup&pgw_code=BO
- For 97% E_t, there are only the following (I=B=R certified product directory; nothing new from AHRI/GAMA):
 - 1 Buderus unit (not the series of boilers)
 - 1 RayPak model series
 - RBl: One unit (not the series of boilers)
 - Viessman: 5 of 6 units
- For 94% E_c, Large units >2.5 Million: Only two manufacturers
 - 1 Buderus model line (3 sizes)
 - 1 Viessmann model line (many sizes)

Cost Impact: The change will not increase the cost of construction, but may reduce it by making more equipment available to meet the requirement.

C406.2, Table C406.2(7)

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

C406.2 Efficient HVAC performance. Equipment shall meet the minimum efficiency requirements of Tables C406.2(1) through ~~C406.2(7)~~ C406.2(6) in addition to the requirements in Section C403. This section shall only be used where the equipment efficiencies in Tables C406.2(1) through ~~C406.2(7)~~ C406.2(6) are greater than the equipment efficiencies listed in Table C403.2.3(1) through ~~403.2.3(7)~~ 403.2.3(6) for the equipment type.

TABLE C406.2(7)
ABSORPTION CHILLERS EFFICIENCY REQUIREMENTS

EQUIPMENT TYPE	MINIMUM EFFICIENCY FULL LOAD COP (IPLV)
Air cooled, single effect	0.60, allowed only in heat recovery applications
Water cooled, single effect	0.70, allowed only in heat recovery applications
Double effect – direct fired	1.0 (1.05)
Double effect – indirect fired	1.20

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Reasons for this specific proposal:

Absorption chillers for air cooled, single effect and water cooled, single effect, absorption double effect indirect fired, and absorption double effect direct fired are listed in both Tables C406.2(6) and C406.2(7). The data is the same in the tables except for double effect- indirect fired minimum efficiency full load COP (IPLV) requirements. The data shown in Table C406.2(6) is correct and agrees with ASHRAE 90.1. Delete Table C406.2(7) as data is in Table C406.2(6). Revise Section C406.2 as it references Table C406.2(7) and it is deleted. This will resolve the overlap in the two tables regulating 'absorption chillers.'

Cost Impact: The code change proposal will not increase the cost of construction. The proposal is editorial in nature and will have no impact on the cost of construction.

CE339-13

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

C406.2(7)T-EC-THOMPSON-SEHPCAC

CE340 – 13

C406.3, Table C406.3, C406.3.1

Proponent: Glenn Heinmiller, Lam Partners, representing International Association of Lighting Designers (glen@lampartners.com)

Revise as follows:

C406.3 ~~Efficient lighting system.~~ Whole building lighting power density (Watts/sf) shall comply with the requirements of Section C406.3.1. **Reduced lighting power density.** The lighting power allowance shall be 90 percent of the lighting power allowance determined according to Section C405.5.2.

C406.3.1 ~~Reduced lighting power density.~~ The total interior lighting power (watts) of the building shall be determined by using the reduced whole building interior lighting power in Table C406.3 times the floor area for the building types.

**TABLE C406.3
REDUCED INTERIOR LIGHTING POWER**

Reason: Simplify and clarify the code. Allow proper design flexibility without reducing stringency.

As currently written, this option only allows the use of Building Area Method lighting power densities according to the values in table C406.3, which are 10% below base code. This prevents the designer from using the space-by-space method to determine the lighting power allowance for this additional efficiency option. This proposal simply requires a 10% reduction in the lighting power from what is allowed in base code. It does not change stringency and it simplifies the code. Also it means that whenever the base code LPD values are updated, no changes to this option will need to be made. No table will need to be revised.

Cost Impact: The code change proposal will not increase the cost of construction.

CE340-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C406.3-EC-HEINMILLER.doc

CE341 – 13

C406.3.1

Proponent: David Handwork, Arkansas State University

Revise as follows:

C406.3.1 Reduced lighting power density. The total interior lighting power (watts) of the building shall be determined by using the reduced whole building interior lighting power in Table C406.3 times the floor area for the building types. Conversion of existing spaces to lighting power densities recommended in Table 406.6 shall be permitted to follow a program acceptable to the authority having jurisdiction.

Reason: While a supporter of all practical energy conservation concepts, the education facilities industry needs to see scalable conformity options as bright line language in this code.

Cost Impact: This code change proposal will not increase the cost of construction. Granting Owners more scalable options regarding lighting retrofits generally reduces costs.

CE341-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C406.3.1-EC-HANDWORK.doc

CE342 – 13

C407.2

Proponent: Tim Nogler, Washington State Building Code Council (tim.nogler@des.wa.gov)

Revise as follows:

C407.2 Mandatory requirements. Compliance with this section requires that the criteria of Sections C402.4, C403.2, C404 and C405 be met.

The permit application for projects utilizing this method shall include in one submittal all building and mechanical construction documents and all information necessary to verify that the building envelope and mechanical design for the project corresponds with the annual energy analysis. Where credit is proposed to be taken for lighting energy savings, an electrical permit application shall also be submitted and approved prior to the issuance of the permit. Where credit is proposed to be taken for energy savings from other components, construction details for those components shall be submitted with the permit application. Otherwise, components of the project that would not be approved as part of a permit application shall be modeled the same in both the proposed building and the *standard reference design* and shall comply with the requirements of this code.

Reason: This proposal addresses a common problem for building officials, that various portions of the construction are submitted under different permits at different times, whereas the document review staff needs to evaluate the entire "total building performance" with all information provided.

Cost Impact: The code change proposal will not increase the cost of construction.

CE342-13

C407.2-EC-NOGLER.doc

CE343 – 13

C407.2, C407.2.1 (NEW)

Proponent: Brian Dean, ICC International, representing Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; Bill Prindle, Energy Efficient Codes Coalition; and Don Vigneau, Northeast Energy Efficiency Partnerships.

Revise as follows:

C407.2 Mandatory requirements. Compliance with this section requires that the criteria of Sections C402.4, C403.2, C404, ~~and C405~~ and C407.2.1 be met.

C407.2.1 Maximum fenestration U-factor and SHGC for compliance based on total building performance (Mandatory). For buildings complying with Section C407, the area-weighted average U-factor permitted for products within each fenestration product category listed in Table C402.3 shall not exceed the applicable U-factor specified in Table C402.3 by more than 25 percent. For buildings complying with Section C407, the area-weighted average SHGC permitted for products within each fenestration product category listed Table C402.3 shall not exceed the applicable SHGC specified in Table C402.3 by more than 50 percent.

Reason: The purpose of the proposed code change is to establish new maximum trade-off limits for fenestration under the commercial performance path. This proposal imports, from the residential *IECC* provisions, an effective backstop on fenestration trade-offs that has been in the *IECC* since 2004, but with some additional modifications and improvements. This new provision will ensure that modern, highly efficient commercial buildings are required to have at least moderately efficient windows:

- New section C407.2.1 would ensure that whenever the simulated performance alternative is used, the windows on a weighted average basis will meet a reasonable level of efficiency (no worse than 25% greater U-factor and 50% greater SHGC than the prescriptive requirements).
- The main difference between this new commercial section and the existing residential trade-off backstop is that the proposed provision would cap trade-offs at a percentage of the U-factor and SHGC requirements as they change over time rather than setting specific maximum values (we are also proposing to change the residential provision to the same approach).
- This approach will allow the cap to slide up or down to match future changes to the U-factor and SHGC requirements, while still ensuring that buildings are designed and constructed with windows that fall within a reasonable range of efficiency.

The fenestration trade-off limits currently found in the residential chapter of the *IECC* are simple, mandatory measures that ensure all new buildings contain high-quality, cost-effective windows that save energy, provide reasonable comfort, resist condensation in colder climates and block unwanted solar gain in warmer climates. Without the protection of this backstop, fenestration values could be traded away to levels unacceptable in modern building practice. Given the improvements to window efficiency brought about by the 2012 *IECC* and our nation's high priority for energy efficiency, this proposal is a common-sense extension of an effective code requirement.

- **Simple compliance.** The residential fenestration maximums are effective and easy to understand. These requirements have been successfully applied for the last several years. All states that have already adopted the 2006, 2009, and 2012 *IECC* have adopted these maximums to residential construction. On the residential side, they are also already seamlessly built into compliance software such as the Department of Energy's REScheck. The same approach would work for commercial building compliance software.
- **Flexible standard.** The area-weighted average approach embodied in the fenestration maximums allows considerable flexibility for the use of decorative glass, glass block, and other fenestration products, while maintaining a baseline performance for the building's overall glazing. In short, not all products are required to individually meet the maximum values; only the area-weighted average of all products in the building are required to meet the maximum values specified in this code provision.
- **Quality windows, energy savings and peak demand savings nationwide.** The fenestration maximums encourage the use of cost-effective energy-efficient windows nationwide. Because good windows reduce energy consumption both during peak cooling times in the summer months and during peak heating hours in the winter months, such windows can help reduce the strain on the electric grid and natural gas pipeline system and delay the need to build expensive peaking facilities. By reducing the trade-off of efficient windows for other measures, the maximums will better capture the benefits of blocking solar gain and providing reasonable insulating value such as peak reduction, reduced cooling system sizes and year-round comfort. Consumers will also enjoy the reduced costs that come with economies of scale and market transformation.
- **More comfortable buildings and less energy use.** Incremental changes in window efficiency can have a huge impact on occupant comfort because even the most efficient windows are, at best, still only the equivalent of about an R-3 wall in the winter. Moreover, unlike the opaque wall, even the best fenestration allows substantial summer solar heat gain into

the conditioned space. Hot spots created by high solar gain in the summer and/or cold or drafty glass in the winter months can force an occupant to adjust the thermostat to compensate. A good window will provide reasonable insulating value, keeping occupants more comfortable during the coldest months. Similarly, windows with low SHGC will protect against hot spots and occupant discomfort, and will make it less likely that occupants will need to adjust the thermostat and use more energy.

For a more detailed discussion of the benefits of good fenestration, see the section on the benefits of efficient windows on the website of the Efficient Windows Collaborative -- <http://www.efficientwindows.org/benefits.cfm>. The fenestration maximums have served an important role in ensuring residential energy efficiency for many years. We recommend that the fenestration maximums in the residential chapter of the *IECC* be duplicated, with the appropriate modifications, in the commercial chapter of the *IECC*.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Mark Nowak, M. Nowak Consulting, LLC, representing Steel Framing Alliance

Add new text as follows:

C407.3.1 Alternative to proposed design. A representative building as described in NREL/TP-5500-46861 or other representative buildings approved by the code official shall be permitted to be used in lieu of the actual building design.

Add new standard to Chapter 5 as follows:

DOE

NREL/TP-5500-46861-11 Commercial Reference Building Models of the National Building Stock

Reason: This proposal will simplify the implementation of the code by allowing a representative building to be used for compliance rather than the actual building. Designers will only need to build a model for the representative building for a given climate zone. Likewise, simulation tool developers would be able to provide the buildings in library files for users. However, it will still leave the designer the option to comply with the actual propose building.

This represents a significant deviation from past and current practice but it is a logical step for the IECC to take. Given that the representative buildings are the basis for the current prescriptive requirements, they should be permitted to be used repeatedly for building design and compliance. This approach would allow the development of multiple prescriptive solutions equivalent to those in the code without cluttering up the code with pages of additional text.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, DOE-NREL/TP-5500-46861-2011 Commercial Reference Building Models of the National Building Stock, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

C407.3.1 (NEW)-EC-NOWAK.doc

CE345 – 13

C407.4.1, C407.6

Proponent: Tim Nogler, Washington State Building Code Council (tim.nogler@des.wa.gov)

Revise as follows:

C407.4.1 Compliance report. ~~Compliance software tools shall generate~~ Permit submittals shall include a report that documents that the *proposed design* has annual energy costs less than or equal to the annual energy costs of the *standard reference design*. The compliance documentation shall include the following information:

1. Address of the building;
2. An inspection checklist documenting the building component characteristics of the *proposed design* as *listed* in Table C407.5.1(1). The inspection checklist shall show the estimated annual energy consumption for both the *standard reference design* and the *proposed design*;
3. Name of individual completing the compliance report; and
4. Name and version of the compliance software tool.

C407.6 Calculation software tools. Calculation procedures used to comply with this section shall be software tools capable of calculating the annual energy consumption of all building elements that differ between the *standard reference design* and the *proposed design* and shall include the following capabilities.

- ~~1. Computer generation of the *standard reference design* using only the input for the *proposed design*. The calculation procedure shall not allow the user to directly modify the building component characteristics of the *standard reference design*.~~
- ~~2. 1. Building operation for a full calendar year (8,760 hours).~~
- ~~3. 2. Climate data for a full calendar year (8,760 hours) and shall reflect *approved* coincident hourly data for temperature, solar radiation, humidity and wind speed for the building location.~~
- ~~4. 3. Ten or more thermal zones.~~
- ~~5. 4. Thermal mass effects.~~
- ~~6. 5. Hourly variations in occupancy, illumination, receptacle loads, thermostat settings, mechanical ventilation, HVAC equipment availability, service hot water usage and any process loads.~~
- ~~7. 6. Part-load performance curves for mechanical equipment.~~
- ~~8. 7. Capacity and efficiency correction curves for mechanical heating and cooling equipment.~~
- ~~9. 8. Printed *code official* inspection checklist listing each of the *proposed design* component characteristics from Table C407.5.1(1) determined by the analysis to provide compliance, along with their respective performance ratings (e.g., *R*-value, *U*-factor, SHGC, HSPF, AFUE, SEER, EF, etc.).~~

Reason: The proposal addresses the issue that no existing software tools are capable of meeting the requirements described in this section. If the language remains as written, the Total Building Performance path cannot be used.

This correction maintains a complete performance path for compliance with the Code, which promotes innovation and flexibility in design and construction.

Cost Impact: The code change proposal will not increase the cost of construction.

Table C407.5.1(1), Chapter 5

Proponent: Robert A. Zabcik, P.E., NCI Building Systems, Inc., representing Cool Metal Roofing Coalition

Revise as follows:

TABLE C407.5.1(1) SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSAL DESIGNS		
BUILDING COMPONENT CHARACTERISTICS	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Roofs	Type: Insulation entirely above deck	As proposed
	Gross Area: same as proposed	As proposed
	U-factor: from Table C402.1.2	As proposed
	Solar absorbance: 0.75 <u>Solar Reflectance: 0.25</u>	As proposed three-year aged solar reflectance^e
	Emittance: 0.90	As proposed three-year aged thermal emittance^e

e. Aged solar reflectance and thermal emittance shall be determined in accordance with CRRC-1.

(Portions of Table not shown remain unchanged)

Add new standard to Chapter 5 as follows:

CRRC Cool Roof Rating Council
1610 Harrison St
Oakland, CA 94612

CRRC-1-2012 CRRC-1 Standard

Reason: The use of initial values of solar reflectance (SR) and thermal emittance (TE) for computer modeling as opposed to three-year aged values is not representative of real-world conditions. Weathering of most roofing materials greatly changes the SR and to a lesser degree, the TE, as documented by Lawrence Berkeley and Oak Ridge National Laboratories. The California Energy Commission (CEC) Title 24 Building Energy Efficiency Standards has addressed this issue very effectively since 2005. By using 3-year aged SR and TE values, a more realistic modeling result is obtained; one that represents the performance of the roofing material during the life of the material rather than at the time of installation. The Cool Roof Rating Council (CRRC) has simultaneously developed the CRRC-1 standard to rigorously qualify the test procedures used to measure SR and TE, as well as the aging process. Thus, referencing the CRRC-1 standard is much more thorough than simply referencing the ASTM test methods used to measure SR and TE directly. The CRRC has recently been ANSI accredited to develop standards, further adding credibility. The change from solar absorbance to SR was made simply to make the nomenclature of Table C407.5.1(1) consistent with that of CRRC-1 and is based on numerical conversion; it does NOT represent a change in performance of the IECC.

It should be noted that ASHRAE made a similar change in the performance modeling requirements in Standard 90.1, Appendix G in 2010. 90.1 also provides default SR and TE values of 0.3 and 0.9 for SR and TE respectively. That approach could be taken here as well should the committee be concerned that aged data might not be readily available. However, since aged values for SR and TE are required in so many other standards nationwide, that data is generally available and there are aging formulas that modify the SR value based on curve fits. Such a formula has been used in the California Energy Commission (CEC) Building Energy Efficiency Standards since 2005.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, CRRC-1-2012 – CRRC-1 Standard, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

C407.5.1(1)T-EC-ZABCIK.doc

CE347 – 13

Table C407.5.1(1)

Proponent: Dr. Thomas D. Culp, Birch Point Consulting LLC, representing the Glazing Industry Code Committee (culp@birchpointconsulting.com)

Revise as follows:

TABLE C407.5.1(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT CHARACTERISTICS	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Space use classification	Same as proposed	The space use classification shall be chosen in accordance with Table C405.5.2 for all areas of the building covered by this permit. Where the space use classification for a building is not known, the building shall be categorized as an office building.
Roofs	Type: Insulation entirely above deck Gross area: same as proposed <i>U</i> -factor: from Table C402.1.2 Solar absorptance: 0.75 Emittance: 0.90	As proposed As proposed As proposed As proposed As proposed
Walls, above-grade	Type: Mass wall if proposed wall is mass; otherwise steel-framed wall Gross area: same as proposed <i>U</i> -factor: from Table C402.1.2 Solar absorptance: 0.75 Emittance: 0.90	As proposed As proposed As proposed As proposed As proposed
Walls, below-grade	Type: Mass wall Gross area: same as proposed <i>U</i> -Factor: from Table C402.1.2 with insulation layer on interior side of walls	As proposed As proposed As proposed
Floors, above-grade	Type: joist/framed floor Gross area: same as proposed <i>U</i> -factor: from Table C402.1.2	As proposed As proposed As proposed
Floors, slab-on-grade	Type: Unheated <i>F</i> -factor: from Table C402.1.2	As proposed As proposed
<u>Opaque</u> Doors	Type: Swinging Area: Same as proposed <i>U</i> -factor: from Table C402.2	As proposed As proposed As proposed

BUILDING COMPONENT CHARACTERISTICS	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
<u>Glazing Vertical</u> <u>Fenestration other than</u> <u>Opaque Doors</u>	Area 1. The proposed glazing area; where the proposed glazing area is less than 40 percent of above-grade wall area. 2. 40 percent of above-grade wall area; where the proposed glazing area is 40 percent or more of the above-grade wall area. U-factor: from Table C402.3 SHGC: from Table C402.3 except that for climates with no requirement (NR) SHGC = 0.40 shall be used External shading and PF: None	As proposed As proposed As proposed As proposed
Skylights	Area 1. The proposed skylight area; where the proposed skylight area is less than 3 percent of gross area of roof assembly. 2. 3 percent of gross area of roof assembly; where the proposed skylight area is 3 percent or more of gross area of roof assembly U-factor: from Table C402.3 SHGC: from Table C402.3 except that for climates with no requirement (NR) SHGC = 0.40 shall be used.	As proposed As proposed As proposed
Lighting, interior	The interior lighting power shall be determined in accordance with Table C405.5.2. Where the occupancy of the building is not known, the lighting power density shall be 1.0 Watt per square foot (10.73 W/m ²) based on the categorization of buildings with unknown space classification as offices.	As proposed
Lighting, exterior	The lighting power shall be determined in accordance with Table C405.6.2(2). Areas and dimensions of tradable and nontradable surfaces shall be the same as proposed.	As proposed
Internal gains	Same as proposed	Receptacle, motor and process loads shall be modeled and estimated based on the space use classification. All end-use load components within and associated with the building shall be modeled to include, but not be limited to, the following: exhaust fans, parking garage ventilation fans, exterior building lighting, swimming pool heaters and pumps, elevators, escalators, refrigeration equipment and cooking equipment.
Schedules	Same as proposed	Operating schedules shall include hourly profiles for daily operation and shall account for variations between weekdays, weekends, holidays and any seasonal operation. Schedules shall model the time-dependent variations in occupancy, illumination, receptacle loads, thermostat settings, mechanical ventilation, HVAC equipment availability, service hot water usage and any process loads. The schedules shall be typical of the proposed building type as determined by the designer and approved by the jurisdiction.
Mechanical ventilation	Same as proposed	As proposed, in accordance with Section C403.2.5.
Heating systems	Fuel type: same as proposed design	As proposed

BUILDING COMPONENT CHARACTERISTICS	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
	Equipment type ^a : from Tables C407.5.1(2) and C407.5.1(3)	As proposed
	Efficiency: from Tables C403.2.3(4) and C403.2.3(5)	As proposed
	Capacity ^b : sized proportionally to the capacities in the proposed design based on sizing runs, and shall be established such that no smaller number of unmet heating load hours and no larger heating capacity safety factors are provided than in the proposed design.	As proposed
Cooling systems	Fuel type: same as proposed design	As proposed
	Equipment type ^c : from Tables C407.5.1(2) and C407.5.1(3)	As proposed
	Efficiency: from Tables C403.2.3(1), C403.2.3(2) and C403.2.3(3)	As proposed
	Capacity ^b : sized proportionally to the capacities in the proposed design based on sizing runs, and shall be established such that no smaller number of unmet cooling load hours and no larger cooling capacity safety factors are provided than in the proposed design.	As proposed
	Economizer ^d : same as proposed, in accordance with Section C403.4.1.	As proposed
Service water heating	Fuel type: same as proposed	As proposed
	Efficiency: from Table C404.2	As proposed
	Capacity: same as proposed	
	Where no service water hot water system exists or is specified in the proposed design, no service hot water heating shall be modeled.	As proposed

- a. Where no heating system exists or has been specified, the heating system shall be modeled as fossil fuel. The system characteristics shall be identical in both the standard reference design and proposed design.
- b. The ratio between the capacities used in the annual simulations and the capacities determined by sizing runs shall be the same for both the standard reference design and proposed design.
- c. Where no cooling system exists or no cooling system has been specified, the cooling system shall be modeled as an air-cooled single-zone system, one unit per thermal zone. The system characteristics shall be identical in both the standard reference design and proposed design.
- d. If an economizer is required in accordance with Table C403.3.1(1), and if no economizer exists or is specified in the proposed design, then a supply air economizer shall be provided in accordance with Section C403.4.1.

Reason: This corrects the terminology in the performance path table to be consistent with the rest of the chapter. "Doors" can include both glazed and opaque doors, but the intent was clearly meant to be opaque doors, since it is referring to only the U-factor in Table C402.2. It is then unclear where to put glazed doors. This proposal clarifies the three fenestration rows as "opaque doors", "vertical fenestration other than opaque doors", and "skylights".

Cost Impact: This proposal will not increase the cost of construction.

CE347-13

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

CE348 – 13

Table C407.5.1(1)

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

TABLE C407.5.1(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT CHARACTERISTICS	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Cooling systems	Fuel type: same as proposed design	As proposed
	Equipment type ^c : from Tables C407.5.1(2) and C407.5.1(3)	As proposed
	Efficiency: from Tables C403.2.3(1), C403.2.3(2) and C403.2.3(3)	As proposed
	Capacity ^b : sized proportionally to the capacities in the proposed design based on sizing runs, and shall be established such that no smaller number of unmet cooling load hours and no larger cooling capacity safety factors are provided than in the proposed design.	As proposed
	Economizer ^d : same as proposed, in accordance with Section C403.4.4 <u>C403.3.1</u> .	As proposed

(Portions of Table not shown remain unchanged)

- Where no heating system exists or has been specified, the heating system shall be modeled as fossil fuel. The system characteristics shall be identical in both the standard reference design and proposed design.
- The ratio between the capacities used in the annual simulations and the capacities determined by sizing runs shall be the same for both the standard reference design and proposed design.
- Where no cooling system exists or no cooling system has been specified, the cooling system shall be modeled as an air-cooled single-zone system, one unit per thermal zone. The system characteristics shall be identical in both the standard reference design and proposed design.
- If an economizer is required in accordance with Table C403.3.1(1), and if no economizer exists or is specified in the proposed design, then a supply air economizer shall be provided in the reference design in accordance with Section ~~C403.4.4~~ C403.3.1.

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

In the 2009 code this footnote refers to a section of the code that addressed supply air economizers in Complex HVAC systems. Now it refers to a section that regulates water economizers in complex HVAC systems. Unless water economizers are 'supply air economizers – the footnote is referring to a section that doesn't address the same topic. The table and footnote are corrected to show that if a building is required to have an economizer, yet the proposed design does not have an economizer, the baseline building shall be designed with an air-side economizer (not water-side). Air economizer is the baseline code. This appears to have been a modeling requirement for several code cycles: IECC and Standard 90.1 do not to allow water-side economizer as the baseline (standard reference) model when no economizer is included in the proposed design case model. If a water-side economizer is included in the proposed design, then there is a 1:1 comparison of water-side in the baseline reference and proposed design. (Please note that if SEHPCAC proposal E20A is approved this proposed change to a reference to Section C403.3.1 will also correlate with the revised provisions.)

Cost Impact: The code change proposal will not increase the cost of construction. The change is editorial in nature. It will not increase the cost of construction.

C407.5.1(1)T-EC-THOMPSON-SEHPCAC

CE349 – 13

C407.6.3 (NEW)

Proponent: Tim Nogler, Washington State Building Code Council (tim.nogler@des.wa.gov)

Add new text as follows:

C407.6.3 Exceptional calculation methods. When the simulation program does not model a design, material, or device of the *proposed design*, an exceptional calculation method shall be used where approved by the *code official*. Where there are multiple designs, materials, or devices that the simulation program does not model, each shall be calculated separately and exceptional savings determined for each. At no time shall the total exceptional savings constitute more than half of the difference between the baseline building performance and the proposed building performance. All applications for approval of an exceptional method shall include:

1. Step-by-step documentation of the exceptional calculation method performed detailed enough to reproduce the results;
2. Copies of all spreadsheets used to perform the calculations;
3. A sensitivity analysis of energy consumption when each of the input parameters is varied from half to double the value assumed;
4. The calculations shall be performed on a time step basis consistent with the simulation program used;
5. The performance rating calculated with and without the exceptional calculation method.

Reason: It is not unusual for the design team to want to claim credit for an energy-efficiency measure that the hourly energy analysis software is not capable of directly modeling. Consequently, designers would submit simple hand-calculations as an “add-on” to the complex calculations made by the hourly energy analysis software. This is an important challenge because it does not make sense to treat hand-calculations as comparable to those coming from sophisticated hourly energy analysis software. It is not uncommon to see designs where a single energy-efficiency measure was being proposed to make up for multiple shortfalls in the proposed design.

ASHRAE/IESNA Standard 90.1, Appendix G, Section G2.5, Exceptional Calculation Methods, has been updated and expanded in the 2010 version. The updated language from ASHRAE/IESNA Standard 90.1-2010 addresses this issue. This will provide guidance to designers and modelers, as well as to building department staff. The result should be more consistent implementation of the annual energy analysis compliance option.

Cost Impact: The code change proposal will not increase the cost of construction.

C407.6.3 (NEW)-EC-NOGLER.doc

CE350 – 13

C408

Proponent: Richard Grace, Fairfax County Government, representing The Virginia Plumbing and Mechanical Inspectors Association, The Virginia Building Code Officials Association
(Richard.Grace@fairfaxcounty.gov)

Revise as follows:

~~Section C408~~ APPENDIX A SYSTEM COMMISSIONING

~~C408.1~~ AC 101.1 General. This ~~section~~ appendix covers the commissioning of the building mechanical systems in Section C403 and electrical power and lighting systems in Section C405.

~~C408.2~~ AC 101.2 Mechanical systems commissioning and completion requirements. Prior to passing the final mechanical inspection, the *registered design professional* shall provide evidence of mechanical systems *commissioning* and completion in accordance the provisions of this ~~section~~. appendix. Construction document notes shall clearly indicate provisions for *commissioning* and completion requirements in accordance with this ~~section~~ appendix and are permitted to refer to specifications for further requirements. Copies of all documentation shall be given to the owner and made available to the *code official* upon request in accordance with Sections ~~C408.2.4 and C408.2.5~~ AC101.2.4 and AC101.2.5

Exception: The following systems are exempt from the commissioning requirements:

1. Mechanical systems in buildings where the total mechanical equipment capacity is less than 480,000 Btu/h (140 690 W) cooling capacity and 600,000 Btu/h (175 860 W) heating capacity.
2. Systems included in Section C403.3 that serve dwelling units and sleeping units in hotels, motels, boarding houses or similar units.

~~C408.2.1~~ AC 101.2.1 Commissioning plan. A *commissioning plan* shall be developed by a *registered design professional* or approved *agency* and shall include the following items:

1. A narrative description of the activities that will be accomplished during each phase of commissioning, including the personnel intended to accomplish each of the activities.
2. A listing of the specific equipment, appliances or systems to be tested and a description of the tests to be performed.
3. Functions to be tested, including, but not limited to calibrations and economizer controls.
4. Conditions under which the test will be performed. At a minimum, testing shall affirm winter and summer design conditions and full outside air conditions.
5. Measurable criteria for performance.

~~C408.2.2~~ AC 101.2.2 Systems adjusting and balancing. HVAC systems shall be balanced in accordance with generally accepted engineering standards. Air and water flow rates shall be measured and adjusted to deliver final flow rates within the tolerances provided in the product specifications. Test and balance activities shall include air system and hydronic system balancing.

~~C408.2.2.1~~ AC 101.2.2.1 Air systems balancing. Each supply air outlet and *zone* terminal device shall be equipped with means for air balancing in accordance with the requirements of Chapter 6 of the *International Mechanical Code*. Discharge dampers are prohibited on constant volume fans and variable volume fans with motors 10 hp (18.6 kW) and larger. Air systems shall be balanced in a manner to first

minimize throttling losses then, for fans with system power of greater than 1 hp (0.74 kW), fan speed shall be adjusted to meet design flow conditions.

Exception: Fans with fan motors of 1 hp (0.74 kW) or less.

C408.2.2.2 AC 101.2.2.2 Hydronic systems balancing. Individual hydronic heating and cooling coils shall be equipped with means for balancing and measuring flow. Hydronic systems shall be proportionately balanced in a manner to first minimize throttling losses, then the pump impeller shall be trimmed or pump speed shall be adjusted to meet design flow conditions. Each hydronic system shall have either the capability to measure pressure across the pump, or test ports at each side of each pump.

Exceptions:

1. Pumps with pump motors of 5 hp (3.7 kW) or less.
2. Where throttling results in no greater than five percent of the nameplate horsepower draw above that required if the impeller were trimmed.

C408.2.3 AC 101.2.3 Functional performance testing. Functional performance testing specified in Sections ~~C408.2.3.1 through C408.2.3.3~~ AC101.2.3.1 through AC101.2.3.3 shall be conducted.

C408.2.3.1 AC 101.2.3.1 Equipment. Equipment functional performance testing shall demonstrate the installation and operation of components, systems, and system-to-system interfacing relationships in accordance with approved plans and specifications such that operation, function, and maintenance serviceability for each of the commissioned systems is confirmed. Testing shall include all modes and *sequence of operation*, including under full-load, part-load and the following emergency conditions:

1. All modes as described in the *sequence of operation*;
2. Redundant or *automatic* back-up mode;
3. Performance of alarms; and
4. Mode of operation upon a loss of power and restoration of power.

Exception: Unitary or packaged HVAC equipment listed in Tables C403.2.3(1) through C403.2.3(3) that do not require supply air economizers.

C408.2.3.2 AC101.2.3.2 Controls. HVAC control systems shall be tested to document that control devices, components, equipment, and systems are calibrated, adjusted and operate in accordance with approved plans and specifications. Sequences of operation shall be functionally tested to document they operate in accordance with *approved* plans and specifications.

C408.2.3.3 AC 101.2.3.3 Economizers. Air economizers shall undergo a functional test to determine that they operate in accordance with manufacturer's specifications.

C408.2.4 AC 101.2.4 Preliminary commissioning report. A preliminary report of commissioning test procedures and results shall be completed and certified by the *registered design professional* or *approved agency* and provided to the building owner. The report shall be identified as "Preliminary Commissioning Report" and shall identify:

1. Itemization of deficiencies found during testing required by this ~~section~~ appendix that have not been corrected at the time of report preparation.
2. Deferred tests that cannot be performed at the time of report preparation because of climatic conditions.
3. Climatic conditions required for performance of the deferred tests.

C408.2.4.1 AC 101.2.4.1 Acceptance of report. *Buildings*, or portions thereof, shall not pass the final mechanical inspection until such time as the *code official* has received a letter of transmittal from the *building* owner acknowledging that the *building* owner has received the Preliminary Commissioning Report.

C408.2.4.2 AC 101.2.4.2 Copy of report. The *code official* shall be permitted to require that a copy of the Preliminary

C408.2.5 AC 101.2.5 Documentation requirements. The *construction documents* shall specify that the *documents* described in this section be provided to the *building owner* within 90 days of the date of receipt of the *certificate of occupancy*.

C408.2.5.1 AC 101.2.5.1 Drawings. Construction documents shall include the location and performance data on each piece of equipment.

C408.2.5.2 AC 101.2.5.2 Manuals. An operating and maintenance manual shall be provided and include all of the following:

1. Submittal data stating equipment size and selected options for each piece of equipment requiring maintenance.
2. Manufacturer's operation manuals and maintenance manuals for each piece of equipment requiring maintenance, except equipment not furnished as part of the project. Required routine maintenance actions shall be clearly identified.
3. Name and address of at least one service agency.
4. HVAC controls system maintenance and calibration information, including wiring diagrams, schematics, and control sequence descriptions. Desired or field-determined setpoints shall be permanently recorded on control drawings at control devices or, for digital control systems, in system programming instructions.
5. A narrative of how each system is intended to operate, including recommended setpoints.

C408.2.5.3 AC 101.2.5.3 System balancing report. A written report describing the activities and measurements completed in accordance with Section C408.2.2: AC 101.2.2.

C408.2.5.4 AC 101.2.5.4 Final commissioning report. A report of test procedures and results identified as "Final Commissioning Report" shall be delivered to the building owner and shall include:

1. Results of functional performance tests.
2. Disposition of deficiencies found during testing, including details of corrective measures used or proposed.
3. Functional performance test procedures used during the commissioning process including measurable criteria for test acceptance, provided herein for repeatability.

Exception: Deferred tests which cannot be performed at the time of report preparation due to climatic conditions.

C408.3 AC 101.3 Lighting system functional testing. Controls for automatic lighting systems shall comply with Section C408.3: AC101.3.

C408.3.1 AC 101.3.1 Functional testing. Testing shall ensure that control hardware and software are calibrated, adjusted, programmed and in proper working condition in accordance with the construction documents and manufacturer's installation instructions. The construction documents shall state the party who will conduct the required functional testing. Where required by the code official, an approved party independent from the design or construction of the project shall be responsible for the functional testing and shall provide documentation to the code official certifying that the installed lighting controls meet the provisions of Section C405.

Where occupant sensors, time switches, programmable schedule controls, photosensors or daylighting controls are installed, the following procedures shall be performed:

1. Confirm that the placement, sensitivity and time-out adjustments for occupant sensors yield acceptable performance.
2. Confirm that the time switches and programmable schedule controls are programmed to turn the lights off.
3. Confirm that the placement and sensitivity adjustments for photosensor controls reduce electric light based on the amount of usable daylight in the space as specified.

Reason: We are not opposed to commissioning, in fact we fully support the concept. What we are opposed to is including language into a code that is not enforceable, inconsistent, or is written in such a way that enforcement will place a burden on building owners when occupancy permits are held up based on incomplete commissioning reports. There are many examples of this contained within this code change.

(1) C408.2 – **“Prior to passing the final mechanical inspection, the registered design professional shall provide evidence of mechanical systems commissioning and completion according to the provisions of this section.”** First off, this language suggests that only a registered design professional is permitted to provide such evidence, even if a licensed, Class A contractor designed the project. Second,

(2) 503.2.9.1 – **“Copies of all documentation shall be given to the owner.”** We do not agree with language included in the code that requires a code official to verify contractual issues between an owner and their agents, designers, or contractors.

(3) 503.2.9.1.2 – **“All HVAC systems shall be balanced in accordance with generally accepted engineering standards.”** “Shall be” is positive, enforceable language, however “generally accepted” is so open ended that consistency between any two individuals will be virtually impossible.

(4) 503.2.9.2 – **“shall not be issued a final certificate of occupancy”**. This section states that a certificate of occupancy shall not be issued without receiving a letter from the owner stating that they have received the Preliminary Commissioning Report. Why should the owner of a building be penalized in such a harsh manner for a procedure that can obviously be conducted after occupancy.

(5) 503.2.9.3 – **“shall require that within 90 days after the date of final certificate of occupancy”**. This section requires the code official to go back to the building owner after issuing the certificate of occupancy and verify that the building owner was provided with drawings, manuals, system balancing report, and the final commissioning report. Wow! After the certificate of occupancy is issued, the International Energy Conservation Code is no longer applicable to the building or building owner. I truly do not understand how this is going to work. What gives the code official the authority to verify and comply with this code section? What recourse does a code official have if the documentation is not provided to the building owner? Is the certificate of occupancy voided and the building occupants forced to vacate? After the certificate of occupancy is issued, the IECC is no longer applicable. The applicable code after the certificate of occupancy is issued is the Property Maintenance Code.

Cost Impact: This code change proposal will not increase the cost of construction.

C408.2, C408.2.1, C408.2.2.1, C408.2.2.2, C408.3.1

Proponent: Brenda A. Thompson, Clark County Development Services, Clark County, Nevada, representing Sustainable/Energy/High Performance Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

SECTION C408 SYSTEM COMMISSIONING

C408.1 General. This section covers the commissioning of the building mechanical systems in Section C403 and electrical power and lighting systems in Section C405.

C408.2 Mechanical systems commissioning and completion requirements. Prior to passing the final mechanical inspection, the *registered design professional or approved agency* shall provide evidence of mechanical systems *commissioning* and completion in accordance the provisions of this section.

Construction document notes shall clearly indicate provisions for *commissioning* and completion requirements in accordance with this section and are permitted to refer to specifications for further requirements. Copies of all documentation shall be given to the owner and made available to the *code official* upon request in accordance with Sections C408.2.4 and C408.2.5.

Exception: The following systems are exempt from the commissioning requirements:

1. Mechanical systems in buildings where the total mechanical equipment capacity is less than 480,000 Btu/h (140 690 W) cooling capacity and 600,000 Btu/h (175 860 W) heating capacity.
2. Systems included in Section C403.3 that serve dwelling units and sleeping units in hotels, motels, boarding houses or similar units.

C408.2.1 Commissioning plan. A *commissioning plan* shall be developed by a *registered design professional* or *approved agency* and shall include the following items:

1. A narrative description of the activities that will be accomplished during each phase of commissioning, including the personnel intended to accomplish each of the activities.
2. A listing of the specific equipment, appliances or systems to be tested and a description of the tests to be performed.
3. Functions to be tested, including, but not limited to calibrations and economizer controls.
4. Conditions under which the test will be performed. ~~At a minimum,~~ Testing shall affirm winter and summer design conditions and full outside air conditions.
5. Measurable criteria for performance.

C408.2.2 Systems adjusting and balancing. HVAC systems shall be balanced in accordance with generally accepted engineering standards. Air and water flow rates shall be measured and adjusted to deliver final flow rates within the tolerances provided in the product specifications. Test and balance activities shall include air system and hydronic system balancing.

C408.2.2.1 Air systems balancing. Each supply air outlet and *zone* terminal device shall be equipped with means for air balancing in accordance with the requirements of Chapter 6 of the *International Mechanical Code*. Discharge dampers are prohibited on constant volume fans and variable volume fans with motors 10 hp (18.6 kW) and larger. Air systems shall be balanced in a manner to first minimize throttling losses then, for fans with system power of greater than 1 hp (0.74 kW), fan speed shall be adjusted to meet design flow conditions.

Exception: Fans with fan motors of 1 hp (0.74 kW) or less are not required to be provided with a means for air balancing.

C408.2.2.2 Hydronic systems balancing. Individual hydronic heating and cooling coils shall be equipped with means for balancing and measuring flow. Hydronic systems shall be proportionately balanced in a manner to first minimize throttling losses, then the pump impeller shall be trimmed or pump speed shall be adjusted to meet design flow conditions. Each hydronic system shall have either the capability to measure pressure across the pump, or test ports at each side of each pump.

Exceptions: The following equipment are not required to be equipped with means for balancing or measuring flow:

1. Pumps with pump motors of 5 hp (3.7 kW) or less.
2. Where throttling results in no greater than five percent of the nameplate horsepower draw above that required if the impeller were trimmed.

C408.2.3 Functional performance testing. Functional performance testing specified in Sections C408.2.3.1 through C408.2.3.3 shall be conducted.

C408.2.3.1 Equipment. Equipment functional performance testing shall demonstrate the installation and operation of components, systems, and system-to-system interfacing relationships in accordance with approved plans and specifications such that operation, function, and maintenance serviceability for each of the commissioned systems is confirmed. Testing shall include all modes and *sequence of operation*, including under full-load, part-load and the following emergency conditions:

1. All modes as described in the *sequence of operation*;
2. Redundant or *automatic* back-up mode;
3. Performance of alarms; and
4. Mode of operation upon a loss of power and restoration of power.

Exception: Unitary or packaged HVAC equipment listed in Tables C403.2.3(1) through C403.2.3(3) that do not require supply air economizers.

C408.2.3.2 Controls. HVAC control systems shall be tested to document that control devices, components, equipment, and systems are calibrated, adjusted and operate in accordance with approved plans and specifications. Sequences of operation shall be functionally tested to document they operate in accordance with *approved* plans and specifications.

C408.2.3.3 Economizers. Air economizers shall undergo a functional test to determine that they operate in accordance with manufacturer's specifications.

C408.2.4 Preliminary commissioning report. A preliminary report of commissioning test procedures and results shall be completed and certified by the *registered design professional* or *approved agency* and provided to the building owner. The report shall be identified as "Preliminary Commissioning Report" and shall identify:

1. Itemization of deficiencies found during testing required by this section that have not been corrected at the time of report preparation.
2. Deferred tests that cannot be performed at the time of report preparation because of climatic conditions.
3. Climatic conditions required for performance of the deferred tests.

C408.2.4.1 Acceptance of report. *Buildings*, or portions thereof, shall not pass the final mechanical inspection until such time as the *code official* has received a letter of transmittal from the *building owner* acknowledging that the *building owner* has received the Preliminary Commissioning Report.

C408.2.4.2 Copy of report. The *code official* shall be permitted to require that a copy of the Preliminary Commissioning Report be made available for review by the *code official*.

C408.2.5 Documentation requirements. The *construction documents* shall specify that the documents described in this section be provided to the *building owner* within 90 days of the date of receipt of the *certificate of occupancy*.

C408.2.5.1 Drawings. *Construction documents* shall include the location and performance data on each piece of equipment.

C408.2.5.2 Manuals. An operating and maintenance manual shall be provided and include all of the following:

1. Submittal data stating equipment size and selected options for each piece of equipment requiring maintenance.
2. Manufacturer's operation manuals and maintenance manuals for each piece of equipment requiring maintenance, except equipment not furnished as part of the project. Required routine maintenance actions shall be clearly identified.
3. Name and address of at least one service agency.
4. HVAC controls system maintenance and calibration information, including wiring diagrams, schematics, and control sequence descriptions. Desired or field-determined setpoints shall be permanently recorded on control drawings at control devices or, for digital control systems, in system programming instructions.
5. A narrative of how each system is intended to operate, including recommended setpoints.

C408.2.5.3 System balancing report. A written report describing the activities and measurements completed in accordance with Section C408.2.2.

C408.2.5.4 Final commissioning report. A report of test procedures and results identified as "Final Commissioning Report" shall be delivered to the building owner and shall include:

1. Results of functional performance tests.
2. Disposition of deficiencies found during testing, including details of corrective measures used or proposed.
3. Functional performance test procedures used during the commissioning process including measurable criteria for test acceptance, provided herein for repeatability.

Exception: Deferred tests which cannot be performed at the time of report preparation due to climatic conditions.

C408.3 Lighting system functional testing. Controls for automatic lighting systems shall comply with Section C408.3.

C408.3.1 Functional testing. Testing shall ensure that control hardware and software are calibrated, adjusted, programmed and in proper working condition in accordance with the construction documents and manufacturer's installation instructions. The construction documents shall state the party who will conduct the required functional testing. Where required by the code official, an approved party independent from the design or construction of the project shall be responsible for the functional testing and shall provide documentation to the code official certifying that the installed lighting controls meet the provisions of Section C405. Where occupant sensors, time switches, programmable schedule controls, photosensors or daylighting controls are installed, the following procedures shall be performed:

1. Confirmation that the placement, sensitivity and time-out adjustments for occupant sensors yield acceptable performance.
2. Confirmation that the time switches and programmable schedule controls are programmed to turn the lights off.

3. Confirmation that the placement and sensitivity adjustments for photosensor controls reduce electric light based on the amount of usable daylight in the space as specified.

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The changes proposed are intended to accomplish consistency between IECC and IgCC commissioning provisions; to clarify the application of various exceptions, and consistency of phrasing and terminology. If the changes to the IECC are approved, a companion change will be submitted by the SEHPCAC for 2014.

Specific changes are:

- C408.2.1 – Replaces the 'as a minimum in item 4 with a new item 6 which makes it clear that the registered design professional should include other elements in the commissioning plan beyond the listed 5 where the designer sees such is appropriate.
- C408.2.2.1 – Provides a complete sentence for the exception. As the preceding paragraph has multiple requirements, it is essential that the exception clearly state the provisions which are 'excepted'.
- C408.2.2.2 – Completes the exceptions; clarifies what is being 'excepted'.
- C408.3.1 – A grammatical clean-up. The lead in text states that 'the following procedures shall be performed'. The text of the 3 listed items are commands, not procedures.

Cost Impact: The code change proposal will not increase the cost of construction. The proposal is editorial in nature and will not affect the cost of construction.

CE351-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C408.2-EC-THOMPSON-SEHPCAC

CE352 – 13

C408.2

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C408.2 Mechanical systems commissioning and completion requirements. Prior to ~~passing~~ the final mechanical inspection, the *registered design professional* shall provide evidence of mechanical systems *commissioning* and completion in accordance the provisions of this section.

Construction document notes shall clearly indicate provisions for *commissioning* and completion requirements in accordance with this section and are permitted to refer to specifications for further requirements. Copies of all documentation shall be given to the owner and made available to the *code official* upon request in accordance with Sections C408.2.4 and C408.2.5.

Exception: The following systems are exempt from the commissioning requirements:

1. Mechanical systems in buildings where the total mechanical equipment capacity is less than 480,000 Btu/h (140 690 W) cooling capacity and 600,000 Btu/h (175 860 W) heating capacity.
2. Systems included in Section C403.3 that serve dwelling units and sleeping units in hotels, motels, boarding houses or similar units

Reason: The current code requires something to be done in advance of a future event. The registered design professional can only provide something either prior to an inspection or after passage of the inspection. This proposal clarifies the order in which commissioning events take place, to clarify the code to foster implementation and compliance verification.

Cost Impact: The code change proposal does not increase the cost of construction.

CE352-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C408.2-#1-EC-WILLIAMS.doc

CE353 – 13

C408.2

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C408.2 Mechanical systems commissioning and completion requirements. Prior to passing the final mechanical inspection, the *registered design professional* shall provide evidence of mechanical systems *commissioning* and completion in accordance the provisions of this section.

Construction document notes shall clearly indicate provisions for *commissioning* and completion requirements in accordance with this section and are permitted to refer to specifications for further requirements. Copies of all documentation shall be given to the owner and made available to the *code official* upon request in accordance with Sections C408.2.4 and C408.2.5.

Exceptions: The following systems are exempt ~~from the commissioning requirements:~~

1. Mechanical systems in buildings where the total mechanical equipment capacity is less than 480,000 Btu/h (140 690 W) cooling capacity and 600,000 Btu/h (175 860 W) heating capacity.
2. Systems included in Section C403.3 that serve individual dwelling units and sleeping units ~~in hotels, motels, boarding houses or similar units~~

Reason: This proposal simplifies and clarifies the exceptions to required mechanical systems commissioning. The objective of this proposal is to clarify the code to foster implementation and compliance verification. It is also not necessary in an exception to re-state the topic in the parent section to which the exception applies. The term "sleeping unit" is defined in the code so the delineation of where such units may or may not occur is not needed and is confusing. The intent, regardless of the type of building in which they are located, is that the systems serving individual sleeping units need not be commissioned. The word "individual" is added so that complex central systems serving multiple sleeping units would not be exempt from commissioning.

Cost Impact: The code change proposal will not increase the cost of construction.

CE353-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C408.2 #2-EC-WILLIAMS.doc

CE354 – 13

C408.2.2.1

Proponent: Amanda Hickman, InterCode Incorporated, representing AMCA International
(Amanda@InterCodeinc.com)

Revise as follows:

C408.2.2.1 Air system balancing. Each supply air outlet and *zone* terminal device shall be equipped with means for air balancing in accordance with the requirements of Chapter 6 of the *International Mechanical Code*. Discharge dampers used for air system balancing are prohibited on constant volume fans and variable volume fans with motors 10 hp (18.6 kW) and larger. Air systems shall be balanced in a manner to first minimize throttling losses then, for fans with system power of greater than 1 hp (0.74 kW), fan speed shall be adjusted to meet design flow conditions.

Exception: Fans with fan motors of 1 hp (0.74 kW) or less.

Reason: Discharge dampers are often used to shield a building area from rain and snow when the fan is not operating. In these situations, dampers use no energy when the fan is off and a minuscule amount of energy when the fan is running.

The added language provides clarity to this section and ensures that the restriction on discharge dampers only applies to those used for air balancing purposes. Disallowing discharge dampers altogether would constitute a restriction and energy loss while the fan is running.

Cost Impact: This proposal will not increase the cost of construction.

CE354-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C408.2.2.1-EC-HICKMAN.doc

CE355 – 13

C408.2.4.1

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

C408.2.4.1 Acceptance of report. *Buildings*, or portions thereof, shall not be considered acceptable for a final inspection pursuant to Section C104.3 ~~pass the final mechanical inspection until such time as the~~ *code official* has received a letter of transmittal from the *building* owner acknowledging that the *building* owner has received the Preliminary Commissioning Report.

Reason: This proposal revises the commissioning provision so that buildings cannot be considered for a final inspection (e.g., do not pass the mechanical inspection) until the owner indicates in writing they have the required commissioning report. This clarifies the code through the reference section for final inspections and eliminates unneeded language “such time as”.

Cost Impact: The code change proposal will not increase the cost of construction.

CE355-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C408.2.4.1-EC-WILLIAMS.doc

CE356 – 13

C408.2.5.2

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C408.2.5.2 Manuals. An operating and maintenance manual shall be provided and include all of the following:

1. Submittal data stating equipment size and selected options for each piece of equipment requiring maintenance.
2. Manufacturer's operation manuals and maintenance manuals for each piece of equipment requiring maintenance, except equipment not furnished as part of the project. Required routine maintenance actions shall be clearly identified.
3. Name and address of at least one service agency.
4. HVAC controls system maintenance and calibration information, including wiring diagrams, schematics, and control sequence descriptions. Desired or field-determined setpoints shall be permanently recorded on control drawings at control devices or, for digital control systems, in system programming instructions.
5. Submittal data indicating all selected options for each piece of lighting equipment and lighting controls.
6. Operation and maintenance manuals for each piece of lighting equipment. Required routine maintenance actions, cleaning and recommended relamping shall be clearly identified.
7. A schedule for inspecting and recalibrating all lighting controls.
8. A narrative of how each system is intended to operate, including recommended setpoints.

Reason: The current requirements for manuals seems specific to HVAC documentation. This proposal adds additional language for the documentation, maintenance, and inspection of lighting equipment and controls. These requirements are consistent with ANSI/ASHRAE/IES Standard 90.1

Cost Impact: The code change proposal will increase the cost of construction.

CE356-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C408.2.5.2-EC-FERGUSON.doc

CE357– 13

C408.3.1

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE) (sferguson@ashrae.org)

Revise as follows:

C408.3.1 Functional testing. Testing shall ensure that control hardware and software are calibrated, adjusted, programmed and in proper working condition in accordance with the construction documents and manufacturer's installation instructions. ~~The construction documents shall state the party who will conduct the required functional testing.~~ Where required by the code official, an approved party individual independent from the design or construction of the project shall be responsible for the functional testing and shall provide documentation to the code official certifying that the installed lighting controls meet the provisions of Section C405.

Where occupant sensors, time switches, programmable schedule controls, photosensors or daylighting controls are installed, the following procedures shall be performed:

1. Confirm that the placement, sensitivity and time-out adjustments for occupant sensors yield acceptable performance.
 - 1.1. For projects with up to seven occupancy sensors, all occupancy sensors shall be tested
 - 1.2. For projects with more than seven the following shall be verified:
 - 1.2.1. Status indicator (as applicable) operates correctly
 - 1.2.2. The controlled lights turn off or down to the permitted level within the required time.
 - 1.2.3. For auto-on occupant sensors, the lights do turn on to the permitted level when someone enters the space.
 - 1.2.4. For manual on sensors, the lights turn on only when manually activated
 - 1.2.5. The lights are not incorrectly turned on by movement in nearby areas or by HVAC operation
2. Confirm that the time switches and programmable schedule controls are programmed to turn the lights off.
3. Confirm that all control devices for daylight controls have been properly located, field-calibrated, and set for design set points and threshold light levels. All daylight control devices shall only be readily accessible to authorized personnel. ~~the placement and sensitivity adjustments for photosensor controls reduce electric light based on the amount of usable daylight in the space as specified.~~

Reason: For consistency with ASHRAE/IES 90.1. These revisions add more specific requirements to the functional testing of lighting controls for the common controls required by the standard and adds some clarification to the description of entities allowed to perform the testing and verification.

Cost Impact: The code change proposal will increase the cost of construction when lighting controls are required in parking garages.

CE357-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

C408.3.1-EC-FERGUSON.doc

CE358 – 13

C408.4 (NEW), C408.4.1 (NEW), C408.4.1.1 (NEW), C408.4.1.2 (NEW), C4038.4.1.3 (NEW)

Proponent: Tim Nogler, Washington State Building Code Council (tim.nogler@des.wa.gov)

Add new text as follows:

C408.4 Service water heating systems commissioning and completion requirements. Service water heating equipment and controls shall comply with Section 408.4. Construction document notes shall clearly indicate provisions for *commissioning* and completion requirements in accordance with this section and are permitted to refer to specifications for further requirements.

Exception: The following systems are exempt from the commissioning requirements:

1. Service water heating systems in buildings where the largest service water heating system capacity is less than 200,000 Btu/h (58 562 W) and where there are no pools or inground permanently installed spas.

C408.4.1 Functional performance testing. Functional performance testing specified in Sections C408.4.1.1 through C408.4.1.3 shall be conducted. Written procedures which clearly describe the individual systematic test procedures, the expected systems' response or acceptance criteria for each procedure, the actual response or findings, and any pertinent discussion shall be followed. Testing shall affirm operation with the system under 50 percent water heating load.

C408.4.1.1 Equipment. Equipment functional performance testing shall demonstrate the installation and operation of components, systems, and system-to-system interfacing relationships in accordance with approved plans and specifications such that operation, function, and maintenance serviceability for each of the commissioned systems is confirmed. Testing shall include all modes and *sequence of operation*, including under full-load, part-load and the following emergency conditions:

1. Redundant or *automatic* back-up mode;
2. Performance of alarms; and
3. Mode of operation upon a loss of power and restoration of power.

C408.4.1.2 Controls. Service water heating controls shall be tested to document that control devices, components, equipment, and systems are calibrated, adjusted and operate in accordance with approved plans and specifications. Sequences of operation shall be functionally tested to document they operate in accordance with *approved plans and specifications*.

C408.4.1.3 Pools and spas. Service water heating equipment, time switches, and heat recovery equipment which serve pools and inground permanently installed spas shall undergo a functional test to determine that they operate in accordance with manufacturer's specifications.

Reason: Large water heating systems (over 200,000 Btu/h) require some fundamental testing of their full sequence of operation and their recovery to normal operations after various emergency conditions. This additional commissioning is inexpensive and provides potential for significant long-term energy savings. Pools and in-ground spas are included, to ensure that their heaters, time switches and heat recovery systems are functioning properly.

Cost Impact: The code change proposal will increase the cost of construction.

CE358-13

C408.4 (NEW) #2-EC-NOGLER.doc

CE359 – 13

C408.4 (NEW), C408.4.1 (NEW), C409 (NEW)

Proponent: Tim Nogler, Washington State Building Code Council (tim.nogler@des.wa.gov)

Add new text as follows:

C408.4 Metering system commissioning. Energy metering systems required by Section 409 shall comply with Section 408.5 and be included in the commissioning process required by Section 408.1. Construction documents shall clearly indicate provisions for *commissioning* in accordance with section 408 and are permitted to refer to specifications for further requirements.

C408.4.1 Functional testing. Functional testing shall be conducted by following written procedures which clearly describe the individual systematic test procedures, the expected systems' response or acceptance criteria for each procedure, the actual response or findings, and any pertinent discussion. Functional testing shall document that energy source meters, energy end-use meters, the energy metering data acquisition system, and required energy consumption display are calibrated, adjusted and operate in accordance with approved plans and specifications. Testing shall confirm that:

1. The metering system devices and components work properly under low and high load conditions
2. The metered data is delivered in a format that is compatible with the data collection system
3. The energy display is accessible to building operation and management personnel
4. The energy display meets code requirements regarding views required in Section 409.4.3. The display shows energy data in identical units (e.g. kWh).

SECTION C409

ENERGY METERING AND ENERGY CONSUMPTION MANAGEMENT

C409.1 General. Buildings with a gross conditioned floor area greater than 50,000 square feet shall comply with Section C409. Buildings shall be equipped to measure, monitor, record and display energy consumption data for each energy source and end use category per the provisions of this section, to enable effective energy management.

Exceptions:

1. Tenant spaces within buildings where the tenant space has its own utility services and utility meters and the space is less than 25,000 square feet gross conditioned floor area.
2. Buildings in which there is no gross conditioned floor area greater than 25,000 square feet, including building common area, that is served by its own utility services and utility meters.

C409.1.2 Alternate metering methods. Where approved by the code official, energy use metering systems are permitted to differ from those required by this section, provided that they are permanently installed and that the source energy measurement, end use category energy measurement, data storage and data display have similar accuracy to and are at least as effective in communicating actionable energy use information to the building management and users, as those required by this section.

C409.1.2 Conversion factor. Any threshold stated in kW shall include the equivalent BTU/heating and cooling capacity of installed equipment at a conversion factor of 3,412 BTU per kW at 50 percent demand.

C409.2 Energy source metering. Buildings shall have a meter at each energy source. For each energy supply source listed in Sections C409.2.1 through C409.2.4, meters shall be capable of collecting data for the whole building, or for each separately metered portion of the building where permitted by the Exceptions to Section C409.1.

Exceptions:

1. Energy source metering is not required where end use metering for an energy source accounts for all usage of that energy type within a building, and the data acquisition system accurately totals the energy delivered to the building or separately-metered portion of the building.
2. Solid fuels such as coal, firewood or wood pellets that are delivered via mobile transportation do not require metering.

C409.2.1 Electrical energy. Metering shall be provided for electrical energy supplied to the building and its associated site, including site lighting, parking, recreational facilities, and other areas that serve the building and its occupants.

C409.2.2 Gas and liquid fuel supply energy. Metering shall be provided for natural gas, fuel oil, propane and other gas or liquid fuel energy supplied to the building and site.

C409.2.3 District energy. Metering shall be provided for net energy extracted from district steam systems, district chilled water loops, district hot water systems, or other energy sources serving multiple buildings.

C409.2.4 Site-generated renewable energy. Metering shall be provided for net energy generated from on-site solar, wind, geothermal, tidal or other natural sources.

C409.3 End-use metering. Meters shall be provided to collect energy use data for each end-use category listed in Sections C409.3.1 and C409.3.2. Meters shall be capable of collecting data for the whole building or for each separately metered portion of the building where permitted by the Exceptions to Section C409.1. Multiple meters are permitted to be used for any end-use category, provided that the data acquisition system totals all of the energy used by that category.

Exceptions:

1. HVAC and water heating equipment serving only an individual dwelling unit does not require end-use metering.
2. Separate metering is not required for fire pumps, stairwell pressurization fans or other life safety systems that operate only during testing or emergency.
3. End use metering is not required for individual tenant spaces not greater than 2,500 square feet in floor area where a dedicated source meter meeting the requirements of Section C409.4.1 is provided for the tenant space.

C409.3.1 HVAC system energy use. Submetering shall be provided for energy including electrical, gas, liquid fuel, district steam and district chilled water that is used by boilers, chillers, pumps, fans and other equipment used to provide space heating, space cooling, dehumidification and ventilation to the building, but not including energy that serves process loads, water heating or miscellaneous loads as defined in Section C409.3. Multiple HVAC energy sources, such as gas, electric and steam, are not required to be summed together.

Exceptions:

1. 120 volt equipment.
2. 208/120 volt equipment in a building where the main service is 480/277 volt power.

C409.3.2 Water heating energy use. Submetering shall be provided for energy used for heating of domestic and service hot water, but not energy used for space heating.

Exception: Water heating energy use less than 50 kW does not require end-use metering.

C409.4 Meters. Meters and other measurement devices required by Section C409 shall be configured to automatically communicate energy data to a data acquisition system. Source meters are permitted to be any digital-type meters. Current sensors or flow meters are allowed for end use metering, provided that they have a tested accuracy of plus or minus 2 percent. Required metering systems and equipment shall provide at least hourly data that is fully integrated into the data acquisition and display system per the requirements of Section C409.

C409.5 Data acquisition system. The data acquisition system shall be capable of storing the data from meters and other sensing devices for a minimum of 36 months. For each energy supply and end use category required by Sections C409.2 and C409.3, it shall provide real-time energy consumption data and logged data for any hour, day, month or year.

C409.6 Energy display. For each building subject to Section C409, either a permanent, readily accessible and visible display, or a web page or other electronic document accessible to building management or to a third-party energy data analysis service shall be provided in the building accessible by building operation and management personnel. The display shall be capable of graphically displaying the current energy consumption rate for each whole building energy source, plus each end use category, as well as the average and peak values for any day, week or year.

C409.7 Commissioning. The entire system shall be commissioned in accordance with Section C408.5. Deficiencies found during testing shall be corrected and re-tested and the commissioning report shall be updated to confirm that the entire metering and data acquisition and display system is fully functional.

C409.8 Existing buildings that were constructed subject to the requirements of this Section. Where new or replacement systems or equipment are installed in an existing building that was constructed subject to the requirements of this Section, metering shall be provided for such new or replacement systems or equipment so that their energy use is included in the corresponding end-use category defined in Section C409.2. This includes systems or equipment added in conjunction with additions or alterations to existing buildings.

C409.8.1 Additions. For existing buildings smaller than 50,000 square feet that were subject to the requirements of this section, where an addition increases the total conditioned floor area by more than 50 percent of the existing building area and causes the total building conditioned floor area to exceed 50,000 square feet, metering and data acquisition systems shall be provided for the new additions over 25,000 square feet in accordance with the requirements of Sections C409.2 and C409.3.

Reason: Energy metering is a critical tool to achieve actual energy savings in buildings. This proposal comes from the State of Washington amendments to the 2012 IECC. Washington state adopted section 409 energy metering based on based on input from energy conservation experts, and experience implementing the metering systems in high performance buildings.

Use of "advanced meters" with a data acquisition and display system, rather than standard utility meters, provides several opportunities for energy savings. This is why the 2013 Edition of ASHRAE 90.1 will have metering requirements, the EPA 2005 requires extensive metering retrofits for existing federal buildings, the Department of Defense requires metering for almost all new construction and alteration projects, LEED provides credits for continuous metering, and ASHRAE Standard 189.1 mandates extensive metering and sub-metering. The DOE Metering Best Practices Guide, Table 8.1, estimates typical savings from metering to be 5% - 15% with more extensive savings sometimes realized. (Elsewhere in the Guide a more conservative estimate of 2% - 10% is cited.) Specific benefits include

- Advanced metering & sub-metering provides automatic benchmarking of building energy use patterns
- Allows comparison of actual energy use for new buildings to modeled energy use
- Advanced metering and Sub-metering will decrease building energy use
 - A recent study in the Puget Sound area showed that more than half of all economizers are not functioning correctly. In most cases, the building owners are not aware of this condition.
- Advanced metering allows building managers to track energy use over time.
 - Data trending provided in the dashboard shows how the building is doing compared to other time periods.
 - Allows building managers to detect system malfunctions and incorrect control settings

Cost Impact: The code change proposal will increase the cost of construction.

CE360 – 13

C409 (NEW)

Proponent: Duane Jonlin, City of Seattle, representing City of Seattle Department of Planning and Development (duane.jonlin@seattle.gov)

Add new text as follows:

SECTION C409

ENERGY CONSUMPTION MANAGEMENT

C409.1 General. Buildings with a gross conditioned floor area larger than 20,000 square feet shall comply with Section C409. Buildings shall be equipped to measure, monitor, record and display energy consumption data for each energy supply and end use category in accordance with this section.

Exceptions:

1. Spaces of less than 10,000 square feet gross conditioned floor area, occupied by one tenant and served by independent utility services and utility meters .
2. Building common areas totaling less than 10,000 square feet gross conditioned floor area and served by independent utility services and utility meters.

C409.2 Energy supply metering. Buildings shall have a meter at each energy supply source. For each energy supply source listed in Sections C409.2.1 through C409.2.4, meters shall be capable of collecting data for the whole building or for each separately metered portion of the building.

Exceptions:

1. Energy supply source metering is not required where end use metering for an energy source accounts for all usage of that energy type within a building, and the data acquisition system accurately totals the energy delivered to the building or separately-metered portion of the building.
2. Solid fuels, including, but not limited to, coal, firewood or wood pellets that are delivered via mobile transportation do not require metering.

C409.2.1 Electrical energy. Meters shall collect data for electrical energy supplied to the building and its associated site, including site lighting, parking, recreational facilities, and other areas that serve the building and its occupants.

C409.2.2 Gas and liquid fuel supply energy. Meters shall collect data for natural gas, fuel oil, propane and other gas or liquid fuel energy supplied to the building and site.

C409.2.3 District energy. Meters shall collect data for net energy extracted from district steam systems, district chilled water loops, district hot water systems, or other energy sources serving multiple buildings.

C409.2.4 Site-generated renewable energy. Meters shall collect data for net energy generated from on-site solar, wind, geothermal, tidal or other natural sources.

C409.3 End-use metering. Meters shall be provided to collect energy use data for each end-use category listed in Sections C409.3.1 through C409.3.5. These meters shall be capable of collecting data for the whole building or for each separately metered portion of the building other than those subject to the exceptions to Section C409.1. Multiple meters are permitted to be used for any end-use category, provided that the data acquisition system totals all of the energy used by that category. Thresholds stated in kW shall include the equivalent BTU/h heating and cooling capacity of installed equipment at a conversion factor of 3,412 BTU per kW at 50 percent demand.

Exceptions:

1. End-use metering is not required for HVAC and water heating equipment serving only an individual dwelling unit.
2. Separate metering is not required for fire pumps, stairway pressurization fans or other life safety systems that operate only during testing or emergency.
3. End use metering is not required for individual tenant spaces not exceeding 2,500 square feet in floor area when a dedicated supply meter meeting the requirements of Section C409.4.1 is provided for the tenant space.
4. Not more than 5 percent of the total connected load of any of the end-use metering categories in Sections C409.3.1 through C409.3.7 is permitted to be excluded from that end-use data collection.
5. Not more than 5 percent of the total connected load of any of the end-use metering categories in Sections C409.3.1 through C409.3.7 is permitted to consist of loads not part of that category.

C409.3.1 HVAC system energy use. Meters shall collect energy use data for electrical, gas, liquid fuel, district steam and district chilled water that is used by equipment used to provide space heating, space cooling, dehumidification and ventilation to the building, but not including energy that serves process loads or water heating. Multiple HVAC energy sources, such as gas, electric and steam, are not required to be summed together.

Exceptions:

1. 120 volt equipment is not required to be included in the HVAC system metering.
2. 208/120 volt equipment in a building where the main service is 480/277 volt power is not required to be included in the HVAC system metering.

C409.3.2 Water heating energy use. Meters shall collect energy use data for heating of domestic and service hot water, but not energy used for space heating.

Exception: Water heating energy loads less than 50 kVA do not require end-use metering.

C409.3.3 Lighting system energy use. Meters shall collect data for energy used by interior and exterior lighting, but not including plug-in task lighting.

C409.3.4 Plug load system energy use. Meters shall collect data for energy used by appliances, computers, plugged-in task lighting, and other equipment and devices, but not including vertical transportation equipment or equipment covered by other end-use metering categories listed in C409.3.

Exception: Where the total capacity of plug load circuits is less than 50 kVA, end-use metering is not required.

C409.3.5 Process load system energy use. Meters shall collect data for energy used by any non-building process load (e.g. nonresidential refrigeration and cooking, industrial equipment).

Exception: Process load energy use less than 50 kVA does not require end-use metering.

C409.4 Measurement devices, data acquisition system and energy display. Each building or separately metered portion of a building shall provide measurement devices, a data acquisition system and an energy display in accordance with this section.

C409.4.1 Measurement devices. Meters and other measurement devices shall be configured to automatically communicate energy data to a data acquisition system. Digital-type meters are permitted to be used as supply source meters. Current sensors or flow meters are allowed for end use metering.

provided that they have a tested accuracy of plus or minus 2 percent. Required metering systems and equipment shall provide at least hourly data that is fully integrated into the data acquisition and display systems required by Section C409.4.

C409.4.2 Data acquisition system. The data acquisition system shall be capable of storing the data from the required meters and other sensing devices for a minimum of 36 months. For each energy supply and end use category required by Sections C409.2 and C409.3, the data acquisition system shall provide real-time energy consumption data and logged data for every hour, day, month or year.

C409.4.3 Energy display. For each building subject to Section C409, either a permanent, readily accessible and visible display, or a web page or other electronic document accessible to building management or to a third-party energy data analysis service shall be provided for the building and shall be accessible to building operation and management personnel. The display shall be capable of graphically displaying the current energy consumption rate for each whole building energy supply, plus each end use category, as well as the average and peak values for every day, week and year.

C409.5 Metering for existing buildings. Where new or replacement systems or equipment are installed in an existing building that was constructed subject to the requirements of Section C409, metering shall be provided for such new or replacement systems or equipment so that their energy use is included in the corresponding end-use category defined in Section C409.3.

Reason: The energy code is approaching a limit to the ability to control energy use solely through design and construction. Increasingly, savings will need to come from the informed use and operation of our buildings, for which end-use metering is a fundamental building block. This proposal is developed based on Seattle's experience implementing a metering code during the 2009 code cycle. It segregates out basic energy use categories to facilitate visualization of patterns and evaluate the impact of changes.

Advanced metering displays save significant energy by providing building owners and managers the tools to monitor and manage energy usage. Use of "advanced meters" rather than standard utility meters provides multiple opportunities for energy savings:

- Benchmarking and data trending of building energy use patterns, so that anomalies are easily detectable
- Comparison of actual energy use of new building systems to modeled energy use
- Evaluating the impact of changes and interventions
- Identifying and correcting system malfunctions

The DOE Metering Best Practices Guide, Table 8.1, estimates typical savings from metering to be 5% - 15% with more extensive savings sometimes realized. EPA 2005 requires extensive metering retrofits for existing federal buildings, the Department of Defense requires metering for almost all new construction and alteration projects, LEED provides credits for continuous metering, and ASHRAE Standard 189.1 mandates extensive metering and sub-metering.

Cost Impact: The code change proposal will increase the cost of construction.

C409 (NEW)-EC-JONLIN.doc

CE361 – 13

C202 (NEW), C410 (NEW)

Proponent: Duane Jonlin, City of Seattle, representing City of Seattle Department of Planning and Development (duane.jonlin@seattle.gov)

Add new text as follows:

C410.1 General. A solar zone shall be provided for buildings which are five stories or less in height above grade plane, and shall be located on the roof of the building or elsewhere on the site. The solar zone shall comply with Sections C410.2 through C410.8 and the International Fire Code.

Exceptions:

1. A solar zone is not required where the solar exposure of the building's roof area is less than 75 percent of that of an unobstructed area in the same location, as measured by one of the following:
 - 1.1. Incident solar radiation expressed in kWh/ft²-yr using typical meteorological year (TMY) data
 - 1.2. Annual sunlight exposure expressed in cumulative hours per year using TMY data
 - 1.3. Shadow studies indicating that the area is more than 25 percent in shadow, on September 21 at 10am, 11am, 12pm, 1pm, and 2pm solar
2. Subject to the approval of the code official, buildings with extensive rooftop equipment that would make full compliance with this section impractical shall be permitted to provide a smaller solar zone than that required by Section C410.3.

C410.2 Minimum area. The minimum area of the solar zone shall be determined in accordance with Section C410.2.1 or C410.2.2, whichever results in the smaller area.

C410.2.1 Percentage of roof area. An area equal to 40 percent of the roof area calculated as the horizontally-projected gross roof area less the area covered by skylights, occupied roof decks and planted areas.

C410.2.2 Percentage of electrical service size. The electrical service size shall be the rated capacity of the total of all electrical services to the building, and the required solar zone size shall be based upon 10 peak watts of PV per square foot for 20 percent of the size of the electrical service.

C410.3 Obstructions. The solar zone shall be free of pipes, vents, ducts, HVAC equipment, skylights and other obstructions, except those serving PV or SWH systems within the solar zone. PV and SHW systems are permitted to be installed within the solar zone.

C410.4 Shading. Any existing or new object on the building or site that is located south, east, or west of the solar zone shall be set back from the solar zone a distance at least two times its height above the roof surface. Such objects include but are not limited to taller portions of the building itself, parapets, chimneys, antennas, signage, rooftop equipment, trees and roof plantings. The solar zone shall not be located on a roof slope greater than 2:12 that faces within 45° of true north.

C410.5 Non-contiguous area. The solar zone is permitted to be comprised of smaller separated sub-zones. Each subzone shall be at least 5 feet wide in the narrowest dimension.

C410.6 Access. Areas contiguous to the solar zone shall provide access pathways and provisions for emergency smoke ventilation as required by the International Fire Code.

C410.7 Structural integrity. Where the *solar zone* is on the roof of the building or another structure on the site, the as-designed dead load and live load for the *solar zone* shall be clearly marked on the construction documents, and shall accommodate future PV or SHW arrays at an assumed dead load of 5 pounds per square foot in addition to other required live and dead loads. For PV systems, a location for inverters shall be designated either within or adjacent to the solar zone, with a minimum area of 2 square feet for each 1000 square feet of solar zone area, and shall accommodate an assumed dead load of 175 pounds per square foot.

C410.8 PV or SWH interconnection provisions. Buildings shall provide for the future interconnection of either a PV system in accordance with Section C410.2.8.1 or an SWH system in accordance with Section C410.2.8.2.

C410.2.8.1 PV interconnection. A capped roof penetration sleeve shall be provided in the vicinity of the future inverter, sized to accommodate the future PV system conduit. Interconnection of the future PV system shall be provided for at the main service panel, either ahead of the service disconnecting means or at the end of the bus opposite the service disconnecting means, in one of the following forms:

1. A space for the mounting of a future overcurrent device, sized to accommodate the largest standard rated overcurrent device that is less than 20 percent of the bus rating; or
2. Lugs sized to accommodate conductors with an ampacity of at least 20 percent of the bus rating, to enable the mounting of an external overcurrent device for interconnection.

The electrical construction documents shall indicate the following:

1. Solar zone boundaries and access pathways;
2. Location for future inverters and metering equipment; and
3. Route for future wiring between the PV panels and the inverter, and between the inverter and the main service panel.

C410.2.8.2 SWH interconnection. Two capped pipe tees shall be provided upstream of the domestic water heating equipment to provide plumbing interconnections between a future SWH system and the domestic water heating system. Two roof penetration sleeves shall be provided in the vicinity of the solar zone, capable of accommodating supply and return piping for a future SWH system.

The plumbing construction documents shall indicate the following:

1. Solar zone boundaries and access pathways;
2. Location for future hot water storage tanks; and
3. Route for future piping between the solar zone and the plumbing interconnection point, following the shortest feasible pathway.

Add new definition as follows:

SECTION C202 GENERAL DEFINITIONS

SOLAR ZONE. A clear area or areas reserved solely for current and future installation of photovoltaic or solar hot water systems.

Reason: The cost of photovoltaic and solar water heating systems has declined markedly in recent years, but at this point they are still only marginally cost-effective. However, their cost continues to decline, and this rule will prepare our new building stock to easily install such systems at an appropriate time. As energy costs rise and solar generation costs decline, a point will be reached where large solar energy systems are a viable investment. This rule brings that date closer in time by clearing away any physical impediments to future installation.

The rule requires an unobstructed "solar zone" for most non-residential buildings of five stories or less, either 40 percent of the building's roof area, or an area large enough to generate 20% of the building's electricity.

Example: A building with a 10,000 SF total roof area, 1,000 SF skylight area, and a 400 Amp, 240 volt single phase electrical service is required to provide a solar zone area of the smaller of the following:

1. $[40\% \times (10,000 \text{ SF roof area} - 1,000 \text{ SF skylights})] = 3,600 \text{ SF}$, or
 2. $[400 \text{ Amp} \times 240 \text{ Volts} \times 20\% / 10 \text{ watts per SF}] = 1,920 \text{ SF}$
- Therefore, a solar zone of 1,920 square feet is required

The solar zone requires a dedicated pathway for future connection to the electrical or water heating system, and may also be located above carports, canopies, or elsewhere on the building or site. Exemptions are provided for roofs that are extensively shaded or congested with equipment.

Cost Impact: The code change proposal will increase the cost of construction.

TENTATIVE ORDER OF DISCUSSION 2013 PROPOSED CHANGES TO THE INTERNATIONAL ENERGY CONSERVATION CODE – RESIDENTIAL

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation **does not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some Residential Energy Changes may not be included on this list as they are being heard by another committee. Please consult the Cross Index of Proposed Changes. Note also that RE1-RE9 are moved to later in the hearing order to all grouping consideration of proposed changes to Chapters 1 and 3 near the beginning of the the consideration of Chapters 1 and 3 of the IECC-Commercial Provisions.

R101.4.3 (IRC N1101.3)

Proponent: Brenda A. Thompson, Clark County Development Services, Las Vegas NV, representing ICC Sustainability, Energy & High Performance Building Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

R101.4.3 (N1101.3) Additions, alterations, renovations or repairs. Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.

Exception: The following need not comply provided the energy use of the building is not increased:

1. Storm windows installed over existing fenestration.
2. Glass only replacements in an existing sash and frame.
3. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.
4. Construction where the existing roof, wall or floor cavity is not exposed.
5. Reroofing for roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.
- ~~6. Replacement of existing doors that separate conditioned space from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a conditioned space from the exterior shall not be removed.~~
- ~~7. 6.~~ Alterations that replace less than 50 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.
- ~~8. 7.~~ Alterations that replace only the bulb and ballast within the existing luminaires in a space provided that the *alteration* does not increase the installed interior lighting power.

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

It is inappropriate to have item 6 in the existing building provisions of the Residential IECC. Chapter 4(RE) has no provisions requiring a vestibule or revolving door in a residential building. Even if such were provided in an existing residential building, the code shouldn't require keeping a feature not required by the code for new construction of a like building.

Cost Impact: The change will not increase the cost of construction.

RE2 – 13

R102.1.2 (NEW) (IRC N1101.8), Chapter 5 (IRC Chapter 44)

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

Add new text as follows:

R102.1.2 (N1101.8) HERS score compliance. Buildings with a certificate of compliance stating the building complies with the HERS scores in Table R102.1.2 shall be considered in compliance with this code. The certificate of compliance shall be from an approved source.

TABLE 102.1.2 (N1101.8)
REQUIRED HERS SCORES BY CLIMATE ZONE AND HOUSING CHARACTERISTICS

<u>Climate Zone</u>	<u>Building Characteristics</u>	<u>Maximum Score</u>
<u>TBD</u>	<u>TBD</u>	<u>TBD</u>

Add new standard to Chapter 5 as follows:

Residential Energy Services Network, Inc.
P.O. Box 4561
Oceanside, CA 92052-4561

RESNET

RESNET PDS 301-01- 2013 RESNET Mortgage Industry National Home Energy Rating Standards.

Reason: The draft RESNET standard is out for public review now. While it is not ready for reference, the standard may be upgraded to where it can be referenced. If the proprietary nature of the proposed standard was resolved, the score was revised to be based on energy as calculated by the IECC, and other comments were resolved, then the RESNET infrastructure could be an asset in demonstrating code compliance. This is a placeholder for that possibility in this code cycle.

Cost Impact: This code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, RESNET PDS 301-01- 2013 RESNET Mortgage Industry National Home Energy Rating Standards with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

For SI: 1 foot = 304.8 mm.

- R*-values are minimums. *U*-factors and SHGC are maximums. When insulation is installed in a cavity which is less than the label or design thickness of the insulation, the installed *R*-value of the insulation shall not be less than the *R*-value specified in the table.
- The fenestration *U*-factor column excludes skylights. The SHGC column applies to all glazed fenestration. Exception: Skylights may be excluded from glazed fenestration SHGC requirements in Climate Zones 1 through 3 where the SHGC for such skylights does not exceed 0.30.
- "15/19" means R-15 continuous insulation on the interior or exterior of the home or R-19 cavity insulation at the interior of the basement wall. "15/19" shall be permitted to be met with R-13 cavity insulation on the interior of the basement wall plus R-5 continuous insulation on the interior or exterior of the home. "10/13" means R-10 continuous insulation on the interior or exterior of the home or R-13 cavity insulation at the interior of the basement wall.
- R-5 shall be added to the required slab edge *R*-values for heated slabs. Insulation depth shall be the depth of the footing or 2 feet, whichever is less in Climate Zones 1 through 3 for heated slabs.
- There are no SHGC requirements in the Marine Zone.
- Basement wall insulation is not required in warm-humid locations as defined by Figure R301.1 and Table R301.1.
- Or insulation sufficient to fill the framing cavity, R-19 minimum.
- First value is cavity insulation, second is continuous insulation or insulated siding, so "13+5" means R-13 cavity insulation plus R-5 continuous insulation or insulated siding. If structural sheathing covers 40 percent or less of the exterior, continuous insulation

R-value shall be permitted to be reduced by no more than R-3 in the locations where structural sheathing is used – to maintain a consistent total sheathing thickness.

i. The second R-value applies when more than half the insulation is on the interior of the mass wall.

j. The second SHGC applies when the home's *west-facing glazing area* is less than or equal to 10% of the home's total glazed fenestration area.

**TABLE R402.1.3 (N1102.1.3)
EQUIVALENT U-FACTORS^a**

CLIMATE ZONE	FENESTRATION U-FACTOR	SKYLIGHT U-FACTOR	CEILING U-FACTOR	FRAME WALL U-FACTOR	MASS WALL U-FACTOR ^b	FLOOR U-FACTOR	BASEMENT WALL U-FACTOR	CRAWL SPACE WALL U-FACTOR

3	0.35	0.55	0.030	0.057	0.098	0.047	0.091 ^c	0.136
4 except Marine	0.35 0.20	0.55	0.026	0.057	0.098	0.047	0.059	0.065
5 and Marine 4	0.32 0.20	0.55	0.026	0.057	0.082	0.033	0.050	0.055
6	0.32 0.20	0.55	0.026	0.048	0.060	0.033	0.050	0.055
7 and 8	0.32 0.20	0.55	0.026	0.048	0.057	0.028	0.050	0.055

a. Nonfenestration U-factors shall be obtained from measurement, calculation or an approved source.

b. When more than half the insulation is on the interior, the mass wall U-factors shall be a maximum of 0.17 in Climate Zone 1, 0.14 in Climate Zone 2, 0.12 in Climate Zone 3, 0.087 in Climate Zone 4 except Marine, 0.065 in Climate Zone 5 and Marine 4, and 0.057 in Climate Zones 6 through 8.

c. Basement wall U-factor of 0.360 in warm-humid locations as defined by Figure R301.1 and Table R301.1.

Add new definitions as follows:

VERTICAL GLAZING. Glazing other than skylights.

WEST-FACING GLAZING AREA. The area of *vertical glazing* facing between 45 degrees south of west and 30 degrees north of west, inclusive.

Reason: According to the attached analysis prepared by the Department of Energy, the proposed U-factor and SHGC reductions are cost effective. Cost-effective measures should be included in the IECC as a measure of sound energy policy and to protect consumers from unnecessarily high future energy costs.

Window U-factor and SHGC

Description

Heat gain through windows is characterized by the Solar Heat Gain Co-efficient (SHGC) and the heat lost through windows is characterized by the heat transfer coefficient (U-factor). For this concept, U-factors lower than the 2012 IECC code requirements are simulated in the colder climate zones and SHGCs lower than the 2012 IECC code requirements are simulated in the warmer climate zones.

IECC Climate Zone	2012 IECC window requirements U-factor SHGC	Windows considered in this concept U-factor SHGC
1	NR 0.25	NR 0.2
2	0.40 0.25	0.35 0.2
3	0.35 0.25	0.35 0.2
4 except marine	0.35 0.40	0.20 0.40
5 & 4-marine	0.32 NR	0.20 NR
6	0.32 NR	0.20 NR
7 & 8	0.32 NR	0.20 NR

Energy Cost Savings

Figure 1 below shows energy cost savings for each climate zone.

Figure 1: Energy Cost Savings for the concept over the 2012 IECC code

Cost Effectiveness

The cost for windows with lower SHGC is based on the Building Component Community Cost database (BC3)¹. The cost for windows with SHGC 0.2 is extrapolated from cost for windows with SHGC 0.28 and 0.25. The cost for R-5 (U=0.2 Btu/hr-ft²-F) windows is derived from DOE's High Efficiency Windows Volume Purchase Initiative². This initiative has a target incremental cost of \$4/ft² for R-5 windows over EnergyStar windows. According to manufacturer data collected, two manufacturers had incremental costs of approximately \$2/sf and two others had a cost of around \$4/sf. It is expected that by the time the 2015 IECC is adopted by states, market transformation will drive down the cost of R-5 windows. We have assumed an incremental cost of \$2/sf for these reasons. EnergyStar requires a U of 0.32 in colder climates so the additional cost of going from U 0.35 in climate zone 4 to the EnergyStar level of U 0.32 is taken into account while calculating the incremental cost of R-5 windows. Table 1 below summarizes incremental costs used in this analysis. These costs are material costs alone and it is assumed that the installation cost will remain the same for all windows.

The lifetime of windows is assumed to be equal to the period of analysis - 30 years.

Table 1: Window costs used in this analysis

SHGC	Window Cost (\$/ea) ³	U-factor	Window Cost (\$/sf) ⁴
0.28	287.20	0.35	34.62
0.25	289.21	0.32	35.09

¹ http://bc3.pnnl.gov/wiki/index.php/Main_Page

² DOE R-5 windows initiative.

³ For 24"x42" vinyl casement windows from the BC3 database

⁴ http://bc3.pnnl.gov/wiki/images/f/fa/Residential_Report.pdf

0.2	292.56*	0.32 -> 0.2	2.00
-----	---------	-------------	------

*indicates extrapolated values

These costs are adjusted using location multipliers specified in Table 2 below, to generate incremental costs by state. State specific fuel costs are used in this analysis as specified in Table 3. Figure 2 shows Life Cycle Cost for this measure, by Climate Zone.

Additional Analysis and discussion

Low SHGC windows are usually tinted and there are concerns that they may have limited acceptance among home owners on account of aesthetics. While we are unaware of any surveys or studies supporting this claim, we understand that this may be a valid concern. Additional analyses were conducted to evaluate an alternative of maintaining the SHGC at the 2012 IECC level and limiting the amount of glazing facing west to yield similar energy savings as would result from using windows with lower SHGC.

DOE's analyses indicate that an appropriate limit on **west facing glazing is 10% of the total glazed fenestration area of the home**. There are multiple ways of achieving this limit: the extra glazing on the west facing wall can be moved to adjacent walls; west facing glazing area can be reduced; or the house can be re-oriented favorably. The cost for all the above approaches would be negligible if they are implemented at the design stage. Reducing glazing area may even reduce the first cost associated with the measure. As such, DOE assumed that all these approaches are zero-cost fixes and hence, cost-effective

Table 2: Cost multipliers by State

Location	State	Climate Zone	Moisture Regime	multiplier

RE5 – 13

R202 (IRC N1101.9)

Proponent: Shaunna Mozingo, City of Cherry Hills Village, representing Colorado Chapter of ICC, Inc.
(smozingo@coloradocode.net)

Delete without substitution as follows:

IECC SECTION R202 (IRC N1101.9) GENERAL DEFINITIONS

ENTRANCE DOOR. ~~Fenestration products used for ingress, egress and access in nonresidential buildings, including, but not limited to, exterior entrances that utilize latching hardware and automatic closers and contain over 50 percent glass specifically designed to withstand heavy use and possibly abuse.~~

Reason: Within the definition itself it clarifies that we are only talking about entrance doors in nonresidential buildings, thus this definition should not be located in the residential chapter.

When the IECC was split up and new chapters 1-3 were created for both the residential and the commercial portions of the code some things were brought over into the commercial chapters that belonged only to residential and vice versa. It becomes necessary now to clean up these very separate and distinct chapters so that those who may be new to the energy code and were not aware of the previous combined versions of chapters 1-3 will not be confused by things that were brought forward by mistake.

Cost Impact: This code change proposal will not increase the cost of construction.

R202-ENTRANCE DOOR-EC-MOZINGO.doc

RE6 – 13

R202 (NEW) (IRC N1101.9 (NEW))

Proponent: Matt Dobson, representing the Vinyl Siding Institute (mdobson@vinylsiding.org)

Add new definition as follows:

IECC SECTION R202 (IRC N1101.9) GENERAL DEFINITIONS

INSULATED SIDING. An insulated cladding with manufacturer-installed insulating material as an integral part of the cladding product having a minimum R-value of R-2, based on testing in accordance with ASTM C1363.

Reason: This definition will help building officials and energy specialists/raters understand how to qualify insulated siding as home insulation. It includes language similar to the definition of insulated vinyl siding in ASTM D7793 and uses insulated sheathing's R-value threshold in the current energy code.

This is a general definition that can be applied to any insulated siding, regardless of the material. It will provide direction to manufacturers of these products that want to properly test their products and qualify them as home insulation.

By setting a minimum R-value threshold for qualification and stating the test method that must be used for insulation, it provides a clear path for evaluation and code acceptance when a cladding system is classified as insulation.

This testing is done using ASTM C1363 (hot box) as specified by the rules for home insulation in Federal Trade Commission regulation 16 CFR Part 460 and as referenced in the energy code under section R303.1.4. The test protocol has been reviewed and deemed to be in the spirit of the rule, 16 CFR Part 460, by the Federal Trade Commission. The test methodology for insulated siding has been accepted and published as a part of the ENERGY STAR Version 3 program for new construction.

There have been questions about how the R-value of insulated siding will be impacted by air movement or wind. As specified in ASTM D7793, insulated vinyl siding is tested under ASTM C1363 without any special sealing of joints or laps, just as it would be installed in the field. ASTM C1363 includes a wind of specified velocity as part of test. Although the primary purpose of this wind is to remove the effect of the boundary air film, it also provides an opportunity for air to circulate into or behind the siding. The R-value reported for the test thus includes the effect of this wind and any reduction in insulating performance due to entry of air.

As part of the development of test methodology for insulated vinyl siding, a variety of profile types were tested both unsealed (as installed) and with all joints and laps sealed. A comparison of the results shows that there is indeed a reduction in R-value of up to about 25% for the unsealed configuration, but that the remaining R-value is still substantial. Below is a sample of the results of this study which show products end R-value in sealed and unsealed configurations. Per ASTM D7793, the R-value reported for insulated vinyl siding must be determined through testing in an unsealed, as-installed configuration.

Product	Lock Style	Wind Config	Sealing	R-value
Single 7	Standard Lock	Perpendicular	Sealed	2.52
		Perpendicular	Unsealed	2.12
		Perpendicular	Unsealed	2.13
		Perpendicular	Unsealed	2.13

R202-INSULATED SIDING (NEW)-EC-DOBSON

RE7 – 13

R302.1 (IRC N1101.11)

Proponent: Jerry Anderson, City of Overland Park, KS, representing self (anderson@opkansas.org)

Revise as follows:

R302.1 (N1101.11) Interior design conditions. The interior design temperatures used for heating and cooling load calculations shall be in accordance with ACCA Manual J. ~~a maximum of 72[°]F (22[°]C) for heating and minimum of 75[°]F (24[°]C) for cooling.~~

Reason: The purpose of this code change is to allow some flexibility in design conditions. There is no valid reason for the code to specify exact temperatures for interior design. Interior design conditions are all about comfort. The 72 degree temperature for heating and the 75 degree temperature for cooling are simply design temps where most people are comfortable, but comfort is dependent on physical attributes of individuals (age, sex, weight, metabolism, etc). If someone wishes to design a home or residential facility with different design conditions they should be allowed to do so. For example a group home being constructed for the elderly in accordance with the IRC provisions may wish to have different interior design temperatures for heating. The standard would allow for different design temperatures because it views the 72 degree and 75 degree marks as target values.

Cost Impact: The code change proposal will not increase the cost of construction.

RE8 – 13

R202 (NEW) (IRC N1101.9 (NEW)), R304 (NEW) (IRC N1102.16 (NEW))

Proponent: Chris Mathis, Mathis Consulting Company, representing self

Add new text as follows:

R304 (N1102.16) SOLAR READY ZONE.

R304.1 (N1102.16.1) General. All new detached one- and two-family dwellings, and multiple single family dwellings having roofs oriented between 110 degrees and 270 degrees of true north shall comply with sections R304.2 through R304.8.

R304.2 (N1102.16.2) Mandatory construction document requirements for solar ready zone. Construction documents for new detached one- and two-family dwellings, and multiple single family dwellings having roofs oriented between 110 degrees and 270 degrees of true north shall indicate the *solar ready zone*.

R304.3 (N1102.16.3) Solar ready zone area. The total *solar ready zone* area shall be no less than 300 square feet exclusive of mandatory access or set back areas required by the *International Fire Code*. New detached one- and two-family dwellings, and multiple single family dwellings with three stories or more and with a total floor area less than or equal to 2000 square feet shall have a *solar ready zone* area no less than 150 square feet. The *solar ready zone* shall be comprised of areas that have no dimension less than five feet and are no less than 80 square feet exclusive of mandatory access or set back areas as required by the *International Fire Code*.

Exceptions:

1. New buildings with a permanently installed on-site renewable energy system.
2. Roof areas in shade more than 70 percent of the time.

R304.4 (N1102.16.4) Obstructions. *Solar ready zones* shall be free from obstructions, including but not limited to vents, chimneys, and roof mounted equipment.

R304.5 (N1102.16.5) Roof load documentation. The structural design loads for roof dead load and roof live load shall be clearly indicated on the construction documents.

R304.6 (N1102.16.6) Interconnection pathway. Construction documents shall indicate the installed pathways for conduit, pre-wiring, pre-plumbing, or plumbing chase from the *solar ready zone* to the electrical service panel or service hot water system.

R304.7 (N1102.16.7) Electrical service reserved space. The main electrical service panel shall have a minimum busbar rating of 200 amps, shall have reserved space to allow installation of a dual pole circuit breaker for future solar electric installation, and shall be labeled "For Future Solar Electric". The reserved space shall be positioned at the opposite (load) end from the input feeder location or main circuit location.

Exception: Building projects with installed pre-plumbing or plumbing chase from the *solar ready zone* to reserved space at the water heating system.

R304.8 (N1102.16.8) Construction documentation. A copy of the construction documents indicating the *solar ready zone* and other requirements of this section shall be posted near the electrical panel, water heater, or other conspicuous location in the building.

Add new definition as follows:

**IECC SECTION R202 (IRC N1101.9)
GENERAL DEFINITIONS**

SOLAR READY ZONE. A section or sections of the roof or building overhang designated and reserved for the future installation of a solar electric or solar thermal system.

Reason: This proposal is intended to support future potential improvements for detached one- and two-family dwellings, and multiple single family dwellings for solar electric and solar thermal systems. The proposed language follows similar language from code adoptions by local municipalities in Tucson, AZ, Boulder, CO, and from the 2013 California Title 24 building code.

This proposal is intended to identify the areas of a residential building roof, called the solar ready zone, for potential future installation of renewable energy systems. This proposal requires documenting necessary solar ready information on the plans, some of which may already be required in permit construction requirements. This proposal also requires the builder to post specific information about the home for use by the homeowner(s).

This proposal requires the installation of chase, conduit, pre wiring, or pre-plumbing. It does not require any specific physical orientation of the residential building. It does not require any increased load capacities for residential roofing systems. When considered at the time of design, this proposal needs not increase the cost of construction, though will add a small, recoverable cost in many cases.

The documentation of solar ready zones and roof load calculations (already performed during the design phase) will assist building departments, as well as any future solar contractors seeking to install renewable energy systems on the roof. The builder/designer is knowledgeable on the intricacies of each model and plan, and easily can identify unobstructed roof areas, as well as spaces where conduit, wiring, and plumbing can be routed from the roof to the respective utility areas. This will save building departments and solar designers time and effort when installing future solar systems.

Upfront costs of renewable energy systems frequently are the largest deterrent to installation. Without preparation at the time of construction, solar installation may not even be technically possible. If a homeowner wishes to install a solar energy system later, this preparation can save thousands of dollars in labor, installation, design, and integration of the solar system into the house. Solar ready design can decrease the payback period tremendously. This is critical as these systems continue to become more cost effective and incentives are more readily available. In the instance that the initial homeowner does not intend to install a solar system, making the building solar ready increases the resale value of the home and the cost can be recovered.

Many building departments have been mandated by local regulations to accelerate permits and inspections for solar installation. Having important information and documentation available to the building department, solar contractor, and homeowner will assist in supporting the accelerated working environment many municipalities have mandated.

The U.S. Department of Energy's (DOE) SunShot Initiative has set a goal to make solar energy cost competitive with other forms of energy by the end of the decade which will reduce installed costs of solar energy systems by about 75%. This initiative, combined with increased pressures on our energy supply and demand, will encourage and drive greater adoption of renewable energy systems on residential buildings.

Cost Impact: The code change proposal will increase the cost of construction.

Add new text as follows:

SECTION R304 **SOLAR READY ZONE**

R304.1 General. (N1102.16.1) New detached one- and two-family dwellings, and multiple single family dwellings having roofs oriented between 110 degrees and 270 degrees of true north shall comply with Sections R304.2 through R304.8.

R304.2 (N1102.16.2) Construction document requirements for solar ready zone. Construction documents for new detached one- and two-family dwellings, and multiple single family dwellings having roofs oriented between 110 degrees and 270 degrees of true north shall indicate a *solar ready zone*.

R304.3 (N1102.16.3) Solar ready zone area. The total *solar ready zone* area shall be no less than 300 square feet exclusive of access or set back areas as required by the *International Fire Code*. New multiple single family dwellings three stories or more in height above grade plane and with a total floor area less than or equal to 2000 square feet shall have a *solar ready zone* area of not less than 150 square feet. The *solar ready zone* shall be comprised of areas not less than five feet in width and not less than 80 square feet exclusive of access or set back areas as required by the *International Fire Code*.

Exceptions:

1. New buildings with a permanently installed on-site renewable energy system.
2. Roof areas that are in shade more than 70 percent of the time.

R304.4 (N1102.16.4) Obstructions. *Solar ready zones* shall be free from obstructions, including but not limited to vents, chimneys, and roof mounted equipment.

R304.5 (N1102.16.5) Roof load documentation. The structural design loads for roof dead load and roof live load shall be clearly indicated on the construction documents.

R304.6 (N1102.16.6) Interconnection pathway. Construction documents shall indicate pathways for routing of conduit or plumbing from the *solar ready zone* to the electrical service panel or service hot water system.

R304.7 (N1102.16.7) Electrical service reserved space. The main electrical service panel shall have a reserved space to allow installation of a dual pole circuit breaker for future solar electric installation and shall be labeled "For Future Solar Electric". The reserved space shall be positioned at the opposite (load) end from the input feeder location or main circuit location.

R304.8 (N1102.16.8) Construction documentation certificate. A permanent certificate, indicating the *solar ready zone* and other requirements of this section, shall be posted near the electrical distribution panel, water heater or other conspicuous location by the builder or registered design professional.

Add new definition as follows:

IECC SECTION R202 (IRC N1101.9) **GENERAL DEFINITIONS**

SOLAR READY ZONE. A section or sections of the roof or building overhang designated and reserved for the future installation of a solar electric or solar thermal system.

Reason: This proposal is intended to support future potential improvements for detached one- and two-family dwellings, and multiple single family dwellings for solar electric and solar thermal systems. The proposed language follows similar language from code adoptions by local municipalities in Tucson, AZ, Boulder, CO, and from the 2013 California Title 24 building code.

This proposal is intended to identify the areas of a residential building roof, called the solar ready zone, for potential future installation of renewable energy systems. This proposal requires documenting necessary solar ready zone information on the plans, some of which may already be required in permit construction requirements. This proposal also requires the builder to post specific information about the home for use by the homeowner(s).

This proposal does not require the installation of conduit, pre wiring, or pre-plumbing. It does not require any specific physical orientation of the residential building. It does not require any increased load capacities for residential roofing systems. It does not require the redesign of plans.

The documentation of solar ready zones and roof load calculations (already performed during the design phase) will assist building departments as well as any future solar contractors seeking to install renewable energy systems on the roof. The builder/designer is knowledgeable on the intricacies of each model and plan and can easily identify unobstructed roof areas as well as spaces where conduit, wiring and plumbing can be routed from the roof to the respective utility areas. This will save building departments and solar designers' time and effort when installing future solar systems. If a homeowner wishes to install a solar energy system later, this documentation can save thousands of dollars in labor, installation, design and integration of the solar system into the house.

Many building departments have been mandated by local regulations to accelerate permits and inspections for solar installation. Having important information and documentation available to the building department, solar contractor and homeowner will assist in supporting the accelerated working environment many municipalities have mandated.

The U.S. Department of Energy's (DOE) SunShot Initiative has set a goal to make solar energy cost competitive with other forms of energy by the end of the decade which will reduce installed costs of solar energy systems by about 75%. This initiative, combined with increased pressures on our energy supply and demand, will encourage and drive greater adoption of renewable energy systems on residential buildings.

Cost Impact: The code change proposal will increase the cost of construction.

R401.2 (IRC N1101.15), R402.4.1.2 (IRC N1102.4.1.2), R402.5 1 (IRC N1102.5.1), R403.2.2 (IRC N1103.2.2), R406 (NEW) (IRC N1106 (NEW))

Proponent: W. Ronald Burton, PTW Advisors, LLC., representing Leading Builders of America

Revise as follows:

R401.2 (N1101.2) Compliance. Projects shall comply with one of the following:

1. Sections identified as “mandatory” and with either sections identified as “prescriptive” or the performance approach in Section R405.
2. Optional Performance Compliance in Section R406.

R402.4.1.2 (N1102.4.1.2) Testing. The building or dwelling unit shall be tested and verified as having an air leakage rate of not exceeding 5 air changes per hour in Climate Zones 1 and 2, and 3 air changes per hour in Climate Zones 3 through 8. Testing shall be conducted with a blower door at a pressure of 0.2 inches w.g. (50 Pascals). Where required by the code official, testing shall be conducted by an approved third party. A written report of the results of the test shall be signed by the party conducting the test and provided to the code official. Testing shall be performed at any time after creation of all penetrations of the building thermal envelope.

Exception: The air leakage rate in buildings complying with the Optional Performance Compliance in Section R406 shall not exceed 7 ACH50.

R402.5 (N1102.5) Maximum fenestration U-factor and SHGC (Mandatory). The area-weighted average maximum fenestration U-factor permitted using tradeoffs from Sections R402.1.4, ~~or~~ R405 or R406 shall be 0.48 in Climate Zones 4 and 5 and 0.40 in Climate Zones 6 through 8 for vertical fenestration, and 0.75 in Climate Zones 4 through 8 for skylights. The area-weighted average maximum fenestration SHGC permitted using tradeoffs from Section R405 or Section R406 in Climate Zones 1 through 3 shall be 0.50

R403.2.2 (N1103.2.2) Sealing (Mandatory). Ducts, air handlers, and filter boxes shall be sealed. Joints and seams shall comply with either the International Mechanical Code or International Residential Code, as applicable.

Exceptions:

1. Air-impermeable spray foam products shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.
3. Continuously welded and locking-type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.

Duct tightness shall be verified by either of the following:

1. Postconstruction test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 ft² (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.

2. Rough-in test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 ft² (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the system, including the manufacturer's air handler enclosure. All registers shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 3 cfm (85 L/min) per 100 ft² (9.29 m²) of conditioned floor area.

Exceptions:

1. Duct tightness test is not required if the air handler and all ducts are located within conditioned space.
2. Buildings complying with the Optional Performance Compliance in Section R406 shall have an air leakage rate not exceeding 8 cfm (226.6 L/min) for ducts located outside of conditioned space.

SECTION R406 (N1106)
OPTIONAL PERFORMANCE COMPLIANCE

R406.1 (N1106.1) Scope. This section establishes criteria for compliance using an optional energy performance analysis. Such analysis shall include only heating, cooling, and service water heating energy only.

R406.2 (N1106.2) Mandatory requirements. Compliance with Section R406 requires compliance with the mandatory provisions identified in Chapter 4 of this code. Supply and return ducts not completely inside the *building thermal envelope* shall be ~~insulated to a minimum of~~ provided with insulation having an R value of not less than R-6.

R406.3 (N1106.3) Performance-based compliance. For *residential buildings* complying with Section R406, compliance based on simulated energy performance requires that a proposed *residential building (proposed design)* be shown to have an annual energy cost that is less than or equal to 95% of the annual energy cost of a residence complying with sections of the residential provisions in Chapter 4 of this code identified as "mandatory" and configured as specified by the *standard reference design* in Table R406.4.2 (1) using the U-factor and SHGC-factors ~~the values in Table R406.4.2 (5)~~. The proposed design values shall not be greater than the U-factors specified in Table R406.4.2 (4) or the SHGC value specified in Table R406.4.2 (3). Energy prices shall be taken from ~~a source~~ an approved source ~~by the code official~~, such as the Department of Energy, Energy Information Administration's State Energy Price and Expenditure Report. Time-of-use pricing in energy cost calculations shall be required where required by the Code Official.

Exception: The energy use based on source energy expressed in Btu or Btu per square foot of *conditioned floor area* shall be alternatives to the energy cost. The source energy multiplier for electricity shall be 3.16. The source energy multiplier for fuels other than electricity shall be 1.1.

R406.4 (N1106.4) Documentation. Documentation of the software used for the performance design and the parameters for the building shall be in accordance with Sections R406.4.1 through R406.4.3.

R406.4.1 (N1106.4.1) Compliance software tools. Documentation verifying that the methods and accuracy of the compliance software tools conform to the provisions of this section shall be provided to the *code official*.

R406.4.2 (N1106.4.2) Compliance report. Compliance software tools shall generate a report that documents that the *proposed design* complies with Section R406.3. The compliance documentation shall include the following information:

1. Address or other identification of the residence;
2. An inspection checklist documenting the building component characteristics of the proposed design as listed in Table R406.4.2 (1). The inspection checklist shall show

results for both the *standard reference design* and the *proposed design*, and shall document all inputs entered by the user necessary to reproduce the results;

3. Name of individual completing the compliance report; and
4. Name and version of the compliance software tool.

406.4.2.1(N1106.4.2.1) Multiple orientations. Where an otherwise identical building model is offered in multiple orientations, documentation that the building meets the performance requirements in each of the four cardinal (north, east, south and west) orientations shall be acceptable for demonstration of compliance for any orientation.

R406.4.3 (N1106.4.3) Additional documentation. The *code official* shall be permitted to require the following documents:

1. Documentation of the building component characteristics of the *standard reference design*.
2. A certification signed by the builder providing the building component characteristics of the proposed design as given in Table R406.4.2 (1).
3. Documentation of the actual values used in the software calculations for the *proposed design*.

R406.5 (N1106.5) Calculation procedure. Calculations of the performance design shall be in accordance with Sections R406.5.1 and R406.5.2.

R406.5.1 (N1106.5.1) General. The *standard reference design* and *proposed design* shall be configured and analyzed using identical methods and techniques.

R406.5.2 (N1106.5.2) Residential building specifications. The *standard reference design* and *proposed design* shall be configured as specified by Table R406.4.2 (1).

R406.5.3 (N1106.5.3) Energy cost analysis. The annual energy cost of the *proposed design* shall be analyzed and compared to a design complying with sections of the residential provisions in Chapter 4 of this code identified as “mandatory” and configured as specified by the *standard reference design* in Table R406.4.2 (1) using the U-factor and SHGC-factors in *Table R406.4.2 (5)*.

R406.6 (N1106.6) Calculation software tools. Calculation software, where used, shall be in accordance with Sections R406.6.1 through R406.6.3.

R406.6.1 (N1106.6.1) Minimum capabilities. Calculation procedures used to comply with this section shall be software tools capable of calculating the annual energy consumption of all building elements that differ between a design complying with sections of the residential provisions in Chapter 4 of this code identified as “mandatory” and configured as specified by the *standard reference design* in Table R406.4.2 (1) using the U-factor and SHGC-factors in *Table R406.4.2 (5)* and the *proposed design* and shall include the following capabilities:

1. The calculation procedure shall not allow the user to directly modify the building component characteristics of the design complying with sections of the residential provisions in Chapter 4 of this code identified as “mandatory” and configured as specified in Table R406.4.2 (1) using the U-factor and SHGC-factors in *Table R406.4.2 (5)*.
2. Calculation of whole-building ~~.(as a single zone.)~~ sizing for the heating and cooling equipment in the *standard reference design* residence in accordance with Section R403.6.
3. Calculations that account for the effects of indoor and outdoor temperatures and part-load ratios on the performance of heating, ventilating and air-conditioning equipment based on climate and equipment sizing.

4. Printed *code official* inspection checklist listing each of the *proposed design* component characteristics from Table R406.4.2 (1) determined by the analysis to provide compliance, along with their respective performance ratings (such as R-value, U-factor, SHGC, HSPF, AFUE, SEER, EF, etc.).

R406.6.2 (N1106.6.2) Specific approval. Performance analysis tools meeting the applicable sections of Section R406 shall be approved. Approval of tools shall be based on meeting a specified threshold for a jurisdiction. The *code official* shall be permitted to approve tools for a specified application or limited scope.

R406.6.3 (N1106.6.3) Input values. When calculations require input values not specified by Sections R403, R404 and R406, those input values shall be taken from an approved source.

TABLE R406.4.2 (1) (N1106.4.2(1))
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
<u>Above-grade walls</u>	Type: mass wall if proposed wall is mass; otherwise wood frame. Gross area: same as proposed U-factor: from Table R406.4.2 (4) Solar absorptance = 0.75 Emittance = 0.90	As proposed As proposed As proposed ^a As proposed As proposed
<u>Basement and crawl space walls</u>	Type: same as proposed Gross area: same as proposed U-factor: from Table R406.4.2 (4), with insulation layer on interior side of walls.	As proposed As proposed As proposed ^a
<u>Above-grade floors</u>	Type: wood frame Gross area: same as proposed U-factor: from Table R406.4.2 (4)	As proposed As proposed As proposed ^a
<u>Ceilings</u>	Type: wood frame Gross area: same as proposed U-factor: from Table R406.4.2 (4)	As proposed As proposed As proposed ^a
<u>Roofs</u>	Type: composition shingle on wood sheathing Gross area: same as proposed Solar absorptance = 0.75 Emittance = 0.90	As proposed As proposed As proposed As proposed
<u>Attics</u>	Type: vented with aperture = 1 ft ² per 300 ft ² ceiling area	As proposed
<u>Foundations</u>	Type: same as proposed foundation wall area above and below grade and soil characteristics.	As proposed
<u>Doors</u>	Area: 40 ft ² Orientation: North U-factor: same as fenestration from Table R406.4.2 (4).	As proposed As proposed As proposed ^a
<u>Glazing^b</u>	Total area ^c = 15% of the conditioned floor area. Orientation: equally distributed to four cardinal compass orientations (N, E, S & W). U-factor: from Table R406.4.2 (4) SHGC: From Table R406.4.2 (3) except that for climates with no requirement (NR) SHGC = 0.40 shall be used. Interior shade fraction: Summer (all hours when cooling is required) = 0.70 Winter (all hours when heating is required) = 0.85 ^e External shading: none	As proposed As proposed As proposed ^d As proposed Same as <i>standard reference design</i> As proposed
<u>Skylights</u>	None	As proposed
<u>Thermally isolated sunrooms</u>	None	As proposed
<u>Air exchange rate</u>	Air leakage rate of 7 air changes per hour at a pressure of 0.2 inches w.g (50 Pa). The mechanical ventilation rate shall be in addition to the air leakage rate and the same as in the proposed design, but no greater than 0.01 x CFA + 7.5 x (N _{br} + 1) where: CFA = conditioned floor area N _{br} = number of bedrooms Energy recovery shall not be assumed for mechanical ventilation.	For residences that are not tested, the same air leakage rate as the <i>standard reference design</i> . For tested residences, the measured air exchange rate ^f . The mechanical ventilation rate ^g shall be in addition

		to the air leakage rate and shall be as proposed.
<u>Mechanical ventilation</u>	None, except where mechanical ventilation is specified by the proposed design, in which case: Annual vent fan energy use: $kWh/yr = 0.03942 \times CFA + 29.565 \times (N_{br} + 1)$ where: CFA = conditioned floor area N _{br} = number of bedrooms	As proposed
<u>Internal gains</u>	IGain = 17,900 + 23.8 x CFA + 4104 x N _{br} (Btu/day per dwelling unit)	Same as <i>standard reference design</i> .
<u>Internal mass</u>	An internal mass for furniture and contents of 8 pounds per square foot of floor area.	Same as <i>standard reference design</i> , plus any additional mass specifically designed as a thermal storage element ^b but not integral to the building envelope or structure.
<u>Structural mass</u>	For concrete or masonry floor slabs, 80% of floor area covered by R-2 carpet and pad, and 20% of floor directly exposed to room air. For concrete or masonry basement walls, as proposed, but with insulation required by Table R406.4.2 (3) located on the interior side of the walls. For other walls, for ceilings, floors, and interior walls, wood frame construction.	As proposed As proposed As proposed
<u>Heating systems</u> ^{i,i}	Fuel type: same as proposed design Efficiencies: Electric: air-source heat pump with prevailing federal minimum standards. Nonelectric furnaces: natural gas furnace with prevailing federal minimum standards. Nonelectric boilers: natural gas boiler with prevailing federal minimum standards. Capacity: sized in accordance with Section R403.6	As proposed As proposed ^m
<u>Cooling systems</u> ^{i,k}	Fuel type: Electric Efficiency: in accordance with prevailing federal minimum standards. Capacity: sized in accordance with Section R403.6.	As proposed
<u>Service water heating</u> ^{i,l}	Fuel type: same as proposed design Efficiency: in accordance with prevailing federal minimum standards. Use: Use: gal/day = 30 + (10 N _{br}) Tank temperature: 120°F	As proposed Same as <i>standard reference design</i> .
<u>Thermal distribution systems</u>	Duct outside the <i>building thermal envelope</i> shall be insulated to R-6 as required by Section R406.2. Untested distribution systems: DSE = 0.88 Tested ducts: Leakage rate to outside conditioned space as specified in Section R403.2.2. Duct location: Unconditioned attic Duct insulation: Per Section R403.2.1	Thermal distribution system efficiency shall be as tested to outside conditioned space or as specified in Table R406.4.2 (2) if not tested. As proposed As proposed
<u>Thermostat</u>	Type: Manual, cooling temperature setpoint = 75°F; Heating temperature setpoint = 72°F	As proposed

For SI: 1 square foot = 0.93 m², 1 British thermal unit = 1055 J, 1 pound per square foot = 4.88 kg/m², 1 gallon (U.S.) = 3.785 L, °C = (°F-32)/1.8, 1 degree = 0.79 rad.

a. If the total building thermal envelope UA (sum of U- factor times assembly area) is less than or equal to the total UA from using the U-factors in Table R406.4.2 (4) (multiplied by the same assembly area as in the proposed building), the building shall be considered to be in compliance with Table R406.4.2 (3). The UA calculation shall be performed using a method consistent with the ASHRAE Handbook of Fundamentals and shall include the thermal bridging effects of framing materials. The SHGC requirements shall be met in addition to UA compliance.

b. Glazing shall be defined as sunlight-transmitting fenestration, including the area of sash, curbing or other framing elements, that enclose conditioned space. Glazing includes the area of sunlight-transmitting fenestration assemblies in walls bounding conditioned basements. For doors where the sunlight-transmitting opening is less than 50 percent of the door area, the glazing area is the

sunlight transmitting opening area. For all other doors, the glazing area is the rough frame opening area for the door including the door and the frame.

c. For residences with conditioned basements, R-2 and R-4 residences and townhouses, the following formula shall be used to determine glazing area:

$$AF = As \times FA \times F$$

where:

AF = Total glazing area.

As = Standard reference design total glazing area.

FA = (Above-grade thermal boundary gross wall area)/(above-grade boundary wall area + 0.5 x below-grade boundary wall area).

F = (Above-grade thermal boundary wall area)/(above-grade thermal boundary wall area + common wall area) or 0.56, whichever is greater.

and where:

Thermal boundary wall is any wall that separates conditioned space from unconditioned space or ambient conditions.

Above-grade thermal boundary wall is any thermal boundary wall component not in contact with soil.

Below-grade boundary wall is any thermal boundary wall in contact with soil.

Common wall area is the area of walls shared with an adjoining dwelling unit.

L and CFA are in the same units.

d. The use of an area-weighted average of fenestration products satisfies the U-factor requirements. The use of an area-weighted average of fenestration products more than 50-percent glazed satisfies the SHGC requirements.

e. For fenestrations facing within 15 degrees (0.26 rad) of true south that are directly coupled to thermal storage mass, the winter interior shade fraction shall be permitted to be increased to 0.95 in the proposed design.

f. Where required by the code official, testing shall be conducted by an approved party. Hourly calculations as specified in the ASHRAE Handbook of Fundamentals, or the equivalent shall be used to determine the energy loads resulting from infiltration.

g. The combined air exchange rate for infiltration and mechanical ventilation shall be determined in accordance with Equation 43 of 2001 ASHRAE Handbook of Fundamentals, and the "Whole-house Ventilation" provisions of 2001 ASHRAE Handbook of Fundamentals, for intermittent mechanical ventilation.

h. Thermal storage element shall mean a component not part of the floors, walls or ceilings that is part of a passive solar system, and that provides thermal storage such as enclosed water columns, rock beds, or phase-change containers. A thermal storage element must shall be in the same room as fenestration that faces within 15 degrees (0.26 rad) of true south, or must shall be connected to such a room with pipes or ducts that allow the element to be actively charged.

i. For a proposed design with multiple heating, cooling or water heating systems using different fuel types, the applicable standard reference design system capacities and fuel types shall be weighted in accordance with their respective loads as calculated by accepted engineering practice for each equipment and fuel type present.

j. For a proposed design without a proposed heating system, a heating system with the prevailing federal minimum efficiency shall be assumed for both the standard reference design and proposed design.

k. For a proposed design home without a proposed cooling system, an electric air conditioner with the prevailing federal minimum efficiency shall be assumed for both the standard reference design and the proposed design.

l. For a proposed design with a nonstorage-type water heater, a 40-gallon storage-type water heater with the prevailing federal minimum energy factor for the same fuel as the predominant heating fuel type shall be assumed. For the case of a proposed design without a proposed water heater, a 40-gallon storage-type water heater with the prevailing federal minimum efficiency for the same fuel as the predominant heating fuel type shall be assumed for both the proposed design and standard reference design.

m. Energy savings resulting from specification of a natural gas furnace with minimum 90% AFUE in climate zones 4-8 shall not be utilized in calculating the annual energy cost of the proposed design.

TABLE R406.4.2 (2) (N1106.4.2(2))
DEFAULT DISTRIBUTION SYSTEM EFFICIENCIES FOR PROPOSED DESIGNS^a

DISTRIBUTION SYSTEM CONFIGURATION AND CONDITION	FORCED AIR SYSTEMS	HYDRONIC SYSTEMS ^b
Distribution system components located in unconditioned space		0.95
Untested distribution systems entirely located in conditioned space ^c	0.88	1
"Ductless" systems ^d	1	

For SI: 1 cubic foot per minute = 0.47 L/s, 1 square foot = 0.093m², 1 pound per square inch = 6895 Pa, 1 inch water gauge = 1250 Pa.

a. Default values given by this table are for untested distribution systems, which must still meet minimum requirements for duct system insulation.

b. Hydronic systems shall mean those systems that distribute heating and cooling energy directly to individual spaces using liquids pumped through closed-loop piping and that do not depend on ducted, forced airflow to maintain space temperatures.

c. Entire system in conditioned space shall mean that no component of the distribution system, including the air-handler unit, is located outside of the conditioned space.

d. Ductless systems shall be allowed to have forced airflow across a coil but shall not have any ducted airflow external to the manufacturer's air-handler enclosure.

TABLE R406.4.2(3) (N1106.4.2(3))
INSULATION AND FENESTRATION BASELINES BY COMPONENT^a

CLIMATE ZONE	FENESTRATION U-FACTOR ^b	SKYLIGHT ^b U-FACTOR	GLAZED FENESTRATION SHGC ^b	CEILING R-VALUE	WOOD FRAME WALL R-VALUE	MASS WALL R-VALUE ^c	FLOOR R-VALUE	BASEMENT ^d WALL R-VALUE	SLAB ^e R-VALUE & DEPTH	CRAWL SPACE ^f WALL R-VALUE
1	1.2	0.75	0.30	30	13	3/4	13	0	0	0
2	0.65 ^g	0.75	0.30	30	13	4/6	13	0	0	0
3	0.50 ^g	0.65	0.30	30	13	5/8	19	5/13 ^h	0	5/13
4 except Marine	0.35	0.60	NR	38	13	5/10	19	10/13	10, 2 ft	10/13
5 and Marine 4	0.35	0.60	NR ^h	38	20 or 13+5 ⁱ	13/17	30 ^j	10/13	10, 2 ft	10/13
6	0.35	0.60	NR	49	20 or 13+5 ⁱ	15/19	30 ^j	15/19	10, 4 ft	10/13
7 and 8	0.35	0.60	NR	49	21	19/21	38 ^j	15/19	10, 4 ft	10/13

For SI: 1 foot = 304.8 mm.

a. R-values are minimums. U-factors and SHGC are maximums. Insulation material used in layers, such as framing cavity insulation and insulating sheathing, shall be summed to compute the component R-value. The manufacturer's settled R-value shall be used for blown insulation. Computed R-values shall not include an R-value for other building materials or air films.

b. The fenestration U-factor column excludes skylights. The SHGC column applies to all glazed fenestration. The use of an area-weighted average of fenestration products more than 50-percent glazed satisfies the SHGC requirements.

c. The second R-value applies where more than half the insulation is on the interior of the mass wall.

d. "15/19" means R-15 continuous insulated sheathing on the interior or exterior of the home or R-19 cavity insulation at the interior of the basement wall. "15/19" is also met with R-13 cavity insulation on the interior of the basement wall plus R-5 continuous insulated sheathing on the interior or exterior of the home. "10/13" means R-10 continuous insulated sheathing on the interior or exterior of the home or R-13 cavity insulation at the interior of the basement wall.

e. R-5 shall be added to the required slab edge R-values for heated slabs. Insulation depth shall be the depth of the footing or 2 feet, whichever is less in Zones 1 through 3 for heated slabs.

f. For impact rated fenestration complying with Section R301.2.1.2 of the International Residential Code or Section 1609.1.2 of the International Building Code, the maximum U-factor shall be 0.75 in Zone 2 and 0.65 in Zone 3.

g. Basement wall insulation is not required in warm-humid locations as defined by Figure R301.1 and Table R301.1.

h. There are no SHGC requirements in the Marine Zone.

i. "13+5" means R-13 cavity insulation plus R-5 insulated sheathing. If structural sheathing covers 25 percent or less of the exterior, insulating sheathing is not required where structural sheathing is used. If structural sheathing covers more than 25 percent of exterior, structural sheathing shall be supplemented with insulated sheathing of at least R-2.

j. Or insulation sufficient to fill the framing cavity, R-19 minimum.

TABLE R406.4.2(4) (N1106.4.2(4))
EQUIVALENT U-FACTORS^{a,b,c}

CLIMATE ZONE	FENESTRATION U-FACTOR ^d	SKYLIGHT U-FACTOR	CEILING U-FACTOR	FRAME WALL U-FACTOR	MASS WALL U-FACTOR ^e	FLOOR U-FACTOR	BASEMENT WALL U-FACTOR	CRAWL SPACE WALL U-FACTOR
1	1.20	0.75	0.035	0.082	0.197	0.064	0.360	0.477
2	0.65	0.75	0.035	0.082	0.165	0.064	0.360	0.477
3	0.50	0.65	0.035	0.082	0.141	0.047	0.091 ^f	0.136
4 except Marine	0.35	0.60	0.030	0.082	0.141	0.047	0.059	0.065
5 and Marine 4	0.35	0.60	0.030	0.057	0.082	0.033	0.059	0.065
6	0.35	0.60	0.026	0.057	0.060	0.033	0.050	0.065
7 and 8	0.35	0.60	0.026	0.057	0.057	0.028	0.050	0.065

a. An assembly with a U-factor equal to or less than that specified in Table R406.4.2 (4) shall be permitted as an alternative to the R-value in Table R406.4.2 (3).

b. If the total building thermal envelope UA (sum of U-factor times assembly area) is less than or equal to the total UA resulting from using the U-factors in Table R406.4.2 (4) (multiplied by the same assembly area as in the proposed building), the building shall be considered in compliance with Table R406.4.2 (3). The UA calculation shall be done using a method consistent with the ASHRAE Handbook of Fundamentals and shall include the thermal bridging effects of framing materials. The SHGC requirements shall be met in addition to UA compliance.

c. Nonfenestration U-factors shall be obtained from measurement, calculation or an approved source.

d. The use of an area-weighted average of fenestration products satisfies the U-factor requirements.

e. When more than half the insulation is on the interior, the mass wall U-factors shall be a maximum of 0.17 in Zone 1, 0.14 in Zone

2. 0.12 in Zone 3, 0.10 in Zone 4 except Marine, and the same as the frame wall U-factor in Marine Zone 4 and Zones 5 through 8.
f. Basement wall U-factor of 0.360 in warm-humid locations as defined by Figure R301.1 and Table R301.1.

TABLE R406.4.2(5) (IRC N1106.4.2(5))
ENERGY COST COMPARISON U- AND SHGC-FACTORS^a

CLIMATE ZONE	FENESTRATION U-FACTOR	GLAZED FENESTRATION SHGC^b	SKYLIGHT U-FACTOR	CEILING U-FACTOR	FRAME WALL U-FACTOR	MASS WALL U-FACTOR^c	FLOOR U-FACTOR	BASEMENT WALL U-FACTOR	CRAWL SPACE WALL U-FACTOR
1	0.50	0.25	0.75	0.035	0.082	0.197	0.064	0.360	0.477
2	0.40	0.25	0.65	0.030	0.082	0.165	0.064	0.360	0.477
3	0.35	0.25	0.55	0.030	0.057	0.098	0.047	0.091 ^d	0.136
4 except Marine	0.35	0.40	0.55	0.026	0.057	0.098	0.047	0.059	0.065
5 and Marine	0.32	NR	0.55	0.026	0.057	0.082	0.033	0.050	0.055
6	0.32	NR	0.55	0.026	0.048	0.060	0.033	0.050	0.055
7 and 8	0.32	NR	0.55	0.026	0.048	0.057	0.028	0.050	0.055

a. Nonfenestration U-factors shall be obtained from measurement, calculation or an approved source.

b. The SHGC column applies to all glazed fenestration. Exception: Skylights are excluded from glazed fenestration SHGC requirements in Climate Zones 1 through 3 where the SHGC for such skylights does not exceed 0.30.

c. Where more than half the insulation is on the interior, the mass wall U-factors shall be not greater than 0.17 in Climate Zone 1, 0.14 in Climate Zone 2, 0.12 in Climate Zone 3, 0.087 in Climate Zone 4 except Marine, 0.065 in Climate Zone 5 and Marine 4, and 0.057 in Climate Zones 6 through 8.

d. Basement wall U-factor of 0.360 in warm-humid locations as defined by Figure R301.1 and Table R301.1.

Reason: This proposal provides a new alternative performance compliance path in the residential section of the IECC that results in much more energy efficient homes by providing greater flexibility and compliance options for builders and design professionals.

Specifically, the proposal adds a new Section R406 – Optional Performance Compliance - and modifies specific sections of the IECC to facilitate the use of this new performance alternative. With these proposed changes in place, users would have the option to comply as currently required using either the prescriptive or performance approach (Section 405) or they can choose to comply with the Optional Performance Compliance in Section R406. Choosing to comply with Section R406 would however result in a home that has an annual energy cost that is less than or equal to 95% of the annual energy cost of a home built in compliance with the current code. Put simply, this alternative path is more stringent than the current IECC because it results in homes that are 5% more energy efficiency than one built in compliance with the current code.

In order to make new Section R406 as easy to understand and use as possible, this section mirrors the format of the current Section R405 performance alternative. That includes the requirement to comply with the current “mandatory” requirements in Chapter 4. Of critical importance however, greater flexibility over the current performance alternative in Section R405 is achieved with the inclusion of much more robust compliance options in the procedures for configuring and analyzing the standard reference design and the proposed design as outlined in Table R406.4.2 (1). These more robust compliance options include the reintroduction of the HVAC equipment trade-offs that were a part of the IECC until they were eliminated in the 2009 edition. Elimination of the ability to take advantage of more efficient heating and cooling equipment has been one of the biggest factors in the lack of support the 2009 and 2012 editions of the IECC have received in the marketplace not only by home builders but by code officials and elected officials as well. It makes little sense to require extremely stringent envelope and other requirements while at the same time greatly discouraging the use of more efficient HVAC equipment. Either we want builders and designers to choose more efficient options or we don’t – and current IECC requirements send a clear message that we do not want to encourage the choice of more innovative and efficient heating and cooling systems. Section R406 compliance directly addresses this issue.

Additional compliance options in the new Optional Performance Compliance path include the ability to take advantage of designs with less glazing than the minimum percentage of glazing in the current performance alternative in Section R405. In addition, the calculation procedure in the new Section R406 includes the much more reasonable U-Factors and SHGC Factors from the 2009 IECC, while also requiring the annual energy cost of the proposed design to be 5% MORE efficient than a home built to the current IECC requirements. Again, the prescriptive path R- and U-Factor and SHGC tables in the current IECC are a major contributing factor in the lack of support, adoption and enforcement of the 2012 IECC. Those problems can be greatly alleviated by allowing builders and designers to have the maximum amount of flexibility in determining compliance with the code. That is especially true given that in exchange for the ability to design and build homes with proven market acceptance in more cost-effective ways, this proposal by a group of the largest U. S. home building companies who build over 80,000 homes in the U. S. each year would actually make the annual energy cost target even more stringent than currently required.

As previously discussed, the heart of this proposal is the new Optional Performance Compliance in Section R406. While large portions of Section R406 mirror the language in the current Section R405, specific sections deserve greater explanation.

- Section R406.2: this section mirrors the current R405.2 language, including the requirement that the “mandatory” provisions in Chapter 4 be met by designs complying with R406.
- Section R406.3: like the current Section R405.3, this section outlines the primary performance compliance concepts and includes the requirement for the annual energy cost of the proposed design to equal or be less than 95% of the annual energy cost of a home built to the current Chapter 4 requirements. This is accomplished by evaluating the annual energy cost of the proposed design versus compliance with the “mandatory” sections in Chapter 4 PLUS the U-Factors and

SHGC Factors found in the 2012 IECC (Tables R402.1.1 and R402.1.3) which are contained in Table R406.4.2 (5). Section R406.3 also references Table R406.4.2 (1) outlining the configuration and analysis of the proposed design using prescriptive requirements in the 2009 code.

- Sections R406.4 Documentation, R406.5 Calculation procedure, and R406.6 Calculation software tools mirror the requirements in the current Section R405 performance alternative.
- Table R406.4.2 (1) contains the standard reference and proposed design parameters for all building component elements.
- Tables R406.4.2 (4) and R406.4.2 (3) contain the insulation and fenestration baseline factors from the 2009 IECC used in the calculation based on the parameters in Table R406.4.2 (1).

Table R406.4.2 (5) contains the energy cost comparison U-Factors and SHGC factors used in calculating the annual energy cost of a home built in compliance with the current Chapter 4 requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

RE10-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R401.2-EC-BURTON.DOC

RE11 – 13

R401.2 (IRC N1101.15)

Proponent: Don Surrena, CBO, representing National Association of Home Builders
(dsurrena@nahb.org)

Revise as follows:

R401.2 (N1101.15) Compliance. Projects shall comply with ~~Sections identified as “mandatory” and with either sections identified as “prescriptive” or the performance approach in Section R405. one of the following:~~

1. Sections R401 through R404 or;
2. Section R405 and the provisions of Sections R401 through R404 labeled “Mandatory” or
3. Approved computer software, worksheets or compliance manuals that also meet the provisions of Sections R401 through R404 labeled “Mandatory” and the intent of this code or;
4. Buildings certified as complying with the energy efficiency requirements of an above code program in accordance with Section R102.1.1.

Reason: This amendment clarifies the section. It also provides for alternative options such as industry rating programs or other programs to be recognized as complying with the IECC.

Cost Impact: The code change proposal will not increase the cost of construction.

RE11-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R401.2-EC-SURRENA

RE12 – 13

R401.2 (IRC N1101.15)

Proponent: Jeremiah Williams, representing U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

R401.2 (N1101.15) Compliance. Projects shall comply with Sections identified as “mandatory” and with either of the following: ~~sections identified as “prescriptive” or the performance approach in Section R405.~~

1. Sections identified as “prescriptive.”
2. Section R405.

Reason: The proposed change provides a clarification. The current wording in the code has led to some confusion as to whether the mandatory lighting provisions of Section R404 are required when a home complies via the performance path of Section R405.

Cost Impact: The code change proposal will not increase the cost of construction.

RE12-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R401.2-EC-WILLIAMS

RE13 – 13

R401.3 (IRC N1101.16)

Proponent: Brian Dean, Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; and Bill Prindle, Energy Efficient Codes Coalition (Brian.Dean@icfi.com)

Revise as follows:

R401.3 (N1101.16) Certificate (Mandatory). A permanent certificate shall be completed and ~~shall be posted on or in the electrical distribution panel~~ by the builder or registered design professional at either an approved accessible location inside the building or electronically in an accessible certificate database maintained by an approved agency or the jurisdiction, with a permanent notification of the location of such record posted at an approved accessible location inside the building. A copy of the certificate shall also ~~be filed in the land records.~~ Where posted on the electrical distribution panel, tThe certificate shall not cover or obstruct the visibility of the circuit directory label, service disconnect label or other required labels. The certificate shall list the ~~predominant~~ R-values of insulation installed in or on ceiling/roof, walls, foundation (slab, ~~basement wall~~, crawlspace wall and/or floor) and ducts outside conditioned spaces; U-factors for fenestration and the solar heat gain coefficient (SHGC) of fenestration, and the results from any required duct system and building envelope air leakage testing done on the building. Where there is more than one value for each component category, the certificate shall list either all of the values with their associated areas or the area-weighted average value for that component category covering the largest area. The certificate shall list the types and efficiencies of heating, cooling and service water heating equipment. Where a gas-fired unvented room heater, electric furnace, or baseboard electric heater is installed in the residence, the certificate shall list “gas-fired unvented room heater,” “electric furnace” or “baseboard electric heater,” as appropriate. An efficiency level shall not be ~~listed~~ for gas-fired unvented room heaters, electric furnaces or electric baseboard heaters.

Reason: The purpose of this code change is to provide reasonable improvements to the certificate and alternatives to the current posting requirement that will meet the intent of the provision and improve the usability of the certificate. Specifically, the change will allow the certificate to be permanently posted at an accessible location other than the electrical panel, including the option of an electronic version that may be maintained off-site (with a permanent notice posted in the home). A copy of the certificate would also be required to be filed with the land record, where it can most easily be located in the future.

The proposal also clarifies that actual U-factors and R-values (or area-weighted averages) must be listed on the label. The current certificate requirement, which only includes listing the value for components “covering the largest area,” does not give enough useful information to future owners or occupants of the home who may be replacing or retrofitting components in the home. The proposed additional information for the certificate should already be well known by the builder or design professional at the time of construction, since it is required for code compliance, so there should be no significant additional work or cost associated with adding these details.

Cost Impact: The code change proposal will not increase the cost of construction.

RE13-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R401.3-EC-DEAN-HARRIS-MISURIELLO-PRINDLE-STONE

RE14 – 13

R401.3 (IRC N1101.16)

Proponent: Andrei Moldoveanu, representing National Electrical Manufacturers Association (NEMA)
(and_moldoveanu@nema.org)

R401.3 (N1101.16) Certificate (Mandatory). A permanent certificate shall be completed by the builder or registered design professional and posted on or in the electrical distribution panel a wall in the space where the furnace is located, a utility room, or an approved location inside the building ~~by the builder or registered design professional. The certificate shall not cover or obstruct the visibility of the circuit directory label, service disconnect label or other required labels.~~ The certificate shall list the predominant R-values of insulation installed in or on ceiling/roof, walls, foundation (slab, *basement wall*, crawlspace wall and/or floor) and ducts outside conditioned spaces; U-factors for fenestration and the solar heat gain coefficient (SHGC) of fenestration, and the results from any required duct system and building envelope air leakage testing done on the building. Where there is more than one value for each component, the certificate shall list the value covering the largest area. The certificate shall list the types and efficiencies of heating, cooling and service water heating equipment. Where a gasfired unvented room heater, electric furnace, or baseboard electric heater is installed in the residence, the certificate shall list “gas-fired unvented room heater,” “electric furnace” or “baseboard electric heater,” as appropriate. An efficiency shall not be *listed* for gas-fired unvented room heaters, electric furnaces or electric baseboard heaters.

Reason:

1. Certificates placed on or in the electrical distribution panel may become destroyed because of the location of the panel. Panels for many buildings in the Southwest portion of the United States are located outside of the building; thereby, causing certificates on or in these panels to become destroyed due to weather.
2. Safety. Additional printed material (such as the energy certificate) on electrical distribution panel makes it difficult to see the warning labels that are located on or in the panel.
3. Certificates located on or in the electrical panel are not very visible due to the location of the panels; thereby, rendering the certificate useless.

Cost Impact: The code change proposal will not increase the cost of construction.

R401.3-EC-STOPPELMOOR

RE16 – 13

R401.3 (IRC N1101.16)

Proponent: Brenda A. Thompson, Clark County Development Services, Las Vegas NV, representing ICC Sustainability, Energy & High Performance Building Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

R401.3 (N1101.16) Certificate (Mandatory). A permanent certificate shall be completed and posted ~~on or in the electrical distribution panel~~ by the builder or registered design professional at an approved location inside the building. ~~Where located on an electrical distribution panel,~~ the certificate shall not cover or obstruct the visibility of the circuit directory label, service disconnect label or other required labels. The certificate shall list the predominant *R* values of insulation installed in or on ceiling/roof, walls, foundation (slab, *basement wall*, crawlspace wall and/or floor) and ducts outside conditioned spaces; *U*-factors for fenestration and the solar heat gain coefficient (SHGC) of fenestration, and the results from any required duct system and building envelope air leakage testing done on the building. Where there is more than one value for each component, the certificate shall list the value covering the largest area. The certificate shall list the types and efficiencies of heating, cooling and service water heating equipment. Where a gasfired unvented room heater, electric furnace, or baseboard electric heater is installed in the residence, the certificate shall list “gas-fired unvented room heater,” “electric furnace” or “baseboard electric heater,” as appropriate. An efficiency shall not be *listed* for gas-fired unvented room heaters, electric furnaces or electric baseboard heaters.

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Reasons for this specific proposal:

1. Certificates placed on or in the electrical distribution panel may become destroyed because of the location of the panel. Panels for many buildings in the Southwest portion of the United States are located outside of the building; thereby, causing certificates on or in these panels to become destroyed due to weather.
2. Safety. Additional printed material (such as the energy certificate) on electrical distribution panel makes it difficult to see the warning labels that are located on or in the panel.
3. Certificates located on or in the electrical panel are not very visible due to the location of the panels; thereby, rendering the certificate useless.
4. Certificates should be located where they are likely to survive over time. Perhaps that location is in a garage next to a water heater or furnace. However such arrangement is not universally common in design. Short of finding a universally acceptable location, the proposal requires the local building official to approve the locations appropriate for the local jurisdiction. The location should be an interior locations so that it isn't lost to weather induced deterioration.

Cost Impact: The proposal is editorial in nature and will not affect the cost of construction..

Proponent: Jay Crandell, P.E., ARES Consulting, representing Foam Sheathing Committee / American Chemistry Council (Jcrandell@aresconsulting.biz)

Revise as follows:

R402.1 (N1102.1) General (Prescriptive). The *building thermal envelope* shall meet the requirements of Sections R402.1.1, R402.1.2, or R402.1.3 based on the climate zone specified in Chapter 3. through R402.1.4.

R402.1.1 (N1102.1.1) Insulation and fenestration criteria U-factor method. ~~The *building thermal envelope* shall meet the requirements of Table R402.1.1. An assembly shall have a *U-factor* equal to or less than that specified in Table R402.1.1. In addition, glazed fenestration SHGC and the equivalent of slab insulation R-value and depth requirements in Table R402.1.2 shall be met. based on the climate zone specified in Chapter 3.~~

R402.1.2 (N1102.1.2) R-value method. As an alternative means of complying with Section R402.1.1, insulation R-values, slab insulation depth, Fenestration U-factors and SHGC requirements shall comply with Table R402.1.2. Alternatives to the R-value requirements in Table R402.1.2 shall comply with Section R402.1.1.

~~R402.1.2 (N1102.1.2)~~ R402.1.2.1 (N1102.1.2.1) R-value computation. Insulation materials used in layers to provide, such as framing, the cavity insulation component or and insulating sheathing continuous insulation component required by Section R402.1.2, shall be summed to compute the corresponding component R-value. The manufacturer's settled R-value shall be used for blown insulation. Computed R-values shall not include an R-value for other building materials or air films.

R402.1.3 (N1102.1.3) U-factor alternative. ~~An with a *U-factor* equal to or less than that specified in Table R402.1.3 shall be permitted as an alternative to the *R-value* in Table R402.1.1.~~

~~R402.1.4 (N1102.1.4)~~ R402.1.3 (N1102.1.3) Total UA method. ~~If t~~The total *building thermal envelope* UA (sum of *U-factor* times assembly area) is shall be less than or equal to the total UA resulting from using the *U-factors* in Table R402.1.2~~1~~ (multiplied by the same assembly area as in the proposed building), ~~the building shall be considered in compliance with Table R402.1.4.~~ The UA calculation shall be done using a method consistent with the ASHRAE *Handbook of Fundamentals* and shall include the thermal bridging effects of framing materials. The glazed fenestration SHGC and the equivalent of slab R-value and depth requirements in Table R402.1.2 shall be met in addition to UA compliance.

TABLE R402.1.1 (N1102.1.2) R402.1.2 (N1102.1.2) INSULATION AND FENESTRATION R-VALUE REQUIREMENTS BY COMPONENT^a

(Portions of Table not shown remain unchanged)

TABLE R402.1.3 (N1102.1.3) R402.1.1 (N1102.1.1) EQUIVALENT ASSEMBLY U-FACTORS REQUIREMENTS^a

(Portions of Table not shown remain unchanged)

Reason: This proposal provides a needed re-organization and clarification of insulation requirements for the building thermal envelope. One of the technical concerns driving this proposal is that there are variations in the levels of efficiency between the current U-factor and R-value requirements. This happens as accommodations are made for common product R-value and various building methods. There are other proposals that are attempting to address these issues. Also, the R-value table is based on an insulation component approach using nominal R-values and the parameters and assumptions necessary to determine an equivalent U-factor are not disclosed in the code and are subject to varying interpretations. It was for this reason that the code has intended that the U-factor table serve as a baseline for alternative insulation strategies. This proposal clarifies that intent. From a formatting perspective, the proposal clearly delineates three methods for compliance. First, it establishes the U-factor method as the primary basis and approach for energy efficiency requirements. Second, the “cook-book” R-value approach is retained as simple means of complying with the required U-factors, also clarifying that alternative R-value solutions shall comply with the U-factor method. Third, it retains the total UA method and makes some editorial improvements.

Cost Impact: The code change proposal will not increase the cost of construction.

RE18– 13

R402.1 (IRC N1102.1), R402.1.1 (NEW) (IRC N1102.1.1 (NEW))

Proponent: Michael D. Fischer, Kellen Company, representing the Center for the Polyurethanes Industry (mfischer@kellencompany.com)

Revise as follows:

R402.1 (N1102.1) General (Prescriptive). The *building thermal envelope* shall meet the requirements of Sections R402.1.1 through ~~R402.1.4~~, R402.1.5.

R402.1.1 (N1102.1.1) Vapor retarder. Wall assemblies in the *building thermal envelope* shall comply with the vapor retarder requirements of Section R702.7 of the *International Residential Code* or Section 1405.3 of the *International Building Code* as applicable.

Reason: The IRC contains detailed vapor retarder provisions that apply specified R-Values for continuous insulation for vapor and condensation control. It is important to ensure that compliance to the envelope requirements of the energy code are coordinated with other building code requirements. While such a cross-reference is not necessary for most building requirements, the vapor retarder provisions are the only place in the IRC that a specific thermal performance provision is called out. This proposal provides the necessary coordination.

Cost Impact: The proposal will not affect the cost of construction..

Note: If this change is approved, it would be shown in Chapter 11 of the IRC without the reference to the IBC as follows:

N1102.1.1 Vapor retarder. Wall assemblies in the *building thermal envelope* shall comply with the vapor retarder requirements of Section R702.7.

(Portions of Table not shown remain unchanged)

Reason: In northern climate zones 5 through 8, this proposal would reduce the prescriptive U-factor to a maximum of 0.25, but provide 5 alternative, U-factor and SHGC combinations that all yield equivalent energy performance to windows having a 0.25 U-factor. Adopting this proposal will provide builders and homeowners with the flexibility of selecting from a number of different frame and glass types to achieve significantly greater energy savings. Such flexibility will also significantly increase the number of products capable of achieving code compliance, thus, increasing competition and, ultimately lowering the cost of compliance.

In 2008, the United States Department of Energy released the results of a regression model developed by Lawrence Berkley National Laboratories ("LBNL") revealing how changes in U-factor and SHGC affect aggregate energy consumption in northern climates. A detailed discussion of the model is found at <http://windows.lbl.gov/ESStar2008>. The LBNL model clearly shows that in northern climates, a 0.05 increase in SHGC produces the same energy benefits as a 0.01 decrease in U-factor. Accordingly, windows with incrementally 0.01 higher U-factors and 0.05 higher SHGCs all yield the same energy benefits.

Using the results of the LBNL regression model, this proposal establishes a prescriptive 0.25 U-factor in zones 5 through 8 and then takes U-factors up in 0.01 increments from 0.25 to 0.30 while simultaneously raising minimum SHGCs in 0.05 increments. All of the matching U-factors and SHGCs will yield energy performance equivalent to the prescriptive 0.25 U-factor.

The US Energy Star Program has already implemented the results of the LBNL model and uses the same types of energy equivalent trade-offs in northern climates. In fact, trade-offs like those in this proposal have been in use in the United States Energy Star Windows Program ever since April 7, 2009, when the Department of Energy issued its Version 5.0 criteria for Energy Star Windows, Doors and Skylights. Indeed, the 0.27 U-factor coupled with a 0.27 SHGC and a 0.28 U-factor coupled with a 0.32 SHGC in the current proposal match the most recent Energy Star trade-offs released by the Environmental Protection Agency (EPA) in its Version 6.0, Draft 1 Energy Star criteria dated July of 2012. In addition to being used in the United States, the Canadian Energy Star Program also reaches essentially the same trade-off results, by matching higher U-factors with higher SHGC values through the application of a formulation known as Energy Ratings, or ERs.

Achieving a 0.25 U-factor is technologically feasible using a double, not a triple, glazed assembly. In fact, all five (5) of the primary glass manufacturers in the United States, offer a low-e coated glass made specifically for use on the #4 surface (or the surface found inside the home) of a double glazed assembly. In the right frame, advent of #4 surface low-e products enable windows to achieve a 0.25 or lower U-factors using double glazed windows. This proposal builds on that technology and the methodology in use in the U.S. Energy Star Windows Program since 2009 of pairing U-factors with SHGCs to yield an energy performance equivalent to a prescriptive U-factor. In this proposal, U-factors are matched to SHGCs to yield the equivalent energy performance of a 0.25 U-factor.

This proposal, if adopted, will significantly increase builder and consumer choice, ultimately lower the costs of code compliance and significantly reduce the aggregate amount of energy consumed by homes in the United States.

Cost Impact: The code change proposal will increase the cost of construction.

(Portions of Table not shown remain unchanged)

Reason: The purpose of this proposal is to provide the next step in energy efficiency for windows in the northern zones. Window technology has advanced in recent years, allowing multiple new options to achieve higher performance levels at reasonable cost. Specifically, a 0.25 U-factor can be achieved by triple glazing, but it may also be achieved in double glazing by using new high performance frames and spacers, or also by the using two low-e coatings. These "4th surface" low-e coatings are now available from all five of the primary glass manufacturers. While total window costs vary widely based on specific product, window manufacturer, and location, public cost data shows the incremental cost for adding a low-e coating is fairly consistent between \$0.25 to \$2 per ft². [1] A reasonable estimate of the incremental cost is \$1.50 per ft², or approximately \$30 per window. This is consistent with the estimate by D&R International for the Energy Star Windows program, which estimated the incremental cost for a 0.27 U-factor at \$34 per window. [2] For 12 different cities in zones 5-7, a RESFEN analysis estimates the energy savings at \$32-73 per year for a typical 2000 ft² home with 300 ft² of windows, with an average payback of 11 ± 3 years, not including any fuel price escalation or future decrease in low-e pricing. A cash flow or ROI analysis would show even more favorable results.

1. Derived from the ASHRAE 90.2 cost database for identical windows with low-e vs. clear glazing, with costs updated to 2011 basis. (See <http://bc3.pnnl.gov>, Economic Database in Support of ASHRAE 90.2, Research Project 1481 prepared by the NAB Research Center.)

Similarly, data for 6 mm commercial glazing shows a range of \$0-4 per ft², which is generally consistent since commercial glazing will be higher than residential. Derived from (a) CASE report for Nonresidential & High-Rise Residential Fenestration Requirements, California Building Energy Efficiency Standards, Sep 2011, and (b) draft Commercial Building Envelope Cost Data Collection, prepared for Pacific Northwest National Laboratory by Faithful & Gould, Dec 2011.

In some cases, a 4th surface low-e and a #2 double silver low-e are less expensive than just a #2 triple silver low-e alone, meaning there is no incremental cost.

2. *ENERGY STAR Program Windows, Doors, and Skylights, Version 6.0 Draft 1 Criteria and Analysis Report*, D&R International for the U.S. Department of Energy, July 2012.

Cost Impact: This proposal will increase the cost of construction.

For SI: 1 foot = 304.8 mm.

- R*-values are minimums. *U*-factors and SHGC are maximums. When insulation is installed in a cavity which is less than the label or design thickness of the insulation, the installed *R*-value of the insulation shall not be less than the *R*-value specified in the table.
- The fenestration *U*-factor column excludes skylights. The SHGC column applies to all glazed fenestration. Exception: Skylights may be excluded from glazed fenestration SHGC requirements in Climate Zones 1 through 3 where the SHGC for such skylights does not exceed 0.30.
- "15/19" means R-15 continuous insulation on the interior or exterior of the home or R-19 cavity insulation at the interior of the basement wall. "15/19" shall be permitted to be met with R-13 cavity insulation on the interior of the basement wall plus R-5 continuous insulation on the interior or exterior of the home. "10/13" means R-10 continuous insulation on the interior or exterior of the home or R-13 cavity insulation at the interior of the basement wall.
- R-5 shall be added to the required slab edge *R*-values for heated slabs. Insulation depth shall be the depth of the footing or 2 feet, whichever is less in Climate Zones 1 through 3 for heated slabs.
- There are no SHGC requirements in the Marine Zone.
- Basement wall insulation is not required in warm-humid locations as defined by Figure R301.1 and Table R301.1.
- Or insulation sufficient to fill the framing cavity, R-19 minimum.

- h. First value is cavity insulation, second is continuous insulation or insulated siding, so “13+5” means R-13 cavity insulation plus R-5 continuous insulation or insulated siding. If structural sheathing covers 40 percent or less of the exterior, continuous insulation *R*-value shall be permitted to be reduced by no more than R-3 in the locations where structural sheathing is used – to maintain a consistent total sheathing thickness.
- i. The second *R*-value applies when more than half the insulation is on the interior of the mass wall.
- j. Dynamic glazing that is automatically controlled to modulate, in multiple steps, the amount of solar gain and light transmitted into the space shall be permitted to have a U-factor of 0.27.

4 except Marine	0.35	0.55	0.030	0.057	0.098	0.047	0.059	0.065
5 and Marine 4	0.32 0.25 ^d	0.55	0.026	0.057	0.082	0.033	0.050	0.055
6	0.32 0.25 ^d	0.55	0.026	0.048	0.060	0.033	0.050	0.055
7 and 8	0.32 0.25 ^d	0.55	0.026	0.048	0.057	0.028	0.050	0.055

- a. Nonfenestration *U*-factors shall be obtained from measurement, calculation or an approved source.
- b. When more than half the insulation is on the interior, the mass wall *U*-factors shall be a maximum of 0.17 in Climate Zone 1, 0.14 in Climate Zone 2, 0.12 in Climate Zone 3, 0.087 in Climate Zone 4 except Marine, 0.065 in Climate Zone 5 and Marine 4, and 0.057 in Climate Zones 6 through 8.
- c. Basement wall *U*-factor of 0.360 in warm-humid locations as defined by Figure R301.1 and Table R301.1.
- d. Dynamic glazing that is automatically controlled to modulate, in multiple steps, the amount of solar gain and light transmitted into the space shall be permitted to have a U-factor of 0.27.

Reason: Achieving a 0.25 *U*-factor is technologically feasible using a double, not a triple, glazed unit. In fact, all five (5) of the primary glass manufacturers in the United States, offer a low-e coated glass made specifically for use on the #4 surface (or the surface found inside the home) of a double glazed unit. In the right frame, advent of #4 surface low-e products enable windows to achieve a 0.25 or lower *U*-factor using double glazed windows.

While total window costs vary widely based on specific product, manufacturer, and location, public cost data indicates a cost of between \$0.25 to \$2 per ft² to add an additional low-e coating to the #4 surface of a double glazed assembly. Given the significant energy savings that will be achieved by reducing *U*-factor from its current level of 0.32 to 0.25 in these climate zones, consumers can reasonably expect a payback between 8 and 14 years (not including fuel price escalation or future decreases in low-e pricing).

An exception for dynamic glazing is included in this proposal. Dynamic glazing is designed primarily to provide adjustable solar heat gain control. While it can achieve good *U*-factors, a 0.25 may be just beyond its current reach without forcing it into triple glazed assemblies. Since dynamic glazing is so integral to ultimately moving to “zero energy homes,” its use should not be discouraged by a small *U*-factor differential in the prescriptive path.

Cost Impact: The code change proposal will increase the cost of construction.

7 and 8	0.32	0.55	Min 0.25 NR	49	20+5 or 13+10 ^h	19 / 21	38 ^g	15/19	10,4ft	15/19

For SI: 1 foot = 304.8 mm.

a. R-values are minimums. U-factors are maximums, and SHGC are maximums (“max”) or minimums (“min”) as noted. When insulation is installed in a cavity which is less than the label or design thickness of the insulation, the installed R-values of the insulation shall not be less than the R-value specified in the table.

(Portions of Table not shown remain unchanged)

Reason: The 2012 IECC made a significant change by lowering the maximum SHGC in zones 1-3 to 0.25. While this reduces energy use for cooling-dominated homes in the south, the combination of this low SHGC in the south with the “NR” no requirement in zones 5-8 creates a loophole that actually harms energy efficiency in the north.

Windows are generally distributed through national networks, and the “NR” allows the same ultra-low SHGC window designed for the south to also be used in the north. However, the performance of homes is simply not the same in Arizona and Vermont. A 0.25 SHGC window will permanently block 75% of the sun’s energy from entering the home for the full life of the window. In Arizona, this is very beneficial for reducing cooling loads, but in Vermont, this significantly hinders the use of free solar energy to reduce heating loads that must otherwise be met using fossil fuels. If ultra low SHGC windows intended for the south are used in the north, it will increase annual energy consumption, rather than conserve it.

This is not just a hypothetical problem. An analysis conducted for EPA in support of the Energy Star Windows program determined that the mean and median SHGC of Energy Star double hung windows from the top 20 window manufacturers is only 0.22. [1] This is clear evidence that national window manufacturers are largely limiting their inventories to a single very low SHGC product that can meet code in all climate zones, regardless of the impact on energy efficiency for a specific location.

In its technical support for the Energy Star Windows program, Lawrence Berkeley National Laboratory (LBNL) has consistently determined that higher solar heat gain saves more energy in the north. In fact, in the latest analysis of August 2012, LBNL concluded that setting a minimum SHGC of 0.35 in the north would double the national aggregate energy savings resulting from the proposed new criteria. [2]

Nonetheless, this proposal seeks to be more moderate, and just establish a base level minimum SHGC to ensure that ultra-low SHGC windows are not inappropriately used in the north. Both EPA and Natural Resources Canada have established a minimum SHGC for the Energy Star Most Efficient designation.[3] A minimum 0.25 SHGC is parallel to the maximum 0.25 SHGC in the south, will ensure different glazing packages are used for the south and north, and includes low-e products available from all glass manufacturers with both high solar gain products for passive solar design and solar control products to mitigate summer peak loads.

This problem has increased as SHGC requirements in the south have decreased in both the IECC and Energy Star. The code must now address this problem and recognize that using the same low SHGC glazing in Phoenix and Boston makes no sense.

1. *Technical Support for ENERGY STAR Windows Version 6.0 Specification Revision*, Lawrence Berkeley National Laboratory and D&R International, July 1, 2012, p. 2.
2. EPA's ENERGY STAR for Windows, Doors and Skylights Draft 1 Criteria and Analysis Report Stakeholder's Meeting, *Energy Star Program Savings Estimates*, Lawrence Berkeley National Laboratory, August 27, 2012, slide 98.
3. http://www.energystar.gov/ia/partners/downloads/EPA_Memo_ENERGY_STAR_Most_Efficient_2013.pdf

Cost Impact: The code change proposal will not increase the cost of construction.

6	0.32	0.55	NR	49	20+5 or 13+5 ^h	15 / 20	30 ^g	15/19	10,4ft	15/19
7 and 8	0.32	0.55	NR	49	20+5 or 13+10 ^h	19 / 21	38 ^g	15/19	10,4ft	15/19

(Portions of Table not shown remain unchanged.)

i. In wind-borne debris regions in Climate Zones 2 through 3, impact rated fenestration complying with Section R301.2.1.2 of the *International Residential Code* or Section 1609.1.2 of the *International Building Code* shall have a maximum U-factor of 1.20 and maximum SHGC of 0.30.

Reason: The purpose of this proposal is to account for the unique situation of hurricane impact-resistant fenestration in wind-borne debris regions. The current U-factor requirements in zones 2-3 require double glazing, which is entirely appropriate for most situations. However, hurricane events pose a unique circumstance with both significant safety and cost issues. In double glazed impact-resistant windows, only one lite is laminated. (Laminating both lites is much less common because it significantly affects cost, weight, and operability of the window.) As a result, one lite is not laminated, and presents a safety issue by potentially creating flying glass debris during a hurricane event. If the unlaminated lite is located to the exterior, this adds to the debris and safety hazard during clean-up. And even worse, if the unlaminated lite is located to the interior, the flying glass debris also poses a potential risk to life safety for occupants inside the home or apartment.

Furthermore, the higher cost of double glazed impact-resistant fenestration (commonly \$200-300 per window higher than non-impact windows) already creates a cost incentive to use the exceptions in Section R301.2.1.2 of the IRC and Section 1609.1.2 of the IBC that allow 1/2" wood structural panels to be provided to the homeowner to install over the windows when a hurricane approaches. This is not desirable in that the use of wood structural panels is highly unreliable – what if the panels cannot be easily located, the panels have been disposed, the homeowner has difficulty installing the panels on the 2nd floor, or if the homeowner is out of town? In this case, the home is left with no protection, increasing the potential life safety risk and property damage.

For these safety and cost reasons, it is prudent to allow monolithic laminated products for the very limited circumstances of coastal wind-borne debris regions in warm climates (zones 1-3). This is accomplished through a footnote to allow a U-factor of 1.2 for this limited area, and also a 0.30 SHGC because it is difficult to achieve 0.25 SHGC in monolithic applications without using darker glass. For a typical 2000 ft² home, the energy impact is approximately \$50-150 per year, which is reasonable given the unique life safety issue and the limited region.

Some might contend that the UA trade-off or performance path can be used to allow monolithic impact-resistant products to be used in these areas without the addition of a new footnote. However, many homes use the prescriptive path, the UA trade-off does not help with SHGC, and *none* of these trade-offs are available for replacement windows. The standards for energy efficiency must be viewed together with life safety requirements and practical application. We believe this proposal provides a good balance for these warmer wind-borne debris regions – maintaining a high level of safety protection while also providing good performance solar control.

Cost Impact: This proposal will lower the cost of construction.

RE24 – 13

Table R402.1.1 (IRC Table N1102.1.1)

Proponent: Don Surrena, CBO, National Association of Home Builders (NAHB) (dsurrena@nahb.org)

Revise as follows:

**TABLE R402.1.1 (N1102.1.1)
INSULATION AND FENESTRATION REQUIREMENTS BY COMPONENT^a**

CLIMATE ZONE	FENESTRATION U-FACTOR ^b	SKYLIGHT ^b U-FACTOR	GLAZED FENESTRATION SHGC ^{b,e}	CEILING R-VALUE	WOOD FRAME WALL R-VALUE	MASS WALL R-VALUE ⁱ	FLOOR R-VALUE	BASEMENT ^c WALL R-VALUE	SLAB ^d R-VALUE & DEPTH	CRAWL SPACE ^c WALL R-VALUE
1	NR	0.75	0.25	30	13	3 / 4	13	0	0	0
2	0.40	0.65	0.25	38	13	4 / 6	13	0	0	0
3	0.35	0.55	0.25	38	20 or 13+5 ^h	8/13	19	5/13 ^f	0	5 / 13
4 except Marine	0.35	0.55	0.40 NR	38	20 or 13+5 ^h	8 / 13	19	10 / 13	10, 2 ft	10/13
5 and Marine 4	0.32	0.55	NR	49	20 or 13+5 ^h	13 / 17	30 ^g	15/19	10,2ft	15/19
6	0.32	0.55	NR	49	20+5 or 13+5 ^h	15 / 20	30 ^g	15/19	10,4ft	15/19
7 and 8	0.32	0.55	NR	49	20+5 or 13+10 ^h	19 / 21	38 ^g	15/19	10,4ft	15/19

(Portions of Table not shown remain unchanged)

Reason: The addition of a prescriptive restriction for the SHGC of 0.40 was added in the 2012 IECC. This is not a requirement that saves energy. In Climate Zone 4, heating degree days outnumber cooling degree days by about 2 to 3 times. Therefore for most of the year, the “sun is your friend” and solar heat gain is beneficial and reduces heating loads. There are some exceptions to this, but the majority of homes will not benefit from this restriction. The values being modified by this proposal are the same as what was proposed by the Department of Energy in their proposal EC13 from the last cycle. The values currently adopted were an increase from proposals not submitted by the Department of Energy.

Energy modeling below shows some examples of the additional energy required when this artificial restriction is placed on windows in Climate Zone 4.

Cost Impact: The code change proposal will not increase the cost of construction.

For SI: 1 foot = 304.8 mm.

(Portions of Table not shown remain unchanged)

Reason: Windows exist mainly to give a view and bring in light. It makes sense to limit the heat (SHGC) in southern climates when doing so does not limit the other goals. Windows at an SHGCs of 0.25 and lower have to limit the visible light. Limiting the SHGC to 0.25 places too much of a limit on the visible light.

Perhaps future residential skylights and windows can provide day lighting, perhaps including automated day lighting in the future. Day lighting can be valuable in terms of limits cooling loads. Limiting SHGC down to 0.25 will tend to keep some of the best day lighting windows / skylights off the market.

Cost Impact: The code change proposal will not increase the cost of construction.

Reason.

Ellis: We support the Department of Energy's code change proposal (EC13) for the 2012 IECC that held the wood frame wall R-value at R-13 in Table R402.1.1. The increase in R-values in Climate Zone 3 in wood frame walls is just not cost effective and shown to have a payback period of over 35 years. When analyzing the construction cost vs. energy savings, the simple payback can potentially be longer than the expected life of the home. This payback will be unacceptable to most homebuyers.

There are other areas within buildings where energy conservation can be increased such as energy efficient equipment or higher quality windows which can be provide a payback that will be more acceptable to most homebuyers.

Thompson: This public comment is submitted by the ICC Sustainability Energy and High Performance Code Action Committee

SEHPCAC: The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 2 open meetings and over 15 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

DOE did not propose changing the value for **Climate Zone 3** in EC13 for the 2012 cycle. This is completely compatible with the DOE proposal which is attached on the following pages.

The cavity only entries proposed for **Climate Zone 6, 7, and 8** are reflective of the cavity only changes proposed for the Commercial chapter for RESIDENTIAL.

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

Halverson-Ross: We support the U.S. Department of Energy's position for Climate Zone 3, as stated in EC13-09/10 that held the wood frame wall R-value at R13 in Table R402.1.1. The increase in R-values for Climate Zone 3 wood frame walls is not cost effective and is shown to have a payback period of over 35 years. When analyzing the construction cost vs. energy savings, the simple payback can potentially be longer than the expected life of the home.

The National Association of Home Builders Research Center estimated the cost to builders to increase the wood framed wall R-value from R13 to R20 to be \$1.33 per square foot of wall or approximately \$3,433 per house. The total increase in cost for the builder to meet the 2012 IECC requirements compared to meeting the 2009 IECC requirements was estimated to be \$7,203. So the cost of increasing just the insulation in the walls was nearly 50% of the total cost of meeting all of the provisions of the 2012 IECC in Climate Zone 3 while the energy savings of the increased wall insulation was only estimated to contribute 10% of the total energy savings.

This payback will be unacceptable to nearly all consumers. With energy savings only running between \$2 and \$5.50 per month in Climate Zone 3, we urge the code body to approve this proposal with the modification made in this Public Comment.

We ask the support of the committee for this proposal.

Cost Impact:

ELLIS: None.

THOMPSON: This code change will decrease the cost of construction.

HALVERSON-ROSS: This code change proposal will not increase the cost of construction.

(Portions of Table not shown remain unchanged)

j. Radiant barriers in vented attics shall comply with the requirements of ASTM C1313 and shall be installed in accordance with ASTM C1743.

Add a new definition as follows:

RADIANT BARRIER. A material having a low emittance surface of 0.1 or less installed in building assemblies.

Add new standards to Chapter 5 as follows:

ASTM

C1313/C1313M-12 Standard Specification for Sheet Radiant Barriers for Building Construction Applications

C1743-12 Standard Practice for Installation and Use of Radiant Barrier Systems (RBS) in Residential Building Construction

Reason: (HALL) The purpose of this proposal is to provide information and references for radiant barriers.

The content of this proposal contains product requirements and references that will aid the contractors and code officials in recognizing and understanding radiant barrier products and correct installation procedures.

Attic radiant barriers are extensively used across Climate Zones 1, 2 and 3, i.e. in the sunbelt areas. These products have been on the market for over 24 years and are used by 87 of the top 100 US Builders. They have an established history and have been accepted into several regional code requirements and are included in the Energy Star Homes Guidelines. Some 650 million square feet of the product is being installed annually.

The current state and city codes that include radiant barrier are:

- HI – Chapter 181 of Title 3, Table 402.1.1.1, Section 402.1.1.6, 402.1.1.8.1
- TX - Austin, Chapter 25-12, Article 12. Energy Code, Section 402.6
- FL – 2010 Florida Building Code, Section 405.6.1, Figure 405.6.1 & Table 303.2 (ASTM Standards)
- CA – Title 24, Part 6, Subsection 8, Section (f), Subsection 2; Table 151-B; Table 151-C; Table 151-D

This product has two ASTM Standards that are applicable – ASTM C1313, “Standard Specification for Sheet Radiant Barriers for Building Construction Applications,” and ASTM C1743, “Standard Practice for Installation and Use of Radiant Barrier Systems (RBS) in Residential Building Construction”. This proposal does not require the use of radiant barriers but requires that, when they are used, they comply with the two ASTM standards just referenced.

ASTM C1743-12 can be viewed at: <http://reflectixinc.com/literature/securedpdfs/C1743.pdf>.

(LOVELL) The use of radiant barriers in vented attics in hot climates has been shown to conserve substantial amounts of energy by reducing the temperatures in the attic. If the attic temperature is lower, that slows the rate of temperature differential and transfers heat away from ceiling envelope elements and HVAC equipment and ducting. Attic radiant barriers are extensively used across Climate Zones 1, 2 and 3, i.e. in the sunbelt areas, and numerous demonstration projects and studies have confirmed the energy savings and cost-effectiveness of these installations. Such radiant barrier products have been on the market for over 24 years and are used by 87 of the top 100 US Builders. They have an established history and have been accepted into several regional code requirements and are included in the Energy Star Homes Guidelines. Some 650 million square feet of the product is installed annually.

The current state and city codes that include radiant barrier are:

- HI – Chapter 181 of Title 3, Table 402.1.1.1, Section 402.1.1.6, 402.1.1.8.1
- TX - Austin, Chapter 25-12, Article 12. Energy Code, Section 402.6
- FL – 2010 Florida Building Code, Section 405.6.1, Figure 405.6.1 & Table 303.2 (ASTM Standards)
- CA – Title 24, Part 6, Subsection 8, Section (f), Subsection 2; Table 151-B; Table 151-C; Table 151-D

This product has two ASTM Standards that are applicable – ASTM C1313, “Standard Specification for Sheet Radiant Barriers for Building Construction Applications,” and ASTM C1743, “Standard Practice for Installation and Use of Radiant Barrier Systems (RBS) in Residential Building Construction”. This proposal requires the use of radiant barriers in a manner consistent with the existing language in the Energy Star for Homes – “Version 3, Exhibit 1” and, additionally, requires that the radiant barriers comply with the two ASTM standards just referenced.

The Department of Energy (DOE) has published the “Radiant Barrier Fact Sheet”¹ that is available on the DOE website through the following link: <http://www.ornl.gov/sci/ees/etsd/btrc/RadiantBarrier/RBFactSheet2010.pdf>

Values taken from this DOE document are utilized in the “Savings Benefit to the Home Owner” section below.

A very comprehensive study was performed by Mario Medina. “This paper provides a general description of RBs, including installation configurations, the physical principles that make them work, and the laboratory and field experiments used to evaluate their thermal performance. An extensive review of the literature is summarized, highlighting fundamental issues, such as reduced ceiling heat flows, reduced space cooling and heating loads, and changes in attic temperatures produced by the installation of RBs in residential attics.”² The document has been mentioned here as an additional reference related to radiant barrier product information and to highlight the scope of “benefit” studies that have been completed.

¹ Department of Energy “Radiant Barrier Fact Sheet” prepared by the Oak Ridge National Laboratory (2012).

² Medina, Mario, “A Comprehensive Review of Radiant Barrier Research Including Laboratory and Field Experiments”, report prepared for the Reflective Insulation Manufacturers Association.

The study entitled "Radiant Barrier Impact on Selected Building Performance Measurements Model Home Case Study"³, authored by B.E. Davis and J. Tiller, from the Appalachian State University Energy Center, sponsored by Centex Homes in Charlotte, NC, and demonstrates the energy savings associated with the use of radiant barriers in attics. In the study, two identical homes were fit with over sixty sensors, where one house contained a radiant barrier (designated as the "Belmont" home) and one did not. The house with the radiant barrier had a peak attic temperature drop by 23% and the improved efficiency of the cool air delivered through the ducts was 57%.

The current language in the Energy Star for Homes – "Version 3, Exhibit 1" requires the use of radiant barriers in vented attics, with an exception for attics containing no HVAC space conditioning equipment and a maximum of 10 linear feet of supply or return ducting.

Cost Calculator – to home owner – new structure – hip roof:

- Product Cost - Radiant Barrier OSB Panel – \$0.11 per sq. ft.-(takes into account waste) ⁴
- 2,000 sq. ft. house, ranch, hip roof
- 2,200 sq. ft. of roof area x \$0.11 per sq. ft. (radiant barrier cost) = \$242.00
- Cost to home owner - \$242.00
- Additional cost added to monthly payment of a 30 year mortgage – 4% fixed interest rate:
- \$242.00 @ 4% = addition of \$1.16 to the monthly payment

Savings Benefit to the Home Owner:

- Cost to add Radiant Barrier OSB - \$1.16 per month (per above)
- 2,000 sq. ft. house, ranch, hip roof
- Savings as calculated in the Department of Energy "Radiant Barrier Fact Sheet"
- Code level insulation with well-sealed ducts in the attic
- Zone 1 - \$0.03 per sq. ft. x 2,000 sq. ft. = \$60.00 / 12 months = \$5.00 per month
- Zone 2 - \$0.03 per sq. ft. x 2,000 sq. ft. = \$60.00 / 12 months = \$5.00 per month
- Zone 3 - \$0.02 per sq. ft. x 2,000 sq. ft. = \$40.00 / 12 months = \$3.33 per month
- The cost for energy is based on first year (2012) values – if increases in energy cost due to inflation and other factors occur – annual savings will increase proportionally.

In summary, this exercise exemplifies the immediate energy cost savings that are netted when a radiant barrier is included in the design of a new home in Climate Zones 1, 2 and 3 with "well-sealed" ducts in the attic. The cost to the new home is small and the energy savings are significant over the life of the home.

(Portions of Table not shown remain unchanged)

Reason: There were four changes in the Ceiling R-value requirements in the 2012 IECC Edition, none of which should have been considered cost-effective. An energy and cost analysis was performed to show that the simple paybacks are in the 80-130 year range.

Climate Zone	Representative City	Change	Energy Savings	Incremental Cost	Simple Payback
2	Orlando, FL	R-38->R-30	\$10/yr	\$1,305	130 years
3	Atlanta, GA	R-38->R-30	\$16/yr	\$1,305	82 years
4	Richmond, VA	R-49->R-38	\$15/yr	\$1,379	92 years
5	Indianapolis, IN	R-49->R-38	\$15/yr	\$1,379	92 years

The energy modeling was done using the Energy Plus simulation engine and BEopt version 1.4. Cost figures came from ASHRAE RP-1481. Vaulted or cathedralized ceiling are very problematic when trying to achieve R-49 which is about 16 inches thick. This would require a rafter at least 17" tall (which does not exist) or an insulated panel, which represents a very small portion of the market.

Cost Impact: The code change proposal will not increase the cost of construction.

Table R402.1.1, (IRC Table N1102.1.1), R402.2 (IRC N1102.2), R402.2.13 (NEW) (IRC N1102.2.13 (NEW))

Proponent: Jay Crandell, P.E., ARES Consulting, representing Foam Sheathing Committee / American Chemistry Council (Jcrandell@aresconsulting.biz)

Revise as follows:

TABLE R402.1.1 (N1102.1.1) INSULATION AND FENESTRATION REQUIREMENTS BY

(Portions of Table not shown remain unchanged)

- h. First value is cavity insulation, second is continuous insulation or insulated siding, so "13 + 5" means R-13 cavity insulation plus R-5 continuous insulation or insulated siding. See Section 402.2.13 for cases where thickness of continuous insulation is varied to maintain a consistent overall sheathing thickness on walls intermittently braced with structural sheathing panels. If structural sheathing covers 40 percent or less of the exterior, continuous insulation R-value shall be permitted to be reduced by no more than R-3 in the locations where structural sheathing is used — to maintain a consistent total sheathing thickness.

R402.2 (N1102.2) Specific insulation requirements (Prescriptive). In addition to the requirements of Section R402.1, insulation shall meet the specific requirements of Sections R402.2.1 through R402.2.12. R402.2.13

R402.2.13 (N1102.2.13) Continuous insulation on walls with intermittent structural sheathing.

Where an exterior wall is intermittently braced with structural sheathing, the R-value of continuous insulation required by Table R402.1.1 shall be permitted to be reduced in the locations where structural sheathing is used in order to maintain a consistent total sheathing thickness when:

1. The overall U-factor of the opaque assembly, including areas with and without structural sheathing, is equal to or less than the required U-factor in Table R402.1.3 and
2. The assembly is in compliance with the vapor retarder requirements of Section R702.7 of the *International Residential Code* or Section 1405.3 of the *International Building Code* as applicable.

Reason: This proposal corrects a discrepancy where frame wall assemblies using component insulation R-values allowed under existing footnote (h) are not currently equivalent to U-factors in Table R402.1.3.

Cost Impact: The code change proposal may increase the cost of construction.

Note: If this change is approved, the proposed Item 2 to Section N1102.2.13 would be shown in Chapter 11 of the IRC without the reference to the IBC as follows:

2. The assembly is in compliance with the vapor retarder requirements of Section R702.7.

RE29-13

R402.1.1T-EC-CRANDELL

RE30 – 13

Table R402.1.1, (IRC Table N1102.1.1)

Proponent: Matt Dobson, Representing Vinyl Siding Institute

Revise as follows:

TABLE R402.1.1 (N1102.1.1) INSULATION AND FENESTRATION REQUIREMENTS BY COMPONENT^a

h. First value is cavity insulation, second is continuous insulation, ~~or insulated siding~~ or combination of the two, so "13 + 5" means R-13 cavity insulation plus R-5 continuous insulation, ~~or insulated siding~~ or combination of the two. If structural sheathing covers 40 percent or less of the exterior, continuous insulation *R*-value shall be permitted to be reduced by no more than R-3 in the locations where structural sheathing is used – to maintain a consistent total sheathing thickness.

(Portions of Table not shown remain unchanged)

Reason: This change is necessary because the current footnote only allows either insulated siding or insulated sheathing (continuous insulation), but the two product categories can be used together to achieve code compliance. This is a simple fix that was lost in the shuffle of the 2012 Final Action Hearings. For more information on insulated siding, go to www.insulatedsiding.info.

Cost Impact: This change will have no cost impact.

(Portions of Table not shown remain unchanged)

Reason: In the last code cycle the primary change to the residential IECC was DOE's EC13. The insulation and fenestration part of that change was nicely balanced between increased energy efficiency and cost, picking out the places where the insulation had value. DOE's change increased insulation where it had the most value. Subsequently, several updates were made to DOE's proposal that increased the insulation requirements in areas which were not as justified. This leaves the insulation increases that DOE had proposed and removes that went beyond the DOE proposal. This change retains the seven increased insulation requirements DOE made and undoes the seven that were not in DOE's proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

(Portions of Table not shown remain unchanged.)

Reason: The purpose of this code change proposal is to ensure product neutrality with regards to the building code. It is not appropriate for the code to require builders in Climate Zones 7 and 8 to use a specific product type (continuous insulation or insulated siding) to meet the prescriptive requirements when other equitable options are readily available. The 2012 IECC set a prescriptive mandate for the use of continuous insulation in the aforementioned zones. This proposal establishes a cavity-only insulation option of R28 for these climate zones.

The U-factor calculation tables below illustrate the performance equivalency between the current prescriptive R-values and the proposed cavity insulation-only R-value option. Use of the cavity insulation-only option will likely require deeper framing members to accommodate thicker insulation that can reach the minimum level of R28. The U-factor calculations assume that the continuous insulation wall assemblies use let-in-bracing to meet the IRC requirements for wall bracing.

Table 1 shows the U-factor calculations for a 2x6 framed wall with R20 cavity insulation plus R5 continuous insulation, and for a 2x8 framed wall using R28 cavity insulation with 3/8-inch thick wood panel sheathing (which is the minimum thickness of wood panel bracing allowed in the IRC). Both calculations yield a wall U-factor of 0.046.

Table 2 shows the U-factor calculation for a 2x4 framed wall with R13 cavity insulation and R10 continuous insulation, and also a calculation for a 2x8 framed wall using R28 cavity insulation with the more common 7/16-inch thick wood structural panel sheathing. The calculations yield U-factors of 0.045 and 0.046, respectively.

This proposed code change will provide additional prescriptive options to designers and builders in these two Climate Zones. We request the committee's support of this proposal.

(Portions of Table not shown remain unchanged)

Reason Statement: The increase in wood frame wall *R*-value in Climate Zone 6 of Table R402.1.1 of the 2012 IECC was essentially arbitrary and is without basis other than it represents the *R*-value for a readily available, specific type of foam sheathing. The requirements also mandate the use of continuous insulation since no cavity-only insulation option was included in the prescriptive table. Stakeholders around the country in Climate Zone 6 do not consider this level of insulation to be cost effective nor necessary in this climate zone. Due in part to such high insulation requirements, the 2012 IECC is not being adopted consistently in these states.

This proposal offers a compromise by increasing stringency significantly beyond the requirements of the 2009 IECC with more cost effective alternatives. The wall insulation can be met with continuous insulation and cavity insulation options (R20+2 or R13+6.5) or the cavity-only option of R24. This proposal creates much more cost effective provisions that will offer builders more alternatives in meeting the wood frame wall requirements found in Table R402.1.1. More choices will help to gain greater stakeholder buy-in and will enable the 2015 IECC to gain greater acceptance, thereby creating more energy conservation opportunities.

In combination with these changes in Table 402.1.1, we propose a corresponding change to the *U*-factor listed in Table R402.1.3 for wood frame walls. Tables 1 and 2 below provide the *U*-factor calculations for all three of the prescriptive wall alternatives identifying that all of the systems meet the proposed *U*-factor target. The right hand columns of Table 2 show that the same *U*-factor is achieved when the commonly used 7/16-inch wood structural panel sheathing is used rather than the code minimum 3/8-inch sheathing.

We ask the support of the committee for this proposal.

(Portions of Table not shown remain unchanged.).

Reason: The prescriptive wall requirement increased to R-20+R5 in Climate zones 6, 7 and 8 of the 2012 IECC. The additional cost for this is estimated at \$1,819 for 1,016 square feet of wall. This makes the simple payback between 26 and 55 years depending on the climate zone. This also will create a negative cash flow for the consumer in all cases.

Climate Zone	Representative City	Basement Wall R-Value Change	Energy Savings	Incremental Cost	Simple Payback
6	Minneapolis, MN	R-20->R-20+5	\$33/yr	\$1,819 (\$1.79/ft ²)	55 years
7	Bemidji, MN	R-20->R-20+5	\$41/yr	\$1,819 (\$1.79/ft ²)	44 years
8	Fairbanks, AK	R-20->R-20+5	\$71/yr	\$1,819 (\$1.79/ft ²)	26 years

The energy modeling was done using the Energy Plus simulation engine and BEopt version 1.4, Cost figures came from ASHRAE RP-1481.

Cost Impact: The code change proposal will not increase the cost of construction.

---------	------	------	-------	-------	-------	-------	-------	-------

(Portions of Table not shown remain unchanged.)

Reason: Frame wall requirements in climate zone 3 changed from R-13 to R-20 which was is not cost effective for the consumer.

Climate Zone	Representative City	Wall R-Value Change	Energy Savings	Incremental Cost	Simple Payback
3	Atlanta, GA	R-13->R-20	\$50/yr	\$1,199	24 years

The energy modeling was done using the Energy Plus simulation engine and BEopt version 1.4. Cost figures came from ASHRAE RP-1481. Not only is the payback 24 years, but for a consumer, there would be a negative cash flow based on the incremental cost and energy savings. The increase in the monthly mortgage would be \$6.43 (@ 5%) and the average monthly energy savings would be \$4.17.

The values being modified by this proposal are the same as what was proposed by the Department of Energy in their proposal EC13 from the last cycle. The values currently adopted were an increase from proposals not submitted by the Department of Energy.

Cost Impact: The code change proposal will not increase the cost of construction.

For SI: 1 foot = 304.8 mm.

i. R-18 insulation shall be permitted in place of the R-20 requirement provided the wall *framing factor* is 20 percent or less or exterior walls with 24" o.c. nominal vertical stud spacing.

Add new definition as follows:

FRAMING FACTOR. The fraction of the total building component area that is structural framing.

Reason: The ASHRAE Handbook of Fundamentals and ASHRAE Transaction 1995 Volume 101, Part 2 assumes that wood framed walls have a framing factor of 25%. Meaning 25 percent of the wall area consists of structural framing members and the remainder of the wall is a cavity suitable for installing insulation. When calculating the U-factor for a wall assembly, a high framing factor increases the overall assembly U-Factor. Reducing the framing factor will also provide an increase in the thermal performance of the wall.

This proposal provides an option for a thermally equivalent tradeoff for 2x6 wall assemblies which have reduced framing factors and R-18 insulation. Below are the calculations showing equal U-Factors for both assemblies (0.060).

Wall Thermal Resistance by Component	2x6 Wall R-20 25%FF (16" o.c.)			2x6 Wall R-18 20% FF

8	0.32	0.55	NR	49	20+7.5 or 32	19/21	38 ^g	15/19	10, 4 ft	15/19

For SI: 1 foot = 304.8 mm.

- R*-values are minimums. *U*-factors and SHGC are maximums. When insulation is installed in a cavity which is less than the label or design thickness of the insulation, the installed *R*-value of the insulation shall not be less than the *R*-value specified in the table.
- The fenestration *U*-factor column excludes skylights. The SHGC column applies to all glazed fenestration. Exception: Skylights may be excluded from glazed fenestration SHGC requirements in Climate Zones 1 through 3 where the SHGC for such skylights does not exceed 0.30.
- "15/19" means R-15 continuous insulation on the interior or exterior of the home or R-19 cavity insulation at the interior of the basement wall. "15/19" shall be permitted to be met with R-13 cavity insulation on the interior of the basement wall plus R-5 continuous insulation on the interior or exterior of the home. "10/13" means R-10 continuous insulation on the interior or exterior of the home or R-13 cavity insulation at the interior of the basement wall.
- R-5 shall be added to the required slab edge *R*-values for heated slabs. Insulation depth shall be the depth of the footing or 2 feet, whichever is less in Climate Zones 1 through 3 for heated slabs.
- There are no SHGC requirements in the Marine Zone.
- Basement wall insulation is not required in warm-humid locations as defined by Figure R301.1 and Table R301.1.

- g. Or insulation sufficient to fill the framing cavity, R-19 minimum.
- h. First value is cavity insulation, second is continuous insulation or insulated siding, so “13+5” means R-13 cavity insulation plus R-5 continuous insulation or insulated siding. If structural sheathing covers 40 percent or less of the exterior, continuous insulation R-value shall be permitted to be reduced by no more than R-3 in the locations where structural sheathing is used – to maintain a consistent total sheathing thickness.
- i. The second R-value applies when more than half the insulation is on the interior of the mass wall.

Reason: This proposal is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The SEHPCAC found discrepancies in the Commercial Energy Code RESIDENTIAL table. The SEHPCAC has proposed a fix to the discrepancy in Table C402.1.1. In an effort to further enhance the Residential Energy Code, the SEHPCAC proposes to include a so-called “Cavity Only” insulation solution in the R Values table. The Task Group assigned to this task looked at using the ASHRAE procedures to calculate an R-value based on the existing table entry of cavity insulation plus continuous insulation (e.g. 20+5 in CZ 6 & 7), and the U-factor entry associated with the respective CZ cell. In addition, the Task Group looked at the Cavity Only requirements for Residential wood frame walls from the Commercial Energy Code. The values shown here are those from the Wood Frame Wall section of the Commercial Energy Code. The SEHPCAC determined that the energy performance of wood frame wall assemblies in a residential use would be effectively similar in either the commercial group or the noncommercial group. Thus the SEHPCAC chose to propose the same values in this table. This proposal also splits climate Zone 8 away from 7 and then plugs in higher R-value into the CZ8 cell for wood frame walls. The rest of the CZ 8 cells simply duplicate the CZ 7 values.

Please note that the SEHPCAC has also submitted other proposals that are coordinated with this proposal and are intended to clarify and improve the usability of the code's prescriptive building thermal envelope provisions. This proposal, however, is intended to stand alone and is not contingent upon the success of other SEHPCAC proposals.

Cost Impact: This proposal will increase construction costs in Climate Zone 8 only.

(Portions of Table not shown remain unchanged)

Reason: It is not practical or cost effective to require more than R-13 insulation for wood frame walls in Climate Zone 3. If this value for frame walls is changed back to R13 as in Table 402.1.1 in the 2009 IECC, then the mass wall R-value in Table 402.1.1 should be changed back to the mass wall R-value for Climate Zone 3 in the 2009 IECC. Similarly, the U-factor should be changed back to the mass wall U-factor in Table 402.1.3 of the 2009 IECC. These changes are indicated above.

The equivalency between mass wall and frame wall R-values in Climate Zone 3 was previously demonstrated for previous versions of the IECC. Mass walls have significant energy saving benefits in Climate Zone 3.

Cost Impact: The code change proposal will not increase the cost of construction.

(Portions of Table not shown remain unchanged.)

Reason: The prescriptive basement wall requirement increased from R-10 to R-15 in the 2012 IECC. Calculations used to justify the change were based on energy models which had less sophisticated algorithms than Energy Plus which is now the preferred modeling software of the Department of Energy. When using Energy Plus, the energy savings in a 700 square foot basement totaled \$7/yr in Chicago (Climate zone 5). The additional cost for this is conservatively estimated at \$590. This makes the simple payback in excess of 58 years. This also will create a negative cash flow for the consumer. The values being modified by this proposal are the same as what was proposed by the Department of Energy in their proposal EC13 from the last cycle. The values currently adopted were an increase from proposals not submitted by the Department of Energy.

Climate Zone	Representative City	Basement Wall R-Value Change	Energy Savings	Incremental Cost	Simple Payback
5	Chicago, IL	R-10->R-15	\$7/yr	\$590 (\$0.82/ft ²)	84 years

The energy modeling was done using the Energy Plus simulation engine and BEopt version 1.4, Cost figures came from ASHRAE RP-1481

Cost Impact: The code change proposal will not increase the cost of construction.

RE41 – 13

R202, Table R402.1.1 (IRC Table N1102.1.1), R402.1.2 (IRC N1102.1.2)

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

Revise as follows:

TABLE R402.1.1 (N1102.1.1) INSULATION AND FENESTRATION REQUIREMENTS BY COMPONENT^a

- h. First value is cavity insulation, second is continuous insulation ~~or insulated siding~~, so “13+5” means R-13 cavity insulation plus R-5 continuous insulation ~~or insulated siding~~. If structural sheathing covers 40 percent or less of the exterior, continuous insulation R-value shall be permitted to be reduced by no more than R-3 in the locations where structural sheathing is used – to maintain a consistent total sheathing thickness.

(Portions of Table not shown remain unchanged)

R402.1.2 (N1102.1.2) R- value computation. Insulation material used in layers, such as framing cavity insulation ~~and insulating sheathing or continuous insulation~~, shall be summed to compute the corresponding component R-value. Framing and cavity insulation values shall be computed separately. The manufacturer’s settled R-value shall be used for blown insulation. Computed R-values shall not include an R-value for other building materials or air films.

Add new definition as follows:

IECC SECTION R202 (IRC N1101.9) GENERAL DEFINITIONS

CONTINUOUS INSULATION. Insulation in the opaque building envelope that extends across framing members without interruption by thermal bridges, except for fasteners and service openings. The insulation may be inside, outside or integral to the building envelope. When referring to an R-value in a multi-layer product, the term refers to the R-value of the insulation material.

Reason: This proposal clarifies what constitutes “continuous insulation”. Several products would qualify as continuous insulation, including insulated sheathing and insulated siding; all combined under the term “continuous insulation”.

The section on calculating R-values was written before the distinction between continuous and cavity insulation entered the code. The rewritten section better differentiates between “continuous” insulation that covers thermal breaks and “cavity” insulation that is separated by thermal breaks into a cavity. From a thermal performance standpoint the two perform significantly differently.

Cost Impact: The code change proposal will not increase the cost of construction.

R202 (New), Table R402.1.1 (IRC Table N1102.1.1), R402.1.2 (IRC N1102.1.2)

Proponent: Jay Crandell, P.E., ARES Consulting, representing Foam Sheathing Committee / American Chemistry Council (Jcrandell@aresconsulting.biz)

Revise as follows:

TABLE R402.1.1 (N1102.1.1) INSULATION AND FENESTRATION REQUIREMENTS BY COMPONENT^a

- h. First value is cavity insulation, second is continuous insulation or insulated siding, so "13 + 5" means R-13 cavity insulation plus R-5 continuous insulation or insulated siding. If structural sheathing covers 40 percent or less of the exterior, continuous insulation R-value shall be permitted to be reduced by no more than R-3 in the locations where structural sheathing is used – to maintain a consistent total sheathing thickness.

(Portions of Table not shown remain unchanged)

R402.1.2 (N1102.1.2) Component R-value computation. Insulation material used in layers to provide the, such as framing cavity insulation component or and the continuous insulation component insulating sheathing, shall be summed to compute the corresponding insulation component R-value. The manufacturer's settled R-value shall be used for blown insulation. Computed R-values shall not include an R-value for other building materials or air films.

Add new definition as follows:

IECC SECTION R202 (IRC N1101.9) GENERAL DEFINITIONS

CONTINUOUS INSULATION (ci): Insulation that is continuous across all structural members without thermal bridges other than fasteners and service openings. It is installed on the interior or exterior or is integral to any opaque surface of the building envelope.

Reason: This proposal provides a needed definition for continuous insulation (a term presently used in the IRC and IECC). The proposed definition is from the 2010 edition of ASHRAE 90.1 and provides an effective definition that is inclusive of all types of continuous insulation materials, including spray foam, insulated siding, foam sheathing, and others. Having this term defined permits simplification of existing code language where specific and sometimes limited lists of continuous insulation material types have been used. Thus, the code was scanned and two locations corrected to ensure consistent and inclusive use of the term continuous insulation. In the process, confusing or misleading language regarding computation of R-values for cavity or continuous insulation was identified and addressed. These are all considered to be editorial improvements.

Cost Impact: The code change proposal will not increase the cost of construction.

RE42-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R402.1.2-EC-CRANDELL

RE43 – 13

R402.1.2 (IRC N1102.1.2)

Proponent: John Woestman, Kellen Company, representing Extruded Polystyrene Foam Association (XPSA) (jwoestman@kellencompany.com)

Revise as follows:

R402.1.2 (N1102.1.2) R-value computation. Insulation material used in layers, such as framing cavity insulation ~~and insulating sheathing, or continuous insulation~~ shall be summed to compute the corresponding component *R*-value. The manufacturer's settled *R*-value shall be used for blown insulation. Computed *R*-values shall not include an *R*-value for other building materials or air films.

Reason: This proposal is intended to clarify intent. It does not alter, add or delete current code requirements or have a cost impact. The proposal makes these changes:

Revised "insulating sheathing" to "continuous insulation". This section of the code is making a distinction between insulation interrupted by framing and insulation that is not interrupted by framing. Insulated sheathing is a type of continuous insulation (insulation that is not interrupted by framing) but not the only type. Therefore this change clarifies the true intent of this section.

Inserted "corresponding". As currently written the language in this section is confusing and could be misinterpreted to mean that you can sum cavity and continuous insulation *R*-values together to come up with the required *R*-values as listed in Table R402.1.1. However, for insulation material used in layers, the intent is for the *R*-values of layered cavity insulation to be summed to meet the required cavity insulation *R*-value and the *R*-values of layered continuous insulation to be summed to meet the continuous insulation *R*-value.

Cost Impact: The code change proposal will not increase the cost of construction.

5 and Marine 4	0.32	0.55	0.026	0.057	0.082	0.033	0.050	0.055
6	0.32	0.55	0.026	0.048	0.060	0.033	0.050	0.055
7 and 8	0.32	0.55	0.026	0.048	0.057	0.028	0.050	0.055

(Portions of Table not shown remain unchanged)

Reason: This code change proposal is intended to correct the assumptions behind the wood-frame wall U-factors embedded in Table R402.1.3 of the IECC. The misrepresent the true performance of homes and, as such, over-estimate the energy efficiency of a typical R13 wood wall assembly when the Total UA or Simulated Performance path is used to demonstrate compliance to the IECC.

The wood wall U-factor values in Table R402.1.3 are currently based on a wall system that assumes the use of 5/8" plywood sheathing, which is well in excess of the minimum (3/8" thick) structural wood panel wall bracing in the International Residential Code (IRC). The U-factor value for the R13+5 wood wall system also assumes that a full double layer of 5/8" plywood sheathing and 1" continuous insulation is used. Neither the use of 5/8" structural panel wall sheathing or double sheathing with structural panels and continuous insulation in single family houses is commonly practiced or required by code.

According to the NAHB Research Center's 2011 Builders Survey, 5/8" or thicker wood structural panel wall sheathing makes up only 10% of the structural wood wall sheathing used in single-family residential construction. While 68% of residential single family wall area used wood structural panel sheathing was 7/16" thick or less.

There are several code options for braced wall segments that can incorporate continuous insulation over the top without adding a layer of structural wood panels. There are also options to use structural panels in combination with continuous insulation in between the structural segments. The code must be based on minimum systems that meet the provisions of the code in order to establish requirements that are fair to all products and assemblies. That minimum system would be a single layer of sheathing using continuous insulation.

Cost Impact: The code change proposal will not increase the cost of construction.

6	0.32	0.55	0.026	0.048	0.060	0.033	0.050	0.055
7 and 8	0.32	0.55	0.026	0.048	0.057	0.028	0.050	0.055

(Portions of Table not shown remain unchanged)

Reason: This code change proposal is intended to correct the assumptions behind the wood-frame wall U-factors embedded in Table R402.1.3 of the IECC. The misrepresent the true performance of homes and, as such, over-estimate the energy efficiency of a typical R13 wood wall assembly when the Total UA or Simulated Performance path is used to demonstrate compliance to the IECC.

The wood wall U-factor values in Table R402.1.3 are currently based on a wall system that assumes the use of 5/8" plywood sheathing, which is well in excess of the minimum (3/8" thick) structural wood panel wall bracing in the International Residential Code (IRC).

While 3/8" is the minimum wood structural panel wall bracing thickness allowed in the IRC, the most common structural panel thickness used in the United States is 7/16-inch. According to the 2011 Builders Survey, 68% of residential single family wall area used wood structural panel sheathing that was 7/16" thick or less. Therefore, it is reasonable to use an R-value for structural wood panels of 0.62R in the calculation for the U-value for climate zones 1 and 2. According to Table 2, that U-factor is 0.084.

Cost Impact: The code change proposal will not increase the cost of construction.

6	0.32	0.55	0.026	0.048	0.060	0.033	0.050	0.055
7 and 8	0.32	0.55	0.026	0.048	0.057	0.028	0.050	0.055

(Portions of Table not shown remain unchanged)

Reason: This code change proposal is intended to bring transparency and accuracy to the code by using more realistic assumptions to generate Climate Zones 3-5 wood frame wall *U*-factors in Table R402.1.3. The *REScheck*TM assumptions result in *U*-factors that misrepresent the true energy performance of wood walls and, as such, over-estimate the energy efficiency of a typical R20 and R13+5 wood wall assemblies when the assembly *U*-factor, Total UA alternative or Simulated Performance alternative is used to demonstrate compliance.

This proposal corrects two *REScheck*TM assumptions which were used to generate the wood wall *U*-factors in Table R402.1.3.

1. It was assumed that 5/8-inch plywood wall sheathing is used.
(This assumption is in excess of the minimum required, 3/8-inch thick, wood structural panel wall bracing that is required in the IRC.)
2. The assumption that a double layer of wall sheathing is used for R13+5 assemblies.
(A layer of R5 continuous insulation with an additional layer of continuous 5/8-inch plywood wall sheathing is assumed.)

Both of these assumptions are not based upon common practice nor are they required by the IRC. In order to establish baseline requirements that are fair to all products and systems, the code should be based upon the minimum performing assemblies that meet the provisions of the code. The minimum performing system in IECC Table R402.1.1 is found in footnote h. It allows continuous insulating sheathing to be used in combination with intermittent structural wall bracing (a.k.a., corner bracing) and results in a *U*-factor of 0.064 as shown below in Table 3.

Recognizing the strong opposition regarding the use of this common prescriptive wall assembly (footnote h) as a basis for generating *U*-factors, we propose basing the Climate Zone 3-5 continuous insulating sheathing *U*-factor on an assembly that uses let-in-bracing (per IRC Table R602.10.4) or metal strap bracing to provide lateral support. The resulting *U*-factor of 0.060 correlates to the *U*-factor for an R20 wall when code minimum 3/8-inch wood structural panel sheathing is used in lieu of 5/8-inch plywood. (See Table 2 below.)

A *U*-factor of 0.060 aligns more closely with common construction practices and would be a more reasonable value for wood frame walls in Climate Zones 3-5.

We ask the support of the committee for this proposal.

Table 1 shows the *REScheck*TM component assumptions which were used to determine the prescriptive *U*-factors in Table R402.1.3 of the IECC^{1,2}. The cells representing the 5/8-inch plywood and double layer wall sheathing assumptions are shaded.

Table 2 shows the component assumptions for the *U*-factor being proposed.

Table 3 represents a code-compliant and common construction approach which is provided for reference.

(Portions of Table not shown remain unchanged)

Reason: The purpose of this code change proposal is to bring transparency and accuracy to the code by correcting the wood-frame wall *U*-factors for Climate Zones 6, 7 and 8 in Table R402.1.3. The previous assembly component assumptions resulted in *U*-factors that misrepresent the true energy performance of wood walls and, as such, underestimate the energy efficiency of a typical R20+5 wood wall assembly. Correcting the *U*-factor to 0.046 from 0.048 is more consistent with common construction practices for the corresponding assemblies listed in Table 402.1.1.¹

Table 402.1.1 lists two prescriptive wood wall assembly options for Climate Zones 6-8, both of which require continuous insulation. In addition to meeting the IECC, these walls must also provide lateral resistance for the house which is typically provided through prescriptive wall bracing or shear walls. There are several structural wall bracing options in Table R602.10.4 of the IRC, two of which are commonly used with continuous insulating sheathing:

1. Let-in-bracing (LIB), and;
2. Intermittent structural sheathing (combined with insulating sheathing installed between the structural sheathing, and a thinner insulating sheathing or insulated siding on top of the structural sheathing, per IECC Table R402.1.1, footnote h).

In order to establish baseline requirements that treat all building products and systems equally, the code should be based on the minimum performing assemblies that meet the provisions of the code. The minimum performing system in IECC Table R402.1.1 is continuous insulating sheathing used in combination with intermittent structural wall bracing (footnote h), which results in a *U*-factor of 0.048 as demonstrated in Tables 2 and 3, below. Recognizing that there is opposition to using footnote h as a baseline assembly, we propose basing the *U*-factors for Climate Zones 6-8 on the continuous insulating sheathing wall assemblies that use let-in-bracing that requires no structural sheathing. This proposal results in a *U*-factor of 0.046, which both assemblies are shown to meet, per Table 1.

We ask the support of the committee for this proposal.

(Portions of Table not shown remain unchanged)

Reason: This code change proposal is intended to bring transparency and accuracy to the code by using more realistic assumptions to generate the Climate Zone 1 and 2 wood-frame wall *U*-factors in Table R402.1.3. The previous assumptions resulted in *U*-factors that misrepresent the true energy performance of wood walls and, as such, overestimate the energy efficiency of a typical R13 wood wall assembly when the assembly *U*-factor alternative, the total UA alternative or Simulated Performance alternative is used to demonstrate compliance. The wood wall *U*-factors in Table R402.1.3 are currently based on an assembly that assumes the use of 5/8-inch plywood sheathing, which is well in excess of the minimum 3/8-inch thick structural wood panel wall bracing in the IRC.

Table 1 incorporates the REScheckTM assumptions which were used to determine the prescriptive *U*-factors in Table R402.1.3 of the IECC^{1,2} in the left hand columns of the table. This base calculation assumes that 5/8-inch thick plywood is used as the sheathing material, resulting in the current 0.082 *U*-factor. The proposed component *R*-value basis in the right-hand columns in Table 1 uses the same REScheckTM assumptions but incorporates the *R*-value for 3/8-inch wood structural panel sheathing, resulting in a *U*-factor of 0.085.

Adjusting the Climate Zone 1-2 *U*-factors in Table R402.1.3 to 0.085 will more accurately reflect the energy efficiency of an R13 wood wall assembly when the Total UA or Simulated Performance alternatives are used to demonstrate compliance.

We ask the support of the committee for this proposal.

Revise as follows:

**TABLE R402.1.3 (N1102.1.3)
EQUIVALENT U-FACTORS^a**

CLIMATE ZONE	FENESTRATION U-FACTOR	SKYLIGHT U-FACTOR	CEILING U-FACTOR	FRAME WALL U-FACTOR	MASS WALL U-FACTOR ^b	FLOOR U-FACTOR	BASEMENT WALL U-FACTOR	CRAWL SPACE WALL U-FACTOR
1	0.50	0.75	0.035	0.082	0.197	0.064	0.360	0.477
2	0.40	0.65	0.030	0.082	0.165	0.064	0.360	0.477
3	0.35	0.55	0.030	0.057 0.060	0.098	0.047	0.091 ^c	0.136
4 except Marine	0.35	0.55	0.026	0.057 0.060	0.098	0.047	0.059	0.065
5 and Marine 4	0.32	0.55	0.026	0.057	0.082	0.033	0.050	0.055
6	0.32	0.55	0.026	0.048 0.044	0.060	0.033	0.050	0.055
7 and 8	0.32	0.55	0.026	0.048 0.044	0.057	0.028	0.050	0.055

- Nonfenestration U-factors shall be obtained from measurement, calculation or an approved source.
- When more than half the insulation is on the interior, the mass wall U-factors shall be a maximum of 0.17 in Climate Zone 1, 0.14 in Climate Zone 2, 0.12 in Climate Zone 3, 0.087 in Climate Zone 4 except Marine, 0.065 in Climate Zone 5 and Marine 4, and 0.057 in Climate Zones 6 through 8.
- Basement wall U-factor of 0.360 in warm-humid locations as defined by Figure R301.1 and Table R301.1.

Reason: The wood framed wall U-factors are all generated using the methodology embedded in the US DOE REScheck software. All of the U-factors assume that structural sheathing is installed over 100% of the wall system with continuous insulation covering the structural sheathing. The 0.048 U-factor was calculated assuming no structural sheathing installed under the continuous insulation. Correcting the U-factor would provide consistency in how the values are calculated.

Cost Impact: The code change proposal will not increase the cost of construction.

(Portions of table not shown remain unchanged)

Reason: The intent of these changes is not to alter the stringency of the code, but rectify the conversion from R-Value to U-Factor. Currently the R-Values and equivalent U-Factors do not match when applying a consistent calculation method.

It is important that the U-Factors and R-Values do match when small alterations are being made to the wall assemblies selected in the R-Value table. For example, a builder does not want to install R-20 as suggested in the R-Value table. Instead, the builder's preferred wall is R-15+R3.8c.i. Although the R-15+R3.8c.i. wall is thermally better than the R-20 wall, it does not meet the requirements of the Equivalent U-Factor table.

Below are a series of calculations which justify the proposed changes to the Frame Wall U-Factor values:

RE51 – 13

R402.1.5 (NEW) (IRC N1102.1.5 (NEW)), Table R402.1.5 (NEW) (IRC 1102.1.5 (NEW)), Table 402.1.6 (NEW) (IRC Table N1102.1.6 (NEW))

Proponent: Brian Dean, Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; and Bill Prindle, Energy Efficient Codes Coalition

Add new text as follows:

R402.1.5 (N1102.1.5) Calculating opaque envelope component *U*-factors. Where determining the *U*-factor of an opaque assembly as part of Section R402.1.3, R402.1.4, or R405.5.2, Table R402.1.5 shall be used to calculate the *U*-factor using a series-parallel path calculation. Where actual insulation and framing fractions have been calculated for the proposed design, they shall be used; otherwise the default insulation and framing fractions in Table R402.1.5 shall be used. Where required by the *code official*:

1. Actual *U*-factors, insulation and framing fractions shall be calculated and documented in a written report; and
2. The calculated and documented values shall be inspected, reviewed, and certified by an independent party approved by the *code official*.

TABLE R402.1.5 (N1102.1.5)
COMPONENT R-VALUE AND INSULATION AND FRAMING FRACTIONS BY ASSEMBLY TYPE

	Interior Air Film	Interior Finish Layer	Cavity Insulation Layer	Cavity Insulation Fraction	Cavity Framing Layer	Framing Fraction	Continuous Insulation Layer ^c	Structural Sheathing Layer ^c	Siding Layer	Exterior Air Film
	<i>R</i> -Value	<i>R</i> -Value	<i>R</i> -Value	Percent	<i>R</i> -Value	Percent	<i>R</i> -Value	<i>R</i> -Value	<i>R</i> -Value	<i>R</i> -Value
Wood Frame Ceiling	0.61	0.45	as specified ^a	93	R-1.25 per inch ^b	7	0 or as specified	-	-	0.61
Wood Frame Wall	0.68	0.45	as specified	75	R-1.25 per inch ^b	25	0 or as specified	0.62	0.59	0.25
Steel Frame Wall	0.68	0.45	as specified	-	-	-	0 or as specified	0.62	0.59	0.25
Mass Wall	0.68	0.45	as specified	-	-	-	0 or as specified	0.62	0.59	0.25
Mass Wall with Frame	0.68	0.45	as specified	75	R-1.25 per inch ^b	25	0 or as specified	0.62	0.59	0.25
Wood Frame Floor	0.92	1.23 + 0.94	as specified	90	R-1.25 per inch ^b	10	0 or as specified	-	-	0.92
Basement Wall	0.68	0.45	as specified	-	-	-	0 or as specified	-	-	0.25
Crawlspace Wall	0.68	0.45	as specified	-	-	-	0 or as specified	-	-	0.25

- a. Where calculating the equivalent *U*-factor for the standard reference design, the depth of the insulation shall be calculated to account for limited depth at the edge of the ceiling based on a standard truss with available depth of 3.86 inches at the edge of the ceiling and a roof slope of 1 foot for every 3 feet across. In the proposed design, the ceiling insulation *U*-value shall be calculated with the actual insulation depths in the proposed design.
- b. The depth of the wood framing shall be based on the actual depth of the wood framing. Where calculating the equivalent *U*-factor for the standard reference design, the depth of the wood framing shall be calculated as the cavity insulation *R*-value divided by 4 and then rounded up to the following depths in inches: 3.5 for a 2x4 frame, 5.5 for a 2x6 frame, 7.5 for a 2x8 frame or 9.5 for a 2x10 frame.

- c. Where calculating the equivalent *U-factor* for the standard reference design using continuous insulation, 100% of the net wall is assumed to be covered by the insulating sheathing. The proposed design shall be calculated with the actual percentage of continuous insulation and structural sheathing.
- d. Where calculating the equivalent *U-factor* of a steel framed assembly using Table R402.1.5, a series path calculation shall be used. The *R-value* of the cavity insulation layer for steel framed assemblies shall be calculated by multiplying the specified cavity insulation *R-value* by the corresponding correction factor located in Table R402.1.6. Where there is no specified cavity insulation, the *R-value* of the cavity/framing layer shall be taken as R-0.8 for 16 inch on center assemblies and R-0.9 for 24 inch on center assemblies.

TABLE R402.1.6 (N1102.1.6)
STEEL FRAMED ASSEMBLIES CAVITY INSULATION CORRECTION FACTORS

Nominal Stud Size	Cavity Insulation <i>R-Value</i>	Nominal Framing Spacing	
		16 in. on center	24 in. on center
<u>2x4</u>	<u>11</u>	<u>0.50</u>	<u>0.60</u>
<u>2x4</u>	<u>13</u>	<u>0.46</u>	<u>0.55</u>
<u>2x4</u>	<u>15</u>	<u>0.43</u>	<u>0.52</u>
<u>2x6</u>	<u>19</u>	<u>0.37</u>	<u>0.45</u>
<u>2x6</u>	<u>20</u>	<u>0.36</u>	<u>0.44</u>
<u>2x6</u>	<u>21</u>	<u>0.35</u>	<u>0.43</u>
<u>2x8</u>	<u>25</u>	<u>0.31</u>	<u>0.38</u>

Reason: The purpose of the code change is to clarify the code by standardizing the method used to calculate the *R-values* and *U-factors* in opaque envelope assemblies. There is currently no method outlined in the *IECC* or *IRC* that would specify the assumptions for calculating the efficiencies of opaque assemblies in compliance software. This proposal does not change the prescriptive insulation *R-value* or *U-factor* requirements, but it standardizes crucial assumptions such as framing fractions that must be used in energy calculations.

The *IECC* currently allows the use of energy modeling tools to show compliance, but the guidance is vague. Section R402.1.4 Total UA alternative requires simply that the "UA calculation shall be done using a method consistent with the *ASHRAE Handbook of Fundamentals* and shall include the thermal bridging effects of framing materials."

Some stakeholders have used the lack of specificity in the code to argue for a "least common denominator" approach to code compliance, in which worst-case assumptions would be used as the baseline in Total UA or performance path calculations. That approach could lead to highly inconsistent results and significant losses of energy efficiency, and it runs counter to the purpose of regulating building energy efficiency in the first place. To be clear, this proposal does not intend to alter the simple prescriptive path, nor does it intend to create multiple prescriptive alternatives. Rather, it specifies the basic assumptions that must be used whenever the Total UA alternative or simulated performance alternative is used and standardizes this approach for all users.

The proposal above offers an objective, uniform set of default assumptions to be used in energy modeling, based on standard and advanced construction techniques. The proposal primarily uses values based on *ASHRAE*, supplemented by the approaches used in US DOE's REScheck compliance software, the HERS program, and the Washington State Energy Code. The proposal has also been carefully refined based on comments received during previous code cycles to similar proposals.

Cost Impact: The code change proposal will not increase the cost of construction.

R402.1.5 (NEW)-EC-DEAN-HARRIS-MISURIELLO-PRINDLE-STONE

RE52 – 13

R402.2.1 (IRC N1102.2.1), R402.2.2 (IRC N1102.2.2)

Proponent: Brian Dean, Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; and Bill Prindle, Energy Efficient Codes Coalition

Revise as follows:

R402.2.1 (N1102.2.1) Ceilings with attic spaces. ~~When Section R402.1.1 would require R-38 in the ceiling, R-30 shall be deemed to satisfy the requirement for R-38 wherever~~ Where the full height of uncompressed R-30 insulation extends over the wall top plate at the eaves does not allow sufficient space for the required insulation in Section R402.1.1, ~~Similarly, R-38 shall be deemed to satisfy the requirement for R-49 wherever the full height of uncompressed R-38 insulation extends over the wall top plate at the eaves. This reduction shall not apply to the U-factor alternative approach in Section R402.1.3 and the total UA alternative in Section R402.1.4 shall be used.~~

R402.2.2 (N1102.2.2) Ceilings without attic spaces. ~~Where Section R402.1.1 would require insulation levels above R-30 and the design of the roof/ceiling assembly does not allow sufficient space for the required insulation in Section R402.1.1, the minimum required insulation for such roof/ceiling assemblies shall be R-30. This reduction of insulation from the requirements of Section R402.1.1 shall be limited to 500 square feet (46 m²) or 20 percent of the total insulated ceiling area, whichever is less. This reduction shall not apply to the U-factor alternative approach in Section R402.1.3 and the total UA alternative in Section R402.1.4 shall be used.~~

Reason: The purpose of this code change is to improve the efficiency of buildings by removing exceptions to the prescriptive ceiling R-value requirements. The 2012 IECC carves out an exception to the ceiling R-value requirements (in Section R402.2.1 for ceilings with attic spaces and Section R402.2.2 for ceilings without attic spaces) for cases (where there is insufficient space in the ceiling design to install the full amount of required insulation. Although this exception reduces the efficiency of ceilings, there is no corresponding increase of efficiency elsewhere in the building.

The proposal above eliminates the exception in each section because it is unnecessary. Where ceiling space is inadequate to install sufficient insulation, the builder or design professional using the prescriptive approach should use the Total UA analysis (or may opt for the Simulated Performance Alternative) to make up for the efficiency loss elsewhere in the thermal envelope or overall performance of the building. There is no valid reason to continue to give a free pass to buildings designed with insufficient space for adequate ceiling insulation.

Cost Impact: The code change proposal will increase the cost of construction.

R402.2.1-EC-DEAN-HARRIS-MISURIELLO-PRINDLE-STONE

RE53 – 13

R402.2.1 (IRC N1102.2.1)

Proponent: Ellen Eggerton, representing Virginia Building and Code Officials Association

Revise as follows:

R402.2.1 (N1102.2.1) Ceilings with attic spaces. ~~When~~ Where Section R402.1.1 would require R38 in the ceiling, installing R30 over 100 percent of the ceiling area requiring insulation shall be deemed to satisfy the requirement for R38 whenever the full height of uncompressed R30 insulation extends over the wall top plate at the eaves. Similarly, where Section R402.1.1 would require R49 in the ceiling, installing R38 over 100 percent of the ceiling area requiring insulation shall be deemed to satisfy the requirement for R49 whenever the full height of uncompressed R38 insulation extends over the wall top plate at the eaves. This reduction shall not apply to the U-factor alternative approach in Section R402.1.3 and the total UA alternative in Section R402.1.4.

Reason: Revised language clarifies how to interpret the “alternative” ceiling insulation requirement. It has come to VBCOA’s attention that some code officials have interpreted R402.1.1 as permitting R38 over the wall top plate when using “raised heel” or “energy” trusses, but where R49 could be installed in the interior of the attic where height permits, R49 would in fact be required in those areas. The amendment seeks to clarify that R38 may be used throughout the entire attic, where a full R38 can be installed over the top plate. This approach is consistent with US DOE analysis of heat flow through insulated attics (ca. 1996), accounting for actual insulation thicknesses and framing members.

Cost Impact: Depending on how this particular provision had been previously enforced, impact may be to reduce overall installed insulation materials in attics and associated costs, with no appreciable difference in heat flow rate through this part of the thermal envelope.

RE53-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R402.2.1-EC-EGGERTON

RE54 – 13

R402.2.1 (IRC N1102.2.1)

Proponent: Robby Schwarz, representing EnergyLogic, Inc. (robby@nrglogic.com)

Revise as follows:

R402.2.1 (N1102.2.1) Ceilings with attic spaces. When Section R402.1.1 would require R-38 in the ceiling, it is required to be continuous across the entire attic at a depth sufficient to achieve an R-38. R-30 shall only be deemed to satisfy the requirement for R-38 wherever the full height of uncompressed R-30 insulation extends over the wall top plate at the eaves and the remainder or the attic continues to be R-38. Similarly, R-38 shall be deemed to satisfy the requirement for R-49 wherever the full height of uncompressed R-38 insulation extends over the wall top plate at the eaves and the remainder or the attic continues to be R-49. This reduction shall not apply to the *U*-factor alternative approach in Section R402.1.3 and the total UA alternative in Section R402.1.4.

Reason: The language of this section has been misinterpreted for years to mean exactly what is being stated in the change. The language change makes it clear that continuous depth of insulation is required across the entire attic to the level that is called out in section R402.1.1. The only exception is over the top plate where insulation depth can be reduced due to the slop of the roof. Efficiency of the home is increased and if a reduction of the R-value is necessary for other building reasons then the other alternative compliance paths are available so tradeoffs can be utilized and code compliance can be achieved.

Cost Impact: The code change proposal will not increase the cost of construction.

RE54-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R402.2.1-EC-SCHWARZ

RE55 – 13

R402.2.2 (IRC N1102.2.2)

Proponent: Robby Schwarz, representing EnergyLogic, Inc. (robby@nrglogic.com)

Revise as follows:

R402.2.2 (N1102.2.2) Ceilings without attic spaces. Where Section R402.1.1 would require insulation levels above R- 30 and the design of the roof/ceiling assembly does not allow sufficient space for the required insulation, ~~the minimum required insulation for such roof/ceiling assemblies shall be R-30 the residential building shall be required to utilize the U-factor alternative approach in Section R402.1.3, the total UA alternative in of Section R402.1.4, or Section 405 to demonstrate code compliance. This reduction of insulation from the requirements of Section R402.1.1 shall be limited to 500 square feet (46 m2) or 20 percent of the total insulated ceiling area, whichever is less. This reduction shall not apply to the U-factor alternative approach in Section R402.1.3 and the total UA alternative in Section R402.1.4.~~

Reason: The R-values have been established to achieve a specific level of quantifiable energy performance. If the levels cannot be achieved in a specific building assembly alternative compliance paths are available that will demonstrate that the assembly meets the requirements of the code.

Cost Impact: The code change proposal will not increase the cost of construction.

RE55-13

	Assembly:	ASF	AMF	DF

R402.2.2-EC-SCHWARZ

RE56 – 13

R202 (NEW) (IRC N1101.9), R402.2.3 (IRC N1102.2.3), R402.2.3.1 (NEW) (IRC N1102.2.3.1 (NEW)), R402.2.3.2 (NEW) (IRC N1102.2.3.2 (NEW)), Chapter 5

Proponent: Forrest Fielder, CBO, Arizona Building Officials (fielder_4@msn.com)

Revise as follows:

R402.2.3 (N1102.2.3) ~~Eave baffle~~ .Vented attics. Roof assemblies containing vented attics shall comply with 402.2.3.1 and 402.2.3.2.

R402.2.3.1 (N1102.2.3.1) Eave baffle. For air permeable insulation in vented attics, a baffle shall be installed adjacent to soffit and eave vents. Baffles shall maintain an opening equal or greater than the size of the vent. The baffle shall extend over the top of the attic insulation. The baffle shall be permitted to be any solid material.

R402.2.3.2 (N1102.2.3.2) Radiant barriers. In Climate Zones 1, 2, and 3, vented attics shall contain radiant barriers, as tested in accordance with ASTM C1313M-12 and installed in accordance with ASTM C1743-12

Exception: Attics containing no HVAC space conditioning equipment or attics with a maximum of 10 lineal feet of supply or return ducting.

Add new definition as follows:

IECC SECTION R202 (IRC N1101.9) GENERAL DEFINITIONS

RADIANT BARRIER. A material having a low emittance surface (0.1 or less) and where installed in building assemblies, the low emittance surface shall face a ventilated or unventilated air space.

Add new standards to Chapter 5 as follows:

ASTM C1313/C1313M-12 Standard Specification for Sheet Radiant Barriers for Building Construction Applications

ASTM C1743-12 Standard Practice for Installation and Use of Radiant Barrier Systems (RBS) in Residential Building Construction

Reason: In cooling climates, attic radiant barriers (ARBs) have been shown to conserve substantial amounts of energy by reducing temperatures in vented attics. Lower attic temperatures slow the rate of temperature differential – driven heat transfer from ceiling envelope elements and HVAC equipment and ducting.

Attic radiant barriers are extensively used across Climate Zones 1, 2 and 3, i.e. in the sunbelt areas, and numerous demonstration projects and studies have confirmed the energy savings and cost-effectiveness of these installations. Such radiant barrier products have been on the market for over 24 years and are used by 87 of the top 100 US Builders. They have an established history and have been accepted into several regional code requirements and are included in the Energy Star Reference Home Guidelines. Some 650 million square feet of radiant barriers are installed annually.

The current state and city codes that include radiant barrier are:

- HI – Chapter 181 of Title 3, Table 402.1.1.1, Section 402.1.1.6, 402.1.1.8.1
- TX - Austin, Chapter 25-12, Article 12. Energy Code, Section 402.6
- FL – 2010 Florida Building Code, Section 405.6.1, Figure 405.6.1 & Table 303.2 (ASTM Standards)
- CA – Title 24, Part 6, Subsection 8, Section (f), Subsection 2; Table 151-B; Table 151-C; Table 151-D

This product has two ASTM Standards that are applicable – ASTM C1313, “Standard Specification for Sheet Radiant Barriers for Building Construction Applications,” and ASTM C1743, “Standard Practice for Installation and Use of Radiant Barrier Systems (RBS) in Residential Building Construction”. This proposal requires the use of radiant barriers in a manner consistent with the existing language in the Energy Star for Homes – “Version 3, Exhibit 1” and, additionally, requires that the radiant barriers comply with the two ASTM standards just referenced.

The Department of Energy (DOE) has published the "Radiant Barrier Fact Sheet"¹ that is available on the DOE website through the following link: <http://www.ornl.gov/sci/ees/etsd/btrc/RadiantBarrier/RBFactSheet2010.pdf>

A comprehensive review of radiant barrier studies was performed by Mario Medina, Ph.D. P.E. "This paper provides a general description of RBs, including installation configurations, the physical principles that make them work, and the laboratory and field experiments used to evaluate their thermal performance. An extensive review of the literature is summarized, highlighting fundamental issues, such as reduced ceiling heat flows, reduced space cooling and heating loads, and changes in attic temperatures produced by the installation of RBs in residential attics."² The document has been mentioned here as an additional reference related to radiant barrier product information and to highlight the scope of "benefit" studies that have been completed.

The study entitled "Radiant Barrier Impact on Selected Building Performance Measurements Model Home Case Study"³, authored by B.E. Davis and J. Tiller, from the Appalachian State University Energy Center, sponsored by Centex Homes in Charlotte, NC, demonstrates the energy savings associated with the use of radiant barriers in attics. In the study, two identical homes were fit with over sixty sensors, where one house contained a radiant barrier (designated as the "Belmont" home) and one did not. The house with the radiant barrier had a peak attic temperature drop by 23%, and the improved efficiency of the cool air delivered through the ducts was 57%.

The current language in the Energy Star for Homes – "Version 3, Exhibit 1" requires the use of radiant barriers in vented attics of the reference home, with an exception for attics containing no HVAC space conditioning equipment and a maximum of 10 linear feet of supply or return ducting.

¹ Department of Energy "Radiant Barrier Fact Sheet" prepared by the Oak Ridge National Laboratory (2012).

² Medina, Mario, "A Comprehensive Review of Radiant Barrier Research Including Laboratory and Field Experiments", report prepared for the Reflective Insulation Manufacturers Association.

³ Davis, Bruce Eugene & Tiller, Jeffrey, "Radiant Barrier Impact on Selected Building Performance Measurements, Model Home Case Study, Centex Homes".

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, ASTM C1313/C1313M-12 Standard Specification for Sheet Radiant Barriers for Building Construction Applications, and C1743-12 Standard Practice for Installation and Use of Radiant Barrier Systems (RBS) in Residential Building Construction with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

Proponent: Wesley Hall, Reflectix, Inc., representing self (wes.hall@reflectixinc.com), Vickie Lovell, InterCode Incorporated, representing the Reflective Insulation Manufacturers Association International (Vickie@InterCodeinc.com)

Revise as follows:

R402.2.3 (N1102.2.3) Vented Attics. Sections 402.2.3.1 and 402.2.3.2 shall apply to roof assemblies containing vented attics.

R402.2.3.1 (N1102.3.1) Eave baffle. For air permeable insulations in vented attics, a baffle shall be installed adjacent to soffit and eave vents. The baffle shall maintain an opening equal or greater than the size of the vent. The baffle shall extend over the top of the attic insulation. The baffle shall be permitted to be any solid material.

R402.2.3.2 (N1102.2.3.2) Radiant barrier. Radiant barriers, used to supplement insulation in Climate Zones 1, 2, and 3, shall comply with the requirements of ASTM C1313 and shall be installed in accordance with ASTM C1743.

~~**R402.2.3 (N1102.2.3) Eave baffle.** For air permeable insulations in vented attics, a baffle shall be installed adjacent to soffit and eave vents. Baffles shall maintain an opening equal or greater than the size of the vent. The baffle shall extend over the top of the attic insulation. The baffle shall be permitted to be any solid material.~~

Add new definition as follows:

IECC SECTION R202 (IRC N1101.9) GENERAL DEFINITIONS

RADIANT BARRIER. A material having a low emittance surface of 0.1 or less installed in building assemblies.

Add new standards to Chapter 5 as follows:

ASTM

C1313/C1313M-12 Standard Specification for Sheet Radiant Barriers for Building Construction Applications

C1743-12 Standard Practice for Installation and Use of Radiant Barrier Systems (RBS) in Residential Building Construction

Analysis: A review of the standards proposed for inclusion in the code, ASTM C1313/C1313M-12 Standard Specification for Sheet Radiant Barriers for Building Construction Applications, and C1743-12 Standard Practice for Installation and Use of Radiant Barrier Systems (RBS) in Residential Building Construction with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

Reason: (HALL) Radiant barriers are a viable building option, widely distributed and have an established place in the market. The purpose of this proposal is to provide information and references for radiant barriers.

The content of this proposal contains product requirements and references that will aid the contractors and code officials in recognizing and understanding radiant barrier products and correct installation procedures.

Attic radiant barriers are extensively used across Climate Zones 1, 2 and 3, i.e. in the sunbelt areas. These products have been on the market for over 24 years and are used by 87 of the top 100 US Builders. They have an established history and have been accepted into several regional code requirements and are included in the Energy Star Homes Guidelines. Some 650 million square feet of the product is being installed annually.

The current state and city codes that include radiant barrier are:

- HI – Chapter 181 of Title 3, Table 402.1.1.1, Section 402.1.1.6, 402.1.1.8.1
- TX - Austin, Chapter 25-12, Article 12. Energy Code, Section 402.6
- FL – 2010 Florida Building Code, Section 405.6.1, Figure 405.6.1 & Table 303.2 (ASTM Standards)
- CA – Title 24, Part 6, Subsection 8, Section (f), Subsection 2; Table 151-B; Table 151-C; Table 151-D

This product has two ASTM Standards that are applicable – ASTM C1313, “Standard Specification for Sheet Radiant Barriers for Building Construction Applications,” and ASTM C1743, “Standard Practice for Installation and Use of Radiant Barrier Systems (RBS) in Residential Building Construction”. This proposal does not require the use of radiant barriers but requires that, when they are used, they comply with the two ASTM standards just referenced.

ASTM C1743-12 can be viewed at: <http://reflectixinc.com/literature/securedpdfs/C1743.pdf>

(LOVELL) The use of radiant barriers in vented attics in hot climates has been shown to conserve substantial amounts of energy by reducing the temperatures in the attic. If the attic temperature is lower, that slows the rate of temperature differential and transfers heat away from ceiling envelope elements and HVAC equipment and ducting. Attic radiant barriers are extensively used across Climate Zones 1, 2 and 3, i.e. in the sunbelt areas, and numerous demonstration projects and studies have confirmed the energy savings and cost-effectiveness of these installations. Such radiant barrier products have been on the market for over 24 years and are used by 87 of the top 100 US Builders. They have an established history and have been accepted into several regional code requirements and are included in the Energy Star Homes Guidelines. Some 650 million square feet of the product is installed annually.

The current state and city codes that include radiant barrier are:

- HI – Chapter 181 of Title 3, Table 402.1.1.1, Section 402.1.1.6, 402.1.1.8.1
- TX - Austin, Chapter 25-12, Article 12. Energy Code, Section 402.6
- FL – 2010 Florida Building Code, Section 405.6.1, Figure 405.6.1 & Table 303.2 (ASTM Standards)
- CA – Title 24, Part 6, Subsection 8, Section (f), Subsection 2; Table 151-B; Table 151-C; Table 151-D

This product has two ASTM Standards that are applicable – ASTM C1313, “Standard Specification for Sheet Radiant Barriers for Building Construction Applications,” and ASTM C1743, “Standard Practice for Installation and Use of Radiant Barrier Systems (RBS) in Residential Building Construction”. This proposal requires the use of radiant barriers in a manner consistent with the existing language in the Energy Star for Homes – “Version 3, Exhibit 1” and, additionally, requires that the radiant barriers comply with the two ASTM standards just referenced.

The Department of Energy (DOE) has published the “Radiant Barrier Fact Sheet that is available on the DOE website through the following link: <http://www.ornl.gov/sci/ees/etsd/btrc/RadiantBarrier/RBFactSheet2010.pdf>

Values taken from this DOE document are utilized in the “Savings Benefit to the Home Owner” section below.

A very comprehensive study was performed by Mario Medina. “This paper provides a general description of RBs, including installation configurations, the physical principles that make them work, and the laboratory and field experiments used to evaluate their thermal performance. An extensive review of the literature is summarized, highlighting fundamental issues, such as reduced ceiling heat flows, reduced space cooling and heating loads, and changes in attic temperatures produced by the installation of RBs in residential attics. The document has been mentioned here as an additional reference related to radiant barrier product information and to highlight the scope of “benefit” studies that have been completed.

The study entitled “Radiant Barrier Impact on Selected Building Performance Measurements Model Home Case Study, authored by B.E. Davis and J. Tiller, from the Appalachian State University Energy Center, sponsored by Centex Homes in Charlotte, NC, and demonstrates the energy savings associated with the use of radiant barriers in attics. In the study, two identical homes were fit with over sixty sensors, where one house contained a radiant barrier (designated as the “Belmont” home) and one did not. The house with the radiant barrier had a peak attic temperature drop by 23% and the improved efficiency of the cool air delivered through the ducts was 57%.

The current language in the Energy Star for Homes – “Version 3, Exhibit 1” requires the use of radiant barriers in vented attics, with an exception for attics containing no HVAC space conditioning equipment and a maximum of 10 linear feet of supply or return ducting.

Cost Calculator – to home owner – new structure – hip roof:

- Product Cost - Radiant Barrier OSB Panel – \$0.11 per sq. ft.-(takes into account waste) ⁴
- 2,000 sq. ft. house, ranch, hip roof
- 2,200 sq. ft. of roof area x \$0.11 per sq. ft. (radiant barrier cost) = \$242.00
- Cost to home owner - \$242.00
- Additional cost added to monthly payment of a 30 year mortgage – 4% fixed interest rate:
- \$242.00 @ 4% = addition of \$1.16 to the monthly payment

Savings Benefit to the Home Owner:

- Cost to add Radiant Barrier OSB - \$1.16 per month (per above)
- 2,000 sq. ft. house, ranch, hip roof
- Savings as calculated in the Department of Energy “Radiant Barrier Fact Sheet”
- Code level insulation with well-sealed ducts in the attic
- Zone 1 - \$0.03 per sq. ft. x 2,000 sq. ft. = \$60.00 / 12 months = \$5.00 per month
- Zone 2 - \$0.03 per sq. ft. x 2,000 sq. ft. = \$60.00 / 12 months = \$5.00 per month
- Zone 3 - \$0.02 per sq. ft. x 2,000 sq. ft. = \$40.00 / 12 months = \$3.33 per month

- The cost for energy is based on first year (2012) values – if increases in energy cost due to inflation and other factors occur – annual savings will increase proportionally.

In summary, this exercise exemplifies the immediate energy cost savings that are netted when a radiant barrier is included in the design of a new home in Climate Zones 1, 2 and 3 with “well-sealed” ducts in the attic. The cost to the new home is small and the energy savings are significant over the life of the home.

R402.3 (NEW)-EC-HALL

RE58 – 13

R402.2.4 (IRC N1102.2.4)

Proponent: Jeff Inks, representing the Window & Door Manufacturers Association.

Revise as follows:

R402.2.4 (N1102.2.4) Access hatches and doors. Access doors from conditioned spaces to unconditioned spaces (e.g., attics and crawl spaces) shall be weatherstripped and insulated to a level equivalent to the insulation on the surrounding surfaces. Access shall be provided to all equipment that prevents damaging or compressing the insulation. A wood framed or equivalent baffle or retainer is required to be provided when loose fill insulation is installed, the purpose of which is to prevent the loose fill insulation from spilling into the living space when the attic access is opened, and to provide a permanent means of maintaining the installed R-value of the loose fill insulation.

Exception: Vertical doors that provide access from conditioned to unconditioned spaces shall be permitted to meet the requirements of Table R402.1.1 based on the applicable climate zone specified in Chapter 3.

Reason: As currently written, this provision is being interpreted in some jurisdictions as requiring vertical doors providing access to certain unconditioned spaces such as attics to meet the thermal insulation levels of the surrounding wall they are installed in rather than the thermal requirements for doors contained in Table R402.1.1 applicable to the building thermal envelope. The thermal performance requirements for these vertical doors should be no greater than those for exterior doors installed elsewhere in the building thermal envelope.

Cost Impact: The code change proposal will not increase the cost of construction.

RE58-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R402.2.4-EC-INKS

RE59 – 13

R402.2.4 (IRC N1102.2.4)

Proponent: Joel Rodriguez, Gwinnett county, Georgia, representing Metropolitan Atlanta Inspector's Association (MAIA) (joel.rodriguez@gwinnettcountry.com)

Revise as follows:

R402.2.4 (N1102.2.4) Access hatches and doors. Access doors from conditioned spaces to unconditioned spaces (e.g., attics and crawl spaces) shall be weatherstripped and insulated to a level in accordance with the following insulation values:

1. Hinged vertical doors shall have a maximum U-Factor of U-0.20 (R-5 minimum);
2. Hatches/scuttle hole covers shall have a maximum U-Factor of U-0.05 (R-19 minimum); and
3. Pull down stairs shall have a maximum U-Factor of U-0.020 with a minimum of 75 percent of the panel area having (R-5 minimum) insulation.

~~equivalent to the insulation on the surrounding surfaces.~~ Access shall be provided to all equipment that prevents damaging or compressing the insulation. A wood framed or equivalent baffle or retainer is required to be provided when loose fill insulation is installed, the purpose of which is to prevent the loose fill insulation from spilling into the living space when the attic access is opened, and to provide a permanent means of maintaining the installed R-value of the loose fill insulation. There shall be a floor or landing on top of the ceiling joist with a minimum width of 10 inches (254 mm) around the perimeter of access hatches and pull down stairs into an attic area.

Reason: To eliminate the conflict in the insulation requirement language in TABLE R402.1.1 INSULATION AND FENESTRATION REQUIREMENTS BY COMPONENT, TABLE R402.1.3 EQUIVALENT U-FACTORS and 402.2.3 Fenestration access hatches and doors. To insulate to the levels specified in R402.2.4 Access hatches and doors compared to the above insulation requirements is expensive, in some cases not practical. It doesn't make sense to require R-30 to R-49 insulation on a hatch or pull down stairs when one can have a skylight that is U-FACTOR 0.55-0.75 (les than R-2). The calculated additional energy costs between and R-5 and R-30 is approximately \$7.00 per year for Climate Zoe 4 (based on the methodology listed in ASHRAE Handbook Fundamentals for 10 SF pull down stairs. (Electricity cost based on \$0.11 KWH and Natural Gas \$0.70 Therm). To require a door into an attic to be R-13 to R-20+ doesn't make sense when a n exterior door or window exposed to the outside can be R-2 to R-3 (U-FACTOR 0.32-0.55). The manufacturers of doors, pull down stairs and hatches currently manufacture fenestration that meets these proposed insulation requirements. There is not a manufacturer that makes an R-13 or better door and the only way to achieve an R-30 or better with pull down stairs is to build or install a separate cover over the pull down stairs. This can create an unsafe entrance into the attic because the step up will be 16 inches or more, and that conflicts with IRC R311.7.5.1 Risers.

Cost Impact: The code change proposal will not increase the cost of construction. The savings will be a minimum of \$200 per opening.

RE59-13

R402.2.4-EC-RODRIGUEZ

RE60 – 13

R402.2.7 (IRC N1102.2.7), Table R402.4.1.1 (IRC Table N1102.4.1.1)

Proponent: Joseph Lstiburek, Building Science Corporation, representing self
(joe@buildingscience.com)

Revise as follows:

R402.2.7 (N1102.2.7) Floors. Floor framing cavity insulation shall be installed to maintain permanent contact with the underside of the subfloor decking.

Exception: The floor framing cavity insulation shall be permitted to be in contact with the topside of sheathing or continuous insulation installed on the bottom side of floor framing when combined with insulation that meets or exceeds the minimum Wood Frame Wall R-value in Table 402.1.1 and extends from the bottom to the top of all perimeter floor framing members.

TABLE 402.4.1.1 (N1102.4.1.1)
AIR BARRIER AND INSULATION INSTALLATION

COMPONENT	CRITERIA
Floors (including above-garage and cantilevered floors)	Insulation Floor framing cavity insulation shall be installed to maintain permanent contact with underside of subfloor decking or <u>floor framing cavity insulation shall be permitted to be in contact with the topside of sheathing or continuous insulation installed on the bottom side of floor framing and extends from the bottom to the top of all perimeter floor framing members.</u> The air barrier shall be installed at any exposed edge of insulation.

(Portions of Table not shown remain unchanged)

Reason: Requiring insulation in floors to be in direct contact with the underside of subfloor decking is one insulating option. Another option is to have an airspace between the floor sheathing and the top of the cavity insulation where this cavity insulation is in direct contact with the topside of sheathing or continuous insulation installed on the underside of the floor framing and is combined with perimeter insulation that meets or exceeds the R-value requirements for walls. This second option leads to fewer cold spots yet does not change the heat loss as long as the cavity insulation is in direct contact with a sheathing below it or continuous insulation below it. It also facilitates services to be enclosed within the thermal envelope. Examples of these configurations are illustrated below:

Cost Impact: The code change proposal will not increase the cost of construction.

RE60-13

Public Hearing: Committee: AS AM D
 Assembly: ASF AMF DF

R402.2.7-EC-LSTIBUREK

RE61 – 13

R402.2.7 (IRC N1102.2.7)

Proponent: Eric Makela, Britt/Makela Group, Inc., representing Northwest Energy Codes Group (Eric@BrittMakela.com)

Revise as follows:

R402.2.7 (N1102.2.7) Floors. Floor insulation shall be installed to maintain permanent contact with the underside of the subfloor decking. Insulation supports for batt insulation shall be installed so that spacing is no more than 24 inches on center and shall not compress the insulation. Foundation vents shall be placed so that the top of the vent is below the lower surface of the floor insulation.

Exception: Where foundation vents are not placed so that the top of the vent is below the lower surface of the floor insulation, a permanently attached baffle shall be installed from the top of the vent to below the lower surface of the floor insulation at an angle of 30° from horizontal, to divert air flow below the lower surface of the floor insulation.

Reason: The 2012 IECC currently requires insulation installed in a floor system to maintain permanent contact with the underside of the subfloor decking. Insulation support systems, if not installed properly, can compress the insulation degrading the insulation R-value. This proposal requires that insulation supports not compress the installed insulation to ensure that it maintains its full R-value.

The second portion of the code change proposal focuses on the installation of foundation vents in relation to the installed insulation. Foundation vents that are installed at the same level as the insulation can direct air directly at the insulation reducing the R-value of the product through windwashing. Insulation will also act as a barrier to ventilation air, reducing the effectiveness of the foundation vent. This proposal will require that foundation vents either be installed below the line of insulation, or when not possible, require the installation of baffles to direct the ventilation air below the insulation

Cost Impact: The code change proposal will not increase the cost of construction.

RE61-13

R402.2.7-EC-MAKELA

RE62 – 13

R402.2.13 (NEW) (IRC N1102.2.13 (NEW))

Proponent: Ellen Eggerton, representing Virginia Building and Code Officials Association

Revise as follows:

R402.2.13 (N1102.2.13) Mechanical rooms. Where a room contains combustion equipment, and outside air is admitted directly into the room to provide combustion air for the equipment, then the walls, ceilings, and floors of that room bound unconditioned space and shall be insulated as part of the *building thermal envelope*.

Reason: AHJs have disagreed regarding how to apply the energy code to “mechanical rooms” with permanently installed air ducts directly connecting the room to the outdoor environment. This proposal attempts to apply the code requirements to these rooms in a feasible and enforceable manner. Note that by identifying the enclosure of the mechanical room as part of the thermal envelope, these surfaces will be sealed as well as insulated, thereby preventing unwanted and energy-consuming air intrusion into the conditioned living space adjacent to the mechanical room.

Cost Impact: To the extent that mechanical rooms have previously been considered unconditioned space and were enforced as such, this clarifying proposal has no cost impact. If these rooms were previously uninsulated, there will be some costs associated with insulating the customary framed walls and ceiling of the room, as well as sealing potential avenues of air infiltration to the conditioned living space beyond.

RE62-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R402.2.13 (NEW)-EC-EGGERTON

RE63 – 13

Table R402.1.1 (IRC Table N1102.1.1), R402.2.13 (NNEW) (IRC N1102.2.13 (NEW))

Proponent: Jeremiah Williams, representing U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

TABLE R402.1.1 (N1102.1.1) INSULATION AND FENESTRATION REQUIREMENTS BY COMPONENT

(Portions of Table not shown remain unchanged)

- h. First value is cavity insulation, second is continuous insulation or insulated siding, so “13+5” means R-13 cavity insulation plus R-5 continuous insulation or insulated siding. ~~If structural sheathing covers 40 percent or less of the exterior, continuous insulation R-value shall be permitted to be reduced by no more than R-3 in the locations where structural sheathing is used – to maintain a consistent total sheathing thickness.~~

R402.2.13 (N1102.2.13) Walls with partial structural sheathing. Where Section R402.1.1 would require continuous insulation on exterior walls and structural sheathing covers 40 percent or less of the gross area of all exterior walls, the continuous insulation *R*-value shall be permitted to be reduced by an amount necessary to result in a consistent total sheathing thickness, but not more than R-3, on areas of the walls covered by structural sheathing. This reduction shall not apply to the *U*-factor alternative approach in Section R402.1.3 and the total UA alternative in Section R402.1.4.

Reason: This is a clarification not intended to change the meaning of the code. Moving the relevant text out of the footnote and into a separate code section allows for a more thorough description of the sheathing reduction allowance.

Cost Impact: The code change proposal will not increase the cost of construction.

RE63-13

R402.3 (NEW) (IRC N1102.3 (NEW)), R402.3.1 (NEW) (IRC N1102.3.1 (NEW)), Table 402.3.1 (NEW) (IRC Table N1102.3.1 (NEW)), Chapter 5

Proponent: Jeremiah Williams, representing U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Add new text as follows:

R402.3 (N1102.3) Solar Properties of Opaque Surfaces (prescriptive).

R402.3.1 (N1102.3.1) Roof Solar Reflectance and Thermal Emittance. Roofs having a slope less than 2:12, directly above cooled *conditioned spaces* in climate zones 1, 2, and 3 shall comply with at least one option in Table R402.3.1.

Exceptions: The following are exempt from the requirements in Table R402.3.1:

1. Portions of roofs that include or are covered by:
 - 1.1 Photovoltaic systems or components
 - 1.2 Solar air or water heating systems or components
 - 1.3 Roof gardens or landscaped roofs
 - 1.4 Above-roof decks or walkways
 - 1.5 Skylights
 - 1.6 HVAC systems, components, and other opaque objects mounted above the roof
 - 1.7 A radiant barrier is installed
2. Portions of roofs shaded during the peak sun angle on the summer solstice by permanent features of the building, or by permanent features of adjacent buildings
3. Ballasted roofs with a minimum stone ballast of 17 lbs/ft² (74 kg/m²) or 23 lbs/ft² pavers (117 kg/m²)
4. Roofs where a minimum of 75% of the roof area meets a minimum of one of the exceptions above.

TABLE R402.3.1 (N1102.3.1)
MINIMUM ROOF REFLECTANCE AND EMITTANCE OPTIONS^a

Three-year aged solar reflectance ^b of 0.55 and three-year aged thermal emittance ^b of 0.75
Initial solar reflectance ^b of 0.70 and initial thermal emittance ^b of 0.75
Three-year-aged solar reflectance index ^c of 64
Initial solar reflectance index ^c of 82

- a. The use of area-weighted averages to meet these requirements shall be permitted. Materials lacking initial tested values for either *solar reflectance* or *thermal reflectance*, shall be assigned both an initial *solar reflectance* of 0.10 and an initial *thermal emittance* of 0.90. Materials lacking three-year aged tested values for either *solar reflectance* or *thermal reflectance*, shall be assigned both a three-year aged *solar reflectance* of 0.10 and a three-year aged *thermal emittance* of 0.90.
- b. Tested solar reflectance and thermal emittance shall be in accordance with ANSI/CRRC-1-2010.
- c. Solar reflectance index (SRI) determined in accordance with ASTM E1980-11 using a convection coefficient of 2.1 BTU/h-ft²-F (12W/m²-K). Calculation of aged SRI shall be based on aged tested values. Calculation of initial SRI shall be based on initial tested values.

Add new standards to Chapter 5 as follows:

ASTM

E 1980-11 Standard Practice for Calculating Solar Reflectance Index of Horizontal and Low-sloped Opaque Surfaces

CRCC Cool Roof Rating Council
1610 Harrison St
Oakland, CA 94612

ANSI/CRCC-1-2010 Cool Roof Rating Council CRCC-1 Standard

Reason: This proposed requirement applies to low-sloped roofs only and is consistent with requirements for commercial buildings in Section C402.2.1.1 of the 2012 IECC. Low-sloped roofs are commonly single-ply membranes, built-up roofs, modified bitumen membranes, and spray polyurethane foam. The U.S. DOE and Levinson report that high levels of reflectance for these types of roofs can typically be obtained for no cost increase over darker, less reflective roofs.

The low-slope DOE Cool Roof Calculator (<http://www.ornl.gov/sci/roofs+walls/facts/CoolCalcEnergy.htm>) reports these energy savings compared to a "black roof":

Climate Zone	Example City	Heating System Type	Net (Heating and Cooling) Annual Savings per 1000 ft² of roof area
2	Houston TX	Heat Pump	\$22
		Natural Gas	\$24
3	Atlanta GA	Heat Pump	\$15
		Natural Gas	\$17
Assumptions: R-30 insulation, 0.70 Solar reflectance, 0.75 thermal emittance, 12 cents/kWh electricity, \$1.00/therm natural gas, 3.5 COP cooling, 2.0 COP heat pump heating, 80% AFUE gas heat.			

Studies illustrating the savings from cool roofs are available on the Cool Roof Ratings Council website. <http://www.coolroofs.org/article.html#energy> For example, the Florida Solar Energy Center tested seven retail shops in a strip mall in Cocoa, Florida over a two-year period, which allowed surface degradation over a year period to be accounted for. The roof was resurfaced to alter the surface reflectivity from approximately 29% to 75%. There was a 25.3% average reduction in summer space cooling energy in the seven shops.

202 (NEW) (IRC N1101.9 (NEW)), R402.3.3 (NEW) (IRC N1102.3.3 (NEW)), Table R402.3.3 (NEW) (IRC Table N1102.3.3 (NEW)), R402.3.6 (IRC N1102.3.6)

Proponent: Dr. Thomas D. Culp, Birch Point Consulting LLC, representing the Glazing Industry Code Committee (culp@birchpointconsulting.com)

Revise as follows:

R402.3.3 (N1102.3.3) SHGC Shading Adjustment. Vertical fenestration in Climate Zones 1 through 3 shall be permitted to meet the SHGC requirements of Table R402.3.3 based upon the calculated projection factor of any overhang, eave, or permanently attached shading device that covers the full width of the glazing and extends a minimum of 12 inches (0.3 m) beyond each side of thereof. Where different windows and glazed doors have different projection factors, they shall each be evaluated separately, or an area-weighted projection factor value shall be permitted.

**TABLE R402.3.3 (N1102.3.3)
EQUIVALENT SHGC FOR VERTICAL FENESTRATION
WITH SHADING PROJECTIONS**

Projection Factor	Maximum SHGC
$PF < 0.2$	0.25
$0.2 \leq PF < 0.5$	0.30
$PF \geq 0.5$	0.40

R402.3.6 (N1102.3.6) R402.3.7 (N1102.3.7) Replacement fenestration. Where some or all of an existing fenestration unit is replaced with a new fenestration product, including sash and glazing, the replacement fenestration unit shall meet the applicable requirements for *U*-factor and SHGC in Table R402.1.1 and Section R402.3.3.

Add new definition as follows:

IECC SECTION R202 (IRC N1101.9) GENERAL DEFINITIONS

PROJECTION FACTOR. The ratio of the horizontal depth of an overhang, eave, or permanently attached shading device, divided by the distance measured vertically from the bottom of the fenestration glazing to the underside of the overhang, eave, or permanently attached shading device.

Reason: The purpose of this proposal is to provide a prescriptive allowance for shading as an appropriate method for controlling solar gains in addition to glazing SHGC. Shading has been part of good building design for millennia, and its use should be encouraged. A prescriptive shading allowance is already included in the commercial IECC as well as ASHRAE 90.1, but is not currently included in the residential IECC, other than through the more complicated performance path.

The need to address shading has become even more important following the 2012 IECC, which introduced a very low 0.25 SHGC in zones 1-3. Even with the newest low-e coatings, it is borderline whether 0.25 SHGC can be achieved for certain products without the addition of tinted glass or a darker low-e, especially for picture windows and sliding glass doors that have a larger glass to frame ratio. Additionally, the low 0.25 SHGC could inhibit homeowners from replacing older inefficient windows, because the new 0.25 SHGC requirement would result in a mismatched appearance between the new replacement windows/doors and the rest of the windows.

Therefore, a shading credit is one way to provide flexibility for both new and replacement windows, while maintaining the overall solar control. This proposal is based on the same shading multipliers as in the commercial IECC, but simplified for easy enforcement in the residential code. Specifically, the shading allowance for south/east/west orientation is used to be conservative and account for the worst orientation, but written simply as an adjusted maximum SHGC that doesn't require determination of orientation by either the builder or code official. This is very conservative, requiring a 0.40 SHGC even for a 3 ft overhang over a 5 ft high window, providing good solar control while also allowing flexibility and promoting architectural shading.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

R402.3.3 (NEW) -EC-CULP

RE66 – 13

R202 (NEW) (IRC N1101.9 (NEW)), R402.3.3 (NEW) (IRC N1102.3.3 (NEW)), Table R402.3.3 (NEW) (IRC Table N1102.3.3 (NEW))

Proponent: Don Surrena, CBO, representing National Association of Home Builders (NAHB) (dsurrena@nahb.org)

Add new text as follows:

R402.3.3 (IRC N1102.3.3) Glazed fenestration SHGC exception. In Climate Zones 1 through 4, permanently shaded vertical fenestration shall be permitted to satisfy the SHGC requirements. The projection factor of an overhang, eave, or permanently attached shading device shall be greater than or equal to the value listed in Table 402.3.3 for the appropriate orientation. The minimum projection shall extend beyond each side of the glazing a minimum of 12 inches (0.3 m). Each orientation shall be rounded to the nearest cardinal orientation (+/-45 degrees or 0.79 rad) for purposes of calculations and demonstrating compliance.

TABLE R402.3.3 (IRC N1102.3.3)
MINIMUM PROJECTION FACTOR REQUIRED BY ORIENTATION FOR SHGC EXCEPTION

<u>ORIENTATION</u>	<u>PROJECTION FACTOR</u>
<u>North</u>	$\geq 0.40^a$
<u>South</u>	≥ 0.20
<u>East</u>	≥ 0.50
<u>West</u>	≥ 0.50

a. For the north orientation, a vertical projection located on the west-edge of the fenestration with equivalent PF ≥ 0.15 shall also satisfy the minimum projection factor requirement.

Add new definition as follows:

IECC SECTION R202 (IRC N1101.9) **GENERAL DEFINITIONS**

PROJECTION FACTOR. The ratio of the horizontal depth of an overhang, eave, or permanently attached shading device, divided by the distance measured vertically from the bottom of the fenestration glazing to the underside of the overhang, eave, or permanently attached shading device.

Reason: The concept of using shading to reduce heat gain is integral to the architectural of some of the oldest world cultures. Shading in modern construction offers many possibilities. This proposed code change allows for the use of overhangs to meet the solar heat gain coefficient requirements within the IECC. Permanent exterior shading features, such as overhangs are allowed to be used in IECC Chapter 5 as a prescriptive trade-off to meeting SHGC requirements within the code. The calculation for determining the projection factor for overhangs has been in the 2000, 2003, 2006, and 2009 IECC for commercial buildings and has been proven to be very simple to calculate, fitting well into a prescriptive approach. The use of the shading devices was previously allowed under the 2003 IECC and is currently allowed as a trade-off under the commercial provisions of the IECC. Allowing flexibility in meeting the solar heat gain coefficient through the use of proven shading alternatives will increase the usability of the code for the building and design community while ensuring that the new fenestration is energy efficient. When credit for shading is permitted in the building code, it encourages an integrated approach to building designs, energy use, construction materials, renewable resources particularly as part of urban infrastructure, site and town planning and building design to be considered holistically. It also creates the opportunity for aesthetically pleasing and ingenious designs that might not otherwise be permitted.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

R402.3.3 (NEW)-EC-SURRENA

RE67 – 13

R402.3.5 (NEW) (IRC N1102.3.5 (NEW))

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

Add new text as follows:

R402.3.5 (N1102.3.5) Energy Rating alternative. Fenestration with an energy rating (ER) of not less than 21 shall be considered in compliance with Table 402.1 for climate zones 6, 7 and 8. The ER shall be determined in accordance with Equation 4-g:

$$ER = (57.76 \times SHGC) - (124 \times U\text{-factor}) - (10 \times (\text{air infiltration rate})) + 40 \quad \text{Equation 4-g}$$

Fenestration U-factor, SHGC, and air infiltration rate shall be determined and labeled as specified in Sections R103.1.3 and R402.4.3. Fenestration complying under this alternative shall be labeled by the manufacturer designation of ER. Default values shall not be used to compute ER.

Reason: The ER (Energy Rating) measures a window's suitability for residential use in a heating climate. ER combines the effects of U-factor, SHGC, and air infiltration rate, which are all based on fenestration testing already specified in the IECC and IRC and should already be on the window's NFRC label. While a low SHGC (low solar heat gain coefficient) is advantageous for cooling (hence the code requirement for a low SHGC in the south), a higher SHGC is advantageous for heating. The ER is only appropriate to a heating-dominated climate; therefore the use of ER is limited to zones 6, 7, and 8.

Since the minimum required ER never varies with the residential design, this alternative way to show compliance is easy to enforce. A window with an ER of 25 or more complies, a window with an ER less than 25 fails.

The ER concept has been used in Canada for more than 10 years and is part of their Model National Energy Code For Houses. Although not needed as a reference, the proposed equation comes from the Canadian ER (in the most recent CSA 440.2 Standard). Using the ER in the United States would encourage window sales across the U.S./Canadian border.

Cost Impact: The code change proposal will not increase the cost of construction.

R402.3.5 (NEW)-EC-CONNER

RE68 – 13

R402.3.5 (IRC N1102.3.5)

Proponent: Daniel J. Walker, P.E., Thomas Associates, Inc., representing the National Sunroom Association (dwalker@thomasamc.com)

Revise as follows:

R402.3.5 (N1102.3.5) Sunroom ~~U-factor~~ Fenestration. All *sunrooms* enclosing conditioned space shall meet the fenestration requirements of this code.

Exception: For *sunrooms* with *thermal isolation* and enclosing *conditioned space*, in ~~Climate Zones 4 through 8~~, the following exceptions to the fenestration requirements of this code shall apply:

1. In Climate Zones 2 through 8 the maximum fenestration *U-factor* shall be 0.45; and
- ~~2. the maximum skylight *U-factor* shall be 0.70.~~
2. In Climate Zones 1 through 3 the maximum SHGC shall be 0.30.

New fenestration separating the *sunroom* with *thermal isolation* from *conditioned space* shall meet the *building thermal envelope* requirements of this code.

Reason: The requirements for thermally isolated sunrooms was changed in the previous code cycle to relax the requirements in recognition of the lower energy consumption of these structures due to their occasional / seasonal use. The change proposed at this time would smooth the U-factor requirements since the previous change left the requirements discontinuous by requiring a lower U-factor in Climate Zones 2 and 3 than in the higher climate zones, which does not make sense. This change would set the U-factor requirements the same for all the climate zones where requirements exist, and would correct the discontinuity in the code between the requirements in Climate Zones 2, 3 and 4.

The proposal also seeks to set relaxed SHGC requirements for thermally isolated sunrooms in Climate Zones 1 through 3 because there is no practical way for the typically larger glazing used in sunrooms to meet the lower SHGC values prescribed by Table R402.1.1 unless very dark glass is used. Consumers purchase sunrooms to create a comfortable enclosed area that provides a view of the outdoors. Extremely dark glass is contrary to the very purpose of a sunroom.

Cost Impact: The proposed change would not increase the cost of construction.

R402.3.5-EC-WALKER

RE69-13

R402.3.6 (N1102.3.6)

Proponent: Dr. Thomas D. Culp, Birch Point Consulting LLC, representing the Glazing Industry Code Committee (culp@birchpointconsulting.com)

Revise as follows:

R402.3.6 (N1102.3.6) Replacement fenestration. Where some or all of an existing fenestration unit is replaced with a new fenestration product, including sash and glazing, the replacement fenestration unit shall meet the applicable requirements for *U*-factor and SHGC in Table R402.1.1.

Exception: In Climate Zones 1-3, replacement of up to 75 square feet (7.0 m²) of vertical fenestration with a maximum SHGC of 0.35.

Reason: The 2012 IECC significantly lowered the SHGC requirement down to 0.25 in zones 1-3. This necessitates the use of different low-e coatings, tinted glass, or both. As a result, windows meeting the 2012 IECC will have a different appearance than previous windows. This may not be an issue for new construction where all the windows use the same glazing product, but one concern for replacement windows is that the 0.25 SHGC requirement could inhibit homeowners from replacing older inefficient windows, because the new 0.25 SHGC requirement would result in a mismatched appearance between the new replacement windows/doors and the rest of the windows.

Even with the newest low-e coatings (known as triple silver coatings), the visible light transmittance will still be approximately 8% lower than other low-e coatings, and equally important, the reflected light and color will be different. Furthermore, even with these coatings, it is borderline whether 0.25 SHGC can be achieved for certain products without the addition of tinted glass or a darker low-e, especially for picture windows and sliding glass doors that have a larger glass to frame ratio.

The California Energy Commission recognized this problem, and not wanting to discourage replacement of older less efficient windows, they created an allowance in the recently developed criteria for Title 24 that allows 0.35 SHGC for up to 75 ft² of vertical fenestration (Title 24-2013, Exception 1 to Section 150.2(b)1B). This is a limited exception that will allow the use of low-e coatings that better match existing windows and remove a barrier to window replacement, while still providing a low SHGC for energy efficient solar control.

Cost Impact: The code change proposal will lower the cost of construction.

R402.3.6-EC-CULP

RE70 – 13

R402.3.6 (NEW) (IRC N1102.3.6 (NEW)), R402.2.13 (NEW) (IRC N1102.2.13 (NEW))

Proponents: Ellen Eggerton, representing Virginia Building and Code Officials Association; Harold A Stills, Jr., Hanover County, VA., representing Virginia Building and Code Officials Association (hastills@hanovercounty.gov)

Add new text as follows:

R402.3.6 (N1102.3.6) Thermally isolated garage door *R-value*. For Climate Zones 4 through 8, when the garage is conditioned, the minimum garage door *R-value* shall be 5.0. All other fenestration shall meet the *building thermal envelope* requirements.

R402.2.13 (N1102.2.13) Thermally isolated garage insulation. All garages shall be thermally isolated and meet ceiling and wall *R-values* as specified in Table R402.1.1. Existing slabs shall be exempt from insulation requirements.

Reason: Eggerton: The current IECC does not allow for the average garage to be conditioned because the average garage door cannot meet the 0.35 U-factor. In addition, it is very difficult to find a garage door that has been tested according to "NFRC 100" (R303.1.3). If one searches for doors at an average big-box home improvement store, it is not difficult to find an insulated garage door with an R-6 or greater R-value.

A garage is not considered "habitable space", but some activities, (such as automobile and household item repair) do occur there. These activities do not require the same level of comfort as the habitable areas of the dwelling, but a temperature other than the current outdoor temperature may be desirable. The average homeowner also realizes that it would not be efficient to maintain this space at the same temperature as the rest of the dwelling.

The last sentence of 402.2.13 recognizes that adding a heating or cooling mechanical system to an existing garage would be acceptable after adding the required insulation to the walls and ceiling, but impractical to add slab insulation. However, ice-melting systems are allowed.

Stills: The current IECC does not allow for the average garage to be conditioned because the average garage door cannot meet the 0.35 U-factor. In addition, it is very difficult to find a garage door that has been tested according to "NFRC 100" (R303.1.3). If one searches for doors at an average big-box home improvement store, it is not difficult to find an insulated garage door with an R-6 or greater R-value. However, ice-melting systems are allowed. A garage is not considered "habitable space", but some activities, (such as automobile and household item repair) do occur there. These activities do not require the same level of comfort as the habitable areas of the dwelling, but a temperature other than the current outdoor temperature may be desirable. The average homeowner also realizes that it would not be efficient to maintain this space at the same temperature as the rest of the dwelling. The last sentence of R402.2.13 recognizes that adding a mechanical system to an existing garage would be acceptable after adding the required insulation to the walls and ceiling, but impractical to add slab insulation.

Cost Impact: The code change proposal will not increase the cost of construction.

R402.4 (IRC N1102.4), R402.4.1.1 (IRC N1102.4.1.1), R402.4.1.2 (IRC N1102.4.1.2), R402.4.1.3 (NEW) (IRC N1102.4.1.3 NEW), R403.2.2 (IRC N1103.2.2), R403.2.2.1 (NEW) (IRC N1103.2.2.1 NEW), R403.2.2.2 (NEW) (IRC N1103.2.2.2 NEW), R403.2.2.3 (NEW) (IRC N1103.2.2.3), Table 405.5.2(1) (IRC Table N1105.5.2(1))

Proponent: Dan Buuck, representing National Association of Home Builders (NAHB)
(dbuuck@nahb.org)

Revise as follows:

R402.4 (N1102.4) Air leakage (Mandatory). The building thermal envelope shall be constructed to limit air leakage in accordance with the requirements of Sections R402.4.1 through R402.4.4.

R402.4.1.1 (N1102.4.1.1) Installation (Mandatory). The components of the *building thermal envelope* as listed in Table R402.4.1.1 shall be installed in accordance with the manufacturer's instructions and the criteria listed in Table R402.4.1.1, as applicable to the method of construction. Where required by the *code official*, an *approved* third party shall inspect all components and verify compliance.

R402.4.1.2 (N1102.4.1.2) Testing (Mandatory). The building or dwelling unit shall be tested ~~and verified as having an air leakage rate of not exceeding 5 air changes per hour in Climate Zones 1 and 2, and 3 air changes per hour in Climate Zones 3 through 8 for air leakage.~~ Testing shall be conducted with a blower door at a pressure of 0.2 inches w.g. (50 Pascals). Where required by the *code official*, testing shall be conducted by an *approved* third party. A written report of the results of the test shall be signed by the party conducting the test and provided to the *code official*. Testing shall be performed at any time after creation of all penetrations of the *building thermal envelope*. During testing:

1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed, beyond the intended weatherstripping or other infiltration control measures;
2. Dampers including exhaust, intake, makeup air, backdraft and flue dampers shall be closed, but not sealed beyond intended infiltration control measures;
3. Interior doors, if installed at the time of the test, shall be open;
4. Exterior doors for continuous ventilation systems and heat r, ecovery ventilators shall be closed and sealed;
5. Heating and cooling systems, if installed at the time of the test, shall be turned off; and
6. Supply and return registers, if installed at the time of the test, shall be fully open.

R402.4.1.3 (N1102.4.1.3) Leakage rate (Prescriptive). The building or dwelling unit shall have an air leakage rate not exceeding 5 air changes per hour in Climate Zones 1 and 2, and 3 air changes per hour in Climate Zones 3 through 8, when tested in accordance with Section R402.4.1.2.

R403.2.2 (N1103.2.2) Sealing (Mandatory). ~~Ducts, air handlers, and filter boxes shall be sealed. Joints and seams shall comply with either the International Mechanical Code or International Residential Code, as applicable.~~

Exceptions:

- ~~1. Air impermeable spray foam products shall be permitted to be applied without additional joint seals.~~
- ~~2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.~~
- ~~3. Continuously welded and locking-type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.~~

~~Duct tightness shall be verified by either of the following:~~

- ~~1. Postconstruction test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.~~
- ~~2. Rough-in test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.4 inches w.g. (25 Pa) across the system, including the manufacturer's air handler enclosure. All registers shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 3 cfm (85 L/min) per 100 square feet (9.29 m²) of conditioned floor area.~~

~~**Exception:** The total leakage test is not required for ducts and air handlers located entirely within the building thermal envelope.~~

R403.2.2.1 (N1103.2.2.1) Construction (Mandatory). Ducts, air handlers, and filter boxes shall be sealed. Joints and seams shall comply with either the International Mechanical Code or International Residential Code, as applicable.

Exceptions:

1. Air-impermeable spray foam products shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.
3. Continuously welded and locking-type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.

R403.2.2.2 (N1103.2.2.2) Duct testing (Mandatory). Ducts shall be pressure tested for air leakage by either of the following methods:

1. Postconstruction test: Total leakage shall be measured when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.
2. Rough-in test: Total leakage shall be measured when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the system, including the manufacturer's air handler enclosure if present at the time of the test. All registers shall be taped or otherwise sealed during the test.

Exception: The total leakage test is not required for ducts and air handlers located entirely within the building thermal envelope.

A written report of the results of the test shall be signed by the party conducting the test and provided to the code official.

R403.2.2.3 (N1103.2.2.3) Duct leakage (Prescriptive). Total leakage of the ducts, when measured in accordance with Section R403.2.2.2, shall be as follows:

1. Postconstruction test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area.
2. Rough-in test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area if the air handler is present at the time of the test, or 3 cfm

(85 L/min) per 100 square feet (9.29 m²) of conditioned floor area if the air handler is not present at the time of the test.

Exception: No maximum duct leakage rate is required when ducts and air handlers are located entirely within the building thermal envelope.

TABLE R405.5.2(1) (N1105.5.2(1))
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Glazing ^a	<p>Total area^b =</p> <p>(a) The proposed glazing area; where proposed glazing area is less than 15% of the conditioned floor area.</p> <p>(b) 15% of the conditioned floor area; where the proposed glazing area is 15% or more of the conditioned floor area.</p> <p>Orientation: equally distributed to four cardinal compass orientations (N, E, S, & W)</p> <p>U-factor: from Table R402.1.3</p> <p>SHGC: From Table R402.1.1 except that for climates with no requirement (NR) SHGC = 0.40 shall be used.</p> <p>Interior shade fraction: 0.92-(0.21 × SHGC for the standard reference design)</p> <p>External shading: none</p>	<p>As proposed</p> <p>As proposed</p> <p>As proposed</p> <p>As proposed</p> <p>0.92-(0.21 × SHGC as proposed)</p> <p>As proposed</p>

Service Water Heating ^{f,g,h,i}	<u>As proposed</u> <u>Fuel type: same as proposed design</u> <u>Efficiency: in accordance with prevailing federal minimum standards</u> <u>Use: gal/day = 30 + 10 × Nbr</u> <u>Tank temperature: 120°F</u> <u>Use: same as proposed design</u>	<u>As proposed</u> <u>As proposed</u> <u>Same as standard reference</u> <u>Same as standard reference</u> <u>gal/day = 30 + (10 × Nbr)</u>
Thermal distribution systems	<u>Untested distribution systems: DSE = 0.88</u> <u>Tested Ducts: Leakage rate to outside conditioned space as specified Section R403.2.2(1)</u> <u>Duct Location: Unconditioned attic</u> <u>Duct Insulation: Per Section R403.2.1</u>	Thermal distribution system efficiency shall be as tested or as specified in Table R405.5.2(2) if not tested. Duct insulation shall be as proposed. <u>Untested distribution systems: DSE from Table R405.5.2(2)</u> <u>Tested Ducts: Tested Leakage rate to outside conditioned space</u> <u>Duct Location: As proposed</u> <u>Duct Insulation: As proposed</u>

(Portions of Table not shown remain unchanged)

Reason: This amendment is a comprehensive proposal which provides flexibility for meeting the energy code requirements while maintaining the energy performance. It will provide a "true" unrestricted performance path that will allow for cost optimized construction of an energy equivalent house. The proposed changes provide alternatives that encourage innovation and the use of materials and equipment which will result in a home which is at least equivalent of that prescribed in the energy code.

The modifications will reinstate many of the changes made since the 2006 IECC which restricted the flexibility of the builder/designer to construct an energy efficient code compliant home while still meeting the energy performance levels of the current code.

Items included in this proposal:

- Energy neutral building tightness trade-offs
- Energy neutral duct tightness trade-offs
- Credit for more energy efficient buildings which incorporate reduced window area
- Energy neutral heating, cooling and water heating equipment efficiency trade-offs

Currently all homes have a mandatory requirement to be equal to or tighter than 3ACH50 or 5ACH50, depending on climate zone. Proposed changes will allow for homes to be less tight provided other efficiency changes are made to the house which offset energy lost due to the change in air infiltration.

Duct tightness requirements are similar to that of the entire building where all ducts must be equal to or tighter than 4 CFM25/100 CFA. Changes in this proposal will also allow for energy neutral tradeoffs for duct tightness.

Currently, when conducting a performance analysis, a building glazing area greater than 15% of the conditioned floor area (CFA) is penalized for using more energy. However, a building with less than 15% window to CFA does not get credit for saving energy. This proposal allows the builder/designer to optimize window area that is both energy efficient and pleasing to the consumer.

Cost Impact: The code change proposal will not increase the cost of construction.

RE71-13

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

R402.4-EC-BUUCK

RE72 – 13

R402.4 (IRC N1102.4), R402.4.1.1 (IRC N1102.4.1.1), R402.4.1.2 (IRC N1102.4.1.2), R402.4.1.3 (NEW) (IRC N1102.4.1.3 (NEW))

Proponents: Craig Conner, Building Quality, representing self (craig.conner@mac.com); Don Surrena, CBO, representing National Association of Home Builders (NAHB) (dsurrena@nahb.org)

Revise as follows:

R402.4 (N1102.4) Air leakage (Mandatory). The building thermal envelope shall be constructed to limit air leakage in accordance with the requirements of Sections R402.4.1 through R402.4.4.

R402.4.1.1 (N1102.4.1.1) Installation (Mandatory). The components of the *building thermal envelope* as listed in Table R402.4.1.1 shall be installed in accordance with the manufacturer's instructions and the criteria listed in Table R402.4.1.1, as applicable to the method of construction. Where required by the *code official*, an *approved* third party shall inspect all components and verify compliance.

R402.4.1.2 (N1102.4.1.2) Testing (Mandatory). The building or dwelling unit shall be tested ~~and verified as having an air leakage rate of not exceeding 5 air changes per hour in Climate Zones 1 and 2, and 3 air changes per hour in Climate Zones 3 through 8 for air leakage.~~ Testing shall be conducted with a blower door at a pressure of 0.2 inches w.g. (50 Pascals). Where required by the *code official*, testing shall be conducted by an *approved* third party. A written report of the results of the test shall be signed by the party conducting the test and provided to the *code official*. Testing shall be performed at any time after creation of all penetrations of the *building thermal envelope*. During testing:

1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed, beyond the intended weatherstripping or other infiltration control measures;
2. Dampers including exhaust, intake, makeup air, backdraft and flue dampers shall be closed, but not sealed beyond intended infiltration control measures;
3. Interior doors, if installed at the time of the test, shall be open;
4. Exterior doors for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
5. Heating and cooling systems, if installed at the time of the test, shall be turned off; and
6. Supply and return registers, if installed at the time of the test, shall be fully open.

R402.4.1.3 (N1102.4.1.3) Leakage rate (Prescriptive). The building or dwelling unit shall have an air leakage rate not exceeding 5 air changes per hour in Climate Zones 1 and 2, and 3 air changes per hour in Climate Zones 3 through 8, when tested in accordance with Section R402.4.1.2.

Reason: Conner: This is exactly the online draft DOE posted. It makes the duct tightness tradable. DOE's posted reason statement said it well:

"Changing the envelope air leakage rate from mandatory to prescriptive will allow builders the option of trading improvements in other building components for less stringent pressure test results. This provides flexibility in meeting the requirements and options for recovering from an unexpected test failure. The proposed change retains a mandatory pressure test and leaves all other aspects of envelope sealing mandatory."

Surrena: These modifications remove the mandatory maximum air tightness requirement and provide designers and builders the flexibility to trade-off building tightness with other performance path measures when using the performance path. Currently the building tightness requirement is mandatory and the 3 and 5 ACH tightness levels even under ideal circumstances, are very difficult to achieve. This will provide energy neutral trade-offs for expensive and sometimes unattainable requirements with other building improvements. This proposal does not change the stringency of the code it only increases the flexibility.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Brian Dean, Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; and Bill Prindle, Energy Efficient Codes Coalition

Revise as follows:

R402.4 (N1102.4) Air leakage (Mandatory). The building thermal envelope shall be constructed to limit air leakage in accordance with the requirements of Sections R402.4.1 through R402.4.4.

R402.4.1 (N1102.4.1) Building thermal envelope. The *building thermal envelope* shall comply with Sections R402.4.1.1 and R402.4.1.2 through R402.4.1.3. ~~The sealing methods between dissimilar materials shall allow for differential expansion and contraction.~~

R402.4.1.1 (N1102.4.1.1) Installation (Mandatory). The components of the *building thermal envelope* as listed in Table R402.4.1.1 shall be installed in accordance with the manufacturer's instructions and the criteria listed in Table R402.4.1.1, as applicable to the method of construction. The sealing methods between dissimilar materials shall allow for differential expansion and contraction. Where required by the *code official*, an *approved* third party shall inspect all components and verify compliance.

R402.4.1.2 (N1102.4.1.2) Testing (Mandatory). The building or dwelling unit shall be tested for air leakage and verified as having an air leakage rate of not exceeding 5 air changes per hour in Climate Zones 1 and 2, and 3 air changes per hour in Climate Zones 3 through 8. Testing shall be conducted with a blower door at a pressure of 0.2 inches w.g. (50 Pascals). ~~Where required by the code official, testing shall be conducted by an approved third party.~~ A written report of the results of the test shall be signed by the party conducting the test and provided to the *code official*. Testing shall be performed at any time after creation of all penetrations of the *building thermal envelope*.

During testing:

1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed, beyond the intended weatherstripping or other infiltration control measures;
2. Dampers including exhaust, intake, makeup air, backdraft and flue dampers shall be closed, but not sealed beyond intended infiltration control measures;
3. Interior doors, if installed at the time of the test, shall be open;
4. Exterior doors for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
5. Heating and cooling systems, if installed at the time of the test, shall be turned off; and
6. Supply and return registers, if installed at the time of the test, shall be fully open.

R402.4.1.3 (N1102.4.1.3) Leakage rate (Prescriptive). The building or dwelling unit shall have an air leakage rate that does not exceed 5 air changes per hour in Climate Zones 1 and 2, and 3 air changes per hour in Climate Zones 3 through 8, when tested in accordance with Section R402.4.1.2.

R402.4.2 (N1102.4.2) Fireplaces (Mandatory). New wood-burning fireplaces shall have tight-fitting flue dampers and outdoor combustion air.

R402.4.3 (N1102.4.3) Fenestration air leakage (Mandatory). Windows, skylights and sliding glass doors shall have an air infiltration rate of no more than 0.3 cfm per square foot (1.5 L/s/m²), and swinging doors no more than 0.5 cfm per square foot (2.6 L/s/m²), when tested according to NFRC 400 or

AAMA/WDMA/CSA 101/I.S.2/A440 by an accredited, independent laboratory and *listed* and *labeled* by the manufacturer.

Exception: Site-built windows, skylights and doors.

R402.4.4 (N1102.4.4.) Recessed lighting (Mandatory). Recessed luminaires installed in the *building thermal envelope* shall be sealed to limit air leakage between conditioned and unconditioned spaces. All recessed luminaires shall be IC-rated and *labeled* as having an air leakage rate not more than 2.0 cfm (0.944 L/s) when tested in accordance with ASTM E 283 at a 1.57 psf (75 pa) pressure differential. All recessed luminaires shall be sealed with a gasket or caulk between the housing and the interior wall or ceiling covering.

Reason: The purpose of this code change is to clarify the code language related to air leakage, modify certain requirements, including changing a mandatory air leakage value to prescriptive and to require all necessary testing to be done by an approved third party. By changing the allowable tested air leakage rate from “mandatory” to “prescriptive,” this proposal would allow air leakage to be part of the tradeoff calculation under section R405 performance trade-offs. The result will maintain energy efficiency, while providing increased flexibility to the builder and an alternative path for cases in which a building fails the air leakage test or where achieving a low air leakage rate would be too difficult. This is an important consideration where the on-site testing requirement is already set at a tight level.

This proposal also adds objectivity and transparency by requiring that all required air leakage testing be administered by a code-official-approved third party. This proposal also reorganizes Section R402.4 to add clarity and simplicity to the code. However, it should be noted that this proposal does not change or tighten required values for tested air leakage, which were initially set in the 2012 *IECC*.

Cost Impact: The code change proposal will increase the cost of construction.

R402.4-EC-DEAN-HARRIS-MISURIELLO-PRINDLE-STONE

RE74 – 13

R402.4 (IRC N1102.4)

Proponent: Eric Makela, Britt/Makela Group, Inc., representing Northwest Energy Codes Group (Eric@BrittMakela.com)

Revise as follows:

R402.4 (N1102.4) Air Leakage (Mandatory). The building thermal envelope shall be constructed to limit air leakage in accordance with the requirements of Sections R402.4.1 through R402.4.4. The building design shall not create conditions of accelerated deterioration from moisture condensation.

Reason: The 2006 IECC Section 502.1.1 Moisture Control provided language that states that “the design shall not create conditions of accelerated deterioration from moisture condensation”. This language was removed from the code in as part of the development of the residential provisions of the 2006 IECC when the requirements for vapor retarders were moved to the International Residential Code. This language was not moved with the vapor retarder language to the detriment of portions of the building. The removal of this language has created problems in cold climates including condensation on rim joists. Air permeable insulation installed in rim joists allows warm air movement through the insulation which can then condense when coming in contact with the cold rim joist causing mold to grow. Adding back in the language “The building design shall not create conditions of accelerated deterioration from moisture condensation” will allow the code official to require air impermeable insulation to insulate the rim joists if a potential problem is identified. Water damage and mold are common occurrences in colder climates where batt insulation is allowed to be installed on rim joists and the band joist is used as the air barrier on the exterior of the wall. Because moisture condensation is a direct result of this type of installation it is important to bring the language back into the code in order to mitigate the problem.

Cost Impact: The code change proposal will not increase the cost of construction.

R402.4-EC-MAKELA

RE75 – 13

R402.4 (IRC N1102.4)

Proponent: Don Surrena, CBO, representing National Association of Home Builders (NAHB)
(dsurrena@nahb.org)

Revise as follows:

R402.4 (N1102.4) Air leakage (Mandatory). The building thermal envelope shall be constructed to limit air leakage in accordance with the requirements of Section R402.4.1 through R402.4.4.

Exception: Dwelling units of R-2 Occupancies shall be permitted to comply with Section C402.4

Reason: Air tightness testing for single family homes is very straightforward; however, it is much more difficult to accurately test multi-family buildings. Currently the code treats low-rise multi-family buildings, which are 3 stories or less, like single family homes and multi-family buildings of 4 stories or more like commercial buildings. Regardless of height, all multi-family buildings have the same air tightness testing complications, such as: Does the entire building need to be tested at one time? What about multi-family buildings with open corridors? Does every dwelling need to be tested? Can the leakages be averaged between units? Is the leakage tested only to the "outside" or should it include leakage to adjacent units?

By approving this change, low-rise multi-family buildings will avoid these complications, but yet will still held to the same level of performance as high rise (R-2) residential building as well as all commercial buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis. This exception will not appear in Chapter 11 of the IRC, since it is not applicable to the IRC.

TABLE R402.4.1.1 (N1102.4.1.1)
AIR BARRIER AND INSULATION INSTALLATION

COMPONENT	AIR BARRIER CRITERIA^a	INSULATION INSTALLATION CRITERIA
<u>General Requirements</u>	<p><u>A continuous air barrier shall be installed in the buildings thermal envelope and be in alignment with the insulation.</u></p> <p><u>Air permeable cavity insulation shall be installed in a six sided assembly.</u></p> <p><u>Breaks or joints in the air barrier shall be sealed with an air impermeable material to ensure that the air barrier system is impermeable to air movement.</u></p> <p><u>Air barriers shall be constructed and mechanically fastened to framing and sealed at edges, gaps, or voids with air sealing materials that are appropriate to the construction materials being sealed.</u></p>	<p><u>Air-permeable insulation shall not be used as a sealing material.</u></p> <p><u>Exterior thermal envelope insulation for framed walls and floors is installed in substantial contact and continuous alignment with building envelopes interior air barrier.</u></p>
<u>Ceiling / attic</u>	<p><u>The air barrier in any dropped ceiling/soffit shall be aligned with the insulation and any gaps in the air barrier shall be sealed.</u></p> <p><u>Access openings, drop down stair or knee wall doors to unconditioned attic spaces shall be sealed.</u></p> <p><u>An air barrier at the drywall conditioned space and a ventilated attic is required</u></p>	<p><u>In any insulated ceiling or dropped ceiling/soffit, the insulation is substantially aligned with the air barrier.</u></p>
<u>Walls</u>	<p><u>The junction of the foundation and sill plate shall be sealed.</u></p> <p><u>The drywall junction at the top plate of interior and exterior walls separating conditioned space from ventilated attic space shall be sealed.</u></p> <p><u>Wall cavity insulation, including knee walls adjacent to attics, shall be encapsulated on</u></p>	<p><u>Corners, headers, and interior wall intersections shall be insulated to a minimum of R-5.</u></p> <p><u>The insulation shall be installed according to manufacturer's instructions and/or industry standards which requires that the insulation material uniformly fills each cavity side-to-side, top-to-bottom, and without substantial gaps or voids.</u></p>

<u>COMPONENT</u>	<u>AIR BARRIER CRITERIA^a</u>	<u>INSULATION INSTALLATION CRITERIA</u>
	<p><u>six sides by an interior and exterior air barrier system</u></p> <p><u>The junction of the bottom plate of the exterior wall and floor sheathing shall be sealed.</u></p>	<p><u>No exterior sheathing shall be visible from the building interior through gaps in the cavity insulation material.</u></p> <p><u>Wall and floor cavity insulation shall be enclosed on all six sides, and shall be in substantial contact with the sheathing material of the surface it is intended to insulate.</u></p> <p><u>For exterior applications of rigid insulation, insulation shall be in firm contact with the structural sheathing materials, and tightly fitted and sealed at joints.</u></p> <p><u>Faced batt insulation shall be surface stapled or inset stapled as long as inset stapled tabs are stapled neatly (no buckling), and provided the batt is only compressed at the edges of each cavity, to the depth of the tab itself.</u></p> <p><u>For sprayed or blown-in fibrous products, density shall be installed to the proper density to achieve the required R-value of the cavity it is installed in.</u></p>
<u>Windows, skylights and doors</u>	<u>The space between window/door jambs and framing and skylights and framing shall be sealed.</u>	<u>Comply with narrow cavity requirements</u>
<u>Rim joists</u>	<u>The rim or band joists shall be sealed at all edges, cracks, and gaps and must have an exterior air barrier</u>	
<u>Floors (including above garage and cantilevered floors)</u>	<p><u>Floors shall encapsulate the cavity insulation on six sides by an interior and exterior air barrier system.</u></p> <p><u>The air barrier shall be sealed at all exposed edge/sides including connections between the house floor system and the floor system above unconditioned space.</u></p>	<p><u>Floor insulation shall be held in permanent contact with the underside of the subfloor decking and shall not be overly compressed by components that are used to hold it in place so that R-value is lost.</u></p> <p><u>Where an obstruction such as a duct or piping is installed in the floor cavity the insulation shall continue to be held in permanent contact with the underside of the subfloor decking, shall encapsulate the obstruction, and a minimum of an R- 19 shall be installed below the obstruction.</u></p>
<u>Crawl space walls</u>	<u>Exposed earth in unvented crawl spaces shall be covered with a Class I vapor retarder with overlapping joints sealed and edges sealed to the foundation walls and footings.</u>	<p><u>Where provided in lieu of floor insulation, insulation shall be permanently attached to the crawlspace walls and extend from the vapor barrier covering the dirt floor to the sill attached to the top of the foundation.</u></p> <p><u>Where the floor system between the house and the crawl space is insulated it must conform with the floor insulation requirement described above.</u></p>
<u>Shafts, penetrations</u>	<u>Duct shafts, utility penetrations, wiring penetrations, plumbing penetrations, gas line penetrations, and flue shafts or other similar penetrations through the building envelope shall be sealed.</u>	<u>Insulation shall not extend through draft-stopping or fire-stopping openings. Use caulking rated for the application</u>
<u>Narrow cavities</u>	<u>Cavities too small to insulate, shall be sealed with an air barrier material.</u>	<u>Batts in narrow cavities shall be cut to fit, or narrow cavities shall be filled by insulation that on installation readily conforms to the available cavity space.</u>

<u>COMPONENT</u>	<u>AIR BARRIER CRITERIA^a</u>	<u>INSULATION INSTALLATION CRITERIA</u>
<u>Garage separation</u>	<u>Air sealing shall be provided between the garage and conditioned spaces.</u>	
<u>Recessed lighting</u>	<u>Recessed light fixtures installed in the building thermal envelope shall be air tight and sealed to the drywall.</u>	<u>Recessed light fixtures installed in the building thermal envelope shall be air tight, IC rated.</u>
<u>Plumbing and wiring</u>	<u>All plumbing, ductwork and wiring air barrier penetrations shall be sealed.</u>	<u>Batt insulation shall be cut neatly to fit around obstructions (such as blocking or bridging), and split, installed, and/or fitted tightly around wiring, plumbing, ducting, and other services in the cavity, or insulation that on installation readily conforms to available space shall encapsulate any obstruction in the cavity.</u>
<u>Shower / tub on exterior wall</u>	<u>Exterior walls adjacent to shower stalls, shower pans, and tubs shall have an air barrier installed separating conditioned space and exterior wall insulation.</u> <u>Tub and shower drain trap penetrations through the subfloor shall be sealed with an air barrier material.</u>	<u>Exterior walls adjacent to showers and tubs shall be insulated.</u>
<u>Electrical / phone box on exterior walls</u>	<u>Electrical, communication, or other boxes located in exterior walls, ceilings, or floors shall be air tight boxes or shall be made to be air tight using air barrier material's</u> <u>Bath fan housing adjacent to and or installed in unconditioned spaces shall be sealed to the drywall and made air tight.</u>	<u>Insulation completely fills voids between the box and exterior sheathing</u>
<u>HVAC register boots</u>	<u>HVAC register boots that penetrate building thermal envelope shall be sealed to the subfloor or drywall.</u>	
<u>Fireplace</u>	<u>Exterior walls adjacent to fireplace enclosures shall have an air barrier installed encapsulating and separating interior conditioned space and exterior wall insulation.</u> <u>Fireplaces shall have tight fitting doors</u>	<u>Exterior walls adjacent to fireplaces shall be insulated.</u>

a. In addition, inspection of log walls shall be in accordance with the provisions of ICC-400.

Reason: Manufacturer instructions, best building practices, DOE's Building America program, Building Energy Code Programs, and other building educators all propose installing products and materials with best building practices and according to manufacturer instructions. However few go further than the code book to learn what best practices and manufactured instructions are. The intent of this new language is to clearly define air barrier and insulation requirements and installation practices that will lead to houses that can easily meet the air leakage standards of the energy code and ensure the performance of the stalled insulation materials.

The 2012 IECC also requires that insulation be installed correctly in order to comply with the air barrier requirements of the IECC. While it is important to install insulation correctly, this type of provision should not be linked to air sealing the house. This proposal provides two distinct sections to the table focused on either air sealing or insulation installation. It also provides a reference in the prescriptive requirements for insulation installation to the table.

Field experience shows that some trades continue to seal holes in the buildings enclosure with air permeable insulation, which is not best building practice does not meet manufacturers' intents for the use of their products.

When the 2009 IECC was released many code officials were introduced to the importance of air barriers and are still struggling to understand where and how an air barrier is integral to the building enclosure. This new language will better prepare trades, builders, and code officials with how and where air barriers should be installed. The quality of the installation and enforcement should increase due to greater clarity and specificity.

The 2009 and 2012 IECC do not require a minimum level of insulation for corners and headers. The new requirement specifies a minimum insulation value and also includes interior wall intersections that also reduce the possibility for full wall insulation in these areas of the building.

Field practice has found kneewalls that are not enclosed on the exterior (attic) vertical plane exhibit more air infiltration and provide the opportunity for insulation to fall away from kneewalls over time reducing the efficiency of the overall building.

Other field practices observed by raters include excessive compression of tabbed insulation batts when stapling the tabs to the side of the stud. This reduces insulation values and does not comply with manufacturer instructions. By adding this language to the table, insulation trades and others who install insulation will have a simplified description for installing batts and inset stapling.

Cost Impact: The code change proposal will not increase the cost of construction.

Revise as follows:

TABLE R402.4.1.1 (N1102.4.1.1)
AIR BARRIER AND INSULATION INSTALLATION INSPECTION

COMPONENT	CRITERIA ^a	<u>AIR BARRIER</u> <u>CRITERIA^a</u>	<u>INSULATION</u> <u>INSTALLATION</u> <u>CRITERIA^a</u>
<u>General Requirements-Air barrier and thermal barrier</u>	A continuous air barrier shall be installed in the building envelope. Exterior thermal envelope contains continuous air barrier. Breaks or joints in the air barrier are sealed. Air-permeable insulation shall not be used as a sealing material.	A continuous air barrier shall be installed in the <u>building thermal envelope</u> . <u>Breaks or joints in the air barrier are sealed.</u> <u>Air-permeable insulation shall not be used as a sealing material.</u>	<u>Exterior thermal envelope insulation for framed wall shall be installed in substantial contact and continuous alignment with building envelope air barrier.</u>
Ceiling / attic	The air barrier in any dropped ceiling / soffit shall be aligned with the insulation and any gaps in the air barrier are sealed. Access openings, drop down stair or knee wall doors to unconditioned attic spaces shall be sealed.	<u>Air barrier in any dropped ceiling / soffit shall be substantially aligned with insulation and any gaps shall be sealed.</u> <u>Attic access, knee wall door or drop down stair to unconditioned attic shall be sealed.</u>	<u>In any dropped ceiling/soffit, the insulation shall be substantially aligned with the air barrier.</u>
<u>Walls and Kneewalls</u>	Corners and headers shall be insulated and the junction of the foundation and sill plate shall be sealed. The junction of the top plate and top of exterior walls shall be sealed. Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and continuous alignment with the air barrier. Knee wall shall be sealed	<u>Junction of foundation and sill plate shall be sealed.</u> <u>Junction of exterior wall and top plate shall be sealed.</u>	<u>Corners and headers shall be insulated.</u> <u>Insulation shall be in substantial contact and continuous alignment with air barrier.</u>
<u>Fenestration Windows, skylights and</u>	The space between window/door jambs and framing and skylights and	<u>Space between fenestration jambs and framing shall be sealed.</u>	

doors	framing shall be sealed		
Rim joists	Rim joists shall be insulated and include the air barrier	<u>Air barrier shall be installed at the rim joist.</u>	<u>Rim joists shall be insulated.</u>
Floors (including above-garage and cantilevered floors)	Insulation shall be installed to maintain permanent contact with underside of subfloor decking. The air barrier shall be installed at any exposed edge of insulation.	<u>Air barrier shall be installed at any exposed edge of insulation.</u>	<u>Insulation shall be installed in accordance with section R402.2.</u>
Crawl space walls	Where provided in lieu of floor insulation, insulation shall be permanently attached to the crawlspace walls. Exposed earth in unvented crawl spaces shall be covered with a Class I vapor retarder with overlapping joints taped.	<u>Exposed earth in unvented crawlspaces shall be covered with Class I vapor retarder with overlapping joints taped.</u>	<u>Insulation shall be permanently attached to walls.</u>
Shafts, penetrations	Duct shafts, utility penetrations, and flue shafts opening to exterior or unconditioned space shall be sealed.	<u>Duct shafts, utility penetrations, knee walls, and flue shafts opening to exterior or unconditioned space shall be sealed.</u>	
Narrow cavities	Batts in narrow cavities shall be cut to fit, or narrow cavities shall be filled by insulation that on installation readily conforms to the available cavity space.	<u>Air sealing shall be provided in narrow cavities.</u>	<u>Insulation in narrow cavities shall be cut to fit, or shall readily conform to the available cavity space upon installation.</u>
Garage separation	Air sealing shall be provided between the garage and conditioned spaces.	<u>Air sealing shall be provided between the garage and conditioned spaces.</u>	
Recessed lighting	Recessed light fixtures installed in the building thermal envelope shall be airtight, IC rated, and sealed to the drywall.	<u>Recessed light fixtures installed in the building thermal envelope shall be airtight, IC rated, and sealed to drywall.</u>	
Plumbing and wiring	Batt insulation shall be cut neatly to fit around wiring and plumbing in exterior walls, or insulation that on installation readily conforms to available space shall extend behind piping and wiring.	<u>All plumbing and wiring penetrations shall be sealed to the air barrier.</u>	<u>Cavity insulation shall be installed to fit closely around wiring and plumbing in exterior walls, or shall readily conform to the available space around piping</u>

			<u>and wiring.</u>
Shower / tub on exterior wall	Exterior walls adjacent to showers and tubs shall be insulated and the air barrier installed separating them from the showers and tubs.	<u>Exterior walls adjacent to showers and tubs shall have an air barrier separating the exterior wall from the shower and tubs.</u>	<u>Exterior walls adjacent to showers and tubs shall have insulation filling gaps or voids between tub or shower walls and unconditioned space.</u>
Exterior Electrical / phone boxes on exterior walls	The air barrier shall be installed behind electrical or communication boxes or air sealed boxes shall be installed.	<u>Air barrier shall be installed behind boxes or air sealed boxes shall be installed.</u>	<u>Insulation shall fill voids around and behind the box.</u>
HVAC register boots	HVAC register boots that penetrate building thermal envelope shall be sealed to the subfloor or drywall.	<u>HVAC register boots that penetrate building envelope shall be sealed to subfloor or drywall.</u>	
Fireplace	An air barrier shall be installed on fireplace walls. Fireplaces shall have gasketed doors.	<u>Air barrier shall be installed on fireplace walls.</u> <u>Fireplaces shall have gasketed doors.</u>	

- a. In addition to meeting the air barrier criteria and the insulation installation criteria in this Table, inspection of log walls shall be in accordance with the provisions of ICC-400.

Reason: The purpose of this code change is to clarify and enhance compliance with and enforcement of the codes by organizing air barrier and insulation installation requirements into two separate checklists in the table. The proposal also updates and improves the language in the table to add clarity and to ensure that crucial elements of the thermal envelope are effectively sealed, installed and verified.

The proper installation of insulation and reasonable control of air leakage are both critical to achieving energy savings in homes. Although every building or dwelling unit is currently required to be tested for air leakage, a better-organized and more specific enumeration of key insulation and sealing requirements will lead to tighter, better-insulated, more energy efficient homes. The two columns are largely based on current insulation installation requirements and air barrier criteria in the 2012 IECC. We expect that as technology advances, and as building and inspection practices improve, this list will be updated. The reorganization of the requirements as presented above will facilitate that regular improvement in future code editions.

Cost Impact: The code change proposal will not increase the cost of construction.

Revise as follows:

**TABLE R402.4.1.1 (N1102.4.1.1)
AIR BARRIER AND INSULATION INTALLATION**

COMPONENT	CRITERIA ^a
Air barrier and thermal barrier	A continuous air barrier shall be installed in the building envelope. Exterior thermal envelope contains a continuous air barrier. Breaks or joints in the air barrier shall be sealed. Air-permeable insulation shall not be used as a sealing material.
Ceiling/attic	The air barrier in any dropped ceiling/soffit shall be aligned with the insulation and any gaps in the air barrier sealed. Access openings, drop down stair or knee wall doors to unconditioned attic spaces shall be sealed.
Walls	Corners and headers shall be insulated and the junction of the foundation and sill plate shall be sealed. The junction of the top plate and top of exterior walls shall be sealed. Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and continuous alignment with the air barrier. Knee walls shall be sealed.
Windows, skylights and doors	The space between window/door jambs and framing and skylights and framing shall be sealed <u>on both the interior and exterior with a middle insulating layer filling the gap between the fenestration and framing/opening.</u>
Rim joists	Rim joists shall be insulated and include the air barrier.
Floors (including above-garage and cantilevered floors)	Insulation shall be installed to maintain permanent contact with underside of subfloor decking. The air barrier shall be installed at any exposed edge of insulation.
Crawl space walls	Where provided in lieu of floor insulation, insulation shall be permanently attached to the crawlspace walls. Exposed earth in unvented crawl spaces shall be covered with a Class I vapor retarder with overlapping joints taped.
Shafts, penetrations	Duct shafts, utility penetrations, and flue shafts opening to exterior or unconditioned space shall be sealed.
Narrow cavities	Batts in narrow cavities shall be cut to fit, or narrow cavities shall be filled by insulation that on installation readily conforms to the available cavity space.
Garage separation	Air sealing shall be provided between the garage and conditioned spaces.
Recessed lighting	Recessed light fixtures installed in the building thermal envelope shall be air tight, IC rated, and sealed to the drywall.
Plumbing and wiring	Batt insulation shall be cut neatly to fit around wiring and plumbing in exterior walls, or insulation that on installation readily conforms to available space shall extend behind piping and wiring.
Shower/tub on exterior wall	Exterior walls adjacent to showers and tubs shall be insulated and the air barrier installed separating them from the showers and tubs.

Electrical/phone box on exterior walls	The air barrier shall be installed behind electrical or communication boxes or air sealed boxes shall be installed.
HVAC register boots	HVAC register boots that penetrate building thermal envelope shall be sealed to the subfloor or drywall.
Fireplace	An air barrier shall be installed on fireplace walls. Fireplaces shall have gasketed doors.

a. In addition, inspection of log walls shall be in accordance with the provisions of ICC-400.

Reason:

1. Installing a seal on both the interior and exterior side helps mitigate infiltration as well as exfiltration of air into or out of the wall assembly, thereby reducing energy needs in mitigating uncontrolled air movement.
2. Requiring insulation insures continuity in the thermal envelope and eliminates conductive transfer of energy through un-insulated spaces.

Cost Impact: The cost would be negligible.

AIR BARRIER AND INSULATION INSTALLATION**

COMPONENT	CRITERIA ^a
Walls	<p>Cavities within corners and headers shall be insulated <u>by completely filling the cavity with a material having a thermal resistance of R3 per inch minimum.</u> and The junction of the foundation and sill plate shall be sealed.</p> <p>The junction of the top plate and top of exterior walls shall be sealed.</p> <p>Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and continuous alignment with the air barrier.</p> <p>Knee walls shall be sealed.</p>

(Portions of Table not shown remain unchanged)

Reason: The current text says, "Corners and headers shall be insulated ..." All headers and corners under all circumstances? Insulated to what level? This provision is a carryover of the 2009 IECC requirement. Varying answers to these questions have already lead to varying interpretations of the code requirements, uneven enforcement, and confusion in the regulated community. This proposal intends to allay some of that confusion by specifying that headers and corners must be insulated when there is an available cavity (e.g., a two-ply 2x header in a 2x4 wall leaves no cavity to fill) and by providing a practical definition of what *insulated* means in this context. Typical insulating materials like fiberglass and rigid foam can easily achieve R3 per inch.

Cost Impact: There will be a cost impact from this proposal to the extent that this requirement was not previously enforced due to ambiguity in the requirement. Regardless, the quantities of insulation being installed are small, but there may be many of these areas to insulate, depending on the size, design, and layout of the proposed residential building.

R402.4.1.1T-EC-EGGERTON

RE84 – 13

Table R402.4.1.1 (IRC Table N1102.4.1.1)

Proponent: Joseph Lstiburek, Building Science Corporation, representing self
(joe@buildingscience.com)

Revise as follows:

TABLE 402.4.1.1 (N1102.4.1.1)
AIR BARRIER AND INSULATION INSTALLATION

COMPONENT	<u>INSULATION INSTALLATION CRITERIA</u>
Floors (including above garage and cantilevered floors)	<u>Floor framing cavity insulation shall be installed to maintain permanent contact with underside of subfloor decking or floor framing cavity insulation shall be permitted to be in contact with the topside of sheathing or continuous insulation installed on the bottom side of floor framing and extends from the bottom to the top of all perimeter floor framing members.</u> The air barrier shall be installed at any exposed edge of insulation.

(Portions of Table not shown remain unchanged)

Reason: Requiring insulation in floors to be in direct contact with the underside of subfloor decking is one insulating option. Another option is to have an airspace between the floor sheathing and the top of the cavity insulation where this cavity insulation is in direct contact with the topside of sheathing or continuous insulation installed on the underside of the floor framing and is combined with perimeter insulation that meets or exceeds the R-value requirements for walls. This second option leads to fewer cold spots yet does not change the heat loss as long as the cavity insulation is in direct contact with a sheathing below it or continuous insulation below it. It also facilitates services to be enclosed within the thermal envelope.

Cost Impact: The code change proposal will not increase the cost of construction.

TABLE 402.4.1.1 (N1102.4.1.1)
AIR BARRIER AND INSULATION INSTALLATION

TABLE 402.4.1.1 (N1102.4.1.1)
AIR BARRIER AND INSULATION INSTALLATION

<u>COMPONENT</u>	<u>AIR BARRIER CRITERIA</u>	<u>INSULATION INSTALLATION CRITERIA</u>
<u>General Requirements</u>	<u>A continuous air barrier shall be installed in the building envelope.</u> <u>Exterior thermal envelope contains a continuous air barrier.</u> <u>Breaks or joints in the air barrier shall be sealed.</u>	<u>Air-permeable insulation shall not be used as a sealing material..</u>
<u>Ceiling / attic</u>	<u>The air barrier in any dropped ceiling/soffit shall be aligned with the insulation and any gaps in the air barrier sealed.</u> <u>Access openings, drop down stair or knee wall doors to unconditioned attic spaces shall be sealed.</u>	<u>The insulation in any dropped ceiling/soffit shall be aligned with the air barrier.</u>
<u>Walls</u>	<u>The junction of the foundation and sill plate shall be sealed.</u> <u>The junction of the top plate and top of exterior walls shall be sealed.</u> <u>Knee walls shall be sealed.</u>	<u>Corners and headers shall be insulated.</u> <u>Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and continuous alignment with the air barrier.</u>
<u>Windows, skylights and doors</u>	<u>The space between window/door jambs and framing and skylights and framing shall be sealed.</u>	
<u>Rim joists</u>	<u>Rim joists shall include the air barrier.</u>	<u>Rim joists shall be insulated.</u>
<u>Floors (including above garage and cantilevered floors)</u>	<u>The air barrier shall be installed at any exposed edge of insulation.</u>	<u>Insulation shall be installed to maintain permanent contact with underside of subfloor decking.</u>
<u>Crawl space walls</u>	<u>Exposed earth in unvented crawl spaces shall be covered with a Class I vapor retarder with overlapping joints taped.</u>	<u>Where provided in lieu of floor insulation, insulation shall be permanently attached to the crawlspace walls.</u>
<u>Shafts, penetrations</u>	<u>Duct shafts, utility penetrations, and flue shafts opening to exterior or unconditioned space shall be sealed.</u>	
<u>Narrow cavities</u>		<u>Batts in narrow cavities shall be cut to fit, or narrow cavities shall be filled by insulation that on installation readily conforms to the available cavity space.</u>
<u>Garage separation</u>	<u>Air sealing shall be provided between</u>	

	<u>the garage and conditioned spaces.</u>	
<u>Recessed lighting</u>	<u>Recessed light fixtures installed in the building thermal envelope shall be sealed to the drywall.</u>	<u>Recessed light fixtures installed in the building thermal envelope shall be air tight, IC rated.</u>
<u>Plumbing and wiring</u>		<u>Batt insulation shall be cut neatly to fit around wiring and plumbing in exterior walls, or insulation that on installation readily conforms to available space shall extend behind piping and wiring.</u>
<u>Shower / tub on exterior wall</u>	<u>The air barrier installed at exterior walls adjacent to showers and tubs shall separate them from the showers and tubs.</u>	<u>Exterior walls adjacent to showers and tubs shall be insulated.</u>
<u>Electrical / phone box on exterior walls</u>	<u>The air barrier shall be installed behind electrical or communication boxes or air sealed boxes shall be installed.</u>	
<u>HVAC register boots</u>	<u>HVAC register boots that penetrate building thermal envelope shall be sealed to the subfloor or drywall.</u>	
<u>Fireplace</u>	<u>An air barrier shall be installed on fireplace walls. Fireplaces shall have gasketed doors</u>	

a. In addition, inspection of log walls shall be in accordance with the provisions of ICC-400.

Reason: Reason: Table R402.4.1.1 in the 2012 IECC and 2009 IECC has contained a table that included insulation and air barrier requirements within the same criteria. This has created confusion with the trades in the construction of residential housing. This change adds an additional column to the table and separates air barrier criteria and insulation criteria. This change adds clarity for the trades.

No substantive changes were made in the narrative criteria descriptions with the exception of separating sentences which contain criteria for both insulation and air barrier into two narratives; one for insulation and one for air barrier criteria.

The "air barrier and thermal barrier" component from Table R402.4.1.1 in the 2009 and 2012 IECC was renamed as "general requirements" but the criteria from the previous "air barrier and thermal barrier" component row has not changed with the exception of separating insulation and air barrier criteria.

Cost Impact: The code change proposal will not increase the cost of construction. No additional costs.

Table R402.4.1.1 (IRC Table N1102.4.1.1), R402.4.2 (IRC N1102.4.2)

Proponent: Thomas Stroud, Senior Manager, Codes & Standards, representing Hearth, Patio & Barbecue Association (stroud@hpba.org)

Revise as follows:

TABLE R402.4.1.1 (N1102.4.1.1)
AIR BARRIER AND INSULATION INSTALLATION

COMPONENT	CRITERIA ^a
Air barrier and thermal barrier	A continuous air barrier shall be installed in the building envelope. Exterior thermal envelope contains a continuous air barrier. Breaks or joints in the air barrier shall be sealed. Air-permeable insulation shall not be used as a sealing material.
Ceiling/attic	The air barrier in any dropped ceiling/soffit shall be aligned with the insulation and any gaps in the air barrier sealed. Access openings, drop down stair or knee wall doors to unconditioned attic spaces shall be sealed.
Walls	Corners and headers shall be insulated and the junction of the foundation and sill plate shall be sealed. The junction of the top plate and top of exterior walls shall be sealed. Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and continuous alignment with the air barrier. Knee walls shall be sealed.
Windows, skylights and doors	The space between window/door jambs and framing and skylights and framing shall be sealed.
Rim joists	Rim joists shall be insulated and include the air barrier.
Floors (including above-garage and cantilevered floors)	Insulation shall be installed to maintain permanent contact with underside of subfloor decking. The air barrier shall be installed at any exposed edge of insulation.
Crawl space walls	Where provided in lieu of floor insulation, insulation shall be permanently attached to the crawlspace walls. Exposed earth in unvented crawl spaces shall be covered with a Class I vapor retarder with overlapping joints taped.
Shafts, penetrations	Duct shafts, utility penetrations, and fire place chases and flue shafts opening to exterior or unconditioned space shall be sealed.
Narrow cavities	Batts in narrow cavities shall be cut to fit, or narrow cavities shall be filled by insulation that on installation readily conforms to the available cavity space.
Garage separation	Air sealing shall be provided between the garage and conditioned spaces.
Recessed lighting	Recessed light fixtures installed in the building thermal envelope shall be air tight, IC rated, and sealed to the drywall.
Plumbing and wiring	Batt insulation shall be cut neatly to fit around wiring and plumbing in exterior walls, or insulation that on installation readily conforms to available space shall extend behind piping and wiring.
Shower/tub on exterior wall	Exterior walls adjacent to showers and tubs shall be insulated and the air barrier installed separating them from the showers and tubs.
Electrical/phone box on exterior walls	The air barrier shall be installed behind electrical or communication boxes or air sealed boxes shall be installed.

HVAC register boots	HVAC register boots that penetrate building thermal envelope shall be sealed to the subfloor or drywall.
Fireplace	An air barrier shall be installed on fireplace walls. Fireplaces shall have gasketed doors.

a. In addition, inspection of log walls shall be in accordance with the provisions of ICC-400.

R402.4.2 (N1102.4.2) Fireplaces. New wood-burning fireplaces shall have tight fitting flue dampers or doors, and outdoor combustion air. When using tight-fitting doors on UL 127 fireplaces, they must be tested and listed for the fireplace.

Reason: In 2012 Table R402.4.1.1 Fireplace criteria states an air barrier shall be installed on fireplace walls. Fireplaces shall have gasketed doors. In Section R402.4.2 it states new wood-burning fireplaces shall have tight-fitting flue dampers or doors, and outdoor combustion air. We interpret this to mean traditional, field-fabricated, "masonry fireplaces" in accordance with 2009 IRC Section R1001, and constructed of concrete or solid clay-masonry units; NOT "factory-built," UL 127 fireplaces in accordance with IRC Section R1004. Because of requirements in the IECC that require all fireplaces to be provided with gasketed doors, a great deal of controversy has resulted. Most factory-built fireplaces are not listed for use with sealed glass doors and installing such doors on fireplaces that are not tested for these doors could cause overheating of the fireplace resulting in a fire hazard. Without testing, the effect of the doors will be an unknown. In this regard, the intent of Section R402.4.2 is to mitigate air leakage during periods of non-use, but not where the conditions of fireplace installation are in violation of the UL 127 listing.

Regarding the requirement for an air barrier on "fireplace walls", this is an unclear statement and is clarified by the addition in *Shafts, Penetrations* that the air sealing is to be on the chase and not on the fireplace. This will address chase sealing details that are needed and gives clarification to address framed wall construction.

Cost Impact: These code changes will not increase the cost of construction.

Table R402.4.1.1, (IRC Table N1102.4.1.1), R402.4.2 (IRC N1102.4.2)

Proponent: Brenda A. Thompson, Clark County Development Services, Las Vegas NV, representing ICC Sustainability, Energy & High Performance Building Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

TABLE R402.4.1.1 (N1102.4.1.1)
AIR BARRIER AND INSULATION INSTALLATION

COMPONENT	CRITERIA ^a
Air barrier and thermal barrier	A continuous air barrier shall be installed in the building envelope. Exterior thermal envelope contains a continuous air barrier. Breaks or joints in the air barrier shall be sealed. Air-permeable insulation shall not be used as a sealing material.
Ceiling/attic	The air barrier in any dropped ceiling/soffit shall be aligned with the insulation and any gaps in the air barrier sealed. Access openings, drop down stair or knee wall doors to unconditioned attic spaces shall be sealed.
Walls	Corners and headers shall be insulated and the junction of the foundation and sill plate shall be sealed. The junction of the top plate and top of exterior walls shall be sealed. Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and continuous alignment with the air barrier. Knee walls shall be sealed.
Windows, skylights and doors	The space between window/door jambs and framing and skylights and framing shall be sealed.
Rim joists	Rim joists shall be insulated and include the air barrier.
Floors (including above-garage and cantilevered floors)	Insulation shall be installed to maintain permanent contact with underside of subfloor decking. The air barrier shall be installed at any exposed edge of insulation.
Crawl space walls	Where provided in lieu of floor insulation, insulation shall be permanently attached to the crawlspace walls. Exposed earth in unvented crawl spaces shall be covered with a Class I vapor retarder with overlapping joints taped.
Shafts, penetrations	Duct shafts, utility penetrations, and flue shafts <u>and fire places</u> opening to exterior or unconditioned space shall be sealed.
Narrow cavities	Batts in narrow cavities shall be cut to fit, or narrow cavities shall be filled by insulation that on installation readily conforms to the available cavity space.
Garage separation	Air sealing shall be provided between the garage and conditioned spaces.
Recessed lighting	Recessed light fixtures installed in the building thermal envelope shall be air tight, IC rated, and sealed to the drywall.
Plumbing and wiring	Batt insulation shall be cut neatly to fit around wiring and plumbing in exterior walls, or insulation that on installation readily conforms to available space shall extend behind piping and wiring.
Shower/tub on exterior wall	Exterior walls adjacent to showers and tubs shall be insulated and the air barrier installed separating them from the showers and tubs.
Electrical/phone box on exterior walls	The air barrier shall be installed behind electrical or communication boxes or air sealed boxes shall be installed.
HVAC register boots	HVAC register boots that penetrate building thermal envelope shall be sealed to the subfloor or drywall.
Fireplace	An air barrier shall be installed on fireplace walls. Fireplaces shall have gasketed doors.

^a In addition, inspection of log structures shall be in accordance with the provisions of ICC-400.

R402.4.2 (IRC N1102.4.2) Fireplaces. New wood-burning fireplaces shall have tight fitting flue dampers or doors, and outdoor combustion air.

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The reason for this proposal:

In 2012 Table R402.4.1.1 Fireplace criteria states an air barrier shall be installed on fireplace walls. Fireplaces shall have gasketed doors. In Section R402.4.2 it states new wood-burning fireplaces shall have tight-fitting flue dampers or doors, and outdoor combustion air. We interpret this to mean traditional, field-fabricated, "masonry fireplaces" in accordance with 2009 IRC Section R1001, and constructed of concrete or solid clay-masonry units; NOT "factory-built," UL 127 fireplaces in accordance with IRC Section R1004. Because of requirements in the IECC that require all fireplaces to be provided with gasketed doors, a great deal of controversy has resulted. Most factory-built fireplaces are not tested for use with sealed glass doors and installing such doors on fireplaces that are not tested for these doors could cause overheating of the fireplace resulting in a fire hazard. Without testing, the effect of the doors will be an unknown. In this regard, the intent of Section R402.4.2 is to mitigate air leakage during periods of non-use, but not where the conditions of fireplace installation are in violation of the UL 127 listing. This will address chase seal details that are needed and gives clarification to address framed wall construction.

Please note that deleting the air barrier requirement for fireplace walls has not net effect as there are at least 2 other locations in the table where the air barrier requirement for walls is restated and such would include fireplace walls.

Cost Impact: The change will not increase the cost of construction.

R402.4.1.1T-EC-THOMPSON-SEHPCAC

RE88 – 13

R402.4.1.2 (IRC N1102.4.1.2), R402.4.1.2.1 (NEW) (IRC N1102.4.1.2.1 (NEW))

Proponent: Michael D. Fischer, Kellen Company, representing the Center for the Polyurethanes Industry (mfischer@kellencompany.com)

Revise as follows:

R402.4.1.2 (N1102.4.1.2) Testing. The building or dwelling unit shall be tested by an approved agency and verified as having an air leakage rate of not exceeding ~~5~~ 4 air changes per hour in Climate Zones 1 and 2, and 3 air changes per hour in Climate Zones 3 through 8. Testing shall be conducted with a blower door at a pressure of 0.2 inches w.g. (50 Pascals). ~~Where required by the code official, testing shall be conducted by an approved third party.~~ A written report of the results of the test shall be signed by the testing agency party conducting the test and provided to the *code official*. Testing shall be performed at any time after creation and sealing of all penetrations of the *building thermal envelope*.

402.4.1.2.1 (N1102.4.1.2.1) The air leakage rate in Climate Zones 3 through 8 shall be permitted to be no greater than 4 air changes per hour where all heating and conditioning ducts, air handlers, and filter boxes are located within the *building thermal envelope*.

Reason: Building envelope tightness is a proven energy efficiency measure. With recent improvements in construction techniques and quality control, builders have demonstrated their ability to comply with air barrier requirements in the code as well as above-code programs. At the same time, the location of air handling ducts within the building thermal envelope has also become a more common and desirable construction technique- especially with new provisions for unvented attics in the IRC. This proposal offers a compromise that establishes a slight improvement in air barrier performance in the southern climate zones, as well as a trade-up in Climate Zones 3-8 that encourages the use of unvented attics.

Cost Impact: This proposal may result in an increased initial construction cost in some climate zones depending upon the method of construction, but is likely to provide a short break-even point on energy consumption and utility costs.

	Assembly:	ASF	AMF	DF

R402.4.1.2-EC-FISCHER

RE89-13

R402.4.1.2 (IRC N1102.4.1.2)

Proponent: Michael Schmeida, Divisional Manager- Sustainability and Government/Regulatory Affairs, representing Tremco Commercial Sealants and Waterproofing, Beachwood, Ohio (mschmeida@tremcoinc.com)

Revise as follows:

R402.4.1.2 (N1102.4.1.2) Testing. The building or dwelling unit shall be tested and verified as having an air leakage rate of not exceeding ~~5 air changes in Climate Zones 1 and 2, and 3 air exchanges per hour in Climate Zones 3 through 8.~~ 0.6 times the volume of the home per hour. Testing shall be conducted with a blower door at a pressure of 0.2 inches w.g. (50 Pascals). Where required by the *code official*, testing shall be conducted by an *approved* third party. A written report of the results of the test shall be signed by the party conducting the test and provided to the *code official*. Testing shall be performed at any time after creation of all penetrations of the *building thermal envelope*.

During testing:

1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed, beyond the intended weatherstripping or other infiltration control measures;
2. Dampers including exhaust, intake, makeup air, backdraft and flue dampers shall be closed, but not sealed beyond intended infiltration control measures;
3. Interior doors, if installed at the time of the test, shall be open;
4. Exterior doors for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
5. Heating and cooling systems, if installed at the time of the test, shall be turned off; and
6. Supply and return registers, if installed at the time of the test, shall be fully open.

Reason:

1. Unmitigated air leakage is often cited as the number one reason for energy loss in structures. Continual reduction of air leakage in code is an ideal means of furthering energy conservation.
2. A climate zone specific mandate for energy-related performance does not conserve energy resources, such as coal and natural gas. Energy is not just what is at the outlet, switch, etc., but the energy in the fuels being burned to create electrical energy. Requiring stricter energy performance in structures regardless of whether they are in warm climates that may use strictly electricity for cooling without significant heating does conserve energy resources.

Cost Impact: The impact would vary greatly from design to design and climate to climate. However, it would be offset by savings in energy use.

RE90 – 13

R402.4.1.2 (IRC N1102.4.1.2), Table R405.5.2(1) (IRC Table N1105.5.2(1))

Proponent: Don Surrena, CBO, representing National Association of Home Builders (NAHB)
(dsurrena@nahb.org)

Revise as follows:

R402.4.1.2 (N1102.4.1.2) Testing. The building or dwelling unit shall be tested and verified as having an air leakage rate of not exceeding 5 air changes per hour in Climate Zones 1 and 2, and ~~3~~ 4 air changes per hour in Climate Zones 3 through 8. Testing shall be conducted with a blower door at a pressure of 0.2 inches w.g. (50 Pascals). Where required by the *code official*, testing shall be conducted by an *approved* third party. A written report of the results of the test shall be signed by the party conducting the test and provided to the *code official*. Testing shall be performed at any time after creation of all penetrations of the *building thermal envelope*.

Table R405.5.2(1) (N1105.5.2(1))
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Air exchange rate	Air leakage rate of 5 air changes per hour in Climate Zones 1 and 2, and 3 4 air changes per hour in Climate Zones 3 through 8 at a pressure of 0.2 inches w.g (50 Pa). The mechanical ventilation rate shall be in addition to the air leakage rate and the same as in the proposed design, but no greater than $0.01 \times \text{CFA} + 7.5 \times (\text{N}_{\text{br}} + 1)$ where: CFA = conditioned floor area Nbr = number of bedrooms Energy recovery shall not be assumed for mechanical ventilation.	For residences that are not tested, the same air leakage rate as the standard reference design. For tested residences, the measured air exchange rate ^c . The mechanical ventilation rated shall be in addition to the air leakage rate and shall be as proposed.

(Portions of table not shown remain unchanged)

Reason: Building tightness is an important part of an energy efficient and comfortable house; however, 3 air changes per hour at 50 Pascals is an extremely low target tightness especially for smaller homes. The ASHRAE Handbook of Fundamentals shows that less than 10% of new homes achieve 3 ACH or less. Four ACH is still an aggressive tightness level which will provide a tight, comfortable, energy efficient home for the consumer.

Cost Impact: The code change proposal will not increase the cost of construction.

R402.4.1.2 (IRC N1102.4.1.2), Chapter 5

Proponent: Theresa A. Weston, PhD., representing DuPont Building Innovations
(theresa.a.weston@usa.dupont.com)

Revise as follows:

R402.4.1.2 (N1102.4.1.2) Testing. The building or dwelling unit shall be tested and verified as having an air leakage rate of not exceeding 5 air changes per hour in Climate Zones 1 and 2, and 3 air changes per hour in Climate Zones 3 through 8. Testing shall be conducted in accordance with ASTM E 779 or ASTM E 1827 with a blower door and reported at a pressure of 0.2 inches w.g. (50 Pascals). Where required by the *code official*, testing shall be conducted by an *approved* third party. A written report of the results of the test shall be signed by the party conducting the test and provided to the *code official*. Testing shall be performed at any time after creation of all penetrations of the *building thermal envelope*.

During testing:

1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed, beyond the intended weatherstripping or other infiltration control measures;
2. Dampers including exhaust, intake, makeup air, backdraft and flue dampers shall be closed, but not sealed beyond intended infiltration control measures;
3. Interior doors, if installed at the time of the test, shall be open;
4. Exterior doors for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
5. Heating and cooling systems, if installed at the time of the test, shall be turned off; and
6. Supply and return registers, if installed at the time of the test, shall be fully open. Add new reference standards:

Add new standards to Chapter 5 as follows:

E779-10 Standard Test Method for Determining Air Leakage Rate by Fan Pressurization

E1827-11 Standard Test Methods for Determining Airtightness of Buildings Using an Orifice Blower Door

Reason: This proposal adds appropriate standard blower door test methods to the code. The code currently does not reference a test method standard. The specification of standard test methods should improve the reliability of the data by which code compliance is determined.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code ASTM E1827-11 Standard Test Methods for Determining Airtightness of Buildings Using an Orifice Blower Door with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013. Standard ASTM E779-03 is currently referenced in the IECC-Commercial Provisions, Chapter 5. Update to the latest edition, 2010 will be considered in a code change proposal for administrative update of standards. See the hearing order for the Administrative Code Committee.

	Assembly:	ASF	AMF	DF

R402.4.1.2-EC-WESTON

RE92 – 13

R402.4.1.2 (New), (IRC N1102.4.1.2)

Proponent: Brent Ursenbach, Salt Lake County representing Utah Chapter ICC and Utah Association of Plumbing and Mechanical Officials Chapter ICC (bursenbach@slco.org)

Add text as follows:

R402.4.1.2 (N1102.4.1.2) Combustion Air Openings. In climate zones 3 through 8, where open combustion air ducts provide combustion air to open combustion fuel burning appliances, the appliances and combustion air opening shall be located outside the thermal envelope or enclosed in a room, isolated from inside the thermal envelope. Such rooms shall be sealed and insulated per the envelope requirements of Table R402.1.1, where the walls shall meet a minimum of the basement wall R-value requirement. The door into the room shall be fully gasketed and any water lines and ducts in the room insulated per the requirements of R403. The combustion air duct must be insulated where it passes through conditioned space to a minimum of R-8.

Exception:

1. Direct vent appliances with both intake and exhaust pipes installed continuous to the outside.
2. Fireplaces and stoves complying with the requirements of R402.4.2 and IRC R1006.

Reason: The entire section R402.4 Air leakage- is of little value when a combustion air duct is installed, open to the conditioned space, virtually placing a large hole through the thermal envelope. Blower door testing as now required by the code cannot be accomplished with a combustion air opening inside the thermal envelope. Testers regularly block these opening as this is the only way they can pressurize the home; only to be opened after the test is completed. Ideally, direct vent, sealed combustion appliances solve the problem. Where less efficient, open combustion fuel burning appliances are used, it is reasonable and proper to isolate the appliances and the required combustion air from inside the thermal envelope.

Cost Impact: The code change proposal will increase the cost of construction, while it will reduce the energy consumption and cost throughout the life of the home.

RE93 – 13

R402.4.1.3 (NEW) (IRC N1102.4.1.3 (NEW))

Proponent: Robby Schwarz, representing EnergyLogic, Inc. (robby@nrglogic.com)

Add new text as follows:

R402.4.1.3 (N1102.4.1.3) Connection to Garage. The building or dwelling unit shall be tested and verified as being separate from an attached garage. While the blower door is being utilized to test the building or dwelling unit's leakage rate, the connection between the dwelling unit and the garage shall also be tested. The pressure in the garage with reference to dwelling unit shall not be less than 45 Pascals relative to the dwelling unit when the dwelling unit pressure is at 50 Pascals relative to the outside.

Reason: Separation between the house(dwelling unit) and garage is specifically called out on the air barrier and insulation table R402.4.1.1 yet it is unclear what is meant by this and why it is called out separately from the rest of the thermal envelopes sealing that separates conditioned space from unconditioned space. The rationale is an extension of efficiency into safety to ensure that pollutants and contaminants from the garage will not enter the home. A visual or written reference to this makes no sense when a test is available to ensure that separation has occurred. Testing is the only way to ensure safety and in extension greater efficiency.

Cost Impact: The code change proposal will not increase the cost of construction.

RE93-13

	Assembly:	ASF	AMF	DF

R402.4.1.3 (NEW)-EC-SCHWARZ

RE94 – 13

R402.4.3 (IRC N1102.4.3)

Proponent: Jeff Inks, representing the Window & Door Manufacturers Association.

Revise as follows:

R402.4.3 (N1102.4.3) Fenestration air leakage. Windows, skylights and sliding glass doors shall have an air infiltration rate of no more than 0.3 cfm per square foot (1.5 L/s/m²), and swinging doors no more than 0.5 cfm per square foot (2.6 L/s/m²), when tested according to NFRC 400 or AAMA/ WDMA/CSA 101/I.S.2/A440 by an accredited, independent laboratory and listed and labeled by the manufacturer.

Exception: ~~Site-built windows, skylights and doors.~~

Reason: This proposal is primarily a clean-up. The exception for site-built fenestration was removed from the commercial requirements during the last code development cycle as there is no justification for allowing it. These assemblies are required to meet the air leakage provisions of C402.4.3 for IECC commercial construction. Likewise, site-built windows, skylights and doors, if used in IECC residential construction, should meet the requirements of Section R402.4.3 without exception.

Cost Impact: The code change proposal will not increase the cost of construction.

RE94-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R402.4.3-EC-INKS

RE95 – 13

R402.5 (IRC N1102.5)

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com); Dr. Thomas D. Culp, Birch Point Consulting LLC, representing the Glazing Industry Code Committee (culp@birchpointconsulting.com)

Delete without substitution:

~~**R402.5 (N1102.5) Maximum fenestration U-factor and SHGC (Mandatory).** The area-weighted average maximum fenestration U-factor permitted using tradeoffs from Section R402.1.4 or R405 shall be 0.48 in Climate Zones 4 and 5 and 0.40 in Climate Zones 6 through 8 for vertical fenestration, and 0.75 in Climate Zones 4 through 8 for skylights. The area-weighted average maximum fenestration SHGC permitted using tradeoffs from Section R405 in Climate Zones 1 through 3 shall be 0.50.~~

Reason:

CONNER: The limits on U-factor and SHGC trade offs reduce flexibility without any compensating energy savings. A decrease in the energy efficiency of the windows through the performance calculation would have to be made up elsewhere leaving the resulting energy efficiency, so the energy result is neutral.

Given the stringency of the newer codes, this section mostly adds a bit of confusion to the code. The statement of a limit on trade offs is sometimes confused with the actual requirement itself (in Table R402.1). There is no need to bulk up the code with even small statements that seldom have any impact.

CULP: By definition, trade-offs are energy neutral, so these mandatory "hard limits" save no energy, but set artificial constraints that limit design flexibility and innovation. Practically speaking, the vast majority of "normal" windows already meet these criteria, so this section has little real impact, and only serves to (a) add confusion between these numbers and the real requirements in Table R402.1.1, and (b) cause compliance problems for unique or special applications.

For example, glass block used in a bathroom remodel:

- ... it has no label, so use the default U-factor and SHGC
- ... but the default values do not meet Table R402.1.1, so use a trade-off
- ... but the default values do not meet the hard limits in this section R402.5, so use area-weighted averaging
- ... but there is nothing else in the remodel to area-weight average.

So it becomes effectively illegal, even if there are other trade-offs that make the overall remodel even more energy efficient, and the only recourse is to seek a special allowance through the alternative methods provision.

This is just one example. What about special products used in tornado storm shelters that won't meet the U-factor hard limit? What about vacuum glazing that meets the U-factor and greatly exceeds the required energy efficiency, but not the SHGC hard limit? Do we want to discourage vacuum glazing?

Granted, these are not common situations, but what have we accomplished by creating artificial barriers and extra headaches for code officials and builders? This section should be removed.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R402.5-EC-CONNER-CULP

RE96 – 13

R402.5 (IRC N1102.5)

Proponent: Brian Dean, Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; and Bill Prindle, Energy Efficient Codes Coalition

Revise as follows:

R402.5 (N1102.5) Maximum fenestration U-factor and SHGC (Mandatory). The area-weighted average maximum fenestration U-factor permitted for vertical fenestration products when complying with this code using trade-offs from under Section R402.1.4 or Section R405 shall not exceed the U-factor specified in Table R402.1.1 by more than 25% be 0.48 in Climate Zones 4 and 5 and 0.40 in Climate Zones 6 through 8 for vertical fenestration, and 0.75 in Climate Zones 4 through 8 for skylights. The area-weighted average U-factor for skylights when complying with this code under Section R402.1.4 or Section R405 shall not exceed the U-factor specified in Table R402.1.1 by more than 25%. The area-weighted average maximum fenestration SHGC permitted for all fenestration products when complying with this code under using trade-offs from Section R405 shall not exceed the SHGC specified in Table R402.1.1 by more than 50% in Climate Zones 1 through 3 shall be 0.50.

Reason: The purpose of this code change is to modify the requirements and clarify the language related to the maximum U-factor and SHGC for fenestration when using trade-offs for code compliance. This revision improves the energy efficiency and usability of the energy code by ensuring that as prescriptive fenestration efficiency requirements change, the mandatory fenestration maximums (for trade-offs) will automatically adjust as well, specifically by setting the maximum weighted average U-factor at 25% above the prescriptive value and the SHGC at 50% above the prescriptive value. In addition, the revision improves and clarifies the language in the section.

For nearly a decade, the current version of the fenestration U-factor and SHGC maximums in Section R402.5 have provided an effective and critical backstop for fenestration efficiency trade-offs under the Total UA compliance path and the Simulated Performance Alternative. This section ensures that fenestration, which is a crucial element in the thermal envelope, particularly from the standpoint of comfort, as well as condensation, energy efficiency and HVAC sizing, will not be overly weakened by trade-offs.

Unfortunately, as prescriptive fenestration U-factors and SHGC requirements have improved substantially over the last few code change cycles, the fenestration maximums have remained unchanged. For example:

- In the 2006 IECC, the prescriptive SHGC requirement in climate zone 3 was 0.40 and the SHGC maximum in trade-offs was 0.50 (25% higher than the prescriptive value).
- In the 2009 IECC, the prescriptive SHGC requirement was improved to 0.30, but the SHGC maximum remained at 0.50 (67% higher).
- In the 2012 IECC, the prescriptive SHGC requirement was further improved to 0.25, but the SHGC maximum remained at 0.50 (100% higher).

The proposal sets the maximum area-weighted average U-factor 25% higher and the SHGC 50% higher than the prescriptive value, giving a reasonable (but not unlimited) amount of flexibility to the design professional. We chose 25% for U-factor and 50% for SHGC based on judgment after reviewing the resulting values, in recognition that prescriptive U-factors tend to be greater than prescriptive SHGC values, justifying a smaller percentage, and reflecting the need for more flexibility for SHGC due to passive solar concerns. The following table shows the effect of this new proposal on the maximum values for vertical windows:

Climate Zone	Prescriptive U-factor	Maximum U-factor Current	Maximum U-factor Proposed	Prescriptive SHGC	Maximum SHGC Current	Maximum SHGC Proposed
1	NR	NR	NR	0.25	0.50	0.38
2	0.40	NR	0.50	0.25	0.50	0.38
3	0.35	NR	0.44	0.25	0.50	0.38
4	0.35	0.48	0.44	0.40	NR	0.60
5	0.32	0.48	0.40	NR	NR	NR
6 - 8	0.32	0.40	0.40	NR	NR	NR

The proposal also applies a uniform backstop percentage over all climate zones, improving efficiency and simplifying compliance and enforcement in states that stretch across multiple climate zones. The new maximums also allow considerable flexibility for innovative designs such as passive solar, because individual or multiple windows may have significantly higher SHGC or U-factor values, as long as they achieve an area-weighted average value that is within a reasonable range of the prescriptive values.

Because the Total UA and Simulated Performance Alternative compliance options are typically software-based, the change to a percentage-based maximum should require no additional effort on the part of the builder or design professional. Over the long run, this proposal will simplify the code, improve energy efficiency, and add consistency because the maximum will automatically track any change to the fenestration U-factor or SHGC requirements.

The fenestration trade-off limits currently found in the residential chapter of the *IECC* are simple, mandatory measures that ensure all new buildings contain high-quality, cost-effective windows that save energy, provide reasonable comfort, resist condensation in colder climates and block unwanted solar gain in warmer climates. Without the protection of this backstop, fenestration values could be traded away to levels unacceptable in modern building practice. Given the improvements to window efficiency brought about by the 2012 *IECC* and our nation's high priority for energy efficiency, this proposal is a common-sense improvement to an effective code requirement.

- **Simple compliance.** The residential fenestration maximums are effective and easy to understand. These requirements have been successfully applied for the last several years. All states that have already adopted the 2006, 2009, and 2012 *IECC* have adopted these maximums to residential construction. They are also already seamlessly built into compliance software such as the Department of Energy's REScheck.
- **Flexible standard.** The area-weighted average approach embodied in the fenestration maximums allows considerable flexibility for the use of decorative glass, glass block, and other fenestration products, while maintaining a baseline performance for the building's overall glazing. In short, not all products are required to individually meet the maximum values; only the area-weighted average of all products in the building are required to meet the maximum values specified in this code provision.
- **Quality windows, energy savings and peak demand savings nationwide.** The fenestration maximums encourage the use of cost-effective energy-efficient windows nationwide. Because good windows reduce energy consumption both during peak cooling times in the summer months and during peak heating hours in the winter months, such windows help to reduce the strain on the electric grid and natural gas pipeline system and delay the need to build expensive peaking facilities. By reducing the trade-off of efficient windows for other measures, the maximums better capture the benefits of blocking solar gain and providing reasonable insulating value such as peak reduction, reduced cooling system sizes and year-round comfort. Consumers also enjoy the reduced costs that come with economies of scale and market transformation.
- **More comfortable buildings and less energy use.** Incremental changes in window efficiency can have a huge impact on occupant comfort because even the most efficient windows are, at best, still only the equivalent of about an R-3 wall in the winter. Moreover, unlike the opaque wall, even the best fenestration allows substantial summer solar heat gain into the conditioned space. Hot spots created by high solar gain in the summer and/or cold or drafty glass in the winter months can force an occupant to adjust the thermostat to compensate. A good window will provide reasonable insulating value, keeping occupants more comfortable during the coldest months. Similarly, windows with low SHGC will protect against hot spots and occupant discomfort, and will make it less likely that occupants will need to adjust the thermostat and use more energy.

For a more detailed discussion of the benefits of good fenestration, see the section on the benefits of efficient windows on the website of the Efficient Windows Collaborative (a Collaborative of the Alliance to Save Energy, the University of Minnesota, Center for Sustainable Building Research and Lawrence Berkeley National Laboratory, with support from the U.S. Department of Energy) -- <http://www.efficientwindows.org/benefits.cfm>.

The fenestration maximums have served an important role in ensuring residential energy efficiency for many years. We recommend that the proposed improvements to the fenestration maximums be adopted.

Cost Impact: The code change proposal will not increase the cost of construction.

RE97 – 13

R402.5 (IRC N1102.5), R405.5 (IRC N1102.5), R405.5.3 (NEW) (IRC N1105.5.3 (NEW))

Proponent: Jeff Sonne, representing the Florida Solar Energy Center (jeff@fsec.ucf.edu)

Revise as follows:

~~**R402.5 (N1102.5) Maximum fenestration U-factor and SHGC (Mandatory).** The area-weighted average maximum fenestration U-factor permitted using tradeoffs from Section R402.1.4 or R405 shall be 0.48 in Climate Zones 4 and 5 and 0.40 in Climate Zones 6 through 8 for vertical fenestration, and 0.75 in Climate Zones 4 through 8 for skylights. The area-weighted average maximum fenestration SHGC permitted using tradeoffs from Section R405 in Climate Zones 1 through 3 shall be 0.50.~~

R405.5 (N1105.5) Calculation procedure. Calculations of the performance design shall be in accordance with Sections R405.5.1 ~~and through~~ R405.5.2 R405.5.3.

R405.5.3 (N1105.5.3) Maximum fenestration SHGC. In Climate Zones 1 through 3 the Proposed Design shall have either an area-weighted average maximum fenestration SHGC of 0.50 or a fenestration area-weighted average overhang of 4.0 feet or greater (all conditioned space fenestration products that are greater than 50-percent glazed shall be included in the calculation).

Reason: Prescriptive compliance already has separate window U-factor and SHGC requirements stipulated in Table R402.1.1, so section R402.5 only applies to performance compliance; this mod moves the requirement to Section R405 (performance) for clarity.

Porches provide shade for windows. Relaxing the SHGC requirement for performance compliance only for dwellings with large overhangs will help lower costs and typically increase visible light in these dwellings, preserving regional vernacular architecture while still upholding energy performance.

Cost Impact: The code change proposal will not increase the cost of construction. The proposal only provides a clarification and a compliance option.

R402.5-EC-SONNE

RE98 – 13

R402.6 (NEW) (IRC N1102.6 (NEW))

Proponent: Jeff Sonne, representing the Florida Solar Energy Center (jeff@fsec.ucf.edu)

Revise as follows:

R402.6 (N1102.6) Limitations to compliance by Section R402 (Prescriptive). Where Section R402 is chosen as the compliance option for the building, the restrictions in Section R402.6.1 through R402.6.3 shall apply.

R402.6.1 (N1102.6.1) Electric space heating. Electric resistance space heating systems shall not be used when complying with this code by Section R402.

Exception: The prohibition on electric resistance heat does not apply to additions, renovations and replacement heating systems installed in existing buildings.

R402.6.2 (N1102.6.2) Air handlers in attics. Air handlers shall not be installed in attics when complying with Section R402.

R402.6.3 (N1102.6.3) Maximum percent fenestration area. The area of fenestration products more than 50-percent glazed shall not exceed 15 percent of the conditioned floor area (CFA).

Exceptions:

1. For new construction the building shall be considered in compliance with Table R402.1.1 where the total *building thermal envelope* UA (sum of U-factor times assembly area) is less than or equal to the total UA resulting from using the U-factors in Table R402.1.3 multiplied by:
 - 1.1 For non-fenestration products: the same assembly area as in the proposed building.
 - 1.2 For fenestration products less than or equal to 50-percent glazed: the same assembly area as in the proposed building.
 - 1.3 For fenestration products that are greater than 50-percent glazed: the assembly area of the fenestration but not greater than 15 percent of the conditioned floor area.
2. For additions the following shall apply:
 - 2.1 Where fenestrations in an existing exterior wall are being removed or enclosed by an addition, the total fenestration area used to determine the installed fenestration percentage need not include the area of the fenestrations removed or enclosed by the addition.
 - 2.2 Additions of not greater than 600 square feet shall have a maximum of 50 percent fenestration area to conditioned floor area.
 - 2.3 Glazed fenestrations that were previously located in an existing exterior wall that is being removed or enclosed by an addition shall not be required to comply with the U-factor and solar heat gain coefficient requirements in Table R402.1.1 when reinstalled as part of the addition.

Reason: Electric space heating: During most cold spells, heat pumps can perform at twice the efficiency of electric resistance furnaces, reducing utility peak winter energy use. 2012 IECC Section R405, Table R405.5.2(1) is clear that the Standard Reference Home specification for heating systems that the "baseline" is an air source heat pump.

Attic air handler exclusion: All the heated or cooled air passes through the air handler. Locating the air handler in an attic creates a considerable summertime heat gain by conduction and by any return side air leakage for the system. Similarly, during winter nights the heated air will lose heat by conduction and any return side leakage will reduce the temperature of the air going into the system. Anyone wishing to comply with an air handler in the attic can comply with the performance method where energy modeling software applies the appropriate energy penalty for an attic location.

Maximum percent fenestration area: This limitation is consistent with the performance compliance reference and helps provide compliance method equivalence. It also provides better assurance that each new home will be able to achieve a high level of energy

performance and reduce large disparity between two minimum code compliant homes. Homes with larger fenestration area have two alternative compliance paths, either the UA alternative method defined in the exception or the performance method.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Brian Dean, Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; and Bill Prindle, Energy Efficient Codes Coalition.

Revise as follows:

R403.1 (N1103.1) Controls (Mandatory). ~~At least one thermostat shall be provided for each separate heating and cooling system.~~ Heating and cooling system controls shall comply with Sections R403.1.1 through R403.1.3.

R403.1.1 (N1103.1.1) Thermostat (Mandatory). Not less than one thermostat shall be provided for each separate heating and cooling system.

~~R403.1.1 (N1103.1.1)~~ R403.1.2 (N1103.1.2) Programmable thermostat (Mandatory). Where the primary heating system is a forced-air furnace, at least one thermostat per dwelling unit shall be capable of controlling the heating and cooling system on a daily schedule to maintain different temperature set points at different times of the day. This thermostat shall include the capability to set back or temporarily operate the system to maintain *zone* temperatures down to 55°F (13°C) or up to 85°F (29°C). The thermostat shall initially be programmed with a heating temperature set point not higher than 70°F (21°C) and a cooling temperature set point not lower than 78°F (26°C).

R403.1.2 (N1103.1.2) R403.1.3 (N1103.1.3) Heat pump supplementary heat (Mandatory). Heat pumps having supplementary electric-resistance heat shall have controls that, except during defrost, prevent supplemental heat operation when the heat pump compressor can meet the heating load.

R403.2 (N1103.2) Ducts. Ducts and air handlers shall be sealed, tested for leakage and insulated in accordance with Sections R403.2.1 through R403.2.36.

~~R403.2.1 (N1103.2.1) Insulation (Prescriptive).~~ ~~Supply ducts in attics shall be insulated to a minimum of R-8. All other ducts shall be insulated to a minimum of R-6.~~

~~Exception:~~ ~~Ducts or portions thereof located completely inside the building thermal envelope.~~

R403.2.1 (N1103.2.1) Building cavities (Mandatory). Building framing cavities shall not be used as ducts or plenums.

R403.2.2 (N1103.2.2) Sealing (Mandatory). Ducts, air handlers, and filter boxes shall be sealed. Joints and seams shall comply with either the *International Mechanical Code* or *International Residential Code*, as applicable.

Exceptions:

1. Air-impermeable spray foam products shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.

3. Continuously welded and locking-type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.

Duct tightness shall be verified by either of the following:

1. ~~Postconstruction test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.~~
2. ~~Rough-in test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the system, including the manufacturer's air handler enclosure. All registers shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 3 cfm (85 L/min) per 100 square feet (9.29 m²) of conditioned floor area.~~

~~Exception: The total leakage test is not required for ducts and air handlers located entirely within the building thermal envelope.~~

~~R403.2.3 (N1103.2.3) Building cavities (Mandatory).~~ Building framing cavities shall not be used as ducts or plenums.

R403.2.3 (N1103.2.3) Duct testing (Mandatory). The ductwork in a building or dwelling unit shall be tested for air leakage. Testing shall be conducted at the rough-in stages or post-construction. Testing for duct leakage shall be at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test. Testing shall be conducted by an *approved* third party. A written report of the results of the test shall be signed by the party conducting the test and shall be provided to the *code official*.

Exception: Ductwork air leakage testing shall not be required where all ducts and air handlers are located entirely within the *building thermal envelope*.

R403.2.4 (N1103.2.4) Duct leakage (Prescriptive). The total leakage of ducts, where measured in testing accordance with Section R403.2.3, shall meet one of the following requirements:

1. Rough-in test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area where the air handler is installed at the time of the test. Where the air handler is not installed at the time of the test, the total leakage shall be less than or equal to 3 cfm (85 L/min) per 100 square feet (9.29 m²) of conditioned floor area.

2. Postconstruction test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area.

Exception:

R403.2.2.1 (N1103.2.2.1) R403.2.5 (N1103.2.5) Sealed Air handler leakage (Mandatory). Air handlers shall have a manufacturer's designation for an air leakage of not more than 2 percent of the design air flow rate when tested in accordance with ASHRAE 193.

R403.2.6 (N1103.2.6) Insulation (Prescriptive). Supply ducts in attics shall be insulated to a *R-value* of not less than R-8. All other ducts shall be insulated to a *R-value* of not less than R-6.

Exception: Ducts or portions of ducts located completely inside the *building thermal envelope* shall not be required to be insulated.

**TABLE R405.2(1) (N1105.2(1))
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS**

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Thermal distribution systems	<p><u>For ducted thermal distribution systems, the duct leakage rate shall be in accordance with Section R403.2.4 and the duct insulation shall be in accordance with Section R403.2.6.</u></p> <p><u>For nonducted thermal distribution systems, a distribution system efficiency, DSE, of 0.88 shall be applied to both the heating and cooling system.</u></p>	Thermal distribution system efficiency shall be as tested or as specified in Table R405.5.2(2) if not tested. Duct insulation shall be as proposed.

(Portions of Table not shown remain unchanged)

Reason: The purpose of this code change is to make a number of improvements to the provisions of the code related to HVAC system controls and ducts. However, it should be noted that this proposal does not change or tighten required values for tested duct leakage, which were initially set in the 2009 *IECC* and tightened in the 2012 *IECC*. The proposed improvements include:

- Reorganize section R403.1 to clearly specify requirements for controls (no change proposed in substantive requirements for this section).
- Reorganize section R403.2 regarding duct sealing, testing and leakage requirements, including the following substantive changes:
 - Clarify that for required testing, such testing must be conducted by a code official-approved third party; and
 - Convert the duct leakage rate from a mandatory to prescriptive requirement (allowing duct leakage to be traded off under the performance path). Note that testing is still mandatory.
- Revise Table R405.5.2(1) to establish a baseline in the Standard Reference Home for duct leakage/distribution system efficiency. The baseline was incorrectly deleted in 2012.

This proposal maintains the efficiency provided by the improved duct leakage rate set in the 2012 *IECC*, and it improves the transparency and objectivity by requiring that testing be administered by a third party. This proposal also creates a practical solution for situations in which a completed duct system fails the leakage test, by allowing the duct performance shortfall to be offset by other improvements under section R405. This is an important consideration where the on-site testing requirement is already set at a tight level. As a result, this proposal adds flexibility for the builder and increased compliance at no additional energy cost. This proposal also reorganizes the subsections related to systems and ducts to add more clarity and simplicity to the code.

Cost Impact: The code change proposal will increase the cost of construction.

R403.1.1 (N1103.1.1) Thermostat provision (Mandatory). Each separate heating and cooling system shall be provided with not less than one thermostat.

~~R403.1.1 (N1103.1.1)~~ R403.1.2 (N1103.1.2) Programmable thermostat (Prescriptive). Where the primary heating system ~~is has~~ a forced-air ~~furnace~~ distribution system, at least one thermostat per dwelling unit shall be capable of controlling the heating and cooling system on a daily schedule to maintain different temperature set points at different times of the day. This thermostat shall include the capability to set back or temporarily operate the system to maintain zone temperatures down to 55°F (13°C) or up to 85°F (29°C). The thermostat shall initially be programmed with a heating temperature set point no higher than 70°F (21°C) and a cooling temperature set point no lower than 78°F (26°C).

~~R403.1.2 (N1103.1.2)~~ R403.1.3 (N1103.1.3) Heat pump supplementary heat (Mandatory). Heat pumps having supplementary electric-resistance heat shall have controls that, except during defrost, prevent supplemental heat operation when the heat pump compressor can meet the heating load.

Reason: Although Section R403.1 Controls, is labeled as Mandatory, it is unclear whether all control requirements are. Table R405.5.2(1) specifies a manual thermostat for Section R405 (performance) compliance. The proposed language would clarify that programmable thermostats are required for prescriptive compliance by Section R402.1 (if the primary heating system is forced-air), but they are not required for Section R405 (performance) compliance (whether the primary heating system is forced-air or not). "Furnace" is replaced with "distribution system" so that forced air heat pumps are also included in this requirement.

Cost Impact: The code change proposal will not increase the cost of construction.

RE100-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R403.1-EC-SONNE.DOC

RE101-13

R403.1.1 (IRC N1103.1.1)

Proponent: Michael J. Early, PD&R, U.S. Department of Housing and Urban Development
(michael.j.early@hud.gov)

Revise as follows:

R403.1.1 (N1103.1.1) Programmable thermostat. Where the primary heating system is a forced air furnace, at least one thermostat per dwelling unit shall be capable of controlling the heating and cooling system on a daily schedule to maintain different temperature set points at different times of the day. The thermostat shall be located on an interior wall within the dwelling unit, in an area that is exposed to the dwelling unit's general airflow and at a location that minimizes the duration that the thermostat is exposed to direct sunlight. The thermostat shall not be in close proximity to the dwelling unit's exterior doors, exterior windows, cooking appliances, cooling appliances, supply vents and heating or cooling devices. This thermostat shall include the capability to set back or temporarily operate the system to maintain *zone* temperatures down to 55°F (13°C) or up to 85°F (29°C). The thermostat shall initially be programmed with a heating temperature set point no higher than 70°F (21°C) and a cooling temperature set point no lower than 78°F (26°C).

Reason: Providing a more prescribed location for a dwelling's thermostat will help regulate the temperature more accurately and also benefit occupants financially by expending less energy.

By positioning the thermostat in a location that avoids direct sunlight and is away from the dwelling's supply vents, devices, and applications, the number of inadvertent temperature fluctuations that the thermostat observes will decrease. In turn, by decreasing the number of fluctuations, the dwelling's heating and cooling systems will cycle on and off less frequently, thereby extending the systems' lifespan and creating more comfortable temperatures.

Cost Impact: The code change will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

R403.1.1 #1-EC-EARLY.DOC

RE102-13

R403.1.1 (IRC N1103.1.1)

Proponent: Michael J. Early, PD&R, U.S. Department of Housing and Urban Development
(michael.j.early@hud.gov)

Revise as follows:

R403.1.1 (N1103.1.1) Programmable thermostat. Where the primary heating system is a forced air furnace, at least one thermostat per dwelling unit shall be capable of controlling the heating and cooling system on a daily schedule to maintain different temperature set points at different times of the day. The thermostat shall be located not greater than 44 inches (1120 mm) above the floor. This thermostat shall include the capability to set back or temporarily operate the system to maintain zone temperatures down to 55°F (13°C) or up to 85°F (29°C). The thermostat shall initially be programmed with a heating temperature set point no higher than 70°F (21°C) and a cooling temperature set point no lower than 78°F (26°C).

Reason: Provide more reachable access for occupants with disabilities to regulate the temperature of a dwelling. Placing the thermostat at a height of not greater than 44 inches (1120 mm) from the floor is in accordance with ADA Accessibility Guidelines for Buildings and Facilities (ADAAG), and provides a convenient location for occupants to observe the dwelling's temperature conditions and make necessary adjustments. As per section 308.2.2 and 308.3.2 of ADAAG (see the following link)

(<http://www.ada.gov/regs2010/2010ADASTandards/2010ADASTandards.pdf>)

the maximum high forward and parallel reaches allowed for objects mounted on the wall above an obstruction are 44 inches (1120 mm) and 46 inches (1170 mm), respectively.

Figure 308.2.1
Unobstructed Forward Reach

Figure 308.2.2
Obstructed High Forward Reach

Figure 308.3.1
Unobstructed Side Reach

Figure 308.3.2
Obstructed High Side Reach

Cost Impact: The code change will not increase the cost of construction.

R403.1.1 #2-EC-EARLY.DOC

RE103-13

R403.1.1 (IRC N1103.1.1)

Proponent: Dr. Thomas D. Culp, Birch Point Consulting LLC, representing self
(culp@birchpointconsulting.com)

Revise as follows:

R403.1.1 (N1103.1.1) Programmable thermostat. Where the primary heating system is a forced-air furnace, at least one thermostat per dwelling unit shall be capable of controlling the heating and cooling system on a daily schedule to maintain different temperature set points at different times of the day. This thermostat shall include the capability to set back or temporarily operate the system to maintain *zone* temperatures down to 55°F (13°C) or up to 85°F (29°C). The thermostat shall initially be programmed by the manufacturer with a heating temperature set point no higher than 70°F (21°C) and a cooling temperature set point no lower than 78°F (26°C).

Reason: When this requirement was added to the 2009 IECC, the last sentence about initial programmed set points was really intended for manufacturer design, so that the thermostat would be ready to go “out of the box”. However, there have been reports that this sentence adds extra compliance work for code officials who have to spend time checking and in some cases programming the thermostat set points. This proposal clarifies that this requirement is the manufacturer's responsibility, so that ultimately all thermostats on the market will come already in compliance with this section.

Cost Impact: None, or possible decrease in compliance time / costs.

R403.1.1 -EC-CULP.DOC

RE104-13

R403.1.1 (IRC N1103.1.1)

Proponent: Craig Conner, Building Quality representing self (craig.conner@mac.com)

Delete without substitution:

R403.1.1 (N1103.1.1) Programmable thermostat. Where the primary heating system is a forced-air furnace, at least one thermostat per dwelling unit shall be capable of controlling the heating and cooling system on a daily schedule to maintain different temperature set points at different times of the day. This thermostat shall include the capability to set back or temporarily operate the system to maintain zone temperatures down to 55°F (13°C) or up to 85°F (29°C). The thermostat shall initially be programmed with a heating temperature set point no higher than 70°F (21°C) and a cooling temperature set point no lower than 78°F (26°C).

Reason: Research shows programmable thermostats don't save energy. Multiple studies of actual use show that those with and without programmable thermostats setback with about equal frequency and have about the same average house temperature. Turns out people without setback thermostats often setback manually, and some people with setback thermostats do not use them. The IECC should not include requirements that don't save energy.

Energy Star acknowledged the lack of impact by removing programmable thermostats. "*The ENERGY STAR specification for programmable thermostats was suspended on December 31, 2009 and the ENERGY STAR label is no longer available for this category.*" http://www.energystar.gov/index.cfm?c=archives.thermostats_spec

The thermostat required by this section differs from the thermostat specified in the performance calculation in Table R405.5.2(1).

	Assembly:	ASF	AMF	DF

R403.1.1-EC-CONNER.DOC

RE105-13

R403.1.1 (IRC N1103.1.1)

Proponent: Ellen Eggerton, representing Virginia Building and Code Officials Association

Revise as follows:

R403.1.1 (N1103.1.1) Programmable thermostat. ~~Where the primary heating system is a forced air furnace, at least one thermostat per~~ The thermostat controlling the primary heating or cooling system of the dwelling unit shall be capable of controlling the heating and cooling system on a daily schedule to maintain different temperature set points at different times of the day. This thermostat shall include the capability to set back or temporarily operate the system to maintain *zone* temperatures down to 55°F (13°C) or up to 85°F (29°C). The thermostat shall initially be programmed with a heating temperature set point no higher than 70°F (21°C) and a cooling temperature set point no lower than 78°F (26°C).

Reason: This suggested change recognizes that forced air heating and air conditioning systems are not the only systems that may benefit from programmable thermostats. Hydronic, radiant electric, and solar thermal systems could also be programmed for night or "unoccupied" setback periods. The proposal concurrently clarifies that the primary heating or cooling system, at minimum, is the system that should receive the programmable thermostat. This clarification is necessary for those residential dwelling units that have multiple systems; e.g., first floor / second floor forced air systems, or radiant electric systems with thermostats in each room. Which system must have a programmable thermostat? It is the "primary" system, typically the one serving the largest area of the dwelling, but subject to reasonable interpretation by the Building Official. Impact of this proposal may be to reduce installation of unnecessary programmable thermostats in multiple H/AC systems.

Cost Impact: If the non-forced air system would otherwise have a non-programmable thermostat installed, then this proposal will increase the cost of construction. However, programmable thermostats are becoming more standard in the marketplace for new residential construction, so the cost impact is effectively zero. Cost differentials when purchasing a programmable vs. non-programmable thermostat are minimal.

RE105-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R403.1.1-EC-EGGERTON.DOC

RE106-13

R403.1.2 (IRC N1103.1.2)

Proponent: Eric Makela / Britt/Makela Group, Inc./ representing Northwest Energy Codes Group
Eric@BrittMakela.com

Revise as follows:

R403.1.2 (N1103.1.2) Heat pump supplementary heat (Mandatory). Heat pumps having supplementary electric-resistance heat shall have controls that, except during defrost, prevent supplemental heat operation when the heat pump compressor can meet the heating load. Unitary air cooled heat pumps shall include controls that minimize supplemental heat usage during start-up, set-up and defrost conditions. The controls shall anticipate need for heat and use compression heating as the first stage of heat. The controls shall indicate when supplemental heating is being used through visual means such as a light emitting diode indicator. Heat pumps equipped with supplementary heaters shall be installed with controls that prevent supplemental heater operation at outdoor temperatures greater than 40°F (4.4 °C). The auxiliary heat lock out control shall be set at 35°F (1.7°C) or less at final inspection.

Reason: The current language in the 2012 IECC requiring heat pump thermostats that is fairly general. The language requires a thermostat for heat pumps and includes language that outlines the general intent of the control but does not provide the level of detail needed to enforce the provision. The proposed language provides guidance on what to inspect for to determine if the supplemental heat is on. The proposed language also provides a temperature setpoint for when the supplemental heat is allowed to come on to satisfy the load (40°F). The existing language states that the control must prevent supplemental heat operation when the heat pump can meet the heating load but without a specific temperature threshold the provision is unenforceable. The proposed language is from the Washington State Residential Energy Code and has been field tested.

Cost Impact: The code change proposal will not increase the cost of construction.

R403.1.2-EC-MAKELA.DOC

RE107-13

R403.2.1 (IRC N1103.2.1)

Proponent: Shaunna Mozingo, City of Cherry Hills Village, representing Colorado Chapter of ICC, Inc.
smozingo@coloradocode.net

Revise as follows:

R403.2.1 (N1103.2.1) Insulation (Prescriptive). Supply and return ducts in attics shall be insulated to a minimum of R-8. ~~All other ducts~~ Supply and return ducts in other portions of the building shall be insulated to a minimum of R-6.

Exception: Ducts or portions thereof located completely inside the building thermal envelope.

Reason: The requirement as written is commonly misinterpreted to say that all supply ducts in attics are insulated to R-8 and all other ducts in attics, including bathroom exhausts, returns, etc are insulated to R-6 when in fact, the intent was that the supply ducts in attics get R-8 and the supplies in other unconditioned spaces in the building, such as garages, ventilated crawl spaces, etc, get R-6. Also, the ducts should not be limited to supplies but should include return ducts as well. This intent is called out much more clearly in the commercial section of the code.

Cost Impact: The code change proposal will not increase the cost of construction.

R403.2.1 (IRC N1103.2.1)

Proponent: Michael Schmeida, Divisional Manager- Sustainability and Government/Regulatory Affairs;
Tremco Commercial Sealants and Waterproofing, Beachwood, Ohio (mschmeida@tremcoinc.com)

Revise as follows:

R403.2.1 (N1103.2.1) Insulation (Prescriptive). Supply ducts in attics shall be insulated to a minimum of R-8. All other ducts shall be insulated to a minimum of R-6.

Exception: ~~Ducts or portions thereof located completely inside the *building thermal envelope*.~~

Reason: The loss of heating or cooling through uninsulated ducts, while not an energy loss to the outside of the thermal envelope, can result in extra run time of HVAC equipment to compensate for air of the proper/intended temperature not reaching the desired occupied areas.

Cost Impact: The cost impact would be <\$1000 depending on design. ROI is not determined at this time.

RE108-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R403.2 (IRC N1103.2), R403.2.2 (IRC N1103.2.2), R403.2.3 (NEW) (IRC N1103.2.3 (NEW)), R403.2.4 (NEW) (IRC N1103.2.4 (NEW))

Proponent: Craig Conner, Building Quality representing self (craig.conner@mac.com)

Revise as follows:

R403.2 (N1103.2) Ducts. Ducts and air handlers shall be in accordance with Sections R403.2.1 through ~~R403.2.3~~ R403.2.5.

R403.2.2 (N1103.2.2) Sealing (Mandatory). Ducts, air handlers, and filter boxes shall be sealed. Joints and seams shall comply with either the International Mechanical Code or International Residential Code, as applicable.

Exceptions:

1. Air-impermeable spray foam products shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.
3. Continuously welded and locking-type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.

~~Duct tightness shall be verified by either of the following:~~

- ~~1. Postconstruction test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.~~
- ~~2. Rough-in test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the system, including the manufacturer's air handler enclosure. All registers shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 3 cfm (85 L/min) per 100 square feet (9.29 m²) of conditioned floor area.~~

~~**Exception:** The total leakage test is not required for ducts and air handlers located entirely within the building thermal envelope.~~

R403.2.3 (N1103.2.3) Duct testing (Mandatory). Ducts shall be pressure tested to determine air leakage by one of the following methods:

1. Postconstruction test: Total leakage shall be measured with a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.
2. Rough-in test: Total leakage shall be measured with a pressure differential of 0.1 inches w.g. (25 Pa) across the system, including the manufacturer's air handler enclosure if installed at the time of the test. All registers shall be taped or otherwise sealed during the test.

Exception: A duct air leakage test shall not be required where the ducts and air handlers are located entirely within the building thermal envelope.

A written report of the results of the test shall be signed by the party conducting the test and provided to the code official.

R403.2.4 (N1103.2.4) Duct leakage (Prescriptive). The total leakage of the ducts, where measured in accordance with Section R403.2.3, shall be as follows:

1. Postconstruction test: The total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area.

2. Rough-in test: The total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area where the air handler is installed at the time of the test. Where the air handler is not installed at the time of the test, the total leakage shall be less than or equal to 3 cfm (85 L/min) per 100 square feet (9.29 m²) of conditioned floor area.

~~R403.2.3~~ R403.2.5 (N1103.2.3 N1103.2.5) Building cavities (Mandatory). Building framing cavities shall not be used as ducts or plenums.

Reason: This is exactly the online draft DOE posted. DOE put it well in their reason statement as posted online with the change above:

"The proposal simply changes the duct leakage requirements from mandatory to prescriptive, while retaining the testing requirement and duct construction specifications. Changing the duct leakage rate from mandatory to prescriptive will allow builders the option of trading improvements in other building components for less stringent pressure test results or vice versa. This provides flexibility in meeting the requirements and options for recovering from an unexpected test failure. "

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

R403.2.2-EC-CONNER.DOC

RE110-13

R403.2.2 (IRC N1103.2.2)

Proponent: Amanda Hickman, InterCode Inc. representing DuctMate Industries
(amanda@intercodeinc.com)

Revise as follows:

R403.2.2 (N1103.2.2) Sealing (Mandatory). Ducts, air handlers, and filter boxes shall be sealed. Joints and seams shall comply with either the *International Mechanical Code* or *International Residential Code*, as applicable.

Exceptions:

1. Air-impermeable spray foam products shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.
3. ~~Continuously welded and locking-type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.~~

Duct tightness shall be verified by either of the following:

1. Postconstruction test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.
2. Rough-in test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the system, including the manufacturer's air handler enclosure. All registers shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 3 cfm (85 L/min) per 100 square feet (9.29 m²) of conditioned floor area.

Exception: The total leakage test is not required for ducts and air handlers located entirely within the building thermal envelope.

Reason: The requirements for low pressure duct sealing were clarified in the International Mechanical Code in M151-12 (proposed by the PMG Code Action Committee). M151-12 was approved by the voting membership in Portland for the 2015 IMC.

Currently, low pressure duct sealing is addressed in the IMC, two places in the IECC, and in the IRC. Identical language in the IECC is not necessary since it defers to the IMC and the IRC (for residential mechanical).

If the code sections in the IMC, IRC, and IECC are not maintained cycle after cycle, inconsistencies can develop between the sections. It is more efficient to simply eliminate the sections altogether in the IECC since they are redundant.

A similar proposal is being submitted to the 2015 IECC Commercial chapter for consistency.

Cost Impact: The code change proposal will not increase the cost of construction.

R403.2.2-EC-HICKMAN.DOC

RE111-13

R403.2.2 (IRC N1103.2.2)

Proponent: Vickie Lovell InterCode Inc. representing DuctMate Industries (vickie@intercodeinc.com)

Revise as follows:

R403.2.2 (N1103.2.2) Sealing (Mandatory). Ducts, air handlers, and filter boxes shall be sealed. Joints and seams shall comply with either the *International Mechanical Code* or *International Residential Code*, as applicable.

Exceptions:

1. Air-impermeable spray foam products shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.
3. ~~Continuously welded and locking-type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.~~ For ducts having a static pressure classification of less than 2 inches of water column (500 Pa), additional closure systems shall not be required for continuously welded joints and seams, and locking-type joints and seams of other than the snap-lock and button-lock types.

Duct tightness shall be verified by either of the following:

1. Postconstruction test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.
2. Rough-in test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the system, including the manufacturer's air handler enclosure. All registers shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 3 cfm (85 L/min) per 100 square feet (9.29 m²) of conditioned floor area.

Exception: The total leakage test is not required for ducts and air handlers located entirely within the building thermal envelope.

Reason: This proposed text is derived from a revision to the International Mechanical Code that was proposed by the PMG Code Action Committee in M151-12 and was approved by the voting membership in Portland for the 2015 IMC. That reason statement is supplied below:

"Unless sealant or a gasket is used, snap-lock and button-lock type seams will leak significantly. The current exception attempted to prevent unnecessary sealing for joints and seams that leak very little or not at all, but it went too far by including all locking type joints and seams. Some locking joints are leakproof such as mechanically folded seams used for spiral seam duct, but this cannot be said for all locking joints."

The identical proposal is being submitted to the 2015 IECC commercial requirements for consistency.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

R403.2.2-EC-LOVELL.DOC

RE112-13

R403.2.2 (IRC N1103.2.2)

Proponent: Eric Makela / Britt/Makela Group, Inc./ representing Northwest Energy Codes Group
(Eric@BrittMakela.com)

Revise as follows:

R403.2.2 (N1103.2.2) Sealing (Mandatory). Ducts, air handlers, and filter boxes shall be sealed. Joints and seams shall comply with either the *International Mechanical Code* or *International Residential Code*, as applicable.

Exceptions:

1. Air-impermeable spray foam products shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.
3. Continuously welded and locking-type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500Pa) pressure classification shall not require additional closure systems.

Duct tightness shall be verified by either of the following:

1. Postconstruction test: Leakage to outdoors shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area or total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.
2. Rough-in test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the system, including the manufacturer's air handler enclosure. All registers shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 3 cfm (85 L/min) per 100 square feet (9.29 m²) of conditioned floor area.

Exception: The total leakage test is not required for ducts and air handlers located entirely within the building thermal envelope.

Reason: Allowing for duct leakage to the outside will give both HVAC installers and homeowners an accurate measurement of duct leaks to the exterior of the building. Duct leakage to the outdoors is an accepted duct testing method in the industry and was allowed under Section 403.2.2 of the 2009 IECC. The proposed leakage rate is set at 4 cfm per 100 square feet of conditioned floor area which consistent with the 2012 requirements for total duct leakage.

Cost Impact: The code change proposal will not increase the cost of construction.

R403.2.2 (IRC N1103.2.2)

Proponent: Michael Schmeida, Divisional Manager- Sustainability and Government/Regulatory Affairs, representing Tremco Commercial Sealants and Waterproofing, Beachwood, Ohio (mschmeida@tremcoinc.com)

Revise as follows:

R403.2.2 (N1103.2.2) Sealing (Mandatory). Ducts, air handlers, and filter boxes shall be sealed. Joints and seams shall comply with either the *International Mechanical Code* or *International Residential Code*, as applicable.

Exceptions:

1. Air-impermeable spray foam products shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.
3. Continuously welded and locking-type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.

Duct tightness shall be verified by either of the following:

1. Postconstruction test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.
2. Rough-in test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the system, including the manufacturer's air handler enclosure. All registers shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 3 cfm (85 L/min) per 100 square feet (9.29 m²) of conditioned floor area.

Exception: ~~The total leakage test is not required for ducts or air handlers located entirely within the building thermal envelope.~~

Reason: The loss of heating or cooling through improperly sealed ducts, while not an energy loss to the outside of the thermal envelope, can result in extra run time of HVAC equipment to compensate for air of the proper/intended temperature not reaching the desired occupied areas.

Cost Impact: The cost impact would be <\$1000 depending on design. ROI is variable depending on climate, design, etc., but is estimated in many studies at 1 -2 years.

	Assembly:	ASF	AMF	DF

R403.2.2-EC-SCHMEIDA.DOC

RE114-13

R403.2.2 (IRC N1103.2.2), Chapter 5

Proponent: Jeff Sonne, Florida Solar Energy Center representing the Florida Solar Energy Center
(jeff@fsec.ucf.edu)

Revise as follows:

R403.2.2 (N1103.2.2) Sealing (Mandatory). Ducts, air handlers, and filter boxes shall be sealed. Joints and seams shall comply with either the *International Mechanical Code* or *International Residential Code*, as applicable.

Exceptions:

1. Air-impermeable spray foam products shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.
3. Continuously welded and locking-type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.

Duct tightness shall be verified by testing in accordance with Section 803 of the RESNET Standards. The allowable leakage shall be one ~~by either~~ of the following:

1. Postconstruction test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.
2. Rough-in test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the system, including the manufacturer's air handler enclosure. All registers shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 3 cfm (85 L/min) per 100 square feet (9.29 m²) of conditioned floor area.

Exception: The total leakage test is not required for ducts and air handlers located entirely within the building thermal envelope.

Add new standard to Chapter 5 (IRC Chapter 44) as follows:

RESNET Residential Energy Services Network, Inc.
P.O. Box 4561
Oceanside, CA 92052-4561

RESNET Standards-2013 RESNET Mortgage Industry National Home Energy Rating Standards.

Reason: RESNET Section 803 is the only standard available that addresses single-point testing, including error analysis, and that does not require both pressurization and depressurization testing to meet the standard.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, RESNET Standards, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

R403.2.2-EC-SONNE.DOC

RE115-13

R403.2.2 (IRC N1103.2.2), R403.2.2.1 (NEW) (IRC N1103.2.2.1 (NEW)), R403.2.2.2 (NEW) (IRC N1103.2.2.2 (NEW)), R403.2.2.3 (NEW) (IRC N1103.2.2.3 (NEW))

Proponent: Don Surrena, CBO, National Association of Home Builders (NAHB) (dsurrena@nahb.org)

Revise as follows:

R403.2.2 (N1103.2.2) Sealing (Mandatory). Ducts, air handlers, and filter boxes shall be sealed and tested in accordance with Sections R403.2.2.1 through R403.2.1.3. ~~Joins and seams shall comply with either the International Mechanical Code or International Residential Code, as applicable.~~

Exceptions:

- ~~1. Air impermeable spray foam products shall be permitted to be applied without additional joint seals.~~
- ~~2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.~~
- ~~3. Continuously welded and locking-type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.~~

~~Duct tightness shall be verified by either of the following:~~

- ~~1. Postconstruction test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.~~
- ~~2. Rough-in test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the system, including the manufacturer's air handler enclosure. All registers shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 3 cfm (85 L/min) per 100 square feet (9.29 m²) of conditioned floor area.~~

Exception: The total leakage test is not required for ducts and air handlers located entirely within the building thermal envelope.

R403.2.2.1 (N1103.2.2.1) Construction (Mandatory). Ducts, air handlers, and filter boxes shall be sealed. Joints and seams shall comply with either the *International Mechanical Code* or *International Residential Code*, as applicable.

Exceptions:

1. Where air-impermeable spray foam products are applied to ducts, air handlers and filter boxes, joints and seams covered by such products shall not be required to be sealed in accordance with *International Mechanical Code* and *International Residential Code*.
2. Where a duct connection is made that is partially inaccessible and three screws or rivets, equally spaced, are installed on the exposed portion of the joint, the joint shall not be required to comply with the duct connection mechanical fastening requirement of the *International Mechanical Code* and *International Residential Code*.

3. Continuously welded and locking-type longitudinal joints and seams in ducts that, in operation, have a static pressure of less than 2 inches of water column (500 Pa), shall not require additional closure systems.

R403.2.2.2 (N1103.2.2.2) Duct testing (Mandatory). Ductwork systems shall be tested for air leakage by one of the following methods:

1. Postconstruction test: The total leakage of the ductwork systems shall be measured when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.
2. Rough-in test: The total leakage of the ductwork systems shall be measured when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the system, including the manufacturer's air handler enclosure where present at the time of the test. All registers shall be taped or otherwise sealed during the test.

Exception: Ductwork leakage tests shall not be required for ducts and air handlers located entirely within the building thermal envelope.

A written report of the results of the test shall be signed by the party conducting the test and provided to the code official.

R403.2.2.3 (N1103.2.2.3) Duct leakage (Prescriptive). The total leakage of the ductwork, when tested in accordance with Section R403.2.2.2, shall be as follows:

1. Postconstruction test: The total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area.
2. Rough-in test: The total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area where the air handler is present at the time of the test or where the air handler is not present at the time of the test, 3 cfm (85 L/min) per 100 square feet (9.29 m²) of conditioned floor area.

Exceptions: The total leakage from ductwork and air handlers located entirely within the building thermal envelope shall be unlimited.

Reason: These modifications remove the mandatory maximum air tightness requirement and provide designers and builders the flexibility to trade-off duct tightness with other performance path measures when using the performance path. Currently the duct tightness requirements are mandatory and even under ideal circumstances, difficult to achieve. This will provide energy neutral trade-offs for expensive and sometimes unattainable requirements with other building improvements. This proposal does not change the stringency of the code it only increases the flexibility.

Cost Impact: The code change proposal will not increase the cost of construction.

R403.2.2 #1-EC-SURRENA.DOC

RE116-13

R403.2.2 (IRC N1103.2.2), Table R405.5.2(1) (IRC Table N1105.5.2(1))

Proponent: Don Surrena, CBO, National Association of Home Builders (NAHB) (dsurrena@nahb.org)

Revise as follows:

R403.2.2 (N1103.2.2) Sealing (Mandatory). Ducts, air handlers, and filter boxes shall be sealed. Joints and seams shall comply with either the *International Mechanical Code* or *International Residential Code*, as applicable.

Exceptions:

1. Air-impermeable spray foam products shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.
3. Continuously welded and locking-type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.

Duct tightness shall be verified by either of the following:

1. Postconstruction test: ~~Total Leakage to the outside of a conditioned space or total leakage~~ shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All registers ~~boots~~ shall be taped or otherwise sealed during the test.
2. Rough-in test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the system, including the manufacturer's air handler enclosure. All registers shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 3 cfm (85 L/min) per 100 square feet (9.29 m²) of conditioned floor area.

Exception: The total leakage test is not required for ducts and air handlers located entirely within the building thermal envelope.

**TABLE R405.5.2(1) (N1105.5.2(1))
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS**

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Thermal distribution systems	<p>Thermal distribution system efficiency shall be as tested or as specified in Table R405.5.2(2) if not tested. Duct insulation shall be as proposed.</p> <p><u>Untested distribution systems: DSE = 0.88</u></p> <p><u>Tested Ducts: Leakage rate to outside conditioned space as specified Section R403.2.2(1)</u></p> <p><u>Tested duct Location: Unconditioned attic</u></p> <p><u>Tested duct Insulation: in accordance with Section R403.2.1</u></p>	<p>Thermal distribution system efficiency shall be as tested or as specified in Table R405.5.2(2) if not tested. Duct insulation shall be as proposed.</p> <p><u>Untested distribution systems: DSE from Table R405.5.2(2)</u></p> <p><u>Tested Ducts: Tested Leakage rate to outside conditioned space</u></p> <p><u>Duct Location: As proposed</u></p> <p><u>Duct Insulation: As proposed</u></p>

Reason: Currently there is no guidance in Table R405.5.2(1) on how to model ducts for the Standard Reference Design when performing a simulated energy performance calculation. Consequently, systems which perform better than the code minimum are not recognized in the performance analysis. Proposed changes provide clarity as to what distribution system efficiency should be applied to the Standard Reference Design and how the ducts should be modeled in the performance path.

The default distribution system efficiency (DSE) is set to 0.88 for untested systems in the standard reference design, which is the established default for ducts located in conditioned space. If ductless or hydronic systems are used, a recognized benefit will result in the performance model.

When a duct system is tested, the standard reference tightness is defined in section R403.2.2(1) (4cfm/100ft² of CFA). Buildings with ducts tighter than the 4cfm/100ft² will get credit for performing better than the minimum requirement. In addition, the manufacturers of the modeling software will have clear definition how to model the Standard Reference Design including duct placement and insulation level.

Changes in section R403.2.2 make it clear that postconstruction duct testing can be tested to either outside conditioned space or total duct leakage, as determined by the contractor.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

R403.2.2 #2-EC-SURRENA.DOC

RE117-13

R403.2.2 (IRC N1103.2.2)

Proponent: Donald J. Vigneau, AIA, Northeast Energy Efficiency Partnerships, Inc. (NEEP)
(dvigneau@neep.org)

Revise as follows:

R403.2.2 (N1103.2.2) Sealing (Mandatory). Ducts, air handlers, and filter boxes shall be sealed. Joints and seams shall comply with either the International Mechanical Code or International Residential Code, as applicable.

Exceptions:

1. Air-impermeable spray foam products shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.
3. Continuously welded and locking-type longitudinal seams in ducts operating at a static pressure less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.

Duct tightness shall be verified by either of the following options:

- ~~1.~~ 2. Rough-in test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handling enclosure. All register boots shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 3 cfm per 100 square feet (9.29 m²) of conditioned floor area.
- ~~2.~~ 4. Post-construction test: Total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handling enclosure. All register boots shall be taped or otherwise sealed during the test.

Exception: The total leakage test is not required for ducts and air handlers located entirely within the building thermal envelope.

Reason: Reversing the order of the required testing options places the first option in a preferential position, to lead the user in selection of these required test options. Rough-in testing is the optimum time for the test, as it allows maximum opportunity to inspect the duct sealing, identify and rectify leaks in the sealed joints, and allow for inspections when the completeness of the ductwork assembly can be verified and before concealed spaces are closed in. The remaining openings for terminals and connections can readily be checked at building appliance and equipment installation inspections customarily accomplished shortly before a final inspection.

Reversing the order increases the probability that problems in the duct sealing not only can be more easily found, but also corrected at the best possible time for easy access and reduced costs for the corrections. No revisions to the existing options text is required; only re-numbering.

Note: This is the second code change proposal submitted on the same code section. Each submittal covers different subsections of the code section requirements and the two proposals are not related.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

R403.2.2 #2-EC-VIGNEAU.DOC

RE119-13

R403.2.3 (IRC N1103.2.3)

Proponent: Dan Buuck, National Association of Home Builders (NAHB) (dbuuck@nahb.org)

Revise as follows:

R403.2.3 (N1103.2.3) Building cavities (Mandatory). Building framing cavities shall not be used as ducts ~~or plenums~~.

Reason: Right now we have a conflict between this section and the IMC and IRC, both of which allow plenums in stud cavities and joist spaces. There is also an apparent conflict within the IECC: It currently allows stud cavity and joist space plenums in residential occupancies more than three stories in height along with all other commercial buildings.

The general prohibition of plenums has also lost its effectiveness in regards to energy savings. When it was approved for the IECC, using stud spaces in exterior walls as plenums was still allowed. That it is now prohibited (see IRC M1601.1.1), so heat loss is not an issue.

During the Group A hearings a proposal to prohibit plenums in the IMC was not successful. The PMG CAC considered this conflict and decided not to support a proposal that would remove language in the IRC that provides guidance on the safe construction of plenums. This would have put the IRC in conflict with the IMC. States are also removing plenums from this section of the IECC as they adopt the 2012 version.

Cost Impact: The code change proposal will not increase the cost of construction.

RE119-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R402.2.3-BUUCK.DOC

RE120-13

R403.2.3 (IRC N1103.2.3)

Proponent: Brenda A. Thompson, Clark County Building Department, Las Vegas NV, representing the ICC Sustainability, Energy & High Performance Code Action Committee (SEHPCAC)

Revise as follows:

R403.2.3 (N1103.2.3) Building cavities (Mandatory). Building framing cavities in the building thermal envelope shall not be used as ducts or plenums.

Reason: This proposal is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

This proposal revises Section R403.2.3 to align with the requirements of Section M1601.1.1 of the IRC and Section 602.3 of the IMC, which prohibit building framing cavities in exterior walls to be used as ducts or plenums, but allow framing cavities in interior walls to be used as ducts or plenums. As currently configured these code sections conflict with one another and make enforcement confusing and difficult.

The current language in Section R403.2.2 of the IECC does not allow building cavities in interior walls or floors to be used as ducts. While this section would not prevent such interior walls or floors to be used as ducts or plenums, Section 602.3 of the IMC and Section M1601.1.1 prohibit their use as supply ducts. Therefore, these interior wall and floor building cavities would ultimately be permitted to be used only as return ducts.

Note that the IECC defines *building thermal envelope* as "The *basement walls*, *exterior walls*, floor, roof and any other building element that enclose *conditioned space* or provides a boundary between *conditioned space* and exempt or unconditioned space."

Also note that, while the *building thermal envelope* is an energy issue, ducts are a mechanical issue and are governed primarily by the IMC and the mechanical chapters of the IRC.

Cost Impact: The code change proposal will decrease the cost of construction.

RE120-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R403.2.3-EC-THOMPSON-SEHPCAC.DOC

RE121-13

R403.4 (IRC N1103.4), R403.4.1 (NEW) (IRC N1103.4.1 (NEW))

Proponent: Brian Dean, Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; and Bill Prindle, Energy Efficient Codes Coalition.

Revise as follows:

R403.4 (N1103.4) Service hot water systems. Energy conservation measures for service hot water systems shall be in accordance with Sections R403.4.1, ~~and~~ R403.4.2 and R403.4.3.

R403.4.1 (N1103.4.1) Service hot water equipment efficiency rating (Mandatory). New or replacement service water heating equipment shall have an efficiency rating equal to or greater than the minimum required by federal law for the geographic location where the equipment is installed.

Reason: The purpose of this code change is to codify the requirement that service hot water equipment must satisfy federal minimum requirements for the location. This proposal does not establish new requirements since it simply requires that equipment meet the federal standard, but it allows the code official to enforce the requirements. This proposal improves the effectiveness of the code by reinforcing a practice that should already be taking place in plan review and inspection -- verification of the efficiency rating of service hot water equipment. Although federal rules set the minimum efficiency levels for manufacturers, only code officials can determine whether equipment actually installed in buildings meets or exceeds the federal minimums. We have offered a similar proposal for heating and cooling equipment under section R403.6.

This proposal is more important now than in the past because federal minimums are expected to shift away from single nationwide efficiency levels to regionally-based efficiency levels that will vary from state to state. It is possible, whether by accident or bad intent, to see equipment that would meet federal requirements in one jurisdiction used in other states or regions in which it does not meet the regional requirement. Although this verification may already be taking place, the proposal above is intended to make it a specific requirement in all buildings. This is an important opportunity for federal, state and local governments to work together to ensure that equipment installed meets federal minimums for the location.

Cost Impact: The code change proposal will not increase the cost of construction.

For SI: 1 inch = 25.4 mm, 1 liquid ounce = 0.0296 liters, 1.0 ounce = 0.00781 gallons,
0.5 gallon (1.9 liters) = 64.0 liquid ounces

Reason: Cold or tepid water in the initial draw from a hot water outlet is often unusable for its intended purpose, and is frequently purged, resulting in a waste of water, energy, and time for building occupants. Pipe insulation significantly reduces heat loss and helps to ensure that hot water gets to the shower sooner. However, a complementary strategy is to reduce the volume of water contained in the hot water distribution system in the first place.

This proposal, which is comparable to the criteria adopted by the US EPA WaterSense for New Homes specification in 2009, establishes a maximum volume of 0.5 gallons for water in a hot water supply line, based on internal volumes specific to the piping material. By allowing the volume limitation to be computed from runs from recirculation loops, this provision allows designers additional flexibility while effectively limiting the amount of water to be purged to 1/2 gallon per draw.

The proposal designates this provision as mandatory. The reason for this is that while the 2012 IECC performance approach allows credit for improving the efficiency of the hot water heat source, no credit is available for features of the hot water distribution system that might actually reduce the amount of hot water used, such as a limitation on hot water supply pipe volume. Thus, even though this design criterion will save significant amounts of energy over the life of the building, its energy savings cannot be "scored" or accumulated within the performance framework of the code. If designated "prescriptive", it is likely to be ignored by builders using the performance path since it cannot contribute to compliance under the IECC performance approach. Thus, "mandatory" is the better approach at this time. If and when Section R405 is modified to ensure that the performance path will account for the energy attributes of the hot water distribution system, consideration can be given to removing the mandatory designation from this proposed section.

Cost Impact: This code change proposal is a design requirement that will not increase the cost of construction.

R202 (IRC N1101.9), R403.4 (IRC N1103.4), R403.4.1 (NEW) (IRC N1103.4.1 (NEW)), Chapter 5

Proponent: Meg Waltner, Natural Resources Defense Council (mwaltner@nrdc.org)

Revise as follows:

R403.4 (N1103.4) Service hot water systems. Energy conservation measures for service hot water systems shall be in accordance with Sections R403.4.1 ~~and R403.4.2~~, R403.4.2 and R403.4.3.

R403.4.1 (N1103.4.1) Water heating equipment (Prescriptive). This section shall apply only to buildings in climate zones 1 through 5. Service water heating equipment shall be of one or more of the types in the following list. Where replacement of existing service water heating equipment is required and the replacement equipment is of the same type as the existing, the replacement shall have an efficiency that is the same or better than the existing equipment. Where existing equipment is replaced with another type of service water heating equipment, the equipment shall be of one or more of the types in the following list.

1. a desuperheater water heater listed and labeled to AHRI 470
2. a heat pump water heater a heat pump water heater with an energy factor, EF, of 2.0 or greater
3. a solar water heating system having a solar system heating fraction of 0.50 or greater
4. an instantaneous water heater
5. a fuel-gas fired storage water heater with energy factor, EF, of 0.67 or greater

Add new definition as follows:

IECC SECTION R202 (IRC N1101.9) GENERAL DEFINITIONS

DESUPERHEATER WATER HEATER. A factory-made assembly of elements by which the flows of refrigerant vapor and water are maintained in a heat transfer relationship so that the refrigerant vapor is desuperheated and the water is heated.

Add new standard to Chapter 5 as follows:

AHRI

470-06 Performance Rating of Desuperheater/Water Heaters

Reason: As shown in the attached analysis prepared by the Department of Energy, there are cost effective ways to achieve significant energy savings in service water heating systems in climate zones 1-5 compared to standard-efficiency storage electric and fuel-fired heaters. The proposed change offers multiple options for compliance with the new requirement. Cost-effective measures should be included in the IECC as a measure of sound energy policy and to protect consumers from unnecessarily high future energy costs.

Water Heaters

Description

Residential envelopes have been getting tighter and better over the last few years. As a result, domestic water heating energy is emerging as a significant end-use from the efficiency stand-point. There are multiple ways of improving the efficiency of generating hot water in homes. DOE analyzed some of the more common methods – for homes with gas water heaters, water heaters with Energy factor (EF) greater than the federal minimum baseline and tankless water heaters are analyzed; for homes with electric water heaters, heat-pump water heaters are analyzed. Desuperheaters are analyzed for all cases.

The Life Cycle cost analysis uses the DOE Cost Effectiveness Methodology¹ for assessing cost effectiveness. This analysis has been carried out for the single family prototype, for 15 locations, one foundation type and one heating system except the heat pump water heater analysis which is carried out for homes with electric resistance and heat pump space heating. Table 1 indicates the

location cost indices provided by Faithful and Gould (2011)¹ used to reflect local construction costs. Recent residential fuel prices specific to each location summarized in Table 2 are used for energy cost calculations. These have been obtained from the DOE Energy Information Administration.^{2,3}

High efficiency gas storage water heaters

This concept looks at the energy savings potential of high efficiency storage water heater. The residential prototype is presently equipped with a 40 gallon hot water heater. Federal minimum efficiency requirements were revised in 2010 and compliance with the required standards for water heaters is required from April 2015. The new rule requires 40 gallon gas storage water heaters to have an EF of 0.615². An EF of 0.67 is analyzed in this concept.

Energy Cost Savings

Figure 1 below shows energy cost savings for each climate zone.

Cost Effectiveness

The cost for high efficiency water heaters were derived from the Technical Support document and Life Cycle Cost (LCC) spreadsheets for the Appliance Standards rule-making for water heaters³⁴. These costs are blended for retrofits and new construction. To generate costs specific to new construction alone, the Crystal Ball (CB) analysis was re-run with the fractions set to 100% new construction and 0% retrofits.

The total installed cost for a 40 gallon gas storage water heater with EF 0.62 works out to \$1609 while the total installed cost for a 40 gallon gas storage water heater with EF 0.67 works out to \$1468. This unexpected drop in costs is due to lower venting costs associated with the high efficiency water heater. The baseline requires natural draft venting which has higher costs than the plastic power venting apparatus required by the high efficiency water heater.

It can be concluded that using a higher efficiency water heater not only saves energy during its life, but also costs less to install. This measure is thus, cost-effective.

Figure 1: Energy Cost Savings for Gas Storage Water Heaters with EF 0.67 over the 2012 IECC code

³ http://www1.eere.energy.gov/buildings/appliance_standards/residential/heating_products_fr_tsd.html

⁴ http://www1.eere.energy.gov/buildings/appliance_standards/residential/heating_products_fr_spreadsheets.html

Tankless Water Heaters

The most common type of water heaters in residences are storage type. Stand-by losses are associated with storage tank water heaters because hot water draws are inconsistent in homes. This concept looks at tankless type of water heaters, which eliminate the stand-by losses almost entirely. Tankless water heaters have a small storage tank, usually 1 gallon, which has a small associated stand-by loss. Tankless water heaters with an Energy Factor (EF) of 0.82, which is the minimum EF for EnergyStar tankless water heaters⁵, are analyzed in this concept.

There is some evidence that instantaneous water heaters don't perform at their rated efficiency when subjected to realistic hot water draw profiles, i.e., shorter draws that occur frequently during a typical day in residences. To account for this reduction in performance, the assumed EF of instantaneous water heaters is reduced to 92% of its value⁶.

Energy Cost Savings

Figure 2 below shows energy cost savings for each climate zone.

Figure 2: Energy Cost Savings for Tankless Water Heaters over the 2012 IECC code

Cost Effectiveness

The costs for gas fired instantaneous water heaters are derived from the Technical Support document and Life Cycle Cost (LCC) spreadsheets for the Appliance Standards rule-making for water heaters. These costs are blended for retrofits and new construction. To generate costs specific to new construction alone, the Crystal Ball (CB) analysis was re-run with the fractions set to 100% new construction and 0% retrofits.

The total installed cost for a 40 gallon gas storage water heater with EF 0.62 works out to \$1609 while the total installed cost for a gas fired instantaneous water heater with EF 0.82 works out to \$2376. Figure 3 below shows the Life Cycle Cost for this measure across all climate zones. Tankless water heaters turn out to be cost effective in the warmer climate zones but not so much as we move to the colder climate zones.

⁵ EnergyStar website http://www.energystar.gov/index.cfm?c=water_heat.pr_crit_water_heaters

⁶ RESNET reduction factor for the EF of instantaneous water heaters

Figure 3: Life Cycle Cost for Tankless water heaters over the 2012 IECC. *Negative values indicate savings.*

Heat-Pump Water Heaters

Heat-Pump water heaters (HPWH) combine the elements of a heat-pump and a water heater. HPWHs extract heat from the surrounding space and use it to heat water. As a result, they provide the dual benefit of cooling a space while providing the required hot water. DOE considered a HPWH with EF 2.0 for this concept.

The HPWH is assumed to be located inside the conditioned living space. Water heaters are usually placed in unconditioned garages or in closets inside a conditioned space. In order to perform effectively, HPWHs require sufficient surrounding space for heat exchange which may not always be available within a conditioned space. Due to the nature of HPWHs, they perform much better within conditioned spaces in cooling dominated climates. HPWHs are simulated in all climate zones in this analysis.

Energy Cost Savings

Figure 4 below shows energy cost savings for each climate zone.

Figure 4: Energy Cost Savings for Heat-Pump Water Heaters over the 2012 IECC code (electric only)

Cost Effectiveness

The cost for high efficiency water heaters were derived from the Technical Support document and Life Cycle Cost (LCC) spreadsheets for the Appliance Standards rule-making for water heaters. These costs are blended for retrofits and new construction. To generate costs specific to new construction alone, the Crystal Ball (CB) analysis was re-run with the fractions set to 100% new construction and 0% retrofits.

According to this data, the installed cost of 40 gallon Electric Storage Water Heaters with EF 0.95 is \$688 and that of an EF 2.35 Heat Pump Water Heater is \$1697. State cost multipliers from table 2 are used to generate incremental costs by state. Figure 5 below shows the Life Cycle Cost Savings from this measure. According to our analysis, Heat-Pump water heaters in place of electric storage water heaters are cost effective in all zones.

Figure 5: Life Cycle Cost for the concept over the 2012 IECC. Negative values indicate savings.

Desuperheaters

During summer operation, the heat removed from the refrigerant would normally be rejected to the atmosphere. Using this heat in the hot water system, therefore, results in significant energy savings because hot water heating is performed at a reduced energy input (greatly reduced in some cases). Heat supplied to the water during winter operation (in the heating season) is not "free" as in the cooling mode, because that heat would normally be used to satisfy space heating demands. However, energy savings are possible because the water heating takes place at an advantageous coefficient of performance (COP).

Energy Cost Savings

Figure 6 below shows energy cost savings for each climate zone. Desuperheaters are most effective for cooling dominated climate zones as it operates only when the air conditioner is running. Hence the expected the energy savings are much higher for CZ 1-3, with decreasing savings for the colder climate zones.

Figure 6: Energy Cost Savings over the 2012 IECC code for Desuperheaters

Cost Effectiveness

Data available online documents the cost of equipment at \$500 with installation costs ranging from \$500-\$1000.^{7 8} An incremental cost of \$1250 has been assumed for both equipment and installation.

Figure 7: Life Cycle Costs over the 2012 IECC code for Desuperheaters

THIS IS A 3 PART CODE CHANGE. PARTS I AND II WILL BE HEARD BY THE IECC RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AS 2 SEPARATE CODE CHANGES. PART III WILL BE HEARD BY THE IRC-PM COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R403.4.1 (IRC N1103.4.1) ~~Circulating hot~~ Heated water circulation and temperature maintenance systems (Mandatory). ~~Circulating hot water systems shall be provided with an automatic or readily accessible manual switch that can turn off the hot water circulating pump when the system is not in use. Heated water circulation systems shall be in accordance with Section R403.4.1.1. Heat trace temperature maintenance systems shall be in accordance with Section R403.4.1.2. Automatic controls, temperature sensors and pumps shall be accessible. Manual controls shall be readily accessible.~~

R403.4.1.1 (IRC N1103.4.1.1) Circulation systems. Heated water circulation systems shall be provided with a circulation pump. The system return pipe shall be a dedicated return pipe or a cold water supply pipe. Gravity and thermo-siphon circulation systems shall be prohibited. Circulation system pump controls shall be demand activated. The controls shall start the pump upon sensing the presence of a user of a fixture or appliance, receiving a signal from the action of an action of a user of a fixture or appliance or sensing the flow of heated water to a fixture or appliance. The controls shall limit the water temperature increase in the return water piping to not more than 10°F (5.6 °C) greater than the initial temperature of the water in the return piping and shall limit the return water temperature to 102°F (38.9°C).

R403.4.1.2 (IRC N1103.4.1.2) Heat trace systems. Electric heat trace systems shall comply with IEEE 515.1. Controls for such systems shall be able to automatically adjust the energy input to the heat tracing to maintain the desired water temperature in the piping in accordance with the times when heated water is used in the occupancy.

Add new standards to Chapter 5 (IRC Chapter 44) as follows:

The Institute of Electrical and Electronic Engineers, Inc.
3 Park Avenue
New York, NY 1016-5997

IEEE

515.1-2012 IEEE Standard for the Testing, Design, Installation, and Maintenance of
Electrical Resistance Trace Heating for Commercial Applications

PART II-IPC

Revise as follows:

[E] 607.2.1 Hot Heated water circulation and temperature maintenance systems controls. For other than Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane, automatic circulating hot water system pumps or heat trace shall be arranged to be conveniently turned off, automatically or manually, when the hot water system is not in operation. Heated water circulation and temperature maintenance systems for Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane shall be in accordance with Section 607.2.1.1.

[E] 607.2.1.1 Group R2, R3 and R4 occupancies 3 stories or less. This section shall apply to Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane. Heated water circulation systems shall be in accordance with Section 607.2.1.1.1. Heat trace temperature maintenance systems shall be in accordance with Section 607.2.1.1.2. Access to automatic controls, temperature sensors and pumps shall be provided. Ready access to manual controls shall be provided.

[E] 607.2.1.1.1 Circulation systems. Heated water circulation systems shall be provided with a circulation pump. The system return pipe shall be a dedicated return pipe or a cold water supply pipe. Gravity and thermo-siphon circulation systems shall be prohibited. Circulation system pump controls shall be demand activated. The controls shall start the pump upon sensing the presence of a user of a fixture or appliance, receiving a signal from the action of an action of a user of a fixture or appliance or sensing the flow of heated water to a fixture or appliance. The controls shall limit the water temperature increase in the return water piping to not more than 10°F (5.6 °C) greater than the initial temperature of the water in the return piping and shall limit the return water temperature to 102°F (38.9°C).

[E] 607.2.1.1.2 Heat trace systems. Electric heat trace systems shall comply with IEEE 515.1. Controls for such systems shall be able to automatically adjust the energy input to the heat tracing to maintain the desired water temperature in the piping in accordance with the times when heated water is used in the occupancy.

Add standards to Chapter 14 as follows:

The Institute of Electrical and Electronic Engineers, Inc.
3 Park Avenue
New York, NY 1016-5997

IEEE

515.1-2012 IEEE Standard for the Testing, Design, Installation, and Maintenance of
Electrical Resistance Trace Heating for Commercial Applications

PART III-IRC

Add new text as follows:

SECTION P2905 **HEATED WATER DISTRIBUTION SYSTEMS**

P2905.1 Heated water systems. Heated water circulation and temperature maintenance systems shall be in accordance with Section N1103.4.1.

Reason: There are 2 primary reasons for this proposed change. 1) Correlate the language in the IECC, the IRC and the IPC; 2) Clarify the requirements for heated water circulation systems and for heat trace systems, if they are installed. The proposed changes do not require the use of circulation or heat trace.

The current code language is not the same in the IECC and the IPC. It should be. It should also be the same in the IRC since the heated water systems do not know what occupancy they are in.

The current language allows for continuously operating circulation pumps, which creates inefficiency in the hot water distribution system. It also does not address the use of heat trace in both codes and there is currently no requirement that the heat trace be suitable for the application. The consequence is that water heating energy consumption is increased.

Figure 1 shows that demand activated circulation is significantly more energy efficient than any other type of heated water circulation system. The annual energy needed to keep the loop hot with water heated electrically or with natural gas are shown separately from the energy needed for the pump. The majority of the energy is lost in keeping the water in the loop at the desired temperature (all of it if there is a gravity loop). A small loop, 100 feet including the supply and the return was analyzed. The savings ranges from 87.5 percent when compared to a recirculation system that runs only 2-hours per day to 99 percent when compared to a recirculation system that runs only 24-hours per day. The operating costs and savings remain proportional as the length of the circulation loop and the flow rate of the pump increase.

Figure 1 Annual Energy Requirements for Demand Activated Circulation and Standard Recirculation

	Standard Recirculation						Demand Activated Circulation
	Daily Hours of Operation						
	24	12	8	6	4	2	0.25
Loop Heat Losses							
Natural Gas (therms)	292	146	97	73	49	24	3
Electric (kWh)	6,388	3,194	2,129	1,597	1,065	532	67
Pump Energy (kWh)	438	219	146	110	73	37	8

Figure 2 shows the differences in run-time at the water heater (or boiler) between a continuously pumped recirculation loop and one that has a demand activated pump control. Blank space (white) means the water heater was off. Red means some percent of run-time between zero and continuous. Pink means the water heater or boiler was running continuously. The test results come from studies done by Southern California Gas Company on a sample of more than 300 multi-family buildings with central water heaters and recirculation systems. Most systems tested were built before insulation was required on hot water recirculation loops. Savings ranged from 10-30 percent of the water heating energy use and 84 percent of the pump electricity use. The costs for installing the retrofit were paid back in just about one year. In new construction, the marginal costs would be recovered in just a few months

Figure 2 Run-time of Water Heater with Two Different Pump Controls

Why is demand-activated circulation such an efficient strategy? The 2012 IECC, IPC and IRC require that the hot water piping in automatic temperature maintenance systems in new buildings be insulated with pipe insulation. This means the water in the circulation loop will stay hot for a very long time – up to 45 minutes for ¾ inch nominal pipe up to 2 hours for 2-inch nominal pipe – even if the circulating pump is shut off. If this is the case, why run the pump when the water is still hot? Why run the pump when no one is in the building or when no one is demanding hot water? The only time it makes sense to run the pump is shortly before hot water is needed: hence the requirement that the pump be controlled on-demand.

The requirements for heat trace are partly to ensure that the systems can be operated in the most energy efficient manner consistent with providing heated water to the occupancy. The reference standards are included to ensure that installed systems are safe for the intended application. The energy consequences of using heat trace are very reasonable. Figure 3 presents the energy requirements for a heat trace system with the same hot water supply piping as the circulation systems shown in Figure 1. The energy requirements of keeping the trunk line hot – the same as keeping the supply portion of the loop hot in a circulating system – are 701 kWh per year, assuming 12 hours at high temp (115F) and 12 hours at economy temp (105F). This is equivalent to

operating the loop about 3 hours per day, but with hot water available 24/7 in the supply trunk! This is a significant savings when water heating is done electrically or with a similarly expensive fuel. If the branches are also traced, we can deliver heated water even more quickly to the fixtures using only 1,682 kWh per year, which is the same energy as running the loop a little more than 6 hours a day.

Figure 3. Annual Energy Needed for Electric Heat Trace Systems

Heat Trace			
	(kWh per year)		
	Trunk	Br	T-Br
Supply Heat Losses			
High Temp	394	552	946
Economy Temp	307	429	736
Total Electricity	701	981	1,682

Cost impact: The proposal does not require either circulation or heat trace; however if either is selected, it clarifies the requirements for installation. Most recirculation systems today are installed with some form of control, usually a timer, a bandwidth thermostat (aquastat) or both. Some come with more sophisticated controls, such as programmable or are connected to an energy management system. In some cases, switching from these control strategies to demand activated controls will cost less. In other cases, the demand-activated controls will cost more.

Analysis: A review of the standards proposed for inclusion in the code, UL 515 and CSA 22.2 No 130-03 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

R403.4.1 #2-EC-KLEIN

RE126-13

R403.4.1 (IRC N1103.4.1)

Proponent: Eric Makela / Britt/Makela Group, Inc. representing Northwest Energy Codes Group
(Eric@BrittMakela.com)

Revise as follows:

R403.4.1 (N1103.4.1) Circulating hot water systems (Mandatory). Circulating hot water systems shall be provided with an automatic or readily accessible manual switch that can turn off the hot water circulating pump when the system is not in use equipped with a control system that controls the recirculation pump operation based on measurement of hot water demand and hot water return temperature.

Reason: The IECC has allowed the use of either manual or automatic controls for turning circulating pumps on and off for hot water recirculating systems. If manual controls are installed, the homeowner is responsible for turning the system on and off when needed. If not turned off, the pump will continue to circulate 120° to 140°F water through piping leading to pipe heat loss and also requiring the water heater to run longer to continue to bring the water up to temperature. Installing a time clock on the circulation pump is more dependable if set properly, but still can lead to losses in the piping and additional run time for the water heater with no benefit to the home owner if set to run when the occupants are not in the house. In addition to piping and water heating energy use, electricity to run the pump can also cost a few hundred dollars per year. Constant recirculation of hot water can also degrade piping. A study conducted by the California Energy Commission's Public Interest Energy Research demonstrated that hot water distribution systems lose significant amounts of energy. This is significant considering that water heating uses 31% of energy in a typical house.

Demand control is the best automatic control option and superior to both manual off and time clock controls. The design features will prevent the pump motor burning out due to an air pocket, which is a common failure. The demand controlled recirculation system matches the user's demand to the delivery of hot water. The user gets the hot water quickly when they want it. On demand pumps for water heating systems can potentially save \$2 billion dollars a year in existing single family homes and \$100 million in new construction. There is more potential for multi-family buildings. On demand systems prevent energy waste and mean less maintenance and repair costs over a standard recirculation system because the pump is only on when the occupant requires hot water.

This proposal will increase energy and water savings over a water heater circulation system with manual or automatic controls.

Cost Impact: The code change proposal will increase the cost of construction.

RE127-13

R403.4.2 (IRC N1103.4.2), IPC [E]607.5, IRC P2905 (New), IRC P2905.1 (New)

THIS IS A 3 PART CODE CHANGE. PARTS I AND II WILL BE HEARD BY THE IECC-RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AS 2 SEPARATE CODE CHANGES. PART III WILL BE HEARD BY THE IRC-PM COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Craig Conner, representing self (craig.conner@mac.com), Gary Klein, Affiliated International Management, LLC (gary@aim4sustainability.com)

PART I IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R403.4.2 (IRC N1103.4.2) Hot Heated water piping insulation (Prescriptive). Insulation for hot water pipe with a minimum thermal resistance (*R*-value) of *R*-3 shall be applied to the following: The following piping conveying water heated by a water heater shall have ~~be externally insulated with insulation with having a thermal resistance (*R*-value) of not less than *R*-3.~~ Pipe insulation shall be continuous except where piping passes through a framing member. Piping that is heat traced shall be insulated in accordance with the heat trace manufacturer's recommendations.

1. Piping larger than 3/4 inch (19 mm) nominal diameter.
2. Piping serving more than one dwelling unit.
3. Piping from the water heater to kitchen outlets.
4. Piping located outside the conditioned space.
- ~~5. Piping from the water heater to a distribution manifold.~~
- ~~6- 5. Piping located in or under a floor concrete slab.~~
- ~~7- 6. Piping that is buried in piping the earth.~~
- ~~8- 7. Supply and return piping in a heated water recirculation systems~~
- ~~8. Supply piping in other than a demand recirculation system.~~
- ~~9. Piping with run lengths greater than the maximum~~
~~— run lengths for the nominal pipe diameter given in~~
~~— Table 403.4.2.~~

All remaining piping shall be insulated to at least *R*-3 or meet the run length requirements of Table 403.4.2.

TABLE R403.4.2
MAXIMUM RUN LENGTH (feet)^a

Nominal Pipe Diameter of Largest Diameter Pipe in the Run (inch)	3/8	1/2	3/4	>3/4
Maximum Run Length	30	20	10	5

For SI: 1 inch=25.4 mm, 1 foot = 304.8 mm

a. Total length of all piping from the distribution manifold or the recirculation loop to a point of use.

PART II-IPC

Revise as follows:

[E] 607.5 Pipe insulation. Hot water piping in automatic temperature maintenance systems shall be insulated with 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h • ft² • °F (1.53 W per 25 mm/m² • K). The first 8 feet (2438 mm) of hot water piping from a *hot water* source that does not have heat traps shall be insulated with 0.5 inch (12.7 mm) of material having a conductivity not

exceeding 0.27 Btu per inch/h • ft² • °F (1.53 W per 25 mm/m² • K). This section does not apply to Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane. Piping in those occupancies shall be insulated in accordance with Section R403.4.2 of the *International Energy Conservation Code*.

Part III – IRC-P

Add new text as follows:

SECTION P2905 HEATED WATER DISTRIBUTION SYSTEMS

P2905.1 Insulation of piping required. Piping conveying water heated by a water heater shall be externally insulated in accordance with Section N1103.4.2.

Reason:

PART I-IECC-RE

Several changes in terminology are included in this proposal. The phrase “water heated by a water heater” was used instead of “hot water” because the IECC does not have a definition for “hot water”. The “hot water” definition found in the IRC and the IPC says water of a temperature 110F or greater. Therefore, the code would not clear about insulation requirements for any piping if the code user stated they intended to set the water heater temperature to 108F. The phrase “water heated by a water heater” clarifies the code.

Items 6, 7 and 8 in the list were clarified. The requirements were not changed.

The first 8 items listed above describe situations where there are more likely to be repeated flows of heated water within less than an hour, or where the piping is in a more harsh environment, such as outside; both cases where the insulation is of more value. In most other situations, there is extended time between hot water draws so that the pipe and the insulation is of limited value.

Item #5 concerning “distribution manifolds” is struck because it is difficult to define “distribution manifold”, because the important piping is probably covered in other items, and because a “distribution manifold” on a line that is seldom used does not make sense to insulate.

Item 9 and the Table were deleted, as these applications of insulation are of limited value. When the supply pipes are located in room temperature air (65-70F), the largest value in pipe insulation comes when it allows heated water to be retained from one use to the next use in the pipes, as subsequent uses do not have to begin with the cooled off water in the pipes. The time spent waiting for hot water is the time it takes to empty the cool water in the pipe and move the hot water to the point of use. After use the water in that pipe cools down and another fill of the pipe with hot water is required for the next use. Pipe insulation saves energy where the pipe has multiple hot water draws within a period of 10 to 60 minutes. Pipe insulation also saves energy by reducing the temperature drop from the water heater to the fixtures; this is a couple of degrees in room temperature air; much more in more adverse environments. The line from the hot water supply to the kitchen is by far the most valuable to insulate due to the high likelihood of multiple hot-water draws in a short time period.

Removing item 9 and Table R403.2 eliminates the need to measure pipe lengths.

PART II – IPC

Normally, the IPC covers plumbing in commercial buildings. However, because the Residential Provisions of the IECC covers R2, R3 and R4 buildings that are 3 stories or less above grade, a ‘pointer’ in the IPC is added to alert the plumbing installer of Group R2, R3 and R4 piping insulation requirements. The installer then knows to allow sufficient space to accommodate the pipe insulation.

PART III – IRC

A new section is added in Chapter 29 of the IRC to alert the plumbing installer that the heated water piping installation includes insulating the piping system. The installer then knows to allow sufficient space to accommodate the insulation.

Cost Impact: The code change proposal will not increase the cost of construction.

R403.4.2-EC-CONNER-KLEIN.DOC

RE128-13

R403.4.2 (IRC N1103.4.2), Table R403.4.2 (IRC Table N1103.4.2)

Proponent: Brian Dean, Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; and Bill Prindle, Energy Efficient Codes Coalition.

Revise as follows:

R403.4.2 (N1103.4.2) Hot water pipe insulation (Prescriptive). Insulation for hot water piping with a minimum thermal resistance (*R*-value) of R-3 shall be applied to the following:

1. Piping larger than 3/4 inch nominal diameter.
2. Piping serving more than one dwelling unit.
3. Piping from the water heater to kitchen outlets.
4. Piping located outside the conditioned space.
5. Piping from the water heater to a distribution manifold.
6. Piping located under a floor slab.
7. Buried piping.
8. Supply and return piping in recirculation systems other than demand recirculation systems.
9. Piping with run lengths greater than the ~~maximum~~ run length limits for pipes without R-3 insulation for the nominal pipe diameter ~~given~~ in Table R403.4.2.

~~All remaining piping shall be insulated to at least R-3 or meet the run length requirements of Table R403.4.2.~~

TABLE R403.4.2 (N1103.4.2)
MAXIMUM RUN LENGTH LIMITS FOR PIPING WITHOUT R-3 INSULATION (feet)^a

Nominal Pipe Diameter of Largest Diameter Pipe in the Run (inch)	3/8	1/2	3/4	≥ 3/4
Maximum Run Lengths Limit (feet)	30	20	10	5

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm

a. Total length of all piping from the distribution manifold or the recirculation loop to a point of use.

Reason: The purpose of this code change is to simplify and clarify the code and clear up potentially confusing language. The proposal does not change the stringency of the requirements. Specifically, the proposal:

- removes duplicative, confusing language from Section R403.4.2 and Table R403.4.2;
- clarifies the requirements for pipe in excess of ¾ inch in diameter, which are always required to be insulated and therefore there is no applicable limit on length; and
- eliminates the use of the word “maximum” related to pipe lengths in the table, which may be read to limit all pipe lengths, when the code provision is intended to only limit pipe lengths where the piping is not fully insulated to R-3.

Cost Impact: The code change proposal will not increase the cost of construction.

R403.4.2 (IRC N1103.4.2), Table R403.4.2 (IRC Table N1103.4.2), IPC [E]607.5, IRC P2905 (NEW)

THIS IS A 3 PART CODE CHANGE PROPOSAL. PARTS I AND II WILL BE HEARD BY THE IECC-RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AS TWO SEPARATE PROPOSALS. PART III WILL BE HEARD BY THE IRC-MP COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Gary Klein, Affiliated International Management, LLC, representing self, (gary@aim4sustainability.com)

PART I – IECC-RESIDENTIAL PROVISIONS

Revise as follows:

R403.4.2 (IRC N1103.4.2) ~~Hot-Heated~~ water pipe insulation (Prescriptive). Piping conveying water heated by a water heater shall be insulated. The insulation shall have a thermal resistance (*R-value*) of not less than R-3 or where tubular pipe insulation is used for insulating piping, the thermal conductivity, k , of such insulation shall be not greater than 0.28 Btu per inch/h•ft² • F [0.40 W/(m•K)] for water temperatures less than or equal to 140°F (60°C) and not greater than 0.29 Btu per inch/h•ft² • F [0.42 W/(m•K)] for water temperatures greater than 140°F (60°C) and less than or equal to 200°F (93.3°C). Tubular pipe insulation shall be installed in accordance with the insulation manufacturer's instructions. Pipe insulation shall be continuous except where the piping passes through a framing member. The minimum insulation thickness requirements of this section shall not supersede any greater insulation thickness requirements necessary for the protection of piping from freezing temperatures or the protection of personnel against external surface temperatures on the insulation. ~~Insulation for hot water pipe with a minimum thermal resistance (*R-value*) of R-3 shall be applied to the following:~~

- ~~1. Piping larger than 3/4 inch (19 mm) nominal diameter.~~
- ~~2. Piping serving more than one dwelling unit.~~
- ~~3. Piping from the water heater to for kitchen outlets.~~
- ~~4. Piping located outside the conditioned space.~~
- ~~5. Piping from the water heater to a distribution manifold.~~
- ~~6. Piping located under a floor slab.~~
- ~~7. Buried in piping.~~
- ~~8. Supply and return piping in recirculation systems other than demand recirculation systems.~~
- ~~9. Piping with run lengths greater than the maximum run lengths for the nominal pipe diameter given in Table 403.4.2.~~

All remaining piping shall be insulated to at least R-3 or meet the run length requirements of Table 403.4.2.

**TABLE R403.4.2 (N1103.4.2)
MAXIMUM RUN LENGTH (feet)^a**

Nominal Pipe Diameter of Largest Diameter Pipe in the Run (inch)	3/8	1/2	3/4	>3/4
Maximum Run Length	30	20	10	5

For SI: 1 inch=25.4 mm, 1 foot=304.8 mm

a. Total length of all piping from the distribution manifold or the recirculation loop to a point of use.

Exceptions: Insulation shall not be required to be installed on the following:

1. Flexible connectors or reduced sized fixture supply tubing from the connection at the end of the fixture supply piping to a fixture fitting.
2. Valves, pumps and threaded unions in heated water piping.
3. Piping from shower and bath mixing valves to the water outlets.
4. Cold water piping that receives heated water as part of a water recirculation system that does not have a dedicated return pipe to the water heater.
5. Tubing from hot drinking-water heating units to the water outlet.
6. Piping at locations where a vertical support of the piping is installed.
7. Piping or tubing from a tankless water heater serving only one fixture.

TABLE R403.4.2 (N1103.4.2)
TUBULAR INSULATION WALL THICKNESS

NOMINAL PIPE OR TUBE DIAMETER (inches)	MINIMUM INSULATION WALL THICKNESS (inches)	
	≤140 °F WATER TEMPERATURE	>140 °F to 200°F WATER TEMPERATURE
≤3/8	3/8	3/8
> 3/8 to <3/4	1/2	1/2
> 3/4 to <1	3/4	1
≥1 to <1 1/2	1	1 1/2
≥1 1/2 to <4	1 1/2	2
≥4 to <8	1 1/2	2
≥8	1 1/2	2

For SI: 1 inch = 25.4 mm; °C = [(°F – 32)]/1.8

PART II-IPC

Revise as follows:

[E] 607.5 Pipe Insulation of piping. Hot water piping in automatic temperature maintenance systems shall be insulated with not less than 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h • ft² • °F (1.53 W per 25 mm/m² • K). The first 8 feet (2438 mm) of hot water piping from a hot water source that does not have heat traps shall be insulated with 0.5 inch (12.7 mm) of material having a conductivity not exceeding 0.27 Btu per inch/h • ft² • °F (1.53 W per 25 mm/m² • K). For other than Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane, piping to the inlet of a water heater and piping conveying water heated by a water heater shall be insulated in accordance with Sections C404.5 of the *International Energy Conservation Code*. For Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane, piping to the inlet of a water heater and piping conveying water heated by a water heater shall be insulated in accordance with Section R403.4.2 of the *International Energy Conservation Code*.

PART III – IRC-P

Add new text as follows:

SECTION P2905 **HEATED WATER DISTRIBUTION SYSTEMS**

P2905.1 Insulation of piping required. Piping conveying water heated by a water heater shall be insulated in accordance with Section N1103.4.2.

Reason: PART I-IECC The current requirements as to where pipe insulation must be installed and the run length allowance where insulation *doesn't* have to be installed, are much too complex for most installers to comprehend. Think of trying to explain the current run length allowance to the typical person that ends up performing this type of work. It also requires too much thinking on the part the inspector when the inspector is facing a plumbing system that has some hot water piping insulated and some not. The insulation requirement needs to be simple – just insulate all of the hot water piping. The minor amount of savings by not insulating

some lengths of hot water piping is overshadowed by confusion/time wasted in the field and the significant potential of not getting it correct (and failing an inspection).

The phrase "water heated by a water heater" was used instead of "hot water" because the IECC does not have a definition for hot water. Code users could refer to the definition found in the IRC and the IPC for hot water which says water of a temperature 110F or greater. However, an installer *could* try to justify not installing insulation on any piping with the claim that they intended to set the water heater temperature at 108F. This is not the intent of the existing language and by using the phrase "water heated by a water heater", this loophole will be closed.

The description of the required insulation is expanded. Where tubular pipe insulation is used, that material does not have an R value rating. The equivalent R value must be calculated. And while some submittal specification sheets show the equivalent R-value for each wall thickness, some do not. And how often does a submittal sheet show up on a jobsite? Tubular pipe insulation is specified in wall thickness and k value. The k value in this code section covers the most commonly used insulation materials for this application. To keep it simple – Table R403.4.2 is provided to show the required wall thicknesses that closely approximates a R value of R-3 for the two most common types of pipe insulation materials. This takes the calculations out of the picture to make it simple for installers and inspectors.

The option for insulating piping with materials that are R-value rated was left in this section because it is sometimes possible to "encapsulate" piping within wall or ceiling insulation without the need for installing tubular pipe insulation. Where piping is properly "nested" into fiberglass batts in walls or is covered with spray-in foam systems, the installation of tubular pipe insulation is a waste of time and money. This option needs to remain to allow these alternate cost savings methods to be used.

The last sentence "Pipe insulation shall be continuous along all piping." is intended to prohibit a common practice of just insulating piping up to where the piping enters and exits a structural member. For example, a pipe that runs vertically through the bottom plate of a wall or through a joist needs to be insulated continuously through those members in order for the insulated piping system to be effective in reducing energy loss.

The exceptions are added to this section to clarify where "piping insulation" is not required. Most items are common sense. Valves and pumps are difficult to insulate and the benefit of such effort is minimal. Let's keep it simple and easy.

PART II– IPC

The text that is struck out in IPC 607.5 is replaced with text that points the appropriate sections on the IECC that cover insulation.

Normally, the IPC only covers plumbing in commercial buildings. However, because the residential chapters in the IECC covers R2, R3 and R4 occupancy buildings that are 3 stories or less above grade plane in height *and* these occupancies are not covered by the plumbing chapter in the IRC, there needs to be a 'pointer section' in the IPC to alert the plumbing installer that there are piping insulation requirements in the residential provisions of the IECC that apply. Of primary concern are for allowing sufficient space around the piping (such as in wall cavities) and properly sizing holes through structural members to accommodate the insulation.

PART III – IRC

A new section is added in Chapter 29 of the IRC to alert the plumbing installer that the heated water piping installation must allow for insulating of the piping system. Of primary concern are for allowing sufficient space around the piping (such as in wall cavities) and properly sizing holes through structural members to accommodate the insulation.

Cost Impact: None.

R403.4.2-EC-KLEIN

RE130-13

R403.4.2 (IRC N1103.4.2)

Proponent: Edward R. Osann, Natural Resources Defense Council, on behalf of self (eosann@nrdc.org)

Revise as follows:

R403.4.2 (N1103.4.2) Hot water pipe insulation (Prescriptive). Insulation for hot water pipe with a minimum thermal resistance (*R*-value) of R-3 shall be applied to the following:

1. Piping larger than $\frac{3}{4}$ inch nominal diameter.
2. Piping serving more than one dwelling unit.
3. Piping from the water heater to kitchen outlets.
4. In occupancies with three or more bedrooms, piping from the water heater or recirculation system piping to the outlet for any shower or tub/shower combination.
45. Piping located outside the conditioned space.
56. Piping from the water heater to a distribution manifold.
67. Piping located under a floor slab.
78. Buried piping.
89. Supply and return piping in recirculation systems other than demand recirculation systems.
910. Piping with run lengths greater than the maximum run lengths for the nominal pipe diameter given in Table R403.4.2.

All remaining piping shall be insulated to at least R-3 or meet the run length requirements of Table R403.4.2.

Reason: Every adult in the United States has experienced the waiting time for water that is hot enough to step into the shower. Most do so on a regular basis, and often for a minute or more. While cold or tepid water in the initial draw from a hot water outlet serving a clothes washer, dishwasher, or lavatory sink may be usable for its intended purpose, cold or tepid water for showering is routinely purged, a waste of water, energy, and time. Pipe insulation significantly reduces heat loss and helps to ensure that hot water gets to the shower sooner. During showering, pipe insulation keeps the water hotter by reducing the temperature drop from the source of hot water to the shower outlet. This saves significant energy by making it possible to reduce the set point for the storage temperature at the hot water heater. Every 1°F reduction in hot water storage temperature reduces standby heat losses by almost 2%. During the cool-down phase, pipe insulation increases the time it takes for the temperature of the water to cool down, roughly doubling the cool-down time for $\frac{1}{2}$ inch nominal pipe and tripling it for $\frac{3}{4}$ inch nominal pipe. This saves energy, water, and time for all those hot water events, including showers, that are clustered between 10 and 45 minutes apart, as when occupants are getting ready for work and school in the AM.

Cost Impact: This code change proposal will increase the cost of construction only to the extent that all or a portion of the pipe run to a shower would not already require insulation under the existing requirements of Section R403.4.2. For example, under the current language of this section, hot water pipe running in an unconditioned crawl space or attic is required to be insulated. Pipe running from a water heater to a distribution manifold is also required to be insulated, while up to 20 feet of $\frac{1}{2}$ inch supply piping from a manifold to an end use such as a shower may be uninsulated. At an estimated cost of materials, labor, and profit of \$1.10 to \$1.50 per linear foot for installing foam insulation¹, the cost of insulating 20 feet of $\frac{1}{2}$ inch supply piping would be \$22 to \$30. Klein, Gary, "Cost Estimation for Materials and Installation of Hot Water Piping Insulation," prepared for Pacific Northwest National Laboratory, June 2012, accessible at <<http://bc3.pnnl.gov/wiki/index.php/Downloads>>.

R403.4.2-EC-OSANN.DOC

RE131-13

R403.4.2 (IRC N1103.4.2)

Proponent: Edward R. Osann, on behalf of Natural Resources Defense Council; Ryan Meres, on behalf of Institute for Market Transformation.(eosann@nrdc.org)

Revise as follows:

R403.4.2 (N1103.4.2) Hot water pipe insulation (Prescriptive Mandatory). Insulation for hot water pipe with a minimum thermal resistance (*R*-value) of R-3 shall be applied to the following:

1. Piping larger than $\frac{3}{4}$ inch nominal diameter.
2. Piping serving more than one dwelling unit.
3. Piping from the water heater to kitchen outlets.
4. Piping located outside the conditioned space.
5. Piping from the water heater to a distribution manifold.
6. Piping located under a floor slab.
7. Buried piping.
8. Supply and return piping in recirculation systems other than demand recirculation systems.
9. Piping with run lengths greater than the maximum run lengths for the nominal pipe diameter given in Table R403.4.2.

All remaining piping shall be insulated to at least R-3 or meet the run length requirements of Table R403.4.2.

Reason: The 2012 edition of the IECC added this prescriptive section on hot water pipe insulation, containing a list of 9 factors or locations that require pipe to be insulated to R-3. However, because it is prescriptive and not mandatory, it is not required in any project that opts for the performance approach. Unfortunately, while the 2012 IECC performance approach allows credit for improving the efficiency of the hot water heat source, no credit is available for features of the hot water distribution system that might actually reduce the amount of hot water used, such as those listed in R403.4.2. (The HERS rating system is similarly drawn, offering no credit for hot water pipe insulation.) Thus, although hot water pipe insulation is known to save significant amounts of energy over the life of the building, the energy savings cannot be "scored" or accumulated within the performance framework of the code. Section R403.4.2 cannot contribute to compliance under the IECC performance approach, and is thus likely to be ignored. For these energy savings to be realized in all new residential buildings covered by the IECC, R403.4.2 should be mandatory instead of prescriptive. If and when Section R405 is modified to ensure that the performance path will account for the energy attributes of the hot water distribution system, consideration can be given to removing the mandatory designation from some or all portions of R403.4.2.

As was noted by the original proponents of Section R403.4.2, insulation of hot water piping reduces the waste of energy, water, and time during the delivery, use, and cool-down phases of a hot water event. During the delivery phase, when the piping runs in unconditioned spaces, in a slab, when it is buried or when the flow rate is very low (less than 1 gpm), pipe insulation significantly reduces the heat loss and helps to ensure that hot enough water gets to the outlets. During the cool-down phase, pipe insulation increases the time it takes for the temperature of the water to cool down, roughly doubling the cool-down time for $\frac{1}{2}$ inch nominal pipe and tripling it for $\frac{3}{4}$ inch nominal pipe. This saves energy, water and time for all those hot water events that are clustered between 10 and 45 minutes apart, as when occupants are getting ready for work and school in the morning and during evening activities such as preparing and cleaning up from supper and getting ready for bed, as well as lunchtime when people are home during the day.

As hot water is being used, pipe insulation keeps the water hotter by reducing the temperature drop from the source of hot water to the outlet. This saves additional energy by making it possible to reduce the set point for storage temperature at the hot water heater. Every 1°F reduction in hot water storage temperature reduces standby heat losses by almost 2%.

Cost Impact: This code change proposal will not increase the cost of construction for builders following the prescriptive approach, i.e., the majority of all builders. For those following the performance path, pipe insulation will be an added cost. A recent estimate¹ of the cost of insulating hot water piping with R-3 foam insulation is \$1.10 to \$1.50 per linear foot, including labor, materials, and profit for the plumbing subcontractor. The cost of insulating all hot water piping in a 2400 ft² home was estimated by the same study to be \$135 to \$325, depending on building configuration. It should be noted that these estimates are based on insulation of *all* hot water piping in the home, which is more than is required by Section R403.4.2. Thus the actual impact on the cost of construction should be somewhat less than this range in most cases.

¹Klein, Gary, "Cost Estimation for Materials and Installation of Hot Water Piping Insulation," prepared for Pacific Northwest National Laboratory, June 2012, accessible at <<http://bc3.pnnl.gov/wiki/index.php/Downloads>>.

R403.4.2-EC-OSANN.DOC

RE132-13

R403.4.2 (IRC N1103.4.2), Table R403.4.2 (IRC Table N1103.4.2)

Proponent: Don Surrena, CBO, National Association of Home Builders (NAHB) (dsurrena@nahb.org)

Revise as follows:

R403.4.2 (N1103.4.2) Hot water pipe insulation (Prescriptive). Insulation for hot water pipe with a minimum thermal resistance (*R*-value) of R-3 shall be applied to the following:

1. Piping larger than 3/4 inch nominal diameter.
2. Piping serving more than one dwelling unit.
- ~~3. Piping from the water heater to kitchen outlets.~~
- ~~43. Piping located outside the conditioned space.~~
- ~~54. Piping from the water heater to a distribution manifold.~~
- ~~65. Piping located under a floor slab.~~
- ~~76. Buried piping.~~
- ~~87. Supply and return piping in recirculation systems other than demand recirculation systems.~~
- ~~9. Piping with run lengths greater than the maximum run lengths for the nominal pipe diameter — given in Table R403.4.2.~~

All remaining piping shall be insulated to at least R-3 or meet the run length requirements of Table R403.4.2.

TABLE R403.4.2 (N1103.4.2)
MAXIMUM RUN LENGTH (feet)^a –

Nominal Pipe Diameter of Largest Diameter Pipe in the Run (inch)	3/8	1/2	3/4	≥ 3/4
Maximum Run Length	30	20	10	5

Reason: Research has been performed by a two different sources that indicate insulating hot water piping in a residential home is not cost effective. The NAHB Research Center performed a study in 2010 that concluded, based on a low cost estimate that the simple payback for insulating hot water piping was in the 60 to 100 year range based on the piping material. Additionally, a 2009 study presented by the National Renewable Energy Lab at the ASME 3rd International Conference of Energy Sustainability estimated paybacks between 72 and 183 years for various insulation configurations.

First cost, as determined in the NAHB Research Center report varied between \$500 and \$1,200. The NREL report had a slightly smaller house with an estimated installation cost of \$366.

The simulations demonstrate that the benefit of insulation is greatest when all of the hot water uses are spaced apart from 10 to 30 minutes; however, this is not typically how hot water is consumed in a home. The benefit of insulation is diminished with shorter and longer time between uses.

It was shown in the study that pipes located in colder locations such as an unconditioned crawl space, benefit more from pipe insulation than pipes located in more conditioned spaces. This is why the insulation requirement was not changed for hot water pipes outside conditioned space.

Plastic pipe was shown to have less loss than copper pipe and commensurately insulation is more beneficial on metal pipe than on plastic pipe. However, copper pipe is losing market share and currently is only being installed in 14% of new homes.

Hendron, R. Burch, J. Hoeschele, M. Rainer, L. (2009), *Potential for Energy Savings Through Residential Hot Water Distribution System Improvements*, Proceedings of the 3rd International Conference on Energy Sustainability

Cost Impact: The code change proposal will not increase the cost of construction.

RE132-13

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

R403.4.2-EC-SURRENA.DOC

RE133-13

R403.4.2 (IRC N1103.4.2)

Proponent: Jeremiah Williams, U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

R403.4.2 (N1103.4.2) Hot water pipe insulation (Prescriptive). Insulation for hot water pipe with a minimum thermal resistance (*R*-value) of R-3 shall be applied to the following:

- ~~1. Piping larger than 3/4 inch nominal diameter.~~
- ~~2. 1. Piping serving more than one dwelling unit.~~
- ~~3. 2. Piping from the water heater to kitchen outlets.~~
- ~~4. 3. Piping located outside the conditioned space.~~
- ~~5. 4. Piping from the water heater to a distribution manifold.~~
- ~~6. 5. Piping located under a floor slab.~~
- ~~7. 6. Buried piping.~~
- ~~8. 7. Supply and return piping in recirculation systems other than demand recirculation systems.~~
- ~~9. 8. Piping with run lengths greater than the maximum run lengths for the nominal pipe diameter given in Table R403.4.2.~~

All remaining piping shall be insulated to at least R-3 or meet the run length requirements of Table R403.4.2.

Reason: Insulation requirements for ¾-in piping are currently inconsistent between the list in Section R403.4.2 and Table R403.4.2. Eliminating the list item eliminates the ambiguity.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R403.4.2-EC-WILLIAMS.DOC

RE134-13

Table R403.4.2 (IRC Table N1103.4.2)

Proponent: Edward R. Osann, Natural Resources Defense Council, on behalf of self.
(eosann@nrdc.org)

Revise as follows:

TABLE R403.4.2 (N1103.4.2)
MAXIMUM RUN LENGTH (feet)^a

Nominal Pipe Diameter of Largest Diameter Pipe in the Run (inch)	$\frac{3}{8}$	$\frac{1}{2}$	$\frac{5}{8}$	$\frac{3}{4}$	$> \frac{3}{4}$
Maximum Run Length	30	20	<u>15</u>	10	5

For SI: 1 inch = 25.4 mm, 1 foot 304.8 mm.

a. Total length of all piping from the distribution manifold or the recirculation loop to a point of use.

Reason: This proposal adds $\frac{5}{8}$ inch pipe to Table R403.4.2 to encourage plumbing system designers and installers to consider opportunities to use $\frac{5}{8}$ inch pipe in hot water applications where the capacity provided by $\frac{1}{2}$ inch pipe is inadequate but $\frac{3}{4}$ inch pipe may not be necessary. The maximum uninsulated run length proposed is proportional to the length limits currently in the table for $\frac{1}{2}$ inch and $\frac{3}{4}$ inch pipe. Where system configurations allow $\frac{5}{8}$ inch pipe to be used in lieu of $\frac{3}{4}$ inch pipe, both energy and water will be saved by reducing the volume of water standing in the pipe subject to cool-down between draws.

Cost Impact: This code change proposal provides a design option and will not increase the cost of construction.

RE134-13

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

R403.4.2T #1-EC-OSANN.DOC

RE135-13

Table R403.4.2 (IRC Table N1103.4.2)

Proponent: Edward R. Osann, Natural Resources Defense Council, on behalf of self.
(eosann@nrdc.org)

Revise as follows:

TABLE R403.4.2 (N1103.4.2)
MAXIMUM RUN LENGTH (feet)^a

Nominal Pipe Diameter of Largest Diameter Pipe in the Run (inch)	$\frac{3}{8}$	$\frac{1}{2}$	$\frac{3}{4}$	$\geq \frac{3}{4}$
Maximum Run Length	30	20	10	5

For SI: 1 inch = 25.4 mm, 1 foot 304.8 mm.

a. Total length of all piping from the distribution manifold or the recirculation loop to a point of use.

Reason: Section R403.4.2 is intended to save energy, water, and time for future occupants by requiring domestic hot water piping to be insulated where savings are likely to be greatest. The text of Section R403.4.2 currently provides that *all* hot water piping larger than $\frac{3}{4}$ inch diameter must be insulated:

"Insulation for hot water pipe with a minimum thermal resistance (*R*-value) of R-3 shall be applied to the following:

1. Piping larger than $\frac{3}{4}$ inch nominal diameter.

* * * * *

9. Piping with run lengths greater than the maximum run lengths for the nominal pipe diameter given in Table R403.4.2.

All remaining piping shall be insulated to at least R-3 or meet the run length requirements of Table R403.4.2."

Table R403.4.2 is intended to identify lengths of pipe of various nominal diameters that may remain uninsulated when running from a distribution manifold or recirculation loop to a point of use. Although Table R403.4.2 is not set out as an exception to the text of this section, the last column of the table can be read to allow for pipe greater than $\frac{3}{4}$ inch to be uninsulated if it is part of a run of up to 5 feet from a manifold or recirculation loop. The last column of the table is at best ambiguous, at worst contradictory. This proposal will resolve this ambiguity by removing pipe greater than $\frac{3}{4}$ inch from the table, reaffirming that all hot water pipe of this dimension must be insulated as per item (1) of Section R403.4.2.

Cost Impact: This code change proposal will not increase the cost of construction, except where the current language may be interpreted to allow for certain hot water pipe runs of up to 5 feet to remain uninsulated. At an estimated cost of materials, labor, and profit of \$1.10 to \$1.50 per linear foot of foam insulation installed, the additional cost for each such run would be in the range of five to seven dollars.

R403.4.2T #2-EC-OSANN.DOC

RE136-13

R403.4.2 (NEW) (IRC N1103.4.2 (NEW)), IPC 202, IPC [E]607.2.1.1 (NEW), IRC P2905 (NEW), IRC P2905.1 (NEW)

THIS IS A 3 PART CODE CHANGE PROPOSAL. PARTS I AND II WILL BE HEARD BY THE IECC-RESIDENTIAL ENERGY CONSERVATION CODE DEVELOPMENT COMMITTEE AS 2 SEPARATE CODE CHANGES. PART III WILL BE HEARD BY THE IRC-PM COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Gary Klein, Affiliated International Management, LLC, representing self, gary@aim4sustainability.com

PART I – IECC-RESIDENTIAL PROVISIONS

Add new text as follows:

R403.4.2 (IRC N1101.4.2) Demand recirculation systems. A water distribution system having one or more recirculation pumps that pump water from a heated water supply pipe back to the heated water source through a cold water supply pipe shall be a *demand recirculation water system*. Pumps shall have controls that comply with both of the following:

1. The control shall start the pump upon receiving a signal from the action of a user of a fixture or appliance, sensing the presence of a user of a fixture or sensing the flow of hot or tempered water to a fixture fitting or appliance.
2. The control shall limit the water temperature increase in the cold water piping to not more than 10°F (5.6 °C) greater than the initial temperature of the water in the piping and limits the temperature entering the cold water piping to 102°F (38.9 °C).

PART II – IPC

Add new definition as follows:

DEMAND RECIRCULATION WATER SYSTEM. A water distribution system where one more pumps prime the service hot water piping with heated water upon demand for hot water.

Add new text as follows:

[E] 607.2.1.1 Demand recirculation controls. This section shall apply only to Group R2, R3 and R4 occupancies that are 3 stories or less in height above grade plane. A water distribution system having one or more recirculation pumps that pump water from a heated water supply pipe back to the heated water source through a cold water supply pipe shall be a *demand recirculation water system*. Pumps shall have controls that comply with both of the following:

1. The control shall start the pump upon receiving a signal from the action of a user of a fixture or appliance, sensing the presence of a user of a fixture or sensing the flow of hot or tempered water to a fixture fitting or appliance.
2. The control shall limit the water temperature increase in the cold water piping to not more than 10°F (5.6 °C) greater than the initial temperature of the water in the piping and limits the temperature entering the cold water piping to 102°F (38.9 °C).

PART III – IRC-P

Add new text as follows:

SECTION P2905 **HEATED WATER DISTRIBUTION SYSTEMS**

P2905.1 Demand recirculation systems. *Demand recirculation water systems shall be in accordance with Section N1103.4.2.*

Reason: The purpose of this code change proposal is to clarify the requirements for installing circulation pumps in applications that use a cold water supply pipe to circulate the water back to the water heater. Demand recirculation water systems are significantly more energy efficient than other recirculation systems and are inherently safer when the cold water supply is used as the return.

Figure 1 shows that demand activated circulation is significantly more energy efficient than any other type of heated water circulation system. The annual energy needed to keep the loop hot with water heated electrically or with natural gas are shown separately from the energy needed for the pump. The majority of the energy is lost in keeping the water in the loop at the desired temperature (all of it if there is a gravity loop). A small loop, 100 feet including the supply and the return was analyzed. The savings ranges from 87.5 percent when compared to a recirculation system that runs only 2-hours per day to 99 percent when compared to a recirculation system that runs only 24-hours per day. The operating costs and savings remain proportional as the length of the circulation loop and the flow rate of the pump increase.

Figure 1 Annual Energy Requirements for Demand Activated Circulation and Standard Recirculation

	Standard Recirculation						Demand Activated Circulation
	Daily Hours of Operation						
	24	12	8	6	4	2	0.25
Loop Heat Losses							
Natural Gas (therms)	292	146	97	73	49	24	3
Electric (kWh)	6,388	3,194	2,129	1,597	1,065	532	67
Pump Energy (kWh)	438	219	146	110	73	37	8

The inherently better safety comes from the fact that the controls specified for demand recirculation water systems limit the flow of water from the hot water supply into the cold water supply to only minutes a day and because they limit the temperature of the water that is allowed to go into the cold water supply. There are five other control strategies for heated water recirculation systems (thermosiphon (gravity), continuous pumping, timer controlled, bandwidth temperature sensor (aquastat) controlled and a combination of timer and bandwidth temperature sensor (aquastat) controlled and none of them has the ability to meet these stringent requirements.

The requirements of this section should be identical in both the IECC and the IPC, since the language for the controls does not depend on occupancy

For more information and background on issues related to hot water distribution and for a more detailed analysis in support of this proposal please go to <http://www.aim4sustainability.com> Follow the link on the home page to Codes.

Cost impact: This proposal will not increase the cost of construction, as it does not require the use of demand recirculation water systems. In addition, the ability to use cold-water supply piping as a return pipe may reduce the cost of installing a circulation loop.

Proponent: Gary Klein, Affiliated International Management, LLC, representing self,
(gary@aim4sustainability.com)

PART I-IECC RESIDENTIAL PROVISIONS

Add new text as follows:

R403.4.2 (IRC N1103.4.2) Efficient heated water supply piping. Heated water supply piping shall be in accordance with Section R403.4.2.1 or Section R403.4.2.2. The flow rate through ¼ inch piping shall not exceed 0.5 gpm (1.9 Lpm). The flow rate through 5/16 inch piping shall not exceed 1 gpm (3.8 Lpm). The flow rate through 3/8 inch piping shall not exceed 1.5 gpm (5.7 Lpm).

R403.4.2.1 (IRC N1103.4.2.1) Maximum allowable pipe length method. The maximum allowable piping length from the nearest source of heated water to the termination of the fixture supply pipe for *plumbing fixtures* and *plumbing appliances* shall be in accordance with the maximum piping length columns in Table R403.4.2.1. Where the piping contains more than one size of pipe, the largest size of pipe within the piping shall be used for determining the maximum allowable length of the piping in Table R403.4.2.1.

**TABLE R403.4.2.1 (IRC TABLE N1103.4.2.1)
PIPING VOLUME AND MAXIMUM PIPING LENGTHS**

<u>NOMINAL PIPE SIZE (inch)</u>	<u>VOLUME (liquid ounces per foot length)</u>	<u>MAXIMUM PIPING LENGTH (feet)</u>	
		<u>WATER FROM A WATER HEATER</u>	<u>WATER FROM A RECIRCULATION LOOP OR HEAT TRACED PIPE</u>
<u>1/4</u>	<u>0.33</u>	<u>50</u>	<u>50</u>
<u>5/16</u>	<u>0.5</u>	<u>50</u>	<u>48</u>
<u>3/8</u>	<u>0.75</u>	<u>50</u>	<u>32</u>
<u>1/2</u>	<u>1.5</u>	<u>43</u>	<u>16</u>
<u>5/8</u>	<u>2</u>	<u>32</u>	<u>12</u>
<u>3/4</u>	<u>3</u>	<u>21</u>	<u>8</u>
<u>7/8</u>	<u>4</u>	<u>16</u>	<u>6</u>
<u>1</u>	<u>5</u>	<u>13</u>	<u>5</u>
<u>1 ¼</u>	<u>8</u>	<u>8</u>	<u>3</u>
<u>1 ½</u>	<u>11</u>	<u>6</u>	<u>2</u>
<u>2 or larger</u>	<u>18</u>	<u>4</u>	<u>1</u>

1 Gallon = 128 ounces. For SI: 1 inch=25.4 mm, 1 foot = 304.8 mm, 1 liquid ounce = 0.030 L

R403.4.2.2 (IRC N1103.4.2.2) Maximum allowable pipe volume method. The water volume in the piping shall be calculated in accordance with Section R404.4.2.2.1. The maximum volume from the nearest source of heated water to the termination of the fixture supply pipe for a *plumbing fixture* or

plumbing appliance shall be 0.5 gallon (1.89 L) where the source of heated water is a water heater; and 0.19 gallon (0.7 L) where the source of heated water is a recirculating system or heat-traced piping.

R403.4.2.2.1 (IRC N1103.4.2.2.1) Water volume determination. The volume shall be the sum of the internal volumes of pipe, fittings, valves, meters and manifolds between the nearest source of heated water and the termination of the fixture supply pipe. The volume in the piping shall be determined from the volume column in Table R403.4.2.1. The volume contained within fixture shut off valves, within flexible water supply connectors to a fixture fitting and within a fixture fitting shall not be included in the water volume determination. Where heated water is supplied by a recirculating system or heat-traced piping, the volume shall include the portion of the fitting on the branch pipe that supplies water to the fixture.

PART II IRC-P

Add new text as follows:

SECTION P2905 **HEATED WATER DISTRIBUTION SYSTEMS**

P2905.1 Heated water supply piping. Heated water supply piping shall be in accordance with Section N1103.4.2.

Reason: This change speeds hot water to the user, saves energy and water, and potentially lowers construction costs. All these are accomplished by limiting the volume of water in the pipes.

We have all have turned on the hot water and waited for it to get hot. While we wait water runs down the drain, wasting clean water. While we wait, our time is wasted. When we are done there is still hot water in the pipes, water which cools thereby wasting as much energy as it took to heat the water in the pipes. Pipes with larger volumes take longer to fill, waste more and are potentially more expensive to build.

This proposal remedies the problems above by reducing the water volume between the source of heated water and the use. The first method (Section R403.4.2.1) requires no calculation; it limits the water volume in the pipes by limiting the pipe length. The second option (Section R403.4.2.1) requires a calculation of volume in the pipes, but provides a table that translates the pipe length into a volume (columns 1 and 2); and provides quick options for different pipe assumptions in columns 3 and 4.

In simple form, cutting the volume in half: cuts the wait time in half, cuts the clean water wasted down the drain in half, cuts the energy loss while water goes through the pipes in half, and cuts the loss of energy from hot water left in the pipes after use in half.

A 2010 study done by the National Association of Home Builders Research Center shows the big impact of reducing hot water pipe volume. Figure 1, from that study, is below. The left half is for pipe 60 feet long. The right half is for pipe 30 feet long. Pick any case on the left and compare it to the same case on the right. Note there is always about a 50% reduction in piping energy lost in the 30-foot case. An example from the figure below, the energy loss of an uninsulated metal pipe 60 feet long drops from just over 10,000 kBtu to just over 5,000 kBtu for a pipe 30 feet long. Similarly uninsulated plastic pipe drops from about 7,300 kBtu to about 3,700 kBtu. The same pattern of reduction occurs when the piping is insulated.

Figure 1 Pipe Loss Comparison Using Parametric Analysis

Source: Domestic Hot Water System Piping Insulation: Analysis of Benefits and Costs, Figure 4, page 10 of 24, NAHB Research Center, December 2010.

Why is the maximum volume 0.5 gallon when the source of heated water is a water heater? So that following standard practice for plumbing engineers and meeting the minimum requirements in the energy code will be aligned. At present, they are not, with the result that hot water delivery times are greater than 30 seconds after the tap is opened; unacceptable performance according to the American Society of Plumbing Engineers.

Why is the maximum volume 0.19 gallon when the source of heated water is a circulation loop or heat-traced pipe? In exchange for the flexibility in the location of the water heater relative to the plumbing fixtures and plumbing appliances, the allowable volume that will be wasted has been reduced and the time-to-tap improved so that it will almost always fall into ASPE's range for Acceptable Performance.

The definition proposed is used in both the IRC and the IPC.

For more information and background on issues related to hot water distribution and for a more detailed analysis in support of this proposal please go to <http://www.aim4sustainability.com>. Follow the link on the home page to Codes.

Cost impact: There are several ways to meet the requirements of this proposal, many of which cost less than current piping practices. I would recommend that builders and developers select one of the less expensive methods.

Proponent: Gary Klein, Affiliated International Management, LLC, representing self, (gary@aim4sustainability.com)

PART I – IECC RESIDENTIAL PROVISIONS

Add new text as follows:

R403.4.2 (N1103.4.2) Efficient heated water supply piping. Heated water supply piping shall be in accordance with Section R403.4.2.1 or Section R403.4.2.2. The flow rate through ¼ inch piping shall not exceed 0.5 gpm (1.9 Lpm). The flow rate through 5/16 inch piping shall not exceed 1 gpm (3.8 Lpm). The flow rate through 3/8 inch piping shall not exceed 1.5 gpm (5.7 Lpm).

R403.4.2.1 (N1103.4.2.1) Maximum allowable pipe length method. The maximum piping length from the nearest source of heated water to the termination of the fixture supply pipe for a public lavatory faucet shall be in accordance with the maximum piping length columns in Table R403.4.2. Where the piping contains more than one size of pipe, the largest size of pipe within the piping shall be used for determining the maximum allowable length of the piping in Table R403.4.2.1.

TABLE R403.4.2.1 (N1103.4.2.1)
PIPING VOLUME AND MAXIMUM PIPING LENGTHS

NOMINAL PIPE SIZE (inch)	VOLUME (liquid ounces per foot length)	MAXIMUM PIPING LENGTH (feet)
		LAVATORY FAUCETS— PUBLIC
1/4	0.33	6
5/16	0.5	4
3/8	0.75	3
1/2	1.5	2
5/8	2	1
3/4	3	0.5
7/8	4	0.5
1	5	0.5
1 ¼	8	0.5
1 ½	11	0.5
2 or larger	18	0.5

For SI: 1 inch=25.4 mm, 1 foot = 304.8 mm, 1 liquid ounce = 0.030 L

R403.4.2.2 (N1103.4.2.2) Maximum allowable pipe volume method. The maximum piping volume from the nearest source of heated water to the termination of the fixture supply pipe for a public lavatory

faucet shall be 2 ounces (0.06 L). The water volume in the piping shall be calculated in accordance with Section R404.4.2.2.1.

R403.4.2.2.1 (N1103.4.2.2.1) Water volume determination. The volume shall be the sum of the internal volumes of pipe, fittings, valves, meters and manifolds between the nearest source of heated water and the termination of the fixture supply pipe. The volume in the piping shall be determined from the volume column in Table R403.4.2.1. The volume contained within fixture shut off valves, within flexible water supply connectors to a fixture fitting and within a fixture fitting shall not be included in the water volume determination. Where heated water is supplied by a recirculating system or heat-traced piping, the volume shall include the portion of the fitting on the branch pipe that supplies water to the fixture.

PART II-IRC-P

Add new text as follows:

SECTION P2905 **HEATED WATER DISTRIBUTION SYSTEMS**

P2905.1 Heated water supply piping. Heated water supply piping shall be in accordance with Section N1103.4.2.

Reason: The problem of heated water taking an excessively long time to arrive at lavatory faucets in public restrooms is well known. The length of time the faucets are used during each hand washing event is very short, often around 5 seconds. Federal law requires low flow rate or small, metered volumes for the faucets in these applications. Health codes expect heated water for washing hands in these applications. The dilemma is that the volume of not-hot water in the piping from the source of hot water to the faucets is much too large for the heated water to arrive in a timely fashion; even at the 50-foot limit currently required in the 2012 IPC. Supporting this proposal will correlate the IECC with Federal law and local health codes by providing heated water for hand washing in a timely matter.

The delivery of hot water to public lavatory faucets needs to be considered separately because of potential health issues. The events are short and the flow rates are low. Table 1 shows the time-to-tap performance based on the requirements in the proposal. The 0.25 and 0.5 gpm columns are typical of the flow rates for public lavatory faucets. The volume in the pipe was chosen so that heated water would arrive in the first part of the hot water event so that every person who uses the public lavatory will have the benefits of hot water.

Table 1 Time-to-Tap Performance when the Volume in the Piping from the Source to the Use is 2 ounces

Volume in the Pipe (ounces)	Minimum Time-to-Tap (seconds) at Selected Flow Rates					
	0.25 gpm	0.5 gpm	1 gpm	1.5 gpm	2 gpm	2.5 gpm
2	3.8	1.9	0.9	0.6	0.5	0.4

The energy savings comes from not losing the heat from the water as it tries to arrive at the faucets.

For more information and background on issues related to hot water distribution please read the 4-part series at: http://www.allianceforwaterefficiency.org/Residential_Hot_Water_Distribution_System_Introduction.aspx

Cost impact: There are several ways to meet the requirements of this proposal, some of which cost less than current heated water system practices. I would recommend that builders and developers select one of the less expensive methods.

	Assembly:	ASF	AMF	DF

R403.4.2 #3 (NEW)-EC-KLEIN

RE139-13

R403.4.3 (NEW) (IRC N1104.4.3 (NEW))

Proponent: Eric Makela, Britt/Makela Group, Inc. representing Northwest Energy Codes Group (Eric@BrittMakela.com)

Add new text as follows:

403.4.3 (N1104.4.3) Electric Water Heater Insulation. Electric water heaters located in unheated spaces or on concrete floors shall be placed on an incompressible, insulated surface having a thermal resistance (R-value) of not less than R-10.

Exception: Electric water heaters in buildings in Climate Zones 1, 2 or 3 shall not be required to comply with this section.

Reason: The Washington State Residential Energy Code has required that electric water heaters located in unheated spaces and on concrete floors be placed on rigid foam insulation to reduce the heat loss from the bottom of the tank. Often these water heaters are placed in a garage or unheated basement. The standby losses through the bottom of the water heaters account for approximately 10% of the total losses in the tank which can be significant over the life of the water heater. Estimated energy savings for an electric water heater is between 22 and 25 kWh per year. Using an average electric rate of \$.10/kWh the total savings will be between \$2.20 and \$2.50 per year. The cost of the insulation board is \$8.00 so the payback on this measure would be between 2.5 to 3.2 years. This requirement is easy to implement measure is very enforceable.

Modeling Assumptions:

- Climate Location: 4,000 HDD 65
- Water Heater EF: 0.945 (NAECA requirement for 2015)
- Gallons of hot water use per day: 64.2 (per DOE test procedure) and 55
- Energy Cost: \$0.10 kWh
- Stand-by losses through bottom of water heater: 10% of total standby loss
- Tank Setback Temperature: 125°F

Cost Impact: The code change proposal will minimally increase the cost of construction.

R403.4.3 (NEW)-EC-MAKLEA.DOC

RE140-13

R403.5.1 (IRC N1103.5.1)

Proponent: Mike Moore, P.E., Newport Ventures, representing Broan-NuTone

Revise as follows:

R403.5.1 (IRC N1103.5.1) Whole-house mechanical ventilation system fan efficacy. Mechanical ventilation system fans shall meet the efficacy requirements of Table R403.5.1.

~~**Exception:** Where mechanical ventilation fans are integral to tested and listed HVAC equipment, they shall be powered by an electronically commutated motor.~~

Reason: At the current stage of development, mechanical ventilation fans that are integral to tested and listed HVAC equipment (also known as central fan integrated, or "CFI" systems), are notorious for their poor performance in regards to energy and/or ventilation, and no special exception should be made in regard to their energy performance. Following are typical known problems with CFIs that are arguments to remove this exception and hold them to the same efficacy standards as other ventilation systems.

- CFIs with electronically commutated motors (ECMs) use much more fan energy than other code-approved ventilation systems: According to IRC M1507, a 2200 sqft, 3 bedroom dwelling has a ventilation flow rate requirement of 60 cfm. Suppose this dwelling has a 3 ton AC unit that has an ECM that operates at 2.5 cfm/W, a typical fan efficacy for ECMs. At the industry sizing standard of 400 cfm/ton, the central fan can be expected to use roughly 480 Watts of power when supplying ventilation air ($3 \times 400 / 2.5 = 480$). Factory settings for typical CFI controllers are set to cycle the central fan for 10 minutes out of every thirty, meaning that to achieve the average 60 cfm code required ventilation rate, 180 cfm of ventilation air must be provided by the CFI system during the 10 minutes of run time (3x the ventilation rate required because only ventilating 1/3 the time). Over an entire year (8760 hours), this system would use 1400 kWh of fan energy to provide the ventilation air required ($8760 \times 1/3 \times 480 / 1000 = 1400$ kWh). To be fair, when the pre-scheduled ventilation run time overlaps with the run time of the central fan for heating or cooling, some of this ventilation fan energy is "free"; however, central fans typically only operate about 20% of the year for heating and cooling. Assuming that this heating and cooling operation is spread out equally across all time, the net fan energy use of the system would be 20% less, or 1120 kWh. Compared to types of ventilation systems that operate at minimum efficacy levels required by this section (e.g., 1.4 cfm/W), the net fan energy use of the CFI system with an ECM uses roughly three times as much fan energy (1120 kWh versus 375 kWh per year). The difference in fan energy use is 745 kWh ($1120 - 375 = 745$), which is about enough to power two typical Energy Star rated refrigerators for an entire year! Obviously, CFI systems with ECMs are a bad choice from an energy perspective, and should not be given an exception within this section.
- Inability to achieve ASHRAE 62.2 and 2012 IRC required flow rates at more than one fan speed setting: (i.e., if code compliant flow is confirmed while the central fan is in cooling mode, lower fan flow rates in heating and fan only mode will not meet the IRC requirements)
- Potential for over-ventilation and wasted energy: If 2012 IRC flow rates are confirmed at the fan's low speed setting (e.g., in heating mode), then these units are likely to severely over-ventilate at higher speed settings (e.g., in cooling mode), wasting energy.
- Difficult-to-confirm flow rates: Unlike HRVs that often ship with pressure taps to calibrate flows or exhaust systems that are easily measured with low cost devices, CFI systems can be very difficult to validate flow rates and so in practice, confirmation of flow rates is seldom done, meaning the system could be over-ventilating (wasting even more energy for heating and cooling), or under-ventilating, meaning adequate indoor air quality is not being achieved.

Cost Impact: No impact to cost. Many other systems are available that at the same or lower cost as CFI systems with ECMs.

RE140-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R403.5.1 #1-EC-MOORE.DOC

RE141-13

R403.5.1 (IRC N1103.5.1), Table R403.5.1 (IRC Table N1103.5.1), R403.5.2 (NEW) (IRC N1103.5.2 (NEW))

Proponent: Mike Moore, P.E., Newport Ventures, representing Broan-NuTone

Revise as follows:

R403.5.1 (N1103.5.1) Whole-house mechanical ventilation system fan efficacy. Mechanical ventilation system fans shall meet the efficacy requirements of Table R403.5.1. This section shall not apply to mechanical ventilation fans that are integral to tested and listed HVAC equipment and that are powered by electronically commutated motors. Fans serving as a component of whole-house mechanical ventilation systems shall be in accordance with the following:

1. Exhaust fans shall have a fan efficacy of not less than 8 cfm/W (0.004 m³/W).
2. Supply fans shall have a fan efficacy of not less than 4 cfm/W (0.002 m³/W).
3. Heat recovery ventilator fans and energy recovery ventilator fans shall have a net air flow fan efficacy of not less than 1.0 cfm/W (0.0005 m³/W).

Exception: Where mechanical ventilation fans are integral to tested and listed HVAC equipment, they shall be powered by an electronically commutated motor.

Table R403.5.1 (N1103.5.1)
MECHANICAL VENTILATION SYSTEM FAN EFFICACY

FAN LOCATION	AIR FLOW RATE MINIMUM (CFM)	MINIMUM EFFICACY (CFM/WATT)	AIR FLOW RATE MAXIMUM (CFM)
Range	Any	2.8 cfm/watt	Any
In-line fan	Any	2.8 cfm/watt	Any
Bathroom, utility room	10	1.4 cfm/watt	< 90
Bathroom, utility room	90	2.8 cfm/watt	Any

For SI: 1 cubic foot per minute = 28.3 L/min.

R403.5.2 (N1103.5.2) Recovery ventilator efficiency. Heat recovery ventilators shall have a sensible recovery efficiency of not less than 65 percent at 32°F (0°C). Energy recovery ventilators shall have a total recovery efficiency of not less than 45 percent at 95°F (35°C).

Reason: The purpose of this proposal is to reduce the energy use impact of whole house mechanical ventilation (WHMV) fans. This change is needed because these fans operate for long duty cycles and can have a significant impact on the energy use of the home. Following is the justification for the various efficacy requirements by system type.

Exhaust Fans

This proposal increases the efficacy requirement for exhaust fans to 8 cfm/W. This improvement in efficacy will reduce the fan energy use of minimum code compliant exhaust only WHMV systems by over 80%. This level of efficacy is available today from multiple manufacturers based on the use of brushless DC fans, and the cost premium is roughly \$100. This first cost premium is easily recovered when the whole-house mechanical ventilation fans are operated continuously, per design (~32 month simple payback; assumptions include: \$0.12/kWh, 60 cfm, 1.4 cfm/W efficacy for current 2012 IECC minimum fan, 8.0 cfm/W efficacy for new code minimum). The length of this payback is expected to fall even further with time.

Supply Fans

The brushless DC motors that are becoming much more common in exhaust fans have not yet been widely adopted in supply fans. So, this proposal strikes a compromise between increasing energy efficiency and ensuring that there are plenty of market-available products. Over 35% of the fans capable of providing supply ventilation in the Energy Star database achieve a minimum efficacy of 4 cfm/W, and these fans are provided by a wide range of manufacturers (87% of the manufacturers of this product class manufacture fans at 4 cfm/W or greater). With such a wide array of products available, there is little to no expected additional cost to specify a 4 cfm/W supply fan versus the current 2012 IECC minimum of 1.4 cfm/W.

Energy Recovery (ERVs) and Heat Recovery (HRVs) Ventilators

The 2012 IECC completely exempts HRVs and ERVs from any efficacy requirements (addresses supply, exhaust, and central integrated systems, but ignores H&ERVs). The reason for this free pass is that H&ERVs are supposed to be inherently more energy efficient than systems that do not include heat or energy recovery. However, building energy simulations show that simply

installing any HRV or ERV is not sufficient to guarantee energy savings versus exhaust or supply only WHMV systems. Rather, net air flow fan efficacy and recovery efficiency are key components to assuring expected performance.

So, for HRVs, this proposal establishes “a minimum sensible recovery efficiency of 65%, and a minimum net air flow fan efficacy of 1.0 cfm/W.” The sensible recovery efficiency of 65% is the minimum criteria established in Canada to qualify as an Energy Star HRV. The fan efficacy of 1.0 cfm/W is the average efficacy of the two tiers of HRVs under the same criterion. Further, based on manufacturer feedback, the overwhelming majority of HRV units sold now meet these criteria. For ERVs, there is no performance specification to reference, so this proposal establishes “a minimum total recovery efficiency of 45%, and a minimum net air flow fan efficacy of 1.0 cfm/W.” These criteria are very achievable based on industry data of available products. Following are charts that show the performance characteristics of ERV and HRV units that are currently available (data from the Home Ventilating Institute, current as of November 2012). Units in the green boxes would meet these criteria, demonstrating that only the worst HRVs and ERVs would not be permitted to be installed. While the TRE and SRE metrics may be new to code officials, they are published by manufacturers and by the Home Ventilating Institute, so are easily referenced.

Also, selection of an ERV or HRV is not mandated by this section, and the builder is always free to choose a lower cost system.

Cost Impact: Builders are able to control costs by selecting from multiple approved system types. Where there are additional first costs, they can be recovered quickly through energy savings. Further, economies of scale are expected to drive down current incremental costs.

RE141-13

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

R403.5.1 #2-EC-MOORE.DOC

RE142-13

R403.6 (IRC N1103.6)

Proponent: Brian Dean, Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; and Bill Prindle, Energy Efficient Codes Coalition.

Revise as follows:

R403.6 (N1103.6) Equipment sizing and efficiency rating (Mandatory). Heating and cooling equipment shall be sized in accordance with ACCA Manual S based on building loads calculated in accordance with ACCA Manual J or other *approved* heating and cooling calculation methodologies. New or replacement heating and cooling equipment shall have an efficiency rating equal to or greater than the minimum required by federal law for the geographic location where the equipment is installed

Reason: The purpose of this code change is to codify the requirement that HVAC equipment must satisfy federal minimum requirements for the location. This proposal does not establish new requirements since it simply requires that equipment meet the federal standard, but it allows the code official to enforce the requirements. This proposal improves the effectiveness of the code by reinforcing a practice that should already be taking place in plan review and inspection -- verification of the efficiency rating of heating and cooling equipment. Although federal rules set the minimum efficiency levels for manufacturers, only code officials can determine whether equipment actually installed in buildings meets or exceeds the federal minimums. The EEC has offered a similar proposal for service hot water equipment under section R403.4.

This proposal is more important now than in the past because federal minimums are expected to shift away from single nationwide efficiency levels to regionally-based efficiency levels that will vary from state to state. It is possible, whether by accident or bad intent, to see equipment that would meet federal requirements in one jurisdiction used in other states or regions in which it does not meet the regional requirement. Although this verification may already be taking place, the proposal above is intended to make it a specific requirement in all buildings. This is an important opportunity for federal, state and local governments to work together to ensure that equipment installed meets federal minimums for the location.

Cost Impact: The code change proposal will not increase the cost of construction.

RE142-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R403.6-EC-DEAN-HARRIS-MISURIELLO-PRINDLE-STONE.DOC

RE143 – 13

R403.6 (IRC N1103.6)

Proponent: Philip Debes, Dan Deen, Steve Frazer, Lloyd Larkin, Allan Tyson, Jim Walker, all of P and N Distribution, Inc. representing themselves. Clifton Payne of DNV KEMA (Det Norske Veritas and Keuring Elektrotechnische Materialen Arnhem) Energy and Sustainability, representing Energy Design Systems, Philip Jeffers, Energy Design Systems, Inc, representing self, Scott Miller, Knauf Insulation representing self

Revise as follows:

R403.6 (N1103.6) Equipment Sizing (Mandatory). Heating and cooling equipment shall be sized in accordance with ~~ACCA Manual S based on building loads calculated in accordance with ACCA Manual J or other approved heating and cooling calculation methodologies.~~ standard engineering heat loss and heat gain formulas coupled with appropriate weather data, home construction materials and other considerations normally used in the HVAC industry.

Reasons:

[DEBES, DEEN, FRAZER, LARKIN, TYSON, WALKER] ACCA Manual J and ACCA Manual S are trademarks. Code officials mistakenly believe ACCA is the certifying agent for IECC code compliance. ACCA charges royalties for ACCA approved software and resells software directly to contractors. ACCA is an HVAC software competitor, not a certifying authority.

[PAYNE] ACCA Manual J and ACCA Manual S are trademarks. ACCA is not the certifying agent for IECC code compliance, as ACCA Code officials appear to mistakenly believe. ACCA charges royalties for ACCA approved software and resells software directly to contractors. ACCA is an HVAC software competitor, not a certifying authority. By referencing ACCA in R403.6, the IECC would be selecting and endorsing one product from the marketplace over others, not simply providing a standard that should be used to size HVAC equipment. This would create an unlevel playing field by providing ACCA with a competitive advantage.

[JEFFERS]

1. ACCA Manual J and ACCA Manual S are trademarks. ACCA and ACCA's software partners are using the IECC code to intimidate contractors. See attachment 1: ACCA "Contractors Beware", See attachment 2: Bob Volin, ACCA Code Committee Member, Photo Shopping his Letterhead onto the Code's Section R403.6 and convincing contractors into buying "ACCA Approved Software" and trying to force software developers into royalty payments totaling millions of dollars. ACCA is restraining trade, eliminating competition, and inhibiting development of more accurate software and procedures. Building Inspectors mistakenly interpret "in accordance with" to mean "approved by". ACCA uses this fact to create a de-facto IECC software certification process, making millions in fees, royalties, and reselling the software ACCA "approves". ACCA is a software competitor and Section R403.6 creates unfair competition.

2. For existing houses ACCA's Manual J procedure has no relationship to any sound engineering practice. None of the inputs such as a home's leakage rate, duct loss/gain, or any other value are known, and these inputs can have wide tolerances. Contractors use inputs that give them the answers they want. This is called confirmation Bias. An ACCA load calculation on an existing house is no different from guessing the size. The fact that contractors work ACCA's procedure backwards is widely known in the HVAC industry. ACCA load calculations average 140% of operating loads and can contribute to comfort, health, safety issues, and dramatically overstate energy usage.

"they simply change some of the inputs to make the procedure spit out answer they're comfortable with and no one questions their answers." - Hank Rutkowski P.E. Author ACCA Manual J.

3. There is no evidence what so ever that "proper sizing" saves energy.

Subject: ACCA NEWS: Contractors: Beware of Inappropriate Load Calculation Software

For Immediate Release

September 6, 2011

Media Contact: Melissa Broadus, [703-575-4477](tel:703-575-4477) melissa.broadus@acca.org

Contractors: Beware of Inappropriate Load Calculation Software

Manual J ® is the ANSI-approved national standard for determining residential load calculations for HVACR systems, and is required by many building codes and regulations. It is produced by the Air Conditioning Contractors of America (ACCA), the nation's largest association of indoor environmental systems professionals.

Given the complexities of modern construction, contractors and design professionals are encouraged to use software for accurate system design. However, not all load calculation software is created equal.

ACCA is reminding contractors that only those software programs that have been approved and licensed by ACCA as "Powered by Manual J ®" can be considered in compliance with codes and regulations requiring the use of Manual J ®.

As of today, the only software programs that meet the requirements for Manual J ® load calculations are:

- **RHVAC Residential Load Calculation from Elite Software**
- **Right – J from Wrightsoft**
- **AccuLoads from ADTEK Software Company**
- **Florida Solar Energy Center's EnergyGauge**

Any other software program, online service or mobile application cannot be considered to be compliant with the Manual J ® standard and should not be used where Manual J ® is required. Use of non-authorized software may pose a liability for the contractor that installs the system.

For more information on Manual J ®, the ACCA system design process, and load calculation software, visit <https://www.acca.org/industry/system-design>.

Software providers interested in applying for validation and licensing of their product should contact Glenn Hourahan at glenn.hourahan@acca.org.

Manual J ® is a registered federal trademark of the Air Conditioning Contractors of America.

The Air Conditioning Contractors of America (ACCA) is a non-profit association serving more than 60,000 professionals and 4,000 businesses in the HVACR community, who work together to promote professional contracting, energy efficiency, and healthy, comfortable indoor environments for all Americans. For more information, visit www.acca.org.

You are receiving this email because you are a member of ACCA and asked to receive communications by email, or you subscribed through our website. To manage your email preferences or to unsubscribe, go to [options](#). To change your email address, please reply to this email with your new address in the body.

Air Conditioning Contractors of America 2800 Shirlington Road, Suite 300 | Arlington, VA 22206 | [703-575-4477](tel:703-575-4477) | www.acca.org

Contractors: Beware of Inappropriate Load Calculation Software

Contractor Alert!

By now most you know as of March 15th 2012 load calculation will be required on
ALL AC CHANGE OUTS.

101.4.7.1.2 Replacement equipment sizing (mandatory). An A/C contractor or licensed Florida PE shall submit a nationally recognized method based sizing calculation to the code official at the time of permit application for total replacement of the condensing and evaporator components of HVAC systems in accordance with Florida law and the provisions of Section 403.6.1 or Section 503.2.1 as applicable.

403.6 Heating and cooling equipment (Mandatory).

403.6.1 Equipment sizing. Heating and cooling equipment shall be sized in accordance with ACCA Manual S based on the equipment loads calculated in accordance with Manual J or other approved heating and cooling calculation methodologies, based on building loads for the directional orientation of the building. The manufacturer and model number of the outdoor and indoor units (if split system) shall be submitted along with the sensible and total cooling capacities at the design conditions described in Section 302.1. This Code does not allow designer safety factors, provisions for future expansion or other factors which affect equipment sizing.

Approved methodologies by Florida code

- ACCA Manual J
- ASHRAE
- Florida PE

Manual J ® is the ANSI-approved national standard for estimating residential heating and cooling loads for HVACR systems. It is the reference cited in both national model building codes. Authorities having jurisdiction (AHJ) may approve alternative methods of load calculation, however, most AHJs recognized Manual J8 due to its long history and wide acceptance in the HVAC industry. Manual J is produced by the Air Conditioning Contractors of America (ACCA), the nation's largest association of indoor environmental systems professionals.

Given the complexities of modeling modern construction, HVAC contractors and other design professionals are encouraged to use software for accurate system design. However, not all load calculation software is created equal. ACCA is reminding contractors that only those software programs that have been approved and licensed by ACCA as "Powered by Manual J ®" can be considered compliant with the procedure referenced in the model codes.

As of today, the only software programs that meet the requirements for Manual J ® load calculations are:

- RHVAC Residential Load Calculation from Elite Software
- Right - J from Wrightsoft
- AccuLoads from ADTEK Software Company
- Florida Solar Energy Center's EnergyGauge

Any other software program, online service or mobile application, or stating they are based upon, cannot be considered to be compliant with the Manual J ® standard and should not be used where Manual J ® is required. Use of non-authorized software may pose a liability for the contractor that represents that they have complied with the Manual J ® procedures.

[MILLER] ACCA Manual J and ACCA Manual S are trademarks. Code officials mistakenly believe ACCA is the certifying agent for IECC code compliance. ACCA charges royalties for ACCA approved software and resells software directly to contractors. ACCA is an HVAC software competitor, not a certifying authority.

ACCA Manual S and Manual J are trademarks of ACCA. According to ACCA, all software must be approved by ACCA or it does not comply with the intent of the IECC R-code and there are significant fees associated with the ACCA approval process. From the following link demonstrates that ACCA believes it has authority to appraise and charge a fee to other software developers for all software used in the IECC 2012 load calculation process:

<https://www.acca.org/archives/news-and-media/news-room/press-releases/5524>

The contents of the above link are as follows and the highlighted portion should be considered problematic from a trade restriction standpoint. It can be proven that this position has cost manufacturers significant sales because the manufacturer's software (while correct) has not been approved by and fees paid to ACCA.

Contractors: Beware of Inappropriate Load Calculation Software

For Immediate Release:

September 6, 2011

Contact: Melissa.Broadus@acca.org

703-824-8842

Manual J ® is the ANSI-approved national standard for determining residential load calculations for HVACR systems, and is required by many building codes and regulations. It is produced by the Air Conditioning Contractors of America (ACCA), the nation's largest association of indoor environmental systems professionals.

Given the complexities of modern construction, contractors and design professionals are encouraged to use software for accurate system design. However, not all load calculation software is created equal.

ACCA is reminding contractors that only those software programs that have been approved and licensed by ACCA as "Powered by Manual J ®" can be considered in compliance with codes and regulations requiring the use of Manual J ®.

As of today, the only software programs that meet the requirements for Manual J ® load calculations are:

- **RHVAC Residential Load Calculation from Elite Software**
- **Right – J from Wrightsoft**
- **AccuLoads from ADTEK Software Company**
- **Florida Solar Energy Center's EnergyGauge**

Any other software program, online service or mobile application cannot be considered to be compliant with the Manual J ® standard and should not be used where Manual J ® is required. Use of non-authorized software may pose a liability for the contractor that installs the system.

For more information on Manual J ®, the ACCA system design process, and load calculation software, visit <https://www.acca.org/industry/system-design>.

Cost Impact: The code change proposal will not increase the cost of construction.

RE143-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R403.6-EC-DEBES.DOC

RE144-13

R403.6 (IRC N1103.6)

Proponent: Richard Grace, Virginia Plumbing and Mechanical Inspectors Association and Virginia Building and Code Officials Association (Richard.Grace@fairfaxcounty.gov)

Revise as follows:

R403.6 (N1103.6) Equipment and appliance Sizing (Mandatory). Heating and cooling equipment and appliances shall be sized in accordance with ACCA Manual S based on building loads calculated in accordance with ACCA Manual J or other approved heating and cooling calculation methodologies.

Exception: Heating and cooling equipment and appliances shall not be limited to the capacities determined in accordance with Manual S where any of the following conditions apply:

1. The specified equipment or appliance utilizes multi-stage technology or variable refrigerant flow technology and the loads calculated in accordance with Manual J fall within the range of the manufacturer's published capacities for that equipment or appliance.
2. The specified equipment or appliance manufacturer's published capacities cannot satisfy both the total and sensible heat gains calculated in accordance with Manual J and the manufacturer's next larger standard size unit is specified.
3. The specified equipment or appliance is the smallest capacity unit available from the specified manufacturer.

Reason:

Item 1 - Current technology is widely available that incorporates multi-stage or VRF systems for increased efficiency. Some of these appliances have such a wide span of functionality that they extend beyond the allowable requirements outlined in Manual S. However, this technology allows the appliance to operate between minimum and maximum capacities, based on loads imposed, thus eliminating the problems associated with single-stage, oversized appliances. Additionally, the appliance will operate efficiently during times where outdoor air temperatures exceed those used to calculate the loads in Manual J.

Item 2 - Often times, the appliance manufacturer's published total and sensible capacities are at odds with the requirements of Manual S. There are many cases where the total capacity of the appliance will fall within the parameters of Manual S in relation to the calculated total gain, however the sensible capacity of the appliance may fall short of the calculated sensible gain, thus unable to provide efficient sensible cooling for the space. When the manufacturer's next standard size larger is chosen to meet the sensible gain, the total capacity of the appliance may then exceed the requirements of Manual S. Choosing the larger appliance will enable a more efficient and effective system.

Item 3 - The current code language does not have provisions for sizing appliances for minimal dwelling unit or dwelling addition loads, other than forcing owners and contractors to change appliances to less desirable systems. For example; a 2 story townhouse, in climate zone 4, with 600 square feet per floor wants to utilize a two-zone system, or a separate heat pump system for each floor. A 1.5 ton unit per floor would exceed the requirements of Manual S, however a 1.5 ton unit could be the smallest available appliance made by the desired manufacturer. Current language would require a complete design change, such as utilizing a single appliance to serve the entire dwelling rather than the more desirable two-zone system, or requiring a system that utilizes electric baseboard heating and window-mounted air conditioning units. This is absurd, and an unfair to an owner that desires to reduce energy costs.

Cost Impact: None

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R403.6-EC-GRACE.DOC

RE145-13

R403.9.3 (NEW) (IRC N1103.9.3.1 (NEW))

Proponent: Edward R. Osann, Natural Resources Defense Council, on behalf of self (eosann@nrdc.org)

Add new text as follows:

R403.9.3.1 (N1103.9.3.1) Mechanical retraction mechanism. Vapor retardant pool covers having a dry weight of 40 lbs (18.1 kg) or more for heated pools associated with one- or two-family homes shall be provided with a mechanical retraction mechanism. The mechanism shall be designed for the cover material, the cover weight and the dimensions of the cover.

Reason: Pool covers serve to retain heat in heated pool systems and reduce water loss due to evaporation – but only when used. Swimming pools at single-family residences are frequently not professionally managed or maintained, and such pools are most likely to go for several consecutive days without use. These characteristics support the use and value of a pool cover. However, the frequent deployment and retraction of a large pool cover by an individual swimmer in a single-family setting is problematic, contributing to widespread disuse of this valuable energy- and water-saving feature.

This proposal would require a pool cover to come with a means for mechanical retraction if it weighs 40 pounds or more. While the most common type of floating cover material is relatively light (0.1 lb per ft²), the weight of a cover for a moderately sized back yard pool (18' X 36') can surpass 60 lbs. and be unwieldy for an individual to handle. The proposal is not specific as to the means or design of the device for mechanical retraction, and does *not* require a permanently affixed automatic retraction system. A hand operated device of suitable size would meet the requirements of this proposal.

Cost Impact: Hand operated mechanical equipment for the retraction of pool covers are marketed at around \$200, and are available from several manufacturers. At least 5 manufacturers provide automatic pool cover equipment.

R403.9.3.1 (NEW)-EC-OSANN.DOC

RE146-13

R403.10 (NEW) (IRC N1103.10 (NEW))

Proponent: Steve Rosenstock, Edison Electric Institute, representing Edison Electric Institute
(srosenstock@eei.org)

Add new text as follows:

R403.10 (N1103.10) Fireplace systems (Mandatory). Fuel gas fired fireplace systems shall not have continuously burning pilot lights.

Reason: This language is consistent with the language on continuously burning pilot lights for pool heaters and gas lighting systems in the IECC. As of April 2012, under a 2009 US Department of Energy rulemaking, residential gas cooking equipment is not allowed to have continuously burning pilot lights.

According to the Hearth, Patio, and Barbecue Association, between 573,000 and 1,017,000 gas fireplace / hearth systems were shipped to North America every year between 2008 and 2011 (about 67 to 70% of total hearth shipments. See <http://www.hpba.org/index.php?id=238> for more details). Many of these units are shipped to new homes with continuously burning pilot lights, ranging from 800 to 1,200 Btu's per hour. For a fireplace that has a pilot light using 1,000 Btu/hr, and is in "standby" mode for about 8000 hours per year (assuming that the fireplace is used 5 hours per day for 150 days of the year), the pilot light uses 8 million Btu's, or 80 therms. At a national average cost of \$1.06 per therm, the cost to a typical consumer is nearly \$85 per year.

With propane systems, 8 million Btu's is equivalent to 87.59 gallons. At a national average cost of \$2.56 per gallon (*Federal Register* page 24940 April 26, 2012, Representative Average Unit Costs of Energy), the cost to a propane consumer is slightly more than \$224 per year.

As a reference point, according to the 2010 AGA *Gas Facts 2008*, a typical gas range uses about 52 therms (5.1 Mcf) per year, and a typical clothes dryer uses about 50 therms (49 Mcf) per year (Table 10-1, page 78). In fact, according to the AGA publication, in the Pacific region of the US, residential natural gas fireplaces use more energy (28.3 Mcf) than a typical residential natural gas water heater (22.1 Mcf) and gas range (5.1 Mcf) combined.

Significant energy savings are available with current technology. With advanced controls (electronic spark ignition, for example), the standby energy losses are eliminated, and the average US consumer saves nearly \$85 to \$224 per year, based on the examples shown.

Cost Impact: The code change proposal will not increase the cost of construction. Electronic ignitions are widely available.

	Assembly:	ASF	AMF	DF

R403.10-EC-ROSENSTOCK.DOC

RE147-13

R403.10 (NEW) (IRC N1103.10 (NEW)), Table R403.10 (NEW) (IRC Table N1103.10 (NEW))

Proponent: Craig Conner, Building Quality representing self (craig.conner@mac.com)

Add new text as follows:

R403.10 (N1103.10) Improved equipment efficiency alternative. Where the installed equipment efficiency exceeds the applicable minimum federal equipment efficiency by the amount given in Table R403.10, the following shall apply:

1. The maximum air leakage rate in Section 402.4.1.2 shall be increased by 1 ACH50.
2. The maximum duct leakage in Section 403.2.2 shall be increased by 1 CFM / 100 ft².

TABLE R403.10 (N1103.10)
EQUIPMENT EFFICIENCY TRADEOFF

<u>ZONE</u>	<u>INCREASED EQUIPMENT EFFICIENCY</u>
<u>1 and 2</u>	<u>1.5 SEER</u>
<u>3</u>	<u>1 SEER and 6 AFUE</u>
<u>4</u>	<u>6 AFUE</u>
<u>5-8</u>	<u>7 AFUE</u>

Reason: This allows increased equipment efficiency to compensate for an increase in envelope and duct air leakage. The increased equipment efficiency applies to cooling in the south and heating in the north. In order to propose this tradeoff a climate zone specific trade needed to be made. This tradeoff uses the DOE computed ratios for increased equipment efficiency vs increased envelop and duct leakage by climate zone. This ratio was as taken from DOE's EC13 proposal of the last code cycle. DOE proposed a tradeoff of increased equipment efficiency for a reduction in air tightness and duct tightness requirements, although that version was not approved in the 2012 IECC.

Unexpected failures in envelope tightness and duct tightness may occur. Increased equipment efficiency represents a simple way to correct the problem of an unexpected test failure in a residence that is almost completed. This proposed option is also an alternative for those who choose not to try for a residence as tight as the new code. Those who wanted a more complete, but more complex, calculation could still use the performance analysis.

The Federal equipment efficiency requirements may be increased in the near future. Therefore this is proposed as an increment above the applicable Federal equipment efficiency and could apply whether or not the equipment efficiency minimums were raised.

Cost Impact: The code change proposal will not increase the cost of construction.

R403.10 (NEW)-EC-CONNER

RE148-13

R404.1 (IRC N1104.1)

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

Revise as follows:

R404.1 (N1104.1) Lighting equipment (Mandatory). ~~A minimum of 75 percent of the Lamps in permanently installed lighting fixtures shall be high-efficacy lamps, or a minimum of 75 percent of the permanently installed lighting fixtures shall contain only high-efficacy lamps.~~

Exceptions:

1. Lamps in low-voltage lighting shall not be required to utilize high-efficiency lamps.
2. Lamps in lighting controlled by a dimmer or automatic control device.
3. Lamps that are 15 watts or less.
4. Lamps in lighting built into appliances.
5. Lamps in lighting automatically controlled to respond to daylighting devices.

Reason: This removes the need to count fixtures and bulbs. Lighting is supposed to be efficient. Several exceptions are added.

Cost Impact: The code change proposal will not increase the cost of construction.

RE148-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R404.1-EC-CONNER.DOC

RE149-13

R202 (IRC N1101.9), R404.1 (IRC N1104.1)

Proponent: Deborah Frankhouser, Four Point Lighting Design, representing the International Association of Lighting Designers (deborah@fourpointlighting.com)

Revise as follows:

R404.1 (N1104.1) Lighting equipment (Mandatory). ~~A minimum of 75 percent of the lamps in permanently installed lighting fixtures shall be high-efficacy lamps or a minimum of 75 percent of the permanently installed lighting fixtures shall contain only high-efficacy lamps. Permanently installed lighting shall be high efficiency luminaires.~~

Exceptions: Low-voltage lighting shall not be required to use high-efficiency lamps.

1. High efficiency luminaires shall not be required where the lamps operate at less than 25 volts, the luminaires are controlled separately from high-efficiency luminaires and the luminaires are controlled by a dimmer or automatic control device.
2. Up to 50 percent of the total number of luminaires shall not be required to be high-efficiency luminaires where all of the following apply:
 1. The non-high-efficiency luminaires do not qualify for Exception 1.
 2. The non-high efficiency luminaires are controlled separately from high-efficiency luminaires.
 3. The non-high efficiency luminaires are controlled by a dimmer or automatic control device.

Revise definition as follows:

HIGH-EFFICIENCY EFFICACY LAMPS LUMINAIRES. Luminaires containing only compact fluorescent lamps, T-8 or smaller diameter fluorescent lamps with electronic ballasts, or lamps or light emitting diodes (LEDs) with a minimum efficacy of:

1. 60 lumens per watt for lamps over 40 watts,
2. 50 lumens per watt for lamps over 15 watts to 40 watts,
3. 40 lumens per watt for lamps 15 watts or less.

Reason: This proposal:

1. Increases the overall requirement for high-efficiency luminaires from 75% to 100% with certain exceptions designed to save energy and provide maximum flexibility to designers, owners and code officials.
2. Changes the Chapter 2 definitions from *high efficacy lamps* to *high efficiency luminaires* as determined by lamp efficacy. This means owners, designers, and building code officials would count luminaires (light fixtures) vs. counting light bulbs to determine the amount of high or low efficient lighting on a project. Luminaires often have multiple lamps, making counting more cumbersome for both the owner/designer as well as the code official. By counting luminaires, the code official simply has to identify lamp type, but doesn't have to count individual lamps within each luminaire.
3. Allows for an optional and more flexible energy savings approach for owners and designers by allowing up to 50% low efficiency luminaires as long as lighting controls are used to reduce or turn off the low efficiency luminaires.

The current code requires 75% of lighting to be *high-efficacy*. However, there is a high amount of dissatisfaction with compact fluorescents because of their poor color, noise, incompatibility with dimming, and mercury content.

(Reference, Dept. of Energy's "Compact Fluorescent Lighting in America: Lessons Learned on the Way to Market," prepared by Pacific Northwest National Laboratory, June 2006) LED technology is still emerging and many of the inexpensive LED's continue to have poor color and incompatibility with dimming.

The most efficient light is the one that is off. The current code does not use lighting controls as a means of energy savings. Regardless of efficacy, light sources achieve maximum energy savings when they are off or reduced to the minimum required by the task. For 120 volt incandescent/halogen sources, dimming reduces energy use, increases lamp life, and dimmers are inexpensive. Automatic controls turn lighting off when not being used. (See reference documentation listed below.)

Cost implications: In most cases, the required high efficiency Fluorescent and LED light fixtures are more expensive than their low efficiency 120 volt incandescent equivalents simply because fluorescent and LED have additional required components such as ballasts and drivers. Dimmers vary significantly in cost, but a 120v incandescent dimmer can be purchased for as little as \$15. When installed with the less expensive 120v incandescent lighting, this combination can be less expensive than purchasing many fluorescent or LED versions controlled by a switch. There

are many options for owners and adding dimmers does not necessarily equal adding dollars when comparing low efficiency and high efficiency luminaires. Also, in residential, dimming is important for reasons other than energy savings and dimming fluorescent and LED sources can significantly increase dimming costs.

Residential is not commercial. In residences, it is very common for decorative lighting to be the main lighting source in a room. Decorative chandeliers are often only available in 120v incandescent medium or candelabra based sockets. Often times these chandeliers exceed the current allowance (25%) even when using high efficacy light sources for other types of architectural lighting such as down lights, task lighting, etc. These fixtures do not qualify for the Low Voltage Exception currently in the code. The proposed Exception 2 gives a greater allowance for 120v incandescent/halogen luminaires than the current code allows to accommodate these decorative products, but encourages energy savings through the use of controls.

4. Clarifies the low voltage lighting exception currently in the code and adds stringency by requiring lighting controls as an energy savings approach for these light fixture types. The current code allows for the use of low voltage with no limits. They are lower in VOLTAGE not WATTAGE. Adding controls will increase the overall energy efficiency of these products.
5. Exception to C405.1 is meant to make residential dwelling units inside commercial construction buildings consistent with the residential section 404.1. There is no reason why different lighting efficiency standards should apply to multi-family residential than to single-family homes.

References

Several reports document savings from using controls residentially, such as:

Cost Impact: The code change proposal will not increase the cost of construction.

RE149-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R404.1-EC-FRANHOUSER.DOC

RE150-13

R202 (NEW) (IRC N1101.9 (NEW)), R404.1 (IRC N1104.1)

Proponent: Don Surrena, CBO, National Association of Home Builders (NAHB) (dsurrena@nahb.org)

Revise as follows:

R404.1 (N1104.1) Lighting equipment (Mandatory). ~~A minimum of seventy-five percent of the Lamps in permanently installed lighting fixtures shall be high efficacy lamps or a minimum of seventy-five percent of the permanently installed lighting fixtures shall contain only high efficacy lamps.~~

Exceptions:

1. Lamps in low-voltage lighting.
2. Lamps controlled by a dimmer or an *automatic control device*.
3. Lamps of 10 watts or less.
4. Lamps contained in appliances

Add new definition as follows:

AUTOMATIC CONTROL DEVICE. A device or system capable of automatically turning lighting loads off without manual intervention. Automatic control devices often include a feature for turning lights on manually.

Reason: Builder installed lighting represents roughly 7% of residential electricity use. This proposal has the potential to reduce household energy use by over 1%.

By requiring lamps (rather than fixtures) to be high efficacy, leaves open the ability for innovative new lighting technologies which can be used in a standard lighting base.

Durability of fixture ballasts is also a concern. Ballast repairs are not generally done by a consumer and will typically require an electrician replace the fixture at a significant cost increase to the consumer.

The new language is simpler, more enforceable and more stringent. It makes the code require 100% high efficacy lighting with an allowance for standard efficacy when special lighting controls are used.

Exceptions still maintain the stringency, but provide reasonable allowances for small lighting loads.

Cost Impact: The code change proposal will not increase the cost of construction.

RE150-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R404.1-EC-SURRENA.DOC

RE151-13

R404.2 (New) (IRC N1104.2 (NEW))

Proponent: Ellen Eggerton, representing Fairfax County, Virginia

Add new text as follows:

R404.2 (N1104.2) Electrical power use display. For dwelling units where the occupant is billed by the electric provider for electric used in the unit, an electrical energy monitoring device shall be installed on the electrical conductors serving the main electrical panel for each dwelling unit. The monitoring device shall be provided with a display indicating the current electrical energy consumption rate of the dwelling unit in kWh and the total electrical energy use of the dwelling unit in kW since the display device was last reset. The display shall be within 100 feet (64.5 m) distance of travel from the main electric panel for the dwelling unit.

Reason: This suggested change provides a homeowner real time electrical energy consumption and related cost information to make informed decisions on the operation of their home. Being able to monitor the energy consumption of plug, lighting and HVAC loads in real time provides immediate feedback information on their actions. The installation of sensors would be too difficult for homeowners but only a ten minute effort for the electrician when wiring the panel. The idea is that if people know exactly how much energy they are consuming and when, they can change old habits and reduce consumption.

The now popular dashboard display providing the miles per gallon rate in cars was a luxury feature and now is in many cars in response to interest by consumers to have useful energy consumption information.

Early adopters are buying individual plug monitors and only able to see the operation of individual appliance. But installing a whole-house sensor during building construction would provide better information and cost much less than sensors at each plug or appliance. Real time energy consumption information would be a very cost effective tool to get energy savings.

Cost Impact: In the current marketplace, the cost rate is about \$80-120 per unit but with higher nationwide demand, the cost per unit could decrease.

RE151-13

	Assembly:	ASF	AMF	DF

R404.1.1-EC-EGGERTON.DOC

RE152-13

R404.2 (NEW) (N1105.2 (NEW))

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

Add new text as follows:

R404.2 (N1105.2) Lamp efficacy. Lamps 5 watts or greater shall have a manufacturer's designation of efficacy.

Exception: Lamps less than 5 watts, UV lamps, black lights, bug lamps, germicidal lamps and lamps in appliances.

Reason: This requires a "manufacturer's designation" of efficacy on light bulb, light spec sheet, or packaging. Efficacy is a code requirement for lamps, but a hard value to find on many lamps. Without such a designation, how does the user of the lamp know the efficacy? How does one inspect for light efficacy?

Cost Impact: The code change proposal will not increase the cost of construction.

RE152-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R404.2-EC-CONNER.DOC

RE153-13

R405.2 (IRC N1105.2)

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

Revise as follows:

R405.2 (N1105.2) Mandatory requirements. Compliance with this section requires that the mandatory provisions identified in Section 401.2 be met. ~~All supply and return ducts not completely inside the building thermal envelope shall be insulated to a minimum of R-6.~~

Reason: Duct insulation is labeled both “prescriptive” in Section R403.2.1 and “mandatory” in R405.2. It can’t be both.

Cost Impact: The code change proposal will not increase the cost of construction.

RE153-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R405.2-EC-CONNER.DOC

RE154-13

R405.2 (IRC N1105.2), R405.2.1 (NEW) (IRC N1105.2.1 (NEW))

Proponent: Robby Schwarz, EnergyLogic Inc., representing EnergyLogic, Inc. (robby@nrglogic.com)

Revise as follows:

R405.2 (N1105.2) Mandatory requirements. Compliance with this section requires that the mandatory provisions identified in Section R401.2 be met. All supply and return ducts not completely inside the *building thermal envelope* shall be insulated to a minimum of ~~R-6~~ R-8. Ductwork, that is either partially or completely within the thermal layer of the wall system of the *building thermal envelope*, shall have insulation of a *R-value* of not less than R-10 on the side of the duct that is away from the conditioned space. Where the duct is in a wall cavity and the R-10 insulation does not completely fill the cavity, the remaining cavity space shall be filled with insulation to the extent that the requirement for insulating the exterior wall of the building is met or the cavity space is completely filled, whichever is less. Ductwork, that is either partially or completely within the thermal layer of a floor system of the *building thermal envelope*, shall have insulation of a *R-value* of not less than R-19 on the side of the duct that is away from the conditioned space. Floor cavity insulation shall be installed in accordance with Section R402.2.7. Where the duct is in a floor cavity and the R-19 insulation does not completely fill the cavity, the remaining cavity space shall be filled with insulation to the extent that the requirement for insulating the floor system of the building is met or the cavity space is completely filled, whichever is less.

R405.2.1 (N1105.2.1) In process inspection requirement. Inspections of the code-required energy specifications documented in the simulated performance code-compliance reports shall be verified to demonstrate that the as-built conditions meet or exceed the specified parameters used for the code-compliance reports. The entity or persons who performed the analysis shall perform the inspections or where approved, other approved entities or persons shall perform the inspection.

Reason: Field inspection, in order to create an accurate computer generated energy analysis, should be required for following reasons:

1. For production building, a plan is often mastered and that one plan may be built over 100 times. To ensure that each house meets the performance analysis, each home must be inspected.
2. Computer generated energy analyses utilize worst case configuration of the proposed design and requires evaluations and inputs that must be confirmed in the specific home that is built to ultimately determine if the actually built home meets the intent of the energy code. Examples of this are worst case air leakage and duct leakage numbers but also orientation, window square footage, number of bedrooms and foundation type.
3. The reality is that houses built from a set of plans change. The actual built home may generally reflect the homes plans but window square footage, orientation, and even insulation and mechanical equipment are often different from what was proposed. The inspection process ensures that the energy analysis is addressed and site specific which ultimately ensures that the home that received its permit from the proposed design's energy analysis has carried out what they have proposed, which is to meet the intent of the code, even if each component of the home is not exactly the same as what was on the set of plans.

Cost Impact: On a national basis there could be a cost impact as most jurisdiction's would allow third party inspections and not do the energy analysis themselves. However, this is one of many code compliance pathways the builder may choose and it is important that the builder realize that when this option is chosen that they in essence are locking themselves into a code compliance path that requires energy analysis and inspection. In Colorado, many builders utilize this path and are seeing value due to increased quality assurance, consistency across jurisdictional boundaries in a home rule state, and measured quantification of compliance.

RE154-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R405.2-EC-SCHWARZ.DOC

RE155-13

R405.3 (IRC N1105.3)

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

Revise as follows:

R405.3 (N1105.3) Performance-based compliance. Compliance based on simulated energy use performance requires that a proposed residence (*proposed design*) be shown to have an annual energy ~~cost~~use that is less than or equal to the annual energy ~~cost~~ use of the *standard reference design*. To equate electricity with other fuels, the electricity use shall be multiplied by 2.9.

Compliance based on energy cost shall be permitted. Energy prices shall be taken from an approved source approved by the code official, such as the Department of Energy, Energy Information Administration's State Energy Price and Expenditure Report. Code officials shall be permitted to require time-of-use pricing in energy cost calculations.

~~**Exception:** The energy use based on source energy expressed in Btu or Btu per square foot of conditioned floor area shall be permitted to be substituted for the energy cost. The source energy multiplier for electricity shall be 3.16. The source energy multiplier for fuels other than electricity shall be 1.1.~~

Reason. Energy costs change over time. Using a specific value means any calculation will remain constant. This makes the constant value the main metric, but allows energy costs, just the reverse of the current. The multiplier, 2.9, is the result of 3.16 divided by 1.1.

Cost Impact: The code change proposal will not increase the cost of construction.

RE155-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R405.3 #1-EC-CONNER.DOC

RE156-13

R405.3 (New) (IRC N1105.3 (New))

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

Add new text as follows:

R405.3 (N1105.3) Additional performance options. *Where approved, performance calculations shall include the impact of controls and energy distribution systems provided that such controls and systems are a physical part of the building. Performance calculations shall consider only energy use within the scope of this code. The calculations shall not consider occupant behavior changes or switching between fossil and electric fuels.*

Reason: As the thermal shell and equipment get more efficient, more of the remaining efficiency will be found in control systems for energy use devices and in the distribution systems for air and water. This establishes a broad principal that permits, but does not require, consideration of a variety of elements that may contribute to the energy efficiency of a residence.

Cost Impact: The code change proposal will not increase the cost of construction.

RE156-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R405.3 #2-EC-CONNER.DOC

RE157-13

R405.3 (IRC N1105.3)

Proponent: Brian Dean, Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; and Bill Prindle, Energy Efficient Codes Coalition.

Revise as follows:

R405.3 (N1105.3) Performance-based compliance. Compliance based on simulated energy performance requires that a proposed residence (*proposed design*) be shown to have an ~~annual~~ energy cost over a 30 year useful life of the building, on a present value basis, that is less than or equal to the ~~annual~~ energy cost over a 30 year useful life of the building, on a present value basis, of the *standard reference design*. Improvements in energy efficiency in the *proposed design* over the *standard reference design* shall be assumed to revert to the *standard reference design* at the end of the useful life of the improvement. Energy prices, energy price escalation rates, discount rates, the useful life of specific building features and components including installed energy efficiency measures in the building and all other necessary assumptions for the analysis shall be taken from a *approved* sources. ~~approved by the code official, such as the Department of Energy, Energy Information Administration's *State Energy Price and Expenditure Report*.~~ Code officials shall be permitted to require time-of-use pricing in energy cost calculations.

Exception: The energy use based on source energy expressed in Btu or Btu per square foot of *conditioned floor area* shall be permitted to be substituted for the energy cost. The source energy multiplier for electricity shall be 3.16. The source energy multiplier for fuels other than electricity shall be 1.1.

Reason: The purpose of this code change is to improve the efficiency of buildings by modifying the methodology to incorporate useful life and present value concepts for calculating energy cost under the Section R405 Simulated Performance Alternative. The current section R405.3 calculates the annual energy cost in the first year of a proposed new home and compares it against a baseline Standard Reference Design home to determine compliance. A major problem with this approach is the comparison of energy cost only in the first year. The home is designed to last for many years and over such period energy costs will change and various components of the home and energy efficiency measures will be required to be replaced due to shorter useful lives. This fact is recognized in the Intent of the IECC, Section R101.3 which is directed at regulating "the design and construction of buildings for the effective use and conservation of energy over the useful life of each building."

A more sophisticated analysis would account for these changes over time. The proposed change is intended to require this more sophisticated analysis. Specifically, the proposed changes require:

- the use of a 30-year useful building life;
- energy costs to be escalated over time;
- incorporation of the useful life of each feature of the building constituting an energy efficiency improvement over the standard reference design, by requiring that the analysis assume that the feature revert to the standard reference design at the end of its useful life;
- the use of the present value of energy costs for comparison purposes; and the assumptions for the analysis be derived from a source approved by the code official.

Cost Impact: The code change proposal will not increase the cost of construction.

RE157-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R405.3-EC-DEAN-HARRIS-MISURIELLO-PRINDLE-STONE.DOC

RE158-13

R405.3 (IRC N1105.3)

Proponent: Keith Dennis, P.E., National Rural Electric Cooperative Association (NRECA) representing NRECA. (Keith.Dennis@nreca.coop)

Revise as follows:

R405.3 (N1105.3) Performance-based compliance. Compliance based on simulated energy performance requires that a proposed residence (*proposed design*) be shown to have an annual energy cost that is less than or equal to the annual energy cost of the *standard reference design*. Energy prices shall be taken from a source *approved by the code official*, such as the Department of Energy, Energy Information Administration's *State Energy Price and Expenditure Report*. *Code officials* shall be permitted to require time-of-use-pricing in energy cost calculations.

Exception: The energy use based on site or source energy expressed in Btu or Btu per square foot of *conditioned floor area* shall be permitted to be substituted for the energy cost. The source energy multiplier for electricity shall be 1.89 ~~3.46~~. The source energy multiplier for fuels other than electricity shall be 1.1.

Reason: This revision provides more flexibility for code officials, and updates the energy source multiplier for electricity to a more current number developed by DOE for appliance energy efficiency standards for 2015 in recent rulemakings (for dishwashers and furnace fans) in Technical Support Documents. The current code includes an outdated factor and does not allow the ability to use site energy, which is the metric that can best be directly affected during construction. The inclusion of site energy would not be setting any precedents. Site energy was originally allowed in this exception and used by code officials. Unfortunately, it was removed in 2009. (See the following sources):

Furnace Fan Technical Support Document, June 2012:

http://www1.eere.energy.gov/buildings/appliance_standards/rulemaking.aspx/ruleid/41

Figure 10.3.1 Site-to-Source Conversion Factors for Electricity

Table 10.3.3 Site-to-Source Conversion Factors for Electricity and Natural Gas

Year	Electricity <u>Btu/kWh</u>	Natural Gas <u>Btu/Btu</u>	Year	Electricity <u>Btu/kWh</u>	Natural Gas <u>Btu/Btu</u>
2010	7,009	1.07	2023	6,506	1.07
2011	6,827	1.07	2024	6,534	1.07
2012	6,651	1.07	2025	6,534	1.07
2013	6,549	1.07	2026	6,538	1.07
2014	6,486	1.07	2027	6,552	1.07
2015	6,448	1.07	2028	6,555	1.07
2016	6,443	1.07	2029	6,551	1.07
2017	6,433	1.07	2030	6,548	1.07
2018	6,427	1.07	2031	6,552	1.07
2019	6,425	1.07	2032	6,551	1.07
2020	6,436	1.07	2033	6,548	1.07
2021	6,468	1.07	2034	6,550	1.07
2022	6,483	1.07	2035–2047	6,561	1.07

Source: NEMS, 2011.

Using the 2015 value, 6,448 Btu / 3,413 Btu/kWh = 1.889246997 = 1.89

Cost Impact: The code change proposal will not increase the cost of construction. There is no cost impact to updating the source energy multiplier for electricity and increasing flexibility.

RE158-13

Public Hearing: Committee: AS AM D
 Assembly: ASF AMF DF

R405.3-EC-DENNIS.DOC

RE159-13

R405.3 (IRC N1105.3)

Proponent: Chuck Foster, Foster and Jamison representing self (cfoster20187@yahoo.com)

Revise as follows:

R405.3 (N1105.3) Performance-based compliance. Compliance based on simulated energy performance requires that a proposed residence (*proposed design*) be shown to have an annual energy cost that is less than or equal to the annual energy cost of the *standard reference design*. Energy prices shall be taken from a source *approved by the code official*, such as the Department of Energy, Energy Information Administration's *State Energy Price and Expenditure Report*. *Code officials* shall be permitted to require time-of-use-pricing in energy cost calculations.

Exception: The Energy use based on source energy expressed in total annual Btu's or annual Btu's per square foot of *conditioned floor area* shall be permitted to be substituted for ~~the~~ energy cost. The source energy multiplier for electricity shall be ~~3.16~~ 1.89. The source energy multiplier for fuels other than electricity shall be 1.1.

Reason: This code proposal changes the source energy multiplier for electricity from its existing value of 3.16 Btu's to 1.89 Btu's. It also clarifies that the Btu or Btu/square foot value should be estimated on an annual basis.

While there are several jurisdictions in the United States that use source energy as the basis of their energy codes, the overwhelming majority use either site energy or cost. This exception (in R405.3) was originally offered to accommodate those few jurisdictions that have chosen to use source energy.

One of the challenges for use of source energy in codes is that the relationship between site and "source energy" consumption is not well defined. For instance, the 3.16 value currently in the code assumes that electricity produced from wind, solar, hydro and other forms of renewable energy is equivalent to the consumption of fossil fuels. The same assumption holds for electricity derived from nuclear energy. Thus, from a source energy perspective an unbiased observer would be relatively indifferent between choosing electricity from 100% renewable sources (wind or hydro for instance) and diesel, fuel oil, or gas. This outcome does not seem helpful.

In addition, the mix of sources for the production of electricity (wind, solar, hydro, nuclear, coal, oil, gas, geothermal, etc.) changes – and will continue to change dramatically going into the future with the proliferation of additional renewable energy resources (especially wind) into the national mix. Even if the 3.16 source energy multiplier was a good number when it was originally adopted (something this proposal disagrees with as argued above), it is surely not still valid.

Finally, it is important to recognize that the impact of the IECC will be realized in the future – codes considered today will have marketplace impacts starting in 2015 so looking at electric source energy multipliers today (2013) that are based on data from 2011 (or earlier) for use in 2015 (or later) is likely to convey to users inaccurate pictures of actual resource impacts.

The U.S. Department of Energy recognized this time lag problem in a recent rulemaking. Per Federal legislation, DOE makes appliance efficiency standards for many residential and commercial products like water heaters and furnaces based on *site* energy consumption.

In addition, however, DOE *estimates* the *source* energy impacts based on data prepared by the Energy Information Agency. In a rulemaking in 2012 on dishwashers, DOE used EIA generation data for the year 2015 going forward as it explained the marketplace impact would be observed in the future and use of current (or past) electric generation data would not be appropriate.

Specifically, DOE used the value of 1.89 for a source energy multiplier in 2015 and this proposal would adopt for the IECC the same source energy value used by DOE. (Dishwasher Technical Support Document, May 2012 http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/67)

Cost Impact: This proposed code change proposal will not increase the cost of construction. There is no cost impact to increasing flexibility in the performance path.

R405.3-EC-FOSTER.DOC

RE160-13

R405.3 (IRC N1105.3)

Proponent: Steve Rosenstock, Edison Electric Institute, representing Edison Electric Institute (srosenstock@eei.org)

Revise as follows:

R405.3 (N1105.3) Performance-based compliance. Compliance based on simulated energy performance requires that a proposed residence (*proposed design*) be shown to have an annual energy cost that is less than or equal to the annual energy cost of the *standard reference design*. Energy prices shall be taken from a source *approved* by the *code official*, such as the Department of Energy, Energy Information Administration's *State Energy Price and Expenditure Report*. *Code officials* shall be permitted to require time-of-use-pricing in energy cost calculations.

Exception: The energy use based on *site* or source energy expressed in Btu or Btu per square foot of *conditioned floor area* shall be permitted to be substituted for the energy cost. The source energy multipliers ~~shall be determined by the code official. for electricity shall be 3.16. The source energy multiplier for fuels other than electricity shall be 1.4.~~

Reason: This proposal will make the provision more flexible for building designers, building owners, and code officials.

Part I: Site Energy

Site energy was part of the exception for many years until it was recently removed. There are many reasons to allow site energy to be used instead of energy costs:

- 1) Site energy is an actual metric that can be measured and verified by code officials, while source energy is an estimate.
- 2) Site energy information is credible, as it is shown on customers' energy bills on a monthly basis and used in other consensus-based code documents, such as ASHRAE 90.1, ASHRAE 90.2, and ICC-700 use site energy metrics for efficiency requirements.
- 3) DOE uses site energy information in many of its energy efficiency and energy consumption publications, such as the Residential Energy Consumption Survey. DOE uses site energy for its appliance energy efficiency standards program and the FTC uses site energy on the yellow EnergyGuide labels found on consumer appliances. EPA uses site energy to determine if an appliance or home qualifies for the Energy Star program.
- 4) Site energy is reliable, since it can be measured by utilities, consumers, and independent 3rd parties. In terms of energy efficiency upgrades, consumers rely on site energy information (amount used by older appliance or equipment compared to new appliance or equipment) to help them make energy efficiency decisions.
- 5) Site energy is replicable, as the units of measurement (kWh, therms, gallons, Btu's) can be used throughout the United States and are familiar to consumers on their monthly energy bills. Source energy is not replicable, as different estimates must be used for different energy sources, and different entities can make different assumptions about upstream production and delivery of different energy sources.
- 6) Site energy is transparent and easy to understand. It can be based on meter readings or DOE test procedures or FTC EnergyGuide labels or Energy Star labels. It is the metric that allows people to easily compare energy efficiency options in the marketplace. It is the metric that allows people to make good economic choices when faced with competitive alternatives.

Part II – Revision of Source Energy Estimates

There are many ways to estimate upstream energy losses. The energy production industry is very dynamic and subject to significant changes. In the United States in 2012 and 2013, there was and will be record amounts of natural gas produced from hydraulic fracturing production techniques. In 2012 and 2013, there will be record amounts of oil produced and imported from oil sands production. In 2012, there was a record amount of electricity produced from renewable forms of energy and a record amount of electricity produced by combined-cycle natural gas turbines.

The values that are currently shown should be deleted and not used for the following reasons:

- 1) The values shown are not consistent with values shown in other published documents.

Many documents and articles have been published over the past several years with source energy estimates. Among them are:

National Renewable Energy Laboratory NREL/TP-550-38617 "Source Energy and Emission Factors for Energy Use in Buildings" (June 2007)

American Gas Association EA 2009-3 "A Comparison of Energy Use, Operating Costs, and Carbon Dioxide Emissions of Home Appliances" (October 2009)

Environmental Protection Agency "Energy Star Performance Ratings Methodology for Incorporating Source Energy Use" (August 2009)

National Renewable Energy Laboratory NREL/TP-550-47246 "Building America Research Benchmark Definition" (January 2010)

International Code Council "International Green Construction Code" (March 2012)

U.S. Department of Energy Residential Dishwasher Energy Efficiency Technical Support Document, May 2012:
http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/67

U.S. Department of Energy Residential Furnace Fan Technical Support Document, June 2012:
http://www1.eere.energy.gov/buildings/appliance_standards/rulemaking.aspx/ruleid/41

The values in the IECC do not match and cannot be substantiated with any of these published documents.

2) Different fossil fuels have different upstream source estimates.

In the IECC, all fossil fuels are assumed to have the same multiplier. In other documents, there is a large variation in the upstream estimates that will have a significant impact on energy performance results. As one example, for fuel oil and propane, EPA Portfolio Manager uses a factor of 1.01 for both, while NREL used estimated values of 1.158 and 1.151.

3) The use of 3.16 for electricity is overstated for many parts of the United States and does not account for significant regional differences or the increase in the use of renewable power generation and combined cycle gas turbines.

In other publications and web sites, the estimates for electricity are shown on a national basis, a regional basis, or a state by state basis. This is due to the variety of electric generation techniques which have upstream energy losses that can vary by orders of magnitude based on local conditions, regional conditions, physical location, season, month, week, or day, as well as hourly fluctuations in the amount of sunlight or wind speed.

In the IGCC Table 602.1.2.1, there are 26 values shown for electricity, based on the power pool sub-region in which a building is located. The values in the IGCC table (which are based on outdated 2005 electric generation data) range from 1.76 to 3.82. Using the value of 3.16 will overstate the source estimate for electricity in 18 (or 69.2%) of the 26 power pool sub-regions shown in the table (that uses 2005 data). Using 2011 or 2012 data would show that the current values is more overstated for the 18 regions and likely to be overstated for other regions as well.

In summary, this code change will allow the code official to use the most recent data for current or projected source energy estimates, rather than use static and outdated values that do not correspond to the rapidly changing nature of energy production in the United States, and worldwide.

Cost Impact: This proposed code change proposal will not increase the cost of construction. There is no cost impact to increasing flexibility in the performance path.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R405.3-EC-ROSENSTOCK.DOC

RE161-13

R405.3 (IRC N1105.3), Chapter 5

Proponent: Robby Schwarz EnergyLogic Inc. representing EnergyLogic, Inc. (robby@nrglogic.com)

Revise as follows:

R405.3 (N1105.3) Performance-based compliance. Compliance based on simulated energy performance requires that a proposed residence *proposed design* be shown to have an annual energy cost that is less than or equal to the annual energy cost of the *standard reference design*. Energy prices shall be taken from a source *approved* by the *code official*, such as the Department of Energy, Energy Information Administration's *State Energy Price and Expenditure Report*. *Code officials* shall be permitted to require time-of-use pricing in energy cost calculations.

Exceptions:

1. The energy use based on source energy expressed in Btu or Btu per square foot of *conditioned floor area* shall be permitted to be substituted for the energy cost. The source energy multiplier for electricity shall be 3.16. The source energy multiplier for fuels other than electricity shall be 1.1.
2. Compliance shall be based on comparative analyses between the *proposed design* and the *standard reference design* using scoring generated by RESNET Mortgage Industry National Home Energy Rating Standards. The *proposed design* shall comply with the code where the score of the *proposed design* is less than or equal to the score of the *standard reference design* provided that the analyses use identical geometry and the energy efficiency features for the *standard reference design* in Table R405.5.2(1) are used for the *standard reference design* analysis.

Add new standard to Chapter 5 as follows:

RESNET Residential Energy Services Network, Inc.
P.O. Box 4561
Oceanside, CA 92052-4561

RESNET Standards-2013 RESNET Mortgage Industry National Home Energy Rating Standards.

Reason: The current annual energy cost matrix for demonstrating code compliance is flawed and may demonstrate that a house that should pass the energy code, based on actual geometry and energy specifications, may not only because the energy costs in a region have changed. More and more jurisdiction and builders across the country are turning to performance scores to represent the efficiency of a home and to demonstrate code compliance. Performance scores in and of themselves do not necessarily demonstrate code compliance. However, if the score is imposed on the existing structure of the code as Exception #2 does, the score can reflect code compliance simply as a means of demonstrating passing and failing.

The current structure of the simulated performance path requires that the mandatory sections of the IECC be complied with, thus ensuring that house performance is maintained and that the score is only a measure to demonstrate compliance. In addition, exception #2 utilizes the code reference home as described in table 405.5.2(1) and therefore energy code compliance utilizing this pathway will have a score that is variable for each qualified home. This is accomplished through the 2015 IECC Reference Design outlined in table 405.5.2(1). When the builders proposed designed home is configured with the IECC reference design features and modeled using approved software, the resulting score becomes the basis for the performance score target for that home. The EPA Energy Star program and the DOE Challenge Home program utilize this same matrix for demonstrating qualification for their programs and have demonstrated that the compliance path described in exception #2 will set the score target for the performance path equal to the performance that would be achieved if the prescriptive path was followed for each individual home. In this way jurisdictions can avoid developing a fixed value, or performance score, which really has no bearing on compliance and instead set the score threshold required for energy code compliance at the same value that the same house would earn if configured to the IECC prescriptive path, as outlined in table 405.5.2(1) Reference Design.

** Footnote to Energy Star and DOE Challenge Home program documents

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, RESNET Standards, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

	Assembly:	ASF	AMF	DF

R405.3-EC-SCHWARZ.DOC

RE162-13

R405.4 (NEW) (IRC N1105.4 (NEW))

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

Add new text as follows:

R405.4 (N1105.4) Renewable energy. On-site energy production from renewables and waste shall be treated as a reduction in energy use. This includes, but is not limited to, photovoltaic and solar hot water systems that are standalone or integrated into the building, as well as renewable energy located on or adjacent to the building site. Both energy generated for use on the building site and energy sent back to the energy supply system shall be considered reductions in energy use.

Reason: This provides a mechanism for treating renewable energy generated at residences as an energy savings for that residence.

Cost Impact: The code change proposal will not increase the cost of construction.

RE162-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R405.4-EC-CONNER.DOC

RE163-13

R405.4.2 (IRC N1105.4.2), R405.4.2.1 (NEW) (IRC N1105.4.2.1 (NEW)), R405.2.2 (NEW) (IRC N1105.4.2.2 (NEW))

Proponent: Robby Schwarz EnergyLogic Inc., representing EnergyLogic, Inc. (robby@nrglogic.com)

Revise as follows:

R405.4.2 (N1105.4.2) Compliance report. Compliance software tools shall generate a report that documents that the *proposed design* complies with Section R405.3. A compliance report on the *proposed design* shall be submitted with the application for the building permit. Upon completion of the building, a compliance report based upon the as-built condition of the building, shall be submitted to the *code official* before a certificate of occupancy is issued by the *code official*. Batch sampling of buildings to determine energy code compliance for all buildings in the batch shall be prohibited.

Compliance reports shall include information in accordance with Sections R405.4.2.1 and R405.4.2.2. The compliance documentation shall include the following information: Where the *proposed design* of a building could be built on different sites where the cardinal orientation of the building on each site is different, compliance of the *proposed design* for the purposes of the application for the building permit, shall be based upon the worst case orientation, worst case configuration, worst case building air leakage and worse case duct leakage. Such worse case parameters shall be used as inputs to the compliance software for energy analysis.

- ~~1. Address or other identification of the residence;~~
- ~~2. An inspection checklist documenting the building component characteristics of the *proposed design* as listed in Table R405.5.2(1). The inspection checklist shall show results for both the *standard reference design* and the *proposed design*, and shall document all inputs entered by the user necessary to reproduce the results;~~
- ~~3. Name of individual completing the compliance report; and~~
- ~~4. Name and version of the compliance software tool.~~

R405.4.2.1 (N1105.4.2.1) Compliance report for permit application. A compliance report submitted with the application for building permit shall include all of the following:

1. Building street address, or other building site identification.
2. A statement indicating that the *proposed design* complies with Section R405.3.
3. An inspection checklist documenting the building component characteristics of the *proposed design* as indicated in Table R405.5.2(1). The inspection checklist shall show results for both the *standard reference design* and the *proposed design* with all user inputs to the compliance software to generate the results.
4. A site-specific energy analysis report that is in compliance with Section R405.3
5. Name of the individual performing the analysis and generating the report.
6. Name and version of the compliance software tool.

R405.4.2.2 (N1105.4.2.2) Compliance report for certificate of occupancy. A compliance report submitted for obtaining the certificate of occupancy shall include all of the following:

1. Building street address, or other building site identification
2. A statement indicating that the as-built building complies with Section R405.3.
3. A certificate indicating that the building passes the performance matrix for code compliance and the energy saving features of the buildings.
4. A site-specific energy analysis report that is in compliance with Section R405.3.
5. Name of the individual performing the analysis and generating the report.

6. Name and version of the compliance software tool.

Exception: ~~Multiple orientations. When an otherwise identical building model is offered in multiple orientations, compliance for any orientation shall be permitted by documenting that the building meets the performance requirements~~

Reason: Jurisdictions, Builders, third party inspection companies and others are not clear of the process for completing and utilizing the simulated performance path. With all pathways through the energy code one must in essence declare how they will meet the intent of the code. For the prescriptive path they simply say they are going prescriptive, for the UA trade off path they submit a document such as a RESCheck report, and for the simulated performance path they must currently submit a document demonstrating that the annual energy cost of the proposed design are less than or equal to the same home if it were built with the reference design specification. It becomes unclear how one demonstrates that they have carried out their proposed design. The revisions proposed for this section clearly outlines a process by which the proposed design is submitted, inspections take place, and additional analysis is preformed to ensure that the proposed design was achieved or bettered for the purposes of compliance.

Cost Impact: The code change proposal will not increase the cost of construction.

RE163-13

	Assembly:	ASF	AMF	DF

R405.4.2-EC-SCHWARZ.DOC

RE164-13

Table R405.5.2(1) (IRC Table N1105.5.2(1))

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

Revise as follows:

TABLE R405.5.2(1) (N1105.5.2(1))
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Glazing ^a	Total area^b = (a) The proposed glazing area; where proposed glazing area is less than 15% of the conditioned floor area. (b) 15% of the conditioned floor area; where the proposed glazing area is 15% or more of the conditioned floor area.	As proposed
	<u>As proposed</u>	
	Orientation: equally distributed to four cardinal compass orientations (N, E, S & W).	As proposed
	U-factor: from Table R402.1.3	As proposed
	SHGC: From Table R402.1.1 except that for climates with no requirement (NR) SHGC = 0.40 shall be used. Interior shade fraction: 0.92-(0.21 × SHGC for the standard reference design) External shading: none	As proposed 0.92-(0.21 × SHGC as proposed) As proposed

For SI: 1 square foot = 0.93 m², 1 British thermal unit = 1055 J, 1 pound per square foot = 4.88 kg/m², 1 gallon (U.S.) = 3.785 L, °C = (°F-3)/1.8, 1 degree = 0.79 rad.

(Portions of Table not shown remain unchanged)

- a. Glazing shall be defined as sunlight-transmitting fenestration, including the area of sash, curbing or other framing elements, that enclose conditioned space. Glazing includes the area of sunlight-transmitting fenestration assemblies in walls bounding conditioned basements. For doors where the sunlight-transmitting opening is less than 50 percent of the door area, the glazing area is the sunlight transmitting opening area. For all other doors, the glazing area is the rough frame opening area for the door including the door and the frame.
- b. ~~For residences with conditioned basements, R-2 and R-4 residences and townhouses, the following formula shall be used to determine glazing area:~~
- ~~$AF = A_s \times FA \times F$~~
- ~~where:~~
- ~~AF = Total glazing area.~~
- ~~A_s = Standard reference design total glazing area.~~
- ~~$FA = (\text{Above-grade thermal boundary gross wall area}) / (\text{above-grade boundary wall area} + 0.5 \times \text{below-grade boundary wall area}).$~~
- ~~$F = (\text{Above-grade thermal boundary wall area}) / (\text{above-grade thermal boundary wall area} + \text{common wall area})$ or 0.56, whichever is greater.~~
- ~~and where:~~
- ~~Thermal boundary wall is any wall that separates conditioned space from unconditioned space or ambient conditions.~~
- ~~Above-grade thermal boundary wall is any thermal boundary wall component not in contact with soil.~~
- ~~Below-grade boundary wall is any thermal boundary wall in soil contact.~~
- ~~Common wall area is the area of walls shared with an adjoining dwelling unit.~~
- ~~L and CFA are in the same units.~~

Reason: The principals should be: Keep it simple. Keep it energy efficient. Simple is setting a specific window requirement and having it apply to the whole performance approach, as is done in the prescriptive approach. Simple is presuming that the glass area

for the performance calculation is the same as the glass area in the proposed new home. Simple is removing unneeded calculations. This change also has the effect of allowing changes from plans to the home as constructed without recalculation.

As windows get more efficient, the window area matters less. In some situations more glass better. In northern climates windows at the edge of what is now in the market may be as good as a "normal" wall. Therefore the impact of window area is decreased and not worth the calculation.

Removal of the window area calculation was the major simplification in the 2003 IECC simplification needed to get to the 2006 IECC. The 2006 IECC simply says use as much window as you want, just make it energy efficient windows. Requiring a specific window for each climate zone created huge markets for those specific levels of efficiency. Window makers respond by making a energy efficient windows a commodity, with a significant fall in the cost for energy efficient windows. The effect has been so strong that the building code has repeatedly pushed Energy Star to move to new levels.

Cost Impact: The code change proposal will not increase the cost of construction.

RE164-13

RE165-13

202 (NEW) (IRC N1101.9 (NEW)), Table R405.5.2(1) (IRC Table N1105.5.2(1))

Proponent: Gary MacFadden, National Electrical Manufacturers Association (NEMA)
(gary.macfadden@Nema.org)

Revise as follows:

TABLE R405.5.2(1) (N1105.5.2(1)) SPECIFICATIONS FOR THE STANDARD REFERENCE DESIGN AND PROPOSED DESIGNS		
BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Heating systems ^{f, g}	<p>As proposed for other than electric heating without a heat pump.</p> <p><u>Where a proposed design utilizes grid-interactive electric thermal storage, the standard reference design shall be as proposed.</u></p> <p><u>Where the proposed design utilizes electric heating without a heat pump, electric heating design does not utilize a heat pump or grid-interactive electric thermal storage, the standard reference design shall be an air source heat pump in accordance with Section C403 of the International Energy Conservation Code.</u></p> <p>Capacity: sized in accordance with Section R403.6</p>	As proposed

(Portions of Table not shown remain unchanged)

Add new definition as follows:

GRID-INTERACTIVE ELECTRIC THERMAL STORAGE (ETS). A device designed for the storage of electrical energy that has been converted into heat, and that has the ability to turn on or off in response to the needs of the utility or the electric grid.

Reason: As it is written, Table R405.5.2(1) requires a modeler to assume a heat pump system whenever a designer proposes to use "... other than electric heating without a heat pump," *i.e.*, electric resistance or electric radiant heating in a new residence. While perhaps serving a valuable function in some fashion in the past (elimination of gaming where a modeler assumes an electric furnace for the reference house and then proposes a heat pump allowing a less stringent envelope), the limitation on use of ERH in the modeling is overly restrictive, particularly as it relates to Grid-interactive electric thermal storage ("ETS"). The definition is being added because the IECC does not currently have a definition for grid-interactive electric thermal storage.

Substantiation: ETS systems have significantly different operational and energy consumption characteristics versus other types of heating systems. These differences are at the core of the rationale behind this code change proposal. In particular, ETS systems have the ability to respond to the needs of the utility and electric grid by storing energy during preferential times of the day or night and turn on or off as needed. This is very beneficial in improving efficiency of power generation, transmission and distribution, for integration of renewable energy and for providing grid power balancing services. Unfortunately, ETS systems are generally lumped together with traditional heating systems (as they are in the existing code language).

Language like that found currently in Table R405.5.2(1) that requires a modeler to assume a heat pump in the reference house, even if the designer intends to use electric resistance heating, including an ETS in the proposed house, has been in the IECC for many years. The justification cited historically for that modeling limitation is:

- That modelers will game the system by assuming ERH in the reference house but a heat pump in the proposed house, thereby allowing a less stringent envelope, and/or

- That a heat pump will consume on the order of half the energy of an electric furnace installed in the same house so the code should discourage designers from specifying ERH and instead should specify a heat pump.

With respect to the former of these justifications, the current language requiring the same equipment to be modeled in both the reference and the proposed designs denies any opportunity to game the system as described above.

That leaves the latter as the potential justification for the restriction against modeling the use of electric resistance heating in the reference house. To some extent, this seems appropriate. If, for instance, in some heating dominated climates, a designer is proposing to install a ducted electric furnace with central air-conditioning, then incenting that designer to use a heat pump instead of an electric furnace might be expected to save some amount of energy at a relatively modest cost.

But there are significant operational and energy consumption characteristics that distinguish ETS from traditional heating systems (whether fueled by electricity, gas, oil or other fuel) as described in more detail below.

Grid-interactive electric thermal systems ("ETS"). ETS have significantly different operational and energy consumption characteristics from traditional electric and fossil heating systems.

Thermal battery. Electric utilities dispatch their generators in the order from the most cost efficient (base load generation) to the least cost efficient (peaking load generation). ETS complements the efficient dispatch of generation by utilities by allowing the storage of energy that is produced more efficiently for use later, and by avoiding the requirement to operate less efficient generators at peak load conditions. ETS accomplishes this feat by charging (heating bricks, water, or other storage media) at times when utilities have excess capacity. Often this is at night but it can vary between utilities. Because the system is grid-interactive, an ETS can charge at times that are optimum for the utility, allowing utilities to efficiently manage their peak demands and their customer costs. Heat that is stored for later use effectively makes ETS a thermal battery.

Renewable energy. ETS is a unique complement to the generation of electricity from renewable energy like wind and solar. Many times peak power production from renewable energy sources does not coincide with a utility's demand for electricity. As an example, wind generation usually peaks at night when demand for energy is not usually the greatest. For that reason, Bonneville Power last year was forced to curtail the generation from wind generators at certain times because it didn't need all the electricity the wind generators were producing! ETS is a good fit for storing excess renewable energy and has been successfully deployed in Bonneville's service territory as well as the service territory of other electric utilities.

Reduces winter peak. When electrical demands on a utility's system grow, it is forced to dispatch less efficient generators to meet that demand, so to the extent demand is *reduced* the utility avoids costs (that would ultimately be passed on to customers) and saves energy. ETS allows the storage of energy produced by more efficient generators.

Replaces fossil fuel in utility grid control. When electrical demand on a utility's grid changes (up or down), the most immediate system response is for the grid's frequency to drift away from ideal (60 cycles per second). To control these frequency excursions, utilities have traditionally operated fossil fuels generators to add voltage to the grid to raise the frequency as it falls away from 60 cycles. Grid-interactive ETS can be dispatched in lieu of fossil fuel generators to remedy frequency excursions, thereby saving energy and costs. According to a Kema report, usage of a non-carbon emitting resource such as ETS for providing regulation services can reduce carbon emissions for regulation by nearly 65%.

ETS offer significant benefits to customers, including the ability to store renewable energy, the ability to reduce utility costs, and the ability to reduce the consumption of fossil fuel by utilities in the regulation of system frequency.

Table R405.5.2(1) (IRC Table N1105.5.2(1))

Proponent: Don Surrena, CBO, National Association of Home Builders (NAHB) (dsurrena@nahb.org)

Revise as follows:

**TABLE R405.5.2(1) (N1105.5.2(1))
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS**

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Heating systems ^{f, g}	<p>As proposed for other than electric heating without a heat pump. Where the proposed design utilizes electric heating without a heat pump the standard reference design shall be an air-source heat pump meeting the requirements of Section R403 of the IECC-Commercial Provisions.</p> <p><u>Fuel type: same as proposed design</u></p> <p><u>Efficiencies:</u></p> <p><u>Electric: air-source heat pump with prevailing federal minimum standards</u></p> <p><u>Non-electric furnaces: natural gas furnace with prevailing federal minimum standards</u></p> <p><u>Non-electric boilers: natural gas boiler with prevailing federal minimum standards</u></p> <p>Capacity: sized in accordance with Section R403.6</p>	<p>As proposed</p> <p><u>As proposed</u></p> <p><u>As proposed</u></p> <p><u>As proposed</u></p> <p><u>As proposed</u></p>
Cooling systems ^{f, h}	<p>As proposed</p> <p><u>Fuel type: Electric</u></p> <p><u>Efficiency: in accordance with prevailing federal minimum standards</u></p> <p>Capacity: sized in accordance with Section R403.6</p>	<p>As proposed</p> <p><u>As proposed</u></p>
Service water heating ^{f, g, h, i}	<p>As proposed</p> <p><u>Fuel type: same as proposed design</u></p> <p><u>Efficiency: in accordance with prevailing federal minimum standards</u></p> <p><u>Use: gal/day = 30 + (10 × Nbr)</u></p> <p><u>Nbr = Number of bedrooms</u></p> <p><u>Tank temperature: 120°F</u></p> <p><u>Use: same as proposed design</u></p>	<p>As proposed</p> <p><u>As proposed</u></p> <p><u>Same as standard reference</u></p> <p><u>Same as standard reference</u></p> <p><u>gal/day = 30 + (10 × Nbr)</u></p>

(Portions of table not shown remain unchanged)

Reason: This amendment serves to retain energy neutral equipment trade-off provisions from the 2006 International Energy Conservation Code (IECC) for the heating systems, cooling systems, and service water heating. By retaining these, builders have an opportunity to optimize a code-compliant house design by using energy efficient equipment. Quite often, the use of this high efficiency equipment provides a more cost effective solution to achieve code compliance. Eliminating this ability discourages the concept of the "house as a system" approach which is a cornerstone of building science.

Rejecting this amendment will create a negative impact on the installation of state-of-the-art, energy efficient equipment. It will increase the cost of construction by driving builders to often use less efficient equipment while increasing the cost of construction.

Significant improvements in the efficiency of HVAC and water heating equipment have been made in the last 20 years. With the increased emphasis on new and improved technologies, this trend is expected to continue and will result in even higher energy savings in future years. If builders are forced to comply with the energy code by installing requirements which are not cost-effective, there will be a resistance to install higher efficiency equipment. This could end up hurting energy efficiency in the long term, consumers which have non-condensing furnaces will be less likely to install a higher efficiency condensing replacement furnace because of the additional cost to run an exhaust vent.

Industries such as log home manufacturers may no longer be able to construct to projected higher envelope requirements. The combination of increases in envelope thermal requirements, building tightness and duct tightness combined with the elimination of energy neutral trade-offs pose a serious threat to the viability of the log home industry. There are practical limitations to the thickness of log home walls, increases in the log diameter has a exponential increase in the cost of the logs making log walls with a U-factor of 0.082 or lower prohibitively expensive.

Cost Impact: The code change proposal will not increase the cost of construction.

R405.5.2(1)T #1-EC-WILLIAMS.DOC

RE168-13

Table R405.5.2(1) (IRC Table N1105.5.2(1))

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

TABLE R405.5.2(1) (N1105.5.2(1))
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Heating systems ^{f,g}	<p>As proposed for other than electric heating without a heat pump. Where the proposed design utilizes electric heating without a heat pump the standard reference design shall be an air-source heat pump meeting the requirements of Section R403 of the IECC-Commercial Provisions.</p> <p><u>Fuel type: same as proposed design</u></p> <p><u>Efficiencies:</u> <u>Electric: air-source heat pump with prevailing federal minimum standards</u></p> <p><u>Nonelectric furnaces: natural gas furnace with prevailing federal minimum standards</u></p> <p><u>Nonelectric boilers: natural gas boiler with prevailing federal minimum standards</u></p> <p>Capacity: Sized in accordance with Section R403.6</p>	<p>As proposed</p> <p><u>As proposed</u></p> <p><u>As proposed</u></p> <p><u>As proposed</u></p> <p><u>As proposed</u></p>
Cooling systems ^{f,h}	<p>As proposed</p> <p>Fuel type: Electric</p> <p>Efficiency: in accordance with prevailing federal minimum standards</p> <p>Capacity: sized in accordance with Section R403.6</p>	<p>As proposed</p> <p><u>As proposed</u></p>
Service Water Heating ^{f,g,h,i}	<p>As proposed</p> <p><u>Fuel type: same as proposed design</u></p> <p><u>Efficiency: in accordance with prevailing federal minimum standards</u></p> <p><u>Use: gal/day = 30 + 10 × Nbr</u></p> <p><u>Tank temperature: 120°F</u></p> <p>Use: same as proposed design</p>	<p>As proposed</p> <p><u>As proposed</u></p> <p><u>Same as standard reference</u></p> <p><u>Same as standard reference</u></p> <p><u>gal/day = 30 + (10 × Nbr)</u></p>

For SI: 1 square foot = 0.93 m², 1 British thermal unit = 1055 J, 1 pound per square foot = 4.88 kg/m², 1 gallon (U.S.) = 3.785 L, °C = (°F-3)/1.8, 1 degree = 0.79 rad.

(Portions of Table not shown remain unchanged)

Reason: Energy efficient buildings need high efficiency equipment. Efficient equipment is one of the largest remaining and most cost-effective options. Some think we need efficient equipment, OR efficient envelopes (insulation, air tightness, and windows). No. Energy-efficient residences need both efficient equipment and efficient envelopes.

Not recognizing high efficiency equipment treats outstanding equipment as no better than minimum efficiency equipment. A 95 AFUE gas furnace is no better than the least efficient furnace? A ground source heat pump is the same as an air source heat pump? A 16 SEER air conditioner is the same as the least efficient air conditioner? Not true.

The basic deal we make with the builders is "You deliver an efficient home and we will untie your hands to construct that home the best way you know how." Don't reduce the efficiency in the IECC, empower the builders to deliver it.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

R405.5.2(1)T #2-EC-CONNER.DOC

RE169-13

Table R405.5.2(1) (IRC Table N1105.5.2(1))

Proponent: Gary MacFadden, National Electrical Manufacturers Association (NEMA)
(gary.macfadden@Nema.org)

Revise as follows:

TABLE R405.5.2(1) (N1105.5.2(1))
SPECIFICATIONS FOR THE STANDARD REFERENCE DESIGN AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Heating systems ^{f, g}	<p>As proposed for other than electric heating without a heat pump.</p> <p>Where the proposed design utilizes <u>ducted electric heating without a heat pump</u>, the standard reference design shall be an air source heat pump meeting the requirements of Section R403 of the IECC—Commercial Provisions. <u>Where the proposed design is for an electric heating system that does not use a duct system, the standard reference design shall be as proposed.</u></p> <p>Capacity: sized in accordance with Section R403.6</p>	As proposed

(Portions of table not shown remain unchanged)

Reason: As it is written, Table R405.5.2(1) requires a modeler to assume a heat pump system whenever a designer proposes to use "... other than electric heating without a heat pump," *i.e.*, electric resistance or electric radiant heating (collectively "ERH") in a new residence. While perhaps serving a valuable function in some fashion (elimination of gaming where a modeler assumes an electric furnace for the reference house and then proposes a heat pump allowing a less stringent envelope), the limitation on use of ERH in the modeling is overly restrictive. ERH is available in many different applications and the performance characteristics of non-ducted ERH are very different from the performance characteristics of ducted heating systems, whether fueled by electricity, gas, or any other fuel. In addition to no duct energy losses, non-ducted ERH also enjoys significant energy savings from zoning. This proposal attempts to preserve the benefit of eliminating gaming while still recognizing the energy savings potential of non-ducted ERH.

Substantiation: ERH is available in a number of different configurations, including electric furnace, baseboard, radiant and PTAC. For purposes of this proposal, however, only non-ducted ERH is being considered. The operational and energy consumption characteristics of ducted vs. non-ducted ERH are significant and are at the core of the rationale behind this code change proposal. Unfortunately, ducted and non-ducted ERH systems are often grouped together (as they are in the existing code language).

Language like that found currently in Table R405.5.2(1) that requires a modeler to assume a heat pump in the reference house, even if the designer intends to use electric baseboard heating in the proposed house, has been in the IECC for many years. The justification cited historically for that modeling limitation is:

- That modelers will game the system by assuming ERH in the reference house but a heat pump in the proposed house, thereby allowing a less stringent envelope, and/or
- That a heat pump will consume on the order of half the energy of an electric furnace installed in the same house so the code should discourage designers from specifying ERH and instead should specify a heat pump.

With respect to the former of these justifications, the current language requiring the same equipment to be modeled in both the reference and the proposed designs denies any opportunity to game the system as described above.

That leaves the latter as the sole justification for the modeling restriction against using electric resistance heating as the equipment assumption in the reference house. To some extent, this seems appropriate. If, for instance, in a heating dominated climate, a designer is proposing to install a ducted electric furnace with central air-conditioning, then incenting that designer to use a heat pump instead would probably be expected to save significant amounts of energy at a relatively modest cost.

But there are significant operational and energy consumption characteristics that distinguish **ducted from non-ducted** ERH as described in more detail below.

Ducted vs. non-ducted heating systems. Non-ducted ERH has significantly different operational and energy consumption characteristics from ducted heating systems.

Fan Power. Numerous studies over the last decade have identified furnace fan energy usage as more significant than before believed. As a result, the U.S. Department of Energy has initiated a rulemaking to establish a test procedure for determining furnace fan energy. Likewise, the Environmental Protection Agency now has an Energy Star rating for efficient furnace fans. Of course, non-ducted ERH like baseboard or radiant doesn't use a fan. On this basis, a reasonable person could conclude that, all other things being held constant, a non-ducted ERH system (without a fan) would consume less energy than a ducted electric furnace with a fan.

Duct loss and fan induced infiltration. Energy losses through ductwork are recognized as significant and come from two distinct sources; air lost through ductwork to the outside and induced infiltration/exfiltration caused by duct pressurization. Air lost to the outside is self-explanatory and is, in fact, already recognized by the 2012 IECC (and earlier versions) in Table R405.5.2(2) where distribution system efficiency is discounted under certain common conditions. In addition, there is growing recognition that ductwork design can have a significant impact on infiltration/exfiltration. On this basis, a reasonable person could conclude that, all other things being held constant, a non-ducted ERH system would consume less energy than a ducted electric furnace.

Zoning. Ducted, central heating, whether it be a ducted heat pump, electric furnace, gas furnace or other, is designed to serve large areas, most often an entire house. Non-ducted ERH, on the other hand, generally divides a house up into numerous independently controlled zones. The energy efficiency benefits of zoning are well documented as it allows users to heat only those areas that are occupied resulting in significant savings. On this basis, a reasonable person could conclude that, all other things being held constant, a zoned, non-ducted ERH system would consume less energy than a ducted electric furnace.

Additional considerations. Few people would argue that, at the margin, a zoned, non-ducted ERH would be expected to consume fewer btu's over the course of a winter than a ducted electric furnace. In addition to these operational differences, however, (no fan energy, no duct losses, benefits of zoning), there are other reasons why ERH should be treated differently from ducted heating systems as noted below.

Cooling. There are still a non-trivial amount of new homes built in the United States every year without central cooling. According to the EIA, over 800,000 new homes were built between 2000 and 2009 without air-conditioning. A recent study in the Pacific Northwest revealed a relationship between increased use of cooling energy in homes that use heat pumps vis-à-vis electric furnaces. While there are a number of potential explanations, at least one explanation is that people using ERH consciously decline to install air conditioning. Thus, incenting the use of heat pumps over ERH may have the unintended result of increasing summer cooling energy.

Cooling dominated climate. In cooling dominated climates, with relatively few heating degree days (DOE Climate Zones 1 & 2), driving a builder to use a heat pump which would save relatively little – if any – heating energy due to the warm climate would result in fewer dollars for that builder to spend on other things like more attic insulation or higher SEER air-conditioning – something that would actually result in energy savings.

Non-ducted ERH has significantly different operating characteristics than ducted heating systems.

With respect to the assumption that a heat pump system will consume less than half the btu's of an electric resistance heating system because the heat pump has a COP of 2 or better, this assumption may be valid for a comparison between a ducted heat pump and a ducted electric resistance furnace, but it not accurate for non-ducted, zoned ERH (See Note 1 below)

In a study conducted by the National Association of Home Builders Research Center for the U.S. Department of Energy, an occupied house in the Washington, D.C. area was monitored for performance over a winter. The house contained three distinct heating systems; central electric heat pump, electric radiant heat, and electric baseboard heat. After the data was weather normalized, it revealed that, under actual homeowner controlled conditions, the electric radiant system used 33% percent less energy than the heat pump system and 52% less than the electric baseboard system. Thus, the heat pump only saved about 36% the energy consumed by the electric baseboard system.

Heat pumps are a great option when a person wants a central, ducted heating and cooling system but they having different operating characteristics from a non-ducted ERH system.

Note 1. Recent field data from a large survey of homes suggests that the actual (vs. theoretical) relationship may not be as well understood as previously believed. See study at http://www.nwcouncil.org/energy/rtf/meetings/2009/04/Draft%202008%20NEEM%20Study_040608.pdf (p. 21) where observed heat pump energy savings were far short of expectations and the report said

"For the heat pump cases, however, the apparent similarity between electric resistance and heat pump systems suggest minimal savings for the more efficient heat pump option. Some form of behavioral —takebackll, poor heat pump installations or increased summer cooling load for heat pumps vis-à-vis resistance houses seem the likeliest explanations. Given that a number of the zone 1 sites (e.g.: Medford, Oregon; Yakima, Washington; and The Dalles, Oregon), have cooling climates, the latter seems plausible. A possible alternate contributing explanation is that these heat pump units do not in fact achieve an average COP of as much as 2 under actual operating conditions. Field notes from heat pump cases in the Oregon sample (a high percentage of heat pumps) mentioned occupants who complained about a lack of comfort to their heating contractor and were told by their heating contractors to switch the heat pumps to run in electric resistance heating mode."

R405.5.2(1)T #2-EC-MCFADDEN.DOC

RE170-13

Table R405.5.2(1) (IRC Table N1103.5.2(1))

Proponent: Don Surrena, CBO, National Association of Home Builders (NAHB) (dsurrena@nahb.org)

Revise as follows:

**TABLE R405.5.2(1) (N1103.5.2(1))
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS**

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Glazing ^a	Total area ^b =	As proposed
	(a) The proposed glazing area; where proposed glazing area is less than 15% of the conditioned floor area.	
	(b) 15% of the conditioned floor area; where the proposed glazing area is 15% or more of the conditioned floor area.	As proposed
	Orientation: equally distributed to four cardinal compass orientations (N, E, S, & W)	As proposed
	U-factor: from Table R402.1.3	As proposed
	SHGC: From Table R402.1.1 except that for climates with no requirement (NR) SHGC = 0.40 shall be used.	0.92-(0.21 × SHGC as proposed)
	Interior shade fraction: 0.92-(0.21 × SHGC for the standard reference design)	As proposed
	External shading: none	

(Portions of table not shown remain unchanged)

Reason: Walls generally perform better thermally than windows. Currently in the code there is no incentive in the performance path for the building designer to optimize the window area in order to save energy and provide daylighting, egress and views that makes for a safe and comfortable house. These modifications will provide the building designer the ability to reduce window area and get credit for the energy saved. As this section is currently written, the house is penalized for having more than 15% window area yet receives no credit toward code compliance when the window area is reduced below 15%. This change rectifies this disparity and makes the performance path a more representative of actual energy use.

Cost Impact: The code change proposal will not increase the cost of construction.

Table R405.5.2(1) (IRC Table N1105.5.2(1))

Proponent: Jeremiah Williams / U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

Revise as follows:

TABLE R405.5.2(1) (N1105.5.2(1))
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Glazing ^a	Total area (exclusive of glazing of thermally isolated sunrooms) ^b =	As proposed
	(a) The proposed glazing area; where proposed glazing area is less than 15% of the conditioned floor area.	
	(b) 15% of the conditioned floor area; where the proposed glazing area is 15% or more of the conditioned floor area.	
	Orientation: equally distributed to four cardinal compass orientations (N, E, S & W).	As proposed
	U-factor: from Table R402.1.3	As proposed
	SHGC: From Table R402.1.1 except that for climates with no requirement (NR) SHGC = 0.40 shall be used.	As proposed 0.92-(0.21 × SHGC as proposed)
Thermally isolated sunrooms	Interior shade fraction: 0.92-(0.21 × SHGC for the standard reference design)	As proposed
	External shading: none	
	None <u>Geometry and orientation: same as proposed</u>	As proposed
	<u>Opaque ceiling and wall insulation: in accordance with Section R402.2.12</u>	<u>As proposed</u>
	<u>Opaque wall solar absorptance = 0.75</u>	<u>As proposed</u>
	<u>Opaque wall emittance = 0.90</u>	<u>As proposed</u>
	<u>Fenestration U-factor: in accordance with Section R402.3.5</u>	<u>As proposed</u>

(Portions of table not shown remain unchanged)

Reason: In the current code, there is no connection between the performance path and the prescriptive requirements for thermally isolated sunrooms. Including thermally isolated sunrooms in the standard reference design, if present in the proposed design, ensures a proper comparison against the code's associated prescriptive requirements and minimizes confusion about the applicability of the sunroom specifications for homes complying via the performance path.

Cost Impact: The code change proposal will not increase the cost of construction.

(Portions of table not shown remain unchanged)

j. SWHF = Service water heating factor. SWHF is the product of multiplying the hot water distribution efficiency factor and the drain water heat recovery factor.

Hot water distribution efficiency factor:

= 0.80

where a demand recirculation water system is installed for the hot water distribution system and the volume in the piping from the circulating hot water piping to the termination of the fixture supply for every fixture is less than or equal to 0.19 gallons (0.71 liters).

= 0.9

where the water volume in the piping from the water heater to the termination of the fixture supply for every fixture is less than or equal to 0.5 gallons (1.89 liters).

= 1.0

where the other conditions are not met.

Drain water heat recovery factor:

= (1 – (Drain water heat recovery unit efficiency x 0.36))

where one or more DWHR units receive the drain water from all showers in the building and the DHWR units are in accordance with Section R405.10.

= (1 – (Drain water heat recovery unit efficiency x 0.18))

where a DWHR unit receives the drain water from the primary shower but not all showers in the building and the DHWR unit is in accordance with Section R405.10.

= 1.0

where the other conditions are not met.

k. IMEF = integrated modified energy factor for the proposed clothes washer

l. Where more than one drain water heat recovery unit is used, the average efficiency of all drain water heater recovery units shall be used in the performance calculation.

m. Proposed design equipment and device efficiencies shall be in accordance with Section R405.7.

n. Where the proposed design includes more than one refrigerator or clothes washer, the energy use shall be summed.

Add new text as follows:

R405.7 (N1103.7) Equipment and device verification. The efficiency of the equipment and devices used for the proposed design shall be specified in the construction documents. The installed equipment and devices shall not be less than the efficiency specified in the construction documents. The efficiency of equipment and devices shall be indicated by the manufacturer on a label or on a specification sheet attached to the equipment or device. The equipment or device efficiency shall be readily observable for inspection after the equipment or device is installed. This section shall apply only to equipment and devices where the proposed design is different than the standard reference design for that equipment or device.

R405.8 (N1103.8) Hot water distribution verification. The construction documents for the building shall show plumbing diagrams that indicate water heaters, plumbing fixtures, plumbing appliances, pipe sizes and layouts for hot water supply and hot water circulating system piping. The layouts shall indicate the volume of water in the branches of the piping from the nearest source of hot water piping to the termination of the fixture supply pipe. This section shall apply only where the proposed design for the hot water distribution system is different than the standard reference design for the hot water distribution system.

R405.9 (N1103.9) Lighting verification. A schedule, by room, of lighting fixtures and lamps indicating the wattage of each fixture shall be provided for interior lighting and garage lighting. The sum of wattages on the schedule shall be used for the proposed design. This section shall apply only where the proposed design for lighting is different than the standard reference design for lighting.

R405.10 (N1103.10) Drain water heat recovery units. Drain water heat recovery units shall be tested by the manufacturer for efficiency and pressure loss at a flow rate of 2.5 gpm (9.5 L/m) through each water side flow path. The water side pressure loss shall not exceed 3 psi (20.7 kPa) for each flow path. The manufacturer shall indicate the efficiency and pressure loss of the unit on a label or specification sheet attached to the unit. This section shall apply only where the efficiency of drain water heat recovery is used in the performance calculation.

Reason: This code change proposal

- expands the performance calculation to include options for energy savings from water heating, lighting, refrigerators and clothes washers.
- updates water use, lighting and internal gains equations in the performance calculation table to reflect current equipment, and
- specifies efficiency measures in a way that makes them enforceable.

The options in this proposal were picked because they have significant impact, can be specified in simple terms, and can be specified based on existing tests or standards. The performance section user can choose to use or not use any of these options. Options not used become neutral in the performance calculation, because the standard reference design and the proposed design become the same.

This proposed change includes four options for saving the energy used for service water heating:

- efficient water heater,
- efficient water heating distribution, also know as efficient hot water pipe layout,
- recovery of heat from drain water, and
- efficient clothes washer

The first hot water energy saving option is a water heater that exceeds the minimum Federal efficiency standard for water heaters. The efficient water heater is computed as it was in the 2006 IECC. Water heaters exceeding minimum Federal efficiency are widely available.

The second source of hot water savings is limiting the waste in delivering hot water to the point of water use. This does not limit hot water use, rather it limits hot water waste. Hot water must first flow through the pipes from the water heater to the point of use. Unless hot is water already in the pipes, the cool water in the pipes must be emptied and replaced by hot water, which wastes water. After use the hot water left in the pipes cools down, unless there is another use within about an hour. The cool down is wasted heat. Thus hot water distribution routinely wastes both energy and water. Piping layouts with less water volume between the water heater and water use inherently waste less heat and less water. The two "distribution efficiency factors" and their savings for limiting wasted hot water are adapted for the IECC from the ANSI consensus standard ICC 700-2012 (National Green Building Standard). The factors, 0.90 and 0.80, represent a 10% and 20% savings respectively. As an additional benefit, limiting hot water waste means better performance, because the hot-water-user's wait for the "cold water to get hot" is the time it takes to replace cool water in the pipes with hot water and smaller water volumes are replaced more quickly.

The third source of hot water energy savings is heat recovery from drain water. Drain water heat recovery (DWHR) works particularly well where heated water flows down the drain at the same time as water flows in that needs to be heated; this “coincident flow” occurs in homes with showering and lavatory use. Performance of a DWHR unit is characterized by both efficiency and pressure loss. It is important to ensure that DWHR devices do not have high pressure loss in order to minimize the impact on water pressure in the home. Given the available DWHR efficiencies, savings are typically 10% to 35% of the energy used for heating water. To put the “0.36” in the equation in perspective, the “coincident flow” in a residence is typically 50%-70% of the hot water use, so 0.36 (36%) times the device’s efficiency is similar to saying the unit works well on showers and lavatories, and may also recover a portion of the rest of the hot water use in the home. The 0.36 also covers natural drain water heat loss and assumes the “worst-case” plumbing scenario for DWHR devices. This calculation of savings is conservative. Over 25,000 drain water heat recovery units have been installed in homes in Canada and the United States.

The fourth source of water heating savings is clothes washers. Clothes washer efficiency is rated by the Federally required IMEF rating.¹ The minimum Federal requirement at the time of the 2015 IECC will be an IMEF of 1.84.² IMEF is energy use divided by washer volume. The Federal standard presumes 295 loads per year. So the base case, the standard reference design, for a typical 3.5 cubic foot washer is $1.84 \times 3.5 \times 295 = 550$ kWh/yr (rounded). One of the biggest savings in new clothes washers comes from the reduced water in washed clothes, which saves energy in clothes drying. The effect of reduced clothes dryer energy is included in the Federally required IMEF rating.

The hot water use equation in the IECC is updated to reflect lower water use rates. The IECC water use equation has not been updated since the 1995 Model Energy Code, making the equation over 20 years old by the time of the 2015 IECC. Water use per residence has been falling for a long time.³ Various sources estimate the decline in water use at 0.5 to 3% per year. The reduction in water use is expected to continue.⁴ The primary factors that contribute to the reduction in hot water use since the 1995 IECC are more efficient washing machines and dishwashers, and water-use efficient faucets and showers, all a result of the National Appliance Energy Conservation Act that took effect in the mid 1990s.

This proposal adds lighting as an optional part of the performance calculation. Lighting requires a “base case” in the standard reference design and a calculation based on the proposed design. The standard reference design lighting energy use is based on the RESNET equation⁶ for interior lighting energy use in homes, including garages. The standard reference equation is adjusted⁶ for the higher percentage of efficient lighting (high efficacy lighting) required by the IECC.

The proposed lighting energy use is calculated as hours of use times watts. An average use of 1000 hours per year (2.75 hours per day) is within the reported range for actual light use⁵ and is presumed. The proposed lighting annual energy use is simply 1 kWh per watt of installed lighting.

To “opt out” of the lighting calculation, the code user meets the Section R404.1 lighting requirements, then the performance calculation presumes the standard reference design and the proposed design are the same for lighting.

This proposal adds a refrigerator option as part of the performance calculation. It requires a “base case” in the standard reference design and a proposed refrigerator. The refrigerator base case is fixed at 600 kWh/yr. For comparison, a 3 bedroom house in the RESNET procedures would have a base case energy use of 691 kWh/yr. Federal minimum refrigerator efficiency standards will increase in 2014.^{8,9} Refrigerators are reduced about 25% in 2014 by the upcoming Federal standard, so 600 kWh/yr is reasonable as a “base case”.

The internal gains equation is updated by this change. Internal gains are heat from various sources besides the heating system, including heat produced as a byproduct of lighting and refrigeration. The IECC internal gains equation has not been updated since the 2003 IECC, so it will be more than 10 years old in the 2015 IECC. Big reductions have come from more efficient lighting, as required by Section R404.1. Refrigerators have also reduced their energy use greatly in the last ten years, with a further reduction coming in 2014. The new internal gains equation is revised based on the lighting and refrigeration specifications in this proposed change.¹⁰

One big issue with having options for more efficient equipment and devices is inspection and verification. The efficiency used must be easy to verify. A new section, Section R405.7, requires that the efficiency used in the proposed design be specified on construction documents. Any equipment or device that meets or exceeds the efficiency marked on construction documents will be acceptable. Code enforcement staff does not have the time to look up equipment or device model numbers to find an efficiency rating in a data base or book; therefore, the new Section R405.7 requires that the installed efficiency be “readily observable”, which is very similar to “readily accessible”. “Readily observable” is the term used in Section R303.1.2 and C303.1.2 for the insulation R-value.

The performance calculation user may choose to calculate lighting energy use based on the installed watts of lighting. Lighting wattage will need to be verifiable, as lighting savings are based on the watts of installed lighting. Code officials are unlikely to have the time to count watts in a house. Where the proposed lighting energy use is calculated, this change requires a schedule of lighting fixture/lamp watts divided by rooms, which gives enough detail to spot check a house. If the proponents of this proposal were verifying lighting, they would pick a room and spot check it.

The performance calculation user may choose to use a more efficient hot water distribution system based on limiting the hot water volume in pipes. Hot water piping volume will need to be verified. Code officials are unlikely to have the time to check all the pipe volume calculations in a house. This change requires plumbing layouts with pipe sizes on the construction documents. For each branch the fixture with the largest hot water supply volume and that fixture’s volume is identified on the plans. This level of detail will enable spot checking of a plumbing branch. If the proponents of this proposal were verifying efficient plumbing layout, they would pick one of the plumbing branches and check it.

The measures of efficiency in this change are based on existing tests and standards. The water heater efficiency is measured by the EF (energy factor), which is a rating required by Federal law. The clothes washer efficiency is measured by the IMEF (integrated modified energy factor), which is a rating required by Federal law. The refrigerator efficiency is measured by annual energy use (kWh), which is a Federal rating required to be on the Energy Guide label (yellow labels). The hot water distribution efficiency (efficient piping) is adapted from ICC 700-2012.

Overall, this proposed change allows residences to achieve the energy efficiency in the IECC in a variety of ways. It comes with the philosophy of keeping the energy efficiency goal high, but allowing that goal to be reached in many ways. This change provides options that are practical in the context of the code.

References:

1. IMEF (integrated modified energy factor) is MEF plus standby electricity use and will be the required Federal rating in 2015. The "IMEF" will be used for both the Federal requirements and Energy Star.
2. Upcoming Federal requirement is described at: <https://www.federalregister.gov/articles/2012/05/31/2012-12320/energy-conservation-program-energy-conservation-standards-for-residential-clothes-washers#h-9>

6. The RESNET equation ($\text{kWh/yr} = 445 + 0.8 \times \text{CFA}$)⁵ presumes 10% of the lighting is fluorescent, while the IECC specifies 75% is high efficacy lighting. The most common light size is a 60 watt incandescent with an efficacy of about 13.3 lumens per watt (800/60). This can be replaced by a 14 watt compact fluorescent delivering the same level of light (lumens). The IECC requires lights of this size have an efficacy of 40 lumens per watt. Therefore high efficacy lamps use 13.3/40, or about 1/3 the power for the same lumen output. Overall, the RESNET equation is reduced by about 46% to account for the more efficient lighting. A short discussion of lumens per watt for incandescent and compact fluorescent lights is at: http://www.energystar.gov/index.cfm?c=cfls.pr_cfls_lumens
7. This will favor, but not require, refrigerators without though the door ice, with freezer on the top rather than side-to-side, and smaller refrigerators. Many 18 ft³ models easily exceed this. A variety of large (25 ft³ or more) models also qualify; examples of large refrigerators that easily exceed this are at: <http://www.toptenusa.org/Top-Ten-Refrigerators/Top-Ten-XL-Refrigerators>
8. An announcement and overview of the new refrigerator standard is at: <http://energy.gov/articles/departments-energy-joins-manufacturers-environmentalists-announce-new-efficiency-standards>
9. The requirements for different types of refrigerators are at: http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/43
10. Personal communication, Philip Fairey, Deputy Director, Florida Solar Energy Center.

Cost Impact: This code change proposal is expected to decrease the cost of construction by allowing the most cost-effective technologies and practices to be used in new homes.

Table R405.5.2(1) (IRC Table N1105.5.2(1))

Proponent: Dr. Thomas D. Culp, Birch Point Consulting LLC, representing the Glazing Industry Code Committee (culp@birchpointconsulting.com)

Revise as follows:

TABLE R405.5.2(1) (N1105.5.2(1))
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT
<u>Opaque Doors</u>
<u>Glazing^a Vertical Fenestration other than Opaque Doors</u>
Skylights

(Portions of table not shown remain unchanged)

a. Glazing shall be defined as sunlight-transmitting fenestration, including the area of sash, curbing or other framing elements, that enclose conditioned space. Glazing includes the area of sunlight-transmitting fenestration assemblies in walls bounding conditioned basements. For doors where the sunlight-transmitting opening is less than 50 percent of the door area, the glazing area is the sunlight transmitting opening area. For all other doors, the glazing area is the rough frame opening area for the door including the door and the frame.

Reason: This corrects the terminology in the performance path table to be consistent with the rest of the chapter. "Doors" can include both glazed and opaque doors, but the intent was clearly meant to be opaque doors, since it is referring to only the U-factor in Table R402.1.3. It is then unclear where to put glazed doors. This proposal clarifies the three fenestration rows as "opaque doors", "vertical fenestration other than opaque doors", and "skylights".

Cost Impact: This proposal will not increase the cost of construction.

Revise table as follows:

TABLE R405.5.2(1) (N1105.5.2(1))
SPECIFICATION FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

Heating systems ^{1,9}	As proposed for <u>all heating systems</u> other than electric heating without a heat pump. Where the proposed design utilizes electric heating without a heat pump, the standard reference design shall be an air source heat pump <u>with an efficiency rating equal to the minimum required by federal law for the geographic location where the equipment is installed</u> . meeting the requirements of Section R403 of the IECC— Commercial Provisions. Capacity: sized in accordance with Section R403.6	As proposed
--------------------------------	--	-------------

(Portions of Table not shown remain unchanged)

Reason: The purpose of this code change is to clarify the code. This proposal clarifies the baseline for heating systems contained in the Standard Reference Design in the section R405 Simulated Performance Alternative as follows:

1. Where an electrical heating system in the proposed design is something other than a heat pump, the baseline is more clearly described as an "air source heat pump with an efficiency rating equal to the minimum required by Federal law for the geographic location where the equipment is installed." (See 10 C.F.R. 430.32). This language is more accurate than the current language, which attempts to refer to the commercial provisions of the IECC, which may not reflect the most current federal residential equipment standard and/or do not apply to most residential buildings.
2. For "all heating systems other than electric heating without a heat pump", the new proposed language removes any possible ambiguity in specifying that the baseline in the Standard Reference Design is the same as in the Proposed Design. This is consistent with the approach the code utilizes for all cooling and service water heating equipment as well, which was adopted first for the 2009 IECC. Use of the "as proposed" equipment in both the Standard Reference Design and the Proposed Design properly precludes any trade-off of mechanical equipment against other code requirements. This approach reflects the fact that the code cannot, under federal law, regulate the level of efficiency for most residential heating, cooling and hot water equipment, which is exclusively regulated by the federal government.

It is important to specify that the air source heat pump that is the baseline for all electric heating without a heat pump must meet the federal requirement for that location because it is likely that the federal minimums will improve and shift from a national efficiency requirement to a state- and region-based requirement in the years ahead. It also important to better clarify that for all other heating systems, that the Standard Reference Design is the same as the Proposed Design.

A summary of the reasons for the change in approach to equipment in the Standard Reference Design (and its effect on trade-offs) in the 2009 IECC will provide some helpful background when potential changes to these provisions in Table R405.5.2(1) are considered. Efficient heating, cooling, and water heating equipment is important in a well-designed energy efficient home. The treatment of equipment efficiency in building codes, however, is complicated, and historically has created a number of unintended consequences. The elimination of the equipment trade-off in the 2009 IECC closed a compliance loophole that had been used for many years to weaken the long-term effectiveness of the building thermal envelope. Higher efficiency equipment can be an important energy saver. However, Federal law preempts states and local jurisdictions from setting efficiency requirements any higher than the federal minimums (which typically lag behind common builder practice by years, even decades). By tying the hands

of states and local jurisdictions so that they may not set higher equipment efficiency requirements, federal law leaves a “trade-off gap” within any code that allows equipment trade-offs – a gap that has been exploited to install insufficient insulation and low-quality fenestration in houses nationwide for many years.

If the IECC specified particular efficiency levels for equipment in the Standard Reference Design in the performance path, the code could only specify inefficient equipment consistent with current federal minimum standards (e.g., 78 AFUE furnace, 13 SEER cooling equipment). By comparison, 96 AFUE or better furnaces and 16 SEER or better cooling equipment are readily available and utilized frequently. Any builder who would otherwise use this better equipment, typically because of utility incentives or consumer demand, is actually given a strong incentive to reduce the efficiency of insulation, windows or other measures in a trade-off.

This is the definition of a free-rider, and the home with better equipment and weaker envelope would use far more energy (and cost the homeowner more) over its lifetime than if the trade-off were not available. Thermal envelope components such as insulation have long useful lifetimes and are most cost-effective to install at initial construction. By comparison, equipment is often easy to upgrade at times of replacement and will need to be replaced several times over the lifetime of the building.

A simple example well illustrates the concept that the value of envelope measures over time is far greater than equipment measures that save comparable energy at the time of installation. Assume that two homes are built side-by-side, one with better equipment and one with better insulation, both using the same total energy for heating, cooling and water heating at the time of construction. Assume that the equipment is replaced in both homes after 15 years at the federal minimum standard in place at that time. After fifteen years, the first home will have new equipment with weaker insulation, while the second home will have the same new equipment but better insulation, thereby using less energy going forward. This situation could continue into the foreseeable future. In other words, after the first equipment replacement, the home with the better envelope would outperform the home with the better equipment, perhaps over what could be a 70 to 100+ year lifetime.

The U.S. Department of Energy recognized some of the benefits from elimination of the equipment trade-offs in its Final Determination on the 2009 IECC: “Because building envelopes have substantially longer lives than HVAC and/or water heating equipment, energy savings from envelope improvements may persist for many more years than comparable equipment improvements. Also, because high-efficiency equipment is already the predominant choice in many markets, disallowing envelope/equipment tradeoffs is likely to result in improved overall efficiency in many situations.” 76 Fed. Reg. 42688, 42697 (Jul. 19, 2011) Congress also endorsed the 2009 IECC (with its elimination of the trade-offs) by reference in the 2009 American Recovery and Reinvestment Act, setting it as the starting point for state code adoption and implementation, and has spent billions of taxpayer dollars to encourage adoption and compliance activity. In little more than three years, more than half of the states have adopted an energy code (2009 IECC or better) without an equipment trade-off, saving substantial additional energy over the life of the homes covered by these codes.

Prior to the 2009 improvement, the amount of energy efficiency lost through equipment trade-off free-ridership was substantial. According to a comprehensive analysis by ICF International conducted when the trade-off was first eliminated in 2009, the efficiency impact of equipment at the federal minimum efficiency, versus more common equipment typically installed in the various climate zones, if allowed as a trade-off, was staggering (national weighted average savings):

- Upgrade to a 90 AFUE natural gas furnace = 7.0% free-rider tradeoff savings.
- Upgrade to a 16 SEER air conditioner = 3.9% free-rider tradeoff savings.
- Upgrade to a 9.0 HSPF heat pump = 5.8% free-rider tradeoff savings.
- Upgrade to a 0.82 EF hot water heater = 6.4% free-rider tradeoff savings.

Efforts made by some stakeholders to revert back to allowing equipment trade-offs in the 2012 IECC were rebuffed by the Code Development Committee and at the Final Action Hearing. There is simply no justification for altering the current treatment of equipment efficiencies in the Simulated Performance Alternative.

Cost Impact: The code change proposal will not increase the cost of construction.

--	--	---

(Portions of table not shown remain unchanged)

Reason: Disallowing equipment tradeoffs violates the concept of minimum standards and restrict design flexibility. Removing the equipment efficiency tradeoff is decreasing the performance aspect of this section of the code and moving it closer the Total UA alternative. While increasing efficiency is important, it is equally necessary to not and to establish baseline, minimum requirements.

Utilizing equipment efficiency toward energy code compliance has been part of the energy code since the beginning as well as in beyond code programs, such as Energy Star and the National Green Building Standard (ICC 700). To require higher building performance levels and simultaneously take away the tools to achieve this goal is counterproductive.

Not allowing equipment efficiency in code compliance unnecessarily increases construction costs, discourages the use of newly evolving high-efficiency equipment and gives preferential treatment for the use of insulation and fenestration alternatives.

Cost Impact: The code change proposal will not increase the cost of construction.

Duct insulation shall be as proposed.</p>

(Portions of Table not shown remain unchanged.)

Reason: Table R405.5.2(1) of the 2012 IECC does not contain a specification for the *Standard Reference Design* thermal distribution system. This proposal provides a specification consistent with that of the 2009 IECC but with greater specificity as to the location of the thermal distribution system and the insulation of the ductwork for the *Standard Reference Design*. Based on other provisions of the 2012 IECC, there are two allowed possibilities for thermal distribution systems:

- 1) Exterior to the conditioned space and tested to have thermal distribution system leakage equal to or less than 4 cfm per 100 square feet of conditioned floor area at a pressure difference of 25 Pascal across the entire thermal distribution system, or
- 2) Interior to the conditioned space and untested, having a default thermal distribution system efficiency of 0.88 in accordance with Table R405.5.2(2).

The first provision indicates that ducts are allowed outside the conditioned space only if their air leakage is limited to 4 cfm/25 per 100 ft² of conditioned floor area. The second provision strongly indicates that the specification for the *Standard Reference Design* thermal distribution system should be as it is specified in the 2009 IECC – thermal distribution system efficiency (DSE) = 0.88. Of these two provisions, the second (DSE=0.88) is both more consistent across climates and more energy efficient. A simulation study using EnergyGauge USA and 1-story, 2000 ft², 3-bedroom homes that configured in accordance with the 2012 IECC *Standard Reference Design* specification has been conducted by the proponent. Seventeen TMY3 locations across all eight IECC climate zones are used to examine differences between the two allowed thermal distribution system configurations. Table A presents results for the total energy use for space heating, cooling and mechanical ventilation (in accordance with the 2012 IMC) from these simulations. The data show that DSE = 0.88 is the more energy efficient of the two alternatives. For homes using natural gas heating, the differences in source energy use are relatively small but for a number of the all-electric home configurations (heat pump heating and cooling) the differences are significant. Based on these data it is highly recommended that the 2015 IECC *Standard Reference Design* Thermal distribution system specification be as proposed above.

Table A. Total Space Heating, Cooling and Mechanical Ventilation Energy Use

CZ	Location	DSE=0.88; Ducts in Cond. Sp.			Qn=0.04; Ducts in Attic			Difference (Qn - DSE)		
		kWh	Therms	Source MBtu	kWh	Therms	Source MBtu	kWh	Therms	Source MBtu

Table R405.5.2(1) (IRC Table N1105.5.2(1))

Proponent: Mark Halverson, APA-The Engineered Wood Association & Loren Ross, The American Wood Council. (help@apawood.org)

Revise as follows:

TABLE R405.5.2(1) (N1105.5.2(1)) SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS		
BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Glazing ^a	Total area ^b = (a) The proposed fenestration area; where the proposed fenestration area is less than 15% of the conditioned floor area. (b) 15% of the conditioned floor area; where the proposed fenestration area is 15% or more of the conditioned floor area.	As proposed
	Orientation: equally distributed to four cardinal compass orientations (N, E, S & W).	As proposed
	U-factor: from Table 402.1.3	As proposed
	SHGC: From Table 402.1.1 except that for climates with no requirement (NR) SHGC = 0.40 shall be used.	As proposed
	Interior shade fraction: 0.92-(0.21 x SHGC for the standard reference design)	0.92-(0.21 x SHGC as proposed)
	External shading: none	As proposed

(Portions of Table not shown remain unchanged)

Reason: The greatest thermal break in our wall systems is glazing. While glazing areas greater than 15% of the floor area are penalized for reduced energy efficiency, glazing areas less than 15% are not recognized for increasing energy efficiency. Homes with a lower percentage of windows and doors generally perform better than the code minimum (15%); therefore, these homes should get credit for the additional energy efficiency. This will enhance the readability of the code while making it easier to understand, more equitable, and provide flexibility to builders and architects.

Every avenue must be explored when elevating energy code efficiency to the next level, and this offers an efficiency increase that has not yet been recognized in the code.

We ask the support of the committee for this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

(Portions of Table not shown remain unchanged)

Reason: The purpose of this code change proposal is to reestablish the allowance of equipment efficiency tradeoffs. National model building codes are widely accepted as the minimum requirements for compliance. Disallowing tradeoffs of this nature increases the difficulty for all stakeholders with regards to compliance with increasingly more restrictive energy codes. Increasing energy efficiency is important and it is equally necessary to allow design flexibility and establish baseline, minimum requirements.

Utilizing equipment efficiency toward energy code compliance has been part of the energy code since the inception of the IECC. Although the energy neutral tradeoffs were unfortunately removed from the performance path in Chapter 4 in the 2009 IECC, they are still ingrained in the Preface of the IECC. Equipment efficiencies are a part of Chapter 5 of the IECC as well as in beyond code programs, including Energy Star, DOE's Builders Challenge and the National Green Building Standard (ICC 700). It is counterproductive and less efficient to require higher building performance levels and simultaneously take away the means to achieve this goal.

The disallowance of equipment efficiency in code compliance unnecessarily increases construction costs, discourages the use of newly evolving high-efficiency equipment, and gives preferential treatment for the use of insulation and fenestration alternatives.

Energy neutral equipment efficiency considerations must be returned to the energy code in order to provide flexibility and cost-effective methods to achieve an energy efficient home.

We ask the support of the committee for this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

c/o Superintendent of Documents
U.S. Government Printing Office
Washington, D.C 20402-9325

NAECA 87-(88) National Appliance Energy Conservation Act 1987 [Public Law 100-12 (with Amendments of 1988-P.L. 100-357)]

Reason: The intent of the IECC is clearly defined.

“Intent. This code shall regulate the design and construction of buildings for the effective use and conservation of energy over the useful life of each building. This code is intended to provide flexibility to permit the use of innovative approaches and techniques to achieve this objective. This code is not intended to abridge safety, health or environmental requirements contained in other applicable codes or ordinances.”

Source: 2012 IECC. Sections C101.3 and R101.3.

The code focus is “energy use... over the useful life of the building”. Buildings will perform to the requirements of this code for a long time. So the intent of the code focuses on “energy use” over the life of the building. Under the performance path, the IECC compares the energy use of a baseline building to the energy use of a proposed building.

This proposal addresses a lingering weakness in the code for those seeking to use innovative energy efficient systems. Simulations provide the means and methods to more fully understand, quantify and model actual energy use, whatever its form. This revision specifies a single standard reference design for heating, cooling, and service water heating systems, using technologies with low energy costs and high source energy efficiency as the baseline in each building component category.

The revised text and tables:

- Establish a single baseline building performance requirement
 - for all service hot water (SHW) and HVAC systems
 - independent of making the system choice for the proposed building
 - at a realistic and achievable level using code-compliant technologies.
- Addresses the inconsistent mix of multiple prescriptive baseline building technology performance requirements in the current standard.
- Provides equitable and consistent treatment of all SHW and HVAC system options, including conventional, renewable energy, hybrid technology, and waste heat recovery options.
- Is indifferent to the SHW and HVAC system choice in the proposed building, comparing all SHW and HVAC system options against a single energy efficient baseline building energy cost or source energy performance requirement.
- Aligns the SHW and HVAC system performance requirement methodology with the envelope single baseline performance requirement methodology.
- Achieves the goal of reducing the site energy cost, consumption of primary energy resources, and global greenhouse gas emissions related to the operation of the building in a cost-effective and equitable manner.

A single technology-blind baseline performance requirement is the most technically defensible methodology for performance path calculations, and it is critical for equitable implementation of the IECC Performance Alternative requirements Section R405. Shifting to a single baseline design provides an equitable credit to all technologies that have lower annual energy costs or source energy consumption compared to the single baseline level irrespective of energy form or technology design.

The current code structure does not facilitate equitable comparison of mechanical systems based energy cost or source energy consumption.

IECC Section R405 currently uses multiple baseline mechanical system performance requirements. The mechanical systems are compared using multiple baselines by separating both categories of equipment and fuel types used within each equipment category. For example, the current code has 14 different baseline configurations across the five SHW system categories that may be relevant to the residential sector, none of which results in the same annual energy cost or source energy budget for performance path calculations. This mix of equivalencies is a counter-productive and inconsistent approach that can be mitigated by shifting to a single baseline building design for all proposed building design alternatives. The existing Section R405 also may be subject to various interpretations on the appropriate baseline design building for advanced multi-fuel appliance options, waste heat recovery options, or emerging technologies that reduce energy costs or source energy consumption significantly compared to options that currently qualify.

The baseline mechanical systems in the revised Table R405 use a single efficient baseline design for all proposed building configurations. The revised Table R405.5.2(1) and additional Table R405.5.2(3) apply a single baseline energy cost requirement consistently to any proposed mechanical system. The baseline does not prohibit any technology options. It correctly allows all options, including higher operating cost options, but considers their strong energy cost or source energy consumption disadvantages compared to the single baseline performance requirement. A designer who chooses a higher energy cost or source energy consumption option for the proposed building would only need to reduce the overall building energy cost or source energy consumption to the baseline level, and could do so through any combination of improved energy performance options, including HVAC, SHW, and envelope improvements.

The existing HVAC and SHW provisions are also inconsistent with standard reference baseline design criteria for envelope building components. Those building element provisions do not prescribe specific technology categories or subcategories, but are true performance based requirements (e.g., envelope requirements in overall U value) that give the designer maximum flexibility BEFORE making technology choices in the design. The designer is free to choose the most cost-effective envelope technology (fiberglass, polyurethane foam) to meet the single energy target for the building without arbitrary technology class prescriptive requirements for fiberglass or foam insulation. Unfortunately, the existing provisions of HVAC and SHW tables impose technology category and subcategory prescriptive requirements when using the performance path instead of true performance-based requirements. The impact is to establish the reference design building AFTER prescriptive technology category and energy design choices are made. This is an inequitable application of prescriptive requirements in the performance path. This constraint eliminates the credit for creative design choices that would significantly reduce energy cost, primary energy use, and greenhouse gas emissions.

The revised tables and text completely decouple the proposed building design choices from the standard reference design building's energy cost or source energy performance requirement. The reference energy and technology choices in the revised section were selected to provide a practical and effective requirement to meet the intent of the standard while still offering appropriate incentives for the best available technologies based on their energy cost benefits. Encouraging rather than discouraging this design flexibility aligns closely with the IECC stated goal of reducing energy costs by 30 percent compared to the 2012 version.

Cost Impact: The code change proposal will not increase the cost of construction.

(Portions of the Table not shown remain unchanged.)

Reason This proposal restores equipment efficiency as a variable in the simulated performance alternative of the IECC, consistent with the code prior to the 2009 edition. In the past, resistance to similar proposals to restore this language have been based partly on an argument that this somehow weakens the code. This proposal does not decrease the level of performance required of

buildings but offers the designer or builder the opportunity to design the building in the most cost effective manner. They will still be required to meet the same level of overall performance as for a building complying prescriptively.

Cost Impact: The code change proposal will not increase the cost of construction.

	<u>Winter: 0.85</u>	<u>Same as Standard Reference Design</u>
	External shading: none	As proposed

(Portions of Table not shown remain unchanged)

Reason:

Glazing Area

Glazed areas are the least efficient and most costly components of homes. Even the best windows and glass doors admit much more solar heat gain than walls, roofs and floors. And even the best windows and doors have thermal conductances that are far inferior to walls, roofs and floors.

Table 1 below presents the 2012 IECC requirements for envelope components in IECC climate zone 2. While there are no IECC requirements for the SHGC of opaque envelope components like walls, ceilings and floors, an equivalent SHGC can be calculated using the component U-Factor, a reasonable sol-air temperature, a reasonable interior temperature (75 °F) and a reasonable incident solar radiation, as follows:

$$SHGC_{equiv} = U-Factor \cdot (T_{sol-air} - T_{int}) / (Solar_{Incident})$$

For Table 1, the assumed sol-air temperatures were 140 °F for walls and 160 °F for roofs (ceilings) and the assumed incident solar radiation was 250 Btu/h for walls and 300 Btu/h for roofs (ceilings). Floors receive no solar radiation and thus do not experience heat gains due to direct solar radiation as do fenestration, walls and roofs (ceilings).

Table 1. Envelope Component Efficacies

Envelope Component	IECC* U-Factor	U-Factor Ratio	IECC* SHGC	SHGC Ratio
Fenestration	0.400	1.00	0.250	1.00
Frame walls	0.082	4.88	0.021**	11.73
Mass walls	0.165	2.42	0.043**	5.83
Ceilings	0.030	13.33	0.009**	29.41
Floors	0.064	6.25	0.000**	∞

* IECC U-Factor and SHGC values for Climate Zone 2

** Computed estimate

The U-Factor and SHGC ratios in Table 1 compare the heat retardation efficacy of each of the other envelope components to the heat retardation efficacy of fenestrations. These ratios show that the opaque envelope components are 2.42 to 13.33 times as efficacious in retarding heat flow by conductance as fenestrations and 5.83 to 29.41 times as efficacious in retarding solar heat gains as fenestrations.

Per unit area, fenestrations are also the most expensive envelope components in new homes. Estimates from the 2011 R.S. Means Residential Cost Data show typical code compliant concrete block wall construction prices to be about \$15/ft² while typical code compliant window prices are somewhat more than double this amount, at about \$32/ft².

The data show that fenestrations are relatively costly home amenities, which are not particularly energy efficient compared with other envelope components. The principle function of fenestration is to visually bring the outdoors into the comfort conditioned interior living space. Thus, cost is the principle determinant of fenestration area as a percentage of conditioned floor area, with larger fenestration percentages much more likely in high-end, expensive homes than in low-end, smaller homes.

Reductions in glazing area improve the energy performance of homes. If homes are evaluated on an energy performance basis then, all other things being equal, the home with the smaller window area will have less energy consumption. That being the case, a simulated performance alternative should recognize this smaller energy consumption rather than adjust the Standard Reference Design glazing area such that this smaller energy use is effectively disallowed as an energy performance characteristic of the home.

Most homes that choose smaller fenestration area are small, low-cost homes. Thus, the choice to incorporate less fenestration area is an economic decision – made to reduce the cost of the home. The fact that these homes are smaller than the typical new home also significantly reduces the energy use of the home compared to the more typical larger new home. As a result, this “sliding” glazing area in the 2012 IECC Standard Reference Design actually requires the smaller, low-cost home with less window area to meet a higher energy performance standard than the larger more energy intensive typical home. This constitutes a strong affirmation of the old saw that “no good deed shall go unpunished.”

For reasons of cost effectiveness and the equitable treatment of smaller, low-cost homes, the Code should set a single standard for glazing area in the Standard Reference Design and not allow it to “float down” with the window area of the Proposed Design.

Interior Shading Coefficient

The 2012 IECC modifies the interior shading coefficient of fenestrations as a function of the SHGC of the fenestration. It does this in both the Standard Reference Design and the Proposed Design. The equation for the 2012 IECC interior shading coefficient is as follows:

$$\text{Interior Shade} = 0.92 * (0.21 * \text{SHGC})$$

Compared with the 2009 IECC interior shading coefficients, which were not dependent on the SHGC of the fenestration but were based on the likely behavior of the home occupants, this equation effectively penalizes high performance windows in climates like Florida where lower SHGCs are desirable. The equation shows that the better the SHGC (lower is better in Florida), the lower the interior shading coefficient. Thus, a window with a SHGC of 0.5 would have an interior shading coefficient of 0.82 while a window with a SHGC of 0.2 would have an interior shading coefficient of 0.88. This results in the poorer performing window getting more energy performance credit from interior shading than the better performing window.

Table 2 examines how the change from the 2009 IECC interior shading coefficients to the 2012 IECC interior shading coefficients impact projected performance. A 2-story, 2400 ft², slab-on-grade frame wall IECC 2012 Standard Reference Design home is used for both sets of simulations. The only change is the manner in which interior shading is treated. The values in the table are the annual kWh for heating and cooling in the cities specified.

Table 2. H&C Interior Shading Example

Condition	Miami	Orlando	Tally
IECC 2009	4981	3507	3426
IECC 2012	5237	3685	3579
kWh change	256	178	153
% change	5.1%	5.1%	4.5%

Table 2 shows that these high performance (SHGC-0.25) windows show 4.5% - 5.1% greater energy use for the IECC 2012 interior shading coefficient specification than for the 2009 IECC interior shading coefficient specification. This means that these high-performance windows will achieve less energy performance credit using the 2012 IECC specification than they do using the 2009 IECC specification. Surely this was not the intent of the 2012 change to the IECC interior shading coefficient.

In addition to the performance differences shown in Table 2, the 2012 IECC interior shading coefficients also do not reflect the likely behavior of the occupants. Occupants are more likely to use shades and blinds principally for privacy reasons but are also likely to use somewhat more shades and blinds during the air conditioning season to keep the sun out of the living space and use

somewhat less shades and blinds during the heating season to let the sun into the living space. This occupant behavior is reflected in the 2009 IECC interior shading coefficient specification but abandoned for unknown reasons in the 2012 IECC interior shading coefficient specification.

Based on this analysis, the proponent recommends that the IECC set a single, non-floating window area to conditioned floor area ratio of 15% for the Standard Reference Design and that the IECC 2009 specification for interior shading coefficient be maintained for both the Standard Reference Design and the Proposed Design.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Brenda A. Thompson, Clark County Development Services, Las Vegas NV, representing ICC Sustainability, Energy & High Performance Building Code Action Committee (bat@clarkcounty.gov)

Revise as follows:

TABLE R405.5.2(1) (N1105.5.2(1))
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Heating systems ^{f,g}	<p>As proposed for other than electric heating without a heat pump. Where the proposed design utilizes electric heating without a heat pump the standard reference design shall be an air source heat pump meeting the requirements of Section R403 of the IECC—Commercial Provisions.</p> <p><u>Fuel type: same as proposed design</u></p> <p><u>Efficiencies:</u> <u>Electric: Air-source heat pump in accordance with prevailing federal minimum efficiency standards</u> <u>Non-electric furnaces: Furnace in accordance with prevailing federal or regional minimum efficiency standards</u> <u>Non-electric boilers: Boiler in accordance with prevailing federal minimum efficiency standards</u></p> <p>Capacity: sized in accordance with Section R403.6.</p>	<p>As proposed</p> <p><u>As proposed</u></p> <p><u>As proposed</u></p> <p><u>As proposed</u></p>
Cooling system ^{f,h}	<p>As proposed</p> <p><u>Fuel type: Electric</u></p> <p><u>Efficiency: In accordance with prevailing federal minimum efficiency standards</u></p> <p>Capacity: sized in accordance with Section R403.6.</p>	<p>As proposed</p> <p><u>As proposed</u></p>

Service Water Heating ^{f,g,h,i}	As proposed	
	<u>Fuel type: same as proposed design</u>	As proposed
	<u>Efficiency: in accordance with prevailing federal minimum efficiency standards</u>	As proposed
	Use: Same_as proposed design	<u>Use:</u> gal/day = 30 + (10 × N_{br}) <u>N_{br}</u> = Number of bedrooms
	<u>Same as proposed design</u>	<u>Tank temperature: 120°F</u>

(Portions of Table not shown remain unchanged)

Reason: This proposal was submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held 3 open meetings and over 30 workgroup calls which included members of the SEHPCAC as well as any interested party to discuss and debate proposed changes and public comments. Related documentation and reports are posted on the SEHPCAC website at: <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Reasons for this specific proposal:

The ability to include high efficiency mechanical equipment in the performance path was removed in the 2009 IECC. However, this is counter to the entire premise of the performance path, which is to allow flexibility to use any number of different means to achieve the same level of energy performance. This limits adaptability for local circumstances and alternative designs, and also discourages integrated design and use of innovative new HVAC and hot water technologies. It is also in contrast with every other building energy code, standard, and green program. As a result, this issue has encountered resistance from a diverse group of academics, builders, building officials, and industry representatives, and in some cases, has hindered local adoption of the code.

One of the primary reasons that equipment trade-offs were removed was that the federal minimum equipment efficiencies were lagging in the market. Specifically, there were concerns that builders were taking credit for putting in a high efficiency condensing furnace over the old baseline 78 AFUE furnaces, although the large majority of the northern market was already using condensing furnaces – so they were getting "free" credit for something they would have done anyway. However, new federal standards will take effect between May 1, 2013 and January 1, 2015 that will upgrade equipment efficiencies, including addressing this specific example by setting a new baseline that will require condensing furnaces in the north.

Therefore, this proposal would reinstate the ability to include high efficiency heating, cooling, and service water heating equipment in the performance path, using similar language as was previously in the 2006 IECC but using the new minimum equipment efficiency standards.

Cost impact: None, or decrease in cost by enabling whole building design to optimize cost and energy efficiency.

R403.8 (N1103.8) Snow melt system controls. ~~(Mandatory)~~ *(Portions of text not shown remains unchanged)*

R403.9 (N1103.9) Pools and inground permanently installed spas. (~~Mandatory~~) *(Portions of text not shown remains unchanged)*

SECTION R404 (N1104)
ELECTRICAL POWER AND LIGHTING SYSTEMS
(~~MANDATORY~~)

R404.1 (N1104.1) Lighting equipment (~~Mandatory~~) *(Portions of text not shown remains unchanged)*

R404.1.1 (N1104.1.1) Lighting equipment (~~Mandatory~~) *(Portions of text not shown remains unchanged)*

SECTION R405 (N1105)
SIMULATED PERFORMANCE ALTERNATIVE
(~~Performance~~)

R405.2 (N1105.2) Mandatory requirements. Compliance with this Section requires that ~~the mandatory provisions identified in Section R401.2 be met~~ projects comply with Sections R401.3, R402.4, R402.5, R403.1, R403.2.2, R403.2.3, R403.4 through R403.9, and R404. All Supply and return ducts not completely inside the building thermal envelope shall be insulated to a minimum of R-6.

Reason: This change corrects the erroneous use of the term “mandatory”. This moves the specification of what can be traded off with the performance approach into the code text about the performance approach, rather than spreading that information throughout the code, as was in energy codes prior to 2006.

The word “shall” and the concept of “mandatory” is woven throughout the I-codes. It is important that the energy code use “shall” correctly. The IRC definition is

SHALL. *The term, when used in this code, is construed to mean “mandatory”.*

Since the IECC inherits the IRC definitions, IECC use of “shall” implies “mandatory”. Implying sections with the word “prescriptive” is not “mandatory” is at the very least confusing, if not wrong.

Why are these labels even in the IECC? The “prescriptive” and “mandatory” labels are intended separate what could from what could not be traded off in the performance path. A simpler and clearer way approach is to list what the performance section is applicable to in the performance section itself. Section R405 (Performance) already has a subsection defining what the performance approach applies to (currently titled “Mandatory Requirements”).

The existing code incorrectly lists some requirements as “prescriptive”, meaning they can be traded off under the performance approach. Requirements incorrectly listed as “tradable” include eve baffle R402.2.3, the definition of “mass walls” R402.2.5, installing insulation to be permanently attached in the floor and crawlspace (Sections 402.2.7 and 402.2.10), and the crawl space vapor retarder (Section 402.2.9). Permanent attachment of the insulation and important vapor retarders should not be traded away in a performance calculation. This change corrects the items incorrectly labeled as tradable.

This change moves the list of requirements that cannot be traded into a single location in the performance section. It removes over 20 instances unnecessary and confusing uses of “mandatory”, “prescriptive” and “performance” from section and subsection heading, and corrects errors in labeling requirements that can be traded; all without any change to section or subsection content.

Cost Impact: The code change proposal will not increase the cost of construction.

R101.4.3, R202, R406 (NEW), (IRC N1101. 3, N1101.9, N1106(NEW))

Proponent: Eric Makela, Britt Makela Group, Inc., representing Institute for Market Transformation (eric@brittmakela.com), Ryan Meres, Institute for Market Transformation

Delete and substitute as follows:

~~R101.4.3 (N1101.3) Additions, alterations, renovations or repairs.~~ Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.

~~Exception:~~ The following need not comply provided the energy use of the building is not increased:

- ~~1. Storm windows installed over existing fenestration.~~
- ~~2. Glass only replacements in an existing sash and frame.~~
- ~~3. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.~~
- ~~4. Construction where the existing roof, wall or floor cavity is not exposed.~~
- ~~5. Reroofing for roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.~~
- ~~6. Replacement of existing doors that separate conditioned space from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a conditioned space from the exterior shall not be removed.~~
- ~~7. Alterations that replace less than 50 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.~~
- ~~8. Alterations that replace only the bulb and ballast within the existing luminaires in a space provided that the alteration does not increase the installed interior lighting power.~~

R101.4.3 (N1101.3) Additions, alterations, or repairs. Additions, alterations, or repairs to an existing building, building system or portion thereof shall comply with Section R406.

Revise definition as follows:

REPAIR. The reconstruction or renewal of any part of an existing building for the purpose of its maintenance.

Add new text as follows:

SECTION R406 (IRC N1106) **ADDITIONS, ALTERATIONS, OR REPAIRS**

R406.1 (IRC N1106.1) Scope. The provisions of this section shall control the *alteration, repair and addition* of existing buildings and structures for compliance with this code.

R406.2 (IRC N1106.2) Existing buildings. Except as specified in this chapter, this code shall not be used to require the removal, *alteration* or abandonment of, nor prevent the continued use and maintenance of, an existing building or building system lawfully in existence at the time of adoption of this code.

R406.4 (IRC N1106.4) Additions, alterations, or repairs. Additions, alterations, or repairs to an existing building, building system or portion thereof shall comply with Sections R406.4.1, R406.4.2 or R406.4.3. Unaltered portions of the existing building or building supply system shall not be required to comply with this code. Additions, alterations, or repairs shall not create an unsafe or hazardous condition or overload existing building systems.

R406.4.1 (IRC N1106.4.1) Additions. An addition shall be deemed to comply with this code if the addition alone complies, if the existing building and addition comply as a single building, or if the building with the addition uses no more energy than the existing building. Additions shall be in accordance with Section 406.4.1.1 or Section 406.4.1.2.

406.4.1.1 (IRC N1106.4.1.1) Prescriptive compliance. Additions shall comply with Sections 406.4.1.1.1 through 406.4.1.1.4.

406.4.1.1.1 (IRC N1106.4.1.1.1) Building envelope. New building envelope assemblies that are part of the addition shall comply with Sections R402.1, R402.2, R402.3.1 through R402.3.5, and R402.4.

Exception. Where nonconditioned space is changed to conditioned space the building envelope of the addition shall comply where the UA, as determined in Section 402.1.4, of the existing building and the addition, and any alterations that are part of the project, is less than or equal to UA generated for the existing building.

R406.4.1.1.2 (IRC N1106.4.1.1.2) Heating and cooling systems. New heating, cooling and duct systems that are part of the addition shall comply with Sections R403.1, R403.2, R403.3, R403.5 and R403.6.

Exception: Where ducts from an existing heating and cooling system are extended to an addition, duct systems with less than 40 linear feet in unconditioned spaces shall not be required to be tested in accordance with Section R403.2.2.

R406.4.1.1.3 (IRC N1106.4.1.1.3) Service hot water systems. New service hot water systems that are part of the addition shall comply with Section R403.4.

R406.4.1.1.4 (IRC N1106.4.1.1.4) Lighting. New lighting systems that are part of the addition shall comply with Section 404.1.

R406.4.1.2 (IRC N1106.4.1.2) Existing plus addition compliance (Simulated Performance Alternative). Where nonconditioned space is changed to conditioned space the addition shall comply where the annual energy cost or energy use of the addition and the existing building, and any alterations that are part of the project, is less than or equal to the annual energy cost of the existing building when modeled in accordance with Section R405. The addition and any alterations that are part of the project shall comply with Section R405 in its entirety.

406.4.2 (IRC N1106.4.2) Alterations. Alterations to existing buildings shall comply with Section R406.4.2.1 through R406.4.2.4. Alterations shall be such that the existing building or structure uses no more energy than the existing building or structure prior to the alteration.

406.4.2.1 (IRC N1106.4.2.1) Building envelope. Building envelope assemblies that are part of the alteration shall comply with Sections R402.1.1 or R402.1.3, R402.2.1 through R402.2.11, R402.3.1, R402.3.2, R402.3.6, R402.4.3 and R402.4.4.

Exceptions: The following building envelope alterations are exempt from Section 406.1.2.1.

1. Storm windows installed over existing fenestration.
2. Glass only replacements in an existing sash and frame.

3. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.
4. Construction where the existing roof, wall or floor cavity is not exposed.
5. Reroofing for roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.

R406.4.2.2 (IRC N1106.4.2.2) Heating and cooling systems. New heating, cooling and duct systems that are part of the alteration shall comply with Sections R403.1, R403.2, R403.3 and R403.6.

Exception: Where ducts from an existing heating and cooling system are extended, duct systems with less than 40 linear feet in unconditioned spaces shall not be required to be tested in accordance with Section R403.2.2.

R406.4.2.3 (IRC N1106.4.2.3) Service hot water systems. New service hot water systems that are part of the alteration shall comply with Section R403.4.

R406.4.2.4 (IRC N1106.4.2.4) Lighting. New lighting systems that are part of the alteration shall comply with Section 404.1.

R406.4.3 Repairs. (IRC N1106.4.3) Work on nondamaged components that is necessary for the required *repair* of damaged components shall be considered part of the *repair* and shall not be subject to the requirements for *alterations* in this section. Routine maintenance, ordinary repairs exempt from *permit*, and abatement of wear due to normal service conditions shall not be subject to the requirements for *alterations*.

Reason: The residential provisions of the 2012 IECC require that additions, alterations renovations or repairs comply with the provisions of the energy code without providing a clear "roadmap" on the specific requirements that apply to these projects. The goal of this code change proposal is to provide clear direction to the code user on what provisions must be complied with based on the type of project. Increasing the clarity of the code will increase the compliance rate and result in increased energy savings for these projects.

This proposal places all of the requirements for additions, alterations, renovations and repairs into a new section in the residential provisions of the IECC and builds off the work conducted by the ICC SEHPCAC in the development of their existing building proposal. The additions portion of the proposal provides an energy neutral method for demonstrating compliance for difficult to comply projects by basically saying that the building with the addition uses no more energy than the existing building. This will allow projects to take advantage of energy efficient alterations on the existing building to offset difficult to comply with features on the addition. For example, garage conversions in Climate Zone 5, where the walls are framed with 2 X 4's, will be forced to increase the insulation levels of the wall system to levels that are difficult to meet without significant cost. Allowing this type of trade-off will increase the overall efficiency of the entire building at a lower potential first cost than insulating the wall system.

An allowance is also included for adding a short duct run in unconditioned space by exempting up to 40 feet of new duct work. Currently the code would require this duct to be tested even though the entire system is very leaky. This allowance is from the Washington State Residential Energy Code.

Exceptions currently included in Section C101.4.3 of the 2012 IECC have been moved into this new section and linked to the applicable references to the building envelope, systems or lighting section. Repairs have been clearly identified and essentially exempted from the requirements of the IECC if they fall within certain defined parameters.

Cost Impact: The code change proposal will not increase the cost of construction.

R403.7 (N1103.7) Systems serving multiple dwelling units. ~~(Mandatory)~~. (Portions of text not shown remains unchanged)

R403.8 (N1103.8) Snow melt system controls. ~~(Mandatory)~~. (Portions of text not shown remains unchanged)

R403.9 (N1103.9) Pools and inground permanently installed spas. (~~Mandatory~~) *(no change to code text)*

SECTION R404 (N1104)
ELECTRICAL POWER AND LIGHTING SYSTEMS
(~~MANDATORY~~)

R404.1 (N1104.1) Lighting equipment (~~Mandatory~~) *(Portions of text not shown remains unchanged)*

R404.1.1 (N1104.1.1) Lighting equipment (~~Mandatory~~) *(Portions of text not shown remains unchanged)*

SECTION R405 (N1105)
SIMULATED PERFORMANCE ALTERNATIVE
(~~Performance~~)

R405.2 (N1105.2) Mandatory requirements. Compliance with this Section requires that ~~the mandatory provisions identified in Section R401.2 be met~~ projects comply with Sections R401.3, R402.4, R402.5, R403.1, R403.2.2, R403.2.3, R403.4 through R403.9, and R404. All Supply and return ducts not completely inside the building thermal envelope shall be insulated to a minimum of R-6.

Reason: This change corrects the erroneous use of the term “mandatory”. This moves the specification of what can be traded off with the performance approach into the code text about the performance approach, rather than spreading that information throughout the code, as was in energy codes prior to 2006.

The word “shall” and the concept of “mandatory” is woven throughout the I-codes. It is important that the energy code use “shall” correctly. The IRC definition is

SHALL. *The term, when used in this code, is construed to mean “mandatory”.*

Since the IECC inherits the IRC definitions, IECC use of “shall” implies “mandatory”. Implying sections with the word “prescriptive” is not “mandatory” is at the very least confusing, if not wrong.

Why are these labels even in the IECC? The “prescriptive” and “mandatory” labels are intended separate what could from what could not be traded off in the performance path. A simpler and clearer way approach is to list what the performance section is applicable to in the performance section itself. Section R405 (Performance) already has a subsection defining what the performance approach applies to (currently titled “Mandatory Requirements”).

The existing code incorrectly lists some requirements as “prescriptive”, meaning they can be traded off under the performance approach. Requirements incorrectly listed as “tradable” include eve baffle R402.2.3, the definition of “mass walls” R402.2.5, installing insulation to be permanently attached in the floor and crawlspace (Sections 402.2.7 and 402.2.10), and the crawl space vapor retarder (Section 402.2.9). Permanent attachment of the insulation and important vapor retarders should not be traded away in a performance calculation. This change corrects the items incorrectly labeled as tradable.

This change moves the list of requirements that cannot be traded into a single location in the performance section. It removes over 20 instances unnecessary and confusing uses of “mandatory”, “prescriptive” and “performance” from section and subsection heading, and corrects errors in labeling requirements that can be traded; all without any change to section or subsection content.

Cost Impact: The code change proposal will not increase the cost of construction.

RE185-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R401.2-#1 EC-CONNER.doc

RE186 – 13

R202 (IRC N1101.9), R401.2 (IRC N1101.15), R406 (NEW) (IRC N1106 (NEW))

Proponent: William Fay, Energy Efficient Codes Coalition; Brian Dean, Energy Efficient Codes Coalition; Garrett Stone, Brickfield Burchette Ritts & Stone, PC; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy; and Bill Prindle, Energy Efficient Codes Coalition

Revise follows:

SECTION R401 (N1101) GENERAL

R401.2 (IRC N1101.15) Compliance. Projects shall comply with Sections identified as "mandatory" and with either sections identified as "prescriptive" or the simulated performance alternative approach in Section R405. In addition, all projects shall comply with Section R406.

SECTION R406 (N1106) ADDITIONAL ENERGY EFFICIENCY (MANDATORY)

R406.1 (N1106.1) Scope. This section establishes additional mandatory requirements applicable to all compliance approaches to achieve additional energy efficiency.

R406.2 (N1106.2) Points-based compliance. One or more energy efficiency measure(s) shall be installed in accordance with Section R406.3 that cumulatively equal or exceed 5 (five) Flex Points for the appropriate Climate Zone. Projects complying under the simulated performance alternative outlined in Section R405 shall demonstrate compliance with Section R405 without including in the proposed design any features that will be utilized to comply with Section R406.

Exceptions: The requirements of this section shall not apply to:

1. Projects complying under the performance approach outlined in Section R405, where the *proposed design* under section R405.3 is shown to have an annual energy cost that is less than or equal to 95% of the annual energy cost of the *standard reference design*.
2. Projects with an on-site or building integrated renewable energy system installed that provides not less than 0.50 watts per square foot (5.4 W/m²) of conditioned floor area.
3. Additions with a conditioned floor area equal to or less than 1,000 square feet.
4. Alterations, renovations and repairs to an existing building.

R406.3 (N1106.3) Flex Points for additional energy efficiency. Measures shall be selected from the applicable Flex Points Table based on the applicable federal minimum equipment efficiency established by federal rule for that state that applies to the specified heating and cooling equipment on the date that a permit is issued. Each measure chosen shall receive credit for the Flex Points as indicated in the applicable Table for the specific Climate Zone. Interpolation of points between measures shall not be permitted.

R406.3.1 (N1106.3.1) Use of Flex Points Table R406.3.1. In states where the applicable federal minimum efficiencies are less than or equal to 80 AFUE for non-weatherized gas residential furnaces, equal to 7.7 HSPF for split system heat pumps, and equal to 13 SEER for split system air conditioners, Table R406.3.1 shall be used.

a. Climate Zone 4C is Climate Zone Marine 4.

b. The Total UA shall be calculated in accordance with Section R402.1.4 Total UA alternative.

c. Minimum Heat Recovery Ventilator (HRV) and Energy Recovery Ventilator (ERV) requirements, measured at the lowest tested net supply airflow, shall be ≥ 75% Sensible Recovery Efficiency (SRE), ≤ 1.1 W/CFM Fan Energy and shall not use recirculation as a defrost strategy. In addition, the Energy Recovery Ventilator (ERV) shall be ≥ 50% Latent Recovery/Moisture Transfer (LRMT).

d. To achieve 100% of the thermal distribution located in the actively conditioned space, no ducts or pipes used for the heating and cooling systems shall be located within walls or ceilings where losses are not directly regained into the conditioned space.

e. For multiple cooling systems, all systems shall meet or exceed the minimum efficiency requirements in Table R406.3.1 and shall be sized to serve 100% of the cooling design load. As an alternative, each system installed shall receive credit for the percentage of the Flex Points for the measure equal to the percentage of the cooling design load served by the system.

f. For multiple heating systems, all systems shall meet or exceed the minimum efficiency requirements in Table R406.3.1 and shall be sized to serve 100% of the heating design load. As an alternative, each system installed shall receive credit for the percentage of the Flex Points for the measure equal to the percentage of the heating design load served by the system.

R406.3.2 (N1106.3.2) Use of Flex Points Table R406.3.2. In states where the applicable federal minimum efficiencies are less than or equal to 80 AFUE for non-weatherized gas residential furnaces, equal to 8.2 HSPF for split system heat pumps, and less than or equal to 14 SEER for split system air conditioners, Table R406.3.2 shall be used.

a. Climate Zone 4C is Climate Zone Marine 4.

b. The Total UA shall be calculated in accordance with Section R402.1.4 Total UA alternative.

c. Minimum Heat Recovery Ventilator (HRV) and Energy Recovery Ventilator (ERV) requirements, measured at the lowest tested net supply airflow, shall be ≥ 75% Sensible Recovery Efficiency (SRE), ≤ 1.1 W/CFM Fan Energy and shall not use recirculation as a defrost strategy. In addition, the Energy Recovery Ventilator (ERV) shall be ≥ 50% Latent Recovery/Moisture Transfer (LRMT).

d. To achieve 100% of the thermal distribution located in the actively conditioned space, no ducts or pipes used for the heating and cooling systems shall be located within walls or ceilings where losses are not directly regained into the conditioned space.

e. For multiple cooling systems, all systems shall meet or exceed the minimum efficiency requirements in Table R406.3.2 and shall be sized to serve 100% of the cooling design load. As an alternative, each system installed shall receive credit for the percentage of the Flex Points for the measure equal to the percentage of the cooling design load served by the system.

f. For multiple heating systems, all systems shall meet or exceed the minimum efficiency requirements in Table R406.3.2 and shall be sized to serve 100% of the heating design load. As an alternative, each system installed shall receive credit for the percentage of the Flex Points for the measure equal to the percentage of the heating design load served by the system.

R406.3.3 (N1106.3.3) Use of Flex Points Table R406.3.3. In states where the applicable federal minimum efficiencies are equal to 90 AFUE for non-weatherized gas residential furnaces, equal to 8.2 HSPF for split system heat pumps, and less than or equal to 14 SEER for split system air conditioners, Table R406.3.3 shall be used.

a. Climate Zone 4C is Climate Zone Marine 4.

b. The Total UA shall be calculated in accordance with Section R402.1.4 Total UA alternative.

c. Minimum Heat Recovery Ventilator (HRV) and Energy Recovery Ventilator (ERV) requirements, measured at the lowest tested net supply airflow, shall be ≥ 75% Sensible Recovery Efficiency (SRE), ≤ 1.1 W/CFM Fan Energy and shall not use recirculation as a defrost strategy. In addition, the Energy Recovery Ventilator (ERV) shall be ≥ 50% Latent Recovery/Moisture Transfer (LRMT).

d. To achieve 100% of the thermal distribution located in the actively conditioned space, no ducts or pipes used for the heating and cooling systems shall be located within walls or ceilings where losses are not directly regained into the conditioned space.

e. For multiple cooling systems, all systems shall meet or exceed the minimum efficiency requirements in Table R406.3.3 and shall be sized to serve 100% of the cooling design load. As an alternative, each system installed shall receive credit for the percentage of the Flex Points for the measure equal to the percentage of the cooling design load served by the system.

f. For multiple heating systems, all systems shall meet or exceed the minimum efficiency requirements in Table R406.3.3 and shall be sized to serve 100% of the heating design load. As an alternative, each system installed shall receive credit for the percentage of the Flex Points for the measure equal to the percentage of the heating design load served by the system.

Revise as follows:

SECTION R202 (IRC N1101.9) GENERAL DEFINITIONS

CONDITIONED SPACE. An area or room within a building that is either *actively conditioned space* or *passively conditioned space* being heated or cooled, containing uninsulated ducts, or with a fixed opening directly into an adjacent conditioned space.

ACTIVELY CONDITIONED SPACE. An area within a *building thermal envelope* that is directly heated or cooled, including any habitable room.

PASSIVELY CONDITIONED SPACE. An area within a *building thermal envelope* that is not directly heated or cooled, including wall cavities, floor cavities, ceiling cavities, storage rooms, closets, non-habitable attic, non-habitable basement, crawlspace, spaces or cavities that contain uninsulated ducts or thermal distribution systems or have an opening directly into an adjacent conditioned space.

Reason: The purpose of this code change is to establish a new mandatory section to achieve additional energy efficiency. This proposal will allow builders the flexibility to choose from a menu of options to achieve 5% or more in energy savings beyond compliance with the current prescriptive or performance paths in the 2012 *IECC*. The new mandatory set of points-based options are predicated on the notion that because the current residential I-Codes require a solid foundation of “whole house” efficiency features, builders should have flexibility to determine the improvements that add onto that foundation. In addition to bringing about a reasonable, but modest, improvement in energy efficiency in the 2015 *IECC*, the proposal will also lay the groundwork for emerging technologies and future improvements to the code. Similar options-based approaches are currently found in both the commercial provisions of the 2012 *IECC* (section C406) and in residential codes adopted in a number of states. As discussed below, this proposal improves the *IECC* in at least five important ways:

The proposal improves the overall energy efficiency of the *IECC* and *IRC* by about five percent, reducing the home’s energy consumption and homeowner operating costs.

From a national energy policy standpoint, the need to improve the efficiency of America’s buildings has not changed. Because buildings continue to consume over 50% of the natural gas and over 70% of the electricity consumed in America, the nation’s building codes should incorporate reasonable measures to reduce energy use and peak demand wherever feasible. The residential requirements of the 2012 *IECC* represent significant improvements over previous editions of the code, and we believe that an additional 5% improvement in efficiency in the 2015 *IECC* is not only feasible, but is crucial to sound national energy policy and our nation’s energy future. Each new building and substantial addition should bring the country one step closer to our national goal of energy independence.

In addition, energy efficient construction generates significant operating savings that quickly recoup the incremental cost of these improvements to new homebuyers. For example, when the US Department of Energy compared homes built to the 2012 *IECC* with homes built to the 2006 *IECC*, average homeowner life-cycle (30-year) cost savings ranged from \$4,763 in Climate Zone 2 (the lowest savings in all climate zones) to \$33,105 in Climate Zone 8 (the highest savings). And, even after accounting for the incremental up-front costs of mortgage fees and down payment, a homeowner’s cumulative cash flow became positive within a year or two in all eight climate zones.

The proposal creates a highly flexible method to achieve additional energy savings that would be difficult to require in the current *IECC* and *IRC* structure.

Although there are many possible improvements beyond the 2012 *IECC*, some of these improvements would be impractical or difficult to include as prescriptive requirements at this time. For example, some emerging technologies may save energy, but because of limited availability, high cost, or federal laws, it may not be reasonable – or even legal – to require these technologies in every building. The *IECC* does not currently have an organized method for recognizing specific prescriptive options beyond the baseline requirements.

This proposal creates an approach and format that recognizes the energy savings potential of a range of systems and building features that otherwise would not be feasible to include in the baseline requirements at this time. For example, the proposal includes high-efficiency heating, cooling, and water heating options that could not be required outright because of federal preemption issues. The proposal also includes envelope-only measures that reward builders for going well beyond the current code requirements. The result is a reasonably flexible system of options that builders can choose from that goes beyond the 2012 *IECC* and *IRC*, provides incentives for good building practice and technologies, and gives jurisdictions an easily-adaptable, and easy to administer method to set ever-improving efficiency requirements.

The proposal lays the groundwork for future improvement in the code by establishing a structure for both prescriptive- and performance-based compliance options.

In order to maximize flexibility and prepare for future improvements to the code, this proposal establishes multiple methods of compliance for new buildings and additions of more than 1,000 square feet (smaller additions, alterations, renovations and repairs are currently proposed to be exempt to keep the proposal simpler).

- For code users who prefer a straightforward points-based approach to code compliance, Section R406 outlines a number of options for each climate zone that can be combined for a total of at least 5 points. Each point represents roughly a one percent decrease in the present value of energy costs over the life of the building (so 5 points equal roughly a 5% improvement in efficiency over the 2012 *IECC*).
- For code users who wish to use the simulated performance alternative in Section R405, the proposal also allows compliance where the proposed design demonstrates an energy cost less than or equal to 95% of the standard reference design. The proposal also allows compliance with the points system so long as the user does not “double count” in its performance analysis any improvements used in points compliance.
- Section R406 also creates a new option to demonstrate compliance through installation of renewable energy systems.

These compliance options can be easily updated in the future. For example, as additional technologies and building practices are improved in the future, these technologies can be added to the table, along with a corresponding point value, without a total rewrite of the code.

Points have been calculated based on the present value of energy cost savings over the current code (with recognition of relevant federal equipment standards), after reflecting the estimated useful life of each measure and an assumed 30-year life of the building for purposes of the analysis (consistent with a 30-year mortgage). This approach factors in the durability and useful life of each additional option chosen, recognizing that it is not the energy cost savings in the first year that is critical, but the cost savings over the life of the home that is most important. Although no building energy simulation on this scale will be perfect, the analysis behind the Flex Points tables is among the most sophisticated and detailed of its type. The analysis used the Department of Energy building analysis and present value calculation methodology, which will allow for easy updates to the table in the future. The analysis includes 105 TMY3 weather locations and 12 building types to account for varying stories, foundations and fuel types for each of the baseline and upgrade measures.

The proposal creates incentives for code users to consider installing high-efficiency heating, cooling, and water heating systems, as well as other alternatives, without degrading the thermal building envelope or violating federal law.

Code-writing organizations have long wrestled with the dilemma of how to incorporate high-efficiency heating, cooling, and water heating requirements into the code without violating federal law and without sacrificing improvements to the thermal envelope in return. In past code cycles, EECC was instrumental in removing the equipment trade-offs from the code to resolve the issues these trade-offs and the federal laws created. We remain strongly committed to that approach today. However, this proposal takes the next step by leaving the 2012 IECC baseline requirements intact, while offering code users the choice of equipment upgrades among several other potential improvements beyond the baseline requirements.

The proposal includes three Flex Points tables that correspond with current requirements and expected changes to HVAC equipment efficiency in the coming years. Although we hope to see improvements in federal efficiency standards for heating and cooling equipment take effect in the near future, it is not yet clear when (or in some cases if) new requirements that have been developed by U.S. DOE will actually become effective. It would not be appropriate to award "credit" for a measure already required by federal law. And U.S. DOE is working to replace national standards with regional-based standards that will vary from one region to the next.

The proposal addresses these complications in a relatively simple way. The point values in each table under Section R406 have been set according to the energy savings that would result based on a specific equipment efficiency baseline in all climate zones. The first table, Table R406(a), establishes a baseline set of the heating and cooling equipment efficiencies reflective of current efficiencies. When federal minimum efficiencies are increased for specific heating and/or cooling equipment, as is reflected under the latest federal rule, states will apply the appropriate table. The choice of tables will allow states to apply the appropriate Flex Points without recalculating the savings for each individual measure.

The proposal allows jurisdictions to "try out" a wide variety of efficiency measures that would be difficult to require as prescriptive requirements.

Innovative building practices or emerging technologies can benefit from being listed in state and local building codes. However, states may have difficulty prescriptively requiring new technologies or building practices for all homes that are not yet widely available. For example, ground-source heat pumps can offer significant energy savings, but because of geological features or regulatory issues, they may not be appropriate in all circumstances. The proposal above provides an incentive to consider installing a ground source heat pump as one of several compliance options under Section R406, but also offers many other comparable options or combinations of such options to achieve the same level of savings.

By incorporating several of these practices and technologies among the multiple options of Section R406, the proposal above essentially gives these emerging technologies and practices a foothold, and allows consumers and the market to determine the most feasible options for any given project. As emerging technologies become more mainstream, Section R406 may also be a good source for additional improvements to the prescriptive baseline in future code editions.

Cost Impact: The code change proposal will increase the cost of construction.

RE187 – 13

R401.2 (IRC N1101.15), R406 (NEW) (IRC N1106 NEW), R406.1 (NEW) (IRC N1106.1 NEW), Table R406.1 (NEW) (IRC N1106.1 NEW)

Proponent: Eric Makela, Britt/Makela Group, Inc., representing Northwest Energy Codes Group (Eric@BrittMakela.com)

Revise as follows:

R401.2 (N1101.15) Compliance. ~~Projects shall comply with Sections identified as “mandatory” and with either sections identified as “prescriptive” or performance approach in Section R405.~~ Residential buildings shall comply with one of the following:

1. The requirements of Section R402.1, Section 406, and all sections identified as “mandatory”.
2. The requirements of Section R405 and all sections identified as “mandatory”. The proposed design shall be equal to or less than 95 percent of the standard reference design building.

SECTION R406 **ADDITIONAL PRESCRIPTIVE EFFICIENCY MEASURES**

R406.1 (N1106.1) Additional efficiency measures. Each dwelling unit shall include one of the measures described in Table R406.1.

Exceptions:

1. Residential buildings which include a ground or water source heat pump with minimum COP meeting the requirements of Table C403.2.3(2).

TABLE R406.1 (N1106.1)
ADDITIONAL EFFICIENCY MEASURES
CLIMATE ZONES 1, 2 and 3

<u>MEASURE</u>	
1	<u>HIGH EFFICIENCY HVAC SYSTEM:</u> <u>SEER 16 Air Conditioner and 95 percent AFUE or</u> <u>SEER 18 and 10.5 HSPF</u>
2	<u>HIGH EFFICIENCY WATER HEATING:</u> <u>Gas water heater for all water heater end uses, EF – 0.80, or</u> <u>Electric water heater for all water heater end uses, EF – 1.15</u>
3	<u>SOLAR HOT WATER</u> <u>Solar Domestic Hot Water with a minimum 0.4 Solar Fraction</u>
4	<u>ENVELOPE AND LIGHTING OPTION::</u> <u>Total UA 10% above the minimum code UA</u>
5	<u>ENVELOPE OPTION:</u> <u>Ceiling with cool roof with the following characteristics:</u> <ul style="list-style-type: none">• <u>Three-year aged solar reflectance^b of 0.55 and three-year aged thermal emittance^b of 0.75, or</u>• <u>Initial solar reflectance^b of 0.70 and initial thermal emittance^b of 0.75, or</u>• <u>Three-year-aged solar reflectance index^c of 64, or</u>• <u>Initial solar reflectance index^c of 82</u>
6	<u>HIGH EFFICIENCY HVAC DISTRIBUTION SYSTEM:</u> <u>All heating and cooling system components installed inside the conditioned space. All combustion equipment shall be direct vent or sealed combustion.</u> <u>Not qualifying: Systems utilizing electric resistant heat, including baseboard and furnace, as the primary heat source.</u>

--	--

CLIMATE ZONES 4, MARINE 4, and 5	
MEASURE	
1	<u>HIGH EFFICIENCY HVAC SYSTEM:</u> <u>Air-source heat pump with minimum HSPF of 10.5</u>
2	<u>ENVELOPE UA:</u> <u>The proposed building envelope shall have a total UA at least 10 percent less than the code target UA as calculated using Table 402.1.4 and Section 402.1.4 Total UA alternative.</u>
3	<u>REDUCED AIR LEAKAGE ENVELOPE:</u> <u>AIR LEAKAGE CONTROL AND EFFICIENT VENTILATION:</u> <u>Reduce the tested air leakage to 2.0 air changes per hour maximum.</u> <u>and</u> <u>All whole house ventilation requirements as determined by Section M1507.3 of the International Residential Code shall be met with a heat recovery ventilation system with minimum sensible heat recovery efficiency of 0.75.</u>
4	<u>HIGH EFFICIENCY HVAC DISTRIBUTION SYSTEM:</u> <u>All heating and cooling system components installed inside the conditioned space. All combustion equipment shall be direct vent or sealed combustion.</u> <u>Not qualifying: Systems utilizing electric resistant heat, including baseboard and furnace, as the primary heat source.</u>
5	<u>HIGH EFFICIENCY WATER HEATING.</u> <u>Water heating system includes one of the following:</u> <u>Gas, propane, or oil water heater with a minimum EF of 0.80 or</u> <u>Electric water heater with a minimum EF of 1.15</u>
6	<u>SOLAR HOT WATER</u> <u>Solar Domestic Hot Water with a minimum 0.4 Solar Fraction</u>
CLIMATE ZONES 6, 7 & 8	
MEASURE	
1	<u>HIGH EFFICIENCY HVAC SYSTEM:</u> <u>Gas propane or oil-fired furnace or boiler with minimum AFUE of 98 percent, or</u> <u>Air-source heat pump with minimum HSPF of 10.5</u>
2	<u>ENVELOPE UA:</u> <u>The proposed building envelope shall have a total UA at least 10 percent less than the code target UA as calculated using Table 402.1.4 and Section 402.1.4 Total UA alternative</u>
3	<u>REDUCED AIR LEAKAGE ENVELOPE:</u> <u>Reduce the tested air leakage to 2.0 air changes per hour maximum.</u> <u>and</u> <u>All whole house ventilation requirements as determined by Section M1507.3 of the International Residential Code shall be met with a heat recovery ventilation system with minimum sensible heat recovery efficiency of 0.75.</u>
4	<u>HIGH EFFICIENCY HVAC DISTRIBUTION SYSTEM:</u> <u>All heating and cooling system components installed inside the conditioned space. All combustion equipment shall be direct vent or sealed combustion.</u> <u>Not qualifying: Systems utilizing electric resistant heat, including baseboard and furnace, as the primary heat source.</u>
5	<u>HIGH EFFICIENCY WATER HEATING AND HIGH EFFICACY LIGHTING:</u> <u>Water heating system includes one of the following:</u> <u>Gas, propane, or oil water heater with a minimum EF of 0.80 or</u> <u>Electric Heat Pump Water Heater with a minimum EF of 1.15.</u> <u>and</u>

	<u>90% High efficacy lighting in accordance with Section R404.1</u>
<u>6</u>	<u>SOLAR HOT WATER</u> <u>Solar Domestic Hot Water with a minimum 0.4 Solar Fraction</u>

Reason: This proposal increases the efficiency of new residential construction approximately 5% above that of a base-case residence meeting the 2012 IECC. The innovative feature of this proposal is the inclusion of menus from which users must pick a fixed number of items. This approach was successfully incorporated into the Oregon residential code and also is the basis for the Washington State residential code. There have been no problems to date implementing the Oregon code.

The current prescriptive format in the IECC has significant limitations on increases to residential building efficiency. Only minimal gains are available for envelope, mechanical, water heating, and lighting efficiency. In order for future versions of the IECC to advance increased efficiency in residential construction, new user-friendly and enforceable code formats must be considered. This proposed code format provides the following benefits:

- Provides flexibility for designers and builders;
- Contains a limited number of discrete option items that are understandable and enforceable which will result in high compliance rates.
- Has a proven track record in Oregon

The options in this table include technologies that are currently available in the market. The code user can have the option of increasing the efficiency of the building envelope, installing a more efficient heating and/or cooling system, or installing a more efficient water heating system or solar hot water systems. Projects that include a ground or water source heat pump system already are not required to select an additional option. Analysis of the energy savings for each of the features was taken from extensive work in developing the Washington State Points system or from ICF analysis.

Cost Impact: The code change proposal will increase the cost of construction but will reduce the cost of operation.

R401.2-EC-MAKELA

RE188 – 13

R202 (NEW) (IRC N1101.9 (NEW)), R401.2 (IRC N1101.15), R406 (NEW) (IRC N1106 NEW)

Proponent: Eric Makela, Britt Makela Group, Inc., David Goldstein, National Resource Defense Council (Eric@BrittMakela.com)

Revise as follows:

R401.2 (N1101.15) Compliance. Projects shall comply with Sections identified as “mandatory” and with either sections identified as “prescriptive”, ~~or the performance approach in Section R405-~~ or an Energy Rating Index (ERI) approach in Section R406.

SECTION R406 (N1106) **ENERGY RATING INDEX COMPLIANCE ALTERNATIVE**

R406.1 (N1106.1) Scope. This section establishes criteria for compliance using an Energy Rating Index analysis.

R406.2 (N1106.2) Mandatory requirements. Compliance with this section requires that the mandatory provisions identified in Section R401.2 and R403.4.2 be met. The building thermal envelope shall be greater than or equal to levels of efficiency and Solar Heat Gain Coefficient in Table 402.1.1 or 402.1.3 of the 2009 *International Energy Conservation Code*.

Exception: Supply and return ducts not completely inside the building thermal envelope shall be insulated to a minimum of R-6.

R406.3 (N1106.3) Energy rating index. The energy rating index (ERI) shall be a numerical integer value that is based on a linear scale constructed such that the *ERI reference design* has an Index value of 100 and a residential building that uses no net purchased energy has an Index value of 0. Each integer value on the scale shall represent a one percent (1%) change in the total energy use of the *rated design* relative to the total energy use of the *ERI reference design*. The ERI shall consider all energy used in the residential building.

R406.3.1 (N1106.3.1) ERI reference design. The *ERI reference design* shall be configured such that it meets the minimum requirements of the 2006 *International Energy Conservation Code* prescriptive requirements

The proposed residential building shall be shown to have an annual total normalized Modified Loads that are less than or equal to the annual total Loads of the *ERI reference design*.

R406.4 (N1106.4) ERI based compliance. Compliance based on an ERI analysis requires that the *rated design* be shown to have an ERI less than or equal to the appropriate value listed in Table R406.3, when compared to the *ERI reference design*.

TABLE R406.4 (N1106.4)
MAXIMUM ENERGY RATING INDEX

<u>Climate Zone</u>	<u>Energy Rating Index</u>
<u>1</u>	<u>52</u>
<u>2</u>	<u>52</u>
<u>3</u>	<u>51</u>
<u>4</u>	<u>54</u>
<u>5</u>	<u>55</u>

<u>6</u>	<u>54</u>
<u>7</u>	<u>53</u>
<u>8</u>	<u>53</u>

R406.5 (N1106.5) Verification by approved agency. Verification of compliance with Section R406 shall be completed by an approved third party.

R406.6 (N1106.6) Documentation. Documentation of the software used to determine the energy rating index and the parameters for the residential building shall be in accordance with Sections R406.6.1 through R406.6.3.

R406.6.1 (N1106.6.1) Compliance software tools. Documentation verifying that the methods and accuracy of the compliance software tools conform to the provisions of this section shall be provided to the code official.

R406.6.2 (N1106.6.2) Compliance report. Compliance software tools shall generate a report that documents that the energy rating index of the *rated design* complies with Sections R406.3 and R406.4. The compliance documentation shall include the following information:

1. Address or other identification of the residential building;
2. An inspection checklist documenting the building component characteristics of the *rated design*. The inspection checklist shall show results for both the *ERI reference design* and the *rated design*, and shall document all inputs entered by the user necessary to reproduce the results;
3. Name of individual completing the compliance report; and
4. Name and version of the compliance software tool.

Exception: Multiple orientations. When an otherwise identical building model is offered in multiple orientations, compliance for any orientation shall be permitted by documenting that the building meets the performance requirements in each of the four cardinal (north, east, south and west) orientations.

R406.6.3 (N1106.6.3) Additional documentation. The code official shall be permitted to require the following documents:

1. Documentation of the building component characteristics of the *ERI reference design*.
2. A certification signed by the builder providing the building component characteristics of the *rated design*.
3. Documentation of the actual values used in the software calculations for the *rated design*.

R406.7 (N1106.7) Calculation software tools. Calculation software, where used, shall be in accordance with Sections R406.7.1 through R406.7.3.

R406.7.1 (N1106.7.1) Minimum capabilities. Calculation procedures used to comply with this section shall be software tools capable of calculating the energy rating index as described in Section R406.3, and shall include the following capabilities:

1. Computer generation of the *ERI reference design* using only the input for the *rated design*. The calculation procedure shall not allow the user to directly modify the building component characteristics of the *ERI reference design*.
2. Calculation of whole-building, as a single *zone*, sizing for the heating and cooling equipment in the *ERI reference design* residence in accordance with Section R403.6.
3. Calculations that account for the effects of indoor and outdoor temperatures and part-load ratios on the performance of heating, ventilating and air-conditioning equipment based on climate and equipment sizing.

4. Printed *code official* inspection checklist listing each of the *rated design* component characteristics determined by the analysis to provide compliance, along with their respective performance ratings.

R406.7.2 (N1106.7.2) Specific approval. Performance analysis tools meeting the applicable sections of Section R406 shall be *approved*. Tools are permitted to be *approved* based on meeting a specified threshold for a jurisdiction. The *code official* shall approve tools for a specified application or limited scope.

R406.7.3 (N1106.7.3) Input values. When calculations require input values not specified by Sections R402, R403, R404 and R405, those input values shall be taken from an *approved* source.

Add new definitions as follows:

RATED DESIGN. A description of the proposed building used to determine the energy rating index.

ERI REFERENCE DESIGN. A version of the *rated design* that meets the minimum requirements of the 2006 *International Energy Conservation Code*.

Reason: The residential provisions of the IECC allows for varying methods for demonstrating compliance with the code. This includes both a prescriptive and simulated performance option in addition to allowing efficiency programs that are designed to go above the minimum code levels as “deemed to comply” programs. These above code programs must be approved by the code official to be used in the jurisdiction. Alternative programs that depend on an Energy Rating Index (ERI) have been approved as an alternative code or above code program in at least 6 states and in over 130 jurisdictions. These types of programs typically take the form of a Home Energy Rating System (HERS) program. Under the current code there is no guidance on setting Energy Rating Index scores, which will lead to inconsistent application of these types of programs based on climate zones.

The goal of this proposal is to introduce an Energy Rating Index with established rating numbers into the code that will allow alternative programs to be designed to meet these criteria. The proposal provides guidelines for the development of the index, documentation provided to ensure compliance and a requirement that an approved 3rd party verify that the building complies with the applicable Energy Rating Index. The reference house is based on a home built to the 2006 IECC which is consistent with ERI based programs.

The 2009 IECC residential envelope requirements have been set as the least efficient level of efficiency for potential trade-offs to ensure that minimum levels of efficiency that have proven to be cost effective are installed in all buildings and that some flexibility is allowed in the approach to alternative designs. This proposal also requires complying with the applicable mandatory requirements to be consistent with the Above Code section in the IECC. And because energy losses in the domestic hot water distribution system fall outside the scope of the energy rating index as it can be calculated with 2013 methodology, current code provisions relating to hot water pipe insulation are mandatory as well. We anticipate that these requirements can be folded into the energy rating index for the 2018 IECC and thus removed from the mandatory sections then.

This proposal is intended to produce substantial additional energy savings compared to the current or proposed levels of prescriptive requirements in the 2015 IECC while allowing considerably greater flexibility to builders using a method with which a large segment of the market is already familiar. This flexibility is likely to result in lower construction costs for any given level of energy efficiency. Builders who do not make use of this proposed method are still able to comply with the Code can still use any of the existing compliance pathways.

Cost Impact: The code change proposal will not increase the cost of construction.

R401.2-EC-GOLDSTEIN-MAKELA.DOC

RE189 – 13

R405.7 (NEW) (IRC N1105.7 (NEW))

Proponent: Craig Conner, Building Quality, representing self (craig.conner@mac.com)

Add new text as follows:

R405.7 (N1105.7) Optional performance compliance. This section establishes an alternative performance criteria. Compliance under Section R405.7 shall be as otherwise given in Section R405, except as specified in Section R405.7.

R405.7.1 (N1105.7.1) Annual energy cost. The annual energy cost for the proposed design shall be less than or equal to 98 percent of the annual energy cost for the standard reference design.

R405.7.2 (N1105.7.2) Modified standard reference design. Equipment efficiency in the standard reference design for Section R405.7 shall be modified as specified in Sections R405.7.2.1 through R405.7.2.3.

R405.7.2.1 (N1105.7.2.1) Heating. Electric heating systems shall utilize an air source heat pump with the efficiency of the prevailing federal minimum standard. Nonelectric furnace and boiler heating systems shall utilize the same fuel type as the proposed design with the efficiency of the prevailing federal minimum standard.

R405.7.2.2 (N1105.7.2.2) Cooling. Cooling systems shall be electric with the efficiency of the prevailing federal minimum standard.

R405.7.2.3 (N1105.7.2.3) Service water heating. Service water heating systems shall utilize the same fuel type as the proposed design with the efficiency of the prevailing federal minimum standard.

R405.7.3 (N1105.7.3) Modified mandatory requirements. The maximum envelope and duct leakage rates for the proposed design in Section R405.7 shall be as specified by R405.7.3.1 and R405.7.3.2. This section shall not modify the annual energy cost specified in Section R405.7.1.

R405.7.3.1 (N1105.7.3.1) Envelope leakage. The maximum building thermal envelop leakage rate shall be 7 air changes per hour at a pressure of 0.2 inches w.g (50 Pa).

R405.7.3.2 (N1105.7.3.2) Duct leakage. The maximum duct leakage shall be 8 cfm (113.3 L/min) per 100 square feet (9.29 m²) of conditioned floor area. Duct leakage shall be permitted to be measured as either total leakage or leakage to outside of conditioned space.

Reason: Many homeowners are interested in energy-efficient homes. Many builders are interested in constructing energy-efficient homes. Builders need to be permitted to construct homes that achieve the energy efficiency goal in the best way they know how.

The IECC's performance section has come to include artificial constraints that do not increase energy efficiency. At best these constraints force what some deem good energy-efficient design. At worst, these constraints are product manufacturer's attempts to increase their market share. The code should not determine the product market shares. Mandatory requirements should be driven by health, safety or durability. The overall energy use goal should be the main criteria for compliance based on performance.

This change makes three modifications to the performance calculation. This change allows the use of efficient heating, cooling, and service water heating equipment to achieve energy savings (new Section R405.7.2). This change relaxes the maximum envelope leakage and duct leakage requirements, without lowering the energy efficiency goals (R405.7.3). The energy costs allowed by the new R405.7 are reduced by 2% (R405.7.1).

The changes proposed here may be accomplished by other proposals. If so, this change would not be needed.

Cost Impact: This proposal adds options for cost-effective ways to achieve energy efficiency.

RE190-13

R406 (New) (IRC N1106 (New))

Proponent: Robby Schwarz, EnergyLogic Inc., Representing EnergyLogic, Inc. (robby@nrglogic.com)

Add new text as follows:

SECTION R406 (N1106) **SIMULATED PERFORMANCE BY** **INDEX SCORE METHOD** **(PERFORMANCE)**

R406.1 (N1106.1) Scope. The simulated performance index score method in Section R406 shall be used for determining that a building complies with this code. Such methods shall include a whole house energy analysis resulting in comparative index scores.

R406.2 (N1106.2) Mandatory requirements. Use of the simulated performance index score alternative method for compliance to this code shall require all of the following:

1. Design and construction of the building in compliance with sections in this code that are indicated as mandatory.
2. Inspections, required for the generation of an index score, are performed including, but not limited to, inspection, by the entity or person performing the energy analysis, of insulation systems and air barriers prior to concealment.
3. Supply and return ducts not completely inside the *building thermal envelope* are insulated with not less than an *R-value* of R-8.
4. Ductwork, that is either partially or completely within the thermal layer of the wall system of the *building thermal envelope*, shall have insulation of a *R-value* of not less than R-10 on the side of the duct that is away from the conditioned space. Where the duct is in a wall cavity and the R-10 insulation does not completely fill the cavity, the remaining cavity space shall be filled with insulation to the extent that the requirement for insulating the exterior wall of the building is met or the cavity space is completely filled, whichever is less. Ductwork, that is either partially or completely within the thermal layer of a floor system of the *building thermal envelope*, shall have insulation of a *R-value* of not less than R-19 on the side of the duct that is away from the conditioned space. Floor cavity insulation shall be installed in accordance with Section R402.2.7. Where the duct is in a floor cavity and the R-19 insulation does not completely fill the cavity, the remaining cavity space shall be filled with insulation to the extent that the requirement for insulating the floor system of the building is met or the cavity space is completely filled, which ever is less.

R406.3 (N1106.3) Performance-based compliance. The proposed building (*proposed design*) shall be complaint with this code where the index score generated by the energy analysis is less than or equal to the index score of the *standard reference design*. The *standard reference design* index score shall be determined by analyzing a building of identical geometry to the proposed building that has the features indicated in the *standard reference design* column of Table R405.5.2(1). The index score of the proposed design shall be calculated in accordance with RESNET Standards.

R406.3.1 (N1106.3.1) Compliance software tools. Software tools used to determine code compliance by the simulated performance index score method shall be accredited by the Residential Energy Services Network organization. Documentation showing the software accreditation shall be provided to the *code official*.

R406.4 (N1106.4) Compliance report and other documentation. Compliance reports and other documentation shall be provided in accordance with Sections R406.4.1 through R406.4.3. A compliance

report on the *proposed design* shall be submitted with the application for the building permit. Upon completion of the building, a compliance report based upon the as-built condition of the building, shall be submitted to the *code official* before a certificate of occupancy is issued by the *code official*. Batch sampling of buildings to determine energy code compliance for all buildings in the batch shall be prohibited.

Compliance reports shall include information in accordance with Sections R405.4.2.1 and R405.4.2.2. Where the *proposed design* of a building could be built on different sites where the cardinal direction orientation of the building on each site is different, compliance of the *proposed design* for the purposes of the application for the building permit, shall be based upon the worst case orientation worst case configuration, worst case building air leakage and worse case duct leakage. Such worse case parameters shall be used as inputs to the compliance software for energy analysis.

R406.4.1 (N1106.4.1) Compliance report for permit application. A compliance report submitted with the application for building permit shall include all of the following:

1. Building street address, or other building site identification.
2. A statement indicating that the *proposed design* complies with Section R405.3.
3. An inspection checklist documenting the building component characteristics of the *proposed design* as indicated in Table R405.5.2(1). The inspection checklist shall show results for both the *standard reference design* and the *proposed design* with all user inputs to the compliance software to generate the results.
4. A site-specific energy analysis report that is in compliance with Section R405.3
5. Name of the individual performing the analysis and generating the report.
6. Name and version of the compliance software tool.

R406.4.2 (N1106.4.2) Compliance report for certificate of occupancy. A compliance report submitted for obtaining the certificate of occupancy shall include all of the following:

1. Building street address, or other building site identification
2. A statement indicating that the as-built building complies with Section R405.3.
3. A certificate indicating that the building meets the requirements of the home energy rating system, HERS, index matrix of the RESNET Standards for code compliance and the energy saving features of the buildings.
4. A site-specific energy analysis report that is in compliance with Section R405.3.
5. Name of the individual performing the analysis and generating the report.
6. Name and version of the compliance software tool.

R406.4.3 (N1106.4.3) Additional documentation. Upon request by the *code official*, the following documentation shall be provided along with compliance reports to the *code official*:

1. Documentation of the building component characteristics of the *standard reference design*.
2. A certification statement, signed by the builder, that lists the *proposed design* building component characteristics indicated in Table R405.5.2(1).

R406.5 (N1106.5) Calculation procedure. Calculations of the energy performance of a building design shall be in accordance with Sections R406.5.1 and R406.5.2.

R406.5.1 (N1106.5.1) Identical methods. The *standard reference design* and *proposed design* shall be configured and analyzed using identical methods and techniques to generate a separate index score for each configuration of the building. The methods and techniques shall be in accordance with the home energy efficiency rating system, HERS, guidelines in the RESNET Standards.

R406.5.2 (N1106.5.2) Building design specifications. The *standard reference design* and *proposed design* shall be configured and analyzed as indicated in Table R405.5.2(1).

R406.6 (N1106.6) Calculation software tools. Calculation software shall be in accordance with Sections R406.6.1 through R406.6.3.

R405.6.1 (N1106.6.1) Minimum capabilities. Software tools shall be capable of calculating the index score of all building elements that differ between the *standard reference design* and the *proposed design*. The software shall have the following capabilities:

1. Computer generation of a report for the *standard reference design* using only the input for the *proposed design*. The calculation software shall prohibit the user from directly modifying the building component characteristics of the *standard reference design*.
2. Calculation of whole-building sizing, as a single zone, for the heating and cooling equipment in the *standard reference design* building in accordance with Section R403.6.
3. Calculations that account for the effects of indoor and outdoor temperatures and part-load ratios on the performance of heating, ventilating and air-conditioning equipment based on climate and equipment sizing.
4. Printing an inspection checklist for the *code official* that lists the characteristic of each of the *proposed design* components indicated in Table R405.5.2(1) that was used to determine compliance. The component characteristics shall include the performance rating for the component such as, but not limited to, *R-value*, *U-factor*, *SHGC*, heating seasonal performance factor-HSPF, annual fuel utilization efficiency-AFUE, seasonal energy efficiency ratio-SEER and energy factor-EF.

R406.6.2 (N1106.6.2) Specific approval. Energy performance analysis tools that do not have accreditation by the Residential Energy Services Network organization shall comply with all other requirements of Section 406 and such tools shall only be used where the tool is *approved*.

R406.6.3 (N1106.6.3) Input values. Where calculations or software programs require input values that are not specified in Sections R402, R403, R404, R405 and R406, the input values used shall be only from *approved sources*.

Add new standard to Chapter 5 as follows:

Residential Energy Services Network, Inc.
P.O. Box 4561
Oceanside, CA 92052-4561

RESNET

RESNET Standards-2013 RESNET Mortgage Industry National Home Energy Rating Standards.

Reason: The current annual energy cost matrix for demonstrating code compliance is flawed and may demonstrate that a house that should pass the energy code, based on actual geometry and energy specifications, may not only because the energy costs in a region have changed. More and more jurisdiction and builders across the country are turning to performance index scores to represent the efficiency of a home and to demonstrate code compliance. Performance scores in and of themselves do not necessarily demonstrate code compliance. However, if the score is imposed on the existing structure of the code as this new alternative compliance path section 406 does, the score can reflect code compliance simply as a means of demonstrating passing and failing.

The current structure of the simulated performance path requires that the mandatory sections of the IECC be complied with, thus ensuring that house performance is maintained and that the score is only a measure to demonstrate compliance. In addition, this new section 406 utilizes the code reference home as described in table 405.5.2(1) and therefore energy code compliance utilizing this pathway will have a score that is variable for each qualified home. This is accomplished through the 2015 IECC Reference Design outlined in table 405.5.2(1). When the builder's proposed designed home is configured with the IECC reference design features and modeled using approved software, the resulting score becomes the basis for the performance score target for that home.

The EPA Energy Star program and the DOE Challenge Home program utilize this same matrix for demonstrating qualification for their programs and have demonstrated that the compliance path described in this new section 406 will set the score target for the performance path equal to the performance that would be achieved if the prescriptive path was followed for each individual home.

In this way jurisdictions can avoid developing a fixed value, or performance index score, which really has no bearing on compliance and instead set the index score threshold required for energy code compliance at the same value that the same house would earn if configured to the IECC prescriptive path, as outlined in table 405.5.2(1) Reference Design.

** Footnote to Energy Star and DOE Challenge Home program documents

Jurisdiction, Builders, third party inspection companies and others are not clear of the process for completing and utilizing the simulated performance path. With all pathways through the energy code one must in essence declare how they will meet the intent of the code. For the prescriptive path they simply say they are going prescriptive, for the UA trade off path they submit a document such as a RESCheck report, and for the simulated performance path they must currently submit a document demonstrating that the annual energy cost of the proposed design are less than or equal to the same home if it were built with the reference design specification. It becomes unclear how one demonstrates that they have carried out their proposed design. The revisions proposed for this section clearly outlines a process by which the proposed design is submitted, inspections take place, and additional analysis is preformed to ensure that the proposed design was achieved or bettered for the purposes of compliance.

Field inspection, in order to create an accurate computer generated energy analysis, should be required for following reasons:

1. For production building a plan is often mastered and that one plan may be built over 100 times. To ensure that each house meets the performance analysis each home must be inspected.
2. Computer generated energy analysis' utilizes worst case configuration of the proposed design and requires evaluations and inputs that must be confirmed in the specific home that is built to ultimately determine if the actually built home meets the intent of the energy code. Examples of this are worst case air leakage and duct leakage numbers but also orientation, window square footage, number of bedrooms, and foundation type.
3. The reality is that houses built from a set of plans change. The actual built home may generally reflect the homes plans but window square footage, orientation, and even insulation and mechanical equipment are often different from what was proposed. The inspection process ensures that the energy analysis is address and site specific which ultimately ensures that the home that received its permit from the proposed design's energy analysis has carried out what they have proposed, which is to meet the intent of the code, even if each component of the home is not exactly the same as what was on the set of plans.

Cost Impact: The code change proposal will not increase the cost of construction more than is already done by the current section R405 simulated performance path.

Analysis: A review of the standards proposed for inclusion in the code, RESNET Standards, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

R406T (NEW)-EC-SCHARZ.DOC

RE191 – 13

R402.1.2, R402.1.4 (IRC N1102.1.2, N1102.1.4)

Proponent: Darren Meyers, P.E., International Energy Conservation Consultants, LLC, consultant to Illinois Energy Office – Department of Commerce & Economic Opportunity (dmeyers@ieccode.com)

Revise as follows:

R402.1.2 (N1102.1.2) Sum of the R-values computation of insulation only. Only the insulation material used in layers, such as framing cavity insulation and continuous insulating sheathing, shall be summed to compute the component R-value. The manufacturer's settled R-value shall be used for blown or loose-fill insulation. Computed R-values shall not include an R-value for other building materials or air films or the thermal bridging effects of framing materials. Fenestration U-factors and SHGC requirements shall comply with Table R402.1.1.

R402.1.3 (N1102.1.3) U-factor alternative. An assembly with a U-factor equal to or less than that specified in Table R402.1.3 shall be permitted as an alternative to the R-value in Table R402.1.1.

R402.1.4 (N1102.1.4) Total UA alternative. If the total *building thermal envelope* UA (sum of U-factor times assembly area) is less than or equal to the total UA resulting from using the U-factors in Table R402.1.3 (multiplied by the same assembly area as in the proposed building), the building shall be considered in compliance with Table R402.1.1. The UA calculation shall be done using a method consistent with the ASHRAE *Handbook of Fundamentals* with R-values and U-factors consistent with ASHRAE 90.1 Normative Appendix 'A', and shall include the thermal bridging effects of framing materials in accordance with ASHRAE 90.1, Normative Appendix 'A'. The U-factor and SHGC requirements shall be met in addition to UA compliance.

Reason: The additions further clarify the intentions of the framers of the 2004 IECC Supplement Edition that Section R402.1.2 expressly prohibits the use of computed R-values of materials "other than insulation as tested" in accordance with the U.S. Federal Trade Commission R-value Rule (CFR Title 16, Part 460) [R303.1.4], or framing correction factors rooted in accepted engineering practice and the use of *approved* consensus standards. This specifically precludes Authorities Having Jurisdiction from employing Section R102 "Alternate Materials and Methods" to permit a solicitor to gain advantage outside the public forum and debate of the *ICC Code Development Process for the International Codes* (CP-28), or through an ICC-ES-facilitated, environmental criteria, to condone the use of R-values for other building materials or air films or the thermal bridging effects of framing materials under IECC Section R402.1.2.

Reference to the ASHRAE 90.1 Standard establishes neutral measurements of the efficiency of thermal envelope components, either "as tested" in accordance with the U.S. Federal Trade Commission R-value Rule (CFR Title 16, Part 460) [R303.1.4], including ASHRAE's research into established framing correction factors based on in-situ studies and accepted engineering practice.

In February 2012, at the conclusion of Illinois' required 9-month review process of the 2012 IECC, the Illinois Energy Code Advisory Council (ECAC) performed an analysis of four (4) alternative proposals submitted the Coalition for Fair Energy Codes (CFEC). American Plywood Association (APA) Trustees representing structural panel producing members of the APA, and including participation by the American Wood Council (AWC) formed the coalition in January 2011 to address the perceived notion that the 2012 IECC has the potential to reduce annual demand for OSB and plywood wall sheathing by approximately 20 percent, or close to 1 billion sq. ft. in a normal housing demand year.

The premise of these proposals was to seek alternative criteria for various wall configurations on the basis of equivalence with the prescriptive residential building thermal envelope R-value requirements of Table 402.1.1 using R-value computations and framing correction factors unrecognized by Section 402.1.1.

It was the conclusion of IECC LLC that CFEC methodologies made use of assumptions predisposed to product-bias or preferential treatment of particular materials, or assemblies of materials, and were not, in the end, neutral measurements of the efficiency of thermal envelope components, either "as tested" in accordance with the U.S. Federal Trade Commission R-value Rule (CFR Title 16, Part 460) [R303.1.4], or based on accepted engineering practice and the use of *approved* consensus standards.

It was also the conclusion of Illinois ECAC that the CFEC approach sought to re-argue a few of the unsuccessful public comments in opposition to code change proposals (EC13-09/10 and EC47-09/10) debated in public forum at the *ICC Code Development Process for the International Codes*.

On May 31, 2012, the ICC-Evaluation Service (ICC-ES) issued a peculiar and lesser publicized 30-day request for comment on a proposal for a new environmental criteria under the alternative criteria process entitled: *Environmental Criteria for Determination of Opaque Framed Wall Assemblies Deemed as Equivalent to the Prescriptive Building Thermal Envelope Tables of the International Energy Conservation Code*® (Subject EC115-0612-R1).

At hearings of the ICC-ES Environmental Committee, held October 1, 2012 at the Hilton St. Louis Frontenac, the Environmental Committee approved Subject EC115-1012-R2 by a vote of 4 -2 with one vote In Abstentia, despite clear language in

Section 402.1.2 to the contrary, and Interpretations from ICC-ES's parent company, the International Code Council and its technical staff as follows:

2009 IECC, Section
402.1.2 - R-value Coi

2009 IECC, Section
402.1.2 - R-value Coi

2009 IECC, Sections
402.1.3-402.1.4 - U-I

It was identified later that the proposal was solicited by Weyerhaeuser Company, one of the world's largest forest products companies, and a contributing company to CFEC.

In summary, without this change, the proposed Subject EC115, having been solicited by a proponent with bias, has the potential to create unnecessary loopholes and weaknesses in the *International Energy Conservation Code* (potentially dating to its former editions, circa IECC 2004). Furthermore, the proposed Subject EC115-0612-R1 could distance the IECC and Illinois (as with other states and U.S. territories adopting the 2009 or 2012 IECC Editions) from our Governors' assurances to the U.S. Department of Energy under Section 410 of the American Recovery and Reinvestment Act of 2009 (H.R. 1) (ARRA) as a condition of receiving funding for State Energy Programs (SEP).

Cost Impact: The code change proposal will not increase the cost of construction.

R202, R403.5, R403.5.2 (New) through R403.5.7 (New) , Table R403.5.6(1) (New) (IRC Table N1103.5.6(1)(New), Table R403.5.6(2) (New)

Proponent: Darren Meyers, P.E., International Energy Conservation Consultants, LLC, consultant to Illinois Energy Office – Department of Commerce & Economic Opportunity (dmeyers@ieccode.com)

Revise as follows:

SECTION R202 GENERAL DEFINITIONS

LOCAL EXHAUST. An exhaust system that uses one or more fans to exhaust air from a specific room or rooms within a dwelling.

WHOLE HOUSE MECHANICAL VENTILATION SYSTEM. An exhaust system, supply system, or combination thereof that is designed in accordance with Section R403.5 to mechanically exchange indoor air for outdoor air when operating continuously or through a programmed intermittent schedule to satisfy the whole house ventilation rate. Outdoor air intakes and exhausts shall have automatic or gravity dampers that close when the ventilation system is not operating.

Revise as follows:

R403.5 Mechanical ventilation (Mandatory). The building shall be provided with ventilation that meets the requirements of ~~the International Residential Code~~ this section or for Group R-2, R-3 and R-4 buildings, ventilation that meets the requirements of the International Mechanical Code, as applicable. Outdoor air intakes and exhausts shall have automatic or gravity dampers that close when the ventilation system is not operating.

R403.5.1 Whole-house mechanical ventilation system fan efficacy. Mechanical ventilation system fans shall meet the efficacy requirements of Table R403.5.1.

Exception: Where mechanical ventilation fans are integral to tested and listed HVAC equipment, they shall be powered by an electronically commutated motor.

R403.5.2 Recirculation of air. Exhaust air from bathrooms and toilet rooms shall not be recirculated within a residence or to another dwelling unit and shall be exhausted directly to the outdoors. Exhaust air from bathrooms and toilet rooms shall not discharge into an attic, crawl space or other areas inside the building.

R403.5.3 Whole-house mechanical ventilation system. Whole-house mechanical ventilation systems shall be designed in accordance with Sections R403.5.4 through R403.5.6.

R403.5.4 System design. The whole-house ventilation system shall consist of one or more supply or exhaust fans, or a combination of such, and associated ducts and controls. Local exhaust or supply fans are permitted to serve as such a system. Outdoor air ducts connected to the return side of an air handler shall be considered to provide supply ventilation.

R403.5.5 System controls. The whole-house mechanical ventilation system shall be provided with controls that enable manual override.

R403.5.6 Mechanical ventilation rate. The whole house mechanical ventilation system shall provide outdoor air at a continuous rate of not less than that determined in accordance with Table R403.5.6(1).

Exception: The whole-house mechanical ventilation system is permitted to operate intermittently where the system has controls that enable operation for not less than 25-percent of each 4-hour

segment and the ventilation rate prescribed in Table R403.5.6(1) is multiplied by the factor determined in accordance with Table R403.5.6(2).

TABLE R403.5.6(1)
CONTINUOUS WHOLE-HOUSE MECHANICAL VENTILATION SYSTEM AIRFLOW RATE REQUIREMENTS

DWELLING UNIT FLOOR AREA (square feet)	NUMBER OF BEDROOMS				
	0 – 1	2 – 3	4 – 5	6 – 7	> 7
	Airflow in CFM				
< 1,500	30	45	60	75	90
1,501 – 3,000	45	60	75	90	105
3,001 – 4,500	60	75	90	105	120
4,501 – 6,000	75	90	105	120	135
6,001 – 7,500	90	105	120	135	150
> 7,500	105	120	135	150	165

For SI: 1 square foot = 0.0929 m², 1 cubic foot per minute = 0.0004719 m³/s.

[RMP] TABLE R403.5.6(2) (Table N1103.5.6(1))

INTERMITTENT WHOLE-HOUSE MECHANICAL VENTILATION RATE FACTORS^{a, b}

RUN-TIME PERCENTAGE IN EACH 4-HOUR SEGMENT	25%	33%	50%	66%	75%	100%
Factor ^a	4	3	2	1.5	1.3	1.0

a. For ventilation system run time values between those given, the factors are permitted to be determined by interpolation.

b. Extrapolation beyond the table is prohibited.

R403.5.7 Local exhaust rates. *Local exhaust* systems shall be designed to have the capacity to exhaust the minimum air flow rate determined in accordance with Table R403.5.7.

TABLE R403.5.7
**MINIMUM REQUIRED LOCAL EXHAUST RATES FOR
ONE- AND TWO-FAMILY DWELLINGS**

AREA TO BE EXHAUSTED	EXHAUST RATES
Kitchens	100 cfm intermittent or 25 cfm continuous
Bathrooms-Toilet Rooms	Mechanical exhaust capacity of 50 cfm intermittent or 20 cfm continuous

For SI: 1 cubic foot per minute = 0.0004719 m³/s.

Reason: As of January 1, 2013, the state of Illinois has made effective the 2012 Illinois Energy Conservation Code (2012 IECC) through the *Illinois Energy Efficient Building Act* [20 ILCS 3125], similar to what the States of Maryland and Minnesota, and various jurisdictions in Arizona (Glendale, Peoria, Pima County), Colorado (Vail), Kansas (Overland Park), Missouri (Kansas City), New Hampshire (Durham) and Texas (El Paso) have done ... *[[Not an all-inclusive list.]]*

For Illinois, The Act takes precedence over home-rule declarations in our state; even those of the City of Chicago. However, The Act does not usurp municipal or county authority to adopt a building code, more specifically the *International Residential Code* (IRC). As such, and over Illinois' required 9-month review process of the 2012 IECC, the Illinois Energy Code Advisory Council (ECAC) concluded that a technical infeasibility would amount from adopting energy efficiency codes like the 2012 IECC which require whole-house mechanical ventilation, coupled with existing and/or delayed municipal ordinances tied to editions of the IRC prior to 2012. The 2012 IRC is the only edition of the IRC which provides a whole-house mechanical ventilation solution for homes with air leakage rates less than 5 ACH50.

Accordingly for Illinois adoption of the 2012 IECC, and we suspect other states and municipalities considering 2015 IECC adoptions, the economy, coupled with an overall lack of political will and municipal indifference to the mandatory residential sprinkler requirements of the 2009 and 2012 editions of the IRC, a disconnect results for new homes subject to 2012 IECC for air tightness (5

ACH50 or less)—thus, whole-house mechanical ventilation—and antiquated IRC editions which have not kept pace with this approach and the resultant whole-house mechanical ventilation solution.

In summary, this change merely reproduces the appropriate technical provisions and appropriate code development committee maintenance duties to the 2015 IECC.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis. The provisions in this proposal are duplicated from Section M1507.3. The proponent chooses to propose this change only to the IECC-R, and not Chapter 11 of the IRC, to avoid possible ~~coordination problems~~ divergence of matching provisions already present with in the IRC – For example, Section M1507.3 of the IRC.

R403.5-EC-MEYERS

RE193 – 13

R202 (IRC N1101.9), 403.10 (New) (IRC N1103.10 (New))

Proponent: Darren Meyers, P.E., International Energy Conservation Consultants, LLC, consultant to Illinois Energy Office – Department of Commerce & Economic Opportunity (dmeyers@ieccode.com)

Revise as follows:

SECTION R202 (N1101.9) GENERAL DEFINITIONS

COMBUSTION APPLIANCE ZONE (CAZ). A contiguous air volume within a building that contains a containing a Category I or II atmospherically-vented appliance or a Category III or IV direct vent or integral vent appliance drawing combustion air from inside of the building or dwelling unit. The CAZ includes but is not limited to, a mechanical closet, mechanical room, or the main body of a house or dwelling unit.

DRAFT. The pressure difference existing between the *appliance* or any component part and the atmosphere, that causes a continuous flow of air and products of *combustion* through the gas passages of the *appliance* to the atmosphere.

Mechanical or induced draft. The pressure difference created by the action of a fan, blower or ejector that is located between the *appliance* and the *chimney* or vent termination.

Natural draft. The pressure difference created by a vent or *chimney* because of its height, and the temperature difference between the *flue gases* and the atmosphere.

SPILLAGE. Combustion gases emerging from an appliance or venting system into the combustion appliance zone during burner operation.

Add new text as follows:

R403.10 (N1103.10) Worst-case testing of atmospheric venting systems. Buildings or dwelling units containing a Category I or II atmospherically-vented appliance; or a Category III or IV direct vent or integral vent appliance drawing combustion air from inside of the building or dwelling unit, shall have the Combustion Appliance Zone (CAZ) tested for spillage, acceptable draft and carbon monoxide (CO) in accordance with this Section. Where required by the *code official*, testing shall be conducted by an *approved* third party. A written report of the results of the test shall be signed by the party conducting the test and provided to the *code official*. Testing shall be performed at any time after creation of all penetrations of the *building thermal envelope* and prior to final inspection.

Exception: Buildings or dwelling units containing only Category III or IV direct vent or integral vent appliances that do not draw combustion air from inside of the building or dwelling unit.

1. The enumerated test procedure below shall be followed during testSet all combustion appliances to the pilot setting or turn off the service disconnects for all combustion appliances. Close all exterior doors and windows and the fireplace damper. With the building or dwelling unit in this configuration, measure and record the baseline ambient pressure inside the building or dwelling unit CAZ. Compare the baseline ambient pressure of the CAZ to that of the outside ambient pressure, and record the difference (Pa).
2. Establish worst case by turning on the *clothes dryer* and all exhaust fans. Close all interior doors that make the CAZ pressure more negative. Turn on the air handler, where present, and leave on if as a result, the pressure in the CAZ becomes more negative. Check interior door positions again, closing only the interior doors that make the CAZ pressure more negative. Measure net change in pressure from the CAZ to outdoor ambient pressure,

correcting for the base ambient pressure inside the home. Record “worst case depressurization” pressure and compare to Table R403.10(1).

3. Where CAZ depressurization limits are exceeded under worst-case conditions according to Table R403.10(1), additional combustion air must be provided or other modifications to building air-leakage performance or exhaust appliances such that depressurization is brought within the limits prescribed in Table R403.10(1).

TABLE R403.10(1) (N1103.10(1))
CAZ DEPRESSURIZATION LIMITS

<u>VENTING CONDITION</u>	<u>LIMIT (Pa)</u>
<u>Category I, atmospherically-vented water heater</u>	<u>-2.0</u>
<u>Category I or II atmospherically-vented boiler or furnace common-vented with a Category I atmospherically-vented water heater</u>	<u>-3.0</u>
<u>Category I or II atmospherically-vented boiler or furnace, equipped with a flue damper, and common-vented with a Category I atmospherically-vented water heater</u>	<u>-5.0</u>
<u>Category I or II atmospherically-vented boiler or furnace alone</u>	
<u>Category I or II atmospherically-vented, fan-assisted boiler or furnace common-vented with a Category I atmospherically-vented water heater</u>	
<u>Decorative vented, gas appliance</u>	
<u>Power vented or induced-draft boiler or furnace alone, or fan assisted water heater alone</u>	<u>-15.0</u>
<u>Category IV direct vented appliances and sealed combustion appliances</u>	<u>-50.0</u>

For SI: 6894.76 Pa = 1.0 psi.

1. Measure worst case spillage, acceptable draft, and carbon monoxide (CO) by firing the fuel-fired appliance with the smallest Btu capacity first.
 - a. Test for spillage at the draft diverter with a mirror or smoke puffer. An appliance that continues to spill flue gases for more than 60 seconds fails the spillage test.
 - b. Test for CO measuring undiluted flue gases, in the throat or flue of the appliance using a digital gauge in parts per million (ppm) at the 10 minute mark. Record CO ppm readings to be compared with Table R403.10(3) upon completion of Step 4. Where the spillage test fails under worst case, go to Step 4.
 - c. Where spillage ends within 60 seconds, test for acceptable draft in the connector no less than one foot, but no more than two feet downstream of the draft diverter. Record draft pressure and compare to Table R403.10(2).
 - d. Fire all other connected appliances simultaneously and test again at the draft diverter of each appliance for spillage, CO and acceptable draft using procedures 3a through 3c.

TABLE R403.10(2) (N1103.10(2))
ACCEPTABLE DRAFT TEST CORRECTION

<u>OUTSIDE TEMPERATURE (°F)</u>	<u>MINIMUM DRAFT PRESSURE REQUIRED (Pa)</u>
<u>< 10</u>	<u>-2.5</u>
<u>10 – 90</u>	<u>(Outside Temperature ÷ 40) – 2.75</u>
<u>> 90</u>	<u>-0.5</u>

For SI: 6894.76 Pa = 1.0 psi.

1. Measure spillage, acceptable draft, and carbon monoxide (CO) under natural conditions—without *clothes dryer* and exhaust fans on—according to the procedure outlined in Step 3, measuring the net change in pressure from worst case condition in Step 3 to natural in the CAZ to confirm the

- worst case depressurization taken in Step 2. Repeat the process for each appliance, allowing each vent system to cool between tests.
2. Monitor indoor ambient CO in the breathing zone continuously during testing, and abort the test where indoor ambient CO exceeds 35 ppm by turning off the appliance, ventilating the space, and evacuating the building. The CO problem must be corrected prior to completing combustion safety diagnostics.
 3. Make recommendations based on test results and the retrofit action prescribed in Table R403.10(3).

TABLE R403.10(3) (N1103.10(3))
ACCEPTABLE DRAFT TEST CORRECTION

<u>CARBON DIOXIDE LEVEL (ppm)</u>	<u>AND OR</u>	<u>SPILLAGE AND ACCEPTABLE DRAFT TEST RESULTS</u>	<u>RETROFIT ACTION</u>
<u>0 – 25</u>	<u>and</u>	<u>Passes</u>	<u>Proceed with work</u>
<u>25 < x ≤ 100</u>	<u>and</u>	<u>Passes</u>	<u>Recommend that CO problem be resolved</u>
<u>25 < x ≤ 100</u>	<u>and</u>	<u>Fails in worst case only</u>	<u>Recommend an appliance service call and repairs to resolve the problem</u>
<u>100 < x ≤ 400</u>	<u>or</u>	<u>Fails under natural conditions</u>	<u>Stop! Work shall not proceed until appliance is serviced and problem resolved</u>
<u>> 400</u>	<u>and</u>	<u>Passes</u>	<u>Stop! Work shall not proceed until appliance is serviced and problem resolved</u>
<u>> 400</u>	<u>and</u>	<u>Fails under any condition</u>	<u>Emergency! Shut off fuel to appliance and call for service immediately</u>

Reason: Energy efficiency improvements often have a direct impact on the building pressure boundary affecting the safe operation of combustion equipment. Routinely sealing up buildings without looking at the combustion equipment risk sooner or later will result in harming someone with back-drafted flue gas conditions.

This proposal is intended to provide clear guidance to builders, code officials and home performance contractors for worst-case testing of atmospheric venting systems where air-sealing techniques and air-leakage performance testing requirements of the 2015 IECC are employed. Worst case testing is used by home performance contractors to identify problems that weaken draft and restrict combustion air. Worst case vent testing uses the home's exhaust fans, air handling appliances and chimneys to create worst case depressurization in the combustion appliance zone (CAZ).

Language that is proposed for R403.10 is basically a distilled version of predominant combustion safety test procedures for atmospherically vented appliances found in readily available home performance programs across the country, such as EPA's Healthy Indoor Environments Protocols, EPA's Home Performance with Energy Star, DOE's Workforce Guidelines for Home Energy Upgrades, HUD's Community Development Block Grants and Weatherization Assistance Programs, BPI's Technical Standards for the Building Analyst Professional, and RESNET's Interim Guidelines for Combustion Appliance Testing and Writing Work Scopes. The proposed language is intended to take the combustion safety test procedures that are used most commonly by these home performance, weatherization, and beyond code programs, and reduce them to their simplest and most straightforward form for the purpose of combustion safety in IECC compliance and field assessment through the use of building diagnostic tools.

For Illinois, our required 9-month review process of the 2012 IECC resulted in the Illinois Energy Code Advisory Council (ECAC) concluding that reductions in building envelope air-leakage from 7 ACH50 (2009 IECC) to 5 ACH50 was a more conservative approach to take for the construction industry in our state than the more "aggressive" 7 ACH50 (2009 IECC) to 3 ACH50, as is the case with the 2012 IECC for Climate Zones 4 and 5.

While part of ECAC's consideration was the decision to insert the 2012 IRC's whole-house ventilation provisions based on ASHRAE 62.2 directly into the Illinois Energy Conservation Code, this proposal recognizes that under certain conditions, perhaps even those of forthcoming 2015 IECC, reduced natural air-leakage coupled with the installation of atmospheric combustion appliances will reduce air exchange to the outside with the potential to contribute to poor indoor air quality and possible health problems due to spillage, inadequate draft, or carbon monoxide concerns.

We suspect other states and municipalities considering 2015 IECC adoptions will seek similar building diagnostic-based solutions to combustion safety.

Cost Impact: The code change proposal will increase the cost of construction.

TENTATIVE ORDER OF DISCUSSION 2013 PROPOSED CHANGES TO THE INTERNATIONAL FIRE CODE AND INTERNATIONAL WILDLAND-URBAN INTERFACE CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation **does not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some IFC code change proposals may not be included on this list, as they are being heard by other committees. Please consult the Cross Index of Proposed Changes. Note also that in this cycle, the hearing order places the code changes affecting hazardous materials first to give them proper attention.

Proponent: Anthony C. Apfelbeck, Fire Marshal/Building Official, City of Altamonte Springs, FL representing Himself (ACApfelbeck@Altamonte.org)

Revise as follows:

Add the following IBC definitions to IFC Section 202.

SECTION 202 GENERAL DEFINITIONS

ACCESSIBLE UNIT. A dwelling unit or sleeping unit that complies with this code and the provisions for Accessible units in ICC A117.1.

[A] ADDITION. An extension or increase in floor area or height of a building or structure.

BUILDING ELEMENT. A fundamental component of building construction, listed in Table 601, which may or may not be of fire-resistance-rated construction and is constructed of materials based on the building type of construction.

CELL (Group I-3 occupancy). A room within a housing unit in a detention or correctional facility used to confine inmates or prisoners.

DEAD LOAD. The weight of materials of construction incorporated into the building, including but not limited to walls, floors, roofs, ceilings, stairways, built-in partitions, finishes, cladding and other similarly incorporated architectural and structural items, and the weight of fixed service equipment, such as cranes, plumbing stacks and risers, electrical feeders, heating, ventilating and air-conditioning systems and automatic sprinkler systems.

DESIGN PROFESSIONAL, REGISTERED. See “Registered design professional.”

EMPLOYEE WORK AREA. All or any portion of a space used only by employees and only for work. Corridors, toilet rooms, kitchenettes and break rooms are not employee work areas.

FLOOD or FLOODING. A general and temporary condition of partial or complete inundation of normally dry land from:

1. The overflow of inland or tidal waters.
2. The unusual and rapid accumulation or runoff of surface waters from any source.

INTERIOR SURFACES. Surfaces other than weather exposed surfaces.

JOINT. The opening in or between adjacent assemblies that is created due to building tolerances, or is designed to allow independent movement of the building in any plane caused by thermal, seismic, wind or any other loading.

LIVE LOAD. A load produced by the use and occupancy of the building or other structure that does not include construction or environmental loads such as wind load, snow load, rain load, earthquake load, flood load or dead load.

MEMBRANE PENETRATION. A breach in one side of a floor-ceiling, roof-ceiling or wall assembly to accommodate an item installed into or passing through the breach.

OCCUPIABLE SPACE. A room or enclosed space designed for human occupancy in which individuals congregate for amusement, educational or similar purposes or in which occupants are engaged at labor, and which is equipped with *means of egress* and light and *ventilation* facilities meeting the requirements of this code.

PLATFORM. A raised area within a building used for worship, the presentation of music, plays or other entertainment; the head table for special guests; the raised area for lecturers and speakers; boxing and wrestling rings; theater-in-the-round *stages*; and similar purposes wherein there are no overhead hanging curtains, drops, scenery or stage effects other than lighting and sound. A temporary platform is one installed for not more than 30 days.

PUBLIC ENTRANCE. An entrance that is not a *service entrance* or a *restricted entrance*.

ROOF COVERING. The covering applied to the *roof deck* for weather resistance, fire classification or appearance.

ROOFTOP STRUCTURE. A structure erected on top of the *roof deck* or on top of any part of a building.

SHAFT. An enclosed space extending through one or more *stories* of a building, connecting vertical openings in successive floors, or floors and roof.

SHAFT ENCLOSURE. The walls or construction forming the boundaries of a *shaft*.

SPECIAL INSPECTION. Inspection of construction requiring the expertise of an *approved special inspector* in order to ensure compliance with this code and the *approved construction documents*.

STAGE. A space within a building utilized for entertainment or presentations, which includes overhead hanging curtains, drops, scenery or stage effects other than lighting and sound.

STRUCTURE. That which is built or constructed.

SWIMMING POOL. Any structure intended for swimming, recreational bathing or wading that contains water over 24 inches (610 mm) deep. This includes in-ground, aboveground and on-ground pools; hot tubs; spas and fixed-inplace wading pools.

veneer. A facing attached to a wall for the purpose of providing counted as adding strength to the wall.

WALKWAY, PEDESTRIAN. A walkway used exclusively as a pedestrian trafficway.

WALL. A vertical element with a horizontal length-to-thickness ratio greater than three, used to enclose space.

Reason: The above terms are utilized in the IFC. However, they are not defined in the IFC. They are defined in the IBC. If the term is utilized in the IFC, and there is an appropriate definition in the IBC, that definition should be extracted into the IFC for better use ability. The following lists the IFC locations using each of the above defined terms:

ACCESSIBLE UNIT. Used in IFC Section(s):

1008.1.1 Exception 7.
1008.1.5 Exception 3.
1008.1.7 Exception 3.
1010.7.3 Exception 1.
1010.7.4 Exception.

[A] ADDITION. Used in IFC Section(s):

202 - Definition of ALTERATION.
311.3 Exception 1.
507.5.2
510.6.1
3311.2

BUILDING ELEMENT. Used in IFC Section(s):

202 - Definition of BLEACHERS.
202 - Definition of FIRE-RESISTANCE RATING.
202 - Definition of FOLDING AND TELESCOPIC SEATING.
202 - Definition of GRANDSTAND.
1003.6
1028.1.1

CELL (Group I-3 occupancy). Used in IFC Section 907.2.6.3.3 Exception 1.

DEAD LOAD. Used in IFC Section 1104.16.5

DESIGN PROFESSIONAL, REGISTERED. See "Registered design professional."

EMPLOYEE WORK AREA. Used in IFC Section 907.5.2.3.2

FLOOD or FLOODING. Used in IFC Section(s):

913.2
5303.16.1
5303.16.5
5504.3.1.1.4
5704.2.7.8
5704.2.8.1
5704.2.8.5
5706.3.2.1
6104.3.2

INTERIOR SURFACES. Used in IFC Sections 202 - Definition of INTERIOR WALL AND CEILING FINISH. and 2404.3.2.2

JOINT. Used in IFC Section(s):

202 - Definition of Fire-Resistant Joint System
308.1.6.2
311.2.3
603.6.1
Section 703
909.10.2
909.13.1

F2 – 13

202 (IBC 202)

Proponent: Kirk Mitchell, Kirk Mitchell & Associates, LLC representing Isocyanurates Industry Ad Hoc Committee (IIAHC) (pkmitchell@bellsouth.net)

Revise as follows:

SECTION 202 (IBC 202)

GENERAL DEFINITIONS

CORROSIVE. A chemical that causes visible destruction of, or irreversible alterations in, living tissue by chemical action at the point of contact. A chemical shall be considered corrosive if, when tested using one of the *in vivo* or *in vitro* OECD test methods authorized on the intact skin of albino rabbit by the method described in DOTn 49 CFR 173.137, such chemical destroys or changes irreversibly the structure of the tissue at the point of contact following an exposure period of 4 hours. This term does not refer to action on inanimate surfaces.

Reason: Current IFC definition limited to albino rabbit testing exclusively does not comport with currently recognized methodologies (See *NFPA 400 – Hazardous Materials Code 2013 Edition*)

Cost Impact: This proposed code change will not increase the cost of construction and/or operation. It is likely to reduce the cost of hazard classification of unknown and re-evaluation of assumed known health hazards by employing simpler pre-emptive testing methodologies and reduce the burden of animal testing.

F2-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202-CORROSIVE-F-MITCHELL

F3 – 13

202 (IBC [F] 202)

Proponent: Marcelo M Hirschler, GBH International (gbhint@aol.com)

Revise as follows:

SECTION 202 (IBC [F] 202) GENERAL DEFINITIONS

DECORATIVE MATERIALS. All materials applied over the building interior finish for decorative, acoustical or other effect ~~(such as including, but not limited to,~~ curtains, draperies, fabrics, and streamers ~~and surface coverings)~~, and all other materials utilized for decorative effect ~~(such as including, but not limited to,~~ bulletin boards, artwork, posters, photographs, paintings, batting, cloth, cotton, hay, stalks, straw, vines, leaves, trees, moss and similar items~~)~~, including foam plastics and materials containing foam plastics. Decorative materials do not include wall coverings, ceiling coverings, floor coverings, ordinary window shades, interior finish and materials 0.025 inch (0.64 mm) or less in thickness applied directly to and adhering tightly to a substrate.

Reason: This is just a small cleanup in the definition of decorative materials to be consistent with section 807 of the code.

Cost Impact: Minimal

F3-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202-DECORATIVE MATERIALS-F-HIRSCHLER

F4 – 13

202 (IBC [F] 202)

Proponent: Amy Carpenter, AIA, Pioneer Network Long Term Care Code Task Force

Revise as follows:

SECTION 202 (IBC [F] 202) GENERAL DEFINITIONS

DECORATIVE MATERIALS. All materials applied over the building *interior finish* for decorative, acoustical or other effect (~~such as including but not limited to~~ curtains, draperies, fabrics, streamers and surface coverings), and all other materials utilized for decorative effect (~~such as including but not limited to, photographs, paintings, bulletin boards, artwork, posters,~~ batting, cloth, cotton, hay, stalks, straw, vines, leaves, trees, moss and similar items), including foam plastics and materials containing foam plastics. Decorative materials do not include floor coverings, ordinary window shades, *interior finish* and materials 0.025 inch (0.64 mm) or less in thickness applied directly to and adhering tightly to a substrate.

Reason: Companion proposal to IFC Section 807. Clarifying and expanding definition of decorative materials, to include paper-based products and for correlation.

Cost Impact: None

F5 – 13

202 (New)

Proponent: Ronald Marts, Telcordia, representing AT&T, Verizon, CenturyLink (rmarts@telcordia.com)

Add new text as follows:

SECTION 202 GENERAL DEFINITIONS

ELECTROLYTE. The medium that provides the ion transport mechanism between the positive and negative electrodes of a cell.

SECTION 602 DEFINITIONS

602.1 Definitions. The following terms are defined in Chapter 2:

BATTERY SYSTEM, STATIONARY LEAD-ACID.

BATTERY TYPES.

COMMERCIAL COOKING APPLIANCES.

ELECTROLYTE.

HOOD.

 Type I.

 Type II.

REFRIGERANT.

REFRIGERATION SYSTEM.

Reason: This term, used in Section 608, needs to be defined. The definition comes from the IEEE Stationary Battery Standards Glossary.

Cost Impact: None.

F5-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202-ELECTROLYTE (NEW)-MARTS

F6 – 13

202 (IBC [F] 202)

Proponent: Elley Klausbruckner representing Klausbruckner & Associates Inc (ek@klausbruckner.com)

Revise as follows:

SECTION 202 (IBC [F] 202) GENERAL DEFINITIONS

FLAMMABLE SOLID. A solid, other than a blasting agent or *explosive*, that is capable of causing fire through friction, absorption of moisture, spontaneous chemical change or retained heat from manufacturing or processing, or which has an ignition temperature below 212°F (100°C) or which burns so vigorously and persistently when ignited as to create a serious hazard. A chemical shall be considered a flammable solid as determined in accordance with the test method of CPSC 16 CFR Part 1500.44, if it ignites and burns with a self-sustained flame at a rate greater than ~~0.4~~ 0.0866 inch (~~2.5 mm~~ 2.2 mm) per second along its major axis.

Reason: The definition proposed is in line with GHS [Globally Harmonized System] which is now adopted by OSHA. When an MSDS is prepared today, a material classified as "Flammable Solids" is typically based on this definition and not the previous definition [existing language in the Fire Code]. For additional details please see <http://www.osha.gov/dsg/hazcom/ghs.html>.

Cost Impact: The code change proposal will not increase the cost of construction.

F6-13

Public Hearing:	Committee:	AS	AM	D

F7 – 13

202 (IBC [F] 202)

Proponent: Kirk Mitchell, Kirk Mitchell & Associates, LLL, representing Isocyanurates Industry Ad Hoc Committee (IIAHC) (pkmitchell@bellsouth.net)

Revise as follows:

SECTION 202 (IBC [F] 202) GENERAL DEFINITIONS

HIGHLY TOXIC. A material that produces a lethal dose or lethal concentration which falls within any of the following categories:

1. A chemical that has a median lethal dose (LD₅₀) of 50 milligrams or less per kilogram of body weight when administered orally to albino rats weighing between 200 g and 300 g each.
2. A chemical that has a median lethal dose (LD₅₀) of 200 milligrams or less per kilogram of body weight when administered by continuous contact for 24 hours (or less if death occurs within 24 hours) with the bare skin of albino rabbits weighing between 2 and 3 kilograms each.
3. A chemical that has a median lethal concentration (LC₅₀) in air of 200 parts per million by volume or less of gas or vapor, or 2 milligrams per liter or less of mist, fume or dust, when administered by continuous inhalation for one hour (or less if death occurs within 1 hour) to albino rats weighing between 200 and 300 grams each.

Existing inhalation toxicity data which has been generated for 4 hour exposure should be multiplied by a factor of 2 for gases and vapors or a factor of 4 for dusts and mists to convert to the value for 1 hour exposure.

~~Mixtures of these materials with ordinary materials, such as water, may not warrant classification as highly toxic. While this system is basically simple in application, any hazard evaluation that is required for the precise categorization of this type of material shall be performed by experienced, technically competent persons.~~

While categorization is basically simple in application, any hazard evaluation that is required for the precise categorization of this type of material shall be performed by experienced, technically competent persons. The degree of hazard depends on many variables which should be carefully considered individually and in combination. Some examples include:

1. Materials wherein the highly toxic component or mixtures thereof are inextricably bound and cannot be released present little or no potential for exposure.
2. Non-volatile, non-frangible solid hazardous materials existing in product forms and in the demonstrated absence of inhalable particles would not present the same inhalation hazard as the chemical components existing in a volatile, frangible state.
3. Mixtures of these materials with ordinary materials, such as water, may not warrant classification as highly toxic.

Reason: Most acute inhalation studies are run for 4 hr, as preferred in OECD 403 Acute Inhalation Toxicity and in OPPTS 870.1300 Acute Inhalation Toxicity. Conversion of 4 hr data to 1 hr data is given in GHS Purple Book, 4th Edition, 2011, Chapter 3.1 and in NFPA 704, section B.4.

Revised last paragraph includes language added to NFPA 400 in A.3.3.61.9.1.

Cost Impact: This proposed code change will not increase the cost of construction and/or operation. It is intended to provide descriptive clarification aligned with conventional acute test methods, GHS Purple Book, etc.

F9 – 13

305.5 (New)

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Add new text as follows:

305.5 Unwanted Fire Ignitions. Where acts or processes have caused repeated ignitions of unwanted fires, the act or process shall be modified to prevent future ignitions.

Reason: Many industrial processes have the potential to produce nuisance fires that generate unwanted alarms necessitating emergency responses which risk health and safety of firefighters and citizens. No other section of the code currently empowers the fire code official to mitigate such nuisance fires.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: <http://www.iccsafe.org/cs/CAC/Pages/default.aspx>.

Cost Impact: This code change will not increase the cost of construction

F9-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

305.5 (NEW)-F-ZUBIA-FCAC

F10 – 13

306.1

Proponent: Mark Ritchie, Houston, TX Fire Department, representing self

Revise as follows:

306.1 Motion picture projection rooms. Electric arc, xenon or other light source projection equipment which develops hazardous gases, dust or radiation and the projection of ribbon-type cellulose ~~nitrate~~ acetate film, regardless of the light source used in projection, shall be operated within a motion picture projection room complying with Section 409 of the *International Building Code*.

Reason: This section was not intended to address the projection of cellulose nitrate film. This section was intended to address projection of cellulose acetate film (safety film). The requirements of Section 409 of IBC are intended to provide construction requirements for a projection room where safety film is used and would not be compliant for use of the more hazardous cellulose nitrate film.

Cost Impact: The code change proposal will not increase the cost of construction.

F10-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

306.1-F-RITCHIE

F11 – 13

307.2, 202

Proponent: Mark D. Lenhart, Greensteads Nonprofit, representing self (info@greensteads.org)

Revise as follows:

307.2 Permit required. A permit shall be obtained from the *fire code official* in accordance with Section 105.6 prior to kindling a fire for recognized silvicultural or range or wildlife management practices, prevention or control of disease or pests, or a bonfire. Application for such approval shall only be presented by and permits issued to the *owner* of the land upon which the fire is to be kindled.

Exception: Outdoor fires in totally enclosed, low emission, pyrolysis-based char-producing stoves, where the fuel consist of dry, solid, biomass-based organic matter, with the purpose of capturing carbon in the form of char, charcoal, or biochar. Fires so contained shall not be considered open burns.

Add new text as follows:

SECTION 202 GENERAL DEFINITIONS

PYROLYSIS BASED CHAR PRODUCING STOVE. A low emission, pyrolysis-based fire contained in an enclosed chamber, burning dry, solid biomass-based organic matter for the purpose of capturing carbon in the form of char, charcoal, or biochar. Pyrolysis-based stoves may also additionally be used for cooking, heating or other recreational purposes.

Reason: There is an emerging need for regulatory guidance for the public and for public city, fire and safety officials for the installation and operation of small scale pyrolysis based stoves that produce charcoal/biochar. There is a great interest among the agriculture/silviculture/horticultural community as well as gardeners to use charcoal/biochar to augment the soil for crop production, the long term capture of atmospheric carbon, extremely efficient and low emission energy harnessing from renewable biomass materials, and the minimization of toxic agricultural and urban run-off.

Charcoal/biochar is the solid carbon residue resulting from the pyrolysis (carbonization or destructive distillation) of carbonaceous raw materials/feedstock (i.e. wood and/or green biomass material) in an oxygen deficient environment or chamber. The heat causes the feedstock to release much of its water and other organic compounds (off gassing) leaving behind the residue (charcoal/biochar), which is rich in carbon. Charcoal/biochar is then crushed into smaller pieces or pulverized and added to soil. Charcoal/biochar production units vary in construction material, size, fuel type, feedstock and complexity. A typical simple unit consists of combustion chamber, pyrolysis chamber and a stack or chimney. The units can be made from steel, brick and/or cinder blocks or a combination of these materials. The commercial biochar producing industry is in it's infancy, forcing many individuals and small organizations to create their own biochar stocks. Additionally, production of Biochar is ideally a local effort, with a minimum of transportation of the main biomass fuel. For these reasons, home and community gardeners, farmers, university researchers, and landscapers are building small biochar producing stoves.

Given the novelty of the practice and technology, public fire officials are suggesting to public community garden managers that there be uniform guidelines for the use of these types of devices in the International Fire Code to avoid endless replicated efforts at every local municipality across the country.

There exists a strong need to provide a simple, unified code for small scale, small entity, non-commercial pyrolysis stoves to simplify the adoption of this environmentally friendly technology.

Cost Impact: The code change proposal will not increase the cost of construction.

F11-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

307.2-F-LENHART

F12 – 13

308.1.1

Proponent: Bob D. Morgan, P.E., Fort Worth Fire Department, representing Fire Advisory Board to North Central Texas Council of Governments

Revise as follows:

308.1.1 Where prohibited. A person shall not take or utilize an open flame or light in a structure, vessel, boat or other place where highly flammable, combustible or explosive material is utilized or stored. Lighting appliances shall be well-secured in a glass globe and wire mesh cage or a similar *approved* device. Unmanned free-floating devices containing an open flame or other heat source including, but not limited to, sky lanterns shall be prohibited.

Reason: This issue of sky lanterns has become a serious concern among fire officials with many different amendments being adopted in an attempt to address the issue.

Cost Impact: The code change proposal will not increase the cost of construction.

F12-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

308.1.1-F-MORGAN

F13 – 13

308.1.6.3 (New), 202 (New)

Proponent: Anthony C. Apfelbeck, City of Altamonte Springs Building/Fire Safety Division, representing self (ACApfelbeck@Altamonte.org)

Add new text as follows:

308.1.6.3 Sky lanterns. No person shall release or cause to be released an untethered sky lantern.

Add new definition as follows:

SECTION 202 GENERAL DEFINITIONS

SKY LANTERN. An unmanned device with a combustible fuel source that incorporates an open flame in order to make the device airborne.

Reason: Sky lanterns contain an open flame used to heat the air inside the device to make it airborne. Once airborne, these devices are subject to winds and other atmospheric conditions so that the location of the landfall is completely unknown and uncontrolled by the user. Obviously, uncontrolled open flame devices descending out of the sky have the significant potential to start wildfires and structural fires.

Cost Impact: This code change will not increase the cost of construction

F13-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

308.1.6.3 (NEW)-F-APFELBECK

F14 – 13

310.3.1 (New)

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care (john.williams@doh.wa.gov) and Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee (cbaldassarra@RJAGroup.com)

Revise as follows:

310.3.1 Group I-2. In Group I-2 occupancies where smoking is prohibited, “No Smoking “ signs are not required in interior locations of the facility where signs are displayed at all major entrances into the facility.

Reason: This proposal will provide correlation with NFPA 101 Section 19.7.4.2 which contains an exception for healthcare occupancies that allows for a facility to not install secondary “No Smoking Signs” throughout a facility if primary signs are prominently displayed at all major entrances. This exception is not currently included in the IFC. Since healthcare facilities already prohibit smoking, where signs are posted at the entrances it is redundant and unnecessary to also require the signs to be posted throughout a facility that does not permit smoking, has a staff trained to monitor and policies in place to quickly stop or prevent the action.

This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April, 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: <http://www.iccsafe.org/cs/AHC/Pages/default.aspx>

This proposal is being co-sponsored by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as “areas of study”. Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>. Since its inception in April/2005, the CTC has held twenty five meetings - all open to the public. In 2012, three of the 25 face-to face meetings were held. In addition to the CTC meetings, the CTC established Study Groups (SG) of interested parties for each of the areas of study. These SG's are responsible for reviewing the available information and making recommendations to the CTC. All totaled, the SG's held over 70 conference calls in 2012.

Cost impact: This proposal will not increase the cost of construction.

310.3.1 (NEW)-F-BALDASSARRA-WILLIAMS-ADHOC-CTC

F15 – 13

312.3

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

SECTION 312 VEHICLE IMPACT PROTECTION

312.1 General. Vehicle impact protection required by this code shall be provided by posts that comply with Section 312.2 or by other *approved* physical barriers that comply with Section 312.3.

312.2 Posts. Guard posts shall comply with all of the following requirements:

1. Constructed of steel not less than 4 inches (102 mm) in diameter and concrete filled.
2. Spaced not more than 4 feet (1219 mm) between posts on center.
3. Set not less than 3 feet (914 mm) deep in a concrete footing of not less than a 15-inch (381 mm) diameter.
4. Set with the top of the posts not less than 3 feet (914 mm) above ground.
5. Located not less than 3 feet (914 mm) from the protected object.

312.3 Other barriers. ~~Physical barriers shall be a minimum of 36 inches (914 mm) in height and shall resist a force of 12,000 pounds (53 375 N) applied 36 inches (914 mm) above the adjacent ground surface.~~ Barriers other than posts specified in Section 312.2 that are designed to resist, deflect or visually deter vehicular impact commensurate with an anticipated impact scenario shall be permitted when approved.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: <http://www.iccsafe.org/cs/CAC/Pages/default.aspx>.

Contrary to what one might assume by reading the code, the current text of Section 312.3 is not a performance-based alternative design basis for the prescriptive provisions in Section 312.2. Instead, the two sections provide redundant and unrelated approaches to providing impact barriers, and there is no known technical relationship between the two design approaches. Section 312.2 was sourced from the Uniform Fire Code, and it was included in the IFC so that jurisdictions transitioning from the Uniform Fire Code to the IFC would not be forced into having to follow new barrier design criteria. Likewise, Section 312.3 was sourced from the BOCA National Fire Prevention Code, and it was included in the IFC so that jurisdictions transitioning from the BOCA National Fire Prevention Code to the IFC would not be forced into having to follow new barrier design criteria. Given that the 2015 IFC will be the 6th IFC edition following the consolidation of legacy codes; it no longer makes sense to retain this inconsistency. The prescriptively specified bollards specified by Section 312.2 are well-established as the default norm for compliance.

This change revises Section 312.3 so that it is truly a performance option to Section 312.2. The text deliberately establishes a broad set of goals that must be achieved by the designer to fit a site-specific application, and the requirement places the onus on the designer to demonstrate selection of a satisfactory design scenario and a suitable solution to achieve approval by the fire code official. Although one might argue that Section 312.3 might simply be deleted in favor of relying on Section 104.9 (alternate materials and methods), it makes more sense to include the suggested guidance in Section 312.3.

In reviewing this proposal, some may wonder whether it is appropriate to maintain the currently specified 12,000 pound “force” criteria. The answer is “no.” This was deliberately deleted for a couple reasons. First, the 12,000-pound “force” is actually specified as a static load, i.e. a load with no associated impact velocity or acceleration. Without knowing an intended impact velocity, the kinetic energy resistance for a barrier cannot be accurately calculated. It is more appropriate for a performance requirement to accommodate determination of a suitable vehicle weight and impact speed as a design basis.

Cost Impact: This code change proposal will not increase the cost of construction

315.3.2

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azumiamia@yahoo.com)

Revise as follows:

315.3.2 Means of egress. Combustible materials shall not be stored in exits, corridors or enclosures for stairways and ramps.

Reason: The code presently does not address storage of combustible materials in exit access corridors. The code prohibits storage in the exit, but says nothing about the corridor. This will provide the inspector with a tool to regulate the storage of combustible materials in a corridor.

Cost Impact: The code change will not increase the cost of construction.

F17 – 13

315.3.5 (New), 903.3.1.1.1 (IBC [F] 903.3.1.1.1)

Proponent: Adolf Zubia, Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Add new text as follows:

315.3.5 Rooms and areas exempted from automatic sprinkler system requirements. Storage shall not be permitted in any room or area where automatic sprinklers have been omitted in accordance with Section 903.3.1.1.1.

Revise as follows:

903.3.1.1.1 (IBC [F] 903.3.1.1.1) Exempt locations. Automatic sprinklers shall not be required in the following rooms or areas where such rooms or areas are protected with an approved automatic fire detection system in accordance with Section 907.2 that will respond to visible or invisible particles of combustion. Sprinklers shall not be omitted from any room merely because it is damp, of fire-resistance-rated construction or contains electrical equipment. Storage shall not be permitted in any room or area omitting automatic sprinklers.

Reason: These exceptions in the IBC go beyond the requirements of NFPA 13 by inserting a heat detection system. Storage needs to be specifically addressed by this section as this exemption can be interpreted to allow storage in an unsprinklered room. Sprinkler systems adjacent to these rooms are not mandated to increase design criteria to accommodate this unsprinklered space. Fires in unsprinklered rooms with unknown or unpermitted storage could overcome the sprinkler system.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. 	Assembly:	ASF	AMF	DF

315.3.5 (NEW)-F-ZUBIA-FCAC

F18 – 13

315.6 (New), 202 (New)

Proponent: Marcelo M Hirschler, GBH International (gbhint@aol.com)

Add new text as follows:

315.6 Storage in Plenums in Group I Occupancies. Storage shall not be permitted in plenums in Group I occupancies. Abandoned material in plenums in Group I occupancies shall be deemed to be storage and shall be removed. The accessible portion of abandoned cables in plenums in Group I occupancies that are not identified for future use with a tag shall be deemed storage and shall be removed.

SECTION 202

GENERAL DEFINITIONS

[M] PLENUM. An enclosed portion of the building structure, other than an occupiable space being conditioned, that is designed to allow air movement, and thereby serve as part of an air distribution system.

Reason: This new section is intended to introduce a concept that has been in the National Electrical Code (as well as in NFPA 90A) for a long time: plenums are intended for a specific use (see definition below), namely to be a part of the air distribution system so as to allow air movement. Plenums are also used (legitimately) for stringing communications and data cables as well as pipes and sprinkler pipes and other similar products. However, in actual fact, it is a common practice not to make the effort to remove products when they become obsolete. Examples include when an updated data system is being installed in the facility (and that typically occurs every 18-24 months). Normally, as the building is being rewired the old wires are cut off the grid but they are left in place and a new wiring system is added on top of them.

The tiles that often support plenums are not intended to support any significant weight and they can, therefore easily be overwhelmed by the added weight of storage or abandoned materials (such as abandoned cables). Recently, Bob Davidson and Sean DeCrane (Plenum Space Fuel Load, NFPA Annual Meeting 2009, M33) did an analysis that showed how the safety of firefighters is compromised by the weight of these abandoned cables. They point out that: "Plenum space fuel loads and wiring issues are a serious concern for fire fighters during interior firefighting operations." Their key recommendation was: "Take out the abandoned wiring!!"

Although the primary reason to recommend the removal of abandoned materials in plenums is weight, fire safety should also be taken into account.

The introduction of a requirement such as the one being proposed here has long been believed not to be enforceable. This is probably true if it were to apply to all occupancies, primarily because fire code inspectors would rarely spend their time looking into plenums in existing buildings. However, the inspection of I occupancies occurs with enough regularity that there should be no significant difficulty in having inspectors identify the existence of abandoned products, especially abandoned cables, classify them as storage and demand their removal.

The proposal recommends that only the "accessible portions" of abandoned cables be removed, because there is no intent to cause potential damage to the building or facility by attempting to remove cables or circuits that are strung through walls, floors or other building elements.

This is a safety issue associated with the safety of firefighters and not an issue of the construction of the plenums (or of the use of materials installed in plenums) and is, therefore, suitable for the IFC and not the IMC. Note that the IMC does not specifically prohibit the use of plenums for storage, presumably because such a requirement would not be associated with the construction of the plenums. This issue is associated with General Safety Provisions and is, therefore, primarily suitable for the IFC.

Duplicating the IMC definition of PLENUM in the IFC will assist the fire code official in enforcement of this section.

Photographs of typical wiring in plenums, as found by Davidson and DeCrane, follow:

F19 – 13

318.1

Proponent: Marcelo M Hirschler, GBH International (gbhint@aol.com)

Revise as follows:

318.1 Laundry carts with a capacity of 1 cubic yard or more. Laundry carts with an individual capacity of 1 cubic yard [200 gallons (0.76 m³)] or more, used in laundries within Group B, E, F-1, I, M and R-1 occupancies shall be constructed of noncombustible materials or materials having a peak rate of heat release not exceeding 300 kW/m² at a flux of 50 kW/m² when tested in a horizontal orientation in accordance with ASTM E 1354.

Exceptions:

1. Laundry carts in areas protected by an *approved automatic sprinkler system* installed throughout in accordance with Section 903.3.1.1.
2. Laundry carts in coin-operated laundries.
3. Laundry carts in day care facilities.

Reason: Laundry carts are likely to be equally (if not more) hazardous in Group E and M occupancies as in B occupancies. The addition of these occupancies should improve fire safety.

Cost Impact: Minimal

F20 – 13

319 (New), 202 (New)

Proponent: Anthony C. Apfelbeck, City of Altamonte Springs Building/Fire Safety Division, representing self (ACApfelbeck@Altamonte.org)

Add new text as follows:

SECTION 319

WILDLAND-URBAN INTERFACE AREAS

319.1 General. Buildings, structures or premises within wildland-urban interface areas shall comply with the *International Wildland-Urban Interface Code*.

SECTION 202

GENERAL DEFINITIONS

WILDLAND-URBAN INTERFACE AREA. That geographical area where structures and other human development meets or intermingles with wildland or vegetative fuels.

Reason: This code change:

1. Provides a definition for a "Wildland-Urban Interface Area" in the IFC Section 202 extracted from the definition in the IWUIC.
2. Provides a direct referral to the "Wildland-Urban Interface Code" in a new Section 319 within the IFC.

This code change will integrate the designation of a "Wildland-Urban Interface Area" and the reference International Wildland-Urban Interface Code as an integral part of the IFC. Rather than forcing a local jurisdiction to adopt the IWUIC separately, the IWUIC will be adopted as a reference when the IFC is adopted. The reason for this is two fold:

1. The base IFC should contain Wildland-Urban Interface requirements as an integral part of the document due to the expanding prevalence of these types of hazards that are confronted by the fire official. Users should not be forced to adopt a second document to be able to utilize the IWUIC and effectively address these types of conditions. Wildland-urban interface fire prevention is no different from the other base fire prevention requirements of the IFC and should be included as part of the model fire prevention code.
2. Adding the direct reference to the IWUIC into the IFC will not burden any jurisdiction with the requirement of the document unless there is an actual "Wildland-Urban Interface Area" within the jurisdiction. If there is a "Wildland-Urban Interface Area" within the jurisdiction, then the code should be specifying that the WUIA needs to be protected appropriately and set the standard of protection.

Cost Impact: This code change proposal will increase the cost of construction. Some WUIA that are not currently protected with a code, but should be protected, will end up with protection under this code change.

	Assembly:	ASF	AMF	DF

319 (NEW)-F-APFELBECK

F21 – 13

401.3.3, 907.6.5.3 (New)

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

401.3.3 Delayed notification. A person shall not, by verbal or written directive, require any delay in the reporting of a fire to the fire department.

Exception: Where permitted by the Fire Chief, an approved supervising station shall be allowed to verify an alarm signal prior to reporting it to the public safety communications center. The verification process shall be in accordance with NFPA 72.

Add new text as follows:

907.6.5.3 Alarm Signal Verification. Where permitted by the Fire Chief, an approved supervising station shall be allowed to verify an alarm signal prior to reporting it to the public safety communications center. The verification process shall be in accordance with NFPA 72.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: <http://www.iccsafe.org/cs/CAC/Pages/default.aspx>.

The intent is to allow fire departments to require verification on both commercial and residential alarm signals in order to assist in effective dispatching of resources and/or reducing nuisance alarms. Currently NFPA 72 allows verification on residential systems (but gives choice of using it to the monitoring company). This would give discretion to the fire chief, and expand use to include commercial alarms which accounts for the majority of false alarms in the U.S.

These provisions allow fire departments to require that alarm monitoring centers attempt to verify an alarm signal before reporting to the 9-1-1 center. Having better information about the cause of alarm activation is critical as many departments have much smaller responses for an automatic alarm signal than for a working structure fire. Additionally, verification has been proven effective in reducing unwanted nuisance alarms. Alarm Verification is already performed extensively on residential fire alarms; this would allow it to be mandated on some or all systems, including commercial occupancies, when required by the Chief.

Cost Impact: This code change will not increase the cost of construction

F21-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

401.3.3-F-ZUBIA-FCAC

F22 – 13

403.2

Proponent: Stephen DiGiovanni, Clark County, NV Fire Department, representing self.

Revise as follows:

403.2 Public safety plan. ~~In other than Group A or E occupancies, w~~Where the fire code official determines that an indoor or outdoor gathering of persons has an adverse impact on public safety through diminished access to buildings, structures, fire hydrants and fire apparatus access roads or where such gatherings adversely affect public safety services of any kind, the fire code official shall have the authority to order the development of, or prescribe a plan for, the provision of an approved level of public safety.

Reason: The exception that eliminates this section from applying to Group A and E occupancies is removed. The majority of crowd management issues occur in places that are considered assembly occupancies. As such, this section would most reasonably apply to Group A occupancies. In addition, Group E occupancy buildings typically are public buildings that are used for a variety of functions that involve gathering of persons. These may be school functions or other community functions, such as voting locations, religious functions, etc. As such, this section would also apply to Group E occupancies. Removing this phrase permits the fire code official to address safety concerns stemming from public gatherings in all buildings, not just a select few.

Cost Impact: This proposal would increase the costs of holding indoor and outdoor gatherings in Group A and Group E occupancies where required by the fire code official to have a public safety plan.

F22-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

403.2-F-DIGIOVANNI

F23 – 13

403.3

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

403.3 Crowd managers. Trained crowd managers shall be provided for facilities or events where more than 4,000 ~~250 or more~~ persons congregate. The minimum number of crowd managers shall be established at a ratio of one crowd manager to every 250 persons. ~~Where approved by the fire code official, the ratio of crowd managers shall be permitted to be reduced where the facility is equipped throughout with an approved automatic sprinkler system or based upon the nature of the event.~~

Exceptions:

1. Where approved, the number of crowd managers shall be permitted to be reduced by up to 50 percent where the fire and life safety protection provided and the nature of the event warrant a reduction.
2. Gatherings exclusively for religious worship with an occupant load not exceeding 1,000.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: <http://www.iccsafe.org/cs/CAC/Pages/default.aspx>.

The current code has no requirement for crowd managers until the occupant load in a public assembly reaches 1,000, then the code requires five trained crowd managers for an occupant load of 1001. This is illogical, especially since one of the events that generated this requirement, the Station Nightclub Fire, had an occupant load of less than 500. Smaller venues sometimes place the public at greater risk than large ones for many reasons, including the fact that larger facilities have greater requirements for other fire protection features. NFPA 1 and NFPA 101 require crowd managers in all public assemblies (except churches), so approving this code change will bring the two regulations closer to conformity.

The formatting change to place the potential reduction in the number of crowd managers in an exception is editorial; the exception was also changed to limit the reduction to half of the required number of crowd managers. Recent events have again emphasized that fire is not the only reason people will need to quickly exit a facility, so reducing the number strictly on the basis of a sprinkler system may be problematic. The exception for places of worship with occupant loads up to 1,000 recognizes the fact that people who are in these places of assembly normally have a greater awareness of their surroundings, and are more familiar with egress routes because they attend the church on a more regular basis than those at performances, who tend to be more transient.

Cost Impact: This code change will not increase the cost of construction

F23-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

403.3-F-ZUBIA-FCAC

F24 – 13

403.3.1 (New), 403.3.2 (New)

Proponent: Adolf Zubia, Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Add new text as follows:

403.3.1 Training. Training for crowd managers shall be approved.

403.3.2 Duties. The duties of crowd managers shall include, but not be limited to:

1. Conduct an inspection of the area of responsibility and identify and address any egress barriers.
2. Conduct an inspection of the area of responsibility to identify and mitigate any fire hazards.
3. Verify compliance with all permit conditions, including those governing pyrotechnics and other special effects.
4. Direct and assist the event attendees in evacuation during an emergency.
5. Assist emergency response personnel where # requested.
6. Other duties required by the fire code official.
7. Other duties as specified in the fire safety plan

Reason: The Code requires “trained crowd managers”, but doesn’t provide any guidance or describe what that training should include. This has been an ongoing issue for enforcement personnel. This change is intended to address that void.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Revise as follows:

SECTION 403 408 **USE AND OCCUPANCY-RELATED EMERGENCY PREPAREDNESS REQUIREMENTS**

403.1 ~~408.1~~ General. In addition to the requirements of Section 401, occupancies, uses and outdoor locations shall comply with the emergency preparedness requirements set forth in Sections 403.2 through 403.11. Where a firesafety and evacuation plan is required by Sections 403.2 through 403.11, evacuation drills shall be in accordance with Section 405 and employee training shall be in accordance with Section 406. In addition to the other requirements of this chapter, the provisions of this section are applicable to specific occupancies listed herein.

403.2 ~~408.2~~ Group A occupancies. An approved fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for Group A occupancies, other than those occupancies used exclusively for purposes of religious worship with an *occupant load* less than 2,000, and for buildings containing both a Group A occupancy and an atrium. Group A occupancies shall also comply with the requirements of Sections 403.2.1 through 403.2.4 ~~408.2.1 and 408.2.2~~ and Sections 401 through 406.

403.2.1 ~~408.2.1~~ Seating plan. In addition to the requirements of Section 404.2, tThe fire safety and evacuation plans for assembly occupancies shall include the information required by Section 404.3 and a detailed seating plan, *occupant load* and *occupant load* limit. Deviations from the approved plans shall be allowed provided the *occupant load* limit for the occupancy is not exceeded and the *aisles* and exit accessways remain unobstructed.

403.2.2 ~~408.2.2~~ Announcements. *(No change to current text)*

403.2.3 Fire watch personnel. Fire watch personnel shall be provided where required by Section 403.11.1.

403.2.4 Crowd managers. Crowd managers shall be provided where required by Section 403.11.3.

403.3 Group B occupancies. An approved fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for buildings containing a Group B occupancy where the Group B occupancy has an *occupant load* of 500 or more persons or more than 100 persons above or below the lowest *level of exit discharge*.

403.4 Group E occupancies. An approved fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for Group E occupancies and for buildings containing both a Group E occupancy and an atrium. Group E occupancies shall also comply with Section 403.4.1

403.4.1 ~~408.3~~ Group E occupancies and Group R-2 college and university buildings. Group E occupancies shall comply with the requirements of Sections 403.4.1.1 through 403.4.1.3 ~~408.3.1 through 408.3.4~~ and Sections 401 through 406. Group R-2 college and university buildings shall comply with the requirements of Sections 408.3.1 and 408.3.3 and Sections 401 through 406.

403.4.1.1 ~~408.3.1~~ First emergency evacuation drill. *(No change to current text)*

408.3.2 Emergency evacuation drill deferral. ~~In severe climates, the fire code official shall have the authority to modify the emergency evacuation drill frequency specified in Section 405.2.~~

403.4.1.2 408.3.3 Time of day. Emergency evacuation drills shall be conducted at different hours of the day or evening, during the changing of classes, when the school is at assembly, during the recess or gymnastic periods, or during other times to avoid distinction between drills and actual fires. ~~In Group R-2 college and university buildings, one required drill shall be held during hours after sunset or before sunrise.~~

403.4.1.3 408.3.4 Assembly points. *(No change to current text)*

403.5 Group F occupancies. An approved fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for buildings containing a Group F occupancy where the Group F occupancy has an occupant load of 500 or more persons or more than 100 persons above or below the lowest level of exit discharge .

403.6 Group H Occupancies. An approved fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for Group H occupancies. Group H-5 occupancies shall also comply with Section 403.6.1.

403.6.1 408.4 Group H-5 occupancies. ~~Group H-5 occupancies shall comply with the requirements of Sections 403.6.1.1 through 403.6.1.4 408.4.1 through 408.4.4 and Sections 401 through 407.~~

403.6.1.1 408.4.1 Plans and diagrams. *(No change to current text)*

403.6.1.2 408.4.2 Plan updating. The plans and diagrams required by Section ~~404~~, 403.6.1.1 and ~~407.6~~ 408.4.4 shall be maintained up to date and the *fire code official* and fire department shall be informed of all major changes.

403.6.1.3 408.4.3 Emergency response team. Responsible persons shall be designated ~~the~~ as an on-site emergency response team and trained to be liaison personnel for the fire department. These persons shall aid the fire department in preplanning emergency responses, identifying locations where HPM is stored, handled and used, and be familiar with the chemical nature of such material. An adequate number of personnel for each work shift shall be designated.

403.6.1.4 408.4.4 Emergency drills. *(No change to current text)*

403.7 Group I occupancies. An approved fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for Group I occupancies. Group I occupancies shall also comply with Sections 403.7.1 through 403.7.3

403.7.1 408.5 Group I-1 occupancies. ~~Group I-1 occupancies shall comply with the requirements of Sections 403.7.1.1 through 403.7.1.6 408.5.1 through 408.5.5 and Sections 401 through 406.~~

403.7.1.1 408.5.1 Fire safety and evacuation plan. The fire safety and evacuation plan required by Section 404 shall include special ~~staff~~ employee actions, including fire protection procedures necessary for residents, and shall be amended or revised upon admission of any resident with unusual needs.

403.7.1.2 408.5.2 Staff-Employee training. Employees shall be periodically instructed and kept informed of their duties and responsibilities under the plan. Such instruction shall be reviewed by ~~the staff~~ employees at intervals not exceeding ~~least every~~ two months. A copy of the plan shall be readily available at all times within the facility.

403.7.1.3 408.5.3 Resident training. *(No change to current text)*

403.7.1.4 408.5.4 Drill frequency. *(No change to current text)*

403.7.1.5 Drill times. Drills times are not required to comply with ~~the time requirements of~~ Section 405.4.

403.7.1.6 ~~408.5.5~~ Resident participation in drills. (No change to current text)

403.7.2 ~~408.6~~ Group I-2 occupancies. Group I-2 occupancies shall comply with ~~the requirements of~~ Sections 403.7.2.1 through 403.7.2.3~~408.6.1 and 408.6.2 and Sections 401 through 406.~~

403.7.2.1 Drill times. Drills times are not required to comply with ~~the time requirements of~~ Section 405.4.

403.7.2.2 ~~408.6.1~~ Evacuation not required. (No change to current text)

403.7.2.3 ~~408.6.2~~ Coded alarm signal. (No change to current text)

403.7.3 ~~408.7~~ Group I-3 occupancies. Group I-3 occupancies shall comply with ~~the requirements of~~ Sections 403.7.3.1 through 403.7.3.4~~408.7.1 through 408.7.4 and Sections 401 through 406.~~

403.7.3.1 ~~408.7.1~~ Employee training. Employees shall be instructed in the proper use of portable fire extinguishers and other manual fire suppression equipment. Training of new ~~staff~~ employees shall be provided promptly upon entrance on duty. Refresher training shall be provided at least annually.

403.7.3.2 ~~408.7.2~~ Employee ~~s~~Staffing. Group I-3 occupancies shall be provided with 24-hour staffing. ~~Staff~~ An employee shall be within three floors or 300 feet (91 440 mm) horizontal distance of the access door of each resident housing area. In ~~Use~~ Conditions 3, 4 and 5, as defined in "Occupancy Classification – Institutional Group I-3" in Chapter 2, the arrangement shall be such that the ~~staff~~ employee involved can start release of locks necessary for emergency evacuation or rescue and initiate other necessary emergency actions within 2 minutes of an alarm.

Exception: An ~~employee~~ Staff shall not be required to be within three floors or 300 feet (9144 mm) in areas in which all locks are unlocked remotely and automatically in accordance with Section 408.4 of the *International Building Code*.

403.7.3.3 ~~408.7.3~~ Notification. Provisions shall be made for residents in ~~Use~~ Conditions 3, 4 and 5, as defined in "Occupancy Classification – Institutional Group I-3" in Chapter 2, to readily notify an employee~~staff~~ of an emergency.

403.7.3.4 ~~408.7.4~~ Keys. Keys necessary for unlocking doors installed in a *means of egress* shall be individually identifiable by both touch and sight.

403.8 Group M occupancies. An approved fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for buildings containing a Group M occupancy, where the Group M occupancy has an occupant load of 500 or more persons or more than 100 persons above or below the lowest level of exit discharge, and for buildings containing both a Group M occupancy and an atrium.

403.9 Group R occupancies.

403.9.1 ~~408.8~~ Group R-1 occupancies. An approved fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for Group R-1 occupancies. Group R-1 occupancies shall also comply with the requirements of Sections 403.9.1.1 through 403.9.1.3, 408.8.1 through 408.8.3 and Sections 401 through 406.

403.9.1.1 ~~408.8.1~~ Evacuation diagrams. (No change to current text)

403.9.1.2 ~~408.8.2~~ Emergency duties. (No change to current text)

403.9.1.3 ~~408.8.3~~ Fire safety and evacuation instructions. (No change to current text)

403.9.2 408.9 Group R-2 occupancies. Group R-2 occupancies shall comply with the requirements of Sections 403.9.2.1 through 403.9.2.3~~408.9.1 through 408.9.4 and Sections 401 through 406.~~

403.9.2.1. College and University Buildings. An approved fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for Group R-2 college and university buildings. Group R-2 college and university buildings shall also comply with Sections 403.9.2.1 and 403.9.2.2.

403.9.2.1.1 First emergency evacuation drill. The first emergency evacuation drill of each school year shall be conducted within 10 days of the beginning of classes.

403.9.2.1.2 Time of day. Emergency evacuation drills shall be conducted at different hours of the day or evening, during the changing of classes, when the school is at assembly, during the recess or gymnastic periods, or during other times to avoid distinction between drills and actual fires. One required drill shall be held during hours after sunset or before sunrise.

403.9.2.2 408.9.4 Emergency guide. Fire emergency guides shall be provided for Group R-2 occupancies. Guide contents, maintenance and distribution shall comply with Sections 403.9.2.2.1 through 403.9.2.2.3

403.9.2.2.1 Guide contents. A fire emergency guides shall be provided which describes the location, function and use of fire protection equipment and appliances accessible to residents, including fire alarm systems, smoke alarms, and portable fire extinguishers. The guides shall also include an emergency evacuation plan for each dwelling unit.

403.9.2.2.2 408.9.3 Emergency guide maintenance. Emergency guides shall be reviewed and approved by the fire code official in accordance with Section 401.2. Evacuation diagrams shall be reviewed and updated in accordance with Section 404.4.

403.9.2.2.3 408.9.4 Emergency guide distribution. (No change to current text)

403.9.2.3 Evacuation diagrams for dormitories. A diagram depicting two evacuation routes shall be posted on or immediately adjacent to every required egress door from each dormitory sleeping unit. Evacuation diagrams shall be reviewed and updated as needed to maintain accuracy.

403.9.3 408.10 Group R-4 occupancies. An approved fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for Group R-4 occupancies. Group R-4 occupancies shall also comply with the requirements of Sections 403.9.3.1 through 403.9.3.6~~408.10.1 through 408.10.5 and Sections 401 through 406.~~

403.9.3.1 408.10.4 Fire safety and evacuation plan. The fire safety and evacuation plan required by Section 404 shall include special staff-employee actions, including fire protection procedures necessary for residents, and shall be amended or revised upon admission of a resident with unusual needs.

403.9.3.2 408.10.2 Staff-employee training. Employees shall be periodically instructed and kept informed of their duties and responsibilities under the plan. Such instruction shall be reviewed by employees at intervals not exceeding the staff at least every two months. A copy of the plan shall be readily available at all times within the facility.

403.9.3.3 408.10.3 Resident training. (No change to current text)

403.9.3.4 408.10.4 Drill frequency. (No change to current text)

403.9.3.5 Drill times. Drills times are not required to comply with the time requirements of Section 405.4.

403.9.3.6 408.10.5 Resident participation in drills. Emergency evacuation drills shall involve the actual evacuation of residents to a selected assembly point and shall provide residents with experience in exiting through all required exits. All required exits shall be used during emergency evacuation drills.

Exception: Actual exiting from windows shall not be required. Opening the window and signaling for help shall be an acceptable alternative.

403.10 Special uses. Special uses shall be in accordance with Sections 403.10.1 through 403.10.3.

403.10.1 408.11 Covered and open mall buildings. Covered and open mall buildings shall comply with the provisions-requirements of Sections 403.10.1.1 through 403.10.1.6~~408.11.1 through 408.11.3.~~

403.10.1.1 Malls and mall buildings exceeding 50,000 square feet. An approved fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for covered malls exceeding 50,000 square feet (4645 m²) in aggregate floor area and for open mall buildings exceeding 50,000 square feet (4645 m²) in aggregate area within the perimeter line.

403.10.1.2 408.11.4 Lease plan. In addition to the requirements of Section 404.2.2, aA lease plan that includes the following information shall be prepared for each covered and open mall building:-The plan shall include the following information in addition to that required by Section 404.3.2:-

1. Each occupancy, including identification of tenant.
2. *Exits* from each tenant space.
3. Fire protection features, including the following:
 - 3.1. Fire department connections.
 - 3.2. *Fire command center.*
 - 3.3. Smoke management system controls.
 - 3.4. Elevators, elevator machine rooms and controls.
 - 3.5. Hose valve outlets.
 - 3.6. Sprinkler and standpipe control valves.
 - 3.7. Automatic fire-extinguishing system areas.
 - 3.8. Automatic fire detector zones.
 - 3.9. *Fire barriers.*

403.10.1.3 408.11.1.4 Lease plan approval. *(No change to current text)*

403.10.1.4 408.11.1.2 Lease plan revisions. *(No change to current text)*

403.10.1.5 408.11.2 Tenant identification. Tenant identification shall be provided for secondary exits from occupied tenant spaces that lead to an *exit corridor* or directly to the exterior of the building. Each occupied tenant space provided with a secondary exit to the exterior or *exit corridor* shall be provided with tenant identification by Tenant identification shall be posted on the exterior side of the exit or exit access door and shall identify the business name and/or address. Letters and numbers shall be posted on the *corridor* side of the door, be using plainly legible letters and numbers that and shall contrast with their background.

Exception: Tenant identification is not required for anchor stores.

(Section 408.11.3 Moved to new Section 311.6)

403.10.1.6 Unoccupied tenant spaces. The fire safety and evacuation plan shall provide for compliance with the requirements for unoccupied tenant spaces in Section 311.

403.10.2 High-rise buildings. An approved fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for high-rise buildings.

403.10.3 Underground buildings. An *approved* fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for underground buildings.

403.11 Special requirements for public safety. Special requirements for public safety shall be in accordance with Sections 403.11.1 through 403.11.3.1.

SECTION 403 PUBLIC ASSEMBLAGES AND EVENTS

403.11.1403.1 Fire watch personnel. When, in the opinion of the *fire code official*, it is essential for public safety in a place of assembly or any other place where people congregate, because of the number of persons, or the nature of the performance, exhibition, display, contest or activity, the *owner*, agent or lessee shall provide one or more fire watch personnel, as required and *approved*. Fire watch personnel shall comply with Sections 403.11.1.1 and 403.11.1.2. ~~to remain on duty during the times such places are open to the public, or when such activity is being conducted.~~

403.1.1 Duties. Fire watch personnel shall keep diligent watch for fires, obstructions to *means of egress* and other hazards during the time such place is open to the public or such activity is being conducted and take prompt measures for remediation of hazards, extinguishment of fires that occur and assist in the evacuation of the public from the structures.

403.11.1.1 Duty Times. Fire watch personnel shall remain on duty during the times places requiring a fire watch are open to the public, or when an activity requiring a fire watch is being conducted.

403.11.1.2 Duties. On-duty fire watch personnel shall have the following duties:

1. Keep diligent watch for fires, obstructions to *means of egress* and other hazards
2. Take prompt measures for remediation of hazards and extinguishment of fires that occur
3. Take prompt measures to assist in the evacuation of the public from the structures.

403.11.2 403.2 Public safety plan for gatherings. In other than Group A or E occupancies, where the *fire code official* determines that an indoor or outdoor gathering of persons has an adverse impact on public safety through diminished access to buildings, structures, fire hydrants and fire apparatus access roads or where such gatherings adversely affect public safety services of any kind, the *fire code official* shall have the authority to order the development of or prescribe a public safety plan that provides an approved level of public safety and addresses the following items: ~~or prescribe a plan for, the provision of an approved level of public safety.~~

403.2.1 Contents. The public safety plan, where required by Section 403.2, shall address such items

1. as Emergency vehicle ingress and egress
2. Fire protection
3. Emergency egress or escape routes
4. Emergency medical services
5. Public assembly areas
6. and The directing of both attendees and vehicles, (including the parking of vehicles)
7. Vendor and food concession distribution
8. and The need for the presence of law enforcement
9. and The need for fire and emergency medical services personnel at the event.

403.11.3 403.3 Crowd managers for gatherings exceeding 1,000 people. Trained crowd managers shall be provided for Where facilities or events involve a gathering of where more than 1,000 people, crowd managers shall be provided in accordance with Section 403.11.3.1 persons congregate. ~~The minimum number of crowd managers shall be established at a ratio of one crowd manager to every 250~~

persons. ~~Where approved by the fire code official, the ratio of crowd managers shall be permitted to be reduced where the facility is equipped throughout with an approved automatic sprinkler system or based upon the nature of the event.~~

403.11.3.1 Number of crowd managers. The minimum number of crowd managers shall be established at a ratio of one crowd manager ~~for~~ to every 250 persons.

Exception: ~~Where approved by the fire code official, the ratio number of crowd managers shall be permitted to be reduced where the facility is equipped throughout with an approved automatic sprinkler system or based upon the nature of the event.~~

SECTION 404 FIRE SAFETY, ~~AND~~ EVACUATION AND LOCKDOWN PLANS

404.1 General. Where required by Section 403, ~~Fire safety, evacuation and lockdown plans and associated drills shall comply with the requirements of Sections 404.2 through 404.4.1~~ 404.5.1.

404.2 Where required. ~~An approved fire safety and evacuation plan shall be prepared and maintained for the following occupancies and buildings.~~

- ~~1. Group A, other than Group A occupancies used exclusively for purposes of religious worship that have an occupant load less than 2,000.~~
- ~~2. Group B buildings having an occupant load of 500 or more persons or more than 100 persons above or below the lowest level of exit discharge.~~
- ~~3. Group E.~~
- ~~4. Group F buildings having an occupant load of 500 or more persons or more than 100 persons above or below the lowest level of exit discharge.~~
- ~~5. Group H.~~
- ~~6. Group I.~~
- ~~7. Group R-1.~~
- ~~8. Group R-2 college and university buildings.~~
- ~~9. Group R-4.~~
- ~~10. High-rise buildings.~~
- ~~11. Group M buildings having an occupant load of 500 or more persons or more than 100 persons above or below the lowest level of exit discharge.~~
- ~~12. Covered malls exceeding 50,000 square feet (4645 m²) in aggregate floor area.~~
- ~~13. Open mall buildings exceeding 50,000 square feet (4645 m²) in aggregate area within perimeter line.~~
- ~~14. Underground buildings.~~
- ~~15. Buildings with an atrium and having an occupancy in Group A, E or M.~~

SECTION 405 EMERGENCY EVACUATION DRILLS

405.1 General. Emergency evacuation drills complying with ~~the provisions of this section.~~ Sections 405.2 through 405.9 shall be conducted at least annually in the occupancies listed in Section 404.2 where firesafety and evacuation plans are required by Section 403 or when required by the fire code official. Drills shall be designed in cooperation with the local authorities.

405.2 Frequency. *(No change to current text)*

405.3 Leadership. *(No change to current text)*

405.4 Time. *(No change to current text)*

405.5 Record keeping. Records shall be maintained of required emergency evacuation drills and include the following information:

1. Identity of the person conducting the drill.
2. Date and time of the drill.
3. Notification method used.
4. ~~Staff members~~ Employees on duty and participating.
5. Number of occupants evacuated.
6. Special conditions simulated.
7. Problems encountered.
8. Weather conditions when occupants were evacuated.
9. Time required to accomplish complete evacuation.

**TABLE 405.2
FIRE AND EVACUATION DRILL
FREQUENCY AND PARTICIPATION**

GROUP OR OCCUPANCY	FREQUENCY	PARTICIPATION
Group A	Quarterly	Employees
Group B ^c	Annually	Employees
Group E	Monthly ^a	All occupants
Group F	Annually	Employees
Group I	Quarterly on each shift	Employees ^b
Group R-1	Quarterly on each shift	Employees
Group R-2 ^d	Four annually	All occupants
Group R-4	Quarterly on each shift	Employees ^b
High-rise buildings	Annually	Employees

- a. ~~In severe climates, the fire code official shall have the authority to modify the emergency evacuation drill frequency.~~ The frequency shall be allowed to be modified in accordance with Section 408.3.2.
- b. Fire and evacuation drills in residential care assisted living facilities shall include complete evacuation of the premises in accordance with Section ~~403.9.3.6~~ 408.10.5. Where occupants receive habilitation or rehabilitation training, fire prevention and fire safety practices shall be included as part of the training program.
- c. Group B buildings having an occupant load of 500 or more persons or more than 100 persons above or below the lowest level of exit discharge.
- d. Applicable to Group R-2 college and university buildings in accordance with Section ~~403.9.2.1~~ 408-3.

406.1 General. ~~Where fire safety and evacuation plans are required by Section 403, Employees in the occupancies listed in Section 404.2 shall be trained in the fire emergency procedures described in their fire evacuation and fire safety plans. Training shall be based on plans prepared in accordance with Section 404.~~ these plans and as described in Section 404.3.

406.3.3 Emergency lockdown training. ~~Where a facility has a lockdown plan, employees shall be trained on their assigned duties and procedures in the event of an emergency lockdown. (moved to Section 406.4)~~

406.3.4 406.3.3 Fire safety training. (No change to current text)

406.4 406.3.3 Emergency lockdown training. (No change to current text)

Revise as follows:

311.1 General. Temporarily unoccupied buildings, structures, premises or portions thereof, including tenant spaces, shall be safeguarded and maintained in accordance with Sections 311.1.1 through 311.5.65.

311.6. 408.11.3 MaintenanceUnoccupied tenant spaces in mall buildings. Unoccupied tenant spaces in covered and open mall buildings shall be:

1. Kept free from the storage of any materials.
2. Separated from the remainder of the building by partitions of at least 0.5-inch-thick (12.7 mm) gypsum board or an *approved* equivalent to the underside of the ceiling of the adjoining tenant spaces.
3. Without doors or other access openings other than one door that shall be kept key locked in the closed position except during that time when opened for inspection.
4. Kept free from combustible waste and be broomswept clean.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: <http://www.iccsafe.org/cs/CAC/Pages/default.aspx>.

This proposal restructures Chapter 4 to place all of the core requirements in the front of the chapter in Section 403. The current code splits such requirements between Section 404.2 and Section 408, making the code difficult to follow and apply. Section 403 in this proposal includes the requirements previously included in Sections 404.2 and 408, which have been merged by occupancy classification or as otherwise appropriate.

The overall intent of this proposal is editorial revision. Provisions have been relocated and text has been edited in an effort to clarify what is believed to be the current intent without technical change and to improve readability. One section dealing with maintenance of unoccupied tenant spaces in malls was determined to be improperly located in Chapter 4 and was moved to Chapter 3 with other vacant use regulations.

In preparing this proposal, it was noted that the provisions for emergency evacuation drills for Group I-1 (403.7.1.6 of the rewrite) and Group R-4 (403.9.3.6 of the rewrite) are not consistent. This may have been deliberate when Chapter 4 was originally written, but it warrants a review to determine if the inconsistency is appropriate.

One change that was made corrects an error made by the Code Correlation Committee when they made what was believed to be an editorial addition to the code in Section 408.9.3 of the 2012 edition. That addition referenced Section 404.4 for review and updating of evacuation diagrams for any Group R-2 dormitory. The reference to Section 404.4 was incorrect because that section only relates to fire safety and evacuation plans, which are not required for Group R-2 except for college and university buildings. This error has been fixed in Section 403.9.2.3.

Because of the complexity of these revisions in legislative format, a clean copy of the final text is provided below to allow an easier review of the proposed text for the 2015 code:

SECTION 403 EMERGENCY PREPAREDNESS REQUIREMENTS

403.1 General. In addition to the requirements of Section 401, occupancies, uses and outdoor locations shall comply with the emergency preparedness requirements set forth in Sections 403.2 through 403.11. Where a firesafety and evacuation plan is required by Sections 403.2 through 403.11, evacuation drills shall be in accordance with Section 405 and employee training shall be in accordance with Section 406.

403.2 Group A occupancies. An *approved* fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for Group A occupancies, other than those occupancies used exclusively for purposes of religious worship with an *occupant load* less than 2,000, and for buildings containing both a Group A occupancy and an atrium. Group A occupancies shall also comply with Sections 403.2.1 through 403.2.4.

403.2.1 Seating plan. In addition to the requirements of Section 404.2, the fire safety and evacuation plans for assembly occupancies shall include a detailed seating plan, *occupant load* and *occupant load* limit. Deviations from the *approved* plans shall be allowed provided the *occupant load* limit for the occupancy is not exceeded and the *aisles* and exit accessways remain unobstructed.

403.2.2 Announcements. In theaters, motion picture theaters, auditoriums and similar assembly occupancies in Group A used for noncontinuous programs, an audible announcement shall be made not more than 10 minutes prior to the start of each program to notify the occupants of the location of the exits to be used in the event of a fire or other emergency.

Exception: In motion picture theaters, the announcement is allowed to be projected upon the screen in a manner *approved by the fire code official.*

403.2.3 Fire watch personnel. Fire watch personnel shall be provided where required by Section 403.11.1.

403.2.4 Crowd managers. Crowd managers shall be provided where required by Section 403.11.3.

403.3 Group B occupancies. An *approved* fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for buildings containing a Group B occupancy where the Group B occupancy has an *occupant load* of 500 or more persons or more than 100 persons above or below the lowest *level of exit discharge*.

403.4 Group E occupancies. An *approved* fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for Group E occupancies and for buildings containing both a Group E occupancy and an atrium. Group E occupancies shall also comply with Section 403.4.1

403.4.1 Group E occupancies. Group E occupancies shall comply with Sections 403.4.1.1 through 403.4.1.3

403.4.1.1 First emergency evacuation drill. The first emergency evacuation drill of each school year shall be conducted within 10 days of the beginning of classes.

403.4.1.2 Time of day. Emergency evacuation drills shall be conducted at different hours of the day or evening, during the changing of classes, when the school is at assembly, during the recess or gymnastic periods, or during other times to avoid distinction between drills and actual fires.

403.4.1.3 Assembly points. Outdoor assembly areas shall be designated and shall be located a safe distance from the building being evacuated so as to avoid interference with fire department operations. The assembly areas shall be arranged to keep each class separate to provide accountability of all individuals.

403.5 Group F occupancies. An *approved* fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for buildings containing a Group F occupancy where the Group F occupancy has an *occupant load* of 500 or more persons or more than 100 persons above or below the lowest *level of exit discharge*.

403.6 Group H Occupancies. An *approved* fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for Group H occupancies. Group H-5 occupancies shall also comply with Section 403.6.1.

403.6.1 Group H-5 occupancies. Group H-5 occupancies shall comply with Sections 403.6.1.1 through 403.6.1.4

403.6.1.1 Plans and diagrams. In addition to the requirements of Section 404 and Section 407.6, plans and diagrams shall be maintained in *approved* locations indicating the approximate plan for each area, the amount and type of HPM stored, handled and used, locations of shutoff valves for HPM supply piping, emergency telephone locations and locations of exits.

403.6.1.2 Plan updating. The plans and diagrams required by Section 404, 403.6.1.1 and 407.6 shall be maintained up to date and the *fire code official* and fire department shall be informed of major changes.

403.6.1.3 Emergency response team. Responsible persons shall be designated as an on-site emergency response team and trained to be liaison personnel for the fire department. These persons shall aid the fire department in preplanning emergency responses, identifying locations where HPM is stored, handled and used, and be familiar with the chemical nature of such material. An adequate number of personnel for each work shift shall be designated.

403.6.1.4 Emergency drills. Emergency drills of the on-site emergency response team shall be conducted on a regular basis but not less than once every three months. Records of drills conducted shall be maintained.

403.7 Group I occupancies. An *approved* fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for Group I occupancies. Group I occupancies shall also comply with Sections 403.7.1 through 403.7.3

403.7.1 Group I-1 occupancies. Group I-1 occupancies shall comply with Sections 403.7.1.1 through 403.7.1.6

403.7.1.1 Fire safety and evacuation plan. The fire safety and evacuation plan required by Section 404 shall include special employee actions, including fire protection procedures necessary for residents, and shall be amended or revised upon admission of any resident with unusual needs.

403.7.1.2 Employee training. Employees shall be periodically instructed and kept informed of their duties and responsibilities under the plan. Such instruction shall be reviewed by employees at intervals not exceeding two months. A copy of the plan shall be readily available at all times within the facility.

403.7.1.3 Resident training. Residents capable of assisting in their own evacuation shall be trained in the proper actions to take in the event of a fire. The training shall include actions to take if the primary escape route is blocked. Where the resident is given rehabilitation or habilitation training, training in fire prevention and actions to take in the event of a fire shall be a part of the rehabilitation training program. Residents shall be trained to assist each other in case of fire to the extent their physical and mental abilities permit them to do so without additional personal risk.

403.7.1.4 Drill frequency. Emergency evacuation drills shall be conducted at least six times per year, two times per year on each shift. Twelve drills shall be conducted in the first year of operation.

403.7.1.5 Drill times. Drill times are not required to comply with Section 405.4.

403.7.1.6 Resident participation in drills. Emergency evacuation drills shall involve the actual evacuation of residents to a selected assembly point.

403.7.2 Group I-2 occupancies. Group I-2 occupancies shall comply with Sections 403.7.2.1 through 403.7.2.3.

403.7.2.1 Drill times. Drill times are not required to comply with Section 405.4.

403.7.2.2 Evacuation not required. During emergency evacuation drills, the movement of patients to safe areas or to the exterior of the building is not required.

403.7.2.3 Coded alarm signal. When emergency evacuation drills are conducted after visiting hours or when patients or residents are expected to be asleep, a coded announcement is allowed instead of audible alarms.

403.7.3 Group I-3 occupancies. Group I-3 occupancies shall comply with Sections 403.7.3.1 through 403.7.3.4.

403.7.3.1 Employee training. Employees shall be instructed in the proper use of portable fire extinguishers and other manual fire suppression equipment. Training of new employees shall be provided promptly upon entrance on duty. Refresher training shall be provided at least annually.

403.7.3.2 Employee staffing. Group I-3 occupancies shall be provided with 24-hour staffing. An employee shall be within three floors or 300 feet (91 440 mm) horizontal distance of the access door of each resident housing area. In Conditions 3, 4 and 5, as defined in "Occupancy Classification – Institutional Group I-3" in Chapter 2, the arrangement shall be such that the employee involved can start release of locks necessary for emergency evacuation or rescue and initiate other necessary emergency actions within 2 minutes of an alarm.

Exception: An employee shall not be required to be within three floors or 300 feet (9144 mm) in areas in which all locks are unlocked remotely and automatically in accordance with Section 408.4 of the *International Building Code*.

403.7.3.3 Notification. Provisions shall be made for residents in Conditions 3, 4 and 5, as defined in "Occupancy Classification – Institutional Group I-3" in Chapter 2, to readily notify an employee of an emergency.

403.7.3.4 Keys. Keys necessary for unlocking doors installed in a *means of egress* shall be individually identifiable by both touch and sight.

403.8 Group M occupancies. An *approved* fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for buildings containing a Group M occupancy, where the Group M occupancy has an *occupant load* of 500 or more persons or more than 100 persons above or below the lowest *level of exit discharge*, and for buildings containing both a Group M occupancy and an atrium.

403.9 Group R occupancies.

403.9.1 Group R-1 occupancies. An *approved* fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for Group R-1 occupancies. Group R-1 occupancies shall also comply with Sections 403.9.1.1 through 403.9.1.3.

403.9.1.1 Evacuation diagrams. A diagram depicting two evacuation routes shall be posted on or immediately adjacent to every required egress door from each hotel or motel sleeping unit.

403.9.1.2 Emergency duties. Upon discovery of a fire or suspected fire, hotel and motel employees shall perform the following duties:

1. Activate the fire alarm system, where provided.
2. Notify the public fire department.
3. Take other action as previously instructed.

403.9.1.3 Fire safety and evacuation instructions. Information shall be provided in the fire safety and evacuation plan required by Section 404 to allow guests to decide whether to evacuate to the outside, evacuate to an *area of refuge*, remain in place, or any combination of the three.

403.9.2 Group R-2 occupancies. Group R-2 occupancies shall comply with Sections 403.9.2.1 through 403.9.2.3.

403.9.2.1. College and University Buildings. An *approved* fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for Group R-2 college and university buildings. Group R-2 college and university buildings shall also comply with Sections 403.9.2.1 and 403.9.2.2.

403.9.2.1.1 First emergency evacuation drill. The first emergency evacuation drill of each school year shall be conducted within 10 days of the beginning of classes.

403.9.2.1.2 Time of day. Emergency evacuation drills shall be conducted at different hours of the day or evening, during the changing of classes, when the school is at assembly, during the recess or gymnastic periods, or during other times to avoid distinction between drills and actual fires. One required drill shall be held during hours after sunset or before sunrise.

403.9.2.2 Emergency guide. Fire emergency guides shall be provided for Group R-2 occupancies. Guide contents, maintenance and distribution shall comply with Sections 403.9.2.2.1 through 403.9.2.2.3

403.9.2.2.1 Guide contents. Fire emergency guides shall describe the location, function and use of fire protection equipment and appliances accessible to residents, including fire alarm systems, smoke alarms, and portable fire extinguishers. Guides shall also include an emergency evacuation plan for each *dwelling unit*.

403.9.2.2.2 Emergency guide maintenance. Emergency guides shall be reviewed and *approved* by the *fire code official*.

403.9.2.2.3 Emergency guide distribution. A copy of the emergency guide shall be given to each tenant prior to initial occupancy.

403.9.2.3 Evacuation diagrams for dormitories. A diagram depicting two evacuation routes shall be posted on or immediately adjacent to every required egress door from each dormitory sleeping unit. Evacuation diagrams shall be reviewed and updated as needed to maintain accuracy.

403.9.3 Group R-4 occupancies. An *approved* fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for Group R-4 occupancies. Group R-4 occupancies shall also comply with Sections 403.9.3.1 through 403.9.3.6.

403.9.3.1 Fire safety and evacuation plan. The fire safety and evacuation plan required by Section 404 shall include special employee actions, including fire protection procedures necessary for residents, and shall be amended or revised upon admission of a resident with unusual needs.

403.9.3.2 Employee training. Employees shall be periodically instructed and kept informed of their duties and responsibilities under the plan. Such instruction shall be reviewed by employees at intervals not exceeding two months. A copy of the plan shall be readily available at all times within the facility.

403.9.3.3 Resident training. Residents capable of assisting in their own evacuation shall be trained in the proper actions to take in the event of a fire. The training shall include actions to take if the primary escape route is blocked. Where the resident is given rehabilitation or habilitation training, training in fire prevention and actions to take in the event of a fire shall be a part of the rehabilitation training program. Residents shall be trained to assist each other in case of fire to the extent their physical and mental abilities permit them to do so without additional personal risk.

403.9.3.4 Drill frequency. Emergency evacuation drills shall be conducted at least six times per year, two times per year on each shift. Twelve drills shall be conducted in the first year of operation.

403.9.3.5 Drill times. Drills times are not required to comply with Section 405.4.

403.9.3.6 Resident participation in drills. Emergency evacuation drills shall involve the actual evacuation of residents to a selected assembly point and shall provide residents with experience in exiting through all required exits. All required exits shall be used during emergency evacuation drills.

Exception: Actual exiting from windows shall not be required. Opening the window and signaling for help shall be an acceptable alternative.

403.10 Special uses.

403.10.1 Covered and open mall buildings. Covered and open mall buildings shall comply with the requirements of Sections 403.10.1.1 through 403.10.1.6.

403.10.1.1 Malls and mall buildings exceeding 50,000 square feet. An *approved* fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for covered malls exceeding 50,000 square feet (4645 m²) in aggregate floor area and for open mall buildings exceeding 50,000 square feet (4645 m²) in aggregate area within perimeter line.

403.10.1.2 Lease plan. In addition to the requirements of Section 404.2.2, a lease plan that includes the following information shall be prepared for each covered and open mall building:

1. Each occupancy, including identification of tenant.
2. *Exits* from each tenant space.
3. Fire protection features, including the following:

- 3.1. Fire department connections.
- 3.2. *Fire command center*.
- 3.3. Smoke management system controls.
- 3.4. Elevators, elevator machine rooms and controls.
- 3.5. Hose valve outlets.
- 3.6. Sprinkler and standpipe control valves.
- 3.7. Automatic fire-extinguishing system areas.
- 3.8. Automatic fire detector zones.
- 3.9. *Fire barriers*.

403.10.1.3 Lease plan approval. The lease plan shall be submitted to the *fire code official* for approval, and shall be maintained on site for immediate reference by responding fire service personnel.

403.10.1.4 Lease plan revisions. The lease plans shall be revised annually or as often as necessary to keep them current. Modifications or changes in tenants or occupancies shall not be made without prior approval of the *fire code official* and building official.

403.10.1.5 Tenant identification. Tenant identification shall be provided for secondary exits from occupied tenant spaces that lead to an *exit corridor* or directly to the exterior of the building. Tenant identification shall be posted on the exterior side of the exit or exit access door and shall identify the business name and/or address using plainly legible letters and numbers that contrast with their background.

Exception: Tenant identification is not required for anchor stores.

403.10.1.6 Unoccupied tenant spaces. The fire safety and evacuation plan shall provide for compliance with the requirements for unoccupied tenant spaces in Section 311.

403.10.2 High-rise buildings. An *approved* fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for high-rise buildings.

403.10.3 Underground buildings. An *approved* fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for underground buildings.

403.11 Special requirements for public safety.

403.11.1 Fire watch personnel. When, in the opinion of the *fire code official*, it is essential for public safety in a place of assembly or any other place where people congregate, because of the number of persons or the nature of the performance, exhibition, display, contest or activity, the *owner*, agent or lessee shall provide one or more fire watch personnel, as required and *approved*. Fire watch personnel shall comply with Sections 403.11.1.1 and 403.11.1.2.

403.11.1.1 Duty Times. Fire watch personnel shall remain on duty during the times places requiring a fire watch are open to the public, or when an activity requiring a fire watch is being conducted.

403.11.1.2 Duties. On-duty fire watch personnel shall have the following duties:

1. Keep diligent watch for fires, obstructions to *means of egress* and other hazards
2. Take prompt measures for remediation of hazards and extinguishment of fires that occur
3. Take prompt measures to assist in the evacuation of the public from the structures.

403.11.2 Public safety plan for gatherings. In other than Group A or E occupancies, where the *fire code official* determines that an indoor or outdoor gathering of persons has an adverse impact on public safety through diminished access to buildings, structures, fire hydrants and fire apparatus access roads or where such gatherings adversely affect public safety services of any kind, the *fire code official* shall have the authority to order the development of or prescribe a public safety plan that provides an approved level of public safety and addresses the following items:

1. Emergency vehicle ingress and egress
2. Fire protection
3. Emergency egress or escape routes
4. Emergency medical services
5. Public assembly areas
6. The directing of both attendees and vehicles, including the parking of vehicles
7. Vendor and food concession distribution
8. The need for the presence of law enforcement
9. The need for fire and emergency medical services personnel.

403.11.3 Crowd managers for gatherings exceeding 1,000 people. Where facilities or events involve a gathering of more than 1,000 people, crowd managers shall be provided in accordance with Section 403.11.3.1.

403.11.3.1 Number of crowd managers. The minimum number of crowd managers shall be established at a ratio of one crowd manager for every 250 persons.

Exception: Where *approved* by the *fire code official*, the number of crowd managers shall be permitted to be reduced where the facility is equipped throughout with an *approved automatic sprinkler system* or based upon the nature of the event.

Revise Section 404 as follows:

SECTION 404 FIRE SAFETY, EVACUATION AND LOCKDOWN PLANS

404.1 General. Where required by Section 403, fire safety, evacuation and lockdown plans shall comply with Sections 404.2 through 404.4.1.

(existing Section 404.2 is relocated and merged into Section 403 with the remaining sections renumbered)

Revise Section 405 as follows:

SECTION 405 EMERGENCY EVACUATION DRILLS

405.1 General. Emergency evacuation drills complying with Sections 405.2 through 405.9 shall be conducted at least annually where firesafety and evacuation plans are required by Section 403 or when required by the *fire code official*. Drills shall be designed in cooperation with the local authorities.

405.2 Frequency. Required emergency evacuation drills shall be held at the intervals specified in Table 405.2 or more frequently where necessary to familiarize all occupants with the drill procedure.

405.3 Leadership. Responsibility for the planning and conduct of drills shall be assigned to competent persons designated to exercise leadership.

405.4 Time. Drills shall be held at unexpected times and under varying conditions to simulate the unusual conditions that occur in case of fire.

405.5 Record keeping. Records shall be maintained of required emergency evacuation drills and include the following information:

1. Identity of the person conducting the drill.
2. Date and time of the drill.
3. Notification method used.
4. Employees on duty and participating.
5. Number of occupants evacuated.
6. Special conditions simulated.
7. Problems encountered.
8. Weather conditions when occupants were evacuated.
9. Time required to accomplish complete evacuation.

**TABLE 405.2
FIRE AND EVACUATION DRILL
FREQUENCY AND PARTICIPATION
FIRE AND EVACUATION DRILL
FREQUENCY AND PARTICIPATION**

GROUP OR OCCUPANCY	FREQUENCY	PARTICIPATION
Group A	Quarterly	Employees
Group B ^c	Annually	Employees
Group E	Monthly ^a	All occupants
Group F	Annually	Employees
Group I	Quarterly on each shift	Employees ^b
Group R-1	Quarterly on each shift	Employees
Group R-2 ^d	Four annually	All occupants
Group R-4	Quarterly on each shift	Employees ^b
High-rise buildings	Annually	Employees

- a. In severe climates, the *fire code official* shall have the authority to modify the emergency evacuation drill frequency.
- b. Fire and evacuation drills in residential care assisted living facilities shall include complete evacuation of the premises in accordance with Section 403.9.3.6. Where occupants receive habilitation or rehabilitation training, fire prevention and fire safety practices shall be included as part of the training program.
- c. Group B buildings having an occupant load of 500 or more persons or more than 100 persons above or below the lowest level of exit discharge.
- d. Applicable to Group R-2 college and university buildings in accordance with Section 403.9.2.1.

405.6 Notification. Where required by the *fire code official*, prior notification of emergency evacuation drills shall be given to the *fire code official*.

405.7 Initiation. Where a fire alarm system is provided, emergency evacuation drills shall be initiated by activating the fire alarm system.

405.8 Accountability. As building occupants arrive at the assembly point, efforts shall be made to determine if all occupants have been successfully evacuated or have been accounted for.

405.9 Recall and reentry. An electrically or mechanically operated signal used to recall occupants after an evacuation shall be separate and distinct from the signal used to initiate the evacuation. The recall signal initiation means shall be manually operated and under the control of the person in charge of the premises or the official in charge of the incident. No one shall reenter the premises until authorized to do so by the official in charge.

Revise Section 406 as follows

406.1 General. Where fire safety and evacuation plans are required by Section 403, employees shall be trained in fire emergency procedures . based on plans prepared in accordance with Section 404.

406.2 Frequency. Employees shall receive training in the contents of fire safety and evacuation plans and their duties as part of new employee orientation and at least annually thereafter. Records shall be kept and made available to the *fire code official* upon request.

406.3 Employee training program. Employees shall be trained in fire prevention, evacuation and fire safety in accordance with Sections 406.3.1 through 406.3.4.

406.3.1 Fire prevention training. Employees shall be apprised of the fire hazards of the materials and processes to which they are exposed. Each employee shall be instructed in the proper procedures for preventing fires in the conduct of their assigned duties.

406.3.2 Evacuation training. Employees shall be familiarized with the fire alarm and evacuation signals, their assigned duties in the event of an alarm or emergency, evacuation routes, areas of refuge, exterior assembly areas and procedures for evacuation.

(moved to Section 406.4)

406.3.3 Fire safety training. Employees assigned firefighting duties shall be trained to know the locations and proper use of portable fire extinguishers or other manual fire-fighting equipment and the protective clothing or equipment required for its safe and proper use.

406.4 Emergency lockdown training. Where a facility has a lockdown plan, employees shall be trained on their assigned duties and procedures in the event of an emergency lockdown.

Delete Section 408 (existing Section 408 has been relocated to Section 403):

Revise Section 311.1 as follows:

311.1 General. Temporarily unoccupied buildings, structures, premises or portions thereof, including tenant spaces, shall be safeguarded and maintained in accordance with Sections 311.1.1 through 311.5.6.

Add a Section 311.6 as follows:

311.6. Unoccupied tenant spaces in mall buildings. Unoccupied tenant spaces in covered and open mall buildings shall be:

1. Kept free from the storage of any materials.
2. Separated from the remainder of the building by partitions of at least 0.5-inch-thick (12.7 mm) gypsum board or an *approved* equivalent to the underside of the ceiling of the adjoining tenant spaces.
3. Without doors or other access openings other than one door that shall be kept key locked in the closed position except during that time when opened for inspection.
4. Kept free from combustible waste and be broom swept clean.

Cost Impact: This code change will not increase the cost of construction

404.2, 404.3.1, 404.3.2, Table 405.2, 408.3 (New), 408.3.1 (New), 408.3.2 (New), 408.3.3 (New), 408.3.4 (New)

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care
(john.williams@doh.wa.gov)

Revise as follows:

404.2 Where required. An *approved* fire safety and evacuation plan shall be prepared and maintained for the following occupancies and buildings:

1. Group A, other than Group A occupancies used exclusively for purposes of religious worship that have an *occupant load* less than 2,000.
2. Group B.
 - 2.1. Buildings having an ambulatory care facility.
 - 2.2. Buildings having an *occupant load* of 500 or more *persons* or more than 100 *persons* above or below the lowest *level of exit discharge*.
- 3 through 15 (No change to current text)

404.3.1 Fire evacuation plans. Fire evacuation plans shall include the following:

1. Emergency egress or escape routes and whether evacuation of the building is to be complete, ~~or, where approved~~, by selected floors or areas only, or with a defend-in-place response.
- 2 through 9 (No change to current text)

404.3.2 Fire safety plans. Fire safety plans shall include the following:

1. The procedure for reporting a fire or other emergency.
2. The life safety strategy including the following:
 - 2.1 ~~and p~~ Procedures for notifying occupants, including areas with a private mode alarm system.
 - 2.2 Procedures for ~~relocating~~ occupants under a defend-in-place response.
 - 2.3 Procedures ~~or for~~ evacuating occupants, including occupants who need assistance in evacuation.
- 3 through 7 (No change to current text)

405.2 Frequency. Required emergency evacuation drills shall be held at the intervals specified in Table 405.2 or more frequently where necessary to familiarize all occupants with the drill procedure.

**TABLE 405.2
FIRE AND EVACUATION DRILL
FREQUENCY AND PARTICIPATION**

GROUP OR OCCUPANCY	FREQUENCY	PARTICIPATION
Group B ^{c,d}	Annually	Employees
Group R-2 ^{d,e}	Four annually	All occupants

(Portions of table not shown remain unchanged)

- a. The frequency shall be allowed to be modified in accordance with Section 408.3.2.
- b. Fire and evacuation drills in residential care assisted living facilities shall include complete evacuation of the premises in accordance with Section 408.10.5. Where occupants receive habilitation or rehabilitation training, fire prevention and fire safety practices shall be included as part of the training program.
- c. Emergency evacuation drills are required in Group B buildings having an occupant load of 500 or more persons or more than 100 persons above or below the lowest level of exit discharge.
- d. Emergency evacuation drills are required in ambulatory care facilities in accordance with Section 408.3.
- e. Applicable to Group R-2 college and university buildings in accordance with Section 408.3.

Add new text as follows:

408.3 Ambulatory Care Facilities. Ambulatory care facilities shall comply with the requirements of Sections 408.3.1 through 408.3.3 and Section 401 through 406.

408.3.1 Fire evacuation plan. The fire safety and evacuation plan required by Section 404 shall include a description of special staff actions. This shall include procedures for stabilizing patients in a defend in place response, staged evacuation, or full evacuation in conjunction with the entire building if part of a multi-tenant facility.

408.3.2 Fire safety plan. A copy of the plan shall be maintained at the facility at all times. Plan shall include the all of following in addition to the requirements of Section 404:

1. Locations where patients are located who are rendered incapable of self preservation.
2. Maximum number of patients rendered incapable of self preservation.
3. Area and extent of each Ambulatory Care Facility.
4. Location of adjacent smoke compartments or refuge areas, where required.
5. Path of travel to adjacent smoke compartments.
6. Location of any special locking, delayed egress or access control arrangements.

408.3.3 Staff training. Employees shall be periodically instructed and kept informed of their duties and responsibilities under the plan. Such instruction shall be reviewed by the staff at least every two months. A copy of the plan shall be readily available at all times within the facility.

408.3.4 Emergency Evacuation Drills. Emergency evacuation drills shall comply with Section 405. Emergency evacuation drills shall be conducted at least four times per year.

Exceptions: The movement of patients to safe areas or to the exterior of the building is not required.

(Renumber subsequent sections)

Reason: This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April, 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: <http://www.iccsafe.org/cs/AHC/Pages/default.aspx>

This code change proposal clarifies the code by accurately describing the documentation needed to understand the typical "defend in place" method of occupant protection. Defend-in-place is a widely used approach to protecting occupants who are bedridden, unconscious or otherwise unable to self-preserve in a fire event. The method relies on both active and passive fire protection systems as well as the actions of trained staff and responders. The heavy emphasis on staff action requires a comprehensive fire safety and evacuation plan.

Any building containing an ambulatory healthcare occupancy will, by definition, contain occupants who may be incapable of self-preservation. The intent of the current IBC requirements for ambulatory care is to create a type of defend-in-place environment. Fire safety and evacuation plans must be developed, reviewed and approved to support this strategy.

The reference to "defend-in-place" is added in Section 404.3.1 to recognize the defend-in-place method. This is not a new concept. The IBC and legacy codes have been written to support this concept for years, yet the code did not name or describe the concept until this cycle. Group A code change G68-12 was approved in 2012 to define the concept, with the understanding that this change would follow.

Fire safety plans should describe in the life safety strategy the method of notifying occupants, including the use of a private mode alarm system as allowed by code. Procedures for dealing with occupants in a defend-in-place strategy should also be described so that it is clear what the staff will be trained on and what the first responders should expect to encounter.

The new Section 408.3 adds requirements for how to create fire safety and evacuation plans for Ambulatory Care Facilities. This section does not include great detail, as there are many successful ways to approach a defend in place response. Rather, this section describes the minimum amount of information necessary aid in the review of facility and the plan. Fire evacuations plan are required to describe the special actions of staff, especially staff that must stabilize a patient prior to moving. This will be the basis of the staff education and training. This will also help the code official understand the expected performance of the building.

It is imperative that the building and fire official know the size and location of the facility as well as the number of patients who are incapable of self-preservation. This information will help the building official determine the proper classification and mitigations

required. It will also allow the fire official to preplan the response for a particular building. Any special characteristics of the means of egress, such as path to the adjacent smoke compartment and special locking arrangements should also be described to aid in verifying code compliance. Practically these documents will be the basis for staff training as well.

Fire safety plans are required to show the location of area where incapable patients are likely to be. They are required to show the location of smoke compartments, routes of travel, patient movement elevators and any locking constraints that might affect the horizontal evacuation of patients. All of these will be essential to robust staff training as well as operational planning for first responders.

Finally, the requirements for emergency evacuation drill have been merged into a single subsection for clarity. The only functional change is to delete the exception which would have allowed drills to not comply with the time requirements of Section 405.4. The committee felt that holding drill at unexpected time and varying conditions was a crucial component of staff training.

These requirements, while new to the fire code, have been a widely accepted practice in the facilities for years. This code change proposal has been reviewed by representatives from both the hospital and nursing home industry who have given their support to these changes.

Cost Impact: This proposal will not increase the cost of construction.

F26-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

404.2-F-WILLIAMS-ADHOC

F27 – 13

404.3.1, 404.3.2, 408.6, 408.6.1, 408.6.2, 408.6.3 (New)

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care (john.williams@doh.wa.gov) and Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee (cbaldassarra@RJAGroup.com)

Revise as follows:

404.3 Contents. Fire safety and evacuation plan contents shall be in accordance with Sections 404.3.1 and 404.3.2.

404.3.1 Fire evacuation plans. Fire evacuation plans shall include the following:

1. Emergency egress or escape routes and whether evacuation of the building is to be complete, ~~or, where approved, by selected floors or areas only, or with a defend-in-place response.~~
- 2 through 9 (No change to current text)

404.3.2 Fire safety plans. Fire safety plans shall include the following:

1. The procedure for reporting a fire or other emergency.
2. The life safety strategy including the following:
 - 2.1. and Procedures for notifying occupants, including areas with a private mode alarm system.
 - 2.2 Procedures for relocating occupants under a defend-in-place response.
 - 2.3 Procedures for evacuating occupants, including occupants who need assistance in evacuation.
- 3 through 7 (No change to current text)

408.6 Group I-2. Group I-2 occupancies shall comply with the requirements of Sections 408.6.1 through 408.6.3 and Section 401 through 406. ~~Drills are not required to comply with the time requirements of Section 405.4.~~

~~**408.6.1 Evacuation not required.** During emergency evacuation drills, the movement of patients to safe areas or to the exterior of the building is not required.~~

~~**408.6.2 Coded alarm signal.** When emergency evacuation drills are conducted after visiting hours or when patients or residents are expected to be asleep, a coded announcement is allowed instead of audible alarms.~~

Add new text as follows:

408.6.1 Fire evacuation plans. The fire safety and evacuation plans required by Section 404 shall include a description of special staff *actions*. Plan shall include all of the following in addition to the requirements of Section 404.

1. Procedures for evacuation for patients with needs for containment or restraint and post evacuation containment, where present.
2. A written plan for maintenance of the means of egress.
3. Procedure for a defend-in-place strategy.
4. Procedures for a full floor or building evacuation, where necessary.

408.6.2 Fire safety plans. A copy of the plan shall be maintained at the facility at all times. Plans shall include all of the following in addition to the requirements of Section 404:

1. Location and number of any patient sleeping rooms and operating rooms.

2. Location of adjacent smoke compartments or refuge areas.
3. Path of travel to adjacent smoke compartments.
4. Location of any special locking, delayed egress or access control arrangements.
5. Location of elevators utilized for patient movement in accordance with the fire safety plan, where provided.

408.6.3 Emergency Evacuation Drills. Emergency evacuation drills shall comply with Section 405.

Exceptions:

1. The movement of patients to safe areas or to the exterior of the building is not required.
2. Where emergency evacuation drills are conducted after visiting hours or where patients or residents are expected to be asleep, a coded announcement shall be an acceptable alternative to audible alarms.

Reason: This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April, 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: <http://www.iccsafe.org/cs/AHC/Pages/default.aspx>

This proposal is being co-sponsored by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/cc/ctc/index.html>. Since its inception in April, 2005, the CTC has held 25 meetings – all open to the public. In 2012, three of the 25 face-to-face meetings were held. In addition to the CTC meetings, the CTC established Study Groups (SG) of interested parties for each of the areas of study. These SG's are responsible for reviewing the available information and making recommendations to the CTC. All totaled, the SG's held over 70 conference calls in 2012.

This code change proposal clarifies the code by accurately describing the documentation needed to understand the typical "defend in place" method of occupant protection. Defend-in-place is a widely used approach to protecting occupants who are bedridden, unconscious or otherwise unable to self-preserve in a fire event. The method relies on both active and passive fire protection systems as well as the actions of trained staff and responders. The heavy emphasis on staff action requires a comprehensive fire safety and evacuation plan.

The reference to "defend-in-place" is added in Section 404.3.1 to recognize the defend-in-place method. This is not a new concept. The IBC and legacy codes have been written to support this concept for years, yet the code did not name or describe the concept until this cycle. Group A code change G68-12 was approved in 2012 to define the concept, with the understanding that this change would follow.

Fire safety plans should describe in the life safety strategy the method of notifying occupants, including the use of a private mode alarm system as allowed by code. Procedures for dealing with occupants in a defend-in-place strategy should also be described so that it is clear what the staff will be trained on and what the first responders should expect to encounter.

It is imperative that the building and fire code officials know the size and location of the facility as well as the number of patients who are incapable of self-preservation. This information will help the building official determine the proper classification and mitigations required. It will also allow the fire official to preplan the response for a particular building. Any special characteristics of the means of egress, such as path to the adjacent smoke compartment and special locking arrangements should also be described to aid in verifying code compliance. Practically these documents will be the basis for staff training as well.

Section 408.6 has been rewritten to accurately reflect the needs and the current practice for Group I-2 occupancies. This section requires the facility to describe the special actions of staff. Due to the special nature of some facilities, specific requirements are made locations where patients are restrained. Since these facilities contain a large number of carts, beds, and other mobile equipment a written plan for maintenance of the means of egress is required. This would address the practical operational needs of the facility while ensuring that the means of egress can be maintained free of obstructions. While these facilities are defend in place, catastrophic failure may require full evacuation. Facilities are asked to describe this procedure so that the first responders can preplan.

Fire safety plans are required to show the location of area where incapable patients are likely to be. They are required to show the location of smoke compartments, routes of travel, patient movement elevators and any locking constraints that might affect the horizontal evacuation of patients. All of these will be essential to robust staff training as well as operational planning for first responders.

Finally, the requirements for emergency evacuation drill have been merged into a single subsection for clarity. The only functional change is to delete the exception which would have allowed drills to not comply with the time requirements of Section 405.4. The committee felt that holding drill at unexpected time and varying conditions was a crucial component of staff training.

These requirements, while new to the fire code, have been a widely accepted practice in the facilities for years. This code

change proposal has been reviewed by representatives from both the hospital and nursing home industry who have given their support to these changes.

Cost Impact: This proposal will not increase the cost of construction.

404.3.1-F-BALDASSARRA-WILLIAMS-ADHOC-CTC

F28 – 13

404.3.1

Proponent: Brian Black, BDBlack Codes, Inc., representing National Elevator Industry Inc.
(bdbblack@neii.org)

Revise as follows:

404.3.1 Fire evacuation plans. Fire evacuation plans shall include the following:

1. Emergency egress or escape routes and whether evacuation of the building is to be complete or, where *approved*, by selected floors or areas only.
2. Procedures for employees who must remain to operate critical equipment before evacuating.
3. Procedures for the use of elevators to evacuate the building where occupant evacuation elevators complying with Section 3008 of the *International Building Code* are provided.
- ~~34.~~ Procedures for assisted rescue for persons unable to use the general means of egress unassisted.
- ~~45.~~ Procedures for accounting for employees and occupants after evacuation has been completed.
- ~~56.~~ Identification and assignment of personnel responsible for rescue or emergency medical aid.
- ~~67.~~ The preferred and any alternative means of notifying occupants of a fire or emergency.
- ~~78.~~ The preferred and any alternative means of reporting fires and other emergencies to the fire department or designated emergency response organization.
- ~~89.~~ Identification and assignment of personnel who can be contacted for further information or explanation of duties under the plan.
910. A description of the emergency voice/alarm communication system alert tone and preprogrammed voice messages, where provided.

Reason: Where Occupant Evacuation Elevators are included in a building design, their use must be specifically spelled out in the building's fire evacuation plan.

Cost Impact: This code change proposal will not increase construction costs.

F28-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

404.3.1-F-BLACK

F29 – 13

404.3.2, 202

Proponent: Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (Gregory.wilson2@fema.dhs.gov); Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net).

Revise as follows:

404.3.2 Fire safety plans. Fire safety plans shall include the following:

1. The procedure for reporting a fire or other emergency.
2. The life safety strategy and procedures for notifying, relocating or evacuating occupants, including occupants who need assistance.
3. Site plans indicating the following:
 - 3.1. The occupancy assembly point.
 - 3.2. The locations of fire hydrants.
 - 3.3. The normal routes of fire department vehicle access.
 - 3.4. Whether the site or any portion thereof, or the normal routes of fire department vehicle access, is located in a flood hazard area.
4. through 7. *(No change to current text.)*

Add new text as follows:

SECTION 202 GENERAL DEFINITIONS

[B] FLOOD HAZARD AREA. The greater of the following two areas:

1. The area within a floodplain subject to a 1-percent or greater chance of flooding in any year.
2. The area designated as a flood hazard area on a community's flood hazard map, or otherwise legally designated.

Reason: Structure fire associated with flooding is fairly common. Most recently, many homes were damaged by fires after Hurricane Sandy. Significant structure fires occurred during flooding in Cedar Rapids, Iowa (2008) and Grand Forks, ND (1997). Although dwellings aren't required by the IFC to have Fire Safety and Evacuation Plans, the occupancies and buildings listed in Section 404.2 are vulnerable to fire following flood.

This proposal would require identification of flood hazard areas as part of Fire Safety and Evacuation Plans. Construction documents and site plans submitted with building permit applications already are required to show information about flood hazard areas, floodways, and design flood elevations (see Section 107.2.5).

The source of flood hazard information is the community's flood hazard map. Flood hazard area information is readily accessible. The Federal Emergency Management Agency has prepared maps for more than 21,000 local jurisdictions (counties, parishes, boroughs, cities, towns, villages, etc.). Jurisdictions that participate in the National Flood Insurance Program are required to make those maps accessible to the public, which means anyone responsible for preparing a fire safety and evacuation plan has access to the public information. In addition, FEMA's flood maps are available online <https://msc.fema.gov> (click on <Product Catalog>). For instruction on how make a PDF of a portion of a FEMA map, click on <FIRMette.>

Cost Impact: None.

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee
(cbaldassarra@RJAGroup.com)

Revise as follows:

404.3.2 Fire safety plans. Fire safety plans shall include the following:

1. The procedure for reporting a fire or other emergency.
2. The life safety strategy and procedures for notifying, relocating or evacuating occupants, including occupants who need assistance.
3. Site plans indicating the following:
 - 3.1. The occupancy assembly point.
 - 3.2. The locations of fire hydrants.
 - 3.3. The normal routes of fire department vehicle access.
4. Floor plans identifying the locations of the following:
 - 4.1. Exits.
 - 4.2. Primary evacuation routes.
 - 4.3. Secondary evacuation routes.
 - 4.4. Accessible egress routes.
 - 4.5. Areas of refuge.
 - 4.6. Refuge areas
 - 4.7 4.6. Exterior areas for assisted rescue.
 - 4.8 4.7. Manual fire alarm boxes.
 - 4.9 4.8. Portable fire extinguishers.
 - 4.10 4.9. Occupant-use hose stations.
 - 4.11 4.10. Fire alarm annunciators and controls.
5. A list of major fire hazards associated with the normal use and occupancy of the premises, including maintenance and housekeeping procedures.
6. Identification and assignment of personnel responsible for maintenance of systems and equipment installed to prevent or control fires.
7. Identification and assignment of personnel responsible for maintenance, housekeeping and controlling fuel hazard sources.

**TABLE 405.2
FIRE AND EVACUATION DRILL
FREQUENCY AND PARTICIPATION**

GROUP OR OCCUPANCY	FREQUENCY	PARTICIPATION
Group A	Quarterly	Employees
Group B ^c	Annually	Employees
Group E	Monthly ^a	All occupants
Group F	Annually	Employees
Group I	Quarterly on each shift ^a	Employees ^b
Group R-1	Quarterly on each shift	Employees
Group R-2 ^d	Four annually	All occupants
Group R-4	Quarterly on each shift ^a	Employees ^b
High-rise buildings	Annually	Employees

a. The frequency shall be allowed to be modified in accordance with Sections 408.3.2, 408.5.6 and 408.10.6.

b. Fire and evacuation drills in residential care assisted living facilities shall include complete evacuation of the premises in accordance with Section 408.10.5. Where occupants receive habilitation or rehabilitation training, fire prevention and fire safety practices shall be included as part of the training program.

c. Group B buildings having an occupant load of 500 or more persons or more than 100 persons above or below the lowest level of exit

- discharge.
- d. Applicable to Group R-2 college and university buildings in accordance with Section 408.3.

408.5.1.1 Fire evacuation plan. The fire evacuation plan required by Section 404 shall include a description of special staff actions. Plans shall include the following in addition to the requirements of Section 404.

1. In Group I-1 Condition 2 occupancies, procedures for evacuation through a refuge area in an adjacent smoke compartment and then to an exterior assembly point.

408.5.1.2 Fire safety plans. A copy of the plan shall be maintained at the facility at all times. Plans shall include the following in addition to the requirements of Section 404:

1. Location and number of any residents sleeping rooms.
2. Location of any special locking or egress control arrangements.

408.5.3 Resident training. Residents capable of assisting in their own evacuation shall be trained in the proper actions to take in the event of a fire. In Group I-1 Condition 2 occupancies training shall include evacuation through an adjacent smoke compartment and then to an exterior assembly point. The training shall include actions to take if the primary escape route is blocked. Where the resident is given rehabilitation or habilitation training, training in fire prevention and actions to take in the event of a fire shall be a part of the rehabilitation training program. Residents shall be trained to assist each other in case of fire to the extent their physical and mental abilities permit them to do so without additional personal risk.

408.5.5 Resident participation. Emergency evacuation drills shall involve the actual evacuation of residents to a selected assembly point and shall provide residents with experience in exiting through all required exits. All required exits shall be used during emergency evacuation drills.

408.5.6 Emergency evacuation drill deferral. In severe climates, the *fire code official* shall have the authority to modify the emergency evacuation drill frequency specified in Section 405.2.

408.10.1.1 Fire safety plans. A copy of the plan shall be maintained at the facility at all times. Plans shall include the following in addition to the requirements of Section 404:

1. Location and number of any residents sleeping rooms.
2. Location of any special locking or egress control arrangements.

408.10.5 Resident participation. Emergency evacuation drills shall involve the actual evacuation of residents to a selected assembly point and shall provide residents with experience in exiting through all required exits. All required exits shall be used during emergency evacuation drills.

Exception: Actual exiting from emergency escape and rescue windows shall not be required. Opening the emergency escape and rescue window and signaling for help shall be an acceptable alternative.

408.10.6 Emergency evacuation drill deferral. In severe climates, the *fire code official* shall have the authority to modify the emergency evacuation drill frequency specified in Section 405.2.

Reason: The intent of this proposal is to clarify the requirements for Group I-1 and R-4 assembly points. It also clarifies the implementation of smoke compartments in the new Group I-1 Condition 2 as was approved for the 2015 IBC in the G 31-12. Finally it proposes severe climate flexibility for fire drill frequency.

The proposed change clarifies that Group I-1 Condition 2 "smoke compartment" refuge areas, as required in the G 31-12 Section 420, can be used as a temporary "refuge area" during evacuation prior to complete building evacuation..

The proposed code change allows for severe climate deferrals, similar to current Group E deferrals that are already allowed. This takes into consideration the possible danger to seniors inhabiting these occupancies, when they are required to go outside during fire drills when possible inclement weather is occurring. The proposal allows the fire code official to modify drill frequency. The provision is left as a general provision purposely due to the variations of severe climate throughout the country, whether it be hot or cold, winter or summer or from storms. It leaves up to local discretion, the opportunity to allow modifications.

(This is reflected in the additional section references in Note a to Table 405.2.) The modifications in actual practice may also include still conducting the drill, while not requiring residents to actually go outside during the drill at certain times of the year. The residents would still be trained to go outside to the outdoor assembly point during a real emergency situation.

The assembly point aspects of the proposed change are more clerical. The revisions are proposed essentially from the current wording in Group E clarifying that an assembly point is outdoors coinciding with the building evacuation concepts of both Group I-1 and R-4 irrelevant of the "Condition."

These changes are stand alone but have been coordinated with the Ad Hoc committee proposed IFC changes for Group I-2 so as not to conflict with those proposed changes. These changes have also been coordinated with the separate CTC proposed IFC changes for the Table 405.2 for fire and safety evacuation drills for both Groups I-1 and R-4.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>. Since its inception in April/2005, the CTC has held twenty five meetings - all open to the public.

Cost Impact: None

Table 405.2

Proponent: Dave Frable representing U.S. General Services Administration, Public Buildings Service

Revise as follows:

**TABLE 405.2
FIRE AND EVACUATION DRILL
FREQUENCY AND PARTICIPATION**

GROUP OR OCCUPANCY	FREQUENCY	PARTICIPATION
Group A	Quarterly	Employees
Group B ^e	Annually	Employees
Group B ^c (transient ^e)	Annually	Employees
Group B ^c (nontransient ^f)	Annually	All occupants
Group E	Monthly ^a	All occupants
Group F	Annually	Employees
Group I	Quarterly on each shift	Employees ^b
Group R-1	Quarterly on each shift	Employees
Group R-2 ^d	Four annually	All occupants
Group R-4	Quarterly on each shift	Employees ^b
High-rise buildings	Annually	Employees

a. through d. (No changes to current text)

e. Applicable to Group B occupancies primarily used by occupants for short term use for less than 30 days.

f. Applicable to Group B occupancies primarily used by occupants for long term use for more than 30 days.

Reason: The intent of this code change is to provide occupants who are working in a Group B occupancy for more than 30 days to have an opportunity to participate in an annual fire and evacuation drill. Currently, only the employees (i.e., building staff) in a Group B occupancy have an opportunity to participate in an annual fire and evacuation drill. Having building occupants participate in an annual drill will provide educational instruction and practice for the building occupants evacuating/relocating as well as serve as a verification tool that the fire safety and evacuation plan, as developed, is functional. An additional benefit is that practice makes perfect when it comes to effective occupant egress during an evacuation and enables occupants to be familiar with egress routes and the fire safety and evacuation plan's details.

It should also be emphasized it is not the intent of this code change to require occupants in all Group B occupancies to participate in fire and evacuation drills. In certain Group B occupancies where occupants are staying or working for less than 30 days, occupants will not be required to participate in an emergency egress and relocation drill. For example, it would not be practical or reasonable for patients in an ambulatory health care facility (considered a Group B occupancy) to participate in a periodic evacuation drill. For these types of circumstances, building employees will still provide the necessary procedures in case of fire to occupants prior to an emergency and facilitate and direct occupants during the emergency regardless of whether the occupants participate in the annual fire and emergency drill.

Cost Impact: The code change proposal will not increase the cost of construction.

Table 405.2, 408.5.4, 408.10.4

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee
(cbaldassarra@RJAGroup.com)

Revise as follows:

SECTION 405 EMERGENCY EVACUATION DRILLS

405.2 Frequency. Required emergency evacuation drills shall be held at the intervals specified in Table 405.2 or more frequently where necessary to familiarize all occupants with the drill procedure.

**TABLE 405.2
FIRE AND EVACUATION DRILL
FREQUENCY AND PARTICIPATION**

GROUP OR OCCUPANCY	FREQUENCY	PARTICIPATION
Group A	Quarterly	Employees
Group B ^{e b}	Annually	Employees
Group E	Monthly ^a	All occupants
Group F	Annually	Employees
Group I	Quarterly on each shift	Employees^b
Group I -1	Twice on each shift per year	All occupants
Group I -2	Quarterly on each shift	Employees
Group I -3	Quarterly on each shift	Employees
Group I -4	Monthly	All occupants
Group R-1	Quarterly on each shift	Employees
Group R-2 ^{d c}	Four annually	All occupants
Group R-4	Quarterly on each shift <u>Twice on each shift per year</u>	Employees^b <u>All occupants</u>
High-rise buildings	Annually	Employees

a. The frequency shall be allowed to be modified in accordance with Section 408.3.2.

b. Fire and evacuation drills in residential care assisted living facilities shall include complete evacuation of the premises in accordance with Section 408.10.5. Where occupants receive habilitation or rehabilitation training, fire prevention and fire safety practices shall be included as part of the training program.

b.c. Group B buildings having an occupant load of 500 or more persons or more than 100 persons above or below the lowest level of exit discharge.

c.d. Applicable to Emergency evacuation drills in Group R-2 college and university buildings shall be in accordance with Section 408.3. Other Group R-2 occupancies shall be in accordance with Section 408.9.

408.5.4 Drill frequency. ~~Emergency evacuation drills shall be conducted at least six times per year, two times per year on each shift.~~ In addition to the evacuation drills in required in Section 405.2, employees shall participate in an additional two times a year on each shift. Twelve drills with all occupants shall be conducted in the first year of operation. Drills are not required to comply with the time requirements of Section 405.4.

408.10.4 Drill frequency. ~~Emergency evacuation drills shall be conducted at least six times per year, two times per year on each shift.~~ In addition to the evacuation drills in required in Section 405.2, employees shall participate in an additional two times a year on each shift. Twelve drills with all occupants shall be conducted in the first year of operation. Drills are not required to comply with the time requirements of Section 405.4.

Reason: The intent is to clarify the requirements for Group I-1, I-4 and R-4 fire and safety evacuation drill requirements. Table 405.2 is expanded to indicate clearly when employees and residents/children are required to participate in the drills. Group I-1 and R-4 require resident's participation for 6 drills a year (common practice). The Group I-4 should have drills consistent with Group E facilities.

Current footnote b does not make logical sense to reference Group R-4 drill participation for residents for Group I facilities. The requirement has been specifically addressed in the appropriate use group section.

Revisions to current footnote d is a clarification for dorms vs. apartments.

Group I-1, must use the provisions in Section 404 in addition to the concerns specific to Group I-1. In Section 408.5.4, staff is required to have additional practice drills. This will equal what was in the table for staff to do quarterly drills on each shift. Section 408.5.5 resident participation is coordinated with Group R-4 language in Section 408.10.5.

In Section 408.10.4, staff is required to have additional practice drills. This will equal what was in the table for staff to do quarterly drills on each shift.

The Adhoc Health Care committee has proposals to fire and safety evacuation plans and drills for Group I-2 and Ambulatory Care Facilities. This proposal can be accepted independently, but would also work in conjunctions with these proposals.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". F35 – 13

408.12 (New)

Proponent: Dwight G. Jones, B.A., Elevaed Medical Inc., representing self (dwight.jones@elevaed.com)

Add new text as follows:

408.12 Public access automated external defibrillators. In high-rise buildings, the main elevator lobby shall be provided with an automated external defibrillator (AED) in an approved and visible location that is accessible to the public.

Reason: Sudden cardiac arrest (SCA), a leading cause of death, takes longer to attend by EMS in high-rise buildings (call volume, urban traffic, security). Please review <http://elevaed.com>

The 'Chain of Survival' is broken, because EMS cannot reliably defibrillate patients within 3-5 minutes, after which progressive organ damage or death occurs. Survival rates are typically single digit, and in this rapidly growing demographic, failed EMS efforts to date have become an intractable and very costly public health problem.

High-rises do, however, offer compact advantages for sharing the cost of an AED, for education in its use, and their elevators enable prompt access by bystanders or volunteers. The most critical factor is having an AED in the building beforehand - one that is publicly visible and accessible 24/7, to bridge the time until the arrival of EMS – which is the sole purpose of an AED. EMS can then arrive within a practical timeframe to consolidate successful defibrillations.

Currently just 2.1% of SCA's have an AED applied by bystanders (Weisfeldt JACC 2010). As a safety agency, the building and fire coding authorities are the appropriate regulators for harmonizing AED deployment. Governments, as legislative agencies, have too many layers and independent AHJ's for uniform and structured adoption, and their statutes largely address 'public' buildings, when most high-rises are privately owned. Local EMS are rescue agencies that act on existing regulations.

This is a *heart safety* issue—a valid parameter for the evolving Green Building initiative—and the coding authorities have a straightforward opportunity to rationalize our (currently chaotic) AED distribution throughout the built environment. AEDs will shortly be connected to the Internet, leading to improved monitoring/assistance by in-building personnel, volunteers and NG9-1-1.

These locations must have a fixed IP address, be documented in databases, and become standardized and trusted. High-rise elevator lobbies will anchor the AED in the public's mind, greatly leveraging its cost, while expanding its use and effectiveness.

This topology also promises to protect adjacent buildings within a two minute radius.

SCA survival in high-rises can possibly improve by an order of difference when supported by cellular communications, volunteer teams, and a location standard. AEDs cannot perform from security guard lunch rooms and desk drawers as they are now expected to do, when they exist at all.

The property management industry will also benefit from unequivocal coding for AEDs. This proposal specifies basic AEDs for high-rise buildings as defined in the code, and their cost or retrofitting is a modest expense in the context of such buildings.

These singular devices will then protect residents and workers around the clock, regardless of their income or health insurance status. The public expects and deserves our attention to this issue, and the world anticipates our leadership in coding for health safety.

Disclosure Statement: Dwight G. Jones and Elevaed are volunteer public advocates only, and have no business relationships or funding from any providers of AEDs, emergency equipment or services.

The following is a letter of support from Dr. Gordon Tomaselli, President, American Heart Association.

August 5, 2011

Dwight G. Jones, CEO
Elevaed Technologies
4550 Birch Bay Lynden Road
Blaine WA 98230-9436

Dear Mr. Jones:

Since 1995 the American Heart Association has recommended the development of lay rescuer AED programs to improve survival rates from out of hospital cardiac arrest. And over the past several years, we have published additional focused scientific statements on lay rescuer AED programs and reducing barriers to bystander CPR – both critical elements in the chain of survival that can greatly improve a cardiac arrest victim's chances of survival.

As recommended in our *2010 AHA Guidelines for CPR & ECC*, and based on peer-reviewed, published research studies, AED programs should be established in public locations where there is a reasonable likelihood of a witnessed cardiac arrest (eg, airports, casinos and sports facilities). We certainly appreciate the innovative approach you've outlined in your proposal to improve out-of-hospital cardiac survival in high rise buildings; it would certainly be beneficial to see the proposal studied in a formal manner and in addition, to see those results published in a peer-reviewed medical journal.

We would be pleased to have you submit a research application to either our Affiliate or National Center Research Program for review. You can learn more about research funding opportunities here: http://my.americanheart.org/professional/Research/Research_UCM_316889_SubHomePage.jsp

I wish you and your company well as you seek to improve sudden cardiac arrest survival.

Sincerely,

Gordon F. Tomaselli, MD, FAHA
President
American Heart Association/American Stroke Association

Cost Impact: The code change proposal will increase the cost of construction.

408.12 (NEW)-F-JONES

F36 – 13

501.5 (New)

Proponent: Michael Jacoby, Seven Valleys, PA, representing self

Add new text as follows:

501.5 Geographic location data. A facility or site's geographic location information or data, being a site's set of latitude and longitude coordinate values, are to be centered on a facility's or structure's main front entrance. Such information shall be provided by a Registered Professional Land Surveyor (PLS), licensed by the appropriate governing authority, using the Datum-World Geodetic System (WGS84). The site's coordinate data shall be recorded in decimal degrees in a numeric format with a tolerance of ± 1 m, including the associated hemispheric value where applicable. The information shall include the name of the certifying PLS in the title block area of the facility's construction documents required by Section 105.4.

Reason: By having accurate GPS coordinate data recorded on construction documents for fire service planning / environmental preparedness to protect communities, families or loved ones especially those with special needs, at time of a review as per section should be very easy for officials to understand especially if you've ever been directed to go to a wrong location in times of crisis or need because of having ambiguous locational information in data systems.

In other words when using a set of coordinates for a site/facility by a licensed professional surveyor that are centered on the entrance of a facility at the time of construction, now that everybody is using GPS locational data for their devices, it should start to eliminate the continuing locational data problems being discovered today in mapping databases (GIS shaped layers) that you might have already encountered locally... when using an address/house number method to determine a location or when Out-Of-Area-Assistance is required in times of crisis or need, especially when every second counts..

Again simply put... State Highway Numbers, Road Names and Postal Delivery Addresses may change throughout the years but a site's set of latitude and longitude coordinates will always stay constant.

Cost Impact: The cost of providing the certified lat/long information/data (GPS coordinates) recorded on construction documentation will be absorbed by the developer/builder or others submitting the construction documents for review.

501.5 (NEW)-F-JACOBY

F37 – 13

503.1.1

Proponent: Erin Crowley, Code Consultants, Inc, representing self.

Revise as follows:

503.1.1 Buildings and Facilities. Approved fire apparatus access roads shall be provided for every facility, building or portion of a building hereafter constructed or moved into or within the jurisdiction. The fire apparatus access road shall comply with the requirements of this section and shall extend to within 150 feet (45 720 mm) of all portions of the facility and all portions of the exterior walls of the first story of the building as measured by an approved route around the exterior of the building or facility.

~~Exception~~ Exceptions: The fire code official is authorized to increase the dimension of 150 feet (45 720 mm) where any of the following conditions occur:

1. The building is equipped throughout with an approved automatic sprinkler system installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3.
2. Fire apparatus access roads cannot be installed because of location on property, topography, waterways, nonnegotiable grades or other similar conditions, and an approved alternative means of fire protection is provided.
3. There are not more than two Group R-3 or Group U occupancies.

Reason: Revising the Exception fixes and clarifies the language to match the original intent of the section based on the UFC. The intent of the original UFC requirement was that each of the three items above would be applied as an independent exception. As written currently, it could be interpreted to mean that one would have to meet all three items in order to benefit from the increase, which was not the original intent of the requirement.

Cost Impact: The code change proposal will not increase the cost of construction.

F37-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

503.1.1-F-CROWLEY

F38 – 13

503.1.1

Proponent: Adria Smith, Fountain Valley Fire Department, representing the California Fire Chiefs Association (adria.smith@fountainvalley.org); Kevin Reinertson, Division Chief, representing the California State Fire Marshal's Office

Revise as follows:

503.1.1 Buildings and facilities. Approved fire apparatus access roads shall be provided for every facility, building or portion of a building hereafter constructed or moved into or within the jurisdiction. The fire apparatus access road shall comply with the requirements of this section and shall extend to within 150 feet (45 720 mm) of all portions of the facility and all portions of the exterior walls of the first story of the building as measured by an approved route around the exterior of the building or facility.

Exceptions:

1. The fire code official is authorized to increase the dimension of 150 feet (45 720 mm) where:
 - 1.1. The building is equipped throughout with an approved automatic sprinkler system installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3.
 - 1.2. Fire apparatus access roads cannot be installed because of location on property, topography, waterways, nonnegotiable grades or other similar conditions, and an approved alternative means of fire protection is provided.
 - 1.3. There are not more than two Group R-3 or Group U occupancies.
2. Where approved by the fire code official, fire apparatus access roads shall be permitted to be exempted or modified for solar photovoltaic power generation facilities.

Reason: Exception two (other exceptions are existing and renumbered) is provided to address photovoltaic panel system/array power generation facilities. The 2012 IFC does not specifically require or exempt these types of facilities. This proposal intends to provide additional guidance to afford jurisdictions avenues to determine if a fire apparatus road is needed for hazard mitigation or if it can be exempted.

Section 503 is specifically scoped to "buildings and facilities". Power generation sites that utilize a ground mounted photovoltaic system/array would not be considered a building. However, they would be considered a facility as defined in Section 202 and are therefore subject to Section 503.

A ground mounted photovoltaic panel system/array is also considered a structure as defined in IFC Section 202.

Although, where ground mounted photovoltaic panel systems/arrays are mounted on a support structure and the support structure does not create or allow for a use below (e.g. parking, lunch/shade structures, etc.), the structure should be considered equipment.

Therefore, sound rational judgment should be made if IFC, Section 503 is to be applied to a solar generation facility. Not all conditions or facilities of similar type or function necessitate fire apparatus access roads and not all structures are subject to IFC Section 503. The IFC is not clear in its application or scope when applying Section 503 to equipment, specifically ground mounted photovoltaic systems/arrays. However, when other buildings or structures are located on the site, an evaluation and/or classification of the use may require fire apparatus access.

Thus, consideration must be given to the purpose of fire apparatus access roads within these facilities and how the section would be applied.

It is important to note that Section 503 does provide exceptions for length, dimensions, and other specifications based on conditions such as terrain, climate, or other similar concerns.

Several issues arise when applying Section 503 to ground mounted photovoltaic systems/arrays. When considering the issues listed below, one should also consider other available code requirements that provide for appropriate hazard mitigation and risk reduction. Issues for consideration include:

1. Risk/hazard to be mitigated
2. Risk/hazard to firefighters or other emergency responders
3. Interest of public safety and welfare
4. Economics
5. Intended access use
6. Fuel load of the facility and adjacent areas that impact the facility
7. Array configuration (tightly spaced, access aisles, height)
8. Actual hazard to public safety and welfare

Cost Impact: This proposal will not increase the cost of construction.

F38-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

503.1.1-F-REINERTSON-SMITH

F39 – 13

503.2.2

Proponent: Carl D. Wren, P.E., Austin Fire Department, representing self (carl.wren@austintexas.gov)

Revise as follows:

503.2.2 Authority. The fire code official shall have the authority to require or permit an increase or a decrease in the minimum access widths where ~~they are inadequate for fire or rescue operations~~ necessary to meet the public safety objectives of the jurisdiction.

Reason: Fire departments respond to many types of emergency situations and the jurisdictions they serve may have traffic safety criteria that have an impact on the design of access roadways used by emergency response vehicles. It would also seem to be a wise course of action for the fire service and ICC to acknowledge and, when it is possible, to assist in developing methods of improving the safety of the public by helping to prevent injuries and deaths from hazards other than fire.

Cost Impact: This code change will not increase the cost of construction

F39-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

503.2.2 -F-WREN

F40 – 13

503.3

Proponent: Barry Greive, representing Target Corporation (barry.greive@target.com)

Revise as follows:

503.3 Marking. Where required by the fire code official, approved signs every 75 lineal feet or other approved notices or markings that include the words NO PARKING—FIRE LANE shall be provided for fire apparatus access roads to identify such roads or prohibit the obstruction thereof. The means by which fire lanes are designated shall be maintained in a clean and legible condition at all times and be replaced or repaired when necessary to provide adequate visibility.

Reason: There is currently no direction in the code on how far apart these signs need to be. Because there is no clear direction in the current provision enforcement of this regulation is inconsistent. A normal space for parallel parking is 25 feet long and this spacing will allow more than enough signs in any general location to be clearly visible and legible to notify people no parking is allowed, and the distance is within normal viewing distances for signs.

Cost Impact: This will not increase the cost of construction

F40-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

503.3-F-GRIEVE

F41 – 13

503.4

Proponent: Daniel E. Nichols, P.E., New York State Department of State (dan.nichols@dos.ny.gov)

Revise as follows:

503.4 Obstruction of fire apparatus access roads. Fire apparatus access roads shall not be obstructed in any manner, including the parking of vehicles. The minimum widths and clearances established in Sections 503.2.1 and 503.2.2 shall be maintained at all times.

Reason: IFC Section 503.2.2 permits the fire code official to require fire apparatus access roads to be widened when inadequate for fire and rescue operations. This section is most commonly used to require wider fire apparatus access roads for ladder trucks and around fire hydrants (as found in Appendix D), but could be for areas that are susceptible to traffic congestion.

However, there is no way in the current IFC to enforce these wider fire apparatus access road requirements since 503.4 only references Section 503.2.1 which, in turn, only requires the 20 foot width requirement.

This code change will permit the fire code official to enforce required widths of fire apparatus access roads after installation.

This proposal is submitted with the endorsement of the New York State Building Officials Conference, the New York State Fire Marshals and Inspectors Association, and the Association of Fire Districts of New York State.

Cost Impact: This change has no cost impact, but is to enforce requirements in place at the time of construction.

F41-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

503.4-F-NICHOLS

F42 – 13

503.4.1

Proponent: Carl D. Wren, P.E., Austin Fire Department, representing self (carl.wren@austintexas.gov)

Revise as follows:

503.4.1 Traffic calming devices. ~~Traffic calming devices shall be prohibited unless approved by the fire code official.~~ The fire code official and the jurisdiction's traffic engineer shall work collaboratively to plan, design, and install traffic calming devices. Approved traffic calming devices shall be designed to provide for adequate emergency vehicle access in addition to mitigating unsafe traffic conditions identified by the traffic engineer.

Reason: Fire departments respond to many types of emergency situations and the jurisdictions they serve may have traffic safety criteria that have an impact on the design of access roadways used by emergency response vehicles. The design of traffic calming features has been changing over the years as traffic engineers better understand measures that can change how people drive their vehicles. Since data available from the Centers for Disease Control indicate that annual traffic fatalities involving pedestrians likely exceed fire deaths in the United States (see http://www.edc.gov/motorvehiclesafety/pedestrian_safety/factsheet.html), it would also seem to be a wise course of action for the fire service and ICC to encourage collaboration with traffic engineers and, when it is possible, to assist in developing methods of improving the safety of the public by helping to prevent injuries and deaths from hazards other than fire.

Cost Impact: This code change will not increase the cost of construction

IFC 505.1; IBC [F] 501.2; IPMC [F] 304.3; IRC R319.1

THIS IS A 4 PART CODE CHANGE. PARTS I THROUGH III WILL BE HEARD BY THE IFC CODE DEVELOPMENT COMMITTEE. PART IV WILL BE HEARD BY THE IRC B/E CODE DEVELOPMENT COMMITTEE. ALL 4 PARTS WILL BE HEARD AS SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azumiamia@yahoo.com)

PART I – INTERNATIONAL FIRE CODE

Revise as follows:

505.1 Address identification. New and existing buildings shall ~~have~~ be provided with approved address ~~numbers, building numbers or approved building identification.~~ The address identification shall be legible and placed in a position that is plainly legible and visible from the street or road fronting the property. ~~These numbers~~ Address identification characters shall contrast with their background. ~~Where required by the fire code official, address numbers shall be provided in additional approved locations to facilitate emergency response.~~ Address numbers shall be Arabic numbers or alphabetical letters. Numbers shall not be spelled out. Numbers Each character shall be a minimum of 4 inches (101.6 mm) high with a minimum stroke width of 0.5 inch (12.7 mm). Where required by the fire code official, address identification shall be provided in additional approved locations to facilitate emergency response. Where access is by means of a private road and the building cannot be viewed from the public way, a monument, pole or other sign or means shall be used to identify the structure. ~~Address numbers~~ identification shall be maintained.

PART II – INTERNATIONAL BUILDING CODE

Revise as follows:

[F] 501.2 Address identification. New and existing buildings shall be provided with approved address ~~numbers or letters~~ identification. The address identification shall be legible and placed in a position that is visible from the street or road fronting the property. Address identification characters shall contrast with their background. Address numbers shall be Arabic numbers. Numbers shall not be spelled out. Each character shall be not less than 4 inches (102 mm) in height and not less than 0.5 inch (12.7 mm) in width. ~~They shall be installed on a contrasting background and be plainly visible from the street or road fronting the property.~~ When Where required by the fire code official, address numbers identification shall be provided in additional approved locations to facilitate emergency response. Where access is by means of a private road and the building address cannot be viewed from the public way, a monument, pole or other approved sign or means shall be used to identify the structure. ~~Address numbers~~ identification shall be maintained.

PART III – INTERNATIONAL PROPERTY MAINTENANCE CODE

Revise as follows:

[F] 304.3 Premises Address identification. Buildings shall ~~have~~ be provided with approved address ~~numbers~~ identification. The address identification shall be legible and placed in a position to be plainly legible and visible from the street or road fronting the property. ~~These numbers~~ Address identification characters shall contrast with their background. Address numbers shall be Arabic numerals or alphabet letters. Numbers shall not be spelled out. Numbers Each character shall be a minimum of 4 inches (102 mm) in height with a minimum stroke width of 0.5 inch (12.7 mm). Where required by the fire code official, address identification shall be provided in additional approved locations to facilitate emergency response.

Where access is by means of a private road and the building cannot be viewed from the public way, a monument, pole or other sign or means shall be used to identify the structure. Address identification shall be maintained.

PART IV – INTERNATIONAL RESIDENTIAL CODE

Revise as follows:

R319.1 Address numbers identification. Buildings shall ~~have~~ be provided with approved address numbers, building numbers or approved building identification. The address identification shall be legible and placed in a position that is plainly legible and visible from the street or road fronting the property. ~~These numbers~~ Address identification characters shall contrast with their background. Address numbers shall be Arabic numbers or alphabetical letters. Numbers shall not be spelled out. Numbers ~~Each character~~ shall be a minimum of 4 inches (102 mm) high with a minimum stroke width of $\frac{1}{4}$ 0.5 inch (12.7 mm). Where required by the fire code official, address identification shall be provided in additional approved locations to facilitate emergency response. Where access is by means of a private road and the building address cannot be viewed from the public way, a monument, pole or other sign or means shall be used to identify the structure. Address identification shall be maintained.

Reason: When the address numbers are difficult to find, read or identify, the result is a delay in the emergency response, whether it be for fire, medical assistance, or law enforcement. Address numbers which are spelled out in alpha characters, add to this difficulty in quickly responding to emergency situations.

This proposal will require that the address numbers are numeric and clearly identifiable. There are correlating sections in the IBC, IFC, IPMC and IRC with regard to address identification.

Cost Impact: The code change proposal will not increase the cost of construction.

505.1-F-ZUBIA-FCAC

F44 – 13

507.2

Proponent: Anthony C. Apfelbeck, City of Altamonte Springs Building/Fire Safety Division, representing self (ACApfelbeck@Altamonte.org)

Revise as follows:

507.2 Types water supply. A water supply shall consist of approved reservoirs, pressure tanks, elevated tanks, water mains, fire department mobile water supply resources or other approved ~~fixed~~ systems capable of providing the required fire flow.

Reason: The current code language in 507.2 does not allow the fire code official to consider fire department rural water supply operations involving tanker shuttles as a means of meeting the required fire flow. For a vast majority of rural areas, the only means of providing a water supply is via a tanker shuttle type operation. This code change will recognize this capability as a reasonable alternative to providing the required water supply. The term “approved” is also added to provide an oversight by the fire code official /Fire Chief in determining if a water supply is appropriate for utilization in providing the needed fire flow.

Cost Impact: This code change proposal will not increase the cost of construction.

F44-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

507.2-F-APFELBECK

F45 – 13

507.4, Chapter 80

Proponent: Bob D. Morgan, P.E., Fort Worth, TX Fire Department representing Fire Advisory Board to North Central Texas Council of Governments

Revise as follows:

507.4 Water supply test date and information. The water supply test used for hydraulic calculation of fire protection systems shall be conducted in accordance with NFPA 291 and within one year of sprinkler plan submittal, or as otherwise approved by the fire code official. The fire code official shall be notified prior to the water supply test. Water supply tests shall be witnessed by the fire code official, as required or approved documentation of the test shall be provided to the fire code official prior to final approval of the water supply system. The exact location of the static/residual hydrant and the flow hydrant shall be indicated on the design drawings. All fire protection plan submittals shall be accompanied by waterflow test report information, or as otherwise approved by the fire code official. At a minimum, the waterflow test report shall indicate the documented fluctuation of the water supply system in question, in accordance with the water supply operator or authority, for an entire year. The fire protection designer shall then design the fire protection system including this fluctuation information, in accordance with the applicable referenced NFPA standard.

Add new standard to Chapter 80 as follows:

NFPA

291-13 Recommended Practice for Fire Flow Testing and Marking of Hydrants

507.4

Reason: Water supply system fluctuation is regularly ignored in fire protection design. Often times, a sprinkler system is designed based on a fire hydrant flow test that only represents one point in time throughout the year when water supply systems may fluctuate up to 50 psi in some areas or more, based on summer vs. winter demands of the systems. This information is critical to ensure that such fire protection systems are designed to account for this potential fluctuation.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, NFPA 291-13, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28), will be posted on the ICC website on or before April 1, 2013.

F45-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

507.4-F-MORGAN

F46 – 13

508.1.3 (IBC [F] 911.1.3)

Proponent: Stephen DiGiovanni, Clark County Fire Department, representing self.

Revise as follows:

508.1.3 (IBC [F] 911.1.3) Size. The fire command center shall be a minimum of 0.015 percent of the total building area of the facility served or 200 square feet (19m²) in area, whichever is greater, with a minimum dimension of 0.7 times the square root of the room area, or 10 feet (3048 mm), whichever is greater.

Reason: The purpose of this amendment is to provide a means to have larger fire command centers for larger facilities. The effect of this change is that buildings that are greater than 1.33 million square feet in total area will require larger fire command centers than the minimum required size of 200 square feet. For reference, this formula would require a fire command center of 750 square feet for a building that is 5 million square feet, and would require a fire command center of 1,500 square feet for a building that is 10 million square feet. These are not seen as unreasonable sizes for a Fire Command Center, in comparison to the associated building sizes.

The amendment also calls for a concurrent calculation for minimum room dimension. The calculation uses a square root of the building area, and applying a 0.7 factor. For the base code required area of 200 square feet, please note that the square root of 200 is approximately 14.14, and the application of the 0.7 factor yields 9.90, which is very close to the base code dimension of 10 feet.

The model codes have set forth varying minimum sizes for Fire Command Centers. For instance, the 2000-2006 editions of the International Building Code set forth a minimum size of 96 square feet, with a minimum dimension of 8 feet. Application of the formula in this amendment would result that a 96 square feet fire command center would be sufficient for a building with area of 640,000 square feet. The square root of 96 is 9.80, and application of the 0.7 factor yields 6.86, which is somewhat close to the base code dimension of 8 feet.

There have been problems with fire command centers that are sized too small for the amount of control equipment and panels that are required for the building. At times, sufficient communication does not occur between the architect and the fire alarm designers, and the fire command center has been sized too small to comfortably accommodate the required equipment. Larger buildings will have more equipment due to the amount of elevators, generators, smoke removal systems, fire alarm nodes, plans, etc., that are present in larger buildings. The list of required items in the fire command centers has been expanded, further stressing the available space of fire command centers. Further, the larger buildings may have unusual fire protection systems, such as deluge systems, video smoke detection, etc., which may require additional control panels and space in the fire command center. It is important to anticipate these issues and develop requirements for larger rooms to accommodate the equipment required in larger facilities.

Please note that this amendment does not increase fire command size until the building exceeds 1.33 million square feet. For smaller buildings, this amendment has no impact.

Cost Impact: Requires additional space for larger buildings over 1.33 million square feet, impact would be lost space to other uses and costs of expanding boundaries of the fire command center.

F46-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

508.1.3-F-DIGIOVANNI

F47 – 13

508.1.5 (New), 315.3.3

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Add new text as follows:

508.1.5 Storage. Storage unrelated to operation of the Fire Command Center shall be prohibited.

(Renumber subsequent section)

Revise as follows:

315.3.3 Equipment rooms. Combustible material shall not be stored in boiler rooms, mechanical rooms, or electrical equipment rooms or in fire command centers as specified in Section 508.1.5.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: <http://www.iccsafe.org/cs/CAC/Pages/default.aspx>.

Fire command centers need to be dedicated to firefighting operations.

Cost Impact: This code change will not increase the cost of construction

F47-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

508.1.6 (NEW)-F-ZUBIA-FCAC

F48 – 13

509.1.1

Proponent: Bob D. Morgan, P.E., Fort Worth, TX Fire Department representing Fire Advisory Board to North Central Texas Council of Governments

Revise as follows:

509.1.1 Utility identification. Where required by the *fire code official*, gas shutoff valves, electric meters, service switches and other utility equipment shall be clearly and legibly marked by signs to identify the unit or space that it serves. Identification shall be made in an approved manner, readily visible and shall be maintained. Lettering for such signs shall have a minimum height of 2 inches (50.8 mm) where located indoors and 4 inches (101.6 mm) where located outdoors, or as approved by the *fire code official*. The letters shall be of a color that contrasts with the background. Signs shall be readily visible and shall be maintained.

Reason: Provides for more consistency with regards to such signage and more guidance to owners/operators and designers to ensure compliance is achieved. Additionally, this addresses an issue of legibility when very small signs are utilized for this purpose.

Cost Impact: The code change proposal will not increase the cost of construction. The signage is already required – this just provides a guide as to the size of such.

F48-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

509.1.1-F-MORGAN

F49 – 13

510.1, 510.6.3

Proponent: Daniel E. Nichols, P.E., New York State Department of State (dan.nichols@dos.ny.gov)

Revise as follows:

510.1 Emergency responder radio coverage in new buildings. Where required by the fire code official, new buildings shall have approved radio coverage for emergency responders within the building. ~~based upon the existing coverage levels of the public safety communication systems of the jurisdiction at the exterior of the building.~~ The requirement shall be based on approved calculations and reports showing the need for such system based upon existing coverage, building location, building properties, and building layout. This section shall not require improvement of the existing public safety communication systems.

Exceptions:

1. Where approved by the building official and the fire code official , a wired communication system in accordance with Section 907.2.13.2 shall be permitted to be installed or maintained in lieu of an approved radio coverage system.
- ~~2. Where it is determined by the fire code official that the radio coverage system is not needed.~~
23. In facilities where emergency responder radio coverage is required and such systems, components or equipment required could have a negative impact on the normal operations of that facility, the fire code official shall have the authority to accept an automatically activated emergency responder radio coverage system.

~~**510.6.3 Field testing.** Agency personnel shall have the right to enter onto the property at any reasonable time to conduct field testing to verify the required level of radio coverage.~~

Reason: This code change proposal is to modify the administrative provisions of the requirements and enforcement of the emergency responder radio coverage. The proposal does not intend to change any technical requirement of the section.

Currently, every building would need to be evaluated for emergency responder radio coverage. The only true way out of this requirement is for the fire code official to state that it isn't needed. The problem with that is 1) there is no standardized test that a fire code official can easily reference to make an appropriate decision and 2) the only baseline is to reference the exterior of a building that hasn't even been built yet.

The proposed code language changes the enforcement to that similar to key boxes, where the fire code official can require it, based on a study or report. This doesn't place the fire code official in a single-point 'yes or no' decision on a system that he/she may have little knowledge in as well as give direct reference to some of the variables that need to be dealt with in evaluating emergency responder radio coverage.

Section 510.6.3 is proposed for deletion since rights of officials on entry to premises is not a condition of technical requirements within the IFC, rather an administrative process requirement.

Cost Impact: This proposal will not affect the cost of construction.

F49-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

510.1-F-NICHOLS

F50 – 13

511 (New); 1103.3 (New)

Proponent: Robert Trotter, MCP, Tennessee Code Development Committee (bobbrotter1023@aol.com)

Add new text as follows:

SECTION 511 **FIRE SERVICE ELECTRICAL DISCONNECT**

511.1 General. All new buildings shall be provided with a fire service electrical disconnect designed to operate a building's shunt trip switch to disconnect electrical power to the building or heavy equipment. Existing buildings shall be provided with a fire service electrical disconnect as required by Section 1103.3.

511.2 Location. The fire service electrical disconnect shall be installed in a location approved by the *fire code official*.

511.2 Alternative locations. The *fire code official* is authorized to require a fire service electrical disconnect at alternative locations for operations including, but not limited to: wind generation stations, solar photovoltaic power system installations, light rail power distribution stations, and amusement parks.

511.3 Enclosure. The shunt trip switch shall be housed in a watertight NEMA container. The switch and NEMA container shall be housed in a secure device operable only by a fire department master key.

511.3.1 Listing. The electrical disconnect enclosure shall be listed in accordance with UL1037.

511.5 Signage. Where the fire service electrical disconnect serves a portion of a building, specific equipment, or alternative locations, an approved sign shall be posted in a readily visible location to indicate the building portion or equipment that the shunt trip serves.

Add new text as follows:

1103.3 Fire Service Electrical Disconnect. Existing buildings shall be provided with a fire service electrical disconnect in accordance with Section 511.

(Renumber subsequent sections)

Reason: Fundamentally, the fire service electrical disconnect is required to provide first responders the ability to safely disconnect electrical power to the building or heavy equipment, and alternative installations so that firefighters are not exposed to shock hazards or injured by equipment in operation during fire suppression and rescue operations.

The principle reason for fire service electrical disconnect is described in Section 101.2 Scope (5) "Conditions affecting the safety of fire fighters and emergency responders during emergency operations". Fire fighters operating in a building with energized electrical service poses extreme risks...risks that can be reduced or eliminated.

The 2008 edition of NFPA 1001, *Standard for Fire Fighter Professional Qualifications* requires Fire Fighter I candidates to requisite knowledge and skills relative to utility control devices.

Chapter 5: Fire Fighter I

5.3 Fireground Operations.

5.3.18 Turn off building utilities, given tools and an assignment, so that the assignment is safely completed.

- (A) Requisite Knowledge.** Properties, principles, and safety concerns for electricity, gas, and water systems; utility disconnect methods and associated dangers; and use of required safety equipment.
- (B) Requisite Skills.** The ability to identify utility control devices, operate control valves or switches, and assess for related hazards.

Cost Impact: The code change proposal will increase the cost of construction. The cost is expected to be less than \$1,250 per installation site.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

511 (NEW)-F-TROTTER

F51 – 13

601.2 (New)

Proponent: Ian Hardage, San Ramon Valley Fire Protection District (ihardage@srvfire.ca.gov) and Amber Anderson, Cosumnes CSD Fire Department (AmberAnderson@csdfire.com), representing California Fire Chiefs Association

Add new text as follows:

601.2 Construction documents. The fire code official shall have the authority to require construction documents and calculations for the installation, rehabilitation or modification of building services and systems necessary to comply with this chapter. Construction documents for building systems shall be submitted for review and approval prior to installation or modification.

(Renumber subsequent sections)

Reason: We all know that construction documents and related calculations for building services and systems must be reviewed before a system is installed. Factors, such as classification of the hazard, amount of material, type of equipment, devices, and design criteria are just a few examples of what is to be considered when reviewed by the fire code official.

In some instances, shop drawings and supporting documentation such as equipment data sheets, manufacturer's installation instructions and warnings, listing sheets, etcetera for specialized building systems may not be prepared during the initial submittal for building construction, but rather may be a deferred submittal by the specializing contractor. It is not uncommon for a jurisdiction to request additional information or to issue a separate construction or operational permit, based on IFC Section 105 for these types of systems from that of the original building permit. This allows the owner or contractor to begin initial construction without delay. This proposal is not meant to require a separate permit. It is also not meant to say that these systems can not be reviewed during the initial architectural submittal. It is meant to assist the owner, contractor, architect, or engineer as well as the local authority having jurisdiction through the construction process by allowing the fire code official to required construction documents when needed, similar to IFC Sections 501, 901, 907, 909, 1101, 2301, 2311, 3103, 3201, and 6101.

Increases in construction costs would only occur if an authority having jurisdiction chose to implement a separate fee for review. All other costs such as design drawings and construction of the system should already be included in the original design budget. We feel that any cost increase by an AHJ would likely be significantly less than any delays in construction or operation of the system when such system is determined to be non-compliant with codes and standards enforced by the fire code official at a time less than ideal for the customer such as at final inspection.

Cost Impact: The code proposal will increase the cost of construction.

601.2 (NEW)-F-ANDERSON-HARDAGE

F52 – 13

604.1 (IBC [F] 2702.1)

Proponent: Robert J Davidson, Davidson Code Concepts, LLC, representing self (BFICOCS)
(rjd@davidsoncodeconcepts.com)

Revise as follows:

604.1 (IBC [F] 2702.1) Installation. Emergency and standby power systems required by this code or the *International Building Code (IBC: International Fire Code)* shall be installed in accordance with this code, the *International Building Code (IBC: International Fire Code)*, NFPA 110 and NFPA 111. Existing installations shall be maintained in accordance with the original approval.

Reason: This proposal is potentially editorial or simply a correlation issue, but if not, it plugs a substantial hole in the installation requirements for these systems.

At first glance Section 604.1 appears thorough, however, though it refers to the IBC for when systems are required, it does not refer to the IBC for the actual installation. The IBC reference is important for addressing structural, flooding and other installation requirements.

To solve the issue the "*International Building Code*" has been added to the installation requirement portion of Section 604.1.

Cost impact: This proposal will not increase the cost of construction.

F52-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

604.1-F-DAVIDSON

F53 – 13

604.1 (IBC [F] 2702.1), 202

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

604.1 (IBC [F] 2702.1) Installation General. Emergency power systems and standby power systems required by this code or the *International Building Code* shall be installed in accordance with this code, NFPA 110 and NFPA 111. Existing installations shall be maintained in accordance with the original approval, shall comply with Sections 604.1.1 through 604.1.7 (IBC [F] 2702.1.1 through [F] 2702.1.6).

604.1.1 (IBC [F] 2702.1.1) Stationary generators. Stationary emergency and standby power generators required by this code shall be *listed* in accordance with UL 2200.

604.1.2 (IBC [F] 2702.1.2) Electrical. Emergency power systems and standby power systems shall be installed in accordance with NFPA 70, NFPA 110 and NFPA 111.

604.1.3 (IBC [F] 2702.1.3) Load transfer. Emergency power systems shall automatically provide secondary power within 10 seconds after primary power is lost, unless specified otherwise in this code. Standby power systems shall automatically provide secondary power within 60 seconds after primary power is lost unless specified otherwise in this code.

604.1.4 (IBC [F] 2702.1.4) Load duration. Emergency power systems and standby power systems shall be designed to provide the required power for a minimum duration of two hours without being refueled or recharged, unless specified otherwise in this code.

604.1.5 (IBC [F] 2702.1.5) Uninterruptable power source. An uninterrupted source of power shall be provided for equipment when required by the manufacturer's instructions, the listing, this code, or applicable referenced standards.

604.1.6 (IBC [F] 2702.1.6) Interchangeability. Emergency power systems shall be an acceptable alternative for installations that require standby power systems.

604.1.7 Maintenance. Existing installations shall be maintained in accordance with the original approval and Section 604.3.

Add new text as follows:

SECTION 202 DEFINITIONS

EMERGENCY POWER SYSTEM. A source of automatic electric power of a required capacity and duration to operate required life safety, fire alarm, detection and ventilation systems in the event of a failure of the primary power. Emergency power systems are required for electrical loads where interruption of the primary power could result in loss of human life or serious injuries.

STANDBY POWER SYSTEM. A source of automatic electric power of a required capacity and duration to operate required building, hazardous materials or ventilation systems in the event of a failure of the primary power. Standby power systems are required for electrical loads where interruption of the primary power could create hazards or hamper rescue or fire-fighting operations.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This

includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: <http://www.iccsafe.org/cs/CAC/Pages/default.aspx>.

The requirements for emergency and standby power system are not treated in a consistent manner in the I-codes. This is one of several proposals designed to add consistency to these requirements. This proposal accomplishes the following:

1. Introduces definitions for emergency power systems and standby power systems that are consistent with definitions in NFPA 110 and NFPA 111.
2. Provides definitive requirements for maximum load transfer times. Emergency power systems must automatically transfer loads within 10 seconds after primary power is lost and standby power systems must automatically transfer loads within 60 seconds after primary power is lost. These times are allowed to vary if so specified in the code
3. To properly design emergency and standby power systems the minimum load duration must be known. This proposal introduces a default minimum two hour duration for systems unless another load duration is specified.
4. Uninterruptible power sources must be provided if required by the manufacturer's instructions, the listing, the code, or applicable referenced standards, such as NFPA 72.
5. A new section clarifies that an emergency power system can be provided to power loads for equipment that requires a standby power source.

Cost Impact: This code change will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

604.1 (NEW)-F-ZUBIA-FCAC

F54 – 13

604.1.2 (New) (IBC [F] 2702.1.2), Chapter 80

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care
(john.williams@doh.wa.gov)

Add new text as follows:

604.1.1(IBC [F] 2702.1.1) Stationary generators. Stationary emergency and standby power generators required by this code shall be *listed* in accordance with UL 2200

604.1.2 (IBC [F] 2702.1.2) Group I-2 Occupancies. In Group I-2 occupancies, where an essential electrical system is located in flood hazard areas established in Section 1612.3 of the *International Building Code*, the system shall be located and installed in accordance with ASCE 24.

Add new standard to Chapter 80 as follows:

ASCE 24-05 Flood Resistant Design and Construction 604.1.2

Reason: This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering, a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April, 2011, the AHC has held 5 open meetings and over 80 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: <http://www.iccsafe.org/cs/AHC/Pages/default.aspx>.

There is no way to get to the requirements or limitations regarding generator placement for healthcare facilities that are in the standard if the code text for the specific code section does not take you there.

The Adhoc committee on healthcare identified this coordination oversight as it has been identified in healthcare facilities and that generators are being installed in areas subject to flooding, and although they were designed to meet the structural loads for the flooding, they would operationally fail.

There is no cost impact for these requirements because the compliance with ASCE 24 is required for these facilities; specific reference to ASCE for coordination of requirements applicable to healthcare facilities that require emergency or standby power systems per federal, state and licensing agency requirements and references. Also, both this section and this proposal are not intended to be retroactive in application. The AHC has a separate code change that would require facilities to do a risk assessment of existing installations.

It is an installation construction requirement that is not specifically addressed in the code; emergency and standby power by generators is necessary for life safety and preservation for healthcare and for other occupancies and uses as specified in 2702.

Note that G80-12 added requirements for essential electrical systems in I-2 occupancies. This is simply a continuation of that concept. This proposal is furthering the reliability of the essential electrical systems when they will be needed most by specifically referencing to ASCE 24. The additional language referencing Section 1612.3 is similar to that used in Section 3001.2 for elevators.

Cost impact: The code change proposal should not increase the cost of construction because compliance is already required by facility licensure requirements.

Analysis: The standard proposed for inclusion in the code, ASCE 24-05, is currently referenced in the IBC. An update in the year edition of that standard will be accomplished by an administrative standards update code change to be heard by the ADM Code Development Committee.

F54-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

604.1.2 (NEW)-F-WILLIAMS-ADHOC

F55 – 13

604.2.14.1.3 (IBC [F] 403.4.8.2) (New)

Proponent: Robert J Davidson, Davidson Code Concepts, LLC, representing self
(rjd@davidsoncodeconcepts.com)

Add new text as follows:

604.2.14.1 (IBC [F] 403.4.8.1) Standby power. A standby power system shall be provided. Where the standby system is a generator set inside a building, the system shall be located in a separate room enclosed with 2-hour fire barriers constructed in accordance with Section 707 of the International Building Code or horizontal assemblies constructed in accordance with Section 711 of the International Building Code, or both. System supervision with manual start and transfer features shall be provided at the fire command center.

604.2.14.1.1 Fuel supply. (No change to current text.)

604.2.14.1.2 Capacity. (No change to current text.)

604.2.14.1.3 (IBC [F] 403.4.8.2) Fuel line piping protection: Fuel lines supplying a generator set inside a building shall be separated from areas of the building other than the room the generator is located in by fire barriers or by an approved piping protective system that have a fire-resistance rating of not less than 2 hours. Where gypsum wallboard is used, joints on the piping side of the enclosure are not required to be taped. Access openings into the enclosure shall be protected by approved fire protection-rated assemblies.

(Renumber subsequent sections)

Reason: Currently IFC Section 604.2.14.1 and IBC Section [F] 403.4.8.1 require the generator to be protected from a fire within the occupancy by enclosure with 2 hour fire-resistance rated construction.

However, for diesel fueled generators it is common to supply the generators with a day tank and resupply the day tank via remote fuel oil tanks and the fuel line piping from those remote tanks to the generator can be exposed to the fire the generator has been protected against. Loss of the fuel line due to fire exposure has the same impact as loss of the generator itself from fire exposure. The wording only refers to "fuel lines" to also provide protection in those cases where a gaseous fuel supply is approved for use.

This proposal calls for fire-resistance protection of those portions of the fuel line piping that are located outside of the fire-resistance rated room the generator is located in. A portion of the new language was taken from IBC Section [F]415.10.6.4 where protection of HPM supply piping is provided for.

Cost Impact: The code change proposal will increase the cost of construction.

604.2.1-F-ZUBIA-FCAC

F57 – 13

604.3 (New) [IBC [F] 2702.3 (New)]; Chapter 80 (IBC Chapter 35)

Proponent: Bob Eugene, representing Underwriters Laboratories (Robert.Eugene@ul.com)

Add new text as follows:

604.3 (IBC [F] 2702.3) Critical circuits. Cables used for survivability of critical circuits shall be listed in accordance with UL 2196. Electrical circuit protective systems shall be installed in accordance with their listing requirements.

(Renumber subsequent sections)

Add new standard to Chapter 80 (IBC Chapter 35) as follows:

UL

2196-2001 Tests for Fire Resistive Cables, with revisions through December 7, 2003...604.3 (2703.2)

Reason: UL 2196 is the ANSI approved standard for tests of fire resistive cables. NFPA 20 (fire pumps) and NFPA 72 (fire alarm) include selective survivability requirements to assure integrity of certain critical circuits. NFPA 70 does not specify the applicable standard within the mandatory provisions of the code, but recognizes electrical circuit protective systems as an alternate to listed cables. An electrical circuit protective system is a field assembly of components that must be installed according to the listing requirements and manufacturer's instructions in order to maintain the listing for the system. There are more than two dozen electrical circuit protective systems listed in the UL Fire Resistance Directory.

Cost Impact: The code change proposal may or may not increase the cost of construction. Such systems are already commonly installed.

Proponent: Al Godwin, CBO, CPM, Aon Fire Protection Engineering, representing Aon Fire Protection Engineering Corporation (al.godwin@aon.com)

Revise as follows:

SECTION 604 EMERGENCY AND STANDBY POWER SYSTEMS

604.1 Installation. Emergency and standby power systems required by this code or the *International Building Code* shall be installed in accordance with this code, NFPA 110 and 111. Existing installations shall be maintained in accordance with the original approval, except as specified in Chapter 11.

604.1.2 (IBC [F] 2702.1.2) Critical Operations Power Systems (COPS). Critical Operations Power Systems necessary to maintain continuous power supply to facilities or parts of facilities that require continuous operation for the reasons of public safety, emergency management, national security, or business continuity, shall comply with NFPA 70.

604.2 (IBC [F] 2702.2) Where required. Emergency and standby power systems shall be provided where required by Sections 604.2.1 through ~~604.2.18.4~~ 604.2.24 or other applicable referenced code.

604.2.1 (IBC [F] 2702.2.1) ~~Group A occupancies.~~ Emergency voice/alarm communications systems. Emergency power shall be provided for emergency voice/alarm communications systems in ~~Group A~~ the following occupancies, and as required in other sections of this code, in accordance with Section ~~907.5.2.2.5~~ 907.2.1.4.

Covered and Open Malls in accordance with Section 604.2.13.
Group A occupancies in accordance with Sections 907.2.1.1 and 907.5.2.2.4.
Group E occupancies in accordance with Section 907.2.3
Special Amusement buildings in accordance with Section 907.2.12.3
High rise buildings in accordance with Section 907.2.13
Atriums in accordance with Section 907.2.14
Deep Underground buildings in accordance with Section 907.2.19
Occupant Evacuation Elevators in accordance with Section 3008.10

604.2.2 (IBC [F] 2702.2.2) Smoke control systems. Standby power shall be provided for smoke control systems in the following occupancies, or as required in other sections of this code, in accordance with Section 909.11:

Covered mall building, *International Building Code* in accordance with Section 404.5
Atriums, *International Building Code* in accordance with Section 404.7
Underground buildings, *International Building Code* in accordance with Section 405.5
Group I-3, *International Building Code* in accordance with Section 408.9
Stages, *International Building Code* in accordance with Section 410.3.7.2
Special Amusement buildings (as applicable to Group A's), *International Building Code* in accordance with Section 411.1
Smoke protected seating in accordance with Section 1028.6.2.1

604.2.3 (IBC [F] 2702.2.3) Exit signs. Emergency power shall be provided for *exit* signs in accordance with Section 1011.6.3.

604.2.4 (IBC [F] 2702.2.4) Means of egress illumination. Emergency power shall be provided for *means of egress* illumination in accordance with Section 1006.3.

604.2.9 (IBC [F] 2702.2.9) Membrane structures. Emergency power shall be provided for *exit* signs in temporary tents and membrane structures in accordance with Section 3103.12.6.1. Standby power shall be provided for auxiliary inflation systems in permanent membrane structures in accordance with the *International Building Code*.

604.2.15 (IBC [F] ~~2702.2.16~~ 2702.2.14) Group I-2 Occupancies. Essential electrical systems for Group I-2 occupancies shall be in accordance with Section 407.11 of the *International Building Code*.

~~604.2.15~~ **604.2.16 (IBC [F] ~~2702.2.16~~ 2702.2.15) Underground buildings.** (No change to current text)

~~604.2.16~~ **604.2.17 (IBC [F] ~~2702.2.17~~ 2702.2.16) Group I-3 occupancies.** (No change to current text)

~~604.2.17~~ **604.2.18 (IBC [F] ~~2702.2.18~~ 2702.2.17) Airport traffic control towers.** (No change to current text)

~~604.2.18~~ **604.2.19 (IBC [F] ~~2702.2.19~~ 2702.2.18) Elevators.** (No change to current text)

604.2.20 (IBC [F] ~~2702.2.20~~ 2702.2.19) Smokeproof enclosures and Stair Pressurization Alternative. Standby power shall be provided for smokeproof enclosures. The stair pressurization alternative and associated automatic fire detection systems in accordance with the *International Building Code*, Section 909.20.6.2.

604.2.21 (IBC [F] 2702.2.20) Elevator pressurization. Standby power shall be provided for elevator pressurization system in accordance with the *International Building Code*, Section 909.21.5.

604.2.22 (IBC [F] 2702.2.21) Elimination of Smoke Dampers in Shaft Penetrations. Standby power shall be provided when eliminating the smoke dampers in ducts penetrating shafts in accordance with the *International Building Code*, Section 717.5.3, exception 2.3.

604.2.23 (IBC [F] 2702.2.22) Common exhaust systems for clothes dryers. Standby power shall be provided for common exhaust systems for clothes dryers located in multistory structures in accordance with the *International Mechanical Code* Section 504.8, item 7.

604.2.24 (IBC [F] 2702.2.23) Common exhaust systems for domestic kitchen exhaust. Standby power shall be provided for common exhaust systems for domestic kitchens using common exhaust systems located in multistory structures in accordance with the *International Mechanical Code* Section 505.3.

604.2.25 (IBC [F] 2702.2.24) Hydrogen Cutoff Rooms. Standby power shall be provided for mechanical ventilation and gas detection systems of Hydrogen Cutoff Rooms in accordance with the *International Building Code*, Section 421.8.

604.2.26 Means of Egress Illumination in Existing Buildings. Emergency power shall be provided for *means of egress* illumination in accordance with Section 1104.5 and 1104.5.1 where required by the fire code official.

604.3 (IBC [F] 2702.3) Energy time duration. Unless a time limit is specified by the fire code official, in this chapter or elsewhere in this code, or in any other referenced code or standard, the emergency and standby power system shall be supplied with enough fuel or energy storage capacity for not less than 2-hour full-demand operation of the system.

Exception: Where *approved*, natural gas from a utility provider shall meet the intent of this section.

~~604.3~~ **604.4 Maintenance.** (No change to current text)

604.4 604.5 Operational inspection and testing. (No change to current text)

604.5 604.6 Emergency lighting equipment. (No change to current text)

604.6 604.7 Supervision of maintenance and testing. (No change to current text)

IBC [F] 2702.2.14 Covered and open mall buildings. Standby power shall be provided for voice/alarm communication systems in covered and open mall buildings in accordance with Section 402.7.3.

[F] 2702.2.15 2702.2.13 High-rise buildings. Emergency and standby power shall be provided in high-rise buildings in accordance with Sections 403.4.8 and 403.4.9.

IBC [F] 2702.3 2702.4 Maintenance. Emergency and standby power systems shall be maintained and tested in accordance with the *International Fire Code*.

Reason: These provisions provide a laundry list that seems to have fallen out of date, are incomplete and don't match. This is intended to bring them into better coordination.

The following section is from G80-12, approved last cycle.

604.2.15 Group I-2 Occupancies. Essential electrical systems for Group I-2 occupancies shall be in accordance with the *International Building Code*, Section 407.11.

The following section is based on M73-12, approved last cycle:

604.2.24 Common exhaust systems for domestic kitchen exhaust. Standby power shall be provided for common exhaust systems for domestic kitchens using common exhaust systems located in multistory structures in accordance with the *International Mechanical Code* Section 505.3.

A new reference to COPS in NFPA 70 is provided. While it is unusual to specifically list a use in NFPA 70, this seems justified at least for discussion.

Also, provided is a specified Energy time duration. It seems to add clarity.

Everything else should be a reference to a code provision that already exists.

Possible Modifications:

Depending on any controversy, the following are two options for modifications:

1. Modify out the reference to COPS.

604.1.2 Critical Operations Power Systems (COPS). ~~For Critical Operations Power Systems necessary to maintain continuous power supply to facilities or parts of facilities that require continuous operation for the reasons of public safety, emergency management, national security, or business continuity, see NFPA 70.~~

2. Modify the Energy time duration to accommodate areas in earthquake zones or hurricane zones who might desire more time as follows:

- a. change to a fill in the blank.

604.3 Energy time duration. Unless a time limit is specified by the fire code official, in this chapter or elsewhere in this code, or in any other referenced code or standard, the emergency and standby power system shall be supplied with enough fuel or energy storage capacity for not less than [fill-in]-hour full-demand operation of the system.

- b. or;

604.3 Energy time duration. Unless a time limit is specified by the fire code official, in this chapter or elsewhere in this code, or in any other referenced code or standard, the emergency and standby power system shall be supplied with enough fuel or energy storage capacity for not less than 2-hour full-demand operation of the system, or longer when designated by the code official in accordance with an acceptable normal procedural process.

Reference to COPS can be modified out. However, if NFPA 70 is adopted by the jurisdiction, then it's listing here as a reminder would seem appropriate.

Cost Impact: Most items are already required. As such, this change will not increase the cost of construction.

Analysis: The text shown at Section **604.2.15 (IBC [F] 2702.2.16 2702.2.14) Group I-2 Occupancies**. Is the text of approved code change G80-12 (AMPC) and is shown as current text for clarity.

604 (IBC [F] 2702) among others; 907.5.2.2.5 (IBC [F] 907.5.2.2.5); IMC [F] 513.11, [F]513.11.1 (New); IWUIC 404.10.3; IEBC 805.4.5

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IFC COMMITTEE AND PART II WILL BE HEARD BY THE IEBC COMMITTEE AS TWO SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THOSE COMMITTEES.

PART I – INTERNATIONAL FIRE CODE

EMERGENCY VOICE/ALARM COMMUNICATION SYSTEMS

***NOTE:** The normal convention for portraying code changes to duplicated texts is by showing the parallel section numbers (e.g., “907.5.2 (IBC [F] 907.5.2)” or “1011.6.3 (IFC [B] 1011.6.3”). In this code change, however, for improved clarity, duplicate texts are shown for each code in this part.*

Revise the IBC as follows:

[F] 402.7.3 Emergency Standby power. *Covered mall buildings* greater than 50,000 square feet (4645 m²) in area and *open mall buildings* greater than 50,000 square feet (4645 m²) within the established perimeter line shall be provided with ~~standby emergency power systems~~ that ~~is~~ are capable of operating the *emergency voice/alarm communication system* in accordance with Section 2702.

[F] 907.5.2.2.5 Emergency power. Emergency voice/alarm communications systems shall be provided with an ~~approved~~ emergency power source in accordance with Section 2702. The system shall be capable of powering the required load for a duration of not less than 24 hours, as required in NFPA 72.

[F] ~~2702.2.1 Group A occupancies.~~ Emergency power shall be provided for emergency voice/alarm communication systems in Group A occupancies in accordance with ~~Section 907.5.2.2.4.~~

[F] ~~2702.2.14 Covered and open mall buildings.~~ Standby power shall be provided for voice/alarm communication systems in ~~covered and open mall buildings~~ in accordance with ~~Section 402.7.3.~~

[F] 2702.2.1 Emergency voice/alarm communication systems. Emergency power shall be provided for emergency voice/alarm communication systems as required in Section 907.5.2.2.5. The system shall be capable of powering the required load for a duration of not less than 24 hours, as required in NFPA 72.

Revise the IFC as follows:

~~604.2.1 Group A occupancies.~~ Emergency power shall be provided for emergency voice/alarm communication systems in Group A occupancies in accordance with ~~Section 907.2.1.1.~~

~~604.2.13 Covered and open mall buildings.~~ ~~Covered mall buildings exceeding 50,000 square feet (4645 m²) and open mall buildings exceeding 50,000 square feet (4645 m²) within the established perimeter line shall be provided with standby power systems that are capable of operating the emergency voice/alarm communication system.~~

604.2.1 Emergency voice/alarm communication systems. Emergency power shall be provided for emergency voice/alarm communication systems as required in Section 907.5.2.2.5. 5. The system shall be capable of powering the required load for a duration of not less than 24 hours, as required in NFPA 72.

907.5.2.2.5 Emergency power. Emergency voice/alarm communications systems shall be provided with an ~~approved~~ emergency power source in accordance with Section 604. The system shall be capable of powering the required load for a duration of not less than 24 hours, as required in NFPA 72.

SMOKE CONTROL SYSTEMS

NOTE: The normal convention for portraying code changes to duplicated texts is by showing the parallel section numbers (e.g., "907.5.2 (IBC [F] 907.5.2)" or "1011.6.3 (IFC [B] 1011.6.3)"). In this code change, however, for improved clarity, duplicate texts are shown for each code in this part.

Revise the IBC as follows:

[F] 404.7 Standby power. Equipment required to provide smoke control shall be provided with standby power in accordance with ~~connected to a standby power system in accordance with~~ Section 909.11.

[F] 909.11 Standby power ~~Power systems.~~ ~~The s~~Smoke control systems shall be provided with standby power in accordance with Section 2702. ~~shall be supplied with two sources of power. Primary power shall be from the normal building power systems. Secondary power shall be from an approved standby source complying with Chapter 27 of this code.~~

[F] 909.11.1 Equipment room. The standby power source and its transfer switches shall be in a room separate from the normal power transformers and switch gears and ventilated directly to and from the exterior. The room shall be enclosed with not less than 1-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both. ~~The transfer to full standby power shall be automatic and within 60 seconds of failure of the primary power.~~

909.20.6.2 Standby power. Mechanical vestibule and *stair* shaft ventilation systems and automatic fire detection systems shall be provided with ~~powered by an approved~~ standby power in accordance with Section 2702. ~~system conforming to Section 403.4.8 and Chapter 27.~~

909.21.5 Standby power. The pressurization system shall be provided with standby power in accordance with Section 2702. ~~from the same source as other required emergency systems for the building.~~

[F] 2702.2.2 Smoke control systems. Standby power shall be provided for smoke control systems as required in ~~in accordance with~~ Sections 404.7, 909.11, 909.20.6.2, and 909.21.5.

[F] 2702.2.20 Smokeproof enclosures. Standby power shall be provided for smokeproof enclosures ~~as required by in~~ Section 909.20.6.2.

Revise the IFC as follows:

604.2.2 Smoke control systems. Standby power shall be provided for smoke control systems as required in ~~in accordance with~~ Section 909.11.

909.11 Standby power ~~Power systems.~~ ~~The s~~Smoke control systems shall be provided with standby power in accordance with Section 2702. ~~shall be supplied with two sources of power. Primary power shall be from the normal building power systems. Secondary power shall be from an approved standby source complying with Chapter 27 of this code.~~

909.11.1 Equipment room. The standby power source and its transfer switches shall be in a room separate from the normal power transformers and switch gears and ventilated directly to and from the exterior. The room shall be enclosed with not less than 1-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both. ~~The transfer to full standby power shall be automatic and within 60 seconds of failure of the primary power.~~

Revise the IMC as follows:

[F] 513.11 Power systems. ~~The sSmoke control system shall be supplied with standby power in accordance with Section 2702 of the International Building Code. two sources of power. Primary power shall be the normal building power systems. Secondary power shall be from an approved standby source complying with Chapter 27 of the International Building Code.~~

[F] 513.11.1 Equipment room. The standby power source and its transfer switches shall be in a room separate from the normal power transformers and switch gear and ventilated directly to and from the exterior. The room shall be enclosed with not less than 1-hour fire-resistance rated fire barriers constructed in accordance with Section 707 of the *International Building Code* or horizontal assemblies constructed in accordance with Section 711 of the *International Building Code*, or both. Power distribution from the two sources shall be by independent routes. ~~Transfer to full standby power shall be automatic and within 60 seconds of failure of the primary power. The systems shall comply with NFPA 70.~~

EXIT SIGNS

NOTE: The normal convention for portraying code changes to duplicated texts is by showing the parallel section numbers (e.g., "907.5.2 (IBC [F] 907.5.2)" or "1011.6.3 (IFC [B] 1011.6.3)"). In this code change, however, for improved clarity, duplicate texts are shown for each code in this part.

Revise the IBC as follows:

[F] 2702.2.3 Exit signs. Emergency power shall be provided for *exit* signs as required in ~~in accordance with~~ Section 1011.6.3. The system shall be capable of powering the required load for a duration of not less than 90 minutes.

Revise the IFC as follows:

604.2.3 Exit signs. Emergency power shall be provided for *exit* signs as required in ~~in accordance with~~ Section 1011.6.3. The system shall be capable of powering the required load for a duration of not less than 90 minutes.

MEANS OF EGRESS ILLUMINATION

NOTE: The normal convention for portraying code changes to duplicated texts is by showing the parallel section numbers (e.g., "907.5.2 (IBC [F] 907.5.2)" or "1011.6.3 (IFC [B] 1011.6.3)"). In this code change, however, for improved clarity, duplicate texts are shown for each code in this part.

Revise the IBC as follows:

[F] 2702.2.4 Means of egress illumination. Emergency power shall be provided for *means of egress* illumination as required in ~~in accordance with~~ Section 1006.3. The system shall be capable of powering the required load for a duration of not less than 90 minutes.

Revise the IFC as follows:

604.2.4 Means of egress illumination. Emergency power shall be provided for *means of egress* illumination in accordance with Sections 1006.3 and 1104.5.1.

1104.5.1 Emergency power duration and installation. Emergency power for means of egress illumination shall be provided in accordance with Section 604. In other than Group I-2, ~~the emergency power system shall provide power~~ shall be provided for not less than 60 minutes. ~~and consist of storage batteries, unit equipment or an on-site generator.~~ In Group I-2, ~~the emergency power system shall provide power~~ shall be provided for not less than 90 minutes. ~~and consist of storage batteries, unit equipment or an on-site generator.~~ ~~The installation of the emergency power system shall be in accordance with Section 604.~~

ELEVATORS AND PLATFORM LIFTS

NOTE: The normal convention for portraying code changes to duplicated texts is by showing the parallel section numbers (e.g., “907.5.2 (IBC [F] 907.5.2)” or “1011.6.3 (IFC [B] 1011.6.3)”). In this code change, however, for improved clarity, duplicate texts are shown for each code in this part.

Revise the IBC as follows:

[F] 2702.2.5 Elevators and platform lifts. Standby power shall be provided for elevators and platform lifts as required in Sections 1007.4, 1007.5, 3003.1, 3007.9 and 3008.9.

[F] 2702.2.5 Accessible means of egress elevators. Standby power shall be provided for elevators that are part of an accessible means of egress in accordance with Section 1007.4.

[F] 2702.2.6 Accessible means of egress platform lifts. Standby power in accordance with this section or ASME A 18.1 shall be provided for platform lifts that are part of an accessible means of egress in accordance with Section 1007.5.

[F] 2702.2.19 Elevators. Standby power for elevators shall be provided as set forth in Sections 3003.1, 3007.9 and 3008.9.

Revise the IFC as follows:

604.2.5 Accessible means of egress elevators. Standby power shall be provided for elevators that are part of an accessible means of egress in accordance with Section 1007.4.

604.2.6 Accessible means of egress platform lifts. Standby power in accordance with this section or ASME A18.1 shall be provided for platform lifts that are part of an accessible means of egress in accordance with Section 1007.5.

604.2.18 Elevators and platform lifts. Standby power shall be provided for elevators and platform lifts as required in Sections 607.2, 1007.4, and 1007.5.

Relocate IFC sections and renumber the remaining sections.

607.2 Standby power. 604.2.18 Elevators. In buildings and structures where standby power is required or furnished to operate an elevator, standby power shall be provided in accordance with Section 604. the eOperation of the system shall be in accordance with Sections 604.2.18.1 through 604.2.18.4 607.2.1 through 607.2.4.

607.2.1 604.2.18.1 Manual transfer. (No change to current text.)

607.2.2 604.2.18.2 One elevator. (No change to current text.)

607.2.3 604.2.18.3 Two or more elevators. (No change to current text.)

607.2.4 604.2.18.4 Machine room ventilation. (No change to current text.)

HORIZONTAL SLIDING DOORS

NOTE: The normal convention for portraying code changes to duplicated texts is by showing the parallel section numbers (e.g., “907.5.2 (IBC [F] 907.5.2)” or “1011.6.3 (IFC [B] 1011.6.3)”). In this code change, however, for improved clarity, duplicate texts are shown for each code in this part.

Revise the IBC as follows:

[F] 2702.2.7 Horizontal sliding doors. Standby power shall be provided for horizontal sliding doors as required in in accordance with Section 1008.1.4.3. The standby power supply shall have a capacity to operate a minimum of 50 closing cycles of the door.

Revise the IFC as follows:

604.2.7 Horizontal sliding doors. Standby power shall be provided for horizontal sliding doors as required in in accordance with Section 1008.1.4.3. The standby power supply shall have a capacity to operate a minimum of 50 closing cycles of the door.

MEMBRANE STRUCTURES

NOTE: The normal convention for portraying code changes to duplicated texts is by showing the parallel section numbers (e.g., "907.5.2 (IBC [F] 907.5.2)" or "1011.6.3 (IFC [B] 1011.6.3)"). In this code change, however, for improved clarity, duplicate texts are shown for each code in this part.

Revise the IBC as follows:

[F] 2702.2.9 Membrane structures. Standby power shall be provided for auxiliary inflation systems in permanent membrane structures as required in in accordance with Section 3102.8.2. Standby power shall be provided for a duration of not less than four hours. Auxiliary inflation systems in temporary air-supported and air-inflated membrane structures shall be provided in accordance with Section 3103.10.4 of Emergency power shall be provided for exit signs in temporary tents and membrane structures in accordance with the International Fire Code.

Revise the IFC as follows:

604.2.9 Membrane structures. Emergency power shall be provided for exit signs in temporary tents and membrane structures in accordance with Section 3103.12.6.1.

Standby power shall be provided for auxiliary inflation systems in permanent membrane structures in accordance with Section 2702 of the International Building Code. Auxiliary inflation systems shall be provided in temporary air-supported and air-inflated membrane structures in accordance with Section 3103.10.4.

3103.10.4 Auxiliary inflation systems power. Places of public assembly for more than 200 persons shall be furnished with an auxiliary inflation system capable of powering a blower with the capacity to maintain full inflation pressure with normal leakage in accordance with Section 3103.10.3 for a minimum duration of four hours. The auxiliary inflation system can be either a fully automatic auxiliary engine-generator set capable of powering one blower continuously for 4 hours, or a supplementary blower powered by an internal combustion engine which shall be automatic in operation. The system shall be capable of automatically operating the required blowers at full power within 60 seconds of a commercial power failure.

SEMICONDUCTOR FABRICATION FACILITIES

NOTE: The normal convention for portraying code changes to duplicated texts is by showing the parallel section numbers (e.g., "907.5.2 (IBC [F] 907.5.2)" or "1011.6.3 (IFC [B] 1011.6.3)"). In this code change, however, for improved clarity, duplicate texts are shown for each code in this part.

Revise the IBC as follows:

[F] 415.10.10 Emergency power system. An emergency power system shall be provided in Group H-5 occupancies in accordance with Section 2702. where required in Section 415.10.10.1. The emergency power system shall be designed to supply power automatically to required the electrical systems specified in Section 415.10.10.1 when the normal electrical supply system is interrupted.

[F] 415.10.10.1 Required electrical systems. Emergency power shall be provided for electrically operated equipment and connected control circuits for the following systems:

1. through 6. (No change to current text.)
7. Manual and automatic fire alarm systems.
8. through 11. (No change to current text.)

[F] 2702.2.8 Semiconductor fabrication facilities. Emergency power shall be provided for semiconductor fabrication facilities as required in ~~in accordance with~~ Section 415.10.10.

Revise the IFC as follows:

604.2.8 Semiconductor fabrication facilities. Emergency power shall be provided for semiconductor fabrication facilities as required in ~~in accordance with~~ Section 2703.15.

2703.15 Emergency power system. An emergency power system shall be provided in Group H-5 occupancies in accordance with ~~where required by~~ Section 604. The emergency power system shall ~~be designed to~~ supply power automatically to ~~required the~~ electrical systems specified in Section 2703.15.1 when the normal supply system is interrupted.

HAZARDOUS MATERIALS

NOTE: The normal convention for portraying code changes to duplicated texts is by showing the parallel section numbers (e.g., "907.5.2 (IBC [F] 907.5.2)" or "1011.6.3 (IFC [B] 1011.6.3)"). In this code change, however, for improved clarity, duplicate texts are shown for each code in this part.

Revise the IBC as follows:

[F] 414.5.3 Emergency or standby power. Where mechanical *ventilation*, treatment systems, temperature control, alarm, detection or other electrically operated systems are required by the *International Fire Code* or this code, such systems shall be provided with an emergency or standby power system in accordance with Section 2702 Chapter 27. ~~Exceptions: 1.~~

[F] 414.5.3.1 Exempt applications. Emergency or standby power are not required for ~~the following storage areas:~~ 1.1. Mechanical ventilation systems provided for:

1. Storage of Class IB and Class IC flammable and combustible liquids in closed containers not exceeding 6.5 gallons (25 L) capacity.
- ~~4.21.1. Storage areas for of Class 1 and 2 oxidizers.~~
- ~~4.31.2. Storage areas for of Class II, III, IV and V organic peroxides.~~
- ~~4.41.3. Storage, use and handling areas for of asphyxiant, irritant and radioactive gases.~~
- ~~4.5. For storage, use and handling areas for highly toxic or toxic materials, see Sections 6004.2.2.8 and 6004.3.4.2 of the International Fire Code.~~

[F] 414.5.3.2 Fail-safe engineered systems. Standby power for mechanical *ventilation*, treatment systems and temperature control systems shall not be required where an approved fail-safe engineered system is installed.

[F] 421.8 Standby power. Mechanical *ventilation* and gas detection systems shall be ~~connected to a provided with~~ standby power system in accordance with Section 2702 Chapter 27.

[F] 2702.2.10 Hazardous materials. Emergency or standby power shall be provided in occupancies with hazardous materials as required in ~~in accordance with~~ Sections 414.5.3 and 421.8 and the *International Fire Code*.

Revise the IFC as follows:

604.2.10 Hazardous materials. Emergency or standby power shall be provided in occupancies with hazardous materials as required in the following in accordance with sections 5004.7 and 5005.1.5:

Hazardous materials – 5001.3.3.10

Highly toxic and toxic gases - 6004.2.2.8, 6004.3.4.2

Organic peroxides - 6204.1.11

5004.7 Standby or emergency power. Where mechanical ventilation, treatment systems, temperature control, alarm, detection or other electrically operated systems are required, such systems shall be provided with an emergency or standby power system in accordance with ~~NFPA 70 and~~ Section 604.

Exceptions:

5004.7.1 Exempt applications. Standby or emergency power is not required for ~~M~~mechanical ventilation systems provided for:

1. Storage of Class IB and Class IC flammable and *combustible liquids* in closed containers not exceeding 61/2 gallons (25 L) capacity.
2. Storage ~~areas for~~ of Class 1 and 2 oxidizers.
3. Storage ~~areas for~~ of Class II, III, IV and V organic peroxides.
4. Storage ~~areas for~~ of asphyxiant, irritant and radioactive gases.
5. ~~For storage areas for highly toxic or toxic materials, see Sections 6004.2.2.8 and 6004.3.4.2.~~

5004.7.2 Fail-safe engineered systems. ~~6-~~ Standby power for mechanical ventilation, treatment systems and temperature control systems shall not be required where an *approved* fail-safe engineered system is installed.

5005.1.5 Standby or emergency power. Where mechanical ventilation, treatment systems, temperature control, manual alarm, detection or other electrically operated systems are required in this code, such systems shall be provided with an emergency or standby power system in accordance with ~~NFPA 70 and~~ Section 604.

Exceptions: ~~1-~~

5005.1.5.1 Exempt applications. Standby power for mechanical ventilation, treatment systems and temperature control systems shall not be required where an *approved* fail-safe engineered system is installed.

2. ~~Systems for highly toxic or toxic gases shall be provided with emergency power in accordance with Sections 6004.2.2.8 and 6004.3.4.2.~~

6004.2.2.8 Emergency power. Emergency power shall be provided for the following systems in accordance with the Section 604. ~~and NFPA 70 shall be provided in lieu of standby power where any of the following systems are required:~~

1. through 7. (No change to current text.)

6004.2.2.8.1 Fail-safe engineered systems. ~~Exception:~~ Emergency power is shall not be required for mechanical exhaust ventilation, treatment systems and temperature control systems where *approved* fail-safe engineered systems are installed.

6204.1.11 Standby power. Standby power ~~in accordance with Section 604 shall be provided for storage areas of Class I and unclassified detonable organic peroxide. shall be provided in accordance with~~

Section 604 for the following systems used to protect Class I and unclassified detonable organic peroxide:

1. through 7. (No change to current text.)

6204.1.11.1 Fail-safe engineered systems. Exception: Standby power shall not be required for mechanical exhaust ventilation, treatment systems and temperature control systems where *approved* fail-safe engineered systems are installed.

HIGH RISE BUILDINGS

NOTE: The normal convention for portraying code changes to duplicated texts is by showing the parallel section numbers (e.g., "907.5.2 (IBC [F] 907.5.2)" or "1011.6.3 (IFC [B] 1011.6.3)"). In this code change, however, for improved clarity, duplicate texts are shown for each code in this part.

Revise the IBC as follows:

[F] 403.4.8 Standby and emergency power. A standby power system complying with Section 2702 Chapter 27 and Section 3003 shall be provided for the standby power loads specified in 403.4.8.2. An emergency power system complying with Section 2702 shall be provided for the emergency power loads specified in Section 403.4.8.3. ~~Where elevators are provided in a high-rise building for accessible means of egress, fire service access or occupant self-evacuation, the standby power system shall also comply with Sections 1007.4, 3007 or 3008, as applicable.~~

[F] 403.4.8.1 Equipment room. Special requirements for standby power systems. If the standby or emergency power system includes is a generator set inside a building, the system shall be located in a separate room enclosed with 2-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both. System supervision with manual start and transfer features shall be provided at the *fire command center*.

[F] 403.4.8.2 Standby power loads. The following are classified as standby power loads:

1. Power and lighting for the *fire command center* required by Section 403.4.6;
2. *Ventilation* and automatic fire detection equipment for *smokeproof enclosures*; and
3. Elevators.
4. Where elevators are provided in a high-rise building for accessible means of egress, fire service access or occupant self-evacuation, the standby power system shall also comply with Sections 1007.4, 3007 or 3008, as applicable.

[F] 403.4.9 Emergency power systems. An emergency power system complying with Chapter 27 shall be provided for emergency power loads specified in Section 403.4.9.1.

[F] 403.4.9.1 403.4.8.3 Emergency power loads. The following are classified as emergency power loads:

1. Exit signs and *means of egress* illumination required by Chapter 10;
2. Elevator car lighting;
3. *Emergency voice/alarm communications systems*;
4. Automatic fire detection systems;
5. *Fire alarm* systems; and
6. Electrically powered fire pumps.

[F] 2702.2.15 High-rise buildings. Emergency and standby power systems shall be provided in high-rise buildings as required in ~~in accordance with~~ Sections 403.4.8 and 403.4.9.

Revise the IFC as follows:

604.2.14 High-rise buildings. Standby power and emergency power, light and emergency systems in high-rise buildings shall be provided as required in Section 403 of the International Building Code, and shall be in accordance with Section 604. ~~comply with the requirements of Sections 604.2.14.1 through 604.2.14.3.~~

604.2.14.1 Standby power. A standby power system shall be provided. Where the standby system is a generator set inside a building, the system shall be located in a separate room enclosed with 2-hour *fire barriers* constructed in accordance with Section 707 of the *International Building Code* or *horizontal assemblies* constructed in accordance with Section 711 of the *International Building Code*, or both. ~~System supervision with manual start and transfer features shall be provided at the fire command center.~~

604.2.14.1.1 Fuel supply. An on-premises fuel supply, sufficient for not less than 2-hour full-demand operation of the system, shall be provided.

Exception: ~~When approved, the system shall be allowed to be supplied by natural gas pipelines.~~

604.2.14.1.2 Capacity. The standby system shall have a capacity and rating that supplies all equipment required to be operational at the same time. The generating capacity is not required to be sized to operate all of the connected electrical equipment simultaneously.

604.2.14.1.3 Connected facilities. Power and lighting facilities for the *fire command center* and elevators specified in Sections 403.4.8.2 and 403.6 of the *International Building Code*, as applicable, shall be transferable to the standby source. Standby power shall be provided for at least one elevator to serve all floors and be transferable to any elevator.

604.2.14.2 Separate circuits and luminaires. Separate lighting circuits and luminaires shall be required to provide sufficient light with an intensity of not less than 1 footcandle (11 lux) measured at floor level in all *means of egress corridors, stairways, smokeproof enclosures, elevator cars and lobbies, and other areas that are clearly a part of the escape route.*

604.2.14.2.1 Other circuits. Circuits supplying lighting for the *fire command center* and mechanical equipment rooms shall be transferable to the standby source.

604.2.14.3 Emergency systems. ~~Exit signs, exit illumination as required by Chapter 10, electrically powered fire pumps required to maintain pressure, and elevator car lighting are classified as emergency systems and shall operate within 10 seconds of failure of the normal power supply and shall be capable of being transferred to the standby source.~~

Exception: ~~Exit sign, exit and means of egress illumination are permitted to be powered by a standby source in buildings of Group F and S occupancies.~~

UNDERGROUND BUILDINGS

NOTE: The normal convention for portraying code changes to duplicated texts is by showing the parallel section numbers (e.g., "907.5.2 (IBC [F] 907.5.2)" or "1011.6.3 (IFC [B] 1011.6.3)"). In this code change, however, for improved clarity, duplicate texts are shown for each code in this part.

Revise the IBC as follows:

[F] 405.8 Standby and emergency power. A standby power system complying with Section 2702 Chapter 27 shall be provided for the standby power loads specified in Section 405.8.1. An emergency power system complying with Section 2702 shall be provided for the emergency power loads specified in Section 405.8.2.

[F] 405.8.1 Standby power loads. The following loads are classified as standby power loads:

1. Smoke control system.
2. Ventilation and automatic fire detection equipment for *smokeproof enclosures*.
3. Fire pumps.
4. ~~Standby power shall be provided for e~~Elevators, ~~as required in~~ in accordance with Section 3003.

[F] 405.8.2 Pick-up time. ~~The standby power system shall pick up its connected loads within 60 seconds of failure of the normal power supply.~~

[F] 405.9 Emergency power. ~~An emergency power system complying with Chapter 27 shall be provided for emergency power loads specified in Section 405.9.1.~~

[F] 405.9.1 405.8.2 Emergency power loads. The following loads are classified as emergency power loads:

1. through 5. *(No change to current text.)*

[F] 2702.2.16 Underground buildings. Emergency and standby power shall be provided in underground buildings as required in ~~in accordance with~~ Sections 405.8 and 405.9.

Revise the IFC as follows:

604.2.15 Underground buildings. Emergency and standby power ~~systems shall be provided in~~ underground buildings covered as required in Chapter 4 Section 405 of the *International Building Code* shall comply with Sections 604.2.15.1 and 604.2.15.2. and shall be in accordance with Section 604.

604.2.15.1 Standby power. A standby power system complying with this section and NFPA 70 shall be provided for standby power loads as specified in Section 604.2.15.1.1.

604.2.15.1.1 Standby power loads. The following loads are classified as standby power loads:

1. ~~Smoke control system.~~
2. ~~Ventilation and automatic fire detection equipment for smokeproof enclosures.~~
3. ~~Fire pumps.~~
4. ~~Standby power shall be provided for elevators in accordance with Section 3003 of the *International Building Code*.~~

604.2.15.1.2 Pickup time. ~~The standby power system shall pick up its connected loads within 60 seconds of failure of the normal power supply.~~

604.2.15.2 Emergency power. ~~An emergency power system complying with this code and NFPA 70 shall be provided for emergency power loads as specified in Section 604.2.15.2.1.~~

604.2.15.2.1 Emergency power loads. The following loads are classified as emergency power loads:

1. ~~Emergency voice/alarm communication systems.~~
2. ~~Fire alarm systems.~~
3. ~~Automatic fire detection systems.~~
4. ~~Elevator car lighting.~~
5. ~~Means of egress lighting and exit sign illumination as required by Chapter 10.~~

GROUP I-3 OCCUPANCY DOOR LOCKS

NOTE: The normal convention for portraying code changes to duplicated texts is by showing the parallel section numbers (e.g., "907.5.2 (IBC [F] 907.5.2)" or "1011.6.3 (IFC [B] 1011.6.3)"). In this code change, however, for improved clarity, duplicate texts are shown for each code in this part. See Part XX for this subject in the IEBC.

Revise the IBC as follows:

[F] 408.4.2 Power-operated doors and locks. Power-operated sliding doors or power-operated locks for swinging doors shall be operable by a manual release mechanism at the door. Emergency power shall be provided for the doors and locks in accordance with Section 2702. ~~and either emergency power or a remote mechanical operating release shall be provided.~~

Exceptions:

1. Emergency power is not required in facilities with 10 or fewer locks complying with the exception to Section 408.4.1.
2. Emergency power is not required when remote mechanical operating releases are provided.

[F] 2702.2.17 Group I-3 occupancies. Emergency power shall be provided for power operated doors and locks in Group I-3 occupancies as required in ~~in accordance with~~ Section 408.4.2.

Revise the IFC as follows:

604.2.16 Group I-3 occupancies. Power-operated sliding doors or power-operated locks for swinging doors shall be operable by a manual release mechanism at the door. Emergency power shall be provided for the doors and locks in accordance with Section 604. ~~and either emergency power or a remote mechanical operating release shall be provided.~~

Exceptions:

1. Emergency power is not required in facilities with 10 or fewer locks complying with the exception to Section 408.4.1.
2. Emergency power is not required when remote mechanical operating releases are provided.

AIRPORT TRAFFIC CONTROL TOWERS

NOTE: The normal convention for portraying code changes to duplicated texts is by showing the parallel section numbers (e.g., "907.5.2 (IBC [F] 907.5.2)" or "1011.6.3 (IFC [B] 1011.6.3)"). In this code change, however, for improved clarity, duplicate texts are shown for each code in this part.

Revise the IBC as follows:

~~**[F] 2702.2.18 Airport traffic control towers.** Standby power shall be provided in airport traffic control towers in accordance with Section 412.3.4.~~

[F] 412.3.4 Standby power. A standby power system that conforms to Chapter 27 shall be provided in airport traffic control towers more than 65 feet (19 812 mm) in height. Power shall be provided to the following equipment:

1. ~~Pressurization equipment, mechanical equipment and lighting.~~
2. ~~Elevator operating equipment.~~
3. ~~Fire alarm and smoke detection systems.~~

Revise the IFC as follows:

604.2.17 Airport traffic control towers. A standby power system shall be provided in airport traffic control towers more than 65 feet (19 812 mm) in height. Power shall be provided to the following equipment:

1. ~~Pressurization equipment, mechanical equipment and lighting.~~
2. ~~Elevator operating equipment.~~
3. ~~Fire alarm and smoke detection systems.~~

SMOKE ALARMS

NOTE: The normal convention for portraying code changes to duplicated texts is by showing the parallel section numbers (e.g., "907.5.2 (IBC [F] 907.5.2)" or "1011.6.3 (IFC [B] 1011.6.3)"). In this code change, however, for improved clarity, duplicate texts are shown for each code in this part.

Revise the IBC as follows:

[F] 907.2.11.4 Power source. In new construction, required smoke alarms shall receive their primary power from the building wiring where such wiring is served from a commercial source and shall be equipped with a battery backup. Smoke alarms with integral strobes that are not equipped with battery backup shall be connected to an emergency electrical system in accordance with Section 2702. Smoke alarms shall emit a signal when the batteries are low. Wiring shall be permanent and without a disconnecting switch other than as required for overcurrent protection.

Exception: Smoke alarms are not required to be equipped with battery backup where they are connected to an emergency electrical system that complies with Section 2702.

Revise the IFC as follows:

907.2.11.4 Power source. In new construction, required smoke alarms shall receive their primary power from the building wiring where such wiring is served from a commercial source and shall be equipped with a battery backup. Smoke alarms with integral strobes that are not equipped with battery back-up shall be connected to an emergency electrical system in accordance with Section 604. Smoke alarms shall emit a signal when the batteries are low. Wiring shall be permanent and without a disconnecting switch other than as required for overcurrent protection.

Exception: Smoke alarms are not required to be equipped with battery backup where they are connected to an emergency electrical system that complies with Section 604.

EMERGENCY ALARM SYSTEMS

NOTE: The normal convention for portraying code changes to duplicated texts is by showing the parallel section numbers (e.g., "907.5.2 (IBC [F] 907.5.2)" or "1011.6.3 (IFC [B] 1011.6.3)"). In this code change, however, for improved clarity, duplicate texts are shown for each code in this part.

Revise the IBC as follows:

[F] 414.7.4 Emergency alarm systems. Emergency alarm systems shall be provided with emergency power in accordance with Section 2702.

[F] 2702.2.21 Emergency alarm systems. Emergency power shall be provided for emergency alarm systems as required by Section 414.7.4.

Revise the IFC as follows:

604.2.19 Emergency alarm systems. Emergency power shall be provided for emergency alarm systems as required by Section 414 of the International Building Code.

EMERGENCY RESPONDER RADIO COVERAGE SYSTEMS

NOTE: The normal convention for portraying code changes to duplicated texts is by showing the parallel section numbers (e.g., "907.5.2 (IBC [F] 907.5.2)" or "1011.6.3 (IFC [B] 1011.6.3)"). In this code change, however, for improved clarity, duplicate texts are shown for each code in this part.

Add a new Section 2702.2.21 to the IBC as follows:

[F] 2702.2.21 Emergency responder radio coverage systems. Standby power shall be provided for emergency responder radio coverage systems required in Section 915 and the *International Fire Code*. The standby power supply shall be capable of operating the emergency responder radio coverage system for a duration of not less than 24 hours.

Revise the IFC as follows:

510.4.2.3 Standby power. ~~Secondary power.~~ Emergency responder radio coverage systems shall be provided with an ~~approved secondary source of~~ standby power in accordance with Section 604. The ~~secondary standby~~ power supply shall be capable of operating the emergency responder radio coverage system for a period of at least duration of not less than 24 hours. ~~When primary power is lost, the power supply to the emergency responder radio coverage system shall automatically transfer to the secondary power supply.~~

604.2.19 Emergency responder radio coverage systems. Standby power shall be provided for emergency responder radio coverage systems as required in Section 510.4.2.3. The standby power supply shall be capable of operating the emergency responder radio coverage system for a duration of not less than 24 hours.

FLARING SYSTEMS FOR MECHANICAL REFRIGERATION

Revise the IFC as follows:

606.12.5 Flaring systems. Flaring systems for incineration of flammable refrigerants shall be designed to incinerate the entire discharge. The products of refrigerant incineration shall not pose health or environmental hazards. Incineration shall be automatic upon initiation of discharge, shall be designed to prevent blowback and shall not expose structures or materials to threat of fire. Standby fuel, such as LP gas, and standby power shall have the capacity to operate for one and one-half the required time for complete incineration of refrigerant in the system. Standby electrical power, where required to complete the incineration process, shall be in accordance with Section 604.

WATER SUPPLY POWER

Revise the IWUIC as follows:

404.10.3 Standby power. Standby power shall be provided to pumps, controllers and related electrical equipment so that Stationary water supply facilities within the wildland-urban interface area that are dependent on electrical power can provide the required to meet adequate water supply. The standby power system shall be demands shall provide standby power systems in accordance with Section 2702 Chapter 27 of the International Building Code, and Section 604 of the International Fire Code. and NFPA 70 to ensure that an uninterrupted water supply is maintained. The standby power source shall be capable of providing power for a minimum of two hours.

Exceptions: *(No change to current text.)*

PART II - INTERNATIONAL EXISTING BUILDING CODE

GROUP I-3 OCCUPANCY DOOR LOCKS

Revise the IEBC as follows:

IEBC 805.4.5 Emergency power source in Group I-3. Power-operated sliding doors or power-operated locks for swinging doors shall be operable by a manual release mechanism at the door. Emergency power shall be provided for the doors and locks in accordance with Section 2702 of the International Building Code.

Exceptions:

1. Emergency power is not required in facilities with 10 or fewer locks complying with the exception to Section 408.4.1.
2. Emergency power is not required where remote mechanical operating releases are provided.

~~Work areas in buildings of Group I-3 occupancy having remote power unlocking capability for more than 10 locks shall be provided with an emergency power source for such locks. Power shall be arranged to operate automatically upon failure of normal power within 10 seconds and for a duration of not less than 1 hour.~~

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: <http://www.iccsafe.org/cs/CAC/Pages/default.aspx>.

This proposal is part of a comprehensive rewrite of the I-Codes emergency and standby power requirements. Some edits are made to provide consistency in how standby power is referenced in the codes.

Part I - INTERNATIONAL FIRE CODE

Emergency voice/alarm communication systems: Emergency voice/alarm communication systems are required to include an emergency power source in IBC/IFC Section 907.5.2.2.5. A reference to these systems has been added to IBC 2702.2 and IFC 604.2. With the addition of this requirement it is no longer necessary to indicate that these systems are required in covered malls and Group A occupancies, which are just two of the many occupancies and building types that require emergency voice/alarm communication systems.

All reference in the IFC and IBC to emergency voice/alarm communication systems requires them to be provided with a source of emergency power, except for IBC Section 402.7.3. This oversight was corrected.

Smoke control systems: Smoke control systems are required to include a standby power source in IBC/IFC Section 909.11. In addition the IBC requires standby power to be provided for smoke control systems or components of the systems in Sections 404.7, 909.20.6.2, and 909.21.5. A reference to these section have been added to IBC 2702.2. By referencing section 909.20.6.2 in Section 2702.2.2, it is no longer necessary to include Section 2702.2.20 smokeproof enclosure reference.

IBC/IFC 909.11 and IMC 513.11 were rather lengthy and included requirements for standby power equipment rooms. These were broken off and put in Section 909.11.1 and 513.11.1. The reference to automatically transferring to standby power within 60 seconds is included in a separate code proposal for Sections 2702.1 and 604.1, and does not need to be repeated here.

Exit signs: The proposal updates references to emergency power requirements by including the appropriate IFC and IBC code sections that specify requirements for emergency power supply and operation of Exit Signs.

Means of egress illumination: Details on system components in 1006.3.1 have been eliminated because these are covered in the revised IFC Section 604.1 and IBC Section 2702.1 requirements. The last part of IFC Section 1006.3 was renumbered 1006.3.1 to match the format used in the equivalent IBC requirements.

Elevators and platform lifts: In IBC Section 2702.2 and IFC Section 604.2, references to three types of elevators or platform lifts were consolidated into a single reference to elevators and platform lifts.

Requirements for the specific rating of the standby systems required in 3007.9 and 3008.9 were removed since they are covered under another comprehensive rewrite of IBC Section 2702.1 and IFC Section 604.1. Elevator requirements in IFC Section 604.2.18 were relocated to IFC Section 607, which covers similar elevator requirements.

Horizontal sliding doors: The requirement for the standby power supply to have a capacity to operate a minimum of 50 opening and closing cycles of the door is based on requirements in NFPA 80, Section 9.4.2.2.2.

Membrane structures: The IBC and IFC require auxiliary inflation systems to be provided for air-supported and air-inflated membrane structures. (The IBC covers permanent membrane structures and the IFC covers temporary membrane structures). The differences are that permanent air-inflated membrane structures include standby power as covered by Section 2702 of the IBC. Temporary air-inflated membrane structures are required to include an automatic engine-generator set or a blower powered by an internal combustion engine to serve as an auxiliary inflation system in the event of a commercial power failure. These are not required to be permanently installed.

Semiconductor fabrication facilities: Automatic fire alarm systems are required to be provided with emergency power, which is consistent with NFPA 72.

Hazardous materials: Reference in Section 2702 of the IBC for emergency power for pyrophoric materials to be provided in accordance with the IFC was removed since backup power is not required in IFC Chapter 64. IBC Section 414.5.3 and IFC Section 5004.7 were reformatted with no substantive changes to the systems that do not require emergency or standby power and fail-safe engineered systems. In IBC Section 414.5.3 the requirements to provide emergency power for ventilation systems required by the IBC (or this code) were removed. This eliminates the need to provide emergency power for normal building ventilation systems as required by Section 1203. In looking at the hazardous material related systems that require a secondary power source, they all fall under the definition of emergency power system as included in NFPA 110. Therefore reference to standby power was removed from this section. References for emergency power were added to Sections 53, 54, 55, 57, 61 and 63 since these sections include requirements for system that require emergency power per Section 5001.3.3.10.

High rise buildings: The scope of IFC Section 604 covers emergency and standby power system, and yet sections 604.2.14.1 through 604.2.14.3 either duplicated requirements in revised Section 604.1, (covered under a separate proposal), or covered electrical system components that are not part of the standby or emergency power system. These requirements were eliminated. If the desire is to include these systems in the IFC they should be placed in a more appropriate location.

Underground buildings: Sections 604.2.15.1 through 604.2.15.2.1 duplicate some, but not all of the IBC requirements for underground buildings, and were therefore eliminated. If the desire is to include these details in the IFC they should be added in their entirety.

Group I-3 occupancy door locks: The proposal updates references to emergency power requirements by including the appropriate IFC and IBC code sections that specify requirements for emergency power supply and operation of power-operated door locks.

Airport traffic control towers: There is no reason to call out emergency and standby power requirements for aircraft traffic control towers. These requirements are specified for the types of electrical systems that will be provided, such as exit signs, egress illumination, elevators, smoke control, etc. In addition there is an error in some of the criteria since emergency power is required for fire alarm and smoke detection equipment and lighting of the means of egress. If the desire is to include a list of all possible emergency and standby power loads that can be included in these towers that can be done.

Smoke alarms: The proposal updates references to emergency power requirements by including the appropriate IFC and IBC code sections that specify requirements for emergency power supply and operation of Smoke Alarms.

Emergency alarms systems: Emergency power for emergency alarm systems is not currently required in either the IBC or the IFC, but it should be, based on the proposed definition of emergency power system.

Emergency responder radio coverage systems: Reference to standby power for emergency responder radio coverage systems was inadvertently left out of IBC Section 2702 and IFC Section 604.

Flaring systems for mechanical refrigeration: The proposal updates references to emergency power requirements by including the appropriate IFC code sections that specify requirements for emergency power supply and operation of flaring systems for mechanical refrigeration.

Clothes dryer exhaust systems: The proposal updates IMC references to stand-by power requirements by including the appropriate IBC code sections that specify requirements for stand-by power supply and operation of clothes dryer exhaust systems.

Water supply power: The proposal updates IWUI references to stand-by power requirements for pumps, controllers and related electrical equipment so that stationary water supply facilities within the *wildland-urban interface* by including the appropriate IFC and IBC code sections that specify requirements for stand-by power supply and operation of specified water supply equipment.

Part II - INTERNATIONAL EXISTING BUILDING CODE

Group I-3 occupancy door locks in the IEBC: The IEBC format was revised to more closely correlate with the IBC and IFC.

Cost Impact: This code change will increase the cost of construction

F59-13

PART I – INTERNATIONAL FIRE CODE

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – INTERNATIONAL EXISTING BUILDING CODE

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

604.2.1(NEW)-F-ZUBIA-FCAC

F60 – 13

604.19 (New) [IBC [F] 2702.2.21 (New)]

Proponent: Robert J Davidson, Davidson Code Concepts, LLC, representing National Renewable Energy Laboratory (NREL) (rjd@davidsoncodeconcepts.com)

Revise as follows:

604.19 (IBC [F] 2702.2.21) Hydrogen gas rooms. Standby power shall be provided for mechanical ventilation and gas detection systems in accordance with Section 5808.8.

Reason: .This proposal is primarily an editorial cleanup, the standby power is already required, it just never got added to the list of where required in IBC Section [F]2702.2 and IFC Section 604.2.

Note: There is a separate proposal to create IFC Section 5808 by copying the language from IBC Section 421. If that proposal fails the reference in proposed Section 604.19 would be IBC Section [F]421.8.

Cost Impact: The code change proposal will not increase the cost of construction.

F60-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

604.19-F-DAVIDSON

F61 – 13

605.11

Proponent: John Smirnow and Joseph H. Cain P.E. representing Solar Energy Industries Association (SEIA) (JSmirnow@seia.org)

Revise as follows:

605.11 Solar photovoltaic power systems. Solar photovoltaic power systems shall be installed in accordance with Sections 605.11.1 through 605.11.4, the International Building Code and NFPA 70.

Exception: Detached, nonhabitable Group U structures including, but not limited to, parking shade structures, carports, solar trellises and similar structures shall not be subject to the requirements of ~~this~~ Sections 605.11.2 through 605.11.3.3.

Reason: This code change proposal is the result of a consensus process established by the Solar Energy Industries Association's (SEIA) Codes and Standards Working Group. Established in 1974, SEIA is the national trade association of the U.S. solar energy industry. As the voice of the industry, SEIA works with its member companies to make solar a mainstream and significant energy source by expanding markets, removing market barriers, strengthening the industry, and educating the public on the benefits of solar energy.

Relocation of exception to a more appropriate section. The exception should not be applicable to all the requirements of Section 605.11. Markings should still be required on Group U Occupancies.

Cost Impact: No Impact on Construction Costs

F61-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.11-F-CAIN-SMIRNOW

F62 – 13

605.11, 605.11.3, 605.11.3.2, 605.11.3.3

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

605.11 Solar photovoltaic power systems. Solar photovoltaic power systems shall be installed in accordance with Sections 605.11.1 through 605.11.4, the *International Building Code* and NFPA 70.

Exception: ~~Detached, nonhabitable Group U structures including, but not limited to, parking shade structures, carports, solar trellises and similar structures shall not be subject to the requirements of this section.~~

605.11.3 Access and pathways. Roof access, pathways, and spacing requirements shall be provided in accordance with Sections 605.11.3.1 through 605.11.3.3.

Exceptions:

- ~~1. Residential structures shall be designed so that each photovoltaic array is no greater than 150 feet (45 720 mm) by 150 feet (45 720 mm) in either axis.~~
- ~~2. Panels/modules shall be permitted to be located up to the roof ridge where an alternative ventilation method approved by the fire chief has been provided or where the fire chief has determined vertical ventilation techniques will not be employed.~~

Exception: Detached, nonhabitable Group U structures including, but not limited to, parking shade structures, carports, solar trellises and similar structures.

605.11.3.2 Residential Solar photovoltaic systems for one- and two-family dwellings. ~~Access to residential Solar photovoltaic systems for one- and two-family dwellings shall be provided in accordance with Sections 605.11.3.2.1 through 605.11.3.2.45.~~

605.11.3.2.1 Size of solar photovoltaic array. Each photovoltaic array shall be limited to 150 feet (45 720 mm) by 150 feet (45 720 mm). Multiple arrays shall be separated by a 3-foot-wide (914 mm) clear access pathway.

605.11.3.2.12 Residential buildings with hip Hip roof layouts. ~~Panels/ and modules installed on residential buildings one- and two-family dwellings~~ with hip roof layouts shall be located in a manner that provides a 3-foot-wide (914 mm) clear access pathway from the eave to the ridge on each roof slope where panels/ and modules are located. The access pathway shall be located at a structurally strong location on the building capable of supporting the live load of fire fighters accessing the roof.

Exception: These requirements shall not apply to roofs with slopes of two units vertical in 12 units horizontal (2:12) or less.

605.11.3.2.23 Residential buildings with a Single ridge roofs. ~~Panels/ and modules installed on residential buildings one- and two-family dwellings~~ with a single ridge shall be located in a manner that provides two, 3-foot-wide (914 mm) access pathways from the eave to the ridge on each roof slope where panels/ and modules are located.

Exception: This requirement shall not apply to roofs with slopes of two units vertical in 12 units horizontal (2:12) or less.

605.11.3.2.34 Residential buildings with roofs with hips and valleys. Panels/ and modules installed on ~~residential buildings one- and two-family dwellings~~ with roof hips and valleys shall be located no closer than 18 inches (457 mm) to a hip or a valley where panels/modules are to be placed on both sides of a hip or valley. Where panels are to be located on only one side of a hip or valley that is of equal length, the panels shall be permitted to be placed directly adjacent to the hip or valley.

Exception: These requirements shall not apply to roofs with slopes of two units vertical in 12 units horizontal (2:12) or less.

605.11.3.2.45 Residential building Allowance for smoke ventilation operations. Panels/ and modules installed on ~~residential buildings one- and two-family dwellings~~ shall be located no higher-less than 3 feet (914 mm) ~~below from~~ the ridge in order to allow for fire department smoke ventilation operations.

Exception: Panels and modules shall be permitted to be located up to the roof ridge where an alternative ventilation method approved by the fire chief has been provided or where the fire chief has determined vertical ventilation techniques will not be employed.

605.11.3.3 Other than residential buildings one- and two-family dwellings. Access to systems for occupancies other than one- and two-family dwellings shall be provided in accordance with Sections 605.11.3.3.1 through 605.11.3.3.3.

Exception: Where it is determined by the fire code official that the roof configuration is similar to that of a one- or two-family dwelling, the residential access and ventilation requirements in Sections 605.11.3.2.1 through 605.11.3.2.4 shall be permitted to be used.

605.11.3.3.1 Access. There shall be a minimum 6-foot-wide (1829 mm) clear perimeter around the edges of the roof.

Exception: Where either axis of the building is 250 feet (76 200 mm) or less, ~~there the clear perimeter around the edges of the roof shall be permitted to be reduced to a minimum 4-foot-wide (1290 mm) clear perimeter around the edges of the roof.~~

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: <http://www.iccsafe.org/cs/CAC/Pages/default.aspx>.

This proposal is primarily an editorial clarification to Section 605.11.3. There is only one section which contains new text, it is Section 605.11.3.2.1. The sections and their revisions are noted below:

- | | |
|-----------------|---|
| 605.11 Exc: | This exception eliminates all requirements for solar PV systems located on Group U structures. This exception inadvertently eliminates the requirements for listing of components, marking and location of disconnects. This exception is relocated to Section 605.11.3 so that it only eliminates the requirements for access and pathways which will then retain the listing and marking requirements. |
| 605.11.3 Exc 1: | This exception is actually a requirement; it is not an exception. Therefore, the exception is deleted and the text has been relocated to Section 605.11.3.2.1. |
| 605.11.3 Exc 2: | This is an exception based on the need for the ability to vertically ventilate smoke through the roof. Section 605.11.3.2.5 (renumbered from 605.11.3.2.4) deals with smoke ventilation. The exception is intended to apply to a specific set of requirements regarding smoke ventilation. If the exception is left in this section, it exempts these systems from all of the requirements in this entire section. Therefore this exception has been relocated to Section 605.11.3.2.5. |
| 605.11.3.2: | The title of this section is revised to correlate with the text of the section. The text only applies to one- and two-family dwellings so the term "residential" is removed from the title. |

Also, the section is revised by deleting the reference to 'access' since the subsections deal with more than access, and additional access requirements are found in 605.11.3.1.

605.11.3.2.1: This section originates from 605.11.3 Exception 1. It is relocated to the section which applies to dwellings and is inserted as a requirement.

Additionally, the 2nd sentence is added as a new requirement. The current requirements limit the size of each PV array but provide no guidance as to the required separation between multiple PV arrays. This requirement fills that void by requiring a 3

foot separation between PV arrays. The 3 foot distance is the same spacing requirement found around PV arrays to the edge of roof or to the ridge of the roof, and provides for access around the arrays.

- 605.11.3.2.2: Renumbered from 605.11.3.2.1. The text is revised to correlate with the previous sections regarding one- and two-family dwellings.
- 605.11.3.2.3: Renumbered from 605.11.3.2.2. The text is revised to correlate with the previous sections regarding one- and two-family dwellings.
- 605.11.3.2.4: Renumbered from 605.11.3.2.3. The text is revised to correlate with the previous sections regarding one- and two-family dwellings.
- 605.11.3.2.5: Renumbered from 605.11.3.2.4. The text is revised to correlate with the previous sections regarding one- and two-family dwellings.

Additionally, the exception is added which was previously located in Section 605.11.3. This exception is based on the need for the ability to vertically ventilate smoke through the roof, and Section 605.11.3.2.5 deals with smoke ventilation.

- 605.11.3.3: The text is revised to correlate with the previous revisions regarding one- and two-family dwellings.
- 605.11.3.3.1: This exception is reworded into an actual exception which states that the required clearance is allowed to be reduced to 4', rather than requiring a clearance of 4'.

Cost Impact: This code change will not increase the cost of construction

F62-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.11 #2-F-ZUBIA-FCAC

F63 – 13

605.11, 605.11.5 (New)

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

605.11 Solar photovoltaic power systems. Solar photovoltaic power systems shall be installed in accordance with Sections 605.11.1 through ~~604.11.4~~ 605.11.5, the International Building Code and NFPA 70.

Exception: ~~Detached, nonhabitable Group U structures including, but not limited to, parking shade structures, carports, solar trellises and similar structures shall not be subject to the requirements of this Section.~~

605.11.5 Group U structures. Solar photovoltaic arrays on detached, nonhabitable Group U structures including, but not limited to, parking shade structures, carports, solar trellises and similar structures shall comply with Sections 605.11 through 605.11.2 and this section. Photovoltaic power systems on ground mounted structures shall also comply with 605.11.4.

Reason: As written the code exempts photovoltaic arrays located on detached canopies and similar structures from complying with the IBC, NFPA 70 and the important emergency responder marking requirements in Sections 605.11.1 and 605.11.2. This proposal requires these arrays to comply with these basic safety requirements, but not the access and pathway requirements in Section 605.11.3. If the group U structure is ground based it is required to also comply with the section 605.11.4 ten foot clear space requirements.

For consistency, the language chosen for this new section is similar to the wording in section 605.11.4.

Cost Impact: A cost increase will be associated with compliance with these requirements when solar PV arrays are installed on Group U occupancies

F63-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.11 #1-F-ZUBIA-FCAC

F64 – 13

605.11.1, 605.11.2

Proponent: Steve Thomas, Colorado Code Consulting, LLC representing self
(sthomas@coloradocode.net)

Revise as follows:

605.11.1 Marking. ~~Marking is required on interior and exterior direct current (DC) conduit, enclosures, raceways, cable assemblies, junction boxes, combiner boxes and disconnects.~~

605.11.1.1 Materials. ~~The materials used for marking shall be reflective, weather resistant and suitable for the environment. Marking as required in Sections 605.11.1.2 through 605.11.1.4 shall have all letters capitalized with a minimum height of 3/8 inch (9.5 mm) white on red background.~~

605.11.1.2 Marking content. ~~The marking shall contain the words "WARNING: PHOTOVOLTAIC POWER SOURCE."~~

605.11.1.3 Main service disconnect. ~~The marking shall be placed adjacent to the main service disconnect in a location clearly visible from the location where the disconnect is operated.~~

605.11.1.4 Location of marking. ~~Marking shall be placed on interior and exterior DC conduit, raceways, enclosures and cable assemblies every 10 feet (3048 mm), within 1 foot (305 mm) of turns or bends and within 1 foot (305 mm) above and below penetrations of roof/ceiling assemblies, walls or barriers.~~

605.11.2 Locations of DC conductors. ~~Conduit, wiring systems, and raceways for photovoltaic circuits shall be located as close as possible to the ridge or hip or valley and from the hip or valley as directly as possible to an outside wall to reduce trip hazards and maximize ventilation opportunities. Conduit runs between sub arrays and to DC combiner boxes shall be installed in a manner that minimizes the total amount of conduit on the roof by taking the shortest path from the array to the DC combiner box. The DC combiner boxes shall be located such that conduit runs are minimized in the pathways between arrays. DC wiring shall be installed in metallic conduit or raceways when located within enclosed spaces in a building. Conduit shall run along the bottom of load bearing members.~~

Reason: The language in these sections relate to the installation of the electrical system for photovoltaic systems. They do not belong in the fire code. The language in this section is similar to that of the NEC. They are already included in the National Electrical Code (NEC), NFPA 70 Article 690.31. The NEC is already referenced in Chapter 27 of the IBC. It states "Electrical components, equipment and systems shall be designed and constructed in accordance with the provisions of NFPA 70". Section 102.4 of the IFC states that the design and construction of buildings shall comply with the IBC. Therefore, the requirements are duplicative and are not needed in the IFC. By having similar requirements in two different codes, there is a great potential for conflicts.

It is my understanding that the original proponent of this section intended to remove the requirements after the NEC adopted requirements for PV electrical installations. They have made those additions and therefore they should be removed from the IFC.

In addition, the ICC decided many years ago to not include electrical installation requirements in any of its codes. We should maintain this position in the fire code as well.

Cost Impact: This change will not affect the cost of construction.

605.11.1-F-THOMAS

F65 – 13

605.11.1.2

Proponent: John Smirnow and Joseph H. Cain P.E. representing Solar Energy Industries Association (SEIA) (JSmirnow@seia.org)

Revise as follows:

605.11.1.2 Marking content. The marking shall contain the words "~~WARNING:~~ PHOTOVOLTAIC POWER SOURCE."

Reason: This code change proposal is the result of a consensus process established by the Solar Energy Industries Association's (SEIA) Codes and Standards Working Group. Established in 1974, SEIA is the national trade association of the U.S. solar energy industry. As the voice of the industry, SEIA works with its member companies to make solar a mainstream and significant energy source by expanding markets, removing market barriers, strengthening the industry, and educating the public on the benefits of solar energy.

This proposal will create consistency with NEC. Consistent prescribed language for labels will eliminate a conflict where multiple labels must be printed for the same purpose.

Cost Impact: This proposal will reduce construction costs by not having to have two different labels on equipment.

F65-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.11.1.2-F-CAIN-SMIRNOW

F66 – 13

605.11.2

Proponent: Dennis Grubb, Orange County Fire Authority, Representing the California Fire Chiefs Association; Kevin Reinertson, Division Chief, Representing the California State Fire Marshal's Office (adria.paesani@fountainvalley.org)

Revise as follows:

605.11.2 Locations of DC conductors. Conduit, wiring systems, and raceways for photovoltaic circuits shall be located as close as possible to the ridge or hip or valley and from the hip or valley as directly as possible to an outside wall to reduce trip hazards and maximize ventilation opportunities. Conduit runs between sub arrays and to DC combiner boxes shall be installed in a manner that minimizes the total amount of conduit on the roof by taking the shortest path from the array to the DC combiner box. The DC combiner boxes shall be located such that conduit runs are minimized in the pathways between arrays. DC wiring shall be installed in metallic conduit or raceways when located within enclosed spaces in a building. Conduit shall run along the bottom of and parallel with load bearing members.

Exception: Where it is not practical to run conduit along the bottom of or parallel with load bearing members, the conduit shall be installed a minimum of 10 inches below the roof as measured from the interior side of the roof sheathing.

Reason: The intent of 2012 International Fire Code, Section 605.11.3 for DC runs in a building is to allow firefighters to ventilate a structure without the inadvertently cutting through a live DC line and being electrocuted. Firefighters are trained not to cut through structural members so running the conduit below these members would preclude the DC line being cut. The current language does not specify the direction the DC line must follow. Running the DC line perpendicular to, but runs along the bottom of the load bearing members can easily be interpreted as code compliant. Adding "and parallel with" clearly defines what the intent of the code section is.

There are many PV system configurations when in is not practical to run the DC line directly below load bearing members. Although firefighting ventilation techniques vary slightly across the country, keeping the DC line 10 inches below the roof creates a safety zone for the chain saw to operate without compromising firefighter safety while providing flexibility in the installation.

Cost Impact: This proposal will not increase the cost of construction.

F66-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.11.2-F-GRUBB

F67 – 13

605.11.2

Proponent: John Smirnow and Joseph H. Cain P.E. representing Solar Energy Industries Association (SEIA) (JSmirnow@seia.org)

Revise as follows:

605.11.2 Locations of DC conductors. Conduit, wiring systems, and raceways for photovoltaic circuits shall be located as close as possible to the ridge or hip or valley and from the hip or valley as directly as possible to an outside wall to reduce trip hazards and maximize ventilation opportunities. Conduit runs between sub arrays and to DC combiner boxes shall be installed in a manner that minimizes the total amount of conduit on the roof by taking the shortest path from the array to the DC combiner box. The DC combiner boxes shall be located such that conduit runs are minimized in the pathways between arrays. DC wiring shall be installed in metallic conduit or raceways when located within enclosed spaces in a building. ~~Conduit shall run along the bottom of load bearing members.~~ Placement of conduit shall be in accordance with NFPA 70.

Reason: This code change proposal is the result of a consensus process established by the Solar Energy Industries Association's (SEIA) Codes and Standards Working Group. Established in 1974, SEIA is the national trade association of the U.S. solar energy industry. As the voice of the industry, SEIA works with its member companies to make solar a mainstream and significant energy source by expanding markets, removing market barriers, strengthening the industry, and educating the public on the benefits of solar energy.

NFPA 70 provides requirements for placement of conduit beneath roof surfaces, for protection of fire fighters. The requirements of NFPA 70 are more specific, and should govern the installation by reference. The NEC recognized roof ventilation techniques will not be used in the portions of roof covered by PV panels.

2011 NEC 690.31(E)(1) Beneath Roofs. Wiring methods shall not be installed within 25 cm (10 in.) of the roof decking or sheathing except where directly below the roof surface covered by PV modules and associated equipment. Circuits shall be run perpendicular to the roof penetration point to supports a minimum of 25 cm (10 in.) below the roof decking.

Cost Impact: There is no cost impact with this proposal.

F67-13

605.11.2-F-CAIN-SMIRNOW

F68 – 13

605.11.3, 605.11.3.2.5 (New)

Proponent: John Smirnow and Joseph H. Cain P.E. representing Solar Energy Industries Association (SEIA) (JSmirnow@seia.org)

Revise as follows:

605.11.3 Access and pathways. Roof access, pathways, and spacing requirements shall be provided in accordance with Sections 605.11.3.1 through 605.11.3.3.3.

Exceptions:

1. ~~Residential structures shall be designed so that each photovoltaic array is no greater than 150 feet (45 720 mm) by 150 feet (45 720 mm) in either axis.~~
2. Panels/modules shall be permitted to be located up to the roof ridge where an alternative ventilation method approved by the fire chief has been provided or where the fire chief has determined vertical ventilation techniques will not be employed.

605.11.3.2.5 Pathways. Residential structures shall be designed so that each photovoltaic array is not greater than 150 feet (45 720 mm) by 150 feet (45 720 mm) in either axis.

Reason: This code change proposal is the result of a consensus process established by the Solar Energy Industries Association's (SEIA) Codes and Standards Working Group. Established in 1974, SEIA is the national trade association of the U.S. solar energy industry. As the voice of the industry, SEIA works with its member companies to make solar a mainstream and significant energy source by expanding markets, removing market barriers, strengthening the industry, and educating the public on the benefits of solar energy.

The exception is not written correctly. It is written as a code requirement. We have relocated it to a more appropriate section by adding it to the residential occupancy section.

Cost Impact: No cost impact

F68-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.11.3 #1-F-CAIN-SMIRNOW

F69 – 13

605.11.3

Proponent: John Smirnow and Joseph H. Cain P.E. representing Solar Energy Industries Association (SEIA) (JSmirnow@seia.org)

Revise as follows:

605.11.3 Access and pathways. Roof access, pathways, and spacing requirements shall be provided in accordance with Sections 605.11.3.1 through 605.11.3.3.3.

Exceptions:

1. Residential structures shall be designed so that each photovoltaic array is no greater than 150 feet (45 720 mm) by 150 feet (45 720 mm) in either axis.
2. ~~Panels/modules shall be permitted to be located up to the roof ridge~~ Roof access, pathways, and spacing requirements need not be provided where an alternative ventilation method approved by the fire chief has been provided or where the fire chief has determined vertical ventilation techniques will not be employed.

Reason: This code change proposal is the result of a consensus process established by the Solar Energy Industries Association's (SEIA) Codes and Standards Working Group. Established in 1974, SEIA is the national trade association of the U.S. solar energy industry. As the voice of the industry, SEIA works with its member companies to make solar a mainstream and significant energy source by expanding markets, removing market barriers, strengthening the industry, and educating the public on the benefits of solar energy.

This proposal provides better language to address roof access for firefighters. The language is consistent with the charging statement. Different fire agencies have different ways to ventilate roof systems. If a fire department has a policy of not accessing roofs, the requirements for roof access are not necessary. This only applies in those cases. Where departments have a policy of accessing roofs, they will still be able to require the access pathways and spacing requirements.

Cost Impact: No cost impact

F69-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.11.3 #2-F-CAIN-SMIRNOW

F70 – 13

605.11.3, 605.11.3.2.4

Proponent: John Smirnow and Joseph H. Cain P.E. representing Solar Energy Industries Association (SEIA) (JSmirnow@seia.org)

Revise as follows:

605.11.3 Access and pathways. Roof access, pathways, and spacing requirements shall be provided in accordance with Sections 605.11.3.1 through 605.11.3.3.3.

Exceptions:

- 4- Residential structures shall be designed so that each photovoltaic array is no greater than 150 feet (45 720 mm) by 150 feet (45 720 mm) in either axis.
- 2- ~~Panels/modules shall be permitted to be located up to the roof ridge where an alternative ventilation method approved by the fire chief has been provided or where the fire chief has determined vertical ventilation techniques will not be employed.~~

605.11.3.2.4 Residential building smoke ventilation. Panels/modules installed on residential buildings shall be located no higher than 3 feet (914 mm) below the ridge in order to allow for fire department smoke ventilation operations.

Exception: Panels/modules shall be permitted to be located up to the roof ridge where an alternative ventilation method approved by the fire chief has been provided or where the fire chief has determined that vertical ventilation techniques will not be employed.

Reason: This code change proposal is the result of a consensus process established by the Solar Energy Industries Association's (SEIA) Codes and Standards Working Group. Established in 1974, SEIA is the national trade association of the U.S. solar energy industry. As the voice of the industry, SEIA works with its member companies to make solar a mainstream and significant energy source by expanding markets, removing market barriers, strengthening the industry, and educating the public on the benefits of solar energy.

This proposal relocates the exception for alternative ventilation methods to a more appropriate section. Section 605.11.3.2.4 is the section that requires the panels to be located 3 feet below the ridge. Therefore, it is a better location for the exception. It is a more specific exception to the placement of panels to the ridge.

Cost Impact: No cost impact

F70-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.11.3 #3-F-CAIN-SMIRNOW

F71 – 13

605.11.3.2

Proponent: Jennifer G. Gallegos, Development Services Department, City of San Antonio, TX, representing Self

Revise as follows:

605.11.3.2 Residential Systems for ~~one- and two-family~~ family dwellings Group R buildings.

Access to residential systems for ~~one- and two-family dwellings~~ Group R buildings shall be provided in accordance with Sections 605.11.3.2.1 through 605.11.3.2.4.

Reason: After discussions with ICC Staff, the referenced code change corrects the intent of the application of pathways to Group R buildings regulated by the International Building Code (IBC). The code proponent did not mention Group R buildings regulated by the International Residential Code (IRC) in his code change proposal or rationale. The current language has caused confusion for jurisdictions and customers as they believe that the code change applies to Group R buildings regulated by the IRC. This has place an undue hardship on Group R buildings regulated by the IRC and homeowners who now are required to comply with these provisions. The Significant Changes to the IFC 2012 Edition also states:

The provisions of Section 605.11.3 address the placement of PV arrays on building roofs. These requirements apply to buildings regulated by the IBC, including Group R-3 uses; they do not apply to buildings regulated by the International Residential Code for One- and Two-Family Dwellings (IRC).

Cost Impact: This will increase not increase the cost of construction as this code change is for clarification purposes only.

F71-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.11.3.2-F-GALLEGOS

F72 – 13

605.11.3.2, 605.11.3.3

Proponent: Tim Pate, City and County of Broomfield, CO, representing Colorado Chapter Code Change Committee

Revise as follows:

605.11.3.2 Residential systems for one- and two-family dwellings. Access to residential systems for ~~one- and two-family dwellings~~ shall be provided in accordance with Sections 605.11.3.2.1 through 605.11.3.2.4.

605.11.3.3 Other than residential buildings. Access to systems for occupancies other than ~~one- and two-family dwellings~~ residential shall be provided in accordance with Sections 605.11.3.3.1 through 605.11.3.3.3.

Exception: Where it is determined by the *fire code official* that the roof configuration is similar to that of a residential occupancy one- or two-family dwelling, the residential access and ventilation requirements in Sections 605.11.3.2.1 through 605.11.3.2.4 shall be permitted to be used.

Reason: This code change proposal will add specific language that will clarify that these new provisions for access to PV systems only apply to structures built under the IBC and not under the IRC. The new language will differentiate between residential and non residential occupancies. Residential occupancies could include an R-3 single family if being built under the IBC but would typically include multifamily residential. The proponent of this code change did not intend to make these provisions apply to IRC structures and even the book published by ICC for significant changes to the IFC says this is not to apply to IRC structures. I have already seen some confusion by Fire Departments and Fire Districts with the language “one and two family dwellings” and if it should apply to IRC structures. This added language will help clear up this confusion.

Cost Impact: Will not increase cost of construction

F72-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.11.3.2-F-PATE

F73 – 13

605.11.3.2.1, 605.11.3.3.2

Proponent: Steve Orlowski, representing National Association of Home Builders (NAHB)
(sorlowski@nahb.org)

Revise as follows:

605.11.3.2.1 Residential buildings with hip roof layouts. Panels/modules installed on residential buildings with hip roof layouts shall be located in a manner that provides a 3-foot-wide (914 mm) clear access pathway from the eave to the ridge on each roof slope where panels/modules are located. The access pathway shall be located at a ~~structurally strong~~ location on the building capable of supporting the live load of fire fighters accessing the roof.

Exception: These requirements shall not apply to roofs with slopes of two units vertical in 12 units horizontal (2:12) or less.

605.11.3.3.2 Pathways. The solar installation shall be designed to provide designated pathways. The pathways shall meet the following requirements:

1. The pathway shall be over areas capable of supporting ~~the live load of~~ fire fighters accessing the roof.
2. The centerline axis pathways shall be provided in both axes of the roof. Centerline axis pathways shall run where the roof structure is capable of supporting ~~the live load of~~ fire fighters accessing the roof.
3. Shall be a straight line not less than 4 feet (1290 mm) clear to skylights or ventilation hatches.
4. Shall be a straight line not less than 4 feet (1290 mm) clear to roof standpipes.
5. Shall provide not less than 4 feet (1290 mm) clear around roof access hatch with at least one not less than 4 feet (1290 mm) clear pathway to parapet or roof edge.

Reason: Changes proposed in this code proposal are two minor editorial fixes to remove language that is currently in the IFC. The first change is to remove the ambiguous term structurally strong, which is not only redundant it does nothing to provide the user with any new information. Roofs by default must be structurally sound and meet the required engineering design loads. None of the residential or commercial structural design manuals, nor the IRC or the IBC give a calculation value for the live load of a fire fighter, which is why we are proposing to remove this term from the IFC.

Cost Impact: The code change proposal will not increase the cost of construction.

F73-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.11.3.2.1-F-ORLOWSKI

F74 – 13

605.11.3.3.2, 605.11.3.3.3

Proponent: John Smirnow and Joseph H. Cain P.E. representing Solar Energy Industries Association (SEIA) (JSmirnow@seia.org)

Revise as follows:

605.11.3.3.2 Pathways. The solar installation shall be designed to provide designated pathways. The pathways shall meet the following requirements:

1. The pathway shall be over areas capable of supporting the live load of firefighters accessing the roof.
2. The centerline axis pathways shall be provided in both axes of the roof. Centerline axis pathways shall run where the roof structure is capable of supporting the live load of fire fighters accessing the roof.
3. Shall be a straight line not less than 4 feet (1290 mm) clear to ~~skylights~~ roof standpipes or ventilation hatches.
- ~~4. Shall be a straight line not less than 4 feet (1290 mm) clear to roof standpipes.~~
- 5 4. Shall provide not less than 4 feet (1290 mm) clear around roof access hatch with at least one not less than 4 feet (1290 mm) clear pathway to parapet or roof edge.

605.11.3.3.3 Smoke ventilation. The solar installation shall be designed to meet the following requirements:

1. Arrays shall be no greater than 150 feet (45 720 mm) by 150 feet (45 720 mm) in distance in either axis in order to create opportunities for fire department smoke ventilation operations.
2. Smoke ventilation options between array sections shall be one of the following:
 - 2.1. A pathway 8 feet (2438 mm) or greater in width.
 - 2.2. A 4-foot (1290 mm) or greater in width pathway and bordering roof skylights or smoke and heat vents on at least one side.
 - 2.3. A 4-foot (1290 mm) or greater in width pathway and bordering 4-foot by 8-foot (1290 mm by 2438 mm) “venting cutouts” every 20 feet (6096 mm) on alternating sides of the pathway.

Reason: This code change proposal is the result of a consensus process established by the Solar Energy Industries Association's (SEIA) Codes and Standards Working Group. Established in 1974, SEIA is the national trade association of the U.S. solar energy industry. As the voice of the industry, SEIA works with its member companies to make solar a mainstream and significant energy source by expanding markets, removing market barriers, strengthening the industry, and educating the public on the benefits of solar energy.

The purpose of pathways in 605.11.3.3.2 is for access for firefighters. Access is necessary for roof standpipes and ventilation hatches. Access to skylights should not have the same level of priority as equipment specifically installed for firefighting operations. Some roofs have skylights every 20 feet whereas ventilation hatches are normally required far less frequently. Buildings with numerous skylights have them primarily for interior lighting, not ventilation opportunities. Section 605.11.3.3.3 allows for the use of skylights for smoke ventilation at the areas between array sections. Removing the reference to skylights in 605.11.3.3.2 clarifies that pathways are not required to every skylight.

Arrays on buildings with few skylights will normally plan for array sections to coincide with the skylights since the skylight areas are already lost mounting space.

Cost Impact: No cost impact

F75 – 13

605.12 (New), 202 (New)

Proponent: Marcelo M Hirschler, GBH International (gbhint@aol.com)

Add new text as follows:

605.12 Abandoned wiring in plenums. Accessible portions of abandoned cables in air handling plenums in Group I occupancies shall be removed. Cables that are unused and have not been tagged for future use shall be considered abandoned.

SECTION 202 GENERAL DEFINITIONS

[M] PLENUM. An enclosed portion of the building structure, other than an occupiable space being conditioned, that is designed to allow air movement, and thereby serve as part of an air distribution system.

Reason: This new section is intended to introduce a concept that has been in the National Electrical Code (as well as in NFPA 90A) for a long time: plenums are intended for a specific use (see definition below), namely to be a part of the air distribution system so as to allow air movement. Plenums are also used (legitimately) for stringing communications and data cables as well as pipes and sprinkler pipes and other similar products. However, in actual fact, it is a common practice not to make the effort to remove products when they become obsolete. Examples include when an updated data system is being installed in the facility (and that typically occurs every 18-24 months). Normally, as the building is being rewired the old wires are cut off the grid but they are left in place and a new wiring system is added on top of them.

The tiles that often support plenums are not intended to support any significant weight and they can, therefore easily be overwhelmed by the added weight of storage or abandoned materials (such as abandoned cables). Recently, Bob Davidson and Sean DeCrane (Plenum Space Fuel Load, NFPA Annual Meeting 2009, M33) did an analysis that showed how the safety of firefighters is compromised by the weight of these abandoned cables. They point out that: "Plenum space fuel loads and wiring issues are a serious concern for fire fighters during interior firefighting operations." Their key recommendation was: "Take out the abandoned wiring!!"

Although the primary reason to recommend the removal of abandoned materials in plenums is weight, fire safety should also be taken into account.

The introduction of a requirement such as the one being proposed here has long been believed not to be enforceable. This is probably true if it were to apply to all occupancies, primarily because fire code inspectors would rarely spend their time looking into plenums in existing buildings. However, the inspection of I occupancies occurs with enough regularity that there should be no significant difficulty in having inspectors identify the existence of abandoned products, especially abandoned cables, classify them as storage and demand their removal.

The proposal recommends that only the "accessible portions" of abandoned cables be removed, because there is no intent to cause potential damage to the building or facility by attempting to remove cables or circuits that are strung through walls, floors or other building elements.

A similar, but broader, proposal was made in 2009 and disapproved (F38-09/10) with the following language: "The committee felt that the subject matter is adequately addressed in NFPA 70 where it belongs. The committee was also concerned that the proposal would put the fire code official in the role of being an electrical inspector and that these issues are manageable under the building permit process."

Unfortunately the requirement to remove abandoned cables is not being enforced. This proposal has a much more limited scope than F38-09/10 and would not require the fire code official to act as an electrical inspector because he/she would simply have to ascertain that the cables are not connected to any active circuits and not tagged before requiring their removal.

This issue is particularly suitable for Chapter 6 (and section 605) of the IFC since it addresses electrical equipment, wiring and hazards, which are not necessarily electrical hazards but address other safety issues, such as illumination, temporary wiring and unapproved conditions, compliance with all of which is being inspected by the fire code official.

Photographs of typical wiring in plenums, as found by Davidson and DeCrane, follow:

Cost Impact: Minimal

605.12 (NEW)-F-HIRSCHLER

F76 – 13

606.5 (New)

Proponent: Mona Casey, United Parents to Restrict Open Access to Refrigerant, representing the United Parents to Restrict Open Access to Refrigerant

Add new text as follows:

606.5 Access port protection. Refrigerant circuit access ports located outdoors shall be fitted with locking-type, tamper-resistant caps or shall be otherwise secured to prevent unauthorized access.

Exception: Refrigerant circuit access ports on equipment installed in controlled areas such as on roof tops with locked and alarmed access hatches or doors.

(Renumber subsequent sections.)

Reason: The purpose of this code change proposal is to add language to the code for securing refrigerant access ports, which will help reduce injuries and fatalities resulting from unauthorized access to refrigerant. Refrigerants are controlled substances that must be properly protected. The IMC currently has requirements for protection of refrigerant ports. This will add the requirements to the IFC to be consistent with the IMC. It will also provide the fire official with proper code language to enforce the requirement.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: Proposed Section 606.5 (without the exception) is identical to IMC Section 1101.10.

606.9.2 (IMC [F] 1106.5.2)

Proponent: Jeffrey M. Shapiro, International Institute of Ammonia Refrigeration
(jeff.shapiro@intlcodeconsultants.com)

Revise as follows:

606.9.2 (IMC [F] 1106.5.2) Ventilation system. A clearly identified switch of the break-glass type or with an approved tamper resistant cover shall provide on-only control of the *machinery room* ventilation fans.

Reason: Correlation with Section 606.9.1 (IMC [F]1106.5.1), which also permits a tamper resistant covered switch in lieu of a break glass type.

Cost Impact: The code change proposal will not increase the cost of construction.

F77-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

606.9.2-F-SHAPIRO

F78 – 13

606.10

Proponent: Jeffrey M. Shapiro, International Institute of Ammonia Refrigeration
(jeff.shapiro@intlcodeconsultants.com)

Revise as follows:

606.10 Emergency pressure control system. Permanently installed rRefrigeration systems containing more than 6.6 pounds (3 kg) of flammable, toxic or highly toxic refrigerant or ammonia shall be provided with an emergency pressure control system in accordance with Sections 606.10.1 and 606.10.2.

Reason: When the provisions for emergency pressure control systems were added to the code, they were provided as an alternative to manual emergency control boxes, which were previously required by some legacy codes. The emergency control box provisions didn't apply to portable refrigeration equipment, such as agricultural cooling trailers used in fields and at processing facilities, and it was never intended that emergency pressure control systems be applied to portable equipment either. Nevertheless, the current code text doesn't provide an exclusion for portable equipment, and lacking that exclusion, the intent of the code is currently unclear. The proposed revision fixes the oversight.

Cost Impact: The code change proposal will not increase the cost of construction.

F78-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

606.10-F-SHAPIO

F79 – 13

606.12

Proponent: Jeffrey M. Shapiro, International Institute of Ammonia Refrigeration

Revise as follows:

606.12 Discharge and termination of pressure relief devices and purge systems. Pressure relief devices, fusible plugs and purge systems discharging to the atmosphere from ~~for~~ refrigeration systems containing ~~more than 6.6 pounds (3 kg) of~~ flammable, toxic or highly toxic refrigerants or ammonia shall be provided with an approved discharge system as required by comply with Sections ~~606.12.1 606.12.2, 606.12.2 606.12.3 and 606.12.3 606.12.4.~~

606.12.1 Fusible plugs and rupture members. Discharge piping and devices connected to the discharge side of a fusible plug or rupture member shall have provisions to prevent plugging the pipe in the event of the fusible plug or rupture member functions.

~~606.12.1 606.12.2~~ **Flammable refrigerants.** Systems containing more than 6.6 pounds (3 kg) of flammable refrigerants having a density equal to or greater than the density of air shall discharge vapor to the atmosphere only through an *approved* treatment system in accordance with Section 606.12.54 or a flaring system in accordance with Section ~~606.12.5 606.12.6.~~ Systems containing more than 6.6 pounds (3 kg) of flammable refrigerants having a density less than the density of air shall be permitted to discharge vapor to the atmosphere provided that the point of discharge is located outside of the structure at not less than 15 feet (4572 mm) above the adjoining grade level and not less than 20 feet (6096 mm) from any window, ventilation opening or *exit*.

~~606.12.2 606.12.3~~ **Toxic and highly toxic refrigerants.** Systems containing more than 6.6 pounds (3 kg) of toxic or highly toxic refrigerants shall discharge vapor to the atmosphere only through an *approved* treatment system in accordance with Section ~~606.12.4 606.12.5~~ or a flaring system in accordance with Section ~~606.12.5 606.12.6.~~

~~606.12.3 606.12.4~~ **Ammonia refrigerant.** Systems containing more than 6.6 pounds (3 kg) of ammonia refrigerant shall discharge vapor to the atmosphere through an *approved* treatment system in accordance with Section ~~606.12.4 606.12.5~~, a flaring system in accordance with Section ~~606.12.5 606.12.6~~, or through an *approved* ammonia diffusion system in accordance with Section ~~606.12.6 606.12.7~~, or by other *approved* means.

Exceptions:

1. Ammonia/water absorption systems containing less than 22 pounds (10 kg) of ammonia and for which the ammonia circuit is located entirely outdoors.
2. When the *fire code official* determines, on review of an engineering analysis prepared in accordance with Section 104.7.2, that a fire, health or environmental hazard would not result from discharging ammonia directly to the atmosphere.

(Renumber subsequent sections)

Reason: The revisions accomplish an editorial cleanup of Section 606.12 and subordinate sections. No technical changes are intended. Section 606.12 has been revised to simply be a charging paragraph for the entire section. The requirements for individual refrigerant classes are now fully contained in the subordinate sections for each class, including the 6.6 pound threshold. The title of 606.12 has been expanded to make it clear that the content of existing section is not limited to termination of vents. This is because the existing section also covers purging, and the second sentence of 606.12 is not related to vent termination. That sentence has been separated into its own subsection, which is not restricted by refrigerant classification, because it applies to fusible plugs and rupture members for ALL refrigeration systems (this is consistent with ASHRAE 15, Section 9.7.8). The addition of "discharging to atmosphere" in Section 606.12 is consistent with the existing text in the sections governing flammable and toxic/highly toxic refrigerants and ammonia. Each of these sections contains a similar phrase, and this has been duplicated into Section 606.12 to make it clear that restrictions on vent termination do not and never have applied to relief arrangements that are internal to a system (i.e. not routed to atmosphere).

Cost Impact: The code change proposal will not increase the cost of construction.

F79-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

606.12-F-SHAPIO

F80 – 13

606.12.1 (New), Chapter 80

Proponent: Jeffrey M. Shapiro, International Institute of Ammonia Refrigeration
(jeff.shapiro@intlcodeconsultants.com)

Revise as follows:

606.12.1 Standards. Refrigeration systems and the buildings in which such systems are installed shall be in accordance with ASHRAE 15.

606.12.1.1 Ammonia Refrigeration. Refrigeration systems using ammonia refrigerant and the buildings in which such systems are installed shall comply with the following standards:

1. IIAR-2 for system design and installation
2. IIAR-6 for maintenance and inspection
3. IIAR-7 for operating procedures
4. IIAR-8 for decommissioning.

Add standards to Chapter 80 as follows:

IIAR

International Institute of Ammonia Refrigeration
1001 N. Fairfax Street, Suite 503
Alexandria, VA 22314

IIAR-2-2014 *Equipment, Design, and Installation of Closed-Circuit Ammonia Mechanical Refrigerating Systems*

IIAR-6-2014 *Maintenance and Inspection of Closed-Circuit Ammonia Mechanical Refrigerating Systems*

IIAR-7-2013 *Developing Operating Procedures for Closed-Circuit Ammonia Mechanical Refrigerating*

IIAR-8-2014 *Decommissioning of Closed- Circuit Ammonia Mechanical Refrigerating Systems*

Reason: The International Institute of Ammonia Refrigeration is completing a suite of standards to prescribe regulations for the safe design, installation, operation, maintenance, inspection and decommissioning of ammonia refrigeration systems. All of these documents will be ANSI standards. As the leading organization representing the interests of the ammonia refrigeration industry, IIAR believes that it is essential for facilities with ammonia refrigeration systems to follow the requirements in these standards, which are being written as enforceable documents, as a basis of providing for the safety of the these facilities as well as surrounding communities.

With the exception of IIAR-2, the remaining standards are at various stages of completion with respect to the ANSI process, and it is anticipated that all will be completed prior to conclusion of the 2013 ICC code cycle.

Note that IIAR-2 is already adopted by the IMC, and it is being proposed for adoption by the IFC as well because the standard includes requirements governing refrigerant leak detection alarms and other topics scoped to the IFC.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, IIAR-6, -7 and -8, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28), will be posted on the ICC website on or before April 1, 2013. IIAR-2-99 with 2005 addendum is currently referenced in the IMC. An update in the year edition of that standard will be accomplished by an administrative standards update code change to be heard by the ADM Code Development Committee.

F80-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

606.12.1 (NEW)-F-SHAPIRO

F81 – 13

606.12.3

Proponent: Jeffrey M. Shapiro, International Institute of Ammonia Refrigeration
(jeff.shapiro@intlcodeconsultants.com)

Revise as follows:

606.12.3 Ammonia refrigerant. Systems containing more than 6.6 pounds (3 kg) of ammonia refrigerant shall discharge vapor to the atmosphere in accordance with one of the following methods: ~~through an approved treatment system in accordance with Section 606.12.4, a flaring system in accordance with Section 606.12.5, or through an approved ammonia diffusion system in accordance with Section 606.12.6, or by other approved means.~~

Exceptions: 4- Ammonia/water absorption systems containing less than 22 pounds (10 kg) of ammonia and for which the ammonia circuit is located entirely outdoors.

- ~~1.2-Directly to atmosphere~~ When the fire code official determines, on review of an engineering analysis prepared in accordance with Section 104.7.2, that a fire, health or environmental hazard would not result from atmospheric dischargeing of ammonia directly to the atmosphere
2. Through an approved treatment system in accordance with Section 606.12.4
3. Through a flaring system in accordance with Section 606.12.5
4. Through an approved ammonia diffusion system in accordance with Section 606.12.6
5. By other approved means.

Reason: Exception 2 in the current text isn't really an exception. It's just another discharge option in addition to the four that are listed in the current base paragraph. The proposed revision restructures the existing text to make this clear, and it duplicates the 6.6 pound threshold currently provided in the parent paragraph (606.12) for clarity. No technical change is intended.

Cost Impact: The code change proposal will not increase the cost of construction.

F81-13

Public Hearing: Committee:	AS	AM	D
Assembly:	ASF	AMF	DF

606.12.3-F-SHAPIRO

F82 – 13

607.4 (New)

Proponent: Brian Black, BDBlack Codes, Inc., representing National Elevator Industry Inc.
(bdbblack@neii.org)

Add new text as follows:

607.4 Occupant evacuation elevator lobbies. Where occupant evacuation elevators are provided in accordance with Section 3008 of the *International Building Code*, occupant evacuation elevator lobbies shall be maintained free of storage and furniture.

[Renumber subsequent sections]

Reason: The proposed text replicates an identical requirement in Section 607.3 for fire service access elevators. It is just as important for occupant evacuation elevator lobbies to be maintained free of storage and furniture if the elevators are to be available and safe for building occupants to use this system to evacuate the building in case of fire.

Cost Impact: The code change proposal will not increase the cost of construction.

F82-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

607.4 (NEW) #1-F-BLACK

F83 – 13

607.4 (New)

Proponent: Brian Black, BDBlack Codes, Inc., representing National Elevator Industry Inc.
(bdbblack@neii.org)

Add new text as follows:

607.4 Water protection of hoistway enclosures. Methods to prevent water from infiltrating into a hoistway enclosure required by Section 3007.4 and Section 3008.4 of the *International Building Code* shall be maintained.

[Renumber subsequent sections]

Reason: The referenced sections of the International Building Code provide performance criteria to ensure that water from the operation of an automatic sprinkler system outside of an enclosed fire service access or occupant evacuation elevator lobby does not enter the hoistway and compromise the function of the elevator. Drains in the lobbies or drainage trenches at the hoistway door openings are two of many ways these requirements can be met. As drain openings are subject to clogging by dirt and debris, it is important that the integrity of these systems be maintained if the elevators are to remain function in case of a fire.

Cost Impact: The code change proposal will not increase the cost of construction.

F83-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

607.4 (NEW) #2-F-BLACK

F84 – 13

607.5, 607.5.1, 607.5.2, 607.5.3

Proponent: Brian Black, BDBlack Codes, Inc., representing National Elevator Industry Inc. (bdbblack@neii.org)

Revise as follows:

607.5 Standardized fire service elevator keys. Buildings with elevators equipped with Phase I emergency recall, Phase II emergency in-car operation, or a fire service access elevator shall be equipped to operate with a standardized fire service elevator key ~~approved by the fire code official complying with ASME A17.1/CSA B44.~~

Exception: ~~The owner shall be permitted to place the building's nonstandardized fire service elevator keys in a key box installed in accordance with Section 506.1.2.~~

607.5.1 Requirements for standardized fire service elevator keys. ~~Standardized fire service elevator keys shall comply with all of the following:~~

- ~~1. All fire service elevator keys within the jurisdiction shall be uniform and specific for the jurisdiction. Keys shall be cut to a uniform key code.~~
- ~~2. Fire service elevator keys shall be of a patent-protected design to prevent unauthorized duplication.~~
- ~~3. Fire service elevator keys shall be factory restricted by the manufacturer to prevent the unauthorized distribution of key blanks. No uncut key blanks shall be permitted to leave the factory.~~
- ~~4. Fire service elevator keys subject to these rules shall be engraved with the words "DO NOT DUPLICATE."~~

607.5.2 Access to standardized fire service keys. ~~Access to standardized fire service elevator keys shall be restricted to the following:~~

- ~~1. Elevator owners or their authorized agents.~~
- ~~2. Elevator contractors.~~
- ~~3. Elevator inspectors of the jurisdiction.~~
- ~~4. Fire code officials of the jurisdiction.~~
- ~~5. The fire department and other emergency response agencies designated by the fire code official.~~

607.5.3 Duplication or distribution of keys. ~~No person shall duplicate a standardized fire service elevator key or issue, give, or sell a duplicated key unless in accordance with this code.~~

607.5.4 Responsibility to provide keys. The building owner shall provide up to three standardized fire service elevator keys where required by the fire code official, upon installation of a standardized fire service key switch or switches in the building.

Reason: The National Elevator Industry Inc. (NEII) agrees with the reason this section was added to the 2012 International Fire Code, that firefighters need a standardized fire service elevator key that is secure and that will work throughout a jurisdiction. However, this is already a requirement in the ASME A17.1/CSA B44 Safety Code for Elevators and Escalators referenced by the International Fire Code:

ASME A17.1-2010/CSA B44-10
SECTION 2.27
EMERGENCY OPERATION AND SIGNALING DEVICES

2.27.8 Switch Keys

The key switches required by 2.27.2 through 2.27.5 for all elevators in a building shall be operable by the FEO-K1 key. The keys shall be Group 3 Security (see 8.1). A separate key shall be provided for each switch. These keys shall be kept on the premises in a location readily accessible to firefighters and emergency personnel, but not where they are available to the public. This key shall be of a tubular, 7 pin, style 137 construction and shall have a biting code of 6143521 starting at the tab sequenced clockwise as viewed from the barrel end of the key. The key shall be coded "FEO-K1." The possession of the "FEO-K1" key shall be limited to elevator personnel, emergency personnel, elevator equipment manufacturers, and authorized personnel during checking of Firefighters' Emergency Operation (see 8.1 and 8.6.11.1).

Where provided, a lock box, including its lock and other components, shall conform to the requirements of UL 1037 (see Part 9).

NOTE (2.27.8): Local authorities may specify additional requirements for a uniform keyed lock box and its location to contain the necessary keys.

Group 3 Security is specified in Section 8.1:

8.1.4 Group 3: Emergency Operation

Group 3 covers access or operation of equipment by emergency, authorized, and elevator personnel.

Simply, this requirement is unnecessary because the need it purports to address is already covered by the code's referenced standard. However, there is a greater problem with having a requirement in the International Fire Code that conflicts with the firefighter key requirements of ASME A17.1/CSA B44.

The proponents of this code provision proposed in the 2012 cycle dismissed the conflict between the IFC and ASME code by claiming that Section 102.7 of the IFC resolves this by stating, "Where differences occur between the provisions of this code and the referenced standards, the provisions of this code apply." This argument may be true for most codes and standards referenced in the I-Codes, but is incorrect in this case.

In many jurisdictions in the United States (e.g., Wisconsin) the building code, fire code and elevator code are enacted by different pieces of legislation and regulated by entirely different state or municipal rules and agencies. Because of this, one department enforces the fire code, another the elevator code, and neither official is obligated or legally able to recognize the requirements of the other. In other words, Section 102.7 of the IFC does not "trump" the laws and rules that adopt and regulate these jurisdictions' elevator codes.

The result is that the State Fire Marshall will require one firefighters' elevator key (the IFC key), the Chief Elevator Inspector will require another (The ASME A17.1 FEO-K1 key), neither will have priority over the other, and the building owner will be continuously in violation of one law or the other.

The other major problem with this new section of the code is that, unlike the demands placed on proponents for most I-Code changes, no evidence was offered to support the need for this change. There was (and is) no evidence that firefighters have been hampered in fighting a building fire because some unauthorized person was using an ASME A17.1 FEO-K1 key at the time. No loss of life or property because some pizza delivery person was able to acquire a firefighter elevator key on the internet (as alleged in the testimony on this code change) and deny elevator use for firefighters or emergency personnel.

Ironically, we found that in Massachusetts the only reported misuses of firefighter keys were by EMTs. EMTs are authorized to be given the special IFC fire key by the existing code text!

A Captain in the Toronto Fire Department who has fought countless high-rise fires in his career dismissed the need for some special fire service elevator key that exceeds the requirements of ASME A17.1/CSA B44 by asking, "What can you do with it? Ride an elevator up and down, up and down until you're bored or sick?" As dismissive as the Captain's statement may be, it demonstrates how unnecessary it is for the IFC to create special requirements for keys that conflict with the ASME requirements that have been in place (and referenced by the IFC and IBC) for years. This code section "solves" a problem that does not exist while creating many more for the Fire Marshall, Elevator Inspector, and building owner.

Cost Impact: The code change proposal will not increase the cost of construction.

F84-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

607.5-F-BLACK

F85 – 13

608.1.1 (New)

Proponent: Ronald Marts, Telcordia, representing AT&T, Verizon, CenturyLink (rmarts@telcordia.com)

Add new text as follows:

608.1.1 Applicability. The requirements in Section 608 shall supersede all the hazardous material designations, permits, and requirements in Chapter 50.

Reason: Chapter 50 does a good job of identifying 14 exceptions to Hazardous Materials. Number 7 is battery systems as regulated in Section 608. Section 608 needs to identify itself as one of those exceptions, thus cross-referencing to Chapter 50.

Many fire and local code officials have insisted that battery systems are hazardous, forcing owners to identify these spaces as Hazardous Uses and imposing restrictions and further requirements on their operations of the space. This in turn increases the expense to the user and incorrectly identifies the space hazards to occupants and emergency responders. The requirements by code officials to obtain a Hazardous Materials Operating Permit and submit Hazardous Materials Inventory Statement, or Hazardous Materials Management Plan are removed by the development and use of this Chapter.

The requirement for the user to report site gross quantities of sulfuric acid in compliance with SARA Title III does not constitute the installation as a hazardous material installation per Section 608 of the code.

Section 608 discusses batteries that are in use, not those batteries that are in storage, such as a warehouse, waiting for shipment to be used.

Section 608 was taken from Article 64 of the UFC, and has been modified over the last few cycles to include new technologies of batteries. Article 64 was written to properly represent the use of Stationary Battery Systems and address specific installation and operational concerns. This early development and adoption was worked out among the Uniform Fire Code (UFC) staff, several regional fire chiefs associations throughout the country, Telcordia and Hughes Associates. Article 64 was accepted during the code hearings in Spokane Washington in August of 1994.

Cost Impact: None.

	Assembly:	ASF	AMF	DF

608.1.1 (NEW)-F-MARTS

F86 – 13

608.6.1 (IMC [F] 502.4.1), Chapter 80 (IMC Chapter 15)

Proponent: Ronald Marts, Telcordia, representing AT&T, Verizon, CenturyLink (rmarts@telcordia.com)

Revise as follows:

608.6.1 Room ventilation. Ventilation shall be provided in accordance with the *International Mechanical Code* and the following:

1. (IMC [F] 502.4.1) For flooded lead-acid, flooded Ni-Cad and VRLA batteries, the ventilation system shall be designed to limit the maximum concentration of hydrogen to 1.0 percent of the total volume of the room in accordance with IEEE 1635 / ASHRAE 21; or
2. (IMC [F] 502.4.2) Continuous ventilation shall be provided at a rate of not less than 1 cubic foot per minute per square foot (1 ft³/min/ft²) [0.0051 m³/s × m²] of floor area of the room.

Exception: Lithium-ion and lithium metal polymer batteries shall not require ventilation

Add new standard to Chapter 80 (IMC Chapter 15) as follows:

IEEE

IEEE Operations Center
445 Hoes Lane
Piscataway, NJ 08854-4141 USA
Phone: +1 732 981 0060

IEEE-1635/ASHRAE 21-12 Guide for the Ventilation and Thermal Management of Batteries for Stationary Applications

Reason: The option to ventilate the space based on the designed hydrogen concentration in option 1 is very beneficial to battery users. This typically provides for a lower ventilation rate than option 2, which saves energy, reduces equipment contamination from outdoor sources, and improves equipment reliability and longevity. As noted in the previous submittal, the IEEE 1635 / ASHRAE 21 Guide to Battery Room Ventilation and Thermal Management provides several useful formulae in determining minimum recommended rates of ventilation so not to exceed the 1.0 percent maximum concentration of hydrogen for the room. For spaces containing batteries, the use of this document provides definitive and accurate calculations to meet the criteria of Section 608.6.1.

As noted above, the new Guide was developed by leaders in both the battery community and the ventilation (ASHRAE) community. IEEE Stationary Battery Committee has published over a dozen standards for battery installation, maintenance, and spill concerns for most existing battery technologies. Including a direct reference to the guide in the standard would facilitate safe and efficient ventilation of the battery spaces.

Cost Impact: None.

Analysis: A review of the standard proposed for inclusion in the code, IEEE-1635/ASHRAE 21-12, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28), will be posted on the ICC website on or before April 1, 2013.

Proponent: Ronald Marts, Telcordia, representing AT&T, Verizon, CenturyLink (rmarts@telcordia.com)

Delete without substitution:

~~**608.6.3 (IMC [F] 502.5.3) Supervision.** Mechanical ventilation systems where required by Sections 608.6.1 and 608.6.2 shall be supervised by an approved central, proprietary or remote station service or shall initiate an audible and visual signal at a constantly attended on-site location.~~

Reason: This requirement was added to the code to assure that ventilation systems operate so as to prevent the buildup of hydrogen gas in the battery room. Experience has shown that the risk of hydrogen buildup in an indoor battery plant installation is extremely low. In normal use, batteries generate little hydrogen gas, and present a very low hydrogen gas hazard. This is noted in manufacturer documentation, proven via testing, and supported by many years of user experience in thousands of locations.

To further detail expected levels of hydrogen and recommended ventilation rates for battery rooms, ASHRAE and IEEE working groups jointly created a new document: IEEE 1635 / ASHRAE 21 Guide to Battery Room Ventilation and Thermal Management. This document focuses primarily on personnel safety hazards from stationary battery plants that can be mitigated through minimal ventilation and thermal management.

IEEE is the world's largest professional association dedicated to advancing technological innovation and excellence for the benefit of humanity. IEEE provides electrical engineering information worldwide via publications, conferences, technology standards, and professional and educational activities.

IEEE has broad industry representation and expertise on stationary battery technologies. IEEE Stationary Battery Committee has published over a dozen standards for battery installation, maintenance, , and spill concerns for most existing battery technologies.

ASHRAE is a building technology society with more than 50,000 members worldwide. The Society and its members focus on building systems, energy efficiency, indoor air quality and sustainability within the industry. Activities include research, standards writing, publishing and continuing education. The mission of ASHRAE is to advance the arts and sciences of heating, ventilating, air conditioning and refrigerating to serve humanity and promote a sustainable world.

Using the formulae in the new guide, it can be shown that it would take months in most normal-sized sealed battery rooms with zero ventilation to reach the lower flammability limit (4% for Hydrogen).

Long before that ever happens, the lack of ventilation would produce a room temperature alarm; thus making the need to independently alarm and monitor the ventilation system unnecessary.

In worst case scenarios, the recommended ventilation levels are very low. The ventilation system does not need to run constantly to achieve the recommended ventilation rate. Excessive ventilation is not desirable as it wastes energy, potentially contributing to global warming and climate change. Alarming an intermittent ventilation system is results in false alarms and c is counterproductive.

Per IEEE 1635 / ASHRAE 21 Guide to Battery Room Ventilation and Thermal Management, remote alarms of mechanical ventilation failure are not required. Furthermore, there is no requirement in the guide for supervision of alarms via a central station. This current Supervision requirement was added to code during the code change hearings in Orlando in the fall of 2006. After lengthy testimony, the committee voted in favor of rejecting the proposed change. The proponent asked for a floor vote, which overturned the committee's rejection by a very small margin. This change was made in response to a widely publicized event that occurred in an unoccupied, non-ventilated installation, where batteries were left on charge for several months after a building was abandoned? The explosion resulted from batteries that were essentially abused and not maintained in accordance with industry practices, and is not reflective of battery safety overall.

Supervision of mechanical ventilation systems for compliance with this requirement is very expensive, complicates installations, and is totally unnecessary given the fire history of stationary battery installations

Cost Impact: This change, if adopted, will save money.

F87-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

608.6.3-F-MARTS

F88 – 13

608.7.1

Proponent: Ronald Marts, Telcordia, representing AT&T, Verizon, CenturyLink (rmarts@telcordia.com)

Revise as follows:

608.7.1 Equipment room and building signage. Doors into electrical equipment rooms or buildings containing stationary battery systems shall be provided with *approved* signs. The signs shall state that:

1. The room contains energized battery systems.
2. The room contains energized electrical circuits.
3. The battery electrolyte solutions, where present, are *corrosive* liquids.

Reason: The existing wording is confusing, as it indicates that if signage is on the outside of the building, that the entire building contains energized batteries and electrical systems, and electrolyte.

The signage is meant to identify that room or space within the building where these systems exist.

Cost Impact: None

F88-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

608.7.1-F-MARTS

F89 – 13

608.7.2 (New)

Proponent: Ronald Marts, Telcordia, representing AT&T, Verizon, CenturyLink (rmarts@telcordia.com)

Add new text as follows:

608.7.2 Specifications. The sign shall be minimum 1/2" block letters in black on a white background.

(Renumber subsequent sections)

Reason: Need to clarify signage requirements. For the sake of first responders, it is prudent to have consistency in the design of the sign.

Cost Impact: None

F89-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

608.7.2 (NEW)-F-MARTS

F90 – 13

609.2

Proponent: Barry Greive, representing Target Corporation (barry.greive@target.com)

Revise as follows:

609.2 Where required. A Type I hood shall be installed at or above all commercial cooking appliances and domestic cooking appliances used for commercial purposes that produce grease vapors.

Exception: A Type I hood shall not be required for an electric cooking appliance where an approved testing agency provides documentation that the appliance effluent contains 5 mg/m³ or less of grease when tested at an exhaust flow rate of 500 cfm (0.236 m³/s) in accordance with Section 17 of UL 710B

Reason: This proposal is intended to bring consistency between the Fire Code and Mechanical Code provisions.

Section 609.1 of the Fire Code states that "Commercial kitchen exhaust hoods shall comply with the requirements of the International Mechanical Code." This statement lends itself to imply that they should be consistent. There are many situations where the amount of grease is very low to almost non-existent and a type 1 hood is not needed. This exception will bring greater consistency between the codes, better clarity to when a type 1 hood is needed, and a test method that must be followed to show compliance.

Cost Impact: This will not increase the cost of construction.

F90-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

609.2-F-GRIEVE

F91 – 13

609.3.3.2, Chapter 80

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

609.3.3.2 Grease accumulation. If during the inspection it is found that hoods, grease-removal devices, fans, ducts or other appurtenances have an accumulation of grease, such components shall be cleaned in accordance with ANSI/IKECA C-10.

Add new standard to Chapter 80 as follows:

IKECA

International Kitchen Exhaust Cleaning Association
100 North 20th, Street, Suite 400
Philadelphia, PA 19103

C10-2011 *Standard for Cleaning of Commercial Kitchen Exhaust Systems...* 609.3.3.2

Reason: Commercial kitchen exhaust systems remove smoke, soot and grease-laden vapor resulting from cooking operations. These systems become contaminated with grease and cooking by-products over time. Accumulations of these combustible contaminants create a fire safety hazard to workers, patrons, other building occupants and property. Mitigation of this hazard requires periodic cleaning of commercial kitchen exhaust systems.

The first edition of ANSI/IKECA C10-2011, *Standard for Cleaning of Commercial Kitchen Exhaust Systems*, was developed by the IKECA Standards Development Committee Consensus Body. It approved the standard on September 1, 2011. It was approved as an American National Standard by the American National Standards Institute (ANSI) on December 9, 2011.

For many years, the commercial kitchen exhaust cleaning industry has relied on certain codes and standards. ANSI/IKECA C10 addresses many of the areas that these other standards and codes do not cover. The other codes include the *International Fire Code*® (Section 609 Commercial Kitchen Hoods; 904 Alternative Automatic Fire-Extinguishing Systems, including: 904.2.1 Hood suppression systems; 904.3.2 Actuation; 904.3.3 System interlocking; 904.3.5 Monitoring; 904.11 Commercial cooking systems; 904.11 thru 904.11.6.5), the *International Mechanical Code*® (Section 202 General Definitions; 506 Commercial Kitchen Grease Ducts and Exhaust Equipment; 507 Commercial Kitchen Hoods; 508 Commercial Kitchen Make Up Air; 509 Fire Suppression Systems; 917 (Solid Fuel) Cooking Appliances), the *ASHRAE® Handbook HVAC Applications* (Chapter 31, Ventilation of the Industrial Environment), and the *NFPA 96®*, *Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations*.

ANSI/IKECA C-10 is intended to determine the frequency and necessity for commercial kitchen exhaust system cleaning through inspection procedures, to define acceptable methods for cleaning exhaust systems and components, and to set standards for acceptable post-cleaning cleanliness.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: <http://www.iccsafe.org/cs/CAC/Pages/default.aspx>.

This standard applies to, but is not limited to, Type I exhaust systems. This standard does not apply to residential kitchen exhaust systems, replacement air systems, fire extinguishing systems, heating and air-conditioning systems, dryer exhaust systems, and toilet exhaust systems.

The purpose of this standard is to enhance public safety by reducing the potential fire safety hazards associated with commercial kitchen exhaust systems through the performance of professional cleaning services, irrespective of the type of cooking equipment used and whether used in public or private facilities.

About IKECA: The International Kitchen Exhaust Cleaning Association (IKECA) formed in 1989 and became an ANSI accredited standards developer in 2008. IKECA was founded by a small group of exhaust kitchen exhaust cleaning specialists who were attending the same meeting. They had similar beliefs in the importance of proper and complete exhaust cleaning to the fire protection world. Within two years, these founders had created the first non-profit trade association for the kitchen exhaust cleaning industry.

Today, IKECA members represent some of the best in the industry from around the world. They are proud to have made significant contributions to the decrease in commercial kitchen fires in the U.S. The current membership is approximately 250. Headquartered in Philadelphia, IKECA is a member of the International Code Council. For more information, visit www.ikeca.org.

Additionally this Standard covers the required documentation associated with the cleaning and inspections of kitchen exhaust hoods. Currently there is no Standard recognized by the IFC for this purpose, and adoption of this Standard will enhance code compliance and enforcement.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: <http://www.iccsafe.org/cs/CAC/Pages/default.aspx>.

Cost Impact: This code change will not increase the cost of construction

Analysis: A review of the standard proposed for inclusion in the code, IKECA C10-2011, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28), will be posted on the ICC website on or before April 1, 2013.

	Assembly:	ASF	AMF	DF

609.3.3.2-F-ZUBIA-FCAC

F92 – 13

609.3.3.2, 609.3.3.3.1 (New), Chapter 80

Proponent: Robert Marshall, Contra Costa County Fire Protection District representing self
(rmars@cccfd.org)

Revise as follows:

609.3.3.2 Grease accumulation. If during the inspection it is found that hoods, grease-removal devices, fans, ducts or other appurtenances have an accumulation of grease, such components shall be cleaned in accordance with ANSI/IKECA C-10.

609.3.3.3.1 Labels. Where a commercial kitchen hood or ducting system is inspected, a certificate, label or tag containing the service provider name, address, telephone number and date of service shall be affixed to the hood in a conspicuous location. Prior certificates, labels or tags shall be covered or removed.

Add new standard to Chapter 80 as follows:

IKECA

International Kitchen Exhaust Cleaning Association
100 North 20th Street, Suite 400
Philadelphia, PA 19103

C10-2011 Standard for Cleaning of Commercial Kitchen Exhaust Systems, 2011 609.3.3.2

Reason: The proposed text clarifies necessary marking requirements to visually confirm serviceability of commercial kitchen hood and ducting systems. The text is consistent with the requirements set forth in ANSI/IKECA C-10, which is proposed for adoption by code change (Insert Code Change Number for Proposal that inserts new section 609.3.3.2).

ANSI/IKECA C-10 is an ANSI accredited nationally recognized standard prescribing pre-cleaning inspections, protection of the equipment, control of the waste and the cleaning process. Additionally this Standard covers the required documentation associated with the cleaning and inspections of kitchen exhaust hoods. Currently there is no Standard recognized by the IFC for this purpose, and adoption of this Standard will enhance code compliance and enforcement.

Cost Impact: This proposal will not increase the cost of construction

Analysis: A review of the standard proposed for inclusion in the code, IKECA C10-2011, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28), will be posted on the ICC website on or before April 1, 2013.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

609.3.3.2-F-MARSHALL

F93 – 13

609.3.3.3.1 (New)

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Add new text as follows:

609.3.3.3 Records. Records for inspections shall state the individual and company performing the inspection, a description of the inspection and when the inspection took place. Records for cleanings shall state the individual and company performing the cleaning and when the cleaning took place. Such records shall be completed after each inspection or cleaning, maintained on the premises for a minimum of three years and be copied to the *fire code official* upon request.

609.3.3.3.1 Tags. Where a commercial kitchen hood or duct system is inspected, a tag containing the service provider name, address, telephone number and date of service shall be provided in a conspicuous location. Prior tags shall be covered or removed.

Reason: The proposed text clarifies necessary marking requirements to visually confirm serviceability of commercial kitchen hood and ducting systems. The text is consistent with the requirements set forth in ANSI/IKECA C-10, which is proposed for adoption by a separate code change proposal submitted by the F-CAC.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: <http://www.iccsafe.org/cs/CAC/Pages/default.aspx>.

Cost Impact: This code change will not increase the cost of construction

	Assembly:	ASF	AMF	DF

609.3.3.3.1 (NEW)-F-ZUBIA-FCAC

F94 – 13

609.4 (New), Chapter 80

Proponent: James Carver, City of El Segundo Fire Department, representing City of El Segundo
(jcarver@elsegundo.org)

Add new text as follows:

609.4 Appliance connection to building piping. Gas-fired commercial cooking appliances installed on casters and appliances that are moved for cleaning and sanitation purposes shall be connected to the piping system with an appliance connector listed as complying with ANSI Z21.69. The commercial cooking appliance connector installation shall be configured in accordance with the manufacturer's installation instructions. Movement of appliances with casters shall be limited by a restraining device installed in accordance with the connector and appliance manufacturer's instructions.

Add new standard to Chapter 80:

ANSI

American National Standards Institute
25 West 43rd Street
Fourth Floor
New York, NY 10036

Z21.69/CSA 616-09 Connectors for Movable Gas Appliances

Reason: The end users of commercial cooking appliances are replacing listed flexible piping with residential flexible piping, causing mechanical damage to the residential flexible piping when the cooking equipment is moved for cleaning, and causing a fire/life safety problem with gas leaks and fires. A similar section exists in the California Plumbing Code, and while it would be followed during initial installation by the plumbing inspector, maintenance of the code section requirements could not be verified by the fire inspector unless it was put into the Fire Code.

Cost Impact: None, the user is complying with existing code requirements.

Analysis: The proposed text is similar to IFGC Section 411.1.1 as revised by code change FG24-12 (AMPC). The standard proposed for inclusion in the code, ANSI Z21.69/CSA 616-09, is currently referenced in the IFGC.

609.4 (NEW)-F-CARVER

F95 – 13

610.1, 610.2, 610.3 (New), 610.4, 610.5, 610.6 (New), 610.7, 5701.2, Chapter 80

Proponent: Andy Burke, Restaurant Technologies, Inc, representing self (aburke@rti-inc.com)

Revise as follows:

610.1 General Commercial Kitchen Cooking Oil Storage Tank Systems. Storage of cooking oil (grease) in commercial cooking operations utilizing aboveground tanks with a capacity greater than 60 gal (227 L) installed within a building shall comply with Chapter 57 Sections 610.2 through 610.7. ~~Systems used to store cooking oils in larger than 60-gallon (227 L) above-ground tanks shall also comply with Sections 610.2 through 610.5.~~ For purposes of this section, cooking oil shall be classified as a Class IIIB liquid unless otherwise determined by testing.

610.2 Metallic Storage Tanks. Metallic cooking oil storage tanks shall be listed in accordance with UL 142 or UL 80, and shall be installed in accordance with ~~Section 5704~~ and the tank manufacturer's instructions.

610.3 Nonmetallic Storage Tanks. Nonmetallic cooking oil storage tanks shall be installed in accordance with the tank manufacturer's instructions and shall also comply with all of the following:

1. Tanks shall be designed in accordance with ASTM D1998 unless otherwise approved.
2. Tank capacity shall not exceed 200 gallons per tank.
3. Tanks shall be suitable for use with cooking oil and the maximum temperature to which the tank will be exposed during use.

~~610.3~~ **610.4 Other Storage Components Cooking Oil Storage System Components.** Cooking oil storage system components ~~including~~ shall include but are not limited to piping, connections, fittings, valves, tubing, hose, pumps, vents, and other related components used for the transfer of cooking oil from the cooking appliance to the storage tank, and from the storage tank to the discharge point, shall be installed in accordance with ~~Section 5703.6~~ and are permitted to be of either metallic or non-metallic construction.

610.4.1 Design Standards. The design, fabrication, and assembly of system components shall be suitable for the working pressures and structural stresses to be encountered by the components.

610.4.2 Components in Contact with Heated Oil. Any system component that comes in contact with heated cooking oil shall be rated for the maximum intermittent and continuous operating temperatures expected in the system.

610.4.3 Plenums. Installation of non-metallic cooking oil system components shall be prohibited in concealed interstitial spaces used as return air plenums unless the components are fully enclosed within continuous noncombustible raceways or enclosures, approved gypsum board assemblies, or within materials listed and labeled for installation within a plenum.

~~610.4~~ **610.5 Tank Venting.** Normal and emergency venting shall be provided for cooking oil storage tanks shall terminate outside the building as specified in ~~Sections 5704.2.7.3 and 5704.2.7.4.~~

610.5.1 Normal Vents. Normal venting shall be located above the maximum normal liquid line, and shall have a minimum effective area at least as large as the largest filling or withdrawal connection.

610.5.2 Emergency Vents. Emergency relief venting shall be located above the maximum normal liquid line, and shall be in the form of a device or devices that will relieve excessive internal pressure caused by

an exposure fire. For non-metallic tanks, the emergency relief vent shall be allowed to be in the form of construction.

610.6 Heating of Cooking Oil. Electrical equipment used for heating cooking oil in cooking oil storage systems shall be listed to UL 499 and shall comply with NFPA 70. Use of electrical immersion heaters shall be prohibited in non-metallic tanks.

~~610.5~~ **610.7 Electrical Equipment.** Electrical equipment used for the operation and heating of the cooking oil storage systems shall be listed and comply with NFPA 70.

Revise as follows:

5701.2 Nonapplicability. This chapter shall not apply to liquids as otherwise provided in other laws or regulations or chapters of this code, including:

1 through 10 *(No change to current text)*

11. Commercial cooking oil storage tank systems located within a building and designed and installed in accordance with Section 610.

Add new standards to Chapter 80 as follows:

ASTM

D 1998-06 Standard Specification for Polyethylene Upright Storage Tanks

UL

499-05 Standard for Electrical Heating Appliances

Reason: The section as written presents practical challenges to innovative restaurant technologies, which entirely eliminate manual handling of cooking oil. These systems provide personnel safety and environmental improvements to existing manual or semi-manual oil handling operations. The proposal seeks to address the following issues:

The requirements as currently written (added in 2012 version of the code) are based on used, spent, or inedible cooking oil. For systems which include fresh cooking oil supply, a foodstuff, tanks and components must be food grade. The metallic tank standards currently referenced are based on fuel oil storage tanks and do not meet food grade requirements. The proposal addresses this limitation by adding requirements for non-metallic tanks, with an associated recognized engineering tank standard adapted for use with cooking oil.

Current references to Chapter 57 are more relevant to industrial flammable and combustible liquid tank requirements. High flash point cooking oil in a restaurant back-of-house setting represents a different, and generally lower, hazard than commonly anticipated by Chapter 57. The proposed exemption to Section 5701.2 unifies all pertinent fire safety requirements into Section 610 and the standards referenced therein. This establishes the level of safety applicable to this hazard. This approach is consistent with other exceptions in Chapter 57, in particular the exception for fuel oil tanks connected with oil burning equipment. The proposal takes into consideration comments received from code officials and fire safety professionals.

Note: This proposal applies only to the storage of cooking oil, a Class IIIB liquid with a high flash point (typically above 500°F), which represents a low fire hazard when stored and used per the requirements of the proposal. All other flammable and combustible liquids must comply with Chapter 57.

As written, Section 610.4 requires tank venting to terminate outside of the building, as specified in Sections 5704.2.7.3 and 5704.2.7.4. These referenced sections allow tanks storing Class IIIB liquids to vent inside the building, based on the relatively low fire hazard associated with Class IIIB liquids. The proposal modifies the current requirements for venting to accurately reflect the level of protection for this hazard as established in Chapter 57.

The intent of the requirements as written, as described in the 2012 substantiation, was to add a level of protection to address the use of immersion heaters in storage tanks containing used cooking oil. The proposal addresses these concerns by requiring compliance to UL 499 and NFPA 70, and by restricting the use of immersion heaters to metallic tanks only. Furthermore, the proposal requires all other electrical equipment used with cooking oil storage tank systems to comply with NFPA 70 as well.

The limitations for installing non-metallic tubing or piping are consistent with the International Mechanical Code requirements.

Cost Impact: The code change proposal will not increase the cost of construction. The introduction of Section 610 to the 2012 IFC increased cost of construction by limiting cooking oil storage tanks to metallic construction. The proposal will allow for non-metallic tank construction, allowing costs to remain reasonable for this type of technology and usage. The proposal also provides cost efficiencies for support/compliance of environmental initiatives to limit/prevent the introduction of used cooking oil and used portable containers into liquid and solid waste streams.

Analysis: A review of the standard proposed for inclusion in the code, ASTM D1998-06, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28), will be posted on the ICC website on or before April 1, 2013. UL 499-05 is currently referenced in the IMC.

F95-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

610.1-F-BURKE

F96 – 13

611 (New)

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care
(john.williams@doh.wa.gov)

Add new text as follows:

SECTION 611

HYPERBARIC FACILITIES

611.1 General. Hyperbaric facilities shall be inspected, tested and maintained, in accordance with NFPA 99.

611.2 Records. Records shall be maintained of all testing and repair conducted on the hyperbaric chamber and associated devices and equipment. Records shall be available to the fire code official.

Reason: This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering, a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April 2011, the AHC has held 5 open meetings and over 80 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: <http://www.iccsafe.org/cs/AHC/Pages/default.aspx>

Currently there is no specific requirement for maintaining hyperbaric chambers in the IFC. Adding this section into Chapter 6 will require that all hyperbaric chambers are maintained to the same NFPA standard they were required to meet when they were installed.

Cost impact: The code change proposal should not increase the cost of construction because compliance is already required by facility licensure requirements.

F96-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

611 (NEW)-F-WILLIAMS-ADHOC

F97 – 13

Chapter 7, 701.1

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

CHAPTER 7

FIRE-RESISTANCE-RATED CONSTRUCTION FIRE AND SMOKE PROTECTION FEATURES

701.1 Scope. ~~The provisions of this chapter shall specify the requirements for and the maintenance of fire resistance-rated construction.~~ The provisions of this chapter govern maintenance of the materials, systems and assemblies used for structural fire resistance and fire-resistance-rated construction separation of adjacent spaces to safeguard against the spread of fire and smoke within a building and the spread of fire to or from buildings. New buildings shall comply with the *International Building Code*.

Reason: This proposal will provide correlation of IBC Chapter 7 which addresses construction of assemblies to limit the spread of fire and smoke with IFC Chapter 7 which addresses maintenance of the constructed assemblies designed to limit the spread of fire and smoke.

Chapter 7 in the IBC is titled "Fire and Smoke Protection Features". Since IFC Chapter 7 is intended to maintain the components which are constructed under IBC Chapter 7, a revision in the title of the IFC Chapter to mirror the IBC is appropriate. The scope of IBC Chapter 7 reads as follows:

701.1 Scope. The provisions of this chapter shall govern the materials, systems and assemblies used for structural *fire resistance* and fire-resistance-rated construction separation of adjacent spaces to safeguard against the spread of fire and smoke within a building and the spread of fire to or from buildings.

The proposed scope of IFC Chapter 7 is written to address maintenance of the items covered in the scope of IBC Chapter 7. Therefore, the similarity in the language is appropriate.

Cost Impact: The code change proposal will not increase the cost of construction.

F97-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

CHAPTER 7-F-ZUBIA-FCAC

F98 – 13

703

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azumiamia@yahoo.com)

Revise as follows:

SECTION 703

FIRE-RESISTANCE-RATED CONSTRUCTION INSPECTION AND MAINTENANCE OF CONSTRUCTION FEATURES

703.1 Maintenance General. ~~The required fire-resistance rating of fire-resistance-rated construction (including walls, firestops, shaft enclosures, partitions, smoke barriers, floors, fire-resistive coatings and sprayed fire-resistant materials applied to structural members and fire-resistant joint systems)~~ Construction features intended to limit the spread of fire or smoke shall be maintained.

703.2 Inspection and Maintenance. Construction features intended to limit the spread of fire or smoke ~~Such elements~~ shall be visually inspected by the owner annually and properly repaired, restored or replaced when damaged, altered, breached or penetrated.

Exception: Where construction features are concealed, ~~such elements shall not be required to be visually inspected~~ visual inspection by the owner is not required unless the concealed space is accessible by the removal or movement of a panel, access door, ceiling tile or similar movable entry to the space.

703.2.1 Openings. ~~Openings made therein in smoke-resistant or fire-resistance-rated assemblies for the passage of pipes, electrical conduit, wires, ducts, air transfer openings and holes made for any reason shall be protected with approved methods or self- or automatic-closing opening protectives capable of resisting the passage of smoke and or fire, as required to maintain the rating of the assembly. Openings through fire-resistance-rated assemblies shall be protected by self- or automatic-closing doors of approved construction meeting the fire protection requirements for the assembly.~~

~~**703.1.1 Fireblocking and draftstopping.** Required fireblocking and draftstopping in combustible concealed spaces shall be maintained to provide continuity and integrity of the construction.~~

~~**703.1.2 703.2.1.1 Smoke Openings in smoke barriers and smoke partitions.** Required smoke barriers and smoke partitions shall be maintained to prevent the passage of smoke. All openings~~ Openings ~~protected with approved smoke barrier doors or smoke dampers shall be maintained in accordance with NFPA 105.~~

~~**703.1.3 Fire walls, fire barriers and fire partitions.** Required fire walls, fire barriers and fire partitions shall be maintained to prevent the passage of fire. All openings protected with approved doors or fire dampers shall be maintained in accordance with NFPA 80.~~

~~**703.2**~~ **703.2.1.2 Opening protectives in fire-resistance rated assemblies.** *(No change to current text)*

~~**703.2.4**~~ **703.2.1.2.1 Signs.** *(No change to current text)*

~~**703.2.2**~~ **703.2.1.2.2 Hold-open devices and closers.** *(No change to current text)*

~~**703.2.3**~~ **703.2.1.2.3 Door operation.** *(No change to current text)*

703.3 Ceilings. *(No change to current text)*

703.4 Testing. *(No change to current text)*

Reason: Chapter 7 and Section 703.1 have been expanded to clearly require that construction features intended to limit the spread of smoke must also be maintained.

Predominantly an editorial code change proposal to clarify the intent of the provisions.

Section 703.1 has been revised to provide a broadly-inclusive requirement to maintain any construction feature that was provided to limit the spread of smoke and/or fire. The parenthetical list in this section has been deleted since it was not all-inclusive. These changes improve the usability of the code and address topics that were previously overlooked, such as maintenance of draft stopping in attics.

The existing text in Section 703.1.1 and the first sentence of Sections 703.1.2 and 703.1.3 have been deleted because they are no longer necessary with the revised text of Section 703.1, which will now encompass fire blocking, draftstopping, smoke barriers, smoke partitions, firewalls, fire barriers and fire partitions.

The second sentence of Section 703.1.3 has been deleted because it is redundant. Section 703.2.1 covers maintenance of opening protectives.

NOTE: To assist in following the revisions proposed in this code change, below is a clean version of section 703 without underline and strikeout.

Cost Impact: The code change proposal will not increase the cost of construction.

F98-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

703-F-ZUBIA-FCAC

F99 – 13

803.5.1

Proponent: Marcelo M Hirschler, GBH International (gbhint@aol.com)

Revise as follows:

803.5.1 Textile wall or ceiling coverings. Textile wall or ceiling coverings shall comply with one of the following:

1. The wall or ceiling covering shall have a Class A flame spread index in accordance with ASTM E 84 or UL 723, and be protected by automatic sprinklers installed in accordance with Section 903.3.1.1 or 903.3.1.2;
2. The wall covering shall meet the criteria of Section ~~803.5.1.1~~ or 803.5.1.2 when tested in the manner intended for use in accordance with NFPA 265 using the product-mounting system, including adhesive, of actual use; or
3. The wall or ceiling covering shall meet the criteria of Section 803.1.2.1 when tested in accordance with NFPA 286 using the product-mounting system, including adhesive, of actual use.

~~803.5.1.1 Method A test protocol.~~ ~~During the Method A protocol, flame shall not spread to the ceiling during the 40-kW exposure. During the 150-kW exposure, the textile wall covering shall comply with all of the following:~~

- ~~1. Flame shall not spread to the outer extremity of the sample on the 8 foot by 12 foot (203 by 305 mm) wall.~~
- ~~2. The specimen shall not burn to the outer extremity of the 2-foot wide (610 mm) samples mounted in the corner of the room.~~
- ~~3. Burning droplets deemed capable of igniting textile wall coverings or that burn for 30 seconds or more shall not form.~~
- ~~4. Flashover, as defined in NFPA 265, shall not occur.~~
- ~~5. The maximum not instantaneous peak heat release rate, determined by subtracting the burner output from the maximum heat release rate, does not exceed 300 kW.~~

Reason: The Method A protocol of NFPA 265 has been deleted from the mandatory portion of the NFPA 265 test. Method A was eliminated from NFPA 265 because it was always considered simply a screening test. Note that NFPA 265 states, in the annex: "Method A test protocol is a screening test method that is useful for testing small amounts of material." Note that NFPA 265 Method A uses small 2 foot samples as opposed to the full 8 foot samples used by the Method B.

Method A of NFPA 265 was retained in the IFC for two more code cycles to accommodate older existing systems but can now be eliminated as no longer needed. The IBC already eliminated Method A 2 cycles ago.

Cost Impact: None

803.5.1-F-HIRSCHLER

F100 – 13

803.7 (New), Chapter 80

Proponent: Marcelo M Hirschler, GBH International (gbhint@aol.com)

Add new text as follows:

803.7 Laminated products factory-produced with a wood substrate. Laminated products factory-produced with a wood substrate shall comply with one of the following:

1. The laminated product shall have a Class A, B, or C flame spread index and smoke developed index, based on the requirements of Table 803, in accordance with ASTM E84 or UL 723. Test specimen preparation and mounting shall be in accordance with ASTM E2579.
2. The laminated product shall meet the criteria of Section 803.1.2.1 when tested in accordance with NFPA 286 using the product-mounting system (including adhesive) of actual use.

(Renumber subsequent sections)

Add new standard to Chapter 80 as follows:

ASTM

ASTM E2579-12	Standard Practice for Specimen Preparation and Mounting of Wood Products to Assess Surface Burning Characteristics	803.7
---------------	--	-------

Reason: Clarification has recently been issued, in the mounting method for wood products in ASTM E84 (namely ASTM E2579), to detail the proper way to test laminated products factory-produced with a wood substrate. They are to be treated the same way as any product but differently from facings or veneers applied "on site" over a wood substrate. A separate proposal addresses veneers applied on site.

The new section in ASTM E2579 reads as follows:

- 8.6 Laminated products factory-produced with a wood substrate:
- 8.6.1 If the factory-produced laminated product includes a facing or wood veneer applied over a wood substrate, the specimens shall comply with 8.6.1.1 as well as with 8.6.1.2.
- 8.6.1.1 The specimens shall consist of the finished product, namely the combination of the facing, panel product or wood veneer, the adhesive used and the specific wood substrate that will be used. Mount the specimens on the ledges of the Test Method E84 furnace without using additional means of support.
- 8.6.1.2 The adhesive used to attach the facing, panel product, or wood veneer, ~~or panel product~~ to the wood substrate shall be that specified by the manufacturer and applied in accordance with manufacturer's application instructions.
- 8.7 Wood veneers or facings intended to be applied on site over a wood substrate. If the laminated product is not factory-produced but the wood veneer or facing is to be applied on-site over a wood substrate, the specimens shall comply with the requirements of Practice E2404.

Cost Impact: None

F100-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

803.7 (NEW) #1-F-HIRSCHLER

F101 – 13

803.7 (New)

Proponent: Marcelo M Hirschler, GBH International (gbhint@aol.com)

Add new text as follows:

803.7 Facings or wood veneers intended to be applied on-site over a wood substrate. Facings or wood veneers intended to be applied on-site over a wood substrate shall comply with one of the following:

1. The facing or wood veneer shall have a Class A, B, or C flame spread index and smoke developed index, based on the requirements of Table 803, in accordance with ASTM E 84 or UL 723. Test specimen preparation and mounting shall be in accordance with ASTM E 2404.
2. The facing or wood veneer shall meet the criteria of Section 803.1.2.1 when tested in accordance with NFPA 286 using the product-mounting system, including adhesive, described in section 5.8.9 of NFPA 286.

(Renumber subsequent sections)

Reason: Clarification has recently been issued, in the mounting method for wall coverings in ASTM E84 (namely ASTM E2404), to detail the proper way to test facings or wood veneers intended to be applied over a wood substrate. They are to be treated the same way as any other wall or ceiling covering applied "on-site" to a wood substrate but differently from panels where the facing or veneer is applied in the factory over the wood substrate and the entire panel is installed. A separate proposal addresses factory-produced panels.

The new section in ASTM E2404 reads as follows:

8.7 Facings or Wood Veneers Intended to be Applied On-site Over a Wood Substrate:

- 8.7.1 *If the facing or wood veneer is intended to be applied on-site over a wood substrate, the specimens shall comply with as well as with 8.1.*
- 8.7.1.1 *The specimens shall consist of the facing or wood veneer mounted on the "A" face of nominal 15/32 in. untreated plywood with a face veneer of Douglas fir. The plywood shall comply with NIST Voluntary Product Standard PS 1-07. The plywood shall carry the grade stamp of either APA-The Engineered Wood Association or TECO, indicating that the plywood has been graded PS 1-07 A-C and is for exterior exposure. Alternatively, the plywood shall be permitted to be stamped as conforming to CSA O121 (Standard for Douglas fir plywood). Mount the specimens on the ledges of the Test Method E84 furnace without using additional means of support.*
- 8.8 *Laminated Products Factory-produced with a Wood Substrate — If the laminated product is factory-produced the specimens shall comply with the requirements of Practice E2579.*
- 8.1 *Whenever a wall or ceiling covering system uses an adhesive to attach a wall or ceiling covering material, the adhesive specified by the manufacturer shall be used for construction of the test specimen in accordance with the wall or ceiling covering manufacturer application instructions.*

Section 5.8.9 of NFPA 286 reads as follows:

- 5.8.9 Wall or Ceiling Coverings Intended to Be Applied over a Wood Substrate.** *If the wall or ceiling coverings are intended to be applied over a wood substrate, the specimens shall consist of the wall or ceiling covering mounted on untreated plywood, with a face veneer of Douglas fir. The plywood shall have the same thickness as the wood substrate used in actual installations, and shall comply with NIST Voluntary Product Standard PS 1-07, Structural Plywood. The plywood shall be marked with a grade stamp indicating that the plywood has been graded PS 1-07 A-B and is for exterior exposure. The grade stamp shall be issued by a quality control agency. Alternatively, the plywood shall be permitted to be stamped as conforming to CSA Standard O121, Douglas Fir Plywood.*

Cost Impact: None

Analysis: ASTM E2404 -08 is currently referenced in the IFC. An update in the year edition of that standard will be accomplished by an administrative standards update code change to be heard by the ADM Code Development Committee.

F101-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

803.7 (NEW) #2-F-HIRSCHLER

F102 – 13

805.1

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee
(cbaldassarra@RJAGroup.com)

Revise as follows:

805.1 Group I-1, ~~board and care facilities~~ Condition 2. The requirements in Sections 805.1.1 through 805.1.2 shall apply to ~~board and care facilities classified~~ in Group I-1 Condition 2.

Reason: The term 'board and care facilities' was deleted from the IBC during the last cycle. These provisions are appropriate for Group I-1 Condition 2, assisted living facilities.

This proposal is submitted by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>. Since its inception in April/2005, the CTC has held twenty-five meetings - all open to the public. In 2012, three of the 25 face-to face meetings were held. In addition to the CTC meetings, the CTC established Study Groups (SG) of interested parties for each of the areas of study. These SG's are responsible for reviewing the available information and making recommendations to the CTC. All totaled, the SG's held over 70 conference calls in 2012.

Cost Impact: None

F103 – 13

805.3.2.2, 805.3.2.2.1 (New), 803.5.3.2.2.2 (New), Chapter 80

Proponent: Marcelo M Hirschler, GBH International (gbhint@aol.com)

Add new text as follows:

805.3.2 Mattresses. Newly introduced mattresses shall meet the requirements of Sections 805.3.2.1 through 805.3.2.3.

805.3.2.1 Ignition by cigarettes. Newly introduced mattresses shall be shown to resist ignition by cigarettes as determined by tests conducted in accordance with DOC 16 CFR Part 1632 and shall have a char length not exceeding 2 inches (51 mm).

805.3.2.2 Fire performance tests. Newly introduced mattresses shall be tested in accordance with Section 805.3.2.2.1 or 805.3.2.2.2.

805.3.2.2.1 Heat release rate. Newly introduced mattresses shall have limited rates of heat release when tested in accordance with ASTM E 1590 or California Technical Bulletin 129, as follows:

1. The peak rate of heat release for the single mattress shall not exceed 100 kW.
2. The total energy released by the single mattress during the first 10 minutes of the test shall not exceed 25 MJ.

805.3.2.2.2 Mass Loss Test. Newly introduced mattresses shall have a mass loss not exceeding 15% of the initial mass of the mattress when tested in accordance with the test in Annex A3 of ASTM F1085.

805.3.2.3 Identification.

Mattresses shall bear the label of an *approved* agency, confirming compliance with the requirements of Sections 805.3.2.1 and 805.3.2.2.

Add new standard to Chapter 80 as follows:

ASTM

F1085-10 Standard Specification for Mattress and Box Springs for Use in Berths in Marine Vessels.....
805.3.2.2.2

Reason: The test method in Annex A3 of ASTM F1085 was developed originally for use in detention and correctional occupancies and it is a very severe test that is a reasonable (and less expensive) alternative to ASTM E1590. This test is very simple and can be conducted at any facility and does not require the use of an instrumented fire test lab. The test can be described in a few words: it involves rolling up a mattress, placing it at an angle (for example by holding it with a brick), introducing newspaper into the volume surrounding the rolled up mattress and igniting the newspaper with a match.

One of the advantages of using the ASTM F1085 Annex A3 test is that if the mattress materials melt away from the flame with flaming drips they may "pass" the ASTM E1590 test but melting will not allow a mattress to pass this test. In this test the material that flames on the floor will keep burning the mattress itself.

The following table shows the results using the ASTM F1085 Annex A3 test for a number of mattresses in two studies (one in 1980 and one in 2003) and it also shows whether the mattresses meet the ASTM E1590 requirements in the IFC code. It is clear from the table that mattresses usually burn up almost completely or lose very little mass and that the ASTM F1085 test will not pass mattresses that fail the IFC code requirements.

Mattress	ASTM F1085 Mass Loss %	IFC Code Pass: Yes or No
1 (2003)	1.22	Yes
2 (2003)	9.47	Yes
3 (2003)	3.30	Yes
4 (2003)	100	No
5 (2003)	100	No
1 (1980)	100	No
2 (1980)	100	No

3 (1980)	98.5	No
4 (1980)	91.1	No
5 (1980)	91	No
6 (1980)	83.1	No
7 (1980)	44.7	No
8 (1980)	3.0	Yes

As another example of the usefulness of this test, two mattresses, both of which pass the ASTM E1590 test requirements, were recently tested to the ASTM F1085 Annex A3 test. One of the mattresses gave a mass loss of 1% while the other one melted and burnt virtually completely.

Test/Results	Polychloroprene Mattress	FR Polyester Mattress
ASTM F1085 Annex A3	1% weight loss (pass)	>90% weight loss (fail)
ASTM E1590	Pass (Peak HRR: 25 kW)	Pass

The test method from Annex A3 of ASTM F1085 is also described (albeit without enough details to conduct the test in a standard fashion) in section 10.2 of ASTM F1870 (Standard Guide for Selection of Fire Test Methods for the Assessment of Upholstered Furnishings in Detention and Correctional Facilities) as a test method "Designed for Detention and Correction Facilities".

Relevant parts of the text of Annex A3 of ASTM F1085 follows:

A3.1 Background

- A3.1.1 *This optional test method provides a means for evaluating mattresses, and mattress inserts, for the weight loss, and fire behavior they exhibit under specified exposure conditions.*
- A3.1.2 *Results of this test method are likely to be reasonably predictive of the results of the test method in Annex A1, in terms of being able to differentiate between mattresses (or mattress inserts) of various degrees of fire performance.*
- A3.1.3 *This test method is capable of subdividing mattresses (or mattress inserts) into several categories depending on their response to the ignition source applied: some mattresses (or mattress inserts) will burn up completely, while some others will lose small fractions of the initial weight, with a series of intermediate fire-test responses also likely.*

A3.2 Test Specimen

- A3.2.1 *Use as the test specimen an actual manufactured mattress, mattress insert, or prototype thereof, in the configuration of its intended use.*
- A3.2.2 *If an actual manufactured mattress, or mattress insert, is not supplied, the size of the default mattress to be tested has the following dimensions: 0.76 by 1.90 m by at least 76 mm thick (30.0 by 75 in. by at least 3 in. thick). Whenever possible an actual mattress shall be used.*
- A3.2.3 *The test specimen used shall be the size representative of the intended use of the product to be tested. Report the actual dimensions of the test specimen used.*
- A3.2.4 *The test specimen, shall, in all respects, reflect the construction of the actual mattress, or mattress insert, that it is intended to represent.*

A3.5 Procedure

- A3.5.1 *Conduct the tests in a room equipped with appropriate exhausts to ensure that the resulting smoke can be vented. The so-called "ASTM room" (2.4 by 3.7 by 2.4 m high; 8 by 12 by 8 ft high) described in Test Method E1590 is an example of a room deemed satisfactory for this test. Rooms of other dimensions are also suitable.*
- A3.5.2 *Weigh 8 double sheets of black print newspaper (not tabloid size) and record the weight, to an accuracy of no less than 1.0 g.*
- A3.5.3 *Weigh the conditioned mattress, or mattress insert, and record the weight, to an accuracy of no less than 50 g. This shall be considered the initial mattress or mattress insert weight. Test within 30 min of weighing the mattress.*
- A3.5.4 *Use a pipe approximately 0.6-1.0 m (24-39 in.) long and 230-250 mm (9-10 in.) in internal diameter for rolling the mattress, or mattress insert.*
- A3.5.5 *Roll the long dimension of the test specimen (mattress, mattress prototype, mattress insert or mattress cushioning material), completely around the pipe. Retain the test specimen in place by using steel poultry netting or a minimum of three steel wire ties. This configuration creates a "chimney effect." Remove the pipe after the roll containing the test specimen has been secured and has formed a test specimen roll.*
- A3.5.5.1 *If the mattress, or mattress insert, is asymmetrical, inasmuch as the top and bottom surfaces are different, tests shall be conducted on both sides. If results differ depending on the side exposed to the ignition source, the appropriate results are those from the test that is shown to be more severe.*
- A3.5.6 *Position the test specimen roll such that it is both: (1) secure from falling and (2) tilted to one side at an angle of 75-80 degrees to the floor. This is achievable: (a) by propping up the test specimen roll on one side, with two 70-80 mm (3 in.) steel angle irons or two bricks, with 70-100 mm separation between them, and securing the test specimen roll from tipping over during testing by attaching 3 wires to the steel netting, with the wires suspended from up high (for example from the ceiling) or (b) by leaning the mattress against a non combustible support at the required angle. The angled configuration is needed to allow air to enter at the bottom of the chimney formed by the test specimen roll.*
- A3.5.7 *Crumple up the sheets of newspaper, loosely, into individual balls approximately 150 mm (6 in.) in diameter and place them in the inside of the chimney.*
- A3.5.8 *Ignite the crumpled newspaper, from the top, with a single match, ensuring that the newspaper is well lit.*
- Note: *A rather intense fire lasting 90-100 s is likely to result.*
- A3.5.9 *Allow free burning of the test specimen roll until the first of the following conditions is reached: (a) All burning has ceased. (b) Flashover in the test room appears inevitable. In this case, extinguish the test specimen fire manually and report the result as a flashover. Weighing of the test specimen remains is not necessary in this case.*

- A3.5.10 *Conclude the test after visible flames have ceased, unless the mattress, or mattress insert, is still smoldering. At the test conclusion, let the mattress, or mattress insert, cool to room temperature and check to ensure that there is no visible smoke and that the mattress, or mattress insert, is not smoldering.*
- A3.5.11 *If the mattress, or mattress insert, is smoldering when visible flames have ceased, do not conclude the test but continue the test until 60 minutes have elapsed and then terminate the test. Report the time at which visible flames have ceased and the time at which smoldering has ceased, unless smoldering has continued until the test has been externally terminated. Report the method of test termination and check to ensure that there is no more smoldering, no visible smoke and that the mattress is dry (if water was used).*
- A3.5.12 *Upon completion of the test, the mattress, or mattress insert, remains, if any, shall be weighed, after placing them in a pre-weighed non combustible container. The mattress, or mattress insert, remains shall include any portion of the test specimen that has fallen off, during or after the test.*
- A3.5.14 *Conduct the test in duplicate. Conduct each burn on an untested specimen.*

Cost Impact: None

Analysis: A review of the standard proposed for inclusion in the code, ASTM F1085-10, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

F103-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

805.3.2-F-HIRSCHLER

F104 – 13

806.1.1

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care
(john.williams@doh.wa.gov)

Add new text as follows:

806.1.1 Restricted occupancies. Natural cut trees shall be prohibited within ambulatory care facilities and Group A, E, I-1, I-2, I-3, I-4, M, R-1, R-2 and R-4 occupancies.

Exceptions:

1. Trees located in areas protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2 shall not be prohibited in Groups A, E, M, R-1 and R-2.
2. Trees shall be allowed within *dwelling units* in Group R-2 occupancies.

Reason: Ambulatory Care Facilities are being added to the list of prohibited occupancies for natural cut trees at Section 806.1.1. Patients in these facilities are rendered incapable of self-preservation in this occupancy in activities that present the same evacuation challenges presented by Group I-2 occupancies which are already in the list. This section is recommended for modification because of the rapid manner in which a natural cut tree is consumed by fire with the associated release of heat and smoke would present a distinct hazard to occupants. A burning tree could not be approached or passed by thus effectively blocking that portion of an egress path while spreading heat and smoke to additional portions of the means of egress.

Ambulatory Care Facilities are located within Business (Group B) occupancies where natural cut trees are permitted. This added prohibition eliminates a hazard that otherwise would not occur for similar activities conducted in a Group I-2 occupancy and provides an improved level of protection for other occupancies in the mixed use situation.

This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April, 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: <http://www.iccsafe.org/cs/AHC/Pages/default.aspx>

Cost impact: This proposal will not increase the cost of construction.

F104-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

806.1.1-F-WILLIAMS-ADHOC

F105 – 13

806.2

Proponent: Amy Carpenter, AIA, Pioneer Network Long Term Care Code Task Force

Revise as follows:

806.2 Artificial vegetation. Artificial decorative vegetation shall ~~meet the flame propagation performance criteria of NFPA 701. Meeting the flame propagation performance criteria of NFPA 701 shall be documented and certified by the manufacturer in an approved manner. Alternatively, the artificial decorative vegetation item shall~~ be tested in accordance with NFPA 289, using the 20 kW ignition source, and shall have a maximum heat release rate of 100 kW.

Exception: In Groups R-2, I-1 and I-2, artificial vegetation shall be permitted in limited quantities such that a hazard of fire development or spread is not present.

Reason: The text stricken from section 806.2 is proposed because it is not a correct reference and should not be included. NFPA 701 is the standard for "flame propagation of Textiles and Films". The scope description, in the standard, is clear that it is for materials that will be used as curtains, drapes and window treatments, therefore it is not the correct reference standard, nor the correct test method, for artificial decorative vegetation that may be used in buildings.

In Groups R-2, I-1 and I-2 Condition 1, residents often seek to create a home-like environment and display decorative items, like a seasonal wreath at their unit entries. It is not always possible, or practical to determine compliance with NFPA 289, especially for items procured by individual residents. The language of this exception is similar to the permissions for decorative materials, in these use groups, under Section 807. Further, as all of these Occupancies are required to have sprinkler coverage, there is a reduced risk for detrimental effects of limited quantities of artificial vegetation.

Cost Impact: No cost impact

806.2-F-CARPENTER

F106 – 13

806.2, 807.1(IBC [F] 806.1), 807.1.2 (IBC [F] 806.1.2), 807.2 (IBC [F] 806.2), 807.4.2.2, 2603.5, 3104.2, 3105.4

Proponent: Timothy T. Earl, GBH International (tearl@gbhinternational.com)

Revise as follows:

806.2 Artificial vegetation. Artificial decorative vegetation shall meet the flame propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701. Meeting the flame propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701 shall be documented and certified by the manufacturer in an *approved* manner. Alternatively, the artificial decorative vegetation item shall be tested in accordance with NFPA 289, using the 20 kW ignition source, and shall have a maximum heat release rate of 100 kW.

807.1 (IBC [F] 806.1) General requirements. In occupancies in Groups A, E, I and R-1, and dormitories in Group R-2, curtains, draperies, hangings and other decorative materials suspended from walls or ceilings shall meet the flame propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701 in accordance with Section 807.2 or be noncombustible.

Exceptions:

1. Curtains, draperies, hangings and other decorative materials suspended from walls of *sleeping units* and *dwelling units* in dormitories in Group R-2 protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1 and such materials are limited to not more than 50 percent of the aggregate area of walls.
2. Decorative materials, including, but not limited to, photographs and paintings in dormitories in Group R-2 where such materials are of limited quantities such that a hazard of fire development or spread is not present.

In Groups I-1 and I-2, combustible decorative materials shall meet the flame propagation criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701 unless the decorative materials, including, but not limited to, photographs and paintings, are of such limited quantities that a hazard of fire development or spread is not present. In Group I-3, combustible decorative materials are prohibited.

Fixed or movable walls and partitions, paneling, wall pads and crash pads, applied structurally or for decoration, acoustical correction, surface insulation or other purposes, shall be considered interior finish if they cover 10 percent or more of the wall or of the ceiling area, and shall not be considered decorative materials or furnishings.

In Group B and M occupancies, fabric partitions suspended from the ceiling and not supported by the floor shall meet the flame propagation performance criteria in accordance with Section 807.2 and Test Method 1 or Test Method 2, as appropriate, of NFPA 701 or shall be noncombustible.

807.1.2 (IBC [F] 806.1.2) Combustible decorative materials. The permissible amount of decorative materials meeting the flame propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701 shall not exceed 10 percent of the specific wall or ceiling area to which it is attached.

Exceptions:

1. In auditoriums in Group A, the permissible amount of decorative material meeting the flame propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701 shall not exceed 75 percent of the aggregate wall area where the building is equipped

throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, and where the material is installed in accordance with Section 803.11 of the *International Building Code*.

2. The amount of fabric partitions suspended from the ceiling and not supported by the floor in Group B and M occupancies shall not be limited.

807.2 (IBC [F] 806.2) Acceptance criteria and reports. Where required to be flame resistant, decorative materials shall be tested by an *approved agency* and meet the flame propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701, or such materials shall be noncombustible.

Reports of test results shall be prepared in accordance with Test Method 1 or Test Method 2, as appropriate, of NFPA 701 and furnished to the *fire code official* upon request.

807.4.2.2 Motion picture screens. The screens upon which motion pictures are projected in new and existing buildings of Group A shall either meet the flame propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701 or shall comply with the requirements for a Class B interior finish in accordance with Section 803 of the *International Building Code*.

Revise as follows:

2603.5 Sealing of buildings, structures and spaces. Paper and other similar materials that do not meet the flame propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701 shall not be used to wrap or cover a building, structure or space in excess of that required for the sealing of cracks, casements and similar openings.

Revise as follows:

3104.2 Flame propagation performance treatment. Before a permit is granted, the *owner* or agent shall file with the *fire code official* a certificate executed by an *approved testing laboratory* certifying that the tents and membrane structures and their appurtenances; sidewalls, drops and tarpaulins; floor coverings, bunting and combustible decorative materials and effects, including sawdust when used on floors or passageways, are composed of material meeting the flame propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701 or shall be treated with a flame retardant in an *approved manner* and meet the flame propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701, and that such flame propagation performance criteria are effective for the period specified by the permit.

IBC [F] 801.4 Decorative materials and trim. *Decorative materials* and *trim* shall be restricted by combustibility, fire performance, or ~~and the flame propagation performance criteria of NFPA 701,~~ in accordance with Section 806.

Reason: In 1989 the NFPA Technical Committee on Fire Tests eliminated the so-called "small-scale test" from NFPA 701 because the results had been shown not to represent a fire performance that corresponded to what happened in real scale. Instead of the "small-scale test" NFPA 701 now (and for over 20 years) contains two tests (Test 1 and Test 2), which apply to materials as indicated by the text of NFPA 701 (2010) that is shown at the bottom of this proposal.

However, a large number of manufacturers continue stating that the materials or products that they sell have been tested to NFPA 701, when they really mean the pre-1989 small-scale test in NFPA 701. That test no longer exists and materials or products meeting that test do not exhibit acceptable fire performance.

The change above was already done in the IBC.

Text of NFPA 701 (2010):

- 1.1.1.1 Test Method 1 shall apply to fabrics or other materials used in curtains, draperies, or other window treatments. Vinyl-coated fabric blackout linings shall be tested according to Test Method 2.
- 1.1.1.2 Test Method 1 shall apply to single-layer fabrics and to multilayer curtain and drapery assemblies in which the layers are fastened together by sewing or other means. Vinyl-coated fabric blackout linings shall be tested according to Test Method 2.

- 1.1.1.3 Test Method 1 shall apply to specimens having an areal density less than or equal to 700 g/m² (21 oz/yd²), except where Test Method 2 is required to be used by 1.1.2.
- 1.1.2.1 Test Method 2 (flat specimen configuration) shall be used for fabrics, including multilayered fabrics, films, and plastic blinds, with or without reinforcement or backing, with areal densities greater than 700 g/m² (21 oz/yd²).
- 1.1.2.2 Test Method 2 shall be used for testing vinyl-coated fabric blackout linings and lined draperies using a vinyl-coated fabric blackout lining.
- 1.1.2.3 Test Method 2 shall be used for testing plastic films, with or without reinforcement or backing, when used for decorative or other purposes inside a building or as temporary or permanent enclosures for buildings under construction.
- 1.1.2.4 Test Method 2 shall apply to fabrics used in the assembly of awnings, tents, tarps, and similar architectural fabric structures and banners.

Note also the following from the text of NFPA 701 (2010):

- 1.2* Purpose.
- 1.2.1 The purpose of Test Methods 1 and 2 shall be to assess the propagation of flame beyond the area exposed to the ignition source.
- A.1.1 A small-scale test method appeared in NFPA 701 until the 1989 edition. It was eliminated from the test method because it has been shown that materials that "pass" the test do not necessarily exhibit a fire performance that is acceptable. The test was not reproducible for many types of fabrics and could not predict actual full-scale performance. It should not, therefore, be used.
- A.1.1.1 For the purposes of Test Method 1, the terms curtains, draperies, or other types of window treatments, where used, should include, but not be limited to, the following items:
 - (1) Window curtains
 - (2) Stage or theater curtains
 - (3) Vertical folding shades
 - (4) Roll-type window shades
 - (5) Hospital privacy curtains
 - (6) Window draperies
 - (7) Fabric shades or blinds
 - (8) Polyvinyl chloride blinds
 - (9) Horizontal folding shades
 - (10) Swags

Examples of textile items other than window treatments to which Test Method 1 applies include:

- (1) Table skirts
- (2) Table linens
- (3) Display booth separators
- (4) Textile wall hangings
- (5) Decorative event tent linings not used in the assembly of a tent

Cost Impact: Minimal

F106-13

Public Hearing:	Committee:	AS	AM	D

806.2-F-EARL

F107 – 13

806.3

Proponent: Amy Carpenter, AIA, Pioneer Network Long Term Care Code Task Force

Revise as follows:

806.3 Obstruction of means of egress. ~~The required width of any portion of a means of egress shall not be obstructed by decorative vegetation.~~ Decorative vegetation shall not protrude more than 6 inches into the means of egress pathway and shall not obstruct any life safety equipment or controls.

Reason: Section 806.3 seeks to clarify a common enforcement mis-conception that decorative vegetation cannot protrude at all into the corridor. Often, calculated egress loads will set a required width of a corridor much lower than the actual provided corridor width. The current language would actually allow items to protrude into the corridor to any distance, as long as the vegetation doesn't encroach more than the required calculated width. This new language restricts the total projection to 6 inches, which is consistent with items such as hand sanitizers.

Cost Impact: No cost impact

806.3-F-CARPENTER

F108 – 13

806.3

Proponent: Robert J Davidson, Davidson Code Concepts, LLC, representing self
(rjd@davidsoncodeconcepts.com)

Revise as follows:

806.3 Obstruction of means of egress. The required width of any portion of a *means of egress* shall not be obstructed by decorative vegetation. Natural cut trees shall not be located within an exit, corridor, or a lobby or vestibule.

Reason: Section 806.3 “Obstruction of the means of egress” is recommended for modification because the rapid manner in which a natural cut tree is consumed by fire with the associated release of heat and smoke would present a distinct hazard to egress regardless of whether it impinged on the required width of the means of egress. A burning tree could not be approached or passed by thus effectively blocking that portion of an egress path while spreading heat and smoke to additional portions of the means of egress. A significant impact would be a natural cut tree located within a lobby that has the allowed 50% of all egress capacity passing through the same lobby.

Cost impact: This proposal will not increase the cost of construction.

Revise as follows:

SECTION 807

DECORATIVE MATERIALS OTHER THAN DECORATIVE VEGETATION IN NEW AND EXISTING BUILDINGS

807.1 (IBC [F]806.1) General. Combustible decorative materials, other than decorative vegetation, shall comply with Section 807.2 through 807.5.

807.1 (IBC [F]806.1) General requirements. In occupancies in Groups A, E, I and R-1 and dormitories in Group R-2, curtains draperies, hangings and other *decorative materials* suspended from walls or ceilings shall meet the flame propagation performance criteria of NFPA 701 in accordance with section 807.2 or be noncombustible.

Exceptions:

1. ~~Curtains, draperies, hangings and other decorative materials suspended from walls of sleeping units and dwelling units in dormitories in Group R-2 protected by an approved automatic sprinkler system installed in accordance with Section 903.3.1 and such materials are limited to not more than 50 percent of the aggregate area of walls. (relocated to Section 807.3 exception 2)~~
2. ~~Decorative materials, including, but not limited to, photographs and paintings in dormitories in Group R-2 where such materials are of limited quantities such that a hazard of fire development or spread is not present. (relocated to Section 807.5.5)~~

~~In Groups I-1 and I-2, combustible decorative materials shall meet the flame propagation criteria of NFPA 701 unless the decorative materials, including, but not limited to, photographs and paintings, are of such limited quantities that a hazard of fire development or spread is not present. In Group I-3, combustible decorative materials are prohibited. (relocated to Section 807.5.6 and 807.5.7)~~

~~Fixed or movable walls and partitions, paneling, wall pads and crash pads, applied structurally or for decoration, acoustical correction, surface insulation or other purposes, shall be considered interior finish if they cover 10 percent or more of the wall or of the ceiling area, and shall not be considered decorative materials or furnishings. (relocated to Section 807.3)~~

~~In Group B and M occupancies, fabric partitions suspended from the ceiling and not supported by the floor shall meet Sections 807.2 and 807.3 the flame propagation performance criteria in accordance with Section 807.2 and NFPA 701 or shall be noncombustible.~~

807.1.1 (IBC [F]806.1.1), 807.2 (IBC [F] 806.2) Noncombustible materials. The permissible amount of noncombustible decorative material shall not be limited.

807.1.2 (IBC [F]806.1.1), 807.3 (IBC [F] 806.3) Combustible decorative materials. In other than Group I-3, The permissible amount of curtains, draperies, fabric hangings and other similar combustible decorative materials suspended from walls or ceilings shall be flame resistant meeting the flame propagation performance criteria of NFPA 701 in accordance with Section 807.4 and shall not exceed 10 percent of the specific wall or ceiling area to which it is attached.

Fixed or movable walls and partitions, paneling, wall pads and crash pads applied structurally or for decoration, acoustical correction, surface insulation or other purposes shall be considered *interior finish* if they cover 10 percent or more of the wall or of the ceiling area, and shall not be considered *decorative materials* or furnishings. (relocated from Section 807.1)

Exceptions:

1. In auditoriums in Group A, the permissible amount of curtains, draperies, fabric hangings and other similar combustible decorative materials suspended from walls or ceilings meeting the flame propagation performance criteria of NFPA 701 shall not exceed 75 percent of the aggregate wall area where the building is equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, and where the material is installed in accordance with Section 803.11 of the *International Building Code*.
2. In Group R-2 dormitories, within sleeping units and dwelling units, the permissible amount of curtains, draperies, fabric hangings and other similar decorative materials suspended from walls or ceiling shall not exceed 50 percent of the aggregate wall areas where the building is equipped throughout with an *approved automatic sprinkler system* installed in accordance with Section 903.3.1. (relocated and revised from Section 807.1, exception 1)
- ~~3.2.~~ In Group B and M occupancies, the amount of fabric partitions suspended from the ceiling and not supported by the floor in ~~Group B and M occupancies~~ shall not be limited.

~~807.2(IBC [F] 806.2)~~ 807.4 (IBC [F] 806.4) Acceptance criteria and reports. Where required to be flame resistant, curtains, draperies, fabric hangings and other similar combustible decorative materials suspended from walls or ceilings shall be tested by an *approved agency* and meet the flame propagation performance criteria of NFPA 701, ~~or such materials shall be noncombustible~~. Reports of test results shall be prepared in accordance with NFPA 701 and furnished to the *fire code official* upon request.

~~807.4~~ 807.5 Occupancy-based requirements. In occupancies specified in Group A, E and I-4 day care facilities, combustible decorative materials not complying with Section 807.3 other than decorative vegetation shall comply with Sections 807.5.1 807.4.4 through 807.4.4.2 807.5.7.

~~IFC 807.5.1 807.4.4~~ General. All of The following requirements shall apply to all occupancies: ~~to all Group A and E occupancies and Group I-4 day care facilities regulated by Sections 807.4.2 through 807.4.4:~~

1. ~~Explosive or highly flammable materials:~~ Furnishings or decorative materials of an explosive or highly flammable character shall not be used.
2. ~~Fire-retardant coatings:~~ Fire-retardant coatings in existing buildings shall be maintained so as to retain the effectiveness of the treatment under service conditions encountered in actual use.
3. ~~Obstructions:~~ Furnishings or other objects shall not be placed to obstruct *exits*, access thereto, egress there from or visibility thereof.

~~807.5.2 807.4.2~~ Group A. In Group A occupancies, the requirements in Sections 807.4.2.4 807.5.2.1 through 807.4.2.3 807.5.2.4 shall apply ~~to occupancies in Group A~~.

~~807.5.2.1 807.4.2.1~~ Foam plastics. Exposed foam plastic materials and unprotected materials containing foam plastic used for decorative purposes or stage scenery or exhibit booths shall have a maximum heat release rate of 100 kW when tested in accordance with UL 1975, or when tested in accordance with NFPA 289 using the 20 kW ignition source.

Exceptions:

1. Individual foam plastic items or items containing foam plastic where the foam plastic does not exceed 1 pound (0.45 kg) in weight.
2. Cellular or foam plastic shall be allowed for trim in accordance with Section 804.2.

807.5.2.2 ~~807.4.2.2~~ Motion Picture Screens. The screens upon which motion pictures are projected in new and existing buildings shall either ~~meet the flame propagation performance criteria of NFPA 701-~~ comply with Section 807.4 or shall comply with the requirements for a Class B interior finish in accordance with Section 803 of the *International Building Code*.

807.5.2.3 ~~807.4.2.3~~ Wood use in ~~Group A-3~~ places of religious worship. In places of religious worship, wood used for ornamental purposes, trusses, paneling or chancel furnishing shall ~~be allowed~~ not be limited.

807.5.2.4 ~~807.3 (IBC [F] 806.4)~~ Pyroxylin plastic. Imitation leather or other material consisting of or coated with a pyroxylin or similarly hazardous base shall not be used ~~in Group A occupancies~~.

807.5.3 ~~807.4.3~~ Group E. Group E occupancies, shall comply with Sections ~~the requirements in Sections 807.4.3.1 807.5.3.1 through and 807.4.3.2 807.5.3.3 shall apply to occupancies in Group E.~~

807.5.3.1 ~~807.4.3.1~~ Storage in corridors and lobbies. Clothing and personal effects shall not be stored in *corridors* and lobbies.

Exceptions:

1. *Corridors* protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1.
2. *Corridors* protected by an *approved smoke detection fire alarm system* installed in accordance with Section 907.
3. Storage in metal lockers, provided the minimum required egress width is maintained.

807.5.3.2 ~~807.4.3.2~~ Artwork in corridors. Artwork and teaching materials shall be limited on the walls of *corridors* to not more than 20 percent of the wall area.

807.5.3.3 Artwork in classrooms. Artwork and teaching materials shall be limited on walls of classrooms to not more than 50 percent of the specific wall area to which they are attached.

807.5.4 ~~807.4.4~~ Group I-4, day care facilities. Group I-4 occupancies shall comply with, the requirements in Sections ~~807.4.4.1 807.5.4.1 through and 807.4.4.2 807.5.4.2 shall apply to day care facilities classified in Group I-4.~~

807.5.4.1 ~~807.4.4.1~~ Storage in corridors and lobbies. Clothing and personal effects shall not be stored in *corridors* and lobbies.

Exceptions:

1. *Corridors* protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1.
2. *Corridors* protected by an *approved smoke detection fire alarm system* installed in accordance with Section 907.
3. Storage in metal lockers, provided the minimum required egress width is maintained.

807.5.4.2 ~~807.4.4.2~~ Artwork in corridors. Artwork and teaching materials shall be limited on the walls of *corridors* to not more than 20 percent of the wall area.

807.5.4.3 Artwork in classrooms. Artwork and teaching materials shall be limited on walls of classrooms to not more than 50 percent of the specific wall area to which they are attached.

807.5.5 Dormitories in Group R-2. In Group R-2 dormitories, within sleeping units and dwelling units, the combustible decorative materials, shall be of limited quantities such that a hazard of fire development or spread is not present. *(relocated and revised from Section 807.1, exception 2)*

807.5.6 Groups I-1 and I-2. In Groups I-1 and I-2 occupancies, combustible *decorative materials* shall be of such limited quantities that a hazard of fire development or spread is not present. *(relocated from Section 807.1)*

IFC 807.5.7 Group I-3. In Group I-3, combustible *decorative materials* are prohibited. *(relocated from Section 807.1)*

Reason: The proposed revision is intended to be a clarification of the combustible materials permitted within a space. Specifically, to understand the different requirements for fabric-type decorative materials and paper-type decorative materials and what quantities of each are permitted in various use groups.

Currently, photographs and paintings, in some use groups, are required to be tested and certified to NFPA 701. The scope of this standard does not address paper items such as artwork and photographs and therefore was impossible to comply with.

The scope of NFPA 701 is as follows:

“1.1.1* Test Method 1

1.1.1.1 Test Method 1 shall apply to fabrics or other materials used in curtains, draperies, or other window treatments. Vinyl-coated fabric blackout linings shall be tested according to Test Method 2.

1.1.1.2 Test Method 1 shall apply to single-layer fabrics and to multi-layer curtain drapery assemblies in which the layers are fastened together by sewing or other means. Vinyl-coated fabric blackout linings shall be tested according to Test Method 2.

1.1.1.3 Test Method 1 shall apply to specimens having an areal density less than or equal to 700 g/m² (21 oz/yd²), except where Test Method 2 is required to be used by 1.1.2.”

Most revisions are editorial and serve to provide better clarity and to group requirements by use group.

807.1 – A general statement was needed so that the requirements match the Section title

The former text in 807.1 was re-organized and is now in Section 807.3 and 807.5 for better clarity.

807.2 – re-number only

807.3 - Since Group I-3 are limited to only non-combustible, the limitation is added to the front of the combustible materials.

The remainder of the sentence is revised for coordination with the next section on acceptance criteria and eliminating redundant reference to NFPA 701. That section starts out with “where required to be flame resistant”. The limitation to “curtains, draperies, hangings and other decorative materials suspended from walls or ceilings” is in the first paragraph in Section 807.1. The addition of the words “fabric” hangings and other “similar” combustible decorative materials is to differentiate between fabrics and films that are covered under NFPA Standard 701 and other materials used for decorative effect, that are discussed in 807.5 for each use group.

Exception 1 is specific to Group A for percentage of materials complying with 701.

Exception 2, curtains for dormitories is relocated from 807.1. It was reformatted to be consistent with the exception for auditoriums. Revised language shown below:

2. In Group R-2 dormitories, within sleeping units and dwelling units, the permissible amount of curtains, draperies, fabric hangings and other similar decorative materials suspended from walls or ceiling of sleeping units and dwelling units in dormitories in Group R-2 shall not exceed 50 percent of the aggregate wall areas where the building is equipped throughout with protected by an approved automatic sprinkler system installed in accordance with Section 903.3.1 and such materials are limited to not more than 50 percent of the aggregate area of walls.

Exception 3, reformatted to put groups first.

807.4 – Deleted text is not needed as this is addressed in 807.2. Added text is intended to specifically reference decorative items that are covered under the NFPA Standard.

807.5 – This proposed revision places requirements for multiple use groups in this section so the listing of groups was deleted. In addition, new section 807.1 already states this section is not applicable to decorative vegetation, so this language was deleted.

807.5.1 – these requirements should apply to all occupancies in this section.
Titles at the beginning of each sentence were redundant and not proper code language.

807.5.2 – text re-organized for consistency. The intent is to clarify the following conditions are applicable to Group A

807.5.2.1 – Re-number only

807.5.2.2 - Re-number. This is a subsection of Group A criteria, so group not needed. Consistency between subsections.

807.5.2.3 – Re-number. This is a subsection of Group A criteria, so group not needed. Plus, only in the title, not the text.
Consistency between subsections.

807.5.2.4 - Relocated to group with Group A requirements. This is a subsection of Group A criteria, so group not needed.
Consistency between subsections.

807.5.3 - text re-organized for consistency. The intent is to clarify the following conditions are applicable to Group E

807.5.3.1 – Re-number. Change in Exception 2 is for consistency in language with Section 907.

807.5.3.2 – Re title and re-number only.

807.5.3.3 - This provide guidance within the classroom as to how much art work is permitted.

807.5.4 - The intent of the first sentence is to clarify that the general provisions are applicable for Group I-4. The phrase “day care facilities” is redundant.

807.5.4.1 – Re-number. Change in Exception 2 is for consistency in language with Section 907.

807.5.4.2 – Re-title and re-number only.

807.5.4.3 – This provide guidance within the classroom as to how much art work is permitted.

807.5.5 - Relocate existing exception 2 in 807.1 related to Group R-2 dormitories. Language is similar to paper in school corridors. NFPA 701 does not apply to Photos or paintings. All Group R are now required to be sprinklered, so the threat of flame spread is reduced. Revised language shown below:

807.5.5 (IBC [F] 806.5.5) Dormitories in Group R-2. In Group R-2 dormitories, within sleeping units and dwelling units, the combustible decorative materials, including, but not limited to, photographs and paintings in dormitories in Group R-2 where such materials are shall be of limited quantities such that a hazard of fire development or spread is not present.

807.5.6 - Relocate existing Group I-1 and I-2 from 2nd paragraph of 807.1. New 807.3 would apply to curtains in all occupancies, including Group I-1 and I-2. This allowance is just for the paper permitted in the facilities. Revised language shown below:

IFC 807.5.6 Groups I-1 and I-2. In Groups I-1 and I-2, combustible *decorative materials* shall meet the flame propagation criteria of NFPA 701 unless the decorative materials, including, but not limited to, photographs and paintings, are be of such limited quantities that a hazard of fire development or spread is not present.

807.5.7 – Re-located from 2nd paragraph of 807.1. Also scoped in 807.3

Cost Impact: None

807.1 (IBC [F] 806.1), 807.2 (IBC [F] 806.2), 807.3 (IBC [F] 806.4), 807.4

Proponent: Marcelo M Hirschler, GBH International (gbhint@aol.com)

Revise as follows:

807.1 (IBC [F] 806.1) General requirements. ~~In occupancies in Groups A, E, I-4 and R-1 occupancies, and dormitories in Group R-2, curtains, draperies, hangings and other decorative materials suspended from walls or ceilings shall comply with 807.1.1, 807.1.2 or 807.1.3 meet the flame propagation performance criteria of NFPA 701 in accordance with Section 807.2 or be noncombustible.~~

807.1.1 (IBC [F] 806.1.1) The decorative materials shall meet the flame propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701 in accordance with Section 807.2.

807.1.2 (IBC [F] 806.1.2) The decorative materials shall exhibit a maximum rate of heat release of 100 kW when tested in accordance with NFPA 289, using the 20 kW ignition source.

807.1.3 (IBC [F] 806.1.3) The decorative materials shall be noncombustible.

Exceptions:

1. ~~Curtains, draperies, hangings and other decorative~~ Decorative materials suspended from walls of *sleeping units* and *dwelling units* in dormitories in Group R-2 protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1 do not need to comply with the requirements of 807.1.1 through 807.1.3 provided and such materials are limited to not more than 50 percent of the area of the specific wall or ceiling to which they are attached ~~aggregate area of walls.~~
2. ~~Decorative materials, including, but not limited to, photographs and paintings in dormitories in Group R-2 do not need to comply with the requirements of 807.1.1 through 807.1.3 where such materials are of limited quantities such that a hazard of fire development or spread is not present.~~

~~In Groups I-1 and I-2, combustible decorative materials shall meet the flame propagation criteria of NFPA 701 unless the decorative materials, including, but not limited to, photographs and paintings, are of such limited quantities that a hazard of fire development or spread is not present. In Group I-3, combustible decorative materials are prohibited.~~

~~Fixed or movable walls and partitions, paneling, wall pads and crash pads, applied structurally or for decoration, acoustical correction, surface insulation or other purposes, shall be considered interior finish if they cover 10 percent or more of the wall or of the ceiling area, and shall not be considered decorative materials or furnishings.~~

~~In Group B and M occupancies, fabric partitions suspended from the ceiling and not supported by the floor shall meet the flame propagation performance criteria in accordance with Section 807.2 and NFPA 701 or shall be noncombustible.~~

807.1.4 (IBC 806.1.4) Wall and ceiling coverings. Fixed or movable walls and partitions, paneling, wall pads and crash pads applied structurally or for decoration, acoustical correction, surface insulation or other purposes shall be considered interior wall or ceiling finish and shall comply with the requirements for interior finish in Section 803 or shall be noncombustible.

Exception: Existing fixed or movable walls and partitions, paneling, wall pads and crash pads applied structurally or for decoration, acoustical correction, surface insulation or other purposes that cover

less than 10 percent of the wall or ceiling area to which they are attached do not need to comply with the requirements of 807.1.4.

807.1.5 (IBC 806.1.5) Fabric partitions. Fabric partitions that are suspended from the ceiling in Group B and M occupancies and not supported by the floor shall comply with the requirements of 807.1.1, 807.1.2 or 807.1.3. The amount of such fabric partitions shall not be limited.

~~807.1.4~~ **807.1.6 (IBC 806.1.6) Noncombustible materials.** The permissible amount of noncombustible decorative material shall not be limited.

~~807.1.2~~ **807.1.7 (IBC 806.1.7) Combustible decorative materials.** The permissible amount of decorative materials meeting the flame propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701 shall not exceed 10 percent of the specific wall or ceiling area to which they are it is attached.

Exceptions:

4. In auditoriums in Group A, the permissible amount of decorative material meeting the flame propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701 shall not exceed 75 percent of the aggregate wall area where the building is equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, and where the material is installed in accordance with Section 803.11 of the *International Building Code*.
- ~~2. The amount of fabric partitions suspended from the ceiling and not supported by the floor in group B and M occupancies shall not be limited.~~

807.2 (IBC [F] 806.2) Acceptance criteria and reports. Where required to be flame resistant, decorative materials shall be tested by an *approved* agency and meet the flame propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701, or such materials shall be noncombustible. Reports of test results shall be prepared in accordance with NFPA 701 and furnished to the *fire code official* upon request.

807.3 (IBC [F] 806.4) Pyroxylin plastic. Imitation leather or other material consisting of or coated with a pyroxylin or similarly hazardous base shall not be used in Group A occupancies.

807.4 Occupancy-based requirements. In occupancies in Group A, E and ~~I~~ I-4 day care facilities, decorative materials other than decorative vegetation shall comply with Sections 807.4.1 through ~~807.4.6.2~~ 807.4.4.2.

807.4.1 General. All of the following requirements shall apply to all Groups A, and E and I occupancies and ~~Group I-4 day care facilities~~ regulated by Sections 807.4.2 through 807.4.4:

1. Explosive or highly flammable materials. Furnishings or decorative materials of an explosive or highly flammable character shall not be used.
2. Fire-retardant coatings. Fire-retardant coatings in existing buildings shall be maintained so as to retain the effectiveness of the treatment under service conditions encountered in actual use.
3. Obstructions. Furnishings or other objects shall not be placed to obstruct *exits*, access thereto, egress therefrom or visibility thereof.

807.4.2 Group A. The requirements in Sections 807.4.2.1 through 807.4.2.3 shall apply to occupancies in Group A.

807.4.2.1 Foam plastics. Exposed foam plastic materials and unprotected materials containing foam plastic used for decorative purposes or stage scenery or exhibit booths shall have a maximum heat release rate of 100 kW when tested in accordance with UL 1975, or when tested in accordance with NFPA 289 using the 20 kW ignition source.

Exceptions:

1. Individual foam plastic items or items containing foam plastic where the foam plastic does not exceed 1 pound (0.45 kg) in weight do not need to comply with the requirements of 807.4.2.1.
2. Cellular or foam plastic shall be allowed for trim in accordance with Section 804.2.

807.4.2.2 Motion picture screens. The screens upon which motion pictures are projected in new and existing buildings of Group A shall either meet the flame propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701 or shall comply with the requirements for a Class B interior finish in accordance with Section 803 of the *International Building Code*.

807.4.2.3 Wood use in Group A-3 places of religious worship. In places of religious worship, wood used for ornamental purposes, trusses, paneling or chancel furnishing shall be allowed.

807.4.3 Group E. The requirements in Sections 807.4.3.1 and 807.4.3.2 shall apply to occupancies in Group E.

807.4.3.1 Storage in corridors and lobbies. Clothing and personal effects shall not be stored in *corridors* and lobbies.

Exceptions:

1. *Corridors* protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1.
2. *Corridors* protected by an *approved smoke detection system* installed in accordance with Section 907.
3. Storage in metal lockers, provided the minimum required egress width is maintained.

807.4.3.2 Artwork in corridors. Artwork and teaching materials shall be limited on the walls of *corridors* to not more than 20 percent of the specific wall area to which they are attached.

807.4.3.3 Artwork in classrooms. Artwork and teaching materials shall be limited on walls of classrooms to not more than 50 percent of the specific wall area to which they are attached.

807.4.4 Groups I-1 and I-2. In Groups I-1 and I-2 occupancies, combustible decorative materials shall comply with the requirements of 807.1.1, 807.1.2 or 807.1.3.

Exceptions:

1. Combustible decorative materials including bulletin boards, artwork, photographs, paintings and similar personal items do not need to comply with the requirements of 807.1.1 through 807.1.3 provided such materials do not exceed 20 percent of the specific wall area to which they are attached.
2. In Group I-2 Condition 1 occupancies and Group I-1 occupancies, combustible decorative materials, including bulletin boards, artwork, photographs, paintings and similar personal items do not need to comply with the requirements of 807.1.1 through 807.1.3 provided such materials do not exceed 50 percent of the specific wall area to which they are attached where located within sleeping units and dwelling units
3.

807.4.5 Group I-3. Combustible decorative materials are prohibited in Group I-3 occupancies.

807.4.4 807.4.6 Group I-4, day care facilities. The requirements in Sections 807.4.6.1 and 807.4.6.2 807.4.4.1 and 807.4.4.2 shall apply to day care facilities classified in Group I-4.

807.4.4.1 807.4.6.1 Storage in corridors and lobbies. Clothing and personal effects shall not be stored in *corridors* and lobbies.

Exceptions:

1. Corridors protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1.
2. Corridors protected by an *approved smoke detection system* installed in accordance with Section 907.
3. Storage in metal lockers, provided the minimum required egress width is maintained.

807.4.4.2 807.4.6.2 Artwork in corridors. Artwork and teaching materials shall be limited on walls of corridors and classrooms to not more than 20 percent of the specific wall area to which they are attached.

807.4.6.3 Artwork in classrooms. Artwork and teaching materials shall be limited on walls of classrooms to not more than 50 percent of the specific wall area to which they are attached.

Reason: This is primarily a reorganization of section 807 without changes, done for clarification. However, some changes were made as shown below.

1. Areas in healthcare occupancies used for long term patients often exhibit patient-prepared art and seasonal decorations, which help to define a friendlier environment. The 2012 IFC limits the decorative materials present to those materials meeting NFPA 701. These requirements are included independently of automatic sprinkler protection but automatic sprinklers are required in Group I-1 & I-2 facilities. Automatic suppression will limit the fire propagation to the area of origin. Small amounts of decorative finishes will not adversely affect the automatic sprinkler performance for typical materials of paper, cloth, textiles, and plastic films in quantities limited to less than 20% of the wall area. Proposed Section 807.4.4, exception 1, will allow up to 20% of the wall area to be decorative material without NFPA 701 documentation. This allowable area is in response to the users' needs to display artwork for the comfort of the patient/client.
2. The original requirements for Group I-1 & I-2 occupancies allow photos and paintings but only in such limited quantities that a hazard of fire development or spread is not present. Materials meeting NFPA 701 flame propagation requirements are in the 2012 IFC for other decorative materials. Burning characteristics vary widely based on the material used. Quick response sprinklers are required by NFPA 13 for hospital room and sleeping room areas. Group I-1 & I-2 corridor and circulation spaces are considered light hazard area for automatic sprinkler protection. These quick response sprinklers will respond 3 to 5 times faster than standard response sprinklers. This faster response will start suppression when the fire is smaller with less heat and products of combustion generation. Proposed Section 807.4.4, exception 2, will allow in Group I-2 nursing homes and in Group I-1 up to 50% of the wall area of sleeping units or dwelling units to be decorative material without NFPA 701 documentation. Again, this allowable area is in response to the users' needs to display artwork for the comfort of the patient/client.
3. The 2012 IFC Section 807.4.3.2 and 807.4.4.2 for Group E and I-4 occupancies allows art work and teaching materials on the corridor walls not to exceed 20% of the wall area. There is trained staff in the facility at all times it is occupied by students, children or clients. Group I-1 and I-2 occupancies have trained staff present 24 hours a day. Similar safe guards are present in these 3 types of occupancies. I-1 and I-2 also have smoke zoning and special protection of hazard requirements to control exposure to the products of combustion.
4. Flame spread on the decorative wall covering will be primarily in the vertical direction. Horizontal propagation will occur at a considerably slower rate than the vertical in typical corridor configurations. This slower horizontal propagation can be retarded or controlled by the quick response sprinklers. 20% of the wall area was selected as a reasonable limit, allowing the facility flexibility in using decorative wall materials.
5. Other issues covered in the re-write follow.
6. Wall coverings and ceiling coverings cannot be tested to NFPA 701. Thus, surface coverings should be deleted from the definition of decorative materials and wall coverings and ceiling coverings added. This was done in a separate proposal, because it is not dependent on this change.
7. If a partition is attached to the wall it is a wall covering system. Such partitions usually are fabric covering foam plastic and they should not be exempt from testing because they can result in having very high heat release.
8. Chapter 8 of the IBC treats wall coverings and ceiling coverings differently because textile ceiling coverings and expanded ceiling coverings cannot be tested to NFPA 265 and therefore the section (now 807.1.4) should address wall and ceiling coverings.
9. If a "partition" is attached to a wall it is not a partition but either a wall covering or a curtain/drape and it is covered by the general requirements for wall coverings in 807.1.4.
10. Once a partition is supported from the floor it becomes more structural and it cannot be tested to NFPA 701.
11. Fabric partitions are covered by 807.1.5, which addresses how they should be tested and there is no need for an exception to 807.1.7.
12. The IFC now includes NFPA 289 as a test and it offers a better option for testing than NFPA 701 so it should be added as an option. It would be an intermediate option between NFPA 701 and noncombustible.
13. NFPA 701 has two tests: test 1 and test 2 (with the weight per unit area of the decoration being what determines which one is used). Many manufacturers advertise fabrics that "meet NFPA 701" and sometime they add that the fabric meets the "small scale test in NFPA 701". The problem is that the "small scale test" was eliminated from NFPA 701 in 1989

(because it does not provide adequate safety) and is now no longer an acceptable test anywhere. This is covered by a separate proposal submitted by Tim Earl, because it is independent of the action here. That has already been done in the IBC.

14. The IFC 2012 code is silent about fixed or movable walls, etc. that cover less than 10% of a wall or ceiling area. To avoid problems the proposal recommends that we grandfather in existing systems.

Cost Impact: Minimal

(IBC [F] 202); 807.1 (IBC [F] 806.1), 807.4, 807.4.1, 807.4.3.1, 807.4.4, 807.4.4.1, 807.4.5(New)

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care (john.williams@doh.wa.gov) and Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee (cbaldassarra@RJAGroup.com)

Revise as follows:

SECTION 202 (IBC [F] 202) GENERAL DEFINITIONS

DECORATIVE MATERIALS. All materials applied over the building *interior finish* for decorative, acoustical or other effect (~~such as including but not limited to~~ curtains, draperies, fabrics, streamers and surface coverings), and all other materials utilized for decorative effect (~~such as including but not limited to, photographs, paintings, bulletin boards, artwork, posters, batting, cloth, cotton, hay, stalks, straw, vines, leaves, trees, moss and similar items~~), including foam plastics and materials containing foam plastics. Decorative materials do not include floor coverings, ordinary window shades, *interior finish* and materials 0.025 inch (0.64 mm) or less in thickness applied directly to and adhering tightly to a substrate.

SECTION 807 DECORATIVE MATERIALS OTHER THAN DECORATIVE VEGETATION IN NEW AND EXISTING BUILDINGS

IFC 807.1 (IBC [F] 806.1) General requirements. In occupancies in Groups A, E, I-1 and R-1 and dormitories in Group R-2, curtains draperies, hangings and other combustible decorative materials suspended from walls or ceilings shall meet the flame propagation performance criteria of NFPA 701 in accordance with section 807.2 or be noncombustible.

Exceptions:

1. Curtains, draperies, hangings and other combustible decorative materials suspended from walls of *sleeping units* and *dwelling units* in dormitories in Group R-2 ~~protected~~ equipped by an approved automatic sprinkler system installed in accordance with Section 903.3.1 and such materials are limited to not more than 50 percent of the aggregate area of walls.
2. Decorative materials, including, but not limited to, photographs and paintings in dormitories in Group R-2 where such materials are of limited quantities such that a hazard of fire development or spread is not present.

In Groups I-1 and I-2, curtains, draperies, hangings and other combustible decorative materials suspended from walls or ceilings shall meet the flame propagation performance criteria of NFPA 701 or be noncombustible unless the decorative materials, including, but not limited to, photographs and paintings, are of such limited quantities that a hazard of fire development or spread is not present.

In Group I-3, combustible decorative materials are prohibited.

Fixed or movable walls and partitions, paneling, wall pads and crash pads applied structurally or for decoration, acoustical correction, surface insulation or other purposes shall be considered *interior finish* if they cover 10 percent or more of the wall or of the ceiling area, and shall not be considered *decorative materials* or furnishings.

In Group B and M occupancies, fabric partitions suspended from the ceiling and not supported by the floor shall meet the flame propagation performance criteria in accordance with Section 806.2 and NFPA 701 or shall be noncombustible.

IFC 807.4 Occupancy-based requirements. In occupancies specified in Group A, E and I-4 day care facilities, combustible decorative materials other than decorative vegetation shall comply with Sections 807.4.1 through 807.4.4.2 807.4.5.4.

IFC 807.4.1 General. All of the following requirements shall apply to all Group A, and E occupancies and Group I-4 day care facilities occupancies regulated by Sections 807.4.2 through 807.4.4:

1. ~~Explosive or highly flammable materials:~~ Furnishings or decorative materials of an explosive or highly flammable character shall not be used.
2. ~~Fire-retardant coatings:~~ Fire-retardant coatings in existing buildings shall be maintained so as to retain the effectiveness of the treatment under service conditions encountered in actual use.
3. ~~Obstructions:~~ Furnishings or other objects shall not be placed to obstruct *exits*, access thereto, egress there from or visibility thereof.

807.4.2 Group A. *(No change)*

807.4.2.1 Foam plastics. *(No change)*

807.4.2.2 Motion picture screens. *(No change)*

807.4.2.3 Wood use in Group A-3 places of religious worship. *(No change)*

807.4.3 Group E. *(No change)*

807.4.3.1 Storage in corridors and lobbies. Clothing and personal effects shall not be stored in *corridors* and lobbies.

Exceptions:

1. *Corridors* protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1.
2. *Corridors* protected by an *approved* smoke detection system installed in accordance with Section 907.
3. Storage in metal lockers, provided the minimum required egress width is maintained.

807.4.3.2 Artwork. *(No change to current text)*

807.4.4 Group I-4, day care facilities. ~~Group I-4 occupancies shall comply with~~ the requirements in Sections 807.4.4.1 and 807.4.4.2 ~~shall apply to day care facilities classified in Group I-4.~~

807.4.4.1 Storage in corridors and lobbies. Clothing and personal effects shall not be stored in *corridors* and lobbies.

Exceptions:

1. *Corridors* protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1.
2. *Corridors* protected by an *approved* smoke detection system installed in accordance with Section 907.
3. Storage in metal lockers, provided the minimum required egress width is maintained.

807.4.4.2 Artwork. Artwork and teaching materials shall be limited on the walls of *corridors* to not more than 20 percent of the wall area.

IFC 807.4.5 Groups I-1 and I-2. In Groups I-1 and I-2 occupancies, combustible decorative materials shall comply with Sections 807.4.5.1 through 807.4.5.4

IFC 807.4.5.1 Group I-1 and Group I-2 Condition 1 within units. In Group I-1 and Group I-2 Condition 1 occupancies, equipped throughout by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1, within sleeping units and dwelling units, combustible decorative materials are limited to not more than 50 percent of the aggregate wall area.

IFC 807.4.5.2 In Group I-1 and Group I-2 Condition 1 for areas other than within units. In Group I-1 and Group I-2 Condition 1 occupancies, equipped throughout by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1, combustible decorative materials in areas other than within dwelling and sleeping units are limited to not more than 30 percent of the aggregate wall area.

IFC 807.4.5.3 In Group I-2 Condition 2. In Group I-2 Condition 2 occupancies, equipped throughout by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1, the combustible decorative materials are limited to not more than 30 percent of the aggregate wall area.

IFC 807.4.5.4 Other areas in Groups I-1 and I-2. In Group I-1 and I-2 occupancies, in areas not equipped throughout by an *approved automatic sprinkler system*, the combustible decorative materials, shall be of such limited quantities that a hazard of fire development or spread is not present.

Reason: The intent of this proposal is to create consistent language for the Group I-1, I-2, and I-4 language for flame resistant curtains complying with NFPA 701 and the appropriate amount of paper permitted in these environments. The format for Group I-2 is consistent with how education and day care are currently addressed.

807.1 –The change from Group I-1 to I-4 in the first line is because I-1, I-2 and I-3 are addressed later in the section. For Group I-1 and I-2, the language is revised so it is clear what materials must comply with NFPA 701. Allowances for other decorative materials in Group I-1 and I-2 will be addressed in a new Section 807.4.5.

In the remainder of revised sections, the changes are editorial clean ups for consistent use of language and current terminology.

- 807.4 is revised to include the provisions added for Group I-1 and I-2.
- 807.4.1 is revised to remove redundant language.
- 807.4.3.1 is revised for consistent language with the referenced Section 907
- 807.4.4 is revised to remove redundant language.
- 807.4.4.1 is revised for consistent language with the referenced Section 907

807.4.5 is new text to address Group I-1 and I-2 facilities.-

Residents/patients in health care facilities increasingly seek to make their stay be comfortable and maintain connections with family and community. Part of this process may include decorating their bedrooms with personal décor from their homes, pictures drawn by their grandchildren, get well cards and other such items. The code currently calls for any combustible decorations to meet the flame spread requirements of NFPA 701, and a report must be provided to the code official. However, it is not practical nor routinely possible for every construction paper drawing or greeting card to be tested to NFPA 701 or to be treated with a flame retardant coating.

However, Section 407.2.1 of the code allows waiting or similar areas to be open to corridors. These types of spaces typically have magazines, bulletin boards with paper notices tacked to them, and other combustible items, not treated with flame retardants nor tested to NFPA 701. We submit that by allowing a specified percentage of un-treated, combustible decorative materials, in fully sprinkled Group I-1 and I-2 buildings, we do not exceed the “ordinary occupancy” classification outlined in NFPA 13, nor to do we increase the fire loading above what is currently permitted. What this proposal does do, though, is provide consistent language to aid enforcement, and provides a guide to providers to determine compliance within their facilities. This should eliminate the haphazard and inconsistent application of these provisions in facilities nationwide. A brief outline of the new provisions are as follows:

Section 807.4.5.1 - Group I-1 and I-2 Condition 1 buildings, that are protected throughout with an automatic sprinkler system, would be allowed to have combustible decorative materials that cover up to 50% of the aggregate area of walls inside of resident rooms. This is consistent with the requirements within sprinklered dwelling units in Group R-2 dormitories.

Section 807.4.5.2 - In I-1 and I-2 Condition 1 buildings, that are protected throughout with an automatic sprinkler system, spaces other than resident rooms would be limited to 30% coverage of walls by combustible decorative materials. This would include common spaces and corridors.

Section 807.4.5.3 - For Group I-2 Condition 2 buildings, protected throughout with an automatic sprinkler system, all spaces would be limited to 30% coverage of walls. The need for this allowance is for such items as pictures, bulletin boards, safety bulletins, educational materials, patient bills or rights, allowing longer term patients to put up cards, and limited holiday decorations.

Section 807.4.5.4 - For existing Group I-1 and I-2 non-sprinkled buildings, and for Group I-2 buildings that have not yet retroactively provide complete automatic sprinkler protection, Section 807.4.5.4 shall apply. This text is current language relocated from Section 807.1.

Please note, that this proposed language change would also include combustible decorations that are tested to NFPA 701 or have been treated with an approved fire retardant coating within these limits. This change would also allow decorations to be placed on doorways, as long as they are either less than 50% coverage inside a Group I-1 or I-2 Condition 1 resident or 30% in other areas, and do not obstruct the use of the door, nor block vision panels.

This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering, a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: <http://www.iccsafe.org/cs/AHC/Pages/default.aspx>.

This proposal is being co-sponsored by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>. Since its inception in April/2005, the CTC has held twenty five meetings - all open to the public.

Proponent: Glen Carter, Justrite Manufacturing Company LLC

Revise as follows:

808.1 Wastebaskets and linen containers in Group I-1, I-2 and I-3 occupancies. Wastebaskets, linen containers and other waste containers, including their lids, located in Group I-1, I-2 and I-3 occupancies shall be constructed of noncombustible materials or of materials that meet a peak rate of heat release not exceeding 300 kW/m² when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m² in the horizontal orientation. Metal wastebaskets and other metal waste containers with a capacity of 20 gallons (75.7 L) or more shall be listed in accordance with UL 1315 or approved in accordance with FM 6921 and shall be provided with a noncombustible lid. Portable containers exceeding 32 gallons (121 L) shall be stored in an area classified as a waste and linen collection room and constructed in accordance with Table 509 of the International Building Code.

808.2 Waste containers with a capacity of 20 gallons or more in Group R-2 college and university dormitories. Waste containers, including their lids, located in Group R-2 college and university dormitories, and with a capacity of 20 gallons (75.7 L) or more, shall be constructed of noncombustible materials or of materials that meet a peak rate of heat release not exceeding 300 kW/m² when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m² in the horizontal orientation. Metal wastebaskets and other metal waste containers with a capacity of 20 gallons (75.7 L) or more shall be listed in accordance with UL 1315 or approved in accordance with FM 6921 and shall be provided with a noncombustible lid. Portable containers exceeding 32 gallons (121 L) shall be stored in an area classified as a waste and linen collection room constructed in accordance

5003.8.7.1 Construction. The interior of cabinets shall be treated, coated or constructed of materials that are nonreactive with the hazardous material stored. Such treatment, coating or construction shall include the entire interior of the cabinet. Cabinets shall either be listed in accordance with UL 1275 or approved in accordance to FM 6050 as suitable for the intended storage or constructed in accordance with the following: with Table 509 of the International Building Code.

5003.9.10 Safety cans. Safety cans shall be listed in accordance with UL 30, UL 1313, or approved in accordance with FM 6051 and FM 6052 when used to increase the maximum allowable quantities per control area of flammable or combustible liquids in accordance with Table 5003.1.1(1). ~~Safety cans listed in accordance with UL 1313 are allowed for flammable and combustible liquids when not used to increase the maximum allowable quantities per control area and for other hazardous material liquids in accordance with the listing.~~

5005.1.10 Liquid transfer. Liquids having a hazard ranking of 3 or 4 in accordance with NFPA 704 shall be transferred by one of the following methods:

1. From safety cans complying with UL 30, UL 1313 or with FM 6051 and FM 6052.
- 2 through 5 *(No change to current text)*

5704.3.2.1.1 Materials. Cabinets shall be listed in accordance with UL 1275, or approved in accordance to FM 6050, or constructed of approved wood or metal in accordance with the following:

5705.2.4 Class I, II and III liquids. Class I liquids or when heated to or above their flash points, Class II and Class III liquids shall be transferred by one of the following methods:

1. From safety cans complying with UL 30, UL 1313 or with FM 6051 and FM 6052
- 2 through 5 *(No change to current text)*

Add standards to Chapter 80 as follows:

FM

6050-96	Approval Standard for Storage Cabinets (Flammable and Combustible Liquids
6051 and 6052-76	Approval Standard for Safety Containers and Filling, Supply and Disposal Containers
6921-04	Approval Standard for Cabinets for Combustible Waste

Reason:

- 1) For those proposals adding the appropriate FM Approval standard: FM Approvals is a nationally and globally recognized laboratory who just like UL has construction specifications these safety products have to be built to, performance specification these safety products are tested to before an approval is issued.

FM Approvals publish an approval guide that lists all the products they have approved. And FM Approvals conducts periodic quality assurance audits to assure the approved products are manufactured to the same standards as those products and designs that were submitted for evaluation. All design changes are submitted to FM Approvals for their approval prior to those changes being allowed. The fire tests conducted by both organizations (UL & FM) on these products are to the same time temperature curve.

It is in this spirit that FM Approvals should be included in the IFC as a nationally & globally recognized approval laboratory.

- 2) For those proposals 5003.9.10, 5005.1.10, and 5705.2.4 I am proposing adding UL 1313 for Non-metallic Safety Cans. Non-metallic safety cans are tested the same way as metallic safety cans and are as safe or safer than the metallic safety cans. If you had ever seen a non-metallic safety can in a fire test you would no longer be a skeptical.
 - a) Intuitively, it is hard to imagine a safety can made of polyethylene surviving a fire test. I was curious about this concept until I witnessed our non-metallic safety can in a fire test conducted at UL. In the fire test, the safety can performed very admirably in the way the design met its goals, in not contributing to the spread of fire. Our non-metallic safety can vented on cue. As the vented vapors were being consumed by fire, the level of the liquid fuel lowered in the can. In turn the polyethylene started to melt but, only in the void above the fluid level. The liquid fuel level was protecting the can from melting further by absorbing the heat. As the fluid level went down the safety can's walls melted inward and further down the height of the can above the fuel level. This continued until all the fuel inside the safety can had been consumed while contained within the safety can's walls. There was no spew of fuel; no rupture of the safety can spreading fuel all over the area. That is exactly the intended result of a well-designed safety can. I believe once anyone has witnessed this test and understood the consequences they would be compelled to agree too.
 - b) There are numerous flammable and combustible liquids that are incompatible with metallic safety cans. As an example, isopropyl alcohol will begin to pit a metallic safety can until micro leaks begin to occur. The only safe and compatible solution for storage of this liquid and others is a non-metallic safety can.
 - c) A non-metallic safety can is definitely more robust during a drop test; our non-metallic safety can designs will rebound undamaged because of its superior thick wall strength. The metallic safety can in a drop test will result in a dented and crumpled shell. Both meet the criteria of a safety can but you cannot top the strength and resilience of the poly can.
 - d) Metallic and non-metallic safety cans both benefit work place safety and each are recognized by many local, state, and federal laws. Non-metallic safety cans would be a loss to the safety community if it is not recognized. It is hard to picture what legal & safe alternative will be available to those whose processes that currently requiring non-metallic safety cans. Non-metallic safety cans have long provided a safe solution over makeshift consumer gasoline cans or glass/plastic carboys etc...

Note: The FM 6051 and 6052 are a combined specification covering metallic and non-metallic safety cans.

- 3) I am proposing the deletion illustrated in section 5003.9.10 to allow non-metallic safety cans to be used to allow the increase of MAQs in a control area for those reasons described in 2 a), b), c), & d) above.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, FM 6050-96, FM 6051 and 6052-76 and FM 6921-04, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28), will be posted on the ICC website on or before April 1, 2013. The standard UL 1313 is currently referenced within the IFC.

XXX

F113 – 13

901.4.1

Proponent: Edwin M. Berkel, CFI, Fire Marshal, Mehlville Fire Protection District, St, Louis, MO
(EBerkel@mehlvillefire.com)

Revise as follows:

901.4.1 Required fire protection systems. Fire protection systems required by this code or the *International Building Code* shall be installed, repaired, operated, tested and maintained in accordance with this code. Any fire protection system for which a design option, exception or reduction to the provisions of this code or the *International Building Code* has been granted shall be considered to be a required system.

Reason: The new text proposed for this section parallels the second paragraph of Section 901.2 of the IBC and will improve the correlation between the IBC and the IFC. While the code may not require a fire protection system for a specific building or portion thereof due to its occupancy, the fire protection system would still be considered a required system if some other code trade-off, exception, reduction or design option was taken based on the installation of the fire protection system. As a typical example, a small office building would not require an automatic sprinkler system solely due to its Group B occupancy classification; however, if an exit access corridor fire-resistance-rating reduction is taken in accordance with Table 1018.1 for buildings equipped throughout with an NFPA 13 sprinkler system, that sprinkler system would then be considered a required system. Code trade-offs, exceptions, reductions or other design options are not unique to the IBC but also occur frequently in the IFC. The following 62 IFC sections, among others, illustrate this fact and validate the need for the added text:

Chapter 3: 5 Sections: 304.3.3, 304.3.4, 308.1.4, 313.1, 318.1)
Chapter 4: Section 403.3
Chapter 5: 2 Sections (503.1.1, 507.5.1)
Chapter 6: Section 603.3.2.1
Chapter 8: 1 3 sections (Table 803.3, 803.5.1, 804.3.3.2, 805.1.1.2, 805.1.2.2, 805.2.1.2, 805.2.2.2, 805.4.1.2, 805.4.2.2, 806.1.1, 807.1, 807.4.3.1, 807.4.4.1)
Chapter 10: 16 sections (1005.3.1, 1005.3.2, 1007.2.1, 1007.3, 1007.4, 1008.1.9.4, 1009.3, Table 1014.3, 1015.1, 1015.2, Table 1016.2, Table 1018.1, 1018.4, Table 1021.2(1), Table 1021.2(2), 1022.1, 1026.6)
Chapter 11: 11 sections (1103.4.2, 1103.4.4, 1103.4.5, 1103.4.6, 1103.7.5.1, 1103.7.6, 1104.16.2, 1104.17, 1104.17.1, Table 1104.17.2, 1104.21)
Chapter 28: Section 2804.2.1
Chapter 32: Section 3204.2
Chapter 50: 3 Tables: 5003.1.1(1), 5003.1.1(2) and 5003.11.1
Chapter 57: 3 Sections: 5704.29.2.3., 5704.3.6.2, Tables 5704.3.6.3(1), (2) and (3)
Chapter 60: Section 6002.3.5
Appendix Sections: B105.1, B105.2; D106.1, D107.1

Cost impact: This proposal will not increase the cost of construction.

901.4.1-F-BERKEL

F114 – 13

901.4.3.1 (New)

Proponent: Al Godwin, CBO, CPM, Aon Fire Protection Engineering, representing Aon Fire Protection Engineering Corporation (al.godwin@aon.com)

Add new text as follows:

901.4.3.1 Speculative buildings. In new buildings or existing buildings undergoing interior demolition, that create vacant *fire areas* in size that exceed the established limits but have a future intent to divide *fire areas* so as not to exceed the limits established for requiring a *fire protection system*, such areas shall install preliminary *fire area* separations as described in Section 901.4.3 until such tenant insertions occur and such separations can be relocated to meeting tenant locations.

Reason: There are some developments that intend on sprinklering but desire to wait until the first tenant is installed, postponing the costs until rent can be collected. And there are some that desire to do such sprinklering with each tenant installation; thus, not achieving a fully sprinklered building until fully occupied. Such buildings are not addressed in this provision but are left to local discretion.

This provision is for buildings that are identified as being non-sprinklered such as retail strip centers. As with sprinklers, an intent is sometimes expressed to install the separations as tenant finish out occurs, avoiding the cost until a renter is installed. In this case, at a bare minimum, the floor/ceiling of a two-story building should have a 1-hour rating installed up front. Of course, an upgrade to 2-hour might be required sporadically in the future.

Having to install such horizontal assembly at a later date, from structural to structural, including the columns to foundation may prove difficult. And, it is possible that such horizontal assemblies are not installed at all due to the difficulty of crossing existing tenants.

Also, it is not uncommon for developers to flip such projects, leaving the new owner and future architects clueless of the requirement. It also requires that the jurisdiction keep up with such buildings so as to tag them with each finish out permit.

Installation up front will comply with code and provide a reminder that such separations are continually required.

Opposition to this code change might express the idea:

1. that a hazard does not exist until occupancy occurs;
2. that this requires double costs for such separation construction; or,
3. such vacant spaces are often not closed in across the front subjecting such protection to the elements.

As such, it should encourage more sprinklering to avoid this issue.

Costs: in jurisdiction where this is not enforced now, this will increase the cost of construction.

F114-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

901.4.3.1 (NEW)-F-GODWIN

F115 – 13

901.4.6 (IBC [F] 901.8)

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

901.4.6 Pump and riser room size. Where provided fire pump rooms and automatic sprinkler system riser rooms shall be designed with adequate space for all equipment necessary for the installation, as defined by the manufacturer, with sufficient working room around the stationary equipment. Clearances around equipment to elements of permanent construction, including other installed equipment and appliances, shall be sufficient to allow inspection, service, repair or replacement without removing such elements of permanent construction or disabling the function of a required fire-resistance-rated assembly. Fire pump and automatic sprinkler system riser rooms shall be provided with a door(s) and unobstructed passageway large enough to allow removal of the largest piece of equipment.

Reason: A fire pump room, an automatic sprinkler riser room, or the combination is not required by this section. This section can be interpreted to require rooms around fire sprinkler risers. The Fire Code committee and proponent verbally clarified this intent during 09/10 cycle. The proponent's intent is to clarify these rooms are not required. When one is provided, it is required to meet Section 901.8.

Cost Impact: This code change will increase the cost of construction

F115-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

901.4.6-F-ZUBIA-FCAC

F116 – 13

901.7, 311.2.2

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

901.7 Systems out of service. In other than one- and two-family dwellings and Group R-3 occupancies, where a required fire protection system is out of service, the fire department and the fire code official shall be notified immediately. In other than one- and two-family dwellings and Group R-3 occupancies, where a required fire protection system is out of service and, where required by the fire code official, the building shall either be evacuated or an approved fire watch shall be provided for all occupants left unprotected by the shutdown until the fire protection system has been returned to service. Vacant premises shall comply with Section 311.2.2.

Where utilized, fire watches shall be provided with at least one approved means for notification of the fire department and their only duty shall be to perform constant patrols of the protected premises and keep watch for fires.

Revise as follows:

311.2.2 Fire protection. Fire alarm, sprinkler and stand-pipe systems shall be maintained in an operable condition at all times. Before a vacant premises is permitted to be reoccupied, the fire code official shall have the authority to require inspection and testing of any fire protection system that has been out of service for 30 days or greater.

Exceptions:

1. When the premises have been cleared of all combustible materials and debris and, in the opinion of the fire code official, the type of construction, fire separation distance and security of the premises do not create a fire hazard.
2. Where approved by the fire chief, buildings that will not be heated and where fire protection systems will be exposed to freezing temperatures, fire alarm and sprinkler systems are permitted to be placed out of service and standpipes are permitted to be maintained as dry systems (without an automatic water supply), provided the building has no contents or storage, and windows, doors and other openings are secured to prohibit entry by unauthorized persons.

Reason: Section 901.7 is revised because it is imperative that the fire department and the fire code official must be notified when **any** fire protection system is taken out of service, not just required systems. Dwellings are eliminated from this requirement since the dwelling fire sprinkler system is designed to provide life safety and only operate for 10 minutes. Arriving firefighters expect the systems they encounter to be operational in commercial facilities, and many times will make decisions based on the operating fire sprinkler system. The second sentence and the remainder of the section are appropriate to apply only to required systems, so the reference to required fire sprinkler systems is added back in at this point.

Additionally, there should also be a reference directing the code user to Section 311.2.2 for the requirements for fire protection systems in vacant buildings.

Section 311.2.2 is revised because when a fire protection system that has been out of service for 30 days or more in a vacant building could have been subject to corrosion or vandalism and needs to be inspected and tested to ensure that it working properly before allowing the building to be reoccupied.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: <http://www.iccsafe.org/cs/CAC/Pages/default.aspx>.

Cost Impact: The code change proposal will not increase the cost of construction.

F116-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

901.7-F-ZUBIA-FCAC

F117 – 13

903.2.1 (IBC [F] 903.2.1)

Proponent: Barry Gupton, PE, NC Department of Insurance, Office of State Fire Marshal, Engineering Division (barry.gupton@ncdoi.gov)

Revise as follows:

903.2.1 (IBC [F] 903.2.1) Group A. An *automatic sprinkler system* shall be provided throughout buildings and portions thereof used as Group A occupancies as provided in this section. For Group A-1, A-2, A-3 and A-4 occupancies, the *automatic sprinkler system* shall be provided throughout the floor ~~area where~~ the containing a Group A-1, A-2, A-3 or A-4 occupancy ~~is located~~, and in all floors from the Group A occupancy to, and including, the nearest *level of exit discharge* serving the Group A occupancy. For Group A-5 occupancies, the *automatic sprinkler system* shall be provided in spaces indicated in Section 903.2.1.5.

Reason The term "floor area" is confusing. "Floor area" infers that only the actual space where the Group A-1, A-2, A-3 or A-4 occupancies are located require sprinklers on that floor. The intent of the code is to provide sprinklers for the entire story where the Group A occupancy is located as well as the stories between that story and the level of exit discharge. The changed wording is to help clarify the intent of the code.

Cost Impact: The code change proposal will not increase the cost of construction.

F117-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

903.2.1 #1-FS-GUPTON

F118 – 13

903.2.1 (IBC [F] 903.2.1)

Proponent: Barry Gupton, PE, NC Department of Insurance, Office of State Fire Marshal, Engineering Division (barry.gupton@ncdoi.gov)

Revise as follows:

903.2.1 (IBC [F] 903.2.1) Group A. An *automatic sprinkler system* shall be provided throughout buildings and portions thereof used as Group A occupancies as provided in this section. For Group A-1, A-2, A-3 and A-4 occupancies, the *automatic sprinkler system* shall be provided throughout the floor area where the Group A-1, A-2, A-3 or A-4 occupancy is located, and in all floors from the Group A occupancy to, and including, the ~~nearest level~~ levels of exit discharge serving the Group A occupancy. For Group A-5 occupancies, the *automatic sprinkler system* shall be provided in spaces indicated in Section 903.2.1.5.

Reason This change insures that floors adjacent to all exit discharges serving the assembly occupancy are protected with sprinklers to provide the additional time required to egress the higher occupant load. The previous language of "nearest level of exit discharge" may only protect one exit when exit discharge is on more than one level.

Cost Impact: The code change proposal will increase the cost of construction for buildings with more than one level of exit discharge that would not otherwise require sprinklers.

F118-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

903.2.1 #2-FS-GUPTON

F119 – 13

903.2.1

Proponent: Daniel E. Nichols, P.E., New York State Department of State (dan.nichols@dos.ny.gov)

Revise as follows:

903.2.1 Group A. An *automatic sprinkler system* shall be provided throughout buildings and portions thereof used as Group A occupancies as provided in this section. For Group A-1, A-2, A-3 and A-4 occupancies, the *automatic sprinkler system* shall be provided throughout the floor area where the Group A-1, A-2, A-3 or A-4 occupancy is located, and in all floors from the Group A occupancy to, and including, the nearest *level of exit discharge* serving the Group A occupancy. For Group A-5 occupancies, the *automatic sprinkler system* shall be provided in the spaces indicated in Section 903.2.1.5.

903.2.1.1 Group A-1. An *automatic sprinkler system* shall be provided for Group A-1 occupancies where one of the following conditions exists:

1. The *fire area* exceeds 12,000 square feet (1115 m²).
2. The *fire area* has an *occupant load* of 300 or more.
3. The *fire area* is located on a floor other than a *level of exit discharge* serving such occupancies.
4. ~~The *fire area* contains a multitheater complex.~~ When separate fire areas share exit or exit access components that have a cumulative occupant load of 300 or more.

903.2.1.2 Group A-2. An *automatic sprinkler system* shall be provided for Group A-2 occupancies where one of the following conditions exists:

1. The *fire area* exceeds 5,000 square feet (464 m²).
2. The *fire area* has an *occupant load* of 100 or more.
3. The *fire area* is located on a floor other than a *level of exit discharge* serving such occupancies.
4. When separate fire areas share exit or exit access components that have a cumulative occupant load of 300 or more.

903.2.1.3 Group A-3. An *automatic sprinkler system* shall be provided for Group A-3 occupancies where one of the following conditions exists:

1. The *fire area* exceeds 12,000 square feet (1115 m²).
2. The *fire area* has an *occupant load* of 300 or more.
3. The *fire area* is located on a floor other than a *level of exit discharge* serving such occupancies.
4. When separate fire areas share exit or exit access components that have a cumulative occupant load of 300 or more.

903.2.1.4 Group A-4. An *automatic sprinkler system* shall be provided for Group A-4 occupancies where one of the following conditions exists:

1. The *fire area* exceeds 12,000 square feet (1115 m²).
2. The *fire area* has an *occupant load* of 300 or more.
3. The *fire area* is located on a floor other than a *level of exit discharge* serving such occupancies.
4. When separate fire areas share exit or exit access components that have a cumulative occupant load of 300 or more.

Reason: Under the current provisions for sprinkler protection in assembly occupancies, the option of a fire area allows for compartmentation to be utilized in place of installing a sprinkler system. The issue with this arrangement is that multiple small assembly occupancies can be placed in a single story building and not trigger a sprinkler system because of the installation of a rated corridor and separation wall.

This proposal adds the requirement that sprinkler systems shall be added when the convergence of more than 300 persons shares an exit. This is consistent with the intent of automatic sprinkler systems being required for life safety and to maintain tenable

exiting in a fire event. A fire event that is near an exit is the same whether there are 300 occupants in one room or three rooms with 100 occupants each sharing an exit. This is also consistent with the requirement in the current IFC for A-1 occupancies in "multitheater complex", which is a requirement for anytime two or more theaters are in the same tenancy and does not consider occupant load as a trigger.

This proposal still provides options for those single story buildings with multiple tenancies that have separate exits and utilize the fire area separation concept; such as buildings with multiple restaurants with separate entrances and strip-style mall buildings.

The State of New York has had experience in both fire losses and new building construction with this topic. First, the Stouffer's Inn and conference center in 1981 killed 23 top-level executives when a fire in a common hallway trapped occupants in several small (50-100 person) conference rooms. Second, the fire area method of separating A-3 occupancies has provided a way to not sprinkler college and university lecture room buildings by separating the spaces but having room occupant loads approaching 1,000 people in the common hallway.

This proposal is submitted with the endorsement of the New York State Building Officials Conference, the New York State Fire Marshals and Inspectors Association, and the Association of Fire Districts of New York State.

Cost Impact: For buildings that have previously utilized the passive method of separating assembly occupancies when exiting is shared, this will increase the cost of construction due to the additional sprinkler requirement.

F119-13

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

903.2.1-F-NICHOLS

F120 – 13

903.2.1

Proponent: Carl D. Wren, P.E., Austin Fire Department, representing self (carl.wren@austintexas.gov)

Revise as follows:

903.2.1 Group A. An automatic sprinkler system shall be provided throughout buildings and portions thereof used as Group A occupancies as provided in this section. For Group A-1, A-2, A-3 and A-4 occupancies, the automatic sprinkler system shall be provided throughout the floor ~~area~~ where the fire area containing the Group A-1, A-2, A-3 or A-4 occupancy is located, and ~~in~~ throughout all floors of the building ~~from above or below~~ the Group A occupancy to, and including, the nearest level of exit discharge serving the Group A occupancy. For Group A-5 occupancies, the automatic sprinkler system shall be provided in the spaces indicated in Section 903.2.1.5.

903.2.1.1 Group A-1. An automatic sprinkler system shall be provided for fire areas containing Group A-1 occupancies and intervening floors of the building that impact the egress pathways where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m2).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.
4. The fire area contains a multitheater complex.

903.2.1.2 Group A-2. An automatic sprinkler system shall be provided for fire areas containing Group A-2 occupancies and intervening floors of the building that impact the egress pathways where one of the following conditions exists:

1. The fire area exceeds 5,000 square feet (464 m2).
2. The fire area has an occupant load of 100 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

903.2.1.3 Group A-3. An automatic sprinkler system shall be provided for fire areas containing Group A-3 occupancies and intervening floors of the building that impact the egress pathways where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m2).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

903.2.1.4 Group A-4. An automatic sprinkler system shall be provided for fire areas containing Group A-4 occupancies and intervening floors of the building that impact the egress pathways where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m2).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

903.2.1.5 Group A-5. An automatic sprinkler system shall be provided for Group A-5 occupancies in the following areas: concession stands, retail areas, press boxes and other accessory use areas in excess of 1,000 square feet (93 m2).

Reason: The current code language can be somewhat confusing since the charging language in 903.2.1 deals with the occupancy and certain building areas outside the occupancy but the language in subsections 903.2.1.1, 903.2.1.2, 903.2.1.3 and 903.2.1.4 require the "occupancy" to be protected by fire sprinklers while it addresses the thresholds in terms of the size of the "fire area". It is not the intent of this proposal to change the requirements of this section, only to clarify them.

Cost Impact: This code change is being proposed as an effort to clarify potentially confusing language and will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

903.2.1F-WREN

F121 – 13

903.2, 102.3, 1106 (New)

Proponent: Al Godwin, CBO, CPM, Aon Fire Protection Engineering, representing Aon Fire Protection Engineering Corporation (al.godwin@aon.com)

Revise as follows:

903.2.1 Group A. An *automatic sprinkler system* in accordance with Section 903.3.1.1 shall be provided throughout buildings and portions thereof used as Group A occupancies ~~when any one of the following conditions exists as provided in this section.~~ For Group A-1, A-2, A-3 and A-4 occupancies, ~~the automatic sprinkler system shall be provided throughout the floor area where the Group A-1, A-2, A-3 or A-4 occupancy is located, and in all floors from the Group A occupancy to, and including, the nearest level of exit discharge serving the Group A occupancy.~~ For Group A-5 occupancies, ~~the automatic sprinkler system shall be provided in the spaces indicated in Section 903.2.1.5.~~

903.2.1.6 Location. When required by Sections 903.2.1.1 through 903.2.1.5, sprinkler installation shall be as follows:

1. For Group A-1, A-2, A-3 and A-4 occupancies, the automatic sprinkler system shall be provided throughout the floor area where the Group A-1, A-2, A-3 or A-4 occupancy is located, and in all floors from the Group A occupancy to, and including, the nearest level of exit discharge serving the Group A occupancy.
2. For Group A-5 occupancies, the automatic sprinkler system shall be provided in the spaces indicated in Section 903.2.1.5.
3. For a Change of Occupancy, Partial Change of Occupancy or Change of Character, compliance shall be as specified in Section 1106.

903.2.2 Ambulatory care facilities. An *automatic sprinkler system* shall be installed ~~throughout the entire floor containing in~~ an ambulatory care facility where either of the following conditions exist at any time:

1. Four or more care recipients are incapable of self-preservation, whether rendered incapable by staff or staff has accepted responsibility for care recipients already incapable.
2. One or more care recipients that are incapable of self-preservation are located at other than the level of exit discharge serving such a facility.

903.2.2.1 Location. Where required by Section 903.2.2, sprinkler installation shall be as follows:

1. Throughout the entire floor containing an ambulatory care facility.
2. In buildings where ambulatory care is provided on levels other than the level of exit discharge, an automatic sprinkler system shall be installed throughout the entire floor where such care is provided as well as all floors below, and all floors between the level of ambulatory care and the nearest level of exit discharge, including the level of exit discharge.
3. For a change of occupancy, partial change of occupancy or change of character, compliance shall be as specified in Section 1106.

903.2.3 Group E. An *automatic sprinkler system* in accordance with Section 903.3.1.1 shall be provided for Group E occupancies where either of the following conditions exist ~~as follows:~~

1. ~~Throughout all~~ The Group E fire areas exceeds greater than 12,000 square feet (1115 m²) in area.
2. ~~Throughout every~~ Where portions of educational buildings are below the lowest level of exit discharge serving that portion of the building.

903.2.3.1 Location. Where required by Section 903.2.3, sprinkler installation shall be as follows:

1. Throughout the applicable *fire areas* as specified above.
2. Throughout the portion of educational buildings that are below the *lowest level of exit discharge* serving that portion of the building.

Exception: An *automatic sprinkler system* is not required in any area below the *lowest level of exit discharge* serving that area where every classroom throughout the building has at least one exterior *exit door* at ground level.

3. For a change of occupancy, partial change of occupancy or change of character, compliance shall be as specified in section 1106.

903.2.4 Group F-1. An *automatic sprinkler system* in accordance with Section 903.1.1 shall be provided throughout all buildings containing a Group F-1 occupancy where one of the following conditions exists:

1. A Group F-1 *fire area* exceeds 12,000 square feet (1115 m²).
2. A Group F-1 *fire area* is located more than three stories above grade plane.
3. The combined area of all Group F-1 *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²).
4. A Group F-1 occupancy used for the manufacture of upholstered furniture or mattresses exceeds 2,500 square feet (232 m²).

903.2.4.1 Woodworking operations. An *automatic sprinkler system* in accordance with Section 903.1.1 shall be provided throughout all Group F-1 occupancy *fire areas* that contain woodworking operations in excess of 2,500 square feet in area (232 m²) which generate finely divided combustible waste or which use finely divided combustible materials.

903.2.4.2 Location. Where required by Sections 903.2.4 or 903.2.4.1, sprinkler installation shall be as follows:

1. Throughout the applicable *fire areas* as specified above.
2. Throughout Group F-1 occupancies used for the manufacture of upholstered furniture or mattresses in excess of 2,500 square feet (232 m²).
3. For a Change of Occupancy, Partial Change of Occupancy or Change of Character, compliance shall be as specified in Section 1106.

903.2.5 Group H. *Automatic sprinkler systems* in accordance with Section 903.3.1.1 shall be provided in high-hazard occupancies as required in Sections 903.2.5.1 through 903.2.5.3 ~~4~~.

903.2.5.1 General. An *automatic sprinkler system* in accordance with Section 903.3.1.1 shall be installed in Group H occupancies.

903.2.5.2 Group H-5 occupancies. An *automatic sprinkler system* in accordance with Section 903.3.1.1 shall be installed (*remainder unchanged*).

903.2.5.3 Pyroxylin plastics. An *automatic sprinkler system* in accordance with Section 903.3.1.1 shall be provided (*remainder unchanged*).

903.2.5.4 Location. Where required by Sections 903.2.5, 903.2.5.1, 903.2.5.2 or 903.2.5.3, sprinkler installation shall be as follows:

1. Throughout the area containing a Group H occupancy.
2. Throughout the floor area where cellulose nitrate film or pyroxylin plastics are manufactured,

stored or handled in quantities exceeding 100 pounds (45 kg).

3. For a change of occupancy, partial change of occupancy or change of character, compliance shall be as specified in section 1106.

903.2.6 Group I. An *automatic sprinkler system* in accordance with Section 903.3.1.1 shall be provided throughout all buildings with a Group I *fire area*.

Exceptions:

1. An *automatic sprinkler system* installed in accordance with Section 903.3.1.2 shall be permitted in Group I-1 facilities.
2. An *automatic sprinkler system* installed in accordance with Section 903.3.1.3 shall be allowed in Group I-1 facilities when in compliance with all of the following:
 - 2.1 A hydraulic design information sign is located on the system riser;
 - 2.2 Exception 1 of Section 903.4 is not applied; and
 - 2.3 Systems shall be maintained in accordance with the requirements of Section 903.3.1.2.
3. ~~An *automatic sprinkler system* is not required where day care facilities are at the *level of exit discharge* and where every room where care is provided has at least one exterior *exit door*.~~
4. ~~In buildings where Group I-4 day care is provided on levels other than the *level of exit discharge*, an *automatic sprinkler system* in accordance with Section 903.3.1.1 shall be installed on the entire floor where care is provided and all floors between the level of care and the *level of exit discharge*, all floors below the *level of exit discharge*, other than areas classified as an open parking garage.~~

903.2.6.1 Location. Where required by Section 903.2.6, sprinkler installation shall be throughout the entire building when containing a Group I occupancy.

Exceptions:

1. An *automatic sprinkler system* is not required where day care facilities are at the *level of exit discharge* and where every room where care is provided has at least one exterior *exit door*.
2. In buildings where Group I-4 day care is provided on levels other than the *level of exit discharge*, an *automatic sprinkler system* in accordance with Section 903.3.1.1 shall be installed on the entire floor where care is provided and all floors between the level of care and the *level of exit discharge*, all floors below the *level of exit discharge*, other than areas classified as an open parking garage.
3. For a change of occupancy, partial change of occupancy or change of character, compliance shall be as specified in section 1106.

903.2.7 Group M. An *automatic sprinkler system* in accordance with Section 903.3.1.1 shall be provided throughout buildings containing a Group M occupancy where one of the following conditions exists:

1. A Group M *fire area* exceeds 12,000 square feet (1115 m²).
2. A Group M *fire area* is located more than three stories above grade plane.
3. The combined area of all Group M *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²).
4. A Group M occupancy used for the display and sale of upholstered furniture or mattresses exceeds 5,000 square feet (464 m²).

903.2.7.1 High-piled storage. An *automatic sprinkler system* in accordance with Section 903.3.1.1 shall be provided as required in Chapter 32 in all buildings of Group M where storage of merchandise is in high-piled or rack storage arrays.

903.2.7.2 Location. Where required by Sections 903.2.7 or 903.2.7.1, sprinkler installation shall be as follows:

1. Throughout the applicable *fire areas* as specified above.
2. Throughout Group M occupancies used for the display and sale of upholstered furniture or mattresses in excess of 5,000 square feet (464 m²).
3. As applicable in Chapter 32 for high-piled storage.
4. For a change of occupancy, partial change of occupancy or change of character, compliance shall be as specified in section 1106.

903.2.8 Group R. An *automatic sprinkler system* installed in accordance with Section 903.3 shall be provided throughout all buildings with a Group R *fire area*.

903.2.8.1 Group R-3 or R-4 congregate residences. An *automatic sprinkler system* installed in accordance with Section 903.3.1.3 shall be permitted in Group R-3 or R-4 congregate living facilities with 16 or fewer residents.

903.2.8.2 Care facilities. An *automatic sprinkler system* installed in accordance with Section 903.3.1.3 shall be permitted in care facilities with 5 or fewer individuals in a single-family dwelling.

903.2.8.3 Location. Where required by Section 903.2.8, sprinkler installation shall be throughout the entire building when containing a Group R occupancy.

Exception: For a change of occupancy, partial change of occupancy or change of character, compliance shall be as specified in section 1106.

903.2.9 Group S-1. An *automatic sprinkler system* shall be provided throughout all buildings containing a Group S-1 occupancy where one of the following conditions exists:

1. A Group S-1 *fire area* exceeds 12,000 square feet (1115 m²).
2. A Group S-1 *fire area* is located more than three stories above grade plane.
3. The combined area of all Group S-1 *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²).
4. A Group S-1 occupancy used for the storage of upholstered furniture or mattresses exceeds 2,500 square feet (232 m²).

903.2.9.1 Repair garages. An *automatic sprinkler system* shall be provided throughout all buildings used as repair garages in accordance with Section 406.8 of the *International Building Code*, where one of the following conditions exists as shown:

1. Buildings having two or more stories above grade plane, including *basements*, with a *fire area* containing a repair garage exceeding 10,000 square feet (929 m²)
2. Buildings no more than one story above grade plane, with a *fire area* containing a repair garage exceeding 12,000 square feet (1115 m²).
3. Buildings with repair garages servicing vehicles parked in *basements*.
4. A Group S-1 *fire area* used for the repair of commercial trucks or buses where the *fire area* exceeds 5,000 square feet (464 m²).

903.2.9.2 Bulk storage of tires. Throughout all buildings and structures where the area for the storage of tires exceeds 20,000 cubic feet (566 m³) shall be equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

903.2.9.3 Location. Where required by Sections 903.2.9, 903.2.9.1 or 903.2.9.2, sprinkler installation shall be as follows:

1. Throughout the applicable *fire areas* as specified above.
2. Throughout Group S-1 occupancies used for the storage of upholstered furniture or mattresses in excess of 2,500 square feet (232 m²).
3. Throughout the entire building when any of the conditions of Sections 903.2.9.1 and 903.2.9.2

- exists.
4. For a change of occupancy, partial change of occupancy or change of character, compliance shall be as specified in section 1106.

903.2.10 Group S-2 enclosed parking garages. An *automatic sprinkler system* shall be provided throughout buildings classified as enclosed parking garages in accordance with Section 406.6 of the *International Building Code* where one of the following conditions exists as follows:

1. Where the *fire area* of the enclosed parking garage exceeds 12,000 square feet (1115 m²); ~~or,~~
2. Where the enclosed parking garage is located beneath other groups.

~~**Exception:** Enclosed parking garages located beneath Group R-3 occupancies.~~

903.2.10.1 Commercial parking garages. An *automatic sprinkler system* shall be provided throughout buildings used storage of commercial trucks or buses where the *fire area* exceeds 5,000 square feet (464 m²).

903.2.10.2 Location. Where required by Sections 903.2.10 or 903.2.10.1, sprinkler installation shall be as follows:

1. Throughout the applicable *fire areas* as specified above.
2. Throughout the area of all floors below other groups used as an enclosed parking garage.

~~**Exception:** Enclosed parking garages located beneath Group R-3 occupancies.~~

3. For a change of occupancy, partial change of occupancy or change of character, compliance shall be as specified in section 1106.

Delete and substitute as follows:

~~**[A] 102.3 Change of use or occupancy.** No change shall be made in the use or occupancy of any structure that would place the structure in a different division of the same group or occupancy or in a different group of occupancies, unless such structure is made to comply with the requirements of this code and the *International Building Code*. Subject to the approval of the *fire code official*, the use or occupancy of an existing structure shall be allowed to be changed and the structure is allowed to be occupied for purposes in other groups without conforming to all of the requirements of this code and the *International Building Code* for those groups, provided the new or proposed use is less hazardous, based on life and fire risk, than the existing use.~~

[A] 102.3 Change of use or occupancy, partial change of occupancy and change of character. No change in use or occupancy, partial change of occupancy or change of character shall be made to any structure without compliance with Section 1106.

Add new text as follows:

SECTION 1106

CHANGE OF OCCUPANCY, PARTIAL CHANGE OF OCCUPANCY, CHANGE OF CHARACTER

1106.1 General. Buildings or portions thereof undergoing a change of occupancy, partial change of occupancy or change of character, shall comply with the provisions of Sections 1106.1.1 through 1106.4

1106.1.1 Special use. Any change of Occupancy, Partial Change of Occupancy or Change of Character that results in the creation of one of the following special use or occupancy shall comply with all of the applicable requirements of this code and the *International Building Code*.

1. Covered and open mall buildings.
2. Atriums.
3. Motor vehicle-related occupancies.
4. Aircraft-related occupancies.
5. Motion picture projection rooms.
6. Stages and platforms.
7. Special amusement buildings.
8. Incidental use areas.
9. Hazardous materials.
10. Ambulatory care facilities.

1106.1.2. Underground buildings. An underground building in which there is a change of occupancy, partial change of occupancy or change of character shall comply with the requirements of this code and the *International Building Code* applicable to underground buildings.

1106.2 Change of use or occupancy. No change shall be made in the use or occupancy of any structure that would place the structure in a different division of the same group or occupancy or in a different group of occupancies, unless such structure is made to comply with the requirements of this code and the *International Building Code*. Subject to the approval of the *fire code official*, the use or occupancy of an existing structure shall be allowed to be changed and the structure is allowed to be changed and is allowed to be occupied for purposes in other groups without conforming to all of the requirements of this code and the *International Building Code* for those groups, provided the new or proposed use is less hazardous, based on life and fire risk, than the existing use.

1106.3 Partial change of occupancy classification. In other than special uses as specified in Section 1106.1.1, where a portion of an existing building is changed to a new occupancy classification, Sections 1106.3.1 and 1106.3.2 shall apply.

1106.3.1 Fire sprinkler system. Automatic sprinkler system provisions of Section 903.2.1 through 903.2.10.1 shall only be applicable to the *fire area* of concern where separated from other *fire areas* as required by Section 707.3.10 of the *International Building Code* except as specifically required by Sections 1106.3.1.1 through 1106.1.8.

1106.3.1.1 Ambulatory care facilities. For ambulatory care facilities, the automatic sprinkler system provisions of Section 903.2.2 shall only be applicable to the floor where the ambulatory care facility is located where the *fire area* of the floor is separated from other floors in accordance with Section 707.3.10 of the *International Building Code*.

1106.3.1.2 Group E occupancies. Group E occupancies created over portions of educational buildings that are below the *lowest level of exit discharge*, an *automatic sprinkler system* is not required in any area below the *lowest level of exit discharge* serving that area where:

- 1 The new Group E *fire area* has at least one exterior *exit door* at ground level; or,
- 2 All existing and new Group E *fire areas* above are separated from the level below in accordance with Section 707.3.10 of the *International Building Code*.

1106.3.1.3 Group F-1 occupancies. For Group F-1 occupancies as provided for in Sections 903.2.4 and 902.4.1, automatic sprinkler system installation shall be as required ~~specified~~ in Section 903.2.4.2.

1106.3.1.4 Group H occupancies. For Group H occupancies as provided for in Sections 903.2.5, 903.2.5.1, 903.2.5.2 and 903.2.5.3, automatic sprinkler system installation shall be as specified in Section 903.2.5.4.

1106.3.1.5 Group I occupancies. For Group I occupancies as provided for in Sections 903.2.6, automatic sprinkler system installation shall be in accordance with one of the following:

- 1 Throughout the building containing a Group I occupancy.
- 2 An *automatic sprinkler system* is not required where Group I-4 day care facilities are at the *level*

of exit discharge and where every room where care is provided has at least one exterior exit door;
or,

- 3 In buildings where a Group I-4 day care is provided on levels other than the level of exit discharge, an automatic sprinkler system in accordance with Section 903.3.1.1 shall only be required to be installed on the floor where the Group I-4 day care is located and where the floor is separated from other floors in accordance with Section 707.3.10 of the International Building Code.

1106.3.1.6 Group M occupancies. For Group M as provided for in Sections 903.2.7 and 903.2.7.1, automatic sprinkler system installation shall be as specified in Section 903.2.7.2.

1106.3.1.7 Group S-1 occupancies. For Group S-1 as provided for in Sections 903.2.9, 903.2.9.1 and 903.2.9.2, automatic sprinkler system installation shall be as specified in Section 903.2.9.3.

1106.3.1.8 Group S-2 occupancies. For Group S-2 enclosed parking garages as provided for in Sections 903.2.10 and 903.2.10.1, automatic sprinkler system installation shall be as specified in Section 903.2.10.2.

106.3.2 Fire alarm and detection system. Fire alarm and detection systems of Section 907.2 shall be provided throughout the area where the partial change of occupancy occurs. Existing alarm notification appliances shall be automatically activated throughout the building. Where the building is not equipped with a fire alarm system, alarm notification appliances shall be provided throughout the area where the partial change of occupancy occurs and shall be automatically activated.

1106.4 Change of character. A change in occupancy with no change of occupancy classification shall not be made to any structure that will subject the structure to any special provisions of the applicable International Codes, without approval of the fire code official. Compliance shall be only as necessary to meet the specified provisions and is not intended to require the entire building be brought into compliance.

Reason: This bold code change is an attempt to accomplish the following:

1. Attempt to explain what areas must be sprinklered under Section 903.2. Some provisions make reference to "throughout buildings", "throughout all buildings" or "in the occupancy." Group R occupancies, Repair garages and bulk storage of tires makes it clear that it is throughout all buildings. The Commentary implies that Group I is the entire building, but it is not clear about other occupancies. Is it the building or just the fire area.
And, the provisions for upholstered furniture and Group H do not use the term fire area. Therefore, the changes to 903.2 is to start discussions about clarification.
Code change E116-12, which was approved As Modified, identifies that Group H occupancies might be sprinklered but in a non-sprinklered building as follows:

E116– 12

Table 1016.2 (IFC [B] Table 1016.2)

Proponent: Patrick A. McLaughlin, McLaughlin & Associates, representing Compressed Gas Association (pmclaugma@aol.com)

Revise as follows:

TABLE 1016.2 (IFC [B] TABLE 1016.2)
EXIT ACCESS TRAVEL DISTANCE^a

OCCUPANCY	WITHOUT SPRINKLER SYSTEM (feet)	WITH SPRINKLER SYSTEM (feet)
A, E, F-1, M, R, S-1	200	250 ^b
I-1	Not Permitted	250 ^b
B	200	300 ^c
F-2, S-2, U	300	400 ^c
H-1	Not Permitted	75 ^d
H-2	Not Permitted	100 ^d
H-3	Not Permitted	150 ^d
H-4	Not Permitted	175 ^d
H-5	Not Permitted	200 ^d

For SI: 1 foot = 304.8 mm.

a. (no change)

b. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2. See Section 903 for occupancies where automatic sprinkler systems are permitted in accordance with Section 903.3.1.2.

c. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

d. Occupancies equipped throughout with an automatic sprinkler system in accordance with Section 903.2.5.1.

Reason: H-1 thru H-4 occupancies are required to be sprinklered, however, if the H occupancy is located within another occupancy, that occupancy may or may not be sprinklered because the sprinkler system is not required throughout. As written, the travel distance allowance would not apply and there is no guidance on what the travel distance should be. Furthermore, the current footnote has led to erroneous interpretation of the code requiring the building to be sprinklered throughout. In our opinion this was never the intent of this table. H occupancies cannot exit through a more hazardous occupancy, therefore the travel distances allowed within the H occupancy seem reasonable when exiting through another occupancy of lesser hazard.

Cost Impact: The code change proposal will not increase the cost of construction.

E116-12

Assembly: ASF AMF DF

T1016.2-E-MCLAUGHLIN

2. Attempt to bring the IFC in line with IEBC Section 1012.2 Fire Protection systems. I don't agree with the blanket provisions provided there and believe that more detail info is needed. 2012 IEBC Section 1012.2 is as follows:

1012.2 Fire protection systems. Fire protection systems shall be provided in accordance with Sections 1012.2.1 and 1012.2.2.

1012.2.1 Fire sprinkler system. Where a change in occupancy classification occurs that requires an automatic fire sprinkler system to be provided based on the new occupancy in accordance with Chapter 9 of the International Building Code, such system shall be provided throughout the area where the change of occupancy occurs.

1012.2.2 Fire alarm and detection system. Where a change in occupancy classification occurs that requires a fire alarm and detection system to be provided based on the new occupancy in accordance with Chapter 9 of the *International Building Code*, such system shall be provided throughout the area where the partial *change of occupancy* occurs. Existing alarm notification appliances shall be automatically activated throughout the building. Where the building is not equipped with a fire alarm system, alarm notification appliances shall be provided throughout the area where the partial *change of occupancy* occurs and shall be automatically activated.

3. Match the IFC with the IEBC Sections 1001, 1002 and 1012 provided below.

SECTION 1001 GENERAL

1001.1 Scope. The provisions of this chapter shall apply where a *change of occupancy* occurs, as defined in Section 202, including:

1. Where the occupancy classification is not changed; or
2. Where there is a change in occupancy classification or the occupancy group designation changes.

1001.2 Change in occupancy with no change of occupancy classification. A change in occupancy, as defined in Section 202, with no *change of occupancy* classification shall not be made to any structure that will subject the structure to any special provisions of the applicable *International Codes*, including the provisions of Sections 1002 through 1011, without the approval of the *code official*. A certificate of occupancy shall be issued where it has been determined that the requirements for the change in occupancy have been met.

1001.2.1 Repair and alteration with no change of occupancy classification. Any *repair* or *alteration* work undertaken in connection with a *change of occupancy* that does not involve a *change of occupancy* classification shall conform to the applicable requirements for the work as classified in Chapter 4 and to the requirements of Sections 1002 through 1011.

Exception: As modified in Section 1205 for *historic buildings*.

1001.3 Change of occupancy classification. Where the occupancy classification of a building changes, the provisions of Sections 1002 through 1012 shall apply. This includes a *change of occupancy* classification within a group as well as a *change of occupancy* classification from one group to a different group.

1001.3.1 Partial change of occupancy classification.

Where a portion of an *existing building* is changed to a new occupancy classification, Section 1012 shall apply.

1001.4 Certificate of occupancy required. A certificate of occupancy shall be issued where a *change of occupancy* occurs that results in a different occupancy classification as determined by the *International Building Code*.

SECTION 1002 SPECIAL USE AND OCCUPANCY

1002.1 Compliance with the building code. Where the character or use of an *existing building* or part of an *existing building* is changed to one of the following special use or occupancy categories as defined in the *International Building Code*, the building shall comply with all of the applicable requirements of the *International Building Code*:

1. Covered and open mall buildings.
2. Atriums.
3. Motor vehicle-related occupancies.
4. Aircraft-related occupancies.
5. Motion picture projection rooms.
6. Stages and platforms.
7. Special amusement buildings.
8. Incidental use areas.
9. Hazardous materials.
10. Ambulatory care facilities.

1002.2 Underground buildings. An underground building in which there is a change of use shall comply with the requirements of the *International Building Code* applicable to underground structures.

SECTION 1012 CHANGE OF OCCUPANCY CLASSIFICATION

1012.1 General. The provisions of this section shall apply to buildings or portions thereof undergoing a change of occupancy classification. This includes a change of occupancy classification within a group as well as a change of occu-

pancy classification from one group to a different group. Such buildings shall also comply with Sections 1002 through 1011. The application of requirements for the change of occupancy shall be as set forth in Sections 1012.1.1 through 1012.1.4. A *change of occupancy*, as defined in Section 202, without a corresponding change of occupancy classification shall comply with Section 1001.2.

1012.1.1 Compliance with Chapter 9. The requirements of Chapter 9 shall be applicable throughout the building for the new occupancy classification based on the separation conditions set forth in Sections 1012.1.1.1 and 1012.1.1.2.

1012.1.1.1 Change of occupancy classification without separation. Where a portion of an *existing building* is changed to a new occupancy classification and that portion is not separated from the remainder of the building with fire barriers having a fire-resistance rating as required in the *International Building Code* for the separate occupancy, the entire building shall comply with all of the requirements of Chapter 9 applied throughout the building for the most restrictive occupancy classification in the building and with the requirements of this chapter.

1012.1.1.2 Change of occupancy classification with separation. Where a portion of an *existing building* that is changed to a new occupancy classification and that portion is separated from the remainder of the building with fire barriers having a fire-resistance rating as required in the *International Building Code* for the separate occupancy, that portion shall comply with all of the requirements of Chapter 9 for the new occupancy classification and with the requirements of this chapter.

1012.1.2 Fire protection and interior finish. The provisions of Sections 1012.2 and 1012.3 for fire protection and interior finish, respectively, shall apply to all buildings undergoing a change of occupancy classification.

1012.1.3 Change of occupancy classification based on hazard category. The relative degree of hazard between different occupancy classifications shall be determined in accordance with the categories specified in Tables 1012.4, 1012.5 and 1012.6. Such a determination shall be the basis for the application of Sections 1012.4 through 1012.7.

1012.1.4 Accessibility. All buildings undergoing a change of occupancy classification shall comply with Section 1012.8.

1012.2 Fire protection systems. Fire protection systems shall be provided in accordance with Sections 1012.2.1 and 1012.2.2.

1012.2.1 Fire sprinkler system. Where a change in occupancy classification occurs that requires an automatic fire sprinkler system to be provided based on the new occupancy in accordance with Chapter 9 of the *International Building Code*, such system shall be provided throughout the area where the *change of occupancy* occurs.

1012.2.2 Fire alarm and detection system. Where a change in occupancy classification occurs that requires a

fire alarm and detection system to be provided based on the new occupancy in accordance with Chapter 9 of the *International Building Code*, such system shall be provided throughout the area where the *change of occupancy* occurs. Existing alarm notification appliances shall be automatically activated throughout the building. Where the building is not equipped with a fire alarm system, alarm notification appliances shall be provided throughout the area where the *change of occupancy* occurs and shall be automatically activated.

4. This is also intended to coordinate with code change G231-12 which was approved as Submitted at the Final Action hearing.

G231-12

202, 3408.1.1 (New) [IEBC [B] 202, 407.1.1 (New)]

Proposed Change as Submitted

Proponent: Al Godwin, CBO, CPM, Aon Fire Protection Engineering (al.godwin@aon.com)

Add new text as follow:

3408.1.1 (IEBC [B] 407.1.1) Change of Character. A change in occupancy with no change of occupancy classification shall not be made to any structure that will subject the structure to any special provisions of the applicable *International Codes*, without approval of the building official. Compliance shall be only as necessary to meet the specific provisions and is not intended to require the entire building be brought into compliance.

Add new definition as follows:

CHANGE OF OCCUPANCY. A change in the purpose or level of activity within a building that involves a change in application of the requirements of this code.

Reason: In the last code cycle, Code Change EB27-09/10 added "10. Ambulatory health care facilities" to IEBC Section 902.1 (now 1002.1) under the classification of "change of character. This section in the IEBC, along with The IEBC definition of Change of Use, in general verbiage, recognizes that there are changes of use that do not involve changing occupancy groups.

IEBC Section 1001.2 states:

"1001.2 Change in occupancy with no change in occupancy classification. A change in occupancy, as defined in Section 202, with no change of occupancy classification shall not be made to any structure that will subject the structure to any special provisions of the applicable *International Codes*, including the provisions of Section 1002 through 1011, without the approval of the code official."

This proposal is to bring those provisions from IEBC Section 1001.2 over into Chapter 34 of the IBC.

As noted in the IEBC, it is possible to change a use without changing the occupancy classification. Some examples are as follows:

1. Group A-2 bar with an occupant load of 275 to a Group A-2 bar with an occupant load of 350. Increasing occupant loads is permitted under Section 1004.2.
2. Group B office to Group B Ambulatory Health Care
3. Group B office to Group B café
4. Group F-1 factory to a Group F-1 woodworking shop.
5. Group H-3 Oxidizing gases to Group H-3 Flammable solids
6. Group M retail to Group M retail of upholstered furniture
7. Group S-1 warehouse to Group S-1 tire warehouse over 20,000 cubic feet
8. Group S-1 warehouse to Group S-1 motor vehicle repair garage
9. Group R-2 apartment to Group R-2 Live/Work unit.

Each of these classifications has particular code provisions that would apply if the occupancy had been originally identified. Some items might be fire protection, alarms, fresh air, restroom facilities, accessibility, smoke barriers, etc. The IBC currently does not specifically address these changes since they do not change Groups or change Divisions within Groups.

When making a change of character, it is not necessary to totally re-evaluate the building. Only the new applicable provisions should be addressed.

For example:

Group A-2 bar with an occupant load of 275 to a Group A-2 bar with an occupant load of 350.

Items that might require review:

Means of egress – 1004.2, to the public way
Sprinklers – 903.2.1.2, only in this space
Alarms – 907.2.1, only in this space
Restrooms – Chapter 29
Fresh air – IMC

Accessibility – see Section 3411
If food – upgrade of interceptor provisions of the IPC

Items that might not require a new review:

Height and area
Exterior walls and openings

As this is a confusing issue, the code official will need to define what items of correction are appropriate. While the wording may be new, code officials have performed this service for years. This proposal just puts it in the code.

Cost Impact: This code change proposal will not increase the cost of construction.

3408.1.1 (NEW)-G-GODWIN

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposed language needs to be revised with terminology such as "change in the character of use." There was some discussion that the definition proposed could be beneficial in the IBC. Some committee members felt that this language was unnecessary.

Assembly Action:

None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Al Godwin, CBO, CPM, Aon Fire Protection Engineering Corporation, requests Approval as Submitted.

Commenter Reason: The Committee made the comment that the wording should be changed to "change in the character of use." Therefore the title of Section 3408.1.1 has been amended to reflect the new provision. This provision already exists in IEBC Section 1001.2. However, according to IEBC Section 301.1 compliance can be achieved by one of the three methods. The provision for Change of Character only exists in the Work Area Method of Section 301.1.2. Change of Character should also occur under the Prescriptive Compliance Method of Chapter 4 which is IBC Section 3408.1.1.

Therefore, this provision is a good change. It merely duplicates an existing IEBC provision and copies it in IEBC 407.1.1, which is also IBC 3408.1.1.

G231-12

Final Action: AS AM AMPC_____ D

5. The design of this code change proposal would allow the adoption of Part I and disapproval of the remainder. As such, all references to "For a Change of Occupancy, Partial Change of Occupancy or Change of Character, compliance shall be as specified in Section 1106" would editorially drop out since that section would not exist.

Cost Impact: This should be considered as a clarification and coordination. While some provisions of Section 1106 are more intensive than currently written in the IEBC, they may be less intensive than what is currently enforced under the IFC. As such, it should be a merge of the potential costs under the IFC and the IEBC.

903.2.1-F-GODWIN

F122 – 13

903.2.1.2 (IBC [F] 903.2.1.2), 903.2.1.6 (New) [IBC [F] 903.2.1.6 (New)]

Proponent: Robert Trotter, MCP., Tennessee Code Development Committee (bobbrotter1023@aol.com)

Revise as follows:

903.2.1.2 (IBC [F] 903.2.1.2) Group A-2. An automatic sprinkler system shall be provided for Group A-2 occupancies where one of the following conditions exists:

1. The fire area exceeds 5,000 square feet (465 m²);
2. The fire area has an occupant load of 100 or more;
- or
3. The ~~fire area~~ Group A-2 occupancy is located on a floor other than the level of exit discharge.

903.2.1.6 (IBC [F] 903.2.1.6) Group A-2 on Roof. Where a Group A-2 occupancy is located on the roof, the building shall be equipped throughout with an automatic sprinkler system.

Reason: Activities involving A-2 occupancies located above or below the level of exit discharge and on the roof of buildings could be unaware of life threatening fire conditions above or below their location. The means of egress can become impassable and untenable conditions can be present regardless of the size of the area or occupant load.

Cost Impact: The code change proposal will increase the cost of construction. However, this proposal only clarifies the requirement and is not expected to increase the cost of construction beyond previously applied provisions.

	Assembly:	ASF	AMF	DF

903.2.1.2-F-TROTTER

F123 – 13

903.2.1.3 (IBC [F] 903.2.1.3), 903.2.1.4 (IBC [F] 903.2.1.4)

Proponent: Joseph E. Moore, representing The City of Maryland Heights

Revise as follows:

903.2.1.3 (IBC [F] 903.2.1.3) Group A-3. An automatic sprinkler system shall be provided for Group A-3 occupancies where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m2);
2. The fire area has an occupant load of 300 or more; or
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

Exception: Areas used exclusively as participant sports areas.

903.2.1.4 (IBC [F] 903.2.1.4) Group A-4. An automatic sprinkler system shall be provided for Group A-4 occupancies where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m2);
2. The fire area has an occupant load of 300 or more; or
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

Exception: Areas used exclusively as participant sports areas.

Reason: These sections of the code were un-necessarily modified by code change F132-07/08. The supporting statement for the change in 07/08 was that the spaces were becoming multi-use facilities that presented higher occupant loads and fuel loading concerns. The previous code language and the revised exception proposed herein, already addresses this concern...Areas used exclusively as participant sports areas. If a gymnasium is to be used for parties, assemblies, meetings, etc. the gym floor would not comply with the exclusive use requirement in the exception. It is the code official's responsibility to make a determination of use prior to issuing the permit for construction.

In 2011 a new aquatic center addition for a public high school was submitted for plan review. The owner was required to install an automatic sprinkler system above the surface of the water in an indoor swimming pool building. There was seating for observing events in the pool area located in a mezzanine which was also suppressed. There is no retractable floor to cover the water surface. The pool itself cannot be used for any purpose except indoor water sports, but due to the lack of the exception it was required that an automatic fire suppression system be installed above a body of water. There are clearly circumstances where the omission of automatic sprinklers above participant sports areas should be permitted.

The persuasive testimony given in the previous hearing stated that during the refinishing of hardwood floors or painting of a pool large quantities of Volatile Organic Compounds could be released creating a highly combustible/explosive environment. It is important to remember that during these operations the building will only be occupied by a few individuals performing these tasks. These individuals are fully trained and familiar with the hazardous nature of the work involved. Furthermore, an automatic fire suppression system in this type of building would not be designed to suppress an explosion or flash fire.

Cost Impact: This represents a significant cost reduction in an indoor swimming pool for example. Simply accessing the area above the water to install the sprinkler system requires a large knuckle boom or bridge scaffold. Maintaining the system in a high humidity environment with corrosive chemicals in the water vapor also requires specialized equipment that must now fit through the doors and corridors in the building.

903.2.1.3-F-MOORE

F124 – 13

903.2.1.6 (New)

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

903.2.1.6 (IBC [F] 903.2.1.6) Assembly use on roofs. Where an occupied roof has an assembly use with an occupant load exceeding 100, all floors between the occupied roof and the level of exit discharge shall be equipped with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

Reason: Currently the code states that if you have a fire area containing an A-2 Assembly on a floor other than the floor of exit discharge, that floor level and all floors to the level of exit discharge must be sprinklered. Frequently, roof tops are being used and occupied as assemblies. Building owners will provide an open air roof-top bar or lounge, or other use similar to a Group A-2 occupancy on the roof of a building.

The roof of the building does not meet the definition of a fire area. So protection of the occupants can be less than what would otherwise be required if the occupancy was on a floor rather than on the roof.

The current fire sprinkler threshold for Group A-2 is an occupant load of 100. It is appropriate to apply this same threshold to the occupant load on the roof.

This proposal will require that when a roof top is occupied for an assembly use AND the occupant load exceeds 100, then the building must be protected with sprinklers. This proposal does not require that the roof top itself is sprinklered, but provides sprinkler protection on all floors to the level of exit discharge.

The reference to Section 903.3.1.2 is added, since this use can occur on the roof of multi-family housing facilities.

Cost Impact: The code change will increase the cost of construction.

903.2.1.6 (NEW)-F-ZUBIA-FCAC

F125 – 13

903.2.2 (New)

Proponent: Daniel E. Nichols, P.E., New York State Department of State (dan.nichols@dos.ny.gov)

Add new text as follows:

903.2.2 Group B. *An automatic sprinkler system shall be provided throughout all buildings containing a Group B occupancy where a Group B fire area is located more than three stories above grade plane.*

903.2.2 903.2.2.1 Ambulatory Care Facilities. (No Changes)

Reason: This proposal is to set a requirement for automatic sprinkler systems to be installed in mid-rise business occupancies. Currently, the only requirement for automatic sprinkler protection in Group B occupancies is when the building meets one of the specific hazard requirements in IFC 903.2.11, generally the occupied floor (30 people) over 55 feet in height requirement.

The State of New York has required the installation of automatic sprinkler systems in all buildings over 30 feet in height for the past 10 years. A majority of that reasoning is to require business and educational occupancies to have an automatic sprinkler system for buildings over 3 stories. The reasoning for this lower height for sprinkler protection is due to the following:

1. Firefighting operations on higher levels is increasing challenging. The IFC already implicitly recognizes the extra challenges by requiring standpipe systems at the 30 feet or more height measurement as well as aerial apparatus access roads (in Appendix D). With the excellent performance of automatic sprinkler systems, the hazards to firefighters is greatly reduced.
2. Group B occupancies create a fire control problem by a majority of floor spaces being open. With the change of the materials used to construct furnishings, smoke produces a greater obscuration of the environment and makes finding the source of the fire more difficult. Other open space floor plan occupancies, such as Group M and F-1 occupancies, already have sprinkler thresholds for buildings above three stories.
3. Group B occupancies are not required to have any automatic fire alarm or detection requirements. The requirement for automatic sprinkler systems to be monitored provides a system to give accelerated warning of a fire within the building , evacuates the area and starts first responders to the scene.
4. In 2011, a Fire Captain in Asheville, North Carolina died while operating on an upper floor of a mid-rise office building that was not sprinkler protected. Several crew members, including the deceased, ran out of breathing air which was attributed to the need for utilizing air during the stair ascent. An automatic sprinkler systems would have allowed firefighters, at a minimum, to not encounter such heavy smoke conditions on lower floors during entry and allow for their air supply to be more adequate for fire attack operations. Information on this fire and recommendations for the installation of fire suppression systems in these occupancies is found in the NIOSH firefighter fatality report # F2011-18.

Over the past 10 years, the State of New York has not been petitioned to omit the sprinkler system on the new construction of mid-rise office buildings (3-7 stories). Many find that the sprinkler system allows for the use of a Class 1 standpipe system. NFPA 14, the referenced standard for standpipe system installation, permits Class 1 standpipes to be of manual wet design. This allows a building with a marginal water supply to use either street pressure or a smaller fire pump to run the sprinkler system and allow the FD to pump the pressures required to the standpipe. Without the sprinkler system, the building is responsible for providing at least 100 psi for at least 750 GPM of flow (2 stairways minimum).

This proposal is submitted with the endorsement of the New York State Building Officials Conference, the New York State Fire Marshals and Inspectors Association, and the Association of Fire Districts of New York State.

Cost Impact: This proposal will add costs to the construction of 4 to 6 story buildings that are not already using sprinklers for a 'tradeoff' of other code requirements. Cost savings may be achieved by not requiring an automatic Class III standpipe, but a manual Class I standpipe.

903.2.2 (NEW)-F-NICHOLS

F126 – 13

903.2.4, 903.2.7, 903.2.9

Proponent: Steve Thomas, Colorado Code Consulting, LLC representing self
(sthomas@coloradocode.net)

Revise as follows:

903.2.4 Group F-1. An automatic sprinkler system shall be provided throughout all buildings containing a Group F-1 occupancy where one of the following conditions exists:

1. A Group F-1 fire area exceeds 12,000 square feet (1115 m²).
2. A Group F-1 fire area is located more than three stories above grade plane.
