Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

S51-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1509-S-SAGAN

S52–12
1509.2.5

Proponent: Marshall Klein, Marshall A. Klein & Associates, Inc.

THIS CODE CHANGE PROPOSAL IS ON THE AGENDA OF THE IBC GENERAL CODE DEVELOPMENT COMMITTEE. SEE THE HEARING ORDER FOR THE IBC GENERAL CODE DEVELOMPENT COMMITTEE.

Revise as follows:

1509.2.5 Type of construction. Penthouses shall be constructed with walls, floors and roofs as required for the type of construction of the building on which such penthouses are built.

Exceptions:

1. On buildings of Type I construction, the exterior walls and roofs of penthouses with a *fire separation distance* greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a 1-hour fire-resistance rating. The exterior walls and roofs of penthouses with a fire separation distance of 20 feet (6096 mm) or greater shall not be required to have a fire-resistance rating.
2. On buildings of Type I construction two stories or less in height above grade plane or of Type II construction, the exterior walls and roofs of penthouses with a fire separation distance greater
   than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a 1-hour fire-resistance rating or a lesser fire-resistance rating as required by Table 602 and be constructed of fire-retardant-treated wood. The exterior walls and roofs of penthouses with a fire separation distance of 20 feet (6096 mm) or greater shall be permitted to be constructed of fire-retardant-treated wood and shall not be required to have a fire-resistance rating. Interior framing and walls shall be permitted to be constructed of fire-retardant-treated wood.
3. On buildings of Type III, IV or V construction, the exterior walls of penthouses with a fire separation distance greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a 1-hour fire-resistance rating or a lesser fire-resistance rating as required by Table 602. On buildings of Type III, IV or VA construction, the exterior walls of penthouses with a fire separation distance of 20 feet (6096 mm) or greater shall be permitted to be of Type IV or noncombustible construction or fire-retardant-treated wood and shall not be required to have a fire-resistance rating.
4. <u>Where the penthouse is constructed in accordance with Section 1509.2 and is considered as a portion of the story directly below the roof deck, the floor of the penthouse is permitted to be constructed as required by Table 601 for the roof of the building on which such penthouse is built.</u>

Reason: Based on the intent of Section 1509.2, the "floor" of the penthouse should be considered for its fire resistance rating requirement under Table 601 as the "roof" of the building on which it is built.

If the provisions of the base paragraph of Section 1509.2.5 are followed as the code currently states, then the penthouse floor is required to be constructed "as required for the type of construction of the building on which such penthouses are built." This would imply that the floor of the penthouse must be built to the higher floor construction requirements of Table 601 instead of the more relaxed roof construction requirements for Construction Type I under Table 601 (i.e. Type IA from 2 hours to 1½ hours and Type IB from 2 hours to 1 hour).

The language of this new exception will clarify that the floor of penthouses that comply with the height, area, and use limitations mentioned in 1509.2 shall be built to the building's roof construction fire resistance rating of Table 601. In addition, penthouses' floors that comply with Section 1509 are intended to permit the use of the shaft requirement under Section 713.12 that relate to terminating the shaft at the roof not the floor. Conversely, if the penthouse does not meet the limitations that Section 1509.2 mentions (which would be compliance with Sections 1509.2.1 through 1509.2.5), then as the last sentence of that section states, the penthouse "shall be considered as an additional story", and the floor of the penthouse would need to meet the fire resistance floor requirements of Table 601 for the building's type of construction.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1509.2.5-S-KLEIN

S53–12
1509.7.1

Proponent: Christine Covington, Solar Energy Industries Association

Revise as follows:

1509.7.1 ~~Wind resistance~~ Structural loads. Rooftop mounted photovoltaic systems shall be ~~designed for wind loads for component and cladding~~ capable of resisting applicable structural loads in accordance with Chapter 16 ~~using an effective wind area based on the dimensions of a single unit frame~~.

Reason: Rooftop PV systems may be subjected to structural loads other than wind. Seismic and snow loads may also be applicable and should be evaluated as part of the design.

IBC Chapter 16 addresses design loads with reference to ASCE 7. Chapter 16 and ASCE 7 include requirements for combinations of loads. Wind requirements are the subject of Chapters 26-31 of ASCE 7-10, which include multiple methods of determining wind loads. Components and cladding methods are appropriate for some rooftop PV systems, but not all. For example, some tall rooftop systems experience wind behavior appropriate to the Main Wind Force Resisting System, and some systems held close to the roof surface have been studied using Wind Tunnel testing. These approved wind load evaluation methods appear to be prohibited by the current language without justification.

Cost Impact: The code change proposal will increase the cost of construction.

Proponent: Joseph H. Cain, P.E., SolarCity Corporation, representing self

THIS CODE CHANGE PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEE. SEE THE HEARING ORDER FOR THE IBC FOR THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEE

Revise as follows:

1509.7.2 Fire classification. Rooftop mounted photovoltaic ~~systems~~ panels and modules shall have ~~the same~~ a fire classification as ~~the roof assembly~~ required for the roof assembly by Section 1505.

Reason: The testing method currently under development by the UL 1703 Standards Technical Committee is overly restrictive. The proposed code change will restore a photovoltaic (PV) panel/module fire classification without disproportionate economic burden to one industry.

Revisions to UL 1703 to include a PV system test are not yet ready for 2012 IBC implementation. Preliminary study of PV system fire classification has been conducted by Solar America Board for Codes and Standards in conjunction with Underwriter's Laboratories. For further information on Solar ABC's on-going fire testing, visit http://www.solarabcs.org/current-issues/fire_class_rating.html

Preliminary results indicate the test procedures being developed under proposed revisions to UL 1703 are overly restrictive, as the tests show nearly all common existing configurations of PV systems as "non-compliant." Using the existing language in 2012 IBC Section 1509.7.2, the UL 1703 Standards Technical Panel is developing language that would effectively trigger a fundamental re-start of the solar industry. The preliminary results indicate a testing standard with possible mitigation measures disproportionate in cost to the risks associated with rooftop installation of solar energy systems.

Preliminary tests by Underwriter's Laboratories have identified only three possible mitigation measures to date for rack-mounted PV systems. While further study is in order, the mitigation measures studied to date do not appear to be practical or cost-effective. The first mitigation measure is to install panels/modules in direct contact with the roof surface. This mitigation will be difficult or impossible to achieve on varying profiles of roof covering materials or on many roof surfaces experiencing code-allowable deflection. The second mitigation measure is to provide a barrier to prevent fire from entering between the PV panel system and the roof covering. An enclosure around the perimeter of all arrays installed tight to the profile of the roof covering will adversely affect the cost-effectiveness of solar electric power as it will simultaneously increase the cost of installation and decrease the production of electricity owing to over-heating panels/modules. The third mitigation measure is to install PV systems high above the roof surface. This will simultaneously increase cost and reduce sales of PV systems, as building owners and architects/designers are concerned about aesthetics as well as system performance.

The rapid adoption of solar technologies is a matter of national importance.

Cost Impact: The code change proposal will not increase the cost of construction.

S54-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1509.7.2 #1-S-CAIN

S55–12
1509.7.2

Proponent: Christine Covington, Solar Energy Industries Association

THIS CODE CHANGE PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEE. SEE THE HEARING ORDER FOR THE IBC FIRE SAFETY CODE DEVELOMPENT COMMITTEE.

Revise as follows:

1509.7.2 Fire classification. Rooftop mounted photovoltaic systems shall have the same fire classification as the roof assembly required by Section 1505.

> <u>**Exception:** Photovoltaic panels and modules having a minimum Class C fire classification are permitted where listed and labeled in accordance with UL 1703 and where installed in direct contact with the roof surface.</u>

Reason: Fire testing of photovoltaic panels/modules was conducted on various roof systems by Underwriter's Laboratories in conjunction with Solar America Board for Codes and Standards (Solar ABC's). This study was conducted to assess the influence of PV panels/modules on the performance of classified roofing systems. This testing found that PV panels/modules placed in contact with the roof deck eliminated channeling of fire that was observed in some of the fire testing for elevated rack mounted systems. Channeling has been shown to contribute to flame spread when conducting the "spread of flame" test component of the fire classification evaluation. When PV panels/modules are installed in contact with the roof, the fire classification of the underlying roof system was not diminished. Therefore, this exception meets the ICC membership's intent to ensure that the installation of PV panels/modules do not degrade the fire classification rating of underlying roof systems.
For further information on Solar ABC's on-going fire testing, visit http://www.solarabcs.org/current-issues/fire_class_rating.html

Cost Impact: The code change proposal will not increase the cost of construction.

S58–12
1509.7.2

Proponent: Christine Covington, Solar Energy Industries Association

THIS CODE CHANGE PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEE. SEE THE HEARING ORDER FOR THE IBC FIRE SAFETY CODE DEVELOMPENT COMMITTEE.

Revise as follows:

1509.7.2 Fire classification. Rooftop mounted photovoltaic systems shall have the same fire classification as the roof assembly required by Section 1505.

> **Exception:** Photovoltaic panels and modules arranged in arrays are permitted where the following conditions are met:
>
> 1.1. Photovoltaic panels and modules have a minimum Class C fire classification where listed and labeled in accordance with UL 1703;
> 1.2. The entire perimeter of the array is provided with a 0.0187-inch (0.4712 mm) (No. 26 gage) corrosion resistant steel or equivalent approved barrier extending from the array to the roof and;
> 1.3. Where any openings between the individual panels and modules on the upper face are provided with screens, flashing or otherwise protected to prevent entry of vegetative debris.

Reason: Fire testing of photovoltaic panels/modules was conducted on various roof systems by Underwriter's Laboratories in conjunction with Solar America Board for Codes and Standards (Solar ABCs). This study was conducted to assess the influence of PV panels/modules on the performance of classified roofing systems. This testing found that PV panels/modules provided with perimeter fire barrier flashing extending from the panel/module to the roof eliminated channeling of fire that was observed in some of the fire testing for elevated rack mounted systems. Channeling has been shown to contribute to flame spread when conducting the "spread of flame" test component of the fire classification evaluation. When PV panels/modules are installed with barrier flashing, the fire classification of the underlying roof system was not diminished. Therefore, this exception meets the ICC membership's intent to ensure that the installation of PV panels/modules do not degrade the fire classification rating of underlying roof systems. For further information on Solar ABC's on-going fire testing, visit http://www.solarabcs.org/current-issues/fire_class_rating.html

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1509.7.2 #3-S-COVINGTON

S59–12
1510.1

Proponent: Michael D. Fischer, Kellen Company, representing Asphalt Roofing Manufacturers Association (mfischer@kellencompany.com)

Revise as follows:

1510.1 General. Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15.

> **Exception:** ~~Reroofing~~ Roof replacement or roof recover of existing low-slope roof coverings shall not be required to meet the minimum design slope requirement of one-quarter unit vertical in 12 units horizontal (2-percent slope) in Section 1507 for roofs that provide positive roof drainage.

Reason: The current text is not clear that steep slope roof coverings are not included in the exception to the ¼ minimum slope requirement. This change is largely editorial since the roof covering approvals should govern.

Cost Impact: The code change proposal will not increase the cost of construction.

S59-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1510.1-S-FISCHER

S60–12
1510.1

Proponent: Mark S. Graham, National Roofing Contractors Association (mgraham@nrca.net)

Revise as follows:

1510.1 General. Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15.

Exceptions:

1. Reroofing shall not be required to meet the minimum design slope requirement of one-quarter unit vertical in 12 units horizontal (2-percent slope) in Section 1507 for roofs that provide positive roof drainage.
2. Recovering or replacing an existing roof covering shall not be required to meet the requirement for secondary (emergency overflow) drains or scuppers in Section 1503.4 for roofs that provide for positive roof drainage.

Reason: IBC 2006 and subsequent editions include a requirement in Section 1503.4-Roof Drainage that for roof drainage systems with roof drains or scuppers, secondary (emergency overflow) drains or scuppers also be provided in the event the primary roof drainage system becomes clogged.

Section 1510-Reroofing requires all materials and methods used in recovering or replacing an existing roof covering comply with the requirements of Chapter 15 (except the minimum roof slope requirement of ¼:12 can be waived for roofs that provide "…positive roof drainage."). This can be interpreted to require the secondary (emergency overflow) drains and scupper provision also apply in reroofing. Since many existing buildings were designed and constructed before the code included a secondary drainage requirement, the secondary drainage provision being applicable in reroofing and the need for adding secondary drains in exsiting buildings during reroofing can be a very costly and disruptive undertaking for owners and occupants.

This proposed code change adds an exception in Section 1510-Reroofing that waives the secondary drainage provision when reroofing existing buildings when the roof drains properly, that being hat provide for positive roof drainage. The term "positive roof drainage' is already defined in Section 202.

Cost Impact: The code change proposal will not increase the cost of construction.

S60-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1510.1-S-GRAHAM

S61 – 12
1510.2

Proponent: Michael D. Fischer, Kellen Company, representing Asphalt Roofing Manufacturers Association (mfischer@kellencompany.com)

Revise as follows:

1510.2 Structural and construction loads. Structural roof components shall be capable of supporting the roof-covering system and the material and equipment loads that will be encountered during installation of the system. <u>Existing structural assemblies shall comply with the requirements of Section 3404.</u>

Reason: Chapter 34 provides good guidance to the designer regarding the types of conditions that should be evaluated during alterations. This proposal provides a necessary reference for the purposes of linking those requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

S61-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1510.2-S-FISCHER

S62–12
1510.3 (NEW), 1510.4

Proponent: Michael D. Fischer, Kellen Company, representing Asphalt Roofing Manufacturers Association (mfischer@kellencompany.com)

Revise as follows:

1510.3 Roof replacement. Roof replacement shall include the removal of all existing layers of roof coverings down to the roof deck.

Exceptions:

1. Complete and separate roofing systems, such as standing-seam metal roof systems, that are designed to transmit the roof loads directly to the building's structural system and that do not rely on existing roofs and roof coverings for support, shall not require the removal of existing roof coverings.
2. Metal panel, metal shingle and concrete and clay tile roof coverings shall be permitted to be installed over existing wood shake roofs where applied in accordance with Section 1510.4.
3. The application of a new protective coating over an existing spray polyurethane foam roofing system shall be permitted without tear-off of existing roof coverings.
4. Where the existing roof assembly includes an ice barrier membrane that is adhered to the roof deck, the existing ice barrier membrane shall be permitted to remain in place and covered with an additional layer of ice barrier membrane in accordance with Section 1507.
5. ~~Where the existing roof or roof covering is water soaked or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing.~~
6. ~~Where the existing roof covering is wood shake, slate, clay, cement or asbestos-cement tile.~~
7. ~~Where the existing roof has two or more applications of any type of roof covering.~~

~~**1510.3**~~ **1510.4** ~~**Recovering versus replacement**~~ **Roof recovering.** ~~New roof coverings shall not be installed without first removing all existing layers of roof coverings down to the roof deck~~ Roof recovering shall be prohibited where any of the following conditions occur:

1. Where the existing roof or roof covering is water soaked or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing.
2. Where the existing roof covering is wood shake, slate, clay, cement or asbestos-cement tile.
3. Where the existing roof has two or more applications of any type of roof covering.

Exceptions:

1. Complete and separate roofing systems, such as standing-seam metal roof systems, that are designed to transmit the roof loads directly to the building's structural system and that do not rely on existing roofs and roof coverings for support, shall not require the removal of existing roof coverings.
2. Metal panel, metal shingle and concrete and clay tile roof coverings shall be permitted to be installed over existing wood shake roofs when applied in accordance with Section 1510.4.
3. The application of a new protective coating over an existing spray polyurethane foam roofing system shall be permitted without tear-off of existing roof coverings.
4. Where the existing roof assembly includes an ice barrier membrane that is adhered to the roof deck, the existing ice barrier membrane shall be permitted to remain in place and covered with an additional layer of ice barrier membrane in accordance with Section 1507.

Reason: The current text is confusing and contains directions on what NOT to do regarding roof recovering. The proposal reorganizes the text without making any technical changes in order to add clarity to the code. The revisions provide clear distinction between roof replacement and roof recovering

Cost Impact: The code change proposal will not increase the cost of construction.

S62-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1510.3 (NEW)-S-FISCHER

S63–12
1510.3, 1510.4

Proponent: Mike Ennis, Single Ply Roofing Industry (SPRI) (m.ennis@mac.com)

Delete and substitute as follows:

~~**1510.3 Recovering versus replacement.** New roof coverings shall not be installed without first removing all existing layers of roof coverings down to the roof deck where any of the following conditions occur:~~

1. ~~Where the existing roof or roof covering is water soaked or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing.~~
2. ~~Where the existing roof covering is wood shake, slate, clay, cement or asbestos-cement tile.~~
3. ~~Where the existing roof has two or more applications of any type of roof covering.~~

~~**Exceptions:**~~

1. ~~Complete and separate roofing systems, such as standing-seam metal roof systems, that are designed to transmit the roof loads directly to the building's structural system and that do not rely on existing roofs and roof coverings for support, shall not require the removal of existing roof coverings.~~
2. ~~Metal panel, metal shingle and concrete and clay tile roof coverings shall be permitted to be installed over existing wood shake roofs when applied in accordance with Section 1510.4.~~
3. ~~The application of a new protective coating over an existing spray polyurethane foam roofing system shall be permitted without tear-off of existing roof coverings.~~
4. ~~Where the existing roof assembly includes an ice barrier membrane that is adhered to the roof deck, the existing ice barrier membrane shall be permitted to remain in place and covered with an additional~~
~~layer of ice barrier membrane in accordance with Section 1507.~~

~~**1510.4 Roof recovering.** Where the application of a new roof covering over wood shingle or shake roofs creates a combustible concealed space, the entire existing surface shall be covered with gypsum board, mineral fiber, glass fiber or other *approved* materials securely fastened in place.~~

1510.3 Roof replacement. Roof replacement requires the removal of all existing roof coverings layers down to the roof deck before the new roof covering is installed. A roof replacement is required and roof recovering shall be prohibited where any of the following conditions exist:

1. Areas of the existing roof or roof covering that are water soaked or that have deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing unless those areas are removed and replaced prior to recover.
2. The existing roof covering is wood shake, slate, clay, cement, or asbestos-cement tile unless it is recovered in accordance with Section 1510.4.2.
3. The existing roof has two or more applications of any type of roof covering unless recovered in accordance with Section1510.4.5.

1510.4 Roof recovering. Roof recovering shall be permitted except where prohibited by section 1510.3.

1510.4.1 Existing complete and separate roofing systems. Complete and separate roofing systems, such as standing-seam metal roof systems, that are designed to transmit the roof loads directly to the building's structural system and do not rely on existing roofs and roof coverings for support, shall not require the removal of existing roof coverings.

1510.4.2 Existing wood shake roofs. Metal panel, metal shingle and concrete and clay tile roof coverings shall be permitted to be installed over existing wood shake roofs where the entire surface is covered with gypsum board, mineral fiber, glass fiber, or other *approved* materials securely fastened in place.

1510.4.3 Existing spray polyurethane foam roofing systems. The application of a new protective coating over an existing spray polyurethane foam roofing system shall be permitted without tear-off of existing roof coverings.

1510.4.4 Existing ice barrier membrane. Where the existing roof assembly includes an ice barrier membrane that is adhered to the roof deck, the existing ice barrier membrane shall be permitted to remain in place and covered with an additional layer of ice barrier membrane in accordance with Section 1507.

1510.4.5 New single-ply membrane. The application of a new single-ply membrane directly over an existing low-slope (roof slope < 2:12) roofing system shall be permitted without tear-off of the existing roof coverings.

Reason: This code change proposal accomplishes several objectives:
1. Clarifies when a roof needs to be replaced and when is may be recovered.
2. Requires that existing water soaked or deteriorated sections of the roof be removed and replaced prior to recovering the roof. The current language would allow those areas to remain in place if any of the exceptions are used.
3. Adds an exception for the installation of a new single ply membrane because a layer of single-ply membrane is very lightweight, adding approximately 1/3 of a pound per square foot to the existing structure. In Climate Zones 1, 2 and 3, a single-ply membrane can be used as a reflective layer to reduce rooftop temperatures, thus providing a cooling benefit for the building, meeting the requirements of the International Energy Conservation Code and the heat island mitigation requirements of the International Green Construction Code. This exception will provide building owners with a cost effective option, with a variety of membrane colors and types, for installing a new waterproofing layer in all climate zones.

The new roof system will still need to meet the requirements of Chapter 15 as called out in Section 1510.1.

Cost Impact: The code change proposal will not increase the cost of construction.

1510.3-S-ENNIS

S64–12
1510.7 (NEW)

Proponent: Al Godwin, CBO, CPM, representing Aon Fire Protection Engineering **(**al.godwin@aon.com)

Add new text as follows:

<u>**1510.7 Construction of sloped roof over flat roof.**</u> <u>Construction of a new roof over an existing roof, in a manner that creates an attic or concealed space shall require the removal of any existing roofing material composed of tar, asphalt or roof insulation not designed for interior use from the newly created interior space.</u>

Reason: It is not uncommon for building owners to convert a flat roof to a sloped roof. When doing so, the former roofing material should be removed from the newly created interior space.

Cost Impact: This code change proposal will increase the cost of construction.

S64-11

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1510.7 (NEW)-S-GODWIN

S65–12
1511.1.1

Proponent: Maureen Traxler, City of Seattle Department of Planning & Development (Maureen.traxler@seattle.gov); Thomas Meyers, City of Central, CO, representing self

Delete without substitution:

~~**1511.1.1 Structural fire resistance.** The structural frame and roof construction supporting the load imposed upon the roof by the photovoltaic panels/modules shall comply with the requirements of Table 601~~.

Reason: (Traxler) This section is not needed because Table 601 will apply regardless of this section. In addition, the terminology used is not consistent with the terms used in Table 601, creating confusion about whether the “structural frame…supporting the load imposed upon the roof” is different than the primary structural frame and secondary members referenced in Table 601. If they are different, then Table 601 doesn’t have any applicable requirements. If they are the same, the section isn’t necessary because compliance with Table 601 is already required by Chapter 6.
(Meyers) This new section was added as part of a comprehensive code change submitted to the IFC and ultimately approved as modified by public comment at the Dallas Final Action Hearings. The new subsection 1511.1.1 has generated considerable confusion. It has been interpreted to require any of the stand-off rack frame used to mount solar panels to the roof to be fire resistance rated consistent with the Type of Construction used by the building. In the case of I-A construction, this interpretation would require the typical aluminum square tube “column” supports to exhibit 3 hour fire endurance. This is extremely excessive and very difficult to achieve in an exposed, exterior application.

It appears that the intent may have been to ensure that the underlying supporting roof structure be provided with the fire performance prescribed by Chapter 6 when supporting any loads imposed by the solar panel array system that includes the racking system. The code already ensures that in Chapter 6. Therefore, this section is completely redundant. As such, it should be eliminated to avoid confusion.

Cost Impact: The code change proposal will not increase the cost of construction.

Delete without substitution:

~~**ARCHITECTURAL TERRA COTTA.** Plain or ornamental hard-burned modified clay units, larger in size than *brick*, with glazed or unglazed ceramic finish.~~

~~**BOND BEAM.** A horizontal grouted element within *masonry* in which reinforcement is embedded.~~

~~**DURATION OF LOAD.** The period of continuous application of a given *load*, or the aggregate of periods of intermittent applications of the same *load*.~~

~~**GLUED BUILT-UP MEMBER.** A structural element, the section of which is composed of built-up lumber, wood structural panels or wood structural panels in combination with lumber, all parts bonded together with structural adhesives.~~

~~**INSPECTION CERTIFICATE.** An identification applied on a product by an *approved agency* containing the name of the manufacturer, the function and performance characteristics, and the name and identification of an *approved agency* that indicates that the product or material has been inspected and evaluated by an *approved agency* (see Section 1703.5 and "*Label*," "Manufacturer's designation" and "*Mark*").~~

~~**RUBBLE MASONRY.** *Masonry* composed of roughly shaped stones.~~
~~**Coursed rubble.** Masonry composed of roughly shaped stones fitting approximately on level beds and well bonded.~~
~~**Random rubble.** Masonry composed of roughly shaped stones laid without regularity of coursing but well bonded and fitted together to form well-divided *joints.*~~
~~**Rough or ordinary rubble.** Masonry composed of unsquared field stones laid without regularity of coursing but well bonded.~~

~~**STACK BOND.** The placement of *masonry units* in a bond pattern is such that head *joints* in successive courses are vertically aligned. For the purpose of this code, requirements for stack bond shall apply to *masonry* laid in other than *running bond*.~~

~~**SUBDIAPHRAGM.** A portion of a larger wood *diaphragm* designed to anchor and transfer local forces to primary *diaphragm* struts and the main *diaphragm*.~~

Revise as follows:

[A] LABEL. An identification applied on a product by the manufacturer that contains the name of the manufacturer, the function and performance characteristics of the product or material, and the name and identification of an *approved agency* and that indicates that the representative sample of the product or material has been tested and evaluated by an *approved agency* (see Section 1703.5 and "~~Inspection certificate~~," "Manufacturer's designation" and "*Mark*").

[A] MANUFACTURER'S DESIGNATION. An identification applied on a product by the manufacturer indicating that a product or material complies with a specified standard or set of rules (see also "~~Inspection certificate~~," "*Label*" and "*Mark*").

[A] MARK. An identification applied on a product by the manufacturer indicating the name of the manufacturer and the function of a product or material (see also "~~Inspection certificate~~," "*Label*" and "Manufacturer's designation").

Reason: The definitions are being deleted because they serve no purpose in the building code. There are no instances of any of the defined terms in the 2012 IBC other than as shown in this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

1602.1-S-BRAZIL.doc

S67–12
1602

Proponent: Charles S. Bajnai, Chesterfield County, VA, representing ICC Building Code Action Committee (bajnaic@chesterfield.gov)

Revise as follows:

DIAPHRAGM. A horizontal or sloped system acting to transmit lateral forces to ~~the vertical-resisting elements~~ vertical elements of the lateral-force-resisting-system. When the term "diaphragm" is used, it shall include horizontal bracing systems.

Reason: This proposal cleans up a grammatical error with the current language. The current definition reads, "…transmit lateral forces to the **vertical-resisting** elements."

As written with the hyphenated term **"vertical-resisting"**, it means that the "elements" resist "vertical" which doesn't make sense. The definition should convey that the vertical elements of the system resist the lateral forces transmitted from the diaphragm(s). The current definition is the same as the definition in American Forest & Paper Associations' *Special Design Provisions for Wind and Seismic* (SDPWS) with the exception of the hyphen between "vertical" and "resisting" that does not occur in SDPWS. Better language is provided in American Society of Civil Engineers', *ASCE 7* where it states, for "Diaphragm Flexibility" in Section 12.3.1, ***"The structural analysis shall consider the relative stiffnesses of diaphragms and the vertical elements of the lateral-force-resisting systems."*** The ASCE 7 language is the best definition of the three and this proposal corrects the error in the current language and aligns it with ASCE 7.

IBC section 1604.4 reads correctly and states,

The total lateral force shall be distributed to the various ***vertical elements of the lateral force-resisting system*** *in proportion to their rigidities, considering the rigidity of the horizontal bracing system or diaphragm.*

This proposal does not change any technical requirements of the code. It merely addresses a grammar error and promotes consistency with ASCE 7 standard.

Cost Impact: The code change proposal will not increase the cost of construction.

S68–12
202 (NEW), 1607.12.3.1

Proponent: Sarah A. Rice, C.B.O., The Preview Group (srice@preview-group.com)

Revise as follows:

1607.12.3.1 Landscaped and vegetative roofs. The uniform design live load in unoccupied landscaped areas on roofs and vegetative roofs shall be 20 psf (0.958 kN/m^2). The weight of all landscaping and vegetative roof materials shall be considered as dead load and shall be computed on the basis of saturation of the soil.

Add new text as follows:

SECTION 202
DEFINITIONS

VEGETATIVE ROOF. An assembly of interacting components designed to waterproof and normally insulate a building's top surface that includes, by design, vegetation and related landscaping elements.

Reason: The IgCC includes an option for addressing the heat island impact of roofs with the installation of a vegetative roof on all or portions of the roof. The IBC addresses landscaped roofs and roof gardens. The vegetative roof is more akin to the landscaped roof in that it is not intended to be an area regularly occupied by building occupants, but is a feature similar to other roof coverings. This change places the loading concerns for vegetative roofs in the same section of Chapter 16 that regulates landscaped roofs. The proposed definition is a direct copy for the 2012 IgCC. It should be scoped for long term maintenance to the Code Development committees for the IgCC.

Cost Impact: The code change proposal will not increase the cost of construction.

1607.12.3.1-S-RICE.doc

S69–12
1603.1.3

Proponent: Edwin Huston, National Council of Structural Engineers Association (NCSEA), representing NCSEA Code Advisory Subcommittee – General Requirements Subcommittee (huston@smithustoninc.com)

Revise as follows:

1603.1.3 Roof snow load data. The ground snow load, P_g, shall be indicated. In areas where the ground snow load, P_g, exceeds 10 pounds per square foot (psf) (0.479 kN/m2), the following additional information shall also be provided, regardless of whether snow loads govern the design of the roof:

1. Flat-roof snow load, P_f.
2. Snow exposure factor, C_e.
3. Snow load importance factor, *I*.
4. Thermal factor, C_t.
5. <u>Drift surcharge load, p_d, where the sum of p_d and P_f exceeds 20 pounds per square foot (psf).</u>
6. <u>Width of snow drift, *w.*</u>

Reason: The addition of loading information and design assumptions to drawings has been valuable to owners and the engineers who are tasked with re-evaluating existing structures. This additional requirement of snow drift design information supplements the information already required and indicates how the registered design professional interpreted the design codes relative to snow drift intensity and width.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 3 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE FIRESAFETY COMMITTEE AND PART II WILL BE HEARD BY THE FIRE CODE COMMITTEE, AS THREE SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Phillip Brazil, P.E., S.E., Reid Middleton, representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

PART I – IBC STRUCTURAL

Revise as follows:

1603.1.4 Wind design data. The following information related to wind loads shall be shown, regardless of whether wind loads govern the design of the lateral force resisting system of the structure:

1. Ultimate design wind speed, V_{ult}, (3-second gust), miles per hour (km/hr) and nominal design wind speed, V_{asd}, as determined in accordance with Section 1609.3.1.
2. *Risk category*.
3. Wind exposure. Where more than one wind exposure is utilized, the wind exposure and applicable wind direction shall be indicated.
4. The applicable internal pressure coefficient.
5. Components and cladding. The design wind pressures in terms of psf (kN/m^2) to be used for the design of exterior component and cladding materials not specifically designed by the <u>responsible</u> *registered design professional*.

1607.10.1.2 Heavy live loads. Live loads that exceed 100 psf (4.79 kN/m^2) shall not be reduced.

Exceptions:

1. The live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent, but the live load shall not be less than *L* as calculated in Section 1607.10.1.
2. For uses other than storage, where *approved*, additional live load reductions shall be permitted where shown by the <u>responsible</u> *registered design professional* that a rational approach has been used and that such reductions are warranted.

1607.10.2 Alternative uniform live load reduction. As an alternative to Section 1607.10.1 and subject to the limitations of Table 1607.1, uniformly distributed live loads are permitted to be reduced in accordance with the following provisions. Such reductions shall apply to slab systems, beams, girders, columns, piers, walls and foundations.

1. A reduction shall not be permitted where the live load exceeds 100 psf (4.79 kN/m^2) except that the design live load for members supporting two or more floors is permitted to be reduced by a maximum of 20 percent.

   Exception: For uses other than storage, where *approved*, additional live load reductions shall be permitted where shown by the <u>responsible</u> *registered design professional* that a rational approach has been used and that such reductions are warranted.

2. A reduction shall not be permitted in passenger vehicle parking garages except that the live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent.

(Portions of section not shown remains unchanged)

Revise as follows:

1704.3.1 Content of statement of special inspections. The statement of special inspections shall identify the following:

1. The materials, systems, components and work required to have *special inspection* or testing by the *building official* or by the responsible *registered design professional* ~~responsible for each portion of the work~~.
2. The type and extent of each *special inspection*.
3. The type and extent of each test.
4. Additional requirements for *special inspection* or testing for seismic or wind resistance as specified in Sections 1705.10, 1705.11 and 1705.12.
5. For each type of *special inspection*, identification as to whether it will be continuous *special inspection* or periodic *special inspection*.

1704.5 Submittals to the building official. In addition to the submittal of reports of *special inspections* and tests in accordance with Section 1704.2.4, reports and certificates shall be submitted by the owner or the owner's authorized agent to the *building official* after review and acceptance by the responsible *registered design professional* and prior to the construction or work being performed for each of the following:

(Renumber remaining sections)

1704.5.1 Structural observations for seismic resistance. Structural observations shall be provided for those structures assigned to *Seismic Design Category* D, E or F where one or more of the following conditions exist:

1. The structure is classified as *Risk Category* III or IV in accordance with Table 1604.5.
2. The height of the structure is greater than 75 feet (22 860 mm) above the base.
3. The structure is assigned to *Seismic Design Category* E, is classified as *Risk Category* I or II in accordance with Table 1604.5, and is greater than two *stories above grade plane*.
4. When so designated by the responsible *registered design professional* ~~responsible for the structural design~~.
5. When such observation is specifically required by the *building official*.

1704.5.2 Structural observations for wind requirements. Structural observations shall be provided for those structures sited where *Vasd* as determined in accordance with Section 1609.3.1 exceeds 110 mph (49 m/sec), where one or more of the following conditions exist:

1. The structure is classified as *Risk Category* III or IV in accordance with Table 1604.5.
2. The *building height* of the structure is greater than 75 feet (22 860 mm).
3. When so designated by the responsible *registered design professional* ~~responsible for the structural design~~.
4. When such observation is specifically required by the *building official*.

TABLE 1705.3
REQUIRED VERIFICATION AND INSPECTION OF CONCRETE CONSTRUCTION

For SI: 1 inch = 25.4 mm.
a. Where applicable, see also Section 1705.11, Special inspections for seismic resistance.
b. Specific requirements for special inspection shall be included in the research report for the anchor issued by an approved source in accordance with ACI 355.2 or other qualification procedures. Where specific requirements are not provided, special inspection

requirements shall be specified by the responsible registered design professional and shall be approved by the building official prior to the commencement of the work.

(Portions of table not shown remains unchanged)

TABLE 1705.7
REQUIRED VERIFICATION AND INSPECTION OF DRIVEN DEEP FOUNDATION ELEMENTS

VERIFICATION AND INSPECTION TASK	CONTINUOUS DURING TASK LISTED	PERIODICALLY DURING TASK LISTED
7. For specialty elements, perform additional inspections as determined by the responsible registered design professional ~~in responsible charge~~.	—	—

(Portions of table not shown remains unchanged)

1705.9 Helical pile foundations. *Special inspections* shall be performed continuously during installation of helical pile foundations. The information recorded shall include installation equipment used, pile dimensions, tip elevations, final depth, final installation torque and other pertinent installation data as required by the responsible *registered design professional* ~~*in responsible charge*~~. The *approved* geotechnical report and the *construction documents* prepared by the *registered design professionals* shall be used to determine compliance.

1705.12.3 Seismic certification of nonstructural components. The responsible *registered design professional* shall specify on the construction documents the requirements for certification by analysis, testing or experience data for nonstructural components and designated seismic systems in accordance with Section 13.2 of ASCE 7, where such certification is required by Section 1705.12.

Revise as follows:

1803.4 Qualified representative. The investigation procedure and apparatus shall be in accordance with generally accepted engineering practice. The responsible *registered design professional* shall have a fully qualified representative on site during all boring or sampling operations.

Revise as follows:

1910.9.3 Natural curing. Natural curing shall not be used in lieu of that specified in this section unless the relative humidity remains at or above 85 percent, and is authorized by the responsible *registered design professional* and *approved* by the *building official*.

Revise as follows:

2207.2 Design. The responsible *registered design professional* shall indicate on the *construction documents* the steel joist and/or steel joist girder designations from the specifications listed in Section 2207.1 and shall indicate the requirements for joist and joist girder design, layout, end supports, anchorage, non-SJI standard bridging, bridging termination connections and bearing connection design to resist uplift and lateral loads. These documents shall indicate special requirements as follows:

1. Special loads including:
   1.1. Concentrated loads;
   1.2. Non-uniform loads;
   1.3. Net uplift loads;
   1.4. Axial loads;
   1.5. End moments; and
   1.6. Connection forces.
2. Special considerations including:
   2.1. Profiles for nonstandard joist and joist girder configurations (standard joist and joist girder configurations are as indicated in the SJI catalog);

2.2. Oversized or other nonstandard web openings; and
2.3. Extended ends.
3. Deflection criteria for live and total loads for non-SJI standard joists.

2207.3 Calculations. The steel joist and joist girder manufacturer shall design the steel joists and/or steel joist girders in accordance with the current SJI specifications and load tables to support the load requirements of Section 2207.2. The responsible *registered design professional* may require submission of the steel joist and joist girder calculations as prepared by a *registered design professional* responsible for the product design. If requested by the responsible *registered design professional*, the steel joist manufacturer shall submit design calculations with a cover letter bearing the seal and signature of the joist manufacturer's *registered design professional*. In addition to standard calculations under this seal and signature, submittal of the following shall be included:

1. Non-SJI standard bridging details (e.g.for cantilevered conditions, net uplift, etc.).
2. Connection details for:
   2.1. Non-SJI standard connections (e.g.flushframed or framed connections);
   2.2. Field splices; and
   2.3. Joist headers.

2303.4.1.4.1 Truss design drawings. Where required by the responsible *registered design professional*, the *building official* or the statutes of the jurisdiction in which the project is to be constructed, each individual truss design drawing shall bear the seal and signature of the truss designer.

Exceptions:

1. Where a cover sheet and truss index sheet are combined into a single sheet and attached to the set of truss design drawings, the single cover/truss index sheet is the only document required to be signed and sealed by the truss designer.
2. When a cover sheet and a truss index sheet are separately provided and attached to the set of truss design drawings, the cover sheet and the truss index sheet are the only documents required to be signed and sealed by the truss designer.

PART II – IBC FIRE SAFETY

Revise as follows:

703.2.3 Restrained classification. Fire-resistance-rated assemblies tested under ASTM E 119 or UL 263 shall not be considered to be restrained unless evidence satisfactory to the *building official* is furnished by the responsible *registered design professional* showing that the construction qualifies for a restrained classification in accordance with ASTM E 119 or UL 263. Restrained construction shall be identified on the plans.

PART III - IFC

[F] 909.9 Design fire. The design fire shall be based on a rational analysis performed by the *registered design professional* and *approved* by the fire code official. The design fire shall be based on the analysis in accordance with Section 909.4 and this section.

Reason: The building code frequently refers to registered design professionals by specifying requirements for "the registered design professional" to perform. The design of a building or structure, however, is not accomplished by a single ("the") registered design professional but by a design team consisting of several registered design professionals, including an architect, structural engineer, geotechnical engineer, mechanical engineer, electrical engineer, plumbing engineer, fire protection engineer, civil engineer and others. In these cases, requiring "the registered design professional" to perform certain tasks is ineffective in that the particular registered design professional expected to perform the task is not identified. The proposal resolves this by revising the code to specify that the "responsible" registered design professional" shall perform the tasks.

The building code also frequently refers to "a registered design professional" to perform certain tasks. In these cases, the required tasks are typically not associated with the actions of a design team for a building or structure but are for a single individual who is also a registered design professional. There are also instances where the language is more specific than "a registered design professional" but the result is the same. We have judged these to be sufficiently clear that changes to the building code consistent with the intent of the proposal are not warranted. The instances are located in Sections 107.1, 107.3.4, 202 ("structural observation"), 909.21.4.4, 1603.1.9, 1605.1.1, 1612.3.1(2), 1612.5, 1704.3-Exc., 1704.5, 1705.6, 1705.7, 1705.8, 1709.2, 1709.3, 1709.3.2, 1710.3, 1803.1, 1803.3.1, 1803.5.10, 1804.4(2), 1810.2.1, 1810.2.4, 1810.3.3.1.2, 1810.3.5.2.2-Exc., 1810.4.11, 2109.3.4.1, 2207.4, 2211.3.3, 2303.4.1.2(3), 2303.4.1.3, 2303.4.4, 2303.4.5, 2308.8.2.1, 2308.10.7, 2403.2, 2404.4, 3405.2.1, B101.2.2, G103.3(2), J103.2(7), K105.3, K105.4, K105.5 and K105.6.

All instances of "registered design professional" in the building code were considered and are either in the proposal or are listed in the paragraph immediately above.

Note that there are instances of the "responsible registered design professional" in the building code and they are located in Section 909.18.8.3. Also, the definition of "registered design professional in responsible charge" was added to the building code by ICC proposal G33-06/07 – AS, Phillip Brazil, Proponent.

This proposal is also a continuation of a separate proposal that adds a new Section 1704.5 specifying submittals to the building official (Sxx-12/13). The charging language in new Section 1704.5 is identical in both proposals except that this proposal adds "approved" before "construction documents."

Cost Impact: The code change proposal will not increase the cost of construction.

1603.1.4 #2-S-BRAZIL.doc

S71–12
1603.1.7

Proponent: John Ingargiola and Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@dhs.gov) (gregory.p.wilson@dhs.gov), Rebecca C. Quinn, RCQuinn Consulting, Inc., representing Department of Homeland Security, Federal Emergency Management Agency (rcquinn@earthlink.net)

Revise as follows:

1603.1.7 Flood design data. For buildings located in whole or in part in *flood hazard areas* as established in Section 1612.3, the documentation pertaining to design, if required in Section 1612.5, shall be included and the following information, referenced to the datum on the community's Flood Insurance Rate Map (FIRM), shall be shown, regardless of whether flood loads govern the design of the building:

1. *Risk Category* assigned according to ASCE 24.
~~1.~~ 2. In *flood hazard areas* not subject to high-velocity wave action, the elevation of the proposed lowest floor, including the basement.
~~2.~~3. In *flood hazard areas* not subject to high-velocity wave action, the elevation to which any nonresidential building will be dry flood proofed.
~~3.~~ 4. In *flood hazard areas* subject to high-velocity wave action, the proposed elevation of the bottom of the lowest horizontal structural member of the lowest floor, including the basement.

Reason: The current edition of ASCE 24 uses the assigned occupancy/structure category primarily to determine elevation of buildings above the design flood elevation, in keeping with the general approach that more important buildings be designed for less frequent environmental loads. The next edition of ASCE 24 will include the Risk Category table from ASCE 7-10. The ASCE committee recognized that ASCE 7-10 eliminated the lists of buildings for each category and determined it important to ensure that the assignment of risk category be guided by definitions that are specifically developed to ensure that buildings in flood hazard areas are appropriately protected. Therefore, the next edition of ASCE 24 requires the user to reevaluate and possibly reassign a risk category specifically for the purpose of flood loads and flood resistant construction requirements.

ASCE began the process of updating ASCE 24-05 in early 2011 and the next edition is expected to be published late 2012 or early 2013. The ASCE committee expects to have the near-final draft prepared and available at least a month before the Group A hearings and copies will be provided to the ICC committee.

Cost Impact: The code change proposal will not increase the cost of construction. The definitions of each risk category that will be in the revised ASCE 24 and used only for the purpose of assigning risk category for flood-resistant design essentially retain the descriptions from the 2012 IBC Table 1604.5 of which buildings fall into each of the risk categories.

Analysis: Will the proposal introduce a conflict with Section 1604.5?

1603.1.7-S-INGARGIOLA-WILSON-QUINN.doc

S72–12
1603.1.8.1 (NEW), 1607.12.5 (NEW), 1607.12.5.1 (NEW), 1607.12.5.2 (NEW), 1607.12.5.3 (NEW), 1607.12.5.4 (NEW)

Proponent: Edwin Huston, National Council of Structural Engineers Associations (NCSEA), representing NCSEA Code Advisory Subcommittee – General Requirements Subcommittee (huston@smithhustoninc.com)

Add new text as follows:

1603.1.8.1 Solar Photovoltaic (PV) Panels/Modules. The Roof/PV live load used in the design of Solar PV Panels shall be indicated on the construction documents.

1607.12.5 Solar Photovoltaic (PV) panels/modules. Solar PV panels/modules shall be designed in accordance with Sections 1607.12.5.1 through 1607.12.5.4, as applicable.

1607.12.5.1 Roof/PV live load. The roof/PV live load is a 20 psf uniform load. Unless each Solar PV panel/module is clearly and permanently marked "Do not walk on this surface – not intended for maintenance access or pedestrian traffic", and appropriate maintenance access paths are provided a non-concurrent 300 pound concentrated load as set forth in Table 1607.1 shall also be applied. The individual Solar PV panels/modules shall be designed to withstand the Roof/PV live load, in combination with other applicable loads.

1607.12.5.2 PV panels/modules. Solar PV panels/modules designed to be installed over and supported by a roof, shall have the structural supports of the roof designed to accommodate the full dead load, including the Solar PV panels/modules dead load; the Roof/PV live load in the areas of the Solar PV panels/modules in combination with other applicable loads. The roof area underneath any Solar PV panels/modules shall also be designed for load combinations including roof live load, in combination with other applicable loads, without the Solar PV panels/modules.

1607.12.5.3 PV panels/modules installed as an independent structure. Solar PV panels/modules that are independent structures and do not have accessible /occupied space underneath are not required to accommodate a roof/PV live load, provided they are marked as required in Section 1607.12.5.1, and the area under the structure is restricted to keep the public away. All other loads and combinations per Section 1605 shall be accommodated.

Solar PV panels/modules that are designed to be the roof, and span to structural supports, and have accessible/occupied space underneath shall have the panels/modules and all supporting structure designed to support a Roof/PV live load, as defined in section 1607.12.5.1 in combination with other applicable loads. Solar PV panels/modules in this application are not permitted to be classified as "not accessible" per 1607.12.5.1.

1607.12.5.4 Ballasted systems. Solar PV panels/modules installed on a roof as a ballasted system need not be rigidly attached to the roof or supporting structure. Ballasted systems shall be designed and installed only on roofs with slopes of ½" per foot or less. The structural supports of the roof under a ballasted system shall be designed, or analyzed, per section 1604.4; checked in accordance with Section 1604.3.6 for deflections; and checked in accordance with Section 1611 for ponding. The ballasted system shall be designed to resist sliding and uplift resulting from lateral and vertical forces as required by Section 1605, using a coefficient of friction determined by acceptable engineering principles.

Reason: This new section is bringing in requirements for Solar PV panels that is currently absent in the code.

Cost Impact: The code change proposal will not increase the cost of construction.

S72-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1603.1.8.1 (NEW)-S-HUSTON

S73–12
1603.1.9

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

Delete without substitution:

~~**1603.1.9 Systems and components requiring special inspections for seismic resistance.** **C***onstruction documents* or specifications shall be prepared for those systems and components requiring *special inspection* for seismic resistance as specified in Section 1705.11 by the *registered design professional* responsible for their design and shall be submitted for approval in accordance with Section 107.1. Reference to seismic standards in lieu of detailed drawings is acceptable.~~

Reason: Section 1603.1.9 is being deleted because it serves no purpose not already being served by Section 107.1, which requires construction documents that are submitted with each permit application to be prepared by a registered design professional but only where required by the statutes of the jurisdiction in which the construction or work is located. Section 1603.1.9, however, requires preparation of construction documents or specifications by the registered design professional responsible for the design of the system or component and references Section 107.1 for the submittal, but not the preparation, of the construction documents.

The deletion also eliminates a conflict with the charging language in Section 1603.1, which requires design loads and other information pertinent to the structural design to be specified on the construction documents. Section 1603.1.9, however, specifies no such design loads or other pertinent information.

Cost Impact: The code change proposal will not increase the cost of construction.

Table 1604.3

Proponent: Edwin Huston, National Council of Structural Engineers Associations (NCSEA), representing NCSEA Code Advisory Subcommittee – General Requirements Subcommittee (huston@smithhustoninc.com)

Revise as follows:

TABLE 1604.3
DEFLECTION LIMITS[a,b,c,h,i]

CONSTRUCTION	L	S or W[f]	D + L[d,g]
Roof Members:[e]			
Supporting plaster ceiling	l / 360	l / 360	l / 240
Supporting plaster ceiling	l / 240	l / 240	l / 180
Not supporting ceiling	l / 180	l / 180	l / 120
Floor Members	l / 360	-	l / 240
Exterior walls and interior partitions:			
With plaster or stucco finishes	-	l / 360	-
With other brittle finishes	-	l / 240	-
With flexible finishes	-	l / 120	-
Farm buildings	-	-	l / 180
Greenhouses	-	-	l / 120

b. ~~Interior partitions not exceeding 6ft in height and~~ Flexible, folding and portable partitions are not governed by the provisions of this section. The deflection criterion for interior partitions is based on the horizontal load defined in section 1607.14.

(Portions of Table not shown remain unchanged)

Reason: In footnote b the reference to interior partitions not exceeding 6ft in height is redundant and not needed. The second sentence of the footnote refers the user to Section 1607.14 (attached to the proposed change for reference) which already limits the live loading to partitions exceeding 6 feet.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Edwin Huston, National Council of Structural Engineers Associations (NCSEA), representing NCSEA Code Advisory Subcommittee – General Requirements Subcommittee (huston@smithhustoninc.com)

Revise as follows:

TABLE 1604.3
DEFLECTION LIMITS[a, b, c, h, i]

CONSTRUCTION	L	S or W[f]	D + L[d,g]
Roof Members:[e]			
Supporting plaster ceiling	*l* / 360	*l* / 360	*l* / 240
Supporting plaster ceiling	*l* / 240	*l* / 240	*l* / 180
Not supporting ceiling	*l* / 180	*l* / 180	*l* / 120
Floor Members	*l* / 360	-	*l* / 240
Exterior walls ~~and interior partitions~~:			
With plaster or stucco finishes	-	*l* / 360	-
With other brittle finishes	-	*l* / 240	-
With flexible finishes	-	*l* / 120	-
Interior Partitions:[b]			
With plaster or stucco finishes	*l* / 360	-	-
With other brittle finishes	*l* / 240	-	-
With flexible finishes	*l* / 120	-	-
Farm buildings	-	-	*l*/180
Greenhouses	-	-	*l*/120

(Portions of Table not shown remain unchanged)

1607.14 Interior walls and partitions. Interior walls and partitions that exceed 6 feet (1829 mm) in height, including their finish materials, shall have adequate strength and stiffness to resist the loads to which they are subjected but not less than a horizontal load of 5 psf (0.240 kN/m2).

> **Exception:** Fabric partitions complying with Section 1607.14.1 shall not be required to resist the minimum horizontal load of 5 psf (0.24 kN/m2).

1607.14.1 Fabric partitions. Fabric partitions that exceed 6 feet (1829 mm) in height, including their finish materials, shall have adequate strength and stiffness to resist the following load conditions:

1. A horizontal distributed load of 5 psf (0.24 kN/m2) applied to the partition framing. The total area used to determine the distributed load shall be the area of the fabric face between the framing members to which the fabric is attached. The total distributed load shall be uniformly applied to such framing members in proportion to the length of each member.
2. A concentrated load of 40 pounds (0.176 kN) applied to an 8-inch diameter (203 mm) area [50.3 square inches (32 452 mm2)] of the fabric face at a height of 54 inches (1372 mm) above the floor.

Reason: Currently Table 1604.3 does not have deflection limits for Live Loads on Interior walls. The 5.0psf requirement in section 1607.14 is classified as a live load and would not require a deflection check. Under the legacy Uniform Building Code this load was treated as an "other load" and was required to meet the deflection limits similar to those in IBC Table 1604.3. To avoid confusion for walls, and to require deflection checks on interior walls, the proposed code change is necessary.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

T1604.3#2-S-HUSTON.doc

S76–12
Table 1604.3

Proponent: Brad Douglas, PE, American Wood Council (pcoats@awc.org)

Revise as follows:

TABLE 1604.3
DEFLECTION LIMITS[a, b, c, h, i]

(Portions of Table and footnotes not shown remain unchanged)

~~d For wood structural members having a moisture content of less than 16 percent at time of installation and used under dry conditions, the deflection resulting from *L* + 0.5*D* is permitted to be substituted for the deflection resulting from *L* + *D*.~~

d. The deflection limit for the *D+L* load combination only applies to the deflection due to the creep component of long-term dead load deflection plus the short-term live load deflection. For wood structural members that are dry at time of installation and used under dry conditions, the creep component of the long-term deflection shall be permitted to be estimated as the immediate dead load deflection resulting from 0.5*D*. For wood structural members at all other moisture conditions, the creep component of the long-term deflection is permitted to be estimated as the immediate dead load deflection resulting from *D*. The value of 0.5D shall not be used in combination with NDS provisions for long-term loading.

Reason: Deflection limits for the load combination *D+L*, were taken from the UBC deflection limits. However, the intent of the UBC limits was not brought forward. The original intent of these provisions was to limit the total deflection based on the combination of live load deflection and the creep component of the dead load deflection. As a result, there have been several prior code cycle modifications to these provisions to re-instate the original intent, such as the addition of footnote "g" for steel structural members which effectively excludes steel from checking for the creep component of dead load deflection. As currently written and formatted, the *D+L* deflection provision can be misinterpreted to suggest that the total deflection due to dead load, *D*, including both the immediate and creep components of the dead load deflection, should be used with the deflection limit in this column. Additionally, use of 0.5*D* in footnote "d" is potentially non-conservative without clarification that the 0.5*D* load reduction approach is a numerically consistent alternative to the NDS provisions. Without this clarification, a potential misinterpretation is that the creep component of dead load deflection is to be calculated using NDS provisions and the reduced dead load (i.e. 0.5*D*). This change makes calculation of *D+L* deflection for comparison against the *D+L* deflection limit in Table 1604.3 consistent with the provisions in NDS 3.5.2 for long-term loading and consistent with the stated intent in the UBC and with similar provisions in ACI 318 as described in the ACI 318 Commentary. The applicable NDS provisions are shown below for reference.

NDS 3.5.2 Long-Term Loading:

3.5 Bending Members – Deflection

3.5.1 Deflection Calculations

If deflection is a factor in design, it shall be calculated by standard methods of engineering mechanics considering bending deflections and, when applicable, shear deflections. Consideration for shear deflection is required when the reference modulus of elasticity has not been adjusted to include the effects of shear deflection (see Appendix F).

3.5.2 Long-Term Loading

Where total deflection under long-term loading must be limited, increasing member size is one way to provide extra stiffness to allow for this time dependent deformation (see Appendix F). Total deflection, Δ_T, shall be calculated as follows:

$$\Delta_T = K_{cr}\,\Delta_{LT} + \Delta_{ST} \qquad (3.5\text{-}1)$$

where:

K_{cr} = time dependent deformation (creep) factor

= 1.5 for seasoned lumber, structural glued laminated timber, prefabricated wood I-joists, or structural composite lumber used in dry service conditions as defined in 4.1.4, 5.1.4, 7.1.4, and 8.1.4, respectively.

= 2.0 for structural glued laminated timber used in wet service conditions as defined in 5.1.4.

= 2.0 for wood structural panels used in dry service conditions as defined in 9.1.4.

= 2.0 for unseasoned lumber or for seasoned lumber used in wet service conditions as defined in 4.1.4.

Δ_{LT} = immediate deflection due to the long-term component of the design load, in.

Δ_{ST} = deflection due to the short-term or normal component of the design load, in.

Cost Impact: The code change proposal will not increase the cost of construction.

S76-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T1604.3-S-DOUGLAS.doc

S77–12
Table 1604.3

Proponent: John Woestman, Kellen Company, representing Builders Masonry Veneer Manufacturers Association (MVMA) (jwoestman@kellencompany.com)

Revise as follows:

TABLE 1604.3
DEFLECTION LIMITS[a,b,c,h, i]

CONSTRUCTION	L	S OR W[f]	D + L[d, g]
Exterior walls and interior partitions:			
With plaster or stucco finishes	---	//360	---
With other brittle finishes[j]	---	//240	---
With flexible finishes	---	//120	---

[j] Includes adhered masonry veneer.

(Portions of Table not shown remain unchanged)

Reason: This code proposal should help with a consistent deflection limit applied to wall systems with adhered masonry veneer.
Adhered masonry veneer does not have the large, flat, monolithic surface of plaster or stucco finishes. As such, adhered masonry veneer can accommodate more deflection.

Cost Impact: The code change proposal will not increase the cost of construction.

S77-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T1604.3-S-WOESTMAN.doc

S78–12

Table 1604.3

Proponent: Thomas S. Zaremba, Roetzel & Andress, representing Glazing Industry Code Committee (tzaremba@ralaw.com)

Revise as follows:

TABLE 1604.3
DEFLECTION LIMITS[a, b, c, h, i]

CONSTRUCTION	*L*	*S* or *W*[f]	*D* + *L*[d, g]
Roof members:[e]			
Supporting plaster or stucco ceiling	*l*/360	*l*/360	*l*/240
Supporting nonplaster ceiling	*l*/240	*l*/240	*l*/180
Not supporting ceiling	*l*/180	*l*/180	*l*/120
Floor members	*l*/360	---	*l*/240
Exterior walls and interior partitions:			
With plaster or stucco finishes	---	*l*/360	---
With other brittle finishes	---	*l*/240	---
With flexible finishes	---	*l*/120	---
Farm buildings	---	---	*l*/180
Greenhouses	---	---	*l*/120

For SI: 1 foot = 304.8 mm.

a. For structural roofing and siding made of formed metal sheets, the total load deflection shall not exceed *l*/60. For secondary roof structural members supporting formed metal roofing, the live load deflection shall not exceed *l*/150. For secondary wall members supporting formed metal siding, the design wind load deflection shall not exceed *l*/90. For roofs, this exception only applies when the metal sheets have no roof covering.
b. Interior partitions not exceeding 6 feet in height and flexible, folding and portable partitions are not governed by the provisions of this section. The deflection criterion for interior partitions is based on the horizontal load defined in Section 1607.14.
c. See Section 2403 for glass supports.
d. For wood structural members having a moisture content of less than 16 percent at time of installation and used under dry conditions, the deflection resulting from *L* + 0.5*D* is permitted to be substituted for the deflection resulting from *L* + *D*.
e. The above deflections do not ensure against ponding. Roofs that do not have sufficient slope or camber to assure adequate drainage shall be investigated for ponding. See Section 1611 for rain and ponding requirements and Section 1503.4 for roof drainage requirements.
f. W shall be taken as the nominal load for wind. The wind load is permitted to be taken as 0.42 times the "component and cladding" loads for the purpose of determining deflection limits ~~herein~~ for main windforce-resisting systems.
g. For steel structural members, the dead load shall be taken as zero.
h. For aluminum structural members or aluminum panels used in skylights and sloped glazing framing, roofs or walls of sunroom additions or patio covers, not supporting edge of glass or aluminum sandwich panels, the total load deflection shall not exceed *l*/60. For continuous aluminum structural members supporting edge of glass, the total load deflection shall not exceed *l*/175 for each glass lite or *l*/60 for the entire length of the member, whichever is more stringent. For aluminum sandwich panels used in roofs or walls of sunroom additions or patio covers, the total load deflection shall not exceed *l*/120.
i. For cantilever members, *l* shall be taken as twice the length of the cantilever.

Reason: Section 1605.2 of the IBC provides load combinations using strength or factored load design while 1605.3 provides load combinations using allowable stress design. For wind load determination, ASCE 7-10 is now based on strength design and ultimate wind speeds. Conversion to allowable working stress (nominal) loads is accomplished by multiplying the factored wind load by 0.6.

The original reduction of 0.7 in footnote (f) in earlier editions of the IBC was changed last cycle by multiplying 0.7 and 0.6 to get the 0.42 factor now shown in the current code. The added sentence to the beginning of the footnote is a clarification to use nominal loads for wind used in allowable stress design to determine deflection which corresponds to the use of the 0.42 reduction.

A second clarification is also added at the end of footnote (f) to properly restrict the use of the 0.42 reduction to deflection calculations of main structural members shown in the Table 1604.3 when using "component and cladding wind load and preventing users from inappropriately combining this reduction with component and cladding deflections described in footnotes (a), (c), and (h) of this table.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee

Delete without substitution:

SECTION 202
DEFINITIONS

DIAPHRAGM. A horizontal or sloped system acting to transmit lateral forces to the vertical-resisting elements. When the term “diaphragm” is used, it shall include horizontal bracing systems.

~~**Diaphragm flexible.** A diaphragm is flexible for the purpose of distribution of story shear and torsional moment where so indicated in Section 12.3.1 of ASCE 7.~~
~~**Diaphragm, rigid.** A diaphragm is rigid for the purpose of distribution of story shear and torsional moment when the lateral deformation of the diaphragm is less than or equal to two times the average story drift.~~

Revise as follows:

SECTION 1602
DEFINITIONS AND NOTATIONS

1602.1 Definitions. The following terms are defined in Chapter 2:

DIAPHRAGM.
Diaphragm, blocked.
Diaphragm boundary.
Diaphragm chord.
~~**Diaphragm flexible.**~~
~~**Diaphragm, rigid.**~~

(Portions of text not shown remains unchanged)

1604.4 Analysis. *Load effects* on structural members and their connections shall be determined by methods of structural analysis that take into account equilibrium, general stability, geometric compatibility and both short- and long-term material properties.

Members that tend to accumulate residual deformations under repeated service loads shall have included in their analysis the added eccentricities expected to occur during their service life.

Any system or method of construction to be used shall be based on a rational analysis in accordance with well-established principles of mechanics. Such analysis shall result in a system that provides a complete load path capable of transferring loads from their point of origin to the load-resisting elements.

The total lateral force shall be distributed to the various vertical elements of the lateral force-resisting system in proportion to their rigidities, considering the rigidity of the horizontal bracing system or diaphragm. Rigid elements assumed not to be a part of the lateral force-resisting system are permitted to be incorporated into buildings provided their effect on the action of the system is considered and provided for in the design~~. Except where diaphragms are flexible, or are permitted to be analyzed as flexible,~~ Provisions shall be made for the increased forces induced on resisting elements of the structural system resulting from torsion due to eccentricity between the center of application of the lateral forces and the center of rigidity of the lateral force-resisting system<u>, except where diaphragms are considered as flexible, permitted to be idealized as flexible or semi-rigid, in accordance with Section 12.3.1 of ASCE for seismic loads or Chapter 26 of ASCE 7 for wind loads</u>.

Every structure shall be designed to resist the overturning effects caused by the lateral forces specified in this chapter. See Section 1609 for wind loads, Section 1610 for lateral soil loads and Section 1613 for earthquake loads.

1610.1 General. Foundation walls and retaining walls shall be designed to resist lateral soil loads. Soil loads specified in Table 1610.1 shall be used as the minimum design lateral soil loads unless determined otherwise by a geotechnical investigation in accordance with Section 1803. Foundation walls and other walls in which horizontal movement is restricted at the top shall be designed for at-rest pressure. Retaining walls free to move and rotate at the top shall be permitted to be designed for active pressure. Design lateral pressure from surcharge loads shall be added to the lateral earth pressure load. Design lateral pressure shall be increased if soils at the site are expansive. Foundation walls shall be designed to support the weight of the full hydrostatic pressure of undrained backfill unless a drainage system is installed in accordance with Sections 1805.4.2 and 1805.4.3.

> **Exception:** Foundation walls extending not more than 8 feet (2438 mm) below grade and laterally supported at the top by ~~flexible~~ diaphragms considered as flexible, permitted to be idealized as flexible or semi-rigid, in accordance with Section 12.3.1 of ASCE for seismic loads or Chapter 26 of ASCE for wind loads shall be permitted to be designed for active pressure.

1613.3.5.1 Alternative seismic design category determination. Where S_1 is less than 0.75, the *seismic design category* is permitted to be determined from Table 1613.3.5(1) alone when all of the following apply:

1. In each of the two orthogonal directions, the approximate fundamental period of the structure, T_a, in each of the two orthogonal directions determined in accordance with Section 12.8.2.1 of ASCE 7, is less than 0.8 T_s determined in accordance with Section 11.4.5 of ASCE 7.
2. In each of the two orthogonal directions, the fundamental period of the structure used to calculate the story drift is less than T_s.
3. Equation 12.8-2 of ASCE 7 is used to determine the seismic response coefficient, C_s.
4. The diaphragms are rigid as defined in Section 12.3.1 of ASCE 7 or, for diaphragms that are considered flexible, permitted to be idealized as flexible or semi-rigid in accordance with Section 12.3.1 of ASCE 7, the distances between vertical elements of the seismic force-resisting system do not exceed 40 feet (12 192 mm).

Reason: The ICC Building Code Action Committee was asked to look at clearing up potential conflicts between the references to, and definitions of, flexible and rigid diaphragms in the IBC and ASCE-7-10. The BCAC did identify potential conflicts between the IBC's definition of a rigid diaphragm and the ASCE 7-10 criteria for classifying a diaphragm as rigid, semi-rigid or flexible. Also, it is considered inappropriate to include enforceable code requirements or references to standards as part of a definition. Thus, by this proposal, the BCAC proposes to remove the separate definitions for flexible and rigid diaphragms from the IBC and supply direct references in IBC Chapter 16 to the relevant requirements in the ASCE 7 seismic and wind chapters for when a diaphragm can be idealized as flexible or semi-rigid. This reference only occurs in the IBC in the sections noted in the code change proposal. In practical application, the code user will be turning to the requirements of ASCE-7 to categorize the diaphragm and perform the design. Therefore, there is no real need or advantage to provide the definitions in the IBC and this will prevent future maintenance of the terms and/or conflict between them.

For reference, ASCE 7-10 states,

12.3.1 Diaphragm Flexibility

The structural analysis shall consider the relative stiffnesses of diaphragms and the vertical elements of the seismic force-resisting system. Unless a diaphragm can be idealized as either flexible or rigid in accordance with Sections 12.3.1.1, 12.3.1.2, or 12.3.1.3, the structural analysis shall explicitly include consideration of the stiffness of the diaphragm (i.e., semirigid modeling assumption).

12.3.1.1 Flexible Diaphragm Condition

Diaphragms constructed of untopped steel decking or wood structural panels are permitted to be idealized as flexible if any of the following conditions exist:

a. In structures where the vertical elements are steel braced frames, steel and concrete composite braced frames or concrete, masonry, steel, or steel and concrete composite shear walls.
b. In one-and two-family dwellings.
c. In structures of light-frame construction where all of the following conditions are met:

1. Topping of concrete or similar materials is not placed over wood structural panel diaphragms except for nonstructural topping no greater than 1 ½" in (38mm) thick.
2. Each line of vertical elements of the seismic force-resisting system complies with the allowable story drift of Table 12.12-1

12.3.1.2 Rigid Diaphragm Condition
Diaphragms of concrete slabs or concrete filled metal deck with span-to-depth ratios of 3 or less in structures that have no horizontal irregularities are permitted to be idealized as rigid.
12.3.1.3 Calculated Flexible Diaphragm Condition
Diaphragms not satisfying the conditions of Sections 12.3.1.1 or 12.3.1.2 are permitted to be idealized as flexible where the computed maximum in-plane deflection of the diaphragm under lateral load is more than two times the average story drift of adjoining vertical elements of the seismic force-resisting system of the associated story under equivalent tributary lateral load as shown in Fig. 12.3-1. The loadings used for this calculation shall be those prescribed by Section 12.8.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Jerry R. Tepe, FAIA, JRT-AIA, representing American Institute of Architects (jrtaia@aol.com)

Revise as follows:

SECTION 202
DEFINITIONS

DANGEROUS. Any *building*, *structure* or portion thereof that meets any of the conditions described below shall be deemed dangerous:

1. The *building* or *structure* has collapsed, has partially collapsed, has moved off its foundation or lacks the necessary support of the ground.
2. There exists a significant risk of collapse, detachment or dislodgment of any portion, member, appurtenance or ornamentation of the *building* or *structure* under ~~service~~ nominal loads.

Revise as follows:

1604.4 Analysis. *Load effects* on structural members and their connections shall be determined by methods of structural analysis that take into account equilibrium, general stability, geometric compatibility and both short- and long-term material properties.

Members that tend to accumulate residual deformations under repeated ~~service~~ nominal loads shall have included in their analysis the added eccentricities expected to occur during their service life.

Any system or method of construction to be used shall be based on a rational analysis in accordance with well-established principles of mechanics. Such analysis shall result in a system that provides a complete load path capable of transferring loads from their point of origin to the load-resisting elements.

The total lateral force shall be distributed to the various vertical elements of the lateral force-resisting system in proportion to their rigidities, considering the rigidity of the horizontal bracing system or diaphragm. Rigid elements assumed not to be a part of the lateral force-resisting system are permitted to be incorporated into buildings provided their effect on the action of the system is considered and provided for in the design. Except where diaphragms are flexible, or are permitted to be analyzed as flexible, provisions shall be made for the increased forces induced on resisting elements of the structural system resulting from torsion due to eccentricity between the center of application of the lateral forces and the center of rigidity of the lateral force-resisting system.

Every structure shall be designed to resist the overturning effects caused by the lateral forces specified in this chapter. See Section 1609 for wind loads, Section 1610 for lateral soil loads and Section 1613 for earthquake loads.

Revise as follows:

1810.3.1.4 Driven piles. Driven piles shall be designed and manufactured in accordance with accepted engineering practice to resist all stresses induced by handling, driving and ~~service~~ nominal loads.

1810.3.1.5 Helical piles. Helical piles shall be designed and manufactured in accordance with accepted engineering practice to resist all stresses induced by installation into the ground and ~~service~~ nominal loads.

Revise as follows:

1908.2 Allowable service load. The allowable ~~service~~ nominal load for headed anchors in shear or tension shall be as indicated in Table 1908.2. Where anchors are subject to combined shear and tension, the following relationship shall be satisfied:

$(P_s / P_t)5/3 + (V_s / V_t)^{5/3} \leq 1$ **(Equation 19-1)**

where:

P_s = Applied tension ~~service~~ nominal load, pounds (N).
P_t = Allowable tension ~~service~~ nominal load from Table 1908.2, pounds (N).
V_s = Applied shear ~~service~~ nominal load, pounds (N).
V_t = Allowable shear ~~service~~ nominal load from Table 1908.2, pounds (N).

TABLE 1908.2
ALLOWABLE ~~SERVICE~~ NOMINAL LOAD ON EMBEDDED BOLTS (pounds)
(Portions of table not shown remain unchanged)

1908.3 Required edge distance and spacing. The allowable ~~service~~ nominal loads in tension and shear specified in Table 1908.2 are for the edge distance and spacing specified. The edge distance and spacing are permitted to be reduced to 50 percent of the values specified with an equal reduction in allowable ~~service~~ nominal load. Where edge distance and spacing are reduced less than 50 percent, the allowable ~~service~~ nominal load shall be determined by linear interpolation.

Reason: “Nominal loads” is a defined term whereas “service loads” is not. Per IBC Interpretation 23-10 issued 12-08-2010, the terms are synonymous. (Note interpretation was from the 2009 edition) Dangerous is used in Chapter 34. The intent is to make this change wherever it occurs in the IBC. What is shown was derived from a word search of the PDF document.

IBC Interpretation 23-10
Q: Is the term "service loads" as used in the definition of DANGEROUS synonymous with the definition of NOMINAL LOADS as defined in Section 1602?
A**:** Yes. The intent is to address loads that a building is likely to experience and precludes consideration of a FACTORED LOAD which applies to limit state or strength design.

NOMINAL LOADS. The magnitudes of the *loads* specified in Chapter 16 (dead, live, soil, wind, snow, rain, *flood* and earthquake).
FACTORED LOAD**.** The product of a *nominal load* and a *load factor*.

Cost Impact: The code change proposal will not increase the cost of construction.

S80-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202-DANGEROUS-G-TEPE

S81–12
1604.5.1

Proponent: Edwin Huston, National Council of Structural Engineers Associations (NCSEA), representing NCSEA Code Advisory Subcommittee – General Requirements Subcommittee (huston@smithhustoninc.com)

Revise as follows:

1604.5.1 Multiple occupancies. Where a building or structure is occupied by two or more occupancies not included in the same *risk category*, it shall be assigned the classification of the highest *risk category* corresponding to the various occupancies. Where buildings or structures have two or more portions that are structurally separated, each portion shall be separately classified. Where a separated portion of a building or structure provides required access to, required egress from or shares life safety components with another portion having a higher *risk category*, both portions shall be assigned to the higher *risk category*.

> <u>**Exception:** A single public assembly room with an occupant load of less than 500 shall be allowed in a *Risk Category II* building or structure and not be considered a multiple occupancy or a separate occupancy.</u>

Reason: The revision to 1604.5.1 will allow a single, modest meeting room or auditorium within an office building (a Risk Category II Building) without requiring the entire building to be designed as a Risk Category III.

Cost Impact: The code change proposal will not increase the cost of construction.

S81-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1604.5.1-S-HUSTON

S82–12
1604.5

Proponent: Edwin Huston, National Council of Structural Engineers Associations (NCSEA), representing NCSEA Code Advisory Subcommittee – General Requirements Subcommittee (huston@smithhustoninc.com)

Revise as follows:

1604.5 Risk category. Each building and structure shall be assigned a *risk category* in accordance with Table 1604.5. Where a referenced standard specifies an occupancy category, the *risk category* shall not be taken as lower than the occupancy category specified therein. <u>Where a referenced standard specifies that the assignment of a risk category be in accordance with ASCE 7, Table 1.5-1, Table 1604.5 shall be used in lieu of ASCE 7, Table 1.5-1.</u>

Reason: IBC Table 1604.5 has a concise and extensive list of various occupancies, whereas ASCE 7, Table 1.5-1 is limited and , being a standard, rather than a code, much more general. This can lead to confusion in the appropriate determination of a risk category, if one tries to comply with both.

As examples of when one can be referred to both tables, consider:

1. IBC Section 1609 Wind Loads requires wind loads to be determined in accordance with ASCE 7, chapters 26 thru 30. The confusion comes in when you are in those chapters of ASCE 7, risk categories per Table 1.5-1 are referenced (26.5.1; Table 27.5-1; Table 28.2-1; Table 29.1-1; Tables 30.4-1 thru 30.7-1).
2. AISC 360-10, Section N5.5b also references ASCE 7 Table 1.5-1 as follows:

5b. CJP Groove Weld NDT
For structures in Risk Category III or IV of Table 1.5-1, Risk Category of Buildings and Other Structures for Flood, Wind, Snow, Earthquake and Ice Loads, of ASCE/SEI 7, *Minimum Design Loads for Buildings and Other Structures*, UT shall be performed by QA on all CJP groove welds subject to transversely applied tension loading in butt, T- and corner joints, in materials 5/16 in. (8 mm) thick or greater. For structures in Risk Category II, UT shall be performed by QA on 10% of CJP groove welds in butt, T- and corner joints subject to transversely applied tension loading, in materials 5/16 in. (8 mm) thick or greater.

This code change is intended to provide consistency by using only IBC Table 1604.5.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Does IBC Section 102.4.1 already provide sufficient clarification?

S82-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1604.5-S-HUSTON

S83–12
Table 1604.5

Proponent: William W. Stewart, FAIA, representing self (codedoc@sbcglobal.net)

Revise as follows:

TABLE 1604.5
RISK CATEGORY OF BUILDINGS AND OTHER STRUCTURES

RISK CATEGORY	NATURE OF OCCUPANCY
III	Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to: • Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300. • Buildings and other structures containing ~~elementary school, secondary school or day care facilities~~ Group E occupancies with an occupant load greater than 250. • Buildings and other structures containing ~~adult education facilities, such as colleges and universities~~, educational occupancies for students above the 12th grade with an occupant load greater than 500. • Group I-2 occupancies with an occupant load of 50 or more resident care recipients but not having surgery or emergency treatment facilities. • Group I-3 occupancies. • Any other occupancy with an occupant load greater than 5,000[a]. • Power-generating stations, water treatment facilities for potable water, waste water treatment facilities and other public utility facilities not included in Risk Category IV. • Buildings and other structures not included in Risk Category IV containing quantities of toxic or explosive materials that: Exceed maximum allowable quantities per control area as given in Table 307.1(1) or 307.1(2) or per outdoor control area in accordance with the *International Fire Code*; and Are sufficient to pose a threat to the public if released [b].

(Portions of table not shown remain unchanged)

Reason: Consistency. The laundry list in the second bullet is exactly the same as the entire list of items that make up E Occupancies in 305. This just substitutes a defined term for a laundry list. My change has the added advantage of making it clearer that the 250 occupant load trigger applies to all, not just day care facilities.

The change in bullet 3 uses the words from 304. Current text says the same thing as in 304 but uses different words.. Additionally it relieves the code from deciding which college freshmen are adults.

This change also makes it clear that trade schools are covered .

Cost Impact: The code change proposal will not increase the cost of construction.

S83-11

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T1604.5-S-STEWART

S84–12
1604.8.2

Proponent: Gary J. Ehrlich, P.E., National Association of Home Builders (NAHB) (gehrlich@nahb.org)

Revise as follows:

1604.8.2 Structural walls. Walls that provide vertical load-bearing resistance or lateral shear resistance for a portion of the structure shall be anchored to the roof and to all floors and members that provide lateral support for the wall or that are supported by the wall. The connections shall be capable of resisting the horizontal forces specified in Section 1.4.4 of ASCE 7 for walls of structures assigned to Seismic Design Category A and to Section 12.11 of ASCE 7 for walls of structures assigned to all other seismic design categories. Required anchors in masonry walls of hollow units or cavity walls shall be embedded in a reinforced grouted structural element of the wall. See Sections 1609 for wind design requirements and 1613 for earthquake design requirements.

<u>Exceptions:</u>

1. <u>In Risk Category I and II buildings or structures, connections for light-frame wood or cold-formed steel walls not exceeding 15 pounds per square foot (718 N/m2) in weight designed and constructed in accordance with Section 2304.9, Section 2308, or Section 2210.7 shall be exempt from the provisions of this section.</u>
2. <u>In Risk Category I and II buildings or structures assigned to Seismic Design Category A, B, or C, connections for light-frame wood or cold-formed steel walls with stone or masonry veneer not exceeding 48 pounds per square foot (2298 N/m2) in weight designed and constructed in accordance with Section 2304.9, Section 2308, or Section 2210.7, shall be exempt from the provisions of this section.</u>

Reason: The purpose of this amendment is to supply exceptions to the new wall anchorage provisions added in ASCE 7-10 and the 2012 IBC. These new provisions were much needed, and we supported their inclusion in ASCE 7. However, during the ASCE 7-10 development process the provisions were expanded to apply to all bearing walls including light frame walls. The result is to impose an unnecessary and unjustified light-frame wall design check on already-overburdened engineers. We are concerned this will be a "nuisance" provision; glossed over until the code official or peer reviewer calls an engineer on it. We are also concerned engineers using prescriptive fastener schedules such as those in the IBC, WFCM or COFS-PM will be asked to justify them. This amendment supplies two exemptions: (1) for light-frame walls less than 15psf in weight in any seismic design category; and (2) for veneered walls less than 48 psf in weight in seismic design categories A, B and C. This will reduce burdens on engineers and code officials applying the new provisions.

Cost Impact: The code change proposal will not increase the cost of construction.

S84-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1604.8.2-S-EHRLICH.doc

S85–12
1604.11 (NEW), 1604.11.1 (NEW), 1604.11.2 (NEW), 1615

Proponent: Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee

Revise as follows:

1604.11 Structural integrity. Structural integrity for buildings and other structures shall be provided in accordance with this section and shall not be less than specific applicable requirements elsewhere in this code.

1604.11.1 General. Buildings and other structures shall comply with Sections 1.4 through 1.4.5 of ASCE 7.

Exceptions:

1. Detached one- and two-family dwellings, assigned to *Seismic Design Category* A, B or C, or located where the mapped short-period spectral response acceleration, S_S, is less than 0.4 g.
2. The seismic-force-resisting system of wood-frame buildings that conform to the provisions of Section 2308 are not required to be analyzed as specified in this section.
3. Agricultural storage structures intended only for incidental human occupancy.
4. Structures that require special consideration of their response characteristics and environment that are not addressed by this code or ASCE 7 and for which other regulations provide seismic criteria, such as vehicular bridges, electrical transmission towers, hydraulic structures, buried utility lines and their appurtenances and nuclear reactors.

1604.11.2 High rise buildings classified as Risk Category III or IV. In addition to the requirements of Section 1604.11.1 high-rise buildings that are classified as Risk Category III or IV shall comply with Section 1615.

SECTION 1615
STRUCTURAL INTEGRITY OF HIGH-RISE RISK CATEGORY III AND IV BUILDINGS

(Portions of text not shown remains unchanged)

Reason: Since the IBC drafting stages, attempts have been made to add minimum general structural integrity requirements based on ASCE 7 Section 1.4. Those attempts have been rejected because the ASCE 7 provisions of Section 1.4 were considered to be unenforceable. With concerns that have been raised over requiring minimum general structural integrity, it was recognized that the Seismic Design Category (SDC) A requirements under earthquake loads constitute a "de facto" set of minimum structural integrity requirements that all structures must meet. Those minimum requirements would be exceeded in the case of higher seismic design categories.

The 2010 edition of ASCE 7 has, in fact, relocated the seismic design requirements for SDC A to Section 1.4 of the standard which is titled "General Structural Integrity". Section 1.4 of ASCE 7 is then referenced by Section 11.7 of the standard for minimum earthquake load and detailing requirements in SDC A. Section 11.7 states,

11.7 DESIGN REQUIREMENTS FOR SEISMIC DESIGN CATEGORY A

Buildings and other structures assigned to Seismic Design Category A need only comply with the requirements of Section 1.4. Nonstructural components in SDC A are exempt from seismic design requirements. In addition, tanks assigned to Risk Category IV shall satisfy the freeboard requirement in Section 15.7.6.1.2

The ASCE 7 seismic loading requirements are applied by reference from IBC **Section 1613.1, "EARTHQUAKE LOADS".** The intent is to ensure minimum structural design criteria by applying Section 1.4 of ASCE 7 to structures that are classified as SDC A under the 2012 IBC.

The proposed scope of reference does not include Section 1.4.6 of ASCE 7 which deals with extraordinary loads and events for which no specific criteria are provided.

Since the structural integrity requirements in Section 1.4 of ASCE 7 are implemented via the earthquake load provisions, the four exceptions currently in Section 1613.1 are copied here, verbatim, as Exceptions 2 through 5. This is done to avoid any unintended technical changes. In 1604.11.2 a cross-reference is added to the structural integrity requirements that are currently in Section 1615.

Since the new proposed section 1604.11 is titled "STRUCTURAL INTEGRITY", the title of the existing section 1615, "STRUCTURAL INTEGRITY", is changed to reflect the specific scope of that section which is High-rise risk category III and IV

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1604.11 (NEW)-S-BAJNAI-BCAC.doc

S86–12
1605.2

Proponent: Edwin Huston, National Council of Structural Engineers Associations (NCSEA), representing NCSEA Code Advisory Subcommittee – General Requirements Subcommittee (huston@smithhustoninc.com)

Revise as follows:

1605.2 Load combinations using strength design or load and resistance factor design. Where strength design or load and resistance factor design is used, buildings and other structures, and portions thereof, shall be designed to resist the most critical effects resulting from the following combinations of factored loads:

$1.4(D + F)$	**(Equation 16-1)**
$1.2(D + F) + 1.6(L + H) + 0.5(L_r \text{ or } S \text{ or } R)$	**(Equation 16-2)**
$1.2(D + F) + 1.6(L_r \text{ or } S \text{ or } R) + 1.6H + (f_1L \text{ or } 0.5W)$	**(Equation 16-3)**
$1.2(D + F) + 1.0W + f_1L + 1.6H + 0.5(L_r \text{ or } S \text{ or } R)$	**(Equation 16-4)**
$1.2(D + F) + 1.0E + f_1L + 1.6H + f_2S$	**(Equation 16-5)**
$0.9D + 1.0W + 1.6H$	**(Equation 16-6)**
$0.9(D + F) + 1.0E + 1.6H$	**(Equation 16-7)**

where:

f_1 = 1 for places of public assembly live loads in excess of 100 pounds per square foot (4.79 kN/m2), and parking garages; and 0.5 for other live loads.

f_2 = 0.7 for roof configurations (such as saw tooth) that do not shed snow off the structure, and 0.2 for other roof configurations.

Exceptions:

1. Where other factored load combinations are specifically required by other provisions of this code, such combinations shall take precedence.
2. Where the effect of H resists the primary variable load effect, a load factor of 0.9 shall be included with H where H is permanent and H shall be set to zero for all other conditions.
3. <u>Crane wheel loads need not be combined with roof live load or with more than three-fourths of the snow load or one-half of the wind load. Alternatively, industry standard reference documents citing additional crane load combinations shall be permitted for the design of buildings subject to horizontal and vertical crane loads.</u>

1605.3.1 Basic load combinations. Where *allowable stress design* (working stress design), as permitted by this code, is used, structures and portions thereof shall resist the most critical effects resulting from the following combinations of loads:

$D + F$	**(Equation 16-8)**
$D + H + F + L$	**(Equation 16-9)**
$D + H + F + (Lr \text{ or } S \text{ or } R)$	**(Equation 16-10)**
$D + H + F + 0.75(L) + 0.75(L_r \text{ or } S \text{ or } R)$	**(Equation 16-11)**
$D + H + F + (0.6W \text{ or } 0.7E)$	**(Equation 16-12)**
$D + H + F + 0.75(0.6W) + 0.75L + 0.75(L_r \text{ or } S \text{ or } R)$	**(Equation 16-13)**
$D + H + F + 0.75\ (0.7\ E) + 0.75\ L + 0.75\ S$	**(Equation 16-14)**
$0.6D + 0.6W + H$	**(Equation 16-15)**
$0.6(D + F) + 0.7E + H$	**(Equation 16-16)**

Exceptions:

1. Crane ~~hook~~ wheel loads need not be combined with roof live load or with more than three-fourths of the snow load or one-half of the wind load. Alternatively, industry standard reference documents citing additional crane load combinations shall be permitted for the design of buildings subject to horizontal and vertical crane loads.
2. Flat roof snow loads of 30 psf (1.44 kN/m2) or less and roof live loads of 30 psf (1.44 kN/m2) or less need not be combined with seismic loads. Where flat roof snow loads exceed 30 psf (1.44 kN/m2), 20 percent shall be combined with seismic loads.
3. Where the effect of *H* resists the primary variable load effect, a load factor of 0.6 shall be included with *H* where *H* is permanent and *H* shall be set to zero for all other conditions.
4. In Equation 16-15, the wind load, *W*, is permitted to be reduced in accordance with Exception 2 of Section 2.4.1 of ASCE 7.
5. In Equation 16-16, 0.6 *D* is permitted to be increased to 0.9 *D* for the design of special reinforced masonry shear walls complying with Chapter 21.

1605.3.2 Alternative basic load combinations. In lieu of the basic load combinations specified in Section 1605.3.1, structures and portions thereof shall be permitted to be designed for the most critical effects resulting from the following combinations. When using these alternative basic load combinations that include wind or seismic loads, allowable stresses are permitted to be increased or load combinations reduced where permitted by the material chapter of this code or the referenced standards. For load combinations that include the counteracting effects of dead and wind loads, only two-thirds of the minimum dead load likely to be in place during a design wind event shall be used. When using allowable tresses which have been increased or load combinations which have been reduced as permitted by the material chapter of this code or the referenced standards, where wind loads are calculated in accordance with Chapters 26 through 31 of ASCE 7, the coefficient (ω) in the following equations shall be taken as 1.3. For other wind loads, (ω) shall be taken as 1. When allowable stresses have not been increased or load combinations have not been reduced as permitted by the material chapter of this code or the referenced standards, (ω) shall be taken as 1. When using these alternative load combinations to evaluate sliding, overturning and soil bearing at the soil-structure interface, the reduction of foundation overturning from Section 12.13.4 in ASCE 7 shall not be used. When using these alternative basic load combinations for proportioning foundations for loadings, which include seismic loads, the vertical seismic *load effect*, E_v, in Equation 12.4-4 of ASCE 7 is permitted to be taken equal to zero.

$D + L + (L_r \text{ or } S \text{ or } R)$ **(Equation 16-17)**

$D + L + 0.6\ \omega W$ **(Equation 16-18)**

$D + L + 0.6\ \omega W + S/2$ **(Equation 16-19)**

$D + L + S + 0.6\ \omega W/2$ **(Equation 16-20)**

$D + L + S + E/1.4$ **(Equation 16-21)**

$0.9D + E/1.4$ **(Equation 16-22)**

Exceptions:

1. Crane ~~hook~~ wheel loads need not be combined with roof live loads or with more than three-fourths of the snow load or one-half of the wind load. Alternatively, industry standard reference documents citing additional crane load combinations shall be permitted for the design of buildings subject to horizontal and vertical crane loads.
2. Flat roof snow loads of 30 psf (1.44 kN/m2) or less and roof live loads of 30 psf (1.44 kN/m2) or less need not be combined with seismic loads. Where flat roof snow loads exceed 30 psf (1.44 kN/m2), 20 percent shall be combined with seismic loads.

Reason: Current code language does not completely or adequately address the issue of load combinations for the design of buildings with bridge cranes. This includes buildings and other structures that have multiple crane runways adjacent to one another and/or multiple cranes on the same runway. An exception pointing to industry standard reference documents, such as the Association of Iron and Steel Technology (AIST) "Technical Report No. 13 - Guide for the Design and Construction of Mill Buildings", allows the engineer to utilize such resources when determining additional load combinations that may control in the design of such buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

Delete without substitution:

SECTION 202
DEFINITIONS

~~**MARQUEE.** A *canopy* that has a top surface which is sloped less than 25 degrees from the horizontal and is located less than 10 feet (3.05 m) from operable openings above or adjacent to the level of the marquee.~~

Revise as follows:

TABLE 1607.1
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_o, AND
MINIMUM CONCENTRATED LIVE LOADS[g]

OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (lbs.)
~~21. Marquees~~	~~75~~	-
26. Roofs		
All roof surfaces subject to maintenance workers		300
Awnings and canopies:		
Fabric construction supported by a skeleton structure	5 Nonreducible	
All other construction	20[n]	
Ordinary flat, pitched, and curved roofs (that are not occupiable)	20	
Where primary roof members are exposed to a work floor, at single panel point of lower chord of roof trusses or any point along primary structural members supporting roofs:		
Over manufacturing, storage warehouses, and repair garages		2,000
All other primary roof members		300
Occupiable roofs:		
Roof gardens	100	
Assembly areas	100[m]	
All other similar areas	Note 1	Note 1

n Where a canopy has a top surface sloped less than 25 degrees from the horizontal and is located less than 10 feet (3.05 m) from operable openings above or adjacent to the level of the canopy, the minimum live load shall be taken as the live load of the adjacent room or space, but not less than 40psf. The maximum live load for canopies less than or equal to 100 square feet in area shall be 60psf.

(Portions of Table and footnotes not shown remain unchanged)

Reason: The purpose of this amendment is to revise the 2012 IBC language regarding canopies and marquees. The language approved for the 2012 IBC will substantially change the design requirements for many small porch and patio roofs on buildings nowhere near public streets. These roofs are currently designed for standard roof live loads or local ground snow loads (typically in the range of 20 or 30 pounds per square foot). These elements will now need to be designed for 75psf if they happen to be less than 10 feet vertically from a window above or horizontally from a window at the level of the canopy. This represents a substantial increase in design requirements for apartment or condominium complexes with these elements, as well as a substantial issue for renovations. This change deletes the definition for marquees in its entirety and transfers the language regarding canopy slope and ability to access the top surface from nearby openings to a footnote on the standard canopy live load. It also requires the window to be operable. The live load for the accessible canopy condition is set to the adjacent occupancy, with a minimum floor of 40psf (equivalent to the traditional load for a residential deck). To avoid effectively further raising the live load requirement from 75psf to 100psf for a small canopy accessible from an egress hallway or stair, a maximum live load of 60psf is established for canopies not exceeding 100 square feet in area (similar to what the traditional load cases were for residential balconies).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T1607.1-S-EHRLICH.doc

S88–12
Table 1607.1

Proponent: Edwin Huston, National Council of Structural Engineers Associations (NCSEA), representing NCSEA Code Advisory Subcommittee – General Requirements Subcommittee (Huston@smithhustoninc.com)

Revise as follows:

TABLE 1607.1
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_o, AND
MINIMUM CONCENTRATED LIVE LOADS[g]

OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (lbs)
24.Recreational uses:		
Ice Skating Rink	250[m]	See Section 1607.7.4
Roller Skating Rink	100[m]	

m. Live load reduction is not permitted unless specific exceptions of Section 1607.10 apply.

(Portions of Table and footnotes not shown remain unchanged)

Reason: : Uniformly distributed live load for rinks were in previous editions of the IBC. They were removed from the IBC 2009, as part of a larger CCP. The intent of this code change proposal is to once again list the recommended minimum uniform live load for rinks back into IBC. The proposed loads are consistent with the recommendations in ASCE7 commentary for minimum uniformly distributed live load.

Cost Impact: The code change proposal will not increase the cost of construction.

S88-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T1607.1-S-HUSTON.doc

S89–12
1607.5

Proponent: Edwin Huston, National Council of Structural Engineers Associations- Code Advisory Committee - General Requirements Subcommittee (huston@smithhustoninc.com)

Revise as follows:

1607.5 Partition loads. In office buildings and in other buildings where partition locations are subject to change, provisions for partition weight shall be made, whether or not partitions are shown on the *construction documents*, unless the specified live load ~~exceeds~~ <u>is</u> 80 psf (3.83 kN/m^2) <u>or greater</u>. The partition load shall not be less than a uniformly distributed live load of 15 psf (0.72 kN/m^2).

Reason: IBC Table 1607.1, item #22 requires a live load of 80 psf for corridors above the first floor. It is a common practice to design an entire floor for an 80 psf live load, and thereby not need to worry about the locations of the corridors, or whether the corridor locations may be moved in the future. The way the code is written now, a floor would have to be designed for a live load of 81 psf (it must "exceed" 80 psf) to be able to take advantage of the exception written into section 1607.5. Otherwise one has to add a 15 psf partition load on top of an 80 psf corridor live load.

This change does not alter the requirements of ASCE 7, section 12.7.2 Effective Seismic Weight, #2 (the greater of 10 psf or the actual weight of the partitions must be used for calculating the seismic weight of a building).

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A FOUR PART CODE CHANGE. ALL PARTS WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. SEE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

PART I – IBC STRUCTURAL

Revise as follows:

1607.7.5 Posting. The maximum weight of the vehicles allowed into or on a garage or other structure shall be posted by the owner <u>or the owner's authorized agent</u> in accordance with Section 106.1.

1703.4.1 Research and investigation. Sufficient technical data shall be submitted to the *building official* to substantiate the proposed use of any material or assembly. If it is determined that the evidence submitted is satisfactory proof of performance for the use intended, the *building official* shall approve the use of the material or assembly subject to the requirements of this code. The costs, reports and investigations required under these provisions shall be paid by the ~~applicant~~ <u>owner or the owner's authorized agent</u>.

1703.6 Evaluation and follow-up inspection services. Where structural components or other items regulated by this code are not visible for inspection after completion of a prefabricated assembly, the ~~applicant~~ <u>owner or the owner's authorize agent</u> shall submit a report of each prefabricated assembly. The report shall indicate the complete details of the assembly, including a description of the assembly and its components, the basis upon which the assembly is being evaluated, test results and similar information and other data as necessary for the *building official* to determine conformance to this code. Such a report shall be *approved* by the *building official*.

1703.6.1 Follow-up inspection. The ~~applicant~~ <u>owner or the owner's authorized agent</u> shall provide for *special inspections* of fabricated items in accordance with Section 1704.2.5.

1704.2 Special inspections. Where application is made for construction as described in this section, the owner or the *registered design professional in responsible charge* acting as the owner's <u>authorized</u> agent shall employ one or more *approved agencies* to perform inspections during construction on the types of work listed under Section 1705. These inspections are in addition to the inspections identified in Section 110.

Exceptions:

1. *Special inspections* are not required for construction of a minor nature or as warranted by conditions in the jurisdiction as *approved* by the *building official*.
2. Unless otherwise required by the *building official*, *special inspections* are not required for Group U occupancies that are accessory to a residential occupancy including, but not limited to, those listed in Section 312.1.
3. Special inspections are not required for portions of structures designed and constructed in accordance with the cold-formed steel light-frame construction provisions of Section 2211.7 or the conventional light-frame construction provisions of Section 2308.

1704.2.4 Report requirement. Special inspectors shall keep records of inspections. The special inspector shall furnish inspection reports to the *building official*, and to the *registered design professional in responsible charge*. Reports shall indicate that work inspected was or was not completed in conformance to *approved construction documents*. Discrepancies shall be brought to the immediate attention of the contractor for correction. If they are not corrected, the discrepancies shall be brought to the attention of the *building official* and to the *registered design professional in responsible charge* prior to the completion of that phase of the work. A final report documenting required *special inspections* and correction of any discrepancies noted in the inspections shall be submitted at a point in time agreed upon prior to the start of work by the ~~applicant and~~ owner or the owner's authorized agent to the *building official*.

1704.4 Contractor responsibility. Each contractor responsible for the construction of a main wind- or seismic force-resisting system, designated seismic system or a wind- or seismic-resisting component listed in the statement of special inspections shall submit a written statement of responsibility to the *building official,* and the owner or the owner's authorized agent, prior to the commencement of work on the system or component. The contractor's statement of responsibility shall contain acknowledgement of awareness of the special requirements contained in the statement of *special inspection*.

1704.5 Structural observations. Where required by the provisions of Section 1704.5.1 or 1704.5.2, the owner or the owner's authorized agent shall employ a *registered design professional* to perform structural observations as defined in Section 1702. Prior to the commencement of observations, the structural observer shall submit to the *building official* a written statement identifying the frequency and extent of structural observations. At the conclusion of the work included in the permit, the structural observer shall submit to the *building official* a written statement that the site visits have been made and identify any reported deficiencies ~~which~~ that, to the best of the structural observer's knowledge, have not been resolved.

1707.1 General. In the absence of *approved* rules or other *approved* standards, the *building official* shall make, or cause to be made, the necessary tests and investigations; or the *building official* shall accept duly authenticated reports from *approved agencies* in respect to the quality and manner of use of new materials or assemblies as provided for in Section 104.11. The cost of all tests and other investigations required under the provisions of this code shall be borne by the ~~applicant~~ owner or the owner's authorized agent.

Revise as follows:

1803.6 Reporting. Where geotechnical investigations are required, a written report of the investigations shall be submitted to the *building official* by the ~~owner or authorized agent~~ permit applicant at the time of *permit* application. This geotechnical report shall include, but need not be limited to, the following information:

1. A plot showing the location of the soil investigations.
2. A complete record of the soil boring and penetration test logs and soil samples.
3. A record of the soil profile.
4. Elevation of the water table, if encountered.
5. Recommendations for foundation type and design criteria, including but not limited to: bearing capacity of natural or compacted soil; provisions to mitigate the effects of expansive soils; mitigation of the effects of liquefaction, differential settlement and varying soil strength; and the effects of adjacent loads.
6. Expected total and differential settlement.
7. Deep foundation information in accordance with Section 1803.5.5.
8. Special design and construction provisions for foundations of structures founded on expansive soils, as necessary.
9. Compacted fill material properties and testing in accordance with Section 1803.5.8.
10. Controlled low-strength material properties and testing in accordance with Section 1803.5.9.

Revise as follows:

2211.3.3 Trusses spanning 60 feet or greater. The owner <u>or the owner's authorized agent</u> shall contract with a *registered design professional* for the design of the temporary installation restraint/bracing and the permanent individual truss member restraint/ bracing for trusses with clear spans 60 feet (18 288 mm) or greater. *Special inspection* of trusses over 60 feet (18 288 mm) in length shall conform to Section 1705.

2303.4.1.3 Trusses spanning 60 feet or greater. The owner <u>or the owner's authorized agent</u> shall contract with any qualified *registered design professional* for the design of the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing for all trusses with clear spans 60 feet (18 288 mm) or greater.

G104.1 Required. Any person, owner or <u>owner's</u> authorized agent who intends to conduct any development in a flood hazard area shall first make application to the *building official* and shall obtain the required *permit*.

J106.1 Maximum slope. The slope of cut surfaces shall be no steeper than is safe for the intended use, and shall be no steeper than two units horizontal to one unit vertical (50-percent slope) unless the owner or <u>the owner's</u> authorized agent furnishes a geotechnical report justifying a steeper slope.

Exceptions:

1. A cut surface shall be permitted to be at a slope of 1.5 units horizontal to one unit vertical (67-percent slope) provided that all of the following are met:
   1.1. It is not intended to support structures or surcharges.
   1.2. It is adequately protected against erosion.
   1.3. It is no more than 8 feet (2438 mm) in height.
   1.4. It is approved by the building code official.
   1.5. Ground water is not encountered.
2. A cut surface in bedrock shall be permitted to be at a slope of one unit horizontal to one unit vertical (100-percent slope).

K102.3 Maintenance. Electrical systems, equipment, materials and appurtenances, both existing and new, and parts thereof shall be maintained in proper operating condition in accordance with the original design and in a safe, hazard-free condition. Devices or safeguards that are required by this code shall be maintained in compliance with the code edition under which installed. The owner or the owner's ~~designated~~ <u>authorized</u> agent shall be responsible for the maintenance of the electrical systems and equipment. To determine compliance with this provision, the *building official* shall have the authority to require that the electrical systems and equipment be re-inspected.

PART II – IBC GENERAL

Revise as follows:

3306.8 Repair, maintenance and removal. Pedestrian protection required by this chapter shall be maintained in place and kept in good order for the entire length of time pedestrians are subject to being endangered. The *owner* or the *owner's* <u>authorized</u> agent, upon the completion of the construction activity, shall immediately remove walkways, debris and other obstructions and leave such public property in as good a condition as it was before such work was commenced.

3401.2 Maintenance. Buildings and structures, and parts thereof, shall be maintained in a safe and sanitary condition. Devices or safeguards which are required by this code shall be maintained in conformance with the code edition under which installed. The owner or the owner's ~~designated~~ <u>authorized</u> agent shall be responsible for the maintenance of buildings and structures. To determine compliance with this subsection, the *building official* shall have the authority to require a building or structure to be reinspected. The requirements of this chapter shall not provide the basis for removal or abrogation of fire protection and safety systems and devices in existing structures.

PART III – IBC FIRE SAFETY

Revise as follows:

901.5 Acceptance tests. *Fire protection systems* shall be tested in accordance with the requirements of this code and the *International Fire Code*. When required, the tests shall be conducted in the presence of the *building official*. Tests required by this code, the *International Fire Code* and the standards listed in this code shall be conducted at the expense of the owner or the owner's ~~representative~~ authorized agent. It shall be unlawful to occupy portions of a structure until the required *fire protection systems* within that portion of the structure have been tested and *approved*.

PART IV – IBC MEANS OF EGRESS

Revise as follows:

1004.3 Posting of occupant load. Every room or space that is an assembly occupancy shall have the *occupant load* of the room or space posted in a conspicuous place, near the main *exit* or *exit access doorway* from the room or space. Posted signs shall be of an *approved* legible permanent design and shall be maintained by the owner or the owner's authorized agent.

Reason: The purpose for the proposal is to update the references to "applicant" and "owner" throughout the building code by changing them to the "owner or the owner's authorized agent" where it is warranted. In conjunction with this proposal there are also changes to Chapter 1 and 2, which are in a separate proposal that will be heard by the Administration Committee. In Sections 1703.4.1 and 1707.1, "the applicant" is changed to "the owner or the owner's authorized agent" because the latter should be responsible for the costs of required tests, reports and investigations. In Sections 1703.6 and 1704.2.4, "the applicant" is changed to "the owner or the owner's authorized agent" because the latter should be responsible for submitting required reports to the building official. In Section 1703.6.1, the applicant" is changed to "the owner or the owner's authorized agent" for consistency with Section 1704.2 that requires the latter to employ the approved agencies. In Section 1803.6, the "owner or authorized agent" is changed to the "permit applicant" because it should be permissible for the latter to submit the geotechnical report with the other submittal documents at the time of permit application.

The 2012 IBC contains additional references to "owner" but, based on the context in which they are used, it is not considered appropriate or useful to revise the language in conjunction with this proposal (e.g., from "the owner" to "the owner or the owner's authorized agent"). See Sections 101.4.4, 104.6, 111.2, 112.3, 116.3, 116.4, 402.3, 913.4, 1107.4-Exc. 1, 1607.7.4, 3108.2, 3307.1, 3412.4, 3412.4.1, G101.2, G105.6-Item 3, K103.1 and L101.3.

The 2012 IBC contains additional references to "applicant" but, based on the context in which they are used, it is also not considered appropriate or useful to revise the language in conjunction with this proposal (e.g., from "the applicant" to "the owner or the owner's authorized agent"). See Sections 104.10.1-Item 5, 105.1.1, 105.3, 107.3.1, 109.3, 109.5, 1612.3.1, 1612.3.2, 1704.2.3, 1704.3, G103.3, G103.4, G103.5.1, G103.6, G104.2, G105.7-Item 5 and J104.1.

All instances in the 2012 IBC of "applicant" and "owner," other than listed above, are included in this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

1607.7.5-S-BRAZIL.doc

S91–12
1607.7, 1607.7.1, 1607.7.3

Proponent: Gary J. Ehrlich, P.E., National Association of Home Builders (NAHB) (gehrlich@nahb.org)

Revise as follows:

1607.7 Heavy vehicle loads. Floors and other surfaces that are intended to support vehicle loads greater than a ~~10,000 pound (4536 kg)~~ 12,000 pound (5443 kg) gross vehicle weight rating shall comply with Sections 1607.7.1 through 1607.7.5.

1607.7.1 Loads. Where any structure does not restrict access for vehicles that exceed a ~~10,000-pound (4536 kg)~~ 12,000 pound (5443 kg) gross vehicle weight rating, those portions of the structure subject to such loads shall be designed using the vehicular live loads, including consideration of impact and fatigue, in accordance with the codes and specifications required by the jurisdiction having authority for the design and construction of the roadways and bridges in the same location of the structure.

1607.7.3 Heavy vehicle garages. Garages designed to accommodate vehicles that exceed a ~~10,000 pound (4536 kg)~~ 12,000 pound (5443 kg) gross vehicle weight rating, shall be designed using the live loading specified by Section 1607.7.1. For garages the design for impact and fatigue is not required.

> **Exception:** The vehicular live loads and load placement are allowed to be determined using the actual vehicle weights for the vehicles allowed onto the garage floors, provided such loads and placement are based on rational engineering principles and are approved by the building official, but shall not be less than 50 psf (2.9 kN/m^2). This live load shall not be reduced.

Reason: The purpose of this amendment is to revise the minimum Gross Vehicle Weight Rating (GVWR) necessary to trigger the new heavy vehicle load design provisions approved for the 2012 IBC. The original intent was to address the design of floors and other surfaces needing to support the weight of commercial trucks, buses, fire engines and other large vehicles. It certainly makes sense for a garage or plaza accessible to these large vehicles to be designed for higher loads. However, during the code development process, a 10,000 pound GVWR trigger was added for the special design requirements, unless the owner posts a weight limit. The problem is that many common pick-up trucks and minivans have GVWR's exceeding 10,000 pounds; for example, the Chevy Silverado 3500 (11,400 pounds for the 2006 & 2007 editions), Dodge Ram 3500 (11,000 pounds for the 2006-2008 editions), or Ford F-350 (10,100 pounds for the 2006-2008 editions). Thus, the 2012 IBC language could negatively affect multifamily and mixed-use projects with garages or plazas accessible to these common vehicles. An owner may decide it is not worth the cost to design his garage to the local bridge and highway design standards mandated by the provisions, in which case they would have to post a weight limit and tell residents and visitors they can't park pickup trucks and minivans in the garage. This amendment raises the trigger to a 12,000 pound GVWR, which would clear all of the large pickup trucks and minivans commonly used as individual and family passenger vehicles.

Cost Impact: The code change proposal will not increase the cost of construction.

1607.7-S-EHRLICH.doc

S92–12
1607.9.3 (NEW)

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc, representing self

Add new text as follows:

1607.9.3 Elements supporting hoists for façade access equipment: In addition to any other applicable live loads, structural elements that support hoists for façade access equipment shall be designed for a live load consisting of the larger of the rated load of the hoist times 2.5 and the stall load of the hoist.

Reason: Historically, the code has been silent on structural requirements for elements that support facade access equipment, such as swing stages and window washing platforms. The Occupational Safety & Health Administration (OSHA) requires that facade access platforms be designed for four to four-and-a-half times the rated load of the suspended platform. Another OSHA requirement is that the platforms should be designed for one-and-a-half times the stall load of the hoist (this applies to platforms that are used for painting and hanging signs or holiday lights as well as other construction activities). Although OSHA requirements are not written in either code language or engineering language, this proposed change closely matches OSHA requirements for suspended platforms. Using a design live load of 2.5 times the rated load, when combined with a live load factor of 1.6, results in a total factored load of 4.0 times the rated load, which matches OSHA's requirements for scaffolds used for building maintenance. Although this overall factor might appear excessive, it is intended by OSHA to address accidental hang-up-and-fall scenarios as well as starting and stopping forces that the platforms experience on a day-to-day basis.

Designing for the stall load of the hoist also makes sense, because suspended platforms can get hung up while ascending, generating forces much larger than the rated load of the platform or hoist. If the stall cut-off is working properly, the stall load should be the maximum load that can be delivered to the structural elements supporting the hoist. The load factor of 1.6 typically associated with live loads should safely accommodate variability in the stall load cut-off mechanism, and provides a factored load that closely matches the requirements of OSHA for facade access platforms that are used for construction activities.

These loads have been missing from the building code for far too long and many engineers do not even know that there are specific design requirements for these elements; these are important loads and need to be provided in the building code.

Cost Impact: The code change proposal will not increase the cost of construction.

1607.9.3 #1-S-SEARER.doc

S93–12
1607.9.3 (NEW)

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc., representing self

Add new text as follows:

1607.9.3 Lifeline anchorages for façade access equipment: In addition to any other applicable live loads, lifeline anchorages and structural elements that support lifeline anchorages shall be designed for a live load of at least 3100 pounds (13.8 kN) per attached lifeline, in every direction that a fall arrest load may be applied.

Reason: Historically, the code has been silent on structural requirements for elements that support lifelines used to safely access the facades of buildings.

The Occupational Safety & Health Administration (OSHA) requires that lifeline anchorages be designed for an ultimate load of at least 5,000 pounds per attached person. Although OSHA requirements are not written in either code language or engineering language, this proposed change closely matches OSHA requirements for lifeline anchorages. Using a design live load of 3,100 pounds, when combined with a live load factor of 1.6, results in a total factored load of 4,960 pounds, which essentially matches OSHA's requirements for lifeline anchorages. Although this load might appear excessive, it is intended by OSHA to address the fall arrest loads that can and do reasonably occur in typical lanyards for body harnesses, and which are highly variable. OSHA allows stopping forces as high as 2540 pounds to be generated by a person free-falling six feet. Since sometimes people weigh more than the weight assumed by OSHA, since sometimes people may fall more than six feet, and since the lifeline anchorages are used if something has gone wrong with the primary suspension system (and thus represents the user's last hope of avoiding a potentially fatal fall), the effective factor of safety of two -- from an ideal design load of 2540 pounds to an ultimate design load of 5,000 pounds -- is what OSHA deems necessary to provide an acceptable level of safety.

These loads have been missing from the building code for far too long and many engineers do not even know that there are specific design requirements for these elements; these are important loads and need to be provided in the building code.

Cost Impact: The code change proposal will not increase the cost of construction.

1607.9.3 #2-S-SEARER.doc

S94–12
1607.10.2

Proponent: Gary R. Searer/Wiss, Janney, Elstner Associates, Inc., representing self

Revise as follows:

1607.10.2 Alternative uniform live load reduction. As an alternative to Section 1607.10.1 and subject to the limitations of Table 1607.1, uniformly distributed live loads are permitted to be reduced in accordance with the following provisions. Such reductions shall apply to slab systems, beams, girders, columns, piers, walls and foundations.

1. A reduction shall not be permitted where the live load exceeds 100 psf (4.79 kN/m^2) except that the design live load for members supporting two or more floors is permitted to be reduced by a maximum of 20 percent.

   Exception: For uses other than storage, where *approved*, additional live load reductions shall be permitted where shown by the *registered design professional* that a rational approach has been used and that such reductions are warranted.

2. A reduction shall not be permitted in passenger vehicle parking garages except that the live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent.
3. For live loads not exceeding 100 psf (4.79 kN/m^2), the design live load for any structural member supporting 150 square feet (13.94 m^2) or more is permitted to be reduced in accordance with Equation 16-24.
4. For one-way slabs, the area, *A*, for use in Equation 16-24 shall not exceed the product of the slab span and a width normal to the span of 0.5 times the slab span.

$R = 0.08(A – 150)$ **(Equation 16-24)**

For SI: $R = 0.861(A – 13.94)$

Such reduction shall not exceed the smallest of:

1. 40 percent for ~~horizontal~~ members <u>supporting one floor</u>;
2. 60 percent for ~~vertical~~ members <u>supporting two or more floors</u>; or
3. *R* as determined by the following equation.

$R = 23.1(1+ D/L_o)$ **(Equation 16-25)**

where:

A = Area of floor supported by the member, square feet (m^2).
D = Dead load per square foot (m^2) of area supported.
L_o = Unreduced live load per square foot (m^2) of area supported.
R = Reduction in percent.

Reason: The alternate live load reductions contained in Section 1607.9.2 originated in the Uniform Building Code and were the primary live load reduction formulas used in the western United States for decades. When the live load reductions were brought into the IBC, they were incorporated as an alternate to Section 1607.9.1. During the incorporation of these reductions into the IBC, the maximum reductions were changed from "40 percent for members receiving load from one level only" and "60 percent for other members" (in the 1997 UBC) to the current 40/60 differentiation between horizontal and vertical members. This current differentiation does not match the original wording (because some horizontal members receive live load from more than one floor and because many vertical elements do not receive live load from more than one floor) and does not match the differentiation in Section 1607.9.1, which, like the UBC, differentiates reductions based on whether a member supports one floor or more than one floor: "L shall not be less than $0.50L_o$ for members supporting one floor and L shall not be less than $0.40L_o$ for members supporting two or more floors." The premise behind differentiating between supporting one floor or more than one floor is basically probability-based, and reasonably assumes that the probability that two or more floors are experiencing a relatively large live load is smaller than that of a single floor experiencing a relatively large live load; hence the larger reduction for elements that support more than one floor. The same premise cannot be said of differentiating live load reductions based on horizontality or verticality of the element under consideration.

Since basing allowable live load reductions on number of floors supported as opposed to whether a member is horizontal or vertical makes more sense, this proposal restores the original intent of the UBC provision and brings the provision into better alignment with Section 1607.9.1.

Cost Impact: The code change proposal will not increase the cost of construction.

S94-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1607.9.2-S-SEARER.doc

S95–12
1607.12.3.1, Chapter 35 (NEW)

Proponent: Jonathan Siu, City of Seattle, Department of Planning & Development (jon.siu@seattle.gov), Mark S. Graham, National Roofing Contractors Association

Revise as follows:

1607.12.3.1 Landscaped roofs. ~~The uniform design live load in unoccupied landscaped areas on roofs shall be 20 psf (0.958 kN/m^2).~~ The weight of all landscaping materials shall be considered as dead load and shall be computed on the basis of saturation of the soil <u>as determined in accordance with ASTM E 2397. The uniform design live load in unoccupied landscaped areas on roofs shall be 20 psf (0.958 kN/m^2). The uniform design live load for occupied landscaped areas on roofs shall be determined in accordance with Table 1607.1.</u>

Add new standard to Chapter 35 as follows:

ASTM

<u>E 2397-11 – Standard Practice for Determination of Dead Loads and Live Loads Associated with Green Roof Systems</u>

Reason: ASTM E 2397 is the standard for how to determine the dead load of soils. This is being inserted in the IBC to coordinate with the IGCC, which has many provisions regarding landscaped roofs (aka “vegetative roofs”). This proposal addresses a gap in the regulations, providing an appropriate standard for addressing soil loads. The other changes are editorial:

- The weight of landscaping materials applies to all landscaped roofs, and therefore is more appropriate at the beginning of the paragraph.

Adding the reference to Table 1607.1 for occupied landscaped areas is for clarification.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

S95-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1607.11.3.1-S-GRAHAM-SIU.doc

S96–12
1607.14, 1607.14.1

Proponent: Edwin Huston, National Council of Structural Engineers Associations- Code Advisory Committee - General Requirements Subcommittee (Huston@smithhustoninc.com)

Revise as follows:

1607.14 Interior walls and partitions. Interior walls and partitions that exceed 6 feet (1829 mm) in height, including their finish materials, shall have adequate strength to resist the loads to which they are subjected but not less than a horizontal load of 5 psf (0.240 kN/m^2).

> ~~**Exception:** Fabric partitions complying with Section 1607.14.1 shall not be required to resist the minimum horizontal load of 5 psf (0.24 kN/m^2).~~

1607.14.1 Fabric partitions. Fabric partitions that exceed 6 feet (1829 mm) in height, including their finish materials, shall have adequate strength to resist the following load conditions:

1~~.~~ ~~A horizontal distributed load of 5 psf (0.24 kN/m^2)~~ The horizontal distributed load need only be applied to the partition framing. The total area used to determine the distributed load shall be the area of the fabric face between the framing members to which the fabric is attached. The total distributed load shall be uniformly applied to such framing members in proportion to the length of each member.
2. A concentrated load of 40 pounds (0.176 kN) applied to an 8-inch diameter (203 mm) area [50.3 square inches (32 452 mm^2)] of the fabric face at a height of 54 inches (1372 mm) above the floor.

Reason: Section 1607.14.1, which is limited to only fabric partitions, restates the loading criteria found in Section 1607.14. Since the 5psf loading for partitions under 1604.14 the load is also applicable to fabric partitions. Having the exception to Section 1607.14 is redundant and not necessary

Cost Impact: The code change proposal will not increase the cost of construction.

1607.14-S-HUSTON.doc

S97–12
1609.1.1, Chapter 35 (NEW)

Proponent: Ray C. Minor, P.E., Hapco, representing self (ray.minor@hapco.com)

Revise as follows:

1609.1.1 Determination of wind loads. Wind loads on every building or structure shall be determined in accordance with Chapters 26 to 30 of ASCE 7 or provisions of the alternate all-heights method in Section 1609.6. The type of opening protection required, the ultimate design wind speed, *Vult*, and the exposure category for a site is permitted to be determined in accordance with Section 1609 or ASCE 7. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

1. Subject to the limitations of Section 1609.1.1.1, the provisions of ICC 600 shall be permitted for applicable Group R-2 and R-3 buildings.
2. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AF&PA WFCM.
3. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AISI S230.
4. Designs using NAAMM FP 1001.
5. Designs using TIA-222 for antenna-supporting structures and antennas, provided the horizontal extent of Topographic Category 2 escarpments in Section 2.6.6.2 of TIA-222 shall be 16 times the height of the escarpment.
6. Wind tunnel tests in accordance with Chapter 31 of ASCE 7.
7. Luminaire support structures designed in accordance with AASHTO LTS-5.

The wind speeds in Figures 1609A, 1609B and 1609C are ultimate design wind speeds, *Vult*, and shall be converted in accordance with Section 1609.3.1 to nominal design wind speeds, *Vasd*, when the provisions of the standards referenced in Exceptions 1 through 5 and 7 are used.

Add new standard to Chapter 35 as follows:

AASHTO

American Association of State Highway and Transportation Officials
444 North Capitol Street, NW Suite 249
Washington, DC 20001

LTS-5 Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals

Reason: AASHTO LTS-5 is based on much research and many years of experience in using primarily pole type structures to support signs, luminaires and traffic signals along roadways. These type structures are also used for non-roadway applications such as sports lighting and parking lot lighting which may fall under the jurisdiction of the IBC. AASHTO LTS-5 incorporates the results of wind tunnel tests specific to shapes of these structures and the equipment they support. The wind pressure calculations are based on ASCE-7 except with some refinements such as more detailed drag coefficients. Stadium lighting poles involved in several recent failures would not meet the fatigue requirements of AASHTO LTS-5 primarily because the base plates were too thin. These failures most likely would not have occurred if the poles were designed to AASHTO LTS-5.

AASHTO LTS-5 is developed by an AASHTO committee with a consensus procedure.

There are other exceptions as precedents for this exception, including similar specifications for flagpoles and communications antennae. The flagpole specification NAAMM 1001 Guide Specification for Design of Metal Flagpoles includes flag wind load equations but otherwise uses the AASHTO LTS-5 procedures for flagpoles

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1609.1.1-S-MINOR

S98–12
1609.1.1, 1609.3.1

Proponent: Randall Shackelford, P.E., Simpson Strong-Tie Company, Inc. (rshackelford@strongtie.com)

Revise as follows:

1609.1.1 Determination of wind loads. Wind loads on every building or structure shall be determined in accordance with Chapters 26 to 30 of ASCE 7 or provisions of the alternate all-heights method in Section 1609.6. The type of opening protection required, the ultimate design wind speed, V_{ult}, and the exposure category for a site is permitted to be determined in accordance with Section 1609 or ASCE 7. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

1. Subject to the limitations of Section 1609.1.1.1, the provisions of ICC 600 shall be permitted for applicable Group R-2 and R-3 buildings.
2. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AF&PA WFCM.
3. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AISI S230.
4. Designs using NAAMM FP 1001.
5. Designs using TIA-222 for antenna-supporting structures and antennas, provided the horizontal extent of Topographic Category 2 escarpments in Section 2.6.6.2 of TIA-222 shall be 16 times the height of the escarpment.
6. Wind tunnel tests in accordance with Chapter 31 of ASCE 7.

The wind speeds in Figures 1609A, 1609B and 1609C are ultimate design wind speeds, V_{ult}, and shall be converted in accordance with Section 1609.3.1 to nominal design wind speeds, V_{asd}, when the provisions of the standards referenced in Exceptions ~~1~~ 3 through 5 are used.

1609.3.1 Wind speed conversion. When required, the ultimate design wind speeds of Figures 1609A, 1609B and 1609C shall be converted to nominal design wind speeds, V_{asd}, using Table 1609.3.1 or Equation 16-33.

$$V_{asd} = V_{ult}\sqrt{0.6}$$ **(Equation 16-33)**

where:

V_{asd}= nominal design wind speed applicable to methods specified in Exceptions ~~1~~ 3 through 5 of Section 1609.1.1 and other standards not based on ultimate wind speeds.
V_{ult}= ultimate design wind speeds determined from Figures 1609A, 1609B or 1609C.

Reason: The 2012 WFCM, as referenced in Exception 2 above, is based on Ultimate Wind Speeds, V_{ult}, and therefore does not require conversion of the ultimate wind speed to the nominal wind speed, V_{asd}.
Further, the WFCM is the reference standard for wood framing in the ICC-600, so conversion should not take place when using ICC-600 to design wood framing. A committee has been appointed to revise ICC-600, and this code change is written assuming that the basis of ICC-600 will be changed to V_{ult} windspeeds, with conversion factors in the standard for converting to V_{asd} where needed. If by the Public Comment deadline it is not clear that this will be the case, I will prepare a Public Comment to restore Exception 1 to the list of items where conversion is required.

If this code change is not approved, structures designed using the 2012 WFCM with converted windspeeds will be designed for pressures that are only 60% of the pressures they should be designed for.

Section 1609.3.1 needs to be revised for similar reasons. Also, there are other building materials that require testing to "nominal" windspeeds, such as composition shingles in Section 1507.2.7.1. So nominal wind speeds, V_{asd}, is not just used in the Exceptions to 16009.1.1.

Cost Impact: This is not really a fair question for this code change. Yes, there will be a cost impact, because it would definitely be cheaper to design to wind loads that are 40% too low. But you don't want to do that.

S98-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1609.1.1-S-SHACKELFORD.doc

S99–12

1609.1.2

Proponent: Edward L. Keith, P.E., APA – The Engineered Wood Association (ed.keith@apawood.org)

Revise as follows:

1609.1.2 Protection of openings. In *wind-borne debris regions*, glazing in buildings shall be impact resistant or protected with an impact-resistant covering meeting the requirements of an *approved* impact-resistant standard or ASTM E 1996 and ASTM E 1886 referenced herein as follows:

1. Glazed openings located within 30 feet (9144 mm) of grade shall meet the requirements of the large missile test of ASTM E 1996.
2. Glazed openings located more than 30 feet (9144 mm) above grade shall meet the provisions of the small missile test of ASTM E 1996.

Exceptions:

1. Wood structural panels with a minimum thickness of $^{7}/_{16}$ inch (11.1 mm) and maximum panel span of 8 feet (2438 mm) shall be permitted for opening protection in ~~one- and two-story buildings~~ buildings with a mean roof height of 33 feet or less classified as Group R-3 or R-4 occupancy. Panels shall be precut so that they shall be attached to the framing surrounding the opening containing the product with the glazed opening. Panels shall be predrilled as required for the anchorage method and shall be secured with the attachment hardware provided. Attachments shall be designed to resist the components and cladding loads determined in accordance with the provisions of ASCE 7, with corrosion-resistant attachment hardware provided and anchors permanently installed on the building. Attachment in accordance with Table 1609.1.2 with corrosion-resistant attachment hardware provided and anchors permanently installed on the building is permitted for buildings with a mean roof height of 45 feet (13 716 mm) or less where V_{asd} determined in accordance with Section 1609.3.1 does not exceed 140 mph (63 m/s).
2. Glazing in *Risk Category* I buildings as defined in Section 1604.5, including greenhouses that are occupied for growing plants on a production or research basis, without public access shall be permitted to be unprotected.
3. Glazing in *Risk Category* II, III or IV buildings located over 60 feet (18 288 mm) above the ground and over 30 feet (9144 mm) above aggregate surface roofs located within 1,500 feet (458 m) of the building shall be permitted to be unprotected.

Reason: In the early days of the development of the SBCCI Deemed-to-Comply document (The precursor to the SBCCI Standard for Hurricane Resistant Residential Construction, SSTD-10, and ultimately the ICC Standard for Residential Construction in High Wind Regions, ICC 600), limits were developed to the geometry of the structures covered by the standard. These limits included a height limit of 33 feet mean roof height. The 33 feet was based on then-current height zoning regulations, the referenced wind speed height in the contemporary ASTM wind standard, as well as height of most anemometers (wind measuring devices). As the Deemed-to-Comply and later documents were limited for wood buildings to two stories in height and as the standards evolved, the height limit was changed from 33 feet mean roof height to simply two stories. Note that the information in the code is based on a mean roof height of 33 feet and NOT two stories. APA developed this information and it is based on 33 feet mean roof height. (APA Form Number T450, free PDF download at apawood.org.)

From a wind perspective, only the geometry of the structure matters. Its internal make-up of floors and walls affect the *resistance* of the structure to the wind but has no impact on the load on the structure. The reason for this change is that the “two story-only” requirement puts artificial limitations on the use of the shutter provisions. This requirement has been used to limit the use of the shutter provisions from 3-story residential structures built on sloped surfaces or with the first story partially embedded in the ground. In either of the cases, the mean roof height may be 33 feet or less.

From the building geometry perspective, the two-story house could be such that the mean roof height exceeds 33 feet. This would make the analytical basis for the shutter design incorrect.

Note that there is no conflict with this proposal and the references to 30 feet in the body of Section 1609.1.2. These provisions are measurements to the glazed openings and are still appropriate with a mean main roof height of 33 feet.

The provisions in the code were originally based on a mean roof height of 33 feet. The shift to two-story was an unfortunate attempt at simplifying the provisions of the early high-wind prescriptive publications. Approval of this change will correct an unintended consequence of this attempt at simplification. Please vote for approval of this provision.

Cost Impact: The code change proposal will not increase the cost of construction.

S99-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1609.1.2-S-KEITH.doc

S100–12
1609.1.1, Chapters 35 (NEW)

Proponent: Jennifer Goupil, P.E., The Structural Engineering Institute of ASCE, representing self (jgoupil@asce.org)

Revise as follows:

1609.1.1 Determination of wind loads. Wind loads on every building or structure shall be determined in accordance with Chapters 26 to 30 of ASCE 7 or provisions of the alternate all-heights method in Section 1609.6. The type of opening protection required, the ultimate design wind speed, V_{ult}, and the exposure category for a site is permitted to be determined in accordance with Section 1609 or ASCE 7. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

1. Subject to the limitations of Section 1609.1.1.1, the provisions of ICC 600 shall be permitted for applicable Group R-2 and R-3 buildings.
2. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AF&PA WFCM.
3. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AISI S230.
4. Designs using NAAMM FP 1001.
5. Designs using TIA-222 for antenna-supporting structures and antennas, provided the horizontal extent of Topographic Category 2 escarpments in Section 2.6.6.2 of TIA-222 shall be 16 times the height of the escarpment.
6. Wind tunnel tests in accordance with ~~Chapter 31 of ASCE 7~~ <u>ASCE 49 and with Sections 31.4 and 31.5 of ASCE 7</u>.

The wind speeds in Figures 1609A, 1609B and 1609C are ultimate design wind speeds, V_{ult}, and shall be converted in accordance with Section 1609.3.1 to nominal design wind speeds, V_{asd}, when the provisions of the standards referenced in Exceptions 1 through 5 are used.

Add new standard to Chapter 35 as follows:

ASCE/SEI

<u>49-07 Wind Tunnel Testing for Buildings and Other Structures</u>

Reason: This change proposes to add the new referenced standard *ASCE 49 Wind Tunnel Testing for Buildings and Other Structures.* This standard provides minimum requirements for wind-tunnel tests to determine wind loads on and responses of buildings and other structures. Loads considered in this standard are wind loads for main wind-force resisting systems and for individual structural components and cladding of buildings and other structures. Loads produced by these tests are suitable for use in building codes and standards.

Provisions of this standard satisfy the requirements for wind-tunnel testing of the ASCE Standard *ASCE 7, Minimum Design Loads for Buildings and Other Structures*. Wind-tunnel testing has the capability to perform measurements beyond those specifically addressed in this standard, including pedestrian wind evaluations, dispersion of airborne pollutants, fugitive particulates, and wind energy siting studies. These studies are permitted to be included within the test report addressing wind loads.

Limited by the scope of ASCE 49, ASCE 7 Sections 31.4 Load Effects and ASCE 7 Section 31.5 Wind-Borne Debris are still essential for determining wind loads and are retained by this proposal.

ASCE/SEI 49 is published and maintained by the Structural Engineering Institute of the American Society of Civil Engineers (SEI/ASCE). The document is a nationally recognized consensus standard developed in full compliance with the ASCE *Rules for Standards Committees*. The ASCE standards process is fully accredited by the American National Standards Institute (ANSI).

The ASCE 49 committee developed the Standard in coordination with the ASCE 7 Wind Loads Subcommittee with the expectation that the ASCE 7 subcommittee will fully adopt ASCE 49. Further, the ASCE 49 standard is expected to be considered for adopted by reference by the ASCE 7 Main Committee during the next revision cycle.

As of the submission date of this code change proposal, the Standard is currently being published by ASCE. The document is designated ASCE 49 *Wind Tunnel Testing for Buildings and Other Structures* it is expected that it will be completed and available for purchase prior to the ICC Final Action Hearings in October of 2012. Any person interested in obtaining a public comment copy of ASCE/SEI 49-07 may do so by contacting the proponent at jgoupil@asce.org. A copy of the standard has been submitted with this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

S100-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1609.1-S-GOUPIL.doc

S101–12
1609.5.2

Proponent: Mark S. Graham, National Roofing Contractors Association (mgraham@nrca.net)

Revise as follows:

1609.5.2 Roof coverings. Roof coverings shall comply with Section 1609.5.1.

Exceptions:

1. Rigid tile roof coverings that are air permeable and installed over a roof deck complying with Section 1609.5.1 are permitted to be designed in accordance with Section 1609.5.3.
2. Asphalt shingles installed over a roof deck complying with Section 1609.5.1 shall comply with he wind-resistance requirements of Section 1507.2.7.1.

Reason: This code change proposal is intended to clarify the intent of the Code.

Section 1609.5.2 currently has an exception applicable to rigid tile roof coverings and asphalt shingles separately. As currently formatted--as two continuous paragraphs--the intent of these items can be easily misconstrued.

This proposed code change separates these two paragraphs into two separate numbered items, clarifying their intent. This change is not intended to change the Code's current technical requirements for rigid tile or asphalt shingles roofs.

Cost Impact: The code change proposal will not increase the cost of construction.

S101-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1609.5.2-S-GRAHAM.doc

S102–12

202 (NEW), 1403.7, 1603.1.7, 1612.4, 1612.5, G103.7, G301.2, G401.2; IPC 309.3; IMC 301.16.1

Proponent: John Ingargiola and Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@dhs.gov, gregory.p.wilson@dhs.gov) and Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net).

Add new text as follows:

SECTION 202
DEFINITIONS

COASTAL A ZONE. Area within a special flood hazard area, landward of a V zone or landward of an open coast without mapped V Zones. In a coastal A zone, the principal source of flooding must be astronomical tides, storm surges, seiches, or tsunamis, not riverine flooding. During the base flood conditions, the potential for breaking wave height shall be greater than or equal to 1.5 ft. The inland limit of the coastal A zone is (a) the Limit of Moderate Wave Action if delineated on a FIRM, or (b) designated by the authority having jurisdiction.

LIMIT OF MODERATE WAVE ACTION. Line that may be shown on FIRMs to indicate the inland limit of the 1.5-foot wave height during the base flood.

Revise as follows:

1403.7 Flood resistance for high-velocity wave action areas and coastal A zones. For buildings in flood hazard areas subject to high-velocity wave action and coastal A zones as established in Section 1612.3, electrical, mechanical and plumbing system components shall not be mounted on or penetrate through exterior walls that are designed to break away under flood loads.

Revise as follows:

1603.1.7 Flood design data. For buildings located in whole or in part in *flood hazard areas* as established in Section 1612.3, the documentation pertaining to design, if required in Section 1612.5, shall be included and the following information, referenced to the datum on the community's Flood Insurance Rate Map (FIRM), shall be shown, regardless of whether flood loads govern the design of the building:

1. In *flood hazard areas* not subject to high-velocity wave action or coastal A zones, the elevation of the proposed lowest floor, including the basement.
2 In *flood hazard areas* not subject to high-velocity wave action or coastal A zones, the elevation to which any nonresidential building will be dry flood proofed.
3. In *flood hazard areas* subject to high-velocity wave action or coastal A zones, the proposed elevation of the bottom of the lowest horizontal structural member of the lowest floor, including the basement.

1612.4 Design and construction. The design and construction of buildings and structures located in *flood hazard areas*, including flood hazard areas subject to high-velocity wave action and coastal A zones, shall be in accordance with Chapter 5 of ASCE 7 and with ASCE 24.

1612.5 Flood hazard documentation. The following documentation shall be prepared and sealed by a *registered design professional* and submitted to the *building official*:

1. For construction in *flood hazard areas* not subject to high-velocity wave action or coastal A zones:

1.1. The elevation of the lowest floor, including the basement, as required by the lowest floor elevation inspection in Section 110.3.3.

1.2. For fully enclosed areas below the design flood elevation where provisions to allow for the automatic entry and exit of floodwaters do not meet the minimum requirements in Section 2.6.2.1 of ASCE 24, c*onstruction documents* shall include a statement that the design will provide for equalization of hydrostatic flood forces in accordance with Section 2.6.2.2 of ASCE 24.

1.3. For dry floodproofed nonresidential buildings, *construction documents* shall include a statement that the dry floodproofing is designed in accordance with ASCE 24.

2. For construction in flood hazard areas subject to high-velocity wave action <u>and coastal A zones</u>:

2.1. The elevation of the bottom of the lowest horizontal structural member as required by the lowest floor elevation inspection in Section 110.3.3.

2.2. *Construction documents* shall include a statement that the building is designed in accordance with ASCE 24, including that the pile or column foundation and building or structure to be attached thereto is designed to be anchored to resist flotation, collapse and lateral movement due to the effects of wind and flood loads acting simultaneously on all building components, and other load requirements of Chapter 16.

2.3. For breakaway walls designed to have a resistance of more than 20 psf (0.96 kN/m^2) determined using allowable stress design, *construction documents* shall include a statement that the breakaway wall is designed in accordance with ASCE 24.

Revise as follows:

G103.7 Alterations in coastal areas. Prior to issuing a permit for any alteration of sand dunes and mangrove stands in flood hazard areas subject to high velocity wave action <u>and coastal A zones</u>, the *building official* shall require submission of an engineering analysis which demonstrates that the proposed alteration will not increase the potential for flood damage.

G301.2 Subdivision requirements. The following requirements shall apply in the case of any proposed subdivision, including proposals for manufactured home parks and subdivisions, any portion of which lies within a flood hazard area:

1. The flood hazard area, including floodways<u>,</u> ~~and~~ areas subject to high velocity wave action<u>, and coastal A zones</u>, as appropriate, shall be delineated on tentative and final subdivision plats;
2. Design flood elevations shall be shown on tentative and final subdivision plats;
3. Residential building lots shall be provided with adequate buildable area outside the floodway; and
4. The design criteria for utilities and facilities set forth in this appendix and appropriate *International Codes* shall be met.

G401.2 Flood hazard areas subject to high-velocity wave action <u>and coastal A zones</u>. In *flood hazard areas* subject to high-velocity wave action <u>and coastal A zones</u>:

1. New buildings and buildings that are substantially improved shall only be authorized landward of the reach of mean high tide.
2. The use of fill for structural support of buildings is prohibited.

[B] 309.3 Flood hazard areas subject to high-velocity wave action <u>and coastal A zones</u>. Structures located in flood hazard areas subject to high-velocity wave action <u>and coastal A zones</u> shall meet the requirements of Section 309.2. The plumbing systems, pipes and fixtures shall not be mounted on or penetrate through walls intended to break away under flood loads.

[B] 301.16.1 High-velocity wave action <u>and coastal A zones</u>. In flood hazard areas subject to high-velocity wave action <u>and coastal A zones</u>, mechanical systems and *equipment* shall not be mounted on or penetrate walls intended to break away under flood loads.

Reason: The IBC achieves compliance with the NFIP in Sec. 1612, by reference to ASCE 24 for the specific design and construction requirements. This proposal is to insert the term "coastal A zone" wherever the term "flood hazard area subject to high velocity wave action" appears, to be consistent with ASCE 24. Because of the way the term is defined, only if the Limit of Moderate Wave Action is delineated (or otherwise designated by the AHJ), is the area to be regulated as coastal A zone. ASCE 24-05 has provisions that apply in all Coastal High Hazard Areas (Zone V) and coastal A zones, essentially treating them the same (there are some slight differences because coastal A zones are shown as "Zone A" on Flood Insurance Rate Maps). When 1612.4 refers the user to ASCE 24, one of the first determinations is which flood hazard zone affects the building site. Currently, ASCE 24-05 requires the designer to determine whether conditions landward of Zone V meet the characteristics necessary for coastal A zone conditions. The proposed definition is consistent with the next edition of ASCE 24 that will specify that only if the Limit of Moderate Wave Action (LiMWA) is delineated on the FIRM (or otherwise designated by the AHJ) will the requirements for CAZ apply. FEMA uses the LiMWA to delineate the inland extend of CAZ.

A separate proposal was submitted to change the term "flood hazard area subject to high velocity wave action" to be "coastal high hazard area," which is the term used in the IRC and ASCE 24.

ASCE began the process of updating ASCE 24-05 in early 2011 and the next edition is expected to be published late 2012 or early 2013. The ASCE committee expects to have the near-final draft prepared and available at least a month before the Group A hearings and copies will be provided to the ICC committee.

Cost Impact: Costs will be lower because the RDP and the building official will not have to made independent determinations as to whether a site landward of a Zone V does or does not have coastal A zone conditions. For areas that are subject to coastal A zone conditions there is no change in construction costs because ASCE 24 already has specifications based on whether a building site is or is not subject to coastal A zone conditions.

Proponent: John Ingargiola and Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@dhs.gov, gregory.p.wilson@dhs.gov) and Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net).

THIS IS A THREE PART CODE CHANGE. ALL THREE PARTS WILL BE HEARD BY THE STRUCTURAL COMMITTEE AS THREE SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

PART I – IBC STRUCTURAL

Revise as follows:

SECTION 202
DEFINITIONS

~~FLOOD HAZARD AREA SUBJECT TO HIGHVELOCITY WAVE ACTION~~ COASTAL HIGH HAZARD AREA. Area within the special *flood hazard area* extending from offshore to the inland limit of a primary dune along an open coast and any other area that is subject to high-velocity wave action from storms or seismic sources, and shown on a Flood Insurance Rate Map (FIRM) or other flood hazard map as velocity zones Zone V, VO, VE or V1-30.

Revise as follows:

1403.7 Flood resistance for ~~high-velocity wave action areas~~ coastal high hazard areas. For buildings in ~~flood hazard areas subject to high-velocity wave action~~ coastal high hazard area as established in Section 1612.3, electrical, mechanical and plumbing system components shall not be mounted on or penetrate through exterior walls that are designed to break away under flood loads.

Revise as follows:

1603.1.7 Flood design data. For buildings located in whole or in part in *flood hazard areas* as established in Section 1612.3, the documentation pertaining to design, if required in Section 1612.5, shall be included and the following information, referenced to the datum on the community's Flood Insurance Rate Map (FIRM), shall be shown, regardless of whether flood loads govern the design of the building:

1. In *flood hazard areas* ~~not subject to high-velocity wave action~~ other than coastal high hazard areas, the elevation of the proposed lowest floor, including the basement.
2. In *flood hazard areas* ~~not subject to high-velocity wave action~~ other than coastal high hazard areas, the elevation to which any nonresidential building will be dry flood proofed.
3. In ~~*flood hazard areas* subject to high-velocity wave action~~ coastal high hazard areas, the proposed elevation of the bottom of the lowest horizontal structural member of the lowest floor, including the basement.

1612.4 Design and construction. The design and construction of buildings and structures located in *flood hazard areas*, including ~~flood hazard areas subject to high-velocity wave action~~ coastal high hazard areas, shall be in accordance with Chapter 5 of ASCE 7 and with ASCE 24.

1612.5 Flood hazard documentation. The following documentation shall be prepared and sealed by a *registered design professional* and submitted to the *building official*:

1. For construction in *flood hazard areas* ~~not subject to high-velocity wave action~~ other than coastal high hazard areas:
   1.1. The elevation of the lowest floor, including the basement, as required by the lowest floor elevation inspection in Section 110.3.3.
   1.2. For fully enclosed areas below the design flood elevation where provisions to allow for the automatic entry and exit of floodwaters do not meet the minimum requirements in Section 2.6.2.1 of ASCE 24, *construction documents* shall include a statement that the design will provide for equalization of hydrostatic flood forces in accordance with Section 2.6.2.2 of ASCE 24.
   1.3. For dry floodproofed nonresidential buildings, *construction documents* shall include a statement that the dry floodproofing is designed in accordance with ASCE 24.
2. For construction in ~~flood hazard areas subject to high-velocity wave action~~ coastal high hazard areas:
   2.1. The elevation of the bottom of the lowest horizontal structural member as required by the lowest floor elevation inspection in Section 110.3.3.
   2.2. *Construction documents* shall include a statement that the building is designed in accordance with ASCE 24, including that the pile or column foundation and building or structure to be attached thereto is designed to be anchored to resist flotation, collapse and lateral movement due to the effects of wind and flood loads acting simultaneously on all building components, and other load requirements of Chapter 16.
   2.3. For breakaway walls designed to have a resistance of more than 20 psf (0.96 kN/m2) determined using allowable stress design, *construction documents* shall include a statement that the breakaway wall is designed in accordance with ASCE 24.

Revise as follows:

1804.4 Grading and fill in flood hazard areas. In *flood hazard areas* established in Section 1612.3, grading and/or fill shall not be *approved*:

1. Unless such fill is placed, compacted and sloped to minimize shifting, slumping and erosion during the rise and fall of flood water and, as applicable, wave action.
2. In floodways, unless it has been demonstrated through hydrologic and hydraulic analyses performed by a *registered design professional* in accordance with standard engineering practice that the proposed grading or fill, or both, will not result in any increase in flood levels during the occurrence of the *design flood*.
3. In ~~flood hazard areas subject to high-velocity wave action~~ coastal high hazard areas, unless such fill is conducted and/or placed to avoid diversion of water and waves toward any building or structure.
4. Where design flood elevations are specified but floodways have not been designated, unless it has been demonstrated that the cumulative effect of the proposed *flood hazard area* encroachment, when combined with all other existing and anticipated *flood hazard area* encroachment, will not increase the design flood elevation more than 1 foot (305 mm) at any point.

Revise as follows:

G103.7 Alterations in coastal areas. Prior to issuing a permit for any alteration of sand dunes and mangrove stands in ~~flood hazard areas subject to high velocity wave action~~ coastal high hazard areas, the *building official* shall require submission of an engineering analysis which demonstrates that the proposed alteration will not increase the potential for flood damage.

G301.2 Subdivision requirements. The following requirements shall apply in the case of any proposed subdivision, including proposals for manufactured home parks and subdivisions, any portion of which lies within a flood hazard area:

1. The flood hazard area, including floodways ~~and areas subject to high velocity wave action~~ coastal high hazard areas, as appropriate, shall be delineated on tentative and final subdivision plats;
2. Design flood elevations shall be shown on tentative and final subdivision plats;
3. Residential building lots shall be provided with adequate buildable area outside the floodway; and
4. The design criteria for utilities and facilities set forth in this appendix and appropriate *International Codes* shall be met.

G401.2 ~~Flood hazard areas subject to high-velocity wave action~~ Coastal high hazard areas. In ~~*flood hazard areas* subject to high-velocity wave action~~ coastal high hazard areas:

1. New buildings and buildings that are substantially improved shall only be authorized landward of the reach of mean high tide.
2. The use of fill for structural support of buildings is prohibited.

G601.1 Placement prohibited. The placement of recreational vehicles shall not be authorized in ~~*flood hazard areas* subject to high velocity wave action~~ coast high hazard areas and in *floodways*.

PART II – IPC

Revise as follows:

[B] P309.3 ~~Flood hazard areas subject to high-velocity wave action~~ Coastal high hazard areas. Structures located in ~~flood hazard areas subject to high-velocity wave action~~ coastal high hazard areas shall meet the requirements of Section 309.2. The plumbing systems, pipes and fixtures shall not be mounted on or penetrate through walls intended to break away under flood loads.

PART III – IMC

Revise as follows:

[B] 301.16.1 ~~High-velocity wave action~~ Coastal high hazard areas. In ~~flood hazard areas subject to high-velocity wave action~~ coastal high hazard areas, mechanical systems and *equipment* shall not be mounted on or penetrate walls intended to break away under flood loads.

Reason: This proposal is to simply replace one term with another and edit the definition to be consistent with how the term is defined in ASCE 24. The term "Flood Hazard Area Subject to High-Velocity Wave Action" is descriptive of the flood hazard areas designated Zone V on Flood Insurance Rate Maps. However, the term is not used by the NFIP, nor is it used in the IRC or in ASCE 24, which is referenced by the IBC (1612.4). The NFIP regulations define "coastal high hazard area" at 40 CFR 59.1.

Cost Impact: The code change proposal will not increase the cost of construction.

202-COASTAL HIGH HAZARD AREA-S-INGARGIOLA-WILSON.doc

S104–12
202

Proponent: John Ingargiola and Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@dhs.gov, pregory.p.wilson@dhs.gov), Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net)

Revise as follows:

DRY FLOODPROOFING. A combination of design modifications that results in a building or structure, including the attendant ~~utility~~ utilities and equipment and sanitary facilities, being water tight with walls substantially impermeable to the passage of water and with structural components having the capacity to resist *loads* as identified in ASCE 7.

Reason: This editorial change is proposed for consistency with term as used in the next edition of ASCE 24. The current edition, ASCE 25-05, uses both the term "attendant utilities and equipment" (preferred) and the term "utilities and attendant equipment." All uses of the latter will be revised for consistency.

ASCE began the process of updating ASCE 24-05 in early 2011 and the next edition is expected to be published late 2012 or early 2013. The ASCE committee expects to have the near-final draft prepared and available at least a month before the Group A hearings and copies will be provided to the ICC committee.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202-S-DRY FLOODPROOFING-INGARGIOLA-WILSON-QUINN.doc

S105– 12
1612.4, 1612.4.1 (NEW), 1612.4.2 (NEW),

Proponent: Stephen V. Skalko, P.E,, Portland Cement Association, Eric T. Stafford, P.E., representing Institute for Business and Home Safety and Jason Thompson, P.E., National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards

Revise as follows:

1612.4 Design and construction. The design and construction of buildings and structures located in *flood hazard areas*, including flood hazard areas subject to high-velocity wave action, shall be in accordance with Chapter 5 of ASCE 7, ASCE 24, Sections 1612.4.1 and 1612.4.2 as applicable.

<u>**1612.4.1 Floor elevation.** Floors required by ASCE 24 to be built above the base flood elevations shall have the floor and their lowest horizontal supporting members not less the higher of the following:</u>

1. <u>design flood elevation,</u>
2. <u>base flood elevation plus 3 feet, or</u>
3. <u>advisory base flood elevation plus 3 feet, or</u>
4. <u>the 500-year flood, if known.</u>

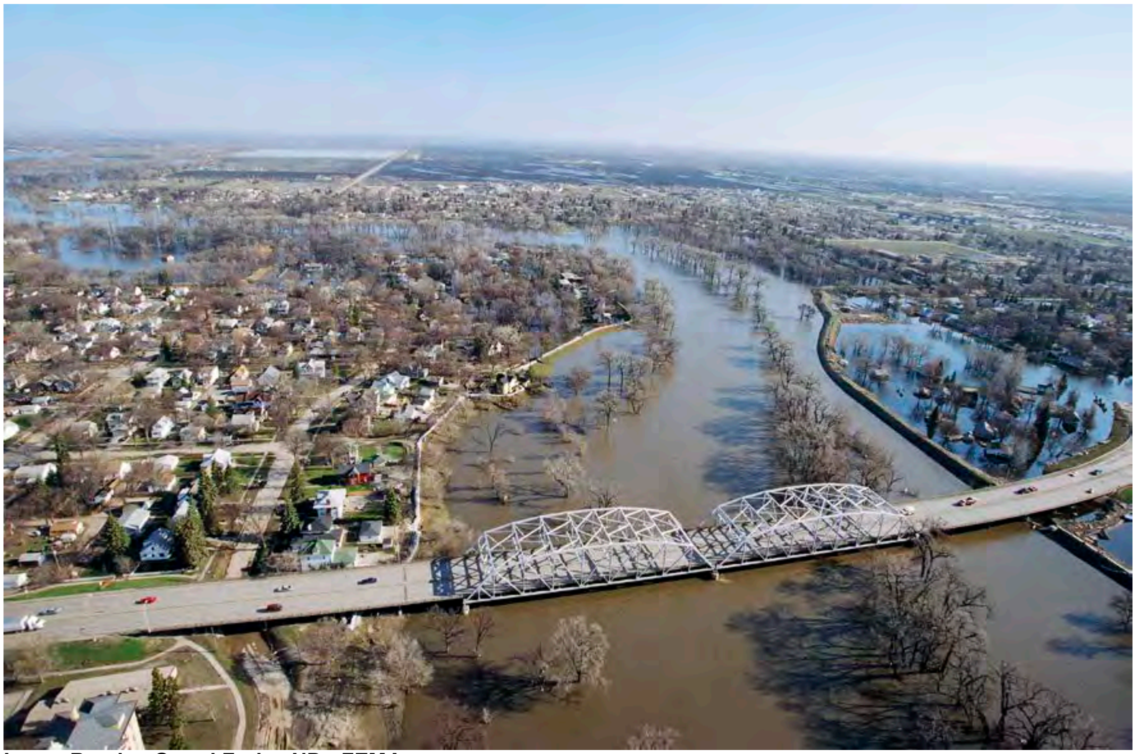
<u>**1612.4.2 Flood protective works.** Buildings designed and constructed in accordance with ASCE 24 shall not consider levees and floodwalls for providing flood protection during the design flood.</u>

Reason: Buildings constructed in accordance with the Section 1612 of the International Building Code are considered to meet minimum requirements. However recent flood hazard events have demonstrated that the requirements in the present code are not sufficient. This proposal strengthens the requirements in the code for establishing the habitable floor elevation with a reasonable safety factor.

First, the elevation of lowest floor level above the base flood elevation is increased from the level normally considered acceptable to meet minimum requirements of the IBC. Many local jurisdictions already modify the IBC with provisions of two, three, or even more feet above the base flood elevation as the required minimum elevation of floors for occupiable space.

Secondly, levees and floodwalls should not be considered as flood protection for structures during a design flood. This is consistent with the primary directive of ASCE 24, *Flood Resistant Design and Construction,* referenced in Section 1612 of the IBC. In recent times there has been an increase in the amount of individual property damage, loss of life and destruction of whole neighborhoods when areas at risk to flooding along river basins are inundated by water after protective works failed or were overtopped or breeched. Examples of levees that failed to protect properties are shown in the attached photographs.

17th Street Levee – New Orleans – USACE



Levee Break – Grand Forks, ND - FEMA

Flood damage - FEMA

Cost Impact: The code change proposal will increase the cost of construction.

S105-12

	Assembly:	ASF	AMF	DF

S106–12
1612.5

Proponent: John Ingargiola and Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@dhs.gov) (gregory.p.wilson@dhs.gov), Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net)

Revise as follows:

1612.5 Flood hazard documentation. The following documentation shall be prepared and sealed by a *registered design professional* and submitted to the *building official*:

1. For construction in *flood hazard areas* not subject to high-velocity wave action:
   1.1. The elevation of the lowest floor, including the basement, as required by the lowest floor elevation inspection in Section 110.3.3 <u>and for the final inspection in Section 110.3.10.1</u>.
   1.2 For fully enclosed areas below the design flood elevation where provisions to allow for the automatic entry and exit of floodwaters do not meet the minimum requirements in Section 2.6.2.1 of ASCE 24, *construction documents* shall include a statement that the design will provide for equalization of hydrostatic flood forces in accordance with Section 2.6.2.2 of ASCE 24.
   1.3. For dry floodproofed nonresidential buildings, *construction documents* shall include a statement that the dry floodproofing is designed in accordance with ASCE 24.
2. For construction in flood hazard areas subject to high velocity wave action:
   2.1 The elevation of the bottom of the lowest horizontal structural member as required by the lowest floor elevation inspection in Section 110.3.3 <u>and for the final inspection in Section 110.3.10.1</u>.
   2.2. *Construction documents* shall include a statement that the building is designed in accordance with ASCE 24, including that the pile or column foundation and building or structure to be attached thereto is designed to be anchored to resist flotation, collapse and lateral movement due to the effects of wind and flood loads acting simultaneously on all building components, and other load requirements of Chapter 16.
   2.3. For breakaway walls designed to have a resistance of more than 20 psf (0.96 kN/m2) determined using allowable stress design, *construction documents* shall include a statement that the breakaway wall is designed in accordance with ASCE 24.

Reason: This proposal achieves consistency with Section 110. The 2012 IBC includes a requirement, added in the last code change cycle, that surveyed building elevations be submitted to the building official prior to the final inspection (approved by ADM14-09/10).

Cost Impact: The code change proposal will not increase the cost of construction.

1612.5-S-INGARGIOLA-WILSON-QUINN.doc

S107–12
1613.1

Proponent: James Bela, Oregon Earthquake Awareness, representing self

Revise as follows:

1613.1 Scope. Every structure, and portion thereof, including nonstructural components that are permanently attached to structures and their supports and attachments, shall be designed and constructed to resist the effects of earthquake motions ~~in accordance with ASCE 7,~~ excluding Chapter 14 and Appendix 11A. The *seismic design category* for a structure ~~is permitted to~~ shall be determined in accordance with Section 1613 ~~or ASCE 7~~.

Exceptions:

1. Detached one- and two-family dwellings, assigned to *Seismic Design Category* A, B or C, or located where the mapped short-period spectral response acceleration, *SS*, is less than 0.4 g.
2. The seismic force-resisting system of wood-frame buildings that conform to the provisions of Section
   2308 are not required to be analyzed as specified in this section.
3. Agricultural storage structures intended only for incidental human occupancy.
4. Structures that require special consideration of their response characteristics and environment that are not addressed by this code or ASCE 7 and for which other regulations provide seismic criteria, such as vehicular bridges, electrical transmission towers, hydraulic structures, buried utility lines and their appurtenances and nuclear reactors.

Reason: (1) ASCE 7 adopted the NEHRP Provisions (developed at the public's expense) as its "standard, then proceeded to charge the engineering community (and the public) for its "commandeering" of those Provisions as its standard.

(a) NEHRP Provisions previously have been adopted into model building codes, as in the Southern Building Code, with no problems (and, particularly, with no "added expense."
ASCE 7 carries a "disclaimer" for its use.

(2) ASCE 7 contains no "references" to justify its legitimacy.
(3) ASCE 7 was the instigator of so-called:) RISK-TARGETED MAXIMUM CONSIDERED EARTHQUAKE (MCE$_R$) (~~MCE~~) GROUND MOTION RESPONSE ACCELERATIONS FOR 0.2- and 1SECOND SPECTRAL RESPONSE ACCELERATION (5% OF CRITICAL DAMPING), SITE CLASS B.

(a) this is based on fatally flawed "applied mathematics" assumed in probabilistic seismic hazard assessment, or psha: see discussions under Code Change: FIGURES 1613.3.1 (1)(2)(3)(4)(5)(6)

(4) ASCE 7 is "codifying everything," and is becoming a de-facto code. Code provisions need to remain in a public consensus arena; their "disclaimer" perhaps absolves them from the problems they are creating – but they are creating "unintended consequences" for professional practice.
(5) ASCE 7 is full of errata, which casts substantial questions about the quality of effort and rigor that is going into its formulation.

Cost Impact: The code change proposal will decrease the cost of construction.

S107-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1613.1-S-BELA.doc

S108–12
1613.1

Proponent: Jeff Sprout, AIA, Target Corporation (jeff.sprout@target.com)

Revise as follows:

1613.1 Scope. Every structure, and portion thereof, including nonstructural components that are permanently attached to structures and their supports and attachments, shall be designed and constructed to resist the effects of earthquake motions in accordance with ASCE 7, excluding Chapter 14 and Appendix 11A. The *seismic deign category* for a structure is permitted to be determined in accordance with Section 1613 or ASCE 7.

Exception:

1. Detached one- and two-family dwellings, assigned to *Seismic Design Category* A, B or C, or located where the mapped short-period special response acceleration, Ss, is less than 0.4g.
2. The seismic force-resisting system of wood-frame building that conform to the provisions of Section 2308 are not required to be analyzed as specified in this section.
3. Agricultural storage structures intended only for incidental human occupancy.
4. Structures that require special consideration of their response characteristics and environment that are not addressed by this code or ASCE 7 and for which other regulations provide seismic criteria, such as vehicular bridges, electrical transmission towers, hydraulic structures, buried utility lines and their appurtenances and nuclear reactors.
5. <u>Anchorage of fixtures, cases, shelves, counters and partitions not over 8’-0” in height when designed to resist overturning.</u>

Reason: To provide further clarification that ties back into Section105.2 Work exempt from permit, item #13: “Nonfixed and movable fixtures, cases, racks, counters and partitions not over 5 feet 9 inches (1753mm) in height”. It has been shown in shake table tests and in the recent Japan earthquake, where unanchored fixtures under 8’ tall, that did resist overturning, kept the aisle ways reasonably clear, allowing for safe exiting.

Cost Impact: The code change proposal will not increase the cost of construction.

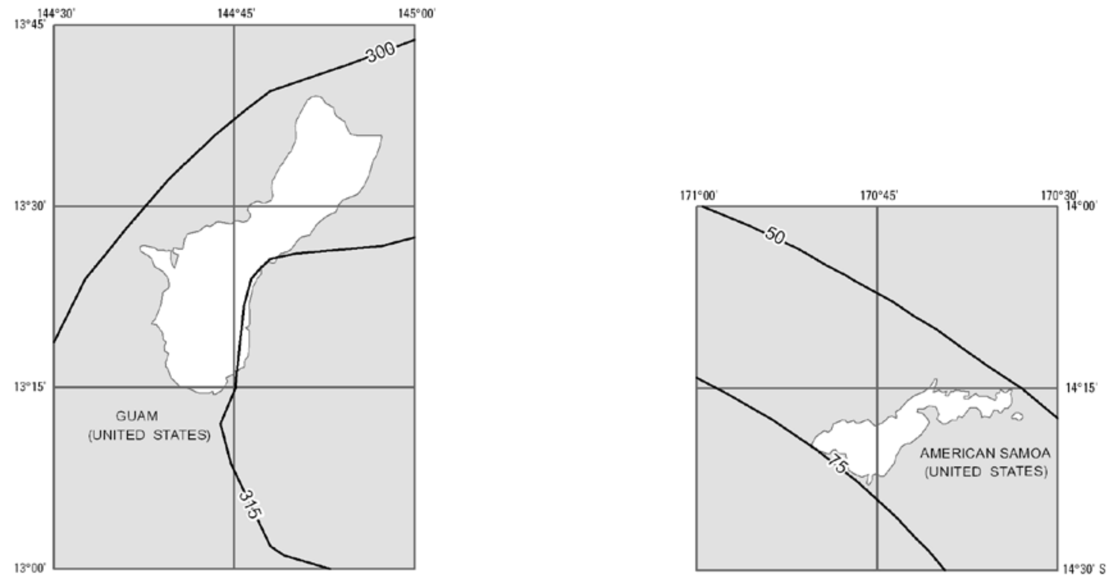
1613.1-S-SPROUT.doc

S109–12
1613.3.1

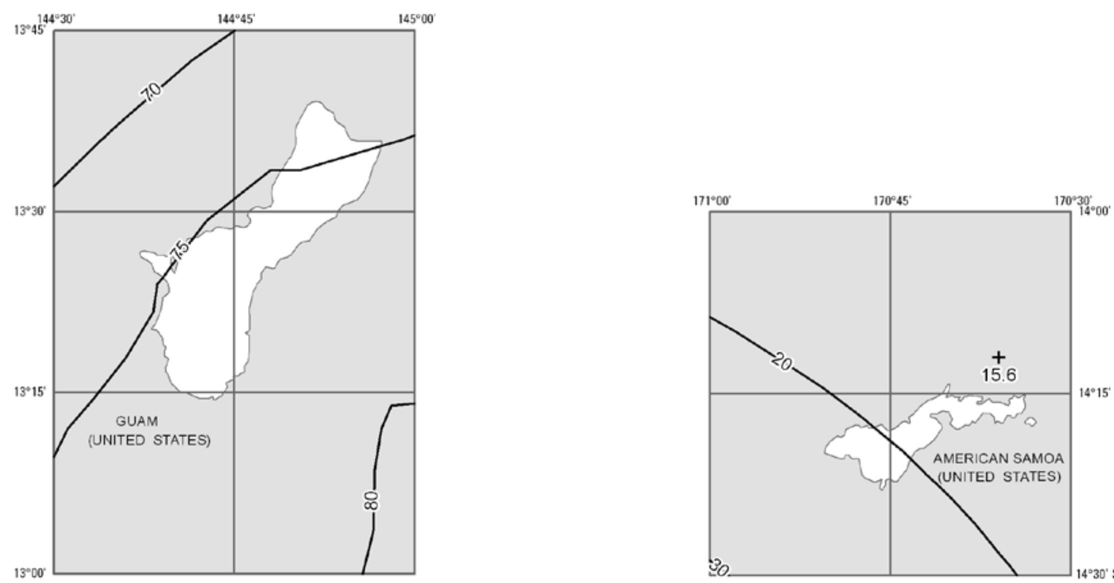
Proponent: Nicolas Luco, US Geological Survey (USGS), representing National Earthquake Hazards Reduction Program (nluco@usgs.gov), Michael Mahoney, Federal Emergency Management Agency (FEMA), representing National Earthquake Hazards Reduction Program

Revise as follows:

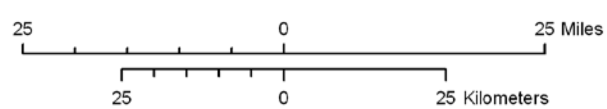
1613.3.1 Mapped acceleration parameters. The parameters S_S and S_1 shall be determined from the 0.2 and 1-second spectral response accelerations shown on Figures 1613.3.1(1) through 1613.3.1(~~6~~<u>7</u>) Where S_1 is less than or equal to 0.04 and S_S is less than or equal to 0.15, the structure is permitted to be assigned *Seismic Design Category* A.~~ The parameters Ss and S1 shall be, respectively, 1.5 and 0.6 for Guam and 1.0 and 0.4 for American Samoa.~~



0.2-Second Spectral Response Acceleration (5% of Critical Damping)



1.0-Second Spectral Response Acceleration (5% of Critical Damping)



Risk-Targeted Maximum Considered Earthquake (MCE_R) Ground Motion Response Accelerations for Guam and American Samoa of 0.2-Second Spectral Response Acceleration (5% of Critical Damping), Site Class B

<u>FIGURE 1613.3.1(7) RISK-TARGETED MAXIMUM CONSIDERED EARTHQUAKE (MCE_R) GROUND MOTION RESPONSE ACCELERATIONS FOR GUAM AND AMERICAN SAMOA OF 0.2- AND 1-SECOND SPECTRAL RESPONSE ACCELERATION (5% OF CRITICAL DAMPING), SITE CLASS B</u>

Reason: The US Geological Survey (USGS) has the responsibility under the National Earthquake Hazards Reduction Program to develop and maintain seismic hazard maps that are the basis of the Risk-Targeted Maximum Considered Earthquake (MCE_R) Ground Motion maps in the nation's model building codes. As part of that responsibility, the USGS recently developed seismic hazard and MCE_R ground motion maps for Guam and American Samoa, using the same methodology as for the conterminous US, Hawaii, Alaska, and Puerto Rico and the US Virgin Islands. The MCE_R ground motion maps developed are being proposed as an addition to the existing maps in Figure 1613.3.1.

Cost Impact: The code change proposal will increase or decrease the cost of construction, depending on the geographic location.

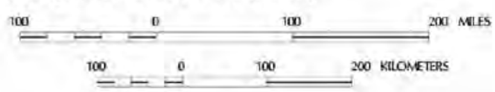
1.0 SEC SPECTRAL RESPONSE ACCELERATION (5% OF CRITICAL DAMPING)



Explanation

+ 6.2	Point value of spectral response acceleration expressed as a percent of gravity
10 / 10	Contours of spectral response acceleration expressed as a percent of gravity. Hachures point in direction of decreasing values.

DISCUSSION

The acceleration values contoured on this map are for the random horizontal component of acceleration. For design purposes, the reference site condition for the map is to be taken as Site Class B.

The two areas shown as zone boundaries are the projection to the earth's surface of horizontal rupture planes at 9 km depth. Spectral accelerations are constant within the boundaries of the zones. The number on the boundary and inside the zone is the median spectral response acceleration times 1.5.

Leyendecker, Frankel, and Rukstales (2001, 2004) have prepared a CD-ROM that contains software to allow determination of Site Class B map values by latitude-longitude. The software on the CD contains site coefficients that allow the user to adjust map values for different Site Classes. Additional maps at different scales are also included on the CD. The CD was prepared using the same data as that used to prepare the Maximum Considered Earthquake Ground Motion maps.

The National Seismic Hazard Mapping Project Web Site, http://eqhazmaps.usgs.gov, contains electronic versions of this map and others. Documentation, gridded values, and Arc/INFO coverages used to make the maps are also available.

Map prepared by U.S. Geological Survey.

FIGURE 1613.3.1(3)
MAXIMUM CONSIDERED EARTHQUAKE (MCE) GROUND MOTION RESPONSE ACCELERATIONS FOR HAWAII OF 0.2- AND 1-SECOND SPECTRAL RESPONSE ACCELERATION (5% OF CRITICAL DAMPING), SITE CLASS B

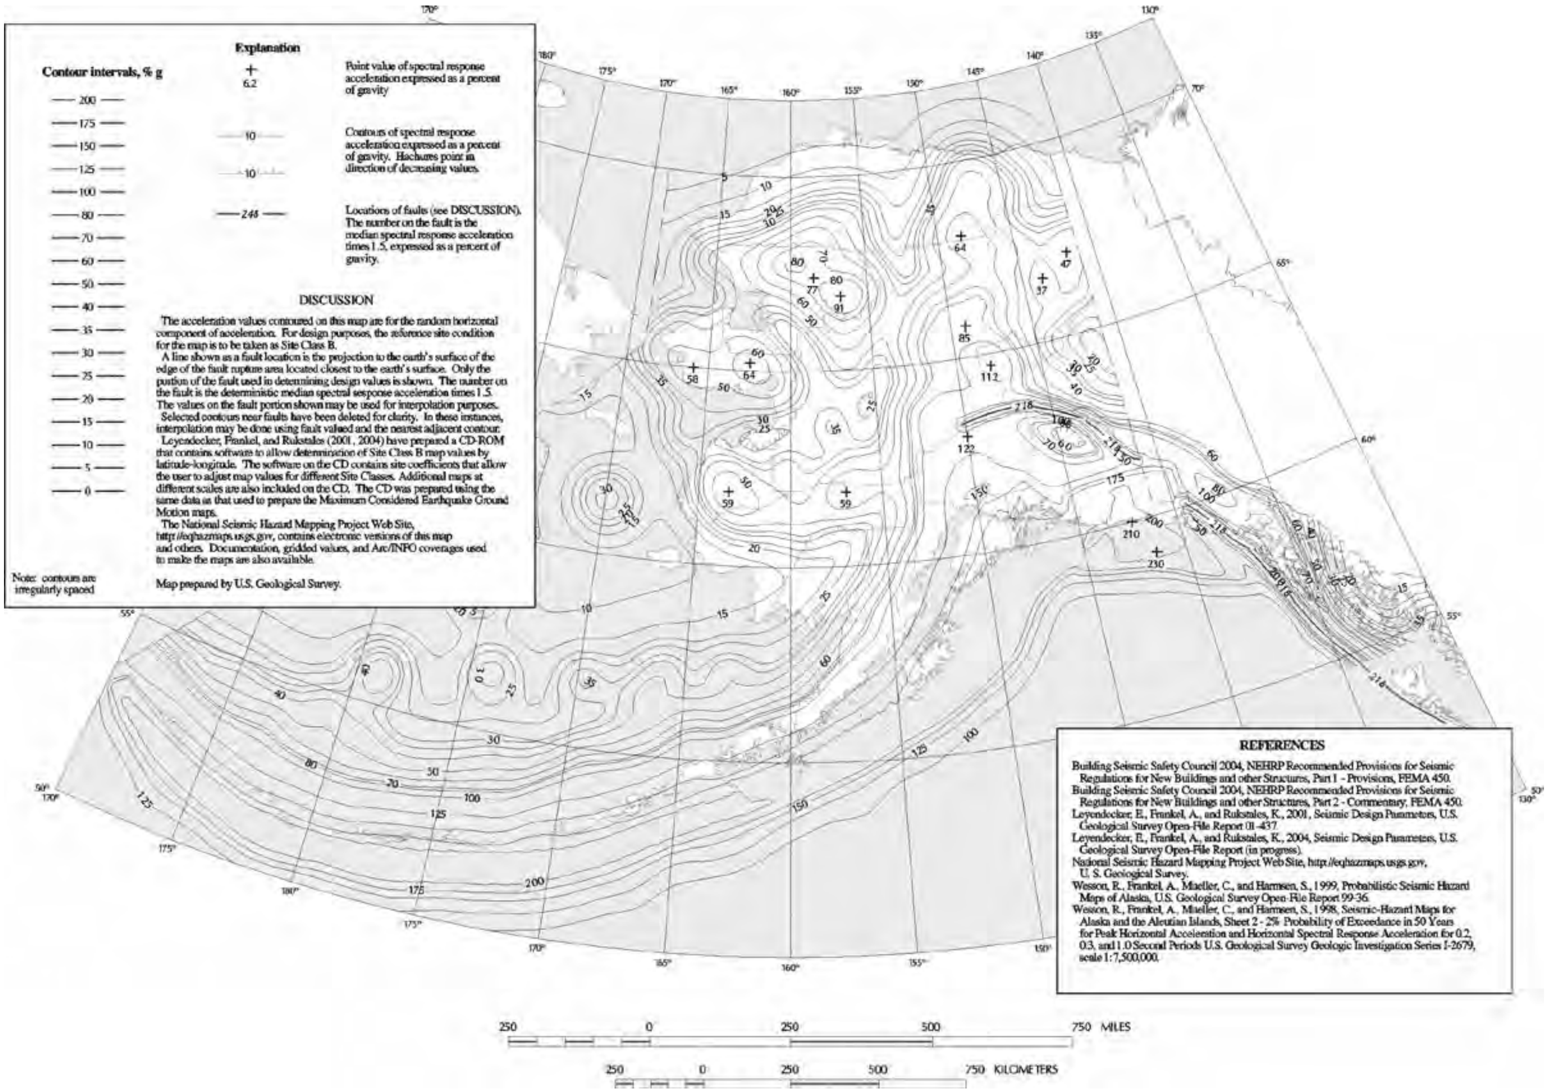

FIGURE 1613.3.1(4)
MAXIMUM CONSIDERED EARTHQUAKE (MCE) GROUND MOTION RESPONSE ACCELERATIONS FOR ALASKA OF 0.2-SECOND SPECTRAL RESPONSE ACCELERATION (5% OF CRITICAL DAMPING), SITE CLASS B

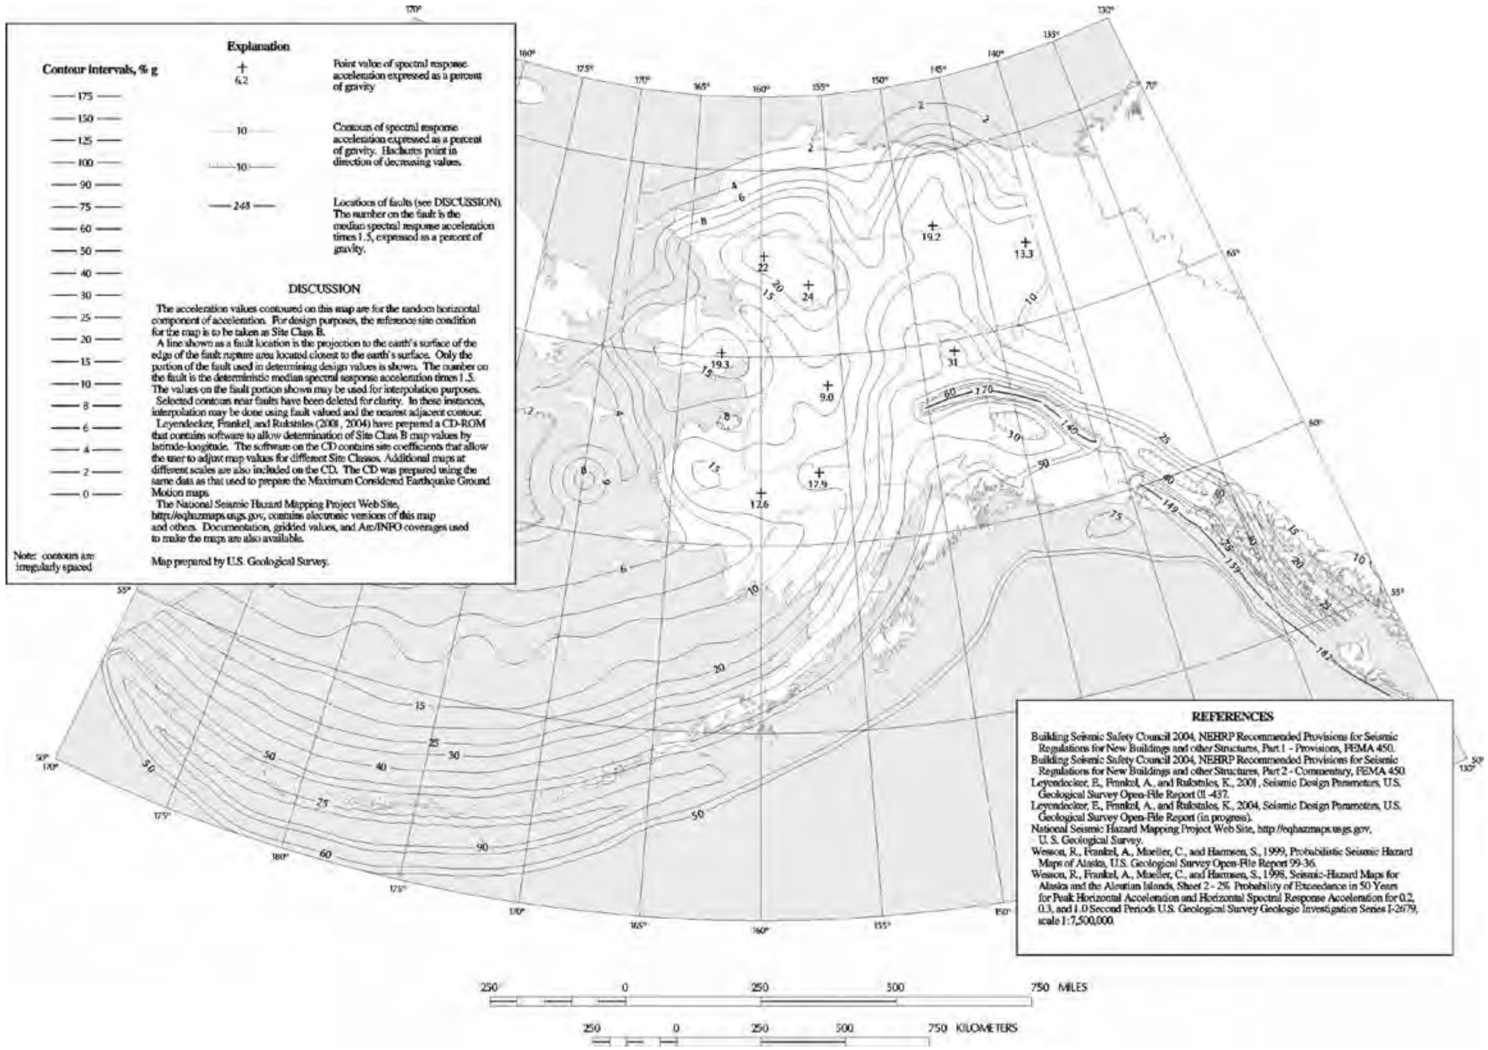

FIGURE 1613.3.1(5)
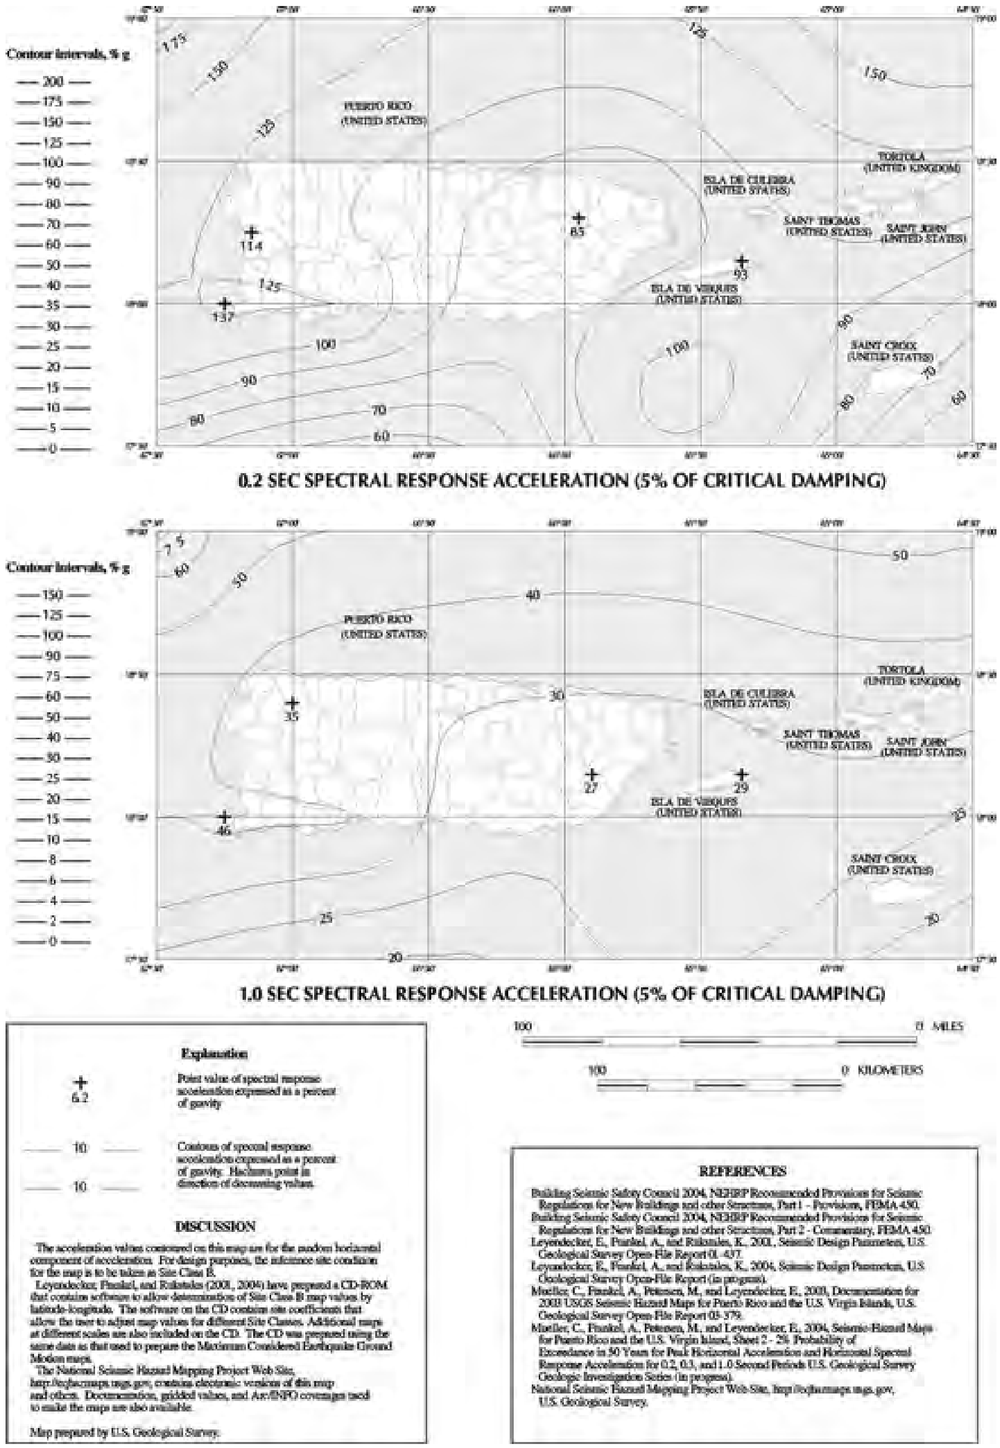
MAXIMUM CONSIDERED EARTHQUAKE (MCE) GROUND MOTION RESPONSE ACCELERATIONS FOR ALASKA OF 1.0-SECOND SPECTRAL RESPONSE ACCELERATION (5% OF CRITICAL DAMPING), SITE CLASS B



<u>**FIGURE 1613.3.1(6)**</u>
<u>**MAXIMUM CONSIDERED EARTHQUAKE (MCE) GROUND MOTION RESPONSE ACCELERATIONS FOR PUERTO RICO AND THE UNITED STATES VIRGIN ISLANDS OF 0.2- AND 1-SECOND SPECTRAL RESPONSE ACCELERATION (5% OF CRITICAL DAMPING), SITE CLASS B**</u>

Reason: (1) Constantly changing the USGS National Seismic Hazard Maps' "ground motion response accelerations contours" is **destabilizing** to design practice, plan review requirements, and code enforcement provisions, because such changes are:

(a) creating **yo-yo earthquake design standards** – "high" one code cycle and "low" the next; or vice-versa; making it, as a result,

ever more difficult to develop, practice and apply "professional engineering judgment" in the design process.
(b) creating serious and perplexing problems for addressing seismic hazards for **existing buildings** – which must then **"benchmark"** to a specific year and to a specific version (year & edition) of seismic hazard map (for any specific public policy mandate/requirements for earthquake retrofit/mitigation ordinances or measures. These required "benchmark" seismic hazard maps will then be different (sometimes a lot different) from the current (and ever-changing and ever-evolving) USGS National Seismic Hazard Maps. This is, and will continue to be, a big source of confusion.

(2) RISK-TARGETED MAXIMUM CONSIDERED EARTHQUAKE (MCE_R) GROUND MOTION RESPONSE ACCELERATIONS contours in the IBC 2012 / ASCE 7-10 are sometimes **30% lower** than previous map values of just a decade ago:

(a) the recent 08-23-2011 M 5.8 Mineral VA (Cuckoo) earthquake had 30% lower design values (with these new maps) than a decade ago – making the earthquake's epicentral region **Seismic Design Category A-B**; yet the **actual intensity of earthquake ground shaking** experienced there was the "stated intensity" that could be expected for the IBC/ASCE 7-10 designation **SDC D!**.(Bela 2011)
(b) when the seismic hazard maps **depict such low hazard ground motion response accelerations** and their corresponding **low** Seismic Design Categories, they both foster and create the "circumstances" for **"comfortable inaction;"** and, unfortunately, this feeling of "comfortable inaction" easily transfers to the arena of public policy.
(c) The condition of "comfortable inaction" (due to perceived low hazard - depicted on the seismic hazard map) was cited as perhaps the main culprit in Christ Church, New Zealand's lack of adequate preparedness during its recent hammering by a "pair" of earthquakes – which killed around 200 people in unsafe **"Killer Buildings."**.
(3) The basic underlying methodology for preparing the USGS National Seismic Hazard Maps (and their derivative so-called Risk-Targeted Maximum Considered Earthquake (MCE_R) Ground Motion Response Accelerations contours); i.e., probabilistic seismic hazard assessment (or psha) is fatally **"flawed"** – due to systemic "errors" in the applied mathematics which both create and define it. And it is, unfortunately, these same flawed "mathematics" that are prescribing how these psha-determined ground motion contours are ultimately derived, computed . . . and then finally codified.
(4) Errors in its methodology aside, the basic problems, difficulties and really insurmountable obstacles to performing a psha seismic hazard assessment *(Mualchin, 2010; Bela and Mualchin 2011)* have **never** actually been "solved." And they still remain unsolved! These problems involve data-driven earth-science requirements for a knowledge and understanding of:

(a) fault slip rates;
(b) frequency of occurrence of earthquakes (and their known magnitudes); and
(c) earthquake source mechanisms – specifically, (i) the style of faulting: and (ii) the hypocentral depth (or where exactly the earthquake rupture process begins).

(5) The psha methodology is easily "manipulated," particularly in the sense that: (i) selecting the probabilistic hazard level is a totally **arbitrary** process; and (ii) changing the hazard level (higher hazard or lower hazard) gives a completely different ground motion response acceleration contour – and consequently, then, different code requirements!
(6) These very real and insurmountable problems with psha's methodology have been swept away by its proponents: by convoluted (and mostly unintelligible) efforts and preoccupations with "logic trees," "quantifying uncertainties," etc. These efforts proceed busily ahead; but, meanwhile, they are "neglecting baseline principles" (of "what" the earthquake can do to you – and "how" it can do it – and the maximum Magnitude it could be). All that mathematical busywork, logic-tree accounting, and so-called "expert opinion" built a the "better model" (or -- so the proponents believe). Unfortunately, that "better model" then:

(a) has become **"substituted"** for "reality" by its creators;
(b) has dismissed criticisms of it -- by claiming (itself) to be "best available science;" and
(c) has become ultimately so **"complicated" --** that not even its proponents now can logically and successfully explain how it came to be (Hamburger et. al., 2010; Bela, 2011); nor can they effectively explain how to apply it to the real world of earthquake engineering, public safety, and socioeconomic issues of community resiliency.

(7) The ground motion accelerations, and their probabilities for exceeding them, are combined and co-mingled in such a way that the actual sources (or **earthquake magnitudes**, **frequency content of earthquake ground motions**, and **duration** of strong ground shaking) are treated more-or-less equally—and they are most certainly not!
(8) The **"Maximum Credible Earthquake" (MCE)** or "Maximum Capable Earthquake" or "Maximum Possible Earthquake" (within ¼ unit of Magnitude, M) is never explicitly stated. And it's really "Magnitude, Magnitude, Magnitude!" (and for the same reasons previously stated in (4)) – that has everything to do with building performance (damage and repair costs) and, more importantly, public safety and community resilience.
(9) R-Factors, or Response Modification Factors, that are used in design become **less reliable** in ascertaining/predicting the **"end result"** (or the building's actual performance in an earthquake). And, **"an earthquake"** really needs to explicitly consider the full suite of earthquake possibilities that the regional tectonics forewarn us can occur (including MCE = Maximum Credible Earthquake, or Maximum Possible Earthquake). "R-Factors" have become less reliable primarily because:
(a) quite a lot of the "ductility" or building "toughness" that the code relies upon to: (i) ride out the earthquake (by bending, not breaking, and absorbing energy); and (ii) remain standing (without killing the occupants) -- is due to "over-strength;" and.
(b) when the code design "strength" is systematically diminished (weakened) or reduced (over several-to-many iterations of seismic hazard mapping --by lowering (yo-yo effect) the "numerator" quantity in the design strength

equation; then when dividing this numerator (now smaller number) by the same "large" number (R-Factor in denominator) – we have now "lost" perhaps a good portion of our "over-strength" – that was implicit in selecting the weights of the various R-Factors in the first place!

Basically, with RISK-TARGETED (MCE_R) , the code is now dividing an ever-decreasing and now smaller number (perhaps by 30%) by the same "large" number (R-Factor denominator) -- with the result that the buildings' performances and outcomes are really now much less certain . . . and also now much more problematical.

(10) The psha methodology has been shown in dramatic and tragic fashion to be not only "misleading", but also deadly, in the last decade or so of the **"Eleven of the World's Deadliest Earthquakes." (Panza et. al. 2011, Table 1)** In example after example, and all across the globe (where now more than 700, 000 people have perished); the psha-methodology "prescribed" seismic hazard: was determined to be either low or very low – but was "disproved" in these many cases by earthquakes that were "surprises" from what psha had determined could be expected. In too many of these deadly "surprises", the actual intensities of ground shaking experienced were greater by factors of 2X to 4X – than what psha had predicted. (Bela 2010; Bela and Mualchin, 2011;

Kossobokov and Nekrasova, 2010;)

It is clear that this is an unsafe situation (to general public) that must **not** continue; but it does continue for some of these following main reasons:

(a) the psha methodology is "anonymous," so when there is clear evidence (> 700,000 casualties) that it is "not working;" no one is accountable for its: (i) external failures (mass casualties); and/or (ii) internal failures (very real errors in its "applied mathematics" derivations).
(b) the psha methodology has a hierarchial and powerful elite behind its influence and continued use.
(c) the psha methodology has a pedigree of high sounding terms (like "quantifying uncertainty," "logic-tree", "expert opinion," "best science," etc.) -- all purporting to increase the method's **"precision."** But the end result, as these Eleven Deadliest Earthquakes" have shown us, is, unfortunately, still too **"inaccurate"** and "too deadly" for protecting the public safety. And in this regard, it is clearly missing its target!

F1613-S-BELA.doc

S111–12
1613.5 (NEW), 1613.5.1 (NEW)

Proponent: Kelly Cobeen, representing self; Dana Deke Smith and Steve Winkel, Building Seismic Safety Council, representing FEMA/Code Resource Support Committee (dsmith@nibs.org) (swinkel@preview-group.com)

Add new text as follows:

1613.5 Amendments to ASCE 7. The provisions of Section 1613.5 shall be permitted as an amendment to the relevant provisions of ASCE 7.

1613.5.1 Transfer of anchorage forces into diaphragm. Modify ASCE 7 Section 12.11.2.2.1 as follows:

12.11.2.2.1 Transfer of anchorage forces into diaphragm. Diaphragms shall be provided with continuous ties or struts between diaphragm chords to distribute these anchorages forces into the diaphragms. Diaphragm connections shall be positive, mechanical, or welded. Added chords are permitted to be used to form subdiaphragms to transmit the anchorage forces to the main continuous cross-ties. The maximum length-to-width ratio of a wood, wood structural panel, or untopped steel deck sheathed structural subdiaphragm that serves as part of the continuous tie system shall be 2.5 to 1. Connections and anchorages capable of resisting the prescribed forces shall be provided between the diaphragm and the attached components. Connections shall extend into the diaphragm a sufficient distance to develop the force transferred into the diaphragm.

Reason: The subdiaphragm aspect ratio is indicated in this proposal as only applying to wood sheathed diaphragms, wood structural panel sheathed diaphragms, and untopped metal deck diaphragm. When limitation of subdiaphragms was first submitted as a proposed change to the 1997 UBC by Kariotis [code change proposal 1631.2.8-95-1 K.A.S.E.] in the form of an allowable shear limitation, the reason focused on tilt-up buildings with nailed diaphragms and contemporary designs not meeting the intent of provisions written after observed poor performance in the 1973 Sylmar Earthquake. When approved for inclusion in the 1997 UBC [code change proposal 16-96-2 SEAOC/ Seismology] the approved wording for the aspect ratio limitation specifically applied only to wood structural subdiaphragms. In the process of being included in the IBC and ASCE 7, the wording designating wood subdiaphragms was dropped, making the requirement applicable to all subdiaphragms. This code change proposes to reintroduce the limit to wood subdiaphragms because they are the original system of concerns and observed poor performance, and include untopped steel deck diaphragms due to the similarities in construction and perceived structural behavior. This aspect ratio limit is not perceived to be necessary for good performance for other diaphragm types; once this aspect ratio limit is removed for concrete, composite deck, and other diaphragm types, other diaphragm limitations within the referenced material standards will govern design.

Cost Impact: The code change proposal will not increase the cost of construction and may reduce cost for some structural systems.

THIS IS A TWO PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IFC COMMITTEE, AS TWO SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES

PART I – IBC STRUCTURAL

Revise as follows:

1703.1.3 Personnel. An *approved agency* shall employ experienced personnel educated in conducting, supervising and evaluating tests and/or *special* inspections.

1703.5.2 Inspection and identification. The *approved agency* shall periodically perform ~~an~~ a *special* inspection, which shall be in-plant if necessary, of the product or material that is to be *labeled*. The ~~inspection~~ *special inspector* shall verify that the labeled product or material is representative of the product or material tested.

1703.6 Evaluation and follow-up inspection services. Where structural components or other items regulated by this code are not visible for *special* inspection after completion of a prefabricated assembly, the applicant shall submit a report of each prefabricated assembly. The report shall indicate the complete details of the assembly, including a description of the assembly and its components, the basis upon which the assembly is being evaluated, test results and similar information and other data as necessary for the *building official* to determine conformance to this code. Such a report shall be *approved* by the *building official*.

1703.6.2 Test and inspection records. Copies of necessary test and *special* inspection records shall be filed with the *building official*.

SECTION 1704
SPECIAL INSPECTIONS AND TESTS, CONTRACTOR RESPONSIBILITY AND STRUCTURAL OBSERVATIONS

1704.1 General. This section provides minimum requirements for special inspections and tests, the statement of special inspections, contractor responsibility and structural observations.

1704.2 Special inspections and tests. Where application is made for construction as described in this section, the owner or the *registered design professional in responsible charge* acting as the owner's agent shall employ one or more *approved agencies* to perform *special* inspections and tests during construction on the types of work listed under Section 1705. These *special* inspections and tests are in addition to the inspections by the building official that are identified in Section 110.

Exceptions:

1. *Special inspections* and tests are not required for construction of a minor nature or as warranted by conditions in the jurisdiction as *approved* by the *building official*.

2. Unless otherwise required by the *building official*, *special inspections* and tests are not required for Group U occupancies that are accessory to a residential occupancy including, but not limited to, those listed in Section 312.1.
3. *Special inspections* and tests are not required for portions of structures designed and constructed in accordance with the cold-formed steel light-frame construction provisions of Section 2211.7 or the conventional light-frame construction provisions of Section 2308.

1704.2.1 Special inspector qualifications. The special inspector shall provide written documentation to the building official demonstrating his or her competence and relevant experience or training. Experience or training shall be considered relevant ~~when~~ where the documented experience or training is related in complexity to the same type of *special inspection* or testing activities for projects of similar complexity and material qualities. These qualifications are in addition to qualifications specified in other sections of this code. The *registered design professional in responsible charge* and engineers of record involved in the design of the project are permitted to act as the *approved agency* and their personnel are permitted to act as the special inspectors for the work designed by them, provided they qualify as special inspectors.

1704.2.2 Access for special inspection. The construction or work for which special inspection or testing is required shall remain accessible and exposed for special inspection or testing purposes until completion of the required special inspections or tests.

1704.2.4 Report requirement. Special inspectors shall keep records of *special* inspections and tests . The special inspector shall ~~furnish~~ submit reports of *special* inspections ~~reports~~ and tests to the *building official*, and to the *registered design professional in responsible charge*. Reports shall indicate that work inspected or tested was or was not completed in conformance to *approved construction documents*. Discrepancies shall be brought to the immediate attention of the contractor for correction. If they are not corrected, the discrepancies shall be brought to the attention of the *building official* and to the *registered design professional in responsible charge* prior to the completion of that phase of the work. A final report documenting required *special inspections* or tests, and correction of any discrepancies noted in the inspections or tests, shall be submitted at a point in time agreed upon prior to the start of work by the applicant and the *building official*.

1704.3 Statement of special inspections. Where *special inspections* or ~~testing is~~ tests are required by Section 1705, the *registered design professional in responsible charge* shall prepare a statement of special inspections in accordance with Section 1704.3.1 for submittal by the applicant in accordance with Section 1704.2.3.

Exception: The statement of *special inspections* is permitted to be prepared by a qualified person *approved* by the *building official* for construction not designed by a *registered design professional*.

1704.3.1 Content of statement of special inspections. The statement of special inspections shall identify the following:

1. The materials, systems, components and work required to have *special inspections* or ~~testing~~ tests by the *building official* or by the *registered design professional* responsible for each portion of the work.
2. The type and extent of each *special inspection*.
3. The type and extent of each test.
4. Additional requirements for *special inspections* or ~~testing~~ tests for seismic or wind resistance as specified in Sections 1705.10, 1705.11 and 1705.12.
5. For each type of *special inspection*, identification as to whether it will be continuous *special inspection* or periodic *special inspection*.

1704.3.2 Seismic requirements in the statement of special inspections. Where Section 1705.11 or 1705.12 specifies special inspection, testing or qualification for seismic resistance, the statement of special inspections shall identify the designated seismic systems and seismic force-resisting systems that are subject to the *special inspections* or tests

SECTION 1705
REQUIRED ~~VERIFICATION AND~~ SPECIAL INSPECTIONS AND TESTS

1705.1 General. ~~Verification and~~ *Special* inspections and tests of elements of buildings and structures shall ~~be as required by~~ meet the applicable requirements of this section.

1705.1.1 Special cases. *Special inspections* and tests shall be required for proposed work that is, in the opinion of the *building official*, unusual in its nature, such as, but not limited to, the following examples:

1. Construction materials and systems that are alternatives to materials and systems prescribed by this code.
2. Unusual design applications of materials described in this code.
3. Materials and systems required to be installed in accordance with additional manufacturer's instructions that prescribe requirements not contained in this code or in standards referenced by this code.

TABLE 1705.2.2
REQUIRED ~~VERIFICATION AND~~ SPECIAL INSPECTIONS OF STEEL CONSTRUCTION OTHER THAN STRUCTURAL STEEL

~~VERIFICATION AND INSPECTION~~ TYPE	CONTINUOUS	PERIODIC	REFERENCED STANDARD[a]
1. Material verification of cold-formed steel deck:			
a. Identification markings to conform to ASTM standards specified in the approved construction documents	—	X	Applicable ASTM material standards
b. Manufacturers' certified test reports.	—	X	
2. Special inspection of welding:			
a. Cold–formed steel deck			
1. Floor and roof deck welds	—	X	AWS D1.3
b. Reinforcing steel:			
1. Verification of weldability of reinforcing steel other than ASTM A706	—	X	
2. Reinforcing steel resisting flexural and axial forces in intermediate and special moment frames, and boundary elements of special structural walls of concrete and shear reinforcement.	X	—	AWS D1.4 ACI 318: Section 3.5.2
3. Shear reinforcement.	X	—	
4. Other reinforcing steel	—	X	

For SI: 1 inch = 25.4 mm.
a. Where applicable, see also Section 1705.11, Special inspections for seismic resistance.

1705.3 Concrete construction. ~~The~~ S*pecial inspections* and ~~verifications for~~ tests of concrete construction shall be as ~~required~~ by performed in accordance with this section and Table 1705.3.

Exception: *Special inspections* and tests shall not be required for:

(Portions of section not shown remain unchanged)

TABLE 1705.3
REQUIRED ~~VERIFICATION AND~~ SPECIAL INSPECTIONS AND TESTS OF CONCRETE CONSTRUCTION

~~VERIFICATION AND INSPECTION~~ TYPE	CONTINUOUS SPECIAL INSPECTION	PERIODIC SPECIAL INSPECTION	REFERENCED STANDARD[a]	IBC REFERENCE

(Portions of table not shown remain unchanged)

1705.3.1 Materials~~s~~ tests. In the absence of sufficient data or documentation providing evidence of conformance to quality standards for materials in Chapter 3 of ACI 318, the building official shall require testing of materials in accordance with the appropriate standards and criteria for the material in Chapter 3 of ACI 318. Weldability of reinforcement, except that which conforms to ASTM A 706, shall be determined in accordance with the requirements of Section 3.5.2 of ACI 318.

1705.4 Masonry construction. *Special inspections* and tests of masonry construction shall be ~~inspected and verified~~ in accordance with the quality assurance program requirements of TMS 402/ACI 530/ASCE 5 and TMS 602/ACI 530.1/ASCE 6 ~~quality assurance program requirements~~.

Exception: *Special inspections* and tests shall not be required for:

1. Empirically designed masonry, glass unit masonry or masonry veneer designed by Section 2109, 2110 or Chapter 14, respectively, where they are part of a structure~~s~~ classified as *Risk Category* I, II or III in accordance with Section 1604.5.
2. Masonry foundation walls constructed in accordance with Table 1807.1.6.3(1), 1807.1.6.3(2), 1807.1.6.3(3) or 1807.1.6.3(4).
3. Masonry fireplaces, masonry heaters or masonry chimneys installed or constructed in accordance.

1705.4.1 Empirically designed masonry, glass unit masonry and masonry veneer in Risk Category IV. ~~The minimum *special inspection* program~~ *Special inspections* and tests for empirically designed masonry, glass unit masonry or masonry veneer designed by Section 2109, 2110 or Chapter 14, respectively, ~~in~~ where they are part of a structure~~s~~ classified as *Risk Category* IV, in accordance with Section 1604.5, shall ~~comply~~ be performed in accordance with TMS 402/ACI 530/ASCE 5, Level B Quality Assurance.

1705.4.2 Vertical masonry foundation elements. *Special inspections* and tests of vertical masonry foundation elements shall be performed in accordance with Section 1705.4 ~~for vertical masonry foundation elements~~.

1705.6 Soils. *Special inspections* ~~for~~ and tests of existing site soil conditions, fill placement and load-bearing requirements shall be ~~as required by~~ performed in accordance with this section and Table 1705.6. The *approved* geotechnical report, and the *construction documents* prepared by the *registered design professionals* shall be used to determine compliance. During fill placement, the special inspector shall ~~determine~~ verify that proper materials and procedures are used in accordance with the provisions of the *approved* geotechnical report.

Exception: Where Section 1803 does not require reporting of materials and procedures for fill placement, the special inspector shall verify that the in-place dry density of the compacted fill is not less than 90 percent of the maximum dry density at optimum moisture content determined in accordance with ASTM D 1557.

TABLE 1705.6
REQUIRED ~~VERIFICATION AND~~ SPECIAL INSPECTIONS AND TESTS OF SOILS

~~VERIFICATION AND INSPECTION TASK~~ TYPE	CONTINUOUS ~~DURING TASK LISTED~~ SPECIAL INSPECTION	~~PERIODICALLY DURING TASK LISTED SPECIAL INSPECTION~~ PERIODIC

(Portions of table not shown remain unchanged)

1705.7 Driven deep foundations. *Special inspections* and tests shall be performed during installation ~~and testing~~ of driven deep foundation elements as ~~required by~~ specified in Table 1705.7. The *approved instruction documents* prepared by the *registered design professionals*, shall be used to determine compliance.

TABLE 1705.7
REQUIRED ~~VERIFICATION AND~~ SPECIAL INSPECTIONS AND TESTS OF DRIVEN DEEP FOUNDATION ELEMENTS

~~VERIFICATION AND INSEPCTION TASK~~ TYPE	CONTINUOUS ~~DURING TASK LISTED~~ SPECIAL INSPECTION	~~PERIODICALLY DURING TASK LISTED~~ PERIODIC SPECIAL INSPECTION
5. For steel elements, perform additional special inspections in accordance with Section 1705.2.	–	-
6. For concrete elements and concrete-filled elements, perform tests and additional special inspections in accordance with Section 1705.3.	–	-

(Portions of table not shown remain unchanged)

1705.8 Cast-in-place deep foundations. *Special inspections* and tests shall be performed during installation ~~and testing~~ of cast-in place deep foundation elements as ~~required by~~ specified in Table 1705.8. The *approved* geotechnical report, and the *construction documents* prepared by the *registered design professionals*, shall be used to determine compliance.

TABLE 1705.8
REQUIRED ~~VERIFICATION AND~~ SPECIAL INSPECTIONS AND TESTS OF CAST-IN-PLACE DEEP FOUNDATION ELEMENTS

~~VERIFICATION AND INSPECTION TASK~~ TYPE	CONTINUOUS ~~DURING TASK LISTED~~ SPECIAL INSPECTION	~~PERIODICALLY DURING TASK LISTED~~ SPECIAL INSPECTION
3. For concrete elements, perform tests and additional special inspections in accordance with Section 1705.3.	—	—

1705.9 Helical pile foundations. Continuous *special inspections* shall be performed ~~continuously~~ during installation of helical pile foundations. The information recorded shall include installation equipment used, pile dimensions, tip elevations, final depth, final installation torque and other pertinent installation data as required by the *registered design professional in responsible charge*. The *approved* geotechnical report and the *construction documents* prepared by the *registered design professional* shall be used to determine compliance.

1705.11.1 Structural steel. *Special inspection* ~~for~~ of structural steel shall be performed in accordance with the quality assurance requirements of AISC 341.

> **Exception:** *Special inspections* of structural steel in structures assigned to *Seismic Design Category* C that are not specifically detailed for seismic resistance, with a response modification coefficient, *R*, of 3 or less, excluding cantilever column systems.

1705.13 Sprayed fire-resistant materials. *Special inspections* ~~for~~ and tests of sprayed fire-resistant materials applied to floor, roof and wall assemblies and structural members shall be performed in accordance with Sections 1705.13.1 through 1705.13.6. *Special inspections* shall be based on the fire-resistance design as designated in the *approved construction documents*. The tests set forth in this section shall be based on samplings from specific floor, roof and wall assemblies and structural members. *Special inspections* and tests shall be performed after the rough installation of electrical, automatic sprinkler, mechanical and plumbing systems and suspension systems for ceilings, where applicable.

1705.13.1 Physical and visual tests. The *special inspections* and tests shall include the ~~following tests and observations~~ to demonstrate compliance with the listing and the fire-resistance rating:

1. Condition of substrates.

2. Thickness of application.
3. Density in pounds per cubic foot (kg/m^3).
4. Bond strength adhesion/cohesion.
5. Condition of finished application.

1705.13.2 Structural member surface conditions. The surfaces shall be prepared in accordance with the *approved* fire-resistance design and the written instructions of *approved* manufacturers. The prepared surface of structural members to be sprayed shall be inspected by the *special inspector* before the application of the sprayed fire-resistant material.

1705.14 Mastic and intumescent fire-resistant coatings. *Special inspections* and tests for mastic and intumescent fire-resistant coatings applied to structural elements and decks shall be performed in accordance with AWCI 12-B. *Special inspections* and tests shall be based on the fire-resistance design as designated in the *approved construction documents*.

Revise as follows:

1901.4 Special inspections and tests. ~~The~~ *Special inspections* and tests of concrete elements of buildings and structures and concreting operations shall be as required by Chapter 17.

PART II - IFC

Revise as follows:

[F] 909.18.8 ~~Special inspections~~ Testing for smoke control. Smoke control systems shall be tested by a special inspector.

[F] 909.18.8.1 Scope of testing. ~~*Special inspections*~~ Testing shall be conducted in accordance with the following:

1. During erection of ductwork and prior to concealment for the purposes of leakage testing and recording of device location.
2. Prior to occupancy and after sufficient completion for the purposes of pressure-difference testing, flow measurements, and detection and control verification.

909.21.7 ~~Special inspection~~ Testing. ~~*Special inspection*~~ Testing for performance shall be required in accordance with Section 909.18.8. System acceptance shall be in accordance with Section 909.19.

[F] 1705.17 ~~Special inspection~~ Testing for smoke control. Smoke control systems shall be tested by a special inspector.

Reason: The proposal has several purposes. It distinguishes between inspections by the building official and special inspections by special inspectors by adding "special" after "inspection" where special inspections by special inspectors are intended. It adds "tests" after "special inspections" to recognize that the requirements of Chapter 17 distinguish between (1) special inspections by the special inspector, and (2) tests by the special inspector or other individuals employed or retained by the approved agency at the construction site or testing facilities. It deletes references to "verification," which is considered superfluous given that a primary purpose for inspection, including special inspection, is to verify that the construction complies with the building code and the approved construction documents. It also changes the charging language in several places to state that special inspections and tests shall be "performed" rather than be "as required by" for consistency with the charging language elsewhere in Chapter 17.

The titles of Tables 1705.3, 1705.6, 1705.7 and 1705.8 are revised to specify tests as well as special inspections due to the tests that are specified in the first column of each table. The columns labeled "continuous" and "periodic" are changed to "continuous special inspection" and "periodic special inspection" because these distinctions apply to special inspections but not to tests. These changes are not made to Table 1705.2.2 because there are no tests specified in the table.

In Section 1705.4.1, "where they are part of" a structure is added for consistency with similar language in Section 1705.4, Exception, Item #1. In Section 1705.17, the title is changed from "special inspection" to "testing" because there are requirements for testing in the section but there are none for special inspection.

An additional benefit of the proposal is that replacement of Table 1705.4 in the 2009 IBC with a reference to TMS 402/ACI 530/ASCE 5 in the 2012 IBC effectively eliminated requirements for special inspection by continuing the use of "inspected." The changes above clarify the intended requirements for special inspection.

Changes to Sections 1705.2 through 1705.2.2 were included in early drafts of this proposal but they were deleted after the changes were incorporated into separate proposals, which was the result of collaboration with the steel industry.

Note that separate proposals:

1. Further modify Section 1704.2 by changing the title from “special inspections” to “approved agency”
2. Further modify Section 1704.3.2 by deleting “qualification”
3. Change “inspection” to “inspections” in Sections 1705.10.1, Exception; 1705.10.2, Exception; 1705.11.2, Exception; and 1705.11.3, Exception
4. Further modify Section 1704.3.1 by deleting Item #1 and
5. Change “inspection” to “inspections” in Sections 1705.2.2 and 1705.2.2.1.2 .

Cost Impact: The code change proposal will not increase the cost of construction.

1703.1.3-S-BRAZIL.doc

S114–12
1703.1, 1703.1.1, 1703.3

Proponent: Phillip Brazil, P.E., S.E., Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

Revise as follows:

1703.1 Approved agency. An *approved agency* shall provide all information as necessary for the *building official* to determine that the agency meets the applicable requirements specified in Sections 1703.1.1 through 1703.1.4.

1703.1.1 Independence. An *approved agency* shall be objective, competent and independent from the contractor responsible for the work being inspected. The agency shall also disclose to the *building official* and the *registered design professional in responsible charge* possible conflicts of interest so that objectivity can be confirmed.

1703.3 ~~Approved~~ Record of approval. For any material, appliance, equipment, system or method of construction that has been *approved*, a record of such approval, including the conditions and limitations of the approval, shall be kept on file in the *building official's* office and shall be ~~open to~~ available for public ~~inspection~~ review at appropriate times.

Reason: Section 1703.1 requires approved agencies to provide the information necessary for the building official to verify that the agency meets the applicable requirements but these requirements are not identified. The proposal specifies the sections containing the requirements.

Section 1703.1.1 requires approved agencies to disclose possible conflicts of interest so that objectivity can be confirmed but the recipient of the disclosure is not identified. The proposal specifies the building official and the registered design professional in responsible charge as the recipients.

Section 1703.3 is clarifies the requirement of the building official to provide access to the public for records of approval.

Cost Impact: The code change proposal will not increase the cost of construction.

1703.1-S-BRAZIL.doc

S115–12

104.11.3 (NEW), 104.11.4 (NEW), 104.12 (NEW), 104.12.1 (NEW), 104.12.2 (NEW), 104.12.3 (NEW), 104.12.4 (NEW), 1703.2, 1703.3, 1703.4, 1703.4.1, 1703.4.2, 1703.5, 1703.5.1, 1703.5.2, 1703.5.3, 1703.5.4

Proponent: D. Kirk Harman,The Harman Group representing, The National Council of Structural Engineers Associations (NCSEA) Code Advisory Committee, Quality Assurance and Special Inspection Subcommittee.

Add new text as follows:

104.11.3 Written approval. Any material, design, equipment, or method of construction that has been shown to meet the requirements of this code shall be *approved* in writing after satisfactory completion of the required tests and submission of required test reports.

104.11.4 Approved record. For any material, design, equipment, or method of construction that has been *approved*, a record of such approval, including the conditions and limitations of the approval, shall be kept on file in the *building official's* office and shall be open to public inspection at appropriate times.

104.12 Labeling. Where materials or assemblies are required by this code to be *labeled*, such materials and assemblies shall be *labeled* by an *approved agency* in accordance with Section 1703. Products and materials required to be labeled shall be labeled in accordance with the procedures set forth in Sections 104.11.5.1 through 104.11.5.4.

104.12.1 Testing. An *approved agency* shall test a representative sample of the product or material being *labeled* to the relevant standard or standards. The *approved agency* shall maintain a record of the tests performed. The record shall provide sufficient detail to verify compliance with the test standard.

104.12.2 Inspection and identification. The *approved agency* shall periodically perform an inspection, which shall be in-plant if necessary, of the product or material that is to be *labeled*. The inspection shall verify that the labeled product or material is representative of the product or material tested.

104.12.3 Label information. The *label* shall contain the manufacturer's or distributor's identification, model number, serial number or definitive information describing the product or material's performance characteristics and *approved agency's* identification.

104.12.4 Method of labeling. Information required to be permanently identified on the product shall be acid etched, sand blasted, ceramic fired, laser etched, embossed or of a type that, once applied, cannot be removed without being destroyed.

Delete without substitution:

~~**1703.2 Written approval.** Any material, appliance, equipment, system or method of construction meeting the requirements of this code shall be *approved* in writing after satisfactory completion of the required tests and submission of required test reports.~~

~~**1703.3 Approved record.** For any material, appliance, equipment, system or method of construction that has been *approved*, a record of such approval, including the conditions and limitations of the approval, shall be kept on file in the *building official's* office and shall be open to public inspection at appropriate times.~~

~~**1703.4 Performance.** Specific information consisting of test reports conducted by an *approved* testing agency in accordance with the appropriate referenced standards, or other such information as necessary, shall be provided for the *building official* to determine that the material meets the applicable code requirements.~~

~~**1703.4.1 Research and investigation.** Sufficient technical data shall be submitted to the *building official* to substantiate the proposed use of any material or assembly. If it is determined that the evidence submitted is satisfactory proof of performance for the use intended, the *building official* shall approve the use of the material or assembly subject to the requirements of this code. The costs, reports and investigations required under these provisions shall be paid by the applicant.~~

~~**1703.4.2 Research reports.** Supporting data, where necessary to assist in the approval of materials or assemblies not specifically provided for in this code, shall consist of valid research reports from *approved* sources.~~

~~**1703.5 Labeling.** Where materials or assemblies are required by this code to be *labeled*, such materials and assemblies shall be *labeled* by an *approved agency* in accordance with Section 1703. Products and materials required to be labeled shall be labeled in accordance with the procedures set forth in Sections 1703.5.1 through 1703.5.4.~~

~~**1703.5.1 Testing.** An *approved agency* shall test a representative sample of the product or material being *labeled* to the relevant standard or standards. The *approved agency* shall maintain a record of the tests performed. The record shall provide sufficient detail to verify compliance with the test standard.~~

~~**1703.5.2 Inspection and identification.** The *approved agency* shall periodically perform an inspection, which shall be in-plant if necessary, of the product or material that is to be *labeled*. The inspection shall verify that the labeled product or material is representative of the product or material tested.~~

~~**1703.5.3 Label information.** The *label* shall contain the manufacturer's or distributor's identification, model number, serial number or definitive information describing the product or material's performance characteristics and *approved agency's* identification.~~

~~**1703.5.4 Method of labeling.** Information required to be permanently identified on the product shall be acid etched, sand blasted, ceramic fired, laser etched, embossed or of a type that, once applied, cannot be removed without being destroyed.~~

Reason: Chapter 17 is titled "Special Inspections and Tests" and as such, should be reserved for the special inspection and testing associated with construction projects.

This proposal moves paragraphs from **SECTION 1703 APPROVALS** to **Section 104.11 Alternate materials, design and methods of construction and equipment**, which is under **SECTION 104 DUTIES AND POWERS OF THE BUILDING OFFICIAL**, as these paragraphs deal with the approval of materials and systems not covered by the Code. The language of new Sections 104.11.3, and 104.11.4 has been modified slightly to align with Section 104.11, and old sections 1703.4, 1703.4.1 and 1703.4.2 have been deleted without being moved to Section 104.11, as existing sections 104.11.1 and 104.11.2 already cover research reports and the testing associated with approval of materials and systems not covered by the Code.

Paragraphs dealing with products that require labeling have been moved to a new Section 104.12, without modification. Existing Sections 1703.6, 1703.6.1, and 1703.6.2 have been deleted without being moved to Chapter 1 as the requirements for fabricated assemblies are already covered in Section 1704.2.5, 1704.2.5.1, and 1704.2.5.2.

Cost Impact: The code change proposal will not increase the cost of construction.

S115-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1703.2-S-HARMAN.doc

S116–12

1703.4, 1703.4.1, 1703.4.2, 1703.5, 1703.5.1, 1703.5.2, 1703.5.3, 1703.5.4

Proponent: Phillip Brazil, P.E., S.E., Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

Revise as follows:

1703.4 Performance. Specific information consisting of test reports conducted by an *approved* testing agency in accordance with the appropriate referenced standards, or other such information as necessary, shall be provided for the *building official* to determine that the product, material or assembly meets the applicable code requirements.

1703.4.1 Research and investigation. Sufficient technical data shall be submitted to the *building official* to substantiate the proposed use of any product, material or assembly. If it is determined that the evidence submitted is satisfactory proof of performance for the use intended, the *building official* shall approve the use of the product material or assembly subject to the requirements of this code. The costs, reports and investigations required under these provisions shall be paid by the applicant.

1703.4.2 Research reports. Supporting data, where necessary to assist in the approval of products, materials or assemblies not specifically provided for in this code, shall consist of valid research reports from *approved* sources.

1703.5 Labeling. ~~Where materials or assemblies are required by this code to be labeled, such materials and assemblies shall be labeled by an approved agency in accordance with Section 1703.~~ Products, ~~and~~ materials or assemblies required to be labeled shall be labeled in accordance with the procedures set forth in Sections 1703.5.1 through 1703.5.4.

1703.5.1 Testing. An approved agency shall test a representative sample of the product, ~~or~~ material or assembly being labeled to the relevant standard or standards. The approved agency shall maintain a record of the tests performed. The record shall provide sufficient detail to verify compliance with the test standard.

1703.5.2 Inspection and identification. The *approved agency* shall periodically perform an inspection, which shall be in-plant if necessary, of the product or material that is to be *labeled*. The inspection shall verify that the labeled product, ~~or~~ material or assembly is representative of the product, ~~or~~ material or assembly tested.

1703.5.3 Label information. The *label* shall contain the manufacturer's ~~or distributor's~~ identification, model number, serial number or definitive information describing ~~the product or material's~~ performance characteristics of the product, material or assembly and the *approved agency's* identification.

1703.5.4 Method of labeling. Information required to be permanently identified on the product, material or assembly shall be acid etched, sand blasted, ceramic fired, laser etched, embossed or of a type that, once applied, cannot be removed without being destroyed.

Reason: The purpose for the proposal is to update the language in Sections 1703.4 and 1703.5 by correlating the references to "product," "material" and "assembly" for internal consistency. In Section 1703.5, the first sentence is deleted because it is superfluous given that the requirements for labeling in this section are specified in its subsections and the second sentence is sufficient to serve as charging language for the section.

In Section 1703.5.3, the reference to the distributor is deleted for consistency with the definition of "label" in Section 202, which specifies that the label is applied by the manufacturer. Note that Section 1703.5.3 requires the label to contain the identifications of the manufacturer and the approved agency and this is consistent with the definition of "label" that specifies the same identifications.

Note that separate proposals:

1. Delete "testing" from Section 1703.4 so that it reads "…approved agency…" and

Change "the applicant" to "the owner or the owner's authorized agent" in Section 1703.4.1.

Cost Impact: The code change proposal will not increase the cost of construction.

202, 1703.4, 1704.2.5.2, 1705.16.1, 1705.16.2, [F]909.18.8.2, [F]909.18.8.3, [F]1705.17.2

Proponent: Phillip Brazil P.E., S.E., Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

THIS IS A THREE PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IBC ADMINISTRATION COMMITTEE. PART III WILL BE HEARD BY THE IFC COMMITTEE AS SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCUTRAL

Revise as follows:

1703.4 Performance. Specific information consisting of test reports conducted by an *approved* ~~testing~~ agency in accordance with the appropriate referenced standards, or other such information as necessary, shall be provided for the *building official* to determine that the material meets the applicable code requirements.

1704.2.5.2 Fabricator approval. *Special inspections* required by Section 1705 are not required where the work is done on the premises of a fabricator registered and *approved* to perform such work without *special inspection*. Approval shall be based upon review of the fabricator's written procedural and quality control manuals and periodic auditing of fabrication practices by an *approved* ~~*special inspection*~~ agency. At completion of fabrication, the *approved* fabricator shall submit a *certificate of compliance* to the *building official* stating that the work was performed in accordance with the *approved construction documents*.

1705.16.1 Penetration firestops. Inspections of penetration fire-stop systems that are tested and listed in accordance with Sections 714.3.1.2 and 714.4.1.2 shall be conducted by an approved ~~inspection~~ agency in accordance with ASTM E 2174.

1705.16.2 Fire-resistant joint systems. Inspection of fire-resistant joint systems that are tested and listed in accordance with Sections 715.3 and 715.4 shall be conducted by an approved ~~inspection~~ agency in accordance with ASTM E 2393.

PART II – IBC ADMINISTRATION

Revise as follows:

[A] LABELED. Equipment, materials or products to which has been affixed a *label*, seal, symbol or other identifying *mark* of a nationally recognized testing laboratory, ~~inspection~~ *approved* agency or other organization concerned with product evaluation that maintains periodic inspection of the production of the above-labeled items and whose labeling indicates either that the equipment, material or product meets identified standards or has been tested and found suitable for a specified purpose.

PART III – IFC

Revise as follows:

[F] 909.18.8.2 Qualifications. ~~*Special inspection*~~ Approved agencies for smoke control shall have expertise in fire protection engineering, mechanical engineering and certification as air balancers.

[F] 909.18.8.3 Reports. A complete report of testing shall be prepared by the ~~special inspector or *special inspection*~~ *approved* agency. The report shall include identification of all devices by manufacturer, nameplate data, design values, measured values and identification tag or *mark*. The report shall be reviewed by the responsible *registered design professional* and, when satisfied that the design intent has been achieved, the responsible *registered design professional* shall seal, sign and date the report.

[F] 1705.17.2 Qualifications. ~~*Special inspection* agencies~~ *Special inspectors* for smoke control shall have expertise in fire protection engineering, mechanical engineering and certification as air balancers.

Reason: The purpose for the proposal is to update references to "approved agency" throughout the building code. Approved agencies (defined in Section 202) are regularly engaged in conducting tests and employ or retain special inspectors (also defined in Section 202) who are qualified to perform inspections, including special inspections.

In Section 1704.2.5.2, "registered" is deleted because no purpose is served by requiring a fabricator who is approved by the building official to also be registered with the same building official.

Note that a separate proposal changes "special inspections" to "testing" in the title of Section 909.18.8 and in Section 909.18.8.1.

Cost Impact: The code change proposal will not increase the cost of construction.

1703.4 #2-S-BRAZIL.doc

S118–12
1704.1, 1704.2.5.2, 1704.5 (New), 1705.12.3, 1910.5, 2207.5

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

Revise as follows:

1704.1 General. This section provides minimum requirements for special inspections, the statement of special inspections, contractor responsibility, submittals to the *building official* and structural observations.

1704.2.5.2 Fabricator approval. *Special inspections* required by Section 1705 are not required where the work is done on the premises of a fabricator registered and *approved* to perform such work without *special inspection*. Approval shall be based upon review of the fabricator's written procedural and quality control manuals and periodic auditing of fabrication practices by an *approved special inspection* agency. At completion of fabrication, the *approved* fabricator shall submit a *certificate of compliance* to the owner or the owner's authorized agent for submittal to the *building official* as specified in Section 1704.5 stating that the work was performed in accordance with the *approved construction documents*.

1704.5 Submittals to the building official. In addition to the submittal of reports of *special inspections* and tests in accordance with Section 1704.2.4, reports and certificates shall be submitted by the owner or the owner's authorized agent to the *building official* after review and acceptance by a *registered design professional* and prior to the construction or work being performed for each of the following:

1. *Certificates of compliance* for the fabrication of structural, load-bearing or lateral load-resisting members or assemblies on the premises of an *approved fabricator* in accordance with Section 1704.2.5.2
2. *Certificates of compliance* for the seismic qualification of nonstructural components, supports and attachments in accordance with Section 1705.12.3
3. *Certificates of compliance* for *designated seismic systems* in accordance with Section 1705.12.4
4. Reports of preconstruction tests for shotcrete in accordance with Section 1910.5
5. *Certificates of compliance* for open web steel joists and joist girders in accordance with Section 2207.5

(Renumber subsequent sections)

1705.12.3 Seismic certification of nonstructural components. The *registered design professional* shall specify on the construction documents the requirements for certification by analysis, testing or experience data for nonstructural components and designated seismic systems in accordance with Section 13.2 of ASCE 7, where such certification is required by Section 1705.12. *Certificates of compliance* shall be submitted to the *building official* as specified in Section 1704.5.

Revise as follows:

1910.5 Preconstruction tests. ~~When~~ Where preconstruction tests are required by ~~the *building official*~~ Section 1910.4, a test panel shall be shot, cured, cored or sawn, examined and tested prior to commencement of the project. The sample panel shall be representative of the project and simulate job conditions as closely as possible. The panel thickness and reinforcing shall reproduce the thickest and most congested area specified in the structural design. It shall be shot at the same angle, using the same nozzleman and with the same concrete mix design that will be used on the project. The equipment used in preconstruction testing shall be the same equipment used in the work requiring such testing, unless substitute equipment is *approved* by the *building official*. Reports of preconstruction tests shall be submitted to the *building official* as specified in Section 1704.5.

Revise as follows:

2207.5 Certification. At completion of manufacture, the steel joist manufacturer shall submit a *certificate of compliance* ~~in accordance with~~ to the owner or the owner's authorized agent for submittal to the *building official* as specified in Section ~~1704.2.5.2~~ 1704.5 stating that work was performed in accordance with *approved construction documents* and with SJI standard specifications.

Reason: The purpose for the proposal is to provide a new section (Section 1704.5) in the building code that comprehensively specifies the requirements for the submittal of reports and certificates related to construction that is subject to special inspections and tests required by Chapter 17 of the building code. Typically, these documents certify or otherwise verify that a material or product meets certain special requirements, or are alternatives to the general requirements, of the building code.

The items in new Section 1704.5 are typically references to provisions elsewhere in the building code or a referenced standard. The charging language of the new section specifies the requirements for submittal to the building official (e.g., by whom, after review and acceptance, and before the work begins) and the requirements apply equally to each listed submittal. The referenced provisions, however, contain additional requirements unique to each situation. The proposal modifies these provisions to be consistent with the submittal requirements in new Section 1704.5. For example, Item 2 requires submittal of the certificate of conformance "in accordance with Section 1705.12.3." Section 1705.12.3, in turn, requires submittal of the certificate of conformance "to the building official as specified in Section 1704.5." Similar language is found in Item 4 and corresponding Section 1910.5.

Item 1 is similar to Item 2 in that it requires submittal of the certificate of conformance "in accordance with Section 1704.2.5.2." Section 1704.2.5.2, however, requires submittal of the certificate of conformance to "the owner or the owner's authorized agent for submittal to the building official as specified in Section 1704.5...". This is because of the requirement in Section 1704.2.5.2 for submittal of the certificate of compliance by the approved fabricator and is done to avoid a conflict with new Section 1704.5. Similar language is found in Item 5 of new Section 1704.5 and corresponding Section 2207.5.

The charging statement in new Section 1704.5 states that the submittals are in addition to the submittal of reports of special inspections and tests because also listing them in the new section is not needed since this activity is already covered in Section 1704.2.4. It is also not advisable because the submittal of reports of special inspections and tests is the responsibility of approved agencies but the submittals listed in this new section are the responsibility of the owner or owner's authorized agent. Examples of reports of special inspections and tests submitted by approved agencies are: tests of concrete for strength, slump and air content (see Table 1705.3); tests of masonry units, grout and mortar (see Section 1705.4); and strength tests of shotcrete (see Table 1705.3).

Item 4 is included in new Section 1704.5 because the preconstruction tests required by Section 1910.4 are not also a requirement in Chapter 17 of the building code and requiring the submittal of test reports to the building official will enable the building official to verify, before construction begins, the validity of structural design assumptions based on the success of the preconstruction tests. Text requiring the submittal of the test reports to the building official is added to Section 1910.5 in conjunction with Item 4.

For Items 2 and 3 of new Section 1704.5, a separate proposal places the provisions of Section 1705.12.3 into two subsections (Sections 1705.12.3 and 1705.12.4) to provide effective charging language for the corresponding provisions in ASCE 7-10. In that proposal, requirements for the submittal of certificates of compliance to the building official are added to each subsection. This proposal for a new Section 1704.5 also adds a similar requirement to Section 1705.12.3 but the only purpose for doing so is to specify Section 1704.5. Should both proposals be approved by the ICC membership, our intent is that Section 1705.12.3 reads: "Certificates of compliance for the seismic qualification shall be submitted to the building official as specified in Section 1704.5;" and Section 1705.12.4 reads: "Certificates of compliance documenting that the requirements are met shall be submitted to the building official as specified in Section 1704.5."

Note that separate proposals:

1. Transfer the requirements of Section 1705.12.1 to new Section 1704.5;
2. Add additional requirements for submittals that are related to structural steel ;
3. Correlate the language in Section 1704.2.5 with the definition of "fabricated item" in Section 202;
4. Add additional requirements for submittals that are related to the welding of concrete reinforcement and anchor bolts;
5. Add additional requirements for submittals that are related to masonry;
6. Change "the owner" to "the owner or the owner's authorized agent";
7. Add a new Section 107.1.1 that correlates with this proposal; and
8. Add "responsible" before "registered design professional".

Cost Impact: The code change proposal will not increase the cost of construction.

S118-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1704.1 #1-S-BRAZIL.doc

S119–12
1704.1

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

Revise as follows:

1704.1 General. ~~This section provides minimum requirements for~~ Special inspections, ~~the~~ statements of special inspections, responsibilities of contractors ~~responsibility~~ and structural observations shall meet the applicable requirements of this section.

Reason: The changes revise the language from being declarative to being mandatory.

Cost Impact: The code change proposal will not increase the cost of construction.

S119-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1704.1 #2-S-BRAZIL.doc

S120–12
1704.2

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

Revise as follows:

1704.2 Special inspections. Where application is made for construction as described in this section, the owner or the ~~*registered design professional in responsible charge* acting as the~~ owner's agent, other than the contractor, shall employ one or more *approved agencies* to perform inspections during construction on the types of work listed under Section 1705. These inspections are in addition to the inspections identified in Section 110.

Exceptions:

1. *Special inspections* are not required for construction of a minor nature or as warranted by conditions in the jurisdiction as *approved* by the *building official*.
2. Unless otherwise required by the *building official*, *special inspections* are not required for Group U occupancies that are accessory to a residential occupancy including, but not limited to, those listed in Section 312.1.
3. Special inspections are not required for portions of structures designed and constructed in accordance with the cold-formed steel light-frame construction provisions of Section 2211.7 or the conventional light-frame construction provisions of Section 2308.
4. The contractor is permitted to employ the approved agencies where the contractor is also the owner.

Reason: The purpose for the proposal is to delete the requirement that only the registered design professional in responsible charge is permitted to serve as the owner's agent for employing an approved agency to perform special inspections and tests required by Section 1705 of the building code. We are not aware of any abilities of registered design professionals in responsible charge that make them uniquely qualified for this role.

The purpose for adding language to prohibit the contractor from employing the approved agencies is to prevent the contractor from serving as the owner's agent. The employment of approved agencies should be the responsibility of the owner. The contractor should not perform this function to avoid potential conflicts of interest. Note that Section 1703.1.1 requires the approved agency to be independent from the contractor responsible for the work being inspected. Exception #4 is added, however, to permit the contractor to do so where the contractor is also the owner.

Note that a separate proposal adds "authorized" before "agent" in Section 1704.2.

Cost Impact: The code change proposal will not increase the cost of construction.

S120-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1704.2 #1-S-BRAZIL.doc

S121–12

1704.2, 1704.2.1, 1704.2.4

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

Revise as follows:

1704.2 Special inspections. Where application is made for construction as described in this section, the owner or the *registered design professional in responsible charge* acting as the owner's agent shall employ one or more *approved agencies* to ~~perform~~ provide inspections during construction on the types of work listed under Section 1705 and identify them to the *building official*. These inspections are in addition to the inspections identified in Section 110.

Exceptions:

1. *Special inspections* are not required for construction of a minor nature or as warranted by conditions in the jurisdiction as *approved* by the *building official*.
2. Unless otherwise required by the *building official*, *special inspections* are not required for Group U occupancies that are accessory to a residential occupancy including, but not limited to, those listed in Section 312.1.
3. Special inspections are not required for portions of structures designed and constructed in accordance with the cold-formed steel light-frame construction provisions of Section 2211.7 or the conventional light-frame construction provisions of Section 2308.

1704.2.1 Special inspector qualifications. Prior to the start of the construction, **t**he ~~special inspector~~ *approved agencies* shall provide written documentation to the building official demonstrating ~~his or her~~ the competence and relevant experience or training of the *special inspectors* who will perform the *special inspections* and tests during construction. Experience or training shall be considered relevant when the documented experience or training is related in complexity to the same type of *special inspection* activities for projects of similar complexity and material qualities. These qualifications are in addition to qualifications specified in other sections of this code. The *registered design professional in responsible charge* and engineers of record involved in the design of the project are permitted to act as the *approved agency* and their personnel are permitted to act as the special inspector for the work designed by them, provided they qualify as special inspectors.

1704.2.4 Report requirement. ~~Special inspectors~~ *Approved agencies* shall keep records of inspections. The ~~special inspector~~ *approved agency* shall furnish inspection reports to the *building official*, and to the *registered design professional in responsible charge*. Reports shall indicate that work inspected was or was not completed in conformance to *approved construction documents*. Discrepancies shall be brought to the immediate attention of the contractor for correction. If they are not corrected, the discrepancies shall be brought to the attention of the *building official* and to the *registered design professional in responsible charge* prior to the completion of that phase of the work. A final report documenting required *special inspections* and correction of any discrepancies noted in the inspections shall be submitted at a point in time agreed upon prior to the start of work by the applicant and the *building official*.

Reason: Section 1704.2 requires the owner or owner's agent to employ approved agencies to perform special inspections and tests required by Section 1705. The act of an owner or owner's agent to employ an approved agency for this purpose, however, is a private matter (typically contractual) and not an appropriate subject for a building code that requires compliance with its provisions. The proposal revises the language to require the owner or owner's agent to identify to the building official the approved agencies who will provide the special inspections and tests required by Section 1705 that will be performed by special inspectors and others (e.g., testing lab personnel) employed or retained by the approved agency.

Section 1704.2.1 requires special inspectors to provide documentation of their qualifications to the building official but it does not specify when this is required to occur. Being a subsection of Section 1704.2, Section 1704.2.1 also does not specify the relationship between the special inspector providing documentation of qualifications and the owner or owner's agent employing an approved agency. Special inspectors are employed or retained by an approved agency to perform special inspections (see definition of "special inspector" in Section 202). The proposal revises the language to require the approved agency to provide to the building official prior to the start of construction documentation of the qualifications for the special inspectors who will perform the special inspections and tests during construction.

An example of written documentation demonstrating the competence and relevant experience of an approved agency would be evidence of accreditation as an approved agency by the International Accreditation Service (IAS), Inc. The requirements for obtaining and maintaining such accreditation from the IAS are in the Accreditation Criteria for Special inspection Agencies, AC291. Notable provisions in AC291 are definitions, many of which are from 2012 IBC Section 202 (Section 2); information required to be submitted by the agency for accreditation (Section 3); requirements for inspection reports issued by the agency, including compliance with the reporting requirements of IBC Chapter 17 (Section 4); requirements for training, supervision and monitoring of special inspectors (Section 5); and minimum qualifications of special inspectors for specific classes of construction, including those in 2012 IBC Section 1705 (Section 6).

Section 1704.2.4 requires special inspectors to keep records of inspections and furnish inspection reports to the building official and the registered design professional in responsible charge. Special inspectors do generate records of their actions but these are typically kept for submittal by the approved agency that employs or retains them. Section 1704.2.4 is changed to require approved agencies to keep records of special inspections and tests and to submit the reports to the building official and the registered design professional in responsible charge.

Note that separate proposals also revise Section 1704.2 to:

1. Distinguish between special inspections and tests by approved agencies and inspections by the building official;
2. Clarify that the application is made to the building official as specified in Section 105 ; and
3. Update references to “approved agency” throughout the building code, including instances of “special inspection agency”.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

1704.2 #2-S-BRAZIL.doc

S122–12
202, 1704.2

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

Revise as follows:

1704.2 ~~Special inspections~~ Approved agency. Where application is made for to the *building official* construction as ~~described in this~~ specified in Section 105, the owner or the *registered design professional in responsible charge* acting as the owner's agent shall employ one or more *approved agencies* to perform inspections during construction on the types of work ~~listed under~~ specified in Section 1705. These inspections are in addition to the inspections identified in Section 110.

Exceptions:

1. *Special inspections* are not required for construction of a minor nature or as warranted by conditions in the jurisdiction as *approved* by the *building official*.
2. Unless otherwise required by the *building official*, *special inspections* are not required for Group U occupancies that are accessory to a residential occupancy including, but not limited to, those listed in Section 312.1.
3. Special inspections are not required for portions of structures designed and constructed in accordance with the cold-formed steel light-frame construction provisions of Section 2211.7 or the conventional light-frame construction provisions of Section 2308.

Revise as follows:

SECTION 202
DEFINITIONS

STRUCTURAL OBSERVATION. The visual observation of the structural system by a *registered design professional* for general conformance to the *approved construction documents*. Structural observation does not include or waive the responsibility for the inspections ~~required by~~ in Section 110~~,~~ or the *special inspections* in Section 1705 ~~or other sections of this code~~.

Reason: The current language in Section 1704.2 references that section for requirements applicable to applications for construction but Section 1704.2 contains no such requirements. The requirements for applications to the building official for permits are located in Section 105.

The definition of structural observation is revised because the current language refers to inspections in Section 110, Section 1705 or other sections of the code but Section 110 specifies inspections to be performed by the building official, Section 1705 specifies special inspections to be performed by special inspectors employed or retained by an approved agency, and there are no other sections in the *International Building Code* with inspections or special inspections to reference other than for smoke control systems, which are not subject to structural observations. The changes will also make the definition consistent with the last sentence of Section 1704.2 ("in addition to the inspections specified in Section 110").

Note that a separate proposal also revises Section 1704.2 to distinguish between special inspections and tests by approved agencies and inspections by the building official.

Cost Impact: The code change proposal will not increase the cost of construction.

S123–12
1704.2.5, 1704.2.5.1, 1704.2.5.2, 1705.10 (NEW)

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing self (pbrazil@reidmiddleton.com)

Revise as follows:

1704.2.5 Special inspection of ~~fabricators~~ fabricated items. Where fabrication of structural load-bearing members and assemblies is being ~~performed~~ conducted on the premises of a fabricator's shop, *special inspection* of the fabricated items shall be ~~required by this section and as required elsewhere in this code~~ performed during fabrication.

Exceptions:

~~**1704.2.5.1 Fabrication and implementation procedures.**~~

1. The special inspector shall verify that the fabricator maintains detailed fabrication and quality control procedures that provide a basis for inspection control of the workmanship and the fabricator's ability to conform to *approved construction documents* and referenced standards. The special inspector shall review the procedures for completeness and adequacy relative to the code requirements for the fabricator's scope of work.

~~**Exception:**~~

2. *Special inspections* ~~as required by Section 1704.2.5 shall~~ are not ~~be~~ required where the fabricator is registered and *approved* in accordance with Section 1704.2.5.2.

~~**1704.2.5.2**~~ **1704.2.5.1 Fabricator approval.** *Special inspections* ~~required by Section 1705~~ during fabrication are not required where the work is done on the premises of a fabricator registered and *approved* to perform such work without *special inspection*. Approval shall be based upon review of the fabricator's written procedural and quality control manuals and periodic auditing of fabrication practices by an *approved special inspection* agency. At completion of fabrication, the *approved* fabricator shall submit a *certificate of compliance* to the *building official* stating that the work was performed in accordance with the *approved construction documents*.

1705.10 Fabricated items. Special inspections of fabricated items shall be performed in accordance with Section 1704.2.5.

(Renumber subsequent sections)

Reason: Section 1704.2.5 requires special inspections to be performed for all structural load-bearing members and assemblies that are fabricated on the premises of a fabricator's shop (e.g., not at the construction site) as specified in the section and elsewhere in the building code. One example of this is the fabrication of metal-plate-connected wood trusses, which is subject to the special inspections required by Section 1704.2.5. Special inspections of the installation of the trusses at the construction site is not required except for trusses spanning 60 feet or greater (Section 1705.5.2).

A second example is the fabrication of precast, prestressed, concrete members (e.g., hollow-core slabs), which is also subject to the special inspections required by Section 1704.2.5 as well as those of Section 1705.3 for concrete construction. Note that Item 9 of Table 1705.3 specifies inspection of prestressed concrete.

Section 1704.2.5 requires special inspections of the fabricated items. Section 1704.2.5.1 specifies duties of the special inspector but these duties are not directly related to special inspections of the fabricated items. Instead, the specified duties are typical of what is conducted by an approved agency for the accreditation of a fabricator by a nationally recognized accreditation service such as the International Accreditation Service. Based on Section 1704.2.5, these duties are required in addition to special inspections of the fabricated items that are required elsewhere in the building code, such as for precast, prestressed, concrete members.

The proposal modifies the provisions in Section 1704.2.5 by requiring special inspections of fabricated items during fabrication. Section 1704.2.5.1 is changed to an exception making it an alternative to the basic requirement for special inspection in Section 1704.2.5.

The other changes in the proposal are made to clarify the language. Section 1705.10 is added because Section 1704.2.5 requires special inspections except where the work is done on the premises of an approved fabricator (Section 1704.2.5.2) and should be included in Section 1705, which specifies required special inspection and tests.

The current provisions in Section 1704.2.5.2 (renumbered to Section 1704.2.5.1 are an acknowledgement that there are fabricators who (1) fabricate products or assemblies with sufficient quality and through the application of documented procedures (e.g., quality management systems), and (2) and are recognized for this through certification, accreditation or qualification by a national recognized organization providing such services, that they should be exempt from further requirements for special inspection of fabrication. Examples are:

1. The certification program of steel fabricators and erectors by the American Institute of Steel Construction (AISC), which is audited by the Quality Management Company;
2. The accreditation of the fabrication inspection programs for reinforced concrete and precast/prestressed concrete, structural steel and wood wall panels by the International Accreditation Service (IAS) (see AC157, AC172 and AC196, respectively, for accreditation criteria);
3. The accreditation of the inspection programs for manufacturers of metal building systems by the International Accreditation Service (IAS) (see AC472 for accreditation criteria); and
4. Qualification of prefabricated items such as prefabricated wood shear panels, cold-formed, pin-connected open-web trusses with wood chords and tubular or angular steel webs, and steel lateral-force-resisting vertical assemblies, as alternatives to applicable requirements in the IBC or other codes by the ICC Evaluation Service (ICC-ES) (see AC130, AC306 and AC322, respectively, for acceptance criteria).
5. The certification of structural and architectural concrete products by the Precast, Prestressed Concrete Institute (PCI).
6. The certification of precast concrete products by the National Precast Concrete Association (NPCA).

Note that separate proposals:

1. Revise Section 1704.2.5.2 to specify that the approved fabricator is required to submit the certificate of compliance to the owner or the owner's authorized agent in conjunction with the requirement in proposed Section 1704.5 for submittal of the certificate to the building official;
2. Revise Sections 1704.2.5 and 1704.2.5.1 for consistency with and to correlate with the definition of "fabricated item" in Section 202; and
3. Revise Section 1704.2.5.2 and other sections to update references to "approved agency" throughout the building code.

Cost Impact: The code change proposal will not increase the cost of construction.

S123-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1704.2.5 #1-S-BRAZIL.doc

S124–12
202, 1704.2.5, 1704.2.5.1

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

Revise as follows:

1704.2.5 Inspection of fabricators. Where fabrication of structural, load-bearing or lateral load-resisting members ~~and~~ or assemblies is being ~~performed~~ conducted on the premises of a fabricator's shop, *special inspection* of the fabricated items shall be performed as required by this section and ~~as required~~ elsewhere in this code.

1704.2.5.1 Fabrication and implementation procedures. The special inspector shall verify that the fabricator maintains detailed fabrication and quality control procedures that provide a basis for ~~inspection~~ control of the workmanship and the fabricator's ability to conform to *approved construction documents* and ~~referenced standards~~ this code. The special inspector shall review the procedures for completeness and adequacy relative to the ~~code~~ requirements ~~for~~ applicable to the fabricator's scope of work.

> **Exception:** *Special inspections* as required by Section 1704.2.5 shall not be required where the fabricator is *approved* in accordance with Section 1704.2.5.2.

Revise as follows:

SECTION 202
DEFINITIONS

FABRICATED ITEM. Structural, load-bearing or lateral load-resisting members or assemblies consisting of materials assembled prior to installation in a building or structure, or subjected to operations such as heat treatment, thermal cutting, cold working or reforming after manufacture and prior to installation in a building or structure. Materials produced in accordance with standards ~~specifications~~ referenced by this code, such as rolled structural steel shapes, steel reinforcing bars, *masonry units* and wood structural panels, or in accordance with a referenced standard ~~which~~ that provides requirements for quality control done under the supervisions of a third-party quality control agency, ~~shall not be considered~~ are not "fabricated items."

Reason: The purpose for the proposal is to correlate the provisions for fabrication on the premises of a fabricator's shop. Section 1704.2.5 and the definition of "fabricated item" in Section 202 are revised for internal consistency. The change from "shall not be" to "are not" in the definition of "fabricated item" eliminates mandatory language, which is not appropriate in a definition. Also, "specifications" is deleted because the building code references standards, not specifications.

In Section 1704.2.5.1, "referenced standards" is replaced with "this code" for consistency with Section 102.4, which establishes that standards referenced by the building code are considered part of the code's requirements to the prescribed extent of the standard. The other changes are made because there are no requirements in the building code for the fabricator's scope of work and the requirements applicable to the fabricator are not limited to the requirements in the building code but also include what is specified in the approved construction documents.

Cost Impact: The code change proposal will not increase the cost of construction.

S124-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1704.2.5 #2-S-BRAZIL.doc

S125–12
1704.2.5, 1704.2.5.1, 1704.2.5.2

Proponent: Stephen Kerr, S.E., Josephson Werdowatz and Associates, representing Structural Engineers Association of California (SEAOC) (skerr@jwa-se.com)

Revise as follows:

1704.2.5 Inspection of ~~fabricators~~ fabricated and pre-fabricated items. Where fabrication of structural load-bearing members and assemblies is being performed on the premises of a fabricator's shop, *special inspection* of the fabricated items shall be required by this section and as required elsewhere in this code.

~~**1704.2.5.1 Fabrication and implementation procedures.** The special inspector shall verify that the fabricator maintains detailed fabrication and quality control procedures that provide a basis for inspection control of the workmanship and the fabricator's ability to conform to *approved construction documents* and referenced standards. The special inspector shall review the procedures for completeness and adequacy relative to the code requirements for the fabricator's scope of work.~~

~~**Exception:** *Special inspections* as required by Section 1704.2.5 shall not be required where the fabricator is *approved* in accordance with Section 1704.2.5.2.~~

~~**1704.2.5.2**~~ **1704.2.5.1 Fabricator approval.** *Special inspections* required by Section 1704.2.5 and Section 1705, except Sections 1705.10, 1705.11 and 1705.12 are not required where the work is done on the premises of a fabricator registered and *approved* to perform such work without *special inspection*. Approval shall be based upon review of the fabricator's written procedural and quality control manuals and periodic auditing of fabrication practices by an *approved special inspection* agency. At completion of fabrication, the *approved* fabricator shall submit a *certificate of compliance* to the *building official* stating that the work was performed in accordance with the *approved construction documents*.

Reason: The proposed change in 1704.2.5 makes it clear that the special inspection is of the fabricated item, not the fabricator. The addition of the word "pre-fabricated" is needed due to the use of the word in 1703.6, and 1705.5. A related code change proposal adds a definition of "prefabricated item", equating it with "fabricated item."

Section 1704.2.5.1 is deleted because it is often confused with the review of the fabricator's quality control procedures that is done as part of the process of approving fabricators to perform work without special inspection. That task should only be done by a qualified auditor when the fabricator is seeking "approved fabricator" status in accordance with 1704.2.5.2 (here renumbered as 1704.2.5.1). As 1704.2.5 requires special inspection of the items being fabricated, verification of the fabricator's quality processes is not needed.

The exception to 1704.2.5.1 is deleted because the exception is adequately covered in 1704.2.5.2 (now renumbered as 1704.2.5.1).

The revision to the first sentence of 1704.2.5.2 is needed because the reorganization of Chapter 17 effected in the last code-change cycle merged all the special inspection requirements, including those for wind and seismic resistance, into Section 1705. The reference to Section 1705 would then allow the waiver of special inspection when work is performed in an approved fabricator's shop to be applicable to the wind-force resisting system in high wind areas and to the seismic force-resisting system. Code Change Proposal S109 07/08 specifically changed this section to clarify that the waiver would not apply to seismic.

Cost Impact: The code change proposal will not increase the cost of construction and may decrease the cost of construction in jurisdictions where the special inspector was performing the verification required by 1704.2.5.1.

S125-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1704.2.5-S-KERR.doc

S126–12
1704.2.5, 1704.2.5.1, 1704.2.5.2

Proponent: Bonnie Manley, P.E., American Iron and Steel Institute, representing American Institute of Steel Construction (bmanley@steel.org)

Revise as follows:

~~1704.2.5~~ <u>1704.3</u> Inspection of fabricators <u>and fabricated items</u>. Where fabrication of structural load-bearing members and assemblies is being performed on the premises of a fabricator's shop, *special inspection* of the fabricated items shall be required by this section and as required elsewhere in this code.

> <u>**Exception:** Special inspections as required by Section 1704.3.1 and Section 1705, except Sections 1705.10, 1705.11 and 1705.12, are not required where the work is done on the premises of a fabricator approved in accordance with Section 1704.3.2 to perform such work without special inspection.</u>

~~1704.2.5.1~~ <u>1704.3.1</u> Fabrication and implementation procedures. The special inspector shall verify that the fabricator maintains detailed fabrication and quality control procedures that provide a basis for inspection control of the workmanship and the fabricator's ability to conform to *approved construction documents* and referenced standards. The special inspector shall review the procedures for completeness and adequacy relative to the code requirements for the fabricator's scope of work.

> ~~**Exception:** *Special inspections* as required by Section 1704.2.5 shall not be required where the fabricator is *approved* in accordance with Section 1704.2.5.2.~~

~~1704.2.5.2~~ <u>1704.3.2</u> Fabricator approval. ~~*Special inspections* required by Section 1705 are not required where the work is done on the premises of a fabricator registered and *approved* to perform such work without *special inspection*.~~ Approval shall be based upon review of the fabricator's written procedural and quality control manuals and periodic auditing of fabrication practices by an *approved special inspection* agency. At completion of fabrication, the *approved* fabricator shall submit a *certificate of compliance* to the *building official* stating that the work was performed in accordance with the *approved construction documents*.

(Renumber subsequent sections)

Reason: This modification corrects the unintended consequences of modifications made by Proposal S116-09/10, effective with IBC 2012, which reorganized Chapter 17 and combined all special inspections and tests into Section 1705, including requirements for additional inspection and testing for wind resistance and seismic resistance. Previously, special inspections for wind resistance and seismic resistance had not been subject to the waiver of special inspections under the approved fabricators provisions, as demonstrated by the modifications made under Proposal S109-07/08, which appears in IBC 2009.

This modification also corrects the unintended consequences of modifications made by Proposal S116-09/10, effective with IBC 2012, which reorganized Section 1704, combining the provisions on inspection of fabricators, approved fabricators, and waiver of special inspections into the same numbering set as the general special inspection provisions.

This is first shown to be an unintended consequence with a modification made through Proposal S109–07/08 regarding 1704.2.2, which added the specific reference to Section 1704 into 1704.2.2, with the reason stated as follows:

> "This modification attempts to clarify exactly which inspections are permitted to be waived when work is done by a registered and approved fabricator. As written now, it could be interpreted to mean that the special inspections for seismic resistance required by Section 1707.2 could be waived. This is not appropriate and needs to be corrected."

This is also shown to be an unintended consequence in that IBC 2009 stated:

> "Section 1706.1 Special inspections for wind requirements. Special inspections itemized in Sections 1706.2 through 1706.4, unless exempted by the exceptions to Section 1704.1, are required ...
>
> Section 1707.1 Special inspections for seismic resistance. Special inspections itemized in Sections 1707.2 through 1707.9, unless exempted by the exceptions of Section 1704.1, 1705.3, or 1705.3.1, are required ....
>
> 1708.1 Testing and qualification for seismic resistance. The testing and qualification specified in Sections 1708.2 through 1708.5, unless exempted from special inspections by the exceptions of Section 1704.1, 1705.3 or 1705.3.1 are required as follows: ... "

In IBC 2009, Section 1704.1 did not include the Approved Fabricator provisions, which were located in 1704.2.

With the reorganization for IBC 2012, the Approved Fabricator provisions were combined into the same number sequence as the previous 1704.1, with new provisions stated as follows:

> "1705.10 Special inspections for wind resistance. Special inspections itemized in Sections 1705.10.1 through 1705.10.3, unless exempted by the exceptions to Section 1704.2, are required for buildings and structures constructed in the following areas: ...
>
> 1705.11 Special inspections for seismic resistance. Special inspections itemized in Sections 1705.11.1 through 1705.11.8, unless exempted by the exceptions of Section 1704.2, are required for the following: ...
>
> 1705.12 Testing and qualification for seismic resistance. The testing and qualification specified in Sections 1705.12.1 through 1705.12.4, unless exempted from special inspections by the exceptions of Section 1704.2 are required as follows: ... "

Therefore, for clarity, the Approved Fabricator provisions that were once distinct need to be renumbered separately from 1704.2 to avoid confusion with the provisions of 1705.10, 1705.11 and 1705.12.

The language in 1704.2.5 led to confusion about whether the waiver of special inspections applied only to the review of the fabricator's procedures, the fabricated items, or both, as the exception appeared in Section 1704.2.5.1. Secondly, the exception was repeated in a different manner in Section 1704.2.5.2. The title of 1704.2.5 addressed fabricators only, and not the fabricated items. The term “registered” is not used for such purposes within the code, and therefore is deleted. The new organization and the combination of statements regarding waiver of special inspections is intended to resolve this confusion.

Cost Impact: This change will increase cost of fabricated items that fall under the requirements for additional inspection and testing for wind resistance and seismic resistance.

S126-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1704.2.5-S-MANLEY.doc

S127–12
1704.3.1

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

Revise as follows:

1704.3.1 Content of statement of special inspections. The statement of special inspections shall identify the following:

~~1. The materials, systems, components and work required to have *special inspection* or testing by the *building official* or by the *registered design professional* responsible for each portion of the work.~~

(Renumber remaining items)

Reason: The purpose for the proposal is to delete the requirement that the statement of special inspections specify the special inspection or testing required to be performed by the building official or the registered design professional responsible for each portion of the work. The building official is required to perform inspections, not special inspections or tests, which are required to be performed by special inspectors employed or retained by approved agencies. IBC Section 104.4 requires the building official to perform all required inspections but the building official is permitted to accept certified reports of inspections by approved agencies or responsible individuals.

Section 1704.2 requires the owner or owner's agent to employ approved agencies to perform special inspections and tests required by Section 1705. There is no requirement in the building code for registered design professionals to perform special inspections or tests but Section 1704.2.1 permits them to act as special inspectors, provided they demonstrate in writing their "competence and relevant experience or training" to the building official. Section 1704.2.1 also permits the registered design professional in responsible charge and engineers of record involved in the design of the project to act as the approved agency and their personnel to act as special inspectors for the work they designed, provided they qualify as special inspectors. Qualification as special inspectors requires the same demonstration of "competence and relevant experience or training" as noted above.

The language in Section 1704.2.1 serves as an alternative to the requirement in Section 1704.2 for the owner or owner's agent to employ approved agencies to perform special inspections and tests required by Section 1705. Based on its definition in Section 202, an approved agency is "established and recognized" as being "regularly engaged in conducting tests or furnishing inspection services." Registered design professionals in responsible charge and engineers of record involved in the design of the project may not be so "established and recognized" but they are permitted to serve as an approved agency and their personnel are permitted to act as special inspectors for the work they designed, provided they demonstrate their qualifications to the building official. However, this does not establish a requirement for registered design professionals to perform special inspections or tests as specified in Item 1 of Section 1704.3.1.

Note that a separate proposal modifies current Item #4 of Section 1704.3.1 by changing "special inspection or testing" to "special inspections or tests".

Cost Impact: The code change proposal will not increase the cost of construction.

S127-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1704.3.1-S-BRAZIL.doc

S128–12
1704.3.1

Proponent: Stephen Kerr, S.E., Josephson Werdowatz and Associates, representing Structural Engineers Association of California (SEAOC) (skerr@jwa-se.com)

Revise as follows:

1704.3.1 Content of statement of special inspections. The statement of special inspections shall identify the following:

1. The materials, systems, components and work required to have *special inspection* or testing by the *building official* or by the *registered design professional* responsible for each portion of the work.
2. The type and extent of each *special inspection*.
3. The type and extent of each test.
4. Additional requirements for *special inspection* or testing for seismic or wind resistance as specified in Sections 1705.10, 1705.11 and 1705.12.
5. For each type of *special inspection*, ~~identification as to~~ whether it will be continuous *special inspection*, ~~or~~ periodic *special inspection*, or performed at a frequency in accordance with the notation used in the reference standard where the inspections are defined.

Reason: The quality assurance requirements of AISC 360 and AISC 341, which are referenced as the standard for special inspections and testing for structural steel, do not describe the frequency of the inspections as “periodic” or ”continuous.” Rather, detailed inspection tasks are defined, and the level of effort for each task is described by the terms “Observe” and “Perform”. This proposal accommodates this alternate approach to the frequency of special inspection.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

1704.3.1-S-KERR.doc

S129–12

1704.3.2, 1705.11.4, 1705.12, 1705.12.3, 1705.12.4 (New)

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

Revise as follows:

1704.3.2 Seismic requirements in the statement of special inspections. Where Section 1705.11 or 1705.12 specifies special inspections~~,~~ ~~testing or qualification~~ or tests for seismic resistance, the statement of special inspections shall identify the designated seismic systems and seismic force-resisting systems that are subject to the *special inspections* or tests.

1705.11.4 Designated seismic systems. The special inspector shall examine designated seismic systems requiring seismic qualification in accordance with Section ~~1705.12.3~~ 13.2.2 of ASCE 7 and verify that the *label*, anchorage ~~or~~ and mounting conforms to the *certificate of compliance*.

1705.12 Testing ~~and qualification~~ for seismic resistance. ~~The~~ Testing ~~and qualification~~ for seismic resistance is required as specified in Sections 1705.12.1 through ~~1705.12.4~~ 1705.12.5, unless exempted from *special inspections* by the exceptions of Section 1704.2 are required as follows:

1. The seismic force-resisting systems in structures assigned to *Seismic Design Category* C, D, E or F shall meet the requirements of Sections 1705.12.1 and 1705.12.2, as applicable.
2. Designated seismic systems in structures assigned to *Seismic Design Category* C, D, E or F and subject to the certification requirements of ASCE 7 Section 13.2.2 shall comply with Section 1705.12.3.
3. Architectural, mechanical and electrical components in structures assigned to *Seismic Design Category* C, D, E or F and where the requirements of ASCE 7 Section 13.2.1 are met by submittal of manufacturer's certification, in accordance with Item 2 therein, shall comply with Section 1705.12.3.
4. The seismic isolation system in seismically isolated structures shall meet the testing requirements of Section 1705.12.4.

1705.12.3 ~~Seismic certification of~~ Nonstructural components. . For *structures* assigned to *Seismic Design Category* B, C, D, E or F, where the requirements of Section 13.2.1 of ASCE 7 for nonstructural components, supports or attachments are met by seismic qualification as specified in Item 2 therein, the *registered design professional* shall specify on the construction documents the requirements for ~~certification~~ seismic qualification by analysis, testing or experience data ~~for nonstructural components and designated seismic systems in accordance with Section 13.2 of ASCE 7, where such certification is required by Section 1705.12~~ *Certificates of compliance* for the seismic qualification shall be submitted to the *building official*.

1705.12.4 Designated seismic systems. For *structures* assigned to *Seismic Design Category* C, D, E or F and with *designated seismic systems* that are subject to the requirements of Section 13.2.2 of ASCE 7 for certification, the *registered design professional* shall specify on the *construction documents* the requirements to be met by analysis, testing or experience data as specified therein. *Certificates of compliance* documenting that the requirements are met shall be submitted to the *building official*.

(Renumber subsequent sections)

Reason: The provisions in Section 1705.12.3 are placed in two sections to provide effective charging language for the corresponding provisions in ASCE 7-10 for nonstructural components meeting special requirements and designated seismic systems, which differ substantially from each other. References to "certification" and "qualification" in this section as well as other sections in the proposal are also revised for consistency with the corresponding provisions of ASCE 7-10. Seismic qualification and certification are technical requirements that are covered by the provisions in ASCE 7-10 (Sections 13.2.1 and 13.2.2). What is relevant in the building code is the submittal of certificates of compliance (manufacturer's certification in ASCE 7-10) to the building official for verification that the requirements for seismic qualification and certification are met and language is added to both sections for this purpose.

The requirement to submit certificates of compliance to the building official is also added to both sections for consistency with corresponding language in ASCE 7-10. Items #1 and #2 in Section 13.2.2 of ASCE 7-10 both specify submittal "for approval to the authority having jurisdiction after review and acceptance by a registered design professional." Item #1 in Section 13.2.1 of ASCE 7-10 contains similar language. Item #2 in Section 13.2.1, however, specifies submittal but not to whom. This has been judged to be an oversight on the part of the ASCE 7 Committee whose membership includes two members of the WABO Technical Code Development Committee. This has been brought to the attention of the ASCE 7 Committee and a proposal that addresses the issue will be submitted for consideration in the next development cycle for the standard.

The current language in Section 1705.12.3 for the registered design professional to specify on the construction documents the requirements to be met by analysis, testing or experience data is not substantively changed by this proposal.

Also in Section 1705.12.3, the scope is expanded to include structures assigned to Seismic Category B. For a nonstructural component in a structure where the option of seismic qualification by analysis, testing or experience data in Section 13.2.1, Item 2, of ASCE 7-10 is chosen, the requirements to document the parameters for seismic qualification on the construction documents and to submit the certificate of compliance for seismic qualification to the building official will apply. These requirements, however, are the consequence of the owner, design team or construction team choosing to comply with Section 13.2.1 of ASCE 7-10 through seismic qualification rather than the design option in Section 13.2.1, Item 1 of ASCE 7-10.

Note that a separate proposal modifies the requirement in Sections 1705.12.3 and 1705.12.4 to submit certificates of compliance for consistency with the changes in that proposal by stating that they shall be submitted to the building official "as specified in Section 1704.5".

Cost Impact: The code change proposal will not increase the cost of construction.

1704.3.2-S-BRAZIL.doc

S130–12
1704.3.3, 1705.10

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing self (pbrazil@reidmiddleton.com)

Revise as follows:

1704.3.3 Wind requirements in the statement of special inspections. Where Section 1705.10 specifies special inspection for wind ~~requirements~~ resistance, the statement of special inspections shall identify the main windforce-resisting systems and wind-resisting components that are subject to *special inspection*.

1705.10 Special inspections for wind resistance. *Special inspections* ~~itemized~~ for wind resistance specified in Sections 1705.10.1 through 1705.10.3, unless exempted by the exceptions to Section 1704.2, are required for buildings and structures constructed in the following areas:

1. In wind Exposure Category B, where V_{asd} as determined in accordance with Section 1609.3.1 is 120 miles per hour (52.8 m/sec) or greater.
2. In wind Exposure Category C or D, where V_{asd} as determined in accordance with Section 1609.3.1 is 110 mph (49 m/sec) or greater.

Reason: The purpose for the proposal is to correlate the language that specifies special inspections for wind resistance with separate proposals that make similar changes to Section 1705.11 on special inspections for seismic resistance and to Section 1705.12 on testing for seismic resistance .

Cost Impact: The code change proposal will not increase the cost of construction.

S130-12

Public Hearing:	Committee:	AS	AM	D

1704.3.3-S-BRAZIL.doc

S131–12
202, 1704.5

Proponent: D. Kirk Harman, P.E., S.E., SECB, FACI, The Harman Group, representing the National Council of Structural Engineers Associations (NCSEA) Code Advisory Committee, Quality Assurance and Special Inspection Subcommittee

Revise as follows:

SECTION 202
DEFINITIONS

STRUCTURAL OBSERVATION. The visual observation of the structural system by a *registered design professional* for general conformance to the *approved construction documents*. ~~Structural observation does not include or waive the responsibility for the inspection required by Section 110, 1705 or other sections of this code.~~

Revise as follows:

1704.5 Structural observations. Where required by the provisions of Section 1704.5.1 or 1704.5.2, the owner shall employ a *registered design professional* to perform structural observations as defined in ~~Section 202~~ Chapter 2. Structural observation does not include or waive the responsibility for the inspections in Section 110 or the *special inspections* in Section 1705.

Prior to the commencement of observations, the structural observer shall submit to the *building official* a written statement identifying the frequency and extent of structural observations.

At the conclusion of the work included in the permit, the structural observer shall submit to the *building official* a written statement that the site visits have been made and identify any reported deficiencies which, to the best of the structural observer's knowledge, have not been resolved.

Reason: The last sentence of the definition in section 202 is moved to section 1704.5 because rules and relationships to other requirements should not be in the definition. The sentence is slightly revised to distinguish between "inspections" and *special inspections* and the reference to "other sections of this code" is deleted as there are no other sections that deal with inspections. The first sentence in 1704.5 is revised to make reference to Chapter 2 where definitions are now located.

Cost Impact: The code change proposal will not increase the cost of construction.

S131-12

1704.5 #1-S-HARMAN.doc

S132–12
1704.5, 1704.5.1, 1704.5.2

Proponent: D. Kirk Harman, P.E., S.E., SECB, FACI, The Harman Group, representing the National Council of Structural Engineers Associations (NCSEA) Code Advisory Committee, Quality Assurance and Special Inspection Subcommittee

Revise as follows:

1704.5 Structural observations. Where required by the provisions of Section 1704.5.1 ~~or 1704.5.2,~~ the owner shall employ a *registered design professional* to perform structural observations as defined in ~~Section 202~~ Chapter 2.

Prior to the commencement of observations, the structural observer shall submit to the *building official* a written statement identifying the frequency and extent of structural observations.

At the conclusion of the work included in the permit, the structural observer shall submit to the *building official* a written statement that the site visits have been made and identify any reported deficiencies which, to the best of the structural observer's knowledge, have not been resolved.

~~**1704.5.1 Structural observations for seismic resistance.** Structural observations shall be provided for those structures assigned to *Seismic Design Category* D, E or F where one or more of the following conditions exist:~~

1. ~~The structure is classified as *Risk Category* III or IV in accordance with Table 1604.5.~~
2. ~~The height of the structure is greater than 75 feet (22 860 mm) above the base.~~
3. ~~The structure is assigned to *Seismic Design Category* E, is classified as *Risk Category* I or II in accordance with Table 1604.5, and is greater than two *stories above grade plane*.~~
4. ~~When so designated by the *registered design professional* responsible for the structural design.~~
5. ~~When such observation is specifically required by the *building official*.~~

~~**1704.5.2 Structural observations for wind requirements.** Structural observations shall be provided for those structures sited where V_{asd} as determined in accordance with Section 1609.3.1 exceeds 110 mph (49 m/sec), where one or more of the following conditions exist:~~

1. ~~The structure is classified as *Risk Category* III or IV in accordance with Table 1604.5.~~
2. ~~The *building height* of the structure is greater than 75 feet (22 860 mm).~~
3. ~~When so designated by the *registered design professional* responsible for the structural design.~~
4. ~~When such observation is specifically required by the *building official*.~~

1704.5.1 Structural observations of the structural system. *Structural observations* shall be provided where one or more of the following conditions exist:

1. The *building height*, or the height above the *grade plane* to the uppermost structural level of a non-building structure, is greater than 75 feet (22860 mm).
2. The structure has an occupant load greater than 500.
3. The structure is classified as *Risk Category* III in accordance with Table 1604.5, and is assigned to *Seismic Design Category* D, E, or F.
4. The structure is classified as *Risk Category* III in accordance with Table 1604.5, and is sited where V_{asd} as determined in accordance with Section 1609.3.1 exceeds 110 mph (49m/sec).
5. The structure is classified as *Risk Category* I or II in accordance with Table 1604.5, is assigned to *Seismic Design Category* E, or F and is greater than two *stories above the grade plane.*
6. The structure is classified as *Risk Category* IV in accordance with Table 1604.5.
7. Where required by the *registered design professional* responsible for the structural design.
8. Where such observation is specifically required by the *building official*.

Reason: Currently the code requires structural observation only in the limited situations of tall buildings or higher risk category structures located in high seismic and wind areas. It is the opinion of the National Council of Structural Engineers Associations that structural observation should be required for all large, or important, buildings anywhere in the country. It is well established that the quality of construction is increased when the engineer who designed the structure can verify that key construction conditions are in conformance with the design intent. Structural observation is meant to augment the detailed inspection provided by the special inspectors. It should be required wherever the consequence of structural failure is greater by virtue of complexity, size, occupancy, or risk.

Currently, a 7 story office building in San Francisco would require structural observation but a 60 story highrise or a 40000 seat stadium in New York would not. This proposal is intended to increase public safety by requiring that all similar structures are afforded the benefit of structural observation, not just the ones at risk of earthquakes or hurricanes.

Cost Impact: The code change proposal will not increase the cost of construction. It is generally held by many structural engineers that requirements stipulated by the building code will viewed as within the normal scope of services therefore it is not anticipated that there will be a general increase in engineering fees resulting from this proposal.

1704.5 #2-S-HARMAN.doc

S133–12
1704.5 (NEW), Chapter 35 (NEW)

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing self (pbrazil@reidmiddleton.com)

Add new text as follows:

1704.5 Submittals to the building official. In addition to the submittal of reports of *special inspections* and tests in accordance with Section 1704.2.4, reports and certificates shall be submitted by the owner or the owner's authorized agent to the *building official* after review and acceptance by a *registered design professional* and prior to the construction or work being performed for each of the following:

1. Welding procedure specifications in accordance with Section 6.1.2 of AWS D1.4 for the welding of concrete reinforcement other than by fillet welds.
2. Test reports for Grade 55 anchor bolts verifying compliance with Supplementary Requirement S1 of ASTM F 1554 for weldability.
3. Test reports for Grade A and B anchor bolts verifying compliance with Supplementary Requirement S1 of ASTM A 307 for weldability.

Add new standard to Chapter 35 as follows:

ASTM

F1554-07a Standard Specification for Anchor Bolts, Steel, 36, 55 and 105-ksi Yield Strength

Reason: This proposal is a continuation of a separate proposal that adds a new Section 1704.5 specifying submittals to the building official. This proposal adds three items to those in the separate proposal and the charging language in new Section 1704.5 is identical in both proposals.

Item 1 is added to new Section 1704.5 because Section 6.1.2 of AWS D1.4 requires qualification testing for the welding procedure specifications (WPS) of all types of welded joints that include reinforcing bars except for those consisting of fillet welds, which are deemed to be prequalified and, thus, exempt from testing. Section 6.1.2.3 of the standard requires the WPS to be made available to those authorized to examine them. The requirement for availability means that welding procedure specifications are available for submittal to the building official. Requiring their submittal to the building official will enable the building official to verify whether the welded joints are adequately designed to meet applicable requirements. Note that the 1998 edition of AWS D1.4 is a referenced standard of the 2012 IBC (see Chapter 35) but the 2011 edition is the current edition.

Item 2 is added to new Section 1704.5 because Grade 55 anchor bolts complying with ASTM F 1554-07a are not suitable for welding but weldable steel is possible, provided the material for the bolts meets Supplementary Requirement S1 of the standard. In ASTM F 1554-07a, Section 4.2 classifies Grade 55 anchor bolts complying with Supplementary Requirement S1 as weldable, Section 5.1 requires orders for anchor bolts to include required test reports (Section 5.1.13), and Section 17.1 requires the purchaser to be furnished with a test report that includes the carbon equivalent in accordance with Supplementary Requirement S1 (Section 17.1.1). The requirement that the purchaser be furnished with the test reports means that they are available for submittal to the building official. Requiring their submittal to the building official will enable the building official to verify whether the anchor bolts meet the applicable requirements for weldability.

Grade 36 bolts complying with ASTM F 1554-07a are weldable because of the limits on carbon in Table 1 ("Chemical Requirements for Grade 36") of the standard, which are 0.26%-0.28% by heat analysis and 0.29%-0.31% by product analysis depending on the bolt diameter. Grade 55 anchor bolts not complying with Supplementary Requirement S1 are not weldable because of the lack of limits on carbon in Table 2 ("Chemical Requirements for Grades 55 and 105") of the standard. In Supplementary Requirement S1, Section S1.2 assumes that suitable welding procedures for the steel being welded and the intended service will be selected, Section S1.5.1 specifies limits on carbon of 0.30% by heat analysis and 0.33% by product analysis, Section S1.5.2 requires an analysis of the carbon equivalent (CE) verifying that limits on CE are met (0.45% for alloy and low-alloy steel and 0.40% for carbon steel), and Section S1.6 requires the anchor bolts to be designated by a white paint mark on the side of the bar to be encased in concrete.

Of the ASTM standards applicable to other commonly used anchor bolts, Table 2 ("Chemical Requirements") of ASTM A 36 for carbon steel shapes, plates and bars of structural quality limits carbon in bars to 0.26%-0.29% depending on nominal diameter; and Table 1 ("Chemical Requirements for Grades A and B Bolts and Studs") of ASTM A 307 for carbon steel bolts and studs limits carbon in Grade A and B bolts and studs to 0.29% by heat analysis and 0.33% by product analysis. ASTM A 307 Grade C bolts and studs are specified as having properties complying with ASTM A 36 (Section 1.1). The effect of these provisions is that anchor bolts with properties complying with ASTM A 36 (e.g., ASTM A 307, Grade C) are weldable but anchor bolts complying with ASTM A 307, Grade A or B, may not be weldable and the standard specifies additional requirements (Section 1.5) to ensure weldability (Supplementary Requirement S1) that are similar to those in ASTM F 1554-07a. Item 3 is added to new Section 1704.5 because of this.

Note that separate proposals:

1. Transfer the requirements of Section 1705.12.1 to new Section 1704.5 ;
2. Add additional requirements for submittals that are related to structural steel;
3. Add additional requirements for submittals that are related to masonry ; and
4. Add a new Section 107.1.1 that correlates with this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

S133-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1704.5 (NEW) #1-S-BRAZIL.doc

S134–12

1704.5 (NEW), Chapter 35 (NEW)

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, representing self (pbrazil@reidmiddleton.com)

Add new text as follows:

1704.5 Submittals to the building official. In addition to the submittal of reports of *special inspections* and tests in accordance with Section 1704.2.4, reports and certificates shall be submitted by the owner or the owner's authorized agent to the *building official* after review and acceptance by a *registered design professional* and prior to the construction or work being performed for each of the following:

1. Test reports verifying compliance with Supplementary Requirement S30 of ASTM A6 for W-shaped and WT-shaped elements of structural steel with flange thicknesses of 1-1/2 inches (38 mm) or greater that are required to have a Charpy V-notch toughness as specified in Section A3.3 of AISC 341;
2. Test reports verifying compliance with Supplementary Requirement S5 of ASTM A6 for structural steel plates of 2 inches (51 mm) in thickness or greater that are required to have a Charpy V-notch toughness as specified in Section A3.3 of AISC 341;
3. *Certificates of compliance* for verification that welds at elements of structural steel and their connections that are in the *seismic force-resisting system* are made with filler metal having a Charpy V-notch toughness as specified in Section A3.3a of AISC 341;
4. *Certificates of compliance* for verification that demand critical welds are made with filler metal having a Charpy V-notch toughness as specified in Section A3.3b of AISC 341;
5. Test reports verifying compliance with Supplementary Requirement S30 of ASTM A6 for hot-rolled shapes of structural steel with flange thicknesses greater than 2 inches (51 mm) that are required to have a Charpy V-notch toughness as specified in Section A3.1c of AISC 360;
6. *Certificates of compliance* for the fabrication of steel buckling-restrained braces on the premises of an *approved fabricator* in accordance with Section 1704.2.5.2.

Add new standard to Chapter 35 as follows:

ASTM

A 6-11 Standard Specification for General Requirements for Rolled Structural Steel Bars, Plates, Shapes and Sheet Piling

Reason: This proposal is a continuation of a separate proposal that adds a new Section 1704.5 specifying submittals to the building official. This proposal adds six items to those in the separate proposal and the charging language in new Section 1704.5 is identical in both proposals. The parenthetic references to AISC 341-05 below are provided for reference and correspond to the referenced provisions of AISC 341-10. Similarly, there are parenthetic references to AISC 360-05 that correspond to the referenced provisions of AISC 360-10.

Items 1 and 2 are added to new Section 1704.5 because of the requirements in Section A3.3 of AISC 341-10 (Section 6.3 of AISC 341-05) for minimum Charpy V-notch (CVN) toughness in (1) hot rolled shapes of structural steel with flange thicknesses of 1-1/2 inches or greater, and (2) structural steel plates 2 inches in thickness or greater and meeting the condition specified therein, where they are elements of the seismic force-resisting system in structures within the scope of AISC 341. However, there are no provisions in AISC 341-10 (or AISC 341-05) for verification by the building official (authority having jurisdiction) that the requirements are met.

The condition specified in Section A3.3 of AISC 341-10 for steel plates is that Charpy V-notch (CVN) toughness is limited for (1) members built up from plate, (2) connection plates where inelastic strain under seismic loading is expected, and (3) the steel core of buckling-restrained braces. Note that there is apparently an error in Section A3.3 of AISC 341-10 for hot-rolled shapes in that the minimum flange thickness is specified as 1/2 inch (38 mm) but, given the stated thickness in millimeters, 1-1/2 inches is intended.

Section A3.3 of AISC 341-10 (Section 6.3 of AISC 341-05) requires the structural steel to comply with Section A3.1c of AISC 360-10 (Section A3.1c of AISC 360-05). For hot rolled shapes of structural steel with flange thicknesses greater than 2 inches and meeting the conditions specified therein, Section A3.1c of AISC 360-10 requires the construction documents (structural design documents) to specify that such shapes shall be supplied with CVN impact test results in accordance with ASTM A6, Supplementary Requirement S30. Assuming that it is not the intent for the shapes to supply the test results, it is assumed that the intent is for tests in accordance with ASTM A6, Supplementary Requirement S30 to be conducted on the shapes.

Section A3.3 of AISC 341-10 also requires the structural steel to be tested for CVN toughness as specified in ASTM A6, Supplementary Requirement S30, for hot-rolled shapes and in accordance with ASTM A 673 for steel plate. This has the effect of modifying the requirement in Section A3.1c of AISC 360-10 to lower the threshold for CVN impact testing of hot-rolled shapes of structural steel to those with flange thicknesses of 1-1/2 inches or greater and to also require CVN impact testing for structural steel plates that are 2 inches in thickness or greater. The requirement for test results means that test reports are available for submittal to the building official. Requiring their submittal to the building official will enable the building official to verify whether the structural steel meets the applicable requirements for CVN toughness.

In ASTM A 6-11, Section 1.8 indicates that the supplementary requirements therein are for use where additional testing or restrictions are required by the purchaser in the purchase order, Section 14.1 requires test reports for each heat supplied, and Section 14.1.6 requires the test reports to report the results of tests required by the purchase order. As for Section A3.1c of AISC 360-10 (discussed above), the requirement for test reports means that they are available for submittal to the building official, and requiring their submittal to the building official will enable the building official to verify whether the structural steel meets the applicable requirements for CVN toughness.

Supplementary Requirement S5 of ASTM A 6-11 requires CVN impact tests to be conducted in accordance with ASTM A 673 (Section S5.1). Supplementary Requirement S30 of ASTM A 6-11 requires CVN impact tests to be conducted in accordance with ASTM A 673 using specimens taken from the alternate core location (Section S30.1). This means that the supplementary requirements are identical in that both require impact testing in accordance with ASTM A 673 to determine CVN toughness except that Supplementary Requirement S30 imposes an additional condition on the testing, which is to take specimens from the alternate core location. Section A3.3 of AISC 341-10 references ASTM A 673 for steel plate but the proposal references Supplementary Requirement S5 of ASTM A 6-11 for consistency with the reference to Supplementary Requirement S30 of ASTM A 6-11 for hot-rolled shapes of structural steel.

Item 1 is limited in scope to W-shaped and WT-shaped structural members because the requirement in Section A3.3 of AISC 341-10 (Section 6.3 of AISC 341-05) for minimum CVN toughness is limited to hot-rolled shapes of structural steel with flange thicknesses of 1-1/2 inches or greater, which occur only in W-shaped and WT-shaped elements of structural steel. Section 3.1.2 of ASTM A 6-11 defines "shapes" as including "W" shapes, "HP" shapes, "S" shapes, "M" shapes, "C" shapes, "MC" shapes and "L" shapes. Of these shapes, the *AISC Steel Construction Manual* (thirteenth edition) only lists W-shaped and WT-shaped elements of structural steel with flange thicknesses of 1-1/2 inches or greater (Tables 1-1 and 1-8). Note that the *Manual* also does not list any "MT" shapes or "ST" shapes with flange thicknesses of 1-1/2 inches or greater.

The provisions in Section A3.3 of AISC 341-10 (Section 6.3 of AISC 341-05) and Section A3.1c of AISC 360-10 (Section A3.1c of AISC 360-05) are limited to hot-rolled shapes of structural steel but are not limited by type of shape. In Items 1 and 2 of this proposal, however, the requirement for submittal of test reports is limited by type of shape but is not limited to hot-rolled shapes of structural steel. The type of shape is limited to eliminate extraneous shapes for which the requirement for submittal does not apply. Limiting the requirement for submittal to shapes that are hot-rolled is not included because "hot-rolled" is a manufacturing process and is not relevant to the requirement for submittal. The "hot-rolled" limit is also not included for consistency with ASTM A 6-11 whose scope specifies the standard as applying to "rolled structural steel bars, plates, shapes and sheet piling" (Section 1.1).

Section A3.3 of AISC 341-10 and Section A3.1c of AISC 360-10 do specify hot-rolled shapes and the same is true of Section 6.3 of AISC 341-05 and Section A3.1c of AISC 360-05. None of these standards, however, define "hot-rolled" nor, to my knowledge, does any referenced standard of the 2012 IBC or any other standard referenced in the AISC standards listed above.

Items 3 and 4 are added to new Section 1704.5 because of the requirements in Sections A4.4a and A4.4b of AISC 341-10 (Sections 7.3a and 7.3b of AISC 341-05) for minimum CVN toughness of welds that are used in elements of structural steel and their connections that are in the seismic force-resisting system of structures within the scope of AISC 341. AISC 341-05 directly specifies the requirements. AISC 341-10 indirectly specifies them by referencing the requirements in Section (Clause) 6.3 of AWS D1.8. As for Items 1 and 2 of the proposal (discussed above), there are no provisions in AISC 341-10 (or AISC 341-05) for verification by the building official (authority having jurisdiction) that the requirements are met.

Section (Clause) 6.3 of AWS D1.8 (2009 edition) contains requirements for filler and weld metal of welds, including demand critical welds, that are within the scope of the standard. Among those requirements, Sections 6.3.1 and 6.3.5 specify mechanical properties for filler metals, including minimum CVN toughness, of welds and demand critical welds, respectively, which are listed in corresponding Tables 6.1 and 6.2. Note that AWS D1.8 is not a referenced standard of the 2012 IBC.

Section (Clause) 6.1.1 of AWS D1.8 requires welding procedure specifications to be prequalified, or to be qualified by testing in accordance with applicable AWS D1.1 requirements. Note that Section 1.1 of AWS D1.8 (1) establishes the applicability of AWS D1.8 as supplementing AWS D1.1 and (2) states that the provisions in AWS D1.1 apply to the welds governed by the provisions AWS D1.1 except where modified in AWS D1.8.

Section (Clause) 4.0 of AWS D1.1 (2008 edition) contains requirements for qualification testing of welding procedure specifications (WPS's). Section 3.1, however, exempts prequalified welding procedure specifications from requirements for qualification testing. A WPS is required to meet the provisions of Chapter 3 of AWS D1.1 in order to be prequalified. However, there are no provisions in Chapter 3 for minimum CVN toughness. Section 4.1.1.3 requires CVN tests to be included in the WPS qualification where required by the construction (contract) documents. Section 1.4.1(5) requires the Engineer to specify in the construction (contract) documents the CVN toughness criteria for weld metal (and base metal). Where notch toughness of welds used in elements of structural steel or their connections (welded joints) is required, Section 2.2.2 requires the Engineer to specify in the construction (contract) documents the minimum absorbed energy and corresponding test temperature for the filler metal (e.g., prequalified) or to specify that the WPS shall be qualified by CVN tests.

The effect of these provisions in AWS D1.1 is that the standard specifies CVN impact testing for qualification of welded joints to meet specified requirements for minimum CVN toughness. The standard does not prevent a prequalified WPS from being qualified to meet requirements for minimum CVN toughness but verification is only possible through review of the WPS. Section 3.1 of the standard requires all prequalified welding procedure specifications to be written. This requirement means that prequalified welding procedure specifications are available for submittal to the building official. Where there are requirements for minimum CVN toughness, requiring the submittal of welding procedure specifications or equivalent documents (see below) to the building official will enable the building official to verify whether the welded joints meet the applicable requirements for CVN toughness.

Given the discussion above on the provisions in AWS D1.8 and D1.1, it would appear that the submittal of welding procedure specifications is needed to verify CVN toughness where required by Section A4.4a or A4.4b of AISC 341-10. AISC 341-10, however, presents another approach. Section J2 contains requirements for documents to be submitted or made available to the engineer of record. Section J2.1 requires the submittal of welding procedure specifications (Item 1); certificates of conformance from the manufacturer for electrodes, fluxes and shielding gases (Item 2); and, for demand critical welds, applicable manufacturer's certifications that the filler metal meets supplemental notch toughness requirements (Item 3). Given these requirements and for consistency with Section 1704.2.5.2 and other sections of the 2012 IBC, the submittal of certificates of compliance instead of welding procedure specifications is specified in Items 3 and 4. Note that Section J2 does not specify that the documents required to be submitted or made available to the engineer of record are also required to be submitted or made available to the authority having jurisdiction (building official).

Item 5 is added to new Section 1704.5 because of the requirement in Section A3.1c of AISC 360-10 (Section A3.1c of AISC 360-05) for minimum Charpy V-notch (CVN) toughness of heavy structural steel shapes (e.g., with flange thicknesses greater than 2 inches) and meeting several conditions specified therein. Section A3.1c requires the construction documents (structural design documents) to specify that such shapes shall be supplied with CVN impact test results in accordance with ASTM A6, Supplementary Requirement S30. The requirement for test results means that test reports are available for submittal to the building official. Requiring their submittal to the building official will enable the building official to verify whether the structural steel meets applicable requirements for CVN toughness.

Item 6 is added to new Section 1704.5 to enable the building official to verify that fabrication of the steel buckling-restrained braces, where it is conducted at a location other than the construction site, was performed in accordance with the building code, its referenced standards (e.g., AISC 341) and the approved construction documents. Otherwise, special inspection at the fabricator's shop should be conducted (see IBC Section 1704.2.5).

Note that separate proposals:

1. Transfer the requirements of Section 1705.12.1 to new Section 1704.5;
2. Add additional requirements for submittals that are related to the welding of concrete reinforcement and anchor bolts;
3. Add additional requirements for submittals that are related to masonry; and
4. Add a new Section 107.1.1 that correlates with this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

1704.5 (NEW) #2-S-BRAZIL.doc

S135–12
1704.5 (NEW)

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing self (pbrazil@reidmiddleton.com)

Add new text as follows:

1704.5 Submittals to the building official. In addition to the submittal of reports of *special inspections* and tests in accordance with Section 1704.2.4, reports and certificates shall be submitted by the owner or the owner's authorized agent to the *building official* after review and acceptance by a *registered design professional* and prior to the construction or work being performed for each of the following:

1. Reports of preconstruction tests for masonry where the prism test method of Section 2105.2.2 is used to determine the *compressive strength of masonry* in accordance with Section 1.19.3 of TMS 402/ACI 530/ASCE 5.
2. Reports of preconstruction tests of grout where the unit strength method of Section 2105.2.2 is used to determine the *compressive strength of masonry* in accordance with Section 1.19.3 of TMS 402/ACI 530/ASCE 5.

Reason: This proposal is a continuation of a separate proposal that adds a new Section 1704.5 specifying submittals to the building official. This proposal adds two items to those in the separate proposal and the charging language in new Section 1704.5 is identical in both proposals.

The items are added to new Section 1704.5 because Section 1.19.3 of TMS 402/ACI 530/ASCE 5 requires compliance with a Level C quality assurance program for engineered masonry in structures classified as Risk Category IV. Table 1.19.3 for Level C quality assurance requires the verification of the specified compressive strength of masonry, f_m, prior to construction. Section 1.19.6.2 requires the compressive strength of masonry to be determined in accordance with TMS 602/ACI 530.1/ASCE 6. Article 1.4.B.1 of TMS 602/ACI 530.1/ASCE 6 requires the determination to be done by the unit strength method or the prism test method. Determination by the prism test method is, therefore, not required but when it is chosen for the verification of f_m prior to construction it requires testing of compressive strength in accordance with ASTM C 1314 (Article 1.4.B.3), which becomes a preconstruction test. Item 1 is added because of this. When the unit strength method is chosen for the same purpose, the grout is required to be tested for compressive strength in accordance with ASTM C 1019 (Article 1.4.B.2b (3b), which also becomes a preconstruction test. Item 2 is added because of this. In each case, requiring the submittal of test reports to the building official will enable the building official to verify, before construction begins, the validity of structural design assumptions based on the success of the preconstruction tests.

Neither TMS 402/ACI 530/ASCE 5 nor TMS 602/ACI 530.1/ASCE 6 specifies submittals to applicable regulatory officials (e.g., building official or authority having jurisdiction). In TMS 402/ACI 530/ASCE 5, Section 1.19.4 requires the quality assurance program to set forth the procedures for reporting and review, and Item 1 in Tables 1.19.2 (Level B Quality Assurance) and 1.19.3 (Level C Quality Assurance) specifies verification of compliance with the approved submittals ("approved" is not defined in Section 1.6, Definitions). In TMS 602/ACI 530.1/ASCE 6, (1) Section 1.5.A specifies that written acceptance of submittals be obtained prior to use of the materials or methods requiring acceptance; (2) Section 1.5.B specifies the submittals; (3) Section 1.2 defines "acceptable/accepted" as being done by the architect/engineer and "architect/engineer" as the individual or firm that issues, or administers the work under, the drawings and specifications ("approved" is not defined); and (4) Sections 1.6.A and 1.6.B specify the services and duties of testing agencies and inspection agencies, respectively, including requirements for the owner to retain the agencies and the agencies to report results and submit final reports to the architect/engineer and contractor.

Note that separate proposals:

1. Transfer the requirements of Section 1705.12.1 to new Section 1704.5 ;
2. Add additional requirements for submittals that are related to structural steel ;
3. Add additional requirements for submittals that are related to the welding of concrete reinforcement and anchor bolts and
4. Add a new Section 107.1.1 that correlates with this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1704.5 (NEW) #3-S-BRAZIL.doc

S136–12
1704.5 (NEW), 1705.3.1, 1705.12.1

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

Revise as follows:

1704.5 Submittals to the building official. In addition to the submittal of reports of *special inspections* and tests in accordance with Section 1704.2.4, reports and certificates shall be submitted by the owner or the owner's authorized agent to the *building official* after review and acceptance by a *registered design professional* and prior to the construction or work being performed for each of the following:

1. Reports of material properties verifying compliance with the requirements of AWS D1.4 for weldability as specified in Section 3.5.2 of ACI 318 for reinforcing bars in concrete complying with a standard other than ASTM A 706 that are to be welded; and
2. Reports of mill tests in accordance with Section 21.1.5.2 of ACI 318 for reinforcing bars complying with ASTM A 615 and used to resist earthquake-induced flexural or axial forces in the special moment frames, special structural walls, or coupling beams connecting special structural walls, of *seismic force-resisting systems* in *structures* assigned to *Seismic Design Category* B, C, D, E or F.

1705.3.1 Materials. In the absence of sufficient data or documentation providing evidence of conformance to quality standards for materials in Chapter 3 of ACI 318, the building official shall require testing of materials in accordance with the appropriate standards and criteria for the material in Chapter 3 of ACI 318. ~~Weldability of reinforcement, except that which conforms to ASTM A 706, shall be determined in accordance with the requirements of Section 3.5.2 of ACI 318.~~

~~**1705.12.1 Concrete reinforcement.** Where reinforcement complying with ASTM A 615 is used to resist earthquake induced flexural and axial forces in special moment frames, special structural walls and coupling beams connecting special structural walls, in structures assigned to *Seismic Design Category* B, C, D, E or F, the reinforcement shall comply with Section 21.1.5.2 of ACI 318. Certified mill test reports shall be provided for each shipment of such reinforcement. Where reinforcement complying with ASTM A 615 is to be welded, chemical tests shall be performed to determine weldability in accordance with Section 3.5.2 of ACI 318.~~

Reason: This proposal is a continuation of a separate proposal that adds a new Section 1704.5 specifying submittals to the building official. This proposal adds two items to those in the separate proposal and the charging language in new Section 1704.5 is identical in both proposals.

The requirement in Section 1705.12.1 to provide certified mill test reports for reinforcement in special moment frames, special structural walls and coupling beams is relocated to Item 2 of new Section 1704.5 because the subject of Section 1705.12 is testing and qualification for seismic resistance but there is no testing specified in Section 1705.12.1. The submittal of certified mill test reports is specified but there is no corresponding requirement in ACI 318-11 that the reports be certified or that the act of submittal amounts to a "qualification." Also ACI 318 has consistently specified "mill tests" since the alternative to reinforcement complying with ASTM A 706 first appeared in the 1983 edition. The limitation in Section 1705.12.1 to reinforcement complying with ASTM A 615 is retained in Item 2 for consistency with the same limitation in the referenced section of ACI 318-11 (Section 21.1.5.2).

Relocating the requirement in Section 1705.12.1 to Item 2 of new Section 1704.5 has an additional benefit that is provided by the charging language in the new section. Section 1705.12.1 requires mill test reports to be provided with each shipment of reinforcement but that does not ensure the reports will be available to the owner, design team, construction team or building official. New Section 1704.5, however, requires the owner or authorized agent to submit the reports to the building official after review and acceptance by a registered design professional and prior to the construction or work begin performed. Also, the current requirement in Section 1705.12.1 that the reports be provided for each shipment means that they are available for submittal to the building official.

The charging language in Section 21.1.5.2 of ACI 318-11 specifies deformed reinforcement but Item 2 specifies reinforcing bars for consistency with (1) the basic requirement in Section 21.1.5.2 for compliance with ASTM A 706, which is limited in scope to "deformed and plain low-alloy steel bars…for concrete reinforcement" (Section 1.1), and (2) the alternative of compliance with ASTM A 615, which is limited in scope to "deformed and plain carbon steel bars for concrete reinforcement," provided the special requirements of Section 21.1.5.2 are also met.

The source document for some of the language in Section 1705.12.1 is the *NEHRP Recommended Provisions for Seismic Regulations for New Buildings and Other Structures* (Section 3.4.1.2 of FEMA 368 and Section 2.4.1.2 of FEMA 450-1).

In Item 1 of new Section 1704.5, the requirement in the last sentence of Section 1705.1.2.1 for chemical tests of reinforcement complying with ASTM A 615 that is to be welded is replaced with a requirement to submit reports of material properties for reinforcing bars complying with a standard other than ASTM A 706 that verify compliance with the requirements of AWS D1.4 for weldability. These changes correct several errors. First, the current language in Section 1705.1.2.1 is limited in scope to Seismic Design Categories B through F by that section, and to Seismic Design Categories C through F by the charging language in Section 1705.12 (Item 1), but verification of weldability is not a seismic issue. Verifying weldability is important for concrete reinforcement designed to resist all load effects, not merely seismic load effects.

Second, the current language in Section 1705.1.2.1 requires chemical tests of reinforcement be performed to determine weldability in accordance with Section 3.5.2 of ACI 318 but Section 3.5.2 of ACI 318 does not require chemical tests to be performed. Instead, it requires the ASTM specification to be supplemented by specifying a "report of material properties."

Third, Section 1705.12.1 requires the chemical tests for reinforcement complying with ASTM A 615 but Section 3.5.2 of ACI 318 specifies the report of material properties for reinforcement complying with a standard other than ASTM A 706. In ACI 318-11, specified standards other than ASTM A 615 and A 706 include A 955, A 996 and A 1035 (see Section 3.5.3.1).

Fourth, Section 1705.12.1 specifies concrete reinforcement but Section 3.5.2 of ACI 318 specifies reinforcing bars, which is done to exclude other types of concrete reinforcement such as plain reinforcement, headed shear studs, structural steel, steel pipe and steel tubing. Refer to Section 3.5, and the definition of "reinforcement" in Section 2.2, in ACI 318-11 for further information.

The language in Item 1 of new Section 1704.5 is consistent with the provisions in Section 3.5.2 of ACI 318 as discussed above. Section 3.5.2 of ACI 318 has consistently specified (1) a report of material properties, (2) a standard other than ASTM A 706 and (3) reinforcing bars, ever since the section first appeared in the 1977 edition. Section 3.5.2 also requires the applicable ASTM specifications for reinforcing bars to be "supplemented to require a report of material properties necessary to conform to the requirements in AWS D1.4." The requirement means that reports of material properties are available for submittal to the building official. Requiring their submittal to the building official will enable the building official to verify whether the reinforcing bars meet the applicable requirements for weldability.

For Items 1 and 2, neither ACI 318-11 nor ACI 301 ("Specifications for Structural Concrete," not an IBC referenced standard) specifies submittals to applicable regulatory officials (e.g., building official or authority having jurisdiction). In ACI 318, (1) Section 1.2.2 specifies the filing of calculations pertinent to the design with the contract documents when required by the building official, (2) Section 1.3.1 specifies inspection as required by the legally adopted general building code, and (3) Sections 1.3.2 through 1.3.4 specify requirements for the keeping and retention of inspection records, but (4) reports of mill tests and material properties are not included. In ACI 301-05, (1) Section 1.5.1 specifies that submittals required by the standard be submitted for review and acceptance; (2) Section 1.2 defines "submitted" as being provided to the architect/engineer for review **or** acceptance and "architect/engineer" as the individual or firm that issues the project drawings and specifications **or** administers the work under the contract documents ("approved" is not defined); (3) Section 1.5.2 specifies reporting by the testing agency of test results to the owner, architect/engineer and contractor; and (4) Section 1.6.2 specifies requirements for testing agencies, including acceptance by the architect/engineer before performing any work.

Note that Section 1.3.4 of AWS D1.4-98 requires the calculation of carbon equivalent for all reinforcing bars, including those complying with ASTM A 706. If mill test reports are not available to enable the calculation, chemical analysis is permitted to be performed. If the chemical composition is not known, special preheat temperatures are required (see Section 1.3.4.3).

Also, the likely source document for the current requirement to perform chemical tests, the *NEHRP Recommended Provisions for Seismic Regulations for New Buildings and Other Structures* (Section 3.4.1.3 of FEMA 368 and Section 2.4.1.3 of FEMA 450-1) did not require chemical tests to be performed. It required verification "that chemical tests have been performed to determine weldability in accordance with Section 3.5.2 of ACI 318."

Note that separate proposals:

1. Add additional requirements for submittals that are related to structural steel (Sxx-12/13);
2. Add additional requirements for submittals that are related to the welding of concrete reinforcement and anchor bolts (Sxx-12/13);
3. Add additional requirements for submittals that are related to masonry (Sxx-12/13); and
4. Add a new Section 107.1.1 that correlates with this proposal (Sxx-12/13).

Cost Impact: The code change proposal will not increase the cost of construction.

1704.5 (NEW) #4-S-BRAZIL.doc

S137–12

1704.5.1, 1705.11, 1705.11.7, 1905.1.8, 2209.1

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

Revise as follows:

1704.5.1 Structural observations for seismic resistance. Structural observations shall be provided for those structures assigned to *Seismic Design Category* D, E or F where one or more of the following conditions exist:

1. The structure is classified as *Risk Category* III or IV in accordance with Table 1604.5.
2. The height of the structure is greater than 75 feet (22 860 mm) above the base as defined in Section 11.2 of ASCE 7.
3. The structure is assigned to *Seismic Design Category* E, is classified as *Risk Category* I or II in Accordance with Table 1604.5, and is greater than two *stories above grade plane*.
4. When so designated by the *registered design professional* responsible for the structural design.
5. When such observation is specifically required by the *building official*.

1705.11 Special inspections for seismic resistance. *Special inspections* itemized in Sections 1705.11.1 through 1705.11.8, unless exempted by the exceptions of Section 1704.2, are required for the following:

1. The seismic force-resisting systems in structures assigned to *Seismic Design Category* C, D, E or F in accordance with Sections 1705.11.1 through 1705.11.3, as applicable.
2. Designated seismic systems in structures assigned to *Seismic Design Category* C, D, E or F in accordance with Section 1705.11.4.
3. Architectural, mechanical and electrical components in accordance with Sections 1705.11.5 and 1705.11.6.
4. Storage racks as defined in Section 11.2 of ASCE 7 that are in structures assigned to *Seismic Design Category* D, E or F in accordance with Section 1705.11.7.
5. Seismic isolation systems in accordance with Section 1705.11.8.

   Exception: Special inspections itemized in Sections 1705.11.1 through 1705.11.8 are not required for structures designed and constructed in accordance with one of the following:

   1. The structure consists of light-frame construction; the design spectral response acceleration at short periods, *SDS*, as determined in Section 1613.3.4, does not exceed 0.5; and the building height of the structure does not exceed 35 feet (10 668 mm).
   2. The seismic force-resisting system of the structure consists of reinforced masonry or reinforced concrete; the design spectral response acceleration at short periods, *SDS*, as determined in Section
      1613.3.4, does not exceed 0.5; and the building height of the structure does not exceed 25 feet (7620 mm).
   3. The structure is a detached one- or two-family dwelling not exceeding two *stories above grade plane* and does not have any of the following horizontal or vertical irregularities in accordance with Section 12.3 of ASCE 7:
      3.1. Torsional or extreme torsional irregularity.
      3.2. Nonparallel systems irregularity.
      3.3. Stiffness-soft story or stiffness-extreme soft story irregularity.
      3.4. Discontinuity in lateral strength-weak story irregularity.

1705.11.7 Storage racks. Periodic *special inspection* is required during the anchorage of storage racks as defined in Section 11.2 of ASCE 7 that are 8 feet (2438 mm) or greater in height in structures assigned to *Seismic Design Category* D, E or F.

Revise as follows:

1905.1.8 ACI 318, Section 22.10. Delete ACI 318, Section 22.10, and replace with the following:

22.10 - Plain concrete in structures assigned to Seismic Design Category C, D, E or F.

22.10.1 - Structures assigned to Seismic Design Category C, D, E or F shall not have elements of structural plain concrete, except as follows:

(a) *Structural plain concrete basement, foundation or other walls below the base as defined in Section 11.2 of ASCE 7 are permitted in detached one- and two-family dwellings three stories or less in height constructed with stud-bearing walls. In dwellings assigned to Seismic Design Category D or E, the height of the wall shall not exceed 8 feet (2438 mm), the thickness shall not be less than 71/2 inches (190 mm), and the wall shall retain no more than 4 feet (1219 mm) of unbalanced fill. Walls shall have reinforcement in accordance with 22.6.6.5.*

(b) *Isolated footings of plain concrete supporting pedestals or columns are permitted, provided the projection of the footing beyond the face of the supported member does not exceed the footing thickness.*

Exception: *In detached one- and two-family dwellings three stories or less in height, the projection of the footing beyond the face of the supported member is permitted to exceed the footing thickness.*

(c) *Plain concrete footings supporting walls are permitted, provided the footings have at least two continuous longitudinal reinforcing bars. Bars shall not be smaller than No. 4 and shall have a total area of not less than 0.002 times the gross cross-sectional area of the footing. For footings that exceed 8 inches (203 mm) in thickness, a minimum of one bar shall be provided at the top and bottom of the footing. Continuity of reinforcement shall be provided at corners and intersections.*

Exceptions:

1. *In Seismic Design Categories A, B and C, detached one- and two-family dwellings three stories or less in height constructed with stud-bearing walls, are permitted to have plain concrete footings without longitudinal reinforcement.*
2. *For foundation systems consisting of a plain concrete footing and a plain concrete stemwall, a minimum of one bar shall be provided at the top of the stemwall and at the bottom of the footing.*
3. *Where a slab on ground is cast monolithically with the footing, one No. 5 bar is permitted to be located at either the top of the slab or bottom of the footing.*

Revise as follows:

2209.1 Storage racks. The design, testing and utilization of ~~industrial steel~~ storage racks as defined in Section 11.2 of ASCE 7 and made of cold-formed or hot-rolled steel structural members, shall be in accordance with RMI/ANSI MH 16.1. Where required by ASCE 7, the seismic design of storage racks shall be in accordance with the provisions of Section 15.5.3 of ASCE 7, except that the mapped acceleration parameters, S_s and S_1, shall be determined in accordance with Section 1613.3.1.

Reason: The purpose for the proposal is to clarify the meaning of "base" and "storage rack," which are defined in ASCE 7-10 but are not also defined in the building code. Both of these terms have meanings that necessitate knowing their definitions to fully understand the technical provisions related to them. Therefore, the proposal adds references to Section 11.2 of ASCE 7-10 for their definitions. The only instances of these terms in the 2012 IBC where they are directly related to their corresponding definitions in ASCE 7-10 are in this proposal.

For storage racks, adding a reference to the definition in ASCE 7-10 in Section 1705.11.7 also has the effect of narrowing the scope to those that are defined. Note that "storage rack" is defined in ASCE 7-10 as including "industrial pallet racks, moveable shelf racks and stacker racks made of cold-formed or hot-rolled structural members;" but excluding "other types of racks such as drive-in and drive-through racks, cantilever racks, portable racks or racks made of materials other than steel."

Cost Impact: The code change proposal will not increase the cost of construction.

S137-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1704.5.1-S-BRAZIL.doc

S138–12
1704.5, 1705.4, 1705.4.1

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

Revise as follows:

1704.5 Structural observations. Where required by the provisions of Section 1704.5.1 or 1704.5.2, the owner shall employ a *registered design professional* to perform structural observations ~~as defined in Section 1702~~. Prior to the commencement of observations, the structural observer shall submit to the *building official* a written statement identifying the frequency and extent of structural observations. At the conclusion of the work included in the permit, the structural observer shall submit to the *building official* a written statement that the site visits have been made and identify any reported deficiencies which, to the best of the structural observer's knowledge, have not been resolved.

1705.4 Masonry construction. Masonry construction shall be inspected and verified in accordance with TMS 402/ACI 530/ASCE 5 and TMS 602/ACI 530.1/ASCE 6 quality assurance program requirements.

Exception: *Special inspections* shall not be required for:

1. Empirically designed masonry, glass unit masonry or masonry veneer designed by Section 2109, 2110 or Chapter 14, respectively, where they are part of structures classified as *Risk Category* I, II or III ~~in accordance with Section 1604.5~~.
2. Masonry foundation walls constructed in accordance with Table 1807.1.6.3(1), 1807.1.6.3(2), 1807.1.6.3(3) or 1807.1.6.3(4).
3. Masonry fireplaces, masonry heaters or masonry chimneys installed or constructed in accordance with Section 2111, 2112 or 2113, respectively.

1705.4.1 Empirically designed masonry, glass unit masonry and masonry veneer in Risk Category IV. The minimum *special inspection* program for empirically designed masonry, glass unit masonry or masonry veneer designed by Section 2109, 2110 or Chapter 14, respectively, in structures classified as *Risk Category* IV~~, in accordance with Section 1604.5,~~ shall comply with TMS 402/ACI 530/ASCE 5 Level B Quality Assurance.

Reason: The purpose for the proposal is to delete language considered superfluous given the definitions in Section 202 for "structural observation" and "risk category." These are the only instances of such language in the structural chapters of the 2012 IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

SECTION 202
DEFINITIONS

~~**MECHANICAL SYSTEMS.** For the purposes of determining seismic *loads* in ASCE 7, mechanical systems shall include plumbing systems as specified therein.~~

Revise as follows:

1705.1 General. Verification and inspection of elements and nonstructural components of buildings and structures shall be as required by this section.

1705.10.1 Structural wood. Continuous special inspection is required during field gluing operations of elements of the main windforce-resisting system. Periodic special inspection is required for nailing, bolting, anchoring and other fastening of ~~components within~~ elements of the main windforce-resisting system, including wood shear walls, wood diaphragms, drag struts, braces and hold-downs.

> **Exception:** *Special inspections* ~~is~~ are not required for wood shear walls, shear panels and diaphragms, including nailing, bolting, anchoring and other fastening to other ~~components~~ elements of the main windforce-resisting system, where the fastener spacing of the sheathing is more than 4 inches (102 mm) on center.

1705.10.2 Cold-formed steel light-frame construction. Periodic special inspection is required during welding operations of elements of the main windforce-resisting system. Periodic special inspection is required for screw attachment, bolting, anchoring and other fastening of ~~components within~~ elements of the main windforce-resisting system, including shear walls, braces, diaphragms, collectors (drag struts) and hold-downs.

> **Exception:** *Special inspections* ~~is~~ are not required for cold-formed steel light-frame shear walls braces, diaphragms, collectors (drag struts) and hold-downs where either of the following apply:
>
> 1. The sheathing is gypsum board or fiberboard.
> 2. The sheathing is wood structural panel or steel sheets on only one side of the shear wall, shear panel or diaphragm assembly and the fastener spacing of the sheathing is more than 4 inches (102 mm) on center (o.c.).

1705.11 Special inspections for seismic resistance. *Special inspections* itemized in Sections 1705.11.1 through 1705.11.8, unless exempted by the exceptions of Section 1704.2, are required for the following:

1. The seismic force-resisting systems in structures assigned to *Seismic Design Category* C, D, E or F in accordance with Sections 1705.11.1 through 1705.11.3, as applicable.
2. Designated seismic systems in structures assigned to *Seismic Design Category* C, D, E or F in accordance with Section 1705.11.4.
3. ~~Architectural, mechanical and electrical~~ Nonstructural components in accordance with Sections 1705.11.5 and 1705.11.6.
4. Storage racks in structures assigned to *Seismic Design Category* D, E or F in accordance with Section 1705.11.7.

5. Seismic isolation systems in accordance with Section 1705.11.8.

   Exception: Special inspections itemized in Sections 1705.11.1 through 1705.11.8 are not required for structures designed and constructed in accordance with one of the following:

   1. The structure consists of light-frame construction; the design spectral response acceleration at short periods, *SDS*, as determined in Section 1613.3.4, does not exceed 0.5; and the building height of the structure does not exceed 35 feet (10 668 mm).
   2. The seismic force-resisting system of the structure consists of reinforced masonry or reinforced concrete; the design spectral response acceleration at short periods, *SDS*, as determined in Section 1613.3.4, does not exceed 0.5; and the building height of the structure does not exceed 25 feet (7620 mm).
   3. The structure is a detached one- or two-family dwelling not exceeding two *stories above grade plane* and does not have any of the following horizontal or vertical irregularities in accordance with Section 12.3 of ASCE 7:
      3.1. Torsional or extreme torsional irregularity.
      3.2. Nonparallel systems irregularity.
      3.3. Stiffness-soft story or stiffness-extreme soft story irregularity.
      3.4. Discontinuity in lateral strength-weak story irregularity.

1705.11.2 Structural wood. Continuous special inspection is required during field gluing operations of elements of the seismic force-resisting system. Periodic special inspection is required for nailing, bolting, anchoring and other fastening of ~~components within~~ elements of the seismic force-resisting system, including wood shear walls, wood diaphragms, drag struts, braces, shear panels and hold-downs.

> **Exception:** *Special inspections* ~~is~~ are not required for wood shear walls, shear panels and diaphragms, including nailing, bolting, anchoring and other fastening to other ~~components~~ elements of the seismic force-resisting system, where the fastener spacing of the sheathing is more than 4 inches (102 mm) on center (o.c.).

1705.11.3 Cold-formed steel light-frame construction. Periodic special inspection is required during welding operations of elements of the seismic force-resisting system. Periodic special inspection is required for screw attachment, bolting, anchoring and other fastening of ~~components within~~ elements of the seismic force-resisting system, including shear walls, braces, diaphragms, collectors (drag struts) and hold-downs.

> **Exception:** *Special inspections* ~~is~~ are not required for coldformed steel light-frame shear walls, braces, diaphragms, collectors (drag struts) and hold-downs where either of the following apply:
>
> 1. The sheathing is gypsum board or fiberboard.
> 2. The sheathing is wood structural panel or steel sheets on only one side of the shear wall, shear panel or diaphragm assembly and the fastener spacing of the sheathing is more than 4 inches (102 mm) o.c.

1705.11.6 Plumbing, mechanical and electrical components. *Special inspection* for plumbing, mechanical and electrical components shall be as follows:

1. Periodic special inspection is required during the anchorage of electrical equipment for emergency or standby power systems in structures assigned to *Seismic Design Category* C, D, E or F;
2. Periodic special inspection is required during the anchorage of other electrical equipment in structures assigned to *Seismic Design Category* E or F;
3. Periodic special inspection is required during the installation and anchorage of piping systems designed to carry hazardous materials and their associated mechanical units in structures assigned to *Seismic Design Category* C, D, E or F;

4. Periodic special inspection is required during the installation and anchorage of ductwork designed to carry hazardous materials in structures assigned to *Seismic Design Category* C, D, E or F; and
5. Periodic special inspection is required during the installation and anchorage of vibration isolation systems in structures assigned to *Seismic Design Category* C, D, E or F where the *construction documents* require a nominal clearance of 1/4 inch (6.4 mm) or less between the equipment support frame and restraint.

Reason: The purpose for the proposal is to correlate the provisions of the building code related to nonstructural components with the corresponding provisions for nonstructural components in ASCE 7-10. Essentially, the seismic chapters of ASCE 7-10 apply to the seismic force-resisting system except for Chapter 13, which applies to nonstructural components. The language in these chapters consistency refers to the seismic force-resisting system in terms of structural members or elements, and to other materials or products that are required to be designed for resistance to seismic load effects as “nonstructural components.” Chapter 13 consistently uses the term “nonstructural component” until later in the chapter where there are individual requirements for groups of nonstructural components. Materials and products subject to the requirements of Chapter 13 are grouped according to whether they are architectural, mechanical or electrical components, and “nonstructural” is dropped because it is, by then, considered redundant. The proposal revises the corresponding provisions in the building code for consistency with this phraseology.

The definition of “mechanical system” is deleted because it isn’t a definition but a requirement, which is incorporated into the building code by adding “plumbing” to Section 1705.11.6. Also, the requirement in the definition that mechanical systems include plumbing systems for “the purposes of determining seismic loads in ASCE 7” serves no purpose in the building code. Section 1613.1 references ASCE 7 for the design and construction of structures to resist the effects of earthquake motions. Chapter 13 of ASCE 7-10 clearly indicates that plumbing systems are included in the provisions for mechanical systems.

In Item 3 of Section 1705.11, “architectural, mechanical and electrical” is replaced with “nonstructural” for consistency with Chapter 13 of ASCE 7-10 and because distinguishing among the groups of nonstructural components in Section 1705.11 serves no purpose but it does serve a purpose in Sections 1705.11.5 and 1705.11.6 where the requirements for architectural components differ from those for plumbing, mechanical and electrical components.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Bonnie Manley, P.E. American Iron and Steel Institute, representing American Institute of Steel Construction (bmanley@steel.org)

Revise as follows:

1705.2 Steel construction. The *special inspections* ~~for~~ and nondestructive testing of steel ~~elements of~~ construction in buildings, ~~and~~ structures, and portions thereof shall be ~~as required~~ in accordance with this section.

> **Exception:** *Special inspections* of the steel fabrication process shall not be required where the fabricator does not perform any welding, thermal cutting or heating operation of any kind as part of the fabrication process. In such cases, the fabricator shall be required to submit a detailed procedure for material control that demonstrates the fabricator's ability to maintain suitable records and procedures such that, at any time during the fabrication process, the material specification, and grade for the main stress-carrying elements are capable of being determined. Mill test reports shall be identifiable to the main stress-carrying elements when required by the approved construction documents.

1705.2.1 Structural steel. Special inspections and nondestructive testing ~~for~~ of ~~structural steel~~ *structural steel elements* in buildings, structures, and portions thereof shall be in accordance with the quality assurance inspection requirements of AISC 360.

> **Exception:** Special inspection of railing systems composed of *structural steel elements* shall be limited to welding inspection of welds at the base of cantilevered rail posts.

1705.2.2 Cold-formed steel ~~construction other than structural steel~~ deck and reinforcing. Special inspections ~~for steel construction other than structural steel~~ of cold-formed steel deck and reinforcing steel in buildings, structures, and portions theeof shall be in accordance with Table 1705.2.2 and this section.

1705.2.2.1.1 Cold-formed steel deck. Welding inspection and welding inspector qualification for cold-formed steel floor and roof decks shall be in accordance with AWS D1.3.

~~**1705.2.2.2**~~ **1705.2.3 Cold-formed steel trusses spanning 60 feet or greater.** Where a cold-formed steel truss clear span is 60 feet (18 288 mm) or greater, the special inspector shall verify that the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing are installed in accordance with the *approved* truss submittal package.

TABLE 1705.2.2
REQUIRED ~~VERIFICATION AND~~ SPECIAL INSPECTIONS OF ~~STEEL CONSTRUCTION OTHER THAN STRUCTURAL STEEL~~ COLD-FORMED STEEL DECK AND REINFORCING STEEL

~~VERIFICATION AND INSPECTION~~TYPE	CONTINUOUS	PERIODIC	REFERENCED STANDARD[a]
1. Material verification of cold-formed steel deck:			
a. Identification markings to conform to ASTM standards specified in the approved construction documents.	—	X	Applicable ASTM material standards
b. Manufacturers' certified test reports.	—	X	
2. Special inspection of welding: a. Cold-formed steel deck:			

~~VERIFICATION AND INSPECTION~~TYPE	CONTINUOUS	PERIODIC	REFERENCED STANDARD[a]
1) Floor and roof deck welds.	—	X	AWS D1.3
b. Reinforcing steel:			
1) Verification of weldability of reinforcing steel other than ASTM A 706.	—	X	AWS D1.4 or ACI 318: Section 3.5.2
2) Reinforcing steel-resisting flexural and axial forces in intermediate and special moment frames, and boundary elements of special reinforced concrete shear walls and shear reinforcement.	X	—	
3) Shear reinforcement.	X	—	
4) Other reinforcing steel.	—	X	

For SI: 1 inch = 25.4 mm.

a. Where applicable, see also Section 1705.11, Special inspections for seismic resistance.

1705.11.1 Structural steel. Special inspections for seismic resistance shall be in accordance with Sections 1705.11.1.1 or 1705.11.1.2, as applicable.

1705.11.1.1 *Special inspections* ~~for structural steel~~ of structural steel seismic-force resisting systems of buildings and structures assigned to *Seismic Design Category* B, C, D, E or F shall be performed in accordance with the quality assurance requirements of AISC 341.

> **Exception:** *Special inspections* ~~of structural steel~~ are not required in the seismic-force resisting systems of buildings and structures assigned to *Seismic Design Category* B or C that are not specifically detailed for seismic resistance, with a response modification coefficient, *R*, of 3 or less, excluding cantilever column systems.

1705.11.1.2 *Special inspections* of *structural steel elements* in seismic-force resisting systems of buildings and structures assigned to *Seismic Design Category* B, C, D, E or F other than those covered in Section 1705.11.1.1, including struts, collectors, chords and foundation elements, shall be performed in accordance with the quality assurance requirements of AISC 341.

> **Exception:** *Special inspections* of *structural steel elements* are not required in the seismic-force resisting systems of buildings and structures assigned to *Seismic Design Category* B or C with a response modification coefficient, *R*, less than 3.

1705.12.2 Structural steel. Nondestructive testing for seismic resistance shall be in accordance with Sections 1705.12.2.1 or 1705.12.2.2, as applicable.

1705.12.2.1 Nondestructive testing ~~for~~ of structural steel seismic-force resisting systems in buildings and structures assigned to *Seismic Design Category* B, C, D, E or F shall be performed in accordance with the quality assurance requirements of AISC 341.

> **Exception:** Nondestructive testing ~~for structural steel~~ is not required in the seismic-force resisting systems of buildings and structures assigned to *Seismic Design Category* B or C that are not specifically detailed for seismic resistance, with a response modification coefficient, *R*, of 3 or less, excluding cantilever column systems.

1705.12.2.2 Nondestructive testing of *structural steel elements* in seismic-force resisting systems of buildings and structures assigned to *Seismic Design Category* B, C, D, E or F other than those covered in Section 1705.12.2.1, including struts, collectors, chords and foundation elements, shall be performed in accordance with the quality assurance requirements of AISC 341.

Exception: Nondestructive testing of *structural steel elements* is not required in the seismic-force resisting systems of buildings and structures assigned to *Seismic Design Category* B or C with a response modification coefficient, *R*, less than 3.

Reason: This comprehensive proposal not only makes a number of editorial modifications for clarification purposes, it also introduces into Chapter 17 the term and associated requirements for "structural steel elements", which is handled in a companion proposal for Chapter 22. In that companion proposal, the definition of "structural steel member" is recommended for replacement by "structural steel element", which is defined as follows:

> **STEEL ELEMENT, STRUCTURAL.** Any steel structural member of a building or structure consisting of rolled shapes, pipe, hollow structural sections, plates, bars, sheets, rods, or steel castings other than cold-formed steel or steel joist members.

The Chapter 22 companion proposal includes a comprehensive discussion in the reason statement – please refer to it for additional background. Building on that proposal's reason statement, this proposal coordinates the existing special inspection and nondestructive testing requirements with the new terminology for structural steel elements. In Section 1705.2.1, changes clarify that structural steel elements in buildings, structures and portions thereof are to be inspected and tested in accordance with the quality assurance requirements in AISC 360. Current code requirements limit the special inspections to "structural steel." The change to "structural steel elements" was made to explicitly include steel construction that is typically designed, fabricated, and constructed in accordance with AISC 360, but that does fall within the definition of structural steel in AISC 360 and the AISC Code of Standard Practice for Buildings and Bridges. An exception is provided for railing systems to reflect what is currently done for these systems and prevent the implementation of excessive requirements.

In Section 1705.11.1 on special inspections for seismic resistance the distinction is drawn between structural steel seismic-force resisting systems, which include the sixteen structural steel systems currently listed in ASCE 7-10, Table 12.2-1, and structural steel elements that work as struts, collectors, chords and foundation elements in seismic-force resisting systems composed of other structural materials. These structural steel elements should be inspected in accordance with the quality assurance requirements of AISC 341, if they are used in a seismic-force resisting system that relies heavily on non-elastic energy dissipation, in this case chosen as a system with a response modification coefficient, R, greater than 3. A parallel change is made in Section 1705.12.2 on nondestructive testing for seismic resistance.

Finally, the proposal includes a number of editorial modifications, including the following:

- It adds reference to "nondestructive testing" to clarify that the quality assurance provisions of AISC 360 and AISC 341covers not only special inspections but also testing of welds. The use of "nondestructive" is the appropriate industry terminology.
- It modifies "steel elements" to "steel construction" in order to match the terminology used in Chapter 22.
- It recognizes that special inspections and testing may be required in buildings, structures or *portions thereof*.
- It changes the title in Section 1705.2.2 to specifically recognize the types of steel construction covered – cold-formed steel deck and reinforcing steel and to get away from the use of "structural steel". Since the section is limited to cold-formed steel deck, Section 1705.2.2.2 on cold-formed steel trusses is shifted to a new sub-section, 1705.2.3.
- It clarifies that the requirements in Sections 1705.11.1 and 1705.12.2 apply to the seismic-force resisting systems of buildings and other structures.

Finally, it clarifies the appropriate SDCs for the requirements and exceptions in both Sections 1705.11.1 and 1705.12.2.

Cost Impact: The code change proposal will not increase the cost of construction.

1705.2, 1705.2.1, 1705.2.2, Table 1705.2.2, 1705.2.2.1.1, 1705.2.2.2, 1705.11.1, 1705.12.2

Proponent: Bonnie Manley, P.E. American Iron and Steel Institute (bmanley@steel.org)

Revise as follows:

1705.2 Steel construction. ~~The~~ *Special inspections* ~~for~~ and nondestructive tests of steel ~~elements of~~ construction in buildings, ~~and~~ structures, and portions thereof shall be ~~as required~~ in accordance with this section.

> **Exception:** *Special inspection* of the steel fabrication process shall not be required where the fabricator does not perform any welding, thermal cutting or heating operation of any kind as part of the fabrication process. In such cases, the fabricator shall be required to submit a detailed procedure for material control that demonstrates the fabricator's ability to maintain suitable records and procedures such that, at any time during the fabrication process, the material specification, and grade for the main stress-carrying elements are capable of being determined. Mill test reports shall be identifiable to the main stress-carrying elements when required by the approved construction documents.

1705.2.1 Structural steel. Special inspections ~~for~~ and nondestructive testing of structural steel in buildings, structures, and portions thereof shall be in accordance with the quality assurance inspection requirements of AISC 360.

1705.2.2 Cold-formed steel ~~construction other than structural steel~~ deck and reinforcing steel. Special inspections ~~for steel construction other than structural steel~~ of cold-formed steel deck and reinforcing steel in buildings, structures, and portions thereof shall be in accordance with Table 1705.2.2 and this section.

1705.2.2.1.1 Cold-formed steel deck. Welding inspection and welding inspector qualification for cold-formed steel floor and roof decks shall be in accordance with AWS D1.3.

~~1705.2.2.2~~ **1705.2.3 Cold-formed steel trusses spanning 60 feet or greater.** Where a cold-formed steel truss clear span is 60 feet (18 288 mm) or greater, the special inspector shall verify that the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing are installed in accordance with the *approved* truss submittal package.

TABLE 1705.2.2
REQUIRED ~~VERIFICATION AND~~ SPECIAL INSPECTIONS OF ~~STEEL CONSTRUCTION OTHER THAN STRUCTURAL STEEL~~ COLD-FORMED STEEL DECK AND REINFORCING STEEL

~~VERIFICATION AND INSPECTION~~TYPE	CONTINUOUS	PERIODIC	REFERENCED STANDARD[a]
1. Material verification of cold-formed steel deck:			
a. Identification markings to conform to ASTM standards specified in the approved construction documents.	—	X	Applicable ASTM material standards
b. Manufacturers' certified test reports.	—	X	
2. Special ~~i~~Inspection of welding: a. Cold-formed steel deck:			
1) Floor and roof deck welds.	—	X	AWS D1.3
b. Reinforcing steel:			

~~VERIFICATION AND INSPECTION~~TYPE	CONTINUOUS	PERIODIC	REFERENCED STANDARD[a]
1) Verification of weldability of reinforcing steel other than ASTM A 706.	—	X	AWS D1.4 or ACI 318: Section 3.5.2
2) Reinforcing steel-resisting flexural and axial forces in intermediate and special moment frames, and boundary elements of special reinforced concrete shear walls and shear reinforcement.	X	—	
3) Shear reinforcement.	X	—	
4) Other reinforcing steel.	—	X	

For SI: 1 inch = 25.4 mm.

a. Where applicable, see also Section 1705.11, Special inspections for seismic resistance.

1705.11.1 Structural steel. *Special inspection*s ~~for~~ of structural steel in the seismic force-resisting systems of buildings and structures assigned to *Seismic Design Category* B, C, D, E or F shall be performed in accordance with the quality assurance requirements of AISC 341.

> **Exception:** *Special inspections* of structural steel are not required in the seismic force-resisting systems of buildings and structures assigned to *Seismic Design Category* B or C that are not specifically detailed for seismic resistance, with a response modification coefficient, *R*, of 3 or less, excluding cantilever column systems.

1705.12.2 Structural steel. Nondestructive testing ~~for~~ of structural steel in the seismic force-resisting systems of buildings and structures assigned to *Seismic Design Category* B, C, D, E or F shall be performed in accordance with the quality assurance requirements of AISC 341.

> **Exception:** Nondestructive testing ~~for~~ of structural steel is not required in the seismic-force resisting systems of buildings and structures assigned to *Seismic Design Category* B or C that are not specifically detailed for seismic resistance, with a response modification coefficient, *R*, of 3 or less, excluding cantilever column systems.

Reason: This proposal is primarily editorial in nature and makes the following modifications:

- It adds reference to “nondestructive testing” to clarify that Chapter 17 covers not only special inspections but also testing. The use of “nondestructive” is the appropriate industry terminology.
- It modifies “steel elements” to “steel construction” in order to match the terminology used in Chapter 22.
- It adds recognition that special inspections and testing may be required in buildings, structures or *portions thereof*.
- It changes the title in Section 1705.2.2 to specifically recognize the types of steel construction covered – cold-formed steel deck and reinforcing steel. Since the section is limited to cold-formed steel deck, Section 1705.2.2.2 on cold-formed steel trusses is shifted to a new sub-section, 1705.2.3.
- It adds reference to “special” inspections in Table 1705.2.2 and coordinates the title with the changes in the charging text.
- It clarifies that the requirements in Sections 1705.11.1 and 1705.12.2 apply to the seismic-force resisting systems of buildings and other structures.

Finally, it clarifies the appropriate SDCs for the requirements and exceptions in both Sections 1705.11.1 and 1705.12.2.

Cost Impact: The code change proposal will not increase the cost of construction.

Add new standard to Chapter 35 as follows:

Steel Deck Institute

SDI QA/QC-2011, Standard for Quality Control and Quality Assurance for Installation of Steel Deck.

Reason: The SDI QA/QC-2011 Standard contains provisions for quality assurance inspection of steel floor and roof deck, and is intended to coordinate with the requirements of AISC 360, as contained in Section 1705.2.1.

The Standard complies with the Special Inspection requirements of the 2012 IBC Chapter 17, and clarifies the scope of required inspections and responsibilities of both the installer's quality control personnel and the quality assurance inspector. The Standard contains tables of inspection tasks that specifically list inspection requirements for material verification, deck installation, welding, and mechanical fastening. These tables amplify and clarify the basic special inspection requirements for steel deck that were contained in the 2012 IBC, and bring all special inspection requirements for steel deck into one place.

This Standard contains the 2012 IBC requirements of using AWS D1.3 for weld quality and requiring material verification. This Standard was developed and approved through a consensus process under ANSI guidelines, and complies with ICC CP 28. This Standard, along with all other Steel Deck Institute (SDI) Standards, will be available for free download from the SDI website for all parties.

For review purposes, the SDI QA/QC-2011 Standard that is being proposed is available for download and review from this website: http://www.sputoandlammert.com/standard.html

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

S143–12
1705.2.2.2, 1705.5.2, 2211.3.3, 2203.4.1.3

Proponent: Mark Gilligan, P.E., S.E., representing self (mark@gilligan.name)

Revise as follows:

1705.2.2.2 Cold-formed steel trusses spanning 60 feet or greater. Where a cold-formed steel truss clear span is 60 feet (18 288 mm) or greater, the special inspector shall verify that the ~~temporary installation restraint/bracing and the~~ permanent individual truss member restraint/bracing are installed in accordance with the *approved* truss submittal package.

1705.5.2 Metal-plate-connected wood trusses spanning 60 feet or greater. Where a truss clear span is 60 feet (18 288 mm) or greater, the special inspector shall verify that ~~the temporary installation restraint/bracing and the~~ permanent individual truss member restraint/bracing are installed in accordance with the *approved* truss submittal package.

Delete without substitution:

~~**2211.3.3 Trussses spanning 60 feet or greater.** The owner shall contract with a *registered design professional* for the design of the temporary installation restraint/bracing and the permanent individual truss member restraint/ bracing for trusses with clear spans 60 feet (18 288 mm) or greater. *Special inspection* of trusses over 60 feet (18 288 mm) in length shall conform to Section 1705.~~

~~**2303.4.1.3 Trusses spanning 60 feet or greater.** The owner shall contract with any qualified *registered design professional* for the design of the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing for all trusses with clear spans 60 feet (18 288 mm) or greater.~~

Reason: The provisions for temporary bracing need to be deleted since building departments do not have authority to enforce safety provisions during construction. The existing provisions deal with contractor's means and methods of construction. The ability to regulate in this area is pre-empted by Federal of State OSHA regulations thus local agencies do not have legal authority to regulate in this area and thus the model code should not contain these requirements.

There is no disagreement about the need for temporary bracing only with it being addressed in the building code. In addition to the legal argument, it is suggested that temporary bracing is an integral part of the installation procedures, thus separating the responsibility for design of temporary bracing from the responsibility for installation procedures will have a negative impact on construction safety.

Deleting these provisions does not alter the code requirements for permanent bracing nor the need to inspect the permanent bracing.

Cost Impact: The code change proposal will not increase the cost of construction.

12. Inspect formwork for shape, location and dimensions of the concrete member being formed.	—	X	ACI 318: 6.1.1	—

For SI: 1 inch = 25.4 mm.

a. Where applicable, see also Section 1705.11, Special inspection for seismic resistance.

b. Specific requirements for special inspection shall be included in the research report for the anchor issued by an approved source in accordance with ACI 355.2 or other qualification procedures. Where specific requirements are not provided, special inspection requirements shall be specified by the registered design professional and shall be approved by the building official prior to the commencement of the work.

~~1705.2.2.1.2~~ 1705.3.1 Welding of reinforcing ~~steel~~ bars. ~~Welding~~ Special inspections of welding and ~~welding inspector~~ qualifications of *special inspectors* for reinforcing ~~steel~~ bars shall be in accordance with the inspection requirements of AWS D1.4 ~~and ACI 318~~ for *special inspection* and the qualification requirements of AWS D1.4 for *special inspector* qualification.

Reason: This proposal is a continuation of a separate proposal that correlates Tables 1705.2.2 and 1705.3.3 with ACI 318-11. The purpose for this proposal is to relocate the requirements for special inspection of reinforcing bar welding in concrete from Item 2b of Table 1705.2.2 for steel construction to Item 2 of Table 1705.3 for concrete construction. Reinforcing bars are related to concrete construction, not steel construction. Note that the referenced standard listed in Table 1705.2.2 for reinforcing bar welding is ACI 318 for structural concrete (e.g., not also for TMS 402/ACI 530/ASCE 5 for masonry structures).

The other changes in the proposal are a consequence of the relocation, which reduces the scope of Table 1705.2.2 to specifying special inspections of cold-formed steel deck. These other changes eliminate language that becomes superfluous with the relocation.

Note that separate proposals:

1. Make several modifications to the titles and column headings of Tables 1705.2.2 and 1705.3 that are related to special inspections and tests as well as continuous and periodic special inspection ; and
2. Further modify Item 2b of Table 1705.2.2 by replacing the last three listings under the item .

The final language in the titles and column headings of Tables 1705.2.2 and 1705.3 from this proposal and the proposal in Item #1 above is shown below for reference.

b. Inspect bracing, strap bracing, drag strut and stiffener locations and sizes.		X	
c. Verify mechanical connectors including screws, powder actuated fasteners, bolts, anchor bolts, hold downs, anchors and other fastening components.		X	Applicable ASTM Standards
d. Inspect material thickness, grade and fastening of diaphragms, and sheathing for the lateral force resisting system.		X	
e. Inspect connections including plates and components; screw quantity, size and spacing; powder actuated fastener quantity size and location; bolt size and location; anchor bolt size, spacing and location; hold down size location and configuration; beam hangers and framing.		X	

For SI: 1 inch = 25.4 mm.

a. Where applicable, see also Section 1705.10 Special inspections for wind resistance and Section 1705.11, Special inspections for seismic resistance.

1705.2.2.1.1 Cold-formed steel. Welding inspection and welding inspector qualification for cold-formed steel floor and roof decks and cold-formed steel light-frame construction shall be in accordance with AWS D1.3.

1705.5 Wood construction. *Special inspections* of the fabrication process of prefabricated wood structural elements and assemblies shall be in accordance with Section 1704.2.5. *Special inspections* of site-built assemblies shall be in accordance with this section and Table 1705.5.

Exceptions:

1. *Special inspection* of wood construction for buildings and structures in Risk Category I shall not be required.
2. *Special inspection* of wood construction for buildings and structures in Risk Category II that are 3 stories or less in height above grade plane and that are not included in Sections 1705.10 or 1705.11 shall not be required.

TABLE 1705.5
REQUIRED VERIFICATION AND INSPECTION OF WOOD CONSTRUCTION

VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	REFERENCED STANDARD[a]
1. Inspection of wood construction including framing, shear walls, diaphragms and shear panels for conformance with the *approved construction documents:*			
a. Verify grade stamp on framing lumber, plywood and OSB.		X	
b. Inspect wood framing including layout, member sizes, blocking, bridging and bearing lengths.		X	
c. Verify mechanical connectors including screws, powder actuated fasteners, bolts, anchor bolts, hold downs, anchors and other fastening components.		X	Applicable ASTM Standards
d. Inspect diaphragms, shear walls and wood structural panel sheathing size and thickness; sizes of framing members at adjoining panel edges and nail or staple size and spacing.		X	
e. Inspect wood connections including plates and components; nail quantity, size and spacing; bolt size and location; anchor bolt		X	

VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	REFERENCED STANDARD[a]
size, spacing and location; hold down size location and configuration; beam hangers and framing.			

a. Where applicable, see Section 1705.10, Special inspections for wind resistance and Section 1705.11, Special inspections for seismic resistance.

1705.10.1 Structural wood. Continuous special inspection is required during field gluing operations of elements of the main windforce-resisting system. Periodic special inspection is required for nailing, bolting, anchoring and other fastening of components within the main windforce-resisting system, including wood shear walls, wood diaphragms, drag struts, braces and hold-downs.

Exception: For buildings and structures in Risk Category I or II that are 3 stories or less in height above grade plane, *special inspection* is not required for wood shear walls, shear panels and diaphragms, including nailing, bolting, anchoring and other fastening to other components of the main wind-force-resisting system, where the fastener spacing of the sheathing is more than 4 inches (102 mm) on center.

1705.10.2 Cold-formed steel light-frame construction. Periodic special inspection is required during welding operations of elements of the main windforce-resisting system. Periodic special inspection is required for screw attachment, bolting, anchoring and other fastening of components within the main windforce-resisting system, including shear walls, braces, diaphragms, collectors (drag struts) and hold-downs.

Exception: For buildings and structures in Risk Category I or II and 3 stories or less in height above grade plane, *special inspection* is not required for cold- formed steel light-frame shear walls, braces, diaphragms, collectors (drag struts) and hold-downs where either of the following apply:

1. The sheathing is gypsum board or fiberboard.
2. The sheathing is wood structural panel or steel sheets on only one side of the shear wall, shear panel or diaphragm assembly and the fastener spacing of the sheathing is more than 4 inches (102 mm) on center (o.c.).

1705.11.2 Structural wood. Continuous special inspection is required during field gluing operations of elements of the seismic force-resisting system. Periodic special inspection is required for nailing, bolting, anchoring and other fastening of components within the seismic force-resisting system, including wood shear walls, wood diaphragms, drag struts, braces, shear panels and hold-downs.

Exception: For buildings and structures in Risk Category I or II and 3 stories or less in height above grade plane *special inspection* is not required for wood shear walls, shear panels and diaphragms, including nailing, bolting, anchoring and other fastening to other components of the seismic force-resisting system, where the fastener spacing of the sheathing is more than 4 inches (102 mm) on center (o.c.).

1705.11.3 Cold-formed steel light-frame construction. Periodic special inspection is required during welding operations of elements of the seismic force-resisting system. Periodic special inspection is required for screw attachment, bolting, anchoring and other fastening of components within the seismic force-resisting system, including shear walls, braces, diaphragms, collectors (drag struts) and hold-downs.

Exception: For buildings and structures in Risk Category I or II and 3 stories or less in height above grade plane, s*pecial inspection* is not required for cold-formed steel light-frame shear walls, braces, diaphragms, collectors (drag struts) and hold-downs where either of the following apply:

1. The sheathing is gypsum board or fiberboard.
2. The sheathing is wood structural panel or steel sheets on only one side of the shear wall, shear panel or diaphragm assembly and the fastener spacing of the sheathing is more than 4 inches (102 mm) o.c.

Reason: : NCSEA believes that light frame construction in wood and cold formed steel have become more commonly used for load bearing applications of significant height and in regions with moderate and high seismic and wind concerns. These types of construction should be subject to Special Inspections in a similar manner and to a comparable extent as other systems such as concrete, structural steel and masonry. There is a large group of buildings constructed with light frame construction that is not subject to the same requirements for Special Inspection as the same buildings constructed with structural steel, concrete or masonry. This proposal seeks to correct this deficiency in the Code.

This proposal provides requirements to be consistent across both wood and cold-formed steel systems to avoid any competitive advantage of one system over the other. This proposal will improve the consistency of special inspections across all of the major structural materials.

Exceptions are provided to limit the applicability of these provisions to exclude single and two family dwellings, small commercial, agricultural and buildings of lesser occupancies unless these minor structures are subject to the existing requirements of 1705.10 and 1705.11.

This proposal contains provisions addressing both wood frame and cold-formed steel light-frame construction together. This is an effort to address both systems in one change therefore avoiding any perception of one system having an advantage over the other regarding special inspection.

The proposed revisions to 1705.2 and 1705.5 improve the Special Inspection requirements for both wood and cold-formed steel light-frame construction in a manner consistent with Special Inspection requirements for structural steel, concrete and masonry.

The proposed revisions to 1705.10 and 1705.11 are to coordinate between the additional requirements for Special Inspections in high seismic and high wind conditions and the proposed provisions. The proposed changes to 1705.10 and 1705.11 do not reduce the requirements of these sections they only prevent the exceptions for these sections from conflicting with the new requirements. In addition, notes are added to the tables to refer to 1705.10 and 1705.11 for additional requirements.

There will be no increase in construction cost due to the increased Special Inspection that will take place. Currently structural engineers provide for these inspections in project specifications. However, individual requirements vary greatly and there is not a consistent level of requirements. Standardization of these requirements in the Code will reduce delays and added costs due to confusion created by varying specifications. The improved field quality assurance will improve safety and reduce field errors resulting in a savings in construction cost and schedule. The improved public safety and potential reduction in construction cost support adoption of this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

1705.2.2-SHARMAN.doc

S146–12
Table 1705.2.2

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing myself (pbrazil@reidmiddleton.com)

Revise as follows:

TABLE 1705.2.2
REQUIRED VERIFICATION AND INSPECTION OF STEEL CONSTRUCTION OTHER THAN STRUCTURAL STEEL

VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	REFERENCED STANDARD[a]
1. Material verification of cold-formed steel deck:			
a. Identification markings to conform to ASTM standards specified in the approved construction documents.	—	X	Applicable ASTM material standards
b. Manufacturers' certified test reports.	—	X	
2. Inspection of welding:	—	—	
a. Cold-formed steel deck			
1. Floor and roof deck welds		X	AWS D1.3
b. Reinforcing steel:			
1. Verification of weldability of reinforcing steel other than ASTM A 706.	—	X	AWS D1.4 ACI 318 Section 3.5.2
2. Reinforcing steel resisting flexural and axial forces in intermediate and special moment frames, and boundary elements of special structural walls of concrete and shear reinforcement.	X	—	
3. Shear reinforcement.	X	—	
4. Other reinforcing steel.	—	X	
<u>3. Installation of open web steel joists and joist girders in accordance with the approved construction documents and steel joist placement plans</u>		<u>X</u>	

For SI: 1 inch = 25.4 mm.
a. Where applicable, see also Section 1705.11, Special inspection for seismic resistance.

Reason: The purpose for this proposal is to require special inspections for the installation of open web steel joists and joist girders. Their structural design is sufficiently complex to warrant inspection from a person with the expertise of a special inspector who is approved by the building official as having the competence necessary to inspect the installation of the joists. Refer to the definitions of "special inspection" and "special inspector" for further information. Examples of the complexity of the structural design that warrant special inspection of the installation are the bearing seat attachments, field splices and bridging attachments.

The standard specifications for open web steel joists (SJI-K-2010 and SJI-LH/DLH-2010), joist girders (SJI-JG-2010) and composite steel joists (SJI-CJ-2010) by the Steel Joist Institute contain provisions for inspections but these are limited to inspections by the manufacturer before shipment to verify compliance and workmanship with the requirements of the specifications. Refer to Section 5.12 of SJI-K-2010, Section 104.13 of SJI-LH/DLH-2010, Section 1004.10 of SJI-JG-2010 and Section 104.13 of SJI-CJ-2010. The sections of the SJI standards noted above are also referenced in Section 4 of the codes of standard practice for steel joists and joist girders (no identifier) and composite steel joists (SJI-CJCOSP-2010). The identifiers cited above match those from the published documents but they are abbreviated in Chapter 35 of the 2012 IBC to K-10, LH/LDH-10, JG-10 and CJ-10, respectively; and are specified as SJI-K-1.1, SJI-LH/LDH-1.1, SJI-JG-1.1 and SJI-CJ-1.0, respectively, in Section 2207.1. Note that the codes of standard practice published by the Steel Joist Institute are not referenced standards of the 2012 IBC.

Cost Impact: The code change proposal will increase the cost of construction.

Table 1705.2.2, Table 1705.3

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

Revise as follows:

TABLE 1705.2.2
REQUIRED VERIFICATION AND INSPECTION OF STEEL CONSTRUCTION OTHER THAN STRUCTURAL STEEL

VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	REFERENCED STANDARD [a]
1. Material verification of cold-formed steel deck:			
a. Identification markings to conform to ASTM standards specified in the approved construction documents.	—	X	Applicable ASTM material standards
b. Manufacturers' certified test reports.	—	X	
2. Inspection of welding:	—	—	
a. Cold-formed steel deck			
1. Floor and roof deck welds		X	AWS D1.3
b. Reinforcing ~~steel~~ bars:			
1. Verification of weldability of reinforcing ~~steel~~ bars other than ASTM A 706.	—	X	AWS D1.4 ACI 318 Section 3.5.2
2. Reinforcing ~~steel~~ bars resisting flexural and axial forces in intermediate and special moment frames, and boundary elements of special structural walls of concrete and shear reinforcement.	X	—	
3. Shear reinforcement.	X	—	
4. Other reinforcing ~~steel~~ bars.	—	X	

For SI: 1 inch = 25.4 mm.
a. Where applicable, see also Section 1705.11, Special inspection for seismic resistance.

TABLE 1705.3
REQUIRED VERIFICATION AND INSPECTION OF CONCRETE CONSTRUCTION

VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	REFERENCED STANDARD [a]	IBC REFERENCE
1. Inspection of ~~reinforcing steel~~ reinforcement, including prestressing tendons, and placement.	—	X	ACI 318: 3.5, 7.1–7.7	1910.4
2. Inspection of reinforcing ~~steel~~ bar welding in accordance with Table 1705.2.2, Item 2b.	—	—	AWS D1.4 ACI 318: 3.5.2	—

(Portions of table not shown remain unchanged)

Reason: The purpose for the proposal is to update Tables 1705.2.2 and 1705.3 for consistency with ACI 318-11, which does not use the term "reinforcing steel" but does use "(concrete) reinforcement" and "reinforcing bars." In Section 2.2 of ACI 318-11, "deformed reinforcement" is defined as including bar mats, deformed wire and welded wire reinforcement as well as deformed reinforcing bars. Section 3.5.1 requires reinforcement in concrete to be deformed reinforcement except that plain reinforcement is permitted for spirals and prestressing steel and reinforcement consisting of headed shear studs, structural steel, steel pipe or steel tubing is also permitted. Section 3.5.2 on welding, however, only specifies reinforcing bars. Note that Section 2.2 of ACI 318-11 also defines "reinforcement," "plain reinforcement," "headed deformed bars," "prestressing steel" and "tendon."

Note that separate proposals:

1. Make several modifications to the titles and column headings of Tables 1705.2.2 and 1705.3 that are related to special inspections and tests as well as continuous and periodic special inspection; and
2. Further modify Item 2b of Table 1705.2.2 by relocating the language to Table 1705.3; and replacing the last three listings under the item.

The final language in the titles and column headings of Tables 1705.2.2 and 1705.3 from the proposal in Item #1 above is shown below for reference.

~~4. Other reinforcing steel.~~	~~—~~	~~X~~	
2. <u>Single-pass fillet welds, maximum 5/16"</u>		<u>X</u>	
3. <u>All other welds</u>	<u>X</u>		

For SI: 1 inch = 25.4 mm.
a. Where applicable, see also Section 1705.11, Special inspection for seismic resistance.

Reason: This proposal is a continuation of separate proposals that correlate Tables 1705.2.2 and 1705.3.3 with ACI 318-11 and relocate the requirements for special inspection of reinforcing bar welding from Table 1705.2.2 to Table 1705.3.3. The purpose for this proposal is to simplify the required extent (continuous or periodic) of special inspection for the welding of reinforcing bars, which is currently based on the structural design (e.g., resisting flexural, axial or shear forces). The proposal changes the extent to continuous special inspection of all welding of reinforcing bars except for single-pass fillet welds that are a maximum of 5/16-inch where periodic special inspection is permitted. This will also be consistent with the historical approach taken by the building code for the extent of special inspections related to welding.

Should this proposal and the proposal to relocate the requirements for special inspection of reinforcing bar welding from Table 1705.2.2 to Table 1705.3.3 both be approved by the ICC membership, our intent is that the language in this proposal at Item 2b of Table 1705.2.2 be placed in Item 2 of Table 1705.3 and that Item 2 of Table 1705.3 read as follows:

2. Inspection of reinforcing bar welding:				
a. Verification of weldability of reinforcing bars other than ASTM A 706.	—	X	AWS D1.4 ACI 318: 3.5.2	
b. Single-pass fillet welds, maximum 5/16"	—	X		
c. All other welds	X	—		

Note that a separate proposal also makes several modifications to the title and column headings of Table 1705.2.2 that are related to special inspections and tests as well as continuous and periodic special inspection.

Cost Impact: The code change proposal will not increase the cost of construction.

202, 1705.3, 1705.11.6, 1705.12.3, 2105.1, 2105.2.2.2.1, 2204.2.1, 2207.4

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

Revise as follows:

SECTION 202
DEFINITIONS

SPECIFIED COMPRESSIVE STRENGTH OF MASONRY, f'_m. Minimum compressive strength, expressed as force per unit of net cross-sectional area, required of the *masonry* used in construction by the <u>approved</u> *construction documents*, and upon which the project design is based. Whenever the quantity f'_m is under the radical sign, the square root of numerical value only is intended and the result has units of pounds per square inch (psi) (MPa).

Revise as follows:

1705.3 Concrete construction. The *special inspections* and verifications for concrete construction shall be as required by this section and Table 1705.3.

Exception: *Special inspections* shall not be required for:

1. Isolated spread concrete footings of buildings three stories or less above *grade plane* that are fully supported on earth or rock.
2. Continuous concrete footings supporting walls of buildings three stories or less above *grade plane* that are fully supported on earth or rock where:
   2.1. The footings support walls of light-frame construction;
   2.2. The footings are designed in accordance with Table 1809.7; or
   2.3. The structural design of the footing is based on a specified compressive strength, f'_c, no greater than 2,500 pounds per square inch (psi) (17.2 MPa), regardless of the compressive strength specified in the <u>approved</u> *construction documents* or used in the footing construction.
3. Nonstructural concrete slabs supported directly on the ground, including prestressed slabs on grade, where the effective prestress in the concrete is less than 150 psi (1.03 MPa).
4. Concrete foundation walls constructed in accordance with Table 1807.1.6.2.

1705.11.6 Mechanical and electrical components. *Special inspection* for mechanical and electrical components shall be as follows:

1. Periodic special inspection is required during the anchorage of electrical equipment for emergency or standby power systems in structures assigned to *Seismic Design Category* C, D, E or F;
2. Periodic special inspection is required during the anchorage of other electrical equipment in structures assigned to *Seismic Design Category* E or F;
3. Periodic special inspection is required during the installation and anchorage of piping systems designed to carry hazardous materials and their associated mechanical units in structures assigned to *Seismic Design Category* C, D, E or F;
4. Periodic special inspection is required during the installation and anchorage of ductwork designed to carry hazardous materials in structures assigned to *Seismic Design Category* C, D, E or F; and
5. Periodic special inspection is required during the installation and anchorage of vibration isolation systems in structures assigned to *Seismic Design Category* C, D, E or F where the <u>approved</u> *construction documents* require a nominal clearance of 1/4 inch (6.4 mm) or less between the equipment support frame and restraint.

1705.12.3 Seismic certification of nonstructural components. The *registered design professional* shall specify on the approved construction documents the requirements for certification by analysis, testing or experience data for nonstructural components and designated seismic systems in accordance with Section 13.2 of ASCE 7, where such certification is required by Section 1705.12.

Revise as follows:

2105.1 General. A quality assurance program shall be used to ensure that the constructed masonry is in compliance with the approved *construction documents*. The quality assurance program shall comply with the inspection and testing requirements of Chapter 17.

2105.2.2.2.1 General. The compressive strength of clay and concrete masonry shall be determined by the prism test method:

1. Where specified in the approved *construction documents*.
2. Where masonry does not meet the requirements for application of the unit strength method in Section 2105.2.2.1.

Revise as follows:

2204.2.1 Anchor rods. Anchor rods shall be set in accordance with the approved *construction documents*. The protrusion of the threaded ends through the connected material shall fully engage the threads of the nuts, but shall not be greater than the length of the threads on the bolts.

2207.4 Steel joist drawings. Steel joist placement plans shall be provided to show the steel joist products as specified on the approved *construction documents* and are to be utilized for field installation in accordance with specific project requirements as stated in Section 2207.2. Steel placement plans shall include, at a minimum, the following:

1. Listing of all applicable loads as stated in Section 2207.2 and used in the design of the steel joists and joist girders as specified in the approved *construction documents*.
2. Profiles for nonstandard joist and joist girder configurations (standard joist and joist girder configurations are as indicated in the SJI catalog).
3. Connection requirements for:
   3.1. Joist supports;
   3.2. Joist girder supports;
   3.3. Field splices; and
   3.4. Bridging attachments.
4. Deflection criteria for live and total loads for non-SJI standard joists.
5. Size, location and connections for all bridging.
6. Joist headers.

Steel joist placement plans do not require the seal and signature of the joist manufacturer's *registered design professional*.

Reason: The purpose for the proposal is to update references to "construction documents" in the building code. Section 107.1 contains the requirements for the submittal of construction documents with each permit application and Section 107.3 requires the building official to approve the construction documents for permit issuance. The building code typically specifies "construction documents" before permit issuance and "approved construction documents" after permit issuance but there are exceptions and this proposal adds "approved" for those cases.

The instances of "construction documents" not preceded by "approved" in the building code typically occur in provisions that require the designers to specify information in the construction documents or to design the building or structure to meet specified requirements. Compliance with these provisions is only possible before the construction documents are approved. These are located in Sections 104.2, 105.3(4), 105.3.1, 105.4, 107.1, 107.1, 107.2, 107.2.1, 107.2.2, 107.2.3, 107.2.4, 107.2.5, 107.3.1, 107.3.2, 107.3.3, 107.3.4.1, 414.1.3, 907.1.1, 909.2, 909.3, 909.4, 909.21.2, 1603.1, 1603.1.6, 1603.1.9, 1607.5, 1705.11.6(5), 1705.12.3, 1901.3, 2101.3, 2101.3.1, 2207.2, 2403.2, 3103.2, 3303.2, G104.2, H105.2, K104.1, K104.2 and K105.5.

The instances of “approved construction documents” in the building code are located in Sections 107.4, 107.5, 114.4, 202 (“certificate of compliance” and “structural observation”), 1704.2.4, 1704.2.5.1, 1704.2.5.2, 1705.2-Exc., 1705.6, 1705.8, 1705.9, 1705.13, 1705.14, 1810.3.5.2.2-Exc., 1910.7, 2207.5, and 2403.1; and Table 1705.2.2. Note that “approved” precedes “geotechnical report and the construction documents” in Sections 1705.6, 1705.8 and 1705.9. In Section 1705.7, however, “*approved*” precedes “*instruction documents*,” which is apparently an advertent error made during the development of the 2012 IBC. On August 9, 2011, I submitted a request to the ICC that this be posted as errata but, as of January 3, 2012, the submittal deadline for Group A change proposals, a posting for the 2012 IBC had not yet been made on the ICC website.

All instances of “construction documents” in the building code were considered and are either in the proposal or are listed in the paragraphs immediately above.

A separate proposal places the provisions of Section 1705.12.3 into two subsections (Sections 1705.12.3 and 1705.12.4) to provide effective charging language for the corresponding provisions in ASCE 7-10. Should both proposals be approved by the ICC membership, our intent is that Sections 1705.12.3 and 1705.12.4 both read: “…the *registered design professional* shall specify on the *approved construction documents* the requirements…”

A separate proposal deletes the definition of “specified” in Section 202. Should both proposals be approved by the ICC membership, our intent is that the definition be deleted.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1705.3-S-BRAZIL.doc

S150–12
1705.3

Proponent: Stephen Kerr, S.E., Josephson Werdowatz and Associates, representing Structural Engineers Association of California (SEAOC) (skerr@jwa-se.com)

Revise as follows:

1705.3 Concrete construction. The *special inspections* and verifications for concrete construction shall be as required by this section and Table 1705.3. The following exceptions shall not apply where Section 1705.10 or 1705.11 invoke *special inspections* or where special inspection of column anchor bolts for structural steel lateral force resisting frames is required by Section 1705.11.1.

Exception: *Special inspections* shall not be required for:

~~1. Isolated spread concrete footings of buildings three stories or less above *grade plane* that are fully supported on earth or rock.~~

~~2~~1. *Isolated spread concrete footings and* continuous concrete footings supporting walls of buildings three stories or less above *grade plane* that are fully supported on earth or rock and where any of the following conditions apply:

~~2.1.~~ 1.1 The footings support walls of light-frame construction;

~~2.2.~~ 1.2 The footings are designed in accordance with Table 1809.7; or

~~2.3.~~ 1.3 The structural design of the footing is based on a specified compressive strength, f'_c, no greater than 2,500 pounds per square inch (psi) (17.2 MPa), regardless of the compressive strength specified in the *construction documents* or used in the footing construction.

~~3~~2. Nonstructural concrete slabs supported directly on the ground, including prestressed slabs on grade, where the effective prestress in the concrete is less than 150 psi (1.03 MPa).

~~4~~3. Concrete foundation walls constructed in accordance with Table 1807.1.6.2.

~~5~~4. Concrete patios, driveways and sidewalks, on grade.

Reason: Special inspections for concrete include such items as proper mix, reinforcing steel, bolts installed in concrete, post-installed anchors, formwork, concrete placement, curing, etc. Under Exception 1, the building could be of any type (concrete, masonry, steel, light frame), utilize high-strength concrete, and have heavily-loaded "isolated" footings. This change proposal makes the exception for isolated spread footings subject to the same limitations as those for continuous footings.

Note also that there are no additional inspection requirements for concrete under 1705.10 (wind), 1705.11 (seismic) and 1705.12 (testing for seismic). Therefore, anchorage elements such as anchor bolts for holdowns or steel frames used in the lateral system would not require special inspection when used in conjunction with light-frame construction or at isolated footings. The proposed change ensures that, when special inspection for light-frame construction is required by Section 1705.10 or 1705.11, the placement of anchor bolts will require special inspection, and that the placement of anchor bolts for steel frames resisting seismic loads will also require special inspection.

Cost Impact: The code change proposal will increase the cost of construction.

10. Inspect erection of precast concrete members.	—	X	ACI 318: Ch. 16	—
11. ~~Verification of~~ Verify in-situ concrete strength, prior to stressing of tendons in post-tensioned concrete and prior to removal of shores and forms from beams and structural slabs.	—	X	ACI 318: 6.2	—
12. Inspect formwork for shape, location and dimensions of the concrete member being formed.	—	X	ACI 318: 6.1.1	—

(No change to footnotes)

TABLE 1705.6
REQUIRED VERIFICATION AND INSPECTION OF SOILS

VERIFICATION AND INSPECTION TASK	CONTINUOUS DURING TASK LISTED	PERIODICALLY DURING TASK LISTED
1. Verify materials below shallow foundations are adequate to achieve the design bearing capacity.	—	X
2. Verify excavations are extended to proper depth and have reached proper material.	—	X
3. Perform classification and testing of compacted fill materials.	—	X
4. Verify use of proper materials, densities and lift thicknesses during placement and compaction of compacted fill.	X	—
5. Prior to placement of compacted fill, ~~observe~~ inspect subgrade and verify that site has been prepared properly.	—	X

TABLE 1705.7
REQUIRED VERIFICATION AND INSPECTION OF DRIVEN DEEP FOUNDATION ELEMENTS

VERIFICATION AND INSPECTION TASK	CONTINUOUS DURING TASK LISTED	PERIODICALLY DURING TASK LISTED
1. Verify element materials, sizes and lengths comply with the requirements.	X	—
2. Determine capacities of test elements and conduct additional load tests, as required.	X	—
3. ~~Observe~~ Inspect driving operations and maintain complete and accurate records for each element.	X	—
4. Verify placement locations and plumbness, confirm type and size of hammer, record number of blows per foot of penetration, determine required penetrations to achieve design capacity, record tip and butt elevations and document any damage to foundation elements.	X	—
5. For steel elements, perform additional inspections in accordance with Section 1705.2.	—	—

VERIFICATION AND INSPECTION TASK	CONTINUOUS DURING TASK LISTED	PERIODICALLY DURING TASK LISTED
6. For concrete elements and concrete-filled elements, perform additional inspections in accordance with Section 1705.3.	—	—
7. For specialty elements, perform additional inspections as determined by the registered design professional in responsible charge.	—	—

TABLE 1705.8
REQUIRED VERIFICATION AND INSPECTION OF CAST-IN-PLACE DEEP FOUNDATION ELEMENTS

VERIFICATION AND INSPECTION TASK	CONTINUOUS DURING TASK LISTED	PERIODICALLY DURING TASK LISTED
1. ~~Observe~~ Inspect drilling operations and maintain complete and accurate records for each element.	X	—
2. Verify placement locations and plumbness, confirm element diameters, bell diameters (if applicable), lengths, embedment into bedrock (if applicable) and adequate end-bearing strata capacity. Record concrete or grout volumes.	X	—
3. For concrete elements, perform additional inspections in accordance with Section 1705.3.	—	—

Reason: This proposal is a continuation of separate proposals that:

1. Correlate Tables 1705.2.2 and 1705.3.3 with ACI 318-11;
2. Relocate the requirements for special inspection of reinforcing bar welding from Table 1705.2.2 to Table 1705.3.3; and
3. Simplify the required extent of special inspection for the welding of reinforcing bars.

The primary purpose for this proposal is to revise Tables 1705.6, 1705.7 and 1705.8 for consistency with Table 1705.3 and to clarify the scope of special inspections in Table 1705.3. The changes from “inspection” to “inspect” in Table 1705.3 are made to reduce confusion with the provisions in the building code for inspections by building inspectors and special inspections by special inspectors. The changes from “observe” to “inspect” in Tables 1705.6, 1705.7 and 1705.8 are made to reduce confusion with the provisions in the building code for structural observation, which have been reported to us by several code users. The changes are also made for consistency with the definitions of “special inspection” and “special inspector” in Section 202.

The current language In Item 6 of Table 1705.3 specifies the performance of slump and air content tests “at the time fresh concrete is sampled to fabricate specimens for strength tests.” The effect of this is that Table 1705.3 does not specify the sampling of fresh concrete for the purpose of performing strength tests and the proposal changes Item 6 to do so.

The current language in Item 9 of Table 1705.3 limits special inspections of the grouting of bonded prestressing tendons to those that are elements of the seismic force-resisting system. In our judgment, it is equally important that the grouting of these tendons be subject to special inspections where they are elements of gravity or wind force-resisting systems and the proposal changes Item 9(b) to do so.

For Item 2 in Table 1705.3, our intent for the dashes opposite the charging language is that they be deleted.

Note that a separate proposal also makes several modifications to the title and column headings of Table 1705.3 that are related to special inspections and tests as well as continuous and periodic special inspection and the final language the title and column headings from that proposal is shown below.

TABLE 1705.3
REQUIRED SPECIAL INSPECTIONS AND TESTS OF CONCRETE CONSTRUCTION

TYPE	CONTINUOUS SPECIAL INSPECTION	PERIODIC SPECIAL INSPECTION	REFERENCED STANDARD [a]	IBC REFERENCE

Cost Impact: The code change proposal will not increase the cost of construction.

S151-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T1705.3-S-BRAZIL.doc

S152–12
1705.5.1

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

Revise as follows:

1705.5.1 High-load diaphragms. High-load diaphragms designed in accordance with Section 2306.2 shall be installed with *special inspections* as indicated in Section 1704.2. The special inspector shall inspect the wood structural panel sheathing to ascertain whether it is of the grade and thickness shown on the *approved* ~~building plans~~ *construction documents*. Additionally, the special inspector must verify the nominal size of framing members at adjoining panel edges, the nail or staple diameter and length, the number of fastener lines and that the spacing between fasteners in each line and at edge margins agrees with the *approved* ~~building plans~~ *construction documents*.

Reason: The purpose for the proposal is to replace the term "building plans," which is not defined in the building code, with "construction documents," which is defined in Section 202. The instances of "building plans" in the proposal are the only ones in the 2012 *International Building Code* other than in Section 911.1.5(12) where the context is such that changing the term would not be appropriate.

Cost Impact: The code change proposal will not increase the cost of construction.

S152-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1705.5.1-S-BRAZIL.doc

S153–12
1705.5

Proponent: Stephen Kerr, S.E., Josephson Werdowatz and Associates, representing Structural Engineers Association of California (SEAOC) (skerr@jwa-se.com)

Revise as follows:

1705.5 Wood construction. *Special inspections* of the fabrication ~~process~~ of prefabricated wood structural elements and assemblies shall be in accordance with Section 1704.2.5. ~~*Special inspections* of site-built assemblies shall be in accordance with this section.~~

Reason: Special inspection should be of the item, not the “process”. The last sentence is not necessary and confuses the issues. The next two sections of 1705.5 (regarding high-load diaphragms and metal-plate-connected wood truss bracing) state the special inspections required and do not need to be invoked by the deleted language.

Cost Impact: The code change proposal will not increase the cost of construction.

S153-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1705.5-S-KERR.doc

S154–12
1705.6, 1705.8, 1705.9

Proponent: Mark Gilligan, representing self (mark@gilligan.name)

Revise as follows:

1705.6 Soils. *Special inspections* for existing site soil conditions, fill placement and load-bearing requirements shall be as required by this section and Table 1705.6. The *approved* ~~geotechnical report, and the~~ *construction documents* ~~prepared by the *registered design professionals*~~ shall be used to determine compliance. ~~During fill placement, the special inspector shall determine that proper materials and procedures are used in accordance with the provisions of the *approved* geotechnical report.~~

> **Exception:** Where Section 1803 does not require reporting of materials and procedures for fill placement, the special inspector shall verify that the in-place dry density of the compacted fill is not less than 90 percent of the maximum dry density at optimum moisture content determined in accordance with ASTM D 1557.

1705.8 Cast-in-place deep foundations. *Special inspections* shall be performed during installation and testing of cast-in-place deep foundation elements as required by Table 1705.8. The *approved* ~~geotechnical report, and the~~ *construction documents* ~~prepared by the *registered design professionals*,~~ shall be used to determine compliance.

1705.9 Helical pile foundations. *Special inspections* shall be performed continuously during installation of helical pile foundations. The information recorded shall include installation equipment used, pile dimensions, tip elevations, final depth, final installation torque and other pertinent installation data as required by the ~~*registered design professional in responsible charge*~~ approved construction documents. The *approved* ~~geotechnical report and the~~ *construction documents* ~~prepared by the *registered design professional*~~ shall be used to determine compliance.

Reason: This change makes it clear that special inspections will be based on the approved construction documents as is the rest of the work and not on the geotechnical report. The geotechnical report is not written to be enforceable as a document to direct the contractor or inspector. Thus the use of a geotechnical report by the contractor to construct the work or the inspectors to inspect it will create the potential for confusion.

The proper role of the geotechnical report is to communicate initial recommendations to the design team and as a resource document that provides information to the Contractor on existing ground conditions. Any criteria or direction needed by the contractor, that exists in the geotechnical report, must be included in the construction documents. The code does not say how the information will be incorporated in the construction documents but it is expected that the geotechnical engineer who prepared the report would play an active role in the process.

The last sentence is 1705.6 is not needed as the requirements for special inspection during fill placement are included as Item 4 in Table 1705.6.

Cost Impact: The code change proposal will not increase the cost of construction.

S154-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1705.6-S-GILLIGAN.doc

S155–12
1705.7.1 (NEW), 1705.8.1 (NEW)

Proponent: Stephen Kerr, S.E., Josephson Werdowatz and Associates, representing Structural Engineers Association of California (SEAOC) (skerr@jwa-se.com)

Add new text as follows:

1705.7.1 Special inspection by a registered design professional. Where higher allowable stresses are used in the design of driven deep foundations in accordance with Section 1810.3.2.8, special inspections shall be performed under the direct supervision of a registered design professional knowledgeable in the field of soil mechanics and deep foundations.

1705.8.1 Special inspection by a registered design professional. Where higher allowable stresses are used in the design of cast-in-place deep foundations in accordance with Section 1810.3.2.8, special inspections shall be performed under the direct supervision of a registered design professional knowledgeable in the field of soil mechanics and deep foundations.

Reason: The special requirements of Section 1810.3.2.8 that the installation of piles designed with higher allowable stresses must be done under the supervision of a registered design professional knowledgeable in the field of soil mechanics and deep foundations should be reflected here so that the special requirements for the qualifications of the special inspector are clarified.

A related proposal seeks to eliminate the special allowable stresses used in Chapter 18 for deep foundation elements, and eliminate the special requirements of Section 1810.3.2.8. If that proposal is accepted, this proposal is not necessary, as the special inspection requirements for deep foundation elements are adequate.

Cost Impact: The code change proposal will not increase the cost of construction.

1705.10.1, 1705.10.1.1 (NEW), 1705.10.1.2 (NEW), 1705.10.1.3 (NEW), 1705.10.2, 1705.10.2.1 (NEW), 1705.10.2.2 (NEW), 1705.11.2, 1705.10.11.2.1 (NEW), 1705.10.11.2.2 (NEW), 1705.11.2.3 (NEW), 1705.11.3, 1705.11.3.1 (NEW), 1705.11.3.2 (NEW)

Proponent: Stephen Kerr, S.E., Structural Engineers Association of California (skerr@jwa-se.com)

Revise as follows:

1705.10.1 Structural wood. Special inspection for wood construction within the main windforce-resisting system shall be as required by this section. Special inspection for wood construction in accordance with this section shall also be provided where vertical elements of the main windforce-resisting system are comprised of other materials, such as steel frames and concrete or masonry shear walls. ~~Continuous special inspection is required during field gluing operations of elements of the main windforce-resisting system. Periodic special inspection is required for nailing, bolting, anchoring and other fastening of components within the main windforce-resisting system, including wood shear walls, wood diaphragms, drag struts, braces, and hold-downs.~~

> ~~**Exception:** *Special inspection* is not required for wood shear walls, shear panels and diaphragms, including nailing, bolting, anchoring and other fastening to other components of the main windforce-resisting system where the fastener spacing of the sheathing is more than 4 inches (102 mm) on center.~~

1705.10.1.1 Field gluing operations. Continuous special inspection is required during field gluing operations of wood elements of the main windforce-resisting system.

1705.10.1.2 Shear walls. Periodic special inspection shall be required for the sheathing fastening, and for other connections within the shear wall. Such connections shall include hold-down or tie-down connections, sill plate and sole plate anchorage and connections, and connections between the top of the wall and the horizontal diaphragm above.

> **Exception:** Special inspection for wood shear walls is not required where the sheathing is gypsum board or fiberboard or where the fastener spacing along shear wall sheathing edges is more than 4 inches (102 mm) on center,

1705.10.1.3 Horizontal diaphragms. Periodic special inspection shall be required for the sheathing fastening, diaphragm chord connections and splices, and collector connections and fastening.

> **Exception:** Special inspection for horizontal wood diaphragms is not required where the sheathing is gypsum board or fiberboard or where the least fastener spacing along sheathing edges or diaphragm boundaries is more than 4 inches (102 mm) on center.

1705.10.2 Cold-formed steel light-frame construction. Special inspection for cold-formed light-frame construction within the main windforce-resisting system shall be as required by this section. Special inspection for cold-formed light-frame construction in accordance with this section shall be provided where vertical elements of the main windforce-resisting system are comprised of other materials, such as steel frames and concrete or masonry shear walls. ~~Periodic special inspection is required during welding operations of elements of the main windforce-resisting system. Periodic special inspection is required for screw attachment, bolting, anchoring and other fastening of components within the main windforce-resisting system, including shear walls, braces, diaphragms, collectors (drag struts), and hold-downs.~~

> ~~**Exception:** *Special inspection* is not required for cold-formed steel light-frame shear walls, braces, diaphragms, collectors (drag struts) and hold-downs where either of the following apply:~~

~~1. The sheathing is gypsum board or fiberboard.~~

~~2. The sheathing is wood structural panel or steel sheets on only one side of the shear wall, shear panel or diaphragm assembly and the fastener spacing of the sheathing is more than 4 inches (102 mm) on center (o.c).~~

1705.10.2.1 Shear walls and strap-braced walls. Periodic special inspection shall be required for the sheathing fastening, the welding or screw attachment of the strap bracing, and for other connections within the shear wall or strap-braced wall. Such connections shall include hold-down or tie-down connections, bottom track anchorage and connections, and connections between the top of the wall and the horizontal diaphragm above.

Exception: Special inspection for cold-formed light-frame shear walls is not required where either of the following apply:

1. The sheathing is gypsum board or fiberboard.
2. The sheathing is wood structural panel or steel sheets on only one side of the shear wall, and the fastener spacing along sheathing edges is more than 4 inches (102 mm) on center.

1705.10.2.2 Horizontal diaphragms. Periodic special inspection shall be required for the sheathing fastening, welding or screw attachment of diagonal strap bracing, diaphragm chord connections and splices, and collector connections and fastening.

Exception: Special inspection for cold-formed light-frame horizontal diaphragms is not required where either of the following apply:

1. The sheathing is gypsum board or fiberboard.
2. The sheathing is wood structural panel or steel sheets on only one side of the framing, and the least fastener spacing along sheathing edges or diaphragm boundaries is more than 4 inches (102 mm) on center.

1705.11.2 Structural wood. Special inspection for wood construction within the seismic force-resisting system shall be as required by this section. Special inspection for wood construction in accordance with this section shall be provided where vertical elements of the seismic force-resisting system are comprised of other materials, such as steel frames and concrete or masonry shear walls.~~Continuous special inspection is required during field gluing operations of elements of the seismic force-resisting system. Periodic special inspection is required for nailing, bolting, anchoring and other fastening of components within the seismic force-resisting system, including wood shear walls, wood diaphragms, drag struts, braces, shear panels and hold-downs.~~

~~**Exception:** *Special inspection* is not required for wood shear walls, shear panels and diaphragms, including nailing, bolting, anchoring and other fastening to other components of the main seismic force-resisting system where the fastener spacing of the sheathing is more than 4 inches (102 mm) on center (o.c).~~

1705.11.2.1 Field gluing operations. Continuous special inspection shall be required during field gluing operations of wood elements of the seismic force-resisting system.

1705.11.2.2 Shear walls. Periodic special inspection shall be required for the sheathing fastening, and for other connections within the shear wall. Such connections shall include hold-down or tie-down connections, sill plate and sole plate anchorage and connections, and connections between the top of the wall and the horizontal diaphragm above.

Exception: Special inspection for wood shear walls is not required where the sheathing is gypsum board or fiberboard or where fastener spacing along shear wall sheathing edges is more than 4 inches (102 mm) on center,

1705.11.2.3 Horizontal diaphragms. Periodic special inspection shall be required for the sheathing fastening, diaphragm chord connections and splices, and collector connections and fastening.

> **Exception:** Special inspection for horizontal wood diaphragms is not required where the sheathing is gypsum board or fiberboard or where least fastener spacing along sheathing edges or diaphragm boundaries is more than 4 inches (102 mm) on center.

1705.11.3 Cold-formed steel light-frame construction. Special inspection for cold-formed light-frame construction within the seismic force-resisting system shall be as required by this section. Special inspection for cold-formed light-frame construction in accordance with this section shall be provided where vertical elements of the seismic force-resisting system are comprised of other materials, such as steel frames and concrete or masonry shear walls~~Periodic special inspection is required during welding operations of elements of the seismic force-resisting system. Periodic special inspection is required for screw attachment, bolting, anchoring and other fastening of components within the seismic force-resisting system, including shear walls, braces, diaphragms, collectors (drag struts), and hold-downs.~~

> ~~**Exception:** *Special inspection* is not required for cold-formed steel light-frame shear walls, braces, diaphragms, collectors (drag struts) and hold-downs where either of the following apply:~~
>
> ~~1. The sheathing is gypsum board or fiberboard.~~
> ~~2. The sheathing is wood structural panel or steel sheets on only one side of the shear wall, shear panel or diaphragm assembly and the fastener spacing of the sheathing is more than 4 inches (102 mm) on center (o.c).~~

1705.11.3.1 Shear walls and strap-braced walls. Periodic special inspection shall be required for the sheathing fastening, the welding or screw attachment of the strap bracing, and for other connections within the shear wall or strap-braced wall. Such connections shall include hold-down or tie-down connections, bottom track anchorage and connections, and connections between the top of the wall and the horizontal diaphragm above.

> **Exception:** Special inspection for cold-formed light-frame shear walls is not required where either of the following apply:
>
> 1. The sheathing is gypsum board or fiberboard.
> 2. The sheathing is wood structural panel or steel sheets on only one side of the shear wall, and the fastener spacing along sheathing edges is more than 4 inches (102 mm) on center.

1705.11.3.2 Horizontal diaphragms. Periodic special inspection shall be required for the sheathing fastening, welding or screw attachment of diagonal strap bracing, diaphragm chord connections and splices, and collector connections and fastening.

> **Exception:** Special inspection for cold-formed light-frame horizontal diaphragms is not required where either of the following apply:
>
> 1. The sheathing is gypsum board or fiberboard.
> 2. The sheathing is wood structural panel or steel sheets on only one side of the framing, and the least fastener spacing along sheathing edges or diaphragm boundaries is more than 4 inches (102 mm) on center.

Reason: As currently written, it is not clear how to apply the exceptions to special inspection for wind and seismic as applicable to wood framing and cold-formed steel light frame construction (together "light-frame construction). The exceptions use "fastener spacing of the sheathing" as the trigger for special inspection. However, the following aspects of light-frame construction are not covered adequately by the exception language:

1. Fastener spacing for shear walls could vary throughout the building. It is not clear that the exception would only be applicable to the particular shear wall or diaphragm with the larger fastening spacing, and to the other elements of the lateral force-resisting system associated with that shear wall or diaphragm.
2. The main elements of the lateral force-resisting system of light-frame buildings are the shear walls and the horizontal diaphragms. Elements associated with the shear walls include hold-downs, and the parts use to make connection to the foundation or the horizontal diaphragms, including sill plates, sole plates, bottom tracks, and blocking and framing clips. Elements associated with the horizontal diaphragms include chords, collectors, and elements used to anchor concrete and masonry walls for out-of-plane forces (such as blocking, straps, and hold-down hardware used horizontally. As written, it is not clear when special inspection would be required for the elements associated with the shear walls and diaphragms.
3. Shear wall sheathing is fastened at the sheathing edges, and in the middle of the panel. It is not clear that the reference to sheathing fastening is intended to apply to fastening along sheathing edges.
4. Diaphragm sheathing fastening is often specified with different spacing at sheathing edges, and at diaphragm boundaries. It is not clear what fastening (edge or boundary) is being referred to, or what portions of a horizontal diaphragm and associated elements would be affected by the exception.
5. Buildings of pre-dominantly light-frame construction often use vertical lateral force-resisting elements made up of other materials, such as steel frames, or concrete shear walls or masonry shear walls. It is not clear under what conditions special inspection would be required for the elements used to connect such vertical lateral force-resisting elements to the light-frame building system.
6. Light-frame diaphragms are often used in buildings where all of the vertical lateral force-resisting elements are made up of other materials, such concrete tilt-up shear or masonry shear walls. It is not clear under what conditions special inspection would be required for the wood, light-frame, and/or steel elements used to anchor the concrete or masonry walls for out-of plane forces.

The proposed change includes similar revisions to the provisions for structural wood, and for cold-formed light-frame construction.

Shear walls and horizontal diaphragms are handled separately and the elements associated with each are identified. This makes it clear, once the special inspection is triggered (by fastener spacing, double sided sheathing, or the use of strap bracing) which elements other than the sheathing fastening, require inspection.

The requirements for inspection of anchorage elements in horizontal diaphragms for out-of-plane support of concrete and masonry walls are made explicit.

Cost Impact: The code change proposal will not increase the cost of construction.

1705.10.1-S-KERR.doc

S157–12
1705.10.2, 1705.11.3, 1705.11.5, 1705.11.6, 1705.11.7

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing self (pbrazil@reidmiddleton.com)

Revise as follows:

1705.10.2 Cold-formed steel light-frame construction. Periodic special inspection is required ~~during~~ for welding operations of elements of the main windforce-resisting system. Periodic special inspection is required for screw attachment, bolting, anchoring and other fastening of components within the main windforce-resisting system, including shear walls, braces, diaphragms, collectors (drag struts) and hold-downs.

> **Exception:** *Special inspection* is not required for cold-formed steel light-frame shear walls, braces, diaphragms, collectors (drag struts) and hold-downs where either of the following apply:
>
> 1. The sheathing is gypsum board or fiberboard.
> 2. The sheathing is wood structural panel or steel sheets on only one side of the shear wall, shear panel or diaphragm assembly and the fastener spacing of the sheathing is more than 4 inches (102 mm) on center (o.c.).

1705.11.3 Cold-formed steel light-frame construction. Periodic special inspection is required ~~during~~ for welding operations of elements of the seismic force-resisting system. Periodic special inspection is required for screw attachment, bolting, anchoring and other fastening of components within the seismic force-resisting system, including shear walls, braces, diaphragms, collectors (drag struts) and hold-downs.

> **Exception:** *Special inspection* is not required for cold-formed steel light-frame shear walls, braces, diaphragms, collectors (drag struts) and hold-downs where either of the following apply:
>
> 1. The sheathing is gypsum board or fiberboard.
> 2. The sheathing is wood structural panel or steel sheets on only one side of the shear wall, shear panel or diaphragm assembly and the fastener spacing of the sheathing is more than 4 inches (102 mm) o.c.

1705.11.5 Architectural components. Periodic *special inspection* is required ~~during~~ for the erection and fastening of exterior cladding, interior and exterior nonbearing walls and interior and exterior veneer in structures assigned to *Seismic Design Category* D, E or F.

> **Exceptions:**
>
> 1. *Special inspection* is not required for exterior cladding, interior and exterior nonbearing walls and interior and exterior veneer 30 feet (9144 mm) or less in height above grade or walking surface.
> 2. *Special inspection* is not required for exterior cladding and interior and exterior veneer weighing 5 psf (24.5 N/m^2) or less.
> 3. *Special inspection* is not required for interior nonbearing walls weighing 15 psf (73.5 N/m^2) or less.

1705.11.6 Mechanical and electrical components. *Special inspection* for mechanical and electrical components shall be as follows:

1. Periodic special inspection is required ~~during~~ for the anchorage of electrical equipment for emergency or standby power systems in structures assigned to *Seismic Design Category* C, D, E or F;

2. Periodic special inspection is required ~~during~~ for the anchorage of other electrical equipment in structures assigned to *Seismic Design Category* E or F;
3. Periodic special inspection is required ~~during~~ for the installation and anchorage of piping systems designed to carry hazardous materials and their associated mechanical units in structures assigned to *Seismic Design Category* C, D, E or F;
4. Periodic special inspection is required ~~during~~ for the installation and anchorage of ductwork designed to carry hazardous materials in structures assigned to *Seismic Design Category* C, D, E or F; and
5. Periodic special inspection is required ~~during~~ for the installation and anchorage of vibration isolation systems in structures assigned to *Seismic Design Category* C, D, E or F where the *construction documents* require a nominal clearance of 1/4 inch (6.4 mm) or less between the equipment support frame and restraint.

1705.11.7 Storage racks. Periodic *special inspection* is required ~~during~~ for the anchorage of storage racks 8 feet (2438 mm) or greater in height in structures assigned to *Seismic Design Category* D, E or F.

Reason: The purpose for this proposal is to correlate the requirements for periodic special inspection in Section 1705 with the definition of periodic special inspection in Section 202, which defines it as special inspection "by the special inspector who is intermittently present where the work to be inspected **has been** (emphasis mine) or is being performed." The proposal changes "during," which is consistent with the definition of continuous special inspection, to "for," which is consistent with the definition of periodic special inspection. The proposal also makes the requirements for periodic special inspection in Section 1705 internally consistent in that the other requirements for periodic special inspection state "for" and not "during" (e.g., Sections 1705.10.1, 1705.10.3, 1705.11.2, 1705.11.5.1 and 1705.11.8).

For more information on the intent of the definition of periodic special inspection, as well the definitions of special inspection and continuous special inspection, refer to ICC Proposal S111-09/10-AMPC, notably the reason statement that accompanied the public comment.

Cost Impact: The code change proposal will not increase the cost of construction.

1705.10.2-S-BRAZIL.doc

S158–12
1705.10.2

Proponent: Bonnie Manley, P.E., American Iron and Steel Institute (bmanley@steel.org)

Revise as follows:

1705.10.2 Cold-formed steel light-frame construction. Periodic special inspection is required during welding operations of elements of the main windforce-resisting system. Periodic special inspection is required for screw attachment, bolting, anchoring and other fastening of ~~components within~~ elements of the main windforce-resisting system, including shear walls, braces, diaphragms, collectors (drag struts) and hold-downs.

> **Exception:** *Special inspections* ~~is~~ are not required for cold- formed steel light-frame shear walls~~,~~ ~~braces,~~ and diaphragms ~~collectors (drag struts) and hold-downs~~, including screwing, bolting, anchoring, and other fastening to components of the seismic-force resisting system where either of the following apply:
>
> 1. The sheathing is gypsum board or fiberboard.
> 2. The sheathing is wood structural panel or steel sheets on only one side of the shear wall, shear panel or diaphragm assembly and the fastener spacing of the sheathing is more than 4 inches (102 mm) on center (o.c.).

Reason: This proposal makes minor changes to this section. In the exception, word "braces" is deleted, since Items 1 and 2 of the exception discuss only sheathing used on shear walls and not braced walls.
Revisions to the remainder of the section are to ensure consistency with the wood exception in Section 1705.10.1 and eliminate confusion.

Cost Impact: The code change proposal will not increase the cost of construction.

S158-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1705.10.2-S-MANLEY.doc

S159–12
1705.10.3

Proponent: Stephen Kerr, S.E. Josephson Werdowatz and Associates, representing Structural Engineers Association of California (SEAOC) (skerr@jwa-se.com)

Revise as follows:

1705.10.3 Wind-resisting components. Periodic special inspection is required for fastening of the following systems and components:

1. Roof ~~cladding~~ covering, roof deck, and roof framing connections.
2. ~~Wall cladding~~ Exterior covering, and wall connections to roof and floor diaphragms and framing.

Reason: The purpose of this change is to provide clarity and detail for the special inspection requirements for wind-resisting components in high-wind regions. The 2009 IBC identified “roof cladding and roof framing connections” and “wall connections to roof and floor diaphragms and framing” as wind-resisting components that needed to be included in the statement of special inspections, but only referenced “roof cladding” and “wall cladding” in the section describing the actual inspection. However, as part of the reorganization of Chapter 17 approved in the previous code change cycle, the more detailed language was deleted when the inspection requirements were combined with the requirements for inclusion in the statement of special inspections. In addition, “cladding” is not defined.

This proposal restores the more detailed description of the elements requiring special inspection, and uses terms defined in the code to identify the elements.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

1705.10.3-S-KERR.doc

S160–12
1705.11.1, 1705.12.2

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing self (pbrazil@reidmiddleton.com)

Revise as follows:

1705.11.1 Structural steel. *Special inspection* for structural steel in the *seismic force-resisting systems* of *structures* assigned to *Seismic Design Category* B, C, D, E or F shall be performed in accordance with the quality assurance requirements of AISC 341.

> **Exception:** *Special inspections* of structural steel are not required in the *seismic force-resisting systems of* structures assigned to *Seismic Design Category B or* C that are not specifically detailed for seismic resistance, with a response modification coefficient, *R*, of 3 or less, excluding cantilever column systems.

1705.12.2 Structural steel. Testing ~~for~~ of structural steel in the *seismic force-resisting systems* of *structures* assigned to *Seismic Design Category* B, C, D, E or F shall be performed in accordance with the quality assurance requirements of AISC 341.

> **Exception:** Testing of structural steel is not required in the *seismic force-resisting systems* of structures assigned to *Seismic Design Category B or* C that are not specifically detailed for seismic resistance, with a response modification coefficient, *R*, of 3 or less, excluding cantilever column systems.

Reason: The proposal correlates the requirements for special inspections and testing of structural steel in Section 1705.11.1 and 1705.11.2 with the applicability of AISC 341-10. The proposal is also a continuation of separate proposals that simplify the provisions of Section 1705.11 on required special inspections for seismic resistance and Section 1705.12.2 on required tests for seismic resistance. The changes in this proposal are identical to the changes in those proposals except Seismic Design Category B is added to the charging language and the exception in both sections of this proposal.

Summarizing, AISC 341-10 applies to:

1. The seismic force-resisting systems in structures assigned to Seismic Design Category D, E or F; and
2. The seismic force-resisting systems designed for a response modification coefficient, *R*, greater than 3 in structures assigned to Seismic Design Category B or C.

This is only a summary because there are additional details affecting the standard's applicability, including nonbuilding structures and cantilever column systems, but these details are not affected by the proposed changes.

Cost Impact: The code change proposal will increase the cost of construction.

S162–12
1705.11.5, 1705.11.6

Proponent: Philip Brazil, P.E., S.E., Senior Structural Engineer, Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

Revise as follows:

1705.11.5 Architectural components. Periodic *special inspection* is required during the erection and fastening of exterior cladding, interior and exterior nonbearing walls and interior and exterior veneer in structures assigned to *Seismic Design Category* D, E or F.

Exception~~s~~: *Periodic special inspection* is not required for the following:

1. ~~*Special inspection* is not required for~~ Exterior cladding, interior and exterior nonbearing walls and interior and exterior veneer 30 feet (9144 mm) or less in height above grade or walking surface.
2. ~~*Special inspection* is not required for~~ Exterior cladding and interior and exterior veneer weighing 5 psf (24.5N/m^2) or less.
3. ~~*Special inspection* is not required for~~ Interior nonbearing walls weighing 15 psf (73.5 N/m^2) or less.

1705.11.6 Mechanical and electrical components. *Periodic special inspection* ~~for~~ of mechanical and electrical components ~~shall be as follows~~ shall be required for the following:

1. ~~Periodic special inspection is required during the~~ Anchorage of electrical equipment for emergency or standby power systems in structures assigned to *Seismic Design Category* C, D, E or F.
2. ~~Periodic special inspection is required during the~~ Anchorage of other electrical equipment in structures assigned to *Seismic Design Category* E or F.
3. ~~Periodic special inspection is required during the~~ Installation and anchorage of piping systems designed to carry hazardous materials and their associated mechanical units in structures assigned to *Seismic Design Category* C, D, E or F.
4. ~~Periodic special inspection is required during the~~ Installation and anchorage of ductwork designed to carry hazardous materials in structures assigned to *Seismic Design Category* C, D, E or F.
5. ~~Periodic special inspection is required during the~~ Installation and anchorage of vibration isolation systems in structures assigned to *Seismic Design Category* C, D, E or F where the *construction documents* require a nominal clearance of 1/4 inch (6.4 mm) or less between the equipment support frame and restraint.

Reason: The purpose for the proposal is to delete superfluous language.

Cost Impact: The code change proposal will not increase the cost of construction.

S162-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1705.11.5-S-BRAZIL.doc

S163–12
1705.11.5

Proponent: Stephen Kerr, S.E., Josephson Werdowatz and Associates, representing Structural Engineers Association of California (SEAOC) (skerr@jwa-se.com)

Revise as follows:

1705.11.5 Architectural components. Periodic *special inspection* is required during the erection and fastening of exterior cladding, interior and exterior nonbearing walls, suspended ceiling systems including their anchorage and interior and exterior veneer in structures assigned to *Seismic Design Category* D, E or F.

Exceptions:

1. *Special inspection* is not required for exterior cladding, interior and exterior nonbearing walls and interior and exterior veneer 30 feet (9144 mm) or less in height above grade or walking surface.
2. *Special inspection* is not required for exterior cladding and interior and exterior veneer weighing 5 psf (24.5 N/m^2) or less.
3. *Special inspection* is not required for interior nonbearing walls weighing 15 psf (73.5 N/m^2) or less.

Reason: This proposal restores the needed special inspection for suspended ceiling systems. The 2009 IBC identified "suspended ceiling systems and their anchorage" as components that needed to be included in the statement of special inspections for Seismic Design Category D, E or F, but did not list them in the section that invoked the actual inspection. Then, as part of the reorganization of Chapter 17 approved in the previous code change cycle, the requirement was deleted completely when the inspection requirements were combined with the requirements for inclusion in the statement of special inspections.

Suspended ceiling systems, when not properly anchored and braced, are well known to fail under strong shaking, resulting in debris that can block exits or otherwise impede egress from buildings.

Cost Impact: The code change proposal will increase the cost of construction.

1705.11.9 (NEW)

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing self (pbrazil@reidmiddleton.com)

Add new text as follows:

1705.11.9 Cold-formed steel special bolted moment frames. Periodic special inspection shall be provided for the installation of cold-formed steel special bolted moment frames in the *seismic force-resisting systems* of *structures* assigned to *Seismic Design Category* D, E or F.

Reason: The purpose for this proposal is to require special inspections for the installation of cold-formed steel special bolted moment frames, which are a new type of seismic force-resisting system and are listed in Table 12.2-1 of ASCE 7-10 in the category of moment-resisting frame systems (Item C.12). Their structural design is sufficiently complex to warrant inspection from a person with the expertise of a special inspector who is approved by the building official as having the competence necessary to inspect the installation of the joists. Refer to the definitions of "special inspection" and "special inspector" for further information. Examples of the complexity of the structural design that warrant special inspection of the installation are the beam-to-column connections and the anchorage to the foundation.

The standard for Seismic Design of Cold-formed Steel Structural Systems: Special Bolted Moment Frames with Supplement No. 1, AISI S110-07/S1-09, contain provisions for inspections but these are limited to quality control by the fabricator and inspections by qualified inspectors representing the owner. Refer to Section E of the standard.

Cost Impact: The code change proposal will increase the cost of construction.

1705.11.9 (NEW)-S-BRAZIL.doc

S166–12

1705.11, 1705.11.1, 1705.11.2, 1705.11.3, 1705.11.4, 1705.11.8

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing self (pbrazil@reidmiddleton.com)

Revise as follows:

1705.11 Special inspections for seismic resistance. *Special inspections* ~~itemized~~ for seismic resistance shall be required as specified in Sections 1705.11.1 through 1705.11.8, unless exempted by the exceptions of Section 1704.2~~, are required for the following:~~

1. ~~The seismic force-resisting systems in structures assigned to *Seismic Design Category* C, D, E or F in accordance with Sections 1705.11.1 through 1705.11.3, as applicable.~~
2. ~~Designated seismic systems in structures assigned to *Seismic Design Category* C, D, E or F in accordance with Section 1705.11.4.~~
3. ~~Architectural, mechanical and electrical components in accordance with Sections 1705.11.5 and 1705.11.6.~~
4. ~~Storage racks in structures assigned to *Seismic Design Category* D, E or F in accordance with Section 1705.11.7.~~
5. ~~Seismic isolation systems in accordance with Section 1705.11.8~~.

Exception: The special inspections ~~itemized~~ specified in Sections 1705.11.1 through 1705.11.8 are not required for structures designed and constructed in accordance with one of the following:

1. The structure consists of light-frame construction; the design spectral response acceleration at short periods, *SDS*, as determined in Section 1613.3.4, does not exceed 0.5; and the building height of the structure does not exceed 35 feet (10 668 mm).
2. The seismic force-resisting system of the structure consists of reinforced masonry or reinforced concrete; the design spectral response acceleration at short periods, *SDS*, as determined in Section 1613.3.4, does not exceed 0.5; and the building height of the structure does not exceed 25 feet (7620 mm).
3. The structure is a detached one- or two-family dwelling not exceeding two *stories above grade plane* and does not have any of the following horizontal or vertical irregularities in accordance with Section 12.3 of ASCE 7:
   3.1. Torsional or extreme torsional irregularity.
   3.2. Nonparallel systems irregularity.
   3.3. Stiffness-soft story or stiffness-extreme soft story irregularity.
   3.4. Discontinuity in lateral strength-weak story irregularity.

1705.11.1 Structural steel. *Special inspection* for structural steel in the *seismic force-resisting systems* of *structures* assigned to *Seismic Design Category* C, D, E or F shall be performed in accordance with the quality assurance requirements of AISC 341.

Exception: *Special inspections* of structural steel are not required in the *seismic force-resisting systems* of structures assigned to *Seismic Design Category* C that are not specifically detailed for seismic resistance, with a response modification coefficient, *R*, of 3 or less, excluding cantilever column systems.

1705.11.2 Structural wood. For the *seismic force-resisting systems* of *structures* assigned to *Seismic Design Category* C, D, E or F:

1. Continuous special inspection shall be required during field gluing operations of elements of the seismic force-resisting system and

2. Periodic special inspection shall be required for nailing, bolting, anchoring and other fastening of components within the seismic force-resisting system, including wood shear walls, wood diaphragms, drag struts, braces, shear panels and hold-downs.

Exception: *Special inspection* is not required for wood shear walls, shear panels and diaphragms, including nailing, bolting, anchoring and other fastening to other components of the seismic force-resisting system, where the fastener spacing of the sheathing is more than 4 inches (102 mm) on center (o.c.).

1705.11.3 Cold-formed steel light-frame construction. For the *seismic force-resisting systems* of *structures* assigned to *Seismic Design Category* C, D, E or F, periodic special inspection shall be required:

1. ~~Periodic special inspection is required~~ During welding operations of elements of the seismic force-resisting system and
2. ~~Periodic special inspection is required~~ For screw attachment, bolting, anchoring and other fastening of components within the seismic force-resisting system, including shear walls, braces, diaphragms, collectors (drag struts) and hold-downs.

Exception: *Special inspection* is not required for cold-formed steel light-frame shear walls, braces, diaphragms, collectors (drag struts) and hold-downs where either of the following apply:

1. The sheathing is gypsum board or fiberboard.
2. The sheathing is wood structural panel or steel sheets on only one side of the shear wall, shear panel or diaphragm assembly and the fastener spacing of the sheathing is more than 4 inches (102 mm) o.c.

1705.11.4 Designated seismic systems. For structures assigned to *seismic Design Category* C, D, E or F, the special inspector shall examine designated seismic systems requiring seismic qualification in accordance with Section 1705.12.3 and verify that the *label*, anchorage or mounting conforms to the *certificate of compliance*.

1705.11.8 Seismic isolation systems. Periodic special inspection shall be provided for seismic isolation systems in seismically isolated structures assigned to *Seismic Design Category* B, C, D, E or F during the fabrication and installation of isolator units and energy dissipation devices.

Reason:
This proposal is the result of collaboration with the steel industry and makes changes to Section 1705.11 similar to the changes made to Section 1705.12 in a separate proposal.
As in Section 1705.12, determining applicable requirements in Section 1705.11 necessitates combining the governing item in Section 1705.11 with the corresponding subsection that follows. This exercise would be useful if it avoided duplication of the language in several of the subsections and this currently occurs for four sections (Sections 1705.11.1, 1705.11.2, 1705.11.3 and 1705.11.4). Because of the collaboration with the steel industry, however, it will now occur in only three sections and, with that, has outlived its usefulness. Any advantage gained is more than offset by the disadvantage in combining the applicable provisions, which can lead to errors by readers of the code. The proposal simplifies the requirements by transferring the language from the items in Section 1705.11 to the applicable subsections where comprehensive provisions are specified for each instance of required special inspections. Changes to Sections 1705.11.5, 1705.11.5.1, 1705.11.6 and 1705.11.7 are not made because none are needed in that the applicable provisions are already present.
Note that a separate proposal revises Section 1705.11.1 for consistency with the scope of AISC 341-10.

Cost Impact: The code change proposal will not increase the cost of construction.

S166-12

Public Hearing:	Committee:	AS	AM	D

1705.11-S-BRAZIL.doc

S167–12
1705.12.1, 1705.3.1, 1705.3.2 (NEW)

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing self (pbrazil@reidmiddleton.com)

Revise as follows:

~~1705.12.1~~ 1705.2.2.1.3 Weldability of concrete reinforcement. ~~Where reinforcement complying with ASTM A 615 is used to resist earthquake induced flexural and axial forces in special moment frames, special structural walls and coupling beams connecting special structural walls, in structures assigned to *Seismic Design Category* B, C, D, E or F, the reinforcement shall comply with Section 21.1.5.2 of ACI 318. Certified mill test reports shall be provided for each shipment of such reinforcement~~. Where concrete reinforcement complying with a standard other than ASTM A ~~615~~ 706 is to be welded and reports of material properties verifying compliance with AWS D1.4 for weldability as specified in Section 3.5.2 of ACI 318 are not available, chemical tests shall be performed to determine weldability ~~in accordance with Section 3.5.2 of ACI 318~~.

1705.3.1 Materials. In the absence of sufficient data or documentation providing evidence of conformance to quality standards for materials in Chapter 3 of ACI 318, the building official shall require testing of materials in accordance with the appropriate standards and criteria for the material in Chapter 3 of ACI 318. ~~Weldability of reinforcement, except that which conforms to ASTM A 706, shall be determined in accordance with the requirements of Section 3.5.2 of ACI 318.~~

1705.3.2 Weldability. Weldability of reinforcement complying with a standard other than ASTM A 706, shall be verified in accordance with Section 3.5.2 of ACI 318.

Reason: The proposal retains the requirement in the last sentence of Section 1705.12.1 for chemical tests to determine weldability for concrete reinforcement complying with ASTM A 615 that is to be welded but:

1. Limits its scope to when reports of material properties verifying compliance with AWS D1.4 for weldability are not available for consistency with the referenced section of ACI 318-11 (Section 3.5.2);
2. Expands the scope to reinforcement designed to resist all load effects, not merely seismic load effects; and
3. Expands the scope to reinforcement complying with standards other that ASTM A 706 for consistency with AWS D1.4 (Section 1.3.4 in the 1998 edition) and well as the referenced section of ACI 318-11.

Cost Impact: The code change proposal will not increase the cost of construction.

1705.12.1-S-BRAZIL.doc

S168–12
1705.12.3, Chapter 35 (NEW)

Proponent: Patrick A. McLaughlin, McLaughlin & Associates, representing Air-Conditioning, Heating & Refrigeration Institute (pmclaugma@aol.com)

Revise as follows:

1705.12.3 Seismic certification of nonstructural components. The *registered design professional* shall specify on the construction documents the requirements for certification by analysis, testing or experience data, or certification by compliance with AHRI 1270 (IP)/1271 (SI) for nonstructural components and designated seismic systems in accordance with Section 13.2 of ASCE 7, where such certification is required by Section 1705.12.

Add new standard Chapter 35 as follows:

AHRI

1270 (I-P)/1271 (SI)-2011 Requirements For Seismic Qualification of HVACR Equipment

Reason: The proposal recognizes compliance with AHRI 1270 (IP)/1271 (SI) Requirements for Seismic Qualification of HVACR Equipment, as a means to confirm seismic qualification of mechanical HVACR equipment. AHRI 1270/1271 was developed to show compliance with both ASCE 7 and IBC seismic requirements. It describes methods for equipment qualification and a process to determine equipment seismic capacity. The standard is available for review and use on AHRI's web site for free download at: http://www.ahrinet.org/search+standards.aspx.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

1705.12.3-S-MCLAUGHLIN.doc

S169–12
1705.12, 1705.12.1, 1705.12.2, 1705.12.3, 1705.12.4

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee (pbrazil@reidmiddleton.com)

Revise as follows:

1705.12 Testing and qualification for seismic resistance. ~~The~~ Testing and qualification for seismic resistance shall be required as specified in Sections 1705.12.1 through 1705.12.4, unless exempted from *special inspections* by the exceptions of Section 1704.2. ~~are required as follows:~~

1. ~~The seismic force-resisting systems in structures assigned to *Seismic Design Category* C, D, E or F shall meet the requirements of Sections 1705.12.1 and 1705.12.2, as applicable.~~
2. ~~Designated seismic systems in structures assigned to *Seismic Design Category* C, D, E or F and subject to the certification requirements of ASCE 7 Section 13.2.2 shall comply with Section 1705.12.3.~~
3. ~~Architectural, mechanical and electrical components in structures assigned to *Seismic Design Category* C, D, E or F and where the requirements of ASCE 7 Section 13.2.1 are met by submittal of manufacturer's certification, in accordance with Item 2 therein, shall comply with Section 1705.12.3.~~
4. ~~The seismic isolation system in seismically isolated structures shall meet the testing requirements of Section 1705.12.4~~.

1705.12.1 Concrete reinforcement. In the *seismic force-resisting systems* of *structures* assigned to *Seismic Design Category* B, C, D, E or F, where reinforcement complying with ASTM A 615 is used to resist earthquake-induced flexural and axial forces in special moment frames, special structural walls ~~and~~ or coupling beams connecting special structural walls, ~~in structures assigned to *Seismic Design Category* B, C, D, E or F,~~ the reinforcement shall comply with Section 21.1.5.2 of ACI 318. Certified mill test reports shall be ~~provided for each shipment of such reinforcement~~ submitted to the *building official*. Where reinforcement complying with ASTM A 615 is to be welded, chemical tests shall be performed to determine weldability in accordance with Section 3.5.2 of ACI 318.

1705.12.2 Structural steel. Testing ~~for~~ of structural steel in the *seismic force-resisting systems* of *structures* assigned to *Seismic Design Category* C, D, E or F shall be performed in accordance with the quality assurance requirements of AISC 341.

> **Exception:** Testing for structural steel is not required in the *seismic force-resisting systems* of structures assigned to *Seismic Design Category* C that are not specifically detailed for seismic resistance, with a response modification coefficient, *R*, of 3 or less, excluding cantilever column systems.

1705.12.3 Seismic certification of nonstructural components. For *structures* assigned to *Seismic Design Category* C, D, E or F, **t**he *registered design professional* shall specify on the construction documents the requirements for certification by analysis, testing or experience data for nonstructural components and designated seismic systems in accordance with Section 13.2 of ASCE 7, where such certification is required by Section 1705.12.

1705.12.4 Seismic isolation systems. Seismic isolation systems in seismically isolated structures assigned to *Seismic Design Category* B, C, D, E or F shall be tested in accordance with Section 17.8 of ASCE 7.

Reason: Determining applicable requirements in Section 1705.12 necessitates combining the governing item in Section 1705.12 with the corresponding subsection that follows. This exercise would be useful if it avoided duplication of the language in the items in several of the subsections but this only occurs once (Sections 1705.12.1 and 1705.12.2). Any advantage gained is more than offset by the disadvantage in combining the applicable provisions, which can lead to errors by readers of the code. Also, the applicability of Section 1705.12.1 to Seismic Design Category B conflicts with corresponding Item 1 of Section 1705.12, which is limited to Seismic Design Categories C, D, E and F. The proposal simplifies the requirements by transferring the language from the items in Section 1705.12 to each of the subsections where comprehensive provisions are specified for each instance of required testing.

In Section 1705.12.1, the language requiring certified mill test reports “be provided for each shipment of such reinforcement” is replaced with “be submitted to the building official” because the details of providing the reports are not relevant to the provisions of the building code but submittal to the building official is relevant and critical to verifying that the reinforcement meets the applicable requirements in Section 21.1.5.2 of ACI 318-11.

The source document for some of the language in Section 1705.12 is the *NEHRP Recommended Provisions for Seismic Regulations for New Buildings and Other Structures* (Sections 3.2 and 3.4 of FEMA 368, and Sections 2.2 and 2.4 of FEMA 450-1).

Note that separate proposals:

1. Delete “qualification” in Section 1705.12 and place the provisions of Section 1705.12.3 into two subsections to provide effective charging language for the corresponding provisions in ASCE 7-10 ;
2. Transfer the requirements of Section 1705.12.1 to a new section on submittals to the building official ; and
3. Revise Section 1705.12.2 for consistency with the scope of AISC 341-10.

Cost Impact: The code change proposal will not increase the cost of construction.

S169-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1705.12-S-BRAZIL.doc

S170–12
1708.1, 1710.1

Proponent: D. Kirk Harman, The Harman Group, representing the National Council of Structural Engineers Associations (NCSEA) Code Advisory Committee, Quality Assurance and Special Inspection Subcommittee.

Revise as follows:

~~SECTION 1708~~
~~TEST SAFE LOAD~~

~~**1708.1 Where required.** Where proposed construction is not capable of being designed by *approved* engineering analysis, or where proposed construction design method does not comply with the applicable material design standard, the system of construction or the structural unit and the connections shall be subjected to the tests prescribed in Section 1710. The *building official* shall accept certified reports of such tests conducted by an *approved* testing agency, provided that such tests meet the requirements of this code and *approved* procedures.~~

(Renumber subsequent sections)

~~**1710.1 General.** In evaluating the physical properties of materials and methods of construction that are not capable of being designed by *approved* engineering analysis or do not comply with the applicable referenced standards, the structural adequacy shall be predetermined based on the load test criteria established in this section.~~

1710.1 General. Where proposed construction is not capable of being designed by *approved* engineering analysis, or where proposed construction design method does not comply with the applicable material design standard, the system of construction or the structural unit and the connections shall be subjected to the tests prescribed in Section 1710. The *building official* shall accept certified reports of such tests conducted by an *approved* testing agency, provided that such tests meet the requirements of this code and *approved* procedures.

Reason: Section 1708 is entirely comprised of section 1708.1. Section 1708.1 references section 1710. Therefore, for clarity, the text of section 1708 should be relocated to section 1710. Furthermore, section 1708.1 essentially restates the text of section 1710.1, but in greater detail. Therefore, current section 1710.1 should be deleted after the substitution as it is redundant.

Cost Impact: The code change proposal will not increase the cost of construction.

S170-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1708-S-HARMAN.doc

S171–12
1709.3.2

Proponent: Gary R. Searer, Wiss, Janey, Elstner Associates Inc., representing self

Revise as follows:

1709.3.2 Load test procedure not specified. In the absence of applicable load test procedures contained within a standard referenced by this code or acceptance criteria for a specific material or method of construction, such *existing structure* shall be subjected to a test procedure developed by a *registered design professional* that simulates applicable loading and deformation conditions. For components that are not a part of the seismic load-resisting system, the test load shall be equal ~~to two times the unfactored design loads~~ to the minimum of the specified factored design loads. For statically loaded components, the test load shall be left in place for a period of 24 hours. For components such as machine supports or fall arrest anchors that carry dynamic loads, the load shall be left in place for a period consistent with the component's actual function. The structure shall be considered to have successfully met the test requirements where the following criteria are satisfied:

1. Under the design load, the deflection shall not exceed the limitations specified in Section 1604.3.
2. Within 24 hours after removal of the test load, the structure shall have recovered not less than 75 percent of the maximum deflection.
3. During and immediately after the test, the structure shall not show evidence of failure.

Reason: This code change proposal does two things: 1) changes the required static test load from *precisely* "two times the unfactored design load" to a "minimum of the specified factored design loads", and 2) specifies how to test components that carry dynamic loads.

It is essentially not possible for the test load to be precisely two times any particular load, and the requirement to test to two times the unfactored load is arbitrary (i.e., why should you test to 2.0D+2.0L if the commonly accepted and statistically based load combination is 1.2D+1.6L?). By adding the phrase "a minimum of" to the requirement and by referencing factored loads, the intent of the provision is made clear -- that the test load should be *at least* the specified factored design load. Nationally recognized design standards such as the AISC Steel Specifications and ACI 318 have been developed with the intent to ensure that very few elements are unable to carry factored loads. To put it another way, if every element in a structure could carry factored loads, the structure's reliability would be consistent with the intent of such standards. In fact, the load testing provisions in each of the AISC and ACI standards make this clear by requiring proof test loads to essentially the full factored loads. This proposal is in-line with both AISC and ACI standards.

When an element is designed to carry short duration or dynamic loads, there is no need to sustain a proof test load for 24 hours.

Cost Impact: The code change proposal will not increase the cost of construction.

S171-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1714.3.2-S-SEARER.doc

S172–12
1710.5

Proponent: Julie Ruth, P.E. JRuth Code Consulting, representing American Architectural Manufacturers Association (AAMA) (julruth@aol.com)

Revise as follows:

1710.5 Exterior window and door assemblies. The design pressure rating of exterior windows and doors in buildings shall be determined in accordance with Section 1710.5.1 or 1710.5.2.

> **Exception:** Structural wind load design pressures for window units ~~smaller~~ other than the size tested in accordance with Section 1710.5.1 or 1710.5.2 shall be permitted to be ~~higher~~ different than the design value of the tested unit provided such ~~higher~~ pressures are determined by accepted engineering analysis or validated by an additional test of the window unit to the alternate allowable design pressure in accordance with Section 1710.5.2. All components of the ~~small~~ alternate size unit shall be the same as the tested or labeled unit. Where ~~such calculated design pressures are~~ engineering analysis is used, ~~they shall be validated by an additional test of the window unit having the highest allowable design pressure~~ the glass shall comply with Section 2403.

Reason: The current exception limits the use of comparative analysis to window units smaller than the size originally tested for labeling purposes. If comparative analysis is used to provide a higher design pressure rating of the smaller unit, its resistance to air infiltration and water penetration at the correspondingly higher design pressure required by AAMA/WDMA/CSA 101/I.S.2/A440 must be verified by testing of the unit. These characteristics cannot be determined by calculation.

Comparative analysis is also appropriate to rate window units larger than the size originally tested for labeling purposes to lower design pressures. In this scenario, the corresponding design pressure used to verify resistance to air infiltration and water penetration would also be lower. Testing would not be required to verify this level of performance since a higher level has already been determined by testing of the same components in a smaller window unit.

This proposal revises this section as appropriate to permit the use of comparative analysis for larger as well as smaller window units than those tested for labeling. The last sentence of the section is also revised to specify that when engineering analysis is used, the glass in the fenestration product must also comply with Section 2403. Section 2403 establishes specific criteria for the deflection of the framing supporting the glass.

Cost Impact: The code change proposal will not increase the cost of construction.

S172-11

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1710.5 #1-S-RUTH

S173–12
1710.5

Proponent: Julie Ruth, P.E., JRuth Code Consulting, representing American Architectural Manufacturers (AAMA) and Joseph R. Hetzel, P.E., Thomas Associates, Inc., representing Door & Access Systems Manufacturers Association (DASMA) International

Revise as follows:

1710.5 Exterior window and door assemblies. The design pressure rating of exterior windows and doors in buildings shall be determined in accordance with Section 1710.5.1 or 1710.5.2. For the purposes of this section, the required design pressure shall be determined using the allowable stress design load combinations of Section 1605.3.

> **Exception:** Structural wind load design pressures for window units smaller than the size tested in accordance with Section 1710.5.1 or 1710.5.2 shall be permitted to be higher than the design value of the tested unit provided such higher pressures are determined by accepted engineering analysis. All components of the small unit shall be the same as the tested unit. Where such calculated design pressures are used, they shall be validated by an additional test of the window unit having the highest allowable design pressure.

Reason: The standards referenced in Section 1710.5 are based upon allowable stress design. This includes AAMA/WDMA/CSA 101/I.S.2/440, ASTM E330 and ANSI/DASMA 108. This proposal adds a sentence to the beginning of the section that clarifies that ASD loads are to be used in the application of this section.

Cost Impact: The code change proposal will not increase the cost of construction.

S173-11

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1710.5 #2-S-RUTH

S174–12
1710.5.1, 1710.5.2

Proponent: Julie Ruth, P.E., JRuth Code Consulting, representing American Architectural Manufacturers Association (AAMA) (julruth@aol.com)

Revise as follows:

1710.5.1 Exterior windows and doors. Exterior windows and sliding doors shall be tested and labeled as conforming to AAMA/WDMA/CSA101/I.S.2/A440. The *label* shall state the name of the manufacturer, the *approved* labeling agency and the product designation as specified in AAMA/ DMA/CSA101/I.S.2/A440. ~~Exterior side hinged doors shall be tested and *labeled* as conforming to AAMA/WDMA/CSA101/I.S.2/A440 or comply with Section 1710.5.2.~~ Products tested and labeled as conforming to AAMA/WDMA/CSA 101/I.S.2/A440 shall not be subject to the requirements of Sections 2403.2 and 2403.3.

1710.5.2 Exterior windows and door assemblies not provided for in Section 1710.5.1. Exterior window and door assemblies shall be tested in accordance with ASTM E 330 except that the structural performance of garage doors and rolling doors shall be determined in accordance with either ASTM E 330 or ANSI/DASMA 108, and shall meet the acceptance criteria of ANSI/DASMA 108. Exterior window and door assemblies containing glass shall comply with Section 2403. The design pressure for testing shall be calculated in accordance with Chapter 16. Each assembly shall be tested for 10 seconds at a load equal to 1.5 times the design pressure.

Reason: At the present time exterior windows and sliding doors are required to be tested and labeled in accordance with AAMA/WDMA/CSA 101/I.S.2/A440. While this specification does require the fenestration product to be tested for resistance to structural load in accordance with ASTM E330, it also requires a number of other tests to be performed. These include resistance to air leakage and water penetration. Other tests such as forced entry resistance may be required depending upon the operator type of the product.

The integrity of the building envelope is dependent upon the performance of the fenestration in the envelope. This is as true for swinging doors as it is for sliding doors and windows. Previous attempts to extend the AAMA/WDMA/CSA 101/I.S.2/A440 labeling requirement to swinging doors were met with resistance. But to date, no acceptable alternative method of determining adequate performance of these products has been provided.

Products that are labeled in accordance with AAMA/WDMA/CSA 101/I.S.2/A440 are now available on the marketplace. Its time to tighten up this important component of the building envelope and require swinging doors to provide the same level of protection to the interior of the building that other components of the building envelope are required to provide.

Cost Impact: There will be no cost increase for products that are already being tested in compliance with Section 1710.5, as required by the IBC.

1710.5.1 #1-S-RUTH.doc

S175 – 12
1710.5.1

Proponent: Thomas S. Zaremba, Roetzel & Associates, representing Glazing Industry Code Committee (tzaremba@ralaw.com)

Revise as follows:

1710.5.1 Exterior windows and doors. Exterior windows and sliding doors shall be tested and labeled as conforming to AAMA/WDMA/CSA101/I.S.2/A440. The *label* shall state the name of the manufacturer, the *approved* labeling agency and the product designation as specified in AAMA/ WDMA/CSA101/I.S.2/A440. Exterior side-hinged doors shall be tested and *labeled* as conforming to AAMA/WDMA/CSA101/I.S.2/A440 or comply with Section 1710.5.2. Products <u>in Risk Category I and II buildings</u> tested and labeled as conforming to AAMA/WDMA/CSA 101/I.S.2/A440 shall not be subject to the requirements of Sections 2403.2 and 2403.3 <u>provided one of the following is met:</u>

1. <u>The required design pressure for the fenestration product does not exceed 60 psf or</u>
2. <u>All glass in the fenestration product is tempered or laminated.</u>

Reason: Chapter 24 and ASTM E1300 require that glazing be firmly supported to prevent breakage under the design load by establishing maximum framing deflection limits. The glass strength calculations in ASTM E1300 use this as a basis to establish a probability of glass breakage less than 8 in 1000. However, Section 1710.5.1 currently exempts certain residential and light commercial products from this requirement if they are labeled to the AAMA/WDMA/CSA 101/I.S.2/A440 standard. While this may be appropriate when these products are used in applications with lower design loads and/or lower risk building types, allowing this exception for *all* product types in *all* occupancies is far too broad. This proposal would correct this overbreadth by ensuring that products used in higher risk situations be firmly supported and meet the frame deflection limit to restore an appropriate safety margin consistent with ASTM E1300.

Specifically, this proposal would limit the exception to only risk category I and II buildings, and products used in higher risk category buildings must meet the Chapter 24 requirement for firmly supported glazing. This includes hospitals, public assembly areas with over 300 people, schools (often used as storm shelters), mission-critical facilities, and infrastructure. To provide flexibility, the proposal also maintains the exception for lower design pressures less than 60 psf, and where tempered or laminated glass is used as an alternative method to reduce the probability of glass breakage and/or potential risk of falling glass.

This proposal is significantly different than other proposals discussed in previous cycles, which would have removed the exception for all buildings other than lowrise residential. This proposal takes a much more moderate approach to restore the appropriate safety margin consistent with Chapter 24 and ASTM E1300 in higher risk situations, but leave the exception and flexibility for residential and light commercial products in lower risk applications.

Cost Impact: The code change proposal will not increase the cost of construction.

S175-12

1710.5.1-S-ZAREMBA.doc

S176–12
202, 1710.6, 2404.2, 2405.5, 2405.5.1, 2405.5.2

Proponent: Julie Ruth, P.E., JRuth Code Consulting, representing American Architectural Manufacturers Association (AAMA) (julruth@aol.com)

Revise as follows:

SECTION 202
DEFINITIONS

SKYLIGHTS AND SLOPED GLAZING. Glass or other transparent or translucent glazing material installed at a slope of 15 degrees (0.26 rad) or more from vertical. Glazing material in skylights, including *unit skylights*, *tubular daylighting devices,* solariums, *sunrooms*, roofs and sloped walls, are included in this definition.

Revise as follows:

1710.6 Skylights and sloped glazing. ~~Unit skylights and tubular daylighting devices (TDDs) shall comply with the requirements of Section 2405. All other~~ Skylights and sloped glazing shall comply with the requirements of Chapter 24.

Revise as follows:

2404.2 Sloped glass. Glass sloped more than 15 degrees (0.26 rad) from vertical in skylights, sunrooms, sloped roofs and other exterior applications shall be designed to resist the most critical of the following combinations of loads.

> **Exception:** The design pressure rating of unit skylights and tubular daylighting devices shall be ~~designed~~ determined in accordance with Section 2405.5.

(Portions of section not shown remain unchanged)

2405.5 Unit skylights and tubular daylighting devices. Unit skylights and tubular devices shall be tested and labeled as complying with AAMA/WDMA/CSA 101/I.S./A440. The *label* shall state the name of the manufacturer, the *approved* labeling agency, the product designation and the performance grade rating as specified in AAMA/WDMA/CSA 101/I.S.2/A440. If the product manufacturer has chosen to have the performance grade of the skylight rated separately for positive and negative design pressure, then the *label* shall state both performance grade ratings as specified in AAMA/ WDMA/CSA 101/I.S.2/A440 and the skylight shall comply with Section 2405.5.2. If the skylight is not rated separately for positive and negative pressure, then the performance grade rating shown on the *label* shall be the performance grade rating determined in accordance with AAMA/WDMA/ CSA 101/I.S.2/A440 for both positive and negative design pressure and the skylight shall conform to Section 2405.5.1.

2405.5.1 ~~Unit~~ Skylights rated for the same performance grade for both positive and negative design pressure. The design of ~~unit~~ skylights shall be based on the following equation:

$F_g \leq PG$ **(Equation 24-13)**

where:

F_g = Maximum load on the skylight determined from Equations 24-2 through 24-4 in Section 2404.2.
PG = Performance grade rating of the skylight.

2405.5.2 ~~Unit~~ Skylights rated for separate performance grades for positive and negative design pressure. The design of ~~unit~~ skylights rated for performance grade for both positive and negative design pressures shall be based on the following equations:

$F_{gi} \le PG_{Po}$ **(Equation 24-14)**
$F_{go} \le PG_{Ne}$ **(Equation 24-15)**

where:

PG_{Pos} = Performance grade rating of the skylight under positive design pressure;
PG_{Neg} = Performance grade rating of the skylight under negative design pressure; and
F_{gi} and F_{go} are determined in accordance with the following:

For $W_o \ge D$,

where:

W_o = Outward wind force, psf (kN/m^2) as calculated in Section 1609.
D = The dead weight of the glazing, psf (kN/m^2) as determined in Section 2404.2 for glass, or by the weight of the plastic, psf (kN/m^2) for plastic glazing.
F_{gi} = Maximum load on the skylight determined from Equations 24-3 and 24-4 in Section 2404.2.
F_{go}= Maximum load on the skylight determined from Equation 24-2.

For $W_o < D$,

where:

W_o = Is the outward wind force, psf (kN/m^2) as calculated in Section 1609.
D = The dead weight of the glazing, psf (kN/m^2) as determined in Section 2404.2 for glass, or by the weight of the plastic for plastic glazing.
F_{gi} = Maximum load on the skylight determined from Equations 24-2 through 24-4 in Section 2404.2.
F_{go}= 0.

Reason: The overall intent of this proposal is to clarify the requirements for tubular daylighting devices, within the context of skylights and sloped glazing in the IBC.

Tubular daylighting devices are a type of skylights, just as unit skylights are. The 2012 IBC contains a definition of TDDs that is consistent with the 2012 IRC. Part I of this proposal simply clarifies that, like unit skylights, TDDs are a type of skylight. This change would also bring consistency to the definition of skylights and sloped glazing between the IRC and IBC.

Section 1710.6 was intended to point the code user to the structural testing provisions of Chapter 24 for skylights and sloped glazing. As currently written, however, it may be misinterpreted as only requiring unit skylights and TDDs to comply with Section 2405.5, and not Chapter 24 in its entirety. This is not correct. The removal of a separate reference for unit skylights and TDDs will help to clarify this.

As currently written, the exception to Section 2404.2 may be interpreted as only requiring unit skylights and TDDs to meet Section 2405.5. This is not the intent of this exception. The proposed revision clarifies that only the design pressure rating of unit skylights and TDDs is to be determined in accordance with Section 2405.5. These products must still meet the other requirements of Chapter 24, and specifically of Section 2405.

Section 2405.5 is revised to clarify that both unit skylights and TDDs are to be tested and labeled in accordance with AAMA/WDMA/CSA 101/I.S.2/A440.

Cost Impact: The code change proposal will not increase the cost of construction.

1710.6-S-RUTH.doc

S177–12
1711.1, 2303.5, 2304.9.3, Chapter 35 (NEW)

Proponent: Brad Douglas, P.E., American Wood Council

Delete without substitution:

~~**1711.1 Joist hangers.** Testing of joist hangers shall be in accordance with Sections 1711.1.1 through 1711.1.3, as applicable.~~

~~**1711.1.1 General.** The vertical load-bearing capacity, torsional moment capacity and deflection characteristics of joist hangers shall be determined in accordance with ASTM D 1761 using lumber having a specific gravity of 0.49 or greater, but not greater than 0.55, as determined in accordance with AF&PA NDS for the joist and headers.~~

> ~~**Exception:** The joist length shall not be required to exceed 24 inches (610 mm).~~

~~**1711.1.2 Vertical load capacity for joist hangers.** The vertical load capacity for the joist hanger shall be determined by testing a minimum of three joist hanger assemblies as specified in ASTM D 1761. If the ultimate vertical load for any one of the tests varies more than 20 percent from the average ultimate vertical load, at least three additional tests shall be conducted. The allowable vertical load of the joist hanger shall be the lowest value determined from the following:~~

1. ~~The lowest ultimate vertical load for a single hanger from any test divided by three (where three tests are conducted and each ultimate vertical load does not vary more than 20 percent from the average ultimate vertical load).~~
2. ~~The average ultimate vertical load for a single hanger from all tests divided by three (where six or more tests are conducted).~~
3. ~~The average from all tests of the vertical loads that produce a vertical movement of the joist with respect to the header of $^{1}/_{8}$ inch (3.2 mm).~~
4. ~~The sum of the allowable design loads for nails or other fasteners utilized to secure the joist hanger to the wood members and allowable bearing loads that contribute to the capacity of the hanger.~~
5. ~~The allowable design load for the wood members forming the connection.~~

~~**1711.1.2.1 Design value modifications for joist hangers.** Allowable design values for joist hangers that are determined by Item 4 or 5 in Section 1711.1.2 shall be permitted to be modified by the appropriate duration of loading factors as specified in AF&PA NDS but shall not exceed the direct loads as determined by Item 1, 2 or 3 in Section 1711.1.2. Allowable design values determined by Item 1, 2 or 3 in Section 1711.1.2 shall not be modified by duration of loading factors.~~

~~**1711.1.3 Torsional moment capacity for joist hangers.** The torsional moment capacity for the joist hanger shall be determined by testing at least three joist hanger assemblies as specified in ASTM D 1761. The allowable torsional moment of the joist hanger shall be the average torsional moment at which the lateral movement of the top or bottom of the joist with respect to the original position of the joist is $^{1}/_{8}$ inch (3.2 mm).~~

(Renumber subsequent sections)

Revise as follows:

2303.5 Test standard for joist hangers. ~~For the required test standards for joist hangers see Section 1711.1~~ Joist hangers shall conform to requirements of ASTM D 7147.

Revise as follows:

2304.9.3 Joist hangers and framing anchors. Connections depending on joist hangers or framing anchors, ties and other mechanical fastenings not otherwise covered are permitted where *approved*. The vertical load-bearing capacity, torsional moment capacity and deflection characteristics of joist hangers shall be determined in accordance with ~~Section 1711.1~~ ASTM D 7147.

Add new standard to Chapter 35 as follows:

ASTM

D 7147-05, Specification for Testing and Establishing Allowable Loads of Joist Hangers

Reason: The 2009 IBC updated the reference to ASTM D 1761 from a prior edition to a 2006 edition for the testing of joist hangers. However, ASTM D1761-06 no longer contains provisions for testing of joist hangers. These provisions were moved to and revised in ASTM D7147. The revisions included sampling and evaluation criteria (currently included in IBC section 1711.1) as well as further refinements regarding quality of test materials, adjustments for variation in test materials, and limits on design values with materials other than those tested. In addition, since ASTM D7147 is specific to joist hangers used with wood and contains provisions that go beyond testing, it is more appropriate to reference it in Chapter 23 rather than Chapter 17.

Cost Impact: The code change proposal will not increase the cost of construction.

1711.1-S-COATS.doc

S178–12
1711.1.1, 1711.1.2, 1711.1.2.1, 1711.1.3, Chapter 35 (NEW)

Proponent: Randall Shackelford, P.E., Simpson Strong-Tie Company, Inc., (rshackelford@strongtie.com)

Revise as follows:

1711.1 Joist hangers. Testing of joist hangers shall be in accordance with Sections 1711.1.1 through ~~1711.1.3~~ 1711.1.2, as applicable.

1711.1.1 ~~General~~ Allowable stress design. The allowable vertical load-bearing capacity, torsional moment capacity and deflection characteristics of joist hangers shall be determined in accordance with ASTM D ~~1761~~ 7147 ~~using lumber having a specific gravity of 0.49 or greater, but not greater than 0.55, as determined in accordance with AF&PA NDS for the joist and headers~~.

~~**Exception:** The joist length shall not be required to exceed 24 inches (610 mm).~~

~~**1711.1.2 Vertical load capacity for joist hangers.** The vertical load-bearing capacity for the joist hanger shall be determined by testing a minimum of three joist hanger assemblies as specified in ASTM D 1761. If the ultimate vertical load for any one of the tests varies more than 20 percent from the average ultimate vertical load, at least three additional tests shall be conducted. The allowable vertical load-bearing of the joist hanger shall be the lowest value determined from the following:~~

1. ~~The lowest ultimate vertical load for a single hanger from any test divided by three (where three tests are conducted and each ultimate vertical load does not vary more than 20 percent from the average ultimate vertical load).~~
2. ~~The average ultimate vertical load for a single hanger from all tests divided by three (where six or more tests are conducted). 3. The average from all tests of the vertical loads that produce a vertical movement of the joist with respect to the header of 1/8 inch (3.2 mm).~~
4. ~~The sum of the allowable design loads for nails or other fasteners utilized to secure the joist hanger to the wood members and allowable bearing loads that contribute to the capacity of the hanger.~~
5. ~~The allowable design load for the wood members forming the connection.~~

~~**1711.1.2.1 Design value modifications for joist hangers.** Allowable design values for joist hangers that are determined by Item 4 or 5 in Section 1711.1.2 shall be permitted to be modified by the appropriate load duration factors as specified in AF&PA NDS but shall not exceed the direct loads as determined by Item 1, 2 or 3 in Section 1711.1.2. Allowable design values determined by Item 1, 2 or 3 in Section 1711.1.2 shall not be modified by load duration factors.~~

~~**1711.1.3 Torsional moment capacity for joist hangers.** The torsional moment capacity for the joist hanger shall be determined by testing at least three joist hanger assemblies as specified in ASTM D 1761. The allowable torsional moment of the joist hanger shall be the average torsional moment at which the lateral movement of the top or bottom of the joist with respect to the original position of the joist is 1/8 inch (3.2 mm).~~

(Renumber subsequent sections)

1711.1.2 LRFD or Strength Design. The resistance of joist hangers for LRFD or strength design shall be determined using an approved method.

Add new standard to Chapter 35 as follows:

ASTM

<u>D 7147—11 Standard Specification for Testing and Establishing Allowable Loads of Joist Hangers</u>

Reason: In the 2012 IBC, this section requires that the capacity of joist hangers be determined using ASTM D1761. The 2006 edition of that standard is referenced in Chapter 35. The problem is that the 2006 edition no longer contains requirements for testing of joist hangers. All joist hanger testing requirements were removed, and a new standard, ASTM D7147 was written for testing of joist hangers. The newest edition of the ASTM D7147 standard is the 2011 edition. That is being suggested as the most applicable standard for determining allowable loads for joist hangers.
The specific methods for evaluating the test data can be deleted because all those requirements are now contained in ASTM D7147, whereas they were not present in D1761.
This standard is only applicable for determining allowable stress loads. It does not give guidance for determining resistances for LRFD. There are documents that give such guidance, such as the American Wood Council *Load and Resistance Factor Design (LRFD) Manual for Engineered Wood Construction.* There is precedence for having sections for both ASD and LRFD. Sections 1908 and 1909 contain requirements for design of anchorage to concrete using allowable stress and strength design, respectively.

Cost Impact: ASTM D7147 does contain some additional requirements for testing and recording the hanger steel strength, wood specific gravity, and bending yield strength of fasteners, which could increase the cost of testing over ASTM D1761-2000, but that standard is no longer referenced anyway so that is not really an option.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

S178-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1711.1-S-SHACKELFORD.doc

S179–12
1803.5.12

Proponent: Mark Petersen, The Shaw Group, Inc., representing Deep Foundations Institute, Seismic and Lateral Load Committee

Revise as follows:

1803.5.12 Seismic Design Categories D through F. For structures assigned to *Seismic Design Category* D, E or F, the geotechnical investigation required by Section 1803.5.11 shall also include all of the following as applicable:

1. The determination of dynamic seismic lateral earth pressures on foundation walls and retaining walls supporting more than 6 feet (1.83 m) of backfill height due to design earthquake ground motions.
2. The potential for liquefaction ~~and~~ , soil strength loss, post-liquefaction reconsolidation settlement, and lateral spreading deformation shall be evaluated for site peak ground acceleration, earthquake magnitude, and source characteristics consistent with the maximum considered earthquake ground motions and the design earthquake ground motions. The deformations associated with the maximum considered earthquake motions should be used to evaluate collapse of the structure. The deformations associated with the design earthquake ground motions should be used for structure design. Peak ground acceleration shall be determined based on:
   - 2.1 A site-specific study in accordance with Section 21.5 of ASCE 7 for the maximum considered earthquake ground motions, use two-thirds of the site-specific maximum considered earthquake peak ground acceleration;; or
   - 2.2 In accordance with Section 11.8.3 of ASCE 7 for the maximum considered earthquake motions and in accordance with Section 11.4.5 of ASCE 7 for the design earthquake motions.
3. An assessment of potential consequences of liquefaction and soil strength loss, including, but not limited to:
   - 3.1. Estimation of total and differential settlement;
   - 3.2. Lateral soil movement;
   - 3.3. Lateral soil loads on foundations;
   - 3.4. Reduction in foundation soil-bearing capacity and lateral soil reaction;
   - 3.5. Soil downdrag and reduction in axial and lateral soil reaction for pile foundations;
   - 3.6. Increases in soil lateral pressures on retaining walls; and
   - 3.7. Flotation of buried structures.
4. Discussion of mitigation measures such as, but not limited to:
   - 4.1. Selection of appropriate foundation type and depths;
   - 4.2. Selection of appropriate structural systems to accommodate anticipated displacements and forces;
   - 4.3. Ground stabilization; or
   - 4.4. Any combination of these measures and how they shall be considered in the design of the structure.

Reason: buildings designed to ASCE 7-05 seismic provisions are expected to resist collapse during an MCE event, and therefore the possible effects of liquefaction on the stability of the foundation and structure require evaluation at this level." (C.B. Crouse, M.S. Power, and D.G. Anderson, "New Liquefaction Requirements and Associated Peak Ground Acceleration Maps", 2010 Structures Congress, ASCE.

The proposed change is consistent with the code philosophy. That is, collapse is evaluated based on liquefaction-induced deformations resulting from the maximum considered earthquake motions and design is based on the liquefaction-induced deformations resulting from the design earthquake ground motions.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

1803.5.12-S-PETERSEN.doc

S180–12
1803.5.6

Proponent: Theodore L Droessler, Clark County Nevada, representing Clark County Development Services, and R. David Charles, P.E., representing ASFE, the Geoprofessional Business Association.

Revise as follows:

1803.5.6 Rock strata. Where subsurface explorations at the project site indicate ~~variations or doubtful characteristics in the structure of~~ the presence of rock upon which foundations are to be constructed, a sufficient number of borings shall be made to a depth of not less than 10 feet (3048 mm) below the level of the foundations ~~to provide assurance of the soundness of the foundation bed~~ assess the competency of the rock and its load-bearing capacity in terms of the rock strength and the presence, orientation, and condition of discontinuities, weathering profiles and other similar profiles of the sampled rock as they apply at a particular site.

Reason: The proposed modification is intended to make the wording of the Code addressing the evaluation of rock materials for foundation support more consistent with current geotechnical engineering practice.

The current wording suggests that it is possible to provide “assurance of the soundness of rock” during the geotechnical evaluation phase. Unfortunately, experience has shown that even at sites where rigorous evaluation of rock conditions is undertaken, it is often determined during construction that rock conditions between the locations sampled can vary significantly. Many times the actual rock conditions at foundation locations are exposed or better defined (through excavation, proof-drilling, etc.) during construction, and interpretations of the conditions exposed during the construction process are necessary to complete the design of the foundation element.

The proposed modifications to Section 1803.5.6 express the characteristics necessary to assess the rock strata and estimate a load-bearing capacity based on observations and testing.

Cost Impact: The code change proposal will not increase the cost of construction.

S180-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1803.5.6-S-CHARLES-DROESSLER.doc

S181–12
1803.5.7, 1804.1, 1804.2 (NEW), 1804.2.1 (NEW),

Proponent: Edwin Huston, National Council of Structural Engineers Associations- Code Advisory Committee - General Requirements Subcommittee (huston@smithhustoninc.com)

Revise as follows:

1803.5.7 Excavation near foundations. Where excavation will remove ~~lateral~~ support from any foundation~~, an investigation shall be conducted to assess the potential consequences and address mitigation measures~~ a Registered Design Professional shall prepare a report summarizing the condition of the structure as determined from examination of the structure, the review of available design documents and if necessary, the excavation of test pits. The Registered Design Professional shall determine the requirements for underpinning and protection and prepare site-specific plans, details, and sequence of work for submission. Such support may be provided by underpinning, sheeting, and bracing, or by other means acceptable to the building official.

1804.1 Excavation near foundations. Excavation for any purpose shall not remove lateral support from any foundation or adjacent foundation without first underpinning or protecting the foundation against settlement or lateral translation.

1804.2 Underpinning. Where the protection and/or support of adjacent structures is required, the underpinning system shall be designed and installed in accordance with provisions of this chapter and Chapter 33.

1804.2.1 Underpinning and bracing installation. Where underpinning is used for the support of adjacent structures, the piers, wall piles or footings shall be installed in such manner so as to prevent the lateral or vertical displacement of the adjacent structure, to prevent deterioration of the foundations or other effects that would disrupt the adjacent structure. The sequence of installation shall be identified in the design.

Reason: At present, excavation of foundations is not specifically addressed in relation to adjacent structures. Section 3307, Protection of Adjacent Property, states: “Adjoining public and private property shall be protected from damage during construction, remodeling and demolition work. Protection shall be provided for footings, foundations, party walls, chimneys, skylights and roofs.”

The code currently has minimal and vague requirements of the due diligence required for investigation for excavation near a neighboring structure. Failures to perform proper pre-construction investigations and monitoring procedures have led to failures in construction during underpinning and excavation operations. Improper excavations result nationally in doors and windows that don’t open, increasing through cracking of bearing walls and support members, failures of structural members and to collapse and fatalities.

Specific guidelines are provided to identify responsibilities and basic requirements for providing safe and successful underpinning and excavations.

Cost Impact: The code change proposal will not increase the cost of construction.

S181-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1803.5.7-S-HUSTON.doc

S182–12
1806.2

Proponent: Theodore L Droessler, Clark County Nevada, representing Clark County Development Services, R. David Charles, P.E., representing ASFE, the Geoprofessional Business Association.

Revise as follows:

1806.2 Presumptive load-bearing values. The load-bearing values used in design for supporting soils near the surface shall not exceed the values specified in Table 1806.2 unless data to substantiate the use of higher values are submitted and *approved*. Where the *building official* has reason to doubt the classification, strength ~~or compressibility~~ of the soil, <u>or in cases where settlement and/or differential settlement of the foundations is a concern for the serviceability or stability of the structure,</u> the requirements of Section 1803.5.2 shall be satisfied. Presumptive load-bearing values shall apply to materials with similar physical characteristics and dispositions. Mud, organic silt, organic clays, peat or unprepared fill shall not be assumed to have a presumptive load-bearing capacity unless data to substantiate the use of such a value are submitted.

> **Exception:** A presumptive load-bearing capacity shall be permitted to be used where the *building official* deems the load-bearing capacity of mud, organic silt or unprepared fill is adequate for the support of lightweight or temporary structures.

Reason: The proposed modification is intended to clarify that the use of “presumptive load-bearing values” should be limited to certain situations, for which judgment needs to be exercised. The term compressibility is replaced with serviceability to reflect similar language used in Chapter 16 for deflection of structural members.

While there is history of using “presumptive load-bearing capacities” for lightly loaded and temporary structures in some jurisdictions, the use of such “presumptive” values to design foundations for structures, without the benefit of subsurface evaluation and geotechnical analysis, should be used with caution. In the event that total or differential settlement of a structure is of concern, a geotechnical evaluation (consistent with Section 1803.5.2) should be performed by a qualified geotechnical professional.

Cost Impact: The code change proposal will not increase the cost of construction.

S182-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1806.2-S-CHARLES-DROESSLER.doc

S183–12
1808.2

Proponent: Theodore L Droessler, Clark County Nevada, representing Clark County Development Services , R. David Charles, P.E., representing ASFE, the Geoprofessional Business Association.

Revise as follows:

1808.2 Design for capacity and settlement. Foundations shall be so designed that the allowable bearing capacity of the soil is not exceeded, and that the estimated total and differential settlement ~~is minimized~~ shall not cause harmful distortion or instability in the structure, nor cause any element to be loaded beyond its limit states or allowable capacity. Foundations in areas with expansive soils shall be designed in accordance with the provisions of Section 1808.6.

Reason: The proposed modification is intended to make the wording of the Code addressing the design of shallow foundation systems consistent with practice of the design of shallow foundation systems. The proposed change also makes the wording of the Code for shallow foundations consistent with the existing wording of the Code for deep foundation systems.

The existing wording of the Code states that shallow foundation systems are to be designed such that "differential settlement is minimized." In many cases, several shallow foundation options are identified as feasible during the geotechnical evaluation for a given structure, with different degrees of potential differential settlement under different options. The final selection of the appropriate foundation option for a specific project should be made by the design team, (including the structural engineer, the geotechnical engineer and the Owner), based on consideration of cost and the implications of the estimated total and differential settlement. The option chosen for a specific project may not necessarily be the one for which "differential settlement is minimized." Therefore, rewording this section of the Code to recognize current practice is appropriate.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

1808.2-S-CHARLES-DROESSLER.doc

S184–12
1808.3.2 (NEW)

Proponent: Edwin Huston, National Council of Structural Engineers Associations (NCSEA), representing NCSEA Code Advisory Subcommittee – General Requirements Subcommittee (huston@smithhustoninc.com)

Add new text as follows:

1808.3.2 Surcharge. No fill or other surcharge loads shall be placed adjacent to any building or structure unless such building or structure is capable of withstanding the additional loads caused by the fill or the surcharge. Existing footings or foundations which will be affected by any excavation shall be underpinned or otherwise protected against settlement and shall be protected against lateral movement.

Reason: The code does not comment on permanent loads surcharging a neighboring structure. It references surcharge loads only in reference to construction loading in Chapter 33.

Cost Impact: The code change proposal will not increase the cost of construction.

S184-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1808.3.2 (NEW)-S-HUSTON.doc

S185–12
1810.2.5

Proponent: Lori A. Simpson, P.E., GE, Treadwell & Roll, a Langan Company, representing Deep Foundations Institute

Revise as follows:

1810.2.5 Group effects. The analysis shall include group effects on lateral behavior where the center-to-center spacing of deep foundation elements in the direction of lateral force is less than eight times the least horizontal dimension of an element. The analysis shall include group effects on axial behavior where the center-to-center spacing of deep foundation elements is less than three times the least horizontal dimension of an element. Group effects shall be evaluated using an approved method of analysis; the analysis for uplift of grouped elements with center-to-center spacing less than three times the least horizontal dimension shall be evaluated in accordance with Section 1810.3.3.1.6.

Reason: To make the evaluation of group effects on uplift more clear that it needs to be performed where spacing is less than three times the least horizontal dimension. While this section may seem clear without the change, Section 1810.3.3.1.6 makes it unclear what spacing necessitates evaluation of group effects for uplift. Cross referencing the other section, plus changes made to Section 1810.3.3.1.6 (see another Code Change Proposal), will clarify this issue.

Cost Impact: The code change proposal will not increase the cost of construction.

S185-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1810.2.5-S-SIMPSON.doc

S186–12

1810.3.1, 1810.3.1.1, 1810.3.1.7 (NEW), 1810.3.1.8 (NEW), 1810.3.2.4, 1810.3.2.6, Table 1810.3.2.6, 1810.3.2.7, 1810.3.2.8, 1905.1.11

Proponent: Stephen Kerr, S.E., Josephson Werdowatz and Associates, representing Structural Engineers Association of California (SEAOC) (skerr@jwa-se.com)

Revise as follows:

1810.3.1 Design conditions. Design of deep foundations shall include the design conditions specified in Sections 1810.3.1.1 through ~~1810.3.1.6~~ 1810.3.1.8, as applicable. As an alternate, the allowable loads can be evaluated using the allowable stresses in Section 1810.3.2.6.

1810.3.1.1 Design methods for concrete elements. Where concrete deep foundations are laterally supported in accordance with Section 1810.2.1 for the entire height and applied forces cause bending moments no greater than those resulting from accidental eccentricities, structural design of the element using the load combinations of Section 1605.3 and the allowable stresses specified in this chapter shall be permitted. Otherwise, the structural design of concrete deep foundation elements shall use the load combinations of Section 1605.2 and ~~*approved* strength design methods.~~ the member design shall be in accordance with ACI 318 subject to the other requirements in this chapter.

1. Prestressed precast concrete piles may use other *approved* strength design methods.
2. Permanent casing can be used in place of confinement reinforcement for cast-in-place concrete elements not greater than 16 inches in diameter if strength and stiffness of the casing is equal or greater than that of the specified confinement reinforcing.

1810.3.1.7 Timber piles. Timber deep foundation elements shall be designed as piles or poles in accordance with AF&PA NDS.

1810.3.1.8 Steel H Piles. Steel H-Piles in Seismic Design Categories D, E, or F shall comply with the Provisions of AISC 360 and AISC 341. In other cases the use of AISC 360 is allowed.

1810.3.2.4 Timber. ~~Timber deep foundation elements shall be designed as piles or poles in accordance with AF&PA NDS~~. Round timber elements shall conform to ASTM D 25. Sawn timber elements shall conform to DOC PS-20.

1810.3.2.6 Allowable stresses. ~~The allowable stresses for materials used in deep foundation elements shall not exceed those specified in Table 1810.3.2.6~~. Allowable stresses in Table 1810.2.6 can be used only where deep foundations are laterally supported in accordance with Section 1810.2.1 for the entire height and applied forces cause bending moments no greater than those resulting from accidental eccentricities, structural design of the element using the load combinations of Section 1605.3. Use of allowable stresses is subject to the constraints of Section 1810.3.1.

TABLE 1810.3.2.6
ALLOWABLE STRESSES FOR MATERIALS USED IN DEEP FOUNDATION ELEMENTS

MATERIAL TYPE AND CONDITION	MAXIMUM ALLOWABLE STRESS[a]
1.Concrete or grout in compression[b]	
~~Cast-in-place with a permanent casing in accordance with Section 1810.3.2.7~~	~~$0.4f'_c$~~
Cast-in-place in a pipe, tube, other permanent casing or rock	$0.33f'_c$
Cast-in-place without a permanent casing	$0.3f'_c$
Precast nonprestressed	$0.33f'_c$
Precast prestressed	$0.33f'_c - 0.27f_{pc}$

MATERIAL TYPE AND CONDITION	MAXIMUM ALLOWABLE STRESS[a]
2.Nonprestressed reinforcement in compression	$0.4f_y \leq 30{,}000$ psi
3. Structural steel in compression Cores within concrete-filled pipes or tubes ~~Pipes, tubes or H-piles, where justified in accordance with Section 1810.3.2.8~~ Pipes or tubes for micropiles ~~Other pipes~~Pipes, tubes or H-piles Helical piles	 $0.5\ F_y \leq 32{,}000$ psi ~~$0.5\ F_y \leq 32{,}000$ psi~~ $0.4\ F_y \leq 32{,}000$ psi $0.35\ F_y \leq 16{,}000$ psi $0.6\ F_y \leq 0.5\ F_u$
4.Nonprestressed reinforcement in tension Within micropiles Other conditions	 $0.6f_y$ $0.5f_y \leq 24{,}000$ psi
5. Structural steel in tension ~~Pipes, tubes or H-piles, where justified in accordance with Section 1810.3.2.8~~ ~~Other pipes~~Pipes, tubes or H-piles Helical piles	 ~~$0.5\ F_y \leq 32{,}000$ psi~~ $0.35\ F_y \leq 16{,}000$ psi $0.6\ F_y \leq 0.5\ F_u$
~~6.Timber~~	~~In accordance with the AF&PA NDS~~

For SI: 1 pound per square inch = 6.895 kPa.

a. f'_c is the specified compressive strength of the concrete or grout; f_{pc} is the compressive stress on the gross concrete section due to effective prestress forces only; f_y is the specified yield strength of reinforcement; F_y is the specified minimum yield stress of structural steel; F_u is the specified minimum tensile stress of structural steel.

b. The stresses specified apply to the gross cross-sectional area within the concrete surface. Where a temporary or permanent casing is used, the inside face of the casing shall be considered the concrete surface.

~~**1810.3.2.7 Increased allowable compressive stress for cased cast-in-place elements.** The allowable compressive stress in the concrete shall be permitted to be increased as specified in Table 1810.3.2.6 for those portions of permanently cased cast-in-place elements that satisfy all of the following conditions:~~

1. ~~The design shall not use the casing to resist any portion of the axial load imposed.~~
2. ~~The casing shall have a sealed tip and be mandrel driven.~~
3. ~~The thickness of the casing shall not be less than manufacturer's standard gage No.14 (0.068 inch) (1.75 mm).~~
4. ~~The casing shall be seamless or provided with seams of strength equal to the basic material and be of a configuration that will provide confinement to the cast-in-place concrete.~~
5. ~~The ratio of steel yield strength (*Fy*) to specified compressive strength (*f ′c*) shall not be less than six.~~
6. ~~The nominal diameter of the element shall not be greater than 16 inches (406 mm).~~

1810.3.2.7 Cased cast-in-place elements. Permanently cased ast-in-place concrete elements shall comply with the following.

1. The design shall not use the casing to resist any portion of the imposed axial load.
2. For mandrel driven piles

   a. The casing shall have a sealed tip and be mandrel driven.
   b. The thickness of the casing shall not be less than No. 14 (0.068 inch) (1.75 mm) gage.
   c. The nominal diameter of the element shall not be greater than 16 inches (406 mm).
   d. The ratio of steel yield strength (F_y) to specified compressive strength (f'_c) shall not be less than six.

3. The casing shall be seamless or provided with seams of strength equal to the basic material and be of a configuration that will provide confinement to the cast-in-place concrete.

~~**1810.3.2.8 Justification of higher allowable stresses.** Use of allowable stresses greater than those specified in Section 1810.3.2.6 shall be permitted where supporting data justifying such higher stresses is filed with the *building official*. Such substantiating data shall include:~~

1. ~~A geotechnical investigation in accordance with Section 1803; and~~
2. ~~Load tests in accordance with Section 1810.3.3.1.2, regardless of the load supported by the element.~~

~~The design and installation of the deep foundation elements shall be under the direct supervision of a *registered design professional* knowledgeable in the field of soil mechanics and deep foundations who shall submit a report to the *building official* stating that the elements as installed satisfy the design criteria.~~

Add new text as follows:

<u>**1905.1.11 ACI 318, Section 1.1.6.** Modify ACI 318 Section 1.1.6 to read as follows:</u>

<u>1.1.6 – This Code does not govern design and installation of portions of prestressed concrete piles, in ground except for structures assigned to Seismic Design Categories D, E. and F. See 21.12.4 for requirements for concrete piles, drilled piers, and caissons in structures assigned to Seismic Design Categories D, E, and F.</u>

Reason: The current code references to increased allowable stresses do not provide guidance on what the increased allowable stresses should be, with a few exceptions. The proposal resolves this ambiguity by making it clear that when higher capacities are desired or the constraints on the use of allowable stresses are not satisfied that strength design methods be used. Thus we no longer need to define values of the higher allowable stresses. This is supported by Section 1810.3.1.1, and other sections which endorse the use of strength design methods.

The existing provisions defining when increased allowable stresses could be used create additional problems since the criteria were not related to additional structural capacity. The load test provisions in Sections 1810.2.8 and 1810.3.3.1.2 address geotechnical failure modes and are not appropriate to evaluate structure failure modes and thus are inappropriate to justify increased member structural capacity. The load tests listed in this chapter are still useful in evaluating geotechnical failure modes but should not be used to define structural capacities.

A structural failure mode below the calculated capacity of the structural element would suggest either significant calculation error, damage during installation, or material not meeting the specified requirements. Load testing isolated piles is not the optimum way to identify these potential problems. Project controls are needed to identify and control these problems since if they occur the default allowable stresses may not be adequate.

The changes proposed here impact only the structural capacity of the deep foundation elements and not the geotechnical failure modes.

In several locations in Section 1810.3.1 instead of referring to “approved strength design methods” specific standards are listed. In the case of Timber piles and steel H piles the standards referenced are existing requirements. In the case of concrete the consensus of the foundation literature endorsed the use of ACI 318. The reference to ACI 318 makes it clear that the standard supplements but does not replace the existing provisions already in this Chapter. Listing specific design standards reduces any ambiguity as to what is acceptable.

1810.3.1

Range of sections listed is revised to reflect the sub sections added by this change.

The last sentence is added to make it clear that Section 1810.3.2.6 is subservient to Section 1810.3.1

1810.3.1.1

Specific reference to ACI is needed both to make specific the strength design provisions mentioned in the current version and because the special inspection provisions in Chapter 17 make reference to provisions of ACI 318 that would not be mandated for these deep foundation elements.

ACI 543 and ACI 336 endorse this approach. The appropriateness of adopting ACI 318 is further supported by that fact that ACI 318 already has design provisions for deep foundation concrete elements.

Item 1 is added to reflect the fact that prestressed piles are not addressed in ACI 318. Refer to the new Section 1905.1.11. Item 2 addresses the special case of small diameter piles cast-in-place concrete piles with permanent bracing.

1810.3.1.7

The language for timber piles was moved, unchanged, from Section 1810.3.2.4 since Section 1810.3.2 deals with materials and not design methodologies.

1810.3.1.8

Because this chapter defines the design standards for deep foundation elements it is necessary to specifically invoke the requirements in AISC 341 that are applicable in high seismic conditions.

1810.3.2.4

The design provisions are moved to Section 1810.3.1 which more appropriately deals with design conditions.

1810.3.2.6

The limitations on the use of concrete deep foundation elements in Section 18810.3.1.2 are made applicable to all deep foundation elements. When buckling is a concern or we are dealing with combined bending and axial forces a more robust methodology is appropriate.

The added language also makes it clear that the use of allowable stresses is subservient to the constraints of Section 1810.3.1 that defines constraints on design of deep foundation elements.

TABLE 1810.3.2.6

The line in item 1 referencing Section 1810.3.2.7 is deleted. Rather than defining increased allowable stress the engineer has the option of using the strength design provisions in Section 1810.3.1.1. Recognizing that applying strength design methods for the piles addressed in 1810.3.2.7 may be difficult because of difficulties with installing confinement reinforcement, Item 1 has been added to Section 1810.3.1.1 allowing the casing to be used as confinement reinforcement thus facilitating the application of strength design methods for these piles.

The lines in items 3 and 5 of the table referencing Section 1810.3.2.8 are deleted because the criteria is not relevant for evaluating structural capacity as opposed to geotechnical capacity. In the absence of the deleted item the designer would be directed to the new Section 1810.3.1.8 which references AISC 360 and AISC 341.

The provision for timber in item 6 of the table are deleted because they are already addressed in Section 1810.3.2.4

1810.3.2.7

This section has been reformatted since they no longer serve as prerequisites for higher allowable stresses.

The existing sub-section 2 would require the use of a mandrel when installing all permanent casing. The changes limit this requirement to the class of piles normally installed with mandrels.

1810.3.2.8

Load tests described in paragraph 1810.3.3.1.2 address the geotechnical capacity and not the structural capacity of deep foundation elements. Thus the provisions of this section should not be used to access the structural capacity of deep foundation elements.

The inspection requirements in the last paragraph are not necessary since Sections 1705.7 and 1705.8 already define the necessary special inspections.

1905.1.11:

Without this change to the scope of ACI 318 the IBC does not provide any technical criteria for the design of the structural aspects of concrete piles, drilled piers, and caissons. ACI 336 “Design and Construction of Drilled Piers”, and ACI 543 “Recommendations for Design, Manufacture of Concrete Piles”, endorse the use of ACI 318 to design these deep foundation elements. The change reflects current practice.

The change in scope of ACI 318 does not include adding prestressed concrete piles because of limited time to resolve technical concerns.

Cost Impact: The code change proposal will not increase the cost of construction.

S186-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1810.3.1-S-KERR.doc

1810.3.2.3, Table 1810.3.2.6, 1810.3.5.3.1, 1810.3.5.3.2 (NEW), 1810.3.5.3.3 (NEW), Chapter 35 (NEW)

Proponent: Bonnie Manley, American Iron and Steel Institute (bmanley@steel.org)

Revise as follows:

1810.3.2.3 ~~Structural steel~~ Steel. Structural steel H-piles and structural steel sheet piling shall conform to the material requirements in ASTM A6. Steel pipe piles shall conform to the material requirements in ASTM A 252. ~~and~~ Fully welded steel piles shall be fabricated from plates ~~shall~~ that conform to the material requirements in ASTM A 36, ~~ASTM A 252~~, ASTM A 283, ASTM A 572, ASTM A 588 or ASTM A 690~~, ASTM A 913 or ASTM A 992~~.

TABLE 1810.3.2.6
ALLOWABLE STRESSES FOR MATERIALS USED IN DEEP FOUNDATION ELEMENTS

MATERIAL TYPE AND CONDITION	MAXIMUM ALLOWABLE STRESS[a]
3. ~~Structural steel~~ Steel in compression	
Cores within concrete-filled pipes or tubes	$0.5\ F_y \leq 32{,}000$ psi
Pipes, tubes or H-piles, where justified in accordance with Section 1810.3.2.8	$0.5\ F_y \leq 32{,}000$ psi
Pipes or tubes for micropiles	$0.4\ F_y \leq 32{,}000$ psi
Other pipes, tubes or H-piles	$0.35\ F_y \leq 16{,}000$ psi
Helical piles	$0.6\ F_y \leq 0.5\ F_u$
5. ~~Structural steel~~ Steel in tension	
Pipes, tubes or H-piles, where justified in accordance with Section 1810.3.2.8	$0.5\ F_y \leq 32{,}000$ psi
Other pipes, tubes or H-piles	$0.35\ F_y \leq 16{,}000$ psi
Helical piles	$0.6\ F_y \leq 0.5\ F_u$

a. f'_c is the specified compressive strength of the concrete or grout; f_{pc} is the compressive stress on the gross concrete section due to effective prestress forces only; f_y is the specified yield strength of reinforcement; F_y is the specified minimum yield stress of ~~structural~~ steel; F_u is the specified minimum tensile stress of ~~structural~~ steel.

(Portions of Table not shown remain unchanged)

1810.3.5.3.1 Structural steel H-piles. Sections of structural steel H-piles shall comply with the requirements for HP shapes in ASTM A6, or the following:

1. The flange projections shall not exceed 14 times the minimum thickness of metal in either the flange or the web and the flange widths shall not be less than 80 percent of the depth of the section.
2. The nominal depth in the direction of the web shall not be less than 8 inches (203 mm).
3. Flanges and web shall have a minimum nominal thickness of 3/8 inch (9.5 mm).

1810.3.5.3.2 Fully welded steel piles fabricated from plates. Sections of fully welded steel piles fabricated from plates shall comply with the following:

1. The flange projections shall not exceed 14 times the minimum thickness of metal in either the flange or the web and the flange widths shall not be less than 80 percent of the depth of the section.
2. The nominal depth in the direction of the web shall not be less than 8 inches (203 mm).
3. Flanges and web shall have a minimum nominal thickness of 3/8 inch (9.5 mm).

1810.3.5.3.3 Structural steel sheet piling. Individual sections of structural steel sheet piling shall conform to the profile indicated by the manufacturer, and shall conform to the general requirements specified by ASTM A 6.

Add new standard to Chapter 35 as follows:

ASTM

<u>A6/A6M-11 Standard Specifications for General Requirements for Rolled Structural Steel Bars, Plates, Shapes, and Sheet Piling</u>

Reason: Section 1810.3.2.3 of this proposal improves the clarity of Section 1810.3.2.3 as it applies to steel foundation elements. First, it coordinates the title with the language that follows. Structural steel is defined in Section 202 and steel pipe piles and fully welded steel piles do not necessarily fall into that classification. Second, the section assigns the appropriate ASTM references to the applicable foundation elements. ASTM A 252 applies only to steel pipe piles. ASTM A 913 and ASTM A 992 both apply to structural shapes and not plates, thus they are not appropriate for fully welded steel piles fabricated from plates. Finally, ASTM A 6 has been added as the appropriate reference for the material requirements for H-piles and another common steel foundation system -- sheet piling. Since ASTM A 6 includes references to all of the applicable listed ASTM standards – ASTM A 36, ASTM A 572, ASTM A 690, ASTM A 913, or ASTM A 992 – duplicate reference of those standards is not necessary for H-piles and sheet piling.

Table 1810.3.2.6 of this proposal coordinates the title change in Section 1810.3.2.3 with requirements in Table 1810.3.2.6. Structural steel is defined in Section 202 and steel pipe and fully welded steel piles do not necessarily fall into that classification, but the intent is to apply the allowable stress limits to those sections as well. Consequently, the term "structural" has been deleted.

1810.3.5.3.1, 1810.3.5.3.2 of this proposal clarifies the Section 1810.3.5.3 by separating the requirements for structural steel H-piles from fully welded steel piles fabricated from plates and adding a new section on structural steel sheet piling. Within the section on structural steel H-piles, Section 1810.3.5.3.1, reference is made to ASTM A 6 for HP shapes, which automatically satisfy the three specified dimensional limitations. Additionally, allowance is made for other structural steel H-pile shapes, if they meet the three dimensional limitations. Clarifying language is added as a new Section 1810.3.5.3.2 permitting the three dimensional limitations to be applied to fully welded steel piles fabricated from plates. Finally, Section 1810.3.5.3.3 is introduced for structural steel sheet piling requiring that the profiles conform to manufacturer's specifications and the general requirements in ASTM A 6.

Chapter 35 of this proposal adopts the latest edition of ASTM A 6 into Chapter 35.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

S187-12

	Assembly:	ASF	AMF	DF

1810.3.2.3-S-MANLEY.doc

S188–12
1810.3.2.5

Proponent: Mark Gilligan, P.E., S.E., representing self (mark@gilligan.name)

Revise as follows:

1810.3.2.5 Protection of materials. Where boring records or site conditions indicate possible deleterious action on the materials used in deep foundation elements because of soil constituents, changing water levels or other factors, the elements shall be adequately protected by materials, methods or processes *approved* by the *building official*. Protective materials shall be applied to the elements so as not to be rendered ineffective by installation. The effectiveness of such protective measures for the particular purpose shall have been thoroughly established by satisfactory service records or other evidence.

<u>The following protections will be considered to comply with this requirement:</u>

1. <u>Concrete in compliance with Chapters 4 and 7 of ACI 318.</u>
2. <u>Wood piles treated in accordance with Section 1810.3.2.4.1.</u>

Reason: The added language makes it clear that conformance with the listed criteria will satisfy the existing language. The current provision does not provide any objective basis for the building official or engineer to evaluate the protection needed. The proposed criteria are already requirements in the code.

Cost Impact: The code change proposal will not increase the cost of construction.

S188-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1810.3.2.5-S-GILLIGAN.doc

S189–12
1810.3.3.1.2

Proponent: Stephen Kerr, S.E., Josephson Werdowatz and Associates, representing Structural Engineers Association of California (SEAOC) (skerr@jwa-se.com)

Revise as follows:

1810.3.3.1.2 Load tests. ~~Where design compressive loads are greater than those determined using the allowable stresses specified in Section 1810.3.2.6,~~ Where the design load for any deep foundation element is in doubt, or where cast-in-place deep foundation elements have an enlarged base formed either by compacting concrete or by driving a precast base, control test elements shall be tested in accordance with ASTM D 1143 or ASTM D 4945. At least one element shall be load tested in each area of uniform subsoil conditions. Where required by the *building official*, additional elements shall be load tested where necessary to establish the safe design capacity. The resulting allowable loads shall not be more than one-half of the ultimate axial load capacity of the test element as assessed by one of the published methods listed in Section 1810.3.3.1.3 with consideration for the test type, duration and subsoil. The ultimate axial load capacity shall be determined ~~by a *registered design professional*~~ with consideration given to tolerable total and differential settlements at design load in accordance with Section 1810.2.3. In subsequent installation of the balance of deep foundation elements, all elements shall be deemed to have a supporting capacity equal to that of the control element where <u>all of the following are satisfied:</u>

1. ~~such~~ Elements are of the same type, size and relative length as the test element;
2. <u>Elements</u> are installed using the same or comparable methods and equipment as the test element;
3. <u>Elements</u> are installed in similar subsoil conditions as the test element; ~~and,~~
4. For driven elements, where the rate of penetration (e.g., net displacement per blow) of such elements is equal to or less than that of the test element driven with the same hammer through a comparable driving distance.

Reason: This section addresses capacity of the soil or of the soil to foundation element transfer and thus the tests are not appropriate to evaluate the structural capacity of the deep foundation element. Thus the reference to Section 1810.3.2.6 is not appropriate.

Reference to registered design professional is deleted because it is redundant.

The last sentence of the last paragraph has been reorganized to make it more readable.

Cost Impact: The code change proposal will not increase the cost of construction.

S189-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1810.3.3.1.2-S-KERR.doc

S190–12
1810.3.3.1.6

Proponent: Lori A. Simpson, P.E., GE, Treadwell & Rollo, a Langan Company, representing Deep Foundations Institute

Revise as follows:

1810.3.3.1.6 Uplift capacity of grouped deep foundation elements. For grouped deep foundation elements subjected to uplift, the allowable working uplift load for the group shall be calculated by an *approved* method of analysis. Where the deep foundation elements in the group are placed at a center-to-center spacing ~~of at least 2.5~~ less than three times the least horizontal dimension of the largest single element, the allowable working uplift load for the group is permitted to be calculated as the lesser of:

1. The proposed individual allowable working uplift ~~working~~ load times the number of elements in the group.
2. Two-thirds of the effective weight of the group and the soil contained within a block defined by the perimeter of the group and the length of the element, plus two-thirds of the ultimate shear resistance long the soil block.

Reason: A period is added because there was a run on sentence which rendered the section unclear. Also, the spacing is clarified to be consistent with Section 1810.2.5. Section 1810.3.3.1.6 had defined the need to evaluate group effects where spacing is at least 2.5 times the least horizontal dimension, but did not define a maximum spacing at which group effects did not need to be evaluated. The minimum spacing for evaluation of group effects on uplift capacity is not appropriate. Section 1810.2.5 says that group effects only need to be evaluated where the spacing is less than 3 times the least horizontal dimension, so that is repeated herein for consistency.

Cost Impact: The code change proposal will not increase the cost of construction.

1810.4.12-S-GILLIGAN.doc

S192–12
1810.4.3

Proponent: Stephen Kerr, S.E., Josephson Werdowatz and Associates, representing Structural Engineers Association of California (SEAOC) (skerr@jwa-se.com)

Revise as follows:

1810.4.3 Location plan. A plan showing the location and designation of deep foundation elements by an identification system shall be ~~filed with the *building official*~~ prepared prior to installation of such elements. The location plan shall be submitted with the special inspection report prepared for deep foundation elements. Detailed records for elements shall bear an identification corresponding to that shown on the plan.

Reason: Since the purpose of the location plan is to allow interpretation of the inspection reports, the location plan should be provided with the special inspection report.

Cost Impact: The code change proposal will not increase the cost of construction.

S192-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1810.4.3-S-KERR.doc

S193–12
1901.3

Proponent: Matthew Senecal, P.E., representing American Concrete Institute (ACI)

Revise as follows:

1901.3 Construction documents. The *construction documents* for structural concrete construction shall include:

1. The specified compressive strength of concrete at the stated ages or stages of construction for which each concrete element is designed.
2. The specified strength or grade of reinforcement.
3. The size and location of structural elements, reinforcement, embeds, and anchors.
4. Provision for dimensional changes resulting from creep, shrinkage and temperature.
5. The magnitude and location of prestressing forces.
6. Anchorage length of reinforcement and location and length of lap splices.
7. Type and location of mechanical and welded splices of reinforcement.
8. Details and location of contraction or isolation joints specified for plain concrete.
9. Minimum concrete compressive strength at time of posttensioning.
10. Stressing sequence for post-tensioning tendons.
11. ~~For structures assigned to *Seismic Design Category* D, E or F,~~ A statement if slab on grade is designed as a structural diaphragm.
12. Protective coatings and systems of reinforcement.
13. Post-installed anchor installation requirement.
14. Concrete cover to reinforcement, embedments, and anchors.
15. Tolerances on cover, reinforcement placement, and dimensions of structural elements.
16. Concrete exposure category and class as defined in 1904.

Reason: This requirement is similar to 1.2.1 in ACI 318-11. It is provided here as a checklist for the building code official. ACI 318 does, however, have a few more mandatory items specified in other parts of the code. This amendment addresses those additional items.

Item 11 was adjusted for all structures. It is important that all parties, present and future, know if the slab serves an essential structural purpose. This is independent of whether seismic loads are predominating or not.

Cost Impact: The code change proposal will not increase the cost of construction.

S193-11

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1901.3-S-SENECAL

S194–12
1901.3

Proponent: Stephen V. Skalko, Portland Cement Association

Delete without substitution:

~~**1901.3 Construction documents.** The *construction documents* for structural concrete construction shall include:~~

1. ~~The specified compressive strength of concrete at the stated ages or stages of construction for which each concrete element is designed.~~
2. ~~The specified strength or grade of reinforcement.~~
3. ~~The size and location of structural elements, reinforcement and anchors.~~
4. ~~Provision for dimensional changes resulting from creep, shrinkage and temperature.~~
5. ~~The magnitude and location of prestressing forces.~~
6. ~~Anchorage length of reinforcement and location and length of lap splices.~~
7. ~~Type and location of mechanical and welded splices of reinforcement.~~
8. ~~Details and location of contraction or isolation joints specified for plain concrete.~~
9. ~~Minimum concrete compressive strength at time of posttensioning.~~
10. ~~Stressing sequence for post-tensioning tendons.~~
11. ~~For structures assigned to *Seismic Design Category* D, E or F, a statement if slab on grade is designed as a structural diaphragm.~~

Reason: There are three reasons this code change is needed to modify Chapter 19 “Concrete” of the *International Building Code* (IBC):

1. This proposal eliminates duplications between the IBC and ACI 318. ACI 318 already addresses the requirements for construction documents in Chapter 1.
2. Changes to requirements for construction documents in ACI 318 will not conflict with a separate list in the IBC
3. The list in the IBC is only a partial listing of the requirements in ACI 318 suggesting that the other requirements for reporting information in construction documents in accordance with ACI 318 are not necessary.

Cost Impact: The code change proposal will not increase the cost of construction.

S194-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1901.3-S-SKALKO.doc

S195–12
1903.1, 1903.2, 1903.3

Proponent: Stephen V. Skalko, Portland Cement Association

Revise as follows:

~~**1903.1 General.** Materials used to produce concrete, concrete itself and testing thereof shall comply with the applicable standards listed in ACI 318. *Where required, special inspections and tests shall be in accordance with Chapter 17.*~~

~~1903.2~~ 1903.1 Glass fiber reinforced concrete. *Glass fiber reinforced concrete (GFRC) and the materials used in such concrete shall be in accordance with the PCI MNL 128 standard.*

~~1903.3~~ 1903.2 Flat wall insulating concrete form (ICF) systems. *Insulating concrete form material used for forming flat concrete walls shall conform to ASTM E 2634*.

Reason: "Section 1901.2 Plain and reinforced concrete." already requires that materials and tests be in compliance with ACI 318. This redundancy is not required. Also, provisions of chapter 17 of the code are applicable based on Section 1901.4. The language "Where required, special inspections and tests shall be in accordance with Chapter 17." is unnecessary and is being deleted**.**

Cost Impact: The code change proposal will not increase the cost of construction.

S195-12

1903.1 #1-S-SKALKO.doc

S196–12
1903.1, 1903.2 (NEW), Chapter 35 (NEW)

Proponent: Stephen V. Skalko, Portland Cement Association

Revise as follows:

1903.1 General. Materials used to produce concrete, concrete itself and testing thereof shall comply with the applicable standards listed in ACI 318.

Exception. The following standards as referenced in Chapter 35 shall be permitted to be used.

1. ASTM C 150
2. ASTM C 595
3. ASTM C 1157

1903.2 Special Inspections. *Where required, special inspections and tests shall be in accordance with Chapter 17.*

Add new standards to Chapter 35:

ASTM

C150-12 Specification for Portland Cement

C595-12 Specification for Blended Hydraulic Cement

C1157-11 Standard Performance Specification for Hydraulic Cement

Reason: To update the specifications standards for Portland Cement, Blended Hydraulic Cement, and Hydraulic Cement referenced for use in concrete. Due to the change in the IBC code development cycle, ACI 318-11 may be the edition finally referenced for concrete in IBC 2015. ACI 318-11 references the 2009 editions of C150, C595 and C1157, which would be more than five years out of date by 2015.

ASTM Committee C01 approved modifications included in the most recent editions of these cement standards that are compatible with ACI 318-11 or ACI 318-14 and provide improvements to the standards as follows:

ASTM C150-12

Compared to ASTM C150-09 referenced in ACI 318-11, ASTM C150-12 includes revisions that:

1. Make the air permeability test the default method for determining compliance with specific surface fineness requirements and moves determination by the turbidimetric method to the optional table. This reflects industry practice.
2. Clarification on Type II (MH) moderate heat and moderate sulfate resistant cement heat index requirements, clarification on procedure for determining potential phase (Bogue) composition, and some additional minor improvements. No changes are made to the physical or chemical requirements of C150.

Additionally, compared to ASTM C150-07*a* referenced in IBC 2012 Chapter 35, ASTM C150-12 includes revisions to:

1. Distinguish between organic and inorganic processing additions and include a limit of 5% on inorganic processing additions and 1% on organic processing additions.
2. Modify procedures for determining potential phase composition to account for effect of inorganic processing additions in cement on potential phase composition calculations.
3. Include provisions for a Type II (MH) designation for moderate heat and moderate sulfate resistant cement.
4. Various other minor improvements. Again no changes were made to the physical or chemical requirements of C150 for portland cements.

The variations in product that will result from the use of C150-12 versus C150-07 will not adversely impact the performance of concrete with regard to compliance with ACI 318 or the provisions of the IBC.

C595-12

Compared to C595-09 referenced in ACI 318-11, ASTM C595-12 includes revisions to:

1. Include provisions for a new Type IL portland-limestone blended cement designation for cement containing from 5% to 15% limestone. C595 Type IL has same physical requirements as Type IP and IS (<70), which are also comparable to ASTM C150 physical requirements. Portland-limestone cement provides an alternative for improving the sustainability of concrete.
2. Several clarifications and improvements to the C595 provisions for Type IT ternary blended cements.
3. Clarifications and improvements to C595 naming practice used to identify amount slag, pozzolan or limestone contained in blended cements.

Additionally, compared to C595-08a referenced in IBC 2012 Chapter 35, ASTM C595-12 also includes provisions for Type IT ternary blended cement (cements containing portland cement with either a combination of two different pozzolans, or slag cement and a pozzolan, a pozzolan and a limestone, or a slag cement and a limestone). Ternary blended cements have the same physical requirements as Type IT and Type IS (<70) cements. Ternary blended cements were first introduced in the 2009 edition of ASTM C595.

The variations in product that will result from the use of C595-12 versus C595-08a will not adversely impact the performance of concrete with regard to compliance with ACI 318 or the provisions of the IBC.

ASTM C1157-12

Compared to C1157-09 referenced in ACI 318-11, ASTM C595-12 includes revisions to:

1. Include provisions for distinguishing between air entraining and non air-entraining C1157 cements with appropriate designations and limits consistent with those of ASTM C150 and C595 for air entraining and non air entraining cements.
2. A minor modification to correct the significant figures for minimum strength limits for SI unit values listed in Table 1.

The variations in product that will result from the use of C1157-12 versus C1157-09 will not adversely impact the performance of concrete with regard to compliance with ACI 318 or the provisions of the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

1903.1 #2-S-SKALKO.doc

S197–12
1903.2

Proponent: Matthew Senecal, P.E., representing American Concrete Institute (ACI)

Revise as follows:

1903.2 Glass fiber reinforced concrete. *Glass fiber reinforced concrete (GFRC) and the materials used in ~~such~~ nonstructural precast concrete elements shall be in accordance with the PCI MNL 128 standard.*

Reason: This is a clarification on what concrete elements are covered by PCI MNL 128.

Cost Impact: The code change proposal will not increase the cost of construction.

S197-11

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1903.2-S-SENECAL

S198–12

1903.4 (NEW), Chapter 35 (NEW)

Proponent: James K. Hicks, P.E., Cera Tech, P.E., representing self (jim.hicks@ceratechinc.com)

Add new text as follows:

1903.4 Rapid hardening concrete. Rapid hardening concrete shall be permitted to be produced using hydraulic cement conforming to ASTM C1600.

Add new standard to Chapter 35 as follows:

ASTM

C 1600-11 Standard Specification for Rapid Hardening Hydraulic Cement

Reason: In those instances wherein rapid hardening is desired, cements conforming to ASTM C 1600 Standard Specification for Rapid hardening Hydraulic Cements are generally desirable and useable. ASTM C 1600 can be one of four cement types, General Rapid Hardening (GRH), Moderate Rapid Hardening (MRH), Very Rapid Hardening (VRH) and Ultra Rapid Hardening (URH). C 1600 is a Specification giving numerous performance requirements. Primary characteristics (with inherent increased design flexibility) are:

•Can produce rapid-hardening concrete, precast concrete, block, mortar and grout.
•Depending on the type cement used and the specific mixture, cements meeting ASTM C 1600 can provide either normal, medium or fast time to service (1.5 to 48 h)
•ASTM C 1600 has rigid durability requirements.

ASTM C 1600 cements are used in products such as:

- Materials for Concrete Repairs
- High Strength Grouts
- Precast
- Paving
- Some Cements - Mass Concrete
- Some Cements – Heat Resistant
- Some Cements – Chemical Resistant

In addition to following pertinent ACI and ASTM requirements, users of C 1600 cements must heed manufacturers instructions for use. Specific durability aspects of any given mortar or concrete to be evaluated by the appropriate test method(s).

Cost Impact: Economic cost of the concrete utilizing C 1600 cements while it may be approximately equal or higher when comparing cementitious to cementitious, is typically negligible for the concrete when considering the costs of other ingredients, transport, placement, finishing and curing.
Environmental costs are generally lower with C 1600 cements as fuel use is generally less, or with the case of activated fly ash based cements, no fuel is used and grinding is not required.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

1903.4 (NEW)-HICKS.doc

S199–12

1904.1, 1904.2, Figure 1904.2, Table 1904.2

Proponent: Matthew Senecal, P.E., American Concrete Institute (ACI)

Delete and substitute as follows:

~~**1904.1 Exposure categories and classes.** Concrete shall be assigned to exposure classes in accordance with the durability requirements of ACI 318 based on:~~

1. ~~Exposure to freezing and thawing in a moist condition or deicer chemicals;~~
2. ~~Exposure to sulfates in water or soil;~~
3. ~~Exposure to water where the concrete is intended to have low permeability; and~~
4. ~~Exposure to chlorides from deicing chemicals, salt, saltwater, brackish water, seawater or spray from these sources, where the concrete has steel reinforcement.~~

~~**1904.2 Concrete properties.** Concrete mixtures shall conform to the most restrictive maximum water-cementitious materials ratios, maximum cementitious admixtures, minimum air-entrainment and minimum specified concrete compressive strength requirements of ACI 318 based on the exposure classes assigned in Section 1904.1.~~

> ~~**Exception:** For occupancies and appurtenances thereto in Group R occupancies that are in buildings less than four stories above grade plane, normal-weight aggregate concrete is permitted to comply with the requirements of Table 1904.2 based on the weathering classification (freezing and thawing) determined from Figure 1904.2 in lieu of the durability requirements of ACI 318.~~

~~TABLE 1904.2~~
~~MINIMUM SPECIFIED COMPRESSIVE STRENGTH (f'_c)~~

~~TYPE OR LOCATION OF CONCRETE CONSTRUCTION~~	~~MINIMUM SPECIFIED COMPRESSIVE STRENGTH (f'_c at 28 days, psi)~~		
	~~Negligible exposure~~	~~Moderate exposure~~	~~Severe exposure~~
~~Basement walls[c] and foundations not exposed to the weather~~	~~2,500~~	~~2,500~~	~~2,500[a]~~
~~Basement slabs and interior slabs on grade, except garage floor slabs~~	~~2,500~~	~~2,500~~	~~2,500[a]~~
~~Basement walls[c], foundation walls, exterior walls and other vertical concrete surfaces exposed to the weather~~	~~2,500~~	~~3,000[b]~~	~~3,000[b]~~
~~Driveways, curbs, walks, patios, porches, carport slabs, steps and other flatwork exposed to the weather, and garage floor slabs~~	~~2,500~~	~~3,000[b,d]~~	~~3,500[b,d]~~

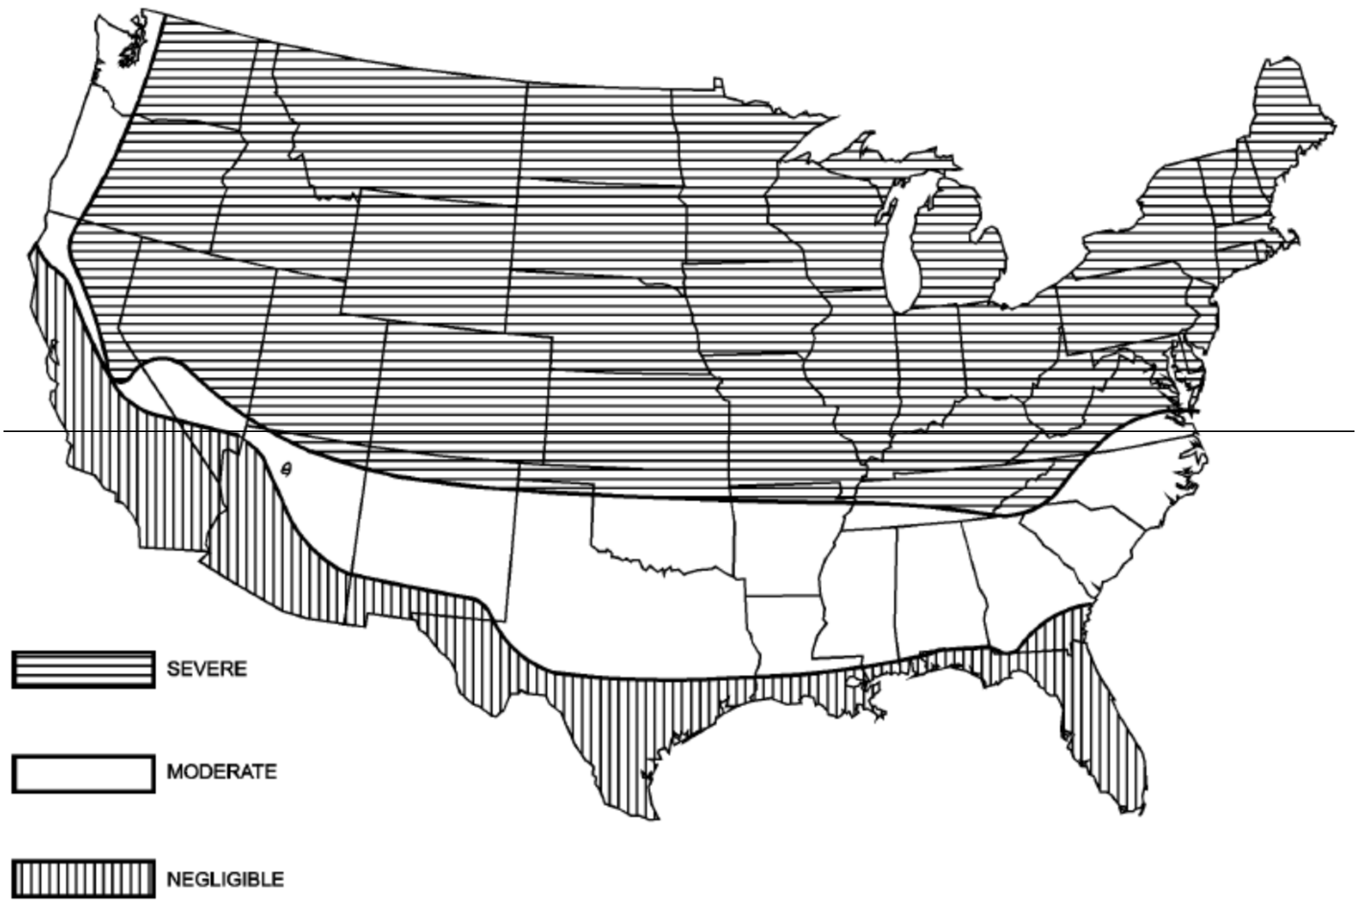
~~For SI: 1 pound per square inch = 0.00689 MPa.~~

a. ~~Concrete in these locations that can be subjected to freezing and thawing during construction shall be of air-entrained concrete in accordance with Section 1904.2.~~

b. ~~Concrete shall be air entrained in accordance with ACI 318.~~

c. ~~Structural plain concrete basement walls are exempt from the requirements for exposure conditions of Section 1904.2.~~

d. ~~For garage floor slabs where a steel trowel finish is used, the total air content required by ACI 318 is permitted to be reduced to not less than 3 percent, provided the minimum specified compressive strength of the concrete is increased to 4,000 psi.~~



~~**FIGURE 1904.2**~~
~~**WEATHERING PROBABILITY MAP FOR CONCRETE[a,b,c]**~~

~~a. Lines defining areas are approximate only. Local areas can be more or less severe than indicated by the region classification.~~
~~b. A "severe" classification is where weather conditions encourage or require the use of deicing chemicals or where there is potential for a continuous presence of moisture during frequent cycles of freezing and thawing. A "moderate" classification is where weather conditions occasionally expose concrete in the presence of moisture to freezing and thawing, but where deicing chemicals are not generally used. A "negligible" classification is where weather conditions rarely expose concrete in the presence of moisture to freezing and thawing.~~
~~c. Alaska and Hawaii are classified as severe and negligible, respectively.~~

1904.1 Structural concrete. Structural concrete shall conform to the durability requirements of ACI 318.

1904.2 Nonstructural concrete. The registered design professional shall assign nonstructural concrete a freeze-thaw exposure class, as defined in ACI 318, based on the anticipated exposure of nonstructural concrete. Nonstructural concrete shall have a minimum specified compressive strength, f'_c, of 2500 psi for Class F0; 3000 psi for Class F1; and 3500 psi for Classes F2 and F3. Nonstructural concrete shall be air entrained in accordance with ACI 318.

Reason: This proposal replaces the weathering probability map with ACI 318's performance requirements; removes the exception for structural concrete; and clarifies the durability requirements for nonstructural concrete.

Probability map: The weathering probability map for concrete can be inaccurate since it is possible to have "severe," "moderate," or "negligible" environments in any of the predefined zones shown on the map. ACI 318 requires the designer to classify concrete into one of the freezing and thawing classes as follows:

F0 – Concrete not exposed to freezing-and-thawing cycles
F1 – Concrete exposed to freezing-and-thawing cycles and occasional exposure to moisture

F2 – Concrete exposed to freezing-and-thawing cycles and in continuous contact with moisture

F3 – Concrete exposed to freezing-and-thawing cycles and in continuous contact with moisture and exposed to deicing chemicals

The concrete classes must be applied by the designer, regardless of geographic location. The commentary to ACI 318 provides further discussion and examples to help the designer determine the appropriate class. It is therefore recommended to remove the map and adopt the ACI 318 approach.

Table: The first and second rows of the table provide limits for interior concrete. Interior concrete is equivalent to Class F0 in ACI 318, which requires a minimum concrete compressive strength of 2500 psi. Therefore, the minimum concrete compressive strength requirements listed in the first two rows are the same as the minimum requirements of ACI 318 and may be removed.

The third row of the table provides an exception for exterior structural concrete walls above or below ground. The exception allows for 3000 psi concrete for any environment other than "negligible" or Class F0. Research[1-2] shows that concrete with a minimum amount of hydrated cement resists the negative effects of freezing and thawing. ACI 318 has determined that 4500 psi concrete provides adequate cement hydration for the range of available concrete mixtures used in construction. It is therefore recommended to remove this exception for structural concrete.

The fourth row of the table states strength limits for exterior nonstructural concrete. ACI 318 does not have durability requirements for nonstructural concrete. Therefore, these limits are not an exception to 318 but a requirement. These limits are simply restated in terms of exposure classes as shown in the revision. The limitation on building category and concrete type have been removed, since this appears to be a misunderstanding of what is required in ACI 318.

References:

1. Klieger, P., 1956, "Curing Requirements for Scale Resistance of Concrete," Highway Research Board Bulletin 150, pp.18-31. (PCA Bulletin 82)

Cost Impact: The code change proposal may increase the cost of construction for structural concrete but decrease the cost for nonstructural concrete. By changing the requirement from geometric location to performance criteria, the cost will increase or decrease depending on location and exposure.

S199-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1904.1 (NEW)-S-SENECAL

S200–12
1904, 1904.1, 1904.2, Table 1904.2, Figure 1904.2

Proponent: Stephen V. Skalko, Portland Cement Association

Delete without substitution:

~~**SECTION 1904**~~
~~**DURABILITY REQUIREMENTS**~~

~~**1904.1 Exposure categories and classes.** Concrete shall be assigned to exposure classes in accordance with the durability requirements of ACI 318 based on:~~

1. ~~Exposure to freezing and thawing in a moist condition or deicer chemicals;~~
2. ~~Exposure to sulfates in water or soil;~~
3. ~~Exposure to water where the concrete is intended to have low permeability; and~~
4. ~~Exposure to chlorides from deicing chemicals, salt, saltwater, brackish water, seawater or spray from these sources, where the concrete has steel reinforcement.~~

~~**1904.2 Concrete properties.** Concrete mixtures shall conform to the most restrictive maximum water-cementitious materials ratios, maximum cementitious admixtures, minimum air-entrainment and minimum specified concrete compressive strength requirements of ACI 318 based on the exposure classes assigned in Section 1904.1.~~

> ~~**Exception:** For occupancies and appurtenances thereto in Group R occupancies that are in buildings less than four stories above grade plane, normal-weight aggregate concrete is permitted to comply with the requirements of Table 1904.2 based on the weathering classification (freezing and thawing) determined from Figure 1904.2 in lieu of the durability requirements of ACI 318.~~

~~**TABLE 1904.2**~~
~~**MINIMUM SPECIFIED COMPRESSIVE STRENGTH (f'_c)**~~

~~**FIGURE 1904.2**~~
~~**WEATHERING PROBABILITY MAP FOR CONCRETE[a, b, c]**~~

Reason: There are three reasons that support this code change intended to modify Chapter 19 "Concrete" of the *International Building Code* (IBC):

1. This proposal removes redundancies in language and reference to specific sections of ACI 318. Such redundancies are not necessary and may be detrimental in that they may cause confusion and result in errors. The introductory section of Chapter 19, "1901.2 Plain and reinforced concrete" adequately and appropriately requires compliance with ACI 318.
2. Current language and approaches referenced in the IBC are inconsistent with both the methods for classifying exposure and the requirements for concrete based on the various exposures. Exposures are no longer limited to freeze-thaw durability and weathering. The new criteria in ACI 318 address freezing and thawing, sulfate, low permeability and corrosion protection. The weathering probability map in no way reflects the problems associated with sulfate exposure. The map puts areas that have the potential for high sulfate exposure into the negligible category.
3. It is clearly not the intent of ACI 318 to have provisions that are only applicable to certain structures. ACI 318 has been developed and is intended for use in such a manner that all provisions are applicable for all structural concrete regardless of occupancy. All provisions of ACI 318 are applicable to all structural concrete regardless of occupancy.

Cost Impact: The code change proposal will not increase the cost of construction.

S201–12
202, 1901.2, 1902, 1905.1 thru 1905.1.10, 1906.1

Proponent: Stephen V. Skalko, P.E., Portland Cement Association

Add new text as follows:

SECTION 202
DEFINITIONS

WALL PIER. A wall segment with a horizontal length-to-thickness ratio of at least 2.5, but not to exceed 6, whose clear height is at least two times its horizontal length.

Revise as follows:

1901.2 Plain and reinforced concrete. Structural concrete shall be designed and constructed in accordance with the requirements of this chapter and ACI 318 ~~as amended in Section 1905 of this code~~. Except for the provisions of Sections 1904 and 1907, the design and construction of slabs on grade shall not be governed by this chapter unless they transmit vertical loads or lateral forces from other parts of the structure to the soil.

~~**1902.1 General.** The words and terms defined in ACI 318 shall, for the purposes of this chapter and as used elsewhere in this code for concrete construction, have the meanings shown in ACI 318 as modified by Section 1905.1.1.~~

~~**1905.1 General.** The text of ACI 318 shall be modified as indicated in Sections 1905.1.1 through 1905.1.10.~~

~~**1905.1.1 ACI 318, Section 2.2.** Modify existing definitions and add the following definitions to ACI 318, Section 2.2.~~

~~**DESIGN DISPLACEMENT.** Total lateral displacement expected for the design-basis earthquake, *as specified by Section 12.8.6 of ASCE 7.*~~

~~***DETAILED PLAIN CONCRETE STRUCTURAL WALL.*** *A wall complying with the requirements of Chapter 22, including 22.6.7.*~~

~~***ORDINARY PRECAST STRUCTURAL WALL.*** *A precast wall complying with the requirements of Chapters 1 through 18.*~~

~~**ORDINARY REINFORCED CONCRETE STRUCTURAL WALL.** A *cast-in-place* wall complying with the requirements of Chapters 1 through 18.~~

~~**ORDINARY STRUCTURAL PLAIN CONCRETE WALL.** A wall complying with the requirements of Chapter 22, *excluding 22.6.7*.~~

~~**SPECIAL STRUCTURAL WALL**. A cast-in-place or precast wall complying with the requirements of 21.1.3 through 21.1.7, 21.9 and 21.10, as applicable, in addition to the requirements for ordinary reinforced concrete structural walls *or ordinary precast structural walls, as applicable. Where ASCE 7 refers to a "special reinforced concrete structural wall," it shall be deemed to mean a "special structural wall."*~~

~~***WALL PIER.*** *A wall segment with a horizontal length-to thickness ratio of at least 2.5, but not exceeding 6, whose clear height is at least two times its horizontal length.*~~

~~**1905.1.2 ACI 318, Section 21.1.1.**~~
~~**1905.1.3 ACI 318, Section 21.4.**~~
~~**1905.1.4 ACI 318, Section 21.9.**~~
~~**1905.1.5 ACI 318, Section 21.10.**~~
~~**1905.1.6 ACI 318, Section 21.12.1.1.**~~
~~**1905.1.7 ACI 318, Section 22.6.**~~
~~**1905.1.8 ACI 318, Section 22.10.**~~
~~**1905.1.9 ACI 318, Section D.3.3.**~~
~~**1905.1.10 ACI 318, Section D.4.2.2.**~~

1906.1 Scope. The design and construction of structural plain concrete, both cast-in-place and precast, shall comply with the minimum requirements of ACI 318~~, as modified in Section 1905~~.

> **Exception:** For Group R-3 occupancies and buildings of other occupancies less than two stories above grade plane of light-frame construction, the required footing thickness of ACI 318 is permitted to be reduced to 6 inches (152 mm), provided that the footing does not extend more than 4 inches (102 mm) on either side of the supported wall.

Reason: There are four main reasons in support of this code change intended as modifications of Chapter 19 "Concrete" of the *International Building Code* (IBC):

1) The requirements and modifications that currently appear in Section 1905 of the 2012 edition of the IBC have been appropriately considered via an ANSI accredited standards development process. Modifications to ACI 318 in the IBC are unnecessary.
2) The proposal removes redundancies in definitions of ACI 318. Such redundancies are not necessary and may be detrimental in that they may cause confusion and result in errors. The introductory section of Chapter 19, "1901.2 Plain and reinforced concrete" adequately and appropriately requires compliance with ACI 318.
3) This proposal improves the consistency of this chapter with other chapters of the IBC such as Chapter 20 which simply states: "Aluminum used for structural purposes in buildings and structures shall comply with AA ASM 35 and AA ADM 1. The nominal loads shall be the minimum design loads required by Chapter 16."
4) If the chapters and sections in whatever edition of ACI 318 that becomes referenced in the 2015 edition of the IBC are not properly coordinated, there will be confusion and will increase the potential for errors in design and construction.

In addition to these general reasons specific additional reasons are provided for each part:

Section 1902.1in the IBC simply directs the user to the appropriate sections of ACI 318 which are already mandated in Section 1901.2. This deletes redundant language.

Section 1905

- "Design displacement" is adequately and appropriately defined in ACI 318.
- Current definition of "Detailed plain concrete structural wall" is not a definition and inappropriately sets design and construction criteria in a definition. Further if the wall is in compliance with Chapter 22 then it is also in compliance with Section 22.6.7 and the redundancy is not necessary.
- Current definition of "Ordinary precast structural wall" is not a definition and inappropriately sets design and construction criteria in a definition.
- Current definition of "Ordinary reinforced concrete structural wall" is not a definition and inappropriately sets design and construction criteria in a definition.
- Current definition of "Ordinary structural plain concrete wall" is not a definition and inappropriately sets design and construction criteria in a definition.
- Current definition of "Special structural wall" is not a definition and inappropriately sets design and construction criteria in a definition. This definition also further modifies the definitions in ASCE 7 increasing confusing.

Wall pier

- The definition of "Wall pier" is not specific to concrete and should be included in Chapter 2.

Section 1905.1.2 thru 1905.1.10

Most of the current sections in the IBC simply direct the user to the appropriate sections of ACI 318 which are already mandated in Section 1901.2. In addition, these provisions have been addressed by the ACI 318 Committee.

Cost Impact: The code change proposal will not increase the cost of construction.

S202–12

1905.1.1, 1905.1.3, 1905.1.4, 1905.1.9, 1905.1.10

Proponent: Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing self (pbrazil@reidmiddleton.com)

Revise as follows:

1905.1.1 ACI 318, Section 2.2. Modify existing definitions and add the following definitions to ACI 318, Section 2.2.

DESIGN DISPLACEMENT. Total lateral displacement expected for the design-basis earthquake, *as specified by Section 12.8.6 of ASCE 7.*

DETAILED PLAIN CONCRETE STRUCTURAL WALL. *A wall complying with the requirements of Chapter 22, including 22.6.7.*

ORDINARY PRECAST STRUCTURAL WALL. *A precast wall complying with the requirements of Chapters 1 through 18.*

ORDINARY REINFORCED CONCRETE STRUCTURAL WALL. A *cast-in-place* wall complying with the requirements of Chapters 1 through 18.

ORDINARY STRUCTURAL PLAIN CONCRETE WALL. A wall complying with the requirements of Chapter 22, *excluding 22.6.7*.

SPECIAL STRUCTURAL WALL. A cast-in-place or precast wall complying with the requirements of 21.1.3 through 21.1.7, 21.9 and 21.10, as applicable, in addition to the requirements for ordinary reinforced concrete structural walls *or ordinary precast structural walls, as applicable*. *Where ASCE 7 refers to a "special reinforced concrete structural wall," it shall be deemed to mean a "special structural wall."*

~~***WALL PIER.*** *A wall segment with a horizontal length-to-thickness ratio of at least 2.5, but not exceeding 6, whose clear height is at least two times its horizontal length.*~~

1905.1.3 ACI 318, Section 21.4. Modify ACI 318, Section 21.4, by renumbering Section 21.4.3 to become 21.4.4 and adding new Sections 21.4.3, ~~21.4.5, 21.4.6 and 21.4.7~~ to read as follows:

21.4.3 - Connections that are designed to yield shall be capable of maintaining 80 percent of their design strength at the deformation induced by the design displacement or shall use Type 2 mechanical splices.
21.4.4 - Elements of the connection that are not designed to yield shall develop at least 1.5 *Sy*.
~~*21.4.5 - Wall piers in Seismic Design Category D, E or F shall comply with Section 1905.1.4 of the International Building Code.*~~
~~*21.4.6 - Wall piers not designed as part of a moment frame in buildings assigned to Seismic Design Category C shall have transverse reinforcement designed to resist the shear forces determined from 21.3.3. Spacing of transverse reinforcement shall not exceed 8 inches (203 mm). Transverse reinforcement shall be extended beyond the pier clear height for at least 12 inches (305 mm).*~~

~~***Exceptions:***~~

1. ~~*Wall piers that satisfy 21.13.*~~
2. ~~*Wall piers along a wall line within a story where other shear wall segments provide lateral support to the wall piers and such segments have a total stiffness of at least six times the sum of the stiffnesses of all the wall piers.*~~

~~*21.4.7 - Wall segments with a horizontal length-to-thickness ratio less than 2.5 shall be designed as columns.*~~

~~**1905.1.4 ACI 318, Section 21.9.** Modify ACI 318, Section 21.9, by deleting Section 21.9.8 and replacing with the following:~~

~~*21.9.8 - Wall piers and wall segments.*~~
~~*21.9.8.1 - Wall piers not designed as a part of a special moment frame shall have transverse reinforcement designed to satisfy the requirements in 21.9.8.2.*~~

~~***Exceptions:***~~

1. ~~*Wall piers that satisfy 21.13.*~~
2. ~~*Wall piers along a wall line within a story where other shear wall segments provide lateral support to the wall piers and such segment have a total stiffness of at least six times the sum of the stiffnesses of all the wall piers.*~~

~~*21.9.8.2 - Transverse reinforcement with seismic hooks at both ends shall be designed to resist the shear forces determined from 21.6.5.1. Spacing of transverse reinforcement shall not exceed 6 inches (152 mm). Transverse reinforcement shall be extended beyond the pier clear height for at least 12 inches (305 mm).*~~
~~*21.9.8.3 - Wall segments with a horizontal length-to-thickness ratio less than 2.5 shall be designed as columns.*~~

~~**1905.1.9 ACI 318, Section D.3.3.** Delete ACI 318 Sections D.3.3.4 through D.3.3.7 and replace with the following:~~

~~*D.3.3.4 - The anchor design strength associated with concrete failure modes shall be taken as 0.75∅N_n and 0.75∅V_n, where ∅ is given in D4.3 or D4.4 and N_n and V_n are deteremined in accordance with D5.2, D5.3, D5.4, D6.2 and D6.3, assuming the concrete is cracked unless it can be demonstrated that the concrete remains uncracked.*~~
~~*D.3.3.5 - Anchors shall be designed to be governed by the steel strength of a ductile steel element as determined in accordance with D.5.1 and D.6.1, unless either D.3.3.6 or D.3.3.7 is satisfied.*~~

~~***Exceptions:***~~

1. ~~*Anchors designed to resist wall out-of-plane forces with design strengths equal to or greater than the force determined in accordance with ASCE 7 Equation 12.11-1 or 12.14-10 need not satisfy* Section D.3.3.5.~~
2. ~~*D.3.3.5 need not apply and the design shear strength in accordance with D.6.2.1(c) need not be computed for anchor bolts attaching wood sill plates of bearing or non-bearing walls of light-frame wood structures to foundations or foundation stem walls provided all of the following are satisfied:*~~
   - ~~*2.1. The allowable in-plane shear strength of the anchor is determined in accordance with AF&PA NDS Table 11E for lateral design values parallel to grain.*~~
   - ~~*2.2 The maximum anchor nominal diameter is 5/8 inches (16 mm).*~~
   - ~~*2.3. Anchor bolts are embedded into concrete a minimum of 7 inches (178 mm).*~~
   - ~~*2.4. Anchor bolts are located a minimum of 13/4 inches (45 mm) from the edge of the concrete parallel to the length of the wood sill plate.*~~
   - ~~*2.5. Anchor bolts are located a minimum of 15 anchor diameters from the edge of the concrete perpendicular to the length of the wood sill plate.*~~
   - ~~*2.6. The sill plate is 2-inch or 3-inch nominal thickness.*~~
3. ~~*Section D.3.3.5 need not apply and the design shear strength in accordance with Section*~~

~~*D.6.2.1(c) need not be computed for anchor bolts attaching cold-formed steel track of bearing or non-bearing walls of light-frame construction to foundations or foundation stem walls provided all of the following are satisfied:*~~

~~*3.1. The maximum anchor nominal diameter is 5/8 inches (16 mm).*~~
~~*3.2. Anchors are embedded into concrete a minimum of 7 inches (178 mm).*~~
~~*3.3. Anchors are located a minimum of 13/4 inches (45 mm) from the edge of the concrete parallel to the length of the track.*~~
~~*3.4. Anchors are located a minimum of 15 anchor diameters from the edge of the concrete perpendicular to the length of the track.*~~
~~*3.5. The track is 33 to 68 mil designation thickness.*~~

~~*Allowable in-plane shear strength of exempt anchors, parallel to the edge of concrete shall be permitted to be determined in accordance with AISI S100 Section E3.3.1.*~~

~~*4. In light-frame construction, design of anchors in concrete shall be permitted to satisfy D.3.3.8.*~~

~~*D.3.3.6 - Instead of D.3.3.5, the attachment that the anchor is connecting to the structure shall be designed so that the attachment will undergo ductile yielding at a force level corresponding to anchor forces no greater than the design strength of anchors specified in D.3.3.4.*~~

~~***Exceptions:***~~

~~*1. Anchors in concrete designed to support nonstructural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section D.3.3.6.*~~
~~*2. Anchors designed to resist wall out-of-plane forces with design strengths equal to or greater than the force determined in accordance with ASCE 7 Equation 12.11-1 or 12.14-10 need not satisfy Section D.3.3.6.*~~

~~*D.3.3.7 - As an alternative to D.3.3.5 and D.3.3.6, it shall be permitted to take the design strength of the anchors as 0.4 times the design strength determined in accordance with D.3.3.4.*~~
~~*D.3.3.8 – In light-frame construction, bearing or nonbearing walls, shear strength of concrete anchors less than or equal to 1 inch [25 mm] in diameter of sill plate or track to foundation or foundation stem wall need not satisfy D.3.3.7 when the design strength of the anchors is determined in accordance with D.6.2.1(c).*~~

~~**1905.1.10 ACI 318, Section D.4.2.2.** Delete ACI 318, Section D.4.2.2, and replace with the following:~~

~~*D.4.2.2 - The concrete breakout strength requirements for anchors in tension shall be considered satisfied by the design procedure of D.5.2 provided Equation D-7 is not used for anchor embedments exceeding 25 inches. The concrete breakout strength requirements for anchors in shear with diameters not exceeding 2 inches shall be considered satisfied by the design procedure of D.6.2. For anchors in shear with diameters exceeding 2 inches, shear anchor reinforcement shall be provided in accordance with the procedures of D.6.2.9.*~~

Reason: The purpose for this proposal is to update the 2012 IBC for consistency with ACI 318-11 and as explained below.

1. In IBC Section 1905.1.1, the definition of "wall pier" is deleted because of the definition of "wall pier" in Section 2.2 of ACI 318-11.
2. In IBC Section 1905.1.3, Sections 21.4.5 through 21.4.7 are deleted because of Section 21.4.4 of ACI 318-11, which reads: "In structures assigned to SDC D, E or F, wall piers shall be designed in accordance with 21.9 or 21.13."
3. IBC Section 1905.1.4 is deleted because of Section 21.9.8 of ACI 318-11, which specifies requirements for wall piers.
4. IBC Section 1905.1.9 is deleted because of Sections D.3.3.4 through D.3.5 of ACI 318-11, which specify seismic design requirements for anchors in structures that are substantially revised from the corresponding provisions in Sections D.3.3.3 through D.3.3.6 of ACI 318-08.
5. IBC Section 1905.1.10 is deleted because of Sections D.4.2.2 and D.4.3 of ACI 318-11, which specify requirements for concrete breakout strength and bond strength that are substantially revised from the corresponding provisions in Section D.4.2.2 of ACI 318-08.

Cost Impact: The code change proposal will not increase the cost of construction.

S203–12
1905.1, 1905.1.1, 1905.1.3, 1905.1.4

Proponent: Matthew Senecal, P.E., American Concrete Institute (ACI)

Revise as follows:

1905.1 General. The text of ACI 318 shall be modified as indicated in Sections 1905.1.1 through ~~1905.1.10~~ 1905.1.9.

~~***WALL PIER.*** *A wall segment with a horizontal length-tothickness ratio of at least 2.5, but not exceeding 6, whose clear height is at least two times its horizontal length.*~~

1905.1.3 ACI 318, Section 21.4. Modify ACI 318, Section 21.4, by adding new Section 21.4.3 and renumbering existing Section 21.4.3 to become 21.4.4. ~~and adding new Sections 21.4.3, 21.4.5, 21.4.6 and 21.4.7 to read as follows:~~

> *21.4.3 - Connections that are designed to yield shall be capable of maintaining 80 percent of their design strength at the deformation induced by the design displacement or shall use Type 2 mechanical splices.*
>
> 21.4.4 - Elements of the connection that are not designed to yield shall develop at least 1.5 $S_{y.}$
>
> ~~*21.4.5 - Wall piers in Seismic Design Category D, E or F shall comply with Section 1905.1.4 of the International Building Code.*~~
>
> ~~*21.4.6 - Wall piers not designed as part of a moment frame in buildings assigned to Seismic Design Category C shall have transverse reinforcement designed to resist the shear forces determined from 21.3.3. Spacing of transverse reinforcement shall not exceed 8 inches (203 mm). Transverse reinforcement shall be extended beyond the pier clear height for at least 12 inches (305 mm).*~~
>
> ~~***Exceptions:***~~
>
> 1. ~~*Wall piers that satisfy 21.13.*~~
> 2. ~~*Wall piers along a wall line within a story where other shear wall segments provide lateral support to the wall piers and such segments have a total stiffness of at least six times the sum of the stiffnesses of all the wall piers.*~~
>
> ~~*21.4.7 - Wall segments with a horizontal length-to thickness ratio less than 2.5 shall be designed as columns.*~~

~~**1905.1.4 ACI 318, Section 21.9.** Modify ACI 318, Section 21.9, by deleting Section 21.9.8 and replacing with the following:~~

> ~~*21.9.8 - Wall piers and wall segments.*~~
>
> ~~*21.9.8.1 - Wall piers not designed as a part of a special moment frame shall have transverse reinforcement designed to satisfy the requirements in 21.9.8.2.*~~
>
> ~~***Exceptions:***~~
>
> 1. ~~*Wall piers that satisfy 21.13.*~~
> 2. ~~*Wall piers along a wall line within a story where other shear wall segments provide lateral support to the wall piers and such segments have a total stiffness of at least six times the sum of the stiffnesses of all the wall piers.*~~

~~21.9.8.2 - Transverse reinforcement with seismic hooks at both ends shall be designed to resist the shear forces determined from 21.6.5.1. Spacing of transverse reinforcement shall not exceed 6 inches (152 mm). Transverse reinforcement shall be extended beyond the pier clear height for at least 12 inches (305 mm).~~

~~21.9.8.3 - Wall segments with a horizontal length-to thickness ratio less than 2.5 shall be designed as columns.~~

Reason: This proposal removes the requirements for wall piers. Wall pier requirements are in 1905 because ACI 318-08 did not address the design of this component. ACI 318 incorporated wall pier design in the 2011 edition. Therefore, these amendments should now be removed.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Stephen V. Skalko, Portland Cement Association

Revise as follows:

SECTION 1905
~~MODIFICATIONS TO ACI 318~~ SEISMIC DESIGN OF STRUCTURAL CONCRETE

1905.1 General. ~~The text of~~ Concrete shall be designed and constructed in accordance with ACI 318 ~~shall be modified as indicated in~~ and Sections 1905.1.1 through 1905.1.10.

1905.1.1 ~~ACI 318, Section 2.2~~ Definitions. ~~Modify existing definitions and add the following definitions to ACI 318, Section 2.2.~~ The following definitions shall apply:

DESIGN DISPLACEMENT. Total lateral displacement expected for the design-basis earthquake, *as specified by Section 12.8.6 of ASCE 7.*

~~***DETAILED PLAIN CONCRETE STRUCTURAL WALL.*** *A wall complying with the requirements of Chapter 22, including 22.6.7.*~~

~~***ORDINARY PRECAST STRUCTURAL WALL.*** *A precast wall complying with the requirements of Chapters 1 through 18.*~~

~~**ORDINARY REINFORCED CONCRETE STRUCTURAL WALL.** A *cast-in-place* wall complying with the requirements of Chapters 1 through 18.~~

~~**ORDINARY STRUCTURAL PLAIN CONCRETE WALL.** A wall complying with the requirements of Chapter 22, *excluding 22.6.7*.~~

~~**SPECIAL STRUCTURAL WALL**. A cast-in-place or precast wall complying with the requirements of 21.1.3 through 21.1.7, 21.9 and 21.10, as applicable, in addition to the requirements for ordinary reinforced concrete structural walls *or ordinary precast structural walls, as applicable. Where ASCE 7 refers to a "special reinforced concrete structural wall," it shall be deemed to mean a "special structural all."*~~

WALL PIER. *A wall segment with a horizontal length-to-thickness ratio of at least 2.5, but not exceeding 6, whose clear height is at least two times its horizontal length.*

1905.1.2 Structural concrete assemblies. Structural concrete assemblies described shall comply with the requirements of this Section.

1905.1.2.1 Detailed plain concrete structural wall. Detailed plain concrete structural walls shall comply with the requirements of ACI 318 Chapter 22 including Section 22.6.7, and the applicable requirements of Sections 1905.3 through 1905.11.

1905.1.2.2 Ordinary precast structural wall. -Ordinary precast structural walls shall comply with the requirements of ACI 318 Chapters 1 through 18 and the applicable requirements of Sections 1905.3 through 1905.11.

1905.1.2.3 Ordinary reinforced concrete structural wall. A cast-in-place ordinary reinforced concrete structural wall comply with the requirements of ACI 318 Chapters 1 through 18 and the applicable requirements of Sections 1905.3 through 1905.11.

1905.1.2.4 Ordinary structural plain concrete wall. Ordinary structural plain concrete walls shall comply with the requirements of ACI 318 Chapter 22, excluding 22.6.7 and the applicable requirement of Sections 1905.3 through 1905.11.

1905.1.2.5 Special structural wall. Special structural walls made of cast-in-place or precast concrete shall comply with the applicable requirements of ACI 318 Sections 21.1.3 through 21.1.7, 21.1.9, and 21.1.10 and Sections 1905.3 through 1905.11 and the requirements for ordinary reinforced concrete structural walls *or ordinary precast structural walls, as applicable. Where ASCE 7 refers to a "special reinforced concrete structural wall," it shall be deemed to mean a "special structural wall."*

~~**1905.1.2 ACI 318, Section 21.1.1 .** Modify ACI 318 Sections 21.1.1.3 and 21.1.1.7 to read as follows:~~
1905.1.3 Requirements for structures based on assigned Seismic Design Categories. The requirements of this section shall apply for the assigned Seismic Design Category.

1905.1.3.1 Provisions of ACI 318. The provisions of ACI 318 Sections 21.1.1.3 and Section 21.1.1.7 shall not apply.

~~*21.1.1.3 –*~~ **1905.1.3.2 Structures assigned to Seismic Design Category A.** Structures assigned to Seismic Design Category A shall satisfy requirements of ACI 318 Chapters 1 to 19 and 22 and the requirements of ACI *Chapter 21 ~~does~~ shall not apply*.

1905.1.3.3 Structures assigned to Seismic Design Category B, C, D, E or F. Structures assigned to *Seismic Design Category* B, C, D, E or F ~~also~~ shall satisfy 21.1.1.4 through 21.1.1.8, as applicable.

1905.1.3.4 Structural elements of plain concrete. ~~*Except for structural elements of plain concrete complying with Section 1905.1.8 of the International Building Code,*~~ *Structural elements of plain concrete are prohibited in structures assigned to Seismic Design Category C, D, E or F.*

Exception: *Structural elements of plain concrete complying with Section 1905.1.9*

~~21.1.1.7 –~~ **1905.1.3.5 Seismic force resisting systems.** Structural systems designated as part of the seismic force-resisting system shall be restricted to those *permitted by ASCE 7*. ~~Except for *Seismic Design Category* A, for which Chapter 21 does not apply,~~ The following provisions shall be satisfied for each structural system designated as part of the seismic force-resisting system for structures assigned to~~,~~ ~~regardless of the~~ *Seismic Design Category* B, C, D, E or F:

(a) Ordinary moment frames shall satisfy ACI 318 Section 21.2.
(b) Ordinary reinforced concrete structural walls *and ordinary precast structural walls* need not satisfy any provisions in ACI 318 Chapter 21.
(c) Intermediate moment frames shall satisfy ACI 318 Section 21.3.
(d) Intermediate precast *structural* walls shall satisfy ACI Section 21.4.
(e) Special moment frames shall satisfy ACI 318 Section 21.5 through 21.8.
(f) Special structural walls shall satisfy ACI 318 Section 21.9.
(g) Special structural walls constructed using precast concrete shall satisfy ACI 318 Section 21.10.

All special moment frames and special structural walls shall also satisfy ACI 318 Section 21.1.3 through 21.1.7.

~~**1905.1.3 ACI 318, Section 21.4.** Modify ACI 318, Section 21.4, by renumbering Section 21.4.3 to become 21.4.4 and adding new Sections 21.4.3, 21.4.5, 21.4.6 and 21.4.7 to read as follows:~~

1905.1.4 Connections. Connections shall comply with the requirements of ACI 318 Section 21.4 and the following requirements:

~~*21.4.3 –*~~ **1905.1.4.1 Connections designed to yield.** *Connections that are designed to yield shall be capable of maintaining 80 percent of their design strength at the deformation induced by the design displacement or shall use Type 2 mechanical splices.*

~~21.4.4 - Elements of the connection that are not designed to yield shall develop at least 1.5 S_y. *21.4.5 –*~~

1905.1.4.2 Wall piers in Seismic Design Category D, E, or F. *Wall piers in Seismic Design Category D, E or F shall comply with Section ~~1905.1.4~~* 1905.1.5 *~~of the International Building Code~~.*

~~*21.4.6 –*~~ **1905.1.4.3 Wall piers not designed as part of a moment frame in buildings assigned to Seismic Design Category C.** *Wall piers not designed as part of a moment frame in buildings assigned to Seismic Design Category C shall have transverse reinforcement designed to resist the shear forces determined from ACI 318 Section 21.3.3. Spacing of transverse reinforcement shall not exceed 8 inches (203 mm). Transverse reinforcement shall be extended beyond the pier clear height for at least 12 inches (305 mm).*

Exceptions:

1. *Wall piers that satisfy ACI 318 Section 21.13.*
2. *Wall piers along a wall line within a story where other shear wall segments provide lateral support to the wall piers and such segments have a total stiffness of at least six times the sum of the stiffnesses of all the wall piers.*

~~*21.4.7 –*~~ **1905.1.4.4 Wall segments.** *Wall segments with a horizontal length-to-thickness ratio less than 2.5 shall be designed as columns.*

~~**1905.1.4 ACI 318, Section 21.9.** Modify ACI 318, Section 21.9, by deleting Section 21.9.8 and replacing with the following:~~ **1905.1.5 Special structural walls and coupling beams.** Wall piers and wall segments in special structural walls shall comply with Section 1905.1.5.1.

~~*21.9.8 -*~~ **1905.1.5.1 Wall piers and wall segments.**

~~*21.9.8.1 –*~~ *a. Wall piers not designed as a part of a special moment frame shall have transverse reinforcement designed to satisfy the requirements in ACI 318 Section 21.9.8.2.*

Exceptions:

1. *Wall piers that satisfy ACI 318 Section 21.13.*
2. *Wall piers along a wall line within a story where other shear wall segments provide lateral support to the wall piers and such segments have a total stiffness of at least six times the sum of the stiffnesses of all the wall piers.*

~~*21.9.8.2 –*~~ *b. Transverse reinforcement with seismic hooks at both ends shall be designed to resist the shear forces determined from ACI 318 Section 21.6.5.1. Spacing of transverse reinforcement shall not exceed 6 inches (152 mm). Transverse reinforcement shall be extended beyond the pier clear height for at least 12 inches (305 mm).*
~~*21.9.8.3*~~ *c. Wall segments with a horizontal length-to-thickness ratio less than 2.5 shall be designed as columns.*

~~**1905.1.5 ACI 318, Section 21.10.** Modify ACI 318, Section 21.10.2, to read as follows:~~ **1905.1.6 Special structural walls constructed using precast.** In addition to Section 21.10.2 of ACI 318 special structural walls constructed using precast concrete shall satisfy ~~all the requirements of 21.9 for cast-in-place special structural walls in addition to Sections 21.4.2 *through* 21.4.4~~ Section 1905.1.4.1.

~~**1905.1.6 ACI 318, Section 21.12.1.1.** Modify ACI 318, Section 21.12.1.1, to read as follows:~~
~~21.12.1.1 - Foundations resisting earthquake-induced forces or transferring earthquake-induced forces between a structure and ground shall comply with the~~

<u>**1905.1.7 Foundations.** The requirements of this section shall apply for foundations resisting earthquake-induced forces or transferring earthquake-inducted forces between a structure and ground.</u>

<u>a.</u> <u>The requirements of ACI 318 Section 21.12.1.1 shall not apply.</u>
<u>b.</u> <u>The</u> requirements of <u>ACI 318</u> Section 21.12 and other applicable provisions of ACI 318 *unless modified by Chapter 18 of the International Building Code.*

~~**1905.1.7 ACI 318, Section 22.6.** Modify ACI 318, Section 22.6, by adding new Section 22.6.7 to read as follows:~~

~~22.6.7 - Detailed plain concrete structural walls.~~
~~22.6.7.1 - Detailed plain concrete structural walls are walls conforming to the requirements of ordinary structural plain concrete walls and 22.6.7.2.~~
~~22.6.7.2 -~~ <u>**1905.1.8 Detailed plain structural concrete walls.**</u> *<u>For detailed plain structural concrete wall</u> reinforcement shall be provided as follows:*

(a) <u>**1905.1.8.2 Vertical reinforcement.**</u> *Vertical reinforcement of at least 0.20 square inch (129 mm2) in cross-sectional area shall be provided continuously from support to support at each corner, at each side of each opening and at the ends of walls. The continuous vertical bar required beside an opening is permitted to substitute for one of the two No. 5 bars required by <u>ACI 318 Section</u> 22.6.6.5.*

~~(b)~~ <u>**1905.1.8.2 Horizontal reinforcement.**</u> *Horizontal reinforcement at least 0.20 square inch (129 mm2) in cross-sectional area shall be provided:*

1. *Continuously at structurally connected roof and floor levels and at the top of walls;*
2. *At the bottom of load-bearing walls or in the top of foundations where doweled to the wall; and*
3. *At a maximum spacing of 120 inches (3048 mm).*

Reinforcement at the top and bottom of openings, where used in determining the maximum spacing specified in Item 3 above, shall be continuous in the wall.

~~**1905.1.8 ACI 318, Section 22.10.** Delete ACI 318, Section 22.10, and replace with the following:~~

~~22.10 –~~ <u>**1905.1.9 Plain concrete in earthquake-resisting structures.**</u> *<u>The requirements of this Section shall apply to</u> plain concrete in structures assigned to Seismic Design Category C, D, E or F.*
<u>(a) The requirements of ACI 318 Section 22.10 shall not apply.</u>
~~22.10.1~~ <u>(b)</u> Structures assigned to Seismic Design Category C, D, E or F shall not have elements of structural plain concrete, except as follows:

~~(a)~~ <u>1.</u> Structural plain concrete basement, foundation or other walls below the base are permitted in detached one- and two-family dwellings three stories or less in height constructed with studbearing walls. In dwellings assigned to Seismic Design Category D or E, the height of the wall shall not exceed 8 feet (2438 mm), the thickness shall not be less than 71/2 inches (190 mm), and the wall shall retain no more than 4 feet (1219 mm) of unbalanced fill. Walls shall have reinforcement in accordance with 22.6.6.5.
~~(b)~~ <u>2.</u> Isolated footings of plain concrete supporting pedestals or columns are permitted, provided the projection of the footing beyond the face of the supported member does not exceed the footing thickness.

__Exception:__ In detached one- and two-family dwellings three stories or less in height, the projection of the footing beyond the face of the supported member is permitted to exceed the footing thickness.

~~(c)~~ 3. Plain concrete footings supporting walls are permitted, provided the footings have at least two continuous longitudinal reinforcing bars.
c. Bars shall not be smaller than No. 4 and shall have a total area of not less than 0.002 times the gross cross-sectional area of the footing.
d. For footings that exceed 8 inches (203 mm) in thickness, a minimum of one bar shall be provided at the top and bottom of the footing. Continuity of reinforcement shall be provided at corners and intersections.

Exceptions:

1. *In Seismic Design Categories A, B and C, detached one- and two-family dwellings three stories or less in height constructed with stud-bearing walls, are permitted to have plain concrete footings without longitudinal reinforcement.*
2. *For foundation systems consisting of a plain concrete footing and a plain concrete stemwall, a minimum of one bar shall be provided at the top of the stemwall and at the bottom of the footing.*
3. Where a slab on ground is cast monolithically with the footing, one No. 5 bar is permitted to be located at either the top of the slab or bottom of the footing.

~~**1905.1.9 ACI 318, Section D.3.3.** Delete ACI 318 Sections D.3.3.4 through D.3.3.7 and replace with the following:~~

~~*D.3.3.4 –*~~ **1905.10 Seismic design for anchoring to concrete.** Requirements for seismic design of anchorage to concrete shall comply with this Section.

(a). The requirements of ACI 318 Sections D3.3.4 through D3.3.7 shall not apply.
(b). The anchor design strength associated with concrete failure modes shall be taken as 0.75∅Nn and 0.75∅Vn, where ∅ is given in D4.3 or D4.4 and Nn and Vn are deteremined in accordance with ACI 318 Sections D5.2, D5.3, D5.4, D6.2 and D6.3, assuming the concrete is cracked unless it can be demonstrated that the concrete remains uncracked.
(c). D.3.3.5 - Anchors shall be designed to be governed by the steel strength of a ductile steel element as determined in accordance with ACI 318 Sections D.5.1 and D.6.1, unless either D.3.3.6 or D.3.3.7 is satisfied.

Exceptions:

1. *Anchors designed to resist wall out-of-plane forces with design strengths equal to or greater than the force determined in accordance with ASCE 7 Equation 12.11-1 or 12.14-10 need not satisfy ACI 318* Section D.3.3.5.
2. *ACI 318 Section D.3.3.5 need not apply and the design shear strength in accordance with ACI Section D.6.2.1(c) need not be computed for anchor bolts attaching wood sill plates of bearing or non-bearing walls of light-frame wood structures to foundations or foundation stem walls provided all of the following are satisfied:*
   2.1. The allowable in-plane shear strength of the anchor is determined in accordance with AF&PA NDS Table 11E for lateral design values parallel to grain.
   2.2 The maximum anchor nominal diameter is 5/8 inches (16 mm).
   2.3. Anchor bolts are embedded into concrete a minimum of 7 inches (178 mm).
   2.4. Anchor bolts are located a minimum of 13/4 inches (45 mm) from the edge of the concrete parallel to the length of the wood sill plate.
   2.5. Anchor bolts are located a minimum of 15 anchor diameters from the edge of the concrete perpendicular to the length of the wood sill plate.
   2.6. The sill plate is 2-inch or 3-inch nominal thickness.

3. *ACI 318 Section D.3.3.5 need not apply and the design shear strength in accordance with ACI 318 Section D.6.2.1(c) need not be computed for anchor bolts attaching cold-formed steel track of bearing or non-bearing walls of light-frame construction to foundations or foundation stem walls provided all of the following are satisfied:*
   3.1. The maximum anchor nominal diameter is 5/8 inches (16 mm).
   3.2. Anchors are embedded into concrete a minimum of 7 inches (178 mm).
   3.3. Anchors are located a minimum of 13/4 inches (45 mm) from the edge of the concrete parallel to the length of the track.
   3.4. Anchors are located a minimum of 15 anchor diameters from the edge of the concrete perpendicular to the length of the track.
   3.5. The track is 33 to 68 mil designation thickness.

Allowable in-plane shear strength of exempt anchors, parallel to the edge of concrete shall be permitted to be determined in accordance with AISI S100 Section E3.3.1.

4. *In light-frame construction, design of anchors in concrete shall be permitted to satisfy Section 1905.1.1(f) ~~D.3.3.8~~.*

~~D.3.3.6 –~~(d). Instead of ~~D.3.3.5~~ the requirements in Section 1905.1.10(c), the attachment that the anchor is connecting to the structure shall be designed so that the attachment will undergo ductile yielding at a force level corresponding to anchor forces no greater than the design strength of anchors specified in Section 1905.1.10 (b).~~D.3.3.4.~~

Exceptions:

1. *Anchors in concrete designed to support nonstructural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section ~~D.3.3.6~~ 1905.1.10(d).*
2. *Anchors designed to resist wall out-of-plane forces with design strengths equal to or greater than the force determined in accordance with ASCE 7 Equation 12.11-1 or 12.14-10 need not satisfy Section ~~D.3.3.6~~ 1905.1.10(d).*

~~D.3.3.7 –~~ (e). As an alternative to ~~D.3.3.5 and D.3.3.6~~ Sections 1905.1.10(c) and (d), it shall be permitted to take the design strength of the anchors as 0.4 times the design strength determined in accordance with ~~D.3.3.4~~ Section 1905.1.10(b).
~~D.3.3.8 –~~ (f.) In light-frame construction, bearing or nonbearing walls, shear strength of concrete anchors less than or equal to 1 inch [25 mm] in diameter of sill plate or track to foundation or foundation stem wall need not satisfy D.3.3.7 when the design strength of the anchors is determined in accordance with D.6.2.1(c).

~~**1905.1.10 ACI 318, Section D.4.2.2.** Delete ACI 318, Section D.4.2.2, and replace with the following:~~

~~D.4.2.2 –~~ **1905.1.11 Anchors with diameters less than 4 in.**

(a). The requirements of ACI 318 Section D4.2.2. shall not apply.
(b)..The concrete breakout strength requirements for anchors in tension shall be considered satisfied by the design procedure of ACI 318 Section D.5.2 provided ACI 318 Equation D-7 is not used for anchor embedments exceeding 25 inches. The concrete breakout strength requirements for anchors in shear with diameters not exceeding 2 inches shall be considered satisfied by the design procedure of ACI 318 Section D.6.2. For anchors in shear with diameters exceeding 2 inches, shear anchor reinforcement shall be provided in accordance with the procedures of ACI 318 Section D.6.2.9.

Reason: There are three main reasons in support of this code change intended as modifications of Chapter 19 "Concrete" of the *International Building Code* (IBC):

1. The proposal removes redundancies in definitions of ACI 318. Such redundancies are not necessary and may be detrimental in that they may cause confusion and result in errors. The introductory section of Chapter 19, "1901.2 Plain and reinforced concrete" adequately and appropriately requires compliance with ACI 318.

2. It is more appropriate to display several definitions in Section 1905.1.1 as code requirements instead of definitions. The language within these definitions contain specific criteria which should be stated as code requirements. These have been revised accordingly.
3. It is inappropriate to modify the provisions of ACI 318 within the body of the IBC. If one wishes to revise provisions of ACI 318 the changes should be submitted to the ACI process. If the provisions contained within Section 1905 are in addition to ACI 318 then they should be worded as such. This proposal makes these revisions to the IBC to reflect these additional requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

1905.1-S-SKALKO.doc

S205–12
1905.1.3, 1905.1.4, 1905.1.5

Proponent: Stephen Kerr, S.E., Josephson Werdowatz and Associates, representing Structural Engineers Association of California (skerr@jwa-se.com)

Revise as follow:

1905.1.3 ACI 318, Section 21.4. Modify ACI 318, Section 21.4, by renumbering Section 21.4.3 to become 21.4.4 and adding new Sections 21.4.3, 21.4.5, 21.4.6 and 21.4.7 to read as follows:

21.4.3 - Connections that are designed to yield shall be capable of maintaining 80 percent of their design strength at the deformation induced by the design displacement or shall use Type 2 mechanical splices.

21.4.4 - Elements of the connection that are not designed to yield shall develop at least 1.5 *Sy*.

21.4.5 - Wall piers in Seismic Design Category D, E or F shall comply with ~~Section 1905.1.4 of the International Building Code~~ ACI 318 Section 21.9.9.

21.4.6 - Wall piers not designed as part of a moment frame in buildings assigned to Seismic Design Category C shall have transverse reinforcement designed to resist the shear forces determined from 21.3.3. Spacing of transverse reinforcement shall not exceed 8 inches (203 mm). Transverse reinforcement shall be extended beyond the pier clear height for at least 12 inches (305 mm).

Exceptions:

1. *Wall piers that satisfy 21.13.*
2. *Wall piers along a wall line within a story where other shear wall segments provide lateral support to the wall piers and such segments have a total stiffness of at least six times the sum of the stiffnesses of all the wall piers.*

21.4.7 - Wall segments with a horizontal length-to-thickness ratio less than 2.5 shall be designed as columns.

~~**1905.1.4 ACI 318, Section 21.9.** Modify ACI 318, Section 21.9, by deleting Section 21.9.8 and replacing with the following:~~

~~*21.9.8 - Wall piers and wall segments.*~~

~~*21.9.8.1 - Wall piers not designed as a part of a special moment frame shall have transverse reinforcement designed to satisfy the requirements in 21.9.8.2.*~~

~~***Exceptions:***~~

1. ~~*Wall piers that satisfy 21.13.*~~
2. ~~*Wall piers along a wall line within a story where other shear wall segments provide lateral support to the wall piers and such segments have a total stiffness of at least six times the sum of the stiffnesses of all the wall piers.*~~

~~*21.9.8.2 - Transverse reinforcement with seismic hooks at both ends shall be designed to resist the shear forces determined from 21.6.5.1. Spacing of transverse reinforcement shall not exceed 6 inches (152 mm). Transverse reinforcement shall be extended beyond the pier clear height for at least 12 inches (305 mm).*~~

~~*21.9.8.3 - Wall segments with a horizontal length-to-thickness ratio less than 2.5 shall be designed as columns.*~~

~~**1905.1.5 ACI 318, Section 21.10.** Modify ACI 318, Section 21.10.2, to read as follows:~~
~~21.10.2 - Special structural walls constructed using precast concrete shall satisfy all the requirements of 21.9 for cast-in-place special structural walls in addition to Sections 21.4.2 *through* 21.4.4.~~

Reason: The purpose of this proposal is to align the IBC Chapter 19 modifications of ACI 318 with the new version of ACI 318.

1905.1.3: ACI 318 Section 21.9.9 is a new section written for wall piers in buildings assigned to SDC D, E or F. This proposal will mandate the requirement of wall pier detailing requirement in the lower SDCs which has been in the Code since 2000.

1905.1.4: Reason: ACI 318 Section 21.9.9 is a new section written for wall piers in buildings assigned to SDC D, E or F. Requirement in this section is no longer needed.

1905.1.5: This requirement is now included under ACI 318-11 section 21.9.1., the requirement in this section is no longer needed.

Cost Impact: The code change proposal will not increase the cost of construction.

1905.1.3-S-KERR.doc

S206–12
1905.1.8

Proponent: Matthew Senecal, P.E., American Concrete Institute (ACI)

Delete and substitute as follows:

~~**1905.1.8 ACI 318, Section 22.10.** Delete ACI 318, Section 22.10, and replace with the following:~~

~~*22.10 - Plain concrete in structures assigned to Seismic Design Category C, D, E or F.*~~

~~*22.10.1 - Structures assigned to Seismic Design CategoyC, D, E or F shall not have elements of structural plain concrete, except as follows:*~~

~~*(a) Structural plain concrete basement, foundation or other walls below the base are permitted in detached one- and two-family dwellings three stories or less in height constructed with studbearing walls. In dwellings assigned to Seismic Design Category D or E, the height of the wall shall not exceed 8 feet (2438 mm), the thickness shall not be less than 71/2 inches (190 mm), and the wall shall retain no more than 4 feet (1219 mm) of unbalanced fill. Walls shall have reinforcement in accordance with 22.6.6.5.*~~
~~*(b) Isolated footings of plain concrete supporting pedestals or columns are permitted, provided the projection of the footing beyond the face of the supported member does not exceed the footing thickness.*~~

~~***Exception:** In detached one- and two-family dwellings three stories or less in height, the projection of the footing beyond the face of the supported member is permitted to exceed the footing thickness.*~~

~~*(c) Plain concrete footings supporting walls are permitted, provided the footings have at least two continuous longitudinal reinforcing bars. Bars shall not be smaller than No. 4 and shall have a total area of not less than 0.002 times the gross cross-sectional area of the footing. For footings that exceed 8 inches (203 mm) in thickness, a minimum of one bar shall be provided at the top and bottom of the footing. Continuity of reinforcement shall be provided at corners and intersections.*~~

~~***Exceptions:***~~

1. ~~*In Seismic Design Categories A, B and C, detached one- and two-family dwellings three stories or less in height constructed with stud-bearing walls, are permitted to have plain concrete footings without longitudinal reinforcement.*~~
2. ~~*For foundation systems consisting of a plain concrete footing and a plain concrete stemwall, a minimum of one bar shall be provided at the top of the stemwall and at the bottom of the footing.*~~
3. ~~*Where a slab on ground is cast monolithically with the footing, one No. 5 bar is permitted to be located at either the top of the slab or bottom of the footing.*~~

1905.1.8 ACI 318, Section 22.10. The requirements of Section 22.10 shall apply for plain concrete in earthquake-resisting structures assigned to Seismic Design Category C, D, E, or F.

Reason: The only substantive difference provided in this revision to ACI 318 is the inclusion of SDC C. The remaining text provides a few detailing changes that are based on engineering practice, not design principles. It is therefore recommended to remove such changes, and retain the inclusion for plain concrete in structures assigned to SDC C.
Discussion:
22.10 is an editorial revision to the heading in ACI 318 which reads, “Plain concrete in earthquake-resisting structures.” This revision is unnecessary.

22.10.1.(a) above is similar to 22.10.1.(c) in ACI 318. The IBC provision limits the height of the wall to 8 ft, which is a practical limit. The design requirements of 22.6 in ACI 318 take wall height into account. Therefore, the height limit is unnecessary.

22.10.1.(b) above is similar to 22.10.1.(a) in ACI 318. The IBC provision limits the projection of the footing where ACI 318 limits the use of plain concrete. Removing this exception results in a slightly more conservative design.

22.10.1.(c) above is similar to 22.10.1.(b) in ACI 318. The IBC provision provides direction on where to place reinforcement, which is a detailing practice. Removing this exception results in no design change.

Cost Impact: The code change proposal will not increase the cost of construction.

S207–12
1905.1.9

Proponent: Kevin Moore, Certus Consulting, Inc. (NCSEA, NIBS, BSSC, CRSC), representing NCSEA Seismic Subcommittee

Delete and substitute as follows:

~~**1905.1.9 ACI 318, Section D.3.3.**~~

1905.1.9 ACI 318, Section D.3.3.5.3 Modify ACI 318, Section D.3.3.5.3, by adding the following: exceptions:

D.3.3.5.3 — Anchors and their attachments shall be designed using one of options (a) through (c):

(a) The anchor or group of anchors shall be designed for the maximum shear that can be transmitted to the anchor or group of anchors based on the development of a ductile yield mechanism in the attachment in flexure, shear, or bearing, or a combination of those conditions, and considering both material overstrength and strain hardening effects in the attachment.
(b) The anchor or group of anchors shall be designed for the maximum shear that can be transmitted to the anchors by a non-yielding attachment.
(c) The anchor or group of anchors shall be designed for the maximum shear obtained from design load combinations that include E, with E increased by Ωo. The anchor design shear strength shall satisfy the shear strength requirements of D.4.1.1.

Exceptions:

1. *Per option D.3.3.5.3 (b), anchor or group of anchor shear strength design need not be computed per D.6.2 or D.6.3 for anchor bolts attaching wood sill plates of bearing or nonbearing walls of light-frame wood structures to foundations or foundation stem walls provided all of the following are satisfied:*
   - *1.1. The allowable in-plane shear strength of the anchor is determined in accordance with AF&PA NDS Table 11E for lateral design values parallel to grain.*
   - *1.2. The maximum anchor nominal diameter is 5/8 inches (16 mm).*
   - *1.3. Anchor bolts are embedded into concrete a minimum of 7 inches (178 mm).*
   - *1.4. Anchor bolts are located a minimum of 13/4 inches (45 mm) from the edge of the concrete parallel to the length of the wood sill plate.*
   - *1.5. Anchor bolts are located a minimum of 15 anchor diameters from the edge of the concrete perpendicular to the length of the wood sill plate.*
   - *1.6. The sill plate is of 2-inch or 3-inch nominal thickness.*
2. *Per option D.3.3.5.3 (b), anchor or group of anchor shear strength design need not be computed per D.6.2 or D.6.3 for anchor bolts attaching cold-formed steel track of bearing or nonbearing walls of light-frame construction to foundations or foundation stem walls provided all of the following are satisfied: 2.2. Anchors are embedded into concrete a minimum of 7 inches (178 mm).*
   - *2.3. Anchors are located a minimum of 13/4 inches (45 mm) from the edge of the concrete parallel to the length of the track.*
   - *2.4. Anchors are located a minimum of 15 anchor diameters from the edge of the concrete perpendicular to the length of the track.*
   - *2.5. The track is 33 to 68 mil designation thickness.*

Allowable in-plane shear strength of exempt anchors, parallel to the edge of concrete shall be permitted to be determined in accordance with AISI S100 Section E3.3.1.

Reason: As currently written in the 2012 IBC, Section 1905.1.9, Section D.3.3 does not align with the section numbering of ACI 318-11, Appendix D. This editorial revision realigns the ACI 318-11 language with primary exceptions for light frame construction sill plates, since they remain relevant.

Please note that the following exceptions were not brought forward: Exception 1 of D.3.3.5 and Exception 2 of D3.3.6 on anchors designed to resist wall out-of-plane forces; Exception 1 of D3.3.6 on anchors designed to support nonstructural components; and, Exception 4 of D.3.3.5 on light-frame construction. The applicability of Exception 1 of D.3.3.5, Exception 4 of D.3.3.5, Exception 1 of D3.3.6 and, Exception 2 of D3.3.6 applied to ACI 318-11, Appendix D could not be verified. Proponents of these exceptions are encouraged to re-evaluate them based upon provisions of ACI 318-11, Appendix D and bring forward public comments as appropriate.

Cost Impact: The code change proposal will not increase the cost of construction.

~~*2. Anchors designed to resist wall out-of-plane forces with design strengths equal to or greater than the force determined in accordance with ASCE 7 Equation 12.11-1 or 12.14-10 need not satisfy Section D.3.3.6.*~~

~~*D.3.3.7 - As an alternative to D.3.3.5 and D.3.3.6, it shall be permitted to take the design strength of the anchors as 0.4 times the design strength determined in accordance with D.3.3.4.*~~

~~*D.3.3.8 –*~~ *(f) In light-frame construction, bearing or nonbearing walls, shear strength of concrete anchors less than or equal to 1 inch [25 mm] in diameter of sill plate or track to foundation or foundation stem wall need not satisfy* ~~*D.3.3.7*~~ *D.3.3.5.3 (a) through (c) when the design strength of the anchors is determined in accordance with D.6.2.1(c).*

Reason: ACI 318-11 has made major modification to Appendix D. This proposed modification to section 1905.1.9 intends to maintain the well thought-out design provisions for sill bolts with minimum edge distance introduced into IBC 2012.

Cost Impact: The code change proposal will not increase the cost of construction.

1905.1.9-S-KERR.doc

S209–12
1905.1.9, 1905.1.10

Proponent: Matthew Senecal, P.E., American Concrete Institute (ACI)

Revise as follows:

1905.1.9 ACI 318, Section D.3.3. ~~Delete~~ Modify ACI 318 Section~~s D.3.3.4 through D3.3.7 and replace~~ D.3.3.5 by adding D.3.3.5.5 ~~with the following~~ as follows:

> ~~*D.3.3.4 - The anchor design strength associated with concrete failure modes shall be taken as 0.75∅ Nn and 0.75∅ Vn, where ∅ is given in D4.3 or D4.4 and Nn and Vn are deteremined in accordance with D5.2, D5.3, D5.4, D6.2 and D6.3, assuming the concrete is cracked unless it can be demonstrated that the concrete remains uncracked.*~~
>
> ~~*D.3.3.5 - Anchors shall be designed to be governed by the steel strength of a ductile steel element as determined in accordance with D.5.1 and D.6.1, unless either D.3.3.6 or D.3.3.7 is satisfied.*~~
>
> ~~***Exceptions:***~~
>
> ~~*1.*~~ ~~*Anchors designed to resist wall out-of-plane forces with design strengths equal to or greater than the force determined in accordance with ASCE 7 Equation 12.11-1 or 12.14-10 need not satisfy*~~ ~~Section D.3.3.5.~~

D.3.3.5.5 – For shear parallel to an edge, the following exceptions are permitted:

~~*2.*~~ *(a).* ~~*D.3.3.5 need not apply and the design shear strength in accordance with*~~ *D.6.2.1(c) need not be computed for anchor bolts attaching wood sill plates of bearing or non-bearing walls of light-frame wood structures to foundations or foundation stem walls provided all of the following are satisfied:*

- ~~*2.1.*~~ *1. The allowable in-plane shear strength of the anchor is determined in accordance with AF&PA NDS Table 11E for lateral design values parallel to grain.*
- ~~*2.2*~~ *2. The maximum anchor nominal diameter is 5/8 inches (16 mm).*
- ~~*2.3.*~~ *3. Anchor bolts are embedded into concrete a minimum of 7 inches (178 mm).*
- ~~*2.4.*~~ *4. Anchor bolts are located a minimum of 13/4 inches (45 mm) from the edge of the concrete parallel to the length of the wood sill plate.*
- ~~*2.5.*~~ *5. Anchor bolts are located a minimum of 15 anchor diameters from the edge of the concrete perpendicular to the length of the wood sill plate.*
- ~~*2.6.*~~ *6. The sill plate is 2-inch or 3-inch nominal thickness.*

~~*3.*~~ *(b). Section D.3.3.5 need not apply and the design shear strength in accordance with Section D.6.2.1(c) need not be computed for anchor bolts attaching cold-formed steel track of bearing or non-bearing walls of light-frame construction to foundations or foundation stem walls provided all of the following are satisfied:*

- ~~*3.1.*~~ *1. The maximum anchor nominal diameter is 5/8 inches (16 mm).*
- ~~*3.2.*~~ *2. Anchors are embedded into concrete a minimum of 7 inches (178 mm).*
- ~~*3.3.*~~ *3. Anchors are located a minimum of 13/4 inches (45 mm) from the edge of the concrete parallel to the length of the track.*
- ~~*3.4.*~~ *4. Anchors are located a minimum of 15 anchor diameters from the edge of the concrete perpendicular to the length of the track.*
- ~~*3.5.*~~ *5. The track is 33 to 68 mil designation thickness.*

Allowable in-plane shear strength of exempt anchors, parallel to the edge of concrete shall be permitted to be determined in accordance with AISI S100 Section E3.3.1.

~~*4 In light-frame construction, design of anchors in concrete shall be permitted to satisfy D.3.3.8.*~~

~~*D.3.3.6 - Instead of D.3.3.5, the attachment that the anchor is connecting to the structure shall be designed so that the attachment will undergo ductile yielding at a force level corresponding to anchor forces no greater than the design strength of anchors specified in D.3.3.4.*~~

~~***Exceptions:***~~

1. ~~*Anchors in concrete designed to support nonstructural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section D.3.3.6.*~~
2. ~~*Anchors designed to resist wall out-of-plane forces with design strengths equal to or greater than the force determined in accordance with ASCE 7 Equation 12.11-1 or 12.14-10 need not satisfy Section D.3.3.6.*~~

~~*D.3.3.7 - As an alternative to D.3.3.5 and D.3.3.6, it shall be permitted to take the design strength of the anchors as 0.4 times the design strength determined in accordance with D.3.3.4.*~~
~~*D.3.3.8 – In light-frame construction, bearing or nonbearing walls, shear strength of concrete anchors less than or equal to 1 inch [25 mm] in diameter of sill plate or track to foundation or foundation stem wall need not satisfy D.3.3.7 when the design strength of the anchors is determined in accordance with D.6.2.1(c).*~~

~~**1905.1.10 ACI 318, Section D.4.2.2.** Delete ACI 318, Section D.4.2.2, and replace with the following:~~

~~*D.4.2.2 - The concrete breakout strength requirements for anchors in tension shall be considered satisfied by the design procedure of D.5.2 provided Equation D-7 is not used for anchor embedments exceeding 25 inches. The concrete breakout strength requirements for anchors in shear with diameters not exceeding 2 inches shall be considered satisfied by the design procedure of D.6.2. For anchors in shear with diameters exceeding 2 inches, shear anchor reinforcement shall be provided in accordance with the procedures of D.6.2.9.*~~

Reason: Appendix D had numerous changes in ACI 318-11, but the code change proposal process is ahead of the administrative update process in which ACI 318-11 was approved. Therefore, the exceptions to the 2012 IBC were based on ACI 318-08.

In the 2012 IBC, all of the changes to the ACI 318-11 seismic anchor provisions were deleted and the ACI 318-08 provisions were inserted with exceptions. ACI does not understand how this change occurred because this was not agreed to at the hearings.

This code change proposal synchronizes IBC with ACI 318-11.

1905.1.9:

- Remove D.3.3.4 and D.3.3.5: These provisions were copied from ACI 318-08.
- Remove Exception 1 to D.3.3.5: Anchors with loads increased by Ω_o do not need to meet the requirements of D.3.3 as allowed in D.3.3.4.3(d) for tension and D3.3.5.3.(c) for shear in ACI 318-11.
- Revise Exceptions 2, 3, and 4 to D.3.3.5: There is no longer a 0.75 reduction for shear in seismic nor does the anchor need to, "be designed to be governed by the steel strength of a ductile steel element," for shear. These exceptions may be removed, but the exceptions as written do not require a concrete failure check according to D.6.2.1(c). Therefore, keep the items as exceptions for shear.
- Remove Exception 4 to D.3.3.5: There is no longer a 0.75 reduction for shear in seismic nor does the anchor need to "be designed to be governed by the steel strength of a ductile steel element" for shear.
- Remove D.3.3.6: This provision was copied from ACI 318-08.
- Remove Exception 1 and 2 to D.3.3.6: Anchors with loads increased by Ω_o do not need to meet the requirements of D.3.3 as allowed in D.3.3.4.3.(d) for tension and D3.3.5.3.(c) for shear in ACI 318-11.
- Remove D.3.3.7: This provision was copied from ACI 318-08.
- Revise D.3.3.8: See note about Exception 4 to D.3.3.5 above.

1905.1.10: This modification was made in the 2009 IBC in anticipation that ACI 318 was going to increase the limits. In ACI 318-11, the limitation on length was removed and the maximum diameter of the anchor was increased to 4 in. Therefore, the modification may now be removed.

Cost Impact: The code change proposal will not increase the cost of construction.

S209-11

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1905.1.9-S-SENECAL

S210–12
1905.1.10 (NEW)

Proponent: Bonnie Manley, American Iron and Steel Institute (bmanley@steel.org)

Add new text as follows:

1905.1.10 ACI 318, Section D.3.3.4.4. Modify ACI 318, Section D.3.3.4.4 by adding the following exception:

D.3.3.4.4 — The anchor design tensile strength for resisting earthquake forces shall be determined from consideration of (a) through (e) for the failure modes given in Table D.4.1.1 assuming the concrete is cracked unless it can be demonstrated that the concrete remains uncracked:

(a) φN_{sa} for a single anchor, or for the most highly stressed individual anchor in a group of anchors;
(b) $0.75\varphi N_{cb}$ or $0.75\varphi N_{cbg}$, except that N_{cb} or N_{cbg} need not be calculated where anchor reinforcement satisfying D.5.2.9 is provided;
(c) $0.75\varphi N_{pn}$ for a single anchor, or for the most highly stressed individual anchor in a group of anchors;
(d) $0.75\varphi N_{sb}$ or $0.75\varphi N_{sbg}$; and
(e) $0.75\varphi N_a$ or $0.75\varphi N_{ag}$

where φ is in accordance with D.4.3 or D.4.4.

Exception:

1. *The anchor design strength need not be reduced by the 0.75 factor for anchors in structural steel seismic force resisting systems designed in accordance with Section 2205, with the following restrictions:*

   a. *Anchor rod has a minimum diameter of 3/4".*
   b. *Anchor rod has a minimum embedment of 12".*
   c. *Concrete foundation elements receiving the anchor rods have the minimum reinforcement required in accordance with ACI 318, Chapters 7 and 10 located within the upper half of the embedment depth of the anchor rods.*

Reason: Section D2.6 of AISC 341-10 prescribes column anchorage required strengths based upon the maximum required strength of the structural steel members delivering the load to the anchorage. These forces are elevated to ensure that the column base has adequate strength to permit the expected ductile behavior for which the system was designed in order for the expected performance to be achieved. In recognition of these elevated design forces, the 0.75 strength reduction factor is redundant and not deemed necessary for cast-in-place anchors, since these anchors have performed well in past earthquakes. Conservatively, this exception is limited to cast-in-place anchors with a minimum diameter of 3/4", a minimum concrete embedment of 12", and minimum reinforcement for temperature and shrinkage crack control.

Cost Impact: The code change proposal will reduce the cost of construction.

1905.1.10 (NEW)-S-MANLEY.doc

S211–12
1906.1

Proponent: Matthew Senecal, P.E., American Concrete Institute (ACI)

Delete without substitution:

~~**1906.1 Scope.** The design and construction of structural plain concrete, both cast-in-place and precast, shall comply with the minimum requirements of ACI 318, as modified in Section 1905.~~

> ~~**Exception:** For Group R-3 occupancies and buildings of other occupancies less than two stories above grade plane of light-frame construction, the required footing thickness of ACI 318 is permitted to be reduced to 6 inches (152 mm), provided that the footing does not extend more than 4 inches (102 mm) on either side of the supported wall.~~

Reason: This proposal removes the exception to the minimum footing thickness required in 22.7.4 in ACI 318-11. The exception reduces the minimum footing thickness from 8 in. to 6 in. The requirement for 8 in. has been in the ACI 318 code since 1941. The requirement for a 6 in. thickness has been in various model codes for a variety of exceptions over the past 40 to 50 years.

Recommend that the IBC accept the ACI 318 limit.

Cost Impact: The code change proposal will increase the cost of construction.

1906.1-S-SENECAL

S212–12
1901.2, 1901.3 (NEW), 1907

Proponent: Matthew Senecal, P.E., representing American Concrete Institute (ACI)

Revise as follows:

1901.2 ~~Plain and reinforced~~ Structural concrete. Plain and reinforced structural concrete shall be designed and constructed in accordance with the requirements of this chapter and ACI 318 as amended in Section 1905 of this code. ~~Except for the provisions of Sections 1904 and 1907, the design and construction of slabs on grade shall not be governed by this chapter unless they transmit vertical loads or lateral forces from other parts of the structure to the soil.~~

1901.3 Nonstructural concrete. Plain and reinforced nonstructural concrete shall be designed and constructed in accordance with the durability requirements of 1904. The thickness of slabs on ground supported directly on the ground shall not be less than 3.5 inches (89 mm).

Delete without substitution:

~~**SECTION 1907 MINIMUM SLAB PROVISIONS**~~

~~**1907.1 General.** The thickness of concrete floor slabs supported directly on the ground shall not be less than 31/2 inches (89 mm). A 6-mil (0.006 inch; 0.15 mm) polyethylene vapor retarder with joints lapped not less than 6 inches (152 mm) shall be placed between the base course or subgrade and the concrete floor slab, or other *approved* equivalent methods or materials shall be used to retard vapor transmission through the floor slab.~~

~~**Exception:** A vapor retarder is not required:~~

1. ~~For detached structures accessory to occupancies in Group R-3, such as garages, utility buildings or other unheated facilities.~~
2. ~~For unheated storage rooms having an area of less than 70 square feet (6.5 m2) and carports attached to occupancies in Group R-3.~~
3. ~~For buildings of other occupancies where migration of moisture through the slab from below will not be detrimental to the intended occupancy of the building.~~
4. ~~For driveways, walks, patios and other flatwork which will not be enclosed at a later date.~~
5. ~~Where *approved* based on local site conditions.~~

Reason: This code change proposal (1) removes a repetitive requirement given in ACI 318, (2) removes vapor barrier as a default requirement, and (3) condenses the remaining code requirements into a single provision.

(1) Repetitive requirement: Section 1.1.7 in ACI 318-11 states the following:

> "This Code does not govern design and construction of slabs-on-ground, unless the slab transmits vertical loads or lateral forces from other portions of the structure to the soil."

In 1901.2, the phrase "the design and construction of slabs on grade shall not be governed by this chapter unless they transmit vertical loads or lateral forces from other parts of the structure to the soil" simply repeats the intent of ACI 318, 1.1.7.

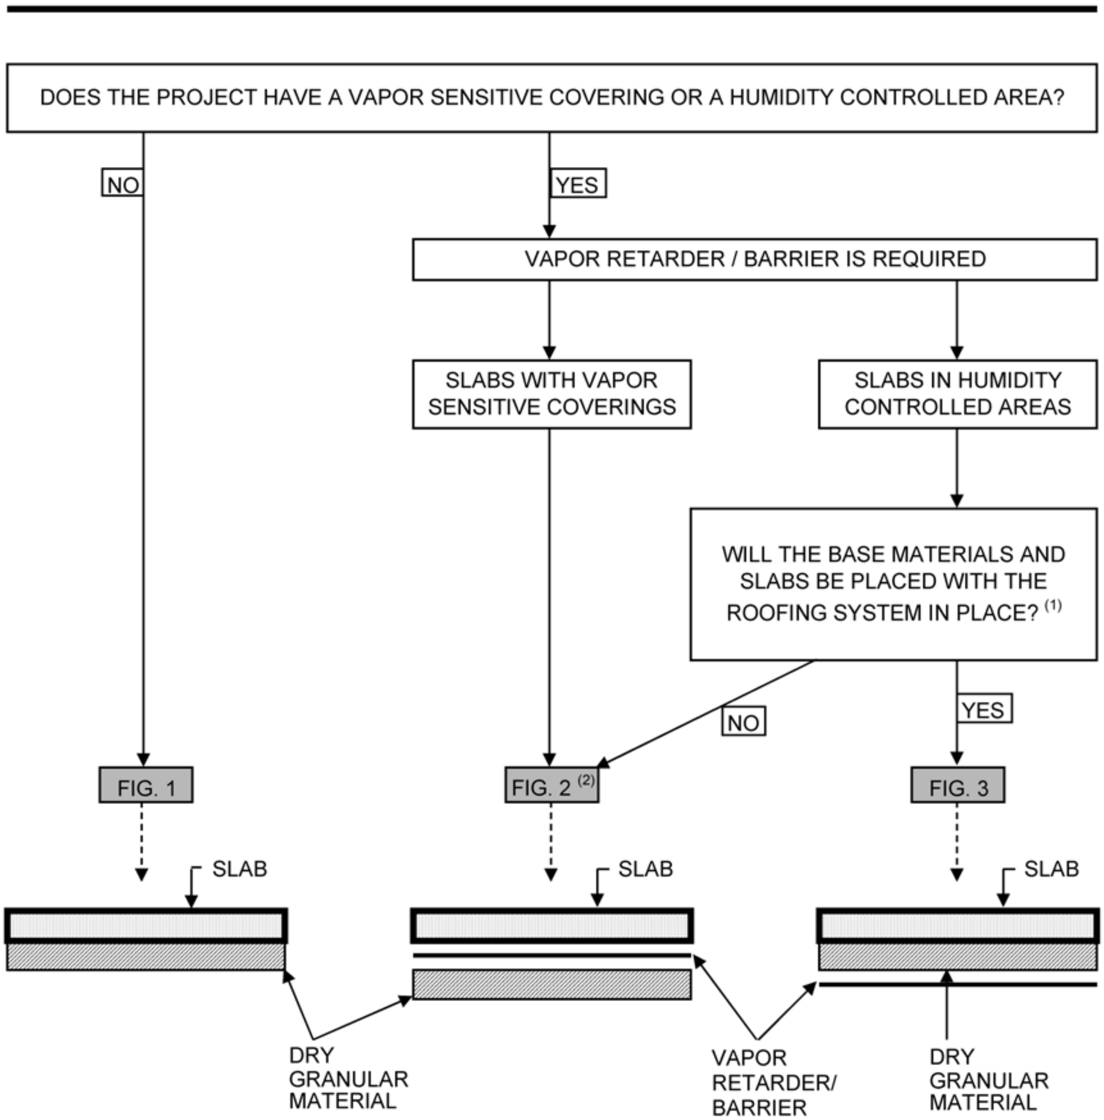
(2) Vapor barrier: Requiring the vapor retarder to be directly under the slab is not always the best design. ACI 302.1R-04, Concrete Floor and Slab Construction, states the following related to concerns for placing concrete directly on a vapor retarder:

> "Placing concrete in direct contact with the vapor retarder or barrier, however, requires additional consideration if potential slab-related problems are to be avoided. When compared with identical concrete cast on a draining base, concrete placed in direct contact with a vapor retarder or barrier has been shown to exhibit significantly larger length change in the first hour after casting, during drying shrinkage, and when subject to environmental change; there is also more settlement (Suprenant 1997). Care should be taken in design detailing to minimize restraint to such movement (Anderson and Roper 1977). Where reinforcing steel is present, settlement cracking over the steel is more likely because of the increased settlement resulting from a longer bleeding period. The potential for a greater measure of slab curl is also increased."

Figure 3.1 from ACI 302.1R-04 (below) is a flow chart that describes when and where to place a vapor retarder.

Therefore, it is proposed to remove the requirement that, in all cases, a vapor barrier be placed between the base course or subgrade and the concrete floor slab. The Registered Design Professional should be given the responsibility to determine the need and location of the vapor retarder.

Fig. 3.1 – DECISION FLOW CHART TO DETERMINE IF A VAPOR RETARDER / BARRIER IS REQUIRED AND WHERE IT IS TO BE PLACED



NOTES:

(1) IF GRANULAR MATERIAL IS SUBJECT TO FUTURE MOISTURE INFILTRATION, USE FIG. 2.
(2) IF FIGURE 2 IS USED, A REDUCED JOINT SPACING, A LOW SHRINKAGE MIX DESIGN, OR OTHER MEASURES TO MINIMIZE SLAB CURL WILL LIKELY BE REQUIRED.

(3) One code provision: If the two deletions are accepted above, the slab requirements may be reduced to an exception in 1901.2.

Cost Impact: The code change proposal will not increase the cost of construction.

(Portions of Table not shown remain unchanged)

Delete without substitution:

~~**SECTION 1908 ANCHORAGE TO CONCRETE—ALLOWABLE STRESS DESIGN**~~

~~**1908.1 Scope.** The provisions of this section shall govern the *allowable stress design* of headed bolts and headed stud anchors cast in normal-weight concrete for purposes of transmitting structural loads from one connected element to the other. These provisions do not apply to anchors installed in hardened concrete or where load combinations include earthquake loads or effects. The bearing area of headed anchors shall be not less than one and one-half times the shank area. Where strength design is used, or where load combinations include earthquake loads or effects, the design strength of anchors shall be determined in accordance with Section 1909. Bolts shall conform to ASTM A 307 or an *approved* equivalent.~~

~~**1908.2 Allowable service load.** The allowable service load for headed anchors in shear or tension shall be as indicated in Table 1908.2. Where anchors are subject to combined shear and tension, the following relationship shall be satisfied:~~

~~$(P_s / P_t)^{5/3} + (V_s / V_t)^{5/3} \leq 1$ **(Equation 19-1)**~~

~~where:~~

~~*Ps* = Applied tension service load, pounds (N).~~
~~*Pt* = Allowable tension service load from Table 1908.2, pounds (N).~~
~~*Vs* = Applied shear service load, pounds (N).~~
~~*Vt* = Allowable shear service load from Table 1908.2, pounds (N).~~

~~**1908.3 Required edge distance and spacing.** The allowable service loads in tension and shear specified in Table 1908.2 are for the edge distance and spacing specified. The edge distance and spacing are permitted to be reduced to 50 percent of the values specified with an equal reduction in allowable service load. Where edge distance and spacing are reduced less than 50 percent, the allowable service load shall be determined by linear interpolation.~~

~~**1908.4 Increase in allowable load.** Increase of the values in Table 1908.2 by one-third is permitted where the provisions of Section 1605.3.2 permit an increase in allowable stress for wind loading.~~

~~**1908.5 Increase for special inspection.** Where *special inspection* is provided for the installation of anchors, a 100- percent increase in the allowable tension values of Table 1908.2 is permitted. No increase in shear value is permitted.~~

Reason: This proposal removes allowable stress design for anchoring to concrete. This approach to anchor design is not consistent with the standards published by ACI, AISC, or ASCE

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1908-S-SENECAL

S214–12
1908, 1909

Proponent: Stephen V. Skalko, Portland Cement Association

Delete without substitution:

~~SECTION 1908~~
~~ANCHORAGE TO CONCRETE—ALLOWABLE STRESS DESIGN~~

~~1908.1 Scope.~~

~~1908.2 Allowable service load.~~

~~1908.3 Required edge distance and spacing.~~

~~1908.4 Increase in allowable load.~~

~~1908.5 Increase for special inspection.~~

~~SECTION 1909~~
~~ANCHORAGE TO CONCRETE—STRENGTH DESIGN~~

~~1909.1 Scope.~~

Reason: There are three main reasons in support of this code change to modify Chapter 19 "Concrete" of the *International Building Code* (IBC):

1. The proposal removes redundancies for anchorage between ACI 318 and the IBC. Such redundancies are not necessary and may be detrimental in that they may cause confusion and result in errors. The introductory section of Chapter 19, "1901.2 Plain and reinforced concrete" adequately and appropriately requires compliance with ACI 318.
2. ACI 318 addresses the criteria for anchorage in a more complete approach. Sections 1908 and 1909 instruct the user that when allowable stress design or strength design are used for anchorage to concrete the other criteria and requirements in ACI 318 are no longer required, including but not limited to break out and types and amount of anchor reinforcement.
3. If the chapters and sections in whatever edition of ACI 318 that becomes referenced in the 2015 edition of the IBC are not properly coordinated, there will be confusion and will increase the potential for errors in design and construction.

Cost Impact: The code change proposal will not increase the cost of construction.

~~SECTION 1909~~
~~ANCHORAGE TO CONCRETE—STRENGTH DESIGN~~

~~**1909.1 Scope.** The provisions of this section shall govern the strength design of anchors installed in concrete for purposes of transmitting structural loads from one connected element to the other. Headed bolts, headed studs and hooked (J- or L-) bolts cast in concrete and expansion anchors and undercut anchors installed in hardened concrete shall be designed in accordance with Appendix D of ACI 318 as modified by Sections 1905.1.9 and 1905.1.10, provided they are within the scope of Appendix D.~~

~~The strength design of anchors that are not within the scope of Appendix D of ACI 318, and as amended in Sections 1905.1.9 and 1905.1.10, shall be in accordance with an *approved* procedure.~~

Reason: Requirements for the design and installation of adhesive anchors was included in ACI 318-11. Requirements for continuous inspection were added for adhesive anchors installed horizontally or in upwardly inclined orientations with sustained loads.

The difficulty of installing adhesive anchors greatly increases when gravity works to drain the placed epoxy out of the predrilled hole. For consistent installation, trained personnel are essential.

Under sustained tension loads, epoxy will creep and debond as evidenced by the epoxy anchors that supported the ceiling panels in the I-90 connector tunnel in Boston. A proper installation is critical in this case and requires continuous inspection.

In the interest of writing concise code language, recommend deleting this section 1909 and providing a general requirement just after 1901.2, “Plain and reinforced concrete.”

Cost Impact: The code change proposal will not increase the cost of construction.

8. Inspection for maintenance of specified curing temperature and techniques.	—	X	ACI 318: 5.11-5.13	~~1910.9~~

(Portions of table not shown remain unchanged)

1901.2.1 Shotcrete. Shotcrete is mortar or concrete that is pneumatically projected at high velocity onto a surface. Shotcrete shall conform to the requirements of this chapter for plain or reinforced concrete, as applicable.

Delete without substitution:

~~**SECTION 1910**~~
~~**SHOTCRETE**~~

~~**1910.1 General.** Shotcrete is mortar or concrete that is pneumatically projected at high velocity onto a surface. Except as specified in this section, shotcrete shall conform to the requirements of this chapter for plain or reinforced concrete.~~

~~**1910.2 Proportions and materials.** Shotcrete proportions shall be selected that allow suitable placement procedures using the delivery equipment selected and shall result in finished in-place hardened shotcrete meeting the strength requirements of this code.~~

~~**1910.3 Aggregate.** Coarse aggregate, if used, shall not exceed 3/4 inch (19.1 mm).~~

~~**1910.4 Reinforcement.** Reinforcement used in shotcrete construction shall comply with the provisions of Sections 1910.4.1 through 1910.4.4.~~

~~**1910.4.1 Size.** The maximum size of reinforcement shall be No. 5 bars unless it is demonstrated by preconstruction tests that adequate encasement of larger bars will be achieved.~~

~~**1910.4.2 Clearance.** When No. 5 or smaller bars are used, there shall be a minimum clearance between parallel reinforcement bars of 21/2 inches (64 mm). When bars larger than No. 5 are permitted, there shall be a minimum clearance between parallel bars equal to six diameters of the bars used. When two curtains of steel are provided, the curtain nearer the nozzle shall have a minimum spacing equal to 12 bar diameters and the remaining curtain shall have a minimum spacing of six bar diameters.~~

> ~~**Exception:** Subject to the approval of the *building official*, required clearances shall be reduced where it is demonstrated by preconstruction tests that adequate encasement of the bars used in the design will be achieved.~~

~~**1910.4.3 Splices.** Lap splices of reinforcing bars shall utilize the noncontact lap splice method with a minimum clearance of 2 inches (51 mm) between bars. The use of contact lap splices necessary for support of the reinforcing is permitted when *approved* by the *building official*, based on satisfactory preconstruction tests that show that adequate encasement of the bars will be achieved, and provided that the splice is oriented so that a plane through the center of the spliced bars is perpendicular to the surface of the shotcrete.~~

~~**1910.4.4 Spirally tied columns.** Shotcrete shall not be applied to spirally tied columns.~~

~~**1910.5 Preconstruction tests.** When required by the *building official*, a test panel shall be shot, cured, cored or sawn, examined and tested prior to commencement of the project. The sample panel shall be representative of the project and simulate job conditions as closely as possible. The panel thickness and reinforcing shall reproduce the thickest and most congested area specified in the structural design. It shall be shot at the same angle, using the same nozzleman and with the same concrete mix design that will be used on the project. The equipment used in preconstruction testing shall be the same equipment used in the work requiring such testing, unless substitute equipment is *approved* by the *building official*.~~

~~**1910.6 Rebound.** Any rebound or accumulated loose aggregate shall be removed from the surfaces to be covered prior to placing the initial or any succeeding layers of shotcrete. Rebound shall not be used as aggregate.~~

~~**1910.7 Joints.** Except where permitted herein, unfinished work shall not be allowed to stand for more than 30 minutes unless edges are sloped to a thin edge. For structural elements that will be under compression and for construction joints shown on the *approved construction documents*, square joints are permitted. Before placing additional material adjacent to previously applied work, sloping and square edges shall be cleaned and wetted.~~

~~**1910.8 Damage.** In-place shotcrete that exhibits sags, sloughs, segregation, honeycombing, sand pockets or other obvious defects shall be removed and replaced. Shotcrete above sags and sloughs shall be removed and replaced while still plastic.~~

~~**1910.9 Curing.** During the curing periods specified herein, shotcrete shall be maintained above 40°F (4°C) and in moist condition.~~

~~**1910.9.1 Initial curing.** Shotcrete shall be kept continuously moist for 24 hours after shotcreting is complete or shall be sealed with an *approved* curing compound.~~

~~**1910.9.2 Final curing.** Final curing shall continue for seven days after shotcreting, or for three days if highearly-strength cement is used, or until the specified strength is obtained. Final curing shall consist of the initial curing process or the shotcrete shall be covered with an *approved* moisture-retaining cover.~~

~~**1910.9.3 Natural curing.** Natural curing shall not be used in lieu of that specified in this section unless the relative humidity remains at or above 85 percent, and is authorized by the *registered design professional* and *approved* by the *building official*.~~

~~**1910.10 Strength tests.** Strength tests for shotcrete shall be made by an *approved agency* on specimens that are representative of the work and which have been water soaked for at least 24 hours prior to testing. When the maximum-size aggregate is larger than 3/8 inch (9.5 mm), specimens shall consist of not less than three 3-inch-diameter (76 mm) cores or 3-inch (76 mm) cubes. When the maximum-size aggregate is 3/8 inch (9.5 mm) or smaller, specimens shall consist of not less than 2-inch-diameter (51 mm) cores or 2-inch (51 mm) cubes.~~

~~**1910.10.1 Sampling.** Specimens shall be taken from the in-place work or from test panels, and shall be taken at least once each shift, but not less than one for each 50 cubic yards (38.2 m3) of shotcrete.~~

~~**1910.10.2 Panel criteria.** When the maximum-size aggregate is larger than 3/8 inch (9.5 mm), the test panels shall have minimum dimensions of 18 inches by 18 inches (457 mm by 457 mm). When the maximum size aggregate is 3/8 inch (9.5 mm) or smaller, the test panels shall have minimum dimensions of 12 inches by 12 inches (305 mm by 305 mm). Panels shall be shot in the same position as the work, during the course of the work and by the nozzlemen doing the work. The conditions under which the panels are cured shall be the same as the work.~~

~~**1910.10.3 Acceptance criteria.** The average compressive strength of three cores from the in-place work or a single test panel shall equal or exceed 0.85 f'_c with no single core less than 0.75 f_c'. The average compressive strength of three cubes taken from the in-place work or a single test panel shall equal or exceed f_c' with no individual cube less than 0.88 f_c'. To check accuracy, locations represented by erratic core or cube strengths shall be retested.~~

Reason: Shotcrete is a concrete placement method that is specified by a registered design professional in a set of contract documents. ACI 318 covers the essential information necessary for the design and construction of concrete structures using shotcrete. The requirements currently in the IBC are outdated construction specifications.

ACI 506.2, Specification for Shotcrete, provides a detailed set of construction requirements that represents the current standard of practice. The specification contains quality assurance requirements, 35 referenced standard test methods and material specifications, placement requirements, and acceptance criteria. ACI 506.2 is not being submitted as a reference standard since construction specifications should not be in the building code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1910-S-SENECAL

S217–12
1911, 2501.1.1, 2514 (NEW)

Proponent: Matthew Senecal, P.E., American Concrete Institute (ACI) and Michael Gardner, Gypsum Association

Revise as follows:

SECTION ~~1911~~ 2514 REINFORCED GYPSUM CONCRETE

~~1911.1~~ 2514.1 General. Reinforced gypsum concrete shall comply with the requirements of ASTM C 317 and ASTM C 956.

~~1911.2~~ 2514.2 Minimum thickness. The minimum thickness of reinforced gypsum concrete shall be 2 inches (51 mm) except the minimum required thickness shall be reduced to 11/2 inches (38 mm), provided the following conditions are satisfied:

1. The overall thickness, including the formboard, is not less than 2 inches (51 mm).
2. The clear span of the gypsum concrete between supports does not exceed 33 inches (838 mm).
3. Diaphragm action is not required.
4. The design live load does not exceed 40 pounds per square foot (psf) (1915 Pa).

2501.1.1 General. Provisions of this chapter shall govern the materials, design, construction and quality of gypsum board, lath, gypsum plaster ~~and~~ cement plaster, and reinforced gypsum concrete.

Reason: The design and construction of gypsum concrete roof decks and slabs are governed by ASTM C317 and ASTM C956. The product is gypsum-based and maintained by the ASTM C 11 Gypsum Products group; thus, making it more appropriate for inclusion in Chapter 25.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1911-S-SENECAL

S218–12
1901.3 (NEW), 1912

Proponent: Matthew Senecal, P.E., American Concrete Institute (ACI)

Revise as follows:

1901.3 Composite structural steel and concrete structures. Systems of structural steel acting compositely with reinforced concrete shall be designed in accordance with Section 2206 of this code.

~~**SECTION 1912 CONCRETE-FILLED PIPE COLUMNS**~~

~~**1912.1 General.** Concrete-filled pipe columns shall be manufactured from standard, extra-strong or double-extra-strong steel pipe or tubing that is filled with concrete so placed and manipulated as to secure maximum density and to ensure complete filling of the pipe without voids.~~

~~**1912.2 Design.** The safe supporting capacity of concrete filled pipe columns shall be computed in accordance with the *approved* rules or as determined by a test.~~

~~**1912.3 Connections**. Caps, base plates and connections shall be of *approved* types and shall be positively attached to the shell and anchored to the concrete core. Welding of brackets without mechanical anchorage shall be prohibited. Where the pipe is slotted to accommodate webs of brackets or other connections, the integrity of the shell shall be restored by welding to ensure hooping action of the composite section.~~

~~**1912.4 Reinforcement.** To increase the safe load-supporting capacity of concrete-filled pipe columns, the steel reinforcement shall be in the form of rods, structural shapes or pipe embedded in the concrete core with sufficient clearance to ensure the composite action of the section, but not nearer than 1 inch (25 mm) to the exterior steel shell. Structural shapes used as reinforcement shall be milled to ensure bearing on cap and base plates.~~

~~**1912.5 Fire-resistance-rating protection.** Pipe columns shall be of such size or so protected as to develop the required fire-resistance ratings specified in Table 601. Where an outer steel shell is used to enclose the fire protective covering, the shell shall not be included in the calculations for strength of the column section. The minimum diameter of pipe columns shall be 4 inches (102 mm) except that in structures of Type V construction not exceeding three *stories above grade plane* or 40 feet (12 192 mm) in *building height*, pipe columns used in basements and as secondary steel members shall have a minimum diameter of 3 inches (76 mm).~~

~~**1912.6 Approvals.** Details of column connections and splices shall be shop fabricated by *approved* methods and shall be *approved* only after tests in accordance with the *approved* rules. Shop-fabricated concrete-filled pipe columns shall be inspected by the *building official* or by an *approved* representative of the manufacturer at the plant.~~

Reason: The design and construction of concrete-filled pipe columns is covered in the reference standards stated in 2206 of this code. The requirements above are not complete nor have they been maintained. Recommend adding a general statement that directs the user to the appropriate section.

Cost Impact: The code change proposal will not increase the cost of construction.

SECTION 202
DEFINITIONS

~~**ANCHOR.** Metal rod, wire or strap that secures *masonry* to its structural support.~~

Revise as follows:

2101.2 Design methods. Masonry shall comply with the provisions of ~~one of the following design methods in this chapter~~ TMS 402/ACI 530/ASCE 5 or TMS 403 as well as the ~~requirements of Sections 2101 through 2104. Masonry designed by the *allowable stress design* provisions of Section 2101.2.1, the strength design provisions of Section 2101.2.2, the prestressed masonry provisions of Section 2101.2.3, or the direct design requirements of Section 2101.2.7 shall comply with Section 2105~~ applicable requirements of this chapter.

~~**2101.2.1 Allowable stress design.** Masonry designed by the *allowable stress design* method shall comply with the provisions of Sections 2106 and 2107.~~

~~**2101.2.2 Strength design.** Masonry designed by the strength design method shall comply with the provisions of Sections 2106 and 2108, except that autoclaved aerated concrete (AAC) masonry shall comply with the provisions of Section 2106 and Chapter 1 and Appendix A of TMS 402/ACI 530/ASCE 5.~~

~~**2101.2.3 Prestressed masonry.** Prestressed masonry shall be designed in accordance with Chapters 1 and 4 of TMS 402/ACI 530/ASCE 5 and Section 2106. *Special inspection* during construction shall be provided as set forth in Section 1705.4.~~

~~**2101.2.4 Empirical design.** Masonry designed by the empirical design method shall comply with the provisions of Sections 2106 and 2109 or Chapter 5 of TMS 402/ACI 530/ASCE 5.~~

~~**2101.2.5 Glass unit masonry.** Glass unit masonry shall comply with the provisions of Section 2110 or Chapter 7 of TMS 402/ACI 530/ASCE 5.~~

~~**2101.2.6**~~ **2101.2.1 Masonry veneer.** Masonry veneer shall comply with the provisions of Chapter 14 ~~or Chapter 6 of TMS 402/ACI 530/ASCE 5~~.

~~**2101.2.7 Direct design.** Masonry designed by the direct design method shall comply with the provisions of TMS 403.~~

~~**2101.3 Construction documents.** The *construction documents* shall show all of the items required by this code including the following:~~

1. ~~Specified size, grade, type and location of reinforcement, anchors and wall ties.~~
2. ~~Reinforcing bars to be welded and welding procedure.~~
3. ~~Size and location of structural elements.~~
4. ~~Provisions for dimensional changes resulting from elastic deformation, creep, shrinkage, temperature and moisture.~~

5. ~~Loads used in the design of masonry.~~
6. ~~Specified compressive strength of masonry at stated ages or stages of construction for which masonry is designed, except where specifically exempted by this code.~~
7. ~~Details of anchorage of masonry to structural members, frames and other construction, including the type, size and location of connectors.~~
8. ~~Size and permitted location of conduits, pipes and sleeves.~~
9. ~~The minimum level of testing and inspection as defined in Chapter 17, or an itemized testing and inspection program that meets or exceeds the requirements of Chapter 17.~~

2101.3 Special Inspection. The special inspection of masonry shall be as defined in Chapter 17, or an itemized testing and inspection program shall be provided that meets or exceeds the requirements of Chapter 17.

~~2101.3.1~~ 2111.2 Fireplace drawings. The *construction documents* shall describe in sufficient detail the location, size and construction of masonry fireplaces. The thickness and characteristics of materials and the clearances from walls, partitions and ceilings shall be indicated.

2102.1 General. For the purposes of this chapter and as used elsewhere in this code, the following terms are defined in Chapter 2:

~~ANCHOR.~~

Reason: Section 2101 provides a series of pointers to specific sections of the IBC as well as the referenced masonry standards that, due largely to the evolution of Chapter 21 over time, has become a source of confusion. In addition, the 2013 edition of TMS 402 standard has been substantially reorganized to be more user friendly; requiring in turn that a number of the Chapters and Sections referenced in TMS 402 be updated. Instead of updating these pointers, this change proposal simply consolidates the charging language of Section 2101. No technical change is intended or implied. Specific discussion related to this change:
1) The reference to Chapter 14 for masonry veneers is maintained as Chapter 14 addresses some types of masonry veneer not covered by the reference standard (for example, anchored stone veneer). Chapter 14 already contains a reference to Chapter 6 of the reference standard.
2) The construction document requirements of Section 2101.3 are virtually identical to the requirements of Section 1.2.2 of TMS 402 and are therefore proposed to be deleted.
3) Although somewhat redundant, a reference to Chapter 17 for special inspection is maintained as a new Section 2101.3 to reinforce compliance with these requirements.
4) Section 2101.3.1 for fireplace drawings is relocated to Section 2111.2, which covers requirements specific to fireplaces.
5) While the term anchor (or anchorage) is used generically throughout the IBC for all types of building materials, this term (as applied specifically to masonry construction) is used only in Section 2101.3, which is proposed for deletion. As such, the IBC definition is proposed for deletion as well. The definition of 'anchor' in TMS 402 is identical to the IBC definition.

Cost Impact: The code change proposal will not increase the cost of construction.

S219-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2101-S-SAMBLANET-THOMPSON.doc

S220–12
202

Proponent: Phillip Brazil, P.E., S.E., Reid Middleton, Inc., representing self (pbrazil@reidmiddleton.com)

Revise as follows:

CLEANOUT <u>(for Chapter 21)</u>. An opening to the bottom of a grout space of sufficient size and spacing to allow the removal of debris.

DIMENSIONS <u>(for Chapter 21)</u>.

> **Nominal.** The *specified* dimension plus an allowance for the *joints* with which the units are to be laid. Nominal dimensions are usually stated in whole numbers. Thickness is given first, followed by height and then length.
> **Specified.** Dimensions specified for the manufacture or construction of a unit, *joint* <u>or</u> element.

~~**EXISTING CONSTRUCTION.** Any buildings and structures for which the *start of construction* commenced before the effective date of the community's first flood plain management code, ordinance or standard. "Existing construction" is also referred to as "existing structures."~~

~~**EXISTING STRUCTURE (For Section 1612.2).** See "Existing construction".~~

FOUNDATION PIER <u>(for Chapter 21)</u>. An isolated vertical foundation member whose horizontal dimension measured at right angles to its thickness does not exceed three times its thickness and whose height is equal to or less than four times its thickness.

OTHER STRUCTURES <u>(for Chapters 16-23)</u>. Structures, other than buildings, for which *loads* are specified in Chapter 16.

WALL <u>(for Chapter 21)</u>. A vertical element with a horizontal length-to-thickness ratio greater than three, used to enclose space.

> **Cavity wall.** A wall built of *masonry units* or of concrete, or a combination of these materials, arranged to provide an airspace within the wall, and in which the inner and outer parts of the wall are tied together with metal ties.
> **Composite wall.** A wall built of a combination of two or more *masonry units* bonded together, one forming the backup and the other forming the facing elements.
> **Dry-stacked, surface-bonded wall.** A wall built of concrete *masonry units* where the units are stacked dry, without *mortar* on the bed or *head joints*, and where both sides of the wall are coated with a surface-bonding *mortar*.
> **Masonry-bonded hollow wall.** A multi-*wythe* wall built of *masonry units* arranged to provide an air space between the *wythes* and with the *wythes* bonded together with *masonry units.*
> **Parapet wall.** The part of any wall entirely above the roof line.

Reason: The purpose for this proposal is to adjust the definitions in Section 202 to (1) clarify their purpose and (2) to correct errors from approved changes in previous ICC code development cycles that were not made in the building code.

Adding "for Chapter 21" to the definitions of "cleanout," "dimensions," "foundation pier" and "wall" is done to reduce their applicability to what is their intended purpose, namely the structural provisions for masonry in Chapter 21. The terms are sufficiently common in use to justify this action and will make them consistent with the definitions of "area," "cell," "shear wall" and "strength," which are identified in a similar manner.

Adding "for Chapter 21" to the definition of "wall" is also done because of ICC Proposal FS85-07/08-AS, Part II, which added to Section 2102.1 after the definition of "wall" the following: "The definition of 'wall' is limited in application to the provisions of Chapter 21." I was the proponent of this proposal and I requested that this be posted as errata but a posting did not occur nor was the language incorporated into later printings of the 2009 IBC or into the 2012 IBC.

The definitions of "existing construction" and "existing structure" are being deleted because they serve no purpose in the building code. There are no instances of "existing construction" in the 2012 IBC other than as shown in this proposal. There are numerous instances of “existing structure” in the 2012 IBC but there are none in Section 1612 and the definition of “existing structure” is limited to that section as specified in Section 202.

The addition of “for Chapters 16-23” to the definition of “other structures” is because of the use of the term in other sections of the building code (e.g., Sections 402.6.2, 424.3 and 3102.1). The source document for the term is ASCE 7 and it was in 2009 IBC Section 1602.1.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

1612.2-S-BRAZIL.doc

S221–12

2103.15 (NEW), 2103.15.1 (NEW), 2103.15.2 (NEW), 2103.15.3 (NEW), 2104.5 (NEW), Chapter 35 (NEW)

Proponent: John Mulder, Intertek Testing Services NA, Inc., representing International Standards Organization Technical Committee 77, *Products in Fibre-reinforced Cement*

Add new text as follows:

2103.15 Fiber-cement backer board and underlayment. Fiber-cement backer board and underlayment shall conform to the requirements of Section 2103.15.1, 2103.15.2, or 2103.15.3, and shall be so identified on labeling listing an approved quality control agency.

2103.15.1 Fiber-cement backer board. Fiber-cement backer board complying with either ASTM C1288 or ISO 8336, Category B or C, is a suitable *backing* for decoration with paint, wallpaper, resilient flooring, tile, natural stone, or dimensioned stone *veneer* on floors, walls, and ceilings in interior dry areas; and for interior use in wet areas of walls and ceilings as permitted in Section 2509.2.

2103.15.2 Fiber-cement underlayment. Fiber-cement underlayment complying with either ASTM C1288 or ISO 8336, Category B or C, is a suitable *backing* for decoration with resilient flooring, tile, natural stone, or dimensioned stone *veneer* in interior wet or dry areas.

2103.15.3 Fiber-cement backer board. Fiber-cement backer board complying with ISO 8336, Category A, is a suitable *backing* for decoration with tile, natural stone, or dimensioned stone *veneer* on exterior walls.

2104.5 Fiber-cement backer board and underlayment construction. Fiber-cement backer board and underlayment complying with Section 2103.15.1, 2103.15.2, or 2103.15.3, shall be installed in accordance with approved manufacturer's instructions.

Add new standard to Chapter 35 as follows:

ISO

ISO 8336 Fibre-cement flat sheets -- Product Specification and Test Methods

Reason: Fiber-cement backer board and underlayment products are cement-based masonry-type products currently recognized for use through ICC-ES evaluation reports (see attached ESR-1381[reference Sections 2, 3 and 4.3], ESR-2280[reference Sections 2, 3 and 4], and ESR-2292[reference Sections 2, 3 and 4.2]). The inclusion in this Code Section confirms their currently recognized use as a base for tile setting materials also included in Chapter 21 of the Code. Fiber-cement backer board and underlayment products are masonry-type products currently recognized for use through ICC-ES evaluation reports (see attached ESR-1381[reference Sections 2.0, 4.3], ESR-2280[reference Section 4.2], and ESR-2292[reference Section 4.2]). The new reference here provides construction guidance. "See the ICC-ES website (http://www.icc-es.org/) to gain access to the referenced ESR reports. "

Cost Impact: The code change proposal will not increase the cost of construction because the proposed addition of fiber-cement backer board or underlayment products only provides for the choice and use of a type of backer board or underlayment product currently recognized through evaluation reports for use in accordance with the Code.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

SECTION 202
DEFINITIONS

~~**THIN-BED MORTAR.** *Mortar* for use in construction of AAC unit masonry with *joints* 0.06 inch (1.5 mm) or less.~~

Revise as follows:

2102.1 General. For the purposes of this chapter and as used elsewhere in this code, the following terms are defined in Chapter 2:

~~**THIN-BED MORTAR.**~~

2103.1 Masonry units. Concrete masonry units, clay or shale masonry units, stone masonry units, glass unit masonry, and AAC masonry units shall comply with Article 2.3 of TMS 602/ACI 530.1/ASCE 6. Architectural cast stone shall conform to ASTM C1364.

~~**2103.1 Concrete masonry units.** Concrete masonry units shall conform to the following standards: ASTM C 55 for concrete brick; ASTM C 73 for calcium silicate face brick; ASTM C 90 for load-bearing concrete masonry units or ASTM C 744 for prefaced concrete and calcium silicate masonry units.~~

~~**2103.2 Clay or shale masonry units.** Clay or shale masonry units shall conform to the following standards: ASTM C 34 for structural clay *load-bearing wall* tile; ASTM C 56 for structural clay nonload-bearing wall tile; ASTM C 62 for building brick (solid masonry units made from clay or shale); ASTM C 1088 for solid units of thin veneer brick; ASTM C 126 for ceramic-glazed structural clay facing tile, facing brick and solid masonry units; ASTM C 212 for structural clay facing tile; ASTM C 216 for facing brick (solid masonry units made from clay or shale); ASTM C 652 for hollow brick (hollow masonry units made from clay or shale) or ASTM C 1405 for glazed brick (single-fired solid brick units).~~

> **Exception:** Structural clay tile for nonstructural use in fireproofing of structural members and in wall furring shall not be required to meet the compressive strength specifications. The fire-resistance rating shall be determined in accordance with ASTM E 119 or UL 263 and shall comply with the requirements of Table 602.

~~**2103.3 AAC masonry.** AAC masonry units shall conform to ASTM C 1386 for the strength class specified.~~

~~**2103.4 Stone masonry units.** Stone masonry units shall conform to the following standards: ASTM C 503 for marble building stone (exterior); ASTM C 568 for limestone building stone; ASTM C 615 for granite building stone; ASTM C 616 for sandstone building stone; or ASTM C 629 for slate building stone.~~

~~**2103.5 Architectural cast stone.** Architectural cast stone shall conform to ASTM C 1364.~~

~~**2103.6 Ceramic tile.** Ceramic tile shall be as defined in, and shall conform to the requirements of, ANSI A137.1.~~

~~**2103.7 Glass unit masonry.** Hollow glass units shall be partially evacuated and have a minimum average glass face thickness of 3/16 inch (4.8 mm). Solid glass-block units shall be provided when required. The surfaces of units intended to be in contact with mortar shall be treated with a polyvinyl butyral coating or latex-based paint. Reclaimed units shall not be used.~~

~~**2103.8**~~ **2103.1.1 Second-hand units.** Second-hand masonry units shall not be reused unless they conform to the requirements of new units. The units shall be of whole, sound materials and free from cracks and other defects that will interfere with proper laying or use. Old mortar shall be cleaned from the unit before reuse.

~~**2103.9 Mortar.** Mortar for use in masonry construction shall conform to ASTM C 270 and Articles 2.1 and 2.6 A of TMS 602/ACI 530.1/ASCE 6, except for mortars listed in Sections 2103.10, 2103.11 and 2103.12. Type S or N mortar conforming to ASTM C 270 shall be used for glass unit masonry.~~

2103.2 Mortar. Mortar for masonry construction shall comply with Section 2103.2.1, 2103.2.2, or 2103.2.3.

2103.2.1 Masonry mortar. Mortar for use in masonry construction shall conform to Articles 2.1 and 2.6 A of TMS 602/ACI 530.1/ASCE 6.

~~**2103.10**~~ **2103.2.2 Surface-bonding mortar.** Surface-bonding mortar shall comply with ASTM C 887. Surface bonding of concrete masonry units shall comply with ASTM C 946.

~~**2103.11**~~ **2103.2.3 Mortars for ceramic wall and floor tile.** Portland cement mortars for installing ceramic wall and floor tile shall comply with ANSI A108.1A and ANSI A108.1B and be of the compositions indicated in Table 2103.11.

~~**2103.12 Mortar for AAC masonry.** Thin-bed mortar for AAC masonry shall comply with Article 2.1 C.1 of TMS 602/ ACI 530.1/ASCE 6. Mortar used for the leveling courses of AAC masonry shall comply with Article 2.1 C.2 of TMS 602/ ACI 530.1/ASCE 6.~~

~~**2103.13**~~ **2103.3 Grout.** Grout shall comply with Article 2.2 of TMS 602/ACI 530.1/ASCE 6.

~~**2103.14**~~ **2103.4 Metal reinforcement and accessories.** Metal reinforcement and accessories shall conform to Article 2.4 of TMS 602/ACI 530.1/ASCE 6. Where unidentified reinforcement is *approved* for use, not less than three tension and three bending tests shall be made on representative specimens of the reinforcement from each shipment and grade of reinforcing steel proposed for use in the work.

Reason: The modifications proposed here simply consolidate the material requirements of Section 2103 by referencing the appropriate articles in TMS 602 instead of transcribing these provisions into the IBC. No substantive change is intended or implied. Some provisions are maintained in Section 2103 as they are not addressed by TMS 602. These include: architectural cast stone meeting ASTM C1364, compressive strength exemptions for structural clay tile used as fireproofing, second-hand units, surface-bonding mortar, mortars for tile, and testing of unidentified reinforcement and accessories.

Cost Impact: The code change proposal will not increase the cost of construction.

2103-S-SAMBLANET-THOMPSON.doc

S223–12
2103.1, Chapter 35 (NEW)

Proponent: Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards (jthompson@nema.org)

Revise as follows:

2103.1 Concrete masonry units. Concrete masonry units shall conform to the following standards: ASTM C 55 for concrete brick; ASTM C 73 for calcium silicate face brick; ASTM C 90 for load-bearing concrete masonry units or ASTM C 744 for prefaced concrete and calcium silicate masonry units or ASTM C1634 for concrete facing brick.

Add new standard to Chapter 35 as follows:

ASTM

C1634-11, Specification for Concrete Facing Brick

Reason: The change proposed to introduce a reference to ASTM C1634 that addresses the minimum requirements for concrete facing brick. Concrete facing brick manufactured to comply with ASTM C1634 are similar in nature to concrete brick manufactured to comply with ASTM C55, with a few notable exceptions as explained in a non-mandatory note contained in ASTM C1634:

NOTE 1—Specification C55 addresses concrete building brick used in non-facing, utilitarian applications (previously referred to in earlier editions of Specification C55 as Grade S—for general use where moderate strength and resistance to frost action and moisture penetration are required). This specification differs from Specification C55 in that it includes expanded consideration for properties of concrete brick used in facing applications and other exposures (previously referred to in earlier editions of Specification C55 as Grade N—for use as architectural veneer and facing units in exterior walls and for use where high strength and resistance to moisture penetration and severe frost action are desired).

Due to the intended applications of C1634 unit, the physical requirements contained in ASTM C1634 are more stringent relative to those of ASTM C55. For example, the average compressive strength of ASTM C55 brick is 2,500 psi; whereas ASTM C1634 required a minimum compressive strength of 3,500 psi. Similarly the maximum absorption requirements of ASTM C1634 are less than the corresponding requirements of ASTM C55.

Historically, the physical requirements for ‘utility brick’ and ‘facing brick’ were covered together within ASTM C55 (as Grade S and Grade N brick, respectively); albeit with unique requirements for each. This often resulted in confusion in the field when a specification simply cited “ASTM C55”, as it was not clear if Grade S or Grade N brick were intended. As a result, the minimum physical requirements for ‘utility brick’ and ‘facing brick’ were separated into their own unique standards.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

2103.1-S-THOMPSON.doc

S224–12
2103.15 (NEW), Chapter 35 (NEW)

Proponent: James K. Hicks, P.E., CeraTech, Inc., representing self (jim.hicks@ceratechinc.com)

Add new text as follows:

2103.15 Rapid Hardening Cement. Rapid hardening hydraulic cement shall conform to ASTM C1600,

Add new standard to Chapter 35 as follows:

ASTM

C1600-11 Standard Specification for Rapid Hardening Hydraulic Cement

Reason: For those instances wherein rapid hardening is desired, cements conforming to ASTM C 1600 Standard Specification for Rapid hardening Hydraulic Cements are useable. ASTM C 1600 can be one of four cement types, General Rapid Hardening (GRH), Moderate Rapid Hardening (MRH), Very Rapid Hardening (VRH) and Ultra Rapid Hardening (URH).

C 1600 is a Specification giving numerous performance requirements. Primary characteristics (with inherent increased design flexibility) are:

•Can produce rapid-hardening concrete, precast concrete, block, mortar and grout.
•Depending on the type cement used and the specific mixture, cements meeting ASTM C 1600 can provide normal, medium or fast time to service (1.5 to 48 h)
•ASTM C 1600 has rigid durability requirements.

ASTM C 1600 cements are used in products such as:

• Materials for Concrete Repairs
•High Strength Grouts
•Precast
•Paving
•Some Cements - Mass Concrete
•Some Cements – Heat Resistant
•Some Cements – Chemical Resistant

In addition to following pertinent ACI and ASTM requirements, users of C 1600 cements must heed manufacturers instructions for use. Specific durability aspects of any given mortar or concrete should be evaluated by the appropriate test method(s).

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

	Assembly:	ASF	AMF	DF

2103.15 (NEW)-S-HICKS.doc

S225–12
2104.1, 2104.1.1, 2104.1.2, 3104.1.3, 2104.1.4, 2104.1.5, 2104.1.6, 2104.2, 2104.2.1, 2104.3, 2104.4

Proponent: Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards (jthompson@nema.org), Phil Samblanet, The Masonry Society, representing The Masonry Society (psamblanet@masonrysociety.org)

Revise as follows:

2104.1 Masonry construction. Masonry construction shall comply with the requirements of Sections ~~2104.1.1 through 2104.4~~ 2104.1.1, 2104.1.2 and with TMS 602/ACI 530.1/ASCE 6.

~~**2104.1.1 Tolerances.** Masonry, except masonry veneer, shall be constructed within the tolerances specified in TMS 602/ACI 530.1/ASCE 6.~~

~~**2104.1.2 Placing mortar and units.** Placement of mortar, grout, and clay, concrete, glass, and AAC masonry units shall comply with TMS 602/ACI 530.1/ASCE 6.~~

~~**2104.1.3 Installation of wall ties.** Wall ties shall be installed in accordance with TMS 602/ACI 530.1/ASCE 6.~~

~~**2104.1.4 Chases and recesses.** Chases and recesses shall be constructed as masonry units are laid. Masonry directly above chases or recesses wider than 12 inches (305 mm) shall be supported on lintels.~~

~~**2104.1.5 Lintels.** The design for lintels shall be in accordance with the masonry design provisions of either Section 2107 or 2108.~~

~~**2104.1.6**~~ **2104.1.1 Support on wood.** Masonry shall not be supported on wood girders or other forms of wood construction except as permitted in Section 2304.12.

~~**2104.2 Corbeled masonry.** Corbeled masonry shall comply with the requirements of Section 1.12 of TMS 402/ACI 530/ ASCE 5.~~

~~**2104.2.1**~~ **2104.1.2 Molded cornices.** Unless structural support and anchorage are provided to resist the overturning moment, the center of gravity of projecting masonry or molded cornices shall lie within the middle one-third of the supporting wall. Terra cotta and metal cornices shall be provided with a structural frame of *approved* noncombustible material anchored in an *approved* manner.

~~**2104.3 Cold weather construction.** The cold weather construction provisions of TMS 602/ACI 530.1/ASCE 6, Article 1.8 C, shall be implemented when the ambient temperature falls below 40°F (4°C).~~

~~**2104.4 Hot weather construction.** The hot weather construction provisions of TMS 602/ACI 530.1/ASCE 6, Article 1.8 D, shall be implemented when the ambient air temperature exceeds 100°F (37.8°C), or 90°F (32.2°C) with a wind velocity greater than 8 mph (12.9 km/hr).~~

Reason: The modifications proposed here simply consolidate the masonry construction requirements of Section 2104 by referencing the requirements of TMS 602 instead of transcribing these provisions into the IBC. No substantive change is intended or implied. Some provisions are maintained in Section 2104 as they are not addressed by TMS 602. These include: support of masonry on wood construction and support/anchorage of molded cornices and terra cotta.

Cost Impact: The code change proposal will not increase the cost of construction.

SECTION 202
DEFINITIONS

~~**COMPRESSIVE STRENGTH OF MASONRY.** Maximum compressive force resisted per unit of net cross-sectional *area* of *masonry*, determined by the testing of masonry *prisms*.~~

~~**PRISM.** An assemblage of *masonry units* and *mortar* with or without grout used as a test specimen for determining properties of the *masonry*.~~

Revise as follows:

2102.1 General. For the purposes of this chapter and as used elsewhere in this code, the following terms are defined in Chapter 2:

~~**COMPRESSIVE STRENGTH OF MASONRY.**~~

~~**PRISM**~~

~~**SECTION 2105**~~
~~**QUALITY ASSURANCE**~~

~~**2105.1 General.**~~

~~**2105.2 Acceptance relative to strength requirements.**~~

~~**2105.2.1 Compliance with *f ′m* and *f ′AAC*.**~~

~~**2105.2.2 Determination of compressive strength.**~~

~~**2105.2.2.1 Unit strength method.**~~

~~**2105.2.2.1.1 Clay masonry.**~~

~~**TABLE 2105.2.2.1.1**~~
~~**COMPRESSIVE STRENGTH OF CLAY MASONRY**~~

~~**2105.2.2.1.2 Concrete masonry.**~~

~~**TABLE 2105.2.2.1.2**~~
~~**COMPRESSIVE STRENGTH OF CONCRETE MASONRY**~~

~~**2105.2.2.1.3 AAC masonry.**~~

~~**2105.2.2.2 Prism test method.**~~

~~**2105.2.2.2.1 General.**~~

~~**2105.2.2.2.2 Number of prisms per test.**~~

~~**2105.3 Testing prisms from constructed masonry.**~~

~~**2105.3.1 Prism sampling and removal.**~~

~~**2105.3.2 Compressive strength calculations.**~~

~~**2105.3.3 Compliance.**~~

SECTION 2105
QUALITY ASSURANCE

2105.1 General. A quality assurance program shall be used to ensure that the constructed masonry is in compliance with the *construction documents*.

The quality assurance program shall comply with the inspection and testing requirements of Chapter 17 and TMS 602/ACI 530.1/ASCE 6.

Reason: The modifications proposed here simply consolidate the masonry quality assurance requirements of Section 2105 by referencing the requirements of TMS 602 instead of transcribing these provisions into the IBC. No substantive change is intended or implied. The provisions of Section 2105 are virtually identical to the corresponding requirements in TMS 602.

Cost Impact: The code change proposal will not increase the cost of construction.

S226-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2105 (NEW)-S-SAMBLANET.doc

S227–12
2107.1, 2107.2, 2107.2.1, 2107.3, 2107.4, 2108.1, 2108.2, 2108.3

Proponent: Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Code and Standards (Thompson@nema.org)

Revise as follows:

2107.1 General. The design of masonry structures using *allowable stress design* shall comply with Section 2106 and the requirements of Chapters 1 and 2 of TMS 402/ACI 530/ ASCE 5 except as modified by Sections 2107.2 ~~through 2107.4~~ and 2107.3.

~~**2107.2 TMS 402/ACI 530/ASCE 5, Section 2.1.7.7.1.1, lap splices.** In lieu of Section 2.1.7.7.1.1, it shall be permitted to design lap splices in accordance with Section 2107.2.1.~~

~~**2107.2.1 Lap splices.** The minimum length of lap splices for reinforcing bars in tension or compression, l_d, shall be~~

~~$l_d = 0.002db\ f_s$ **(Equation 21-1)**~~

~~For SI: $l_d = 0.29db\ f_s$~~

~~but not less than 12 inches (305 mm). In no case shall the length of the lapped splice be less than 40 bar diameters.~~

~~where:~~

~~d_b = Diameter of reinforcement, inches (mm).~~
~~f_s = Computed stress in reinforcement due to design loads, psi (MPa).~~

~~In regions of moment where the design tensile stresses in the reinforcement are greater than 80 percent of the allowable steel tension stress, F_s, the lap length of splices shall be increased not less than 50 percent of the minimum required length. Other equivalent means of stress transfer to accomplish the same 50 percent increase shall be permitted. Where epoxy coated bars are used, lap length shall be increased by 50 percent.~~

~~2107.3~~ 2107.2 TMS 402/ACI 530/ASCE 5, Section 2.1.7.1, splices of reinforcement. Modify Section 2.1.8.7 as follows:

> 2.1.7.1 Splices of reinforcement. Lap splices, welded splices or mechanical splices are permitted in accordance with the provisions of this section. All welding shall conform to AWS D1.4. Welded splices shall be of ASTM A 706 steel reinforcement. Reinforcement larger than No. 9 (M #29) shall be spliced using mechanical connections in accordance with Section 2.1.7.7.3.

~~2107.4~~ 2107.3 TMS 402/ACI 530/ASCE 5, Section 2.3.6, maximum bar size. Add the following to Chapter 2:

> 2.3.7 Maximum bar size. The bar diameter shall not exceed one-eighth of the nominal wall thickness and shall not exceed one-quarter of the least dimension of the cell, course or collar joint in which it is placed.

2108.1 General. The design of masonry structures using strength design shall comply with Section 2106 and the requirements of Chapters 1 and 3 of TMS 402/ACI 530/ ASCE 5, except as modified by Section 2108.2 ~~through 2108.3~~.

Exception: AAC masonry shall comply with the requirements of Chapters 1 and 8 of TMS 402/ACI 530/ASCE 5.

~~**2108.2 TMS 402/ACI 530/ASCE 5, Section 3.3.3.3 development.** Modify the second paragraph of Section 3.3.3.3 as follows:~~

~~The required development length of reinforcement shall be determined by Equation (3-16), but shall not be less than 12 inches (305 mm) and need not be greater than 72~~ ~~d_b.~~

~~**2108.3**~~ **2108.2** **TMS 402/ACI 530/ASCE 5, Section 3.3.3.4, splices.** Modify items (c) and (d) of Section 3.3.3.4 as follows:

3.3.3.4 (c). A welded splice shall have the bars butted and welded to develop at least 125 percent of the yield strength, f_y, of the bar in tension or compression, as required. Welded splices shall be of ASTM A 706 steel reinforcement. Welded splices shall not be permitted in plastic hinge zones of intermediate or special reinforced walls or special moment frames of masonry.

3.3.3.4 (d). Mechanical splices shall be classified as Type 1 or 2 according to Section 21.2.6.1 of ACI 318. Type 1 mechanical splices shall not be used within a plastic hinge zone or within a beam-column joint of intermediate or special reinforced masonry shear walls or special moment frames. Type 2 mechanical splices are permitted in any location within a member.

Reason: Several cycles back the allowable stress and strength design lap splicing requirements for masonry construction were modified as research in this area was still underway. The modifications introduced into the IBC were a stop-gap measure of implementing lap splice detailing requirements based upon similar provisions from the UBC (for ASD) or an upper lap length cap (for SD) while this research was being completed. The research is now complete and the results are reflected in the latest edition of the TMS 402 standard; and as such the lap splicing modifications in Chapter 21 are proposed to be deleted.

Early in the research investigation, concern was expressed that lap splice lengths would become unfeasibly long for certain combinations of bar size, clearance, or cover distances in order to maintain the ductility inherently assumed or explicitly required by contemporary seismic design models and loading requirements as summarized in the following research investigation: http://www.ncma.org/resources/design/Research%20Reports/MR12.pdf

As this research concludes, some reinforcement detailing alternatives (such as a very large diameter reinforcing bar located with minimal masonry cover distance) do not provide targeted strength or ductility with lap splices unless the lap length is exceptionally long or reinforcement is placed transverse to the lap-spliced reinforcement (such as reinforcement in bond beams) as highlighted in the following report: http://www.ncma.org/resources/design/Research%20Reports/MR33.pdf. The IBC lap splice modifications proposed for deletion are based on an upper limit bond strength between reinforcement and grout (in the case of ASD) and an arbitrary cap (in the case of SD) that may not capture all possible failure modes, and therefore may not provide the same level of performance as the lap splice detailing requirements in the TMS 402 reference standard.

Cost Impact: The code change proposal will not increase the cost of construction.

S227-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2107-S-THOMPSON.doc

S228–12
2108.3

Proponent: Charles S. Bajnai, Chesterfield County, VA, representing ICC Building Code Action Committee

Revise as follows:

2108.3 TMS 402/ACI 530/ASCE 5, Section 3.3.3.4, splices. Modify items (c) and (d) of Section 3.3.3.4 as follows:

> 3.3.3.4 (c). A welded splice shall have the bars butted and welded to develop at least 125 percent of the yield strength, f_y, of the bar in tension or compression, as required. Welded splices shall be of ASTM A 706 steel reinforcement. Welded splices shall not be permitted in plastic hinge zones of intermediate or special reinforced walls ~~or special moment frames of masonry~~.
>
> 3.3.3.4 (d). Mechanical splices shall be classified as Type 1 or 2 according to Section 21.2.6.1 of ACI 318. Type 1 mechanical splices shall not be used within a plastic hinge zone or within a beam-column joint of intermediate or special reinforced masonry shear walls ~~or special moment frames~~. Type 2 mechanical splices are permitted in any location within a member.

Reason: The International Code Council's Building Code Action Committee was asked to look at addressing the "special moment frames" reference in the code. This term actually refers to masonry wall frames [a.k.a. special moment frames] which were located in Section 2108.9.6 of the 2000 IBC. The requirements for masonry wall frames were removed from the IBC by code change S145-02 which, along with S122-02, substituted a reference to the strength requirements of the 2002 MSJC for the masonry strength design provisions of the IBC. No other current code or standard contains requirements for masonry wall frames so the reference serves no purpose. The committee also conferred with the Masonry Society and it was affirmed that the deletion of this term is appropriate.

Cost Impact: The code change proposal will not increase the cost of construction.

2111.1, 2111.3, 2111.4, 2113.1, 2113.3, 2113.4

Proponent: Charles S. Bajnai, Chesterfield County, VA, representing ICC Building Code Action Committee (bajnaic@chesterfield.gov)

Revise as follows:

SECTION 2111
MASONRY FIREPLACES

~~**2111.1 Definition.** A masonry fireplace is a fireplace constructed of concrete or masonry. Masonry fireplaces shall be constructed in accordance with this section.~~

2111.1 General. The construction of masonry fireplaces consisting of concrete or masonry shall be in accordance with this section.

~~**2111.3 Seismic reinforcing.** In structures assigned to Seismic Design Category A or B, reinforcement and seismic anchorage are not required. Masonry or concrete fireplaces shall be constructed, anchored, supported and reinforced as required in this chapter. In structures assigned to *Seismic Design Category* C or D, masonry and concrete fireplaces shall be reinforced and anchored as detailed in Sections 2111.3.1, 2111.3.2, 2111.4 and 2111.4.1 for chimneys serving fireplaces. In structures assigned to *Seismic Design Category* E or F, masonry and concrete chimneys shall be reinforced in accordance with the requirements of Sections 2101 through 2108.~~

2111.3 Seismic reinforcing. In structures assigned to *Seismic Design Category* A or B, seismic reinforcement is not required. In structures assigned to *Seismic Design Category* C or D, masonry fireplaces shall be reinforced and anchored as detailed in Sections 2111.3.1, 2111.3.2 and 2111.4. In structures assigned to *Seismic Design Category* E or F, masonry fireplaces shall be reinforced in accordance with the requirements of Sections 2101 through 2108.

~~**2111.4 Seismic anchorage.** Masonry and concrete chimneys in structures assigned to *Seismic Design Category* C or D shall be anchored at each floor, ceiling or roof line more than 6 feet (1829 mm) above grade, except where constructed completely within the *exterior walls*. Anchorage shall conform to the following requirements.~~

2111.4 Seismic anchorage.. Masonry fireplaces and foundations shall be anchored at each floor, ceiling or roof line more than 6 feet (1829 mm) above grade with two 3/16-inch by 1-inch (4.8 mm by 25 mm) straps embedded a minimum of 12 inches (305 mm) into the chimney. Straps shall be hooked around the outer bars and extend 6 inches (152 mm) beyond the bend. Each strap shall be fastened to a minimum of four floor joists with two 1/2-inch (12.7 mm) bolts.

Exception: Seismic anchorage is not required for the following;

1. In structures assigned to *Seismic Design Category* A or B.
2. Where the masonry fireplace is constructed completely within the *exterior walls*.

~~**2111.4.1 Anchorage.** Two 3/16-inch by 1-inch (4.8 mm by 25.4 mm) straps shall be embedded a minimum of 12 inches (305 mm) into the chimney. Straps shall be hooked around the outer bars and extend 6 inches (152 mm) beyond the bend. Each strap shall be fastened to a minimum of four floor joists with two 1/2-inch (12.7 mm) bolts.~~

~~**2113.1 Definition.** A masonry chimney is a chimney constructed of solid masonry units, hollow masonry units grouted solid, stone or concrete, hereinafter referred to as “masonry.” Masonry chimneys shall be constructed, anchored, supported and reinforced as required in this chapter.~~

2113.1 General. The construction of masonry chimneys consisting of solid masonry units, hollow masonry units grouted solid, stone or concrete shall be in accordance with this section.

~~**2113.3 Seismic reinforcing.** Masonry or concrete chimneys shall be constructed, anchored, supported and reinforced as required in this chapter. In structures assigned to *Seismic Design Category* C or D, masonry and concrete chimneys shall be reinforced and anchored as detailed in Sections 2113.3.1, 2113.3.2 and 2113.4. In structures assigned to *Seismic Design Category* A or B, reinforcement and Seismic anchorage is not required. In structures assigned to *Seismic Design Category* E or F, masonry and concrete chimneys shall be reinforced in accordance with the requirements of Sections 2101 through 2108.~~

2113.3 Seismic reinforcing. In structures assigned to *Seismic Design Category* A or B, seismic reinforcement is not required. In structures assigned to *Seismic Design Category* C or D, masonry chimneys shall be reinforced and anchored as detailed in Sections 2113.3.1, 2113.3.2 and 2113.4. In structures assigned to *Seismic Design Category* E or F, masonry chimneys shall be reinforced in accordance with the requirements of Sections 2101 through 2108 and anchored as detailed in Section 2113.4.

~~**2113.4 Seismic anchorage.** Masonry and concrete chimneys and foundations in structures assigned to *Seismic Design Category* C or D shall be anchored at each floor, ceiling or roof line more than 6 feet (1829 mm) above grade, except where constructed completely within the *exterior walls*. Anchorage shall conform to the following requirements.~~

2113.4 Seismic anchorage.. Masonry chimneys and foundations shall be anchored at each floor, ceiling or roof line more than 6 feet (1829 mm) above grade with two 3/16-inch by 1-inch (4.8 mm by 25 mm) straps embedded a minimum of 12 inches (305 mm) into the chimney. Straps shall be hooked around the outer bars and extend 6 inches (152 mm) beyond the bend. Each strap shall be fastened to a minimum of four floor joists with two 1/2-inch (12.7 mm) bolts.

Exception: Seismic anchorage is not required for the following;

1. In structures assigned to *Seismic Design Category* A or B.
2. Where the masonry fireplace is constructed completely within the *exterior walls*.

~~**2113.4.1 Anchorage.** Two 3/16-inch by 1-inch (4.8 mm by 25 mm) straps shall be embedded a minimum of 12 inches (305 mm) into the chimney. Straps shall be hooked around the outer bars and extend 6 inches (152 mm) beyond the bend. Each strap shall be fastened to a minimum of four floor joists with two 1/2-inch (12.7 mm) bolts.~~

Reason: The ICC Building Code Action Committee was asked to look at several concerns with sections 2111 and 2113.

First, it was suggested that a definition for masonry fireplaces and chimneys be added to section 202 instead of the current code language that provides a definition of masonry fireplaces and masonry chimneys within the text of the code, Sections 2111.1 and 2113.1 respectively. However, the was the opinion of the committee that definitions are not necessary for this section. The word “Definitions” is proposed to be removed from the titles of Section 2111.1 and Section 2113.1 as shown and the language was modified from the current “defining” language to be “directive” language. No technical changes were made.

Secondly, there have been errors in the code masonry fireplaces and masonry chimneys were split into two separate sections (S261-99). Sections 2111.3 and 2111.4 refer to seismic reinforcement and anchorage for **fireplaces** while 2113.3 and 2113.4 refer to the seismic reinforcement and anchorage requirements for **chimneys**.

In section 2111.3 it states that “In structures assigned to Seismic Design Category C or D, masonry and concrete **fireplaces** shall be reinforced and anchored…..” Then the following sentence says, “In structures assigned to Seismic Design Category E or F, masonry and concrete **chimneys** shall be reinforced in accordance with….”. Section 2111 is describing **fireplaces** while 2113 describes **chimneys.** So, the reference to “chimneys” should be to “fireplaces”. In addition to the wrong word being used, as written, it implies that fireplaces in SDC C and D are required to be “anchored” while (by omission due to the wrong word) they are not required to be “anchored” in SDC E and F.

In this proposal, sections 2111.3 and 2113.3 have been re-written to address those items as well as to re-organize them to be more clear. In addition, the “Seismic anchorage” and “Anchorage” sections 2111.4/2111.4.1 and 2113.4/2113.4.1, respectively, have been combined for clarity and to remove unnecessary language.

No technical changes have been made and no additional requirements have been added to either section.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

2111.1-S-BAJNAI-BCAC.doc

S230–12
2111.1

Proponent: Jim Buckley, Buckley Rumford Co., representing Masonry Alliance for Codes and Standards and Clay Flue Lining Institute (buckley@rumford.com)

Revise as follows:

2111.1 Definition. A masonry fireplace is a fireplace constructed of ~~concrete or masonry~~ solid masonry units, hollow masonry units grouted solid, stone or concrete, hereinafter referred to as "masonry". Masonry fireplaces shall be constructed in accordance with this section.

Reason: To match the language in Section 2113.1 and in the IRC

Cost Impact: The code change proposal will not increase the cost of construction.

S230-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2111.1-S-BUCKLEY.doc

S231–12
2111.2, 2111.3, 2111.4, 2111.12, 2113.3, 2113.3.1, 2113.3.2

Proponent: Jim Buckley, Buckley Rumford Co., representing Masonry Alliance for Codes and Standards and Clay Flue Lining Institute (buckley@rumford.com)

Revise as follows:

2111.2 Footings and foundations. Footings for masonry fireplaces ~~and their chimneys~~ shall be constructed of concrete or solid masonry at least 12 inches (305 mm) thick and shall extend at least 6 inches (153 mm) beyond the face of the fireplace or foundation wall on all sides. Footings shall be founded on natural undisturbed earth or engineered fill below frost depth. In areas not subjected to freezing, footings shall be at least 12 inches (305 mm) below finished grade.

2111.3 Seismic ~~reinforcing~~ reinforcement. In structures assigned to Seismic Design Category A or B, reinforcement and seismic anchorage are not required. Masonry or concrete fireplaces shall be constructed, anchored, supported and reinforced as required in this chapter. In structures assigned to *Seismic Design Category* C or D, masonry and concrete fireplaces shall be reinforced and anchored as detailed in Sections 2111.3.1, 2111.3.2, 2111.4 and 2111.4.1 for chimneys serving fireplaces. In structures assigned to *Seismic Design Category* E or F, masonry and concrete ~~chimneys~~ fireplaces shall be reinforced in accordance with the requirements of Sections 2101 through 2108.

2111.4 Seismic anchorage. Masonry and concrete ~~chimneys~~ fireplaces in structures assigned to *Seismic Design Category* C or D shall be anchored at each floor, ceiling or roof line more than 6 feet (1829 mm) above grade, except where constructed completely within the *exterior walls*. Anchorage shall conform to the following requirements.

2111.12 Fireplace fireblocking. All spaces between fireplaces and floors and ceilings through which fireplaces pass shall be fireblocked with noncombustible material securely fastened in place. The fireblocking of spaces between wood joists, beams or headers shall be to a depth of 1 inch (25 mm) and shall only be placed on strips of metal or metal lath laid across the spaces between combustible material and the ~~chimney~~ fireplaces.

2113.3 Seismic ~~reinforcing~~ reinforcement. Masonry or concrete chimneys shall be constructed, anchored, supported and reinforced as required in this chapter. In structures assigned to *Seismic Design Category* C or D, masonry and concrete chimneys shall be reinforced and anchored as detailed in Sections 2113.3.1, 2113.3.2 and 2113.4. In structures assigned to *Seismic Design Category* A or B, reinforcement and seismic anchorage is not required. In structures assigned to *Seismic Design Category* E or F, masonry and concrete chimneys shall be reinforced in accordance with the requirements of Sections 2101 through 2108.

2113.3.1 Vertical ~~reinforcing~~ reinforcement. For chimneys up to 40 inches (1016 mm) wide, four No. 4 continuous vertical bars anchored in the foundation shall be placed in the concrete between wythes of solid masonry or within the cells of hollow unit masonry and grouted in accordance with Section 2103.12. Grout shall be prevented from bonding with the flue liner so that the flue liner is free to move with thermal expansion. For chimneys greater than 40 inches (1016 mm) wide, two additional No. 4 vertical bars shall be provided for each additional 40 inches (1016 mm) in width or fraction thereof.

2113.3.2 Horizontal ~~reinforcing~~ reinforcement. Vertical reinforcement shall be placed enclosed within 1/4-inch (6.4 mm) ties, or other reinforcing of equivalent net cross-sectional area, spaced not to exceed 18 inches (457 mm) o.c. in concrete, or placed in the bed joints of unit masonry, at a minimum of every 18 inches (457 mm) of vertical height. Two such ties shall be provided at each bend in the vertical bars.

Reason: More clear, better English.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2111.2-S-BUCKLEY.doc

S232–12
2111.11

Proponent: Jim Buckley, Buckley Rumford Co., representing Masonry Alliance for Codes and Standards and Clay Flue Lining Institute (buckley@rumford.com)

Revise as follows:

2111.11 Fireplace clearance. Any portion of a masonry fireplace located in the interior of a building or within the *exterior wall* of a building shall have a clearance to combustibles of not less than 2 inches (51 mm) from the front faces and sides of masonry fireplaces and not less than 4 inches (102 mm) from the back faces of masonry fireplaces. The airspace shall not be filled, except <u>with noncombustible insulation or</u> to provide fireblocking in accordance with Section 2111.12.

Exceptions:

1. Masonry fireplaces *listed* and labeled for use in contact with combustibles in accordance with UL 127 and installed in accordance with the manufacturer's installation instructions are permitted to have combustible material in contact with their exterior surfaces.
2. When masonry fireplaces are constructed as part of masonry or concrete walls, combustible materials shall not be in contact with the masonry or concrete walls less than 12 inches (306 mm) from the inside surface of the nearest firebox lining.
3. Exposed combustible *trim* and the edges of sheathing materials, such as wood siding, flooring and drywall, are permitted to abut the masonry fireplace sidewalls and hearth extension, in accordance with Figure 2111.11, provided such combustible *trim* or sheathing is a minimum of 12 inches (306 mm) from the inside surface of the nearest firebox lining.
4. Exposed combustible mantels or *trim* is permitted to be placed directly on the masonry fireplace front surrounding the fireplace opening, provided such combustible materials shall not be placed within 6 inches (153 mm) of a fireplace opening. Combustible material directly above and within 12 inches (305 mm) of the fireplace opening shall not project more than 1/8 inch (3.2 mm) for each 1-inch (25 mm) distance from such opening. Combustible materials located along the sides of the fireplace opening that project more than 11/2 inches (38 mm) from the face of the fireplace shall have an additional clearance equal to the projection.

Reason: To allow noncombustible insulation in clearance to combustible spaces. It clears up confusion with the reference to fireblocking (which can be noncombustible insulation) and is what builders do anyway.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

2111.12-S-BUCKLEY.doc

S234–12
2112.2, 2112.5, Chapter 35 (NEW)

Proponent: Timothy N. Seaton, B.S.C.E, Empire Masonry Heaters LLC (tseaton@masonryheater.com)

Revise as follows:

2112.2 Installation. Masonry heaters shall be installed in accordance with this section and comply with one of the following:

1. Masonry heaters shall comply with the requirements of ASTM E 1602; or
2. Masonry heaters shall be *listed* and labeled in accordance with UL 1482 <u>or EN 15250</u> and installed in accordance with the manufacturer's installation instructions.

2112.5 Masonry heater clearance. Combustible materials shall not be placed within 36 inches (765 mm) of the outside surface of a masonry heater in accordance with NFPA 211, Section 8-7 (clearances for solid fuel-burning appliances), and the required space between the heater and combustible material shall be fully vented to permit the free flow of air around all heater surfaces.

Exceptions:

1. When the masonry heater wall thickness is at least 8 inches (203 mm) thick of solid masonry and the wall thickness of the heat exchange channels is at least 5 inches (127 mm) thick of solid masonry, combustible materials shall not be placed within 4 inches (102 mm) of the outside surface of a masonry heater. A clearance of at least 8 inches (203 mm) shall be provided between the gas-tight capping slab of the heater and a combustible ceiling.
2. Masonry heaters *listed* and labeled in accordance with UL 1482 <u>or EN 15250</u> and installed in accordance with the manufacturer's instructions.

Add new standard to Chapter 35 as follows:

<u>**EN**</u>

<u>EN 15250 - Slow heat release appliances fired by solid fuel – Requirements and test methods</u>

Reason: UL 1482, *Solid-Fuel Type Room Heaters*, was created to evaluate wood stoves and similar appliances. It does not address thermal mass storage devices of masonry construction such as masonry heaters and contains significant deficiencies in evaluating them. Specifically, UL 1482 stipulates fueling the appliance until temperature equilibrium is reached at which point the safety clearances are verified. This is not an appropriate end of test for masonry heaters and cannot in testing application actually be clearly reached. While UL 1482 may eventually be modified to specifically address masonry heaters, in 2007 the European standard EN 15250, *Slow heat release appliances fired by solid fuel. Requirements and test method,* was finalized specifically to address masonry heaters and similar devices and has since been adopted by 37 countries in Europe and elsewhere. Since Europe is the original source of virtually all masonry heater technology and since IBC already references European Union standards elsewhere, it is appropriate to reference this standard here. EN 15250 stipulates the same allowable temperature elevations of adjacent combustible materials as UL 1482 but uses an appropriate test fueling method.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

2112.2-S-SEATON.doc

S235–12
2112.5, Table 2112.1 (NEW), Chapter 35 (NEW)

Proponent: Timothy N. Seaton, B.S.C.E., Empire Masonry Heaters LLC

Revise as follows:

2112.5 Masonry heater clearance. Combustible materials shall not be placed within 36 inches (765 mm) of the outside surface of a masonry heater in accordance with NFPA 211, Section 8-7 (clearances for solid fuel-burning appliances), and the required space between the heater and combustible material shall be fully vented to permit the free flow of air around all heater surfaces.

Exceptions:

1. Where the masonry heater wall thickness is at least 8 inches (203 mm) thick of solid masonry and the wall thickness of the heat exchange channels is at least 5 inches (127 mm) thick of solid masonry, ~~combustible materials shall not be placed within 4 inches (102 mm) of the outside surface of a masonry heater. A clearance of at least 8 inches (203 mm) shall be provided between the gas-tight capping slab of the heater and a combustible ceiling.~~ or when the wall thicknesses are similarly 4 inches (102 mm) at the firebox and 2 ½ inches (64 mm) at the heat exchange channel but are lined with at least the inner 2 inches (51 mm) and 1 inch (25 mm) respectively of firebrick(ASTM C27 or ASTM C1261) or refractory equivalent, clearances shall be according to Table 2112.5
2. Where masonry heaters *listed* and labeled in accordance with UL 1482 and installed in accordance with the manufacturer's instructions clearances will be as listed.

TABLE 2112.5
MASONRY HEATER CLEARANCES TO COMBUSTIBLE MATERIALS

CONTROLLING STANDARD PROVISIONS	MINIMUM MASONRY HEATER WALL CONSTRUCTION THICKNESS		CLEARANCES FROM COMBUSTIBLE					
			WALLS				CEILINGS	
	Firebox	Channels	Unprotected	Non-combustible wall surface material[b]	Protective shield[c] (from shield)	Both surface[b] and shield[b] (from shield)	Unprotected	Protective shield[c] (from shield)
2112.5 ASTM E 1602 (with NFPA 211)			36" (914 mm)	As per NFPA 211 Section 12.6			As per NFPA 211 Section 12.6	
2112.5.1 ASTM E 1602 (with Exception 1)	8" (203 mm)	5" (127 mm)	4" (102 mm)				8" (203 mm)	
	4" (100 mm) [including 2" (50 mm) firebrick lining[a]]	2.5" (64 mm) [including 1" (25 mm) firebrick lining[a]}	10" (250 mm)	6" (150 mm)	5" (127 mm)	3" (75 mm)	10" (260 mm)	5" (127 mm)
2112.5.2 UL 1482/EN 15250 (with Exception 2)	As per manufacturer		As per listing				As per listing	

a. "Firebrick lining" is a lining constructed of firebrick conforming to ASTM C27 or C1261 or refactor equivalent.

b. "Non-combustible wall surface material" is a wall covering facing the masonry heater made from non-combustible material (Fire Class A) and having at least a 30 minute Fire Resistance Rating

c. "Protective shield" is a non-combustible protective shield placed between the masonry heater and the wall, which extends sideways beyond the heater, and is separated from the wall by at least 1.25 inches (30 mm) and from the floor and ceiling by at least 2 inches (50 mm). The clearance is measured from the shield.

Add new standard to Chapter 35 as follows:

EN

EN 15250-2007 Slow Heat Release Appliances Fired by Solid Fuel - Requirements and Test Methods

Reason: North American masonry heater technology is virtually all sourced in Europe where the devices have been built for centuries. In conformance with typical European standards, ASTM E1602, *Standard Guide for Construction of Solid Fuel Burning Masonry Heaters,* does not stipulate masonry heater wall thickness nor relate it to clearances to combustibles. In contrast to masonry fireplace construction and operation, masonry heater wall thickness does not necessarily relate to surface temperature but instead to the time it takes for the heat to begin radiating from the surface and to the total time radiation will occur. For this reason thicker wall construction may in fact be more dangerous with overfiring situations than thinner wall construction.

Until recent IBC and IRC code revisions, all minimum masonry heater clearances were 4" (102 mm) to surface wall or protective shield as per ASTM E1602. I can locate no documented examples of wall ignition from masonry heaters of any wall thickness at this clearance or under ASTM E1602 as the sole ruling clearance standard.

In the recent IBC/IRC code revisions "NFPA 211, Section 8-7 (clearances for solid fuel-burning appliances)" (*sic)* was made the ruling standard for masonry heater clearances instead of ASTM E1602 even though this former standard was created for wood stoves and similar appliances and had no real application to masonry heaters. This standard stipulates 36" clearance to combustible materials with possible reduction to 12" with approved reduction methods. These clearances may be realistic for metal stoves and similar appliances but are unnecessarily restrictive for masonry heaters which in contrast by definition cannot exceed 230º F (110º C) surface temperatures in normal operation (ASTM E1602 Section 3.2.14).

The recent IBC/IRC revisions created two exceptions to the NFPA 211 rule; 1) for lab tested and listed devices, and 2) for masonry heaters with thick firebox and heat channel walls which by European practice are only used for masonry heaters with large heat storage intended to be fired at very long intervals. This latter class of masonry heaters is built increasingly rarely in Europe as the energy codes were written and tightened there and lower output and more responsive masonry heating was required. The same change in code structure is occurring here in North America, and the 36" clearance stipulation for other than thick walled masonry heaters is making masonry heater construction in new projects and particularly in renovation projects unnecessarily complex and expensive. The typical masonry heater sold is custom in design and cannot support laboratory safety testing.

I am not proposing removing existing code clearance provisions though they have not been lab safety tested and verified (as the code provisions for masonry fireplaces have not). The existing safety tests, UL127 and UL1482 were created for manufactured metal appliances and limited in their application to masonry devices. Instead I am proposing IBC adopt building code provisions from Europe for masonry heater clearances where such clearances have been verified through decades and centuries of use. There is no overall European Union document for code built (as opposed to listed) masonry heater clearances. I am attaching the prevailing Austrian standard TRVB 105:1986, *Technical Regulations for Preventive Fire Protection: Fireplaces for Solid Fuels* as a more conservative European example. I propose these clearances, which are more restrictive than ASTM E1602, be adopted for masonry heaters not covered by the existing IBC language under an expanded Exception 1. Please note that in this Austrian standard "fireplaces" refers collectively to iron stoves, open fireplaces, and masonry heaters.

Note also that the ASTM C27 and C1261 firebrick citation is borrowed from existing IBC/IRC fireplace provisions. C1261 is no longer listed in the ASTM standards volume and may not have been renewed.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

S235-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2112.5 #1-S-SEATON.doc

S236–12
2112.5

Proponent: Timothy N. Seaton, B.S.C.E., Empire Masonry Heaters LLC (tseaton@masonryheater.com)

Revise as follows:

2112.5 Masonry heater clearance. Combustible materials shall not be placed within 36 inches (~~765~~ 914 mm) or the distance of the allowed reduction method ~~of~~ from the outside surface of a masonry heater in accordance with NFPA 211, Section ~~8-7 (clearances for solid fuel-burning appliances),~~ 12.6 Clearances from Solid Fuel-Burning Appliances, and the required space between the heater and combustible material shall be fully vented to permit the free flow of air around all heater surfaces.

Exceptions:

1. When the masonry heater wall thickness is at least 8 inches (203 mm) thick of solid masonry and the wall thickness of the heat exchange channels is at least 5 inches (127 mm) thick of solid masonry, combustible materials shall not be placed within 4 inches (102 mm) of the outside surface of a masonry heater. A clearance of at least 8 inches (203 mm) shall be provided between the gas-tight capping slab of the heater and a combustible ceiling.
2. Masonry heaters *listed* and labeled in accordance with UL 1482 and installed in accordance with the manufacturer's instructions.

Reason: 1) Metric conversion is incorrect; 2) NFPA 211 citation is incorrect; and 3) NFPA 211 Section 12.6 allows clearances under 36" with stipulated distance reduction strategies.

Cost Impact: The code change proposal will not increase the cost of construction.

S236-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2112.5 #2-S-SEATON.doc

S237–12
2113.19

Proponent: Jim Buckley, Buckley Rumford Co., representing Masonry Alliance for Codes and Standards and Clay Flue Lining Institute (buckley@rumford.com)

Revise as follows:

2113.19 Chimney clearances. Any portion of a masonry chimney located in the interior of the building or within the *exterior wall* of the building shall have a minimum airspace clearance to combustibles of 2 inches (51 mm). Chimneys located entirely outside the *exterior walls* of the building, including chimneys that pass through the soffit or cornice, shall have a minimum airspace clearance of 1 inch (25 mm). The airspace shall not be filled, except to provide noncombustible insulation and fireblocking in accordance with Section 2113.20.

Exceptions:

1. Masonry chimneys equipped with a chimney lining system *listed* and labeled for use in chimneys in contact with combustibles in accordance with UL 1777, and installed in accordance with the manufacturer's instructions, are permitted to have combustible material in contact with their exterior surfaces.
2. Where masonry chimneys are constructed as part of masonry or concrete walls, combustible materials shall not be in contact with the masonry or concrete wall less than ~~12 inches (305 mm)~~ 8 inches (204 mm) from the inside surface of the nearest flue lining.
3. Exposed combustible *trim* and the edges of sheathing materials, such as wood siding, are permitted to abut the masonry chimney sidewalls, in accordance with Figure 2113.19, provided such combustible *trim* or sheathing is a minimum of ~~12 inches (305 mm)~~ 8 inches (204 mm) from the inside surface of the nearest flue lining.
   Combustible material and *trim* shall not overlap the corners of the chimney by more than 1 inch (25 mm).

Reason: To allow non ombustible insulation in clearance to combustible spaces. It clears up confusion with the reference to fireblocking (which can be noncombustible insulation) and is what builders do anyway.

Changing the 12" of solid masonry to 8" where chimneys can be in contact with combustible trim or framing in a masonry wall is consistent with the relative wall thicknesses, historic experience and recent engineering studies.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Bonnie Manley, American Iron and Steel Institute, representing American Institute of Steel Construction (bmanley@steel.org)

Revise as follows:

SECTION 202
DEFINITIONS

STEEL ~~MEMBER~~ ELEMENT, STRUCTURAL. Any steel structural member of a building or structure consisting of ~~a rolled steel structural shape~~ rolled shapes, pipe, hollow structural sections, plates, bars, sheets, rods or steel castings other than cold-formed steel, or steel joist members.

Revise as follows:

722.5.1 Structural steel columns. The *fire-resistance ratings* of structural steel columns shall be based on the size of the element and the type of protection provided in accordance with this section.

722.5.1.1 General. These procedures establish a basis for determining the *fire resistance* of column assemblies as a function of the thickness of fire-resistant material and, the weight, *W*, and heated perimeter, *D*, of structural steel columns. As used in these sections, *W* is the average weight of a structural steel column in pounds per linear foot. The heated perimeter, *D*, is the inside perimeter of the fire-resistant material in inches as illustrated in Figure 722.5.1(1).

722.5.1.4 Concrete-protected columns. The *fire resistance* of structural steel columns protected with concrete, as illustrated in Figure 722.5.1(6) (a) and (b), shall be permitted to be determined from the following expression:

$R = R_o(1 + 0.03_m)$ **(Equation 7-14)**

where:

$R_o = 10\ (W/D)^{0.7} + 17\ (h^{1.6}/k_c^{0.2}) \times [1 + 26\ \{H/p_c c_c h\ (L + h)\}^{0.8}]$

As used in these expressions:

R = Fire endurance at equilibrium moisture conditions (minutes).
R_o = Fire endurance at zero moisture content (minutes).
m = Equilibrium moisture content of the concrete by volume (percent).
W = Average weight of the structural steel column (pounds per linear foot).
D = Heated perimeter of the structural steel column (inches).
h = Thickness of the concrete cover (inches).
k_c = Ambient temperature thermal conductivity of the concrete (Btu/hr ft °F).
H = Ambient temperature thermal capacity of the structural steel column = 0.11W (Btu/ ft °F).
p_c = Concrete density (pounds per cubic foot).
c_c = Ambient temperature specific heat of concrete (Btu/lb °F).
L = Interior dimension of one side of a square concrete box protection (inches).

722.5.1.4.1 Reentrant space filled. For wide-flange <u>structural</u> steel columns completely encased in concrete with all reentrant spaces filled [Figure 722.5.1(6)(c)], the thermal capacity of the concrete within the reentrant spaces shall be permitted to be added to the thermal capacity of the steel column, as follows:

$H = 0.11\ W + (p_c c_c/144)\ (b_f d - A_s)$ **(Equation 7-15)**

where:

b_f = Flange width of the <u>structural</u> steel column (inches).
d = Depth of the <u>structural</u> steel column (inches).
A_s = Cross-sectional area of the steel column (square inches).

FIGURE 721.5.1(5)
WIDE FLANGE ~~STRUCTURE~~ <u>STRUCTURAL</u> STEEL COLUMNS WITH SPRAYED FIRE-RESISTANT MATERIALS

(No change to figure)

722.5.1.4.5 Masonry protection. The *fire resistance* of structural steel columns protected with concrete masonry units or clay masonry units as illustrated in Figure 722.5.1(7), shall be permitted to be determined from the following expression:

$R = 0.17\ (W/D)^{0.7} + [0.285\ (T_e^{1.6}/K^{0.2})]$
$[1.0 + 42.7\ \{(A_s/d_m\ T_e)/(0.25p + T_e)\}^{0.8}]$ **(Equation 7-16)**

where:

R = *Fire-resistance rating* of column assembly (hours).
W = Average weight of <u>structural</u> steel column (pounds per foot).
D = Heated perimeter of <u>structural</u> steel column (inches) [see Figure 722.5.1(7)].
T_e = Equivalent thickness of concrete or clay masonry unit (inches) (see Table 722.3.2 Note a or Section 722.4.1).
K = Thermal conductivity of concrete or clay masonry unit (Btu/hr · ft · °F) [see Table 722.5.1(3)].
A_s = Cross-sectional area of <u>structural</u> steel column (square inches).
d_m = Density of the concrete or clay masonry unit (pounds per cubic foot).
p = Inner perimeter of concrete or clay masonry protection (inches) [see Figure 722.5.1(7)].

722.5.2 Structural steel beams and girders. The *fire resistance ratings* of <u>structural</u> steel beams and girders shall be based upon the size of the element and the type of protection provided in accordance with this section.

722.5.2.1 Determination of *fire resistance*. These procedures establish a basis for determining resistance of structural steel beams and girders which differ in size from that specified in *approved* fire-resistance-rated assemblies as a function of the thickness of fire-resistant material and the weight (W) and heated perimeter (D) of the beam or girder. As used in these sections, W is the average weight of a ~~structural steel member~~ <u>*structural steel element*</u> in pounds per linear foot (plf). The heated perimeter, D, is the inside perimeter of the fire-resistant material in inches as illustrated in Figure 722.5.2.

722.5.2.2.1 Minimum thickness. The use of Equation 7-17 is subject to the following conditions:

1. The weight-to-heated-perimeter ratio for the substitute beam or girder (*W2/D2*) shall not be less than 0.37.
2. The thickness of fire protection materials calculated for the substitute beam or girder (*T1*) shall not be less than 3/8 inch (9.5 mm).
3. The unrestrained or restrained beam rating shall not be less than 1 hour.
4. When used to adjust the material thickness for a restrained beam, the use of this procedure is

limited to structural steel sections classified as compact in accordance with the ~~AISC~~ ~~*Specification for Structural Steel Buildings*,~~ (AISC 360-~~05~~).

Revise as follows:

1615.3.2 Structural steel, open web steel joist or joist girder, or composite steel and concrete frame structures. Frame structures constructed with a structural steel frame or a frame composed of open web steel joists, joist girders with or without other ~~structural steel elements~~ *structural steel elements* or a frame composed of composite steel or composite steel joists and reinforced concrete elements shall conform to the requirements of this section.

Revise as follows:

1809.11 Steel grillage footings. Grillage footings of ~~structural steel shapes~~ *structural steel elements* shall be separated with *approved* steel spacers and be entirely encased in concrete with at least 6 inches (152 mm) on the bottom and at least 4 inches (102 mm) at all other points. The spaces between the shapes shall be completely filled with concrete or cement grout.

Revise as follows:

2203.1 Identification. Identification of ~~structural steel members~~ *structural steel elements* shall comply with the requirements contained in AISC 360. Identification of cold-formed steel members shall comply with the requirements contained in AISI S100. Identification of cold-formed steel light-frame construction shall also comply with the requirements contained in AISI S200. Other steel furnished for structural load-carrying purposes shall be properly identified for conformity to the ordered grade in accordance with the specified ASTM standard or other specification and the provisions of this chapter. Steel that is not readily identifiable as to grade from marking and test records shall be tested to determine conformity to such standards.

2203.2 Protection. Painting of ~~structural steel members~~ *structural steel elements* shall comply with the requirements contained in AISC 360. Painting of open-web steel joists and joist girders shall comply with the requirements of SJI CJ-1.0, SJI JG-1.1, SJI K-1.1 and SJI LH/DLH-1.1. Individual structural members and assembled panels of cold-formed steel construction shall be protected against corrosion in accordance with the requirements contained in AISI S100. Protection of cold-formed steel light-frame construction shall also comply with the requirements contained in AISI S200.

2205.1 General. The design, fabrication and erection of *structural steel elements* in ~~for~~ buildings, ~~and~~ structures, and portions thereof shall be in accordance with AISC 360. ~~Where required, the seismic design of structural steel structures shall be in accordance with the additional provisions of Section 2205.2.~~

2205.2 Seismic design. Where required, the seismic design, fabrication and erection of buildings, structures, and portions thereof shall be in accordance with Sections 2205.2.1 or 2205.2.2, as applicable.

2205.2.1 ~~**Seismic requirements for structural steel structures**~~ **Structural steel seismic-force resisting systems.** The design, fabrication and erection of structural steel ~~structures to resist seismic forces~~ seismic-force resisting systems shall be in accordance with the provisions of Section ~~2205.2.1~~ 2205.2.1.1 or ~~2205.2.2~~ 2205.2.1.2, as applicable.

~~**2205.2.1**~~ **2205.2.1.1 Seismic Design Category B or C.** ~~Structural steel~~ Structures assigned to *Seismic Design Category* B or C shall be of any construction permitted in Section 2205. Where a response modification coefficient, R, in accordance with ASCE 7, Table 12.2-1 is used for the design of ~~structural steel~~ structures assigned to *Seismic Design Category* B or C, the structures shall be designed and detailed in accordance with the requirements of AISC 341.

Exception: The response modification coefficient, R, designated for "Steel systems not specifically detailed for seismic resistance, excluding cantilever column systems" in ASCE 7, Table 12.2-1 shall be permitted for systems designed and detailed in accordance with AISC 360, and need not be designed and detailed in accordance with AISC 341.

<u>2205.2.2</u> **Seismic Design Category D, E or F.** ~~Structural steel~~ Structures assigned to *Seismic Design Category* D, E or F shall be designed and detailed in accordance with AISC 341, except as permitted in ASCE 7, Table 15.4-1.

<u>**2205.2.2 Structural steel elements.** The design, fabrication and erection of *structural steel elements* in seismic-force resisting systems other than those covered in Section 2205.2.1, including struts, collectors, chords and foundation elements, shall be designed and detailed in accordance with AISC 341 if:</u>

1. <u>The structure is assigned to Seismic Design Category D, E or F, except as permitted in ASCE 7, Table 15.4-1.</u>
2. <u>A response modification coefficient, R, greater than 3 in accordance with ASCE 7, Table 12.2-1 is used for the design of the structure assigned to Seismic Design Category B or C.</u>

2206.1 General. Systems of ~~structural steel~~ <u>*structural steel elements*</u> acting compositely with reinforced concrete shall be designed in accordance with AISC 360 and ACI 318, excluding ACI 318 Chapter 22. ~~Where required, the seismic design of composite steel and concrete systems shall be in accordance with the additional provisions of Section 2206.2.~~

<u>**2206.2 Seismic design.** Where required, the seismic design, fabrication and erection of composite steel and concrete systems shall be in accordance with the additional provisions of this section.</u>

~~2206.2~~ <u>2206.2.1</u> **Seismic requirements for composite structural steel and concrete construction.** Where a response modification coefficient, R, in accordance with ASCE 7, Table 12.2-1 is used for the design of systems of structural steel acting compositely with reinforced concrete, the structures shall be designed and detailed in accordance with the requirements of AISC 341.

Reason: This comprehensive proposal not only makes a number of editorial modifications for clarification purposes, it also introduces into Chapter 22 the term and associated requirements for "structural steel elements" and carries that change throughout the remainder of the IBC, as necessary. Note that the Chapter 17 proposal introducing this term is handled in a separate, companion proposal. Please refer to it for additional background.

The purpose of introducing this new term and its associated requirements is to ensure that the wide range of structural steel components in buildings, structures and portions thereof are appropriately covered for design, fabrication and erection. Concerns have been expressed by the structural engineering community regarding the limited definition of *structural steel* contained in AISC 360-10:

> *Structural steel.* Steel elements as defined in Section 2.1 of the AISC *Code of Standard Practice for Steel Buildings and Bridges (AISC COSP).*

Section 2.1 of AISC COSP goes on to list many items that are considered structural steel, and Section 2.1 identifies those items that are specifically excluded from the definition. However, these provisions in AISC COSP are intended to provide a default separation of scope between the work of the structural steel fabricator and erector, and the entity providing miscellaneous iron and steel.

Thus, the AISC COSP provides a definition of *structural steel* for default trade practices. Upon reflection, this is not an ideal definition for use in a model building code. To rectify this situation, this proposal introduces the defined term "structural steel element". The specific change from "member" to "element" was to get away from the confusion caused by the difference between the general term, "steel structural member", and the specific AISC-related term, "structural steel member", used throughout the code. Also, language was added clarifying the types of rolled product that fall under this category of steel construction.

Once the definition was settled upon, the new term was integrated into Section 2205. In Section 2205.1, the intent is for all structural steel elements to be designed, fabricated and erected in accordance with AISC 360. Within the seismic design section, the distinction was drawn between structural steel seismic-force resisting systems, which refer to the sixteen structural steel systems currently listed in ASCE 7-10, Table 12.2-1, and structural steel elements that work as struts, collectors, chords and foundation elements in seismic-force resisting systems composed primarily of other structural materials. These structural steel elements are intended to be designed and detailed in accordance with AISC 341, if they are used in a structural in a high seismic area (SDC D, E or F) or they are utilized in a system that relies heavily on non-elastic energy dissipation, in this case chosen to be a system with a response modification coefficient, R, greater than 3.

The remainder of this proposal simply carries the newly defined term through the rest of the IBC.

Cost Impact:.No impact to the cost of construction is anticipated.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202-STEEL MEMBER, STRUCTURAL-G-MANLEY

S239–12
2204.1, 2204.2, 2204.2.1

Proponent: Bonnie Manley, P.E., American Iron and Steel Institute (bmanley@steel.org)

Revise as follows:

2204.1 Welding. The details of design, workmanship and technique for welding, ~~inspection of welding~~ and qualification of welding ~~operators~~ personnel shall conform to the requirements of the specifications listed in Sections 2205, 2206, 2207, 2208, 2210 and 2211. For s*pecial inspection* of welding, see ~~shall be provided where required by~~ Section ~~1705~~ 1705.2.

2204.2 Bolting. The design, installation and inspection of bolts shall be in accordance with the requirements of the specifications listed in Sections 2205, 2206, 2207, 2210 and 2211. For *special inspection* of the installation of high-strength bolts ~~shall be provided where required by~~ see Section ~~1705~~ 1705.2.

~~2204.2.1~~ 2204.3 Anchor rods. Anchor rods shall be set in accordance with the *construction documents*. The protrusion of the threaded ends through the connected material shall fully engage the threads of the nuts, but shall not be greater than the length of the threads on the bolts.

Reason: These changes are editorial in nature and include the following:

- Clarification of the relationship between the standards referenced in Chapter 22 and the requirements for special inspection in Chapter 17
- Deletion of the term "operators" in favor of the term "personnel". The term "operators" excludes welders and tack welders as defined by AWS D1.1. "Personnel" is the more inclusive term.
- Modification of the hierarchy with regard to Anchor Rods. Anchor rods are not bolts. They are rods. They should not be a subsection of bolting, but rather stand on their own.

Cost Impact: The code change proposal will not increase the cost of construction.

1604.3.3, 2203.2, 2207.1, 2207.1.1 (NEW), 2207.2, 2207.3, 2207.4, 2207.5,

Proponent: Bonnie Manley, P.E., American Iron and Steel Institute, representing Steel Joist Institute (bmanley@steel.org)

Revise as follows:

1604.3.3 Steel. The deflection of steel structural members shall not exceed that permitted by AISC 360, AISI S100, ASCE 8, SJI CJ~~-1.0~~, SJI JG~~-1.1~~, SJI K~~-1.1~~ or SJI LH/ DLH~~-1.1~~, as applicable.

2203.2 Protection. Painting of structural steel members shall comply with the requirements contained in AISC 360. Painting of open-web steel joists and joist girders shall comply with the requirements of SJI CJ~~-1.0~~, SJI JG~~-1.1~~, SJI K-1.1 and SJI LH/DLH~~-1.1~~. Individual structural members and assembled panels of cold-formed steel construction shall be protected against corrosion in accordance with the requirements contained in AISI S100. Protection of cold-formed steel light-frame construction shall also comply with the requirements contained in AISI S200.

2207.1 General. The design, manufacture and use of open web steel joists and joist girders shall be in accordance with one of the following Steel Joist Institute (SJI) specifications:

1. SJI-CJ~~-1.0~~
2. SJI-K~~-1.1~~
3. SJI-LH/DLH~~-1.1~~
4. SJI-JG~~-1.1~~

<u>**2207.1.1 Seismic design.**</u> <u>Where required, the seismic design of buildings shall be in accordance with the additional provisions of Section 2205.2 or 2211.6.</u>

2207.2 Design. The *registered design professional* shall indicate on the *construction documents* the steel joist and/or steel joist girder designations from the specifications listed in Section 2207.1 and shall indicate the requirements for joist and joist girder design, layout, end supports, anchorage~~, non-SJI standard~~ bridging, bridging termination connections and bearing connection design to resist uplift and lateral loads. These documents shall indicate special requirements as follows:

1. Special loads including:
   - 1.1. Concentrated loads;
   - 1.2. Nonuniform loads;
   - 1.3. Net uplift loads;
   - 1.4. Axial loads;
   - 1.5. End moments; and
   - 1.6. Connection forces.
2. Special considerations including:
   - 2.1. Profiles for ~~nonstandard~~ joist and joist girder configurations ~~(standard joist and joist girder are as indicated in the SJI catalog)~~ <u>that differ from those defined by the SJI specifications listed in Section 2207.1</u>;
   - 2.2. Oversized or other nonstandard web openings; and
   - 2.3. Extended ends.
3. <u>Live load</u> deflection criteria ~~for live and total loads~~ for ~~non-SJI standard joists~~ <u>and joist girder configurations that differ from those defined by the SJI specifications listed in Section 2207.1</u>.

2207.3 Calculations. The steel joist and joist girder manufacturer shall design the steel joists and/or steel joist girders in accordance with the ~~current~~ SJI specifications ~~and load tables~~ <u>listed in Section 2207.1</u> to support the load requirements of Section 2207.2. The *registered design professional* ~~may~~ <u>shall be permitted to</u> require submission of the steel joist and joist girder calculations as prepared by a *registered* *design professional* responsible for the product design. If requested by the *registered design professional*, the steel joist manufacturer shall submit design calculations with a cover letter bearing the seal and signature of the joist manufacturer's *registered design professional*. In addition to ~~standard~~ the design calculations submitted under ~~this~~ seal and signature, ~~submittal~~ of the following shall be included:

1. ~~Non-SJI standard~~ Bridging ~~details~~ design that differs from the SJI specifications listed in Section 2207.1 (e.g.for cantilevered conditions, net uplift, etc.).
2. Connection ~~details~~ design for:
   2.1. ~~Non-SJI standar~~ Connections that differ from the SJI specifications listed in Section 2207.1 (e.g.flushframed or framed connections);
   2.2. Field splices; and
   2.3. Joist headers.

2207.4 Steel joist drawings. Steel joist placement plans shall be provided to show the steel joist products as specified on the *construction documents* and are to be utilized for field installation in accordance with specific project requirements as stated in Section 2207.2. Steel joist placement plans shall include, at a minimum, the following:

1. Listing of all applicable loads as stated in Section 2207.2 and used in the design of the steel joists and joist girders as specified in the *construction documents*.
2. Profiles for ~~nonstandard~~ joist and joist girder configurations ~~(standard joist and joist girder configurations are as indicated in the SJI catalog)~~ that differ from those defined by the SJI specifications listed in Section 2207.1.
3. Connection requirements for:
   3.1. Joist supports;
   3.2. Joist girder supports;
   3.3. Field splices; and
   3.4. Bridging attachments.
4. Live and total load deflection criteria ~~for live and total loads~~ for ~~non-SJI standard joists~~ and joist girder configurations that differ from those defined by the SJI specifications listed in Section 2207.1.
5. Size, location and connections for all bridging.
6. Joist headers.

Steel joist placement plans do not require the seal and signature of the joist manufacturer's *registered design professional*.

2207.5 Certification. At completion of manufacture, the steel joist manufacturer shall submit a *certificate of compliance* in accordance with Section 1704.2.5.2 stating that work was performed in accordance with *approved construction documents* and with SJI ~~standard~~ specifications listed in Section 2207.1.

Reason: This code change is primarily editorial in nature with the intent to clarify and streamline the requirements for steel joists. Major changes include the following:
- Correction of short titles in Section 2207.1, 1604.3.3 and 2203.2 to reflect the appropriate short title listing in Chapter 35 and correction of SJI address in Chapter 35.
- Deletion of reference to the SJI catalog – it is not an adopted reference.
- Deletion of reference to the load tables; they are now incorporated into the relevant SJI specifications.
- Elimination of the vague terms "nonstandard", "non SJI standard", and "standard" used throughout the section. These terms are not defined. To clarify what is intended, a reference to the requirements found in the SJI specifications listed in Section 2207.1 is substituted.

Addition of "joist girders" to Section 2207.2, Item 3 and Section 2207.4, Item 4 for consistency.

Cost Impact: The code change proposal will not increase the cost of construction.

2207.1-S-MANLEY.doc

S241–12
2207.4

Proponent: Bonnie Manley, P.E., American Iron and Steel Institute, representing Steel Joist Institute (bmanley@steel.org)

Revise as follows:

2207.4 Steel joist drawings. Steel joist placement plans shall be provided to show the steel joist products as specified on the *construction documents* and are to be utilized for field installation in accordance with specific project requirements as stated in Section 2207.2. Steel placement plans shall include, at a minimum, the following:

1. Listing of all applicable loads as stated in Section 2207.2 and used in the design of the steel joists and joist girders as specified in the *construction documents*.
2. Profiles for nonstandard joist and joist girder configurations (standard joist and joist girder configurations are as indicated in the SJI catalog).
3. Connection requirements for:
   3.1. Joist supports;
   3.2. Joist girder supports;
   3.3. Field splices; and
   3.4. Bridging attachments.
4. Deflection criteria for live and total loads for non-SJI standard joists.
5. Size, location and connections for all bridging.
6. Joist headers.

~~Steel joist placement plans do not require the seal and signature of the~~ The joist manufacturer's *registered design professional* shall not be required to sign and seal the steel joist placement plans.

Reason: This code change is editorial in nature, with the intent of correcting the grammar of the sentence.

Cost Impact: The code change proposal will not increase the cost of construction.

S241-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2207.4-S-MANLEY.doc

S242–12
2207.4

Proponent: George R. Stevenson, Jr., S.E., Structural Concepts, Inc., representing Structural Engineers Association of Arizona (gstevenson@scice.com)

Revise as follows:

2207.4 Steel joist drawings. Steel joist placement plans shall be provided to show the steel joist products as specified on the *construction documents* and are to be utilized for field installation in accordance with specific project requirements as stated in Section 2207.2. Steel placement plans shall include, at a minimum, the following:

1. Listing of all applicable loads as stated in Section 2207.2 and used in the design of the steel joists and joist girders as specified in the *construction documents*.
2. Profiles for nonstandard joist and joist girder configurations (standard joist and joist girder configurations are as indicated in the SJI catalog).
3. Connection requirements for:
   3.1. Joist supports;
   3.2. Joist girder supports;
   3.3. Field splices; and
   3.4. Bridging attachments.
4. Deflection criteria for live and total loads for non-SJI standard joists.
5. Size, location and connections for all bridging.
6. Joist headers.

~~Steel joist placement plans do not require the seal and signature of the joist manufacturer's *registered design professional*.~~ If required by the *registered design professional in responsible charge,* the steel joist manufacturer shall submit steel joist drawings bearing the seal and signature of the joist manufacturer's *registered design professional*.

Reason: The sentence deleted above was first included in the 2006 IBC and has caused widespread havoc for structural engineers checking submittals for steel joists since that time. For many decades, it has been customary and necessary for the registered design professional in responsible charge (or engineer of record - EOR) to specify that the joist manufacturer provide structural calculations and joist drawings signed and sealed by their registered design professional. Since 2006, the deleted sentence has commonly been cited by joist suppliers as code-sanctioned grounds why they no longer need to provide signed and sealed joist drawings even if the EOR has specified the requirement. This proposed modification will clarify the code so as to not interfere with submittal requirements specified by the EOR. The language is consistent with that in section 2207.3 for required seals on joist calculations.

As background information, the verification of specified joist loading is one of the most important items to be checked in a joist submittal. The joist loading is typically clearly shown on the joist drawings as required by section 2207.4.1. But, per current code, the joist drawings need not be sealed by the joist engineer; the joist engineer only seals the calculations, which do not clearly show joist loading. Because the calculations and joist drawings are not both sealed by the joist engineer, there is no link between them and it is very difficult for the EOR to determine if the joist engineer used the correct loading by looking at the calculations only, which are typically printouts of some proprietary calculation software. This leads to a safety issue because the joist design cannot be adequately reviewed or verified by the EOR.

Cost Impact: The code change proposal will not increase the cost of construction. No additional work is required.

S242-11

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2207.4-S-STEVENSON

S243–12
2209.1

Proponent: Victor D. Azzi, P.E., Consulting Structural Engineer, representing the Rack Manufacturers Institute (victorazzi@comcast.net)

Revise as follows:

2209.1 Storage racks. The design, testing and utilization of industrial steel storage racks made of cold-formed or hot-rolled steel structural members, shall be in accordance with RMI/ANSI MH 16.1. Where required by ASCE 7, the seismic design of storage racks shall be in accordance with the provisions of Section 15.5.3 of ASCE 7~~, except that the mapped acceleration parameters,~~ ~~S_s and S_1, shall be determined in accordance with Section 1613.3.1~~.

Reason: The new USGS maps, and the mapped acceleration parameters included in IBC Section 1613.3.1, are included in the new 2011 edition of the RMI/ANSI MH 16.1 standard, as well as in the ASCE 7-2010 and Supplement 1. The new RMI Standard, which is included by reference in the ASCE 7, also includes clarification of Load Combinations (including vertical seismic effects), Redundancy Factors, Minimum Seismic Force for Above-Grade Installations, Beam-to-Column Rotational Capacity and Testing, and Periodic Inspection.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: This code change proposal references RMI standard MH16.1, which is already referenced in this code. However, the proposed change to code text is written to correlate with a new edition of the standard MH16.1-11 rather than the edition presently referenced in the code, which is the -08 edition. The update to this standard will be considered by the Administrative Code Committee during the 2013 Code Development Cycle. Should this code change proposal be approved, but the update to the standard not be approved, the code text will revert to the text as it appears in the 2012 Edition of the Code.

S243-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2209.1-S-AZZI.doc

S244–12
2210.1.1.3 (NEW), Chapter 35 (NEW)

Proponent: Thomas Sputo, Ph.D., P.E., S.E., Steel Deck Institute

Add new text as follows:

2210.1.1.3 Composite slabs on steel decks. Composite slabs of concrete and steel deck shall be permitted to be designed and constructed in accordance with SDI-C.

Add new standard to Chapter 35 as follows:

SDI

SDI-C-2011 Standard for Composite Steel Floor Deck Slabs

Reason: This Standard contains provisions for the design and construction of composite steel deck-slabs of concrete on composite steel deck, and reflects current design and construction industry practices.

The 2012 IBC contains no provisions for the design of composite slabs on steel deck. The previous reference standard that was contained in the 2009 IBC was deleted from the 2012 IBC. Designers and code officials currently must rely on Section 104.11 of the IBC to use this very common structural system. Adding this Standard to the 2015 IBC would fill this gap.

This Standard is an update to the previous 2006 version of this Standard, and was developed and approved through a consensus process under ANSI guidelines, and complies with ICC CP 28. This Standard, along with all other Steel Deck Institute (SDI) Standards, will be available for free download from the SDI website for all parties.

For review purposes, the SDI C-2011 Standard that is being proposed is available for download and review from this website: http://www.sputoandlammert.com/standard.html

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

S244-11

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2210.1.1.3 (NEW)-S-SPUTO

S245–12

2201.1, 2203.1, 2203.2, 2211.1, 2211.4, Table 2506.2, Table 2507.2, Chapter 35

Proponent: Bonnie Manley, P.E., American Iron and Steel Institute (bmanley@steel.org)

Revise as follows:

2201.1 Scope. The provisions of this chapter govern the quality, design, fabrication and erection of steel ~~used structurally in buildings or structures~~ construction.

2203.1 Identification. Identification of structural steel members shall comply with the requirements contained in AISC 360. Identification of cold-formed steel members shall comply with the requirements contained in AISI S100. Identification of cold-formed steel light-frame construction shall also comply with the requirements contained in AISI S200 or AISI S220, as applicable. Other steel furnished for structural load-carrying purposes shall be properly identified for conformity to the ordered grade in accordance with the specified ASTM standard or other specification and the provisions of this chapter. Steel that is not readily identifiable as to grade from marking and test records shall be tested to determine conformity to such standards.

2203.2 Protection. Painting of structural steel members shall comply with the requirements contained in AISC 360. Painting of open-web steel joists and joist girders shall comply with the requirements of SJI CJ-1.0, SJI JG-1.1, SJI K-1.1 and SJI LH/DLH-1.1. Individual structural members and assembled panels of cold-formed steel construction shall be protected against corrosion in accordance with the requirements contained in AISI S100. Protection of cold-formed steel light-frame construction shall also comply with the requirements contained in AISI S200 or AISI S220, as applicable.

2211.1 General. The design and installation of structural members and nonstructural members utilized in cold-formed steel light-frame construction where the specified minimum base steel thickness is ~~between 0.0179 inches (0.455 mm) and~~ not greater than 0.1180 inches (2.997 mm) shall be in accordance with AISI S200 and Sections 2211.2 through 2211.7, or AISI S220, as applicable.

2211.4 Structural wall stud design. Structural wall studs shall be designed in accordance with either AISI S211 or AISI S100.

Revise as follows:

TABLE 2506.2
GYPSUM BOARD MATERIALS AND ACCESSORIES

MATERIAL	STANDARD
~~Steel studs, load-bearing~~ Cold-formed steel studs and track, structural	AISI S200 and ASTM C955,Section 8
~~Steel studs, nonload-bearing~~ Cold-formed steel studs and track, nonstructural	AISI S220 and ASTM C645, Section 10

(Portions of Table not shown remain unchanged)

TABLE 2507.2
LATH, PLASTERING MATERIALS AND ACCESSORIES

MATERIAL	STANDARD
~~Steel studs and track~~ Cold-formed steel studs and track, structural	~~ASTM C 645~~ AISI S200 and; ASTM C 955,Section 8
Cold-formed steel studs and track, nonstructural	AISI S200 and ASTM C645, Section 10

(Portions of Table not shown remain unchanged)

Add new standard to Chapter 35 as follows:

AISI

AISI S220—11 North American Standard for Cold-formed Steel Framing-Nonstructural Members

Reason: This proposal represents the results of a major effort to synchronize and coordinate the industry standards related to cold-formed steel framing. ASTM Committees C11 and A05, and AISI have been working within the steel framing industry on this "Code Synchronization" effort, the goal of which is to organize and maintain a single path for the building code requirements of cold-formed steel light frame construction products. To this end, a new document, AISI S220, was developed to contain all the necessary requirements for nonstructural products. AISI S220 represents a clarification and coordination of industry requirements. The Steel Framing Industry Association (SFIA), the Steel Stud Manufacturers Association (SSMA), the Association of the Wall and Ceiling Industry (AWCI), and the Gypsum Association (GA) all participated in this effort.

The proper integration of AISI S220 into the IBC requires the following changes:

- Section 2201.1: The scope of this chapter now includes products that are non-structural. Therefore, the statement has been simplified to reflect the broad spectrum of steel construction.
- Section 2203: AISI S220, Section A6.5 includes requirements that cover the identification and protection of nonstructural cold-formed steel framing.
- Section 2211.1: Because of the addition of the reference for nonstructural cold-formed steel framing, the lower limit of the minimum base thickness has been deleted.
- Section 2211.4: The charging language to AISI S211 has been clarified to reflect the distinction between AISI S211 and AISI S220.
- Table 2506.2: The material column has been clarified to refer to "structural" and "nonstructural" CFS studs and track. Additionally, AISI S200 and AISI S220 have been incorporated into the table as the primary references. Only ASTM C645 Section 10, and ASTM C955 Section 8, which cover the requirements for the Penetration Test for screws, have been retained. These sections provide a procedure for evaluating the member's ability to pull the head of a screw below the surface of gypsum sheathing. At this time, AISI S220 does not include this test. Future editions may include it, allowing for the eventual deletion of the specific references to ASTM C645 and C955. AISI S200 and AISI S220 incorporate the material and manufacturing provisions previously included in ASTM C955 and ASTM C645 respectively. Limiting the specific references to ASTM C645 Section 10 and C955 Section 8 removes the "dual paths to code compliance", which has caused confusion in the cold-formed steel framing industry.
- Table 2507.2: Entries match what is contained in Table 2506.2.
- Chapter 35: Reflects the necessary changes to the referenced standards.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

S245-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2201.1-S-MANLEY.doc

S246–12
2301.2, 2308.1, 2309 (NEW)

Proponent: Paul Coats, PE, CBO, American Wood Council (pcoats@awc.org)

Revise as follows:

2301.2 General design requirements. The design of structural elements or systems, constructed partially or wholly of wood or wood-based products, shall be in accordance with one of the following methods:

1. *Allowable stress design* in accordance with Sections 2304, 2305 and 2306.
2. *Load and resistance factor design* in accordance with Sections 2304, 2305 and 2307.
3. *Conventional light-frame construction* in accordance with Sections 2304 and 2308.

   ~~**Exception:** Buildings designed in accordance with the provisions of the AF&PA WFCM shall be deemed to meet the requirements of the provisions of Section 2308.~~

4. WFCM in accordance with Section 2309
~~4~~5. The design and construction of log structures shall be in accordance with the provisions of ICC 400.

2308.1 General. The requirements of this section are intended for *conventional light-frame construction*. Other methods are permitted to be used, provided a satisfactory design is submitted showing compliance with other provisions of this code. Interior nonload-bearing partitions, ceilings and curtain walls of *conventional light-frame construction* are not subject to the limitations of this section~~. Alternatively, compliance with AF&PA WFCM shall be permitted subject to the limitations therein and the limitations of this code.~~ Detached one- and two-family dwellings and multiple single-family dwellings (townhouses) not more than three *stories above grade plane* in height with a separate *means of egress* and their accessory structures shall comply with the *International Residential Code*.

SECTION 2309
WOOD FRAME CONSTRUCTION MANUAL

2309.1 WFCM. Structural design in accordance with the WFCM shall be permitted for buildings in any use group subject to the limitations of Section 1.1.3 of the WFCM and the load assumptions contained therein. Structural elements beyond these limitations shall be designed in accordance with accepted engineering practice.

Reason: The WFCM is a consensus document that contains both engineering criteria and engineered prescriptive provisions for wood frame construction. It is an ANSI standard developed by technical committees organized by the American Wood Council and it is already referenced in the code for the design of wood frame structures within its scope.

Item #1 revises the manner in which the WFCM is referenced by removing its association with conventional constructions provisions of 2308. The proposed revision in 2301.2 recognizes WFCM as a separate design method.

Item #2 removes the reference to WFCM as an alternative in Section 2308.1 because it is no longer needed and may lead to confusion about its applicability in accordance with its own applicability limits rather than the limits for conventional construction listed in 2308.2.

Item #3 incorporates reference to WFCM under a new 2309 section, and states clearly that the WFCM may be used for buildings of any use group that fit within the WFCM's applicability limits for building size, configuration, and loads as set out in Section 1.1.3 of the standard.

While WFCM provisions are intended primarily for detached one-and two-family dwellings due to the floor live load assumption associated with those occupancies, many of the WFCM provisions for specific geographic wind, seismic, and snow loads may remain applicable for other buildings. For example, wind provisions for sizing of roof sheathing, wall sheathing, fastening schedule, uplift straps, shear anchorage, shear wall lengths, and wall studs for out of plane wind loads are included in WFCM and are applicable for other use groups within the load limitations of the WFCM tables. Similarly, roof rafter size and spacing for heavy snow, and shear wall lengths and anchorage for seismic are applicable within the load limitations of the WFCM tables. Applications outside the scope of the WFCM tabulated requirements, such as floor joist design for 60 psf loading and design of supporting gravity elements for the additional floor live load is beyond the applicability of the WFCM and must be designed in accordance with accepted engineering practice. This parallels the approach taken in Section R301.1.3 of the IRC, which permits unconventional elements of one and two-family dwellings to be designed per the IBC. This change will expand the availability of engineered but prescriptive options for design of wood frame commercial buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2301.2-S-COATS.doc

S247–12
202 (NEW), 2303.1.12 (NEW), Chapter 35 (New)

Proponent: Edward L. Keith, APA – The Engineered Wood Association (ed.keith@apawood.org)

Add new text as follows:

CROSS-LAMINATED TIMBER. A prefabricated engineered-wood product consisting of at least three layers of solid-sawn lumber or structural composite lumber where the adjacent layers are cross-oriented and bonded with structural adhesive to form a solid wood element.

Add new text as follows:

2303.1.12 Cross-laminated timber. Cross-laminated timber (CLT) shall conform to ANSI/APA PRG 320. Cross-laminated timber shall be identified by grade, thickness, and mill name or identification number by marks provided by an approved testing or grading agency indicating conformance to the referenced standard.

Add new standard to Chapter 35 as follows:

APA

ANSI/APA PRG 320-2011 Standard for Performance-Rated Cross-Laminated Timbers

Reason: While new to the North America, cross-laminated timber (CLT) construction is a well established building system in Europe. This system is made up of solid wood slabs up to 52 feet long, 9 feet wide, and 12 inches thick. Cross-laminated like plywood from lumber planks, CLT has a minimum of 3 layers. (Think plywood on a grand scale!)

These timbers come in a number of configurations suitable for wall, roof and/or floor applications. Due to their makeup, these wall-size timbers can be used in heavy timber construction and have exceptional in plane (shear walls and bracing) and out of plane (wind) strength and stiffness. Having essentially no inside cavities and being solid throughout, air infiltration and inner-wall condensation are essentially eliminated. Being wall sized, these timbers came to the jobsite with all openings pre-cut and erection times are just a fraction of those for conventional construction.

In parallel with the research and development work being conducted in North America, the APA completed the development of an ANSI product standard. A National Design Specification (NDS) supplement is currently under development and several test projects are underway in North America.

Additional information is available at:
http://www.woodworks.org/files/PDF/Presentations/SE-Nov-2010/Mohammad.pdf

Cost Impact: The code change proposal will not increase the cost of construction.

S247-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202-CROSS LAMINATED TIMBER (NEW)-G-KEITH

S248–12
202 (NEW), 2303.1.12 (NEW), Chapter 35 (NEW)

Proponent: Brad Douglas, American Wood Council

Add new text as follows:

SECTION 202
DEFINITIONS

ENGINEERED WOOD RIM BOARD. A full-depth structural composite lumber, wood structural panel, structural glued laminated timber, or pre-fabricated wood I-joist member designed to transfer horizontal (shear) and vertical (compression) loads, provide attachment for diaphragm sheathing, siding and exterior deck ledgers, and provide lateral support at the ends of floor or roof joists or rafters.

Add new text as follows:

2303.1.12 Engineered wood rim board. Engineered wood rim boards shall conform to ANSI/APA PRR 410 or shall be evaluated in accordance with ASTM D 7672. Structural capacities shall be in accordance with ANSI/APA PRR 410 or established in accordance with ASTM D 7672. Rim boards conforming to ANSI/APA PRR 410 shall be marked in accordance with that standard.

Add new standards to Chapter 35 as follows:

ANSI

ANSI/APA PRR 410-2011 Standard for Performance-Rated Engineered Wood Rim Boards

ASTM

ASTM D 7672-2011e1 Standard Specifications for Evaluating Structural Capacities of Rim Board Products and Assemblies

Reason: Engineered rim board is a key structural element in many engineered wood floor applications where both structural load path through the perimeter member and dimensional change compatibility are design considerations. Two new consensus standards address products intended for engineered wood rim board applications. While both ANSI/APA PRR 410 and ASTM D7672 standards address the fundamental requirements for testing and evaluation of engineered rim board, PRR 410 also includes performance categories for engineered wood products used in engineered rim board applications. Under PRR 410, products are assigned a grade based on performance category (e.g. categories based on structural capacity) and will bear a mark in accordance with the grade. In contrast, ASTM D7672 is applicable for determination of product specific rim board performance (i.e. structural capacities) for engineered wood products that may be recognized in manufacturer's literature or product evaluation reports.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

S248-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202-ENGINEERED WOOD RIM BOARD (NEW)-G-COATS

S249–12

202 (NEW), 2303.1.2 (NEW), Chapter 35 (NEW)

Proponent: Edward L. Keith, P.E., APA – The Engineered Wood Association (ed.keith@apawood.org)

Add new text as follows:

SECTION 202
DEFINITIONS

ENGINEERED WOOD RIM JOIST/RIM BOARD. A full-depth structural composite lumber, wood structural panel, structural glued laminated timber, or pre-fabricated wood I-joist member designed to transfer horizontal (shear) and vertical (compression) loads, provide attachment for diaphragm sheathing, siding and exterior deck ledgers, and provide lateral support at the ends of floor or roof joists or rafters.

Add new text as follows:

2303.1.12 Engineered wood rim joist/rim board. Engineered wood rim joists shall conform to ANSI/APA PRR 410 or shall be evaluated in accordance with ASTM D 7672. Engineered wood rim joists conforming to ANSI/APA PRR 410 shall be identified by marks provided by an approved testing or grading agency indicating conformance to the referenced standard.

Add new standard to Chapter 35 as follows:

APA

ANSI/APA PRR 410-2011-Standard for Performance Rated Engineered Wood Rim Boards

ASTM

ASTM D 7672-2011e1-Standard Specification for Evaluating Structural Capacities of Rim Board Products and Assemblies

Reason: With the acceptance of engineered wood floor joists and beams into modern building systems, it had become increasingly important to match the physical properties of the various wood systems used in parallel load paths. The rim joist is a good example in that a solid sawn lumber rim joist should not be used in conjunction with engineered wood floor joists. The engineered wood floor joists are often dry when they are placed in the building system and subject to very little shrinkage as they reach equilibrium moisture content with the completed building system. As such it is imperative that a rim joist product with similar physical properties be used in conjunction with the engineered wood floor joists.

Lumber is normally delivered to the jobsite at a moisture content of from 16 to 18%. As the lumber rim joist dries out and reaches equilibrium moisture content of 8 – 10%, it can shrink by as much as ½". As the lumber rim joist shrinks away from the top of the engineered wood framing all of the vertical loads carried by the rim joist are effectively redistributed to the floor joists and other framing members, not designed for the extra load. For this reason, as well as the resource utilization advantages of engineered wood products, engineered wood rim joists have been produced and sold as compatible sizes to other popular engineered wood products, such as prefabricated wood I-joists. Up until now each of these rim joist products has been manufactured to proprietary standards or no standards at all. The building official was left without any guidance from the building code on the acceptability of these very common produces. Two new consensus-based standards, the ANSI/APA PRR 410 and ASTM D7672, have been developed by industry to correct this discrepancy. The ANSI/APA PRR 410 Standard was developed to provide a vehicle whereby commodity engineered wood rim joists can be manufactured and the ASTM D7672 Standard provides procedures for testing and establishing the structural capacities of proprietary rim joist products.

Voting to accept this consensus-based standard will make the building officials' job easier, provide for better and safer structures to the consumer, promote the use of "Green" materials as well as reducing the regulatory burden for the commodity product manufacturers.

Cost Impact: The code change proposal will not increase the cost of construction.

S249-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202-ENGINEERED WOOD RIM JOIST-RIM BOARD (NEW)-G-KEITH

S250–12
202 (NEW), 2303.1.4 (NEW), Chapter 35 (NEW)

Proponent: Sam Francis, representing American Wood Council (sfrancis@awc.org)

Add new definition as follows:

SECTION 202
DEFINITIONS

CROSS-LAMINATED TIMBER. A prefabricated engineered wood product consisting of at least three layers of solid-sawn lumber or *structural composite lumber* where the adjacent layers are cross-oriented and bonded with structural adhesive to form a solid wood element.

Add new text as follows:

2303.1.4 Structural glued cross-laminated timber. Cross-laminated timbers shall be manufactured and identified as required in ANSI/APA PRG 320-2011.

Add new standard to Chapter 35 as follows:

ANSI

ANSI/APA PRG 320-2011 Standard for Performance-Rated Cross-Laminated Timber

Reason: Cross-Laminated Timber (CLT) is a new product in North America. First developed in Europe nearly 20 years ago, it is used extensively in Europe. A new North American product manufacturing standard, ANSI/APA PRG 320-2011, has just been completed. This large section, engineered wood product should be defined by the code, and it should conform to the newly developed consensus manufacturing standard.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

S250-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2303.1.4 (NEW)-S-FRANCIS.doc

S251–12
2303.1.8.1

Proponent: Stephen C. Shields, Arch Wood Protection, A Lonza Company, representing self (steve_shields@lonza.com)

Revise as follows:

2303.1.8.1 Identification. Wood required by Section 2304.11 to be preservative treated shall bear the quality *mark* of an inspection agency that maintains continuing supervision, testing and inspection over the quality of the *preservative-treated wood*. Inspection agencies for *preservative-treated wood* shall be *listed* by an accreditation body that complies with the requirements of the American Lumber Standards Treated Wood Program, or equivalent. The quality *mark* shall be on a stamp or *label* affixed to the *preservative-treated wood*, and shall include the following information:

1. Identification of treating manufacturer.
2. Type of preservative used.
~~3. Minimum preservative retention (pcf).~~
~~4~~<u>3.</u> End use for which the product is treated.
~~5~~<u>4.</u> AWPA standard to which the product was treated.
~~6~~<u>5.</u> Identity of the accredited inspection agency.

Reason: This change will simplify treated wood quality marking by removing information that is no longer of value.

With many different preservatives now in commercial use, retentions are no longer meaningful and have become confusing for consumers and building inspectors. The traditional 0.25 pounds per cubic foot (pcf) retention, which was at one time universally recognized for above ground treatment, is now only rarely found on commercially treated wood. For treated wood used in exposed, above ground applications (Use Category 3B) in the American Wood Protection Association Standards, various preservatives are listed with minimum retention requirements of 0.013, 0.019, 0.20, 0.04, 0.06, 0.07, 0.10, 0.15, 0.19, 0.206, 0.25, 0.40 and 8.0 pounds per cubic foot.

The existing (remaining) requirements for identification of the type of preservative, a description of the end use, the AWPA standard to which the product was treated and the identity of the approved inspection agency provide all of the information needed so that (1) inspection agency personnel can verify that the product has been manufactured to the retention and penetration required by the referenced standard and (2) a building inspector or consumer can verify that the product has been produced to the recognized standard under a recognized third party quality supervision program and that the product is being used in an application consistent with the end use description.

This change would not prohibit including the preservative retention on a label should a producer desire to do so, it would simply remove it from the listed of mandatory items required by the code. This would also allow producers to remove the retention reference as they redesign product labels from time to time in the normal course of business.

Cost Impact: The code change proposal will not increase the cost of construction.

S251-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2303.1.8.1-S-SHIELDS.doc

S252–12
202, 2303.2

Proponent: Al Godwin, CBO, CPM, Aon Fire Protection Engineering (al.godwin@aon.com)

Revise as follows:

2303.2 Fire-retardant-treated wood. *Fire-retardant-treated wood* shall be in accordance with Sections 2303.2.1 through 2303.2.9. ~~Fire-retardant-treated wood is any wood product which, when impregnated with chemicals by a pressure process or other means during manufacture, shall have, when tested in accordance with ASTM E 84 or UL 723, a listed flame spread index of 25 or less and show no evidence of significant progressive combustion when the test is continued for an additional 20-minute period. Additionally, the flame front shall not progress more than 101/2 feet (3200 mm) beyond the centerline of the burners at any time during the test.~~

SECTION 202
DEFINITIONS

TREATED WOOD. Wood and wood-based materials that use vacuum-pressure impregnation processes to enhance fire retardant or preservative properties.

Fire-retardant-treated wood. Any wood product which, when impregnated with chemicals by a pressure process or other means during manufacture, shall have, when tested in accordance with ASTM E 84 or UL 723, a listed flame spread index of 25 or less and show no evidence of significant progressive combustion when the test is continued for an additional 20-minute period. Additionally, the flame front shall not progress more than 10½ feet (3200 mm) beyond the centerline of the burners at any time during the test. ~~Pressure-treated lumber and plywood that exhibit reduced surface-burning characteristics and resist propagation of fire.~~

Preservative-treated wood. Pressure-treated wood products that exhibit reduced susceptibility to damage by fungi, insects or marine borers.

Reason: There are actually two definitions of Fire retardant treated wood. One in Section 202 and a more detail definition in the wood Section 2303.2, which states:

> "*Fire-retardant-treated* wood is any wood product which, when impregnated with chemicals by a pressure process or other means during manufacture, shall have, when tested in accordance with ASTM E 84 or UL 723, a *listed* flame spread index of 25 or less and show no evidence of significant progressive combustion when the test is continued for an additional 20-minute period. Additionally, the flame front shall not progress more than 10 ½ feet (3200 mm) beyond the centerline of the burners at any time during the test."

At this time, they do not match. This will correct that issue and place the definition language from Section 2303.2 within Section 202 where it belongs.

Depending on the outcome of this proposal, a Group B proposal would be as follows:

Revise R802.1.3 as follows:

R802.1.3 Fire-retardant-treated wood. Fire-retardant treated wood (FRTW) shall be in accordance with Section R802.1.3.1 and R802.1.3.8. ~~is any wood product which, when impregnated with chemicals by a pressure process or other means during manufacture, shall have, when tested in accordance with ASTM E 84 or UL 723, a listed flame spread index of 25 or less and shows no evidence of significant progressive combustion when the test is continued for an additional 20-minute period. In addition, the flame front shall not progress more than 10.5 feet (3200 mm) beyond the center line of the burners at any time during the test.~~

Revise R202as follows:

FIRE-RETARDANT-TREATED WOOD. Any wood product which, when impregnated with chemicals by a pressure process or other means during manufacture, shall have, when tested in accordance with ASTM E 84 pr UL723, a listed flame spread index of 25 or less and shows no evidence of significant progressive combustion when the test is continued for an additional 20-minute period. In addition, the flame front shall not progress more than 10.5 feet (3200 mm) beyond the center line of the burners at any time during the test.~~Pressure-treated lumber and plywood that exhibit reduced surface-burning characteristics and resist propagation of fire.~~

~~**Other means during manufacturing.** A process where the wood raw material is treated with a fire-retardant formulation while undergoing creation as a finished product.~~

~~**Pressure process.** A process for treating wood using an initial vacuum followed by the introduction of pressure above atmosphere.~~

Cost Impact: This code change proposal will not increase the cost of construction since the provisions already exist in the code.

S252-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202-FIRE RETARDANT TREATED WOOD-G-GODWIN.doc

S253–12
2303.2, Chapter 35 (NEW)

Proponent: Marcelo M. Hirschler, GBH International (gbhint@aol.com)

Revise as follows:

2303.2 Fire-retardant-treated wood. *Fire-retardant-treated wood* is any homogeneous wood product which, when impregnated with chemicals by a pressure process or other means during manufacture, ~~shall have, when tested in accordance with ASTM E 84 or UL 723, a *listed* flame spread index of 25 or less and show no evidence of significant progressive combustion when the test is continued for an additional 20-minute period. Additionally, the flame front shall not progress more than 101/2 feet (3200 mm) beyond the centerline of the burners at any time during the test~~ complies with the requirements of ASTM E 2768 and is listed.

Add new standard to Chapter 35 as follows:

ASTM

E2768-2011 Standard Test Method for Extended Duration Surface Burning Characteristics of Building Materials (30 min Tunnel Test)

Reason: ASTM has now issued a test method, ASTM E2768, which contains the three requirements discussed in section 2303.2, namely that a product be tested in accordance with ASTM E84 or UL 723, and exhibit a flame spread index of 25 or less, show no evidence of significant progressive combustion when the test is continued for 30 minutes (i.e. an additional 20-minute period over the standard ASTM E84 duration of 10 minutes) and that the flame front not progress more than 101/2 feet (3200 mm) beyond the centerline of the burners at any time during the test.

Note that products listed as fire-retardant treated wood to UL 723 or to ASTM E84 (with the additional requirements shown above) will be able to continue to be listed to ASTM E2768 without having to be retested as the ASTM E2768 test method contains all of those requirements. Therefore, this code proposal is basically simple clarification.

The addition of the requirement that fire-retardant treated wood must be a “homogeneous” product is necessary to ensure that products that are coated or only partially impregnated with chemicals are not considered “fire-retardant treated wood” as they are not.

Note that there also needs to be consistency between the definition of fire-retardant treated wood and the requirements in this Chapter 23. At the last cycle it was established that it is important that the code not place a requirement regarding the means of manufacture and the definition at present in Chapter 2 discusses purely “pressure treated wood”. A separate proposal has been made to change the definition. The two changes can be made independently.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

	Assembly:	ASF	AMF	DF

2303.2-S-HIRSCHLER.doc

S254–12
2303.4.3

Proponent: Larry Wainright, Qualtim, representing Structural Building Components Association (lwainright@qualtim.com)

Revise as follows:

2303.4.3 Truss submittal package. The truss submittal package provided by the truss manufacturer shall consist of each individual truss design drawing, the truss placement diagram, the permanent individual truss member restraint/bracing method and details and any other structural details germane to the trusses; and, as applicable, the cover/truss index sheet. The submittal package shall be submitted to the *registered design professional in responsible charge* for final approval prior to fabrication of trusses.

Reason: The purpose of this proposal is to help close the gap in communication that many times exists whereby the RDP does not get the truss submittal package for review to ensure the truss package meets the intent of the building design. The RDP should always have the opportunity to review these prior to fabrication. The language in this proposal is taken from the North Carolina Building Code where the issue of RDP approval has been thoroughly vetted.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2303.4.3-S-WAINRIGHT.doc

S255–12
2304.6

Proponent: Jay Crandell, ARES Consulting, representing Foam Sheathing Committee (jcrandell@aresconsulting.biz)

Revise as follows:

2304.6 Wall sheathing. Where wall sheathing is used or required and except as provided for in Section 1405 for weatherboarding or where stucco construction that complies with Section 2510 is installed, enclosed buildings shall be sheathed with one of the materials of the nominal thickness specified in Table 2304.6, foam plastic insulation wall sheathing in accordance with Section 2603 or any other *approved* material ~~of equivalent strength or durability~~.

Reason: Foam plastic insulation wall sheathing is a commonly used sheathing material on wood frame walls and provides a means for energy code compliance and also, when approved, water resistive barrier compliance. Its inclusion in Section 2304.6 is necessary to ensure its appropriate use and provide guidance for enforcement by reference to requirements in Section 2603. In addition, Section 2304.6 as currently written requires that “wall sheathing” be used at the exclusion of other accepted wood construction practices that do not use wall sheathing. One example is post-frame buildings which often rely on metal panel diaphragms for weather resistance and bracing without use of wall sheathing. It is important to recognize that Section 2304 does not just apply to conventional wood frame construction using wall sheathing and should not exclusively require use of wall sheathing. Finally, the words “equivalent strength or durability” are stricken because the performance requirements for sheathing will depend on its purpose and application (e.g., all sheathing must have strength to resist wind load, but not all sheathing materials are used as bracing and should not be required to be equivalent on that attribute). Using the term “approved material” adequately conveys that appropriate attributes for sheathing must be provided on the basis of the intended application.

Cost Impact: The code change proposal will not increase the cost of construction.

2304.6-S-CRANDELL.doc

S256–12
Table 2304.6.1

Proponent: Edward L. Keith, P.E., APA – The Engineered Wood Association (ed.keith@apawood.org)

Revise as follows:

TABLE 2304.6.1
MAXIMUM NOMINAL DESIGN WIND SPEED, V_{asd} PERMITTED FOR WOOD STRUCTURAL PANEL WALL SHEATHING USED TO RESIST WIND PRESSURES [a,b,c]

b. The table is based on wind pressures acting toward and away from building surfaces in accordance with Section 30.7 of ASCE 7. Lateral requirements shall be in accordance with Section 2305 or Section 2308. <u>The table was developed based on the requirement that the specified wood structural panels would alone resist 100% of the applied wind load. Evaluation includes stud strength, nail withdrawal, nail head pull-through, and the sheathing deflection criteria of *l*/120 in accordance with Table 1604.3, where *l* = distance between studs.</u>

(Portions of table and footnotes not shown remain unchanged)

Reason: This code change is proposed to clarify the basis on which Table 2304.6.1 was developed and approved so as to provide guidance for any materials that are intended to establish equivalency to this table in accordance with Section 104.11 of the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

T2304.6.1-S-KEITH.doc

S257–12

2301.2, 2308.2.1, Table 2304.9.1, 2304.7.2.1(NEW), 2304.7.2.1.1 (NEW), Figure 2304.7.2.1.1 (NEW)

Proponent: T. Eric Stafford, representing Insurance Institute for Business and Home Safety

Revise as follows:

2301.2 General design requirements. The design of structural elements or systems, constructed partially or wholly of wood or wood-based products, shall be in accordance with one of the following methods:

1. *Allowable stress design* in accordance with Sections 2304, 2305 and 2306.
2. *Load and resistance factor design* in accordance with Sections 2304, 2305 and 2307.
3. *Conventional light-frame construction* in accordance with Sections 2304 and 2308.

   Exception: Buildings designed in accordance with the provisions of the AF&PA WFCM and Section 2304.7.2.1 shall be deemed to meet the requirements of the provisions of Section 2308.

4. The design and construction of log structures shall be in accordance with the provisions of ICC 400.

2308.2.1 Nominal design wind speed greater than 100 mph (3-second gust). Where V_{asd} as determined in accordance with Section 1609.3.1 exceeds 100 mph (3-second gust), the provisions of either AF&PA WFCM, or the ICC 600 are permitted to be used. Wind speeds in Figures 1609A, 1609B, and 1609C shall be converted in accordance with Section 1609.3.1 for use with AF&PA WFCM or ICC 600. Section 2304.7.2.1 shall apply to roof sheathing attachment when using the AF&PA WFCM or ICC 600.

TABLE 2304.9.1
FASTENING SCHEDULE

CONNECTION	FASTENING[a,m]	LOCATION
31. Wood structural panels and particleboard[b] Subfloor, roof and wall sheathing (to framing) Where V_{ult} equals or exceeds 130 mph, wood structural panel roof sheathing shall be fastened in accordance with Section 2304.7.2.1 Single floor (combination subfloor-underlayment to framing)		

(Portions of Table not shown remain unchanged)

2304.7.2.1 Wood structural panel roof sheathing attachment. Where V_{ult} equals or exceeds 130 mph, wood structural panels used as roof sheathing shall be installed with joints staggered and fastened in accordance with Section 2304.7.2.1.1.

2304.7.2.1.1 Sheathing fastenings. Wood structural panel sheathing shall be fastened to roof framing with 8d annular ring-shank nails at 6 inches on center at edges and 6 inches on center at intermediate framing. Ring-shank nails shall have the following minimum dimensions:

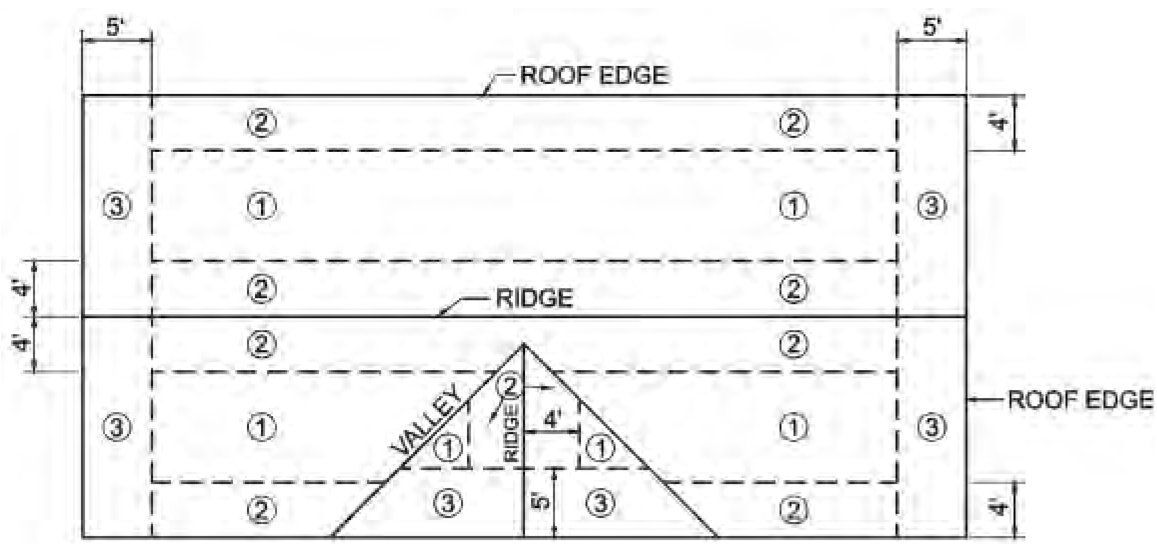
1. 0.113 inch nominal shank diameter
2. Ring diameter of 0.012 over shank diameter

3. <u>16 to 20 rings per inch</u>
4. <u>0.280 inch full round head diameter</u>
5. <u>2 inch nail length</u>

<u>Where roof framing with a specific gravity, 0.42 ≤ G < 0.49 is used, spacing of ring-shank fasteners shall be 4 inches on center in nailing zone 3 in accordance with Figure 2304.7.2.1.1 where V_{ult} is 130 mph or greater.</u>

<u>Exceptions:</u>

1. <u>Where roof framing with a specific gravity, 0.42 ≤ G < 0.49 is used, spacing of ring-shank fasteners shall be permitted at 12 inches on center at intermediate framing in nailing zone 1 for any V_{ult} and in nailing zone 2 for V_{ult} less than or equal to 140 mph in accordance with Figure 2304.7.2.1.1.</u>
2. <u>Where roof framing with a specific gravity, G ≥ 0.49 is used, spacing of ring-shank fasteners shall be permitted at 12 inches on center at intermediate framing in nailing zone 1 for any V_{ult} and in nailing zone 2 for V_{ult} less than or equal to 150 mph in accordance with Figure 2304.7.2.1.1.</u>
3. <u>Where roof framing with a specific gravity, G ≥ 0.49 is used, 8d common or 8d hot dipped galvanized box nails at 6 inches on center at edges and 6 inches on center at intermediate framing shall be permitted for V_{ult} less than or equal to 120 mph in accordance with Figure 2304.7.2.1.1.</u>
4. <u>Where roof diaphragm requirements necessitate a closer fastener spacing.</u>



<u>FIGURE 2304.7.2.1.1 ROOF SHEATHING NAILING ZONES</u>

Reason: This proposed modification, if approved, will significantly improve the performance of wood structural panel roofs when subjected to high wind loads. It does so at a minimal to negligible cost which provides an extremely generous benefit/cost ratio. The requirements are based on hundreds of true wood structural panel tests. Extensive roof sheathing fastening tests at Clemson University (Reinhold 2000 – 2002, McKinley 2001) and at the International Hurricane Center – Florida International University (Reinhold, Alvarez 2003) compared the Mean Failure Pressure in psf for roof sheathing panels using both the 8d common and the 8d ring shank nails spaced at 6 inches as prescribed by the code. Sheathing consisted of 5/8 inch thick plywood attached to nominal 2x4 Southern Yellow Pine rafters.

The results of these tests were as follows:

(1) Mean ultimate uplift capacity for panels attached with 8d common nails at 6 inch spacing: 126 pounds per square foot
(2) Mean ultimate uplift capacity for panels attached with 8d ring shank nails at 6 inch spacing: 292 pounds per square foot

This shows a 131% improvement in performance when 8d ring shank nails are used instead of the currently prescribed 8d common nails.

Requiring the use of 8d ring shank nails would result in an almost negligible increase in cost. While variations will occur regionally, it's estimated that the cost increase will be less than $10 for 2000 square foot roof.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2301.2-S-STAFFORD.doc

S258–12
2302.1, Table 2304.7(4)

Proponent: John Mulder, Intertek Testing Services, NA, Inc., representing International Standards Organization Technical Committee 77, *Products in Fibre-reinforced Cement,* and self

Revise as follows:

2302.1 Definitions. For the purposes of this chapter, and as used elsewhere in this code the following terms are defined in Chapter 2:

FIBER-CEMENT PRODUCTS

TABLE 2304.7(4)
ALLOWABLE SPAN FOR WOOD STRUCTURAL PANEL COMBINATION SUBFLOOR-UNDERLAYMENT (SINGLE FLOOR)[a, b]
(Panels Continuous Over Two or More Spans and Strength Axis Perpendicular to Supports)

For SI: 1 inch = 25.4 mm, 1 pound per square foot = 0.0479 kN/m^2.

a. Spans limited to value shown because of possible effects of concentrated loads. Allowable uniform loads based on deflection of $^1/_{360}$ of span is 100 pounds per square foot except allowable total uniform load for 1$^1/_8$-inch wood structural panels over joists spaced 48 inches on center is 65 pounds per square foot. Panel edges shall have approved tongue-and-groove joints or shall be supported with blocking, unless $^1/_4$-inch minimum thickness wood panel-type or fiber-cement underlayment or 1$^1/_2$ inches of approved cellular or lightweight concrete is placed over the subfloor, or finish floor is $^3/_4$-inch wood strip.

(Portions of table not shown remain unchanged)

Reason: A revision to Table 2304.7(4) is proposed to include “fiber-cement underlayment”. The term “fiber-cement products” is proposed to be included in the definitions here consistent with the definition published in the Terminology Standard ASTM C1154-06, *Standard Terminology for Non-Asbestos Fiber-Reinforced Cement Products* (see attached Standard) and also proposed for revision in Chapter 2 of the IBC code. The current footnote does not clearly describe the allowable type of permitted underlayment. The inclusion of references to ”wood panel-type” and “fiber-cement” clarifies the types of recognized products permitted in this type of Code-compliant subfloor/underlayment application (see attached ICC-ES ESR-1381[reference Section 4.3], ESR-2280[reference Sections 4.2.2.1 and 4.2.3.1], and ESR-2292[reference Section 4.2]). “See the ICC-ES website (http://www.icc-es.org/) to gain access to the referenced ESR reports. “

Cost Impact: The code change proposal will not increase the cost of construction because the proposed addition of fiber-cement underlayment to the table footnote only provides for the choice and use of a type of underlayment currently used in this type of application and permitted in Evaluation Service Reports.

2304.9.1, Table 2304.9.1

Proponent: Erin Ashley, URS Corporation, representing Department of Homeland Security, Federal Emergency Management Agency (erin.ashley@urscom), John Ingargiola, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@fema.dhs.gov)

Revise as follows:

2304.9.1 Fastener requirements. Connections for wood members shall be designed in accordance with the appropriate methodology in Section 2301.2. For conventional light frame construction in accordance with Section 2308, connections for wood members are permitted to be in accordance with Table 2304.9.1. The number and size of fasteners connecting wood members shall not be less than that set forth in Table 2304.9.1 for any method of wood construction.

TABLE 2304.9.1
FASTENING SCHEDULE

CONNECTION	FASTENING[a,m,g]	LOCATION

g. This table is subject to the limitations stated in Section 2308.2

(Portions of table and footnotes not shown remain unchanged)

Reason: The proposed addition of the footnote identifies the limitations of Table 2304.9.1 **Fastening Schedule,** which are set forth several sections later in the code as a condition of the table addressing *conventional light-frame construction*. Limitations to *conventional light-frame construction* are located in Section 2308.2, but these limitations are not directly referred to in Section 2304.9 **Connectors and fasteners** and not currently referenced for the entire Table 2304.9.1.

Cost Impact: The code change proposal will not increase the cost of construction.

S259-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2304.9.1-S-ASHLEY-INGARGIOLA.doc

S260–12
2304.9.6

Proponent: Jay Crandell, ARES Consulting, representing Foam Sheathing Committee (jcrandell@aresconsulting.biz)

Revise as follows:

2304.9.6 Load path. Where wall framing members are not continuous from foundation sill to roof, the members shall be secured to ensure a continuous load path. Where required, sheet metal clamps, ties or clips shall be formed of galvanized steel <u>not less than 0.0179 inch (0.45 mm) minimum thickness</u> or other *approved* corrosion-resistant material ~~not less than 0.040 inch (1.01 mm) nominal thickness~~ <u>capable of resisting the applied loads</u>.

Reason: The code needs to allow thinner steel based on performance to, when possible, avoid interference of uplift straps with fastening/installation of interior and exterior finishes and sheathings. AISI Standard S105 Product Data permits minimum steel thickness of 0.0179 inches thick for structural and non-structural applications. In addition, 24CFR Section 3280.305 also permits uplift straps of minimum 26 gage (0.0179 inch thick) for manufactured homes even in the highest of wind zones. The current minimum 0.040 inch thickness requirement is not consistent with existing industry consensus standards and needs to be changed such that minimum required steel thickness is governed by performance needed for a specific application.

Cost Impact: The code change proposal will not increase the cost of construction.

S260-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2304.9.6-S-CRANDELL.doc

S261–12
Table 2304.9.1

Proponent: Stephen Kerr, S.E., Josephson Werdowatz and Associates, representing Structural Engineers Association of California (SEAOC) (skerr@jwa-se.com)

Revise as follows:

TABLE 2304.9.1
FASTENING SCHEDULE

CONNECTION	FASTENING[a,m]	LOCATION
12. Rim joist to top plate, or other framing below	8d (21/2" × 0.131") at 6" o.c. 3" × 0.131" nail at 6" o.c. 3" 14 gage staple at 6" o.c.	toenail

(Portions of table not shown remain unchanged)

Reason: The current code language does not explicitly require connections at perimeter joists to a foundation sill ("mudsill") in the case where a framed floor is built over a crawlspace without cripple-walls (the foundation walls extend to the underside of the floor framing).

This item was first introduced in the 1994 UBC to provide a more complete lateral load path to resist earthquake or wind forces. The original intent surely was to provide for lateral strength in all buildings constructed over a raised foundation: not just cases where cripple walls are present, and not to exclude connections along the sides of the building where framing is parallel to the foundation or cripple wall below.

Lack of connection along joists to the parallel supporting members is considered a deficiency under the 2009 IEBC (for buildings with more than one floor above). IEBC Section A304.1.4 requires supplementation of the joist-to-mudsill or joist-to-top plate connection if existing connectors are not present at 6" on center. The current IBC language for this connection requirement allows construction that is immediately in need of strengthening under the IEBC.

Cost Impact: Negligible cost for new construction; Substantial savings in possible retrofit costs in the case where the deficient connection would have to be supplemented to meet IEBC requirements; Immense savings over losing a building in an earthquake due to an incomplete load path.

S261-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T2304.9.1#1-S-KERR.doc

S262–12
Table 2304.9.1

Proponent: Thor Matteson, S.E., representing self

Revise as follows:

TABLE 2304.9.1
FASTENING SCHEDULE

Connection	**Fastening**	**Location**
11. Blocking between joists or rafters to foundation sill, girder, beam, top plate, or other framing below	3 - 8d common ($2^1/_2$″ × 0.131″) 3 - 3″ × 0.131″ nails 3 - 3″14 gage staples	Toe-nail

(Portions of table not shown remain unchanged)

Reason: The current code language does not explicitly require connections at blocking to a foundation sill ("mudsill") in the case where a framed floor is built over a crawlspace without cripple-walls (the foundation walls extend to the underside of the floor framing).

This item was first introduced in the 1994 UBC to provide a more complete lateral load path to resist earthquake or wind forces. The original intent surely was to provide for lateral strength in all buildings constructed over a raised foundation, not just cases where cripple walls are present.

Lack of connection to the mudsill is considered a deficiency under the 2009 IEBC (for buildings with more than one floor above). IEBC Section A304.1.3 requires supplementation of the blocking-to-mudsill connection if existing connectors are not present at 6" on center. The current IBC language for this connection requirement allows construction that is immediately in need of strengthening under the IEBC.

Cost Impact: Negligible cost for new construction; Substantial savings in possible retrofit costs in the case where the deficient connection would have to be supplemented to meet IEBC requirements; Immense savings over losing a building in an earthquake due to an incomplete load path.

The current IBC language for this connection requirement allows construction that is immediately in need of strengthening under the IEBC.

Cost Impact: Negligible cost for new construction; Substantial savings in possible retrofit costs in the case where the deficient connection would have to be supplemented to meet IEBC requirements; Immense savings over losing a building in an earthquake due to an incomplete load path.

S263-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T2304.9.1#2-S-KERR.doc

S264–12
Table 2304.9.1

Proponent: Thor Matteson, Structural Engineer, representing self (thor2304@shearwalls.com)

Revise as follows:

TABLE 2304.9.1
FASTENING SCHEDULE

CONNECTION	FASTENING[a,m]	LOCATION
12. ~~Rim~~ Perimeter joist (end-joist, or band, rim, or header joist) to foundation sill, girder, beam, top plate, or other framing below	8d ($2^{1}/_{2}$″ × 0.131″) at 6″ o.c. 3″ × 0.131″ nail at 6″ o.c. 3″14 gage staple at 6″ o.c.	Toenail

(Portions of table not shown remain unchanged.)

Reason: The current code language does not explicitly require connections at perimeter joists to a foundation sill ("mudsill") in the case where a framed floor is built over a crawlspace without cripple-walls (the foundation walls extend to the underside of the floor framing). The current code also does not define "Rim joist". Carpenters in different regions use different terms for various framing members. In some areas the term "Rim joist" may mean any perimeter floor framing member; in other areas it may exclude perimeter joists that run parallel to footings or walls below (such members are commonly called "End joists").

This item was first introduced in the 1994 UBC to provide a more complete lateral load path to resist earthquake or wind forces. The original intent surely was to provide for lateral strength in all buildings constructed over a raised foundation: not just cases where cripple walls are present, and not to exclude connections along the sides of the building where framing is parallel to the foundation or cripple wall below.

Lack of connection along joists to the parallel supporting members is considered a deficiency under the 2009 IEBC (for buildings with more than one floor above). IEBC Section A304.1.4 requires supplementation of the joist-to-mudsill or joist-to-top plate connection if existing connectors are not present at 6" on center. The current IBC language for this connection requirement allows construction that is immediately in need of strengthening under the IEBC.

This change would also make the Code more usable (internationally especially) where terminology varies for different framing components.

Cost Impact: Negligible cost for new construction; Substantial savings in possible retrofit costs in the case where the deficient connection would have to be supplemented to meet IEBC requirements; Immense savings over losing a building in an earthquake due to an incomplete load path.

	DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER	SPACING AND LOCATION
		3” x 0.131” nails; or 3-3” 14 gage staples, 7/16” crown	
9	Stud to stud and abutting studs at intersecting wall corners (at braced wall panels)	16d common (3.5” x 0.162”); or	16” o.c. face nail
		16d box (3.5” x 0.135”); or	12” o.c. face nail
		3” x 0.131” nails; or 3-3” 14 gage staples, 7/16” crown	12” o.c. face nail
10	Built-up header (2-inch to 2-inch header)	16d common (3.5" x 0.162"); or	16” o.c. each edge, face nail
		16d box (3.5” x 0.135”)	12” o.c. each edge, face nail
11	Continuous header to stud	4-8d common (2.5" x 0.131"); or 4-10d box (3" x 0.128")	Toenail
12	Top plate to top plate	16d common (3.5" x 0.162"); or	16” o.c. face nail
		10d box (3" x 0.128"); or 3” x 0.131” nails; or 3” 14 gage staples, 7/16” crown	12” o.c. face nail
13	Top plate to top plate, at end joints	8-16d common (3.5" x 0.162"); or 12-10d box (3" x 0.128"); or 12-3” x 0.131” nails; or 12-3” 14 gage staples, 7/16” crown	Face nail on each side of end joint (minimum 24” lap splice length each side of end joint)
14	Bottom plate to joist, rim joist, band joist or blocking (not at braced wall panels)	16d common (3.5" x 0.162"); or	16” o.c. face nail
		16d box (3.5" x 0.135"); or 3” x 0.131” nails; or 3” 14 gage staples, 7/16” crown	12” o.c. face nail
15	Bottom plate to joist, rim joist, band joist or blocking at braced wall panels	2-16d common (3.5" x 0.162"); or 3-16d box (3.5" x 0.135"); or 4-3” x 0.131” nails; or 4-3” 14 gage staples, 7/16” crown	16” o.c. face nail
16	Stud to bottom plate	4-8d common (2.5" x 0.131"); or 4-10d box (3" x 0.128"); or 4-3” x 0.131” nails; or 4-3” 14 gage staples, 7/16” crown; or	Toenail
		2-16d common (3.5" x 0.162"); or 3-10d box (3" x 0.128"); or 3-3” x 0.131” nails; or 3-3” 14 gage staples, 7/16” crown	End nail
17	Top or bottom plate to stud	2-16d common (3.5" x 0.162"); or 3-10d box (3" x 0.128"); or 3-3” x 0.131” nails; or 3-3” 14 gage staples, 7/16” crown	End nail
18	Top plates, laps at corners and intersections	2-16d common (3.5" x 0.162"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16” crown	Face nail
19	1” brace to each stud and plate	2-8d common (2.5" x 0.131"); or 2-10d box (3" x 0.128"); or 2-3" x 0.131" nails; or 2-3" 14 gage staples, 7/16” crown	Face nail
20	1” x 6” sheathing to each bearing	2-8d common (2.5" x 0.131"); or 2-10d box (3" x 0.128")	Face nail

	DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER	SPACING AND LOCATION	
21	1” x 8” and wider sheathing to each bearing	3-8d common (2.5" x 0.131"); or 3-10d box (3" x 0.128")	Face nail	
	FLOOR			
22	Joist to sill, top plate, or girder	3-8d common (2.5" x 0.131"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16” crown	Toenail	
23	Rim joist, band joist, or blocking to sill or top plate	8d common (2.5" x 0.131"); or 10d box (3" x 0.128"); or 3" x 0.131" nails; or 3" 14 gage staples, 7/16” crown	6” o.c., toenail	
24	1” x 6” subfloor or less to each joist	2-8d common (2.5" x 0.131"); or 3-10d box (3" x 0.128")	Face nail	
25	2” subfloor to joist or girder	2-16d common (3.5" x 0.162")	Face nail	
26	2” planks (plank & beam – floor & roof)	2-16d common (3.5" x 0.162")	At each bearing, face nail	
27	Built-up girders and beams, 2-inch lumber layers	20d common (4” x 0.192”)	32” o.c., face nail at top and bottom staggered on opposite sides	
		10d box (3" x 0.128"); or 3" x 0.131" nails; or 3" 14 gage staples, 7/16” crown	24” o.c. face nail at top and bottom staggered on opposite sides	
		And: 2-20d common (4” x 0.192”); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16” crown	Face nail at ends and at each splice	
28	Ledger strip supporting joists or rafters	3-16d common (3.5" x 0.162"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16” crown	At each joist or rafter, face nail	
29	Joist to band joist or rim joist	3-16d common (3.5" x 0.162"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16” crown	End nail	
30	Bridging to joist	2-8d common (2.5" x 0.131"); or 2-10d box (3" x 0.128"); or 2-3" x 0.131" nails; or 2-3" 14 gage staples, 7/16” crown	Each end, toenail	
	Wood structural panels (WSP), subfloor, roof and interior wall sheathing to framing and particleboard wall sheathing to framing[a]			
			Edges (inches)	Intermediate supports (inches)
31	3/8” – 1/2"	6d common or deformed (2” x 0.113”) (subfloor and wall)	6	12
		8d box or deformed (2.5" x 0.113") (roof)	6	12
		2 3/8” x 0.113” nail (subfloor and wall)	6	12
		1 ¾” 16 gage staple, 7/16” crown	4	8

	DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER	SPACING AND LOCATION	
		(subfloor and wall)		
		2 3/8 x 0.113" nail (roof)	4	8
		1 ¾" 16 gage staple, 7/16" crown (roof)	3	6
32	19/32" – 3/4"	8d common (2.5" x 0.131"); or 6d deformed (2" x 0.113)	6	12
		2 3/8" x 0.113" nail; or 2" 16 gage staple, 7/16" crown	4	8
33	7/8" – 1 1/4"	10d common (3" x 0.148"); or 8d deformed (2.5" x 0.131")	6	12
	Other exterior wall sheathing			
34	1/2" fiberboard sheathing[b]	1 ½" galvanized roofing nail (7/16" head diameter; or 6d common (2" x 0.113"); or 1 ¼" 16 gage staple with 7/16" or 1" crown	3	6
35	25/32" fiberboard sheathing[b]	1 ¾" galvanized roofing nail (7/16" diameter head); or 8d common (2.5" x 0.131"); or 1 ½" 16 gage staple with 7/16" or 1" crown	3	6
	Wood structural panels, combination subfloor underlayment to framing			
36	3/4" and less	8d common (2.5" x 0.131"); or6d deformed (2" x 0.113")	6	12
37	7/8" – 1"	8d common (2.5" x 0.131"); or 8d deformed (2 ½" x 0.131")	6	12
38	1 1/8" – 1 ¼"	10d common (3" x 0.148"); or 8d deformed (2 ½" x 0.131")	6	12
	Panel Siding to Framing			
39	½" or less	6d corrosion-resistant siding (1 7/8" × 0.106"); or 6d corrosion-resistant casing (2" × 0.099")	6	12
40	5/8"	8d corrosion-resistant siding (2 3/8" × 0.128"); or 8d corrosion-resistant casing (2 1/2" × 0.113")	6	12
	Interior Paneling			
41	¼"	4d casing (11/2" × 0.080"); or 4d finish (11/2" × 0.072")	6	12
42	3/8"	6d casing (2" × 0.099"); or 6d finish (Panel supports at 24 inches)	6	12

a. Nails spaced at 6 inches at intermediate supports where spans are 48 inches or more. For nailing of wood structural panel and particleboard diaphragms and shear walls, refer to Section 2305. Nails for wall sheathing are permitted to be common, box, or casing.

b. Spacing shall be 6 inches on center on the edges and 12 inches on center at intermediate supports for nonstructural applications. Panel supports at 16 inches (20 inches if strength axis in the long direction of the panel, unless otherwise marked).

c. Where a rafter is fastened to an adjacent parallel ceiling joist in accordance with this schedule and the ceiling joist is fastened to the top plate in accordance with this schedule, the number of toenails in the rafter shall be permitted to be reduced by one nail.

Reason: The ICC Building Code Action Committee sought to reformat and correlate the current fastening schedule for wood frame construction in Chapter 23 with the current fastening schedule in the IRC. The organization of the IRC table was thought to be easier to use, and it was generally acknowledged that it may help users of both codes if the tables more closely resembled each other in format and content.

Descriptions of specified fastening and their capacities in the IBC and IRC tables were compared. In developing the proposed new table, the committee tried to make as few technical changes as possible while reorganizing and reformatting the IBC table to look more like the IRC table. Care was taken to retain, for the most part, all fastening alternatives currently in the IBC, while at the same time adding appropriate alternatives that appear in the IRC for the same connection, if they were missing.

To attain complete coordination between the two tables was not possible because certain technical changes that would have been required were beyond the chosen scope of the committee's work. However, the proposed table is much closer to the IRC table and the committee will look at the IRC table in the Group B changes to attempt further correlations between the two.

When inconsistencies or apparent anomalies were discovered between tables or within the IBC table itself, in general the following principles were applied:

a. attempt to establish a reference common nail specification for each connection where it appeared to be lacking;
b. provide box nails alternatives, if lacking, where possible
c. retain all current alternatives for power-driven and staple alternatives (though in a few cases the number or size of fastener was adjusted to be consistent with the IRC or to achieve consistency within the IBC table itself based on other entries);
d. in creating box nail alternatives where they currently are missing, for simplicity assume 10d box nails (3" x 0.128") to be equivalent to 3" x 0.131" power-driven fasteners;
e. take into account calculated connection capacities. (These were also compared to the engineered connections specified in the AWC Wood Frame Construction Manual for like connections.)

Finally, this proposed IBC table is much cleaner and more complete than the current table. Besides adding many fastener alternatives, many detailed and difficult-to-use footnotes in the current table were eliminated since their content was incorporated directly into the proposed table.

The following three tables are provided: i) the proposed IBC Table 2304.9.1 with an additional column of notes explaining how it correlates to the existing IBC table, ii) the existing IBC Table 2304.9.1 with an additional column of notes explaining how it correlates to the proposed IBC table, and iii) the existing IRC table, shown for reference.

Proposed Table 2304.9.1 with additional column of explanation:

	DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER	SPACING AND LOCATION	*Notes:*
		ROOF		
1	Blocking between ceiling joists or rafters to top plate	3-8d common (2.5" x 0.131"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	at each end, toenail	*-Nailing from IBC Row 11. -10d box equivalent to 8d common added.*
2	Ceiling joists to top plate	3-8d common (2.5" x 0.131"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	per joist, toenail	*-Nailing from IBC Row 15. -10d box equivalent to 8d common added. -Correct power driven number from 5 to 3.*
3	Ceiling joist not attached to parallel rafter, laps over partitions (no thrust) (for parallel rafter case see Section 2308.10.4.1, Table 2308.10.4.1)	3-16d common (3.5" x 0.162"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown	Face nail	*-Nailing from IBC Row 17. -10d box equivalent to power driven nail size added.*
4	Ceiling joist attached to parallel rafter (heel joint) (see Section 2308.10.4.1, Table 2308.10.4.1)	Per table 2308.10.4.1	Face nail	*-Nailing from IBC Row 18.*
5	Collar tie to rafter	3-10d common (3" x 0.148"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown	Face nail	*-Nailing from IBC Row 26. -10d box equivalent to power driven nail size added.*
6	Rafter or roof truss to top plate (See Section 2308.10.1, Table 2308.10.1)	3-10 common (3" x 0.148"); or 3-16d box (3.5" x 0.135"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131 nails; or 4-3" 14 gage staples, 7/16" crown	Toenail[c]	*-Nailing from IRC Row 5. -10d box equivalent to power driven nail size added.*

	DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER	SPACING AND LOCATION	*Notes:*
7	Roof rafters to ridge valley or hip rafters; or, roof rafter to 2-inch ridge beam	2-16d common (3.5" x 0.162"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown; or	End nail	*-Nailing from IBC Rows 27 and 28.* *-10d box equivalent to power driven nail size added.*
		3-10d common (3.5" x 0.148"); or 3-16d box (3.5" x 0.135"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown	Toenail	*-Nailing from IBC Rows 27 and 28.* *-10d box equivalent to power driven nail size added.* *-16d box per IRC for toenailing of rafter in Row 6 added.*
		WALL		
8	Stud to stud (not at braced wall panels)	16d common (3.5" x 0.162");	24" o.c. face nail	*-Nailing from IBC Row 9.*
		10d box (3" x 0.128"); or 3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	16" o.c. face nail	*-10d box equivalent to power driven nail size added.* *-Corrected spacing for power driven nail to be equivalent to the specified common nail.*
9	Stud to stud and abutting studs at intersecting wall corners (at braced wall panels)	16d common (3.5" x 0.162"); or	16" o.c. face nail	*-Nailing from IBC Row 23.* *-16d box equivalent from IRC Row 8.*
		16d box (3.5" x 0.135"); or 3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	12" o.c. face nail	
10	Built-up header (2-inch to 2-inch header)	16d common (3.5" x 0.162"); or	16" o.c. each edge, face nail	*-Nailing from IBC Row 14.* *-16d box equivalent added but at 12" o.c. spacing.*
		16d box (3.5" x 0.135")	12" o.c. each edge, face nail	
11	Continuous header to stud	4-8d common (2.5" x 0.131"); or 4-10d box (3" x 0.128")	Toenail	*-Nailing from IBC Row 16.* *-10d box equivalent to 8d common added.*
12	Top plate to top plate	16d common (3.5" x 0.162"); or	16" o.c. face nail	*-Nailing from IBC Row 10 except that 16d common specified in lieu of 16d box to align with power driven sizes.* *-10d box equivalent to power driven sizes added.*
		10d box (3" x 0.128"); or 3" x 0.131" nails; or 3" 14 gage staples, 7/16" crown	12" o.c. face nail	
13	Top plate to top plate, at end joints	8-16d common (3.5" x 0.162"); or 12-10d box (3" x 0.128"); or 12-3" x 0.131" nails; or 12-3" 14 gage staples, 7/16" crown	Face nail on each side of end joint (minimum 24" lap splice length each side of end joint)	*-Nailing from IBC Row 10.* *-10d box equivalent to power driven sizes added.*
14	Bottom plate to joist, rim joist, band joist or blocking (not at braced wall panels)	16d common (3.5" x 0.162"); or	16" o.c. face nail	*-Nailing from IBC Row 6 except that 16d common used in lieu of 16d box.* *-16d box equivalent added at 12" o.c.*

	DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER	SPACING AND LOCATION	*Notes:*
		16d box (3.5" x 0.135"); or 3" x 0.131" nails; or 3" 14 gage staples, 7/16" crown	12" o.c. face nail	
15	Bottom plate to joist, rim joist, band joist or blocking at braced wall panels	2-16d common (3.5" x 0.162"); or 3-16d box (3.5" x 0.135"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown	16" o.c. face nail	*-Nailing from IBC Row 6; 16d common equivalent added*
16	Stud to bottom plate	4-8d common (2.5" x 0.131"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown; or	Toenail	*-Nailing per IBC Row 8.* *-10d box equivalent to 8d common added.*
		2-16d common (3.5" x 0.162"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	End nail	*-Nailing per IBC Row 8.* *-10d box equivalent to power driven sizes added.*
17	Top or bottom plate to stud	2-16d common (3.5" x 0.162"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	End nail	*-Nailing per IBC Row 7.* *-10d box equivalent to power driven sizes added.*
18	Top plates, laps at corners and intersections	2-16d common (3.5" x 0.162"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	Face nail	*-Nailing per IBC Row 13.* *-10d box equivalent to power driven sizes added.*
19	1" brace to each stud and plate	2-8d common (2.5" x 0.131"); or 2-10d box (3" x 0.128"); or 2-3" x 0.131" nails; or 2-3" 14 gage staples, 7/16" crown	Face nail	*-Nailing per IBC Row 20.* *-10d box equivalent to 8d common added.*
20	1" x 6" sheathing to each bearing	2-8d common (2.5" x 0.131"); or 2-10d box (3" x 0.128")	Face nail	*-Nailing per IRC Row 21 .* *-10d box equivalent to 8d common added.*
21	1" x 8" and wider sheathing to each bearing	3-8d common (2.5" x 0.131"); or 3-10d box (3" x 0.128")	Face nail	*-Nailing per IRC Rows 22 and 23, and IBC Rows 4, 21 and 22.* *-10d box equivalent to 8d common added.*
		FLOOR		
22	Joist to sill, top plate, or girder	3-8d common (2.5" x 0.131"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	Toenail	*-Nailing from IBC Row 1.* *-10d box equivalent to 8d common added.*
23	Rim joist, band joist, or blocking to sill or top plate	8d common (2.5" x 0.131"); or 10d box (3" x 0.128"); or 3" x 0.131" nails; or 3" 14 gage staples, 7/16" crown	6" o.c., toenail	*-Nailing from IBC Row 12.* *-10d box equivalent to 8d common added.*
24	1" x 6" subfloor or less to each joist	2-8d common (2.5" x 0.131"); or 3-10d box (3" x 0.128")	Face nail	*-Nailing from IBC Row 3.* *-10d box equivalent to 8d common added*
25	2" subfloor to joist or girder	2-16d common (3.5" x 0.162")	Face nail	*-Nailing from IBC Row 5.*

	DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER	SPACING AND LOCATION		*Notes:*
26	2" planks (plank & beam – floor & roof)	2-16d common (3.5" x 0.162")	At each bearing, face nail		*-Nailing from IBC Row 25.*
27	Built-up girders and beams, 2-inch lumber layers	20d common (4" x 0.192")	32" o.c., face nail at top and bottom staggered on opposite sides		*-Nailing from IBC Row 24. -10d box equivalent to power driven nail size added.*
		10d box (3" x 0.128"); or 3" x 0.131" nails; or 3" 14 gage staples, 7/16" crown	24" o.c. face nail at top and bottom staggered on opposite sides		
		And: 2-20d common (4" x 0.192"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	Face nail at ends and at each splice		*-Nailing from IBC Row 24. -10d box equivalent to power driven nail sizes added.*
28	Ledger strip supporting joists or rafters	3-16d common (3.5" x 0.162"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown	At each joist or rafter, face nail		*-Nailing from IBC Row 30. -10d box equivalent to power driven nail size added.*
29	Joist to band joist or rim joist	3-16d common (3.5" x 0.162"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown	End nail		*-Nailing from IBC Row 29. -10d box equivalent to power driven nail size added.*
30	Bridging to joist	2-8d common (2.5" x 0.131"); or 2-10d box (3" x 0.128"); or 2-3" x 0.131" nails; or 2-3" 14 gage staples, 7/16" crown	Each end, toenail		*-Nailing from IBC Row 2. -10d box equivalent to 8d common nail added.*

42	3/8”	6d casing (2" × 0.099"); or 6d finish (Panel supports at 24 inches)	6	12	*-Nailing from IBC Row 34 and footnote “k”.*

a. Nails spaced at 6 inches at intermediate supports where spans are 48 inches or more. For nailing of wood structural panel and particleboard diaphragms and shear walls, refer to Section 2305. Nails for wall sheathing are permitted to be common, box or casing.

b. Spacing shall be 6 inches on center on the edges and 12 inches on center at intermediate supports for nonstructural applications. Panel supports at 16 inches (20 inches if strength axis in the long direction of the panel, unless otherwise marked).

c. Where a rafter is fastened to an adjacent parallel ceiling joist in accordance with this schedule and the ceiling joist is fastened to the top plate in accordance with this schedule, the number of toenails in the rafter shall be permitted to be reduced by one nail.

Current (Existing) Table 2304.9.1 with additional column indicating new location:

CONNECTION	FASTENING[a, m]	LOCATION	*Notes:*

	25/32”	No. 11 gage roofing nail[h] 8d common nail (2” x 0.113”) No. 16 gage staple[i]		*to new row 35*
34. Interior paneling	¼”	4d[j]		*to new row 41*
	3/8”	6d[k]		*to new row 42*

For SI: 1 inch = 25.4 mm.

a. common or box nails are permitted to be used except where otherwise stated.

b. Nails spaced at 6 inches on center at edges, 12 inches at intermediate supports except 6 inches at supports where spans are 48 inches or more. For nailing of wood structural panel and particleboard diaphragms and shear walls, refer to Section 2305. Nails for wall sheathing are permitted to be common, box or casing.

c. Common or deformed shank (6d-2” x 0.113”; 8d-2 ½” x 0.131”; 10d-3” x 0.148”).

d. Common (6d-2” x 0.113”; 8d-2 ½” x 0.131”; 10d-3” x 0.148”).

e. Deformed shank (6d-2” x 0.113”; 8d-2 ½” x 0.131”; 10d-3” x 0.148”).

f. Corrosion-resistant siding (6d-1 7/8 x 0.106”; 8d-2 3/8” x 0.128”) or casing (6d-2” x 0.099”; 8d-2 ½” x 0.113”) nail.

g. Fasteners spaced 3 inches on center at exterior edges and 6 inches on center at intermediate supports, when used as structural sheathing. Spacing shall be 6 inches on center on the edges and 12 inches on center at intermediate supports for nonstructural applications.

h. Corrosion-resistant roofing nails with 7/16-inch-diameter head and d1 1 1/2"-inch length for ½-inch sheathing and 1 ¾-inch length for 25/32-inch sheathing.

i. Corrosion-resistant staples with nominal 7/16-inch crown or 1-inch crown and 1 ¼-inch length for ½-inch sheathing and 1 ½-inch length for 25/32-inch sheathing. Panel supports at 16 inches (20 inches if strength axis in the long direction of the panel, unless otherwise marked).

j. Casing (1 ½” x 0.080”) or finish (1 ½” x 0.072”) nails spaced 6 inches on panel edges, 12 inches at intermediate supports

k. Panel supports at 24 inches. Casing or finish nails spaced 6 inches on panel edges, 12 inches at intermediate supports.

l. For roof sheathing applications, 8d nails (2 ½” x 0.113”) are the minimum required for wood structural panels.

m. Staples shall have a minimum crown width of 7:16 inch.

n. For roof sheathing applications, fasteners spaced 4 inches on center at edges, 8 inches at intermediate supports.

o. Fasteners spaced 4 inches on center at edges, 8 inches at intermediate supports for subfloor and wall sheathing and 3 inches on center at edges, 6 inches at intermediate supports for roof sheathing.
p. Fasteners spaced 4 inches on center at edges, 8 inches at intermediate supports.

(The 2012 IRC fastener schedule is shown below for reference)

TABLE R602.3(1)
FASTENER SCHEDULE FOR STRUCTURAL MEMBERS

ITEM	DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER[a, b, c]	SPACING OF FASTENERS
		Roof	
1	Blocking between joists or rafters to top plate, toe nail	3-8d ($2^1/_2$″ × 0.113″)	—
2	Ceiling joists to plate, toe nail	3-8d ($2^1/_2$″ × 0.113″)	—
3	Ceiling joists not attached to parallel rafter, laps over partitions, face nail	3-10d	—
4	Collar tie to rafter, face nail or $1^1/_4$″ × 20 gage ridge strap	3-10d (3″ × 0.128″)	—
5	Rafter or roof truss to plate, toe nail	3-16d box nails ($3^1/_2$″ × 0.135″) or 3-10d common nails (3″ × 0.148″)	2 toe nails on one side and 1 toe nail on opposite side of each rafter or truss[j]
6	Roof rafters to ridge, valley or hip rafters: toe nail face nail	4-16d ($3^1/_2$″ × 0.135″) 3-16d ($3^1/_2$″ × 0.135″)	—
		Wall	
7	Built-up studs-face nail	10d (3″ × 0.128″)	24″ o.c.
8	Abutting studs at intersecting wall corners, face nail	16d (3 ½" x 0.135")	12″ o.c.
9	Built-up header, two pieces with $^1/_2$″ spacer	16d ($3^1/_2$″ × 0.135″)	16″ o.c. along each edge
10	Continued header, two pieces	16d ($3^1/_2$″ × 0.135″)	16″ o.c. along each edge
11	Continuous header to stud, toe nail	4-8d ($2^1/_2$″ × 0.113″)	—
12	Double studs, face nail	10d (3″ × 0.128″)	24″ o.c.
13	Double top plates, face nail	10d (3″ × 0.128″)	24″ o.c.
14	Double top plates, minimum 24-inch offset of end joints, face nail in lapped area	8-16d ($3^1/_2$″ × 0.135″)	—
15	Sole plate to joist or blocking, face nail	16d ($3^1/_2$″ × 0.135″)	16″ o.c.
16	Sole plate to joist or blocking at braced wall panels	3-16d ($3^1/_2$″ × 0.135″)	16″ o.c.
17	Stud to sole plate, toe nail	3-8d ($2^1/_2$″ × 0.113″) or 2-16d ($3^1/_2$″ × 0.135″)	— —
18	Top or sole plate to stud, end nail	2-16d ($3^1/_2$″ × 0.135″)	—
19	Top plates, laps at corners and intersections, face nail	2-10d (3″ × 0.128″)	—
20	1″ brace to each stud and plate, face nail	2-8d ($2^1/_2$″ × 0.113″) 2 staples $1^3/_4$″	— —
21	1″ × 6″ sheathing to each bearing, face nail	2-8d ($2^1/_2$″ × 0.113″) 2 staples $1^3/_4$″	— —
22	1″ × 8″ sheathing to each bearing, face nail	2-8d ($2^1/_2$″ × 0.113″) 3 staples $1^3/_4$″	— —
23	Wider than 1″ × 8″ sheathing to each bearing, face nail	3-8d ($2^1/_2$″ × 0.113″) 4 staples $1^3/_4$″	— —
		Floor	
24	Joist to sill or girder, toe nail	3-8d ($2^1/_2$″ × 0.113″)	—
25	Rim joist to top plate, toe nail (roof applications also)	8d ($2^1/_2$″ × 0.113″)	6″ o.c.
26	Rim joist or blocking to sill plate, toe nail	8d (2 ½″ × 0.113″)	6″ o.c.
27	1″ × 6″ subfloor or less to each joist, face nail	2-8d ($2^1/_2$″ × 0.113″) 2 staples $1^3/_4$″	— —
28	2″ subfloor to joist or girder, blind and face nail	2-16d ($3^1/_2$″ × 0.135″)	—
29	2″ planks (plank & beam - floor & roof)	2-16d ($3^1/_2$″ × 0.135″)	at each bearing
30	Built-up girders and beams, 2-inch lumber layers	10d (3″ × 0.128″)	Nail each layer as follows: 32″ o.c. at top and bottom and staggered. Two nails at ends and at each splice.
31	Ledger strip supporting joists or rafters	3-16d ($3^1/_2$″ × 0.135″)	At each joist or rafter

TABLE R602.3(1)—continued
FASTENER SCHEDULE FOR STRUCTURAL MEMBERS

ITEM	DESCRIPTION OF BUILDING MATERIALS	DESCRIPTION OF FASTENER[b, c, e]	SPACING OF FASTENERS	
			Edges (inches)[i]	Intermediate supports[c, e] (inches)
Wood structural panels, subfloor, roof and interior wall sheathing to framing and particleboard wall sheathing to framing				
32	$^3/_8$" - $^1/_2$"	6d common (2" × 0.113") nail (subfloor wall)[j] 8d common ($2^1/_2$" × 0.131") nail (roof)[f]	6	12[g]
33	$^{19}/_{32}$" - 1"	8d common nail ($2^1/_2$" × 0.131")	6	12[g]
34	$1^1/_8$" - $1^1/_4$"	10d common (3" × 0.148") nail or 8d ($2^1/_2$" × 0.131") deformed nail	6	12
Other wall sheathing[h]				
35	$^1/_2$" structural cellulosic fiberboard sheathing	$^1/_2$" galvanized roofing nail, $^7/_{16}$" crown or 1" crown staple 16 ga., $1^1/_4$" long	3	6
36	$^{25}/_{32}$" structural cellulosic fiberboard sheathing	$1^3/_4$" galvanized roofing nail, $^7/_{16}$" crown or 1" crown staple 16 ga., $1^1/_2$" long	3	6
37	$^1/_2$" gypsum sheathing[d]	$1^1/_2$" galvanized roofing nail; staple galvanized, $1^1/_2$" long; $1^1/_4$ screws, Type W or S	7	7
38	$^5/_8$" gypsum sheathing[d]	$1^3/_4$" galvanized roofing nail; staple galvanized, $1^5/_8$" long; $1^5/_8$" screws, Type W or S	7	7
Wood structural panels, combination subfloor underlayment to framing				
39	$^3/_4$" and less	6d deformed (2" × 0.120") nail or 8d common ($2^1/_2$" × 0.131") nail	6	12
40	$^7/_8$" - 1"	8d common ($2^1/_2$" × 0.131") nail or 8d deformed ($2^1/_2$" × 0.120") nail	6	12
41	$1^1/_8$" - $1^1/_4$"	10d common (3" × 0.148") nail or 8d deformed ($2^1/_2$" × 0.120") nail	6	12

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 mile per hour = 0.447 m/s; 1 Ksi = 6.895 MPa.

a. All nails are smooth-common, box or deformed shanks except where otherwise stated. Nails used for framing and sheathing connections shall have minimum average bending yield strengths as shown: 80 ksi for shank diameter of 0.192 inch (20d common nail), 90 ksi for shank diameters larger than 0.142 inch but not larger than 0.177 inch, and 100 ksi for shank diameters of 0.142 inch or less.

b. Staples are 16 gage wire and have a minimum $^7/_{16}$-inch on diameter crown width.

c. Nails shall be spaced at not more than 6 inches on center at all supports where spans are 48 inches or greater.

d. Four-foot by 8-foot or 4-foot by 9-foot panels shall be applied vertically.

e. Spacing of fasteners not included in this table shall be based on Table R602.3(2).

f. For regions having basic wind speed of 110 mph or greater, 8d deformed ($2^1/_2$" × 0.120) nails shall be used for attaching plywood and wood structural panel roof sheathing to framing within minimum 48-inch distance from gable end walls, if mean roof height is more than 25 feet, up to 35 feet maximum.

g. For regions having basic wind speed of 100 mph or less, nails for attaching wood structural panel roof sheathing to gable end wall framing shall be spaced 6 inches on center. When basic wind speed is greater than 100 mph, nails for attaching panel roof sheathing to intermediate supports shall be spaced 6 inches on center for minimum 48-inch distance from ridges, eaves and gable end walls; and 4 inches on center to gable end wall framing.

h. Gypsum sheathing shall conform to ASTM C 1396 and shall be installed in accordance with GA 253. Fiberboard sheathing shall conform to ASTM C 208.

i. Spacing of fasteners on floor sheathing panel edges applies to panel edges supported by framing members and required blocking and at all floor perimeters only. Spacing of fasteners on roof sheathing panel edges applies to panel edges supported by framing members and required blocking. Blocking of roof or floor sheathing panel edges perpendicular to the framing members need not be provided except as required by other provisions of this code. Floor perimeter shall be supported by framing members or solid blocking.

j. Where a rafter is fastened to an adjacent parallel ceiling joist in accordance with this schedule, provide two toe nails on one side of the rafter and toe nails from the ceiling joist to top plate in accordance with this schedule. The toe nail on the opposite side of the rafter shall not be required.

Cost Impact: The code change proposal will not increase the cost of construction.

T2304.9.1-S-BAJNAI-BCAC.doc

S266–12
Table 2304.9.1

Proponent: Paul Coats, American Wood Council (pcoats@awc.org)

Revise as follows:

TABLE 2304.9.1
FASTENING SCHEDULE

CONNECTION	FASTENING[a,m]		LOCATION
33. Fiberboard sheathing[g]	1/2"	No. 11 gage roofing nail[h] ~~6d common nail (2" × 0.113")~~ No. 16 gage staple[i]	
	25/32"	No. 11 gage roofing nail[h] ~~8d common nail (21/2" × 0.131")~~ No. 16 gage staple[i]	

(Portions of table not shown remain unchanged)

Reason: Recommended fastening for fiberboard sheathing no longer includes 6d common or 8d common nails. Removal of these common nail fastener sizes coordinates with revisions made in the 2008 Special Design Provisions for Wind and Seismic (SDPWS) and 2012 Wood Frame Construction Manual (WFCM) referenced in this code and applicable for design of structural fiberboard shear walls. Specified roofing nails and staples incorporate a larger head/crown size per footnotes h and i for increased head pull-through resistance.

Cost Impact: The code change proposal will not increase the cost of construction.

S266-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T2304.9.1-S-COATS.doc

S267–12
Table 2304.9.1

Proponent: Jay Crandell, ARES Consulting, representing the Foam Sheathing Committee of the American Chemistry Council- Plastics Division (jcrandell@aresconsulting.biz)

Revise as follows:

TABLE 2304.9.1
FASTENING SCHEDULE

7. Top plate to stud	2 - 16d common ($3^{1}/_{2}$" × 0.162") 3 - 3" × 0.131" nails 3 - 3" 14 gage staples	end nail
	4 - 8d common (21/2" × 0.131") 4 - 3" × 0.131" nails 3 - 3" 14 gage staples	toenail

(Portions of table not shown remain unchanged)

Reason: The code already provides a toenail connection option for the stud to bottom plate connection (see Item 8 in the same table). This code change proposal makes requirements consistent for connection of the stud to the top plate. Toe nail connections provide a better uplift load path than end nails, so this option should be provided for both ends of the stud, not just at the bottom end of the stud.

Cost Impact: The code change proposal will not increase the cost of construction.

2304.11, 2304.11.1, 2304.11.2, 2304.11.2.1, 2304.11.2.2, 2304.11.2.3, 2304.2.4, 2304.11.2.5, 2304.11.2.6, 2304.11.2.7, 2304.11.3, 2304.11.4, 2304.11.4.1, 2304.11.4.2, 2304.11.5, 2304.11.6, 2304.11.7

Proponent: Dennis Pitts, American Wood Council, (dpitts@awc.org)

Revise as follows:

2304.11 Protection against decay and termites. Wood shall be protected from decay and termites in accordance with the applicable provisions of Sections 2304.11.1 through ~~2304.11.9~~ 2304.11.7.

~~**2304.11.1 General.** Where required by this section, protection from decay and termites shall be provided by the use of naturally durable or *preservative-treated wood*.~~

~~**2304.11.2 Wood used above ground**~~ **2304.11.1 Location requiring water-borne preservatives.** Wood used above ground in the locations specified in Sections ~~2304.11.2.1~~ 2304.11.1.1 through ~~2304.11.2.7~~ 2304.11.1.5, 2304.11.3 and 2304.11.5 shall be naturally durable wood or *preservative-treated wood* using water-borne preservatives, in accordance with AWPA U1 ~~(Commodity Specifications A or F)~~ for above-ground use.

~~**2304.11.2.1**~~ **2304.11.1.1 Joists, girders and subfloor.** ~~Where~~ Wood joists or ~~the bottom of~~ a wood structural floor ~~without joists are~~ closer than 18 inches (457 mm), or wood girders ~~are~~ closer than 12 inches (305 mm) to the exposed ground in crawl spaces or unexcavated areas located within the perimeter of the building foundation~~, the floor construction (including posts, girders, joists and subfloor)~~ shall be of naturally durable or *preservative-treated wood*.

~~**2304.11.2.2**~~ **2304.11.1.2 Wood supported by exterior foundation walls.** Wood framing members, including wood sheathing, that ~~rest on~~ are in contact with exterior foundation walls and are less than 8 inches (203 mm) from exposed earth shall be of naturally durable or *preservative-treated wood*.

~~**2304.11.2.3**~~ **2304.11.1.3 Exterior walls below grade.** Wood framing members and furring strips ~~attached directly to~~ in direct contact with the interior of exterior masonry or concrete walls below grade shall be of naturally durable or *preservative-treated wood*.

~~**2304.11.2.4**~~ **2304.11.1.4 Sleepers and sills.** Sleepers and sills on a concrete or masonry slab that is in direct contact with earth shall be of naturally durable or *preservative-treated wood*.

~~**2304.11.2.6**~~ **2304.11.1.5 Wood siding.** Clearance between wood siding and earth on the exterior of a building shall not be less than 6 inches (152 mm) or less than 2 inches (51 mm) vertical from concrete steps, porch slabs, patio slabs and similar horizontal surfaces exposed to the weather except where siding, sheathing and wall framing are of naturally durable or *preservative-treated wood*.

2304.11.2 Other locations. Wood used in the locations specified in Sections 2304.11.2.1 through 2304.11.2.5 shall be naturally durable wood or *preservative treated wood* in accordance with AWPA U1. Preservative treated wood used in interior locations shall be protected with two coats of urethane, shellac, latex epoxy, or varnish unless waterborne preservatives are used. Prior to application of the protective finish, the wood shall be dried in accordance with the manufacturer's recommendations.

~~**2304.11.2.5**~~ **2304.11.2.1 Girder ends.** The ends of wood girders entering exterior masonry or concrete walls shall be provided with a 1/2-inch (12.7 mm) air space on top, sides and end, unless naturally durable or pr*eservative-treated wood* is used.

~~2304.11.2.7~~ **2304.11.2.2 Posts or columns.** Posts or columns supporting permanent structures and supported by a concrete or masonry slab or footing that is in direct contact with the earth shall be of naturally durable or *preservative-treated wood*.

Exceptions:

~~1.~~ Posts or columns that are ~~either~~ not exposed to the weather ~~or located in basements or cellars,~~ are supported by concrete piers or metal pedestals projected at least 1 inch (25 mm) above the slab or deck and ~~6~~ 8 inches (152 mm) above exposed earth, and are separated ~~therefrom~~ by an impervious moisture barrier.

~~2. Posts or columns in enclosed crawl spaces or unexcavated areas located within the periphery of the building, supported by a concrete pier or metal pedestal at a height greater than 8 inches (203 mm) from exposed ground, and are separated therefrom by an impervious moisture barrier.~~

~~2304.11.5~~ **2304.11.2.3 Supporting member for permanent appurtenances.** Naturally durable or *preservative-treated wood* shall be utilized for those portions of wood members that form the structural supports of buildings, balconies, porches or similar permanent building appurtenances where such members are exposed to the weather without adequate protection from a roof, eave, overhang or other covering to prevent moisture or water accumulation on the surface or at joints between members.

Exception: When a building is located in a geographical region where experience has demonstrated that climatic conditions preclude the need to use durable materials where the structure is exposed to the weather.

~~2304.11.3~~ **2304.11.2.4 Laminated timbers.** The portions of glued-laminated timbers that form the structural supports of a building or other structure and are exposed to weather and not fully protected from moisture by a roof, eave or similar covering shall be pressure treated with preservative or be manufactured from naturally durable or *preservative-treated wood*.

2304.11.2.5. Supporting members for permeable floors and roofs. Wood structural members that support moisture-permeable floors or roofs that are exposed to the weather, such as concrete or masonry slabs, shall be of naturally durable or *preservative-treated wood* unless separated from such floors or roofs by an impervious moisture barrier.

~~2304.11.4~~ **2304.11.3 Wood in contact with the ground or fresh water.** Wood used in contact with the ground (exposed earth) ~~in the locations specified in Sections 2304.11.4.1 and 2304.11.4.2~~ shall be naturally durable (species for both decay and termite resistance) or preservative treated ~~using water-borne preservatives~~ in accordance with AWPA U1 ~~(Commodity Specifications A or F)~~ for soil or fresh water use.

Exception: Untreated wood is permitted where such wood is continuously and entirely below the groundwater level or submerged in fresh water.

~~2304.11.4.1~~ **2304.11.3.1 Posts or columns.** Posts and columns supporting permanent structures that are embedded in concrete that is ~~in direct contact with the earth, embedded in concrete that is~~ exposed to the weather or in direct contact with the earth shall be of *preservative-treated wood*.

~~**2304.11.4.2 Wood structural members.** Wood structural members that support moisture-permeable floors or roofs that are exposed to the weather, such as concrete or masonry slabs, shall be of naturally durable or *preservative-treated wood* unless separated from such floors or roofs by an impervious moisture barrier.~~

~~2304.11.6~~ **2304.11.4 Termite protection.** In geographical areas where hazard of termite damage is known to be very heavy, wood floor framing in the locations specified in Section 2304.11.1.1 and exposed framing of exterior decks or balconies shall be of naturally durable species (termite resistant) or preservative treated in accordance with AWPA U1 for the species, product preservative and end use or provided with *approved* methods of termite protection.

~~2304.11.7~~ 2304.11.5 Wood used in retaining walls and cribs. Wood installed in retaining or crib walls shall be preservative treated in accordance with AWPA U1 ~~(Commodity Specifications A or F)~~ for soil and fresh water use.

Reason: This code change contains few technical changes but addresses many editorial clean-ups and some re-organization. The technical change is a delineation of exactly where waterborne preservatives should be required and where they should not. In a reorganization of this section in the 2005 code change cycle, glued laminated and certain exterior applications were lumped under a general section for the purposes of citing the new AWPA U1 standard, but a requirement for waterborne preservatives was inadvertently imposed for all applications in that reorganization. This proposed code change restores the ability for glued laminated beams and wood in exterior applications to be treated with other-than waterborne preservatives in accordance with the U1 standard. As a precaution, a requirement for the drying of treated wood and its sealing was added where used on the interior of a building (proposed section 2304.11.2).

Other changes are explained as follows:

Existing section 2304.11.1 deletion: This section became superfluous.

Proposed 2304.11.1: Section references are changed, and the specific mention of commodity specifications in the U1 standard was deleted because it is unnecessary.

Proposed 2304.11.1.1: Removing "the floor construction (including posts, girders, joists and subfloor)" makes it clear that only those floor elements within proximity to exposed ground need to be protected.

Proposed 2304.11.1.2: Better wording to meet current intent.

Proposed 2304.11.1.3: Better wording to meet current intent.

Proposed 2304.11.2: This new section is needed to introduce the subsections for locations where other-than waterborne preservatives are permitted under certain circumstances, as long as treatment is in accordance with the AWPA U1 standard.

Proposed 2304.11.2.2 Exceptions: The first exception was worded incorrectly and would seem to exempt exposed wood from protection; the proposed wording is a fix. With Exception 1 fixed, exception 2 was so similar in requirement that it was combined with Exception 1 and the clearance dimension was changed from 6 to 8 inches to preserve the intent of the deleted exception and be consistent with the clearance required for wood supported by exterior foundation walls in proposed Section 2304.11.1.2.

Proposed 2304.11.2.5: This is not a new section, but is re-titled and moved up in the text from Section 2304.11.4.2 (shown struck-out further down). There is no obvious reason why it must be a subsection of current 2304.11.4.

Proposed 2304.11.3: The requirement that water-borne preservatives be used exclusively has been struck in accordance with the purpose of this change, which indicates those locations where water-borne preservatives must be used up in proposed Section 2304.11.1 and subsections.

Existing section 2304.11.4.1 and 2304.11.4.2 (shown struck out): These were not lost. The current 2304.11.4.2 was moved up to become proposed 2304.11.2.5, and the current 2304.11.4.1 became 2304.11.3.1 with some editorial rewording for clarity.

Cost Impact: The code change proposal will not increase the cost of construction.

2304.11-S-PITTS.doc

S269–12
2304.11.2, 2304.11.3, 2304.11.4, 2304.11.5, 2304.11.7

Proponent: Paul Coats, P.E., CBO, American Wood Council (pcoats@awc.org)

Revise as follows:

2304.11.2 Wood used above ground. Wood used above ground in the locations specified in Sections 2304.11.2.1 through 2304.11.2.7, ~~2304.11.3 and 2304.11.5~~ shall be naturally durable wood or *preservative-treated wood* using water-borne preservatives, in accordance with AWPA U1 ~~(Commodity Specifications A or F)~~ for above-ground use.

2304.11.3 Laminated timbers. The portions of glued-laminated timbers that form the structural supports of a building or other structure and are exposed to weather and not fully protected from moisture by a roof, eave or similar covering shall be ~~pressure~~ preservative treated ~~with preservative~~ in accordance with AWPA U1 or be manufactured from naturally durable or *preservative-treated wood*.

Unless waterborne preservatives are used, preservative treated glued laminated timbers used in interior locations shall be protected with two coats of urethane, shellac, latex epoxy, or varnish. Prior to application of the protective finish, the wood shall be dried in accordance with the manufacturer's recommendations.

2304.11.4 Wood in contact with the ground or fresh water. Wood used in contact with the ground (exposed earth) in the locations specified in Sections 2304.11.4.1 and 2304.11.4.2 shall be naturally durable (species for both decay and termite resistance) or preservative treated using water-borne preservatives in accordance with AWPA U1 ~~(Commodity Specifications A or F)~~ for soil or fresh water use.

> **Exception:** Untreated wood is permitted where such wood is continuously and entirely below the groundwater level or submerged in fresh water.

2304.11.5 Supporting member for permanent appurtenances. Naturally durable wood or wood that is *preservative-treated* ~~*wood*~~ in accordance with AWPA U1 shall be utilized for those portions of wood members that form the structural supports of buildings, balconies, porches or similar permanent building appurtenances where such members are exposed to the weather without adequate protection from a roof, eave, overhang or other covering to prevent moisture or water accumulation on the surface or at joints between members.

> **Exception:** When a building is located in a geographical region where experience has demonstrated that climatic conditions preclude the need to use durable materials where the structure is exposed to the weather.

2304.11.7 Wood used in retaining walls and cribs. Wood installed in retaining or crib walls shall be preservative treated in accordance with AWPA U1 ~~(Commodity Specifications A or F)~~ for soil and fresh water use.

Reason: It is common practice for glued-laminated structural members to be treated with other than water-borne preservatives. In the 2006 IBC, a change was introduced which re-organized the preservative treated wood section and inadvertently imposed a water-borne preservative mandate on glued laminated timbers and exterior applications of other structural members (see code change S51-03/04). The reason for the original change was to bring all applications under the new AWPA U1 standard. This proposed change retains the intent of having the U1 standard apply to all applications but enables current industry practice for the use of other preservatives for exterior and glued-laminated applications. As a precaution against air quality concerns, wording is introduced to require the drying and sealing of glued laminated members when used in interior applications, if water-borne preservatives are not used. Also, the limitation to Commodity Specifications A or F is no longer necessary since the standard now clearly indicates the applicability limits of its various specifications.

Cost Impact: The code change proposal will not increase the cost of construction.

2304.11.2-S-COATS.doc

S270–12
2304.11.2.1

Proponent: Edward L. Keith, P.E., APA The Engineered Wood Association (ed.keith@apawood.org)

Revise as follows:

2304.11.2.1 Joists, girders and subfloor. Where wood joists or the bottom of a wood structural floor without joists are closer than 18 inches (457 mm), or wood girders are closer than 12 inches (305 mm) to the exposed ground in crawl spaces or unexcavated areas located within the perimeter of the building foundation, the floor construction (including posts, girders, joists and subfloor) shall be of naturally durable or *preservative-treated wood*.

> **Exception:** The clearance between the wood floor joists or the bottom of a wood structural floor without joists and the exposed ground shall be permitted to be reduced to 12 inches in areas where all of the following conditions have been met:
>
> 1. The grade within the perimeter of the foundation slopes away from the floor framing in such a way as to make all of the floor joists, the bottom of a wood structural floor without joists, and girders readily accessible,
> 2. The average distance between grade and the bottom of the wood floor joists or the bottom of a wood structural floor without joists is at least 18", and
> 3. The foundation is ventilated in accordance with Section 1203.3.

Reason: The purpose of this proposal is to reduce the raised-wood floor clearance height only in those areas that doing so will not adversely impact the long-term performance of the floor system. The provisions of this exception accomplish two things:

1) It recognizes the method of floor construction whereby the floor joists are face-mounted to the side of the girders and occupy the same depth as the girder. As such, both portions of the system would have the same clearance above grade. If 12 inches of clearance from grade provides sufficient moisture separation for girders, the same distance will provide sufficient moisture separation for floor joists as well.

2) Recognizing that at least part of the reason for requiring 18 inches of clearance under floor joists is to provide accessibility to the underside of the floor, permitting the separation to be reduced to 12 inches can only be made under three conditions specified to maintain access to the under-floor area and still provide sufficient ventilation to insure the serviceability of the floor system through moisture control. These conditions are as follows:
   a. This reduction in separation for the floor joists or the bottom of a wood structural floor without joists is only permitted in foundations where the ground slopes away from the floor in a way such that only readily accessible portions of the floor may meet this reduced separation requirement.
   b. The minimum average clearance requirement is provided to insure sufficient slope is present to provide the ready accessibility to the portions of the floor meeting the new reduced clearance to grade requirement.
   c. This exception is applicable only to those under-floor spaces meeting the ventilation requirements of Section 1203.3.

It is anticipated that this exception as written will provide some cost savings to buildings constructed on sloped sites by reducing the crawl space height dictated by a small percent of the floor area while providing similar accessibility and serviceability as is intended by the Section 2304.11.2.1.

It also recognizes the increasingly common low profile floors whereby the floor joists are hung off of the sides of the floor girders. These are becoming increasingly popular as builders discover the availability of engineered wood beams made in I-joist-compatible depths. The use of such beams and girders had the potential to reduce first-floor elevations by 6 to 9 inches with a corresponding savings in labor and construction materials.

Cost Impact: The code change proposal will not increase the cost of construction.

S270-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2304.11.2.1-S-KEITH.doc

S271–12
2304.11.2.7

Proponent: Dennis Pitts, American Wood Council, (dpitts@awc.org)

Revise as follows:

2304.11.2.7 Posts or columns. Posts or columns supporting permanent structures and supported by a concrete or masonry slab or footing that is in direct contact with the earth shall be of naturally durable or *preservative-treated wood*.

Exception:

~~1.~~ Posts or columns that are ~~either~~ not exposed to the weather ~~or located in basements or cellars,~~ and are supported by concrete piers or metal pedestals projected at least 1 inch (25 mm) above the slab or deck and ~~6 inches (152 mm)~~ 8 inches (203 mm) above exposed earth, and are separated therefrom by an impervious moisture barrier.

~~2. Posts or columns in enclosed crawl spaces or unexcavated areas located within the periphery of the building, supported by a concrete pier or metal pedestal at a height greater than 8 inches (203 mm) from exposed ground, and are separated therefrom by an impervious moisture barrier.~~

Reason: The current wording of Exception 1 conflicts with requirements in 2304.11.3 and 2304.11.5 and is technically incorrect. Those sections make it clear that all posts or columns exposed to the weather must be protected, regardless of location. The proposed wording removes any confusion. Exceptions 1 and 2 are very similar and with the proposed clean-up of the first exception, the second is superfluous except for the dimension of 8 inches, which differs from the 6-inch dimension in Exception 1. For consistency with other requirements such as for wood supported by exterior foundation walls in 2304.11.2.2, the 8-inch clearance dimension is preferable.

A comparable revision is made as part of the general cleanup and reorganization of this section proposed by AWC in a separate proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

S271-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2304.11.2.7-S-PITTS.doc

S272–12
2301.2, 2308

Proponent: Charles S. Bajnai, Chesterfield County, VA, (bajnaic@chesterfield.gov)

Revise as follows:

2301.2 General design requirements. The design of structural elements or systems, constructed partially or wholly of wood or wood-based products, shall be in accordance with one of the following methods:

1. *Allowable stress design* in accordance with Sections 2304, 2305 and 2306.
2. *Load and resistance factor design* in accordance with Sections 2304, 2305 and 2307.
3. *Conventional light-frame construction* in accordance with Sections 2304 and 2308.

   Exceptions:

   1. Buildings designed in accordance with the provisions of the AF&PA WFCM shall be deemed to meet the requirements of the provisions of Section 2308.
   2. Buildings designed in accordance to the prescriptive structural provisions of the International Residential Code, shall be permitted in accordance with Section 2303 limitations.

4. The design and construction of log structures shall be in accordance with the provisions of ICC 400.

Delete and substitute as follows:

~~**SECTION 2308**~~
~~**CONVENTIONAL LIGHT-FRAME CONSTRUCTION**~~

SECTION 2308
CONVENTIONAL LIGHT-FRAME CONSTRUCTION

2308.1 General. For purposes of defining the structural requirements for buildings using conventional light-frame construction, the International Residential Code (IRC) shall be permitted to be used. The limitations for height, area, egress and the necessity for sprinklers are not to be modified. If there are differences encountered between the IBC and the IRC, the IBC or accepted engineering practice shall govern.

Other construction methods are permitted to be used in accordance with Section 2301.2.

2308.2 Limitations. Buildings are permitted to be constructed in accordance with the provisions of this section and the International Residential Code subject to the following limitations:

1. Buildings shall be limited to a maximum of three stories above grade plane.
2. Maximum floor-to-floor height shall not exceed 11 feet, 7 inches in height. Bearing wall height shall not exceed a stud height of 12 feet.
3. Live load for floors shall not exceed 40 psf when built on conventional light-frame construction.
4. V_{asd} shall be 109 mph or less.
5. Structures of Risk Category I, II, or III.
6. Seismic Design Category A thru D_2. Structures in SDC E shall conform to the wall bracing requirements of Seismic Design Category D_2 as established in the IRC.

2308.3. Climatic and Geographic Design Criteria. The Climatic and Geographic Design Criteria in IRC Table R301.2(1) and the related maps and tables shall be applied.

Reason: There are intrinsic deficiencies in the IBC, Section 2308.

I. IBC Section 2308 is prescriptive code. It tells the designer everything from anchor bolt location and sizes to floor joist, ceiling joist and header tables. What is the difference between house construction and a small office building constructed of wood? My contention is that there is nothing different. This code change is intended to tell the designer/builder that the requirements for *conventional light-frame construction* are sufficient for the buildings and structure within the scope of the IRC and are equally sufficient for other buildings and structures other than one and two family dwellings.

II. IBC Section 2308 has numerous technical flaws in its engineering, namely:

1. The wall bracing requirements were set up in the IBC for seismic events, not wind events. What this means is that the building exposed to wind events (more than half of the country) may be adequately strong in its long dimension, but weak/under designed in its narrow dimension. See example at the end of this reason statement.
2. The IBC does not take into consideration that the lateral loads are accumulative from the upper floors down to the lower floors. All of the floors are treated as if they are the same with respect to the amount of bracing required. This is not a true phenomenon.
   The IRC addresses this in both the wind and seismic tables – the length of bracing on the lower levels is more than the bracing required on the upper levels.
3. The IBC does not specify the minimum length of bracing required. Instead, it has a table, 2308.9.3.1 which shows "X" for the methods allowed and references back to the location requirement of not more than 12.5 feet from braced wall corners. The IBC tries to control the required length of bracing based on the panel spacing – this is like trying to control gas mileage of a car based on the tire size…they just don't have too much influence on each other.

III. IBC Section 2308 does not allow the engineer/builder to gain the benefits of other advancements that have been added to the IRC, namely:

1. There are wall bracing methods in the IRC that should be available to structures using the IBC, namely, continuous wall bracing methods. The current IBC provides no benefit for continuously sheathing the exterior of the structure.
2. The IRC actually allows for stud height of 12 feet. The IBC limitations in Section 2308 limits stud heights to 10 feet.
3. In the IBC there is no difference if the wind is ≤90 mph (over half of the country) or <110 mph. By inference then, the IBC provisions must be designing for the worst case situation for all structures.

The Ad-hoc Committee on Wall Bracing (AHWB) spent over five years getting the 2012 IRC to correctly reflect the technical differences between wind and seismic events. The rules are different and the amount of bracing required is different depending on which event governs.

Unfortunately, the IBC was not in the purview of the AHWB committee. Therefore no effort was put into coordinating the IRC with the IBC. Part of the problem had to deal with the fact that the wind and seismic provisions in the IBC are based on ASCE 7 while the wind and seismic provisions in the IRC are based on prescriptive maps.

This code change is not intended to change or negate any of the height and area nor the egress requirements, in the IBC. Likewise, this code change is not intended to say that all structures using the IRC must now be sprinklered. This code change is intended to say that the prescriptive requirements in the IRC can be used for of structures besides houses.

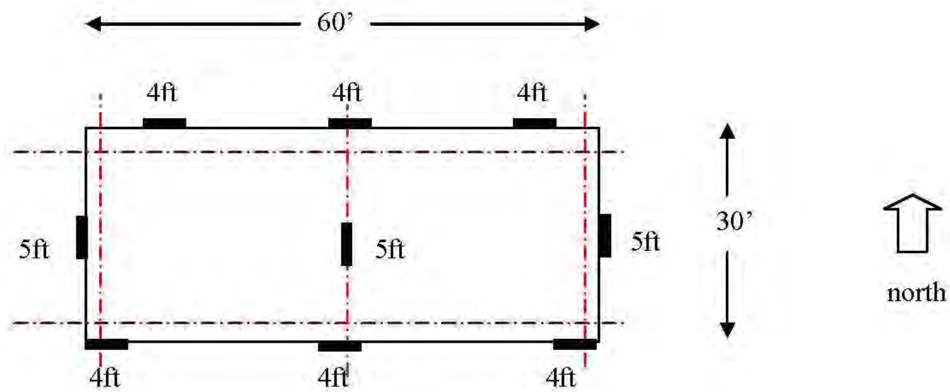
Why not just copy the IRC tables into the IBC?

Some experts may suggest that if the IBC is flawed then the wall bracing requirements in the IRC should be copied over in their entirety to the IBC. It is nearly impossible to just drop the wind tables and seismic tables directly into the IBC; the two books do not have a hand and glove relationship - they are better off remaining distinct.

The AHWC committee in its effort to be more flexible took the six pages from Section R602.10 in the 2006 IRC and made it into thirty pages in the 2012 IRC. Do we really want to do this again??? Even if we did, copying the IRC wall bracing provisions into the IBC does not rectify the original prescriptive language problem inherent in Section 2308.

Example of the difference between the IRC and the IBC with regard to wall bracing assuming most liberal code allowances:

Example of the difference between the IRC and the IBC with regard to wall bracing assuming most liberal code allowances:



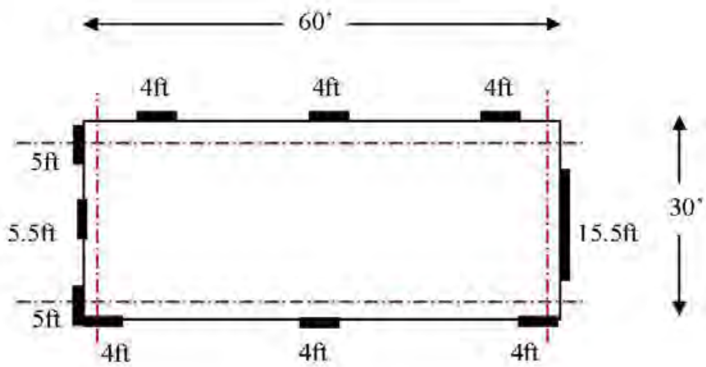
Parameters:
One Story, Exposure B, SDC B, Wind Speed <110 mph
Wall height 10', Eve to ridge height 10
Using wood structural panels (method 3)

According to the IBC
Braced wall lines: max spacing for SDC B = 35'
Braced wall lines may be offset from actual walls ≤ 4'

Braced wall panels must be within 12.5' of the end of the structure
Braced wall panel spacing may not exceed 25' o.c.

According to the IBC parameters,

- Long side: minimum 12' of bracing x 2 sides = 24' total bracing to resist wind blowing east/west
- Short side: minimum 5' of bracing x 3 lines = 15' total bracing to resist wind blowing north/south



Parameters:
One Story, Exposure B, SDC B, Wind Speed <110 mph
Wall height 10', Eve to ridge height 10
Using wood structural panels (WSP)

According to the IRC
Braced wall lines: max spacing for SDC B = 60'
Braced wall lines may be offset from actual walls ≤ 4'

Braced wall panels must be within 10' of the end of the structure
Braced wall panel spacing may not exceed 20' end to end.

According to the IRC parameters,

- Long side: minimum tabular length required is 8.5', but braced wall panel spacing governs so 12' is the minimum length x 2 sides = 24' total bracing to resist wind blowing east/west
- Short sides: minimum tabular length required is 15.5' x 2 sides = 31' total bracing to resist wind blowing north/south

Conclusion:
The length of bracing for this one example shows that if wind is blowing north/south against the long face of the structure, the IBC has under designed the length of bracing required over fifty percent.

This code change is good for the IBC and should be passed.

Conclusion:
The length of bracing for this one example shows that if wind is blowing north/south against the long face of the structure, the IBC has under designed the length of bracing required over fifty percent. **This code change is good for the IBC and should be passed.**

Cost Impact: The impact of this change could be a significant cost reduction by allowing the prescriptive code to be used on small commercial projects that would otherwise require an engineered design. The exact amount of savings will be dependent on the cost of the architectural/engineering services. The cost of the construction should be the same.

~~**SECTION 2308**~~
~~**CONVENTIONAL LIGHT-FRAME CONSTRUCTION**~~

SECTION 2308
CONVENTIONAL LIGHT-FRAME CONSTRUCTION

2308.1 General. The requirements of this section are intended for *conventional light-frame construction*. Other construction methods are permitted to be used, provided a satisfactory design is submitted showing compliance with other provisions of this code. Interior non-load-bearing partitions, ceilings and curtain walls of *conventional light-frame construction* are not subject to the limitations of section 2308.2. Alternatively, compliance with AF&PA WFCM shall be permitted subject to the limitations therein and the limitations of this code. Detached one- and two-family dwellings and multiple single-family dwellings (townhouses) not more than three *stories above grade plane* in height with a separate *means of egress* and their accessory structures shall comply with the *International Residential Code*.

2308.2 Limitations. Buildings are permitted to be constructed in accordance with the provisions of *conventional light-frame construction*, subject to the following limitations;

2308.2.1 Stories. Structures of *conventional light-frame construction* shall be limited in story height according to Table 2308.2.1

TABLE 2308.2.1
ALLOWABLE STORY HEIGHT

Seismic Design Category	Allowable Story above grade plane
A and B	Three stories
C	Two Stories
D and E [a]	One story

a. For the purposes of this section, for buildings assigned to *Seismic Design Category* D or E, cripple walls shall be considered to be a *story* unless cripple walls are solid blocked and do not exceed 14 inches in height,

2308.2.2 Allowable floor-to-floor height. Maximum floor-to-floor height shall not exceed 11 feet, 7 inches (3531 mm). Exterior bearing wall and interior braced wall heights shall not exceed a stud height of 10 feet (3048 mm).

2308.2.3 Allowable Loads. Loads shall be in accordance with Chapter 16 and shall not exceed the following:

1. Average dead loads shall not exceed 15 psf (718 N/m^2) for combined roof and ceiling, exterior walls, floors and partitions.

   Exceptions:

   1. Subject to the limitations of Section 2308.6.10.2, stone or masonry veneer up to the lesser of 5 inches (127 mm) thick or 50 psf (2395 N/m^2) and installed in accordance with Chapter 14 is permitted to a height of 30 feet (9144 mm) above a noncombustible foundation, with an additional 8 feet (2438 mm) permitted for gable ends.

2. Concrete or masonry fireplaces, heaters and chimneys shall be permitted in accordance with the provisions of this code.

2. Live loads shall not exceed 40 psf (1916 N/m^2) for floors.
3. Ground snow loads shall not exceed 50 psf (2395 N/m^2).

2308.2.4 Allowable wind speed. V_{asd} as determined in accordance with Section 1609.3.1 shall not exceed 100 miles per hour (mph) (44 m/s) (3-second gust).

Exceptions:

1. V_{asd} as determined in accordance with Section 1609.3.1 shall not exceed 110 mph (48.4 m/s) (3-second gust) for buildings in Exposure Category B that are not located in a *hurricane-prone region*.
2. Where V_{asd} as determined in accordance with Section 1609.3.1 exceeds 100 mph (3-second gust), the provisions of either AF&PA WFCM or ICC 600 are permitted to be used. Wind speeds in Figures 1609A, 1609B, and 1609C shall be converted in accordance with Section 1609.3.1 for use with AF&PA WFCM or ICC 600.

2308.2.5 Allowable roof span. Roof trusses and rafters shall not span more than 40 feet (12 192 mm) between points of vertical support.

2308.2.6 Risk Category limitation. The use of the provisions for *conventional light-frame construction* in this section shall not be permitted for *Risk Category* IV buildings, as determined by Section 1604.5, assigned to *Seismic Design Category* B, C, D or E.

2308.2.7 Portions exceeding limitations of conventional light-frame construction. When portions of a building of otherwise conventional light-frame construction exceed the limits of Section 2308.2, those portions and the supporting load path shall be designed in accordance with accepted engineering practice and the provisions of this code. For the purposes of this section, the term “portions” shall mean parts of buildings containing volume and area such as a room or a series of rooms. The extent of such design need only demonstrate compliance of the non-conventionally light-framed elements with other applicable provisions of this code and shall be compatible with the performance of the conventional light-framed system.

2308.3 Foundations and footings. Foundations and footings shall be designed and constructed in accordance with Chapter 18 . Connections to foundations and footings shall comply with this section.

2308.3.1 Foundation plates or sills. Foundation plates or sills resting on concrete or masonry foundations shall comply with Section 2304.3.1. Foundation plates or sills shall be bolted or anchored to the foundation with not less than 1/2-inch-diameter (12.7 mm) steel bolts or *approved* anchors spaced to provide equivalent anchorage as the steel bolts. Along *braced wall lines* in structures assigned to *Seismic Design Category* E, steel bolts with a minimum nominal diameter of 5/8 inch (15.9 mm) or approved anchor straps load rated in accordance with Section 1706.1 and spaced to provide equivalent anchorage shall be used. Bolts shall be embedded at least 7 inches (178 mm) into concrete or masonry.

Bolts shall be spaced not more than 6 feet (1829 mm) apart and there shall be a minimum of two bolts or anchor straps per piece with one bolt or anchor strap located not more than 12 inches (305 mm) or less than 4 inches (102 mm) from each end of each piece. Bolts in *braced wall lines* in structures over two stories above grade shall be spaced not more the 4 feet (1219 mm) o.c.. A properly sized nut and washer shall be tightened on each bolt to the plate.

2308.3.2 Braced wall line sill plate anchorage in *Seismic Design Category* D and E. Sill plates along *braced wall lines* shall be anchored with anchor bolts with steel plate washers between the foundation sill plate and the nut, or *approved* anchor straps load rated in accordance with Section 1706.1. Such washers shall be a minimum of 0.229 inch by 3 inches by 3 inches (5.82 mm by 76 mm by 76 mm) in size. The hole in the plate washer is permitted to be diagonally slotted with a width of up to 3/16 inch (4.76 mm) larger than the bolt diameter and a slot length not to exceed 1-3/4 inches (44 mm), provided a standard cut washer is placed between the plate washer and the nut.

2308.4 Floor framing. Floor framing shall comply with this section.

2308.4.1 Girders. Girders for single-story construction or girders supporting loads from a single floor shall not be less than 4 inches by 6 inches (102 mm by 152 mm) for spans 6 feet (1829 mm) or less, provided that girders are spaced not more than 8 feet (2438 mm) o.c. Spans for built-up 2-inch girders shall be in accordance with Table 2308.4.1(1) or 2308.4.1(2). Other girders shall be designed to support the loads specified in this code. Girder end joints shall occur over supports.

Where a girder is spliced over a support, an adequate tie shall be provided. The ends of beams or girders supported on masonry or concrete shall not have less than 3 inches (76 mm) of bearing.

~~TABLE 2308.9.5~~ TABLE 2308.4.1(1)
HEADER AND GIRDER SPANS[a] FOR EXTERIOR BEARING WALLS
(Maximum Spans for Douglas Fir-Larch, Hem-Fir, Southern Pine and Spruce-Pine-Fir[b] and Required Number of Jack Studs)

(Portions of table not shown remain unchanged)

~~TABLE 2308.9.6~~ TABLE 2308.4.1(2)
HEADER AND GIRDER SPANS[a] FOR INTERIOR BEARING WALLS
(Maximum Spans for Douglas Fir-Larch, Hem-Fir, Southern Pine and Spruce-Pine-Fir[b] and Required Number of Jack Studs)

(Portions of table not shown remain unchanged)

2308.4.2 Floor joists. Floor joists shall comply with this section.

2308.4.2.1 Span. Spans for floor joists shall be in accordance with Tables 2308.4.2.1(1) or 2308.4.2.1(2) or the *AF&PA Span Tables for Joists and Rafters*.

2308.4.2.2 Bearing. The ends of each joist shall not have less than 1-1/2 inches (38 mm) of bearing on wood or metal, or not less than 3 inches (76 mm) on masonry, except where supported on a 1-inch by 4-inch (25.4 mm by 102 mm) ribbon strip and nailed to the adjoining stud,

2308.4.2.3 Framing details. Joists shall be supported laterally at the ends and at each support by solid blocking except where the ends of the joists are nailed to a header, band or rim joist or to an adjoining stud or by other means. Solid blocking shall not be less than 2 inches (51mm) in thickness and the full depth of the joist. Joist framing from opposite sides of a beam, girder or partition shall be lapped at least 3 inches (76 mm) or the opposing joists shall be tied together in an approved manner. Joists framing into the side of a wood girder shall be supported by framing anchors or on ledger strips not less than 2 inches by 2 inches (51 mm by 51 mm).

TABLE ~~2308.8(1)~~ 2308.4.2.1(1)
FLOOR JOIST SPANS FOR COMMON LUMBER SPECIES
(Residential Sleeping Areas, Live Load = 30 psf, L/Δ = 360)
(Portions of table not shown remain unchanged)

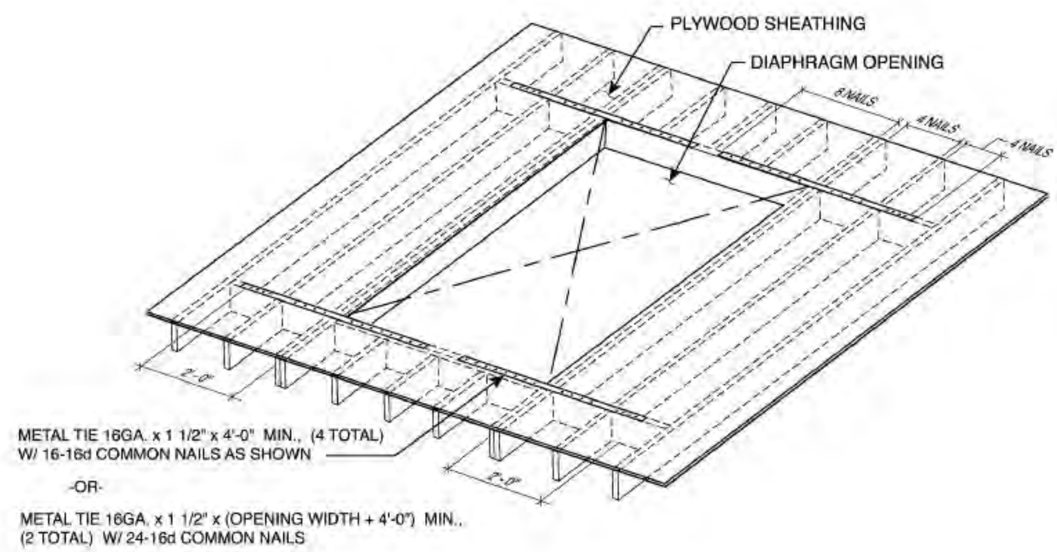
TABLE ~~2308.8(2)~~ 2308.4.2.1(2)
FLOOR JOIST SPANS FOR COMMON LUMBER SPECIES
(Residential Living Areas, Live Load = 40 psf, L/Δ = 360)
(Portions of table not shown remain unchanged)

2308.4.2.4 Notches and holes. Notches on the ends of joists shall not exceed one-fourth the joist depth. Notches in the top or bottom of joists shall not exceed one sixth the depth and shall not be located in the middle third of the span. Holes bored in joists shall not be within 2 inches (51 mm) of the top or bottom of the joist and the diameter of any such hole shall not exceed one-third the depth of the joist.

2308.4.3 Engineered wood products. Engineered wood products shall be installed in accordance with manufacturer's recommendations. Cuts, notches and holes bored in trusses, structural composite lumber, structural glue-laminated members or I-joists are not permitted except where permitted by the manufacturer's recommendations or where the effects of such alterations are specifically considered in the design of the member by a *registered design professional*.

2308.4.4 Framing around openings. Trimmer and header joists shall be doubled, or of lumber of equivalent cross section, where the span of the header exceeds 4 feet (1219 mm). The ends of header joists more than 6 feet (1829 mm) long shall be supported by framing anchors or joist hangers unless bearing on a beam, partition or wall. Tail joists over 12 feet (3658 mm) long shall be supported at the header by framing anchors or on ledger strips not less than 2 inches by 2 inches (51 mm by 51 mm).

2308.4.4.1 Openings in floor diaphragms in *Seismic Design Categories* B, C, D and E. Openings in horizontal diaphragms with a dimension perpendicular to the joist that is greater than 4 feet (1219 mm) shall be constructed with metal ties and blocking in accordance with this section and Figure 2308.4.4.1(1). Metal ties shall not be less than 0.058 inch [1.47 mm (16 galvanized gage)] thick by 1-1/2 inches (38 mm) wide with a minimum yield stress of 33,000 psi (227 Mpa). Blocking shall be provided 2 feet minimum beyond headers. Ties shall be attached to blocking with eight 16d common nails on each side of the header-joist intersection.



For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

FIGURE 2308.4.4.1(1)
OPENINGS IN FLOOR AND ROOF DIAPHRAGMS

Openings in floor diaphragms in *Seismic Design Categories D and E* shall not exceed a dimension greater than 50 percent of the distance between braced wall lines or an area greater than 25 percent of the area between orthogonal pairs of braced wall lines [see Figure 2308.4.4.1(2)], or shall be designed in accordance with accepted engineering practice.

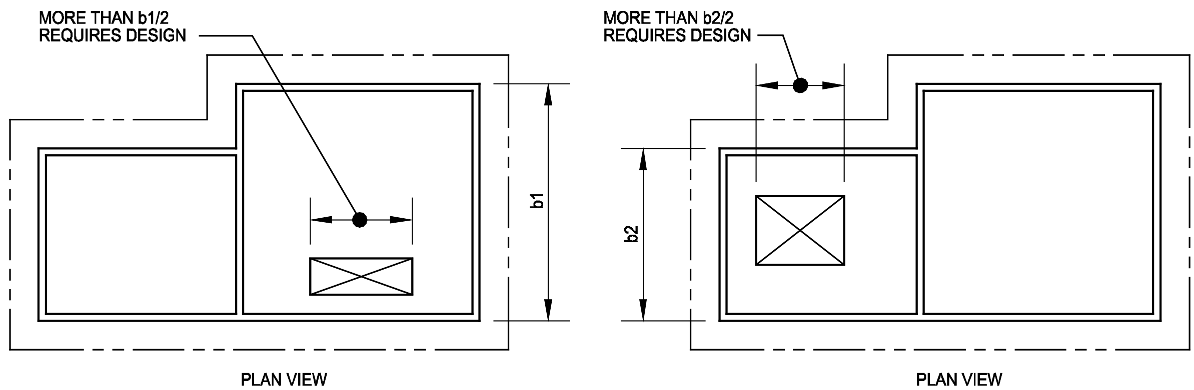


FIGURE 2308.4.4.1(2)
OPENING LIMITATIONS FOR FLOOR AND ROOF DIAPHRAGMS

2308.4.4.2 Vertical offsets in floor diaphragms in *Seismic Design Categories* D and E. Portions of a floor level shall not be vertically offset such that the framing members on either side of the offset cannot be lapped or tied together in an *approved* manner in accordance with Figure 2308.4.4.2.

> **Exception:** Framing supported directly by foundations need not be lapped or tied directly together.

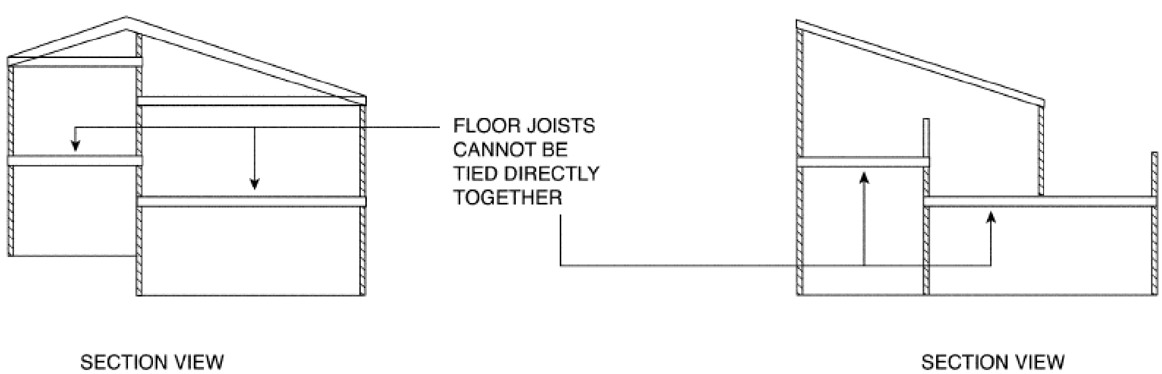

FIGURE 2308.4.4.2
PORTIONS OF FLOOR LEVEL OFFSET VERTICALLY

2308.4.5 Joists supporting bearing partitions. Bearing partitions parallel to joists shall be supported on beams, girders, doubled joists, walls or other bearing partitions. Bearing partitions perpendicular to joists shall not be offset from supporting girders, walls or partitions more than the joist depth unless such joists are of sufficient size to carry the additional load.

2308.4.6 Lateral support. Floor and ceiling framing with a nominal depth-to-thickness ratio greater than or equal to 5:1 shall have one edge held in line for the entire span. Where the nominal depth-to- thickness ratio of the framing member exceeds 6:1, there shall be one line of bridging for each 8 feet (2438 mm) of span, unless both edges of the member are held in line. The bridging shall consist of not less than 1-inch by 3-inch (25 mm by 76 mm) lumber, double nailed at each end, of equivalent metal bracing of equal rigidity, full-depth solid blocking or other *approved* means. A line of bridging shall also be required at supports where equivalent lateral support is not otherwise provided.

2308.4.7 Structural floor sheathing. Structural floor sheathing shall comply with the provisions of Section 2304.7.1.

2308.4.8 Under-floor ventilation. For under-floor ventilation, see Section 1203.3.

2308.4.9 Floor framing supporting *braced wall panels*. When *braced wall panels* are supported by cantilevered floors or are setback from the floor joist support the floor framing shall comply section 2308.6.7.

2308.4.10 Anchorage of exterior means of egress components in *Seismic Design Category D and E*. Exterior egress balconies, exterior exit stairways and similar *means of egress* components in structures assigned to *Seismic Design Category D or E* shall be positively anchored to the primary structure at not over 8 feet (2438 mm) o.c. or shall be designed for lateral forces. Such attachment shall not be accomplished by use of toenails or nails subject to withdrawal.

2308.5 Wall construction. Walls of *conventional light-frame construction* shall be in accordance with this section.

2308.5.1 Stud size, height and spacing. The size, height and spacing of studs shall be in accordance with Table 2308.5.1

Studs shall be continuous from a support at the sole plate to a support at the top plate to resist loads perpendicular to the wall. The support shall be a foundation or floor, ceiling or roof diaphragm or shall be designed in accordance with accepted engineering practice.

> **Exception:** Jack studs, trimmer studs and cripple studs at openings in walls that comply with Table 2308.4.1(1) or 2308.4.1(2).

2308.5.2 Framing details. Studs shall be placed with their wide dimension perpendicular to the wall. Not less than three studs shall be installed at each corner of an *exterior wall*.

Exceptions:

1. In interior nonbearing walls and partition, studs are permitted to be set with the long dimension parallel to the wall.

2. At corners, two studs are permitted, provided wood spacers or backup cleats of 3/8-inch-thick (9.5 mm) wood structural panel, 3/8-inch (9.5 mm) Type M “Exterior Glue” particleboard, 1-inch-thick (25 mm) lumber or other *approved* devices that will serve as an adequate backing for the attachment of facing materials are used. Where fire-resistance ratings or shear values are involved, wood spacers, backup cleats or other devices shall not be used unless specifically *approved* for such use.

TABLE 2308.5.1
SIZE, HEIGHT AND SPACING OF WOOD STUDS[c]

STUD SIZE (inches)	BEARING WALLS: Laterally unsupported stud height[a] (feet)	BEARING WALLS: Supporting roof and ceiling only — Spacing (inches)	BEARING WALLS: Supporting one floor, roof and ceiling — Spacing (inches)	BEARING WALLS: Supporting two floors, roof and ceiling — Spacing (inches)	NONBEARING WALLS: Laterally unsupported stud height[a] (feet)	NONBEARING WALLS: Spacing (inches)
2 × 3[b]	NP	NP	NP	NP	10	16
2 × 4	10	24	16	NP	14	24
3 × 4	10	24	24	16	14	24
2 × 5	10	24	24	NP	16	24
2 × 6	10	24	24	16	20	24

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.
NP=Not Permitted
a. Listed heights are distances between points of lateral support placed perpendicular to the plane of the wall. Increases in unsupported height are permitted where justified by an analysis.
b. Shall not be used in exterior walls.
c. Utility-grade studs shall not be spaced more than 16 inches (406 mm) o.c., or support more than a roof and ceiling, or exceed 8 feet (2438 mm) in height for exterior walls and load-bearing walls or 10 feet (3048 mm) for interior non-load-bearing walls.

2308.5.3 Plates and sills. Studs shall have plates and sills according to this section.

2308.5.3.1. Bottom plate or sill. Studs shall have full bearing on a plate or sill. Plates or sills shall not be less than 2 inches (51 mm) nominal in thickness and have a width at least equal to the width of the wall studs.

2308.5.3.2 Top plates. Studs shall be capped with double top plates installed to provide overlapping at corners and at intersections with other partitions. End joints in double top plates shall be offset at least 48 inches (1219 mm), and shall be nailed in accordance with Table 2304.9.1. Plates shall be a nominal 2 inches (51 mm) in depth and have a width at least equal to the width of the studs.

> **Exception:** A single top plate is permitted, provided the plate is adequately tied at joints, corners and intersecting walls by at least the equivalent of 3-inch by 6-inch (76 mm by 152 mm) by 0.036-inch-thick (0.914 mm) galvanized steel connector that is nailed to each wall or segment of wall by six 8d nails or equivalent, provided the rafters, joists or trusses are centered over the studs with a tolerance of not more than 1 inch (25 mm).

Where bearing studs are spaced at 24-inch (610 mm) intervals and top plates are less than two 2- inch by 6-inch (51 mm by 152 mm) or two 3-inch by 4- inch (76 mm by 102 mm) members and where the floor joists, floor trusses or roof trusses that they support are spaced at more than 16-inch (406 mm) intervals, such joists or trusses shall bear within 5 inches (127 mm) of the studs beneath or a third plate shall be installed.

2308.5.4 Nonbearing walls and partitions. In nonbearing walls and partitions, studs shall be spaced not more than 28 inches (711 mm) o.c. and in interior nonbearing walls and partitions, are permitted to be set with the long dimension parallel to the wall. Interior nonbearing partitions shall be capped with no less than a single top plate installed to provide overlapping at corners and at intersections with other walls and partitions. The plate shall be continuously tied at joints by solid blocking at least 16 inches (406 mm) in length and equal in size to the plate or by 1/2-inch by 1-1/2-inch (12.7 mm by 38 mm) metal ties with spliced sections fastened with two 16d nails on each side of the joint.

2308.5.5 Openings in walls and partitions. Openings in exterior and interior walls and partitions shall comply with sections 2308.5.5.1 through 2308.5.5.3

2308.5.5.1 Openings in exterior bearing walls. Headers shall be provided over each opening in exterior bearing walls. The size and spans in Table 2308.4.1(1) are permitted to be used for one- and two-family *dwellings*. Headers for other buildings shall be designed in accordance with Section 2301.2, Item 1 or 2. Headers shall be of two pieces of nominal 2-inch (51mm) framing lumber set on edge as permitted by Table 2308.4.1(1) and nailed together in accordance with Table 2304.9.1 or of solid lumber of equivalent size.

Wall studs shall support the ends of the header in accordance with Tables 2308.4.1(1). Each end of a lintel or header shall have a bearing length of not less than 1-1/2 inches (38 mm) for the full width of the lintel.

2308.5.5.2 Openings in interior bearing partitions. Headers shall be provided over each opening in interior bearing partitions as required in Section 2308.5.5.1 The spans in Table 2308.4.1(2) are permitted to be used. Wall studs shall support the ends of the header in accordance with Table 2308.4.1(1) or 2308.4.1(2), as appropriate.

2308.5.5.3 Openings in interior nonbearing partitions. Openings in nonbearing partitions are permitted to be framed with single studs and headers. Each end of a lintel or header shall have a bearing length of not less than 11/2 inches (38 mm) for the full width of the lintel.

2308.5.6 Cripple walls. Foundation cripple walls shall be framed of studs not less in size than the studding above with a minimum length of 14 inches (356 mm), or shall be framed of solid blocking. Where exceeding 4 feet (1219 mm) in height, such walls shall be framed of studs having the size required for an additional *story*. See section 2308.6.5 for cripple wall bracing.

2308.5.7 Bridging. Unless covered by interior or *exterior wall coverings* or sheathing meeting the minimum requirements of this code, stud partitions or walls with studs having a height-to-least-thickness ratio exceeding 50 shall have bridging not less than 2 inches (51 mm) in thickness and of the same width as the studs fitted snugly and nailed thereto to provide adequate lateral support. Bridging shall be placed in every stud cavity and at a frequency such that no stud so braced shall have a height-to-least-thickness ratio exceeding 50 with the height of the stud measured between horizontal framing and bridging or between bridging, whichever is greater.

2308.5.8 Pipes in walls. Stud partitions containing plumbing, heating or other pipes shall be so framed and the joists underneath so spaced as to give proper clearance for the piping. Where a partition containing such piping runs parallel to the floor joists, the joists underneath such partitions shall be doubled and spaced to *permit* the passage of such pipes and shall be bridged. Where plumbing, heating or other pipes are placed in or partly in a partition, necessitating the cutting of the soles or plates, a metal tie not less than 0.058 inch (1.47 mm) (16 galvanized gage) and 11/2 inches (38 mm) wide shall be fastened to each plate across and to each side of the opening with not less than six 16d nails.

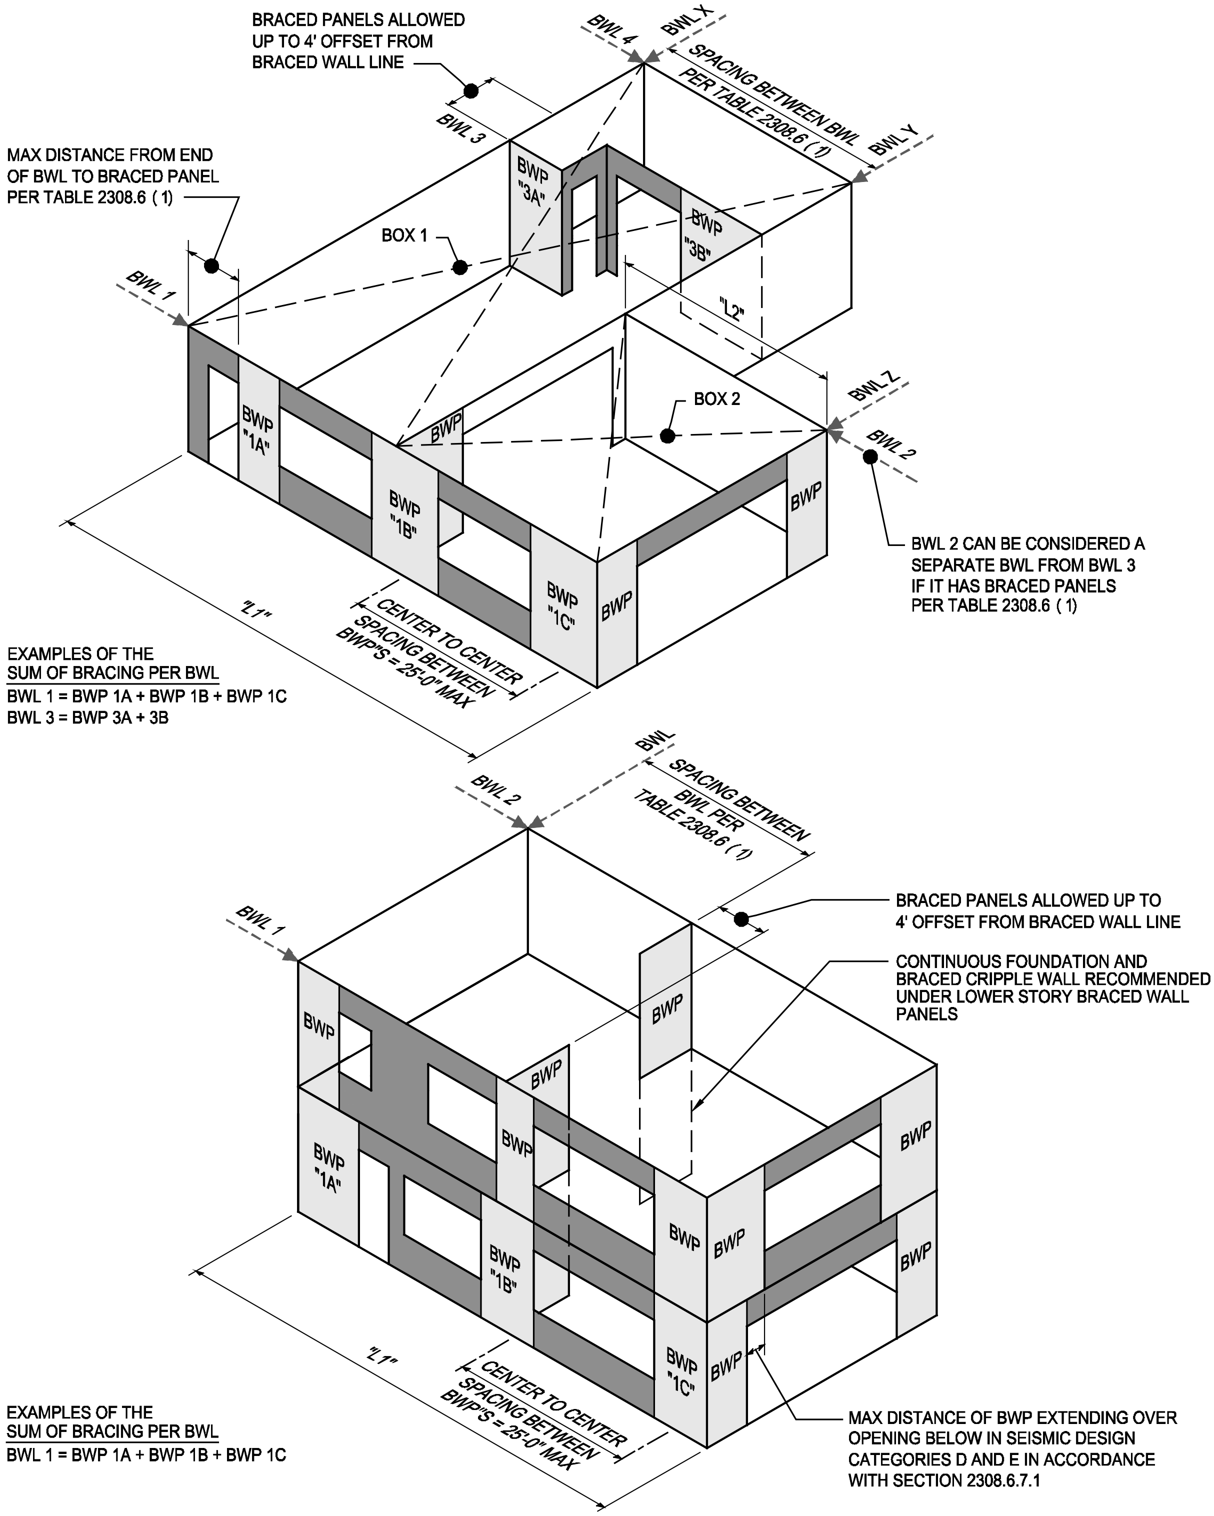
2308.5.9 Cutting and notching. In exterior walls and bearing partitions, any wood stud is permitted to be cut or notched to a depth not exceeding 25 percent of its width. Cutting or notching of studs to a depth not greater than 40 percent of the width of the stud is permitted in nonbearing partitions supporting no loads other than the weight of the partition.

2308.5.10 Bored holes. A hole not greater in diameter than 40 percent of the stud width is permitted to be bored in any wood stud. Bored holes not greater than 60 percent of the width of the stud are permitted in nonbearing partitions or in any wall where each bored stud is doubled, provided not more than two such successive doubled studs are so bored. In no case shall the edge of the bored hole be nearer than 5/8 inch (15.9 mm) to the edge of the stud. Bored holes shall not be located at the same section of stud as a cut or notch.

2308.6 Wall Bracing. Buildings shall be provided with exterior and interior braced wall lines as described in Sections 2308.6.1 through 2308.6.9.2.

2308.6.1 *Braced wall lines*. For the purpose of determining the amount and location of bracing required along each story level of a building, *braced wall lines* shall be designated as straight lines through the building plan in both the longitudinal and transverse direction and placed in accordance with Table 2308.6.1 and Figure 2308.6.1. *Braced wall line* spacing shall not exceed the distance specified in Table 2308.6.1. In structures assigned to Seismic Design Category D or E, braced wall lines shall intersect perpendicularly to each other.

2308.6.2 *Braced wall panels*. *Braced wall panels* shall be placed along *braced wall lines* in accordance with Table 2308.6.1 and Figure 2308.6(1) and specified in Table 2308.6.2(1). A *braced wall panel* must be located at each end of the braced wall line and at the corners of intersecting *braced wall lines* or may begin within the maximum distance from the end of the *braced wall line* in accordance with Table 2308.6(1). *Braced wall panels* in a *braced wall line* shall not be offset from each other by more than 4 feet (1219 mm). Braced wall panels shall be clearly indicated on the plans.



For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.
BWL = BRACED WALL LINE, BWP = BRACED WALL PANEL

				0.5 ≤ Sds < 0.75: Each end and ≤25'-0" o.c. (min 32% of wall length) [e]	0.5 ≤ Sds < 0.75: Each end and ≤25'-0" o.c. (min 59% of wall length) [e]	
				0.75 ≤Sds ≤ 1.00: Each end and ≤25'-0" o.c. (min 37% of wall length) [e]	0.75 ≤Sds ≤ 1.00: Each end and ≤25'-0" o.c. (min 75% of wall length) [e]	
				Sds > 1.00: Each end and ≤25'-0" o.c. (min 48% of wall length) [e]	Sds > 1.00: Each end and ≤25'-0" o.c. (min 100% of wall length) [e]	

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.
NP = Not Permitted

a. This table specifies minimum requirements for *braced wall panels* along interior or exterior *braced wall lines*.
b. See Section 2308.6.2 for full description of bracing methods.
c. Gypsum wallboard applied to framing supports that are spaced at 16 inches on center.
d. The required lengths shall be doubled for gypsum board applied to only one face of a braced wall panel.
e. Percentage shown represents the minimum amount of bracing required along the building length (or wall length if the structure has an irregular shape)

2308.6.3 Braced wall panel methods. Construction of *braced wall panels* shall be by one or a combination of the methods in Table 2308.6.3(1). *Braced wall panel* length shall be in accordance with Section 2308.6.4 or 2308.6.5.

Over sheathing	$^3/_8$	16″ o.c.	8d	6″ o.c. edges; 12″ o.c. at intermediate supports	4″ o.c. edges; 8″ o.c. at intermediate supports

For SI: 1 inch = 25.4 mm.
a. Nails shall be corrosion resistant.
b. Minimum acceptable nail dimensions:

	Panel Siding (inch)	Lap Siding (inch)
Shank diameter	0.092	0.099
Head diameter	0.225	0.240

c. Where used to comply with Section 2308.9.3.
d. Nail length must accommodate the sheathing and penetrate framing $1^1/_2$ inches.

2308.6.4 Length of *braced wall panels.* For Methods DWB, WSP, SFB, PBS, PCP and HPS each panel must be at least 48 inches (1219 mm) in length, covering three stud spaces where studs are spaced 16 inches (406 mm) apart and covering two stud spaces where studs are spaced 24 inches (610 mm) apart. *Braced wall panels* less than the required 48" length shall not contribute towards the amount of bracing required. *Braced wall panels* longer than the required length shall be credited for their actual length. For Method GB, each panel must be at least 96 inches (2438 mm) in length where applied to one side of the studs or 48 inches (1219 mm) where applied to both sides.

All vertical joints of panel sheathing shall occur over studs and adjacent panel joints shall be nailed to common framing members. Horizontal joints shall occur over blocking or other framing equal in size to the studding except where waived by the installation requirements for the specific sheathing materials. Sole plates shall be nailed to the floor framing in accordance with Section 2308.3.2 and top plates shall be connected to the framing above in accordance with Section 2308.5.3. Where joists are perpendicular to braced wall lines above, blocking shall be provided under and in line with the *braced wall panels.*

2308.6.5 Alternative bracing. An Alternate Braced Wall (ABW) or a Portal Frame with Hold-downs (PFH) described in this section is permitted to substitute for a 48" braced wall panel of methods DWB, WSP, SFB, PBS, PCP or HPS. For method GB, each 96- inch (2438 mm) section (applied to one face) or 48-inch (1219 mm) section (applied to both faces) or portion thereof required by Table 2308.6.1 is permitted to be replaced by one panel constructed in accordance with method ABW or PFH.

2308.6.5.1. Alternate Braced Wall (ABW). An ABW shall be constructed in accordance with this section and Figure 2308.6.5.1. In one-story buildings, each panel shall have a length of not less than 2 feet 8 inches (813 mm) and a height of not more than 10 feet (3048 mm). Each panel shall be sheathed on one face with 3/8- inch-minimum-thickness (9.5 mm) wood structural panel sheathing nailed with 8d common or galvanized box nails in accordance with Table 2304.9.1 and blocked at wood structural panel edges. Two anchor bolts installed in accordance with Section 2308.3.1 shall be provided in each panel. Anchor bolts shall be placed at each panel outside quarter points. Each panel end stud shall have a hold-down device fastened to the foundation, capable of providing an *approved* uplift capacity of not less than 1,800 pounds (8006 N). The hold-down device shall be installed in accordance with the manufacturer's recommendations. The ABW shall be supported directly on a foundation or on floor framing supported directly on a foundation that is continuous across the entire length of the braced wall line. This foundation shall be reinforced with not less than one No. 4 bar top and bottom. Where the continuous foundation is required to have a depth greater than 12 inches (305 mm), a minimum 12-inch by 12-inch (305 mm by 305 mm) continuous footing or turned down slab edge is permitted at door openings in the braced wall line. This continuous footing or turned down slab edge shall be reinforced with not less than one No. 4 bar top and bottom. This reinforcement shall be lapped 15 inches (381 mm) with the reinforcement required in the continuous foundation located directly under the braced wall line.

When the ABW is installed at the first *story* of two-story buildings, the wood structural panel sheathing shall be provided on both faces, three anchor bolts shall be placed at one-quarter points, and tie-down device uplift capacity shall not be less than 3,000 pounds (13 344 N).

2308.6.5.2 Portal Frame with Hold-downs (PFH). A PFH shall be constructed in accordance with this section and Figure 2308.6.5.2. The adjacent door or window opening shall have a full-length header.

In one-story buildings, each panel shall have a length of not less than 16 inches (406 mm) and a height of not more than 10 feet (3048 mm). Each panel shall be sheathed on one face with a single layer of 3/8 inch (9.5 mm) minimum thickness wood structural panel sheathing nailed with 8d common or galvanized box nails in accordance with Figure 2308.6.5.2. The wood structural panel sheathing shall extend up over the solid sawn or glued-laminated header and shall be nailed in accordance with Figure 2308.6.5. A built-up header consisting of at least two 2 × 12s and fastened in accordance with Item 24 of Table 2304.9.1 shall be permitted to be used. A spacer, if used, shall be placed on the side of the built-up beam opposite the wood structural panel sheathing. The header shall extend between the inside faces of the first full-length outer studs of each panel. The clear span of the header between the inner studs of each panel shall be not less than 6 feet (1829 mm) and not more than 18 feet (5486 mm) in length. A strap with an uplift capacity of not less than 1,000 pounds (4,400 N) shall fasten the header to the inner studs opposite the sheathing. One anchor bolt not less than 5/8 inch (15.9 mm) diameter and installed in accordance with Section 2308.3.1 shall be provided in the center of each sill plate. The studs at each end of the panel shall have a hold-down device fastened to the foundation with an uplift capacity of not less than 4,200 pounds (18 480 N).

Where a panel is located on one side of the opening, the header shall extend between the inside face of the first full-length stud of the panel and the bearing studs at the other end of the opening. A strap with an uplift capacity of not less than 1,000 pounds (4400 N) shall fasten the header to the bearing studs. The bearing studs shall also have a hold-down device fastened to the foundation with an uplift capacity of not less than 1,000 pounds (4400 N). The hold-down devices shall be an embedded strap type, installed in accordance with the manufacturer's recommendations. The PFH panels shall be supported directly on a foundation that is continuous across the entire length of the braced wall line. This foundation shall be reinforced with not less than one No. 4 bar top and bottom. Where the continuous foundation is required to have a depth greater than 12 inches (305 mm), a minimum 12-inch by 12-inch (305 mm by 305 mm) continuous footing or turned down slab edge is permitted at door openings in the braced wall line. This continuous footing or turned down slab edge shall be reinforced with not less than one No. 4 bar top and bottom. This reinforcement shall be lapped not less than 15 inches (381 mm) with the reinforcement required in the continuous foundation located directly under the braced wall line.

When a PFH is installed at the first *story* of two-story buildings, each panel shall have a length of not less than 24 inches (610 mm).

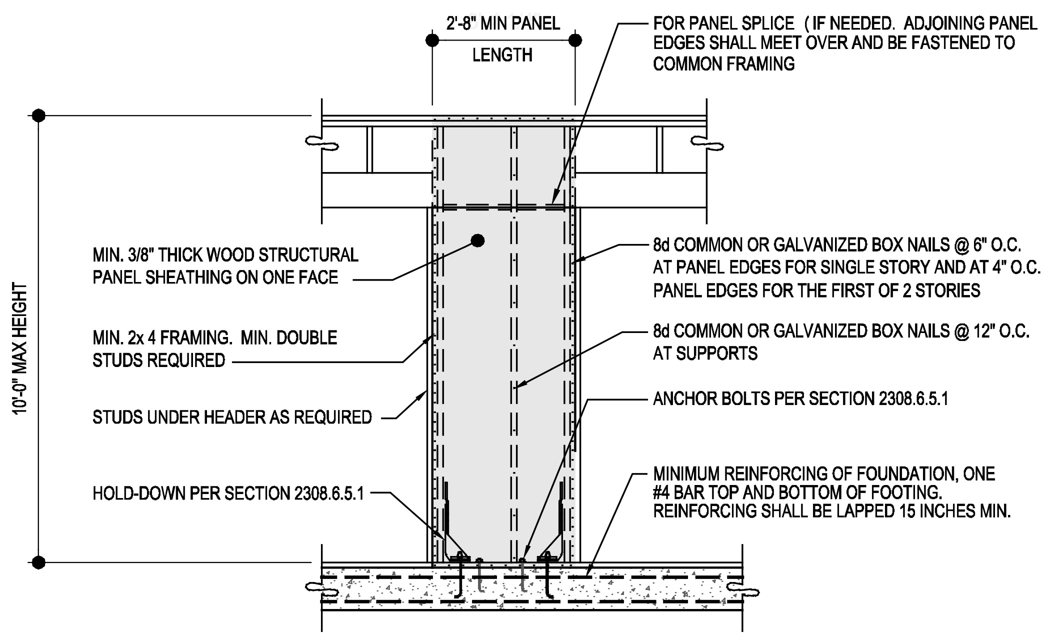

FIGURE 2308.6.5.1
ALTERNATE BRACED WALL PANEL (ABW)

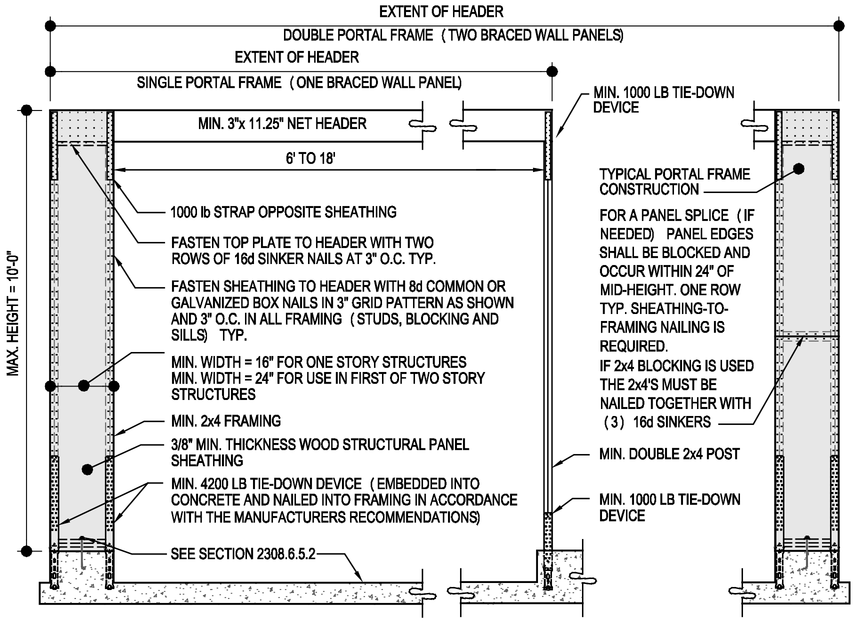

Figure 2308.6.5.2
PORTAL FRAME WITH HOLD-DOWNS (PFH)

2308.6.5 Cripple wall bracing. Cripple walls shall be braced in accordance with the following.

2308.6.5.1 Cripple wall bracing in *Seismic Design Category* A, B and C.. For the purposes of this section, cripple walls having a stud height exceeding 14 inches (356 mm) shall be considered a *story* and shall be braced in accordance with Table 2308.6(1). Spacing of edge nailing for required cripple wall bracing shall not exceed 6 inches (152mm) o.c. along the foundation plate and the top plate of the cripple wall. Nail size, nail spacing for field nailing and more restrictive boundary nailing requirements shall be as required elsewhere in the code for the specific bracing material used.

2308.6.5.2 Cripple wall bracing in *Seismic Design Category* D and E For the purposes of this section, cripple walls having a stud height exceeding 14 inches (356 mm) shall be considered a *story* and shall be braced in accordance with Table 2308.6(1). Where interior braced wall lines occur without a continuous foundation below, the length of parallel exterior cripple wall bracing shall be one and one-half times the lengths required by Table 2308.6(1). Where the cripple wall sheathing type used is method WSP or DWB and this additional length of bracing cannot be provided, the capacity of WSP or DWB sheathing shall be increased by reducing the spacing of fasteners along the perimeter of each piece of sheathing to 4 inches (102 mm) o.c.

2308.6.6 Connections of *braced wall panels*. Braced wall panel joints shall occur over studs or blocking. *Braced wall panels* shall be fastened to studs, top and bottom plates and at panel edges. *Braced wall panels* shall be applied to nominal 2-inch-wide [actual 1-1/2 inch (38 mm)] or larger stud framing.

2308.6.6.1 Bottom plate connection. Braced wall line bottom plates shall be connected to joists or full-depth blocking below in accordance with Table 2304.9.1, Item 6, or to foundations in accordance with Section 2308.3.3.

2308.6.6.2 Top plate connection. Where joists and/or rafters are used, braced wall line top plates shall be fastened over the full length of the braced wall line to joists, rafters, rim boards or blocking above in accordance with Table 2304.9.1, as applicable, based on the orientation of the joists or rafters to the braced wall line. Blocking at joists with walls above shall be equal to the depth of the joist at the braced wall line. Blocking at rafters need not be full depth but shall extend to within 2 inches (51 mm) from the roof sheathing above. Blocking shall be a minimum of 2 inches (51 mm) nominal thickness and shall be fastened to the braced wall line top plate as specified in Table 2304.9.1, Item 11. Notching or drilling of holes in blocking in accordance with the requirements of Section 2308.8.2 or Section 2308.10.4.2 shall be permitted.

At exterior gable end walls braced wall panel sheathing in the top *story* shall be extended and fastened to roof framing where the spacing between parallel exterior braced wall lines is greater than 50 feet (15 240 mm).

Where roof trusses are used and are installed perpendicular to an exterior braced wall line, lateral forces shall be transferred from the roof diaphragm to the braced wall over the full length of the braced wall line by blocking of the ends of the trusses or by other *approved* methods providing equivalent lateral force transfer. Blocking shall be minimum 2 inches (51 mm) nominal thickness and shall extend to within 2 inches (51 mm) from the roof sheathing above and shall be fastened to the braced wall line top plate as specified in Table 2304.9.1. Notching or drilling of holes in blocking in accordance with the requirements of Section 2308.4.2.4 or Section 2308.7.4 shall be permitted.

2308.6.6.3 Sill anchorage. Where foundations are required by Section 2308.6.7, braced wall line sills shall be anchored to concrete or masonry foundations. Such anchorage shall conform to the requirements of Section 2308.3. The anchors shall be distributed along the length of the braced wall line. Other anchorage devices having equivalent capacity are permitted.

2308.6.6.4 Anchorage to all-wood foundations. Where all-wood foundations are used, the force transfer from the braced wall lines shall be determined based on calculation and shall have a capacity greater than or equal to the connections required by Section 2308.3.

2308.6.7 Braced wall line and diaphragm support. Braced wall lines and floor and roof diaphragms shall be supported in accordance to this section.

2308.6.7.1 Foundation requirements. Braced wall lines shall be supported by continuous foundations.

Exception: For structures with a maximum plan dimension not over 50 feet (15 240 mm), continuous foundations are required at exterior walls only.

For structures in *Seismic Design Category D and E,* exterior *braced wall panels* shall be in the same plane vertically with the foundation or the braced wall line shall be designed in accordance with accepted engineering practice according to section 2308.1.1

Exceptions:

1. Exterior *braced wall panels* may be located up to 4 feet from the foundation below when supported by a floor constructed in accordance with all the following:

   1.1 Cantilevers or setbacks shall not exceed four times the nominal depth of the floor joists
   1.2. Floor joists shall be 2 inches by 10 inches (51 mm by 254 mm) or larger and spaced not more than 16 inches (406 mm) o.c.
   1.3. The ratio of the back span to the cantilever shall be at least 2:1.
   1.4. Floor joists at ends of *braced wall panels* shall be doubled.
   1.5. A continuous rim joist shall be connected to the ends of cantilevered joists. The rim joist is permitted to be spliced using a metal tie not less than 0.058 inch (1.47 mm) (16 galvanized gage) and 11/2 inches (38 mm) wide fastened with six 16d common nails on each side. The metal tie shall have a minimum yield stress of 33,000 psi (227 MPa).

1.6. Joists at setbacks or the end of cantilevered joists shall not carry gravity loads from more than a single *story* having uniform wall and roof loads, nor carry the reactions from headers having a span of 8 feet (2438 mm) or more.

2. The end of a required braced wall panel shall be allowed to extend not more than 1 foot (305 mm) over an opening in the wall below. This requirement is applicable to *braced wall panels* offset in plane and to *braced wall panels* offset out of plane as permitted by the exception to Item 1 above in this section.

   Exception: *Braced wall panels* are permitted to extend over an opening not more than 8 feet (2438 mm) in width where the header is a 4-inch by 12-inch (102 mm by 305 mm) or larger member.

2308.6.7.2 Floor and roof diaphragm support in *Seismic Design Category D and E*. In structures assigned to *Seismic Design Category D or E,* floor and roof diaphragms shall be laterally supported by braced wall lines on all edges and connected in accordance with Section 2308.3.2 [see Figure 2308.6.7.2(1)].

Exception: Portions of roofs or floors that do not support *braced wall panels* above are permitted to extend up to 6 feet (1829 mm) beyond a braced wall line [see Figure 2308.6.7.2(2)] provided that the framing members are connected to the braced wall line below in accordance with Section 2308.6.6.

2308.6.7.3 Stepped footings in Seismic Design Category B, C, D and E . Where the height of a required braced wall panel extending from foundation to floor above varies more than 4 feet (1219 mm), the following construction shall be used:

1. Where the bottom of the footing is stepped and the lowest floor framing rests directly on a sill bolted to the footings, the sill shall be anchored as required in Section 2308.3.3.
2. Where the lowest floor framing rests directly on a sill bolted to a footing not less than 8 feet (2438 mm) in length along a line of bracing, the line shall be considered to be braced. The double plate of the cripple stud wall beyond the segment of footing extending to the lowest framed floor shall be spliced to the sill plate with metal ties, one on each side of the sill and plate. The metal ties shall not be less than 0.058 inch [1.47 mm (16 galvanized gage)] by 11/2 inches (38 mm) wide by 48 inches (1219 mm) with eight 16d common nails on each side of the splice location (see Figure 2308.6.7.3(1). The metal tie shall have a minimum yield stress of 33,000 pounds per square inch (psi) (227 MPa).
3. Where cripple walls occur between the top of the footing and the lowest floor framing, the bracing requirements for a *story* shall apply.

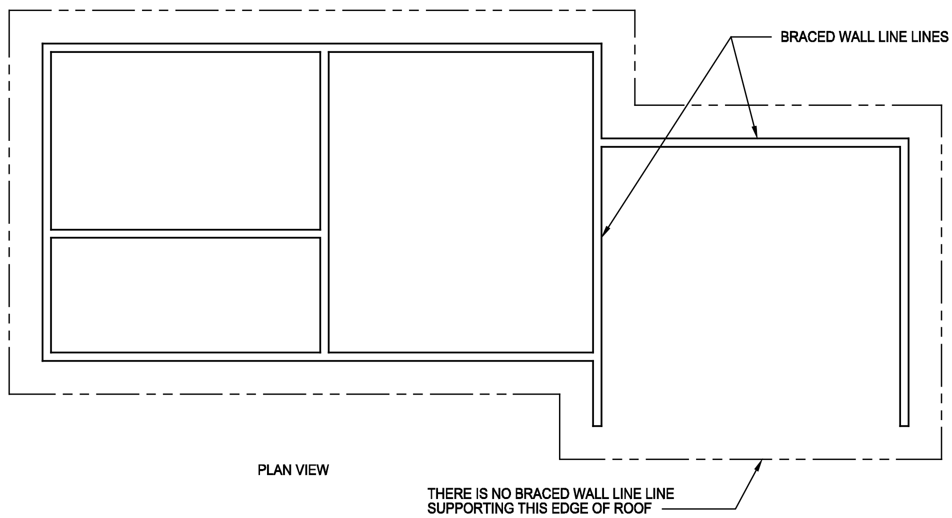

FIGURE 2308.6.7.2(1)
ROOF IN SDC D OR E NOT SUPPORTED ON ALL EDGES

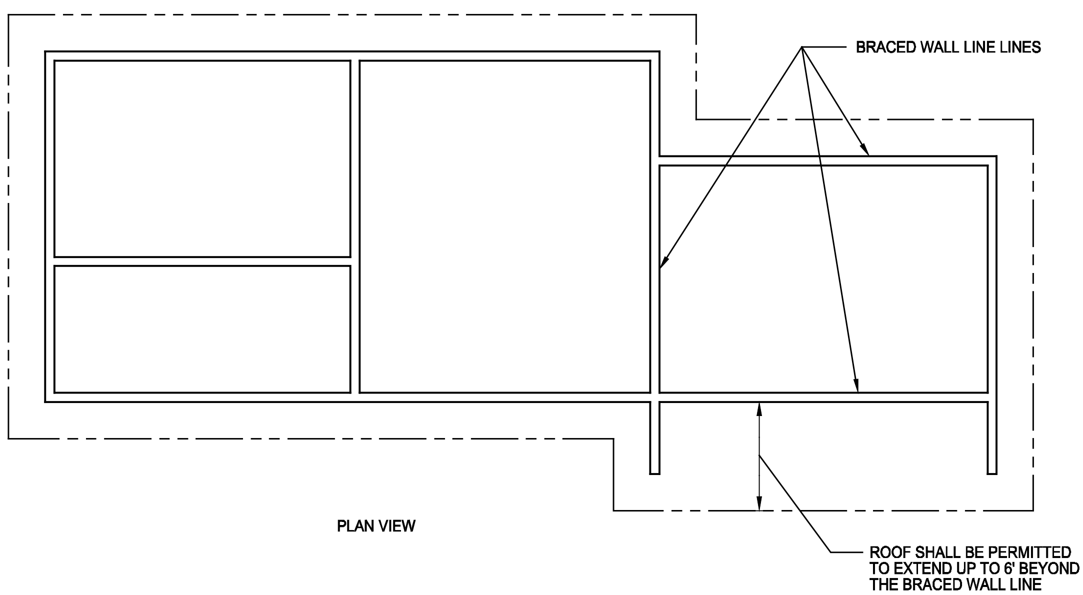

FIGURE 2308.6.7.2(2)
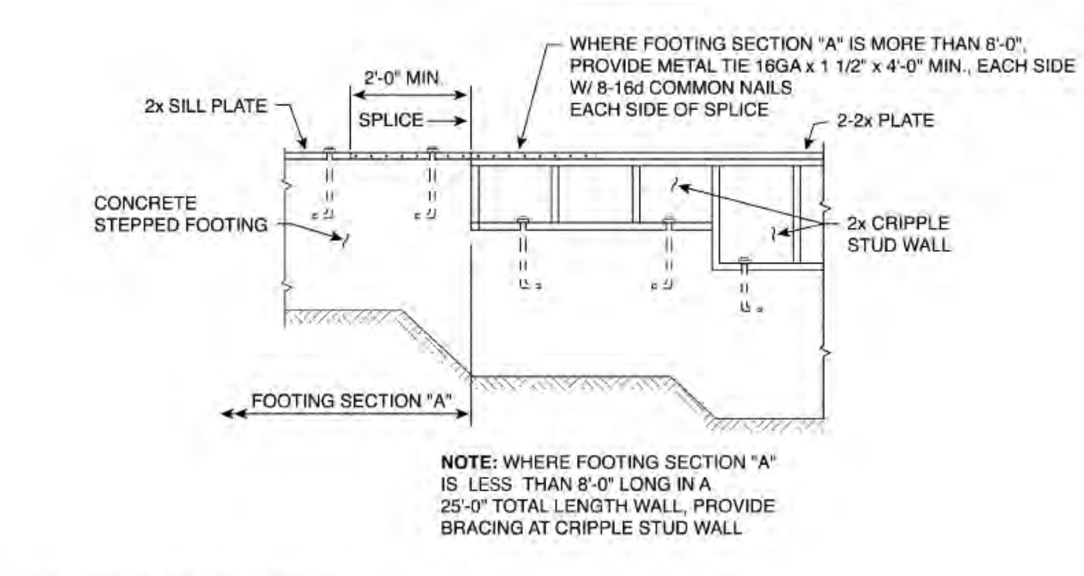
ROOF EXTENSION IN SDC D OR E BEYOND BRACED WALL LINE



For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

FIGURE 2308.6.7.3(1)
STEPPED FOOTING CONNECTION DETAILS

2308.6.8 Attachment of sheathing. Fastening of braced wall panel sheathing shall not be less than that prescribed in Tables 2308.6(1) and 2304.9.1. Wall sheathing shall not be attached to framing members by adhesives.

2308.6.9 Limitations of concrete or masonry veneer. Concrete or masonry veneer shall comply with Chapter 14 and this section.

2308.6.9.1 Limitations of concrete or masonry veneer in *Seismic Design Categories* B or C.. Concrete or masonry walls and stone or masonry veneer shall not extend above a basement.

Exceptions:

1. In structures assigned to *Seismic Design Category* B, stone and masonry veneer is permitted to be used in the first two stories above grade plane or the first three stories above grade plane where the lowest story has concrete or masonry walls, provided that structural use panel wall bracing is used and the length of bracing provided is one and one-half times the required length as determined in Table 2308.9.3(1).
2. Stone and masonry veneer is permitted to be used in the first story above grade plane or the first two stories above grade plane where the lowest story has concrete or masonry walls.
3. Stone and masonry veneer is permitted to be used in both stories of buildings with two stories above grade plane, provided the following criteria are met:
   - 3.1. Type of brace per Section 2308.9.3 shall be WSP and the allowable shear capacity in accordance with Section 2306.3 shall be a minimum of 350 plf (5108 N/m).
   - 3.2. *Braced wall panels* in the second *story* shall be located in accordance with Section 2308.9.3 and not more than 25 feet (7620 mm) on center, and the total length of braced wall panels shall be not less than 25 percent of the braced wall line length. *Braced wall panels* in the first *story* shall be located in accordance with Section 2308.9.3 and not more than 25 feet (7620 mm) on center, and the total length of *braced wall panels* shall be not less than 45 percent of the braced wall line length.
   - 3.3. Hold-down connectors shall be provided at the ends of each *braced wall panel* for the second *story* to first *story* connection with an allowable capacity of 2,000 pounds (8896 N). Hold-down connectors shall be provided at the ends of each *braced wall panel* for the first story to foundation connection with an allowable capacity of 3,900

pounds (17 347 N). In all cases, the hold-down connector force shall be transferred to the foundation.

3.4. Cripple walls shall not be permitted.

2308.6.9.2 Limitations of concrete or masonry in *Seismic Design Categories D and E* Concrete or masonry walls and stone or masonry veneer shall not extend above a basement.

Exception: In structures assigned to *Seismic Design Category* D, stone and masonry veneer is permitted to be used in the first story above grade plane, provided the following criteria are met:

1. Type of brace in accordance with Section 2308.9.3 shall be WSP and the allowable shear capacity in accordance with Section 2306.3 shall be a minimum of 350 plf (5108 N/m).
2. The bracing of the first *story* shall be located at each end and at least every 25 feet (7620 mm) o.c. but not less than 45 percent of the braced wall line.
3. Hold-down connectors shall be provided at the ends of braced walls for the first floor to foundation with an allowable capacity of 2,100 pounds (9341 N).
4. Cripple walls shall not be permitted.

2308.7 Roof and ceiling framing. The framing details required in this section apply to roofs having a minimum slope of three units vertical in 12 units horizontal (25-percent slope) or greater. Where the roof slope is less than three units vertical in 12 units horizontal (25-percent slope), members supporting rafters and ceiling joists such as ridge board, hips and valleys shall be designed as beams.

2308.7.1 Ceiling joist spans. Allowable spans for ceiling joists shall be in accordance with Table 2308.7.1(1) or 2308.7.1(2). For other grades and species, refer to the *AF&PA Span Tables for Joists and Rafters*.

~~TABLE 2308.10.2(1)~~ TABLE 2308.7.1(1)

~~TABLE 2308.10.3(6)~~ TABLE 2308.7.2(6)
RAFTER SPANS FOR COMMON LUMBER SPECIES
(Ground Snow Load = 50 pounds per square foot, Ceiling Attached to Rafters, L/Δ = 240)

(Portions of Table not shown remain unchanged)

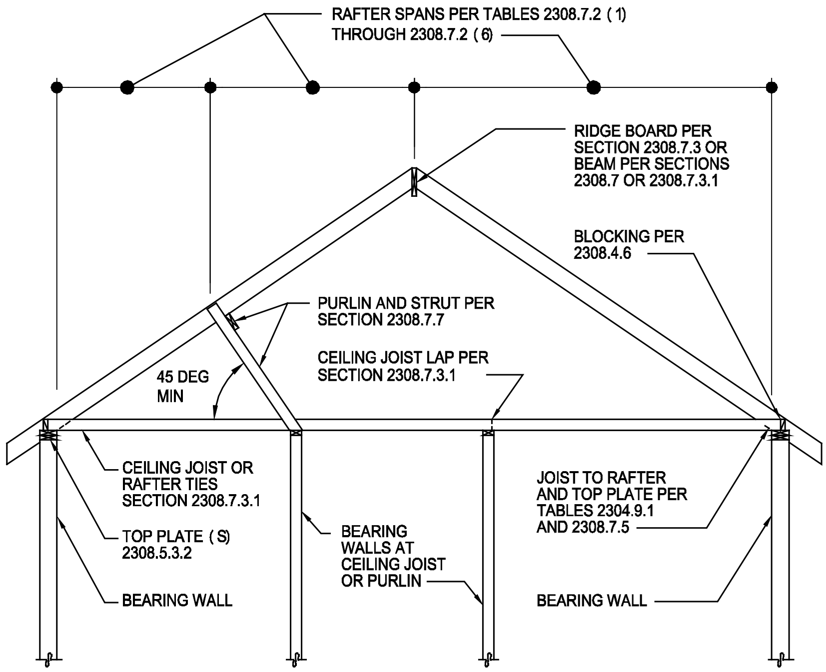
2308.7.3 Ceiling joist and rafter framing. Rafters shall be framed directly opposite each other at the ridge. There shall be a ridge board at least 1-inch (25 mm) nominal thickness at ridges and not less in depth than the cut end of the rafter. At valleys and hips, there shall be a single valley or hip rafter not less than 2-inch (51 mm) nominal thickness and not less in depth than the cut end of the rafter.

2308.7.3.1 Ceiling joist and rafter connections. Ceiling joists and rafters shall be nailed to each other and the assembly shall be nailed to the top wall plate in accordance with Tables 2304.9.1 and 2308.7.5. Ceiling joists shall be continuous or securely joined where they meet over interior partitions and be fastened to adjacent rafters in accordance with Tables 2304.9.1 and 2308.7.3.1 to provide a continuous rafter tie across the building where such joists are parallel to the rafters. Ceiling joists shall have a bearing surface of not less than 1-1/2 inches (38 mm) on the top plate at each end.

Where ceiling joists are not parallel to rafters, an equivalent rafter tie shall be installed in a manner to provide a continuous tie across the building, at a spacing of not more than 4 feet (1219 mm) o.c. The connections shall be in accordance with Tables 2308.7.3.1 and 2304.9.1, or connections of equivalent capacities shall be provided. Where ceiling joists or rafter ties are not provided at the top of the rafter support walls, the ridge formed by these rafters shall also be supported by a girder conforming to Section 2308.2.7. Rafter ties shall be spaced not more than 4 feet (1219 mm) o.c.

Rafter tie connections shall be based on the equivalent rafter spacing in Table 2308.7.3.1. Rafter/ceiling joist connections and rafter/tie connections shall be of sufficient size and number to prevent splitting from nailing.

Roof framing member connection to braced wall lines shall be in accordance with 2308.6.6.2.



For SI: 1 inch = 25.4 mm, 1 foot = 305 mm, 1 degree = 0.018 rad.
Note: Where ceiling joints run perpendicular to the rafter, rafter ties shall be installed per section 2308.7.3.1

FIGURE 2308.7
ROOF CEILING FRAMING

~~TABLE 2308.10.4.1~~ TABLE 2308.7.3.1
RAFTER TIE CONNECTIONS[g]

(Portions of Table not shown remain unchanged)

2308.7.4 Notches and holes. Notching at the ends of rafters or ceiling joists shall not exceed one-fourth the depth. Notches in the top or bottom of the rafter or ceiling joist shall not exceed one-sixth the depth and shall not be located in the middle one-third of the span, except that a notch not exceeding one-third of the depth is permitted in the top of the rafter or ceiling joist not further from the face of the support than the depth of the member. Holes bored in rafters or ceiling joists shall not be within 2 inches (51 mm) of the top and bottom and their diameter shall not exceed one-third the depth of the member.

2308.7.5 Wind uplift. The roof construction shall have rafter and truss ties to the wall below. Resultant uplift loads shall be transferred to the foundation using a continuous load path. The rafter or truss to wall connection shall comply with Tables 2304.9.1 and 2308.7.5

~~TABLE 2308.10.1~~ TABLE 2308.7.5
REQUIRED RATING OF APPROVED UPLIFT CONNECTORS (pounds)[a, b, c, e, f, g, h]

(Portions of Table not shown remain unchanged)

2308.7.6 Framing around openings. Trimmer and header rafters shall be doubled, or of lumber of equivalent cross section, where the span of the header exceeds 4 feet (1219 mm). The ends of header rafters more than 6 feet (1829 mm) long shall be supported by framing anchors or rafter hangers unless bearing on a beam, partition or wall.

2308.7.6.1 Openings in roof diaphragms in *Seismic Design Categories* B, C, D and E. Openings in horizontal diaphragms with a dimension perpendicular to the joist that is greater than 4 feet (1219 mm) shall be constructed with metal ties and blocking in accordance with this section and Figure 2308.4.4.1(1). Metal ties shall not be less than 0.058 inch [1.47 mm (16 galvanized gage)] thick by 1-1/2 inches (38 mm) wide with a minimum yield stress of 33,000 psi (227 Mpa). Blocking shall be provided 2 feet minimum beyond headers. Ties shall be attached to blocking with eight 16d common nails on each side of the header-joist intersection.

2308.7.7 Purlins. Purlins to support roof loads are permitted to be installed to reduce the span of rafters within allowable limits and shall be supported by struts to bearing walls. The maximum span of 2-inch by 4-inch (51 mm by 102 mm) purlins shall be 4 feet (1219 mm). The maximum span of the 2-inch by 6-inch (51 mm by 152 mm) purlin shall be 6 feet (1829 mm), but in no case shall the purlin be smaller than the supported rafter. Struts shall not be smaller than 2-inch by 4-inch (51 mm by 102 mm) members. The unbraced length of struts shall not exceed 8 feet (2438 mm) and the minimum slope of the struts shall not be less than 45 degrees (0.79 rad) from the horizontal.

2308.7.8 Blocking. Roof rafters and ceiling joists shall be supported laterally to prevent rotation and lateral displacement in accordance with the provisions of Section 2308.8.5 and connected to braced wall lines per Section 2308.6.6.2.

2308.7.9 Engineered wood products. Prefabricated wood I-joists, structural glued-laminated timber and structural composite lumber shall not be notched or drilled except where permitted by the manufacturer's recommendations or where the effects of such alterations are specifically considered in the design of the member by a *registered design professional*.

2308.7.10 Roof sheathing. Roof sheathing shall be in accordance with Tables 2304.7(3) and 2304.7(5) for wood structural panels, and Tables 2304.7(1) and 2304.7(2) for lumber and shall comply with Section 2304.7.2.

2308.7.11 Joints. Joints in lumber sheathing shall occur over supports unless *approved* end-matched lumber is used, in which case each piece shall bear on at least two supports.

2308.7.12 Roof planking. Planking shall be designed in accordance with the general provisions of this code.

In lieu of such design, 2-inch (51 mm) tongue-and groove planking is permitted in accordance with Table 2308.10.9. Joints in such planking are permitted to be randomly spaced, provided the system is applied to not less than three continuous spans, planks are center matched and end matched or splined, each plank bears on at least one support, and joints are separated by at least 24 inches (610 mm) in adjacent pieces.

2308.7.13 Wood trusses. Wood trusses shall be designed in accordance with Section 2303.4. Connection to braced wall lines shall be in accordance with Section 2308.6.6.2.

2308.7.14 Attic ventilation. For *attic* ventilation, see Section 1203.2.

Reason: This proposal is intended to completely replace the existing section 2308 "Conventional Light-Frame Construction" with a re-formatted version. This proposal is not intended to introduce any new requirements into, nor remove any requirements from, the existing section 2308.

As a result of many code cycles, Section 2308 has become fragmented and is not organized in a logical manner and is difficult to use. With this proposal, Section 2308 is formatted to begin with general requirements then proceed to foundations, floor framing, wall framing, wall bracing and roof-ceiling construction in that order. The additional requirements for *Seismic Design Categories* in the 2012 IBC Sections 2308.11 and 2308.12 (SDC B/C and SDC D/E respectively) have been merged into the appropriate new sections based on the type of construction such as floor framing, wall bracing and roof framing.

Terminology has been coordinated throughout the section such as the terms, "conventional light-frame construction", "braced wall line" and "braced wall panel".

This proposal is intended to be non-technical and separate proposals have been submitted to address technical items in section 2308.

In order to make the prescriptive provisions of the IBC more closely resemble the format of the similar provisions in the IRC, much of the wall bracing terminology is replicated from the IRC, namely:

- The requirements for braced wall line spacing were put into a single table format based on Seismic Design Category rather than scattered throughout all of Section 2308.
- The wall bracing methods were compiled into a table similar to the IRC, including abbreviations for the methods, rather

than referring to them by a number. The fasteners specified in this table were cross-referenced to the fastener table 2308.9.3.1 where applicable.

- For the section, “Alternate bracing” a figure (copied from the IRC) was introduced, but no technical changes were made.
- Similarly, for Section 2308.9.3.2, “Alternate bracing wall panel adjacent to a door or window opening” was renamed since it aligned perfectly with the Portal Frame with Hold-downs method (PFH) in the IRC. The figure was already in the IBC, so the title was changed to reflect the new name.

Comparison of the proposed 2015 to the existing 2012

<table>
<tr><th>Proposed 2015</th><th>2012 IBC</th></tr>
<tr><td>2308 Conventional Light-Frame Construction</td><td>2308 Conventional Light-Frame Construction</td></tr>
<tr><td>2308.1 General. The requirements of this section are intended for conventional light-frame construction. Other construction methods are permitted to be used, provided a satisfactory design is submitted showing compliance with other provisions of this code. Interior non-load-bearing partitions, ceilings and curtain walls of conventional light-frame construction are not subject to the limitations of ~~this~~ section 2308.2.</td><td>2308.1 General. As shown modified to the left</td></tr>
<tr><td></td><td>2308.1.1 Portions exceeding limitations of conventional construction. Moved to 2308.2.8</td></tr>
<tr><td>2308.2 Limitations</td><td>2308.2 Limitations. Included reference to items in 2308.11 (SDC B and C) and 2308.12 (SDC D and E). Those items have been moved here and elsewhere in the section as noted.</td></tr>
<tr><td>2308.2.1 Stories. The height limitations in the table are from:

2308.2.1 Stories. Structures of conventional light-frame construction shall be limited in story height according to the following:
<table>
<tr><th>Seismic Design Category</th><th>Allowable Story above grade plane</th></tr>
<tr><td>A and B</td><td>Three stories</td></tr>
<tr><td>C</td><td>Two Stories</td></tr>
<tr><td>D and E [a]</td><td>One story</td></tr>
</table>
a. For the purposes of this section, for buildings assigned to Seismic Design Category D or E, unless cripple walls are solid blocked and do not exceed 14 inches in height, cripple walls shall be considered to be a story.</td><td>2308.2 Limitations. Buildings are permitted to be constructed in accordance with the provisions of conventional light-frame construction, subject to the following limitations, and to further limitations of Sections 2308.11 and 2308.12.
1. Buildings shall be limited to a maximum of three stories above grade plane. For the purposes of this section, for buildings assigned to Seismic Design Category D or E, cripple stud walls shall be considered to be a story.
Exception: Solid blocked cripple walls not exceeding 14 inches (356 mm) in height need not be considered a story.

2308.11.1 Number of stories. Structures of conventional light-frame construction and assigned to Seismic Design Category C shall not exceed two stories above grade plane.

2308.12.1 Number of stories. Structures of conventional light-frame construction and assigned to Seismic Design Category D or E shall not exceed one story above grade plane.</td></tr>
<tr><td>2308.2.2 Allowable floor-to-floor height</td><td>Moved from 2308.2, item 2</td></tr>

2308.4.2.2 Bearing	Moved from 2308.8.1. Switched first sentence to end of paragraph
2308.4.2.3 Framing details	Moved from 2308.8.2. Notches portion removed and placed in section 2308.4.2.4
2308.4.2.4 Notches and holes	Moved from 2308.8.2
2308.4.3 Engineered wood products	Moved from 2308.8.2.1. First sentence is new.
2308.4.4 Framing around openings	Moved from 2308.8.3
2308.4.4.1 Openings in horizontal diaphragms in SDC B, C, D and E	From 2308.11.3.3 The text of this section has been re-arranged for clarity. The first sentence states that a tie and blocking are required. Then, the tie is described followed by the blocking.
2308.4.5 Joists supporting bearing partitions	Moved from 2308.8.4
2308.4.6 Lateral support	Moved from 2308.8.5. Changed "Floor, attic and roof…." to "Floor and ceiling…"
2308.4.7 Structural floor sheathing	Moved from 2308.8.6
2308.4.8 Under-floor ventilation	Moved from 2308.8.7
2308.4.9 Floor framing supporting braced wall panels	Reference to existing requirements from 2308.12.6 that have been moved to 2308.6.7
2308.4.10 Anchorage of exterior means of egress components in Seismic Design Category D or E	Moved from 2308.12.7
2308.5 Wall Construction	
2308.5.1 Stud size, height and spacing	Moved from 2308.9.1.
2308.5.2 Framing details	Moved from 2308.9.2 Exception #1 from 2308.9.2.3 Exception #2 from 2308.9.2
Table 2308.5.1	From existing Table 2308.9.1 Footnote "c" is from existing language in section 2308.9.1
2308.5.3 Plates and sills	
2308.5.3.1 Bottom plate or sill	From 2308.9.2.4
2308.5.3.2 Top plates	From 2308.9.2.1
2308.5.4 Nonbearing walls and partitions	From 2308.9.2.3
2308.5.5 Openings in walls and partitions	From 2308.9.5.
2308.5.5.1 Openings in exterior bearing walls "Wall studs shall support……"	From 2308.9.5.1 From 2308.9.5.2
2308.5.5.2 Openings in interior bearing partitions	From 2308.9.6
2308.5.5.2 Openings in interior nonbearing partitions	From 2308.9.7.
2308.5.6 Cripple walls	From 2308.9.4
2308.5.7 Bridging	From 2308.9.9
2308.5.8 Pipes in walls	From 2308.9.8
2308.5.9 Cutting and notching	From 2308.9.10
2308.5.10 Bored holes	From 2308.9.11
2308.6 Wall bracing	
2308.6.1 Braced wall line spacing Refers to new Table 2308.6.1 that contains spacing information from:	 BWL at 35' o.c. from 2308.3.1 BWL in SDC D/E at 25' o.c. from 2308.12.3
2308.6.2 Location of braced panels	From 2308.9.3. Distance of panel from end of wall line (12 ½ feet) was moved to Table 2308.6.1 along with SDC D and E limitation of 8 feet from 2308.12.4
2308.6.3 Braced wall panel methods New Table 2308.6.3(1)	From 2308.9.3. items 1 through 8 are re-located into Table 2308.6.3.(1) and renamed;

	1 LIB Let In Bracing 2 DWB Diagonal Wood Boards 3 WSP Wood Structural Panels 4 SFB Structural Fiberboard Sheathing 5 GB Gypsum Board 6 PBS Particle Board Sheathing 7 PCP Portland Cement Plaster 8 HPS Hardboard Panel Siding The two "Alternative bracing" options from 2308.9.3.1 are incorporated into Table 2308.6.3(1) as items 9 and 10 9 Alt bracing from 2308.9.3.1 ABW (Alternate Braced Wall) 10 Alt bracing wall panel adjacent to a door or window opening PFH (Portal Frame w/ Hold-downs)
2308.6.4 Length of braced wall panels	From 2308.9.3
2308.6.5 Alternative bracing	From 2308.9.3.1
2308.6.5.1 Alternate Braced Wall (ABW)	From 2308.9.3.1
2308.6.5.2 Portal Frame w/ Hold-downs (PFH)	From 2308.9.3.2 "Alternate bracing wall panel adjacent to a door or window opening"
2308.6.6 Cripple wall bracing	From 2308.9.4.1
2308.6.6.1 Cripple wall bracing in Seismic Design Category A, B and C	From 2308.9.4.1 and 2308.9.4.2
2308.6.6.2 Cripple wall bracing in Seismic Design Category D and E	From 2308.12.4
2308.6.7 Connections of braced wall panels	From 2308.12.4
2308.6.6.1 Bottom plate connection	From 2308.3.2.1
2308.6.6.2 Top plate connection	From 2308.3.2.2
2308.6.6.3 Sill anchorage	From first portion of 2308.3.3. The remainder of 2308.3.3 is moved to 2308.3.1 "Foundation Plates and Sills"
2308.6.6.4 Anchorage to all-wood foundations	From 2308.3.3.1
2308.6.7 Braced wall line support	
2308.6.7.1 Foundation requirements Cantilever floor provisions Braced panel over beam below	From 2308.3.4 From 2308.12.6, Item 1 (re-worded) From 2308.12.6, Item 3 (re-worded and shown in Fig. 2308.6(1)
2308.6.7.2 Floor and roof diaphragm support in Seismic Design Category D and E	From 2308.12.6, item 2
2308.6.7.3 Stepped footings in SDC B,C,D and E	From 2308.11.3.2
2308.6.8 Attachment of sheathing	From 2308.12.5
2308.6.9 Limitation of concrete or masonry veneer	
2308.6.9.1 Concrete or masonry veneer in Seismic Design Category B and C	From 2308.11.2
2308.6.9.2 Concrete or masonry veneer in Seismic Design Category D and E	From 2308.12.2
2308.7 Roof and ceiling framing	From 2308.10. Figure 2308.7 is new and is similar to the Figure in the IRC
2308.7.1 Ceiling joist spans	From 2308.10.2
2308.7.2 Rafter spans	From 2308.10.3
2308.7.3 Ceiling joist and rafter framing	From 2308.10.4
2308.7.3 Ceiling joist and rafter connections	From 2308.10.4
2308.7.4 Notches and holes	From 2308.10.4.2
2308.7.5 Wind uplift	From 2308.10.1
2308.7.6 Framing around openings	From 2308.10.4.3

2308.7.6 Openings in roof diaphragms in SDC B, C, D and E	From 2308.11.3.3 The text of this section has been re-arranged for clarity. The first sentence states that a tie and blocking are required. Then, the tie is described followed by the blocking.
2308.7.7 Purlins	From 2308.10.5
2308.7.9 Engineered wood products	From 2308.10.7
2308.7.10 Roof sheathing	From 2308.10.8
2308.7.11 Joints	From 2308.10.8.1
2308.7.12 Roof planking	From 2308.10.9
2308.7.13 Trusses	From 2308.10.10
2308.7.14 Attic ventilation	From 2308.10.11

Cost Impact: The code change proposal will not increase the cost of construction.

S273-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2308-S-RICE.doc

S274–12
2308.2.1

Proponent: Philip Line, American Wood Council

Revise as follows:

2308.2.1 Nominal design wind speed greater than ~~100~~ 130 mph (3-second gust). Where ~~V_{asd} as determined in accordance with Section 1609.3.1~~ V_{ult} exceeds ~~100~~ 130 mph (3-second gust), the provisions of either AF&PA WFCM, or the ICC 600 are permitted to be used. Wind speeds in Figures 1609A, 1609B, and 1609C shall be converted to V_{asd} wind speed in accordance with Section 1609.3.1 for use with ~~AF&PA WFCM or~~ ICC 600.

Reason: ASD wind speeds, V_{asd}, are converted to V_{ult} wind speeds to work directly with V_{ult} wind speed maps in the IBC (Figure 1609A, Figure 1609B, and Figure 1609C). For 2012 WFCM, the conversion to V_{asd} is not applicable as the updated AWC's 2012 WFCM utilizes V_{ult} wind speeds. Text is added to clarify application of 1609.3.1 for determination of V_{asd} wind speeds for use with ICC 600.

Cost Impact: The code change proposal will not increase the cost of construction.

S274-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2308.2.1-S-LINE.doc

S275–12
2308.2.1

Proponent: Randall Shackelford, P.E., Simpson Strong-Tie Company, Inc. (rshackelford@strongtie.com)

Revise as follows:

2308.2.1 Nominal design wind speed greater than 100 mph (3-second gust). Where V_{asd} as determined in accordance with Section 1609.3.1 exceeds 100 mph (3-second gust), the provisions of either AF&PA WFCM, or the ICC 600 are permitted to be used. ~~Wind speeds in Figures 1609A, 1609B, and 1609C shall be converted in accordance with Section 1609.3.1 for use with AF&PA WFCM or ICC 600.~~

Reason: The 2012 WFCM, as referenced in Chapter 35 of the 2012 IBC, is based on Ultimate Wind Speeds, V_{ult}, and therefore does not require conversion of the ultimate wind speed to the nominal wind speed, V_{asd}.
Further, the WFCM is the reference standard for wood framing in the ICC-600, so conversion should not take place when using ICC-600 to design wood framing. A committee has been appointed to revise ICC-600, and this code change is written assuming that the basis of ICC-600 will be changed to V_{ult} wind speeds, with conversion factors in the standard for converting to V_{asd} where needed. If by the Public Comment deadline it is not clear that this will be the case, I will prepare a Public Comment to restore Exception 1 to the list of items where conversion is required.

If this code change is not approved, structures designed using the 2012 WFCM with converted wind speeds will be designed for wind speeds that are only 60% of the pressures they should be designed for.

Cost Impact: The code change proposal will not increase the cost of construction.

2308.2

Proponent: Charles S. Bajnai, Chesterfield County (bajnaic@chesterfield.gov), VA, Ed Keith, American Plywood Association, representing Chesterfield County, VA, Robert Rice, OBOA, representing Chesterfield County, VA

Revise as follows:

2308.2 Limitations. Buildings are permitted to be constructed in accordance with the provisions of *conventional light-frame construction*, subject to the following limitations, and to further limitations of Sections 2308.11 and 2308.12.

3.1. Average dead loads shall not exceed 15 psf (718 N/m2) for combined roof and ceiling, exterior walls, floors and partitions.

Exceptions:

1. Subject to the limitations of Sections 2308.11.2 and 2308.12.2, stone or masonry veneer up to the lesser of 5 inches (127 mm) thick or 50 psf (2395 N/m^2) and installed in accordance with Chapter 14 is permitted to a height of 30 feet (9144 mm) above a noncombustible foundation, with an additional 8 feet (2438 mm) permitted for gable ends.
2. Concrete or masonry fireplaces, heaters and chimneys shall be permitted in accordance with the provisions of this code. 3.2. Live loads shall not exceed 40 psf (1916 N/m^2) for floors.

3.2. Live loads shall not exceed 40 psf (1916 N/m^2) for floors <u>of conventional light-frame construction</u>.

3.3. Ground snow loads shall not exceed 50 psf (2395 N/m^2).

(Portions of text not shown remain unchanged)

Reason: The limitation of 40 psf live load for floors from Table 1607.1 makes Section 2308, Conventional Light- Frame Construction, essentially restricted to residential construction.

This code change proposal is intended to clarify that the 40 psf live load for floors applies to all stories constructed of conventional light-frame construction.

This new exemption would allow Section 2308, Conventional Light-Frame Construction to apply to live/work structures, and one story offices, retail spaces, assembly spaces, schools, etc

Cost Impact: The code change proposal will not increase the cost of construction.

2308.2-BAJNAI-RICE.doc

S277–12
2308.2

Proponent: Philip Line, American Wood Council

Revise as follows:

2308.2 Limitations. Buildings are permitted to be constructed in accordance with the provisions of *conventional light-frame construction*, subject to the following limitations, and to further limitations of Sections 2308.11 and 2308.12.

1. Buildings shall be limited to a maximum of three *stories above grade plane*. For the purposes of this section, for buildings assigned to *Seismic Design Category* D or E, cripple stud walls shall be considered to be a *story*.

   Exception: Solid blocked cripple walls not exceeding 14 inches (356 mm) in height need not be considered a *story*.

2. Maximum floor-to-floor height shall not exceed 11 feet, 7 inches (3531 mm). Bearing wall height shall not exceed a stud height of 10 feet (3048 mm).
3. Loads as determined in Chapter 16 shall not exceed the following:
   3.1. Average dead loads shall not exceed 15 psf (718 N/m^2) for combined roof and ceiling, exterior walls, floors and partitions.

   Exceptions:

   1. Subject to the limitations of Sections 2308.11.2 and 2308.12.2, stone or masonry veneer up to the lesser of 5 inches (127 mm) thick or 50 psf (2395 N/m^2) and installed in accordance with Chapter 14 is permitted to a height of 30 feet (9144 mm) above a noncombustible foundation, with an additional 8 feet (2438 mm) permitted for gable ends.
   2. Concrete or masonry fireplaces, heaters and chimneys shall be permitted in accordance with the provisions of this code.

   3.2. Live loads shall not exceed 40 psf (1916 N/m^2) for floors.
   3.3. Ground snow loads shall not exceed 50 psf (2395 N/m^2).

4. ~~V_{asd} as determined in accordance with Section 1609.3.1~~ <u>V_{ult}</u> shall not exceed ~~100~~ <u>130</u> miles per hour (mph) (~~44~~ <u>57.2</u> m/s) (3- second gust).

   Exception: ~~V_{asd} as determined in accordance with Section 1609.3.1~~ <u>V_{ult}</u> shall not exceed ~~110~~ <u>140</u> mph (~~48.4~~ <u>61.6</u> m/s) (3-second gust) for buildings in Exposure Category B that are not located in a *hurricane-prone region*.

5. Roof trusses and rafters shall not span more than 40 feet (12 192 mm) between points of vertical support.
6. The use of the provisions for *conventional light-frame construction* in this section shall not be permitted for *Risk Category* IV buildings assigned to *Seismic Design Category* B, C, D, E or F.
7. *Conventional light-frame construction* is limited in irregular structures assigned to *Seismic Design Category* D or E, as specified in Section 2308.12.6.

Reason: ASD wind speeds, V_{asd}, are converted to V_{ult} wind speeds to work directly with V_{ult} wind speed maps in the IBC (Figure 1609A, Figure 1609B, and Figure 1609C). This change will allow direct comparison of the wind speed limits in 2308.2 Item 4 with IBC wind speed maps for determination of applicability of provisions in 2308 eliminating potential error due to mathematical conversion of V_{asd} to V_{ult}. Use of V_{ult} also better coordinates with the V_{ult} wind speed of 115 mph defined in Chapter 2 for hurricane prone region. Additionally, this change will allow better coordination with V_{ult} basis of WFCM wind design provisions and strength design basis ASCE 7-10 wind load provisions.

The value of 130 mph comes from the solving Equation 16-33 for V_{ult} and rounding as follows:
$V_{ult} = (V_{asd})/(0.6\hat{}0.5)$
V_{ult} = (100 mph)/(0.6^0.5) = 129.099 mph
V_{ult} = 130 mph

The value of 140 mph comes from solving Equation 16-33 for V_{ult} and rounding as follows:
$V_{ult} = (V_{asd})/(0.6\hat{}0.5)$
V_{ult} = (110 mph)/(0.6^0.5) = 142.009 mph
V_{ult} = 140 mph

With the exception of rounding to facilitate use of mapped wind speed contours, this change does not introduce technical change to existing wind speed limitations. Rounding up to 130 mph affects locations with V_{ult} wind speed between 129 mph and 130 mph such that provisions of 2308 are now applicable in those locations. Rounding down to 140 mph affects locations with V_{ult} wind speed between 140 mph and 142 mph such that provisions of 2308 are no longer applicable in those locations.

Cost Impact: The code change proposal will not increase the cost of construction.

2308.2-S-LINE.doc

S278–12
2308.2

Proponent: Robert Rice, Josephine County, OR, representing Oregon Building Officials Association (structdesigner@yahoo.com)

Revise as follows:

2308.2 Limitations. Buildings are permitted to be constructed in accordance with the provisions of *conventional light-frame construction*, subject to the following limitations, and to further limitations of Sections 2308.11 and 2308.12.

1. Buildings shall be limited to a maximum of three *stories above grade plane*. For the purposes of this section, for buildings assigned to *Seismic Design Category* D or E, cripple stud walls shall be considered to be a *story*.

   Exception: Solid blocked cripple walls not exceeding 14 inches (356 mm) in height need not be considered a *story*.

2. Maximum floor-to-floor height shall not exceed 11 feet, 7 inches (3531 mm). Bearing wall height shall not exceed a stud height of 10 feet (3048 mm).
3. Loads as determined in Chapter 16 shall not exceed the following:
   3.1. Average dead loads shall not exceed 15 psf (718 N/m^2) for combined roof and ceiling, exterior walls, floors and partitions.

   Exceptions:

   1. Subject to the limitations of Sections 2308.11.2 and 2308.12.2, stone or masonry veneer up to the lesser of 5 inches (127 mm) thick or 50 psf (2395 N/m^2) and installed in accordance with Chapter 14 is permitted to a height of 30 feet (9144 mm) above a noncombustible foundation, with an additional 8 feet (2438 mm) permitted for gable ends.
   2. Concrete or masonry fireplaces, heaters and chimneys shall be permitted in accordance with the provisions of this code.

   3.2. Live loads shall not exceed 40 psf (1916 N/m^2) for floors.
   3.3. Ground snow loads shall not exceed 50 psf (2395 N/m^2).
4. V_{asd} as determined in accordance with Section 1609.3.1 shall not exceed 100 miles per hour (mph) (44 m/s) (3- second gust).

   Exception: V_{asd} as determined in accordance with Section 1609.3.1 shall not exceed 110 mph (48.4 m/ s) (3-second gust) for buildings in Exposure Category B that are not located in a *hurricane-prone region*.

5. ~~Roof trusses and~~ <u>Ceiling joist and</u> rafters <u>framing constructed in accordance with Section 2308.10 and trusses</u> shall not span more than 40 feet (12 192 mm) between points of vertical support. <u>A ridge board in accordance with Section 2308.10 or 2308.10.4.1 shall not be considered a vertical support.</u>
6. The use of the provisions for *conventional light-frame construction* in this section shall not be permitted for *Risk Category* IV buildings assigned to *Seismic Design Category* B, C, D, E or F.
7. *Conventional light-frame construction* is limited in irregular structures assigned to *Seismic Design Category* D or E, as specified in Section 2308.12.6.

Reason: This proposal clarifies the requirements of the existing code language. The provisions of the existing code defining the construction of roof/ceiling assemblies with *conventional light-frame construction* are predicated on the fact that a "ridge-board" does not provide “vertical support”. According to the commentary, the current code limitation of *“Roof trusses and rafters shall not span more than 40 feet (12 192 mm) between points of vertical support.”* is intended to limit the use the rafter/ceiling joist (or rafter tie) provisions of *“Conventional light-frame construction”.*

The commentary states:

“In buildings with roof framing spans in excess of 40 feet (12192 mm), the horizontal thrust of that framing on the top plate on which it rests is greater than can be resisted by the ceiling joist and rafter connections specified in Section 2308.10.4.1. Note that the limitation is on the span of the truss or rafter and not on the width of the building. The building width could exceed 40 feet (12192 mm) as long as the actual span of the roof framing is no more than 40 feet (12192 mm).”

The commentary correctly identifies that there are “horizontal thrust” forces in a rafter/ceiling joist assembly. Those forces are addressed in Section 2308.10.4.1 where it states, *“Ceiling joists shall be continuous or securely joined where they meet over interior partitions and fastened to adjacent rafters in accordance with* ***Tables 2308.10.4.1*** *and 2304.9.1 to provide a continuous rafter tie across the building where such joists are parallel to the rafters.”* Table 2308.10.4.1 contains the necessary rafter tie connections based on rafter slope, snow load and roof span. The roof span, per the table, is up to 36 feet. In addition, footnote “c” of Table 2308.10.4.1 further verifies this with the statement that, *“Rafter tie heel joint connections are not required where the ridge is supported by a load-bearing wall, header or ridge beam.”* An error exists in the statement of the commentary in that trusses do not impose the “horizontal thrust” on the top plate of the wall like rafter/ceiling joist framing does. The horizontal forces of a truss at it’s bearing points are non-existent, or negligible, due to the fact that the forces are resolved within the chords and web members of the truss and only vertical loads exist at it’s bearing points such as on the exterior walls.

However, a second concern exists and is a factor in limiting the roof span to 40 feet. The bearing wall studs in Table 2308.9.1 are limited in their capacity to resist buckling due to the vertical (axial) forces and the unbraced length of the studs. When considering the load limitations of 2308.2 item 3.1, 15 psf dead load, and item 3.3, snow load of 50 psf, the combined roof load could be 65 psf. A 40 foot span would result in a load of 65 x 40/2 = 1300 plf to the top plates. With studs at 16 inch o.c. the load/stud = 1300 x (16/12) = 1733#/stud.

Therefore, the purpose of this proposal is to clarify that a non-vertically-supporting “ridge board” is not to be considered a “vertical support”. If it were to be mistakenly considered to be a support, the tributary roof load would far exceed that capacity of the studs as well as the limitations of the values in the rafter tie table. This clarification will not effect the requirements for wall bracing and the location, or spacing, of braced wall lines. Currently, braced wall lines are required at 35 feet o.c. in each direction in *Seismic Design Category* A, B and C and 25 feet o.c. in each direction in *Seismic Design Category* D and E.

For reference, sections 2308.10 and 2308.10.4.1 state:

2308.10 Roof and ceiling framing. *The framing details required in this section apply to roofs having a minimum slope of three units vertical in 12 units horizontal (25-percent slope) or greater.* ***Where the roof slope is less than three units vertical in 12 units horizontal (25-percent slope), members supporting rafters and ceiling joists such as ridge board, hips and valleys shall be designed as beams.***

2308.10.4.1 Ceiling joist and rafter connections. *Ceiling joists and rafters shall be nailed to each other and the assembly shall be nailed to the top wall plate in accordance with Tables 2304.9.1 and 2308.10.1. Ceiling joists shall be continuous or securely joined where they meet over interior partitions and fastened to adjacent rafters in accordance with Tables 2308.10.4.1 and 2304.9.1 to provide a continuous rafter tie across the building where such joists are parallel to the rafters. Ceiling joists shall have a bearing surface of not less than 11/2 inches (38 mm) on the top plate at each end. Where ceiling joists are not parallel to rafters, an equivalent rafter tie shall be installed in a manner to provide a continuous tie across the building, at a spacing of not more than 4 feet (1219 mm) o.c. The connections shall be in accordance with Tables 2308.10.4.1 and 2304.9.1, or connections of equivalent capacities shall be provided.* ***Where ceiling joists or rafter ties are not provided at the top of the rafter support walls, the ridge formed by these rafters shall also be supported by a girder conforming to Section 2308.4.***

Cost Impact: The code change proposal will not increase the cost of construction. This proposal does not add any new requirement or limitation to the code. It is intended to clarify the code for consistency in application.

	Assembly:	ASF	AMF	DF

2308.2-S-RICE.doc

S279–12
2308.3.2.2

Proponent: Robert Rice, C.B.O, Josephine County, OR, representing Oregon Building Officials Association (structdesigner@yahoo.com), R. Terry Malone, P.E., S.E., representing self

Revise as follows:

2308.3.2.2 Top plate connection. Where joists and/or rafters are used, braced wall line top plates shall be fastened over the full length of the braced wall line to joists, rafters, rimboards or <u>full-depth</u> blocking above in accordance with Table 2304.9.1, Items 11, 12, 15 or 19, as applicable, based on the orientation of the joists or rafters to the braced wall line. ~~Blocking at joists with walls above shall be equal to the depth of the joist at the braced wall line. Blocking at rafters need not be full depth but shall extend to within 2 inches (51 mm) from the roof sheathing above.~~ Blocking shall be a minimum of 2 inches (51 mm) nominal thickness and shall be fastened to the braced wall line top plate as specified in Table 2304.9.1, Item 11. Notching or drilling of holes in blocking in accordance with the requirements of Section 2308.8.2 or Section 2308.10.4.2 shall be permitted.

At exterior gable end walls braced wall panel sheathing in the top *story* shall be extended and fastened to roof framing where the spacing between parallel exterior braced wall lines is greater than 50 feet (15 240 mm).

Where roof trusses are used and are installed perpendicular to an exterior braced wall line, lateral forces shall be transferred from the roof diaphragm to the braced wall over the full length of the braced wall line by blocking of the ends of the trusses or by other *approved* methods providing equivalent lateral force transfer. Blocking shall be minimum 2 inch (51 mm) nominal thickness and ~~shall extend to within 2 inches (51 mm) from the roof sheathing above~~ <u>equal to the depth of the truss at the wall line</u> and shall be fastened to the braced wall line top plate as specified in Table 2304.9.1, Item 11. Notching or drilling of holes in blocking in accordance with the requirements of Section 2308.8.2 or Section 2308.10.4.2 shall be permitted.

Reason: In the last code cycle for the development of the 2012 code, section 2308.3.2 was modified. The proposal (S211) re-arranged the section into bottom plate connections (2308.3.2.1) and top plate connections (2308.3.2.2). Another proposal was submitted (S212) to make technical changes to this section regarding the blocking between joists, rafters or trusses particularly at high-heel or cantilevered trusses. The 2009 IBC language specifically stated that the blocking was required to be "full-height". As a result of working with other stake-holders and industry representatives, a provision was written into S211 to allow the blocking to stop 2 inches short of the roof sheathing. This provision was intended as a method of allowing for the required venting. Reports and analysis were cited that indicated that the cross-grain bending of the rafter or truss chord was not a significant concern and that the diaphragm forces could be transferred through typical connections and fastening per Table 2304.9.1. However, there has been concern raised since that time that the 2 inch gap at the top causes a disconnect in the lateral load path and is not consistent with referenced standards and other sections of the IBC.

All diaphragm testing and accepted allowable diaphragm shear value tables (past and present) are based on diaphragms having boundary nailing. This nailing is required to transfer diaphragm shears into the boundary elements (shear walls and/or collectors and struts), in accordance with IBC section 1602.1 and ASCE7 section 11.2. If a 2" air gap is allowed between the sheathing and the top of the blocking, this shear transfer cannot happen and the allowable shear values should not be allowed to be used.

The definition of a diaphragm boundary from the 2012 IBC states;

Diaphragm boundary. *In light-frame construction, a location where shear is transferred into or out of the diaphragm sheathing. Transfer is either to a boundary element or to another force-resisting element.*

IBC section 1604.4, ASCE 7 section 1.3.5, and SDPWS sections 4.1.1 and 4.2.6 all require complete load paths. Since the 2" air gap does not allow a direct load path for the transfer of diaphragm shears to the blocking, then down into the shear walls or collectors, an alternate load path must be provided. With the 2" gap, the diaphragm shears and resulting load path must be transferred through the unsupported diaphragm sheathing, which must act as the initial diaphragm boundary element taking tension and compression (not allowed by IBC section 2305.1.2 and SDPWS section 4.1.4), then into the trusses or joists, then by bearing (assuming full bearing is achieved) into the blocking, and then down into the boundary element. Past and present testing has shown that eliminating blocking, providing partial (skip) blocking or reducing the height of blocking produces failure modes that are undesirable (i.e. trust/joist rotation, loss of gang-nail plates by popping off from cross grain shear forces being applied, or shifting of loads to other members that were not designed to receive those loads). At the very least, the gap should occur at the bottom of the blocking so that the boundary nailing can be installed. However, doing so will not resolve the bad testing failure modes.

Installing blocking only over the shear walls would create shears in the blocking and its connections (transferring the shears into the framing) in excess the connection capacity shown in the prescriptive fastening schedules in the IBC tables, and would also eliminate the boundary elements connecting the shear walls together. This violates IBC sections 1602.1 (boundary member and chord), 2302, 2305.1.2, SDPWS sections 4.1.4, 4.1.1 and 4.2.6, and ASCE 7 sections 11.2, 12.10.2 and 1.3.5. The shears are not only being applied in the plane of the wall. Loads are applied to the diaphragm in both the transverse and longitudinal directions. When the loads are applied in the transverse direction (perpendicular to the wall), without blocking, or if installed only at the shear walls, the diaphragm sheathing is the only element that can act as the diaphragm chord because the shears cannot be transferred to the blocking and therefore the sheathing must take all of the tension and compression forces, which is in direct violation with the code.

Cost Impact: This change would require that the blocking be 2 inches taller than what is currently required. The additional cost would be negligible. In addition, this change would require boundary nailing (6 inch o.c.) of the roof sheathing to the blocking along the braced wall line. That would be an additional, but undetermined, cost..

(Portions of table not shown remain unchanged)

Reason: The 2012 IBC has fairly clear wording in Section 2308.3.2 that when the Conventional Light-Frame Construction provisions are used that the diaphragms need to be connected to the braced wall line to resist wind and seismic (lateral) forces and states.

The prescriptive provisions of "conventional light-frame construction" as provided for in section 2308 are very limited in scope. In section 2308.2 they are limited to:

1. Three stories max (two stories max in SDC C, one story in SDC D and above)
2. Max floor to floor height of 11'-7"
3. Max dead loads of 15 psf
4. Floor live load of 40 psf max
5. Ground snow of 50 psf max
6. Wind speeds of 100 max
7. Roof truss span of 40 feet max between vertical supports
8. Not allowed to be used for Occupancy Category IV buildings in SDC B,C,D,E

9 More restrictive requirements for SDC B,C, D and E defined in 2308.11.

10 Even more restrictive requirements specifically for SDC D and E

11. Limited by "irregular structures" definitions in 2308.12.6
12. Braced wall line spacing 35 feet max each direction, each floor.
13. In SDC D and E max spacing is 25 feet. (IRC allow exception up to 50 feet)

In other words, due to the limitations listed above as well as the other limitations in the code not listed here, the structures that are built with the provisions of section 2308 are small, light-framed buildings that do not have the significant lateral loading that other buildings do.

The alternate provisions in the exceptions are intended to address the increasingly common occurrence of cantilevered/high-heel trusses. This occurs due to insulation requirements and to provide a cantilevered portion of roof to be an exterior covered porch. The current provisions of this section of code do not cover this common condition. The current code language requires that "Blocking shall be a minimum of 2 inches (51 mm) nominal thickness…" This does not work for heights greater than what a 2x 10 or 2x 12 will accommodate.

The current code text (IBC) states the intention of connecting the braced wall line to the roof or floor diaphragm above in section 2308.3.2. A similar version of this proposal was adopted as an Oregon amendment in 2006 for the adoption of the 2006 IBC and has worked well for many years and two more code cycles Since then, countless hours have gone into developing proposals for both the IRC and the IBC code development process. The IRC proposal was approved in Minneapolis for the 2009 code. During the process of resolving concerns and developing a consensus changes were made to the proposal. Based on engineering reports and historical data, an exception was made for low heel connections (9 ¼") in lower wind and seismic zones to not require the blocking.

This proposal does not add additional requirements to the code. This proposal clarifies that the connection needs to occur and provides prescriptive solutions when solid blocking, per the current text, is not possible or is impractical..

Per accepted engineering practice for lateral design loads, the floor and roof diaphragms transmit wind and seismic loads into the braced walls (engineered shearwalls or prescriptive braced panels). The fact that the diaphragm needs to be connected to the braced wall line to complete the load path is often not fully understood by plans examiners, inspectors and contractors. The typical requirement that is intended by the code is that full height solid blocking occur at this connection with edge nailing to the blocking and the blocking connected to the top plate of the wall to transfer the diaphragm (plf) force to the wall top plates. This is evidenced in the IBC by the exception to irregular structures stating, *"..lateral forces shall be transferred from the roof diaphragm to the braced wall by blocking of the ends of the trusses..".* In order for the forces to be transferred there has to be a connection capable of transferring the diaphragm shear evenly to the top plates.

Without this clarification of the text it is a connection that may or may not occur based on what I have seen in the field and have discussed with code officials. The blocking that is called for in the code serves three functions. It provides closure to prevent animals, birds, etc. from entering the attic space, it prevents the trusses or rafters from "rolling over" and it transfers the diaphragm forces to the wall. Most code officials, inspectors and contractors understand the first two objectives. However, the latter is a concept that is often not fully understood. This needs to be perceived, understood and implemented in a uniform way.

In addition, rather than identify a problem without providing a solution, my proposal includes two details to accomplish this connection simply. The solutions are, in principle, fundamentally extending the roof diaphragm sheathing to the wall top plates either vertically in the truss bays or horizontally through the soffit. No design is required since it is just completing the load path with the already defined sheathing and nailing.

Without prescriptive provisions in the current code this condition would require engineering or, as stated in 2308.3.2, Exception to item 1 "..by other approved methods." would be left up to the Authority Having Jurisdiction to determine what is acceptable without any guidance or uniformity between jurisdictions.

Typically, the engineering solution would provide details similar to those included in this proposal. Therefore, the solution and construction costs would not change. Costs would be reduced by eliminating additional costs for engineering where these prescriptive solutions work.

Cost Impact: The code change proposal will not increase the cost of construction.

S280-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2308.3.2.2-S-RICE.doc

S281–12

2308.7, 2308.9.1, 2308.9.5.1, 2308.9.5.2, 2308.9.6, Table 2308.9.5, Table 2308.9.6

Proponent: Paul Coats, PE, CBO, American Wood Council (pcoats@awc.org)

Revise as follows:

2308.7 Girders. Girders for single-story construction or girders supporting loads from a single floor shall not be less than 4 inches by 6 inches (102 mm by 152 mm) for spans 6 feet (1829 mm) or less, provided that girders are spaced not more than 8 feet (2438 mm) o.c. ~~Spans for built-up 2-inch (51 mm) girders shall be in accordance with Table 2308.9.5 or 2308.9.6. Other girders~~ Girders shall be designed to support the loads specified in this code. Girder end joints shall occur over supports. Where a girder is spliced over a support, an adequate tie shall be provided. The ends of beams or girders supported on masonry or concrete shall not have less than 3 inches (76 mm) of bearing.

2308.9.1 Size, height and spacing. The size, height and spacing of studs shall be in accordance with Table 2308.9.1 except that utility-grade studs shall not be spaced more than 16 inches (406 mm) o.c., or support more than a roof and ceiling, or exceed 8 feet (2438 mm) in height for exterior walls and load-bearing walls or 10 feet (3048 mm) for interior nonload-bearing walls. Studs shall be continuous from a support at the sole plate to a support at the top plate to resist loads perpendicular to the wall. The support shall be a foundation or floor, ceiling or roof diaphragm or shall be designed in accordance with accepted engineering practice.

> **Exception:** Jack studs, trimmer studs and cripple studs at openings in walls that comply with ~~Table 2308.9.5~~ Section 2308.9.5.2.

2308.9.5.1 Headers. Headers shall be provided over each opening in exterior-bearing walls. ~~The spans in Table 2308.9.5 are permitted to be used for one- and two-family *dwellings*.~~ Headers ~~for other buildings~~ shall be designed in accordance with Section 2301.2, Item 1 or 2. Headers shall be of two or more pieces of nominal 2-inch (51 mm) framing lumber set on edge ~~as permitted by Table 2308.9.5~~ and nailed together in accordance with Table 2304.9.1 or of solid lumber of equivalent size.

2308.9.5.2 Header support. Wall studs shall be designed to support the ends of the header ~~in accordance with Table 2308.9.5~~. Each end of a lintel or header shall have a length of bearing of not less than 1 1/2 inches (38 mm) for the full width of the lintel.

2308.9.6 Openings in interior bearing partitions. Headers shall be provided over each opening in interior bearing partitions as required in Section 2308.9.5. ~~The spans in Table 2308.9.6 are permitted to be used.~~ Wall studs shall support the ends of the header in accordance with ~~Table 2308.9.5 or 2308.9.6, as appropriate~~ Section 2308.9.5.2.

~~TABLE 2308.9.5~~
~~HEADER AND GIRDER SPANS[a] FOR EXTERIOR BEARING WALLS~~
~~(Maximum Spans for Douglas Fir-Larch, Hem-Fir, Southern Pine and Spruce-Pine-Fir[b] and Required Number of Jack Studs)~~

~~TABLE 2308.9.6~~
~~HEADER AND GIRDER SPANS[a] FOR INTERIOR BEARING WALLS~~
~~(Maximum Spans for Douglas Fir-Larch, Hem-Fir, Southern Pine and Spruce-Pine-Fir[b] and Required Number of Jack Studs)~~

Reason: Deletion of Table 2308.9.5 and Table 2308.9.6 without replacement is proposed because of limited applicability of the tabulated header spans resulting from the exclusion of detached one- and two-family dwellings from the scope of 2308 and the live load limitation of 40 psf per 2308.2. In addition, the species-based header spans are subject to being dated should design values change. Design value-based prescriptive engineered options for header spans are available from other sources. For example, header spans for conditions covered by Table 2308.9.5 and Table 2308.9.6, as well as support of headers by use of jack studs providing full bearing, can be found in the WFCM.

Specific reference to "one- and two- family dwellings" from 2308.9.5.1 is deleted to coordinate with the exclusion of detached one-and two-family dwellings from the scope of 2308. Other text sections are revised to coordinate with removal of the Tables.

Cost Impact: The code change proposal will not increase the cost of construction.

2308.7-S-COATS.doc

S282–12
2308.8.5

Proponent: Robert Rice, C.B.O., Josephine County, OR, representing Oregon Building Officials Association (structdesigner@yahoo.com)

Revise as follows:

2308.8.5 Lateral support. Floor, *attic* and roof framing with a nominal depth-to-thickness ratio greater than or equal to 5:1 shall have ~~one~~ the compression edge held in line for the entire span. Where the nominal depth-to-thickness ratio of the framing member exceeds 6:1, there shall be one line of bridging for each 8 feet (2438 mm) of span, unless both edges of the member are held in line. The bridging shall consist of not less than 1-inch by 3-inch (25 mm by 76 mm) lumber, double nailed at each end, of equivalent metal bracing of equal rigidity, full-depth solid blocking or other *approved* means. A line of bridging shall also be required at supports where equivalent lateral support is not otherwise provided.

Reason: This proposal clarifies the requirements of the existing code language. The first sentence requires framing with a depth-to-thickness ratio greater or equal to 5:1 (e.g. 2x10) to have **"…one edge held in line…".** The second sentence states that when the depth-to-thickness ratio exceeds 6:1 (e.g. 2x12) "…there shall be one **line of bridging** for each 8 feet of the span…." in addition to the requirement above unless "both edges of the member are **held in line."** The remainder of the section describes what the bridging shall be. What is missing from the first sentence is the clarification that it is the compression flange that requires bracing or "support". This is consistent with accepted engineering practice and design standards such as the *National Design Specification published by American Forest and Paper Association.*

The Commentary states,

When the depth-to-thickness ratio of joists and rafters exceeds 5:1, as would be the case in members larger than 2 inches by 10 inches (51 mm by 254 mm), the lateral support required by Ssection 2308.8.2 is not sufficient to prevent ***lateral buckling*** *between supports. Additional resistance is required.* ***Sheathing, subflooring, decking and similar materials*** *attached to each joist or rafter are considered to provide edge restraint. These requirements are cumulative. The support required by Section 2308.8.2 applies to all joists. Additionally, members greater than 2 inches by 10 inches (51 mm by 254 mm) must have one edge held in line, and members greater than 2 inches by 12 inches (51 mm by 305 mm) must have one edge held in line as well as a line of bridging at each 8 feet (2438 mm) of span (which may be omitted if both edges are held in line).*

As indicated by the commentary above, the concern is "*..lateral buckling between supports."* The susceptibility of lateral buckling for floor, attic or roof framing is due to an un-braced compression flange. Section 2308.8.2 requires that *"Joists shall be supported laterally at the ends and at each support by solid blocking except where the ends of the joists are nailed to a header, band or rim joist or to an adjoining stud or by other means."* The requirements of this section, 2308.8.5 are in addition to 2308.8.2 and are specifically to address out-of-plane buckling of the compression flange.

Cost Impact: The code change proposal will not increase the cost of construction. This proposal is intended to clarify the code and does not add any new requirement to the code.

~~(Roof Live Load = 20 pounds per square foot, Ceiling Attached to Rafters, L/Δ = 240)~~

~~TABLE 2308.10.3(3)~~
~~RAFTER SPANS FOR COMMON LUMBER SPECIES~~
~~(Ground Snow Load = 30 pounds per square foot, Ceiling Not Attached to Rafters, L/Δ = 180)~~

~~TABLE 2308.10.3(4)~~
~~RAFTER SPANS FOR COMMON LUMBER SPECIES~~
~~(Ground Snow Load = 50 pounds per square foot, Ceiling Not Attached to Rafters, L/Δ = 180)~~

~~**TABLE 2308.10.3(5)**~~
~~**RAFTER SPANS FOR COMMON LUMBER SPECIES**~~
~~**(Ground Snow Load = 30 pounds per square foot, Ceiling Attached to Rafters, L/Δ = 240)**~~

~~**TABLE 2308.10.3(6)**~~
~~**RAFTER SPANS FOR COMMON LUMBER SPECIES**~~
~~**(Ground Snow Load = 50 pounds per square foot, Ceiling Attached to Rafters, L/Δ = 240)**~~

Reason: Species- and grade-specific span tables are subject to becoming dated if design values for specific species or grades change, and therefore it is proposed to directly reference the AWC Span Tables for Joists and Rafters. The design value format of the tabulated spans in Span Tables for Joists and Rafters is not sensitive to design value changes for specific species and grades. Span Tables for Joists and Rafters is currently included as a reference in IBC 2306.

Cost Impact: The code change proposal will not increase the cost of construction.

S283-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2308.8-S-COATS.doc

S284–12
2308.9.2.1

Proponent: Edward L. Keith, APA – The Engineered Wood Association (ed.keith@apawood.org)

Revise as follows:

2308.9.2.1 Top plates. Bearing and *exterior wall* studs shall be capped with double top plates installed to provide overlapping at corners and at intersections with other partitions. End joints in double top plates shall be offset at least 48 inches (1219 mm), and shall be nailed with not less than eight 16d face nails on each side of the joint. Plates shall be a nominal 2 inches (51 mm) in depth and have a width at least equal to the width of the studs.

> **Exception:** A single top plate is permitted, provided the plate is adequately tied at joints, corners and intersecting walls by at least the equivalent of 3-inch by 6-inch (76 mm by 152 mm) by 0.036-inch-thick (0.914 mm) galvanized steel plate that is nailed to each wall or segment of wall by six 8d 2-1/2" x 0.113") nails or equivalent on each side of the joint. For the butt-joint splice between adjacent single top plates at least the equivalent of 3-inch by 12-inch (76 mm by 304 mm) by a 0.036-inch-thick (0.914 mm) galvanized steel plate that is nailed to each wall or segment of wall by twelve 8 d (2-1/2" x 0.113") nails on each side of the joint shall be required, provided the rafters, joists or trusses are centered over the studs with a tolerance of no more than 1 inch (25 mm). The top plate may be omitted over headers that are adequately tied to adjacent wall sections with steel plates or equivalent as previously described for the butt joint splice between adjacent single top plates

Reason: Item 10 of the 2012 IBC Table 2304.9.1 establishes the minimum capacity required to insure an adequate tension splice in top plates. Aside from simply providing continuity between wall segments, the top-plate splice also acts as a tension tie (often called a collector or drag strut) to distribute the roof and floor shear loads into the bracing elements often spaced as much as 20 feet apart. Assuming spruce-pine-fir top plates, Table 2304.9.1, item 10 requires a top-plate splice with eight 16d box nails on each side of the splice. In accordance with the NDS Table 11N, assuming SPF plates and a duration of load of 1.6 for lateral loads, the design capacity of the item 10 connection is (88 lb/nail x 8 nails x 1.6 dol =) 1,126 lbf.

While sufficient for intersections and corners the *3-inch by 6-inch (76 mm by 152 mm) by a 0.036-inch-thick (0.914 mm) galvanized steel plate that is nailed to each wall or segment of wall by six 8d nails on each side…"* only provides about 600 lbf tension capacity (NDS Table 11P, SPF framing, box nails: 60 lbf/nail x 6 nails x 1.6 dol = 576 lbf). This is about ½ of what is required in Table 2304.9.1, item 10. As such, the splice plate requirement for in-line butt joints in single top plate systems should be twice what is currently required:

"… the equivalent of 3-inch by 12-inch (76 mm by 304) by a 0.036-inch-thick (0.914 mm) galvanized steel plate that is nailed to each wall or segment of wall by twelve 8d (2-1.2" x 0.113") nails on each side…"

As a matter of clarification, the type of nail to be used was defined by description as only the penny-weight was specified. This is in keeping with current code style guidelines. I also specified which splice type was appropriate for headers when present. This was taken from the IRC. As these are neither corners nor intersections, it is clear that the butt-joint splice was the appropriate reference.

Cost Impact: The code change proposal will not increase the cost of construction.

S284-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2308.9.2.1-S-KEITH.doc

S285–12

Table 2308.9.1, 2308.9.2.3

Proponent: Edwin Huston, National Council of Structural Engineers Associations (NCSEA), representing NCSEA Code Advisory Subcommittee – General Requirements Subcommittee (huston@smithhustoninc.com)

Revise as follows:

TABLE 2308.9.1
SIZE, HEIGHT, AND SPACING OF WOOD STUDS

STUD SIZE (INCHES)	**BEARING WALLS**				**NONBEARING WALLS**	
	Laterally unsupported stud height[a] (feet)	Supporting roof and ceiling only	Supporting one floor, roof and ceiling	Supporting two floors, roof and ceiling	Laterally unsupported stud height[a] (feet)	Maximum Stud ~~S~~spacing (inches)
		Maximum Stud ~~S~~spacing (inches)				
2x3[b]	-	-	-	-	10	16
2x4	10	24	16	-	14	24
3x4	10	24	24	16	14	24
2x5	10	24	24	-	16	24
2x6	10	24	24	16	20	24

For SI: 1 inch = 25.4mm, 1 foot = 304.8 mm.

a. Listed heights are distances between points of lateral support placed perpendicular to the plane of the wall. Increases in unsupported height are permitted where justified by an analysis.

b. Shall not be used in exterior walls.

2308.9.2.3 Nonload-bearing walls and partitions. In nonload-bearing walls and partitions, when not part of a braced wall line, studs shall be spaced not more than ~~28~~ 24 inches (~~711~~ 610 mm) o.c. ~~and~~ In interior nonload-bearing walls and partitions, are permitted to be set with the long dimension parallel to the wall. Where studs are set with the long dimensions parallel to the wall use of utility grade lumber or studs exceeding 10 feet (3048 mm) is not permitted. Interior nonbearing partitions shall be capped with no less than a single top plate installed to provide overlapping at corners and at intersections with other walls and partitions. The plate shall be continuously tied at joints by solid blocking at least 16 inches (406 mm) in length and equal in size to the plate or by 1/2-inch by 11/2-inch (12.7 mm by 38 mm) metal ties with spliced sections fastened with two 16d nails on each side of the joint.

Reason: Several minor modifications to nonbearing walls and partitions are proposed. Changes include:

1. Limit spacing to 24". Studs bending about the strong axis, as shown in Table 2308.9.1, are limited to 24" on center, so the same should also be applied to flat wise (weak axis bending) studs. Also note that the NDS, National Design Specification, the Repetitive Member Factor Cr is limited to framing members spaced not more than 24 inches on center.
2. Exclude the use of utility grade flat wise studs and studs over 10 feet in height because the bending stress exceeds the NDS allowable stress limits. For example, 2x4 #3 Spruce-Pine-Fir studs @ 28" o.c. have an allowable maximum span of 7'-6" versus the Table 2308.9.1 limit of 14'-0".
3. Limit to exclude braced wall lines, to match the requirements of IRC R602.5 which states the following:
   "**R602.5 Interior nonbearing walls.** Interior nonbearing walls shall be permitted to be constructed with 2 inch by 3 inch (51 mm by 76 mm) studs spaced 24 inches (610 mm) on center or, when part of a *braced wall line*, 2 inch by 4 inch (51 mm by 102 mm) flat studs spaced at 16 inches (406 mm) on center. Interior nonbearing walls shall be capped with at least a single top plate. Interior nonbearing walls shall be fireblocked in accordance with Section R602.8."
3. Add the words *Maximum Stud* before Spacing to better define the spacing limit. This will also to match the language in the wood stud table in the International Residential Code, IRC Table R602.3(5).
4. Change wording of nonbearing to nonload-bearing to match the definition as shown in IBC Section 202 and Section 2308.9.1

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

2308.9.2.3-S-HUSTON.doc

S286–12
2308.9.2.3

Proponent: Robert Rice, C.B.O., Josephine County, OR, representing Oregon Building Officials Association (structdesigner@yahoo.com)

Revise as follows:

2308.9.2.3 Nonbearing walls and partitions. In nonbearing walls and partitions <u>that do not serve as *braced wall panels*</u>, studs shall be spaced not more than 28 inches (711 mm) o.c. and in interior nonbearing walls and partitions, are permitted to be set with the long dimension parallel to the wall. Interior nonbearing partitions shall be capped with no less than a single top plate installed to provide overlapping at corners and at intersections with other walls and partitions. The plate shall be continuously tied at joints by solid blocking at least 16 inches (406 mm) in length and equal in size to the plate or by 1/2-inch by 11/2-inch (12.7 mm by 38 mm) metal ties with spliced sections fastened with two 16d nails on each side of the joint.

Reason: This proposal clarifies that studs cannot be installed flat when interior walls serve as wall bracing walls and panels.

Cost Impact: The code change proposal will not increase the cost of construction.

202 (NEW), 2302, 2308.9.3 (NEW), 2304.6, Table 2304.6, 2304.6.1, 2304.6.2,

Proponent: Paul Coats, American Wood Council, (pcoats@awc.org)

Add new text as follows:

SECTION 202
DEFINITIONS

GABLE. The triangular portion of the wall beneath a dual-slope, pitched, or mono-slope roof.

Revise as follows:

2302.1 Definitions. For the purposes of this chapter, and as used elsewhere in this code the following terms are defined in Chapter 2:

GABLE

2304.6 Exterior wall sheathing. ~~Except as provided for in Section 1405 for weatherboarding or where stucco construction that complies with Section 2510 is installed, enclosed buildings shall be sheathed with one of the materials of the nominal thickness specified in Table 2304.6 or any other *approved* material of equivalent strength or durability~~ Wall sheathing on the outside of exterior walls, including gables, and the connection of sheathing to framing shall be designed in accordance with the general provisions of this code and shall be capable of resisting wind pressures in accordance with Section 1609..

2304.6.1 Wood structural panel sheathing. Where wood structural panel sheathing is used as the exposed finish on the outside of exterior walls, it shall have an exterior exposure durability classification. Where wood structural panel sheathing is used elsewhere, but not as the exposed finish, it shall be of a type manufactured with exterior glue (Exposure 1 or Exterior). ~~Wood structural panel wall sheathing or siding used as structural sheathing shall be capable of resisting wind pressures in accordance with Section 1609. Maximum wind speeds for wood~~ Wood structural panel sheathing ~~used to resist wind pressures~~, connections, and framing spacing shall be in accordance with Table 2304.6.1 for the applicable wind speed and exposure category when used with enclosed buildings with a mean roof height not greater than 30 feet (9144 mm) and a topographic factor (K_{zt}) of 1.0.

~~2304.6.2~~ 2304.7 **Interior paneling.** Softwood wood structural panels used for interior paneling shall conform to the provisions of Chapter 8 and shall be installed in accordance with Table 2304.9.1. Panels shall comply with DOC PS 1, DOC PS 2 or ANSI/APA PRP 210. Prefinished hardboard paneling shall meet the requirements of CPA/ANSI A135.5. Hardwood plywood shall conform to HPVA HP-1.

2308.9.3 Exterior wall sheathing. Except where stucco construction that complies with Section 2510 is installed, the outside of exterior walls, including gables, of enclosed buildings shall be sheathed with one of the materials of the nominal thickness specified in Table 2308.9.3. with fasteners in accordance with requirements of 2304.9 or fasteners designed in accordance with accepted engineering practice.

TABLE ~~2304.6~~ 2308.9.3
MINIMUM THICKNESS OF WALL SHEATHING

SHEATING TYPE	MINIMUM THICKNESS	MAXIMUM WALL STUD SPACING
Wood boards	5/8 inch	24 inches on center
Fiberboard	1/2 inch	16 inches on center
Wood structural panel	In accordance with Tables 2308.9.3(2) and 2308.9.3(3)	--
M-S “Exterior Glue” and M-2	In accordance with Section	--

SHEATING TYPE	MINIMUM THICKNESS	MAXIMUM WALL STUD SPACING
“Exterior Glue” Particleboard	2306.3 and Table 2308.9.3(4)	
Gypsum sheathing	½ inch	16 inches on center
~~Gypsum wallboard~~	~~½ inch~~	~~24 inches on center~~
Reinforced cement mortar	1 inch	24 inches on center

For SI: 1 inch = 25.4 mm.

Reason: (2308.9.3) This new section comes from existing Section 2304.6. The content of the current section is moved to 2308.9.3 because it contains prescriptive minimum sheathings more suitable for wind speeds in accordance with limitations of 2308. The section is clarified as being applicable to exterior wall sheathing. The term “gable” is included to clarify that exterior wall sheathing recommendations are equally applicable to the gable.

Table 2304.6 is moved and renumbered as Table 2308.9.3. Gypsum wallboard is removed from the table to make it clear the table applies to exterior wall sheathing, in accordance with the proposed Section 2308.9.3.

Section 2304.6 is rewritten to establish minimum structural performance requirements and clarify that wall sheathing on the outside of exterior walls, as well as connection of sheathing to framing, must be capable of resisting wind pressures in accordance with Section 1609. The term “gable” is included to clarify that exterior wall sheathing recommendations for out of plane wind resistance are equally applicable to the gable.

Revisions to 2304.6.1 coordinate with the minimum structural performance requirements added in the new 2304.6. Prior language covering design for out of plane wind resistance is deleted because it is addressed in new section 2304.6. Reference to Table 2304.6.1 is revised to clarify that several factors are critical for determination of the applicable maximum wind speed including fastener schedule and stud spacing.

This renumbers Section 2304.6.2 to 2304.7 to separate provisions for Interior Paneling from 2306.6 which would contain new provisions applicable to exterior wall sheathing but not to interior paneling.

A definition is added for “gable” used in proposed revisions in Item #1 and #2 to clarify that gables should be sheathed in accordance with provisions for walls.

Cost Impact: The code change proposal will not increase the cost of construction.

2308.9.3 (NEW)-S-COATS.doc

S288–12
2308.9.3

Proponent: Paul Coats, P.E., CBO, American Wood Council (pcoats@awc.org)

Revise as follows:

2308.9.3 Bracing. Braced wall lines shall consist of braced wall panels that meet the requirements for location, type and amount of bracing as shown in Figure 2308.9.3, specified in Table 2308.9.3(1) and are in line or offset from each other by not more than 4 feet (1219 mm). Braced wall panels shall start not more than 12 1/2 feet (3810 mm) from each end of a braced wall line. Braced wall panels shall be clearly indicated on the plans. Construction of braced wall panels shall be by one of the following methods:

1. Nominal 1-inch by 4-inch (25 mm by 102 mm) continuous diagonal braces let into top and bottom plates and intervening studs, placed at an angle not more than 60 degrees (1.0 rad) or less than 45 degrees (0.79 rad) from the horizontal and attached to the framing in conformance with Table 2304.9.1.
2. Wood boards of 5/8 inch (15.9 mm) net minimum thickness applied diagonally on studs spaced not over 24 inches (610 mm) o.c.
3. Wood structural panel sheathing with a thickness not less than 3/8 inch (9.5 mm) for 16-inch (406 mm) or 24-inch (610 mm) stud spacing in accordance with Tables 2308.9.3(2) and 2308.9.3(3).
4. Fiberboard sheathing panels not less than 1/2 inch (12.7 mm) thick applied vertically or horizontally on studs spaced not over 16 inches (406 mm) o.c. where installed with fasteners in accordance with ~~Section 2306.6 and Table 2306.6~~ <u>Table 2304.9.1</u>.
5. Gypsum board [sheathing 1/2-inch-thick (12.7 mm) by 4-feet-wide (1219 mm) wallboard or veneer base] on studs spaced not over 24 inches (610 mm) o.c. and nailed at 7 inches (178 mm) o.c. ~~with nails as required by Table 2306.7~~ <u>along panel edges (including top and bottom plates) and 7” o.c. in the field with 5d (0.086 inch diameter) cooler nails</u>.
6. Particleboard wall sheathing panels where installed in accordance with Table 2308.9.3(4).
7. Portland cement plaster on studs spaced 16 inches (406 mm) o.c.installed in accordance with Section 2510.
8. Hardboard panel siding where installed in accordance with Section 2303.1.6 and Table 2308.9.3(5).

For cripple wall bracing, see Section 2308.9.4.1. For Methods 2, 3, 4, 6, 7 and 8, each panel must be at least 48 inches (1219 mm) in length, covering three stud spaces where studs are spaced 16 inches (406 mm) apart and covering two stud spaces where studs are spaced 24 inches (610 mm) apart.

For Method 5, each panel must be at least 96 inches (2438 mm) in length where applied to one face of a panel and 48 inches (1219 mm) where applied to both faces. All vertical joints of panel sheathing shall occur over studs and adjacent panel joints shall be nailed to common framing members. Horizontal joints shall occur over blocking or other framing equal in size to the studding except where waived by the installation requirements for the specific sheathing materials. Sole plates shall be nailed to the floor framing and top plates shall be connected to the framing above in accordance with Section 2308.3.2. Where joists are perpendicular to braced wall lines above, blocking shall be provided under and in line with the braced wall panels.

Reason: In the 2012 code, some provisions for fasteners in Chapter 23 were removed and the AF&PA Special Design Provisions for Wind and Seismic was referenced instead. This proposed change cleans up some references to tables that are no longer applicable, while retaining prescriptive guidance in the code for conventional wall bracing methods. For fiberboard sheathing attachment, Section 2306.6 and Table 2306.6 are no longer applicable. In the 2012 IBC, Table 2304.9.1 would be an appropriate reference for fastener size for attachment of fiberboard sheathing. Table 2306.7 is no longer the correct reference in the 2012 IBC for gypsum wallboard attachment. The appropriate fastener, 5d cooler nails, is proposed for consistency with Table 2308.12.4 which addresses nail size for gypsum wallboard bracing used in Seismic Design Category D and E.

Cost Impact: The code change proposal will not increase the cost of construction.

2308.9.3-S-COATS.doc

S289–12
2308.9.3

Proponent: Michael Gardner, Gypsum Association (mgardner@gypsum.org)

Revise as follows:

2308.9.3 Bracing. Braced wall lines shall consist of braced wall panels that meet the requirements for location, type and amount of bracing as shown in Figure 2308.9.3, specified in Table 2308.9.3(1) and are in line or offset from each other by not more than 4 feet (1219 mm). Braced wall panels shall start not more than 12 1/2 feet (3810 mm) from each end of a braced wall line. Braced wall panels shall be clearly indicated on the plans. Construction of braced wall panels shall be by one of the following methods:

1. Nominal 1-inch by 4-inch (25 mm by 102 mm) continuous diagonal braces let into top and bottom plates and intervening studs, placed at an angle not more than 60 degrees (1.0 rad) or less than 45 degrees (0.79 rad) from the horizontal and attached to the framing in conformance with Table 2304.9.1.
2. Wood boards of 5/8 inch (15.9 mm) net minimum thickness applied diagonally on studs spaced not over 24 inches (610 mm) o.c.
3. Wood structural panel sheathing with a thickness not less than 3/8 inch (9.5 mm) for 16-inch (406 mm) or 24-inch (610 mm) stud spacing in accordance with Tables 2308.9.3(2) and 2308.9.3(3).
4. Fiberboard sheathing panels not less than 1/2 inch (12.7 mm) thick applied vertically or horizontally on studs spaced not over 16 inches (406 mm) o.c. where installed with fasteners in accordance with Section 2306.6 and Table 2306.6.
5. Gypsum board [sheathing 1/2-inch-thick (12.7 mm) or 5/8-inch-thick (15.9 mm) by 4-feet-wide (1219 mm) wallboard or veneer base] on studs spaced not over 24 inches (610 mm) o.c. and ~~nailed~~ fastened to studs at 7 inches (178 mm) o.c. with nails ~~as required by Table 2306.7.~~ or screws. Nails or screws shall be installed in the field of the board and at board edges. Nails and screws shall comply with Section 2506.2. Nails shall be annular ringed and not less than 1 ½ inches in length. Screws shall be not less than 1 ¼ inches in length.
6. Particleboard wall sheathing panels where installed in accordance with Table 2308.9.3(4).
7. Portland cement plaster on studs spaced 16 inches (406 mm) o.c.installed in accordance with Section 2510.
8. Hardboard panel siding where installed in accordance with Section 2303.1.6 and Table 2308.9.3(5).

For cripple wall bracing, see Section 2308.9.4.1. For Methods 2, 3, 4, 6, 7 and 8, each panel must be at least 48 inches (1219 mm) in length, covering three stud spaces where studs are spaced 16 inches (406 mm) apart and covering two stud spaces where studs are spaced 24 inches (610 mm) apart.

For Method 5, each panel must be at least 96 inches (2438 mm) in length where applied to one face of a panel and 48 inches (1219 mm) where applied to both faces. All vertical joints of panel sheathing shall occur over studs and adjacent panel joints shall be nailed to common framing members. Horizontal joints shall occur over blocking or other framing equal in size to the studding except where waived by the installation requirements for the specific sheathing materials. Sole plates shall be nailed to the floor framing and top plates shall be connected to the framing above in accordance with Section 2308.3.2. Where joists are perpendicular to braced wall lines above, blocking shall be provided under and in line with the braced wall panels.

Reason: The proposal adds screws as an acceptable method of panel attachment when gypsum board is used as bracing. It also adds 5/8-inch-thick gypsum board to the list of materials used for bracing in structures constructed to the IBC.

The ability to use screws for the attachment of gypsum board used as bracing was inserted into the International Residential Code by the approval of Public Comment 2 on Proposal RB143 – 07/08. For consistency, similar language should be inserted into the IBC.

The addition of 5/8-inch-thick gypsum board to the text reflects the use of the thicker, when compared to ½ thick gypsum board, material commonly installed in structures constructed to the IBC. The bracing capability of the thicker material is greater than that of the thinner material, so the addition of the reference will not diminish the bracing attributes of the structure.

The reference to Section 2506.2 establishes that the nail or screw must comply with the minimum head size and shank diameter requirements in the appropriate standard in Table 2506.2. The standards referenced in Table 2506.2 are the same standards referenced in the IRC.

The nail and screw length minimum contained in the proposal establishes a fastener length that is no less than the length of the equivalent fastener as prescribed by the IRC for installation of gypsum board used as bracing. Because Table R702.3.5. of the IRC lists four potential nail types, the language requiring the use of an annular ringed nail – a common drywall nail – is inserted. Fastener lengths also reflect the minimum fastener length requirements contained in GA-216, Application and Finishing of Gypsum Board that is referenced in Section 2508 of the IBC.

While the literature presented as substantiation for the IRC modification indicated that a broader spacing for screws, when compared to nails, is justified, it is recommended that, for simplicity and consistency of installation, a one-for-one swap of screws for nails reflecting the current spacing contained in the text is more appropriate. The spacing in this proposal is identical to the spacing presently contained in Table R602.10.4 of the IRC.

Cost Impact: The code change proposal will not increase the cost of construction.

2308.9.3-S-GARDNER.doc

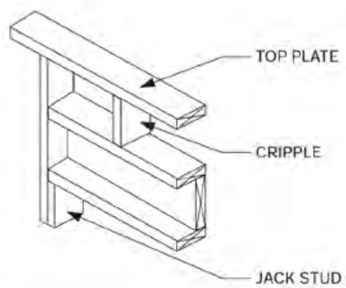
S290–12
2308.9.5.1, Figure 2308.9.5.1.1(1) (NEW), Figure 2308.9.5.1.1(2), 2308.9.5.1.1 (NEW)

Proponent: Paul Coats, American Wood Council (pcoats@awc.org)

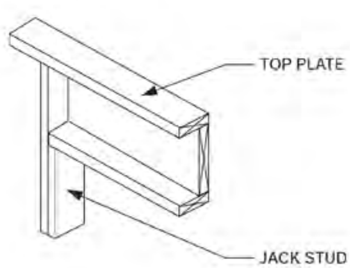
Revise as follows:

2308.9.5.1 Headers. Headers shall be provided over each opening in exterior-bearing walls. The spans in Table 2308.9.5 are permitted to be used for one- and two-family *dwellings*. Headers for other buildings shall be designed in accordance with Section 2301.2, Item 1 or 2. Headers ~~shall be~~ of two <u>or more</u> pieces of nominal 2-inch (51 mm) framing lumber <u>shall be</u> set on edge as permitted by Table 2308.9.5 and nailed together in accordance with Table 2304.9.1 or of solid lumber of equivalent size.

<u>**2308.9.5.1.1 Single member headers.** Single member headers shall be permitted when attached to a single flat 2-inch-nominal (51 mm) member or wall plate not less in width than the wall studs on the top and bottom of the header in accordance with Figures 2308.9.5.1.1(1) and 2308.9.5.1.1(2). Single-ply headers shall be designed in accordance with Section 2301.2, Item 1 or 2.</u>



<u>**FIGURE 2308.9.5.1.1(1) SINGLE MEMBER HEADER IN EXTERIOR BEARING WALL**</u>



<u>**FIGURE 2308.9.5.1.1(2) ALTERNATIVE SINGLE MEMBER HEADER WITHOUT CRIPPLE**</u>

Reason: The single ply header option is added for consistency with similar construction provisions for single ply header in the IRC. The figure illustrates recommended use of 2x material flat-wise as a method to provide resistance to out of plane wind loads as well as to brace the less stable single ply header when compared to a typical 2-ply header. Allowable spans for single ply headers are tabulated in the WFCM.

Cost Impact: The code change proposal will not increase the cost of construction.

S291–12
2308.9.3.2, Figure 2308.9.3.2

Proponent: Edward L. Keith, P.E., APA – The Engineered Wood Association (ed.keith@apawood.org)

Revise as follows:

2308.9.3.2 Alternate bracing wall panel adjacent to a door or window opening. Any bracing required by Section 2308.9.3 is permitted to be replaced by the following when used adjacent to a door or window opening with a full-length header:

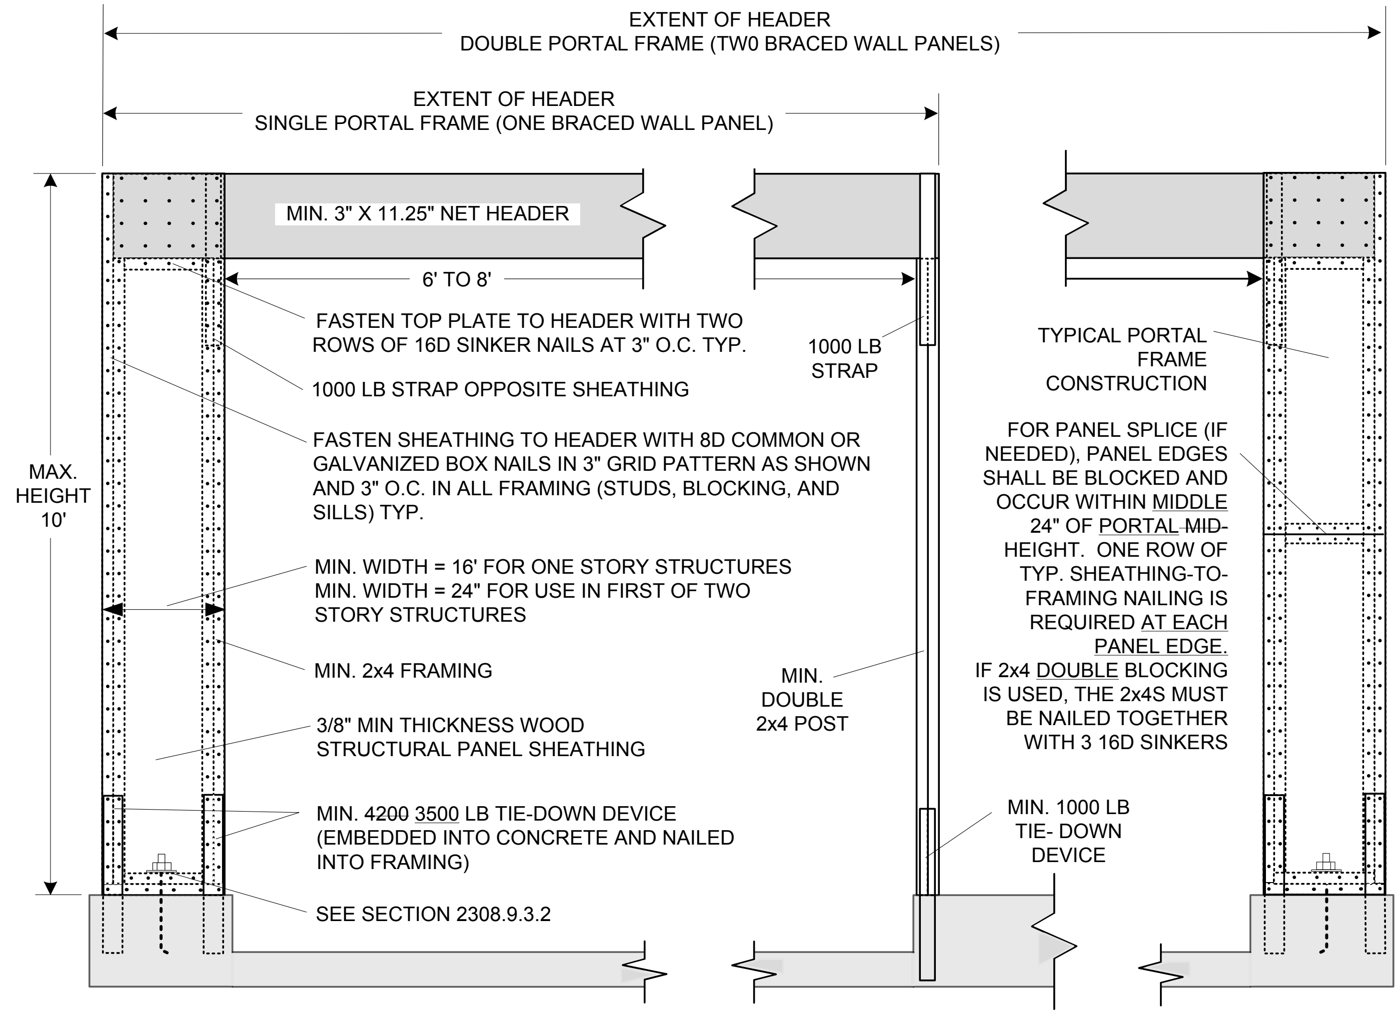
1. In one-story buildings, each panel shall have a length of not less than 16 inches (406 mm) and a height of not more than 10 feet (3048 mm). Each panel shall be sheathed on one face with a single layer of 3/8 inch (9.5 mm) minimum thickness wood structural panel sheathing nailed with 8d common or galvanized box nails in accordance with Figure 2308.9.3.2. The wood structural panel sheathing shall extend up over the solid sawn or glued-laminated header and shall be nailed in accordance with Figure 2308.9.3.2. A built-up header consisting of at least two 2 × 12s and fastened in accordance with Item 24 of Table 2304.9.1 shall be permitted to be used. A spacer, if used, shall be placed on the side of the built-up beam opposite the wood structural panel sheathing. The header shall extend between the inside faces of the first full-length outer studs of each panel. The clear span of the header between the inner studs of each panel shall be not less than 6 feet (1829 mm) and not more than 18 feet (5486 mm) in length. A strap with an uplift capacity of not less than 1,000 pounds (4,400 N) shall fasten the header to the inner studs opposite the sheathing. One anchor bolt not less than 5/8 inch (15.9 mm) diameter and installed in accordance with Section 2308.6 shall be provided in the center of ach sill plate. The studs at each end of the panel shall have a tie-down device fastened to the foundation with an uplift capacity of not less than ~~4,200~~ <u>3,500</u> pounds (~~18 480~~ <u>15 570</u> N).

   Where a panel is located on one side of the opening, the header shall extend between the inside face of the first full-length stud of the panel and the bearing studs at the other end of the opening. A strap with an uplift capacity of not less than 1,000 pounds (4400 N) shall fasten the header to the bearing studs. The bearing studs shall also have a tie-down device fastened to the foundation with an uplift capacity of not less than 1,000 pounds (4400 N).

   The tie-down devices shall be an embedded strap type, installed in accordance with the manufacturer's recommendations. The panels shall be supported directly on a foundation that is continuous across the entire length of the braced wall line. This foundation shall be reinforced with not less than one No. 4 bar top and bottom.

   Where the continuous foundation is required to have a depth greater than 12 inches (305 mm), a minimum 12-inch by 12-inch (305 mm by 305 mm) continuous footing or turned down slab edge is permitted at door openings in the braced wall line. This continuous footing or turned down slab edge shall be reinforced with not less than one No. 4 bar top and bottom. This reinforcement shall be lapped not less than 15 inches (381 mm) with the reinforcement required in the continuous foundation located directly under the braced wall line.

2. In the first *story* of two-story buildings, each wall panel shall be braced in accordance with Item 1 bove, except that each panel shall have a length of not less than 24 inches (610 mm).



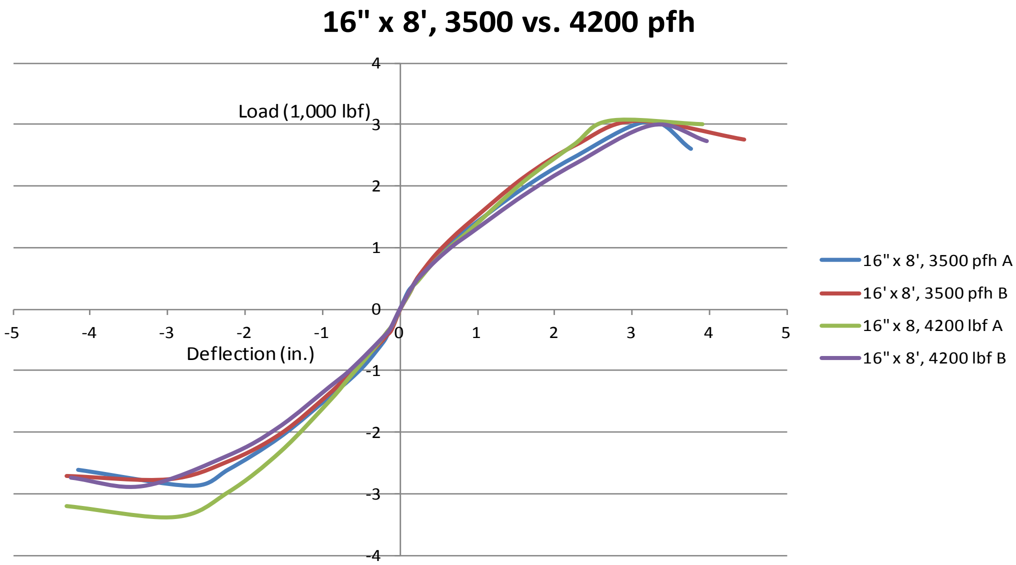
~~FIGURE 2308.9.3.2~~
~~ALTERNATE BRACED WALL PANEL ADJACENT TO A DOOR OR WINDOW OPENING~~

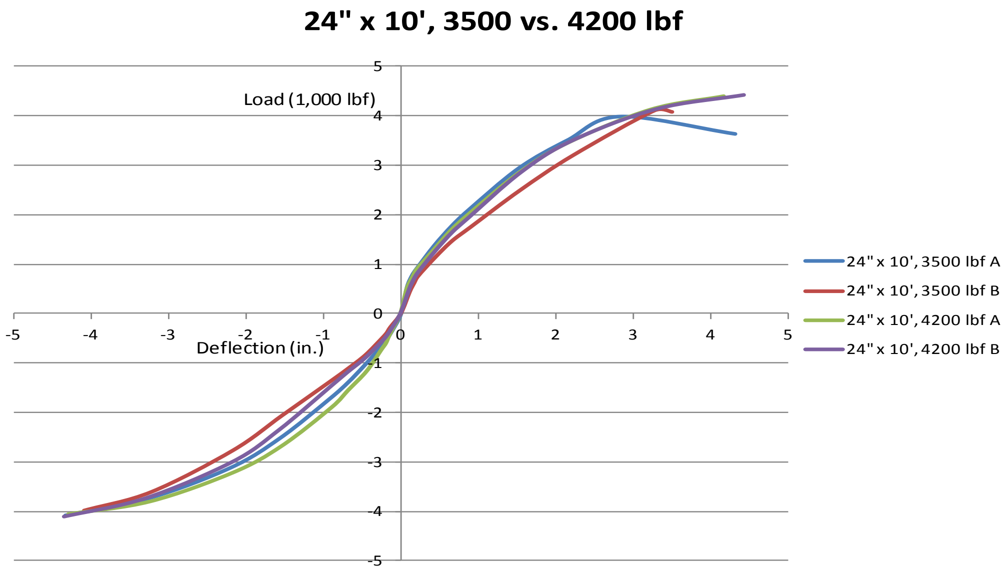
Reason: 1) There are a couple of types of changes to Figure 2308.9.3.2 proposed. There are both technical changes and editorial changes.

Technical changes: The two technical changes made to the figure are the reduction of the capacity of the portal frame leg tie-down devices from 4200 lbf to 3500 lbf and the removal of the third bottom plate at the portal frame leg. (Note that the third bottom plate we propose to delete is NOT shown in the figure above. The normal strikethrough and underline procedures are difficult to apply to figure changes.)

A. The first technical change is the reduction of the tie-down from 4200 lbf to 3500 lbf. The initial testing was conducted on the portal frames utilizing the 4200 lbf hold down because that was what was readily available and in common use by the construction industry. At the time of initial testing, no attempt was made to determine the sensitivity of the system to such a reduction in tie-down capacity. As the initial prescriptive parameters of the portal frame were based on testing, there was no latitude for determining the impact of the industry wide reduction to such tie-downs in response to the cracked-concrete provisions of ACI 318. As such, retesting of the portal frames with both 4200 lbf and 3500 lbf tie-downs was necessary to determine the impact on the performance of the system, if any. Portals with 16" wide legs x 8 ft height as well as 24" wide x 10 ft high were recently retested by APA. Pairs of each size were tested with 4200 lbf tie-downs and then retested with 3500 lbf tie-downs. The results of these tests showed that the system was relatively insensitive to the reduction in tie-down capacity from 4200 lbf to 3500 lbf. No attempt was made to determine how low the tie-down capacity could be reduced before an impact on the performance of the portal frames could be seen.

These tests were conducted using the CUREe method, as described in ASTM E2126, with a frequency of 0.5 Hz. The following charts show the backbone curves for the Method PFH portal frames tested with 3500 lbf and 4200 lbf tie-downs at both the 16" wide leg portals 8' high as well as the 24" wide portals 10' high.





Free PDF Copies of the full lab report on this testing program entitled APA Report T2011-15, *Bracing Method PFH (Portal Frame with Hold down) – Alternative Attachment,* can be obtained at http://www.apawood.org.

B. The second technical change is the removal of the third bottom plate. As mentioned above the original testing was conducted with the third plate in place. The third plate causes numerous difficulties in the field, not the least of which is that the normal length threaded anchors are too short to accommodate the third plate and provide the required depth of penetration into the foundation. This results in inadequate anchor depth-of-embedment or the use of threaded sleeves and all-thread to extend the bolt length to accommodate the third plate. When investigating the change to the 3500 lbf hold down, we utilized this opportunity to run the tests with only double bottom plates. All subsequent testing was done without the third bottom plate. The results of this testing indicated that the third bottom plate has negligible impact on the performance of the portal frames.

<u>Non-technical changes:</u>

1. The intent of the note concerning the location of the portal-leg sheathing-splice, when present, is to place the splice butt joint within the middle 24" of the portal frame height. As currently written "within 24" of mid height" means the splice could be placed within 24 inches either above or below of mid height, or within a band 48" wide. This was never the intent. The proposed language is clearer that the joint must "occur within the middle 24" of portal height", where portal height is illustrated in the figure.
2. At the splice plate, the current wording requires a single row of nailing. The proposed change required this at <u>each panel edge</u> at the splice as was the original intent.
3. In the same annotation, a provision is provided that would permit the splice to be made over a pair of 2x4s as long as they are spliced together. The proposal changes "blocking" to "double blocking" to clarify the intent.

2) The revision to Section 2308.9.3.2 is as explained above.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

F2308.9.3.2-S-KEITH.doc

S292–12
2308.11.3.3

Proponent: Robert Rice, C.B.O., Josephine County, OR, representing Oregon Building Officials Association (structdesigner@yahoo.com), R. Terry Malone, P.E., S.E.

Revise as follows:

2308.11.3.3 Openings in horizontal diaphragms. Horizontal diaphragms with openings having dimension perpendicular to the joist that is greater than 4 feet (1219 mm) shall be designed in accordance with accepted engineering practice. Openings in horizontal diaphragms with a dimension perpendicular to the joist that is not greater than 4 feet (1219 mm) shall be constructed ~~in accordance with the following:~~ with metal ties and blocking in accordance with this section and Figure 2308.11.3.3.

1. ~~Blocking shall be provided beyond headers.~~
2. Metal ties shall not be less than 0.058 inch thick [1.47 mm (16 galvanized gage)] by 1 1/2 inches (38 mm) wide and shall have a minimum yield strength of 33,000 psi (227 MPa). Blocking shall extend 2 feet minimum beyond headers. Ties shall be attached to blocking with eight 16d common nails on each side of the header-joist intersection ~~shall be provided (see Figure 2308.11.3.3). The metal ties shall have a minimum yield of 33,000 psi (227 MPa)~~.

Reason: This proposal re-arranges the existing text to read more clearly, corrects an error in the code and clarifies the requirements and limitations of openings in diaphragms in structures assigned to Seismic Design Category B, C, D and E. The text of the current code is intended to provide a prescriptive solution for diaphragm openings, in high seismic design categories, that are 4 feet or less. The current code is missing the word "not" which would make this section correct. The commentary for this code section correctly states,

Horizontal diaphragms are floor and roof assemblies that are usually clad with structural wood sheathing panels, such as plywood or OSB. Though more complicated and difficult to visualize, lateral forces that are applied to a building from wind or seismic events follow a load path that distributes and transfers shear and overturning forces from the lateral loads. When openings are built into the diaphragm, they disrupt the continuity of load across the diaphragm and they must be reinforced to compensate. Another concern is the stiffness of the diaphragm. These provisions are a prescriptive solution for openings not greater than 4 feet (1219 mm) in dimension and provide a general means for a load path in these specific cases in lieu of an engineered design.- 2009 IBC Commentary, International Code Council

Cost Impact: The code change proposal will not increase the cost of construction.

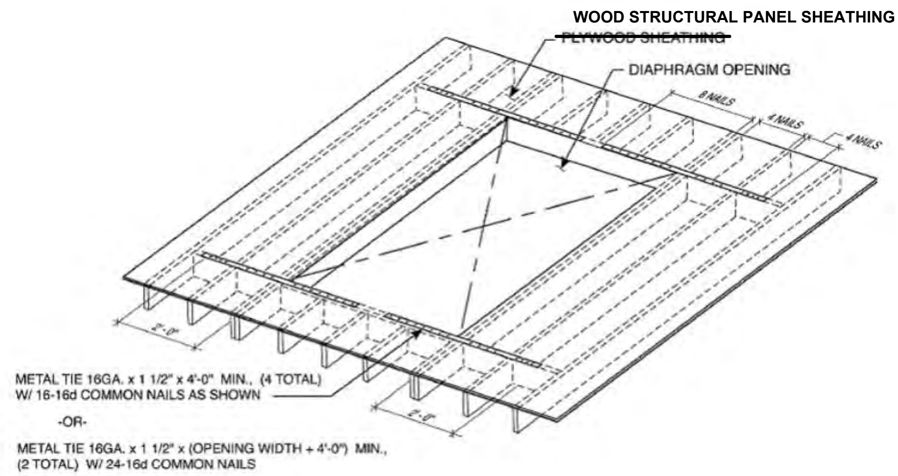
Figure 2308.11.3.3

Proponent: Edward L. Keith, P.E., APA – The Engineered Wood Association (ed.keith@apawood.org)

Revise as follows:



For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

FIGURE 2308.11.3.3
OPENINGS IN HORIZONTAL DIAPHRAGMS

2012 INTERNATIONAL BUILDING CODE® 513

Reason: This is one of the last remaining references to "plywood" in the code that should have been converted to the more generic "wood structural panel" (WSP) in the 2000 first printing of the IBC. In terms of structural capacity, the IBC makes no distinction to the type of wood structural panel sheathing used. In addition, the type of floor sheathing is inconsequence to the subject of the figure, which relates to floor framing. We request approval of the code change proposal for the sake of consistency in the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

1504.2.1.1 (NEW), 1504.2.1.2 (NEW), 1711.1, 1711.1.1, 1711.1.2, 1711.1.2.1, 1711.1.3, 1711.2, 1711.2.1, 1711.2.2, 2309 (NEW)

Proponent: D. Kirk Harman, P.E., S.E., SECB, FACI, The Harman Group, Inc., National Council of Structural Engineering Association

Revise as follows:

~~SECTION 1711~~
~~MATERIAL AND TEST STANDARDS~~

SECTION 2409
JOIST HANGERS

~~1711.1~~ 2309 Joist hangers. Testing of joist hangers shall be in accordance with Sections 1711.1.1 through 1711.1.3, as applicable.

~~1711.1.1~~ 2309.1 General. The vertical load-bearing capacity, torsional moment capacity and deflection characteristics of joist hangers shall be determined in accordance with ASTM D 1761 using lumber having a specific gravity of 0.49 or greater, but not greater than 0.55, as determined in accordance with AF&PA NDS for the joist and headers.

Exception: The joist length shall not be required to exceed 24 inches (610 mm).

1711.1.2 2309.2 Vertical load capacity for joist hangers. The vertical load-bearing capacity for the joist hanger shall be determined by testing a minimum of three joist hanger assemblies as specified in ASTM D 1761. If the ultimate vertical load for any one of the tests varies more than 20 percent from the average ultimate vertical load, at least three additional tests shall be conducted. The allowable vertical load-bearing of the joist hanger shall be the lowest value determined from the following:

1. The lowest ultimate vertical load for a single hanger from any test divided by three (where three tests are conducted and each ultimate vertical load does not vary more than 20 percent from the average ultimate vertical load).
2. The average ultimate vertical load for a single hanger from all tests divided.by three (where six or more tests are conducted)
3. The average from all tests of the vertical loads that produce a vertical movement of the joist with respect to the header of 1/8 inch (3.2 mm).
4. The sum of the allowable design loads for nails or other fasteners utilized to secure the joist hanger to the wood members and allowable bearing loads that contribute to the capacity of the hanger.
5. The allowable design load for the wood members forming the connection.

~~1711.1.2.1~~ 2309.2.1 Design value modifications for joist hangers. Allowable design values for joist hangers that are determined by Item 4 or 5 in Section 1711.1.2 shall be permitted to be modified by the appropriate load duration factors as specified in AF&PA NDS but shall not exceed the direct loads as determined by Item 1, 2 or 3 in Section 1711.1.2. Allowable design values determined by Item 1, 2 or 3 in Section 1711.1.2 shall not be modified by load duration factors.

~~1711.1.3~~ 2309.3 Torsional moment capacity for joist hangers. The torsional moment capacity for the joist hanger shall be determined by testing at least three joist hanger assemblies as specified in ASTM D 1761. The allowable torsional moment of the joist hanger shall be the average torsional moment at which the lateral movement of the top or bottom of the joist with respect to the original position of the joist is 1/8 inch (3.2 mm).

~~**1711.2 Concrete and clay roof tiles**~~ **1504.2.1 Testing.** Testing of concrete and clay roof tiles shall be in accordance with ~~Sections 1711.2.1 and 1711.2.2, as applicable.~~ this section.

~~**1711.2.1**~~ **1504.2.1.1 Overturning resistance.** Concrete and clay roof tiles shall be tested to determine their resistance to overturning due to wind in accordance with SBCCI SSTD 11 and Chapter 15.

~~**1711.2.2**~~ **1504.2.1.2 Wind tunnel testing.** Where concrete and clay roof tiles do not satisfy the limitations in Chapter 16 for rigid tile, a wind tunnel test shall be used to determine the wind characteristics of the concrete or clay tile roof covering in accordance with SBCCI SSTD 11 and Chapter 15.

Reason: Chapter 17 is titled “Special Inspections and Tests” and as such, is intended to be primarily reserved for the special inspection and testing associated with the actual construction work. NCSEA holds the opinion that material compliance testing for joist hangers belongs in Chapter 23 as this testing is not associated with the actual construction work. Similarly, wind tunnel testing to determine overturning resistance of roof tiles belongs in Chapter 15 as these tests are also not associated with the actual construction work and an existing section dealing with wind resistance for concrete and clay roof tiles currently exists as section 1502.1. Current Section 1711 is comprised solely of the two sections proposed to be relocated, and can therefore be deleted subsequent to the relocations.

Cost Impact: The code change proposal will not increase the cost of construction.

S294-12

2309 (NEW)-S-HARMAN.doc

S295–12

2404.1, 2404.2, 2404.3.1, 2404.3.2, 2404.3.3, 2404.3.4, 2404.3.5, 2405.5.2

Proponent: Julie Ruth, JRuth Code Consulting, representing American Architectural Manufacturers Association (julruth@aol.com)

Revise as follows:

2404.1 Vertical glass. Glass sloped 15 degrees (0.26 rad) or less from vertical in windows, curtain and window walls, doors and other exterior applications shall be designed to resist the wind loads due to ultimate design wind speed V_{ult} in Section 1609 for components and cladding. Glass in glazed curtain walls, glazed storefronts and glazed partitions shall meet the seismic requirements of ASCE 7, Section 13.5.9. The load resistance of glass under uniform load shall be determined in accordance with ASTM E 1300.

The design of vertical glazing shall be based on the following equation:

$\underline{0.6}F_{gw} \le F_{ga}$ **(Equation 24-1)**

where:

F_{gw} = Wind load on the glass due to ultimate design wind speed V_{ult}~~,~~ computed in accordance with Section 1609.

F_{ga} = Short duration load on the glass as determined in accordance with ASTM E 1300.

2404.2 Sloped glass. Glass sloped more than 15 degrees (0.26 rad) from vertical in skylights, sunrooms, sloped roofs and other exterior applications shall be designed to resist the most critical of the following combinations of loads.

$F_g = \underline{0.6}Wo - D$ **(Equation 24-2)**

$F_g = \underline{0.6}W_i + D + 0.5\ S$ **(Equation 24-3)**

$F_g = \cancel{0.5}\ \underline{0.3}W_i + D + S$ **(Equation 24-4)**

where:

D = Glass dead load psf (kN/m2).

For glass sloped 30 degrees (0.52 rad) or less from horizontal,

= 13 t_g (For SI: 0.0245 tg).

For glass sloped more than 30 degrees (0.52 rad) from horizontal,

= 13 t_g cos θ (For SI: 0.0245 tg cos θ).

F_g = Total load, psf (kN/m2) on glass.

S = Snow load, psf (kN/m2) as determined in Section 1608.

t_g = Total glass thickness, inches (mm) of glass panes and plies.

W_i = Inward wind force, psf (kN/m2) due to ultimate design wind speed V_{ult} as calculated in Section 1609.

W_o = Outward wind force, psf (kN/m2) due to ultimate design wind speed V_{ult}~~,~~ as calculated in Section 1609.

θ = Angle of slope from horizontal.

Exception: Unit skylights shall be designed in accordance with Section 2405.5.

The design of sloped glazing shall be based on the following equation:

$F_g \le F_{ga}$ **(Equation 24-5)**

where:

F_g = Total load on the glass determined from the load combinations above.
F_{ga} = Short duration load resistance of the glass as determined according to ASTM E 1300 for Equations 24-2 and 24-3; or the long duration load resistance of the glass as determined according to ASTM E 1300 for Equation 24-4.

2404.3.1 Vertical wired glass. Wired glass sloped 15 degrees (0.26 rad) or less from vertical in windows, curtain and window walls, doors and other exterior applications shall be designed to resist the wind loads in Section 1609 for components and cladding according to the following equation:

$\underline{0.6}F_{gw} < 0.5\ F_{ge}$ **(Equation 24-6)**

where:

F_{gw} = Is the wind load on the glass due to ultimate design wind speed V_{ult}, computed per Section 1609.
F_{ge} = Nonfactored load from ASTM E 1300 using a thickness designation for monolithic glass that is not greater than the thickness of wired glass.

2404.3.2 Sloped wired glass. Wired glass sloped more than 15 degrees (0.26 rad) from vertical in skylights, sunspaces, sloped roofs and other exterior applications shall be designed to resist the most critical of the combinations of loads from Section 2404.2.

For Equations 24-2 and 24-3:

$F_g < 0.5\ F_{ge}$ **(Equation 24-7)**

For Equation 24-4:

$F_g < 0.3\ F_{ge}$ **(Equation 24-8)**

where:

F_g = Total load on the glass, as determined by equations 24-2, 24-3 or 24-4.
F_{ge} = Nonfactored load from ASTM E 1300.

2404.3.3 Vertical patterned glass. Patterned glass sloped 15 degrees (0.26 rad) or less from vertical in windows, curtain and window walls, doors and other exterior applications shall be designed to resist the wind loads in Section 1609 for components and cladding according to the following equation:

$F_{gw} < 1.0\ F_{ge}$ **(Equation 24-9)**

where:

F_{gw} = Wind load on the glass due to ultimate design wind speed V_{ult} computed per Section 1609.
F_{ge} = Nonfactored load from ASTM E 1300. The value for patterned glass shall be based on the thinnest part of the glass. Interpolation between nonfactored load charts in ASTM E 1300 shall be permitted.

2404.3.4 Sloped patterned glass. Patterned glass sloped more than 15 degrees (0.26 rad) from vertical in skylights, sunspaces, sloped roofs and other exterior applications shall be designed to resist the most critical of the combinations of loads from Section 2404.2.

For Equations 24-2 and 24-3:

$F_g < 1.0\ F_{ge}$ **(Equation 24-10)**

For Equation 24-4:

$F_g < 0.6F_{ge}$ **(Equation 24-11)**

Where

F_g = Total load on the glass, as determined by equations 24-2, 24-3 or 24-4.
F_{ge} = Nonfactored load from ASTM E 1300. The value for patterned glass shall be based on the thinnest part of the glass. Interpolation between the nonfactored load charts in ASTM E 1300 shall be permitted.

2404.3.5 Vertical sandblasted glass. Sandblasted glass sloped 15 degrees (0.26 rad) or less from vertical in windows, curtain and window walls, doors, and other exterior applications shall be designed to resist the wind loads in Section 1609 for components and cladding according to the following equation:

$\cancel{Fg}\,0.6F_{gw} < 0.5\ F_{ge}$ **(Equation 24-12)**

where:

$\cancel{F_g}$ F_{gw} = ~~Total~~ Wind load on the glass due to ultimate design wind speed V_{ult} computed per Section 1609.
F_{ge} = Nonfactored load from ASTM E 1300. The value for sandblasted glass is for moderate levels Of sandblasting.

2405.5.2 Unit skylights rated for separate performance grades for positive and negative design pressure. The design of unit skylights rated for performance grade for both positive and negative design pressures shall be based on the following equations:

$F_{gi} \leq PG_{Po}$ **(Equation 24-14)**
$F_{go} \leq PG_{Ne}$ **(Equation 24-15)**

where:

PG_{Pos} = Performance grade rating of the skylight under positive design pressure;
PG_{Neg} = Performance grade rating of the skylight under negative design pressure; and

F_{gi} and F_{go} are determined in accordance with the following:

For $0.6W_o \geq D$,

where:

W_o = Outward wind force, psf (kN/m2) due to ultimate design wind speed V_{ult}, as calculated in Section 1609.
D = The dead weight of the glazing, psf (kN/m2) as determined in Section 2404.2 for glass, or by the weight of the plastic, psf (kN/m2) for plastic glazing.
F_{gi} = Maximum load on the skylight determined from Equations 24-3 and 24-4 in Section 2404.2.
F_{go} = Maximum load on the skylight determined from Equation 24-2.

For $0.6W_o < D$, where:

W_o = Is the outward wind force, psf (kN/m2) due to ultimate design wind speed V_{ult} as calculated in Section 1609.
D = The dead weight of the glazing, psf (kN/m2) as determined in Section 2404.2 for glass, or by the weight of the plastic for plastic glazing.

F_{gi} = Maximum load on the skylight determined from Equations 24-2 through 24-4 in Section 2404.2.
F_{go} = 0.

Reason: The purpose of this proposal is to coordinate the glass design load equations of Chapter 24 with those of Chapter 16.

The design load equations of Chapter 16 of the 2012 IBC were revised as appropriate to respond to the change of design wind load model from Allowable Stress Design to Strength Design in ASCE 7-10. These revisions, however, were not carried back to the glass design load equations of Chapter 24.

This proposal corrects this previous omission.

Cost Impact: The code change proposal will not increase the cost of construction.

2404.1-S-RUTH.doc

S296–12
2406.4.5

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professions (jen@jhatfieldandassociates.com)

Revise as follows:

2406.4.5 Glazing and wet surfaces. Glazing in walls, enclosures or fences containing or facing ~~hot tubs, spas, whirlpools~~ aquatic vessels, saunas, steam rooms, bathtubs, and showers ~~and indoor or outdoor swimming pools~~ where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) measured vertically above any standing or walking surface shall be considered a hazardous location. This shall apply to single glazing and all panes in multiple glazing.

> **Exception:** Glazing that is more than 60 inches (1524 mm), measured horizontally and in a straight line, from the water's edge of a bathtub~~, hot tub, spa, whirlpool, or swimming pool~~ or aquatic vessel.

Reason: The new International Swimming Pool & Spa Code (ISPSC) utilizes a new definition to encompass all different types of pools, hot tubs, and spas – aquatic vessel. This proposal utilizes the new terminology found in the ISPSC for consistency between the I-codes.

Cost Impact: The code change proposal will not increase the cost of construction.

2406.4.5-S-HATFIELD.doc

S297–12
2406.4.7

Proponent: Tim Pate, City & County of Broomfield Building Division, representing Colorado Chapter Code Change Committee

Revise as follows:

2406.4.7 Glazing adjacent to the bottom stair landing. Glazing adjacent to the landing at the bottom of a stairway where the glazing is less than ~~36 inches (914 mm)~~ 60 inches (1524 mm) above the landing and within 60 inches (1524 mm) horizontally of the bottom tread shall be considered a hazardous location.

> **Exception:** Glazing that is protected by a guard complying with Sections 1013 and 1607.8 where the plane of the glass is greater than 18 inches (457 mm) from the guard.

Reason: Previous editions of the IBC before the 2012 required glazing that is less than 60" above the landing to be approved safety glazing. It is not clear why this requirement was changed in the 2012. It does not make sense that section 2406.4.6 applies to glazing that is less than 60" above the stairs and intermediate landings but the glazing at bottom landing is treated differently – only when below 36" The potential for falling through the glazing at bottom landing is the same. This change will bring back the 60" height which will then match the requirement at intermediate landings and stairs.

Cost Impact: The code change proposal will increase the cost of construction.

	Assembly:	ASF	AMF	DF

2406.4#1-S-PATE.doc

S298–12
2406.4.7

Proponent: Tim Pate, City & County of Broomfield Building Division, representing self

Revise as follows:

2406.4.7 Glazing adjacent to the bottom stair landing. Glazing adjacent to the landing at the bottom of a stairway where the glazing is less than 36 inches (914 mm) above the landing and within a 60 inches (1524 mm) horizontally of arc less than 180 degrees from the bottom tread shall be considered a hazardous location.

> **Exception:** Glazing that is protected by a guard complying with Sections 1013 and 1607.8 where the plane of the glass is greater than 18 inches (457 mm) from the guard.

Reason: Previous editions of the IBC before the 2012 required glazing that is 60” horizontally in any direction to be approved safety glazing. It is not clear why this requirement was changed in the 2012. The previous editions had the additional wording “in any direction” when applying the 60” horizontal rule. This is due to the “splay” factor for when someone gets to the last tread and falls. The tendency is for someone to flail out in any direction. This added wording will make this section apply to any glazing that is in a wall that is less than 180 degrees from the bottom tread. This will make it very clear what the intent was and still is with this section.

Cost Impact: The code change proposal will increase the cost of construction.

2406.4.7#2-S-PATE.doc

S299–12
2407.1.2

Proponent: Anthony Leto, The Wagner Companies

Revise as follows:

2407.1.2 Support. Each handrail or *guard* section shall be supported by a minimum of three glass balusters or shall be otherwise supported to remain in place should one baluster panel fail. Glass balusters shall not be installed without an attached ~~handrail or *guard*~~ top rail.

> **Exception:** A top rail shall not be required where the glass balusters are laminated glass with two or more glass plies of equal thickness and the same glass type when *approved* by the *building official*. The panels shall be designed to withstand the loads specified in Section 1607.8.

Reason: While the ICC opinion on top railing requirements for monolithic glass baluster guards has remained consistent, we continue to see installations without the required top rail. Where is the disconnect?

The confusion begins with *IBC Section 2407.1.1.2 Support*. There are three issues:

1. **The term *guard* is used improperly at the end of the second sentence.**
   The ICC defines *guard* as being in place to stop accidental falls and refers to the full assembly not the guard top. The word *guard* should be replaced with the words *top rail* as is noted in the *Exception*.
2. **In a glass baluster handrail, the handrail and top rail are the same component.**
   A glass baluster being used only as a handrail (i.e. a stair where there is less than a 30 inch drop from the top step) will require a handrail which must meet the dimensional and clearance requirements for handrail. It should be noted, that under the strict definition of handrail clearance, a handrail placed directly on top of a glass baluster does not meet code as the glass would be considered a 100% obstruction. The handrail would need to be attached to the glass baluster with brackets to provide code compliant clearance. The handrail would be the top most portion of the assembly, therefore the handrail would also serve as the top rail.
3. **Misinterpretation of the phrase, *Glass balusters shall not be installed without an attached handrail or guard.***
   Handrail is required on stairs and is located 34 to 38 inches above the stair nosing. A guard is required when there is a 30 inch drop. The IBC minimum for a guard is 42 inches above the walking surace. If a stair has a drop of greater than 30 inches, it would be required to have both a handrail and a guard. However, if the stair height does not exceed 30 inches, only a handrail is required.
   There are some who interpret that *Section 2407.1.1.2* allows a glass baluster guard to be installed with *either* a handrail or a guard (top rail).

   However, the section's intention is that a glass baluster *handrail* must have an attached *handrail* and that a glass baluster *guard* must have an attached *guard* (top rail). **The presence of a *handrail* on a *guard* does not eliminate the need for a top railing.** This interpretation is supported by:

   A. **The ICC**
   In 2008, Todd Daniel of the National Ornamental and Miscellaneous Metals Association (NOMMA) asked the following question of the International Code Council (ICC):

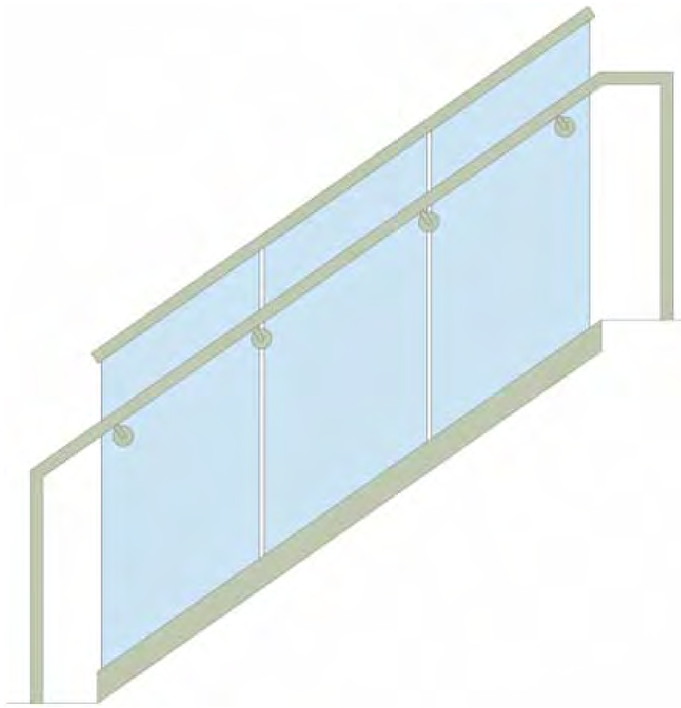
   Can a glass rail system be installed without a guard on top of the glass IF there is a handrail attached to the glass. In other words...no cap, exposed top edge of glass at 42 inch height with a handrail mounted on the side of the glass at handrail heights.
   ICC Staff Opinion: No
   Reason: The application you describe can only be allowed if the glass can withstand the loads for guards and handrails in Section 1607.7

   B. **The 2009 IBC Exception**
   The ICC approved an exception in 2009 that a top railing was not required if laminated glass is used that meets the load requirements and is approved by the building official. If this is the exception to the rule, then it should be understood that a top railing is required in all other situations.

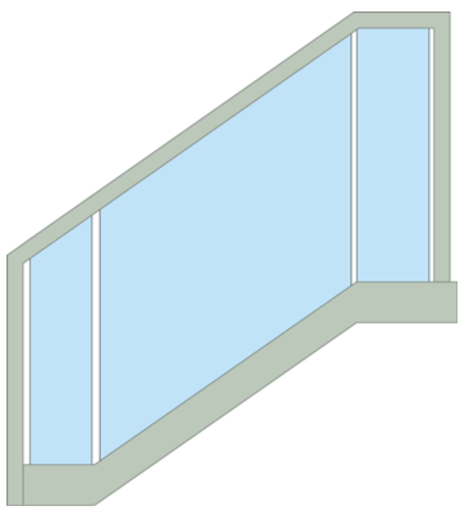
   C. **The Load Requirements**
   Section 2407.1.1 requires that glass baluster handrails and guards must meet the load requirements of 1607.7 with a safety factor of four.
   In a required guard, the loads must be applied to the *top* of the guard -- not the top of the handrail. Having a 42 inch guard with an attached handrail at between 34 and 38 inches will not meet the load requirement unless it is laminated tempered glass or the monolithic, tempered glass is of significant thickness.

   Standard 1/2 inch monolithic, tempered glass edges are highly susceptable to rupture under load. Directing an 800 pound concentrated load (200 lbs multiplied by a safety factor of four) to that bare edge will most likely result in failure.

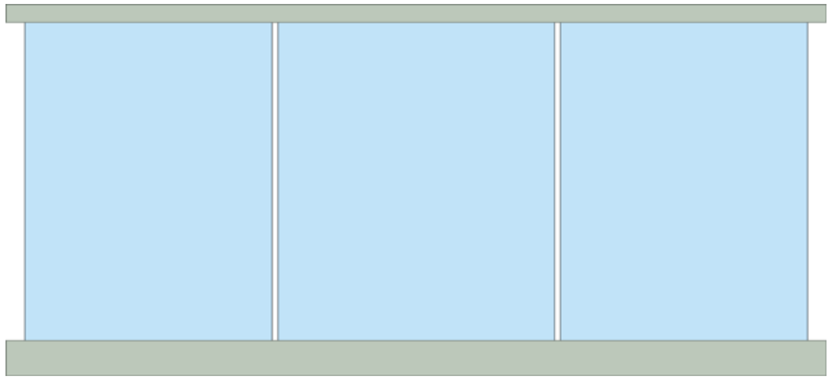
In 2011, there were numerous cases of glass railing failures across the US and Canada. An article relating these failuures was published this past October by US Glass Magazine (http://www.usglassmag.com/digital/2011/Oct2011.pdf). While most cases were likely the result of nickel sulfide inclusions in the glass, the consulting engineering firm brought in to determine the reasons for failure of glass railings at the W Hotel in Austin, TX noted that in one event, the failure was related to debris from above striking a bare edge of a glass panel.



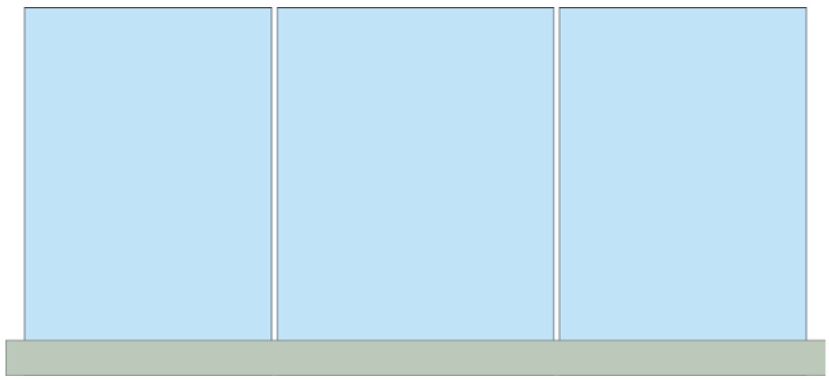
Stair with required guard and attached handrail.



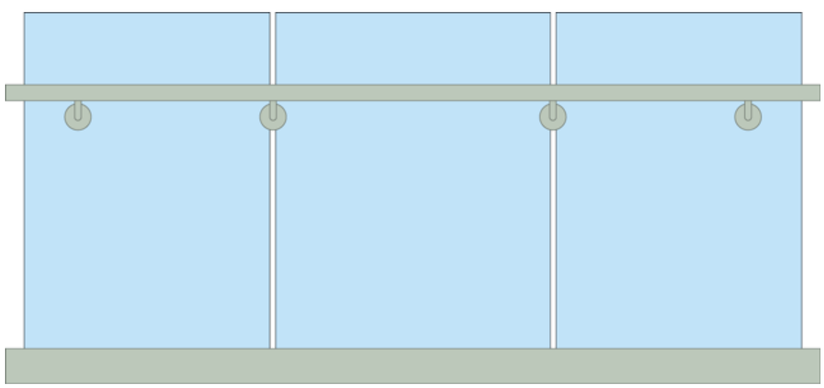
Required handrail for stair when a guard is not required.



Guard with top railing



Guard without top railing. Per ICC staff opinion, permitted only when used with laminated, tempered glass or if the glass meets the structural requirements of 1607.7



Guard with non-required handrail -- handrail is in place in an attempt to meet the requirements of an attached handrail or guard. However, the requirement is that the guard be able to withstand the load at the top of the guard. The handrail is not the top of the guard therefore the load must be met by the top edge of glass -- by a safety factor of four.

Cost Impact: There should be no cost impact since this change is to clarify and eliminate misinterpretation whereby glass railings are being installed without a top rail. In reality there will be long term savings as there are now situations where, as part of due diligence during a building purchase, consulting engineers are pointing out that glass rails without a top rail are not code compliant. Building owners in turn are requiring engineers/architects of record to have the railing redesigned to be code compliant.

S299-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2407.1.2-S-LETO.doc

S300–12
2407.1, 2407.1.1

Proponent: Thomas S. Zaremba, Roetzel & Andress, representing Glazing Industry Code Committee (tzaremba@ralaw.com)

Revise as follows:

2407.1 Materials. Glass used ~~as~~ in a handrail ~~assembly~~ , guardrail or a *guard* section shall be laminated glass constructed of ~~either single fully tempered glass, laminated~~ fully tempered glass or ~~laminated~~ heat-strengthened glass and shall comply with Category II of CPSC 16 CFR Part 1201 or Class A of ANSI Z97.1. Glazing in railing in-fill panels shall be of an *approved* safety glazing material that conforms to the provisions of Section 2406.1.1. For all glazing types, the minimum nominal thickness shall be 1/4 inch (6.4 mm). ~~Fully tempered glass and laminated glass shall comply with Category II of CPSC 16 CFR Part 1201 or Class A of ANSI Z97.1.~~

> **Exception:** Single fully tempered glass complying with Category II of CPSC 16 CFR Part 1201 or Class A of ANSI Z97.1 may be used in handrails and guardrails if there is no walking surface beneath them or the walking surface is permanently protected from the risk of falling glass.

2407.1.1 Loads. The panels and their support system shall be designed to withstand the loads specified in Section 1607.8. A ~~safety~~ design factor of four shall be used for safety.

Reason: Several recent incidents involving spontaneous breakage of fully tempered glass in handrail or guardrail systems on high rise balconies has prompted the Glazing Industry Code Committee to seek this change which, if adopted, will make mandatory the use of the retentive characteristics of laminated glass in these applications unless there is no walking surface below or it is permanently protected from falling glass, in which case, fully tempered glass meeting the safety criteria of Cat. II of CPSC 16 CFR 1201 or Class A of ANSI Z97.1 would be permitted. Additionally, the proposal adds the term “guardrail” to section 2407.1 since that term is also used in various locations throughout the I-codes in connection with these types of systems.

Finally, proposal changes Section 2407.1.1 are intended to make it clear that a “design” factor of four is required “for safety.” The intent of this section is to use a “design” factor of four when determining the loads of these panels and their support systems. Using the word “safety” in the way it is currently found in this section is ambiguous and may or may not achieve the section’s intended purpose.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2407.1-S-ZAREMBA.doc

S301–12
2409, 2409.1 (NEW), Chapter 35 (NEW)

Proponent: Thomas S. Zaremba, Roetzel & Andress, representing Glazing Industry Code Committee (tzaremba@ralaw.com)

Revise as follows:

SECTION 2409
GLASS IN WALKWAYS, ELEVATOR HOISTWAYS AND ELEVATOR CARS

2409.1 Glass walkways. Glass installed as a part of a floor/ceiling assembly as a walking surface and constructed with laminated glass shall comply with ASTM E 2751-11, otherwise it shall comply with the load requirements specified in Chapter 16. Such assemblies shall also comply with the fire-resistance rating requirements of this code where applicable.

Add new standard to Chapter 35 as follows:

ASTM

E 2751 Standard Practice for Design and Performance of Supported Glass Walkways

Reason: : In the development cycle leading to the 2006 IBC, the Glazing Industry Code Committee ("GICC") asked this body to delete the glass walkway provisions found in Chapter 24 of the 2003 IBC. The reason for its request was that the glass walkway provisions found in the 2003 IBC used load requirements derived from ASTM E1300 and glass walkways are not within the scope of ASTM E1300. As a result, the glass walkway provisions of Chapter 24 were deleted from the 2006 IBC.

Since then, ASTM E2751-11 has been issued and specifically addresses load-bearing glass walkways constructed of laminated glass. If adopted, this new section 2409.1 would apply to glass walkways constructed of laminated glass, otherwise the load requirements of Chapter 16 would apply to glass walkways constructed of non-laminated glass, for example, walkways constructed using glass block.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

S301-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2409.1 (NEW)-S-ZAREMBA.doc

S302–12
202 (NEW), 1710.6, 2410 (NEW), 2410.1 (NEW), 2410.2 (NEW)

Proponent: Timothy Burgos, InterCode Incorporated, representing 3M Company

Add new text as follows:

SECTION 202
DEFINITIONS

SUNLIGHT DELIVERY SYSTEM (SDS). A unit primarily designed to transmit daylight from an exterior surface to an interior space via a reflective duct or conduit. The basic unit consists of an exterior solar collecting device, a daylight-transmitting duct or conduit with a reflective interior surface, and an interior-ceiling device such as a translucent ceiling panel. The unit can be factory assembled, or field-assembled from a manufactured kit.

Revise as follows:

1710.6 Skylights ~~and~~ sloped glazing, and sunlight delivery systems. Unit skylights ~~and tubular daylighting devices (TDDs)~~ shall comply with the requirements of Section 2405. Sunlight delivery systems (SDS's) and tubular daylighting devices (TDDs) shall comply with the requirements of Section 2410. All other skylights and sloped glazing shall comply with the requirements of Chapter 24.

Add new text as follows:

SECTION 2410
SUNLIGHT DELIVERY SYSTEMS AND TUBULAR DAYLIGHTING DEVICES

2410.1 General. Sunlight delivery systems and tubular daylighting devices shall comply with the requirements of this code and be installed per the manufacturer's specifications.

2410.2 Definition. The following terms are defined in Chapter 2:

SUNLIGHT DELIVERY SYSTEM.

TUBULAR DAYLIGHTING DEVICE.

Reason: The purpose of this proposed edit is to create a more expansive definition of the tubular daylighting device. While tubular daylighting devices are a common implementation of the principles of reflective daylighting, new advancements in the field are available worldwide and should be included in the next edition of the International Building Code. Having a more expansive definition in the International Building Code for sunlight delivery systems will open up new technologies that can introduce natural sunlight into the interior areas that do not have windows or natural light entering that room. A sunlight delivery system provides designers with a new method of daylighting that offers significantly greater capabilities than existing alternatives. Traditional daylighting methods, such as skylights or tubular daylighting devices, are limited. These systems can require multiple entry points and are often limited to top floor applications. An example of a sunlight delivery system can be found in the pictures at the end of this reason statement.

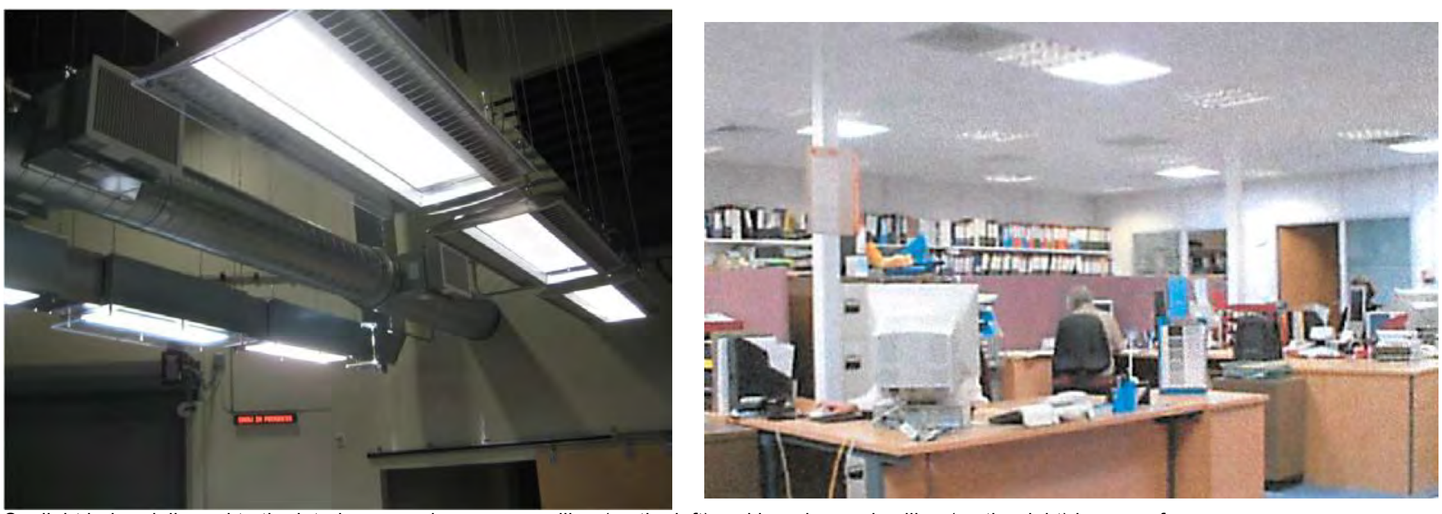
The widespread use of electrical lighting in the 20th century changed the design of buildings but often made it impossible to illuminate internal rooms with daylight, thus requiring the use of artificial light in internal spaces. The use of artificial light currently makes up as much as 45% of the energy use in commercial and industrial buildings and up to 35% in residential buildings.

Sunlight delivery systems can significantly reduce energy costs for illumination. In a paper presented to LuxEuropa in 2009 entitled *Hybrid Lighting systems: a feasibility study for Europe* by Mohammed S. Mayhoub and David Carter, energy savings ranging from 28% to 85% (in latitudes ranging from 60^0 North (Oslo, Norway) to 36^0 North (Khania, Greece) were reported when a variety of sunlight delivery systems were tested. These locations correlate to locations in the United States as follows: Oslo, Norway is similar in latitude to Juneau and Anchorage, AK and Khania, Greece is similar to Virginia Beach, VA; Las Vegas, NV; and Nashville, TN.

The study showed that the greatest savings were realized in the Southern most latitudes (in the Northern Hemisphere) but still showed the possibility that 50% savings could be realized at 60^0 North with the most advanced systems. Because the study was limited to European Union countries, no analysis was conducted in more southern latitudes similar to the southernmost portion of the United States where cities such as Tampa, San Antonio, and New Orleans are located. In fact, most of the land mass of the contiguous 48 United States lies well below 50^0 North indicating that greater savings could be realized in the United States than those projected in Europe.

An abundance of research and knowledge shows not only that the preferred light source in buildings is natural daylight but also that lack of exposure to daylight can lead to biological issues, lack of productivity, higher levels of stress, sleep difficulties and a variety of other human response issues. Studies suggest that creating healthy indoor lighting by providing day-lighting and natural lighting cycles can be a simple form of preventative medicine and can lead to higher production and overall better mental and physical health for the inhabitants. The health benefits that a sunlight delivery device provides is one of the reasons for this code change to be approved.

Roof top solar collecting devices used in a sunlight delivery system.



Sunlight being delivered to the interior space in an open ceiling (on the left) and in a dropped ceiling (on the right) by way of a sunlight duct system.

Cost Impact: The code change proposal will not increase the cost of construction.

202, 1710.6, 2410 (NEW), 2410.1 (NEW), 2410.2 (NEW)

Proponent: Timothy Burgos, InterCode Incorporated, representing 3M Company

Revise as follows:

SECTION 202
DEFINITIONS

~~**TUBULAR DAYLIGHTING DEVICE (TDD)**~~ **SUNLIGHT DELIVERY SYSTEM (SDS)** **.** A ~~nonoperable fenestration~~ unit primarily designed to transmit daylight from ~~a roof~~ exterior surface to an interior ~~ceiling~~ space via a ~~tubular~~ reflective duct or conduit. The basic unit consists of an exterior ~~glazed weathering surface,~~ solar collecting device a daylight-transmitting ~~tube~~ duct or conduit with a reflective interior surface, and an interior ~~sealing~~ ceiling device such as a translucent ceiling panel. The unit can be factory assembled, or field assembled from a manufactured kit.

Revise as follows:

1710.6 Skylights ~~and~~ sloped glazing, and sunlight delivery systems . Unit skylights ~~and tubular daylighting devices (TDDs)~~ shall comply with the requirements of Section 2405. Sunlight delivery systems (SDS's) shall comply with the requirements of Section 2410. All other skylights and sloped glazing shall comply with the requirements of Chapter 24.

Add new text as follows:

SECTION 2410
SUNLIGHT DELIVERY SYSTEMS AND TUBULAR DAYLIGHTING DEVICES

2410.1 General. Sunlight delivery systems and tubular daylighting devices shall comply with the requirements of this code and be installed per the manufacturer's specifications.

2410.2 Definition. The following terms are defined in Chapter 2:

SUNLIGHT DELIVERY SYSTEM.

Reason: The purpose of this proposed edit is to create a more expansive definition of the tubular daylighting device. While tubular daylighting devices are a common implementation of the principles of reflective daylighting, new advancements in the field are available worldwide and should be included in the next edition of the International Building Code. Having a more expansive definition in the International Building Code for sunlight delivery systems will open up new technologies that can introduce natural sunlight into the interior areas that do not have windows or natural light entering that room. A sunlight delivery system provides designers with a new method of daylighting that offers significantly greater capabilities than existing alternatives. Traditional daylighting methods, such as skylights or tubular daylighting devices, are limited. These systems can require multiple entry points and are often limited to top floor applications. An example of a sunlight delivery system can be found in the pictures at the end of this reason statement.

The widespread use of electrical lighting in the 20th century changed the design of buildings but often made it impossible to illuminate internal rooms with daylight, thus requiring the use of artificial light in internal spaces. The use of artificial light currently makes up as much as 45% of the energy use in commercial and industrial buildings and up to 35% in residential buildings.

Sunlight delivery systems can significantly reduce energy costs for illumination. In a paper presented to LuxEuropa in 2009 entitled *Hybrid Lighting systems: a feasibility study for Europe* by Mohammed S. Mayhoub and David Carter, energy savings ranging from 28% to 85% (in latitudes ranging from 60^0 North (Oslo, Norway) to 36^0 North (Khania, Greece) were reported when a variety of sunlight delivery systems were tested. These locations correlate to locations in the United States as follows: Oslo, Norway is similar in latitude to Juneau and Anchorage, AK and Khania, Greece is similar to Virginia Beach, VA; Las Vegas, NV; and Nashville, TN.

The study showed that the greatest savings were realized in the Southern most latitudes (in the Northern Hemisphere) but still showed the possibility that 50% savings could be realized at 60^0 North with the most advanced systems. Because the study was limited to European Union countries, no analysis was conducted in more southern latitudes similar to the southernmost portion of the United States where cities such as Tampa, San Antonio, and New Orleans are located. In fact, most of the land mass of the contiguous 48 United States lies well below 50^0 North indicating that greater savings could be realized in the United States than those projected in Europe.

An abundance of research and knowledge shows not only that the preferred light source in buildings is natural daylight but also that lack of exposure to daylight can lead to biological issues, lack of productivity, higher levels of stress, sleep difficulties and a variety of other human response issues. Studies suggest that creating healthy indoor lighting by providing day-lighting and natural lighting cycles can be a simple form of preventative medicine and can lead to higher production and overall better mental and physical health for the inhabitants. The health benefits that a sunlight delivery device provides is one of the reasons for this code change to be approved.

Roof top solar collecting devices used in a sunlight delivery system.

Sunlight being delivered to the interior space in an open ceiling (on the left) and in a dropped ceiling (on the right) by way of a sunlight duct system.

Cost Impact: The code change proposal will not increase the cost of construction.

[A]110.3.5, 202, 2501.1.1, 2502.1, 2503.1, 2504, 2505, 2506 and 2508

Proponent: Michael Gardner, Gypsum Association (mgardner@gypsum.org)

THIS IS A TWO PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC ADMINISTRATION COMMITTEE. PART II WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE, AS TWO SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC ADMINISTATION

Revise as follows:

[A] 110.3.5 Lath, ~~and~~ gypsum board, and gypsum panel product inspection. Lath, ~~and~~ gypsum board and gypsum panel product inspections shall be made after lathing, ~~and~~ gypsum board, and gypsum panel products, interior and exterior, ~~is~~ are in place, but before any plastering is applied or gypsum board or gypsum panel product joints and fasteners are taped and finished.

> **Exception:** Gypsum board and gypsum panel products that ~~is~~ are not part of a fire resistance- rated assembly or a shear assembly.

PART II – IBC STRUCTURAL

Revise as follows:

GYPSUM BOARD. The generic name for a family of sheet products consisting of a noncombustible core primarily of gypsum with paper surfacing. Gypsum wallboard, gypsum sheathing, gypsum base for gypsum *veneer* plaster, exterior gypsum soffit board, predecorated gypsum board ~~or~~ and water-resistant gypsum backing board complying with the standards listed in Tables 2506.2, 2507.2 and Chapter 35 are types of gypsum board

Add new text as follows:

SECTION 202
DEFINITIONS

GYPSUM PANEL PRODUCT. The general name for a family of sheet products consisting essentially of gypsum.

Revise as follows:

CHAPTER 25
GYPSUM BOARD, GYPSUM PANEL PRODUCTS, AND PLASTER

2501.1.1 General. Provisions of this chapter shall govern the materials, design, construction and quality of gypsum board, gypsum panel products, lath, gypsum plaster and cement plaster.

2501.1.2 Performance. Lathing, plastering, ~~and~~ gypsum board, and gypsum panel product construction shall be done in the manner and with the materials specified in this chapter, and when required for fire protection, shall also comply with the provisions of Chapter 7.

2502.1 Definitions. For the purposes of this chapter and as used elsewhere in this code, the following terms are defined in Chapter 2:

GYPSUM PANEL PRODUCTS

2503.1 Inspection. Lath, ~~and~~ gypsum board, gypsum panel products shall be inspected in accordance with Section 110.3.5.

2504.1 Scope. The following requirements shall be met where construction involves gypsum board, gypsum panel products, or lath and plaster in vertical and horizontal assemblies.

2504.1.1 Wood framing. Wood supports for lath, ~~or~~ gypsum board, or gypsum panel products, as well as wood stripping or furring, shall not be less than 2 inches (51 mm) nominal thickness in the least dimension.

> **Exception:** The minimum nominal dimension of wood furring strips installed over solid backing shall not be less than 1 inch by 2 inches (25 mm by 51 mm).

2504.1.2 Studless partitions. The minimum thickness of vertically erected studless solid plaster partitions of 3/8- inch (9.5 mm) and 3/4-inch (19.1 mm) rib metal lath or 1/2- inch thick (12.7 mm) ~~long-length~~ gypsum lath, ~~and~~ gypsum board, or gypsum panel product partitions shall be 2 inches (51 mm).

2505.1 Resistance to shear (wood framing). Wood-framed shear walls sheathed with gypsum board, gypsum panel products, or lath and plaster shall be designed and constructed in accordance with Section 2306.3 and are permitted to resist wind and seismic loads. Walls resisting seismic loads shall be subject to the limitations in Section 12.2.1 of ASCE 7.

2505.2 Resistance to shear (steel framing). Cold-formed steel-framed shear walls sheathed with gypsum board or gypsum panel products, and constructed in accordance with the materials and provisions of Section 2211.6 are permitted to resist wind and seismic loads. Walls resisting seismic loads shall be subject to the limitations in Section 12.2.1 of ASCE 7.

SECTION 2506
GYPSUM BOARD AND GYPSUM PANEL PRODUCT MATERIALS

2506.1 General. Gypsum board, ~~materials~~ gypsum panel products, and accessories shall be identified by the manufacturer's designation to indicate compliance with the appropriate standards referenced in this section and stored to protect such materials from the weather.

2506.2 Standards. Gypsum board ~~materials~~ and gypsum panel products shall conform to the appropriate standards listed in Table 2506.2 and Chapter 35 and, where required for fire protection, shall conform to the provisions of Chapter 7.

2508.1 General. Gypsum board, gypsum panel product, and gypsum plaster construction shall be of the materials listed in Tables 2506.2 and 2507.2. These materials shall be assembled and installed in compliance with the appropriate standards listed in Tables 2508.1 and 2511.1.1, and Chapter 35.

TABLE 2508.1
INSTALLATION OF GYPSUM CONSTRUCTION

MATERIAL	STANDARD
Gypsum board and gypsum panel products	GA-216; ASTM C 840
Gypsum sheathing and gypsum panel products	ASTM C 1280
Gypsum veneer base	ASTM C 844
Interior lathing and furring	ASTM C 841
Steel framing for gypsum boards and gypsum panel products	ASTM C 754; C 1007

2508.3 Single-ply application. Edges and ends of gypsum boards and gypsum panel products shall occur on the framing members, except those edges and ends that are perpendicular to the framing members. Edges and ends of gypsum boards and gypsum panel products shall be in moderate contact except in concealed spaces where fire-resistance rated construction, shear resistance or diaphragm action is not required.

2508.4 Joint treatment. Gypsum board and gypsum panel product fire-resistance-rated assemblies shall have joints and fasteners treated.

Exception: Joint and fastener treatment need not be provided where any of the following conditions occur:

1. Where the gypsum board or the gypsum panel product is to receive a decorative finish such as wood paneling, battens, acoustical finishes or any similar application that would be equivalent to joint treatment.
2. On single-layer systems where joints occur over wood framing members.
3. Square edge or tongue-and-groove edge gypsum board (V-edge), gypsum panel product, gypsum backing board or gypsum sheathing.
4. On multilayer systems where the joints of adjacent layers are offset from one to another.
5. Assemblies tested without joint treatment.

2508.5 Horizontal gypsum board or gypsum panel product diaphragm ceilings. Gypsum board or gypsum panel products shall be permitted to be used on wood joists to create a horizontal diaphragm ceiling in accordance with Table 2508.5.

2508.5.2 Installation. Gypsum board or gypsum panel products used in a horizontal diaphragm ceiling shall be installed perpendicular to ceiling framing members. End joints of adjacent courses of gypsum board shall not occur on the same joist.

2508.5.3 Blocking of perimeter edges. All perimeter edges shall be blocked using a wood member not less than 2-inch by 6-inch (51 mm by 159 mm) nominal dimension. Blocking material shall be installed flat over the top plate of the wall to provide a nailing surface not less than 2 inches (51 mm) in width for the attachment of the gypsum board or gypsum panel product.

2508.5.4 Fasteners. Fasteners used for the attachment of gypsum board or gypsum panel products to a horizontal diaphragm ceiling shall be as defined in Table 2508.5. Fasteners shall be spaced not more than 7 inches (178 mm) on center (o.c.) at all supports, including perimeter blocking, and not more than 3/8 inch (9.5 mm) from the edges and ends of the gypsum board or gypsum panel product.

2508.5.5 Lateral force restrictions. Gypsum board or gypsum panel products shall not be used in diaphragm ceilings to resist lateral forces imposed by masonry or concrete construction.

TABLE 2508.5
SHEAR CAPACITY FOR HORIZONTAL WOOD FRAMED GYPSUM BOARD DIAPHRAGM CEILING ASSEMBLIES

MATERIAL	THICKNESS OF MATERIAL	SPACING OF FRAMING MEMBERS	SHEAR VALUE	MINIMUM FASTENER SIZE
Gypsum board or gypsum panel product	*No change*	*No change*	*No change*	*No change*
Gypsum board or gypsum panel product	*No change*	*No change*	*No change*	*No change*

(Portions of Table not shown remain unchanged)

Reason: This proposal inserts the term gypsum panel product in Chapter 25 where relevant. It also revises Section 110, which is referenced by Section 2503, adds a definition for gypsum panel products to Chapter 2, and revises the existing definition for gypsum board in Chapter 2.

Gypsum panel product is a term that was created by the gypsum manufacturing industry to describe gypsum sheet products that are manufactured unfaced or with a facing other than paper. Glass mat-faced and unfaced gypsum sheet materials are examples of gypsum panel products.

Some gypsum application standards referenced by the code, such as GA 216, ASTM C 840, and ASTM C 1280, are used to define application requirements for both board and panel products, a dual role that is not reflected in current code text. In addition, while the ASTM manufacturing standards for many gypsum panel products (ref. C 1278; C1178; C1658; C1177) were incorporated into Chapter 25 during the past decade, the general text of Chapter 25 was not updated to reflect the incorporation of the new standards. This proposal addresses both issues. It adds text to Table 2508.1 to indicate where the application standards may function as an application reference standard for either a board or a panel product, and it inserts the term gypsum panel product throughout the chapter where appropriate.

The definition for gypsum panel product proposed for Chapter 2 is extracted verbatim from ASTM International Standard C 11, *Standard Terminology Relating to Gypsum and Related Building Materials and Systems*.

The first sentence of the proposed revision to the current definition for gypsum board is extracted verbatim from the ASTM International Standard C 11 definition for gypsum board. The existing code text has been retained for clarity, notwithstanding a slight modification.

As a part of this proposal it is also suggested that the phrase “long length” should be removed from Section 2504.1.2. It appears to be extraneous text.

Following action on this proposal, other sections of the code requiring parallel modifications will be addressed in subsequent editions of the code.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – INTERNATIONAL BUILDING CODE- ADMINISTRATION

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – INTERNATIONAL BUILDING CODE - STRUCTURAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

CH 25-S-GARDNER

S305–12
202, 2102.1 (NEW), 2502.1 (NEW)

Proponent: John Mulder, Intertek Testing Services NA, Inc., representing International Standards Organization Technical Committee 77, *Products in Fibre-reinforced Cement* and self

Revise as follows:

SECTION 202
DEFINITIONS

FIBER-CEMENT ~~SIDING~~ PRODUCTS. ~~A~~ Manufactured, ~~fiber-reinforcing product made with an inorganic hydraulic or calcium silicate binder formed by chemical reaction and reinforced with discrete organic or inorganic nonasbestos fibers, or both. Additives that enhance manufacturing or product performance are permitted.~~ thin section composites of hydraulic cementitious matrices and discrete non-asbestos fibers. Fiber-cement backer board products have either a smooth or textured face and are normally installed to wall or ceiling framing over which paint, wallpaper, resilient flooring, tile, natural stone or dimensioned stone *veneer* are applied. Fiber-cement underlayment products have either a smooth or textured face and are installed on a wood subfloor over which resilient flooring, tile, natural stone or dimensioned stone *veneer* are applied. Fiber-cement lap or panel siding, soffit, and trim products have either smooth or textured faces and are intended for *exterior wall* and related applications.

Add new text as follows:

2102.1 General. For the purposes of this chapter and as used elsewhere in this code, the following terms are defined in Chapter 2:

FIBER-CEMENT PRODUCTS

Add new text as follows:

2502.1 Definitions. The following terms are defined in Chapter 2:

FIBER-CEMENT PRODUCTS

Reason: The current definition is limited to fiber-cement siding products. The proposal corrects the definition to that published in ASTM C1154-06, *Standard Terminology for Non-Asbestos Fiber-reinforced Cement Products* (see attached copy of ASTM C1154-06), for "fiber-cement products". Additional text describes types of fiber-cement products to include also fiber-cement backer board, underlayment, soffit and trim products currently recognized in the Code (IBC Sections 1404.10, 1405.16, and 2509.2). The proposed code change eliminates a barrier to trade by including other fiber-cement products currently permitted by the Code.

A revision to Section 2103 (new Section 2103.15) is proposed to include "fiber-cement backer board and underlayment". The term "fiber-cement products" is proposed to be included in the definitions here consistent with the definition published in the Terminology Standard ASTM C1154-06, *Standard Terminology for Non-Asbestos Fiber-Reinforced Cement Products* (see attached Standard).

"Fiber-cement backer board is currently permitted for use in Section 2509.2. A new term is added to reference the permitted backer board material now defined in proposed new TABLE 2509.2, where all 3 permitted products are now listed and the proposed revision to Section 202 to include "fiber-cement products".

Cost Impact: The code change proposal will not increase the cost of construction because the change simply corrects the current definition to be consistent with the National Standard and provides examples of the types of products covered by the definition.

S305-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202-FIBER-CEMENT SIDING-S-MULDER.doc

S306–12
Table 2507.2, Chapter 35 (New)

Proponent: James K. Hicks, P.E., CeraTech, Inc., representing self

Revise as follows:

TABLE 2507.2
LATH, PLASTERING MATERIALS AND ACCESSORIES

MATERIAL	STANDARD
Hydraulic Cement	ASTM C 1157; C1600

(Portions of table not shown remain unchanged)

Add new standard to Chapter 35 as follows:

ASTM

C 1157-11 Standard Performance Specification for Hydraulic Cement
C 1600-11 Standard Specification for Rapid Hardening Hydraulic Cement

Reason: ASTM C 1157 Cements:
ASTM C 1157 and C 1600 cements are "Green Cements" in deference to other cements that take substantial amounts of energy and use primarily virgin materials.

More flexibility is gained by use of any of ASTM C 1157 and C 1600 cements due to their incorporating recovered materials in much of their production. They can be made by using portland cement in combination with ground granulated blast furnace slag, natural pozzolans or up to 95% fly ash in their production. These cements contrast with cements manufactured from mostly virgin materials and require significant amounts of fuel and electrical energy for their production. The above standards allow in excess of the minimum amounts of recycled materials listed in Sections 503.2 and 503.3. Having the specifications listed allows the specifier information to readily access those standards and provides for better flexibility than language allowed in the IBC.

ASTM C 1157 cements with types GU— Hydraulic cement for general construction, Type HE—High Early-Strength, Type MS—Moderate Sulfate Resistance, Type HS—High Sulfate Resistance, Type MH—Moderate Heat of Hydration, Type LH—Low Heat of Hydration can be specified. They are general counterparts for ASTM C 150 Standard Specification for Portland Cement Type I, Type III, Type II, Type V and Type II with the low heat of hydration option.

C 1600 Cements:
In addition to the above characteristics, for those instances wherein rapid hardening is desired, cements conforming to ASTM C 1600 Standard Specification for Rapid hardening Hydraulic Cements should be useable. ASTM C 1600 can be one of four cement types, General Rapid Hardening (GRH), Moderate Rapid Hardening (MRH), Very Rapid Hardening (VRH) and Ultra Rapid Hardening (URH).

C 1600 is a Specification giving numerous performance requirements. Primary characteristics (with inherent increased design flexibility) are:

- Can produce rapid-hardening concrete, precast concrete, block, mortar and grout and is used in rapid hardening stuccos and plasters.
- Depending on the type cement used and the specific mixture, cements meeting ASTM C 1600 can provide either normal, medium or fast time to service (1.5 to 48 h)
- ASTM C 1600 has rigid durability requirements.

ASTM C 1600 cements are used in products such as:

- Materials for Concrete Repairs
- High Strength Grouts
- Precast
- Paving
- Some Cements - Mass Concrete
- Some Cements – Heat Resistant
- Some Cements – Chemical Resistant

Cost Impact: Economic cost of plaster utilizing C 1157 cements may be equal or slightly lower than portland cement concrete due to their sometimes lower process and additive costs. Environmental costs are generally lower with C 1157 cements as fuel use is generally less, costs of components may be less or with the case of activated fly ash based cements, no fuel is used and grinding is not required.

Economic cost of plaster utilizing C 1600 cements, while it may be approximately equal or higher when comparing cementitious to cementitious, is typically negligible for the concrete when considering the costs of other ingredients, transport, placement, finishing and curing.

Environmental costs are generally lower with C 1600 cements as fuel use is generally less, costs of components may be less or with the case of activated fly ash based cements, no fuel is used and grinding is not required.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

S306-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

35-ASTM-S-HICKS.doc

S307–12
2509.2, Table 2509.2 (NEW), Chapter 35 (NEW)

Proponent: John Mulder, Intertek Testing Services NA, Inc. representing International Standards Organization Technical Committee 77, *Products in Fibre-reinforced cement* and self

Revise as follows:

2509.2 Base for tile. ~~Glass mat water-resistant gypsum backing panels, discrete nonasbestos fiber-cement interior substrate sheets or nonasbestos fiber-mat reinforced cementitious backer units in compliance with ASTM C 1178, C 1288 or C 1325 and installed in accordance with manufacturer recommendations shall be~~ Materials used as a base for wall tile in tub and shower areas and wall and ceiling panels in shower areas shall be of materials listed in Table 2509.2 and installed in accordance with manufacturer recommendations. Water-resistant gypsum backing board shall be used as a base for tile in water closet compartment walls when installed in accordance with GA-216 or ASTM C 840 and manufacturer recommendations. Regular gypsum wallboard is permitted under tile or wall panels in other wall and ceiling areas when installed in accordance with GA-216 or ASTM C 840.

TABLE 2509.2
BACKERBOARD MATERIALS

MATERIAL	STANDARD
Glass mat gypsum backing panel	ASTM C1178
Nonasbestos fiber-cement backer board	ASTM C1288 or ISO 8336
Nonasbestos fiber mat reinforced cementitious backer unit	ASTM C1325

Add new standard to Chapter 35 as follows:

ISO

8336 Fibre-cement flat sheets -- Product specification and test methods

Reason: GYPSUM BOARD" IN SHOWER AND WATER CLOSETS misrepresents the materials permitted for use in this section, specifically fiber-reinforced cement backer board products. The text is revised to reference permitted backer board materials now defined in new TABLE 2509.2, where all 3 permitted products would now be listed. This revision also makes the addition of future recognized products to the Code easier by simple addition to the table.

Performance requirements of ISO 8336, *Fibre-cement flat sheets – Product specification and test methods*, have been harmonized with the performance requirements of ASTM C1288, *Standard Specification for Discrete Non-Asbestos Fiber-Cement Interior Substrate Sheets*. Fiber-cement producers in Mexico, Central and South America, Europe, Asia, Australia and New Zealand currently manufacture and test their fiber-cement siding products for compliance with ISO 8336. The inclusion of this Standard reference in the IBC will permit manufacturers worldwide to demonstrate product compliance to IBC requirements. The addition of a reference to ISO 8336 in the Code removes a barrier to trade

Cost Impact: The code change proposal will not increase the cost of construction because the proposed code change is editorial in nature to better clarify and present the backer board products currently recognized in the Code.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

S307-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2509-S-MULDER.doc

S308–12
2509.3

Proponent: Michael Gardner, Gypsum Association (mgardner@gypsum.org)

Revise as follows:

2509.3 Limitations. Water-resistant gypsum backing board shall not be used in the following locations:

1. Over a vapor retarder in shower or bathtub compartments.
2. Where there will be direct exposure to water or in areas subject to continuous high humidity.
3. ~~On ceilings where frame spacing exceeds 12 inches (305 mm) o.c. for 1/2-inch thick (12.7 mm) water-resistant gypsum backing board and more than 16 inches (406 mm) o.c. for 5/8-inch thick (15.9 mm) water-resistant gypsum backing board.~~

Reason: Concurrent language necessitating the addition of supplemental framing members when water-resistant ceiling board is installed on a ceiling has been or is being removed from the code-referenced gypsum board and panel application standards, GA-216 and ASTM C 840.

Testing has shown that water-resistant gypsum board, as presently manufactured, has better sag resistance than regular core board of the same thickness. As a consequence, the supplemental framing limitation is no longer necessary.

Cost Impact: The code change proposal will reduce the cost of construction.

S308-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2509.3-S-GARDNER

S309–12
202 (NEW), 1404.13 (NEW), 2510.6, Chapter 35 (NEW)

Proponent: John Woestman, Kellen Company, representing Building Enclosure Moisture Management Institute (BEMMI) (jwoestman@kellencompany.com)

THIS CODE CHANGE PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEE.

Add new text as follows:

SECTION 202
DEFINITIONS

<u>**POLYMERIC RAINSCREEN PRODUCT.** Material in roll or sheet form, installed behind exterior cladding products, that creates a space that allows drainage and ventilation of liquid and vapor moisture that enters an above-grade exterior wall assembly. Rainscreen products are used to reduce / minimize water transfer to the water resistive barrier.</u>

Add new text as follows:

<u>**1404.13 Polymeric rainscreen products.** Polymeric rainscreen products shall comply with BEMMI 100.</u>

Revise as follows:

2510.6 Water-resistive barriers. *Water-resistive barrier*s shall be installed as required in Section 1404.2 and, where applied over wood-based sheathing, shall include a water-resistive vapor-permeable barrier with a performance at least equivalent to two layers of Grade D paper. The individual layers shall be installed independently such that each layer provides a separate continuous plane and any flashing (installed in accordance with Section 1405.4) intended to drain to the water-resistive barrier is directed between the layers.

> **Exception:** Where the *water-resistive barrier* that is applied over wood-based sheathing has a water resistance equal to or greater than that of 60-minute Grade D paper and is separated from the stucco by an intervening, substantially nonwater-absorbing layer<u>,</u> ~~or~~ <u>a</u> drainage space<u>, or polymeric rainscreen products complying with BEMMI 100.</u>

Add new standard to Chapter 35 as follows:

<u>**BEMMI** Building Enclosure Moisture Management Institute</u>
<u>355 Lexington Avenue, 15th Floor</u>
<u>New York, NY 10017-6603</u>

<u>BEMMI 100-12 Voluntary Test Standard for Evaluation of Polymeric Rainscreen Products</u>

Reason: The Building Enclosure Moisture Management Institute (BEMMI) is developing a new voluntary test standard for evaluation of rainscreen products. This standard will include tests to indicate performance of the rainscreen material behind cladding systems and facilitate drainage and drying of moisture that may get into the wall system behind the cladding.

This standard is currently under development, and is targeted for completion by the Final Action Hearings in 2012.

Note: this proposal is not requiring rainscreens to be incorporated in wall systems, only that if rainscreen materials are used, they are to comply with the BEMMI standard.

Cost Impact: This proposal will not increase the cost of construction as it will be an option to current requirements.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

S309-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1404.13 (NEW)-S-WOESTMAN.doc

S310–12

2510.6, Chapter 35 (NEW)

Proponent: Theresa Weston, DuPont Building Innovation (theresa.a.weston@usa.dupont.com)

Revise as follows:

2510.6 Water-resistive barriers. *Water-resistive barrier*s shall be installed as required in Section 1404.2 and, where applied over wood-based sheathing, shall include a water-resistive vapor-permeable barrier with a performance at least equivalent to two layers of ~~Grade D paper~~ water-resistive barrier complying with ASTM E 2556 Type 1. The individual layers shall be installed independently such that each layer provides a separate continuous plane and any flashing (installed in accordance with Section 1405.4) intended to drain to the water-resistive barrier is directed between the layers.

> **Exception:** Where the *water-resistive barrier* that is applied over wood-based sheathing has a water resistance equal to or greater than that of ~~60-minute Grade D paper~~ a water-resistive barrier complying with ASTM E 2556 Type II and is separated from the stucco by an intervening, substantially nonwater-absorbing layer or drainage space.

Add new standard to Chapter 35 as follows:

ASTM

E 2556 - Standard Specification for Vapor Permeable Flexible Sheet Water-Resistive Barriers Intended for Mechanical Attachment

Reason: The proposal updates the water-resistive barrier reference to the most recent consensus standard. ASTM E2556 includes house wrap materials, building papers and felt, instead of just building paper and therefore is more representative of the state of the industry. Within ASTM E2556 Grade D paper is a Type I WRB and 60 minute Grade D paper is a Type II WRB. ASTM E2556 is consistent with the current ICC-ES acceptance criteria for water-resistive barriers (AC-38) and therefore should not limit the use of current WRBs.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

2510.6-S-WESTON.doc

S311–12
2510.6

Proponent: John Woestman, Kellen Company, representing Builders Masonry Veneer Manufacturers Association (MVMA) (jwoestman@kellencompany.com)

Revise as follows:

2510.6 Water-resistive barriers. *Water-resistive barrier*s shall be installed as required in Section 1404.2 and, where applied over wood-based sheathing, shall include a ~~water-resistive vapor-permeable barrier with a performance at least equivalent to~~ water-resistive barrier with a moisture vapor permeance equal to or greater than that of two layers of Grade D paper. The individual layers shall be installed independently such that each layer provides a separate continuous plane and any flashing (installed in accordance with Section 1405.4) intended to drain to the water-resistive barrier is directed between the layers.

> **Exception:** Where the *water-resistive barrier* that is applied over wood-based sheathing has a water resistance and a moisture vapor permeance equal to or greater than that of 60-minute Grade D paper and is separated from the stucco by an intervening, substantially nonwater-absorbing layer or drainage space.

Reason: Existing language may be considered ambiguous as to what performance attribute is desired to be at least equivalent to two layers of Grade D paper. Water resistance? Moisture vapor permeance? This proposal clarifies moisture vapor permeability is the performance attribute desired to be at least equivalent to Grade D paper. And in the Exception, states moisture vapor permeance equal to or greater than that of 60-minute Grade D paper.

Cost Impact: The code change proposal will not increase the cost of construction.

S312–12

202 (NEW), 2614 (NEW), Chapter 35 (NEW)

Proponent: Betsy Steiner, EPS Molders Association (emsteiner@epscentral.org)

Add new text as follows:

SECTION 202
DEFINITIONS

GEOFOAM – Block or planar rigid cellular foam polymeric material used in geotechnical engineering applications.

Add new text as follows:

SECTION 2614 GEOFOAM

2614.1 General. The provisions of this Section shall govern the quality and methods of application of geofoam for use as a load bearing material in buildings and structures.

2614.2 Material standards. Geofoam shall comply with ASTM D 6817.

2614.3 Load bearing value. The allowable load bearing capacity of geofoam shall be the compressive resistance at 1% deformation in accordance with ASTM D 6817.

2614.4 Labeling and identification. Geofoam delivered to the job site shall bear the label of an approved agency showing the manufacturer's name, product listing, product identification and information sufficient to determine that the end use will comply with the code requirements.

2614.5 Surface-burning characteristics. Geofoam shall have a maximum flame spread index of 75 and a smoke-developed index of 450 when tested at a thickness of 4 inches (102 mm).

2614.6 Protection. Geofoam 4 inches (102 mm) or less in thickness shall be separated from the interior of a building by ½-inch (12.7 mm) gypsum wallboard or a material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275. Geofoam greater than 4 inches (102 mm) in thickness, shall be separated from the interior of the building by two layers of Type X gypsum wallboard or a minimum of 1-inch (25 mm) thickness of masonry or concrete.

Add new standard to Chapter 35 as follows:

ASTM

D 6817-11 - Standard Specification for Rigid Cellular Polystyrene Geofoam

Reason: Geofoam has been used as a geotechnical material since 1960"s providing lightweight, stable solution to engineering challenges. Its many applications include providing stable, insulating sub-surface for building foundations; slope stabilization; road, runway, railway base layer; stadium and theater tiered platform base. Geofoam, in addition to providing excellent insulation also delivers earthquake shock, noise and vibration dampening. Physical properties of geofoam have been established by ASTM Standard D6817. The current version of the standard, D6817-11, is attached to this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

THIS IS A THREE PART CODE CHANGE ALL PARTS WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE AS THREE SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

Add new text as follows:

CHAPTER 27
LIGHT STRAW-CLAY CONSTRUCTION

SECTION 2701
GENERAL

2701.1. Scope. This chapter shall govern the use of *light straw-clay* as a *non-bearing* building material and wall *infill* system.

SECTION 2702
DEFINITIONS

2702.1. General. The following words and terms shall, for the purposes of this chapter, have the meanings shown herein. Refer to Chapter 2 of the *International Building Code* for general definitions.

CLAY. Inorganic soil with particle sizes less than 0.00008 in. (0.002 mm) having the characteristics of high to very high dry strength and medium to high plasticity.

CLAY SLIP. A suspension of clay soil in water.

CLAY SOIL. Inorganic soil containing 50% or more clay by volume.

INFILL. Light straw-clay that is placed between the structural members of a building.

LIGHT STRAW-CLAY. A mixture of straw and clay compacted to form insulation and plaster substrate between or around structural and non-structural members in a wall.

NON-BEARING. Not bearing the weight of the building other than the weight of the light straw-clay itself and its finish.

STRAW. The dry stems of cereal grains after the seed heads have been removed.

VOID. Any space in a light straw-clay wall in which a 2-inch (51 mm) sphere can be inserted.

SECTION 2703
NON-BEARING LIGHT STRAW-CLAY CONSTRUCTION

2703.1 General. Light straw-clay shall not be used to support the weight of the building other than the weight of the light straw-clay material and its finish. Light straw-clay shall be limited to use as infill between or around structural and non-structural wall framing members.

2703.2 Structure. The structure of buildings using light straw-clay shall be designed in accordance with the *International Building Code*. Unfinished light straw-clay shall be deemed to have a design dead load of 40 pounds per cubic foot (640 kg per cubic meter) unless otherwise demonstrated to the *building official*.

2703.3 Materials. The materials used in light straw-clay construction shall be in accordance with Sections 2703.3.1, 2703.3.2 and 2703.3.3.

2703.3.1 Straw. Straw shall be wheat, rye, oats, rice, or barley, and shall be free of visible decay and insects.

2703.3.2 Clay Soil. Suitability of clay soil shall be determined in accordance with the Figure 2 Ribbon Test or the Figure 3 Ball Test of the Appendix to ASTM E 2392/2392M.

2703.3.3 Clay slip. Clay slip shall be of sufficient viscosity such that a finger dipped in the slip and withdrawn remains coated with an opaque coating.

2703.3.4 Light straw-clay mixture. Light straw-clay shall contain not less than 65 percent and not more than 85 percent straw, by volume of bale-compacted straw to clay soil. Loose straw shall be mixed and coated with clay slip such that there is no more than 5 percent uncoated straw.

2703.4 Wall Construction. Light straw-clay wall construction shall be in accordance with the requirements of Sections 2703.4.1, through 2703.4.8.

2703.4.1 Number of stories. The light straw-clay infill system requirements of this chapter shall be limited to buildings and structures that are not more than 2 stories in height above grade plane. Light straw-clay infill systems for buildings that are greater than 2 stories in height above grade plane shall be in accordance with an approved design by a registered design professional.

2703.4.2 Light straw-clay maximum thickness. Light straw-clay shall be not more than12 inches (305 mm) thick, to allow adequate drying of the installed material.

2703.4.3 Distance above grade. Light straw-clay shall not be used below grade. Light straw-clay and its exterior finish shall be not less than 8 inches (203 mm) above exterior finished grade.

2703.4.4 Moisture barrier. An approved moisture barrier shall separate the bottom of light straw-clay walls from any masonry or concrete foundation or slab that directly supports the walls. Penetrations and joints in the barrier shall be sealed with an approved sealant.

2703.4.5 Contact with wood members. Light straw clay shall be permitted to be in contact with untreated wood members.

2703.4.6 Contact with non-wood structural members.
Non-wood structural members in contact with light straw-clay shall be resistant to corrosion or shall be coated to prevent corrosion with an approved coating.

2703.4.7 Wall Reinforcing. Light straw-clay shall be reinforced as follows:

1. Vertical reinforcing shall be a minimum of nominal 2-inch by 4-inch (51 mm by 102 mm) wood members at a maximum of 32 inches (813 mm) on center where the vertical reinforcing is non-bearing and at 24”(610mm) on center where it is load-bearing. The vertical reinforcing shall be attached at top and bottom in accordance with Table 2304.9.1 and anchored to the foundation in accordance with Section 2308.6 or shall be in accordance with an approved design by a registered design professional. Vertical reinforcing shall not exceed an unrestrained height of 10 feet (3,048 mm) or shall be in accordance with an approved design by a registered design professional.
2. Horizontal reinforcing to control settlement of the light straw-clay infill, and to resist out of plane forces shall be installed in the center of the wall at not more than 24 inches (610 mm) on center

and shall be secured to vertical members. Horizontal reinforcing shall be of any of the following: ¾ inch (19 mm) bamboo, ½ inch (13 mm) fiberglass rod, 1-inch (25 mm) wood dowel or nominal 1-inch by 2-inch (25 mm by 51 mm) wood.

2703.4.8 Installation. Light straw-clay shall be installed in accordance with the following:

1. Formwork shall be sufficiently strong to resist bowing when the light straw-clay is compacted into the forms.
2. Light straw-clay shall be uniformly placed into forms and evenly tamped to achieve stable walls free of voids. Light straw-clay shall be placed in lifts of no more than 6 inches (152 mm) and shall be thoroughly tamped before additional material is added.
3 Formwork shall be removed from walls within 24 hours after tamping, and walls shall remain exposed until moisture content is in accordance with Section 2703.5.2. Any visible voids shall be patched with light straw-clay prior to plastering.

2703.4.9 Openings in Walls. Openings in walls shall be in accordance with the following:

1. Doors and windows. Rough bucks or frames for doors and windows shall be fastened securely to structural members. Windows and doors shall be flashed in accordance with the *International Building Code*.
2. Window sills. An approved moisture barrier shall be installed at window sills in light straw-clay walls prior to installation of windows.

2703.5 Wall Finishes. The interior and exterior surfaces of light straw-clay walls shall be protected with a finish in accordance with Sections 2703.5.1 through 2703.5.4.

2703.5.1 Moisture content of light straw-clay prior to application of finish. Light straw-clay walls shall be dry to a maximum moisture content of 20 percent at a depth of 4 inches (102 mm), as measured from each side of the wall, prior to the application of finish on either side of the wall. Moisture content shall be measured with a moisture meter equipped with a probe that is designed for use with baled straw or hay.

2703.5.2 Plaster finish. Exterior plaster finishes shall be clay plaster and lime plaster. Interior plaster finishes shall be clay plaster, lime plaster, and gypsum plaster. Plasters shall be permitted to be applied directly to the surface of the light straw-clay walls without reinforcement, except that the juncture of dissimilar substrates shall be in accordance with Section 2703.5.3. Exterior clay plaster shall be finished with a lime-based or silicate-mineral coating.

2703.5.3 Bridging across dissimilar substrates. Bridging shall be installed across dissimilar substrates prior to the application of plaster. Acceptable bridging materials shall include: expanded metal lath, woven wire mesh, welded wire mesh, fiberglass mesh, reed matting, or burlap. Bridging shall extend not less than 4 inches (102 mm), on both sides of the juncture.

2703.5.4 Exterior siding. Exterior wood, metal, or composite material siding shall be spaced a minimum of 3/4 inch (19 mm) from the light straw-clay such that a ventilation space is created to allow for moisture diffusion. The siding shall be fastened to wood furring strips in accordance with manufacturer's recommendations. Furring strips shall be spaced not more than 32 inches (813 mm) on center, and shall be securely fastened to the vertical wall reinforcing or structural framing. Insect screening shall be provided at the top and bottom of the ventilation space. An air barrier consisting of clay plaster, lime plaster, or other approved air barrier shall be applied to the light straw-clay prior to application of siding.

PART II – IBC GENERAL

Add new text as follows:

SECTION 2704
TYPE OF CONSTRUCTION

2704.1 Type of construction. Buildings or portions thereof containing light straw-clay in accordance with this chapter shall be classified as Type V-B construction.

PART III - IECC

Add new text as follows:

SECTION 2705
THERMAL INSULATION

2705.1 R-value. Light straw-clay, when installed in accordance with this chapter, shall be deemed to have an R-value of 1.6 per inch.

Add new standard to Chapter 35 as follows:

ASTM

E 2392/2392 M-10 Standard Guide for Design of Earthen Wall Building Systems

Reason: The purpose of the proposed code change is to include the use of Light Straw Clay as a nonload-bearing building material and wall infill ystem into the IBC because no such section currently exists.

Light straw-clay construction has proven to be a viable, ecologically sound, and energy efficient building method. To date, permitting of light straw-clay construction has generally been left to the discretion of individual building officials on a case-by-case basis. Two exceptions are the State of New Mexico and the State of Oregon. Since 1998 the State of New Mexico has successfully permitted straw-clay construction using its standard permitting process when a project complies with its "Clay Straw Guidelines".

The proposed light straw-clay section of the IBC is derived from and builds upon the fourteen years of success of New Mexico's Clay Straw Guidelines. In October of 2011 the Oregon Reach Code (ORC) was amended to include light straw-clay construction. Inclusion in the IBC would make proven provisions accessible to more designers and builders interested in using this environmentally beneficial material and to building officials who will be evaluating and enforcing its proper use.

The proposed mixture of clay and straw as a monolithic non-load bearing building enclosure has been successfully used in the United States since 1990 and since 1950 in Europe. Prior to this a heavier form of clay, straw, and woven wood construction known as wattle and daub was in common use throughout Europe, Africa, Asia, and North and South America. Many thousands of existing structures dating back 300-400 years have been continuously occupied, attesting to the durability of these natural materials. In the United States residential and non-residential structures using straw-clay have been completed in 17 states, and most of those have been constructed with full permits and inspections.

The centuries old European predecessors and light straw clay buildings built to date in North America have all been constructed without the use of a moisture barrier. The proposed light straw clay materials are vapor permeable and do not require a moisture barrier. Code precedents for vapor permeable construction exist for adobe construction, log construction and half-timber construction. In these systems as in light straw clay construction there is sufficient hygric capacity to hold and re-release moisture without damage to structural members or degradation of the wall due to weather related moisture fluctuations. Furthermore for exterior siding applications, with ventilated space and rain screen a water resistive barrier is not necessary.

Through The EcoNest Company, and as a licensed architect for over 25 years, I have been involved in the design and/or construction of over 50 buildings utilizing light straw-clay construction. In 2005 I co-authored, with my husband and business partner Robert Laporte, the book "Econest, Creating Sustainable Sanctuaries of Clay, Straw and Timber".

Official guidelines for straw-clay construction have been in effect in New Mexico since 1998. At least 20 residential structures have been successfully permitted and built since that time in New Mexico following these guidelines. Other building officials in surrounding States have also permitted straw-clay construction in their jurisdictions based on these guidelines.

In 2004 the Canada Mortgage and Housing Corporation (CMHC) funded a study to explore the material characteristics of Straw Light Clay (SLC) construction. The proposed section for the IBC uses this study as well as the many years of experience of our company and other practitioners of light straw-clay construction as its basis. The CMHC study includes issues of thermal performance, fire-resistance, moisture, and vapor permeability. The CMHC study and other supporting documentation is available for viewing and download at: http://www.econesthomes.com/natural-building-resources/technical/. EcoNest's numerous projects utilizing light straw-clay construction can be viewed at www.econesthomes.com.

- 2011 Oregon Reach Code (Section 1307) (Based on 2012 International Green Construction Code)
- Baker-Laporte, Laporte (2005) *Econest, Creating Sustainable Sanctuaries of Clay, Straw and Timber*, Gibbs Smith Publishers (This book is available only by purchase. See http://www.econesthomes.com/bookstore/)

- J. Thornton (2004) *Initial Material Characterization of Straw Light Clay* Canada Mortgage and Housing Corporation
  State of New Mexico Construction Industries Division (2001) *Clay Straw Guidelines*

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [IBC] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

Appendix N (NEW)

Proponent: Paula Baker-Laporte, FAIA, EcoNest Company, representing Natural Building Network (paula@econest.com)

Add new text as follows:

APPENDIX N
LIGHT STRAW-CLAY CONSTRUCTION

The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance.

SECTION N101
GENERAL

N101.1. Scope. This appendix shall govern the use of *light straw-clay* as a *non-bearing* building material and wall infill system.

SECTION N102
DEFINITIONS

N102.1. General. The following words and terms shall, for the purposes of this appendix, have the meanings shown herein. Refer to Chapter 2 for the *International Building Code* for general definitions.

CLAY. Inorganic soil with particle sizes less than 0.00008 in. (0.002 mm) having the characteristics of high to very high dry strength and medium to high plasticity.

CLAY SLIP. A suspension of clay soil in water.

CLAY SOIL. Inorganic soil containing 50% or more clay by volume.

INFILL. Light straw-clay that is placed between the structural members of a building.

LIGHT STRAW-CLAY. A mixture of straw and clay compacted to form insulation and plaster substrate between or around structural and non-structural members in a wall.

NON-BEARING. Not bearing the weight of the building other than the weight of the light straw-clay itself and its finish.

STRAW. The dry stems of cereal grains after the seed heads have been removed.

VOID. Any space in a light straw-clay wall in which a 2-inch (51 mm) sphere can be inserted.

SECTION N103
NON-BEARING LIGHT STRAW-CLAY CONSTRUCTION

N103.1 General. Light straw-clay shall not be used to support the weight of the building other than the weight of the light straw-clay material and its finish. Light straw-clay shall be limited to use as infill between or around structural and non-structural wall framing members.

N103.2 Structure. The structure of buildings using light straw-clay shall be designed in accordance with the *International Building Code*. Unfinished light straw-clay shall be deemed to have a design dead load of 40 pounds per cubic foot (640 kg per cubic meter) unless otherwise demonstrated to the *building* *official*.

N103.3 Materials. The materials used in light straw-clay construction shall be in accordance with Sections N103.3.1, N103.3.2, N103.3.3 and N103.3.4.

N103.3.1 Straw. Straw shall be wheat, rye, oats, rice, or barley, and shall be free of visible decay and insects.

N103.3.2 Clay soil. Suitability of clay soil shall be determined in accordance with the Figure 2 Ribbon Test or the Figure 3 Ball Test of the Appendix to ASTM 2392/2392M.

N103.3.3 Clay slip. Clay slip shall be of sufficient viscosity such that a finger dipped in the slip and withdrawn remains coated with an opaque coating.

N103.3.4 Light straw-clay mixture. Light straw-clay shall contain a minimum of 65 percent and a maximum of 85 percent straw, by volume of bale-compacted straw to clay soil. Loose straw shall be mixed and coated with clay slip such that there is no more than 5 percent uncoated straw.

N103.4 Wall Construction. Light straw-clay wall construction shall be in accordance with the requirements of Sections N103.4.1, through N103.4.8.

N103.4.1 Number of stories. The light straw-clay infill system requirements of this chapter shall be limited to buildings and structures that are not more than 2 stories in height above grade plane. Light straw-clay infill systems for buildings that are greater than 2 stories in height above grade plane shall be in accordance with an approved design by a registered design professional.

N103.4.2 Light straw-clay maximum thickness. Light straw-clay shall be not more than12 inches (305 mm) thick, to allow adequate drying of the installed material.

N103.4.3 Distance above grade. Light straw-clay shall not be used below grade. Light straw-clay and its exterior finish shall be not less than 8 inches (203 mm) above exterior finished grade.

N103.4.4 Moisture barrier. An approved moisture barrier shall separate the bottom of light straw-clay walls from any masonry or concrete foundation or slab that directly supports the walls. Penetrations and joints in the barrier, shall be sealed with an approved sealant.

N103.4.5 Contact with wood members. Light straw clay shall be permitted to be in contact with untreated wood members.

N103.4.6 Contact with non-wood structural members. Non-wood structural members in contact with light straw-clay shall be resistant to corrosion or shall be coated to prevent corrosion with an approved coating.

N103.4.7 Wall Reinforcing. Light straw-clay shall be reinforced as follows:

1, Vertical reinforcing shall be a minimum of nominal 2-inch by 4-inch (51 mm by 102 mm) wood members at a maximum of 32 inches (813 mm) on center where the vertical reinforcing is non-bearing and at 24”(610mm) on center where it is load-bearing. The vertical reinforcing shall be attached at top and bottom in accordance with Table 2304.9.1 and anchored to the foundation in accordance with Section 2308.6 or shall be in accordance with an approved design by a registered design professional. Vertical reinforcing shall not exceed an unrestrained height of 10 feet (3,048 mm) or shall be in accordance with an approved design by a registered design professional.

2. Horizontal reinforcing to control settlement of the light straw-clay infill, and to resist out of plane forces shall be installed in the center of the wall at not more than 24 inches (610 mm) on center

and shall be secured to vertical members. Horizontal reinforcing shall be of any of the following: ¾ inch (19 mm) bamboo, ½ inch (13 mm) fiberglass rod, 1-inch (25 mm) wood dowel or nominal 1-inch by 2-inch (25 mm by 51 mm) wood.

N103.4.8 Installation. Light straw-clay shall be installed in accordance with the following:

1. Formwork shall be sufficiently strong to resist bowing when the light straw-clay is compacted into the forms.
2. Light straw-clay shall be uniformly placed into forms and evenly tamped to achieve stable walls free of voids. Light straw-clay shall be placed in lifts of no more than 6 inches (152 mm) and shall be thoroughly tamped before additional material is added.
3. Formwork shall be removed from walls within 24 hours after tamping, and walls shall remain exposed until moisture content is in accordance with Section N103.5. Any visible voids shall be patched with light straw-clay prior to plastering.

N103.4.9 Openings in Walls. Openings in walls shall be in accordance with the following:

1. Doors and windows. Rough bucks or frames for doors and windows shall be fastened securely to structural members. Windows and doors shall be flashed in accordance with the *International Building Code*.
2. Window sills. An approved moisture barrier shall be installed at window sills in light straw-clay walls prior to installation of windows.

N103.5 Wall Finishes. The interior and exterior surfaces of light straw-clay walls shall be protected with a finish in accordance with Sections N103.5.1 through N103.5.4.

N103.5.1 Moisture content of light straw-clay prior to application of finish. Light straw-clay walls shall be dry to a maximum moisture content of 20 percent at a depth of 4 inches (102 mm), as measured from each side of the wall, prior to the application of finish on either side of the wall. Moisture content shall be measured with a moisture meter equipped with a probe that is designed for use with baled straw or hay.

N103.5.2 Plaster finish. Exterior plaster finishes shall be clay plaster and lime plaster. Interior plaster finishes shall be clay plaster, lime plaster, and gypsum plaster. Plasters shall be permitted to be applied directly to the surface of the light straw-clay walls without reinforcement, except that the juncture of dissimilar substrates shall be in accordance with Section N103.5.3. Exterior clay plaster shall be finished with a lime-based or silicate-mineral coating.

N103.5.3 Bridging across dissimilar substrates. Bridging shall be installed across dissimilar substrates prior to the application of plaster. Acceptable bridging materials shall include: expanded metal lath, woven wire mesh, welded wire mesh, fiberglass mesh, reed matting, or burlap. Bridging shall extend not less than 4 inches (102 mm), on both sides of the juncture.

N103.5.4 Exterior siding. Exterior wood, metal, or composite material siding shall be spaced a minimum of 3/4 inch (19 mm) from the light straw-clay such that a ventilation space is created to allow for moisture diffusion. The siding shall be fastened to wood furring strips in accordance with manufacturer's recommendations. Furring strips shall be spaced not more than 32 inches (813 mm) on center, and shall be securely fastened to the vertical wall reinforcing or structural framing. Insect screening shall be provided at the top and bottom of the ventilation space. An air barrier consisting of clay plaster, lime plaster, or other approved air barrier shall be applied to the light straw-clay prior to application of siding.

SECTION N104
TYPE OF CONSTRUCTION

N104.1 Type of construction. Buildings or portions thereof containing light straw-clay in accordance with this appendix shall be classified as Type V-B construction.

SECTION N105
THERMAL INSULATION

N105.1 R-value. Light straw-clay, when installed in accordance with this chapter, shall be deemed to have an R-value of 1.6 per inch.

SECTION N106
REFERENCE STANDARDS

ASTM

E2392-10 Standard Guide for Design Earthen Wall Building Systems

Reason: The purpose of the proposed code change is to include Light Straw Clay as a nonload-bearing building material and wall infill system into the IBC because no such section currently exists.

Light straw-clay construction has proven to be a viable, ecologically sound, and energy efficient building method. To date, permitting of light straw-clay construction has generally been left to the discretion of individual building officials on a case-by-case basis. Two exceptions are the State of New Mexico and the State of Oregon. Since 1998 the State of New Mexico has successfully permitted straw-clay construction using its standard permitting process when a project complies with its "Clay Straw Guidelines".

The proposed light straw-clay section of the IBC is derived from and builds upon the fourteen years of success of New Mexico's Clay Straw Guidelines. In October of 2011 the Oregon Reach Code (ORC) was amended to include light straw-clay construction. Inclusion in the IBC would make proven provisions accessible to more designers and builders interested in using this environmentally beneficial material and to building officials who will be evaluating and enforcing its proper use.

The proposed mixture of clay and straw as a monolithic non-load bearing building enclosure has been successfully used in the United States since 1990 and since 1950 in Europe. Prior to this a heavier form of clay, straw, and woven wood construction known as wattle and daub was in common use throughout Europe, Africa, Asia, and North and South America. Many thousands of existing structures dating back 300-400 years have been continuously occupied, attesting to the durability of these natural materials. In the United States residential and non-residential structures using straw-clay have been completed in 17 states, and most of those have been constructed with full permits and inspections.

The centuries old European predecessors and light straw clay buildings built to date in North America have all been constructed without the use of a moisture barrier. The proposed light straw clay materials are vapor permeable and do not require a moisture barrier. Code precedents for vapor permeable construction exist for adobe construction, log construction and half-timber construction. In these systems as in light straw clay construction there is sufficient hygric capacity to hold and re-release moisture without damage to structural members or degradation of the wall due to weather related moisture fluctuations. Furthermore for exterior siding applications, with ventilated space and rain screen a water resistive barrier is not necessary.

Through The EcoNest Company, and as a licensed architect for over 25 years, I have been involved in the design and/or construction of over 50 buildings utilizing light straw-clay construction. In 2005 I co-authored, with my husband and business partner Robert Laporte, the book "Econest, Creating Sustainable Sanctuaries of Clay, Straw and Timber".

Official guidelines for straw-clay construction have been in effect in New Mexico since 1998. At least 20 residential structures have been successfully permitted and built since that time in New Mexico following these guidelines. Other building officials in surrounding States have also permitted straw-clay construction in their jurisdictions based on these guidelines.

In 2004 the Canada Mortgage and Housing Corporation (CMHC) funded a study to explore the material characteristics of Straw Light Clay (SLC) construction. The proposed section for the IBC uses this study as well as the many years of experience of our company and other practitioners of light straw-clay construction as its basis. The CMHC study includes issues of thermal performance, fire-resistance, moisture, and vapor permeability. The CMHC study and other supporting documentation is available for viewing and download at: http://www.econesthomes.com/natural-building-resources/technical/. EcoNest's numerous projects utilizing light straw-clay construction can be viewed at www.econesthomes.com.

Appendix N (NEW)

Proponent: Martin Hammer, Architect, representing California Straw Building Association, Colorado Straw Bale Association, Straw Bale Construction Association – New Mexico, Ontario Bale Building Coalition, Development Center for Appropriate Technology, Environmental Building Network (mfhammer@pacbell.net)

THIS IS A TWO PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. SEE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES

PART I – IBC STRUCTURAL

Add new text as follows:

APPENDIX N
STRAWBALE CONSTRUCTION

The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance.

SECTION N101
GENERAL

N101.1 Scope. This appendix shall govern the use of baled straw as a building material.

SECTION N102
DEFINITIONS

N102.1 Definitions. The following words and terms shall, for the purposes of this appendix, have the meanings shown herein. Refer to Chapter 2 of the *International Building Code* for general definitions.

BALE. Equivalent to straw bale.

CLAY. Inorganic soil with particle sizes less than 0.00008 in. (0.002 mm) having the characteristics of high to very high dry strength and medium to high plasticity.

CLAY SLIP. A suspension of clay particles in water.

FLAKE. An intact section of compressed straw removed from an untied bale.

LAID FLAT. The orientation of a bale with its largest faces horizontal, its longest dimension parallel with the wall plane, its ties concealed in the unfinished wall and its straw lengths oriented across the thickness of the wall.

LOAD-BEARING WALL. For the purposes of this appendix, any strawbale wall that supports more than 100 lb/linear ft (1,459 N/m) of vertical load in addition to its own weight.

MESH. An openwork fabric of linked strands of metal, plastic, or natural or synthetic fiber, embedded in plaster to provide tensile reinforcement or bonding.

NONLOAD-BEARING WALL. For the purpose of this appendix, any wall that is not a load-bearing wall.

NONSTRUCTURAL WALL. All walls other than load-bearing walls or shear walls.

ON-EDGE. The orientation of a bale with its largest faces vertical, its longest dimension parallel with the wall plane, its ties on the face of the wall, and its straw lengths oriented vertically.

PIN. Metal rod, wood dowel, or bamboo, driven into, or through-tied on the surface of stacked bales for the purpose of connection or stability.

PLASTER. Gypsum, lime, cement-lime, or cement plasters, as defined in Chapter 25 and in Section N106, or clay plaster as defined in Section N106.9, or soil-cement plaster as defined in Section N106.10.

PRE-COMPRESSION. Vertical compression of stacked bales before the application of finish.

REINFORCED PLASTER. A plaster containing mesh reinforcement.

RUNNING BOND. For the purposes of this appendix, the placement of straw bales such that the head joints in successive courses are offset at least one quarter the bale length.

SHEAR WALL. A strawbale wall designed to resist lateral forces parallel to the plane of the wall in accordance with Section N105.15.

SKIN. The compilation of plaster and reinforcing, if any, applied to the surface of stacked bales.

STRUCTURAL WALL. A wall that meets the definition for a load-bearing wall or shear wall.

STACK BOND. For the purposes of this appendix, the placement of straw bales such that head joints in successive courses are vertically aligned.

STRAW. The dry stems of cereal grains after the seed heads have been removed.

STRAW BALE. A rectangular compressed block of straw, bound by ties.

STRAWBALE. The adjective form of straw bale.

STRAW-CLAY. Loose straw mixed and coated with clay slip.

TIE. A synthetic fiber, natural fiber, or metal wire used to confine a straw bale.

TRUTH WINDOW. An area of a strawbale wall left without its finish, to allow view of the straw otherwise concealed by its finish.

SECTION N103
BALES

N103.1 Types of straw. Bales shall be composed of straw from wheat, rice, rye, barley, or oat.

N103.2 Shape. Bales shall be rectangular in shape.

N103.3 Size. Bales shall have a minimum height and thickness of 12 inches (305 mm), except as otherwise permitted or required in this appendix. Bales used within a continuous wall shall be of consistent height and thickness to ensure even distribution of loads within the wall system.

N103.4 Ties. Bales shall be confined with synthetic fiber, natural fiber, or metal ties sufficient to maintain required bale density. Ties shall be at least 3 inches (76 mm) and not more than 6 inches (152 mm) from bale faces and shall be spaced not more than 12 (305 mm) inches apart. Bales with broken ties shall be retied with sufficient tension to maintain required bale density.

N103.5 Moisture content. The moisture content of bales at the time of application of the first coat of plaster or the installation of another finish shall not exceed 20 percent of the weight of the bale. The moisture content of bales shall be determined by use of a moisture meter designed for use with baled straw or hay, equipped with a probe of sufficient length to reach the center of the bale. At least 5 percent and not less than ten bales used shall be randomly selected and tested.

N103.6 Density. Bales shall have a minimum dry density of 6.5 pounds per cubic foot (92 kg/cubic meter). The dry density shall be calculated by subtracting the weight of the moisture in pounds (kg) from the actual bale weight and dividing by the volume of the bale in cubic feet (cubic meters). At least 2 percent and not less than five bales to be used shall be randomly selected and tested on site.

N103.7 Partial bales. Partial bales made after original fabrication shall be retied with ties complying with N103.4.

SECTION N104
MOISTURE CONTROL

N104.1 General. All weather-exposed bale walls and bale walls enclosing showers or steam rooms, shall be protected from water damage and moisture intrusion in accordance with this section.

N104.2 Water-resistive barriers and vapor permeance ratings. Plastered bale walls shall be constructed without any membrane barrier between straw and plaster to facilitate transpiration of moisture from the bales, and to secure a structural bond between straw and plaster, except as permitted or required elsewhere in this appendix. Where a water-resistive barrier is placed behind the exterior finish, it shall have a vapor permeance rating of at least 5 perms, except as permitted or required elsewhere in this appendix. Wall finishes shall be vapor permeable or shall have an equivalent vapor permeance rating of a Class III vapor retarder.

N104.3 Horizontal surfaces. Bale walls and other bale elements shall be provided with a moisture barrier at all weather-exposed horizontal surfaces. The moisture barrier shall be of a material and installation that will prevent water from entering the wall system. Horizontal surfaces shall include, but shall not be limited to, exterior window sills, sills at exterior niches, and buttresses. The finish material at such surfaces shall be sloped not less than 1 unit vertical in 12 units horizontal (8-percent slope) and shall drain away from all bale walls and elements. Where the moisture barrier is below the finish material, it shall be sloped not less than 1 unit vertical in 12 units horizontal (8-percent slope) and shall drain to the outside surface of the bale's vertical finish.

N104.4 Bale and concrete separation. A sheet or liquid applied Class II vapor retarder shall be installed between bales and supporting concrete or masonry. The bales shall be separated from the vapor retarder by not less than 3/4-inch (19 mm), and that space shall be filled with an insulating material such as wood or rigid insulation, or a material that allows vapor dispersion such as gravel, or other *approved* insulating or vapor dispersion material. Sill plates in structural walls shall comply with Table N105.14 and Table N105.15. Where bales abut a concrete or masonry wall that retains earth, a Class II vapor retarder shall be provided between such wall and the bales.

N104.5 Separation of bales and earth. Bales shall be separated from earth a minimum of 8" (203 mm).

N104.6 Separation of exterior plaster and earth. Exterior plaster applied to straw bales shall be located not less than 4 inches (102 mm) above the earth or 2 inches (51 mm) above paved areas.

N104.7 Showers walls and steam rooms. Bale walls enclosing showers or steam rooms shall be protected by a water-resistive barrier or by a Class I or Class II vapor retarder on the interior face between the finish and the bales.

SECTION N105
STRUCTURAL USE

N105.1 Scope. This section shall apply to structural strawbale walls. Sections N105.11, N105.12, and N105.16 shall also apply to nonstructural strawbale walls.

N105.2 General. An approved engineered design in accordance with Section N105 and the *International Building Code* shall be provided for buildings or portions thereof using structural strawbale walls.

N105.3 Foundations. Foundations for strawbale walls shall be of any type permitted by, and shall be designed in accordance with, the *International Building Code*.

N105.4 Building height and stories. Building height shall not exceed 35 feet and the limits contained in Table N105.13. Structural use of strawbale walls shall be permitted in multi-story buildings where:

1. Complete vertical and lateral load paths are demonstrated by an *approved* engineered design.
2. Strawbale walls interrupted by floor assemblies are designed and detailed by a *registered design professional*.

N105.5 Configuration of bales. Bales in structural walls shall be laid flat or on-edge and in a running bond or stack bond, except that bales in structural walls with unreinforced plasters shall be laid in a running bond only.

N105.6 Pre-compression of load-bearing strawbale walls. Prior to application of plaster, walls designed to be load-bearing shall be pre-compressed by a uniform load of not less than 100 pounds per linear foot.

N105.7 Voids and stuffing. Voids between bales in structural strawbale walls shall not exceed 4 inches (102 mm) in width, and such voids shall be stuffed with flakes of straw or straw-clay, before application of finish.

N105.8 Plaster skins. Plaster skins on structural walls shall be of any type permitted by Section N106, except gypsum plaster, and shall be in accordance with Tables N105.14 and N105.15.

N105.8.1 Straightness. Plaster skins on structural strawbale walls shall be straight, as a function of the bale wall surfaces they are applied to, as follows:

1. As measured across the face of a bale, straw bulges shall not protrude more than 3/4 inch (19 mm) across 2 feet (610 mm) of its height or length.

2. As measured across the face of a bale wall, straw bulges shall not protrude from the vertical plane of a bale wall more than 2 inches (51 mm) over 8 feet (2438 mm).

3. The vertical face of adjacent bales shall not be offset more than 1/2 inch (13 mm)

N105.8.2 Plaster and membranes. Structural strawbale walls shall not have a membrane between straw and plaster, or shall have attachment through the bale wall from one plaster skin to the other in accordance with an *approved* engineered design.

N105.9 Transfer of loads to and from plaster skins. Where plastered strawbale walls are used to support superimposed vertical loads, such loads shall be transferred to the plaster skins by continuous direct bearing or by an *approved* engineered design. Where plastered strawbale walls are used to resist in-plane lateral loads, such loads shall be transferred via the reinforcing mesh from the structural member or assembly above and to the sill plate in accordance with Table N105.15, or by an *approved* engineered design.

N105.10 Support of plaster skins. Plaster skins for structural strawbale walls shall be continuously supported along their bottom edge to facilitate the transfer of loads to the foundation system. Acceptable supports include, but are not limited to: a concrete or masonry stem wall, a concrete slab on grade, a wood-framed floor adequately blocked, with an *approved* engineered design, or a steel angle adequately anchored, with an *approved* engineered design. A conventional metal or plastic weep screed is not an acceptable support.

N105.11 Unrestrained wall height. Strawbale walls shall not exceed the ratios of stacked bale height to bale thickness between restraints, as stated in Section 2505.12, except where an *approved* engineered design demonstrates the wall will resist buckling from superimposed vertical loads and out-of-plane design loads.

N105.12 Resistance to out-of-plane lateral loads. Structural and non-structural strawbale walls shall be considered capable of resisting out-of-plane loads prescribed in the *International Building Code* with the following limitations and requirements, except where an *approved* engineered design is provided:

1. Walls with unreinforced plasters or a non-plaster finish, and without pins in accordance with N105.12.4, or other *approved* means of out-of-plane bracing, shall not exceed a 5:1 ratio of stacked bale height to bale thickness.
2. Clay plaster walls with reinforced plasters, or pins in accordance with N105.12 Item 4, or other *approved* means of out-of-plane bracing, shall not exceed the ratio indicated in Equation 24-1. Plaster reinforcement shall be any type described in Table N105.15 with staples spaced not more than 6 inches (152 mm) on center.

$H^2/T = 65$ **(Equation N-1)**

Where:

H = stacked bale height
T = bale thickness
H and T are measured in feet. ($H^2/T = 19{,}800$ when H and T are measured in mm)

3. Cement, cement-lime, lime, or soil cement plaster walls with reinforced plasters, or pins in accordance with N105.12 Item 4, or other *approved* means of out-of-plane bracing, shall not exceed the ratio indicated in Equation 24-2. Plaster reinforcement shall be any type described in Table N105.15 with staples spaced not more than 6 inches (152 mm) on center.

$H^2/T = 80$ **(Equation N-2)**

Where:

H = stacked bale height
T = bale thickness
H and T are measured in feet. ($H^2/T = 24{,}400$ when H and T are measured in mm)

4. Pins shall be in accordance with an *approved* engineered design or shall comply with the following:
    - 4.1 Pins shall be 3/8 inch (10 mm) diameter steel, 3/4 inch diameter (19 mm) wood, or 1/2 inch diameter (13 mm) bamboo. Pins shall be external or internal.
    - 4.2 External pins shall be installed on both sides of the wall spaced not more than 24 inches (610 mm) on center.
    - 4.3 External pins shall have full lateral bearing on the sill plate and the roof- or floor-bearing member, and shall be tightly tied through the wall to an opposing pin with ties spaced not more than 30 inches (762 mm) apart and not more than 15 inches (381 mm) from each end.
    - 4.4 Internal pins shall be installed vertically not more than 24 inches (610 mm) on center in the center third of the bales, and shall extend from top course to bottom course.

4.5 The bottom course shall be similarly connected to its support and the top course shall be similarly connected to the roof- or floor-bearing member above with pins or other *approved* means.
4.6 Internal pins shall be continuous or shall overlap through not less than one bale course.

N105.13 Design coefficients and factors for seismic design. The values given in Table N105.13 shall apply to seismic design using strawbale shear walls detailed in accordance with Table N105.15.

N105.14 Load-bearing strawbale walls. Load-bearing strawbale walls shall be in accordance with Table N105.14 as part of an *approved* engineered design to support superimposed vertical loads.

N105.15 Strawbale shear walls. Strawbale shear walls shall be in accordance with Table N105.13 as part of an *approved* engineered design to resist in-plane lateral loads. Other *approved* in-plane lateral load resisting systems shall be permitted to be used in combination with strawbale shear walls with apportionment of design loads as prescribed in the *International Building Code*.

N105.16 Connection of light-frame walls to strawbale walls. Light-frame walls perpendicular to, or at an angle to a straw bale wall assembly, shall be fastened to the bottom and top wood members of the strawbale wall in accordance with requirements for wood or cold-formed steel light-frame walls in the *International Building Code*, or the abutting stud shall be connected to alternating straw bale courses with a 1/2 inch (13mm) diameter steel, 3/4" diameter (19 mm) wood, or 5/8" diameter (16 mm) bamboo dowel, with minimum 8 inch (203 mm) penetration.

TABLE N105.13
DESIGN COEFFICIENTS AND FACTORS FOR SEISMIC-FORCE-RESISTING SYSTEMS

Seismic-Force-Resisting System		**Response Modification Coefficient, *R*[1]**	**System Overstrength Factor, Omega[2]**	**Deflection Amplification Factor, *C***	**Structural System Limitations and Building Height (ft) Limits**				
					Seismic Design Category				
					B	C	D	E	F
A. Bearing Wall Systems									
Strawbale shear walls		3.5	3	3	25	25	15	15	15
B. Building Frame Systems									
Strawbale shear walls		4	3	3.5	35	35	25	25	25

a. R reduces forces to a strength level, not an allowable stress level
b. The tabulated value of the overstrength factor is permitted to be reduced by subtracting 0.5 for structures with flexible diaphragms, but shall not be taken as less than 2.0 for any structure.

TABLE N105.14
ALLOWABLE GRAVITY LOADS (LBS./FOOT) FOR PLASTERED STRAWBALE WALLS

WALL DESIGNATION	**PLASTER (both sides) Thickness each side**	**SILL PLATES[b,c]**	**ANCHOR[c] BOLTS (or other sill fastening)**	**MESH[d]**	**STAPLES[e,f,g]**	**ALLOWABLE BEARING CAPACITY[h] (plf)**
A	Clay[i] 1-1/2"	c	c	None required[j]	None required[j]	400
B	Soil-cement[k] 1"	c	c	d	e,f,g	800
C	Lime[l] 7/8"	c	c	d	e,f,g	500

WALL DESIGNATION	PLASTER (both sides) Thickness each side	SILL PLATES[b,c]	ANCHOR[c] BOLTS (or other sill fastening)	MESH[d]	STAPLES[e,f,g]	ALLOWABLE BEARING CAPACITY[h] (plf)
D	Cement-lime[k] 7/8”	c	c	d	e,f,g	800
E	Cement 7/8”	c	c	d	e,f,g	800

For SI: 1 inch=25.4mm, 1 pound per foot = 14.5939 N/m.

a. Plasters shall conform with Sections N106.9 through N106.12 for makeup and thickness, with Section N105.8.1 for straightness, and with Section N105.10 for support of plaster skins.

b. Sill plates shall support and be flush with each face of the bale wall and shall be preservative-treated where required by the *International Building Code*..

c. For walls supporting gravity loads only or for non-structural walls, sill plates and fastening shall be in accordance with the requirements for wood framed walls in the *International Building Code*. See Table N105.15 for requirements for shear walls.

d. Any metal mesh allowed by this section shall be installed throughout the plaster with minimum 4-inch laps and fastened in accordance with footnote e.

e. Staples shall be at maximum spacing of 2-inches on center, to roof or floor bearing assembly, or as shown in an approved design in accordance with Section N105.9, and at a maximum spacing of 4-inches on center to sill plates.

f. Staples shall be gun staples, stainless steel or electro-galvanized, 16 gauge with 1 ¼-inch legs, 7/16-inch crown; or manually driven staples, galvanized 15 gauge with 7/8-inch legs, 3/16-inch inner spread and rounded shoulder. Other staples shall be permitted to be used as designed by a *registered design professional*. Staples into preservative-treated wood shall be stainless steel.

g. Staples shall be firmly driven diagonally across mesh intersections at the spacing indicated.

h. For walls with a different plaster on each side, the lower value shall be used.

i. Except as necessary to transfer roof or floor loads to the plaster skins in accordance with Section N105.9.

j. The building official is authorized to require a cube compression test to demonstrate a minimum 100 psi compressive strength.

k. The building official is authorized to require a compression test to demonstrate a minimum 1000 psi compressive strength.

l. Lime plaster shall use hydraulic or natural hydraulic lime. The building official is authorized to require a cube compression test to demonstrate a minimum 600 psi compressive strength.

m. The building official is authorized to require a cube compression test to demonstrate a minimum 1400 psi compressive strength.

TABLE N105.15
ALLOWABLE SHEAR (POUNDS PER FOOT) FOR PLASTERED STRAWBALE WALLS[a]

DESIGNATION	PLASTER[b]		SILL PLATES[d]	ANCHOR[d] BOLTS (on center)	MESH[e]	STAPLES[f, g, h] (on center)	ALLOWABLE SHEAR[i, j, k] (plf)
	TYPE	THICK-NESS (each side)					
A1	Clay[m]	1.5-in.	2 x 4	2 ft. 8 in.	None	None	60
A2	Clay[m]	1.5-in.	2 x 4	2 ft. 8 in.	2 in. by 2 in. high-density polypropylene	2-inches	140
A3	Clay[m]	1.5-in,	2 x 4	2 ft. 8 in.	2”x2”x14ga[l]	4-inches	180
B	Soil-cement[o]	1-in.	4 x 4	2 ft. 0 in	2 in. by 2 in. by 14ga[l]	2-inches	520
C1	Lime[n]	7/8-in.	2 x 4	2 ft. 8 in.	17 ga. woven wire	3-inches	330
C2	Lime[n]	7/8-in.	4 x 4	2 ft. 0 in.	2 in. by 2 in. by 14ga[l]	2-inches	450
D1	Cement-lime[o]	7/8-in.	4 x 4	2 ft. 8 in	17 ga. woven wire	2-inches	380
D2	Cement-lime[o]	7/8-in.	4 x 4	2 ft. 0 in.	2 in. by 2 in. by 14ga[l]	2-inches	520
E1	Cement[p]	7/8-in.	4 x 4	2 ft. 8 in.	2 in. by 2 in. by 14 ga[l]	2-inches	540
E2	Cement[p]	1.5-in.	4 x 4	2 ft. 0 in.	2 in. by 2 in. by 14ga[l]	2-inches	680

SI: 1 inch=25.4 mm, 1 pound per foot = 14.5939 N/m

a. Bales shall be not less than 15 inches thick.

b. Plasters shall comply with Sections N106.7 through N106.12 for makeup and thickness, with Section N105.8.1 for straightness, and with Section N105.10 for support.

c. Sill plates shall be Douglas fir-larch or southern pine and shall be preservative-treated where required by the *International Building Code*. Multiply allowable shear value by .82 for other species with specific gravity of .42 or greater, or by .65 for all other species.

d. Anchor bolts shall be 5/8-inch diameter with 2-inch by 2-inch by 3/16-inch washers, with not less than 7-inch embedment in concrete or masonry foundation. Anchor bolts or other fasteners into framed floors shall be engineered.

e. Mesh shall run continuous vertically from sill plate to top plate, roof or floor beam, or roof or floor bearing assembly, or shall lap not less than 12-inches. Horizontal laps shall be a not less than 4-inches. Steel mesh shall be galvanized. Galvanized steel mesh shall be separated from preservative-treated wood by grade D paper, 15# roofing felt, or other *approved* barrier.

f. Staples shall be gun staples, stainless steel or electro-galvanized, 16 gauge with 1 ¼-inch legs, 7/16-inch crown; or manually driven staples, galvanized 15 gauge with 7/8-inch legs, 3/16-inch inner spread and rounded shoulder. Other staples shall be permitted to be used as designed by a registered design professional. Staples into preservative-treated wood shall be stainless steel.

g. Staples at spacing indicated are to boundary conditions, including sill plates, and top plate, roof or floor beam, or roof or floor bearing assembly,

h. Staples shall be firmly driven diagonally across mesh intersections at spacing indicated.

i. Values shown are for aspect ratios of 1:1 or less. Reduce values shown to 50 percent for the limit of a 2:1 aspect ratio. Linear interpolation shall be permitted for ratios between 1:1 and 2:1. The full value shown shall be used for aspect ratios greater than 1:1, where an additional layer of mesh is installed at the base of the wall to a height where the remainder of the wall has an aspect ratio of 1:1 or less, and the second layer of mesh is fastened to the sill plate with the required stapling, and the sill bolt spacing is decreased with linear interpolation between1:1 and 2:1.

j. For walls with a plaster Type A on one side and any other plaster type on the other side, a registered design professional shall show transfer of the design lateral load into the stiffer Type B, C, D, or E plaster only, and 50% of the allowable shear value shown for that wall type shall be used.

k. These values are permitted to be increased 40 percent for wind design.

l. 16 gauge mesh shall be permitted to be used with a reduction to 0.60 of the allowable shear values shown.

m. The building official is authorized to require a cube compression test demonstrating not less than 600 psi compressive strength.

n. Lime plaster shall use hydraulic or natural hydraulic lime. The building official is authorized to require a cube compression test demonstrating not less than 600 psi compressive strength.

o. The building official is authorized to require a cube compression test demonstrating not less than 1000 psi compressive strength.

p. The building official is authorized to require a cube compression test demonstrating not less than 1400 psi compressive strength.

SECTION N106
FINISHES

N106.1 General. Finishes applied to strawbale walls shall be any type permitted by the *International Building Code*, and shall comply with this section and with Chapters 14 and 25 unless stated otherwise in this section.

N106.2 Purpose, and where required. Strawbale walls shall be finished so as to provide mechanical protection, fire resistance, restrict the passage of air through the bales, and protect them from weather in accordance with this appendix and the *International Building Code*.

> **Exception:** Truth windows shall be permitted where a fire-resistive rating is not required. Weather-exposed truth windows shall be fitted with a weather-tight cover.

N106.3 Vapor retarders. Class I and Class II vapor retarders shall not be used on a strawbale walls, nor shall any other material be used that has a vapor permeance rating of less than 5 perms, except as permitted or required elsewhere in this appendix, or as *approved* and demonstrated to be necessary by a *registered design professional*.

N106.4 Plaster. Plaster applied to bales shall be of any type described in Section N106, and as required or limited in this appendix.

N106.5 Plaster and membranes. Plaster shall be applied directly to strawbale walls to facilitate transpiration of moisture from the bales, and to secure a mechanical bond between the skin and the bales, except where a membrane is allowed or required elsewhere in this appendix. Structural bale walls shall have no membrane between straw and plaster, or shall have attachment through the bale wall from one plaster skin to the other in accordance with an approved engineered design.

N106.6 Lath and mesh for plaster. The surface of the straw bales functions as lath, and no other lath or mesh shall be required, except as required for tensile or shear strength in structural applications as required in Table N105.14, Table N105.15, or by an *approved* engineered design.

N106.7 Plaster on non-structural walls. Plaster on non-structural walls shall be in accordance with Section N106.9, N106.10, N106.11, N106.12, N106.13 or N106.14.

N106.8 Plaster on structural walls. Plaster on structural walls shall comply with Section N106.9, N106.10, N106.11, N106.12, N106.13 or N106.14. Plaster on load-bearing walls shall also comply with Table N105.14. Plaster on shear walls shall also comply with Table N105.15.

N106.9 Clay plaster. Clay plaster shall comply with Sections N106.9.1 through N106.9.6.

N106.9.1 General. Clay plaster shall be any plaster having a clay or clay soil binder. Such plaster shall contain sufficient clay to fully bind the plaster, sand or other inert granular material, and shall be permitted to contain reinforcing fibers. Reinforcing fibers shall include, but shall not be limited to, chopped straw, sisal, and animal hair.

N106.9.2 Mesh. Clay plaster shall not be required to contain reinforcing mesh except as required in Table N105.15. Where provided, mesh shall be natural fiber, corrosion-resistant metal, nylon mesh, or high-density polypropylene.

N106.9.3 Thickness and coats. Clay plaster shall be a minimum 1 inch (25 mm) thick, unless required to be thicker for structure or fire-resistance, as described elsewhere in this appendix, and shall be applied with in not less than two coats.

N106.9.4 Rain-exposed. Clay plaster, where exposed to rain, shall be finished with lime wash, linseed oil, or other *approved* erosion resistant finish.

N106.9.5 Prohibited finish coat. Cement plaster shall not be permitted as a finish coat over clay plasters.

N106.9.6 Additives. Additives shall be permitted to increase the plaster's workability, durability, strength, or water resistance.

N106.10 Soil-cement plaster. Soil-cement plaster shall comply with Sections N106.10.1 through N106.10.3.

N106.10.1 General. Soil-cement plaster shall be comprised of soil (free of organic matter), sand, and not less than10 percent Portland cement by volume, and shall be permitted to contain reinforcing fibers.

N106.10.2 Mesh. Soil-cement plaster shall use any corrosion-resistant metal mesh permitted by the *International Building Code*, or as required in Section N105 where used on a structural wall.

N106.10.3 Thickness. Soil-cement plaster shall be not less than 1 inch (25 mm) thick.

N106.11 Gypsum plaster. Gypsum plaster shall comply with Section 2511 of the *International Building Code*. Gypsum plaster shall be limited to use on interior surfaces, and on non-structural walls, except as an interior finish coat over a structural plaster that complies with this appendix.

N106.12 Lime plaster. Lime plaster shall comply with Sections N106.12.1 and N106.12.2.

N106.12.1 General. Lime plaster is any plaster whose binder is comprised of calcium hydroxide (CaOH) including Type N or Type S hydrated lime, hydraulic lime, natural hydraulic lime, or quicklime. Hydrated lime plasters shall comply with ASTM C 206. Quicklime plasters shall comply with ASTM C 5. Lime plaster shall be permitted to be applied in 2 coats, provided that the combined thickness is at least 7/8 inch (22 mm), and each coat is not greater than 1/2 inch (13 mm) thick.

N106.12.2 On structural walls. Lime plaster on structural strawbale walls in accordance with Table N105.14 or Table N105.15 shall use hydraulic or natural hydraulic lime.

N106.13 Cement-lime plaster. Cement-lime plaster shall be plaster mixes CL or FL as described in ASTM C 926. Cement-lime plaster shall be permitted to be applied in 2 coats, provided the combined thickness is at least 7/8 inch (22 mm) thick, and each coat is not greater than 1/2 inch (13 mm) thick.

N106.14 Cement plaster. Cement plaster shall comply with Section 2512 of the *International Building Code*, except that the amount of lime in all plaster coats shall be not less than 1 part lime to 6 parts cement to allow a minimum acceptable vapor permeability. The plaster shall be permitted to be applied in 2 coats, provided the combined thickness is at least 7/8 inch (22 mm), and each coat is not greater than 1/2 inch (13 mm) thick. The combined thickness of all plaster coats shall be not more than 1 1/2 inch (38 mm) thick.

N106.15 Finishes over plaster. Other finishes, as permitted elsewhere in this section and the *International Building Code*, shall be permitted to be applied over the plaster, except as prohibited in Section N106.16.

N106.16 Prohibited plasters and finishes. Any plaster or finish with a singular or cumulative perm rating less than 5 perms shall be prohibited on straw bale walls, except where approved and demonstrated to be necessary by a *registered design professional*, or as required elsewhere in this appendix.

N106.17 Separation of wood and plaster. Where wood framing or wood sheathing occurs in strawbale walls, such wood surfaces shall be separated from exterior plaster with No. 15 asphalt felt, grade D paper, or other *approved* material in accordance with Section 1404.2 of the *International Building Code*, except where the wood is preservative-treated or naturally durable.

Exception: Exterior clay plasters shall not be required to be separated from wood.

SECTION N108
THERMAL INSULATION

N108.1 R-value. The unit R-value of a strawbale wall with bales laid flat is R-1.3 per inch, and with bales on-edge is R-2 per inch.

PART II – IBC FIRE SAFETY

SECTION N107
FIRE RESISTANCE

N107.1 Fire-resistance rating. Fire-resistance ratings for strawbale walls shall be established in accordance with Section N107.1.1 or N107.1.2, or shall be determined in accordance with Section 703.2 or 703.3 of the *International Building Code*.

N107.1.1 1-hour rated clay plastered wall. 1-hour fire-resistance-rated nonload-bearing clay plastered strawbale walls shall comply with all of the following:

1. Bales shall be laid flat or on-edge in a running bond. Gaps shall be fire-stopped with straw-clay,
2. Bales shall maintain thickness of not less than 18 inches (457 mm),

3. Clay plaster on each side of the wall shall be not less than 1 inch (25 mm) thick and shall be comprised of a mixture of 3 parts clay, 2 parts chopped straw, and 6 parts sand, or an alternative *approved* clay plaster.
4. Plaster application shall be in accordance with Section N106.9 for the number and thickness of coats.

N107.1.2 2-hour rated cement plastered wall. 2-hour fire-resistance-rated nonload-bearing cement plastered strawbale walls shall comply with all of the following:

1. Bales shall be laid flat or on-edge in a running bond. Gaps shall be fire-stopped with straw-clay.
2. Bales shall maintain a thickness of not less than 14 inches (356 mm).
3. 1 1/2 inch (38 mm) by 17 gauge galvanized woven wire mesh shall be attached to wood members with 1 1/2 inch (38 mm) staples at 6 inches (406 mm) on center. 9 gauge U-pins with minimum 8 inch (203 mm) legs shall be installed in the field at 18 inches (457 mm) on center.
4. Cement plaster on each side of the wall shall be not less than 1 inch (25 mm) thick.
5. Plaster application shall be in accordance with Section N106.14 for the number and thickness of coats.

N107.2 Openings in rated walls. Openings and penetrations in bale walls required to have a fire-resistance rating shall satisfy the same requirements for openings and penetrations as prescribed in the *International Building Code*.

N107.3 Clearance to fireplaces and chimneys. Strawbale surfaces adjacent to fireplaces or chimneys shall have a minimum 3/8 inch (10 mm) thick plaster coat of any type permitted by this section, and shall maintain the specified clearances to the plaster finish as required to combustibles in *International Building Code* Chapter 21, Sections 2111, 2112, and 2113, or as required by manufacturer's installation instructions, whichever is more restrictive.

N107.4 Type of construction. Buildings or portions thereof utilizing strawbale walls in accordance with this appendix shall be classified as Type V-B construction. Strawbale walls constructed in compliance with Section N107.1.1 or N107.1.2 shall be permitted wherever combustible walls of the same fire-resistance are allowed by Chapter 6 of the *International Buildlng Code*. Strawbale walls with any finish allowed by this appendix shall be permitted wherever non-rated combustible walls are allowed by the *International Building Code*.

Reason: Strawbale construction has proven to be a safe, durable, resource efficient, and fully viable method of construction. However, the International Building Code does not contain a section on strawbale construction, which has been an impediment to this construction system's proper and broader use.

First practiced in Nebraska in the late 1800's, with buildings over 100 years old still in service, strawbale construction was rediscovered in the 1980's in the American southwest. Since then it has been further developed and explored, including considerable testing and research regarding structural performance (under vertical and lateral loads), moisture, fire, and its thermal and acoustic properties.

Currently only Oregon and New Mexico have adopted statewide strawbale building codes. California has legislated strawbale construction guidelines that are voluntarily adopted at the local level. In addition, nine U.S. cities or counties have adopted strawbale building codes. Three countries outside the United States – Germany, France, and Belarus - have limited strawbale building codes.

Most of the strawbale building codes that do exist are derived from the first such code, created for and adopted by Tucson / Pima County, Arizona in 1996. Much experience, testing, and research since then have proven these codes to be deficient. They are often either too restrictive, or not restrictive enough, and in some cases don't address important issues at all.

Although strawbale codes are both few and flawed, strawbale buildings are now found in 49 of the 50 United States, and strawbale construction is practiced in over 45 countries throughout the world and in every climate. There are an estimated 600-1000 strawbale buildings in California alone. The strawbale buildings in the U.S. include residences, schools, office buildings, wineries, multi-story buildings, buildings over 10,000 sq.ft in floor area, load-bearing strawbale structures, and structures in areas of high seismic risk (plastered strawbale walls are particularly resistant to earthquakes). The practice of, and the desire to utilize strawbale construction, continues to increase and promises to accelerate as we face increased pressure on our environment and natural resources.

There is great need for a comprehensive strawbale code, with full benefit of the experience and knowledge that has been gained to date about this method of construction. The following proposed Strawbale Construction appendix for the IBC was created to fulfill this need. It is based on the collective experience of the design, construction, and testing of strawbale buildings over 20 years by architects, engineers, builders, and academics throughout the U.S., Canada, and other countries throughout the world. The testing, research, and comprehensive understanding of the performance of strawbale buildings are summarized in the book

Design of Straw Bale Buildings (B.King, et al, 2006, Green Building Press). Testing, research reports, and other supporting documentation are available for viewing and download at: http://www.ecobuildnetwork.org/strawbale-construction-code-supporting-documentation

As lead author of the proposed appendix, and as a licensed architect for 25 years, I have been involved in the design, construction, testing, and research of strawbale buildings since 1995. In 2001 I spearheaded legislation and revisions to the current California Guidelines for Straw-Bale Structures. The proposed Strawbale Construction appendix for the IBC has benefited from numerous peer reviews by experienced, licensed design and building professionals over the course of more than five years. It would serve designers, builders, owners, inhabitants, and building officials alike in the construction and utilization of strawbale buildings.

Chapter 24 (NEW), 202

Proponent: Proponent: Martin Hammer, Architect, representing California Straw Building Association, Colorado Straw Bale Association, Straw Bale Construction Association-New Mexico, Ontario Straw Bale Building Coalition, Development Center for Appropriate Technology, Environmental Building Network (mfhammer@pacbell.net)

THIS IS A TWO PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES

PART I – IBC STRUCTURAL

Add new text as follows:

CHAPTER 24
STRAWBALE CONSTRUCTION

SECTION 2401
GENERAL

2401.1 Scope. This Chapter shall govern the use of baled straw as a building material.

SECTION 2402
DEFINITIONS

2402.1 Definitions. The following terms are defined in Chapter 2.

BALE.
CLAY.
CLAY SLIP.
FLAKE.
LAID FLAT.
MESH.
ON-EDGE.
PIN.
PRE-COMPRESSION.
REINFORCED PLASTER.
RUNNING BOND.
SHEAR WALL, STRAWBALE.
SKIN.
STACK BOND.
STRAW.
STRAW BALE.
STRAWBALE.
STRAW-CLAY.
TIE.
TRUTH WINDOW.
WALL, LOAD-BEARING.
WALL, NONLOAD-BEARING
WALL, NONSTRUCTURAL.
WALL, STRUCTURAL.

SECTION 2403
BALES

2403.1 Types of straw. Bales shall be composed of straw from wheat, rice, rye, barley, or oat.

2403.2 Shape. Bales shall be rectangular in shape.

2403.3 Size. Bales shall have a minimum height and thickness of 12 inches (305 mm), except as otherwise permitted or required in this chapter. Bales used within a continuous wall shall be of consistent height and thickness to ensure even distribution of loads within the wall system.

2403.4 Ties. Bales shall be confined with synthetic fiber, natural fiber, or metal ties sufficient to maintain required bale density. Ties shall be at least 3 inches (76 mm) and not more than 6 inches (152 mm) from bale faces and shall be spaced not more than 12 (305 mm) inches apart. Bales with broken ties shall be retied with sufficient tension to maintain required bale density.

2403.5 Moisture content. The moisture content of bales at the time of application of the first coat of plaster or the installation of another finish shall not exceed 20 percent of the weight of the bale. The moisture content of bales shall be determined by use of a moisture meter designed for use with baled straw or hay, equipped with a probe of sufficient length to reach the center of the bale. At least 5 percent and not less than ten bales used shall be randomly selected and tested.

2403.6 Density. Bales shall have a minimum dry density of 6.5 pounds per cubic foot (92 kg/cubic meter). The dry density shall be calculated by subtracting the weight of the moisture in pounds (kg) from the actual bale weight and dividing by the volume of the bale in cubic feet (cubic meters). At least 2 percent and not less than five bales to be used shall be randomly selected and tested on site.

2403.7 Partial bales. Partial bales made after original fabrication shall be retied with ties complying with 2403.4.

SECTION 2404
MOISTURE CONTROL

2404.1 General. All weather-exposed bale walls and bale walls enclosing showers or steam rooms, shall be protected from water damage and moisture intrusion in accordance with this section.

2404.2 Water-resistant barriers and vapor permeance ratings. Plastered bale walls shall be permitted to be constructed without any membrane barrier between straw and plaster to facilitate transpiration of moisture from the bales, or to secure a structural bond between straw and plaster, except as allowed or required elsewhere in this chapter. Where a water-resistant barrier is placed behind the exterior finish, it shall have a minimum vapor permeance rating of 5 perms, except as permitted or required elsewhere in this chapter, or as demonstrated to be necessary by a *registered design professional*. Wall finishes shall be vapor permeable or have an equivalent vapor permeance rating of a Class III vapor retarder

2404.3 Horizontal surfaces. Bale walls and other bale elements shall have a moisture barrier at all horizontal surfaces exposed to weather. This moisture barrier shall be of a material and installation that will prevent water from entering the wall system. Horizontal surfaces include, but are not limited to, exterior window sills, sills at exterior niches, and buttresses. The finish material at all such surfaces shall be sloped not less than 1 unit vertical in 12 units horizontal (8-percent slope) and shall drain away from all bale walls and elements. Where the moisture barrier is below the finish material, it shall be sloped not less than 1 unit vertical in 12 units horizontal (8-percent slope) and shall drain to the outside surface of the bale's vertical finish.

2404.4 Bale and concrete separation. A sheet or liquid applied Class II vapor retarder shall be installed between bales and supporting concrete or masonry. The bales shall be separated from the vapor retarder a minimum of 3/4" (19 mm), and that space shall be filled with an insulating material such as wood or rigid insulation, or a material allowing vapor dispersion, such as gravel. Sill plates in structural walls shall comply with Table 2405.14 and Table 2405.15. Where bales abut a concrete or masonry wall that retains earth, a Class II vapor retarder shall be provided between such wall and the bales.

2404.5 Separation of bales and earth. Bales shall be separated from earth a minimum of 8" (203 mm).

2404.6 Separation of exterior plaster and earth. Exterior plaster applied to straw bales shall be a minimum of 4 inches (102 mm) above the earth or 2 inches (51 mm) above paved areas.

2404.7 Shower walls, steam rooms. Bale walls enclosing showers, tub shower combinations, or steam rooms shall be protected by a water-resistive barrier or by a Class I or Class II vapor retarder.

SECTION 2405
STRUCTURAL USE

2405.1 Scope. This section shall apply to structural strawbale walls. Sections 2405.11, 2405.12, and 2405.16 shall also apply to nonstructural strawbale walls.

2405.2 General. An approved engineered design in accordance with Section 2405 and the *International Building Code* shall be provided for buildings or portions thereof using structural strawbale walls.

2405.3 Foundations. Foundations for strawbale walls shall be any type permitted by, and shall be designed in accordance with, the *International Building Code*.

2405.4 Building height and stories. Building height shall not exceed 35 feet and the limits contained in Table 2405.13. Structural use of strawbale walls shall be permitted in multi-story buildings where:

1. Complete vertical and lateral load paths are demonstrated by an *approved* engineered design.
2. Strawbale walls interrupted by floor assemblies are designed and detailed by a *registered design professional*.

2405.5 Configuration of bales. Bales in structural walls shall be laid flat or on-edge and in a running bond or stack bond, except that bales in structural walls with unreinforced plasters shall be laid in a running bond only.

2405.6 Pre-compression of load-bearing strawbale walls. Prior to application of plaster, walls designed to be load-bearing shall be pre-compressed by a uniform load of not less than 100 pounds per linear foot.

2405.7 Voids and stuffing. Voids between bales in structural strawbale walls shall not exceed 4 inches (102 mm) in width, and such voids shall be stuffed with flakes of straw or straw-clay, before application of finish.

2405.8 Plaster skins. Plaster skins on structural walls shall be of any type permitted by Section 2406, except gypsum plaster, and shall be in accordance with Tables 2405.14 and 2405.15.

2405.8.1 Straightness. Plaster skins on structural strawbale walls shall be straight, as a function of the bale wall surfaces they are applied to, as follows:

1. As measured across the face of a bale, straw bulges shall not protrude more than 3/4 inch (19 mm) across 2 feet (610 mm) of its height or length.
2. As measured across the face of a bale wall, straw bulges shall not protrude from the vertical plane of a bale wall more than 2 inches (51 mm) over 8 feet (2438 mm).
3. The vertical face of adjacent bales shall not be offset more than 1/2 inch (13 mm)

2405.8.2 Plaster and membranes. Structural strawbale walls shall not have a membrane between straw and plaster, or shall have attachment through the bale wall from one plaster skin to the other in accordance with an *approved* engineered design.

2405.9 Transfer of loads to and from plaster skins. Where plastered strawbale walls are used to support superimposed vertical loads, such loads shall be transferred to the plaster skins by continuous direct bearing or by an *approved* engineered design. Where plastered strawbale walls are used to resist in-plane lateral loads, such loads shall be transferred via the reinforcing mesh from the structural member or assembly above and to the sill plate in accordance with Table 2405.15, or in accordance with an *approved* engineered design.

2405.10 Support of plaster skins. Plaster skins for structural strawbale walls shall be continuously supported along their bottom edge to facilitate the transfer of loads to the foundation system. Supports shall include, but shall not be limited to: a concrete or masonry stem wall, a concrete slab on grade, a wood-framed floor adequately blocked, with an *approved* engineered design, or a steel angle adequately anchored, with an *approved* engineered design. A conventional metal or plastic weep screed is not an acceptable support.

2405.11 Unrestrained wall height. Strawbale walls shall not exceed the ratios of stacked bale height to bale thickness between restraints, as stated in Section 2505.12, except where an *approved* engineered design demonstrates the wall will resist buckling from superimposed vertical loads and out-of-plane design loads.

2405.12 Resistance to out-of-plane lateral loads. Structural and non-structural strawbale walls shall be considered capable of resisting the out-of-plane loads prescribed in the *International Building Code* with the following limitations and requirements, except where an *approved* engineered design is provided:

1. Walls with unreinforced plasters or a non-plaster finish, and without pins in accordance with 2405.12.4, or other *approved* means of out-of-plane bracing, shall not exceed a 5:1 ratio of stacked bale height to bale thickness.
2. Clay plaster walls with reinforced plasters, or pins in accordance with 2405.12 Item 4, or other *approved* means of out-of-plane bracing, shall not exceed the ratio indicated in Equation 24-1. Plaster reinforcement shall be any type described in Table 2405.15 with staples spaced not more than 6 inches (152 mm) on center.

$H^2/T = 65$ **(Equation 24-1)**

Where:

H = stacked bale height
T = bale thickness
H and T are measured in feet. (H^2/T = 19,800 when H and T are measured in mm)

3. Cement, cement-lime, lime, or soil cement plaster walls with reinforced plasters, or pins in accordance with 2405.12 Item 4, or other *approved* means of out-of-plane bracing, shall not exceed the ratio indicated in Equation 24-2. Plaster reinforcement shall be any type described in Table 2405.15 with staples spaced not more than 6 inches (152 mm) on center.

$H^2/T = 80$ **(Equation 24-2)**

Where:

H = stacked bale height
T = bale thickness
H and T are measured in feet. (H^2/T = 24,400 when H and T are measured in mm)

4. Pins shall be in accordance with an *approved* engineered design, or shall comply with the following: Pins shall be 3/8 inch (10 mm) diameter steel, 3/4 inch diameter (19 mm) wood, or 1/2 inch diameter (13 mm) bamboo. Pins shall be external or internal. External pins shall be installed on both sides of the wall spaced not more than 24 inches (610 mm) on center. External pins shall have full lateral bearing on the sill plate and the roof- or floor-bearing member, and shall be tightly tied through the wall to an opposing pin with ties spaced not more than 30 inches (762 mm) apart and not more than 15 inches (381 mm) from each end. Internal pins shall be installed vertically not more than 24 inches (610 mm) on center in the center third of the bales, and shall extend from top course to bottom course. The bottom course shall be similarly connected to its support and the top course shall be similarly connected to the roof- or floor-bearing member above with pins or other *approved* means. Internal pins shall be continuous or shall overlap through not less than one bale course.

2405.13 Design coefficients and factors for seismic design. The values given in Table 2405.13 shall apply to seismic design using strawbale shear walls detailed in accordance with Table 2405.15.

2405.14 Load-bearing strawbale walls. Load-bearing strawbale walls shall be in accordance with Table 2405.14 as part of an *approved* engineered design to support superimposed vertical loads.

2405.15 Strawbale shear walls. Strawbale shear walls shall be in accordance with Table 2405.13 as part of an *approved* engineered design to resist in-plane lateral loads. Other *approved* in-plane lateral load resisting systems shall be permitted to be used in combination with strawbale shear walls with apportionment of design loads as prescribed in the *International Building Code*.

2405.16 Connection of light-frame walls to strawbale walls. Light-frame walls perpendicular to, or at an angle to a straw bale wall assembly, shall be fastened to the bottom and top wood members of the strawbale wall in accordance with requirements for wood or cold-formed steel light-frame walls in the *International Building Code*, or the abutting stud shall be connected to alternating straw bale courses with a 1/2 inch (13mm) diameter steel, 3/4" diameter (19 mm) wood, or 5/8" diameter (16 mm) bamboo dowel, with minimum 8 inch (203 mm) penetration.

TABLE 2405.13
DESIGN COEFFICIENTS AND FACTORS FOR SEISMIC-FORCE-RESISTING SYSTEMS

Seismic-Force-Resisting System		**Response Modification Coefficient, *R*[1]**	**System Overstrength Factor, Omega[2]**	**Deflection Amplification Factor, *C***	**Structural System Limitations and Building Height (ft) Limits**				
					Seismic Design Category				
					B	C	D	E	F
A. Bearing Wall Systems									
Strawbale shear walls		3.5	3	3	25	25	15	15	15
B. Building Frame Systems									
Strawbale shear walls		4	3	3.5	35	35	25	25	25

[a] R reduces forces to a strength level, not an allowable stress level
[b] The tabulated value of the overstrength factor is permitted to be reduced by subtracting 0.5 for structures with flexible diaphragms, but shall not be taken s less than 2.0 for any structure.

TABLE 2405.14
ALLOWABLE GRAVITY LOADS (LBS./FOOT) FOR PLASTERED STRAWBALE WALLS

WALL DESIGNATION	PLASTER (both sides) Thickness each side	SILL PLATES[b,c]	ANCHOR[c] BOLTS (or other sill fastening)	MESH[d]	STAPLES[e,f,g]	ALLOWABLE BEARING CAPACITY[h] (plf)
A	Clay[j] 1-1/2”	c	c	None required[i]	None required[i]	400
B	Soil-cement[k] 1”	c	c	d	e,f,g	800
C	Lime[l] 7/8”	c	c	d	e,f,g	500
D	Cement-lime[k] 7/8”	c	c	d	e,f,g	800
E	Cement 7/8”	c	c	d	e,f,g	800

For SI: 1 inch=25.4mm, 1 pound per foot = 14.5939 N/m.

a. Plasters shall conform with Sections 2406.9 through 2406.12 for makeup and thickness, with Section 2405.8.1 for straightness, and with Section 2405.10 for support of plaster skins. Specified minimum plaster thicknesses are applied on each face of the wall.

b. Sill plates shall support and be flush with each face of the bale wall and shall be preservative-treated where required by the *International Building Code*..

c. For walls supporting gravity loads only or for non-structural walls, sill plates and fastening shall be in accordance with the requirements for wood framed walls in the *International Building Code*. See Table 2405.15 for requirements for shear walls.

d. Any metal mesh allowed by this section shall be installed throughout the plaster with minimum 4-inch laps and fastened per footnote e.

e. Staples shall be at maximum spacing of 2-inches o.c., to roof or floor bearing assembly, or as shown necessary to transfer loads into the plaster skins in accordance with Section 2405.9, and at a maximum spacing of 4-inches o.c. to sill plates.

f. Staples shall be gun staples, stainless steel or electro-galvanized, 16 gauge with 1 ¼-inch legs, 7/16-inch crown; or manually driven staples, galvanized 15 gauge with 7/8-inch legs, 3/16-inch inner spread and rounded shoulder. Other staples shall be permitted to be used as designed by a *registered design professional*. Staples into preservative-treated wood shall be stainless steel.

g. Staples shall be firmly driven diagonally across mesh intersections at the spacing indicated.

h. For walls with a different plaster on each side, the lower value shall be used.

i. Except as necessary to transfer roof or floor loads to the plaster skins in accordance with Section 2405.9.

j. The building official is authorized to require a cube compression test to demonstrate a minimum 100 psi compressive strength.

k. The building official is authorized to require a compression test to demonstrate a minimum 1000 psi compressive strength.

l. Lime plaster shall use hydraulic or natural hydraulic lime. The building official is authorized to require a cube compression test

m. to demonstrate a minimum 600 psi compressive strength.

n. The building official is authorized to require a cube compression test to demonstrate a minimum 1400 psi compressive strength.

SI: 1 inch=25.4 mm, 1 pound per foot = 14.5939 N/m

a. Bales shall be a minimum of 15 inches thick.

b. Plasters shall comply with Sections 2406.7 through 2406.12 for makeup and thickness, with Section 2405.8.1 for straightness, and with Section 2405.10 for support.

c. Sill plates shall be Douglas fir-larch or southern pine and shall be preservative-treated where required by the *International Building Code*. Multiply allowable shear value by .82 for other species with specific gravity of .42 or greater, or by .65 for all other species.

d. Anchor bolts shall be 5/8-inch diameter with 2-inch by 2-inch by 3/16-inch washers, with not less than 7-inch embedment in concrete or masonry foundation. Anchor bolts or other fasteners into framed floors shall be engineered.

e. Mesh shall run continuous vertically from sill plate to top plate, roof or floor beam, or roof or floor bearing assembly, or shall lap a not less than 12-inches. Horizontal laps shall be not less than 4-inches. Steel mesh shall be galvanized. Galvanized steel mesh shall be separated from preservative-treated wood by grade D paper, 15# roofing felt, or other *approved* barrier.

f. Staples shall be gun staples, stainless steel or electro-galvanized, 16 gauge with 1 ¼-inch legs, 7/16-inch crown; or manually driven staples, galvanized 15 gauge with 7/8-inch legs, 3/16-inch inner spread and rounded shoulder. Other staples shall be permitted to be used as designed by a registered design professional. Staples into preservative-treated wood shall be stainless steel.

g. Staples at spacing indicated are to boundary conditions, including sill plates, and top plate, roof or floor beam, or roof or floor bearing assembly,

h. Staples shall be firmly driven diagonally across mesh intersections at spacing indicated.

i. Values shown are for aspect ratios of 1:1 or less. Reduce values shown to 50% for the limit of a 2:1 aspect ratio. Linear interpolation shall be permitted for ratios between 1:1 and 2:1. The full value shown shall be used for aspect ratios greater than 1:1, where an additional layer of mesh is installed at the base of the wall to a height where the remainder of the wall has an aspect ratio of 1:1 or less, and the second layer of mesh is fastened to the sill plate with the required stapling, and the sill bolt spacing is decreased with linear interpolation between1:1 and 2:1.

j. For walls with a plaster Type A on one side and any other plaster type on the other side, a registered design professional shall show transfer of the design lateral load into the stiffer Type B, C, D, or E plaster only, and 50% of the allowable shear value shown for that wall type shall be used.

k. These values are permitted to be increased 40 percent for wind design.

l. 16 gauge mesh shall be permitted to be used with a reduction to 0.60 of the allowable shear values shown.

m. The building official is authorized to require a cube compression test demonstrating not less than 600 psi compressive strength.

n. Lime plaster shall use hydraulic or natural hydraulic lime. The building official is authorized to require a cube compression test demonstrating not less than 600 psi compressive strength.

o. The building official is authorized to require a cube compression test demonstrating not less than 1000 psi compressive strength.

p. The building official is authorized to require a cube compression test demonstrating not less than 1400 psi compressive strength.

SECTION 2406
FINISHES

2406.1 General. Finishes applied to strawbale walls shall be any type permitted by the *International Building Code*, and shall comply with this section and with Chapters 14 and 25 unless stated otherwise in this section.

2406.2 Purpose, and where required. Strawbale walls shall be finished so as to provide mechanical protection, fire resistance, restrict the passage of air through the bales, and protect them from weather in accordance with this chapter and the *International Building Code*.

Exception: Truth windows are permitted where a fire-resistive rating is not required. Weather-exposed truth windows shall be fitted with a weather-tight cover.

2406.3 Vapor retarders. Class I and Class II vapor retarders shall not be used on a strawbale walls, nor shall any other material be used that has a vapor permeance rating less than 5 perms, except as permitted or required elsewhere in this chapter, or as *approved* and demonstrated to be necessary by a *registered design professional*.

2406.4 Plaster. Plaster applied to bales shall be of any type described in Section 2406, and as required or limited in this chapter.

2406.5 Plaster and membranes. Plaster shall be applied directly to strawbale walls to facilitate transpiration of moisture from the bales, and to secure a mechanical bond between the skin and the bales, except where a membrane is allowed or required elsewhere in this chapter. Structural bale walls shall have no membrane between straw and plaster, or shall have attachment through the bale wall from one plaster skin to the other in accordance with an approved engineered design.

2406.6 Lath and mesh for plaster. The surface of the straw bales functions as lath, and no other lath or mesh shall be required, except as required for tensile or shear strength in structural applications as required in Table 2405.14, Table 2405.15, or by an *approved* engineered design.

2406.7 Plaster on non-structural walls. Plaster on non-structural walls shall be in accordance with Section 2406.9, 2406.10, 2406.11, 2406.12, 2406.13 or 2406.14.

2406.8 Plaster on structural walls. Plaster on structural walls shall comply with Section 2406.9, 2406.10, 2406.11, 2406.12, 2406.13 or 2406.14. Plaster on load-bearing walls shall also comply with Table 2405.14. Plaster on shear walls shall also comply with Table 2405.15.

2406.9 Clay plaster. Clay plaster shall comply with Sections 2406.9.1 through 2406.9.6.

2406.9.1 General. Clay plaster shall be any plaster having a clay or clay soil binder. Such plaster shall contain sufficient clay to fully bind the plaster, sand or other inert granular material, and shall be permitted to contain reinforcing fibers. Reinforcing fibers shall include, but shall not be limited to, chopped straw, sisal, and animal hair.

2406.9.2 Mesh. Clay plaster shall not be required to contain reinforcing mesh except as required in Table 2405.15. Clay plaster shall be permitted to contain natural fiber mesh, corrosion-resistant metal mesh, nylon mesh, or high-density polypropylene mesh.

2406.9.3 Thickness and coats. Clay plaster shall be not less than 1 inch (25 mm) thick, unless required to be thicker for structure or fire-resistance, as described elsewhere in this chapter, and shall be applied with a minimum of two coats.

2406.9.4 Rain-exposed. Clay plaster, where exposed to rain, shall be finished with lime wash, linseed oil, or other *approved* erosion resistant finish.

2406.9.5 Prohibited finish coat. Cement plaster is prohibited as a finish coat over clay plasters.

2406.9.6 Additives. Additives shall be permitted to increase the plaster's workability, durability, strength, or water resistance.

2406.10 Soil-cement plaster. Soil-cement plaster shall comply with Sections 2406.10.1 through 2406.10.3.

2406.10.1 General. Soil-cement plaster shall be comprised of soil (free of organic matter), sand, and not less than 10 percent Portland cement by volume, and shall be permitted to contain reinforcing fibers.

2406.10.2 Mesh. Soil-cement plaster shall use any corrosion-resistant metal mesh permitted by the *International Building Code*, or as required in Section 2405 where used on a structural wall.

2406.10.3 Thickness. Soil-cement plaster shall be a minimum of 1 inch (25 mm) thick.

2406.11 Gypsum plaster. Gypsum plaster shall comply with Section 2511 of the *International Building Code*. Gypsum plaster shall be limited to use on interior surfaces, and on non-structural walls, except as an interior finish coat over a structural plaster that complies with this chapter.

2406.12 Lime plaster. Lime plaster shall comply with Sections 2406.12.1 and 2406.12.2.

2406.12.1 General. Lime plaster is any plaster whose binder is comprised of calcium hydroxide (CaOH) including Type N or Type S hydrated lime, hydraulic lime, natural hydraulic lime, or quicklime. Hydrated lime plasters shall comply with ASTM C 206. Quicklime plasters shall comply with ASTM C 5. Liime plaster shall be permitted to be applied in 2 coats, provided that the combined thickness is at least 7/8 inch (22 mm), and each coat is no greater than 1/2 inch (13 mm).

2406.12.2 On structural walls. Lime plaster on structural strawbale walls in accordance with Table 2405.14 or Table 2405.15 shall use hydraulic or natural hydraulic lime.

2406.13 Cement-lime plaster. Cement-lime plaster shall be plaster mixes CL or FL as described in ASTM C 926. Cement-lime plaster shall be permitted to be applied in 2 coats, provided the combined thickness is at least 7/8 inch (22 mm) thick, and each coat is not greater than 1/2 inch (13 mm) thick.

2406.14 Cement plaster. Cement plaster shall comply with Section 2512 of the *International Building Code*, except that the amount of lime in all plaster coats shall be not less than 1 part lime to 6 parts cement to allow a minimum acceptable vapor permeability. The plaster shall be permitted to be applied in 2 coats, provided the combined thickness is at least 7/8 inch (22 mm), and each coat is not greater than 1/2 inch (13 mm) thick. The combined thickness of all plaster coats shall be not more than 1 1/2 inch (38 mm) thick.

2406.15 Finishes over plaster. Other finishes, as permitted elsewhere in this section and the *International Building Code*, shall be permitted to be applied over the plaster, except as prohibited in Section 2406.16.

2406.16 Prohibited plasters and finishes. Any plaster or finish with a singular or cumulative perm rating less than 5 perms shall be prohibited on straw bale walls, except where approved and demonstrated to be necessary by a *registered design professional*, or as required elsewhere in this chapter.

2406.17 Separation of wood and plaster. Where wood framing or wood sheathing occurs in strawbale walls, such wood surfaces shall be separated from exterior plaster with No. 15 asphalt felt, grade D paper, or other *approved* material in accordance with Section 1404.2 of the *International Building Code*, except where the wood is preservative-treated or naturally durable.

> **Exception:** Exterior clay plasters shall not be required to be separated from wood.

SECTION 2408
THERMAL INSULATION

2408.1 R-value. The unit R-value of a strawbale wall with bales laid flat is R-1.3 per inch, and with bales on-edge is R-2 per inch.

Revise as follows:

SECTION 202
DEFINITIONS

BALE. Equivalent to straw bale.
CLAY. Inorganic soil with particle sizes less than 0.00008 in. (0.002 mm) having the characteristics of high to very high dry strength and medium to high plasticity.
CLAY SLIP. A suspension of clay particles in water.
FLAKE. An intact section of compressed straw removed from an untied bale.
LAID FLAT. The orientation of a bale with its largest faces horizontal, its longest dimension parallel with the wall plane, its ties concealed in the unfinished wall and its straw lengths oriented across the thickness of the wall.
MESH. An openwork fabric of linked strands of metal, plastic, or natural or synthetic fiber, embedded in plaster to provide tensile reinforcement or bonding.
ON-EDGE. The orientation of a bale with its largest faces vertical, its longest dimension parallel with the wall plane, its ties on the face of the wall, and its straw lengths oriented vertically.
PIN. Metal rod, wood dowel, or bamboo, driven into or through-tied on the surface of stacked bales for purpose of connection or stability.
PRE-COMPRESSION. Vertical compression of stacked bales before application of finish.
REINFORCED PLASTER. A plaster containing mesh reinforcement.
RUNNING BOND. The placement of *masonry units* or straw bales such that the *head joints* in successive courses are offset at least one-quarter the unit or bale length.
STRAWBALE SHEAR WALL. A strawbale wall designed to resist lateral forces parallel to the plane of the wall in accordance with Section 2405.15.
SKIN. The compilation of plaster and reinforcing, if any, applied to the surface of stacked straw bales.
STACK BOND. The placement of *masonry units* or straw bales such that *head joints* in successive courses are vertically aligned. For the purposes of this code, requirements of stack bond shall apply to *masonry* or straw bales laid in other than a *running bond*.
STRAW. The dry stems of cereal grains after the seed heads have been removed.
STRAW BALE. A rectangular compressed block of straw, bound by ties.
STRAWBALE. The adjective form of straw bale.
STRAW-CLAY. Loose straw mixed and coated with clay slip.
TIE. A synthetic fiber, natural fiber, or metal wire used to confine a straw bale.
TRUTH WINDOW. An area of a strawbale wall left without its finish, to allow view of the straw otherwise concealed by its finish.
WALL, LOAD-BEARING. Any wall meeting ~~either~~ one of the following classifications:

1. Any metal or wood stud wall that supports more than 100 pounds per linear foo (1459 N/m) of vertical load in addition to its own weight.
2. Any masonry or concrete wall that supports more than 200 pound per linear foot (2919 N/m) of vertical load in addition to its own weight.
3. Any strawbale wall that supports more than 100 lb/linear ft (1,459 N/m) of vertical load in addition to its own weight.

WALL, NONSTRUCTURAL. All walls other than load-bearing walls or shear walls.
WALL, STRUCTURAL. A wall that meets the definition for a load-bearing wall or shear wall.

PART II – IBC FIRE SAFETY

SECTION 2407
FIRE RESISTANCE

2407.1 Fire-resistance rating. Fire-resistance ratings for strawbale walls shall be established in accordance with Section 2407.1.1 or 2407.1.2, or shall be determined in accordance with Section 703.2 or 703.3 of the *International Building Code*.

2407.1.1 1-hour rated clay plastered wall. 1-hour fire-resistance-rated nonload-bearing clay plastered strawbale walls shall comply with all of the following:

1. Bales shall be laid flat or on-edge in a running bond. Gaps shall be fire-stopped with straw-clay,
2. Bales shall maintain a thickness of not less than 18 inches (457 mm),
3. Clay plaster on each side of the wall shall be not less than 1 inch (25 mm) thick and shall be comprised of a mixture of 3 parts clay, 2 parts chopped straw, and 6 parts sand, or an alternative *approved* clay plaster.
4. Plaster application shall be in accordance with Section 2406.9 for the number and thickness of coats.

2407.1.2 2-hour rated cement plastered wall. 2-hour fire-resistance-rated nonload-bearing cement plastered strawbale walls shall comply with all of the following:

1. Bales shall be laid flat or on-edge in a running bond. Gaps shall be fire-stopped with straw-clay.
2. Bales shall maintain a minimum thickness of 14 inches (356 mm).
3. 1 1/2 inch (38 mm) by 17 gauge galvanized woven wire mesh shall be attached to wood members with 1 1/2 inch (38 mm) staples at 6 inches (406 mm) on center. 9 gauge U-pins with minimum 8 inch (203 mm) legs shall be installed in the field at 18 inches (457 mm) on center.
4. Cement plaster on each side of the wall shall be not less than 1 inch (25 mm) thick.
5. Plaster application shall be in accordance with Section 2406.14 for the number and thickness of coats.

2407.2 Openings in rated walls. Openings and penetrations in bale walls required to have a fire-resistance rating, shall satisfy the same requirements for openings and penetrations as prescribed in the *International Building Code*.

2407.3 Clearance to fireplaces and chimneys. Strawbale surfaces adjacent to fireplaces or chimneys shall have a minimum 3/8 inch (10 mm) thick plaster coat of any type permitted by this section, and shall maintain the specified clearances to the plaster finish as required to combustibles in *International Building Code* Chapter 21, Sections 2111, 2112, and 2113, or as required by manufacturer's installation instructions, whichever is more restrictive.

2407.4 Type of construction. Buildings or portions thereof utilizing strawbale walls in accordance with this chapter shall be classified as Type V-B construction. Strawbale walls constructed in compliance with Section 2407.1.1 or 2407.1.2 shall be permitted wherever combustible walls of the same fire-resistance are allowed by Chapter 6 of the *International BuildIng Code*. Strawbale walls with any finish allowed by this chapter shall be permitted wherever non-rated combustible walls are allowed by the *International Building Code*.

Reason: Strawbale construction has proven to be a safe, durable, resource efficient, and fully viable method of construction. However, the International Building Code does not contain a section on strawbale construction, which has been an impediment to this construction system's proper and broader use.

First practiced in Nebraska in the late 1800's, with buildings over 100 years old still in service, strawbale construction was rediscovered in the 1980's in the American southwest. Since then it has been further developed and explored, including considerable testing and research regarding structural performance (under vertical and lateral loads), moisture, fire, and its thermal and acoustic properties.

Currently only Oregon and New Mexico have adopted statewide strawbale building codes. California has legislated strawbale construction guidelines that are voluntarily adopted at the local level. In addition, nine U.S. cities or counties have adopted strawbale building codes. Three countries outside the United States – Germany, France, and Belarus - have limited strawbale building codes.

Most of the strawbale building codes that do exist are derived from the first such code, created for and adopted by Tucson / Pima County, Arizona in 1996. Much experience, testing, and research since then have proven these codes to be deficient. They are often either too restrictive, or not restrictive enough, and in some cases don't address important issues at all.

Although strawbale codes are both few and flawed, strawbale buildings are now found in 49 of the 50 United States, and strawbale construction is practiced in over 45 countries throughout the world and in every climate. There are an estimated 600-1000 strawbale buildings in California alone. The strawbale buildings in the U.S. include residences, schools, office buildings, wineries, multi-story buildings, buildings over 10,000 sq.ft in floor area, load-bearing strawbale structures, and structures in areas of high seismic risk (plastered strawbale walls are particularly resistant to earthquakes). The practice of, and the desire to utilize strawbale construction, continues to increase and promises to accelerate as we face increased pressure on our environment and natural resources

There is great need for a comprehensive strawbale code, with full benefit of the experience and knowledge that has been gained to date about this method of construction. The following proposed Strawbale Construction chapter for the IBC was created to fulfill this need. It is based on the collective experience of the design, construction, and testing of strawbale buildings over 20 years by architects, engineers, builders, and academics throughout the U.S., Canada, and other countries throughout the world. The testing, research, and comprehensive understanding of the performance of strawbale buildings are summarized in the book *Design of Straw Bale Buildings* (B.King, et al, 2006, Green Building Press). Testing, research reports, and other supporting documentation are available for viewing and download at: http://www.ecobuildnetwork.org/strawbale-construction-code-supporting-documentation

As lead author of the proposed chapter, and as a licensed architect for 25 years, I have been involved in the design, construction, testing, and research of strawbale buildings since 1995. In 2001 I spearheaded legislation and revisions to the current California Guidelines for Straw-Bale Structures. The proposed Strawbale Construction chapter for the IBC has benefited from numerous peer reviews by experienced, licensed design and building professionals over the course of more than five years. It would serve designers, builders, owners, inhabitants, and building officials alike in the construction and utilization of strawbale buildings.

S317–12
Chapter 35 (NEW)

Proponent: John Woestman, Kellen Company, representing Composite Lumber Manufacturers Association (CLMA) (jwoestman@kellencompany.com)

Add new text as follows:

CHAPTER 35
COMPOSITES

SECTION 3501
GENERAL

3501.1 Scope. These provisions shall govern the materials, design, application, construction and installation of composite materials and products.

SECTION 3502
DEFINITIONS

3502.1 General. The following words and terms shall, for the purposes of this chapter have the meanings shown herein.

WOOD PLASTIC COMPOSITE. A composite material made primarily from wood or cellulose-based materials, and plastic.

SECTION 3503
WOOD PLASTIC COMPOSITE EXTERIOR MATERIALS AND PRODUCTS

3503.1 General. The provisions of this section shall govern the requirements and uses of wood plastic composite materials and products for exterior decks, balconies, and porches of buildings and structures.

3503.1.1 Wood plastic composite exterior deck boards, stair treads, handrails, and guardrail systems. Exterior deck boards, stair treads, handrails, and guardrail systems of wood plastic composite shall comply with this section.

3503.1.1.1 Minimum standards and quality. Exterior wood plastic composite deck boards, stair treads, and handrails and guardrail systems shall comply with ASTM D 7032.

3503.1.1.2 Structural. The allowable load and maximum allowable span for exterior wood plastic composite deck boards and stair treads shall be determined in accordance with ASTM D7032. Testing of handrails and guardrail systems to demonstrate compliance to the structural performance requirements of this code shall be in accordance with ASTM D7032.

3503.1.1.3 Labeling. Deck boards and stair treads shall bear a label that indicates compliance to ASTM D7032 and includes the allowable load and maximum allowable span. Handrails and guardrail systems or their packaging shall bear a label that indicates compliance to ASTM D7032 and includes the maximum allowable span.

3503.1.1.4 Installation. Wood plastic composite deck components shall be installed in accordance with the manufacturer's instructions.

Add new standard to Chapter 35 as follows:

ASTM

<u>D 7032-10a</u> <u>Standard Specification for Establishing Performance Ratings For Wood-Plastic Composite Deck Boards and Guardrail Systems (Guards or Handrails)</u>

Reason: Currently, the IBC is silent regarding specific requirements for wood plastic composite decking materials.

Composite materials may not neatly fit into the wood chapter of the IBC (Chapter 23) or in the plastics chapter (Chapter 26). A logical location for this material is in a new chapter titled “Composites.” Looking to the future, this new chapter creates a logical location in the IBC for other composites that may be utilized in building construction but fall outside the scopes of Chapter 23 and Chapter 26. If Chapter 35, at the end of the IBC, is not the best location for this proposed new chapter for composites, ICC staff can editorially move this proposed new chapter to a more appropriate location in the IBC.

This proposal introduces a definition of wood plastic composite (limited to the scope of this chapter) and creates a section for exterior materials and products made from this specific material. Then the proposal limits the scope of the requirements to materials and products for exterior decks, balconies, and porches. Finally, the proposal introduces specific requirements for exterior wood plastic composite deck boards, stair treads, handrails, and guardrail systems.

With this proposal, CLMA seeks to introduce mandatory requirements in the IBC for exterior wood plastic composite deck components while making it easier for builders to comply with the code and for building officials to enforce the code.

Including the labeling requirement in this proposal brings WPCs within the requirements of the definition of “label” in Chapter 2 of the IBC, thus requiring 3rd party certification of these WPCs and ongoing quality assurance. This requirement helps to assure building officials that wood plastic composite decking and guards will meet the performance requirements of the IBC.

As with most engineered building components, wood plastic composite deck components should be required to be installed per the manufacturer’s instructions. The manufacturer’s instructions and this proposed language limits the use of these wood plastics to only those uses they were designed for.

This proposal requires wood plastic composite deck boards, stair treads, handrails and guardrail systems to meet the requirements of ASTM D7032, a standard developed specifically for demonstrating code compliance of WPC exterior deck components. Meeting the requirements of ASTM D7032 verifies the engineered WPC products are appropriate for use as exterior deck components. ASTM D7032 includes deck-related performance evaluations and performance requirements such as flexural tests, bio-degradation tests, fire performance tests, creep recovery tests, mechanical fastener holding tests, and slip resistance tests. The standard also includes consideration of the effects of temperature, moisture, concentrated loads, freeze-thaw resistance tests, UV resistance, and duration of load on WPC deck boards, stair treads, and handrail and guardrail systems.

The design capacity of each WPC deck board, stair tread, handrail, and guardrail system is tested and evaluated according to product specification ASTM D7032. The testing required in D7032 addresses IBC requirements for deck boards, stair treads, handrails, and guardrail systems.

The result of these tests determines an allowable load and span rating for deck boards and a stringer spacing for stair treads. Product labels will show verification of compliance with ASTM D 7032 and provide the appropriate performance information. For example, deck board labels would identify the allowable load and span (e.g., 100 psf load on a 16” span would be expressed as “16/100”). For stair treads, ASTM D7032 requires load and span testing at higher loads (300 psf and 750 lb concentrated load). This concentrated load test for WPC stair treads is 2.5 times what’s required in the IBC in Table 1607.1, Footnote f.

Guardrail systems, per ASTM D7032, are required to be subjected to and pass the in-fill load test, the uniform load test, and the concentrated load test at 2.5 times the loads required by the IBC (in Section 1607.8) with the guardrail system constructed according to the manufacturer’s instructions. These tests evaluate the strength and stiffness of all components and their connections.

For designers, specifiers, builders, and for code enforcement, the maximum post spacing (span) for guardrail systems is required to be on the label, as is verifying compliance to ASTM D7032. And, of course, guardrail systems for projects constructed under the IBC must meet the requirements of Section 1012 and 1013.

Assuming WPC deck boards, stair treads, and guardrail systems are selected, specified, and installed according to the manufacturer’s instructions – and the manufacturer confirms compliance to ASTM D7032 in their literature and on the product label – designing exterior deck projects which use WPC components is quite straightforward: 1) Select WPC deck boards that meet or exceed the required load (per IBC Table 1607.1) at the desired span of the deck’s joists. 2) Plan for stair stringers no farther apart than the maximum allowable span for the desired WPC stair treads. 3) Select a WPC guardrail system that meets the minimum height requirements for the project (i.e. 42” for the IBC) and plan for guardrail supports (posts) no further apart than the maximum spacing (span) allowed by the guardrail system’s manufacturer.

Cost Impact: Zero to a cost reduction because of easier code compliance with specific requirements included in the IBC.

G1001.4

Proponent: John Ingargiola and Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@dhs.gov, gregory.p.wilson@dhs.gov) and Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net).

Revise as follows:

G1001.4 Enclosures below design flood elevation. Fully enclosed areas below the design flood elevation shall be ~~at or above grade on all sides and conform to the following:~~ constructed in accordance with ASCE 24.

1. ~~In *flood hazard areas* not subject to high-velocity wave action, enclosed areas shall have flood openings to allow for the automatic inflow and outflow of floodwaters.~~
2. ~~In *flood hazard areas* subject to high-velocity wave action, enclosed areas shall have walls below the design flood elevation that are designed to break away or collapse from a water load less than that which would occur during the design flood, without causing collapse, displacement or other structural damage to the building or structure~~.

Reason: ASCE 24 includes requirements for enclosures below elevated buildings that vary based on flood zone. Referencing ASCE 24 eliminates the need to make coordinating changes if ASCE 24 changes in the future.

ASCE began the process of updating ASCE 24-05 in early 2011 and the next edition is expected to be published late 2012 or early 2013. The ASCE committee expects to have the near-final draft prepared and available at least a month before the Group A hearings and copies will be provided to the ICC committee.

Cost Impact: The code change proposal will not increase the cost of construction. Utility and miscellaneous group U buildings with enclosures should already be required to meet the requirements for enclosures.

	Assembly:	ASF	AMF	DF

G1001.4-S-INGARGIOLA-WILSON-QUINN.doc

S319–12
G102.1

Proponent: John Ingargiola and Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@dhs.gov, gregory.p.wilson@dhs.gov) and Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net)

Revise as follows:

G102.1 General. This appendix, in conjunction with the *International Building Code*, provides minimum requirements for development located in flood hazard areas, including the subdivision of land; site improvements and installation of utilities; placement and replacement of manufactured homes; placement of recreational vehicles; new construction and repair, reconstruction, rehabilitation or additions to new construction; substantial improvement of existing buildings and structures, including restoration after damage, installation of tanks; temporary structures, and temporary or permanent storage, utility and miscellaneous Group U buildings and structures, and certain building work exempt from permit under Section 105.2 and other buildings and development activities.

Reason: The purpose of this section is to identify the development activities for which minimum requirements are listed in Appendix G. The proposed changes are consistent with the subsections in Appendix G (including some proposed new subsections).

Cost Impact: The code change proposal will not increase the cost of construction.

S319-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

G102.1-S-INGARGIOLA-WILSON-QUINN.doc

S320–12
G103.1

Proponent: John Ingargiola and Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@dhs.gov, gregory.p.wilson@dhs.gov) and Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net)

Revise as follows:

G103.1 Permit applications. All applications for permits must comply with the following

1. The *building official* shall review all *permit* applications to determine whether proposed development ~~sites will be reasonably safe from flooding~~ are located in flood hazard areas established in Section G102.2.
2. If a proposed development site is in a flood hazard area, ~~all site development activities (including grading, filling, utility installation and drainage modification), all new construction and substantial improvements (including the placement of prefabricated buildings and manufactured homes) and certain building work exempt from *permit* under Section 105.2~~ all development to which this appendix is applicable as specified in Section G102.1 shall be designed and constructed with methods, practices and materials that minimize flood damage and that are in accordance with this code and ASCE 24.

Reason: This proposal clarifies that the first step is to determine whether proposed development activities are locate in (or out) of the mapped flood hazard area. The second item is simplified; rather than restate the long list of development activities, it is clearer to refer to the list that is already present in G102.1.

Cost Impact: The code change proposal will not increase the cost of construction.

S320-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

G103.1-S-INGARGIOLA-WILSON-QUINN.doc

S321–12
G103.4, G103.5, G103.6.1, G401.1

Proponent: John Ingargiola and Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@dhs.gov, gregory.p.wilson@dhs.gov) and Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net).

Revise as follows:

G103.4 Activities in riverine flood hazard areas. In riverine *flood hazard areas* where *design flood elevations* are specified but *floodways* have not been designated, the *building official* shall not permit any new construction, substantial improvement or other development, including fill, unless the applicant submits an engineering analysis prepared and sealed by a registered design professional, that demonstrates that the cumulative effect of the proposed development, when combined with all other existing and anticipated flood hazard area encroachment, will not increase the design flood elevation more than 1 foot (305 mm) at any point within the community.

G103.5 Floodway encroachment. Prior to issuing a *permit* for any *floodway* encroachment, including fill, new construction, substantial improvements and other development or land-disturbing activity, the *building official* shall require submission of a certification, sealed by a registered design professional, along with supporting technical data, that demonstrates that such development will not cause any increase of the level of the base *flood*.

G103.6.1 Engineering analysis. The *building official* shall require submission of an engineering analysis, prepared and sealed by a registered professional, which demonstrates that the flood-carrying capacity of the altered or relocated portion of the watercourse will not be decreased. Such watercourses shall be maintained in a manner which preserves the channel's flood-carrying capacity.

G103.7 Alterations in coastal areas. Prior to issuing a permit for any alteration of sand dunes and mangrove stands in flood hazard areas subject to high velocity wave action, the *building official* shall require submission of an engineering analysis, prepared and sealed by a registered design professional, which demonstrates that the proposed alteration will not increase the potential for flood damage.

G401.1 Development in floodways. Development or land disturbing activity shall not be authorized in the *floodway* unless it has been demonstrated through hydrologic and hydraulic analyses performed in accordance with standard engineering practice, and prepared and sealed by a registered design professional, that the proposed encroachment will not result in any increase in the level of the base *flood*.

Reason: The analyses referred to in these sections are prepared by engineers. The building official is not expected to have the experience or qualifications to determine whether such analyses were properly prepared. Specifying that the work has to be prepared and sealed by an RDP puts the burden on the RDP to meet standards of practice for these analyses. This requirement is consistent with the NFIP and the same requirement should already appear in local floodplain management regulations.

Cost Impact: The code change proposal will not increase the cost of construction. This requirement is consistent with the NFIP and the same requirement should already appear in local floodplain management regulations.

S321-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

G103.4-S-INGARGIOLA-WILSON-QUINN.doc

S322–12
G103.8 (NEW)

Proponent: John Ingargiola and Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@dhs.gov, gregory.p.wilson@dhs.gov) and Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net)

Add new text as follows:

G103.8 Inspections. Development for which a permit under this appendix is required shall be subject to inspection. The building official or the building official's designee shall make or cause to be made, inspections of all development in flood hazard areas authorized by issuance of a permit under this appendix.

Reason: Just as the code requires inspection of permitted buildings, this appendix should require inspection of all other development in flood hazard areas for which permits are issued.

Cost Impact: The code change proposal will not increase the cost of construction. Inspection of non-building development that is permitted in flood hazard areas should already be performed by communities that participate in the NFIP.

S322-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

G103.8 #1-S-INGARGIOLA-WILSON-QUINN.doc

S323–12
G103.8 (NEW), G104.2

Proponent: John Ingargiola and Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@dhs.gov, gregory.p.wilson@dhs.gov) and Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net)

Revise as follows:

<u>**G103.8 Substantial improvement and substantial damage determinations.** For permit applications to improve or repair buildings and structures, including additions, repairs, rehabilitations, renovations, alterations, relocations, reconstructions, or other work, the building official, shall:</u>

1. <u>Estimate the market value, or require the applicant to obtain a professional appraisal of the market value, of the building or structure before the proposed work is performed; the market value of the building or structure shall be the market value before the damage occurred or before any improvement is made;</u>
2. <u>Compare the cost to perform the improvement, the cost to repair the damaged building to its pre-damaged condition, or the combined costs of improvements and repairs, if applicable, to the market value of the building or structure;</u>
3. <u>Determine and document whether the proposed work constitutes substantial improvement or repair of substantial damage; and</u>
4. <u>If the determination finds that the proposed work constitutes substantial improvement or repair of substantial damage, notify the applicant of the results of the determination and whether compliance with the requirements of the building code is required.</u>

~~G103.8~~ <u>G103.9</u> Records. The *building official* shall maintain a permanent record of all *permits* issued in *flood hazard areas*, including copies of inspection reports and certifications required in Section 1612.

G104.2 Application for permit. The applicant shall file an application in writing on a form furnished by the *building official*. Such application shall:

1. Identify and describe the development to be covered by the permit.
2. Describe the land on which the proposed development is to be conducted by legal description, street address or similar description that will readily identify and definitely locate the site.
3. Include a site plan showing the delineation of flood hazard areas, floodway boundaries, flood zones, design flood elevations, ground elevations, proposed fill and excavation and drainage patterns and facilities.
4. Indicate the use and occupancy for which the proposed development is intended.
5. Be accompanied by construction documents, grading and filling plans and other information deemed appropriate by the building official.
6. State the valuation of the proposed work.
7. <u>Include a market value appraisal of the building (excluding land), for applications for work on existing buildings, unless otherwise advised by the building official.</u>

~~7~~<u>8.</u> Be signed by the applicant or the applicant's authorized agent.

Reason: Communities that participate in the NFIP agree to regulate all development in flood hazard areas. FEMA states that the flood provisions in the I-Codes are consistent with the NFIP requirements for the design and construction of buildings. To fully meet the requirements of the NFIP local jurisdictions must adopt a local ordinance or Appendix G in order to have the necessary administrative provisions and requirements for development other than buildings.

Section 105.3 of the code requires the applicant to describe the work to be covered by the permit and to state the valuation of the proposed work. The building code defines and uses the terms “substantial improvement” and “substantial damage.” This proposal clarifies how the building official is to use the information to determine whether proposed work meets the definitions.

FEMA recently published FEMA P-758, *Substantial Improvement/Substantial Damage Desk Reference*, that includes guidance for local officials on estimating market value as well as estimating costs. This proposal states that the applicant shall submit a market value appraisal unless otherwise advised; FEMA guidance now states that local officials may use “adjusted assessed value” or “actual cash value” (replacement minus depreciation).

Cost Impact: The code change proposal will not increase the cost of construction. Determining whether work proposed on an existing building is substantial improvement or repair of substantial damage is implicit in the definitions of those terms. This proposal does not change the fact that determining whether proposed work meets those definitions has to be done. It simply clarifies how it is to be done.

S323-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

G103.8 #2-S-INGARGIOLA-WILSON-QUINN.doc

S324–12
G104.2

Proponent: John Ingargiola and Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@dhs.gov, gregory.p.wilson@dhs.gov) and Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net)

Revise as follows:

G104.2 Application for permit. The applicant shall file an application in writing on a form furnished by the *building official*. Such application shall:

1. Identify and describe the development to be covered by the permit.
2. Describe the land on which the proposed development is to be conducted by legal description, street address or similar description that will readily identify and definitely locate the site.
3. Include a site plan showing the delineation of flood hazard areas, floodway boundaries, flood zones, design flood elevations, ground elevations, proposed fill and excavation and drainage patterns and facilities.
4. Include in subdivision proposals and other proposed developments with more than 50 lots or larger than 5 acres, base flood elevation data in accordance with to Section 1612.3.1 if such data are not identified for the flood hazard areas established in Section G102.2.

~~4~~5. Indicate the use and occupancy for which the proposed development is intended.
~~5~~6. Be accompanied by construction documents, grading and filling plans and other information deemed appropriate by the building official.
~~6~~7. State the valuation of the proposed work.
~~7~~8. Be signed by the applicant or the applicant's authorized agent.

Reason: Appendix G includes requirements for subdivisions which is consistent with the NFIP requirement un federal regulation (44 CFR 60.3(b)(3)). If proposals for larger developments and subdivisions are affected by flood hazard areas shown on FIRMs, but the areas do not have base flood elevations, the requirement is that elevations have to be developed. Section 1612.3.1 allows use of data available from other sources, or authorizes the building official to require such information be developed by the applicant.

Cost Impact: The code change proposal will not increase the cost of construction. This should already be required by communities that participate in the NFIP

S324-12

	Assembly:	ASF	AMF	DF

G104.2-S-INGARGIOLA-WILSON-QUINN.doc

S325–12
G501 (NEW)

Proponent: John Ingargiola and Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@dhs.gov, gregory.p.wilson@dhs.gov) and Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net)

Add new text as follows:

G501.4 Protection of mechanical equipment and outside appliances. Mechanical equipment and outside appliances shall be elevated to or above the design flood elevation.

> **Exception.** Where such equipment and appliances are designed and installed to prevent water from entering or accumulating within their components and the systems are constructed to resist hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding up to the elevation required by Section 1612, the systems and equipment shall be permitted to be located below the elevation required by Section 1612. Electrical wiring systems shall be permitted below the design flood elevation provided they conform to the provisions of NFPA 70.

Reason: This language comes from G1001.6. Adding this does not create a new requirement because the NFIP requires that the same code requirements for equipment and appliances associated with buildings in flood hazard areas also apply to equipment and appliances associated with manufactured homes.. FEMA guidance is found in *Protecting Manufactured Homes from Floods and Other Hazards* (FEMA P-85, issued November 2009).

Cost Impact: The code change proposal will not increase the cost of construction. Elevation or protection of equipment and appliances is already a requirement for communities that participate in the NFIP

Add new text as follows:

G501.4 Enclosures. Fully enclosed areas below elevated manufactured homes shall comply with the requirements of Section 1612.

Reason: Adding this does not create a new requirement because the NFIP and local floodplain management ordinances require that the same requirements for enclosed areas below elevated buildings also apply to enclosures under elevated manufactured homes (Section 1612 refers to ASCE 24 for specific requirements, which vary based on flood zone). FEMA guidance is found in *Protecting Manufactured Homes from Floods and Other Hazards* (FEMA P-85, issued November 2009).

Cost Impact: The code change proposal will not increase the cost of construction. Already a requirement for communities that participate in the NFIP.

S326-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

G501-S-INGARGIOLA-WILSON-QUINN.doc

S327–12
G701.1 (NEW)

Proponent: John Ingargiola and Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@dhs.gov, gregory.p.wilson@dhs.gov) and Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net).

Delete and substitute as follows:

~~**G701.1 Underground tanks.** Underground tanks in *flood hazard areas* shall be anchored to prevent flotation, collapse or lateral movement resulting from hydrostatic loads, including the effects of buoyancy, during conditions of the design *flood*.~~

~~**G701.2 Above-ground tanks.** Above-ground tanks in flood hazard areas shall be elevated to or above the design *flood* elevation or shall be anchored or otherwise designed and constructed to prevent flotation, collapse or lateral movement resulting from hydrodynamic and hydrostatic loads, including the effects of buoyancy, during conditions of the design *flood*.~~

~~**G701.3 Tank inlets and vents.** In *flood hazard areas*, tank inlets, fill openings, outlets and vents shall be:~~

1. ~~At or above the design flood elevation or fitted with covers designed to prevent the inflow of floodwater or outflow of the contents of the tanks during conditions of the design *flood*.~~
2. ~~Anchored to prevent lateral movement resulting from hydrodynamic and hydrostatic loads, including the effects of buoyancy, during conditions of the design *flood*.~~

<u>**G701.1 Tanks.** Underground and above-ground tanks shall be designed, constructed, installed and anchored in accordance with ASCE 24.</u>

Reason: ASCE 24 contains both performance requirements for tanks and the limitations based on flood zone. This proposal references ASCE 24, rather than replicate those requirements in Appendix G, thus eliminating the need to make coordinating changes if ASCE 24 changes in the future.

ASCE began the process of updating ASCE 24-05 in early 2011 and the next edition is expected to be published late 2012 or early 2013. The ASCE committee expects to have the near-final draft prepared and available at least a month before the Group A hearings and copies will be provided to the ICC committee.

Cost Impact: The code change proposal will not increase the cost of construction. Tanks in flood hazard areas are already regulated.

S327-12

S328–12
G801.1

Proponent: John Ingargiola and Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@dhs.gov, gregory.p.wilson@dhs.gov) and Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net)

Revise as follows:

G801.1 ~~Detached~~ Garages and accessory structures. ~~Detached accessory structures shall be anchored to prevent flotation, collapse or lateral movement resulting from hydrostatic loads, including the effects of bouyancy, during conditions of the design *flood*. Fully enclosed accessory structures shall have flood openings to allow for the automatic entry and exit of *flood* waters~~. Garages and accessory structures shall be designed and constructed in accordance with ASCE 24.

Reason: ASCE 24 contains requirements garages and accessory structures that allow them to be constructed without meeting the elevation requirements, provided certain other requirements are met. Those requirements are, in part, based on flood zone. This proposal references ASCE 24, rather than replicate those requirements in Appendix G, thus eliminating the need to make coordinating changes if ASCE 24 changes in the future.

ASCE began the process of updating ASCE 24-05 in early 2011 and the next edition is expected to be published late 2012 or early 2013. The ASCE committee expects to have the near-final draft prepared and available at least a month before the Group A hearings and copies will be provided to the ICC committee.

Cost Impact: The code change proposal will not increase the cost of construction. Garaged and accessory structures in flood hazard areas are development and thus are already regulated.

S332–12
G801.6 (NEW)

Proponent: John Ingargiola and Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@dhs.gov, gregory.p.wilson@dhs.gov) and Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net)

Add new text as follows:

G801.6 Roads and watercourse crossings in regulated floodways. Roads and watercourse crossings that encroach into regulated floodways, including roads, bridges, culverts, low-water crossings and similar means for vehicles or pedestrians to travel from one side of a watercourse to the other side, shall meet the requirement of Section G103.5.

Reason: The NFIP requires communities to regulate all development. The concern with roads and other crossings is whether they encroach into floodways. Floodway encroachments may cause increases in flood elevations which can increase flooding on other properties and increase the extend of mapped special flood hazard areas.

Cost Impact: The code change proposal will not increase the cost of construction. Waterway crossings are development and thus are already regulated.

S332-12

Public Hearing:	Committee:	AS	AM	D

L101.1

Proponent: James Bela, Oregon Earthquake Awareness, representing self

Revise as follows:

L101.1 General. Every ~~structure~~ building located ~~where the 1-second spectral response acceleration, S1, in accordance with Section 1613.3 is greater than 0.40~~ within 15 miles distance of an active fault with a maximum potential earthquake M 6 or above, or lies within 25 miles distance of an active fault wit a maximum potential earthquake M 7 or avove; that either 1) exceeds six stories in height with an aggregate floor area of 60,000 square feet (5574 m2) or more, or 2) exceeds ten stories in height regardless of floor area, shall be equipped with not less than three approved recording accelerographs. The accelerographs shall be interconnected for common start and common timing.

Reason: The 1-second spectral response acceleration contours are interesting, but their locations are yo-yoing around with each new addition of the maps; such that they are not reliable over time. See discussion per Code Change: **IBC-12.13 FIGURE 1613.3.3.1 (1)(2)(3)(4)(5)(6)_.**

An earthquake will occur on a fault, and it is the proximity of a building to an earthquake source that determines its actual experience to ground shaking in a real earthquake. This additional charging language fills this hole in locations, particularly in the western U.S. where there are active faults; but the sum total (of probabilities of exceedence) of all contributing faults is not enough to give 1-second contours of 0.40g.

The term building is as used in the city of Los Angeles strong motion accelerograph language. We have building officials, building codes, building permits, building maintenance, Building Owners and Managers Associations . . . so everyone is pretty clear what a "building" actually is. Maybe, for example, an airplane hangar is more of a structure, than it is a building?

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Michael Mahoney, Federal Emergency Management Agency, representing National Tsunami Hazard Mitigation Program

Revise as follows:

APPENDIX M
TSUNAMI-GENERATED FLOOD HAZARD
The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance

~~SECTION M101~~
~~TSUNAMI-GENERATED FLOOD HAZARD~~

SECTION M101
GENERAL

M101.1 ~~General~~ Scope. The purpose of this appendix is to provide tsunami regulatory criteria for those communities that have a tsunami hazard and have elected to develop and adopt a map of their tsunami hazard ~~inundation~~ zone. This appendix applies to structures located within an identified Tsunami Hazard Zone, as defined by the Authority Having Jurisdiction.

M101.2 Performance objectives. All structures that are considered either essential to the community and its disaster response or structures that represent a substantial hazard to human life in the event of failure, as defined by Risk Category III and IV as specified under Section 1604.5 of the *International Building Code*, must be protected from tsunamis by either being located outside of the Tsunami Hazard Zone or be designed and constructed to withstand without collapse the specified loads and effects associated with the Maximum Considered Tsunami. For structures in other Risk Categories, life safety protection is to be provided by a community Tsunami Warning and Evacuation Procedure.

M101.3 Tsunami Design Hazard Level. The regulatory criteria contained in this appendix is based on the Maximum Considered Tsunami and its associated flow elevation and velocity, which shall be determined by the Authority Having Jurisdiction. The Maximum Considered Tsunami shall be permitted to be derived either deterministically or probabilistically by the Authority Having Jurisdiction. The Maximum Considered Tsunami shall be represented using a Tsunami Hazard Zone Map adopted by the Authority Having Jurisdiction.

~~M101.2~~ M101.4 Definitions. The following words and terms shall, for the purposes of this appendix, have the meanings shown herein.

MAXIMUM CONSIDERED TSUNAMI. A tsunami that is determined and adopted by the Authority Having Jurisdiction for design purposes and represented using a Tsunami Hazard Zone Map. The Maximum Considered Tsunami shall be taken as having a collapse prevention design equivalent of a 2% probability of being exceeded in a 50-year period or a 2500 year average return period.

TSUNAMI HAZARD ZONE MAP. A map adopted by the ~~community~~ authority having jurisdiction that designates the extent of inundation ~~by a design event~~ the maximum considered tsunami. This map shall ~~be based on the~~ take into consideration any available tsunami inundation map which is developed and provided to a community by either the applicable State agency or the National Oceanic and Atmospheric ~~and Oceanic~~ Administration (NOAA) under the National Tsunami Hazard Mitigation program, but shall be permitted to utilize a different probability or hazard level.

TSUNAMI HAZARD ZONE. The area vulnerable to being flooded or inundated ~~by a design event~~ the maximum considered tsunami as identified on a community's Tsunami Hazard Zone Map.

TSUNAMI VERTICAL EVACUATION REFUGE. A Tsunami Vertical Evacuation Refuge is a structure designated to serve as a point of refuge to which a community's population can evacuate above a tsunami when high ground is not available. It is designed and constructed so as to comply with the applicable provisions of the latest edition of *Guidelines for Design of Structures for Vertical Evacuation from Tsunamis*, published by the Federal Emergency Management Agency (FEMA P-646).

TSUNAMI WARNING AND EVACUATION PROCEDURE. A Tsunami Warning and Evacuation Procedure is a plan and procedure developed and adopted by a community that would receive a tsunami warning from the National Oceanic and Atmospheric Administration (NOAA) at all hours and transmit that warning to its citizens and establishes and designates evacuation routes for its citizens to either high ground or to a designated Tsunami Vertical Evacuation Refuge. Tsunami evacuation procedures may use evacuation maps that are significantly greater in extent than the tsunami hazard zone and are not developed for design purposes. Tsunami evacuation maps are based on the tsunami inundation map which is developed and provided to a community by either the applicable State agency or NOAA under the National Tsunami Hazard Mitigation Program.

SECTION M102
TSUNAMI REGULATORY CRITERIA

~~M101.3~~ M102.1 Establishment of Tsunami Hazard Zone. Where applicable, if a community has adopted a Tsunami Hazard Zone Map, that map shall be used to establish a community's Tsunami Hazard Zone.

~~M101.4~~ M102.2 Construction within the Tsunami Hazard Zone. Construction of structures designated Risk Category III and IV as specified under Section 1604.5 shall be prohibited within a Tsunami Hazard Zone.

Exception~~s~~:

~~1. A vertical evacuation tsunami refuge shall be permitted to be located in a Tsunami Hazard Zone provided it is constructed in accordance with FEMA P646.~~

~~2.~~ Community Risk Category III and IV structures and other critical facilities shall be permitted to be located within the Tsunami Hazard Zone when such a location is necessary to fulfill their function, providing ~~suitable structural and emergency evacuation~~ the following measures have been incorporated.

1. The structure and its foundation shall be designed to resist without collapse all tsunami loads associated with the Maximum Considered Tsunami, including hydrostatic, hydrodynamic, waterborne debris accumulation and impact loads, and scour.
2. A Tsunami Warning and Evacuation Procedure has been incorporated for the facilities.

M102.3 Tsunami Vertical Evacuation Refuge. A structure designated as a Tsunami Vertical Evacuation Refuge shall be permitted to be located in a Tsunami Hazard Zone provided it meets the following criteria:

1. The structure shall be designated as a Tsunami Vertical Evacuation Refuge Structure and shall be capable of being operational within the community's tsunami warning time.
2. The structure shall be designed and constructed so as to comply with the applicable provisions of the latest edition of *Guidelines for Design of Structures for Vertical Evacuation from Tsunamis*, published by the Federal Emergency Management Agency (FEMA P-646).
3. All operational components of the refuge structure necessary for life safety shall be located above the elevation of the Maximum Considered Tsunami. .

The structure and its foundation shall be designed and constructed to resist seismic loads as defined in Chapter 16 of the *International Building Code* for Risk Category IV structures.

M102.4 Tsunami Warning and Evacuation Procedure. The jurisdiction shall have a Tsunami Warning and Evacuation Procedure adopted and enforced by a community that shall be capable of receiving a tsunami warning from the National Oceanic and Atmospheric Administration (NOAA) at all hours and transmit that warning to its citizens and shall establish and designate evacuation routes for its citizens to either high ground or to a designated Tsunami Vertical Evacuation Refuge.

SECTION ~~M102~~ M103
REFERENCED STANDARDS

FEMA P646—08 Guidelines for Design of Structures for Vertical Evacuation from Tsunamis

Reason: On March 11, 2011, a magnitude 9.0 earthquake struck off the coast of Japan. Although Japan is the most advanced country in the world when it comes to tsunami protection measures, 20,000 people perished from the resulting tsunami. While the damage was utterly devastating with over 250,000 structures collapsed, there were many examples of engineered buildings of multi-story construction that survived the earthquake and subsequent tsunami as well as many partially inundated vertical evacuation refuge buildings that successfully saved many lives.

This same type of subduction fault lies off the coastline of Washington, Oregon and northern California, and Alaska and is capable of unleashing a similar magnitude earthquake and resulting tsunami. Furthermore, tsunamis can and have struck the entire Pacific coast, Hawaii, the Caribbean, portions of the Atlantic coast and even within the Gulf of Mexico. While the probability of a damaging tsunami may be low, the consequences would be enormous.

Prior to the 2011 Japan tsunami, the American Society of Civil Engineers/Structural Engineering Institute Standard ASCE/SEI 7 *Minimum Design Loads for Buildings and Other Structures* had formed a new committee to develop a new chapter on tsunami design. While the committee's work is ongoing, we should update Appendix M with some of their work to date relating to the tsunami load criteria and associated design provisions for essential facilities, such as defining a Maximum Considered Tsunami.

The first Appendix M, adopted and published in the 2012 IBC, focused on keeping critical and high risk structures out of the tsunami inundation zone. This revision keeps that same philosophy but expands the description of what is a properly constructed Tsunami Vertical Evacuation Refuge that can withstand without collapse the hydrostatic, hydrodynamic, debris accumulation and impact loads, and scour associated with the Maximum Considered Tsunami.

The National Tsunami Hazard Mitigation Program is proposing this change to keep Appendix M as current as possible with the latest appropriate information to come out of the ongoing ASCE/SEI 7 Tsunami Loads and Effects Committee's development work. This change proposal has been reviewed by the committee.

Cost Impact: Since the primary difference between this proposed change and the current Appendix M is that it would allow for construction within the Tsunami Inundation Zone providing it meets certain criteria, cost impact is not applicable.

~~**SECTION M102 REFERENCED STANDARDS**~~

~~FEMA P646—08 Guidelines for Design of M101.4 Structures for Vertical Evacuation from Tsunamis~~

Reason: Given the recent M 9.1 Great 11 March 2011 Tohoku Earthquake and Tsunami disaster in Japan, I would view this code section to be extremely dangerous to public safety; and I believe that it should be removed. Vertical evacuation structures were overtopped in the Tohoku earthquake, and people were killed as a result. Even concrete structures (previously assumed to be "invincible" were overturned and destroyed.

This "weak" and very problematical FEMA effort has copied the same "failed approach" for U.S. Building design practice – it presupposes a "design tsunami event" – and somehow probabilistically determined. No one is accountable for its failures and tragic loss-of-life that could result if such a standard were "followed." They are too uncertain for "local tsunami" generated waves and coastal innundation.

There needs to be a more "stringent" for accepting something into the building code as a "standard". The fact that it is located in the appendix speaks for itself.

Appendix L (NEW)

Proponent: Stephen V. Skalko, P.E., Portland Cement Association; Eric T. Stafford, representing Institute for Business and Home Safety

Add new text as follows:

APPENDIX L
BUILDING RESILIENCE

The provisions in this appendix are not mandatory unless specifically referenced in the adopting ordinance.

SECTION L101
GENERAL

L101.1 Purpose. The purpose of this Appendix is to promote enhanced public health, safety and general welfare and to reduce public and private property losses due to hazards and natural disasters associated with fires, flooding, high winds and earthquakes.

SECTION L102
STRUCTURAL

L102.1 Ground snowloads. The ground snowloads to be used in determining the design snow loads for roofs shall be equal to 1.2 times the ground snowloads determined in accordance with ASCE 7 or Figure 1608.2 for the contiguous United States and Table 1608.2 for Alaska in the *International Building Code*. Site-specific case studies shall be made in areas designated “CS” in Figure 1608.2. Ground snow loads for sites at elevations above the limits indicated in Figure 1608.2 and for all sites within the CS areas shall be *approved*. Ground snow load determination for such sites shall be based on an extreme value statistical analysis of data available in the vicinity of the site using a value with a 2-percent annual probability of being exceeded (50-year mean recurrence interval). Snow loads are zero for Hawaii, except in mountainous regions as *approved* by the *building official*.

L102.2 Determination of wind loads. Wind loads on every building or structure shall be determined in accordance with Chapters 26 to 30 of ASCE 7 or provisions of the alternate all-heights method in Section 1609.6. The type of opening protection required, the ultimate design wind speed, V_{ult}, and the exposure category for a site is permitted to be determined in accordance with Section 1609 or ASCE 7. The design wind pressure, *p*, and design wind force, *F*, determined in accordance with ASCE 7 or 1609.6 shall be based on a design wind speed equal to the basic wind speed (or locally adopted basic wind speed in special wind zones, if higher) determined in accordance with Section 1609.3 as follows:

1. Ultimate design wind speed from Figure 1609A plus 20-mph.
2. Ultimate design wind speed from Figure 1609B plus 10 mph
3. Ultimate design wind speed from Figure 1609C.

Component and cladding loads shall be determined for the design wind speed defined assuming terrain Exposure C, regardless of the actual local exposure. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

L102.3 Flood loads. Buildings designed and constructed in flood hazard areas defined in Section 1612.2 of the Code shall comply with Sections L102.3.1 and L102.3.2.

L102.3.1 Floors above base flood elevation. Floors required by ASCE 24 to be built above base flood elevations shall have the floor and their lowest horizontal supporting member not less than the higher of the following:

(a) Design flood elevation,
(b) Base flood elevation plus 3 feet, or
(c) advisory base flood elevation plus 3 feet, or
(d) 500-year flood, if known

L102.3.2 Flood protective works. Buildings designed and constructed in accordance with ASCE 24 shall not consider levees or floodwalls for providing flood protection during the design flood.

L102.4 Earthquake loads. In order to limit the impact of seismic events on the *building* the *building* shall comply with Section L102.4.1 and L102.4.2

L102.4.1 Seismic design importance factor. Where the ASCE 7 mapped 0.2 sec spectral response acceleration parameter, S_S, shown on Figures 1613.3.1(1), 1613.3.1(3), 1613.3.1(4) or 1613.3.1(6) is greater than or equal to 40%g, the importance factor, I, in Table 11.5-1 of ASCE 7 shall be:

1. Not less than 1.15 for Risk Category II buildings
2. Not less than 1.35 for Risk Category III buildings
3. Not less than 1.6 for Risk Category IV buildings

L102.4.2 Seismic Design Categories C, D, E and F. If the *seismic design category* is determined to be C, D, E or F in accordance with Section 1613.3.5 a site specific geotechnical report complying with the provisions of ASCE 7 Section 11.8 is required, and the building shall be designed by a *registered design professional*.

L102.5 Storm shelters. *Buildings* and structures shall be provided with storm shelters conforming to the requirements of Section 423 where required by Sections L102.5.1 through L102.5.2 of this code.

L102.5.1 Storm shelters required. Storm shelters shall be provided for occupants of buildings in accordance with Sections L102.5.1.1, L102.5.1.2 and L102.5.2.

Exceptions:

1. *Buildings* meeting the requirements for shelter design in ICC/NSSA 500.
2. Where storm shelters within 1/4-mile of the proposed *building* are available and have adequate size to accommodate the added occupant load of the proposed *building*.
3. Where the code official determines the *building* size, location or occupant load does not warrant shelters.

L102.5.1.1 Hurricane areas. In hurricane-prone regions as defined in Section 1609.2 the following buildings shall be provided with storm shelters:

1. Community halls, gymnasiums and libraries assigned to Group A3 occupancy classification.
2. Civic administration facilities assigned to Group B occupancy classification.
3. Buildings assigned to Group E, I-1, I-2, I-3, M or R occupancy classifications.
4. Buildings assigned to Risk Category I in accordance with Section 1604.5.

L102.5.1.2 Tornado areas. In areas where the shelter design wind speed for tornadoes of Figure 304.2.(1) of ICC/NSSA 500 is 160 mph or greater, tornado shelters shall be provided, except that such shelters shall not be required for buildings classified as Group U occupancies or classified as Risk Category I according to Table 1604.5.

L102.5.2 Combined hurricane and tornado shelters. Where combined hurricane and tornado shelters are provided the shelter shall comply with the more stringent requirements of ICC/NSSA-500 for both types of shelters.

L102.6 Wildland In order to limit the impact of wildland fires on the *building* the *building* shall comply with Sections L102.6.1 through L102.6.3

L102.6.1 Wildland Fires. The provisions of the *International Wildland-Urban Interface Code* shall apply to the construction, alteration, movement, repair, maintenance and use of any building, structure or premises within the wildland interface areas in this jurisdiction.

L102.6.2 Exterior walls. Exterior wall requirements shall be based on the Fire Hazard Severity specified in Table 502.1 in the *International Wildland-Urban Interface Code*.

L102.6.3 Smoke Detection. An automatic smoke detection system shall be installed throughout buildings located within areas designated by the jurisdiction as being a wild land urban interface area.

L103 Reference Standards

ASCE

ASCE 7 Minimum Design Loads for Other Structures
ASCE 24 Flood Resistant Design and Construction

ICC

ICC International Wildland-Urban Interface Code (IWUIC)

Reason: This reason statement has the following two segments to explain the reasons for this change: (A) The code change is explained with specific substantiation; and (B) General background information identifying the need for enhanced property protection and functional resilience for to strengthen the built environment;

(A)

The following are reports of dollar loss to property from wind, cold weather and fire disasters.

- The American Society of Civil Engineers reported in *Normalized Hurricane Damage in the United States*, *1900 – 2005,* National Hazard Review, ASCE 2008, that property damage from hurricanes was 81 billion dollars in 2005.
- The National Weather Service reports that U.S. property damage due to winter storms and ice exceeded 1.5 billion dollars in 2009.
- *Fire Losses in the United States During 2009* by the National Fire Protection Association, August 2010 shows that property loss due to structure fires in buildings other than one and two family dwellings was approximately 4.5 billion dollars.

Increasing the stringency of the design criteria of buildings for hazards such as wind, snow or fire results in more robust buildings. Such requirements reduce the amount of energy and resources required for repair, removal, disposal and replacement of building components and systems damaged from these disasters. A further benefit is a reduction in the amount of damaged building materials and content entering landfills.

Additional benefits are enhanced life safety, security and occupant comfort; potentially less demand on community resources required for emergency response; and allowing facilities to be more readily adapted for re-use if there is a change of occupancy in the future.

(B)

Minimum building requirements whether through energy codes, plumbing codes, mechanical codes, zoning codes, or basic building codes, do not encourage truly sustainable buildings. The proposal is one of several that attempt to integrate the concepts of the *Whole Building Design Guide* (WBDG) into the International Building Code as a non-mandatory Appendix. This allows adopting jurisdictions the option of incorporating code requirements into the building code to improve the resilience of the built environment without the need to add another code to the community requirements.

The WBDG, developed in partnership between the National Institute of Building Sciences (NIBS) and the Sustainable Building Industries Council (SBIC), has as its key concepts: accessible, aesthetics, cost-effective, functional/operational, historic preservation, productive, secure/safe, and sustainable.

There are numerous references about the economic, societal, and environmental benefits that result when enhanced functional resilience for resource minimization are integrated into building design and construction. Six examples demonstrating the importance and supporting the concepts are:

1. ***Natural Hazard Mitigation Saves: An Independent Study to Assess the Future Savings from Mitigation Activities***
National Institute of Building Sciences Multi-Hazard Mitigation Council - 2005

One of the findings in this report is "The analysis of the statistically representative sample of FEMA grants awarded during the study period indicates that a dollar spent on disaster mitigation saves society an average of $4." The programs studied often addressed issues and strategies other than enhanced disaster resistance of buildings and other structures. However, more disaster-resistant buildings enhance life safety; reduce costs and environmental impacts associated with repair, removal, disposal, and replacement; and reduce the time and resources required for community recovery.

2. Five Years Later – Are we better prepared?
Institute for Business and Home Safety - 2010

This IBHS report states: "When Hurricane Katrina made landfall on Aug. 29, 2005, it caused an estimated $41.1 billion in insured losses across six states, and took an incalculable economic and social toll on many communities. Five years later, the recovery continues and some residents in the most severely affected states of Alabama, Louisiana and Mississippi are still struggling. There is no question that no one wants a repeat performance of this devastating event that left at least 1,300 people dead. Yet, the steps taken to improve the quality of the building stock, whether through rebuilding or new construction, call into question the commitment of some key stakeholders to ensuring that past mistakes are not repeated." This report indicates that there is a need to implement provisions to make buildings more disaster-resistant. Clearly this suggests that functional resilience should at least be integrated into the design and construction of sustainable buildings.

3. National Weather Service Office of Climate, Water and Weather Services
National Oceanic and Atmospheric Administration (NOAA) - 2010

Data provided on the NOAA website [www.weather.gov/os/hazstats.shtml] indicates that the average annual direct property loss due to natural disasters in the United States exceeds of $35,000,000,000. This does not include indirect costs associated with loss of residences, business closures, and resources expended for emergency response and management. These direct property losses also do not reflect the direct environmental impact due to reconstruction after the disasters. Functional resilience will help alleviate the environmental impact and minimize both direct and indirect losses from natural disasters.

4. Global Climate Change Impacts in the United States

U.S. Global Change Research Program (USGCRP) - 2009
The USGCRP includes the departments of Agriculture, Commerce, Defense, Energy, Health and Human Services, Interior, State and Transportation; National Aeronautic and Space Administration; Environmental Protection Agency, USA International Development, National Science Foundation and Smithsonian Institution

The report identifies that: "Climate changes are underway in the United States and are projected to grow. Climate-related changes are already observed in the United States and its coastal waters. These include increases in heavy downpours, rising temperature and sea level, rapidly retreating glaciers, thawing permafrost, lengthening growing seasons, lengthening ice-free seasons in the ocean and on lakes and rivers, earlier snowmelt, and alterations in river flows. These changes are projected to grow." The report further identifies that the: "Threats to human health will increase. Health impacts of climate change are related to heat stress, waterborne diseases, poor air quality, extreme weather events, and diseases transmitted by insects and rodents. Robust public health infrastructure can reduce the potential for negative impacts." Key messages in the report on societal impacts include:

- "City residents and city infrastructure have unique vulnerabilities to climate change. "
- "Climate change affects communities through changes in climate-sensitive resources that occur both locally and at great distances."
- "Insurance is one of the industries particularly vulnerable to increasing extreme weather events such as severe storms, but it can also help society manage the risks."

Sustainable building design and construction cannot be about protecting the natural environment without consideration of the projected growth in severe weather. Minimum codes primarily based on past natural events are not appropriate for truly sustainable buildings. Buildings expected to have long term positive impacts on the environment must be protected from these extreme changes in the natural environment. The provisions for improved property protections are necessary to reduce the amount of energy and resources associated with repair, removal, disposal, and replacement due to routine maintenance and damage from disasters. Further such provisions reduce the time and resources required for community disaster recovery.

5. ***Sustainable Stewardship -*** *Historic preservation plays an essential role in fighting climate change ,Traditional Building,*
National Trust for Historic Preservation - 2008

In the article Richard Moe summarizes the results of a study by the Brookings Institution which projects that by 2030 we will have demolished and replaced 82 billion square feet of our current building stock, or nearly 1/3 of our existing buildings, largely because the vast majority of them weren't designed and built to last any longer. Durability, as a component of functional resilience, can reduce these losses.

6. **Opportunities for Integrating Disaster Mitigation and Energy Retrofit Programs**
Senate Environment and Public Works Committee Room, Dirksen Senate Office Building, Washington, D.C. - 2010

During this panel discussion a representative of the National Conference of State Historic Preservation Officers noted that more robust buildings erected prior to 1950 tend to be more adaptable for reuse and renovation. Prior to the mid-1950s most local jurisdictions developed their own building code requirements that uniquely addressed the community's needs, issues and concerns. Pre-1950 building codes typically resulted in more durable and robust construction that lasts longer.

The total environmental impact of insulation, high efficiency equipment, components, and appliances, low-flow plumbing fixtures, and other building materials and contents are relatively insignificant when rendered irreparable or contaminated and must be disposed of in landfills after disasters. The US Army Corps of Engineers estimated that after Hurricane Katrina nearly 1.2 billion cubic feet of building materials and contents ended up in landfills. This is analogous to stacking enough refrigerators a fifth of the way to the moon or placing them end to end around the equator of the Earth twice.

Cost Impact: The code change proposal will increase the cost of construction.

Staff note: This proposal is one of several proposals adding a new appendix L. The intention of the proponent has been indicated that the contents of the proposals be combined if they should be approved into a single Appendix L Titled "Appendix L, Building Resilience."

APPENDIX L (NEW)-S-SKALKO-STAFFORD.doc

S339–12
1710.5.1

Proponent: Julie Ruth, P.E., JRuth Code Consulting, representing American Architectural Manufacturers Association (AAMA) (julruth@aol.com)

Revise as follows:

1710.5.1 Exterior windows and doors. Exterior windows and sliding doors shall be tested and labeled as conforming to AAMA/WDMA/CSA101/I.S.2/A440. The *label* shall state the name of the manufacturer, the *approved* labeling agency and the product designation as specified in AAMA/ WDMA/CSA101/I.S.2/A440. Exterior side-hinged doors shall be tested and *labeled* as conforming to AAMA/WDMA/CSA101/I.S.2/A440 or comply with Section 1710.5.2. Products in *Risk Category* I or II buildings that are tested and labeled as conforming to AAMA/WDMA/CSA 101/I.S.2/A440 shall not be subject to the requirements of Sections 2403.2 and 2403.3 if one of the following is met:

1. The required design pressure for the fenestration product does not exceed 60 psf or
2. All glass in the fenestration product is tempered or laminated.

Reason: The appropriate deflection limit for framing members supporting glass has been widely debated within the fenestration industry for many years.

Section 2403.2 of the 2012 IBC requires testing or analysis signed by a registered design professional for any glazed assembly when one or more sides of the glass is not firmly supported. Section 2403.3 defines firm support as not deflecting more than 1/175 of the length of glass edge being supported. These provisions have been in the IBC since its first edition in 2000.

Section 1710.5.1 provides an alternative to the requirements of Section 2403.2 and 2403.3 for fenestration products that are tested and labeled in accordance with AAMA/WDMA/CSA 101/I.S.2/A440. This is based upon the referenced specification providing a level of review equivalent to the requirements of Sections 2403.2 and 2403.3.

All editions of the IRC require exterior windows to be tested and labeled to AAMA/WDMA/CSA 101/I.S.2/A440, or one of its predecessor specifications. The provisions of Section 2403.2 and 2403.3 of the 2012 IBC do not occur in the 2012 IRC, or in any of its predecessor editions.

There has been strong evidence that homes built under the IRC have performed well under high wind conditions. This suggests that AAMA/WDMA/CSA 101/I.S.2/A440 adequately addresses all structural design considerations for fenestration in homes built under the IRC, including deflection of glass supporting framing. Additional requirements for framing deflection of fenestration under these applications do not appear necessary.

The scope of the IRC, however, is limited to one and two family dwellings and townhouses three stories or less in height, in regions with design wind speeds of 110 mph or less. The scope of the IBC is all buildings not included within the scope of the IRC. Hence, the IBC applies to all occupancies, and buildings of much greater height than those addressed in the IRC, including those in regions with much higher design wind speeds.

Use of the alternative provided in Section 1710.5 of the IBC for all fenestration in all buildings regardless of the intended occupancy of the building, its height, type of construction or design wind pressures may not be conservative. Therefore the scope of this alternative is being revisited at this time.

This proposal provides a moderately conservative solution to the question – Just how broadly should this alternative be permitted to be used?

It is appropriate to retain the current alternative to Sections 2403.2 and 2403.3 in the IBC for buildings that are similar to those within the scope of the IRC. This includes buildings of similar height in the same design wind speed region if they are not of an occupancy that is required to be designed to a greater level of stringency by the IBC for other reasons.

The only provisions of the IBC that distinguish design wind pressure of a building based upon its use or occupancy are the Risk Category provisions. Homes built under the IRC are Risk Category II. Risk Category I buildings are designed to a lower level of life safety than Risk Category II. Therefore this proposal limits the application of the alternate in Section 1710.5 to buildings in Risk Category I and II.

Based upon Tables R301.2 (2) and R301.2 (3) of the 2012 IRC, the highest possible required design pressure rating for components and cladding on a home built under the 2012 IRC is 54.4 psf, based upon the following calculation:

Max. $DP_{req'd}$ = 29.1 psf (fenestration < 10 sq. ft. in size in zone 5 – near the corner of the building) X 1.87 (opening 60 feet above grade in Exposure D) = 54.4 psf

This proposal rounds that number up to the next nearest multiple of 10, which is 60 psf.

AAMA/WDMA/CSA 101/I.S.2/A440 permits Performance Class R windows to be rated up to 90 psf even if their framing deflects more than L/175 under design pressure. Therefore, requiring additional testing and analysis by a Registered Design Professional for windows with Design Pressure ratings greater than 60 psf is more conservative than the referenced specification.

This proposal also permits the use of either tempered or laminated glass throughout the fenestration product as an alternate to Sections 2403.2 and 2403.3 in Risk Category I and II buildings. The concern of Sections 2403.2 and 2403.3 is the potential breakage of glass due to deflection of the supporting framing. If the product is glazed entirely with tempered or laminated glass this is less of a concern for 2 reasons.

1) Both tempered and laminated glass are capable of resisting higher loads than a similar thickness of the more commonly used annealed glass. AAMA/WDMA/CSA 101/I.S.2/A440 requires the fenestration products to be glazed with the weakest glass permitted

by ASTM E1300 for that particular opening, prior to testing for resistance to structural load. In most cases that weakest glass would be annealed. The strength characteristics of tempered or laminated glass are typically 2 to 4 times greater than those of annealed glass in the same thickness.

2) If broken both tempered and laminated glass has less of a tendency to result in large shards of glass being flung from the opening than annealed glass. Tempered glass has a tendency to shatter into small pieces with less sharp edges than annealed glass. The plastic interlayer of laminated glass tends to hold any broken or shattered glass in place rather than permitting it to be flung from the opening.

Therefore the use of tempered or laminated glass is considered to provide an additional level of safety, particularly in openings with a required design pressure rating of 60 psf or greater.

This proposal permits the alternate of Section 1710.5 to continue to be used in those applications where evidence exists that it is conservative to do so, while addressing concerns that its use may not be appropriate for all buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

TENTATIVE ORDER OF DISCUSSION 2012 PROPOSED CHANGES TO THE INTERNATIONAL FUEL GAS CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation **does not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some IFGC code change proposals may not be included on this list, as they are being heard by other committees. Please consult the Cross Index of Proposed Changes.

FG1 – 12
301.15

Proponent: Bob Scott, Kye Lehr, Daryl Kuiper, Colorado Department of Regulatory Agencies, Division of Registrations Electrical and Plumbing Boards, representing self; Monty Hood, Plumbing Inspector, representing the state of Colorado

Revise as follows:

301.15. **Prohibited Locations.** The appliances, equipment and systems regulated by this code shall not be located in an elevator shaft. <u>Gas-fired appliances shall not be located under egress stairs.</u>

Reason: Locating gas appliances under stairs may cause a fire that could trap persons and prevent escape.

Cost Impact: None.

FG1-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

301.15-FG-SCOTT-LEHR-KUIPER-HOOD

FG2 – 12
303.3

Proponent: Guy McMann MCP, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

Revise as follows:

303.3 Prohibited locations. Appliances shall not be located in sleeping rooms, bathrooms, toilet rooms, storage closets~~ or surgical rooms~~, or in a space that opens only into such rooms or spaces, except where the installation complies with one of the following:

1. The appliance is a direct-vent appliance installed in accordance with the conditions of the listing and the manufacturer's instructions.
2. Vented room heaters, wall furnaces, vented decorative appliances, vented gas fireplaces, vented gas fireplace heaters and decorative appliances for installation in vented solid fuel-burning fireplaces are installed in rooms that meet the required volume criteria of Section 304.5.
3. A single wall-mounted unvented room heater is installed in a bathroom and such unvented room heater is equipped as specified in Section 621.6 and has an input rating not greater than 6,000 Btu/h (1.76 kW). The bathroom shall meet the required volume criteria of Section 304.5.
4. A single wall-mounted unvented room heater is installed in a bedroom and such unvented room heater is equipped as specified in Section 621.6 and has an input rating not greater than 10,000 Btu/h (2.93 kW). The bedroom shall meet the required volume criteria of Section 304.5.
5. The appliance is installed in a room or space that opens only into a bedroom or bathroom, and such room or space is used for no other purpose and is provided with a solid weather-stripped door equipped with an approved self-closing device. ~~All~~ Combustion air shall be taken directly from the outdoors, ~~in accordance with Section 304.6~~ indoors or a combination of both in accordance with Section 304. Combustion air openings in the enclosure shall not communicate with the prohibited locations listed in this section.

Reason: No designer would ever install a fuel burning appliance in a surgical room and there could conceivably be a long list of other locations where fuel burning appliances should not be installed. There is no technical justification to limit combustion air to outdoor air only in this scenario. Indoor air can be effectively utilized when openings are sized per the code and those openings do not connect the enclosure with the various rooms listed. This could save money avoiding cutting holes in exterior walls and searching for a path for ducts to run which could be very difficult to achieve.

Cost Impact: This proposal may decrease the cost of construction**.**

FG2-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

303.3-FG-MCMANN

FG3 – 12
303.3.1 (New); IMC: 901.5 (New), 901.6 (New)

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IFGC COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE.

PART I – IFGC

Add new text as follows:

303.3.1 Fireplaces and decorative appliances in Group I-2 occupancies. In addition to the requirements of Section 303.3, fuel gas-fired fireplaces and decorative appliances in Group I-2 occupancies shall not be located in sleeping rooms, storage closets, surgical rooms, toilet rooms and bathrooms located in the patient sleeping or dwelling units. Fuel gas-fired fireplaces and decorative appliances are permitted in other areas that open into such rooms or spaces only where the installation complies with all of the following:

1. Combustion air is taken directly from the outdoors,
2. Flue gases are discharged directly to the outdoors.
3. Appliance combustion chambers are separated from the environmental air on the interior of the building.
4. Appliances shall automatically shut down and stop fuel flow upon any of the following events:
   - 4.1 when temperatures exceed the appliance listing,
   - 4.2 when there is failure to ignite
   - 4.3 upon activation of the fire alarm system
5. Appliance controls are located in an approved restricted or locked location.
6. A carbon monoxide detector with a local alarm shall be provided and installed in accordance with Section 908.7 of the IBC.

PART II – IMC

Add new text as follows:

901.5 Fuel gas-fired Fireplaces and appliances in Group I-2. Fuel gas-fired fireplaces and decorative appliances located within smoke compartments containing patient sleeping rooms and surgical rooms in Group I-2 occupancies shall be installed in accordance with Section 303.3.1 of the IFGC.

901.6 Solid fuel-burning fire places and appliances in Group I-2. Solid fuel-burning fireplaces and appliances shall not be located in Group I-2 occupancies.

> **Exception:** Solid fuel-burning fireplaces and appliances shall not be prohibited in Group I-2 nursing homes provided that they are not located in smoke compartments that contain patient sleeping rooms.

Reason: This proposal is submitted by the ICC Ad Hoc Committee on Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April, 2011, the AHC has held 5 open meetings and over 80 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx .

The AHC is proposing a revision to address some of the oversights in the I-Codes of long-standing and operational requirements for hospitals and healthcare facilities that has not been specifically addressed. The requirements being proposed in this code change have been long-standing provisions of the construction and operational requirements for healthcare facilities.

Justification: The language proposed in the IFGC prescribes the limitations and conditions to provide the necessary safety and limitations of hazards found within the healthcare environments to the fire and ignition sources inherent to all fireplaces and gas-fired appliances. Combustion air is restricted from being drawn from a healthcare environment for more than the last decade. It is standard practice and operational procedure to control the ignition sources in these occupancies that can contain combustible, flammable (and sometimes even explosive) material. Fire risks need to be limited to the maximum extent feasible and specific requirements for these facilities are not currently or completely addressed in the I-Codes. The physical separation of the combustion chambers of fireplaces and gas-fired equipment is required to separate and provide a barrier between the ignition sources and the environmental air within healthcare occupancies. All combustion air is required to be taken directly from the exterior of the building with one exception that is already provided for in IFGC Section 303.3.

The solid fuel burning fireplaces and appliances (decorative or heating) present open flames that cannot otherwise be controlled or extinguished like similar gas-fired appliances. The attention to and the tending of the open flames from solid fuel burning appliances require the opening any surrounding compartment while the flames and ignition sources are present; thereby, exposing the I-2 environment (within the patient smoke compartment) to the ignition sources. When gas-fired appliances are utilized, the ability to completely control the fuel source and all open flames and ignition sources is possible and does not require exposure to or tending of solid fuel burning materials . The AHC committee is recommending the restriction of solid-fuel burning fireplaces and appliances in the I-2 occupancy.

Future submissions to proposals to the IFC are being drafted to clarify, restrict and limit the ignition source hazards in healthcare occupancies that will reference these requirements being proposed in the IBC, IMC AND IFGC. The code sections that address the installation of fuel gas-fire fireplaces and appliances will also provide alternative means for compliance for existing facilities. Given the hazards present with these appliances in the I-2 Occupancies, the proposed IFC requirements will be 'retro-active' requirements for healthcare occupancies (I-2); please note, these are not new requirements for the I-2 Occupancy facilities but are needed in the I-Codes for coordination of the long-standing provision of the construction and operational requirements for healthcare facilities.

Cost Impact: No increase to the cost of construction for these facilities is associated with these code changes. This change is consistent with existing federal certification requirements.

FG3-12

PART I – INTERNATIONAL FUEL GAS CODE

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – INTERNATIONAL MECHANICAL CODE

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

303.3.1-FG-Williams-Adhoc

FG4 – 12
303.4, 303.4.1 (New), 303.4.2 (New)

Proponent: Bob Scott, Kye Lehr, Daryl Kuiper, Colorado Department of Regulatory Agencies, Division of Registrations Electrical and Plumbing Boards, representing self; Dennis Gardner, State of Colorado Plumbing and Gas Inspector

Revise as follows:

303.4 Protection from vehicle impact damage. Appliances shall not be installed in a location subject to vehicle impact damage except where protected by ~~an~~ *approved* ~~means~~ physical barriers that comply with Section 303.4.1 or guard posts that comply with Section 303.4.2.

303.4.1 Physical barriers. Physical barriers shall be a minimum of 36” (614mm) in height and shall resist a force of 12,000 pounds (53 375N) applied 36 inches (914mm) above the adjacent floor surface.

303.4.2 Guard Posts. Guard posts shall be:

1. Constructed of steel pipe not less than 4 inches (102mm) in diameter and shall be filled with concrete.
2. Spaced not more than 4feet (1219mm) between posts on center.
3. Set not less than 3 feet (914mm) deep in a concrete footing not less than15 inches (381mm) in diameter.
4. Set with the top of the posts not less than 3 feet (914mm) above the floor.
5. Located not less than 3 feet (914mm) from the protected appliance.

Reason: No guidelines are given in this section for *approved* means. It took time and a lot of research to find these requirements which are only found in the International Fire Code. By incorporating these requirements in the code we have once again clarified the requirements for the Architect, Engineer, installer and the inspector. Making sure that what has been installed is adequate protection of gas fired appliance in the direct path of a vehicle, making it safer for the home owner, business owner and occupants.

Cost Impact: None, these barriers are already required by code, by adding the text it just insures the barriers are installed properly for life, health and safety of the occupants within the building.

FG4-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

303.4-FG-SCOTT-LEHR-KUIPER-GARDNER

FG5–12
307.6

Proponent: Guy McMann MCP, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

Add new text as follows:

307.6 Condensate pumps. Condensate pumps located in uninhabitable spaces, such as attics and crawl spaces, shall be connected to the appliance or equipment served such that when the pump fails, the appliance or equipment will be prevented from operating. Pumps shall be installed in accordance with the manufacturers' installation instructions.

Reason: Pumps that are not connected in this fashion will permit the appliances to keep operating, spilling waste water where ever the appliance is located. When this condition continues over time, it could result in damage to building components or other property. This overflow condition may result in mold issues among other things. Most pump manufacturers already have this feature incorporated into the pump but the code does not require it to be connected. Damage as a result of not connecting this feature could prove to be very costly. This is not as much of a concern when appliances are readily accessible to occupants where leakage may be noticed in a timely manner.

Cost Impact: None

FG5-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

307.6 (NEW)-FG-MCMANN

FG6– 12
308.2, Chapter 8

Proponent: Bob Eugene, representing Underwriters Laboratories (Robert.Eugene@ul.com)

Revise as follows:

308.2 Reduction table. The allowable *clearance* reduction shall be based on one of the methods specified in Table 308.2 or shall utilize ~~an~~ <u>a reduced clearance protective</u> assembly *listed* ~~for such application~~ <u>and labeled in accordance with UL 1618</u>. Where required clearances are not listed in Table 308.2, the reduced clearances shall be determined by linear interpolation between the distances listed in the table. Reduced clearances shall not be derived by extrapolation below the range of the table. The reduction of the required clearances to combustibles for *listed* and *labeled* appliances and *equipment* shall be in accordance with the requirements of this section except that such clearances shall not be reduced where reduction is specifically prohibited by the terms of the *appliance* or *equipment* listing [see Figures 308.2(1) through 308.2(3)].

Add the standard to Chapter 8 as follows:

UL
<u>1618-2009 Wall Protectors, Floor Protectors, and Hearth Extensions……………308.2</u>

Reason: UL 1618 is the ANSI standard used to list reduced clearance protective assemblies. UL 1618 is already referenced in the International Mechanical Code for reduced clearances.

Cost Impact: None

FG6-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

308.2-FG-EUGENE

FG7 – 12
311 (New)

Proponent: Guy McMann MCP, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

Add new text as follows:

Section 311
Insulation protection

311.1 Protection of piping Insulation. Pipe insulation exposed to the weather shall be listed and labeled for exterior use or shall be protected in accordance with the manufacturer's installation instructions. Insulation subject to physical damage shall be protected by shields or by other approved methods.

Reason. Pipe insulation exposed to the elements needs to be protected from solar and UV effects and should be listed for such exposure when applied in this situation. Insulation must also be protected in locations where maintenance or other activity takes place that may damage the installation. This is information the plan reviewer, inspector or installer would need to be aware of at the planning stage of a project.

Cost Impact: None

FG7-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

311 (NEW)-FG-MCMANN

FG8 – 12
401.9

Proponent: James Ranfone, American Gas Association (jranfon@aga.org)

Revise as follows:

401.9 Identification. Each length of pipe and tubing and each pipe fitting, utilized in a fuel gas system, shall bear the identification of the manufacturer.

> **Exception:** The manufacturer identification for fittings and pipe nipples shall be on each piece or shall be printed on the fitting or nipple packaging or provided documentation.

Reason: The exception would allow identification of fittings to be provided on or with the packaging. Some piping fittings, short nipples for example, do not have the physical room for a manufacturers mark.

Cost Impact: The code change proposal will not increase the cost of construction.

FG8-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

401.9-FG-RANFONE

FG9 – 12
401.9

Proponent: Robert Torbin, representing Omega Flex, Inc. (bob.torbin@omegaflex.net)

Revise as follows:

401.9 Identification. Each length of pipe and tubing and each pipe fitting, utilized in a fuel gas system, shall bear the identification of the manufacturer <u>and the mark of an approved third-party testing or certifying agency.</u>

Reason: There is no reasonable and cost-effective manner for the local code enforcement official to determine if the installed piping and fittings have actually been tested or certified without the mark of the testing/certifying agency identified on the piping/fitting. There is no practical way to transfer the paperwork associated with these products from the manufacturer to the plumbing supply house to the installer plumber and then to the local plumbing inspector.

Cost Impact: The code change proposal will not increase the cost of construction. If the manufacturer is required to have its piping and fitting products tested and certified as part of its compliance with the referenced standard, then the cost of adding an additional mark (the manufacturer's name is already required) to the piping and fittings is negligible or zero. CSST gas piping and fittings are currently marked with both the manufacturer's name and testing/certifying agency. However, the cost savings in the field will be significant with reductions in paperwork chasing and inspection labor.

FG9-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

401.9-FG-TORBIN

FG10 – 12
403.10.1

Proponent: Bob Scott, Kye Lehr, Daryl Kuiper, Colorado Department of Regulatory Agencies, Division of Registrations Electrical and Plumbing Boards, representing self; Dennis Gardner, State of Colorado Plumbing and Gas Inspector

Revise as follows:

403.10.1 Pipe joints. Pipe joints shall be threaded, flanged, brazed or welded. Where nonferrous pipe is brazed, the brazing materials shall have a melting point in excess of 1,000°F (538°C). Brazing alloys shall not contain more than 0.05-percent phosphorus. Welded pipe shall be installed by personnel who are qualified by testing to the requirements of the A.S.M.E. Boiler and pressure Vessels Code, Section IX. Welded joints shall be performed in accordance with the same requirements under which the welder was tested.

Reason: There are presently no requirements for welders or welds to meet under the IFGC code. This would set a minimum standard for the welder, and a minimum standard that all welded gas piping must meet. I have had piping welded in a one pass process, and after the problem was found the welds did not pass the testing requirements under which the welder was tested. In short, the welder short cut the process because there were no guidelines in the code to follow, thus bringing into question the strength and safety of the gas pipe welds.

Cost Impact: None, This process should already be followed.

FG10-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

403.10-FG-SCOTT-LEHR-KUIPER-GARDNER

FG11 – 12
403.10.1, 403.10.2, 403.10.3

Proponent: Pennie L. Feehan, Pennie L. Feehan Consulting, representing Copper Development Association (penniefeehan@me.com)

Revise as follows:

~~**403.10.1 Pipe joints.** Pipe joints shall be threaded, flanged, brazed or welded. Where nonferrous pipe is brazed, the brazing materials shall have a melting point in excess of 1,000°F (538°C). Brazing alloys shall not contain more than 0.05-percent phosphorus.~~

<u>**403.10.1 Pipe and tubing joints.** Joints shall be threaded, flanged, brazed or welded. Brazed joints between copper pipe or tubing and fittings shall be made with brazing alloys having a liquid temperature above 1,000°F (538°C). All joints surfaces to be brazed shall be cleaned. An *approved* brazing flux shall be applied to the joint surfaces where required by manufacturer's recommendation. The joints shall be brazed with a brazing filler metal conforming to AWS A5.8. Brazing filler metal and shall be applied at the point where the pipe or tubing enters the socket of the fitting.</u>

403.10.2 <u>**Pressed**</u> ~~**Tubing**~~ **joints.** ~~Tubing joints shall be made with *approved* gas tubing fittings, brazed with a material having a melting point in excess of 1,000°F (538°C) or made with~~ <u>P</u>~~p~~ress-connect fittings <u>shall</u> comply with ANSI LC-4. <u>The joint shall be pressed using the tool recommended by the fitting manufacturer.</u> ~~Brazing alloys shall not contain more than 0.05-percent phosphorus.~~

403.10.3 Flared joints. Flared joints shall be used only in systems constructed from nonferrous pipe and tubing where experience or tests have demonstrated that the joint is suitable for the conditions and where provisions are made in the design to prevent separation of the joints. <u>Flared joints shall be made by a tool designed for that operation.</u>

Reason: The above proposal combined two similar code sections and provides important language from the standards to aid the end user.

Cost Impact: This code change will not increase the cost of construction.

FG11-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

403.10.1-FG-FEEHAN

FG12 – 12
404.5

Proponent: James Ranfone, American Gas Association (jranfon@aga.org)

Revise as follows:

404.5 ~~Piping~~ Fittings in concealed locations. ~~Portions of a piping system~~ Fittings installed in concealed locations shall be limited to the following types: ~~not have unions, tubing fittings, right and left couplings, bushings, compression couplings and swing joints made by combinations of fittings.~~

1. Threaded elbows, tees and couplings
2. Brazed fittings
3. Welded fittings
4. Fittings listed to ANSI LC-1/CSA 6.26, Fuel Gas Piping Systems Using Corrugated Stainless Steel Tubing (CSST), or ANSI LC-4, Press-Connect Copper and Copper Alloy Fittings for Use in Fuel Gas Distribution Systems.

~~Exceptions:~~

~~1. Tubing joined by brazing.~~
~~2. Fittings listed for use in concealed locations.~~

Reason: There are three revisions requested by this proposal:

1. Specify the actual standards for fittings listed for use in concealed locations. Currently, these standards are LC-1 and LC-4. This revision will improve enforcement.
2. Allow the use of right and left couplings. These fittings are often used in large gas piping systems to ease the disassembly of a middle portion of the piping system. These couplings have historically been allowed by several large jurisdictions, including New York City.
3. Reorganize the requirements into a list format to improve clarity.

All of these changes have been adopted into the 2012 National Fuel Gas Code.

Cost Impact: The code change proposal will not increase the cost of construction.

FG12-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

404.5-FG-RANFONE

FG13 – 12
404.6

Proponent: James Ranfone, American Gas Association (jranfon@aga.org)

Revise as follows:

404.6 ~~Underground penetrations prohibited.~~ Piping through Foundation Wall. ~~Gas piping shall not penetrate building foundation walls at any point below grade. Gas piping shall enter and exit a building at a point above grade and the annular space between the pipe and the wall shall be sealed.~~ Underground piping installed through the outer foundation or basement wall of a building, shall be encased in a protective sleeve or protected by an approved device or method. The space between the gas piping and the sleeve and between the sleeve and the wall shall be sealed to prevent entry of gas and water.

Reason: A change adopted into the 2012 edition would prohibit gas piping from penetrating a foundation wall below grade. This change was adopted without evidence that such penetrations have resulted in a safety concern. Below grade penetrations have long been permitted and have proven to be safe installation method. The revised language would reinstate this allowance.

Cost Impact: The code change proposal will not increase the cost of construction.

FG13-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

404.6-FG-RANFONE

FG14 – 12
404.6

Proponent: Dan Buuck, representing National Association of Home Builders (NAHB) (dbuuck@nahb.org)

Delete and substitute as follows:

~~**404.6 Underground penetrations prohibited.** Gas *piping* shall not penetrate building foundation walls at any point below grade. Gas *piping* shall enter and exit a building at a point above grade and the annular space between the pipe and the wall shall be sealed.~~

404.6 Piping through foundation wall. Where installed below grade through the outer foundation or basement wall of a building, gas *piping* shall be encased in a protective sleeve or shall be protected by an approved device or method. The sleeve shall extend into the building at least 2 inches (508 mm) from the face of the foundation wall and at least 18 inches (457 mm) from the exterior wall face. The annular space between the gas *piping* and the sleeve and between the sleeve and the wall shall be sealed to prevent the entrance of gas and moisture.

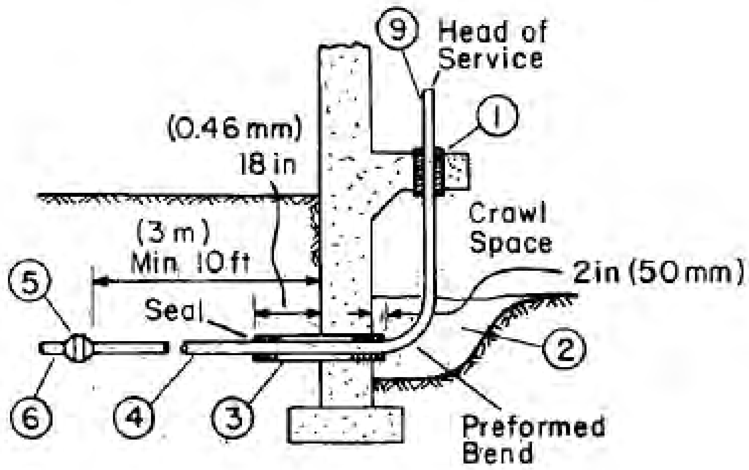
Reason: The conventional installation practice of allowing piping to go through foundation walls below grade should not be prohibited. This is an installation method that has been used for decades. No data was ever presented that would show a safety problem or inadequacy when a proper installation and sealing of the opening was installed in accordance with the IFGC. Furthermore, this proposal will coordinate the IFGC provisions with other industry fuel gas codes.

If there is an assumed problem that gas in the soil may be allowed to enter the building around the gas piping, then that should be specifically addressed in this section. Banning an installation method outright is the same as banning a product or material. If a method is found to meet the safety requirements of the code, then it should be allowed by the same. (See Section 105.2 Alternative materials, methods, appliances and equipment.)

It could be said that the current language of this section is faulty, because it does not provide intent. It simply bans a method. This proposal seeks to add the text “shall be sealed to prevent the entrance of gas and moisture” in order to give code officials the language necessary to identify the intent. It gives them the tools they need to ensure a safe installation—possibly by approving an alternate method. Fig. 1 shows a gasket that would provide effective protection against gas leaking into the building as it is designed to create a reliable seal against ground water. It is included as an example of a method which apparently was not considered when the current code language was adopted.

Requiring above grade entry points into the foundation will require extra piping and joints, both inside and outside, exposing the piping system to physical damage and increased risk of leakage on the outside of buildings as well as within the building. This increase in outside exposure will be particularly significant in a city or at congested commercial locations where piping must come above grade at times through sidewalks at the front or rear of the building or come through the ground in public ways before turning to enter the foundation or building. This will also present practical issues of locating the exterior and interior piping system to have entry points that are compatible with the building design, i.e., doorways, loading docks, accessible entry systems (ramps) etc. There will also be additional costs in these circumstances when the underground piping must be relocated to accommodate above-grade obstacles. How can this be accomplished in cities where streets, alleys, and sidewalks surround buildings? Currently gas meters are contained in below-grade vaults from where the gas piping enters the building. These installations are not underground, but the piping would still need to be routed up out of the vault to comply with this section (see definition of “grade”). This would arguably cause greater safety concerns due to the potential for impact from vehicles and pedestrians.

Finally, the insurance industry apparently has no concerns about below-grade gas piping penetrations as they provide details for a correct installation in the current edition of Factory Mutual’s Property Loss Prevention Data Sheets (see Figure below). According to FM Global’s engineering records, the 18-inch extension on the outside face of the foundation wall was added as an “additional precaution to prevent breakage and corrosion of buried pipe.”



(c.)

1. Pipe sleeve and seal of cement grout.
2. Excavation around inside pipe; at least 18 in. (0.46 m) clearance.
3. Pipe sleeve and seals of cement grout. Sleeve is copper when inner pipe is copper. Sleeve is steel with field- or shop-applied wrapping and coating when inner pipe is steel
4. Wrapped and coated steel pipe without joints or unwrapped copper tubing without joints.
5. First outside pipe joint.
6. Pitch to drain back to yard system.
7. Meter located in occupied space or out of doors.
8. Drip pot (if necessary) piped to outdoors.
9. Unwrapped pipe.

Cost Impact: The code change proposal will not increase the cost of construction.

FG14-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

404.6-FG-BUUCK

FG15 – 12
404.7, 404.7.1 (New), 404.7.2 (New)

Proponent: Shawn Strausbaugh, Arlington County, VA, representing PMG CAC

Revise as follows:

404.7 Protection against physical damage. In concealed locations where *piping*, other than black or galvanized steel, is installed through holes or notches in studs, joists, rafters or similar members less than 1-1/2 inches (38 mm) from the nearest edge of the member, the pipe shall be protected by steel shield plates. ~~Protective steel~~ Such shield plates shall have~~ing~~ a ~~minimum~~ thickness of not less than 0.0575 inch (1.463 mm) (No. 16 gage). Such plates shall cover the area of the pipe where the member is notched or bored and shall extend not less than 4 inches (102 mm) above sole plates, and below top plates and to each side of a stud, joist, rafter or similar member.

404.7.1 Formed steel framing members. *Piping*, other than black or galvanized steel, shall not be installed within the channel of a formed steel framing member except where the piping is not less than 1-1/2 inches from the backside of any fastening face of the member.

404.7.2 Piping installed parallel to framing members. In concealed locations where *piping*, other than black or galvanized steel, is installed parallel to studs, joists, rafters or similar members less than 1-1/2 inches (38 mm) from the nearest edge of the member, such pipe shall be protected along its length by steel shield plates that comply with the requirements of Section 404.7.

Reason: Like the IPC, Section 404.7 does not address pipe or tubing run down the side of a stud or inside of a "C" channel metal stud or rafter. Such installations are subject to penetrations but the code addresses only holes and notches for pipe and tubing that runs perpendicular to the framing member. The NEC treats wiring that runs parallel to framing members the same as wiring that runs perpendicular. The IMC, IFGC and IPC need to catch up. If the sheeting material fasteners miss a framing member, they can easily penetrate piping which is why the code requires the protection shield to extend 4 inches on both sides. Placing piping parallel to a member, either on the side or within a channel, exposes the piping to penetration, yet current code addresses only perpendicular penetrations.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: This code change proposal will increase the cost of construction.

FG15-12

404.7-FG-STRAUSBAUGH.PMGCAC

FG16 – 12
404.8.1, 404.8.2, 404.14.1, 404.14.2

Proponent: Shawn Strausbaugh, Arlington County, VA, representing PMG CAC

Revise as follows:

~~**404.8.1 Conduit with one end terminating outdoors.** The conduit shall extend into an occupiable portion of the building and, at the point where the conduit terminates in the building, the space between the conduit and the gas *piping* shall be sealed to prevent the possible entrance of any gas leakage. The conduit shall extend not less than 2 inches (51 mm) beyond the point where the pipe emerges from the floor. If the end sealing is capable of withstanding the full pressure of the gas pipe, the conduit shall be designed for the same pressure as the pipe. Such conduit shall extend not less than 4 inches (102 mm) outside the building, shall be vented above grade to the outdoors andshall be installed so as prevent the entrance of water and insects.~~

~~**404.8.2 Conduit with both ends terminating indoors.** Where the conduit originates and terminates within the same building, the conduit shall originate and terminate in an accessible portion of the building and shall not be sealed. The conduit shall extend not less than 2 inches (51 mm) beyond the point where the pipe emerges from the floor.~~

404.8 Piping in solid floors. Piping in solid floors shall be laid in channels in the floor and covered in a manner that will allow access to the piping with a minimum amount of damage to the building. Where such piping is subject to exposure to excessive moisture or corrosive substances, the piping shall be protected in an approved manner. As an alternative to installation in channels, the piping shall be installed in a conduit of Schedule 40 steel, wrought iron, PVC or ABS pipe in accordance with Section 404.8.1 or 404.8.2. <u>Where the conduit originates and terminates within the same building, the conduit shall originate and terminate in an accessible portion of the building and shall not be sealed. The conduit shall extend not less than 2 inches (51 mm) beyond the point where the pipe emerges from the floor.</u>

~~**404.14.1 Conduit with one end terminating outdoors.** The conduit shall extend into an occupiable portion of the building and, at the point where the conduit terminates in the building, the space between the conduit and the gas *piping* shall be sealed to prevent the possible entrance of any gas leakage. The conduit shall extend not less than 2 inches (51 mm) beyond the point where the pipe emerges from the floor. Where the end sealing is capable of withstanding the full pressure of the gas pipe, the conduit shall be designed for the same pressure as the pipe. Such conduit shall extend not less than 4 inches (102 mm) outside of the building, shall be vented above grade to the outdoors and shall be installed so as to prevent the entrance of water and insects.~~

~~**404.14.2 Conduit with both ends terminating indoors.** Where the conduit originates and terminates within the same building, the conduit shall originate and terminate in an accessible portion of the building and shall not be sealed. The conduit shall extend not less than 2 inches (51 mm) beyond the point where the pipe emerges from the floor.~~

404.14 Piping underground beneath buildings. Piping installed underground beneath buildings is prohibited except where the piping is encased in a conduit of wrought iron, plastic pipe, steel pipe or other approved conduit material designed to withstand the superimposed loads. The conduit shall be protected from corrosion in accordance with Section 404.11 and shall be installed in accordance with Section 404.14.1 or 404.14.2. <u>Where the conduit originates and terminates within the same building, the conduit shall originate and terminate in an accessible portion of the building and shall not be sealed. The conduit shall extend not less than 2 inches (51 mm) beyond the point where the pipe emerges from the floor.</u>

Reason: Sections 404.8.1 and 404.14.1 are trumped by Section 404.6 and although they would still apply to a very limited type of installation, they give the appearance of a direct conflict with Section 404.6 and have caused interpretation issues. There is no actual conflict, but the main application of these sections was for bringing gas piping into or out of a building below grade which is now expressly prohibited by Section 404.6. These sections would now only apply to gas piping running from point A to point B within the building. It is extremely unlikely that anyone would use these sections considering that Sections 404.8.2 and 404.14.2 provide a much simpler option that does not require a vent to the outdoors. Sections 404.8.1 and 404.14.1 should be deleted to avoid confusion and because they have almost no practical application value. The utility of these sections has been eliminated by the Section 404.6.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: This code change proposal will not increase the cost of construction.

FG16-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

404.8.1-FG-STRAUSBAUGH.PMGCAC

FG17 – 12
404.14

Proponent: James Ranfone, American Gas Association (jranfon@aga.org)

Revise as follows:

404.14 Piping underground beneath buildings. Piping installed underground beneath buildings is prohibited except where the piping is encased in a conduit of wrought iron, plastic pipe, steel pipe or other approved conduit material designed to withstand the superimposed loads <u>or is encased in a listed encasement system</u>. The conduit shall be protected from corrosion in accordance with Section 404.11 and shall be installed in accordance with Section 404.14.1 or 404.14.2.

Reason: To permit the use of an encasement system that is listed. This change has been adopted into the 2012 National Fuel Gas Code.

Cost Impact: The code change proposal will not increase the cost of construction.

FG17-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

404.14-FG-RANFONE

FG18 – 12
404.14

Proponent: Robert Torbin, representing Omega Flex, Inc. (bob.torbin@omegaflex.net)

Revise as follows:

404.14 Piping underground beneath buildings. Piping installed underground beneath buildings is prohibited except where the piping is encased in a conduit of wrought iron, plastic pipe, steel pipe, or other approved conduit material designed to withstand the superimposed loads <u>or within an encasement system listed for installation beneath buildings</u>. The conduit shall be protected from corrosion in accordance with Section 404.11 and shall be installed in accordance with Section 404.14.1 and 404.14.2.

Reason: ICC Evaluation Service has previously evaluated these types of encasement systems and has issues PMG listings. (ICC-ES PMG 1052) The 2012 National Fuel Gas Code Section 7.1.6 recognizes this type of conduit system. Use of pre-assembled encasement systems streamlines the installation of gas piping beneath builds, and also eliminates underground joints on both the conduit and internal gas piping. This will improve safety (no potential leakage sites) when installing such systems.

Cost Impact: The code change proposal will not increase the cost of construction. The use of encasement systems results in cost savings because the piping and encasement are installed simultaneously. This avoids the labor cost of separately installing the conduit and piping. In addition, the sealing and venting methods (when required) are also integrated within the encasement system, thus eliminating the need to separately assemble sealing and venting components onto standard conduit.

404.14-FG-TORBIN

FG19 – 12
404.18 (New)

Proponent: Shawn Strausbaugh, Arlington County, VA, representing PMG CAC

Add new text as follows:

404.18 Pipe cleaning. The use of a flammable or combustible gas to clean or remove debris from a piping system shall be prohibited.

Reason: The U.S. Chemical Safety and Hazard Investigation Board has recommended that the ICC include the proposed text in the applicable codes. This is in reaction to a tragic accident that occurred at a power plant in Connecticut in 2010. It is unsafe and unnecessary to use fuel gas as the medium to cleanse piping. Air, nitrogen, steam, water and pigs are all equally effective alternatives to fuel gases.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: This code change proposal will not increase the cost of construction.

404.18-FG-STRAUSBAUGH.PMGCAC

FG20 – 12
409.1.4 (New)

Proponent: Andrew Scott Jones, President, A Better Deal Heating and Air Conditioning, Inc, representing self tfkolter@gmail.com/tom.kolter@yahoo.com

Add new text as follows:

409.1.4 Leak monitor. For newly installed piping systems, a device or system shall be installed that will monitor for water or gas leaks and provide automatic shut off of the water or gas supply.

Reason: Flood damage in buildings resulting from undetected and uncontrolled water leaks is substantial and can be largely eliminated with an automatic supply shut-off valve and leak detection system. Likewise, an uncontrolled gas leaks present a danger to life, and can be largely eliminated if residential properties were protected with an automatic shut off valve and leak detection system.

Many such systems are available on the market at varying costs with a variety of leak detection and shut-off designs. This proposal is limited to new construction and to total refit of plumbing and gas systems, not repairs.

Cost impact: This code change will increase the cost of construction.

FG20-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

409.1.4 (NEW)-FG-JONES

FG21 – 12
409.5

Proponent: Jean Steckler, representing TECO Americas (jeans@aa-fs.com)

Revise as follows:

409.5 Appliance shutoff valve. Each *appliance s*hall be provided with a shutoff valve in accordance with Section 409.5.1, 409.5.2 or 409.5.3. <u>Each gas appliance shall be equipped with a passive thermal shut-off device that will automatically stop the flow of gas to the appliance in the event of a fire. The thermal gas shut-off device shall not be a substitute for the manual shut-off valve required by this section. A combination type valve that serves as both a shutoff valve and a thermal shutoff device satisfies the requirements of this section. The thermal shut-off device shall not require electricity or batteries to stop the flow of gas.</u>

Reason: According to the National Fire Protection Association (NFPA), U.S. fire departments face 2,110 home fires each year where natural gas is the first material ignited, and 1,170 home fires a year where LP-gas is involved with the start of a fire. Most home gas fires originate in the kitchen at the stove or gas range.

Building occupants have a false sense of security regarding gas appliances. Occupants assume they have the protection of automatic thermal gas shut-offs, when in reality the manual valves have to be physically shut off to prevent gas release. An automatic thermal shut-off provides passive gas and fire safety, and does not depend on a facility manager to locate and manipulate a manual valve. Automatic thermal gas shutoffs stop the gas from feeding the fire during the time it takes for first responders to reach the facility.

When manual gas shut-off valves are combined with passive, automatic thermal shut-offs, occupants and first responders greatly reduce risk to their lives. And they are much better protected from personal harm and property damage. Automatic thermal gas shutoffs greatly reduce the amount of gas released to the atmosphere when fire occurs. Uncontrolled gas leaks pose a significant hazard to firefighters, emergency responders, and the public.

According to the National Fire Incident Reporting System (NFIRS) database, a system established by the National Fire Data Center of the United States Fire Administration (USFA) to document and develop uniform data reporting when gathering and analyzing information on fires across the U.S., there have been 36,577 fires in the 49 states and the District of Columbia where gas was the material first ignited resulting in an uncontrolled or self-perpetuating fire in the five year period between 2005-2009. Automatic thermal gas shutoffs mitigate consequences of fires:

- Thermal gas shutoffs stop the flow of gas instantaneously when the fire temperature reaches 212°F
- When the curb valve is too close to a burning building to be safely operated, or it is non-existent or inoperable
- Thermal gas shutoffs are intended to shutoff the flow of gas when fire occurs near the gas line
- Automatic thermal gas shutoffs assist in the prevention of risk to fire personnel and first responders when gas is released and acts as an accelerant

The primary incident consequences that would be reduced are deaths, injuries, and property damage. Additional benefits would be an expected reduction in the severity of fires, explosions, and evacuation occurring at incidents, and the quantity of gas lost during incidents.

Cost Impact: Minimal Cost Impact.

FG21-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

409.5-FG-STECKLER

FG22 – 12
409.5.3

Proponent: Brent Ursenbach, Salt Lake County, representing Utah Chapter ICC (bursenbach@slco.org)

Revise as follows:

409.5.3 Located at manifold. Where the *appliance* shutoff valve is installed at a manifold, such shutoff valve shall be located within 50' (15240mm) of the *appliance* served, shall be located on the same building level as the *appliance* and shall be readily accessible and permanently identified. The *piping* from the manifold to within 6 feet (1829 mm) of the *appliance* shall be designed, sized and installed in accordance with 401 through 408.

Reason: It is common to have a gas manifold located in a basement level furnace room or mechanical room, with gas appliances located on other levels within a building. It is poses a safety hazard to not have a gas shutoff reasonable close to the gas appliance. Installing and servicing technicians performing start-up and testing procedures on gas appliances may need to turn the gas on and off multiple times as they test inlet and outlet (manifold) pressures. It creates a hazardous condition to not have a means to immediately stop the gas flow while performing service on a gas appliance.

Cost Impact: The code change proposal will not increase the cost of construction

FG22-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

409.5.3-FG-URSENBACH

FG23 – 12
410.2

Proponent: Shawn Strausbaugh, Arlington County, VA, representing PMG CAC

Revise as follows:

410.2 MP regulators. MP pressure regulators shall comply with the following:

1. The MP regulator shall be approved and shall be suitable for the inlet and outlet gas pressures for the application.
2. The MP regulator shall maintain a reduced outlet pressure under lockup (no-flow) conditions.
3. The capacity of the MP regulator, determined by published ratings of its manufacturer, shall be adequate to supply the appliances served.
4. The MP pressure regulator shall be provided with access. Where located indoors, the regulator shall be vented to the outdoors or shall be equipped with a leaklimiting device, in either case complying with Section 410.3.
5. A tee fitting with one opening capped or plugged shall be installed between the MP regulator and its upstream shutoff valve. Such tee fitting shall be positioned to allow connection of a pressure-measuring instrument and to serve as a sediment trap.
6. A tee fitting with one opening capped or plugged shall be installed not less than 10 pipe diameters downstream of the MP regulator outlet. Such tee fitting shall be positioned to allow connection of a pressure-measuring instrument.
7. <u>Where connected to rigid piping, a union shall be installed within 1 foot of either side of the MP regulator.</u>

Reason: Section 410.2 needs an item # 7 to require a union upstream of the regulator to allow it to be removed/replaced. Currently, a regulator could be piped inline with rigid steel piping with no way to remove it or isolate it for pressure testing without disassembling a lot of piping upstream or downstream of the regulator. The union can be on either side of a regulator because it is there only to allow the regulator to be removed or isolated for piping testing purposes. Section 409.4 requires a shutoff valve ahead of the regulator.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: This code change proposal will increase the cost of construction.

	Assembly:	ASF	AMF	DF

410.2-FG-STRAUSBAUGH.PMGCAC

FG24 – 12
411.1, 411.1.1, 411.1.4

Proponent: James Ranfone, American Gas Association (jranfon@aga.org)

Revise as follows:

411.1 Connecting appliances. Except as required by Section 411.1.1, appliances shall be connected to the piping system by one of the following:

1. Rigid metallic pipe and fittings.
2. Corrugated stainless steel tubing (CSST) where installed in accordance with the manufacturer's instructions.
3. Semirigid metallic tubing and metallic fittings. Lengths shall not exceed 6 feet (1829 mm) and shall be located entirely in the same room as the appliance. Semirigid metallic tubing shall not enter a motor-operated appliance through an unprotected knockout opening.
4. Listed and labeled appliance connectors in compliance with ANSI Z21.24 and installed in accordance with the manufacturer's instructions and located entirely in the same room as the appliance.
5. Listed and labeled quick-disconnect devices used in conjunction with listed and labeled appliance connectors.
6. Listed and labeled convenience outlets used in conjunction with listed and labeled appliance connectors.
7. Listed and labeled outdoor appliance connectors in compliance with ANSI Z21.75/CSA 6.27 and installed in accordance with the manufacturer's instructions.
8. Listed outdoor gas hose connectors in compliance with ANSI Z21.54 used to connect portable outdoor appliances. The gas hose connection shall be made only in the outdoor area where the appliance is to be used, and shall be to the gas piping supply at an appliance shutoff valve, a listed quick-disconnect device, or listed gas convenience outlet.

411.1.1 Commercial cooking appliances. Commercial cooking appliances installed on casters and appliances that are moved for cleaning and sanitation purposes shall be connected to the piping system with an appliance connector listed as complying with ANSI Z21.69 ~~or in accordance with Item 1 or 3 of Section 411.1~~. The commercial cooking appliance connector installation shall be configured in accordance with the manufacturer's installation instructions. Movement of appliances with casters shall be limited by a restraining device installed in accordance with the connector and appliance manufacturer's instructions.

~~**411.1.4 Movable appliances.** Where appliances are equipped with casters or are otherwise subject to periodic movement or relocation for purposes such as routine cleaning and maintenance, such appliances shall be connected to the supply system piping by means of an approved flexible connector designed and labeled for the application. Such flexible connectors shall be installed and protected against physical damage in accordance with the manufacturer's installation instructions.~~

Reason: The proposal accomplishes three changes:
1. 411.1 - Add a requirement that a Z21.54 listed connector be used to connect portable outdoor appliances to the house piping system. Z21.54 connectors are designed for such application.
2. 411.1.1 - Requires the use of a Z21.69 listed connector for all commercial cooking appliances on casters and for appliances that are moved for cleaning purposes. This would change eliminate the use of rigid pipe and semirigid metallic tubing. Z21.69 connectors are designed specifically for such application. The change also adds requirements for the proper installation of the connector and requires the installation of a restraining device to project the connector.
3. 411.1.4 – The requirements in this section are covered by the proposed changes to 411.1.1 and the section is no longer needed.

These revisions are consistent with changes adopted into the 2012 National Fuel Gas Code.

Cost Impact: The code change proposal will not increase the cost of construction.

FG24-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

411.1-FG-RANFONE

FG25 – 12
411.1.1

Proponent: Shawn Strausbaugh, Arlington County, VA, representing VA Plumbing and Mechanical Inspectors Association (VPMIA) and VA Building Code Officials Association (VBCOA)

Revise as follows:

411.1.1 Commercial cooking appliances. Commercial cooking appliances installed on casters ~~and appliances that are moved for cleaning and sanitation purposes~~ shall be connected to the piping system with an appliance connector listed as complying with ANSI Z21.69. ~~or in accordance with Item 1 or 3 of Section 411.1.~~

Reason: It's not advantageous to have line staff disconnecting and connecting unions and fittings or bending pipe in an effort to reconnect piping so as to be able to clean behind appliances on wheels. This is an unsafe practice. Simply requiring ANSI approved connectors is a much safer practice thereby preventing gas leaks.

When an appliance is manufactured on wheels or casters, it is for the sole purpose to enable movement usually to permit cleaning of the surfaces in the space it normally occupies. It is not reasonable to expect kitchen or cleaning staff to take apart unions or disconnect piping systems to perform daily routine cleaning. The proposal incorporates the ANSI standard which requires several things. First it will require a standoff restraint that is less distance than the connector. Then it requires a connector that is flexible in design and construction. Lastly the connecter will have a "quick-connect" adapter that allows even the most untrained personal to easily remove the line. The line must be reconnected properly or gas will not flow through the line.

Cost Impact: None.

FG25-12

Public Hearing:	Committee:	AS	AM	D

411.1.1-FG-STRAUSBAUGH

FG26 – 12
411.1.1

Proponent: Guy McMann MCP, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

Revise as follows:

411.1.1 Commercial cooking appliances. Commercial cooking appliances installed on casters and appliances that are moved for cleaning and sanitation purposes shall be connected to the piping system with an appliance connector listed as complying with ANSI Z21.69 ~~or in accordance with Item 1 or 3 of Section 411.1~~

Reason; It's not practical for line staff or others to remove pipe and fitting in order to move appliances for cleaning and servicing. This practice could become problematic and when not reconnected correctly could result in gas leaks. Only permitting a listed flex connector is a much safer practice.

Cost Impact: None

FG26-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

411.1.1-FG-MCMANN

FG27 – 12
411.1.1, 411.1.4

Proponent: Shawn Strausbaugh, Arlington County, VA, representing PMG CAC

Revise as follows:

~~**411.1.1 Commercial cooking appliances.** Commercial cooking appliances installed on casters and appliances that are moved for cleaning and sanitation purposes shall be connected to the piping system with an appliance connector listed as complying with ANSI Z21.69 or in accordance with Item 1 or 3 of Section 411.1.~~

411.1.4 Movable appliances. Where appliances are equipped with casters or are otherwise subject to periodic movement or relocation for purposes such as routine cleaning and maintenance, such appliances shall be connected to the supply system piping by means of an ~~approved flexible connector designed and labeled for the application~~ appliance connector listed as complying with ANSI Z21.69 or by means of item 1 of section 411.1. Such ~~flexible~~ connectors shall be installed and protected against physical damage in accordance with the manufacturer's installation instructions.

Reason: In Section 411.1.1, does it make sense to permit appliances on casters and appliances that are routinely moved to be connected with metallic tubing? Soft copper tubing, for example, would be work-hardened and damaged as the result of repeated movement and bending. If a deep fryer is on wheels and pulled out for cleaning once per month, who is going to disconnect and reconnect tubing fittings, test for leaks, etc ? Section 411.1.1 is redundant and not needed because section 411.1.4 already covers all movable appliances, including cooking appliances. There is no logical reason to treat cooking appliances differently than any other appliance that is on wheels or is moved for cleaning, servicing or maintenance. The same quality connection should apply for all such appliances. Specifying ANSI Z21.69 is preferable to just requiring the connector to be approved by the code official and labeled for the application. Most connector listings will not prohibit the connector from being used with a moveable appliance, therefore, other connectors that are not as robust as a Z21.69 connector could end up being used, even though they may not be suitable for such harsh duty. If an appliance is periodically moved, a special connector or rigid pipe connections should be used.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: This code change proposal will not increase the cost of construction.

411.1.1-FG-STRAUSBAUGH.PMGCAC

FG28 – 12
502.1

Proponent: Larry Gill, P.Eng. IPEX USA LLC (larry.gill@ipexna.com)

Revise as follows:

502.1 General. All vents, except as provided in Section 503.7, shall be *listed* and *labeled*. Type B and BW vents shall be tested in accordance with UL 441. Type L vents shall be tested in accordance with UL 641. Vents for Category II, ~~and~~ III and IV appliances shall be tested in accordance with UL 1738. ~~Plastic vents for Category IV appliances shall not be required to be *listed* and *labeled* where such vents are as specified by the *appliance* manufacturer and are installed in accordance with the *appliance* manufacturer's installation instructions.~~

Reason: UL 1738 is the Standard for Safety for Venting Systems for Gas-Burning Appliances, Categories II, III, and IV and should be referenced in the IFGC for all venting materials included in scope of the standard. The current exception not requiring plastic venting to be listed and labelled should be removed as recent changes to UL 1738 now allow PVC and CPVC venting to be tested and listed to the 1738 standard. Further, appliance standards do not adequately address venting and only list plumbing DWV products. Plumbing products are not adequate for venting of appliances. UL 1738 is a system standard and does not permit the mixing of different pipe, fittings or joining methods from different manufacturers. This along with a listed and labelled system specifically designed for appliance venting will provide for a safer environment.

Cost Impact: The proposed change may increase the cost of construction depending on the cost of a listed and labeled venting system.

502.7.1 (New)

Proponent: Guy McMann MCP, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

Add new text as follows:

502.7.1 Door swing. Appliance and equipment vent terminals shall be located such that doors cannot swing within 12 inches (305 mm) horizontally of the vent terminal. Door stops or closures shall not be installed to obtain this clearance.

Reason: As indicated in the photo, any gas vent can be subject to damage as a result of a door swing even when the vent has been installed in accordance with the manufacturer's instructions. Most manufacturers do not address proximity to doors on a different plane. Even if the door doesn't come in contact with the vent terminal, the door could be too close to the vent when the appliance is operating and possibly overheating the door causing problems.

Cost Impact: None

FG29-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

502.7.1 (NEW)-FG-MCMANN

FG30 – 12
503.8

Proponent: James Ranfone, American Gas Association (jranfon@aga.org)

Revise as follows:

503.8 Venting system termination location. The location of venting system terminations shall comply with the following (see Appendix C):

1. A mechanical draft venting system shall terminate at least 3 feet (914 mm) above any forced-air inlet located within 10 feet (3048 mm).

   Exceptions:

   1. This provision shall not apply to the combustion air intake of a direct-vent appliance.
   2. This provision shall not apply to the separation of the integral outdoor air inlet and flue gas discharge of listed outdoor appliances.

2. A mechanical draft venting system, excluding directvent appliances, shall terminate at least 4 feet (1219 mm) below, 4 feet (1219 mm) horizontally from, or 1 foot (305 mm) above any door, operable window or gravity air inlet into any building. The bottom of the vent terminal shall be located at least 12 inches (305 mm) above finished ground level.
3. The vent terminal of a direct-vent appliance with an input of 10,000 Btu per hour (3 kW) or less shall be located at least 6 inches (152 mm) from any air opening into a building, and such an appliance with an input over 10,000 Btu per hour (3 kW) but not over 50,000 Btu per hour (14.7 kW) shall be installed with a 9-inch (230 mm) vent termination clearance, and an appliance with an input over 50,000 Btu/h (14.7 kW) shall have at least a 12-inch (305 mm) vent termination clearance.The bottom of the vent terminal and the air intake shall be located at least 12 inches (305 mm) above finished ground level.
4. Through-the-wall vents for Category II and IV appliances and noncategorized condensing appliances shall not terminate over public walkways or over an area where condensate or vapor could create a nuisance or hazard or could be detrimental to the operation of regulators, relief valves or other equipment. Where local experience indicates that condensate is a problem with Category I and III appliances, this provision shall also apply. Drains for condensate shall be installed in accordance with the appliance and vent manufacturers' instructions.
5. Vent systems for Category IV appliances that terminate through an outside wall of a building and discharge flue gases perpendicular to the adjacent wall shall be located not less than 10 ft (3 m) horizontally from an operable opening in an adjacent building. This requirement shall not apply to vent terminals that are 2 ft (0.6 m) or more above or 25 ft (7.6 m) or more below operable openings.

Reason: New Extract from the 2012 National Fuel Gas Code. The new coverage adds clearance provisions for category IV appliance side wall vent terminations to adjacent building openings. The National Fire Protection Foundation and the American Gas Association funded a computer modeling study to gauge the extent of ice buildup on adjacent properties from the exhaust of category IV appliances. While the modeling was limited in scope (number of appliances & Btu inputs, location of vent termination and clearance distances), the 10 ft clearance did show that ice buildup would be minimized. The new provision is being provided to the ICC for consideration as an extract for the IFGC.

Cost Impact: The code change proposal will not increase the cost of construction.

FG30-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

503.8-FG-RANFONE

FG31 – 12
505.1.1

Proponent: Shawn Strausbaugh, Arlington County, VA, representing PMG CAC

Revise as follows:

505.1.1 Commercial cooking appliances vented by exhaust hoods. Where commercial cooking appliances are vented by means of the Type I or II kitchen exhaust hood system that serves such appliances, the exhaust system shall be fan powered and the appliances shall be interlocked with the exhaust hood system to prevent appliance operation when the exhaust hood system is not operating. The method of interlock between the exhaust hood system and the appliances equipped with standing pilot burner ignition systems shall not cause such pilots to be extinguished. Where a solenoid valve is installed in the gas piping as part of an interlock system, gas piping shall not be installed to bypass such valve. Dampers shall not be installed in the exhaust system.

> **Exception:** An interlock between the cooking appliance(s) and the exhaust hood system shall not be required where heat sensors or other approved methods automatically activate the exhaust hood system when cooking ~~operations occur~~ appliances are operating.

Reason: What about when the appliances are firing to be ready to cook, but no cooking is occurring? The hood system is typically the venting means for the products of combustion generated by the gas-fired appliances. The intent of the code is to make certain that the exhaust system is operating any time that the appliances are firing and this is not necessarily related to when actual cooking is taking place.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: This code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

505.1.1-FG-STRAUSBAUGH.PMGCAC

FG32 – 12
505.1.1

Proponent: Guy McMann MCP, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

Revise as follows:

505.1.1 Commercial cooking appliances vented by exhaust hoods. Where commercial cooking appliances are vented by means of the Type I or II kitchen exhaust hood system that serves such appliances, the exhaust system shall be fan powered and the appliances shall be interlocked with the exhaust hood system to prevent appliance operation when the exhaust hood system is not operating. The method of interlock between the exhaust hood system and the appliances equipped with standing pilot burner ignition systems shall not cause such pilots to be extinguished. Where a solenoid valve is installed in the gas piping as part of an interlock system, gas piping shall not be installed to bypass the <u>solenoid</u> valve <u>and the circuitry for the interlock system shall be arranged to require a manual reset operation so that after power has been interrupted to the valve the valve will not automatically re-open upon restoration of the power supply</u>. ~~Dampers shall not be installed in the exhaust system~~.

> **Exception:** An interlock between the cooking appliance(s) and the exhaust hood system shall not be required where heat sensors or other approved methods automatically activate the exhaust hood system when cooking operations occur

Reason: A realistic scenario exists where in the event of a power failure during normal cooking operations the line stall could walk away from the stove or cook top and not shut off the valves. When the power comes back on gas could flow freely creating a potential disaster. In fact, any time that the hood is powered off for any reason, the kitchen staff could walk away from the appliances without turning off the burners and when the hood is powered again, the appliances could be unattended. Installing a manual reset device will ensure that this could not happen. The last sentence has been stricken as this is an IMC issue and isn't related to the IFGC.

Cost Impact: This may increase cost

618.4, 618.5, 618.6, 309 (New), 310 (New)

Proponent: Guy McMann MCP, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

Revise as follows:

~~**618.4 Prohibited sources.** Outdoor or return air for forcedair heating and cooling systems shall not be taken from the following locations:~~

1. ~~Closer than 10 feet (3048 mm) from an appliance vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the outside air inlet.~~
2. ~~Where there is the presence of objectionable odors, fumes or flammable vapors; or where located less than 10 feet (3048 mm)above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.~~
3. ~~A hazardous or insanitary location or a refrigeration machinery room as defined in the International Mechanical Code.~~
4. ~~A room or space, the volume of which is less than 25 percent of the entire volume served by such system. Where connected by a permanent opening having an area sized in accordance with Section 618.2, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of such rooms or spaces.~~

   ~~**Exception:** The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to such room or space.~~

5. ~~A room or space containing an appliance where such a room or space serves as the sole source of return air.~~

   ~~**Exception:** This shall not apply where:~~

   1. ~~The appliance is a direct-vent appliance or an appliance not requiring a vent in accordance with Section 501.8.~~
   2. ~~The room or space complies with the following requirements:~~
      - ~~2.1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6L/W) of combined input rating of all fuel-burning appliances therein.~~
      - ~~2.2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.~~
      - ~~2.3. Return-air inlets shall not be located within 10 feet (3048 mm) of a draft hood in the same room or space or the combustion chamber of any atmospheric burner appliance in the same room or space.~~
   3. ~~Rooms or spaces containing solid fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of such appliances.~~
6. ~~A closet, bathroom, toilet room, kitchen, garage, boiler room, furnace room or unconditioned attic.~~

   ~~**Exceptions:**~~

   1. ~~Where return air intakes are located not less than 10 feet (3048 mm) from cooking appliances and serve only the kitchen area, taking return air from a kitchen area shall not be prohibited.~~
   2. ~~Dedicated forced air systems serving only a garage shall not be prohibited from obtaining return air from the garage.~~

7. ~~A crawl space by means of direct connection to the return side of a forced-air system. Transfer openings in the crawl space enclosure shall not be prohibited.~~

618.5 Return air and outdoor openings. Return air openings shall be located and installed in accordance with Section 309. Outdoor air openings shall be located and installed in accordance with Section 310.

~~**618.5 Screen.** Required outdoor air inlets for residential portions of a building shall be covered with a screen having 1/4-inch (6.4 mm) openings. Required outdoor air inlets serving a nonresidential portion of a building shall be covered with screen having openings larger than 1/4 inch (6.4 mm) and not larger than 1 inch (25 mm).~~

~~**618.6 Return-air limitation.** Return air from one dwelling unit shall not be discharged into another dwelling unit .~~

Add new text as follows:

SECTION 309
RETURN AIR

309.1 Return air openings. Return air openings for heating, ventilation and air conditioning systems shall comply with all of the following:

1. Openings shall not be located less than 10 feet measured in any direction from an open combustion chamber or draft hood of another appliance located in the same room or space.
2. Return air shall not be taken from a hazardous or insanitary location or a refrigeration room as defined in this code.
3. The amount of return air taken from any room or space shall be not greater than the flow rate of supply air delivered to such room or space.
4. Return and transfer openings shall be sized in accordance with the appliance or equipment manufacturers' installation instructions, Manual D or the design of the *registered design professional*.
5. Return air shall not be taken from a closet, bathroom, toilet room, kitchen garage, mechanical room, boiler room, furnace room or unconditioned attic.

   Exceptions:

   1. Where return air is taken from a kitchen and such return air serves the kitchen only, openings shall be located not less than 10 feet from the cooking appliances.
   2. Dedicated forced air systems serving only the garage shall not be prohibited from obtaining return air from the garage

6. Taking return air from a crawl space shall not be accomplished through a direct connection to the return side of a forced air furnace. Transfer openings in the crawl space enclosure shall not be prohibited.
7. Return air from one dwelling unit shall not be discharged into or taken from another dwelling unit.

310
INTAKE OPENINGS.

310.1 Intake opening location. Air intake openings shall comply with all of the following:

1. Intake openings shall be located a minimum of 10 feet (3048 mm) from lot lines or buildings on the same lot.

2. Mechanical and gravity outdoor air intake openings shall be located not less than 10 feet (3048 mm) horizontally from any hazardous or noxious contaminant source, such as vents, streets, alleys, parking lots and loading docks, except as specified in Item 3 or Section 501.2.1. Outdoor intake openings shall be permitted to be located less than 10 feet horizontally from streets, alleys, parking lots and loading docks provided that the openings are located not less than 25 feet (7620 mm) vertically above such locations. Where openings front a street or public way, the distance shall be measured from the closest edge of the street or public way.
3. Intake openings shall be located not less than 3 feet (914 mm) below contaminant sources where such sources are located within 10 feet (3048 mm) of the opening.
4. Intake openings on structures in flood hazard areas shall be at or above the elevation required by Section 1612 of the *International Building Code.*

310.2 Intake opening protection. Air intake openings that terminate outdoors shall be protected with corrosion-resistant screens, louvers or grilles. Openings in louvers, grilles and screens shall be sized in accordance with Table 310.2, and shall be protected against local weather conditions. Louvers that protect air intake openings in structures located in hurricane-prone regions, as defined in the *International Building Code*, shall comply with AMCA 550. Outdoor air intake openings located in exterior walls shall meet the provisions for exterior wall opening protectives in accordance with the International Building Code.

TABLE 310.2
OPENING SIZES IN LOUVERS, GRILLES AND SCREENS PROTECTING AIR INTAKE OPENINGS

OUTDOOR OPENING TYPE	**MINIMUM AND MAXIMUM OPENING SIZES IN LOUVERS, GRILLES AND SCREENS MEASURED IN ANY DIRECTION**
Intake openings in residential occupancies	Not < 1/4 inch and not > 1/2 Inch
Intake openings in other than residential occupancies	> 1/4 inch and not > 1 inch

For SI:1 inch =25.4mm.

(Renumber subsequent sections)

Reason: This is an attempt to reorganize and delete language in this section that contains outdated legacy code language. Also, this proposal separates outside and return air openings into two distinct categories and places them in a neutral place. These requirements apply to more than just furnaces. This section is much more complicated than it needs to be as the foremost concern regarding return air is to keep contaminants out of the openings and air stream. This section is long over-due for an overhaul, the intent in which is to simplify the matter.

- This section is being relocated to more central location as the subject matter applies to more than just furnaces; it applies to air conditioning and ventilation systems as well. A simple reference to this new Section is all that will be required. Outdoor air intake openings now have their own section as well.

- Existing item 1 and 2 dealt primarily with outdoor opening which can be referenced in the new 310.2.

- Existing text in item 3 remains in its new location.

- Existing text in item 4 will literally prevent a return air opening in most bedrooms as they are usually less than 25% of the area served. There is no technical justification for this benchmark. What significance would there be between 25% and 26% that will impact the return air system? There is no need for such an arbitrary benchmark. What's really important is not to take too much air out of a room as noted in the new #3.

- The size of any transfer should be according to design, not arbitrary, outdated numbers as in the existing #4

- Item 5 has many problems and has been deleted in its entirety. It's a tortured approach as it attempts to describe a furnace in an enclosure with no return air duct along side a water heater all the while using the enclosure as a plenum utilizing louvered doors or openings to bring air back to the unit. This is not current practice and is prohibited. It calls for volume which is twice as much as current combustion requirements and is very difficult to explain the picture it attempts to deliver.

- Existing text in item 6 and 7 remain in the new location.

Section 618.7 has been incorporated into the new location as #7.
All the usual requirements that can affect the quality and installation of return air openings are contained in this new location and in turn, simplifies the subject matter for the user. There are no new requirements.

Cost Impact: None

      - ~~2.2.~~ ~~The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.~~
      - ~~2.3.~~ ~~Return-air inlets shall not be located within 10 feet (3048 mm) of a draft hood in the same room or space or the combustion chamber of any atmospheric burner appliance in the same room or space.~~
   3. ~~Rooms or spaces containing solid fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of such appliances.~~
6. ~~A closet, bathroom, toilet room, kitchen, garage, boiler room, furnace room or unconditioned attic.~~

   ~~**Exceptions:**~~

   1. ~~Where return air intakes are located not less than 10 feet (3048 mm) from cooking appliances and serve only the kitchen area, taking return air from a kitchen area shall not be prohibited.~~
   2. ~~Dedicated forced air systems serving only a garage shall not be prohibited from obtaining return air from the garage.~~

7. ~~A crawl space by means of direct connection to the return side of a forced-air system. Transfer openings in the crawl space enclosure shall not be prohibited.~~

618.5 Outdoor air openings: Outdoor air intake openings for a forced-air heating system shall be located in accordance with all of the following:

1. Outdoor air openings located within 10 feet horizontally of an appliance vent outlet, a plumbing vent outlet, or an exhaust fan discharge outletshall be not less than 3 feet below such outlets.
2. They shall be not less than 10 feet (3048 mm) above the surface of any adjoining sidewalk, street, alley or driveway.
3. They shall be an approved distance from a storage location where the stored materials emit odors, fumes, hazardous or flammable vapors.

618.6 Indoor return air openings: Indoor return air intake openings for a forced-air heating system shall be in accordance with all of the following:

1. Shall be located in rooms or spaces where the supply air rate discharged back into the room or space is equal to or greater than the return air rate taken from the space.
2. Shall be located a minimum of 10 feet (3048 mm) from a cooking appliance or the firebox or draft hood of a natural draft vented fuel-burning appliance.
3. Where located in a closet, bathroom, toilet room, kitchen, garage, boiler room, furnace room or attic. Return air is permitted to be taken from such spaces where they are served by a dedicated force-air heating system and the supply air rate discharged back into the room or space is equal to or greater than the return air rate taken from the space.
4. Return air intake openings shall not be located in the following locations:
   4.1. Where stored materials emit odors, fumes, hazardous or flammable vapors
   4.2. A refrigeration machinery room as defined in the *International Mechanical Code*

Reason: The proposal seeks to clarify the provisions as follows:
1. Reorganize code requirements by outdoor and indoor air opening locations.
2. State provisions in a positive manner and minimize the use of exceptions.
3. Eliminate unenforceable language or language open to wide interpretation – for example “insanitary location”, “objectionable odors”
4. Simplify the requirements regarding indoor return air openings
5. Allow return air openings a wider variety of spaces where a dedicated forced-air system is installed. Currently coverage only permits kitchen installations.
6. Eliminate the 25% requirement that has no technical basis. The revised text such spaces to be supplied with an equal or greater rate of supply air. (New 618.6 #1)

Cost Impact: The code change proposal will not increase the cost of construction.

FG35-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

618.5-FG-RANFONE

FG36 – 12
621.2, 621.4

Proponent: Craig Conner, Building Quality, representing self

Revise as follows:

Revise as follows:

~~**621.2 Prohibited use.** One or more unvented room heaters shall not be used as the sole source of comfort heating in a dwelling unit.~~

621.4 Prohibited locations. Unvented room heaters shall not be installed within occupancies in Groups A, E and I. Unvented room heaters shall not be installed within dwelling units. The location of unvented room heaters shall also comply with Section 303.3.

Reason: Unvented room heaters should not be allowed in the dwelling units of new, tight, energy-efficient buildings. A new study by the Building Research Council at the University of Illinois measured the air quality produced by unvented heaters as used in real residences. The study demonstrated problems with the indoor air quality in residences with unvented heaters. The study also calls into question the extent of the protection provided by one of the industry's key safety devices, the oxygen depletion sensor (ODS).

A study of 30 homes with unvented gas fireplaces was recently published in the Indoor Air journal[1]. The study monitored the combustion products in the residences. Of the greatest concern was the measured nitrogen dioxide levels (NO_2). There are 4 relevant guidelines/standards for NO_2. About 40% of the residences exceeded both the most lenient ANSI Standard Z21.11.2 value of 300 ppb and the Health Canada guideline of 250 ppb. About 80% exceeded both the US National Ambient Air Quality Standards/EPA standard of 100 ppb and the World Health Organization (WHO) guideline of 110 ppb.[2] A whopping 40% were at least triple the US standard. The study concluded

> "*Levels of NO_2 that exceeded health-based guidelines occurred regardless of usage patterns, so should be considered inherent to the fireplace performance."*

Twenty percent of the heaters exceeded the carbon monoxide (CO) safety level, as established by the US National Ambient Air Quality Standards/EPA standard of 100 ppm (8 hour period).

Unvented heater proponents routinely argue that unvented heaters with oxygen depletion sensors (ODS) have never been shown to have significant health or safety issues. The unvented trade association says "*Vent-free appliances feature an automatic safety shut-off device (Oxygen Detection System or ODS). The ODS turns off the gas in case of a malfunction.*" It is perhaps stating the obvious, but an oxygen depletion sensor monitors oxygen, not carbon monoxide or nitrogen dioxide. Clearly the ODS sensor allowed the indoor air quality to exceed safe levels far too often. It is clear that the ODS did not turn of the gas for the 20% of the heaters that exceeded the carbon monoxide (CO) safety level. Worse yet an outright majority of the unvented heaters exceeded the safety levels for NO[2]. (http://www.ventfree.org/images/stories/files/VentFree_SafeEfficient_V06.pdf)

The study monitored the combustion products in the residences for only 3 to 4 days in each of the 30 homes. It only took 3 or 4 days to find the air quality problems reported. Longer monitoring would likely have reported problems with additional residences. Does the industry still conclude there is no evidence of problems?

The 2012 IECC requires residences in most of the US (climates zone 3 to 8) to be tested to show an air leakage of 3 ACH50 or less (IECC R402.4.1.2). The residences in this study were also tested for air tightness, with the tightest being almost twice as leaky as allowed by the new IECC and the average (median) being almost 4 times as leaky as allowed by the new energy code. New commercial buildings also have substantially more stringent air tightness requirements ((IECC C402.4). If anything, the study of the 30 residences underestimates the air quality problems in new dwelling units.

As if to echo these concerns with health and safety here, it is significant that a number of the producers of vented heater products refuse to produce unvented products due to their concerns with health and safety issues (Hearth & Home Technologies, Jotul, Kozy Heat Fireplaces, Mendota Fireplaces, Renni, Travis Industries), including the largest maker of fireplaces and hearth products.

Unvented gas room heaters do not belong in dwelling units.

1. "Measured concentrations of combustion gases from the use of unvented gas fireplaces". Francisco, P. W., Gordon, J. R. and Rose, B. (2010), Indoor Air, volume 20: pages 370–379.
2. NO_2 measurements are average over one hour.
3. http://www.ventfree.org/images/stories/files/VentFree_SafeEfficient_V06.pdf

Cost Impact: This code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

621.2-FG-CONNER

FG37 – 12
623.2

Proponent: James Ranfone, American Gas Association (jranfon@aga.org)

Revise as follows:

623.2 Prohibited location. Cooking appliances designed, tested, *listed and labeled for use in commercial occupancies* shall not be installed within dwelling units or within any area where domestic cooking operations occur.

<u>**Exception:** Appliances that are also listed as domestic cooking appliances.</u>

Reason: There are cooking appliances that carry dual listings, meeting the requirements of both the commercial and residential ANSI cooking standards. Section 623.2 currently prohibits such appliances from being installed in dwelling units. The exception is meant to allow dual listed appliances to be installed in dwelling units that are listed to the Z21.58 (residential) and Z83.11 (commercial) standards.

Cost Impact: The code change proposal will not increase the cost of construction.

FG37-12

635.2 (New), 635.2.2 (New), 635.3 (New), Chapter 8; IMC: 926.2 (New), 926.2.1 (New), 926.2.2 (New), 926.3 (New)

Proponent: Robert J Davidson, Code Consultant, Davidson Code Concepts, LLC (rjd@davidsoncodeconcepts.com); Robert Boyd, Chair – Hydrogen Industry Panel on Codes (HIPOC)

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IFGC COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE.

PART I - IFGC

Add new text as follows:

SECTION 635 (IFGC)
GASEOUS HYDROGEN SYSTEMS

635.2 Hydrogen generation. Hydrogen generators shall be tested and listed or shall be approved. Hydrogen generators shall be installed in accordance with the manufacturer's instructions, the International Building Code and the International Fire Code.

635.2.1 Water electrolysis process. Hydrogen generators utilizing the water electrolysis process shall be tested and listed in accordance with ISO 22734-1 or ISO 22734-2.

635.2.2 Fuel processing technologies. Hydrogen generators utilizing fuel processing technologies with a capacity of less than 400 m3/h at 0 °C and 101,325 kPa, shall be tested and listed in accordance with ISO 16110-1.

635.3 Generators with integral storage. Hydrogen generators with integral storage shall be located in accordance with the International Fire Code.

Add new standards to Chapter 8 as follows:

ISO 22734-1:2008 Hydrogen generators using water electrolysis process -- Part 1: Industrial and commercial applications

ISO 22734-2:2011 Hydrogen generators using water electrolysis process -- Part 2: Residential applications

ISO 16110-1:2007 Hydrogen generators using fuel processing technologies -- Part 1: Safety

PART II – IMC

Add new text as follows:

SECTION 926
GASEOUS HYDROGEN SYSTEMS

926.1 Installation. The installation of gaseous hydrogen systems shall be in accordance with the applicable requirements of this code, the International Fire Code, the International Fuel Gas Code and the International Building Code.

926.2 Hydrogen generation. Hydrogen generators shall be tested and listed or shall be approved Hydrogen generators shall be installed in accordance with the manufacturer's instructions, the International Building Code, the International Fuel Gas Code and the International Fire Code.

926.2.1 Water electrolysis process. Hydrogen generators utilizing the water electrolysis process shall be tested and listed in accordance with ISO 22734-1 or ISO 22734-2.

926.2.2 Fuel processing technologies. Hydrogen generators utilizing fuel processing technologies with a capacity of less than 400 m3/h at 0 °C and 101,325 kPa, shall be tested and listed in accordance with ISO 16110-1.

926.3 Generators with integral storage. Hydrogen generators with integral storage shall be located in accordance with the International Fire Code.

Add new standards to Chapter 15 as follows:

ISO 22734-1:2008 Hydrogen generators using water electrolysis process -- Part 1: Industrial and commercial applications

ISO 22734-2:2011 Hydrogen generators using water electrolysis process -- Part 2: Residential applications

ISO 16110-1:2007 Hydrogen generators using fuel processing technologies -- Part 1: Safety

Reason: The purpose of this code change is to correct an unintended consequence that came about as the I-Codes have been added to and modified to provide for the safe use of hydrogen as a fuel gas for fuel cells in both stationary and mobile applications.

Hydrogen generators without integral storage of the hydrogen gas have long been in use in industrial and laboratory settings for the production of hydrogen gas as a fuel gas. They can be safely used in indoor or outdoor applications in accordance with manufacturer's instructions and relevant codes and standards. In many situations a hydrogen gas generator is a safer option than stored cylinders of compressed hydrogen. When a generator is shut down you stop generating hydrogen, the hydrogen gas that may remain is what is in the closed fuel gas supply piping. Whereas a cylinder of compressed hydrogen gas will continue to contain whatever amount of gas remains in a compressed state, maintaining the possibility of a release beyond what is in the fuel gas piping.

With the crafting of new language for the safe use of various applications involving hydrogen as a fuel gas the codes and standards have developed and applied distance to exposure requirements for installations involving the storage of hydrogen gas. The distance tables are built around the hazard presented by the amount of hydrogen stored and the conditions of storage. Those distances were not intended to apply to the hydrogen generators that do not have integral storage of the hydrogen produced. Unfortunately code officials have occasionally, and incorrectly, applied the new location and distance requirements against hydrogen generators without integral storage.

What this proposal does is add language to both the IFGC and the IMC specific to hydrogen generators requiring that they be tested and listed or approved. It provides three new referenced standards for two common types of hydrogen generators and it clarifies that only those hydrogen generators with integral storage of the hydrogen gas produced are to be located as required by the International Fire Code.

Cost Impact: The code change proposal will not increase the cost of construction; it will reduce costs by eliminating the unintended application of new site distance requirements to hydrogen generators.

Analysis: A review of the standard proposed for inclusion in the code, ISO 22734-1, ISO 22734-2, and ISO 16110-1 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

FG38-12
PART I - INTERNATIONAL FUEL GAS CODE

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II - INTERNATIONAL MECHANICAL CODE

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

635.2 (NEW)-FG-DAVIDSON

FG39– 12
704.1.2, 704.1.2.4, 705.2, 705.3, Chapter 8

Proponent: Robert J Davidson, Code Consultant, Davidson Code Concepts, LLC (rjd@davidsoncodeconcepts.com); Robert Boyd, Chair – Hydrogen Industry Panel on Codes (HIPOC)

Revise as follows:

704.1.2 Piping systems. Piping, tubing, valves and fittings conveying gaseous hydrogen shall be designed and installed in accordance with Sections 704.1.2.1 through 704.1.2.5.1, Chapter 50 of the International Fire Code, and ~~ASME B31.3~~ ASME B31.12. Cast-iron pipe, valves and fittings shall not be used.

704.1.2.4 Joints. Joints in piping and tubing in hydrogen service shall be listed as complying with ASME B31.3 to include the use of welded, brazed, flared, socket, slip and compression fittings. Gaskets and sealants used in hydrogen service shall be listed as complying with ~~ASME B31.3~~ ASME 31.12. Threaded and flanged connections shall not be used in areas other than hydrogen cutoff rooms and outdoors.

705.2 Inspections. Inspections shall consist of a visual examination of the entire piping system installation and a pressure test. Hydrogen piping systems shall be inspected in accordance with this code. Inspection methods such as outlined in ~~ASME B31.3~~ ASME 31.12shall be permitted where specified by the design engineer and approved by the code official. Inspections shall be conducted or verified by the code official prior to system operation.

705.3 Pressure tests. A hydrostatic or pneumatic leak test shall be performed. Testing of hydrogen piping systems shall utilize testing procedures identified in ~~ASME B31.3~~ ASME 31.12 or other approved methods, provided that the testing is performed in accordance with the minimum provisions specified in Sections 705.3.1 through 705.4.1.

Add new standard to Chapter 8 as follows:

ASME B31.12-2008 Hydrogen Piping and Pipelines

Reason: The Hydrogen Industry Panel on Codes and Standards recommends this change from one ASME standard to another. In 2008 ASME published the standard, ASME B31.12 Hydrogen Piping and Pipelines, this standard incorporates all of the hydrogen related content from ASME 31.3 of B31.1, B31.3 and B31.8, thus making a single reference to ASME 31.12 all that is needed. In addition the ASME Hydrogen Piping standard B31.12 provides expanded guidance on material selection, testing and fabrication specific to hydrogen applications. ASME B31.12 is accepted in the emerging hydrogen transport fuel industry as well as the tradtional industrial hydrogen applications used by industriy. This change also harmonizes the IFGC with similar model codes for hydrogen applications and would simplify both regulation and compliance by reducing the quantity of reference documents.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASME B31.12 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

TENTATIVE ORDER OF DISCUSSION
2012 PROPOSED CHANGES TO THE
INTERNATIONAL PLUMBING/PRIVATE SEWAGE DISPOSAL CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation **does not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some IPC code change proposals may not be included on this list, as they are being heard by other committees. Please consult the Cross Index of Proposed Changes.

P1 – 12
202

Proponent: Michael Moss, American Backflow Prevention Association (msmoss@utah.gov)

Revise as follows:

BACKFLOW PREVENTER. A backflow prevention assembly, a backflow prevention device or other means or method to prevent backflow into the potable water supply.

Reason: This definition is used throughout the code. However, it does not define to the user of the code, how to specifically identify or apply proper "protection" to a use or connection. Industry standards differentiate between backflow prevention devices and backflow prevention assemblies. A backflow prevention assembly is a specific type of mechanical backflow prevention protection which is field testable and repairable in-line, with shutoff valves and test cock fittings.

Cost Impact: The code change proposal will not increase the cost of construction.

P1-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202 BACKFLOW PREVENTER-P-MOSS

P2– 12
202

Proponent: Michael Moss, American Backflow Prevention Association (msmoss@utah.gov)

Revise as follows:

CONTAMINATION. A~~n~~ high hazard or health hazard impairment of the quality of the potable water that creates an actual hazard to the public health through poisoning or through the spread of disease by sewage, industrial fluids or waste.

Reason: The code does not define "high hazard" or health hazard, however, the term is used as a footnote for Table 608.1. This terminology is required to more correctly determine the type of backflow prevention assembly, backflow prevention device, means or method which is required for the protection of the water system to ensure protection of public health.

Cost Impact: The code change proposal will not increase the cost of construction.

P2-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202 CONTAMINATION-P-MOSS

P3 – 12
202

THIS CODE CHANGE PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE HEARING ORDER FOR THE IBC STRUCTURAL DEVELOPMENT COMMITTEE.

Proponent: John Ingargiola and Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@dhs.gov, gregory.p.wilson@dhs.gov), Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net).

Revise as follows:

[B] DESIGN FLOOD ELEVATION. The elevation of the “design flood,” including wave height, relative to the datum specified on the community’s legally designated flood hazard map. <u>In areas designated as Zone AO, the *design flood elevation* shall be the elevation of the highest existing grade of the *building’s* perimeter plus the depth number (in feet) specified on the flood hazard map. In areas designated as Zone AO where a depth number is not specified on the map, the depth number shall be taken as being equal to 2 feet (610 mm).</u>

Reason: This definition is controlled by the IBC; this proposal brings the IPC, IMC, IFGC, and IPSDC definitions in line with the term as defined by the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

P3-12

202-P-DESIGN FLOOD ELEVATION-INGARGIOLA-WILSON.doc

P4 – 12
202

Proponent: James Paschal, Paschal Engineering representing himself (Jim@PaschalEngineering.com)

Revise as follows:

MECHANICAL JOINT. A connection between pipes, fittings, or pipes and fittings that is not screwed, caulked, threaded, soldered, solvent cemented, brazed, ~~or~~ welded, or heat-fused. A joint in which compression is applied along the centerline of the pieces being joined. In some applications, the joint is part of a coupling, fitting, or adapter.

Reason: Heat fusion is now a defined type of joint for plastic piping, and is considered separate from welding because there is not any additional filler material used in forming the joint. However, heat-fusion joints are not mechanical joints and as such should be excluded from the definition of mechanical joints.

Cost Impact: None

P4-12

	Assembly:	ASF	AMF	DF

202 MECHANICAL JOINT-P-PASCHAL

P5– 12
202

Proponent: Robert G. Konyndyk, Chief, Plumbing Division, Bureau of Construction Codes, Department of Licensing and Regulatory Affairs, State of Michigan, representing The Bureau of Construction Codes (konyndykr@michigan.gov)

Revise as follows:

PLUMBING SYSTEMS. Includes the water ~~supply and~~ distribution pipes; plumbing fixtures and traps; water-treating or water-using equipment; soil, waste and vent pipes; ~~and sanitary and storm sewers~~ and building drains; in addition to their respective connections, devices and appurtenances within a structure or premises~~.~~; and the water service, building sewer and building storm sewer serving such structure or premises.

Reason: This code change revision will improve the code by providing greater clarity. The code proposal revision will not add or delete any of the current areas identified in the code. It will rearrange the items to enhance the understanding that water supplies, storm sanitary and storm sewers are located outside the structures. They are however identified in the code and remain critical to the operation of structures.

Cost Impact: The revision will not affect construction costs and may reduce construction planning costs.

P5-11

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202 PLUMBING SYSTEMS-P-KONYNDYK

P6 – 12
202

Proponent: Michael Moss, American Backflow Prevention Association (msmoss@utah.gov)

Revise as follows:

POLLUTION. A~~n~~ low hazard or non-health hazard impairment of the quality of the potable water to a degree that does not create a hazard to the public health, but that does adversely and unreasonably affect the aesthetic qualities of such potable water supply for domestic use.

Reason: The code does not define “low hazard” or non-health, however, the term is used in Table 608.1 as a footnote. This terminology is required to more correctly determine the type of backflow prevention assembly, backflow prevention device, means or method which is required for the protection of the water system to ensure protection of public health.

Cost Impact: The code change proposal will not increase the cost of construction.

P6-12

	Assembly:	ASF	AMF	DF

202 POLLUTION-P-MOSS

P7 – 12
202

Proponent: Windell F. Peters, representing the Georgia State Inspectors Association (windellf@bellsouth.net)

Revise as follows:

Public sewer. ~~A common sewer directly controlled by public authority.~~ That part of the drainage system of pipes, installed and maintained by a city, township, county, public utility company or other public entity, and located on public property, in the street or in an approved dedicated easement of public or community use.

Reason: The AHJ requires approval before work can be performed on any utilities under their control. The IPC references public sewer and water main numerous times. The current definition of Public Sewer does not adequately define the term. Water mains and public sewers are controlled by local government and located in an area controlled by them as well. The definition of public sewer should be as detailed as the current definition of water main
for clarity purposes.

Cost Impact: The code change proposal will not increase the cost of construction.

P7-12

	Assembly:	ASF	AMF	DF

202 PUBLIC SEWER-P-PETERS

P8 – 12
202

Proponent: Dana Bres, P.E, U.S. Department of Housing and Urban Development representing the U.S. Department of Housing and Urban Development (dana.b.bres@hud.gov)

Add new definition as follows:

TANKLESS WATER HEATER. A non-storage water heating appliance or equipment that heats potable water on demand and supplies such water to the potable *hot water* distribution system.

Reason: Tankless water heaters are becoming more common in construction. The term is not defined although the term is used in section 501.6 and in proposed changes elsewhere. This definition would not include instantaneous point of use heaters as those systems would not supply hot water to the distribution system of a building.

Cost Impact: The code change proposal will not increase the cost of construction.

P9– 12
202

Proponent: Bob Adkins, Prince William County VA Representing, the Virginia Plumbing and Mechanical Inspectors Association and The Virginia Building Code Officials Association and ICC Region 7 (radkins@pwcgov.org)

Add new definition as follows:

TOILET FACILITY. A room or space that contains not less than one water closet and one lavatory.

Reason: A definition for "toilet facility" is needed. The term is found in the code 27 times but yet the never really provides a clear indication of what is intended in each case its mentioned.

Cost Impact: none

P9-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202 TOILET FACILITY-P-ADKINS

P10 – 12
202

Proponent: Shawn Strausbaugh, Arlington County VA representing the Virginia Plumbing and Mechanical Inspectors Association and The Virginia Building Code Officials Association and ICC Region 7 (Sstrausbaugh@arlingtonva.us)

Add new definition as follows:

<u>**WASTE RECEPTOR.** A floor sink, standpipe, hub drain or a floor drain that receives the discharge of one or more indirect waste pipes.</u>

Reason: A definition for “waste receptor” is needed. The term is found in the code 24 times with no exact description. Also, see coordinated proposed change in Chapter 8 based on this definition.

Cost Impact: None

P10-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202 WASTE RECEPTOR (NEW)-P-STRAUSBAUGH

P11 – 12
202, 301.3, Chapter 13, Chapter 13 (New), Chapter 14 (New)

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Add new definitions as follows:

STORAGE TANK. A fixed container for holding water at atmospheric pressure for subsequent reuse as part of a plumbing or irrigation system.

RECLAIMED WATER. *Non-potable water* that has been derived from the treatment of wastewater by a facility or system licensed or permitted to produce water meeting the jurisdiction's water requirements for its intended uses. Also known as "Recycled Water."

ONSITE NON-POTABLE WATER REUSE SYSTEMS. Water systems for the collection, treatment, storage, distribution, and reuse of non-potable water generated onsite, including but not limited to graywater systems. This definition does not include rainwater harvesting systems.

DISTRIBUTION PIPE. Pressurized or non-pressure piping used within the plumbing system of a building to deliver rainwater or graywater from the *storage tank* or pump to the point of use.

COLLECTION PIPE. Unpressurized pipe used within the collection system that drains onsite non-potable water or rainwater to a storage tank by gravity.

ALTERNATE ON–SITE NON-POTABLE WATER. Non-potable water from other than public utilities, onsite surface sources and subsurface natural freshwater sources. Examples of such water are graywater, on-site reclaimed water, collected rainwater, captured condensate, and rejected water from reverse osmosis systems.

METER. A measuring device used to collect data and indicate water usage.

RAINWATER. Water from natural precipitation.

Revise as follows:

301.3 Connections to drainage system. Plumbing fixtures, drains, appurtenances and appliances used to receive or discharge liquid wastes or sewage shall be directly connected to the sanitary drainage system of the building or premises, in accordance with the requirements of this code. This section shall not be construed to prevent indirect waste systems required by Chapter 8.

> **Exception:** Bathtubs, showers, lavatories, clothes washers and laundry trays shall not be required to discharge to the sanitary drainage system where such fixtures discharge to an approved ~~gray water~~ system in accordance with Chapter 13 and 14 ~~for flushing of water closets and urinals or for subsurface landscape irrigation~~.

Delete existing Chapter 13 and substitute as follows:

~~CHAPTER 13~~
~~GRAY WATER RECYCLING SYSTEMS~~

CHAPTER 13
NON-POTABLE WATER SYSTEMS

SECTION 1301

GENERAL

1301.1 Scope. The provisions of Chapter 13 shall govern the materials, design, construction and installation of systems for the collection, storage, treatment, and distribution of non-potable water. The use and application of non-potable water shall comply with laws, rules and ordinances applicable in the jurisdiction.

1301.2 Water quality. Non-potable water for each end use application shall meet the minimum water quality requirements as established for the intended application by the laws, rules and ordinances applicable in the jurisdiction. Where *non-potable* water from different sources is combined in a system, the system shall comply with the most stringent of the requirements of this code that are applicable to such sources.

1301.2.1 Residual disinfectants. Where chlorine is used for disinfection, the *non-potable* water shall contain not more than 4 mg/L of chloramines or free chlorine when tested in accordance with ASTM D1253. Where ozone is used for disinfection, the *non-potable* water shall not contain gas bubbles having elevated levels of ozone at the point of use.

1301.2.2 Filtration required. *Non-potable* water utilized for water closet and urinal flushing applications shall be filtered by a 100 micron or finer filter.

> **Exception:** Reclaimed water sources shall not be required to comply with the requirements of 1301.2.1 and 1301.2.2.

1301.3 Signage required. All non-potable water outlets such as hose connections, open ended pipes, and faucets shall be identified at the point of use for each outlet with signage that reads as follows: “Non-potable water is utilized for [application name]. Caution: non-potable water. DO NOT DRINK.” The words shall be legibly and indelibly printed on a tag or sign constructed of corrosion-resistant waterproof material or shall be indelibly printed on the fixture. The letters of the words shall be not less than 0.5 inches in height and in colors in contrast to the background on which they are applied. In addition to the required wordage, the pictograph shown in Figure 1301.3 shall appear on the signage required by this section.

Figure 1301.3 – Pictograph DO NOT DRINK

1301.4 Permits. *Permits* shall be required for the construction, installation, *alteration*, and *repair* of non-potable water systems. *Construction documents*, engineering calculations, diagrams, and other such data pertaining to the non-potable water system shall be submitted with each application for *permit*.

1301.5 Potable water connections. Where a *potable* system is connected to a non-potable water system, the *potable* water supply shall be protected against backflow in accordance with Section 608.

1301.6 Approved components and materials. Piping, plumbing components, and materials used in the collection and conveyance systems shall be manufactured of material *approved* for the intended application and compatible with any disinfection and treatment systems used.

1301.7 Insect and vermin control. The system shall be protected to prevent the entrance of insects and vermin into *storage tanks* and piping systems. Any screen materials shall be compatible with contacting system components and shall not accelerate corrosion of system components.

1301.8 Freeze protection. Where sustained freezing temperatures occur, provisions shall be made to keep *storage tanks* and the related piping from freezing.

1301.9 Non-potable water storage tanks. Where used, non-potable water *storage tanks* shall comply with Sections 1301.9.1 through 1301.9.11.

1301.9.1 Sizing. The holding capacity of the *storage tank* shall be sized in accordance with the anticipated demand.

1301.9.2 Location. *Storage tanks* shall be installed above or below grade. Above grade *storage tanks* shall be protected from direct sunlight and shall be constructed using opaque, UV resistant, materials such as, but not limited to, heavily tinted plastic, fiberglass, lined metal, concrete, wood, or painted to prevent algae growth, or shall have specially constructed sun barriers including but not limited to installation in garages, crawlspaces, or sheds. *Storage tanks* and their manholes shall not be located directly under any soil or waste piping or any source of contamination.

1301.9.3 Materials. Where collected onsite, water shall be collected in an *approved* tank constructed of durable, nonabsorbent and corrosion-resistant materials. The *storage tank* shall be constructed of materials compatible with any disinfection systems used to treat water upstream of the tank and with any systems used to maintain water quality within the tank. Wooden *storage tanks* that are not equipped with a makeup water source shall be provided with a flexible liner.

1301.9.4 Foundation and supports. *Storage tanks* shall be supported on a firm base capable of withstanding the *storage tank's* weight when filled to capacity. *Storage tanks* shall be supported in accordance with the *International Building Code*.

1301.9.4.1 Ballast. Where the soil can become saturated, an underground *storage tank* shall be ballasted, or otherwise secured, to prevent the tank from floating out of the ground when empty. The combined weight of the tank and hold down ballast shall meet or exceed the buoyancy force of the tank. Where the installation requires a foundation, the foundation shall be flat and shall be designed to support the *storage tank* weight when full, consistent with the bearing capability of adjacent soil.

1301.9.4.2 Structural support. Where installed below grade, *storage tank* installations shall be designed to withstand earth and surface structural loads without damage and with minimal deformation when filled with water or empty.

1301.9.5 Makeup water. Where an uninterrupted supply is required for the intended application, *potable* or reclaimed water shall be provided as a source of makeup water for the *storage tank*. The makeup water supply shall be protected against backflow in accordance with Section 608. A full-open valve located on the makeup water supply line to the *storage tank* shall be provided. Inlets to *storage tank* shall be controlled by fill valves or other automatic supply valves installed so as to prevent the tank from overflowing and to prevent the water level from dropping below a predetermined point. Where makeup water is provided, the water level shall not be permitted to drop below the source water inlet or the intake of any attached pump.

1301.9.6 Overflow. The *storage tank* shall be equipped with an overflow pipe having a diameter not less than that shown in Table 606.5.4 The overflow pipe shall be protected from insects or vermin and shall be discharged in a manner consistent with storm water runoff requirements of the jurisdiction. The overlow piope shall discharge at a sufficient distance from the tank to avoid damaging the tank foundation or the adjacent property. Drainage from overflow pipes shall be directed so as not to freeze on roof walks. The overflow drain shall not be equipped with a shutoff valve. A cleanout shall be provided on each overflow pipe in accordance with Section 708.

1301.9.7 Access. A minimum of one access opening shall be provided to allow inspection and cleaning of the tank interior. Access openings shall have an *approved* locking device or other *approved* method of securing access. Below grade *storage tanks*, located outside of the *building*, shall be provided with either a manhole not less than 24 inches (610 mm) square or a manhole with an inside diameter not less than 24 inches (610 mm) . Manholes shall extend not less than 4 inches above ground or shall be designed to as to prevent water infiltration. Finished grade shall be sloped away from the manhole to divert surface water from the manhole. Each manhole cover shall be secured to prevent unauthorized access. Service ports in manhole covers shall be not less than 8 inches (203 mm) in diameter and shall be a minimum of 4 inches (102 mm) above the finished grade level. The service port be secured to prevent unauthorized access.

> **Exception:** *Storage tanks* under 800 gallons in volume installed below grade shall not be required to be equipped with a manhole, but shall have a service port not less than 8 inches (203 mm) in diameter.

1301.9.8 Venting. *Storage tanks* shall be provided with a vent sized in accordance with Chapter 9 and based on the aggregate diameter of all tank influent pipes. The reservoir vent shall not be connected to sanitary drainage system vents. Vents shall be protected from contamination by means of a U-bend installed with the opening directed downward or an *approved* cap. Vent outlets shall extend a minimum of 4” above grade, or as necessary to prevent surface water from entering the *storage tank*. Vent openings shall be protected against the entrance of vermin and insects in accordance with the requirements of Section 1307.1.

1301.9.9 Draining of tanks. Where tanks require draining for service or cleaning, tanks shall be drained by using a pump or by a drain located at the lowest point in the tank The tank drain pipe shall discharge as required for overflow pipes and shall not be smaller in size than specified in Table 606.5.7. A minimum of one cleanout shall be provided on each drain pipe in accordance with Section 708.

1301.9.10 Marking and signage. Each non-potable water *storage tank* shall be *labeled* with its rated capacity. The contents of *storage tanks* shall be identified with the words “CAUTION: NON-POTABLE WATER – DO NOT DRINK.” Where an opening is provided that could allow the entry of personnel, the opening shall be marked with the words, “DANGER – CONFINED SPACE.” Markings shall be indelibly printed on a tag or sign constructed of corrosion-resistant waterproof material mounted on the tank or shall be indelibly printed on the tank. The letters of the words shall be not less than 0.5 inches in height and shall be of a color in contrast with the background on which they are applied.

1301.9.11 Storage tank tests. *Storage tanks* shall be tested in accordance with the following:

Storage tanks shall be filled with water to the overflow line prior to and during inspection. All seams and joints shall be left exposed and the tank shall remain water tight without leakage for a period of 24 hours.

1. After 24 hours, supplemental water shall be introduced for a period of 15 minutes to verify proper drainage of the overflow system and verify that there are no leaks.

2. The tank drain shall be observed for proper operation.
3. The makeup water system shall be observed for proper operation and successful automatic shutoff of the system at the refill threshold shall be verified.

1301.10 System abandonment. If the owner of an onsite non-potable water reuse system or *rainwater collection and conveyance system* elects to cease use of, or fails to properly maintain such system, the system shall be abandoned and shall comply with the following:

1. All system piping connecting to a utility-provided water system shall be removed or disabled.
2. The *distribution piping* system shall be replaced with an *approved potable* water supply piping system. Where an existing *potable* pipe system is already in place, the fixtures shall be connected to the existing system.
3. The storage tank shall be secured from accidental access by sealing or locking tank inlets and access points, or filling with sand or equivalent.

1301.11 Trenching requirements for non-potable water piping. Non-potable water collection and distribution piping and reclaimed water piping shall be separated from the *building* sewer and *potable* water piping underground by 5 feet (1524 m) of undisturbed or compacted earth. Non-potable water collection and distribution piping shall not be located in, under or above cesspools, septic tanks, septic tank drainage fields or seepage pits. Buried non-potable water piping shall comply with the requirements of Section 306.

Exceptions:

1. The required separation distance shall not apply where the bottom of the non-potable water pipe within 5 feet (1524 mm) of the sewer is not less than 12 inches (305 mm) above the top of the highest point of the sewer and the pipe materials conforms to Table 702.3.
2. The required separation distance shall not apply where the bottom of the *potable* water service pipe within 5 feet (1524 mm) of the non-potable water pipe is a minimum of 12 inches (305 mm) above the top of the highest point of the non-potable water pipe and the pipe materials comply with the requirements of Table 605.4
3. Non-potable water pipe is permitted to be located in the same trench with a building sewer, provided that such sewer is constructed of materials that comply with the requirements of Table 702.2.
4. The required separation distance shall not apply where a non-potable water pipe crosses a sewer pipe provided that the pipe is sleeved to at least 5 feet (1524 mm) horizontally from the sewer pipe centerline on both sides of such crossing with pipe materials that comply with Table 702.2.
5. The required separation distance shall not apply where a *potable* water service pipe crosses a non-potable water pipe provided that the *potable* water service pipe is sleeved for a distance of at least 5 feet (1524 mm) horizontally from the centerline of the non-potable pipe on both sides of such crossing with pipe materials that comply with Table 702.2.
6. Irrigation piping located outside of a *building* and downstream of the backflow preventer is not required to meet the trenching requirements where non-potable water is used for outdoor applications.

1301.12 Outdoor outlet access. Sillcocks, hose bibs, wall hydrants, yard hydrants, and other outdoor outlets supplied by *non-potable* water shall be located in a locked vault or shall be operable only by means of a removable key.

SECTION 1302
ONSITE NON-POTABLE WATER REUSE SYSTEMS

1302.1 General. The provisions of Section 1302 shall govern the construction, installation, *alteration,* and *repair* of *onsite non-potable water reuse systems* for the collection, storage, treatment and distribution of on-site sources of non-potable water as permitted by the jurisdiction.

1302.2 Sources. Onsite non-potable water reuse systems shall collect waste discharge from only the following sources: bathtubs, showers, lavatories, clothes washers, and laundry trays. Water from other approved non-potable sources including swimming pool backwash operations, air conditioner condensate, rainwater, cooling tower blow-down water, foundation drain water, steam system condensate, fluid cooler discharge water, food steamer discharge water, combination oven discharge water, industrial process water, and fire pump test water shall also be permitted to be collected for reuse by onsite non-potable water reuse systems, as approved by the code official and as appropriate for the intended application.

1302.2.1 Prohibited sources. Wastewater containing urine or fecal matter shall not be diverted to onsite non-potable water reuse systems and shall discharge to the sanitary drainage system of the building or premises in accordance with Chapter 7. Water from reverse osmosis system reject water, water softener discharge water, kitchen sink wastewater, dishwasher wastewater, and wastewater discharged from wet-hood scrubbers shall not be collected for reuse within a to onsite non-potable water reuse systems.

1302.3 Traps. Traps serving fixtures and devices discharging wastewater to to onsite non-potable water reuse systems shall comply with the Section 1002.4.

1302.4 Collection pipe. Onsite non-potable water reuse systems shall utilize drainage piping *approved* for use within plumbing drainage systems to collect and convey untreated water for reuse. Vent piping *approved* for use within plumbing venting systems shall be utilized for vents within the graywater system. Collection and vent piping materials shall comply with Section 702.

1302.3.1 Installation. Collection piping conveying untreated water for reuse shall be installed in accordance with Section 704.

1302.3.2 Joints. Collection piping conveying untreated water for reuse shall utilize joints *approved* for use with the *distribution piping* and appropriate for the intended applications as specified in Section 705.

1302.3.3 Size. Collection piping conveying untreated water for reuse shall be sized in accordance with drainage sizing requirements specified in Section 710.

1302.3.4 Labeling and marking. Additional marking of collection piping conveying untreated water for reuse shall not be required beyond that required for sanitary drainage, waste, and vent piping by the Chapter 7.

1302.5 Filtration. Untreated water collected for reuse shall be filtered as required for the intended end use. Filters shall be accessible for inspection and maintenance. Filters shall utilize a pressure gage or other *approved* method to provide indication when a filter requires servicing or replacement. Filters shall be installed with shutoff valves installed immediately upstream and downstream to allow for isolation during maintenance.

1302.6 Disinfection. Where the intended application for non-potable water collected onsite for reuse requires disinfection or other treatment or both, it shall be disinfected as needed to ensure that the required water quality is delivered at the point of use. Non-potable water collected onsite containing untreated *graywater* shall be retained in collection reservoirs for a maximum of 24 hours.

1302.7 Storage tanks. *Storage tanks* utilized in onsite non-potable water reuse systems shall comply with Section 1301.9.

1302.7.1 Location. *Storage tanks* shall be located with a minimum horizontal distance between various elements as indicated in Table 1302.7.1.

TABLE 1302.7.1
LOCATION OF NON-POTABLE WATER REUSE STORAGE TANKS

ELEMENT	MINIMUM HORIZONTAL DISTANCE FROM STORAGE TANK (FEET)
Critical root zone (CRZ) of protected trees	2
Lot line adjoining private lots	5
Seepage pits	5
Septic tanks	5
Water wells	50
Streams and lakes	50
Water service	5
Public water main	10

1302.7.3 Outlets. Outlets shall be located at least 4 inches (102 mm) above the bottom of the *storage tank*, and shall not skim water from the surface.

1302.8 Valves. Valves shall be supplied on onsite non-potable water reuse systems in accordance with Sections 1302.8.1 and 1302.8.2.

1302.8.1 Bypass valve. One three-way diverter valve listed and labeled to NSF 50 or other *approved* device shall be installed on collection piping upstream of each *storage tank*, or drainfield, as applicable, to divert untreated onsite reuse sources to the sanitary sewer to allow servicing and inspection of the system. Bypass valves shall be installed downstream of fixture traps and vent connections Bypass valves shall be *marked* to indicate the direction of flow, connection and *storage tank* or drainfield connection. Bypass valves shall be installed in accessible locations. Two shutoff valves shall not be installed to serve as a bypass valve.

1302.8.2 Backwater valve. One or more *backwater valves* shall be installed on each overflow and tank drain pipe. *Backwater valves* shall be in accordance with Section 715.

1302.9 Pumping and control system. Mechanical equipment including pumps, valves and filters shall be easily accessible and removable in order to perform *repair*, maintenance and cleaning. The minimum flow rate and flow pressure delivered by the pumping system shall appropriate for the application and in accordance with Section 604.

1302.10 Water-pressure reducing valve or regulator. Where the water pressure supplied by the pumping system exceeds 80 psi (552 kPa) static, a pressure-reducing valve shall be installed to reduce the pressure in the nonnpotable water distribution system piping to 80 psi (552 kPa) static or less. Pressure-reducing valves shall be specified and installed in accordance with Section 604.8.

1302.11 Distribution pipe. *Distribution piping* utilized in onsite non-potable water reuse systems shall comply with Sections 1302.11.1 through 1302.11.4.

Exception: Irrigation piping located outside of the *building* and downstream of a backflow preventer.

1302.11.1 Materials, joints and connections. *Distribution piping* shall conform to the standards and requirements specified in Section 605.

1302.11.2 Design. Onsite non-potable water reuse distribution piping systems shall be designed and sized in accordance with Section 604 for the intended application.

1302.11.3 Marking. Onsite non-potable water distribution piping labeling and marking shall comply with Section 608.8.

1302.12 Tests and inspections. Tests and inspections shall be performed in accordance with Sections 1302.12.1 through 1302.12.6.

1302.12.1 Collection pipe and vent test. Drain, waste and vent piping used for onsite water reuse systems shall be tested in accordance with Section 312.

1302.12.2 Storage tank test. *Storage tanks* shall be tested in accordance with the Section 1301.9.11.

1302.12.3 Water supply system test. The testing of makeup water supply piping and *distribution piping* shall be conducted in accordance with Section 312.5.

1302.12.4 Inspection and testing of backflow prevention assemblies. The testing of backflow preventers and *backwater valves* shall be conducted in accordance with Section 312.10.

1302.12.5 Inspection vermin and insect protection. Inlets and vents to the system shall be inspected to verify that each is protected to prevent the entrance of insects and vermin into the *storage tank* and piping systems in accordance with Section 1301.7.

1302.12.6 Water quality test. The quality of the water for the intended application shall be verified at the point of use in accordance with the requirements of the *jurisdiction*.

1302.13 Operation and maintenance manuals. Operations and maintenance materials shall be supplied with non-potable onsite water reuse systems in accordance with Sections 1302.13.1 through 1302.13.4.

1302.13.1 Manual. A detailed operations and maintenance manual shall be supplied in hardcopy form with all systems.

1302.13.2 Schematics. The manual shall include a detailed system schematic, locations of all system components, and a list of all system components including manufacturer and model number.

1302.13.3 Maintenance procedures. The manual shall provide a maintenance schedule and procedures for all system components requiring periodic maintenance. Consumable parts including filters shall be noted along with part numbers.

1302.13.4 Operations procedures. The manual shall include system startup and shutdown procedures. The manual shall include detailed operating procedures for the system.

SECTION 1303
NON-POTABLE RAINWATER COLLECTION AND DISTRIBUTION SYSTEMS

1303.1 General. The provisions of Section 1303 shall govern the construction, installation, *alteration,* and *repair* of *rainwater collection and conveyance systems* for the collection, storage, treatment and distribution of rainwater for non-potable applications, as permitted by the jurisdiction.

1303.2 Collection surface. *Rainwater* shall be collected only from above-ground impervious roofing surfaces constructed from *approved* materials. Collection of water from vehicular parking or pedestrian surfaces shall be prohibited except where the water is used exclusively for landscape irrigation. Overflow and bleed-off pipes from roof-mounted appliances including but not limited to evaporative coolers, water heaters, and solar water heaters shall not discharge onto *rainwater* collection surfaces.

1303.3 Debris excluders. Downspouts and leaders shall be connected to a *roof washer* and shall be equipped with a debris excluder or equivalent device to prevent the contamination of collected *rainwater* with leaves, sticks, pine needles and similar material. Debris excluders and equivalent devices shall be self-cleaning.

1303.4 Roof washer. A sufficient amount of *rainwater* shall be diverted at the beginning of each rain event, and not allowed to enter the *storage tank*, to wash accumulated debris from the collection surface. The amount of rainfall to be diverted shall be field adjustable as necessary to minimize *storage tank* water contamination. The *roof washer* shall not rely on *manually* operated valves or devices, and shall operate automatically. Diverted *rainwater* shall not be drained to the roof surface, and shall be discharged in a manner consistent with the storm water runoff requirements of the *jurisdiction*. *Roof washers* shall be accessible for maintenance and service.

1303.5 Roof gutters and downspouts. Gutters and downspouts shall be constructed of materials that are compatible with the collection surface and the *rainwater* quality for the desired end use. Joints shall be made water-tight.

1303.5.1 Slope. Roof gutters, leaders, and *rainwater* collection piping shall slope continuously toward collection inlets. Gutters and downspouts shall have a slope of not less than 1/8 inch per foot along their entire length, and shall not permit the collection or pooling of water at any point.

> **Exception:** Siphonic drainage systems installed in accordance with the manufacturer's installation instructions shall not be required to have slope.

1303.5.2 Size. Gutters and downspouts shall be installed and sized in accordance with Section 1106.6 and local rainfall rates.

1303.5.3 Cleanouts. Cleanouts shall be provided in the water conveyance system so as to allow access to all filters, flushes, pipes and downspouts.

1303.6 Drainage. Water drained from the *roof washer* or debris excluder shall not be drained to the sanitary sewer. Such water shall be diverted from the *storage tank* and discharge in a location that will not cause erosion or damage to property in accordance with the *International Building Code*. *Roof washers* and debris excluders shall be provided with an automatic means of self draining between rain events, and shall not drain onto roof surfaces.

1303.7 Collection pipe. Rainwater collection and conveyance systems shall utilize drainage piping *approved* for use within plumbing drainage systems to collect and convey captured rainwater. Vent piping *approved* for use within plumbing venting systems shall be utilized for vents within the rainwater system. Collection and vent piping materials shall comply with Section 702.

1303.7.1 Installation. Collection piping conveying captured rainwater shall be installed in accordance with Section 704.

1303.7.2 Joints. Collection piping conveying captured rainwater shall utilize joints *approved* for use with the *distribution piping* and appropriate for the intended applications as specified in Section 705.

1303.7.3 Size. Collection piping conveying captured rainwater shall be sized in accordance with drainage sizing requirements specified in Section 710.

1303.7.4 Labeling and marking. Additional marking of collection piping conveying captured rainwater for reuse shall not be required beyond that required for sanitary drainage, waste, and vent piping by the Chapter 7.

1303.8 Filtration. Collected rainwater shall be filtered as required for the intended end use. Filters shall be accessible for inspection and maintenance. Filters shall utilize a pressure gage or other *approved* method to provide indication when a filter requires servicing or replacement. Filters shall be installed with shutoff valves installed immediately upstream and downstream to allow for isolation during maintenance.

1303.9 Disinfection. Where the intended application for rainwater requires disinfection or other treatment or both, it shall be disinfected as needed to ensure that the required water quality is delivered at the point of use. Where chlorine is used for disinfection or treatment, water shall be tested for residual chlorine in accordance with ASTM D1253. The levels of residual chlorine shall not exceed the levels allowed for the intended use in accordance with the requirements of the *jurisdiction*.

1303.10 Storage tanks. *Storage tanks* utilized in non-potable rainwater collection and conveyance systems shall comply with Section 1301.9 and 1303.10.1 through 1303.10.3.

1303.10.1 Location. *Storage tanks* shall be located with a minimum horizontal distance between various elements as indicated in Table 1303.10.1.

TABLE 1303.10.1
LOCATION OF RAINWATER STORAGE TANKS

ELEMENT	**MINIMUM HORIZONTAL DISTANCE FROM STORAGE TANK (FEET)**
Critical root zone (CRZ) of protected trees	2
Lot line adjoining private lots	5
Seepage pits	5
Septic tanks	5

1303.10.2 Inlets. *Storage tank* inlets shall be designed to introduce collected rainwater into the tank with minimum turbulence, and shall be located and designed to avoid agitating the contents of the *storage tank*.

1303.10.3 Outlets. Outlets shall be located at least 4 inches (102 mm) above the bottom of the *storage tank*, and shall not skim water from the surface.

1303.11 Valves. Valves shall be supplied on rainwater collection and conveyance systems in accordance with Sections 1303.11.1 and 1303.11.2.

1303.10.2 Backwater valve. *Backwater valves* shall be installed on each overflow and tank drain pipe. *Backwater valves* shall be in accordance with Section 715.

1303.12 Pumping and control system. Mechanical equipment including pumps, valves and filters shall be easily accessible and removable in order to perform *repair*, maintenance and cleaning. The minimum flow rate and flow pressure delivered by the pumping system shall appropriate for the application and in accordance with Section 604.

1303.13 Water-pressure reducing valve or regulator. Where the water pressure supplied by the pumping system exceeds 80 psi (552 kPa) static, a pressure-reducing valve shall be installed to reduce the pressure in the rainwater distribution system piping to 80 psi (552 kPa) static or less. Pressure-reducing valves shall be specified and installed in accordance with Section 604.8.

1303.14 Distribution pipe. *Distribution piping* utilized in rainwater collection and conveyance systems shall comply with Sections 1303.14.1 through 1303.14.3.

Exception: Irrigation piping located outside of the *building* and downstream of a backflow preventer.

1303.14.1 Materials, joints and connections. *Distribution piping* shall conform to the standards and requirements specified in Section 605 for non-potable water.

1303.14.2 Design. Distribution piping systems shall be designed and sized in accordance with the Section 604 for the intended application.

1303.14.3 Marking. Non-potable rainwater distribution piping labeling and marking shall comply with Section 608.8.

1303.15 Tests and inspections. Tests and inspections shall be performed in accordance with Sections 1303.15.1 through 1303.15.8.

1303.15.1 Roof gutter inspection and test. Roof gutters shall be inspected to verify that the installation and slope is in accordance with Section 1303.5.1. Gutters shall be tested by pouring a minimum of one gallon of water into the end of the gutter opposite the collection point. The gutter being tested shall not leak and shall not retain standing water.

1303.15.2 Roofwasher test. Roofwashers shall be tested by introducing water into the gutters. Proper diversion of the first quantity of water in accordance with the requirements of Section 1303.4 shall be verified.

1303.15.3 Collection pipe and vent test. Drain, waste and vent piping used for rainwater collection and conveyance systems shall be tested in accordance with Section 312.

1303.15.4 Storage tank test. *Storage tanks* shall be tested in accordance with the Section 1301.9.11.

1303.15.5 Water supply system test. The testing of makeup water supply piping and *distribution piping* shall be conducted in accordance with Section 312.5.

1303.15.6 Inspection and testing of backflow prevention assemblies. The testing of backflow preventers and *backwater valves* shall be conducted in accordance with Section 312.10.

1303.15.7 Inspection vermin and insect protection. Inlets and vents to the system shall be inspected to verify that each is protected to prevent the entrance of insects and vermin into the *storage tank* and piping systems in accordance with Section 1301.7.

1303.15.8 Water quality test. The quality of the water for the intended application shall be verified at the point of use in accordance with the requirements of the *jurisdiction*. Except where site conditions as specified in ASTM E2727 affect the rainwater, collected rainwater shall be considered to have the parameters indicated in Table 1303.15.8.

TABLE 1303.15.8
RAINWATER QUALITY

PARAMETER	VALUE
pH	6.0-7.0
BOD	Not greater than 10 mg/L
NTU	Not greater than 2
Fecal Coliform	No detectable fecal coli in 100 mL
Sodium	No detectable sodium in 100 mL
Chlorine	No detectable chlorine in 100 mL
Enteroviruses	No detectable enteroviruses in 100 mL

1303.16 Operation and maintenance manuals. Operations and maintenance materials shall be supplied with rainwater collection and conveyance systems in accordance with Sections 1303.16.1 through 1303.16.4.

1303.16.1 Manual. A detailed operations and maintenance manual shall be supplied in hardcopy form with all systems.

1303.16.2 Schematics. The manual shall include a detailed system schematic, locations of all system components, and a list of all system components including manufacturer and model number.

1303.16.3 Maintenance procedures. The manual shall provide a maintenance schedule and procedures for all system components requiring periodic maintenance. Consumable parts including filters shall be noted along with part numbers.

1303.16.4 Operations procedures. The manual shall include system startup and shutdown procedures. The manual shall include detailed operating procedures for the system.

SECTION 1304
RECLAIMED WATER SYSTEMS

1304.1 General. The provisions of this section shall govern the construction, installation, *alteration*, and *repair* of systems supplying *non-potable reclaimed water*.

1304.2 Water-pressure reducing valve or regulator. Where the *reclaimed water* pressure supplied to the *building* exceeds 80 psi (552 kPa) static, a pressure-reducing valve shall be installed to reduce the pressure in the *reclaimed water* distribution system piping to 80 psi (552 kPa) static or less. Pressure-reducing valves shall be specified and installed in accordance with Section 604.8 of the *International Plumbing Code*.

1304.3 Reclaimed water systems. The design of the *reclaimed water* systems shall conform to ASTM E 2635 and *accepted engineering practice.*

1304.3.1 Distribution pipe. *Distribution piping* shall comply with Sections 1304.3.1.1 through 1304.3.1.3.

> **Exception:** Irrigation piping located outside of the *building* and downstream of a backflow preventer.

1304.3.1.1 Materials, joints and connections. *Distribution piping* conveying reclaimed water shall conform to standards and requirements specified in Section 605 for non-potable water.

1304.3.1.2 Design. Distribution piping systems shall be designed and sized in accordance with the Section 604 for the intended application.

1304.3.1.3 Labeling and marking. Non-potable rainwater distribution piping labeling and marking shall comply with Section 608.8.

1304.4 Tests and inspections. Tests and inspections shall be performed in accordance with Sections 1304.4.1 and 1304.4.2.

1304.4.1 Water supply system test. The testing of makeup water supply piping and *reclaimed water distribution piping* shall be conducted in accordance with Section 312.5.

1304.4.2 Inspection and testing of backflow prevention assemblies. The testing of backflow preventers shall be conducted in accordance with Section 312.10.

Add new Chapter and next text as follows:

CHAPTER 14
SUBSURFACE LANDSCAPE IRRIGATION SYSTEMS

SECTION 1401
GENERAL

1401.1 Scope. The provisions of Chapter 14 shall govern the materials, design, construction and installation of subsurface landscape irrigation systems connected to non-potable water from onsite water reuse systems.

1401.2 Materials. Above-ground drain, waste and vent piping for subsurface landscape irrigation systems shall conform to one of the standards listed in Table 702.1. Subsurface landscape irrigation underground building drainage and vent pipe shall conform to one of the standards listed in Table 702.2.

1401.3 Tests. Drain, waste and vent piping for subsurface landscape irrigation systems shall be tested in accordance with Section 312.

1401.4 Inspections. Subsurface landscape irrigation systems shall be inspected in accordance with Section 107.

1401.5 Disinfection. Disinfection shall not be required for onsite non-potable reuse water used for subsurface landscape irrigation systems.

1401.6 Coloring. Onsite non-potable reuse water used for subsurface landscape irrigation systems shall not be required to be dyed.

SECTION 1402
SYSTEM DESIGN AND SIZING

1402.1 Sizing. The system shall be sized in accordance with the sum of the output of all water sources connected to the subsurface irrigation system. Where gray water collection piping is connected to subsurface landscape irrigation systems, gray water output shall be calculated according to the gallons-per-day-per-occupant number based on the type of fixtures connected. The gray water discharge shall be calculated by the following equation:

C = A x B **(Equation 14-1)**

where:

A = Number of occupants:

Residential–Number of occupants shall be determined by the actual number of occupants, but not less than two occupants for one bedroom and one occupant for each additional bedroom.
Commercial–Number of occupants shall be determined by the *International Building Code.*

B = Estimated flow demands for each occupant:

Residential–25 gallons per day (94.6 lpd) per occupant for showers, bathtubs and lavatories and 15 gallons per day (56.7 lpd) per occupant for clothes washers or laundry trays.

Commercial–Based on type of fixture or water use records minus the discharge of fixtures other than those discharging gray water.

C = Estimated gray water discharge based on the total number of occupants.

1402.2 Percolation tests. The permeability of the soil in the proposed absorption system shall be determined by percolation tests or permeability evaluation.

1402.2.1 Percolation tests and procedures. At least three percolation tests in each system area shall be conducted. The holes shall be spaced uniformly in relation to the bottom depth of the proposed absorption system. More percolation tests shall be made where necessary, depending on system design.

1402.2.1.1 Percolation test hole. The test hole shall be dug or bored. The test hole shall have vertical sides and a horizontal dimension of 4 inches to 8 inches (102 mm to 203 mm). The bottom and sides of the hole shall be scratched with a sharp-pointed instrument to expose the natural soil. All loose material shall be removed from the hole and the bottom shall be covered with 2 inches (51 mm) of gravel or coarse sand.

1402.2.1.2 Test procedure, sandy soils. The hole shall be filled with clear water to a minimum of 12 inches (305 mm) above the bottom of the hole for tests in sandy soils. The time for this amount of water to seep away shall be determined, and this procedure shall be repeated if the water from the second filling of the hole seeps away in 10 minutes or less. The test shall proceed as follows: Water shall be added to a point not more than 6 inches (152 mm) above the gravel or coarse sand. Thereupon, from a fixed reference point, water levels shall be measured at 10-minute intervals for a period of 1 hour. Where 6 inches (152 mm) of water seeps away in less than 10 minutes, a shorter interval between measurements shall be used, but in no case shall the water depth exceed 6 inches (152 mm). Where 6 inches (152 mm) of water seeps away in less than 2 minutes, the test shall be stopped and a rate of less than 3 minutes per inch (7.2 s/mm) shall be reported. The final water level drop shall be used to calculate the percolation rate. Soils not meeting the above requirements shall be tested in accordance with Section 1303.7.1.3.

1402.2.1.3 Test procedure, other soils. The hole shall be filled with clear water, and a minimum water depth of 12 inches (305 mm) shall be maintained above the bottom of the hole for a 4-hour period by refilling whenever necessary or by use of an automatic siphon. Water remaining in the hole after 4 hours shall not be removed. Thereafter, the soil shall be allowed to swell not less than 16 hours or more than 30 hours. Immediately after the soil swelling period, the measurements for determining the percolation rate shall be made as follows: any soil sloughed into the hole shall be removed and the water level shall be adjusted to 6 inches (152 mm) above the gravel or coarse sand. Thereupon, from a fixed reference point, the water level shall be measured at 30-minute intervals for a period of 4 hours, unless two successive water level drops do not vary by more than 1/16 inch (1.59 mm). At least three water level drops shall be observed and recorded. The hole shall be filled with clear water to a point not more than 6 inches (152 mm) above the gravel or coarse sand whenever it becomes nearly empty. Adjustments of the water level shall not be made during the three measurement periods except to the limits of the last measured water level drop. When the first 6 inches (152 mm) of water seeps away in less than 30 minutes, the time interval between measurements shall be 10 minutes and the test run for 1 hour. The water depth shall not exceed 5 inches (127 mm) at any time during the measurement period. The drop that occurs during the final measurement period shall be used in calculating the percolation rate.

1402.2.1.4 Mechanical test equipment. Mechanical percolation test equipment shall be of an approved type.

1402.2.2 Permeability evaluation. Soil shall be evaluated for estimated percolation based on structure and texture in accordance with accepted soil evaluation practices. Borings shall be made in accordance with Section 1402.2.1.1 for evaluating the soil.

1402.3 Subsurface landscape irrigation site location. The surface grade of all soil absorption systems shall be located at a point lower than the surface grade of any water well or reservoir on the same or adjoining lot. Where this is not possible, the site shall be located so surface water drainage from the site is not directed toward a well or reservoir. The soil absorption system shall be located with a minimum horizontal distance between various elements as indicated in Table 1402.3. Private sewage disposal systems in compacted areas, such as parking lots and driveways, are prohibited. Surface water shall be diverted away from any soil absorption site on the same or neighboring lots.

TABLE 1402.3
LOCATION OF SUBSURFACE IRRIGATION SYSTEM

ELEMENT	MINIMUM HORIZONTAL DISTANCE	
	STORAGE TANK (feet)	**IRRIGATION DISPOSAL FIELD (feet)**
Buildings	5	2
Lot line adjoining private property	5	5
Water wells	50	100
Streams and lakes	50	50
Seepage pits	5	5
Septic tanks	0	5
Water service	5	5
Public water main	10	10

For SI: 1 foot = 304.8 mm.

SECTION 1403
INSTALLATION

1403.1 Installation. Absorption systems shall be installed in accordance with Sections 1403.1.1 through 1403.2.1 to provide landscape irrigation without surfacing of water.

1403.1.1 Absorption area. The total absorption area required shall be computed from the estimated daily gray water discharge and the design-loading rate based on the percolation rate for the site. The required absorption area equals the estimated gray water discharge divided by the design-loading rate from Table 1403.1.1.

TABLE 1403.1.1
DESIGN LOADING RATE

PERCOLATION RATE (minutes per inch)	DESIGN LOADING FACTOR (gallons per square foot per day)
0 to less than 10	1.2
10 to less than 30	0.8
30 to less than 45	0.72
45 to 60	0.4

For SI: 1 minute per inch = min/25.4 mm,
1 gallon per square foot = 40.7 L/m2.

1403.1.2 Seepage trench excavations. Seepage trench excavations shall be not less than 1 foot (304 mm) in width and not greater than 5 feet (1524 mm) in width. Trench excavations shall be spaced not less than 2 feet (610 mm) apart. The soil absorption area of a seepage trench shall be computed by using the bottom of the trench area (width) multiplied by the length of pipe. Individual seepage trenches shall be not greater than100 feet (30 480 mm) in developed length.

1403.1.3 Seepage bed excavations. Seepage bed excavations shall be not less than 5 feet (1524 mm) in width and have more than one distribution pipe. The absorption area of a seepage bed shall be computed by using the bottom of the trench area. Distribution piping in a seepage bed shall be uniformly spaced not greater than 5 feet (1524 mm) and not less than 3 feet (914 mm) apart, and greater than 3 feet (914 mm) and not less than 1 foot (305 mm) from the sidewall or headwall.

1403.1.4 Excavation and construction. The bottom of a trench or bed excavation shall be level. Seepage trenches or beds shall not be excavated where the soil is so wet that such material rolled between the hands forms a soil wire. All smeared or compacted soil surfaces in the sidewalls or bottom of seepage trench or bed excavations shall be scarified to the depth of smearing or compaction and the loose material removed. Where rain falls on an open excavation, the soil shall be left until sufficiently dry so a soil wire will not form when soil from the excavation bottom is rolled between the hands. The bottom area shall then be scarified and loose material removed.

1403.1.5 Aggregate and backfill. Not less than 6 inches in depth of aggregate ranging in size from 1/2 to 21/2 inches (12.7 mm to 64 mm) shall be laid into the trench below the distribution piping elevation. The aggregate shall be evenly distributed not less than 2 inches (51 mm) in depth over the top of the distribution pipe. The aggregate shall be covered with approved synthetic materials or 9 inches (229 mm) of uncompacted marsh hay or straw. Building paper shall not be used to cover the aggregate. Not less than 9 inches (229 mm) of soil backfill shall be provided above the covering.

1403.2 Distribution piping. Distribution piping shall be not less than 3 inches (76 mm) in diameter. Materials shall comply with Table 1303.10. The top of the distribution pipe shall be not less than 8 inches (203 mm) below the original surface. The slope of the distribution pipes shall be not less than 2 inches (51 mm) and not greater than 4 inches (102 mm) per 100 feet (30 480 mm).

TABLE 1403.2
DISTRIBUTION PIPE

MATERIAL	STANDARD
Polyethylene (PE) plastic pipe	ASTM F 405
Polyvinyl chloride (PVC) plastic pipe	ASTM D 2729
Polyvinyl chloride (PVC) plastic pipe with a 3.5 inch O.D. and solid cellular core or composite wall.	ASTM F 1488

1403.2.1 Joints. Joints in distribution pipe shall be made in accordance with Section 705 of this code.

Reason: The sections shown to be added to the code are from the IgCC. These sections really need to be in the IPC as these subjects are more applicable to the IPC scope. Currently, the IPC does not address different types of nonpotable water (other than gray water) and therefore provides no guidance as to how nonpotable waters are to be collected, stored and distributed. The current Chapter 13 only deals with the use/reuse of gray water for the flushing of water closets and urinals and subsurface irrigation. It is clarified that gray water and rain water recycling systems must be separate systems and may not be interconnected.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

301.3-P-STRAUSBAUGH.PMGCAC

P12 – 12
301.4

Proponent: Shawn Strausbaugh, Arlington County VA representing the Virginia Plumbing and Mechanical Inspectors Association and The Virginia Building Code Officials Association and ICC Region 7 (Sstrausbaugh@arlingtonva.us)

Revise as follows:

301.4 Connections to water supply. ~~Every~~ Plumbing fixtures, devices or appliances requiring or using water ~~for its proper operation~~ shall be directly or indirectly connected to the water supply system in accordance with the provisions of this code. Faucets provided with a connection for cold water shall be connected to the cold water distribution system.

Reason: The current code does not require a fixture to be supplied with cold water even if the handles or trim plate indicate cold water will be supplied when it is turned to the “on” position.. If a faucet has the “indication” that cold water can be obtained (e.g. single handle cold water position or a two handle faucet), the code should require that cold water actually be connected and provided to the faucet.

Cost Impact: none

P12-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

301.4-P-STRAUSBAUGH

P13 – 12
303.1

Proponent: James Ranfone, American Gas Association (jranfon@aga.org)

Revise as follows:

303.1 Identification. Each length of pipe and each pipe fitting, trap, fixture, material and device utilized in a plumbing system shall bear the identification of the manufacturer and any markings required by the applicable referenced standards.

> <u>**Exception:** The manufacturer identification for fittings and pipe nipples shall be on each piece or shall be printed on the packaging or provided documentation.</u>

Reason: The exception would allow identification of fittings to be provided on or with the packaging. Some piping fittings, short couplings for example, do not have the physical room for a manufacturers mark.

Cost Impact: The code change proposal will not increase the cost of construction.

P13-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

303.1-P-RANFONE

P14 – 12
303.3, 611.3

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., representing self. (JBEngineer@aol.com)

Delete without substitution:

~~**303.3 Plastic pipe, fittings and components.** All plastic pipe, fittings and components shall be third-party certified as conforming to NSF 14.~~

Revise as follows:

611.3 Connection tubing. The tubing to and from drinking water treatment units shall be of a size and material as recommended by the manufacturer. The tubing shall comply with ~~NSF 14,~~ NSF 42, NSF 44, NSF 53, NSF 58 or NSF 61.

Reason: With the addition of Section 303.4 to the 2012 edition, there is no need to have a separate reference to NSF 14. All plumbing material must be listed by a third party certifier.

NSF 14 was originally inserted into the code as a quality control standard. In the latest edition of NSF 14, material requirements were added. It is completely inappropriate for a quality control standard to have material requirements. The material requirements belong in the material standards that are listed in the code (and referenced in NSF 14), not a quality control standard. With the change to NSF 14, it is no longer a viable quality control standard. It has crossed over to being a quazi-material standard. All material standards should be complete material standards regulating the full requirements of the material. NSF 14 does not do this.

For these reasons, NSF 14 should no longer be referenced in the International Plumbing Code.

Cost Impact: This may reduce the cost of certain plumbing products.

P14-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

303.3-P-BALLANCO

P15 – 12
305.1

Proponent: Shawn Strausbaugh, Arlington County VA representing the Virginia Plumbing and Mechanical Inspectors Association and The Virginia Building Code Officials Association and ICC Region 7 (Sstrausbaugh@arlingtonva.us)

Delete and substitute as follows:

~~**305.1 Corrosion.** Pipes passing through concrete or cinder walls and floors or other corrosive material shall be protected against external corrosion by a protective sheathing or wrapping or other means that will withstand any reaction from the lime and acid of concrete, cinder or other corrosive material. Sheathing or wrapping shall allow for movement including expansion and contraction of piping. The wall thickness of the material shall be not less than 0.025 inch (0.64 mm).~~

<u>**305.1 Corrosion.** Metallic piping shall not be installed in direct contact with concrete, masonry or corrosive soil. Where plastic sheathing is used to prevent direct contact, the wall thickness of the sheathing shall be not less than 0.006 inches (6 mil) (0.152 mm) thick .</u>

Reason: The intent of the code is to protect piping from direct contact with concrete, masonry and corrosive soils, this proposal is a cleanup action to clarify that intent. The commonly used plastic sheathing for pipe protection has a wall thickness of only 0.004 inches or 0.006 inches thick. The 0.025 inch thick material is really unnecessary and beyond the minimum standard practice used to protect the piping system. The thinner material has been used for years with satisfactory results.

Cost Impact: none

P_-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

305.1-P-STRAUSBAUGH

P16 – 12

305.6, 305.6.1 (New), 305.6.2 (New)

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

305.6 Protection against physical damage. In concealed locations where piping, other than cast-iron or galvanized steel, is installed through holes or notches in studs, joists, rafters or similar members less than 1-1/2 inches (38 mm) from the nearest edge of the member, the pipe shall be protected by steel shield plates. Such shield plates shall have a thickness of not less than 0.0575 inch (1.463 mm) (No. 16 gage). Such plates shall cover the area of the pipe where the member is notched or bored, and shall extend not less than 2 inches (51 mm) above sole plates<u>,</u> ~~and~~ below top plates <u>and to each side of a stud, joist, rafter or similar member.</u>

<u>**305.6.1 Formed steel framing members.** *Piping*, other than cast-iron or galvanized steel, shall not be installed within the channel of a formed steel framing member except where the piping is not less than 1-1/2 inches from the backside of any fastening face of the member.</u>

<u>**305.6.2 Piping installed parallel to framing members**. In concealed locations where *piping*, other than cast-iron or galvanized steel, is installed parallel to studs, joists, rafters or similar members less than 1-1/2 inches (38 mm) from the nearest edge of the member, such pipe shall be protected along its length by steel shield plates that comply with the requirements of Section 305.6.</u>

Reason: Like the IPC, Section 404.7 does not address pipe or tubing run down the side of a stud or inside of a "C" channel metal stud or rafter. Such installations are subject to penetrations but the code addresses only holes and notches for pipe and tubing that runs perpendicular to the framing member. The NEC treats wiring that runs parallel to framing members the same as wiring that runs perpendicular. The IMC, IFGC and IPC need to catch up. If the sheeting material fasteners miss a framing member, they can easily penetrate piping which is why the code requires the protection shield to extend 2 inches above and below wall plates. Placing piping parallel to a member, either on the side or within a channel, exposes the piping to penetration, yet current code addresses only perpendicular penetrations.Given the speed at which drywall installers put up and fasten drywall to studs and rafters, there is a great potential for drywall screws or nails to miss the intended stud and hit a pipe or tube. The code already requires that shield plates on sole plates and top plates extend 2 inches above and below the edges of those framing members. Why should not piping to the sides of framing members be protected to the same degree?

Section 305.6.1 is being added to prohibit piping from being installed within 1-1/2 inches of the backside of the fastening flange of a formed steel member. Piping located in this area is likely to be penetrated by drywall fasteners. An all too common practice is to install piping "inside" of formed steel members such that the piping is within 1-1/2" of the fastening face of the member. It is unrealistic to protect the piping with steel shield plates as installing the shield plates requires the installation fasteners. Piping just should not be placed in this location.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P17 – 12
307.5

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Delete and substitute as follows:

~~**307.5 Protection of footings.** Trenching installed parallel to footings shall not extend below the 45-degree (0.79 rad) bearing plane of the footing or wall~~.

307.5 Protection of footings. Trenching installed parallel to footings and walls shall not extend into the bearing plane of a footing or wall. The upper boundary of the bearing plane is a line that extends downward, at an angle of 45 degrees from horizontal, from the outside bottom edge of the footing or wall.

Reason: The current language is not especially clear and is easily misunderstood. The proposed text is explicit and captures the intent of this provision.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. 307.5-P-STRAUSBAUGH.PMGCAC

P18 – 12
308.5

Proponent: James Paschal, Paschal Engineering representing himself (Jim@PaschalEngineering.com)

Revise as follows:

308.5 Interval of support. Pipe shall be supported in accordance with Table 308.5.

> **Exception:** The interval of support for piping systems designed to provide for expansion/contraction shall conform to the engineered design in accordance with Section 316.1. <u>The interval of support for fiberglass or metal reinforced plastic piping shall be in accordance with the manufacturer's specifications and shall conform to the engineered design in accordance with Section 316.1.</u>

Reason: There are a variety of plastic piping systems available which utilize metal or fiberglass reinforcement to add rigidity and strength to the piping, and as a result, may require different support spacing than the traditional materials shown in Table 308.5. In addition to the existing requirement that the spacing be per the engineered design and approved by the code official, the proposed wording here also requires that the spacing be per the manufacturer's specifications. This will ensure that the spacing is consistent between the design professional, code official, and manufacturer.

Table 308.5

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

TABLE 308.5
HANGER SPACING

PIPING MATERIAL	MAXIMUM HORIZONTAL SPACING (feet)	MAXIMUM VERTICAL SPACING (feet)
ABS pipe	4	10[b]
Aluminum tubing	10	15
Brass pipe	10	10
Cast-iron pipe	5[a]	15
Copper or copper-alloy pipe	12	10
Copper or copper-alloy tubing, $1^1/_4$-inch diameter and smaller	6	10
Copper or copper-alloy tubing, $1^1/_2$-inch diameter and larger	10	10
Cross-linked polyethylene (PEX) pipe	2.67 (32 inches)	10[b]
Cross-linked polyethylene/ aluminum/cross-linked polyethylene (PEX-AL-PEX) pipe	2.67 (32 inches)	4
CPVC pipe or tubing, 1 inch and smaller	3	10[b]
CPVC pipe or tubing, $1^1/_4$ inches and larger	4	10[b]
Steel pipe	12	15
Lead pipe	Continuous	4
Polyethylene/aluminum/polyethylene (PE-AL-PE) pipe	2.67 (32 inches)	4
Polyethylene of raised temperature (PE-RT) pipe	2.67 (32 inches)	10[b]
Polypropylene (PP) pipe or tubing 1 inch and smaller	2.67 (32 inches)	10[b]

Polypropylene (PP) pipe or tubing, 1 1/4 inches and larger	4	10[b]
PVC pipe	4	10[b]
Stainless steel drainage systems	10	10[b]

a. The maximum horizontal spacing of cast iron pipe hangers shall be increased to 10 feet where 10 foot lengths of pipe are installed.

b. ~~Mid-story guide~~ For sizes 2 inches and smaller, a guide shall be installed midway between required vertical supports. Such guides shall prevent pipe movement in a direction perpendicular to the axis of the pipe.

Reason: What constitutes a "mid-story guide" and what is it supposed to do? The current footnote doesn't clearly state a requirement. What is the purpose of the guide and how limiting is the guide supposed to be? The term mid-story seems out of context considering that the intent of the footnote is to require a guide midway between vertical supports. The vertical supports don't necessarily correspond to a support at each story. Stories can be any height. The revised language provides the necessary information to make this footnote clearly state the intent.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. P20 – 12
309.2

THIS CODE CHANGE PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE HEARING ORDER FOR THE IBC STRUCTURAL DEVELOPMENT COMMITTEE.

Proponent: John Ingargiola and Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@dhs.gov, gregory.p.wilson@dhs.gov) and Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net).

Revise as follows:

[B] 309.2 Flood hazard. For structures located in flood hazard areas, the following systems and equipment shall be located and installed as required by Section 1612 of the *International Building Code*.

> ~~**Exception:** The following systems are permitted to be located below the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment provided that the systems are designed and installed to prevent water from entering or accumulating within their components and the systems are constructed to resist hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding to up to such elevation.~~

1. ~~All~~ water service pipes.
2. Pump seals in individual water supply systems where the pump is located below the *design flood elevation*.
3. Covers on potable water wells shall be sealed, except where the top of the casing well or pipe sleeve is elevated to not less than 1 foot (305 mm) above the *design flood elevation*.
4. ~~All~~ Sanitary drainage piping.
5. ~~All~~ Storm drainage piping.
6. Manhole covers shall be sealed, except where elevated to or above the *design flood elevation*.
7. ~~All~~ Other plumbing fixtures, faucets, fixture fittings, piping systems and equipment.
8. Water heaters.
9. Vents and vent systems.

   <u>**Exception:** The systems listed in this section are permitted to be located below the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment provided that the systems are designed and installed to prevent water from entering our accumulating within their components and the systems are constructed to resist hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding up to such elevation.</u>

Reason: This proposal simply moves the exception language below the list. It is awkward and certainly confusing to have the exception placed between the parent language “the following systems and equipment”) and the list. This change is editorial. ICC staff recommended deletion of “all” in four locations.

Cost Impact: The code change proposal will not increase the cost of construction.

311.1

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

311.1 General. Toilet facilities shall be provided for construction workers and such facilities shall be maintained in a sanitary condition. Construction worker toilet facilities of the nonsewer type shall conform to ANSI Z4.3. <u>Not less than one portable toilet facility for every 50 workers or fraction thereof shall be provided.</u>

Reason: The code currently provides no guidance as to how many portable toilet facilities are needed for construction sites. To save money, a contractor could provide just one toilet facility for hundreds of workers. The ratio of 1 per fifty workers is reasonable.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. Floor area in square foot per occupant.
b. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.
c. Fixed seating without dividing arms shall be one person for each 18” of seating length. Booth seating shall be one person for each 24” of seating length, measured at the back rest.
d. GLA, the gross leasable area (square feet)
e. The minimum number of required drinking fountains shall comply with Table 403.1 and Chapter 11 of the International Building Code.
f. Drinking fountains are not required for an occupant load of 15 or fewer.
g. For business and mercantile occupancies with an occupant load of 15 or fewer, service sinks shall not be required.

Reason: This code change is intended to place the methodology for occupant load assessment for plumbing fixtures under the purview of the IPC Code Development Committee. Currently, occupant loads are derived from the IBC means of egress chapter. These egress-oriented occupant loads are intended to represent conservative loading at highest anticipated occupancy. This is essential to the IBC’s primary life safety goal of ensuring adequate egress capacity.

During the past several years, members of our Chapter have encountered designs using less than adequate occupant loads for egress purposes. When asked, designers involved have indicated that they were trying to moderate plumbing fixture counts to a level more representative of “normal” levels of building occupant loads. In their effort to justify fewer plumbing fixtures, the design capacity of the egress system was affected. This could result in serious life safety detriment.

Assessment of plumbing fixture counts using an occupant load basis is appropriate for determining fixture counts. This change intends to provide for that assessment independently of the IBC means of egress chapter. This change will allow the IPC Code Development Committee to have complete ownership over the appropriate occupant load factor to be employed for each use group represented within the building.

The change from “occupancy” group to “function” is imperative for proper assessment of buildings with uses that may be denser than an occupancy classification may imply. For instance, a building made up of multiple conference spaces, each of which under the 50 occupant Group A assembly classification, may be classified as a Group B Occupancy. In reality, the assembly use of the conference spaces has a much higher density of 5-7 times that ascribed to a Group B. This change allows the IPC Committee to assign fixtures based on that actual use, not just the overall and frequently limiting occupancy classification.

This change does not intend to either increase or decrease the amount of plumbing fixtures currently required by the IPC. It is intended to provide an independent, function-based assessment method that is similar to that tried and proven in the IMC. Ultimately, better assessment will be assured and the primary life safety required of the means of egress system will be assured. If approved, the committee may adjust these values as they see fit, without unintended consequence to the building’s means of egress system.

Cost Impact: None

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

403.1-P-ARCHER

P26 – 12
403.1 (IBC [P] 2902.1)

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., representing self. (JBEngineer@aol.com)

Revise as follows:

403.1 (IBC [P] 2902.1) Minimum number of fixtures. Plumbing fixtures shall be provided ~~for the type of occupancy and~~ in the minimum number as shown in Table 403.1 based upon the actual use of the building or space. ~~Types of occupancies~~ Uses not shown in Table 403.1 shall be considered individually by the code official. The number of occupants shall be determined by the International Building Code. ~~Occupancy classification shall be determined in accordance with the International Building Code.~~

Reason: The purpose of the table is to provide fixtures based on the use of the building space, not based on the use group classification. By referencing the use group in accordance with the Building Code, an incorrect number of fixtures may be established for a building. A typical example is a mixed use building. Each use must be considered separately as to the fixture demands. Another example would be a high school that has a cafeteria, an auditorium for productions, and a stadium for sporting events. Each space would have different requirements. The listing of the use group in the table was done merely for convenience. The fixture demands have always been based on the use of the space.

Cost Impact: There is no impact to the cost of a building.

Proponent: Eirene Oliphant, MCP, BRR Architecture, representing self

Add new definitions as follows:
(Definitions to also be added to the IBC)

ATHLETIC FIELDS. Outdoor sporting venues that contain spectator seating in the form of *grandstands* or *bleachers*, excluding stadiums and coliseums.

BLEACHERS. Tiered seating that is supported on a dedicated structural system, that is two or more rows high and that is not a *building element*. See "Grandstand".

BUILDING ELEMENT. A functional component of building construction that is listed in Table 601 of the *International Building Code*. Such components are constructed of materials consistent with the construction type of the building and can be fire-resistance-rated.

COMMUTER PARKING LOT. Parking designated specifically for the temporary storage of personal vehicles at or near the workplace or at a location from where an employee commutes to work by transit, vanpooling or carpools.

GRANDSTAND. Tiered seating that is supported on a dedicated structural system, that is two or more rows high and that is not a *building element*. See "Bleachers".

DEVELOPED LINEAR PARK. A park that is longer than wide, often formed as a part of a system of trails that are made of materials that provide a stable and firm surface.

MARINAS. A facility for personally owned sailboats and yachts, typically offering docking, fuel, off-season out-of-water storage and other services; sometimes with a restaurant.

ORGANIZED CAMP. A site with program and facilities established for the primary purposes of providing an outdoor group living experience with social, spiritual, educational, or recreational objectives, for five days or more during one or more seasons of the year.

PICNIC AREA. A tract of land set aside within a park that contains tables and cooking equipment for the purposes of eating outdoors.

PUBLIC BEACH. A public beach is any beach, whether publicly or privately owned, extending inland from the line of mean low tide to the natural line of vegetation to which the public has acquired the right of use. This definition does not include a beach that is not accessible by means of public transportation such as roads and ferries.

PUBLIC SWIMMING POOL. A pool, other than a residential pool, that is intended to be used for swimming or bathing and is operated by an owner, lessee, operator, licensee, or concessionaire, regardless of whether a fee is charged for use.

RIDING ARENAS. Buildings used for boarding, breeding and training of horses, riding instruction and competitions and that have an occupant load of less than 200.

Revise as follows:

403.1 (IBC [P]2902.1)Minimum number of fixtures. Plumbing fixtures shall be provided ~~for~~ in accordance with ~~the type of *occupancy* and in the minimum number shown in per~~ Table 403.1.1 or Table

403.1.2. ~~Types of occupancies not shown in Table 403.1 shall be considered individually by the code official.~~ The number of occupants and occupancy classification shall be determined by the International Building Code. ~~Occupancy classification shall be determined in accordance with the International Building Code.~~ Those groups which are accessory to the main use group shall be provided with fixtures in accordance with the main use group classification.

Types of ~~occupancies~~ uses not shown in Table 403.1.1 or Table 403.1.2 shall be considered individually by the code official.

TABLE 403.1.1 (IBC [P]2902.1.1)
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES BASED ON USE GROUP CLASSIFICATION
(See Sections 403.2 and 403.3)

(Portions of table not shown remain unchanged)

TABLE 403.1.2 (IBC [P]2902.1.2)
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES

TYPE OF BUILDING OR USE	WATER CLOSETS		LAVATORIES	BATHTUB/ SHOWER	DRINKING FOUNTAIN
	MALE	FEMALE			
Picnic areas	1 per 50		1 for every 2 water closets		
Organized camps	1 per 15		1 per 15	1 per 150	1 per camping area
Public swimming pools[b]	1 per 125[a]	1 per 75	1 for every 2 water closets	1 per 200	1 per 1,000
Developed linear parks and trails[c](ARA)	1 per each 3.1 miles (5 km) interval		1 for every water closet	--	--
Athletic fields[e,f]	1 per 75	1 per 40	1 for every 2 water closets	--	1 per 1,000[g]
Marinas	1 per 100 slips		1 for every 2 water closets	--	--

Public beaches	1 per 100		1 for every 2 water closets	--	--
Riding arenas	1 per 100		1 for every 2 water closets	--	--

a. Urinals shall be permitted to be substituted for not more than 67 percent of the required number of water closets.
b. Where the occupant load is less than 15, one family or assisted use toilet facility shall be permitted to be substituted for separate male/female toilet facilities. Where the occupant load is less than 50, two family or assisted use toilet facilities shall be permitted to be substituted for separate male/female toilet facilities..
c. Separate facilities shall not be required where one or more family or assisted use toilet facilities is provided.
d. Where the parking lot capacity is less than 10 vehicles, fixtures shall not be required.
e. Facilities shall be within 500 feet of field perimeter.
f. Where the total bleacher or grandstand seating capacity is less than 150 persons and permanent toilet facilities are not provided, portable toilets facilities that conform to ANSI 4.3 shall be provided.
g. Where the total bleacher or grandstand seating capacity is less than 150 persons, drinking fountains shall not be required.

Reason: While the language in 403.1 provides discretion to the code official to determine the "best fit" for occupancies not shown in Table 403.1, there are situations where it just does not "fit" into the Table. The proposed table is to provide additional direction to the code official for situations that are not defined in Table 403.1 yet should be provided with fixtures and at a lower rate than those defined in Table 403.1 due to their infrequent usage.

Many of the proposed required fixtures exist in other codes, some of which have modified the IPC at the state or local level to provide direction to their respective jurisdictions. Other uses have been added to reflect growing trends in parks and transportation (ride sharing areas).

The proposed fixtures are intended to be permanent in nature, not portable facilities. While there is a footnote providing an exception to allow for portable facilities in one use, the enforcement of providing and maintaining portable facilities is not feasible in many jurisdictions due to recent economic problems resulting in doing more with less.

Cost Impact: The code change proposal will increase the cost of construction.

403.1-P-OLIPHANT

P28 – 12

Table 403.1 (IBC Table [P]2902.1)

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

TABLE 403.1
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a]
(See Sections 403.2 and 403.3)

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS SEE SECTION 419.2) MALE	WATER CLOSETS (URINALS SEE SECTION 419.2) FEMALE	LAVATORIES MALE	LAVATORIES FEMALE	BATHTUBS/ SHOWERS	DRINKING FOUNTAIN[e, f] (SEE SECTION 410.1)	OTHER
2	Business	B	Buildings for the transaction of business, professional services, other services involving merchandise, office buildings, banks, light industrial and similar uses.[j]	1 per 25 for the first 50 and 1 per 50 for the remainder exceeding 50		1 per 40 for the first 80 and 1 per 80 for the remainder exceeding 80		—	1 per 100	1 service sink[g]

j. Exam and procedure rooms in doctor, dentist and veterinarian offices shall be provided with a hand washing sink.

(Portions of table and footnotes not shown remain unchanged)

Reason: The code is silent about requiring hand washing sinks in doctor, dentist and veterinarian exam and procedures rooms. Sanitation is vitally important to prevent the spread of disease causing organisms. Hand washing is critical in preventing this spreading. The code needs to require hand washing sinks in these areas to allow for proper sanitation.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P28-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T403.1-P-STRAUSBAUGH.PMGCAC

P29 – 12
202 (IBC 202), Table 403.1 (IBC Table [P]2902.1)

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Add new definitions as follows:
(Definitions to also be added to the IBC)

GRANDSTAND. Tiered seating that is supported on a dedicated structural system, that is two or more rows high and that is not a *building element*. See "Bleachers".

BLEACHERS. Tiered seating that is supported on a dedicated structural system, that is two or more rows high and that is not a *building element*. See "Grandstand".

BUILDING ELEMENT. A functional component of building construction that is listed in Table 601 of the IBC. Such components are constructed of materials consistent with the construction type of the building and can be fire-resistance-rated.

Revise table as follows:

TABLE 403.1 (IBC Table [P]2902.1)
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a]
(See Sections 403.2 and 403.3)

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS SEE SECTION 419.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN[e, f] (SEE SECTION 410.1)	OTHER
				MALE	FEMALE	MALE	FEMALE			
1	Assembly	A-5	Stadiums, amusement parks, bleachers and grandstands for outdoor sporting events and activities[h]	1 per 75 for the first 1,500 and 1 per 120 for the remainder exceeding 1,500	1 per 40 for the first 1,520and 1 per 60 for the remainder exceeding 1,520	1 per 200	1 per 150	—	1 per 1,000[i]	1 service sink[i]

(Portions of table and footnotes not shown are unchanged)

h. Where the total *bleacher* or *grandstand* seating capacity is less than 150 persons and permanent toilet facilities are not provided, portable toilets facilities that conform to ANSI 4.3 shall be provided.
i. Where the total *bleacher* or *grandstand* seating capacity is less than 150 persons, drinking fountains and service sinks shall not be required.

Reason: Consider a small city park with a ball field having a several bleacher units. The code currently requires that any venue with bleachers and grandstands have permanent toilet facilities and a drinking fountain and a service sink. This seems to be an unreasonable requirement where the ball field is used only seasonally, the anticipated attendance is very low and the provision of utilities (water, sewer) might be difficult. However, it is recognized that the presence of even a small number of people at an event does create the need for basic toilet facilities. Therefore, if permanent toilet facilities are not required, then portable toilet facilities need to be required.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P29-12

	Assembly:	ASF	AMF	DF

T403.1 #2-P-STRAUSBAUGH.PMGCAC

P30 – 12
Table 403.1 (IBC [P]2902.1), 410.2 (New) (IBC 2902.6 (New))

Proponent: Matt Archer - Douglas County, CO - representing the Colorado Chapter ICC (marcher@douglas.co.us)

Revise as follows:

TABLE 403.1
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a]

(See Sections 403.2 and 403.3)

BATHTUBS/ SHOWERS	DRINKING FOUNTAIN~~[e, f]~~ (SEE SECTION 410~~.1~~)	OTHER

(Portions of table not shown remain unchanged.)

a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the International Building Code.
b. Toilet facilities for employees shall be separate from facilities for inmates or care recipients.
c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient sleeping units hall be permitted where such room is provided with direct access from each patient sleeping unit and with provisions for privacy.
d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.
~~e. The minimum number of required drinking fountains shall comply with Table 403.1 and Chapter 11 of the International Building Code.~~
~~f. Drinking fountains are not required for an occupant load of 15 or fewer.~~
~~g~~e. For business and mercantile occupancies with an occupant load of 15 or fewer, service sinks shall not be required.

410.2 (IBC 2902.6)Small occupancies. Drinking fountains shall not be required for an occupant load of 15 or fewer.

(Renumber subsequent section)

Reason: I believe footnotes serve as a guide for how to use the table. Footnotes are not meant to create new requirements or exceptions.

I deleted footnote e because the table will refer you to the main Section 410 where the (existing) section 410.2 stating that 2 drinking fountains are required for accessibility reasons can be found. Therefore, footnote e will be redundant and should be removed.

I deleted footnote f because this footnote applies to the entire table and not a specific function within the table. Therefore, this type of exception should be placed in the body of the code by moving the footnote to a new section under Section 410, drinking fountains.

Cost Impact: None

P30-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T403.1-ARCHER

P31 – 12
Table 403.1 (IBC [P]2902.1)

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C. representing InSinkErator (JBEngineer@aol.com)

Revise as follows:

TABLE 403.1
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS		LAVATORIES		BATHTUBS / SHOWERS	DRINKING FOUNTAINS	OTHER
				MALE	FEMALE	MALE	FEMALE			
1	Assembly	A-2	Restaurants, banquet halls and food courts	1 per 75	1 per 75	1 per 200		-	1 per 500	1 service sink, 1 food waste grinder

Reason: Food waste grinders are an important component of every commercial kitchen and food handling establishment. This change will merely emphasize that such an appliance is required for these establishments. Plumbing engineers already provide food waste grinders in the design of commercial kitchens. Hence, this is not a significant change since it is common practice to install a food waste grinder.

It is well known as to the purpose of a food waste grinder. By having a food waste grinder in a commercial kitchen, there will be a reduction in the number of stoppages, since food waste will be reduced in size to allow the water to transport the food waste to the public sewer.

Cost Impact: This change will increase the cost of construction.

P31-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T403.1-P-BALLANCO

P32 – 12
Table 403.1 (IBC Table [P]2902.1)

Proponent: Robert G. Konyndyk, Chief, Plumbing Division, Bureau of Construction Codes, Department of Licensing and Regulatory Affairs, State of Michigan representing The Bureau of Construction Codes. (konyndykr@michigan.gov)

Revise as follows:

TABLE 403.1 (IBC Table [P]2902.1)
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a]
(See Sections 403.2 and 403.3)

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS SEE SECTION 419.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN[e, f] (SEE SECTION 410.1)	OTHER
				MALE	FEMALE	MALE	FEMALE			

h. Structures not designed for occupants or as an employee's regular working area shall not be required to have toilet facilities.

(Portions of table and footnotes not shown remain unchanged.)

Reason: This code change revision will improve the code by providing greater clarity. This footnote clarification provides a restroom exception for structures like very small remote metering stations, unattended airplane hangers, etcetera. For example it is understood that Number 8, Classification Storage, Occupancy S-1 and S-2 in the table above address structures where individuals are present.

Cost Impact: Construction cost will be reduced by providing greater understanding of non occupied structures.

P32-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T403.1-P-KONYNDYK

P33 – 12
Table 403.1 (IBC [P]Table 2902.1)

Proponent: Gary Kreutziger,M.C.P., City of San Antonio, representing himself (gkreutziger@sanantonio.gov)

Revise as follows:

TABLE 403.1 (IBC [P]Table 2902.1)
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a]

(See Sections 403.2 and 403.3)

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS SEE SECTION 419.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN[e, f] (SEE SECTION 410.1)	OTHER
				MALE	FEMALE	MALE	FEMALE			

f. Drinking fountains are not required for an occupant load of 15 or fewer <u>or in clinic, outpatient occupancies as defined in the *International Building Code*.</u>

(Portions of table and footnotes not shown remain unchanged.)

Reason: The installation of a drinking fountain in *clinic, outpatient* occupancies is an obstacle in a clinics ability to maintain sanitary conditions and infection control within the medical office. Per the Center for Disease Control, indirect transmisssion of infectious diseases can occur by contact of an infectious agent through a contaminated intermediate object and some viruses and bacteria can live two hours or longer on most surfaces. Also most clinical staff would prefer to control the distribution of drinking water due to patients not being allowed any food or drink prior to a procedure.

Cost Impact: The code change proposal will not increase the cost of construction.

T403.1-P-KREUTZIGER

P34 – 12
403.2 (IBC [P] 2902.2)

Proponent: David Porter AIA, representing David Porter Associates and self.
(dporter@porterarchitects.com)

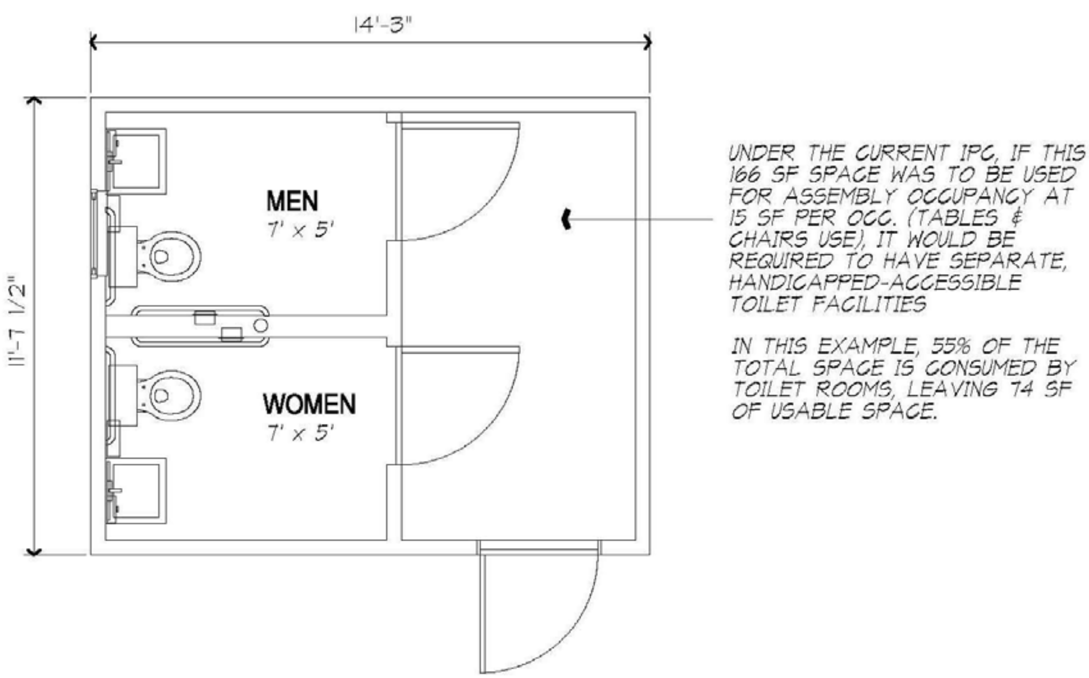
Revise as follows:

403.2 (IBC [P] 2902.2) Separate facilities. Where plumbing fixtures are required, separate facilities shall be provided for
each sex.

Exceptions:

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile occupancies in which the maximum occupant load is 100 or fewer.
4. <u>Separate facilities shall not be required in assembly occupancies in which the maximum occupant load is 50 or fewer.</u>

Reason: There is no current exception for allowing a single toilet room in very small assembly occupancies. One could conceivably have a 100 SF, small community hall where the occupant load would be 7 persons (15 SF per occupant for table and chair seating) but where two, separate, handicapped-accessible toilet rooms are currently required. Those two toilet rooms would consume no less than 70 SF of the 100 SF space and that does not seem to be the intent of the Code (see attached illustrative example of the current code requirement).



Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

403.2-P-PORTER

P35 – 12
403.3 (IBC [P] 2902.3)

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., representing Little Caesar Enterprises (JBEngineer@aol.com)

Revise as follows:

403.3 (IBC [P] 2902.3) Required public toilet facilities. Customers, patrons and visitors shall be provided with *public* toilet facilities in structures and tenant spaces intended for public utilization. The number of plumbing fixtures located within the required toilet facilities shall be provided in accordance with Section 403 for all users. Employees shall be provided with toilet facilities in all *occupancies*. Employee toilet facilities shall be either separate or combined employee and *public* toilet facilities.

Exceptions: Public toilet facilities shall not be required in<u>:</u>

<u>1.</u> Open or enclosed parking garages~~. Toilet facilities shall not be required in parking garages~~ where there are no parking attendants.
<u>2.</u> <u>Structures and tenant spaces intended for quick transactions, including take out, pick up and drop off, having a public access area less than or equal to 300 square feet.</u>

Reason: Tenant spaces that are only intended for quick transactions do not need to provide public facilities for customers, patrons, and visitors. The public does not rely on such spaces to provide public toilet rooms. Patrons spend a short period of time completing a transaction, then they depart.

Examples of these types of spaces include: take out food locations, such as Chinese food take outs; pizza take outs; and carry out ribs. Similar quick transaction facilities include: dry cleaners, atm facilities, florists, shoe repair shops, and newspaper stands.

It is recognized that the text of the second exception could be shortened to read: <u>Structures and tenant spaces having a public access area less than or equal to 300 square feet.</u> The added text is provided for clarity.

The purpose of this section has always been to provide comfort facilities for anyone spending a period of time in the public space. Quick transaction spaces are unique, in that people are not in the space for any length of time. Furthermore, the space open to the public is limited to 300 square feet.

It would be a safety and/or health hazard to have the public travel to the working areas of the tenant space to use toilet facilities. Hence, if a public toilet room is added, the space for the toilet room would have to be located in the front space where the small public area is located. This creates a security concern where the public toilet room would block openings in the front tenant space.

The 300 square foot dimension is based on the standard large spaces used by these types of facilities. Most tenant spaces of this type have an area less than 300 square feet for the public.

Cost Impact: This change does not increase the cost of construction.

P35-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

403.3-P-BALLANCO

P36 – 12
403.3.1 (IBC [P] 2902.3.1)

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee, the Virginia Plumbing and Mechanical Inspectors Association (VPMIA), the Virginia Building Code Officials Association (VBCOA) and ICC Region 7.

Revise as follows:

403.3.1 (IBC [P] 2902.3.1) Location and access. The required public toilet facilities shall be located in the same building or in an adjacent building that is under the same tenant control. Access to the required facilities shall be from within the building or from the exterior of the building. ~~All~~ Access routes shall comply with the accessibility requirements of the *International Building Code*. The access route to ~~the~~ *public* toilet facilities ~~required by Section 403.3~~ shall not pass through kitchens, storage rooms or closets. The public shall have access to the required toilet facilities at all times that the building is occupied.

Reason: Access to toilet facilities can be from the exterior of a building and facilities for one building can be located in another building given that the required travel distance is met and it's an accessible route. This proposal ensures that the tenant that is required to provide facilities is actually authorized to use toilets in another area during all times that such tenant space is occupied. The current problem is that some creative designs have attempted to utilize facilities where the tenant has absolutely no control over the location of the non-local facilities. Concerning the second line: If access to toilet facilities can be from the exterior of a building, could toilet facilities for one building be located in another building given that the required travel distance is met?

Examples: Could amusement park buildings have central toilet facilities in one building to serve the requirements of those buildings? Could a business office building with an adjacent working warehouse building have the toilet facilities for the warehouse in the office building?

For example, a strip center type mall setting may have an adjacent retail building. The tenants in the mall might expect their customers to use the facilities in the adjacent building, so long as they are not more than 500 feet away and on an accessible route. This proposal prevents that from occurring if the adjacent retail building is not under the same "tenant control." This example creates two serious problems. The first is the retail building owner may not be aware that he is the facility provider for spaces in the strip mall. In addition there is no way to regulate or mandate the hours of operation for the adjacent building to coincide with those of the strip mall. The second is what if the adjacent building operation goes out of business? There are many examples of campus type properties and outlet mall complexes where the required toilet facilities are in another building and this should be allowed if access to such buildings is controlled such that the facilities will always be available when needed.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P36-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

403.3.1-P-STRAUSBAUGH.PMGCAC

P37–12
403.3.6 (IBC [P]2902.3.5)

Proponent: Randall R. Dahmen, P.E. Wisconsin licensed Commercial Building Inspector, representing himself (randy.dahmen@wi.gov)

Revise as follows:

403.3.6 (IBC [P]2902.3.5) Door locking. ~~Where a toilet room is provided for the use of multiple occupants, the egress door for the room shall not be lockable from the inside of the room. This section does not apply to family or assisted-use toilet rooms.~~ Doors to toilet rooms shall not be lockable from either side of the door.

Exceptions:

1. Toilet room doors located on the exterior of a building that are associated with a motor fuel-dispensing facility shall be permitted to be lockable from the exterior provided that the key for access is available from a building attendant. When an attendant is not present, such toilet rooms can be locked from the exterior.
2. The doors to family-or-assisted-use toilet rooms and toilet rooms designed for a single occupant shall be permitted to have a lock on the inside of the door.

Reason: The proposed language addresses the limitations for access to toilet rooms not currently addressed in the code. Motor fuel-dispensing facilities many times will have toilet rooms that are accessible from the exterior of the building. These facilities many times require a key for access to be obtained from the building attendant. At present, there are many such facilities that remain limitedly open by allowing fuel dispensing to take place under an attached canopy by a customer, when there are no longer workers located in the main building. The proposed language is to clarify when toilet rooms for these type of buildings are expected to available for use. The 2nd exception is included so as to address previous code language.

Cost Impact: The code change proposal will not increase the cost of construction.

P37-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

403.3.6 (NEW)-P-DAHMEN

P38 – 12
403.4 (IBC [P]2902.4)

Proponent: Larry Brown, National Association of Home Builders (NAHB)

Revise as follows:

403.4 (IBC [P]2902.4)Signage. Required public facilities shall be provided with ~~designated by a legible~~ signs that ~~for each~~ designate the sex as required by Section 403.2. Signs shall be readily visible and located near the entrance to each toilet facility. Signs for accessible toilet facilities shall comply with Section 1110 of the *International Building Code*.

Reason: This modification is proposed as the IPC and IBC do not always require a separate toilet facility for each sex, as shown below in the Exceptions to Section 403.2. As Section 2902.4 (above) only addresses the signs themselves, is it more appropriate that sign itself have the correct designation for the sex, or for a facility that can be used by either sex. This modification achieves this intent.

403.2 Separate facilities. Where plumbing fixtures are required, separate facilities shall be provided for each sex.

Exceptions:

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile occupancies in which the maximum occupant load is 100 or fewer.

Cost Impact: The code change proposal will not increase the cost of construction.

P38-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

403.4-P-BROWN

P39 – 12
403.4.1 (IBC [P] 2902.4.1)

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

403.4.1 (IBC [P] 2902.4.1) Directional signage. Directional signage indicating the route to the required public toilet facilities shall be posted ~~in accordance with Section 3107 of the *International Building Code*. Such signage shall be located~~ in a lobby, corridor, ~~or~~ aisle or similar space, such that it can be readily seen from the main ~~at the~~ entrance to the building or tenant space. ~~facilities for customers, and visitors~~.

Reason: IBC Section 3107 is silent with respect to the posting of this directional signage, so the reference to this section is being removed. The current language indicates that that signage should be located at the entrance to the toilet facilities. The intent of this section is to require signage at the entrance of the building or tenant space so that persons entering such spaces are made aware that toilet facilities do exist and the general direction to those facilities. The overall reason why this section is in the code is to prevent the tenant from telling people that toilet facilities are not available. The requirement for a sign to be displayed at the entrance to the building or tenant space puts the tenant on notice that he cannot deny that public toilet facilities exist to those persons needing those facilities. How can the tenant or owner say that he/she has no public toilet facilities when there is a sign clearly indicating the location of those supposedly non-existing facilities?

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P39-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

403.4.1-P-STRAUSBAUGH.PMGCAC

P40– 12
404.1, Chapter 14

Proponent: Sidney L. Cavanaugh, Cavanaugh Consulting representing Truebro (sidneycavanaugh@yahoo.com)

Revise as follows:

404.1 Where required. Accessible plumbing facilities and fixtures shall be provided in accordance with the International Building Code. Where accessible plumbing facilities or fixtures are required, such facilities and fixtures shall comply with ICC A117.1. Exposed waste and supplies on such fixtures shall be protected and insulated in accordance with ASME A112.18.9.

Add new standards to Chapter 14 as follows:

ASME

A112.18.9-2011	Protectors/Insulators for Exposed Waste and Supplies on Accessible Fixtures.

ICC

A117.1-2009	Standard for Accessible and Usable Buildings and Facilities for Persons with Physical Disabilities

Reason: The completion of the national consensus standard for protectors/insulators for exposed waste and supplies which are required by ANSI/ICC A117.1 allows for compliance with that standard and consistent installation and protection in the field. In addition, plumbing fixtures and fittings and their inspection are under the jurisdiction of the plumbing inspector, including accessible ones. Accordingly the ANCI/ICC standard should be referenced in the plumbing code.

Cost Impact: No additional cost

P40-11

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

404.1-CAVANAUGH

P41 – 12
404.1.1 (New), Chapter 14

Proponent: Fred Constantino, American Society of Mechanical Engineers (ASME), representing the ASME A112 Plumbing Materials and Equipment Standards Committee.

Add new text as follows:

<u>**404.1.1 Exposed Pipes and Surfaces.** Water supply and drain pipes under accessible lavatories and sinks shall be insulated/protected by covers complying with ASME A112.18.9.</u>

Add new standard to Chapter 14 as follows:

ASME
<u>A112.18.9–2011</u> <u>Protectors/Insulators for Exposed Waste and Supplies on Accessible Fixtures</u>

Reason: ASME A112.18.9 Protectors/Insulators for Exposed Waste and Supplies on Accessible Fixtures is a National standard (ANSI). This Standard is intended to cover products that will satisfy the requirements of ICC/ANSI A117.1, Standard for Accessible and Usable Buildings and Facilities for Persons With Physical Disabilities, and contains acceptable performance requirements for protectors/insulators for exposed waste and supplies, so a physically challenged person will be protected when using a sink or lavatory in a public/commercial or private/residential facility.

Cost Impact: The code change proposal will not increase the cost of construction.

P41-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

404.1.1 (NEW)-CONSTANTINO

P42 – 12
404.2 (New), 404.3 (New), Chapter 14

Proponent: Julius Ballanco, P.E./JB Engineering and Code Consulting, P.C. representing McGuire Manufacturing (JBEngineer@aol.com)

Add new text as follows:

<u>**404.2 Accessible fixture requirements.** Accessible plumbing fixtures shall be installed with the clearance, height, spacing, and arrangement in accordance with ICC A117.1.</u>

<u>**404.3 Exposed pipes and surfaces.** Water supply and drain pipes under accessible lavatories and sinks shall be covered or otherwise configured to protect against contact . Pipe coverings shall comply with ASME A112.18.9.</u>

Add new standards to Chapter 14 as follows:

ASME
<u>A112.18.9-2011</u> <u>Protectors/Insulators for Exposed Waste and Supplies on Accessible Fixtures</u>

ICC
<u>A117.1-2009</u> <u>Accessible and Usable Buildings and Facilities</u>

Reason: Reference should be made to ICC A117.1 in the plumbing code. While this standard is referenced in the Building Code, it should also be referenced in the Plumbing Code since the standard contains requirements for plumbing fixture installations.

One of the common concerns is who inspects accessible plumbing fixtures for compliance with ICC A117.1? Plumbing fixtures are inspected by the plumbing official. Therefore, appropriate reference to the spacing, sizing, and configuration requirements needs to be placed in the plumbing code.

ASME A112.18.9 Protectors/Insulators for Exposed Waste and Supplies on Accessible Fixtures is the national consensus standard regulating protective covers for water and drain pipes. This Standard is intended to regulate products that must meet the requirements of ICC A117.1. The standard has performance requirements for protectors/insulators for exposed waste and supplies, so a physically challenged person will be protected when using a sink or lavatory in a public/commercial or private/residential facility.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASME A112.18.9-2011 and ICC A117.1-2009, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

404.2-P-BALLANCO

P43 – 12
405.10 (New)

Proponent: Daniel D. Fish, Roda LLC,representing self (info@drainbrain.us)

Add new text as follows:

405.10 Wastewater leak containment, detection and notification. Where a plumbing fixture such as a water closet, shower, or bathtub is installed in a location where wastewater leakage from the fixture will cause damage, an early-warning wastewater leak containment, detection, and notification device shall be required. This device shall be equipped with an auditory alarm, visual signal, and a means for notification to the affected building occupants, property owners or the property management staff. The auditory alarm shall have a sound pressure level rating of not less than 85 dB when measured at a distance of ten feet.

Reason: Millions of wastewater leaks occur every year in multi-story buildings from leaking drains, waste lines, and toilets. Toilets are especially high risks for water leakage. Research has shown that 30 percent of all toilets in the United States leak. Toilets with unreliable wax gaskets and flanges – a common problem – cause the most damage to the unit below. Also, the float valve that controls water entering the toilet tank often malfunction, which allows water to run into toilet waste line continuously .

Wastewater leaks typically go undetected until considerable damage has been done. These leaks: (1) waste millions of gallons of water, (2) damage property/materials, generating millions of tons of debris that swells landfills, and (3) develop mold on building components, creating property damage and a health hazard. Property owners spend millions of dollars to repair the damage from wastewater leaks and cure mold-related problems.

An early-warning wastewater leak containment, detection, and notification device will give building occupants and owners the opportunity to avoid wastewater leak damage and its attendant costs. Taking action early will conserve millions of gallons of water and eliminate the environmental, economic, and health hazards from wastewater leaks. This solution for the age-old wastewater leak problem will meet the intent of this code by safeguarding the public health, safety, and welfare.

Cost Impact: The code change proposal will not increase the cost of construction.

P43-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

405.10 (NEW)-P-FISH

P44– 12
405.3.1

Proponent: Bob Scott, Kye Lehr and Daryl Kuiper - Colorado Department of Regulatory Agencies, Division of Registrations Electrical and Plumbing Boards

Revise as follows:

405.3.1 Water Closets, urinals, lavatories and bidets. A water closet, urinal, lavatory or bidet shall not be set closer than 15 inches from its center to any side wall, partition, vanity, <u>paper holder, accessory</u> or other obstruction, or closer than 30 inches (762mm) center to center between adjacent fixtures. There shall be a 21 inch clearance in front of the water closet, urinal, lavatory or bidet to any wall, fixture or door. Water closet compartments shall be not less than 30 inches (762mm) in width and not less than 60 inches (1524 mm) in depth for floor mounted water closets and not less than 30 inches(762mm) in width and 56 inches (1422 m) in depth for wall-hung water closets.

Reason: Today's construction is typically limited to the minimums permitted in this section. Once tissue holders, napkin disposals and paper dispensers are installed this min area is reduced to a non- practical size when located adjacent to the fixture. Adding the language proposed would require installers to take into consideration these types of obstructions and locate them in front of the fixture where usage of the fixture is not compromised.

Cost Impact: none. The practice of locating accessories in front of the fixture instead of adjacent to it would cause no additional labor or costs.

P44-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

405.3.1-P-SCOTT

P45 – 12
405.3.2

Proponent: Shawn Strausbaugh, Arlington County VA Representing, the Virginia Plumbing and Mechanical Inspectors Association and The Virginia Building Code Officials Association and ICC Region 7 (Sstrausbaugh@arlingtonva.us)

Revise as follows:

405.3.2 Public lavatories. In employee and *public* toilet rooms, the required lavatory shall be located in the same room as the water closet.

> <u>**Exception:** In educational use occupancies, the required lavatory shall be permitted to be located adjacent to the room or space containing the water closet provided that not more than one operational door is between the water closet and the lavatory.</u>

Reason: This has been a long standing practice in school construction. It is geared towards helping educate children on the importance of personal hygiene. This arrangement also allows for group wash fixtures to be located adjacent to core toilet rooms. This allows the instructors to wait outside and assure the children wash their hands upon exit of the toilet room. More commonly, it permits the installation of the lavatory to be located within the classroom when water closets are installed in the classroom itself. So when a child uses the facilities they walk through a single door (no different in concept to exiting a typical toilet stall) into the classroom where the instructor can assure hands are washed.

Cost Impact: None

P45-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

405.3.2-P-STRAUSBAUGH

P46 – 12
406.1

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

406.1 Water connection. The water supply to an automatic clothes washer shall be protected against backflow by an air gap that is integral with ~~installed~~ ~~integrally within~~ the machine or ~~with the installation of~~ a backflow preventer shall be installed in accordance with Section 608. Air gaps shall comply with ASME A112.1.3 or A112.1.2.

Reason: The requirement for automatic clothes washing machines to comply with ASSE 1007 (covering the requirement for an internal air gap on the water supply) was removed from the 2012 code because ACW manufacturers are no longer certifying their machines to ASSE 1007. Standards that they do comply with, ASME A112.1.3 or A112.1.2 are being included in this section so that inspectors are able to verify that the ACW's have integral backflow protection.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P46-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

406.1-P-STRAUSBAUGH.PMGCAC

P47 – 12
406.2

Proponent: Richard Allison, A.R.K. Plumbing, Inc, representing self

Revise as follows:

406.2 Waste connection. The waste from an automatic clothes washer shall discharge through an air break into a standpipe in accordance with Section 802.4 or into a laundry sink. The trap and fixture drain for an automatic clothes washer standpipe shall be not less than 2 inches (51 mm) in diameter. ~~The fixture drain for the standpipe serving an automatic clothes washer shall connect to a 3-inch (76 mm) or larger diameter fixture *branch* or *stack*.~~ Automatic clothes washers that discharge by gravity shall be permitted to drain to a waste receptor or an approved trench drain.

Reason: Certain jurisdictions are interpreting this as needing a 3 inch fixture branch solely for automatic clothes washer. Their interpretation of this is that we need to use a 3 x 1 ½ x 2 sanitary tee and cannot wet vent the automatic clothes washer with a laundry tub. All other jurisdictions only require us to tie into a 3 inch stack.

Cost Impact: Minimal- More importantly on the cost, is in many instances, the framing won't allow this.

Proponent: Len Swatkowski representing Plumbing Manufacturers International (lswatkowski@pmihome.org)

Revise as follows:

410.1 Approval. Drinking fountains shall conform to ASME A112.19.1/CSA B45.2, ~~or~~ ASME A112.19.2/CSA B45.1 or ASME A112.19.3/CSA B45.4. Drinking fountains with self-contained refrigeration units for chilling the drinking water ~~and water coolers~~ shall also conform to ~~ARI 1010~~ ASHRAE Standard 18. Drinking fountains ~~and water coolers~~ shall conform to NSF 61, Section 9.

410.3 Substitution. Where restaurants provide drinking water in a container free of charge, drinking fountains shall not be required in those restaurants. In other occupancies, where drinking fountains are required, ~~water coolers~~ permanently-installed bottle filling stations ~~or bottled water dispensers~~ shall be permitted to be substituted for not more than 50 percent of the required number of drinking fountains. Bottle filling stations shall conform to NSF 61. Where bottle filling stations have self-contained refrigeration units for chilling the drinking water, they shall conform to ASHRAE Standard 18. Bottled water dispensers shall not be substituted for required drinking fountains.

410.4 Prohibited location. Drinking fountains and bottle filling stations~~,~~ ~~water coolers~~ ~~and bottle water dispensers~~ shall not be installed in public restrooms.

Add new standard to Chapter 14 as follows:

American Society of Heating, Refrigeration and Air-Conditioning Engineers, Inc.
1791 Tullie Circle, NE
Atlanta, GA 30329

ASHRAE

Standard 18-2008	Methods of Testing for Rating Drinking-Water Coolers with Self-Contained Mechanical Refrigeration

Reason: There is considerable confusion in the code enforcement and design communities about terminology for drinking fountains. Currently the Section 410.1 talks about drinking fountains and water coolers. Drinking fountain manufacturers use the term “water cooler” to indicate a drinking fountain that supplies chilled drinking water. However, for years, many people have thought of water coolers as the water dispensers that have a 5 gallon water bottle turned upside down on top of them. Because the code uses the term “water cooler” in Section 410.1, some misunderstand that the code allows for a complete substitution of drinking fountains with bottled water dispensers. This is not the intent of the code nor would we want these “temporary” water dispensers to be the only source of drinking water in a building. My proposed changes eliminate the term “water cooler” to prevent future misunderstanding of what is allowed and what is not.

The substitution of bottled water dispensers for a *required* number of drinking fountains is often used to “get around the code requirement” for providing the full number of required permanent fixtures for providing drinking water. It is not uncommon for bottled water dispensers to frequently run dry, for cups not to be available or for management to realize how much they end up paying for the bottled water service and discontinue the service. Ultimately, the intent of the code is not being realized in many buildings. Because of the temporary nature of bottled water dispensers, they should not be allowed to be a substitute for permanent fixtures.

There is no denying that the use of personal drinking water bottles has increased dramatically in recent years. Use of a personal water bottle eliminates having to obtain drinking water from a drinking fountain that might not have been cleaned for some time. Some people just don’t like the idea of putting their mouth so close to an area where others have done so previously. Getting water from a lavatory in order to fill a water bottle is no better. So why not realize the trend towards personal water bottle use and have the code allow a bottle filling station substitution for drinking fountains? It is a permanent fixture, it provides access to a clean supply of drinking water, it encourages reuse of bottles (a green practice), reduces the carbon footprint of bottled water delivery (a very green practice) and provides drinking water in a manner that the public is demanding more and more. It’s time for the code to come out of the dark ages and provide complete access to safe drinking water.

And finally, the ASHRAE 18 standard is being proposed to replace the AHRI 1010 standard that has not be used for many years for water cooling systems. AHRI no longer maintains the standard (the last revision was 10 years ago). The code needs to stay abreast of current standards.

Cost Impact: None

Analysis: A review of the standard proposed for inclusion in the code, ASHRAE Standard 18-2008, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P52-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

410.1-P-SWATKOWSKI

P53 – 12
202, 410.1, 410.3, 410.4, Chapter 14

Proponent: John Watson, Manager-Compliance and Sustainability, Elkay Manufacturing, representing Elkay Manufacturing (john.watson@elkay.com)

Add new definitions as follows:

BOTTLE FILLING STATION. A plumbing fixture that is connected to the potable water distribution and building drainage system and is designed and intended for filling personal use drinking water bottles not less than 10 inches (250 mm) in height. Such fixtures can be separate from or integral to a *drinking fountain*.

DRINKING FOUNTAIN. A plumbing fixture connected to the potable water distribution system that provides drinking water in a flowing stream so that the user can consume water directly from the fixture without the use of any accessories. Drinking fountains can incorporate a *bottle filling station*. Wasted water from the flowing stream and from the *bottle filling station* is captured and directed into the building's drainage system. These fixtures have a permanent connection to a building's potable cold water supply and to the building's drainage system through a trap and can incorporate a water filter and a cooling system for chilling the drinking water.

Revise as follows:

410.1 Approval. Drinking fountains shall conform to ASME A112.19.1/CSA B45.2, ~~or~~ ASME A112.19.2/CSA B45.1 or ASME A112.19.3/CSA B45.4. Drinking fountains and *bottle filling stations* with a self contained cooling system for chilling the drinking water ~~and water coolers~~ shall conform to ~~ARI 1010~~ ASHRAE Standard 18. Drinking fountains and ~~water coolers~~ bottle filling stations shall conform to NSF 61, Section 9.

410.3 Substitution. Where restaurants provide drinking water in a container free of charge, drinking fountains shall not be required in those restaurants. In other occupancies, where drinking fountains are required, *bottle filling stations* ~~water coolers or bottled water dispensers~~ shall be permitted to be substituted for not more than 50 percent of the required number of drinking fountains. Bottled water dispensers shall not be substituted for required drinking fountains.

410.4 Prohibited location. Drinking fountains and *bottle filling stations*~~, water coolers and bottle water dispensers~~ shall not be installed in public ~~restrooms~~ toilet facilities.

Add new standard to Chapter 14 as follows:

American Society of Heating, Refrigeration and Air-Conditioning Engineers, Inc.
1791 Tullie Circle, NE
Atlanta, GA 30329

ASHRAE
Standard 18-2008 Methods of Testing for Rating Drinking-Water Coolers with Self-Contained Mechanical Refrigeration

Reason: Drinking fountain manufacturers use the term "water cooler" to indicate a drinking fountain that supplies chilled drinking water. However, some people think of water coolers as the bottled water dispensers. My proposal eliminates the term "water cooler" to prevent future misunderstanding of what is allowed and what is not.

Using bottled water dispensers to substitute for a *required* number of permanently installed drinking fountains is just a cheap way for the designer to get around the full intent of the code. Providing permanent fixtures for obtaining drinking water is the intent of the code. Bottled water dispensers frequently run dry, cups for their use are sometimes not to be available and it's too easy for a bottled water service to be discontinued. Bottled water dispensers are temporary and should not be allowed to be a substitute for permanent fixtures.

We need to recognize that the use of personal drinking water bottles or containers has increased dramatically in recent years. Use of such a personal device eliminates having to obtain drinking water from a drinking fountain that might not have been cleaned for some time. Some people just don't like the idea of putting their mouth so close to an area where others have previously done so; and getting water from a lavatory in order to fill a water bottle is no better. So why not realize the trend towards personal water bottle use and have the code allow a bottle filling station substitution for drinking fountains? It is a permanent fixture, it provides access to a clean supply of drinking water, it encourages reuse of bottles (a green practice), reduces the carbon footprint of bottled water delivery (a very green practice) and provides drinking water in a manner that the public is obviously demanding. It's time for the code to recognize this new product and take a stance to provide complete access to safe drinking water.

And finally, the ASHRAE 18 standard is being proposed to replace the ARI 1010 standard that has not be used for many years for water cooling systems. ARI no longer maintains the standard (the last revision was 10 years ago). The code needs to stay abreast of current standards.

Cost Impact: None

Analysis: A review of the standard proposed for inclusion in the code, ASHRAE Standard 18-2008, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P53-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

410.1-WATSON

P54 – 12
202, 410.3, 410.4

Proponent: Roger Harper, Jr, Louisa County VA, representing, the Virginia Plumbing and Mechanical Inspectors Association (sharper@louisa.org)

Add new definitions as follows:

DRINKING FOUNTAIN. A plumbing fixture that is connected to the potable water distribution system and the drainage system. The fixture allows the user to obtain a drink directly from a stream of flowing water without the use of any accessories.

WATER DISPENSER. A plumbing fixture that is manually controlled by the user for the purpose of dispensing potable drinking water into a receptacle such as a cup, glass or bottle. Such fixture is connected to the potable water distribution system of the premises. This definition also includes a freestanding apparatus for the same purpose that is not connected to the potable water distribution system and that is supplied with potable water from a container, bottle or reservoir.

WATER COOLER. A drinking fountain that incorporates a means of reducing the temperature of the water supplied to it from the potable water distribution system.

Revise as follows:

410.3 Substitution. Where restaurants provide drinking water in a container free of charge, *drinking fountains* shall not be required in those restaurants. In other occupancies where *drinking fountains* are required, ~~water coolers or bottled~~ *water dispensers* shall be permitted to be substituted for not more than 50 percent of the required number of drinking fountains.

410.4 Prohibited location. *Drinking fountains, water coolers* and ~~bottle~~ *water dispensers* shall not be installed in public restrooms.

Reason: There is often confusion regarding what is or is not a water cooler. Some people think that a water cooler is a drinking fountain since typically, they do also cool the water that is being dispensed. Others think that a water cooler is a bottled water dispenser that is capable of cooling the water dispensed. Currently the code does not define any of the terms. In reality, drinking fountains are drinking fountains and everything else is some form of a water dispenser. Whether or not the water is cooled is irrelevant. The code does not require cooled water. The code can be simplified in Section 410.3 by referring only to drinking fountains or their alternative, water dispensers. The new definitions establish that a drinking fountain and a water dispenser that is connected to the potable water supply system are both plumbing fixtures by definition and a bottled water dispenser is not a plumbing fixture by definition. It is necessary to be clear as to what the code requires to be provided and also what the code intends to allow as an alternative. This proposal also paves the way for new technology that is being marketed and installed today, namely water dispensers that are built into a wall, connected to the potable water supply system and dispense water into cups, glasses and bottles. These units typically treat the potable water with additional filtering and/or reverse osmosis treatment.

Cost Impact: none

P54-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

410.3-P-HARPER

P55 – 12
412.5 (New)

Proponent: Joseph Campanella, representing self

Add new text as follows:

412.5 Floor drains required. Not less than one floor drain shall be installed in every kitchen and bathroom of a multi-story building.

Reason: Water from fire sprinkler activations, dishwasher overflows, and toilet overflows typically causes catastrophic damage to a building because there is nowhere for the water drain to except into the lower floors of a building. For high rise structures, this means that the water damage can extend for many floors below the floor where the water event occurred. This collateral damage is very costly for building owners and residents and could be prevented by the installation of floor drains in rooms where water catastrophes are most likely to occur. There would be significant cost savings on insurance premiums.

Cost Impact: The code change proposal will increase the cost of construction

Proponent: Julius Ballanco, P.E./ JB Engineering and Code Consulting, P.C. representing InSinkErator (JBEngineer@aol.com)

Revise as follows:

SECTION 413
FOOD WASTE DISPOSERS ~~GRINDER UNITS~~

413.1 Approval. Domestic food waste ~~grinders~~ disposers shall conform to ASSE 1008. Food waste ~~grinders~~ disposers shall not increase the drainage fixture unit load on the sanitary drainage system.

413.2 Domestic food waste ~~grinders~~ disposers waste outlets. Domestic food waste ~~grinders~~ disposers shall be connected to a drain of not less than 1 1/2 inches (38 mm) in diameter.

413.3 Commercial food waste ~~grinders~~ disposers waste outlets. Commercial food waste ~~grinders~~ disposers shall be connected to a drain not less than 1 1/2 inches (38 mm) in diameter. Commercial food waste ~~grinders~~ disposers shall be connected and trapped separately from any other fixtures or sink compartments.

413.4 Water supply required. All food waste ~~grinders~~ disposers shall be provided with a supply of cold water. The water supply shall be protected against backflow by an *air gap* or backflow preventer in accordance with Section 608.

Revise as follows:

TABLE 709.1
DRAINAGE FIXTURE UNITS FOR FIXTURES AND GROUPS

FIXTURE TYPE	DRAINAGE FIXTURE UNIT VALUE AS LOAD FACTORS	MINIMUM SIZE OF TRAP (inches)
Kitchen sink, domestic with food waste ~~grinder~~ disposer and/or dishwasher	2	1 ½

(Portions of table not shown remain unchanged.)

Revise as follows:

802.1.6 Domestic dishwashing machines. Domestic dishwashing machines shall discharge indirectly through an *air gap* or *air break* into a standpipe or waste receptor in accordance with Section 802.2, or discharge into a wye branch fitting on the tailpiece of the kitchen sink or the dishwasher connection of a food waste ~~grinder~~ disposer. The waste line of a domestic dishwashing machine discharging into a kitchen sink tailpiece or food waste ~~grinder~~ disposer shall connect to a deck-mounted *air gap* or the waste line shall rise and be securely fastened to the underside of the sink rim or counter.

Revise as follows:

915.1 Type of fixtures. A combination waste and vent system shall not serve fixtures other than floor drains, sinks, lavatories and drinking fountains. Combination waste and vent systems shall not receive the discharge from a food waste ~~grinder~~ disposer or clinical sink.

916.1 Limitation. Island fixture venting shall not be permitted for fixtures other than sinks and lavatories. Residential kitchen sinks with a dishwasher waste connection, a food waste ~~grinder~~ disposer, or both, in combination with the kitchen sink waste, shall be permitted to be vented in accordance with this section.

Revise as follows:

1003.3.2 Food waste grinders. Where food waste ~~grinders~~ disposers connect to grease interceptors, a solids interceptor shall separate the discharge before connecting to the grease interceptor. Solids interceptors and grease interceptors shall be sized and rated for the discharge of the food waste ~~grinder~~ disposer. Emulsifiers, chemicals, enzymes and bacteria shall not discharge into the food waste ~~grinder~~ disposer.

Reason: The proper term used in the plumbing profession is food waste disposers, not food waste grinders. This will correct the language in the code to the proper terminology for this type of plumbing appliance.

Cost Impact: This change does not increase the cost of construction.

P56-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

413-P-BALLANCO

P57 – 12
413.1, Chapter 14

Proponent: Bob Eugene, Underwriters Laboratories (Robert.Eugene@ul.com)

Revise as follows:

413.1 Approval. Domestic food waste grinders shall conform to ASSE 1008 <u>and shall be listed and labeled in accordance with UL 430</u>. Food waste grinders shall not increase the drainage fixture unit load on the sanitary drainage system.

Add new standard to Chapter 14 as follows:

UL
<u>430-2009</u> <u>Waste Disposers, with revisions through March 23, 2011</u>

Reason: Referenced UL standards contain important safety and plumbing requirements that should be covered in the International Plumbing Code. UL 430 is an ANSI approved standard for waste disposers.

Cost Impact: None

Analysis: A review of the standard proposed for inclusion in the code, UL 430-2009 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P57-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

413.1-P-EUGENE

P58 – 12
413.3

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C. representing InSinkErator (JBEngineer@aol.com)

Revise as follows:

413.3 Commercial food waste grinder waste outlets. Commercial food waste grinders shall be connected to a drain not less than 11/2 inches (38 mm) in diameter. Commercial food waste grinders shall be connected and trapped separately from any other fixtures or sink compartments <u>and shall not discharge through a grease interceptor</u>.

Reason: This is a companion change to the change proposed to Section 1003. A food waste grinder should never discharge through a grease interceptor. The purpose of a food waste grinder is to pulverize food waste to small enough particles to discharge to the sewer. If a grinder connects to a grease interceptor, the food particles will separate out, defeating the purpose of a food waste grinder. Similarly, if a food waste grinder discharges to a solids interceptor, the food particles will be separated.

Cost Impact: This change does not increase the cost of construction.

P58-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

413.3-P-BALLANCO

P59 – 12
417.4.1

Proponent: Roger Harper, Jr, Louisa County VA, representing, the Virginia Plumbing and Mechanical Inspectors Association and The Virginia Building Code Officials Association and ICC Region 7 (sharper@louisa.org)

Revise as follows:

417.4.1 Wall area. Bathtub floors, shower floors, ~~the~~ wall areas above built-in tubs ~~with~~ that have installed shower heads and walls in shower compartments shall be constructed of smooth, ~~noncorrosive~~ corrosion-resistant and nonabsorbent waterproof materials. Wall materials shall extend to a height of not less than 6 feet (1829 mm) above the room floor level~~,~~ and not less than 70 inches (1778 mm) above the drain of the tub or shower. ~~where measured from the compartment floor at the drain.~~ Such walls shall form a water-tight joint with each other and with either the tub~~, receptor~~ or shower floor.

Reason: This is consistent with the language currently in the IRC. This adds the missing requirement from the IPC that bath tubs and showers are required to have non-absorbent floors, the same as the IRC currently requires. This change also incorporates the term "corrosion resistant" in place of "non-corrosive". The materials must be made of materials that resist corrosion. This is consistent industry terminology used throughout the I-codes.

Cost Impact: None

P59-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

417.4.1-P-HARPER

P60 – 12
417.5.2

Proponent: Tom Allen, City of Mount Dora, FL, representing self

Revise as follows:

417.5.2 Shower lining. Floors under shower compartments, except where prefabricated receptors have been provided, shall be lined and made water tight utilizing material complying with Sections 417.5.2.1 through 417.5.2.6. Such liners shall turn up on all sides not less than 2 inches (51 mm) above the finished threshold level. Liners shall be recessed and fastened to an *approved* backing so as not to occupy the space required for wall covering, and shall not be nailed or perforated at any point less than 1 inch (25 mm) above the finished threshold. Liners shall be pitched one-fourth unit vertical in 12 units horizontal (2-percent slope) and shall be sloped toward the fixture drains and be securely fastened to the waste outlet at the seepage entrance, making a water-tight joint between the liner and the outlet. The completed liner shall be tested in accordance with Section 312.9.

Exceptions:

1. Floor surfaces under shower heads provided for rinsing laid directly on the ground are not required to comply with this section.
2. Where a sheet-applied, load-bearing, bonded, waterproof membrane is installed as the shower lining, the membrane shall not be required to be recessed.
3. <u>Shower floors integrally cast into a concrete slab-on-grade floor and recessed such that the top of the shower drain is not less than 2 inches (51mm) below the room floor shall not be required to comply with this section.</u>

Reason: Recessing shower floors in concrete slab-on-grade floors has been common practice in many areas of the country. The advantage of this method for shower receptor construction is that the threshold doesn't require a curb. The shower floor is tiled so that the shower floor is even with the floor of the room. This makes it easy for elderly people to walk in and out of the shower. Because the recessed area for the shower receptor is cast integral to the rest of the slab and that any water seepage through the tile floor would just contact concrete, there is no need to install a liner in these situations. If the shower drain did become clogged to the point where water would fill the receptor, the water would run out the threshold at the same time the level would rise to a point to begin leaking through the tile and onto the top of the floor slab. The occupant would take action to shut off the water/unclog the drain long before any water would have the chance to seep through the tile and get into areas where wood construction (stud walls) would be damaged. Again, installing a liner in this recessed floor arrangement is simply a waste of time.

Cost Impact: There is no cost impact.

P60-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

417.5.2-P-ALLEN

P61 – 12
419.1.1 (New)

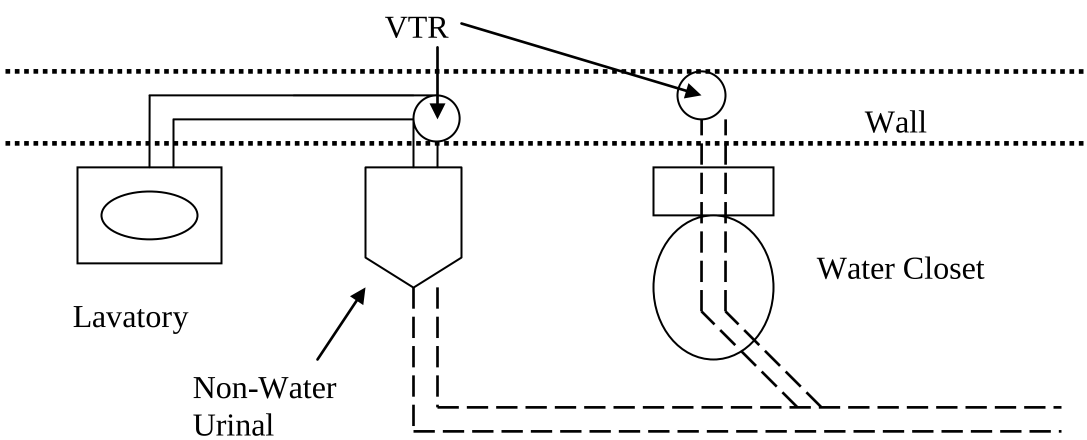
Proponent: Gary Kreutziger, M.C.P., City of San Antonio, representing self (gkreutziger@sanantonio.gov)

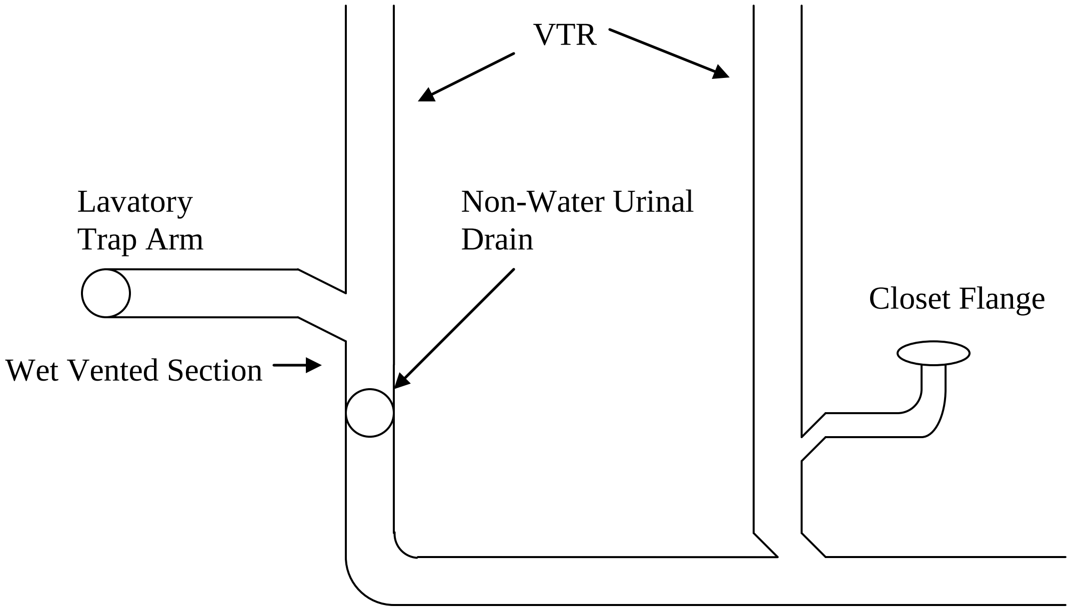
Add new text as follows:

419.1.1 Water-less urinal drain connection. The fixture drain from a water-less urinal shall be installed in accordance with one of the following:

1. The fixture drain shall connect to a horizontal drain that serves one or more water-supplied fixtures that connect to the horizontal drain upstream of the water-less urinal fixture drain connection . The vertical section of the water-less urinal fixture drain shall be provided with access and shall be installed with *mechanical joints* at each end of the vertical section of fixture drain.
2. The fixture drain shall be the lower fixture connection of a common vented drain arrangement where the upper fixture drain is a water-supplied fixture drain.

Reason: The drain lines of a water-less urinal are very prone to uric acid salt build up. Most manufacturers' maintenance protocols require flushing a urinal with water or "cleaning fluid" at every cartridge change. This flushing is too little, too late. By the time the urine has passed through the drain line and the uric acid salts are left behind to solidify the water or "cleaning fluid " have very little effect on the build up. Utilizing installation method #1 the horizontal drain line will receive frequent flushing from an upstream fixture, creating the same performance of the drain as is expected of a water-supplied urinal drain. The small vertical section of the urinal drain line that receives no flushing from an upstream fixture will remain accessible and easily replaceable with the mechanical joints when it does clog. Installation method #2 will utilize the gray water from another water-supplied fixture drain to frequently flush the entire urinal drain.





Cost Impact: The code change proposal will not increase the cost of construction.

P61-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

419.1.1 (NEW)-P-KREUTZIGER

P62 – 12
419.4 (New)

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

419.4 Nonwater urinal connection. The fixture drain for a nonwater urinal shall independently connect to a branch drain that serves one or more lavatories, water closets or water-using urinals that discharge upstream of such nonwater urinals.

Reason: Nonwater urinals have such a concentrated discharge that fixture drains and branch drain lines carrying only urine have a tendency to accumulate urine salt deposits. Designing such systems with water using fixtures is a method that solves the potential clogging problem by keeping the drain lines washed out with the discharge of other types of fixtures.. The proposed language is adapted from what is currently in the IgCC.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P62-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

419.4 (NEW)-P-STRAUSBAUGH.PMGCAC

P63 – 12
420.1, Chapter 14

Proponent: Fred Constantino, American Society of Mechanical Engineers (ASME), representing the ASME A112 Plumbing Materials and Equipment Standards Committee.

Revise as follows:

420.1 Approval. Water closets shall conform to the water consumption requirements of Section 604.4 and shall conform to ANSI Z124.4, ASME A112.19.2/CSA B45.1, ASME A112.19.3/CSA B45.4 or CSA B45.5. Water closets shall conform to the hydraulic performance requirements of ASME A112.19.2/CSA B45.1. Water closet tanks shall conform to ANSI Z124.4, ASME A112.19.2/CSA B45.1, ASME A112.19.3/CSA B45.4 or CSA B45.5. Electro-hydraulic water closets shall comply with ASME A112.19.2/CSA B45.1. <u>Water closets equipped with a dual flushing device shall comply with ASME A112.19.14.</u>

Add new standard to Chapter 14 as follows:

ASME
<u>A112.19.14–2006(R2011)</u>   <u>Six-Liter Water Closets Equipped with a Dual Flushing Device</u>

Reason: Dual flush water closets which consist of a full flush of 1.6 gpf and a reduce flush of less than 1.1 gpf do exist and should be required to comply with some performance requirements. This is a National standard (ANSI) which covers the performance requirements for these types of systems.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASME A112.19.14-2006(R2011) with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P63-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

420.1-P-CONSTANTINO

P64 – 12
420.1.1 (New), Chapter 14

Proponent: Fred Constantino, American Society of Mechanical Engineers (ASME), representing the ASME A112 Plumbing Materials and Equipment Standards Committee.

Add new text as follows:

<u>**420.1.1 Dual flush devices.** Dual flush devices for water closets shall comply with ASME A112.19.10.</u>

Add new standard to Chapter 14 as follows:

ASME
<u>A112.19.10–2003(R2008)</u> <u>Dual Flush Devices for Water Closets</u>

Reason: Dual flush devices for water closets is a device that consist of a full flush of 1.6 gpf and a reduce flush of less than 1.1 gpf and these products do exist and should be required to comply with some performance requirements. This is a National standard (ANSI) which covers the performance requirements for these types of systems.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASME A112.19.10, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P64-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

420.1.1(NEW)-P-CONSTANTINO

P65 – 12
420.3

Proponent: Bob Scott and Kye Lehr - Colorado Department of Regulatory Agencies, Division of Registrations Electrical and Plumbing Boards

Revise as follows:

420.3 Water Closet Seats. Water closets shall be equipped with seats of smooth, nonabsorbent material. All seats of water closets provided for public or employee toilet facilities shall be of the hinged open-front type. Integral water closet seats shall be of the same material as the fixture. Water closet seats shall be sized for the water closet bowl type.

> **Exception**: Water closet seats shall not be required in facilities such as mental health centers or correctional facilities.

Reason: Seats are commonly eliminated in these facilities to avoid suicide or injury to the occupants. Adding the exception will allow these installations without conflict to the code.

Cost Impact: None. The elimination of seats would reduce costs and labor to install them.

P65-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

420.3 #1-P-SCOTT-LEHR

P66 – 12
420.3

Proponent: Bob Scott and Kye Lehr - Colorado Department of Regulatory Agencies, Division of Registrations Electrical and Plumbing Boards

Revise as follows:

420.3 Water closet seats. Water closets shall be equipped with seats of smooth, nonabsorbent material. All seats of water closets provided for public or employee toilet facilities shall be of the ~~hinged~~ open-front type. Integral water closet seats shall be of the same material as the fixture. Water closet seats shall be sized for the water closet bowl type.

Reason: Seats are commonly eliminated in public facilities such as mental health centers or correctional facilities. Removing the "hinged" verbiage allows integral water closet seats to be used.

Cost Impact: None. The elimination of this word would only clarify the code.

P66-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

420.3 #2-P-SCOTT-LEHR

P67 – 12
420.5 (New)

Proponent: Christopher Salazar / Penguin Toilets LLC./ Penguin Toilets LLC

Add new text as follows:

420.5 Overflow protection. Where an overflow from the bowl of a water closet will cause damage, one of the following shall be installed:

1. A water closet with overflow protection means.
2. A floor drain located within the same room as the water closet.

Reason: To be in compliance with IPC section 101.3: (to provide minimum standards to safeguard life or limb, health, property and public welfare)

Toilet overflow (BLACKWATER spill) has not been addressed in the current code. Different from a grey water spill, a black water spill pose an unhealthy environment and is a very expensive event to mediate/repair. Adding this section into the code provides an additional safeguard to health, property and public welfare thus improving this code.

Cost Impact: The code change proposal will not increase the cost of construction. Cost impact is none to little depending on method of protection.

P67-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

420.5 (NEW)-P-SALAZAR

P68 – 12
421.1

Proponent: Bob Eugene, Underwriters Laboratories (Robert.Eugene@ul.com)

Revise as follows:

421.1 Approval. Whirlpool bathtubs shall comply with ASME A112.19.7/CSA B45.10 and shall be listed and labeled in accordance with UL1795.

Add new standard to Chapter 14 as follows:

UL
1795-2009 Hydromassage Bathtubs, including revisions through August 23, 2011

Reason: Referenced UL standard contains important safety and plumbing requirements that should be covered in the International Plumbing Code.

Cost Impact: None

Analysis: A review of the standard proposed for inclusion in the code, UL 1795-2009 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P68-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

421.1-P-EUGENE

P69 – 12
422.11(New)

Proponent: Daniel D. Fish, Roda LLC, representing self (info@drainbrain.us)

Add new text as follows:

422.11 Wastewater leak containment, detection and notification. An early-warning wastewater leak containment, detection and notification device shall be required in hospitals and other healthcare occupancies. The device shall contain and detect wastewater leakage from water closets, showers and bathtubs. The device shall be equipped with an auditory alarm, visual signal, and a means for notification to the building occupants, property owners or the property management staff. The auditory alarm shall have a sound pressure level rating of not less than 85 dB when measured at a distance of ten feet.

Reason: Millions of wastewater leaks occur every year in multi-story buildings from leaking drains, waste lines, and toilets. Toilets are especially high risks for water leakage. Research has shown that 30 percent of all toilets in the United States leak. Toilets with unreliable wax gaskets and flanges – a common problem – cause the most damage to the unit below. Also, the float valve that controls water entering the toilet tank often malfunction, which allows water to run into toilet waste line continuously.

Wastewater leaks typically go undetected until considerable damage has been done. These leaks: (1) waste millions of gallons of water, (2) damage property/materials, generating millions of tons of debris that swells landfills, and (3) develop mold on building components, creating property damage and a health hazard. Property owners spend millions of dollars to repair the damage from wastewater leaks and cure mold-related problems

. An early-warning wastewater leak containment, detection, and notification device will give building occupants and facility managers/owners the opportunity to avoid wastewater leak damage and its attendant costs. Taking action early will conserve millions of gallons of water and eliminate the environmental, economic, and health hazards from wastewater leaks. This solution for the age-old wastewater leak problem will meet the intent of this code by safeguarding the public health, safety, and welfare.

Cost Impact: The code change proposal will not increase the cost of construction.

P69-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

422.11 (NEW)-P-FISH

P70 – 12
423.3 (New)

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Add new text as follows:

423.3 Footbaths, pedicure baths and head shampoo sinks. The water supplied to specialty plumbing fixtures such as pedicure chairs having an integral foot bath tub, footbaths, and head shampoo sinks, shall be limited to a maximum temperature of 110 °F by a water temperature limiting device that conforms to ASSE 1070 or CSA B125.3.

Reason: The code does not address maximum water temperature for foot baths and head shampoo sinks. Feet and heads should be protected from potentially scalding water.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

423.3 (NEW)-P-STRAUSBAUGH.PMGCAC

P71 – 12
424.3

Proponent: Edward R. Osann, Natural Resources Defense Council, representing self (eosann@nrdc.org); Harry Misuriello, American Council for an Energy-Efficient Economy, representing himself (misuriello@verizon.net)

Revise as follows:

424.3 Individual shower valves. Individual shower and tub-shower combination valves shall be balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valves that conform to the requirements of ASSE 1016 or ASME A112.18.1/CSA B125.1 when tested at a flow rate of 1.5 gpm ± 0.1 gpm (5.75 L/m ± 0.35 L/m). ~~and~~ Such valves shall be installed at the point of use. Such valves shall be factory marked with the manufacturer's minimum rated flow and such marking shall be visible at final inspection. Shower and tub-shower combination valves required by this section shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted in accordance with the manufacturer's instructions. In-line thermostatic valves shall not be utilized for compliance with this section.

Reason: The thermal protection afforded by shower valves can be compromised if the flow rate of the showerhead is less than the flow rate for which the protective components of the valve have been designed. As noted by Martin and Johnson (2008) (as cited in Codes and Standards Enhancement Initiative (CASE), "Multi-Head Showers and Lower-Flow Shower Heads," *2013 California Building Energy Efficiency Standards,* California Utilities Statewide Codes and Standards Team, September 2011), combinations of valves and shower heads were tested to determine whether pressure-compensating valves and thermostatic valves rated for 2.5gpm would perform adequately at lower flow rates. The tests included 22 shower valves from six manufacturers, and the valves were assessed on their ability to maintain water temperature within certain bounds for a given time after a change in pressure event, as described by the ASSE 1016-2005 standard for shower valves. The results indicated that a significant share of shower valves rated for 2.5 gpm failed to provide the thermal protection specified by ASSE 1016 when tested at lower flow rates. As summarized in the CASE report (p. 15): "These results indicate that shower valve temperature maintenance is strongly affected by flow rate, and that new showers with lower-flow shower heads would have to be installed with valves that are designed for 2.0 and lower flow rates."

Showerheads with maximum flow rates below 2.5 gpm are widely available on the market today, and simple replacement of a showerhead is typically not subject to code. Since shower valve components are located behind finished walls, replacement of showerheads is likely to be more frequent than replacement of shower valves. This proposed change seeks to reduce the likelihood that consumers replacing a showerhead will compromise the thermal protection offered by a building subject to this code by ensuring that shower valves can fully accommodate showerheads with lower flow rates than the current maximum federal standard of 2.5 gpm. The current EPA WaterSense specification for showerheads has a maximum flow rate of 2.0 gpm, and many showerheads are already available with flow rates between 2.0 and 1.5 gpm. As manufacturers continue to innovate with more water- and energy-efficient showerheads, the code change proposed here will help ensure that new buildings built to this code can safely accommodate showerheads with lower flow rates that may be selected by building occupants in future years.

Note that this language does not require that the showerhead itself have a flow rate of 1.5 gpm, but simply that the shower valve provide the thermal protection called for under the recognized standard when tested at a flow rate as low as 1.5 gpm.

Cost Impact: Conforming products are on the market today without a significant cost premium. The code change proposal will not increase the cost of construction.

428 (New), 428.1 (New), 428.2 (New), Chapter 14

Proponent: Jeremy Brown, NSF International (Jeremy@nsf.org)

Add new text as follows:

SECTION 428
NON-LIQUID SATURATED TREATMENT SYSTEMS

428.1 Approval. Materials, design, construction and performance of non-liquid saturated treatment systems shall comply with NSF 41.

428.2 Installation. Non-liquid saturated treatment systems shall be installed in accordance with the manufacturer's instructions.

Add new standard to Chapter 14 as follows:

NSF
41-2011 Non-liquid Saturated Treatment Systems

Reason: NSF/ANSI-41 *Non-liquid Saturated Treatment Systems* is the American National Standard for the materials, design, construction and performance of composting toilets treating residential black water. Composting Toilets are a viable alternative are a viable alternative to traditional water closets and offer advantages of low water consumption. NSF/ANSI 41 is currently permitted in the IPSDC. A copy of this standard may be obtained from brown@nsf.org

Cost Impact: This will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, NSF 41-2011, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

	Assembly:	ASF	AMF	DF

428-P-BROWN

P75 – 12
501.3

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

501.3 Drain valves. Drain valves for emptying shall be installed at the bottom of each tank-type water heater and hot water storage tank. ~~Drain valves shall conform to ASSE 1005.~~ The drain valve inlet shall be not less than ¾ inch nominal iron pipe size and the outlet shall be provided with male garden hose threads.

Reason: ASSE discontinued the 1005 standard. The new language proposed for this section provides for minimum requirements for water heater drain valves.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P76 – 12
501.6

Proponent: Ron George, CPD, Plumb-Tech Design & Consulting Services LLC, representing self (Ron@Plumb-TechLLC.com)

Revise as follows:

501.6 Water temperature control ~~in piping from tankless~~ <u>for water</u> heaters. <u>The temperature of hot water supplied to a hot water distribution system that supplies hot water for domestic use shall not exceed</u> ~~from tankless water heaters shall be not greater than~~ 140°F (60°C) ~~where intended for domestic uses~~. <u>The thermostat on the water heater supplying such system shall not be used for meeting this provision.</u> This provision shall not supersede the requirement for protective shower valves in accordance with Section 424.3.

Reason: There is no reason to limit the maximum hot water temperature in just tankless water heaters. The thermostat dial on a water heater is not intended or designed to adequately control the outlet hot water temperature of a water heater. The water heater thermostat is located near the bottom of the water heater to sense incoming cold water and turn "on" and "off" the fuel source for a storage type water heater. Other code sections for combined systems, (IPC 501.2 and 501.6) already limit hot water intended for domestic used to 140 degrees Fahrenheit. This code change correlates with those code requirements and applies to all water heaters for all domestic hot water. Recent ill advised, attempts to minimize scalding have been to simply instruct people to turn the thermostat down on a water heater. When this is done hot water runs short and other problems occur in the system. Calls of "lack of hot water" usually result in the thermostat being readjusted upwards after users experience a hot water shortage. This increases the scalding potential significantly. The thermostat on the water heater does not accurately control the outlet temperature of hot water from a water heater. Turning down the thermostat can cause condensing and premature corrosion from the burner side of the heater, a shortage of hot water and lower temperatures increase the possibility of incubating or amplifying the bacteria like Legionella in the hot water system to levels that can trigger outbreaks in people with suppressed immune systems. A thermostatic mixing valve located as shown in figure 6 would allow the water heater to be turned up to a temperature that would minimize condensation, kill Legionella bacteria and deliver an ample supply of hot water and allow hot water to be delivered at a safe temperature.

<u>Temperature/Time Burn Chart</u>

Temp. in Deg. F	Time for 1st deg. Burn.	Time for 2nd -3rd Deg. Burn.
111 F =	270 min's.	300 min's.
113 F =	120 min's.	180 min's.
116 F =	20 min's.	45 min's.
118 F =	15 min's.	20 min's.
120 F =	8 min's.	10 min's.
124 F =	2 min's.	4.2 min's.
131 F =	17 seconds	30 seconds
140 F =	3 seconds	5 seconds
151 F =	Instant	2 Seconds

(Source: Report prepared by Dr. Moritz and Dr. Henriques at Harvard Medical School in the 1940s for adult males. Children and elderly can receive burns in less time because their skin is thinner.)

Figure 1 – Table showing the relationship of Time/Temperature and Degree of Burn

Figure – 2 Photos of scald burns.

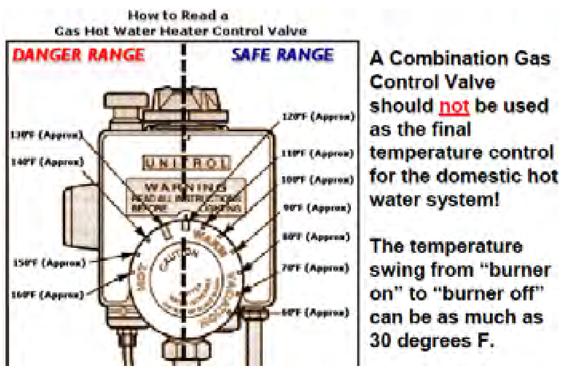

Figure 3 – T-Stat Setting – illustration from a manufacturers catalog.

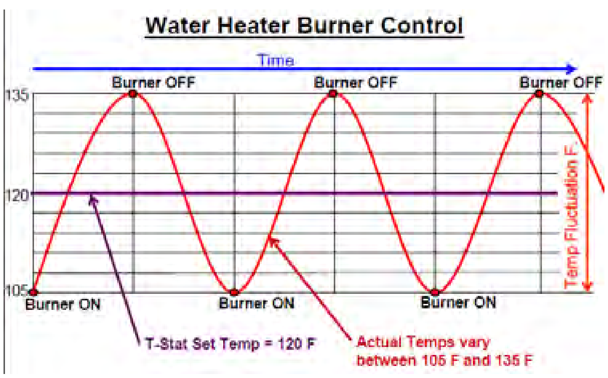

Figure 4 – Example of Water heater Thermostat setting verses HW outlet temperature at the top of the heater.

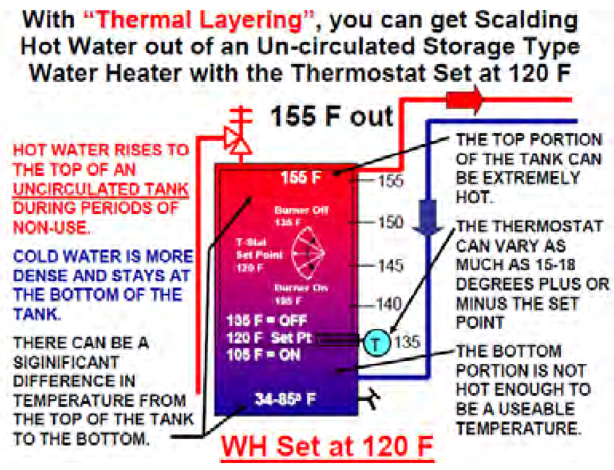

Figure 5 – Illustration showing how stacking or thermal layering
This figure shows how the hot water at the top outlet of a water heater can exceed the thermostat setting near the bottom of the water heater.

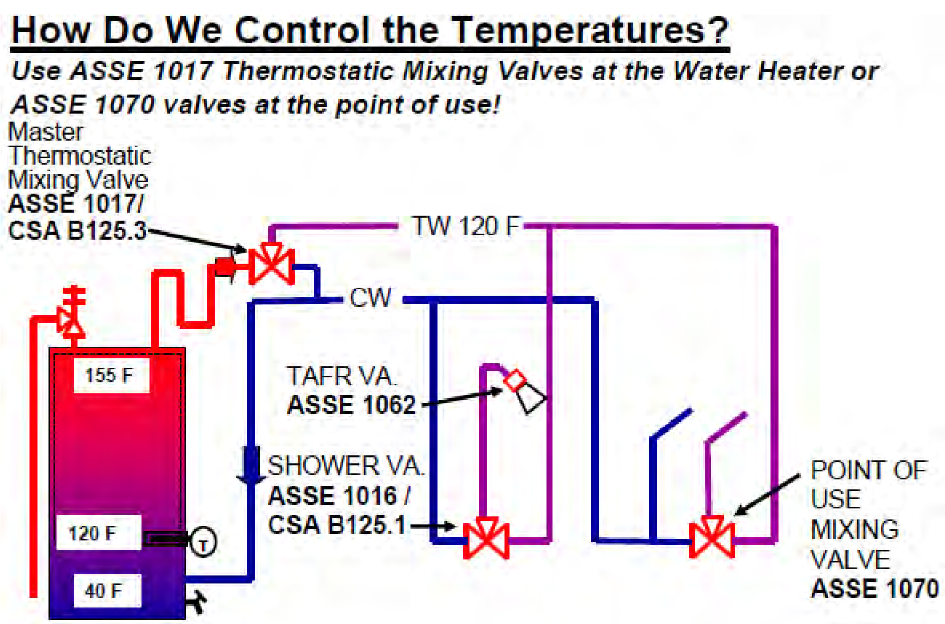

Figure 6 – Illustration of various temperature control methods available.

Cost Impact: This code change will slightly increase the cost of construction in some cases. Mixing valves are already required when temperatures exceed 140 F. A properly designed hot water system will already have a thermostatic mixing valve. There are several types of devices available to accomplish the tempering of the domestic hot water. ASSE 1070 thermostatic temperature limiting valves and ASSE 1017 Master thermostatic mixing valves can be utilized to provide safe hot water distribution temperatures.

P76-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

501.6-P-GEORGE

P77 – 12
501.8

Proponent: Ron George, CPD, Plumb-Tech Design & Consulting Services LLC representing himself (Ron@Plumb-TechLLC.com)

Revise as follows:

501.8 Temperature controls. ~~Hot water supply systems~~ Water heaters shall be equipped with an automatic temperature control thermostat capable of adjustments from the lowest to the highest ~~acceptable~~ temperature settings for the intended temperature operating range. Water heaters installed in dwelling units shall have a maximum thermostat temperature setting capability of 160°F (71.1°C). Water heaters installed in other than dwelling units shall have a maximum thermostat temperature setting capability of 180°F (82.2°C). Thermostats on water heaters shall not be used to limit the water temperature discharged from shower valves or bathtub valves as required by Sections 424.3 through 424.5.

Reason: All residential water heaters have a maximum thermostat setting of 160 F. All commercial water heaters have a maximum thermostat setting of 180F. Heating boiler thermostats can go up to 200 degrees Fahrenheit. This language will assure that the inspector can verify that the proper temperature range thermostat is installed in accordance with the available thermostat temperature ranges for a given installation. The water heaters are supplied with installation and operation manuals that indicate the temperature settings on the thermostat dial. Inspectors can verify the maximum water heater outlet temperature by looking at the literature if it is not printed on the thermostat dial. The thermostat temperature ranges are called out in the ANSI or UL standards for thermostats. The boiler thermostat would be covered in the mechanical code so it was not listed here.

The language also allows the inspector to verify that proper temperature controls are installed on the water heater for a given application. The language about the thermostat not being the final temperature control was added here for instances where a permit is pulled for inspection of a water heater replacement. The inspector can verify if an approved type of shower or water temperature control valve is installed downstream of the water heater to protect bathers in older installations so that they are not relying only on the water heater thermostat. This language helps the inspector to verify that the proper safety devices such as an ASSE 1017 master mixing valve, or an ASSE 1070 (point-of-use) local mixing valve or an ASSE 1016 shower or tub/shower valve or an ASSE 1069 gang shower valve is installed downstream of the water heater to protect the bather from scalding or thermal shock hazards.

Cost Impact: There is no additional cost to construction associated with this code change. This change is simply adding clarification and correlation between other sections of the code.

P77-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

501.8-P-GEORGE

P78 – 12
502.6 (New)

Proponent: Tom Allen, City of Mt. Dora, FL, representing self

Add new text as follows:

502.6 Water heater instructions. Water heaters shall be installed in accordance with the manufacturer's instructions. Such instructions shall be available on the job site at the time of inspection.

Reason: Allows for installation per the manufacturer's requirements and requires the instructions to be on site for inspection.

Cost Impact: There is no cost impact.

P78-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

502.6 (NEW)-P-ALLEN

P79 – 12
504.4

Proponent: Dana Bres, P.E./U.S. Department of Housing and Urban Development/U.S. Department of Housing and Urban Development (dana.b.bres@hud.gov)

Revise as follows:

504.4 Relief valve. Storage water heaters operating above atmospheric pressure shall be provided with an approved, self-closing (levered) pressure relief valve and temperature relief valve or combination thereof. The relief valve shall conform to ANSI Z21.22. The relief valve shall not be used as a means of controlling thermal expansion. <u>Tankless water heaters shall not be required to be provided with a pressure relief valve or a temperature relief valve except where such valves are required by the tankless water heater listing or the tankless water heater manufacturer's instructions.</u>

Reason: The discussion of temperature and pressure relief valves for tankless water heaters is vague. The current language in IPC 504.4 is silent on tankless water heaters, which can lead to confusion. For electric tankless water heaters, UL 499 (Sec 28.11) indicates a requirement when the vessel diameter is more than 3.0 inches. Tankless water heaters have little stored volume and the burner or heating element operates only when water is being consumed. The proposed change would clarify the code requirements for installation of tankless water heaters. Similar changes will be proposed to section P2803 of the IRC in the next cycle. This change would help harmonize the two codes and would clarify the current code language regarding installation of tankless water heaters. These changes would facilitate the acceptance of an appliance that provides energy and space savings in a home.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

504.4-P-BRES

P80 – 12
504.6

Proponent: Roger Harper, Jr, Louisa County VA Representing, the Virginia Plumbing and Mechanical Inspectors Association and The Virginia Building Code Officials Association and ICC Region 7 (sharper@louisa.org)

Revise as follows:

504.6 Requirements for discharge piping. The discharge piping serving a pressure relief valve, temperature relief valve or combination thereof shall:

(Items 1-9 remain unchanged)

10. ~~Not~~ terminate not more than 6 inches (152 mm) above and not less than two times the discharge pipe diameter above the floor or waste receptor flood level rim.

Reason: A minimum distance is not stated. Typically, the minimum air gap would be two nominal pipe diameters as stated in Section 802.2.1 for indirect wastes pipe.

Cost Impact: None

P80-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

504.6-P-HARPER

P81 – 12
504.6

Proponent: Bob Scott, Kye Lehr and Dennis Gardner, Colorado Department of Regulatory Agencies, Division of Registrations Electrical and Plumbing Boards

Revise as follows:

504.6 Requirements for discharge piping. The discharge piping serving a pressure relief valve, Temperature relief valve or combination thereof shall:

1. Not be directly connected to the drainage system.
2. Discharge through an air gap located in the same room as the water heater.
3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the air gap.
4 Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor, to the pan serving the water heater or storage tank, to a waste receptor or to the outdoors.
6. Discharge to the floor, ~~to the pan serving the heater or storage tank,~~ to a waste receptor or to the outdoors.
7. Discharge to a termination point that is readily observable by the building occupants.
8. Not be trapped.
9. Be installed so as to flow by gravity.
10. Not terminate more than 6 inches (152 mm) above the floor or waste receptor.
11. Not have a threaded connection at the end of such piping.
12. Not have valves or tee fittings.
13. Be constructed of those materials listed in Section 605.4 or materials tested, rated and approved for such use in accordance with ASME A112.4.1.

Reason: We all know what the commentary states is true that the relief valve discharges are in small amounts or continuous trickles of water or all out blowouts and with the latter the pan will not handle it anyway. The pan drain will allow the pan to retain from ½"to ¾" of water leaving the water heater to set in a pool of water until the problem is found by the owner. Most owners are not mechanically inclined and will not look at the water heater until it fails leaving the legs or the bottom of an electric water heater to rust to an unsafe condition thus creating another problem either with the electric, gas or flue piping connection. All of which could produce disastrous consequences. Pans were brought in because of the concerns for structural damage which I feel is justified, we are trading one problem for others and we need to solve all. Our jobs are to protect the home owners not make the job easier for the installers.

Cost Impact: None-the pan must already go to an approved place of disposal that drain can serve both the pan and the P&T valve by many methods.

P81-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

504.6-P-SCOTT-LEHR-GARDNER

P82 – 12
504.6

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

504.6 Requirements for discharge piping. The discharge piping serving a pressure relief valve, temperature relief valve or combination thereof shall:

(Items 1 through 13 remain unchanged)

14. <u>Be one nominal size larger than the size of the relief valve outlet, where the relief valve discharge piping is constructed of PEX or PE-RT tubing. The outlet end of such tubing shall be fastened in place.</u>

Reason: PEX and PE-RT tubing use insert fittings for connections. The bore size for a ¾ inch male adapter fitting is small such that there is concern that the discharge from a T & P valve could be restricted. The proposed language requires that PEX and PE-RT tubing used for relief valve discharge piping be one size larger so that the insert fitting has a larger bore which would not restrict flow.

PEX and PE-RT tubing is somewhat flexible and where supplied from a coil, the tubing has a memory to stay in a coil shape. This flexibility and memory to a coil shape can cause the discharge end of the tubing to be displaced from its required or intended position. To prevent displacement, new language is being added to require that the outlet end of the tubing be fastened in place.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P82-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

504.6-P-STRAUSBAUGH.PMGCAC

P83 – 12
504.7

Proponent: Ron George, CPD, Plumb-Tech Design & Consulting Services LLC, representing himself (Ron@Plumb-TechLLC.com)

Revise as follows:

504.7 Required pan. Where a ~~storage tank-type~~ water heater or a hot water storage tank is installed in a location where water leakage from the water heater or tank will cause damage, the water heater or tank shall be installed in a galvanized steel pan having a material thickness of not less than 0.0236 inch (0.6010mm) (No. 24 gage), or other pans approved for such use.

> **Exception:** A drain pan shall not be required for a tankless water heater installed in an exposed location under a wall hung fixture where the floor material under the water heater is waterproof, there is a floor drain nearby and the water heater is in a readily observable location under the fixture.

Reason: During the last code cycle a code change was submitted to change the wording to this section to so that only require tank type water heaters would require drain pans. There was testimony from people wanting to eliminate drain pans under tankless water heaters with statements that tankless heaters don't have tanks and there is only a few ounces of water in the heat exchange therefore they do not need drain pans because not much water is stored in them so the potential for leaks was not there. This code change is to correct that loophole that will allow water damage from tankless heaters. Tankless water heaters work under significant thermal stresses and are subject to failures and leaks at a rate equivalent to or greater than tank type heaters. When tankless water heaters leak, they are connected to the entire municipal water system, so the volume of water in the heater is irrelevant. Small leaks can cause significant water damage. Tankless heaters can leak hundreds or thousands of gallons and cause significant structural damage to building materials that are subject to water damage. I realize some installations can be installed under a lavatory or wall hung sink in a restroom with tile or other water resistant flooring materials and a floor drain so the potential for damage is less as long as they are located in an areas where a leak would be readily observable, the flooring is water resistant and a drain is located in the same room. I proposed the above code change to address the need for a drain pan under all water heaters located in concealed locations where water leaks can cause structural damage. I have witnessed several plastic and fiberglass bodied electric tankless water heaters fail over the years. When many of them failed, they leaked and caused significant structural and property damage. A quick search of the internet yielded several examples of tankless water heater failures. I do not know the person in this video and I have no problems with the manufacturer in the video. This video simply demonstrates that tankless heaters can cause as much or more water damage than a tank type heater. Tankless heaters are often manufactured from plastic or other polymer materials that can fail catastrophically. The attached link shows a video of one of these tankless heater failures that leaked and caused significant structural damage to hardwood floors and other water damage on the floors below.
http://www.youtube.com/watch?v=BgU-rjh2LXE,

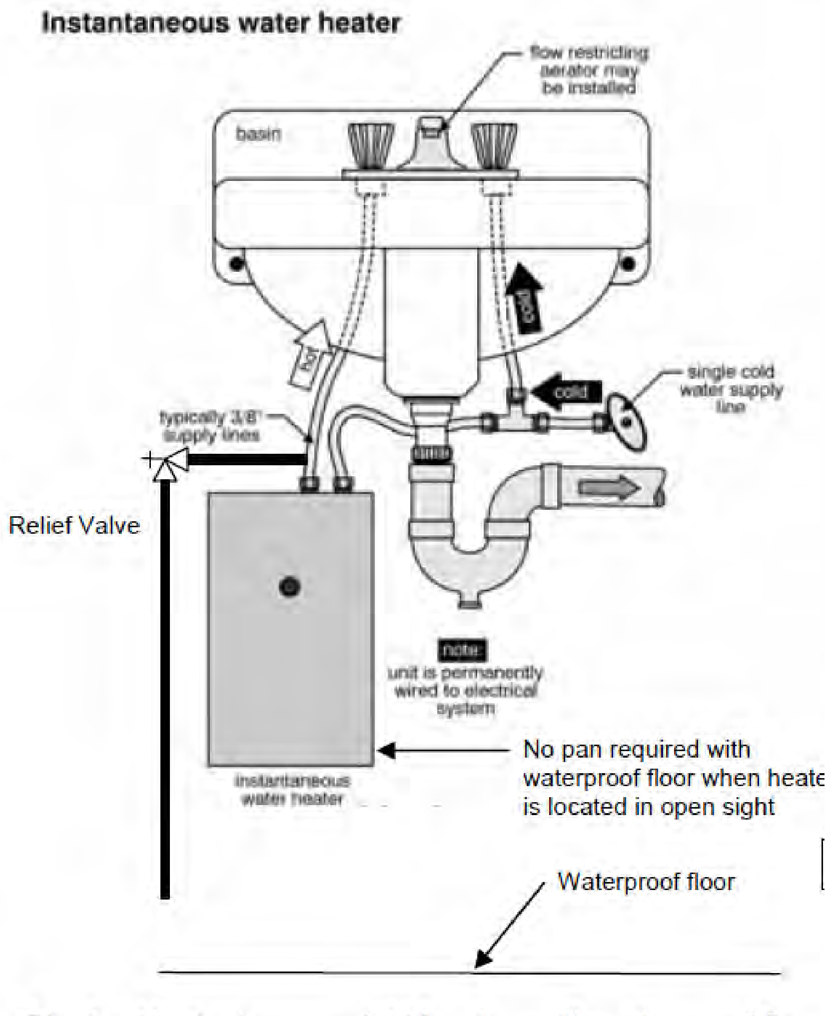

Fig. 1 – Heater in open sight location with water proof floor

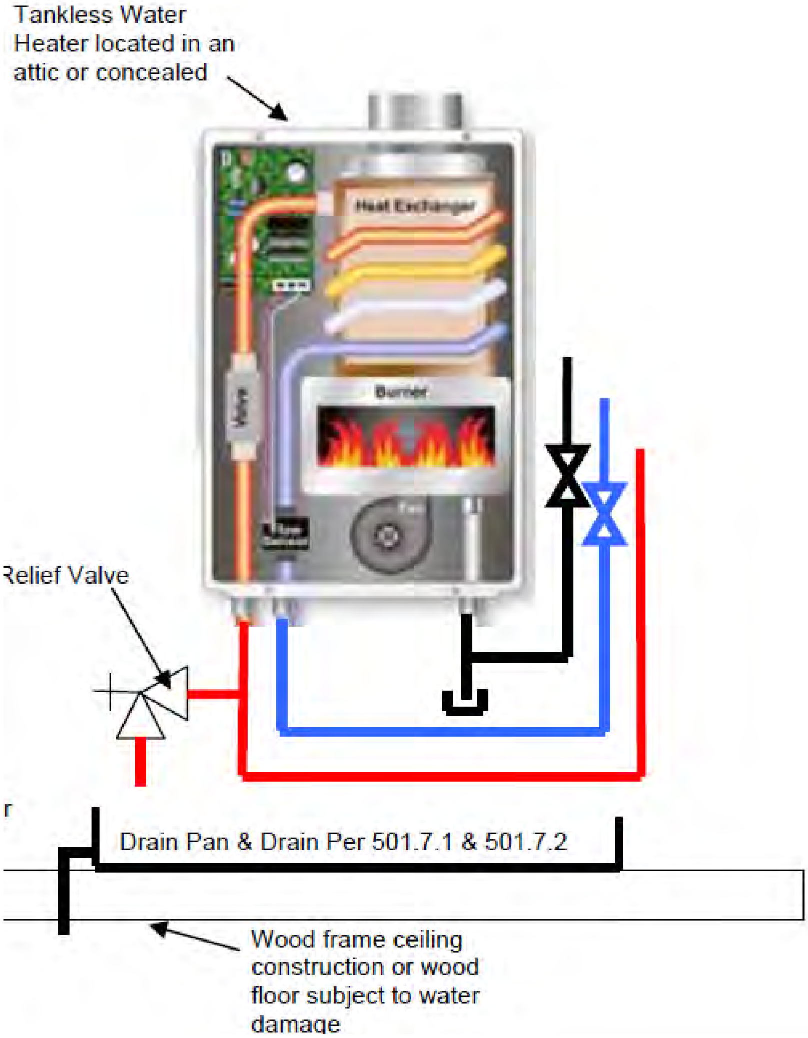

Fig. 2 – Heater located in concealed location with construction subject to water damage

Cost Impact: The code change proposal will not increase the cost of construction when there is a construction material or flooring that will not be damaged by water and exposed tankless heater are located under a lavatory. Pans were required for all water heaters prior to the previous code
cycle code change. The requirement to only require drain pans under tank type heaters appears to be an effort to make the more expensive tankless heaters more affordable and increasing the risk of damage to building materials and contents. Calculations show that when you factor in the purchase price and life expectancy, of tankless heaters versus newer high efficient storage type heaters and the increased in size of the energy service and installation costs tankless heaters do not save money over the life of the heater.

P83-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

504.7-P-GEORGE

P84 – 12
504.7

Proponent: Tom Allen, City of Mount Dora, FL, representing self

Revise as follows:

504.7 Required pan. Where a storage tank-type water heater or a hot water storage tank is installed <u>above the ground floor space, in attics, in areas above ceilings or within the habitable space</u> ~~in a location where water leakage from the tank will cause damage,~~ the tank shall be installed in a galvanized steel pan <u>or other metal pan of equal corrosion resistance</u> having a material thickness of not less than 0.0236 inch (0.6010mm) (No. 24 gage), or other pans approved for such use. <u>Electric water heaters shall be installed in a metal pan as herein required or in a pan of high-impact material having a thickness of not less than 0.0625 inch (1.59 mm).</u>

Reason: Clarifies pan locations "in a location where water leakage form the tank will cause damage" is too subjective. Allows for other metal pans and for plastic pans for electric water heaters.

Cost Impact: There is no cost impact.

P84-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

504.7-P-ALLEN

P85 – 12
504.7, 504.7.1

Proponent: Jim Whitehead, IPS Corporation

Revise as follows:

504.7 Required pan. Where a storage tank-type water heater or a hot water storage tank is installed in a location where water leakage from the tank will cause damage, the tank shall be installed in a pan. Pans shall be constructed of galvanized steel ~~pan~~ having a material thickness of not less than 0.0236 inch (0.6010mm) (No. 24 gage), aluminum having a material thickness of not less than 0.030 inch (0.762 mm), plastic having a material thickness on the bottom of the pan of not less than 0.036 inch or other ~~pans~~ approved materials ~~for such use~~.

504.7.1 Pan size and drain. The pan shall be not less than 1½ inches (38 mm) in depth and shall be ~~of sufficient size and shape to receive all dripping or condensate from the tank or water heater.~~ not less than 2 inches (51 mm) larger in width or diameter than the diameter of the water heater or tank. The pan shall be drained by an indirect waste pipe having a diameter of not less than 3/4 inch (19 mm). Piping for safety pan drains shall be of those materials listed in Table 605.4.

Reason: Inspectors call our company often to determine if a water heater pan made of anything other than galvanized steel (24 gage) is acceptable and how is it deemed acceptable. Clarifying the standard to include the common materials used will be helpful to inspectors in the field.

Cost Impact:

P85-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

504.7-P-WHITEHEAD

P86 – 12
504.7.2

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

504.7.2 Pan drain termination. The pan drain shall extend full-size and terminate over a suitably located indirect waste receptor or floor drain or extend to the exterior of the building and terminate not less than 6 inches (152 mm) and not more than 24 inches (610 mm) above the adjacent ground surface. <u>Where a pan drain was not previously installed, a pan drain shall not be required for a replacement water heater installation.</u>

Reason: Consider a water heater installation where the code did not require the original installation to have a drain for the T&P valve or a drain for a drip pan or such drain was required, but never installed. Upon replacement of the water heater, under the current code, a drain is required. Should a drain be installed regardless of the difficulty or cost?

The replacement of an existing water heater must be installed to the current code as if it was a new installation. If the original water heater installation did not require a pan, then in many cases, there is not a suitable disposal point for a pan drain. However, if the installation requires a pan, the current code requires that the pan have a pan drain. Many times, there is not a way to provide for a suitable disposal point for the pan drain. For example, consider a slab-on-grade building where the water heater is located in the center of the building where there is not a floor drain or waste receptor. When that water heater is replaced, the current code requires that the water heater have a pan and that the pan have a pan drain (that runs to a suitable disposal point). How is this to be accomplished in this existing building? There is not always a practical solution. Therefore, the proposed language provides an exception for replacement water heaters to not be required to have a pan drain, if the installation requires a pan. The code would still require the pan, but not the pan drain. A pan with no drain is better than no pan at all.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

504.7.2-P-STRAUSBAUGH.PMGCAC

P87 – 12
601.5 (New), Chapter 14

Proponent: Sidney L. Cavanaugh, Cavanaugh Consulting representing CuraFlo (sidneycavanaugh@yahoo.com)

Add new text as follows:

601.5 Rehabilitation of piping systems. Where pressure piping systems are rehabilitated using an epoxy lining system, such lining system shall comply with ASTM F 2831.

Add new standard to Chapter 14 as follows:

ASTM

F 2831-11	Standard Practice for Internal Non Structural Epoxy Barrier Coating Material Used In Rehabilitation of Metallic Pressurized Piping Systems

Reason: These systems are being used everyday across North America when systems need to be replaced or repaired when they do not meet minimum pressures and flow rates. It is important that they these epoxy lining systems meet a national consensus standard to assure proper installation and use.

Cost Impact: no additional cost when considering the replacement cost.

Analysis: A review of the standard proposed for inclusion in the code, ASTM F 2831-11 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P87-12

	Assembly:	ASF	AMF	DF

601.5 (NEW)-P-CAVANAUGH

P88 – 12
603.2

Proponent: Shawn Strausbaugh, Arlington County VA Representing, the Virginia Plumbing and Mechanical Inspectors Association and The Virginia Building Code Officials Association and ICC Region 7

Delete and substitute as follows:

~~**603.2 Separation of water service and building sewer.** Water service pipe and the building sewer shall be separated by not less than 5 feet of undisturbed or compacted earth.~~

~~**Exceptions:**~~

1. ~~The required separation distance shall not apply where the bottom of the water service pipe within 5 feet of the sewer is not less than 12 inches above the top of the highest point of the sewer and the pipe materials conform to Table 702.3.~~
2. ~~Water service pipe is permitted to be located in the same trench with the building sewer, provided such sewer is constructed of materials listed in Table 702.2.~~
3. ~~The required separation distance shall not apply where a water service pipe crosses a sewer pipe, provided the water service is sleeved to a point not less than 5 feet horizontally from the sewer pipe centerline on both sides of such crossing with pipe materials listed in Table 605.3, 702.2 or 702.3.~~

603.2 Separation of water service and building sewer. Where water service piping is located in the same trench with the building sewer, such sewer shall be constructed of materials listed in Table 702.2. Where the building sewer piping is not constructed of materials listed in Table 702.2, the water service pipe and the building sewer shall be horizontally separated by not less than 5 feet (1524 mm) of undisturbed or compacted earth. The required separation distance shall not apply where a water service pipe crosses a sewer pipe, provided the water service is sleeved to a point not less than 5 feet (1524 mm) horizontally from the sewer pipe centerline on both sides of such crossing. The sleeve shall be of pipe materials listed in Table 605.3, 702.2 or 702.3. The required separation distance shall not apply where the bottom of the water service pipe located within 5 feet (1524 mm) of the sewer is not less than 12 inches (305 mm) above the highest point of the top of the building sewer.

Reason: This proposal is consistent with IRC Section 2905.4.2. Exception item number 2 of the existing text is the most common method utilized for sewer and water service installations across the country. Therefore it should not be the exception but rather the rule. The other provisions, items 1 and 2 in the proposal, have not been changed but simply reformatted into a more user friendly format.

Cost Impact: None

604.2

Proponent: Gary Klein, Affiliated International Management, LLC, representing self (gary@aim4sustainability.com)

Revise as follows:

604.2 System interconnection. At the points of interconnection between the hot and cold water supply piping systems and the individual fixtures, appliances or devices, provision shall be made to prevent flow between such piping systems.

> <u>**Exception:** Hot or tempered water recirculation systems that pump water from a hot or tempered water pipe through a cold water pipe back to the hot water source shall be permitted provided that the system complies with all of the following:</u>
>
> 1. <u>The system is demand activated by a switch operated by the user of the fixture, a motion sensor triggered by the presence of the user of the fixture, a flow switch activated by the flow of hot water at a fixture or a door switch activated by the door to the room containing hot water-supplied fixtures. a fixture, a door switch activated by the door to the room containing hot water-supplied fixtures or a voice activated command.</u>
> 2. <u>After the pump starts, the controls shall allow the pump to operate until the water temperature in the return pipe rises not more than 10ºF (5.6 ºC) above the initial temperature of the water in the pipe. The controls shall not allow the pump to operate when the temperature in the pipe exceeds 102ºF (38.9 ºC). Controls shall limit pump operation to not more than 5 minutes for each activation in the event that both means of shutting off the pump have failed.</u>
> 3. <u>The manufacturer of the controls for the recirculation pump provides installation and operation instructions that provide details of the operation of the controls and such instructions are available at the jobsite for inspection by the code official.</u>

Reason: As I understand it, the intent of IPC Section 604.2 is to prevent interconnections between the hot and cold piping systems so that hot water is not drawn <u>unintentionally</u> into the cold-water piping and vice-versa. The two most obvious issues with such <u>unintentional</u> interconnections is that 1) hot water could flow from a cold water faucet which might cause a potential for scalding and 2) hot water might be prevented from ever reaching certain fixtures.

The reason for the proposed exception is to resolve the question of whether or not a "no return pipe" hot water recirculation system violates the intent of this code section.

Typical "no return pipe" hot water recirculation systems utilize a pump in the hot water line to cause flow of water from the hot water piping through a special valve and into the cold water piping near a fixture that is most remote from the water heater. Some systems have the pump operating continuously or on timer to run continuously during certain time periods of the day. Even though the pump might be running continuously or semi-continuously, the special valve controls the flow of water in the hot water pipe to the cold water pipe. Other systems are demand controlled such that the user activates the pump operation only when hot water is intended to be used.

When the temperature sensing mechanism determines that the temperature of the water in the hot water piping is either rising quickly (demand controlled) or is approximately 105 degrees F (aquastat controlled), the valve automatically closes to stop flow so that the cold water line is not continuously being filled with hot water. The valve also prevents the flow of hot water to the cold supply pipe while cold water is flowing from the faucet.

Regardless of the shut-off mechanism, the overall operation of "no return pipe" hot water systems is the same - a valve controls when flow is allowed to pass from the hot water piping to the cold-water piping.

In my opinion, even without the proposed revisions, these "no return pipe" hot water recirculation systems do not violate the intent of the code. Because the valve prevents water of a temperature greater than approximately 105 degrees F from being introduced into the cold-water piping, the potential for scalding is not an issue. The valve also prevents cold water from entering into the hot water piping so the issue of cold water replacing hot water in a water distribution system doesn't exist.

However, “no return pipe” hot water recirculation systems that use timers, aquastats or a combination of timers and aquastats to control the flow of hot water into the “temporary” cold-water return line can operate up to 24 hours a day, either intentionally or unintentionally; intentionally if the timer is set to allow the pump to run continuously. Unintentionally if the aquastat has been disconnected; or the valve is jammed open; or if the temperature drop between the water heater and the shut-off valve with aquastat is large enough to prevent the shut-off temperature from ever being reached. An example: the water heater is set at 125F, the aquastat is set to close the valve at 105F and the temperature drop between the water heater and the aquastat is 25F. This large temperature drop is possible when the pipes are installed in a vented crawl space or under a slab. The reason the pump was installed was to overcome a hot water delivery problem, which these applications almost certainly had! The problem is that with a 25F temperature drop, the temperature at the aquastat will never reach 105F (125-25 = 100F) and the valve will never close, allowing water to continually, and in some sense, unintentionally, pass into the cold-water line.

In contrast, demand controlled priming pumps shut off based on a temperature rise, rather than an absolute temperature. As an example, when the pump is activated, the controls determine the temperature of the water in the pipe, which is likely to be close to ambient room temperature or about 65-70F. The controls allow the pump to run until the temperature rises about 5F, and then shut off typically when the water temperature is between 70 and 75F. There are other safety mechanisms built into the controls that restrict operation to no more than 5 minutes or when the temperature rises to 105F. Since these pumps only operate on demand, when intentionally activated shortly before hot water is desired, they restrict the time hot water is flowing in the cold water piping to typically less than 20 minutes a day in residential occupancies served by their own water heater or boiler, and similarly small durations in other occupancies. In contrast, timer, aquastat and combination timer and aquastat controlled pumps typically operate 4-8 hours per day and often much longer, up to 24/7.

In addition to coming closest to meeting the intent of this section, which is to prevent unintentional flow between hot and cold water supply piping, demand controlled hot water priming pumps are significantly more energy efficient that the other options. The energy costs of operation are a combination of the heat losses in the piping and the electricity requirement of the pump: the heat losses dominate the energy costs. The energy costs of demand-controlled hot water priming pumps are at least 75 percent and typically 90 percent less than the alternatives.

It is for these reasons that I have proposed only allowing the exception for pumps that prime the hot or tempered water supply piping on demand.

I urge your support for this proposal. Thank you.

Cost Impact: The code change proposal will not increase the cost of construction.

No new requirements have been added, only a clarification of an existing section.

Table 604.3

Proponent: Edward R. Osann, Natural Resources Defense Council, representing self (eosann@nrdc.org); Harry Misuriello, American Council for an Energy-Efficient Economy, representing himself (misuriello@verizon.net)

Revise as follows:

TABLE 604.3
WATER DISTRIBUTION SYSTEM DESIGN CRITERIA REQUIRED CAPACITY AT FIXTURE SUPPLY PIPE OUTLETS

FIXTURE SUPPLY OUTLET SERVING	FLOW RATE[a] (gpm)	FLOW PRESSURE (psi)
Bathtub, balanced-pressure, thermostatic or combination balanced-pressure/ thermo-static mixing valve	4	20
Bidet, thermostatic mixing valve	2	20
Combination fixture	4	8
Dishwasher, residential	2.75	8
Drinking fountain	0.75	8
Laundry tray	4	8
Lavatory, private	~~2~~ 0.8	8
Lavatory, private, mixing valve	0.8	8
Lavatory, public	0.4	8
Shower	~~3~~ 2.5	8
Shower, balanced-pressure, thermostatic or combination balanced-pressure/ thermo-static mixing valve	~~3~~ 2.5[b]	20
Sillcock, hose bibb	5	8
Sink, residential	~~2.5~~ 1.75	8
Sink, service	3	8
Urinal, valve	12	25
Water closet, blow out, flushometer Valve	25	45
Water closet, flushometer tank	1.6	20
Water closet, siphonic, flushometer Valve	25	35
Water closet, tank, close coupled	3	20
Water closet, tank, one piece	6	20

For SI: 1 pound per square inch = 6.895 kPa,1 gallon per minute = 3.785 L/m.
a. For additional requirements for flow rates and quantities, see Section 604.4.
b. Where the shower mixing valve manufacturer indicates a lower flow rating for the mixing valve, the lower value shall be applied.

Reason: TABLE 604.3 WATER DISTRIBUTION SYSTEM DESIGN CRITERIA REQUIRED CAPACITY AT FIXTURE SUPPLY PIPE OUTLETS requires plumbing distribution system design to achieve flow rates of *at least* 3 gpm for showers, 2.5 gpm for sink faucets, and 2 gpm for lavatory faucets, all of which are excessive as minimum requirements. The *minimum* flow rate for a shower in this table is above the allowable *maximum* flow rate for a showerhead as specified by Table 604.4 of this code and by the nationwide standard that has been in effect for nearly 20 years. Similarly, the minimum flow rate for lavatories does not distinguish between public and private fixtures, and thus sets a minimum flow for public lavatories that is in excess of the maximum flow allowable under Table 604.4 of this code. And for residential sinks other than service sinks, the *minimum* flow rate is again set higher than the allowable *maximum* flow rate for a sink faucet as specified by Table 604.4. For applications at the low end of the acceptable range of water pressure, these excessive minimum flow values tend to encourage the oversizing of pipes leading to fixture outlets, leaving a larger volume of cooled hot water to purge before use, and thus exacerbating the problem of the energy and water lost while waiting for actual hot water to arrive at the fixture. In some installations, these excessive minimum values may require water pressure booster systems that might otherwise be unnecessary.

Under this proposal, public lavatories would be distinguished from private lavatories, single-handle mixing valves for private lavatories would be recognized, and the minimum flow rates for lavatory, residential sink, and shower supply pipes would be adjusted downward. Minimum flow rates for showers would be set at 2.5 gpm, or such lower flow rate as would match the manufacturer's minimum rated flow for the mixing valve to provide the level of thermal protection prescribed by the industry standard. The minimum flow rate for a residential sink, other than a service sink, would be set at 1.75 gpm, which is 80 percent of the value of the maximum flow rate allowed by this code under Table 604.4. The minimum flow rate for a public lavatory would be set at 0.4 gpm, 80 percent of the value of the maximum flow rate allowed by this code under Table 604.4. The minimum flow rate for a private lavatory would be set at 0.8 gpm, which is the minimum flow rate prescribed for private lavatory faucets by the US EPA's WaterSense specification (version 1.0, October 2007).

Cost Impact: This proposal will have the effect of reducing the diameter of pipe that is allowed to serve lavatories, sinks, and showers in some installations, and may also eliminate the need for water pressure booster systems in some applications. This code change proposal will not increase the cost of construction.

P90-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T604.3-P-OSANN

P91 – 12
Table 604.4

Proponent: Edward R. Osann, Natural Resources Defense Council, representing self (eosann@ndrc.org); Harry Misuriello, American Council for an Energy-Efficient Economy, representing himself (misuriello@verizon.net)

Revise as follows:

TABLE 604.4
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY[b]
Lavatory, private	~~2.2~~ 1.5 gpm at 60 psi
Lavatory, public (metering)	0.25 gallon per metering cycle
Lavatory, public (other than metering)	0.5 gpm at 60 psi
Shower head[a]	~~2.5~~ 2.0 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Urinal	~~1.0~~ 0.5 gallon per flushing cycle
Water closet	~~1.6~~ 1.3 gallons per flushing cycle[c]

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m,1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray is a shower head.
b. Consumption tolerances shall be determined from referenced standards.
c. The effective flush volume for a dual-flush water closet is defined as the composite, average flush volume of two reduced flushes and one full flush.

Reason: The maximum flow rates and water consumption levels in the current Table 604.4 for water closets, urinals, shower heads, and lavatory faucets equate to nationwide standards enacted nearly 20 years ago. In December, 2010, the US Department of Energy determined that states were no longer preempted from adopting more stringent efficiency standards for these products. (*Federal Register*, Vol. 75, No. 245, December 22, 2010, p. 80289; this document is attached).

Today, fixtures and fittings that perform well at flush volumes and flow rates lower than the values currently shown in Table 604.4 are widely available. Since 2006, the establishment of the WaterSense voluntary labeling program for water efficient products and services by the Environmental Protection Agency has provided a framework for the recognition of products that are substantially more efficient than minimum federal requirements while maintaining full functionality and customer satisfaction. WaterSense criteria were established for tank-type toilets (1.28 gpf) in 2007; lavatory faucets (1.5 gpm @ 60 psi) in 2007; urinals (0.5 gpf) in 2009; and showerheads (2.0 gpm @ 80 psi) in 2010. Manufacturers have responded by bringing large numbers of models to market that meet or exceed WaterSense specifications. Based on the most recent reports by WaterSense partners, the following figures regarding the number of WaterSense labeled models available as of October 2011 indicate the widespread availability and commercial viability of plumbing products that are more efficient than the federal minimum standards shown in Table 604.4:

- Tank-type water closets 886 models from 60 brands
- Lavatory faucets and accessories 809 models from 86 brands
- Urinals
  - 47 models of fixtures from 9 brands
  - 41 models of valves from 4 brands
- Showerheads 402 models from 28 brands

With the pace of introduction of new models that meet WaterSense specifications, it is reasonable to expect that these figures will be substantially larger by 2015.

Improving the water efficiency of water closets, urinals, shower heads, and lavatory faucets in new construction will save building owners money and reduce the likelihood of municipal water and wastewater capacity constraints that can lead to moratoria on new connections.

NRDC estimates that nationwide adoption of the revised values in this proposal, effective 2016, can be expected to save:

- 243.1 million gallons of water per day by 2030;
- More than 2.8 billion kilowatt hours per year by 2030;
- More than 178 hundred million therms of natural gas per year by 2030; and
- Consumers will realize more than $2.18 billion dollars in reduced energy and water costs.

Cost Impact: While the costs of plumbing fixtures and fittings vary greatly due to style, trim, colors, and materials, the incremental cost of greater efficiency alone for products meeting the flush volumes and flow rates contained in this proposal is negligible. This code change proposal will not increase the cost of construction.

P91-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T604.4-P-OSANN

P92 – 12
604.5

Proponent: Gary Klein, Affiliated International Management, LLC, representing self (gary@aim4sustainability.com)

Revise as follows:

604.5 Size of fixture supply. The minimum size of a fixture supply pipe shall be as shown in Table 604.5.The fixture supply pipe shall terminate not more than 30 inches (762 mm) from the point of connection to the fixture. A reduced size flexible water connector installed between the supply pipe and the fixture shall be of an *approved* type. The supply pipe shall extend to the floor or wall adjacent to the fixture. The minimum size of individual distribution lines utilized in gridded or parallel water distribution systems shall be as shown in Table 604.5.

Exceptions:

1. Where the developed length of a fixture supply pipe is 50 feet (15 240 mm) or less and the maximum fixture flow rate does not exceed 0.5 gpm (1.9 lpm), the minimum size of fixture supply pipe shall be 1/4 inch (6.4 mm).
2. Where the developed length of a fixture supply pipe is 50 feet (15 240 mm) or less and the maximum fixture flow rate does not exceed 1 gpm (3.8 lpm), the minimum size of fixture supply pipe shall be 5/16 inch (8 mm).
3. Where the developed length of a fixture supply pipe is 50 feet (15 240 mm) or less and the maximum fixture flow rate does not exceed 1.5 gpm (5.7 lpm), the minimum size of fixture supply pipe shall be 3/8 inch (9.5 mm).

Reason: The 2012 IGCC approved GEW 327 that contained a footnote to a table limiting the flow rate of hot or tempered water in small diameter piping (1/4, 5/16 and 3/8 inch) to 0.5, 1, and 1.5 gpm respectively. Putting a requirement in a footnote is not the best code language. The table also limited the length of these pipe diameters to 50 feet, or 50 feet of developed length, whichever is less (within the context of the 2012 IPC).

This proposal takes the requirement out of the footnote of a table and makes the flow rate and developed length requirements applicable to hot, tempered or cold-water distribution lines.

Why limit the maximum fixture flow rate when 1/4, 5/16 and 3/8 inch diameter piping is being used? The answer is that the flow rates were selected, using the Hazen-Williams formulas, to keep the velocity below 5 feet per second, which minimizes pressure drop, reduces noise and limits the rate of any internal corrosion. The same formulas were used to limit the pressure drop at these flow rates to not more than 5 psi in the 50 foot lengths of 1/4, 5/16 and 3/8 inch diameter piping.

Why limit the length of the small diameter tubing to 50 feet of developed length? The answer is that this restriction is necessary to correlate with the changes to Section 607.2 of the IPC that limited the distance between the source of hot or tempered water and the fixtures to no more than 50 feet of developed length. While this is particularly important in hot water supply piping, it is also a very reasonable restriction for cold water supply piping used for low flow rate fixtures. Pressure loss at lengths greater than 50 feet would be excessive and unacceptable, as would heat loss in the hot or tempered water supply piping. In addition, for the low flow rate fixtures used with the small diameter piping, limiting length to 50 feet reduces the time-to-tap and the amount of water wasted while waiting for hot or tempered water to arrive, thereby improving performance for the user as well as water and energy waste.

I urge your support for this proposal. Thank you.

Cost Impact: The code change proposal will not increase the cost of construction. In fact, if the smaller diameter piping becomes commonly used, it might decrease the costs of construction.

P92-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

604.5-P-KLEIN

P93 – 12
Table 604.5

Proponent: Gary Klein, Affiliated International Management, LLC, representing self (gary@aim4sustainability.com)

Revise as follows:

TABLE 604.5
MINIMUM SIZES OF FIXTURE WATER SUPPLY PIPES

FIXTURE SUPPLY OUTLET SERVING	FLOW RATE[a] (gpm)	FLOW PRESSURE (psi)

a. Where the developed length of the distribution line is ~~60~~ 50 feet or less, and the available pressure at the meter is 35 psi or greater, the minimum size of an individual distribution line supplied from a manifold and installed as part of a parallel water distribution system shall be one nominal tube size smaller than the sizes indicated.

(Portions of table not shown remain unchanged.)

Reason: Section 607.2 of the 2012 IPC limits the developed length of hot or tempered water supply piping to 50 feet.

The change recommended in this proposal correlates Table 604 with Section 607.2. It will apply to cold water as well as to hot or tempered water, which quite frankly is fine from the perspective of minimizing pressure drop and maintaining acceptable performance at the fixtures.

I urge your support for this proposal. Thank you.

Cost Impact: The code change proposal will not increase the cost of construction. In fact, if the smaller diameter piping becomes commonly used, it might decrease the costs of construction.

Table 605.3, Table 605.4, 605.17 (New)

Proponent: David W. Ash, Lubrizol Advanced Materials, Inc.

Revise as follows:

TABLE 605.3
WATER SERVICE PIPE

Chlorinated polyvinyl chloride/aluminum/ chlorinated polyvinyl chloride (CPVC/AL/CPVC)	ASTM F2855

(Portions of table not shown remain unchanged)

TABLE 605.4
WATER DISTRIBUTION PIPE

Chlorinated polyvinyl chloride/aluminum/ chlorinated polyvinyl chloride (CPVC/AL/CPVC) pipe and tubing	ASTM F2855

(Portions of table not shown remain unchanged)

605.17 Chlorinated polyvinyl chloride/aluminum/ chlorinated polyvinyl chloride (CPVC/AL/CPVC) pipe and tubing. Joints between CPVC/AL/CPVC plastic pipe or CPVC fittings shall comply with Sections 605.17.1 and 605.17.2.

605.17.1 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer's instructions.

605.17.2 Solvent cementing. Joint surfaces shall be clean and free from moisture, and an *approved* primer shall be applied. Solvent cement, orange in color and conforming to ASTM F 493, shall be applied to joint surfaces. The joint shall be made while the cement is wet, and in accordance with ASTM D 2846 or ASTM F 493. Solvent cement joints shall be permitted above or below ground.

Exception: A primer is not required where all of the following conditions apply:

1. The solvent cement used is third-party certified as conforming to ASTM F 493.
2. The solvent cement used is yellow in color.
3. The solvent cement is used only for joining ½ inch (12.7 mm) through 2 inch (51 mm) diameter
   CPVC/AL/CPVC pipe and CPVC fittings.
4. The CPVC fittings are manufactured in accordance with ASTM D 2846.

Add new standard to Chapter 14 as follows:

ASTM
F2855-11 Specification for Poly(Vinyl Chloride)/Aluminum/Poly(Vinyl Chloride) (CPVC/AL/CPVC) Composite Pressure Tubing

Reason: CPVC/AL/CPVC pipe has been developed that is suitable for use as potable water piping, both as water service pipe and water distribution pipe. This product has been successfully used successfully on a limited basis since 2007 based on NSF standard 61 and a special engineering standard (SE) from NSF International. Including this product in the IPC will recognize another plumbing pipe option for installers.

Cost Impact: None

Analysis: A review of the standard proposed for inclusion in the code, ASTM F 2855-11 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

MATERIAL	STANDARD
Fittings for polyethylene of raised temperature (PE-RT) plastic tubing	ASTM F 1807; ASTM F 2098; ASTM F 2159; ASTM F 2735; <u>ASTM F2769</u>

Reason: I am adding standard ASTM F2769 (already in the code) to the pipe fittings table because the standard includes fittings for PE-RT tubing. This standard should have added to this table during the last cycle when the standard was first introduced into the code for Tables 605.3 and 605.4.

Cost Impact: The proposed change will not increase the cost of construction

P100-12

	Assembly:	ASF	AMF	DF

T605.5 #2-P-GILL

P101 – 12
Table 605.5, Chapter 14

Proponent: Kevin Simko, Victaulic representing Victaulic (ksimko@victaulic.com)

Revise as follows:

TABLE 605.5
PIPE FITTINGS

MATERIALS	STANDARDS
Copper or copper alloy	ASME B16.15; ASME B16.18; ASME B16.22; ASME B16.23; ASME 16.26; ASME B16.29; ASTM B 75: ASTM B 152; ASTM B 584
Gray iron and ductile iron	AWWA C110/A21.10; AWWA C153/A21.53; ASTM A395; ASTM A 536; ASTM F 1476: ASTM F 1548
Stainless steel (Type 304/304L)	ASTM A 312; ASTM A 778; ASTM A 351; ASTM A403: ASTM A 743; ASTM A 744; ASTM A 890
Stainless steel (Type 316/316L)	ASTM A 312; ASTM A 778; ASTM A 351; ASTM A 403: ASTM A 743; ASTM A 744; ASTM A 890
Steel	ASME B16.9; ASME B16.11; ASME B16.28; ASTM A 53; ASTM A 106; ASTM A 234; ASTM A 395; ASTM A 536; ASTM F1476; ASTM F1548

(Portions of table not shown remain unchanged.)

Add new standards to Chapter 14 as follows:

ASTM

A106/A106M-11	Standard Specification for Seamless Carbon Steel Pipe for High-Temperature Service
A234/A234M-11a	Standard Specification for Piping Fittings of Wrought Carbon Steel and Alloy Steel for Moderate and High Temperature Service
A 351-10	Standard Specification for Castings, Austenitic, for Pressure-Containing Parts
A 395/A395M-99(2009)	Standard Specification for Ferritic Ductile Iron Pressure-Retaining Castings for Use at Elevated Temperatures
A 403-11	Standard Specification for Wrought Austenitic Stainless Steel Piping Fittings
A 536-84(2009)	Standard Specification for Ductile Iron Castings
A 743/A743M-06(2010)	Standard Specification for Castings, Iron-Chromium, Iron-Chromium-Nickel, Corrosion Resistant, for General Application
A 744/A744M-10e1	Standard Specification for Castings, Iron-Chromium-Nickel, Corrosion Resistant, for Severe Service
A 890/A890M-10	Standard Specification for Castings, Iron-Chromium-Nickel-Molybdenum Corrosion-Resistant, Duplex (Austenitic/Ferritic) for General Application
B 584-11	Standard Specification for Copper Alloy Sand Castings for General Applications
F 1476-07	Standard Specification for Performance of Gasketed Mechanical Couplings for Use in Piping Applications

F1548-01(2006) Standard Specification for the Performance of Fittings for Use with Gasketed Mechanical Couplings Used in Piping Applications

Reason: The materials currently listed in Table 605.5 do not fully represent the materials being used for potable water systems in the industry. The code is overly-restrictive with regard to pipe materials and does not allow for the use of materials that offer improved mechanical and electrochemical properties compared with allowed materials. The additions of the standard materials will allows the use of high grade materials that provide improved performance. ,amy of these materials are also currently used in the International Mechanical Code and other piping codes.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, ASTM A106/A106M-11, ASTM A234/A234M-11a, ASTM A 351-10, ASTM A 395/A 395M-99(2009), ASTM A 403-11, ASTM A536-84(2009), ASTM A536-84(2009), ASTM B584-11, ASTM A 743/A 743M-06(2010)m ASTM A 744/A 744M-10e1, ASTM A890/A890M-10, ASTM F 1476-07 and ASTM F 1548-01(2006), with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P101-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T605.5-P-SIMKO

P102 – 12
Table 605.5

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee (Sstrausbaugh@arlingtonva.us)

Revise as follows:

TABLE 605.5
PIPE FITTINGS

MATERIAL	STANDARD
Cast-iron	ASME B16.4~~; ASME B16.12~~

(Portions of table not shown remain unchanged)

Reason: ASME B16.12 is for threaded *drainage* fittings and is inappropriate in a water distribution pipe fitting table.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P103 – 12

605.14, 605.14.1, 605.14.2, 605.14.3, 605.14.4, 605.14.5, 605.14.6 (New), 605.14.7 (New), 605.14.8 (New), 605.15

Proponent: Pennie L. Feehan, Pennie L. Feehan Consulting representing The Copper Development Association (penniefeehan@me.com)

Revise as follows:

605.14 Copper pipe and tubing. Joints between copper or copper-alloy pipe, tubing, and ~~or~~ fittings shall comply with Sections 605.14.1 through 605.14.~~5~~8.

605.14.1 Brazed joints. Brazed joints between copper pipe or tubing and fittings shall be made with a brazing alloy having a liquid temperature exceeding 1000˚F (538˚C). ~~All~~ Joint surfaces to be brazed shall be cleaned bright by manual or mechanical means. The ends of pipe or tubing shall be cut square and shall be reamed to the full inside diameter. Burrs on the outside end of the pipe or tubing shall be removed. Where required by the brazing alloy manufacturer's instructions, an approved brazing flux shall be applied to the joint surfaces. The joint shall be brazed with a brazing filler metal conforming to AWS A5.8. Brazing filler metal shall be applied at the point where the pipe or tubing enters the socket of the fitting.

605.14.2 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer's instructions. Mechanical joints shall include compression type, flanged type, grooved type and press type.

605.14.3 Soldered joints. Solder joints between copper pipe or tubing and fittings shall be made in accordance with the methods of ASTM B 828 with the following sequence of joint preparation and operation: measuring and cutting, reaming, cleaning, fluxing, assembly and support, heating, applying the solder, cooling and cleaning. ~~All cut~~ The ends of pipe or tub~~e~~ing shall be cut square and shall be reamed to the full inside diameter of the pipe or tub~~e~~ing. ~~end.~~ Burrs on the outside end of the pipe or tubing shall be removed. ~~All~~ Joint surfaces to be soldered shall be cleaned bright by manual or mechanical means. ~~A~~ Flux conforming to ASTM B 813 shall be applied to the pipe or tubing and fittings. Such flux shall be noncorrosive and nontoxic after soldering. ~~be applied.~~ Pipe or tubing shall be inserted to the base of the fitting. Excess flux shall be removed from the exterior of the joint. The assembled joint shall be supported to create a uniform capillary space around the joint. An LP gas or acetylene air /fuel torch shall be used to apply heat to the assembled joint. The heat shall be applied with the flame perpendicular to the pipe or tubing. The flame shall be moved alternately between the fitting cup and the pipe or tubing. Solder in compliance with ASTM B 32 shall be applied to the joint surfaces until capillary action draws the molten solder into the cup of the fitting. ~~The joint shall be soldered with a solder conforming to ASTM B 32.~~ The soldered joint shall not be disturbed until cool. Remaining flux residue shall be cleaned from the exterior of the joint.

605.14.4 Threaded joints. Threads shall conform to ASME B1.20.1. Pipe-joint compound or tape shall be applied on the male threads only.

605.14.5 Welded joints. ~~All~~ Welded joint surfaces shall be cleaned. The joint shall be welded with ~~an~~ *approved* filler metal.

605.14.6 Flared joints. Flared joints for water pipe shall be made by a tool designed for that operation.

605.14.7 Push-Connect joints. Removable and non-removable push fit fittings for copper tubing or pipe shall comply with ASSE 1061. Push fit fittings for copper pipe or tubing shall have an *approved* elastomeric O-ring that seals the joint. The end of pipe or tubing shall be cut square, chamfered and reamed to full inside diameter. The pipe or tubing shall be fully inserted into the fitting and the pipe or tubing shall be marked at the shoulder of the fitting. The fitting alignment shall be checked against the mark on the pipe or tubing to verify that the pipe or tubing is fully inserted into the fitting and the gripping mechanism has engaged on the pipe or tube.

605.14.8 Pressed-Connect joints. Pressed fittings for copper pipe or tubing shall have an elastomeric O-ring that seals the joint. The pipe or tubing shall be fully inserted into the fitting, and the pipe or tubing shall be marked at the shoulder of the fitting. Pressed fittings for copper pipe or tubing shall have an *approved* elastomeric O-ring that forms the joint. The ends of pipe or tubing shall be cut square, chamfered and reamed to full inside diameter. The fitting alignment shall be checked against the mark on the pipe or tubing to verify that the pipe or tubing is fully inserted into the fitting. The joint shall be pressed using the tool recommended by the manufacturer of the press fitting.

~~**605.15 Copper tubing.** Joints between copper or copper alloy tubing or fittings shall comply with Sections 605.15.1 through 605.15.4.~~

~~**605.15.1 Brazed joints.** Joint surfaces shall be cleaned. An *approved* flux shall be applied where required. The joint shall be brazed with a filler metal conforming to AWS A5.8.~~

~~**605.15.2 Flared joints.** Flared joints for water pipe shall be made by a tool designed for that operation.~~

~~**605.15.3 Mechanical joints.** Mechanical joints shall be installed in accordance with the manufacturer's instructions.~~

~~**605.15.4 Soldered joints.** Solder joints shall be made in accordance with the methods of ASTM B 828. All cut tube ends shall be reamed to the full inside diameter of the tube end. All joint surfaces shall be cleaned. A flux conforming to ASTM B 813 shall be applied. The joint shall be soldered with a solder conforming to ASTM B 32. The joining of water supply piping shall be made with lead-free solders and fluxes. "Lead free" shall mean a chemical composition equal to or less than 0.2-percent lead.~~

(Renumber subsequent sections)

Reason: The above language combines pipe and tubing into one section and provides the joining methods of copper and copper alloys as referenced in Table 605.5. In addition, important language from the standards has been added to aid the end user.

Cost Impact: This code change will not increase the cost of construction.

P103-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.14-P-FEEHAN

P104 – 12

605.15, 605.15.4 (New)

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., representing self (JBEngineer@aol.com)

Revise as follows:

605.15 Copper tubing. Joints between copper or copper alloy tubing or fittings shall comply with Sections 605.15.1 through ~~605.15.4~~ 605.15.5.

605.15.1 Brazed joints. Joint surfaces shall be cleaned. An *approved* flux shall be applied where required. The joint shall be brazed with a filler metal conforming to AWS A5.8.

605.15.2 Flared joints. Flared joints for water pipe shall be made by a tool designed for that operation.

605.15.3 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer's instructions.

605.15.4 Press connect. Cut tube ends shall be reamed to the full inside diameter of the tube end. Joint surfaces shall be cleaned. The tube shall be fully inserted into the press connect fitting. Press connect joints shall be pressed with a tool certified by the manufacturer.

~~605.15.4~~ 605.15.5 Soldered joints. Solder joints shall be made in accordance with the methods of ASTM B 828. All cut tube ends shall be reamed to the full inside diameter of the tube end. All joint surfaces shall be cleaned. A flux conforming to ASTM B 813 shall be applied. The joint shall be soldered with a solder conforming to ASTM B 32. The joining of water supply piping shall be made with lead-free solders and fluxes. "Lead free" shall mean a chemical composition equal to or less than 0.2-percent lead.

Reason: This change coordinates with the change to add the press connect fitting standard to Table 605.5. The proposed new text identifies the method of joining copper tube by press connect. The tube must be cut square and reamed. The tool must be certified by the manufacturer to assure that the proper press connection is made.

Cost Impact: This change does not increase the cost of construction.

605.15-P-BALLANCO

P105 – 12

605.15.3 (New), Chapter 14

Proponent: Kevin Simko, Victaulic, representing Victaulic (ksimko@victaulic.com)

Add new text as follows:

605.15.3 Grooved and shouldered mechanical joints. Grooved and shouldered mechanical joints shall comply with ASTM F1476, shall be made with an *approved* elastomeric seal and shall be installed in accordance with the manufacturer's instructions. Such joints shall be permitted to be concealed.

Add new standard to Chapter 14 as follows:

ASTM

ASTM F1476-07	Specification for Performance of Gasketed Mechanical Couplings for Use in Piping Applications

Reason: The code as written contains no provision specifically identifying grooved and shoulder mechanical joints. These types of joints are acceptable within the International Mechanical Code with the same verbiage. These type sof joints are commonly used in steel, stainless steel, copper and PVC potable water systems when incorporating a gasket that meets the requirements of the NSF 61. Without this provision, the current code is not representative of current materials and methods.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASTM F1476-07 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P105-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.15.3 (NEW)-P-SIMKO

P106 – 12
605.15.5 (New)

Proponent: Robert Hall, SE Technical Manager, Viega, LLC, representing Viega LLC (Robert.hall@viega.com)

Add new text as follows:

605.15.5 Press Connect Joints. Press connect joints shall be installed in accordance with the manufacturer's instructions. Press-connect joints shall conform to one of the standards listed in Table 605.5

Reason: Need press connect fittings reference in Section 605.15 Copper tube.

Cost Impact: None

P106-11

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.15.5 (NEW)-P-HALL

P107 – 12
605.16.2

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., representing self (JBEngineer@aol.com)

Revise as follows:

605.16.2 Solvent cementing. Joint surfaces shall be clean and free from moisture~~,~~. Joints shall be made in accordance with the pipe manufacturer's installation instructions. Where such instructions require ~~and~~ that ~~an~~ ~~*approved*~~ primer be used, the primer shall be applied to the joint surfaces and a solvent cement, orange in color and conforming to ASTM F 493, shall be applied to the joint surfaces. Where such instructions allow for a one step solvent cement, yellow in color and conforming to ASTM F 493, to be used, the joint surfaces shall not require application of a primer before the solvent cement is applied. The joint shall be made while the cement is wet and in accordance with ASTM D 2846 or ASTM F 493. Solvent cemented joints shall be permitted above or below ground.

~~**Exception:** A primer is not required where all of the following conditions apply:~~

1. ~~The solvent cement used is third-party certified as conforming to ASTM F 493.~~
2. ~~The solvent cement used is yellow in color.~~
3. ~~The solvent cement is used only for joining ½ inch (12.7 mm) through 2 inch (51 mm) diameter CPVC pipe and fittings.~~
4. ~~The CPVC pipe and fittings are manufactured in accordance with ASTM D 2846.~~

Reason: This section is currently very convoluted. The requirements can be simplified by referencing the pipe manufacturer's installation instructions. The installation instructions are part of the listing which is required by the code. This will also recognize changes to the listing of the joining method, rather than requiring constant changing of this section.

The current requirements are incorrect since UL lists ASTM F442 for joining with one-step solvent cement. Furthermore, UL lists the joining for pipe up to 3 inch in diameter. Neither requirement is addressed in the current code text.

Cost Impact: This change does not increase the cost of construction.

P107-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.16.2-P-BALLANCO

P108 – 12
605.16.2

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., representing self (JBEngineer@aol.com)

Revise as follows:

605.16.2 Solvent cementing. Joint surfaces shall be clean and free from moisture, and an approved primer shall be applied. Solvent cement, orange in color and conforming to ASTM F 493, shall be applied to joint surfaces. The joint shall be made while the cement is wet, and in accordance with ASTM D 2846 or ASTM F 493. Solvent cement joints shall be permitted above or below ground.

Exception: A primer is not required where all of the following conditions apply:

1. The solvent cement used is third-party certified as conforming to ASTM F 493.
2. The solvent cement used is yellow or red in color.
3. The solvent cement is used only for joining ½ inch (12.7 mm) through 2 inch (51 mm) diameter
   CPVC pipe and fittings.
4. The CPVC pipe and fittings are manufactured in accordance with ASTM D 2846 or ASTM F442.

Reason: ASTM F442 CPVC is used in sprinkler systems, as well as, plumbing systems. With the use of multipurpose piping systems in one and two family dwellings and townhouses, it has become common to see both ASTM F442 and ASTM D2846 pipe being installed. UL has listed ASTM F442 pipe for joining with one step solvent cement. However, UL requires the solvent cement to be red in color. The yellow and red one step solvent cement are the same, other than the color. This will allow the use of a single color solvent cement when doing a multipurpose residential sprinkler installation.

Cost Impact: This change does not increase the cost of construction.

P108-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.16.2-P-BALLANCO

P109 – 12
605.18.3 (New), Chapter 14

Proponent: Kevin Simko, Victaulic representing Victaulic (ksimko@victaulic.com)

Add new text as follows:

605.18.3 Grooved and shouldered mechanical joints. Grooved and shouldered mechanical joints shall comply with ASTM F1476, shall be made with an *approved* elastomeric seal and shall be installed in accordance with the manufacturer's instructions. Such joints shall be permitted to be concealed.

Add new standard to Chapter 14 as follows:

ASTM

ASTM F1476-07	Specification for Performance of Gasketed Mechanical Couplings for Use in Piping Applications

Reason: The code as written contains no provision specifically identifying grooved and shoulder mechanical joints. These types of joints are acceptable within the International Mechanical Code with the same verbiage. These type sof joints are commonly used in steel, stainless steel, copper and PVC potable water systems when incorporating a gasket that meets the requirements of the NSF 61. Without this provision, the current code is not representative of current materials and methods.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASTM F 1476-07 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P109-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.18.3 (NEW)-P-SIMKO

P110 – 12
202, 605.2

Proponent: Jeremy Brown, NSF International (Jeremy@nsf.org)

Revise as follows:

LEAD-FREE PIPE AND FITTINGS. ~~Containing not more than 8.0 percent lead~~ Pipe and fittings where the wetted surfaces of such pipe and fittings have a weighted average lead content of 0.25 percent or less.

605.2 Lead content of water supply pipe and fittings. Pipe and pipe fittings, including valves and faucets, utilized in the water supply system and providing water for human consumption shall ~~have a maximum of 8% lead content~~ be lead-free.

Reason: Section 1417 of the Safe Drinking Water Act (42 U.S.C. 300g–6) was amended by Senate Bill.3874 of 2010 http://www.gpo.gov/fdsys/pkg/BILLS-111s3874enr/pdf/BILLS-111s3874enr.pdf This changes the definition of lead free in the Safe Drinking Water Act from not more than 8 percent lead to not more than a weighted average of 0,25 percent. The effective date of the SDWA revision is January 4, 2014. This proposal makes the corresponding adjustment to the definitions and code section.

Cost Impact: This will not increase the cost of construction.

P110-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.2-P-BROWN

P111 – 12
202, 605.2, 605.2.1 (New), 605.14.3, 605.15.4

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Delete the following definitions without substitution:

~~**LEAD-FREE PIPE AND FITTINGS.** Containing not more than 8.0-percent lead.~~

~~**LEAD-FREE SOLDER AND FLUX.** Containing not more than 0.2-percent lead.~~

Revise as follows:

605.2 Lead content of water supply pipe and fittings. <u>The wetted surfaces of</u> pipe and pipe fittings, including valves and faucets, utilized in the water supply system shall have ~~a maximum of 8 -percent~~ <u>not more than a weighted average of 0.25 percent lead.</u>

<u>**605.2.1 Calculation.** The weighted average lead content of pipe and pipe fitting, plumbing fittings, valves and faucets shall be calculated in accordance with this section: For the purposes of this section and Section 605.2, a wetted surface is defined as a surface that is in contact with the water that it contains. To determine the weighted percentage of lead of each wetted component, the percentage of lead in that component shall be multiplied by the ratio of the wetted surface area of that component to the total wetted surface area of the entire product. The weighted percentages of lead of each of the wetted components shall be added together and the sum of the weighted percentages shall constitute the weighted average lead content of the product. The lead content of the material used to produce wetted components shall be used to determine compliance with Section 605.2. For the lead content of materials that are provided as a range, the maximum content of the range shall be used.</u>

605.14.3 Soldered joints. Solder joints shall be made in accordance with the methods of ASTM B 828. Cut tube ends shall be reamed to the full inside diameter of the tube end. Joint surfaces shall be cleaned. A flux conforming to ASTM B 813 shall be applied. The joint shall be soldered with a solder conforming to ASTM B 32. The joining of water supply piping shall be made with ~~lead-free~~ solder and fluxes~~. "Lead free" shall mean a~~ <u>having a</u> chemical composition equal to or less than 0.2-percent lead.

605.15.4 Soldered joints. Solder joints shall be made in accordance with the methods of ASTM B 828. All cut tube ends shall be reamed to the full inside diameter of the tube end. All joint surfaces shall be cleaned. A flux conforming to ASTM B 813 shall be applied. The joint shall be soldered with a solder conforming to ASTM B 32. The joining of water supply piping shall be made with ~~lead-free~~ solders and fluxes~~. "Lead free" shall mean~~ <u>having</u> a chemical composition equal to or less than 0.2-percent lead.

Reason: The Safe Drinking Water Act (42 U.S.C. 300g–6) was amended by Senate Bill.3874 of 2010 http://www.gpo.gov/fdsys/pkg/BILLS-111s3874enr/pdf/BILLS-111s3874enr.pdf This amendment changes the definition of lead free in the Safe Drinking Water Act from not more than 8 percent lead to not more than a weighted average of 0.25 percent for wetted surfaces. The effective date of the SDWA revision is January 4, 2014. Accepting this change will align the IPC with Federal requirements.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P111-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.2-P-STRAUSBAUGH.PMGCAC

P112 – 12
605.2.1 (New), Chapter 14

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C. representing self (JBEngineer@aol.com)

Add new text as follows:

605.2.1 Lead content of drinking water pipe and fittings. Pipe, pipe fittings, joints, valves, faucets, and fixture fittings utilized to supply water for drinking or cooking purposes shall comply with NSF 372 and shall have a weighted average lead content of 0.25 percent lead or less.

Add new standard to Chapter 14 as follows:

NSF
372-2010 Drinking Water System Components - Lead Content

Reason: This change will coordinate the IPC with Federal legislation limiting the amount of lead that can be used to supply drinking water. Section 605.2 is still necessary since remaining components in a potable water distribution system must still have a maximum of 8 percent lead. The Federal legislation only applies to drinking water components. There are other components that have a greater quantity of lead than 0.25 percent and are permitted to by Federal law.

NSF 372 is the new standard used to evaluate the weighted average of lead in drinking water components. This standard allows manufacturers to perform a mathematical analysis of their product to determine the weighted average of lead. NSF 372 is consistent with the Federal legislation.

Cost Impact: This change does not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, NSF 372-2010 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P112-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.2.1 (NEW)-P-BALLANCO

P113 – 12
605.5

Proponent: Kevin Simko, Victaulic representing Victaulic (ksimko@victaulic.com)

Revise as follows:

605.5 Fittings. Pipe fittings shall be *approved* for installation with the piping material installed and shall comply with the applicable standards listed in Table 605.5. Pipe fittings utilized in water supply systems shall also comply with NSF 61. Ductile and gray iron pipe <u>and pipe fittings utilized within water service piping systems</u> shall be cement mortar lined in accordance with AWWA C104.

Reason: The code as written requires that any fitting manufactured from ductile iron must be cement lined. This ambiguity results in overly-restrictive fitting requirements that do not represent current materials and methods. The requirement for cement lining needs to be specific for water service pipe and not distribution piping. Distribution piping typically incorporates galvanized steel of ductile iron components and not cement lining. Cement lining is used exclusively in ductile iron water main piping.

Cost Impact: The code change proposal will not increase the cost of construction.

P113-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.5-P-SIMKO

P114 – 12
605.5.1.3 (New), 605.9

Proponent: Kevin Simko, Victaulic, representing Victaulic (ksimko@victaulic.com)

Revise as follows:

<u>**605.5.1.3 Mechanical joints for branch lines.** Mechanical joints that are used to create branch lines of a pipe run shall incorporate a locating collar that is designed for alignment and prevention of the rotation of the mechanical joint after installation. The locating collar shall extend into a predrilled hole in the pipe. The mechanical joint shall be installed in accordance with the manufacturer's instructions. Sealing of the joint shall be made with an *approved* elastomeric seal.</u>

605.9 Prohibited joints and connections. The following types of joints and connections shall be prohibited:

1. Cement or concrete joints.
2. Joints made with fittings not *approved* for the specific installation.
3. Solvent-cement joints between different types of plastic pipe.
4. Saddle-type fittings.

   <u>**Exception:** Mechanical joints in accordance with Section 605.5.1.3 and used for branch line connections shall be permitted.</u>

Reason: There is no provision in the IPC allowing or preventing the use of mechanical joints for branch lines. Mechanical joints for branch lines are used in HVAC and other applications not in the scope of the IPC. Mechanical joints for branch lines offer improved performance and safety compared with saddles, Materials are the same used in other acceptable products.

Cost Impact: The code change proposal will not increase the cost of construction.

P114-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.5.1.3-P-SIMKO

P115 – 12
605.7

Proponent: Jeremy Brown, NSF International (brown@nsf.org)

Revise as follows:

605.7 Valves. All valves shall be of an approved type and compatible with the type of piping material installed in the system. ~~Ball valves, gate valves, butterfly valves, globe valves and plug.~~ Valves intended to supply drinking water shall meet the requirements of NSF 61.

Reason: NSF/ANSI Standard 61 Drinking Water System Components-Health Effects addresses crucial aspects of drinking water system components: whether contaminants that leach or migrate from the product/material into the drinking water are above acceptable levels in finished waters. Requiring NSF 61 will help protect the drinking water supply from the leaching of contaminants. The IPC and IRC already requires conformance to NSF 61 for pipes, fittings, faucets and valves intended to supply drinking water. (Sections 424.1, 605.3, 605.4, 605.5, 605.7 of IPC).

The current list of valves in Section 605.7 which require NSF-61 was a concession during previous code change cycles to allow manufacturers time to bring product lines into compliance with this standard. The requirement should apply to all valves intended to supply drinking water. The Uniform Plumbing Code currently requires all valves to conform to NSF 61.

Cost Impact: This will not increase the cost of construction.

Vienna, VA 22180

SP-42-2009 Corrosion Resistant Gate, Globe, Angle and Check Valves with Flanged and Butt Weld Ends (Classes 150, 300 & 600)

SP-67-2011 Butterfly Valves
SP-70-2011 Gray Iron Gate Valves, Flanged and Threaded Ends
SP-71-2011 Grey Iron Swing Check Valves, Flanged and Threaded Ends
SP-72-2010 Ball Valves with Flanged or Butt-Welding Ends for General Service

SP-78-2011 Cast Iron Plug Valves, Flanged and Threaded Ends
SP-80-2008 Bronze Gate, Globe, Angle and Check Valves
SP-110-2010 Ball Valves, Threaded, Socket Welded, Solder Joint, Grooved and Flared Ends

NSF
359-2011 Valves for Crosslinked Polyethylene (PEX) Water Distribution Tubing Systems

Reason: Currently the code requires valves to be approved but does not contain requirements for which performance standards are acceptable for use. While a number of valve standards have been created over the years, they have not been included in the code. The intent of this code change is to create a table to identify appropriate standards for valves. This list is not all inclusive of all material types and in some cases there are not national standards for every type of valve and material used. For this reason, the language “shall be approved or conform to . . .”

Cost Impact: This will not increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, ASME A112.4.14–2004 , ASME B16.34–2009 , ASTM A126-04(2009), ASTM F1970-05, AWWA C500-09, AWWA C504-10, AWWA C507-11, MSS SP-42-2009, MSS SP-67-2011, MSS SP-70-2011, MSS SP-71-2011, MSS SP-72-2010, MSS SP-78-2011, MSS SP-80-2008, MSS SP-100-2010 and NSF 359-2011 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

605.7 #2-P-BROWN

P117 – 12
605.7.1 (New), Chapter 14

Proponent: Fred Constantino, American Society of Mechanical Engineers (ASME), representing the ASME A112 Plumbing Materials and Equipment Standards Committee.

Add new text as follows:

605.7.1 Quarter-turn shut-off valves. Manually operated, quarter-turn shut off valves, 2 inches (51mm) or less in size, shall conform to ASME A112.4.14.

Add new standard to Chapter 14 as follows:

ASME

A112.4.14–2004(R2010)	Manually Operated, Quarter-Turn Shutoff Valves for Use in Plumbing Systems

Reason: ASME A112.4.14 Manually Operated, Quarter-Turn Shutoff Valves for Use in Plumbing Systems is a National standard (ANSI). These valves are intended for indoor installation as potable water shutoff valves between the meter and the supply stop. Valves governed by this Standard are intended for service at temperatures between 34°F (1°C) and 180°F (82°C), with an allowable working pressure rating not less than 125 psi (862 kPa).

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASME A112.4.14-2004(R2010) with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P119– 12
605.22.2 (New), Chapter 14

Proponent: Kevin Simko, Victaulic representing Victaulic (ksimko@victaulic.com)

Add new text as follows:

605.22.2 Grooved and shouldered mechanical joints. Grooved and shouldered mechanical joints shall comply with ASTM F1476, shall be made with an *approved* elastomeric seal and shall be installed in accordance with the manufacturer's instructions. Such joints shall be permitted to be concealed.

Add new standard to Chapter 14 as follows:

ASTM

ASTM F1476-07	Specification for Performance of Gasketed Mechanical Couplings for Use in Piping Applications

Reason: The code as written contains no provision specifically identifying grooved and shoulder mechanical joints. These types of joints are acceptable within the International Mechanical Code with the same verbiage. These type sof joints are commonly used in steel, stainless steel, copper and PVC potable water systems when incorporating a gasket that meets the requirements of the NSF 61. Without this provision, the current code is not representative of current materials and methods.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASTM F 1476-07 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

605.23.3 (NEW)-P-SIMKO

P121– 12
605.24.2

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

605.24.2 Plastic pipe or tubing to other piping material. Joints between different ~~grades~~ types of plastic pipe or between plastic pipe and other piping material shall be made with ~~an~~ *approved* adapters or transition fittings.

Reason: There is a number of different grades of plastic within a type of plastic pipe. For example, PVC can be made from various grades of PVC. All grades of PVC are solvent welded in the same manner with the same cement. This section is concerned with joints between different types of plastic pipe such as between PVC and ABS. These two different types of pipe cannot be directly joined together because the solvent cement approved for one type is not suitable for the other type. This corresponding section in the IRC was corrected many cycles ago and for uniformity, the IPC needs the same correction.

The term "transition" was added because some manufacturers provide special fittings for the purpose of joining two different types of plastic pipe.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P121-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

605.24.2-P-STRAUSBAUGH.PMGCAC

P122 – 12
605.25.1

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

~~**605.25.1 Flared joints.** Flared pipe ends shall be made by a tool designed for that operation.~~

(Renumber subsequent sections)

Reason: Manufacturers of PE-RT tubing indicate that the tubing cannot be flared and that a tool for flaring this type of tubing does not exist.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

	Assembly:	ASF	AMF	DF

605.25.1-P-STRAUSBAUGH.PMGCAC

P123 – 12

605.26 (New), Chapter 14

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Add new text as follows:

605.26 Brass fittings and brass valves for plastic piping systems. Where used as components of plastic piping systems and where made from copper alloys, brass fittings and brass valves shall comply with NSF14.

Reason: Dezincification of yellow brass piping components has become a real problem. There are 32,000 houses in Las Vegas that are being re-piped at a cost in excess of over $300 million due to dezincification of brass fittings in PEX domestic water systems. It is also occurring in other parts of the country (southern California and Hawaii to name just two). This also occurs in brass valves. 20 years ago Nibco had this problem when they started making brass valves in Taiwan. They figured out what they were doing wrong and it stopped. Now we have all these products being made abroad and the problem has come back times 10 or even 100.

The ASTM standards for these products allow several different alloys and since the codes are not specific as to which alloy to use for what, some manufacturers choose the least expensive one. Some of these alloys require more copper and allow less zinc (red brasses having the least amount of zinc) and other alloys require less copper and allow more zinc (yellow brasses). A poorly made yellow brass valve may be ok on a domestic water line in Chicago, or a drain line or air line or even a condenser water line in Las Vegas or San Diego. However, it will certainly fail in short order in a domestic water line in Las Vegas or San Diego or Honolulu. It is all about the local water and quality of the brass valve or PEX fitting. The brass valves and fittings that are failing meet the current codes. You can't treat the water because people drink it. The only solution is to regulate better through the codes and local enforcement.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

Analysis: This code change proposal references NSF Standard 14, which is already referenced in the code. However, the proposed change to code text is written to correlate with a new edition of the standard NSF Standard 14-2010a, rather than the edition presently referenced in the code, which is the 2008e edition. The update to this standard will be considered by the Administrative Code Committee during the 2013 Code Development Cycle. Should this code change proposal be approved, but the update to the standard not be approved, the code text will revert to the text as it appears in the 2012 Edition of the Code.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

606.1 (NEW)-P-ACKROYD

P125 – 12
606.1.1 (New)

Proponent: Andrew Scott Jones, President, A Better Deal Heating and Air Conditioning, Inc., a Texas Corporation, representing self (tfkolter@gmail.com)

Add new text as follows:

606.1.1 Leak monitor. Where new piping is installed or piping is replaced, a device or system to monitor for water leaks shall be provided. Such device ot systems shall automatically shut off the water upon detection of a leak.

Reason: Flood damage in buildings resulting from undetected and uncontrolled water leaks is substantial and can be largely eliminated with an automatic supply shut-off valve and leak detection system. Likewise, an uncontrolled gas leaks present a danger to life, and can be largely eliminated if residential properties were protected with an automatic shut off valve and leak detection system.

Many such systems are available on the market at varying costs with a variety of leak detection and shut-off designs. This proposal is limited to new construction and to total refit of plumbing and gas systems, not repairs.

Cost Impact: The code change will increase the cost of construction, totaling an estimated $300.00 to $500.00 per unit, cost to the contractor.

P125-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

606.1.1 (NEW)-P-JONES

P126 – 12

202, 606.8 (New), 606.8.1 (New), 606.8.2 (New)

Proponent: Edward R. Osann, Natural Resources Defense Council, representing self (eosann@nrdc.org); Harry Misuriello, American Council for an Energy-Efficient Economy, representing himself (misuriello@verizon.net)

Add new definitions as follows:

WATER METER. A device that measures the volume of water supplied from a public water main to a building or to an irrigated landscape and that is used by a public water supplier to bill for water.

WATER SUB-METER. A device, other than a *water meter*, installed on a water distribution pipe or makeup water pipe that measures the volume of water supplied to a specified space or specified equipment within a building or at the building site.

Add new text as follows:

606.8 Water measurement required for multi-family residential occupancies. The volume of water supplied to buildings of R-2 residential occupancy or a mixed-use occupancy that includes an R-2 residential occupancy shall be measured as required by Sections 606.8.1 and 606.8.2.

606.8.1 Sub-meters for individual multi-family dwelling units. *Water sub-meters* shall be installed to measure the volume of water supplied to each dwelling unit. *Water sub-meters* shall be installed in accordance with the manufacturer's instructions. Where point of use *water sub-meters* capable of communicating water consumption data remotely are installed at every fixture within the dwelling unit, a dwelling unit *water sub-meter* shall not be required.

> **Exception**: *Water sub-meters* shall not be required for dormitories, fraternities, sororities, and boarding houses (non-transient).

606.8.2 Sub-meters for water features and landscaped areas. A *water sub-meter* shall be installed to measure the volume of water supplied to an outdoor water feature or to an automatically controlled irrigation system serving irrigated landscapes having a combined area exceeding 2,500 ft^2 (232 m^2). Such *water sub-meter* shall be installed in accordance with the manufacturer's instructions.

> **Exception:** A *water sub-meter* shall not be required for an irrigated landscape that is supplied through a *water meter* dedicated to the landscape irrigation system.

Reason: This proposal requires the installation of water sub-meters for individual units in newly constructed apartment buildings. Public water suppliers typically do not install meters of their own on water supply piping to individual units, and occupants typically pay for water and sewer service as part of their rent or condominium fee.

Sub-metering in new multi-family buildings, when used for allocating the cost of water and wastewater service to individual dwelling units, ensures that water users receive an appropriate signal regarding the volume and cost of their water use, and thus incentivizes residents to undertake responsible water use and prompt reporting of fixtures in need of repair. Sub-metering is also useful in identifying leakage or unintended use in unoccupied dwelling units within multifamily buildings.

The National Multiple Family Sub-metering and Allocation Study (2004), sponsored by the US EPA and thirteen public water suppliers in different parts of the country, demonstrated that sub-metering reduces indoor water consumption substantially, by about 16% or 7,960 gallons per household unit per year, as a mid-range estimate. Nationwide, an estimated 5.9 million additional households will be living in multifamily housing by 2030 compared with 2015 (US Energy Information Agency, *Annual Energy Outlook 2011*, Residential Sector Key Indicators and Consumption, Reference Case). If beginning in 2016 all new multifamily housing is equipped with sub-meters used for billing allocation, even a conservative savings estimate of 3,110 gallons per unit per year (the value at the lower bound of the confidence band of the 2004 National Study estimate) yields water savings of 388 million gallons per day by 2030. Additionally, the measurement of water used for landscape purposes and for outdoor water features, such as swimming pools, ornamental ponds, and fountains, is essential to the effective management and avoidance of waste in large landscape maintenance.

Cost Impact: The estimated cost to install a sub-meter in new construction is $175. The National Multiple Family Sub-metering and Allocation Study cites $150 per meter. Additionally, according to Northland Investment Corp, water sub-meters can be installed for $125 to $175 per meter (see http://www.allbusiness.com/real-estate-rental-leasing/real-activities-related-to-real/680669-1.html) and as per the City of San Diego, it costs $150 - $300 per unit to install sub-meters in new construction (See http://www.sdnn.com/sandiego/2010-04-02/politics-city-county-government/city-council-to-consider-new-water-meter-rules#ixzz0jyvjUjrD). However, installation of sub-meters to allocate the cost of the building's water and wastewater service to individual occupants removes these utility costs from the owner's income statement and effectively increases the net cash flow and capitalized value of each rental unit.

P126-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

606.8-P-OSANN

P127 – 12
607.1.2 (New), 607.1.3 (New)

Proponent: Ron George, CPD, Plumb-Tech Design & Consulting Services LLC, representing self (Ron@Plumb-TechLLC.com)

Add new text as follows:

607.1.2 Master water temperature-actuated mixing valves. Where a master water temperature-actuated mixing valve is installed to control the hot water temperature to specified limits, it shall be located at the water heater. The piping from the hot water outlet of the water heater to the mixing valve shall have a mechanical heat trap installed or the piping shall be configured in a heat trap piping arrangement that drops not less than 24 inches (610mm) before rising to connect to the mixing valve. A shut off valve shall be installed in the piping before each inlet and after the outlet of the mixing valve. A water temperature indicating device shall be installed in the outlet of the valve or in the outlet piping and shall be located within six feet (1829 mm) of the outlet of the mixing valve. The mixing valve shall be sized for the maximum and minimum anticipated flows in accordance with the manufacturer's sizing instructions or generally accepted engineering practices. Master water temperature-actuated mixing valves shall comply with ASSE 1017 or CSA B125.3 and shall be installed in accordance with the manufacturer's instructions.

607.1.3 Point-of-use water temperature mixing valves. Point-of-use water temperature-actuated mixing valves installed for the purpose of limiting the water temperature at a sink, lavatory or group of lavatories shall comply with ASSE 1070. A shutoff valve shall be installed in the piping to each inlet of the mixing valve. The mixing valve shall be sized in accordance with the manufacturer's sizing instructions for the maximum and minimum anticipated flows. Point-of use water temperature mixing valves shall be installed in accordance with the manufacturer's installation instructions.

(Renumber subsequent section)

Reason: Language was needed addressing the installation of thermostatic mixing valves in domestic hot water systems. For master mixing valves a temperature gauge is needed to see what the valve is mixing to. For local mixing valves no temperature gauge is needed because water temperatures can be tested at a nearby fixture.

Cost Impact: The code change proposal will not increase the cost of construction. These mixing valve devices are not mandatory so there is no increase in cost. This code language gives guidance by listing the appropriate industry standards, shut-off valves and installation instructions to comply with only when these devices are installed.

Reason: This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

The 2012 IPC limits the run of hot water lines in Section 607.2 to 50 feet. The IgCC, however, limits hot Reason: The 2012 IPC limits the run of hot water lines in Section 607.2 to 50’. The IgCC, however, limits hot water line length based on the volume in the pipe, therefore the maximum length is different for different sizes of pipe. The IPC should be revised to better correspond with the IgCC and provisions for recirculation systems should be updated to include demand-based recirculation. This method of reducing water waste is much more accurate than simply stated a “catch-all” maximum length.

Cost Impact: None

607.2.2 (New), 607.2.2.1(New), 607.2.2.2 (New)

Proponent: Gary Klein, Affiliated International Management, LLC, representing self

Add new text as follows:

607.2.2 Hot or tempered water recirculation systems. Hot or tempered water recirculation systems shall be provided with a recirculation pump. Gravity and thermo-syphon circulation systems shall be prohibited. Recirculation system pump controls shall comply with Sections 607.2.2.1 and 607.2.2.

607.2.2.1 Recirculating pump controls. Recirculating pump controls that allow timer-activated, water temperature-activated or continuous operation of the pump shall be prohibited. Recirculating pumps shall be demand activated by one of the following means:

1. A switch operated by the user of the fixture.
2. A motion sensor triggered by the presence of the user of the fixture.
3. A flow switch activated by the flow of hot water at a fixture.
4. A door switch activated by the door to the room containing hot water-supplied fixtures.
5. A voice activated command.

After the pump starts, the controls shall allow the pump to operate until the water temperature in the return pipe rises not more than 10ºF (5.6 ºC) above the initial temperature of the water in the pipe. The controls shall not allow the pump to operate when the temperature in the pipe exceeds 102ºF (38.9 ºC). Controls shall limit pump operation to not more than 5 minutes for each activation in the event that both means of shutting off the pump have failed.

607.2.2.2 Control manufacturer instructions . The manufacturer of the controls for the recirculation pump shall provide installation and operation instructions that provide details of the operation of the controls. Such instructions shall be available at the jobsite for inspection by the code official.

(Renumber subsequent section)

Reason:

1. This proposal was approved on consent at the 2012 IgCC Final Action Hearing in Phoenix. The wording in this proposal has the same content and has been modified for better correlation with the IPC. The description of the allowable pump control – on demand – has been drawn from the definition of Demand Recirculation Water System in the 2012 IECC.
2. Circulation systems with demand controlled pumps are significantly more energy efficient than any other type of hot water circulation system. The table below shows the relative energy consumption for all types of circulating systems covered in this section. The annual energy needed to keep the loop hot with water heated electrically or with natural gas are shown separately from the energy needed for the pump. The majority of the energy is lost in keeping the water in the loop at the desired temperature (all of it if there is a gravity loop). Two lengths of circulation loop are analyzed: 100 feet and 200 feet. The costs and savings remain proportional as the length of the circulation loop and the flow rate of the pump increase. Savings from demand controlled pumping systems have been documented by the Southern California Gas Company, which is now running an energy efficiency program that supports their installation.
3. The IPC requires that the hot water piping in automatic temperature maintenance systems be insulated with at least 1 inch of pipe insulation. The water in the circulation loop will stay hot for a very long time – 45 minutes for ¾ inch nominal pipe up to 2 hours for 2-inch nominal pipe – if the circulating pump is shut off.
4. If this is the case, why run the pump? Why run the pump when no one is in the building or when no one is demanding hot water? The only time it makes sense to run the pump is shortly before hot water is needed: hence the requirement that the pump be controlled on-demand by one of the mechanisms in the section.

Annual Energy Required for Operating Circulation Systems

		Recirculation						Demand Controlled Priming	
		Daily Hours of Operation							
		24	12	8	6	4	2		
1	**Small Hot Water System: Trunk, Branch, and Twig**								
	Loop Heat Losses							**Loop Heat Losses**

Add new text as follows:

607.2.3 Efficient hot and tempered water supply piping. Hot and tempered water supply piping shall comply with either the maximum allowable pipe length or maximum allowable pipe volume methods in this section.

607.2.3.1 Maximum allowable pipe length method. The maximum allowable pipe length from the source of hot or tempered water to the termination of the fixture supply pipe shall be in accordance with the maximum pipe length columns in Table 607.2.3.1. Where the length contains more than one size of pipe, the largest size pipe shall be used for determining the maximum allowable length of the pipe in Table 607.2.3.1.

607.2.3.2 Maximum allowable pipe volume method. The water volume in the piping shall be calculated in accordance with Section 607.2.3.3. The maximum volume of hot or tempered water in the piping to public lavatory faucets, metering or non-metering, shall be 2 ounces (0.06 L). For other fixtures the maximum volume shall be 64 ounces (1.89 L) for hot or tempered water from a water heater or boiler; and 24 ounces (0.7 L) for hot or tempered water from recirculating system or heat-traced piping.

607.2.3.2.1 Water volume determination. The volume shall be the sum of the internal volumes of pipe, fittings, valves, meters and manifolds between the source of hot water and the termination of the fixture supply pipe. The volume shall be determined from the liquid ounces per foot column of Table 607.2.3.1. The volume contained within fixture shut off valves, flexible water supply connectors to a fixture fitting or within a fixture fitting shall not be included in the water volume determination. Where hot or tempered water is supplied by recirculating system or heat-traced piping, the volume shall include the portion of the fitting on the source pipe that supplies water to the fixture.

607.2.3.3 Maximum flow rate. The flow rate of fixtures shall be limited to 0.5 gpm where connected to 1/4 inch piping; to 1 gpm where connected to 5/16 inch piping; and to 1.5 gpm where connected to 3/8 inch piping.

TABLE 607.2.3.1
MAXIMUM LENGTH OF PIPE

NOMINAL PIPE SIZE (INCH)	LIQUID OUNCES PER FOOT OF LENGTH	MAXIMUM PIPE LENGTH		
		SYSTEM WITHOUT A CIRCULATION LOOP OR HEAT TRACED LINE (FEET)	SYSTEM WITH A CIRCULATION LOOP OR HEAT TRACED LINE (FEET)	LAVATORY FAUCETS—PUBLIC (METERING AND NON-METERING) (FEET)
1/4	0.33	50	16	6
5/16	0.5	50	16	4
3/8	0.75	50	16	3
1/2	1.5	43	16	2
5/8	2	32	12	1
3/4	3	21	8	0.5

NOMINAL PIPE SIZE (INCH)	LIQUID OUNCES PER FOOT OF LENGTH	MAXIMUM PIPE LENGTH		
		SYSTEM WITHOUT A CIRCULATION LOOP OR HEAT TRACED LINE (FEET)	SYSTEM WITH A CIRCULATION LOOP OR HEAT TRACED LINE (FEET)	LAVATORY FAUCETS—PUBLIC (METERING AND NON-METERING) (FEET)
7/8	4	16	6	0.5
1	5	13	5	0.5
1 ¼	8	8	3	0.5
1 ½	11	6	2	0.5
2 or larger	18	4	1	0.5

Reason:

1. The 2012 IPC reduced the allowable distance from the source of hot or tempered water to the fixtures from100 to 50 feet. This was an excellent change. However, limiting the length did not get at the real issue, which is the volume from the source to the use, Limiting volume has the effect of limiting pressure losses due to length, reducing the time it takes for hot water to arrive (time-to-tap) and reducing the amount of water wasted while waiting for the hot water (volume-to-hot). Limiting the volume in the hot water supply system piping also has the effect of reducing the energy losses during use and when the water in the pipes eventually cools down.
2. This proposal builds on the 2012 IPC by limiting the volume, while staying within the 50 foot developed length restriction, which is the intent of the proponents.
   a. It is possible for a single pipe to be installed 50 feet long with no fittings in between the source and the fixture; in that case the developed length is the same as the actual length.
   b. When fittings and valves are needed, which is likely, the actual length may need to be reduced to accommodate the extra pressure drop. This is most likely to be necessary for nominal ¼, 5/16 and 3/8 inch pipe in hot water supplies without recirculation system or heat-traced piping, however, it may also be necessary for other diameters too if the fittings and valves create significant restrictions to flow.
3. The core of this proposal was approved at the 2012 IGCC Final Action Hearing in Phoenix. The wording has been revised so that it fits within context of Section 607.2 of the IPC. The footnote has been removed so that the language could be more appropriately worded as a requirement.
   a. The proposal that was approved at the IGCC FAH was revised from the original wording in IGCC Public Version 2. Improvements include clarifying the distinctions between two types of hot water supply systems; those with a recirculation system or heat traced trunk line and those without and providing for a means of compliance without it being necessary to calculate the volume for most applications. This makes it easier for everyone involved.
   b. The table in PV 2 contained ounces per foot of different types of hot or tempered water piping. Based on recommendations from several code officials around the country, the table was revised to
      I Simplify the calculations, when necessary, by averaging the volumes for the different types of piping for each nominal pipe diameter and then rounding off to a simple to use and easy to remember number. The volumes that were averaged were taken from the table in PV 2 and are also contained in Table E 202.1 of the IPC. The revised table is now applicable to all piping materials approved now or in the future for use with hot or tempered water.
      II Include 1/4, 5/16, 5/8 and 7/8 inch nominal diameters. Piping materials are available in these diameters, although they are not widely used. Including them in this table provides values that will enable their use.
      III Limit the maximum fixture flow rate when 1/4, 5/16 and 3/8 inch diameter piping is being used (Section 607.2.3.3). The flow rates in the footnote were selected, using the Hazen-Williams formulas, to keep the velocity below 5 feet per second, which minimizes pressure drop, reduces noise and limits the rate of any internal corrosion. The same formulas were used to limit the pressure drop at these flow rates to no more than 5 psi in the 50 foot lengths of 1/4, 5/16 and 3/8 inch diameter piping; the pressure drop will be much less in the shorter lengths in the other columns.
      IV Limit the length of the small diameter tubing (1/4 – 1/2 inch inclusive) at 50 feet in hot water supply piping without recirculation systems or heat-traced lines. This correlates with the changes adopted in the 2012 IPC. Another reason for not using the 64-ounce volume allowance in small tubing is that otherwise the maximum length of 5/16 inch tubing could be 128 feet and 1/4 inch tubing could be 192 feet! Pressure loss at these lengths would be excessive and unacceptable, as would heat loss. In addition, limiting length to 50 feet reduces the time-to-tap and the amount of water wasted while waiting for hot water to arrive, thereby improving performance for the user as well as water and energy waste.
      V Limit the length of the small diameter tubing (1/4 – 1/2 inch inclusive) at 16 feet in hot water supply piping with recirculation systems or heat-traced lines. The purpose of the circulation loop or heat-traced line is to bring the source of hot water close (in volume) to the fixtures, thereby reducing the time-to-tap and the waste of water and energy. Given typical floor-to-ceiling heights in the occupancies covered by this code, it is possible to reach the angle stop of a lavatory or a tub-shower valve with 16 feet of pipe coming down the wall from a recirculation system in the ceiling. Additionally, limiting the length of the smaller diameter tubing will improve the time-to-tap for the lower flow rate fixtures the tubing is intended to serve.
      VI Limit the length serving lavatory faucets – public (metering and non-metering) in all hot water supply systems. These are the faucets where we wait a very long time for hot water to arrive – or we give up! Lavatory faucets are generally used for very short periods of time and hot water needs to arrive very quickly for it to be useful. Since the flow rates

are so low, it is critical that there be very little volume between the source of hot water and these faucets. I know that 2 ounces, and the corresponding feet are very small, but if we do this, hot water will arrive in less than 5 seconds after we turn on the faucet. And, there are several cost effective, energy efficient ways to meet this requirement.

VII It is the intent of the proponents that either the maximum allowable volume or maximum allowable length method be allowed in any occupancy.

VII It is also the intent of the proponents that the contents of this section apply to all occupancies.

4. Adopting this proposal will improve the performance of hot water distribution systems by:
   a. Helping to ensure that the pressure drop from the source of hot water to the fixtures is not excessive.
   b. Reducing the time it takes to get hot water after opening a tap. This is particularly important for lavatory faucets-public, which, in accordance with Federal law that has been in effect since the mid-1990s, are required to have flow rates no larger than 0.5 gallons per minute (non-metering) or 0.25 gallons per cycle (metering).
   c. Reducing the waste of water while waiting for hot water to arrive.
   d. Reducing the energy losses during delivery, use and cool down phases of all hot water events.
5. We urge your support for this proposal. Thank you.

Cost Impact: The code change proposal will not increase the cost of construction.

The 2012 IPC limits the distance from the source of hot water to the use to no more than 50 feet of developed length. There is no limit on the volume in this length of pipe. (By way of reference, the 2009 IPC had a limit of 100 feet and no limit on the volume, so the 2012 IPC is an improvement over 2009.)

This code change minimizes the volume in the piping between the source of hot water and the uses. It has the effect of eliminating long, large volume pipe runs resulting in sizable material and labor savings.

In most cases, reducing the volume between the sources of hot water and the fixtures will reduce costs. There are generally many more branches, and particularly fixture branches, than there are trunk lines, recirculation system or heat-traced piping in a building. Getting the source closer to the use reduces the number of feet in each of these branches and it will also reduce the diameter: both of these reduce costs of the hot water supply piping as well as any insulation that is required. In some cases it will be necessary to increase the length of the trunk or recirculation system piping to get closer to the fixtures. In others the architect and engineers will decide to locate the hot water uses more centrally: this will reduce the costs of the hot water, the cold water, the drain lines and any required insulation too!

There are two primary cases to be considered: (1) when the source of hot water is a water heater or boiler and (2) when the source of hot water is recirculation system or heat-traced piping.

Assuming that there is a bathroom group at the end of the 50 feet of length, it would be very common to see a 1-inch pipe, either from a water heater or from a circulation loop in any occupancy. This pipe contains approximately 2 gallons. In order for hot water to get to the bathroom group a minimum of 2 gallons will run down the drain before the hot water arrives. In practice, we observe 3-4 gallons will run down the drain. (If the pipe were 3/4-inch nominal, the volume would be closer to 1.25 gallons and the typical waste would range from 1.25 to 2.5 gallons. However, if someone decided to use a 1.5-inch branch line to the bathroom group, the volume in the pipe would be more than 4.25 gallons and the waste would range from 4.25 to more than 8 gallons.)

Based on the above example, it is reasonable to assume that the amount of water currently wasted while waiting for hot water to arrive ranges from 1 gallon (128 ounces) to more than 4 gallons (512 ounces), the savings from a water heater will range from 50% ((128-64)/128) for a branch from a water heater to the use to 95% ((512-24)/512) for a branch from recirculation system or heat-traced piping to the use.

In addition to lower first costs, there are significant savings in water, energy and time. All of this water came through the water heater, so there is energy attached to it. There is also energy lost as the hot water moves from the source to the use, even if it is insulated. If the hot water is on an upper story, there is energy expended in lifting it to that floor. In addition, there is energy embedded in the cold water that came to the building and to the water that is taken away for wastewater treatment.

P130-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

607.2.3 (NEW)-P-KLEIN-SNYDER

P131 – 12
607.3, 607.3.1, 607.3.2

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

607.3 Thermal expansion control. ~~A means of controlling increased pressure caused by thermal expansion shall be provided where required in accordance with Sections 607.3.1 and 607.3.2.~~ Where a storage water heater is supplied with cold water that passes through a check valve, pressure reducing valve or backflow preventer, a thermal expansion tank shall be connected to the water heater cold water supply pipe at a point that is downstream of all check valves, pressure reducing valves and backflow preventers. Thermal expansion tanks shall be sized in accordance with the tank manufacturer's instructions and shall be sized such that the pressure in the water distribution system shall not exceed that required by Section 604.8.

~~**607.3.1 Pressure-reducing valve.** For water service system sizes up to and including 2 inches (51 mm), a device for controlling pressure shall be installed where, because of thermal expansion, the pressure on the downstream side of a pressure-reducing valve exceeds the pressure-reducing valve setting.~~

~~**607.3.2 Backflow prevention device or check valve.** Where a backflow prevention device, check valve or other device is installed on a water supply system utilizing storage water heating equipment such that thermal expansion causes an increase in pressure, a device for controlling pressure shall be installed.~~

Reason: Any time there is a pressure reducing device, a check valve or a backflow preventer in the cold water piping to a storage-type water heater, a means to compensate for thermal expansion must be installed. This is typically accomplished with an expansion tank. Other methods for relieving thermal expansion pressure, such additional relief valves, waste water for the life of the system. Thermal expansion tanks are required by most storage water heater manufacturers to protect the water heater. Expansion tank manufacturers typically size their tanks so that the water distribution system pressure will remain just shy of the pressure required to open a 150 psi water heater relief valve. This will allow the system pressure to exceed the maximum pressure intended by Section 604.8, which is unacceptable.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P132 – 12
Table 608.1, 608.13.6, Chapter 14

Proponent: Fred Constantino, American Society of Mechanical Engineers (ASME), representing the ASME A112 Plumbing Materials and Equipment Standards Committee.

Revise as follows:

TABLE 608.1
APPLICATION OF BACKFLOW PREVENTERS

Hose connection backflow preventer	High or low hazard	Low head backpressure, rated working pressure, backpressure or backsiphonage Sizes $^{1}/_{2}$″–1″	ASME A112.21.3, ASSE 1052, CSA B64.2.1.1
Hose connection vacuum breaker	High or low hazard	Low head backpressure or backsiphonage Sizes 1/2″,3/4″, 1″	ASME A112.21.3, ASSE 1011, CSA B64.2, CSA B64.2.1
Vacuum breaker wall hydrants, frost-resistant, automatic draining type	High or low hazard	Low head backpressure or backsiphonage Sizes 3/4″, 1″	ASME A112.21.3, ASSE 1019, CSA B64.2.2

(Portions of table not shown remain unchanged)

608.13.6 Atmospheric-type vacuum breakers. Pipe-applied atmospheric-type vacuum breakers shall conform to ASSE 1001 or CSA B64.1.1. Hose-connection vacuum breakers shall conform to ASME A112.21.3, ASSE 1011, ASSE 1019, ASSE 1035, ASSE 1052, CSA B64.2, CSA B64.2.1, CSA B64.2.1.1, CSA B64.2.2 or CSA B64.7. These devices shall operate under normal atmospheric pressure when the critical level is installed at the required height.

Add new standard to Chapter 14 as follows:

ASME
A112.21.3–1985(R2007) Hydrants for Utility and Maintenance Use

Reason: There also other hydrants and hose connections with the proper backflow preventer or vacuum breaker that exist other than those complying with the ASSE and CSA standards. These hydrants are for utility and maintenance use. This is a National standard (ANSI) which covers the performance requirements for these types of devices.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASME A112.21.3-1985(R2007) with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

For SI: 1 inch = 25.4 mm

a. Low Hazard - See Pollution (Section 202), High Hazard - See Contamination (Section 202)

b. See Backpressure (Section 202), See Backpressure, low head (Section 202), See Backsiphonage (Section 202)

Reason: There is much confusion concerning protection provided by any 'backflow preventer'. Reorganizing this table would better identify proper and correct applications for code users by identifying the different protection methods: assemblies, backflow prevention devices and other means or methods. The existing table gives the mistaken understanding that "any of the above provides adequate protection for any job". This is not true. Adequate protection is based on hazard classification, application and proper installation. Backflow prevention assemblies are specifically recognized and accepted as separate and distinct units based on Section 312.10.2 because of their requirement for periodic testing to ensure proper and reliable operation in order to protect public health.

Cost Impact: The code change proposal will not increase the cost of construction.

P133-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T608.1-P-MOSS

P134 – 12
608.6

Proponent: Michael Moss, American Backflow Prevention Association (msmoss@utah.gov)

Revise as follows:

608.6 Cross-connection control. Cross-connections shall be prohibited, except where approved <u>backflow prevention assemblies, backflow prevention devices or other means or</u> methods are installed to protect the potable water supply.

Reason: "Methods" are not defined in the definitions. The term from Chapter 2 is **"**Backflow Preventer**.** The definition of methods would be complete and precise with a change to: "BACKFLOW PREVENTER**.** A backflow prevention assembly, a backflow prevention device or other means or method to prevent backflow into the potable water supply."

Cost Impact: The code change proposal will not increase the cost of construction.

P134-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

608.6-P-MOSS

P135 – 12
608.8, 608.8.1

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

608.8 Identification of nonpotable water systems. Where *nonpotable* water systems are installed, the piping conveying the nonpotable water shall be identified either by color marking or metal tags in accordance with Sections 608.8.1 through 608.8.~~3~~2.

608.8.1 Signage Required. All nonpotable water outlets such as hose connections, open ended pipes, and faucets shall be identified ~~at the point of use for each outlet with the words, "Nonpotable-not safe for drinking~~ ." with signage that reads as follows: "Non-potable water is utilized for [application name]. Caution: non-potable water. DO NOT DRINK."The words shall be legibly and indelibly printed on a tag or sign constructed of corrosion-resistant waterproof material or shall be indelibly printed on the fixture. The letters of the words shall be not less than 0.5 inches in height and in colors in contrast to the background on which they are applied. In addition to the required wordage, the pictograph shown in Figure 608.8.1 shall appear on the signage required by this section.

608.8.~~1~~2 ~~Information~~. Distribution Pipe Labeling and Marking. Non-potable distribution piping shall be of the color purple and shall be embossed or integrally stamped or marked with the words: "CAUTION: NONPOTABLE WATER – DO NOT DRINK" or shall be installed with a purple identification tape or wrap. Pipe identification shall include the contents of the piping system and an arrow indicating the direction of flow. Hazardous piping systems shall also contain information addressing the nature of the hazard. Pipe identification shall be repeated at intervals not exceeding 25 feet (7620 mm) and at each point where the piping passes through a wall, floor or roof. Lettering shall be readily observable within the room or space where the piping is located.

608.8.2.1 Color. The color of the pipe identification shall be discernable and consistent throughout the building. The color purple shall be used to identify reclaimed, rain and gray water distribution systems.

608.8.2.2 Lettering Size. The size of the background color field and lettering shall comply with Table 608.8.2.2.

608.8.2.3 Identification Tape. Where used, identification tape shall be at least 3 inches wide and have white or black lettering on purple field stating "CAUTION: NON-POTABLE WATER – DO NOT DRINK". Identification tape shall be installed on top of non-potable rainwater distribution pipes, fastened at least every 10 feet to each pipe length and run continuously the entire length of the pipe.

Table 608.8.2.2

SIZE OF PIPE IDENTIFICATION

PIPE DIAMETER (inches)	LENGTH BACKGROUND COLOR FIELD (inches)	SIZE OF LETTERS (inches)
$^3/_4$ to $1^1/_4$	8	0.5
$1^1/_2$ to 2	8	0.75
$2^1/_2$ to 6	12	1.25
8 to 10	24	2.5
over 10	32	3.5

For SI 1 inch = 25.4 mm.

Figure 706.2 Pictograph – DO NOT DRINK

Figure 608.1.1 Pictograph – DO NOT DRINK

Reason: Water distribution systems of other than potable water are being installed in buildings and the code needs to require marking of the piping and signage for the outlets for safety reasons. The basis for this new language is text from the IgCC and is written to be in alignment with the IgCC requirements.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P135-12

P136 – 12
202, 608.8.2

Proponent: Alan Rimer, Black and Veatch, representing the American Water Works Association's Water Reuse Committee

Add new definition as follows:

<u>**RECLAIMED WATER DISTRIBUTION SYSTEM.** Piping and appurtenances that are of the color purple and that are intended to convey only reclaimed water.</u>

Revise as follows:

608.8.2 Color. The color of the pipe identification shall be discernable and consistent throughout the building. The color purple shall be used to identify *reclaimed*~~, rain and gray~~ *water distribution systems*. <u>The color gray with purple striping shall be used to identify rain and gray water distribution systems.</u>

Reason: Current municipal utilities throughout the world have adopted purple as the color used for any pipe conveying reclaimed water. It is an ASTM approved standard and does not permit the conveyance of other waters (such as rainwater or grey water) in purple pipe.

Cost Impact: The code change proposal will not increase the cost of construction.

P136-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

608.8.2-P-RIMER

AS SUBMITTED:

P________ – 12
202, 608.8.2

Proponent: Alan Rimer, Black and Veatch, representing the American Water Works Association's Water Reuse Committee

Add new definition as follows:

RECLAIMED WATER DISTRIBUTION SYSTEM. A reclaimed water distribution system shall consist of piping and appurtenances that are of the color purple and are intended to convey only reclaimed water.

Revise as follows:

608.8.2 Color. The color of the pipe identification shall be discernable and consistent throughout the building. The color purple shall be used to identify *reclaimed*~~, rain and gray~~ *water distribution systems*. The color gray with purple striping shall be used to identify rain and gray water distribution systems.

Reason: Current municipal utilities throughout the world have adopted purple as the color used for any pipe conveying reclaimed water. It is an ASTM approved standard and does not permit the ????

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

608.8.2-RIMER

P137 – 12
608.11

Proponent: Jeremy Brown, NSF International (brown@nsf.org)

Revise as follows:

608.11 ~~Painting of~~ Potable water tanks. Potable water tanks, interior coatings for potable water tanks and liners for potable water tanks shall conform to NSF 61. The interior surface of a potable water tank shall not be lined, painted or repaired with any material that changes the taste, odor, color or potability of the water supply when the tank is placed in, or returned to service.

Reason: NSF/ANSI Standard 61 Drinking Water System Components-Health Effects addresses crucial aspects of drinking water system components: whether contaminants that leach or migrate from the product/material into the drinking water are above acceptable levels in finished waters. Requiring NSF 61 will help protect the drinking water supply from the leaching of contaminants. The IPC and IRC already requires conformance to NSF 61 for pipes, fittings, faucets and valves intended to supply drinking water. (Sections 424.1, 605.3, 605.4, 605.5, 605.7 of IPC). It is logical that tanks should have to meet this same requirement to protect the drinking water. This requirement is also referenced in the Uniform Plumbing Code, and the water works regulations of 46 states.

There are adequate products on the market to fulfill this requirement as there are hundreds of products listed by NSF and other third party certifiers.

Cost Impact: This will not increase the cost of construction.

P137-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

608.11-P-BROWN

P138 – 12
608.13.3

Proponent: Michael Moss, American Backflow Prevention Association (msmoss@utah.gov)

Revise as follows:

608.13.3 Backflow preventer with an intermediate atmospheric vent. Backflow preventers with an intermediate atmospheric vent~~s~~ shall conform to ASSE 1012 or CSA B64.3. These backflow prevention devices shall be permitted to be installed where subject to continuous pressure conditions downstream of the device. Such devices shall only be installed in systems serving a single dwelling unit. The installation of these devices shall be prohibited where chemicals are introduced into the system downstream of the device. The relief opening shall discharge by air gap and shall be prevented from being submerged.

Reason: These backflow preventers are designed and sold for non-health hazard installations according to manufacturer specification sheets. They are inadequate for chemical additions or injections. Their use should be limited to potable water systems within a residential system only. Reference in Section 608.15.3 and Section 608.16.2.

Cost Impact: The code change proposal will not increase the cost of construction.

P138-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

608.13.3-P-MOSS

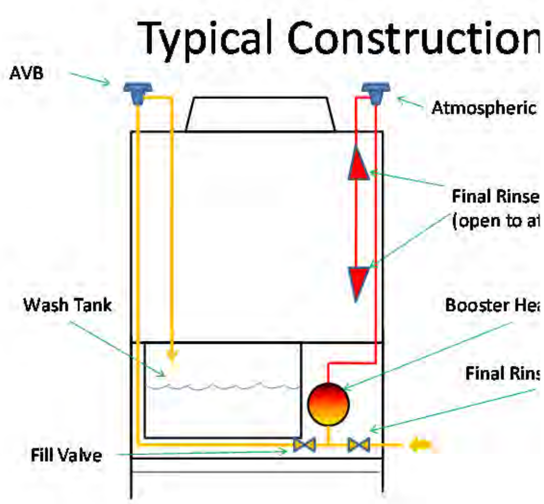
P139 – 12
608.13.6

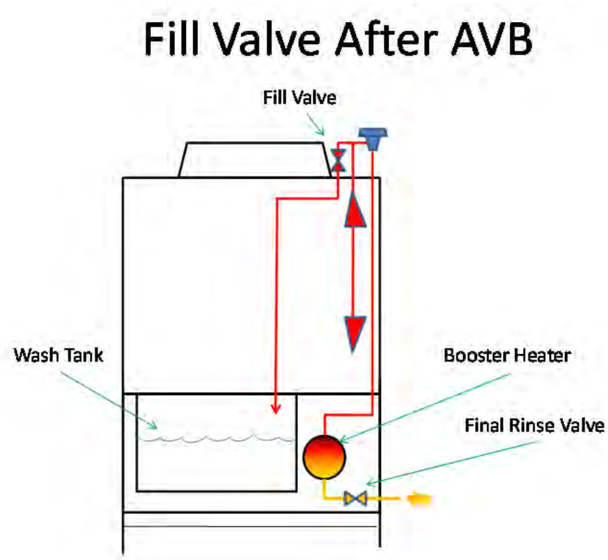
Proponent: Joel F. Hipp, Hobart Corporation representing Hobart Corporation (joel.hipp@hobartcorp.com)

Revise as follows:

608.13.6 Atmospheric-type vacuum breakers. Pipe applied atmospheric-type vacuum breakers shall conform to ASSE 1001 or CSA B64.1.1. Hose-connection vacuum breakers shall conform to ASSE 1011, ASSE 1019, ASSE 1035, ASSE 1052, CSA B64.2, CSA B64.2.1, CSA B64.2.1.1, CSA B64.2.2 or CSA B64.7. These devices shall operate under normal atmospheric pressure when the critical level is installed at the required height. <u>The outlet of a pipe applied atmospheric vacuum breaker shall not have a valve downstream except where there are multiple outlets where not less than one outlet is continuously open to atmosphere.</u>

Reason: Commentary for paragraph 608.13.6 of the 2006 IPC states, "The outlet of atmospheric vacuum breakers must remain open to the atmosphere by terminating with a pipe, spout or similar unobstructed opening. Valves must not be installed downstream of this device because this would subject the device to supply pressure, thereby rendering it inoperative." However, when designed properly, a valve can be located downstream from the AVB. The following figures illustrate this on a commercial dishwasher application.





Even though the fill valve is downstream from the atmospheric vacuum breaker, the "TEE" between the two allows pressure to remain atmospheric at all times. Although the commentary is not a substitute for the code, it is often interpreted and enforced as code language. For this reason we urge the committee to add the wording as proposed.

Cost Impact: The code change proposal will not increase the cost of construction.

P139-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

608.13.6-P-HIPP

P140 – 12
608.13.6

Proponent: Michael Moss, American Backflow Prevention Association **(**msmoss@utah.gov)

Revise as follows:

608.13.6 Atmospheric-type vacuum breakers. ~~Pipe applied~~ Atmospheric-type vacuum breakers shall conform to ASSE 1001 or CSA B64.1.1. Hose-connection vacuum breakers shall conform to ASSE 1011, ASSE 1019, ASSE 1035, ASSE 1052, CSA B64.2, CSA B64.2.1, CSA B64.2.1.1, CSA B64.2.2 or CSA B64.7. The outlet of a ~~These devices~~ vacuum breaker shall be open to the atmosphere.~~operate under normal atmospheric pressure when the critical level is installed at the required height.~~ The atmospheric vacuum breaker shall be installed with it's critical level marking not less than 6 inches (152 mm) above the highest elevation of the downstream piping or the flood level rim of the fixture or device.

Reason: Installation of vacuum breakers needs to be compliant with published manufacturer installation instructions. The information is the minimum standard for industry. This installation criteria provides adequate protection of the water supply and ensures protection of public health.

Cost Impact: The code change proposal will not increase the cost of construction.

P140-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

608.13.6-P-MOSS

P141 – 12
608.13.7

Proponent: Michael Moss, American Backflow Prevention Association (msmoss@utah.gov)

Revise as follows:

608.13.7 Double check~~-valve~~ backflow prevention assemblies. Double check~~-valve~~ backflow prevention assemblies shall conform to ASSE 1015, CSA B64.5, CSA B64.5.1 or AWWA C510. Double-~~detector~~ check~~-valve~~ detector fire protection backflow prevention assemblies shall conform to ASSE 1048. These ~~devices~~ assemblies shall be capable of operating under continuous pressure conditions.

Reason: To provide consistent terminology throughout the code for reference and comparison.

Cost Impact: The code change proposal will not increase the cost of construction.

P141-11

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

608.13.7-P-MOSS

P142 – 12
608.13.10 (New)

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Add new text as follows:

608.13.10 Dual check valve backflow preventer. Dual check valve backflow preventers shall conform to ASSE 1024 or CSA B64.6.

Reason: Table 608.1 lists ASSE 1024, CSA B64.6 (dual check valves) but currently there is no code text associated with these devices. This new section is added to correct this problem.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

	Assembly:	ASF	AMF	DF

608.13.10 (NEW)-P-STRAUSBAUGH.PMGCAC

P143 – 12
608.15.4

Proponent: Michael Moss, American Backflow Prevention Association representing himself (msmoss@utah.gov)

Revise as follows:

608.15.4 Protection by a vacuum breaker. Openings and outlets shall be protected by atmospheric-type or pressure~~-type~~ vacuum breaker~~s~~ assemblies. ~~The critical level of the vacuum breaker shall be set a minimum of 6 inches (152 mm) above the flood level rim of the fixture or device.~~ Vacuum breakers shall not be installed under exhaust hoods or similar locations that will contain toxic fumes or vapors. Atmospheric type ~~Pipe-applied~~ vacuum breakers shall be installed with their critical level at a point not less than 6 inches (152 mm) above the highest elevation of downstream piping and the flood level rim of ~~the~~ any fixture, receptor or device served. Fill valves shall be ~~set~~ installed in accordance with Section 425.3.1. Pressure vacuum breaker and spill resistant vacuum breaker assemblies shall be installed with their critical level at a point not less than 12 inches (304 mm) above the highest elevation of downstream piping and the flood level rim of any fixture, receptor or device served.

Reason: Installation of different types of vacuum breakers within this section conflicts with published manufacturer installation instructions. Manufacturer literature recommends 12 inch installation above downstream piping and outlets for PVB's and SVB's for most conditions. This provides adequate protection of the water supply and ensures protection of public health.

Cost Impact: The code change proposal will not increase the cost of construction.

P143-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

608.15.4-P-MOSS

P144 – 12
608.15.4.2

Proponent: Michael Moss, American Backflow Prevention Association (msmoss@utah.gov)

Revise as follows:

608.15.4.2 Hose connections. Sillcocks, hose bibbs, wall hydrants and other openings with a hose connection shall be protected by an atmospheric-type <u>vacuum breaker</u> or <u>a</u> pressure-type vacuum breaker <u>assembly</u> or a permanently attached hose connection vacuum breaker.

Exceptions:

1. This section shall not apply to water heater and boiler drain valves that are provided with hose connection threads and that are intended only for tank or vessel draining.
2. This section shall not apply to water supply valves intended for connection of clothes washing machines where backflow prevention is otherwise provided or is integral with the machine.

Reason: To provide consistent terminology throughout the code for reference and comparison.

Cost Impact: The code change proposal will not increase the cost of construction.

P144-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

608.15.4.2-P-MOSS

P145 – 12
608.15.4.3 (New)

Proponent: Bob Scott, Kye Lehr and Robert Gallegos, Colorado Department of Regulatory Agencies, Division of Registrations Electrical and Plumbing Boards

Add new text as follows:

<u>**608.15.4.3 Urinal Flushometers.** Integral vacuum breakers for urinal flushometers shall be located with the critical level located not less than 6 inches (152 mm) above the highest portion of the fixture.</u>

Reason: This added verbiage will remove confusion on installation of flushometers on urinals where the critical level must be a located at least 6 inches above the top of the fixture.

Cost Impact: None.

P145-11

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

608.15.4.3 (NEW)-P-SCOTT-LEHR-GALLEGOS

P146 – 12
608.16.2

Proponent: Michael Moss, American Backflow Prevention Association (msmoss@utah.gov)

Revise as follows:

608.16.2 Connections to boilers. ~~The potable supply to the boiler shall be equipped with a backflow preventer with an intermediate atmospheric vent complying with ASSE 1012 or CSA B64.3. Where conditioning chemicals are introduced into the system,~~ The potable water connection <u>to a boiler</u> shall be protected by an *air gap* or a reduced pressure principle backflow preventer complying with ASSE 1013, CSA B64.4 or AWWA C511.

Reason: These assemblies are designed and sold for high-health hazard installations according to manufacturer specification sheets. They are adequate for chemical additions or injections. Reference in Section 608.15.3 and Section 608.16.2.

Cost Impact: The code change proposal will not increase the cost of construction.

P146-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

608.16.2-P-MOSS

P147 – 12
610.1

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

610.1 General. New ~~or repaired~~ potable water systems shall be purged of deleterious matter and disinfected prior to utilization. The method to be followed shall be that prescribed by the health authority or water purveyor having jurisdiction or, in the absence of a prescribed method, the procedure described in either AWWA C651 or AWWA C652, or as described in this section. This requirement shall apply to "on-site" or "in-plant" fabrication of a system or to a modular portion of a system.

1. The pipe system shall be flushed with clean, potable water until dirty water does not appear at the points of outlet.
2. The system or part thereof shall be filled with a water/chlorine solution containing not less than 50 parts per million (50 mg/L) of chlorine, and the system or part thereof shall be valved off and allowed to stand for 24 hours; or the system or part thereof shall be filled with a water/chlorine solution containing not less than 200 parts per million (200 mg/L) of chlorine and allowed to stand for 3 hours.
3. Following the required standing time, the system shall be flushed with clean potable water until the chlorine is purged from the system.
4. The procedure shall be repeated where shown by a bacteriological examination that contamination remains present in the system.

Reason: The current language seems to suggest that anytime a general repair is made to a potable water system that the entire system must then be disinfected. For example, one riser valve in a 35 story high rise is repaired or replaced. Is it the intent of the code to then require the entire potable water system to be disinfected? Repairs should not trigger the need for disinfection of an entire water system.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P147-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

610.1-P-STRAUSBAUGH.PMGCAC

P148– 12
613.1, 613.2 (New), 613.3 (New)

Proponent: Ron George, CPD, Plumb-Tech Design & Consulting Services LLC, representing himself (Ron@Plumb-TechLLC.com)

Revise as follows:

613.1 Master water temperature-actuated mixing valves. ~~Temperature actuated mixing valves, which are installed to reduce water temperatures to defined limits, shall comply with ASSE1017.~~ Where a master water temperature-actuated mixing valve is installed to control the hot water temperature to specified limits, it shall be located at the water heater. The piping from the hot water outlet of the water heater to the mixing valve shall be have a mechanical heat trap installed or the piping shall be configured in a heat trap piping arrangement that drops not less than 24 inches (610mm) before rising to connect to the mixing valve. A shut off valve shall be installed in the piping before each inlet and after the outlet of the mixing valve. A water temperature indicating device shall be installed in the outlet piping and shall be located within six feet (1829 mm) of the outlet of the mixing valve. The mixing valve shall be sized for the maximum and minimum anticipated flows in accordance with the manufacturer's sizing instructions or generally accepted engineering guidelines. Master water temperature-actuated mixing valves shall comply with ASSE 1017 and shall be installed in accordance with the manufacturer's instructions.

613.2 Point-of-use water temperature-actuated mixing valves. Point-of-use water temperature-actuated mixing valves installed for the purpose of limiting the water temperature at a sink, lavatory or group of lavatories shall comply with ASSE 1070 or CSA B125.3. A shutoff valve shall be installed in the piping to each inlet of the mixing valve. The mixing valve shall be sized in accordance with the manufacturer's sizing instructions for the maximum and minimum anticipated flows. Point-of use water temperature mixing valves shall be installed in accordance with the manufacturer's instructions.

613.3 Temperature-actuated mixing valves for gang showers. Temperature-actuated mixing valves installed for the purpose of limiting the water temperature to gang showers shall comply with Section 424.4. A shut off valve shall be installed in the piping before each inlet and after the outlet of the mixing valve. A water temperature measuring device shall be installed in the piping at the shower valve that is nearest to the mixing valve. The temperature indicator for the water temperature measuring device shall shall be located within six feet (1829 mm) of the mixing valve. The mixing valve shall be sized and installed in accordance with the manufacturer's sizing and installation instructions for the maximum and minimum anticipated flows or generally accepted engineering practices.

Reason: Language was needed addressing the installation of thermostatic mixing valves in domestic hot water systems. For master mixing valves a temperature gauge is needed to see what the valve is mixing to. For local mixing valves no temperature gauge is needed because water temperatures can be tested at a nearby fixture. Gang showers need a temperature gauge at the valve, because it is often remote from the showers in school, prison or jail applications.

Cost Impact: The code change proposal will not increase the cost of construction. These mixing valve devices are not mandatory so there is no increase in cost. This code language gives guidance by listing the appropriate industry standards to comply with only when these devices are installed.

Add text as follows:

SECTION 614
WELL PUMPS AND TANKS USED FOR PRIVATE POTABLE WATER SYSTEMS

614.1 Pumps. Well pumps used for potable water shall comply with Sections 614.1.1 and 614.1.2

614.1.1 Pump installation. Pumps shall be installed for operation without repriming or breaking suction. Pumps shall be connected to the well head by means of a union, companion flange or compression coupling in such a manner that it is accessible for maintenance, repair and removal.

614.1.2 Pump sizing. The minimum pump well pump size shall be determined in accordance with Table 614.1.2

TABLE 614.1.2
MINIMUM PRIVATE POTABLE WATER SYSTEM PUMP SIZE

	NUMBER OF BATHROOMS IN BUILDING[b]				
	1	1 to 1 ½	2 to 2 ½	3 to 4	5 to 6
MINIMUM PUMP SIZE[a]	7 gpm	10 gpm	14 gpm	17 gpm	21 gpm

a. Values shown are average and do not include high or low extremes.
b. Installations over 6 bathrooms shall be approved by the code official.

614.2 Pressure tanks. Pressure tanks relying on expansion of a flexible membrane within a restricting container or tanks with direct water-to-air interface to provide pressure in the water system shall be used. Pressure tanks for storing potable water under pressure, including those having an air-space for pressure for expansion, shall be identified by a seal, label or plate indicating the manufacturer's name and model number. Tanks shall comply with all of the following:

1. Pressure tank drawdown shall be not less than of 1 gallon (3.8 L) for every gallon per minute produced by the pump.

   Exception: Pump start applications, constant pressure devices and variable speed pumps.

2. Pressure tanks shall be constructed of steel, fiberglass or comparable materials. Tanks to be buried shall be designed by the manufacturer for underground use. Fiberglass or other nonmetallic tanks to be buried shall have the structural strength to prevent collapse.

614.3 Piping. Piping associated with pumps and tanks shall comply with Sections 614.3.1 through 614.3.3.

614.3.1 Drop pipe. The drop pipe from the submersible pump to the first fitting past the well seal shall be either galvanized steel, stainless steel or PVC Schedule 80 threaded/coupled or lock joint pipe. The drop pipe for a single pipe, deep well jet pump shall be either galvanized steel or stainless steel. The drop pipe for a double pipe, deep well jet pump shall be either galvanized steel on the suction side and or minimum PVC schedule 40 on the pressure side.

614.3.2 Pump discharge pipe sizing. For submersible pumps, pipe size shall be equal to the pump discharge. Piping for all other types of pumps shall be sized in accordance with the pump manufacturer's specifications.

612.3.3 Pressure tank pipe sizing. Piping size for the offset of the pressure tank shall use the piping friction loss charts for the piping material used.

614.4 Electrical wiring. Wiring shall be installed in accordance with Chapter 27 of the *International Building Code.*

614.5 Disinfection. The pump installer shall disinfect the potable well and water system in accordance with Section 610.

614.6 Valves. A pressure relief valve shall be installed on pumping systems that can produce pressures of 75 psi (517 kPa) or greater. A check valve shall be installed at the well head of submersible pumps.

Reason: Provides prescriptive requirements for wells for private potable water systems

Cost Impact: There is a cost impact.

Proponent: Edward R. Osann, Natural Resources Defense Council, representing self (eosann@nrdc.org); Harry Misuriello, American Council for an Energy-Efficient Economy, representing himself (misuriello@verizon.net)

Add new definitions as follows:

WATER METER. A device that measures the volume of water supplied from a public water main to a building or to an irrigated landscape and that is used by a public water supplier to bill for water.

WATER SUB-METER. A device, other than a *water meter*, installed on a water distribution pipe or makeup water pipe that measures the volume of water supplied to a specified space or specified equipment within a building or at the building site.

Add new text as follows:

SECTION 614
WATER SUB-METERS

614.1 General. *Water sub-meters* shall be installed on sources of water and applications of water in accordance with this section. Such *water sub-meters* shall be installed in accordance with the manufacturer's installation instructions.

614.2 Sources requiring the installation of a water sub-meter. Each source of water at the building or building site intended for beneficial use shall be separately measured with a *water sub-meter*.

> **Exception:** A *water sub-meter* shall not be required for a source of water supplied to a building or building site through a *water meter*.

614.2.1 Sump pump discharge. A *water sub-meter* shall be installed on the discharge pipe serving a *sump pump*.

614.3 Applications requiring the installation of a water sub-meter. A *water sub-meter* shall be installed on a water distribution pipe that is connect to any of the following applications:

1. Automatically controlled irrigation systems serving irrigated landscapes having a combined area exceeding 2,500 ft^2 (232 m^2).
2. Cooling tower makeup water supply and blow-down water supply.
3. Evaporative coolers designed to operate with an average flow rate of more than 0.6 gpm (2.3 Lpm).
4. Fluid coolers and chillers that do not utilize closed-loop recirculation.
5. Industrial processes with a design requirement for more than 1,000 gallons (3785 L) of water per day.
6. Makeup water supplied to closed-loop cooling systems that have a rated cooling capacity of 50 tons or more.
7. Makeup water supplied to closed-loop heating systems that have a rated heating capacity of 500,000 BTU/h (146.5 kW/hr) or more.
8. Makeup water supplied to onsite water collection systems.
9. Outdoor ornamental water features with a permanently installed water supply.
10. Pools and in-ground spas, whether indoor or outdoor.
11. Roof spray systems for the irrigation of vegetated roofs or for thermal conditioning of roofs.
12. Steam boilers that have a rating of 500,000 BTU/h (146.5 kW/hr) or more.

13. Tenant spaces with a design requirement for more than 1,000 gallons (3785 L) of water per day.

614.3.1 Point of Measurement. *Water sub-meters* shall be installed at a point in the water supply system that is downstream of any connection to any other application.

614.3.2 Multiple appliances and equipment. Multiple appliances and equipment performing a single application shall be permitted to be grouped and supplied from piping connected to a single *water sub-meter*.

614.4 Requirements for water sub-meters. The *water sub-meters* required by this section shall be capable of communicating water consumption data remotely, be capable of providing daily data with electronic data storage, and have reporting capability that can produce reports that show daily, monthly, and annual water consumption.

Reason:

1. The main reasons to measure sources and applications of water include: quantify the production of on-site sources of water; identify major sub-metered uses; quantify use to determine efficiency; and identify leaks and equipment problems. Daily reporting capability will allow for prompt remediation of equipment problems and reduced duration of water loss and property damage due to leaks and equipment failure.
2. Water utilities estimate unmetered water consumption is reduced 15 to 30 percent when metering is implemented.
3. According to USEPA's WaterSense, as much as 50 percent of commercial and residential irrigation water use goes to waste due to evaporation, wind, improper system design, or overwatering. Without metering outdoor uses, that use and potential waste cannot be identified.
4. This will also bring this part of the plumbing code into alignment with ASHRAE 189.1, reducing confusion.
5. This proposal is substantially similar to language approved for the IGCC in November, 2011 (submitted by Bill Hoffman); additional language is provided here for additional clarity and to further align with the IPC.

Cost Impact: The cost impact would be minor and would depend on the type of meters for each use. Meters that meet American Water Works Association (AWWA) standards and state regulatory requirements cost between $40 (residential size) to $2,000+ (industrial size). The estimated cost to install a sub-meter in new construction is $175. The National Multiple Family Sub-metering and Allocation Study cites $150 per meter. Additionally, according to Northland Investment Corp, water sub-meters can be installed for $125 to $175 per meter (see http://www.allbusiness.com/real-estate-rental-leasing/real-activities-related-to-real/680669-1.html) and as per the City of San Diego, it costs $150 - $300 per unit to install sub-meters in new construction (See http://www.sdnn.com/sandiego/2010-04-02/politics-city-county-government/city-council-to-consider-new-water-meter-rules#ixzz0jyvjUjrD).

P152 – 12
701.7

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C. representing self (JBEngineer@aol.com)

Delete without substitution:

~~**701.7 Connections.** Direct connection of a steam exhaust, blowoff or drip pipe shall not be made with the building drainage system. Waste water where discharged into the building drainage system shall be at a temperature not greater than 140°F (60°C). Where higher temperatures exist, *approved* cooling methods shall be provided.~~

Reason: This section was added to be consistent with Section 803.1. Section 803.1 dates back to the A40.8-1955 National Plumbing Code. The requirement for limiting the temperature of the hot water was based on concerns that temperatures above 140 degrees will remove the galvanizing from galvanized steel pipe. Today, there are numerous other piping materials used for sanitary drainage systems. Most piping materials can handle waste temperatures in excess of 140 degrees.

The last sentence has no meaning since there are no approved cooling methods identified. The common method is adding cold water to the waste stream. However, this is an unnecessary waste of water.

Cost Impact: This change does not increase the cost of construction.

P152-12

	Assembly:	ASF	AMF	DF

701.7-P-BALLANCO

P153 – 12

Table 702.1, Table 702.2, Table 702.4, Chapter 14

Proponent: Brian Conner, Charlotte Pipe and Foundry Company (bconner@charlottepipe.com)

Revise as follows:

TABLE 702.1
ABOVE-GROUND DRAINAGE AND VENT PIPE

MATERIAL	STANDARD
Chlorinated polyvinyl chloride (CPVC) plastic pipe	ASTM F 2618

(Portions of table not shown remain unchanged)

TABLE 702.2
UNDERGROUND BUILDING DRAINAGE AND VENT PIPE

MATERIAL	STANDARD
Chlorinated polyvinyl chloride (CPVC) plastic pipe	ASTM F 2618

(Portions of table not shown remain unchanged)

TABLE 702.4
PIPE FITTINGS

MATERIAL	STANDARD
Chlorinated polyvinyl chloride (CPVC) plastic	ASTM F 2618

(Portions of table not shown remain unchanged)

Add new standard to Chapter 14 as follows:

ASTM
F 2618-09 Standard for Chlorinated Poly (Vinyl Chloride) (CPVC) Pipe and Fittings for Chemical waste Drainage Systems

Reason: CPVC Chemical waste pipe has been used in hundreds of installations throughout the country without the presence of standard or inclusion in the code. Adding this consensus standard to the code to the tables indicated takes the guesswork out of the hands of the code officials as to whether they should allow it as an alternative material.

Cost Impact: This proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASTM F 2618-09 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P154 – 12
701.10 (New)

Proponent: William (Bill) LeVan, Cast Iron Soil Pipe Institute representing self

Add new text as follows:

701.10 Inspections. Where sanitary drainage piping penetrates a fire resistance rated wall, a fire resistance rated floor or a fire resistance rated ceiling, the piping shall be inspected before and after the installation of fire stopping material to verify that the piping system has not been modified.

Reason: This change is proposed to assure that the installation of the piping is not altered during the installation of fire stopping materials.

Cost Impact: The code change proposal will not increase the cost of construction

P154-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

701.10 (NEW)-P-LEVAN

P155 – 12/13
702.5 (New), 803.1

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., representing self

Revise as follows:

702.5 Temperature rating. Where the wastewater temperature will be greater than 140°F (60°C), the sanitary drainage piping material shall be rated for the highest temperature of the wastewater.

~~**803.1 Waste water temperature.** Steam pipes shall not connect to any part of a drainage or plumbing system and water above 140°F (60°C) shall not be discharged into any part of a drainage system. Such pipes shall discharge into an indirect waste receptor connected to the drainage system.~~

Reason: Section 803.1 dates back to the A40.8-1955 National Plumbing Code. The requirement for limiting the temperature of the hot water was based on concerns that temperatures above 140 degrees will remove the galvanizing from galvanized steel pipe. Today, there are numerous other piping materials used for sanitary drainage systems. Most piping materials can handle waste temperatures in excess of 140 degrees.

In the 1950's, the means of cooling waste water was the addition of cold water. This is a waste of water that the code no longer permits.

Cost Impact: This change does not increase the cost of construction.

	Assembly:	ASF	AMF	DF

702.5 (NEW)-BALLANCO

P156 – 12
702.7

Proponent: William (Bill) LeVan, Cast Iron Soil Pipe Institute, representing self

Add new text as follows:

702.7 Cast iron soil pipe, fittings and mechanical joint hubless couplings. Upon request by the code official, certificates of conformance shall be provided by the manufacturer to the code official indicating that cast iron pipe, cast iron fittings and mechanical joint hubless couplings are in compliance with Sections 705 and 702.

Reason: This will ensure the purchaser and/or owner meet or exceed the requirements of the code and manufacturer requirements.

P156-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

702.7 (NEW)-P-LEVAN

P157 – 12
703.1

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee, the Virginia Plumbing and Mechanical Inspectors Association (VPMIA), the Virginia Building Code Officials Association (VBCOA) and ICC Region 7.

Revise as follows:

703.1 Building sewer pipe near the water service. ~~Where the building sewer is installed within 5 feet (1524 mm) of the water service, the installation shall comply with the provisions of Section 603.2.~~ The proximity of a sewer to a water service shall comply with Section 603.2.

Reason: This section only triggers Section 603.2 if the sewer is 5 feet or less from the water service. If the building sewer and water service are more than 5 foot apart, the reader is not referred back to Section 603.2 which requires that the separation be of undisturbed or compacted earth. In other words, Section 703.1 would allow for a building sewer and water service to be in a wide trench without undisturbed/compacted earth between. This would violate the requirements of Section 603.2. The solution to this problem is simply to refer the reader back to the section that requires the separation so that there is no question that the five foot of separation is of compacted or undisturbed earth.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P157-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

703.1-P-STRAUSBAUGH.PMGCAC

P158 – 12
703.6 (New), 1109, 1109.1

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C. representing self (JBEngineer@aol.com)

Add new text as follows:

<u>**703.6 Combined sanitary and storm public sewer.** Where the public sewer is a combined system for both sanitary and storm water, the sanitary sewer shall be connected independently to the public sewer.</u>

Revise as follows:

SECTION 1109
COMBINED SANITARY AND STORM ~~SYSTEM~~ <u>PUBLIC SEWER</u>

1109.1 ~~**Size of combined drains and sewers.** The size of a combination sanitary and *storm drain* or se*wer s*hall be computed in accordance with the method in Section 1106.3. The fixture units shall be converted into an equivalent projected roof or paved area. Where the total fixture load on the combined drain is less than or equal to 256 fixture units, the equivalent drainage area in horizontal projection shall be taken as 4,000 square feet (372 m2). Where the total fixture load exceeds 256 fixture units, each additional fixture unit shall be considered the equivalent of 15.6 square feet (1.5 m2) of drainage area. These values are based on a rainfall rate of 1 inch (25 mm) per hour.~~ <u>**General.** Where the public sewer is a combined system for both sanitary and storm water, the storm sewer shall be connect independently to the public sewer.</u>

Reason: The section on combined sanitary and storm systems implies that the two systems are combined inside the building. Hence, the need for some language to reflect how the combined piping is sized. However, when a combined sewer is only available, the connections are made separately to the public sewer. The combined system is in the street. Only older cities have combined sewers. Even these cities strive to separate the sewers. As such, the building connection must be separate to allow for the easy change over to a two sewer system.

The proposed change adds a requirement to Chapter 7 since there is no text regarding combined system. The text in Chapter 11 is modified to be consistent with the proposed new text in Chapter 7.

Cost Impact: This change does not increase the cost of construction.

P158-12

	Assembly:	ASF	AMF	DF

703.6 (NEW)-P-BALLANCO

P159 – 12

705 (New)

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Add new text as follows:

SECTION 705
REPLACEMENT OF UNDERGROUND SEWERS
BY PIPE BURSTING METHODS

705.1 General. This section shall govern the replacement of existing building sewer piping by pipe-bursting methods.

705.2 Applicability. The replacement of building sewer piping by pipe bursting methods shall be limited to gravity drainage piping of sizes 6 inches and smaller. The replacement piping shall be of the same nominal size as the existing piping.

705.3 Pre-installation inspection. The existing piping sections to be replaced shall be inspected internally by a recorded video camera survey. The survey shall include notations of the position of cleanouts and the depth of connections to the existing piping.

705.4 Pipe. The replacement piping shall be of extra high molecular weight PE3408 material and shall be manufactured with an SDR of 17 and in compliance with ASTM F 714.

705.5 Pipe fittings. Pipe fittings to be connected to the replacement piping shall be of extra high molecular weight PE3408 material and shall be manufactured with an SDR of 17 and in compliance with ASTM D2683.

705.6 Cleanouts. Where the existing building sewer did not have cleanouts meeting the requirements of this code, cleanout fittings shall be installed as required by this code.

705.7 Installation procedure. The installation procedure shall be in accordance with the following steps:

1. The existing pipe section to be replaced shall be cleaned of debris.
2. The beginning and end of the piping section to be replaced shall be exposed as necessary to enable pulling equipment to be properly installed and the replacement piping to be inserted without bending of the pipe at less than the minimum allowable bending radius as recommended by the pipe manufacturer.
3. A pulling cable shall be retrieved from the pulling end of the piping to be replaced and pulled to the insertion end of the piping to be replaced.
4. A pipe bursting and pulling head shall be connected to one end of the replacement piping. The bursting/pulling head shall be connected to the pulling cable.
5. In accordance with the pulling equipment and pipe bursting head manufacturer's operating instructions, the pipe bursting/pulling head shall be simultaneously operated and pulled through the existing piping until the end of the new piping exits at the pulling end of the operation.
6. The pipe bursting/pulling head shall be disconnected from the new piping and the pulling equipment removed from the area. The replacement piping ends shall be cut to length as required and shall be connected to the existing piping beyond the pipe section that was replaced. Connections to the ends of the replacement piping shall be in accordance with Section 705.
7. Where a connection to the replacement piping at a point between the pulling end and the insertion end of the pipe section that was replaced is required, the replacement piping shall be exposed at that location. A section of replacement piping shall be removed and a fitting of the appropriate configuration in accordance with Table 706.3 shall be installed. The connections between the fitting and the pipe shall be made in accordance with Section 705.16.

705.8 Post-installation inspection. The completed replacement piping section shall be inspected internally by a recorded video camera survey. The video survey shall be reviewed and approved by the code official prior to pressure testing of the replacement piping system.

705.9 Pressure testing. The replacement piping system as well as the connections to the replacement piping shall be tested in accordance with Section 312.

(Renumber subsequent sections)

Add new standards to Chapter 14 as follows:

ASTM

D2683-04	Standard Specification for Polyethylene Fittings for Outside Diameter Controlled Polyethylene Pipe and Tubing.
F 714-06a	Standard Specification for Polyethylene (PE) Plastic Pipe (SDR-PR) based on Outside Diameter.

Reason: The IPC lacks coverage concerning the replacement of sewer systems by pipe bursting methods. These methods are being widely used throughout the country. Proper guidance concerning this type of replacement provides additional value to the code.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

Analysis: A review of the standards proposed for inclusion in the code, ASTM F 714-06a and ASTM D2683-04 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P160 – 12
705.5.2

Proponent: William (Bill) LeVan, Cast Iron Soil Pipe Institute , representing self (blevan@mindspring.com)

Revise as follows:

705.5.2 Compression gasket joints. Compression gasket joints for hub and spigot pipe and fittings shall conform to ASTM 564 and shall be tested to ASTM 1563. <u>Prior to installation, g</u>askets shall be <u>lubricated with lubricant recommended by the pipe and fitting manufacturer. Gaskets shall be</u> compressed when the pipe is fully inserted.

Reason: To allow easier and better insertion of the gasket into the pipe or fitting

Cost Impact: The code change proposal will not affect the cost of construction.

P160-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

705.5.2-P-LEVAN

P161 – 12
705.5.3

Proponent: William (Bill) LeVan, Cast Iron Soil Pipe Institute representing self (blevan@mindspring.com)

Revise as follows:

705.5.3 Mechanical joint coupling. Mechanical joint couplings for hubless pipe and fittings shall consist of an elastomeric sealing sleeve and a metallic shield that comply with CISPI 310, ASTM C1277 or ASTM C1540. The elastomeric sealing sleeve shall conform to ASTM C564 or CSA B602 and shall be provided with a center stop. Mechanical joint couplings shall be installed in accordance with the manufacturer's installation instructions.

Reason: The metallic shield coupling provides protection for the elastomeric sealing sleeve and provides shear strength for the system.

Cost Impact: The code change proposal will not increase the cost of construction.

P161-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

705.5.3-P-LEVAN

P162 – 12
705.7, 705.7.1, 705.7.2

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Delete without substitution:

~~**705.7 Coextruded composite ABS pipe, joints.** Joints between coextruded composite pipe with an ABS outer layer or ABS fittings shall comply with Sections 705.7.1 and 705.7.2.~~

~~**705.7.1 Mechanical joints.** Mechanical joints on drainage pipe shall be made with an elastomeric seal conforming to ASTM C1173, ASTM D 3212 or CSA B602. Mechanical joints shall not be installed in above-ground systems, unless otherwise approved. Joints shall be installed in accordance with the manufacturer's instructions.~~

~~**705.7.2 Solvent cementing.** Joint surfaces shall be clean and free from moisture. Solvent cement that conforms to ASTM D 2235 or CSA B181.1 shall be applied to all joint surfaces. The joint shall be made while the cement is wet. Joints shall be made in accordance with ASTM D 2235, ASTM D 2661, ASTM F 628 or CSA B181.1. Solvent cement joints shall be permitted above or below ground.~~

Reason: ABS pipe can be made by several different methods. The manufacturing method of an ABS pipe has nothing to do with how the pipe is joined. All forms of ABS pipe are joined by the joining method for ABS pipe, Section 705.2. These sections are redundant and should be deleted.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. 	Assembly:	ASF	AMF	DF

705.8-P-STRAUSBAUGH.PMGCAC

P164 – 12
705.8.2, 705.14.2

Proponent: Michael Cudahy, Plastic Pipe and Fittings Association (mikec@cmservnet.com)

Revise as follows:

705.8.2 Solvent cementing. Joint surfaces shall be clean and free from moisture. A purple primer that conforms to ASTM F 656 shall be applied. Solvent cement not purple in color and conforming to ASTM D2564, CSA B137.3, CSA B181.2 or CSA B182.1 shall be applied to all joint surfaces. The joint shall be made while the cement is wet and shall be in accordance with ASTM D 2855. Solvent-cement joints shall be permitted above or below ground.

Exception: A primer is not required where both of the following conditions apply:

1. The solvent cement used is third-party certified as conforming to ASTM D 2564.
2. The solvent cement is used only for joining PVC drain, waste and vent pipe and fittings in non-pressure applications in sizes up to and including 4 inch (102 mm) in diameter.

705.14.2 Solvent cementing. Joint surfaces shall be clean and free from moisture. A purple primer that conforms to ASTM F 656 shall be applied. Solvent cement not purple in color and conforming to ASTMD2564, CSA B137.3, CSA B181.2 or CSA B182.1 shall be applied to all joint surfaces. The joint shall be made while the cement is wet and shall be in accordance with ASTM D 2855. Solvent-cement joints shall be permitted above or below ground.

Exception: A primer is not required where both of the following conditions apply:

1. The solvent cement used is third-party certified as conforming to ASTM D 2564.
2. The solvent cement is used only for joining PVC drain, waste and vent pipe and fittings in non-pressure applications in sizes up to and including 4 inch (102 mm) in diameter

Reason: To introduce an exception in chapter 7, Sanitary Drainage, allowing for the practice of one-step solvent cementing of non-pressure DWV systems 4" and under.

This exception allows for an optional one-step procedure for joining non-pressure DWV PVC piping systems 4" in diameter and below with solvent cement conforming to ASTM D 2564. This method is practiced, and the code should include specific language to indicate when it is acceptable.

Pressure testing completed by NSF International has shown that solvent cement conforming to ASTM D 2564, when used without primer on PVC DWV pipe and fittings, both solid wall and cell core, generates bonding forces well in excess of what is required for these systems. The strength of the joint often exceeds the pipe and fitting pressure capacity.

705.9, 705.9.1, 705.9.2, 705.9.3, 705.9.4, 705.9.5, 705.10, 705.10.1, 705.10.2, 705.10.3

Proponent: Pennie L. Feehan, Pennie L. Feehan Consulting representing The Copper Development Association (penniefeehan@me.com)

Revise as follows:

705.9 Copper pipe and tubing. Joints between copper or copper-alloy pipe, tubing, and ~~or~~ fittings shall comply with one of the methods indicated in Sections 705.9.1 through 705.9.5.

705.9.1 Brazed joints. Brazed joints between copper pipe or tubing and fittings shall be made with a brazing alloy having a liquid temperature exceeding 1000˚F (538˚C). ~~All~~ Joint surfaces to be brazed shall be cleaned bright by manual or mechanical means. The ends of pipe or tubing shall be cut square and shall be reamed to the full inside diameter. Burrs on the outside end of the pipe or tubing shall be removed. Where required by the brazing alloy manufacturer's instructions, an approved brazing flux shall be applied to the joint surfaces. The joint shall be brazed with a brazing filler metal conforming to AWS A5.8. Brazing filler metal shall be applied at the point where the pipe or tubing enters the socket of the fitting.

705.9.2 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer's instructions. Mechanical joints shall include compression type, flanged type, grooved type and press type.

705.9.3 Soldered joints. Solder joints between copper pipe or tubing and fittings shall be made in accordance with the methods of ASTM B 828 with the following sequence of joint preparation and operation: measuring and cutting, reaming, cleaning, fluxing, assembly and support, heating, applying the solder, cooling and cleaning. ~~All cut~~ The ends of pipe or tub~~e~~ing shall be cut square and shall be reamed to the full inside diameter of the pipe or tub~~e~~ing. ~~end.~~ Burrs on the outside end of the pipe or tubing shall be removed. ~~All~~ Joint surfaces to be soldered shall be cleaned bright by manual or mechanical means. ~~A~~ Flux conforming to ASTM B 813 shall be applied to the pipe or tubing and fittings. Such flux shall be noncorrosive and nontoxic after soldering. ~~be applied.~~ Pipe or tubing shall be inserted to the base of the fitting. Excess flux shall be removed from the exterior of the joint. The assembled joint shall be supported to create a uniform capillary space around the joint. An LP gas or acetylene air /fuel torch shall be used to apply heat to the assembled joint. The heat shall be applied with the flame perpendicular to the pipe or tubing. The flame shall be moved alternately between the fitting cup and the pipe or tubing. Solder in compliance with ASTM B 32 shall be applied to the joint surfaces until capillary action draws the molten solder into the cup of the fitting. ~~The joint shall be soldered with a solder conforming to ASTM B 32.~~ The soldered joint shall not be disturbed until cool. Remaining flux residue shall be cleaned from the exterior of the joint.

705.9.4 Threaded joints. Threads shall conform to ASME B1.20.1. Pipe-joint compound or tape shall be applied on the male threads only.

705.9.5 Welded joints. ~~All~~ Welded joint surfaces shall be cleaned. The joint shall be welded with ~~an~~ *approved* filler metal.

~~**705.10 Copper tubing.** Joints between copper or copper alloy tubing or fittings shall comply with Sections 705.10.1 through 705.10.3.~~

~~**705.10.1 Brazed joints.** All joint surfaces shall be cleaned. An *approved* flux shall be applied where required. The joint shall be brazed with a filler metal conforming to AWS A5.8.~~

~~**705.10.2 Mechanical joints.** Mechanical joints shall be installed in accordance with the manufacturer's instructions.~~

~~**705.10.3 Soldered joints.** Solder joints shall be made in accordance with the methods of ASTM B 828. All cut tube ends shall be reamed to the full inside diameter of the tube end. All joint surfaces shall be cleaned. A flux conforming to ASTM B 813 shall be applied. The joint shall be soldered with a solder conforming to ASTM B 32.~~

(Renumber subsequent sections)

Reason: The above language combines pipe and tubing into one section and provides the joining methods of copper and copper alloys as referenced in Table 702.4. In addition, important language from the standards has been added to aid the end user.

Cost Impact: This code change will not increase the cost of construction.

AS SUBMITTED:

P_________ – 12

705.9, 705.9.1, 705.9.2, 705.9.3, 705.9.4, 705.9.5, 705.10, 705,10.1, 705.10.2, 705.10.3

Proponent: Pennie L. Feehan, Pennie L. Feehan Consulting representing The Copper Development Association

Revise as follows:

705.9 Copper pipe and tubing. Joints between copper or copper-alloy pipe, tubing, and ~~or~~ fittings shall comply with Sections 705.9.1 through 705.9.5

705.9.1 Brazed joints. Brazed joints between copper pipe or tubing and fittings shall be made with brazing alloys having a liquid temperature above 1000˚F (538˚C). All joint surfaces to be brazed shall be cleaned bright by either manual or mechanical means. Tubing shall be cut square and reamed to full inside diameter. An approved brazing flux shall be applied to the joint surfaces where required by manufacturer's recommendation. The joint shall be brazed with a brazing filler metal conforming to AWS A5.8. Brazing filler metal and shall be applied at the point where the pipe or tubing enters the socket of the fitting.

705.9.2 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer's instructions. Joints shall include compression, flanged, grooved, press, and threaded.

705.9.3 Soldered joints. Solder joints between copper pipe or tubing and fittings shall be made in accordance with the methods of ASTM B 828 with the following sequence of joint preparation and operation as follows: measuring and cutting, reaming, cleaning, fluxing, assembly and support, heating, applying the solder, cooling and cleaning. ~~All cut~~ Pipe or tub~~e~~ing ~~ends~~ shall be cut square and reamed to the full inside diameter including the removal of burrs on the outside of the pipe and tub~~e~~ing. ~~end.~~ ~~All~~ Joint surfaces to be joined shall be cleaned bright by manual or mechanical means. ~~A f~~Flux shall be applied to pipe or tubing and fittings and shall be in accordance with ~~conforming to~~ ASTM B 813 and shall become noncorrosive and nontoxic after soldering ~~be applied~~. Insert pipe or tubing into the base of the fitting and remove excess flux. Pipe or tubing and fitting shall be supported to ensure a uniform capillary space around the joint. Heat shall be applied using an air or fuel torch with the flame perpendicular to the pipe or tubing using acetylene or an LP gas. Preheating shall depend on the size of the joint. The flame shall be moved to the fitting cup and alternate between the pipe or tubing and fitting. The joint shall be soldered with a solder in accordance with ~~conforming to~~ ASTM B 32 and shall be applied to the joint surfaces until capillary action draws the molten solder into the cup. Joint surfaces shall not be disturbed until cool and any remaining flux residue shall be cleaned.

705.9.4 Threaded joints. Threads shall conform to ASME B1.20.1. Pipe-joint compound or tape shall be applied on the male threads only.

705.9.5 Welded joints. ~~All~~ Welded joint surfaces shall be cleaned. The joint shall be welded with ~~an~~ approved filler metal.

~~**705.10 Copper tubing.** Joints between copper or copper alloy tubing or fittings shall comply with Sections 705.10.1 through 705.10.3.~~

~~**705.10.1 Brazed joints.** All joint surfaces shall be cleaned. An *approved* flux shall be applied where required. The joint shall be brazed with a filler metal conforming to AWS A5.8.~~

~~**705.10.2 Mechanical joints.** Mechanical joints shall be installed in accordance with the manufacturer's instructions.~~

~~**705.10.3 Soldered joints.** Solder joints shall be made in accordance with the methods of ASTM B 828. All cut tube ends shall be reamed to the full inside diameter of the tube end. All joint surfaces shall be cleaned. A flux conforming to ASTM B 813 shall be applied. The joint shall be soldered with a solder conforming to ASTM B 32.~~

Renumber subsequent sections

Reason: The above language combines pipe and tubing into one section and provides the joining methods of copper and copper alloys as referenced in Table 702.4. In addition, important language from the standards has been added to aid the end user.

705.9-FEEHAN

P166 – 12
706.3, Table 706.3

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee (Sstrausbaugh@arlingtonva.us)

Delete and substitute as follows:

~~**706.3 Installation of fittings.** Fittings shall be installed to guide sewage and waste in the direction of flow. Change in direction shall be made by fittings installed in accordance with Table 706.3. Change in direction by combination fittings, side inlets or increasers shall be installed in accordance with Table 706.3 based on the pattern of flow created by the fitting. Double sanitary tee patterns shall not receive the discharge of back-to-back water closets and fixtures or appliances with pumping action discharge.~~

> ~~**Exception:** Back-to-back water closet connections to double sanitary tees shall be permitted where the horizontal developed length between the outlet of the water closet and the connection to the double sanitary tee pattern is 18 inches (457 mm) or greater.~~

706.3 Installation of fittings. Changes in the direction of flow in drainage piping shall be made by fittings installed in an orientation that directs the drainage in the direction of flow. The following are prohibited applications of fittings:

1. A cast iron quarter bend or short sweep elbow smaller than 3 inches shall not be used for a vertical-to-horizontal or horizontal-to-horizontal change in direction of flow except where conveying flow from a single fixture drain.
2. A cast iron quarter bend or short sweep elbow that is 3 inches and larger shall not be used for a horizontal-to-horizontal change in direction of flow.
3. A plastic quarter bend elbow smaller than 3 inches, other than a long sweep quarter bend elbow, shall not be used for a vertical-to-horizontal or horizontal-to-horizontal change in direction of flow except where conveying flow from a single fixture drain.
4. A plastic quarter bend elbow that is 3 inches and larger, other than a long sweep quarter bend elbow, shall not be used for a horizontal-to-horizontal change in direction of flow.
5. A heel inlet of a quarter bend elbow shall not receive the discharge from any fixture where the elbow receives the discharge of a water closet and changes the flow direction from vertical-to-horizontal .
6. A low-heel inlet of a quarter bend elbow shall not be used as a connection for a wet vent or wet vented fixture where the elbow changes the flow direction from vertical-to-horizontal.
7. The side inlet of a quarter bend elbow shall not be used as a drainage connection where the elbow changes the flow direction from horizontal to horizontal.
8. A sanitary tee shall not be used in an orientation where the run of the tee is in the horizontal plane, or an angle less than 45 degrees thereto, except where the branch of the tee serves as a dry vent.
9. A double sanitary tee shall not receive the discharge of water closets through both branches nor shall it receive pumped waste flow in either branch.

   Exception: Water closets shall be permitted to connect to both branches of a double sanitary tee where the horizontal developed length between the outlet of each water closet and the connection to the double sanitary tee is 18 inches (457 mm) or greater.

Reason: The existing section and accompanying table are unclear as to how the table is to be used and exactly what the prohibitions of fitting uses are. The problem is that the table is too limiting and does not address the materials of the fittings relative to the pattern (i.e. short sweep versus quarter bend). Also, the table doesn't address the use of a drainage fitting where a branch is used as vent connection (e.g. sanitary tee). The text proposed clearly indicates the specific prohibitions and uses in mandatory language.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P166-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

706.3-P-STRAUSBAUGH.PMGCAC

P167 – 12
707.1

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

707.1 Prohibited joints. The following types of joints and connections shall be prohibited:

1. Cement or concrete joints.
2. Mastic or hot-pour bituminous joints.
3. Joints made with fittings not *approved* for the specific installation.
4. Joints between different diameter pipes made with elastomeric rolling O-rings.
5. Solvent-cement joints between different types of plastic pipe.
6. Saddle-type fittings.
7. <u>Where a pipe or fitting is inserted inside of another pipe.</u>

Reason: This proposed new item intends to prevent the misapplication of fittings and pipe of all materials. The IRC already prohibits the installation of a 4 x 3 plastic closet flange into the inside of a 4 inch plastic pipe. (Section P3003.19) . The reason for this is that the internal diameter of DWV plastic pipe is not controlled during manufacturing which results in a non-uniform and sometimes wavy surface inside of the pipe. Such surface was never intended to be part of solvent welded joint. The inside surface of fitting sockets are precisely controlled during manufacturing because they are designed to be part of a solvent welded joint, but this is not for the ID of pipe. If pipe or fittings are misapplied by attempting solvent weld joints in the inside of pipe, poorly made joints will result which are mechanically weak and prone to failure or leakage in service. Leakage may not be detected during DWV testing because closet flanges are commonly installed *after* testing and also because a poorly made weak joint could survive the test and fail at a later time as the piping system expands and contracts, ages and moves from building settlement. This problem is not limited to closet flanges as installers have attempted to install other fittings such as wyes inside of pipe.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. 707.1-P-STRAUSBAUGH.PMGCAC

P168 – 12
708

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Delete and substitute as follows:

~~**SECTION 708**~~
~~**CLEANOUTS**~~

SECTION 708
CLEANOUTS

708.1 Cleanouts required. Cleanouts shall be provided for drainage piping in accordance with Sections 708.1.1 through 708.1.11.

708.1.1 Horizontal drains and building drains. Horizontal drainage pipes in buildings shall have cleanouts located at intervals of not more than 100 feet (30 480 mm). Building drains shall have cleanouts located at intervals of not more than100 feet (30 480 mm) except where manholes are used instead of cleanouts, the manholes shall be located at intervals of not more than 400 feet (122 m). The interval length shall be measured from the cleanout or manhole opening, along the developed length of the piping to the next drainage fitting providing access for cleaning, the end of the horizontal drain or the end of the building drain.

> **Exception:** Horizontal fixture drain piping serving a nonremovable trap shall not be required to have a cleanout for the section of piping between the trap and the vent connection for such trap.

708.1.2 Building sewers. Building sewers smaller than 8 inches (203 mm) shall have cleanouts located at intervals of not more than 100 feet (30 480 mm). Building sewers 8 inches (203 mm) and larger shall have a manhole located not more than 200 feet (60 960 mm) from the junction of the building drain and building sewer and at intervals of not more than 400 feet (122 m). The interval length shall be measured from the cleanout or manhole opening, along the developed length of the piping to the next drainage fitting providing access for cleaning, a manhole or the end of the building sewer.

708.1.3 Building drain and building sewer junction. The junction of the building drain and the building sewer shall be served by a cleanout that is located at the junction or within 10 feet (3048 mm) developed length of piping upstream of the junction. For the requirements of this section, the removal of water closet shall not be required to provide cleanout access.

708.1.4 Changes of direction. Where a horizontal drainage pipe, a building drain or a building sewer has a change of horizontal direction greater than 45 degrees (0.79 rad), a cleanout shall be installed at the change of direction. Where more than one change of horizontal direction greater than 45 degrees (0.79 rad) occurs within 40 feet (12 192 mm) of developed length of piping, the cleanout installed at the first change of direction shall serve as the cleanout for all changes in direction within that 40 feet (12 192 mm) of developed length of piping.

708.1.5 Cleanout size. Cleanouts shall be the same size as the piping served by the cleanout except cleanouts for piping larger than 4 inches (102 mm) need not be larger than 4 inches (102 mm).

> **Exceptions:**
>
> 1. A removable P- trap with slip or ground joint connections can serve as a cleanout for drain piping that is one size larger than the P-trap size.
> 2. Cleanouts located on stacks can be one size smaller than the stack size.

3. The size of cleanouts for cast-iron piping can be in accordance with the referenced standards for cast iron fittings as indicated in Table 702.4.

708.1.6 Cleanout plugs. Cleanout plugs shall be brass, plastic or other approved materials. Cleanout plugs for borosilicate glass piping systems shall be of borosilicate glass. Brass cleanout plugs shall conform to ASTM A74 and shall be limited for use only on metallic piping systems. Plastic cleanout plugs shall conform to the referenced standards for plastic pipe fittings as indicated in Table 702.4. Cleanout plugs shall have a raised square head, a countersunk square head or a countersunk slot head. Where a cleanout plug will have a trim cover screw installed into the plug, the plug shall be manufactured with a blind end threaded hole for such purpose.

708.1.7 Manholes. Manholes and manhole covers shall be of an approved type. Manholes located inside of a building shall have gas-tight covers that require tools for removal.

708.1.8 Installation arrangement. The installation arrangement of a cleanout shall enable cleaning of drainage piping only in the direction of drainage flow.

Exceptions:

1. Test tees serving as cleanouts.
2. A two-way cleanout installation that is approved for meeting the requirements of Section 708.1.3.

708.1.9 Required clearance. Cleanouts for 6-inch (153 mm) and smaller piping shall be provided with a clearance of not less than 18 inches (457 mm) from, and perpendicular to, the face of the opening to any obstruction. Cleanouts for 8-inch (203 mm) and larger piping shall be provided with a clearance of not less than 36 inches (914 mm) from, and perpendicular to, the face of the opening to any obstruction.

708.1.10 Cleanout access. Required cleanouts shall not be installed in concealed locations. For the purposes of this section, concealed locations include, but are not limited to, the inside of plenums, within walls, within floor/ceiling assemblies, below grade and in crawl spaces where the height from the crawl space floor to the nearest obstruction along the path from the crawl space opening to the cleanout location is less than 24 inches (610 mm). Cleanouts with openings at a finished wall shall have the face of the opening located within 1-1/2 inches (38 mm) of the finished wall surface. Cleanouts located below grade shall be extended to grade level so that the top of the cleanout plug is at or above grade. A cleanout installed in a floor or walkway that will not have a trim cover installed shall have a countersunk plug installed so the top surface of the plug is flush with the finished surface of the floor or walkway.

708.1.10.1 Cleanout plug trim covers. Trim covers and access doors for cleanout plugs shall be designed for such purposes and shall be approved. Trim cover fasteners that thread into cleanout plugs shall be corrosion resistant. Cleanout plugs shall not be covered with mortar, plaster or any other permanent material.

708.1.10.2 Floor cleanout assemblies. Where it is necessary to protect a cleanout plug from the loads of vehicular traffic, cleanout assemblies in accordance with ASME A112.36.2M shall be installed.

708.1.11 Prohibited use. The use of a threaded cleanout opening to add a fixture or extend piping shall be prohibited except where another cleanout of equal size is installed with the required access and clearance.

Reason: Section 708 is disorganized. For example, the second Section 708.2 discusses requirements for cleanout plugs. The more significant sections of the section are scattered throughout the remainder of the section in a disorganized fashion. This proposal reorganizes this section in a more logical format for ease of understanding.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P168-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

708-P-STRAUSBAUGH.PMGCAC

P169 – 12
708.4, 708.8

Proponent: Dennis Gardner, State of Colorado plumbing inspector representing self.

Revise as follows:

708.4 Concealed piping. Cleanouts on concealed piping or piping under a floor slab or in a crawl space of less than ~~24 inches (610 mm)~~ 36 inches (914 mm) in height or a plenum shall be extended through and terminate flush with the finished wall, floor or ground surface or shall be extended to the outside of the building. Cleanout plugs shall not be covered with cement, plaster or any other permanent finish material. Where it isnecessary to conceal a cleanout or to terminate a cleanout in an area subject to vehicular traffic, the covering plate, *access* door or cleanout shall be of an *approved* type designed and installed for this purpose.

708.8 Clearances. Cleanouts on ~~6-inch (153 mm)~~ 3 inches (76 mm) and smaller pipes shall be provided with a clearance of not less than 18 inches (457 mm) for rodding. ~~Cleanouts on 8-inch (203 mm) and larger pipes shall be provided with a clearance of not less than 36 inches (914 mm) for rodding.~~ *C*leanouts for piping 4 inches (102mm) and larger shall be provided with a working space in front of the cleanout and such waorkign space shall be not less than 36 inches (914 mm) wide by 36 inches (914 mm) high by 36 inches (914 mm) deep. Fixtures shall not encroach upon such working space.

Reason: The definition of *access* in regards to the location of a cleanout is inappropriate language for clearances for operating a cleaning machine without the risk of harm to the operator of the equipment or the property. I recently had a 4 inch cleanout between a wall and the water closet set 18 inches from the wall. It gives the 18 inches mandatory clearance in front as required by code but does not give adequate *access* to be used. You would think common sense would prevail but without the proper guidelines winning a battle with contractors, architects or engineers who have never worked in the field or won't admit they are wrong, makes the call impossible to enforce and the cleanout impossible to use. To just use the term (*Access* shall be provided to all cleanouts*) is grossly inadequate.*

None: The cleanouts are already required by code it is just making the code clearer insuring cleanouts are accessible for use as the code has intended.

P169-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

708.4-P-GARDNER

P170 – 12
712.3.2

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

712.3.2 Sump pit. The sump pit shall be not less than 18 inches (457 mm) in diameter and not less than 24 inches (610 mm) in depth, unless otherwise approved. The pit shall be accessible and located such that all drainage flows into the pit by gravity. The sump pit shall be constructed of tile, concrete, steel, plastic or other approved materials. The pit bottom shall be solid and provide permanent support for the pump. The sump pit shall be fitted with a gas-tight removable cover that is <u>installed flush with grade or above grade. The cover shall be </u>adequate to support anticipated loads in the area of use. The sump pit shall be vented in accordance with Chapter 9.

Reason: The cover for sump pits needs to be located at grade or above grade. Otherwise, there is nothing to prevent an installation where the cover is located below grade in a well such that in order to service the pump, someone has to stand on his head in order to just remove the sump pit cover. Requiring the cover to be at or above grade eliminates this problem.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

712.3.2-P-STRAUSBAUGH.PMGCAC

P171 – 12
713.12 (New)

Proponent: Daniel D. Fish, Roda LLC, representing self (info@drainbrain.us)

Add new text as follows:

713.12 Wastewater leak containment, detection and notification. An early-warning wastewater leak containment, detection and notification device shall be required in hospitals and other healthcare occupancies stated in section 713.1. This device shall contain and detect a wastewater leak in the building's water closets, showers and bathtubs. This device shall be equipped with an auditory alarm, visual signal, and a means for notification to the affected building occupants, property owners or the property management staff. The auditory alarm shall have a sound pressure level rating of not less than 85 dB when measured at a distance of ten feet.

Reason: Millions of wastewater leaks occur every year in multi-story buildings from leaking drains, waste lines, and toilets. Toilets are especially high risks for water leakage. Research has shown that 30 percent of all toilets in the United States leak. Toilets with unreliable wax gaskets and flanges – a common problem – cause the most damage to the unit below. Also, the float valve that controls water entering the toilet tank often malfunction, which allows water to run into toilet waste line continuously.

Wastewater leaks typically go undetected until considerable damage has been done. These leaks: (1) waste millions of gallons of water, (2) damage property/materials, generating millions of tons of debris that swells landfills, and (3) develop mold on building components, creating property damage and a health hazard. Property owners spend millions of dollars to repair the damage from wastewater leaks and cure mold-related problems.

An early-warning wastewater leak containment, detection, and notification device will give building occupants and facility managers/owners the opportunity to avoid wastewater leak damage and its attendant costs. Taking action early will conserve millions of gallons of water and eliminate the environmental, economic, and health hazards from wastewater leaks. This solution for the age-old wastewater leak problem will meet the intent of this code by safeguarding the public health, safety, and welfare.

Cost Impact: The code change proposal will not increase the cost of construction.

P171-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

713.12 (NEW)-P-FISH

P172 – 12
715.1

Proponent: Thomas C. Pitcherello, N.J. Department of Community Affairs, representing self (tpitcherello@dca.state.nj.us)

Revise as follows:

715.1 Sewage backflow. Where plumbing fixtures are installed on a floor with a finished floor elevation below the elevation of the manhole cover of the next upstream manhole in the *public sewer,* such fixtures shall be protected by a backwater valve installed in the *building drain,* or horizontal *branch* serving such fixtures. Plumbing fixtures installed on a floor with a finished floor elevation above the elevation of the manhole cover of the next upstream manhole in the *public sewer* shall not discharge through a backwater valve.

> **Exception:** In existing buildings, fixtures above the elevation of the manhole cover of the next upstream manhole in the *public sewer* shall not be prohibited from discharging through a backwater valve.

Reason: Building owners who have experienced a sewage backup in a building that was caused by problems in an existing public sewer main should be allowed to install a backwater valve in the building drain or sewer to protect their property. Having a basement full of raw sewage is an experience that no one wants to repeat. The requirement that only those fixtures that are on a floor elevation below the top of the next upstream manhole in the public sewer are allowed to discharge through the BWV, places a significant impediment for the building owner to protect his property against an event over which currently he has no control. For example, consider an existing two story hotel with multiple stacks connecting to a building drain. The fixtures on the lower floor are connected to the same building drain. The existing code language would require that all of the stacks be rerouted to connect downstream of a backwater valve installed to serve only the fixtures on the lower floor level. This would be cost prohibitive to do. The simpler solution would be to just install the BWV in the building drain or sewer. However, as the code is currently written, this is prohibited. The main reason why the code prohibits this is so that the discharge from upper floors does not flood the lower floor when the building sewer is backed up. If the BWV serves only the lower elevation fixtures, it would be closed when the sewer backed up and any discharge from higher elevation fixtures could not flow out of the lower elevation fixtures. BWV's are not known to create problems in a building sewer; rather, they provide protection from sewage backups and provide peace of mind for the building owners and occupants. Although the current code requirement can be easily accomplished in new construction, it is a hardship for those building owners who need protection for existing buildings. Imagine the work that would be necessary to separate the building drain into different sub building drains in an existing building with piping under slab floors.

Cost Impact: The code change proposal will not increase the cost of construction.

Add new text as follows:

SECTION 716
CURED-IN-PLACE PIPE LINERS

716.1 Approval. Cured-in-place pipe liner materials shall conform to NSF-14.

716.2 Installation. Installation of cured-in-place pipe liners shall be in accordance with the manufacturer's instructions and ASTM F1216, ASTM F1783 or ASTM F 2019.

Add new standards to Chapter 14 as follows:

ASTM

F1216-09	Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin Impregnated Tube
F1743-08	Standard Practice for Rehabilitation of Existing Pipelines and Conduits by Pulled-in-Place Installation of Cured-In-Place Thermosetting Resin Pipe (CIPP)
F2019-11	Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Pulled in Place Installation of Glass reinforced Plastic (GRP) Cured-in-Place Thermosetting Resin Pipe (CIPP).

Reason: Trenchless technology is commonly used to rehabilitate existing drain and sewer lines. This proposal establishes requirements by referring to appropriate standards for the materials and installation.

Cost Impact: This will not increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, ASTM F1216-09, ASTM F1743-08 and ASTM F2019-11 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

716 (New), Appendix C

Proponent: David R. Scott, AIA, representing Target Corporation.

Delete without substitution:

~~**APPENDIX C**~~
~~**VACUUM DRAINAGE SYSTEM**~~

(Renumber subsequent Appendices)

Add new text as follows:

SECTION 716
VACUUM DRAINAGE SYSTEMS

716.1 Scope. Vacuum drainage systems shall be in accordance with Sections 716.2 through 716.4.

716.2 System design. Vacuum drainage systems shall be designed in accordance with the vacuum drainage system manufacturer's instructions. The system layout, including piping layout, tank assemblies, vacuum pump assembly and other components necessary for proper function of the system shall be in accordance with the manufacturer's instructions. Plans, specifications and other data for such systems shall be submitted to the code official for review and approval prior to installation.

716.2.1 Fixtures. Gravity-type fixtures installed in vacuum drainage systems shall comply with Chapter 4.

716.2.2 Drainage fixture units. Fixture units for gravity drainage systems which discharge into or receive discharge from vacuum drainage systems shall be based on the values in Chapter 7.

716.2.3 Water supply fixture units. Water supply fixture units shall be based on values in Chapter 6 of this code except that the water supply fixture unit for a vacuum-type water closet shall be 1.

716.2.4 Traps and cleanouts. Gravity drainage fixtures shall be provided with traps and cleanouts in accordance with Chapters 7 and 10.

716.2.5 Materials. Vacuum drainage pipe, fitting and valve materials shall be in accordance with the vacuum drainage system manufacturer's instructions and the requirements of Chapter 7.

716.3 Testing and demonstrations. After completion of the entire system installation, the system shall be subjected to a vacuum test of 19 inches (483 mm) of mercury and shall be operated to function as required by the code official and the manufacturer of the vacuum drainage system. Recorded proof of all tests shall be submitted to the code official.

716.4 Written instructions. Written instructions for the operation, maintenance, safety and emergency procedures shall be provided to the building owner. The code official shall verify that the building owner is in receipt of such instructions.

Reason: Vacuum drainage system is a proven technology and should be allowed for situations where draining by gravity is prohibitive or not possible. Moving this information into Chapter 7 will allow for acceptance of vacuum drainage systems in jurisdictions that have not adopted the appendices.

Cost Impact: The code change proposal will not increase the cost of construction.

P174-12

Public Hearing:	Committee:	AS	AM	D

716-P-SCOTT

P175 – 12
802.1, 802.1.8

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

802.1 Where required. Food-handling equipment <u>in other than dwelling units</u>, and clearwater waste shall discharge through an indirect waste pipe as specified in Sections 802.1.1 through 802.1.8. Health-care related fixtures, devices and equipment shall discharge to the drainage system through an indirect waste pipe by means of an air gap in accordance with this chapter and Section 713.3. Fixtures not required by this section to be indirectly connected shall be directly connected to the plumbing system in accordance with Chapter 7.

802.1.8 Food utensils, dishes, pots and pans sinks. Sinks, <u>in other than dwelling units</u>, used for the washing, rinsing or sanitizing of utensils, dishes, pots, pans or service ware used in the preparation, serving or eating of food shall discharge indirectly through an air gap or an air break to the drainage system.

Reason: The current language requires that the waste discharge from food handling equipment as specified in Sections 802.1.1 through 802.1.8 in commercial and residential occupancies be indirectly connected. This should not be applicable for dwelling units but nonetheless, Section 802.1.1 requires fixtures (i.e. a kitchen sink in dwelling unit) to be indirectly connected. The IPC applies to multi-family dwelling buildings and is inappropriately requiring an indirect waste connection for a dwelling kitchen sink because such sink is used for food handling and ware washing (i.e. 802.1.1and 802.1.8).

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

	Assembly:	ASF	AMF	DF

802.1 #1-P-STRAUSBAUGH.PMGCAC

P176 – 12
802.1

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

802.1 Where required. Food-handling equipment, ~~and~~ clear-water waste, <u>dishwashing machines and utensil, pots, pans and dish washing sinks</u> shall discharge through an indirect waste pipe as specified in Sections 802.1.1 through 802.1.8. Health-care related fixtures, devices and equipment shall discharge to the drainage system through an indirect waste pipe by means of an air gap in accordance with this chapter and Section 713.3. Fixtures not required by this section to be indirectly connected shall be directly connected to the plumbing system in accordance with Chapter 7.

Reason: The subject of the first sentence of current Section 802.1 is food handling and clear water waste. This sentence introduces Subsections 802.1.6, 802.1.7 and 802.1.8, however, these sections are not food handling or clear-water related. Revising the first sentence of Section 802.1 corrects this inaccuracy.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. 802.1 #2-P-STRAUSBAUGH.PMGCAC

P177 – 12
802.1.1

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

802.1.1 Food handling. Equipment and fixtures utilized for the storage, preparation and handling of food shall discharge through an indirect waste pipe by means of an air gap. <u>Each well of a multi-compartment sink shall discharge independently to a waste receptor.</u>

Reason: An all too common practice for drain connections to a multi-compartment sink is to manifold the drain piping together and run a single indirect waste pipe to the waste receptor. If one compartment is draining and another compartment is empty or less full , the waste flow can back up into the empty or less full compartment and contaminate that compartment. Requiring each well to discharge independently to the waste receptor prevents this potential for contamination.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. 802.1.1-P-STRAUSBAUGH.PMGCAC

P178 – 12
802.1.6

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C. representing self (JBEngineer@aol.com)

Revise as follows:

802.1.6 Domestic dishwashing machines. Domestic dishwashing machines shall discharge indirectly through an ~~*air gap* or~~ *air break* into a standpipe or waste receptor in accordance with Section 802.2, or discharge into a wye branch fitting on the tailpiece of the kitchen sink or the dishwasher connection of a food waste grinder. The waste line of a domestic dishwashing machine discharging into a kitchen sink tailpiece or food waste grinder ~~shall connect to a deck-mounted *air gap* or the waste line~~ shall rise ~~and be securely fastened~~ to the underside of the sink rim or counter.

Reason: The connection as an air gap qualifies as an air break, therefore, there is no need to mention air gap. A deck mounted air gap fitting is never necessary for the connection of a dishwasher. The code should not mention a connection that is not required. If someone wants to add an air gap fitting they are free to do so. The drain still rises to the underside of the sink. A requirement for securely fastened is inappropriate since there is no definition of securely fastened.

Cost Impact: This change does not increase the cost of construction.

P178-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

802.1.6-P-BALLANCO

P179 – 12
802.1.6, 802.1.7, 802.2, 802.2.2

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

802.1.6 Domestic dishwashing machines. Domestic dishwashing machines shall discharge indirectly through an *air gap* or *air break* into a ~~standpipe or~~ waste receptor in accordance with Section 802.2, or discharge into a wye branch fitting on the tailpiece of the kitchen sink or the dishwasher connection of a food waste grinder. The waste line of a domestic dishwashing machine discharging into a kitchen sink tailpiece or food waste grinder shall connect to a deck-mounted *air gap* or the waste line shall rise and be securely fastened to the underside of the sink rim or counter.

802.1.7 Commercial dishwashing machines. The discharge from a commercial dishwashing machine shall be through an *air gap* or *air break* into a ~~standpipe or~~ waste receptor in accordance with Section 802.2.

802.2 Installation. Indirect waste piping shall discharge through an *air gap* or *air break* into a waste receptor. Waste receptors ~~and standpipes~~ shall be trapped and vented and shall connect to the building drainage system. All indirect waste piping that exceeds 30 inches (762 mm) in developed length measured horizontally, or 54 inches (1372 mm) in total developed length, shall be trapped.

802.2.2 Air break. An *air break* shall be provided between the indirect waste pipe and the trap seal of the waste receptor ~~or standpipe~~.

Reason: Because a standpipe is a waste receptor, it is redundant to state “standpipe and waste receptor” in these sections. Therefore, the word standpipe is removed as waste receptors include standpipes. A companion code change proposal relocates Section 802.4 to be a subsection of 802.3, because standpipes are a type of waste receptor and belong with the other waste receptors.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P179-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

802.1.6-P-STRAUSBAUGH.PMGCAC

P180 – 12
802.3

Proponent: Dennis Gardner, State of Colorado Plumbing and Gas Inspector

Revise as follows:

802.3 Waste receptors. Waste receptors shall be of an *approved* type. A removable strainer or basket shall cover the outlet of the waste receptors. Waste receptors shall be installed in ~~ventilated~~ spaces <u>normally occupied by the occupants of the building.</u> Waste receptors shall not be installed in bathrooms, toilet rooms, plenums, crawl spaces, attics, interstitial spaces above ceilings and below floors or in an inaccessible space or unventilated space such as a closet or storeroom. Ready *access* shall be provided to the waste receptors.

Reason: There has always been a question about what constitutes a ventilated space. I believe that the real intent of the code is to make sure that waste receptors will be located in areas that are frequented by the occupants of the building so that if there is a problem such as a backup, the occupants will notice the problem.

Cost impact: None

P180-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

802.3-P-GARDNER

P181 – 12
802.3

Proponent: Shawn Strausbaugh, Arlington County VA, representing, the Virginia Plumbing and Mechanical Inspectors Association and The Virginia Building Code Officials Association and ICC Region 7 (Sstrausbaugh@arlingtonva.us)

Revise as follows:

802.3 Waste receptors. ~~Waste receptors shall be of an approved type.~~ For other than standpipes and hub drains, a removable strainer or basket shall cover the waste outlet of waste receptors. Waste receptors shall not be installed in ~~ventilated~~ concealed spaces. Waste receptors shall not be installed in ~~bathrooms, toilet rooms~~, plenums, crawl spaces, attics, interstitial spaces above ceilings and below floors ~~or in any inaccessible or unventilated space such as a closet or storeroom~~. Ready access shall be provided to waste receptors.

Reason: This is a companion proposal with a newly added definition of waste receptor. We have attempted to identify exactly what constitutes an 'approved type" of waste receptor. The code fails to provide guidance as to what is a ventilated space, so we suggest removing the terms. This proposal takes the provisions in the direction of clear mandatory language that provides the user with terminology that clearly explains where a waste receptor is not permitted to be located. Further, there is no real problem associated with having a hub drain in a closet or storeroom where items such as water heaters and condensate producing appliances are located so that text has been removed.

Cost Impact: None

P181-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

802.3-P-STRAUSBAUGH

P182 – 12
202, 802.3, 802.3.2, 802.4

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Add new definition as follows:

WASTE RECEPTOR. A floor sink, standpipe, hub drain or a floor drain that receives the discharge of one or more indirect waste pipes.

Revise as follows:

802.3 Waste receptors. ~~Waste receptors shall be of an approved type.~~ For other than hub drains that receive only clear-water waste and standpipes, a removable strainer or basket shall cover the waste outlet of waste receptors. Waste receptors shall not be installed in ~~ventilated~~ concealed spaces. Waste receptors shall not be installed in ~~bathrooms, toilet rooms~~, plenums, crawl spaces, attics, interstitial spaces above ceilings and below floors. ~~or in any inaccessible or unventilated space such as a closet or storeroom~~. Ready access shall be provided to waste receptors.

802.3.2 ~~Open~~ Hub drains ~~waste receptors~~. A hub drain~~Waste receptors~~ shall be ~~permitted~~ in the form of a hub or a pipe extending not less than 1 inch (25.4 mm) above a water-impervious floor. ~~and are not required to have a strainer.~~

~~802.4~~ 802.3.3 Standpipes. Standpipes shall be individually trapped. Standpipes shall extend not less than 18 inches (457 mm) but not greater than 42 inches (1066 mm) above the trap weir. *Access* shall be provided to all standpipes and drains for rodding.

Reason: A definition for "waste receptor" is needed. The term is found in the code 24 times with no exact description. The proposed definition identifies exactly what constitutes an 'approved type" of waste receptor. The code fails to provide guidance as to what is a ventilated space so the language was changed to prevent waste receptors from being installed in a concealed space. There is no logical reason to prohibit waste receptors from being installed in a bathroom or toilet room. It is not unusual for a clothes washing machine (requiring a standpipe) to be placed in a bathroom or a toilet room in a multifamily residential occupancy. Waste receptors (typically a hub drain) are frequently needed in closets or storerooms where appliances discharge condensate or where relief valve discharge pipes are located.. The term "open hub waste receptor" is redundant and unclear and was eliminated in favor of the more common term "hub drain". As a hub drain is a waste receptor, a strainer is required except where the hub drain receives only clear water wastes. Standpipes are just another breed of waste receptors and should be included as a subsection under the waste receptor section.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P182-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

802.3-P-STRAUSBAUGH.PMGCAC

P183 – 12
803.1

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

803.1 Waste water temperature. Steam pipes shall not directly connect ~~to any part of~~ to a drainage ~~or plumbing~~ system. Such pipes shall discharge into a waste receptor that is connected to the drainage system. ~~and~~ Water ~~above~~ having a temperature of 140°F (60°C) or greater shall not be discharged into ~~any part of~~ a drainage system. except where it is cooled to a temperature of less than 140°F (60°C) . ~~Such pipes shall discharge into an indirect waste receptor connected to the drainage system.~~

Reason: The existing language appears to be contradicting. The current text states that water greater than 140F must not discharge to a drainage system but the next line seems to say that it's OK if you dump it in a waste receptor first. This section was reworded to indicate that water temperatures of a 140°F or greater must be cooled to less than 140°F before being discharged to the drainage system

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Cost Impact: None

P184-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

901.2-P-STRAUSBAUGH.PMGCAC

P185 – 12
903.1

Proponent: Shawn Strausbaugh, representing the ICC PMG Code Action Committee

Revise as follows:

903.1 Roof extension. Open vent pipes that extend through a roof shall be terminated not less than [NUMBER] inches (mm) above the roof~~, except that~~. Where a roof is to be used for assembly or as a promenade, observation deck, sunbathing deck or similar purposes ~~for any purpose other than weather protection~~, ~~the~~ open vent pipes ~~extensions~~ shall terminate not less than 7 feet (2134 mm) above the roof.

Reason: The current language literally states that if a roof is to be used for anything other than weather protection, then vent pipes must be extended 7 feet above the roof. If there is equipment on the roof (HVAC units, grease duct fans, etc.), the roof is being used for another purpose, but, that is not the intent of the section. The intent of the section is that when the roof can be "normally occupied" such as where the roof is being used as an assembly area, a promenade, observation deck or sunbathing deck, that is when the vent pipes must be extended. The revised language makes the intent of the section more clear.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P185-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

903.1-P-STRAUSBAUGH.PMGCAC

P186 – 12
903.2

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

903.2 Frost closure. Where the 97.5-percent value for outside design temperature is 0°F (-18°C) or less, ~~every~~ vent extensions through a roof or wall shall be not less than 3 inches (76 mm) in diameter. Any increase in the size of the vent shall be made not less than 1 foot inside the ~~structure at a point not less than 1 foot (305 mm) below the roof or inside the wall~~ building's thermal envelope.

Reason: Requiring that the size transition occur at least 1 foot below the roof accomplishes nothing if it is just as cold below the roof as it is outdoors. The intent is to prevent frost blockage in the vent by making the part that is exposed to freezing temperatures at least 3 inches in diameter. The part of the vent that is less than 3 inches in size must be located in an area that stays above freezing. In most attics, the attic temperatures are very near the outdoor temperature , therefore, putting the size transition in the cold attic will subject the smaller pipe to freezing temperatures which is exactly what this section intended to avoid. The transition from a smaller size vent pipe to the 3 inch (or larger size) needs to occur at least one foot inside of the building's thermal envelope in order to avoid frost blockage.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P186-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

903.2-P-STRAUSBAUGH.PMGCAC

P187 – 12
904.1

Proponent: Tom Allen, City of Mt. Dora, representing self

Revise as follows:

904.1 Roof extension. ~~All open~~ Vent pipes that extend through a roof to terminate to the outdoors shall be terminated ~~at least~~ not less than ~~[NUMBER]~~ 6 inches (152 mm) above the roof. Where the roof is subject to ponding of storm water, vent pipes shall terminate not less than 2 inches (51 mm) above the highest elevation of ponded stormwater. ~~except that~~ Where a roof is to be used for any purpose other than weather protection, ~~the~~ vent pipes ~~extensions~~ shall ~~be run at least~~ extend not less than 7 feet (2134 mm) above the roof.

Reason: The code should state minimum height of the vent pipe above the roof as there are many jurisdictions that simply fail to fill in the [NUMBER] blank upon adoption. Where roofs are designed to pond storm water in case the primary roof drainage system is blocked, the vent pipe opening need to be above highest level of ponded water so that the storm water doesn't enter the plumbing vent systems and cause flooding in the building. The last sentence is changed to remove poor code language.

Cost Impact: There is not a cost impact.

P187-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

904.1-P-ALLEN

P188 – 12
904.3.1 (New)

Proponent: Bob Scott, Kye Lehr and Dennis Gardner - Colorado Department of Regulatory Agencies, Division of Registrations Electrical and Plumbing Boards

Add new text as follows:

<u>**904.3.1 Vent through metal roofs.** In climates where snow occurs, vent pipes passing through metal roofs shall be protected from loading caused by ice and snow sliding down the metal roof or the vent shall penetrate the roof within 4 feet of the roof peak. Protection methods and devices shall be approved by the code official.</u>

Reason: Protection of piping is presently limited to piping through walls, footers, and foundation. No mention of piping through the roof. Pipes that have been broken in the walls leak sewer gas or closed off. These vent pipes are difficult to repair once damaged in the wall or below the roof depending on location. We tried Steel and cast Iron pipe through the roof anchored them to framing members only to have the Ice and snow break the piping over inside the home causing structural damage by breaking through walls and knocking kitchen cabinets off the walls. Damaged vent pictures are available.

Cost Impact: Cost of approved material as required by local jurisdiction.

P188-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

904.3.1 (NEW)-P-SCOTT-LEHR-GARDNER

P189 – 12
915.1

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C. representing InSinkErator (JBEngineer@aol.com)

Revise as follows:

915.1 Type of fixtures. A combination waste and vent system shall not serve fixtures other than floor drains, sinks, lavatories and drinking fountains. Combination waste and vent systems shall not receive the discharge from a ~~food waste grinder or~~ clinical sink.

Reason: There is no technical justification for prohibiting a food waste grinder from discharging to a combination waste and vent system. A food waste grinder does not change the pressure in the piping system any differently than a sink operating without a food waste grinder. The food waste grinder will not impact the performance of the combination waste and vent system. A video was made showing the discharge from a food waste grinder. The video of the clear pipe shows the flow from a food waste grinder as being the same as the flow from the sink without a food waste grinder.

Cost Impact: This change does not increase the cost of construction.

P189-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

915.1-P-BALLANCO

P190 – 12
915.2.2

Proponent: Bob Scott and Daryl Kuiper, Colorado Department of Regulatory Agencies, Division of Registrations Electrical and Plumbing Boards

Revise as follows:

915.2.2 Connection. The combination waste and vent system shall be provided with a dry vent connected at any point within the system or the system shall connect to a horizontal drain that <u>serves vented fixtures located on the same floor.</u> ~~is vented in accordance with one of the venting methods specified in this chapter.~~ Combination waste and vent systems connecting to building drains receiving only the discharge from a <u>one or more</u> ~~stack or~~ stacks shall be provided with a dry vent. The vent connection to the combination waste and vent pipe shall extend vertically to a point not less than 6 inches (152 mm) above the flood level rim of the highest fixture being vented before offsetting horizontally. The horizontal length of a combination waste and vent system shall be unlimited.

Reason: The struck out phrase: "is vented in accordance with one of the venting methods specified in this chapter." is vague about how the horizontal drain needs to be vented. Does this mean that the horizontal drain serving a CWV system can be vented through a connection from a waste or soil stack that might extend many floors before exiting the roof? We believe that the intent of the code is for the horizontal drain to be vented by serving vented fixtures on the same floor as the CWV system is located. Depending upon venting air through waste flow in stacks might not provide consistent pressure conditions to keep from causing trap seal problems in the traps on a CWV system.

Cost Impact: None

P190-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

915.2.2-P-SCOTT-LEHR

P191 – 12
915.2.2

Proponent: Bob Scott, Kye Lehr and Dennis Gardner, Colorado Department of Regulatory Agencies, Division of Registrations Electrical and Plumbing Boards

Revise as follows:

915.2.2 Connection. The combination drain and vent system shall be provided with a dry vent connected at any point within the system ~~or be connected to a horizontal drain that is vented in accordance with one of the venting methods specified in the chapter.~~ Combination drain and vent systems connecting to building drains receiving only discharge from a *stack* or stacks shall be provided with a dry vent. The vent connection to the combination drain and vent pipe shall extend vertically a minimum of 6 inches (152mm) above the *flood level rim* of the highest fixture being vented before offsetting horizontally.

Reason: We have seen piping arrangements where the nearest vent connection on a horizontal drain line is over 100 feet away from the CWV system connection to the horizontal drain. If the horizontal drain is flowing at capacity (i.e. ½ full), is the air space above the flow line consistently adequate to provide sufficient venting air for the CWV system? This code section says it is but given the long horizontal drain lengths in large commercial buildings, we seriously doubt that there will be adequate venting for a CWV system. Our experience says that a dry vent for the CWV system should always be required. Depending on a vented horizontal drain in a one- or two-family dwelling where the drain lines are relatively short, should not be a problem. But in a large commercial building, the horizontal drain lines can be so lengthy that it is not wise to depend on such a line to provide venting air for a CWV system.

Cost Impact: Minimal cost impact.

P191-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

915.2.2-P-SCOTT-LEHR-GARDNER

P192– 12
918.5

Proponent: Shawn Strausbaugh, representing the ICC PMG Code Action Committee

Revise as follows:

918.5 Access and ventilation. Access shall be provided to all air admittance valves. ~~The~~ Such valves shall be installed in a loca~~ted~~tion ~~within a ventilated space~~ that allows air to enter the valve.

Reason: The question is frequently raised: "What constitutes a ventilated space?" The proposed language simply requires the AAVs to be located where air can enter the valve. For example, an AAV installed in wall cavity would require some means to allow air to enter the cavity.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P192-11

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

918.5-P-STRAUSBAUGH.PMGCAC

P193 – 12
1002.1

Proponent: Robert G. Konyndyk, Chief, Plumbing Division, Bureau of Construction Codes, Department of Licensing and Regulatory Affairs, State of Michigan representing The Bureau of Construction Codes.

Revise as follows:

1002.1 Fixture traps. Each plumbing fixture shall be separately trapped by a liquid-seal trap, except as otherwise permitted by this code. The vertical distance from the fixture outlet to the trap weir shall not exceed 24 inches (610 mm), and the horizontal distance shall not exceed 30 inches (610 mm) measured from the centerline of the fixture outlet to the centerline of the inlet of the trap. The height of a clothes washer standpipe above a trap shall conform to Section 802.4. A fixture shall not be double trapped.

Exceptions:

1. This section shall not apply to fixtures with integral traps.
2. A combination plumbing fixture is permitted to be installed on one trap, provided that one compartment is not more than 6 inches (152 mm) deeper than the other compartment and the waste outlets are not more than 30 inches (762 mm) apart.
3. A grease interceptor intended to serve as a fixture trap in accordance with the manufacturer's installation instructions shall be permitted to serve as the trap for a single fixture or a combination sink of not more than three compartments where the vertical distance from the fixture outlet to the inlet of the interceptor does not exceed 30 inches (762 mm) and the *developed length* of the waste pipe from the most upstream fixture outlet to the inlet of the interceptor does not exceed 60 inches (1524 mm).
4. <u>Floor drains in multilevel parking structures that discharge to a building storm sewer shall not be required to be individually trapped.</u> Where floor drains in multilevel parking structures are required to discharge to a combined building sewer system, the floor drains shall not be required to be individually trapped provided that they are connect to a main trap in accordance with Section 1103.1.

Reason: This code change revision will improve the code by providing greater clarity. Sections 1002.1 and 1103.1 of the code currently address floor drains, leaders, and storm drains connected to combined building sewers. Storm water shall not discharge to sanitary sewers as stated in Section 1101.3. The absence of trap requirement instruction for floor drains connected to building storm sewer systems has been understood to not required traps for floor drains connected to storm sewers. The exceptions revision to the subject of floor drains in parking structures will provide a logical understanding of the subject.

Cost Impact: Construction cost will be reduced by providing greater understanding of proper floor drain application in building storm sewer use.

P193-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1002.1-P-KONYNDYK

P194 – 12
1002.3, Chapter 14

Proponent: Fred Constantino, American Society of Mechanical Engineers (ASME), representing the ASME A112 Plumbing Materials and Equipment Standards Committee.

Revise as follows:

1002.3 Prohibited traps. The following types of traps are prohibited:

1. Traps that depend on moving parts to maintain the seal.

   <u>**Exception:** In-line sanitary waste valves complying with ASME A112.18.8.</u>

2. Bell traps.
3. Crown-vented traps.
4. Traps not integral with a fixture and that depend on interior partitions for the seal, except those traps constructed of an *approved* material that is resistant to corrosion and degradation.
5. "S" traps.
6. Drum traps.

   Exception: Drum traps used as solids interceptors and drum traps serving chemical waste systems shall not be prohibited.

Add new standard to Chapter 14 as follows:

ASME
<u>A112.18.8–2009</u> <u>In-Line Sanitary Waste Valves for Plumbing Drainage</u>

Reason: In-Line sanitary waste valves are mechanical traps which have been tested and proven to maintain a gas tight seal when used in lieu of a normal p-trap. These valves are mainly used in manufactured homes in areas of small and limited confined spaces. The performance requirements for these valves are mentioned within the ASME A112.18.8 ANSI approved standard with a gas tight seal test.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASME A112.18.8–2009,with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P194-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1002.3-P-CONSTANTINO

P195 – 12

1002.4. 1002.4.1 (New), 1002.4.1.1 (New), 1002.4.1.2 (New), 1002.4.1.3 (New), 1002. 4.1.4 (New), Chapter 14

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C. representing Sure Seal (JBEngineer@aol.com)

Revise as follows:

1002.4 Trap seals. Each fixture trap shall have a liquid seal of not less than 2 inches (51 mm) and not more than 4 inches (102 mm), or deeper for special designs relating to accessible fixtures. ~~Where a trap seal is subject to loss by evaporation, a trap seal primer valve shall be installed. Trap seal primer valves shall connect to the trap at a point above the level of the trap seal. A trap seal primer valve shall conform to ASSE 1018 or ASSE 1044.~~

1002.4.1 Trap seal protection. Traps seals of emergency floor drain traps and traps subject to evaporation shall be protected by one of the methods in Sections 1002.4.1.1 through 1002.4.1.4.

1002.4.1.1 Potable water supplied trap seal primer valve. A potable water supplied trap seal primer valve shall supply water to the trap. Water supplied trap seal primer valves shall conform to ASSE 1018. The discharge pipe from the trap seal primer valve shall connect to the trap above the trap seal on the inlet side of the trap. Water supplied trap seal primer valves shall discharge not more than 8 gallons of water per year.

1002.4.1.2 Reclaimed or gray water supplied trap seal primer valve. A reclaimed or gray water supplied trap seal primer valve shall supply water to the trap. Water supplied trap seal primer valves shall conform to ASSE 1018. The discharge pipe from the trap seal primer valve shall connect to the trap above the trap seal on the inlet side of the trap. The yearly discharge volume from reclaimed or gray water supplied trap seal primer valves shall not be limited.

1002.4.1.3 Waste water supplied trap primer device. A waste water supplied trap primer device shall supply water to the trap. Waste water supplied trap primer devices shall conform to ASSE 1044. The discharge pipe from the trap seal primer device shall connect to the trap above the trap seal on the inlet side of the trap.

1002.4.1.4 Barrier type trap seal protection device. A barrier-type trap seal protection device shall protect the floor drain trap seal from evaporation. Barrier type floor drain trap seal protection devices shall conform to ASSE 1072 and shall have an ASSE 1072 rating of AF-GW. The devices shall be installed in accordance with the manufacturer's instructions.

Add new standard to Chapter 14 as follows:

ASSE
1072-07 Performance Requirements for Barrier Type Floor Drain Tap Seal Protection Devices

Reason: This modification adds language to identify all of the methods available for protecting the trap seal of emergency floor drain traps or traps subject to evaporation. The four methods available are: water supplied trap seal primers, waste supplied trap primer devices, trap seal protection devices, and reclaimed water. A water supplied trap seal primer that is unrestricted can discharge 300 to 500 gallons a year to a trap. A 2" trap requires less than ½ gallon a year to maintain the trap seal. There are now devices available that limit the amount of water discharging to 8 gallons per year. The IPC currently has many water conservation measures. This is another water conservation measure.

Waste supplied trap primer devices divert water from a sink or lavatory to the trap. There is no need to limit the flow on these devices since they use waste water.

Trap seal protection devices do not require any water. They are tested for providing protection of the trap seal. By requiring a rating of AF-GW, all of the tests in ASSE 1072 become required. There were previous objections to not requiring all of the tests in the standard.

Reclaimed water can also be used to maintain the trap seal. Since the water is reclaimed, there is no need to limit the annual discharge.

Cost Impact: This change does not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASSE 1072-07 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P_-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1002.4-P-BALLANCO

P196– 12
1002.4, Chapter 14

Proponent: David R. Scott, AIA, representing Target Corporation.

Revise as follows:

1002.4 Trap seals. Each fixture trap shall have a liquid seal of not less than 2 inches (51 mm) and not more than 4 inches (102 mm), or deeper for special designs relating to accessible fixtures. Where a trap seal is subject to loss by evaporation, ~~a trap seal primer valve~~ one of the following shall be installed~~.~~: ~~Trap seal primer valves shall connect to the trap at a point above the level of the trap seal. A trap seal primer valve shall conform to ASSE 1018 or ASSE 1044.~~

1. A trap seal primer valve conforming to ASSE 1018 or ASSE 1044. The discharge pipe from a trap seal primer valve shall terminate at a point that is above the level of the trap seal.
2. Barrier type floor drain trap seal protection device complying with ASSE 1072.

Add new standard to Chapter 14 as follows:

ASSE
1072-2007 Performance requirements for Barrier Type Floor Drain Trap Seal Protection Devices

Reason: Some locations of floor drains and water source do not allow for proper trap seal primer valve installation. There is no easy way to verify if the trap seal primer valve has failed. A barrier-type device is much more accessible to verify proper operation and is easy to replace if needed. Water conservation measures make the barrier-type device more appealing as well.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASSE 1072-2007 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P196-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1002.4-P-SCOTT

P197 – 12
1002.6

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C. representing self (JBEngineer@aol.com)

Revise as follows:

1002.6 Building traps. Building (house) traps shall be prohibited~~, except where local conditions necessitate such traps. Building traps shall be provided with a cleanout and a relief vent or fresh air intake on the inlet side of the trap. The size of the relief vent or fresh air intake shall not be less than onehalf the diameter of the drain to which the relief vent or air intake connects. Such relief vent or fresh air intake shall be carried above grade and shall be terminated in a screened outlet located outside the building~~.

Reason: The only remaining purpose identified for the installation of a building trap is to keep rats out of the building. However, super rats can swim through the building trap. Hence, the building trap serves no useful purpose. The problem with building traps is that they create a major obstruction to the flow of sewage. As a result, they often cause stoppages. Since the 1960's, it has been recognized that building traps should be eliminated. The code needs to recognize this by deleting the wording requested by certain major cities. These cities should eliminate their requirements for building traps since they are an obstruction to the flow.

Cost Impact: This change does not increase the cost of construction.

P197-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1002.6-P-BALLANCO

P198 – 12/13
1003.3 (New), 1003.3.2

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C. representing InSinkErator (JBEngineer@aol.com)

Revise as follows:

<u>**1003.3 Grease interceptors required.** A grease interceptor shall be required to receive the drainage from fixtures and equipment with grease-laden waste from food service establishments, such as restaurants, hotel kitchens, bars, factory cafeterias or restaurants, school cafeterias, and clubs. The discharge from a food waste grinder shall not be classified as grease-laden waste and shall not discharge through a grease interceptor.</u>

~~**1003.3.2 Food waste grinders.** Where food waste grinders connect to grease interceptors, a solids interceptor shall separate the discharge before connecting to the grease interceptor. Solids interceptors and grease interceptors shall be sized and rated for the discharge of the food waste grinder. Emulsifiers, chemicals, enzymes and bacteria shall not discharge into the food waste grinder.~~

(Renumber subsequent sections)

Reason: The legacy codes were much clearer in establishing when a grease interceptor is requirement. This text was extracted from the BOCA National Plumbing Code/1993. There are a few changes including the addition of "school cafeterias" to the list and the revision of the facilities to "food service establishments". The other change was the modification of the last sentence to state that the discharge from food waste grinders is not classified as grease laden waste, which was the intent of the legacy codes. The SBCCI Standard Plumbing Code had similar text. The current section 1003.1 and 1003.2 are very unclear as to when grease interceptors are necessary. This will assist the inspector with necessary language for mandating grease interceptors.

The deletion of Section 1003.3.2 will also clarify that food waste grinders are not permitted to discharge through a grease interceptor. This, again, was the intent of the legacy codes. A food waste grinder should never discharge through a grease interceptor. The purpose of a food waste grinder is to pulverize food waste to small enough particles to discharge to the sewer. If a grinder connects to a grease interceptor, the food particles will separate out, defeating the purpose of a food waste grinder. Similarly, if a food waste grinder discharges to a solids interceptor, the food particles will be separated.

Cost Impact: This change does not increase the cost of construction.

	Assembly:	ASF	AMF	DF

1003.3.4 – P-ACKROYD

P200– 12
202, 1003.3.6 (New), Chapter 14

Proponent: Rand H Ackroyd, Rand Technical Consulting LLC, representing Rand Technical Consulting LLC (rackroyd@comcast.net)

Add new definition to Chapter 2 as follows:

GREASE INTERCEPTORS.

Fats, Oils, and Greases (FOG) disposal systems. Plumbing appurtenances that reduce nonpetroleum fats, oils, and grease (FOG) in effluent by separation, mass and volume reduction.

Add new text as follows:

1003.3.6 Gravity grease interceptors and gravity grease interceptors with fats, oils, and greases disposal systems. The required capacity of *gravity grease interceptors* and *gravity grease interceptors* with *fats, oils, and greases disposal systems* shall be determined by multiplying the peak drain flow into the interceptor in gallons per minute by a retention time of 30 minutes. *Gravity grease interceptors* shall be designed and tested in accordance with IAPMO/ANSI Z100. *Gravity grease interceptors* with *fats, oils, and greases disposal systems* shall be designed and tested in accordance with ASME 112.14.6 and IAPMO/ANSI Z1001. *Gravity grease interceptors* and *gravity grease interceptors* with *fats, oils, and greases disposal systems* shall be installed in accordance with manufacturer's instructions. Where manufacturer's instructions are not provided, *gravity grease interceptors* and *gravity grease interceptors* with *fats, oils, and greases disposal systems* shall be installed in compliance with ASME A112.14.6 and IAPMO/ANSI Z1001.

Add new standards to Chapter 14 as follows:

ASME
A112.14.6-2010 FOG (Fats, Oils, and Greases) Disposal Systems

IAPMO
5001 East Philadelphia Street
Ontario, CA 91761

IAPMO
Z1001 -2007 Prefabricated Gravity Grease Interceptors

Reason: Gravity Grease Interceptors are defined in Chapter 2 and there is a National consensus standard IAPMO/ANSI Z1001-2007. ASME A112.14.6 2010 FOG (Fats, Oils, and Greases) Disposal Systems is a National standard(ANSI) It covers performance requirements for FOG Systems for both Hydro-mechanical Grease Interceptors and Gravity Grease interceptors

Cost Impact: None

Analysis: A review of the standards proposed for inclusion in the code, ASME A112.14.6-2010 and IAPMO Z1001-2007, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P200-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1003.3.6 (NEW)-P-ACKROYD

P201 – 12
1003.3.6 (New), Chapter 14

Proponent: Fred Constantino, American Society of Mechanical Engineers (ASME), representing the ASME A112 Plumbing Materials and Equipment Standards Committee.

Add new text as follows:

1003.3.6 Fats, oils, and greases disposal systems. Fats, oils, greases disposal systems shall be designed and tested in accordance with ASME 112.14.6. Such systems shall be installed in accordance with manufacturer's instructions. Where manufacturer's instructions are not provided, such systems shall be installed in compliance with ASME A112.14.6.

Add new standard to Chapter 14 as follows:

ASME
A112.14.6–2010 FOG (Fats, Oils, and Greases) Disposal Systems

Reason: A FOG (Fats, Oils, and Greases) Disposal System is another type of grease removal device that needs to be included under Section 1003.3. The standard covers the performance requirements for these types of systems and requires that the effluent from such systems be not greater than 100 mg/L FOG as measured by USEPA Method 1664**.** ASME A112.14.16 is a National standard (ANSI).

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASME A112.14.6-2010 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

1003.3.6 (NEW)-P-CONSTANTINO

P202 – 12
1003.3.6 (New)

Proponent: Shawn Strausbaugh, Arlington County VA representing, the Virginia Plumbing and Mechanical Inspectors Association and The Virginia Building Code Officials Association and ICC Region 7 (Sstrausbaugh@arlingtonva.us)

Add new text as follows:

1003.3.6 Direct connection. The discharge piping from a grease interceptor shall be directly connected to the sanitary drainage system.

Reason: The contents found within a correctly functioning grease interceptor produce some of the foulest odors in the plumbing system. Many interceptors are typically located directly in the kitchen they serve where the food is being prepared for human consumption. It is not reasonable to have the outlet side of the grease interceptor open to atmosphere in any situation, yet some manufacturers do not prohibit such an arrangement in their installation instructions. Many designers want to extend indirect waste piping to a waste receptacle several feet away in lieu of providing a direct connect for shear convenience. In this situation they have added even more pungent surface area exposed to the interior environment in the food handling operation that serves the public. The code is a minimum standard and it should be minimally expected that grease storage odors should not be present in a restaurant setting.

Cost Impact: None

P202-12

Public Hearing:	Committee:	AS	AM	D

1003.3.6 (NEW)-P-STRAUSBAUGH

P203 – 12

1003.3.6 (New), 1003.3.6.1 (New), 1003.3.6.2 (New), 1003.3.6.3 (New), Chapter 14

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Add new text as follows:

1003.3.6 Gravity grease interceptors. Gravity grease interceptors shall be water and gas tight. Interceptors shall be engineered to withstand the load to be placed on the interceptor such as from vehicular traffic. Interceptor capacity shall be not less than 750 gallons (2839 l). Gravity grease interceptors shall comply with IAPMO/ANSI Z1001.

1003.3.6.1 Grease capacity. The grease retention capacity of interceptors in pounds shall be not less than two times the flow-through rate. Grease interceptors for restaurants shall be sized in accordance with Equation 10-1. Grease interceptors for other establishments with commercial kitchens shall be sized in accordance with Equation 10-2. Where a grease interceptor discharges to a private sewage disposal system, the required capacity obtained by Equations 10-1 and 10-2 shall be increased 25 percent.

C = S ● GS ● (HR/12) ● LF ● 0.75 **(Equation 10-1)**

where:

C = Required capacity of grease interceptor in gallons

S = Number of seats in dining area

GS = Gallons of waste water per seat

where:

GS = 25 for restaurants with china dishes or automatic dishwasher
GS = 10 for restaurants with paper plates or baskets and without dishwasher

HR = Number of hours that restaurant is open

LF = Loading factor

where:

LF = 2.00 for interstate highway location
LF = 1.50 for other freeway location
LF = 1.25 recreational areas location
LF = 1.00 for main highway location
LF = 0.75 other highway location

For SI: 1 gallon = 3.8 liters

C = M ● GM ● LF x 0.75 **(Equation 10-2)**

where:

C = Required capacity of grease interceptor in gallons

M = Meals prepared per day

GM = Gallons of wastewater per meal

where:

GM = 5 for all applications

LF = Loading factor

where:

LF = 1.0 for presence of dishwashing machine
LF = 0.75 for without a dishwashing machine

For SI: 1 gallon = 3.8 liters

1003.3.6.2 Interceptor construction. Interceptors shall be prefabricated or field fabricated and shall have not less than one baffle that extends from the bottom of the interceptor to within 6 inches (152 mm)of the top of the interceptor. The baffles shall have an inverted long radius elbow fitting or other approved means equivalent in size to the inlet piping but in no case less than 4 inches (102 mm) in size installed in the inlet compartment side of the baffle with the fitting placed 12 inches (305 mm) above the bottom of the interceptor. The depth of the liquid shall be not less than 42 inches (1067 mm). Compartments shall be provided with access through an opening that is not less than 18 inches (457 mm) square or in diameter.

1003.3.6.3 Inlet and outlet piping. The inlet and outlet piping shall have a two way cleanout tee installed. Inlet piping shall enter at 2 ½ inches (64 mm) above the elevation of the invert of the outlet piping. Inlet piping shall extend to 24 inches (610 mm) below the water level. The outlet pipe shall start at 8 inches (203 mm) above the bottom of the interceptor and extend vertically to a tee. The tee and pipe shall be not less than 4 inches (102 mm) in diameter. The tee shall be installed with the run in the vertical orientation.

Add new standard to Chapter 14 as follows:

IAPMO
5001 East Philadelphia Street
Ontario, CA 91761

IAPMO
Z1001-2007 Prefabricated Gravity Grease Interceptors

Reason: To update the correct standard reference and to provide enforceable uniform criteria for sizing grease interceptors. The current code requires interceptors (for flows exceeding 100 gpm) but lacks enforceable code criteria for sizing interceptors. Similar language has been adopted within statewide codes for Florida and Massachusetts.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

Analysis: A review of the standard proposed for inclusion in the code, IAPMO Z1001-2007, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P203-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1003.3.6 (NEW)-P-STRAUSBAUGH.PMGCAC

P204 – 12
1003.4

Proponent: Robert G. Konyndyk, Chief, Plumbing Division, Bureau of Construction Codes, Department of Licensing and Regulatory Affairs, State of Michigan representing The Bureau of Construction Codes. (konyndykr@michigan.gov)

Revise as follows:

1003.4 Oil separators required. At repair garages, car washing facilities, at factories where oily and flammable liquid wastes are produced and in hydraulic elevator pits, separators shall be installed into which all oil-bearing, grease bearing or flammable wastes shall be discharged before emptying into building drainage system or other point of disposal.

> **Exception:** An oil separator is not required in hydraulic elevator pits where an *approved* alarm system is installed<u>. Such alarm systems shall not terminate the operation of pumps utilized to maintain emergency operation of the elevator by firefighters.</u>

Reason: This code change revision will improve the code by addressing life safety issues. Adoption of the American Society of Mechanical Engineers (ASME) A17.1 Edition 2007, Safety Code for Elevators and Escalators, 2.2.2.5, requires elevators for Firefighters Emergency Operation to have a drain or pump capacity to remove 50 gallons per minute. The removal capacity provides consideration for fire suppression discharges. The consideration is to assure elevator operations for life safety matters by having identified discharge capacities and operations. The IPC Commentary discussion mistakenly only considers the subsoil water presence for drainage. This proposed revision assures that approved alarm systems shall not stop the pump operation. The approval should be centered upon an alarm visual and audio notification to the building operator of oil or water presence.

Cost Impact: Construction cost will not be affected by this life safety matter.

P204-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1003.4-P-KONYNDYK

P205 – 12
1003.4

Proponent: Andy Neuman, Assistant Chief, Plumbing Division, Bureau of Construction Codes, Department of Licensing and Regulatory Affairs, State of Michigan representing The Bureau of Construction Codes.(konyndykr@michigan.gov)

Revise as follows:

1003.4 Oil separators required. At repair garages, car washing facilities, <u>and</u> at factories where oily and flammable liquid wastes are produced ~~and in hydraulic elevator pits,~~ separators shall be installed into which all oil-bearing, grease bearing or flammable wastes shall be discharged before emptying into building drainage system or other point of disposal.

> ~~**Exception:** An oil separator is not required in hydraulic elevator pits where an approved alarm system is installed~~.

Reason: This code change revision will improve the code by correcting overly restrictive text which is addressed by practical elevator preventive maintenance. Adoption of the American Society of Mechanical Engineers (ASME) A17.1 Edition 2007, Safety Code for Elevators and Escalators, 2.2.2.5, requires elevators for Firefighters Emergency Operation to have a drain or pump capacity to remove 50 gallons per minute. The removal capacity provides consideration for fire suppression discharges. The consideration assures elevator operations for life safety matters by having identified discharge capacities and operations.

The IPC Commentary discussion mistakenly only considers the subsoil water presence for drainage. Elevator pits are designed to allow a very minimal amount of subsoil water if any. Additionally elevator pits are generally required to be inspected which would identify the presence of hydraulic fluid. Requiring oil separators for an emergency fire sprinkler discharge is impractical. Further the sizing of an oil separator in this case is not clarified by code. Is it sized by potential amounts? Who can predict the number of head discharges? Is it sized by the floor area per Section 1003.4.2.2? That floor area could be the pit area only or the entire floor area divided by the number of serving elevators.

This proposed revision mirrors concerns expressed by the design community and welcomes any sizing clarification from hearing attendees.

Cost Impact: Construction cost will be reduced by the proposed revision.

P205-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1003.4-P-NEUMAN

P206 – 12
1003.4

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

1003.4 Oil separators required. At repair garages <u>where floor or trench drains are provided</u>, carwashing facilities, ~~at~~ factories where oily and flammable liquid wastes are produced and ~~in~~ hydraulic elevator pits, <u>oil</u> separators shall be installed into which ~~all~~ oil-bearing, greasebearing or flammable wastes shall be discharged before emptying into the building drainage system or other point of disposal.

> **Exception:** An oil separator is not required in a hydraulic elevator pit where an approved alarm system is installed.

Reason: The current text appears to assume that repair garages have floor drains, trench drains or some drains into which oily wastes are being discharged. If a repair garage has no such drains, what is the purpose of an oil separator? The requirement for a separator should be triggered by the presence of fixtures that are a source of oily waste. A repair garage with only a toilet facility has no need for a separator.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P206-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1003.4-P-STRAUSBAUGH.PMGCAC

P207 – 12
1003.6

Proponent: Jim Kendzel, MPH, CAE, Executive Director/CEO American Society of Plumbing Engineers (ASPE) representing himself (jkendzel@aspe.org)

Revise as follows:

1003.6 ~~Laundries~~ Clothes washer discharge interceptor. ~~Laundry facilities not installed within an individual dwelling unit or intended for individual family use~~ Clothes washers shall discharge through an interceptor that is provided with a wire basket or similar device, removable for cleaning, that prevents passage into the drainage system of solids ½ inch (12.7 mm) or larger in size, string, rags, buttons or other materials detrimental to the public sewage system.

Exceptions:

1. Clothes washers in individual dwelling units shall not be required to discharge through an interceptor.
2. A single clothes washer designed for use in individual dwelling units and installed in a location other than an individual dwelling unit shall not be required to discharge through an interceptor.

Reason: The phrase "intended for individual family use" is vague and seems to indicate that a roomful of residential type clothes washing machines in an apartment complex would not require an interceptor. This application is no different from a standalone laundry facility that has multiple residential type clothes washers that would, logically, need an interceptor. The first exception already exists in current code text. The second exception is for the small business establishments such as hair salons, small restaurants, and small apartment buildings where only one dwelling unit-type machine is installed as such use is typically no worse than a family use of the single machine.

Cost Impact: The code change proposal will not increase the cost of construction.

P207-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1003.6-P-KENDZEL

P208 – 12
1003.9

Proponent: Shawn Strausbaugh, Arlington County VA, representing, the Virginia Plumbing and Mechanical Inspectors Association and The Virginia Building Code Officials Association and ICC Region (Sstrausbaugh@arlingtonva.us)

Revise as follows:

1003.9 Venting of interceptors and separators. Interceptors and separators shall be designed so as not to become air bound. ~~where tight covers are utilized. Each~~ Interceptors ~~or~~ and separators shall be vented in accordance with one of the methods of Chapter 9. ~~where subject to a loss of trap seal.~~

Reason: Where subject to a "loss of trap seal." is inaccurate terminology for this application. In many instances we are referring to a tank or large sump that contains a body of water which is not actually a "trap seal" but rather a storage area for some type of contained debris. Venting methods located in Chapter 9 are provided to prevent the occurrence of siphonage and eliminate the potential for a piping system to be subject to a pressure differential of more than 1 inch of water column.

Cost Impact: None

P208-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1003.9-P-STRAUSBAUGH

P209 – 12
202, 1101.2

Proponent: Karen Hobbs, Natural Resources Defense Council, representing herself (khobbs@nrdc.org); Eddie Van Giesen, BRAE Rainwater Technologies, representing himself (vangig@watts.com); Harry Misuriello, American Council for an Energy-Efficient Economy, representing himself (misuriello@verizon.net)

Add new definitions as follows:

RAINWATER: Precipitation on any public or private parcel that has not entered an offsite storm drain system or channel, a flood control channel, or any other stream channel, and has not previously been put to beneficial use.

RAINWATER CAPTURE SYSTEM: A system designed to capture and store rainwater flowing off of a building, parking lot, or any other manmade, impervious surface for the purposes of using the rainwater for beneficial onsite use.

STORMWATER. Precipitation that has contacted a surface at grade or below grade and has not been put to beneficial use.

Revise as follows:

1101.2 Where required. *Rainwater* from ~~all~~ roofs, paved areas, yards, courts and courtyards shall drain onto open, unpaved areas for infiltration or evapotranspiration where such drainage will not cause or contribute to health, geotechnical or other hazards; or rainwater shall drain to a *rainwater capture system*. Where drainage onto open unpaved areas is not possible and a *rainwater capture system* would not provide beneficial use for the building, *rainwater* from ~~all~~ roofs, paved areas, yards, courts and courtyards shall drain into a separate storm *sewer* system, a combined *sewer* system or to an *approved* place of discharge. ~~For one- and two-family dwellings, and where approved,~~ *Storm water* is permitted to discharge onto flat areas, such as streets or lawns, provided that the storm water flows away from the building.

Reason:

1. The costs to repair and replace our nation's aging water infrastructure are enormous, with investment needs of $298 billion or more over the next 20 years, according to the U.S. Environmental Protection Agency (USEPA, 2008; http://water.epa.gov/scitech/datait/databases/cwns/upload/cwns2008rtc.pdf). In 2009, the American Society of Civil Engineers gave the nation's wastewater facilities a grade of D-minus due to their condition (American Society of Civil Engineers, 2009; http://www.infrastructurereportcard.org/sites/default/files/RC2009_full_report.pdf).
2. As NRDC recently documented in its "Rooftops to Rivers II" report (available at http://www.nrdc.org/water/pollution/rooftopsii/files/rooftopstoriversII.pdf), many cities recognize the unnecessary stress to their wastewater systems caused by having roofs and other paved areas draining directly into the sewer system, when other options exist, such as having those same surfaces drain to open, unpaved areas or captured for reuse through a rainwater harvesting system. Cities often require that roofs and paved areas drain into open, unpaved areas where the rainwater can either be infiltrated into the ground, evapotranspirated, or captured for later reuse. Many cities also have mandatory downspout disconnection programs for existing construction and many are considering mandatory downspout disconnections for new construction.
3. There are also a range of benefits that communities accrue when rainwater is either captured or reused. In a study conducted by NRDC and the University of California, Santa Barbara, *A Clear Blue Future (*http://www.nrdc.org/water/lid) found that implementing practices that emphasize on-site infiltration or capture and reuse had the potential to increase local water supplies by up to 405,000 acre-feet per year by 2030 at new and redeveloped residential and commercial properties in Southern California and the San Francisco Bay area. This represents roughly two-thirds of the volume of water used by the entire city of Los Angeles each year. These water savings translate into electricity savings of up to 1,225,500 megawatt-hours—which would decrease the release of carbon dioxide (CO_2) into the atmosphere by as much as 535,500 metric tons per year—because more plentiful local water reduces the need for energy-intensive imported water. And, perhaps most importantly, these benefits would increase every year.

Cost Impact: There is no cost impact to this proposal.

P209-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1101.2-P-HOBBS

P210 – 12
1101.3

Proponent: Bob Scott and Kye Lehr-Colorado Department of Regulatory Agencies, Division of Registrations Electrical and Plumbing Boards

Revise as follows:

1101.3 Prohibited Drainage. Storm water shall not be drained into sewers only intended for sewage. <u>Storm water shall not discharge onto public walkways.</u>

Reason: Storm water can cause a slip hazard when pooled on walkways. This is especially true in climates where freezing is possible.

Cost Impact: None. The practice of locating storm terminations at approved locations in decided at the design phase.

P210-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1101.3-P-SCOTT-LEHR

P211 – 12
1101.7

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., representing self (JBEngineer@aol.com)

Revise as follows:

1101.7 Roof design. Roofs shall be designed for the maximum possible depth of water that will pond thereon as determined by the relative levels of roof deck and overflow weirs, scuppers, edges or serviceable drains in combination with the deflected structural elements. In determining the maximum possible depth of water, all primary roof drainage means shall be assumed to be blocked. <u>The maximum possible depth of water on the roof shall include the height of the water required above the inlet of the secondary roof drainage means to achieve the required flow rate of the secondary drainage means to accommodate the design rainfall rate as required by Section 1106.</u>

Reason: Quite often, structural engineers are using the lower edge of a secondary roof drain to be the determining factor for establishing the maximum depth of water that can pond on the roof. However, the drain requires a certain head height to achieve a particular flow rate. That additional head height of water adds to the structural load. This change merely clarifies the intent of the current requirement. This change is consistent with the load requirements in the Building Code.

Cost Impact: This change does not increase the cost of construction.

P211-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1101.7-P-BALLANCO

P212 – 12
1101.8 (New)

Proponent: Bob Scott, Kye Lehr and Dennis Gardner, Colorado Department of Regulatory Agencies, Division of Registrations Electrical and Plumbing Boards

Add new text as follows:

<u>**1101.8 Heated roof drain discharge termination required.** Where the 97.5-percent value for the outdoor design temperature is 0°F (-18°C) or less and the primary roof drain system discharges to a location exposed to such temperature, the piping at the discharge location shall be heated to prevent water freezing and blocking the outlet.</u>

(Renumber subsequent sections)

Reason: In cold climate areas the roof drains will freeze shut at the outlet causing a backup of Ice in the roof drain causing the Ice and water to build up on the roof and in the drain. The problem then is the roof drain freezes solid breaking the pipe causing damage not only to the pipe but to the inside of the building as it thaws and causes an unnecessary buildup of ice and water on the roof causing even more damage when it thaws.

Cost Impact: Low compared to the cost of repair for not making the change to the code.

P212-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

P213 – 12
1101.10 (New)

Proponent: William (Bill) LeVan, Cast Iron Soil Pipe Institute representing self (blevan@mindspring.com)

Add new text as follows:

1101.10 Inspections. Where storm drainage piping penetrates a fire resistance rated wall, a fire resistant rated floor or a fire resistant rated ceiling, the piping shall be inspected before and after the installation of fire stopping material to verify that the piping system has not been modified.

Reason: This change is proposed to assure that the installation of the piping is not altered during the installation of fire stopping materials.

Cost Impact: The code change proposal will not increase the cost of construction

P213-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1101.10 (NEW)-P-LEVAN

P214 – 12
Table 1102.5

Proponent: Shawn Strausbaugh representing the ICC PMG Code Action Committee

Revise as follows:

TABLE 1102.5
SUBSOIL DRAIN PIPE

MATERIAL	STANDARD
Polyvinyl chloride (PVC) Plastic pipe (type sewer pipe, SDR 35 PS25, PS50 or PS100)	ASTM D 2729; ASTM D 3034; ASTM F 891; CSA B182.2; CSA B182.4

(Portions of table not shown remain unchanged)

Reason: This type of pipe material is readily available in perforated form and should be allowed to be used in the application.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

P214-12

	Assembly:	ASF	AMF	DF

T1102.5-P-STRAUSBAUGH.PMGCAC

P215 – 12
1102.8 (New)

Proponent: William (Bill) LeVan, Cast Iron Soil Pipe Institute representing self (blevan@mindspring.com)

Add new text as follows:

1102.8 Cast iron soil pipe, fittings and mechanical joint hubless couplings. Upon request by the code official, certificates of conformance shall be provided by the manufacturer to the code official indicating that cast iron pipe, cast iron fittings and mechanical joint hubless couplings are in compliance with Sections 705 and 1102.

Reason: This will ensure the purchaser and/or owner meet or exceed the requirements of the code and manufacturer requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

P215-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1102.8 (NEW)-P-LEVAN

P216 – 12
1103.1

Proponent: Robert G. Konyndyk, Chief, Plumbing Division, Bureau of Construction Codes, Department of Licensing and Regulatory Affairs, State of Michigan representing The Bureau of Construction Codes (konyndykr@michigan.gov)

Revise as follows:

1103.1 Main trap. Leaders and storm drains connected to a combined sewer shall be trapped. Individual storm water traps shall be installed on the storm water drain *branch* serving each conductor, or a single trap shall be installed in the main *storm drain* just before its connection with the combined *building sewer* or the *public sewer*. <u>Leaders and storm drains connected to a building storm sewer shall not be required to be trapped.</u>

Reason: This code change revision will improve the code by providing greater clarity. Sections 1002.1 and 1103.1 of the code currently address floor drains, leaders, and storm drains connected to combined building sewers. Storm water shall not discharge to sanitary sewers as stated in Section 1101.3. The absence of trap requirement instruction for leader/conductors and storm drains connections to building storm sewer systems has been understood to not require traps to storm sewers. The IPC Commentary for Section 1103.1 states: “Unlike a sanitary system, a storm drainage system is not designed for any precautions against sewer gas.”

This last sentence clarification will provide a logical understanding of the subject. Further it is my understanding that text addressing the overall subject matter is preferred to be within the section body rather than using an exception.

Cost Impact: Construction cost will be reduced by providing greater understanding of proper trap requirements when building storm sewers are utilized.

P216-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1103.1-P-KONYNDYK

P217– 12
1104.2

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C. representing self (JBEngineer@aol.com)

Delete without substitution:

~~**1104.2 Combining storm with sanitary drainage.** The sanitary and storm drainage systems of a structure shall be entirely separate except where combined *sewer* systems are utilized. Where a combined *sewer* is utilized, the building *storm drain* shall be connected in the same horizontal plane through a single-wye fitting to the combined *sewer* not less than 10 feet (3048 mm) downstream from any soil *stack*.~~

Reason: The section on combined sanitary and storm systems implies that the two systems are combined inside the building. A companion code change will require the connection to be independent to the public sewer. This allows the separation of systems when separate sewer systems are added in the future to the public system.

Cost Impact: This change does not increase the cost of construction.

P217-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1104.2-P-BALLANCO

P218 – 12
1105.2 (New)

Proponent: Julius Ballanco, P.E., CPD, FASPE, JB Engineering and Code Consulting, P.C. representing self (JBEngineer@aol.com)

Add new text as follows:

1105.2 Roof drain flow rate. The published roof drain flow rate based upon the head of water above the roof drain shall be used to size the storm drainage system in accordance with Section 1106. The flow rate used for sizing the storm drainage piping shall be based on the maximum anticipated ponding at the roof drain.

(Renumber subsequent sections)

Reason: The code currently requires the storm drainage system to be sized based on the roof area. The sizing never considered the flow rate through a roof drain, nor the ponding around the roof drain required to achieve that flow rate. A study by the ASPE Research Foundation discovered that the flow rates through roof drain vary based on the design of the roof drain. The study also found that for certain roof drains, there were different flow rates depending on which strainer was installed. As a result, some smaller drains are allowing more water through the drain than the pipe is designed to handle under open channel flow.

The only proper way to size a storm drainage system is to apply the known flow rates through the roof drain such that the piping is properly sized. Without knowledge of the flow rate through a roof drain, a storm drainage system can be either undersized or oversized.

Cost Impact: This change will increase the cost of construction.

a. Dimensions are width by depth for rectangular shapes.
Single dimensions are diameters of a semicircle.

Reason: The ASPE Research Foundation completed a research project on the flow rates through roof drains. What was uncovered was the fact that storm drainage systems have been improperly designed since the code requirements inception. The code requirements date back to the original National Plumbing Code recommendations from the National Bureau of Standards published in 1940. The current code assumes that the water will gradually flow to a roof drain and flow into the piping, never to exceed the amount of flow permitted in the drain.

What is occurring is the rain water flows at different rates depending on the pitch of the roof. The more ponding of water at the roof drain, the greater the quantity of flow through the roof drain. The research discovered that for smaller roof drains, the roof drain often allowed a much greater quantity of water to flow in the drain than is permitted by pipe sizing. The end result is the storm drain becomes a pressurized piping system. There are many occurrences of pipe failures resulting from storm drainage piping blowing apart inside the building. This can be attributed to improper sizing of the storm drainage system. Either a smaller roof drain was required, or a larger storm drain pipe.

By changing the method of sizing, the flow through the roof drain is finally considered when sizing the piping system. This is no different than sizing a sanitary drainage system whereby the system is sized based on the flow rate from a given fixture drain.

There is no need to indicate roof areas since the slope and shape of the roof will impact the sizing of the storm drainage system. An engineer will have to evaluate the amount of ponding around the roof drain during a 100 year storm of one hour duration. Once the ponding is known, the drain can be selected based on the flow rate of that particular drain. The piping is then sized based on the flow through the roof drain.

The sizing for all of the tables was taken from the ASPE Sizing Tables Application. Schedule 40 PVC was used for the pipe sizes, with the exception of 5 inch. Cast iron was used to develop the 5 inch numbers. The flow rates are maximum flows using one third full for the stacks and full flow for the horizontal drains. One third full stacks was identified by the National Bureau of Standards as a flow amount that will assure open channel flow in the piping system.

Gutter sizing was also taken from the ASPE Sizing Table Application.

The ASPE Research Foundation report has not been published as of the date of code change submittal deadline. However, the testing has been completed. The flow rate through roof drains varies with manufacturer, type of strainer, and head height. There is no one size fits all result from the testing. An engineer must know the flow through the roof drain they select in order to properly size the system.

Cost Impact: This change will increase the cost of construction.

P219-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1106.2-P-BALLANCO

P220 – 12
1108.1

Proponent: Bob Adkins, Prince William County VA Representing, the Virginia Plumbing and Mechanical Inspectors Association and The Virginia Building Code Officials Association and ICC Region 7 (radkins@pwcgov.org)

Revise as follows:

1108.1 Secondary (emergency overflow) drains or scuppers. Where roof drains are required, secondary (emergency overflow) roof drains or scuppers shall be provided where the roof perimeter construction extends above the roof in such a manner that water will be entrapped if the primary drains allow buildup for any reason. <u>Where primary and secondary roof drains are manufactured as a single assembly, the inlet and outlet for each drain shall be independent.</u>

Reason: Fittings are available today to accomplish a single roof penetration and provide both a primary drain and a secondary roof drain. This added text will assure compliance is met with Section 1108.2 to maintain separate primary and secondary systems.

Cost Impact: None

P220-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1108.1-P-ADKINS

P221 – 12
1108.3

Proponent: Julius Ballanco, P.E., CPD, FASPE, JB Engineering and Code Consulting, P.C. representing self (JBEngineer@aol.com)

Revise as follows:

1108.3 Sizing of secondary drains. Secondary (emergency) roof drain systems shall be sized in accordance with Section 1106 based on the rainfall rate for which the primary system is sized ~~in Tables 1106.2(1), 1106.2(2), 1106.3 and 1106.6~~. Scuppers shall be sized to prevent the depth of ponding water from exceeding that for which the roof was designed as determined by Section 1101.7. Scuppers shall have an opening dimension of not less than 4 inches (102 mm). The flow through the primary system shall not be considered when sizing the secondary roof drain system.

Reason: This is a companion change to the change to Section 1106. There is no need to reference the tables in Section 1106. By merely referencing the section, the code adequately identifies the requirements for sizing the secondary drainage system.

P221-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1108.3-P-BALLANCO

P222 – 12
1110, 1110.1

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C. representing self (JBEngineer@aol.com)

Delete without substitution:

~~**SECTION 1110**~~
~~**VALUES FOR CONTINUOUS FLOW**~~

~~**1110.1 Equivalent roof area.** Where there is a continuous or semicontinuous discharge into the building *storm rain* or building storm *sewer*, such as from a pump, ejector, air conditioning plant or similar device, each gallon per minute (L/m) of such discharge shall be computed as being equivalent to 96 square feet (9 m2) of roof area, based on a rainfall rate of 1 inch (25.4 mm) per hour.~~

Reason: This is a companion change to the change in sizing in Section 1106. Since the new sizing method uses gpm for sizing, there is no need to convert numbers for adding values for continuous flow. The gpm is simply added to the rainfall gpm.

Cost Impact: This change does not increase the cost of construction.

P222-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1110-P-BALLANCO

P223– 12
1302.2, Chapter 14

Proponent: Jeremy Brown, NSF International (Jeremy@nsf.org)

Revise as follows:

1302.2 Disinfection and treatment. ~~Gray water shall be disinfected by an approved method that employs one or more disinfectants such as chlorine, iodine or ozone that are recommended for use with the pipes, fittings and equipment by the manufacturer of the pipes, fittings and equipment.~~ Gray water shall be disinfected and treated by an on-site water reuse treatment system complying with NSF 350.

Add new standard to Chapter 14 as follows:

NSF
350-2011 Onsite Residential and Commercial Water Reuse Treatment Systems

Reason: In addition to microbiological contaminants that need disinfection, gray water contains organic compounds, suspended solids, turbidity, surfactants, and other contaminants that have the potential to accumulate and negatively impact the functioning of water closets and urinals if not treated properly. NSF/ANSI-350 *Onsite Residential and Commercial Water Reuse Treatment Systems* establishes the minimum materials, design and construction, and performance requirements for systems that disinfect and treat gray water for non-potable reuse applications, including flushing water for closets and urinals. Rigorous testing with gray water as defined by the standard ensures the treatment systems meet strict effluent quality requirements suitable for reuse applications, along with providing protection of public health and the environment. NSF 350 is currently referenced in the IGCC and IAPMO Green Supplement. Copies of this document may be obtained from the proponent.

Cost Impact: This will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, NSF 350-2011, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P223-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1302.2-P-BROWN

P224 – 12
1302.4

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C. representing self (JBEngineer@aol.com)

Revise as follows:

~~**1302.4 Coloring.** The gray water shall be dyed blue or green with a food grade vegetable dye before such water is supplied to the fixtures.~~

Reason: This is an archaic requirement that dates back to when gray water was first considered for flushing water closets and urinals. The reason for abandoning the practice was because the dye stained building components when there was splashing of the dyed gray water. The means of identifying gray water is the purple coloring of the piping system.

Cost Impact: This change does not increase the cost of construction.

P224-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1302.4-P-BALLANCO

P225_ – 12
1308.1.1 (New), Chapter 14

Proponent: Lorri Grainawi, STI/SPFA Representing the Steel Tank Institute / Steel Plate Fabricators Association (lgrainawi@steeltank.com)

Add new text as follows:

1308.1.1 Design and construction. Reservoirs shall be designed and constructed in accordance with Chapters 16 through 22 of the International Building Code and in accordance with the following standards as appropriate for the material of the reservoir: AWWA D100, AWWA D115, AWWA D120, UL 58, UL 1746, UL 1316, UL 142, API 12F or API 12D.

Add new standards to Chapter 14 as follows:

American Petroleum Institute
1220 L Street, NW
Washington, DC 20005

API

API 12F-2008	Specification for Shop Welded Tanks for Storage of Production Liquids, effective April 1, 2009
API 12D-2008	Specification for Field Welded Tanks for Storage of Production Liquids, effective April 1, 2009

AWWA

D100-05	AWWA Standard for Welded Carbon Steel Tanks for Water Storage
D115-06	AWWA Standard for Tendon Prestressed-Concrete Water Tanks
D120-09	AWWA Standard for Thermosetting Fiberglass-Reinforced Plastic Tanks

UL

UL 58-1996	Steel Underground Tanks for Flammable and Combustible Liquids with revisions through July 27, 1998
UL 1746-2007	External Corrosion Protection Systems for Steel Underground Storage Tanks
UL 1316-1994	Glass-Fiber Reinforced Plastic Underground Storage Tanks for Petroleum Products, Alcohols, and Alcohol Gasoline Mixtures with revisions through May 12, 2006
UL 142-2006	Steel Aboveground Tanks for Flammable and Combustible Liquids with revisions through February 12, 2010

Reason: The Steel Tank Institute is proposing the above language in response to the fact that there are no specific references to allow the designer the ability to directly reference the appropriate provisions for the design and construction of reservoirs.

In addition, we would note that the graywater and rainwater reservoir market today is unregulated. We have experienced this through the number of communications to the Institute, were it has been found that the inquiries were citing an inconsistent application for the design and construction of reservoirs.

Our position is that some form of structural provisions needs to be incorporated in order to ensure that this subject is, at the very least, addressed. These provisions are not intended, nor do they, favor one or more materials or types of constructions of reservoirs. We simply feel that basic structural and foundation provisions of the International Building Code should be used to provide for the safe storage and installation of reservoirs holding gray water and rainwater.

With respect to the listing of standards, STI has simply employed those standards used in other applications, such as automatic fire suppression reservoirs and fuel tank reservoirs. Unfortunately, until either these standards are enhanced, or new standards are created, to handle gray water and rain water applications we felt these the most appropriate since they do cover the structural design of a reservoir.

Cost Impact: We do not anticipate significant additional costs.

Analysis: A review of the standards proposed for inclusion in the code, API 12F-2008, API 12D-2008, AWWA D100-05, AWWA D115-06, AWWA D120-09, UL 58-1996, UL 1746-2007, UL 1316-1994 and UL 142-2006, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

P225-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1308.1.1-P-GRAINAWI

P226 – 12
Table E202.1

Proponent: Michael Cudahy, Plastic Pipe and Fittings Association (mike@cmservnet.com)

Revise as follows:

TABLE E202.1
INTERNAL VOLUME OF VARIOUS WATER DISTRIBUTION TUBING

OUNCES OF WATER PER FOOT OF TUBE									
Size Nominal, Inch	**Copper Type M**	**Copper Type L**	**Copper Type K**	**CPVC CTS SDR 11**	**CPVC SCH 40**	**<u>CPVC SCH 80</u>**	**<u>PE-RT SDR 9</u>**	**Composite ASTM F 1281**	**PEX CTS SDR 9**
3/8”	1.06	0.97	0.84	N/A	1.17	<u>-</u>	<u>0.64</u>	0.63	0.64
1/2”	1.69	1.55	1.45	1.25	1.89	<u>1.46</u>	<u>1.18</u>	1.31	1.18
3/4”	3.43	3.22	2.90	2.67	3.38	<u>2.74</u>	<u>2.35</u>	3.39	2.35
1”	5.81	5.49	5.17	4.43	5.53	<u>4.57</u>	<u>3.91</u>	5.56	3.91
1 1/4	8.70	8.36	8.09	6.61	9.66	<u>8.24</u>	<u>5.81</u>	8.49	5.81
1 1/2	12.18	11.83	11.45	9.22	13.20	<u>11.38</u>	<u>8.09</u>	13.88	8.09
2”	21.08	20.58	20.04	15.79	21.88	<u>19.11</u>	<u>13.86</u>	21.48	13.86

For SI: 1 ounces = 0.030 liter

Reason: This proposal simply adds two more commonly used water distribution piping and tubing materials to this table in order to make the table more useful to designers.

Cost Impact: None

P226-11

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

TE202.1-P-CUDAHY

P227 – 12
Table E202.1

Proponent: Larry Gill, P.Eng. IPEX USA LLC (larry.gill@ipexna.com)

Revise as follows:

TABLE E202.1
INTERNAL VOLUME OF VARIOUS WATER DISTRIBUTION PIPING

OUNCES OF WATER PER FOOT OF TUBE							
Size Nominal Inch	Copper Type M	Copper Type L	Copper Type K	CPVC CTS SDR 11	CPVC SCH 40	Composite ASTM F 1281	PEX CTS SDR 9, <u>PE-RT SDR 9</u>

(Portions of table not shown remain unchanged.)

Reason: Revise the table to include polyethylene of raised temperature (PE-RT) (same dimensions as PEX). All dimensions in the table remain unchanged.

Cost Impact: The proposed change will not increase the cost of construction

P227-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

TE202.1-P-GILL

P228 – 12
202

THIS CODE CHANGE PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE HEARING ORDER FOR THE IBC STRUCTURAL DEVELOPMENT COMMITTEE.

Proponent: John Ingargiola and Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (john.ingargiola@dhs.gov, gregory.p.wilson@dhs.gov) and Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net).

Revise as follows:

[B] DESIGN FLOOD ELEVATION. The elevation of the “design flood,” including wave height, relative to the datum specified on the community’s legally designated flood hazard map. In areas designated as Zone AO, the *design flood elevation* shall be the elevation of the highest existing grade of the *building’s* perimeter plus the depth number (in feet) specified on the flood hazard map. In areas designated as Zone AO where a depth number is not specified on the map, the depth number shall be taken as being equal to 2 feet (610 mm).

Reason: This definition is controlled by the IBC; this proposal brings the IPC, IMC, IFGC, and IPSDC definitions in line with the term as defined by the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

P228-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202-PSD-DESIGN FLOOD ELEVATION-INGARGIOLA-WILSON-QUINN.doc

P229 – 12
505.8.2

Proponent: Pennie L. Feehan, Pennie L. Feehan Consulting representing The Copper Development Association (penniefeehan@me.com)

Revise as follows:

505.8.2 Soldered joints. Solder joints between copper pipe or tubing and fittings shall be made in accordance with the methods of ASTM B 828 with the following sequence of joint preparation and operation: measuring and cutting, reaming, cleaning, fluxing, assembly and support, heating, applying the solder, cooling and cleaning. ~~All cut~~ The ends of pipe or tub~~e~~ing shall be cut square and shall be reamed to the full inside diameter of the pipe or tub~~e~~ing. ~~end.~~ Burrs on the outside end of the pipe or tubing shall be removed. ~~All~~ Joint surfaces to be soldered shall be cleaned bright by manual or mechanical means. ~~A~~ Flux conforming to ASTM B 813 shall be applied to the pipe or tubing and fittings. Such flux shall be noncorrosive and nontoxic after soldering. ~~be applied.~~ Pipe or tubing shall be inserted to the base of the fitting. Excess flux shall be removed from the exterior of the joint. The assembled joint shall be supported to create a uniform capillary space around the joint. An LP gas or acetylene air /fuel torch shall be used to apply heat to the assembled joint. The heat shall be applied with the flame perpendicular to the pipe or tubing. The flame shall be moved alternately between the fitting cup and the pipe or tubing. Solder in compliance with ASTM B 32 shall be applied to the joint surfaces until capillary action draws the molten solder into the cup of the fitting. ~~The joint shall be soldered with a solder conforming to ASTM B 32.~~ The soldered joint shall not be disturbed until cool. Remaining flux residue shall be cleaned from the exterior of the joint.

Reason: The above proposal provides important language from the standards to aid the end user.

Cost Impact: None

P229-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

505.8.2-P-FEEHAN

P230 – 12
1101.3 (New), Chapter 14

Proponent: Jeremy Brown, NSF International (Jeremy@nsf.org)

Add new text as follows:

1101.3 Residential water reuse treatment systems. Where gray water or wastewater is treated to produce water for non-potable reuse applications, such treatment systems shall comply with NSF 350.

Add new standard to Chapter 14 as follows:

NSF
350-11 Onsite Residential and Commercial Water Reuse Treatment Systems

Reason: NSF 350 *Onsite Residential and Commercial Water Reuse Treatment Systems* was newly adopted in 2011 as an American National Standard, establishing the minimum materials, design and construction, and performance requirements for systems that treat residential gray water or combined wastewater for non-potable reuse applications, including flushing water for closets and urinals, irrigation and other. Rigorous testing as defined by the standard ensures the treatment systems meet strict effluent quality requirements suitable for reuse applications, along with providing protection of public health and the environment. NSF 350 is currently referenced in the IGCC and IAPMO Green Supplement.

Cost Impact: This will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, NSF 35-11 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

TENTATIVE ORDER OF DISCUSSION
2012 PROPOSED CHANGES TO THE INTERNATIONAL MECHANICAL CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation **does not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some IMC code change proposals may not be included on this list, as they are being heard by other committees. Please consult the Cross Index of Proposed Changes.

M1– 12
202

Proponent: Thomas Peterson, Brigham City, UT, Brigham City Corporation, representing the Utah Chapter of ICC
(Tpeterson@brighamcity.utah.gov)

Revise as follows:

CONDITIONED SPACE. An area, room or space <u>enclosed within the building thermal envelope</u> that is heated or cooled ~~by any equipment or appliance~~.

Reason: The change provides clarification that conditioned space is required to be inside the building thermal envelope. It also allows an unfinished basement to be considered conditioned space, if enclosed in the building thermal envelope, without the requirement of supply and return air by radiant heat transfer supplied by the non-insulated ductwork system.

Cost Impact: The code change proposal will not increase the cost of construction.

M1-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202-CONDITIONED SPACE-M-PETERSON.DOC

M2 – 12
202

Proponent: Brent Ursenbach, Salt Lake City, UT, Salt Lake County Planning and Development representing the Utah Chapter ICC
(bursenbach@slco.org)

Revise as follows:

CONDITIONED SPACE. An area, room or space that is ~~being heated or cooled by any *equipment* or *appliance*.~~ enclosed within the building thermal envelope and that is directly heated or cooled or that is indirectly heated or cooled. Spaces are indirectly heated or cooled where they communicate thru openings with conditioned spaces, where they are separated from conditioned spaces by un-insulated walls, floors or ceilings and where they contain un-insulated ducts, piping or other sources of heating or cooling.

Reason: Confusion exists between the two different definitions in the IMC and IECC. The IECC attempts to define how a space may be indirectly conditioned; however, further clarification is needed. This proposed change is similar to the definition in ASHRAE 90.1 – 2010.

Cost Impact: The code change proposal will not increase the cost of construction.

M2-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202-CONDITIONED SPACE-M-URSENBACH.DOC

M3–12
202

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

EXTRA-HEAVY-DUTY COOKING APPLIANCE. Extra-heavy-duty cooking appliances are those ~~include appliances~~ utilizing open flame combustion of solid fuel at any time. ~~such as wood, charcoal and briquettes. and mesquite to provide all or part of the heat source for cooking.~~

HEAVY-DUTY COOKING APPLIANCE. Heavy-duty cooking *appliances* include electric under-fired broilers, electric chain (conveyor) broilers, gas under-fired broilers, gas chain (conveyor) broilers, gas open-burner ranges (with or without oven), electric and gas wok ranges, smokers, smoker ovens, and electric and gas over-fired (upright) broilers and salamanders.

Reason: The definition of Extra-heavy-duty appliances does not appear to address smokers and smoker grills. The wood is not burned to contribute heat for cooking in these appliances, so these appliances seem to fall through the crack. Smokers would appear to require hoods based on Section 507.2.4. By defining smokers as “Heavy-duty” instead of “Extra-heavy-duty,” they can be placed under a Type I hood with other heavy-, medium- and light-duty appliances. There is no apparent reason for them to be under an independent exhaust system as is required for appliances that have open flame combustion. As revised, the definition distinguishes between appliances that produce only smoke and those that actually combust the solid fuel for heat.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

202-HEAVY DUTY COOKING APPLIANCES (NEW)-M-STRAUSBAUGH.PMGCAC.DOC

M4–12
202, Chapter 15

Proponent: Marcelo M. Hirschler, GBH International
(gbhint@aol.com)

Add new definition as follows:

FIRE-RETARDANT TREATED WOOD. A homogeneous wood product that is impregnated with chemicals by a pressure process or other means during manufacture and that complies with the requirements of ASTM E2768.

Add new standard to Chapter 15 as follows:

ASTM E2768-11
Standard Test Method for Extended Duration Surface Burning Characteristics of Building Materials (30 min Tunnel Test) (2011), to Chapter 35, on Referenced Standards.

Reason: The IMC contains a reference to fire-retardant treated wood but no definition. This definition is added, which is consistent with section 2303.2 of the IBC. Note that ASTM has now issued a test method, ASTM E2768, which contains the three requirements discussed in section 2303.2, namely that a product be tested in accordance with ASTM E84 or UL 723, and exhibit a flame spread index of 25 or less, show no evidence of significant progressive combustion when the test is continued for 30 minutes (i.e. an additional 20-minute period over the standard ASTM E84 duration of 10 minutes) and that the flame front not progress more than 101/2 feet (3200 mm) beyond the centerline of the burners at any time during the test.

The existing definition of "fire-retardant treated wood" in chapter 2 of the IBC is inconsistent with the requirements within section 2303.2 of the IBC in two respects: (a) it can be met by a material that has minimal amount of fire retardant treatment and (b) it requires the fire retardant treatment to be incorporated by a "pressure treatment" and not, as in 2303.2, by a "pressure process or other means during manufacture". During the 2012 ICC code development process this issue was discussed, in proposal S201 (to the IBC and IRC) and associated comments, and the requirements in 2303.2 were upheld. The definition of fire-retardant treated wood in the IMC and in the IBC needs to be a stand-alone definition that contains the requirements and that is consistent with section 2303.2 of the IBC.

Moreover, the addition of the requirement that fire-retardant treated wood must be a "homogeneous" product is necessary to ensure that products that are coated or only partially impregnated with chemicals are not considered "fire-retardant treated wood" as they are not.

The IMC reference to fire-retardant treated wood can be found in section 1402.4.1.

Cost Impact: None

Analysis: A review of the standard proposed for inclusion in the code, [ASTM E2768-11] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

202-FIRE RETARDANT TREATED WOOD-M-HIRSCHLER.DOC

M5–12
202

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Add new definition as follows:

<u>**FLEXIBLE AIR CONNECTOR**. Flexible air connectors are tested for compliance with UL 181 with the exception of the fire penetration, puncture and impact tests of that standard. Flexible air connectors are labeled as such and are used to connect sections of ductwork, connect ductwork to equipment and connect ductwork to inlet and outlet terminals. The UL181 standard limits the length of flexible air connectors to 14 feet or less.</u>

Reason: The code does not define “flexible air connector.” As seen in the field, flexible air connectors are often indistinguishable from flexible ducts and the only way to tell them apart is to look at their labels. It is the product listing and label that dictates whether the product is an air connector or an air duct.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. 202-FLEXIBLE AIR CONNECTOR-M-STRAUSBAUGH-PMGCAC.DOC

M6–12
202

Proponent: Ken Sagan, NRG Code Advocates, representing Reflective Insulation Manufacturers Association International

Revise as follows:

GROUND SOURCE HEAT PUMP LOOP SYSTEM. Piping ~~buried~~ installed for the purpose of transporting heat transfer fluid to and from a heat pump and installed in horizontal or vertical excavations below the frost or heat level at a depth where the ground temperature remains relatively constant, ~~or~~ placed in a body of water at a depth to avoid freezing or connected to a free-flowing water source such as a well or stream ~~for the purpose of transporting heat transfer liquid to and from a heat pump~~. ~~Included in this definition are closed loop systems in which the liquid is recirculated and open loop systems in which the liquid is drawn from a well or other source.~~ Closed loop systems recirculate heat transfer liquids containing antifreeze through pressurized pipes while open loop systems extract and return water to the source.

Reason: The potential for confusion in the placement of Loop Systems for Ground Source Heat Pumps exists because of various uses of the phrase “surface of the earth” or “earth” in definitions of Ground Source, Ground Source Heat Pump Technology and Loop Systems. The most common omission in the descriptions is the optimum installation depth at which the “loop” should be placed.

In the IMC definition being addressed in this proposal, the loop system is described as: “piping buried in horizontal or vertical excavations or placed in a body of water for the purpose of transporting heat transfer liquid to and from a heat pump”. No specifications exist for the minimum “burial” depth of the pipe in either the ground or the body of water. This omission could lead to pipes being installed at too shallow a depth in either the ground or body of water causing inefficient operation or failure of the mechanical equipment.

Recent actions in the International Green Construction Code hearings led to changes in the definition of “Ground Source” to the following: “Use of the ground (surface of the earth) as a heat source or sink for heating and/or cooling provided by heat pumps”. This definition change was introduced by Robert Dewey from the U.S. Department of Energy and was approved in final action hearings and does not specify the depth of the heat source or sink.

On U.S. Department of Energy’s Energy Efficiency & Renewable Energy, Geothermal Technologies Program Website: http://www1.eere.energy.gov/geothermal/heatpumps.html it is stated that: “The technology [GSHP] relies on the fact that the Earth (beneath the surface) remains at a relatively constant temperature throughout the year…..”

The two U.S. Department of Energy statements or definitions appear to contradict each other as one refers to “the surface of the earth” and the other refers to “beneath the surface” and neither defines the word “surface”.

To further confuse the matter most non-geologists or lay persons interpret “surface” to be the top most plane of something, the part that is easily touched or seen: for instance, in the sentence – the insect appeared to be walking on the surface of the water – it is clear that the insect is on the very top of the water.

The “surface” of the earth (sometimes referred to as the crust) is described by geologists as the top 5 – 31kilometers of the earth’s crust. Using that scientific description:
The IGCC definition appears to suggest that GSHP Loop systems can be installed anywhere from the top of the ground (where vegetation grows) to a depth of 31 kilometers.

The U.S. DOE description would mean that the loop pipes must be installed below the 5 - 31 kilometer thick surface
Changes to the IMC’s Ground Source Heat Pump Loop System in this proposal defines the optimum depth at which the loop system should be installed and allows for variations based on local conditions. It further clarifies the requirement for installing open loop systems.

Cost Impact: None

202-GROUND SOURCE HEAT PUMP LOOP SYSTEM-M-SAGAN.DOC

M7–12
202

Proponent: James Paschal, Paschal Engineering, representing self
(Jim@PaschalEngineering.com)

Revise as follows:

MECHANICAL JOINT.

1. A connection between pipes, fittings, or pipes and fittings that is not welded, brazed, caulked, soldered, ~~or~~ solvent cemented, or heat-fused.
2. A general form of gas or liquid-tight connections obtained by the joining of parts through a positive holding mechanical construction such as, but not limited to, flanged, screwed, clamped or flared connections.

Reason: Heat fusion is now a defined type of joint for plastic piping, and is considered separate from welding because there is not any additional filler material used in forming the joint. However, heat-fusion joints are not mechanical joints and as such should be excluded from the definition of mechanical joints.

Cost Impact: This proposal will not increase the cost of construction.

M7-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

202-MECHANICAL JOINT-M-PASCHAL.DOC

M8–12
301.3

Proponent: James Ranfone, representing American Gas Association
(jranfon@aga.org)

Revise as follows:

301.3 Identification. Each length of pipe and tubing and each pipe fitting utilized in a mechanical system shall bear the identification of the manufacturer.

> <u>**Exception:** Manufacturer identification for fittings and pipe nipples shall be on each piece or shall be printed on the fitting or nipple packaging or provided documentation.</u>

Reason: The exception would allow identification of fittings to be provided on or with the packaging. Some piping fittings, short nipples for example, do not have the physical room for a manufacturers mark.

Cost Impact: The code change proposal will not increase the cost of construction.

M8-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

301.3-M-RANFONE.DOC

M9–12
303.3

Proponent: Richard Grace, Fairfax County, representing Virginia Plumbing and Mechanical Inspectors Association, Virginia Building Code Officials Association

Revise as follows:

303.3 Prohibited locations. Fuel-fired appliances shall not be located in, or obtain combustion air from, any of the following rooms or spaces:

1. Sleeping rooms.
2. Bathrooms.
3. Toilet rooms.
4. Storage closets.
5. Surgical rooms.

Exception: This section shall not apply to the following appliances:

1. Direct-vent appliances that obtain all combustion air directly from the outdoors.
~~2. Solid fuel-fired appliances, provided that the room is not a confined space and the building is not of unusually tight construction.~~

~~3~~ 2 Appliances installed in a dedicated enclosure in which all combustion air is taken directly from the outdoors, in accordance with Chapter 7. Access to such enclosure shall be through a solid door, weather-stripped in accordance with the exterior door air leakage requirements of the *International Energy Conservation Code* and equipped with an approved self-closing device.

Reason: The terms “confined space” and “unusually tight construction” are no longer referenced in the IMC, and can no longer dictate the installation of these appliances.

Cost Impact: The code change proposal will not increase the cost of construction.

M9-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

303.3-M-GRACE.DOC

M10–12
303.3

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

303.3 Prohibited locations. Fuel-fired appliances shall not be located in, or obtain combustion air from, any of the following rooms or spaces:

1. Sleeping Rooms
2. Bathrooms
3. Toilet Rooms
4. Storage Closets
5. Surgical Rooms

Exception: This section shall not apply to the following appliances:

1. Direct-vent appliances that obtain all combustion air from the outdoors.
2. Solid fuel-fired appliances, provided that ~~the room is not a confined space and the building is not of unusually tight construction~~ combustion air is provided in accordance with the manufacturers' instructions.
3. Appliances installed in a dedicated enclosure in which all combustion air is taken directly from the outdoors, in accordance with Chapter 7. Access to such enclosure shall be through a solid door, weather-stripped in accordance with the exterior door leakage requirements of the International Conservation Code and equipped with an approved self-closing device.

Reason: The concepts of confined space and unusually tight construction are no longer valid and were deleted from the IFGC along with the definitions of such.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

M10-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

303.3-M-STRAUSBAUGH-PMGCAC.DOC

M11–12
303.5

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

303.5 Indoor locations. Furnaces and boilers installed in closets and alcoves shall be listed for such installation. ~~For purposes of this section, a closet or alcove shall be defined as a room or space having a volume less than 12 times the total volume of the fuel-fired appliances other than boilers and less than 16 times the total volume of boilers. Room volume shall be computed using the gross floor area and the actual ceiling height up to a maximum computation height of 8 feet.~~

Reason: This section needs to be coordinated with the IFGC. The volume rules for 12 times and 16 times the appliance volume, along with the concept of "rooms large in comparison with the appliance" were deleted from the IFGC and are a thing of the past. This IMC text is based on IFGC text that is antiquated and no longer existing in the IFGC.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

303.5-M-STRAUSBAUGH-PMGCAC.DOC

M12–12
304.10

Proponent: Jay F. Rowland, J.F.R. Enterprises, Inc., representing himself

Revise as follows:

304.10 Clearances from grade. Equipment and *appliances* installed at grade level shall be supported on a level concrete slab or other *approved* material extending not less than 3 inches (76 mm) above adjoining grade. Prefabricated supports placed on grade without excavation shall maintain ground contact around the support perimeter. Soil shall be backfilled under the support in a manner that will resist erosion and settling. Alternatively, the equipment and appliances ~~or~~ shall be suspended not less than 6 inches (152 mm) above adjoining grade. Such support shall be in accordance with the manufacturer's installation instructions.

Reason: "Other approved materials" (plastic and lightweight concrete pads) have seen continuous reduction of material/ribbing over the years as manufacturers lower costs and compete for market share. Plus, they want to make a lighter product that is friendly to installers. This suggested code change reminds manufacturers and installers that the equipment pads are expected to remain level over time, not just initial installation. Don't "set it and forget it" unless it's set correctly.

Take a look at homes in your neighborhood, and you will see that a large percentage of prefab equipment pads have been installed and maintained improperly. Too many pads have lost all soil under their downslope edges and are held in place largely by the weight of the unit and the line set. On the other hand, many pads have no clearance from grade.

Unfortunately, neither manufacturers nor techs have put enough focus on proper excavation of the soil, backfilling, placing rock around the pad, or other steps to resist erosion and settling (which will still occur to some degree even with a perfect install). We stop short of requiring strip footers tied into the pad from below. That's the best way to stop erosion, but it adds a higher cost, and the manufacturers can come up with similar options.

Installation instructions have been insufficient to address these common issues. In fact, prefab pads as currently made (3" height, and many of 2" height) cannot meet code if the site is properly excavated. Excavation requires going below grade, and a 3" pad cannot then extend 3" above grade. With 3" pads, the best option is to provide protection for the soil under and around the pad. Some calculations by a registered engineer are attached as substantiation of the significance of erosion.

In a nutshell, ground contact/support and erosion control (protecting soil under and around the pad) determine the actual clearance from grade.

Note: Rock, landscaping fabric, etc. should not be placed under a pad, so erosion channels aren't created.

Cost Impact: The code change proposal will not increase the cost of construction. If you expressly require strip footing or a similar solution, then the cost of construction will increase.

M12-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

304.10-M-ROWLAND.DOC

M13–12
304.10

Proponent: Tom Allen, representing himself

Revise as follows:

304.10 Clearances from grade. Equipment and *appliances* installed at grade level shall be supported on a level concrete slab or other *approved* material extending not less than 3 inches (76 mm) above adjoining grade or shall be suspended not less than 6 inches (152 mm) above adjoining grade. Such support shall be in accordance with the manufacturer's installation instructions.

> **Exception:** Existing support platforms shall not be required to comply with the heights above grade specified in this section where such platforms complied with the applicable code when originally installed.

Reason: Adds an exception for existing support platforms that met code when they were installed.

Cost Impact: There is no cost impact.

M13-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

304.10-M-ALLEN.DOC

M14–12
[B]304.11

Proponent: Gary Kreutziger, M.C.P., City of San Antonio, representing self (gkreutziger@sanantonio.gov)

THIS CODE CHANGE WILL BE HEARD BY THE IBC-MEANS OF EGRESS COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Revise as follows:

[B] 304.11 Guards. Guards shall be provided where appliances, *equipment,* fans or other components that require service and roof hatch openings are located within 10 feet (3048mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762mm) above the floor, roof, or grade below. The guard shall extend not less than 30 inches (762mm) beyond each end of such appliances, *equipment,* fans, <u>or</u> components ~~and roof hatch openings~~ and the top of the guard shall be located not less than 42 inches (1067mm) above the elevated surface adjacent to the guard. The guard shall be constructed so as to prevent the passage of a 21-inch-diameter (533mm) sphere and shall comply with the loading requirements for guards specified in the *International Building Code.*

Reason: The change will correlate the IMC with the IBC and IFC where there is currently a conflict. The IBC and IFC do not require the guards to extend 30 inches beyond a roof hatch opening as is currently required in the IMC. There are manufactured guards available now that mount directly to the roof hatch curb and encircle the roof hatch opening but do not extend 30 inches beyond the opening as required in the IMC, however, as the IMC is currently written these guards would not be allowed, but are allowed per the IBC and IFC. These guards meet the prescriptive requirements and intent of the IBC and IFC but not the IMC. The guards that encircle the roof hatch opening provide a safer access to the roof when oriented correctly, by serving as a handrail as well as a guard and also add value by limiting roof penetrations.

Cost Impact: The code change proposal will not increase the cost of construction.

M14-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

[B]304.11-M-KREUTZIGER

M15–12
305.4, Chapter 15

Proponent: Robert O'Neill; David Thompson, Manufacturers Standardization Society, representing Manufacturers Standardization Society
(dthompson@mss-hq.org)

Revise as follows:

305.4 Interval of support. Piping shall be supported at distances not exceeding the spacing specified in Table 305.4, or in accordance with ~~MSS SP-69~~ <u>ANSI/MSS SP-58-2009.</u>

Add new standard to Chapter 15 as follows:

<u>ANSI/MSS SP-58-2009</u>
<u>Pipe Hangers and Supports –Materials, Design, Manufacture, Selection, Application, and Installation</u>

Reason: In 2009, SP-58 was revised (including the title) to comprehensively combine and incorporate all of the content of five Pipe Hanger and Support standards into a single document; specifically including all of the information from **ANSI/MSS SP-69-2003, *Selection and Application***; MSS SP-77-1995 (R 2000), *Guidelines for Pipe Support Contractual Relations*; MSS SP-89-2003, *Fabrication and Installation Practices*; and MSS SP-90-2000, *Guidelines on Terminology for Pipe Hangers and Supports*. On February 11, 2011, the revised SP-58 was approved by the American National Standards Institute (ANSI) as an American National Standard (ANS). The new title is **ANSI/MSS SP-58-2009, *Pipe Hangers and Supports –Materials, Design, Manufacture, Selection, Application, and Installation***. The aforementioned SP-69 <u>will not be revised</u> (will "sunset" by 2014) and SP-77, 89, and 90 were withdrawn in 2010. **This ANSI/MSS SP-58-2009 edition can officially be utilized and referenced in place of the aforementioned Standard Practices.**

Cost Impact: The code change proposal will not increase the cost of construction other than the minimal difference in cost to acquire the ANSI/MSS SP-58-2009 standard document.

Analysis: A review of the standard proposed for inclusion in the code, [ANSI/MSS SP-58-2009] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

305.4-M-ONEILL-THOMPSON.DOC

M16–12
TABLE 305.4

Proponent: Larry Gill, P. Eng., IPEX USA LLC (larry.gill@ipexna.com)

Revise as follows:

TABLE 305.4
PIPING SUPPORT SPACING[a]

PIPING MATERIAL	MAXIMUM HORIZONTAL SPACING (feet)	MAXIMUM VERTICAL SPACING (feet)
PE-RT ≤ 1”	2 ⅔ (32 inches)	4
PE-RT ≥ 1¼	4	4

Reason: Add support dimensions for polyethylene of raised temperature (PE-RT). PE-RT is already in the International Codes and adding the support spacing will provide additional information for installation. All other dimensions in the table remain unchanged.

Cost Impact: The proposed change will not increase the cost of construction.

M16-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T305.4-M-GILL.DOC

M17–12
305.5

Proponent: Jillian M. Frenkel – Georgia Licensed Residential Builder

Revise as follows:

305.5 Protection against physical damage. In concealed locations where piping, other than cast-iron or steel, is installed through holes or notches in studs, joists, rafters or similar members less than 11/2 inches (38 mm) from the nearest edge of the member, the pipe shall be protected by shield plates. Protective steel shield plates having a minimum thickness of 0.0575 inch (1.463 mm) (No. 16 gage) shall cover the area of the pipe where the member is notched or bored, and shall extend a minimum of 2 inches (51 mm) above sole plates and below top plates.

<u>In concealed locations where piping other than cast iron or steel is installed within exterior wall cavities formed by framing members, and such piping is less than 1 ½ inches from the inside surface of the exterior wall sheathing, such piping shall be protected for its entire length within the cavity by shield plates have a minimum thickness of 0.0575 inch (1.463mm) (16 Gage).</u>

Reason: Currently, the code requires protection by use of steel shield plate at the top and sole plates. This proposition is to add protection to mechanical lines that are located on exterior walls within the bays formed by framing members as seen in Figure 1. These unprotected lines can be punctured by installation of exterior coverings (i.e. siding, shake, etc) and left undetected during the building process or later by the homeowner. The reason/intent for the revision to the existing code is to prevent hazardous conditions and/or expensive repairs.

An example of a hazardous condition is a punctured refrigerant line. When a line is first punctured, the seal may be so tight that a leak is left undetected. In time, the metals will corrode and Freon will eventually leak out of the refrigerant lines. Over time, exposure to Freon can cause health issues ranging from minor to severe. It is documented that effects of Freon exposure via inhalation include mouth and nasal area irritation, dizziness and irregular heartbeat.

In yet another scenario, a punctured condensation line has the potential to become an unnecessary and expensive repair which can result in drywall repair, mechanical line repair, floor replacement, possibly insulation replacement and paint repair.

Cost Impact: The code change proposal will increase the cost of construction. The cost is roughly $40/10ft wall.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

305.5-M-FRENKEL.DOC

M18–12
306.1

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

306.1 Access. Appliances, <u>controls devices, heat exchangers and HVAC system components that utilize energy</u> shall be accessible for inspection, service, repair and replacement without disabling the function of a fire-resistance-rated assembly or removing permanent construction, other appliances, venting systems or any other piping or ducts not connected to the *appliance* being inspected, serviced, repaired or replaced. A level working space at least 30 inches deep and 30 inches wide (762 mm by 762 mm) shall be provided in front of the control side to service an *appliance*.

Reason: Section 306.1 applies to appliances and therefore does not address equipment such as fan/coil units, air handling units, damper motors, HVAC controls, etc. Units with heat exchangers need to be provided with access so that they can be cleaned. Air handlers and fan/coil units are not considered to be appliances because they do not fall under the definition because the code provides no specific requirements for them.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: This could increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

306.1-M-STRAUSBAUGH-PMGCAC.DOC

M19–12
306.3.2 (NEW)

Proponent: Tom Allen, representing himself

Add new text as follows:

306.6 Air Handling Units. Air handling units shall not be located in attics in dwelling units except where all of the following conditions are met:

1. A device is installed to alert the owner or shut off the unit when the condensation drainage system has failed.
2. The attic access opening is large enough to allow replacement of the air handler.
3. A notice is posted on the electric service panel indicating to the homeowner that an air handler is located in the attic. Such notice shall be in uppercase letters, in 16 point type, and with the title and first paragraph in bold and shall read as follows:

NOTICE TO HOMEOWNER

A PART OF YOUR AIR CONDITIONING SYSTEM, THE AIR HANDLER, IS LOCATED IN THE ATTIC. FOR PROPER, EFFICIENT, AND ECONOMIC OPERATION OF THE AIR CONDITIONING SYSTEM, YOU MUST ENSURE THAT REGULAR MAINTENANCE IS PERFORMED.

YOUR AIR CONDITIONING SYSTEM IS EQUIPPED WITH ONE OR BOTH OF THE FOLLOWING: 1) A DEVICE THAT WILL ALERT YOU WHEN THE CONDENSATION DRAIN IS NOT WORKING PROPERLY OR 2) A DEVICE THAT WILL SHUT OFF THE SYSTEM WHEN THE CONDENSATION DRAIN IS NOT WORKING. TO LIMIT POTENTIAL DAMAGE TO YOUR HOME, AND TO AVOID DISRUPTION OF SERVICE, IT IS RECOMMENDED THAT YOU VERIFY PROPER WORKING ORDER OF THESE DEVICES BEFORE EACH SEASON OF PEAK OPERATION.

Reason: Adds prescriptive requirements and notice requirements for air handler units in attics.

Cost Impact: There is a cost impact.

306.3.2 (NEW)-ALLEN.DOC

M20–12
307.2

Proponent: Patrick A. McLaughlin, McLaughlin & Associates, representing Air-Conditioning, Heating & Refrigeration Institute
(pmclaugma@aol.com)

Revise as follows:

307.2 Evaporators and cooling coils. Condensate drain systems shall be provided for *equipment* and appliances containing evaporators or cooling coils. Condensate drain systems shall be designed, constructed and installed in accordance with Sections 307.2.1 through 307.2.4.

> **Exception:** Evaporators and cooling coils that are designed to operate in sensible cooling only and not support condensation shall not be required to meet the requirements of this section.

Reason: The introduction of chilled beam technology is relatively new in the North American market. The code does not take into consideration the fact that dry coils are utilized in most all chilled beam designs; it is an integral part of the design. The chilled beam products have been successfully operating in applications all over the world in this dry manner for over 25 years. Additionally, it is more hygienic and provides greater energy efficiency to design these systems with dry coils. Finally condensation prevention strategies are already employed as part of the design of chilled beam systems.

Cost Impact: The code change proposal will not increase the cost of construction.

M21–12
307.2.2

Proponent: Tom Allen, representing self

Revise as follows:

307.2.2 Drain pipe materials and sizes. Components of the condensate disposal system shall be cast iron, galvanized steel, copper, cross-linked polyethylene, polybutylene, polyethylene, ABS, CPVC or PVC pipe or tubing. All components shall be selected for the pressure and temperature rating of the installation. Joints and connections shall be made in accordance with the applicable provisions of Chapter 7 of the *International Plumbing Code* relative to the material type. Condensate waste and drain line size shall be not less than 3/4-inch (19 mm) internal diameter and shall not decrease in size from the drain pan connection to the place of condensate disposal. Where the drain pipes from more than one unit are manifolded together for condensate drainage, the pipe or tubing shall be sized in accordance with Table 307.2.2.

> **Exception:** Where the drain pipe is less than 10 feet (3048 mm) in length for wall mounted ductless split units with a cooling capacity of less than 36,001 Btu/h, the size of the drain pipe need not be larger than the size of the factory drain outlet on the equipment.

Reason: Exception for small units that utilize a smaller drain than allowed by the table.

Cost Impact: There is no cost impact.

307.2.2-M-PASCHAL.DOC

M23–12
307.2.3

Proponent: Richard Grace, Fairfax County, Virginia Plumbing and Mechanical Inspectors Association, Virginia Building Code Officials Association

Revise as follows:

307.2.3 Auxiliary and secondary drain systems. In addition to the requirements of Section 307.2.1, where damage to any building components could occur as a result of overflow from the *equipment* primary condensate removal system, one of the following auxiliary protection methods shall be provided for each cooling coil or fuel-fired *appliance* that produces condensate:

(1. thru 3. No change)

4. A water level detection device conforming to UL 508 shall be provided that will shut off the equipment served in the event that the primary drain is blocked. The device shall be installed in ~~the primary drain line,~~ the overflow drain line~~,~~ or in the equipment-supplied drain pan, located at a point higher than the primary drain line connection and below the overflow rim of such pan.

Reason: When these devices are installed in the primary drain line, they are not typically installed where the primary line connects to the equipment supplied drain pan. They are typically installed in the uppermost vertical level above the P-trap (approximately 6 or so inches horizontal of the unit itself). If a blockage occurs at the connection point of the primary line to the equipment supplied drain pan, or within the 6” piece of horizontal pipe between the unit and the detection device, the pan will fill and overflow without detection.

Cost Impact: The code change proposal will not increase the cost of construction.

307.2.3-M-GRACE.DOC

M24–12
307.2.3

Proponent: Jay F. Rowland, J.F.R. Enterprises, Inc., representing himself (code@jfrenterprises.com)

Revise as follows:

307.2.3 Auxiliary and secondary drain systems. In addition to the requirements of Section 307.2.1, where damage to any building components could occur as a result of overflow from the *equipment* primary condensate removal system, one of the following auxiliary protection methods shall be provided for each cooling coil or fuel-fired *appliance* that produces condensate:

1. An auxiliary drain pan with a separate drain shall be provided under the coils on which condensation will occur. The auxiliary pan drain shall discharge to a conspicuous point of disposal to alert occupants in the event of a stoppage of the primary drain. The pan shall have a minimum depth of $1^1/_2$ inches (38 mm), shall not be less than 3 inches (76 mm) larger than the unit or the coil dimensions in width and length and shall be constructed of corrosion-resistant material. Galvanized sheet steel pans shall have a minimum thickness of not less than 0.0236 inch (0.6010 mm) (No. 24 gage). Nonmetallic pans shall have a minimum thickness of not less than 0.0625 inch (1.6 mm).
   The auxiliary drain pan shall be provided with a water-level detection device conforming to UL 508 that will shut off the *equipment* served prior to overflow of the pan, or when condensate is sensed in the pan.
2. A separate overflow drain line shall be connected to the primary drain pan provided with the *equipment*. Such overflow drain shall discharge to a conspicuous point of disposal to alert occupants in the event of a stoppage of the primary drain. The overflow drain line shall connect to the drain pan at a higher level than the primary drain connection.
   A water-level detection device conforming to UL 508 shall be provided that will shut off the *equipment* served in the event that the primary drain is blocked. The device shall be installed in the primary drain line, the overflow drain line, or in the equipment-supplied drain pan, located at a point higher than the primary drain line connection and below the overflow rim of such pan.
3. ~~An auxiliary drain pan without a separate drain line shall be provided under the coils on which condensate will occur. Such pan shall be equipped with a water-level detection device conforming to UL 508 that will shut off the *equipment* served prior to overflow of the pan. The auxiliary drain pan shall be constructed in accordance with Item 1 of this section.~~
4. ~~A water-level detection device conforming to UL 508 shall be provided that will shut off the *equipment* served in the event that the primary drain is blocked. The device shall be installed in the primary drain line, the overflow drain line, or in the equipment-supplied drain pan, located at a point higher than the primary drain line connection and below the overflow rim of such pan.~~

   Exception: Fuel-fired appliances that automatically shut down operation in the event of a stoppage in the condensate drainage system.

Reason: This code change is requested in order to bring the code in line with traditional best practices. The end result is building occupants saved from condensate catastrophes.

For decades, contractors have commonly installed three lines of protection against condensate overflow. Besides the drain line from the primary drain pan, they installed a secondary drain pan with a drain line *and* a float switch or similar device in the secondary drain pan. This practice is still common today, as evidenced by the strong tandem sales of shut-off devices along with secondary pans with holes pre-drilled.

Yet the code allows the installer to drop one line of protection as a way of saving a little money in the short run. The current requirement is for the drain from the primary pan to be backed up by only one other option. If the secondary drain line clogs, and there is no shut-off device, then the building is damaged. If the shut-off fails, and there is no secondary drain, then the building is damaged. The risk of a secondary device failing is significant, so a tertiary device isn't overkill. It is wise.

The code body should not assume that equipment is properly installed or maintained or, even if it is, that mechanical devices will always perform as desired. Especially over time, as all things perform less effectively as they age.

The IRC review committee tried to address this issue in its corresponding code section M1411.3.1 by adding the requirement of a secondary drain or pan. We have also submitted a code change request to clarify that section, as the language is a bit ambiguous. We hope, however, that the wording in both codes will be harmonized.

This code change uses existing language in a different arrangement (making methods 3 & 4 part of methods 1 & 2, respectively).

Note: We added the word “primary” to method 2 because some equipment is provided with both primary and secondary drain pans.

Cost Impact: The code change proposal will not increase the cost of construction. At least this is true for the contractors who protect their customers and follow the traditional best practices. Alternatively, we would point out that the cost of keeping the third line of defense against condensate damage is much lower than the cost of re-construction after damage is done. This type of water damage often is not covered by property insurance. Thank you for your consideration.

	Assembly:	ASF	AMF	DF

307.2.3#1-M-ROWLAND.DOC

M25–12
307.2.3

Proponent: Jay F. Rowland, J.F.R. Enterprises, Inc., representing himself (code@jfrenterprises.com)

Revise as follows:

307.2.3 Auxiliary and secondary drain systems. In addition to the requirements of Section 307.2.1, where damage to any building components could occur as a result of overflow from the *equipment* primary condensate removal system, one of the following auxiliary protection methods shall be provided for each cooling coil or fuel-fired *appliance* that produces condensate:

1. An auxiliary drain pan with a separate drain shall be provided under the coils on which condensation will occur. The auxiliary pan drain shall discharge to a conspicuous point of disposal to alert occupants in the event of a stoppage of the primary drain. The pan shall have a minimum depth of $1^1/_2$ inches (38 mm), shall not be less than 3 inches (76 mm) larger than the unit or the coil dimensions in width and length and shall be constructed of corrosion-resistant material. Galvanized sheet steel pans shall have a minimum thickness of not less than 0.0236 inch (0.6010 mm) (No. 24 gage)<u>, shall have seamless corners, and the interior shall be coated with a waterproof material</u>. Nonmetallic pans shall have a minimum thickness of not less than 0.0625 inch (1.6 mm).
2. A separate overflow drain line shall be connected to the drain pan provided with the *equipment*. Such overflow drain shall discharge to a conspicuous point of disposal to alert occupants in the event of a stoppage of the primary drain. The overflow drain line shall connect to the drain pan at a higher level than the primary drain connection.
3. An auxiliary drain pan without a separate drain line shall be provided under the coils on which condensate will occur. Such pan shall be equipped with a water-level detection device conforming to UL 508 that will shut off the *equipment* served prior to overflow of the pan. The auxiliary drain pan shall be constructed in accordance with Item 1 of this section.
4. A water-level detection device conforming to UL 508 shall be provided that will shut off the *equipment* served in the event that the primary drain is blocked. The device shall be installed in the primary drain line, the overflow drain line, or in the equipment-supplied drain pan, located at a point higher than the primary drain line connection and below the overflow rim of such pan.

   Exception: Fuel-fired appliances that automatically shut down operation in the event of a stoppage in the condensate drainage system.

Reason: This code change is proposed to address the quality of drain pans, which play an obviously key role in preventing damage due to condensate.

First, we suggest that drain pan corners be "seamless," such as folded corners for metal pans. Notched corners that are later caulked, or perhaps welded, are prone to error.

More importantly, we suggest that drain pans essentially be rustproof. Resisting rust is not sufficient, because the drain pan is the one thing that should not rust through…and the technologies and products available today provide easy solutions. Polymer coatings, plastic pans, etc. have been used and proven for years. We've never seen a plastic pan rust through.

We stop short of saying that the entire pan must be rustproof, and focus only on the interior of the pan, because galvanized steel is so widely used. However, popularity does not justify its continued widespread use for this application. Whenever serious damage is caused to a building due to a rusted or leaky pan, it's a pretty safe bet that the pan was galvanized steel.

We believe this code change will increase the quality of construction and reflect well on the code.

Cost Impact: The code change proposal will increase the cost of construction. We hesitate to say there will be no increase in cost on commercial installations, but we believe any increase will be negligible…more psychological than real. Galvanized pans will have to be coated before installation, rather than after they start to rust. Alternatively, the installer may use a plastic pan.

If the auxiliary pan is viewed properly as insurance, then any cost difference is more than offset by not having to repair ceilings and other building components due to flooding (which is often not covered by property insurance). Thank you for your consideration.

M25-12

Public Hearing: Committee: AS AM D

M26– 12
202 (NEW), Section 307.2.3.1

Proponent: Timothy Burgos, InterCode Incorporated, representing Rectorseal Corporation and Ken Sagan, NRG Code Advocates, representing self
(ken@nrgcodeadvocates.com)

Add new definition as follows:

DUCTLESS MINI-SPLIT SYSTEM. A heating and cooling system that is comprised of one or multiple indoor evaporator/air handler units and an outdoor condensing unit that is connected by refrigerant piping and electrical wiring. A ductless mini-split system is capable of cooling or heating one or more rooms without the use of a traditional ductwork system.

Revise as follows:

307.2.3.1 Water-level monitoring devices and condensate pumps. On down-flow units and all other coils that do not have a secondary drain or provisions to install a secondary or auxiliary drain pan, a water-level monitoring device shall be installed inside the primary drain pan. This device shall shut off the *equipment* served in the event that the primary drain becomes restricted. Devices installed in the drain line shall not be permitted. For ductless mini-split equipment that is not able to drain condensate from the unit by gravity, a condensate pump shall be installed to remove water from the *equipment.* The condensate pump shall be powered by the same power supply that powers the *equipment* being served and shall be capable of shutting off the equipment served in the event of failure of the pump to remove condensate.

Reason: Ductless mini-split systems have existed for more than 50 years and have been available for more than 30 years in the United States HVAC residential and/or light commercial markets. Most American consumers, however, are unaware of these products. A ductless mini-split system is not a window unit; it is a permanently installed mechanical system used in new construction, additions, multi-family (condo/apartment) housing, and to improve comfort in poorly conditioned spaces.

Ductless Mini-split equipment must follow the same code requirements as other condensate producing equipment due to the potential damage and health risk associated with uncontrolled condensation. Ductless mini-split units also do not have provisions for a secondary drain, or auxiliary drain pans to prevent condensation from overflowing the primary drain pan. Currently it is unclear in the code if ductless mini-split units require water-level monitoring devices. In installations where gravity drains condensation removal is impossible, a condensate pump must be installed that communicates with the ductless mini-split to stop the equipment if there is a failure of the condensate removal system. Power for the condensate pump should be provided from the mini-split equipment and not from a separate power source. The danger of using a separate power supply is that if the circuit that supplies power to the condensate pump fails, but the circuit providing power to the mini split equipment remains active, the pump will not operate and the equipment will produce excessive condensation without shutting down. This code change addresses the condensate requirement and allows simplicity in code compliance.

Cost Impact: The code change proposal will not increase the cost of construction.

202-DUCTLESS MINI SPLIT SYSTEM (NEW) #2-M-BURGOS-SAGAN.DOC

M27–12
307.2.3.2

Proponent: Riley Archer, Rectorseal Corporation, representing Rectorseal Corporation (rileya@rectorseal.com)

Add new text as follows:

307.2.3.2 Ductless Mini split water-level monitoring devices and condensate pumps. A water-level monitoring device shall be installed inside the main drain pan of mini-split *equipment*. Such device shall shut off the *equipment* served in the event that the primary drain becomes restricted. For ductless mini split equipment that cannot drain condensation from the unit by gravity, a separate condensate pump shall be installed to remove water from the *equipment*, in addition to a water-level monitoring device. The condensate pump shall be capable of shutting off the equipment in the event that the condensate removal system has failed and shall be connected to the same electrical branch circuit as the *equipment* being served.

Reason: Ductless mini split equipment must follow the same regulations as other condensate producing equipment, due to the potential damage and health risk associated with uncontrolled condensation. Ductless mini split units also do not have provisions for secondary drain, secondary or auxiliary drain pans to prevent condensation from overflowing the primary drain pan. Currently it is unclear in the code language if mini split units require water-level monitoring devices. Applications where the ability to drain condensation with the use of gravity is not possible a condensate pump must be installed with the ductless mini split equipment. This pump should be able to stop the equipment for producing condensation if there is a failure in the condensate removal system. The condensate pump should be powered by the mini split equipment itself to ensure that a separate power supply is not used. The danger of using a separate power supply is that if the circuit that supplies power to the condensate pump fails, but the circuit providing power to the ductless mini split equipment remains active the pump will not operate and the equipment will produce condensation without shutting down. Both a condensate pump and water-level monitoring device are necessary due to restrictions occurring inside the drain pan and inside the condensate line will trip each devices cut off functions separately.

Cost Impact: There is little to no cost impact.

	Assembly:	ASF	AMF	DF

202-DUCTLESS MINI SPLIT SYSTEM (NEW) #1-M-BURGOS-SAGAN.DOC

M29–12
202, 307.2.4.1

Proponent: Timothy Burgos, InterCode Incorporated, representing Rectorseal Corporation and Ken Sagan, NRG Code Advocates, representing self

Add new definition as follows:

<u>**DUCTLESS MINI-SPLIT SYSTEM.** A heating and cooling system that is comprised of one or multiple indoor evaporator/air handler units and an outdoor condensing unit that is connected by refrigerant piping and electrical wiring. A ductless mini-split system is capable of cooling or heating one or more rooms without the use of a traditional ductwork system.</u>

Add new text as follows:

<u>**307.2.4.1 Ductless Mini-Split Traps.** Ductless mini split equipment that produces condensation shall be provided with an inline check valve located in the drain line instead of a trap.</u>

Reason: Ductless mini-split condensate lines are direct openings for unconditioned outside air, contaminants, insects and other undesirable materials to enter the conditioned space and should be trapped using an inline check valve as a preventative measure.

Ductless mini-split systems have existed for more than 50 years and have been available for more than 30 years in the United States HVAC residential and/or light commercial markets. Most American consumers, however, are unaware of these products. A ductless-mini split system is not a window unit; it is a permanently installed mechanical system used in new construction, additions, multi-family (condo/apartment) housing, and to improve comfort in poorly conditioned spaces. Since mini-splits require no ducts and indoor components are mounted directly on interior ceiling, walls, or on the floor, they avoid the energy losses associated with ductwork of central forced air systems. Duct losses can account for more than 30% of energy consumption for space conditioning, especially if the ducts are in an unconditioned space such as an attic.

Ductless mini-split heating and cooling systems are highly efficient products that deliver warm or cool air directly into different zones in a building instead of through ducts. They are also called mini-split, multi-split, or variable refrigerant flow (VRF) heat pump systems. They are an increasingly popular and cost-effective solution to replace inefficient baseboard electric heating and window air conditioners in existing homes.

Ductless mini-split systems have numerous potential applications in residential, commercial, and institutional buildings. The most common applications are in multifamily housing or as retrofit add-ons in houses with "non-ducted" heating systems, such as hydronic (hot water heat), radiant (electric resistance), and space heaters (wood, kerosene, propane). They can also be a good choice for room additions and small apartments where extending or installing distribution ductwork (for a central air-conditioner or heating systems) is not feasible or where existing equipment cannot handle the additional load.

A ductless mini-split system is comprised of an indoor unit called the evaporator and an outdoor unit called the condenser. The evaporator is connected to the condensing unit by copper tubing and electrical wiring which is passed through a 2 ½" – 4" hole. Basically, it is a small central air unit with the flexibility of cooling or heating one or more room.

The advantages of installing a ductless mini-split over a central air system.

The main advantages of a ductless mini-split are their small size and flexibility for zoning or heating and cooling individual rooms. Models can have as many as four indoor air handling units (for four zones or rooms) connected to one outdoor unit. The number of units is determined by how much heating or cooling is required for the building or each zone (which in turn is affected by the properties of the building envelope). Since each of the zones has its own thermostat, the space can be conditioned only when occupied saving energy and money.

1. With Central Air, an entire home must be cooled when only one room may be occupied. Ductless mini-splits cool only the areas that require conditioning.
2. 18,000 BTU is a typical minimum central air unit: ductless mini-splits are available beginning at 9,000 or 12,000 BTUs.
3. Typical homes requiring 3-ton HVAC units may not be zoned or require complex zoning systems that are very expensive for the homeowner. With ductless mini-splits, multiple evaporators make zoning as simple as setting a remote control.
4. Energy wasted in long lengths of uninsulated ductwork means higher energy bills. Less than 5% cooling loss occurs in insulated refrigerant lines compared with up to 25% through ducts.
5. Retrofitting existing homes with whole house air conditioning requires cutting holes in walls, floors, ceilings or decreasing closet space with ducts.
6. Ductless mini-splits require just a 2 ½ or 4" diameter hole in the outside wall meaningless mess and better home aesthetics.

Most systems now incorporate inverter-driven compressors, which allow for system ramp-up until the desired set temperature is met, then permit the system to modulate its operation so that a comfortable temperature is maintained. This operation avoids the abrupt and energy-consuming start and stop exhibited by traditional HVAC systems.

Ductless mini-split systems are also often easier to install than other types of space conditioning systems. For example, the hook-up between the outdoor and indoor units generally requires only a three inch (~8 centimeter [cm]) hole through a wall for the conduit. Also, most manufacturers of this type of system can provide a variety of lengths of connecting conduits. So, if necessary, you can locate the outdoor unit as far away as 50 feet (~15 meters [m]) from the indoor evaporator. This makes it possible to cool rooms on the front side of a building with the compressor in a more appropriate or inconspicuous place on the outside of the building.

Indoor air handlers can be suspended from a ceiling, flush-mounted in a drop ceiling, or hung on a wall. Floor-standing models are also available. Many offer a remote control to make control of high mounted units easier. Split systems can also contribute to the security of a building by eliminating the need for larger openings required for through-the-wall units or unsecured windows housing window-mounted units –openings that can provide easy access for intruders

Ductless mini-split equipment must follow the same code requirements as other condensate producing equipment due to the potential damage and health risk associated with uncontrolled condensation. Ductless mini-split units also do not have provisions for a secondary drain, or auxiliary drain pans to prevent condensation from overflowing the primary drain pan. Currently it is unclear in the code if ductless mini-split units require water-level monitoring devices. In installations where gravity drains condensation removal is impossible, a condensate pump must be installed that communicates with the ductless mini-split to stop the equipment if there is a failure of the condensate removal system. Power for the condensate pump should be provided from the mini-split equipment and not from a separate power source. The danger of using a separate power supply is that if the circuit that supplies power to the condensate pump fails, but the circuit providing power to the mini split equipment remains active, the pump will not operate and the equipment will produce excessive condensation without shutting down.

Cost Impact: The code change proposal will not increase the cost of construction.

(tfkolter@gmail.com/tom.kolter@yahoo.com)

Add new text as follows:

307.2.5 Cleanouts. Condensate drains shall be provided with a means to allow cleaning of the drain and clearing of blockages without having to cut or disassemble the piping.

Reason: Drain line stoppages in evaporative coils drain pan drain lines are unavoidable and common occurrences requiring clearing the drain line. Clearing these lines almost always involves cutting the drain line itself, causing water to leak into the attic or closet where the drain is located, possible collected in a bucket or soaked up with rags or paper towels. Then the technician blows compressed air through the drain line in both directions from the cut. The cut must be repaired by resealing the drain line with a PVC coupling and solvent.

This process exposes the surrounding area to water leakage and spilling with the risk of damage, mold, spilling, as well as the extra time and effort of carrying extra equipment, parts and flammable solvent. The process takes extra time and costs the homeowner more money.

With a device that permits the introduction of compressed air or nitrogen directly into the drain system permitting clearing in both directions, there is no spillage of water, no cost for the couplings or solvent and no risk of water damage or mold. The entire process requires less than five minutes.

Typically the cost of clearing a drain equipped with such a device is at least 50% less to the homeowner than the cost of clearing a blockage through the common method of cutting the pipe, attempting to collect the condensate water and repairing the cut in the drain line.

Each time a drain line is cleared though the cutting/repair process, the repair could be accomplished by installing a $15.00 line clearing device rather than a simple coupling.

Also, if clearing the drain lines were part of regular maintenance, line blockages could largely be prevented in the first place.

Cost Impact: The code change will increase the cost of construction, totaling an estimated $15.00 per unit.

M32-12

307.2.3-M-JONES.DOC

M33–12
307.2.5

Proponent: Riley Archer, Rectorseal Corporation, representing Rectorseal Corporation (rileya@rectorseal.com)

Add new text as follows:

307.2.5 Back-flow prevention. Where the condensate drains from multiple appliances or equipment share common drain piping, a self-sealing check valve device shall be installed in the condensate line at the primary condensate pan. This device shall prevent condensate form flowing back into the *equipment* in the event of a blockage in the main drain line and shall be provided with a cleanout opening and a means to allow visual inspection of condensate flow.

Reason: On multi-story or single story buildings where multiple air conditioning units are tied into a common condensate line a clog in the disposal line will cause water to back up into the drain pans of all lower units tied into the condensate disposal line. This will occur even if all units are equipped with water-level detection devices due to the fact that the equipment on the lower level will shut down due to a backup, but the equipment on the higher level will continue to operate until water reaches the water-level detection device at that level. A manual cleanout is necessary to allow for removal of the clog within the line without cutting the condensate line to do so. The device must be capable of visual inspection to allow for view of check valve and flow of condensate.

Cost Impact: This code change proposal will increase the cost of construction.

307.2.5 (NEW)-M-ARCHER.DOC

M34–12
202, 308

Proponent: Bob Eugene, representing Underwriters Laboratories (Robert.Eugene@ul.com)

Revise as follows:

PROTECTIVE ASSEMBLY (REDUCED CLEARANCE). Any noncombustible assembly that is *labeled* or constructed in accordance with Table 308.~~6~~4.2 and is placed between combustible materials or assemblies and mechanical appliances, devices or *equipment*, for the purpose of reducing required airspace clearances. Protective assemblies attached directly to a combustible assembly shall not be considered as part of that combustible assembly.

308.4 Allowable reduction. The reduction of required *clearances* to combustible assemblies or combustible materials shall be based on the utilization of a reduced *clearance* protective assembly in accordance with Section 308.~~5~~4.1 or 308.~~6~~4.2.

308.~~5~~4.1 Labeled assemblies. The allowable clearance reduction shall be based on an approved reduced clearance protective assembly that is listed and labeled in accordance with UL 1618.

308.~~6~~4.2 Reduction table. The allowable *clearance* reduction shall be based on one of the methods specified in Table 308.~~6~~4.2. Where required *clearances* are not listed in Table 308.~~6~~4.2, the reduced *clearances* shall be determined by linear interpolation between the distances listed in the table. Reduced *clearances* shall not be derived by extrapolation below the range of the table.

308.~~7~~5 Solid fuel-burning appliances. The *clearance* reduction methods specified in Table 308.~~6~~4.2 shall not be utilized to reduce the *clearance* required for solid fuel-burning appliances that are *labeled* for installation with clearances of 12 inches (305 mm) or less. Where appliances are *labeled* for installation with *clearances* of greater than 12 inches (305 mm), the *clearance* reduction methods of Table 308.~~6~~4.2 shall not reduce the *clearance* to less than 12 inches (305 mm).

308.~~8~~6 Masonry chimneys. The *clearance* reduction methods specified in 308.~~6~~4.2 shall not be utilized to reduce the *clearances* required for masonry *chimneys* as specified in Chapter 8 and the *International Building Code*.

308.~~9~~7 Chimney connector pass-throughs. The *clearance* reduction methods specified in 308.~~6~~4.2 shall not be utilized to reduce the *clearances* required for *chimney* connector pass-throughs as specified in Section 803.10.4.

308.~~10~~8 Masonry fireplaces. The *clearance* reduction methods specified in 308.~~6~~4.2 shall not be utilized to reduce the *clearances* required for masonry fireplaces as specified in Chapter 8 and the *International Building Code*.

308.~~11~~9 Kitchen exhaust ducts. The *clearance* reduction methods specified in 308.~~6~~4.2 shall not be utilized to reduce the minimum *clearances* required by Section 506.3.11 for kitchen exhaust ducts enclosed in a shaft.

TABLE ~~308.6~~ 308.4.2
CLEARANCE REDUCTION METHODS[b]

(Portions of table and footnotes not shown remain unchanged)

b. For limitations on clearance reduction for solid fuel-burning appliances, masonry chimneys, connector pass-throughs, masonry fire places and kitchen ducts, see Sections ~~308.7 through 308.11~~ 308.5 through 308.9.

Reason: Provide clarity that there are two different methods for reducing clearances.

Cost Impact: None

308.4-M-EUGENE.DOC

M35–12
[B] 309.2 (NEW)

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

THIS CODE CHANGE PROPOSAL WILL BE HEARD BY THE IBC-GENERAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Add new text as follows:

[**B] 309.2 Space-cooling systems.** Where the Dry bulb 2 ½ % Summer Design Temperature as determined in accordance with Appendix D of the *International Plumbing Code* is 92° F or greater, occupancies in groups E, I1, I2, I4 and R shall be provided with active or passive space-cooling systems capable of maintaining an indoor temperature of 75° F on the design day. Wall mounted and window mounted cooling units used to comply with this section shall not obstruct any required emergency escape and rescue openings.

Reason: Section 309 addresses the requirements for space heating in interior spaces and requires that the system be able to maintain a temperature of at least 68 degrees. This is considered to be necessary to make the space occupiable. However, the code does not have any cooling requirements for hospitals, operating rooms, health care facilities, nursing homes, etc. In warm humid climates, space cooling can become a life safety issue for some members of society. This is not about luxury; rather, it can be the difference between life and death.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: This proposal will increase the cost of construction.

(Portions of table and footnotes not shown remain unchanged)

Add new text as follows:

SECTION 407
AMBULATORY CARE FACILITIES AND GROUP I-2 OCCUPANCIES

Section 407.1 General. Mechanical ventilation for ambulatory care facilities and Group I-2 occupancies shall be designed and installed in accordance with this code and ASHRAE 170.

Add new referenced standard to Chapter 15:

ASHRAE

Standard Reference Number	Title	Referenced in code section number
<u>170-2008</u>	<u>Ventilation of Health Care Facilities (with addendums a through h – 2011)</u>	<u>407.1</u>

PART II- IBC GENERAL

Revise as follows:

1203.1 General. Buildings shall be provided with natural ventilation in accordance with Section 1203.4, or mechanical ventilation in accordance with the *International Mechanical Code*. Where the air infiltration rate in a *dwelling unit* is less than 5 air changes per hour when tested with a blower door at a pressure 0.2 inch w.c. (50 Pa) in accordance with Section 402.4.1.2 of the *International Energy Conservation Code*, the *dwelling unit* shall be ventilated by mechanical means in accordance with Section 403 of the *International Mechanical Code*. <u>Ambulatory care facilities and Group I-2 occupancies shall be ventilated by mechanical means in accordance with Section 407 of the *International Mechanical Code.*</u>

Reason: This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April, 2011, the AHC has held 5 open meetings and over 80 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx. This proposal is being co-sponsored by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April, 2005, the CTC has held twenty-two meetings – all open to the public.

Currently Table 403.3 if the IMC has a limited number of spaces identified with ventilation rates, additionally if a room is not identified in the table then one is required to use the ventilation rate of an adjacent room that is on the list which is problematic if the space usage is vastly different. ASHRAE Standard 170, Table 7-1 has more comprehensive in the spaces that are identified as well as the design parameter requirements. Facility Guidelines Institute (FGI) has also incorporated ASHRAE 170 into the ventilation design requirements at health care facilities. ASHRAE 170 is similar in nature to the IMC referenced standard for the International Institute for Ammonia Refrigeration.

Cost Impact: The code change proposal should not increase the cost of construction because compliance with the standard is already required by facility licensure requirements.

Analysis: A review of the standard proposed for inclusion in the code, [ASHRAE170-2008] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

	Assembly:	ASF	AMF	DF

401.2-M-WILLIAMS-ADHOCHEALTHCARE.DOC

M37–12
401.2, Chapter 15, IBC 1203.1, IBC CHAPTER 35

Proponent: Steve Ferguson representing the American Society of Heating, Refrigerating, and Air-Conditioning Engineers

THIS IS A 2 PART CODE CHANGE, BOTH PARTS WILL BE HEARD BY THE INTERNATIONAL MECHANICAL CODE COMMITTEE AS 2 SEPARATE CODE CHANGES, SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE.

PART I - IMC

Revise as follows:

401.2 Ventilation required. Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403. ~~Where the air infiltration rate in a dwelling unit is less than 5 air changes per hour when tested with a blower door at a pressure of 0.2-inch water column (50 Pa) in accordance with Section 402.4.1.2 of the International Energy Conservation Code, the dwelling unit shall be ventilated by mechanical means in accordance with Section 403~~. R-2, R-3, and R-4 buildings three stories or less in height above grade plane shall be ventilated by mechanical means in accordance with addendum j of ASHRAE Standard 62.2.

Add standard to Chapter 15 as follows:

ASHRAE Standard 62.2-10
Ventilation and Acceptable Indoor Air Quality in Low-Rise Residential Buildings

PART II – IBC-GENERAL

1203.1 General. Buildings shall be provided with natural ventilation in accordance with Section 1203.4, or mechanical ventilation in accordance with the *International Mechanical Code.* ~~Where the air infiltration rate in a *dwelling unit* is less than 5 air changes per hour when tested with a blower door at a pressure 0.2 inch w.c. (50 Pa) in accordance with Section 402.4.1.2 of the *International Energy Conservation Code*, the *dwelling unit* shall be ventilated by mechanical means in accordance with Section 403 of the *International Mechanical Code*.~~ R-2, R-3, and R-4 buildings three stories or less in height above grade plane shall be ventilated by mechanical means in accordance with addendum j of ASHRAE Standard 62.2.

Add referenced standard to Chapter 35 as follows:

ASHRAE Standard 62.2-10
Ventilation and Acceptable Indoor Air Quality in Low-Rise Residential Buildings

Reason: The previous requirements in the IMC were based on requirements in ASHRAE Standard 62.2.-2007. Since that time, the mechanical ventilation requirements in ASHRAE Standard 62.2 in R-2, R-3, and R-4 buildings have changed. This proposes to reference ASHRAE Standard 62.2 for ventilation requirements in these building types.
The changes in addendum j to 62.2-2010 account for unique features of multifamily buildings as compared to single-family buildings and include (1) adjusting the whole-building ventilation rate due to the fact that infiltration cannot be relied on for individual units in multifamily buildings; (2) provision of ventilation to common spaces and common parking garages, which do not exist in single-family buildings; and (3) prevention of contaminant transfer from other units through walls or ducts.

Cost Impact: There is no expected increase to the cost of construction, as this is simply a clarification of existing requirements.

Analysis: A review of the standard proposed for inclusion in the code, [ASHRAE 62.2-10] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

M38–12
401.2, 401.3 (NEW), IBC 1203.1

Proponent: Craig Conner, representing self.

BOTH PARTS I AND II OF THIS CODE CHANGE WILL BE HEARD BY THE IMC COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Part I – IMC

Revise as follows:

401.2 Ventilation required. Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403. ~~Where the air infiltration in a *dwelling unit* is less than 5 air changes per hour when tested with a blower door with a pressure of 0.2 inc W.C. (50 Pa) in accordance with Section 402.4.1.2~~ Where a dwelling unit complies with the air tightness requirements in Section C402.4.1 or R402.4.1.2 of the *International Energy Conservation Code*, the dwelling unit shall be ventilated by mechanical means in accordance with Section 403.

Add new text as follows:

401.3 Backdrafting elimination. Dwelling units that comply with the air tightness requirements in Section C402.4.1 or R402.4.1.2 of the *International Energy Conservation Code*, shall comply with at least one of the following options:

1) Space heating appliances, boilers, water heating appliances, wood stoves, and fireplaces in the conditioned space of the dwelling unit shall be of the direct-vent, induced-draft, or power-vented type.

2) Mechanical ventilation for the conditioned space, exhaust systems, clothes dryers and central vacuum systems shall not contribute to depressurization. Systems that provide *makeup air* at a rate approximately equal to or greater than the *exhaust air* rate, that are equipped with a means of closure, and that are automatically controlled to start and operate simultaneously with the exhaust system shall not be deemed to contribute to depressurization.

3) Testing demonstrates compliance with the CAN/CGSB 51.71-2005 depressurization test. Where required by the *code official,* testing shall be performed by an *approved* third party.

4) The *registered design professional* demonstrates in an approved manner that backdrafting will not occur.

Part II – IBC-GENERAL

Revise as follows:

1203.1 General. Buildings shall be provided with natural ventilation in accordance with Section 1203.4, or mechanical ventilation in accordance with the *International Mechanical Code*.

Dwelling units that comply with the air tightness requirements in Section C402.4.1 or R402.4.1.2 of the *International Energy Conservation Code*, ~~Where the air infiltration in a *dwelling unit* is less than 5 air changes per hour when tested with a blower door with a pressure of 0.2 inc W.C. (50 Pa) in accordance with Section 402.4.1.2 of the *International Energy Conservation Code*, the dwelling unit~~ shall be ventilated by mechanical means in accordance with Section 403 of the *International Mechanical Code.*

Add new standard to Chapter 15 as follows:

<u>CAN/CGSB 51.71-2005 Depressurization Test</u>

Reason: Backdrafting combustion appliances can lead to serious health consequences, occasionally including death. This change is designed to greatly reduce the likelihood of backdrafting. This change is also intended to remove the apparent requirement to apply a residential air tightness test to commercial spaces, and remove redundancy in the IBC and IMC.

The 2012 I-codes and common practices are increasing the potential for backdrafting in dwelling units. Back drafting is most likely if three things are true- construction is airtight, exhaust-only ventilation is used, and atmospherically vented (natural draft) combustion appliances are in conditioned spaces. New construction is required by the 2012 IECC to be much more airtight (C402.4.1 for commercial, R402.4.1.2 for residential). Mechanical ventilation is required by the 2012 I-codes in dwelling units, with the least expensive form of mechanical ventilation being the exhaust-only ventilation fans already in common use. The energy code no longer encourages more efficient condensing furnaces by recognizing their high energy efficiency; thereby, removing some of the motivation for condensing furnaces. The trend towards large exhaust fans, such as kitchen hoods, also contributes to the problem. This combination is a recipe for back drafting problems.

The proposed change gives several options. The first two options prevent back drafting by eliminating at least one of major contributor, either the natural draft (atmospherically vented) combustion appliances, or exhaust-only ventilation. The third option is a "Depressurization Test" (standard CAN/CGSB 51.71-2005), which tests for excessive depressurization levels in dwelling units. If a vented combustion appliance using combustion air from the conditioned space experiences strong enough depressurization, the flue gases will spill into the home. Anything more than a brief reverse flow can be serious. The fourth option could be used in situations where the registered design professional can show backdrafting is not a problem without doing a full depressurization test.

Confusion on when the 2012 IBC and IMC require mechanical ventilation in dwelling units is corrected by this change. The IBC and IMC partially, but not completely, repeat air tightness requirements from the IECC. The existing IBC and IMC can be read to require the residential criteria be applied to portions of commercial buildings, whereas the commercial portion of the IECC has its own air tightness criteria. Does a new dwelling unit in a commercial building that meets the 2012 IECC commercial air tightness requirements also require mechanical ventilation? In the 2012 IBC and IMC the answer is unclear unless the residential test is also performed, a test which may be difficult for some commercial buildings. Dwelling units which meet the relatively air tight 2012 IECC commercial criteria should require mechanical ventilation. This proposed change clarifies the IBC and IMC by simply referencing the IECC for air tightness requirements.

Cost Impact: This code change proposal will increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [CAN/CGSB 51.71-2005] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

401.2-M-CONNER.DOC

M39–12
401.2, IBC 1203.1

Proponent: Mike Moore, Newport Ventures, representing Broan NuTone (mmoore@newportpartnersllc.com)

THIS IS A 2 PART CODE CHANGE, BOTH PARTS WILL BE HEARD BY THE MECHANICAL CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE

PART I – IMC

Revise as follows:

401.2 Ventilation required. Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403. ~~Where the air infiltration rate in a dwelling unit is less than 5 air changes per hour when tested with a blower door at a pressure of 0.2 inch water column (50 Pa) in accordance with Section 402.4.1.2 of the International Energy Conservation Code, the dwelling unit shall be ventilated by mechanical means in accordance with Section 403~~. R-2, R-3, and R-4 buildings three stories or less in height above grade plane shall be ventilated by mechanical means in accordance with Section 403.

PART II – IBC GENERAL

Revise as follows:

1203.1 General. Buildings shall be provided with natural ventilation in accordance with Section 1203.4, or mechanical ventilation in accordance with the *International Mechanical Code*. ~~Where the air infiltration rate in a *dwelling unit* is less than 5 air changes per hour when tested with a blower door at a pressure 0.2 inch w.c. (50 Pa) in accordance with Section 402.4.1.2 of the *International Energy Conservation Code*, the *dwelling unit* shall be ventilated by mechanical means in accordance with Section 403 of the *International Mechanical Code.*~~ R-2, R-3, and R-4 buildings three stories or less in height above grade plane shall be ventilated by mechanical means in accordance with Section 403 of the *International Mechanical Code.*

Reason: To identify the mechanical ventilation requirements of dwelling units, designers are now required to cross reference the 2012 IECC, determine if the dwelling unit is within a building that is covered within the scope of Chapter 4 or Chapter 5 of the IECC, and then determine if the air tightness level of the unit is sufficiently tight to require mechanical ventilation per Section 401.2 of the IMC.

This proposal short cuts this burdensome circuit by clearly stating what the designer would find if he or she were to go through this exercise – that mechanical ventilation is required by the overlap of the 2012 IECC and 2012 IMC for R-2, R-3, and R-4 buildings. The reason for this is as follows:

1. The 2012 IMC 401.2 requires dwelling units with an air infiltration rate less than 5 ACH 50 (air changes per hour at 50 Pa, as confirmed by a blower door test in accordance with 2012 IECC Section 402.4.1.2) to be provided with mechanical ventilation.
2. The scope of Chapter 4 of the 2012 IECC overlaps with that of the IMC for R-2, R-3, and R-4 buildings three stories or less above grade plane (see the definition of Residential within Chapter 2 of the IECC).
3. 2012 IECC 402.4.1.2 requires that the air leakage rate for all buildings or dwelling units within its scope be less than or equal to 5 air changes per hour when tested with a blower door at a pressure of 0.2 inch water column (50 Pa).
4. The net result is that R-2, R-3, and R-4 buildings three stories or less in height above grade plane are required to be ventilated by mechanical means in accordance with Section 403 of the IMC.
5. Additionally, 2012 IECC 403.5 reads: "Mechanical Ventilation (Mandatory). The building shall be provided with ventilation that meets the requirements of the International Residential Code or International Mechanical Code, as applicable, or with other approved means of ventilation."

Combined, the overlap of the two codes requires that mechanical ventilation should be provided in accordance with Section 403. This proposal is needed to clarify this requirement and remove ambiguity in the code. Note that there is a companion code change proposed for Section 1203.1 of the IBC.

Cost Impact: There is no expected increase to the cost of construction, as this is simply a clarification of existing requirements.

M39-12
PART I – INTERNATIONAL MECHANICAL CODE

	Assembly:	ASF	AMF	DF

PART II – INTERNATIONAL BUILDING CODE

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

401.2-M-MOORE.DOC

M40–12
401.2.1 NEW

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Add new text as follows:

401.2 .1 Dwelling unit mechanical ventilation. The mechanical ventilation required for dwelling units by Section 401.2 shall be provided by means of one or more supply or exhaust fans or one or more local supply or exhaust fans. Outdoor air ducts connected to the return side of an air handler shall be considered as providing supply ventilation where utilized in conjunction with exhaust fans.

Reason: Section 401.2 requires mechanical ventilation in dwelling units under specified conditions, but unlike the IRC, it does not provide any guidance as to how this is to be accomplished. The proposed text is borrowed from the IRC.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

401.2.1-M-STRAUSBAUGH-PMGCAC.DOC

M41–12
401.3

Proponent: Randall R. Dahmen, P.E. Wisconsin licensed Commercial Building Inspector, representing self

Revise as follows:

401.3 When required. Ventilation shall be provided during the periods that the room or space is occupied. <u>Continuous mechanical ventilation shall be provided for swimming pool areas.</u>

Reason: As is typical, there is high humidity and an accumulation of chemicals in the air of enclosed spaces involving swimming pools. Without continuous air movement and air exchange, the humidity has been known to promote the growth of mold within the space. Additionally, due to chemicals commonly used to treat pool water, corrosion to exposed metals in such spaces have been known to occur where air movement and air exchange is not maintained.

Cost Impact: There would be an increase operational costs as associated with supply & exhaust fan operations and the need for additional tempered outside air as associated with IMC 403.2.1 Item 2. and IMC Table 403.3. Such costs are dependent on the size of the pool & deck.

Proponent: Mike Moore, Newport Ventures, representing Broan NuTone (mmoore@newportpartnersllc.com)

Revise as follows:

403.1 Ventilation system. Except as required by Section 403.1.1, mechanical ventilation shall be provided by a method of supply air and return or exhaust air. The amount of supply air shall be approximately equal to the amount of return and exhaust air. The system shall not be prohibited from producing negative or positive pressure. The system to convey ventilation air shall be designed and installed in accordance with Chapter 6.

403.1.1 R-2, R-3 and R-4 occupancies. Mechanical ventilation air requirements for R-2, R-3, and R-4 buildings three stories or less in height above grade plane shall be provided by an exhaust system, supply system, or combination thereof.

403.2 Outdoor air required. The minimum outdoor airflow rate shall be determined in accordance with Section 403.3. ~~Ventilation supply systems shall be designed to deliver the required rate of outdoor airflow to the breathing zone within each occupiable space.~~

> **Exception:** Where the registered design professional demonstrates that an engineered ventilation system design will prevent the maximum concentration of contaminants from exceeding that obtainable by the rate of outdoor ventilation determined in accordance with Section 403.3, the minimum required rate of outdoor air shall be reduced in accordance with such engineered system design.

403.2.1 Recirculation of air. The outdoor air required by Section 403.3 shall not be recirculated. Air in excess of that required by Section 403.3 shall not be prohibited from being recirculated as a component of supply air to building spaces, except that:

1. Ventilation air shall not be recirculated from one dwelling to another or to dissimilar occupancies.
2. Supply air to a swimming pool and associated deck areas shall not be recirculated unless such air is dehumidified to maintain the relative humidity of the area at 60 percent or less. Air from this area shall not be recirculated to other spaces where more than 10 percent of the resulting supply airstream consists of air recirculated from these spaces.
3. Where mechanical exhaust is required by Note b in Table 403.3.1.1, recirculation of air from such spaces shall be prohibited. All air supplied to such spaces shall be exhausted, including any air in excess of that required by Table 403.3.1.1.
4. Where mechanical exhaust is required by Note g in Table 403.3.1.1, mechanical exhaust is required and recirculation is prohibited where more than 10 percent of the resulting supply airstream consists of air recirculated from these spaces.

403.2.2 Transfer air. Except where recirculation from such spaces is prohibited by Table 403.3.1.1, air transferred from occupiable spaces is not prohibited from serving as makeup air for required exhaust systems in such spaces as kitchens, baths, toilet rooms, elevators and smoking lounges. The amount of transfer air and exhaust air shall be sufficient to provide the flow rates as specified in Section 403.3.1.1. The required outdoor airflow rates specified in Table 403.3.1.1 shall be introduced directly into such spaces or into the occupied spaces from which air is transferred or a combination of both.

In R-2, R-3, and R-4 occupancies three stories or less in height, measures shall be taken to minimize air movement across envelope components separating dwelling units including sealing penetrations in the common walls, ceilings, and floors of each unit, and by sealing vertical chases adjacent to the units. Doors between dwelling units and common hallways shall be gasketed or otherwise made airtight.

403.3 Outdoor air and local exhaust airflow rates. R-2, R-3, and R-4 buildings three stories or less in height above grade plane shall be provided with outdoor air and local exhaust in accordance with Section 403.3.2. All other buildings intended to be occupied shall be provided with outdoor air and local exhaust, in accordance with Section 403.3.1.

403.3.1 Other buildings intended to be occupied. The design of local exhaust systems and ventilation systems for outdoor air for occupancies other than R-2, R-3 and R-4 three stories are less above grade plane, shall comply with this section.

~~403.3~~403.3.1.1 Outdoor airflow rate. Ventilation systems shall be designed to have the capacity to supply the minimum outdoor airflow rate, determined in accordance with this section. Ventilation supply systems shall be designed to deliver the required rate of outdoor airflow to the breathing zone within each occupiable space. The occupant load utilized for design of the ventilation system shall not be less than the number determined from the estimated maximum occupant load rate indicated in Table 403.3.1.1. Ventilation rates for occupancies not represented in Table 403.3.1.1 shall be those for a listed occupancy classification that is most similar in terms of occupant density, activities and building construction; or shall be determined by an approved engineering analysis. The ventilation system shall be designed to supply the required rate of ventilation air continuously during the period the building is occupied, except as otherwise stated in other provisions of the code.

With the exception of smoking lounges, the ventilation rates in Table 403.3.1.1 are based on the absence of smoking in occupiable spaces. Where smoking is anticipated in a space other than a smoking lounge, the ventilation system serving the space shall be designed to provide ventilation over and above that required by Table 403.3.1.1 in accordance with accepted engineering practice.

> **Exception:** The occupant load is not required to be determined based on the estimated maximum occupant load rate indicated in Table 403.3.1.1 where approved statistical data document the accuracy of an alternate anticipated occupant density.

(Renumber current sections as indicated in table)

Old Section Numbering	New Section Numbering	Section Heading
403.3	403.3.1.1	Outdoor airflow rate
403.3.1	403.3.1.1.1	Zone outdoor airflow
403.3.1.1	403.3.1.1.1.1	Breathing zone outdoor airflow
403.3.1.2	403.3.1.1.1.2	Zone air distribution effectiveness
403.3.1.3	403.3.1.1.1.3	Zone outdoor airflow
403.3.2	403.3.1.1.2	System outdoor airflow
403.3.2.1	403.3.1.1.2.1	Single zone systems
403.3.2.2	403.3.1.1.2.2	100-percent outdoor air systems
403.3.2.3	403.3.1.1.2.3	Multiple zone recirculating systems
403.3.2.3.1	403.3.1.1.2.3.1	Primary outdoor air fraction
403.3.2.3.2	403.3.1.1.2.3.2	System ventilation efficiency
403.3.2.3.3	403.3.1.1.2.3.3	Uncorrected outdoor air intake
403.3.2.3.4	403.3.1.1.2.3.4	Outdoor air intake flow rate
403.4	403.3.1.2	Exhaust ventilation
403.5	403.3.1.3	System operation
403.6	403.3.1.4	Variable air volume system control
403.7	403.3.1.5	Balancing

403.3.2 R-2, R-3, and R-4 buildings three stories or less in height above grade plane. The design of local exhaust systems and ventilation systems for outdoor air in R-2, R-3, and R-4 occupancies three stories and less in height above grade plane shall comply with sections 403.3.2.1 through 403.3.2.4.

403.3.2.1 Outdoor air for dwelling units. An outdoor air ventilation system consisting of a mechanical exhaust system, supply system, or combination thereof shall be installed for each dwelling unit. Local exhaust or supply systems, including outdoor air ducts connected to the return side of an air handler, are permitted to serve as such a system. The outdoor air ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the building is occupied. The minimum continuous outdoor airflow rate is specified in Equation 4-1.

$Q_{OA} = 0.03A_{floor} + 7.5(N_{br} + 1)$ (**Equation 4-1**)

where

Q_{OA} = outdoor airflow rate, cfm

A_{floor} = floor area, ft^2

N_{br} = number of bedrooms; not to be less than one

> **Exception:** The outdoor air ventilation system shall be permitted to be designed to operate intermittently where the system has controls that enable operation for not less than 25-percent of each 4-hour segment and the outdoor airflow rate prescribed by Equation 4-1 is multiplied by the factor determined in accordance with Table 403.3.2.1. This factor shall be applied after the outdoor airflow rate is adjusted for occupant density in accordance with Section 403.3.2.1.1.

TABLE 403.3.2.1
INTERMITTENT OUTDOOR AIR RATE FACTORS[a,b]

RUN-TIME PERCENTAGE IN EACH 4-HOUR SEGMENT	25%	33%	50%	66%	75%	100%
Factor[a]	4	3	2	1.5	1.3	1.0

403.3.2.1.1 Occupant density. Equation 4-1 assumes that there are two occupants in a studio or one-bedroom dwelling unit and an additional occupant for each additional bedroom. Where higher occupant densities are known, the outdoor airflow rate shall be increased by 7.5 cfm for each additional occupant. Lower occupant densities shall not be used except where approved by the code official.

403.3.2.2 Outdoor air for other spaces. Corridors and other common areas within the conditioned space shall be provided with outdoor air at a rate of not less than 0.06 cfm per ft^2 of floor area.

403.3.2.3 Local exhaust. Local exhaust systems shall be provided in kitchens, bathrooms, and toilet rooms, and shall have the capacity to exhaust the minimum airflow rate determined in accordance with Table 403.3.2.3.

TABLE 403.3.2.3
MINIMUM REQUIRED LOCAL EXHAUST RATES FOR R-2, R-3, AND R-4 OCCUPANCIES

AREA TO BE EXHAUSTED	EXHAUST RATE CAPACITY
Kitchens	100 cfm intermittent or 25 cfm continuous
Bathrooms-Toilet Rooms	50 cfm intermittent or 20 cfm continuous

403.3.2.4. System controls. Local exhaust systems and ventilation systems for outdoor air shall be provided with controls that enable manual override.

Reason: Historically, the basis of the mechanical ventilation requirements for all buildings within the scope of the IMC has been ASHRAE Standard 62.1, Ventilation for Acceptable Indoor Air Quality. However, the scope of ASHRAE Standard 62.1 does not address R-2, R-3, and R-4 buildings with a height of three stories or less above grade plane. Instead, mechanical ventilation requirements for these buildings fall under the scope of ASHRAE Standard 62.2, *Ventilation and Acceptable Indoor Air Quality in Low-Rise Residential Buildings*. This proposal seeks to align the mechanical ventilation requirements for R-2, R-3, and R-4 buildings of three stories or less above grade plane with the latest requirements of ASHRAE 62.2, while retaining common elements with the 2012 IRC mechanical ventilation requirements in Section M1507 wherever possible (e.g., Table 403.3.2.3 is the same as M1507.4; Table 403.3.2.1 is the same as M1507.3.3(2)).

This proposal makes no changes to the mechanical ventilation requirements of buildings other than R-2, R-3, and R-4 buildings of three stories or less above grade plane (note that the text removed from 403.2 has simply been reinserted in 403.3.1.1).

The effect of this proposal will be to simplify and clarify mechanical ventilation requirements for R-2, R-3, and R-4 buildings with a height of three stories or less above grade plane, ensuring that the IMC requirements are aligned with the latest ASHRAE standard that addresses these building types. Note that the latest ASHRAE 62.2 requirements addressing R-2, R-3, and R-4 buildings are found in addendum j to the 2010 edition. To receive a complimentary copy of addendum j, contact ASHRAE at (404) 636-8400.

Cost Impact: There is no expected increase to the cost of construction.

403.1-M-MOORE.DOC

M43–12
403.2.1, Table 403.3

Proponent: Richard Grace, Fairfax County, Virginia Plumbing and Mechanical Inspectors Association, Virginia Building Code Officials Association

Revise as follows:

403.2.1 Recirculation of air. The air required by Section 403.3 shall not be recirculated. Air in excess of that required by Section 403.3 shall not be prohibited from being recirculated as a component of supply air to building spaces, except that:

3. Where mechanical exhaust is required by Note b in Table 403.3, recirculation of air from such spaces shall be prohibited. Recirculation of air that is contained completely within such spaces shall not be prohibited. Where recirculation of air is prohibited, ~~A~~all air supplied to such spaces shall be exhausted, including any air in excess of that required by Table 403.3.

(Portions not shown remain unchanged)

Revise footnote as follows:

TABLE 403.3
MINIMUM VENTILATION RATES

b. Mechanical exhaust required and the recirculation of air from such spaces is prohibited. Recirculation of air that is contained completely within such spaces shall not be prohibited. (see Section 403.2.1, Item 3).

Reason: The language used in these sections is accurate, yet weak. The intent is commonly being misinterpreted, resulting in a requirement of 100% outdoor air systems to all spaces applicable to footnote b. This type of misinterpretation would not allow for the installation of a mini-split type room air conditioner or even a ceiling mounted paddle fan because both would recirculate air within the space. This is not the intent of this requirement. The intent of these sections is to prohibit air that is delivered to a space, such as a beauty salon or a repair garage, from being taken out of that space and delivered to another, unrelated space such as a dining room or a classroom or an operating room. Where a space is provided with an air distribution system dedicated to such space, the air delivered to that space cannot possibly be distributed to other, unrelated spaces, therefore recirculation “from” such spaces is not possible. The outdoor air and exhaust requirements for spaces subject to this footnote effectively remove the contaminants generated within such spaces, therefore air provided to such spaces that is in excess of that required by Table 403.3 may safely be recirculated *within* such spaces.

Cost Impact: The code change proposal will not increase the cost of construction.

403.2.1#1-M-GRACE.DOC

M44–12
403.2.1, Table 403.3

Proponent: Richard Grace, Fairfax County, Virginia Plumbing and Mechanical Inspectors Association, Virginia Building Code Officials Association

Revise as follows:

403.2.1 Recirculation of air. The air required by Section 403.3 shall not be recirculated. Air in excess of that required by Section 403.3 shall not be prohibited from being recirculated as a component of supply air to building spaces, except that:

(No changes to items 1 through 3)

4. Where mechanical exhaust is required by Note g in Table 403.3, mechanical exhaust is required and recirculation <u>from such spaces</u> is prohibited where more than 10 percent of the resulting supply airstream consists of air recirculated from these spaces. <u>Recirculation of air that is contained completely within such spaces shall not be prohibited.</u>

TABLE 403.3
MINIMUM VENTILATION RATES

g. Mechanical exhaust is required and recirculation <u>from such spaces</u> is prohibited except that recirculation shall be permitted where the resulting supply airstream consists of not more than 10 percent air recirculated from these spaces<u>. Recirculation of air that is contained completely within such spaces shall not be prohibited.</u> (see Section 403.2.1, Items 2 and 4).

(Portions of table and footnotes not shown remain unchanged)

Reason: Unlike footnote b (Table 403.3), footnote g *does* allow for recirculation of air *from* such a space to another space. The purpose of footnote g was to encourage the use of heat recovery systems in air handling units and exhaust systems that served bathrooms, toilet rooms, locker rooms, and the like. For this reason, recirculation of air, from these spaces to other spaces, is limited. That limitation allowed for a small amount of leakage from the exhaust to the supply by the energy recovery units. Where energy recovery units are not used, meeting this requirement would be rare, where this requirement is applicable. The intent of this section is being misinterpreted, resulting in a requirement of 100% outdoor air systems where dedicated air handling units are being specified for such spaces. Where a space is provided with an air distribution system dedicated to such space, the air delivered to that space cannot possibly be distributed to other, unrelated spaces, therefore recirculation “from” such spaces is not possible. The outdoor air and exhaust requirements for spaces subject to this footnote effectively remove the contaminants generated within such spaces, therefore air provided to such spaces that is in excess of that required by Table 403.3 may safely be recirculated *within* such spaces, regardless of the percentage of the resulting supply airstream.

Cost Impact: The code change proposal will not increase the cost of construction.

Revise as follows:

TABLE 403.3
MINIMUM VENTILATION RATES

OCCUPANCY CLASSIFICATION	OCCUPANT DENSITY #/1000 FT^{2a}	PEOPLE OUTDOOR AIRFLOW RATE IN BREATHING ZONE, R_p CFM/PERSON	AREA OUTDOOR AIRFLOW RATE IN BREATHING ZONE, R_a CFM/FT^{2a}	EXHAUST AIRFLOW RATE CFM/FT^{2a}
Storage				
Repair garages, enclosed parking garages and aircraft hangars[b,d]	—	—	—	0.75

(Portions of table not shown remain unchanged.)

Reason: Enclosed parking garages have typically been viewed as a space in which automotive vehicles are to be located. The application of “enclosed parking garage” has been called into question when examining its application for use with aircraft hangars. The intent of the change is to provide clarity that the code entry involving a minimum exhaust rate is also applicable to aircraft hangars.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T403.3#1-M-DAHMENDOC.DOC

M46–12
Table 403.3

Proponent: Richard Grace, Fairfax County, Virginia Plumbing and Mechanical Inspectors Association, Virginia Building Code Officials Association and Guy McMann, MCP, Jefferson County Colorado, Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

Revise as follows:

TABLE 403.3
MINIMUM VENTILATION RATES

h. For nail salons, each nail station shall be provided with a *source capture system* capable of exhausting not less than 50 cfm per station. <u>Where one or more required source capture systems operate continuously during occupancy, the exhaust rate from such systems shall be permitted to be applied to the exhaust flow rate required by Table 403.3 for the nail salon.</u>

(Portions of table and footnotes not shown remain unchanged.)

Reasons:
Grace-The exhaust rate in the Table was established before the requirement for source capture systems was required. It's punitive to add more exhaust when the original amount was sufficient. It's not the intent for the source capture system flow rate to be in addition to the general exhaust requirement when it runs continuously as most of the vapors are being contained at the source. The balance of exhaust required will cover any fugitive vapors that may slip by the station exhaust system. If for instance there are individually controlled fans at each station, then that amount of exhaust would be in addition to the general amount because there is no guarantee that the fans will be used.

McMann-Currently the code is silent on how to apply both the general exhaust column and note h of Table 403.3 The exhaust rate in the Table was established before the requirement for source capture systems were required. It's punitive to add more exhaust when the original amount was sufficient. It's not the intent for the source capture system flow rate to be in addition to the general exhaust requirement when it runs continuously during occupancy as most of the chemical vapors are being contained at the source. The balance of exhaust required will cover any fugitive vapors that may slip by the station exhaust system. If for instance there are individually controlled fans at each station, then that amount of exhaust would be in addition to the general amount because there is no guarantee they will be operated. As an example, if the salon is required to have 800 cfm of general exhaust by Table 403.3 and 6 nail stations exhaust the required minimum of 300 cfm continuously, the general exhaust could be reduced to 500 cfm. The intent of the code is met because a total of 800 cfm is still being exhausted and the vapors are still being captured at their source.

Cost Impact: None

M46-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T403#1-M-GRACE-MCMANN.DOC

M47-12/13
Table 403.3

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee

Revise as follows:

TABLE 403.3
MINIMUM VENTILATION RATES

OCCUPANCY CLASSIFICATION	PEOPLE OUTDOOR AIRFLOW RATE IN BREATHING ZONE, *Rp* CFM/PERSON	AREA OUTDOOR AIRFLOW RATE IN BREATHIN ZONE, *Ra* CFM/FT2	DEFAULT OCCUPANT DENSITY #/1000 FT2	EXHAUST AIRFLOW RATE CFM/FT2
Hospitals~~,~~ and nursing ~~and convalescent~~ homes [j] Autopsy rooms[b] Medical procedure rooms Operating rooms Patient rooms Physical therapy Recovery and ICU				

(Portions of table and notes not shown remain unchanged)

Reason: The term 'convalescent home' is currently being used incorrectly in IMC Table 403.3 as a Group I-2 facility. These facilities are currently listed as Group I-1 and R-4, therefore the requirements listed in the ventilation tables are not correct. In addition, there is a correlative change to delete this term from Group I-1 and R-4 as an outdated term.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April, 2005, the CTC has held twenty-two meetings – all open to the public.

Proponent: Guy McMann, MCP, Jefferson County Colorado, Colorado Association of Plumbing and Mechanical Officials (CAPMO) and Richard Grace, Fairfax County Government, representing The Virginia Plumbing and Mechanical Inspectors Association, The Virginia Building Code Officials Association (gmcmann@jeffco.us)

Revise as follows:

TABLE 403.3
MINIMUM VENTILATION RATES

OCCUPANCY CLASSIFICATION	OCCUPANT DENSITY #/1000 FT^{2} [a]	PEOPLE OUTDOOR AIRFLOW RATE IN BREATHING ZONE CFM/PERSON	AREA OUTDOOR AIRFLOW RATE IN BREATHING ZONE R_a CFM/FT^{2} [a]	EXHAUST AIRFLOW RATE CFM/FT^{2} [a]
Private dwellings, single and multiple				
Garages, common for multiple units[b]	—	—	—	0.75
~~Garages, separate for each dwelling[b]~~	—	—	—	~~100 cfm per car~~
Kitchens[b]	—	—	—	25/100[f]
Living areas[c]	— Based upon number of bedrooms. First bedroom, 2; each additional bedroom, 1	— 0.35 ACH but not less than 15 cfm/person	— —	—
Toilet rooms and bathrooms[g]	—	—		20/50[f]

(Portions of table not shown remain unchanged.)

Reason:

McMann-The requirement for an exhaust system which is a form of ventilation seems to conflict with Section 502.14 which exempts one and two family dwellings from being ventilated. The concern is installing a fan of this size will have no impact on the garage space as it would not provide much in the way of flow. There are very few if any jurisdictions enforcing a fan in a residential garage. There is no technical justification to require this provision because simply opening the door when a car leaves will provide more ventilation than any fan of this size would even if the garage has no windows and certainly makeup air could technically come into play which isn't practical either.

Grace-This is in direct conflict with Section 502.14 Exception # 2 which exempts one and two family dwellings. This makes no sense as there are no values to supply a garage with ventilation air and installing a fan of this size will have no impact on the garage space as it would not provide much in the way of flow. There are few if any jurisdictions enforcing a fan in a residential garage. There is no technical justification to require this provision because simply opening the door when a car leaves will provide more ventilation than any fan would and certainly makeup air would come into play which isn't practical either.

Cost Impact: This could *decrease* the cost of construction**.**

T403.3#1-M-MCMANN.DOC

M50– 12
403

Proponent: Steve Ferguson representing the American Society of Heating, Refrigerating, and Air-Conditioning Engineers

Revise as follows:

403.3.1.1 Breathing zone outdoor airflow. The outdoor airflow rate required in the *breathing zone* (Vbz) of the occupiable space or spaces in a zone shall be not less than the value determined in accordance with Equation 4-1.

$Vbz = RpPz + RaAz$ (Equation 4-1)

Where:

Az = zone floor area: the net occupiable floor area of the space or spaces in the zone.
Pz = zone population: the number of people in the space or spaces in the zone as determined by Section 403.3.1.4.
Rp = people outdoor air rate: the outdoor airflow rate required per person from Table 403.3
Ra = area outdoor air rate: the outdoor airflow rate required per unit area from Table 403.3

403.3.1.2 Zone air distribution effectiveness. The *zone air distribution effectiveness* (*Ez*) shall be not greater than the value determined using Table 403.3.1.2.

403.3.1.4 Design Zone Population. Design *zone population (Pz)* shall equal the largest (peak) number of people expected to occupy the *ventilation zone* during typical usage.

Exceptions:

1. Where the number of people expected to occupy the *ventilation zone* fluctuates, a *zone population* equal to the average number of people shall be permitted to be used,
2. Where the largest or average number of people expected to occupy the *ventilation zone* cannot be established for a specific design, an estimated value for *zone population* shall be permitted to be used, provided that such value is the product of the *net occupiable area* of the *ventilation zone* and the occupant density listed in Table 403.3.

403.3.2 System outdoor airflow. The outdoor air required to be supplied by each ventilation system shall be determined in accordance with Section 403.3.2.1 through 403.2.3 as a function of system type and zone outdoor airflow rates.

403.3.2.1 Single zone systems. ~~When~~ For *ventilation* systems wherein one or more air handler supplies a mixture of outdoor air and recirculated return air to only one zone, the system *outdoor air intake flow rate* (*Vot*) shall be determined in accordance with Equation 4-3.

$Vot = Voz$ (Equation 4-3)

403.3.2.2 100% outdoor air systems. ~~When~~ For *ventilation* systems wherein one or more air handler supplies only outdoor air to one or more zones, the system *outdoor air intake flow* rate (*Vot*) shall be determined using Equation 4-4.

$Vot = \Sigma all\ zones Voz$ (Equation 4-4)

403.3.2.3 Multiple zone recirculating systems. Where one air handler supplies a mixture of outdoor air and recirculated return air to more than one zone, the system outdoor air intake flow rate (*Vot*) shall be determined
in accordance with Sections 403.3.2.3.1 through 403.3.2.3.4.

$Z_p = Voz/ Vpz$ (Equation 4-5)

Where

Vpz = Primary airflow: The airflow rate supplied to the zone from the air-handling unit at which the outdoor air intake is located. It includes outdoor intake air and recirculated air from that air-handling unit but does not include air transferred or air recirculated to the zone by other means. For design purposes, *Vpz* shall be the zone design primary
airflow rate, except for zones with variable air volume supply and *Vpz* shall be the lowest expected primary airflow rate to the zone when it is fully occupied.

TABLE 403.3

For SI: 1 cubic foot per minute = 0.0004719 m^3/s, 1 ton = 908 kg, 1 cubic foot per minute per square foot = 0.00508 $m^3/(s \cdot m^2)$, °C = [(°F) - 32]/1.8, 1 square foot = 0.0929 m^2.

a. Based upon *net occupiable floor area*.
b. Mechanical exhaust required and the recirculation of air from such spaces is prohibited (see Section 403.2.1, Item 3).
c. Spaces unheated or maintained below 50°F are not covered by these requirements unless the occupancy is continuous.
d. Ventilation systems in enclosed parking garages shall comply with Section 404.
e. Rates are per water closet or urinal. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.
f. Rates are per room unless otherwise indicated. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.
g. Mechanical exhaust is required and recirculation is prohibited except that recirculation shall be permitted where the resulting supply airstream consists of not more than 10 percent air recirculated from these spaces (see Section 403.2.1, Items 2 and 4).
h. For nail salons, each nail station shall be provided with a *source capture system* capable of exhausting not less than 50 cfm per station.

Reason: The current ventilation criteria in the IMC are essentially based on ASHRAE Standard 62-2007. Research has been conducted since then our knowledge of indoor air quality and ventilation has evolved. In response to these actions ASHRAE has enhanced Standard 62.1, upon which the IMC is based. This code change would make the IMC consistent with ventilation rate procedures defined in ANSI/ASHRAE Standard 62.1-2010.

Substantiation: ANSI/ASHRAE Standard 62.1-2010 is a consensus national standard. Standard 62.1 ventilation rate calculation procedure has been substantially updated in the 2010 version to reflect the latest research on building indoor air quality. The procedure now requires designers to account for pollutant sources other than occupants, such as building materials and furnishings, and to account for the efficiency of the ventilation system to deliver outdoor air to the breathing zone. Ventilation systems designed using the new procedures will result in slightly lower outdoor rates for most occupancies compared to the current code, reducing first costs and energy costs.

Cost Impact: The code change proposal will not increase the cost of construction, and in some instances will reduce the first cost of construction. Engineering design effort and jurisdictional plan review processes will not be materially affected due to the availability and greater specificity of compliance tools.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

403.3.1.1-M-FERGUSON.DOC

M51–12
403.2

Proponent: Maureen Traxler/City of Seattle Dept of Planning & Development/ City of Seattle Dept of Planning & Development
(maureen.traxler@seattle.gov)

Revise as follows:

403.2 Outdoor air required. The minimum outdoor airflow rate shall be determined in accordance with Section 403.3. ~~Ventilation~~ In occupiable spaces, the ventilation supply system~~s~~ shall be designed to deliver the required rate of outdoor airflow to the *breathing zone* ~~within each *occupiable space*~~.

> **Exception:** Where the *registered design professional* demonstrates that an engineered ventilation system design will prevent the maximum concentration of contaminants from exceeding that obtainable by the rate of outdoor air ventilation determined in accordance with Section 403.3, the minimum required rate of outdoor air shall be reduced in accordance with such engineered system design.

Reason: The purpose of this proposal is to make an editorial clarification. As currently worded, the provision has caused confusion that ventilation systems are only required for occupiable spaces. The purpose of the second sentence of Section 403.2 is to require that the outdoor airflow be directed to the breathing zone—a requirement that is only applicable in occupiable spaces because, according to the definition, "breathing zones" only occur in occupied spaces. The first sentence establishes the general requirement that minimum rates of outdoor air are required in all the locations specified in Table 403.3; as written, the second sentence causes some confusion that the outdoor air is only required for occupiable spaces. This proposal clarifies the meaning of the section without changing its impact.

Cost Impact: The code change proposal will not increase the cost of construction.

M51-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

403.2-M-TRAXLER.DOC

M52–12
403.4

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

403.4 Exhaust ventilation. Exhaust airflow rate shall be provided in accordance with the requirements in Table 403.3. Where Table 403.3 specifies a people outdoor airflow rate, an area outdoor airflow rate, or both for an occupancy that also has an exhaust airflow rate specified by Table 403.3, the space served by the required exhaust airflow shall be supplied with outdoor air at a rate not less than that determined in accordance with Section 403.3 and such outdoor air shall be either a component of the makeup air for the required exhaust airflow or it shall be otherwise relieved or exhausted. Exhaust *makeup air* shall be permitted to be any combination of outdoor air, recirculated air and transfer air provided that the outdoor air requirements of Table 403.3 are satisfied ~~except as limited in accordance with Section 403.2~~.

Reason: Consistent with the intent of ASHRAE 62.1, the exhaust rate prescribed by the last (far right) column of Table 403.3 is NOT applied in addition to the rate determined from the other columns. Note that the exhaust column rate will almost always be greater than the rate determined from the other columns, therefore, the exhaust rate column rules. For example, see table entries for cells with plumbing, wood shops, science labs, barber shops, ice arenas and copy rooms. This raises the question of why are there numbers in the first 3 columns if they are overridden by the exhaust column. According to ASHRAE, the reason is to make sure that at least that much outdoor air is introduced into the space as makeup air for the exhaust system, with the rest of the makeup air being transfer air from other spaces. For example, assume a standalone barber shop of 1000 sq ft with a single zone and assume a zone effectiveness (E_z) of 1. So, 0.5 times 1000 = 500 CFM for the exhaust column. For the other columns, 7.5 times 25 occupants = 188CFM and 0.06 times 1000 = 60 CFM; 60 plus 188 = 248 CFM which is less than 500. The intent is that 500CFM is the required ventilation rate for the shop and the makeup air has to be composed of at least 248 CFM of outdoor air and the remainder of 252 CFM can be transfer air or outdoor air. Now that it can be seen how this is supposed to work, it is apparent that Section 403.4 fails to explain this. The code user would have no idea based on current text.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

M52-12

Public Hearing:	Committee:	AS	AM	D

403.4-M-STRAUSBAUGH.PMGCAC.DOC

M53–12
404.1

Proponent: Randall R. Dahmen, P.E. Wisconsin licensed Commercial Building Inspector, representing self

Revise as follows:

404.1 Enclosed parking garages. Where mechanical ventilation systems for enclosed parking garages ~~shall be permitted to~~ operate intermittently, such systems shall be in accordance with Item 1, 2 or both.

1. The system shall be arranged to operate automatically upon detection of vehicle operation or the presence of occupants by approved automatic detection devices.
2. The system shall be arranged to operate automatically by means of carbon monoxide detectors applied in conjunction with nitrogen dioxide detectors. Such detectors shall be installed in accordance with their manufacturers' recommendations. Additionally, the system shall operate at an exhaust rate of 0.75 cfm per square foot (0.0038 $m^3/s \cdot m^2$) of floor area for a total of 5 hours during any 24 consecutive hour period.

Reason: The operation of motion sensors in parking garages is very costly and energy inefficient. Initially the code just required carbon monoxide detectors and there was a concern about diesel emissions which would not be detected by the carbon monoxide detectors. Since that time, nitrogen dioxide detectors have been developed which will detect diesel emissions solving the concern about the increase of diesel powered vehicles in parking garages. Using both detectors has been the preferred option as an alternate method of addressing the problem.

The proposed additional language addressing the need for the system to operate 5 hrs per 24 hour period, is so that contaminants, other than those of carbon monoxide and nitrogen dioxide, that may be located within the garage enclosure, can be removed at regular intervals. The revision to the main section simply gets rid of permissive language.

Cost Impact: The code change proposal will not increase the cost of construction.

M53-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

404.1-M-DAHMEN.DOC

M54–12
404.1

Proponent: Don Davies, Salt Lake City Corp/Salt Lake County representing Utah Chapter of ICC, Brent Ursenbach, Utah Chapter of ICC (don.davies@slcgov.com) and Donald R. Monahan, PE, Walker Parking Consultants/Engineers, Inc. representing the Parking Consultants Council of the National Parking Association, Washington, DC (don.monahan@walkerparking.com)

Revise as follows:

404.1 Enclosed parking garages. Where mechanical ventilation systems for enclosed parking garages ~~shall be~~ ~~permitted to~~ operate intermittently, such operation shall be automatic ~~in accordance with Item 1, Item 2 or both.~~

~~1.~~ ~~The system shall be arranged to operate automatically upon detection of vehicle operation or the presence of occupants by approved automatic detection devices.~~

~~2.~~ ~~The system shall be arranged to operate automatically~~ by means of carbon monoxide detectors applied in conjunction with nitrogen dioxide detectors. Such detectors shall be installed in accordance with their manufacturers' recommendations.

Reason: Enclosed parking garages require mechanical ventilation to safeguard the building occupants from emissions of high levels of carbon monoxide (CO) by cars and/or nitrogen dioxide (NO_2) from diesel engines. In most enclosed parking garages the operation of the ventilation system consumes the major portion of the total energy use of the facility. Reducing the energy use for ventilation while maintaining adequate indoor air quality can be achieved using demand ventilation control strategies. However permitting motion detectors to operate the ventilation system does not promote energy efficiency and will not provide optimum life safety protection for the following reasons:

- The mechanical ventilation system will run, unnecessarily, every time a vehicle or person moves even though the CO or NO_2 concentrations are within safe indoor air quality levels.
- Dangerous levels of CO and/or NO_2 from an idling vehicle will go undetected by motion detectors.

Whereas the mechanical ventilation system will only run when toxic gases present a threat to the safety of people, which is the most import purpose of a ventilation system. The revision to the main section simply gets rid of permissive language.

Cost Impact: There will be a significant savings in energy cost with approval of this proposal as follows:
Consider a 100,000 sf underground parking structure for about 350 parking spaces with a combined horsepower of all fans of approximately 75 HP. 75 HP X 746 Watts per HP = 55,950 watts or 55.95 kilowatts. Annual fan power consumption without gas detection = 12 hours per day X 365 days per year x 55.95 kW = 245,061 kWh. With gas detection demand control = 2 hours per day X 365 days X 55.95 kilowatts = 40,844 kWh. The annual savings is 204,217 kWh. At a U.S. average electric utility rate of $0.10 per kWh, the annual cost savings is $20,422.
(Source: "Demand Controlled Ventilation Cuts Energy Bills, Increases Patron Comfort", Parking Magazine by National Parking Association, March 2011.) In the 2000 ASHRAE Transactions, the paper "Evaluation of Design Ventilation Requirements for Enclosed Parking Facilities" by Ayari and Krarti indicated an energy savings of 17 to 46% with demand control ventilation strategies.

M54-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

404.1-M-DAVIES-MONAHAN-URSENBACH.DOC

M55–12
406.1

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Delete without substitution:

~~**406.1 General.** Uninhabited spaces, such as crawl spaces and attics, shall be provided with natural ventilation openings as required by the International Building Code or shall be provided with a mechanical exhaust and supply air system. The mechanical exhaust rate shall be not less than 0.02 cfm per square foot (0.00001 m3/s • m2) of horizontal area and shall be automatically controlled to operate when the relative humidity in the space served exceeds 60 percent.~~

Reason: The scoping statement for IMC Chapter 4, section 401.1, states that "This chapter shall govern the ventilation of spaces within a building intended to be occupied". Ventilation of unoccupied (uninhabited) spaces is a matter for the IBC to regulate and has no place in the IMC. Section 406 should be removed in its entirety.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

406.1-M-STRAUSBAUGH.PMGCAC.DOC

M56–12
202, 428 (NEW)

Proponent: Karen Hobbs, Natural Resources Defense Council, representing self (khobbs@nrdc.org); Harry Misuriello, American Council for an Energy-Efficient Economy, representing himself (misuriello@verizon.net)

Add new definition as follows:

EVAPORATIVE COOLING SYSTEM. A system for cooling the air in a building or space by removing heat from the outdoor air by means of the evaporation of water. The system forces air through wet porous pads, causing the latent heat of evaporation to cool the air. Water is continuously circulated over the pads to replenish the evaporated water. Where the cooled air is sent directly into the building, the system is referred to as "direct evaporative cooling". Where the cooled air is sent through heat exchangers re-circulating indoor air, the system is referred to as "indirect evaporative cooling".

Add new text as follows:

SECTION 428
EVAPORATIVE COOLING SYSTEMS

428.1 Evaporative Cooling. Evaporative cooling systems shall utilize use less than 4 gallons of water per ton-hour of cooling when system controls are set to maximum water use. Water use, expressed in maximum water use per ton-hour of cooling, shall be marked on the device and included in product user manuals, product information literature and installation instructions. Water use information shall be readily available at the time of code compliance inspection.

428.1.1 Overflow Alarm. The evaporative cooling system shall be equipped with an overflow alarm to alert building owners, tenants or maintenance personnel when the water refill valve continues to allow water to flow into the reservoir when the reservoir is full. The alarm shall have a minimum sound pressure level rating of 85 dB measured at a distance of ten feet.

428.1.2 Automatic Pump Shut-off. The evaporative cooling system shall automatically cease pumping water to the evaporation pads when there is no demand for sensible heat reduction.

428.1.3 Cooler Reservoir Discharge. A water quality management system is required utilizing a timer or water quality sensor. Where timers are used, the time interval between periods of discharging of water from the reservoir shall be set for six hours or greater of cooler operation. Continuous discharge and continuous bleed systems are prohibited.

428.1.3.1 Discharge Water Reuse. Where a nonpotable water source system exists on site, evaporative cooler discharge water shall be collected and discharged to such collection system.

> **Exception:** Where the reservoir water will adversely affect the quality of the nonpotable water supply making the nonpotable water unusable for its intended purposes.

428.1.3.2 Discharge Water to Drain. Where discharge water is not required to be recovered for reuse, the sump overflow drain line shall discharge to an approved location. Drain lines shall not be directly connected to any drainage system. Where the discharge water is discharged into a sanitary drain, an air gap of not less than 6 inches is required between the termination of the discharge line and the drain opening. The drain line shall terminate in a location that is readily visible to the building owner, tenants or maintenance personnel.

Reason:

1. This proposal was approved by the IGCC in May, 2011, as submitted by the Alliance for Water Efficiency (AWE) and Natural Resources Defense Council (NRDC).
2. Evaporative coolers can waste large quantities of water. There is great variance in water efficiencies of different makes and models. Limiting systems to use less than 4 gallons of water per hour is a relatively low standard and should be easily met by most systems.
3. NRDC estimates that nationwide adoption of the revised values in this proposal, effective 2016, can be expected to save:
   - 19 million gallons of water per day by 2030;
   - 9.3 million kilowatt hours per year by 2030; and
   - Consumers will realize more than $27 million dollars in reduced electricity and water costs.
4. Faulty float valves can cause reservoirs to overflow, sending thousands of gallons of water into the wastewater line without the problem detected. Alarms are needed to alert the operator of this waste.
5. The discharge water is nonpotable, but of sufficient quality to be reused for other applications.
6. There are no known water use standards for these systems by AHRI or any other known organization.

Cost Impact: None

M56-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

428(NEW)-P-HOBBS.DOC

M57–12
501.3 (NEW), 501.4 (NEW)

Proponent: Mike Moore, Newport Ventures, representing Broan NuTone (mmoore@newportpartnersllc.com)

Add new text as follows:

501.3 Common exhaust ducts for environmental air in dwelling units. A common exhaust duct shall not be used to convey environmental air from separate dwelling units unless a single fan designed and intended to run continuously is located downstream of the exhaust inlets. Common exhaust ducts for clothes dryers shall comply with Section 504.

501.4 Common supply ducts for ventilation air in dwelling units. A common supply duct shall not be used to provide ventilation air to separate dwelling units unless a single fan designed and intended to run continuously is located upstream of the supply outlets.

Reason: This change is intended to address cross-contamination of dwelling units with transfer air that could be communicated between units through common exhaust ducts that convey environmental air (e.g., exhaust from kitchens or baths) or common supply ducts that convey ventilation air. The language proposed is based on language that is sourced from ASHRAE 62.2-2010, addendum j. Without this requirement, the kitchen or bath exhaust from one dwelling unit could find its way into adjacent dwelling units, transporting moisture, odors, and other pollutants between units, instead of being conveyed outside the building. Similarly, cross contamination could also occur through the use of common supply ducts for ventilation air, unless properly addressed.

Common exhaust ducts for clothes dryers are already explicitly addressed in Section 504, and so are excluded from this requirement.

Cost Impact: Where contractors are not already installing separately ducted units or a common fan, the cost of construction is expected to increase.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

501.3(NEW)-M-MOORE.DOC

M58–12
501.3.1

Proponent: Umesh Kumar Bhargava, PE, Bhargava International Inc., representing self.

Revise as follows:

501.3.1 Location of exhaust outlets. The termination point of exhaust outlets and ducts discharging to the outdoors shall be located with the following minimum distances:

3. For all *environmental air* exhaust: ~~3~~ 1 feet) from property lines; ~~3~~ 1 feet from operable openings into buildings for all occupancies other than Group U and ~~10~~ 5 feet from mechanical air intakes. Such exhaust shall not be considered to be hazardous or noxious.

(Portions not shown remain unchanged)

Reason: Local exhaust is more effective than central exhaust. Therefore, in dwelling unit's side wall exhaust is gaining more popularity amongst engineers. However due to limited exterior wall space availability and clearances requirements from openings, the proposed change is suggested based on following reasons:

a. Environmental air is discharged to outside the dwelling and therefore is diluted instantly and does not have impact on indoor air quality.
b. Products of combustion from Direct Vent appliances are permitted to terminate with 1 foot.
c. IMC permits to recirculate kitchen exhaust air. It indicates that environmental air is acceptable to be recirculating with carbon filter. Dilution of environmental air by mixing with atmospheric air should more effective than carbon filter, which depend on user behavior.
d. Velocity at exterior termination is approximately 5 miles per hour (600 feet per minute, 50 CFM thru 4 inch diameter duct)
e. High discharge velocity also results in mixing outside atmospheric air instantaneous dilution.

Cost Impact: None

M58-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

501.2.1-M-BHARGAVA.DOC

M59–12
501.3

Proponent: Umesh Kumar Bhargava, PE, Bhargava International Inc., representing self

Revise as follows:

501.3 Exhaust discharge. The air removed by every mechanical exhaust system shall be discharged outdoors at a point where it will not cause a nuisance and not less than the distances specified in Section 501.3.1. The air shall be discharged to a location from which it cannot again be readily drawn in by a ventilating system. Air shall not be exhausted into an attic or crawl space.

Exceptions:

1. Whole-house ventilation-type attic fans shall be permitted to discharge into the attic space of *dwelling units* having private attics.
2. Commercial cooking recirculating systems.
3. <u>Where installed in accordance with the manufacturer's installation instructions and where mechanical or *natural ventilation* is otherwise provided in accordance with Chapter 4, *listed* and *labeled* ductless range hoods shall not be required to discharge to the outdoors.</u>

Reason: Residential kitchen exhaust recirculating hoods are not stated in the Code explicitly.

Cost Impact: None

M59-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

501.2-M-BHARGAVA.DOC

M60–12
501.3, 501.3.1.1

Proponent: Robert Atkins, Prince William, VA, representing VA Plumbing and Mechanical Inspectors Association (VPMIA) and VA Building Code Officials Association (VBCOA) (radkins@pwcgov.org) and Guy McMann, MCP, Jefferson County Colorado, represented Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

Revise as follows:

501.3 Exhaust discharge. The air removed by every mechanical exhaust system shall be discharged outdoors at a point~~ where it will not cause a nuisance and~~ not less than the distances specified in Section 501.3.1. The air shall be discharged to a location from which it cannot again be readily drawn in by a ventilating system. Air shall not be exhausted into an attic, ~~or~~ crawl space, or be directed onto walkways.

~~**501.3.1.1 Exhaust discharge**. Exhaust air shall not be directed onto walkways.~~

Reason:
Atkins-.The term "nuisance" is too subjective and un-enforceable. Combining 501.3.1.1 into 501.3 (both titled "Exhaust discharge") is appropriate as it is applicable to all locations of exhaust discharge.

McMann-It's not necessary to have an entire Section on this topic when it can be incorporated into 501.2. The term "nuisance" in this instance is un-enforceable as it is too subjective in nature.

Cost Impact: None

M60-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

501.3-M-ATKINS-MCMANN.DOC

M61–12
501.4

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., representing Self (JBEngineer@aol.com)

Revise as follows:

501.4 Pressure equalization. Mechanical exhaust systems shall be sized to remove the quantity of air required by this chapter to be exhausted. The system shall operate when air is required to be exhausted. Where mechanical exhaust is required in a room or space in other than occupancies in R-3 and *dwelling units* in R-2, such space shall be maintained with a neutral or negative pressure. If a greater quantity of air is supplied by a mechanical ventilating supply system than is removed by a mechanical exhaust for a room, adequate means shall be provided for the natural or mechanical exhaust of the excess air supplied. If only a mechanical exhaust system is installed for a room or if a greater quantity of air is removed by a mechanical exhaust system than is supplied by a mechanical ventilating supply system for a room, adequate *makeup air* consisting of supply air, transfer air or outdoor air shall be provided to satisfy the deficiency. ~~The calculated building infiltration rate shall not be used to satisfy the requirements of this section.~~

Reason: Calculating the building infiltration rate is a valid method of providing make up for an exhaust system. I have personally designed in excess of 1000 buildings using the calculated infiltration rate to provide make up air for the exhaust system. All of these buildings are working without incident. Mechanical engineers are trained in methods for calculating the infiltration rate. There should not be an arbitrary requirement in the code that prohibits common engineering design practices.

Cost Impact: This change does not increase the cost of construction.

M61-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

501.4-M-BALLANCO.DOC

M62–12
501.3.2

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., representing self (JBEngineer@aol.com)

Revise as follows:

501.3.2 Exhaust opening protection. Exhaust openings that terminate outdoors shall be protected with corrosion resistant screens, louvers or grilles. ~~Openings in screens, louvers and grilles shall be sized not less than 1/4 inch (6 mm) and not larger than 1/2 inch (13 mm).~~ Openings shall be protected against local weather conditions. Louvers that protect exhaust openings in structures located in hurricane-prone regions, as defined in the *International Building Code*, shall comply with AMCA Standard 550. Outdoor openings located in exterior walls shall meet the provisions for exterior wall opening protectives in accordance with the *International Building Code*.

Reason: There is no justification for requiring a small opening size for exhaust terminations. Furthermore, this can result in a fire hazard for exhaust ducts, such as dryer exhaust duct terminations. Many commercial buildings are performing without incident with louvers that have openings that exceed ½ inch. By implication, every termination would require a screen since a louver is either horizontal or vertical with the opening much greater than ½ inch. The opening size of a exhaust termination should be left for the engineer to design based on the system being installed.

Cost Impact: This change does not increase the cost of construction.

M62-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

501.3.2-M-BALLANCO.DOC

M63–12
502.14

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

502.14 Motor Vehicle Operation. In areas where motor vehicles operate, mechanical ventilation shall be provided in accordance with Section 403. Additionally, areas in which stationary motor vehicles are operated shall be provided with a source capture system that connects directly to the motor vehicle exhaust systems. <u>Such system shall be engineered by a registered design professional or shall be factory-built equipment designed and sized for the purpose.</u>

Exceptions:

1. This section shall not apply where the motor vehicles being operated or repaired are electrically powered.
2. This section shall not apply to one- and two- family dwellings.
3. This section shall not apply to motor vehicle service areas where engines are operated inside the building only for the duration necessary to move the motor vehicles in and out of the building.

Reason: Section 502.14 requires a *source capture system,* but no criteria or specs are given for such systems. At minimum, such systems need to be engineered systems as opposed to randomly chosen fans, pipe and hoses thrown together by an installer. The term is defined as a mechanical exhaust system that discharges to the outdoors with no further criteria given. Without this revision, the code could not be cited to prevent home-made concoctions and "handyman" specials from being installed.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: This proposal could increase the cost of construction.

M63-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

502.14-M-STRAUSBAUGH-PMGCAC.DOC

M64–12
502.20 (NEW), Table 404.3

Proponent: Guy McMann MCP, Jefferson County Colorado representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gmcmann@jeffco.us)

Add new text as follows:

502.20 Manicure and pedicure stations. Manicure and pedicure stations shall be provided with an exhaust system in accordance with Table 403.3, note h. Manicure tables and pedicure stations not provided with factory-installed exhaust inlets shall be provided with exhaust inlets located not more than 12 inches horizontally and vertically from the point of chemical application.

Revise as follows:

TABLE 404.3
MINIMUM VENTILATION RATES

h. For nail salons, each ~~nail~~ manicure and pedicure station shall be provided with a source capture system capable of exhausting not less than 50 cfm per station. Exhaust inlets shall be located in accordance with Section 502.20

(Portions of table and footnotes not shown remain unchanged)

Reason: There needs to be more guidance in the code for code officials, designers and installers to reinforce the requirements for the source capture system at pedicure and manicure stations. Chemicals are being applied at pedicure stations and therefore needs to be included. There is much confusion as to where these outlets should be located in order to obtain maximum efficiency with as few fugitive vapors as possible. These dimensions have proven to work very well in observing many installations since these requirements were first a code requirement, and still provides the designer with flexibility. This will provide guidance where there currently is none as the definition of "source capture system" does not provide any.

Cost Impact: None

M64-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

502.20 (NEW)-M-MCMANN.DOC

M65–12
504.2 (NEW)

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBEngineer@aol.com)

Add new text as follows:

504.2 Exhaust duct connections. Dryer exhaust ducts located in framed walls shall commence at a noncombustible dryer exhaust duct wall receptacle. The wall receptacle shall accommodate the connection between the dryer and the dryer exhaust duct.

(Renumber subsequent sections.)

Reason: A receptacle behind the dryer that facilitates the connection and the collection of the flex hose to occur in the cell of the wall is a device that will save lives and prevent property damage from dryer fires and increase the efficiency of the dryer appliance. It is well established that there are an average of 15,000 dryer fires a year in the United States.

Without a receptacle, an elbow connection endures stress that could damage the fitting to the point of needing replacement. Undetected leaks in the elbow can result in dryer exhaust air leaking into the cavity wall, creating a fire hazard.

Cost Impact: This will not increase the cost of construction.

M65-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

504.2(NEW)-M-BALLANCO.DOC

M66–12
504.4, 504.6.2

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

504.4 Exhaust installation. Dryer exhaust ducts for clothes dryers shall terminate on the outside of the building and shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination~~. Ducts shall not be connected or installed with sheet metal screws or other fasteners that will obstruct the exhaust flow.~~ Clothes dryer exhaust ducts shall not be connected to a vent connector, vent or *chimney*. Clothes dryer exhaust ducts shall not extend into or through ducts or plenums.

504.6.2 Duct installation. Exhaust ducts shall be supported at 4-foot (1219 mm) intervals and secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Ducts shall ~~not~~ be joined with <u>nominal ¼ inch long by 1/8 inch diameter rivets</u> ~~screws~~ or <u>other</u> fasteners that <u>do not</u> protrude into the inside of the duct <u>more than such rivets.</u>

Reason: Sections 504.4 and 504.6.2 both discuss duct fasteners, but, state different requirements and the IRC says something different yet. The IRC allows duct fasteners that protrude into the duct a limited distance. It is not logical for the IRC and IMC to differ on this subject. If duct fasteners are not allowed, there would be no method of securing duct joints other than duct tape. Tapes are sealing methods, not duct joining methods, and will eventually allow the duct joints to separate in concealed locations.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

	Assembly:	ASF	AMF	DF

504.4-M-STRAUSBAUGH.PMGCAC.DOC

M67–12
504.5

Proponent: Umesh Kumar Bhargava, Bhargava International, Inc.

Revise as follows:

504.5 Makeup air. Installations exhausting more than 200 cfm (0.09m3/s) shall be provided with *makeup air*. Where a closet is designed for the installation of a clothes dryer, an opening having an area of not less than 100 square inches (0.0645 m2) shall be provided in the closet enclosure or *makeup air* shall be provided by other *approved* means. <u>Make up air shall be provided at a rate of not less than 80 cfm for each domestic clothes dryer.</u>

Reason:
1. Clothes dryers manufacturers do not publish dryer exhaust air CFM requirements. These manufacturers publish only exhaust duct diameter requirements and equivalent duct length.
2. IMC should provide guidance of exhaust CFM for residential type clothes dryers. I have contacted several manufacturers and only one manufacturer indicated 220 CFM outlet with no duct attached.
3. Most manufacturers require 4 inch diameter round duct with 65 feet of equivalent length.
4. Duct diameter: 4 inch Pressure drop 1 inch wg per 100 feet Pressure Drop 65 feet = 0.65 CFM 100 Velocity: 1200
5. To keep laundry in negative pressure 80 CFM per dryer is suggested.

Cost Impact: None

M67-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

504.5(NEW)-M-BHARGAVA.DOC

M68–12
504.5 (NEW), 504.6.4, 504.6.4.3(NEW), Chapter 15

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., self

Add new text as follows:

504.5 Dryer Exhaust Duct Power Ventilators. Domestic dryer exhaust duct power ventilators shall conform to UL 705 for use in dryer exhaust duct systems. The dryer exhaust duct power ventilator shall be installed in accordance with the manufacturer's instructions.

(Renumber subsequent sections)

Revise text as follows:

504.6.4 Duct length. The maximum allowable exhaust duct length shall be determined by one of the methods specified in Sections 504.6.4.1 ~~or 504.6.4.2~~ through 504.6.4.3.

Add new text as follows:

504.6.4.3 Dryer exhaust duct power ventilator length. The maximum length of the exhaust duct shall be determined by the dryer exhaust duct power ventilator manufacturer's installation instructions.

Add new standard to Chapter 15 as follows:

UL Underwriters Laboratories, Inc.
333 Pfingsten Road
Northbrook, IL 60062-2096

Standard Referenced number	Title	Reference in code section number
705-2004 Revision 5	Standard for Power Ventilators	504.5

Reason: This is a companion change to the change adding reference to UL 705 for dryer exhaust power ventilators. UL 705 has testing requirements that will establish the maximum length permitted for a dryer duct connecting to a dryer exhaust duct power ventilator. The maximum dryer duct length must be included in the manufacturer's installation instructions.

This will add the requirements for dryer exhaust power ventilators for domestic dryer use. Dryer exhaust duct power ventilators are now regulated by Supplemental requirements to UL 705. These supplemental requirements specify testing for ventilators used in this application. The requirements include many safety provisions for the ventilators. The ventilator manufacturer specifies the maximum length of the dryer exhaust duct. This length is used for testing and listing the ventilator, thus verifying the instructions.

Cost Impact: This will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [UL 705-2004, Revision 5] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

504.5-504.6.4-M-BALLANCO.DOC

M69–12
504.6.4.1

Proponent: Tom Allen, representing self

Revise as follows:

504.6.4.1 Specified length. The maximum length of the exhaust duct shall be 35 feet (10 668 mm) from the connection to the transition duct from the dryer to the outlet terminal. Where fittings are used, the maximum length of the exhaust duct shall be reduced in accordance with Table 504.6.4.1.

> **Exception.** Where a clothes dryer booster fan is installed and listed and labeled for the application, the maximum length of the exhaust duct, including any transition duct, shall be permitted to be in accordance with the booster fan manufacturer's installation instructions. Where a clothes dryer booster fan is installed and not readily accessible from the room in which the dryer is located, a permanent identifying label shall be placed adjacent to where the exhaust duct enters the wall. The label shall bear the words: "This dryer exhaust system is equipped with a remotely located booster fan."

Reason: Adds prescriptive and labeling requirements for drier boosted fan.

Cost Impact: There is a cost impact.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

504.6.4.1-M-ALLEN.DOC

M70–12
504.6.5

Proponent: Richard Grace, Fairfax County Government, representing The Virginia Plumbing and Mechanical Inspectors Association, The Virginia Building Code Officials Association and Guy McMann MCP, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gmcmann@jeffco.us)

Revise as follows:

504.6.5 Length identification. Where the exhaust duct <u>equivalent length exceeds 35 feet</u> ~~is concealed within the building construction~~, the equivalent length of the exhaust duct shall be identified on a permanent label or tag. The label or tag shall be located within 6 feet (1829 mm) of the exhaust duct connection.

Reason: If the equivalent length is code compliant, there is no need for extra signage. This puts the code official in a position of recording each installation in order to verify at time of final that the stated length is accurate. This is over the top for code officials and installers to keep track of in a world of increasing duties and fewer resources. It should not matter if the duct is concealed or not as this is a benefit for the building owner or user.

Cost Impact: None

M70-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

504.6.5-M-GRACE-MCMANN.DOC

M71–12
504.6.7, 504.6, IFGC 614.6.3, IFGC 614.6

Proponent: C. Ray Allshouse, AIA, CBO, City of Shoreline, WA, representing the Washington Association of Building Officials Technical Code Development Committee (rallshouse@shorelinewa.gov)

Revise as follows:

504.6~~.7~~ (IFGC 614.6~~.3~~) Protection required. Protective shield plates shall be placed where nails or screws from finish or other work are likely to penetrate the clothes dryer exhaust duct. Shield plates shall be placed on the finished face of all framing members where there is less than $1^1/_4$ inches (32 mm) between the duct and the finished face of the framing member. Protective shield plates shall be constructed of steel, have a thickness of 0.062 inch (1.6 mm) and extend a minimum of 2 inches (51 mm) above sole plates and below top plates.

504.~~6~~7 (IFGC 614.~~6~~7) Domestic clothes dryer ducts. Exhaust ducts for domestic clothes dryers shall conform to the requirements of Sections 504.6.1 through 504.6.~~7~~6.

Reason: Existing dryer duct protection requirements for concealed dryer exhaust ducts should apply not only to domestic installations but to commercial installations as well. By making this a general dryer duct requirement, protection will be extended to include commercial clothes dryer exhaust ducts.

Cost Impact: The code change proposal will increase the cost of construction.

	Assembly:	ASF	AMF	DF

504.6.7-614.6.3-M-ALLSHOUSE-.DOC

M72–12
504.8, Chapter 15

Proponent: John D. Nicholas of Perceptive Solutions LLC representing Unifrax I LLC (john@perceptivesolutionsllc.com)

Revise as follows:

504.8 Common exhaust systems for clothes dryers located in multistory structures. Where a common multistory duct system is designed and installed to convey exhaust from multiple clothes dryers, the construction of the system shall be in accordance with all of the following:

1. The shaft in which the duct is installed shall be constructed and fire-resistance rated as required by the *International Building Code.* Where a fire resistive metallic duct system is installed instead of a duct system within a shaft, the fire-resistive metallic duct system shall be listed and labeled in accordance with ASTM E2816 and the fire resistance rating shall be as required by the *International Building Code.*

(Portions not shown remain unchanged.)

Add new standard to Chapter 15 as follows:

ASTM
E2816-11, *Standard Test Methods for Fire Resistive Metallic HVAC Duct Systems*

Reason: This proposed code change allows for the use of either a pre-fabricated duct system or field applied enclosure system in lieu of a shaft when these duct systems are tested and listed in accordance with *ASTM E2816-11, Standard Test Methods for Fire Resistive Metallic HVAC Duct Systems* a full consensus test method that was specifically designed to assess both specific end use of the duct and its protection materials.

The history of many provisions in our building codes are traced back to ASTM E119 as it is the oldest fire-resistance standard cited in the U.S. building codes. However, when fire test standards were developed for specific material applications those test standards replaced ASTM E119. There are many examples of advancements in fire testing being used to provide a fire test based on ASTM E119 but specifically developed for a particular application: doors, windows, firestop systems, joint systems, etc. For example, doors were tested to ASTM E119, then ASTM E152, and now to UL10b and 10c, which were developed to assess the door's fire performance in a specific application. As products are in service for prolonged periods of time some performance limitations are noted and addressed by industry and the codes. This proposed code change is a cost effective method of providing a test specifically designed to test the duct system as the shaft is not tested as constructed in the field but rather as a wall panel. ASTM E119 does not have a protocol for testing shafts that can be engulfed in a fire. The fire-resistance engulfment test of ASTM E2816 is a much more serve test scenario for a shaft or duct system as the volume of air within the shaft or duct is limited and will heat faster than the ambient laboratory air in contact with the wall panel. Also, the stability of the shaft as constructed in the field will react differently than a wall panel. The corners of the shaft will be tested as the sides of the shaft create stresses on the corners that are not evaluated by the ASTM E119 wall panel, which is secured into a test frame. Using tests designed to address the actual construction and application of materials is more conservative and usually increases life safety. Further, sometimes newer fire tests allow more cost effective materials and construction than materials assessed by traditional tests not specifically designed to address their actual construction and application.

The clothes dryer exhaust duct system should comply with ASTM E2816 horizontal duct and vertical duct under the following situation. According to the text in Section 504.8 and referenced use, the clothes dryer exhaust duct system is designed to expel "…moisture and any products of *combustion* to the outside of the building," which indicates that the pressure of the contaminated air is negative relative to the building. There is a possibility that a fire may originate in the clothes dryer exhaust duct system because there may be products of combustion within the clothes dryer exhaust. Another possibility is that a fire surrounds (engulfs) the clothes dryer exhaust duct system. An unprotected clothes dryer exhaust duct system will allow the products of *combustion* to be heated and potentially ignite, which may facilitate the spread of fire within the building. Therefore, clothes dryer exhaust duct system should be isolated from the building to prevent the spread of fire as intended by the use of a fire resistive metallic duct systems, which are fire tested for these specific events: fire inside the duct and fire outside the duct. Fire resistive metallic duct systems tested and listed to ASTM E2816 may provide a higher degree of fire protection. Shaft enclosures tested to ASTM E119 are tested as panels and are not subjected to an engulfment scenario as are fire resistive metallic duct systems tested and listed to ASTM E2816.

This method of tests uses the ASTM E119 time-temperature curve and replicates use of exhaust by using a fan technique to create a negative pressure within the duct similar to that occurring while a clothes dryer exhaust system is in use. This method of tests also assesses both an internal and external fire threat to the duct as well as the transition or connection of horizontal ducts to vertical ducts. In ASTM E2816, the systems supports are also tested as part of the fire resistance test. ASTM E2816 offers the following tests to assess performance: ASTM E84 for the system's flame spread and smoke developed indices, ASTM E136 for insulation's non-combustibility, ASTM C518 for the insulation's durability and ASTM E814 for the system's ability as a firestop to prevent the spread of fire from compartment to compartment, ASTM E2226 for the resistance to the application of a hose stream, and ASTM C411 for the insulation covering's and lining's ability to resist flaming, glowing, smoldering or smoking while in service, which was just approved in December 2011 and this test method will also become part of the standard upon its latest publication. ICC-ES AC179, *Acceptance Criteria for Metallic HVAC Duct Enclosure Assemblies,* originally cited ISO 6944 as the test to determine the duct system's fire resistance but now cites ASTM E2816-11 for that purpose as well as to determine the characteristics of the system and enclosure material currently cited in the codes. ICC-ES AC179, *Acceptance Criteria for Metallic HVAC Duct Enclosure Assemblies,* cites ASTM E2816-11 to establish requirements for fire protection enclosure systems, applied to metallic HVAC ducts which provide an alternate to required fire-resistance-rated shafts or an alternate to required fire dampers in specific locations, as well as to determine the characteristics of the system and enclosure material currently cited in the codes.

Table 1. Loss Measures for Clothes Dryer Fires in Buildings[1]

[All fires, 3-year average (2002-2004)]

Measure	All Buildings	Non-residential Buildings	Residential Buildings
Loss per fire	$8,891	$7,462	$9,176
Injuries per 1000 fires	37.2	58.9	33.0
Deaths per 1000 fires	1.0	0.0	1.2

Source: NFIRS 5.0 data only; Loss per fire is computed for only those fires where loss information was provided

These comments are respectfully submitted as the ASTM Task Group Chair of ASTM E2816 who drafted its first version, as the ANSI Designated Expert to ISO TC92 SC2 WG4 that created and maintains ISO 6944 *Fire Containment — Elements of Building Construction — Part 1: Ventilation Ducts* and one who has designed, supervised, and overseen HVAC fire tests as part of an international laboratory as well as one who had jurisdiction over the product certification process for products and materials.

Bibliography:
1. www.usfa.fema.gov/downloads/pdf/tfrs/v7i1.pdf

Cost Impact: This change will potentially reduce the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [ASTM E2816-11] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

	Assembly:	ASF	AMF	DF

504.8-M-NICHOLAS.DOC

M73–12
504.8, 505.3 (NEW)

Proponent: Al Godwin, CBO, CPM representing Aon Fire Protection Engineering (al.godwin@aon.com)

Revise as follows:

504.8 Common exhaust systems for clothes dryers located in multistory structures. Where a common multistory duct system is designed and installed to convey exhaust from multiple clothes dryers, the construction of the system shall be in accordance with all of the following:

(Items 1 through 12 remain unchanged)

13. Dryer ducts shall have a cleanout located near the shaft penetration to permit cleaning of the 22” subduct required by Section 607.5.5, exception 2. The subduct length shall be considered in the calculation of allowable duct length.

505.3 Common exhaust systems for domestic kitchens located in multistory structures. Where a common multistory duct system is designed and installed to convey exhaust from multiple domestic kitchen exhaust systems, the construction of the system shall be in accordance with all of the following:

1. The shaft in which the duct is installed shall be constructed and fire-resistance rated as required by the *International Building Code*.
2. Dampers shall be prohibited in the exhaust duct, except as specified in Section 505.1. Penetrations of the shaft and ductwork shall be protected in accordance with Section 607.5.5, exception 2.
3. Rigid metal ductwork shall be installed within the shaft to convey the exhaust. The ductwork shall be constructed of sheet steel having a minimum thickness of 0.0187 inch (0.4712 mm) (No. 26 gage) and in accordance with SMACNA *Duct Construction Standards*.
4. The ductwork within the shaft shall be designed and installed without offsets.
5. The exhaust fan motor design shall be in accordance with Section 503.2.
6. The exhaust fan motor shall be located outside of the airstream.
7. The exhaust fan shall run continuously, and shall be connected to a standby power source.
8. Exhaust fan operation shall be monitored in an *approved* location and shall initiate an audible or visual signal when the fan is not in operation.
9. Makeup air shall be provided for the exhaust system.
10. A cleanup opening shall be located at the base of the shaft to provide access to the duct to allow for cleanout and inspection. The finished openings shall be not less than 12 inches by 12 inches (305 mm by 305 mm).
11. Screens shall not be installed at the termination.
12. The common multistory duct system shall serve only kitchen exhaust and shall be independent of other exhaust systems.

Reason: Since exception 2 has been installed in the IBC, it has been incomplete. The IMC has done a good job of updating the provisions for common ducts with clothes dryers but nothing has been done for domestic kitchens. Designers would not go to the expense of installing a shaft for domestic kitchen exhaust if there was not a smoke issue. When expensive condo’s install super domestic kitchens, there is going to be smoke.

Also, IMC Section 505.1 specifically requires systems with downdraft exhaust to discharge to the exterior. How is that going to be done in a multi-story building? And, where there is smoke, there is grease. Thus, provisions are needed for kitchen exhaust and such exhaust needs to be separate from bathroom/toilet exhaust. The designer should take some responsibility for controlling grease discharge, but specifics are left to his/her discretion. Long dryer ducts have to install a 90 degree riser at the very end of their discharge, the weakest point. A cleanout is appropriate. Perhaps someone has a better idea, but this should be a start.

Cost Impact: This code proposal will not increase the cost of construction since this is the method it should be designed to and it is less expensive than installation of a Type I hood.

M73-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

504.8-M-GODWIN.DOC

M74–12
504.8, Chapter 15

Proponent: Tony Crimi, A.C. Consulting Solutions Inc, representing International Firestop Council

Revise as follows:

504.8 Common exhaust systems for clothes dryers located in multistory structures. Where a common multistory duct system is designed and installed to convey exhaust from multiple clothes dryers, the construction of the system shall be in accordance with all of the following:

1. The shaft in which the duct is installed shall be constructed and fire-resistance rated as required by the *International Building Code*. <u>As an alternative to a fire-resistance-rated shaft, the duct shall be enclosed in a duct enclosure system tested and *listed* to have not less than a 2-hour fire-resistance rating in accordance with ASTM E2816-11.</u>

(Portions not shown remain unchanged)

Add new Referenced Standard to Chapter 15 as follows:

<u>ASTM E2816-11, Standard Test Methods for Fire Resistive Metallic HVAC Duct Systems.</u>

Reason: This proposal would allow an additional tested method of protection for duct enclosures systems to be used. The enclosures or ductwork would be permitted to be used if it were protected by a tested and listed assembly conforming to the new *ASTM E2816-11, Standard Test Methods for Fire Resistive Metallic HVAC Duct Systems* evaluated for the specific purpose. This test is now also referenced as part of ICC-ES AC179, Acceptance Criteria for Metallic HVAC Duct Enclosure Assemblies. The purpose of these acceptance criteria is to establish requirements for fire protection enclosure systems applied to metallic HVAC ducts, which provides an alternate to required fire-resistance-rated shafts or an alternate to required fire dampers in specific locations. This criterion provides an alternate to shaft enclosures for vertical ducts.

The new ASTM Standard evaluates the HVAC duct systems for surface burning characteristics, non-combustibility, fire resistance, durability, and fire engulfment with horizontal and vertical through-penetration firestops. The Standard evaluates the fire performance of HVAC ducts for both supply (pressurization) and return air, in the vertical and horizontal orientation, with or without openings. These test methods evaluate the ability of a HVAC duct system to resist the spread of fire from one compartment to another compartment when subjected to the standard time-temperature curve of ASTM E119.

Cost Impact: This change will potentially reduce the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [ASTM E2816-11] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

504.8-M-CRIMI.DOC

M75–12
505.1

Proponent: Joshua Smith, New York State Office of Fire Prevention and Control (Joshua.Smith@dhses.ny.gov)

Revise as follows:

SECTION 505
DOMESTIC KITCHEN EXHAUST EQUIPMENT

505.1 Domestic systems. Where domestic range hoods and domestic appliances equipped with downdraft or updraft exhaust are located within dwelling units, such hoods and appliances shall discharge to the outdoors through sheet metal ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls and shall be air tight and equipped with a backdraft damper.

Exceptions:

1. Where installed in accordance with the manufacturer's installation instructions, where mechanical or natural ventilation is otherwise provided in accordance with Chapter 4 and, where a smoke alarm or detector is not present within 20 ft horizontally of the cooking appliances, listed and labeled ductless range hoods shall not be required to discharge to the outdoors
2. Ducts for domestic kitchen cooking appliances equipped with downdraft exhaust systems shall be permitted to be constructed of Schedule 40 PVC pipe provided that the installation complies with all of the following:
   - 2.1. The duct shall be installed under a concrete slab poured on grade.
   - 2.2. The underfloor trench in which the duct is installed shall be completely backfilled with sand or gravel.
   - 2.3. The PVC duct shall extend not greater than 1 inch (25 mm) above the indoor concrete floor surface.
   - 2.4. The PVC duct shall extend not greater than 1 inch (25 mm) above grade outside of the building.
   - 2.5. The PVC ducts shall be solvent cemented.

Reason: The purpose of this code change is to reduce the number of nuisance fire alarms due to normal cooking conditions. Hoods that do not vent to the outside have added to the number of nuisance fire alarms by recirculating the dirty air further throughout the cooking area. In many cases the hoods that do not vent to the outside end up pointing the products of combustion directly at a smoke detector. R-2 Occupancies specifically can present a special hazard because many are required to have smoke detection in the kitchen area because it is located directly outside of a sleeping room. The design and layout of the dwelling unit within the occupancy in itself can be a cause for a rise in nuisance fire alarms. Because it is impractical and dangerous to remove life safety devices other provisions should be made to reduce the number of nuisance alarms. In R-2 occupancies that have retrofitted in ventilation direct to the outside of the building the number of cooking related nuisance fire alarms due to normal cooking vapor have been reduced.

Cost Impact: This proposal will increase the cost of construction.

M75-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

505.1-M-SMITH.DOC

M76-12
505.1, 505.3(NEW), 507.2.3

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee

Revise as follows:

SECTION 505
DOMESTIC KITCHEN EXHAUST EQUIPMENT

505.1 Domestic systems. Where domestic range hoods and domestic appliances equipped with downdraft exhaust are ~~located within dwelling units~~ provided, such hoods and appliances shall discharge to the outdoors through sheet metal ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls, shall be air tight, shall be equipped with a backdraft damper, and shall be independent of all other exhaust systems.

Exceptions:

1. In other than Group I-1 and I-2, where installed in accordance with the manufacturer's installation instructions and where mechanical or *natural ventilation* is otherwise provided in accordance with Chapter 4, *listed* and *labeled* ductless range hoods shall not be required to discharge to the outdoors.
2. Ducts for domestic kitchen cooking appliances equipped with downdraft exhaust systems shall be permitted to be constructed of Schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:
   - 2.1. The duct shall be installed under a concrete slab poured on grade.
   - 2.2. The under floor trench in which the duct is installed shall be completely backfilled with sand or gravel.
   - 2.3. The PVC duct shall extend not more than 1 inch (25 mm) above the indoor concrete floor surface.
   - 2.4. The PVC duct shall extend not more than 1 inch (25 mm) above grade outside of the building.
   - 2.5. The PVC ducts shall be solvent cemented.

505.2 Makeup air required. Exhaust hood systems capable of exhausting in excess of 400 cfm (0.19 m^3/s) shall be provided with *makeup air* at a rate approximately equal to the *exhaust air* rate. Such *makeup air* systems shall be equipped with a means of closure and shall be automatically controlled to start and operate simultaneously with the exhaust system.

505.3 Other than Group R. In other than Group R occupancies, where domestic cooking appliances are utilized for domestic purposes, such appliances shall be provided with domestic range hoods. Hoods and exhaust systems shall be in accordance with Sections 505.1 and 505.2.

SECTION 507
COMMERCIAL KITCHEN HOODS

507.2.3 Domestic cooking appliances used for commercial purposes. Domestic cooking appliances utilized for commercial purposes shall be provided with Type I or Type II hoods as required for the type of appliances and processes in accordance with Sections 507.2, 507.2.1 and 507.2.2. Domestic cooking appliances utilized for domestic purposes shall comply with Section 505.

Reason: The intent of this proposal is to clarify requirements and address new situations as Assisted Living and Nursing Home designs change.

Current requirements for domestic appliances used for domestic purposes are geared towards Group R facilities. When a stove is located in another use group, often a requirement for commercial hoods is misapplied. In a residential dwelling unit, often a range hood is not required if there is enough ventilation. Given the different types of facilities, this proposal would always require a hood when a range was provided in another use group.

As the style of assisted living facilities and nursing homes attempts to produce a more residential atmosphere, domestic ranges are provided either within the unit (some assisted living) or in common use areas (assisted living or nursing home residential 'suites'). Residents use this equipment for light cooking duties (few people and only occasional meals) or special cooking (i.e., cookies, cakes). If this equipment is used for cooking for a large number of residents on a regular basis, it is being used for commercial purposes, and it would fall under 507.2.3.

Hospitals or outpatient rehab facilities sometimes have domestic ranges in occupational therapy and dietician areas. The goal being to provide residents with training on good eating habits when they are at home.

Changes to 505.1 would allow residential and areas such as business break rooms to allow for recirculation if the mechanical system is designed for it.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April, 2005, the CTC has held twenty-two meetings – all open to the public.

Cost Impact: Reduction

M76-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

505-M-BALDASSARRA-CTC.DOC

M77–12
505.1

Proponent: Gary Kreutziger, M.C.P., City of San Antonio, representing Gary Kreutziger (gkreutziger@sanantonio.gov)

Revise as follows:

505.1 Domestic systems. Where domestic range hoods and domestic appliances equipped with downdraft exhaust are ~~located within dwelling units~~ installed, such hoods and appliances shall discharge to the outdoors through sheet metal ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls, shall be air tight, shall be equipped with a backdraft damper, and shall be independent of all other exhaust systems.

Reason: The change will provide prescriptive requirements for all installations of domestic range hoods and domestic appliances with downdraft exhaust. As the section is currently written it only applies to dwelling units. Domestic appliances are often installed in church kitchens, assisted living classrooms, break rooms, child care facilities, fire stations, etc. all of which use the domestic appliances in the same manner and with approximately the same frequency as a dwelling unit. IMC section 507.2.3 requires a type I or II hood over domestic appliances utilized for commercial purposes. Most jurisdictions would not consider the domestic appliances installed in the aforementioned occupancies as utilized for commercial purposes. This code change will provide direction where the code is currently silent.

Cost Impact: The code change proposal will not increase the cost of construction.

M77-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

505.1-M-KREUTZIGER

M78–12
505.1, 505.1.1(NEW)

Proponent: William Freer, New York State Office of Fire Prevention and Control (WFreer@dhses.ny.gov)

Revise as follows:

SECTION 505
DOMESTIC KITCHEN EXHAUST EQUIPMENT

505.1 Domestic systems. Where domestic range hoods and domestic appliances equipped with downdraft exhaust are located within dwelling units, such hoods and appliances shall discharge to the outdoors through sheet metal ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls, shall be air tight, shall be equipped with a backdraft damper, and shall be independent of all other exhaust systems.

Exceptions:

1. Where installed in accordance with the manufacturer's installation instructions and where mechanical or natural ventilation is otherwise provided in accordance with Chapter 4, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.

2. Ducts for domestic kitchen cooking appliances equipped with downdraft exhaust systems shall be permitted to be constructed of Schedule 40 PVC pipe provided that the installation complies with all of the following:
   2.1. The duct shall be installed under a concrete slab poured on grade.
   2.2. The underfloor trench in which the duct is installed shall be completely backfilled with sand or gravel.
   2.3. The PVC duct shall extend not greater than 1 inch (25 mm) above the indoor concrete floor surface.
   2.4. The PVC duct shall extend not greater than 1 inch (25 mm) above grade outside of the building.
   2.5. The PVC ducts shall be solvent cemented.

<u>**505.1.1 Exhaust equipment activation.** Where required by the code official, domestic range hood and downdraft exhaust systems shall be interconnected with the domestic cooking appliance served so that such range hoods and downdraft exhaust systems automatically activate when the domestic appliance is in use.</u>

Reason: The purpose of this code change is to reduce the number of nuisance fire alarms. A major contributor to the number of nuisance alarms in R-2 occupancies has been the resident failing to turn the hood on while cooking. This is most prevalent in student housing but can also been seen in senior and apartment housing. The current code requires the hood / ventilation be in place but has no means of requiring or making the user turn them on. By adding a low cost interlock the vent would be in operation anytime cooking was in progress. This would strengthen the current code while keeping with its original intent.

At Bard College in Northern Dutchess County they have a major nuisance fire alarm problem that they have been diligently working on. They first tried changing their hoods to vent to the outside. That change cut the nuisance alarm in about half. Still not happy with the number of nuisance alarms they added the interlocking devices to the new dorm. To date, there have been no nuisance alarms in the new building.

Cost Impact: The code change proposal would increase the cost of construction.

M78-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

505.1.1(NEW)-M-FREER.DOC

M79–12
505.2

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

505.2 Makeup air required. Exhaust hood systems capable of exhausting in excess of 400 cfm shall be mechanically provided with *makeup air* at a rate approximately equal to the *exhaust air* rate. Such *makeup air* systems shall be equipped with a means of closure and shall be automatically controlled to start and operate simultaneously with the exhaust system.

Reason: Section 505.2 does not state whether the makeup air system is required to be mechanical or gravity. Current text certainly suggests that mechanical is required. Should a simple louvered opening with a damper be permitted to provide makeup air by gravity? If so, how much pressure loss is allowed across the louvered opening? This loss must be known in order to calculate the opening and louver size. The code is silent on this. The intent is to prevent negative pressures from being developed by the kitchen exhaust that would affect other exhaust systems, chimneys, fireplaces, appliances and appliance vents. A small gravity opening to the outdoors would allow makeup air to enter the kitchen, but how negative must the space go to cause the necessary airflow rate to pass through such opening? Mechanical makeup air can be matched to the exhaust rate with no pressurization of the space.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: This could increase the cost of construction depending on how current text is interpreted.

M79-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

505.2-M-STRAUSBAUGH.PMGCAC.DOC

M80–12
505.2

Proponent: Dan Buuck, National Association of Home Builders (NAHB) (dbuuck@nahb.org)

Revise as follows:

505.2 Makeup air required. Exhaust hood systems capable of exhausting in excess of 400 cubic feet per minute (0.19 m3/s) shall be provided with makeup air at a rate approximately equal to the difference between the exhaust air rate and 400 cubic feet per minute (0.19 m3/s). Such makeup air systems shall be equipped with a backdraft damper~~means of closure and shall be automatically controlled to start and operate simultaneously with the exhaust system~~.

> **Exception:** In dwelling units, where all appliances are of direct-vent, power-vented, unvented, or electric type, makeup air is not required for hood systems that exhaust 600 CFM or less. Exhaust hood systems located in such dwelling units and capable of exhausting in excess of 600 cubic feet per minute (0.28 m3/s) shall be provided with makeup air at a rate approximately equal to the difference between the exhaust air rate and 600 cubic feet per minute.

Reason: This section, new in the 2009 International Residential Code (IRC) and 2009 International Mechanical Code (IMC), attempts to solve an unproven backdrafting problem with range hoods. The exhaust rate of 400 cubic feet per minute (cfm) was chosen arbitrarily and without substantiation other than it being greater than the minimum exhaust rate of range hoods on the market. However, several manufacturers do not produce any range hoods below the 400 cfm threshold, effectively reducing a homeowner's choice of kitchen exhaust options without the added difficulty and expense of installing makeup air.

The reasoning that kitchen exhaust systems are available with an exhaust rate under 400 cfm does not take down-draft systems, popular with homeowners, into consideration. Most of them operate at 500 to 600 cfm and therefore require makeup air under this section.

As written, this section allows range hoods up to 400 cfm to be installed without makeup air. It would be consistent to require makeup air equaling the amount above and beyond 400 cfm for larger fans. Essentially, there would be no difference between the effect a 400 cfm fan has on a house and a 600 cfm fan with 200 cfm of makeup air. This would also improve the feasibility and acceptance of this code section as well as cut down on the amount of wasted energy in heating or cooling the makeup air.

This section requires an automatic means of closure for the makeup air opening beyond what the code has historically required for residential construction. For example, Section G2407.6 requires no dampers whatsoever for combustion air openings to the outdoors, such as found in many homes in the northern US. The amended section would allow barometric dampers as required for clothes dryer exhaust ducts.

Finally, the current code section does not take into account the fact that in many homes there is no danger of backdrafting (the original reason for this code section) due to the lack of natural draft appliances. The 400 cfm threshold could be raised to 600 cfm in those cases with no added danger. This would allow for down-draft fans without dedicated makeup air when the exception is met.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Steve Ferguson, representing ASHRAE

Delete and substitute as follows:

~~**506.3.2.5 Grease duct test.** Prior to the use or concealment of any portion of a grease duct system, a leakage test shall be performed. Ducts shall be considered to be concealed where installed in shafts or covered by coatings or wraps that prevent the ductwork from being visually inspected on all sides. The permit holder shall be responsible to provide the necessary *equipment* and perform the grease duct leakage test. A light test shall be performed to determine that all welded and brazed joints are liquid tight.~~

~~A light test shall be performed by passing a lamp having a power rating of not less than 100 watts through the entire section of ductwork to be tested. The lamp shall be open so as to emit light equally in all directions perpendicular to the duct walls. A test shall be performed for the entire duct system, including the hood-to-duct connection. The duct work shall be permitted to be tested in sections, provided that every joint is tested. For *listed* factory-built grease ducts, this test shall be limited to duct joints assembled in the field and shall exclude factory welds.~~

506.3.2.5 Duct Leakage Performance Testing. Prior to the use or concealment of any portion of a grease duct system, a leakage test shall be performed to determine that all welded joints and seams are liquid tight. Ducts shall be considered to be concealed where they are installed in shafts or covered by coatings or wraps that prevent the duct from being visually inspected on all sides. It is permissible to test the duct in sections, provided that, after the duct system is completely assembled, all field-assembled joints, including the duct-to-hood connection, are tested. For testing performed in accordance with this section, only the field-assembled joints of listed factory-built grease ducts are required to be tested.

The leakage test shall consist of a light test, an air or a water pressure test, or an approved equivalent test. The permit holder shall be responsible for providing the necessary equipment for performing the test.

506.3.2.5.1 Light Test. The light test shall be performed by passing a lamp having a power rating of not less than 100 watts through the entire section of ductwork to be tested. The lamp shall be open so as to emit light equally in all directions perpendicular to the duct walls. Light from the duct interior shall not be visible through any exterior surface.

506.3.2.5.2 Air Test. The air test shall be performed by sealing the entire duct system from the hood exhaust opening(s) to the duct termination. The sealed duct system shall then be pressurized to a pressure of not less than 1.0 inch water column and the duct system shall be required to hold this pressure for not less than 20 minutes.

506.3.2.5.3 Water Test. The water test shall be performed by use of a pressure washer operating at a pressure of not less than 1,500 psi and simulating cleaning operations. The water shall be applied directly to all areas to be tested. Water applied to the duct interior shall not be visible on any exterior surface in any volume during the test.

Reason: The proposed language is the current Section 5.2 Duct Leakage Performance Testing of ASHRAE's Standard 154-2011 "Ventilation for Commercial Cooking Operations". The 154 Standards Committee received input from the general public, committee members, members of ASHRAE TC 5.10 "Kitchen Ventilation", IMC members, specifiers, end-users and manufacturers while considering the proposed language for inclusion in Standard 154. During the considerations some of the comments and reasons for the final language include:

1. In field installations where duct systems may be high above finished floors or in tight enclosures it may be very difficult or even unsafe for an inspector to access all seams and joints that need to be inspected using the IMC light test method.
2. Pressure test may be more practical for longer or elevated runs. The pressure test is already in use in some areas including Minnesota where it is a grease duct test method required by State Building/Mechanical Code.

3. Water leaks are more easily located than light or pressure leaks. Additionally pressure washing is one of the primary methods used to clean kitchen grease duct systems. Exposing these duct systems to the water test method during commissioning can detect and prevent future water leaks caused by high pressure washing.
4. These tests may be used in combination if the facility and duct routing make one test in one area of the duct system more practical than another.

Cost Impact: Zero. The light test is already a code requirement. The additional test methods only offer alternatives that may be better suited to a particular installation.

M83-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

506.3.2.5-M-FERGUSON.DOC

M84–12
506.3.2.5

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

506.3.2.5 Grease duct test. Prior to the use or concealment of any portion of a grease duct system, a leakage test shall be performed. Ducts shall be considered to be concealed where installed in shafts or covered by coatings or wraps that prevent the ductwork from being visually inspected on all sides. The permit holder shall be responsible to provide the necessary *equipment* and perform the grease duct leakage test. A light test or an air test shall be performed to determine that all welded and brazed joints are liquid tight. A test shall be performed for the entire duct system, including the hood-to-duct connection. For listed factory-built ducts, tests shall be limited to duct joints assembled in the field and shall exclude factory welds. The duct work shall be permitted to be tested in sections, provided that every joint is tested.

A light test shall be performed by passing a lamp having a power rating of not less than 100 watts through the entire section of ductwork to be tested. The lamp shall be open so as to emit light equally in all directions perpendicular to the duct walls. ~~A test shall be performed for the entire duct system, including the hood-to-duct connection. The duct work shall be permitted to be tested in sections, provided that every joint is tested. For *listed* factory-built grease ducts, this test shall be limited to duct joints assembled in the field and shall exclude factory welds.~~

An air test shall be performed by capping the ductwork system at the outlet and at the point of connection to the hood and then pressurizing the system with air at a pressure of not less than 1 inch wc. A manometer shall be used to measure pressure within the ductwork. Before taking pressure readings, the temperature of the air in the ductwork and the ductwork itself shall be allowed to stabilize and the source of air pressure shall be disconnected from the ductwork system. The ductwork system shall maintain the pressure without loss for a period of not less than 15 minutes.

Reason: The code allows only one method of testing grease ducts and that method is far from precise. An air test is much more likely to expose a leak and provides the installer with an option. This air test is also allowed by ASHRAE 154. Much of Sections 506 and 507 is parallel with 154.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

506.3.2.5-M-STRAUSBAUGH.PMGCAC.DOC

M85–12
506.3.7.1

Proponent: Curt Campbell, Chesterfield County, VA, representing Va. Plumbing and Mechanical Inspectors Association (VPMIA) and Va. Building Code Officials Association (VBCOA) (CampbellCu@chesterfield.gov)

Revise as follows:

506.3.7.1 Grease <u>duct</u> reservoirs. Grease <u>duct</u> reservoirs shall:

1. Be constructed as required for the grease duct they serve.
2. Be located on the bottom of the horizontal duct or the bottommost section of the duct riser.
3. Have a length and width of not less than 12 inches (305 mm). Where the grease duct is less than 12 inches (305 mm) in a dimension, the reservoir shall be not more than 2 inches (51 mm) smaller than the duct in that dimension.
4. Have a depth of not less than 1 inch (25.4 mm).
5. Have a bottom that is sloped to a point for drainage.
6. Be provided with a cleanout opening constructed in accordance with Section 506.3.8 and installed to provide direct access to the reservoir. The cleanout opening shall be located on a side or on top of the duct so as to permit cleaning of the reservoir.
7. Be installed in accordance with the manufacturer's instructions where manufactured devices are utilized.

Reason: IMC 506.5.2 references an approved grease reservoir for manufactured vertical grease exhaust fans. The current language would require this reservoir to comply with 506.3.7.1, which of course is not applicable. This language should clearly show that these two grease reservoirs are two entirely different devices.

Cost Impact: The code change proposal will not increase the cost of construction.

506.3.8

Proponent: Guy McMann, MCP, Jefferson County Colorado, Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

506.3.8 Grease duct cleanouts and openings. Grease duct cleanouts and openings shall comply with all of the following:

1. Grease ducts shall not have openings except where required for the operation and maintenance of the system.
2. Sections of <u>vertical</u> grease ducts that are inaccessible from the hood or discharge openings shall be provided with cleanout openings <u>spaced not more than 20 feet apart and not more than 10 feet from changes in direction greater than 45 degrees</u>.
3. Cleanouts and openings shall be equipped with tight-fitting doors constructed of steel having a thickness not less than that required for the duct.
4. Cleanout doors shall be installed liquid tight.
5. Door assemblies including any frames and gaskets shall be approved for the application and shall not have fasteners that penetrate the duct.
6. Gasket and sealing materials shall be rated for not less than 1500ºF (816ºC).
7. Listed door assemblies shall be installed in accordance with the manufacturer's instructions.

Reason: Sometimes there are vertical sections of grease duct that are in the middle of a run and inaccessible from the hood, fan or horizontal cleanouts and it can extend long distances. This may apply in high rise buildings as the grease will congeal over this vertical distance as it cools making it difficult to clean because there is no access. This is a helpful clarification as how to access these sections of duct that could not be otherwise accessed.

Cost Impact: This may increase the cost of construction.

M86-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

506.3.5-M-MCMANN.DOC

M87–12
506.3.7.1

Proponent: Guy McMann, MCP, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gmcmann@jeffco.us)

Revise as follows:

506.3.7.1 Grease reservoirs. Grease reservoirs shall:

1. Be constructed as required for the grease duct they serve.
2. Be located on the bottom of the horizontal duct or the bottommost section of the duct riser.
3. ~~Have a length and width of not less than 12 inches (305 mm). Where the grease duct is less than 12 inches (305 mm) in a dimension, the reservoir shall be not more than 2 inches (51 mm) smaller than the duct in that dimension.~~
3. Extend across the full width of the duct and have a length of not less than 12 inches.
4. Have a depth of not less than 1 inch (25.4 mm).
5. Have a bottom that ~~is sloped to a point for drainage.~~ slopes to a drain.
6. Be provided with a cleanout opening constructed in accordance with Section 506.3.8 and installed to provide direct access to the reservoir. The cleanout opening shall be located on a side or on top of the duct so as to permit cleaning of the reservoir.
7. Be installed in accordance with the manufacturer's instructions where manufactured devices are utilized.

Reason: The current text permits grease to pass by the trap as a result of being anything smaller than the full width of the duct. There is no need to require a minimum arbitrary length as long as the fitting captures the grease as intended by the designer. Item 5 requires a sloped bottom but fails to actually require a drain. Sometimes simpler is better.

Cost Impact: None

506.3.11

Proponent: Richard Grace, Fairfax County Government, representing The Virginia Plumbing and Mechanical Inspectors Association, The Virginia Building Code Officials Association; Guy McMann, MCP, Jefferson County Colorado, Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

THIS CODE CHANGE WILL BE HEARD BY THE IBC FIRE SAFETY. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Revise as follows:

506.3.11 Grease duct enclosures. A grease duct serving a Type I hood that penetrates a ceiling, wall or floor shall be enclosed from the point of penetration to the outlet terminal. A duct shall penetrate exterior walls only at locations where unprotected openings are permitted by the International Building Code . The duct enclosure shall serve a single grease duct and shall not contain other ducts, piping or wiring systems. Duct enclosures shall be either field-applied or factory-built. Duct enclosures shall have a fire-resistance rating not less than that of the floor assembly penetrated, and not less than 1 hour. <u>Fire dampers shall not be installed in grease ducts.</u> Duct enclosures shall be as prescribed by Section 506.3.11.1, 506.3.11.2 or 506.3.11.3.

Reason: Although this states the obvious, the code just needs to come out and directly say that this is not an option.

Cost Impact: None

506.3.11-M-GRACE-MCMANN.DOC

M89–12

506.3.11, 506.3.11.1

Proponent: Tony Crimi, A.C. Consulting Solutions Inc., representing International Firestop Council (tcrimi@sympatico.ca) and John D. Nicholas of Perceptive Solutions LLC representing Unifrax I LLC (john@perceptivesolutionsllc.com)

Revise as follows:

506.3.11 Grease duct enclosures. A grease duct serving a Type I hood that penetrates a ceiling, wall, floor or any concealed spaces shall be enclosed from the point of penetration to the outlet terminal. A duct shall penetrate exterior walls only at locations where unprotected openings are permitted by the *International Building Code*. The duct enclosure shall serve a single grease duct and shall not contain other ducts, piping or wiring systems. Duct enclosures shall be either field-applied or factory-built. Duct enclosures shall have a fire-resistance rating of not less than that of the assembly penetrated and not less than 1 hour. Duct enclosures shall be as prescribed by Section 506.3.11.1 or 506.3.11.2 ~~or 506.3.11.3~~.

~~**506.3.11.1 Shaft enclosure.** Commercial kitchen grease ducts constructed in accordance with Section 506.3.1 shall be permitted to be enclosed in accordance with the *International Building Code* requirements for shaft construction. Such grease duct systems and exhaust *equipment* shall have a *clearance* to combustible construction of not less than 18 inches (457 mm), and shall have a *clearance* to noncombustible construction and gypsum wallboard attached to noncombustible structures of not less than 6 inches (76 mm). Duct enclosures shall be sealed around the duct at the point of penetration and vented to the outside of the building through the use of weather-protected openings.~~

506.3.11.<u>1</u> ~~2~~ Field-applied grease duct enclosure.
Commercial kitchen grease ducts constructed in accordance with Section 506.3.1 shall be enclosed by field applied grease duct enclosure that is a listed and labeled material, system, product, or method of construction specifically evaluated for such purpose in accordance with ASTM E 2336. The surface of the duct shall be continuously covered on all sides from the point at which the duct originates to the outlet terminal. Duct penetrations shall be protected with a through-penetration fire-stop system classified in accordance with ASTM E 814 or UL 1497 and having a "F" and "T" rating equal to the fire-resistance rating of the assembly being penetrated. Such systems shall be installed in accordance with the listing and the manufacturer's installation instructions. Partial application of a field-applied grease duct enclosure system shall not be installed for the sole purpose of reducing clearances to combustibles at isolated sections of grease duct. Exposed duct-wrap systems shall be protected where subject to physical damage.

506.3.11.<u>2</u> ~~3~~ Factory-built grease duct assemblies. Factory- built grease duct assemblies incorporating integral enclosure materials shall be *listed* and *labeled* for use as commercial kitchen grease duct assemblies in accordance with UL 2221. Duct penetrations shall be protected with a through-penetration firestop system classified in accordance with ASTM E 814 or UL 1479 and having an "F" and "T" rating equal to the fire-resistance rating of the assembly being penetrated. Such assemblies shall be installed in accordance with the listing and the manufacturer's installation instructions.

506.3.11.<u>3</u> 4 Duct enclosure not required. A duct enclosure shall not be required for a grease duct that penetrates only a nonfire-resistance-rated roof/ceiling assembly.

Reasons:

CRIMI- The use of a grease duct enclosure installed in conformance with the IBC requirements for shaft construction is really just another "field-applied" grease duct enclosure system, and should be subject to the same conditions as any other field-applied grease duct enclosure system. In that case, Section 506.3.1 becomes redundant, since testing in conformance with ASTM E2336 addresses the issues related to clearances to combustible and noncombustible construction.

The historical practice of allowing certain materials to be used to enclose grease ducts serving Type 1 hoods without specifically fire testing then for the application needs to be revisited. The IBC requirements for shaft construction cover many items, but the fire-resistance requirements to conform to ASTM E119 do not address normal service conditions for grease ducts at all. Evaluating enclosure materials used to protect a grease duct from fire is an aid for predicting their fire performance and promotes uniformity in requirements of various authorities. To do this it is necessary that the fire-endurance properties of enclosure materials be measured and specified according to a common standard expressed in terms that are applicable alike to a wide variety of materials, situations, and conditions of exposure. The ASTM E2336 and UL 2221 test methods evaluate the enclosure materials and the grease duct enclosure systems using the following test methods: noncombustibility, fire resistance, durability, internal fire, and fire-engulfment with a through-penetration fire stop.

In contrast to the requirements of IBC Section 713 for Shaft Enclosures, these test methods prescribe a standardized fire exposure for comparing the test results of grease duct enclosure materials and grease duct enclosure systems. Using these test results to predict the performance of actual grease duct enclosure systems requires the evaluation of these specific test conditions.

Over the last decade, the technology surrounding the installation and protection of grease ducts has evolved in response to growing concern over grease duct fires, and concerns over space. The protection of grease ducts under fire exposure conditions is an item of importance in securing constructions that are safe, and that are not a menace to adjacent construction or building occupants. Protection of grease ducts has long been addressed in the codes of many authorities, municipal and other agencies. Many types of enclosure materials are used to protect grease ducts. Normally, these enclosure materials are either applied to grease ducts in the field or are fabricated as part of the grease duct when shipped from the factory.

NICHOLAS-This proposed code change allows for the use of either a pre-fabricated duct system or field applied enclosure system when these systems are tested and listed in accordance with *ASTM E2336, Standard Test Methods for Fire Resistive Grease Duct Enclosure Systems* a full consensus test method that was specifically designed to assess both specific end use of the duct and its protection materials.

The history of many provisions in our building codes are traced back to ASTM E119 as it is the oldest fire-resistance standard cited in the U.S. building codes. However, when fire test standards are developed for specific material applications those test standards replaced ASTM E119. There are many examples of advancements in fire testing being used to provide a fire test based on ASTM E119 but specifically developed for a particular application: doors, windows, firestop systems, joint systems, etc. For example, doors were tested to ASTM E119, then ASTM E152, and now to UL10b and 10c, which were developed to assess the door's fire performance in a specific application. This proposed code change is a cost effective method of providing a test specifically designed to test the duct system as the shaft is not tested as constructed in the field but rather as a wall panel. ASTM E119 does not have a protocol for testing shafts that can be engulfed in a fire. The fire-resistance engulfment test of ASTM E2336 is a much more serve test scenario for a shaft or duct system as the volume of air within the shaft or duct is limited and will heat faster than the ambient laboratory air in contact with the wall panel. Also, the stability of the shaft as constructed in the field will react differently than a wall panel. The corners of the shaft will be tested as the sides of the shaft create stresses on the corners that are not evaluated by the ASTM E119 wall panel, which is secured into a test frame. Using tests designed to address the actual construction and application of materials is more conservative and usually increases life safety. Further, sometimes newer fire tests of materials allow more cost effective materials and construction than materials assessed by traditional tests not specifically designed to address their actual construction and application.

As products are in service for prolonged periods of time some performance limitations are noted and addressed by industry and the codes. GA-216-2007, *Specifications for the Application and Finishing of Gypsum Panel Products* states "1.4 Gypsum panel products shall not be used where they will be exposed to sustained temperatures of more than 125ºF (52ºC) for extended periods of time.[1]"

Also, several changes related to the use of conventional shaft materials have taken place within the building and mechanical codes over the years. For example, the IMC under Section 602.2 **Construction** states, "The use of gypsum boards to form plenums shall be limited to systems where the air temperatures do not exceed 125ºF (52ºC) and the building and mechanical system design conditions are such that the gypsum board surface temperature will be maintained above the airstream dew-point temperature." A similar limitation is noted in the IMC under Section 603.5.1 **Gypsum Ducts** states, "The use of gypsum boards to form air shafts (ducts) shall be limited to return air systems where the air temperatures do not exceed 125ºF (52ºC) and the gypsum board surface temperature is maintained above the airstream dew-point temperature. Air ducts formed by gypsum boards shall not be incorporated in air-handling systems utilizing evaporative coolers." For these reasons, a shaft wall construction tested to ASTM E119 as a panel may not provide the performance when that construction is tested as a shaft engulfed in a fire. Nor may a shaft wall construction tested to ASTM E119 as a panel maintain its stability and insulation when tested as a shaft subjected to a prolonged service test temperature established by UL1978 and adopted by ASTM E2336 and UL 2221.

Both ASTM E2336 and UL2221 have an engulfment fire tests and a portion of their standard dedicated to a prolonged internal service temperature test, approximately 500°F, which must be maintained for a minimum of 4-hour exposure. Then with 15 minutes the fire test temperature is increase to approximately 2000°F and sustained for 30 minutes. These test protocols are designed to subject the fire protection materials to an exposure that may be experienced in service. As these tests where not developed for a particular material, having conventional shaft materials tested to the same tests will ensure conformity of fire protection and dispel concerns about the service temperature limitations, which may decrease the performance of conventional shaft materials, cited in the codes and by the industry.

This method of tests uses the ASTM E119 time-temperature for the engulfment test to assess the duct system. This method of tests also assesses both internal and external fire threats as well as both horizontal ducts and vertical ducts. In ASTM E2336, the systems supports are also tested as part of the fire resistance test. ASTM E2336 offers the following tests to assess performance: ASTM E136 for insulation's non-combustibility, ASTM C518 for the insulation's durability and ASTM E814 for the system's ability as a firestop to prevent the spread of fire from compartment to compartment, and ASTM E2226 for the resistance to the application of a hose stream.

ICC-ES AC101, *Acceptance Criteria For Grease Duct Enclosure Assemblies*, establishes requirements for fire protection enclosure systems, applied to grease ducts which provide an alternate to required fire-resistance-rated shafts, as well as to determine the characteristics of the system and enclosure material currently cited in the codes.

These comments are respectfully submitted as the ASTM Task Group Chair of ASTM E2336 who drafted its first version, as the ANSI Designated Expert to ISO TC92 SC2 WG4 that created and maintains ISO 6944 *Fire Containment — Elements of Building Construction — Part 2: Kitchen Extract Ducts* and one who has designed, supervised, and overseen grease duct fire tests as part of an international laboratory as well as one who had jurisdiction over the product certification process for products and materials.

506.3.11-M-CRIMI-NICHOLAS.DOC

M90–12
506.3.11

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

506.3.11 Grease duct enclosures. A grease duct serving a Type I hood that penetrates a ceiling, wall, floor or any concealed spaces shall be enclosed from the point of penetration to the outlet terminal. <u>In-line exhaust fans not located outdoors shall be enclosed as required for grease ducts.</u> A duct shall penetrate exterior walls only at locations where unprotected openings are permitted by the *International Building Code*.

Reason: Section 506.3.11 does not state that in-line fans located inside the building would have to be enclosed no differently than a grease duct. Such fans are installed in, and as part of, the duct system and if the duct must be enclosed, so too must the fan.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: This proposal could increase the cost of construction depending upon how current text is interpreted.

506.3.11#2-M-STRAUSBAUGH.PMGCAC.DOC

M91–12
506.3.11

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

THIS CODE CHANGE WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Revise as follows:

506.3.11 Grease duct enclosures. A grease duct serving a Type I hood that penetrates a ceiling, wall, floor or any concealed spaces shall be enclosed from the point of penetration to the outlet terminal. A duct shall penetrate exterior walls only at locations where unprotected openings are permitted by the *International Building Code*. The duct enclosure shall serve a single grease duct and shall not contain other ducts, piping or wiring systems. Duct enclosures shall be either field-applied or factory-built. Duct enclosures shall have a fire-resistance rating of not less than that of the assembly penetrated and not less than 1 hour. Duct enclosures shall be as prescribed by Section 506.3.10.1, 506.3.10.2 or 506.3.10.3. Penetrations of the grease duct enclosure made by the grease duct are not required to be protected by fire dampers or smoke dampers.

Reason: Section 712.1.5 of the IBC refers to the IMC for protection of grease duct penetrations. It is the intent that the enclosure requirements of Section 506.3.11 negate the need for fire dampers in grease ducts, however, the code has never clearly stated this intent. This proposal does not prohibit the installation of fire dampers that are part of a listed Type I hood.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

M92–12
506.3.11, 506.3.11.1, 506.3.11.2, 506.3.11.3, Chapter 15

Proponent: Bob Eugene/Underwriters Laboratories/Underwriters Laboratories (Robert.Eugene@ul.com)

Revise as follows:

506.3.11 Grease duct enclosures. A commercial kitchen grease duct serving a Type I hood that penetrates a ceiling, wall, floor or any concealed spaces shall be enclosed from the point of penetration to the outlet terminal. A duct shall penetrate exterior walls only at locations where unprotected openings are permitted by the *International Building Code*. The duct enclosure shall serve a single grease duct and shall not contain other ducts, piping or wiring systems. Duct enclosures shall be ~~either~~ a shaft enclosure in accordance with Section 506.3.11.1, a field-applied enclosure assembly in accordance with 506.3.11.2 or a factory-built enclosure assembly in accordance with Section 506.3.11.3. Duct enclosures shall have a fire-resistance rating of not less than that of the assembly penetrated and not less than 1 hour. ~~Duct enclosures shall be as prescribed by Section 506.3.11.1, 506.3.11.2 or 506.3.11.3.~~

> **Exception:** ~~**506.3.11.4 Duct enclosure not required.**~~ A duct enclosure shall not be required for a grease duct that penetrates only a nonfire-resistance-rated roof/ceiling assembly.

506.3.11.1 Shaft enclosure. ~~Commercial kitchen grease~~ Grease ducts constructed in accordance with Section 506.3.1 shall be permitted to be enclosed in accordance with the *International Building Code* requirements for shaft construction. Such grease duct systems and exhaust *equipment* shall have a *clearance* to combustible construction of not less than 18 inches (457 mm), and shall have a *clearance* to noncombustible construction and gypsum wallboard attached to noncombustible structures of not less than 6 inches (76 mm). Duct enclosures shall be sealed around the duct at the point of penetration and vented to the outside of the building through the use of weather-protected openings.

506.3.11.2 Field-applied grease duct enclosure. ~~Commercial kitchen grease~~ Grease ducts constructed in accordance with Section 506.3.1 shall be enclosed by a *listed* and *labeled* field-applied grease duct enclosure ~~that is a listed and labeled~~ material, systems, product, or method of construction specifically evaluated for such purpose in accordance with ASTM E 2336. The surface of the duct shall be continuously covered on all sides from the point at which the duct originates to the outlet terminal. Duct penetrations shall be protected with a through-penetration ~~fire-stop~~ firestop system ~~classified~~ tested and *listed* in accordance with ASTM E 814 or UL ~~1497~~ 1479 and having a “F” and “T” rating equal to the fire-resistance rating of the assembly being penetrated. The grease duct enclosure and firestop system shall be installed in accordance with the listing and the manufacturer’s instructions. ~~Such fire-stop systems shall be installed in accordance with the listing and the manufacturer’s installation instructions.~~ Partial application of a field-applied grease duct enclosure shall not be installed for the sole purpose of reducing clearances to combustibles at isolated sections of grease duct. Exposed duct-wrap systems shall be protected where subject to physical damage.

506.3.11.3 Factory-built grease duct enclosure assemblies. Factory-built grease ducts ~~assemblies~~ incorporating integral enclosure materials shall be *listed* and *labeled* for use as ~~commercial kitchen~~ grease duct enclosure assemblies specifically evaluated for such purpose in accordance with UL 2221. Duct penetrations shall be protected with a through-penetration firestop system ~~classified~~ tested and *listed* in accordance with ASTM E 814 or UL 1479 and having an “F” and “T” rating equal to the fire-resistance rating of the assembly being penetrated. ~~Such assemblies~~ The grease duct enclosure assembly and firestop system shall be installed in accordance with the listing and the manufacturer’s instructions.

Add referenced standard to Chapter 15 as follows:

UL 1479-03 Standard for Fire Tests of Through-Penetration Firestops

Reason: There is a lot of confusion regarding the options for enclosing a commercial kitchen grease duct in the code community due to the current wording of section 506.3.11. The general requirements are mixed in with the specific requirements for the three construction options and the wording does not accurately define how these products are tested and listed. The focus of this effort is to combine common requirements in the first paragraph, clearly delineate which requirements apply to each of the three construction options and to clarify the wording to accurately reflect how these products are tested, listed and labeled.

Cost Impact: None

Analysis: A review of the standard proposed for inclusion in the code, [UL 1479-03] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

506.3.11-M-EUGENE.DOC

M93–12
506.3.11.1

Proponent: Vickie J. Lovell, Intercode Incorporated, representing 3M Company (vickie@intercodeinc.com)

Revise as follows:

506.3.11.1 Shaft enclosure. Commercial kitchen grease ducts constructed in accordance with Section 506.3.1 shall be permitted to be enclosed by a listed and labelled material, system, product, or method of construction specifically evaluated for such purpose in accordance with ASTM E2336. ~~in accordance with the *International Building Code* requirements for shaft construction.~~ Such grease duct systems and exhaust *equipment* shall have a *clearance* to combustible construction of not less than 18 inches (457 mm), and shall have a *clearance* to noncombustible construction and gypsum wallboard attached to noncombustible structures of not less than 6 inches (76 mm). Duct enclosures shall be sealed around the duct at the point of penetration in accordance with the *International Building Code* Section 714 and vented to the outside of the building through the use of weather-protected openings.

Reason: The IBC requirements for shaft construction cover many items, but the construction of a fire-resistance shaft that conform to ASTM E119 do not address fire conditions for grease duct enclosures at all.

The use of a grease duct enclosure installed in conformance with the IBC requirements for shaft construction should meet the same performance as any other "field-applied" grease duct enclosure system, and should be subjected to the same test conditions as any other field-applied grease duct enclosure system.

The ASTM E2336 test methods evaluate the enclosure materials and the grease duct enclosure systems using the following test methods: noncombustibility, fire resistance, durability, internal fire, and fire-engulfment with a through-penetration fire stop.

The proposed revisions to 506.3.11.1 do not preclude the use of gypsum boards or any other material to form a grease duct enclosure, but ensures that it will be assembled in a configuration that has been demonstrated to provide adequate protection necessary to contain a grease duct fire.

Cost Impact: The code change proposal will not increase the cost of construction.

M93-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

506.3.11-M-LOVELL.DOC

M94–12
506.3.11.1

Proponent: Vickie Lovell, InterCode Incorporated representing the 3M Company (vickie@intercodeinc.com)

Revise as follows:

506.3.11.1 Shaft enclosure. Commercial kitchen grease ducts constructed in accordance with Section 506.3.1 shall be permitted to be enclosed in accordance with the *International Building Code* requirements for shaft construction. Such grease duct systems and exhaust *equipment* shall have a *clearance* to combustible construction of not less than 18 inches (457 mm), and shall have a *clearance* to noncombustible construction and gypsum wallboard attached to noncombustible structures of not less than 6 inches (76 mm). <u>The materials used to form such enclosures shall be limited to an assemblage of materials that can withstand temperatures that exceed 125ºF (52ºC) for the time period of the fire-resistance rating of the floor or roof assembly penetrated.</u> Duct enclosures shall be sealed around the duct at the point of penetration and vented to the outside of the building through the use of weather-protected openings.

Reason: The historical practice of allowing certain materials, such as gypsum wallboard, to be used to enclose grease ducts serving Type 1 hoods is in consistent with the requirements for field applied, and factory built grease duct enclosures. The IBC requirements for shaft construction cover many items, but the fire-resistance requirements to conform to ASTM E119 do not address normal service conditions for grease ducts at all.

As written, any assembly of gypsum board would be permitted as a grease duct enclosure. Section 602.2 of the IMC has, for many years, recognized the practical limitations of using gypsum wallboard in elevated temperature applications.

In the IMC 602.2. the use of gypsum boards to form plenums is limited to conditions where the air temperatures do not exceed 125ºF (52ºC) and the building and mechanical system design conditions are such that the gypsum board surface temperature will be maintained.

Grease duct fires are typically very hot, exceeding the capability of a single layer of 5/8 inch gypsum board without some specific instruction on how it should be configured to provide adequate fire protection, including internal and external fire exposure for the duration and at the expected temperatures of a grease fire.

Cost Impact: This code change will not increase the cost of construction and may in fact reduce the cost of construction.

	Assembly:	ASF	AMF	DF

506.3.11.1-M-LOVELL.DOC

M95–12
506.3.11.2

Proponent: Richard Grace, Fairfax County Government, representing The Virginia Plumbing and Mechanical Inspectors Association, The Virginia Building Code Officials Association; Guy McMann, MCP, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

Revise as follows:

506.3.11.2 Field-applied grease duct enclosure Commercial kitchen grease ducts constructed in accordance with Section 506.3.1 shall be enclosed by a field-applied grease duct enclosure that is a listed and labeled material, system, product or method of construction specifically evaluated for such purpose in accordance with ASTM E 2336.

The surface of the duct shall be continuously covered on all sides <u>with two layers of field applied grease duct enclosure material, </u>from the point at which the duct originates to the outlet terminal. Duct penetrations shall be protected with a through-penetration fire stop system classified in accordance with ASTM E 814 or UL 1479 and having an "F" and "T" rating equal to the fire-resistance rating of the assembly being penetrated. Such systems shall be installed in accordance with the listing and the manufacturer's installation instructions. Partial application of a field applied grease duct enclosure system shall not be installed for the sole purpose of reducing clearances to combustibles at isolated sections of grease duct. Exposed duct wrap systems shall be protected where subject to physical damage

Reason: As with many Standards, some of the pertinent language is not included in code text forcing the user to locate the Standard which may not be available or possibly even having to purchase it. In order to satisfy ASTM E 2336, two layers of wrapping material must be installed. This is extremely important information that the user needs to be aware of ahead of time, not only for bidding purposes but in order to pass an inspection the fist time around. Inspectors also need this information so they know what to look for. Although the manufacturer’s instructions require the two layers, this is simply a benefit for the user as this will aid on the front side of a possible installation.

Cost Impact: None

506.4.1.1 (New), 505.1.1 (New)

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

THIS CODE CHANGE WILL BE HEARD BY THE IBC-FIRE SAFETY COMMITTEE, SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Add new text as follows:

506.4.1.1 Duct Penetrations. Fire dampers, combination fire/smoke dampers and ceiling radiation dampers are not required in exhaust ducts serving Type II hoods. Ducts that penetrate fire-resistance-rated assemblies and that are not required by this section to have dampers shall comply with the requirements of Sections 714.2 through 714.3.3 of the *International Building Code.* Ducts that penetrate horizontal assemblies and that are not required to be contained within a shaft and not required by this section to have dampers shall comply with the requirements of Sections 714.4 through 714.4.2.2 of the *International Building Code.*

505.1.1 Duct Penetrations. Fire dampers, combination fire/smoke dampers and ceiling radiation dampers are not required in domestic kitchen hood exhaust ducts. Ducts that penetrate fire-resistance-rated assemblies and that are not required by this section to have dampers shall comply with the requirements of Sections 714.2 through 714.3.3 of the *International Building Code.* Ducts that penetrate horizontal assemblies and that are not required to be contained within a shaft and not required by this section to have dampers shall comply with the requirements of Sections 714.4 through 714.2.2 of the *International Building Code.*

Reason: Exception # 5 to Section 717.5.3 (IMC [B]607.5.5) addresses kitchen exhaust ducts but does not identify whether this means Type I, Type II, domestic or all of these. Rather than trying to revise the IBC text, the committee decided to let the exception apply broadly to all kitchen exhaust ducts without limitation and address the penetration protection requirements in the relative location in the IMC. For Type I kitchen exhaust ducts, dampers are not required, as was the probable intent of exception # 5. Such ducts are required to be enclosed in rated enclosures by Section 506.3.11. Because Type II and domestic exhaust ducts are not required to enclosed, some form of penetration protection would be required, therefore the proposed new text requires protection in accordance with the IBC, such as through-penetration firestop systems.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

506.4.1.1-M-STRAUSBAUGH.PMGCAC.DOC

M97–12
506.5.1.1 (NEW)

Proponent: Guy McMann, MCP, Jefferson County Colorado representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Add new text as follows:

506.5.1.1 In line fan Location. Where enclosed duct systems are connected to in line fans, the fan shall be located in a room or space having the same fire resistance rating as the duct enclosure. Access shall be provided for servicing and cleaning of fan components. Such rooms or spaces shall be ventilated in accordance with the fan manufacturers' installation instructions.

Reason: Currently there is no guidance in the IMC as to how and where an in-line fan is to be located as these types of fans are usually in unique locations. Fans cannot be treated the same way as ducts as far as ratings are concerned. Fans cannot be wrapped with duct wrap material. This proposal would require the fan be installed in a rated room or a rated enclosure when the ducts attached to the fan are required to be protected. The rated rooms or enclosures may need to be ventilated according to the fan manufacturers' instructions. This language is consistent with NFPA-96.

Cost Impact: This may or may not increase cost.

M98–12
506.5.1.1(NEW)

Proponent: Richard Grace, Fairfax County Government, representing The Virginia Plumbing and Mechanical Inspectors Association, The Virginia Building Code Officials Association

Add new text as follows:

506.5.1.1 In line fan Location. Where enclosed duct systems are connected to in-line fans, such fans shall be located in a room, space or enclosure having the same fire-resistance rating as the duct enclosure.

Reason: Currently there is no guidance in the IMC as to how and where an in-line fan is to be located as these types of fans are usually in unique locations. There is a misconception that the fan itself has to be in some kind of an enclosure itself which it does not, just be located in a rated room. This language is consistent with NFPA-96.

Cost Impact: None

506.5.1.1-M-GRACE.DOC

M99–12
506.5.1.2(NEW), 507.2

Proponent: Guy McMann, MCP, Jefferson County Colorado, Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gmcmann@jeffco.us)

Revise as follows:

507.2 Where required. A Type I or Type II hood shall be installed at or above all commercial cooking appliances in accordance with Sections 507.2.1 and 507.2.2. Where any cooking appliance under a single hood requires a Type I hood, a Type I hood shall be installed. Where a Type II hood is required, a Type I or Type II hood shall be installed.

> **Exception:** Where cooking appliances are equipped with integral down draft exhaust systems and such appliances and exhaust systems are listed and labeled for the application, ~~in accordance with NFPA 96~~, a hood shall not be required at or above them.

<u>**506.5.1.2 Down draft cooking appliances and ventilation systems.** Down draft cooking appliances and ventilation systems shall be installed in accordance with the manufacturer's instructions and shall comply with all of the following requirements:</u>

1. <u>Exhaust ducts shall comply with Section 506.</u>
2. <u>Clearances to combustibles shall be in accordance with the manufacturer's listing.</u>
3. <u>Appliances shall be provided with filters complying with UL 1046.</u>
4. <u>Spaces containing such appliances shall be provided with makeup air complying with Section 508.</u>
5. <u>Appliances shall be interlocked with the exhaust system such that they cannot operate unless the exhaust system and makeup air system are operating.</u>
6. <u>The exhaust system shall be provided with controls that will prevent appliance operation when airflow falls below 25% of the normal operating flow rate or 10% below the exhaust air flow specified in the equipment listing, whichever is lower.</u>
7. <u>The ventilation system shall be capable of capturing and containing the effluent at the source</u>

Reason: It's not a good practice to send the user to another Standard only to be confused by the different language and requirements that are not in the IMC. The IMC has all the pertinent information required for safe installations.

Currently the code is silent and provides no guidance on what to expect when code officials come across these types of appliances (Hibachi Tables). The National Standard contains requirements that are not present in the code and needs to be addressed. These appliances usually involve bottom discharge exhaust systems that may need monitoring to maintain capture and containment as they are not required to have type I hoods over them.

Cost Impact: None

506.5.3

Proponent: Guy McMann, MCP, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) and Richard Grace, Fairfax County Government, The Virginia Plumbing and Mechanical Inspectors Association, The Virginia Building Code Officials Association

Revise as follows:

506.5.3 Exhaust fan mounting ~~An~~ Up-blast fans serving Type I hoods and installed in a vertical or horizontal position shall be hinged, ~~and~~ supplied with a flexible weatherproof electrical cable to permit inspection and cleaning and shall be equipped with a means of restraint to limit the swing of the fan on its hinge. The ductwork shall extend a minimum of 18 inches (457 mm) above the roof surface.

Reason: Some clarification is needed in distinguishing between Type I fans and all others. Type II fans and other types of up-blast fans do not require hinges. There needs to be some method of restraint on hinged fans as they can become quite large and heavy. If one was to get loose from a grip the potential for damage from the fan falling in an opposite direction becomes high. This could result in damage to the electrical cable on the roof, wall or elsewhere. Also, the fan could tear itself off the curb altogether. In any case, property damage or personal injury could result. A restraining cable will aid in stabilizing the fan so cleaning and maintenance operations can be accomplished safely.

Cost Impact: Adding a cable may increase the cost of the fan.

Revise as follows:

SECTION 507
COMMERCIAL KITCHEN HOODS

507.1 General. Commercial kitchen exhaust hoods shall comply with the requirements of this section. Hoods shall be Type I or II and shall be designed to capture and confine cooking vapors and residues. A Type I or Type II hood shall be installed at or above all *commercial cooking appliances* in accordance with Sections 507.2 and 507.3. Where any cooking *appliance* under a single hood requires a Type I hood, a Type I hood shall be installed. Where a Type II hood is required, a Type I or Type II hood shall be installed. ~~Commercial kitchen exhaust hood systems shall operate during the cooking operation.~~

Exceptions:

1. Factory-built commercial exhaust hoods that are listed and labeled in accordance with UL 710, and installed in accordance with Section 304.1 shall not be required to comply with Sections 507.1.5, 507.2.3, 507.2.5, 507.2.8, 507.3.1, 507.3.3, 507.4 and 507.5. ~~507.4, 507.5, 507.7, 507.11, 507.12, 507.13, 507.14, and 507.15.~~
2. Factory-built commercial cooking recirculating systems that are listed and labeled in accordance with UL 710B, and installed in accordance with Section 304.1 shall not be required to comply with Sections 507.1.5, 507.2.3, 507.2.5, 507.2.8, 507.3.1, 507.3.3, 507.4 and 507.5. ~~507.4, 507.5, 507.7, 507.11, 507.12, 507.13, 507.14, and 507.15~~. Spaces in which such systems are located shall be considered to be kitchens and shall be ventilated in accordance with Table 403.3. For the purpose of determining the floor area required to be ventilated, each individual *appliance* shall be considered as occupying not less than 100 square feet (9.3 m2).
3. ~~Net exhaust volumes for hoods shall be permitted to be reduced during part-load cooking conditions, where engineered or *listed* multispeed or variable speed controls automatically operate the exhaust system to maintain capture and removal of cooking effluents as required by this section. Reduced volumes shall not be below that required to maintain capture and removal of effluents from the idle cooking appliances that are operating in a standby mode.~~
3. Where cooking appliances are equipped with integral down-draft exhaust systems and such appliances and exhaust systems are listed and labeled for the application in accordance with NFPA 96, a hood shall not be required at or above them.

507.1.1 Operation. Commercial kitchen exhaust hood systems shall operate during the cooking operation. The hood exhaust rate shall comply with the listing of the hood or shall comply with Section 507.5. ~~Type I~~ Hood systems shall be designed and installed to automatically activate the exhaust fan whenever cooking operations occur. The activation of the exhaust fan shall occur through an interlock with the cooking appliances, by means of heat sensors or by means of other approved methods. A method of interlock between an exhaust hood system and appliances equipped with standing pilot burners shall not cause the pilot burners to be extinguished. A method of interlock between an exhaust hood system and cooking appliances shall not involve or depend upon any component of a fire extinguishing system.

The net exhaust volumes for hoods shall be permitted to be reduced during part-load cooking conditions, where engineered or *listed* multispeed or variable speed controls automatically operate the exhaust system to maintain capture and removal of cooking effluents as required by this section. Reduced volumes shall not be below that required to maintain capture and removal of effluents from the idle cooking appliances that are operating in a standby mode.

~~**507.2 Where required.** A Type I or Type II hood shall be installed at or above all *commercial cooking appliances* in accordance with Sections 507.2.1 and 507.2.2. Where any cooking *appliance* under a single hood requires a Type I hood, a Type I hood shall be installed. Where a Type II hood is required, a Type I or Type II hood shall be installed.~~

> ~~**Exception:** Where cooking appliances are equipped with integral down-draft exhaust systems and such appliances and exhaust systems are listed and labeled for the application in accordance with NFPA 96, a hood shall not be required at or above them.~~

507.1.23 Domestic cooking appliances used for commercial purposes. Domestic cooking appliances utilized for commercial purposes shall be provided with Type I or Type II hoods as required for the type of appliances and processes in accordance with Sections 507.2 and 507.3.

507.1.3 Fuel-burning appliances. Where vented fuel-burning appliances are located in the same room or space as the hood, provisions shall be made to prevent the hood system from interfering with normal operation of the *appliance* vents.

507.1.4 Cleaning. A hood shall be designed to provide for thorough cleaning of the entire hood.

507.1.5 Exhaust outlets. Exhaust outlets located within the hood shall be located so as to optimize the capture of particulate matter. Each outlet shall serve not more than a 12-foot (3658 mm) section of hood.

507.2~~.1~~ Type I hoods. Type I hoods shall be installed where cooking *appliances* produce grease or smoke as a result of the cooking process. Type I hoods shall be installed over *medium-duty*, *heavy-duty* and *extra-heavy duty cooking appliances*. Type I hoods shall be installed over *light-duty cooking appliances* that produce grease or smoke.

> **Exception:** A Type I hood shall not be required for an electric cooking appliance where an approved testing agency provides documentation that the appliance effluent contains 5 mg/m3 or less of grease when tested at an exhaust flow rate of 500 cfm (0.236 m3/s) in accordance with Section 17 of UL 710B.

~~**507.2.1.1 Operation.** Type I hood systems shall be designed and installed to automatically activate the exhaust fan whenever cooking operations occur. The activation of the exhaust fan shall occur through an interlock with the cooking appliances, by means of heat sensors or by means of other *approved* methods. A method of interlock between an exhaust hood system and appliances equipped with standing pilot burners shall not cause the pilot burners to be extinguished. A method of interlock between an exhaust hood system and cooking appliances shall not involve or depend upon any component of a fire extinguishing system.~~

507.2.1~~.2~~ Type I exhaust flow rate label. Type I hoods shall bear a label indicating the minimum exhaust flow rate in cfm per linear foot (1.55 L/s per linear meter) of hood that provides for capture and containment of the exhaust effluent for the cooking appliances served by the hood, based on the cooking appliance duty classifications defined in this code.

507.2.2 Type I extra-heavy-duty. Type I hoods used over *extra-heavy-duty cooking appliances* shall not cover *heavy-*, *medium-* or *light-duty appliances*. Such hoods shall discharge to an exhaust system that is independent of other exhaust systems.

507.2.3 Type I materials. Type I hoods shall be constructed of steel having a minimum thickness of 0.0466 inch (1.181 mm) (No. 18 gage) or stainless steel not less than 0.0335 inch [0.8525 mm (No. 20 MSG)] in thickness.

507.2.4 Type I supports. Type I hoods shall be secured in place by non-combustible supports. All Type I hood supports shall be adequate for the applied load of the hood, the unsupported ductwork, the effluent loading and the possible weight of personnel working in or on the hood.

507.2.5 Type I joints, seams and penetrations. External hood joints, seams and penetrations for Type I hoods shall be made with a continuous external liquid-tight weld or braze to the lowest outermost perimeter of the hood. Internal hood joints, seams, penetrations, filter support frames and other appendages attached inside the hood shall not be required to be welded or brazed but shall be otherwise sealed to be grease tight.

Exceptions:

1. Penetrations shall not be required to be welded or brazed where sealed by devices that are *listed* for the application.
2. Internal welding or brazing of seams, joints and penetrations of the hood shall not be prohibited provided that the joint is formed smooth or ground so as to not trap grease, and is readily cleanable.

507.2.6 Clearances for Type I hood. A Type I hood shall be installed with a *clearance* to combustibles of not less than 18 inches (457 mm).

Exception: *Clearance* shall not be required from gypsum wallboard or 1/2-inch (12.7 mm) or thicker cementitious wallboard attached to noncombustible structures provided that a smooth, cleanable, nonabsorbent and noncombustible material is installed between the hood and the gypsum or cementitious wallboard over an area extending not less than 18 inches (457 mm) in all directions from the hood.

507.2.7 Type I hoods penetrating a ceiling. Type I hoods or portions thereof penetrating a ceiling, wall or furred space shall comply with Section 506.3.11. Field-applied grease duct enclosure systems, as addressed in Section 506.3.11.2, shall not be utilized to satisfy the requirements of this section.

507.2.8 Type I grease filters. Type I hoods shall be equipped with grease filters listed and labeled in accordance with UL 1046 and designed for the specific purpose. Grease-collecting *equipment* shall be provided with access for cleaning. The lowest edge of a grease filter located above the cooking surface shall be not less than the height specified in Table 507.2.8.

TABLE 507.2.8
MINIMUM DISTANCE BETWEEN THE LOWEST EDGE OF A GREASE FILTER AND THE COOKING SURFACE OR THE HEATING SURFACE

Type of Cooking Appliances	Height Above Cooking Surface (feet)
Without exposed flame	0.5
Exposed flame and burners	2
Exposed charcoal and charbroil type	3.5

For SI: 1 foot = 304.8 mm.

507.2.8.1 Criteria. Filters shall be of such size, type and arrangement as will permit the required quantity of air to pass through such units at rates not exceeding those for which the filter or unit was designed or *approved*. Filter units shall be installed in frames or holders so as to be readily removable without the use of separate tools, unless designed and installed to be cleaned in place and the system is equipped for such cleaning in place. Removable filter units shall be of a size that will allow them to be cleaned in a dishwashing machine or pot sink. Filter units shall be arranged in place or provided with drip-intercepting devices to prevent grease or other condensate from dripping into food or on food preparation surfaces.

507.2.8.2. Mounting position of grease filters. Filters shall be installed at an angle of not less than 45 degrees (0.79 rad) from the horizontal and shall be equipped with a drip tray beneath the lower edge of the filters.

507.2.9 Grease gutters for Type I hood. Grease gutters shall drain to an *approved* collection receptacle that is fabricated, designed and installed to allow access for cleaning.

507.3~~2.2~~ Type II hoods. Type II hoods shall be installed above dishwashers and appliances that produce heat or moisture and do not produce grease or smoke as a result of the cooking process, except where the heat and moisture loads from such appliances are incorporated into the HVAC system design or into the design of a separate removal system. Type II hoods shall be installed above all appliances that produce products of *combustion* and do not produce grease or smoke as a result of the cooking process. Spaces containing cooking appliances that do not require Type II hoods shall be provided with exhaust at a rate of 0.70 cfm per square foot (0.00033 m3/s). For the purpose of determining the floor area required to be exhausted, each individual *appliance* that is not required to be installed under a Type II hood shall be considered as occupying not less than 100 square feet (9.3 m2). Such additional square footage shall be provided with exhaust at a rate of 0.70 cfm per square foot [.00356 m3/(s · m2)].

> ~~**507.2.3 Domestic cooking appliances used for commercial purposes.** Domestic cooking appliances utilized for commercial purposes shall be provided with Type I or Type II hoods as required for the type of appliances and processes in accordance with Sections 507.2, 507.2.1 and 507.2.2.~~
>
> ~~**507.2.4 Extra-heavy-duty.** Type I hoods for use over *extra-heavy-duty cooking appliances* shall not cover *heavy-*, *medium-* or *light-duty appliances*. Such hoods shall discharge to an exhaust system that is independent of other exhaust systems.~~

~~**507.3 Fuel-burning appliances.** Where vented fuel-burning appliances are located in the same room or space as the hood, provisions shall be made to prevent the hood system from interfering with normal operation of the *appliance* vents.~~

~~**507.4 Type I materials.** Type I hoods shall be constructed of steel having a minimum thickness of 0.0466 inch (1.181 mm) (No. 18 gage) or stainless steel not less than 0.0335 inch [0.8525 mm (No. 20 MSG)] in thickness.~~

507.3.1~~5~~ Type II hood materials. Type II hoods shall be constructed of steel having a minimum thickness of 0.0296 inch (0.7534 mm) (No. 22 gage) or stainless steel not less than 0.0220 inch (0.5550 mm) (No. 24 gage) in thickness, copper sheets weighing not less than 24 ounces per square foot (7.3 kg/m2) or of other *approved* material and gage.

507.3.2~~6~~ Type II Supports. ~~Type I hoods shall be secured in place by non-combustible supports.~~ All ~~Type I and~~ Type II hood supports shall be adequate for the applied load of the hood, the unsupported ductwork, the effluent loading and the possible weight of personnel working in or on the hood.

~~**507.7 Hood joints, seams and penetrations.** Hood joints, seams and penetrations shall comply with Sections 507.7.1 and 507.7.2.~~

~~**507.7.1 Type I hoods.** External hood joints, seams and penetrations for Type I hoods shall be made with a continuous external liquid-tight weld or braze to the lowest outermost perimeter of the hood. Internal hood joints, seams, penetrations, filter support frames and other appendages attached inside the hood shall not be required to be welded or brazed but shall be otherwise sealed to be grease tight.~~

~~**Exceptions:**~~

1. ~~Penetrations shall not be required to be welded or brazed where sealed by devices that are *listed* for the application.~~
2. ~~Internal welding or brazing of seams, joints and penetrations of the hood shall not be prohibited provided that the joint is formed smooth or ground so as to not trap grease, and is readily cleanable.~~

507.3.3~~7.2~~ Type II hoods joint, seams and penetrations. Joints, seams and penetrations for Type II hoods shall be constructed as set forth in Chapter 6, shall be sealed on the interior of the hood and shall provide a smooth surface that is readily cleanable and watertight.

~~**507.8 Cleaning and grease gutters.** A hood shall be designed to provide for thorough cleaning of the entire hood. Grease gutters shall drain to an *approved* collection receptacle that is fabricated, designed and installed to allow access for cleaning.~~

~~**507.9 Clearances for Type I hood.** A Type I hood shall be installed with a *clearance* to combustibles of not less than 18 inches (457 mm).~~

> ~~**Exception:** *Clearance* shall not be required from gypsum wallboard or 1/2-inch (12.7 mm) or thicker cementitious wallboard attached to noncombustible structures provided that a smooth, cleanable, nonabsorbent and noncombustible material is installed between the hood and the gypsum or cementitious wallboard over an area extending not less than 18 inches (457 mm) in all directions from the hood.~~

~~**507.10 Hoods penetrating a ceiling.** Type I hoods or portionsthereof penetrating a ceiling, wall or furred space shall comply with Section 506.3.11. Field-applied grease duct enclosure systems, as addressed in Section 506.3.11.2, shall not be utilized to satisfy the requirements of this section.~~

~~**507.11 Grease filters.** Type I hoods shall be equipped with grease filters listed and labeled in accordance with UL 1046 and designed for the specific purpose. Grease-collecting *equipment* shall be provided with access for cleaning. The lowest edge of a grease filter located above the cooking surface shall be not less than the height specified in Table 507.11.~~

~~TABLE 507.11~~
~~MINIMUM DISTANCE BETWEEN THE LOWEST EDGE OF A GREASE FILTER AND THE COOKING SURFACE OR THE HEATING SURFACE~~

~~**Type of Cooking Appliances**~~	~~**Height Above Cooking Surface (feet)**~~
~~Without exposed flame~~	~~0.5~~
~~Exposed flame and burners~~	~~2~~
~~Exposed charcoal and charbroil type~~	~~3.5~~

~~For SI: 1 foot = 304.8 mm.~~

~~**507.11.1 Criteria.** Filters shall be of such size, type and arrangement as will permit the required quantity of air to pass through such units at rates not exceeding those for which the filter or unit was designed or *approved*. Filter units shall be installed in frames or holders so as to be readily removable without the use of separate tools, unless designed and installed to be cleaned in place and the system is equipped for such cleaning in place. Removable filter units shall be of a size that will allow them to be cleaned in a dishwashing machine or pot sink. Filter units shall be arranged in place or provided with drip-intercepting devices to prevent grease or other condensate from dripping into food or on food preparation surfaces.~~

~~**507.11.2 Mounting position.** Filters shall be installed at an angle of not less than 45 degrees (0.79 rad) from the horizontal and shall be equipped with a drip tray beneath the lower edge of the filters.~~

507.4 Hood size and location. Hoods shall comply with the overhang, set back and height requires in accordance with Sections 507.4.1 and 507.4.2 based on the type hood.

507.4.1 ~~12~~ Canopy hoods. The inside lower edge of canopy-type Type I and II commercial hoods shall overhang or extend a horizontal distance of not less than 6 inches (152 mm) beyond the edge of the top horizontal surface of the *appliance* on all open sides. The vertical distance between the front lower lip of the hood and such surface shall not exceed 4 feet (1219 mm).

Exception: The hood shall be permitted to be flush with the outer edge of the cooking surface where the hood is closed to the *appliance* side by a noncombustible wall or panel.

507.4.2 ~~14~~ Noncanopy hoods. Noncanopy-type hoods shall be located a maximum of 3 feet (914 mm) above the cooking surface. The edge of the hood shall be set back a maximum of 1 foot (305 mm) from the edge of the cooking surface.

507.5 ~~13~~ Capacity of hoods. Commercial food service hoods shall exhaust a minimum net quantity of air determined in accordance with this section and Sections 507.5~~13~~.1 through 507.5~~13~~.5. The net quantity of *exhaust air* shall be calculated by subtracting any airflow supplied directly to a hood cavity from the total exhaust flow rate of a hood. Where any combination of *heavy-duty*, *medium-duty* and *light-duty cooking appliances* are utilized under a single hood, the exhaust rate required by this section for the heaviest duty *appliance* covered by the hood shall be used for the entire hood.

507.5~~13~~.1 Extra-heavy-duty cooking appliances. The minimum net airflow for hoods, as determined by Section 507.1~~2~~, used for *extra-heavy-duty cooking appliances* shall be determined as follows:

Type of Hood	**CFM per linear foot of hood**
Backshelf/pass-over	Not allowed
Double island canopy (per side)	550
Eyebrow	Not allowed
Single island canopy	700
Wall-mounted canopy	550

For SI: 1 cfm per linear foot = 1.55 L/s per linear meter.

507.5~~13~~.2 Heavy-duty cooking appliances. The minimum net airflow for hoods, as determined by Section 507.1~~2~~, used for *heavy-duty cooking appliances* shall be determined as follows:

Type of Hood	**CFM per linear foot of hood**
Backshelf/pass-over	400
Double island canopy (per side)	400
Eyebrow	Not allowed
Single island canopy	600
Wall-mounted canopy	400

For SI: 1 cfm per linear foot = 1.55 L/s per linear meter.

507.5~~13~~.3 Medium-duty cooking appliances. The minimum net airflow for hoods, as determined by Section 507.1~~2~~, used for *medium-duty cooking appliances* shall be determined as follows:

Type of Hood	**CFM per linear foot of hood**
Backshelf/pass-over	300
Double island canopy (per side)	300
Eyebrow	250
Single island canopy	500
Wall-mounted canopy	300

For SI: 1 cfm per linear foot = 1.55 L/s per linear meter.

507.5~~13~~.4 Light-duty cooking appliances. The minimum net airflow for hoods, as determined by Section 507.1~~2~~, used for *light-duty cooking appliances* and food service preparation shall be determined as follows:

Type of Hood	**CFM per linear foot of hood**
Backshelf/pass-over	250
Double island canopy (per side)	250
Eyebrow	250

Single island canopy	400
Wall-mounted canopy	200

For SI: 1 cfm per linear foot = 1.55 L/s per linear meter.

507.5~~13~~.5 Dishwashing appliances. The minimum net airflow for Type II hoods used for dishwashing appliances shall be 100 CFM per linear foot of hood length.

Exception: Dishwashing appliances and *equipment* installed in accordance with Section 507.3~~2.2~~.

~~**507.14 Noncanopy size and location.** Noncanopy-type hoods shall be located a maximum of 3 feet (914 mm) above the cooking surface. The edge of the hood shall be set back a maximum of 1 foot (305 mm) from the edge of the cooking surface.~~

~~**507.15 Exhaust outlets.** Exhaust outlets located within the hood shall be located so as to optimize the capture of particulate matter. Each outlet shall serve not more than a 12-foot (3658 mm) section of hood.~~

507.6~~16~~ Performance test. A performance test shall be conducted upon completion and before final approval of the installation of a ventilation system serving *commercial cooking appliances*. The test shall verify the rate of exhaust airflow required by Section 507.5~~13~~, makeup airflow required by Section 508 and proper operation as specified in this chapter. The permit holder shall furnish the necessary test *equipment* and devices required to perform the tests.

507.6~~16~~.1 Capture and containment test. The permit holder shall verify capture and containment performance of the exhaust system. This field test shall be conducted with all appliances under the hood at operating temperatures, with all sources of outdoor air providing *makeup air* for the hood operating and with all sources of recirculated air providing conditioning for the space in which the hood is located operating. Capture and containment shall be verified visually by observing smoke or steam produced by actual or simulated cooking, such as with smoke candles, smoke puffers, etc.

Reason: This section needs to be reorganized. The scope of this section has become much too large and non-cohesive due to multiple "tweaks" in the past. Requirements are "jumbled" and bounce around between the different types of hoods. There has been no change to intent in this proposed reorganization, only the presentation of the text has changed.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

507.M-STRAUSBAUGH.PMGCAC.DOC

M102–12
507

Proponent: Steve Ferguson, American Society of Heating Refrigerating and Air-Conditioning Engineers (ASHRAE)

Revise as follows:

507.1 General. Commercial kitchen exhaust hoods shall comply with the requirements of this section, shall be listed and labeled in accordance with UL 710 or 710 B as applicable and shall be installed in accordance with Section 304.1. Hoods shall be Type I or II and shall be designed to capture and confine cooking vapors and residues. Commercial kitchen exhaust hood systems shall operate during the cooking operation.

Exception~~s~~:

~~1. Factory-built commercial exhaust hoods that are listed and labeled in accordance with UL 710, and installed in accordance with Section 304.1 shall not be required to comply with Sections 507.4, 507.5, 507.7, 507.11, 507.12, 507.13, 507.14, and 507.15.~~

~~2. Factory-built commercial cooking recirculating systems that are listed and labeled in accordance with UL 710B, and installed in accordance with Section 304.1 shall not be required to comply with Sections 507.4, 507.5, 507.7, 507.11, 507.12, 507.13, 507.14, and 507.15. Spaces in which such systems are located shall be considered to be kitchens and shall be ventilated in accordance with Table 403.3. For the purpose of determining the floor area required to be ventilated, each individual *appliance* shall be considered as occupying not less than 100 square feet (9.3 m^2).~~

~~3~~1 Net exhaust volumes for hoods shall be permitted to be reduced during part-load cooking conditions, where engineered or *listed* multispeed or variable-speed controls automatically operate the exhaust system to maintain capture and removal of cooking effluents as required by this section. Reduced volumes shall not be below that required to maintain capture and removal of effluents from the idle cooking appliances that are operating in a standby mode.

507.1.1 Kitchen ventilation. Spaces in which factory-built commercial cooking recirculating systems are located shall be considered to be kitchens and shall be ventilated in accordance with Table 403.3. For the purpose of determining the floor area required to be ventilated, each individual *appliance* shall be considered as occupying not less than 100 square feet (9.3 m^2).

Delete sections without substitution as follows:

~~**507.4**~~
~~**507.5**~~
~~**507.7**~~
~~**507.11**~~
~~**507.12**~~
~~**507.13**~~
~~**507.14**~~
~~**507.15**~~

Reason: ASHRAE standard 154 no longer recognizes unlisted hoods. This proposal makes the IMC parallel with 154 and simplifies it by eliminating the code coverage for unlisted hoods and eliminates the confusion created by the 2 exceptions to Section 507.1 that exempt listed hoods from much of the current code requirements.

Cost Impact: There is some cost impact of requiring listed Type I hoods but this is offset by additional energy savings since listed hoods operate at a lower airflow rate and are more energy efficient than unlisted hoods.

M102-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

507.1-M-FERGUSON.DOC

M103–12
507.2.1.1.1(NEW)

Proponent: Guy McMann, MCP, Jefferson County Colorado, Colorado Association of Plumbing and Mechanical Officials (CAPMO) and Roger Harper, Louisa County, VA, representing VA. Plumbing and Mechanical Inspectors Association (VPMIA)

Revise as follows:

507.2.1.1.1 Multiple hoods utilizing a single exhaust system. Where heat or radiant energy sensors are utilized in hood systems consisting of multiple hoods served by a single exhaust system, such sensors shall be provided in each hood. Sensors shall be capable of being accessed from the hood outlet or from a cleanout location.

(Renumber subsequent section)

Reason:
Harper-Utilizing heat sensors to activate the exhaust hood is only effective if the sensors are placed in an appropriate location. Having sensors installed in a duct system, downstream of the cooking appliances, affects the time in which the hood will activate and will not be consistent with the intent of 507.2.1.1. Locating a sensor in the exhaust outlet of each hood will assure timely fan activation.

McMann-Having sensors installed elsewhere in a duct system affects the time in which the hood will activate and will not be consistent with the intent of 507.2.1.1. For example, 5 hoods on a single fan system where the sensor is located in a trunk duct downstream of 5 branches. The heat from the hood farthest away will take some time to reach the sensor under passive conditions if it makes it there at all under a light load. Its possible that reverse flow may occur under negative building pressure. Locating a sensor in the exhaust outlet of each hood will assure timely fan activation.

Sensors require periodic cleaning and access is required to the inside to the duct to mount them or replace then. Provisions need to be made for these operations. Installing a sensor on a non-factory made cleanout is a excellent solution or simply providing nearby works as well.

Cost Impact: This may increase cost.

M103-507.2.1.1.1(NEW)-M-MCMANN-HARPER.DOC

M104–12
507.2

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

507.2 Where required. A Type I or Type II hood shall be installed at or above all commercial cooking appliances in accordance with Sections 507.2.1 and 507.2.2 Where any cooking appliance under a single hood requires a Type I hood, a Type I hood shall be installed. Where a Type II hood is required, a Type I or Type II hood shall be installed. <u>Where a Type I hood is installed, the installation of the entire system, including the hood, ducts, exhaust equipment and makeup air system shall comply with the requirements of Sections 506, 507, 508 and 509.</u>

Reason: The code allows a Type I hood to be installed where the installation is required to have a Type II hood. The problem with replacing a Type II hood with a Type I is that the building can change hands and cooking operations can commence legally without triggering a permit. A Type I hood substituted for a Type II can be fitted with lesser gage duct with no thought to clearances and when a new tenant comes in, they see a Type I hood and start cooking items that produce grease and smoke, not understanding what's really above the ceiling. This situation provides a false sense of security for owners, tenants and code officials and this can lead to significant hazards down the road. If Type I hoods are installed, they should be installed with all of the materials and requirements that are associated such an installation. Installing a Type I hood without Type I ducts, clearances, etc is analogous to installing fire sprinkler heads without a water supply.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: This proposal will increase the cost of construction.

[a]A hood shall be provided for an electric appliance if it produces 3.1×10^{-7} lb/ft^3 (5 mg/m^3) of grease or more when measured at 500 cfm (236 L/s). See Section 4.2.1.

[b]Where hoods are not required, the additional heat and moisture loads generated by such appliances shall be accounted for in the sensible and latent loads for the HVAC system.

507.2.2.1 Type II hood exhaust flow rates. The net exhaust flow rate for Type II hoods shall comply with Table 507.2.2.1. The duty level for the hood shall be the duty level of the appliance that has the highest (heaviest) duty level of all of the appliances that are installed underneath the hood according to Table 507.2.2. The net exhaust flow rate is the exhaust flow rate for a hood, minus any internal discharge makeup air flow rate.

TABLE 507.2.2.1:
TYPE II HOOD MINIMUM NET EXHAUST AIRFLOW RATES

Type of Hood	**Minimum Net Exhaust Flow Rate per Linear Hood Length in cfm/ft (L/s/m)**	
	Light Duty Equipment	**Medium Duty Equipment**
Wall-mounted Canopy	200 (310)	300 (465)

Delete definitions as follows:

~~LIGHT-DUTY COOKING APPLIANCE~~
~~MEDIUM DUTY COOKING APPLIANCE~~
~~HEAVY-DUTY COOKING APPLIANCE~~
~~EXTRA-HEAVY-DUTY COOKING APPLIANCE~~

Reason: The changes presented here reflect ASHRAE Standard 154-2011. Unlisted Type I hoods have been eliminated – the reasons for this change are that Type 1 hoods have been tested for the ability to structurally not warp or fail when subjected to grease fires as well as listed hoods tend to be more energy efficient than unlisted Type I hoods. Additionally Standard 154 has classified the duty-level required for both Type 1 and Type II hoods based on ASHRAE research projects. Additionally, Standard 154 has determined whether appliances need to be classified as unhooded, requiring Type 1 hoods or requiring Type II hoods.

Cost Impact: Requiring Type I hoods and showing which appliances can be unhooded does not have a cost for the operator. Both of these actually save significant amounts of energy (and costs) by reducing the amount of exhaust air required in kitchen spaced. Additionally there are cost savings in terms of reduced fan and duct sizes.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

507.2.1-M-FERGUSON.DOC

M106–12
507.2.1

Proponent: Roger Harper, Louisa County, VA, representing Va. Plumbing and Mechanical Inspectors Association (VPMIA), Va. Building Code Officials Association (VBCOA), and ICC Region VII (sharper@louisa.org) and Guy McMann MCP, Jefferson County Colorado, Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gmcmann@jeffco.us)

Revise as follows:

507.2.1 Type I hoods. Type I hoods shall be installed where cooking appliances produce grease or smoke. Type I hoods shall be installed over medium-duty, heavy-duty and extra-heavy-duty cooking appliances. ~~Type I hoods shall be installed over light-duty cooking appliances that produce grease or smoke.~~

Reason: This does nothing but create confusion for designers and code officials. By definition, light duty appliances cannot produce grease or smoke and there are no examples of what this is referring to. Does this apply to burnt toast? It's anybody's guess. If it can't be explained it should not be in the code.

Cost Impact: None

M106-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

507.2.1-M-HARPER-MCMANN.DOC

M107–12
507.2.1.1

Proponent: Steve Ferguson, American Society of Heating Refrigerating and Air-Conditioning Engineers (ASHRAE)

Revise as follows:

507.2.1.1 Operation. ~~Type I hood systems shall be designed and installed to automatically activate the exhaust fan whenever cooking operations occur. The activation of the exhaust fan shall occur through an interlock with the cooking appliances, by means of heat sensors or by means of other *approved* methods~~. <u>The exhaust fan serving a Type I hood shall have automatic controls that will activate the fan when any appliance that requires such Type I Hood is turned on, or a means of interlock shall be provided that will prevent operation of such appliances when the exhaust fan is not turned on. Where one or more temperature or radiant energy sensors are used to activate a Type I hood exhaust fan, the fan shall activate not more than 15-minutes after the first appliance, served by that hood, has been turned on.</u> A method of interlock between an exhaust hood system and appliances equipped with standing pilot burners shall not cause the pilot burners to be extinguished. A method of interlock between an exhaust hood system and cooking appliances shall not involve or depend upon any component of a fire extinguishing system.

Reason: Clarification that the exhaust fan interlock is to prevent appliance operation when the exhaust fan is not on instead of preventing operation of the exhaust fan when appliance is not on. Also to recognize exhaust systems that include multiple hoods and or hood sections with multiple exhaust fans. The intent is to provide exhaust for operating appliances only. If this can be achieved with only one of multiple fans in a system then there is no need to pay the energy penalty of turning the complete system on. Also recognition that many low energy input cooking appliances require a warm-up period before any cooking may take place.

Cost Impact: None. This is already a code requirement to ensure fan operation when the appliances are in operation.

M107-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

507.2.1.1-M-FERGUSON.DOC

M108–12
507.3

Proponent: Guy McMann, MCP, Jefferson County Colorado, Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

507.3 Fuel-burning appliances. ~~Where vented fuel-burning appliances are located in the same room or space as the hood, provisions shall be made to prevent the hood system from interfering with normal operation of the appliance vents.~~ Fuel burning appliances located in the same room or space as a Type-I or Type-II hood and not located beneath the hood shall be direct-vent appliances.

Reason: 507.3 only states that "provisions" need to be made when dealing with non-direct vent appliances but provides no guidance as to what's really required or intended. This creates confusion for the user. Non-direct vent appliances and those with draft hoods are subject to many factors, one of which is a loss in building pressure which will result in improper venting and spilling flue gases back into the space. These appliances are also in competition for air with other appliances and are no match for powered exhaust equipment such as hoods. The kitchen environment lends itself to negative pressure either by design or by accident. A perfectly balanced system usually doesn't last long as every minute detail affects the system. Limiting fuel burning appliances to direct-vent removes the risk of spillage, providing a safe environment for line staff, regardless of the kitchen pressure.

Cost Impact: This may increase cost.

M108-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

507.3-M-MCMANN.DOC

M109–12
507.3 (NEW)

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Add new text as follows:

507.3 Fuel-burning appliances. Vented fuel-burning appliances of other than the direct-vent type shall not be located in the same room as a kitchen exhaust hood and shall not be located in a room that opens directly into a room containing a kitchen exhaust hood.

Reason: Current Section 507.3 is very vague and provides no course of action to prevent the problem. Traditionally, this negative pressure problem has been corrected by either using direct-vent appliances or by simply not installing appliances in the same room as the hood system.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: This proposal will increase the cost of construction.

507.3-M-STRAUSBAUGH.PMGCAC.DOC

M110–12
507.11

Proponent: Jay Parikh, P.E., Compliance Solutions International Inc., representing himself

Revise as follows:

507.11 Grease filters. Type I hoods shall be equipped with grease filters listed and labeled in accordance with UL 1046 ~~and designed for the specific purpose~~. Grease~~-collecting *equipment*~~ filters shall be provided with access for cleaning or replacement. The lowest edge of a grease filter located above the cooking surface shall be not less than the height specified in Table 507.11.

Reason: (1) The grease filter listed and labeled in accordance with UL 1046 is designed for the specific purpose of using it in Type I hoods in commercial cooking operations. Hence, the phrase "and designed for the specific purpose" is not needed. This phrase is a carry-over from the earlier editions of this code, when the filter listing in accordance with UL 1046 was not required. (2) "Grease filter" is a better and more appropriate term instead of the term "Grease collecting equipment" to refer to these filters, as used in the heading of this section and also in other two sentences in this section, and hence "Grease filter" should be used in the second sentence as well. (3) Some grease filters available today are not to be cleaned, but are to be disposed of when loaded with grease, and replaced with new filters. The proposed change in the second sentence addresses such filters.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

507.11.1-M-PARIKH.DOC

M112–12
508.1.2 (NEW)

Proponent: Steve Ferguson, American Society of Heating Refrigerating and Air-Conditioning Engineers

Add new text as follows:

<u>**508.1.2 Air balance**. Design plans for a facility with a commercial kitchen ventilation system shall include a schedule or diagram indicating the design outdoor air balance. The design outdoor air balance shall indicate all exhaust and replacement air for the facility, plus the net exfiltration if applicable. The total replacement air airflow rate shall equal the total exhaust airflow rate plus the net exfiltration.</u>

Reason: The proposed text is consistent with ASHRAE 154 and the IMC is currently silent on this issue.

Cost Impact: This will not increase the cost of construction.

M112-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

508.1.2(NEW)-M-FERGUSON.DOC

M113–12
510.4, 510.5

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

510.4 Independent system. Hazardous exhaust systems shall be independent of other types of exhaust systems. ~~Incompatible materials, as defined in the *International Fire Code*, shall not be exhausted through the same hazardous exhaust system. Hazardous exhaust systems shall not share common shafts with other duct systems, except where such systems are hazardous exhaust systems originating in the same fire area.~~

> ~~**Exception:** The provision of this section shall not apply to laboratory exhaust systems where all of the following conditions apply:~~
>
> 1. ~~All of the hazardous exhaust ductwork and otherlaboratory exhaust within both the occupied space and the shafts are under negative pressure while in operation.~~
> 2. ~~The hazardous exhaust ductwork manifolded together within the occupied space must originate within the same fire area.~~
> 3. ~~Each control branch has a flow regulating device.~~
> 4. ~~Perchloric acid hoods and connected exhaust shall be prohibited from manifolding.~~
> 5. ~~Radioisotope hoods are equipped with filtration and/ or carbon beds where required by the *registered design professional*.~~
> 6. ~~Biological safety cabinets are filtered.~~
> 7. ~~Provision is made for continuous maintenance of negative static pressure in the ductwork. Contaminated air shall not be recirculated to occupiable areas. Air containing explosive or lammable vapors, fumes or dusts; flammable, highly toxic or toxic gases; or radioactive material shall be considered to be contaminated.~~

510.5 Incompatible materials and common shafts. Incompatible materials, as defined in the *International Fire Code*, shall not be exhausted through the same hazardous exhaust system. Hazardous exhaust systems shall not share common shafts with other duct systems, except where such systems are hazardous exhaust systems originating in the same fire area.

> **Exception:** The provisions of this section shall not apply tolaboratory exhaust systems where all of the following conditions apply:
>
> 1. All of the hazardous exhaust ductwork and other laboratory exhaust within both the occupied space and the shafts are under negative pressure while in operation.
> 2. The hazardous exhaust ductwork manifolded together within the occupied space must originate within the same fire area.
> 3. Each control branch has a flow regulating device.
> 4. Perchloric acid hoods and connected exhaust shall be prohibited from manifolding.
> 5. Radioisotope hoods are equipped with filtration and/or carbon beds where required by the *registered design professional*.
> 6. Biological safety cabinets are filtered.
> 7. Provision is made for continuous maintenance of negative static pressure in the ductwork.

Contaminated air shall not be recirculated to occupiable areas. Air containing explosive or flammable vapors, fumes or dusts; flammable, highly toxic or toxic gases; or radioactive material shall be considered to be contaminated.

Reason: The exception to Section 510.4 states that the provision (singular) of this section does not apply if the 7 items are met. Which provision of the three provisions in the main section is being exempted? While it appears that this was meant to apply only to the 2nd and 3rd sentences, it actually applies to the entire section. It makes no sense for the exception to negate the 1st sentence of the main section. Hazardous exhaust must always be independent of other types of exhaust.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

510.4.#2-M-STRAUSBAUGH.PMGCAC.DOC

M114–12
510.4

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

510.4 Independent system. Hazardous exhaust systems shall be independent of other types of exhaust systems. Incompatible materials, as defined in the *International Fire Code*, shall not be exhausted through the same hazardous exhaust system. Hazardous exhaust systems shall not share common shafts with other duct systems, except where such systems are hazardous exhaust systems originating in the same fire area.

Exception: The provision of this section shall not apply to laboratory exhaust systems where all of the following conditions apply:

1. All of the hazardous exhaust ductwork and other laboratory exhaust within both the occupied space and the shafts are under negative pressure while in operation.
2. The hazardous exhaust ductwork manifolded together within the occupied space must originate within the same fire area.
3. Each control branch has a flow regulating device.
4. Perchloric acid hoods and connected exhaust shall be prohibited from manifolding.
5. Radioisotope hoods are equipped with filtration and/or carbon beds where required by the *registered design professional*.
6. Biological safety cabinets are filtered.
7. Provision is made for continuous maintenance of negative static pressure in the ductwork.

~~Contaminated air shall not be recirculated to occupiable areas. Air containing explosive or flammable vapors, fumes or dusts; flammable, highly toxic or toxic gases; or radioactive material shall be considered to be contaminated.~~

Reason: Section 510.4, the last paragraph, conflicts with section 501.3 by implying that hazardous exhaust can be recirculated if cleaned somehow. It was never the intent to allow hazardous exhaust under Section 510 to be recirculated because the complexity of the exhaust is such that effective filtering cannot be prescribed in most cases and because it poses unacceptable risk to the occupants. Filter maintenance is also a major concern. Hazardous exhaust should always discharge to the outdoors, as was intended by this section.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None.

510.4#4-M-STRAUSBAUGH.PMGCAC.DOC

M115–12
510.4

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

510.4 Independent system. Hazardous exhaust systems shall be independent of other types of exhaust systems. Incompatible materials, as defined in the *International Fire Code*, shall not be exhausted through the same hazardous exhaust system. Hazardous exhaust systems shall not share common shafts with other duct systems, except where such systems are hazardous exhaust systems originating in the same fire area.

> **Exception:** The provision of this section shall not apply to laboratory exhaust systems where all of the following conditions apply:
>
> 1. All of the hazardous exhaust ductwork and other laboratory exhaust within both the occupied space and the shafts are under negative pressure while in operation.
> 2. The hazardous exhaust ductwork manifolded together ~~within the occupied space~~ must originate within the same fire area.
> 3. Each control branch has a flow regulating device.
> 4. Perchloric acid hoods and connected exhaust shall be prohibited from manifolding.
> 5. Radioisotope hoods are equipped with filtration and/or carbon beds where required by the *registered design professional*.
> 6. Biological safety cabinets are filtered.
> 7. Provision is made for continuous maintenance of negative static pressure in the ductwork.

Contaminated air shall not be recirculated to occupiable areas. Air containing explosive or flammable vapors, fumes or dusts; flammable, highly toxic or toxic gases; or radioactive material shall be considered to be contaminated.

Reason: The words "**in the occupied space**" have led to interpretation issues. Such words beg the question of what the code intends if the ducts are manifolded in an **unoccupied** space. The code is conspicuously silent on this question. If the intent is to prevent the spread of fire, smoke and hazardous contaminants from one fire area to another, the location of the manifold is irrelevant. Any manifold, regardless of location, would link the ducts and, in turn, link the fire areas in which they originate.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. 510.4#3-M-STRAUSBAUGH.PMGCAC.DOC

M116–12
510.4, 510.5

Proponent: Jeremy Lebowitz, P.E., Rolf Jensen & Associates, Inc., representing himself (jlebowitz@rjagroup.com)

Revise as follows:

510.4 Independent system. Hazardous exhaust systems shall be independent of other types of exhaust systems. Incompatible materials, as defined in the *International Fire Code*, shall not be exhausted through the same hazardous exhaust system. Hazardous exhaust systems shall not share common shafts with other duct systems, except where such systems are hazardous exhaust systems originating in the same fire area.

Exception: The provision of this section shall not apply to laboratory exhaust systems where all of the following conditions apply:

1. All of the hazardous exhaust ductwork and other laboratory exhaust within both the occupied space and the shafts are under negative pressure while in operation.
2. The hazardous exhaust ductwork manifolded together within the occupied space must originate within the same fire area.
3. <u>Hazardous exhaust ductwork originating in different fire areas and manifolded together in an unoccupied common shaft shall meet the provisions of Section 717.5.3, Exception 1.1 of the *International Building Code*.</u>
4. Each control branch has a flow regulating device.
5. Perchloric acid hoods and connected exhaust shall be prohibited from manifolding.
6. Radioisotope hoods are equipped with filtration and/or carbon beds where required by the *registered design professional*.
7. Biological safety cabinets are filtered.
8. Provision is made for continuous maintenance of negative static pressure in the ductwork.

<u>**510.5 Contaminated air.**</u> Contaminated air shall not be recirculated to occupiable areas. Air containing explosive or flammable vapors, fumes or dusts; flammable, highly toxic or toxic gases; or radioactive material shall be considered to be contaminated.

(Renumber subsequent sections)

Reason: Non-laboratory hazardous exhaust is already permitted to be manifolded together in a common exhaust duct when originating from the same fire area. IMC 510.4 Exception addresses ducts acting as a direct link between different fire areas through the requirement for continuous negative pressure within the duct. The manifold location is relevant as the amount of dilution inside the shaft is far greater than outside of it. IMC 510.4 Exception should allow manifolding of hazardous exhaust ducts from different fire areas within shafts. Fire dampers are prohibited at the shaft penetration, but alternative protection can and should be provided via subducts. 2012 IBC 717.5.3 Exception 1.1 allows 22-inch subducts with continuous upward airflow in lieu of fire dampers at shaft penetrations. This code approach suggests that a subduct with continuous airflow prevents contaminants from spreading between fire areas and justifies the manifolding of hazardous laboratory exhaust from separate fire areas within shafts.

Additionally, the requirements after the exception (new section 510.5) should be broken out into a separate code section to clearly show that they apply to all hazardous exhaust systems, including laboratory exhaust systems meeting the requirements of the exception.

Cost Impact: The code change will not increase the cost of construction, as it would generally permit the use of fewer shafts throughout a given building.

M116-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

510.4-M-LEBOWITZ

M117–12
510.4

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

Independent system. Hazardous exhaust systems shall be independent of other types of exhaust systems. Incompatible materials, as defined in the *International Fire Code*, shall not be exhausted through the same hazardous exhaust system. Hazardous exhaust systems shall not share common shafts with other duct systems, except where such systems are hazardous exhaust systems originating in the same fire area.

Exceptions: The provision of this section shall not apply to laboratory exhaust systems where all of the following conditions apply:

1. All of the hazardous exhaust ductwork and other laboratory exhaust within both the occupied space and the shafts are under negative pressure while in operation.
2. The hazardous exhaust ductwork manifolded together within the occupied space must originate within the same fire area.
3. Each control branch has a flow regulating device.
4. Perchloric acid hoods and connected exhaust shall be prohibited from manifolding.
5. Radioisotope hoods are equipped with filtration and/ or carbon beds where required by the *registered design professional*.
6. Biological safety cabinets are filtered.
7. ~~Provision is made for continuous maintenance of negative static pressure in the ductwork.~~ Each hazardous exhaust duct system shall be served by redundant exhaust fans that comply with either of the following:
   7.1 The fans shall operate simultaneously in parallel and each fan shall be individually capable of providing the required exhaust rate.
   7.2 Each of the redundant fans is controlled so as to operate when the other fan has ailed or is shut down for servicing.

(Portions of text not shown remain unchanged.)

Reason: Section 510.4, exception item #7 says nothing about how the intent is to be accomplished. Does this imply standby power, redundant fans, both? Code change M55-03/04 that put this text in the code suggests that the intent was to require redundant exhaust fans in case one fan fails or needs to be serviced.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: This proposal will increase the cost of construction.

510.4 #1-M-STRAUSBAUGH.PMGCAC.DOC

M118–12
510.5.5

Proponent: Dustin McLehaney, Chesterfield County, VA, Va. Plumbing and Mechanical Inspectors Association (VPMIA) And Va. Building Code Officials Association (VBCOA) and Guy McMann, MCP, Jefferson County Colorado, Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

510.5.5 Makeup air. Makeup air shall be provided at a rate approximately equal to the rate that air is exhausted by the hazardous exhaust system. Makeup-air intakes shall be located ~~so as to avoid recirculation of contaminated air.~~ in accordance with Section 401.4.

Reason:
McLehaney-This is editorial in nature. It removes ineffective language ("avoid") and references the appropriate code section for intakes opening locations.
McMann- This is editorial in nature and referencing the Section for intakes provides all the requirements for intake openings instead of merely addressing recirculation generically.

Cost Impact: None

M118-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

510.5.5-M-MCLEHANEY.DOC

M119–12
510.6.1.1(NEW)

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Add new text as follows:

<u>**510.6.1.1** Hazardous exhaust ducts that penetrate fire-resistance-rated shafts shall comply with Section 714.3.1 or 714.3.1.2 of the International Building Code.</u>

Reason: Section 510.6 prohibits Fire/Smoke dampers in hazardous exhaust ducts but section 607.5.5 says the opposite. Section 510.6.2 addresses floor/ceiling assemblies. Section 510.3 addresses fire-resistance-rated wall assemblies. Section 510.6.4 addresses fire walls. The code is silent on penetration of fire rated shaft walls.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: This proposal will increase the cost of construction.

	Assembly:	ASF	AMF	DF

510.6.1.1-M-STRAUSBAUGH.PMGCAC.DOC

M120–12
510.8

Proponent: Marcelo M. Hirschler, GBH International (gbhint@aol.com)

Delete and substitute as follows:

~~**510.8 Duct construction.** Ducts used to convey hazardous exhaust shall be constructed of *approved* G90 galvanized sheet steel, with a minimum nominal thickness as specified in Table 510.8. Nonmetallic ducts used in systems exhausting nonflammable corrosive fumes or vapors shall be *listed* and *labeled*. Nonmetallic ducts shall have a flame spread index of 25 or less and a smoke-developed index of 50 or less, when tested in accordance with ASTM E 84 or UL 723. Ducts shall be *approved* for installation in such an exhaust system. Where the products being exhausted are detrimental to the duct material, the ducts shall be constructed of alternative materials that are compatible with the exhaust.~~

510.8 Duct construction. Ducts used to convey hazardous exhaust shall be constructed of materials *approved* for installation in such an exhaust system and shall comply with one of the following:

1. Ducts shall be constructed of *approved* G90 galvanized sheet steel, with a minimum nominal thickness as specified in Table 510.8.
2. Ducts used in systems exhausting nonflammable corrosive fumes or vapors shall be constructed of nonmetallic materials that exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E84 or UL 723 or that are *listed* and *labeled* for the application.
3. Where the products being exhausted are detrimental to the duct material, the ducts shall be constructed of alternative materials that are compatible with the exhaust.

Reason: This is simply editorial cleanup. The present section seems to suggest, in the first sentence, that the ducts must be constructed of galvanized sheet steel, something which the second sentence contradicts. Any material used for construction of hazardous exhaust ducts needs to be approved for the system.

Cost Impact: None

M121–12
511.3.1(NEW), 511.3.2(NEW), 511.3.3(NEW)

Proponent: Tom Allen, representing himself

Add new text as follows:

511.3.1 Ambient Temperature Noncombustible Materials. Ducts conveying noncombustible materials at ambient temperatures shall have a clearance of not less than 1/2 inch from combustible construction and a clearance not less than of 6 inches to stored combustible materials.

511.3.2 Ambient Temperature Combustible Materials. Ducts conveying combustible materials at ambient temperature shall have a clearance of not less than 18 inches from combustible construction and combustible materials.

Exceptions:

1. The required clearance shall be 6 inches from combustible materials and 1/2 inch from combustible construction where the duct system is provided for the specific hazard.
2. Where the combustible material is protected in accordance with Table M308.6. the clearances between ducts and combustible materials shall be in accordance with that table.

511.3.3 Systems Operating at Temperatures Above 100ºF. Ducts conveying materials whose temperature exceeds 100ºF (37.7ºC) shall have clearances in accordance with Table M511.3.3. All ducts shall be lined with refractory materials if the temperature of the conveyed material exceeds 900º.

TABLE 511.3.3
CLEARANCES FOR DUCTS CONVEYING MATERIALS
TEMPERATURES EXCEEDING 100ºF

Product Temperature (In Duct)	Maximum Dimension of Duct (inches)	Minimum Clearance (inches)
101º-600	Up to and including 8 Over 8	8 12
601º-900º	Up to and including 8 Over 8	18 24
901º	All ducts shall be lined with refractory material	24

Reason: Adds requirements for clearances from ducts to combustible construction.

Cost Impact: There is a cost impact.

511.3(NEW)-M-ALLEN.DOC

M122–12
514.2

Proponent: Randall R. Dahmen, P.E. Wisconsin licensed Commercial Building Inspector, representing himself

Revise as follows:

514.2 Prohibited applications. Energy recovery ventilation systems shall not be used in the following systems:

1. Hazardous exhaust systems covered in Section 510.
2. Dust, stock and refuse systems that convey explosive or flammable vapors, fumes or dust.
3. Smoke control systems covered in Section 513.
4. Commercial kitchen exhaust systems serving Type I and Type II hoods.
5. Clothes dryer exhaust systems covered in Section 504.

   Exception: The use of an energy recovery ventilation system design is not prohibited for the applications listed herein provided that corrosion, heat, cross-contamination and fouling are addressed through an approved engineering analysis.

Reason: There are various types of energy recovery designs on the market that can adequately address various concerns involving corrosion, heat, cross-contamination and fouling. As currently written, the language in the IMC provides no exceptions. Clearly, any energy recovery system designated for use with any of the listed systems would need to be fully thought-out and specifically engineered for the proposed system. To completely eliminate the opportunity for an engineered design, also completely eliminates the opportunity for energy recovery. The proposed language provides the authority having jurisdiction the final say on the acceptability of the proposed system based on the engineering analysis provided at the specific site in question.

Cost Impact: The code change proposal will not increase the cost of construction.

M123–12
514.2

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

514.2 Prohibited applications. Energy recovery ventilation systems shall not be used in the following systems:

> **Exception:** The application of ERV equipment that recovers sensible heat only utilizing coil-type and fixed- plate heat exchangers shall not be limited by this section.

Portions not shown remain unchanged.

Reason: Section 514 limits the applications for ERV's and was focused on wheel- type heat exchanger units. Exemptions should apply for "run-around-coils", fixed plate heat exchangers and other non- latent energy types of ERV's. The ERV types in the exception cannot leak contaminants from one air stream to another, which was the concern of the original text. ERV's are in demand for some of these applications to meet the goals of energy and sustainability "green" codes, standards and rating systems.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. (steve.clark@aquathermpipe.com)

Revise as follows:

SECTION 602
PLENUMS

602.1 General. Supply, return, exhaust, relief and ventilation air <u>distribution systems shall be constructed in accordance with Section 603.</u> ~~plenums shall be limited to uninhabited crawl spaces, areas above a ceiling or below the floor, attic spaces and mechanical *equipment* rooms. Plenums shall be limited to one fire area. Fuel-fired appliances shall not be installed within a *plenum*.~~

~~**602.2 Construction.** *Plenum* enclosures shall be constructed of materials permitted for the type of construction classification of the building. The use of gypsum boards to form plenums shall be limited to systems where the air temperatures do not exceed 125ºF (52ºC) and the building and mechanical system design conditions are such that the gypsum board surface temperature will be maintained above the airstream dew-point temperature. Air plenums formed by gypsum boards shall not be incorporated in air-handling systems utilizing evaporative coolers.~~

~~**602.2.1 Materials within plenums.** Except as required by Sections 602.2.1.1 through 602.2.1.5, materials within plenums shall be noncombustible or shall be listed and labeled as having a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.~~

~~**Exceptions:**~~

1. ~~Rigid and flexible ducts and connectors shall conform to Section 603. 2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.~~
3. ~~This section shall not apply to materials exposed within plenums in one- and two-family dwellings.~~
4. ~~This section shall not apply to smoke detectors.~~
5. ~~Combustible materials fully enclosed within one of the following:~~
    - ~~5.1. Continuous noncombustible raceways orenclosures.~~
    - ~~5.2. Approved gypsum board assemblies.~~
    - ~~5.3. Materials listed and labeled for installation within a plenum.~~
6. ~~Materials in Group H, Division 5 fabrication areas and the areas above and below the fabrication area that share a common air recirculation path with the fabrication area.~~

~~**602.2.1.1 Wiring.** Combustible electrical wires and cables and optical fiber cables exposed within a plenum shall be listed as having a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 5 feet (1524 mm) or less when tested in accordance with NFPA 262 or shall be installed in metal raceways or metal sheathed cable. Combustible optical fiber and communication raceways exposed within a plenum shall be listed as having a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 5 feet (1524 mm) or less when tested in accordance with ANSI/UL 2024. Only plenum-rated wires and cables shall be installed in plenum-rated raceways. Electrical wires and cables, optical fiber cables and raceways addressed in this section shall be listed and labeled and shall be installed in accordance with NFPA 70.~~

~~**602.2.1.2 Fire sprinkler piping.** Plastic fire sprinkler piping exposed within a *plenum* shall be used only in wet pipe systems and shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1887. Piping shall be *listed* and *labeled*.~~

~~**602.2.1.3 Pneumatic tubing.** Combustible pneumatic tubing exposed within a *plenum* shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1820. Combustible pneumatic tubing shall be *listed* and *labeled*.~~

~~**602.2.1.4 Electrical equipment in plenums.** Electrical *equipment* exposed within a *plenum* shall comply with~~
~~Sections 602.2.1.4.1 and 602.2.1.4.2.~~

~~**602.2.1.4.1 Equipment in metallic enclosures.** Electrical *equipment* with metallic enclosures exposed within a *plenum* shall be permitted.~~

~~**602.2.1.4.2 Equipment in combustible enclosures.** Electrical *equipment* with combustible enclosures exposed within a *plenum* shall be *listed* and *labeled* for such use in accordance with UL 2043.~~

~~**602.2.1.5 Foam plastic insulation.** Foam plastic insulation used as interior wall or ceiling finish, or as interior trim, in plenums shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 and shall also comply with one or more of Sections 602.2.1.5.1, 602.2.1.5.2 and 602.2.1.5.3.~~

~~**602.2.1.5.1 Separation required.** The foam plastic insulation shall be separated from the plenum by a thermal barrier complying with Section 2603.4 of the *International Building Code* and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.~~

~~**602.2.1.5.2 Approval.** The foam plastic insulation shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use and shall meet the acceptance criteria of Section 803.1.2 of the *International*~~
~~*Building Code* when tested in accordance with NFPA 286.~~

~~The foam plastic insulation shall be approved based on tests conducted in accordance with Section 2603.10 of the *International Building Code*.~~

~~**602.2.1.5.3 Covering.** The foam plastic insulation shall be covered by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm) and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.~~

~~**602.3 Stud cavity and joist space plenums.** Stud wall cavities and the spaces between solid floor joists to be utilized asair plenums shall comply with the following conditions:~~

1. ~~Such cavities or spaces shall not be utilized as a *plenum* for supply air.~~
2. ~~Such cavities or spaces shall not be part of a required fire-resistance-rated assembly.~~
3. ~~Stud wall cavities shall not convey air from more than one floor level.~~
4. ~~Stud wall cavities and joist space plenums shall complywith the floor penetration protection requirements of the *International Building Code*.~~
5. ~~Stud wall cavities and joist space plenums shall be isolated from adjacent concealed spaces by *approved* fireblocking as required in the *International Building Code*.~~
6. ~~Studwall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.~~

~~**[B] 602.4 Flood hazard.** For structures located in flood hazard areas, plenum spaces shall be located above the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment or shall be designed and constructed to prevent water from entering or accumulating within the plenum spaces during floods up to such elevation. If the plenum spaces are located below the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment, they shall be capable of resisting hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding up to such elevation.~~

Reason: Purpose of Code Change – To improve the health and life safety of buildings by eliminating a major loophole that favors some HVAC systems over others.

Air plenums are often formed out of cavities within the building structure, under the assumption that eliminating ductwork saves some construction costs as well as engineering design time. This is a false economy and a poor and unsafe practice for a number of reasons:

1. Due to fires that have started or spread through plenums, numerous codes regulate the construction and materials allowed in plenums. These requirements to have everything from pipes and insulation to control wiring be “plenum rated” has driven up the costs of construction for many of the other trades on the project. These “plenum rated” materials often contain hazardous materials.
2. Plenum air systems are impossible to clean due to the type of construction and the wires, cables and pipes that are in the way. Since this is the air the occupants are breathing, this can lead to numerous health issues.
3. Plenum air systems can grow mold.

1. Plenum return air systems are not compatible with the use or return air grill filters, which keep the return air system cleaner.
2. Plenum air systems typically contain materials that can produce VOX gases that then end up in the air stream.
3. Plenum return air systems present a fire hazard, where fires can start or are drawn into, can quickly spread and are very difficult to fight.
4. The chemicals found in a plenum can produce deadly combustion gases during a fire and these deadly fumes can now be spread by the air system.
5. Plenums add considerable work load to the code enforcement community while offering no health or safety benefit.

Cost Impact: Any savings that could be gained by avoiding following the requirements for ducting air in Section 603, and instead following the loophole provided in section 602 only applies when the designer chooses to use Forced Air HVAC systems and chooses not to spend the time designing a return air system. Thermal transfer mediums other than air are for more compact and efficient at moving thermal energy around a building. (Water uses one tenth the transfer energy of air.) By hiding the cost of the forced air systems in the bids of other trades, the existing loophole acts as a misleading subsidy to forced air systems, making them appear less costly than they really are. This distorts the relative HVAC system economics, driving the market towards inefficient systems.

Most likely, the cost of buildings is far higher due to the use a plenums. Many non-HVAC building trades are impacted and forced to use more expensive materials and construction technics to meet the "plenum rated" requirements. While nearly impossible to calculate, it is doubtful that there is any net savings to the total project cost by having plenums.

There should be a substantial savings for the code enforcement community by eliminating the confusion and safety issues presented by the current loophole.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

602.1-M-CLARK.DOC

M126–12
602.1

Proponent: Guy McMann, MCP, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gmcmann@jeffco.us)

Revise as follows:

SECTION 602
PLENUMS

602.1 General. Supply, return, exhaust, relief and ventilation air plenums shall be limited to uninhabited crawl spaces, areas above a ceiling or below the floor, attic spaces and mechanical equipment rooms. Plenums shall be limited to one fire area. <u>Return and transfer air shall be ducted from the boundary of the fire area directly to the air handling equipment.</u> Fuel-fired appliances shall not be installed within a plenum**.**

Reason: It needs to be clarified that protected openings connecting one fire area to another are still linking the fire areas together regardless of whether a fire damper is installed in a fire barrier. There will still be a physical path for smoke to travel through even when the equipment has stopped in fire mode. Making it clear that this situation would require a direct ducted connection to the air handling equipment will be helpful to the user.

Cost Impact: None

602.1.#2-M-MCMANN.DOC

M127–12
602.1, 602.2.1, 602.3, 1104.4.3

Proponent: Guy McMann, MCP, Jefferson County Colorado, Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gmcmann@jeffco.us)

Revise as follows:

SECTION 602
PLENUMS

602.1 General Supply, return, exhaust, relief and ventilation air plenums shall be limited to <u>under floor spaces in computer rooms, shafts</u> ~~uninhabited crawl spaces, areas above a ceiling or below the floor, attic spaces~~ and mechanical equipment rooms. <u>HVAC systems in other spaces shall be ducted.</u> Plenums shall be limited to one fire area. Fuel-fired appliances shall not be installed within a plenum

602.2.1 Materials within plenums. Except as required by sections 602.2.1.1 through 602.2.1.5, materials within plenums shall be noncombustible or shall be listed and labeled as having a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within one of the following:
   5.1. Continuous noncombustible raceways or enclosures.
   5.2. Approved gypsum board assemblies.
   5.3. Materials listed and labeled for installation within a plenum.
6. ~~Materials in Group H, Division 5 fabrication areas and the areas above and below the fabrication area that share a common air recirculation path with the fabrication area.~~

~~**602.3 Stud cavity and joist space plenums** Stud wall cavities and the spaces between solid floor joists to be utilized as air plenums shall comply with the following conditions:~~

1. ~~Such cavities or spaces shall not be utilized as a plenum for supply air.~~
2. ~~Such cavities or spaces shall not be part of a required fire-resistance-rated assembly.~~
3. ~~Stud wall cavities shall not convey air from more than one floor level.~~
4. ~~Stud wall cavities and joist space plenums shall comply with the floor penetration protection requirements of the International Building Code.~~
5. ~~Stud wall cavities and joist space plenums shall be isolated from adjacent concealed spaces by approved fireblocking as required in the International Building Code.~~
6. ~~Studwall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.~~

~~**1104.4.3 Plenums**. Where the space above a suspended ceiling is continuous and part of the supply or return air plenum system, this space shall be included in calculating the volume of the enclosed space.~~

Reason: As a result of the direction the Energy code is taking us, its time for building cavities to stop being utilized as return air plenums. Ducting the returns eliminates many problems as plenum ceiling over time become contaminated with dirt and other impurities contributing to sick building syndrome.

- Insulation cannot be effectively cleaned.

- A ducted system can be cleaned and is efficient where a ceiling really cannot be effectively cleaned.
- There are friable material issues that may lead to health problems.
- Air admittance valves could be installed in all ceilings.
- Ducts can be sealed, cleaned and tested.
- Return air temperatures can be kept down without the light and roof heat load.
- The plenum construction might not need to be as tight.
- Balancing issues exist due to low return air pressure path that doesn't effectively pull the air from rooms and make its way back to the fan.
- Mold spores can be transported from above ceiling wet area such as condensate pans, ceiling tiles, leaky pipe or utility chases, general water damage, etc. that could create a microbial habitat. This proposal limits plenums to shafts, equipment rooms and computer rooms as equipment in computer rooms are specifically designed to be used in conjunction with built up floors. This will still permit shafts in office buildings to still be employed as return air plenums and sub duct systems would not be affected either. Many systems are designed to eliminate plenums and those designs would not be affected but there could be cost increase for the balance. Eliminating 99% of plenums greatly simplifies the inspection and plan review process. Stricken language will not be required if ceiling plenums are prohibited. The elimination of the majority of plenums will need to be approved in the Mechanical Code before the other codes can be modified.

Cost Impact: This proposal may increase cost.

M127-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

602.1#1-M-MCMANN.DOC

M128–12
602.1

Proponent: Gary Kreutziger,M.C.P., City of San Antonio, representing Gary Kreutziger (gkreutziger@sanantonio.gov)

Revise as follows:

602.1 General. Supply, return, exhaust, relief and *ventilation air* plenums shall be limited to uninhabited crawl spaces, areas above a ceiling or below the floor, attic spaces and mechanical *equipment* rooms. Plenums shall be limited to one fire area <u>and one smoke compartment</u>. Fuel-fired appliances shall not be installed within a *plenum*.

Reason: With the principal cause of death in fire victims being carbon monoxide poisoning followed by carbon dioxide poisoning and/or oxygen deficiency, it should be a code priority to limit the ability for smoke to migrate from one smoke compartment to another smoke compartment. But the code does not prioritize smoke migration in the same way it does fire migration. In the same manner that fire is restricted from migrating from one fire area to another fire area by limiting plenums to one fire area, so should smoke be restricted from migrating from one smoke compartment to another smoke compartment. Transfer openings in fire barriers are required to have fire dampers and transfer openings in smoke barriers are required to have smoke dampers, however, this is where the similarity stops. If plenums are limited to one fire area, then why not also to one smoke compartment, since smoke is the principal cause of death in fire victims?

Cost Impact: The code change proposal will not increase the cost of construction.

602.1#2-M-KREUTZIGER.DOC

M129–12
202, Section 602

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Add new definition as follows:

<u>**NON-DISCRETE PRODUCT.** Products such as conduit, cable and plastic piping systems that are tested in accordance with ASTM E84 or UL 723.</u>

Delete and substitute as follows:

~~SECTION 602~~
~~PLENUMS~~

~~**602.1 General.** Supply, return, exhaust, relief and *ventilation air* plenums shall be limited to uninhabited crawl spaces, areas above a ceiling or below the floor, attic spaces and mechanical *equipment* rooms. Plenums shall be limited to one fire area. Fuel-fired appliances shall not be installed within a *plenum*.~~

~~**602.2 Construction.** *Plenum* enclosures shall be constructed of materials permitted for the type of construction classification of the building.~~

~~The use of gypsum boards to form plenums shall be limited to systems where the air temperatures do not exceed 125ºF (52ºC) and the building and mechanical system design conditions are such that the gypsum board surface temperature will be maintained above the airstream dew-point temperature. Air plenums formed by gypsum boards shall not be incorporated in air-handling systems utilizing evaporative coolers.~~

~~**602.2.1 Materials within plenums.** Except as required by Sections 602.2.1.1 through 602.2.1.5, materials within plenums shall be noncombustible or shall be listed and labeled as having a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.~~

~~Exceptions:~~

1. ~~Rigid and flexible ducts and connectors shall conform to Section 603.~~
2. ~~Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.~~
3. ~~This section shall not apply to materials exposed within plenums in one- and two-family dwellings.~~
4. ~~This section shall not apply to smoke detectors.~~
5. ~~Combustible materials fully enclosed within one of the following:~~
   - ~~5.1. Continuous noncombustible raceways or enclosures.~~
   - ~~5.2. Approved gypsum board assemblies.~~
   - ~~5.3. Materials listed and labeled for installation within a plenum.~~
6. ~~Materials in Group H, Division 5 fabrication areas and the areas above and below the fabrication area that share a common air recirculation path with the fabrication area.~~

~~**602.2.1.1 Wiring.** Combustible electrical wires and cables and optical fiber cables exposed within a plenum shall be listed as having a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 5 feet (1524 mm) or less when tested in accordance with NFPA 262 or shall be installed in metal raceways or metal sheathed cable. Combustible optical fiber and communication raceways exposed within a plenum shall be listed as having a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 5 feet (1524 mm) or less when tested in accordance with ANSI/UL 2024. Only plenum-rated wires and cables shall be installed in plenum-rated raceways. Electrical wires and cables, optical fiber cables and raceways addressed in this section shall be listed and labeled and shall be installed in accordance with NFPA 70.~~

~~**602.2.1.2 Fire sprinkler piping.** Plastic fire sprinkler piping exposed within a *plenum* shall be used only in wet pipe systems and shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1887. Piping shall be *listed* and *labeled*.~~

~~**602.2.1.3 Pneumatic tubing.** Combustible pneumatic tubing exposed within a *plenum* shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1820. Combustible pneumatic tubing shall be *listed* and *labeled*.~~

~~**602.2.1.4 Electrical equipment in plenums.** Electrical *equipment* exposed within a *plenum* shall comply with Sections 602.2.1.4.1 and 602.2.1.4.2.~~

~~**602.2.1.4.1 Equipment in metallic enclosures.**Electrical *equipment* with metallic enclosures exposed within a *plenum* shall be permitted.~~

~~**602.2.1.4.2 Equipment in combustible enclosures.**Electrical *equipment* with combustible enclosures exposed within a *plenum* shall be *listed* and *labeled* for such use in accordance with UL 2043.~~

~~**602.2.1.5 Foam plastic insulation.** Foam plastic insulation used as interior wall or ceiling finish, or as interior~~
~~trim, in plenums shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 and shall also comply with one or more of Sections 602.2.1.5.1, 602.2.1.5.2 and 602.2.1.5.3.~~

~~**602.2.1.5.1 Separation required.** The foam plastic insulation shall be separated from the plenum by a thermal barrier complying with Section 2603.4 of the *International Building Code* and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.~~

~~**602.2.1.5.2 Approval.** The foam plastic insulation shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use and shall meet the acceptance criteria of Section 803.1.2 of the *International Building Code* when tested in accordance with NFPA 286.~~

~~The foam plastic insulation shall be approved based on tests conducted in accordance with Section 2603.10 of the *International Building Code*.~~

~~**602.2.1.5.3 Covering.** The foam plastic insulation shall be covered by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm) and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.~~

~~**602.3 Stud cavity and joist space plenums.** Stud wall cavities and the spaces between solid floor joists to be utilized as air plenums shall comply with the following conditions:~~

1. ~~Such cavities or spaces shall not be utilized as a *plenum* for supply air.~~
2. ~~Such cavities or spaces shall not be part of a required fire-resistance-rated assembly.~~
3. ~~Stud wall cavities shall not convey air from more than one floor level.~~
4. ~~Stud wall cavities and joist space plenums shall comply with the floor penetration protection requirements of the *International Building Code*.~~
5. ~~Stud wall cavities and joist space plenums shall be isolated from adjacent concealed spaces by *approved* fireblocking as required in the *International Building Code*.~~
6. ~~Studwall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.~~

~~**[B] 602.4 Flood hazard.** For structures located in flood hazard areas, plenum spaces shall be located above the elevation required by Section 1612 of the *International Building Code* for utilities and attendant~~

~~equipment or shall be designed and constructed to prevent water from entering or accumulating within the plenum spaces during floods up to such elevation.~~

~~If the plenum spaces are located below the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment, they shall be capable of resisting hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding up to such elevation.~~

602.1 General. Supply, return, exhaust, relief and ventilation air plenums shall be limited to uninhabited crawl spaces, areas above a ceiling or below the floor, attic spaces and mechanical equipment rooms. Plenums shall be limited to one fire area. Fuel-fired appliances shall not be installed within a plenum.

602.2 Construction. Plenum enclosures shall be constructed of materials permitted for the type of construction classification of the building.

The use of gypsum boards to form plenums shall be limited to systems where the air temperatures do not exceed 125ºF (52ºC) and the building and mechanical system design conditions are such that the gypsum board surface temperature will be maintained above the airstream dew-point temperature. Air plenums formed by gypsum boards shall not be incorporated in air-handling systems utilizing evaporative coolers.

602.3 Materials installed within plenums. Sections 602. 3.1 through 602.3.8 shall apply to materials exposed within plenums. Such sections shall not apply to the following:

1. Dwelling units.
2. Smoke detectors.
3. Combustible materials fully enclosed within continuous noncombustible raceways or enclosures, gypsum board or other assembly meeting the fire resistive requirements of the building type of construction.
4. Materials in Group H, Division 5 fabrication areas and the areas above and below the fabrication area that share a common air recirculation path with the fabrication area.

602.3.1 Rigid and flexible ducts and connectors. Rigid and flexible ducts and connectors shall conform to Section 603.

602.3.2 Duct coverings, linings, tape and connectors. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.

602.3.3 Combustible Wiring. Combustible electrical wires and cables and optical fiber cables exposed within a plenum shall be listed as having a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 5 feet (1524 mm) or less when tested in accordance with NFPA 262 or shall be installed in metal raceways or metal sheathed cable. Combustible optical fiber and communication raceways exposed within a plenum shall be listed as having a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 5 feet (1524 mm) or less when tested in accordance with ANSI/UL 2024. Only plenum-rated wires and cables shall be installed in plenum-rated raceways. Electrical wires and cables, optical fiber cables and raceways addressed in this section shall be listed and labeled and shall be installed in accordance with NFPA 70.

602.3.4 Combustible fire sprinkler piping. Combustible fire sprinkler piping exposed within a plenum shall be used only in wet pipe systems and shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1887.

602.3.5 Combustible pneumatic tubing. Combustible pneumatic tubing exposed within a plenum shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1820.

602.3.6 Electrical equipment in plenums. Electrical equipment exposed within a plenum shall be enclosed within metallic enclosures or shall meet the requirements of UL 2043.

602.3.7 Foam plastic insulation. Foam plastic insulation used as interior wall or ceiling finish, or as interior trim, in plenums shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 and shall also comply with one or more of the following:

1. The foam plastic insulation shall be separated from the plenum by a thermal barrier complying with Section 2603.4 of the International Building Code and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.
2. The foam plastic insulation shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use and shall meet the acceptance criteria of Section 803.1.2 of the International Building Code when tested in accordance with NFPA 286. The foam plastic insulation shall be approved based on tests conducted in accordance with Section 2603.10 of the International Building Code .
3. The foam plastic insulation shall be covered by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm) and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.

602.3.8 Non-discrete products. *Non-discrete products* not addressed in Sections 602.3.1 through 602.3.7 installed within plenums shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Reason: This section was reorganized to eliminate a format having several exceptions. New text was added to cover what was addressed in the current Section 602.2.1, which was, in essence, what the industry refers to as non–discrete products that can be tested to ASTM E 84 or UL 723.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

202-NON-DISCRETE PRODUCT-M-STRAUSBAUGH.PMGCAC.DOC

M130–12
602.2

Proponent: Marcelo M. Hirschler, GBH International and Robert J Davidson, Davidson Code Concepts (gbhint@aol.com)

Revise as follows:

602.2 Construction. *Plenum* enclosures shall be constructed of materials that comply with the requirements of section 703.5 of the *International Building Code* or of materials that have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723 ~~permitted for the type of construction classification of the building~~. The use of gypsum boards to form plenums shall be limited to systems where the air temperatures do not exceed 125ºF (52ºC) and the building and mechanical system design conditions are such that the gypsum board surface temperature will be maintained above the airstream dew-point temperature. Air plenums formed by gypsum boards shall not be incorporated in air-handling systems utilizing evaporative coolers.

Reason: All the materials contained within a plenum must be noncombustible or have a flame spread index of not more than 25 and a smoke developed index of not more than 50, except for a series of materials that meet their own special tests. The materials of construction of the plenum itself need to meet similar requirements. The IMC section is shown below.

> **602.2.1 Materials within plenums**. Except as required by Sections 602.2.1.1 through 602.2.1.6, materials within plenums shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Plenums should not be allowed to be constructed simply of combustible materials (for example plain wood) because if the plenum enclosures can be made of wood, any fire would be able to spread along the walls of the plenum (wood typically has a flame spread index of up to 200) even with the best materials contained within the plenum.

During the last cycle proposal M88 introduced this issue but the technical committee was concerned that the proposal was placed in the wrong location because the requirements were placed in section 602.2.1 and they conflicted with the requirements of section 602.2 which would appear to allow plenum enclosures to be constructed of wood or other combustible building materials.

Requiring that a material be noncombustible in accordance with Section 703.5 of the IBC is much less onerous than simply requiring it to be noncombustible because composite materials are actually permitted to be “somewhat combustible” in accordance with 703.5.2 and only “elementary materials” are required to be strictly noncombustible. In particular section 703.5.2 of the IBC is intended to allow gypsum board to be classified as noncombustible, and, therefore, this avoids a conflict with the remainder of section 602.2 that allows gypsum board into certain plenums.

Section 703.5 of the IBC reads as follows:

703.5 Noncombustibility tests. *The tests indicated in Sections 703.5.1 and 703.5.2 shall serve as criteria for acceptance of building materials as set forth in Sections 602.2 602.3 and 602.4 in Type I, II, III and IV construction. The term “noncombustible” does not apply to the flame spread characteristics of interior finish or trim materials. A material shall not be classified as a noncombustible building construction material if it is subject to an increase in combustibility or flame spread beyond the limitations herein established through the effects of age, moisture or other atmospheric conditions.*
703.5.1 Elementary materials. *Materials required to be noncombustible shall be tested in accordance with ASTM E 136.*
703.5.2 Composite materials. *Materials having a structural base of noncombustible material as determined in accordance with Section 703.5.1 with a surfacing not more than 0.125 inch (3.18 mm) thick that has a flame spread index not greater than 50 when tested in accordance with ASTM E 84 or UL 723 shall be acceptable as noncombustible materials.*

The revised language proposed for the IMC takes care of the problem of using highly combustible materials to construct plenums by requiring that plenum enclosures be constructed of noncombustible materials (in accordance with section 703.5 of the IBC, which includes gypsum board) or of materials that meet the same fire test requirements as the materials contained within the plenum for all types of buildings.

Cost Impact: Plenums will not be permitted to be constructed of wood.

M130-12

Public Hearing:	Committee:	AS	AM	D

602.2-M-HIRSCHLER.DOC

M131–12
202, 602.2.1, 602.2.1.6 (NEW), Chapter 15

Proponent: Michael Cudahy, Plastic Pipe and Fittings Association (PPFA)
(mikec@cmservnet.com)

Add definition as follows:

WATER DISTRIBUTION PIPE. <u>A piping or tubing within the structure or on the premises that conveys water from the water service pipe, or from the meter when the meter is at the structure, to the points of utilization.</u>

Add text as follows:

602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1 through 602.2.1.~~5~~<u>6</u>, materials within plenums shall be noncombustible or shall be listed and labeled as having a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within one of the following:
    5.1. Continuous noncombustible raceways or enclosures.
    5.2. Approved gypsum board assemblies.
    5.3. Materials listed and labeled for installation within a plenum.
6. Materials in Group H, Division 5 fabrication areas and the areas above and below the fabrication area that share a common air recirculation path with the fabrication area.

<u>**602.2.1.6 Plastic water distribution pipe.** Plastic water distribution piping and tubing used in a pressurized wet system exposed within a plenum shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1887 or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84, UL 723 or CAN/ULC S102.2</u>

Add referenced standard to Chapter 15:

<u>CAN/ULC S102.2-10</u>
<u>Standard Method of Test for Burning Characteristics of Flooring, Floor Coverings and Miscellaneous Materials and Assemblies.</u>

Reason: The intent of this proposal is to provide known and accepted test methods, such as CAN/ULC S102.2 and UL-1887, to evaluate the acceptability of combustible supply piping to be used in plenum spaces. Such piping is used for hot and cold water supply but not as drain, waste and vent piping.

This action will complement the current standard, the ASTM E-84 test method, which is available to assess flame spread properties of combustible supply piping, and provide regulators and suppliers with the improved option of the UL test method to assess production of smoke by combustible piping. We do not wish to remove ASTM E84 as a suitable test for there are existing listings.

While UL 1887 is specifically scoped for use with combustible sprinkler piping at the present time, it is my understanding from discussions with UL representatives that allowing for/requiring its utilization for combustible pressure piping, will not require modification of that standard. The membership should note that such piping is functionally equivalent to sprinkler piping in the application covered by the proposed code change.

In all cases testing according to UL 1887 is carried out on empty piping, i.e. piping NOT including water or any other liquid. This was a concern stated by the Committee in its earlier deliberations. This test condition insures that under the proposal combustible piping will be tested according to the most pessimistic scenario possible when comparing full or empty piping. This is because empty combustible piping is far more easily ignited and presents a greater smoke hazard than combustible piping that is full of water when they are compared directly.

S102.2 is referenced in the building code, and UL 1887 is already in the IMC.
The term “water distribution pipe” is already defined in the IPC.

Cost Impact: None

Analysis: A review of the standard proposed for inclusion in the code, [CAN/ULC S102.2-10] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

M131-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

602.2.1-M-CUDAHY.DOC

M132–12
602.2.1, Chapter 15

Proponent: Joseph Dorney, Quality Assurance Engineer, Chamberlin Rubber Company Inc., representing self (JDorney@crubber.com)

Revise as follows:

602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1 through 602.2.1.5, materials within plenums shall be noncombustible or shall be listed and labeled as having a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84~~,~~ ~~or~~ UL 723, or UL 94.

Add new standard to Chapter 15 as follows:

UL 94-06 Tests for Flammability of Plastic Materials for Parts in Devices and Appliances

Reason: The UL94 fire rating test is a more rigorous and applicable standard for hydronic system hoses to be tested and rated to. This proposal would simply add this code to the list of acceptable standards for materials within plenums.

Cost Impact: This code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [UL 94-06] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

M132-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

602.2.1-M-DORNEY

M133–12
602.2.1

Proponent: Tony Crimi, A.C. Consulting Solutions Inc, representing International Firestop Council (tcrimi@sympatico.ca)

Revise as follows:

602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1 through 602.2.1.5, materials within plenums shall be noncombustible or shall be listed and labeled as having a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within one of the following:
   - 5.1. Continuous noncombustible raceways or enclosures.
   - 5.2. Approved gypsum board assemblies.
   - 5.3. Materials listed and labeled as <u>plenum protection systems</u> for use within a plenum.

Reason: This proposal aims to clarify Exception 5 to 602.2.1 which permits combustible materials to be installed in plenums provided they are fully enclosed in, amongst other things, "Materials listed and labelled for installation within a plenum." However, the current language lacks any kind of specific test standard, or detail as to the intent. Some have interpreted the exception to mean that the combustible item can be covered with *any* 25/50 rated material to bring it into code compliance. Testing has demonstrated that this is not the case. An individual material may pass the flame/smoke criteria, but may not provide enough protection for the combustible item beneath it to also pass the test. Reasons for this may include material shrinkage, high thermal conductivity, inadequate thickness, etc.

Testing and Certification Laboratories do provide Listings for "Plenum Protection Systems", which serve to protect a combustible item, keeping it from the degrading under fire conditions. These materials are qualified through fire testing of the combustible item together with the 'plenum protection material' as a system, to one of the plenum fire test methods dictated by the item type (such as NFPA 262, UL 1887, UL 1820 or UL 2024). These fire tests are a modified version of ASTM E 84 and utilise the Steiner Tunnel furnace. Testing is conducted at nationally recognised testing laboratories (NRTL) such as Intertek, ETL or UL. Listed system are then identified under the plenum protection (PP) category in the lab's Certifications Directory.

Cost Impact: This proposal will not affect the cost of construction.

M133-12

	Assembly:	ASF	AMF	DF

602.2.2.1-M-CRIMI.DOC

M134–12
202, 602.2.1.4

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Add new definition as follows:

DISCRETE PRODUCT. Products such as duct straps, duct fittings, duct registers, and pipe hangers that are tested to UL 2043.

Revise as follows:

~~**602.2.1.4 Electrical equipment in plenums**. Electrical equipment exposed within a plenum shall comply with Sections 602.2.1.4.1 and 602.2.1.4.2~~

~~**602.2.1.4.1 Equipment in metallic enclosures.** Electrical equipment with metallic enclosures exposed within a plenum shall be permitted.~~

~~**602.2.1.4.2 Equipment in combustible enclosures**. Electrical equipment with combustible enclosures exposed within a plenum shall be listed and labeled for such use in accordance with UL 2043.~~

602.2.1.4 **Discrete electrical, plumbing and mechanical products in plenums.** Where discrete electrical, plumbing and mechanical products and appurtenances are located in a plenum and have exposed combustible material, they shall be listed and labeled for such use in accordance with UL 2043.

Reason: The first part of this proposal is just a text cleanup to delete unnecessary wording. Section 602.2.1.4.1 does not state a requirement and is simply the inverse of section 602.2.1.4.2. With Section 602.2.1.4.1 gone, Section 602.2.1.4 has no purpose. The only actual requirement is stated in Section 602.2.1.4.2. The second part of this proposal revises the remaining section to broaden its coverage to more than electrical products. There are combustible plumbing and mechanical products such as plumbing appurtenances, pipe and duct supports, condensate pumps, duct fittings, etc that are used in plenums and that cannot be effectively tested in accordance with standards ASTM E84 or UL 723. The UL 2043 standard was developed to test products and materials not able to be tested in accordance with ASTM E84 or UL 723, and is currently adopted by reference in Section 602.2.1.4.2. These products are individual distinct pieces and non-continuous (i.e. “discrete”). This proposal was presented last cycle and the Committee had questions about the term “discrete’. Per the dictionary, ‘discrete’ refers to products that are non-continuous, individual distinct pieces, as compared to non-discrete products such as cable or plastic pipe. If adopted, this proposal will provide consistency in how the ICC codes treat discrete components in plenums. The new definition is necessary because of the new term. The definition basically states that a discrete product is something that is necessarily tested to UL 2043. A discrete product is defined by how it is tested.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

602.2.1.4-M-STRAUSBAUGH.PMGCAC.DOC

M136–12
602.2.1.6 (NEW)

Proponent: Marcelo M. Hirschler/GBH International
(gbhint@aol.com)

Add new text as follows:

602.2.1.6 Plastic piping and tubing used in plumbing systems shall exhibit a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E84 or UL 723. The fire test report shall indicate that the materials were tested at full width of the tunnel and without water or any other liquid in the piping or tubing during the test.

Reason: The IMC requires, in 602.2.1, that all materials within plenums must meet a flame spread index of 25 and a smoke developed index of 50 when tested to ASTM E84. However, in actual practice, many plastic piping and tubing materials are tested by filling the product with water during the test. This is neither a test in accordance with ASTM E84 nor is it adequate for the following reasons:

1. The plastic piping and tubing is listed for use in plenums and can be used with liquids other than water. For example it could be used for combustible liquids.
2. The plastic piping and tubing is not required to be held horizontally in the plenum. If the pipe is not horizontal then the water will not be retained in the pipe during use.
3. During construction and remodeling pipes are often empty.
4. Fire testing for all other products using ASTM E84 is conducted on the material to be used and not on the material with some fillings.
5. ASTM E84 requires all materials and products to be tested at full tunnel width, with only very few exceptions. Plastic piping and tubing is not one of the exceptions. The exceptions in ATM E84 are: (1) when there is a standard practice for the material (as shown in section 6.8), (2) when adhesives and trim have been listed with tests at less than full width and (3) when a specific test or application standard has been issued (as shown in Appendix X5). The relevant sections are shown below (section 6.3 and its associated subsections, section 6.8 and appendix X5).
6. Other plastic piping and tubing materials are tested without water and the comparison is inadequate if some materials are tested full of water.
7. Some materials are tested with water simply because they cannot meet the requirements otherwise.
8. If the IMC committee believes that ASTM E84 is not an appropriate test for such materials (which is a reasonable approach) a code change is needed and an alternate test must be specified because the present wording of section 602.2.1 of the IMC requires plastic piping and tubing to be tested to the ASTM E84/UL 723 test by default, without offering additional guidance on how to do the testing.

ASTM E84 section 6.3, 6.8 and Appendix X5:
6.3 The size of the test specimen shall be:
Width: between 20 and 24 in. (508 and 610 mm)
Length: 24 ft + 12 in. — 6 in.
Thickness: maximum 4 in. (101 mm).
NOTE 1 - The test apparatus is not designed for testing at thicknesses greater than 4 in. (101 mm), but has the ability to be modified if required. This is accomplished through (a) modifications to the test apparatus lid to maintain an airtight seal, and (b) the introduction, usually of additional sample/lid supports above the test apparatus ledges. Due to the composition of some materials, test results obtained at a thickness greater than 4 in. (101 mm) will potentially vary from results of a test on the same material tested at a thickness of 4 in. (101 mm) or less.
6.3.1 The test specimen shall not be required to conform to the test specimen length and width described in 6.3 when the material complies with 6.3.1.1-6.3.1.3.
NOTE 2—When tests are conducted with materials installed at less than full width, representing the end-use width, any resulting flame spread and smoke developed indices will not relate to indices obtained with the calibration material, which is tested using the specimen width described in 6.3.
6.3.1.1 Materials for which there is a standard practice to address specimen preparation and mounting with this test method shall be tested as described in the appropriate standard practice (see 6.8).
6.3.1.2 Adhesives and trim shall be permitted to be tested in the width or length, or both, specified in their listings, or as part of their conditions for being labeled, by a nationally recognized testing laboratory.
6.3.1.3 Materials and products for which there is a specific test method or application standard requiring the use of the apparatus described in Section 5 shall be permitted to be tested in accordance with that specific test method or application standard (see Appendix X5).
6.8 In addition to the above provisions, the standard practices listed below shall be used for specimen preparation and mounting of the relevant test materials. For all other products, guidance on mounting methods is provided in Appendix X1.
E2231 for pipe and duct insulation materials.
E2404 for paper, vinyl and textile wall and ceiling covering materials.
E2573 for site-fabricated stretch systems.

E2579 for the following wood products: solid board, lumber and timber products (including solid boards, lumber, timber, fingerjoined lumber, glulam, laminate wood, laminated veneer lumber and parallel strand lumber products), panel products (including fibreboard, hardboard, oriented strandboard, waferboard, and plywood panel products), decorative wood products (including fine woodwork, millwork and moulding) and shingles and shakes used as interior wall and ceiling finish and interior trim.
E2599 for reflective insulation, radiant barrier and vinyl stretch ceiling materials for building applications.
E2688 for tapes up to and including 8 in. (203.2 mm) in width.
E2690 for caulks and sealants intended to be applied up to and including 8 in. (203.2 mm) in width.

X5. SPECIFIC TEST METHODS AND APPLICATION STANDARDS
X5.1 The following standards address testing of materials in accordance with test methods that are applications or variations of this test method or apparatus.
X5.1.1 Wires and cables for use in air-handling spaces are covered by NFPA 262.
X5.1.2 Pneumatic tubing for control systems are covered by UL 1820.
X5.1.3 Combustible sprinkler piping is covered by UL 1887.
X5.1.4 Optical fiber and communications raceways are covered by UL 2024.

IMC 602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1 through 602.2.1.5, materials within plenums shall be noncombustible or shall be listed and labeled as having a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E84 or UL 723.

For information also:
NFPA 90A (section on ceiling cavity plenums)
4.3.11.2.6.6 Plastic piping and tubing used in plumbing systems shall be permitted to be used within a ceiling cavity plenum if it exhibits a flame spread index of 25 or less and a smoke developed index of 50 or less when tested in accordance with ASTM E 84, *Standard Test Method for Surface Burning Characteristics of Building Materials*, or ANSI/UL 723, *Standard for Test for Surface Burning Characteristics of Building Materials*, at full width of the tunnel and with no water or any other liquid in the pipe during the test.

NFPA 90A (section on raised floor plenums)
4.3.11.5.5.7 Plastic piping and tubing used in plumbing systems shall be permitted to be used within a raised floor plenum if it exhibits a flame spread index of 25 or less and a smoke developed index of 50 or less when tested in accordance with ASTM E 84, *Standard Test Method for Surface Burning Characteristics of Building Materials*, or ANSI/UL 723, *Standard for Test for Surface Burning Characteristics of Building Materials*, at full width of the tunnel and with no water or any other liquid in the pipe during the test.

	Assembly:	ASF	AMF	DF

602.2.1.6(NEW)-M-HIRSCHLER.DOC

M137–12
602.2.1.6(NEW), Chapter 15

Proponent: David W. Ash, Lubrizol Advanced Materials Inc.

Add next text as follows:

602.2.1.6 Plastic plumbing piping. Plastic plumbing piping exposed within a plenum shall have a peak optical density not greater than 0.50. an average optical density not greater than 0.15, and a flame spread index of not greater than 5 feet (1524 mm) when tested in accordance with UL 1887 or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with CAN/ULC S102.2. Piping shall be listed and labeled.

Add referenced standard to Chapter 15:

CAN/ULC S102.2-10
Standard Method of Test for Surface Burning Characteristics of Flooring. Floor Coverings and Miscellaneous Materials and Assemblies

Reason: Currently ASTM E-84 is the required test to determine the flame and smoke properties of materials. These values then determine whether or not a material may be used within plenums. There are exceptions to this standard for those products with special criteria and those are shown in sections 602.2.1.1 through 602.2.1.5.

Since that test is specified by the IMC, all other products, including plastic plumbing pipe, must be evaluated by this test. The scope of ASTM E-84 test states that it is applicable to surfaces such as walls and ceilings. Many products that are not used in a flat form are impacted by this requirement. Obviously, a pipe's tubular shape does not correspond to a flat shape. Although an ASTM committee has been attempting to decide on a test method for pipe, to date they have not been successful. Consequently, ASTM E-84 does not provide any direction in testing a pipe.

Other test standards have been developed that do include provisions for testing pipe. These standards have been successfully used for a number of years. The UL 1887 and CAN/ULC S1 02.2 standards recognize that the appropriate way to evaluate the flame and smoke characteristics of a pipe is to test a sample in that shape. These standards provide specific direction in the testing of the pipe and do not leave the decision of what sample to test up to the manufacturer or the testing agency. The addition of these two standards to the IMC as method to evaluate plastic plumbing pipe provides a clearer direction than what the IMC currently offers.

The CAN/ULC S102.2 standard is currently referenced in the International Building Code. The UL 1887 standard is currently referenced in the International Mechanical Code.

Cost Impact: This proposal would not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [CAN/ULC S102.2-10] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

Delete and substitute as follows:

~~**602.3 Stud cavity and joist space plenums.** Stud wall cavities and the spaces between solid floor joists to be utilized as air plenums shall comply with the following conditions:~~

1. ~~Such cavities or spaces shall not be utilized as a plenum for supply air.~~
2. ~~Such cavities or spaces shall not be part of a required fire-resistance-rated assembly.~~
3. ~~Stud wall cavities shall not convey air from more than one floor level.~~
4. ~~Stud wall cavities and joist space plenums shall comply with the floor penetration protection requirements of the *International Building Code*.~~
5. ~~Stud wall cavities and joist space plenums shall be isolated from adjacent concealed spaces by approved fire-blocking as required in the *International Building Code*.~~
6. ~~Stud wall cavities in the outside wall of building envelope assemblies shall not be utilized as air plenums.~~

602.3 Building cavities. Building framing cavities shall not be used as ducts or plenums.

Reason: 2012 IECC section R403.2.3 and IRC N1103.2.3 both read as follows;

Building cavities. *Building framing cavities shall not be used as ducts or plenums.*

This practice is not permitted in residential applications. There is no logical reasoning that it should be permitted in a commercial application.

Cost Impact: The code change proposal will not increase the cost of construction.

602.3-M-MCLEHANEY.DOC

M140–12
603

Proponent: Bob Eugene, Underwriters Laboratories, representing Underwriters Laboratories (Robert.Eugene@ul.com)

Revise as follows:

603.4 Metallic ducts. All metallic ducts shall be constructed as specified in the SMACNA *HVAC Duct Construction Standards- Metal and Flexible or shall comply with UL181.* Flexible metallic ducts complying with UL 181 shall be listed and labeled as Class 0 or Class 1 flexible air ducts and shall be installed in accordance with Section 304.1.

> **Exception:** Ducts constructed and installed in accordance with SMACNA *HVAC Duct Construction Standards- Metal and Flexible* within single *dwelling units* shall have a minimum thickness as specified in Table 603.4

603.4.1 Minimum fasteners. Rigid Round metallic ducts constructed in accordance with SMACNA *HVAC Duct Construction Standards- Metal and Flexible* shall be mechanically fastened by means of at least three sheet metal screws or rivets spaced equally around the joint.

> **Exception:** Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion so as to prevent a hinge effect.

603.5 Nonmetallic ducts. Nonmetallic ducts shall comply with UL 181, shall be ~~constructed~~ listed and labeled as ~~with~~ Class 0 or Class 1 flexible air ducts ~~material~~, and shall be ~~comply with UL 181~~ installed in accordance with Section 304.1. Fibrous duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards.* The air temperature within nonmetallic ducts shall not exceed 250ºF (121ºC).

603.6 Installation of listed and labeled air ducts. Listed and labeled air ducts shall be installed in accordance with Sections 603.6.1 and 603.6.2.

603.6.1 Air temperature. The design temperature of air to be conveyed in flexible air ducts and flexible air connectors shall be less than 250ºF (121ºC).

603.6.2 Flexible air duct and air connector clearance. Flexible air ducts and air connectors shall be installed with a minimum *clearance* to an *appliance* as specified in the *appliance* manufacturer's installation instructions.

~~**603.6 Flexible air ducts and flexible air connectors.** Flexible air ducts, both metallic and nonmetallic, shall not be limited in length. shall comply with Sections 603.6.1, 603.6.1.1, 603.6.3 and 603.6.4. Flexible air connectors, both metallic and nonmetallic, shall comply with Sections 603.6.2 through 603.6.4.~~

~~**603.6.1 Flexible air ducts.** Flexible air ducts, both metallic and nonmetallic, shall be tested in accordance with UL 181. Such ducts shall be *listed* and *labeled* as Class 0 or Class 1 flexible air ducts and shall be installed in accordance with Section 304.1.~~

~~**603.6.2.**~~ **603.7 Flexible air connectors.** Flexible air connectors, both metallic and nonmetallic, shall comply with UL 181, shall be *listed* and *labeled* as Class 0 or Class 1 flexible air connectors, and shall be installed in accordance with Section 304.1.

~~**603.6.2.1**~~ **603.7.1 Connector length.** Flexible air connectors shall be limited in length to 14 feet (4267 mm).

~~**603.6.2.2**~~ **603.7.2 Connector penetration limitations.** Flexible air connectors shall not pass through any wall, floor or ceiling.

~~**603.6.3 Air temperature.** The design temperature of air to be conveyed in flexible air ducts and flexible air connectors shall be less than 250ºF (121ºC).~~

~~**603.6.4 Flexible air duct and air connector clearance.** Flexible air ducts and air connectors shall be installed with a minimum *clearance* to an *appliance* as specified in the *appliance* manufacturer's installation instructions.~~

603.9 Joints, seams and connections. All longitudinal and transverse joints, seams and connections in metallic and nonmetallic ducts shall be constructed as specified in *SMACNA HVAC Duct Construction Standards—Metal and Flexible or NAIMA Fibrous Glass Duct Construction Standards* in accordance with 603.9.1 *or* shall comply with *UL181* in accordance with Section 603.9.2. Duct connections to flanges of air distribution system equipment shall be sealed and mechanically fastened. Closure systems used to seal ductwork shall be installed in accordance with the duct and closure system manufacturer's instructions. Unlisted duct tape is not permitted as a sealant on any duct.

603.9.1 Ducts in accordance with SMACNA and NAIMA. Joints, seams and connections in metallic and nonmetallic ducts constructed as specified in *SMACNA HVAC Duct Construction Standards—Metal and Flexible and NAIMA Fibrous Glass Duct Construction Standards* ~~All joints, longitudinal and transverse seams and connections in ductwork~~ shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems, liquid sealants ~~or~~ tapes, or closure systems in accordance with Section 603.9.2.

> **Exception:** Continuously welded and locking-type longitudinal joints and seams in ducts operating at static pressures of less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.

603.9.2 Ducts in accordance with UL 181. Closure systems used to seal ductwork in accordance with UL181 shall be listed and labeled in accordance with either UL 181A or 181B in accordance with Table 603.9.2. Closure systems used to seal rigid metallic and rigid fiberglass ducts shall comply with 181A and shall be marked "181A-P" for pressure-sensitive tape, "181 A-M" for mastic or "181 A-H" for heat-sensitive tape. Closure systems used to seal flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked "181B-FX" for pressure-sensitive tape or "181B-M" for mastic. ~~Duct connections to flanges of air distribution system *equipment* shall be sealed and mechanically fastened.~~ Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked "181B-C." ~~Closure systems used to seal metal ductwork shall be installed in accordance with the manufacturer's installation instructions. Unlisted duct tape is not permitted as a sealant on any duct.~~

> ~~**Exception:** Continuously welded and locking-type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.~~

TABLE 603.9.2
CLOSURE SYSTEMS

Type of Ductwork	Standard	Type of Closure System	Marking
Rigid Metallic or Rigid Fiberglass	UL 181A	Pressure Sensitive Tape	181A-P
Rigid Metallic or Rigid Fiberglass	UL 181A	Mastic Tape	181A-M
Rigid Metallic or Rigid Fiberglass	UL 181A	Heat Sensitive Tape	181A–H
Flexible Air Ducts and Air Connectors	UL 181B	Pressure Sensitive Tape	181B-FX
Flexible Air Ducts and Air Connectors	UL 181B	Mastic Tape	181B-M
Flexible Non-Metallic Air Ducts	UL181B	Mechanical Fastener[a]	181B-C[a]

[a]Mechanical fasteners shall be used in conjunction with a listed pressure sensitive tape or mastic in accordance with UL181.

(Portions not shown remain unchanged.)

Reason: To provide additional clarity and consistency in the requirements air ducts constructed to SMACNA requirements and those that comply with UL181. This also provides additional clarity and consistency for the sealing of all ductwork.

Cost Impact: None

603.4-M-EUGENE.DOC

M141–12
603.1.1(NEW), 603.1.2 (NEW), 603.1.3 (NEW)

Proponent: Tom Allen, representing himself

Add new text as follows:

603.1.1 Mechanical fastening. Joints between sections of air ducts and plenums, between intermediate and terminal fittings and other components of air distribution systems, and between subsections of these components shall be mechanically fastened to secure the sections independently of the closure system(s).

603.1.2 Sealing. Air distribution system components shall be sealed with approved closure systems.

603.1.3 Space provided. Space shall be provided adjacent to all mechanical components located in or forming a part of the air distribution system to provide access for construction and sealing in accordance with the requirements of Section 603.1, inspection, cleaning and maintenance. Not less than 4 inches (102 mm) of space hall be provided around air handling units.

> **Exception**: Retrofit and replacement units not part of a renovation are exempt from the minimum clearance requirement.

Reason: Adds requirements for fastening, sealing and providing space to install, inspect, and maintain ducts and plenums.

Cost Impact: There is a cost impact.

M141-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

603.1.1(NEW)-M-ALLEN.DOC

M142–12
603.2, 918.2

Proponent: Guy McMann, MCP, Jefferson County Colorado, Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gmcmann@jeffco.us)

Revise as follows:

603.2 Duct sizing. Ducts installed within a single dwelling unit shall be sized in accordance with ACCA Manual D, the appliance manufacturer's installation instructions or other approved methods. Ducts installed within all other buildings shall be sized in accordance with the ASHRAE Handbook of Fundamentals or other equivalent computation procedure.

Revise as follows:

~~**918.2 Minimum duct sizes.** The minimum unobstructed total area of the outdoor and return air ducts or openings to a forced-air warm-air furnace shall be not less than 2 square inches per 1,000 Btu/h (4402 mm2/kW) output rating capacity of the furnace and not less than that specified in the furnace manufacturer's installation instructions. The minimum unobstructed total area of supply ducts from a forced-air warm-air furnace shall not be less than 2 square inches for each 1,000 Btu/h (4402 mm2/kW) output rating capacity of the furnace and not less than that specified in the furnace manufacturer's installation instructions.~~

> ~~**Exception:** The total area of the supply air ducts and outdoor and return air ducts shall not be required to be larger than the minimum size required by the furnace manufacturer's installation instructions.~~

918.~~3~~ 2 Heat pumps~~. The minimum unobstructed total area of the outdoor and return air ducts or openings to a heat pump shall be not less than 6 square inches per 1,000 Btu/h (13 208 mm2/kW) output rating or as indicated by the conditions of listing of the heat pump~~ Electric heat pumps shall be tested in accordance with UL 1995.

Reason: This is outdated legacy code language and is not consistent with current practice. It is up to the design professional, or the requirements from Manual D or the manufacturer of the appliances to determine minimum sizes of ducts and transfer openings, not the code. If these numbers where to be applied, then the code could be condoning an undersized system. This subject matter is already covered in 603.2. There are too many variables and different situations for just one minimum to work for everything.

Cost Impact: None

M142-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

603.2-M-MCMANN.DOC

M143–12
TABLE 603.4

Proponent: Luis Escobar, Air Conditioning Contractors of America, representing ACCA (luis.escobar@acca.org)

Revise as follows:

TABLE 603.4
DUCT CONSTRUCTION MINIMUM SHEET METAL THICKNESSES FOR SINGLE DWELLING UNITS

DUCT SIZE	GALVANIZED		Appropriate Aluminum B&S Gauge ~~ALUMINUM MINIMUM THICKNESS (in.)~~
	Minimum thickness (in.)	Equivalent galvanized gauge ~~gage~~ no.	
Round ducts and enclosed rectangular ducts			
14 inches or less	0.013 ~~0.0157~~	30 ~~28~~	26 ~~0.0175~~
Over 14” ~~16 and 18 inches~~	0.016 ~~0.0187~~	28 ~~26~~	24 ~~0.018~~
~~20 inches and over~~	~~0.0236~~	~~24~~	~~0.023~~
Exposed rectangular ducts			
14 inches or less	0.016 ~~0.0157~~	28	24 ~~0.0175~~
Over 14 inches[a]	0.019 ~~0.0187~~	26	22 ~~0.018~~

For SI: 1 inch = 25.4 mm, 1 inch water gage = 249 Pa.

~~a. For duct gages and reinforcement requirements at static pressures of ½-inch, 1-inch and 2-inch w.g., SMACNA *HVAC Duct Construction Standards*, Tables 2-1, 2-2, and 2-3, shall apply.~~

Reason: The change that was previously made in the 2009 IMC (and carried forward to the 2012 IMC) unnecessarily increased the material thickness required for round sheet metal ducts.

This proposed change seeks to return to the requirements of 2006 and previous IMC editions which have historically recognized 30 gauge sheet metal as being appropriate for round ducts 14 inches or less diameter in “Single Dwelling Units”.

The changes to table 603.4 in the 2009 IMC (and carried forward to the 2012 IMC):

1. Significantly increased cost for round sheet metal ducts
2. Did not improve safety
3. Did not improve energy performance
4. Encourages increased use of less expensive and less efficient non-metallic ducts.

Cost Impact: This code change proposal will **not** increase the cost of construction.

M143-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T603.4-M-ESCOBAR.DOC

M144–12
603.4, T603.4

Proponent: Guy McMann, MCP, Jefferson County Colorado, Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gmcmann@jeffco.us)

Revise text as follows:

603.4 Metallic ducts. All metallic ducts shall be constructed as specified in the SMACNA *HVAC Duct Construction Standards-Metal and Flexible*.

> ~~**Exception:** Ducts installed within single *dwelling units* shall have a minimum thickness as specified in Table 603.4.~~

~~**TABLE 603.4**~~
~~**DUCT CONSTRUCTION MINIMUM SHEET METAL THICKNESSES FOR SINGLE DWELLING UNITS**~~

~~**DUCT SIZE**~~	~~**Galvanized**~~		~~**Aluminum**~~
	~~**Minimum thickness (in)**~~	~~**Equivalent galvanized gauge no.**~~	~~**Minimum thickness**~~
~~Round ducts and enclosed rectangular ducts~~			
~~14" or less~~	~~0.0157~~	~~28~~	~~0.0175~~
~~16 and 18 inch~~	~~0.0187~~	~~26~~	~~0.018~~
~~20 inch and over~~	~~0.0236~~	~~24~~	~~0.023~~
~~Exposed rectangular ducts~~			
~~14" or less~~	~~0.0157~~	~~28~~	~~0.0175~~
~~Over 14"inches[a]~~	~~0.0187~~	~~26~~	~~0..018~~

~~For SI: 1 inch = 25.4 mm, 1 inch water gage = 249 Pa.~~
~~a. For duct gages and reinforcement requirements at static pressures of ½", 1" and 2" w.g., see SMACNA Duct Construction Standard, Tables 2-1; 2-2 and 2-3; 2005, 3rd edition.~~

Reason: The exception is of no value because the Table is not different from the Standard. The Table has no value added because it is flawed. It says that an enclosed duct of 20 inches and larger needs to be a heavier gage than exposed duct of the same size which is backwards. This Table would need to be larger and more complete in scope to be of any value and therefore should be deleted. It's easier to just check the Standard than to re-write it in Table format.

Cost Impact: None

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T603.4-M-MCMANN.DOC

M145–12
603.4.2 (NEW)

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Add new text as follows:

603.4.2 Duct lap. Crimp joints for round and oval metal ducts shall be lapped not less than one inch and the male end of the duct shall extend into the adjoining duct in the direction of airflow.

Reason: Section 603.4.1 states the number of fasteners to be used for the fastening of metal ducts but is silent on how many inches the ducts must be lapped and if the ducts must be lapped in a certain direction. The code should specifically state how much lap there should be within the ducts prior to securing them as stated in Section 603.4.1.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

M145-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

603.4.2-M-STRAUSBAUGH.PMGCAC.DOC

M146–12
603.6.1.1

Proponent: Eli P. Howard III, Sheet Metal and Air-Conditioning Contractors' National Association, Inc. (ehoward@smacna.org)

Revise as follows:

603.6.1.1 Duct length. Flexible air ducts shall ~~not~~ be limited in length to 5 feet within a single branch run.

Reason: Current practice is that flexible duct is run in such long lengths as to restrict airflow because of the higher air resistance inherent in flexible duct. Further compounding the problem, installers will use a full box (25 ft) to make a 20 ft or shorter run and this "compression" results in even higher resistance to airflow. Consider that ASHRAE's Advanced Energy Guides require the 5 foot limit in an effort to reduce fan horsepower requirements in commercial construction.

Cost Impact: Initial cost will increase modestly but energy savings will quickly offset that cost.

M146-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

603.6.1.1-M-HOWARD.DOC

M147–12
603.8.3

Proponent: Jim Wischhusen, Monoxivent, representing self
(jimw@monoxivent.com)

Revise as follows:

603.8.3 Plastic ducts and fittings. Plastic ducts shall be constructed ~~of PVC~~ with Class 0 or Class 1 material in accordance with UL 181 and having a minimum pipe stiffness of 8 psi (55 kPa) at 5-percent deflection when tested in accordance with ASTM D2412~~. Plastic duct fittings shall constructed of either PVC or high density polyethylene.~~ ~~Plastic duct and fittings shall be utilized in underground installations only.~~ The maximum design temperature for systems utilizing plastic duct and fittings shall be 150^{0}F (66^{0}C).

Reason: Fire, heat and smoke can readily pass through the interior of HVAC ducts constructed of any material, even if it is buried. Therefore, regardless of whether the duct is buried or not, plastic ducts should be constructed with Class 0 or Class 1 duct material in accordance with UL 181 (ref. 2009 IMC Section 603.5). Neither PVC or high-density polyethylene are Class 0 or Class 1 materials, so reference to these in this section as construction materials should be deleted. Also, if the plastic duct is constructed of a Class 0 or Class 1 material, it should not be limited to underground installations only. This proposal provides for the use of newer fire retardant materials that offer additional safety in the event of a building fire.

Cost Impact: The code change proposal will not increase the cost of construction.

M147-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

603.8.3#2-M-WISCHHUSEN.DOC

M148–12
603.9

Proponent: Timothy Burgos, InterCode Incorporated, representing Ductmate Industries

Revise as follows:

603.9 Joints, seams and connections. All longitudinal and transverse joints, seams and connections in metallic and nonmetallic ducts shall be constructed as specified in SMACNA *HVAC Duct Construction Standards—Metal and Flexible* and NAIMA *Fibrous Glass Duct Construction Standards*. All joints, longitudinal and transverse seams and connections in ductwork shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems, liquid sealants or tapes. Closure systems used to seal ductwork *listed* and *labeled* in accordance with UL 181A shall be marked "181A-P" for pressure-sensitive tape, "181 A-M" for mastic or "181 A-H" for heat-sensitive tape. Closure systems used to seal flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked "181B-FX" for pressure-sensitive tape or "181B-M" for mastic. Duct connections to flanges of air distribution system *equipment* shall be sealed and mechanically fastened. Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked "181B-C." Closure systems used to seal metal ductwork shall be installed in accordance with the manufacturer's installation instructions. Unlisted duct tape is not permitted as a sealant on any duct.

> **Exception:** Continuously welded ~~and locking-type longitudinal joints and~~ seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.

Reason: There is a conflict between Section 603.9 and its exception. This code change proposal removes the conflict by not allowing locking type longitudinal joints to be exempt from the sealing requirements of Section 603.9.

Section 603.9 states that all joints need to be sealed. Locking type longitudinal joints are not air tight and must be sealed, and should not be exempt from the sealing requirements found in Section 603.9. Continuously welded seams, as demonstrated in welded pipe, are considered to be air tight and therefore should be exempt from any additional sealing requirements.

Requiring locking-type longitudinal joints to be sealed in accordance with Section 603.9 will reduce the amount of air leakage from the duct, thus, increasing the energy efficiency of the duct system.

Cost Impact: The code change proposal will not increase the cost of construction.

M148-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

603.9-M-BURGOS.DOC

M149–12
603.9

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

603.9 Joints, seams and connections All longitudinal and transverse joints, seams and connections in metallic and nonmetallic ducts shall be constructed as specified in SMACNA *HVAC Duct Construction Standards-Metal and Flexible* and NAIMA *Fibrous Glass Duct Construction Standards.* All joints, longitudinal and transverse seams and connections in ductwork shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems, liquid sealants or tapes. ~~Closure systems~~ Tapes and mastics used to seal metallic and fibrous glass ductwork shall be *listed* and *labeled* in accordance with UL 181A and shall be marked "181A-P" for pressure-sensitive tape, "181 A-M" for mastic or "181 A-H" for heat-sensitive tape. Closure systems used to seal flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked "181B-FX" for pressure-sensitive tape or "181B-M" for mastic. Duct connections to flanges of air distribution system *equipment* shall be sealed and mechanically fastened. Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked "181B-C." Closure systems used to seal ~~metal~~ all ductwork shall be installed in accordance with the manufacturer's ~~installation~~ instructions. ~~Unlisted duct tape is not permitted as a sealant on any duct~~.

Reason: This proposal simplifies this section by stating what is meant by "closure systems." Tapes and mastics are addressed in UL181A. There is no closure system listed specifically for metal ducts, but it is appropriate to require sealing products used for metal ducts to be listed to UL181A because if the sealing product is good enough for fibrous glass ducts it is good enough for metal ducts. This is the case in the field, as fibrous glass duct tapes are commonly used with metal ducts. The manufacturer's instructions should apply for all closure systems, not just those for metal ducts. The last sentence is unnecessary because this proposal requires all tapes to be listed, including those used with metal ducts.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

	Assembly:	ASF	AMF	DF

603.9#1-M-STRAUSBAUGH.PMGCAC.DOC

M150–12
603.9.1 (NEW), Chapter 15

Proponent: Timothy Burgos, InterCode Incorporated, Representing Ductmate Industries

Add new text as follows:

603.9.1 Duct system leak-testing. Ducts shall be installed and sealed in accordance with Section 603.9. Ducts and plenums shall be leak-tested in accordance with the SMACNA *HVAC Air Duct Leakage Test Manual* with an air leakage class (*CL*) less than or equal to 6.0 as determined in accordance with Equation 6-1.

$CL = F/P^{0.65}$ **(Equation 6-1)**

where:

F = The measured leakage rate in cfm per 100 square feet of duct surface.
P = The static pressure of the test.

Documentation shall be furnished by the designer demonstrating that representative sections totaling at least 25 percent of the duct area have been tested and that all tested sections meet the requirements of this section.

Add new referenced standard to Chapter 15 as follows:

SMACNA HVAC Air Duct Leakage Test Manual - 1985

Reason: Currently, there are no requirements for leak-testing in the International Mechanical Code. This code change proposal introduces a requirement for leak-testing all ductwork. The language for this proposal was adapted from Section C403.2.7.1.3 of the 2012 International Energy Conservation Code.

By requiring all pressure classes of ductwork to be tested, it will eliminate the confusion for a building official in determining which duct needs to be tested. Section 603.9 states the requirements of how ducts are supposed to be constructed and sealed. However, the section lacks a specific requirement in establishing a maximum air leakage rate for a duct. This proposal, if accepted, will establish these requirements by requiring all ductwork to be leak-tested in accordance with *SMACNA HVAC Air Duct Leakage Test Manual* using Equation 4-5, as noted in the section. By providing this equation, a more consistent test procedure can be established.

As new technologies are developed that increase HVAC efficiencies, it would only make sense to include requirements to improve the efficiencies of the ductwork. This proposal provides a means for the code officials to verify compliance with the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [SMACNA HVAC Air Duct Leakage Test Manual - 1985] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

603.9.1(NEW)-M-BURGOS.DOC

M151–12
603.9

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

603.9 Joints, seams and connections. All longitudinal and transverse joints, seams and connections in metallic and nonmetallic ducts shall be constructed as specified in SMACNA *HVAC Duct Construction Standards—Metal and Flexible* and NAIMA *Fibrous Glass Duct Construction Standards*. All joints, longitudinal and transverse seams and connections in ductwork shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems, liquid sealants or tapes. Closure systems used to seal ductwork *listed* and *labeled* in accordance with UL 181A shall be marked “181A-P” for pressure-sensitive tape, “181 A-M” for mastic or “181 A-H” for heat-sensitive tape. Closure systems used to seal flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked “181B-FX” for pressure-sensitive tape or “181B-M” for mastic. Duct connections to flanges of air distribution system *equipment* shall be sealed and mechanically fastened. Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked “181B-C.” Closure systems used to seal metal ductwork shall be installed in accordance with the manufacturer’s installation instructions. Unlisted duct tape is not permitted as a sealant on any duct.

> **Exception:** ~~Continuously welded and locking-type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems~~ For ducts having a static pressure classification of less than 2 inches of water column (500Pa), additional closure systems shall not be required for continuously welded joints and seams and locking-type joints and seams of other than the snap-lock and button-lock types.

Reason: Unless sealant or a gasket is used, snap-lock and button-lock type seams will leak significantly. The current exception attempted to prevent unnecessary sealing for joints and seams that leak very little or not at all, but it went too far by including all locking type joints and seams. Some locking joints are leakproof such as mechanically folded seams used for spiral seam duct, but this cannot be said for all locking joints.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

603.9-#2-M-STRAUSBAUGH.PMGCAC.DOC

M152–12
603.10

Proponent: Anthony Frank Caminita, Duct Saddle LLC., representing self
(fcaminita@ductsaddle.com)

Revise as follows:

603.10 Supports. Ducts shall be supported at intervals not to exceed 12 feet (3658mm) and shall be in accordance with SMACNA-HVAC Duct Construction Standards- Metal and Flexible. Flexible and other factory-made ducts shall be supported by a saddle <u>not less than 5.5 inches in width and shall be supported</u> in accordance with the manufacturer's instructions.

Reason: When ducts are laying on a flat surface in an attic or crawl space in a high humidity area, the bottom of the duct will condensate and drip water on to the sheet rock which will develop into stains, mold and possibly attracting tennites. The heat in the attic will dry the top part of the duct's outer jacket but cannot reach the lower part that is touching the flat surface. Also by requiring ducts to be supported with a minimum 5 %" wide support, this would prevent kinking and sagging in the duct which can lead to restriction of air flow when the duct is installed in a twisted pattern on the attic floor.

Cost Impact: The code change will add minimal cost.

M152-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

603.10-M-CAMINITA.DOC

M153–12
603.10

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

603.10 Supports. Ducts shall be supported ~~at intervals not to exceed 12 feet (3658 mm) and shall be~~ in accordance with SMACNA *HVAC Duct Construction Standards—Metal and Flexible*. ~~Flexible and other factory-made ducts shall be supported in accordance with the manufacturer's instructions.~~

Reason: This section should just reference the SMACNA standards as opposed to specifying a support interval. The 12 foot interval requirement is too broad and is inappropriate for many sizes and types of ducts . Many ducts require closer supports. This text could be easily interpreted as allowing 12 feet maximum support intervals for all ducts.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. 603.10-M-STRAUSBAUGH.PMGCAC.DOC

M154–12
603.12

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

603.12 Condensation. Provisions shall be made to prevent the formation of condensation on the exterior <u>and interior surfaces</u> of any duct.

Reason: Ducts such as toilet and kitchen exhaust and clothes dryer exhaust that are run in unconditioned spaces will be subject to the formation of condensation on the inside of the duct. It is common for exhaust ducts in ventilated attics to fill with water in low points and become blocked and/or leak into the exhaust fan or dryer. Condensation can also form in HVAC ducts where humid indoor air passes through such ducts that are chilled in unconditioned spaces. External insulation combined with a vapor barrier can prevent condensation on the outside of ducts and that same insulation with or without a vapor barrier can also prevent condensation on the inside of a duct, except for when the airflow initially starts. When the duct temperature comes up to the temperature of the air within it, the condensation will stop and the initial condensation will evaporate.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: This proposal will increase the cost of construction.

603.12-M-STRAUSBAUGH.PMGCAC.DOC

M155–12
202, 604.7

Proponent: Ken Sagan, NRG Code Advocates, representing Reflective Insulation Manufacturers Association International
(ken@nrgcodeadvocates.com)

Add new text as follows:

REFLECTIVE INSULATION. Reflective insulation materials consist of one or more low-emittance surfaces, such as metallic foil or metallic deposits, unmounted or mounted on substrates. Reflective insulations derive their thermal performance from surfaces with an emittance of 0.1 or less, facing enclosed air spaces, yielding a reduction in radiant heat transfer.

Revise text as follows:

604.7 Identification. External duct insulation, except spray polyurethane foam, and factory-insulated flexible duct shall be legibly printed or identified at intervals not greater than 36 inches (914 mm) with the name of the manufacturer, the thermal resistance R-value at the specified installed thickness and the flame spread and smoke-developed indexes of the composite materials. All duct insulation product R-values shall be based on insulation only, excluding air films, vapor retarders or other duct components, and shall be based on tested C-values at 75°F (24°C) mean temperature at the installed thickness, in accordance with recognized industry procedures. The installed thickness of duct insulation used to determine its R-value shall be determined as follows:

1. For duct board, duct liner and factory-made rigid ducts not normally subjected to compression, the normal insulation thickness shall be used.
2. For duct wrap, the installed thickness shall be assumed to be 75 percent (25 percent compression) of normal thickness.
3. For factory-made flexible air ducts, the installed thickness shall be determined by dividing the difference between the actual outside diameter and nominal inside diameter by two.
4. For spray foam polyurethane foam, the aged R-value per inch, measured in accordance with recognized industry standards, shall be provided to the customer in writing at the time of foam application.
5. For reflective insulation, R-values shall be based on tested U-values using recognized industry procedures as a reflective insulation system on rigid duct in heating, ventilation and air conditioning systems. Packages of reflective insulation shall be labeled with the number of reflective sheets, the number and thickness of the air spaces in the assembly and the R-value of the assembly.

Reason: A type of reflective insulation (reflective plastic core insulation) is currently included in the IBC Code Definitions. This proposal attempts to provide additional information relating to that product category as a whole and for the products specified in this proposal.

The proposal proposes to clarify the process within the codes for accurately labeling and evaluating the performance of reflective insulation when installed on ducts. ASTM C1668-10 addresses this issue and provides specification on how to determine product performance.

Cost Impact: The code change proposal will not increase the cost of construction.

202-REFLECTIVE INSULATION-M-SAGAN.DOC

M156–12
605.1

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

605.1 General. Heating and air-conditioning systems ~~of the central type~~ shall be provided with *approved* air filters. Filters shall be installed <u>such that all return air, outdoor air and makeup air is filtered</u> ~~in the return air system,~~ upstream from any heat exchanger or coil. <u>Filters shall be installed</u> in an *approved* convenient location. Liquid adhesive coatings used on filters shall have a flash point not lower than 325ºF (163ºC).

Reason: It is just as important to filter outdoor air and makeup air as it is to filter return air. This provision should not be limited to central type systems because all heat exchangers need to be protected from fouling by air-borne debris.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

605.1-M-STRAUSBAUGH.PMGCAC.DOC

M157–12

[B] 607.5.4.1

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

THIS CODE CHANGE WILL BE HEARD BY THE INTERNATIONAL MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Revise as follows:

[B] 607.5.4.1 Smoke damper. <u>Smoke dampers shall close as required by Section 607.3.3.2.</u>

~~The smoke damper shall close upon actuation of a listed smoke detector or detectors installed in accordance with the International Building Code and one of the following methods, as applicable:~~

1. ~~Where a smoke damper is installed within a duct, a smoke detector shall be installed in the duct within 5 feet (1524 mm) of the damper with no air outlets or inlets between the detector and the damper . The detector shall be listed for the air velocity, temperature and humidity anticipated at the point where it is installed. Other than in mechanical smoke control systems, dampers shall be closed upon fan shutdown where local smoke detectors require a minimum velocity to operate.~~
2. ~~Where a smoke damper is installed above smoke barrier doors in a smoke barrier , a spot-type detector listed for releasing service shall be installed on either side of the smoke barrier door opening.~~
3. ~~Where a smoke damper is installed within an air transfer opening in a wall, a spot-type detector listed for releasing service shall be installed within 5 feet (1524 mm) horizontally of the damper .~~
4. ~~Where a smoke damper is installed in a corridor wall or ceiling, the damper shall be permitted to be controlled by a smoke detection system installed in the corridor .~~
5. ~~Where a total-coverage smoke detector system is provided within areas served by a heating, ventilation and air-conditioning (HVAC) system, smoke dampers shall be permitted to be controlled by the smoke detection system.~~

Reason: This text is redundant language and is not needed as Section 607.3.3.2 says exactly the same thing.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. 607.5.4.1-M-STRAUSBAUGH.PMGCAC.DOC

M158–12
202 (New), 608 (New), 608.1 (New)

Proponent: Timothy Burgos, InterCode Incorporated, representing 3M Company

Add new text as follows:

REFLECTIVE DUCT. A duct or conduit with a reflective interior surface utilized for conveying daylight or artificial light.

SECTION 608
REFLECTIVE DUCTS

608.1 Reflective Ducts. Reflective ducts that are designed and installed to provide light to the interior space of a building shall be constructed, braced, reinforced and installed to provide structural strength and durability in accordance with the requirements of Section 603. The installation of reflective ducts shall not affect the fire protection requirements specified in the *International Building Code*. Reflective ducts shall not be used for conveying air and are not required to be pressurized.

Reason: The purpose of this code change proposal is to add a new definition and section to the International Mechanical Code in order to differentiate between duct used to convey air and duct used to convey light. There are many new technologies that exist worldwide today that bring light from the exterior of a building to the interior space of a building. These technologies utilize a reflective duct to convey the light into the building. The reflective duct is similar in construction to duct used to convey air in the way it is braced, reinforced, and installed. Reflective duct differs because it is not used to condition a space. Additionally, reflective duct does not need to meet all the requirements of an air conveying duct, i.e. the insulation and pressurization requirements.

The language used to create the new Section 608.1 was adapted from Section 603 of the 2012 International Mechanical Code. The definition for reflective duct was adapted from the definition of duct found in the 2012 International Mechanical Code.

Reflective duct (the two ducts on the outside) in an open ceiling alongside a traditional HVAC duct.

Cost Impact: The code change proposal will not increase the cost of construction.

701.2 (NEW)

Proponent: Guy McMann, MCP, Jefferson County Colorado, Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gmcmann@jeffco.us)

Add new text as follows:

701.2 Dampered openings Where combustion air openings are provided with volume, smoke or fire dampers, the dampers shall be interlocked with the firing cycle of the appliances served, so as to prevent operation of any appliance that draws combustion air from the room or space when any of the dampers are closed. Manual dampers shall not be installed in combustion air ducts. Ducts not provided with dampers and that pass through rated construction shall be enclosed in a shaft in accordance with the *International Building Code*.

Reason: This is basic pertinent information that the user shouldn't have to go to the standard to figure out.

Cost Impact: None

M159-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

702(NEW)-M-MCMANN.DOC

M160–12
802.9

Proponent: Guy McMann, MCP, Jefferson County Colorado, Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gmcmann@jeffco.us)

Add new text as follows:

802.9 Protection against physical damage. In concealed locations, where a vent is installed through holes or notches in studs, joists, rafters or similar members less than 11/2 inches (38 mm) from the nearest edge of the member, the vent shall be protected by shield plates. Protective steel shield plates having a minimum thickness of 0.0575 inch (1.463 mm) (No. 16 gage), shall cover the area of the vent where the member is notched or bored and shall extend a minimum of 4 inches (102 mm) above sole plates, below top plates and to each side of a stud, joist or rafter.

Reason: All vent piping needs to be protected from punctures and other forms of damage. This text is absent from this section and is consistent with the same subject matter in the family of PMG codes.

Cost Impact: None

901.4-M-STRAUSBAUGH.PMGCAC.DOC

M163–12
903.4(NEW)

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee and Thomas Stroud, Senior Manager of Codes & Standards for the Hearth, Patio & Barbecue Association, representing the Hearth, Patio & Barbecue Association.

Add new text as follows:

<u>**903.4 Gasketed fireplace doors.** A gasketed fireplace door shall not be installed on a factory-built fireplace except where the fireplace system has been specifically tested, *listed* and *labeled* for such use in accordance with UL 127.</u>

Reason:
Strausbaugh, PMG-CAC-Because of requirements in the IECC that require all fireplaces to be provided with gasketed doors, a great deal of controversy has resulted. Most factory-built fireplaces are not tested for use with sealed glass doors and installing such doors on fireplaces that are not tested for these doors could cause overheating of the fireplace resulting in a fire hazard. Without testing, the effect of the doors will be an unknown.

Stroud-Combustible clearances of the factory built fireplace and chimney system are determined by rigorous testing under UL 127. The addition of gasketed fireplace doors not specifically tested and listed for use with the fireplace can cause a change in the performance of the fireplace resulting in a hazardous condition.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. M164–12
908.5

Proponent: Guy Tomberlin, Fairfax County Virginia, representing Fairfax County Virginia (guy.tomberlin@fairfaxcounty.gov)

Revise as follows:

908.5 Water supply. Cooling towers, evaporative coolers and fluid coolers shall be provided with an approved water supply, sized for peak demand. The quality of water shall be provided in accordance with the equipment manufacturer's recommendations. ~~Water supplies~~ The piping system and protection of the potable water supply system shall be installed as required by the *International Plumbing Code.*

Reason: Various water resources are being utilized across the nation in many different ways. This is being done for many various reasons. Some are because of water shortages, others are in effort to simply conserve our precious resources and others are being done to constructively utilize rain water and properly treated re-use water. Technology provides us with the options for many different water reuses such as reclaimed and rainwater. This proposal clarifies that if the quality of water can be achieved then alternate sources shall be permitted. In addition if an interconnection or back up is provided with the potable system then proper cross connection contamination prevention shall be provided in accordance with the International Plumbing Code. Lastly, the piping system shall be installed according to the International Plumbing Code.

Cost Impact: reduces the cost below current requirements for the initial installation and throughout the life of the structure.

M164-12

	Assembly:	ASF	AMF	DF

908.5-M-TOMBERLIN.DOC

M165–12
908.8(NEW), Chapter 15

Proponent: Tracy Quinn, Natural Resources Defense Council, on behalf of self (tquinn@nrdc.org)

Add new text as follows:

908.8 Cooling Towers. Cooling towers greater than 150 tons in capacity shall comply with Sections 908.8.1 through 908.8.4.

908.8.1 Conductivity or Flow-based Control. Cooling towers shall include of controls that maximize the cycles of concentration based on local water quality conditions. Such controls shall automate system bleed and chemical feed based on conductivityor in proportion to metered makeup volume, metered bleed volume, or bleed time.

908.8.2 Flow Meter. A water meter or sub-meter shall be installed to measure the volume of makeup water entering the cooling tower. Where both potable and non-potable water are supplied to the tower, a meter or sub-meter shall be installed to measure each source separately.

908.8.3 Overflow Alarm. Cooling towers shall include of an overflow alarm to prevent overflow of the sump in case of makeup water valve failure. Such overflow alarm shall send an audible signal or provide an alert by means of the Building Management System to the tower operator in case of sump overflow.

908.8.4 Drift Eliminators. Cooling towers shall be equipped with drift eliminators that achieve drift reduction to 0.002 percent of the circulated water volume. Drift eliminators shall be tested using the Isokinetic Drift Measurement Test Cost for Water Cooling Tower – ATC – 140" testing code from the Cooling Technology Institute.

Add new standard to Chapter 15 as follows:

ATC-140-2011 Isokinetic Drift Measurement Test Cost for Water Cooling Tower – ATC-140" testing code.

Reason: This section includes water efficiency provisions for cooling towers and evaporative cooling systems that tend to waste large quantities of water.

The complexity of managing cooling systems combined with the high operational and financial cost of early failure of a cooling tower, can result in an overly conservative approach to tower bleed frequency. The codes as proposed here aim to ensure that all cooling towers covered by the IMC have the controls necessary to maximize cycles of concentration and minimize unintentional waters losses such as leaks and overflow. Below we have provided information specific to the revisions we have proposed. The information comes from a 2011 Codes and Standards Enhancement Initiative (CASE) for Cooling Tower Water Savings prepared by the California Statewide Utility Code and Standards Program on Cooling Tower Water Savings (attached), hereafter referred to as the CASE study.

Flow meter – "This measure provides a number of water-efficiency benefits. A flow meter on the makeup water line effectively submeters the cooling tower, allowing the operator to know how much water the tower is using and facilitating the identification of excessive water use due to leaks, for example."

Alarm – "Unintended water losses can occur if the standard float valve that controls the flow of makeup water in the sump fails, resulting in overflow into the sewer line. The failure of the makeup water line control also results in uncontrolled dilution and no activation of chemical feed, putting the system at risk for scale. An overflow alarm prevents these losses from going undetected for days, weeks or longer. An overflow alarm system includes a float switch and an audible electronic signaling device or notification through a building management system. Industry contacts, including cooling tower manufacturers and water treatment companies, generally indicated that the prevalence of installed overflow alarms is very low."

Drift Eliminators – "Efficient drift eliminators minimize losses due to drift, which is liquid water that is blown or splashed out of the tower during normal operations. Drift eliminators include secondary benefits, such as minimizing the spread of disease and preventing damage to adjacent property, such as parked cars, that would otherwise be splashed. According to representatives of cooling tower manufacturers, water treatment companies and drift eliminator distributors, most cooling towers have drift eliminators installed and the drift eliminators are likely to control drift losses to 0.005% or less. Current practice for new tower installations is to include drift eliminators and at least one manufacturer, Evapco, specifies equipment that limits losses to a maximum of 0.0001%." The Cooling Technology Institute (CTI) has a test code for measuring drift that should be used to meet this requirement; "Isokinetic Drift Measurement Test Cost for Water Cooling Tower – ATC – 140". The purpose of this code is to describe instrumentation and procedures for the testing and evaluation of drift from water-cooling towers. The code was revised in July 2011.

According to the CASE study, application of these code changes should result in a first year statewide water savings 32.3 million gallons in California (based on statewide annual sales of water-cooled chillers). Using the statewide average embedded energy value of 9.977 kWh/million gallons of water, the first year statewide energy savings is 323 MWh. Extracting this to an estimated national savings (based on population ratios), this code change could save 268 million gallons of water in the first year, and 2678 MWh.

Cost Impact: A cost-effectiveness analysis was performed as part of a Codes and Standards Enhancement Initiative (CASE) for Cooling Tower Water Savings, prepared by the California Statewide Utility Codes and Standards Program (attached).

From CASE: “Below are the present value costs and savings associated with the proposed measures installed on a 350 ton cooling tower over the 15 year analysis period.”

Table 11. Life Cycle Cost of Proposed Measures

Measure Name	Additional Costs- Current Measure Costs (Relative to Basecase) ($)		PV of Additional Maintenance Costs (Savings) (Relative to Basecase) (PV$)		PV of Water and Chemical Cost Savings - Per Proto Building (PV$)	LCC Per Prototype Building ($)	
	Per unit	Per Proto Building	Per unit	Per Proto Building		Based on Current Costs	Based on Post-Adoption Costs
Cooling Tower Measures	$3,624	$3,624	$0	$0	$11,165	-$7,540	-$7,540

Analysis: A review of the standard proposed for inclusion in the code, [ATC-140-2011] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

~~**918.6 Prohibited sources.** Outdoor or return air for forced air heating and cooling systems shall not be taken from the following locations:~~

1. ~~Less than 10 feet (3048 mm) from an *appliance* vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the outdoor air inlet.~~
2. ~~Where there is the presence of objectionable odors, fumes or flammable vapors; or where located less than 10 feet (3048 mm) above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.~~
3. ~~A hazardous or insanitary location or a refrigeration *machinery room* as defined in this code.~~
4. ~~A room or space, the volume of which is less than 25 percent of the entire volume served by such system. Where connected by a permanent opening having an area sized in accordance with Sections 918.2 and 918.3, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of such rooms or spaces.~~

   ~~**Exception:** The minimum volume requirement shall not apply where the amount of return air taken from~~
   ~~a room or space is less than or equal to the amount of supply air delivered to such room or space.~~

5. ~~A closet, bathroom, toilet room, kitchen, garage, boiler room, furnace room or unconditioned attic.~~

   ~~**Exceptions:**~~

   ~~5.1 Where return air intakes are located not less than 10 feet (3048 mm) from cooking appliances, and serve the kitchen area only, taking return air from a kitchen shall not be prohibited.~~
   ~~5.2 Dedicated forced-air systems serving only a garage shall not be prohibited from obtaining return air from the garage.~~
6. ~~An unconditioned crawl space by means of direct connection to the return side of a forced air system. Transfer openings in the crawl space enclosure shall not be prohibited.~~
   ~~7. A room or space containing a fuel-burning *appliance* where such room or space serves as the sole source of return air.~~

   ~~**Exceptions:**~~

   ~~7.1. This shall not apply where the fuel-burning *appliance* is a direct-vent *appliance*.~~
   ~~7.2. This shall not apply where the room or space complies with the following requirements:~~
   ~~7.2.1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6 L/W) of combined input rating of all fuelburning appliances therein.~~
   ~~7.2.2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.~~
   ~~7.2.3. Return-air inlets shall not be located within 10 feet (3048 mm) of any *appliance* firebox or draft hood in the same room or space.~~

~~7.3. This shall not apply to rooms or spaces containing solid-fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of the appliances.~~

~~**918.8 Return-air limitation.** Return air from one *dwelling unit* shall not be discharged into another *dwelling unit*.~~

918.6 Outdoor and Return air openings. Outdoor intake openings shall be located in accordance with Section 401.4. Return air openings shall be located in accordance with Section 601.5.

601.5. Return air openings. Return air openings for heating, ventilation and air conditioning systems shall comply with all of the following:

1. Openings shall not be located less than 10 feet measured in any direction from an open combustion chamber or draft hood of another appliance located in the same room or space.
2. Return air shall not be taken from a hazardous or insanitary location or a refrigeration room as defined in this code.
3. The amount of return air taken from any room or space shall be not greater than the flow rate of supply air delivered to such room or space.
4. Return and transfer openings shall be sized in accordance with the appliance or equipment manufacturers' installation instructions, ACCA Manual D or the design of the *registered design professional*.
5. Return air from one dwelling unit shall not be discharged into or taken from another dwelling unit.
6. Taking return air from a crawl space shall not be accomplished through a direct connection to the return side of a forced air furnace. Transfer openings in the crawl space enclosure shall not be prohibited.
7. Return air shall not be taken from a closet, bathroom, toilet room, kitchen, garage, boiler room, furnace room or unconditioned attic.

Exceptions:

1. Taking return air from a kitchen is not prohibited where such return air openings serve the kitchen only, and are located not less than 10 feet from the cooking appliances.
2. Dedicated forced air systems serving only the garage shall not be prohibited from obtaining return air from the garage

Reason: This is an attempt to reorganize and delete language in this section that contains outdated legacy code language. This Section is much more complicated than it needs to be as the foremost concern regarding return air is to keep contaminants out of the openings and air stream. This section is long over-due for an overhaul the intent in which is to simplify the matter.

- This section is being relocated to more central location as the subject matter applies to more than just furnaces; it applies to air conditioning and ventilation systems as well. A simple reference to this new Section is all that will be required in the new 918.6. Outdoor air intake openings are already covered in 401.4 and do not need to be duplicated here.

- Existing item 1 and 2 dealt primarily with outdoor opening which can be referenced in 401.4.

    - Existing item 3 remains in its new location.

    - Existing item 4 will literally prevent a return air opening in most bedrooms as they are usually less than 25% of the area served. There is no technical justification for this benchmark. What significance would there be between 25% and 26% that will impact the return air system? There is no need for such an arbitrary benchmark. What's really important is not to take too much air out of a room as noted in the new #3.

    - The size of any transfer should be according to design, not arbitrary, outdated numbers as in the existing #4

    - Existing 5 and 6 remain in the new location.

    - Item 7 has many problems and has been deleted in its entirety. It's a tortured approach as it attempts to describe a furnace in an enclosure with no return air duct along side a water heater all the while using the enclosure as a plenum utilizing louvered doors or openings to bring air back to the unit. This is not current practice and is prohibited. It calls for volume which is twice as much as current combustion requirements and is very difficult to explain the picture it attempts to deliver.

- Section 918.8 has been incorporated into the new location as #7.

All the usual requirements that can affect the quality and installation of return air openings are contained in this new location and in turn, simplifies the subject matter for the user. There are no new requirements.

Cost Impact: None

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

918.6-M-MCMANN.DOC

M168–12
928.1

Proponent: Guy Tomberlin, Fairfax County VA, representing Fairfax County Virginia (guy.tomberlin@fairfaxcounty.gov)

Revise as follows:

928.1 General. Evaporative coolers equipment shall:

1. Be installed in accordance with the manufactures instructions.
2. Be installed on a level platform in accordance with section 304.10.
3. Have openings in exterior walls or roofs flashed in accordance with the *International Building Code.*
4. ~~Be provided with potable water backflow protection in accordance with section 608 of the *International Plumbing Code*.~~Be provided with an approved water supply, sized for peak demand. The quality of water shall be provided in accordance with the equipment manufacturer's recommendations. The piping system and protection of the potable water supply system shall be installed as required by the *International Plumbing Code*.
5. Have air intake opening locations in accordance with Section 401.4.

Reason: This is consistent action in accordance with the proposal submitted to Section 908 for cooling towers. Various water resources are being utilized across the nation in many different ways. This is being done for many various reasons. Some are because of water shortages, others are in effort to simply conserve our precious resources and others are being done to constructively utilize rain water and properly treated re-use water. Technology provides us with the options for many different water reuses such as reclaimed and rainwater. This proposal clarifies that if the quality of water can be achieved then alternate sources shall be permitted. In addition if an interconnection or back up is provided with the potable system then proper cross connection contamination prevention shall be provided in accordance with the International Plumbing Code. Lastly, the piping system shall be installed according to the International Plumbing Code.

Cost Impact: reduces the cost below current requirements for the initial installation and throughout the life of the structure.

M168-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

928.1-M-TOMBERLIN.DOC

M169–12
923.1

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

THIS IS A 2 PART CODE CHANGE, BOTH PARTS WILL BE HEARD BY THE IMC COMMITTEE AS 2 SEPARATE CODE CHANGES, SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE.

PART I-IMC

Revise as follows:

SECTION 923
~~SMALL~~ CERAMIC KILNS

923.1 General. ~~The provisions of this section shall apply to kilns that are used for ceramics, have a maximum interior volume of 20 cubic feet (0.566 m^3) and are used for hobby and noncommercial purposes~~. Kilns shall be listed and labeled unless otherwise approved in accordance with Section 105.2. Electric kilns shall comply with UL 499. The approval of unlisted appliances in accordance with Section 105.2 shall be based upon approved engineering evaluation.

Reason: The code is silent on kilns over 20 cubic feet in volume. For example, if someone wanted to construct a very large gas-fired kiln, the code would provide no guidance and such appliance would likely be unlisted. A similar change is proposed for the IFGC.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

PART II-IFGC

SECTION 629
~~SMALL~~ CERAMIC KILNS

629.1 General. ~~Ceramic~~ Kilns ~~with a maximum interior volume of 20 cubic feet and used for hobby and noncommercial purposes~~ shall be installed in accordance with the manufacturer's ~~installation~~ instructions and the provisions of this code. Kilns shall comply with Section 301.3

Reason: The code is silent on kilns over 20 cubic feet in volume. For example, if someone wanted to construct a very large gas-fired kiln, the code would provide no guidance and such appliance would likely be unlisted. A similar change is proposed for the IMC.

Cost Impact: None

M169-12
PART I-IMC

PART II-IFGC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

923.1-M-STRAUSBAUGH.PMGCAC.DOC

M170–12
1001.1

Proponent: Guy McMann, MCP, Jefferson County Colorado, Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gmcmann@jeffco.us)

Revise as follows:

SECTION 1001
GENERAL

1001.1 Scope. This chapter shall govern the installation, alteration and repair of boilers, water heaters and pressure vessels.

Exceptions:

1. Pressure vessels used for unheated water supply.
2. Portable unfired pressure vessels and Interstate Commerce Commission containers.
3. Containers for bulk oxygen and medical gas.
4. Unfired pressure vessels having a volume of 5 cubic feet (0.14 m3) or less operating at pressures not exceeding 250 pounds per square inch (psi) (1724 kPa) and located within occupancies of Groups B, F, H, M, R, S and U.
5. Pressure vessels used in refrigeration systems that are regulated by Chapter 11 of this code.
6. Pressure tanks used in conjunction with coaxial cables, telephone cables, power cables and other similar humidity control systems.
7. ~~Any boiler or pressure vessel subject to inspection by federal or state inspectors.~~

Reason: This is not a code requirement. It's a given that Federal and State requirements can trump local codes and this would occur for more than just boilers. If this is absent from the code nothing changes. Why is this language only in Chapter 10? It should be in Chapter 1 if anywhere as this is administrative in nature. This would need to be in each chapter to be effective which doesn't make much sense.

Cost Impact: None

M170-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1001.1-M-MCMANN.DOC

M171–12
1003.1

Proponent: Gary L. Scribner, Deputy Chief, Missouri Division of Fire Safety, representing the National Board of Boiler & Pressure Vessel Inspectors
(gary.scribner@dfs.dps.mo.gov)

Revise as follows:

1003.1 General. All pressure vessels, unless otherwise *approved* shall be constructed and certified in accordance with the ASME *Boiler and Pressure Vessel Codes,* ~~*shall bear the label of an approved agency*~~ and shall be installed in accordance with the manufacturer's instructions and nationally recognized standards. Directly fired pressure vessels shall meet the requirements of Section 1004.

Reason: This proposal provides language as contained in the ASME Boiler and Pressure Vessel Codes and gives the authority having jurisdiction the ability to approve other constructions while still adopting the IMC.

Cost Impact: The code change proposal will not increase the cost of construction.

M171-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1003.1-M-SCRIBNER.DOC

M172– 12
1003.3, Chapter 15

Proponent: Gary L. Scribner, Deputy Chief, Missouri Division of Fire Safety, representing the National Board of Boiler & Pressure Vessel Inspectors
(gary.scribner@dfs.dps.mo.gov)

Revise as follows:

1003.3 Welding. Welding on pressure vessels shall be performed by ~~*approved* welders in compliance with nationally recognized standards.~~ an R-Stamp holder in accordance with the *National Board Inspection Code, Part 3* or in accordance with an *approved* standard.

Add new standard to Chapter 15 as follows:

National Board Inspection Code 2011, Part 3

Reason: The National Board R- Stamp program is the only nationally recognized standard for weld repairs and/or alterations to boilers and pressure vessels. The standard is also required by the U.S. Department of Transportation. Some state and local jurisdictions do have modified versions of the R stamp program that they utilize; the proposed wording covers both possibilities while clearly stating the nationally recognized standard.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [National Board Inspection Code 2011, Part 3] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

M172-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1003.3-M-SCRIBNER.DOC

M173–12
1004.1

Proponent: Gary L. Scribner, Deputy Chief, Missouri Division of Fire Safety, representing the National Board of Boiler & Pressure Vessel Inspectors
(gary.scribner@dfs.dps.mo.gov)

Revise as follows:

1004.1 Standards. ~~Oil-fired boilers and their control systems shall be listed and labeled in accordance with UL 726. Electric boilers and their control systems shall be listed and labeled in accordance with UL 834. Solid-fuel-fired boilers shall be listed and labeled in accordance with UL 2523. Boilers shall be designed and constructed in accordance with the requirements of ASME CSD-1 and as applicable, the ASME *Boiler and Pressure Vessel Code*, Section I or IV; NFPA 8501; NFPA 8502 or NFPA 8504.~~ Boilers shall be designed, constructed and certified in accordance with the ASME *Boiler and Pressure Vessel Code*, Section I or IV. Controls and safety devices for boilers with fuel input ratings of 12,500,000 Btu/hr or less shall meet the requirements of ASME *CSD-1.* Controls and Safety devices for boilers with inputs greater than 12,500,000 shall meet the requirements of *NFPA 85.* Package oil fired boilers shall be listed and labeled in accordance with *UL 726* or other *approved* standard. Packaged electric boilers shall be listed and labeled in accordance with *UL 834* or other *approved* standard.

Reason: Current wording is not correct since ASME CSD-1 is not a construction standard. The proposed wording starts with the vessel construction requirements and continues with the acceptable standards for complete appliances. The proposed wording is no change from the intent of the previous wording. NFPA 8501, 8502 & 8504 have been combined into NFPA 85.

Cost Impact: The code change proposal will not increase the cost of construction.

M173-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1004.1-M-SCRIBNER.doc

M174–12
1006.8

Proponent: Gary L. Scribner, Deputy Chief, Missouri Division of Fire Safety, representing the National Board of Boiler & Pressure Vessel Inspectors
(gary.scribner@dfs.dps.mo.gov)

Revise as follows:

1006.8 Electrical requirements. The power supply to the electrical control system shall be from a two-wire branch circuit that has a grounded conductor, or from an isolation transformer with a two-wire secondary. Where an isolation transformer is provided, one conductor of the secondary winding shall be grounded. Control voltage shall not exceed 150 volts nominal, line to line. Control and limit devices shall interrupt the ungrounded side of the circuit. A means to manually disconnecting the control circuit shall be provided, and controls shall be arranged so that when deenergized, the burner shall be inoperative. Such means shall be capable of being locked in the off position and shall be provided with ready access. A manually operated remote shutdown switch or circuit breaker shall be installed at an *approved* location.

Reason: The proposed wording clarifies an important electrical requirement that is already in codes that are referenced by the IMC. (ASME CSD-1).

Cost Impact: The code change proposal will not increase the cost of construction.

M174-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1006.8-M-SCRIBNER.DOC

M175–12
1007.1, 1007.2, 1007.3

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

1007.1 General. ~~All~~ Steam and hot water boilers shall be protected with a low-water cutoff control except as required by Section 1007.2.

1007.2 Flow sensing control. Coil-type and water-tube-type boilers that require forced circulation of water through the boiler shall be protected with a flow sensing control.

1007.~~2~~ 3 Operation. ~~The~~ Low-water cutoff controls and flow sensing controls required by Sections 1007.1 and 1007.2 shall automatically stop the combustion operation of the appliance when the water level drops below the lowest safe water level as established by the manufacturer or when water circulation stops, respectively.

Reason: There is no exception to Section 1007.1 for coil-type hot water supply boilers that require forced circulation and use flow switches to stop combustion when water flow is lost. Flow switches that monitor forced circulation through a water tube- or coil-type boiler provide the same function as a low-water cutoff and should be recognized as an alternative to a low-water cutoff.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

M175-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1007.1-M-STRAUSBAUGH.PMGCAC.DOC

M176–12
1008, 1008.1

Proponent: Gary L. Scribner, Deputy Chief, Missouri Division of Fire Safety, representing the National Board of Boiler & Pressure Vessel Inspectors
(gary.scribner@dfs.dps.mo.gov)

Revise as follows:

SECTION 1008
~~STEAM~~ BOTTOM BLOWOFF VALVE

Revise as follows:

1008.1 General. Every steam boiler shall be equipped with ~~a quick-opening blowoff valve.~~ bottom blowoff valve(s). The valve(s) shall be installed in the opening provided on the boiler. The minimum size of the valve(s) and associated piping shall be the size specified by the boiler manufacturer or the size of the boiler blowoff-valve opening. Where the maximum allowable working pressure of the boiler exceeds 100 psig, two bottom blowoff valves shall be provided consisting of either two slow opening valves in series or one quick opening valve and one slow opening in series with the quick opening valve installed closest to the boiler.

Reason: The proposed wording clarifies the type of valve. The term steam blowoff valve is confused with a safety or safety relieve valve. The proposed wording is consistent with *ASME Boiler & Pressure Vessel Codes* and the *National Board Inspection Code*. The proposed wording is consistent with *ASME Boiler & Pressure Vessel Codes* and *ASME Code for Pressure Piping.* (B31.1).

Cost Impact: This proposed change could have a cost impact of $200 to $2000 depending on the size of the boiler. The cost would include the cost of the valve and labor to install it. Boiler systems that are designed in accordance with the ASME Boiler & Pressure Vessel codes would not be impacted since they already meet this requirement.

M176-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1008-1008.1-M-SCRIBNER.DOC

M177–12
1009.2

Proponent: Gary L. Scribner, State of Missouri/Missouri Division of Fire Safety, the National Board of Boiler & Pressure Vessel Inspectors
(gary.scribner@dfs.dps.mo.gov)

Revise as follows:

1009.2 Closed-type expansion tanks. Closed-type expansion tanks shall be installed in accordance with the manufacturer's instructions. Expansion tanks for systems designed to have an operating pressure in excess of 30 psi shall be constructed and certified in accordance with the ASME *Boiler and Pressure Vessel Codes.* The size of the tank shall be based on the capacity of the hot-water-heating system. The minimum size of the tank shall be determined in accordance with the following equation where all necessary information is known:

(Portions of text not shown remain unchanged.)

The minimum size of the tank shall be determined from Table 1009.2 where all necessary information is not known:

TABLE 1009.2
CLOSED-TYPE EXPANSION TANK SIZING

System Volume In gallons	Tank Capacities in gallons	
	Pressurized Diaphragm Type	Non-Pressurized Type
100	9	15
200	17	30
300	25	45
400	33	60
500	42	75
1,000	83	150
2,000	165	300

Reason: The proposed wording is consistent with *ASME Boiler & Pressure Vessel Codes* Section IV, Paragraph HG-709.2 & Table 709.2.

Cost Impact: The code change proposal will not increase the cost of construction.

M177-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1009.2-M-SCRIBNER.DOC

M178–12
1011.1

Proponent: Gary L. Scribner, Deputy Chief, Missouri Division of Fire Safety, representing the National Board of Boiler & Pressure Vessel Inspectors
(gary.scribner@dfs.dps.mo.gov)

Revise as follows:

1011.1 Tests. Upon completion of the assembly and installation of boilers and pressure vessels, acceptance tests shall be conducted in accordance with the requirements of the ASME *Boiler and Pressure Vessel Code* or the manufacturer's requirements and such tests shall be *approved*. ~~Where field assembly of pressure vessels or boilers is required, a copy of the completed U-1 Manufacturer's Data Report required by the *ASME Boiler & Pressure Vessel Code* shall be submitted to the code official.~~ A copy of all test documents along with all manufacturer's data reports required by the ASME *Boiler and Pressure Vessel Codes* shall be submitted to the code official.

Reason: Current wording requires a form U1-a which is an ASME manufacturer's data report for a pressure vessel only. There are several manufacturer's data reports depending on the type of vessel and the section of the code the vessel was built to. The proposed meets the current intent of the code without detailing each form required for each type of vessel.

Cost Impact: The code change proposal will not increase the cost of construction.

M178-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1011.1-M-SCRIBNER.DOC

M179–12
1101.10

Proponent: David R. Scott, AIA, representing Target Corporation. (David.Scott@Target.com)

Revise as follows:

1101.10 Locking access port caps. Refrigerant circuit access ports located outdoors shall be fitted with locking-type tamper-resistant caps or shall be otherwise secured to prevent unauthorized access.

> <u>**Exception:** This section shall not apply to refrigerant circuit access ports on equipment installed in controlled areas such as on roof tops with locked and alarmed access hatches or doors.</u>

Reason: Building roofs that secure equipment by means of locked and alarmed devices prevent unauthorized access to such areas.

Cost Impact: The code change proposal will not increase the cost of construction.

M179-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1101.10-M-SCOTT.DOC

M180-12
1101.10

Proponent: Claude Kennedy, Oregon Mechanical Officials Association
(ckennedy@cityofsalem.net)

Revise as follows:

1101.10 Locking access port caps. Refrigerant circuit access ports located outdoors shall be fitted with locking-type tamper-resistant caps or shall be otherwise secured to prevent unauthorized access.

> **Exception:** Refrigerant circuit access ports on roof top units not accessible to the public.

Reason: The purpose of this section is to prevent the inappropriate usage of refrigerant by the public by making access to the refrigerant access ports difficult if not impossible. We feel that placing units in these locations makes access to the ports difficult if not impossible.

Cost Impact: Savings due to not requiring installation of locking caps in unnecessary locations.

M180-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1107.1-M-KENNEDY.DOC

M181–12
1102.3 (NEW)

Proponent: Mona Casey, Founder, United Parents to Restrict Open Access to Refrigerant

Add new text as follows:

1102.3 Access port protection. Refrigerant access ports shall be protected in accordance with Section 1101.10 whenever refrigerant is added to or recovered from refrigeration or air conditioning systems.

Reason: The purpose of the code change proposal is to add requirements to the code for securing refrigerant access ports whenever intrusive access to the refrigeration or air conditioning units are necessary for adding or recovering refrigerant. This change compliments the current requirements in the code.

Cost Impact: The code change proposal will increase the cost of construction.

M181-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1102.3(NEW)-M-CASEY.DOC

M182–12
202, Table 1103.1, 1104.1

Proponent: Steve Ferguson, representing the American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE**)**

Revise as follows:

SECTION 202
GENERAL DEFINITIONS

FLAMMABILITY CLASSIFICATION. Refrigerants shall be assigned to one of the three classes—1, 2 or 3— and one optional subclass (2L), in accordance with ASHRAE 34. For Classes 2, 2L, and 3, the heat of *combustion* shall be calculated assuming that *combustion* products are in the gas phase and in their most stable state.

> **Class 1.** Refrigerants that do not show flame propagation when tested in air at 14.7 psia (101 kPa) and ~~70~~ 140ºF (~~21~~ 60ºC).
>
> **Class 2.** Refrigerants having a lower flammability limit (LFL) of more than 0.00625 pound per cubic foot (0.10 kg/m$_3$) at ~~70~~ 140ºF (~~21~~ 60ºC) and 14.7 psia (101 kPa) and a heat of *combustion* of less than ~~8,174~~ 8169 Btu/lb (19 000 kJ/kg).
>
> > **Subclass 2L (Optional),** Refrigerants that meet the additional condition of having a maximum burning velocity of less than or equal to 3.9 in/s (10 cm/s) when tested at 73.4 ºF (23ºC) and 14.7 psia (101.3 kPa).
>
> **Class 3.** Refrigerants that are highly flammable, having a LFL of less than or equal to 0.00625 pound per cubic foot (0.10 kg/m$_3$) at ~~70~~ 140ºF (~~21~~ 60ºC) and 14.7 psia (101 kPa) or a heat of *combustion* greater than or equal to ~~8,174~~ 8169 Btu/lb (19 000 kJ/kg).

OCCUPATIONAL EXPOSURE LIMIT (OEL). The time-weighted average (TWA) concentration for a normal eight-hour workday and a 40-hour workweek to which nearly all workers can be repeatedly exposed without adverse effect, based on the OSHA PEL, ACGIH TLV-TWA, AIHA WEEL, or consistent value.

REFRIGERANT SAFETY CLASSIFICATIONS. Groupings that indicate the toxicity and flammability classes in accordance with Section 1103.1. The classification group is made up of a letter (A or B) that indicates the toxicity class, followed by ~~a number~~ one or two alphanumeric characters (1, 2, 2L or 3) that indicates the flammability class. Refrigerant blends are similarly classified, based on the compositions at their worst cases of fractionation, as separately determined for toxicity and flammability. In some cases, the worst case of fractionation is the original formulation.

> **Flammability.** See "FLAMMABILITY CLASSIFICATION" ~~Class 1 indicates refrigerants that do not show flame propagation in air when tested by prescribed methods at specified conditions. Classes 2 and 3 signify refrigerants with "lower flammability" and "higher flammability," respectively; the distinction depends on both the LFL and heat of *combustion*.~~
>
> **Toxicity.** See "TOXICITY CLASSIFICATION". ~~Classes A and B signify refrigerants with "lower toxicity" and "higher toxicity," respectively, based on prescribed measures of chronic (long-term, repeated exposures) toxicity.~~

TOXICITY CLASSIFICATION. Refrigerants shall be classified for toxicity to one of two classes in accordance with ASHRAE 34:

> **Class A.** Refrigerants ~~for which toxicity has not been identified at concentrations~~ that have an occupational exposure limit (OEL) of ~~less than or equal to~~ 400 parts per million (ppm) or greater.~~, based on data used to determine Threshold Limit Value-Time-Weighted Average (TLVTWA) or consistent indices.~~
>
> **Class B.** Refrigerants ~~for which there is evidence of toxicity at concentrations below~~ that have an OEL of less than 400 ppm.~~, based on data used to determine TLV-TWA or consistent indices.~~

R-1150	$CH_2=CH_2$	ethene (ethylene)	A3	1-4-2	—	—	—	200
R-1234yf	$CF_3CF=CH_2$	2,3,3,3-tetrafluoro-1 propene	A2L	—	4.7	16,000	75	500
R-1234ze(E)	$CF_3CH=CHF$	trans-1,3,3,3-tetrafluoro-1-propene	A2L	-	4.7	16,000	75	800
R-1270	$CH_3CH=CH_2$	~~P~~propene (propylene)	A3	1-4-1	0.11	1,000	1.7	500

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.0283 m^3.

a. Degrees of hazard are for health, fire, and reactivity, respectively, in accordance with NFPA 704.
b. Reduction to 1-0-0 is allowed if analysis satisfactory to the code official shows that the maximum concentration for a rupture or full loss of refrigerant charge would not exceed the IDLH, considering both the refrigerant quantity and room volume.
c. For installations that are entirely outdoors, use 3-1-0.
d. Class I ozone depleting substance; prohibited for new installations.
e. Occupational Exposure Limit based on the OSHA PEL, ACGIH TLV-TWA, the AIHA WEEL or consistent value on a time-weighted average (TWA) basis (unless noted C for ceiling) for an 8 hr/d and 40 hr/wk.

SECTION 1104
SYSTEM APPLICATION REQUIREMENTS

1104.1 General. The refrigerant, *occupancy* and system classification cited in this section shall be determined in accordance with Sections 1103.1, 1103.2 and 1103.3, respectively. ~~For refrigerant blends assigned dual classifications, as formulated and for the worst case of fractionation, the classifications for the worst case of fractionation shall be used.~~

Reason: ASHRAE recently added a new flammability classification, "2L", to ANSI/ASHRAE Standard 34, Designation and Safety Classification of Refrigerants. Refrigerants classified as 2L meet the requirements for class 2 refrigerants and have a burning velocity of less than 3.9 in/s (10 cm/s). These refrigerants, while flammable, are difficult to ignite and have unstable flames that are easy to extinguish. The new classification was established to differentiate these refrigerants from other Class 2 refrigerants that burn more rapidly and present a larger risk if ignited. This change was precipitated by the need for refrigerants with a lower global warming potential, some of which are mildly flammable. A separate code change proposal is being submitted by ASHRAE based on changes to Standard 15, Safety Standard for Refrigeration Systems, that will provide the requirements for the use of class 2L refrigerants. The changes resulting from the additional of the new safety classification are included below along with other changes to update the IMC with new refrigerants and to correct some of the data in Table 1103.1.

Section 202, GENERAL DEFINITIONS

The definition of FLAMMABILITY CLASSIFICATION is being updated to include the 2L classification. This is being added as an optional subclass of Class 2 so that only those manufacturers that want their refrigerant classified as 2L will have to measure the burning velocity. The test temperature for determining flame propagation and for measuring the LFL of a refrigerant has been increased to be consistent to be consistent with common practice today and with the requirements of ANSI/ASHRAE Standard 34. The higher test temperature is a more conservative measure of the LFL.

The DEFINITION OF TOXICITY CLASSIFICATION is being modified to make it easier to understand. This is an editorial change and does not result in a change to the toxicity classification of any refrigerants in table 1103.1

A definition of OCCUPATIONAL EXPOSURE LIMITS (OEL) is being added because it used to determine the toxicity classification of a refrigerant. This is a generic term, and allows the use of OELs from various organizations that evaluate the toxicity of refrigerants and publish exposure limits, e.g. Workplace Environmental Exposure Limit (WEEL) from the American Industrial Hygiene Association (AHIA), Threshold Limit Values – Time Weighted Average (TLV-TWA) from the American Conference of Governmental Industrial Hygienists (ACGIH), Permissible Exposure Limits (PEL) from the National Institute for Occupational Safety and Health (NIOSH).

The definition for REFRIGERANT SAFETY CLASSIFICATIONS is being updated to include the new 2L flammability safety classification. The portions of this definition related to flammability classification and toxicity classification refer the reader to the other definitions rather than repeating the information as part of this definition as is done in the 2012 IMC.

Table 1103.1 REFRIGERANT CLASSIFICATION, AMOUNT AND OEL

Several new refrigerants have been developed to replace ozone depleting substances and/or to replace refrigerants with a high global warming potential. Nine refrigerants have been added to ANSI/ASHRAE Standard 34 since publication of the 2012 IMC. These refrigerants are: R-407F, R-417B, R-439A, R-440A, R-441A, R-442A, R-511A, R-512A, and R-1234ze(E)

Corrections were made to the amount of refrigerant per occupied space for R-152a, R-E170, R-402A, R-415A, R-415B, R-417B, R-418A, R-419A, R-422B, R-436A, R-436B, R-437A, R-511A, R-512A, R-600, R-600a, R-601, R-601a, and R-1270. These changes are being made to correct errors in the 2012 IMC.

The cardiac sensitization NOEL for R-32 has been changed from 200,000 ppm to 350,000 ppm based on more recent studies using acceptable GLP methodology. This had no effect on the amount of refrigerant per occupied space for R-32 but did result in changes to the amount of refrigerant per occupied space for refrigerant blends containing R-32 and these have been changed accordingly (i.e. R-407A, R-407B, R-407C, R-407D, R-407E, R-410A, R-410B, R-425A, R-427A, R-438A, and R-504).

The flammability safety classifications for R-32, R-143a, R-717, and R-1234yf have been changed from 2 to 2L to reflect the addition of this new classification to ASHRAE Standard 34 for refrigerants which meet the criteria for class 2 and have a burning velocity of 3.9 in/s (10cm/s). One new refrigerant, R-1234ze(E), also has a flammability classification of 2L.

The compositions of several refrigerant blends have been updated to include the appropriate number of significant figures.

SECTION 1104, SYSTEM APPLIATION REQUIREMENTS

The sentence referring to refrigerant blends with dual classifications is being deleted since the industry no longer assigns dual classifications to refrigerant blends. Today, the worst case fractionated formulation is used to determine a single safety classification for refrigerant blends and therefore the bends have a single classification.

Cost Impact: The code change proposal will not increase the cost of construction.

202-FLAMMABILITY CLASSIFICATION-M-FERGUSON.DOC

M183–12
1104.4.1

Proponent: Paul L. Doppel, Director of Industry and Government Relations, Mitsubishi Electric and Electronics USA, Inc., representing himself
(pdoppel@hvac.mea.com)

Revise as follows:

1104.4.1 Noncommunicating spaces. Where the refrigerant-containing parts of a system are located in one or more spaces that do not communicate through permanent openings or HVAC ducts, the volume of the smallest enclosed occupied space shall be used to determine the permissible quantity of refrigerant in the system. <u>Where two enclosed occupied spaces communicate through openings such as under-cut doors or transfer grilles and such openings have an area of 0.15% or more of the total floor area of the smaller enclosed occupied space in which refrigerant-containing parts are located, the two spaces shall be considered as one space.</u>

Reason: Paragraph 1104.4.1, as written, does not give enough guidance as to the allowable opening, other than HV AC ducts that allow two spaces to be considered as communication spaces. The proposed addition is based on JAPANESE STANDARD; JRA-GL13. The specific reference to"0.15% of the floor area" is used in the Mitsubishi Electric Data Book for the Mitsubishi Variable Refrigerant Flow systems as guidance for engineers using these VRF systems. This reference has been in the Mitsubishi data books and engineering manuals for many years.

Cost Impact: The code change proposal will not increase the cost of construction.

M183-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1104.4.1-M-DOPPEL.DOC

M184–12
1106.3

Proponent: Jeffrey Shapiro, International Code Consultants, representing International Institute of Ammonia Refrigeration
(jeff.shapiro@intlcodeconsultants.com)

Revise as follows:

1106.3 Ammonia room ventilation. Ventilation systems in ammonia machinery rooms shall be operated continuously at the ~~emergency~~ ventilation rate specified in ~~determined in~~ ~~accordance with~~ Section 1105.6.3~~.2~~.

Exceptions:

1. Machinery rooms equipped with a vapor detector that will automatically start the ventilation system at the ~~emergency~~ ventilation rate specified in ~~determined in accordance with~~ Section 1105.6.3~~.2~~, and that will actuate an alarm at a detection level not to exceed 1,000 ppm; or
2. Machinery rooms conforming to the Class 1, Division 2, *hazardous location* classification requirements of NFPA 70.

Reason: Editorial correction. A change to the 2009 code revised the ventilation rate requirements for ammonia, and the provisions are now contained in Section 1105.6.3.

Cost Impact: The code change proposal will not increase the cost of construction.

M184-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1106.3-M-SHAPIRO.DOC

M185–12
1107.1, Chapter 15

Proponent: Walter J. Sperko, Sperko Engineering Services, Inc. representing Mechanical Contractors Association of America
(Sperko@asme.org)

Revise as follows:

1107.1 General. <u>The design of refrigerant piping shall be in accordance with ASME B31.5.</u> ~~All~~ Refrigerant piping shall be installed, tested and placed in operation in accordance with this chapter.

Add new standard to Chapter 15 as follows:

<u>ASME B31.5-2001 Refrigerant Piping and Heat Transfer Components</u>

Reason: The present rules have no requirements for design, analysis, supports, stress limits or anything else regarding design of refrigerant piping. B31.5 is specifically written for refrigeration piping and provides appropriate design requirements. The addition of this requirement does not conflict with existing requirements in this chapter since it only governs design of the piping.

Cost Impact: None. Designers should be following B31.5 or similar standard already. Jurisdiction will not have to buy copies of B31.5 since the engineer will have to have a copy to demonstrate compliance and the change would not affect installation requirements.

Analysis: A review of the standard proposed for inclusion in the code, [ASME B31.5-2001] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

	Assembly:	ASF	AMF	DF

1107.1-M-SPERKO.DOC

M186–12
1201.1

Proponent: Ed Flanagan/Mike Quiroz for Tim Sharp, Business Manager/Secretary-Treasurer, Alaska District Council of Laborers, representing the local unions and members of the Laborers Int'l Union of North America in the state of Alaska

Revise as follows:

1201.1 Scope. The provisions of this chapter shall govern the construction, installation, alteration and repair of hydronic piping systems within buildings. This chapter shall apply to hydronic piping systems that are within buildings and that are part of heating, ventilation, and air conditioning systems. Such piping systems shall include steam, hot water, chilled water, and steam condensate ~~and ground source heat pump loop~~ systems. Potable cold and hot water distribution systems shall be installed in accordance with the International Plumbing Code.

Reason: Some jurisdictions have interpreted the scope of Chapter 12 to assert applicability of the IMC to the loop fields associated with Ground Source Heat Pump installations. The IMC should regulate the pump and interior hydronic piping associated with it, but not the exterior piping of the earth connection/loop field.

Cost Impact: Costs to building or project owners should be reduced due to the cost effectiveness and efficiency gained by allowing general or utility contractors and their qualified workers (Laborer Pipelayers) to perform the heat fusion and installation of this exterior piping.

Proponent: Michael Cudahy, Plastic Pipe and Fittings Association
(mikec@cmservnet.com)

Revise as follows:

TABLE 1202.4
HYDRONIC PIPE

MATERIAL	STANDARD (see Chapter 15)
~~Polyethylene (PE) pipe, tubing and fittings (for ground source heat pump loop systems)~~	~~ASTM D 2513; ASTM D 3035; ASTM D 2447; ASTM D 2683; ASTM F 1055; ASTM D 2837; ASTM D 3350; ASTM D 1693~~

Portions of table not shown remain unchanged

~~**1203.15 Polyethylene plastic pipe and tubing for ground source heat pump loop systems.** Joints between polyethylene plastic pipe and tubing or fittings for ground source heat pump loop systems shall be heat fusion joints conforming to Section 1203.15.1, electrofusion joints conforming to Section 1203.15.2, or stab-type insertion joints conforming to Section 1203.15.3.~~

~~**1203.15.1 Heat-fusion joints.** Joints shall be of the socket-fusion, saddle-fusion or butt-fusion type, joined in accordance with ASTM D 2657. Joint surfaces shall be clean and free of moisture. Joint surfaces shall be heated to melt temperatures and joined. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM D 2683 or ASTM D 3261.~~

~~**1203.15.2 Electrofusion joints.** Joints shall be of the electrofusion type. Joint surfaces shall be clean and free of moisture, and scoured to expose virgin resin. Joint surfaces shall be heated to melt temperatures for the period of time specified by the manufacturer. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM F 1055.~~

~~**1203.15.3 Stab-type insert fittings.** Joint surfaces shall be clean and free of moisture. Pipe ends shall be chamfered and inserted into the fittings to full depth. Fittings shall be manufactured in accordance with ASTM F 1924.~~

SECTION 1208
TESTS

1208.1 General. Hydronic piping systems ~~other than groundsource heat pump loop systems~~ shall be tested hydrostatically at one and one-half times the maximum system design pressure, but not less than 100 psi (689 kPa). The duration of each test shall be not less than 15 minutes, but not more than 20 minutes. ~~Ground-source heat pump loop systems shall be tested in accordance with Section 1208.1.1.~~

~~**1208.1.1 Ground source heat pump loop systems.** Before connection (header) trenches are backfilled, the assembled loop system shall be pressure tested with water at 100 psi (689 kPa) for 30 minutes with no observed leaks. Flow and pressure loss testing shall be performed and the actual flow rates and pressure drops shall be compared to the calculated design values. If actual flow rate or pressure drop values differ from calculated design values by more than 10 percent, the problem shall be identified and corrected.~~

SECTION 1210
GROUND-SOURCE HEAT PUMP LOOP SYSTEMS

1210.1 Ground-Source Heat Pump-Loop Water Piping. Ground source heat pump ground loop-piping and tubing material for water-based systems shall conform to the standards cited in this section.

1210.2 Used materials. Reused pipe, fittings, valves, and other materials shall not be permitted in ground-source heat pump loop systems.

1210.3 Material rating. Pipe and tubing shall be rated for the operating temperature and pressure of the ground source heat pump-loop system. Fittings shall be suitable for the pressure applications and recommended by the manufacturer for installation with the pipe and tubing material installed. Where used underground, materials shall be suitable for burial.

1210.4 Piping and tubing materials standards. Ground source heat pump ground-loop pipe and tubing shall conform to the standards listed in Table 1210.4.

TABLE 1210.4
GROUND SOURCE LOOP PIPE

MATERIAL	STANDARD (see Chapter 15)
Chlorinated polyvinyl chloride (CPVC)	ASTM D2846; ASTM F441; ASTM F442

SECTION 1211
JOINTS AND CONNECTIONS

1211.1 Approval. Joints and connections shall be of an approved type. Joints and connections shall be tight for the pressure of the ground source -loop system. Joints used underground shall be approved for buried applications.

1211.1.1 Joints between different piping materials. Joints between different piping materials shall be made with approved transition fittings.

1211.2 Preparation of pipe ends. Pipe shall be cut square, reamed, and shall be free of burrs and obstructions. CPVC, PE, and PVC pipe shall be chamfered. Pipe ends shall have full-bore openings and shall not be undercut.

1211.3 Joint preparation and installation. Where required by Sections 1211.4 through 1211.6, the preparation and installation of mechanical and thermoplastic-welded joints shall comply with Sections 1211.3.1 and 1211.3.2.

1211.3.1 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer's instructions.

1211.3.2 Thermoplastic-welded joints. Joint surfaces for thermo plastic-welded joints shall be cleaned by an approved procedure. Joints shall be welded in accordance with the manufacturer's instructions.

1211.4 CPVC plastic pipe. Joints between CPVC plastic pipe or fittings shall be solvent-cemented or threaded joints complying with Section 1203.3.

1211.5 Cross-linked polyethylene (PEX) plastic tubing. Joints between cross-linked polyethylene plastic tubing and fittings shall comply with Sections 1211.4.1 and 1211.4.2. Mechanical joints shall comply with Section 1211.3.

1211.5.1 Compression-type fittings. Where compression- type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

1211.5.2 Plastic-to-metal connections. Soldering on the metal portion of the system shall be performed at least 18 inches (457 mm) from a plastic-to-metal adapter in the same water line.

1211.6 Polyethylene plastic pipe and tubing for ground source heat pump loop systems. Joints between polyethylene plastic pipe and tubing or fittings for ground source heat pump loop systems shall be heat fusion joints complying with Section 1211.6.1, electrofusion joints complying with Section 1211.6.2, or stab-type insertion joints complying with Section 1211.6.3.

1211.6.1 Heat-fusion joints. Joints shall be of the socket-fusion, saddle-fusion or butt-fusion type, joined in accordance with ASTM D 2657. Joint surfaces shall be clean and free of moisture. Joint surfaces shall be heated to melt temperatures and joined. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM D 2683 or ASTM D 3261.

1211.6.2 Electrofusion joints. Joints shall be of the electrofusion type. Joint surfaces shall be clean and free of moisture, and scoured to expose virgin resin. Joint surfaces shall be heated to melt temperatures for the period of time specified by the manufacturer. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM F 1055.

1211.6.3 Stab-type insert fittings. Joint surfaces shall be clean and free of moisture. Pipe ends shall be chamfered and inserted into the fittings to full depth. Fittings shall be manufactured in accordance with ASTM F 1924.

1211.7 Polypropylene (PP) plastic. Joints between PP plastic pipe and fittings shall comply with Sections 1211.7.1 and 1211.7.2.

1211.7.1 Heat-fusion joints. Heat-fusion joints for polypropylene (PP) pipe and tubing joints shall be installed with socket-type heat-fused polypropylene fittings, electrofusion polypropylene fittings or by butt fusion. Joint surfaces shall be clean and free from moisture. The joint shall be undisturbed until cool. Joints shall be made in accordance with ASTM F 2389.

1211.7.2 Mechanical and compression sleeve joints. Mechanical and compression sleeve joints shall be installed in accordance with the manufacturer's instructions.

1211.8 Raised temperature polyethylene (PE-RT) plastic tubing. Joints between raised temperature polyethylene tubing and fittings shall complying with Sections 1211.8.1 and 1211.8.2. Mechanical joints shall comply with Section 1211.3.

1211.8.1 Compression-type fittings. Where compression-type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

1211.8.2 PE-RT-to-metal connections. Solder joints in a metal pipe shall not occur within 18 inches (457 mm) of a transition from such metal pipe to PE-RT pipe.

1211.9 PVC plastic pipe. Joints between PVC plastic pipe and fittings shall be solvent-cemented or threaded joints comply with Section 1203.3.

SECTION 1212
VALVES

1212.1 Where required. Shutoff valves shall be installed in ground source-loop piping systems in the locations indicated in Sections 1212.1.1 through 1212.1.6.

1212.1.1 Heat exchangers. Shutoff valves shall be installed on the supply and return side of a heat exchanger.

> **Exception:** Shutoff valves shall not be required where heat exchangers are integral with a boiler or are a component of a manufacturer's boiler and heat exchanger packaged unit and are capable of being isolated from the hydronic system by the supply and return valves required by Section 1005.1.

1212.1.2 Central systems. Shutoff valves shall be installed on the building supply and return of a central utility system.

1212.1.3 Pressure vessels. Shutoff valves shall be installed on the connection to any pressure vessel.

1212.1.4 Pressure-reducing valves. Shutoff valves shall be installed on both sides of a pressure-reducing valve.

1212.1.5 Equipment and appliances. Shutoff valves shall be installed on connections to mechanical *equipment* and appliances. This requirement does not apply to components of a ground source loop system such as pumps, air separators, metering devices, and similar *equipment*.

1212.1.6 Expansion tanks. Shutoff valves shall be installed at connections to nondiaphragm-type expansion tanks.

1212.2 Reduced pressure. A pressure relief valve shall be installed on the low-pressure side of a hydronic piping system that has been reduced in pressure. The relief valve shall be set at the maximum pressure of the system design. The valve shall be installed in accordance with Section 1006.

SECTION 1213
PIPING INSTALLATION

1213.1 General. Piping, valves, fittings, and connections shall be installed in accordance with the conditions of approval.

1213.3 Protection of potable water. Where ground source heat pump ground loop systems have a connection to a potable water supply, the potable water system shall be protected from backflow in accordance with the *International Plumbing Code*.

1213.4 Pipe penetrations. Openings for pipe penetrations in walls, floors and ceilings shall be larger than the penetrating pipe. Openings through concrete or masonry building elements shall be sleeved. The annular space surrounding pipe penetrations shall be protected in accordance with the *International Building Code*.

1213.5 Clearance from combustibles. A pipe in a ground source heat pump piping system having an exterior surface temperature exceeding 250°F (121°C) shall have a minimum *clearance* of 1 inch (25 mm) from combustible materials.

1213.6 Contact with building material. A ground source heat pump ground-loop piping system shall not be in direct contact with building materials that cause the piping or fitting material to degrade or corrode, or that interfere with the operation of the system.

1213.7 Strains and stresses. Piping shall be installed so as to prevent detrimental strains and stresses in the pipe. Provisions shall be made to protect piping from damage resulting from expansion, contraction and structural settlement. Piping shall be installed so as to avoid structural stresses or strains within building components.

1213.7.1 Flood hazard. Piping located in a flood hazard area shall be capable of resisting hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding to the *design flood elevation*.

1213.8 Pipe support. Pipe shall be supported in accordance with Section 305.

1213.9 Velocities. Ground source heat pump ground-loop systems shall be designed so that the flow velocities do not exceed the maximum flow velocity recommended by the pipe and fittings manufacturer and shall be controlled to reduce the possibility of water hammer.

1213.10 Labeling and Marking. Ground source heat pump ground-loop system piping shall be marked with tape, metal tags or other method where it enters a building indicating “GROUND SOURCE HEAT PUMP-LOOP SYSTEM”. The marking shall indicate any antifreeze used in the system by name and concentration.

1213.11 Chemical Compatibility. Antifreeze and other materials used in the system shall be chemically compatible with the pipe, tubing, fittings, and mechanical systems.

SECTION 1214
WORKING FLUID

1214.1 Makeup water. The transfer fluid shall be compatible with the makeup water supplied to the system.

SECTION 1215
TESTS

1215.1 Ground source heat pump loop systems. Before connection header trenches are backfilled, the assembled loop system shall be pressure tested with water at 100 psi (689 kPa) for 30 minutes, but not more than 35 minutes, with no observed leaks. Flow and pressure loss testing shall be performed and the actual flow rates and pressure drops shall be compared to the calculated design values. If actual flow rate or pressure drop values differ from calculated design values by more than 10 percent, the cause shall be identified and corrective action taken.

SECTION 1216
EMBEDDED PIPING

1216.1 Pressurizing during installation. Ground source heat pump ground loop piping to be embedded in concrete shall be pressure tested prior to pouring concrete. During pouring, the pipe shall be maintained at the proposed operating pressure.

Add new standard as follows:

CSA C448 SERIES-02-CAN/CSA-2002
Design and Installation of Earth Energy Systems - First Edition; Update 2: October 2009; Consolidated Reprint 10/2009

Reason: Water based geothermal PE piping is currently listed in the hydronics section where it doesn't quite fit. This special and growing application should have its own section, and it should cover other materials that could potentially be used. Green building rating systems are promoting geothermal ground loop heating and cooling systems, and the code should have more information. I am re-introducing this proposal to accomplish that and would accept friendly amendments to it for any other materials. While HDPE dominates the water based technology with an expected 95% of the systems, other materials can be utilized. Copper is used in direct expansion systems that do not run on water.

Cost Impact: None

Analysis: A review of the standard proposed for inclusion in the code, [CSA C448 SERIES-02-CAN/CSA-2002] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

M189–12
Table 1202.4, Chapter 15

Proponent: James Gilchrist, P.E., Georg Fischer Sloane, LLC, representing GF Piping Systems (jim.gilchrist@georgfischer.com)

Revise as follows:

Table 1202.4
HYDRONIC PIPE

MATERIAL	STANDARD (see Chapter 15)
Acrylonitrile butadiene styrene (ABS) plastic pipe	ASTM D 1527; ~~ASTM D 2282~~ F2806
……	
~~Polybutylene (PB) plastic pipe and tubing~~	~~ASTM D3309~~
……	
Polyethylene (PE) pipe, tubing and fittings (for ground source heat pump loop systems)	ASTM D 2513; ASTM D 3035; ~~ASTM D 2447~~; ASTM D 2683; ASTM F 1055; ~~ASTM D 2837~~; ~~ASTM D 3350;~~ ~~ASTM D 1693~~
…..	

Portions not shown remain unchanged.

Add new standard to Chapter 15 as follows:

ASTM F2806-10
Standard Specification for Acrylonitrile-Butadiene-Styrene (ABS) Plastic Pipe (Metric SDR-PR)

Reason: Updates to this table are needed so that it is aligned with current ASTM standards for plastic pipe and fittings. Also, several standards are included which are incorporated into product standards but are not product standards themselves. For clarity these should be removed.

-D2282 was withdrawn in 2007 without replacement. ASTM F2806-10e1, "Standard Specification for Acrylonitrile-Butadiene-Styrene (ABS) Plastic Pipe (Metric SDR-PR)," was approved in 2010.
-D3309 was withdrawn in 2010 without replacement. Polybutylene pipe is not currently manufactured or used in the United States for this application.
-D2447 was withdrawn in 2010 without replacement.
-ASTM D2837 - 11 "Standard Test Method for Obtaining Hydrostatic Design Basis for Thermoplastic Pipe Materials or Pressure Design Basis for Thermoplastic Pipe Products," is a test method, not a specification for PE pipe and fittings.
-ASTM D3350 - 10a "Standard Specification for Polyethylene Plastics Pipe and Fittings Materials," is a specification for materials, not finished product.
-ASTM D1693 - 08 "Standard Test Method for Environmental Stress-Cracking of Ethylene Plastics," is a test method, not a specification for PE pipe and fittings.

Copy of new standard, ASTM F2806-10e1, is attached in PDF form.

Cost Impact: The code change proposal will not increase the cost of construction. The change only aligns the code with current ASTM standards.

Analysis: A review of the standard proposed for inclusion in the code, [ASTM F2806-10] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

M190–12
TABLE 1202.4, 1203.15, 1208, 1210-1216 (NEW), Chapter 15

Proponent: Jeremy Brown, NSF International, (brown@nsf.org)

Revise as follows:

TABLE 1202.4
HYDRONIC PIPE

MATERIAL	STANDARD (see Chapter 15)
~~Polyethylene (PE) pipe, tubing and fittings (for ground source heat pump loop systems)~~	~~ASTM D 2513; ASTM D 3035; ASTM D 2447; ASTM D 2683; ASTM F 1055; ASTM D 2837; ASTM D 3350; ASTM D 1693~~

Other sections of table unchanged

~~**1203.15 Polyethylene plastic pipe and tubing for ground source heat pump loop systems.** Joints between polyethylene plastic pipe and tubing or fittings for ground source heat pump loop systems shall be heat fusion joints conforming to Section 1203.15.1, electrofusion joints conforming to Section 1203.15.2, or stab-type insertion joints conforming to Section 1203.15.3.~~

~~**1203.15.1 Heat-fusion joints.** Joints shall be of the socket-fusion, saddle-fusion or butt-fusion type, joined in accordance with ASTM D 2657. Joint surfaces shall be clean and free of moisture. Joint surfaces shall be heated to melt temperatures and joined. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM D 2683 or ASTM D 3261.~~

~~**1203.15.2 Electrofusion joints.** Joints shall be of the electrofusion type. Joint surfaces shall be clean and free of moisture, and scoured to expose virgin resin. Joint surfaces shall be heated to melt temperatures for the period of time specified by the manufacturer. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM F 1055.~~

~~**1203.15.3 Stab-type insert fittings.** Joint surfaces shall be clean and free of moisture. Pipe ends shall be chamfered and inserted into the fittings to full depth. Fittings shall be manufactured in accordance with ASTM F 1924.~~

SECTION 1208
TESTS

1208.1 General. Hydronic piping systems ~~other than groundsource heat pump loop systems~~ shall be tested hydrostatically at one and one-half times the maximum system design pressure, but not less than 100 psi (689 kPa). The duration of each test shall be not less than 15 minutes, but not more than 20 minutes. ~~Ground-source heat pump loop systems shall be tested in accordance with Section 1208.1.1.~~

~~**1208.1.1 Ground source heat pump loop systems.** Before connection (header) trenches are backfilled, the assembled loop system shall be pressure tested with water at 100 psi (689 kPa) for 30 minutes with no observed leaks. Flow and pressure loss testing shall be performed and the actual flow rates and pressure drops shall be compared to the calculated design values. If actual flow rate or pressure drop values differ from calculated design values by more than 10 percent, the problem shall be identified and corrected.~~

SECTION 1210
GROUND-SOURCE HEAT PUMP LOOP SYSTEMS

1210.1 Ground Source-Loop Water Piping. Ground source loop-piping and tubing material for water-based systems shall conform to the standards cited in this section.

1210.2 Used materials. Reused pipe, fittings, valves, and other materials shall not be permitted in ground source-loop systems.

1210.3 Material rating. Pipe and tubing shall be rated for the operating temperature and pressure of the ground-loop system. Fittings shall be suitable for the pressure applications and recommended by the manufacturer for installation with the pipe and tubing material installed. Where used underground, materials shall be suitable for burial.

1210.4 Piping and tubing materials standards. Ground-loop pipe and tubing shall conform to the standards listed in Table 1210.4.

TABLE 1210.4
GROUND SOURCE LOOP PIPE

MATERIAL	STANDARD (see Chapter 15)
Chlorinated polyvinyl chloride (CPVC)	ASTM D2846; ASTM F441; ASTM F442
Cross-linked polyethylene (PEX)	ASTM F876; ASTM F877 CSA B137.5;NSF 358-3
Polyethylene/aluminum/polyethylene (PE-AL-PE) pressure pipe	ASTM F1282; CSA B137.9
High Density Polyethylene (HDPE)	ASTM D3035; ASTM D2737; ASTM F714; AWWA C901; CSA B137.1; CSA C448; NSF 358-1
Polypropylene (PP-R)	ASTM F2389; CSA B137.11, NSF 358-2
Polyvinyl chloride (PVC)	ASTM D1785; ASTM D2241
Raised temperature polyethylene (PE-RT)	ASTM F2623

1210.5 Fittings. Ground source pipe fittings shall be approved for installation with the piping materials to be installed shall conform to the standards listed in Table 1210.5 and if installed underground shall be suitable for burial.

TABLE 1210.5
GROUND SOURCE LOOP PIPE FITTINGS

PIPE MATERIAL	STANDARD (see Chapter 15)
Chlorinated polyvinyl chloride (CPVC)	ASTM D 2846; ASTM F437; ASTM F438; ASTM F439; CSA B137.6
Cross-linked polyethylene (PEX)	ASTM F 877; ASTM F1807; ASTM F 1960; ASTM F 2080; ASTM F2159; ASTM F2434; CSA B137.5; NSF 358-3
Polyethylene/aluminum/polyethylene (PE-AL-PE)	ASTM F 2434; ASTM F1282, CSA B137.9
High Density Polyethylene (HDPE)	ASTM D2683; ASTM D3261;

	ASTM F1055; CSA B137.1; CSA C448; NSF 358-1
Polypropylene (PP-R)	ASTM F2389; CSA B137.11; NSF 358-2
Polyvinyl chloride (PVC)	ASTM D2464; ASTM D2466; ASTM D2467; CSA B137.2; CSA B137.3
Raised temperature polyethylene (PE-RT)	ASTM D3261; ASTM F1807; ASTM F2159; B137.1

SECTION 1211
JOINTS AND CONNECTIONS

1211.1 Approval. Joints and connections shall be of an approved type. Joints and connections shall be tight for the pressure of the ground source-loop system. Joints used underground shall be approved for buried applications.

1211.1.1 Joints between different piping materials. Joints between different piping materials shall be made with approved transition fittings.

1211.2 Preparation of pipe ends. Pipe shall be cut square, reamed, and shall be free of burrs and obstructions. CPVC, PE, and PVC pipe shall be chamfered. Pipe ends shall have full-bore openings and shall not be undercut.

1211.3 Joint preparation and installation. Where required by Sections 1211.4 through 1211.6, the preparation and installation of mechanical and thermoplastic-welded joints shall comply with Sections 1211.3.1 and 1211.3.2.

1211.3.1 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer's instructions.

1211.3.2 Thermoplastic-welded joints. Joint surfaces for thermo plastic-welded joints shall be cleaned by an approved procedure. Joints shall be welded in accordance with the manufacturer's instructions.

1211.4 CPVC plastic pipe. Joints between CPVC plastic pipe or fittings shall be solvent-cemented or threaded joints complying with Section 1203.3.

1211.5 Cross-linked polyethylene (PEX) plastic tubing. Joints between cross-linked polyethylene plastic tubing and fittings shall comply with Sections 1211.4.1 and 1211.4.2. Mechanical joints shall complying with Section 1211.3.

1211.5.1 Compression-type fittings. Where compression- type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

1211.5.2 Plastic-to-metal connections. Soldering on the metal portion of the system shall be performed at least 18 inches (457 mm) from a plastic-to-metal adapter in the same water line.

1211.6 Polyethylene plastic pipe and tubing for ground source heat pump loop systems. Joints between polyethylene plastic pipe and tubing or fittings for ground source heat pump loop systems shall be heat fusion joints complying with Section 1211.6.1, electrofusion joints complying with Section 1211.6.2, or stab-type insertion joints complying with Section 1211.6.3.

1211.6.1 Heat-fusion joints. Joints shall be of the socket-fusion, saddle-fusion or butt-fusion type, joined in accordance with ASTM D 2657. Joint surfaces shall be clean and free of moisture. Joint surfaces shall be heated to melt temperatures and joined. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM D 2683 or ASTM D 3261.

1211.6.2 Electrofusion joints. Joints shall be of the electrofusion type. Joint surfaces shall be clean and free of moisture, and scoured to expose virgin resin. Joint surfaces shall be heated to melt temperatures for the period of time specified by the manufacturer. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM F 1055.

1211.6.3 Stab-type insert fittings. Joint surfaces shall be clean and free of moisture. Pipe ends shall be chamfered and inserted into the fittings to full depth. Fittings shall be manufactured in accordance with ASTM F 1924.

1211.7 Polypropylene (PP) plastic. Joints between PP plastic pipe and fittings shall comply with Sections 1211.7.1 and 1211.7.2.

1211.7.1 Heat-fusion joints. Heat-fusion joints for polypropylene (PP) pipe and tubing joints shall be installed with socket-type heat-fused polypropylene fittings, electrofusion polypropylene fittings or by butt fusion. Joint surfaces shall be clean and free from moisture. The joint shall be undisturbed until cool. Joints shall be made in accordance with ASTM F 2389.

1211.7.2 Mechanical and compression sleeve joints. Mechanical and compression sleeve joints shall be installed in accordance with the manufacturer's instructions.

1211.8 Raised temperature polyethylene (PE-RT) plastic tubing. Joints between raised temperature polyethylene tubing and fittings shall complying with Sections 1211.8.1 and 1211.8.2. Mechanical joints shall complying with Section 1211.3.

1211.8.1 Compression-type fittings. Where compression-type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

1211.8.2 PE-RT-to-metal connections. Solder joints in a metal pipe shall not occur within 18 inches (457 mm) of a transition from such metal pipe to PE-RT pipe.

1211.9 PVC plastic pipe. Joints between PVC plastic pipe and fittings shall be solvent-cemented or threaded joints complying with Section 1203.3.

SECTION 1212
VALVES

1212.1 Where required. Shutoff valves shall be installed in ground source-loop piping systems in the locations indicated in Sections 1212.1.1 through 1212.1.6.

1212.1.1 Heat exchangers. Shutoff valves shall be installed on the supply and return side of a heat exchanger.

Exception: Shutoff valves shall not be required where heat exchangers are integral with a boiler or are a component of a manufacturer's boiler and heat exchanger packaged unit and are capable of being isolated from the hydronic system by the supply and return valves required by Section 1005.1.

1212.1.2 Central systems. Shutoff valves shall be installed on the building supply and return of a central utility system.

1212.1.3 Pressure vessels. Shutoff valves shall be installed on the connection to any pressure vessel.

1212.1.4 Pressure-reducing valves. Shutoff valves shall be installed on both sides of a pressure-reducing valve.

1212.1.5 Equipment and appliances. Shutoff valves shall be installed on connections to mechanical *equipment* and appliances. This requirement does not apply to components of a ground source loop system such as pumps, air separators, metering devices, and similar *equipment*.

1212.1.6 Expansion tanks. Shutoff valves shall be installed at connections to nondiaphragm-type expansion tanks.

1212.2 Reduced pressure. A pressure relief valve shall be installed on the low-pressure side of a hydronic piping system that has been reduced in pressure. The relief valve shall be set at the maximum pressure of the system design. The valve shall be installed in accordance with Section 1006.

SECTION 1213
PIPING INSTALLATION

1213.1 General. Piping, valves, fittings, and connections shall be installed in accordance with the conditions of approval.

1213.3 Protection of potable water. Where ground source loop systems have a connection to a potable water supply, the potable water system shall be protected from backflow in accordance with the *International Plumbing Code*.

1213.4 Pipe penetrations. Openings for pipe penetrations in walls, floors and ceilings shall be larger than the penetrating pipe. Openings through concrete or masonry building elements shall be sleeved. The annular space surrounding pipe penetrations shall be protected in accordance with the *International Building Code*.

1213.5 Clearance from combustibles. A pipe in a ground source piping system having an exterior surface temperature exceeding 250°F (121°C) shall have a minimum *clearance* of 1 inch (25 mm) from combustible materials.

1213.6 Contact with building material. A ground source-loop piping system shall not be in direct contact with building materials that cause the piping or fitting material to degrade or corrode, or that interfere with the operation of the system.

1213.7 Strains and stresses. Piping shall be installed so as to prevent detrimental strains and stresses in the pipe. Provisions shall be made to protect piping from damage resulting from expansion, contraction and structural settlement. Piping shall be installed so as to avoid structural stresses or strains within building components.

1213.7.1 Flood hazard. Piping located in a flood hazard area shall be capable of resisting hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding to the *design flood elevation*.

1213.8 Pipe support. Pipe shall be supported in accordance with Section 305.

1213.9 Velocities. Ground source-loop systems shall be designed so that the flow velocities do not exceed the maximum flow velocity recommended by the pipe and fittings manufacturer and the velocities shall be controlled to reduce the possibility of water hammer.

1213.10 Labeling and Marking. Ground source-loop system piping shall be marked with tape, metal tags or other method where it enters a building indicating “GROUND SOURCE-LOOP SYSTEM”. The marking shall indicate any antifreeze used in the system by name and concentration.

1213.11 Chemical Compatibility. Antifreeze and other materials used in the system shall be chemically compatible with the pipe, tubing, fittings, and mechanical systems.

SECTION 1214
WORKING FLUID

1214.1 Makeup water. The transfer fluid shall be compatible with the makeup water supplied to the system.

SECTION 1215
TESTS

1215.1 Ground source heat pump loop systems. Before connection header trenches are backfilled, the assembled loop system shall be pressure tested with water at 100 psi (689 kPa) for 30 minutes, but not more than 35 minutes, with no observed leaks. Flow and pressure loss testing shall be performed and the actual flow rates and pressure drops shall be compared to the calculated design values. If actual flow rate or pressure drop values differ from calculated design values by more than 10 percent, the cause shall be identified and corrective action taken.

SECTION 1216
EMBEDDED PIPING

1216.1 Pressurizing during installation. Ground loop piping to be embedded in concrete shall be pressure tested prior to pouring concrete. During pouring, the pipe shall be maintained at the proposed operating pressure.

Add new standards to Chapter 15 as follows:

ASTM

D2737-12
Standard Specification for Polyethylene (PE) Plastic Tubing

F437-09
Standard Specification for Threaded Chlorinated Poly(Vinyl Chloride) (CPVC) Plastic Pipe Fittings, Schedule 80

F714-10
Standard Specification for Polyethylene (PE) Plastic Pipe (SDR-PR) Based on Outside Diameter

F1282–10
Standard Specification for Polyethylene/Aluminum/Polyethylene (PE-AL-PE) Composite Pressure Pipe

F1960-11e1
Standard Specification for Cold Expansion Fittings with PEX Reinforcing Rings for Use with Cross-linked Polyethylene (PEX) Tubing

F2434-09
Standard Specification for Metal Insert Fittings Utilizing a Copper Crimp Ring for SDR9 Cross-linked Polyethylene (PEX) Tubing and SDR9 Cross-linked Polyethylene/Aluminum/Cross-linked Polyethylene (PEX-AL-PEX) Tubing

AWWA

C901-08
AWWA Standard for Polyethylene (PE) Pressure Pipe and Tubing, ½ In. (13 mm) through 3 In. (76 mm), for Water Service

CSA

B137.1-09 Polyethylene (PE) pipe, tubing, and fittings for cold-water pressure services

B137.2-05 Polyvinylchloride (PVC) injection-moulded gasketed fittings for pressure applications

B137.3-09 Rigid polyvinylchloride (PVC) pipe and fittings for pressure applications

B137.5-09 Crosslinked polyethylene (PEX) tubing systems for pressure applications

B137.11-99 Polypropylene (PP-R) Pipe and Fittings for Pressure Applications

C448-10/2009
Design and Installation of Earth Energy Systems - First Edition; Update 2: October 2009; Consolidated Reprint

NSF

358-1
Polyethylene Pipe and Fittings for Water-Based Ground-Source (Geothermal) Heat Pump Systems

358-2
Polypropylene Pipe and Fittings for Water-Based Ground-Source(Geothermal) Heat Pump Systems

358-3
Cross-linked Polyethylene (PEX) Pipe and Fittings for Water-Based Ground-Source (Geothermal) Heat Pump Systems

Reason: The IMC requires improvement on the approved materials for us in geothermal systems. While Polyethylene pipe and fittings dominates the current geothermal market, other materials are appropriate.

At the time of submission of proposals, NSF is in the process of writing NSF Series of Standards 358 to address material specific requirements for plastic piping system components used in geothermal systems. The standard can be obtained from brown@nsf.org.

Cost Impact: None

Analysis: A review of the standard proposed for inclusion in the code, [ASTM D2737-12, F437-09, F714-10, F1282–10, F1960-11e1, F2434-09; AWWA C901-08; CSA B137.1-09, B137.2-05, B137.3-09, B137.5-09, B137.11-99, C448-10/2009; NSF 358-1, 358-2, 358-3.] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

M192–12
TABLE 1202.5, Chapter 15

Proponent: Kevin J. Simko, Victaulic, representing Victaulic

Revise as follows:

MATERIAL	STANDARD
Brass	ASTM F 1974
Bronze	ASTM B 16.24
Copper or copper alloy	ASME BI6.15; ASME BI6.18; ASME BI6.22; ASME BI6.23; ASME BI6.26; AS ME BI6.29; ASTM B 75; ASTM B 152; ASTM B 584
Ductile iron and gray iron	ANSI/AWWA C110/A21.10; A WWA C153/A21.53; ASTM A 395; ASTM A 536; ASTM F 1476; ASTM F 1548
Ductile Iron	ANSI/AWWA *C153/A21.53*
Gray Iron	ASTM A 126
Malleable iron	ASME BI6.3
PEX fittings	ASTM F 877; ASTM F 1807; ASTM F 2159
Plastic	ASTM D 2466; ASTM D 2467; ASTM D 2468; ASTM F 438; ASTM F 439; ASTM F 877; ASTM F2389; ASTM F 2735
Steel	ASME BI6.5; ASME BI6.9; ASME B16.11; ASME BI6.28; ASTM A 53; ASTM A 106; ASTM A 234; ASTM A 420; ASTM A 536; ASTM A 395; ASTM F 1476; ASTM F 1548

Portions not shown remain unchanged.

Add new standards to Chapter 15 as follows:

ASTM A234 / A234M - 11a
Standard Specification for Piping Fittings of Wrought Carbon Steel and Alloy Steel for Moderate and High Temperature Service

ASTM A395 / A395M - 99(2009)
Standard Specification for Ferritic Ductile Iron Pressure-Retaining Castings for Use at Elevated Temperatures

ASTM A536 - 84(2009)
Standard Specification for Ductile Iron Castings

ASTM B152 / B152M – 09
Standard Specification for Copper Sheet, Strip, Plate, and Rolled Bar

ASTM B584 – 11
Standard Specification for Copper Alloy Sand Castings for General Applications

ASTM F1548 - 01(2006)
Standard Specification for the Performance of Fittings for Use with Gasketed Mechanical Couplings Used in Piping Applications

AWWA C153/A21.53-06
Ductile-Iron Compact Fittings for Water Service

Reason: The materials currently listed in Table 1202.5 do not fully represent the materials being used for hydronic systems in the industry. ,the code is overly restrictive with regard to pipe materials and does not allow for the use of materials that offer improved mechanical and electrochemical properties compared with allowed materials. The addition of these standard materials will allow the use of high grade materials that provide improved performance, while still allowing the use of currently approved materials. Many of these materials are also currently referenced in other piping codes.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [ASTM A234 / A234M - 11a, A395 / A395M - 99(2009), A536 - 84(2009), B152 / B152M – 09, B584 – 11, F1548 - 01(2006); AWWA C153/A21.53-06] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

T1202.5-M-SIMKO.DOC

M193–12
Table 1202.5

Proponent: Pennie L. Feehan, Pennie L. Feehan Consulting, representing Copper Development Association
(penniefeehan@me.com)

Revise as follows:

TABLE 1202.5
HYDRONIC PIPE FITTINGS

MATERIAL	STANDARD
~~Brass~~	~~ASTM F 1974~~
~~Bronze~~	~~ASTM B16.24~~
Copper or copper alloy	ASME B16.15; ASME B16.18; ASME B16.22; ~~ASME B16.23;~~ ASME B16.26; ASTM F1974, ASTM B16.24, ~~ASME B16.29~~

(Portions of table not shown remain unchanged.)

Reason: Brass and Bronze are copper alloys. Moving the standards under the applicable heading cleans-up the table and provides the appropriate terminology and correct information to the end user.

ASME B16.23 - Cast Copper Alloy Solder Joint Drainage Fittings - DWV and ASME B 16.29 - Wrought Copper and Wrought Copper Alloy Solder Joint Drainage Fittings – DWV, are Drain, Waste, and Vent fittings and should not be listed here.

Cost Impact: This code change will not increase the cost of construction.

M193-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T1202.5-M-FEEHAN.DOC

M194–12
TABLE 1202.5, Chapter 15

Proponent: James Gilchrist, P.E., Georg Fischer Sloane, LLC, representing Georg Fischer Piping Systems
(jim.gilchrist@georgfischer.com)

Revise as follows:

Table 1202.5
HYDRONIC PIPE FITTINGS

MATERIAL	STANDARD (see Chapter 15)
<u>Thermoplastic</u> ~~Plastic~~	ASTM D 2466; ASTM D 2467; ~~ASTM D 2468~~; <u>ISO 15493 Annex A</u>; ASTM F 438; ASTM F 439; ASTM F 877; ASTM F 2389; ASTM F 2735

(Portions of table not shown remain unchanged.)

Add new standard to Chapter 15 as follows:

<u>ISO 15493 Annex A-2003</u>
<u>Plastics piping systems for industrial applications - Acrylonitrile-butadiene-styrene (ABS), unplasticized poly(vinyl chloride) (PVC-U) and chlorinated poly(vinyl chloride) (PVC-C) - Specifications for components and the system Metric series</u>

Reason: Updates to this table are needed so that it is aligned with current ASTM and ISO standards for plastic pipe and fittings.
-Using the term "Thermoplastic" differentiates these materials from the newer material PEX, which is a thermoset.
-ASTM D2468 - 96a Standard "Specification for Acrylonitrile Butadiene Styrene (ABS) Plastic Pipe Fittings, Schedule 40" was withdrawn in 2003 without replacement.
-ISO 15493 Annex A defines ABS fittings that are compatible with hydronic cooling pipe. ISO 15493:2003 Plastics piping systems for industrial applications -- Acrylonitrile-butadiene-styrene (ABS), unplasticized poly(vinyl chloride) (PVC-U) and chlorinated poly(vinyl chloride) (PVC-C) -- Specifications for components and the system -- Metric series
Copy of ISO 15493 is attached in PDF form.

Cost Impact: The code change proposal will not increase the cost of construction. The change only aligns the code with current standards.

Analysis: A review of the standard proposed for inclusion in the code, [ISO 15493 Annex A-2003] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T1202.5#2-M-GILCHRIST.DOC

M195–12
T1202.5, Chapter 15

Proponent: Robert Hall, SE Technical Manager, representing Viega, LLC

Revise as follows:

TABLE 1202.5
HYDRONIC PIPE FITTINGS

MATERIALS	STANDARDS
Copper or copper alloy	ASME B16.15; ASME B16.18; ASME B16.22; ASME B16.23; ASME 16.26; ASME B16.29; ASME B16.51, ICC LC 1002

(Portions of table not shown remain unchanged)

Add new standards to Chapter 15 as follows:

ASME B16.51-11
Copper and Copper Alloy Press-Connect Pressure Fittings

ICC LC 1002-08
PMG Listing Criteria for Press-Connection Fittings for Potable Water Tube and Radiant Heating Systems

Reason: New, ASME Material Standard for Press-Connect fittings and ICC Standard.

Cost Impact: None

Analysis: A review of the standard proposed for inclusion in the code, [ASME B16.51-11] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

	Assembly:	ASF	AMF	DF

T1202.5 #1-M-HALL.DOC

M196–12
Table 1202.5, Chapter 15

Proponent: Larry Gill, P.Eng. IPEX USA LLC
(larry.gill@ipexna.com)

Revise as follows:

TABLE 1202.5
PIPE FITTINGS

Material	**Standard**
Plastic	ASTM D 2466; ASTM D 2467; ASTM D 2468; ASTM F 438; ASTM F 439; ASTM F 877; ASTM F 2389, ASTM F2735, <u>ASTM F 2769, ASTM F2159, ASTM F2098</u>

(Portions of table not shown remain unchanged)

Add new standards to Chapter 15 as follows:

<u>ASTM F2098-08</u>
<u>Standard Specification for Stainless Steel Clamps for Securing SDR9 Cross-linked Polyethylene (PEX) Tubing to Metal Insert and Plastic Insert Fittings</u>

Reason: Add new standards for PE-RT fittings. ASTM 2159 and F2098 are fittings standards and ASTM F2769 is a standard for hot and cold water tubing and distribution systems and includes provisions for tubing, fittings, valves and manifolds.

Cost Impact: The proposed change will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [ASTM F2098-08] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

M197–12
Table 1202.5, 1209.3.4(New), Chapter 15

Proponent: Larry Gill, P.Eng. IPEX USA LLC
(larry.gill@ipexna.com)

Revise as follows:

TABLE 1202.5
HYDRONIC PIPE FITINGS

MATERIAL	STANDARD (see chapter 15)
PE-RT fittings	ASTM F 1807, ASTM F 2098, ASTM F2159, ASTM F 2735, ASTM F2769

(Portions of table not shown remain unchanged)

SECTION 1209
EMBEDDED PIPING

1209.3.4 Polyethylene of raised temperature (PE-RT) joints. PE-RT tubing shall be installed in continuous lengths or shall be joined by hydronic fittings listed in Table 1202.5.

Add new standard to Chapter 15 as follows:

ASTM F2098 – 08
Standard Specification for Stainless Steel Clamps for Securing SDR9 Cross-linked Polyethylene (PEX) Tubing to Metal Insert and Plastic Insert Fittings

Reason: Add new requirements for PE-RT fittings. ASTM F1807, ASTM F2098, ASTM F2159, ASTM F2735 are fittings standards and ASTM F2769 is a standard for hot and cold water tubing and distribution systems and includes provisions for tubing, fittings, valves and manifolds.

Cost Impact: The proposed change will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [ASTM F2098 - 08] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

M197-12

	Assembly:	ASF	AMF	DF

1209.3.4(NEW)-M-GILL.DOC

M198–12
TABLE 1202.5, Chapter 15

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., Self

Revise as follows:

TABLE 1202.5
HYDRONIC PIPE FITTINGS

Material	Standards
Copper or copper alloy	ASME B16.15; ASME B16.18; ASME B16.22; ASME B16.23; ASME B16.26; ASME B16.29, ASME B16.51

(Portions of table not shown remain unchanged.)

Add referenced standards to Chapter 15 as follows:

ASME B16.51-2011
Copper and Copper Alloy Press-Connect Pressure Fittings Table 605.5

Reason: This adds the new standard for copper press connect fittings. ASME B16.51 was published in December 2011. The standard regulates the size, design, and performance requirements for press connect fittings.

Cost Impact: This change does not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [ASME B16.51-2011] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

T1202.5-M-BALLANCO.DOC

M199–12
1203.1 thru 1203.8.3, Chapter 15

Proponent: Pennie L. Feehan, Pennie L. Feehan Consulting, representing Copper Development Association (penniefeehan@me.com)

Revise as follows:

1203.3.1 Brazed joints. Brazed joints between copper pipe or tubing and fittings shall be made with brazing alloys having a liquid temperature exceeding 1000˚F (538˚C). Joint surfaces to be brazed shall be cleaned bright by manual or mechanical means. The ends of the tubing shall be cut square and reamed to full inside diameter. Burrs on the outside end of the pipe or tubing shall be removed. Where required by the brazing alloy manufacturer's instructions, an *approved* brazing flux shall be applied to the joint surfaces ~~where required~~. The joint shall be brazed with a brazing filler metal conforming to AWS A5.8. Brazing filler metal shall be applied at the point where the pipe or tubing enters the socket of the fitting.

1203.3.2 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer's instructions. Joints shall include compression, flanged, grooved, press type and threaded.

1203.3.3 Soldered joints. Solder joints ~~surfaces shall be cleaned~~. between copper pipe or tubing and fittings shall be made in accordance with the methods of ASTM B 828 with the following sequence of joint preparation and operation: measuring and cutting, reaming, cleaning, fluxing, assembly and support, heating, applying the solder, cooling and cleaning. The ends of the pipe or tubing shall be cut square and reamed to the full inside diameter. Burrs on the outside end of the pipe or tubing shall be removed. Joint surfaces to be joined shall be cleaned bright by manual or mechanical means. ~~A~~ Flux conforming to ASTM B 813 shall be applied to pipe or tubing and fittings. Such flux shall become noncorrosive and nontoxic after soldering ~~shall be applied~~. Pipe or tubing shall be inserted to the base of the fitting. Excess flux shall be removed from the exterior of the joint. The assembled joint shall be supported to create a uniform capillary space around the joint. An LP gas or acetylene air fuel torch shall be used to apply heat to the assembled joint. The heat shall be applied with the flame perpendicular to the pipe or tubing. The flame shall be moved alternately between the fitting cup and pipe or tubing. ~~The joint shall be soldered with a~~ Solder in compliance with ~~conforming to~~ ASTM B 32 shall be applied to the joint surfaces until capillary action draws the molten solder into the cup of the fitting. The soldered joint shall not be disturbed until cool. Remaining flux residue shall be cleaned from the exterior of the joint. The joining of water supply piping shall be made with lead-free solder and fluxes. "Lead free" shall mean a chemical composition equal to or less than 0.2-percent lead.

1203.3.4 Flared joints. Flared joints shall be made by a tool designed for that operation.

1203.3.5 Push-fit joints. Push-fit joints shall be installed in accordance with the manufacturer's instructions.

1203.3.6 Press joints. *Press joints* shall be installed in accordance with the manufacturer's instructions.

1203.3.7 Grooved and shouldered mechanical joints. Grooved and shouldered mechanical joints shall conform to the requirements of ASTM F 1476 and shall be installed in accordance with the manufacturer's instructions.

1203.3.8 Mechanically formed tee fittings. Mechanically extracted outlets shall have a height not less than three times the thickness of the branch tube wall.

1203.3.8.1 Full flow assurance. Branch tubes shall not restrict the flow in the run tube. A dimple/depth stop shall be formed in the branch tube to ensure that penetration into the outlet is of the correct depth. For inspection purposes, a second dimple shall be placed 1/4 inch (6.4 mm) above the first dimple.

Dimples shall be aligned with the tube run.

1203.3.8.2 Brazed joints. Mechanically formed tee fittings shall be brazed in accordance with Section 1203.3.1.

1203.~~3.4~~ 3.9 Solvent-cemented joints. Joint surfaces shall be clean and free of moisture. An *approved* primer shall be applied to CPVC and PVC pipe-joint surfaces. Joints shall be made while the cement is wet. Solvent cement conforming to the following standards shall be applied to all joint surfaces:

1. ASTM D 2235 for ABS joints.
2. ASTM F 493 for CPVC joints.
3. ASTM D 2564 for PVC joints.
   CPVC joints shall be made in accordance with ASTM D 2846.

Exception: For CPVC pipe joint connections, a primer is not required where all of the following conditions apply:

1. The solvent cement used is third-party certified as conforming to ASTM F 493.
2. The solvent cement is yellow in color.
3. The solvent cement is used only for joining ½ inch (12.7 mm) through 2-inch (51 mm) diameter CPVC pipe and fittings.
4. The CPVC pipe and fittings are manufactured in accordance with ASTM D 2846.

1203.3.~~5~~10 Threaded joints. Threads shall conform to ASME B1.20.1. Schedule 80 or heavier plastic pipe shall be threaded with dies specifically designed for plastic pipe. Thread lubricant, pipe-joint compound or tape shall be applied on the male threads only and shall be *approved* for application on the piping material.

1203.3.~~6~~11 Welded joints. Joint surfaces shall be cleaned by an *approved* procedure. Joints shall be welded with an *approved* filler metal.

~~**1203.3.7 Grooved and shouldered mechanical joints.** Grooved and shouldered mechanical joints shall conform to the requirements of ASTM F 1476 and shall be installed in accordance with the manufacturer's installation instructions.~~

~~**1203.3.8 Mechanically formed tee fittings.** Mechanically extracted outlets shall have a height not less than three times the thickness of the branch tube wall.~~

~~**1203.3.8.1 Full flow assurance.** Branch tubes shall not restrict the flow in the run tube. A dimple/depth stop shall be formed in the branch tube to ensure that penetration into the outlet is of the correct depth. For inspection purposes, a second dimple shall be placed 1/4 inch (6.4 mm) above the first dimple. Dimples shall be aligned with the tube run.~~

~~**1203.3.8.2 Brazed joints.** Mechanically formed tee fittings shall be brazed in accordance with Section 1203.3.1.~~

~~**1203.4 ABS plastic pipe.** Joints between ABS plastic pipe or fittings shall be solvent-cemented or threaded joints conforming to Section 1203.3.~~

~~**1203.5 Brass pipe.** Joints between brass pipe or fittings shall be brazed, mechanical, threaded or welded joints conforming to Section 1203.3.~~

~~**1203.6 Brass tubing.** Joints between brass tubing or fittings shall be brazed, mechanical or soldered joints conforming to Section 1203.3.~~

~~**1203.7 Copper or copper-alloy pipe.** Joints between copper or copper-alloy pipe or fittings shall be brazed, mechanical, soldered, threaded or welded joints conforming to Section 1203.3.~~

~~**1203.8 Copper or copper-alloy tubing.** Joints between copper or copper-alloy tubing or fittings shall be brazed, mechanical or soldered joints conforming to Section 1203.3, flared joints conforming to Section 1203.8.1, push-fit joints conforming to Section 1203.8.2 or press-type joints conforming to Section 1203.8.3.~~

~~**1203.8.1 Flared joints.** Flared joints shall be made by a tool designed for that operation.~~

~~**1203.8.2 Push-fit joints.** Push-fit joints shall be installed in accordance with the manufacturer's instructions.~~

~~**1203.8.3 Press joints.** *Press joints* shall be installed in accordance with the manufacturer's instructions.~~

Add new standard to Chapter 15 as follows:

<u>ASTM B828 - 02(2010)</u>
<u>Standard Practice for Making Capillary Joints by Soldering of Copper and Copper Alloy Tube and Fittings</u>

Reason: The above proposal adds important language from the applicable standards, relocated, renumbered, and deleted other redundant sections to help the end user.

Cost Impact: This code change will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [ASTM B828 - 02(2010)], with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

M199-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1203.3.1-M-FEEHAN.DOC

M200–12
1203.3.9(NEW)

Proponent: Robert Hall, SE Technical Manager, Viega, LLC, representing Viega LLC

Add new text as follows:

1203.3.9 Press Connect Joints. Press connect joints shall be installed in accordance with the manufacturer's instructions. Press-connect joints shall conform to one of the standards listed in Table 1202.5.

Reason: Need press connect fittings reference in Section 1203.3 Joint preparation and installation.

Cost Impact: None

M200-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1203.3.9-M-HALL.DOC

M201–12
1203.3.9 (NEW)

Proponent: Kevin Simko, Victaulic, representing Victaulic
(ksimko@victaulic.com)

Add new text as follows:

1203.3.9 Mechanical joints for branch lines. Mechanical joint fittings that are used to create branch openings in a pipe run shall incorporate a locating collar, designed for alignment to prevent the rotation of the mechanical joint after installation. The locating collar shall extend into a predrilled hole in the pipe. The mechanical joint fitting shall be installed in accordance with the manufacturer's installation instructions, and be made with an approved elastomeric seal.

Reason: There is no provision in the IMC allowing or prohibiting the use of mechanical joints for branch lines. Mechanical joints for branch lines are commonly used in HVAC applications. Materials are the same used in other acceptable products.

Cost Impact: The code change proposal will not increase the cost of construction.

M201-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1203.3.9(NEW)-M-SIMKO.DOC

M202–12
1203.8

Proponent: Robert Hall, SE Technical Manager, Viega, LLC, representing Viega LLC (Robert.hall@viega.com)

Revise as follows:

1203.8 Copper and copper alloy tubing. Joints between copper or copper-alloy tubing or fittings shall be brazed, mechanical, press connect or soldered joints conforming to Section 1203.3, flared joints conforming to Section 1203.8.1, push-fit joints conforming to Section 1203.8.2 or press-type joints conforming to Section 1203.8.3.

Reason: Press connect should be included in this copper and copper alloy tubing section.

Cost Impact: None

M202-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1203.8-M-HALL.DOC

M203–12
1206.9

Proponent: Walter J. Sperko, Sperko Engineering Services, Inc. representing Mechanical Contractors Association of America
(Sperko@asme.org)

Revise as follows:

1206.9 Strains and stresses. ~~Piping shall be installed so as to prevent detrimental strains and stresses in the pipe.~~ Piping systems shall be designed in accordance with ASME B31.9. Provisions shall be made to protect piping from damage resulting from ~~expansion, contraction and~~ structural settlement. ~~Piping shall be installed so as to avoid structural stresses or strains within building components.~~ The effects of piping loads on other building components shall be evaluated by the designer.

Reason: Avoiding detrimental stresses and strains has to be an engineering consideration at the design stage; they cannot be controlled or limited as part of installation. Further, jurisdiction has no way to determine if there are detrimental stresses or strains unless there is a requirement to analyze the design, supports and restraints and there is a basis for determining if the stresses and strains are or are not acceptable. ASME B31.9 requires analysis of the design and comparison to stress limits and imposing it will ensure that detrimental stresses and strains are avoided. Part of the analysis of the design requires evaluation of the piping for effects associated with expansion and contraction.

It is not possible to comply with the present requirement to avoid piping-induced stresses and strains within other building components if the pipe is attached to those components in any way. Loads on building components to which piping is attached, however, can and should be evaluated during the design process.

Cost Impact: None. Designers should be following B31.9 or similar standard already. Jurisdiction will not have to buy copies of B31.9 since the engineer will have to have a copy to demonstrate compliance.

M203-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1206.9-M-SPERKO.DOC

M204–12
1206.10

Proponent: Walter J. Sperko, Sperko Engineering Services, Inc. representing Mechanical Contractors Association of America
(Sperko@asme.org)

Revise as follows:

1206.10 Pipe support. Pipe shall be supported in accordance with Section 305 or as specified by the designer.

Reason: While Table 305.4 is a good average guideline, a 12 foot for spacing between supports, it is a little excessive for NPS 1 pipe and way overly conservative for NPS 16 and larger which should be more like 30 feet between supports. The requirements for spacing between supports are integral to the design, the layout and results of analysis of the piping system and should be the responsibility of the piping system designer.

Cost Impact: None. Designers should be following B31.9 or similar standard already. Jurisdiction will not have to buy copies of B31.9 since the engineer will have to have a copy to demonstrate compliance and the change would not affect other installation requirements since this change only affects support spacing and requires the designer to specify it or default to Section 305 which provides a table or allows use of MSS SP-69 which costs $218.00.

M204-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1206.10-M-SPERKO.DOC

M205–12
1209.5

Proponent: Guy McMann, MCP, Jefferson County Colorado, Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gmcmann@jeffco.us)

Revise as follows:

1209.5 Thermal barrier required. Radiant floor <u>and snow melt</u> heating systems shall be provided with a thermal barrier in accordance with Sections 1209.5.1 through 1209.5.4.

Reason: This is a simple clarification to include snow melt systems as this is what was always intended to be included.

Cost Impact: None

M205-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1209.5-M-MCMANN.DOC

M206–12
1209.3.2

Proponent: Pennie L. Feehan, Pennie L. Feehan Consulting, representing Copper Development Association
(penniefeehan@me.com)

Revise as follows:

1209.3.2 Copper tubing joints. Copper tubing shall be joined by brazing <u>complying with Section 1203.3.1.</u> ~~with filler metals having a melting point of not less than 1,000°F (538°C).~~

Reason: The proposed language refers the end user to the appropriate code section with important language from the applicable standards.

Cost Impact: This code change will not increase the cost of construction.

M206-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1209.3.2-M-FEEHAN.DOC

M207–12
1209.5.1

Proponent: Randall R. Dahmen, P.E. Wisconsin licensed Commercial Building Inspector, representing himself

Revise as follows:

1209.5.1 Slab-on-grade installation. Radiant piping utilized in concrete slab ~~on-grade~~ applications shall be provided with insulating materials installed beneath the piping for the entire slab, regardless of depth below grade, The insulation shall have an R-value of not less than 5.

Reason: The current code language only addresses slab on grade applications in which radiant piping is utilized. Significant heat loss is also associated with slabs associated with basements that are not at grade. The ground acts as a heat sink, pulling away heat from the radiant piping. Although the temperature of the dirt beneath a basement concrete floor may not be exposed to temperatures as cold as those associated with a slab on grade installation, it is well acknowledged that the ground beneath the slab will be cooler and will reduce a radiant system's efficiency.

Cost Impact: The code change proposal will increase the cost of construction. Cost of minimum R-5 insulation for placement under slab is estimated to be offset by the increased efficiency of the radiant piping system.

M207-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1209.5.1-M-DAHMEN.DOC

M208–12
Table 1302.3

Proponent: Pennie L. Feehan, Pennie L. Feehan Consulting, representing Copper Development Association
(penniefeehan@me.com)

Revise as follows:

TABLE 1302.3
FUEL OIL PIPING

MATERIAL	STANDARD (see Chapter 15)
~~Brass pipe~~	~~ASTM B 43~~
~~Brass tubing~~	~~ASTM B 135~~
Copper or copper-alloy pipe	ASTM B 42; <u>ASTM B 43;</u> ASTM B 302
Copper or copper-alloy tube (Type K, L or M)	ASTM B 75; ASTM B 88; <u>ASTM B 135</u> ASTM B 280

(*Portions of table not shown remain unchanged)*

Reason: Brass pipe and tubing are copper alloys. Moving brass under the applicable heading cleans-up the table and provides the appropriate terminology and correct information to the end user.

Cost Impact: This code change will not increase the cost of construction.

M208-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

T1302.3-M-FEEHAN.DOC

M209–12
1303.3 through 1303.7

Proponent: Pennie L. Feehan, Pennie L. Feehan Consulting, representing Copper Development Association
(penniefeehan@me.com)

Revise as follows:

1303.3 Joint preparation and installation. Where required by Sections 1303.4 through 1303.10, the preparation and installation of brazed, mechanical, threaded and welded joints shall comply with Sections 1303.3.1 through 1303.3.~~4~~5.

1303.3.1 Brazed joints. ~~All~~ Brazed joint between copper pipe or tubing and fittings shall be made with brazing alloys having a liquid temperature above 1000˚F (538˚C). All joints surfaces to be brazed shall be cleaned. An *approved* brazing flux shall be applied to the joint surfaces where required by manufacturer's recommendation. The joints shall be brazed with a brazing filler metal conforming to AWS A5.8. Brazing filler metal shall be applied at the point where the pipe or tubing enters the socket of the fitting.

1303.3.5 Flared joints. Flared joints shall be made by a tool designed for that operation.

~~**1303.4 Brass pipe.** Joints between brass pipe or fittings shall be brazed, mechanical, threaded or welded joints complying with Section 1303.3.~~

~~**1303.5 Brass tubing.** Joints between brass tubing or fittings shall be brazed or mechanical joints complying with Section 1303.3.~~

~~**1303.6 Copper or copper-alloy pipe.** Joints between copper or copper-alloy pipe or fittings shall be brazed, mechanical, threaded or welded joints complying with Section 1303.3.~~

1303.7 ~~**Copper or copper-alloy tubing.** Joints between copper or copper-alloy tubing or fittings shall be brazed or mechanical joints complying with Section 1303.3 or flared joints. Flared joints shall be made by a tool designed for that operation.~~

Reason: The proposed removes unnecessary language and adds important language from the applicable standards.

Cost Impact: This code change will not increase the cost of construction.

M213–12
1401.1, 1405 (NEW), Chapter 15

Proponent: Shawn Strausbaugh, Chair, Plumbing/Mechanical/Gas Code Action Committee

Revise as follows:

1401.1 Scope. This chapter shall govern the design, construction, installation, *alteration* and repair of systems, *equipment* and appliances intended to utilize solar energy for space heating or cooling, domestic hot water heating, swimming pool heating ~~or~~ process heating or generation of electricity.

1405 PHOTOVOLTAIC SYSTEMS

1405.1 General. This section provides for the design, construction, installation, alteration, and repair of photovoltaic equipment and systems.

1405.2 Requirements. The installation, inspection, maintenance, repair and replacement of photovoltaic systems and all system components shall comply with the manufacturer's instructions, Sections 1405.1.1 through 1405.2.3 and NFPA 70.

1405.2.1 Roof-mounted panels and modules. Where photovoltaic panels and modules are installed on roofs, the roof shall be constructed to support the loads imposed by such modules. Roof-mounted photovoltaic panels and modules that serve as roof covering shall conform to the requirements for roof coverings in the *International Building Code*. Where mounted on or above the roof coverings, the photovoltaic panels and modules and supporting structure shall be constructed of noncombustible materials or fire-retardant-treated wood equivalent to that required for the roof construction.

1405.2.2 Roof and wall penetrations. Roof and wall penetrations shall be flashed and sealed in accordance with the *International Building Code* to prevent entry of water, rodents, and insects.
1405.2.3 Ground-mounted panels and modules. Ground-mounted panels and modules shall be installed in accordance with the manufacturer's instructions.

1405.3 Photovoltaic panels and modules. Photovoltaic panels and modules shall be listed and labeled in accordance with UL 1703.

1405.4 Inverters. Inverters shall be listed and labeled in accordance with UL 1741. Systems connected to the utility grid shall use inverters listed for utility interaction.

Add new text as follows:

306.5.2 Solar photovoltaic panels,modules and arrays. Solar photovoltaic panels, modules and arrays installed upon a roof or as an integral part of a roof assembly shall comply with the requirements of the *International Building Code* and the *International Fire Code*.

Add new referenced standards to Chapter 15 as follows:

UL 1703-02
Standard for Flat-Plate Photovoltaic Modules and Panels

UL 1741-99
Standard for Inverters, Converters, Controllers and Interconnection System Equipment for Use With Distributed Energy Resources

Reason: Section 304.11 and Section 306 do not address photovoltaic PV) solar panels and this has caused interpretation issues. The 2012 IFC now covers PV solar panels. Since there is a solar Chapter 14 in the IMC and solar is going to be growing, shouldn't

PV be covered in the IMC? The scope of Chapter 14 needs to be changed to include PV collectors, otherwise, Section 306 could not be applied to PV because it is not currently within the scope of the code. Section 101.2 speaks of “equipment specifically addressed herein” and PV is not addressed in the code. The new Section 1405 is duplicated text from Section M2302 of the IRC. Section 1401.1 has to be changed to bring PV into the scope of Chapter 14 which currently excludes PV.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: None

Analysis: A review of the standard proposed for inclusion in the code, [UL 1703-02, UL 1741-99] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2012.

M213-12

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1401.1-M-STRAUSBAUGH.PMGCAC.DOC

M214–12
1404.2.1 (NEW)

Proponent: Timothy Burgos, InterCode Incorporated, Representing Rectorseal Corporation and Ken Sagan, NRG Code Advocates, representing self
(ken@nrgcodeadvocates.com)

Add new text as follows:

1404.2.1 Protection of piping insulation. Piping insulation exposed to the weather shall be protected from damage, including that caused by sunlight, moisture, equipment maintenance and wind. The means of protection shall provide shielding from solar radiation that can cause degradation of the material. Adhesive tape shall not be permitted as a means of such protection.

Reason: This proposal attempts to maintain consistency between the IMC and the IECC allowing the code official easier code enforcement.

This proposal was taken out of the 2012 IECC where the Committee, in their reason statement felt that this change was needed to ensure durable materials met the requirements of the code. Below is the IECC committee reason for this proposal.
Committee Reason: *Protection of outside piping insulation is necessary to assure durable materials to meet the energy code requirements. The modification simply removes the laundry list of possible protections, as the committee felt this was unnecessary.*

This reason statement below, was taken from EC110-09/10, proposed by Howard Ahern and approved as modified as printed above.

"Outdoor piping insulation needs to be protected from weather, physical damage or from UV deterioration. Pipe insulation in outdoor locations is typically protected by an aluminum or sheet metal jacket, painted canvas, plastic cover, or coating that is water retardant and UV resistant.

All AC units require periodic maintenance. The frequency varies with how hard the unit operates, exterior temperature, preventive maintenance program, and many others. In every occasion, every maintenance provides an excuse for the Freon line insulation to be touched and removed. Adhesives Tape is not permitted as it will limit maintenance and damage insulations permeability characteristics. Removal of tape damages the integrity of the original insulation into pieces, specially, if the insulation has reached thermo set state. Protection can also keep silted pipe insulation from commonly separating thus saving additional energy cost. This simple common sense proposal is cost-effective as it will save energy and will prolong insulation life reducing replacement.
This proposal will save residential building energy cost following the same initiative being taken by the American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE) to improve energy efficiency levels by 30% in the **ASHRAE 90.1 2007 Section 6.4.4.1.1** commercial building standards. It also reflects the energy efficiency improvement approved by Congress American Recovery and Reinvestment Act of 2009 (ARRA).

ASHRAE 90.1 2007 Section 6.4.4.1.1:
Piping Insulation exposed to weather shall be protected from damage, including that due to sunlight, moisture, equipment maintenance, and wind but not limited to the following
A. Piping Insulation exposed to weather shall be suitable for outdoor service e.g., protected by aluminum, sheet metal, painted canvas, or plastic cover. Cellular foam insulation shall be protected as above or painted with a coating that is water retardant and provides shielding from solar radiation that can cause degradation of the material.

Cost Impact: The code change proposal will increase the cost of construction.

M214-12

	Assembly:	ASF	AMF	DF

1404.2.1(NEW)-M-BURGOS-SAGAN.DOC

CODE CORRELATION COMMITTEE
February, 2012

Following is a compilation of editorial changes made to the 2012 I-Codes that will appear in the 2015 I-Codes. Most of these editorial changes are code change proposals received that were deemed editorial, and therefore not required to be considered by the applicable code change committee during the 2012/2013 Code Change Cycle. These are shown with the original proponent's name. Additionally, the Code Correlation Committee identified needed editorial revisions to some code provisions. In those cases, the Code Correlation Committee is listed as the proponent. The item numbers refer to committee items discussed and considered at the Code Correlation Committee Conference Call on February 22, 2012. The entire agenda of the CCC discussed on February 22 can be viewed at:
http://www.iccsafe.org/cs/CCC/Documents/Agenda/022212-EditorialIssuesGroupA.pdf

IBC

Item # CCC 12-G1

IBC

Chapter 2 - Definitions

Proponent: Ken Sagan, NRG Code Advocates, representing Reflective Insulation Manufacturers Association International
Ref: 202-Reflective Plastic Core Foil Insulation-G-Sagan

Revise as follows:

Reflective Plastic Core ~~Foil~~ Insulation. An insulation material packaged in rolls that is less than 0.5 inches thick, with at least one exterior low emittance surface (0.1 or less) and a core material containing voids or cells.

Reason: Product innovations require that the term "Reflective Plastic Core Foil Insulation" be revised with the deletion of the word "foil". Possible use of low emittance surfaces such as metalized deposits now fall into this product category and should not be excluded by the utilization of the term "foil".

Item # CCC 12-G2

IBC

Chapter 2 - Definitions

Proponent: Philip Brazil, P.E., Senior Engineer, Reid Middleton, Inc., representing Washington Association of Building Officials, Technical Code Development Committee

REF: 202-SMOKEPROOF ENCLOSURE-G-Brazil

Revise as follows:

SECTION 202
DEFINITIONS

SMOKEPROOF ENCLOSURE. An _interior_ *exit stairway* designed and constructed so that the movement of the products of combustion produced by a fire occurring in any part of the building into the enclosure is limited.

Reason: "Interior" is added before "exit stairway" because "exit stairway" includes exterior exit stairways but they are not permitted to be components of smokeproof enclosures by Section 909.20, which requires a smokeproof enclosure to consist of an "enclosed interior exit stairway…and an open exterior balcony or ventilated vestibule." Based on our analysis of the 2012 IBC, there is only one instance of "exit stairway" in provisions for or related to smokeproof enclosures, where a change to "interior exit stairway" is warranted, and it is in this proposal.

Item # CCC 12-G7

IBC

407.5.1, 407.9, Table 1018.2

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care and Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee

REF: 407.5.1-G-Williams Ad Hoc

Find and replace the terms "gurney" and "litter" throughout the I-Codes with the term "stretcher."

407.5.1 Refuge area. Refuge areas shall be provided within each *smoke compartment*. The size of the refuge area shall accommodate the occupants and care recipients from the adjoining *smoke compartment*. Where a *smoke compartment* is adjoined by two or more *smoke compartments*, the minimum area of the refuge area shall accommodate the largest *occupant load* of the adjoining compartments. The size of the refuge area shall provide the following:

1. Not less than 30 net square feet (2.8 m2) for each care recipient confined to bed or ~~litter~~ _stretcher_.
2. Not less than 6 square feet (0.56 m2) for each ambulatory care recipient not confined to bed or ~~litter~~ _tretcher_ and for other occupants.

Areas or spaces permitted to be included in the calculation of refuge area are *corridors*, sleeping areas, treatment rooms, lounge or dining areas and other low hazard areas.

407.9 Secured yards. Grounds are permitted to be fenced and gates therein are permitted to be equipped with locks, provided that safe dispersal areas having 30 net square feet (2.8 m2) for bed and ~~litter~~ _stretcher_ care recipients and 6 net square feet (0.56 m2) for ambulatory care recipients and other occupants are located between the building and the fence. Such provided safe dispersal area shall be located not less than 50 feet (15 240 mm) from the building they serve.

Table 1018.2
MINIMUM CORRIDOR WIDTH
Occupancy Width (min)

Table 1018.2

In *corridors* and areas serving ~~gurney~~ stretcher traffic in occupancies where patients receive outpatient medical care, which causes the patient to be incapable of *self-preservation.*	72 inches

Reason: This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering, a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April 2011, the AHC has held 5 open meetings and over 80 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Revising these terms will be more consistent with current healthcare terminology and create consistency throughout the code. The term stretcher in place of either gurney or litter in the code has no financial impact on construction.

Item # CCC 12-G9

IBC
Table 414.2.5(1)

Proponent: Jerry R. Tepe, FAIA, JRT•AIA ARCHITECT representing The American Institute of Architects

Revise as follows:

[F] TABLE 414.2.5(1)
MAXIMUM ALLOWABLE QUANTITY PER INDOOR AND OUTDOOR CONTROL AREA IN GROUP M AND S OCCUPANCIES
NONFLAMMABLE SOLIDS AND NONFLAMMABLE AND NONCOMBUSTIBLE LIQUIDS [d,e,f]

(No change to Table proposed – shown only for reference.)

B. Physical-hazard materials—nonflammable and noncombustible solids and liquids			
1. Oxidizers[b,c]	4	Not Allowed	Not Allowed
	3	1,150[g]	115
	2	2,250[h]	225
	1	18,000 [i,j]	1,800 [i,j]

Footnotes

g. Maximum amounts ~~are permitted to~~ shall be increased to 2,250 pounds when individual packages are in the original sealed containers from the manufacturer or packager and do not exceed 10 pounds each.
h. Maximum amounts ~~are permitted to~~ shall be increased to 4,500 pounds when individual packages are in the original sealed containers from the manufacturer or packager and do not exceed 10 pounds each.

Reason: This changes the footnote language to the imperative rather than the permissive and creates consistency of language with other footnotes (see d and e in this Table and also d and e in Table 307.1(1)). Not technical change is intended.

Item # CCC 12-G10

IBC

419.6

Proponent: Hoyt Jeter, PE Eagle Eye Consulting Engineers, P.S
Representing Washington Association of Building Officials Technical Code Development Committee

Revise as follows:

Section 419.6. Floor<u>s</u> ~~loading for the areas~~ within a live/work unit shall be designed ~~to conform to~~ <u>for the live loads in</u> Table 1607.1 based on the function within the space.

Reason: The modification correlates with similar terminology used throughout the international building codes; IBC Table 1607.1 does not specify anything "to conform to" but does specify live loads required to design space, which Section 1607.3 charges.

CCC Action:

Item # CCC 12-G11

IBC

422.3, 422.4, & 422.5

Proponent: Homer Maiel, PE, CBO, Town of Atherton, Representing ICC Tri-Chapter (Peninsula, East Bay, and Monterey Bay)

REF: 422.4-G-MAIEL

Revise as follows:

422.3 Smoke compartments. Where the aggregate area of one or more *ambulatory care facilities* is greater than 10,000 square feet (929 m^2) on one *story*, the *story* shall be provided with a *smoke barrier* to subdivide the *story* into no fewer than two *smoke compartments*. The area of any one such *smoke compartment* shall be not greater than 22,500 square feet (2092 m^2). The area of any one such smoke compartment shall be not greater than 22,500 square feet (2092 m^2). The travel distance from any point in a *smoke compartment* to a *smoke barrier* door shall be not greater than 200 feet (60 960 mm). The *smoke barrier* shall be installed in accordance with Section 709 with the exception that *smoke barriers* shall be continuous from outside wall to an outside wall, a floor to a floor, or from a *smoke barrier* to a *smoke barrier* or a combination thereof.

> **~~422.4~~ <u>422.3.1</u> Refuge area.** Not less than 30 net square feet (2.8 m^2) for each nonambulatory care recipient shall be provided within the aggregate area of *corridors,* care recipient rooms, treatment rooms, lounge or dining areas and other low-hazard areas within each *smoke compartment.* Each occupant of an *ambulatory care facility* shall be provided with access to a refuge area without passing through or utilizing adjacent tenant spaces.

~~422.5~~ **422.3.2** **Independent egress.** A *means of egress* shall be provided from each *smoke compartment* created by smoke barriers without having to return through the *smoke compartment* from which *means of egress* originated.

~~422.6~~ 422.4(No change to text)

~~422.7~~ 422.5 (No change to text)

Reason: This is only an editorial change. Since Refuge Area and Independent Egress are subsections to Smoke Compartment, they need to be indented and to have subsection numbering. This section is similar to Section407.5 and 4075.1 and 407.5.2 which are correctly indented and subsectioned. .

Item # CCC 12-G12

IBC

506.1

Proponent: Kranz

Revise as follows:

BUILDING AREA MODIFICATIONS

506.1 General. The building areas limited by Table 503 shall be permitted to be increased due to frontage (If) and automatic sprinkler system protection (Is) in accordance with the following:

(Equation 5-1)

where:

Aa = Allowable building area per story (square feet).

At = Tabular building area per story in accordance with Table 503 (square feet).

If = Area increase factor due to frontage as calculated in accordance with Section 506.2.

I s = Area increase factor due to sprinkler protection as calculated in accordance with Section 506.3.

506.2 Frontage increase. Every building shall adjoin or have access to a public way to receive a building area increase for frontage. Where a building has more than 25 percent of its perimeter on a public way or open space having a minimum width of 20 feet (6096 mm), the frontage increase shall be determined in accordance with the following:

(Equation 5-2)

where:

If = Area increase factor due to frontage.

F = Building perimeter that fronts on a public way or open space having 20 feet (6096 mm) open minimum width (feet).

P = Perimeter of entire building (feet).

W = Width of public way or open space (feet) in accordance with Section 506.2.1.

Reason: Adding the word “factor” after “Area increase” creates consistency with the definition of “If” in Equation 5-1 above.

CCC Action:

Item # CCC 12-G13

IBC

507.3

Proponent: Eirene Oliphant, MCP, BRR Architecture, representing self

Revise as follows:

507.3 Sprinklered, one story. ~~The area of a Group B, F, M or S building no more than one *story above grade plane* of any construction type, or~~ ~~t~~The area of a Group A-4 building no more than one story above grade plane of other than Type V construction, or the area of a Group B, F, M or S building no more than one *story above grade plane* of any construction type, shall not be limited where the building is provided with an *automatic sprinkler system* throughout in accordance with Section 903.3.1.1 and is surrounded and adjoined by *public ways* or *yards* not less than 60 feet (18 288 mm) in width.

Reason:
While the intent of this section is to allow all types of construction for Groups B, F, M or S buildings and limit the type of construction for Group A-4, the way it is currently worded creates confusion. There are some who read this section to say that Type VB would not be a permitted construction type for an unlimited Group M building. This proposed code change is an attempt to clarify the language to clearly indicate that it is only the Group A-4 which has restrictions on the type of construction to allow unlimited area.

CCC Action:

Item # CCC 12-G14

IBC

507.5

Proponent: Jerry R. Tepe, FAIA, JRT•AIA ARCHITECT representing The American Institute of Architects

REF: 507.5-G-Tepe

Revise as follows:

507.~~5~~2 Reduced open space. The *public ways* or *yards* of 60 feet (18 288 mm) in width required in Sections 507.~~2~~3, 507.~~3~~4, 507.~~4~~5, 507.6 and 507.11 shall be permitted to be reduced to not less than 40 feet (12 192 mm) in width provided all of the following requirements are met:

1. The reduced width shall not be allowed for more than 75 percent of the perimeter of the building.
2. The *exterior walls* facing the reduced width shall have a *fire-resistance rating* of not less than 3 hours.
3. Openings in the *exterior walls* facing the reduced width shall have opening protectives with a *fire protection rating* of not less than 3 hours.

507.~~2~~3 Nonsprinklered, one story. No change.
507.~~3~~4 Sprinklered, one story. No change.
507.~~3~~4.1 Mixed occupancy buildings with Groups A-1 and A-2. No change.
507.~~4~~5 Two story. No change.

Reason:

This change simply puts the more general requirement at the front of the section and before all the referenced sections. Currently it is located in the middle of the referenced sections and is often overlooked as a result. There is no technical change proposed.

Item # CCC 12-FS1

IBC

703.2, 703.2.4(new)

Proponent: Bob Eugene/Underwriters Laboratories/Underwriters Laboratories

Revise as follows:

Relocate portions of section 703.2 to a new section 703.2.4 as follows:

703.2 Fire-resistance ratings. The fire-resistance rating of building elements, components or assemblies shall be determined in accordance with the test procedures set forth in ASTM E 119 or UL 263 or in accordance with Section 703.3. ~~Where materials, systems or devices that have not been tested as part of a fire-resistance-rated assembly are incorporated into the building element, component or assembly, sufficient data shall be made available to the building official to show that the required fire-resistance rating is not reduced.~~ Materials and methods of construction used to protect joints and penetrations in fire-resistance-rated building elements, components or assemblies shall not reduce the required fire-resistance rating.

Exception: <Unchanged>

<u>**703.2.4 Supplemental features.** Where materials, systems or devices that have not been tested as part of a fire-resistance-rated assembly are incorporated into the building element, component or assembly, sufficient data shall be made available to the building official to show that the required fire-resistance rating is not reduced.</u>

Portions not shown remain unchanged.

Reason: Section 703.2 currently covers four distinct concepts that are jumbled together in one section and exception, which is confusing for the code user. This proposal relocates one of the concepts, covering supplemental materials to its own section without making any changes to existing text.

CCC Action:

Item # CCC 12-FS2

IBC

703.2, 703.2.5(new)

Proponent: Bob Eugene/Underwriters Laboratories/Underwriters Laboratories

Revise as follows:

703.2 Fire-resistance ratings. The fire-resistance rating of building elements, components or assemblies shall be determined in accordance with the test procedures set forth in ASTM E 119 or UL 263 or in accordance with Section 703.3. Where materials, systems or devices that have not been tested as part of a fire-resistance-rated assembly are incorporated into the building element, component or assembly, sufficient data shall be made available to the building official to show that the required fire-resistance rating is not reduced. Materials and methods of construction used to protect joints and penetrations in fire-resistance-rated building elements, components or assemblies shall not reduce the required fire-resistance rating.

703.2.5 Exterior bearing walls ~~**Exception:**~~ In determining the fire-resistance rating of exterior bearing walls, compliance with the ASTM E 119 or UL 263 criteria for unexposed surface temperature rise and ignition of cotton waste due to passage of flame or gases is required only for a period of time corresponding to the required fire-resistance rating of an exterior nonbearing wall with the same fire separation distance, and in a building of the same group. When the fire-resistance rating determined in accordance with this exception exceeds the fire-resistance rating determined in accordance with ASTM E 119 or UL 263, the fire exposure time period, water pressure and application duration criteria for the hose stream test of ASTM E 119 or UL 263 shall be based upon the fire-resistance rating determined in accordance with this section ~~exception~~.

(Portions not shown remain unchanged.)

Reason: Section 703.2 currently covers four distinct concepts that are jumbled together in one section, which is confusing for the code user. This proposal takes the requirements in the exception, and moves them with no text changes to a new section on exterior load bearing walls. Relocating these requirements to a new section will make it easier for code users to locate them. The current arrangement is confusing since the exterior bearing wall requirements were not really an exception to the base requirements.

Item # CCC 12-FS7

IBC
704.2

Proponent: Homer Maiel, PE, CBO, Town of Atherton, Representing ICC Tri-Chapter (Peninsula, East Bay, and Monterey Bay)

Revise as follows:

704.2 Column protection. Where columns are required to have protection to be fire-resistance rated, the entire column shall be provided individual encasement protection by protecting it on all sides for the full column ~~length~~ height, including connections to other structural members, with materials having the required *fire-resistance rating*. Where the column extends through a ceiling, the encasement protection shall be continuous from the top of the foundation or floor/ceiling assembly below through the ceiling space to the top of the column.

Reason: This is only an editorial change. The word “length” associates with horizontal measurements. The word “height” on the other hand associates with vertical measurements and more appropriate for column.

<u>Item # CCC 12-FS8</u>

IBC

704.2, 704.4

Proponent: Maureen Traxler/City of Seattle Dept of Planning & Development/ City of Seattle Dept of Planning & Development

Revise as follows:

704.2 Column protection. Where columns are required to have protection to <u>achieve a fire-resistance rating</u> ~~be fire-resistance rated~~, the entire column shall be provided individual encasement protection by protecting it on all sides for the full column length, including connections to other structural members, with materials having the required fire-resistance rating. Where the column extends through a ceiling, the encasement protection shall be continuous from the top of the foundation or floor/ceiling assembly below through the ceiling space to the top of the column.

704.4 Protection of secondary members. Secondary members that are required to have <u>protection to achieve</u> a *fire-resistance rating* shall be protected by individual encasement protection, by the membrane or ceiling of a *horizontal assembly* in accordance with Section 711, or by a combination of both.

Reason: This proposal is intended to bring consistency to the terminology and provisions for individual encasement of structural members. Sections 704.2, 704.3 and 704.4 all require individual encasement for members that are required to have fire-resistance rating. However, Sections 704.2 and 704.3 require it only for members that require additional protection to get the required rating. For example, heavy timber columns would not be required to be individually encased. This proposal adds that same provision to Section 704.4 so that secondary members will also only be required to be individually encased if they need additional protection to get the required rating. This distinction that individual encasement is required only for members that require additional protection was introduced into these sections in the 09/10 code cycle by code change FS9-09/10.

This proposal also revises Section 704.2 so that the terminology is consistent in all three sections.

<u>Item # CCC 12-FS12</u>

IBC

708.1

Proponent: Al Godwin, CBO, CPM, Aon Fire Protection Engineering representing same.

Revise as follows:

IBC amend Section 708.1 to add an item 6 to read as follows:

708.1 General. The following wall assemblies shall comply with this section.

1. (no change)
2. (no change)
3. (no change)
4. (no change)
5. (no change)
6. <u>Egress balconies as required by Section 1019.2.</u>

Reason: The laundry list might as well be complete.

Item # CCC 12-FS17

IBC

Chapter 8

Proponent: Marcelo M. Hirschler/GBH International

Revise as follows:

Please revise the order of the sections so that all sections addressing individual materials follow each other. This means that sections 803.12 and 803.13 should be to immediately follow section 803.8. The order would then remain as shown below.

803 Wall and Ceiling Finishes
803.1 General
803.2 Thickness exemption
803.3 Heavy timber exemption
803.4 Foam plastics
803.5 Textile wall coverings
803.6 Textile ceiling coverings
803.7 Expanded vinyl wall coverings
803.8 Expanded vinyl ceiling coverings
803.9 High density polyethylene and polypropylene
803.10 Site-fabricated stretch systems
803.11 Interior finish requirements based on group
803.12 Stability
803.13 Application of interior finish materials to fire resistance-rated or noncombustible building elements

Reason: Section 803 addresses wall and ceiling finishes and its flow is not logical at present.

Section 803 correctly starts with a general section (that includes the test methods, 803.1) and follows with the exemptions (thin materials and heavy timber, 803.2 and 803.3) before starting a section on various interior finish materials that require special attention to their testing (803.4 to 803.8). It then moves to requirements based on group (803.9), stability (803.10) and application of interior finish to certain building elements (803.11). It ends by returning one more time to some interior finish materials that require special attention (803.12 and 803.13). High density polyethylene, polypropylene and site-fabricated stretch systems, the materials addressed in the last two sections, should be included in the initial sequence of materials and become sections 803.9 and 803.10. Then sections 803.9 to 803.11 should be renumbered to become 803.11 to 803.13.

There is no change in requirements or even in code language proposed.

Item # CCC 12-E5

1008.1.2 (IFC [B] 1008.1.2)

Proponent: William E. Koffel, P.E., Koffel Associates, Inc. representing Won-Door Corporation

Revise as follows:

1008.1.2 (IFC [B] 1008.1.2) Door swing. Egress doors shall be of the pivoted or side-hinged swinging type.

Exceptions:

1. Private garages, office areas, factory and storage areas with an occupant load of 10 or less.
2. Group I-3 occupancies used as a place of detention.
3. Critical or intensive care patient rooms within suites of health care facilities.

4. Doors within or serving a single dwelling unit in Groups R-2 and R-3.
5. In other than Group H occupancies, revolving doors complying with Section 1008.1.4.1.
6. In other than Group H occupancies, horizontal sliding doors complying with Section 1008.1.4.3 are permitted in a means of egress .
7. Power-operated doors in accordance with Section 1008.1.4.2.
8. Doors serving a bathroom within an individual sleeping unit in Group R-1.
9. In other than Group H occupancies, manually operated horizontal sliding doors are permitted in a means of egress from spaces with an occupant load of 10 or less.

1008.1.2.1 (IFC [B] 1008.1.2.1) Direction of Swing. Swinging d~~D~~oors shall swing in the direction of egress travel where serving an occupant load of 50 or more persons or a Group H occupancy.

Reason: The location of the requirement for doors to swing in the direction of egress travel has been misinterpreted to apply to horizontal sliding doors since it is located after the exceptions, thereby limiting the application of horizontal sliding doors to an occupant load of less than 50. It should be noted that Section 1008.1.4.3 does not restrict the use of horizontal sliding doors in Group A occupancies or any other occupancy with an occupant load of 50 or more.

Consideration was given to moving the sentence to before the exceptions but if that is done, one might use Exception #1 to override the requirement to swing in the direction of egress in Group H occupancies, regardless of occupant load.

Item # CCC 12-E7

IBC

1013.6, 1013.7 (IFC [B] 1013.6, 1013.7) (IMC [B] 304.11, 304.12(New))

Proponent: Kim Paarlberg

Revise as follows:

1013.6 (IFC [B] 1013.6; IMC [B] 304.11) Mechanical equipment. Guards shall be provided where appliances, equipment, fans~~, roof hatch openings~~ or other components that require service are located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof or grade below. The guard shall be constructed so as to prevent the passage of a sphere 21 inches (533 mm) in diameter. The guard shall extend not less than 30 inches (762 mm) beyond each end of such appliance, equipment, fan or component.

1013.7 (IFC [B] 1013.7; IMC [B] 304.12) Roof access. *Guards* shall be provided where the roof hatch opening is located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof or grade below. The guard shall be constructed so as to prevent passage of a sphere 21 inches (533 mm) in diameter.

Reason: The current requirements for guards for mechanical equipment and roof access is the same, so taking 'roof hatch opening' out of the list in Section 1013.6 is eliminating duplication with 1013.7. Also, Section 1013.6 is in the Intenational Mechanical Code, but roof access is not. It seems like this since the roof hatch provides access to the equipment, and the IMC text currently includes "roof hatch opening", that it would be consistent to add it to the IMC.

<u>Item # CCC 12-E8</u>

IBC

1018.2 (IFC [B] 1018.2)

Proponent: Maureen Traxler, City of Seattle Department of Planning and Development, representing City of Seattle Department of Planning and Development

Revise as follows:

1018.2 (IFC [B] 1018.2) Width. The minimum width of *corridors* <u>shall be as</u> specified in Table 1018.2, <u>and</u> shall be <u>not less than</u> as determined in Section 1005.1.

Reason: The language in Section 1018.2 of the 2012 IBC is very difficult to understand and apply. This code change proposal revises the language to provide that the minimum width of corridors is calculated according to Table 1018.2 which includes minimum corridor widths based on occupancy and occupant load. Section 1005.1 also provides minimum widths that are generally applicable to means of egress components, including corridors. The proposed language expresses the relationship more clearly.

<u>Item # CCC 12-E10</u>

1025.4 (IFC [B] 1025.4)

Proponent: Kim Paarlberg

Revise as follows:

1025.4 (IFC [B] 1025.4) Capacity of refuge area. The refuge area of a *horizontal exit* shall be a space occupied by the same tenant or a public area and each such refuge area shall be adequate to accommodate the original *occupant load* of the refuge area plus the *occupant load* anticipated from the adjoining compartment. The anticipated *occupant load* from the adjoining compartment shall be based on the capacity of the *horizontal exit* doors entering the refuge area.

<u>**1025.4.1 (IFC [B] 1025.4.1) Capacity of refuge area.**</u> The capacity of the refuge area shall be computed based on a *net floor area* allowance of 3 square feet (0.2787 m2) for each occupant to be accommodated therein.

> **Exception:** The *net floor area* allowable per occupant shall be as follows for the indicated occupancies:
>
> 1. Six square feet (0.6 m^2) per occupant for occupancies in Group I-3.
> 2. Fifteen square feet (1.4 m^2) per occupant for ambulatory occupancies in Group I-2.
> 3. Thirty square feet (2.8 m^2) per occupant for nonambulatory occupancies in Group I-2.

<u>**1025.4.2 (IFC 1025.4.2) Number of exits.**</u> The refuge area into which a *horizontal exit* leads shall be provided with *exits* adequate to meet the occupant requirements of this chapter, but not including the added *occupant load* imposed by persons entering it through *horizontal exits* from other areas. At least one refuge area exit shall lead directly to the exterior or to an *interior exit stairway* or *ramp*.

> **Exception:** The adjoining compartment shall not be required to have a *stairway* or door leading directly outside, provided the refuge area into which a *horizontal exit* leads has *stairways* or doors

leading directly outside and are so arranged that egress shall not require the occupants to return through the compartment from which egress originates.

Reason: Separating this section into parts is editorial and will add additional clarity, especially for application of the exceptions.

Item # CCC 12-E15

IBC

Table 1106.1

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee

Revise as follows:

1106.1 Required. Where parking is provided, accessible parking spaces shall be provided in compliance with Table 1106.1, except as required by Sections 1106.2 through 1106.4. Where more than one parking facility is provided on a site, the number of parking spaces required to be accessible shall be calculated separately for each parking facility.

TABLE 1106.1
ACCESSIBLE PARKING SPACES

TOTAL PARKING SPACES PROVIDED IN PARKING FACILITIES	REQUIRED MINIMUM NUMBER OF ACCESSIBLE SPACES

(Portions of table not shown remain unchanged.)

Reason: The title in the table should match the requirement in text. This will also match ADA Table 208.2.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April, 2005, the CTC has held twenty-two meetings – all open to the public.

1106.1#1-E-BALDASSARRA-CTC.docx

Item # CCC 12-E16

IBC

1108.2.2

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee

Revise as follows:

1108.2.2 Wheelchair spaces. In ~~theaters, bleachers, grandstands, stadiums, arenas and other fixed seating~~ rooms and spaces used for assembly ~~areas~~ purposes with fixed seating, accessible wheelchair spaces shall be provided in accordance with Sections 1108.2.2.1 through 1108.2.2.4.

Reason: The proposal better harmonizes with the ADA (Section 221.2) by deleting a list of spaces that is not included in the requirements of ADA and clearly applying the requirement to spaces with fixed seating. Spaces having fixed seating are not limited to the laundry list that is proposed to be deleted by this proposal. Both the IBC and ADA require wheelchair spaces where there are as few as 4 fixed seats. The laundry list would likely have many more than 4 seats while other spaces potentially having as few as 4 fixed seats are not included within the list. Therefore, the list should be deleted and it should be clarified that these requirements apply to those spaces with fixed seating.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as “areas of study”. Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April, 2005, the CTC has held twenty-two meetings – all open to the public.

Item # CCC 12-E19

IBC
Table 1018.2 (IFC [B] Table 1018.2)

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care

Revise as follows:

1018.2 (IFC [B] 1018.2) Width. The minimum width of corridors specified in Table 1018.2 shall be as determined in Section 1005.1.

Table 1018.2 (IFC [B] Table 1018.2)
MINIMUM CORRIDOR WIDTH

Occupancy	Width (min)
Any facilities not listed below	44 inches (1118 mm)
Access to and utilization of mechanical, plumbing or electrical systems or equipment	24 inches (610 mm)
With a required occupancy capacity less than 50	36 inches (914 mm)
Within a dwelling unit	36 inches (914 mm)
In Group E with a corridor having a required capacity of 100 or more	72 inches (1829 mm)
In corridors and areas serving gurney traffic in ~~occupancies where patients receive outpatient medical care, which causes the patient to be incapable of self-preservation~~ ambulatory care facilities	72 inches (1829 mm)
Group I-2 in areas where required for bed movement	96 inches (2438 mm)

Reason: The language in the 2009 table conflicts with language found in chapter 2’s definition for Ambulatory Care Facilities. The definition for Ambulatory Care Facilities addresses the ability of the patients in this section appropriately. Using the previously defined term will simplify and clarify the table. The size of the stretchers or gurneys are the same as any typical stretcher or gurney (average 74”L x 22”w) and under normal situations are able to be moved in aisle widths as narrow as 36” (typically this size stretcher is used in the field by EMT’s in typical residential occupancies) however, 72” aisles are needed in Ambulatory Surgery Facilities because of the additional equipment that may be attached to a stretcher or gurney such as I.V poles, monitors and the multiple staff that may be involved in moving a patient to or from surgery under normal circumstances or in emergencies, hence, the only reason that Ambulatory Surgery Facilities require the wider aisle width)

Additionally, Ambulatory Care Facilities utilize stretchers or gurneys which are much narrower than a hospital bed, which is intended for overnight stays (overnight stays are not allowed in Ambulatory Surgery Facilities). Group I-2 hospitals require wider aisles for movement of these larger beds and this chapter dictates that I-2 Occupancy aisles used for movement of patient beds be 96”.

This proposal is submitted by the ICC Ad Hoc Committee on Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April, 2011, the AHC has held 5 open meetings and over 80 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.

Cost Impact: None

CCC Action:

<u>Item # CCC 12-E20</u>

IBC
1009.13.1, 1009.14 (IFC [B] 1009.13.1, 1009.14)

Proponent: David W. Cooper, Stairway Manufacturing and Design Consultants representing Stairway Manufacturers' Association

Revise as follows:

1009.13.1 (IFC 1009.13.1) Handrails of alternating tread devices. *Handrails* shall be provided on both sides of *alternating tread devices* ~~and shall comply with section 1012~~.

1009.14 (IFC [B] 1009.14) Ship ladders. Ship ladders are permitted to be used in Group I-3 as a component of a *means of egress* to and from control rooms or elevated facility observation stations not more than 250 square feet (23 m^2) with not more than three occupants and for access to unoccupied roofs. <u>The minimum clear width at and below the *handrails* shall be 20 inches (508 mm).</u>

<u>**1009.14.1 (IFC [B] 1009.14.1) Handrails of ship ladders.** *Handrails* shall be provided on both sides of ship ladders.</u>

<u>**1009.14.2 (IFC [B] 1009.14.2) Treads of ship ladders.**</u> Ship ladders shall have a minimum tread depth of 5 inches (127 mm). The tread shall be projected such that the total of the tread depth plus the *nosing* projection is no less than 8 1/2 inches (216 mm). The maximum riser height shall be 9 1/2 inches (241 mm).

~~*Handrails* shall be provided on both sides of ship ladders~~. ~~The minimum clear width at and below the *handrails* shall be 20 inches (508 mm).~~

Reason: The reference to section **1012 Handrails** is unnecessary, superfluous and has been stricken. It is clearly understood that all handrail requirements for stairs, ramps, alternating tread devices, and ship ladders are located there as well as applicable exceptions for alternating tread devices and ship ladders.

This is a simple reorganization without change to the text or meaning. The intent is to model the format established by the preceding section,1009.13 Alternating tread devices to aid in understanding and compliance.

<u>Item # CCC 12-S7</u>

IBC
1507.4.2

Proponent: ***Name/Company/Representing (***

Bonnie Manley, P.E., American Iron and Steel Institute

Revise as follows:

1507.4.2 Deck slope. Minimum slopes for metal roof panels shall comply with the following:

1. The minimum slope for lapped, nonsoldered seam metal roof~~s~~ <u>panels</u> without applied lap sealant shall be three units vertical in 12 units horizontal (25-percent slope).
2. The minimum slope for lapped, nonsoldered seam metal roof~~s~~ <u>panels</u> with applied lap sealant shall be one-half unit vertical in 12 units horizontal (4-percent slope). Lap sealants shall be applied in accordance with the *approved* manufacturer's installation instructions.

3. The minimum slope for standing seam metal ~~of~~ roof panel systems shall be one-quarter unit vertical in 12 units horizontal (2-percent slope).

Reason: These minor editorial modifications bring consistency to the terminology used throughout the section.

CCC Action:

Item # CCC 12-S8

IBC
1510.3

Proponent: Bonnie Manley, P.E., American Iron and Steel Institute

Revise as follows:

1510.3 Recovering versus replacement. New roof coverings shall not be installed without first removing all existing layers of roof coverings down to the roof deck where any of the following conditions occur:

1. Where the existing roof or roof covering is water soaked or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing.
2. Where the existing roof covering is wood shake, slate, clay, cement or asbestos-cement tile.
3. Where the existing roof has two or more applications of any type of roof covering.

Exceptions:

1. Complete and separate roofing systems, such as standing-seam metal roof panel systems, that are designed to transmit the roof loads directly to the building's structural system and that do not rely on existing roofs and roof coverings for support, shall not require the removal of existing roof coverings.
2. Metal panel, metal shingle and concrete and clay tile roof coverings shall be permitted to be installed over existing wood shake roofs when applied in accordance with Section 1510.4.
3. The application of a new protective coating over an existing spray polyurethane foam roofing system shall be permitted without tear-off of existing roof coverings.
4. Where the existing roof assembly includes an ice barrier membrane that is adhered to the roof deck, the existing ice barrier membrane shall be permitted to remain in place and covered with an additional layer of ice barrier membrane in accordance with Section 1507.

Reason: Minor editorial modification corrects terminology to reflect what is used in Section 1507.4.
