__**605.11.1.2.3**__ ~~**605.11.3.2.3**~~ **Single ridge roofs.** Panels and modules installed on __Group R-3 buildings__ ~~one- and two-family dwellings~~ with a single ridge shall be located in a manner that provides two, 3-foot-wide (914 mm) access pathways from the eave to the ridge on each roof slope where panels and modules are located.

> **Exception:** This requirement shall not apply to roofs with slopes of two units vertical in 12 units horizontal (2:12) or less.

__**605.11.1.2.4**__ ~~**605.11.3.2.4**~~ **Roofs with hips and valleys.** Panels and modules installed on __Group R-3 buildings__ ~~one- and two-family dwellings~~ with roof hips and valleys shall be located no closer than 18 inches (457 mm) to a hip or a valley where panels and modules are to be placed on both sides of a hip or valley. Where panels are to be located on only one side of a hip or valley that is of equal length, the panels shall be permitted to be placed directly adjacent to the hip or valley.

> **Exception:** These requirements shall not apply to roofs with slopes of two units vertical in 12 units horizontal (2:12) or less.

__**605.11.1.2.5**__ ~~**605.11.3.2.5**~~ **Allowance for smoke ventilation operation.** Panels and modules installed __Group R-3 buildings__ ~~one- and two-family dwellings~~ shall be located no less than 3 feet (914 mm) from the ridge in order to allow for fire department smoke ventilation operations.

> **Exception:** Panels and modules shall be permitted to be located up to the roof ridge where an alternative ventilation method approved by the fire chief has been provided or where the fire chief has determined vertical ventilation techniques will not be employed.

__**605.11.1.3**__ ~~**605.11.3.3**~~ **Other than ~~one- and two-family dwellings~~ Group R-3 buildings.** Access to systems for __buildings__ ~~occupancies~~ other than __those containing__ Group R-3 __occupancies__ ~~buildings~~ shall be provided in accordance with Sections __605.11.2.3.1__ ~~605.11.3.3.1~~ through __605.11.2.3.3__ ~~605.11.3.3.3~~.

> **Exception:** Where it is determined by the *fire code official* that the roof configuration is similar to that of a Group R-3 occupancy, the residential access and ventilation requirements in Sections __605.11.2.2.1__ ~~605.11.3.2.1~~ through __605.11.2.2.5__ ~~605.11.3.2.4~~ shall be permitted to be used.

__**605.11.1.3.1**__ ~~**605.11.3.3.1**~~ **Access.** There shall be a minimum 6-foot-wide (1829 mm) clear perimeter around the edges of the roof.

> **Exception:** Where either axis of the building is 250 feet (76 200 mm) or less, the clear perimeter around the edges of the roof shall be a minimum 4-foot-wide (1290 mm).

__**605.11.1.3.2**__ ~~**605.11.3.3.2**~~ **Pathways.** The solar installation shall be designed to provide designated pathways. The pathways shall meet the following requirements:

1. The pathway shall be over areas capable of supporting fire fighters accessing the roof.
2. The centerline axis pathways shall be provided in both axes of the roof. Centerline axis pathways shall run where the roof structure is capable of supporting the live load of fire fighters accessing the roof.
3. Shall be a straight line not less than 4 feet (1290 mm) clear to skylights or ventilation hatches.
4. Shall be a straight line not less than 4 feet (1290 mm) clear to roof standpipes.
5. Shall provide not less than 4 feet (1290 mm) clear around roof access hatch with at least one not less than 4 feet (1290 mm) clear pathway to parapet or roof edge.

__**605.11.1.3.3**__ ~~**605.11.3.3.3**~~ **Smoke ventilation.** The solar installation shall be designed to meet the following requirements:

1. Arrays shall be no greater than 150 feet (45 720 mm) by 150 feet (45 720 mm) in distance in either axis in order to create opportunities for fire department smoke ventilation operations.
2. Smoke ventilation options between array sections shall be one of the following:

2.1. A pathway 8 feet (2438 mm) or greater in width.
2.2. A 4-foot (1290 mm) or greater in width pathway and bordering roof skylights or gravity operated drop-out smoke and heat vents.
2.3. A 4-foot (1290 mm) or greater in width pathway and bordering all sides of non-gravity-operated drop out smoke and heat vents.
2.4. A 4-foot (1290 mm) or greater in width pathway and bordering 4-foot by 8-foot (1290 mm by 2438 mm) "venting cutouts" every 20 feet (6096 mm) on alternating sides of the pathway.

605.11.2 ~~**605.11.4**~~ **Ground-mounted photovoltaic arrays.** Ground-mounted photovoltaic arrays shall comply with Section~~s~~ 605.11 ~~through 605.11.2~~ and this section. Setback requirements shall not apply to ground-mounted, free-standing photovoltaic arrays. A clear, brush-free area of 10 feet (3048 mm) shall be required for ground mounted photovoltaic arrays.

Commenter's Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

Proposals F62-13, F64-13, F69-13, F72-13, F73-13, F74-13 and RM96-13 all made revisions to Section 605.11 requirements for solar photovoltaic power systems. Most of the revisions accepted by the committee worked well together, with a few exceptions that need coordination/clarification.

This public comment to F62-13 shows what Section 605.11 will look like if all of the approved proposals are adopted. The changes included in this proposal accomplish the following:

1. Editorially show the new numbering system that results from F94-13 deleting Sections 905.11.1 through 905.11.2. (Note - ICC staff ultimately decide the numbering system to be used)
2. In new Section 605.11.1, proposal F62-13 removed what is shown as exception 2, but this section was modified by F69-13. This exception was retained.
3. In new Section 605.11.1.2 the exception was added by proposal RM96-13.
4. In new Section 605.11.1.3 both F62-13 and F72-13 (as modified) added wording which resulted in the title of the section reading "Other than one- and two-family dwellings Group R-3 buildings". This title was revised to only include "Group R-3 buildings". In addition the text in this section was editorially revised to clarify that it applies to buildings, other than those containing Group R-3 occupancies. In addition references to "one- and two-family dwellings" was changed to "Group R-3 buildings" in Sections 605.11.1.2.2 , 605.11.1.2.3, 605.11.1.2.4 and 605.11.1.2.5 for consistency.
5. New Section 605.11.2 deleted referenced to previous Section 605.11.2 since this section was deleted by proposal F64-13.

F62-13

Final Action: AS AM AMPC____ D

F76-13
606.5 (New)

Proposed Change as Submitted

Proponent: Mona Casey, United Parents to Restrict Open Access to Refrigerant, representing the United Parents to Restrict Open Access to Refrigerant

Add new text as follows:

606.5 Access port protection. Refrigerant circuit access ports located outdoors shall be fitted with locking-type, tamper-resistant caps or shall be otherwise secured to prevent unauthorized access.

> **Exception:** Refrigerant circuit access ports on equipment installed in controlled areas such as on roof tops with locked and alarmed access hatches or doors.

(Renumber subsequent sections.)

Reason: The purpose of this code change proposal is to add language to the code for securing refrigerant access ports, which will help reduce injuries and fatalities resulting from unauthorized access to refrigerant. Refrigerants are controlled substances that must be properly protected. The IMC currently has requirements for protection of refrigerant ports. This will add the requirements to the IFC to be consistent with the IMC. It will also provide the fire official with proper code language to enforce the requirement.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: Proposed Section 606.5 (without the exception) is identical to IMC Section 1101.10.

606.5 (NEW)-F-CASEY.doc

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee agreed with the proponent's reason statement that the code change provides a safeguard against unauthorized tampering with readily accessible refrigerant ports and also provides correlation with the IMC.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Barry Greive, representing Target Corporation, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

606.5 Access port protection. Refrigerant circuit access ports located outdoors shall be fitted with locking-type, tamper-resistant caps or shall be otherwise secured to prevent unauthorized access.

> **Exception:** Refrigerant circuit access ports on equipment installed in controlled areas such as on roofs ~~tops~~ with locked ~~and alarmed~~ access hatches or doors.

Commenter's Reason: This change is needed to be consistent with the modification and approval made by the Mechanical Code Committee and the ICC Membership during the Cycle A Mechanical Code Hearings.

There was a lot of discussion regarding refrigeration systems behind locked areas such as enclosures including roofs with hatches. The Mechanical Committee and ICC Membership felt that the areas are already secured and made safe by locking methods and the need for alarming on top of that was not necessary.

The Fire Code and Mechanical Code need to be consistent for uniform enforcement.

Public Comment 2:

Steve Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC, requests Disapproval.

Commenter's Reason: This requirement does not belong in the Fire Code. It is a construction requirement and is already covered in the IMC and IRC. The Fire Code is not a mechanical code. We do not need to duplicate code requirements in all of the codes just to make sure it is covered. The protection is adequately covered in the other codes. Section 606.1 of the Fire Code specifically requires refrigeration systems to be installed in accordance the IMC which already require the caps.

F76-13
Final Action: AS AM AMPC____ D

F80-13
606.12.1 (New), Chapter 80

Proposed Change as Submitted

Proponent: Jeffrey M. Shapiro, International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com)

Revise as follows:

606.12.1 Standards. Refrigeration systems and the buildings in which such systems are installed shall be in accordance with ASHRAE 15.

606.12.1.1 Ammonia Refrigeration. Refrigeration systems using ammonia refrigerant and the buildings in which such systems are installed shall comply with the following standards:

1. IIAR-2 for system design and installation
2. IIAR-6 for maintenance and inspection
3. IIAR-7 for operating procedures
4. IIAR-8 for decommissioning.

Add standards to Chapter 80 as follows:

IIAR

International Institute of Ammonia Refrigeration
1001 N. Fairfax Street, Suite 503
Alexandria, VA 22314

IIAR-2-2014	*Equipment, Design, and Installation of Closed-Circuit Ammonia Mechanical Refrigerating Systems*
IIAR-6-2014	*Maintenance and Inspection of Closed-Circuit Ammonia Mechanical Refrigerating Systems*
IIAR-7-2013	*Developing Operating Procedures for Closed-Circuit Ammonia Mechanical Refrigerating*
IIAR-8-2014	*Decommissioning of Closed- Circuit Ammonia Mechanical Refrigerating Systems*

Reason: The International Institute of Ammonia Refrigeration is completing a suite of standards to prescribe regulations for the safe design, installation, operation, maintenance, inspection and decommissioning of ammonia refrigeration systems. All of these documents will be ANSI standards. As the leading organization representing the interests of the ammonia refrigeration industry, IIAR believes that it is essential for facilities with ammonia refrigeration systems to follow the requirements in these standards, which are being written as enforceable documents, as a basis of providing for the safety of the these facilities as well as surrounding communities.

With the exception of IIAR-2, the remaining standards are at various stages of completion with respect to the ANSI process, and it is anticipated that all will be completed prior to conclusion of the 2013 ICC code cycle.

Note that IIAR-2 is already adopted by the IMC, and it is being proposed for adoption by the IFC as well because the standard includes requirements governing refrigerant leak detection alarms and other topics scoped to the IFC.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, IIAR-6, -7 and -8, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28), will be posted on the ICC website on or before April 1, 2013. IIAR-2-99 with 2005 addendum is currently referenced in the IMC. An update in the year edition of that standard will be accomplished by an administrative standards update code change to be heard by the ADM Code Development Committee.

606.12.1 (NEW)-F-SHAPIRO

Committee Action Hearing Results

For staff analysis of the content of IIAR-2-2014 relative to CP#28, Section 3.6, please visit:
http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/ProposedStandards.pdf

Committee Action: Approved as Modified

Modify the proposal as follows:

606.12.1 Standards. Refrigeration systems and the buildings in which such systems are installed shall be in accordance with ASHRAE 15.

606.12.1.1 Ammonia Refrigeration. Refrigeration systems using ammonia refrigerant and the buildings in which such systems are installed shall comply with ~~the following standards: 1.~~ IIAR-2 for system design and installation.

~~2. IIAR-6 for maintenance and inspection~~
~~3. IIAR-7 for operating procedures~~
~~4. IIAR-8 for decommissioning.~~

Add standards to Chapter 80 as follows:

IIAR

International Institute of Ammonia Refrigeration
1001 N. Fairfax Street, Suite 503
Alexandria, VA 22314

IIAR-2-2014	*Equipment, Design, and Installation of Closed-Circuit Ammonia Mechanical Refrigerating Systems*
~~IIAR-6-2014~~	~~*Maintenance and Inspection of Closed-Circuit Ammonia Mechanical Refrigerating Systems*~~
~~IIAR-7-2013~~	~~*Developing Operating Procedures for Closed-Circuit Ammonia Mechanical Refrigerating*~~
~~IIAR-8-2014~~	~~*Decommissioning of Closed- Circuit Ammonia Mechanical Refrigerating Systems*~~

Committee Reason: The committee agreed with the proponent's reason statement that the code change provides an appropriate referenced standard for refrigeration system design and installation. The modification deletes standards that are not yet approved and ready for publication.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jeffrey M. Shapiro, P.E., International Code Consultants, representing International Institute of Ammonia Refrigeration, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

606.12.1.1 Ammonia Refrigeration. Refrigeration systems using ammonia refrigerant and the buildings in which such systems are installed shall comply with IIAR-2 for system design and installation and IIAR 7 for operating procedures.

Add a standard to Chapter 80 as follows:

IIAR

International Institute of Ammonia Refrigeration
1001 N. Fairfax Street, Suite 503
Alexandria, VA 22314

IIAR-7-2013 *Developing Operating Procedures for Closed-Circuit Ammonia Mechanical Refrigerating*

(Portions of proposal not shown remain unchanged)

Commenter's Reason: At the time of the committee hearing, development of IIAR 7 was slightly behind schedule, and the standard had not yet been finalized. Accordingly, as the proponent of the proposal, we asked the committee to exclude IIAR 7 from consideration at that time. The standard has now completed the ANSI standard development process and has been finalized. A copy is available for download at http://tinyurl.com/IIAR7. IIAR 7 represents a significant step forward in refrigeration safety by establishing a minimum standard for mandatory operating procedures for ammonia refrigeration systems. Referencing this document in the IFC will give code enforcers a means to require that appropriate operating procedures be developed and maintained, which, when followed, will significantly reduce the risk of accidents.

Analysis: The draft of IIAR7-2013 was submitted with code change F80-13 and was reviewed by the IFC committee. For analysis of the content of IIAR7-2013 relative to CP #28, Section 3.6, please visit, http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/ProposedStandards.pdf.

F80-13

Final Action: AS AM AMPC____ D

F84-13
607.5, 607.5.1, 607.5.2, 607.5.3

Proposed Change as Submitted

Proponent: Brian Black, BDBlack Codes, Inc., representing National Elevator Industry Inc. (bdblack@neii.org)

Revise as follows:

607.5 Standardized fire service elevator keys. Buildings with elevators equipped with Phase I emergency recall, Phase II emergency in-car operation, or a fire service access elevator shall be equipped to operate with a standardized fire service elevator key ~~*approved* by the *fire code official*~~ complying with ASME A17.1/CSA B44.

> ~~**Exception:** The owner shall be permitted to place the building's nonstandardized fire service elevator keys in a key box installed in accordance with Section 506.1.2.~~

~~**607.5.1 Requirements for standardized fire service elevator keys.** Standardized fire service elevator keys shall comply with all of the following:~~

1. ~~All fire service elevator keys within the jurisdiction shall be uniform and specific for the jurisdiction. Keys shall be cut to a uniform key code.~~
2. ~~Fire service elevator keys shall be of a patent-protected design to prevent unauthorized duplication.~~
3. ~~Fire service elevator keys shall be factory restricted by the manufacturer to prevent the unauthorized distribution of key blanks. No uncut key blanks shall be permitted to leave the factory.~~
4. ~~Fire service elevator keys subject to these rules shall be engraved with the words "DO NOT DUPLICATE."~~

~~**607.5.2 Access to standardized fire service keys.** Access to standardized fire service elevator keys shall be restricted to the following:~~

1. ~~Elevator owners or their authorized agents.~~
2. ~~Elevator contractors.~~
3. ~~Elevator inspectors of the jurisdiction.~~
4. ~~*Fire code officials* of the jurisdiction.~~
5. ~~The fire department and other emergency response agencies designated by the *fire code official*.~~

~~**607.5.3 Duplication or distribution of keys.** No person shall duplicate a standardized fire service elevator key or issue, give, or sell a duplicated key unless in accordance with this code.~~

607.5.4 Responsibility to provide keys. The building *owner* shall provide up to three standardized fire service elevator keys where required by the *fire code official*, upon installation of a standardized fire service key switch or switches in the building.

Reason: The National Elevator Industry Inc. (NEII) agrees with the reason this section was added to the 2012 International Fire Code, that firefighters need a standardized fire service elevator key that is secure and that will work throughout a jurisdiction. However, this is already a requirement in the ASME A17.1/CSA B44 Safety Code for Elevators and Escalators referenced by the International Fire Code:

ASME A17.1-2010/CSA B44-10
SECTION 2.27
EMERGENCY OPERATION AND SIGNALING DEVICES

2.27.8 Switch Keys

The key switches required by 2.27.2 through 2.27.5 for all elevators in a building shall be operable by the FEO-K1 key. The keys shall be Group 3 Security (see 8.1). A separate key shall be provided for each switch. These keys shall be kept on the premises in a location readily accessible to firefighters and emergency personnel, but not where they are available to the public. This key shall be of a tubular, 7 pin, style 137 construction and shall have a bitting code of 6143521 starting at the tab sequenced clockwise as viewed from the barrel end of the key. The key shall be coded “FEO-K1.” The possession of the “FEO-K1” key shall be limited to elevator personnel, emergency personnel, elevator equipment manufacturers, and authorized personnel during checking of Firefighters’ Emergency Operation (see 8.1 and 8.6.11.1).

Where provided, a lock box, including its lock and other components, shall conform to the requirements of UL 1037 (see Part 9).

NOTE (2.27.8): Local authorities may specify additional requirements for a uniform keyed lock box and its location to contain the necessary keys.

Group 3 Security is specified in Section 8.1:

8.1.4 Group 3: Emergency Operation

Group 3 covers access or operation of equipment by emergency, authorized, and elevator personnel.

Simply, this requirement is unnecessary because the need it purports to address is already covered by the code’s referenced standard. However, there is a greater problem with having a requirement in the International Fire Code that conflicts with the firefighter key requirements of ASME A17.1/CSA B44.

The proponents of this code provision proposed in the 2012 cycle dismissed the conflict between the IFC and ASME code by claiming that Section 102.7 of the IFC resolves this by stating, “Where differences occur between the provisions of this code and the referenced standards, the provisions of this code apply.” This argument may be true for most codes and standards referenced in the I-Codes, but is incorrect in this case.

In many jurisdictions in the United States (e.g., Wisconsin) the building code, fire code and elevator code are enacted by different pieces of legislation and regulated by entirely different state or municipal rules and agencies. Because of this, one department enforces the fire code, another the elevator code, and neither official is obligated or legally able to recognize the requirements of the other. In other words, Section 102.7 of the IFC does not “trump” the laws and rules that adopt and regulate these jurisdictions’ elevator codes.

The result is that the State Fire Marshall will require one firefighters’ elevator key (the IFC key), the Chief Elevator Inspector will require another (The ASME A17.1 FEO-K1 key), neither will have priority over the other, and the building owner will be continuously in violation of one law or the other.

The other major problem with this new section of the code is that, unlike the demands placed on proponents for most I-Code changes, no evidence was offered to support the need for this change. There was (and is) no evidence that firefighters have been hampered in fighting a building fire because some unauthorized person was using an ASME A17.1 FEO-K1 key at the time. No loss of life or property because some pizza delivery person was able to acquire a firefighter elevator key on the internet (as alleged in the testimony on this code change) and deny elevator use for firefighters or emergency personnel.

Ironically, we found that in Massachusetts the only reported misuses of firefighter keys were by EMTs. EMTs are authorized to be given the special IFC fire key by the existing code text!

A Captain in the Toronto Fire Department who has fought countless high-rise fires in his career dismissed the need for some special fire service elevator key that exceeds the requirements of ASME A17.1/CSA B44 by asking, “What can you do with it? Ride an elevator up and down, up and down until you’re bored or sick?” As dismissive as the Captain’s statement may be, it demonstrates how unnecessary it is for the IFC to create special requirements for keys that conflict with the ASME requirements that have been in place (and referenced by the IFC and IBC) for years. This code section “solves” a problem that does not exist while creating many more for the Fire Marshall, Elevator Inspector, and building owner.

Cost Impact: The code change proposal will not increase the cost of construction.

607.5-F-BLACK

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The committee’s disapproval was based on its agreement with testimony that indicated the current text is new to the 2012 edition and is widely approved by the fire service as providing much more specific, secure and comprehensive key criteria than the referenced standard. It was also noted that ASME A17.1 may not be readily available to fire code officials and would thus make enforcement difficult.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Brian Black, BDBlack & Associates, Ltd., representing National Elevator Industry Inc. (NEII), requests Approval as Submitted.

Commenter's Reason: The Committee Reason as stated in the *2013 Report of the Committee Action Hearing Results* does not address the principle reason this proposal was submitted, that being that in scores of state and local jurisdictions in the US there are separate elevator laws that require conformance with the ASME A17.1/CSA B44 firefighter key requirements. Any different requirements adopted through reference to the ICC *International Fire Code* do not trump this legal reality. The Section of the IFC that states,

> ***102.7.1 Conflicts.*** *Where conflicts occur between provisions of this code and referenced codes and standards,the provisions of this code shall apply.*

does not apply where a separate elevator law requires enforcement of the ASME A17.1/CSA B44 code.

The reality is that elevator manufacturers will install equipment with ASME A17.1/CSA B44 FEO-K1 keys to satisfy the initial inspection requirements enforced by the jurisdiction Elevator Inspector, leaving the building owner to battle between the Elevator Inspector and Fire Marshall after the installation is complete.

The statement that *". . . the current text is new to the 2012 edition and is widely approved by the fire service . . . "* is very confusing. The 2012 edition of the code has yet to be widely adopted, so the alleged approval is not apparent. Conversely, almost every state in the US has adopted an edition of the ASME A17.1/CSA B44 code that references use of its specified FEO-K1 firefighter key. The requirements for the FEO-K1 key were developed by the ASME A17 Emergency Operations Committee that included numerous members of the fire service profession.

Whether the IFC firefighter key is more secure than that specified by ASME A17.1/CSA B44 is an interesting supposition that has yet to be proven, but the question remains: What is the safety problem the IFC text is attempting to resolve? Research done by the ASME A17.1/CSA B44 Task Groups on the Use of Elevators in Fires indicates there has not been a significant problem of elevators being unavailable to firefighters because they were "captured" by persons unauthorized to have FEO-K1 keys.

Finally, the committee suggested enforcement could be difficult because the ASME A17.1/CSA B44 code may not be readily available to fire code officials. This is contradicted by the fact that the 2012 edition of the IFC already references ASME A17.1/CSA B44 in Sections 508.1.5 (elevator recall switch), 607.1 (Phase I and Phase II emergency recall) and 907.3.3 (fire detectors installed in accordance with ASME A17.1). Additionally, in many jurisdictions the Elevator Inspector can confirm compliance with the ASME A17.1/CSA B44 code.

F84-13

Final Action: AS AM AMPC____ D

F90-13
609.2

Proposed Change as Submitted

Proponent: Barry Greive, representing Target Corporation (barry.greive@target.com)

Revise as follows:

609.2 Where required. A Type I hood shall be installed at or above all commercial cooking appliances and domestic cooking appliances used for commercial purposes that produce grease vapors.

> **Exception:** A Type I hood shall not be required for an electric cooking appliance where an approved testing agency provides documentation that the appliance effluent contains 5 mg/m^3 or less of grease when tested at an exhaust flow rate of 500 cfm (0.236 m^3/s) in accordance with Section 17 of UL 710B

Reason: This proposal is intended to bring consistency between the Fire Code and Mechanical Code provisions.

Section 609.1 of the Fire Code states that "Commercial kitchen exhaust hoods shall comply with the requirements of the International Mechanical Code." This statement lends itself to imply that they should be consistent. There are many situations where the amount of grease is very low to almost non-existent and a type 1 hood is not needed. This exception will bring greater consistency between the codes, better clarity to when a type 1 hood is needed, and a test method that must be followed to show compliance.

Cost Impact: This will not increase the cost of construction.

609.2-F-GRIEVE

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

609.2 Where required. A Type I hood shall be installed at or above all commercial cooking appliances and domestic cooking appliances used for commercial purposes that produce grease vapors.

> **Exception:** A Type I hood shall not be required for an electric cooking appliance where an approved testing agency provides documentation that the appliance effluent contains 5 mg/m^3 or less of grease when tested at an exhaust flow rate of 500 cfm (0.236 m^3/s) in accordance with ~~Section 17 of~~ UL 710B.

Committee Reason: The committee agreed with the proponent's reason statement. The modification correlates with the IMC on the subject.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Tony Crimi, A.C. Consulting Solutions Inc., representing International Firestop Council (IFC), requests Disapproval.

Commenter's Reason: The proposed exception addresses the performance of the equipment, but not the accumulation of grease in the duct. While 5 mg/m^3 is a small quantity, grease will continue to accumulate in the duct over time. Some minimum requirements for construction, inspection and maintenance of the duct need to be added if this exception is to be permitted. The proposal does not identify any of these.

Over the last decade, the technology surrounding the installation and protection of grease ducts has evolved in response to growing concern over grease duct fires, and concerns over space. The protection of grease ducts under fire exposure conditions is an item of importance in securing constructions that are safe, and that are not a menace to adjacent construction or building occupants. Protection of grease ducts has long been addressed in the codes of many authorities, municipal and other agencies. Many types of enclosure materials are used to protect grease ducts. Some provisions for construction and maintenance of these non-Type 1 hoods needs to be included.

F90-13

Final Action: AS AM AMPC____ D

F91-13
609.3.3.2, Chapter 80

<u>Proposed Change as Submitted</u>

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

609.3.3.2 Grease accumulation. If during the inspection it is found that hoods, grease-removal devices, fans, ducts or other appurtenances have an accumulation of grease, such components shall be cleaned <u>in accordance with ANSI/IKECA C-10</u>.

Add new standard to Chapter 80 as follows:

IKECA

International Kitchen Exhaust Cleaning Association
100 North 20th, Street, Suite 400
Philadelphia, PA 19103

C10-2011 *Standard for Cleaning of Commercial Kitchen Exhaust Systems…* 609.3.3.2

Reason: Commercial kitchen exhaust systems remove smoke, soot and grease-laden vapor resulting from cooking operations. These systems become contaminated with grease and cooking by-products over time. Accumulations of these combustible contaminants create a fire safety hazard to workers, patrons, other building occupants and property. Mitigation of this hazard requires periodic cleaning of commercial kitchen exhaust systems.

The first edition of ANSI/IKECA C10-2011, *Standard for Cleaning of Commercial Kitchen Exhaust Systems*, was developed by the IKECA Standards Development Committee Consensus Body. It approved the standard on September 1, 2011. It was approved as an American National Standard by the American National Standards Institute (ANSI) on December 9, 2011.

For many years, the commercial kitchen exhaust cleaning industry has relied on certain codes and standards. ANSI/IKECA C10 addresses many of the areas that these other standards and codes do not cover. The other codes include the *International Fire Code*® (Section 609 Commercial Kitchen Hoods; 904 Alternative Automatic Fire-Extinguishing Systems, including: 904.2.1 Hood suppression systems; 904.3.2 Actuation; 904.3.3 System interlocking; 904.3.5 Monitoring; 904.11 Commercial cooking systems; 904.11 thru 904.11.6.5), the *International Mechanical Code*® (Section 202 General Definitions; 506 Commercial Kitchen Grease Ducts and Exhaust Equipment; 507 Commercial Kitchen Hoods; 508 Commercial Kitchen Make Up Air; 509 Fire Suppression Systems; 917 (Solid Fuel) Cooking Appliances), the A*SHRAE® Handbook HVAC Applications* (Chapter 31, Ventilation of the Industrial Environment), and the *NFPA 96®, Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations*.

ANSI/IKECA C-10 is intended to determine the frequency and necessity for commercial kitchen exhaust system cleaning through inspection procedures, to define acceptable methods for cleaning exhaust systems and components, and to set standards for acceptable post-cleaning cleanliness.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

This standard applies to, but is not limited to, Type I exhaust systems. This standard does not apply to residential kitchen exhaust systems, replacement air systems, fire extinguishing systems, heating and air-conditioning systems, dryer exhaust systems, and toilet exhaust systems.

The purpose of this standard is to enhance public safety by reducing the potential fire safety hazards associated with commercial kitchen exhaust systems through the performance of professional cleaning services, irrespective of the type of cooking equipment used and whether used in public or private facilities.

About IKECA: The International Kitchen Exhaust Cleaning Association (IKECA) formed in 1989 and became an ANSI accredited standards developer in 2008. IKECA was founded by a small group of exhaust kitchen exhaust cleaning specialists who were attending the same meeting. They had similar beliefs in the importance of proper and complete exhaust cleaning to the fire protection world. Within two years, these founders had created the first non-profit trade association for the kitchen exhaust cleaning industry.

Today, IKECA members represent some of the best in the industry from around the world. They are proud to have made significant contributions to the decrease in commercial kitchen fires in the U.S. The current membership is approximately 250. Headquartered in Philadelphia, IKECA is a member of the International Code Council. For more information, visit www.ikeca.org.

Additionally this Standard covers the required documentation associated with the cleaning and inspections of kitchen exhaust hoods. Currently there is no Standard recognized by the IFC for this purpose, and adoption of this Standard will enhance code compliance and enforcement.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

Cost Impact: This code change will not increase the cost of construction

Analysis: A review of the standard proposed for inclusion in the code, IKECA C10-2011, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28), will be posted on the ICC website on or before April 1, 2013.

609.3.3.2-F-ZUBIA-FCAC

Committee Action Hearing Results

For staff analysis of the content of IKECA C10-2011 relative to CP#28, Section 3.6, please visit:
http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/ProposedStandards.pdf

Committee Action: Approved as Submitted

Committee Reason: The committee agreed with the proponent's reason statement that the code change provides a needed standard to assist the fire code official in determining standards of and methods for cleaning hood and duct systems.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Glenn A. Dean, Virginia State Fire Marshal's Office, requests Disapproval.

Commenter's Reason: The ICC Fire Code Committee approved F91 "as submitted" on a 14-0 vote. The committee reason for accepting F91 was, *"The committee agreed with the proponent's reason statement that the code change provides a needed standard to assist the fire code official in determining standards of and methods for cleaning hood and duct systems."* I too, agree that a standard for determining the need for cleaning is needed, but the adoption of F91 and the referenced ANSI/IKECA C10-2011 standard in its present form may not be it.

It's not an uncommon occurrence to adopt a change early in Virginia and F91 was a candidate for such early adoption until subsequent research revealed the following with items 3, 4 and 5 being the most substantial points:

1. The entire standard published by the International Kitchen Exhaust Cleaning Association (IKECA) is comprised of 31 pages including the covers, Table of Content, index, forward, list of committee members, proposal form, etc., leaving 20 pages for *the meat of the standard*. Of those 20 pages, 10 pages are definitions. That leaves 10 pages of *technical stuff*.
2. Of the 10 pages of technical stuff, there are 8 chapters. Chapter 4 is "pre-Cleaning Operations Inspection"; Chapter 5 is "Energy Source Protection"; Chapter 6 "Protection of Workspace Areas; Chapter 7 "By-Product Control Process Preparation"; Chapter 8 "Process Personnel Protection"; Chapter 9 "Cleaning Processes and Controls" (as I see it, the crux of the standard); Chapter 10 "Exhaust Duct Access and Labeling; and Chapter 11 "Exhaust Cleaning Process Reporting".
3. In these 10 pages of technical stuff, the word "should" appears 8 times. According to ANSI/IKECA C10, Chapter 2, the definition of "should" means, "Indicates a recommendation or that which is advised but not required." I believe the use of this type of advisory language is contrary to the normal practice of the I-Codes to say something "may" or "shall" be done.
4. Aside from the standard's definition of "certified", the body of the standard makes reference to using only certified personnel to perform certain duties 5 times. My question is, certified by whom? IKECA does have a certification program and information on that can be found at http://www.ikeca.org/certification/types. Beyond this, I know of no other certification program. So for me, it raises the question of whether or not this standard and its adoption would be self-serving to IKECA.

5. The depiction of a “depth gauge comb” is contained in the standard. The section that references that depiction states a determination for cleaning is made by scraping the comb along the duct surface. My initial reaction was very supportive because initially I viewed such gauge as less subjective to making a determination. Since then my view has changed. I suppose with a duct surface that appears to be clean enough, if I drag the comb far enough or repeatedly enough, if I were to find a single square inch of sufficient depth in a duct system composed of 50 square feet, by example, I can present the need for cleaning the system to the owner. I think a more definitive method needs to be employed such as limiting a single scrap to a distance of 1-inch, or a foot, or whatever is appropriate. Leaving the language as it is may allow some unscrupulous character to take advantage of a situation or system owner.

The F91 proposed change says that system “components shall be cleaned in accordance with ANSI/IKECA C-10” with the operative word being “cleaned”. If confined to that and that only, and not when cleaning is to be performed, then Chapter 9 of the standard lists the methods of cleaning. My question then becomes, what is different between that and what’s normally done? By referencing the standard, does this become a substantial benefit to adopt the standard? If the reference to the standard is for the method of cleaning only, then the change and commentary needs to strongly and clearly indicate that.

As an individual, I supported this change thinking it would assist in an important area. I thought a less subjective method of determining when a hood and duct systems needs to be cleaned or its level of cleanliness would be of benefit to all involved, but upon looking at this standard and finding the above, I submit it needs to overcome the defects of its self-serving possibility as it relates to certification, strengthening how the depth gauge comb is to used to determine the need for cleaning, and getting rid of the advisory language, all of which forms the basis for this request disapprove the change.

F91-13

Final Action: AS AM AMPC____ D

F95-13

610.1, 610.2, 610.3 (New), 610.4, 610.5, 610.6 (New), 610.7, 5701.2, Chapter 80

Proposed Change as Submitted

Proponent: Andy Burke, Restaurant Technologies, Inc, representing self (aburke@rti-inc.com)

Revise as follows:

610.1 ~~General~~ Commercial Kitchen Cooking Oil Storage Tank Systems. Storage of cooking oil (grease) in commercial cooking operations utilizing aboveground tanks with a capacity greater than 60 gal (227 L) installed within a building shall comply with ~~Chapter 57~~ Sections 610.2 through 610.7. ~~Systems used to store cooking oils in larger than 60-gallon (227 L) above-ground tanks shall also comply with Sections 610.2 through 610.5~~. For purposes of this section, cooking oil shall be classified as a Class IIIB liquid unless otherwise determined by testing.

610.2 Metallic Storage Tanks. Metallic **c**ooking oil storage tanks shall be listed in accordance with UL 142 or UL 80, and shall be installed in accordance with ~~Section 5704 and~~ the tank manufacturer's instructions.

610.3 Nonmetallic Storage Tanks. Nonmetallic cooking oil storage tanks shall be installed in accordance with the tank manufacturer's instructions and shall also comply with all of the following:

1. Tanks shall be designed in accordance with ASTM D1998 unless otherwise approved.
2. Tank capacity shall not exceed 200 gallons per tank.
3. Tanks shall be suitable for use with cooking oil and the maximum temperature to which the tank will be exposed during use.

~~610.3~~ 610.4 ~~Other Storage Components~~ Cooking Oil Storage System Components. Cooking oil storage system components ~~including~~ shall include but are not limited to piping, connections, fittings, valves, tubing, hose, pumps, vents, and other related components used for the transfer of cooking oil ~~from the cooking appliance to the storage tank, and from the storage tank to the discharge point, shall be installed in accordance with Section 5703.6~~ and are permitted to be of either metallic or non-metallic construction.

610.4.1 Design Standards. The design, fabrication, and assembly of system components shall be suitable for the working pressures and structural stresses to be encountered by the components.

610.4.2 Components in Contact with Heated Oil. Any system component that comes in contact with heated cooking oil shall be rated for the maximum intermittent and continuous operating temperatures expected in the system.

610.4.3 Plenums. Installation of non-metallic cooking oil system components shall be prohibited in concealed interstitial spaces used as return air plenums unless the components are fully enclosed within continuous noncombustible raceways or enclosures, approved gypsum board assemblies, or within materials listed and labeled for installation within a plenum.

~~610.4~~ 610.5 Tank Venting. Normal and emergency venting shall be provided for cooking oil storage tanks ~~shall terminate outside the building as specified in Sections 5704.2.7.3 and 5704.2.7.4~~.

610.5.1 Normal Vents. Normal venting shall be located above the maximum normal liquid line, and shall have a minimum effective area at least as large as the largest filling or withdrawal connection.

610.5.2 Emergency Vents. Emergency relief venting shall be located above the maximum normal liquid line, and shall be in the form of a device or devices that will relieve excessive internal pressure caused by an exposure fire. For non-metallic tanks, the emergency relief vent shall be allowed to be in the form of construction.

610.6 Heating of Cooking Oil. Electrical equipment used for heating cooking oil in cooking oil storage systems shall be listed to UL 499 and shall comply with NFPA 70. Use of electrical immersion heaters shall be prohibited in non-metallic tanks.

~~610.5~~ 610.7 Electrical Equipment. Electrical equipment used for the operation ~~and heating~~ of ~~the~~ cooking oil storage systems shall ~~be listed and~~ comply with NFPA 70.

Revise as follows:

5701.2 Nonapplicability. This chapter shall not apply to liquids as otherwise provided in other laws or regulations or chapters of this code, including:

1 through 10 *(No change to current text)*

11. Commercial cooking oil storage tank systems located within a building and designed and installed in accordance with Section 610.

Add new standards to Chapter 80 as follows:

ASTM

D 1998-06 Standard Specification for Polyethylene Upright Storage Tanks

UL

499-05 Standard for Electrical Heating Appliances

Reason: The section as written presents practical challenges to innovative restaurant technologies, which entirely eliminate manual handling of cooking oil. These systems provide personnel safety and environmental improvements to existing manual or semi-manual oil handling operations. The proposal seeks to address the following issues:

The requirements as currently written (added in 2012 version of the code) are based on used, spent, or inedible cooking oil. For systems which include fresh cooking oil supply, a foodstuff, tanks and components must be food grade. The metallic tank standards currently referenced are based on fuel oil storage tanks and do not meet food grade requirements. The proposal addresses this limitation by adding requirements for non-metallic tanks, with an associated recognized engineering tank standard adapted for use with cooking oil.

Current references to Chapter 57 are more relevant to industrial flammable and combustible liquid tank requirements. High flash point cooking oil in a restaurant back-of-house setting represents a different, and generally lower, hazard than commonly anticipated by Chapter 57. The proposed exemption to Section 5701.2 unifies all pertinent fire safety requirements into Section 610 and the standards referenced therein. This establishes the level of safety applicable to this hazard. This approach is consistent with other exceptions in Chapter 57, in particular the exception for fuel oil tanks connected with oil burning equipment. The proposal takes into consideration comments received from code officials and fire safety professionals.

Note: This proposal applies only to the storage of cooking oil, a Class IIIB liquid with a high flash point (typically above 500°F), which represents a low fire hazard when stored and used per the requirements of the proposal. All other flammable and combustible liquids must comply with Chapter 57.

As written, Section 610.4 requires tank venting to terminate outside of the building, as specified in Sections 5704.2.7.3 and 5704.2.7.4. These referenced sections allow tanks storing Class IIIB liquids to vent inside the building, based on the relatively low fire hazard associated with Class IIIB liquids. The proposal modifies the current requirements for venting to accurately reflect the level of protection for this hazard as established in Chapter 57.

The intent of the requirements as written, as described in the 2012 substantiation, was to add a level of protection to address the use of immersion heaters in storage tanks containing used cooking oil. The proposal addresses these concerns by requiring compliance to UL 499 and NFPA 70, and by restricting the use of immersion heaters to metallic tanks only. Furthermore, the proposal requires all other electrical equipment used with cooking oil storage tank systems to comply with NFPA 70 as well.

The limitations for installing non-metallic tubing or piping are consistent with the International Mechanical Code requirements.

Cost Impact: The code change proposal will not increase the cost of construction. The introduction of Section 610 to the 2012 IFC increased cost of construction by limiting cooking oil storage tanks to metallic construction. The proposal will allow for non-metallic tank construction, allowing costs to remain reasonable for this type of technology and usage. The proposal also provides cost efficiencies for support/compliance of environmental initiatives to limit/prevent the introduction of used cooking oil and used portable containers into liquid and solid waste streams.

Analysis: A review of the standard proposed for inclusion in the code, ASTM D1998-06, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28), will be posted on the ICC website on or before April 1, 2013. UL 499-05 is currently referenced in the IMC.

610.1-F-BUR

Committee Action Hearing Results

For staff analysis of the content of ASTM D1998-06 and UL 499-05 relative to CP#28, Section 3.6, please visit: http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/ProposedStandards.pdf

Committee Action: Disapproved

Committee Reason: The committee's disapproval was based on its agreement with testimony that indicated that the proposed standard ASTM D1998 is scoped to apply only to tanks with a capacity greater than 500 gallons, that the tank testing that has been done to ASTM D1998 so far does not speak to tank material degradation over time or to the storage of liquids with a temperature over 140-150 degrees F which are the limits of the standard. Concern was also expressed that the fire code official would be put in a position to approve the suitability of tanks and their materials without adequate technical information. The committee also felt that it was unacceptable to run piping in overhead return air plenums under any circumstances, to allow non-metallic relief valves for non-metallic tanks and was concerned as to where the normal and emergency tanks vents would discharge. The concept of the proposal was felt to be a good one but that more appropriate standard development and testing need to be done first.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Andy Burke, Restaurant Technologies, Inc., representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

610.1 Commercial Kitchen Cooking Oil Storage Tank Systems. Storage of cooking oil (grease) in commercial cooking operations utilizing aboveground tanks installed within a building to store cooking oils with a capacity greater than 60 gal (227 L) shall comply with Sections 610.2 through 610.7, and NFPA 30. For purposes of this section, cooking oil shall be classified as a Class IIIB liquid unless otherwise determined by testing.

610.2 Metallic Storage Tanks. Metallic cooking oil storage tanks shall be listed in accordance with UL 142 or UL 80, and shall be installed in accordance with the tank manufacturer's instructions.

610.3 Nonmetallic Storage Tanks. Nonmetallic cooking oil storage tanks shall be installed in accordance with the tank manufacturer's instructions and shall also comply with all of the following:

1. Tanks shall be ~~designed in accordance with ASTM D1998 unless otherwise approved.~~ listed for use with cooking oil, including the maximum temperature to which the tank will be exposed during use.
2. Tank capacity shall not exceed 200 gallons per tank.
3. ~~Tanks shall be suitable for use with cooking oil and the maximum temperature to which the tank will be exposed during use.~~

610.4 Cooking Oil Storage System Components. Cooking oil storage system components shall include but are not limited to piping, connections, fittings, valves, tubing, hose, pumps, vents, and other related components used for the transfer of cooking oil and are permitted to be of either metallic or non-metallic construction.

610.4.1 Design Standards. The design, fabrication, and assembly of system components shall be suitable for the working pressures, temperatures and structural stresses to be encountered by the components.

610.4.2 Components in Contact with Heated Oil. Any system component that comes in contact with heated cooking oil shall be rated for the maximum ~~intermittent and continuous~~ operating temperatures expected in the system.

~~**610.4.3 Plenums.** Installation of non-metallic cooking oil system components shall be prohibited in concealed interstitial spaces used as return air plenums unless the components are fully enclosed within continuous noncombustible raceways or enclosures, approved gypsum board assemblies, or within materials listed and labeled for such application.~~

610.5 Tank Venting. Normal and emergency venting shall be provided for cooking oil storage tanks.

610.5.1 Normal Vents. Normal ~~venting~~ vents shall be located above the maximum normal liquid line, and shall have a minimum effective area at least as large as the largest filling or withdrawal connection. Normal vents shall be permitted to vent inside the building.

610.5.2 Emergency Vents. Emergency relief ~~venting~~ vents shall be located above the maximum normal liquid line, and shall be in the form of a device or devices that will relieve excessive internal pressure caused by an exposure fire. For non-metallic tanks, the emergency relief vent shall be allowed to be in the form of construction. Emergency vents shall be permitted to vent inside the building.

610.6 Heating of Cooking Oil. Electrical equipment used for heating cooking oil in cooking oil storage systems shall be listed to UL 499 and shall comply with NFPA 70. Use of electrical immersion heaters shall be prohibited in non-metallic tanks.

610.7 Electrical Equipment. Electrical equipment used for the operation of cooking oil storage systems shall comply with NFPA 70.

Revise as follows:

5701.2 Nonapplicability. This chapter shall not apply to liquids as otherwise provided in other laws or regulations or chapters of this code, including:

11. Commercial cooking oil storage tank systems located within a building and designed and installed in accordance with Section 610 and NFPA 30.

Revise Chapter 80 standards as follows:

ASTM
~~D 1998-06 Standard Specification for Polyethylene Upright Storage Tanks~~

UL
499-05 Standard for Electrical Heating Appliances

Commenter's Reason: To speak to the IFC Committee's reasons for disapproval of this code change, an item-by-item discussion follows:

610.1, 610.3, 5701.2(11) and Chapter 80 reference: The IFC Committee expressed concerns about the scope of the referenced standard, ASTM D1998, as applies to non-metallic cooking oil storage tanks, specifically the capacity of the tanks, tank material degradation over time, and the storage of cooking oil at elevated temperatures. The Committee also expressed concern that the fire code official would be put in a position to approve tanks and their materials without adequate technical information. Based on these concerns, and with further discussions and recommendations from the fire code community, the Fire-CAC and NFPA 30, it is proposed to delete the ASTM standard referenced in 610.3 and Chapter 80 and replace with the requirement that non-metallic tanks must be listed for use with cooking oil.

610.4.1: Add temperature requirements to the design standards to address storage at elevated temperatures.

610.4.2: Eliminate the words "intermittent and continuous" to clarify that components shall be rated for the maximum exposure temperature.

610.4.3: To address the IFC Committee concerns about piping in overhead return air plenums, this paragraph will be removed.

610.5.1 and 610.5.2: The IFC Committee expressed concern as to where the normal and emergency vents would discharge. The proposal is to allow the tanks to vent to the inside of the building, understanding that the fire and health safety risk would be very low considering this would apply only to tanks storing cooking oil, a Class IIIB liquid with a high flash point, and also considering the low frequency, volume and speed with which transfer operations occur.

The IFC Committee expressed concerns about non-metallic relief valves for non-metallic tanks. For metallic tanks, venting requirements are contained in the tank standards referenced in 610.2 and no changes to these requirements are proposed. For non-metallic tanks, the vent devices will be included as part of the overall listing. Furthermore, the proposal to add the NFPA 30, Chapter 19 requirement includes venting requirements in accordance with NFPA 30, Chapter 22.

F95-13

Final Action: AS AM AMPC____ D

F98-13
703

Proposed Change as Submitted

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azumiamia@yahoo.com)

Revise as follows:

SECTION 703
~~FIRE-RESISTANCE-RATED CONSTRUCTION~~ INSPECTION AND MAINTENANCE OF CONSTRUCTION FEATURES

703.1 ~~Maintenance~~ General. ~~The required fire-resistance rating of fire-resistance-rated construction (including walls, firestops, shaft enclosures, partitions, smoke barriers, floors, fire-resistive coatings and sprayed fire-resistant materials applied to structural members and fire-resistant joint systems)~~ Construction features intended to limit the spread of fire or smoke shall be maintained.

703.2 Inspection and Maintenance. Construction features intended to limit the spread of fire or smoke ~~Such elements~~ shall be visually inspected by the owner annually and properly repaired, restored or replaced when damaged, altered, breached or penetrated.

> **Exception:** Where construction features are concealed, ~~such elements shall not be required to be visually inspected~~ visual inspection by the owner is not required unless the concealed space is accessible by the removal or movement of a panel, access door, ceiling tile or similar movable entry to the space.

703.2.1 Openings. Openings made ~~therein~~ in smoke-resistant or fire-resistance-rated assemblies for the passage of pipes, electrical conduit, wires, ducts, air transfer openings and holes made for any reason shall be protected with approved methods or self- or automatic-closing opening protectives capable of resisting the passage of smoke ~~and~~ or fire, as required to maintain the rating of the assembly. ~~Openings through fire-resistance-rated assemblies shall be protected by self- or automatic-closing doors of approved construction meeting the fire protection requirements for the assembly.~~

~~**703.1.1 Fireblocking and draftstopping.** Required fireblocking and draftstopping in combustible concealed spaces shall be maintained to provide continuity and integrity of the construction.~~

~~703.1.2~~ 703.2.1.1 ~~Smoke~~ Openings in smoke barriers and smoke partitions. ~~Required smoke barriers and smoke partitions shall be maintained to prevent the passage of smoke. All openings~~ Openings protected with ~~approved~~ smoke barrier doors or smoke dampers shall be maintained in accordance with NFPA 105.

~~**703.1.3 Fire walls, fire barriers and fire partitions.** Required fire walls, fire barriers and fire partitions shall be maintained to prevent the passage of fire. All openings protected with *approved* doors or fire dampers shall be maintained in accordance with NFPA 80.~~

~~703.2~~ 703.2.1.2 Opening protectives in fire-resistance rated assemblies. *(No change to current text)*

~~703.2.1~~ 703.2.1.2.1 Signs. *(No change to current text)*

~~703.2.2~~ 703.2.1.2.2 Hold-open devices and closers. *(No change to current text)*

~~703.2.3~~ 703.2.1.2.3 Door operation. *(No change to current text)*

703.3 Ceilings. *(No change to current text)*

703.4 Testing. *(No change to current text)*

Reason: Chapter 7 and Section 703.1 have been expanded to clearly require that construction features intended to limit the spread of smoke must also be maintained.

Predominantly an editorial code change proposal to clarify the intent of the provisions.

Section 703.1 has been revised to provide a broadly-inclusive requirement to maintain any construction feature that was provided to limit the spread of smoke and/or fire. The parenthetical list in this section has been deleted since it was not all-inclusive. These changes improve the usability of the code and address topics that were previously overlooked, such as maintenance of draft stopping in attics.

The existing text in Section 703.1.1 and the first sentence of Sections 703.1.2 and 703.1.3 have been deleted because they are no longer necessary with the revised text of Section 703.1, which will now encompass fire blocking, draftstopping, smoke barriers, smoke partitions, firewalls, fire barriers and fire partitions.

The second sentence of Section 703.1.3 has been deleted because it is redundant. Section 703.2.1 covers maintenance of opening protectives.

NOTE: To assist in following the revisions proposed in this code change, below is a clean version of section 703 without underline and strikeout.

Cost Impact: The code change proposal will not increase the cost of construction.

703-F-ZUBIA-FCAC

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The proposal was disapproved as it appeared to delete important maintenance requirements for fire resistance such as "coatings and sprayed fire resistance." It was noted that this chapter is in need of revision but this proposal appears to be deleting important provisions. It was stressed that Chapter 7 plays a key role in the IFC and provides for the long term performance of a building during a fire.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

SECTION 703
~~FIRE-RESISTANCE-RATED~~ INSPECTION AND MAINTENANCE OF CONSTRUCTION

703.1 General. ~~Maintenance.~~ The integrity and any required rating of construction features intended to provide fire-resistance protection to structural elements or to limit the spread of fire or smoke shall be maintained. ~~The required *fire-resistance rating* of fire-resistance-rated construction (including walls, firestops, shaft enclosures, partitions, *smoke barriers*, floors, fire-resistive coatings and sprayed fire-resistant materials applied to structural members and fire-resistant joint systems) shall be maintained.~~

703.1.1 Inspection and repair. Construction features intended to provide fire-resistance protection to structural elements or to limit the spread of fire or smoke ~~Such elements~~ shall be visually inspected by the *owner* annually and properly repaired, restored or replaced when damaged, altered, breached or penetrated. Where concealed, such elements shall not be required to be visually inspected by the *owner* unless the concealed space is accessible by the removal or movement of a panel, access door, ceiling tile or similar movable entry to the space.

703.1.2 Penetrations. Penetrations ~~Openings~~ made in fire and smoke-resistant construction ~~therein~~ for the passage of pipes, electrical conduit, wires, ducts, air transfer openings and holes made for any reason shall be protected with *approved* methods capable of resisting the passage of smoke and fire. ~~Openings through fire-resistance-rated assemblies shall be protected by self- or automatic-closing doors of *approved* construction meeting the fire protection requirements for the assembly.~~

<u>703.1.3</u> **~~703.1.1~~** **Fireblocking and draftstopping.** Required <u>continuity and integrity of</u> *fireblocking* and draftstopping in combustible concealed spaces shall be maintained. ~~to provide continuity and integrity of the construction.~~

<u>703.1.4</u> **~~703.1.2~~** **Smoke barriers and smoke partitions.** Required *smoke barriers* and smoke partitions shall be maintained<u>.</u> ~~to prevent the passage of smoke. All o~~ <u>O</u>penings protected with *approved* smoke barrier doors or smoke dampers shall be maintained in accordance with NFPA 105.

<u>703.1.5</u> **~~703.1.3~~** **Fire walls, fire barriers and fire partitions.** Required *fire walls*, *fire barriers* and *fire partitions* shall be maintained<u>.</u> ~~to prevent the passage of fire. All~~ <u>openings</u> ~~protected with *approved* doors or fire dampers~~ <u>Openings shall be protected by approved methods meeting the fire rating requirements for the assembly and</u> shall be maintained in accordance with NFPA 80.

(Portions of code change not shown remain unchanged)

Commenter's Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

This section has been revised to clarify the requirements for inspecting and maintaining fire and smoke-protection construction. The changes accomplish the following:

1. The revised title of Section 703 clarifies that this section covers inspection and maintenance of fire and smoke protection construction. Proposal F97 changed the title of Chapter 7 to FIRE AND SMOKE PROTECTION FEATURES, so it should not be necessary to repeat "fire and smoke protection" in this section title, since it will appear on the same page as the chapter title.
2. Existing section 703.1 was really long and covered many different areas. This section has been broken into three sections; 703.1, 703.1.1 and 703.1.2, and titles were inserted to reflect what is covered in each section.
3. A new charging statement was added to 703.1to clarify that this section covers construction features intended to provide fire-resistance protection to structural elements or to limit the spread of fire or smoke, not just fire resistance ratings. Also, a laundry list of construction types was deleted that served no real purpose.
4. The title "Inspection and repair" was added to new Section 703.1.1, and clarification that the section covered construction features intended to provide fire-resistance protection to structural elements or to limit the spread of fire or smoke (same as 703.1).
5. The existing code requirements moved to new Section 703.1.2 starts with "Openings made therein for the passage of pipes, electrical conduit, wires", etc. To be consistent with terminology used in the current IBC the terms "openings" were changed to "penetrations". The requirements at the end of this section covering openings protected by doors were removed from this section, and are now covered in Sections 703.1.4 and 703.1.5.
6. Editorial changes were made to Section 703.1.3, 703.1.4 and 703.1.5, and new language was added to 703.1.5 to cover opening protection.

Finally, the revisions suggested in this public comment are consistent with the action taken on F97.

F98-13

Final Action: AS AM AMPC____ D

F105-13
806.2

Proposed Change as Submitted

Proponent: Amy Carpenter, AIA, Pioneer Network Long Term Care Code Task Force

Revise as follows:

806.2 Artificial vegetation. Artificial decorative vegetation shall ~~meet the flame propagation performance criteria of NFPA 701. Meeting the flame propagation performance criteria of NFPA 701 shall be documented and certified by the manufacturer in an *approved* manner. Alternatively, the artificial decorative vegetation item shall~~ be tested in accordance ith NFPA 289, using the 20 kW ignition source, and shall have a maximum heat release rate of 100 kW.

> **Exception:** In Groups R-2, I-1 and I-2, artificial vegetation shall be permitted in limited quantities such that a hazard of fire development or spread is not present.

Reason: The text stricken from section 806.2 is proposed because it is not a correct reference and should not be included. NFPA 701 is the standard for "flame propagation of Textiles and Films". The scope description, in the standard, is clear that it is for materials that will be used as curtains, drapes and window treatments, therefore it is not the correct reference standard, nor the correct test method, for artificial decorative vegetation that may be used in buildings.

In Groups R-2, I-1 and I-2 Condition 1, residents often seek to create a home-like environment and display decorative items, like a seasonal wreath at their unit entries. It is not always possible, or practical to determine compliance with NFPA 289, especially for items procured by individual residents. The language of this exception is similar to the permissions for decorative materials, in these use groups, under Section 807. Further, as all of these Occupancies are required to have sprinkler coverage, there is a reduced risk for detrimental effects of limited quantities of artificial vegetation.

Cost Impact: No cost impact

806.2-F-CARPENTER

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee felt that NFPA 289 was a more appropriate test for artificial vegetation. There was some concern with the language found in the exception but it was noted that such language is existing language found in other sections of 806.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Marcelo M. Hirschler, (GBH International), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

806.2 Artificial vegetation. Artificial decorative vegetation shall be tested in accordance with NFPA 289, using the 20 kW ignition source, and shall have a maximum heat release rate of 100 kW.

> ~~**Exception:** In Groups R-2, I-1 and I-2, artificial vegetation shall be permitted in limited quantities such that a hazard of fire development or spread is not present.~~

Commenter's Reason: This comment proposes to eliminate the exception from the proposal because it would allow the introduction of materials that can bring a severe fire problem. It would be difficult for a fire code official to assess properly what is a "limited quantity of artificial vegetation" that does not introduce a hazard of fire development or spread without a fire test. If a fire test has been conducted and the results are satisfactory, then the exception is unnecessary and if a fire test has been conducted and the results are unsatisfactory the exception becomes moot because the artificial vegetation would clearly introduce a significant fire hazard.

The intent of the submitter is clear: to allow an occasional seasonal wreath at the unit entry. However, it is also clear that some artificial Christmas trees that are used during the holiday season can introduce a very large amount of heat release when they burn. NIST tests in 1999 have shown that the heat release rate from a single natural Christmas tree can be as high as 5 MW. More recently, tests with some artificial Christmas trees have shown that even higher levels of heat release will result, particularly when the trees are constructed of polyolefin materials.

The fact that the change introduced by the proposal requires that the fire testing be done in accordance with a much better (albeit more severe and more expensive) fire test makes the probability of finding test results for decorative vegetation more unlikely and would lead to more fire code officials being required to make determinations of fire hazard with little or no basis.

If the code is silent, the fire code official in fact always has the leeway of allowing what the submitter wishes with a much lower probability of inadvertently introducing a severe fire problem.

Final Action: AS AM AMPC____ D

F108-13
806.3

<u>Proposed Change as Submitted</u>

Proponent: Robert J Davidson, Davidson Code Concepts, LLC, representing self (rjd@davidsoncodeconcepts.com)

Revise as follows:

806.3 Obstruction of means of egress. The required width of any portion of a *means of egress* shall not be obstructed by decorative vegetation. <u>Natural cut trees shall not be located within an exit, corridor, or a lobby or vestibule.</u>

Reason: Section 806.3 "Obstruction of the means of egress" is recommended for modification because the rapid manner in which a natural cut tree is consumed by fire with the associated release of heat and smoke would present a distinct hazard to egress regardless of whether it impinged on the required width of the means of egress. A burning tree could not be approached or passed by thus effectively blocking that portion of an egress path while spreading heat and smoke to additional portions of the means of egress. A significant impact would be a natural cut tree located within a lobby that has the allowed 50% of all egress capacity passing through the same lobby.

Cost impact: This proposal will not increase the cost of construction.

806.3-F-DAVIDSON

<u>Committee Action Hearing Results</u>

Committee Action: **Approved as Submitted**

Committee Reason: This proposal was approved as it simply prohibits natural cut trees within specific critical areas of the means of egress.

Assembly Action: **None**

<u>Individual Consideration Agenda</u>

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Dave Frable, representing U.S. General Services Administration, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

806.3 Obstruction of means of egress. The required width of any portion of a *means of egress* shall not be obstructed by decorative vegetation. Natural cut trees shall not be located within an exit, corridor, or a lobby or vestibule.

<u>**Exception:** Where *approved*, natural cut trees can be placed in the building lobby where all the following condition are met:</u>

<u>1. The building is protected throughout by an automatic sprinkler system designed and installed in accordance with Section 903.3.1.1 or 903.3.1.2 as applicable.</u>
<u>2. The tree is located in the lobby for not more than 2 weeks,</u>
<u>3. The tree stands in a support device capable of containing a minimum two-day supply of water,</u>
<u>4. The water level in the tree support device is maintained at least 2 inches above the tree trunk and checked at least once daily,</u>
<u>5. The position of the tree is clear of exit routes by a distance equal to the height of the tree plus 6 feet,</u>
<u>6. There are no other combustibles likely to be ignited by a fire in the tree within 3 feet of the outer edges of the tree,</u>
<u>7. The maximum height of the tree does not exceed two/thirds of the ceiling height and,</u>
<u>8. The tree is sprayed with an approved non-toxic flame retardant coating.</u>

Commenter's Reason: The intent of this proposed revision is to permit the fire code official flexibility when enforcing the requirements for the placement of natural cut trees during the holiday season in buildings having large lobbies.

Although the number of natural cut tree fires is low, the proponent is correct that these fires carry a higher level of hazard than other fires that occur in a structure. A NIST study in residential structures, supported by the U. S. Fire Administration, evaluated the following three objectives: 1) characterize the heat release rate of dry Fraser fir trees 2) demonstrate the ignition resistance of a tree with a high moisture content and 3) examine the impact of a residential sprinkler on the heat release rate of a dry tree that is on fire in a compartment.

The heat release rates of the trees which were allowed to dry ranged from 3.2 MW to 4.3 MW. The study found that trees that were kept in water, so that the needles maintained a moisture content in excess of 100 %, self-extinguished after being exposed to a flaming book of matches.

The data from the furnished sprinklered room experiment demonstrated that even under conditions of extreme fire growth, a single sprinkler was able to prevent flashover and limit the spread of fire to other objects. The peak heat release rate, from the sprinklered room, was limited to approximately 1.8 MW. The furnished non-sprinklered room experiment generated a post-flashover heat release rate in excess of 6 MW.

Based on the information from the NIST study and the additional requirements in the proposed exception we believe a reasonable degree of safety can be maintain for permitting on a temporary basis natural cut trees in buildings with large lobbies.

F109-13
807 (IBC [F] 806)

<u>Proposed Change as Submitted</u>

Proponent: Amy Carpenter, representing Pioneer Network Long Term Care Code Task Force (acarpenter@lenhardtrodgers.net) and Wayne Jewell Township of Green Oak, MI representing self

Revise as follows:

SECTION 807
DECORATIVE MATERIALS OTHER THAN DECORATIVE VEGETATION IN NEW AND EXISTING BUILDINGS

<u>**807.1 (IBC [F]806.1) General**. Combustible</u> <u>decorative materials, other than decorative vegetation, shall comply with Section 807.2 through 807.5.</u>

~~**807.1 (IBC [F]806.1) General requirements**. In occupancies in Groups A, E, I and R-1 and dormitories in Group R-2, curtains draperies, hangings and other *decorative materials* suspended from walls or ceilings shall meet the flame propagation performance criteria of NFPA 701 in accordance with section 807.2 or be noncombustible.~~

~~**Exceptions:**~~

1. ~~Curtains, draperies, hangings and other decorative materials suspended from walls of *sleeping units* and *dwelling units* in dormitories in Group R-2 protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1 and such materials are limited to not more than 50 percent of the aggregate area of walls.~~ *(relocated to Section 807.3 exception 2)*
2. ~~Decorative materials, including, but not limited to, photographs and paintings in dormitories in Group R-2 where such materials are of limited quantities such that a hazard of fire development or spread is not present.~~ *(relocated to Section 807.5.5)*

~~In Groups I-1 and I-2, combustible decorative materials shall meet the flame propagation criteria of NFPA 701 unless the decorative materials, including, but not limited to, photographs and paintings, are of such limited quantities that a hazard of fire development or spread is not present. In Group I-3, combustible decorative materials are prohibited.~~ *(relocated to Section 807.5.6 and 807.5.7)*

~~Fixed or movable walls and partitions, paneling, wall pads and crash pads, applied structurally or for decoration, acoustical correction, surface insulation or other purposes, shall be considered interior finish if they cover 10 percent or more of the wall or of the ceiling area, and shall not be considered decorative materials or furnishings.~~ *(relocated to Section 807.3)*

~~In Group B and M occupancies, fabric partitions suspended from the ceiling and not supported by the floor shall meet Sections 807.2 and 807.3 the flame propagation performance criteria in accordance with Section 807.2 and NFPA 701 or shall be noncombustible.~~

~~**807.1.1(IBC [F]806.1.1)**~~ <u>**807.2 (IBC [F] 806.2)**</u> **Noncombustible materials.** The permissible amount of noncombustible decorative material shall not be limited.

~~**807.1.2 (IBC [F]806.1.1)**~~ <u>**807.3 (IBC [F] 806.3)**</u> **Combustible decorative materials.** <u>In other than Group I-3,</u> ~~The permissible amount of~~ <u>curtains, draperies, fabric hangings and other similar combustible</u> decorative materials <u>suspended from walls or ceilings shall be flame resistant</u> ~~meeting~~ ~~the flame~~

~~propagation performance criteria of NFPA 701~~ in accordance with Section 807.4 and shall not exceed 10 percent of the specific wall or ceiling area to which it is attached.

Fixed or movable walls and partitions, paneling, wall pads and crash pads applied structurally or for decoration, acoustical correction, surface insulation or other purposes shall be considered *interior finish* if they cover 10 percent or more of the wall or of the ceiling area, and shall not be considered *decorative materials* or furnishings. *(relocated from Section 807.1)*

Exceptions:

1. In auditoriums in Group A, the permissible amount of curtains, draperies, fabric hangings and other similar combustible decorative materials suspended from walls or ceilings ~~meeting the flame propagation performance criteria of NFPA 701~~ shall not exceed 75 percent of the aggregate wall area where the building is equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, and where the material is installed in accordance with Section 803.11 of the *International Building Code.*
2. In Group R-2 dormitories, within sleeping units and dwelling units, the permissible amount of curtains, draperies, fabric hangings and other similar decorative materials suspended from walls or ceiling shall not exceed 50 percent of the aggregate wall areas where the building is equipped throughout with an *approved automatic sprinkler system* installed in accordance with Section 903.3.1. *(relocated and revised from Section 807.1, exception 1)*

3.~~2.~~ In Group B and M occupancies, the amount of fabric partitions suspended from the ceiling and not supported by the floor ~~in Group B and M occupancies~~ shall not be limited.

~~**807.2(IBC [F] 806.2)**~~ **807.4 (IBC [F] 806.4) Acceptance criteria and reports.** Where required to be flame resistant, curtains, draperies, fabric hangings and other similar combustible decorative materials suspended from walls or ceilings shall be tested by an *approved* agency and meet the flame propagation performance criteria of NFPA 701~~, or such materials shall be noncombustible~~. Reports of test results shall be prepared in accordance with NFPA 701 and furnished to the *fire code official* upon request.

~~**807.4**~~ **807.5 Occupancy-based requirements.** In occupancies specified ~~in Group A, E and I-4 day care facilities~~, combustible decorative materials not complying with Section 807.3 ~~other than decorative vegetation~~ shall comply with Sections 807.5.1 ~~807.4.1~~ through ~~807.4.4.2~~ 807.5.7.

IFC 807.5.1 ~~**807.4.1**~~ **General.** ~~All of~~ The following requirements shall apply to all occupancies: ~~to all Group A and E occupancies and Group I-4 day care facilities regulated by Sections 807.4.2 through 807.4.4~~:

1. ~~Explosive or highly flammable materials:~~ Furnishings or decorative materials of an explosive or highly flammable character shall not be used.
2. ~~Fire-retardant coatings:~~ Fire-retardant coatings in existing buildings shall be maintained so as to retain the effectiveness of the treatment under service conditions encountered in actual use.
3. ~~Obstructions:~~ Furnishings or other objects shall not be placed to obstruct *exits,* access thereto, egress there from or visibility thereof.

807.5.2 ~~**807.4.2**~~ **Group A.** In Group A occupancies, the requirements in Sections ~~807.4.2.1~~ 807.5.2.1 through ~~807.4.2.3~~ 807.5.2.4 shall apply ~~to occupancies in Group A~~.

807.5.2.1 ~~**807.4.2.1**~~ **Foam plastics.** Exposed foam plastic materials and unprotected materials containing foam plastic used for decorative purposes or stage scenery or exhibit booths shall have a maximum heat release rate of 100 kW when tested in accordance with UL 1975, or when tested in accordance with NFPA 289 using the 20 kW ignition source.

Exceptions:

1. Individual foam plastic items or items containing foam plastic where the foam plastic does not exceed 1 pound (0.45 kg) in weight.
2. Cellular or foam plastic shall be allowed for trim in accordance with Section 804.2.

807.5.2.2 ~~807.4.2.2~~ Motion Picture Screens. The screens upon which motion pictures are projected in new and existing buildings shall either ~~meet the flame propagation performance criteria of NFPA 701~~ comply with Section 807.4 or shall comply with the requirements for a Class B interior finish in accordance with Section 803 of the *International Building Code*.

807.5.2.3 ~~807.4.2.3~~ Wood use in ~~Group A-3~~ places of religious worship. In places of religious worship, wood used for ornamental purposes, trusses, paneling or chancel furnishing shall ~~be allowed~~ not be limited.

807.5.2.4 ~~807.3 (IBC [F] 806.4)~~ Pyroxylin plastic. Imitation leather or other material consisting of or coated with a pyroxylin or similarly hazardous base shall not be used ~~in Group A occupancies~~.

807.5.3 ~~807.4.3~~ Group E. Group E occupancies, shall comply with Sections ~~the requirements in Sections 807.4.3.1~~ 807.5.3.1 through ~~and 807.4.3.2~~ 807.5.3.3 ~~shall apply to occupancies in Group E~~.

807.5.3.1 ~~807.4.3.1~~ Storage in corridors and lobbies. Clothing and personal effects shall not be stored in *corridors* and lobbies.

Exceptions:

1. *Corridors* protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1.
2. *Corridors* protected by an *approved* ~~smoke detection~~ fire alarm system installed in accordance with Section 907.
3. Storage in metal lockers, provided the minimum required egress width is maintained.

807.5.3.2 ~~807.4.3.2~~ Artwork in corridors. Artwork and teaching materials shall be limited on the walls of *corridors* to not more than 20 percent of the wall area.

807.5.3.3 Artwork in classrooms. Artwork and teaching materials shall be limited on walls of classrooms to not more than 50 percent of the specific wall area to which they are attached.

807.5.4 ~~807.4.4~~ Group I-4~~, day care facilities.~~ Group I-4 occupancies shall comply with, the requirements in Section~~s~~ ~~807.4.4.1~~ 807.5.4.1 through ~~and~~ ~~807.4.4.2~~ 807.5.4.2 ~~shall apply to day care facilities classified in Group I-4~~.

807.5.4.1 ~~807.4.4.1~~ Storage in corridors and lobbies. Clothing and personal effects shall not be stored in *corridors* and lobbies.

Exceptions:

1. *Corridors* protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1.
2. *Corridors* protected by an *approved* ~~smoke detection~~ fire alarm system installed in accordance with Section 907.
3. Storage in metal lockers, provided the minimum required egress width is maintained.

807.5.4.2 ~~807.4.4.2~~ Artwork in corridors. Artwork and teaching materials shall be limited on the walls of *corridors* to not more than 20 percent of the wall area.

807.5.4.3 Artwork in classrooms. Artwork and teaching materials shall be limited on walls of classrooms to not more than 50 percent of the specific wall area to which they are attached.

807.5.5 Dormitories in Group R-2. In Group R-2 dormitories, within sleeping units and dwelling units, the combustible decorative materials, shall be of limited quantities such that a hazard of fire development or spread is not present. *(relocated and revised from Section 807.1, exception 2)*

807.5.6 Groups I-1 and I-2. In Groups I-1 and I-2 occupancies, combustible *decorative materials* shall be of such limited quantities that a hazard of fire development or spread is not present.*(relocated from Section 807.1)*

IFC 807.5.7 Group I-3. In Group I-3, combustible *decorative materials* are prohibited. *(relocated from Section 807.1)*

Reason: The proposed revision is intended to be a clarification of the combustible materials permitted within a space. Specifically, to understand the different requirements for fabric-type decorative materials and paper-type decorative materials and what quantities of each are permitted in various use groups.

Currently, photographs and paintings, in some use groups, are required to be tested and certified to NFPA 701. The scope of this standard does not address paper items such as artwork and photographs and therefore was impossible to comply with.

The scope of NFPA 701 is as follows:
"*1.1.1* Test Method 1*
1.1.1.1 Test Method 1 shall apply to fabrics or other materials used in curtains, draperies, or other window treatments. Vinyl-coated fabric blackout linings shall be tested according to Test Method 2.

1.1.1.2 Test Method 1 shall apply to single-layer fabrics and to multi-layer curtain drapery assemblies in which the layers are fastened together by sewing or other means. Vinyl-coated fabric blackout linings shall be tested according to Test Method 2.

1.1.1.3 Test Method 1 shall apply to specimens having an areal density less than or equal to 700 g/m2 (21 oz/yd2), except where Test Method 2 is required to be used by 1.1.2."

Most revisions are editorial and serve to provide better clarity and to group requirements by use group.

807.1 – A general statement was needed so that the requirements match the Section title
The former text in 807.1 was re-organized and is now in Section 807.3 and 807.5 for better clarity.

807.2 – re-number only

807.3 - Since Group I-3 are limited to only non-combustible, the limitation is added to the front of the combustible materials.

The remainder of the sentence is revised for coordination with the next section on acceptance criteria and eliminating redundant reference to NFPA 701. That section starts out with "where required to be flame resistant". The limitation to "curtains, draperies, hangings and other decorative materials suspended from walls or ceilings" is in the first paragraph in Section 807.1. The addition of the words "fabric" hangings and other "similar" combustible decorative materials is to differentiate between fabrics and films that are covered under NFPA Standard 701 and other materials used for decorative effect, that are discussed in 807.5 for each use group.

Exception 1 is specific to Group A for percentage of materials complying with 701.

Exception 2, curtains for dormitories is relocated from 807.1. It was reformatted to be consistent with the exception for auditoriums. Revised language shown below:

> 2. In Group R-2 dormitories, within sleeping units and dwelling units, the permissible amount of curtains, draperies, fabric hangings and other similar decorative materials suspended from walls or ceiling ~~of *sleeping units* and *dwelling units* in dormitories in Group R-2~~ shall not exceed 50 percent of the aggregate wall areas where the building is equipped throughout with ~~protected by~~ an *approved automatic sprinkler system* installed in accordance with Section 903.3.1 ~~and such materials are limited to not more than 50 percent of the aggregate area of walls~~.

Exception 3, reformatted to put groups first.

807.4 – Deleted text is not needed as this is addressed in 807.2. Added text is intended to specifically reference decorative items that are covered under the NFPA Standard.

807.5 – This proposed revision places requirements for multiple use groups in this section so the listing of groups was deleted. In addition, new section 807.1 already states this section is not applicable to decorative vegetation, so this language was deleted.

807.5.1 – these requirements should apply to all occupancies in this section.
Titles at the beginning of each sentence were redundant and not proper code language.

807.5.2 – text re-organized for consistency. The intent is to clarify the following conditions are applicable to Group A

807.5.2.1 – Re-number only

807.5.2.2 - Re-number. This is a subsection of Group A criteria, so group not needed. Consistency between subsections.

807.5.2.3 – Re-number. This is a subsection of Group A criteria, so group not needed. Plus, only in the title, not the text. Consistency between subsections.

807.5.2.4 - Relocated to group with Group A requirements. This is a subsection of Group A criteria, so group not needed. Consistency between subsections.

807.5.3 - text re-organized for consistency. The intent is to clarify the following conditions are applicable to Group E

807.5.3.1 – Re-number. Change in Exception 2 is for consistency in language with Section 907.

807.5.3.2 – Re title and re-number only.

807.5.3.3 - This provide guidance within the classroom as to how much art work is permitted.

807.5.4 - The intent of the first sentence is to clarify that the general provisions are applicable for Group I-4. The phrase "day care facilities" is redundant.

807.5.4.1 – Re-number. Change in Exception 2 is for consistency in language with Section 907.

807.5.4.2 – Re-title and re-number only.

807.5.4.3 – This provide guidance within the classroom as to how much art work is permitted.

807.5.5 - Relocate existing exception 2 in 807.1 related to Group R-2 dormitories. Language is similar to paper in school corridors. NFPA 701 does not apply to Photos or paintings. All Group R are now required to be sprinklered, so the threat of flame spread is reduced. Revised language shown below:

> **807.5.5 (IBC [F] 806.5.5) Dormitories in Group R-2.** In Group R-2 dormitories, within sleeping units and dwelling units, the combustible decorative materials, ~~including, but not limited to, photographs and paintings in dormitories in Group R-2 where such materials are~~ shall be of limited quantities such that a hazard of fire development or spread is not present.

807.5.6 - Relocate existing Group I-1 and I-2 from 2nd paragraph of 807.1. New 807.3 would apply to curtains in all occupancies, including Group I-1 and I-2. This allowance is just for the paper permitted in the facilities. Revised language shown below:

> **IFC 807.5.6 Groups I-1 and I-2.** In Groups I-1 and I-2, combustible *decorative materials* shall ~~meet the flame propagation criteria of NFPA 701 unless the decorative materials, including, but not limited to, photographs and paintings, are~~ be of such limited quantities that a hazard of fire development or spread is not present.

807.5.7 – Re-located from 2nd paragraph of 807.1. Also scoped in 807.3

Cost Impact: None

807.1-F-CARPENTER.doc

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

SECTION 807
DECORATIVE MATERIALS OTHER THAN DECORATIVE VEGETATION IN NEW AND EXISTING BUILDINGS

807.1 (IBC [F]806.1) General. Combustible decorative materials, other than decorative vegetation, shall comply with Section 807.2

through 807.5.

<u>**807.2 General.** The following requirements shall apply to all occupancies:</u>

1. <u>Furnishings or decorative materials of an explosive or highly flammable character shall not be used.</u>
2. <u>Fire-retardant coatings in existing buildings shall be maintained so as to retain the effectiveness of the treatment under service conditions encountered in actual use.</u>
3. <u>Furnishings or other objects shall not be placed to obstruct *exits,* access thereto, egress there from or visibility thereof.</u>
4. <u>The permissible amount of noncombustible decorative materials shall not be limited.</u>

~~**807.2 (IBC [F] 806.2) Noncombustible materials.** The permissible amount of noncombustible decorative material shall not be limited.~~

807.3 (IBC [F] 806.3) Combustible decorative materials. In other than Group I-3, curtains, draperies, fabric hangings and other similar combustible decorative materials suspended from walls or ceilings shall <u>comply</u> ~~be flame resistant~~ ~~in accordance~~ with Section 807.4 and shall not exceed 10 percent of the specific wall or ceiling area to which <u>they are</u> ~~it is~~ attached.

Fixed or movable walls and partitions, paneling, wall pads and crash pads applied structurally or for decoration, acoustical correction, surface insulation or other purposes shall be considered *interior finish,* <u>shall comply with Section 803</u> ~~if they cover 10 percent or more of the wall or of the ceiling area,~~ and shall not be considered *decorative materials* or furnishings. *(relocated from Section 807.1)*

Exceptions:

1. In auditoriums in Group A, the permissible amount of curtains, draperies, fabric hangings and other similar combustible decorative materials suspended from walls or ceilings shall not exceed 75 percent of the aggregate wall area where the building is equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, and where the material is installed in accordance with Section 803.11 of the *International Building Code.*

2. n Group R-2 dormitories, within sleeping units and dwelling units, the permissible amount of curtains, draperies, fabric hangings and other similar decorative materials suspended from walls or ceiling shall not exceed 50 percent of the aggregate wall areas where the building is equipped throughout with an *approved automatic sprinkler system* installed in accordance with Section 903.3.1. *(relocated and revised from Section 807.1, exception 1)*

3. In Group B and M occupancies, the amount of <u>combustible</u> fabric partitions suspended from the ceiling and not supported by the floor <u>shall comply with Section 807.4 and</u> shall not be limited.

807.4 (IBC [F] 806.4) Acceptance criteria and reports. Where required to <u>exhibit improved fire performance</u> ~~be flame resistant~~, curtains, draperies, fabric hangings and other similar combustible decorative materials suspended from walls or ceilings shall be tested by an *approved* agency and meet the flame propagation performance criteria of <u>Test 1 or Test 2, as appropriate of</u> NFPA 701 <u>or exhibit a maximum rate of heat release of 100kW when tested in accordance with NFPA 289, using the 20 kW ignition source</u>. Reports of test results shall be prepared in accordance with <u>the test method used</u> ~~NFPA 701~~ and furnished to the *fire code official* upon request.

807.5 Occupancy-based requirements. In occupancies, combustible decorative materials not complying with Section 807.3 shall comply with Sections 807.5.1 through 807.5.7.

~~**807.5.1 General.** The following requirements shall apply to all occupancies:~~

1. ~~Furnishings or decorative materials of an explosive or highly flammable character shall not be used.~~
2. ~~Fire-retardant coatings in existing buildings shall be maintained so as to retain the effectiveness of the treatment under service conditions encountered in actual use.~~
3. ~~Furnishings or other objects shall not be placed to obstruct *exits,* access thereto, egress there from or visibility thereof.~~

<u>807.5.1</u> ~~807.5.2~~ Group A. In Group A occupancies, the requirements in Sections 807.5.2.1 through 807.5.2.4 shall apply to occupancies in Group A.

<u>807.5.1.1</u> ~~807.5.2.1~~ Foam plastics. Exposed foam plastic materials and unprotected materials containing foam plastic used for decorative purposes or stage scenery or exhibit booths shall have a maximum heat release rate of 100 kW when tested in accordance with UL 1975, or when tested in accordance with NFPA 289 using the 20 kW ignition source.

Exceptions:

1. Individual foam plastic items or items containing foam plastic where the foam plastic does not exceed 1 pound (0.45 kg) in weight.
2. Cellular or foam plastic shall be allowed for trim in accordance with Section 804.2.

<u>807.5.1.2</u> ~~807.5.2.2~~ Motion Picture Screens. The screens upon which motion pictures are projected in new and existing buildings shall either comply with Section 807.4 or shall comply with the requirements for a Class B interior finish in accordance with Section 803 of the *International Building Code*.

__807.5.1.3__ ~~807.5.2.3~~ **Wood use in places of religious worship.** In places of religious worship, wood used for ornamental purposes, trusses, paneling or chancel furnishing shall not be limited.

__807.5.1.4__ ~~807.5.2.4~~ **(IBC [F] 806.4) Pyroxylin plastic.** Imitation leather or other material consisting of or coated with a pyroxylin or similarly hazardous base shall not be used.

__807.5.2__ ~~807.5.3~~ **Group E.** Group E occupancies, shall comply with Sections the requirements in Sections 807.5.3.1 through 807.5.3.3

__807.5.2.1__ ~~807.5.3.1~~ **Storage in corridors and lobbies.** Clothing and personal effects shall not be stored in *corridors* and lobbies.

Exceptions:

1. *Corridors* protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1.
2. *Corridors* protected by an *approved* fire alarm system installed in accordance with Section 907.
3. Storage in metal lockers, provided the minimum required egress width is maintained.

__807.5.2.2__ ~~807.5.3.2~~ **Artwork in corridors.** Artwork and teaching materials shall be limited on the walls of *corridors* to not more than 20 percent of the wall area.

__807.5.2.3__ ~~807.5.3.3~~ **Artwork in classrooms.** Artwork and teaching materials shall be limited on walls of classrooms to not more than 50 percent of the specific wall area to which they are attached.

__807.5.3__ ~~807.5.4~~ **Group I-4, day care facilities.** Group I-4 occupancies shall comply with, the requirements in Sections 807.5.4.1 through 807.5.4.2 .

__807.5.3.1__ ~~807.5.4.1~~ **Storage in corridors and lobbies.** Clothing and personal effects shall not be stored in *corridors* and lobbies.

Exceptions:

1. *Corridors* protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1.
2. *Corridors* protected by an *approved* fire alarm system installed in accordance with Section 907.
3. Storage in metal lockers, provided the minimum required egress width is maintained.

__807.5.3.2__ ~~807.5.4.2~~ **Artwork in corridors.** Artwork and teaching materials shall be limited on the walls of *corridors* to not more than 20 percent of the wall area.

__807.5.3.3__ ~~807.5.4.3~~ **Artwork in classrooms.** Artwork and teaching materials shall be limited on walls of classrooms to not more than 50 percent of the specific wall area to which they are attached.

__807.5.4__ ~~807.5.5~~ **Dormitories in Group R-2.** In Group R-2 dormitories, within sleeping units and dwelling units, the combustible decorative materials, shall be of limited quantities such that a hazard of fire development or spread is not present. *(relocated and revised from Section 807.1, exception 2)*

__807.5.5__ ~~807.5.6~~ **Groups I-1 and I-2.** In Groups I-1 and I-2 occupancies, combustible *decorative materials* shall be of such limited quantities that a hazard of fire development or spread is not present.*(relocated from Section 807.1)*

__807.5.6__ ~~807.5.7~~ **Group I-3.** In Group I-3, combustible *decorative materials* are prohibited. *(relocated from Section 807.1)*

Committee Reason: This proposal was seen as a good clarification and organization of the requirements in Section 807. A modification was presented that combined elements from F110-13 and made some additional adjustments to clarify the proposal. Section 807.2 in the modification was relocated from the proposed location 807.5.1. Section 807.2 was relocated into item 4 in the new section 807.2. Other revisions related to the appropriate application of NFPA 701 and the addition of NFPA 289 as a viable test for decorative materials.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Dave Frable, representing U.S. General Services Administration, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

807.1 (IBC [F]806.1) General. Combustible decorative materials, other than decorative vegetation, shall comply with Section 807.2 through 807.5.

> <u>**Exception:** The provisions of Section 807 shall not apply to Group F, R-2 other than dormitories, R-3, S and U Occupancies.</u>

807.3 (IBC [F] 806.3) Combustible decorative materials. In other than Group I-3, curtains, draperies, fabric hangings and other similar combustible decorative materials suspended from walls or ceilings shall comply with Section 807.4 and shall not exceed 10 percent of the specific wall or ceiling area to which they are attached. <u>See Section 807.5.6 for the requirements for Group I-3 occupancies.</u>

Fixed or movable walls and partitions, paneling, wall pads and crash pads applied structurally or for decoration, acoustical correction, surface insulation or other purposes shall be considered *interior finish,* shall comply with Section 803 and shall not be considered *decorative materials* or furnishings. *(relocated from Section 807.1)*

Exceptions:

1. In auditoriums in Group A, the permissible amount of curtains, draperies, fabric hangings and other similar combustible decorative materials suspended from walls or ceilings shall not exceed 75 percent of the aggregate wall area where the building is equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, and where the material is installed in accordance with Section 803.11 of the *International Building Code.*
2. n Group R-2 dormitories, within sleeping units and dwelling units, the permissible amount of curtains, draperies, fabric hangings and other similar decorative materials suspended from walls or ceiling shall not exceed 50 percent of the aggregate wall areas where the building is equipped throughout with an *approved automatic sprinkler system* installed in accordance with Section 903.3.1. *(relocated and revised from Section 807.1, exception 1)*
3. In Group B and M occupancies, the amount of combustible fabric partitions suspended from the ceiling and not supported by the floor shall comply with Section 807.4 and shall not be limited.

(Portions of proposal not shown remain unchanged.)

Commenter's Reason: This proposal narrows down the applicability of these provisions. This is consistent to how the occupancies were regulated previously. R-2 dormitories were regulated previously but not R-2 occupancies in general. Additionally, as currently written it would apply to individual apartment units. Occupancies such as F and S are locations where the public is not likely to be present unlike Group M or A occupancies. The reference to the Group I-3 restrictions are necessary as they may be easily missed where currently placed in the new section 807.5.6.

Public Comment 2:

John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care and Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee, request Approval as Modified by this Public Comment.

Further modify the proposal as follows:

<u>**IFC 807.5.3 Groups I-1 and I-2.** In Groups I-1 and I-2 occupancies, combustible *decorative materials* shall comply with Sections 807.5.3.1 through 807.5.3.4.</u>

<u>**IFC 807.5.3.1 Group I-1 and Group I-2 Condition 1 within sleeping units and dwelling units.** In Group I-1 and Group I-2 Condition 1 occupancies, equipped throughout by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1, within sleeping units and dwelling units, combustible decorative materials are limited to not more than 50 percent of the aggregate wall area.</u>

IFC 807.5.3.2 In Group I-1 and Group I-2 Condition 1 for areas other than within sleeping units and dwelling units. In Group I-1 and Group I-2 Condition 1 occupancies, equipped throughout by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1, combustible decorative materials in areas other than within sleeping units and dwelling units are limited to not more than 30 percent of the aggregate wall area.

IFC 807.5.3.3 In Group I-2 Condition 2. In Group I-2 Condition 2 occupancies, equipped throughout by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1, the combustible decorative materials are limited to not more than 30 percent of the aggregate wall area.

IFC 807.5.3.4 Other areas in Groups I-1 and I-2. In Group I-1 and I-2 occupancies, in areas not equipped throughout by an *approved automatic sprinkler system*, the combustible decorative materials, shall be of such limited quantities that a hazard of fire development or spread is not present.

~~**807.5.5 Groups I-1 and I-2.** In Groups I-1 and I-2 occupancies, combustible *decorative materials* shall be of such limited quantities that a hazard of fire development or spread is not present.~~

807.5.4 ~~**807.5.6**~~ **Group I-3.** *(No change to text)*

807.5.5 ~~**807.5.3**~~ **Group I-4, day care facilities.** *(No change to text)*

807.5.5.1 ~~**807.5.3.1**~~ **Storage in corridors and lobbies.** *(No change to text)*

807.5.5.2 ~~**807.5.3.2**~~ **Artwork in corridors.** *(No change to text)*

807.5.5.3 ~~**807.5.3.3**~~ **Artwork in classrooms.** *(No change to text)*

807.5.6 ~~**807.5.4**~~ **Dormitories in Group R-2.** *(No change to text)*

(Portions of proposal not shown remain unchanged.)

Commenter's Reason: The renumbering is to put the groups addressed in alphabetical order for ease of use.
Code change F109 was approved as modified as part of a coordination effort between F109 and F110. This is a good cleanup of the section and is indicated below as it will appear in the 2015 IBC. This change, along with the approval of F3, addressed the issues in F111 with the exception of the allowance for paper in assisted living facilities, nursing homes and hospitals.

The committee did not really express any reasons for not approving the percentages recommended. There was a floor modification that attempted to coordinate F111 with the coordination work being done with F109 and F110 which appeared to confuse the issue.

Section 807.5.5, dealing with Group I-2, while a relocation of existing language, is very open for interpretation and/or unenforceable. This proposal for Section 807.5.3, replaces Section 807.5.5, and pulls the more exact language in F111 to put it here to address situations in Group I-1 and I-2 facilities such as assisted living, nursing homes and hospitals.

SECTION 807 (IBC [F] 806)
DECORATIVE MATERIALS OTHER THAN DECORATIVE VEGETATION IN NEW AND EXISTING BUILDINGS

807.1 (IBC [F]806.1) General. Combustible decorative materials, other than decorative vegetation, shall comply with Section 807.2 through 807.5.

807.2 (IBC [F]806.2) General. The following requirements shall apply to all occupancies:

1. Furnishings or decorative materials of an explosive or highly flammable character shall not be used.
2. Fire-retardant coatings in existing buildings shall be maintained so as to retain the effectiveness of the treatment under service conditions encountered in actual use.
3. Furnishings or other objects shall not be placed to obstruct *exits,* access thereto, egress there from or visibility thereof.
4. The permissible amount of noncombustible decorative materials shall not be limited.

807.3 (IBC [F] 806.3) Combustible decorative materials. In other than Group I-3, curtains, draperies, fabric hangings and other similar combustible decorative materials suspended from walls or ceilings shall comply with Section 807.4 and shall not exceed 10 percent of the specific wall or ceiling area to which they are attached.

Fixed or movable walls and partitions, paneling, wall pads and crash pads applied structurally or for decoration, acoustical correction, surface insulation or other purposes shall be considered *interior finish* shall comply with Section 803 and shall not be considered *decorative materials* or furnishings.

Exceptions:

1. In auditoriums in Group A, the permissible amount of curtains, draperies, fabric hangings and other similar combustible decorative materials suspended from walls or ceilings shall not exceed 75 percent of the aggregate wall area where the building is equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, and where the material is installed in accordance with Section 803.11 of the *International Building Code.*

2. In Group R-2 dormitories, within sleeping units and dwelling units, the permissible amount of curtains, draperies, fabric hangings and other similar decorative materials suspended from walls or ceiling shall not exceed 50 percent of the aggregate wall areas where the building is equipped throughout with an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.
3. In Group B and M occupancies, the amount of combustible fabric partitions suspended from the ceiling and not supported by the floor shall comply with Section 807.4 and shall not be limited.

807.4 (IBC [F] 806.4) Acceptance criteria and reports. Where required to exhibit improved fire performance, curtains, draperies, fabric hangings and other similar combustible decorative materials suspended from walls or ceilings shall be tested by an *approved* agency and meet the flame propagation performance criteria of Test 1 or Test 2, as appropriate of NFPA 701 or exhibit a maximum rate of heat release of 100kW when tested in accordance with NFPA 289, using the 20 kW ignition source. Reports of test results shall be prepared in accordance with the test method used and furnished to the *fire code official* upon request.

807.5 Occupancy-based requirements. In occupancies, combustible decorative materials not complying with Section 807.3 shall comply with Sections 807.5.1 through 807.5.7.

807.5.1 Group A. In Group A occupancies, the requirements in Sections 807.5.2.1 through 807.5.2.4 shall apply to occupancies in Group A.

807.5.1.1 Foam plastics. Exposed foam plastic materials and unprotected materials containing foam plastic used for decorative purposes or stage scenery or exhibit booths shall have a maximum heat release rate of 100 kW when tested in accordance with UL 1975, or when tested in accordance with NFPA 289 using the 20 kW ignition source.

Exceptions:

1. Individual foam plastic items or items containing foam plastic where the foam plastic does not exceed 1 pound (0.45 kg) in weight.
2. Cellular or foam plastic shall be allowed for trim in accordance with Section 804.2.

807.5.1.2 Motion Picture Screens. The screens upon which motion pictures are projected in new and existing buildings shall either comply with Section 807.4 or shall comply with the requirements for a Class B interior finish in accordance with Section 803 of the *International Building Code*.

807.5.1.3 Wood use in places of religious worship. In places of religious worship, wood used for ornamental purposes, trusses, paneling or chancel furnishing shall not be limited.

807.5.1.4 Pyroxylin plastic. Imitation leather or other material consisting of or coated with a pyroxylin or similarly hazardous base shall not be used.

807.5.2 Group E. Group E occupancies, shall comply with Sections the requirements in Sections 807.5.3.1 through 807.5.3.3

807.5.2.1 Storage in corridors and lobbies. Clothing and personal effects shall not be stored in *corridors* and lobbies.

Exceptions:

1. *Corridors* protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1.
2. *Corridors* protected by an *approved* fire alarm system installed in accordance with Section 907.
3. Storage in metal lockers, provided the minimum required egress width is maintained.

807.5.2.2 Artwork in corridors. Artwork and teaching materials shall be limited on the walls of *corridors* to not more than 20 percent of the wall area.

807.5.2.3 Artwork in classrooms. Artwork and teaching materials shall be limited on walls of classrooms to not more than 50 percent of the specific wall area to which they are attached.

807.5.3 Group I-4, day care facilities. Group I-4 occupancies shall comply with, the requirements in Sections 807.5.4.1 through 807.5.4.2 .

807.5.3.1 Storage in corridors and lobbies. Clothing and personal effects shall not be stored in *corridors* and lobbies.

Exceptions:

1. *Corridors* protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1.
2. *Corridors* protected by an *approved* fire alarm system installed in accordance with Section 907.
3. Storage in metal lockers, provided the minimum required egress width is maintained.

807.5.3.2 Artwork in corridors. Artwork and teaching materials shall be limited on the walls of *corridors* to not more than 20 percent of the wall area.

807.5.3.3 Artwork in classrooms. Artwork and teaching materials shall be limited on walls of classrooms to not more than 50 percent of the specific wall area to which they are attached.

807.5.4 Dormitories in Group R-2. In Group R-2 dormitories, within sleeping units and dwelling units, the combustible decorative materials, shall be of limited quantities such that a hazard of fire development or spread is not present.

807.5.5 Groups I-1 and I-2. In Groups I-1 and I-2 occupancies, combustible *decorative materials* shall be of such limited quantities that a hazard of fire development or spread is not present.

807.5.6 Group I-3. In Group I-3, combustible *decorative materials* are prohibited.

This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering, a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

This proposal is being co-sponsored by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/CTC/Pages/default.aspx. Since its inception in April/2005, the CTC has held twenty five meetings - all open to the public.

Public Comment 3:

Marcelo M. Hirschler, (GBH International), requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

807.5.3 Groups I-1 and I-2. In Groups I-1 and I-2 occupancies, combustible *decorative materials* shall comply with Sections 807.5.3.1 through 807.5.3.4.

807.5.3.1 Group I-1 and Group I-2 Condition 1 within units. In Group I-1 and Group I-2 Condition 1 occupancies, equipped throughout by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1, within sleeping units and dwelling units, combustible decorative materials placed on walls shall be limited to not more than 50 percent of the wall area to which they are attached.

807.5.3.2 In Group I-1 and Group I-2 Condition 1 for areas other than within units. In Group I-1 and Group I-2 Condition 1 occupancies, equipped throughout by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1, combustible decorative materials placed on walls in areas other than within dwelling and sleeping units shall be limited to not more than 30 percent of the wall area to which they are attached.

807.5.3.3 In Group I-2 Condition 2. In Group I-2 Condition 2 occupancies, equipped throughout by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1, combustible decorative materials placed on walls shall be limited to not more than 30 percent of the wall area to which they are attached.

807.5.3.4 Other areas in Groups I-1 and I-2. In Group I-1 and I-2 occupancies, in areas not equipped throughout by an *approved automatic sprinkler system*, combustible decorative materials shall be of such limited quantities that a hazard of fire development or spread is not present.

~~**807.5.5 Groups I-1 and I-2.** In Groups I-1 and I-2 occupancies, combustible *decorative materials* shall be of such limited quantities that a hazard of fire development or spread is not present.~~

807.5.4 ~~**807.5.6**~~ **Group I-3.** *(No change to text)*

807.5.5 ~~**807.5.3**~~ **Group I-4, day care facilities.** *(No change to text)*

807.5.5.1 ~~**807.5.3.1**~~ **Storage in corridors and lobbies.** *(No change to text)*

807.5.5.2 ~~**807.5.3.2**~~ **Artwork in corridors.** *(No change to text)*

807.5.5.3 ~~**807.5.3.3**~~ **Artwork in classrooms.** *(No change to text)*

<u>807.5.6</u> ~~807.5.4~~ Dormitories in Group R-2. *(No change to text)*

(Portions of proposal not shown remain unchanged.)

Commenter's Reason: This comment proposes to integrate the proposed additional requirements (with sprinkler trade-offs) for Group I-1 and Group I-2 Condition 1 occupancies, as proposed by F111, within the accepted language of proposal F109. The proposed language would replace section 807.5.5 from the approved as modified version of proposal F109 by the new language in Section 807.5.3 . The renumbering is consistent with the alphabetical order of the occupancies.. The only other minor added changes made to the proposed language in F111 are the use of the words "decorative materials placed on walls" (because it is not possible to measure decorative materials placed other than on walls) and basing the limitation on the walls to which the decorative materials are attached because that provides added safety.

F109-13

Final Action: AS AM AMPC____ D

F112-13

808.1, 808.2, 5003.8.7.1, 5003.9.10, 5005.1.10, 5704.3.2.1.1, 5705.2.4, Chapter 80

Proposed Change as Submitted

Proponent: Glen Carter, Justrite Manufacturing Company LLC

Revise as follows:

808.1 Wastebaskets and linen containers in Group I-1, I-2 and I-3 occupancies. Wastebaskets, linen containers and other waste containers, including their lids, located in Group I-1, I-2 and I-3 occupancies shall be constructed of noncombustible materials or of materials that meet a peak rate of heat release not exceeding 300 kW/m2 when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m2 in the horizontal orientation. Metal wastebaskets and other metal waste containers with a capacity of 20 gallons (75.7 L) or more shall be listed in accordance with UL 1315 or approved in accordance with FM 6921 and shall be provided with a noncombustible lid. Portable containers exceeding 32 gallons (121 L) shall be stored in an area classified as a waste and linen collection room and constructed in accordance with Table 509 of the International Building Code.

808.2 Waste containers with a capacity of 20 gallons or more in Group R-2 college and university dormitories. Waste containers, including their lids, located in Group R-2 college and university dormitories, and with a capacity of 20 gallons (75.7 L) or more, shall be constructed of noncombustible materials or of materials that meet a peak rate of heat release not exceeding 300 kW/m2 when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m2 in the horizontal orientation. Metal wastebaskets and other metal waste containers with a capacity of 20 gallons (75.7 L) or more shall be listed in accordance with UL 1315 or approved in accordance with FM 6921 and shall be provided with a noncombustible lid. Portable containers exceeding 32 gallons (121 L) shall be stored in an area classified as a waste and linen collection room constructed in accordance

5003.8.7.1 Construction. The interior of cabinets shall be treated, coated or constructed of materials that are nonreactive with the hazardous material stored. Such treatment, coating or construction shall include the entire interior of the cabinet. Cabinets shall either be listed in accordance with UL 1275 or approved in accordance to FM 6050 as suitable for the intended storage or constructed in accordance with the following: with Table 509 of the International Building Code.

5003.9.10 Safety cans. Safety cans shall be listed in accordance with UL 30, UL 1313, or approved in accordance with FM 6051 and FM 6052 when used to increase the maximum allowable quantities per control area of flammable or combustible liquids in accordance with Table 5003.1.1(1). ~~Safety cans listed in accordance with UL 1313 are allowed for flammable and combustible liquids when not used to increase the maximum allowable quantities per control area and for other hazardous material liquids in accordance with the listing.~~

5005.1.10 Liquid transfer. Liquids having a hazard ranking of 3 or 4 in accordance with NFPA 704 shall be transferred by one of the following methods:

1. From safety cans complying with UL 30, UL 1313 or with FM 6051 and FM 6052.

2 through 5 *(No change to current text)*

5704.3.2.1.1 Materials. Cabinets shall be listed in accordance with UL 1275, or approved in accordance to FM 6050, or constructed of approved wood or metal in accordance with the following:

5705.2.4 Class I, II and III liquids. Class I liquids or when heated to or above their flash points, Class II and Class III liquids shall be transferred by one of the following methods:

1. From safety cans complying with UL 30, UL 1313 or with FM 6051 and FM 6052

2 through 5 *(No change to current text)*

Add standards to Chapter 80 as follows:

FM

6050-96	Approval Standard for Storage Cabinets (Flammable and Combustible Liquids
6051 and 6052-76	Approval Standard for Safety Containers and Filling, Supply and Disposal Containers
6921-04	Approval Standard for Cabinets for Combustible Waste

Reason:

1) For those proposals adding the appropriate FM Approval standard: FM Approvals is a nationally and globally recognized laboratory who just like UL has construction specifications these safety products have to be built to, performance specification these safety products are tested to before an approval is issued.

FM Approvals publish an approval guide that lists all the products they have approved. And FM Approvals conducts periodic quality assurance audits to assure the approved products are manufactured to the same standards as those products and designs that were submitted for evaluation. All design changes are submitted to FM Approvals for their approval prior to those changes being allowed. The fire tests conducted by both organizations (UL & FM) on these products are to the same time temperature curve.

It is in this spirit that FM Approvals should be included in the IFC as a nationally & globally recognized approval laboratory.

2) For those proposals 5003.9.10, 5005.1.10, and 5705.2.4 I am proposing adding UL 1313 for Non-metallic Safety Cans. Non-metallic safety cans are tested the same way as metallic safety cans and are as safe or safer than the metallic safety cans. If you had ever seen a non-metallic safety can in a fire test you would no longer be a skeptical.

   a) Intuitively, it is hard to imagine a safety san made of polyethylene surviving a fire test. I was curious about this concept until I witnessed our non-metallic safety can in a fire test conducted at UL. In the fire test, the safety can performed very admirably in the way the design met its goals, in not contributing to the spread of fire. Our non-metallic safety can vented on cue. As the vented vapors were being consumed by fire, the level of the liquid fuel lowered in the can. In turn the polyethylene started to melt but, only in the void above the fluid level. The liquid fuel level was protecting the can from melting further by absorbing the heat. As the fluid level went down the safety can's walls melted inward and further down the height of the can above the fuel level. This continued until all the fuel inside the safety can had been consumed while contained within the safety can's walls. There was no spew of fuel; no rupture of the safety can spreading fuel all over the area. That is exactly the intended result of a well-designed safety can. I believe once anyone has witnessed this test and understood the consequences they would be compelled to agree too.
   b) There are numerous flammable and combustible liquids that are incompatible with metallic safety cans. As an example, isopropyl alcohol will begin to pit a metallic safety can until micro leaks begin to occur. The only safe and compatible solution for storage of this liquid and others is a non-metallic safety can.
   c) A non-metallic safety can is definitely more robust during a drop test; our non-metallic safety can designs will rebound undamaged because of its superior thick wall strength. The metallic safety can in a drop test will result in a dented and crumpled shell. Both meet the criteria of a safety can but you cannot top the strength and resilience of the poly can.
   d) Metallic and non-metallic safety cans both benefit work place safety and each are recognized by many local, state, and federal laws. Non-metallic safety cans would be a loss to the safety community if it is not recognized. It is hard to picture what legal & safe alternative will be available to those whose processes that currently requiring non-metallic safety cans. Non-metallic safety cans have long provided a safe solution over makeshift consumer gasoline cans or glass/plastic carboys etc...

Note: The FM 6051 and 6052 are a combined specification covering metallic and non-metallic safety cans.

3) I am proposing the deletion illustrated in section 5003.9.10 to allow non-metallic safety cans to be used to allow the increase of MAQs in a control area for those reasons described in 2 a), b), c), & d) above.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, FM 6050-96, FM 6051 and 6052-76 and FM 6921-04 , with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28), will be posted on the ICC website on or before April 1, 2013. The standard UL 1313 is currently referenced within the IFC.

F112-808.1-F-CARTER

Committee Action Hearing Results

The following is an errata that was not posted to the ICC website.

The bolded current text was not printed with the original proposal:

808.2 Waste containers with a capacity of 20 gallons or more in Group R-2 college and university dormitories. Waste containers, including their lids, located in Group R-2 college and university dormitories, and with a capacity of 20 gallons (75.7 L) or more, shall be constructed of noncombustible materials or of materials that meet a peak rate of heat release not exceeding 300 kW/m2 when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m2 in the horizontal orientation. Metal wastebaskets and other metal waste containers with a capacity of 20 gallons (75.7 L) or more shall be listed in accordance with UL 1315 <u>or approved in accordance with FM 6921</u> and shall be provided with a noncombustible lid. Portable containers exceeding 32 gallons (121 L) shall be stored in an area classified as a waste and linen collection room constructed in accordance **with Table 509 of the *International Building Code***.

(Portions of proposal not shown remain unchanged)

For staff analysis of the content of FM 6050-96, FM 6051 and 6052-76 and FM 6921-04 relative to CP#28, Section 3.6, please visit: http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/ProposedStandards.pdf

Committee Action: Disapproved

Committee Reason: The proposal was not ready for implementation. One particular concern was that Section 5705.2.4 addresses heated liquids, which is outside the scope of the proposed referenced standard UL1313. Also there was confusion with the term "approved" as it is used differently within the proposal than as defined in Section 202. There was also concern that materials other than metal were being addressed in a section only dealing with metal containers.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care and Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee, request Approval as Modified by this Public Comment.

Modify the proposal as follows:

808.1 Wastebaskets and linen containers in Group I-1, I-2 and I-3 occupancies. Wastebaskets, linen containers and other waste containers, including their lids, located in Group I-1, I-2 and I-3 occupancies shall be constructed of noncombustible materials or of materials that meet a peak rate of heat release not exceeding 300 kW/m2 when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m2 in the horizontal orientation. Metal wastebaskets and other metal waste containers with a capacity of 20 gallons (75.7 L) or more shall be listed in accordance with UL 1315 or ~~approved in accordance with~~ FM 6921 and shall be provided with a noncombustible lid. Portable containers exceeding 32 gallons (121 L) shall be stored in an area classified as a waste and linen collection room and constructed in accordance with Table 509 of the International Building Code.

> <u>**Exception:**</u> <u>Portable containers complying with FM6921 and limited to clean waste recycling or disposal of patient records and does not exceed 96 gallons (363 L) shall not be required to be stored in an area classified as a waste and linen collection room.</u>

(Portions of proposal not shown remain unchanged.)

Reason: This allows for the option of compliance with FM6921 and addresses the committees concern over the "approved" language. The scope of this public comment is limited to concerns with Group I-2 concerns and their 'green' recycling initiatives and patient privacy with regard to proper disposal of medical records.

This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the <u>American Society for Healthcare Engineering</u>, a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

This proposal is being co-sponsored by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/CTC/Pages/default.aspx. Since its inception in April/2005, the CTC has held twenty five meetings - all open to the public.

F112-13

Final Action: AS AM AMPC____ D

F119-13
903.2.1

Proposed Change as Submitted

Proponent: Daniel E. Nichols, P.E., New York State Department of State (dan.nichols@dos.ny.gov)

Revise as follows:

903.2.1 Group A. An *automatic sprinkler system* shall be provided throughout buildings and portions thereof used as Group A occupancies as provided in this section. For Group A-1, A-2, A-3 and A-4 occupancies, the *automatic sprinkler system* shall be provided throughout the floor area where the Group A-1, A-2, A-3 or A-4 occupancy is located, and in all floors from the Group A occupancy to, and including, the nearest *level of exit discharge* serving the Group A occupancy. For Group A-5 occupancies, the *automatic sprinkler system* shall be provided in the spaces indicated in Section 903.2.1.5.

903.2.1.1 Group A-1. An *automatic sprinkler system* shall be provided for Group A-1 occupancies where one of the following conditions exists:

1. The *fire area* exceeds 12,000 square feet (1115 m^2).
2. The *fire area* has an *occupant load* of 300 or more.
3. The *fire area* is located on a floor other than a *level of exit discharge* serving such occupancies.
4. ~~The *fire area* contains a multitheater complex.~~ <u>When separate fire areas share exit or exit access components that have a cumulative occupant load of 300 or more.</u>

903.2.1.2 Group A-2. An *automatic sprinkler system* shall be provided for Group A-2 occupancies where one of the following conditions exists:

1. The *fire area* exceeds 5,000 square feet (464 m^2).
2. The *fire area* has an *occupant load* of 100 or more.
3. The *fire area* is located on a floor other than a *level of exit discharge* serving such occupancies.
4. <u>When separate fire areas share exit or exit access components that have a cumulative occupant load of 300 or more.</u>

903.2.1.3 Group A-3. An *automatic sprinkler system* shall be provided for Group A-3 occupancies where one of the following conditions exists:

1. The *fire area* exceeds 12,000 square feet (1115 m^2).
2. The *fire area* has an *occupant load* of 300 or more.
3. The *fire area* is located on a floor other than a *level of exit discharge* serving such occupancies.
4. <u>When separate fire areas share exit or exit access components that have a cumulative occupant load of 300 or more.</u>

903.2.1.4 Group A-4. An *automatic sprinkler system* shall be provided for Group A-4 occupancies where one of the following conditions exists:

1. The *fire area* exceeds 12,000 square feet (1115 m^2).
2. The *fire area* has an *occupant load* of 300 or more.
3. The *fire area* is located on a floor other than a *level of exit discharge* serving such occupancies.
4. <u>When separate fire areas share exit or exit access components that have a cumulative occupant load of 300 or more.</u>

Reason: Under the current provisions for sprinkler protection is assembly occupancies, the option of a fire area allows for compartmentation to be utilized in place of installing a sprinkler system. The issue with this arrangement is that multiple small assembly occupancies can be placed in a single story building and not trigger a sprinkler system because of the installation of a rated corridor and separation wall.

This proposal adds the requirement that sprinkler systems shall be added when the convergence of more than 300 persons shares an exit. This is consistent with the intent of autoamtic sprinkler systems being required for life safety and to maintain tenable exiting in a fire event. A fire event that is near an exit is the same whether there are 300 occupants in one room or three rooms with 100 occupants each sharing an exit. This is also consistent with the requirement in the current IFC for A-1 occupancies in 'multitheater complex", which is a requirement for anytime two or more theaters are in the same tenancy and does not consider occupant load as a trigger.

This proposal still provides options for those single story buildings with mutliple tenancies that have separate exits and utilize the fire area separation concept; such as buildings with multiple restaurants with separate entrances and strip-style mall buildings.

The State of New York has had experience in both fire losses and new building construction with this topic. FIrst, the Stouffer's Inn and conference center in 1981 killed 23 top-level executives when a fire in a common hallway trapped occupants in several small (50-100 person) conference rooms. Second, the fire area method of separating A-3 occupancies has provided a way to not sprinkler college and university lecture room buildings by separating the spaces but having room occupant loads approaching 1,000 people in the common hallway.

This proposal is submitted with the endorsement of the New York State Building Officials Conference, the New York State Fire Marshals and Inspectors Association, and the Association of Fire Districts of New York State.

Cost Impact: For buildings that have previously utilized the passive method of separating assembly occupancies when exiting is shared, this will increase the cost of construction due to the additional sprinkler requirement.

903.2.1-F-NICHOLS

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The terminology "when separate fire areas share exit or exit access components" was confusing. More specifically it was unclear what occupancies were sharing with the Group A occupancy. Second, concerns were raised with the deletion of the specific requirement for multi-theater complexes.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Daniel E. Nichols, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

<u>**903.2.1.6 Multiple fire areas**. An automatic sprinkler system shall be provided where multiple fire areas of Group A-1, A-2, A-3, or A-4 occupancies share exit or exit access components and the combined occupant load of these fire areas is 300 or more.</u>

(Portions of proposal not shown remain unchanged.)

Commenter's Reason: Much discussion was held on this topic in Dallas; mainly regarding the potential confusion of the language, the applicability to buildings with different types of assembly use groups, and coordination with other sections of the IBC.

This public comment has moved the originally proposed modifications to 903.2.1.1 through 903.2.1.4 to a new 903.2.1.6. This modification is done to address the different assembly use group issue. The language of the proposal has been modified to create a qualifier (…where multiple fire areas of Group A-1....) and the two conditions (1. share exit or exit access components and 2. the occupant load of the fire area is 300 or more). This is done to minimize confusion of when this section is used, as well as to direct the code user what the bounds of the occupant load are (i.e. the occupant load of the fire areas, not the exit or exit access components).

The multitheater complex is being retained. No changes to 903.2.1.1 through 903.2.1.4 are being considered in this proposal.

F119-13

Final Action: AS AM AMPC____ D

F120-13
903.2.1

Proposed Change as Submitted

Proponent: Carl D. Wren, P.E., Austin Fire Department, representing self (carl.wren@austintexas.gov)

Revise as follows:

903.2.1 Group A. An automatic sprinkler system shall be provided throughout buildings and portions thereof used as Group A occupancies as provided in this section. For Group A-1, A-2, A-3 and A-4 occupancies, the automatic sprinkler system shall be provided throughout the floor ~~area~~ where the fire area containing the Group A-1, A-2, A-3 or A-4 occupancy is located, and ~~in~~ throughout all floors of the building ~~from~~ above or below the Group A occupancy to, and including, the nearest level of exit discharge serving the Group A occupancy. For Group A-5 occupancies, the automatic sprinkler system shall be provided in the spaces indicated in Section 903.2.1.5.

903.2.1.1 Group A-1. An automatic sprinkler system shall be provided for fire areas containing Group A-1 occupancies and intervening floors of the building that impact the egress pathways where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m2).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.
4. The fire area contains a multitheater complex.

903.2.1.2 Group A-2. An automatic sprinkler system shall be provided for fire areas containing Group A-2 occupancies and intervening floors of the building that impact the egress pathways where one of the following conditions exists:

1. The fire area exceeds 5,000 square feet (464 m2).
2. The fire area has an occupant load of 100 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

903.2.1.3 Group A-3. An automatic sprinkler system shall be provided for fire areas containing Group A-3 occupancies and intervening floors of the building that impact the egress pathways where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m2).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

903.2.1.4 Group A-4. An automatic sprinkler system shall be provided for fire areas containing Group A-4 occupancies and intervening floors of the building that impact the egress pathways where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m2).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

903.2.1.5 Group A-5. An automatic sprinkler system shall be provided for Group A-5 occupancies in the following areas: concession stands, retail areas, press boxes and other accessory use areas in excess of 1,000 square feet (93 m2).

Reason: The current code language can be somewhat confusing since the charging language in 903.2.1 deals with the occupancy and certain building areas outside the occupancy but the language in subsections 903.2.1.1, 903.2.1.2, 903.2.1.3 and 903.2.1.4 require the "occupancy" to be protected by fire sprinklers while it addresses the thresholds in terms of the size of the "fire area". It is not the intent of this proposal to change the requirements of this section, only to clarify them.

Cost Impact: This code change is being proposed as an effort to clarify potentially confusing language and will not increase the cost of construction.

903.2.1F-WREN

Committee Action Hearing Results

Committee Action: Approved as Modified

Modify the proposal as follows:

903.2.1 Group A. An automatic sprinkler system shall be provided throughout buildings and portions thereof used as Group A occupancies as provided in this section. For Group A-1, A-2, A-3 and A-4 occupancies, the automatic sprinkler system shall be provided throughout the floor where the fire area containing the Group A-1, A-2, A-3 or A-4 occupancy is located, and throughout all floors of the building <u>from</u> ~~above or below~~ the Group A occupancy to, and including, the nearest level of exit discharge serving the Group A occupancy. For Group A-5 occupancies, the automatic sprinkler system shall be provided in the spaces indicated in Section 903.2.1.5.

903.2.1.1 Group A-1. An automatic sprinkler system shall be provided for fire areas containing Group A-1 occupancies and intervening floors of the building ~~that impact the egress pathways~~ where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m2).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.
4. The fire area contains a multi-theater complex.

903.2.1.2 Group A-2. An automatic sprinkler system shall be provided for fire areas containing Group A-2 occupancies and intervening floors of the building ~~that impact the egress pathways~~ where one of the following conditions exists:

1. The fire area exceeds 5,000 square feet (464 m2).
2. The fire area has an occupant load of 100 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

903.2.1.3 Group A-3. An automatic sprinkler system shall be provided for fire areas containing Group A-3 occupancies and intervening floors of the building ~~that impact the egress pathways~~ where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m2).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

903.2.1.4 Group A-4. An automatic sprinkler system shall be provided for fire areas containing Group A-4 occupancies and intervening floors of the building ~~that impact the egress pathways~~ where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m2).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

903.2.1.5 Group A-5. An automatic sprinkler system shall be provided for Group A-5 occupancies in the following areas: concession stands, retail areas, press boxes and other accessory use areas in excess of 1,000 square feet (93 m2).

Committee Reason: The committee felt that this proposal better clarified the application of 903.2.1 than proposal F117-13. Several modifications were made to further clarify the application of the proposal. The first removes “above or below” and restores the term “from.” This will address above or below grade situations as necessary. The next modification removes the language “that impact the egress pathways” as the language was felt difficult to enforce.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Gregory R. Keith, Professional heuristic Development, representing The Boeing Company, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

903.2.1 Group A. An automatic sprinkler system shall be provided throughout buildings and portions thereof used as Group A occupancies as provided in this section. For Group A-1, A-2, A-3 and A-4 occupancies, the automatic sprinkler system shall be provided throughout the story ~~floor~~ where the fire area containing the Group A-1, A-2, A-3 or A-4 occupancy is located, and throughout all stories ~~floors~~ of the building from the Group A occupancy to, and including, the nearest level of exit discharge serving the Group A occupancy. For Group A-5 occupancies, the automatic sprinkler system shall be provided in the spaces indicated in Section 903.2.1.5.

903.2.1.1 Group A-1. An automatic sprinkler system shall be provided for fire areas containing Group A-1 occupancies and intervening floors of the building where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m2).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.
4. The fire area contains a multi-theater complex.

903.2.1.2 Group A-2. An automatic sprinkler system shall be provided for fire areas containing Group A-2 occupancies and intervening floors of the building where one of the following conditions exists:

1. The fire area exceeds 5,000 square feet (464 m2).
2. The fire area has an occupant load of 100 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

903.2.1.3 Group A-3. An automatic sprinkler system shall be provided for fire areas containing Group A-3 occupancies and intervening floors of the building where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m2).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

903.2.1.4 Group A-4. An automatic sprinkler system shall be provided for fire areas containing Group A-4 occupancies and intervening floors of the building where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m2).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

903.2.1.5 Group A-5. An automatic sprinkler system shall be provided for Group A-5 occupancies in the following areas: concession stands, retail areas, press boxes and other accessory use areas in excess of 1,000 square feet (93 m2).

Commenter's Reason: This public comment for approval as further modified is intended to be entirely editorial in nature. It replaces the term "floor(s)" with the term "story(s)" in two locations. Floor is not a defined term in the IBC or IFC. Story is a defined term: "That portion of a building included between the upper surface of a floor and the upper surface of the floor… Additionally, Section 903.2.1 refers to the "level of exit discharge." That term is defined as, "The story at the point at which an exit terminates and an exit discharge begins." Replacement of the term "floor" with the term "story" will be consistent with current IBC/IFC terminology and will assist code users by clarifying the application of this important provision.

Public Comment 2:

Maureen Traxler, representing City of Seattle Dept of Planning & Development, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

903.2.1 Group A. An automatic sprinkler system shall be provided throughout buildings and portions thereof used as Group A occupancies as provided in this section. ~~For Group A-1, A-2, A-3 and A-4 occupancies, the automatic sprinkler system shall be provided throughout the floor where the fire area containing the Group A-1, A-2, A-3 or A-4 occupancy is located, and throughout all floors of the building from the Group A occupancy to, and including, the nearest level of exit discharge serving the Group A occupancy. For Group A-5 occupancies, the automatic sprinkler system shall be provided in the spaces indicated in Section 903.2.1.5.~~

903.2.1.1 Group A-1. An automatic sprinkler system shall be provided ~~for~~ throughout the floor where fire areas containing Group A-1 occupancies are located and ~~intervening floors~~ throughout all floors of the building from the Group A-1 occupancy to, and including, the nearest level of exit discharge serving the Group A-1 occupancy where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m2).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.
4. The fire area contains a multi-theater complex.

903.2.1.2 Group A-2. An automatic sprinkler system shall be provided ~~for~~ throughout the floor where fire areas containing Group A-2 occupancies are located and ~~intervening floors~~ throughout all floors of the building from the Group A-2 occupancy to, and including, the nearest level of exit discharge serving the Group A-2 occupancy ~~of the building~~ where one of the following conditions exists:

1. The fire area exceeds 5,000 square feet (464 m2).
2. The fire area has an occupant load of 100 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

903.2.1.3 Group A-3. An automatic sprinkler system shall be provided ~~for~~ throughout the floor where fire areas containing Group A-3 occupancies are located and ~~intervening floors~~ throughout all floors of the building from the Group A-3 occupancy to, and including, the nearest level of exit discharge serving the Group A-3 occupancy ~~of the building~~ where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m2).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

903.2.1.4 Group A-4. An automatic sprinkler system shall be provided ~~for~~ throughout the floor where fire areas containing Group A-4 occupancies are located and ~~intervening floors~~ throughout all floors of the building from the Group A-4 occupancy to, and including, the nearest level of exit discharge serving the Group A-4 occupancy ~~of the building~~ where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m2).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

903.2.1.5 Group A-5. An automatic sprinkler system shall be provided for Group A-5 occupancies in the following areas: concession stands, retail areas, press boxes and other accessory use areas in excess of 1,000 square feet (93 m2).

Commenter's Reason: The proposal clarified the questions of whether sprinklers are required only in the occupancy or also outside the occupancy. Another question arises, however, of whether sprinklers are required on the floor where the A occupancy is located, or in the fire area which may be different than the floor. The charging paragraph says sprinklers are required throughout the floor, but the subsections only require sprinklers in the fire area. (In both places, the sprinklers are required to extend to the level of exit discharge.) To clarify, this modification moves language from the charging paragraph to the subsections for each A group. The modification also clarifies what is meant by "intervening floors." The original proposal doesn't clearly state what the floors intervene between. Any redundancy created by the modification is justified by the additional clarity and ease of applying the Group A sprinkler requirements.

F120-13

Final Action: AS AM AMPC____ D

F124-13
903.2.1.6 (New)

Proposed Change as Submitted

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

903.2.1.6 (IBC [F] 903.2.1.6) Assembly use on roofs. Where an occupied roof has an assembly use with an occupant load exceeding 100, all floors between the occupied roof and the level of exit discharge shall be equipped with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

Reason: Currently the code states that if you have a fire area containing an A-2 Assembly on a floor other than the floor of exit discharge, that floor level and all floors to the level of exit discharge must be sprinklered. Frequently, roof tops are being used and occupied as assemblies. Building owners will provide an open air roof-top bar or lounge, or other use similar to a Group A-2 occupancy on the roof of a building.

The roof of the building does not meet the definition of a fire area. So protection of the occupants can be less than what would otherwise be required if the occupancy was on a floor rather than on the roof.

The current fire sprinkler threshold for Group A-2 is an occupant load of 100. It is appropriate to apply this same threshold to the occupant load on the roof.

This proposal will require that when a roof top is occupied for an assembly use AND the occupant load exceeds 100, then the building must be protected with sprinklers. This proposal does not require that the roof top itself is sprinklered, but provides sprinkler protection on all floors to the level of exit discharge.

The reference to Section 903.3.1.2 is added, since this use can occur on the roof of multi-family housing facilities.

Cost Impact: The code change will increase the cost of construction.

903.2.1.6 (NEW)-F-ZUBIA-FCAC

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify proposal as follows:

903.2.1.6 (IBC [F] 903.2.1.6) Assembly ~~use~~ occupancy on roofs. Where an occupied roof has an assembly ~~use~~ occupancy with an occupant load exceeding 100, all floors between the occupied roof and the level of exit discharge shall be equipped with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

Committee Reason: Requiring an automatic sprinkler system within a building where a group A occupancy is located on the roof was felt to be a necessary lifesafety requirement. This is consistent with the requirements in Section 903.2.1 that protect the occupants from hazards they may need to egress through. The occupants of the Group A occupancy, whether within the building or on the roof, are unaware of the hazards in the building and need to evacuate through the building. There was some concern that this proposal along with F122-13 were overly restrictive. Sprinklers would be required when the occupant load of the Group A occupancy exceeds 100. The modification revises the term "use" to "occupancy" to be consistent with the use of the terms in the I-Codes.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Emory Rodgers, VDHCO, representing self, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

903.2.1.6 Assembly occupancy on roofs. Where an occupied roof has an assembly occupancy with an occupant load exceeding 100 <u>for Group A-2 and 300 for other Group A occupancies,</u> all floors between the occupied roof and the level of exit discharge shall be equipped with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

Commenter's Reason:

- Other Group A occupancies require sprinklers at 300 occupants not 100 that is only for A-2's. These other Group A's could have roof assemblies.
- The fire data clearly demonstrates there is no need to have such stringency for all other Group A occupancies
- In fact this Group A roof assembly and the 903.2.1 for Group A occupancies already will trigger sprinklers for any unsprinkled occupancy with a Group A-2 occupancy when on a 1st floor for that entire floor to be sprinkled or any other floors to sprinkle the entire building.
- Support the AM challenge for open parking garages and this AM challenge to allow 300 occupants for Group A-1's, A-3's and A-4's.

Public Comment 2:

Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

903.2.1.6 (IBC [F] 903.2.1.6) Assembly occupancy on roofs. Where an occupied roof has an assembly occupancy with an occupant load exceeding 100, all floors between the occupied roof and the level of exit discharge shall be equipped with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

<u>**Exception:** Open parking garages of Type I or II construction.</u>

Commenter's Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

The proposed exception for open parking garages is consistent with the existing code requirement exception for open parking garages under Section 903.2.11.3 for "Buildings 55 feet or more in height".

It is becoming more common in the urban renewal areas throughout the US that jurisdictions are asking developers to provide additional recreational and green spaces for its citizens to enjoy within their own communities. Because of the limited space available it is not uncommon for such recreational and green spaces to be provided on the roofs of open parking garages. Based on the existing wording of this new Section (903.2.1.6) of code, these recreational and green spaces greater than 700 sq. ft. (based on 7 sq. ft. net /occupant) or 1500 sq. ft. (based on 15 sq. ft. net /occupant) would now require the open parking garage to be sprinklered. In other words, an open recreational or green space on a roof of an open parking structure that is more than a 26' to 39' square would require the garage to be sprinklered with a dry pipe sprinkler system that is initially a major cost to the project as well as a major monthly and yearly maintenance expense. Such an expense would most likely have an adverse affect on developers doing major city urban renewal projects from agreeing to provide such amenities for the local jurisdiction.

There is considerable supporting data for this proposed exception for open parking garages in the following national publications:

1. 2006 NFPA Fire Data Report, "Structure and Vehicle Fires in General Vehicle Parking Garages"
2. 2008 Parking Consultants Council Fire Safety Committee Report, "Parking Structure Fire Facts

These fire reports provide the following justifications for support of this public comment:

1. There is an average of only 660 fire/year in **all** types of parking garages in the US. This represents only 0.006% of all the annual fires/year in the US in all occupancy classifications. These fires caused an annual average of under one death, 11 injuries. However, for parking garages constructed of Construction Type I or II, they account for only 200 fire/year with no fire deaths, and only 2 injuries/year. Therefore, fires in parking garages occur very infrequently, especially for Construction Type I or Type II parking garages.
2. No structural damage occurred in 98.7% of vehicle fires in parking garages.
3. Vehicle fires in parking garages typically do not spread (external spread of vehicle fires occurred in only 7% of the incidents).

Public Comment 3:

Jeffrey M. Shapiro, P.E., International Code Consultants, representing National Multi Housing Council, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

903.2.1.6 (IBC [F] 903.2.1.6) Assembly occupancy on roofs. Where an occupied roof has an assembly occupancy with an occupant load exceeding 100, all floors between the occupied roof and the level of exit discharge shall be equipped with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

Exception: Open Parking Garages of Construction Type I or II.

Commenter's Reason: This comment is not challenging the addition of a general requirement to sprinkler building areas beneath an unenclosed assembly use located on a roof. However, adding this requirement for buildings having a rooftop assembly area with an open parking garage beneath is excessive. There has been no documentation presented to suggest that such an arrangement would expose occupants of the open rooftop area to any significant risk. Although a vehicle fire below may transmit some smoke to the roof, it is incumbent on the proponent to demonstrate that the level of associated risk for such an event is acute to warrant a new requirement. Lacking that demonstration, the proposed exception, which has been limited to Type I and Type II construction, is appropriate, and it is consistent with many other allowances for open parking structures in the IBC and IFC.

Public Comment 4:

David S. Collins, FAIA, The Preview Group, Inc., representing The American Institute of Architects, requests Disapproval.

Commenter's Reason: Adding requirements for levels below the roof to be protected without any consideration for the number of levels and the configuration of the means of egress from the roof is inappropriate. A single story building with a rooftop dining area or bar would be required to install sprinklers in the first floor even if it had no connection with the rooftop operation and shared no means of egress with that floor.

F124-13

Final Action: AS AM AMPC____ D

F125-13
903.2.2 (New)

<u>Proposed Change as Submitted</u>

Proponent: Daniel E. Nichols, P.E., New York State Department of State (dan.nichols@dos.ny.gov)

Add new text as follows:

<u>**903.2.2 Group B.** An *automatic sprinkler system* shall be provided throughout all buildings containing a Group B occupancy where a Group B *fire area* is located more than three stories above grade plane.</u>

~~**903.2.2**~~ **<u>903.2.2.1</u> Ambulatory Care Facilities.** (No Changes)

Reason: This proposal is to set a requirement for automatic sprinkler systems to be installed in mid-rise business occupancies. Currently, the only requirement for automatic sprinkler protection in Group B occupancies is when the building meets one of the specific hazard requirements in IFC 903.2.11, generally the occupied floor (30 people) over 55 feet in height requirement.

The State of New York has required the installation of automatic sprinkler systems in all buildings over 30 feet in height for the past 10 years. A majority of that reasoning is to require business and educational occupancies to have an automatic sprinkler system for buildings over 3 stories. The reasoning for this lower height for sprinkler protection is due to the following:

1. Firefighting operations on higher levels is increasing challenging. The IFC already implicitly recognizes the extra challenges by requiring standpipe systems at the 30 feet or more height measurement as well as aerial apparatus access roads (in Appendix D). With the excellent performance of automatic sprinkler systems, the hazards to firefighters is greatly reduced.
2. Group B occupancies create a fire control problem by a majority of floor spaces being open. With the change of the materials used to construct furnishings, smoke produces a greater obscuration of the environment and makes finding the source of the fire more difficult. Other open space floor plan occupancies, such as Group M and F-1 occupancies, already have sprinkler thresholds for buildings above three stories.
3. Group B occupancies are not required to have any automatic fire alarm or detection requirements. The requirement for automatic sprinkler systems to be monitored provides a system to give accelerated warning of a fire within the building , evacuates the area and starts first responders to the scene.
4. In 2011, a Fire Captain in Asheville, North Carolina died while operating on an upper floor of a mid-rise office building that was not sprinkler protected. Several crew members, including the deceased, ran out of breathing air which was attributed to the need for utilizing air during the stair ascent. An automatic sprinkler systems would have allowed firefighters, at a minimum, to not encounter such heavy smoke conditions on lower floors during entry and allow for their air supply to be more adequate for fire attack operations. Information on this fire an recommendations for the installation of fire suppression systems in these occupancies is found in the NIOSH firefighter fatality report # F2011-18.

Over the past 10 years, the State of New York has not been petitioned to omit the sprinkler system on the new construction of mid-rise office buildings (3-7 stories). Many find that the sprinkler system allows for the use of a Class 1 standpipe system. NFPA 14, the referenced standard for standpipe system installation, permits Class 1 standpipes to be of manual wet design. This allows a building with a marginal water supply to use either street pressure or a smaller fire pump to run the sprinkler system and allow the FD to pump the pressures required to the standpipe. Without the sprinkler system, the building is responsible for providing at least 100 psi for at least 750 GPM of flow (2 stairways minimum).

This proposal is submitted with the endorsement of the New York State Building Officials Conference, the New York State Fire Marshals and Inspectors Association, and the Association of Fire Districts of New York State.

Cost Impact: This proposal will add costs to the construction of 4 to 6 story buildings that are not already using sprinklers for a 'tradeoff' of other code requirements. Cost savings may be achieved by not requiring an automatic Class III standpipe, but a manual Class I standpipe.

903.2.2 (NEW)-F-NICHOLS

<u>Committee Action Hearing Results</u>

Committee Action: **Disapproved**

Committee Reason: The proposal to add sprinklers for Group B occupancies more than 3 stories above grade plane was seen as overly restrictive. Section 903.2.11.3 already requires buildings with floor levels with an occupant load of 30 or more that are located 55 feet or more above the lowest level of fire department vehicle access to have an automatic sprinkler system. This was felt to be an adequate requirement. Also, loss data to support this requirement were not presented.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Daniel E. Nichols, requests Approval as Submitted.

Commenter's Reason: In Dallas, the comments asking for disapproval of this code change proposal mainly included validation of the need by fire reports as well as the reliance of the 55 foot sprinkler requirement for almost every use group.

As it applies to fire reporting, the NFPA report "U.S. Structure Fires in Office Properties" (November 2010) reports that only 20% of fires in office buildings occur during normally closed hours (10p-7a) but constitute 55% of direct property damage, or $59.4 million over 5 years. Further, 19% of fires occurred on weekends but constituted 30% of associated property loss. Even in the executive summary, "These findings highlight the need for automatic detection and extinguishing equipment to protect these properties when they aren't occupied."

To correlate these findings with the original proposal- firefighting in upper floors of buildings is more hazardous than operating on grade level due to the need to use interior stairways to advance handlines and the need for the use of ladders for rescue, entry, and ventilation. Even though the IFC requires the installation of a standpipe system for buildings greater than 30 feet in height, providing an automatic sprinkler system in Group B occupancies when the building hits 4 stories is needed to address the need for fire control and safer firefighting operations in an occupancy with a record of damage in off-hours. The record of the buildings having a low civilian causality rate is noted; but doesn't provide to the needs of firefighters (as described in the original proposal).

To the use of the 55 foot requirement to handle sprinkler coverage, this proposal was submitted using identical language found for Group F-1, M, and S-1 occupancies as it relates to building height (above 3 stories). The fire area square footage requirements were not carried over since the proposal is not based on control areas, but firefighter access to upper levels. With the fire statistics seen in the NFPA report in office properties, it seems appropriate that a Group B is more like an A, F-1, M, and S-1 (all require sprinklers at 4 stories) rather than noncombustible fabrication and storage facilities.

F125-13
Final Action: AS AM AMPC____ D

F126-13
903.2.4, 903.2.7, 903.2.9

Proposed Change as Submitted

Proponent: Steve Thomas, Colorado Code Consulting, LLC representing self (sthomas@coloradocode.net)

Revise as follows:

903.2.4 Group F-1. An automatic sprinkler system shall be provided throughout all buildings containing a Group F-1 occupancy where one of the following conditions exists:

1. A Group F-1 fire area exceeds 12,000 square feet (1115 m^2).
2. A Group F-1 fire area is located more than three stories above grade plane.
3. The combined area of all Group F-1 fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m^2).
4. ~~A Group F-1 occupancy used for the manufacture of upholstered furniture or mattresses exceeds 2,500 square feet (232 m²).~~

903.2.7 Group M. An automatic sprinkler system shall be provided throughout buildings containing a Group M occupancy where one of the following conditions exists:

1. A Group M fire area exceeds 12,000 square feet (1115 m2).
2. A Group M fire area is located more than three stories above grade plane.
3. The combined area of all Group M fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m^2).
4. ~~A Group M occupancy used for the display and sale of upholstered furniture or mattresses exceeds 5,000 square feet (464 m²).~~

903.2.9 Group S-1. An automatic sprinkler system shall be provided throughout all buildings containing a Group S-1 occupancy where one of the following conditions exists:

1. A Group S-1 fire area exceeds 12,000 square feet (1115 m^2).
2. A Group S-1 fire area is located more than three stories above grade plane.
3. The combined area of all Group S-1 fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m^2).
4. A Group S-1 fire area used for the storage of commercial trucks or buses where the fire area exceeds 5,000 square feet (464 m^2).
5. ~~A Group S-1 occupancy used for the storage of upholstered furniture or mattresses exceeds 2,500 square feet (232 m²).~~

Reason: The original proponent offered no technical justification in the original proposal. The fire event that was used to support the original emotional proposal was located in a building that was 59,000 square feet in area. It was not provided with fire sprinklers. The code currently requires that this size building be provided with fire sprinklers. Previous legacy codes have also required fire sprinklers in this size building. This requirement is over-restrictive and should be removed from the code.

When the provisions were revised in the 2012 IFC, the revision was not tied to FIRE AREA, but instead was based on some area of the upholstered furniture and mattresses. It is not clear how the areas are measured. Is it the area of the space, display or building that requires the fire sprinklers? This vague language makes enforcement more difficult.

The second issue is that the provisions in these sections conflicts with provision in Section 3206.2 for high piled combustible storage (HPCS). It creates a loophole because the IFC high piled combustible storage provisions set an area threshold of 500 square feet when the height of mattress storage is > 6 feet in a public-accessible area. The provision for Group M occupancies for upholstered mattresses and furniture sets an occupancy area threshold of 5,000 square feet. The committee wasn't thinking about HPCS when they considered the proposal and it was further amended on the floor.

Finally, loss history has never been presented substantiating why upholstered furniture and mattresses warrant a different threshold for sprinkler protection.

Cost Impact: This will reduce the cost of construction.

903.2.4-F-THOMAS

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The justification to remove the requirements for sprinklers where upholstered furniture is manufactured, stored and displayed was not seen as adequate. It was noted that although the building in Charleston should have been sprinklered previous to these requirements being implemented into the IFC that the current requirements were still necessary. The hazard of upholstered furniture was equated to being similar to that of hazardous materials. One concern raised regarding the current requirements was an example of a smaller store just over 5000 square feet that displays one or two upholstered chairs.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Steve Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

903.2.4 Group F-1. An automatic sprinkler system shall be provided throughout all buildings containing a Group F-1 occupancy where one of the following conditions exists:

1. A Group F-1 fire area exceeds 12,000 square feet (1115 m^2).
2. A Group F-1 fire area is located more than three stories above grade plane.
3. The combined area of all Group F-1 fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m^2).
4. A Group F-1 occupancy where the floor area used for the manufacture of upholstered furniture or mattresses exceeds 2,500 square feet (232 m^2).

903.2.7 Group M. An automatic sprinkler system shall be provided throughout buildings containing a Group M occupancy where one of the following conditions exists:

1. A Group M fire area exceeds 12,000 square feet (1115 m2).
2. A Group M fire area is located more than three stories above grade plane.
3. The combined area of all Group M fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m^2).
4. A Group M occupancy where the floor area used for the display and sale of upholstered furniture or mattresses exceeds 5,000 square feet (464 m^2).

903.2.9 Group S-1. An automatic sprinkler system shall be provided throughout all buildings containing a Group S-1 occupancy where one of the following conditions exists:

1. A Group S-1 fire area exceeds 12,000 square feet (1115 m^2).
2. A Group S-1 fire area is located more than three stories above grade plane.
3. The combined area of all Group S-1 fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m^2).
4. A Group S-1 fire area used for the storage of commercial trucks or buses where the fire area exceeds 5,000 square feet (464 m^2).
5. A Group S-1 occupancy where the floor area used for the storage of upholstered furniture or mattresses exceeds 2,500 square feet (232 m^2).

Commenter's Reason: It was obvious that the committee and the opposition felt that it was important to provide sprinklers in occupancies that contain upholstered furniture and mattresses. Therefore, this public comment makes the language clearer to understand the intent of the requirement. The current language is confusing. It is not clear what the area includes. In discussion with staff and other people involved in this change, the intent is to require sprinklers when the floor area of the actual material exceeds the threshold. The proposed language clarifies this and agrees with the interpretation of ICC.

Public Comment 2:

Gary Lampella, City of Redmond, representing Oregon Building Officials Association, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

903.2.7 Group M. An *automatic sprinkler system* in accordance with Section 903.3.1.1 shall be provided throughout buildings containing a Group M occupancy where one of the following conditions exists:

1. A Group M *fire area* exceeds 12,000 square feet (1115 m^2).
2. A Group M *fire area* is located more than three stories above grade plane.
3. The combined area of all Group M *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m^2).
4. ~~A Group M occupancy used for the display and sale of upholstered furniture or mattresses exceeds 5,000 square feet (464 m2).~~

903.2.7.1 Display and sale of upholstered furniture or mattresses. An automatic sprinkler system shall be provided throughout the fire area of a Group M occupancy used for the display and sale of upholstered furniture or mattresses where the fire area exceeds 5,000 square feet (464 m^2).

Commenter's Reason: The current code as written is overly restrictive. We understand the hazards faced by first responders but the current text would require the entire building that contained an M occupancy exceeding 5,000 square feet that had any amount of upholstered furniture or mattresses to be fully sprinkled. This include an M occupancies that had one chair or one mattress displayed for sale. Properly designed and constructed fire-resistive assemblies have proven to be very effective in controlling fire spread and smoke. The code requires in Section 901.7 that in order reduce the fire area below the limits for fire protection you have to comply with Section 707.3.9. This would require a minimum 2-hour fire barriers or horizontal assemblies for an M occupancy. Limiting M occupancies to a maximum fire area of 5,000 of a fire area with 2-hour assemblies will provide the safety features needed for this type of commodity. The NIST fire report which these sprinkler requirements were based detailed the fire spread though different parts of the building that would not have occurred if 2-hour fire barriers had been present. Tying the requirement to fire area instead of the whole building approach lessens the impact on adjoining existing occupancies without reducing the level of protection for upholstered furniture and mattresses.

Public Comment 3:

Gary Lampella, City of Redmond, representing Oregon Building Officials Association, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

903.2.4 Group F-1. An automatic sprinkler system shall be provided throughout all buildings containing a Group F-1 occupancy where one of the following conditions exists:

1. A Group F-1 fire area exceeds 12,000 square feet (1115 m^2).
2. A Group F-1 fire area is located more than three stories above grade plane.
3. The combined area of all Group F-1 fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m^2).
4. ~~A Group F-1 occupancy used for the manufacture of upholstered furniture or mattresses exceeds 2,500 square feet (232 m2).~~

903.2.4.3 Group F-1 manufacture of upholstered furniture or mattresses. An automatic sprinkler system shall be provided throughout the fire area of a Group F-1 occupancy used for the manufacture of upholstered furniture or mattresses where the fire area exceeds 2,500 square feet (232 m^2).

(Renumber following section.)

Commenter's Reason: The current code as written is overly restrictive. We understand the hazards faced by first responders but the current text would require the entire building that contained an F-1 occupancy exceeding 2,500 square feet that had any amount of upholstered furniture or mattresses being manufactured to be fully sprinkled. This includes F-1 occupancies that had one chair or one mattress being manufactured. Properly designed and constructed fire-resistive assemblies have proven to be very effective in controlling fire spread and smoke. The code requires in Section 901.7 that in order reduce the fire area below the limits for fire protection you have to comply with Section 707.3.9. This would require a minimum 3-hour fire barriers or horizontal assemblies for an F-1 occupancy. Limiting F-1 occupancies to a maximum fire area of 2,500 of a fire area with 3-hour assemblies will provide the safety features needed for this type of commodity. The NIST fire report which these sprinkler requirements were based detailed the fire spread though different parts of the building that would not have occurred if 3-hour fire barriers had been present. Tying the requirement to fire area instead of the whole building approach lessens the impact on adjoining existing occupancies without reducing the level of protection for upholstered furniture and mattresses.

Public Comment 4:

Gary Lampella, City of Redmond, representing Oregon Building Officials Association, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

903.2.9 Group S-1. An automatic sprinkler system shall be provided throughout all buildings containing a Group S-1 occupancy where one of the following conditions exists:

1. A Group S-1 fire area exceeds 12,000 square feet (1115 m^2).
2. A Group S-1 fire area is located more than three stories above grade plane.
3. The combined area of all Group S-1 fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m^2).
4. A Group S-1 fire area used for the storage of commercial trucks or buses where the fire area exceeds 5,000 square feet (464 m^2).
5. ~~A Group S-1 occupancy used for the storage of upholstered furniture or mattresses exceeds 2,500 square feet (232 m^2).~~

<u>**903.2.9.1 Storage of upholstered furniture or mattresses.** An automatic sprinkler system shall be provided throughout the fire area of a Group S-1 occupancy used for the storage of upholstered furniture or mattresses where the fire area exceeds 2,500 square feet (232 m^2).</u>

(Renumber following sections.)

Commenter's Reason: The current code as written is overly restrictive. We understand the hazards faced by first responders but the current text would require the entire building that contained an S-1 occupancy exceeding 2,500 square feet that had any amount of upholstered furniture or mattresses being stored to be fully sprinkled. This includes S-1 occupancies that had one chair or one mattress being stored. Properly designed and constructed fire-resistive assemblies have proven to be very effective in controlling fire spread and smoke. The code requires in Section 901.7 that in order reduce the fire area below the limits for fire protection you have to comply with Section 707.3.9. This would require a minimum 3-hour fire barriers or horizontal assemblies for an S-1 occupancy. Limiting S-1 occupancies to a maximum fire area of 2,500 of a fire area with 3-hour assemblies will provide the safety features needed for this type of commodity. The NIST fire report which these sprinkler requirements were based detailed the fire spread though different parts of the building that would not have occurred if 3-hour fire barriers had been present. Tying the requirement to fire area instead of the whole building approach lessens the impact on adjoining existing occupancies without reducing the level of protection for upholstered furniture and mattresses.

Proposed Change as Submitted

Proponent: Brad Emerick, Denver Fire Department representing the Fire Marshal's Association of Colorado (FMAC) and the Colorado Chapter of the ICC (CCICC) (brad.emerick@denvergov.org)

Add new text as follows:

903.2.5.2 (IBC [F] 903.2.5.2) Group H-3 Bulk storage of distilled spirits. Automatic Sprinkler system requirements for bulk storage of distilled spirits in wooden barrels and casks shall be in accordance with Sections 903.2.5.2.1 and 903.2.5.2.2.

903.2.5.2.1 (IBC [F] 903.2.5.2.1) Ceiling sprinklers. Distilled spirits stored in wooden barrels and casks in H-3 fire areas shall be protected with ceiling sprinklers in accordance with the requirements for relieving-style metal containers in NFPA 30 for the following storage configurations

1. Double-row racks with a load depth of no more than 3 barrels per row on each rack and 10 feet or less in height, or
2. Single-row racks with no more than 4 barrels per row, and 10 feet or less in height

903.2.5.2.2 (IBC [F] 903.2.5.2.2) Engineered systems. An approved engineered automatic sprinkler system design or an automatic sprinkler system in accordance with other nationally-recognized standards or recommended practices acceptable to the *fire code official* is required for bulk storage of distilled spirits stored in wooden barrels and casks in Group H-3 fire areas for any of the following storage configurations.

1. Storage in multi-row racks with three or more rows of racks
2. The number of barrels or casks per row exceeds that specified in Section 903.2.5.2.1.
3. Storage height Greater than 10 feet.

(Renumber subsequent sections)

Reason: There is confusion about the applicability of flammable liquid (Chapter 57) and hazardous materials (Chapter 50) provisions to distilled spirits because of the exceptions for distilled spirits and wines stored in wooden barrels and casks in IFC Chapters 50 and 57 (and NFPA 30). The issue arises because of the growing popularity of "boutique" or "craft" distillers locating their operations in urban areas. The proposed language clarifies bulk storage provisions for distilled spirits but does not alter the intent. The proposed language does not affect provisions applicable to use, nor those applicable to liquor storage in retail or wholesale establishments.

First, note distilled spirits are Class 1C and Class 1B flammable liquids. They are primarily comprised of ethyl alcohol (ethanol) and water with concentrations ranging from approximately 19% to 99%. The boiling point of pure ethanol is approximately 178ºF so an ethanol mixture with water will boil between 178ºF and 212ºF. The closed cup flash point for a 19% concentration of ethanol in water is 100ºF and for a 58% concentration is 73ºF making the mixtures in this range Class 1C flammable liquids (these values are not adjusted for altitude). Ethanol concentrations in water between 58% and 99% are Class 1B flammable liquids.

Second, the Building Code establishes occupancy. If a quantity of a Class 1B or Class 1C flammable liquid exceeding the maximum allowable quantity (MAQ), the room in which it is located is an H3 Occupancy. Please remember this applies to bulk storage (casks, barrels, metal containers, etc. exceeding 1.3 gallon capacities) and not liquor stores and wholesale distributors for which there are several exceptions.

Third, H occupancies have to be sprinklered. The sprinklering requirements for flammable and combustible liquids are outside the scope of NFPA 13. NFPA 13 points to NFPA 30 (Flammable and Combustible Liquids Code) for detailed requirements. Ethanol stored in any container larger than those excepted for retail – other than wood – is addressed there.

This is not because wood is inherently safer than metal, plastic or glass – it is not. It was probably inserted in the legacy code(s) back when casks were stored in liquid storage warehouses separated by hundreds of feet from one another and urban distilleries weren't contemplated. It was probably held over today because there is not yet an established sprinkler criteria for the storage of Class 1C flammable liquids in wooden barrels and casks. THIS HOWEVER DOES NOT MEAN THESE ROOMS SHOULD BE EXEMPT FROM SPRINKLERING REQUIREMENTS!

Fourth, there is no established sprinkler criteria for flammable and combustible liquids stored in wood casks. The modification proposed to Section 903.2.5.2 provides a baseline sprinkler criteria for distilled spirit storage quantities over the Class 1C flammable liquid MAQ, up to 10 feet in height, 2 racks (flu space) with 3 barrels per row in each rack, or single rack with 4 barrels per row. An engineered sprinkler design is required for quantities over the MAQ stored in a manner that exceeds any of these parameters. The language allows the fire code official the latitude to accept published recommended industry practices in lieu of an engineered design or test.

Relieving-style containers are identified because the wooden barrels and casks will release their contents when exposed to fire as the metal bands expand and the staves separate. Metal is identified because plastic and glass are much more vulnerable than wood. Ten foot height is identified as this envelopes the maximum storage heights of wooden barrels and casks typically seen in craft distilleries and is well below the 25 foot storage height permitted in NFPA 30 for relieving-style metal containers.

Last, please note that except for establishing a baseline sprinkler design criteria, the applicable code requirements have not been changed.

Cost Impact: This change will not affect the cost of construction.

903.2.5.2-F-EMERICK

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The proposal was disapproved based upon the proponent's request. This request by the proponent was related to the need to correlate with F285-13.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Brad Emerick, Denver Fire Department, representing Fire Marshal's Association of Colorado (FMAC), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

903.2.5.2 (IBC [F] 903.2.5.2) Group H-3 Bulk storage of distilled spirits in wooden barrels and casks. The bulk storage of distilled spirits in wooden barrels and casks shall be protected by an engineered automatic sprinkler system or by a sprinkler system designed in accordance with nationally-recognized standards or recommended practices acceptable to the *fire code official*: ~~Automatic Sprinkler system requirements for bulk storage of distilled spirits in wooden barrels and casks shall be in accordance with Sections 903.2.5.2.1 and 903.2.5.2.2.~~ Automatic sprinkler protection in accordance with NFPA 30 for relieving style metal containers shall be considered to comply with the requirements of this section for the following configurations.

1. Double-row racks with a load depth of no more than 3 barrels per row on each rack and 10 feet or less in height, or
2. Single-row racks with no more than 4 barrels per row, and 10 feet or less in height

~~**903.2.5.2.1 (IBC [F] 903.2.5.2.1) Ceiling sprinklers.** Distilled spirits stored in wooden barrels and casks in H-3 fire areas shall be protected with ceiling sprinklers in accordance with the requirements for relieving-style metal containers in NFPA 30 for the following storage configurations~~

~~1. Double-row racks with a load depth of no more than 3 barrels per row on each rack and 10 feet or less in height, or~~
~~2. Single-row racks with no more than 4 barrels per row, and 10 feet or less in height~~

~~**903.2.5.2.2 (IBC [F] 903.2.5.2.2) Engineered systems.** An approved engineered automatic sprinkler system design is required for bulk storage of distilled spirits stored in wooden barrels and casks in Group H-3 fire areas for any of the following storage configurations.~~

~~1. Storage in multi-row racks with three or more rows of racks~~
~~2. The number of barrels or casks per row exceeds that specified in Section 903.2.5.2.1.~~
~~3. Storage height Greater than 10 feet.~~

Commenter's Reason: The issue arises because of the growing popularity of "boutique" or "craft" distillers locating their operations in urban areas. Because there is no established sprinkler criteria for flammable and combustible liquids stored in wooden barrels and casks, the codes require an engineered design for the sprinkler protection in H3 fire areas regardless of the size operation (explanation below*****). But the quantity, storage volume, and storage height typically used in micro-distilleries typically do not present the hazard of large-scale operations. The proposed language specifies small-scale storage configurations where an “off the shelf” sprinkler design detailed per NFPA 30 may be used so the operators are not required to hire an engineer or have tests conducted in order to open their operations. The proposed language does not affect provisions applicable to use, dispensing or handling, or those applicable to liquor storage in retail or wholesale establishments.

The proposed language provides a sprinkler design criteria for distilled spirit storage quantities in excess of the Class 1B/1C flammable liquid MAQ, up to 10 feet in height. Either a 2 racks (flu space) with 3 barrels per row in each rack, or single rack with 4 barrels per row would be permitted. An engineered sprinkler design is required for any storage configuration that exceeds any of these parameters. The language allows an engineered design to be accepted in any case and also provides the fire code official latitude to accept published recommended industry practices in lieu of an engineered design or test.

Relieving-style containers are identified because the wooden barrels and casks will release their contents when exposed to fire as the metal bands expand and the staves separate. Metal is identified because plastic and glass are much more vulnerable than wood and the corresponding sprinkler criteria is too conservative. A 10’ height is identified as this envelopes the maximum storage heights of wooden barrels and casks typically seen in craft distilleries while well below the 25’ storage height permitted in NFPA 30 for relieving-style metal containers.

***Explanation for an engineered sprinkler design:**
There is confusion about the applicability of flammable liquid (Chapter 57), hazardous materials (Chapter 50), and NFPA 30 provisions to distilled spirits because of the exceptions for distilled spirits and wines stored in wooden barrels and casks contained therein.

First, note ethanol/water mixtures ranging from approximately 19% concentration of alcohol by volume (ABV) to pure ethanol (100% ABV) are Class 1C and Class 1B flammable liquids. Ethanol/water mixtures will boil between 178^{0}F and 212^{0}F at sea level. The closed cup flash point for a 19% concentration of ethanol in water is 100^{0}F and for a 58% concentration is 73^{0}F making the mixtures in this range Class 1C flammable liquids. Ethanol concentrations in water between 58% and 100% are Class 1B flammable liquids. These values are not adjusted for altitude.

Second, the Building Code establishes occupancy. If a quantity of a Class 1B or Class 1C flammable liquid exceeds the maximum allowable quantity (MAQ), the room in which it is located is an H3 Occupancy. Please remember this applies to bulk storage (casks, barrels, metal containers, etc. exceeding 1.3 gallon capacities) and not to liquor stores and wholesale distributors for which there are several exceptions.

Third, H occupancies have to be sprinklered. The sprinklering requirements for flammable and combustible liquids are outside the scope of NFPA 13. NFPA 13 points to NFPA 30 (Flammable and Combustible Liquids Code) for detailed requirements. Ethanol stored in any container larger than those exempted for retail – other than wood – is addressed there. This is not because wood is inherently safer than metal, plastic or glass – it is not. It is because there is not yet an established sprinkler criteria for the storage of Class 1B and 1C flammable liquids in wooden barrels and casks. THIS HOWEVER DOES NOT MEAN THESE ROOMS SHOULD BE EXEMPT FROM SPRINKLERING REQUIREMENTS!

Fourth, please note that except for establishing a baseline sprinkler design criteria, the applicable code requirements have not been changed.

F127-13
Final Action: AS AM AMPC____ D

F131-13
903.2.11.3 (IBC [F] 903.2.11.3)

Proposed Change as Submitted

Proponent: Brad Emerick, Denver Fire Department representing the Fire Marshal's Association of Colorado (FMAC) and the Colorado Chapter of the ICC (CCICC) (brad.emerick@denvergov.org)

Revise as follows:

903.2.11.3 (IBC [F] 903.2.11.3) Buildings 55 feet or more in height. An automatic sprinkler system <u>in accordance with Section 903.3.1.1</u> shall be installed throughout buildings with a floor level having an occupant load of 30 or more that is located 55 feet (16 764 mm) or more above the lowest level of fire department vehicle access.

Exceptions:

1. Airport control towers.
2. Open parking structures.
3. Occupancies in Group F-2.

Reason: This proposal revises the language to specify a NFPA 13 sprinkler system is required in buildings meeting the height criteria. The proposed change only affects residential buildings on sloping sites where the lowest level of fire department vehicle access is significantly below grade plane. It has no other effect on sprinkler requirements related to the height of a building, namely IBC Section 540.2 which permits NFPA 13R sprinkler systems in residential buildings up to 60 feet in height – measured to the roof from grade plane (vs. lowest level of FD vehicle access).

If the lowest level of fire department vehicle access is at grade plane or on the high-elevation side of a sloping site, and the building height with respect to grade plane is 60 feet, then the highest occupied floor will be 10+ feet below this at a height of 50 feet or less – but below "55 feet to the highest occupied floor" in either case. Per IBC Section 540.2, a 13R sprinkler system is still permitted.

On a sloping site, where the lowest level of fire department vehicle access is on the low-elevation side of the site, firefighters are presented a building face taller in stories and feet than the nominal height of the building. If this face is tall enough that the highest occupied floor is 55 feet above them, the additional protection afforded by an NFPA 13 sprinkler system- especially with combustible construction – is warranted.

Cost Impact: This change will not affect the cost of construction.

903.2.11.3-F-EMERICK

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

903.2.11.3 (IBC [F] 903.2.11.3) Buildings 55 feet or more in height. An automatic sprinkler system ~~in accordance with Section 903.3.1.1~~ shall be installed throughout buildings <u>that have one or more stories</u> with ~~a floor level having~~ an occupant load of 30 or more ~~that is~~ located 55 feet (16 764 mm) or more above the lowest level of fire department vehicle access<u>, measured to the finished floor</u>.

Exceptions:

1. Airport control towers.
2. Open parking structures.
3. Occupancies in Group F-2.

Committee Reason: This proposal was approved as it helps to clarify how the height of the building is to be measured to determine whether a sprinkler system is required and through the modification the specific requirement for a NFPA 13 system was removed. There are likely very few situations that an NFPA 13R system would be applicable and the justification to restrict the type of sprinkler systems to NFPA 13 was not provided. The modification further clarifies that the measurement is taken to the finished floor level and not to the ceiling of the story.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Brad Emerick, Denver Fire Department, representing Fire Marshal's Association of Colorado (FMAC), requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

903.2.11.3 (IBC [F] 903.2.11.3) Buildings 55 feet or more in height. An automatic sprinkler system in accordance with Section 903.3.1.1 shall be installed throughout buildings that have one or more stories with an occupant load of 30 or more located 55 feet (16 764 mm) or more above the lowest level of fire department vehicle access, measured to the finished floor.

Exceptions:

1. Open parking structures.
2. Occupancies in Group F-2.

Commenter's Reason: The intent of this proposal is specifying an NFPA 13 sprinkler system in residential buildings that fall into the gap between the way heights are regulated in the codes; i.e., where a building is 60' or less in height above grade plane, but has an occupied floor more than 55' above the lowest level of fire department vehicle access (see figure).

Multi-story residential buildings 60' or less in height (measured from grade plane to the roof) are permitted to be sprinklered with an NFPA 13R system (Bldg 1 in figure).

However, such a building on a sloping site where the lowest level of fire department vehicle access is on the low side of the site, presents firefighters a building face taller than 60' (Bldg 2 in figure).

If this face is so tall that the highest occupied floor is 55 feet above them, the additional protection afforded by an NFPA 13 sprinkler system is warranted – especially since the top 4 stories of these buildings are now permitted to be combustible construction.

Notes:

[1] the proposal only affects residential buildings exceeding the height criteria as a non-residential buildings are required to be sprinklered with NFPA 13 systems.

[2] the proposal only affects multi-story residential buildings on sloping sites where the lowest level of fire department vehicle access in on the low side of the site. In other words, if the lowest level of fire department vehicle access to a 60'-tall residential building (measured from grade plane) is at grade plane or on the high-elevation side of a sloping site, a 13R sprinkler system is permitted.

[3] The issue arises because of the difference in the two ways building height is regulated; i.e.:
Height 1: average grade elevation around the perimeter of the building (grade plane) up to the average roof elevation, and
Height 2: lowest level of fire department vehicle access up to the highest occupied floor.

F131-13

Final Action: AS AM AMPC____ D

F133-13

903.3.1.1 (IBC [F] 903.3.1.1), 903.3.1.1.2 (New) [IBC [F] 903.3.1.1.2]

Proposed Change as Submitted

Proponent: Marshall Klein, International Code Consultants, representing Multi Housing Council

Revise as follows:

903.3.1.1 (IBC [F] 903.3.1.1) NFPA 13 sprinkler systems. Where the provisions of this code require that a building or portion thereof be equipped throughout with an automatic sprinkler system in accordance with this section, sprinklers shall be installed throughout in accordance with NFPA 13 except as provided in Sections 903.3.1.1.1 and 903.3.1.1.2.

903.3.1.1.2 (IBC [F] 903.3.1.1.2) Bathrooms. In Group R occupancies, other than Group R residential care facilities, sprinklers shall not be required in bathrooms that do not exceed 55 square feet in area and are located within individual dwelling units or sleeping units, provided that walls and ceilings, including the walls and ceilings behind any shower enclosure or tub, are of noncombustible or limited-combustible materials with a 15-minute thermal barrier rating.

Reason: This change is necessary to reinstate an exception that has been in existence since 1976 but was nevertheless deleted from the 2013 edition of NFPA 13 with no technical justification. Because the 2015 I-codes will reference the 2013 edition of NFPA 13, it is necessary and appropriate for the IBC and IFC to reverse NFPA's unsupported action on this issue.

Although reinstating the small bathroom exception will have a limited impact on new construction because many bathrooms exceed the 55 sq. ft. area limit in the exception to accommodate wheelchair access, the more important consequence will be removing an unnecessary cost increase for building owners who choose to retrofit existing properties with small bathrooms that were built before it was common to provide wheelchair access. Codes and standards should not erect any unnecessary barriers to retrofitting sprinklers into existing properties, such as existing high-rise buildings.

Background: In the 1976 edition of the Life Safety Code, to encourage cost effective fire protection systems for apartment buildings, NFPA 101 Section 11-3.8.3.4.1 provided an exception to permit bathrooms that did not exceed 55 sq. ft within individual dwelling units to omit sprinklers when the apartment building was sprinklered in accordance with NFPA 13. The basis of the 55 sq. ft. area is that this area accommodates a "typical" small bathroom that contains a standard tub, a toilet and a sink…nothing more. This exception was later duplicated from NFPA 101 into the 1991 edition of NFPA 13 with the understanding that the next edition of NFPA 101 (1994) could delete the exception since NFPA 13 would have it covered. NFPA 101-1994 then, as planned, deleted the exception.

The situation remained "status quo" until the cycle that produced the 2010 edition of NFPA 13. A proposal to delete the bathroom exception for apartments was initially rejected by the NFPA 13 Committee during the ROP process (Code Proposal 13-202 Log #79) with the Committee Statement for rejection as "No technical data was provided supporting this change". During the ROC process, a public comment (Comment 13-141 Log #235) was submitted by the National Fire Sprinkler Association (NFSA), and the NFPA 13 Committee reversed itself by accepting the Comment, even though no new technical information had been provided. Nevertheless, the NFPA membership rejected this revision at NFPA's annual conference, and the 2010 edition of NFPA 13 retained the exception.

During the 2013 edition cycle for NFPA 13, the issue was raised again, and this time, still with no technical justification, NFPA accepted the change. As a result, NFPA 13-2013 (Section 8.15.8.1.1) only allows omission of sprinklers from in bathrooms in hotels and motels, not apartments.

The history of apartment unit bathroom fires is statistically minimal. According to the recent NFPA Home Structure Fire Report, January 2009, Table 9B, "Reported Apartment Structure Fires by Area of Origin 2003-2006 Annual Averages", out of 113,000 fires/year, only 1600 (1%) are in bathrooms. Given that we have more than 35 years of experience with the bathroom sprinkler exception being in place (since it was put into NFPA 101 in 1976), one would certainly expect anecdotal or statistical experience to indicate the existence of a problem, if there were one. On the contrary, apartments have consistently rank at the top of the list with respect to sprinkler reliability and performance statistics, and no statistical (or other) evidence was presented to or by the NFPA 13 committee to justify deletion of the bathroom sprinkler exception for apartments.

Cost Impact: The code change proposal will not increase the cost of construction.

903.3.1.1-F-KLEIN

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

903.3.1.1 (IBC [F] 903.3.1.1) NFPA 13 sprinkler systems. Where the provisions of this code require that a building or portion thereof be equipped throughout with an automatic sprinkler system in accordance with this section, sprinklers shall be installed throughout in accordance with NFPA 13 except as provided in Sections 903.3.1.1.1 and 903.3.1.1.2.

903.3.1.1.2 (IBC [F] 903.3.1.1.2) Bathrooms. In Group R occupancies, other than Group R-4 occupancies ~~Group R residential care facilities~~, sprinklers shall not be required in bathrooms that do not exceed 55 square feet in area and are located within individual dwelling units or sleeping units, provided that walls and ceilings, including the walls and ceilings behind any shower enclosure or tub, are of noncombustible or limited-combustible materials with a 15-minute thermal barrier rating.

Committee Reason: The exception for bathrooms has been deleted in the 2013 edition of NFPA 13 with no technical justification. Therefore, to retain this exception for use with the IFC and IBC it is necessary to add a new section 903.3.1.1.2. In addition it was a concern that this particular allowance should be within the IBC and IFC as often the architects miss the 15 minute thermal barrier requirement that NFPA 13 requires. The modification simply replaces “Group R residential care facility” with the proper I-Code occupancy terminology Group R-4.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

903.3.1.1.2 (IBC [F] 903.3.1.1.2) Bathrooms. In Group R occupancies, ~~other than Group R-4 occupancies,~~ sprinklers shall not be required in bathrooms that do not exceed 55 square feet in area and are located within individual dwelling units or sleeping units, provided that walls and ceilings, including the walls and ceilings behind any shower enclosure or tub, are of noncombustible or limited-combustible materials with a 15-minute thermal barrier rating.

Reason: The Group R-4 is limited to 16 occupants capable or self-preservation, therefore, the chance that they would need a NFPA 13 system (i.e., 5 stories or taller) is very limited. In addition, the Fair Housing Act, requires that group homes be treated the same as any other congregate residence. Therefore, the language shown struck should be removed. The Group R-4 occupancy should have the same allowance for these small bathrooms as all other Group R occupancies. There is very minimal fire hazards in this area.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as “areas of study”. Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/CTC/Pages/default.aspx. Since its inception in April/2005, the CTC has held twenty five meetings - all open to the public.

F133-13

Final Action: AS AM AMPC____ D

F135-13
903.3.1.2 (IBC [F] 903.3.1.2)

Proposed Change as Submitted

Proponent: Tim Pate, City and County of Broomfield, CO, representing Colorado Chapter Code Change Committee

Revise as follows:

903.3.1.2 (IBC [F] 903.3.1.2) NFPA 13R sprinkler systems. Automatic sprinkler systems in Group R occupancies up to and including four stories ~~in height~~ <u>above grade plane</u> shall be permitted to be installed throughout in accordance with NFPA 13R.

> <u>**Exception:** The number of stories of Group R occupancies constructed in accordance with Section 510.2 and 510.4 of the International Building Code shall be measured from the horizontal assembly creating separate buildings.</u>

Reason: There has been confusion as to where you measure the four story limitation for NFPA 13R sprinkler systems. This proposal clarifies the intent of NFPA 13R limitations by using the correct language for building height and addressing the use of these systems in podium buildings.

Cost Impact: This change will not affect the cost of construction.

903.3.1.2-F-PATE

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify proposal as follows:

903.3.1.2 (IBC [F] 903.3.1.2) NFPA 13R sprinkler systems. Automatic sprinkler systems in Group R occupancies up to and including four stories <u>in height</u> ~~above grade plane~~ shall be permitted to be installed throughout in accordance with NFPA 13R.

> ~~**Exception:**~~ The number of stories of Group R occupancies constructed in accordance with Section 510.2 and 510.4 of the International Building Code shall be measured from the horizontal assembly creating separate buildings.

Committee Reason: This proposal was approved as it addresses the scenario where NFPA 13R systems are desired to be installed on residential buildings using the podium building allowance in Section 510.2 and 510.4 of the IBC. The modification clarifies that the number of stories in height is not related to grade plane. In addition the exception was revised to be part of the main section as the provisions of the exception are merely clarification of the application of the provisions in Section 510.2 and 510.4. The committee made it clear that it was not their intention to override the action taken on F134-13.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Brad Emerick, Denver Fire Department, representing Fire Marshal's Association of Colorado (FMAC), requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

903.3.1.2 (IBC [F] 903.3.1.2) NFPA 13R sprinkler systems. *Automatic sprinkler systems* <u>in accordance with NFPA 13R shall be permitted to be installed throughout</u> ~~in~~ Group R occupancies <u>in buildings</u> up to and including four stories <u>and 60 feet</u> in height <u>above</u>

grade plane~~ shall be permitted to be installed throughout in accordance with NFPA 13R~~. ~~The number of stories of Group R occupancies constructed in accordance with Section 510.2 and 510.4 of the *International Building Code* shall be measured from the horizontal assembly creating separate buildings.~~

Commenter's Reason: This proposal clarifies the intent of NFPA 13R limitations by using the correct language for building height and correlating with the NFPA 13R committee with respect to separation of buildings.

It was never the intent to recognize the horizontal 3-hour separation permitted for "pedestal-style" buildings (IBC Section 510.2) as creating separate buildings for all code requirements like a Fire Wall does. Under the applicable special provision, the overall building may be considered as two separate buildings only for the purposes of:

[1] determining area limitations,
[2] continuity of fire walls,
[3] limitation of number of stories, and
[4] type of construction.

However the overall building still has to be safe and accessible for escape and for fire department suppression, search and rescue operations.

There is a breakpoint in the codes for building heights between 30 feet above the lowest level of fire department access and four stories above grade plane. This is the point where stair enclosures have to be 2-hour rated, where at least one stair is required to extend to the roof, when standpipes are required, where emergency escape and rescue windows are no longer required, etc.

This height correlates with the upper limit at which fire departments can conduct operations using ground ladders. Hand-carried ladders can typically only reach 30 to 40 feet above the grade from where they're set. A higher degree of safety has historically been required in buildings taller than this because an offensive attack will include – maybe exclusively – internal operations.

In residential buildings, this is also the threshold where sprinkler systems are required to be more robust; i.e., where NFPA 13 systems are required.

With the relaxation in requirements for residential pedestal buildings leading to the consolidation of combustible framing (and the contents) in the highest stories, it makes no sense to also relax the sprinklering requirements for that portion of the building.

More stories means more time required for search and rescue.

Combustible construction with unprotected attics and floor/ceiling spaces means less time is provided.

Public Comment 2:

Jeffrey M. Shapiro, P.E., International Code Consultants, representing National Multi Housing Council, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

903.3.1.2 (IBC [F] 903.3.1.2) NFPA 13R sprinkler systems. Automatic sprinkler systems in Group R occupancies up to and including four stories in height in buildings not exceeding 60 feet in height above grade plane shall be permitted to be installed throughout in accordance with NFPA 13R. The number of stories of Group R occupancies constructed in accordance with Section 510.2 and 510.4 of the International Building Code shall be measured from the horizontal assembly creating separate buildings.

Commenter's Reason: Proposals F134 and F135 both affect Section 903.3.1.2, and it was the committee's intent to have both proposals incorporated into the section. The committee report doesn't clearly reflect this, so to avoid any possible confusion with respect to what the final text should be, this comment has been prepared to merge the content of F134 into F135. If this comment is approved, it is the intent that the final action on F135 will override F134 so that the final text of the section will include all of the intended revisions. .

F135-13

Final Action: AS AM AMPC____ D

F138-13
903.3, 903.3.8 (New), 903.4 (IBC [F] 903.4), 903.3.5.1 (IBC [F] 903.3.5.1), 903.3.5.2 (IBC [F] 903.3.5.2)

Proposed Change as Submitted

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

903.3 Installation requirements. *Automatic sprinkler systems* shall be designed and installed in accordance with Sections 903.3.1 through 903.3.8~~7~~.

~~**903.3.5.1.1 Limited area sprinkler systems.**~~
~~Limited area sprinkler systems serving fewer than 20 sprinklers on any single connection are permitted to be connected to the domestic service where a wet automatic standpipe is not available. Limited area sprinkler systems connected to domestic water supplies shall comply with each of the following requirements:~~

1. ~~Valves shall not be installed between the domestic water riser control valve and the sprinklers.~~

   ~~**Exception:** An *approved* indicating control valve supervised in the open position in accordance with Section 903.4.~~

2. ~~The domestic service shall be capable of supplying the simultaneous domestic demand and the sprinkler demand required to be hydraulically calculated by NFPA 13, NFPA 13D or NFPA 13R.~~

~~903.3.5.1~~ 903.3.5.2 (IBC [F] ~~903.3.5.1~~ 903.3.5.2) Residential combination services. A single combination water supply shall be allowed provided that the domestic demand is added to the sprinkler demand as required by NFPA 13R.

903.3.8 (IBC [F] 903.3.8) Limited area sprinkler systems. Limited area sprinkler systems shall be in accordance with the standards listed in Section 903.3.1 except as provided in Sections 903.3.8.1 through 903.3.8.5.

903.3.8.1 Number of sprinklers. Limited area sprinkler systems shall not exceed 6 sprinklers in any single fire area.

903.3.8.2 Occupancy hazard classification. Only areas classified by NFPA 13 as Light Hazard or Ordinary Hazard Group 1 shall be permitted to be protected by limited area sprinkler systems.

903.3.8.3 Piping arrangement. Where a limited area sprinkler system is installed in a building with an automatic-wet standpipe system, sprinklers shall be supplied by the standpipe system. Where a limited area sprinkler system is installed in a building without a wet-pipe automatic standpipe system, water shall be permitted to be supplied by the plumbing system provided that the plumbing system is capable of simultaneously supplying domestic and sprinkler demands.

903.3.8.4 Supervision. Control valves shall not be installed between the water supply and sprinklers unless the valves are of an approved indicating type that are supervised or secured in the open position.

903.3.8.5 Calculations. Hydraulic calculations in accordance with NFPA 13 shall be provided to demonstrate that the available water flow and pressure are adequate to supply all sprinklers installed in any single fire area with discharge densities corresponding to the hazard classification.

~~903.3.5.2~~ 903.3.5.3 (IBC [F] ~~903.3.5.2~~ 903.3.5.3) Secondary water supply. An automatic secondary on-site water supply having a capacity not less than the hydraulically calculated sprinkler demand, including the hose stream requirement, shall be provided for high-rise buildings in Seismic Design Category C, D, E or F as determined by the *International Building Code*. An additional fire pump shall not be required for the secondary water supply unless needed to provide the minimum design intake pressure at the suction side of the fire pump supplying the *automatic sprinkler system*. The secondary water supply shall have a duration of not less than 30 minutes as determined by the occupancy hazard classification in accordance with NFPA 13.

Exception: Existing buildings.

903.4 (IBC [F] 903.4) Sprinkler system monitoring and alarms. All valves controlling the water supply for automatic sprinkler systems, pumps, tanks, water levels and temperatures, critical air pressures, and water-flow switches on all sprinkler systems shall be electrically supervised.

Exceptions:

1. Automatic sprinkler systems protecting one- and two-family dwellings.
2. Limited area systems ~~serving fewer than 20 sprinklers~~ in accordance with Section 903.3.8..

3 through 7 (*No change to current text)*

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

This code section as it exists allows the protection of large areas by a system of automatic sprinklers that is not afforded the same level of protection required by NFPA standards 13, 13R and 25. Some of these include waterflow alarms, components listed for fire protection systems, fire department connections, testing and maintenance.

This code change would reduce the number of sprinklers that may be supplied from a building plumbing system to six in a single fire area to eliminate the potential for multiple limited area sprinkler systems and combined water supply demands necessary to control a single fire event.

It also limits the six sprinklers to a discharge density of Light Hazard or Ordinary Hazard Group I. The basis for these values provides coordination with longstanding requirements in NFPA 101, Life Safety Code, Section 9.7.1.2, which limits the number and discharge density of automatic sprinklers supplied from a plumbing system. Such a limit is reasonable in that it can allow for a pipe schedule design if the plumbing system is capable of satisfying the NFPA 13 pipe diameter requirements.

Cost Impact: This code change would increase the cost of construction

903.3-F-ZUBIA-FCAC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: This proposal was approved as it is more reasonable to allow limited area sprinkler systems for 6 sprinklers versus 20. There was some concern that now that there are more controls associated with such systems that the number should be revised back to 20.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Emory Rodgers, VDHCO, representing self, requests Disapproval.

Commenter's Reason: Taking limited area sprinkler systems from 20 sprinkler heads to 6 based on assumptions that building officials would let owners do multiple limited area sprinkler systems, thereby allowing the owner to avoid where full sprinkler systems for the occupancy is a real stretch and to imagine that occurs frequently? Then limit area or occupancies such as A, M or B and not allow H. Only light hazards have ever been allowed.

That water lines for existing buildings could fail to supply the pressure or water volume is always possible. I can agree the calculations can support those assumptions. However, 90% of these systems are used today to allow existing buildings to be updated and renovated under the IEBC. Many limited systems use between 8 and 16 heads. Don't take away this viable and economical option to use spaces such as basements for dry storage, meat and food lockers, manger office or changing areas for employees in the A, B and M occupancies. This will force business owners to use spaces illegally without permits.

This will force small businesses to expend thousands of dollars to put in a fire line and water meter that does make the difference in the financial viability for anyone wanting to open a new small business.

Life safety and property protection is enhanced by this limited area sprinkler system that has been in the codes for decades with much success and not a lot of fire data to dispute that these limited are sprinkler systems are serving a fire safety need and a need to have light hazard storage space.

Let the proponents come back with a sensible and viable option that works for the many impacted building owners and small business stakeholders and that addresses real problems instead of seemly benefitting a few providing and installing fire systems.

Vote to overturn the committee with a simple majority and then I will introduce for denial that takes a simple majority.

F138-13

Final Action: AS AM AMPC____ D

F139-13
903.3.5.2 (IBC [F] 903.3.5.2); IBC [F] 403.3

Proposed Change as Submitted

Proponent: Jeffrey M. Hugo, CBO, representing the National Fire Sprinkler Association (hugo@nfsa.org)

Revise as follows:

IBC [F] 403.3 Automatic sprinkler system. Buildings and structures shall be equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 and a secondary water supply where required by Section ~~903.3.5.2~~ 403.3.3.

~~903.3.5.2 (IBC [F] 903.3.5.2)~~ IBC [F]403.3.3 Secondary water supply. An automatic secondary on-site water supply having a capacity not less than the hydraulically calculated sprinkler demand, including the hose stream requirement, shall be provided for high-rise buildings assigned to Seismic Design Category C, D, E or F as determined by the International Building Code. An additional fire pump shall not be required for the secondary water supply unless needed to provide the minimum design intake pressure at the suction side of the fire pump supplying the automatic sprinkler system. The secondary water supply shall have a duration of not less than 30 minutes

IBC [F] ~~403.3.3~~ 403.3.4 Fire pump room. Fire pumps shall be located in rooms protected in accordance with Section 913.2.1.

Reason: Secondary water supply for high rises is in Chapter 9, whereas the requirements for high rises are in Section 403 of the *International Building Code*. Since this secondary water supply requirement only applies to high rises it is more appropriate for designers and users in Section 403.3.3 of the *International Building Code*.

Cost Impact: Will not increase the cost of construction

903.3.5.2-FS-HUGO

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The secondary water supply requirements are very specific to high rise buildings and are more appropriately located within Section 403.3 of the IBC.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jeffrey M. Hugo, CBO, representing National Fire Sprinkler Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

IBC [F] 403.3 Automatic sprinkler system. Buildings and structures shall be equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 and a secondary water supply where required by Section 403.3.3.

IBC [F]403.3.3 Secondary water supply. An automatic secondary on-site water supply having a capacity not less than the hydraulically calculated sprinkler demand, including the hose stream requirement, shall be provided for high-rise buildings assigned to Seismic Design Category C, D, E or F as determined by the International Building Code. An additional fire pump shall not be required for the secondary water supply unless needed to provide the minimum design intake pressure at the suction side of the fire pump supplying the automatic sprinkler system. The secondary water supply shall have a duration of not less than 30 minutes

IBC [F] 403.3.4 Fire pump room. Fire pumps shall be located in rooms protected in accordance with Section 913.2.1.

IFC 914.3.3 Secondary water supply. An automatic secondary on-site water supply having a capacity not less than the hydraulically calculated sprinkler demand, including the hose stream requirement, shall be provided for high-rise buildings assigned to Seismic Design Category C, D, E or F as determined by the *International Building Code*. An additional fire pump shall not be required for the secondary water supply unless needed to provide the minimum design intake pressure at the suction side of the fire pump supplying the *automatic sprinkler system*. The secondary water supply shall have a duration of not less than 30 minutes as determined by the occupancy hazard classification in accordance with NFPA 13.

Exception: Existing buildings.

Commenter's Reason: The proposal in the Committee Action Hearings did not make the change in the IFC. This public comment moves 903.3.5.2 of the IFC to 914.3.3. Approval of this public comment would make the IBC and the IFC the same in regards to secondary water for high rise buildings.

F139-13

Final Action: AS AM AMPC____ D

F148-13
905.4

Proposed Change as Submitted

Proponent: Al Godwin, CBO, CPM, Aon Fire Protection Engineering, representing Aon Fire Protection Engineering Corporation (al.godwin@aon.com)

Revise as follows:

905.4 Location of Class I standpipe hose connections. Class I standpipe hose connections shall be provided in all of the following locations:

1. In every required interior *exit stairway*, a hose connection shall be provided for each floor level above, ~~and~~ below and at grade. Hose connections shall be located at an intermediate floor level landing between floors, unless otherwise approved by the fire code official.

2 through 6 *(No change to current text)*

Reason: Since hose connections are placed at intermediate landings between floors, it is not clear as to which floor the hose connection serves. However, by not listing "at grade" the provision could be read that one is not required to serve the floor at grade, whichever intermediate landing that might be, leading to some challenges of its meaning. Hopefully, this provides clarification.

Cost Impact: This appears to be a correction. As such, it is not an increase in cost over what the original intent of the code provision should require.

905.4-F-GODWIN

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The proposal was approved as it will require the appropriate placement of hose connections including the floor level at grade. Note that there were some concerns with terminology such as "for each floor level" that may be better addressed by language that addresses stories. However, it was noted that use of the term "story" may lose locations such as penthouses and mezzanines.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Gregory R. Keith, Professional heuristic Development, representing The Boeing Company, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

905.4 Location of Class I standpipe hose connections. Class I standpipe hose connections shall be provided in all of the following locations:

1. In every required *interior exit stairway*, a hose connection shall be provided for each floor level above~~,~~ and below ~~and at~~ grade plane. Hose connections shall be located at an intermediate floor level landing between floors, unless otherwise approved by the fire code official.

2 through 6 *(No change to current text)*

Commenter's Reason: The original proposal intended to clarify that the provision applied to stories at grade. Unfortunately, it modified currently incorrect terminology. "Grade" is not a defined term in the IBC/IFC. However, "grade plane" is a defined term.

Returning to the original "above and below" language and adding "plane" after "grade" solves the problem. "Grade plane" is a defined term and represents a reference datum plane. "Story above grade plane" is also a defined term. Accordingly, all stories are either above or below grade plane. If a story is precisely at grade plane, it is above grade plane, by definition. Approval of this editorial modification will bring this standpipe provision into context with current IBC/IFC definitions and intent and will provide for more consistent interpretations.

Public Comment 2:

Gregory R. Keith, Professional heuristic Development, representing The Boeing Company, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

905.4 Location of Class I standpipe hose connections. Class I standpipe hose connections shall be provided in all of the following locations:

1. In every required *interior exit stairway*, a hose connection shall be provided for each story ~~floor level~~ above, below and at grade. Hose connections shall be located at an intermediate ~~floor level~~ landing between stories ~~floors~~, unless otherwise approved by the fire code official.

2 through 6 *(No change to current text)*

Commenter's Reason: When the IFC Code Committee approved this proposal, it mentioned in its reason statement, "Note that there were some concerns with terminology such as "for each floor level" that may be better addressed by language that addresses stories. "Floor" and "floor level" are not defined terms in the IBC/IFC. The term "story" is a defined term. This modification addresses that concern and uses proper terminology that will result in more consistent interpretations of this provision.

F148-13

Final Action: AS AM AMPC____ D

F149-13
905.9 (IBC [F] 905.9)

Proposed Change as Submitted

Proponent: Bob D. Morgan, P.E., Fort Worth, TX Fire Department representing Fire Advisory Board to North Central Texas Council of Governments

Revise as follows:

905.9 (IBC [F] 905.9) Supervision. Supervision of standpipes shall be in accordance with Sections 905.9.1 and 905.9.2.

905.9.1 (IBC [F] 905.9.1) Valve Supervision. (*unchanged*)

905.9.2 (IBC [F] 905.9.2) Manual dry standpipes. Manual dry standpipe systems shall be supervised with a minimum of 10 psig and a maximum of 40 psig air pressure and monitored by a low air pressure alarm.

Reason: Improves the integrity of such systems for utilization in a fire event, which could otherwise have all hose valves opened or develop multiple leaks without anyone knowing until such system is charged with water.

Cost Impact: The code change proposal will increase the cost of construction of such systems to install an air compressor and low air pressure alarm.

905.2-F-MORGAN

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The requirement for supervision and monitoring were felt better addressed by the maintenance requirements in NFPA 25. There was concern with how this would alert appropriate persons to a problem. The benefit to such equipment compared to the potential maintenance cost would be small. A concern was noted that if the standpipes were not being maintained in accordance with NFPA 25 the equipment as proposed would also not be maintained.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bob D. Morgan, P.E., Fort Worth Fire Dept, representing Fire Advisory Board to North Central Texas Council of Governments, requests Approval as Modified by this Public Comment.

Modify proposal as follows:

905.9 (IBC [F] 905.9) Supervision. Supervision of standpipes shall be in accordance with Sections 905.9.1 and 905.9.2.

905.9.1 (IBC [F] 905.9.1) Valve Supervision. (*unchanged*)

905.9.2 (IBC [F] 905.9.2) Manual dry standpipes. Manual dry standpipe systems shall be monitored with supervisory air pressure having a low air pressure alarm. This alarm shall have an approved exterior audible device. Where a fire alarm system is installed, actuation of the low air pressure alarm shall be monitored as a supervisory alarm. ~~supervised with a minimum of 10 psig and a maximum of 40 psig air pressure and monitored by a low air pressure alarm.~~

Commenter's Reason: The originally submitted wording has been adopted in the North Texas region for several years with great success in ensuring such dry standpipes' integrity. The primary issue addressed is vandals opening hose valves, such that the standpipe does not serve its intended purpose in a fire event when needed, resulting in significant firefighting delays, due to lack of immediate water availability. The proposal has been modified to accommodate the issues addressed in the committee's reason statement, i.e. greater specificity has been provided relative to the alarm, similar to what is provided in 903.4.2 for sprinkler waterflow alarms. Relative to the maintenance issue, most manual dry standpipes are only required to be inspected annually, with a hydro/flow test every 5 years, so if the system is leaking, it is highly probably that it could be several years before anyone is aware of such. Although there is an increased cost, please note that NFPA 14 as of the 2003 edition requires this 'supervisory air pressure' for dry standpipes where the standpipe is concealed, i.e. the requirement is not new and is becoming more common, cost effective, and widely accepted.

F149-13

Final Action: AS AM AMPC____ D

F150-13
901.8.2 (New)

<u>Proposed Change as Submitted</u>

Proponent: William Freer, New York State Office of Fire Prevention and Control (WFreer@DHSES.ny.gov)

Add new text as follows:

<u>**901.8.2 Removal of occupant use hose.** Removal of the occupant use hose line attached to a Class II standpipe system or a Class III standpipe system shall be permitted where either of the following conditions exist:</u>

1. <u>The building is equipped with a Class I standpipe system.</u>
2. <u>The building is not required to be equipped with a Class I standpipe system and the building is equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1.</u>

Reason: The current code does not require occupant use hoses in as many locations as were required in previous codes. There has been a shift in the philosophy of whether or not occupants should be asked to attempt to extinguish the fire or evacuate the structure. Most of the population is now being taught to evacuate the building, not fight the fire. This shift is mainly due to the safety risk of having a non-trained person attempting to fight a fire with more than a fire extinguisher.
Many jurisdictions have already enacted local legislation or code changes to address this issue.

The City of Philadelphia has added the following:

F-905.11 Existing buildings. Existing structures with occupied floors located more than 50 feet (15,240 mm) above or below the lowest level of fire department *vehicle* access shall be equipped with standpipes installed in accordance with Section F-905. The standpipes shall have an approved fire department connection with hose connections at each floor level above or below the lowest level of fire department *vehicle* access. **[**The fire code official is authorized to approve the installation of manual standpipe systems to achieve compliance with this section where the responding fire department is capable of providing the required fire flow at the highest standpipe outlet.**]** *These requirements shall also apply to buildings that were granted variances prior to January 1, 2004 to omit standpipes from the required exit stairways. Buildings or structures that are not in compliance with Section F-905 on the effective date of this code, shall, with written request to and upon written approval from the Fire Department, be granted three years from the effective date of this code to comply.*

Exceptions:

1. *In existing buildings having the highest occupied floors located not more than 75 feet above the lowest level of fire department vehicle access, Class I standpipe systems are permitted to be manual wet systems.*
2. *Standpipe systems installed prior to January 1, 1995 that provide a residual pressure of 65 psi (448 kPa) or greater at the highest hose outlet are exempt from the requirement to provide a residual pressure of 100 psi (690 kPa) at the highest hose outlet.*
3. *Standpipe systems with a residual pressure of less than 100 psi (690 kPa) at the topmost hose outlet are permitted where:*
   - *3.1 The building existing prior to the effective date of this code;*
   - *3.2 The building is equipped throughout with an automatic sprinkler system; and*
   - *3.3 The highest floor level is not more than 150 feet (45 720 mm) above the lowest level of fire department vehicle access,*

F-905.11.1 Removal of occupant use hoseline or Class II standpipe systems. *Removal of the hoseline attached to a Class II standpipe system or a Class III standpipe system that is not required by this code, or removal of an entire Class II standpipe system is permitted where the following conditions are met:*

1. *Removal of hoseline only: The building is equipped with a Class I standpipe system or the building is not required to have a Class I system.*
2. *Removal of the Class II standpipe system is permitted where one of the following exists:*
   - *2.1 The building is equipped throughout with an automatic fire-extinguishing system and has more than one Class I standpipe hose outlet riser in a multi-exit building or at least one riser in a single exit building;*
   - *2.2 The building is in the process of being equipped throughout with an automatic fire-extinguishing system and there is more than one standpipe hose outlet riser in a multi-exit building or there is at least one riser in a single exit building. When the sprinklers on a floor have been placed in service, the Class II standpipe*

hose stations on that floor are permitted to be removed; or

2.3 The building is not equipped throughout with an automatic fire-extinguishing system, there is more than one automatic wet Class I standpipe hose outlet riser in a multi-exit building and there is at least one automatic wet riser in a single exit building.

The City of San Francisco added:

4.09 Removal of Class II Standpipe Hose Cabinets in Sprinkler Retrofitted Buildings (PDF)

Reference: 2010 S.F.F.C. 901.8

Section 901.8 of the 2010 SFFC requires written approval from the fire code official in order to remove existing fire appliances. In order to speed the permit process, buildings subject to the San Francisco High-rise Sprinkler Ordinance will be permitted to remove Class II Standpipe hose cabinets on individual floors after they have been fully sprinklered. The applicant shall state his or her intention to remove the hose cabinets on the approved sprinkler plans.

Buildings not subject to the ordinance will continue to require written approval from the fire code official in order to remove any fire appliance. These written requests will be considered on a case-by-case basis.

Canada also allows the removal of occupant hoses but requires more signage in places where it is done.

It should also be noted that occupant use hoses are not required by NFPA 14 as follows:

1. NFPA 14--2007, Standard for the Installation of Standpipe and Hose Systems details the design and installation of standpipe systems.

7.3.4 Class III Systems. Class III systems shall be provided with hose connections as required for both Class I and Class II systems.

7.3.4.1 Where the building is protected throughout by an approved automatic sprinkler system in accordance with NFPA 13, Standard for the Installation of Sprinkler Systems, and NFPA 13R, Standard for the Installation of Sprinkler Systems in Residential Occupancies up to Four Stories in Height, Class II hose stations for use by trained personnel shall not be required, subject to the approval of the local fire department, provided that each Class I hose connection is 2 1/2 in. and is equipped with a 2 1/2 in. × 1 1/2 in. reducer and a cap attached with a chain.

This code change would not increase the cost of construction but would decrease the cost of maintenance and upkeep.

Cost Impact: The code change proposal will not increase the cost of construction.

905.11 (NEW)-F-FREER

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Substitute the proposal as follows:

<u>**901.8.2 Removal of occupant use hose.** The fire code official is authorized to permit the removal of existing 1 ½- inch (38 mm) hose lines where the following conditions exist:</u>

1. <u>The current fire and building codes do not require their placement and</u>
2. <u>The fire code official determines that the 1 ½ -inch (38 mm) hose line will not be utilized by the trained personnel or the fire department.</u>

Committee Reason: The committee approved the proposal to address the concern that it is often necessary to remove occupant use hose but no authority is provided. However, the proposal as initially written took the authority away from the fire code official to determine. The proposed modification places that authority back but provides them with the necessary tool to allow the removal of hose lines that are not required and that will not be used by the building occupants.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

901.8.2 Removal of <u>existing</u> occupant-use hose <u>lines</u>. The *fire code official* is authorized to permit the removal of existing ~~1 ½-inch (38 mm)~~ <u>occupant-use</u> hose lines where <u>all of</u> the following conditions exist:

1. <u>Installation is not required by the current *International Fire Code* or *International Building Code*</u> ~~The current fire and building codes do not require their placement and~~
2. The ~~fire code official determines that the 1 ½ -inch (38 mm)~~ hose line<u>s</u> will not be utilized by ~~the~~ trained personnel or the fire department.
3. <u>The remaining outlets are compatible with local fire department fittings.</u>

Commenter's Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

The committee approved F150-13 at the hearings in Dallas with modification. After review, the FCAC felt that clarification and modifications were needed. The modifications were made due to the following:

- Hoses may be of different sizes, not always 1 1/2", so the reference to the size was removed. Also, the language was modified to say that all of the conditions (1, 2 and 3) need to have been met for the removal to be allowed.
- The language in condition 1 was changed to reference installation, not placement, and includes reference to the current IFC and IBC.
- The language in condition 2 was modified to delete an unnecessary fire code official determination; this authority is already established in the charging section.
- A condition 3 was added to ensure that any outlets that remained were useable by the Fire Department by requiring them to be compatible with local fire department fittings.

F150-13

Final Action: AS AM AMPC____ D

F151-13
906.1 (IBC [F] 906.1)

Proposed Change as Submitted

Proponent: Dave Frable representing U.S. General Services Administration, Public Buildings Service

Revise as follows:

906.1 (IBC [F] 906.1) Where required. Portable fire extinguishers shall be installed in the following locations.

1. In new and existing Group A, B, E, F, H, I, M, R-1, R-2, R-4 and S occupancies.

   ~~**Exception**~~ **Exceptions:**

   1. In Group R-2 occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each *dwelling unit* is provided with a portable fire extinguisher having a minimum rating of 1-A:10-B:C.
   2. In new and existing Group B occupancies equipped throughout with quick- response sprinklers, portable fire extinguishers shall be required only in locations specified in Items 2 through 6.

2. Within 30 feet (9144 mm) of commercial cooking equipment.
3. In areas where flammable or *combustible liquids* a restored, used or dispensed.
4. On each floor of structures under construction, except Group R-3 occupancies, in accordance with Section 3315.1.
5. Where required by the sections indicated in Table 906.1.
6. Special-hazard areas, including but not limited to laboratories, computer rooms and generator rooms, where required by the *fire code official*.

Reason: The intent of this code change is to re-introduce an IFC code requirement that was in the past editions of the IFC (i.e., editions 2000 to 2009). However, in the 2012 edition of the IFC, the subject exception was removed from the IFC without any technical substantiation.

Exception #2 acknowledges the reliable advantages of an automatic sprinkler system designed to comply with NFPA 13. Group B occupancies are considered light hazard occupancies and must be protected by quick response sprinklers (see Section 903.3.2). The faster acting sprinklers and the lower fuel load associated with Group B occupancies alleviate the need for portable fire extinguishers to be installed throughout non-hazardous areas within this occupancy. In addition, the evacuation strategy for this occupancy is for occupants to evacuate building or relocate to a safe area within the building in lieu of delaying evacuation/relocation and having occupants attempt to utilize a portable fire extinguisher to try to extinguish a fire.

It should be noted that building occupants in Group B occupancies are not required to be trained in the use of portable fire extinguishers since training building occupants in the use of portable fire extinguishers is not addressed within the IFC nor is there a requirement in the IFC stating that portable fire extinguishers have been installed for occupant use. In addition, fire department personnel typically will also not use the portable fire extinguishers which have been installed within a building due to the uncertainty they have regarding the subject extinguisher operating when needed. Therefore, the installation of this type of manual extinguishing equipment throughout a Group B occupancy equipped with an operational sprinkler system utilizing quick-response sprinklers is questionable and not warranted or cost effective (e.g., installation costs, maintenance costs, etc.) over the life of a building.

Cost Impact: The code change proposal will not increase the cost of construction.

906.1-F-FRABLE

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee felt that fire extinguishers are still the first line of defense in many situations and should not be removed in Group B occupancies. In fact many fires are never reported due to the fact that extinguishers are used before the fires grow very large. It was also noted that singling out only Group B occupancies was inappropriate. There was some concern raised that fire extinguishers should be a choice and not a requirement.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Dave Frable, representing U.S. General Services Administration, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

906.1 (IBC [F] 906.1) Where required. Portable fire extinguishers shall be installed in the following locations.

1. In new and existing Group A, B, E, F, H, I, M, R-1, R-2, R-4 and S occupancies.

   ~~**Exception**~~ **Exceptions:**

   1. In Group R-2 occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each *dwelling unit* is provided with a portable fire extinguisher having a minimum rating of 1-A:10-B:C.
   2. In new and existing Group B occupancies having a fire alarm system that activates the occupant notification system in accordance with Section 907.5 and is protected throughout by an automatic sprinkler system designed and installed in accordance Section 903.3.1.1 utilizing quick- response sprinklers, portable fire extinguishers shall be required only in locations specified in Items 2 through 6.
2. Within 30 feet (9144 mm) of commercial cooking equipment.
3. In areas where flammable or *combustible liquids* a restored, used or dispensed.
4. On each floor of structures under construction, except Group R-3 occupancies, in accordance with Section 3315.1.
5. Where required by the sections indicated in Table 906.1.
6. Special-hazard areas, including but not limited to laboratories, computer rooms and generator rooms, where required by the *fire code official*.

Commenter's Reason: The intent of this code change is to re-introduce an exception for the installation of portable fire extinguishers in Group B occupancies that was in the past editions of the IFC (i.e., editions 2000 to 2009). However, in the 2012 edition of the IFC, the subject exception was removed from the IFC without any technical substantiation.

The new exception will permit a building owner to be exempt from installing portable fire extinguishers in new and existing Group B occupancies if the Group B occupancy has a fire alarm system installed that activates the occupant notification system and that also is protected throughout with an automatic sprinkler system designed and installed in accordance with NFPA 13 that utilizes quick response sprinkler which faster acting sprinklers. Upon activation of the fire alarm system, the typical evacuation strategy for this occupancy is for occupants to evacuate the building or relocate to a safe area within the building in lieu of delaying evacuation/relocation and having occupants attempt to utilize a portable fire extinguisher to try to extinguish a fire. The requirement for the installation of a fire alarm system that will assure that building occupants are notified to evacuate the building in a timely fashion.

It should be noted that building occupants in Group B occupancies are not required to be trained in the use of portable fire extinguishers since training building occupants in the use of portable fire extinguishers is not addressed within the IFC nor is there a requirement in the IFC stating that portable fire extinguishers have been installed for occupant use. In addition, fire department personnel typically will not use the portable fire extinguishers which have been installed within a building due to the uncertainty they have regarding the subject extinguisher operating when needed. Therefore, the installation of this type of manual extinguishing equipment throughout a Group B occupancy equipped with a fire alarm system and an operational sprinkler system utilizing quick-response sprinklers is questionable and not justifiable.

It should also be noted that the Occupational Safety and Health Administration (OSHA), 29 CFR 1910.157(g)(1), also addresses portable fire extinguishers by specifically stating: "Where the employer has provided portable fire extinguishers **for employee use** in the workplace, the employer shall also provide an educational program to familiarize employees with the general principles of fire extinguisher use and the hazards involved with incipient stage fire fighting." Therefore, if portable fire extinguishers have been installed in a building and have been designated for occupant use and incorporated into the building's fire safety plan, training would be required. However, if this protocol for occupants using portable fire extinguishers is not incorporated in the building's fire safety plan, no training would be required. Hence, the occupants will not be properly trained to use the subject portable fire extinguishers as some Code Committee members suggested.

Fire is a rare event; however, should a fire occur in this occupancy, the probability that occupants are knowledgeable and have been trained proficiently in the use of portable fire extinguishers to effectively extinguish a fire is low. We also believe the cost associated with the installation of portable fire extinguishers in these occupancies is unjustified, taking into consideration maintaining the subject fire extinguishers for the life of the building. We also believe these costs savings would be better expended active fire detection and suppression systems.

Opponents of this code change will argue that fire extinguishers are still the first line of defense in many situations and therefore should not be removed in Group B occupancies since occupants should be able to use them if they choose to do so. However, several Fire Code Committee members believe that if this is the case, the installation of portable fire extinguishers in Group B occupancies should also be a choice and not a requirement. We believe that when a fire does occur in an office building, evacuation of the building should be the first action of the occupants, not fighting the fire.

F151-13

Final Action: AS AM AMPC____ D

F154-13
907.2.1 (IBC [F] 907.2.1)

Proposed Change as Submitted

Proponent: Timothy W. Fisher, State of Alaska, Department of Public Safety, Division of Fire and Life Safety, representing Alaska State Fire Marshal's Office & ICC Alaska Central Chapter

Revise as follows:

907.2.1 (IBC [F] 907.2.1) Group A. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.5 shall be installed in Group A occupancies ~~where the occupant load due to the assembly occupancy is 300 or more~~ <u>where a required automatic sprinkler system is installed, the automatic sprinkler system shall be connected to the building fire alarm system.</u> ~~Group A occupancies not separated from one another in accordance with Section 707.3.9 of the International Building Code shall be considered as a single occupancy for the purposes of applying this section.~~ Portions of Group E occupancies occupied for assembly purposes shall be provided with a fire alarm system as required for the Group E occupancy.

> **Exception:** Manual fire alarm boxes are not required when the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 and the occupant notification appliances will activate throughout the notification zones upon sprinkler waterflow.

Reason: In the 2006 International Code Adoption, the requirement for a Fire Sprinkler System in an A-2 occupancy was reduced to an occupant load of 100 from 300. Currently, a Fire Alarm System is required in an A occupancy when the occupant load is greater than 300. This has left a void of 100 to 300 occupants.

Previously, the Fire Alarm System requirements mirrored the Fire Sprinkler System requirements at 300 occupants; it seemed prudent to also require a fire alarm system at 100 occupants in an A-2 occupancy, same as the sprinkler requirement.

The intent of the revision is to remove a set number of (300) for occupant loading from the Fire Alarm System requirements for Assembly (A) Occupancy, then requiring a Fire Alarm System based on the requirements in the Fire Sprinkler System section. Then it would render the Sentence with Section 707.3.9 "Fire Areas" obsolete as it would be based on the Fire Sprinkler System fire area requirements.

The Station Night Club incident didn't have sprinklers, causing a change in the sprinkler requirements where as the Fire Alarm System requirements were not adjusted for A-2 occupancies in the event of an emergency. This change would require notification appliances that would ensure occupants are alerted within an A-2 occupancy during a sprinkler activation or a kitchen hood and duct suppression system activation.

Revising this code section will realign the fire systems according to the historical requirements; provide an acceptable level of fire and public safety as well as providing notification appliances throughout the facility to notify occupants that there is an emergency in the facility and to promptly evacuate, saving lives.

Cost Impact: Cost varies on location, size, and company for the installation of Fire Alarm System (Notification Appliances Only)

907.2.1-F-FISHER

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The wording was considered confusing as to how it relates the automatic sprinkler requirements to the fire alarm requirements. Also, without further revision the existing exception would be difficult to apply.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Timothy W. Fisher, representing Alaska State Fire Marshal's Office/ ICC Alaska Central Chapter, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

[F] 907.2.1 Group A. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.5 shall be installed in Group A occupancies where a required automatic sprinkler system is installed~~, the automatic sprinkler system shall be connected to the building fire alarm system~~. Portions of Group E occupancies occupied for assembly purposes shall be provided with a fire alarm system as required for the Group E occupancy.

> **Exception:** Manual fire alarm boxes are not required when the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 and the occupant notification appliances will activate throughout the notification zones upon sprinkler waterflow.

Commenter's Reason: In the 2006 International Code Adoption, the requirement for a Fire Sprinkler System in an A-2 occupancy was reduced to an occupant load of 100 from 300. Currently, a Fire Alarm System is required in an A occupancy when the occupant load is greater than 300. This has left a void of 100 to 300 occupants.

Previously, the Fire Alarm System requirements mirrored the Fire Sprinkler System requirements at 300 occupants; it seemed prudent to also require a fire alarm system at 100 occupants in an A-2 occupancy, same as the sprinkler requirement.

The intent of the revision is to remove a set number of (300) for occupant loading from the Fire Alarm System requirements for Assembly (A) Occupancy, then requiring a Fire Alarm System based on the requirements of a Sprinkler.

The Station Night Club incident didn't have sprinklers, causing a change in the sprinkler requirements whereas the Fire Alarm System requirements were not adjusted for A-2 occupancies in the event of an emergency. This change would require notification appliances that would ensure occupants are alerted within an A-2 occupancy during a sprinkler activation or a kitchen hood and duct suppression system activation.

Revising this code section will realign the fire systems according to the historical requirements; provide an acceptable level of fire and public safety as well as providing notification appliances throughout the facility to notify occupants that there is an emergency in the facility and to promptly evacuate, saving lives.

Such a facility could have an assembly on the second floor without prompt notification, thus notification appliances should be required. The committees request to clean up the language for sprinkler system has been addressed by a strike through of the connection to the fire alarm, which was taken from the Education code section. The exception can't be removed as per committee request as a "Manual Fire Alarm System" and "Manual fire alarm boxes" are different requirements of the code. The pull box is part of the system.

F154-13

Final Action: AS AM AMPC____ D

F158-13
907.2.3 (IBC [F] 907.2.3)

Proposed Change as Submitted

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

907.2.3 (IBC [F] 907.2.3) Group E. A manual fire alarm system that initiates the occupant notification signal utilizing an emergency voice/alarm communication system meeting the requirements of Section 907.5.2.2 and installed in accordance with Section 907.6 shall be installed in Group E occupancies. When automatic sprinkler systems or smoke detectors are installed, such systems or detectors shall be connected to the building fire alarm system.

Exceptions:

1. A manual fire alarm system is not required in Group E occupancies with an occupant load of ~~30~~ 50 or less.
2. Emergency voice/ alarm communication systems meeting the requirements of Section 907.5.2.2 and installed in accordance with Section 907.6 shall not be required in Group E occupancies with occupant loads of 100 or less, provided that activation of the manual fire alarm system initiates an approved occupant notification signal in accordance with Section 907.5.

~~2~~3. Manual fire alarm boxes are not required in Group E occupancies where all of the following apply:
   ~~2.1~~ 31. Interior corridors are protected by smoke detectors.
   ~~2.2~~ 3.2. Auditoriums, cafeterias, gymnasiums and similar areas are protected by heat detectors or other approved detection devices.
   ~~2.3~~ 33. Shops and laboratories involving dusts or vapors are protected by heat detectors or other approved detection devices.

~~3~~4. Manual fire alarm boxes shall not be required in Group E occupancies where the building is equipped throughout with an approved automatic sprinkler system installed in accordance with Section 903.3.1.1, the emergency voice/alarm communication system will activate on sprinkler water flow and manual activation.

Reason: Many small schools or day cares consist of one or two rooms. For such small buildings, there is no need to install a notification system to warn occupants of fires or other emergencies, as occupants are typically in close visual or audible contact with all occupied spaces and with each other. This arrangement provides for adequate means to notify all occupants of the building of potential hazardous conditions to initiate emergency actions, including evacuation.

The threshold in Exception 1 has been reduced from 50 to 30 with no apparent loss history. The testimony presented by the proponent of Code Change F107-09/10 was that the number was modified to correlate the occupant load trigger for 1-HR rated corridors. It is common that individual classrooms contain an occupant load of 30 students. It seems that a more appropriate occupant load trigger is the egress provision which requires a second exit at an occupant load of 50, not 30.

An alarm system in a single classroom, or set of small classrooms, does not appear justified. It appears that the appropriate 'occupant load trigger' is 50 since that is when a fire alarm system has been required for many years without any major incidents. Therefore, this proposal will move the trigger to an occupant load of 50 to determine when a manual fire alarm system is required.

Exception 2 is proposed to be added. This exception would require the emergency voice communication system when the occupant load exceeds 100, as buildings with larger numbers of occupants may necessitate detailed instructions regarding evacuation, relocation, or other actions to ensure safety of building occupants. Often, these buildings include multiple floors, fire areas, and egress paths, and occupants may require notification of more detailed or modified instructions on alternate courses action other than those stated in a standard evacuation plan.

The result of this proposal is that when the occupant load is:

50 or less – fire alarm system is not required
51 to 100 – manual fire alarm system is required
101 or more – manual fire alarm system with emergency voice/alarm communication system

Cost Impact: The code change proposal will reduce the cost of construction.

907.2.3-F-ZUBIA-FCAC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The proposal was felt to be a more reasonable approach for smaller schools. A manual fire alarm system for greater than 50 is reasonable while still maintaining the emergency voice communication system where the occupant load exceeds 100.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Emory Rodgers, VDHCO, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

907.2.3 (IBC [F] 907.2.3) Group E. A manual fire alarm system that initiates the occupant notification signal utilizing an emergency voice/alarm communication system meeting the requirements of Section 907.5.2.2 and installed in accordance with Section 907.6 shall be installed in Group E occupancies. When automatic sprinkler systems or smoke detectors are installed, such systems or detectors shall be connected to the building fire alarm system.

Exceptions:

1. A manual fire alarm system is not required in Group E occupancies with an occupant load of 50 or less.
2. Emergency voice/ alarm communication systems meeting the requirements of Section 907.5.2.2 and installed in accordance with Section 907.6 shall not be required in Group E occupancies with occupant loads of ~~100~~ 500 or less, provided that activation of the manual fire alarm system initiates an approved occupant notification signal in accordance with Section 907.5.
3. Manual fire alarm boxes are not required in Group E occupancies where all of the following apply:
   31. Interior corridors are protected by smoke detectors.
   3.2. Auditoriums, cafeterias, gymnasiums and similar areas are protected by heat detectors or other approved detection devices.
   3.3 Shops and laboratories involving dusts or vapors are protected by heat detectors or other approved detection devices.
4. Manual fire alarm boxes shall not be required in Group E occupancies where the building is equipped throughout with an approved automatic sprinkler system installed in accordance with Section 903.3.1.1, the emergency voice/alarm communication system will activate on sprinkler water flow and manual activation.

Commenter's Reason: Setting the threshold at 100 occupants is overly stringent, costly and not justified. This is 4-5 classrooms. There was no data to justify.

In A there is a 1,000 occupant load for these EVAC systems where the patrons are not always familiar with the building or space while in E occupancies there are fire drills, security plans and public address systems that are adequate to convey emergency information that is commonly done in thousands of schools.

The IFC CDC denied F159-13 that had a 1,000 occupant limit as being too large. So 500 is a typical size of an elementary school.

Urge you approval as AM or F159 if it is challenged for approval as submitted.

F158-13

Final Action: AS AM AMPC____ D

F159-13
907.2.3 (IBC [F] 907.2.3)

Proposed Change as Submitted

Proponent: Frank G. Castelvecchi, III, PE, representing County of Henrico, Virginia (cas13@co.henrico.va.us)

Revise as follows:

907.2.3 (IBC [F] 907.2.3) Group E. A manual fire alarm system that initiates the occupant notification signal utilizing an emergency voice/alarm communication system meeting the requirements of Section 907.5.2.2 and installed in accordance with Section 907.6 shall be installed in Group E occupancies. When *automatic sprinkler systems* or smoke detectors are installed, such systems or detectors shall be connected to the building fire alarm system.

Exceptions:

1. A manual fire alarm system is not required in Group E occupancies with an *occupant load* of 30 or less.
2. Manual fire alarm boxes are not required in Group E occupancies where all of the following apply:
   - 2.1. Interior *corridors* are protected by smoke detectors.
   - 2.2. Auditoriums, cafeterias, gymnasiums and similar areas are protected by *heat detectors* or other *approved* detection devices.
   - 2.3. Shops and laboratories involving dusts or vapors are protected by *heat detectors* or other *approved* detection devices.
3. Manual fire alarm boxes shall not be required in Group E occupancies where the building is equipped throughout with an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1, the emergency voice/alarm communication system will activate on sprinkler water flow and manual activation is provided from a normally occupied location.
4. <u>An occupant notification system meeting the requirements of Section 907.5.2 without emergency voice/alarm communication system features is permitted where the occupant load is 1000 or less.</u>

Reason: Requiring a voice alarm system for educational uses imposes significant unnecessary costs on daycares and school systems that are already short of funds. Most schools already have public address systems that can be used for emergency notification. The 1000 occupant threshold proposed here is the same as that for assembly buildings with occupants that are less familiar with the building, often do not have public address systems and may involve the consumption of alcoholic beverages. Requiring an expensive voice alarm system in a small storefront daycare center, a small school, or a school trailer is a ludicrous imposition of significant costs on schools and small businesses.

The fire record these occupancies does not justify these added expenses. The children in these occupancies are required to be under competent adult supervision.

Cost Impact: This will reduce the cost of construction

907.2.3 #2-F-CASTELVECCHI

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The revision to 1000 occupants was seen as excessive. Although this comes from the assembly occupancy requirements for schools this number is too high. The benefits of emergency voice communication are too great to set the criteria this high.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Frank G Castelvecchi III PE, representing County of Henrico Virginia, requests Approval as Submitted.

Commenter's Reason: Requiring voice alarm systems in small schools and daycares presents a significant unnecessary cost burden on these small businesses, nonprofits, and local jurisdictions. These occupancies are required to have fire drills and present an excellent safety record. Schools have public address systems with two way communications with the office that can and is used for various emergency communications. The proposed 1000 person threshold is the same as has been established for other assembly occupancies. Virginia in adopting the 2012 IBC/IFC is reverting back to the 2009 language with a 50 person alarm threshold and no requirements for voice alarms in E use groups.

F159-13
Final Action: AS AM AMPC____ D

F162-13, Part I
FC 907.2.11 (IBC [F] 907.2.11), 907.10 (New) (IBC [F] 907.10 (New))

Proposed Change as Submitted

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IFC CODE DEVELOPMENT COMMITTEE AS SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMMITTEE.

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

PART I – INTERNATIONAL FIRE CODE

Revise as follows:

907.2.11 Single- and multiple-station smoke alarms. *Listed* single- and multiple-station smoke alarms complying with UL 217 shall be installed in accordance with Sections 907.2.11.1 through 907.2.11.4 and NFPA 72. <u>Single- and multiple-station smoke alarms shall be maintained in accordance with Section 907.10.</u>

<u>**907.10 Single- and multiple-station smoke alarms.** Single- and multiple-station smoke alarms shall be tested and maintained in accordance with the manufacturer's instructions. Smoke alarms that no longer function shall be replaced. Smoke alarms installed in one- and two-family dwellings shall be replaced not more than 10 years from the date of manufacture marked on the unit, or if the date of manufacture cannot be determined.</u>

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

This proposal supplements the requirements in Section 901.4 for testing and maintaining smoke alarms, and specifies when the devices need to be replaced. The proposed requirements are consistent with NFPA 72 provisions. In particular NFPA 72 requires smoke alarms installed in one- and two-family dwellings to not remain in service longer than 10 years from the date of manufacture, and UL 217 requires the date of manufacture to be marked on the smoke alarms.

It is recognized that it may not always be practical for the code official to enforce the requirements for testing, maintenance and replacement of smoke alarms in residential dwelling units. However realtors and landlords often have checklists that verify that these dwellings comply with codes and other requirements, and they may be in a position to verify compliance with the proposed provisions when the units are sold or leased.

UL 217 has required the month and date of manufacture be marked on smoke alarms for more than 10 years.

Cost Impact: This code change will not increase the cost of construction

907.2.11-F-ZUBIA-FCAC~REVISED

Committee Action Hearing Results

The code change is contained in the Updates to the 2013 Proposed Changes posted on the ICC website. Please go to http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf for more information."

PART I – IFC
Committee Action: **Approved as Submitted**

Committee Reason: The provisions requiring the replacement of smoke alarms is needed within the IFC.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Emory Rodgers, VDHCO, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

907.2.11 Single- and multiple-station smoke alarms. *Listed* single- and multiple-station smoke alarms complying with UL 217 shall be installed in accordance with Sections 907.2.11.1 through 907.2.11.4 and NFPA 72. Single- and multiple-station smoke alarms shall be maintained in accordance with Section 907.10.

907.10 Single- and multiple-station smoke alarms. Single- and multiple-station smoke alarms shall be tested and maintained in accordance with the manufacturer's instructions. Smoke alarms that no longer function shall be replaced. ~~Smoke alarms installed in one- and two-family dwellings shall be replaced not more than 10 years from the date of manufacture marked on the unit, or if the date of manufacture cannot be determined.~~

Commenter's Reason: Both sections have testing and maintenance requirements and if not operating than the smoke alarms have to be replaced.

There is thus no need to invoke a 10 year mandated replacement.

So how is enforcement to be accomplished? How is the fire or maintenance official to enter into all 1&2 family dwelling units? How can it not increase the cost of maintenance? This maybe a good practice but not to be a mandate. The supporting statement recognizes these enforcement flaws, but then says realtors and landlords can be responsible to verify.

So why not mandate all smoke alarms in any occupancy to be replaced?

Overturn the IFC CDC for AM motion to delete this mandated 10 year replacements.

Public Comment 2:

Maureen Traxler, representing City of Seattle Dept of Planning & Development, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

907.10 Single- and multiple-station smoke alarms. Single- and multiple-station smoke alarms shall be tested and maintained in accordance with the manufacturer's instructions. Smoke alarms that no longer function shall be replaced. Smoke alarms installed in one- and two-family dwellings shall be replaced not more than 10 years from the date of manufacture marked on the unit, or shall be replaced if the date of manufacture cannot be determined.

Commenter's Reason: The modification makes the section clearer and easier to read.

907.2.11-F-ZUBIA-FCAC~REVISED

Committee Action Hearing Results

The code change is contained in the Updates to the 2013 Proposed Changes posted on the ICC website. Please go to http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf for more information."

PART II – IPMC
Committee Action: **Approved as Modified**

Modify proposal as follows:

IPMC [F] 704.5 Maintenance. Smoke alarms shall be tested and maintained in accordance with the manufacturer's instructions. Smoke alarms that no longer function shall be replaced. Smoke alarms installed in one and two family dwellings ~~Group R or I-1 occupancies~~ shall be replaced not more than 10 years from the date of manufacture marked on the unit, or if the date of manufacture cannot be determined.

Committee Reason: This proposal is consistent with the action taken on F162-13 Part I. The modification aligns the language with F162-13 Part I that focuses on one and two family dwellings.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Emory Rodgers, VDHCO, representing self, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

IPMC [F] 704.5 Maintenance. Smoke alarms shall be tested and maintained in accordance with the manufacturer's instructions. Smoke alarms that no longer function shall be replaced. ~~Smoke alarms installed in Group R or I-1 occupancies shall be replaced not more than 10 years from the date of manufacture marked on the unit, or if the date of manufacture cannot be determined.~~

Commenter's Reason: Both sections have testing and maintenance requirements and if not operating then the smoke alarms have to be replaced.

There is thus no need to invoke a 10 year mandated replacement.

So how is enforcement to be accomplished? How is the fire or maintenance official to enter into all 1&2 family dwelling units? How can it not increase the cost of maintenance? This maybe a good practice but not to be a mandate. The supporting statement recognizes these enforcement flaws, but then says realtors and landlords can be responsible to verify.

So why not mandate all smoke alarms in any occupancy to be replaced?

Overturn the IFC CDC for AM motion to delete this mandated 10 year replacements.

Public Comment 2:

Maureen Traxler, representing City of Seattle Dept of Planning & Development, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

IPMC [F] 704.5 Maintenance. Smoke alarms shall be tested and maintained in accordance with the manufacturer's instructions. Smoke alarms that no longer function shall be replaced. Smoke alarms installed in one and two family dwellings shall be replaced not more than 10 years from the date of manufacture marked on the unit, or <u>shall be replaced</u> if the date of manufacture cannot be determined.

Commenter's Reason: The modification makes the section clearer and easier to read.

F162-13, Part II

Final Action: AS AM AMPC____ D

F164-13
907.2.11.5 (New) (IBC [F] 907.2.11.5 (New))

Proposed Change as Submitted

Proponent: Thomas P. Hammerberg, representing Automatic Fire Alarm Association (TomHammerberg@afaa.org)

Revise as follows:

907.2.11.5 (IBC [F] 907.2.11.5) Automatic sprinkler system waterflow. Where an automatic sprinkler system installed in accordance with Section 903.3.1.2 or 903.3.1.3 is provided a sprinkler waterflow alarm-initiating device shall be connected to the multiple-station alarm or household fire alarm system to activate an alarm signal.

Reason: This language is currently used in NFPA-72-2013, 29.7.7.7.3. The purpose is to provide notification to occupants of waterflow activation. If a sprinkler activates in another part of the dwelling unit, this provides earlier warning of the fire situation and will allow additional time to leave the premises. Since the time to escape has reduced significantly in recent years, this will improve fire safety for the occupants.

Cost Impact: minimal

907.2.11.5 (NEW)-F-HAMMERBERG

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: Monitoring of NFPA 13D systems was seen as excessive. Homeowners have the option for monitoring but should not be mandated.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Thomas F. Norton, Norel Service Co., Inc., representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

907.2.11.5 (IBC [F] 907.2.11.5) Automatic sprinkler system waterflow. Where an automatic sprinkler system installed in accordance with Section 903.3.1.2 or 903.3.1.3 is provided a sprinkler waterflow alarm-initiating device shall be permitted to be connected to the multiple-station alarm or household fire alarm system to activate an alarm signal.

Commenter's Reason: The proposal seeks to permit the Authority Having Jurisdiction (AHJ) to allow the use of a water flow monitoring device the installation of which is described in NFPA-722013 29.7.7.7.3.

F164-13
Final Action: AS AM AMPC____ D

F169-13
907.3.1 (IBC [F] 907.3.1)

Proposed Change as Submitted

Proponent: Barry Greive, representing Target Corporation (barry.greive@target.com)

Revise as follows:

907.3.1 (IBC [F] 907.3.1) Duct smoke detectors. Smoke detectors installed in ducts shall be listed for the air velocity, temperature and humidity present in the duct. Duct smoke detectors shall be connected to the building's fire alarm control unit when a fire alarm system is required by Section 907.2. Activation of a duct smoke detector shall initiate a visible and audible supervisory signal at a constantly attended location and shall perform the intended fire safety function in accordance with this code and the International Mechanical Code. Duct smoke detectors <u>shall report as a supervisory signal not a fire alarm, and they</u> shall not be used as a substitute for required open area detection.

Exceptions:

1. The supervisory signal at a constantly attended location is not required where duct smoke detectors activate the building's alarm notification appliances.
2. In occupancies not required to be equipped with a fire alarm system, actuation of a smoke detector shall activate a visible and an audible signal in an approved location. Smoke detector trouble conditions shall activate a visible or audible signal in an approved location and shall be identified as air duct detector trouble.

Reason: Duct detectors are widely known to be a cause of false alarms which is a safety concern for first responders. Duct detectors need to report as a supervisory signal to indicate that there is an issue and need to be repaired or replaced but should not report as a fire alarm like a water flow device. This adds clarity to a section that is not enforced uniformly and will add to fire fighter safety by lessening the amount of potential false alarms.

Cost Impact: This will not increase the cost of construction

907.3.1-F-GRIEVE

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposal would create confusion on the application of the exceptions and possibly create a conflict. It was suggested that the proposal be reworded to deal with the potential conflict in the form of a public comment.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Barry Greive, representing Target Corporation, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

907.3.1 Duct smoke detectors. Smoke detectors installed in ducts shall be listed for the air velocity, temperature and humidity present in the duct. Duct smoke detectors shall be connected to the building's fire alarm control unit when a fire alarm system is required by Section 907.2. Activation of a duct smoke detector shall initiate a visible and audible supervisory signal at a constantly attended location and shall perform the intended fire safety function in accordance with this code and the International Mechanical Code. In facilities that are required to monitored by a supervising station, duct smoke detectors shall only report as a supervisory signal and not a fire alarm ~~and~~. They shall not be used as a substitute for required open area detection.

Exceptions:

1. The supervisory signal at a constantly attended location is not required where duct smoke detectors activate the building's alarm notification appliances.
2. In occupancies not required to be equipped with a fire alarm system, actuation of a smoke detector shall activate a visible and an audible signal in an approved location. Smoke detector trouble conditions shall activate a visible or audible signal in an approved location and shall be identified as air duct detector trouble.

Commenter's Reason: Duct detectors are widely known to be a cause of false alarms which is a safety concern for first responders. Duct detectors need to report as a supervisory signal to indicate that there is an issue and either need to be repaired or replaced but should not report as a fire alarm like a water flow device. This change adds clarity to a section that is not enforced uniformly and will add to fire fighter safety by lessening the amount of potential false alarms

During the Committee hearings it was mentioned by several members that their reason for denial was that the code section already states that duct detectors shall report as supervisory and no further clarification is needed. Unfortunately this section is widely miss-interpreted, anytime a duct detector reports as a fire alarm we are putting the first responders in harm's way and it takes them away from more important duties. This code section needs greater clarification, smoke detectors and duct smoke detectors are one of the greatest contributors to false alarms in a building.

F169-13

Final Action: AS AM AMPC____ D

F172-13
907.5.2.3.3 (IBC [F] 907.5.2.3.3)

Proposed Change as Submitted

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee (cbaldassarra@RJAGroup.com)

Revise as follows:

907.5.2.3.3 (IBC [F] 907.5.2.3.3) Groups I-1 and R-1. Group I-1 and R-1 *dwelling units* or *sleeping units* in accordance with Table 907.5.2.3.3 shall be provided with ~~a~~ visible alarm notification ~~appliance~~ throughout the unit, activated by both the in-room smoke alarm and the building fire alarm system.

Reason: The revised language will clarify that within hotel rooms and assisted living units that visible alarms must provide full coverage.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/CTC/Pages/default.aspx. Since its inception in April/2005, the CTC has held twenty five meetings - all open to the public.

Cost Impact: None

907.5.2.3.3-F-BALDASSARRA-CTC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposal was disapproved as the language "throughout the unit" was not specific enough. It was noted that ADA has specific requirements as to how you deal with the space and the proposal should coordinate with those requirements. Concerns specifically related to bathrooms and closets as to how they are to be addressed.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

907.5.2.3.3 (IBC [F] 907.5.2.3.3) Groups I-1 and R-1. Group I-1 and R-1 *dwelling units* or *sleeping units* in accordance with Table 907.5.2.3.3 shall be provided with ~~a~~ visible alarm notification appliances, activated by both the in-room smoke alarm and the building fire alarm system. Visible alarm notification appliances shall be provided in all habitable spaces and bathrooms.

Reason: An opponent indicated that ADA and the IBC had different visible alarm requirements. While the 1994 ADA did have separate visible alarm requirements, the 2010 ADA references NFPA 72 for visible alarms.

All alarm systems are required to be installed in accordance with NFPA 72 by Section 907.2. The number of 'hearing impaired' rooms is specifically scoped in Table 907.5.2.3.3. It was not our intent to require visible alarms in closets, but rather in all habitable areas. In a hotel room bathroom, the door may be closed and a person would take out their hearing aid while bathing, so a visible alarm should also be provided in this space.

F172-13

Final Action: AS AM AMPC____ D

F176-13
907.6.5.3 (New) (IBC [F] 907.6.5.3 (New)), 401.3.2

Proposed Change as Submitted

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

<u>**907.6.5.3 Alarm Signal Verification**. Where permitted by the *Fire Chief*, an *approved* supervising station shall be allowed to verify an alarm signal prior to reporting it to the public safety communications center. The verification process shall be in compliance with NFPA 72.</u>

401.3 Emergency responder notification. Notification of emergency responders shall be in accordance with Sections 401.3.1 through 401.3.3.

401.3.1 Fire events. In the event an unwanted fire occurs on a property, the *owner* or occupant shall immediately report such condition to the fire department.

401.3.2 Alarm activations. Upon activation of a fire alarm signal employees or staff shall immediately notify the fire department.

<u>**Exception:** Alarm signal verification permitted by section 907.6.5.3</u>.

401.3.3 Delayed notification. A person shall not, by verbal or written directive, require any delay in the reporting of a fire to the fire department.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

The intent is to allow fire departments to require verification on both commercial and residential alarm signals in order to assist in effective dispatching of resources and/or reducing the impact of nuisance alarms. Currently NFPA 72 allows verification on residential systems (but gives choice of using it to the monitoring company). This would give discretion to the fire chief, and expand use to include commercial alarms which accounts for the majority of false alarms in the U.S.

These provisions allow fire departments to require that alarm monitoring centers attempt to verify an alarm signal before reporting to the 9-1-1 center. Having better information about the cause of alarm activation is critical as many departments have much smaller responses for an automatic alarm signal than for a working structure fire. Additionally, verification has been proven effective in reducing unwanted nuisance alarms. Alarm Verification is already performed extensively on residential fire alarms; this would allow it to be mandated on some or all systems, including commercial occupancies, when required by the Chief.

The revision to Section 401.3 will clarify the intent of the code and alleviate potential interpretation and enforcement conflicts with proposed new section - Section 907.6.5.3 Alarm Signal Verification

Cost Impact: This code change will not increase the cost of construction

907.6.5.3 (NEW)-F-ZUBIA-FCAC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: This allowance for alarm signal verification was felt to be a necessary tool for jurisdictions to manage risk in their community. The proposal is consistent with NFPA 72.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Steve Seddig, representing City of Wylie/Wylie Fire Marshal's Office, requests Approval as Modified by this Public Comment

Modify the proposal as follows:

907.6.5.3 Alarm Signal Verification. Where permitted by the *Fire Chief*, an *approved* supervising station shall be allowed 90 seconds to verify an alarm signal prior to reporting it to the public safety communications center. The verification process shall be in compliance with NFPA 72.

401.3 Emergency responder notification. Notification of emergency responders shall be in accordance with Sections 401.3.1 through 401.3.3.

401.3.1 Fire events. In the event an unwanted fire occurs on a property, the *owner* or occupant shall immediately report such condition to the fire department.

401.3.2 Alarm activations. Upon activation of a fire alarm signal employees or staff shall immediately notify the fire department.

Exception: Alarm signal verification permitted by section 907.6.5.3.

Commenter's Reason: The idea of not providing a time frame for reporting fire alarm activation by a monitoring station could be problematic. The NFPA Standard listed below details a maximum time of 90 seconds to verify the alarm signals. To be consistent and give specific guidance, I think it's important to place a time limit for accomplishing the task of verifying alarm signals.

In NFPA 72 (2013) Section 29.7.9.2: Remote monitoring stations shall be permitted to verify alarm signals prior to reporting them to the fire service, provided that the alarm verification process does not delay the reporting more than 90 seconds.

Public Comment 2:

Sean DeCrane, representing Cleveland Division of Fire / International Association of Fire Fighters, requests Disapproval.

Commenter's Reason: The reason for request for Disapproval is a fundamental difference of approach to reduce unwanted alarms. In this proposed change that was approved by the committee the proponent is taking an operational approach to a maintenance issue. We all agree in the benefits of reducing unwanted alarms, in fact this author is very aware of the risks to fire fighters and the public during emergency responses. The issue is how to reduce the unwanted alarms without raising the risks to the building's occupants or the responding fire fighters.

By allowing property owners additional time to verify the legitimacy of an alarm is potentially increasing the risk of loss to that property owner. It also raises the risk to the responding fire fighters. We have seen numerous studies conducted by Underwriters Laboratories and the National Institute of Standards and Technologies demonstrating the increased fuel loads we are placing inside our occupancies. We have realized a shorter time to flashover, an increase in energy produced in today's fires and the widespread use of construction practices utilizing less mass. This is a dangerous combination in the event of an "unwanted" fire.

This issue is a maintenance issue, if an occupancy is experiencing numerous unwanted alarms then the responsible party should be required to determine the cause of the multiple alarms. Is the system aging? Are there construction efforts causing dust? Is it a cleaning or lack of that is causing the situation? All of these situations can be addressed through proper maintenance.

This same committee took the steps and approved the ability of the local fire official to require the replacement of an alarm system if it is not performing as designed or has become a functioning liability. These are the tools to use if a property is experiencing a lack of proper performance of the installed alarm system. To change operational responses by delaying notification is dangerous. Currently many jurisdictions including ours initiates our response, and it can be tiered, and then allows the alarm company to verify the alarm then notify us if they find a situation of an unwanted alarm. We will continue the response by the first due unit to verify the false situation while returning the other responding units to service immediately. In this response if the alarm company determines there is no cause for alarm we return our units. If the alarm company should determine indeed there was a cause for alarm then our crews will arrive earlier in the event with a better chance to bring it to a successful conclusion earlier in the event. I urge you to Disapprove the original submission.

F176-13

Final Action: AS AM AMPC____ D

F178-13
907.8.6 (New)

Proposed Change as Submitted

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Add new text as follows:

<u>**907.8.6 Problematic systems.** Where required by the fire code official, fire alarm systems that produce chronic, unwanted or nuisance alarms shall be monitored with central station service in accordance with NFPA 72 requirements. A copy of the certificate, placard or other documentation issued by the organization that listed the central station, or the prime fire alarm system contractor, shall be provided to the fire code official.</u>

Reason: This section is intended to address the situation where a fire alarm system has not been repaired to make it fully functional or eliminate chronic unwanted or nuisance alarms. The determination of what constitutes chronic unwanted or nuisance alarms is up to the fire code official to decide based on local policies and practices. By requiring central station service it is understood that the system at the protected premise is now covered by an audit program administered by the company that listed the central station. These audit programs have shown significant success in reducing nuisance and unwanted alarms.

Cost Impact: This proposal will increase the cost of construction.

907.8.6 (NEW)-F-ZUBIA-FCAC

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify proposal as follows:

907.8.6 Problematic systems. Where required by the fire code official, fire alarm systems that produce chronic unwanted or nuisance alarms shall be monitored with central station service in accordance with NFPA 72 requirements. A copy of the <u>premises</u> certificate, placard or other documentation issued by the organization that listed the central station, or the prime fire alarm system contractor, shall be provided to the fire code official.

Committee Reason: This proposal was preferred to F177-13 and requires central stations to monitor fire alarm systems with chronic unwanted or nuisance alarms. The requirement would involve the need for a maintenance contract. Generally this requirement encourages repair instead of mandating replacement. The cost associated with this requirement was not seen as excessive. The modification simply adds the term “premises” to denote the type of certificate required. There was still some concern as to what was considered “chronic” or “nuisance.”

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

J. William Degnan, President, representing National Association of State Fire Marshals, requests Disapproval.

Commenter’s Reason: NASFM fully supports the intent to provide further incentives for property owners to maintain fire alarm devices and systems in accordance with the applicable reference standard(s). However, the Association does not believe this is the best tactic to achieve such a goal. NASFM continues to believe there remains a lack of clarity in this particular proposal in regard to what the thresholds of a chronic or nuisance alarm are. Additionally, who determines such?

Furthermore, NASFM also has concern that the language as presented in this proposal "…shall be monitored with central station service in accordance with NFPA 72 requirements" could be interpreted to mean that the alarm verification criteria [IE: a delay in FD notification] contained in NFPA 72 would thereafter permissible in all occupancy types.

Public Comment 2:

Dave Frable, representing U.S. General Services Administration, requests Disapproval.

Commenter's Reason: The proponent's intent to reduce the number of "unwanted" fire alarms in buildings in an effort to assist fire departments in effective dispatching of resources is noteworthy. However, this code proposal is not a solution to reduce the number of "unwanted" fire alarms. The proposed text would include non-definable terms in the code (i.e., chronic and nuisance alarms) and mandate that the property owner must have their fire alarm system monitored by a central station service if the code official determines the subject fire alarm system is causing "chronic" alarms. In addition, based on the proposed text and the requirements in NFPA 72, the central station service will need to consist of the following elements: (1) installation of alarm transmitters; (2) alarm, guard, supervisory, and trouble signal monitoring; (3) retransmission; (4) associated record keeping and reporting; (5) testing and maintenance; and (6) runner service. To mandate a building owner to incorporate all of these elements into an existing fire alarm system may be very costly depending on the age and complexity of the fire alarm system.

It should be noted that a vast majority of "unwanted alarms" are due to the existing fire alarm system not being initially designed and installed in accordance with the requirements of NFPA 72 or the fire alarm system not being maintained in accordance with the requirements of NFPA 72. In addition, no data has been provided by the proponent that substantiates that requiring a fire alarm system transmitting alarms directly to a central station service in lieu of directly to (1) a fire department; (2) a public safety communication center; (3) a remote supervising station service or (4) a proprietary supervising station service will reduce the number of "unwanted" alarms. Therefore, without adequate data the added expense for mandating central station service does not seem like a reasonable solution.

In addition, current code text regarding inspection, testing, and maintenance in Section 901.6 in the IFC specifically states that fire alarm systems "shall be maintained in operative condition at all times, and shall be replaced or repaired where defective". This current requirement should adequately address "unwanted" alarms and provide the fire code official authority to require a property owner to repair or replace a fire alarm system which should inherently reduce the number of "unwanted" alarms in a local jursidiction.

F178-13

Final Action: AS AM AMPC____ D

F192-13
909.12.1 (IBC [F] 909.12.1, IMC [F] 513.12.1), 909.20.6 (New)

Proposed Change as Submitted

Proponent: Jeffrey Tubbs, PE, FSFPE, Arup USA, Inc., representing self (jeff.tubbs@arup.com)

Revise as follows:

909.12 (IBC [F] 909.12, IMC [F] 513.12) Detection and control systems. Fire detection systems providing control input or output signals to mechanical smoke control systems or elements thereof shall comply with the requirements of Section 907. Such systems shall be equipped with a control unit complying with UL 864 and *listed* as smoke control equipment.

909.12.1 (IBC [F] 909.12.1, IMC [F] 513.12.1) Verification. Control systems for mechanical smoke control systems shall include provisions for verification. Verification shall include positive confirmation of actuation, testing, manual override, and the presence of power downstream of all disconnects. A ~~and, through a~~ preprogrammed weekly test sequence shall ~~,~~ report abnormal conditions audibly, visually and by printed report. The preprogrammed weekly test shall operate all devices, equipment, and components.

> **Exception:** Where verification of individual components tested through the preprogrammed weekly testing sequence will interfere with normal building operation and produce unwanted effects to normal building operation, such individual components are permitted to be bypassed from the weekly preprogrammed weekly testing, where approved by the code official and in accordance with the following:
>
> 1. Power supplies for components that are bypassed from the preprogrammed weekly test, such as power breakers, power disconnects, automatic transfer switches, motor starters, and motor controls, shall be electrically supervised by the listed control unit.
> 2. Testing of all components bypassed from the preprogrammed weekly test shall be in accordance with Section 909.20.6.

(Renumber subsequent sections)

909.20.6 Components bypassing weekly test. Where components of the smoke control system are bypassed by the preprogrammed weekly test required by Section 909.12.1 such components shall be tested semi-annually. The system shall also be tested under standby power conditions.

Reason: The current provisions require weekly tests of smoke control systems. For many systems, the weekly test requires the introduction of untreated air into the smoke zone. This can be impractical in areas with cold or hot climates, and for buildings that require close control of temperature and humidity, such as art museums and similar facilities. The introduction of the untreated air can also result in wasting energy to reheat, re-cool, humidify, or dehumidify the smoke control zone.

The intent of the current code provisions is to provide means to verify that the required systems will be available when needed. The code requires and will continue to require control units to comply with UL 864, thus all components of the control system will be supervised. The code change adds requirements for supervision of all power supply components such as power breakers, power disconnects, automatic transfer switches, motor starters, and motor controls. This will provide reasonable assurance that power will be available for all smoke control components, such as fans, dampers, doors, and windows. The code change also adds the semi-annual requirement for a complete system test. This allows the building owner to schedule complete system testing on days that will reduce the impact to the building and energy needs. The combination of additional supervision and additional testing provides a reasonable alternative to weekly testing.

Cost Impact: The code change allows optional additional features that may increase initial costs but reduce long-term operational costs.

909.12.1 (NEW)-F-TUBBS

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: This proposal provides a viable option for the weekly preprogrammed test through semi-annual testing and more restrictive supervision requirements.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jeffrey Tubbs, Arup USA Inc, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

909.12 (IBC [F] 909.12; IMC [F] 513.12) Detection and control systems. Fire detection systems providing control input or output signals to mechanical smoke control systems or elements thereof shall comply with the requirements of Section 907. Such systems shall be equipped with a control unit complying with UL 864 and *listed* as smoke control equipment.

909.12.1 (IBC [F] 909.12.1; IMC [F] 513.12.1) Verification. Control systems for mechanical smoke control systems shall include provisions for verification. Verification shall include positive confirmation of actuation, testing, manual override, and the presence of power downstream of all disconnects. A preprogrammed weekly test sequence shall report abnormal conditions audibly, visually and by printed report. The preprogrammed weekly test shall operate all devices, equipment, and components used for smoke control.

> **Exception:** Where verification of individual components tested through the preprogrammed weekly testing sequence will interfere with normal building operation and produce unwanted effects to normal building operation, such individual components are permitted to be bypassed from the ~~weekly~~ preprogrammed weekly testing, where approved by the code official and in accordance with the following:
>
> 1. ~~Power supplies for~~ Where the operation of components ~~that are~~ is bypassed from the preprogrammed weekly test, ~~such as power breakers, power disconnects, automatic transfer switches, motor starters, and motor controls,~~ presence of power downstream of all disconnects shall be ~~electrically supervised~~ verified weekly by ~~the~~ a listed control unit.
> 2. Testing of all components bypassed from the preprogrammed weekly test shall be in accordance with Section 909.20.6.

(Renumber subsequent sections)

909.20.6 Components bypassing weekly test. Where components of the smoke control system are bypassed by the preprogrammed weekly test required by Section 909.12.1 such components shall be tested semi-annually. The system shall also be tested under standby power conditions.

Commenter's Reason: The intent of the current code provisions is to provide means to verify that the required systems will be available when needed. The code requires and will continue to require control units to comply with UL 864, thus all components of the control system will be supervised. The intent of the code change was to monitor the presence of power downstream rather than to mandate a specific method (electrical supervision vs monitoring of power) for monitoring the presence of power. The revised text retains the requirement to verify that power is present downstream of all disconnects without specifying any particular method, thereby allowing any method that is consistent with the listing of the control unit. As with the original code change, this modification includes the combination of additional supervision and additional testing, and thus provides a reasonable alternative to weekly testing.

910.1 (IBC [F] 910.1), 910.3.5 (IBC [F] 910.3.5), 202, 3202, Table 3206.2

Proposed Change as Submitted

Proponent: Jeffrey M. Shapiro, International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com)

Revise as follows:

910.1 General. Where required by this code or otherwise installed, smoke and heat vents, or mechanical smoke exhaust systems, and draft curtains shall conform to the requirements of this section.

Exceptions:

1. Frozen food warehouses used solely for storage of Class I and II commodities where protected by an *approved automatic sprinkler system*.
2. Where areas of buildings are equipped with early suppression fast-response (ESFR) or quick-response storage (QRS) sprinklers, automatic smoke and heat vents shall not be required within these areas.

910.3.5 (IBC [F] 910.3.5) Draft curtains. Where required by Table 910.3, draft curtains shall be installed on the underside of the roof in accordance with this section.

Exception: Where areas of buildings are equipped with ESFR or QRS sprinklers, draft curtains shall not be provided within these areas. Draft curtains shall only be provided at the separation between the ESFR sprinklers and the non-ESFR sprinklers, and between QRS and the non-QRS sprinklers.

Add new definition as follows:

SECTION 202
GENERAL DEFINITIONS

QUICK RESPONSE STORAGE (QRS) SPRINKLER. A sprinkler with a response time index of 50 or less that is listed to control a specified fire in stored commodities with 12 or fewer sprinklers.

Revise as follows:

SECTION 3202
DEFINITIONS

QUICK RESPONSE STORAGE (QRS) SPRINKLER.

TABLE 3206.2
GENERAL FIRE PROTECTION AND LIFE SAFETY REQUIREMENTS

COMMODITY CLASS	SIZE OF HIGH-PILED STORAGE AREA[a] (square feet) (see Sections 3206.2 and 3206.4)	ALL STORAGE AREAS (See Sections 3206, 3207 and 3208)[b]					SOLID-PILED STORAGE, SHELF STORAGE AND PALLETIZED STORAGE (see Section 3207.3)		
		Automatic fire-extinguishing system (see Section 3206.4)	Fire detection system (see Section 3206.5)	Building access (see Section 3206.6)	Smoke and heat removal (see Section 3206.7)	Draft curtains (see Section 3206.7)	Maximum pile dimension[c] (feet)	Maximum permissible storage height[d] (feet)	Maximum pile volume (cubic feet)

(Portions of table not shown remain unchanged)

a through i *(No change to current text*

j. Not required when storage areas are protected by early suppression fast response (ESFR) or quick-response storage (QRS) sprinkler systems installed in accordance with NFPA 13.

Reason: Factory Mutual data sheets no longer reference special sprinkler classifications, such as ESFR. Instead, FM now classifies sprinklers as "storage" and "non-storage" and provides appropriate installation parameters. Storage sprinklers now encompass a new category of quick-response sprinklers that share the key characteristics of ESFR sprinklers, i.e. fast response thermal elements and design areas that involve 12 or fewer sprinklers, but are not designated as ESFR. These quick-response storage sprinklers require similar precautions to ESFR sprinklers with respect to not introducing unknowns that were not represented in full-scale fire tests conducted to determine listing parameters. Thereby, it is important to extend the current provisions in Chapters 9 and 32 that are applicable to ESFR sprinklers to include quick-response storage sprinklers.

Cost Impact: The code change proposal will not increase the cost of construction.

910.1-F-SHAPIRO

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: There was concern that the technology was too new to be properly addressed within the code. In addition concerns and questions with regard to smoke and heat vent and the operation of the sprinklers were raised. There was particular concern with the terminology used and related testing. There was some concern for the need to provide specific data and reports for every installation.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jeffrey M. Shapiro, P.E., International Code Consultants, representing Tyco; Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

910.1 General. Where required by this code or otherwise installed, smoke and heat vents, or mechanical smoke exhaust systems, and draft curtains shall conform to the requirements of this section.

Exceptions:

1. Frozen food warehouses used solely for storage of Class I and II commodities where protected by an *approved automatic sprinkler system*.
2. Where areas of buildings are equipped with early suppression fast-response (ESFR) sprinklers, automatic smoke and heat vents shall not be required within these areas.
3. Where areas of buildings are equipped with control mode special application sprinklers with a response time index of 50 or less, which are listed to control a fire in the stored commodities with 12 or fewer sprinklers, automatic smoke and heat vents shall not be required within these areas.

910.3.5 (IBC [F] 910.3.5) Draft curtains. Where required by Table 910.3, draft curtains shall be installed on the underside of the roof in accordance with this section.

Exceptions:

1. Where areas of buildings are equipped with ESFR sprinklers, draft curtains shall not be provided within these areas. Draft curtains shall only be provided at the separation between the ESFR sprinklers and the non-ESFR sprinklers.
2. Where areas of buildings are equipped with control mode special application sprinklers with a response time index of 50 or less, which are listed to control a fire in the stored commodities with 12 or fewer sprinklers, draft curtains shall not be provided within these areas. Draft curtains shall only be provided at the separation between these areas and areas protected by other types of sprinklers.

TABLE 3206.2
GENERAL FIRE PROTECTION AND LIFE SAFETY REQUIREMENTS

j. Not required when storage areas are protected by either early suppression fast response (ESFR) sprinkler systems or control mode special application sprinklers with a response time index of 50 or less, which are listed to control a fire in the stored commodities with 12 or fewer sprinklers, installed in accordance with NFPA 13.

Commenter's Reason:
Shapiro: The text proposed in this public comment addresses the concerns that were raised at the committee hearing. In particular, it resolves questions that were raised about introducing the new term "quick response storage sprinkler" by no longer using that term, and it clarifies that both the RTI and number of sprinklers operating limits (not just one or the other) must be satisfied to for the referenced sprinklers to be treated equivalently to ESFR.

After the hearing, I spoke with a number of attendees and committee members to better understand their concerns and see if there were other questions about this proposal. I learned that some people were confused as to why the sprinklers included in this proposal are not simply considered ESFR. In response, I explained that the type of sprinklers covered by this proposal is very versatile. They can qualify and be used as either control mode density area (CMDA) or CMSA sprinklers under their UL listing and NFPA 13. When these sprinklers are used as CMDA, they are essentially "regular" sprinklers that can be used with smoke and heat vents because the installation will involve large design areas. When they are used as CMSA with limitations that parallel those that are applicable to ESFR (as described in this proposal), the same concerns about compatibility with smoke and heat vents apply. Once these points were clear, individuals who I spoke with, including some committee members who had opposed the change, agreed with the proposal.

It is also important to note that the proposal was cleared with FM, UL the National Fire Sprinkler Association and the American Fire Sprinkler Association.

Zubia: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

There is a new category of fire sprinklers that shares the key characteristics of ESFR sprinklers, i.e. thermal elements that have a response time index (RTI) of 50 or less and that are listed to protect a design area that involves 12 or fewer sprinklers. These sprinklers are not called ESFR, but they still require similar precautions to ESFR sprinklers with respect to not introducing unknowns, such as smoke and heat vents, that were not present in the full-scale fire tests that determined the listing parameters. Such unknowns can lead to sprinkler "skipping" and exceeding the 12 sprinkler design area, which was the exact concern that led to the ESFR-related provisions that are currently in Chapters 9 and 32. This comment will extend application of the special ESFR provisions to include quick-response storage sprinklers that share ESFR characteristics.

The public comment also resolves the concerns expressed by some at the committee hearing that the introduction of new terminology suggested in the original proposal might have confused some code users. The previously proposed terminology is not included in this public comment. Instead, the technical provisions are provided directly in the sections of the code where they will apply. The text has also been revised to clarify that sprinklers must have BOTH an RTI of 50 or less and be listed to control/suppress a fire with 12 or fewer sprinklers to qualify for an exception to smoke and heat venting requirements. Any sprinkler listed as "quick response" will satisfy the "50 RTI or less" criteria, based on the definition of "quick response" in NFPA 13 Section 3.6.4.7. The number of operating sprinklers will be indicated in the listing criteria for each sprinkler.

In summary, there is no technical basis for not accepting this proposal. The proposed exceptions parallel those that the code already provides for ESFR sprinklers, and the sprinklers that will qualify for the proposed new exceptions must meet the ESFR RTI and suppression area criteria.

F196-13
Final Action: AS AM AMPC____ D

F203-13
913.2.2 (New) [IBC [F] 913.2.2 (New)]

Proposed Change as Submitted

Proponent: Robert J Davidson, Davidson Code Concepts, LLC, representing self (rjd@davidsoncodeconcepts.com)

Revise as follows:

913.2.2 (IBC [F] 913.2.2) Fuel line piping protection. Fuel lines supplying diesel engine driven fire pumps shall be protected by an approved fuel line protective system with a fire-resistance rating equivalent to the fire resistance rating of the construction enclosing the fire pump room where such piping is located in areas outside the fire pump room.

Reason: When electric powered fire pumps are installed Section [F] 913.2 and the referenced standards, (NFPA 20 and NFPA 70), require protection against exposure from fire for the fire pump, the components and the wiring supplying the electric powered fire pump.

NFPA 20
INSTALLATION OF STATIONARY PUMPS FOR FIRE PROTECTION

Chapter 9 Electric Drive for Pumps
9.1.4* All power supplies shall be located and arranged to protect against damage by fire from within the premises and exposing hazards.

NFPA 70
ARTICLE 695
Fire Pumps

(E) Arrangement. All power supplies shall be located and arranged to protect against damage by fire from within the premises and exposing hazards. [20:9.1.4]

Multiple power sources shall be arranged so that a fire at one source does not cause an interruption at the other source.

913.2-F-DAVIDSON

913.2-F-DAVIDSON
Additional NFPA 20 protection language

4.12* Equipment Protection.

4.12.1* General Requirements. The fire pump, driver, controller, water supply, and power supply shall be protected against possible interruption of service through damage caused by explosion, fire, flood, earthquake, rodents, insects, windstorm, freezing, vandalism, and other adverse conditions.

4.12.1.1* Indoor Fire Pump Units.

4.12.1.1.1 Fire pump units serving high-rise buildings shall be protected from surrounding occupancies by a minimum of 2-hour fire-rated construction or physically separated from the protected building by a minimum of 50 ft (15.3 m).

4.12.1.1.2 Indoor fire pump rooms in non-high-rise buildings or in separate fire pump buildings shall be physically separated or protected by fire-rated construction in accordance with Table 4.12.1.1.2.

4.12.1.1.3 The location of and access to the fire pump room shall be preplanned with the fire department.

However, the same protection against fire exposure is not provided for fuel lines serving diesel engine powered fire pumps, a component just as important to ensure availability of fire flows as the other fire pump components.

NFPA 20
INSTALLATION OF STATIONARY PUMPS FOR FIRE PROTECTION

11.4.4* Fuel Piping.

11.4.4.1 Flame-resistant reinforced flexible hose listed for this service with threaded connections shall be provided at the engine for connection to fuel system piping.
11.4.4.2 Fuel piping shall not be galvanized steel or copper.
11.4.4.3 The fuel return line shall be installed according to the engine manufacturer's recommendation.

11.4.4.4 There shall be no shutoff valve in the fuel return line to the tank.

11.4.4.5* Fuel Line Protection. A guard, pipe protection, or approved double-walled pipe shall be provided for all exposed fuel lines.

11.4.4.6 Fuel Solenoid Valve. Where an electric solenoid valve is used to control the engine fuel supply, it shall be capable of manual mechanical operation or of being manually bypassed in the event of a control circuit failure.

This proposal adds a new Section "913.2.2 / [F] 913.2.3 Fuel line piping protection" that provides for a level of fire resistance protection equal to the fire-resistance rating of the fire pump room enclosing construction for those portions of the fuel oil piping that are installed outside of the fire pump room where they may be exposed to a fire in the occupancy protected.
The IBC language is shown here for visualization of how the added language would appear in that document.

[F] 913.2 Protection against interruption of service.The fire pump, driver and controller shall be protected in accordance with NFPA 20 against possible interruption of service through damage caused by explosion, fire, flood, earthquake, rodents, insects, windstorm, freezing, vandalism and other adverse conditions.

913.2.1 Protection of fire pump rooms. Fire pumps shall be located in rooms that are separated from all other areas of the building by 2-hour fire barriers constructed in accordance with Section 707 or 2-hour horizontal assemblies constructed in accordance with Section 711, or both.

Exceptions:

1. In other than high-rise buildings, separation by 1-hour fire barriers constructed in accordance with Section 707 or 1-hour horizontal assemblies constructed in accordance with Section 711, or both, shall be permitted in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.
2. Separation is not required for fire pumps physically separated in accordance with NFPA 20.

[F] 913.2.2 Fuel line piping protection: In addition to complying the requirements of NFPA 20, Fuel lines supplying diesel powered fire pumps shall be protected against fire by an approved fuel line protective system with a fire-resistance rating equivalent to the rating of the construction enclosing the fire pump room where portions of the fuel line piping are located in areas outside the room the fire pump is located in.

Cost Impact: The code change proposal will increase the cost of construction.

913.2-F-DAVIDSON

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: This requirement should be more appropriately addressed by NFPA 20 and not by Chapter 9 of the IFC. There was a question as to what is considered a "fuel line protective system.". Also, no credit is given to buildings provided with an automatic sprinkler system.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Robert J Davidson, Davidson Code Concepts, LLC, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

913.2.2 (IBC [F] 913.2.2) Fuel line piping protection. Fuel lines supplying diesel engine driven fire pumps shall be protected by an approved ~~fuel line protective system~~ method or assembly with a fire-resistance rating equivalent to the fire resistance rating of the construction enclosing the fire pump room where such piping is located in areas of the protected building outside the fire pump room.

Commenter's Reason: In response to the committee concerns the specific methods have been deleted to instead refer to a generic requirement of protection with "an approved method or assembly". In recognition of the committee discussion this modified wording provides for acceptance of a wider base of solutions.

Recognition for sprinkler protection is inherent in the language in that it requires the protection to match the rating required of the pump room enclosure. Section 913.2.1 provides for a reduction in the rating of the pump room enclosure with Exception 1, with the new language tied to the rating of the enclosure the sprinkler recognition is built in.

During the hearing a committee member suggested that clarification be made as to where the piping required the protection. To address that concern, the intent has been clarified that the protection applies to portions of the piping located within the building protected by the fire pump.

In deference to the reason statement mention of the requirement belonging in NFPA 20, the protection from fire and other means of disruption is already in the IBC/IFC Section 913.2. The added language should accompany the language it is building upon.

The introduction of the discussion on NFPA 20 was brought about by testimony from the floor that NFPA 20 requires the fuel supply to be located in the same room as the fire pump. That testimony was incorrect. NFPA 20 only requires the supply to be located within the same room when subject to freezing.

NFPA 20-2010
11.4.3.2 In zones where freezing temperatures [32°F (0°C)] are possible, the fuel supply tanks shall be located in the pump room

Additionally, with many facilities concerned with business continuity, they are providing for generators for backup power with fuel supplies for long periods of time. In doing so it is not uncommon to use the above ground protected fuel supply for both the diesel fuel pump and the generators, the result being a run of supply piping this new section would provide protection for.

F203-13
Final Action: AS AM AMPC____ D

F204-13
913.2.2 (IBC [F] 913.2.2 (New)), Chapter 80 (IBC Chapter 35)

Proposed Change as Submitted

Proponent: Bob Eugene, representing Underwriters Laboratories (Robert.Eugene@ul.com)

Add new text as follows:

913.2.2 (IBC [F] 913.2.2) Circuits supplying fire pumps. Cables used for survivability of circuits supplying fire pumps shall be listed in accordance with UL 2196. Electrical circuit protective systems shall be installed in accordance with their listing requirements.

Add new standard to Chapter 80 (IBC Chapter 35) as follows:

UL

2196-2001 Tests for Fire Resistive Cables, with revisions through December 7, 2003……..913.2.2

Reason: UL 2196 is the ANSI approved standard for tests of fire resistive cables. NFPA 20 (fire pumps) includes selective survivability requirements to assure integrity of certain critical circuits. NFPA 70 does not specify the applicable standard within the mandatory provisions of the code, but recognizes electrical circuit protective systems as an alternate to listed cables. An electrical circuit protective system is a field assembly of components that must be installed according to the listing requirements and manufacturer's instructions in order to maintain the listing for the system. There are more than two dozen electrical circuit protective systems listed in the UL Fire Resistance Directory.

Cost Impact: None.

Analysis: A review of the standard proposed for inclusion in the code, UL 2196-2001, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28), will be posted on the ICC website on or before April 1, 2013.

913.2.2 (NEW)-F-EUGENE

Committee Action Hearing Results

For staff analysis of the content of UL2196-2001 relative to CP#28, Section 3.6, please visit:
http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/ProposedStandards.pdf

Committee Action: **Approved as Submitted**

Committee Reason: This provides a direct reference to the standard that addresses cables used to provide survivability of circuits. This reference was felt necessary to avoid confusion as to what was required in accordance with NFPA 20 and NFPA 70.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bob Eugene, representing UL LLC, requests Approval as Modified by Public Comment.

Modify the proposal as follows:

UL	Underwriters Laboratories	
Standard Reference Number	**Title**	**Referenced in Code Section Number**
2196-2001	Tests for Fire Resistive Cables, with revisions through ~~December 7, 2003~~ March 2012	913.2.2 (913.2.2)

(Portions of proposal not shown remain unchanged)

Commenter's Reason: This proposal was originally submitted with the Group A proposals, but held over for the Group B proposals. The revisions to the standard, including ANSI approval, occurred after the original submittal and should be included in the 2015 edition of the codes.

Analysis: The edition of UL2196 that was submitted for review by the IFC Committee included the revisions through March, 2012. For the analysis of the content of this standard, please visit: http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/ProposedStandards.pdf

F204-13

Final Action: AS AM AMPC____ D

F205-13
913.3 (New) [IBC [F] 913.3(New)]

Proposed Change as Submitted

Proponent: Jeffrey M. Hugo, CBO, representing the National Fire Sprinkler Association (hugo@nfsa.org)

Add new text as follows:

913.3 (IBC [F] 913.3) Fire Pump rooms egress and access. Fire pump rooms located on levels other than the level of exit discharge shall discharge into an exit passageway constructed in accordance with Section 1023 or directly into a interior exit stairway in accordance with Section 1022.

Reason: New sections are necessary as NFPA 20 permits fire pump rooms to be located on floors that are not always on the same floor as the level of exit discharge. While the fire pump is operating, NFPA 20 requires building personnel to be in the room for testing and during a fire event and requires the exit of the fire pump room to go into an exit passageway.

During a fire, the person being sent to the pump room on an upper or lower floor than the level of exit discharge needs to be able to safely get from the stairwell to the pump room without encountering the fire. Therefore, the exit stairwell or an exit passageway needs to lead to the pump room.

Cost Impact: Will not increase the cost of construction

913.2.1.2 (NEW)-FS-HUGO

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The primary concern with this proposal is that it would create a conflict with the IBC exit passageway requirements in Chapter 10. It was suggested that perhaps rated corridors may be a better approach to provide a protected path to fire pump rooms.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Dave Frable, representing U.S. General Services Administration, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

913.~~3~~ 2(IBC [F] 913.~~3~~ 2) ~~Fire Pump rooms egress and access.~~ ~~Fire pump rooms located on levels other than the level of exit discharge shall discharge into an exit passageway constructed in accordance with Section 1023 or directly into a interior exit stairway in accordance with Section 1022~~. **Location and access.** The location and accessibility of the fire pump room shall be approved by the fire chief.

Commenter's Reason: The intent of this proposed code change is to provide some direction to architects when determining the location of a fire pump room in a project. The new code text should also provide design flexibility on a case-by-case basis in determining best location for the fire pump room. We believe the proposed language will also meet the original intent of the proponent and concerns raised by the Code Committee. The proposed language is similar language in Section 508, Fire Command Center.

F205-13
Final Action: AS AM AMPC____ D

F210-13
1101.3

Proposed Change as Submitted

Proponent: David S. Collins, FAIA, The Preview Group, Inc., representing The American Institute of Architects (dcollins@preview-group.com); Robert J Davidson, Davidson Code Concepts, LLC

Revise as follows:

1101.3 Permits. Permits for alterations necessary to comply with this section shall be required as set forth in Section~~s 105.6 and 105.7 and the *International Building Code*~~ 105.1 of the *International Existing Building Code*.

Reason: This change will direct the code user to the correct reference section for obtaining a permit to make any alterations necessary to conform to this section of the IFC. Sections 105.6 and 105.7 are for operational permits for various operations or the installation of certain systems, not alterations to an existing building. With the deletion of Chapter 34 from the IBC, the only provisions in the ICC family of codes for permits for existing buildings are found in the IEBC.

Cost Impact: There is no cost impact of this change.

1101.3 (NEW)-F-COLLINS

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The disapproval was based on the committee's judgment that, while the intent of the code change is good, the amount of testimony in opposition indicated that the proposal is more than just a simple correlation issue and needs additional work to revise other sections affected by the change. It was also felt that the reference to the IBC needs to be retained in the section.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Robert J Davidson, representing Davidson Code Concepts, LLC and David S. Collins, FAIA, The Preview Group, Inc., requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1101.3 Permits. Permits for alterations necessary to comply with this section shall be required as set forth in Section 105.7, the *International Building Code* and Section 105.1 of the *International Existing Building Code*.

Commenter's Reason: In response to the committee comments and testimony, in this modification ONLY the reference to operational permits of the IFC has been deleted since installation/construction of the improvements in Chapter 11 are not operational permit activities, they are construction permit topics. The reference to the IBC has been left in as requested by the committee and the reference to the IEBC has been added since that is the document to refer to now that Chapter 34 has been removed from the IBC.

F210-13
Final Action: AS AM AMPC____ D

F212-13, Part I
1103.1, 1104.1

Proposed Change as Submitted

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IFC CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE IEBC CODE DEVELOPMENT COMMITTEE AS SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMMITTEES.

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care (john.williams@doh.wa.gov)

PART I – INTERNATIONAL FIRE CODE
.
Revise as follows:

SECTION 1103
FIRE SAFETY REQUIREMENTS FOR EXISTING BUILDING

1103.1 Required construction. Existing buildings shall comply with not less than the minimum provisions specified in Table 1103.1 and as further enumerated in Sections 1103.2 through 1103.9.

The provisions of this chapter shall not be construed to allow the elimination of fire protection systems or a reduction in the level of fire safety provided in buildings constructed in accordance with previously adopted codes.

Exceptions:

1. Where approved in accordance with Section 102.4, in Group I-2 Condition 2 buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 has been added and the building is now sprinklered throughout, the existing fire resistance ratings, opening protectives, penetrations and joints in assemblies are not required to be maintained where such fire resistance ratings, opening protectives, penetrations and joints are not required in new construction for sprinklered buildings.
2. Group U occupancies.

SECTION 1104
MEANS OF EGRESS FOR EXISTING BUILDINGS

1104.1 General. *Means of egress* in existing buildings shall comply with the minimum egress requirements when specified in Table 1103.1 as further enumerated in Sections 1104.2 through 1104.23, and the building code that applied at the time of construction. Where the provisions of this chapter conflict with the building code that applied at the time of construction, the most restrictive provision shall apply. Existing buildings that were not required to comply with a building code at the time of construction shall comply with the minimum egress requirements when specified in Table 1103.1 as further enumerated in Sections 1104.2 through 1104.24.

Exception: Where approved in accordance with Section 102.4, in Group I-2 Condition 2 buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 has been added and the building is now sprinklered throughout, the existing fire resistance ratings, opening protectives, penetrations and joints in assemblies are not required to be maintained where such fire resistance ratings, opening protectives, penetrations and joints are not required in new construction for sprinklered buildings.

Reason: The changes provide tradeoffs for installation of automatic sprinkler systems consistent with those allowed for new construction and also with those allowed by CMS. In many editions of the legacy codes and the ICC Codes dating from the 1980s and even before, the same or similar tradeoffs were allowed when a facility elected to provide sprinkler protection. The AD Hoc Committee on Health Care is proposing requiring retrofit of sprinklers in Hospitals that we feel provide the best protection available and feel because of this the tradeoffs are justified in existing facilities as has been vetted and justified in new construction for many years. These requirements are part of a package of retrofit requirements that provide a minimum level of safety considered necessary for patients, staff and first responders in an environment in which patients are in many instances not capable of self preservation and must be protected in place. Automatic sprinkler protection is key to any plan for protecting residents in place and for the safety of those responding to emergencies by providing the extra time needed to respond. The requirements are also consistent with current CMS standards that apply to all hospitals nationwide receiving Medicare/Medicaid funding and would not add additional requirements to those facilities beyond current nationwide Federal requirements but would allow the facilities to better meet those requirements without possible costly conflicts in other codes.

If this proposal is successful and the proposal for a new Section 1105 is also approved, the Adhoc Health Care committee will bring forward a corresponding exception to be applicable for the new Section 1105.1 as follows:

SECTION 1105
CONSTRUCTION REQUIREMENTS FOR EXISTING GROUP I-2

1105.1 General. Existing Group I-2 shall meet the following requirements:

1. The minimum fire safety requirements in Section 1103, and
2. The minimum egress requirements in Section 1104, and
3. The additional egress and construction requirements in Sections 1105.2 through 1105.7.5.2.

Where the provisions of this chapter conflict with the construction requirements that applied at the time of construction, the most restrictive provision shall apply.

> **Exception:** Where approved in accordance with Section 102.4, in Group I-2 Condition 2 buildings where a sprinkler system installed in accordance with Section 903.3.1.1 has been added and the building is now sprinklered throughout, the existing fire resistance ratings, opening protectives, penetrations and joints in assemblies are not required to be maintained where such fire resistance ratings, opening protective, penetrations and joints are not required in new construction for sprinklered buildings.

This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering, a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Cost Impact: None

1103.1-F-WILLIAMS-ADHOC

Committee Action Hearing Results

PART I – IFC
Committee Action: Disapproved

Committee Reason: The disapproval was based on the committee's concerns that the proposal needs to be well-correlated with code change EB26-13 which is related. It was also unclear as to why the exception should be limited to Group I-2 Condition 2 only when other occupancies would likely want to take advantage of it. The proposal also does not take into account alternative methods that may have been previously granted. Record keeping and documentation of reduced fire resistance ratings would be a major challenge as would trying to determine rating reductions by visual inspection.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care and Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee, request Approval as Modified by this Public Comment.

Replace the proposal as follows:

SECTION 1103
FIRE SAFETY REQUIREMENTS FOR EXISTING BUILDING

1103.1 Required construction. Existing buildings shall comply with not less than the minimum provisions specified in Table 1103.1 and as further enumerated in Sections 1103.2 through 1103.9.

~~The provisions of this chapter shall not be construed to allow the elimination of fire protection systems or a reduction in the level of fire safety provided in buildings constructed in accordance with previously adopted codes.~~

Exception: Group U occupancies.

<u>**1103.1.1 Existing construction.** The provisions of this chapter shall not be construed to allow the elimination of fire protection systems or a reduction in the level of fire safety provided in buildings constructed in accordance with previously adopted codes.</u>

<u>**Exception:** Where approved by the fire code official, in Group I-2 buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 has been added and the building is now sprinklered throughout, the fire-resistance ratings of building elements and materials shall be permitted to meet the requirements of the current building code. Plans, investigation and evaluation reports, and other data shall be submitted indicating which building elements and materials the applicant is requesting the fire code official to review and approve for determination of applying the current building code fire-resistance ratings. Any special construction features, conditions of occupancy, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building that impact required fire-resistance ratings shall be identified in the evaluation reports submitted.</u>

Reason: This code change responds to the committee's questions regarding the original proposal while keeping true to its original purpose. The Adhoc Healthcare Committee (AHC) firmly believes that all hospital buildings should be retroactively sprinklered throughout. This code change provides incentives for facilities to do that. It also addresses a common question. As code officials, we are often faced with existing building stock that has been upgraded by adding a sprinkler system. This code change and EB 26 were intended to provide the code official with a means, written in code, to accommodate the relatively common practice of reconsidering the value of SOME existing passive systems when sprinklered are installed.

To be clear, this code change is only the incentive. During the Group A hearing the Fire Code committee passed a proposal from AHC to REQUIRE mandatory retroactive sprinklering throughout the building. This change provides the incentive for hospital administrator's move to this requirement sooner. As mentioned in the committee's reason statement, EB 26 was a more comprehensive, better crafted code change. The AHC listened and based this public comment entirely on the language from EB-26. The committee questioned why this code change solely focused on Group I-2 when EB-26 broadly applied to all occupancies. While the AHC might agree with that point, our scope is limited to Group I-2 facilities and any change that addressed other occupancies would be out of scope. The fire code committee asked whether this change would take into account the previous alternative methods. This change would not invalidate the ability of a code official to consider ANY alternative means or method available to them. We are not touching any section that would allow a code that deals with alternative methods. In fact, this change supports the concept that the decision belongs in the hands of the code official. The committee's last statement furthers that idea. The committee was concerned that record keeping for decisions and any reduced fire ratings would be problematic. The revised language taken straight from EB 26 the burden for identifying existing conditions, documenting changes and providing evaluation reports squarely on the shoulders of the applicant. Foe comparison, the approved language of EB-26 is shown below:

EB26-13 AM

<u>**803.6 Fire-resistance ratings.** Where approved by the code official, buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 and 903.3.1.2 of the International Building has been added, and the building is now sprinklered throughout, the required fire-resistance ratings of building elements and materials shall be permitted to meet the requirements of the current building code. The building is required to meet the other applicable fire protection requirements of Chapter 9 of the International Building Code.</u>

<u>Plans, investigation and evaluation reports, and other data shall be submitted indicating which building elements and materials the applicant is requesting the code official to review and approve for determination of applying the current building code fire-resistance ratings. Any special construction features, conditions of occupancy, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building that impact required fire-resistance ratings shall be identified in the evaluation reports submitted.</u>

The AHCs proposal is different from EB 26 in two specific ways. The scope of the AHCs work (along with co-proponent ICC Code Technology Committee) is Group I-2. In EB 26, the existing building code committee approved the same concept for all occupancy types. Since the scope of this change is limited to I-2, the reference to a residential sprinkler system per 903.3.1.2 is not appropriate and was deleted. The AHC is also recommending to delete the reference to Chapter 9. While this reference would provide an additional pointer to the sprinkler requirements, it would also pick requirements for things like smoke control or pressurized stairs. We believe these have little relation to fire resistance ratings. In addition, the AHC has already sponsored a comprehensive set of code changes for minimum existing fire protection rating in the committee approved changes for Section 1105. In these changes, the committee approved sweeping retroactive minimum standards that address concepts like corridor construction, structural fire protection ratings, retroactive smoke compartmentation and many other changes. These changes go way beyond what is required by the current "maintain it under the code from which it was constructed" logic of chapter 7. They can be found in F236 through F243. We believe these fundamental increases to chapter 11, along with the committee's preferred language from EB 26 is comprehensive package.

Public Comment 2:

Tony Crimi, A.C. Consulting Solutions Inc., representing International Firestop Council (IFC), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION 1103
FIRE SAFETY REQUIREMENTS FOR EXISTING BUILDING

1103.1 Required construction. Existing buildings shall comply with not less than the minimum provisions specified in Table 1103.1 and as further enumerated in Sections 1103.2 through 1103.9.

The provisions of this chapter shall not be construed to allow the elimination of fire protection systems or a reduction in the level of fire safety provided in buildings constructed in accordance with previously adopted codes.

Exceptions:

1. Where approved by the building code official in Group I-2, Condition 2 buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2 of the *International Building Code* has been added, and the building is now sprinklered throughout, the required fire-resistance ratings of building elements and materials shall be permitted to meet the requirements of the current building code provided the building also complies with the other applicable fire protection requirements of Chapter 9 and Chapter 10 of the *International Building Code*.

   Plans, investigation and evaluation reports, and other data shall be submitted indicating which building elements and materials the applicant is requesting the code official to review and approve for determination of applying the current building code fire-resistance ratings. Any special construction features, conditions of occupancy, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building that impact required fire-resistance ratings shall be identified in the evaluation reports submitted.

   ~~Where approved in accordance with Section 102.4, in Group I-2 Condition 2 buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 has been added and the building is now sprinklered throughout, the existing fire resistance ratings, opening protectives, penetrations and joints in assemblies are not required to be maintained where such fire resistance ratings, opening protectives, penetrations and joints are not required in new construction for sprinklered buildings.~~
2. Group U occupancies.

SECTION 1104
MEANS OF EGRESS FOR EXISTING BUILDINGS

1104.1 General. *Means of egress* in existing buildings shall comply with the minimum egress requirements when specified in Table 1103.1 as further enumerated in Sections 1104.2 through 1104.23, and the building code that applied at the time of construction. Where the provisions of this chapter conflict with the building code that applied at the time of construction, the most restrictive provision shall apply. Existing buildings that were not required to comply with a building code at the time of construction shall comply with the minimum egress requirements when specified in Table 1103.1 as further enumerated in Sections 1104.2 through 1104.24.

Exception: Where approved by the building code official in Group I-2, Condition 2 buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2 of the *International Building Code* has been added, and the building is now sprinklered throughout, the required fire-resistance ratings of building elements and materials shall be permitted to meet the requirements of the current building code provided the building also complies with the other applicable fire protection requirements of Chapter 9 and Chapter 10 of the *International Building Code*.

Plans, investigation and evaluation reports, and other data shall be submitted indicating which building elements and materials the applicant is requesting the code official to review and approve for determination of applying the current building code fire-resistance

<u>ratings. Any special construction features, conditions of occupancy, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building that impact required fire-resistance ratings shall be identified in the evaluation reports submitted.</u>

~~Where approved in accordance with Section 102.4, in Group I-2 Condition 2 buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 has been added and the building is now sprinklered throughout, the existing fire resistance ratings, opening protectives, penetrations and joints in assemblies are not required to be maintained where such fire resistance ratings, opening protectives, penetrations and joints are not required in new construction for sprinklered buildings.~~

Commenter's Reason: This modification makes the language in this proposal consistent with the language approved in EB26-13, but also adds a critical element that is lacking in the current proposal.

The current proposal as modified by the Committee would permit all of the sprinkler tradeoffs permitted for new construction in the IBC, even though the means of egress of the existing building have not been evaluated. If a building falls short of the IBC's requirements for means of egress (IBC Chapter 10), allowing that building to then take all of the IBC's sprinkler trade-offs and cease maintenance of fire safety features that would be traded away for sprinklers will result in reducing the level of fire safety of that existing building well below its current levels, and well below the level envisioned by the IBC. The minimum requirements of the IBC for means of egress are clearly stipulated in Chapter 10. These minimums are assumed to be in place and thus required before the sprinkler tradeoff provisions are permitted in other sections of the Code. The IBC goes as far as to state the following:

> **"1001.2 Minimum requirements.** It shall be unlawful to alter a building or structure in a manner that will reduce the number of *exits* or the capacity of the *means of egress* to less than required by this code."

By attempting to take advantage of <u>all</u> of the permitted reductions in fire-resistance ratings permitted by the IBC under these assumptions, this proposal needs to ensure that the base level of fire safety is also maintained. A fully adequate (safe) means of egress is an absolute bare minimum requirement. With a building already having egress deficiencies as compared to the current IBC, there should not be a possibility to further reduce fire safety features in that building.

As just one example, if an existing building had egress stairs that were narrower than the current IBC would allow, then allowing existing fire-rated egress corridors to lose their fire resistance rating could be a very detrimental loss of an essential fire safety feature for the evacuating occupants, who could be forced to wait much longer in the corridors before being able to enter the stairway.

This proposal attempts to outline the process for a proper review to be performed by the building code official to ensure there are no impediments to granting an approval that may result in the reduction of existing levels of protection. The suggested language provides that once an existing building is sprinklered throughout and meets the other fire protection requirements of Chapter 9 and Chapter 10 of the IBC, plans, investigation and evaluation reports, and other data can be submitted seeking approval of the code official for the assignment of the new fire-resistance ratings which might me a reduction, or potentially an increase. The suggested language also requires that any special construction features, conditions of occupancy, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building that impact required fire-resistance ratings shall be identified in the evaluation reports submitted. This is to ensure special conditions are identified that may prevent a reduction in fire-resistance ratings.

An additional part of this Code Change Comment clarifies that the responsibility for reviewing these evaluations, which are based solely on the new construction requirements of the IBC, rests with the Building Official rather than the Fire Code Official. It is the building officials that have the training and experience to review a building for compliance to the IBC. It cannot be assumed that all Fire Official have the required knowledge of the IBC to critically evaluate a building against IBC requirements.

Public Comment 3:

Robert J Davidson, Davidson Code Concepts, LLC, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION 1103
FIRE SAFETY REQUIREMENTS FOR EXISTING BUILDING

1103.1 Required construction. Existing buildings shall comply with not less than the minimum provisions specified in Table 1103.1 and as further enumerated in Sections 1103.2 through 1103.9.

The provisions of this chapter shall not be construed to allow the elimination of fire protection systems or a reduction in the level of fire safety provided in buildings constructed in accordance with previously adopted codes.

Exceptions:

1. <u>Where a change in fire resistance rating has been approved in accordance with Section 803.6 of the International Existing Building Code.</u> ~~Where approved in accordance with Section 102.4, in Group I-2 Condition 2 buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 has been added and the building is now sprinklered throughout, the existing fire resistance ratings, opening protectives, penetrations and joints in assemblies are not required to be maintained where such fire resistance ratings, opening protectives, penetrations and joints are not required in new construction for sprinklered buildings.~~

2. Group U occupancies.

Commenter's Reason: In response to the committee reason statement this proposal coordinates the IFC with the new language added to the IEBC by EB26-13 with a direct reference to the new language.

This puts into place a process for what is currently happening. Jurisdictions are granting approvals for passive fire protection reduction without clear guidance from the family of I-Codes. In some cases the reductions can be haphazardly approved and when buildings are not provided with an automatic fire suppression system throughout. The requirement is for the entire building to be sprinklered before this evaluation is considered and the pointer to the new Section 803.6 affirms that requirement and provides for a thorough review of the passive protection the applicant is seeking to obtain approval for reduction. This will have the added benefit of stopping the reduction in passive protections for projects to individual work areas or smoke compartments. The building would have to be considered as a whole.

EB26 is included here for reference.

EB26-13 AM

803.6 Fire-resistance ratings. *Where approved by the code official, buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 and 903.3.1.2 of the International Building has been added, and the building is now sprinklered throughout, the required fire-resistance ratings of building elements and materials shall be permitted to meet the requirements of the current building code. The building is required to meet the other applicable fire protection requirements of Chapter 9 of the International Building Code.*

Plans, investigation and evaluation reports, and other data shall be submitted indicating which building elements and materials the applicant is requesting the code official to review and approve for determination of applying the current building code fire-resistance ratings. Any special construction features, conditions of occupancy, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building that impact required fire-resistance ratings shall be identified in the evaluation reports submitted.

Public Comment 4:

William E. Koffel, P.E., Koffel Associates, Inc., representing Firestop Contractors International Association (FCIA), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION 1103
FIRE SAFETY REQUIREMENTS FOR EXISTING BUILDING

1103.1 Required construction. Existing buildings shall comply with not less than the minimum provisions specified in Table 1103.1 and as further enumerated in Sections 1103.2 through 1103.9.

The provisions of this chapter shall not be construed to allow the elimination of fire protection systems or a reduction in the level of fire safety provided in buildings constructed in accordance with previously adopted codes.

Exceptions:

1. ~~Where approved in accordance with Section 102.4, in Group I-2 Condition 2 buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 has been added and the building is now sprinklered throughout, the existing fire resistance ratings, opening protectives, penetrations and joints in assemblies are not required to be maintained where such fire resistance ratings, opening protectives, penetrations and joints are not required in new construction for sprinklered buildings.~~
   Where approved by the code official, in Group I-2, Condition 2 buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 of the *International Building* has been added, and the building is now sprinklered throughout, the required fire-resistance ratings of building elements and materials shall be permitted to meet the requirements of the current building code. The building is required to meet the other applicable requirements of the *International Building Code*.
   Plans, investigation and evaluation reports, and other data shall be submitted indicating which building elements and materials the applicant is requesting the code official to review and approve for determination of applying the current building code fire-resistance ratings. Any special construction features including fire resistance rated assemblies and smoke resistive assemblies, conditions of occupancy, means of egress conditions, fire code deficiencies, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building that impact required fire-resistance ratings shall be identified in the evaluation reports submitted.

2. Group U occupancies.

SECTION 1104
MEANS OF EGRESS FOR EXISTING BUILDINGS

1104.1 General. *Means of egress* in existing buildings shall comply with the minimum egress requirements when specified in Table 1103.1 as further enumerated in Sections 1104.2 through 1104.23, and the building code that applied at the time of construction. Where the provisions of this chapter conflict with the building code that applied at the time of construction, the most restrictive provision shall apply. Existing buildings that were not required to comply with a building code at the time of construction shall comply with the minimum egress requirements when specified in Table 1103.1 as further enumerated in Sections 1104.2 through 1104.24.

Exception: ~~Where approved in accordance with Section 102.4, in Group I-2 Condition 2 buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 has been added and the building is now sprinklered throughout, the existing fire resistance ratings, opening protectives, penetrations and joints in assemblies are not required to be maintained where such fire resistance ratings, opening protectives, penetrations and joints are not required in new construction for sprinklered buildings.~~

Where approved by the code official, in Group I-2, Condition 2 buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 of the *International Building* has been added, and the building is now sprinklered throughout, the required fire-resistance ratings of building elements and materials shall be permitted to meet the requirements of the current building code. The building is required to meet the other applicable requirements of the *International Building Code*.
Plans, investigation and evaluation reports, and other data shall be submitted indicating which building elements and materials the applicant is requesting the code official to review and approve for determination of applying the current building code fire-resistance ratings. Any special construction features including fire resistance rated assemblies and smoke resistive assemblies, conditions of occupancy, means of egress conditions, fire code deficiencies, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building that impact required fire-resistance ratings shall be identified in the evaluation reports submitted.

Commenter's Reason: As suggested by the Code Development Committee, the proposal uses language similar to EB26 as the basis for the exception originally proposed for Sections 1103.1 and 1104.1. The differences between the language proposed and EB26 are as follows:

- The application is limited to Group I-2, Condition 2 as originally proposed in F212.
- The use of NFPA 13R sprinkler systems (903.3.1.2). NFPA 13R systems are not appropriate for Group I-2, Condition 2 occupancies.
- The reference to Chapter 9 was deleted since it implies that Chapter 9 requirements are the only ones that need to be considered. A similar Public Comment has been submitted on EB26.

The list of items to be considered has been expanded to include rated assemblies, means of egress assemblies, and fire code deficiencies. It is understood that this is in the IFC but it also recognizes that existing buildings may have deficiencies that still need to be addressed through a plan of correction. A similar Public Comment has been submitted on EB26.

Public Comment 5:

William E. Koffel, P.E., Koffel Associates, Inc., representing Firestop Contractors International Association (FCIA), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION 1103
FIRE SAFETY REQUIREMENTS FOR EXISTING BUILDING

1103.1 Required construction. Existing buildings shall comply with not less than the minimum provisions specified in Table 1103.1 and as further enumerated in Sections 1103.2 through 1103.9.

The provisions of this chapter shall not be construed to allow the elimination of fire protection systems or a reduction in the level of fire safety provided in buildings constructed in accordance with previously adopted codes.

Exceptions:

1 ~~Where approved in accordance with Section 102.4, in Group I-2 Condition 2 buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 has been added and the building is now sprinklered throughout, the existing fire resistance ratings, opening protectives, penetrations and joints in assemblies are not required to be maintained where such fire resistance ratings, opening protectives, penetrations and joints are not required in new construction for sprinklered buildings.~~
Where approved by the code official, in Group I-2, Condition 2 buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 of the *International Building* has been added, and the building is now sprinklered throughout, the required fire-resistance ratings of building elements and materials shall be permitted to meet the requirements of the current building code. The building is required to meet the other applicable requirements of the *International Building Code*.
Plans, investigation and evaluation reports, and other data shall be submitted indicating which building elements and materials the applicant is requesting the code official to review and approve for determination of applying the current

<ins>building code fire-resistance ratings. Any special construction features including fire resistance rated assemblies and smoke resistive assemblies, conditions of occupancy, means of egress conditions, fire code deficiencies, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building that impact required fire-resistance ratings shall be identified in the evaluation reports submitted. Where required by the code official, the plans and evaluation reports submitted to the code official shall be prepared by a registered design professional.</ins>

2. Group U occupancies.

SECTION 1104
MEANS OF EGRESS FOR EXISTING BUILDINGS

1104.1 General. *Means of egress* in existing buildings shall comply with the minimum egress requirements when specified in Table 1103.1 as further enumerated in Sections 1104.2 through 1104.23, and the building code that applied at the time of construction. Where the provisions of this chapter conflict with the building code that applied at the time of construction, the most restrictive provision shall apply. Existing buildings that were not required to comply with a building code at the time of construction shall comply with the minimum egress requirements when specified in Table 1103.1 as further enumerated in Sections 1104.2 through 1104.24.

> **Exception:** ~~Where approved in accordance with Section 102.4, in Group I-2 Condition 2 buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 has been added and the building is now sprinklered throughout, the existing fire resistance ratings, opening protectives, penetrations and joints in assemblies are not required to be maintained where such fire resistance ratings, opening protectives, penetrations and joints are not required in new construction for sprinklered buildings.~~ <ins>Where approved by the code official, in Group I-2, Condition 2 buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 of the *International Building* has been added, and the building is now sprinklered throughout, the required fire-resistance ratings of building elements and materials shall be permitted to meet the requirements of the current building code. The building is required to meet the other applicable requirements of the *International Building Code*.</ins>
>
> <ins>Plans, investigation and evaluation reports, and other data shall be submitted indicating which building elements and materials the applicant is requesting the code official to review and approve for determination of applying the current building code fire-resistance ratings. Any special construction features including fire resistance rated assemblies and smoke resistive assemblies, conditions of occupancy, means of egress conditions, fire code deficiencies, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building that impact required fire-resistance ratings shall be identified in the evaluation reports submitted. Where required by the code official, the plans and evaluation reports submitted to the code official shall be prepared by a registered design professional.</ins>

Commenter's Reason: As suggested by the Code Development Committee, the proposal uses language similar to EB26 as the basis for the exception originally proposed for Sections 1103.1 and 1104.1. The differences between the language proposed and EB26 are as follows:

- The application is limited to Group I-2, Condition 2 as originally proposed in F212.
- The use of NFPA 13R sprinkler systems (903.3.1.2). NFPA 13R systems are not appropriate for Group I-2, Condition 2 occupancies.
- The reference to Chapter 9 was deleted since it implies that Chapter 9 requirements are the only ones that need to be considered. A similar Public Comment has been submitted on EB26.
- The list of items to be considered has been expanded to include rated assemblies, means of egress assemblies, and fire code deficiencies. It is understood that this is in the IFC but it also recognizes that existing buildings may have deficiencies that still need to be addressed through a plan of correction. A similar Public Comment has been submitted on EB26.

This verbiage differs from our similar Public Comment in that it provides an additional provision that the Code Official may require the plans and evaluation reports to be prepared by a registered design professional. There may be some instances in would be appropriate to have a registered design professional prepare the evaluation to determine which requirements from the IBC should be applicable.

Public Comment 6:

Steve Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION 1103
FIRE SAFETY REQUIREMENTS FOR EXISTING BUILDING

1103.1 Required construction. Existing buildings shall comply with not less than the minimum provisions specified in Table 1103.1 and as further enumerated in Sections 1103.2 through 1103.9.

The provisions of this chapter shall not be construed to allow the elimination of fire protection systems or a reduction in the level of fire safety provided in buildings constructed in accordance with previously adopted codes.

Exceptions:

1. Where approved in accordance with Section 102.4, ~~in Group I-2 Condition 2~~ buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2 has been added and the building is now sprinklered throughout, the existing fire resistance ratings, opening protectives, penetrations and joints in assemblies are not required to be maintained where such fire resistance ratings, opening protectives, penetrations and joints are not required in new construction for sprinklered buildings.
2. Group U occupancies.

SECTION 1104
MEANS OF EGRESS FOR EXISTING BUILDINGS

1104.1 General. *Means of egress* in existing buildings shall comply with the minimum egress requirements when specified in Table 1103.1 as further enumerated in Sections 1104.2 through 1104.23, and the building code that applied at the time of construction. Where the provisions of this chapter conflict with the building code that applied at the time of construction, the most restrictive provision shall apply. Existing buildings that were not required to comply with a building code at the time of construction shall comply with the minimum egress requirements when specified in Table 1103.1 as further enumerated in Sections 1104.2 through 1104.24.

Exception: Where approved in accordance with Section 102.4, ~~in Group I-2 Condition 2~~ buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.1.1.2 has been added and the building is now sprinklered throughout, the existing fire resistance ratings, opening protectives, penetrations and joints in assemblies are not required to be maintained where such fire resistance ratings, opening protectives, penetrations and joints are not required in new construction for sprinklered buildings.

Commenter's Reason: This proposal should not just apply to Group I-2 occupancies. When the ad hoc committee worked on this issue, they were limited in scope to just I-2 occupancies. Therefore, they could not propose a change that would be applicable to other occupancies. Therefore, this public comment expands the scope of the provision to all occupancies.

If an owner of an existing building chooses to install an automatic fire sprinkler system, they should be able to take advantage of all of the modifications permitted by the current codes. They should not be penalized if a complete fire sprinkler system is installed.

Public Comment 7:

Vickie Lovell, Intercode, Inc., representing Fire Safe North America, formerly known as Alliance For Fire and Smoke Containment and Control, requests Disapproval.

Commenter's Reason: The committee succinctly identified numerous concerns related to the implementation of this poorly written proposal. The decision making process of determining which assemblies and features would be eliminated or reduced is distilled into one sentence. This proposal, if approved, would give unlimited decision making power to an unidentified person(s) to arbitrarily determine what becomes obsolete and what stays functioning without any defined qualifications.

Granted, a hospital may have access to advanced health care facilities engineering to determine what fire protection features are relevant in a sprinklered building. However, the committee rightfully posed the questions as to why the exception should be limited to Group I-2 Condition 2 only when other occupancies would likely want to take advantage of such a broad, sweeping exception to Section 1103 if it were to be approved. If every occupancy and use group were afforded the opportunity to reduce the ratings throughout without any accountability or qualifications, the International Fire Code would likely become irrelevant.

The recommendation for disapproval is merited, and the committee correctly identified EB26 as having improved language, but still needing further modifications.

F212-13, Part I
Final Action: AS AM AMPC____ D

F212-13, Part II

IEBC 804.2.2.2 (NEW)

<u>Proposed Change as Submitted</u>

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IFC CODE DEVELOPMENT COMMITTEE AND PART II WILL BE HEARD BY THE IEBC CODE DEVELOPMENT COMMITTEE AS SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMMITTEES.

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care (john.williams@doh.wa.gov)

PART II – INTERNATIONAL EXISTING BUILDING CODE

Add new text as follows:

<u>**804.2.2.2 Group I-2.** Where approved, in Group I-2 Condition 2 buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 of the *International Building Code* has been added and the building is now equipped throughout with an automatic sprinkler system, the existing fire resistance ratings, opening protectives, penetrations and joints in assemblies are not required to be maintained where such fire resistance ratings, opening protectives, penetrations and joints are not required in new construction for buildings equipped throughout with an automatic sprinkler system.</u>

Reason: The changes provide tradeoffs for installation of automatic sprinkler systems consistent with those allowed for new construction and also with those allowed by CMS. In many editions of the legacy codes and the ICC Codes dating from the 1980s and even before, the same or similar tradeoffs were allowed when a facility elected to provide sprinkler protection. The AD Hoc Committee on Health Care is proposing requiring retrofit of sprinklers in Hospitals that we feel provide the best protection available and feel because of this the tradeoffs are justified in existing facilities as has been vetted and justified in new construction for many years. These requirements are part of a package of retrofit requirements that provide a minimum level of safety considered necessary for patients, staff and first responders in an environment in which patients are in many instances not capable of self preservation and must be protected in place. Automatic sprinkler protection is key to any plan for protecting residents in place and for the safety of those responding to emergencies by providing the extra time needed to respond. The requirements are also consistent with current CMS standards that apply to all hospitals nationwide receiving Medicare/Medicaid funding and would not add additional requirements to those facilities beyond current nationwide Federal requirements but would allow the facilities to better meet those requirements without possible costly conflicts in other codes.

If this proposal is successful and the proposal for a new Section 1105 is also approved, the Adhoc Health Care committee will bring forward a corresponding exception to be applicable for the new Section 1105.1 as follows:

SECTION 1105
CONSTRUCTION REQUIREMENTS FOR EXISTING GROUP I-2

<u>**1105.1 General**</u>**.** Existing Group I-2 shall meet the following requirements:

1. The minimum fire safety requirements in Section 1103, and
2. The minimum egress requirements in Section 1104, and
3. The additional egress and construction requirements in Sections 1105.2 through 1105.7.5.2.

Where the provisions of this chapter conflict with the construction requirements that applied at the time of construction, the most restrictive provision shall apply.

> <u>**Exception:** Where approved in accordance with Section 102.4, in Group I-2 Condition 2 buildings where a sprinkler system installed in accordance with Section 903.3.1.1 has been added and the building is now sprinklered throughout, the existing fire resistance ratings, opening protectives, penetrations and joints in assemblies are not required to be maintained where such fire resistance ratings, opening protective, penetrations and joints are not required in new construction for sprinklered buildings.</u>

This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the <u>American Society for Healthcare Engineering</u>, a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Cost Impact: None

1103.1-F-WILLIAMS-ADHOC

Committee Action Hearing Results

PART II – IEBC
This code change was heard by the IEBC code development committee.

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this proposal in favor of the action taken on EB26-13 and by the request of the proponent.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Tony Crimi, A.C. Consulting Solutions Inc., representing International Firestop Council (IFC), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

804.2.2.2 Group I-2. Where approved by the building code official in Group I-2, Condition 2 buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2 of the *International Building Code* has been added, and the building is now sprinklered throughout, the required fire-resistance ratings of building elements and materials shall be permitted to meet the requirements of the current building code provided the building also complies with the other applicable fire protection requirements of Chapter 9 and Chapter 10 of the *International Building Code*.

Plans, investigation and evaluation reports, and other data shall be submitted indicating which building elements and materials the applicant is requesting the code official to review and approve for determination of applying the current building code fire-resistance ratings. Any special construction features, conditions of occupancy, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building that impact required fire-resistance ratings shall be identified in the evaluation reports submitted.

~~Where approved, in Group I-2 Condition 2 buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 of the *International Building Code* has been added and the building is now equipped throughout with an automatic sprinkler system, the existing fire resistance ratings, opening protectives, penetrations and joints in assemblies are not required to be maintained where such fire resistance ratings, opening protectives, penetrations and joints are not required in new construction for buildings equipped throughout with an automatic sprinkler system.~~

Commenter's Reason: This modification makes the language in this proposal consistent with the language approved in EB26-13, but also adds a critical element that is lacking in the current proposal.

The current proposal as modified by the Committee would permit all of the sprinkler tradeoffs permitted for new construction in the IBC, even though the means of egress of the existing building have not been evaluated. If a building falls short of the IBC's requirements for means of egress (IBC Chapter 10), allowing that building to then take all of the IBC's sprinkler trade-offs and cease maintenance of fire safety features that would be traded away for sprinklers will result in reducing the level of fire safety of that existing building well below its current levels, and well below the level envisioned by the IBC. The minimum requirements of the IBC for means of egress are clearly stipulated in Chapter 10. These minimums are assumed to be in place and thus required before the sprinkler tradeoff provisions are permitted in other sections of the Code. The IBC goes as far as to state the following:

> "**1001.2 Minimum requirements.** It shall be unlawful to alter a building or structure in a manner that will reduce the number of *exits* or the capacity of the *means of egress* to less than required by this code."

By attempting to take advantage of all of the permitted reductions in fire-resistance ratings permitted by the IBC under these assumptions, this proposal needs to ensure that the base level of fire safety is also maintained. A fully adequate (safe) means of egress is an absolute bare minimum requirement. With a building already having egress deficiencies as compared to the current IBC, there should not be a possibility to further reduce fire safety features in that building.

As just one example, if an existing building had egress stairs that were narrower than the current IBC would allow, then allowing existing fire-rated egress corridors to lose their fire resistance rating could be a very detrimental loss of an essential fire safety feature for the evacuating occupants, who could be forced to wait much longer in the corridors before being able to enter the stairway.

This proposal attempts to outline the process for a proper review to be performed by the building code official to ensure there are no impediments to granting an approval that may result in the reduction of existing levels of protection. The suggested language provides that once an existing building is sprinklered throughout and meets the other fire protection requirements of Chapter 9 and Chapter 10 of the IBC, plans, investigation and evaluation reports, and other data can be submitted seeking approval of the code official for the assignment of the new fire-resistance ratings which might me a reduction, or potentially an increase. The suggested language also requires that any special construction features, conditions of occupancy, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building that impact required fire-resistance ratings shall be identified in the evaluation reports submitted. This is to ensure special conditions are identified that may prevent a reduction in fire-resistance ratings.

An additional part of this Code Change Comment clarifies that the responsibility for reviewing these evaluations, which are based solely on the new construction requirements of the IBC, rests with the Building Official rather than the Fire Code Official. It is the building officials that have the training and experience to review a building for compliance to the IBC. It cannot be assumed that all Fire Official have the required knowledge of the IBC to critically evaluate a building against IBC requirements.

Public Comment 2:

Steve Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

804.2.2.2 ~~Group I-2~~ Sprinklered Buildings. Where approved, ~~in Group I-2 Condition 2~~ buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.1.1.2 of the *International Building Code* has been added and the building is now equipped throughout with an automatic sprinkler system, the existing fire resistance ratings, opening protectives, penetrations and joints in assemblies are not required to be maintained where such fire resistance ratings, opening protectives, penetrations and joints are not required in new construction for buildings equipped throughout with an automatic sprinkler system.

Commenter's Reason: This proposal should not just apply to Group I-2 occupancies. When the ad hoc committee worked on this issue, they were limited in scope to just I-2 occupancies. Therefore, they could not propose a change that would be applicable to other occupancies. Therefore, this public comment expands the scope of the provision to all occupancies.

If an owner of an existing building chooses to install an automatic fire sprinkler system, they should be able to take advantage of all of the modifications permitted by the current codes. They should not be penalized if a complete fire sprinkler system is installed.

Public Comment 3:

Vickie Lovell, Intercode, Inc., representing Fire Safe North America, formerly known as Alliance For Fire and Smoke Containment and Control, requests Disapproval.

Commenter's Reason: The committee succinctly identified numerous concerns related to the implementation of this poorly written proposal. The decision making process of determining which assemblies and features would be eliminated or reduced is distilled into one sentence. This proposal, if approved, would give unlimited decision making power to an unidentified person(s) to arbitrarily determine what becomes obsolete and what stays functioning without any defined qualifications.

Granted, a hospital may have access to advanced health care facilities engineering to determine what fire protection features are relevant in a sprinklered building. However, the committee rightfully posed the questions as to why the exception should be limited to Group I-2 Condition 2 only when other occupancies would likely want to take advantage of such a broad, sweeping exception to Section 1103 if it were to be approved. If every occupancy and use group were afforded the opportunity to reduce the ratings throughout without any accountability or qualifications, the International Fire Code would likely become irrelevant.

The recommendation for disapproval is merited, and the committee correctly identified EB26 as having improved language, but still needing further modifications.

F212-13, Part II

Final Action: AS AM AMPC____ D

F218-13
1103.4.1

Proposed Change as Submitted

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care (john.williams@doh.wa.gov)

Revise as follows:

IFC 1103.4.1 Group I occupancies. In Group I occupancies, interior vertical openings connecting two or more stories shall be protected with 1-hour fire-resistance-rated construction.

Exceptions:

1. In Group I-2 Condition 2 equipped throughout with an automatic sprinkler system, vertical opening connecting two or more stories need not be protected with 1-hour fire-resistance-rated construction where both of the following conditions are met:
   1.1. The atrium volume is accounted for in the design of a smoke control system in accordance with Section 909.
   1.2 The floor levels within the vertical opening shall contain only low or ordinary fire hazard uses.
2. In Group I-2 Condition 2, where an automatic sprlnkler system is installed in accordance with Section 404.6 of the *International Building Code,* glass walls shall be considered to be equivalent to 1-hour fire-resistance-rated construction for purposes of this section. Where glass doors are provided in the glass wall, they shall be either self-closing or automatic-closing.
3. In Group I-2 Condition 2, 1-hour fire-resistance-rated construction is not required where a glass-block wall assembly complying with Section 2110 of the *International Building Code* and having a ¾-hour fire protection rating is provided.

Reason: The intent of this code change is to make the IFC consistent with federal standards that are in place for the maintenance of Group I-2 Condition 2 (hospitals) and to clarify the allowable use and construction of atria in hospitals. This adds language to clarify the fire hazard class allowed in the existing atrium (no higher than ordinary), as opposed to only low hazard class in new. A smoke control system is also acknowledged as a factor when it comes to separation of the atrium, and clarifies that the smoke control system's engineering analysis must account for any spaces open to it.

Glass walls points back to the language in IBC Section 404.6 in an attempt to set that as a minimum, retroactive standard. It is far simpler to address a potential deficiency with addition of a smoke control system or properly installed sprinklers at the glass, rather than reconstructing the walls themselves.

This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April, 2011, the AHC has held 5 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx

Cost impact: This proposal would make the IFC consistent with federal standards that are in place for the maintenance of hospitals, and therefore would not represent an increase in cost.

907.2.6-F-WILLIAMS-ADHOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The disapproval was based on the committee's concern that the exceptions in the proposal do not exactly mirror Section 404.6 of the IBC which it felt should be the minimum standard. The automatic sprinkler requirements are also not coordinated with regard to complete protection of the building or only protection in the Group I-2 fire area.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care and Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

IFC 1103.4.1 Group I occupancies. In Group I occupancies, interior vertical openings connecting two or more stories shall be protected with 1-hour fire-resistance-rated construction.

Exceptions:

1. In Group I-2, unenclosed vertical openings not exceeding two connected stories and not concealed within the building construction shall be permitted as follows:
   - 1.1 The unenclosed vertical openings shall be separated from other unenclosed vertical openings serving other floors by a smoke barrier.
   - 1.2 The unenclosed vertical openings shall be separated from corridors by smoke partitions.
   - 1.3 The unenclosed vertical openings shall be separated from other fire or smoke compartments on the same floors by a smoke barrier.
   - 1.4 On other than the lowest level, the unenclosed vertical openings shall not serve as a required means of egress.
2. In Group I-2, atriums connecting three or more stories shall not require a 1-hour fire resistance rated construction when the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3, and all of the following conditions are met:
   - 2.1. For other than existing approved atriums with a smoke control system, where the atrium was constructed and is maintained in accordance with the code in effect at the time the atrium was created, the atrium shall have a smoke control system that is in compliance with Section 909; and,
   - 2.2. Glass walls forming a smoke partition or a glass-block wall assembly shall be permitted when in compliance with 2.2.1 or 2.2.2:
     - 2.2.1. Glass walls forming a smoke partition shall be permitted where all of the following conditions are met:
       1. Automatic Sprinklers are provided along both sides of the separation wall and doors, or on the room side only if there is not a walkway or occupied space on the atrium side.
       2. The sprinklers shall not be more than 12 inches away from the face of the glass and at intervals along the glass of not greater than 72 inches.
       3. Windows in the glass wall shall be non-operating type.
       4. The glass wall and windows shall be installed in a gasket frame in a manner that the framing system deflects without breaking (loading) the glass before the sprinkler system operates.
       5. The sprinkler system shall be designed so that the entire surface of the glass is wet upon activation of the sprinkler system without obstruction.
     - 2.2.2. A fire barrier is not required where a glass-block wall assembly complying with Section 2110 of the International Building Code and having a 3/4-hour fire protection rating is provided.
   - 2.3. Where doors are provided in the glass wall, they shall be either self-closing or automatic-closing and shall be constructed to resist the passage of smoke.

Commenter's Reason: Based on the input from the committee and interested parties, the AHC and CTC present the revised proposal above. The intent of this change is to appropriately address floor openings in existing construction. Today a conflict exists in the code, the building code would allow you to construction a floor opening without a 1 hour fire barrier in certain specific cases. The fire code would then tell you that approval is void and unilaterally require a 1 hour rating around all openings. This also impacts all historical non-rated floor openings that have been reviewed, approved and maintained. Practically we believe that this is not being enforced today and may be a reason why many jurisdictions do not adopt this chapter of the IFC. To set an appropriate retroactive standard, we believe the code should consider the historical context of the model codes. Unrated vertical openings have been allowed in hospitals and nursing homes previously. Atriums have been installed with various types of smoke venting and removal systems over the past few decades. The AHC has attempted to determine the general requirements that have been broadly used through these versions of codes. If we set the requirements based on the current version of the IBC, the facilities will constantly be tearing out existing, compliant construction to upgrade to new requirements. The federal regulations governing hospitals and nursing homes have used a retroactive standard similar to the one above for the past 10 years. Through our experiences with facilities during that period of time, we believe that the requirements listed above are reasonably consistent with that action.

In regards to the sprinkler question, currently all Group I-2 fire areas are required to have sprinklers retroactively per Chapter 11 of this Code. In Dallas, a code change was accepted to provide sprinkler protection throughout the building by a date certain provided by the adopting jurisdiction. The code change here was modified to state that the atrium option can be used if the "building is equipped throughout".

Public Comment 2:

Robert J Davidson, Davidson Code Concepts, LLC, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

IFC 1103.4.1 Group I occupancies. In Group I and I-3 occupancies, interior vertical openings connecting two or more stories shall be protected with 1-hour fire-resistance-rated construction.

> **Exception** ~~**Exceptions:**~~ Atriums constructed in accordance with the code in effect at the time the atrium was created and which include automatic fire suppression, fire detection, alarm notification, and smoke control system protection. The atrium shall have been maintained in accordance with manufacturer's instructions and in accordance with the fire code in effect during occupancy of the atrium.

1. ~~In Group I-2 Condition 2 equipped throughout with an automatic sprinkler system, vertical opening connecting two or more stories need not be protected with 1-hour fire-resistance-rated construction where both of the following conditions are met:~~
   ~~1.1. The atrium volume is accounted for in the design of a smoke control system in accordance with Section 909.~~
   ~~1.2 The floor levels within the vertical opening shall contain only low or ordinary fire hazard uses.~~
2. ~~In Group I-2 Condition 2, where an automatic sprlnkler system is installed in accordance with Section 404.6 of the *International Building Code,* glass walls shall be considered to be equivalent to 1-hour fire-resistance-rated construction for purposes of this section. Where glass doors are provided in the glass wall, they shall be either self-closing or automatic-closing.~~
3. ~~In Group I-2 Condition 2, 1-hour fire-resistance-rated construction is not required where a glass-block wall assembly complying with Section 2110 of the *International Building Code* and having a ¾-hour fire protection rating is provided.~~

Commenter's Reason: Though testimony on the floor and the committee reason statement point to the acceptable level of protection being the current requirements for atriums in Section 404.0 of the International Building Code; the intent of Chapter 11 of the fire code is to be applied to buildings not in compliance with the International Building Code.

Since the target is an existing atrium, the atrium may have been designed and constructed to earlier editions of the International Building Code or in accordance with one of the legacy codes. The suggested replacement wording will provide for recognition of an atrium regardless of which code it was constructed under as long as it has been properly maintained during the life of the atrium.

When atriums were introduced as a design feature in the legacy codes, the fire protection required included automatic fire suppression systems, fire detection systems, alarm notification appliances, smoke control systems and separation from connecting floors that were not provided for in the design of the smoke control system. Those protection features are included in this proposal to make it clear they must not only be present, but must have been properly maintained as well. The intent is also to make it clear that you cannot take what was once considered an "open well" under legacy codes and rename it an atrium for application of this exception. To apply this exception the atrium would have had to have been designed and constructed pursuant to all of the requirements for an atrium after the design feature was added to the legacy codes and contain all of the listed fire protection features.

Section 1103.4.1 has been modified by the addition of the I-3 group designation to be consistent with F217 approved by the committee.

Public Comment 3:

Vickie Lovell, Intercode, Inc., representing Fire Safe North America, formerly known as Alliance For Fire and Smoke Containment and Control, requests Disapproval.

Commenter's Reason: In Dallas, there was much testimony from the floor pointing out the serious flaws with this proposal. The proposal seeks to grandfather existing atrium spaces, but it does it so by cherry-picking some of the atrium requirements that have historically applied as a whole package. This proposal allows compliance with only a small portion of the requirements found with current and legacy codes.

Testimony on the floor and the comments from the International Fire Code Committee members regarding Exception #1 coalesced around a simply reference to Section 404.0 Atriums in the International Building Code as the appropriate level of protection. However, from a practical standpoint, even that solution would not work for an exception to the fire code requirement for a 1 hour fire resistance rated construction. A review of the legacy codes versus the current IBC will document that the requirements for the installation of smoke control systems in older buildings have vast differences from systems designed to the current IBC 909 requirements. Existing smoke control systems designed and installed in accordance with some legacy codes would require completely new designs and major upgrades that will present practical difficulties, therefore making exception #1 impractical and effectively useless as a code requirement. Some of the same practical difficulties would also be presented for those older atrium spaces without smoke control systems that this proposed exception would apply to.

If the building and smoke control system are not designed to work together as a building system, there will be practical difficulty installing required exhaust inlets and ductwork, make-up air inlets and openings, locating exhaust fans, load carrying capability of the structure, capability of the building power supply including the available emergency power to handle the load of the newly installed or increased number of fans in an older building. Specialists in the smoke control field know that if the design is not correct or the design is not properly followed in a newly constructed building, problems with the smoke control system discovered near the end of the job are very difficult to correct due to practical issues.

Exception #2 is a woefully inadequate description of the correct use of sprinklers in combination with a glass wall as an alternative to a 1-hour fire rated assembly. ICC ES recently reissued revised acceptance criteria (AC385 - Acceptance Criteria for Special-purpose Sprinkler Heads Used with Fixed Glazed Assemblies to Provide a Fire-resistance-rated Wall Assembly) for the use of sprinklers and glazed assemblies. The acceptance criteria contain a detailed description of how the glass assembly is to be constructed and how the sprinklers are to be placed. It also clarifies some of the limitations as to the appropriate use of this type of assembly as an alternative (not an equivalent) to a fire resistance rated assembly. This exception applies everywhere and anywhere in I-2 Condition 2 facilities, which is not consistent with AC 385.

As an interested party, I monitored the discussion of the ICC Ad Hoc on Health Care on the public comment, and was not satisfied that the public comment would adequately resolve these concerns. The proposed exceptions in this proposal, including the further modifications by the proponent, are completely inadequate. A reference to Section 404.0 Atriums as a solution will introduce complexity and difficulties that cannot be overcome in most if not all cases. The committee decision to disapprove should be upheld.

F218-13

Final Action: AS AM AMPC____ D

F222-13
1103.5.3 (New), Table 1103.1

Proposed Change as Submitted

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

1103.5.3 Group A-2. An automatic sprinkler system shall be installed in accordance with Section 903.3.1.1 throughout existing buildings or portions thereof used as Group A-2 occupancies with an occupant load of 300 or more.

Table 1103.1
OCCUPANCY AND USE REQUIREMENTS

Section	Use			Occupancy Classification																		
				A	B	E	F	H-1	H-2	H-3	H-4	H-5	I-1	I-2	I-3	I-4	M	R-1	R-2	R-3	R-4	S
1103.5.3	-	-	-	R[a]	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

(Portions of table not shown remain unchanged)

a. Only applies to Group A-2 occupancies

Reason: This requirement implements the Recommendation #1 included in the NIST Report of the Technical Investigation of The Station Nightclub Fire (NIST NCSTAR 2: Vol. I). *Recommendation 1* of the NIST report states:

> "Model codes should require sprinkler systems for all new and existing nightclubs regardless of size."

There is a list of fires in Group A-2 occupancies. This list includes the Station Nightclub, Beverly Hill Supper Club, the Coconut Grove and others. Each of these fires have resulted in a significant loss of life.

Group A-2 occupancies involve conditions such as large occupant loads, high occupant density, significant fuel loading and moveable furnishings and decorations. Group A-2 occupancies also include the potential for reduced lighting levels, high noise levels, combustible decorations, strobe and flashing lights, alcohol consumption, and confusing egress paths. Each of these alone can be a significant issue, but when combined they lead to the inability of the occupants to promptly and safely exit the building under fire conditions.

This proposal considers the arrangement of the IBC occupancy classifications and the inclusion of other uses in addition to nightclubs within the Group A-2 classification. Therefore, this proposal does not reach as far as the recommendation from NIST. While the NIST proposal recommends fire sprinklers in ALL facilities, this proposal will require existing Group A-2 occupancies to be retrofit with a fire sprinkler system only if the occupant load exceeds 300. Setting the threshold at 300 occupants will place the requirement where the higher potential for loss of life exists.

The proposed section only requires that the Group A-2 occupancy is provided with a fire sprinkler system. The section does not require the entire fire area to be protected, nor does it require the entire floor to be protected. The fire sprinkler system would be installed in the portion of the building which contains the Group A-2 occupancy.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

Cost Impact: The code change will not increase the cost of new construction, but it will create a cost for existing unsprinklered buildings classified as Group A-2.

1103.5.3 (NEW) #1-F-ZUBIA-FCAC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee approved the code change based on the proponent's reason statement and because there is a fire history in Group A-2 occupancies. While the committee felt that the scope of sprinkler protection was adequately stated, it was suggested that the scope could be better defined in the public comment phase.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

TABLE 903.2.11.6
ADDITIONAL REQUIRED FIRE SUPPRESSION SYSTEMS

1103.5.3	Existing Group A-2 occupancies

1103.5 Sprinkler systems. An automatic sprinkler system shall be provided in existing buildings in accordance with Sections 1103.5.1 through ~~and 1103.5.2~~ 1103.5.3.

1103.5.3 Group A-2. An automatic sprinkler system shall be installed in accordance with Section 903.3.1.1 throughout existing buildings or portions thereof used as Group A-2 occupancies with an occupant load of 300 or more that serve alcoholic beverages.

Section	Use			Occupancy Classification																		
				A	B	E	F	H-1	H-2	H-3	H-4	H-5	I-1	I-2	I-3	I-4	M	R-1	R-2	R-3	R-4	S
1103.5.3	-	-	-	R[~~a~~b]	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

~~a~~ b. Only applies to Group A-2 occupancies that serve alcoholic beverages.

Commenter's Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

Although Item F222-13 was approved as submitted by the code development committee, comments offered at the Dallas hearing warranted further consideration. As a result, the Fire Code Action Committee, as the original proponent, recommends some additional changes, as follows:

1. A cross reference to new Section 1103.5.3 has been added to Table 903.2.11.6 and Section 1103.5.
2. The footnote in Table 1103.1 has been corrected to (b), since there is an existing (a).
3. The sprinkler retrofit requirement has been targeted to only apply to Group A-2 occupancies that serve alcoholic beverages, which reduces the original scope of the change that affected all Group A-2 occupancies. This is felt to be more in line with the NIST recommendations that were made following the Station Nightclub fire recognizing that intoxication of patrons plays a significant role in the potential risk of injury or loss of life in the event of a fire. In addition, limiting the scope of the change to only those occupancies that serve alcoholic beverages allows a connection to licensing laws that jurisdictions typically have in place for sale of such beverages. Such licensing laws, where they apply, will provide significant leverage for jurisdictions to be able to effectively enforce the requirement for a fire sprinkler system as a condition of being code compliant and issuance of a license.

Public Comment 2:

Tim Ryan, representing The International Association of Building Officials, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

APPENDIX K
GROUP A-2 OCCUPANCIES - RETROACTIVE AUTOMATIC SPRINKLER REQUIREMENT

K101.1 Scope. An automatic sprinkler system shall be installed in existing buildings in accordance with this appendix.

K101.2 Group A-2. An automatic sprinkler system shall be installed in accordance with Section 903.3.1.1 throughout existing buildings or portions thereof used as Group A-2 occupancies with an occupant load of 300 or more.

Commenter's Reason: The International Association of Building Officials believes that retroactive requirements for A-2 occupancies is overly restrictive and can financially penalize business owners. Mandatory, retroactive requirements for existing buildings that were previously permitted, inspected and properly maintained should be a jurisdictional choice and not be the minimum recognized standard in a model code. Deletion of chapter 11 provisions is a common practice by jurisdictions when adopting the IFC. By locating these provisions into the appendices it allows for enhanced due process for deliberating on such changes. This proposal is being made to be consistent with IFC Committee Action on F223, 224 and F347 related to R-1 occupancies.

F222-13
Final Action: AS AM AMPC____ D

F226-13
1103.5.3 (New)

<u>Proposed Change as Submitted</u>

Proponent: Thomas G. Daly representing The Hospitality Security Consulting Group, LLC

Add new text as follows:

<u>**1103.5.3 Group R-1 hotels and motels.** An *automatic sprinkler system* shall be provided throughout existing Group R-1 hotels and motels.</u>

> <u>**Exception:** Group R-1 hotels and motels of one story in height where all individual guestrooms and contiguous attic and crawl spaces are separated from each other and public and common areas by at least 1-hour fire partitions and each individual guestroom has an exit directly to a public exit court or yard.</u>

Reason:

A. Background: In the United States civilian fire deaths in Group R-1 hotels and motels over the past two decades have occurred exclusively in non-sprinklered and multi-story low-rise hotels/motels as predicted by the hotel industry. Notable National Fire Protection Association (NFPA) *and/or* media reported multiple loss of life low-rise hotel/motel fires include:
   1. Fontana Hotel - Miami Beach, FL - three stories - 9 civilian fire deaths - *4/6/1990*
   2. Paxton Hotel- Chicago, IL - four stories - 21 civilian fire deaths - *3/23/1993*
   3. Howard Johnson Hotel - Bowling Green, KY - two stories - 4 civilian deaths -*1/6/1996*
   4. Comfort Inn Hotel- Greenville, SC - three stories - 6 civilian deaths - *1/25/2004*
   5. Mason Hotel- San Diego, CA - three stories - 2 civilian deaths - *12/17/2004*
   6. Mitzpah Hotel- Reno, NV - three stories -12 civilian deaths -*10/31/2006*
   7. Zanzibar Motel- Reno, NV - two stories - 2 civilian deaths -*12/10/2007*
   8. Days Inn Hotel- Hoover, AL - two stories - 4 civilian deaths - *1/16/2010*

   Civilian fire deaths in hotels/motels averaged 7.7 per 1000 fires with no automatic suppression system present for the 1994-1998 timeframe. Civilian fire deaths in hotel/motel fires averaged11 each year from 2003-2007"- Civilian fire injuries in hotel/motel fires averaged 151 per year for the period 2003-2007.4

B. Code provisions remain inadequate to address hazard. Despite firesafety improvements for existing buildings mandated by the IFC starting in 20005 those changes have not resulted in a reduction in the annual civilian fire death statistics in nonsprinklered hotels/motels. Comparatively, no fire civilian fire deaths have been reported in sprinklered Group R-1 hotels/motels. After a decade of these codes changes fire deaths and injuries continue to occur in low-rise non-sprinklered Group R-1 hotels/motels. Without further code enhancements for existing hotels/motels, this carnage will continue. As such, a 'distinct hazard' continues to be present to occupants of non-sprinklered Group R-1 hotels and motels with regard to fires therein.

C. Cost/benefits: The U.S. lodging industry has largely completed the mostly voluntary sprinkler retrofitting of existing high-rise hotels, an effort which resulted in zero fire fatalities over the past two decades in such hotels? Leading lodging operators and franchisors including Hilton, Marriott and Starwood have also completed the sprinkler retrofitting of their low-rise hotels, dispelling the myth that such retrofit costs are prohibitive. Those costs are no more expensive than the routinely scheduled replacement of furnishings, fixtures and equipment (FF&E) including mattresses, case goods, carpeting, draperies and wall covering done by the industry. A hotel/motel sprinkler retrofit project is a one-time capital cost whereas the replacement of FF&E is a continuing periodic capital cost which the industry routinely bears. A hotel/motel sprinkler retrofit provides for a reduction in property insurance premiums and reduces the risk to firefighters engaged in fire suppression activities therein. As a result of these sprinkler system retrofits none of those cited hotel chains has experienced a civilian fire fatality in any of their hotels in the last two decades. Nonetheless, some lodging chains and many independent low-rise hotel owners/operators have not taken the same proactive action to protect their guests. The cost of such retrofits for commercial buildings including hotels and motels has been mitigated significantly by the permitted use of NFPA 13R as the installation standard for residential occupancies of 4 stories and less, the use of listed CPVC pipe in lieu of steel pipe or copper tube, the use of extended coverage sprinklers, the lack of the need in most cases for a fire pump in low rise Group R-1 buildings and through tax incentives in the forms of grants, tax credits, tax deductions and/or low interest loans for doing so see, for examples, state statutes in Alaska, South Carolina 10 and California 11 as well as numerous local ordinances.

Summary: Existing IFC provIsions have failed to prevent hotel/motel fire fatalities and thus a 'distinct hazard' to Group R-1 hotel and motel occupants continues to exist. The code change proposed herein, if adopted, will eliminate the 'distinct hazard' to life for such occupants.

Cost Impact: The proposal will increase the cost of construction.

1103.5.3 (NEW)-F-DALY

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The disapproval was based on the committee's judgment that the cost-benefit analysis does not justify the code change. It was also felt that the exception would unreasonably limit the exit discharge to the defined areas of an "exit court" or "yard" and that the change could be financially onerous for small lodging operations. It was suggested that the proposal should be revised to increase the threshold to more than one story.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Thomas G. Daly, representing The Hospitality Security Consulting Group, LLC, requests Approval as Submitted.

Commenter's Reason: Code Change proposal F-226-13 will end the fire risk to life in low-rise non-sprinklered hotels and motels and is not cost prohibitive as evidenced by the thousands of such existing hotel owners/operators who have retrofitted their facilities with automatic sprinkler systems.

Public Comment 2:

J. William Degnan, President, representing National Association of State Fire Marshals, requests Approval as Submitted.

Commenter's Reason: NASFM disagrees with the cost-benefit analysis by the committee. The proponent provides valid justification and support for this proposal, as shown by both civilian and firefighter deaths. The increased fuel loads and synthetic materials have greatly changed the rate and size at which the fire spread. Less than a year ago, 4 Houston firefighters were killed in a low rise motel fire. We support the need to address the court or yard exit.

Public Comment 3:

Jonathan Dunaway, Clark County (WA) Fire Marshal's Office, representing Washington State Association of Fire Marshals; Robert Marshall representing California Fire Chiefs, request Approval as Modified by this Public Comment.

Modify the proposal as follows:

1103.5.3 Group R-1 hotels and motels. An *automatic sprinkler system* shall be provided throughout existing Group R-1 hotels and motels that are three stories or more in height as measured from the lowest level of fire department access.

> ~~**Exception:** Group R-1 hotels and motels of one story in height where all individual guestrooms and contiguous attic and crawl spaces are separated from each other and public and common areas by at least 1-hour fire partitions and each individual guestroom has an exit directly to a public exit court or yard.~~

Commenter's Reason: This proposal addresses the committee's concerns that the threshold b more than one story and better justifies the existing Group R-1 hotels and motels three or more stories are beyond the reach of ground ladders for firefighting operations.

F226-13

Final Action: AS AM AMPC____ D

F228-13
1103.7.6

Proposed Change as Submitted

Proponent: Jeffrey M. Shapiro, International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com)

Revise as follows:

1103.7.6 Group R-2. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.6 shall be installed in existing Group R-2 occupancies more than three stories in height or with more than 16 *dwelling* or *sleeping units.*

Exceptions:

1. Where each living unit is separated from other contiguous living units by *fire barriers* having a *fire-resistance rating* of not less than 0.75 hour, and where each living unit has either its own independent *exit* or its own independent stairway or ramp discharging at grade.
2. A separate fire alarm system is not required in buildings that are equipped throughout with an *approved* supervised *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2 and having a local alarm to notify all occupants.
3. A fire alarm system is not required in buildings that do not have interior *corridors* serving *dwelling units* and are protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, provided that *dwelling units* either have a *means of egress* door opening directly to an exterior *exit access* that leads directly to the *exits* or are served by open ended *corridors* designed in accordance with Section 1026.6, Exception 4.
4. <u>A fire alarm system is not required in buildings that do not have interior *corridors* serving *dwelling units*, do not exceed 3 stories in height and comply with all of the following:</u>
   <u>4.1 Each *dwelling unit* is separated from other contiguous *dwelling units* by *fire barriers* having a *fire-resistance rating* of not less than ¾ hour</u>
   <u>4.2 Each *dwelling unit* is provided with interconnected smoke alarms complying with Section 907.2.11 in all sleeping rooms, plus not less than one hardwired smoke alarm in the common area of each floor or mezzanine level. Interconnection shall be permitted to be hardwired or by listed smoke alarms with wireless interconnect capability</u>

Reason: The proposal provides a reasonable alternative to retrofitting a manual fire alarm system in existing Group R-2 occupancy buildings not exceeding three stories in height and having exits that lead directly to the outside. Fire risk in apartments tends to be greatest for occupants inside the dwelling unit where a fire originates, and money spent to retrofit firesafety equipment in apartments is better spent within dwelling units, as opposed to common areas.

Countless existing apartment buildings have only a single smoke alarm in the common area, and the IFC does not require retrofitting of smoke alarms in sleeping rooms when such alarms weren't required at the time of construction. The lack of smoke alarms in bedrooms, and particularly the lack of interconnecting alarm signals, increases the risk of injury or death in a unit of fire origin and other units that experience smoke infiltration. An additional consequence may be delayed recognition of a fire event, which increases the risk of harm to other building occupants and may delay notification of the fire department.

The alternative of a manual fire alarm system is less beneficial from a safety perspective because it requires an occupant to detect a fire event (which may take more time with fewer smoke alarms) and then find and activate a pull stations. Occupants must then respond to the alarm signal, and with the history of false alarms associated with manual fire alarm systems in apartment buildings, a response without other indications of a fire is questionable.

Cost Impact: The code change proposal will not increase the cost of construction.

1103.7.6-F-SHAPIRO

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee agreed with the proponent that the code change will provide an increased level of life safety in an economical fashion for existing Group R-2 buildings.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Jeffrey M. Shapiro, P.E., International Code Consultants, representing National Multi Housing Council, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1103.7.6 Group R-2. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.6 shall be installed in existing Group R-2 occupancies more than three stories in height or with more than 16 *dwelling* or *sleeping units.*

Exceptions:

1. Where each living unit is separated from other contiguous living units by *fire barriers* having a *fire-resistance rating* of not less than 0.75 hour, and where each living unit has either its own independent *exit* or its own independent stairway or ramp discharging at grade.
2. A separate fire alarm system is not required in buildings that are equipped throughout with an *approved* supervised *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2 and having a local alarm to notify all occupants.
3. A fire alarm system is not required in buildings that do not have interior *corridors* serving *dwelling units* and are protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, provided that *dwelling units* either have a *means of egress* door opening directly to an exterior *exit access* that leads directly to the *exits* or are served by open ended *corridors* designed in accordance with Section 1026.6, Exception 4.
4. A fire alarm system is not required in buildings that do not have interior *corridors* serving *dwelling units*, do not exceed 3 stories in height and comply with all of the following:
   - 4.1 Each *dwelling unit* is separated from other contiguous *dwelling units* by *fire barriers* having a *fire-resistance rating* of not less than ¾ hour
   - 4.2 Each dwelling unit is provided with <u>smoke alarms complying with the requirements of Section 907.2.11.</u> ~~interconnected smoke alarms complying with Section 907.2.11 in all sleeping rooms, plus not less than one hardwired smoke alarm in the common area of each floor or mezzanine level. Interconnection shall be permitted to be hardwired or by listed smoke alarms with wireless interconnect capability~~

Commenter's Reason: After the committee approved this proposal, questions were raised regarding the clarity of the requirements in Item 4.2. In reviewing those concerns, it seems to make better sense to simply reference the installation requirements that apply to new construction in Section 907.2.11. The basic logic of the original proposal, which was approved without opposition at the committee hearing with a 14:0 vote, continues to apply. Retrofitting interconnected smoke alarms into all sleeping rooms in existing dwelling units is preferable to a manual fire alarm system for buildings that do not have interior corridors and do not exceed 3 stories in height.

It should be noted that the requirement in Section 1103.7.6 have been in the code for quite some time. Any jurisdiction intending to enforce the existing manual fire alarm requirement has already had several years to adopt and apply that requirement. In those jurisdictions that have not yet been able to enact a retroactive fire alarm requirement, this exception provides an alternative solution that greatly increase safety and has the support of the National Multi Housing Council.

Public Comment 2:

Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1103.7.6 Group R-2. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.6 shall be installed in existing Group R-2 occupancies more than three stories in height or with more than 16 *dwelling* or *sleeping units.*

Exceptions:

1. Where each living unit is separated from other contiguous living units by *fire barriers* having a *fire-resistance rating* of not less than 0.75 hour, and where each living unit has either its own independent *exit* or its own independent stairway or ramp discharging at grade.
2. A separate fire alarm system is not required in buildings that are equipped throughout with an *approved* supervised *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2 and having a local alarm to notify all occupants.
3. A fire alarm system is not required in buildings that do not have interior *corridors* serving *dwelling units* and are protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, provided that *dwelling units* either have a *means of egress* door opening directly to an exterior *exit access* that leads directly to the *exits* or are served by open ended *corridors* designed in accordance with Section 1026.6, Exception 4.
4. A fire alarm system is not required in buildings that do not have interior *corridors* serving *dwelling units*, do not exceed ~~3~~ 2 stories in height and comply with all of the following:
   4.1 Each *dwelling unit* is separated from other contiguous *dwelling units* by *fire barriers* having a *fire-resistance rating* of not less than ¾ hour
   4.2 Each *dwelling unit* is provided with hard wired interconnected smoke alarms as required for new construction in Section 907.2.11. ~~Each *dwelling unit* is provided with interconnected smoke alarms complying with Section 907.2.11 in all sleeping rooms, plus not less than one hardwired smoke alarm in the common area of each floor or mezzanine level. Interconnection shall be permitted to be hardwired or by listed smoke alarms with wireless interconnect capability~~

Commenter's Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

This public comment addresses two concerns with the proposal. First, it was felt that providing this exception for three story R-2 occupancies was not justified due to the risk associated with evacuating occupants from such a building without the benefit of a manual fire alarm system. The increased risk to occupants on the third floor necessitate the need for a manual fire alarm system that would provide early warning to all occupants when a fire on the first floor could block egress from the two floors above. Evacuating occupants from a two story building does not pose as great of a risk.

Essentially this exception, approved as submitted, would remove the requirement to retroactively install a manual fire alarm system by only installing a battery-powered smoke alarm in each sleeping room of a three story building. .

Second, the wording included in exception 4.2 was very confusing, including the reference to a 'common area' in buildings that do not contain interior corridors, the references to how interconnection is to be provided, and requiring hard wiring for just the smoke alarm in the 'common area'.

F228-13

Final Action: AS AM AMPC____ D

F229-13
1103.8.1

Proposed Change as Submitted

Proponent: David S. Collins, FAIA, The Preview Group, Inc., representing The American Institute of Architects (dcollins@preview-group.com); Robert J Davidson, Davidson Code Concepts, LLC

Revise as follows:

1103.8.1 Where required. Existing Group I-1 and R occupancies shall be provided with single-station smoke alarms in accordance with Section 907.2.11 of the *International Building Code*, except as ~~provided~~ required in Sections 1103.8.2. ~~and~~ or 1103.8.3.

Reason: The provisions of 1103.8.2 and 1103.8.3 aren't exceptions, but additional requirements for interconnection and power source for specific applications. Each of these two sections can be applied independently without connection to one another.

Cost Impact: The proposal will not increase the cost of construction.

1103.8.1-F-COLLINS-DAVIDSON

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify proposal as follows:

1103.8.1 Where required. Existing Group I-1 and R occupancies shall be provided with single-station smoke alarms in accordance with Section 907.2.11 of the *International Building Code*~~, except~~ as required in Section~~s~~ 1103.8.2 or 1103.8.3.

Committee Reason: The committee agreed with the proponent that the code change provides a needed clarification of the text. The modification further clarifies that the two cited sections are requirements rather than exceptions.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment :

Jeffrey M. Shapiro, P.E., International Code Consultants, representing National Multi Housing Council, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

1103.8.1 Where required. Existing Group I-1 and R occupancies shall be provided with single-station smoke alarms in accordance with Section 907.2.11 of the *International Building Code*~~,~~. Interconnection and power sources shall be in accordance with ~~as required in~~ Sections 1103.8.2 ~~or~~ and 1103.8.3.

Commenter's Reason: The committee approved text isn't entirely clear since Sections 1103.8.2 and 1103.8.3 are only supplemental to the basic requirement of complying with Section 907.2.11. The proposed revision clarifies this point. No technical change is intended.

F229-13
Final Action: AS AM AMPC____ D

F239-13
1105.3 (New); 202 (New)

Proposed Change as Submitted

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care (john.williams@doh.wa.gov) and Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee (cbaldassarra@RJAGroup.com)

Add new text as follows:

IFC SECTION 1105
CONSTRUCTION REQUIREMENTS FOR EXISTING GROUP I-2

1105.3 Corridor construction. In Group I-2, in areas housing patient sleeping or care rooms, corridor walls and the opening protectives therein shall provide a barrier designed to resist the passage of smoke in accordance with Sections 1105.3.1 through 1105.3.7.

1105.3.1 Materials. The walls shall be of materials permitted by the building type of construction.

1105.3.2 Fire-resistance rating. Unless required elsewhere in the code, corridor walls are not required to have a fire-resistance rating.

1105.3.3 Corridor Walls Continuity. Corridor walls shall extend from the top of the foundation or floor below to one of the following:

1. The underside of the floor or roof sheathing, deck or slab above.
2. The underside of a ceiling above where the ceiling membrane is constructed to limit the passage of smoke.
3. The underside of a lay-in ceiling system where the ceiling tiles weigh at least one pound per square foot of tile.

1105.3.4 Openings in corridor walls. Openings in corridor walls shall provide protection in accordance with 1105.3.4.1 through 1105.3.4.3.

1105.3.4.1 Windows. Windows in corridor walls shall be sealed to limit the passage of smoke, or the window shall be automatic closing upon detection of smoke, or the window opening shall be protected by an automatic closing device that closes upon detection of smoke.

Exception: In smoke compartments not containing patient sleeping rooms, pass-through windows or similar openings shall be permitted in accordance with Section 1105.3.4.3.

1105.3.4.2 Doors. Doors in corridor walls shall comply with Sections 1105.3.4.2.1 through 1105.3.4.2.3.

1105.3.4.2.1 Louvers. Doors in corridor walls shall not include louvers, transfer grills or similar openings.
Exception: Doors shall be permitted to have louvers, transfer grills or similar openings at toilet rooms or bathrooms; storage rooms that do not contain storage of flammable or combustible material; and storage rooms that are not required to be separated as incidental uses.

1105.3.4.2.2 Corridor doors. Doors in corridor walls shall limit the transfer of smoke by complying with the following:

1. Doors shall be constructed of not less than 1-3/4 inch (44 mm) thick solid bonded core wood or capable of resisting fire for a minimum of 1/3 hours.
   Exception: Corridor doors in buildings equipped throughout with an automatic sprinkler system.

2. Frames for side hinged swinging doors shall have stops on the sides and top to limit transfer of smoke.
3. Where provided, vision panels in doors shall be a fixed glass window assembly installed to limit the passage of smoke.Existing wired glass panels with steel frames shall be permitted to remain in place.
4. Doors undercuts shall not exceed 1 inch (25 mm).
5. Doors shall be positive latching with devices that resist not less than 5 pounds (22.2 N). Roller latches are prohibited.
6. Mail slots or similar openings shall be permitted in accordance with Section 1105.3.4.3.

1105.3.4.2.3 Dutch doors. Where provided, dutch doors shall comply with Section 1105.3.4.2.2. In addition, dutch doors shall be equipped with latching devices on either the top or bottom leaf to allow leaves to latch together. The space between the leaves shall be protected with devices such as astragals to limit the passage of smoke.

1105.3.4.2.4 Self- or automatic-closing doors. Where self- or automatic-closing doors are required, closers shall be maintained in operational condition.

1105.3.4.3 Openings in corridor walls and doors. Mail slots, pass through windows or similar openings shall not be required to be protected where the aggregate area of the openings between the corridor and a room are not greater than 80 square inches (51 613 mm^2) and are located with the top edge of any opening no higher than 48 inches above the floor.

1105.3.5 Penetrations. The space around penetrating items shall be filled with an *approved* material to limit the passage of smoke.

1105.3.6 Joints. Joints shall be filled with an *approved* material to limit the passage of smoke.

1105.3.7 Ducts and air transfer openings. The space around a duct penetrating a smoke partition shall be filled with an *approved* material to limit the passage of smoke. Air transfer openings in smoke partitions shall be provided with a *smoke damper* complying with Section 717.3.2.2 of the International Building Code.

> **Exception:** Where the installation of a *smoke damper* will interfere with the operation of a required smoke control system in accordance with Section 909, *approved* alternative protection shall be utilized.

1104.17 Corridors construction. Corridors serving an occupant load greater than 30 and the openings therein shall provide an effective barrier to resist the movement of smoke. Transoms, louvers, doors and other openings shall be kept closed or be self closing. In Group I-2, corridors in areas housing patient sleeping or care rooms shall comply with Section 1105.3.

Exceptions:

1. Corridors in occupancies other than in Group H ~~and I-2,~~ which are equipped throughout with an approved automatic sprinkler system.
2. ~~Patient room doors in corridors in occupancies in Group I-2 where smoke barriers are provided in accordance with the International Building Code.~~

~~3~~2. Corridors in occupancies in Group E where each room utilized for instruction or assembly has at least one-half of the required means of egress doors opening directly to the exterior of the building at ground level.

~~4~~3. Corridors that are in accordance with the *International Building Code*.

SECTION 202
GENERAL DEFINITIONS

DUTCH DOOR. A door divided horizontally so that the top can be operated independently from the bottom.

Reason: This change adds minimum requirements for existing Group I-2 into Chapter 11 by adding specific retrofit requirements. This change will move the existing retrofit requirements for corridors in I-2 occupancies to proposed new section 1105.3 and add more detailed specific requirements. The intent is to increase the bare minimum safety requirements due to the fragile and sensitive populations within these facilities. These requirements are meant to be applied retroactively. This is not a new concept for these facilities as it aligns with the current approach by the Center for Medicaid and Medicare Services (CMS), the federal authority having jurisdiction. Hospitals are now required by CMS to have a life safety survey on a regular basis. If the facility does not meet certain life safety minimums, they are required to upgrade their existing facility. These retroactive requirements are added to assist code officials and surveyors during the ongoing regular inspection of hospital facilities and are consistent with the inspections required by federal laws for certification and reimbursement. The requirements consider the minimum previously approved construction methods. These requirements will provide jurisdictions the ability to adopt minimum retroactive provisions that provide a more uniform level of safety and eliminate many of the current code conflicts for existing facilities.

We looked at several sources to determine what the appropriate minimum bar should be, including the current building and fire code, current CMS guidelines, and previous versions of the ICC and model codes. On all issues, enforcement agencies and the regulated facilities weighed in to ensure that these changes are both necessary and achievable.

These provisions are written specifically for hospitals (Group I-2, Condition 2). These are retrofit requirements that provide a minimum level of safety considered necessary for patients, staff and first responders in an environment in which patients are in many instances not capable of self preservation and must be protected in place. The changes also provide tradeoffs for automatic sprinkler systems consistent with those allowed for new construction and also with those allowed by CMS. In no way does this affect the existing requirement that existing, approved construction must be maintained in the manner that it was approved. It simply provides a tool for evaluating historical construction techniques.

Specific points include:

- Existing corridor construction should primarily be evaluated for it's ability to resist or limit the transfer of smoke, regardless of the code at the time of construction.. Corridor walls, even if they were built 60 years ago, should be regularly assessed confirm that they minimize the transfer of smoke. This section describes some criteria by which this can be assessed.
- The requirements clearly indicate that portions of corridor walls required to have a fire resistance ratings by other code provisions must meet those provisions. This addresses where a corridor wall also happens to be a smoke barrier, incidental use area separation, etc.
- The Ad Hoc Committee added a specific section on dutch doors. Dutch doors have been used in health care facilities for many years for various necessary operational reasons. While existing language in the IBC does not specifically speak of dutch doors, their use is not prohibited but if used must meet the requirements contained in Section 407.3 including positive latching and limiting the transfer of smoke. This change will

provide clarity for existing installations by giving specific guidance on the minimum acceptable requirements including positive latching and smoke transfer for their use in corridor walls. A definition is provided for additional clarity.

- The Ad Hoc committee also proposes similar detail for doors, windows, louvers and other potential penetrations or openings in corridor walls in an attempt to add clarity to the intent of the code on limiting the transfer of smoke. These proposals are consistent with current CMS standards.
- There are exceptions that deal with existing mail slot, pass-through and similar openings that are commonly found in hospitals. These are needed for privacy, medication security and other operational needs. Our proposal places restrictions on these existing openings similar to the current federal requirements.

This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering, a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

This proposal is being co-sponsored by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/CTC/Pages/default.aspx. Since its inception in April/2005, the CTC has held twenty five meetings - all open to the public.

Cost Impact: None

1105.3 (NEW)-F-BALDASSARRA-WILLIAMS-ADHOC

Committee Action Hearing Results

Committee Action: Approved as Submitted

Committee Reason: The committee agreed with the proponent that the code change reflects an important and needed coordination effort to correlate the IFC with Federal Center for Medicaid and Medicare Services (CMS) healthcare regulations with which all facilities must now comply and that it will eliminate costly conflicting requirements among different codes applicable to such facilities.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Aaron Johnson representing Patient Fire Safety Coalition, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1105.3.2 Fire-resistance rating. ~~Unless required elsewhere in the code, corridor walls are not required to have a fire-resistance rating.~~ Unless otherwise approved, corridor walls that were installed as fire-resistance rated assemblies in accordance with the applicable codes under which the building was constructed, remodeled, or altered shall be maintained as such, but shall at no time be permitted to be less than 1/2 hour rated.

1105.3.4.1 Windows. Windows in corridor walls shall be sealed to resist the free passage of smoke, or the window shall be automatic closing upon detection of smoke, or the window opening shall be protected by an automatic closing device that closes upon detection of smoke.

> **Exception:** In smoke compartments not containing patient sleeping rooms, unprotected pass-through windows or similar openings shall not be ~~permitted in accordance with Section 1105.3.4.3~~ required to be protected where the openings are not greater than 80 square inches (51 613 mm).

~~**1105.3.4.3 Openings in corridor walls and doors.** Mail slots, pass through windows or similar openings shall not be required to be protected where the aggregate area of the openings between the corridor and a room are not greater than 80 square inches (51 613 mm) and are located with the top edge of any opening no higher than 48 inches above the floor.~~

1105.3.5 Penetrations. The space around penetrating items shall be filled with an *approved* material to limit the free passage of smoke. Where the corridor wall is being maintained as a fire-resistance-rated assembly, penetrations shall be firestopped in accordance with Section 714 of the *International Building Code*.

1105.3.6 Joints. Joints shall be filled with an *approved* material to limit the free passage of smoke.

1105.3.7 Ducts and air transfer openings. The space around a duct penetrating a smoke partition shall be filled with an *approved* material to limit the free passage of smoke. Air transfer openings in smoke partitions shall be provided with a *smoke damper* complying with Section 717.3.2.2 of the International Building Code.

> **Exception:** Where the installation of a *smoke damper* will interfere with the operation of a required smoke control system in accordance with Section 909, *approved* alternative protection shall be utilized.

(Portions of proposal not shown remain unchanged.)

Commenter's Reason: The proposed requirement in 1105.3.2 for corridor walls that were mandated to be fire resistance rated at the time of original construction to have their fire rating maintained is consistent with other sections of this code (e.g. 107.1, 701.2). The relaxation to allow the fire resistance rating to be as low as ½ hour is consistent with NFPA 101 (19.3.6.2.2), which would therefore aid in the harmonization with the Life Safety Code that the AdHoc Healthcare Committee has been seeking. The additional new text relating to fire-rated corridors will help ensure that the code official does not overlook the need for possible fire ratings where the building was built or renovated with such rated walls.

Where the corridor walls do have a fire resistance rating, maintain their ability to stop the passage of fire and smoke despite having numerous penetrations for utilities and other through-penetrations would require those penetrations to be suitably sealed. Thus, 1105.3.5 is modified to point the user to the International Building Code, where detailed requirements are provided for the proper sealing of those penetrations.

The AdHoc Committee for Healthcare has stated that they are bringing forth these proposals to more closely align with CMS requirements. However, as CMS conducts life safety inspections based on NFPA codes and standards this change is not consistent with their stated desired alignment. NFPA 101:19.3.6.2.3 states, "Corridor walls shall form a barrier to limit the transfer of smoke." Other relevant sections of NFPA 101 restrict the usage of louvers in corridor doors and limit the clearance at the bottom of the doors to a maximum of 1 inch. The proposed unprotected 80 square inch unprotected openings are completely inconsistent with the NFPA 101 measures designed to keep smoke from traveling unimpeded between corridors and patient rooms.

Public Comment 2:

William E. Koffel, P.E., Koffel Associates, Inc., representing Firestop Contractors International Association (FCIA), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1105.3.3 Corridor Walls Continuity. Corridor walls shall extend from the top of the foundation or floor below to one of the following:

1. The underside of the floor or roof sheathing, deck or slab above.
2. The underside of a ceiling above where the ceiling membrane is constructed to limit the passage of smoke.
3. The underside of a lay-in ceiling system <u>where the ceiling system is constructed to limit the passage of smoke and</u> where the ceiling tiles weigh at least one pound per square foot of tile.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: The intent is that the ceiling system, either the ceiling membrane (Item 2) or the lay-in ceiling system (Item 3), is required to limit the passage of smoke. The proposed revision merely clarifies that some type of open ceiling tile that happens to weigh one pound per square foot is not acceptable. Likewise, a ceiling system with openings serving a plenum would not be acceptable, even if the ceiling tiles weighed one pound per square foot.

Public Comment 3:

William E. Koffel, P.E., Koffel Associates, Inc., representing Firestop Contractors International Association (FCIA), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1105.3.2 Fire-resistance rating. Unless required <u>by Sections 1103 and 1104</u> ~~elsewhere in the code~~, corridor walls are not required to have a fire-resistance rating.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: The intent is to provide a more specific reference for the user of the Code as to where one might find requirements for a fire-resistance rating for a corridor in a Group I-2 occupancy. Sections 1103 and 1104 both contain language regarding maintaining fire resistance ratings for corridors when the building was originally constructed with corridors having a fire resistance rating.

Public Comment 4:

William E. Koffel, P.E., Koffel Associates, Inc., representing Firestop Contractors International Association (FCIA), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1105.3.4.3 Openings in corridor walls and doors. <u>In other than smoke compartments containing patient sleeping rooms, m</u>~~M~~ail slots, pass through windows or similar openings shall not be required to be protected where the aggregate area of the openings between the corridor and a room are not greater than 80 square inches (51 613 mm^2) and are located with the top edge of any opening no higher than 48 inches above the floor.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: A similar provision existing in NFPA 101, *Life Safety Code*, and is based upon computer calculations of smoke flow through an opening. The calculations assumed a fire in a room adjacent to the corridor and the quantity of smoke that might flow into a corridor. The NFPA Life Safety Technical Committee on Health Care Occupancies did not consider the scenario where smoke may be in the corridor and the openings may allow the smoke to migrate into adjacent patient sleeping rooms. Using the "defend in place" philosophy, allowing such openings in a corridor wall could result in the need to evacuate or relocate more patients than anticipated and that relocation would be through a corridor in which there is considerable smoke. The smoke resistant separation between the corridor and the patient sleeping room should be maintained.

Public Comment 5:

Vickie Lovell, Intercode, Inc., representing Fire Safe North America, formerly known as Alliance For Fire and Smoke Containment and Control, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1105.3.2 Fire-resistance rating. Unless required ~~elsewhere in the~~ by Section 1104 of this code, or required by a previously approved code, corridor walls are not required to have a fire-resistance rating.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: The intent of this code change is a useful addition to the fire code because it attempts to address very old building hospital designs that did not recognize the importance of containing smoke migration to a limited area, and leaves paths of egress such as corridors unprotected.

Although the current fire code does not require existing corridors to have a fire rating (only to limit smoke), legacy building codes did. There are a significant number of hospitals that are not sprinklered that maintain fire rated corridors.

The flaw with the proposal as currently written is that it could be interpreted to mean that ALL corridors (rated and non rated) in existing hospitals (sprinklered and un-sprinklered) can be modified to simply limit smoke.

Although Section 703.1 of the fire code could prevent an incorrect interpretation from occurring, this modification to the proposal clarifies that existing I-2s would continue to maintain the integrity of the fire resistance ratings of the corridors IF such ratings were required under this code or an older code to which the hospital was built. A public comment is submitted on F98 that fortifies the requirement for the maintenance provision of existing fire rated assemblies and fire protection ratings.

Public Comment 6:

John Valiulis, Hilti, Inc., requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1105.3 Corridor construction. In Group I-2, in areas housing patient sleeping or care rooms, corridor walls and the opening protectives therein shall provide a barrier designed to resist the passage of smoke in accordance with Sections 1105.3.1 through 1105.3.7. Where the provisions of this section conflict with the construction requirements that applied at the time of construction, the most restrictive provision shall apply.

1105.3.1 Materials. The walls shall be of materials permitted by the building type of construction.

1105.3.2 Fire-resistance rating. ~~Unless required elsewhere in the code, corridor walls are not required to have a fire-resistance rating.~~ Corridor walls shall be maintained to provide the fire resistance rating that was provided at the time of construction, unless approved otherwise.

(Portions of proposal not shown remain unchanged)

Commenter's Reason:

~40% of hospitals are estimated to be unsprinklered

The latest statistics published by the NFPA (Fires in Healthcare Facilities, Ahrens, M., Nov 2012), covering the period 2006-2010, indicate that sprinklers were present in 55% of reported healthcare fires. Making the simplifying assumption that fires occur at about the same frequency in sprinklered and non-sprinklered buildings, this would mean that roughly 45% of hospitals are unsprinklered. Even with progress on sprinklering between 2010 and 2013 (which may have been minimal due to the recession), the percentage of unsprinklered hospitals can be safely assumed to be in the range of about 40%.

Fire code should be just as clear and easy to apply to all buildings, sprinklered and unsprinklered

Since the Fire Code applies to existing buildings, it must be written to allow clear and correct application of code mandates for buildings as they exist today. The wording developed for code change proposal F239, which only ever requires smoke resistance, and not fire resistance, therefore suitably covers the topic of corridor walls only if all hospitals were built with sprinklers. The provision of smoke resistance alone, without fire resistance, was never accepted by any of the legacy codes for corridor walls in unsprinklered healthcare facilities. Thus, the originally proposed wording for F239 did a disservice to the hope of proper code enforcement in existing hospitals, since the inspectors are likely to be dealing with unsprinklered hospitals about 40% of the time, and need some code sections to clearly and unambiguously allow them to enforce corridor fire resistance requirements (when applicable) for existing non-sprinklered hospitals.

1105.3.2 is revised to default to fire rating equal to that mandated at time of construction

Section 1105.3.2 therefore needs to provide some minimal guidelines to ensure that the corridor walls in non-spriinklered healthcare facilities are suitably verified to have the required fire resistance rating. The three legacy codes, plus NFPA 101, all required 1-hour rated corridors in unsprinklered hospitals for several decades prior to the advent of the IBC. It does a disservice to the novice fire inspector to start with the assumption in 1105.3.2 that "corridor walls are not required to have a fire resistance rating", which would likely be correct only about 60% of the time. Rather, the starting point would much more accurately be that the fire resistance of the corridor wall in an existing building will be as it was required to be in the code under which the building was built. Thus, 1105.3.2 is proposed to be revised to more broadly start with that statement, which would then be true for 100% of the corridor walls. If there was no building code or fire code requiring corridor fire resistance at the time of construction, then the various provisions listed here for smoke resistance would be the ones setting the minimum performance requirements.

New text at the end of Section 1105.3 makes it clear that original construction requirements are not superseded by the lower requirements here

The other revision proposed for F239 is the addition of a new sentence for the entire section 1105.3 on corridors, to state that where any of the numerous minimum construction requirements listed here (e.g. for doors, openings, penetrations, joints, ducts) conflict with the requirements that were in effect when the walls were originally built, that the most restrictive provision shall apply. This would then adequately cover the ~40% of healthcare facilities that are not sprinkler protected, and likely had some fire resistance requirements to meet within the corridor walls. This wording provides the language that the fire official needs to be able to reference in order to enforce the maintenance of the building to the level of fire safety that it was constructed, making it clear that the code requirements listed in this section do not create a new lower minimum level of performance for the existing construction. As is typical for the Fire Code, the provisions listed here provide minimum requirements to which a building would need to be upgraded if it had not already met the more stringent requirements of a previous code.

Many of the other articles proposed in code change proposal F239 could also benefit from a revision to indicate what the minimum requirements would be in the case where the corridor wall was built to comply with a fire resistance rating. However, the over-arching new text in Section 1105.3 avoids the need to do that, as it's a blanket statement that would apply to all of this proposed new section's requirements.

It may be argued that dealing with the corridor construction requirements for unsprinklered hospitals is unnecessary, as all hospitals are supposed to be sprinklered, and even if they are not today, that they all will be some year soon. With a substantial portion of hospitals not being sprinklered today, it certainly makes sense to include clear and consistent guidance for how to enforce fire code requirements for those buildings. However, if the percent unsprinklered ever dwindles to some insignificant percent in the future, then the fire code articles dealing with unsprinklered buildings could be proposed for removal from the IFC at that time.

Public Comment 7:

Tony Crimi, A.C. Consulting Solutions Inc., representing International Firestop Council (IFC), requests Disapproval.

Commenter's Reason: This proposal seeks to carve out a separate set of provisions for Group I-2 Hospitals that differs from how other occupancies are treated under Chapter 11. <u>This proposal appears to assume that the Group I-2 fire area is sprinklered, and therefore it offers design alternatives that are sprinkler tradeoffs in the IBC whether the facility is sprinklered or not.</u> This is highlighted in the proponents supporting statement, which indicates the following:

> "The changes also provide tradeoffs for automatic sprinkler systems consistent with those allowed for new construction and also with those allowed by CMS. **In no way does this affect the existing requirement that existing, approved construction must be maintained in the manner that it was approved.** It simply provides a tool for evaluating historical construction techniques."

According to the NFPA "Report on Fires in Health Care Facilities" published November 2012, between 2006 and 2010, Sprinklers were present in only 55% of reported health care fires[1]. The fact remains that many existing I-2 occupancies are not sprinklered throughout.

But, nowhere in this code section does it ever state that the building mist be sprinklered for this section to apply. Without a precondition that the facility be sprinklered before any of these design alternatives can be acceptable, this becomes an unprecedented reduction of hospital fire safety features.

This substantiation is not consistent with the proposed changes. As indicated in the preceding sentence, in this proposal, tradeoffs for automatic sprinkler systems consistent with those allowed for <u>new construction</u> and with those allowed by CMS are provided even if sprinklers are not installed. This is in conflict with the IBC and CMS requirements and would produce a level of protection that is clearly different than "the manner that it was approved". The proponents do not provide the Technical justification for many of these relaxations, and do not provide a review of other complimentary required features that would be omitted here, but required in new construction. Instead, the proponents cite a coordination effort to correlate the IFC with Federal Center for Medicaid and Medicare Services (CMS) healthcare regulations.

In addition, the requirements are too vague to allow consistent compliance and enforcement. Some examples are as follows:

1105.3.3 Corridor Walls - How does the Fire Official determine the weight of the ceiling tiles? Will he be measuring each tile on site? Also, the 1 lbs/sq. ft. minimum weight requirement comes from requirements for Fire Resistance Rated assemblies. No evidence has been provided that this bears any relationship to limiting the passage of smoke. According to industry representatives, the majority of Class A ceiling tiles sold in the US today would not meet the 1 lbs/sq. ft. threshold.

1105.3.4.2.2 Corridor doors - Item (1) indicates that doors may be "capable of resisting fire for a minimum of 1/3 hours". "Resisting fire" is not an enforceable term that would connect to any specific fire resistance or fire protection test. Does that mean they need a 1/3h fire protection rating per the IBC, or a 1/3 hour fire resistance rating, or is an adhoc onsite "match test" sufficient?

1105.3.4.3 Openings in corridor walls and doors - There is no justification provided for permitting 80 square inch unprotected openings for every single patient room for mail slots, pass through windows, or other similar openings. Hospital corridors have needed to be fire partitions per the legacy codes in unsprinklered facilities, and corridors are required to be smoke partitions in the IBC, capable of restricting the movement of smoke between patient rooms and the corridors. Allowing unprotected holes up to 80 square inches to exist in every single room's corridor wall would completely invalidate the effectiveness of either fire partition walls or smoke partition walls for the corridors. There has been no substation provided to show that the condition would be safe, nor has there been any effort to show some overwhelming need for such large, frequent and unprotected holes that would trump the need for fire safety.

Contrary to the tone of the proponents supporting statement, statistics show that fires do occur in Group I occupancies on a regular basis. According to the NFPA "Report on Fires in Health Care Facilities" published November 2012, between 2006 and 2010, U.S. fire departments responded to an estimated average of 6,240 structure fires in or on health care properties per year. These fires caused an average of six civilian deaths, 171 civilian injuries and $52.1 million in direct property damage annually. Almost half (46%) were at nursing homes, and almost one-quarter (23%) were in hospitals or hospices. To put these numbers into a larger perspective, during 2006-2010, the 6,240 **fires in health care properties accounted for 1.2% of the 506,400 structure fires in the US[1].**

1 Source: NFPA "Fires in Health Care Facilities" Author: Marty Ahrens Issued: November 2012, National Fire Protection Association Fire Analysis and Research Division

Public Comment 8:

Aaron Johnson, representing Patient Fire Safety Coalition, requests Disapproval.

Commenter's Reason: Two primary portions of this proposal that are in direct conflict with the goals of fire and life safety are sections 1105.3.2 and 1105.3.4.3.

Section **1105.3.2** states that "unless required elsewhere in *this* code, corridor walls are not required to have a fire-resistance rating." The IFC never actually requires any specific wall to have a given fire rating, therefore, this requirement essentially points to nothing at all. As this proposal, also, is not predicated on sprinkler protection or anything else, the easiest and most common interpretation of this code will be that "no corridor needs a fire rating."

There are no fire-resistance ratings specifically mandated within the IFC, for sprinklered occupancies or non-sprinklered. Only the IBC sets requirements for fire-resistance rated corridors, and in fact, the IBC presupposes that I-2 occupancies are sprinklered so no rated corridor is called out. Rated corridors are only called out in the legacy codes which applied at the time of new construction.

The building codes which applied at the time of construction are what required these fire rated corridors, not this fire code. On what basis can these corridors now be blindly abandoned? It is unknown what provisions were made, or local standards applied at the time of original construction.

Nowhere in this proposal does it point back to IFC 701.2 or 107.1, which state that any required fire resistant components are to be maintained to the codes to which the building was originally built, remodeled, or altered too. Based on my own nearly 10 years of experience as a municipal inspector, I would conclude that it is highly likely that the intent of 1105.3.2 will surely be misinterpreted by local officials to mean that "no corridor needs a fire rating", thus creating an unsafe condition.

Section **1105.3.4.3** allows for completely unprotected slots and pass-through openings in corridor walls and doors. The openings are not required to have any type of closure, neither automatic nor manual, and can be permanently open The code works as a system. Whether a given corridor wall is a fire partition, due to construction under a legacy code, or is a smoke partition, that egress corridor wall is part of a system. A hospital corridor wallis always designed to limit the spread of fire or smoke. To henceforth allow 80 square inch unprotected holes in the corridor wall at every patient room is in disagreement with IFC 703.1.3 that states that all fire walls, barriers, and partitions shall be maintained to prevent the passage of fire, and is in disagreement with 703.1.2 that states that all smoke partitions shall be maintained to prevent the passage of smoke. Allowing these openings will enhance the spread of fire and smoke, naturally seeking the path of least resistance, throughout the facility.

The AdHoc Committee for Healthcare has stated that they are bringing forth these proposals to more closely align with CMS requirements. However, as CMS conducts life safety inspections based on NFPA codes and standards this change is not consistent with their stated desired alignment. NFPA 101:19.3.6.2.3 states, "Corridor walls shall form a barrier to limit the transfer of smoke." Other relevant sections of NFPA 101 restrict the usage of louvers in corridor doors and limit the clearance at the bottom of the doors to a maximum of 1 inch. The proposed unprotected 80 square inch unprotected openings are completely inconsistent with the NFPA 101 measures designed to keep smoke from traveling unimpeded between corridors and patient rooms.

F239-13

Final Action: AS AM AMPC____ D

F241-13
1105.5 (New)

Proposed Change as Submitted

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care (john.williams@doh.wa.gov)

Add new text as follows:

SECTION 1105
CONSTRUCTION REQUIREMENTS FOR EXISTING GROUP I-2

1105.5 Smoke compartments. Smoke compartments shall be provided in existing Group I-2 Condition 2, in accordance with Sections 1105.5.1 through 1105.5.4.

1105.5.1 Design. Smoke barriers shall be provided to subdivide each story used for patients sleeping with an occupant load of more than 30 patients into no fewer than two smoke compartments.

1105.5.1.1 Refuge areas. Refuge areas shall be provided within each smoke compartment. The size of the refuge area shall accommodate the occupants and care recipients from the adjoining smoke compartment. Where a smoke compartment is adjoined by two or more smoke compartments, the minimum area of the refuge area shall accommodate the largest occupant load of the adjoining compartments.

The size of the refuge area shall provide the following:

1. Not less than 30 net square feet (2.8 m^2) for each care recipient confined to bed or stretcher.
2. Not less than 15 square feet (1.4 m^2) for each resident in a Group I-2 using mobility assistance devices.
3. Not less than 6 square feet (0.56 m^2) for each occupant not addressed in Items 1 and 2.

Areas of spaces permitted to be included in the calculation of the refuge area of corridors, sleeping areas, treatment rooms, lounge or dining areas and other low-hazard areas.

1105.5.2 Smoke barriers. Smoke barriers shall be constructed in accordance with Section 709 of the *International Building Code*.

Exceptions:

1. Existing smoke barriers with a minimum of 1/2 –hour fire-resistance rating are permitted to remain.
2. Smoke barriers shall be permitted to terminate at an atrium enclosure in accordance with Section 404.6 of the *International Building Code.*

1105.5.3 Opening protectives. Openings in smoke barriers shall be protected in accordance with Section 716 of the *International Building Code*. Opening protectives shall have a with a minimum fire-protection-rating of 1/3 hours.

Exception: Wired glass vision panels in doors shall be permitted to remain.

1105.5.4 Duct and air transfer openings. Penetrations in a smoke barrier by duct and air transfer openings shall comply with Section 717 of the *International Building Code*.

Exception: Where existing duct and air transfer openings in smoke barriers exist without smoke dampers, they shall be permitted to remain. Any changes to existing smoke dampers shall be submitted for review and approved in accordance with IBC Section 717 of the *International Building Code*.

Reason: This change adds minimum requirements for existing hospitals (Group I-2, Condition 2) into Chapter 11. The intent is to increase the bare minimum safety requirements due to the fragile and sensitive populations within these facilities. These requirements are meant to be applied retroactively. This is not a new concept for these facilities – it aligns with the current approach by the Center for Medicaid and Medicare Services (CMS), the federal authority having jurisdiction. Hospitals are now required by CMS to have a life safety survey on a regular basis. If the facility does not meet certain life safety minimums, they are required to upgrade their existing facility. This code change will align the Fire Code with those CMS minimum requirements and will hopefully lead to industry consolidation. These retroactive requirements are added to assist code officials and surveyors during the ongoing regular inspection of hospital facilities and are consistent with the inspections required by federal laws for certification and reimbursement. The requirements consider the minimum previously approved construction methods. These requirements will provide jurisdictions the ability to adopt minimum retroactive provisions that have been vetted by the industry as well as code officials and that are consistent with current national standards used by the Federal Government providing a more uniform level of safety and eliminating many of the current code conflicts for existing facilities.
We looked at several sources to determine what the appropriate minimum bar should be, including the current building and fire code, current CMS guidelines, and previous versions of the ICC and model codes. On all issues, enforcement agencies and the regulated facilities weighed in to ensure that these changes are both necessary and achievable.

This provision is written in regard to the design, construction and application of smoke compartments for Group I-2 hospital facilities. Smoke compartments are a key component of the defend in place strategy, a strategy where victims are protected from fire without relocation, used in healthcare facilities to limit the movement of smoke. These compartments act as safe locations for patients by preventing the spread of smoke. Through compartmentalization, patients may remain safely in their rooms as fire suppression systems and fire responders extinguish the fire. Under severe fire conditions that threaten the immediate compartment area, patients may be evacuated horizontally to the safety of an adjacent compartment on the same floor. Being able to do this is critical since due to the health status of many patients their evacuation from the building might put them in grave danger. The proper design, construction and application of smoke compartments will provide added protection, buy valuable time and save lives of critically ill patients before a total evacuation may become necessary.

These retroactive requirements are added to assist code officials and surveyors during the ongoing regular inspection of hospital facilities. These inspections are required by federal laws for certification and reimbursement. This requirement considers the minimum previously approved construction methods. This is consistent with the federal requirements that these facilities are currently held too. Specific concepts include:

- 1105.5 Smoke compartments – The defend-in-place concept is a basic minimum level of safety for these facilities. Every facility should be equipped at least two smoke compartments for temporary relocation of patients.
- 1105.5.1 Design - This section addresses existing acceptable configuration of smoke barrier walls and smoke barriers for existing hospitals in areas with sleeping rooms.
- 1105.5.1.1 Refuge area – Addresses adequate sizing of refuge areas. IBC 407.5.1 also includes requirements for independent egress and horizontal assemblies.
- 1105.5.2 Smoke barriers – The intent is to bring noncompliant smoke barriers to at least ½ hour fire resistance rating. Previously approved smoke barriers are not intended to be reduced to ½. Chapter 7 of the IFC would require maintenance of approved construction.
- 1105.5.3 Opening protectives - Address doors in smoke barriers in existing Group I-2 occupancies. Reference to 716 is so you that don't loose other requirements.
- 1105.5.4, Guides the inspector of existing facilities on how they would look at opening protectives. Smoke dampers have not always been required in hospitals, and the 2015 IBC would not require them. Therefore, in those hospitals that were originally approved without smoke dampers required, that condition is allowed to remain in place. Any modification of existing smoke dampers would have to go throught he normal process for making an alteration to existing construction.

This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering, a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Cost Impact: None

1105.5 (NEW)-F-WILLIAMS-ADHOC

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

1105.5.2 Smoke barriers. Smoke barriers shall be constructed in accordance with Section 709 of the *International Building Code*.

Exceptions:

1. Existing smoke barriers ~~with a minimum of 1/2 - hour fire-resistance rating~~ are permitted to remain where the existing smoke barrier has a minimum fire resistance rating of ½ hour.
2. Smoke barriers shall be permitted to terminate at an atrium enclosure in accordance with Section 404.6 of the *International Building Code.*

1105.5.3 Opening protective. Openings in smoke barriers shall be protected in accordance with Section 716 of the *International Building Code.* Opening protective shall have ~~a with~~ a minimum fire-protection-rating of 1/3 hours.

Exception: Existing wired glass vision panels in doors shall be permitted to remain.

(Portions of the proposal not shown remain unchanged.)

Committee Reason: The committee agreed with the proponent that the code change reflects an important and needed coordination effort to correlate the IFC with Federal Center for Medicaid and Medicare Services (CMS) healthcare regulations with which all facilities must now comply and that it will eliminate costly conflicting requirements among different codes applicable to such facilities. The modification clarifies the applicability of the exception.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Tony Crimi, A.C. Consulting Solutions Inc., representing International Firestop Council (IFC), requests Approval as Submitted.

Further modify the proposal as follows:

SECTION 1105
CONSTRUCTION REQUIREMENTS FOR EXISTING GROUP I-2

1105.5 Smoke compartments. Smoke compartments shall be provided in existing Group I-2 Condition 2, in accordance with Sections 1105.5.1 through ~~1105.5.4~~ 1105.5.6.

1105.5.5 Penetrations. Penetrations of smoke barriers shall comply with Section 714 of the International Building Code.

1105.5.6 Joints. Joints made in or between smoke barriers shall comply with Section 715 of the International Building Code.

(Portions of proposal not shown remain unchanged.)

Commenter's Reason: This modification adds two critical elements that are lacking in the current proposals. As the proponents have indicated, the proposed change is intended to add minimum requirements for existing hospitals (Group I-2, Condition 2) into Chapter 11. Their intent is to increase the minimum safety requirements due to the fragile and sensitive populations within these facilities.

Protection of Penetrations and Joints through smoke barriers is critical to their performance in resisting the passage of both smoke and fire. The proposal initially acknowledges this need by including requirements for Opening Protectives, Ducts, and Air Transfer Openings, but has omitted two of the other components that are critical to the ability of walls and floors to limit the transfer of fire and smoke. Joints and Penetrations through these existing assemblies would already have been required to comply with these provisions by prior Legacy Codes, so their omission now will actually reduce the existing minimum level of performance for these fragile and sensitive populations.

The IBC and IFC currently require protection of Penetrations and Joints in Fire Partitions, Smoke Partitions, Smoke Barriers, Fire Barriers and Fire Walls. Since the proponents stated intent is to increase the bare minimum safety requirements due to the fragile and sensitive populations within these facilities, it is not possible to achieve that acceptable minimum level of safety for I-2 occupancies without including these protection provisions.

Public Comment 2:

William E. Koffel, P.E., Koffel Associates, Inc., representing Firestop Contractors International Association (FCIA), requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

<u>**1105.5.4 Penetrations.** Penetrations of *smoke barriers* shall comply with the *International Building Code*.</u>

<u>**Exception:** Approved existing materials and methods of construction.</u>

<u>**1105.5.5 Joints.** Joints made in or between *smoke barriers* shall comply with *International Building Code*.</u>

<u>**Exception:** Approved existing materials and methods of construction.</u>

(Renumber subsequent sections)

(Portions of proposal not shown remain unchanged.)

Commenter's Reason: The proposed new section for existing smoke barriers does not address penetrations and joints. Especially as compared to some of the other new sections, the lack of requirements could imply that there are no requirements. Note that F239 (corridors) contains sections on penetrations and joints.

The proposed language indicates that penetrations and joints are to be protected as required by the IBC. However, recognizing that existing penetrations and joints may be protected using materials or construction methods that were acceptable at the time of construction but not permitted by the current edition of the IBC, the proposed language exempts existing approved materials and methods of construction. However, it should be noted that new penetration in an existing smoke barrier would need to be protected as required by the IBC

Public Comment 3:

Vickie Lovell, Intercode, Inc., representing Air Movement and Control Association International, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

1105.5.4 Duct and air transfer openings. Penetrations in a smoke barrier by duct and air transfer openings shall comply with Section 717 of the International Building Code.

~~**Exception:** Where existing duct and air transfer openings in smoke barriers exist without smoke dampers, they shall be permitted to remain. Any changes to existing smoke dampers shall be submitted for review and approved in accordance with IBC Section 717 of the International Building Code.~~

(Portions of proposal not shown remain unchanged.)

Commenter's Reason: The Air Movement and Control Association, International disagrees with the need for the exception for 1105.5.4 in this proposal. There is no reason to have this exception to exist as written if the Fire Code references the 2015 International Building Code.

The proponent is only partially accurate in the reason statement:

"Smoke dampers have not always been **required** ***in hospitals, and the 2015 IBC would not require them."***

Smoke dampers have been required in smoke barriers since the 2000 IBC. The new 2015 IBC exception for smoke dampers in smoke barriers in I-2s is conditional upon the construction of the duct system and the building being fully sprinklered. Therefore, this exception as written is potentially more generous than what the current 2015 IBC permits if the terms of the 2015 IBC exception are not taken into account. If they are taken into account, then there is no need for the exception.

The Fire Code does not trigger the installation of new smoke dampers in duct and air transfers in previously approved existing buildings. Therefore, there is no need for the exception.

The proposed exception states that "any modification of existing smoke dampers would have to go through the normal process for making an alteration to existing construction." What would that be? Dampers are typically not modified in the field, other than for needed repairs. This exception creates confusion and speculation about what damper "modification" might be.

Smoke dampers could also be required to be installed in an existing duct system when a smoke control system is newly installed in an atrium. However, the IBC states that they cannot be eliminated (and be required) if they are part of a smoke control system. So, the proposed exception could create a barrier to making an alteration in existing hospitals, when required. Simply pointing to the current IBC in 717 covers all these conditions, and once again, the exception is not necessary.

Public Comment 4:

Brice Miller representing International Firestop Council (IFC), requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

SECTION 1105
CONSTRUCTION REQUIREMENTS FOR EXISTING GROUP I-2

1105.5.2 Smoke barriers. Smoke barriers shall be constructed in accordance with Section 709 of the International Building Code.

Exceptions:

1. <u>Where approved by the building official, e</u>xisting smoke barriers are permitted to remain where the existing smoke barrier <u>is</u> ~~has~~ <u>determined to have</u> a minimum fire resistance rating of ½ hour <u>based on plans, investigation, evaluation reports and other data submitted.</u>
2. Smoke barriers shall be permitted to terminate at an atrium enclosure in accordance with Section 404.6 of the International Building Code.

(Portions of proposal not shown remain unchanged.)

Commenter's Reason: This public comment is a clarification of the proposed language. As the proponents have indicated, the proposed change is intended to add minimum requirements for existing hospitals (Group I-2, Condition 2) into Chapter 11. Their intent is to increase the minimum safety requirements due to the fragile and sensitive populations within these facilities.

This revised language attempts to address the issue of how to ensure a proper review by the building code official is performed to ensure there are no impediments to granting an approval that may result in the reduction of existing levels of protection. It identifies that process by stipulating that plans, investigation and evaluation reports, and other data can be submitted seeking approval of the code official for the assignment of the new fire-resistance ratings which might be a reduction in the current level. Any special construction features conditions of occupancy, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building that impact required fire-resistance ratings must also be identified in the evaluation reports submitted. This is to ensure special conditions are identified that may prevent a reduction in fire-resistance ratings and fire safety of the building.

Final Action: AS AM AMPC____ D

F245-13
2204.1

Proposed Change as Submitted

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

2204.1 Standards. ~~The *fire code official* is authorized to enforce applicable provisions of the c~~ Codes and standards listed in Table 2204.1 ~~to prevent and control dust explosions~~ shall apply to operations involving combustible dust.

Reason: This change is based on a recommendation from the Chemical Safety Board (CSB) following their investigation of the dust explosions at the Hoeganaes Corporation in Gallatin, Tennessee. The CSB determined that the state of Tennessee considered the language in this code section to be a discretionary (not mandatory) code requirements; the state of Tennessee did not adopt this section of the IFC because it considered the requirement as not mandatory. This code change is intended to clarify the intent of this code section as to when the applicable dust standards must be enforced top prevent dust accumulations that could lead to dust explosions.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

Cost Impact: This code change will not increase the cost of construction

2204.1-F-ZUBIA-FCAC

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

2204.1 Standards. The applicable provisions of the codes and standards listed in Table 2204.1 shall apply to operations involving combustible dust.

Committee Reason: The committee agreed with the proponent's reason statement that the code change makes the provisions of the combustible dust standards mandatory rather than discretionary. The modification clarifies the applicability of the standard contents.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Elley Klausbruckner, representing Klausbruckner & Associates Inc., requests Disapproval.

Commenter's Reason: We do not believe that the proponents, in their evaluation of these standards, fully realize the consequences of the changes to the requirements and its effect on small operations such as small woodshops in schools, etc. Additionally, the standards proposed provide conflicting requirements, and would subject the code users and AHJs to liability. For example, the requirements for maximum dust thickness on surfaces are conflicting in different NFPA Standards:

NFPA-654 1/32” @ 75 lb/ft3, Adjusted for Lower Bulk Density
NFPA-664 1/8”, Assumes 20 lb/ft3 Bulk Density
NFPA-484 Does Not Allow Accumulation, Infers Daily Cleaning Schedule
NFPA-61 Remove Concurrently with Operations, Refers to 654; OSHA 1910.272 for grain handling facilities used 1/8”

While, for example, NFPA 61 would not conflict with NFPA 484 because one addresses agricultural and food products while the other address combustible metals, the requirements of NFPA 654 [addresses all combustible dust particles] does conflict with the remainder of these standards.

As another example, NFPA 664 for woodworking facilities apply when >5,000 sq ft or where dust producing equipment require an aggregate dust collection flow rate of >1500 ft^3/min [NFPA 664, 2012 Edition, Section 1.1.2]. Additionally NFPA 664, when applicable, references NFPA 69 on explosion prevention [e.g. Section 8.2.2.5.3 on construction of dust collectors with deflagration hazard]. The proposed revision to the language by the proponent and as approved by the committee, would require explosion prevention by the AHJ for woodworking shops less than 5000 sq ft, since NFPA 69 is still “applicable” [since this standard is applicable to explosion prevention of combustible dust] even if NFPA 664, the standard which is more specific to woodworking does not require it. Additionally a small woodworking shop [<5000 sq ft] would require compliance with NFPA 654 since NFPA 654, section 1.1.1 states that the standard applies to “*all phases of the manufacturing, processing, blending, conveying, repackaging, and <u>handling</u> of combustible particulate solids or hybrid mixtures, regardless of concentration or particle size, where the materials present a fire or explosion hazard.”* As part of NFPA 654, the business owner is required to meet the prescriptive requirements and/or expensive evaluations to minimize the construction cost [if prescriptive option is chosen] for their small woodshop as listed in the attached table. Please note that this would apply to even small woodshop in local school theaters, etc.

While IFC Chapter 22 may need additional revisions, the language proposed will create conflicting code requirements and it will apply a very stringent and broad brush across many uses and businesses where in many cases a simple local dust collection is all that may needed. We would recommend a future code change to Chapter 22 with more specific requirements applicable to specific hazards.

F245-13
Final Action: AS AM AMPC____ D

F248-13
2307.2 (IFGC [F] 412.2), 2307.2.2 (IFGC [F] 412.4); 2307.2.3 (IFGC [F] 412.5) (New)

Proposed Change as Submitted

Proponent: Bruce Swiecicki representing National Propane Gas Association (bswiecicki@npga.org)

Revise as follows:

2307.2 (IFGC [F] 412.2) Approvals. Storage vessels and equipment used for the storage or dispensing of LP-gas shall be *approved* or *listed* in accordance with Sections 2307.2.1 ~~and 2307.2.2~~ through 2307.2.3.

2307.2.1 (IFGC [F] 412.3) Approved equipment. Containers, pressure relief devices (including pressure relief valves), pressure regulators, and piping for LP-gas shall be *approved*.

2307.2.2 (IFGC [F] 412.4) Listed equipment. Hoses, hose connections, vehicle fuel connections, ~~dispensers~~, LP-gas pumps and electrical equipment used for LP-gas shall be *listed*.

2307.2.3 (IFGC [F] 412.5) LP-Gas dispensers. Where installed at facilities that are not intended for public refueling of vehicles, LP-gas dispensing equipment shall be approved. Where installed at facilities that are intended for public refueling of vehicles, LP-gas dispensers shall be listed.

Reason: The vast majority of LP-gas motor fuel dispensers in use today are not listed units. However, these dispensers are not available to the general public to refuel its vehicles. They are installed at private companies for use with fleet vehicles or for filling portable motor fuel cylinders used with forklift trucks, lawn mowers and other motorized applications. Requiring these dispensers to be "approved" rather than "listed" allows for their continued installation and use. The code official is able to approve the installation whether the "packaged" dispenser system itself is listed or not, using the requirements in Section 2307 and Chapter 61 of the IFC, as well as referenced standard NFPA 58 "LP-Gas Code." These references provide all the necessary requirements for approving the installation of a dispenser. The individuals that use these dispensers are properly trained on the hazards of LP-gas and the safe use of the filling equipment.
Dispensers may also be located at public refueling stations (gasoline stations) along with other fuels. We are proposing in paragraph 2307.2.3 that for these applications, propane dispenser systems must be listed units to make them equivalent to the units that are being installed for self-service gasoline and diesel applications. These units would be factory-assembled with a storage container, pump, meter and dispenser hose and hose end valve on a common base or skid and shipped to the site for installation as a packaged unit. Or, they may be assembled at a factory and fully contained within a cabinet, shipped to the site for installation on an island and served by a remote LP-gas tank, similar to gasoline dispensers,

Cost Impact: This proposal will not increase the cost of construction.

2307.2.2-F-SWIECICKI

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The disapproval was based on the committee's judgment that the hazards of LPG dispensing warrant requiring that all dispensers be listed, not just the ones for public use.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bruce Swiecicki, National Propane Gas Association, representing self, requests Approval as Submitted.

Commenter's Reason: The vast majority of LP-gas motor fuel dispensers in use today are not listed units. However, they are fabricated from using listed equipment as required in current Section 2307.2.2. These dispensers are not available to the general public because they are installed at private companies for use with fleet vehicles. The code official is able to approve the installation whether the dispenser is listed as a unit or built from listed equipment, using the requirements in Section 2307 and Chapter 61 of the IFC. These references provide all the necessary requirements for approving the installation of a dispenser. The individuals that use any LP-Gas dispenser are required to be properly trained on the hazards of LP-gas and the safe use of the filling equipment.

Dispensers may also be located at public refueling stations (gasoline stations) along with other fuels. We are proposing in paragraph 2307.2.3 that for these applications, propane dispenser systems must be listed units. We believe this was the original intent of the code and would maintain consistency with the units that are being installed for self-service gasoline and diesel applications, as well as other alternative fuels.

F248-13
Final Action: AS AM AMPC____ D

F250-13
2307.4 (IFGC [F] 412.6)

Proposed Change as Submitted

Proponent: Bruce Swiecicki representing National Propane Gas Association (bswiecicki@npga.org)

Revise as follows:

2307.4 (IFGC [F] 412.6) Location of dispensing operations and equipment. ~~In addition to the requirements of Section 2306.7, the point of transfer for LP-gas dispensing operations shall be 25 feet (7620 mm) or more from buildings having combustible exterior wall surfaces, buildings having noncombustible exterior wall surfaces that are not part of a 1-hour fire-resistance-rated assembly, or buildings having combustible overhangs, *lot lines* of property which could be built on, public streets, or sidewalks and railroads; and at least 10 feet (3048 mm) from driveways and buildings having noncombustible exterior wall surfaces that are part of a fire-resistance-rated assembly having a rating of 1 hour or more.~~ <u>The point of transfer for LP-Gas dispensing operations shall be separated from buildings and other exposures in accordance with the following:</u>

1. <u>Not less than 25 feet from buildings in which the exterior wall is not part of a fire-resistance-rated assembly having a rating of 1 hour or greater.</u>
2. <u>Not less than 25 feet from combustible overhangs on buildings, measured from a vertical line dropped from the face of the overhang at a point nearest the point of transfer.</u>
3. <u>Not less than 25 feet from the lot line of property that can be built upon.</u>
4. <u>Not less than 25 feet from mainline railroad track centers.</u>
5. <u>Not less than 10 feet from public streets, highways, thoroughfares, sidewalks and driveways.</u>
6. <u>Not less than 10 feet from buildings in which the exterior wall is part of a fire resistance rated assembly having a rating of 1 hour or greater.</u>

Exception: The point of transfer for LP-gas dispensing operations need not be separated from canopies that are constructed in accordance with the *International Building Code* and that provide weather protection for the dispensing equipment. LP-gas containers shall be located in accordance with Chapter 61. LP-gas storage and dispensing equipment shall be located outdoors ~~and in accordance with Section 2306.7~~.

Reason: The changes to section 2307.4 are necessary in order to make the paragraph easier to understand and to eliminate reference to Section 2306.7, which addresses dispenser installations for gasoline and diesel fuels, neither of which are similar to LP-gas. Therefore, Section 2306.7 contains many requirements that do not make sense when applied to LP-gas installations. We are therefore proposing a new section (2307.5) that will contain just those requirements from 2306.7 that are applicable to LP-gas dispensers.

Also included in the new formatting are proposed changes that will bring the IFC into agreement with NFPA 58 "LP-Gas Code" with respect to separation distances.

Cost Impact: This proposal will not increase the cost of construction.

2307.4-F-SWIECICKI

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee agreed with the proponent's reason statement that the code change provides a needed clarification and improved format of the requirements applicable to LPG equipment apart from the flammable liquid requirements and improves correlation with NFPA 58. The committee indicated that it felt that a simple reference to NFPA 58 would be sufficient.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

2307.4 (IFGC [F] 412.6) Location of dispensing operations and equipment. The point of transfer for LP-Gas dispensing operations shall be separated from buildings and other exposures in accordance with the following:

1. Not less than 25 feet from buildings in which the exterior wall is not part of a fire-resistance-rated assembly having a rating of 1 hour or greater.
2. Not less than 25 feet from combustible overhangs on buildings, measured from a vertical line dropped from the face of the overhang at a point nearest the point of transfer.
3. Not less than 25 feet from the lot line of property that can be built upon.
4. Not less than 25 feet from the centerline of the nearest mainline railroad track ~~centers~~.
5. Not less than 10 feet from public streets, highways, thoroughfares, sidewalks and driveways.
6. Not less than 10 feet from buildings in which the exterior wall is part of a fire resistance rated assembly having a rating of 1 hour or greater.

   Exception: The point of transfer for LP-gas dispensing operations need not be separated from canopies that are constructed in accordance with the *International Building Code* and that provide weather protection for the dispensing equipment.

LP-gas containers shall be located in accordance with Chapter 61. LP-gas storage and dispensing equipment shall be located outdoors.

Commenter's Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

This proposal will clarify the intent of where the measurement is taken to mainline railroad track centers and is consistent with Table 6.5.3 of NFPA 58.

F250-13

Final Action: AS AM AMPC____ D

F252 – 13
2307.6 (IFGC [F] 412.8), 2307.7

Proposed Change as Submitted

Proponent: Bruce Swiecicki representing National Propane Gas Association (bswiecicki@npga.org)

Revise as follows:

2307.6 (IFGC [F] 412.8) ~~Private~~ Public fueling of motor vehicles. ~~Self-service LP-gas dispensing systems, including key, code and card lock dispensing systems, shall not be open to the public and shall be limited to the filling of permanently mounted fuel containers on LP-gas powered vehicles~~ Self-service LP-Gas dispensing systems, including key, code and card lock dispensing systems, shall be limited to the filling of containers providing fuel to the LP-Gas powered vehicle.

~~In addition to the requirements of Sections 2305 and 2306.7,~~ The requirements for self-service LP-gas dispensing systems shall be in accordance with the following:

1. The arrangement and operation of the transfer of product into a vehicle shall be in accordance with this section and Chapter 61.
2. The system shall be provided with an emergency shutoff switch located within 100 feet (30 480 mm) of, but not less than 20 feet (6096 mm) from, dispensers.
~~2~~3. The *owner* of the LP-gas motor fuel-dispensing facility or the owner's designee shall provide for the safe operation of the system and the training of users.
4. The dispenser and hose-end valve shall release not more than 4cc of liquid to the atmosphere upon breaking the connection with the fill valve on the vehicle.
5. Fire extinguishers shall be provided in accordance with Section 2305.4.
6. Warning signs shall be provided in accordance with Section 2305.6.
7. The area around the dispenser shall be maintained in accordance with Section 2305.7.

2307.7 Overfilling. LP-gas containers shall not be filled with LP-gas in excess of the volume determined using the fixed maximum liquid level gauge installed on the container, the volume determined by the overfilling prevention device installed on the container, ~~outage installed by the manufacturer~~ or the weight determined by the required percentage of the water capacity marked on the container ~~stamped on the tank~~.

Reason: Propane is recognized as an alternative motor vehicle fuel by the U.S. government. In order for the public to take full advantage of the benefits of its reduced emissions and cleaner burning properties, the code must be changed to recognize the technologies that are available to ensure the safe refueling of LP-gas vehicles, which in turn will result in increasing acceptance of this smart alternative fuel.

The current provisions in Section 2307.6, which prohibit public access to self-service equipment, are too restrictive and without any basis in safety or technical experience. There are no reasons to prohibit anyone who has been properly trained to perform the refueling operation from refueling their LP-gas vehicle at a public refueling facility. Propane (LP-Gas) refueling technology provides the following features:

- Liquid product will not flow out of the hose end valve unless the valve is completely connected and securely in place on the fill valve of the vehicle.
- Propane hose end valves will mate with the fill valve on the vehicle and upon disconnect will release no more than 4 cubic centimeters of liquid to the atmosphere.
- The propane refueling system is a closed system, which means that there is no opportunity for air, water or any other contaminant to enter the system.
- Individuals must be trained in order to use the filling equipment. This requirement is ensured by the use of key, code and card lock dispensing systems. Only trained individuals are issued the necessary security devices to enable the refueling of the vehicle.

Regarding the proposed changes to 2307.6, the deletion of references to Sections 2305 and 2306.7 are necessary because those sections are mostly intended to be used for the installation of Class I or Class II liquids. Since propane is a liquefied petroleum gas, many of the provisions in those sections are not applicable to propane installations. The applicable requirements from those two sections have been relocated to 2307.6. In addition, proposed requirement #4 is based on NFPA 30A *Motor Fuel Dispensing Facilities and Repair Garages.*

The proposed change to 2307.7 is necessary in order to incorporate the correct terminology and also recognize that sometimes, the fixed maximum liquid level gauge is installed by a trained service technician. This is especially the case if repairs are being made to the container or the valve. In addition, some vehicles rely upon an overfilling prevention device and the fixed maximum liquid level gauge is not used. Therefore, it is necessary to list that device as an approved means for filling the container.

Cost Impact: This proposal will not increase the cost of construction.

2307.6-F-SWIECICKI

Committee Action Hearing Results

Committee Action: Approved as Submitted

Committee Reason: The committee agreed with the proponent's reason statement and that the code change is consistent with the committee action on code changes F250-13 and F251-13. The committee expressed concern that there needs to be similar specific requirements for private fueling.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bruce Swiecicki, National Propane Gas Association, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

2307.6 (IFGC [F] 412.8) Public fueling of motor vehicles. Self-service LP-Gas dispensing systems, including key, code and card lock dispensing systems, shall be limited to the filling of <u>permanently mounted</u> containers providing fuel to the LP-Gas powered vehicle.

The requirements for self-service LP-gas dispensing systems shall be in accordance with the following:

1. The arrangement and operation of the transfer of product into a vehicle shall be in accordance with this section and Chapter 61.
2. The system shall be provided with an emergency shutoff switch located within 100 feet (30 480 mm) of, but not less than 20 feet (6096 mm) from, dispensers.
3. The *owner* of the LP-gas motor fuel-dispensing facility or the owner's designee shall provide for the safe operation of the system and the training of users.
4. The dispenser and hose-end valve shall release not more than 4cc of liquid to the atmosphere upon breaking the connection with the fill valve on the vehicle.
5. Fire extinguishers shall be provided in accordance with Section 2305.4.
6. Warning signs shall be provided in accordance with Section 2305.6.
7. The area around the dispenser shall be maintained in accordance with Section 2305.7.

(Portions of proposal not shown remain unchanged.)

Commenter's Reason: Concerns were expressed at the Code Change Hearings in Dallas that containers other than those used to provide fuel to vehicles could be filled using the LP-Gas dispenser. Even though the concerns were unfounded (the filling connection for motor vehicles is unique and not able to connect to cylinders and other containers), the proposed change to 2307.6 will provide further clarification that only containers permanently mounted on the vehicle for providing fuel to that vehicle can be filled by this dispenser at this location.

Final Action: AS AM AMPC____ D

F258 – 13
2311.7

Proposed Change as Submitted

Proponent: Spencer Quong, Quong & Associates, Inc. representing Toyota Technical Center (squong@squong.com)

Revise as follows:

2311.7 Repair garages for vehicles fueled by lighter-than air fuels. Repair garages for the conversion and repair of vehicles which use CNG, liquefied natural gas (LNG), hydrogen or other lighter-than-air motor fuels shall be in accordance with Sections 2311.7 through 2311.7.2.3 in addition to the other requirements of Section 2311.

Exception<u>s</u>:

1. Repair garages where work is not performed on the fuel system and is limited to exchange of parts and maintenance requiring no open flame or welding.
2. <u>Repair garages where all of the following conditions exist:</u>
   - <u>2.1 Work is not performed on the hydrogen storage tank and is limited to exchange of parts and maintenance requiring no open flame or welding.</u>
   - <u>2.2 Where work is performed on the hydrogen fuel system, the hydrogen fuel storage container shall be securely sealed such that it is a closed system during maintenance using manufacturer approved procedures.</u>
   - <u>2.3 The entire fuel system shall be defueled in accordance with Section 2311.8 to a quantity that is less than 200 cubic feet (5.6 m^3).</u>

Reason: This proposal is requesting to modify exception to Section 2311.7 to allow work on the fuel system, except for the hydrogen storage tank without having to install additional ventilation and gas detection systems in the repair garage. If work is performed on the fuel system, the vehicle's shutoff valve must be securely closed on the fuel storage container so that it is a closed system and no gas can escape during maintenance operations. In addition, the proposal also requires that entire vehicle fuel system, including the storage container, be defueled to less than 200 cubic feet (NTP).

Although each hydrogen passenger vehicle is different, typically their storage containers hold between 5000-50000 cubic feet (NTP) of hydrogen at high pressure (5000-10000 psi). However, the hydrogen leaving the storage container is regulated to a lower pressure, typically less than 250 psi and less than 10 cubic feet (NTP) of hydrogen.

Any release of hazardous material can pose a problem. However, this proposal addresses the issues in two ways. First, it requires that the shutoff valve on the fuel storage container to be securely closed. Hydrogen vehicles are required to have a manual valve that can be shut off for maintenance[1]. In most vehicles, the shutoff valve fails shut, so the standard operating procedure to ensure that the valve is closed is to disconnect the 12V battery. For manual valves, it can be tagged and locked in the off position. Since almost all of the hydrogen is in the fuel storage container, this requirement will ensure only a minimal amount of hydrogen is left in the remainder of the fuel system.

Second, in the event that the fuel storage container is opened during repairs and all of the hydrogen is allowed to escape, this proposal requires that the entire fuel system be defueled to less than 200 cubic feet (NTP). <u>**This is less than 20% of the Maximum Allowable Quantity (MAQ) per control area**</u> listed in Table 5003.1.1(1) through 5003.1.1(4). In addition, Section 5308.1.1 allows for the indoor storage and use of cylinders of non-liquefied compressed, flammable gases not exceeding a capacity of 250 cubic feet NTP used for maintenance purposes without any ventilation and gas detection systems. Finally, according to Table 105.6.8, an operational permit is not required for less than 200 cubic feet (NTP) of flammable, compressed gases.

With more and more hydrogen vehicles on the road, there is a need to be able to work on the low pressure side of the fuel system at any repair garage without adding additional ventilation and gas detection systems. This proposal allows for this work as long as two requirements are met: the fuel storage container is closed and amount of hydrogen is less than <u>**the existing IFC limitations for hazardous materials, and flammable and compressed gases**</u>. Already, repair garages have industrial cylinders of acetylene and other flammable gases without additional ventilation and detection equipment. Even if the repair garages meet the requirements in this exception, they will still need to be in accordance with Sections 5001 and 5003.

[1] Section 4.1.1.3 of SAEJ2579 "Standard for Fuel Systems in Fuel Cell and Other Hydrogen Vehicles"

Cost Impact: The code change proposal will not increase the cost of construction.

2311.7-F-QUONG

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee's disapproval was based on its agreement with testimony that indicated that NFPA 2 Hydrogen Code is being revised on this topic but that the exact wording is not yet known and could be in conflict with these provisions if they were to be approved. The committee suggested that Exception 2, Item 2.1 should be clarified to indicate if hot work would be allowed elsewhere in the repair garage. It was also suggested that the exceptions be rewritten as compliance alternatives rather than exceptions.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Spencer Quong, Quong & Associates, Inc., representing Toyota Technical Center, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

2311.7 Repair garages for vehicles fueled by lighter-than air fuels. Repair garages for the conversion and repair of vehicles which use CNG, liquefied natural gas (LNG), hydrogen or other lighter-than-air motor fuels shall be in accordance with Sections 2311.7 through 2311.7.2.3 in addition to the other requirements of Section 2311.

Exceptions:

1. Repair garages where work is not performed on the fuel system and is limited to exchange of parts and maintenance requiring no open flame or welding on the CNG, liquefied natural gas (LNG), hydrogen or other lighter-than-air motor fueled vehicle..
2. Repair garages for hydrogen fueled vehicles where work is not performed on the hydrogen storage tank and is limited to the exchange of parts and maintenance requiring no open flame or welding on the hydrogen fueled vehicle. During the work the entire hydrogen fuel system shall contain a quantity that is less than 200 cubic feet (5.6 m3) of hydrogen. ~~Repair garages where all of the following conditions exist:~~
   ~~2.1 Work is not performed on the hydrogen storage tank and is limited to exchange of parts and maintenance requiring no open flame or welding.~~
   ~~2.2 Where work is performed on the hydrogen fuel system, the hydrogen fuel storage container shall be securely sealed such that it is a closed system during maintenance using manufacturer approved procedures.~~
   ~~2.3 The entire fuel system shall be defueled in accordance with Section 2311.8 to a quantity that is less than 200 cubic feet (5.6 m^3).~~

Commenter's Reason: The modification to the exception has been condense the language. The 2.2 portion of the original submittal is already covered by Section 2311.5 of the IFC. As requested by the committee, the existing language has been clarified by identifying that no open flame or welding shall be performed on the vehicle containing the gaseous motor fuel.

The added exception for the hydrogen fueled vehicle repairs will be consistent with language currently under development by the NFPA 2 committee.

F258-13

Final Action: AS AM AMPC____ D

F260-13
2404.6.1.2.1

Proposed Change as Submitted

Proponent: Geoff Raifsnider, P.E., Global Finishing Solutions representing self (graifsnider@globalfinishing.com)

Revise as follows:

2404.6.1.2.1 Interlocks. The spraying apparatus, drying apparatus and ventilating system for the spray booth or spray room shall be equipped with interlocks arranged to:

1. Prevent operation of the spraying apparatus while drying operations are in progress.
2. Where the drying apparatus is located in the spray booth or spray room, prevent operation of the drying apparatus until a timed purge of spray vapors from the spray booth or spray room is complete. This purge time shall be based upon completing not less than 4 air changes of spray booth or spray room volume. ~~Purge spray vapors from the spray booth or spray room for a period of not less than 3 minutes before the drying apparatus is rendered operable.~~
3. Have the ventilating system maintain a safe atmosphere within the spray booth or spray room during the drying process and automatically shut off drying apparatus in the event of a failure of the ventilating system.
4. Shut off the drying apparatus automatically if the air temperature within the booth exceeds 200°F (93°C).

Reason: The current language does not state how the value is calculated. The proposed language clarifies how to calculate the purge time and bases it upon the amount of fresh air introduced in the same manner that is used for purging an oven. This is appropriate since the drying operation has turned the spray booth into an oven.

As mentioned this proposal is based upon the language in NFPA 86 Standard for Ovens and Furnaces 2011 Edition. The idea is to replace the air in the booth at least four times (4 ft^3 of air/ft^3 of booth) to ensure that the concentration at the end of the purge interval is less than 25% of the lower flammable limit.

The IFC (2406.1.2) currently requires compliance with Chapter 30 when utilizing drying in a spray booth. Section 3007.2 states that a nameplate shall be provided that, among other information, indicates the required purge time (2107.2(3)). The code official can initially verify that the purge timer is set to this value. If there is cause to doubt this information the calculations mentioned can be performed to verify the minimum purge time.

The purge interval is a function of the spray booth size (cubic feet) and the ventilation rate (cubic feet per minute). Both of these values are documented and measurable for a given spray booth.

To verify that the purge time is sufficient to meet the code, multiply the volume of the booth by four (4) and divide by the exhaust flow rate. An example would be a spray booth that measures 10 ft wide x 10 ft high x 14 ft long (volume = 1,400 ft3). If this booth was designed for 100 feet per minute downdraft the exhaust flow rate would be 14,000 ft3/min (10 ft x 14 ft x 100 fpm). To calculate the minimum purge time you would multiply 1400 ft3 by four (4) and divide by 14,000 ft3/min. The resulting minimum purge time would be 0.4 minutes (1400x4/14000=0.4).

For booths that elevate the air temperature for curing via the same supply air unit used for tempering the air for painting, there is no need for a post paint purge of spray vapors. One type of spray/cure booth elevates the incoming (outside) air temperature and does not recirculate. This type poses no risk of bringing spray vapors back around and through the heating source. The other type of spray/cure booth switches to a recirculation mode during cure. In this mode, the spray/cure booth functions just like an oven and since other sections of the code require the concentration in the exhaust air stream to be less than 25% of the LFL the concentration that could be seen at the burner is not flammable. However if the drying apparatus is in the spray area and could be directly exposed to spray vapors, it makes sense to purge that space prior to energizing the drying apparatus.

There are many paint finishing operations, typically in the automotive refinish industry, that are negatively affected by the delay between painting and curing at an elevated temperature. By allowing the proposed changes, the spray booth designer can take into account the importance the purge interval may have on the process. By designing for the correct air flow, both a safe environment for energizing the drying apparatus and a minimum time between spray and cure can be achieved.

Cost Impact: This code change proposal will not increase the cost of construction

2404.6.1.2.1-F-RAIFSNIDER

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The disapproval was based on the committee's judgment that the ventilation duration needs clarification by being more specific and should include a minimum run-on time prior to shutting down operations.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Geoffrey Raifsnider, Global Finishing Solutions, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

2404.6.1.2.1 Interlocks. The spraying apparatus, drying apparatus and ventilating system for the spray booth or spray room shall be equipped with interlocks arranged to:

1. Prevent operation of the spraying apparatus while drying operations are in progress.
2. Where the drying apparatus is located in the spray booth or spray room, prevent operation of the drying apparatus until a timed purge of spray vapors from the spray booth or spray room is complete. This purge time shall be based upon completing at least 4 air changes of spray booth or spray room volume <u>or for a period of not less than 3 minutes, whichever is greater</u>.
3. Have the ventilating system maintain a safe atmosphere within the spray booth or spray room during the drying process and automatically shut off drying apparatus in the event of a failure of the ventilating system.
4. Shut off the drying apparatus automatically if the air temperature within the booth exceeds 200°F (93°C).

Commenter's Reason: The current language does not state how the value is calculated. The proposed language clarifies how to calculate the purge time and bases it upon the amount of fresh air introduced in the same manner that is used for purging an oven. This is appropriate since the drying operation has turned the spray booth into an oven. **The 3 minute minimum from the original language has been added back into the proposal.**

As mentioned this proposal is based upon the language in <u>NFPA 86 Standard for Ovens and Furnaces 2011 Edition</u>. The idea is to replace the air in the booth at least four times (4 ft^3 of air/ft^3 of booth) to ensure that the concentration at the end of the purge interval is less than 25% of the lower flammable limit.

The IFC (2406.1.2) currently requires compliance with Chapter 30 when utilizing drying in a spray booth. Section 3007.2 states that a nameplate shall be provided that, among other information, indicates the required purge time (2107.2(3)). The code official can initially verify that the purge timer is set to this value. If there is cause to doubt this information the calculations mentioned can be performed to verify the minimum purge time.

The purge interval is a function of the spray booth size (cubic feet) and the ventilation rate (cubic feet per minute). Both of these values are documented and measurable for a given spray booth.

To verify that the purge time is sufficient to meet the code, multiply the volume of the booth by four (4) and divide by the exhaust flow rate. An example would be a spray booth that measures 10 ft wide x 10 ft high x 14 ft long (volume = 1,400 ft3). If this booth was designed for 100 feet per minute downdraft the exhaust flow rate would be 14,000 ft3/min (10 ft x 14 ft x 100 fpm). To calculate the minimum purge time you would multiply 1400 ft3 by four (4) and divide by 14,000 ft3/min. The resulting minimum purge time would be 0.4 minutes (1400x4/14000=0.4).

For booths that elevate the air temperature for curing via the same supply air unit used for tempering the air for painting, there is no need for a post paint purge of spray vapors. One type of spray/cure booth elevates the incoming (outside) air temperature and does not recirculate. This type poses no risk of bringing spray vapors back around and through the heating source. The other type of spray/cure booth switches to a recirculation mode during cure. Final Action: AS AM AMPC____ D

F261-13
2404.7.3 (IMC [F] 502.7.3.3)

Proposed Change as Submitted

Proponent: Geoff Raifsnider, P.E., Global Finishing Solutions representing self (graifsnider@globalfinishing.com)

Revise as follows:

2404.7.3 (IMC [F] 502.7.3.3) Air velocity. ~~Ventilation systems shall be designed, installed and maintained such that the average air velocity over the open face of the booth, or booth cross section in the direction of airflow during spraying operations, shall not be less than 100 feet per minute (0.51 m/s).~~ Each spray area shall be provided with mechanical ventilation in accordance with Sections 2404.7.3.1 through 2404.7.3.3 (IMC 502.7.3.3.1 through 502.7.3.3.3).

2404.7.3.1 (IMC [F] 502.7.3.3.1) Open face or open front spray booth. For spray application operations conducted in an open face or open front spray booth, the ventilation system shall be designed, installed and maintained such that the average air velocity into the spray booth through all openings shall be not less than 100 feet per minute (0.51 m/s).

> **Exception:** For fixed or automated electrostatic spray application equipment the average air velocity into the spray booth through all openings shall be not less than 50 feet per minute (0.25 m/s).

2404.7.3.2 (IMC [F] 502.7.3.3.2) Enclosed spray booth or spray room. For spray application operations conducted in an enclosed spray booth or spray room, the ventilation system shall be designed, installed and maintained so that the flammable contaminants are diluted in noncontaminated air to maintain concentrations in the exhaust air flow below 25 percent of the contaminant's lower flammable limit (LFL).

2404.7.3.3 (IMC [F] 502.7.3.3.3) Enclosed spray booth or spray room with openings for product conveyance. In addition to the requirements of 2404.7.3.2, the ventilation system shall be designed, installed and maintained so that the average air velocity into the spray booth through openings shall be not less than 100 feet per minute (0.51 m/s).

> **Exception:** Where methods are used to reduce cross drafts that can draw vapors and overspray through openings from the spray booth or spray room, the average air velocity into the spray booth or spray room shall be capable of capturing and confining vapors and overspray to the spray booth or spray room.

Reason: For spray application using flammable and combustible materials, the industry standards are OSHA 1910.107 and 1910.94, Chapter 24 of the International Fire Code (IFC), and NFPA 33.

With regards to ventilating spray booths and spray rooms, NFPA 33 and the IFC have similar language stating that the concentration of flammable materials in the exhaust system must be kept below 25 percent of the lower flammable limit (LFL).[1, 2] From this requirement alone the minimum ventilation rate of a spray booth or spray room could be calculated. And by dividing this ventilation rate by the cross sectional area of the booth in the direction of air flow a minimum average velocity can be calculated. OSHA requirements for average air velocity were based upon the 1969 edition of NFPA 33 and were intended to provide a measureable that could be used to check the effectiveness of maintaining the booth exhaust below 25% of the LFL.[5] OSHA has recognized that the requirements for average air velocity were not intended for totally enclosed booths.[6]

Current language in the IFC specifies 100 feet per minute minimum air velocity and offers explanation in their commentary that the objective is containment within a designated spraying space and limiting the overspray.[3, 4] It goes on to explain that 100 FPM is the minimum capture velocity for particulate spray material. In an open face booth, it may be necessary to have a face velocity of 100 FPM or higher to provide the capture needed; but in an enclosed booth the enclosure provides the containment.

The following ventilation design basis for paint spray booths is common in the industry and has been effective in providing clean, safe and reliable painting environments which are in compliance with the intent of the International Fire Code, OSHA, and NFPA 33.

1. The total exhaust ventilation rate shall be based upon the minimum amount of air required to maintain the concentration of flammable vapors in the exhaust below 25%
2. Where appropriate the exhaust rate shall be increased by the amount of air needed to:
    - maintain a minimum average velocity through all openings which prevent the escape of overspray from the spray booth
    - achieve the desired collection of overspray toward the exhaust filters
    - achieve the desired paint transfer efficiency

There are many types of booths and rooms in which the 100 fpm value would be detrimental to the quality of the product and based upon the amount of paint used is well in excess of the minimum dilution air needed to keep the exhaust below 25% of the LFL. This extra air also increases the operating costs. The air velocities for a specific spray booth or spray room should be specific to the individual design that accomplishes the desired performance (i.e. 25% LFL or containment of overspray at openings). Chapter 13.75 of Industrial Ventilation – A Manual of Recommended Practice 26th Edition Published by ACGIH, lists many recommended air velocity ranges for various painting operations, some above and some below 100 fpm. This publication could be referenced in the standard or commentary.

This proposal does not require additional knowledge or tools for the AHJ. The designer or owner of the spray booth or room can provide calculations showing the minimum ventilation rate based upon the type and amount of paint being sprayed. The ventilation rate can be converted into an average velocity in the spray area. The AHJ can ask for balancing information to confirm the installation meets the code requirements or can independently measure the design velocity in the same manner as currently used by the AHJ to confirm 100 FPM.

The following are the references indicated above:

1. Chapter 7.2, NFPA 33, Standard for Spray Application Using Flammable or Combustible Materials 2007 Edition
"Each spray area shall be provided with mechanical ventilation that is capable of confining and removing vapors and mists to a safe location and is capable of confining and controlling combustible residues, dusts, and deposits. The concentration of the vapors and mists in the exhaust stream of the ventilation system shall not exceed 25 percent of the lower flammable limit."
2. Chapter 510.3, 2012 International Mechanical Code® 2012 Edition
"The design and operation of the exhaust system shall be such that flammable contaminants are diluted in noncontaminated air to maintain concentrations in the exhaust flow below 25 percent of the contaminant's lower flammability limit."
3. Chapter 2404.7.3, 2012 International Fire Code® 2012 Edition
"Air velocity. Ventilation systems shall be designed, installed and maintained such that the average air velocity over the open face of the booth, or booth cross section in the direction of airflow during spraying operations, shall not be less than 100 feet per minute (0.51 m/s)."
4. Chapter 1504.7.3, 2006 International Fire Code® Commentary

"To facilitate the keeping of flammable vapors within a designated spraying space and limiting the amount of overspray, the code requires that the exhaust system be adequately sized to maintain an average velocity over the open face of the booth or booth cross section of no less than 100 feet per minute (0.51 m/s), which is the minimum velocity to capture particulate spray material. Velocities exceeding 200 lineal feet per minute (1.01 m/s) have been determined to be too great for this purpose. To determine the minimum ventilation/exhaust capacity in cubic feet per minute (cfm), multiply the booth width (feet) by booth height (feet) by 100 (lineal per feet)."

1. OSHA Directive STD 01-05-010 - STD 1-5.10 - Clarification of 29 CFR 1910.107(b)(5)(i) Average Air Velocity of Spray Booths, June 1, 1973

    "The average air velocity requirements over the open face of the booth stated in this paragraph for spray finishing operations using flammable and combustible liquids were taken from NFPA-33-1969 and pertain to those hazards associated with fire protection or the removal of flammable vapor accumulation from the interior of the booth during spraying operations. This paragraph applies to maintaining the concentration of flammable vapors below the lower explosive limit (LEL) in a spray booth but does not apply to maintaining operator exposures to within the permissible exposure limits (PEL)."
2. OSHA Standard Interpretations 10/22/2001 - Clarification of minimum face velocity requirements for spray booths, October 22, 2001

*"**Question:** 29 CFR 1910.107(b)(5) only refers to a dry filter spray booth. What is the minimum air velocity requirement for a waterwash spray booth or an enclosed booth with no openings?*
***Reply:** OSHA currently does not have specific standards addressing velocity requirements for a waterwash spray booth or an enclosed booth with no openings. However, 1910.94(c)(6)(ii) requires that the vapor concentration in all area of the booth remain at a level below 25 percent of the lower explosive limit (LEL). This requirement corresponds to the requirements of NFPA 33, section 5.2, Ventilation, performance requirements (2000 edition)."*

Cost Impact: This code change proposal will not increase the cost of construction.

2404.7.3-F-RAIFSNIDER

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The disapproval was based on the committee's judgment that the velocity should be 100 fpm or 25% of the LFL, whichever is greater, since the characteristics of the spraying materials may vary considerably.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Geoffrey Raifsnider, Global Finishing Solutions, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

2404.7.3 (IMC [F] 502.7.3.3) Air velocity. <u>The ventilation system shall be designed, installed and maintained so that the flammable contaminants are diluted in noncontaminated air to maintain concentrations in the exhaust air flow below 25 percent of the contaminant's lower flammable limit (LFL). In addition, the spray booth shall be provided with mechanical ventilation so that the average air velocity through openings is in accordance with Sections 2404.7.3.1 and 2404.7.3.2 (IMC 502.7.3.3.1 and 502.7.3.3.2).</u> ~~Each spray area shall be provided with mechanical ventilation in accordance with Sections 2404.7.3.1 through 2404.7.3.3~~

2404.7.3.1 (IMC [F] 502.7.3.3.1) Open face or open front spray booth. For spray application operations conducted in an open face or open front spray booth, the ventilation system shall be designed, installed and maintained ~~such~~ <u>so</u> that the average air velocity into the spray booth through all openings shall be not less than 100 feet per minute (0.51 m/s).

> **Exception:** For fixed or automated electrostatic spray application equipment the average air velocity into the spray booth through all openings shall not be less than 50 feet per minute (0.25 m/s).

~~**2404.7.3.2 (IMC [F] 502.7.3.3.2) Enclosed spray booth or spray room.** For spray application operations conducted in an enclosed spray booth or spray room, the ventilation system shall be designed, installed and maintained so that the flammable contaminants are diluted in noncontaminated air to maintain concentrations in the exhaust flow below 25 percent of the contaminant's lower flammable limit (LFL).~~

2404.7.3.2 (IMC [F] 502.7.3.3.2) Enclosed spray booth or spray room with openings for product conveyance. ~~In addition to the requirements of 2404.7.3.2,~~ <u>For spray application operations conducted in an enclosed spray booth or spray room with openings for product conveyance,</u> the ventilation system shall also be designed, installed and maintained so that the average air velocity into the spray booth through openings shall be not less than 100 feet per minute (0.51 m/s).

> **Exception<u>s:</u>**
>
> <u>1. For fixed or automated electrostatic spray application equipment the average air velocity into the spray booth through all openings shall not be less than 50 feet per minute (0.25 m/s).</u>
>
> <u>2</u>: Where methods are used to reduce cross drafts that can draw vapors and overspray through openings from the spray booth or spray room, the average air velocity into the spray booth or spray room shall be capable of capturing and confining vapors and overspray to the spray booth or spray room.

Commenter's Reason: Original proposal has been revised to establish the overall requirement that concentration in the exhaust must be kept below 25% of the LFL. The characteristics of the materials being sprayed must be taken into account to determine the amount of air exhausted.

It has also been revised to include the minimum velocity requirements through conveyor openings for capture and confinement of overspray and vapors.

The following ventilation design basis for paint spray booths is common in the industry and has been effective in providing clean, safe and reliable painting environments which are in compliance with the intent of the International Fire Code, OSHA, and NFPA 33.

1. The total exhaust ventilation rate shall be based upon the minimum amount of air required to maintain the concentration of flammable vapors in the exhaust below 25%
2. Where appropriate the exhaust rate shall be increased by the amount of air needed to:
   a maintain a minimum average velocity through all openings which prevent the escape of overspray from the spray booth
   b achieve the desired collection of overspray toward the exhaust filters

c achieve the desired paint transfer efficiency

There are many types of booths and rooms in which the 100 fpm value within the spray area would be detrimental to the quality of the product and based upon the amount of paint used is well in excess of the minimum dilution air needed to keep the exhaust below 25% of the LFL. This extra air also increases the operating costs. The air velocities for a specific spray booth or spray room should be specific to the individual design that accomplishes the desired performance (i.e. 25% LFL or containment of overspray at openings).

This proposal does not require additional knowledge or tools for the AHJ. The designer or owner of the spray booth or room can provide calculations showing the minimum ventilation rate based upon the type and amount of paint being sprayed. The ventilation rate can be converted into an average velocity in the spray area. The AHJ can ask for balancing information to confirm the installation meets the code requirements or can independently measure the design velocity in the same manner as currently used by the AHJ to confirm 100 FPM.

Final Action: AS AM AMPC____ D

F265-13
2810 (New), 2801.1

Proposed Change as Submitted

Proponent: Robert J Davidson, Davidson Code Concepts, LLC, representing self (rjd@davidsoncodeconcepts.com)

Add new text as follows:

SECTION 2810
WOOD AND PLASTIC PALLET STORAGE AND REHABILITATION

2810.1 General. All facilities with either storage or rehabilitation of pallets shall be in accordance with Sections 2810.2 through 2810.5.2 and Section 2803.

2810.2 Fire Flow. The minimum required fire flow in pallet storage yards exceeding 3200 sq feet of pallet storage areas shall be not less than 2,000 gpm (7571 L/m). For storage yards with stable piles greater that 6,200 sq. ft. (576 m2) the required fire flow shall be not less than 3,000 gpm (8516 L/m). Pallet storage yards shall not exceed the available fire hydrant flow and spacing.

2810.3 Fire Hydrants. Fire hydrants required for fire flow purposes for pallet storage arrays shall be installed in accordance with Section 507 within three hundred (300) feet (152.4m) of pallet locations measured along unobstructed access paths.

2810.4 Fire Department Access. Fire apparatus access roads in accordance with Section 503 shall be located within one hundred fifty (150) feet (45,720mm) of all portions of the pallet storage array(s). Permanent delineation of on-site fire apparatus access roads shall be provided as required by the fire code official.

2810.5 Idle Pallet Storage. Pallet storage shall be in compliance with Sections 2810.5.1 or 2810.5.2 as applicable.

2810.5.1 Exterior pallet repair and storage areas greater than 3,200 sq ft. Exterior pallet storage arrays greater than 3200 square feet shall comply with all of the following:

1. Stacks shall not exceed a height of fifteen (15) ft. (4.57 m).
2. Stacks shall be no closer than eight (8) ft. (2.44 m) to any property line or a distance equal to the stack height, whichever is greater.
3. Stacks shall be no closer than eight (8) ft. (2.44 m) to any other on-site storage area.
4. Stacks shall be no closer than fifteen (15) ft. (4.57 m) to any on-site structure.
5. Stacks shall be arranged to form stable piles.
6. Piles shall not contain more than six thousand (6,000) cu. ft. (170 m3) of pallets.
7. Piles shall be separated from other piles by a minimum distance of eight (8) ft. (2.44 m).
8. Piles shall be arranged in a grid system to form pallet storage arrays with a maximum dimension of fifty (50) ft. by fifty (50) ft. (15.25 m by 15.25 m).
9. Pallet storage arrays shall be separated by a minimum distance of twenty four (24) ft. (7.32 m).

2810.5.2 Exterior storage not greater than 3200 sq ft in area. Exterior pallet storage not greater than 3200 square feet shall comply with all of the following:

1. Stacks shall be no closer than eight (8) ft. (2.44 m) to any property line or a distance equal to the stack height, whichever is greater.
2. Stacks shall be no closer than eight (8) ft. (2.44 m) to any other on-site storage.
3. Stacks shall be no closer than fifteen (15) ft. (4.57 m) to any on-site structure.

Exception: Where approved by the fire code official, stacks located closer than fifteen (15) ft. to an on-site structure shall maintain minimum horizontal clearances based on the quantity of pallets and the level of protection provided by the building construction as follows:

1. The minimum horizontal clearance for 50 pallets or less adjacent to a masonry wall without openings located within twenty (20) ft. (6 m) horizontally of the pallet stacks, or adjacnt to a masonry wall with 2 hour fire-resistance rated protected openings shall be zero (0) feet (0 m).
. The minimum horizontal clearance for 51 to 200 pallets adjacent to a masonry wall without openings located within twenty (20) ft. (6 m) horizontally of the pallet stacks, or a masonry wall with 2 hour fire-resistance rated protected openings shall be eight (8) feet (2.44 m).
3. The minimum horizontal clearance for 50 pallets or less adjacent to a wood or metal building equipped throughout with an approved automatic sprinkler system shall be eight (8) ft. (2.44 m).
4. Stacks located less than fifteen (15) ft. (4.57 m) from an exterior building wall shall not exceed a height equal to thirty (30) inches below the roof line elevation, or fifteen (15) feet (4.57 m), whichever is less.
5. Stacks shall be arranged to form stable piles.

Revise as follows:

SECTION 2801
GENERAL

2801.1 Scope. The storage, manufacturing and processing of timber, lumber, plywood, non-metallic pallets, veneers and byproducts shall be in accordance with this chapter.

Reason: There have been an increasing number of large scale fires involving the repair and outdoor storage of combustible pallets. Numerous local jurisdictions have been adding local requirements to their fire code adoptions to deal with this increased fire threat. These new requirements are to provide code language in the IFC addressing the high challenge fire protection issues involving large amounts of idle pallets. The concepts for the technical language in this proposal were taken from the Clark County, Nevada fire code amendments, a county that has dealt with large scale fires and developed the requirements in response to those conflagrations.

Section 2810.2 specifies that the requirements apply to facilities that store or rehabilitate wood or plastic pallets. The rehabilitation activities include storage along with additional hazards introduced by the rehabilitation activities.

Fires in pallet storage areas are fast growing and spreading requiring an adequate fire flow. Threshold of 2,000 GPM for greater than 3,200 sq. ft. of storage will provide for up to 4 - 500 GPM master stream appliances to be utilized when required, increasing to 3,000 GPM when piles larger than 6,200 sq. ft. exist.

Referring to IFC Table B105.1 for required fire flows the 2,000 GPM requirement is for Type V-B buildings of 4,401 - 6,200 sq. ft., since the open array of the pallets provide for a faster fire spread and greater need for master stream appliances than a completed building typically would, the 2,000 GPM is appropriate for the minimum flow required. Since pile size is and separation from individual piles is provided for in Section 2810.5 a fire flow 3,000 GPM was utilized for areas of storage over 6,200 sq. ft.

Fire department access roads are required in section 2810.4.

Section 2810.5 provides for the storage arrangement of piles and stacks addressing height, maximum pile size and distances from exposures. A stack is an individual stack of pallets, a pile is a group of 2 or more stacks of pallets grouped together.

Cost Impact: The code change proposal will increase the cost of construction.

2801.1-F-DAVIDSON

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

SECTION 2810
EXTERIOR WOOD AND PLASTIC PALLET STORAGE AND REHABILITATION

2810.5.1 Exterior pallet repair and storage areas greater than 3,200 sq ft. Exterior pallet storage arrays greater than 3200 square feet shall comply with all of the following:

1. Stacks shall not exceed a height of 18 feet. ~~fifteen (15) ft. (4.57 m).~~
2. Stacks shall be no closer than eight (8) ft. (2.44 m) to any property line or a distance equal to the stack height, whichever is greater.
3. Stacks shall be no closer than eight (8) ft. (2.44 m) to any other on-site storage area.
4. Stacks shall be no closer than fifteen (15) ft. (4.57 m) to any on-site structure.
5. Stacks shall be arranged to form stable piles.
6. Piles shall not contain more than six thousand (6,000) cu. ft. (170 m3) of pallets.
7. Piles shall be separated from other piles by a minimum distance of eight (8) ft. (2.44 m).
8. Piles shall be arranged in a grid system to form pallet storage arrays with a maximum dimension of fifty (50) ft. by fifty (50) ft. (15.25 m by 15.25 m).
9. Pallet storage arrays shall be separated by a minimum distance of twenty four (24) ft. (7.32 m).

(Portions of the proposal not shown remain unchanged.)

Committee Reason: The committee approved the code change based on the proponent's reason statement. It was noted by the committee that the proposal needs further clarification regarding its applicability to exterior only and should provide guidance for inside operations as well. Clarification is also needed to indicate that the fire flows for the pallet storage would be in addition to any other required fire flows for the site or buildings on it. The modifications clarify that the section is applicable to exterior storage & rehab only and recognize that current industry practices need a stack height of 18 feet.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Robert J Davidson, Davidson Code Concepts, LLC , representing self; Sean DeCrane, representing Cleveland Division of Fire / International Association of Fire Fighters, request Approval as Modified by this Public Comment.

Further modify the proposal as follows:

2810.1 General. All facilities with either exterior storage or exterior rehabilitation of pallets shall be in accordance with Sections 2810.2 through 2810.5.2 and Section 2803.

2810.1.1 Interior storage or rehabilitation. The interior storage or rehabilitation of pallets shall be in compliance with the applicable portions of this code and the *International Building Code*.

2810.2 Fire Flow. The minimum required fire flow in pallet storage yards exceeding 3200 sq feet of pallet storage areas shall be not less than 2,000 gpm (7571 L/m). For storage yards with stable piles greater that 6,200 sq. ft. (576 m2) the required fire flow shall be not less than 3,000 gpm (8516 L/m). The fire flow for a pallet storage yard shall be in addition to any fire flow otherwise required for the site or buildings located on the site. Pallet storage yards shall not exceed the available fire ~~hydrant~~ flow ~~and spacing~~.

2810.3 Fire Hydrants. Fire hydrants required for fire flow purposes for pallet storage arrays shall be installed in accordance with Section 507 within three hundred (300) feet (152.4m) of pallet locations measured along unobstructed access paths.

2810.3.1 Areas without water supply systems. For fire hydrants and water supplies in rural and suburban areas in which adequate and reliable water supply systems do not exist, NFPA 1142 or the International Wildland-Urban Interface Code shall be permitted to be utilized, when approved by the fire code official.

2810.5.1 Exterior pallet repair and storage areas greater than 3,200 sq ft. Exterior pallet storage arrays greater than 3200 square feet shall comply with all of the following:

1. Stacks shall not exceed a height of 18 feet. ~~fifteen (15) ft. (4.57 m).~~
2. Stacks shall be no closer than eight (8) ft. (2.44 m) to any property line or a distance equal to the stack height, whichever is greater. The separation distance is allowed to be reduced when the fire code official determines that no hazard to the adjoining property exists.
3. Stacks shall be no closer than eight (8) ft. (2.44 m) to any other on-site storage area.
4. Stacks shall be no closer than fifteen (15) ft. (4.57 m) to any on-site structure.
5. Stacks shall be arranged to form stable piles.

6. Piles shall not contain more than ~~six thousand (6,000) cu. ft. (170 m3)~~ seven thousand two hundred (7200) cu. Ft. (204 m3) of pallets.
7. Piles shall be separated from other piles by a minimum distance of eight (8) ft. (2.44 m).
8. Piles shall be arranged in a grid system to form pallet storage arrays with a maximum dimension of fifty (50) ft. by fifty (50) ft. (15.25 m by 15.25 m).
9. Pallet storage arrays shall be separated by a minimum distance of ~~twenty four (24) ft. (7.32 m)~~ twenty (20) ft. (6096 mm).

(Portions of proposal not shown remain unchanged)

Commenter's Reason: The purpose of this public comment for modification is to address committee requests for clarification, to coordinate provisions with this new section of code with other portions of the fire code and to address some concerns/request for clarification raised by industry interested parties.

The word "exterior" has been added to two places in Section 2810.1 and a new Section 2810.1.1 has been added as requested by the committee to clarify that this new section is for exterior activities and that interior activities shall comply with other appropriate sections of the fire code.

Section 2810.2 has been modified as requested by the committee to clarify that the fire flow for this activity is separate from other required fire flows for the site. The reference to fire hydrants has been deleted from this section since fire hydrants are covered by Section 2810.3.

A new Section 2810.3.1 has been added to clarify that for rural or suburban areas without adequate water supplies the fire code official can permit the use of either NFPA 1142 or the International Wildland-Urban Interface Code for establishing the needed fire flow. Currently similar language is located in Appendix B of the code and fire code officials know to go there for guidance when applying Section 507 Fire Protection Water Supplies, however, a significant number of interested parties have inquired about facilities located in rural areas without public water systems and adding the clarification will provide for a more informed application of the new language and requirements.

Section 2810.5.1, Item 2 has been modified by adding language to give the fire code official the ability to allow a reduction in the required separation distance from property lines. This same language can be found in the exception to "Section 315.4 Outside storage" of the fire code. The addition is in response to industry questions and provides for a correlation with the existing code language.

Section 2810.5.1, Item 6 is modified by increasing the cubic footage per pile to 7,200 cu ft. This is needed to correlate with the modification the committee made to stack height during the hearing based upon an industry request, (changed 15 ft to 18 ft). The height and dimensions of the storage arrangement are related so an increase in the stack height requires a corresponding increase in the cubic feet of storage permitted per pile to match pile dimensions

Section 2810.5.1, Item 9 is proposed to be modified to reduce the array separation distance to 20 feet to correlate this distance with the dimension of a fire apparatus access road. In response to an industry request to consider this action, a review of the Clark County, Nevada adoption of similar requirements that was utilized for drafting of the IFC proposal identified that Clark County also increased their minimum fire apparatus roadway width to 24 feet. Since the two distances are correlated, this modification will correlate the measurements specified in this section of the new IFC language with the existing dimension for fire apparatus roads found at Section 503.2.1.

Public Comment 2:

Susan R. Jennings, President, Virginia Forest Products Association; Mike Mullin, Brambles Limited, request Approval as Modified by this Public Comment.

Further modify the proposal as follows:

2810.2 Fire Flow. The minimum required fire flow in pallet storage yards at facilities, buildings or portions of buildings hereafter constructed or moved into ~~exceeding 3200 sq feet of pallet storage areas~~ shall be not less than ~~2,000~~1,500 gpm (5678~~7571~~ L/m). ~~For storage yards with stable piles greater that 6,200 sq. ft. (576 m2) the required fire flow shall be not less than 3,000 gpm (8516 L/m).~~ Pallet storage yards shall not exceed the available fire hydrant flow and spacing.

> **Exception:** Where approved by the fire code official for rural areas or other areas with decreased fire flow capacity, the minimum required fire flow may be reduced below 1,500 gpm.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: The fire flow proposal is based upon standards adopted by the Fire Department of Clark County, a populous county of roughly 2 million in the southern part of Nevada, encompassing Las Vegas, accounting for nearly three-quarters of the state's residents. The standards established by Clark County are not appropriately applied on a broad scale in the International Fire Code. Fire flow available in Clark County may not be available in many other areas where the IFC is adopted, particularly in rural areas. Moreover, in adopting the standards for its jurisdiction, Clark County had significant information regarding and control over the fire flow available within the county. By contrast, the standard proposed for adoption in the IFC is suggested with no knowledge of, let alone control over, the fire flow capacity of any particular jurisdiction.

Although Clark County established 2,000 gpm as the minimum fire flow for pallet storage areas, the Clark County standards refer to Appendix B, Table B105.1. A more appropriate minimum fire flow would be 1,500 gpm, the minimum flow established in Table B105.1. Additionally, the standard should explicitly provide an exception for rural areas or other areas with decreased fire flow capacity. This proposed exception is taken directly from Section 1412.2 of the Clark County standards.

Additionally, the “hereafter constructed or moved into” language should be added to ensure that the requirements of this section are only applied prospectively, consistent with Section 507.1 of the current IFC code.

Public Comment 3:

Susan R. Jennings, President, Virginia Forest Products Association; Brent McClendon, President/CEO, National Wooden Pallet and Container Association, request Approval as Modified by this Public Comment.

Further modify the proposal as follows:

~~**2810.2 Fire Flow.** The minimum required fire flow in pallet storage yards exceeding 3200 sq feet of pallet storage areas shall be not less than 2,000 gpm (<u>5678</u> L/m). For storage yards with stable piles greater that 6,200 sq. ft. (576 m2) the required fire flow shall be not less than 3,000 gpm (8516 L/m). Pallet storage yards shall not exceed the available fire hydrant flow and spacing.~~

(Portions of proposal not shown remain unchanged)

Commenter’s Reason:

Jennings: The fire flow proposal is based upon standards adopted by the Fire Department of Clark County, a populous county of roughly 2 million in the southern part of Nevada, encompassing Las Vegas, accounting for nearly three-quarters of the state’s residents. The standards established by Clark County are not appropriately applied on a broad scale in the International Fire Code. Fire flow available in Clark County may not be available in many other areas where the IFC is adopted, particularly in rural areas. Moreover, in adopting the standards for its jurisdiction, Clark County had significant information regarding and control over the fire flow available within the county. By contrast, the standard proposed for adoption in the IFC is suggested with no knowledge of, let alone control over, the fire flow capacity of any particular jurisdiction.

Fire flow under the IFC is currently calculated pursuant to Appendix B, which is based upon the size and construction type of buildings. There is no indication that the current fire flow practice for buildings is insufficient to account for outdoor pallet storage. Accordingly, this section of the proposal should be removed.

McClendon: We understand the fire flow proposal is based upon standards adopted by the Fire Department of Clark County, a populous county of roughly 2 million in the southern part of Nevada, encompassing Las Vegas. Many of our company members are located in rural areas that do not meet the requirements in the proposal. Furthermore, many of these companies are family-owned operations with an average of 25 workers.

Clark County had significant information regarding and control over the fire flow available within the county. By contrast, the standard proposed for adoption in the IFC is suggested with no knowledge of, let alone control over, the fire flow capacity of any particular jurisdiction.

Further, the fire flow under the IFC is based on the size and construction type of buildings. There is no indication that the current fire flow practice for buildings is insufficient to account for outdoor pallet storage. Accordingly, this section of the proposal should be removed.

Public Comment 4:

Susan R. Jennings, President, Virginia Forest Products Association; Mike Mullin, Director of Government Affairs – Americas, Brambles Limited, representing Brambles Limited, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

2810.3 Fire Hydrants. Fire hydrants required for fire flow purposes for pallet storage arrays <u>at facilities, buildings or portions of buildings hereafter constructed or moved into</u> shall be installed in accordance with Section 507 within three hundred (300) feet (152.4m) of pallet locations measured along unobstructed access paths <u>except as otherwise approved by the fire code official</u>.

(Portions of proposal not shown remain unchanged)

Commenter’s Reason: This proposed section references Section 507 of the IFC but does not incorporate the discretion provided to the fire code official under Section 507.5.1. Such discretion should be explicitly incorporated in the proposed standard.

Additionally, the “hereafter constructed or moved into” language should be added to ensure that the requirements of this section are only applied prospectively, consistent with Section 507.1 of the current IFC code.

Public Comment 5:

Susan R. Jennings, President, Virginia Forest Products Association; Brent McClendon, President/CEO, National Wooden Pallet and Container Association, request Approval as Modified by this Public Comment.

Further modify the proposal as follows:

~~**2810.3 Fire Hydrants.** Fire hydrants required for fire flow purposes for pallet storage arrays shall be installed in accordance with Section 507 within three hundred (300) feet (152.4m) of pallet locations measured along unobstructed access paths.~~

(Portions of proposal not shown remain unchanged)

Commenter's Reason:

Jennings: Section 507 provides requirements for fire protection water supplies to "premises upon which facilities, buildings, or portions of buildings are hereafter constructed or moved into." This requirement is duplicative of Section 507.1 and unnecessary. Accordingly, this section of the proposal should be removed.

McClendon: There are already requirements in Section 507 for fire protection water supplies to be available to "premises upon which facilities, buildings, or portions of buildings are hereafter constructed or moved into." This requirement is therefore unnecessary and the proposal should be removed.

Public Comment 6:

Susan R. Jennings, President, Virginia Forest Products Association; Brent McClendon, President/CEO, National Wooden Pallet and Container Association; Mike Mullin, Director of Government Affairs – Americas, Brambles Limited, representing Brambles Limited, request Approval as Modified by this Public Comment.

Further modify the proposal as follows:

2810.4 Fire Department Access. Fire apparatus access roads in accordance with Section 503 shall be located within one hundred fifty (150) feet (45,720mm) of all portions of the pallet storage array(s) <u>at facilities, buildings or portions of buildings hereafter constructed or moved into the jurisdiction</u>. Permanent delineation of on-site fire apparatus access roads shall be provided as required by the fire code official.

> <u>**Exception**: The fire code official is authorized to increase the dimension of 150 feet where fire apparatus access roads cannot be installed because of location on property, topography, waterways, nonnegotiable grades or other similar conditions, and an approved alternative means of fire protection is provided.</u>

(Portions of proposal not shown remain unchanged)

Commenter's Reason:

Jennings/Mullin: This proposed section references Section 503 of the IFC but does not incorporate the discretionary exception for the fire code official under Section 503.1.1. This discretionary exception should be explicitly incorporated in the proposed standard.

Additionally, the "hereafter constructed or moved into" language should be added to ensure that the requirements of this section are only applied prospectively, consistent with Section 503.1.1 of the current IFC code.

McClendon: Local fire officials must have the ability to apply their discretion to decision making based on unique conditions in their jurisdiction. This proposed section references Section 503 of the IFC but does not incorporate the discretionary exception for the fire code official under Section 503.1.1. This discretionary exception should be explicitly incorporated in the proposed standard.

Additionally, the "hereafter constructed or moved into" language should be added to ensure that the requirements of this section are only applied prospectively, consistent with Section 503.1.1 of the current IFC code.

Public Comment 7:

Susan R. Jennings, President, Virginia Forest Products Association, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

~~**2810.4 Fire Department Access.** Fire apparatus access roads in accordance with Section 503 shall be located within one hundred fifty (150) feet (45,720mm) of all portions of the pallet storage array(s). Permanent delineation of on-site fire apparatus access roads shall be provided as required by the fire code official.~~

Commenter's Reason: Section 503.1 provides requirements for fire department access to all portions of the facility. This requirement is duplicative of Section 503.1 and unnecessary. Accordingly, this section of the proposal should be removed.

(Portions of proposal not shown remain unchanged)

Public Comment 8:

Susan R. Jennings, President, Virginia Forest Products Association; Brent McClendon, President/CEO, National Wooden Pallet and Container Association; Mike Mullin, Director of Government Affairs – Americas, Brambles Limited, representing Brambles Limited, request Approval as Modified by this Public Comment.

Further modify the proposal as follows:

2810.5 Idle Pallet Storage. Pallet storage <u>at facilities, buildings or portions of buildings hereafter constructed or moved into the jurisdiction</u> shall be in compliance with Sections 2810.5.1 or 2810.5.2 as applicable.

(Portions of proposal not shown remain unchanged)

Commenter's Reason:

Jennings/Mullin: The pallet storage requirements in the proposal, if applied retroactively, could cause significant reduction in available outdoor pallet storage space at existing facilities. The proposal identifies only an increased cost of construction, suggesting that the rule is not intended to require changes in storage practices at existing facilities. This should be specifically stated in the standard. Accordingly, the "hereafter constructed or moved into" language should be added to ensure that the requirements of this section are only applied prospectively, consistent with other sections of the current IFC code affected by this proposal.

McClendon: Companies in our industry have estimated that this proposal, if applied, would cause significant reduction in available outdoor pallet storage space with losses reported as high as 60 percent. The proposal identifies only an increased cost of construction, suggesting that the rule is not intended to require changes in storage practices at existing facilities. For clarity throughout the industry, this should be specifically stated in the standard. Accordingly, the "hereafter constructed or moved into" language should be added to ensure that the requirements of this section are only applied prospectively, consistent with other sections of the current IFC code affected by this proposal.

Public Comment 9:

Susan R. Jennings, President, Virginia Forest Products Association; Brent McClendon, President/CEO, National Wooden Pallet and Container Association; Mike Mullin, Director of Government Affairs – Americas, Brambles Limited, representing Brambles Limited, request Approval as Modified by this Public Comment.

Further modify the proposal as follows:

2810.5.1 Exterior pallet repair and storage areas greater than 3,200 sq ft. Exterior pallet storage arrays greater than 3200 square feet shall comply with all of the following:

1. Stacks shall not exceed a height of fifteen (15) ft. (4.57 m).
2. Stacks shall be no closer than eight (8) ft. (2.44 m) to any property line~~ or a distance equal to the stack height, whichever is greater~~.

3 through 9 *(No change to text)*

(Portions of proposal not shown remain unchanged)

Commenter's Reason:

Jennings/Mullin: Section 2810.5.1(1) allows stack heights up to 18 feet; therefore, this Section 2810.5.1(2) sets a de facto minimum separation of 18 feet from the property line. No justification for this 18-foot separation has been articulated. Under NFPA

1 Section 34.10.4, only eight (8) feet of separation from the property line is required. This provision should be amended to require only eight (8) feet minimum separation, consistent with NFPA 1.

McClendon: Section 2810.5.1(1) allows stack heights up to 18 feet; therefore, this Section 2810.5.1(2) sets a de facto minimum separation of 18 feet from the property line. No justification for this 18-foot separation has been articulated. Under NFPA 1 Section 34.10.4, only eight (8) feet of separation from the property line is required. This provision should be amended to require only eight (8) feet minimum separation, consistent with NFPA 1.

Public Comment 10:

Susan R. Jennings, President, Virginia Forest Products Association and Mike Mullin, Director of Government Affairs – Americas, Brambles Limited, representing Brambles Limited, request Approval as Modified by this Public Comment.

Further modify the proposal as follows:

2810.5.1 Exterior pallet repair and storage areas greater than 3,200 sq ft. Exterior pallet storage arrays greater than 3200 square feet shall comply with all of the following:

1 through t 5 *(No change to text)*
6. Piles shall not contain more than 7,200 ~~six thousand (6,000)~~ cu. ft. (204 ~~170~~ m3) of pallets.
7 through 9 *(No change to text)*

(Portions of proposal not shown remain unchanged)

Commenter's Reason: The proposal of 6,000 cubic feet was based upon a pile size of 20 feet by 20 feet at a height of 15 feet. When the stack height was increased to 18 feet during the committee meetings, there was no corresponding change to the pile size. This change is necessary to maintaining uniform pile sizes.

Public Comment 11:

Susan R. Jennings, President, Virginia Forest Products Association and Brent McClendon, President/CEO, National Wooden Pallet and Container Association, request Approval as Modified by this Public Comment.

Further modify the proposal as follows:

2810.5.1 Exterior pallet repair and storage areas greater than 3,200 sq ft. Exterior pallet storage arrays greater than 3200 square feet shall comply with all of the following:

1 through t 5 *(No change to text)*
~~6. Piles shall not contain more than six thousand (6,000) cu. ft. (170 m3) of pallets.~~
7 through 9 *(No change to text)*

(Portions of proposal not shown remain unchanged)

Commenter's Reason:

Jennings: Section 2810.5.1(6) should be deleted. Once the stack height has been limited, and the spacing between pallet storage arrays, there is no reason to also limit pile size. This is a redundant and duplicative standard that does not appear to provide any additional fire protection benefit. Moreover, the fact that Clark County, Nevada, limits piles to 20 feet by 20 feet does not make this the appropriate standard. As another example, the West Sacramento, California, fire code limits pallet stack sizes for outdoor storage to 25 feet by 100 feet, or 2500 square feet. There is no clear justification for the stated pile size limitation. Accordingly, this provision should be deleted.

McClendon: In other parts of the code, the stack height limits have been specified as well as the spacing between the pallet stacks and there is no safety benefit of setting a pile size limit. The fact that Clark County, Nevada, has chosen to limits piles to 20 feet by 20 feet does not make this the best standard nationally. As another example, the West Sacramento, California, fire code limits pallet stack sizes for outdoor storage to 25 feet by 100 feet, or 2500 square feet. There is no clear justification for the stated pile size limitation. Accordingly, this provision should be deleted.

Public Comment 12:

Susan R. Jennings, President, Virginia Forest Products Association; Brent McClendon, President/CEO, National Wooden Pallet and Container Association; Mike Mullin, Director of Government Affairs – Americas, Brambles Limited, representing Brambles Limited, request Approval as Modified by this Public Comment.

Further modify the proposal as follows:

2810.5.1 Exterior pallet repair and storage areas greater than 3,200 sq ft. Exterior pallet storage arrays greater than 3200 square feet shall comply with all of the following:

1 through t 6 *(No change to text)*
~~7. Piles shall be separated from other piles by a minimum distance of eight (8) ft. (2.44 m).~~
8 through 9 *(No change to text)*

(Portions of proposal not shown remain unchanged)

Commenter's Reason:

Jennings: Section 2810.5.1(7) should be deleted. No justification has been articulated for this separation between piles. The separation between pallet storage arrays is designed to provide fire apparatus access roads, which are typically 20 feet. This 8-foot separation does not provide fire apparatus access and does not appear to be rationally related to any fire control access requirement. Adding this pile separation within the 50-foot storage arrays reduces the available storage area within an array by 36% without any additional fire protection benefit. Accordingly, this provision should be deleted.

McClendon: This appears to be an arbitrary requirement since it is not enough space to create a fire access road (20-feet) nor does it appear to provide a significant fire control benefit. Adding this pile separation within the 50-foot storage arrays reduces the available storage area within an array by 36% without any additional fire protection benefit. Accordingly, this provision should be deleted.

Mullin: Section 2810.5.1(7) should be deleted. No justification has been articulated for this separation between piles. The separation between pallet storage arrays is designed to provide fire apparatus access roads, which are typically 20 feet. This 8-foot separation does not provide fire apparatus access and does not appear to be rationally related to any fire control access requirement. Adding this pile separation within the 50-foot storage arrays reduces the available storage area within an array by 36% without any additional fire protection benefit.

Moreover, the fact that Clark County, Nevada, limits piles to 20 feet by 20 feet while requiring an additional 8-foot separation does not make this the appropriate or necessary standard. As another example, the West Sacramento, California, fire code limits pallet stack sizes for outdoor storage to 25 feet by 100 feet, or 2500 square feet. There is no clear justification for the stated separation between individual piles. Removing the 8-foot separation and keeping the 50 foot by 50 foot array size would effectively limit pile sizes to 2500 square feet, the same as the West Sacramento standard. Accordingly, this provision should be deleted.

Public Comment 13:

Susan R. Jennings, President, Virginia Forest Products Association; Brent McClendon, President/CEO, National Wooden Pallet and Container Association; Mike Mullin, Director of Government Affairs – Americas, Brambles Limited, representing Brambles Limited, request Approval as Modified by this Public Comment.

Further modify the proposal as follows:

2810.5.1 Exterior pallet repair and storage areas greater than 3,200 sq ft. Exterior pallet storage arrays greater than 3200 square feet shall comply with all of the following:

1 through t 8 *(No change to text)*
9. Pallet storage arrays shall be separated by a minimum distance of twenty ~~four~~ (20 24) ft. (6.1 ~~7.32~~ m).

(Portions of proposal not shown remain unchanged)

Commenter's Reason:

Jennings/Mullin: This provision was designed to create fire apparatus access roads between pallet storage. The normal width of a fire apparatus access road is 20 feet. No justification was articulated for requiring 24 feet between pallet arrays instead of 20 feet. This additional 4 feet of separation between pallet arrays decreases available storage space by almost 1000 square feet for every four pallet storage arrays within the storage area, without providing any additional fire protection benefit.

McClendon: The normal width of a fire apparatus access road is 20 feet. No justification was expressed for requiring an additional 4 feet between pallet stacks. This additional 4 feet of separation decreases available storage space by almost 1000 square feet for every four pallet storage arrays within the storage area, without providing any additional fire protection benefit. This would create a significant loss of property use for the majority of our members.

Public Comment 14:

Susan R. Jennings, President, Virginia Forest Products Association; Brent McClendon, President/CEO, National Wooden Pallet and Container Association; Mike Mullin, Director of Government Affairs – Americas, Brambles Limited, representing Brambles Limited, request Approval as Modified by this Public Comment.

Further modify the proposal as follows:

2810.5.2 Exterior storage not greater than 3200 sq ft in area. Exterior pallet storage not greater than 3200 square feet shall comply with all of the following:

1. Stacks shall be no closer than eight (8) ft. (2.44 m) to any property line~~ or a distance equal to the stack height, whichever is greater~~.

2 and 3 *(No change to text)*

(Portions of proposal not shown remain unchanged)

Commenter's Reason:

Jennings/Mullin: No justification has been articulated for requiring additional spacing between pallet stacks and the property line. Under NFPA 1 Section 34.10.4, only eight (8) feet of separation from the property line is required. This provision should be amended to require only eight (8) feet minimum separation, consistent with NFPA 1.

McClendon: Eight feet of space from the property line should be adequate for safety whether the stack is 8 ft. or the allowed 18 ft. No justification has been referenced for imposing a different property line spacing based on stack height. Under NFPA 1 Section 34.10.4, only eight (8) feet of separation from the property line is required. This provision should be amended to require only eight (8) feet minimum separation, consistent with NFPA 1.

Public Comment 15:

Kathleen Dietrich, Commercial Lumber and Pallet Company, Inc; Bernie Kamps, CEO, Kamps Pallets, Inc; Lawrence A. Konz, Konz Wood Products; Joseph O'Brien, Industrial Pallet, LLC; Terry Rodino, Duro Recycling Inc; James Ruder, L&R Pallet Service; James S. Schwab, Pallet Logistics of America; Steen Yelland, J.F. Rohrbaugh Co., Inc, request Disapproval.

Commenter's Reason:

Dietrich: Commercial lumber and Pallet Company has been in business since 1941 and has two locations in California employing over 200 people. We are a family owned and operated business and view our employees as our #1 asset. We have an extensive safety program and housekeeping at both locations and we are pleased to state that as a result, our Experience Modification is 80%. We are 100% recyclable and are also pleased that we have achieved SFI certification in Sustainable Sourcing. We strongly care about our people and our environment.

Kamps: Code Change Proposal F265-13 should be disapproved. As an owner of a 600 employee pallet recycling and new pallet manufacturing company in 4-5 Midwestern states for 40 years, this proposal will adversely impact our company. Our 10 plants have safety programs that we adhere to and fire safety is very important to us.

O'Brien: Industrial Pallet, LLC has been in business for 15 years. We are located in the rural northeastern portion of Connecticut and employee 65 people. We worked closely with our volunteer fire department on safety and access issues when we built our plant. Our insurance underwriter inspects our facility annually. We comply with all the recommendations. Because of our rural location we have no hydrant systems and must rely on good judgment and the timely response of volunteers. In fifteen years we have not had to call the fire department once nor have we ever had a property damage claim related to fire with our insurance company.

Ruder: This is the first time I have ever participated in the public comment process for fire code development. We are a family owned and operated business celebrating 40 years of service across the entire state of Colorado and shipping to customers within a 600 mile radius of Denver. We currently employ 115 people (families) and take their safety and well being very seriously. This proposal is of major concern because it will be detrimental to our way of doing business and our ability to support the families that have devoted years of their lives to our company.

I feel the need to participate in this public comment process for two reasons: First, if the above referenced fire code proposal is implemented; it would have significant negative consequences to my company. On average, our industry would lose more than 30 percent of the use of our yard storage to this rule. There is no data present in the proposal to support the necessity of a change of such enormous proportions. The storage of pallets themselves proposes no danger. It is easy to do in a organized and methodical manner. My facility is located on a 7 acre site. More than ½ of this property is dedicated to the outdoor storage of product and I could not operate without the ability to accommodate the "seasonal" inbound and outbound fluctuations associated with recycled pallets and lumber. The nature of the business is that you must "store" the pallets in large mass when you can find them so you have them available for when you cannot. These swings are very cyclic.

Schwab: My name is Jim Schwab and I am President of Pallet Logistics of America. We are a privately hend company headquartered in Dallas, TX. We are also the largest independent pallet recycling and services company in the South Central United States. With over 300 employees serving over 600 customers from 5 locations in Texas and Oklahoma, we have developed a "Best in Class" reputation for operating with excellence across the board. Safety and Cleanliness go hand and hand and are 2 of the 7 core values we espouse as an organization, so this topic is very important to me and our employees.

Yelland: The Rohrbaugh Company is a fifth generation family business started in 1880. We have 65 full-time employees. We have worked closely to implement suggestions and input in regards to corporate safety from our local fire chief and insurance vendors to insure a safe working environment for our employees.

ALL: This is the first time I have ever participated in the public comment process for fire code development. I am doing so for two reasons. First, if the above referenced fire code proposal is implemented, it would have significant negative consequences to my company. On average, our industry would lose more than 30 percent of the use of our yard storage to this rule. There is no data present in the proposal to support the necessity of a change of such enormous proportions.

Secondly, as a member of the board of directors of the National Wooden Pallet & Container Association (NWPCA) I am troubled that the International Code Council (ICC), when considering an issue that would directly impact the wood pallet and container industry, failed to reach out to our association's professional staff or elected leadership.

It is in the best interest of our companies to protect our products, facilities and workers; safety is a priority for me and my industry colleagues. The association has a safety manual available to members that covers the broad range of potential risks involved in the manufacturing and repair of wood pallets including fire safety and posts safety articles on our website on a continuing basis.

Our association worked in collaboration with the National Association of State Fire Marshalls (NASFM) on an education module. We have demonstrated our commitment to safety and have a unique and thorough knowledge of pallet storage in both warehouses and outdoors.

The proposal says the code changes were developed in response to "an increasing number of large scale fires," in the outdoor storage of pallets. There is no aggregate data on these series of fires in the proposal nor even the description of the conditions of a single fire. Lacking reliable aggregated data, there is no way to draw dependable conclusions as to 1) whether or not there is a problem so profoundly unmet by the existing code that it warrants a vast loss of property use by business owners, and 2) would this proposal solve such a problem? If this information has been collected, it has not been distributed to the wood pallet industry, and we are the ones who will be most impacted.

As a board member, elected by my colleagues in the association to represent their interests, I urge the ICC to vote to disapprove this proposal in favor of working collaboratively with the wood pallet industry to establish necessary and workable safety procedures.

Public Comment 16:

Susan R. Jennings, President, Virginia Forest Products Association, requests Disapproval.

Commenter's Reason: Code Change Proposal F265-13 should be disapproved. The changes would impose a significant loss of facility usage to wood packaging companies and the thousands of businesses in hundreds of industries that rely on wood pallets to transport and store their products. We have seen no data that that would justify modifications to the code that would impose such a hardship on our industry.

VFPA is a state trade association serving the Commonwealth's $25+ billion forest products industry, and 2008 marked our 50th Anniversary providing support to our membership. We currently have more than 200 companies representing a broad range of facilities, including lumber mills, pallet plants, wood treaters, timber harvesters, and associated organizations. VFPA co-sponsors ExpoRichmond, America's leading trade show for the forest products industry, biennially. We are proud to say one of the major business focuses of our membership and Expo Richmond is the production and rehabilitation of wooden pallets in the Commonwealth. Our membership represents core businesses affected by the proposed rule change by the International Code Council.

On average, pallet industry companies employ more than 40 workers each. Nationally, the industry accounts for more than 50,000 jobs and payroll surpassing $1 billion. The majority of these companies are located in economically depressed areas with few alternative employment opportunities. The total economic value of the wooden pallet industry exceeds $15 billion annually. Recognizing wood pallets and containers are produced from sustainable materials, reusable, repairable and recyclable, the global marketplace utilizes wooden pallets for more than 93% of its needs. The pallet and container industry, related Associations, and individual members are fully committed to industry and individual safety within ours and associated industries. While the proposed standards address purported safety issues, VFPA respectfully contends the proposed changes unfairly analyze and apply the proposed standards across the industry without the appropriate and necessary input from member organizations and/or representatives.

As wooden pallets and containers are an essential component of the global industry, the development of a new standard for which the industry has unique knowledge regarding, VFPA is disappointed the ICC failed to contact industry members or Associations representing such. The National Wooden Pallet & Container Association is a leading representative of the industry and its members and VFPA has close ties and works cooperatively with NWPCA. VFPA has been alerted to the proposed rule changes by the ICC through our association with NWPCA and fully support the inclusion of NWPCA representatives in an issue that will so tremendously affect our industry. At this late stage in the process, VFPA fully supports NWPCA and their comments submitted regarding the proposed changes to the rule and lack of access to the complete data and analysis utilized in this process. In reviewing the proposed rule change, analysis of the new requirements and the potential impact of the changes required under the new standards, our members conclude the economic impact to their businesses will range in a 15 to 60 percent loss of their pallet yards. While our membership includes companies as large as Fortune 500 entities, the overwhelming majority of our group can be best characterized as family businesses, where minimal margins already exist. This additional change in stacking patterns will cause tremendous hardship and potential business closure due to the decreased production and storage capability, thereby limiting income producing activities related to pallets. Additionally, in areas where expansion may be cost prohibitive, the simple inability to expand due to the proposed changes may cause businesses to shut down.

We additionally voice our concerns regarding the methodology and data specifically:

- The revision consideration indicates “an increasing number of large scale fires involving the repair and outdoor storage of combustible pallets.” VFPA feels this statement is a broad, sweeping generalization and requests further information on the specific count of fires in the years prior to the proposed change. Additionally, the parameters distinguishing “large scale” from other classifications are vague and as such, immeasurable.
- By what percentage has the number of fires attributed to combustible pallets increased over previous years? And by what percentage does the ICC anticipate the proposed change to decrease the number?
- Were injuries to workers or damage due to the fires on the rise? And if so, the analysis of such.
- Any further analysis regarding cause, nature and incidents encountered regarding the referenced fires causing this sweeping change would be appreciated.
- This proposed change requires significant and sweeping changes within the pallet industry and to its members. The significant loss of use of facilities members face is overwhelming to those already fighting the ongoing challenging economic environment. VFPA encourages an in-depth analysis of risk vs. return with regard to business operations and the combustible pallet industry as a whole.

The wood packaging industry will face significant negative consequences if this proposal is passed as it currently exists. At a minimum, our industry deserves to have access to the data upon which this decision has been made and provide alternative solutions. In full support of NWPCA, Virginia Forest Products Association recognizes that a lot of work has already been done by ICC committees in developing the modified code, however, we believe it is imperative that the industry have the chance to lend our expertise to the process and request representatives of NWPCA, its member organizations, or duly authorized representatives be included in a collaborative work group that can effectively meet the safety goals and be less financially impactful thereby allowing a more comprehensive embrace by the wood packaging community.

Public Comment 17:

Brent McClendon, President/CEO, National Wooden Pallet and Container Association, requests Disapproval.

Commenter’s Reason: Code Change Proposal F265-13 should be disapproved. NWPCA represents the entire pallet manufacturing and recycling industry in the U.S. We are comprised of more than 600 company members. As a trade organization, when NWPCA submits comments, its conclusions have gone through a deliberative process by numerous industry representatives and represent a consensus of the industry.

The changes would impose a significant loss of facility usage to wood packaging companies and the thousands of businesses in hundreds of industries that rely on wood pallets to transport and store their products. We have seen no data that that would justify modifications to the code that would impose such a hardship on our industry.

The National Wooden Pallet and Container Association (NWPCA), the largest wood packaging trade association in the world was not included in the development of the proposal. NWPCA worked for six months with the National Association of State Fire Marshalls (NASFM) on a fire safety education module addressing pallet stacking in warehouses and would have been supportive of lending our expertise to a similar collaborative effort with the ICC on this issue.

The reason cited for the proposed changes is “an increasing number of large scale fires involving the repair and outdoor storage of combustible pallets.”

- What was the number of fires nationally in the years prior to the decision to change the code?
- By what percentage had the number of fires increased over previous years?
- Were injuries to workers or damage to property increasing? If yes, by what percentage?
- By what percentage does ICC expect to decrease the number of fires or property damage with the change in the code?
- In a risk/reward analysis what was the committee’s estimate of the percentage increase in safety vs. the percentage of loss of property usage?

The wood packaging industry will face significant negative consequences if this proposal is passed as it currently exists. At a minimum, our industry deserves to have access to the data upon which this decision has- been made and provide alternative solutions. NWPCA recognizes that a lot of work has already been done by ICC committees in developing the modified code. We believe it is imperative that as the key stakeholder, we be given the chance to lend our expertise to the process. It is better to disapprove the code at this time and give NWPCA and the ICC committee the opportunity to develop a collaborative work product that would meet the safety goals and be embraced by the wood packaging community.

Public Comment 18:

Mike Mullin, Director of Government Affairs – Americas, Brambles Limited, representing Brambles Limited, requests Disapproval.

Commenter's Reason: On behalf of Brambles Limited and its operating companies (Brambles), we are requesting that Code Change Proposal F265-13 be disapproved.

Brambles is a pooling solutions company specializing in the provision of reusable pallets, crates, containers, and associated logistics services. Its Americas headquarters is located in Atlanta, Georgia. Brambles operates across multiple industry supply chains in more than 50 countries. Its pooling solutions are operated under two core brands:

"CHEP" is a pooling solutions business specializing in the provision of reusable pallets, crates, containers, and associated logistics services. CHEP owns and manages approximately 300 million pallets, crates and containers in more than 50 countries.

"IFCO" operates a pool of more than 150 million reusable plastic crates (RPCs) worldwide and, in the USA, sorts, repairs, and reissues about 200 million pallets a year through its pallet management network.

In all of its operations, Brambles is committed to sustainability and corporate social responsibility. In this regard, Brambles' objective is to be recognized by its customers, employees, shareholders, and the community as a global leader in corporate responsibility and sustainability.

As a leader in the pallet industry, we consider partnering with stakeholders, particularly regulators and communities, very important. Accordingly, we engage transparently with public officials who serve our local, state, and federal governments. We welcome the opportunity to provide expertise and insights on various issues. In the normal course of our business, we work in a positive way with those agencies that regulate aspects of our business. We respond to requests from regulators when they seek to know how their rulemaking will impact our business and our customers.

Regrettably, we and our industry have become aware of this potential change to the International Fire Code (IFC) only after it had first moved through the committee. Unfortunately, there is no requirement for the proponent of the proposal to seek out input from the affected parties. Having said that, we recognize that we must be more vigilant in engaging with the International Code Council (ICC), and we intend to do so in earnest beginning with the October meeting. In this spirit, when we learned of the proposal, we reached out to its proponent, Bob Davidson, to gain a better understanding of the impetus behind the proposal. We appreciate Mr. Davidson's willingness to explain his rationale for introducing the proposal and only wish that he had reached out to the industry in advance so that we would not be in a position to now ask that this code change proposal be disapproved. We believe that if there are legitimate issues regarding the outdoor storage of pallets, they should be addressed in a spirit of partnership in which industry, insurance, and fire experts can come together and jointly develop approaches that protect the well-being of communities.

The justification for the proposal generically refers to an increasing number of fires involving repair and outdoor storage of pallets but does not specifically identify any such fires or provide data to support that fires associated with pallet storage are actually increasing, either in frequency of occurrence or severity of the loss. Accordingly, the proponent has not identified – and Brambles is not aware of – any distinct hazard to life or property being addressed by the proposal. Indeed, we have not been made aware of any fire safety-related issues with outdoor pallet storage or water supply or access or fire department access to pallet storage facilities. None of these issues have been raised by the fire professionals who visit our facilities each year. None have been raised by our insurers or other stakeholders.

Under those circumstances, and in the absence of any imminent or distinct hazard, we would seek to find common ground and use available data to determine whether the risk actually justifies a significant change to the code. If so, any changes should be based upon a consideration of all these factors. Instead, this proposal is developed based upon standards adopted by the Fire Department of Clark County, a populous county of roughly 2 million in the southern part of Nevada, encompassing Las Vegas, accounting for nearly three-quarters of the state's residents. The standards established by Clark County are not appropriately applied on a broad scale in the IFC. Whereas Clark County has significant access to information regarding and control over issues like fire flow, fire hydrant placement, and other requirements covered by this proposal, this proposal is made without specific information or knowledge of these issues for each jurisdiction, let alone control over them.

In closing, we sincerely respect Bob Davidson's initiative, and Brambles would like to partner with Mr. Davidson and the ICC to develop appropriate outdoor pallet storage requirements that provide sufficient fire safety protection but also take into account the practicalities and realities of effectively managing fire risks associated with outdoor pallet storage. Based upon our business model and mission, as described above, we believe we are uniquely suited to assist in such an endeavor. Such an effort could take place in the next code development cycle and be ready in time for submittal for consideration in 2016.

However, we must request that the current proposal be disapproved. A fundamental problem with adopting the proposal as drafted as part of the current cycle is that it appears to impose retroactive requirements on existing facilities and operations, contrary to many of the other sections of the IFC on which the proposal relies upon for its provisions. Some of these changes will significantly reduce outdoor storage capacity at some Brambles' facilities. Accordingly, Brambles believes the best course of action is to disapprove the proposal entirely. However, in the spirit of communication and cooperation, Brambles is also providing specific suggested revisions that it believes would make the proposal more manageable from an industry perspective without any reduction in fire protection benefits or safety.

Public Comment 19:

Jordan Piland, Atlas Division of Williamsburg Pallets/A Millwork Corporation, requests Disapproval.

Commenter's Reason: I am a stakeholder whose company will be significantly impacted if the above referenced change of the fire code is implemented. My company is Atlas Pallets/ A Division of Williamsburg Millwork Corporation located in Bowling Green, Virginia, a relatively rural area. We are a family owned and operated company; my father is president and I am vice president. We employee 56 workers.

As chairman of the Standards Committee for the National Wooden Pallet & Container Association, I am very involved in debating and analyzing standards for the industry at a detailed level. With regard to the proposed fire code change, I met with a task group to discuss the ramifications of the proposed changes. That same day I met with my local fire chief to discuss the specific implications of the proposal to Caroline County.

My county fire chief pointed out that the maximum pump capacity in the county is 1,250 gallons per minute; the biggest tanker is 3,000 gallons. The International Code Council (ICC) proposal would force most location to have multiple fire hydrants; this is rate in rural areas like mine.

Most concerning is that this standard would severely limit then number of pallets stored on the yard of my company. Tis would mean a significant loss of use of my property.

Years past, we met with our local fire department to discuss fire truck access to our plant. We have lanes that are kept open so that in the event of a fire, fire trucks have easy access to our pallet storage area. This proposal goes far beyond what we considered a good safe practice.

I have seen the proposal, but while the changes are proposed as a result of “an increasing number of large scale fires,” it does not identify any fires in which pallet stacking patters limited the fire fighters’ ability to access areas key to putting out the fire. As someone who has spent a great many years working on industry standards with colleagues from around the country, I know that to get buy-in from the industry at large, we must provide specific examples of the need for change, data to support the severity and scope of the problem, and a risk/reward analysis demonstrating that the change is proportionate to the hazard involved. If this information has been collected, it has not been distributed to the wood pallet industry.

I ask as both a pallet company owner and as the chairman of the industry standards committee that the ICC defer voting on this proposal until the pallet industry has time to work collaboratively with you on establishing necessary and workable safety procedures.

F265-13

Final Action: AS AM AMPC____ D

F267-13
3103.3.1 (New)

Proposed Change as Submitted

Proponent: Brad Emerick, Denver Fire Department representing the Fire Marshal's Association of Colorado (FMAC) and the Colorado Chapter of the ICC (CCICC) (brad.emerick@denvergov.org)

Add new text as follows:

3103.3.1 Special Amusement. Tents and other membrane structures erected for the purpose of a *special amusement building* shall comply with the provisions of Section 411 of the *International Building Code*.

Reason: The scoping language in Section 3101 doesn't leave much room for stepping outside Chapter 31 for proposed uses other than those contemplated in Chapter 31. However, temporary membrane structures are being used for an increasingly wider variety of occupancies. One of the more hazardous is special amusement buildings.

The growing popularity of haunted houses usually erected within a month of Halloween and dismantled shortly thereafter, has enticed producers to (try to) utilize temporary membrane structures for these events. Due to the intentionally disorienting nature of these occupancies, additional life-safety measures beyond those prescribed in Chapter 31 (which really only contemplates large, open, usually seated assembly occupancies) are required. The section cited in the IBC addresses temporary special amusement buildings as well as permanent, and provides established life-safety measures.

Cost Impact: This change will not affect the cost of construction.

3103.3.1-F-EMERICK

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee's disapproval was based on its agreement with testimony that indicated that the proposal needs to be expanded to include all specific requirements for such structures rather than just a simple reference back to the IBC.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Brad Emerick, Denver Fire Department/Fire Prevention Division, representing Fire Marshal's Association of Colorado (FMAC), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

3103.3.1 Special Amusement. Tents and other membrane structures shall not be used as ~~erected~~ ~~for the purpose of a~~ *special amusement buildings* ~~shall comply with the provisions of Section 411 of the International Building Code~~.

.

Reason: Based on direction from the state chapters of the fire code officials, the original language of this proposal was written to not prohibit the use of temporary membrane structures as special amusement buildings, but to permit them if the requirements in IBC Chapter 4 could be met – a tall order, but not technically impossible.

Based on the discussion of the code committee, the language was changed to the above.

F267-13

Final Action: AS AM AMPC____ D

F268-13
3103.9; 3103.9.1 (New), 3103.9.2 (New)

Proposed Change as Submitted

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

3103.9 Anchorage required. Tents or membrane structures and their appurtenances shall be adequately roped, braced and anchored to withstand the elements of weather and prevent against collapsing. ~~Documentation of structural stability shall be furnished to the fire code official on request.~~

3103.9.1 Structural design. Tents and membrane structures shall be designed and constructed to comply with Chapter 16 of the *International Building Code* where any of the following conditions occur:

1. The occupant load of the tent or membrane structure exceeds 100,
2. The tent or membrane structure is classified as a Group A, E, or I,
3. The tent or membrane structure is classified as a Group R Occupancy with an occupant load exceeding 50, or
4. The tent or membrane structure exceeds one story.

3103.9.2 Documentation. Documentation of structural stability shall be furnished to the fire code official upon request.

Reason: There has been confusion with attempting to apply the IFC requirements in Chapter 31 to temporary tents and membrane structures relative to structural stability.

These structures can be seen at concerts, outdoor functions, fairs, etc. Even though the provision of 'temporary' limits the usability of these structures to less than 180 days, improper structural design can still lead to problems.

Many of these temporary tents and temporary membrane structures have multiple floors, and over 30 feet in height. As the height increases, the impact of collapse increases and typically these structures are surrounded by hundreds of people.

This proposal revises IFC Section 3103.9 to include requirements for temporary tents and membrane structures to comply with IBC Chapter 16 structural requirements when there is a significant life hazard within the structure, as reflected in Section 3103.9.1. The relative significance is based on the occupancy classification, the occupant load, or the number of levels within the tent or membrane structure.

The requirement for documentation is relocated from 3103.9 to 3103.9.2.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

Cost Impact: This code change may increase the cost of construction

3103.9-F-ZUBIA-FCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The disapproval was based on the committee's judgment that the proposal has merit but needs to contain separate requirements for tents and for membrane structures due to their different characteristics. A concern was also expressed that Section 3103.9.1(2) could be applied to very small tents that could not comply with all the requirements.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

3103.9 Anchorage required. Tents or membrane structures and their appurtenances shall be adequately roped, braced and anchored to withstand the elements of weather and prevent against collapsing. Documentation of structural stability shall be furnished to the fire code official on request.

3103.9.1 Tents and membrane structures exceeding one story. Tents and membrane structures exceeding one story shall be designed and constructed to comply with Chapter 16 of the *International Building Code.*

Commenter's Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

Members of the IFC committee and others at the Dallas hearings thought the original proposal that required tents and membrane structures to comply with IBC structural design requirements was not justified for all of the structures described in the proposal. We cannot disagree with those opinions.

However, there are an ever increasing number of multiple story tents and membrane structures showing up in jurisdictions. These structures can be seen at concerts, outdoor functions, fairs, etc. Even though the provision of 'temporary' limits the usability of these multistory structures to less than 180 days, improper structural design can pose a significant safety hazard.

The code currently requires that documentation of structural stability be furnished to the fire code official on request, but provides no guidance on how to determine an acceptable level of structural integrity.

This proposal closes this loophole by requiring multiple story tents and membrane structures to be designed and constructed in accordance with Chapter 16 of the IBC. This provides the fire code official with a solid tool to use to verify proper structural design.

F268-13

Final Action: AS AM AMPC____ D

F278-13
3304.2, 3304.3 (New), 3304.4

Proposed Change as Submitted

Proponent: Marcelo M Hirschler, GBH International (gbhint@aol.com)

Revise as follows:

~~**3304.2 Waste disposal.** Combustible debris shall not be accumulated within buildings. Combustible debris, rubbish and waste material shall be removed from buildings at the end of each shift of work. Combustible debris, rubbish and waste material shall not be disposed of by burning on the site unless *approved*.~~

3304.2 Combustible debris, rubbish and waste. Combustible debris, rubbish and waste material shall comply with the requirements of Sections 3304.2.1 through 3304.2.4.

3304.2.1 Combustible debris, rubbish and waste material shall not be accumulated within buildings.

3304.2.2 Combustible debris, rubbish and waste material shall be removed from buildings at the end of each shift of work.

3304.2.3 Rubbish containers. Containers with tight-fitting or self-closing lids shall be provided for temporary storage of combustible debris, rubbish and waste material, until the end of each shift of work. The rubbish containers shall be constructed entirely of materials that comply with any one of the following:

1. Noncombustible materials.
2. Materials that meet a peak rate of heat release not exceeding 300 kW/m^2 when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation.

3304.2.4 Spontaneous ignition. Materials susceptible to spontaneous ignition, such as oily rags, shall be stored in a *listed* disposal container.

3304.3 Burning of combustible debris, rubbish and waste. Combustible debris, rubbish and waste material shall not be disposed of by burning on the site unless *approved*.

~~**3304.3**~~ **3304.4 Open burning.** *Open burning* shall comply with Section 307.

~~**3304.4 Spontaneous ignition.** Materials susceptible to spontaneous ignition, such as oily rags, shall be stored in a *listed* disposal container.~~

Reason: This section needs to be rewritten in a more logical fashion because 3304.2 needs to address what to do with combustible debris, rubbish and waste but not address prohibitions or ***what not to do***, which should be covered in another section (burning of the rubbish). The use of the phrase “combustible debris, rubbish and waste material” makes this section consistent with other sections of the IFC.

When dealing with what needs to be done, the proper sequence is: (a) don’t accumulate it, (b) remove it at the end of a work shift and (c) (which is missing) put it in appropriate rubbish containers while you are working. Section 3304.4 addresses a special rubbish container for materials susceptible to pontaneous ignition and should also be covered under 3304.2 and not in a separate section.

With regard to burning of combustible waste, this should have its own section, preceding the section on open burning, and should not be covered under what to do with rubbish.

The added requirement for the rubbish containers (other than those for spontaneous ignition materials) tells inspectors that rubbish containers should be provided for temporary storage of combustible rubbish (until the end of the shift of work). Such containers should be constructed of materials that have been shown to be safe by meeting a very severe fire test, just like those required by section 808 for I1, I2 and I3 occupancies. A key requirement is that the lids be tight fitting or self-closing.

Cost Impact: Minimal.

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The disapproval was based on the fact that Section 3304.2.3 doesn't include a container size as do other sections of the code and because Section 3304.2.2 is unclear as to why a container would need to be emptied if it were not full and if it would need to be emptied if it became full before the end of a work shift.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Marcelo M. Hirschler, (GBH International), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

3304.2.3 Rubbish containers. Where rubbish containers with a capacity exceeding 5.33 cubic feet (40 gallons) (0.15 m^3) are used ~~Containers with tight-fitting or self-closing lids shall be provided~~ for temporary storage of combustible debris, rubbish and waste material, ~~until the end of each shift of work~~ they shall have tight fitting or self closing lids. Such ~~The~~ rubbish containers shall be constructed entirely of materials that comply with one of the following:

1. Noncombustible materials.
2. Materials that meet a peak rate of heat release not exceeding 300 kW/m^2 when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation.

(Portions of proposal not shown remain unchanged.)

Commenter's Reason: The technical committee did not disagree with the requirement but was concerned about the lack of a minimum size limit. The minimum size limit added is consistent with the size requirements in section 304.3 of the IFC. The fire safety requirements are consistent with those for large rubbish containers throughout the IFC. At present there are no fire safety requirements for rubbish containers in this application and that is the only IFC section lacking such requirements.

The technical committee was also concerned about the requirement to empty containers at the end of each shift of work and it has been eliminated.

The proposal adds clarity to this section by reorganizing it in a more logical fashion.

Final Action: AS AM AMPC____ D

F279-13
3304.2.1 (New)

Proposed Change as Submitted

Proponent: Marcelo M Hirschler, GBH International (gbhint@aol.com)

Add new text as follows:

3304.2.1 Rubbish containers. Containers with tight-fitting or self-closing lids shall be provided for temporary storage of combustible debris, rubbish and waste material, until the end of each shift of work. The rubbish containers shall be constructed entirely of materials that comply with either of the following:

1. Noncombustible materials.
2. Materials that meet a peak rate of heat release not exceeding 300 kW/m^2 when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation.

Reason: Rubbish containers should be provided for temporary storage of combustible rubbish (until the end of the shift of work). Such containers need not be constructed of metal but can be constructed of other noncombustible materials, including materials that have been shown to be safe by meeting a very severe fire test, just like those required by section 808 for I1, I2 and I3 occupancies. A key requirement is that the lids be tight fitting or self closing. Note that this does not address materials susceptible to spontaneous ignition, such as oily rags, covered by 3304.4. The use of the phrase "combustible debris, rubbish and waste" makes this section consistent with other sections of the IFC.

Cost Impact: Minimal

3304.2.1 (NEW)-F-HIRSCHLER

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The disapproval was based on the fact that the proposal doesn't include a container size.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Marcelo M. Hirschler, (GBH International), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

3304.2.1 Rubbish containers. Where rubbish containers with a capacity exceeding 5.33 cubic feet (40 gallons) (0.15 m^3) are used ~~Containers with tight-fitting or self-closing lids shall be provided~~ for temporary storage of combustible debris, rubbish and waste material~~, until the end of each shift of work~~ they shall have tight fitting or self closing lids. ~~The~~ Such rubbish containers shall be constructed entirely of materials that comply with either of the following:

1. Noncombustible materials.
2. Materials that meet a peak rate of heat release not exceeding 300 kW/m^2 when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation.

Commenter's Reason: The technical committee did not disagree with the requirement but was concerned about the lack of a minimum size limit. The minimum size limit added is consistent with the size requirements in section 304.3 of the IFC. The fire safety requirements are consistent with those for large rubbish containers throughout the IFC. At present there are no fire safety requirements for rubbish containers in this application and that is the only IFC section lacking such requirements,

F285-13
5001.1, 5004.2.2, 5004.3, 5701.2

Proposed Change as Submitted

Proponent: Brad Emerick, Denver Fire Department representing the Fire Marshal's Association of Colorado (FMAC) and the Colorado Chapter of the ICC (CCICC) (brad.emerick@denvergov.org)

Revise as follows:

5001.1 Scope. Prevention, control and mitigation of dangerous conditions related to storage, dispensing, use and handling of hazardous materials shall be in accordance with this chapter.
This chapter shall apply to all hazardous materials, including those materials regulated elsewhere in this code, except that when specific requirements are provided in other chapters, those specific requirements shall apply in accordance with the applicable chapter. Where a material has multiple hazards, all hazards shall be addressed.

Exceptions:

1 through 9 *(No change to current text)*
~~10. The storage of distilled spirits and wines in wooden barrels and casks.~~
11. *(No change to current text)*

5004.2.2 Secondary containment for hazardous material liquids and solids. Where required by Table 5004.2.2 buildings, rooms or areas used for the storage of hazardous materials liquids or solids shall be provided with secondary containment in accordance with this section when the capacity of an individual vessel or the aggregate capacity of multiple vessels exceeds the following:

1. Liquids: Capacity of an individual vessel exceeds 55 gallons (208 L) or the aggregate capacity of multiple vessels exceeds 1,000 gallons (3785 L); and
2. Solids: Capacity of an individual vessel exceeds 550 pounds (250 kg) or the aggregate capacity of multiple vessels exceeds 10,000 pounds (4540 kg).

Exception: The release of a liquid or solid without secondary containment into a sanitary or storm-water drainage system or onto the ground is allowed when in compliance with federal, state, or local governmental agencies' regulations and permits.

5004.3 Ventilation. Indoor storage areas and storage buildings shall be provided with mechanical exhaust ventilation or natural ventilation where natural ventilation can be shown to be acceptable for the materials stored.

~~Exception~~ Exceptions:

1. Storage areas for flammable solids complying with Chapter 59.
2. Storage areas for distilled spirits in wooden barrels or casks.

5701.2 Nonapplicability. This chapter shall not apply to liquids as otherwise provided in other laws or regulations or chapters of this code, including:

1 through 9 *(No change to current text)*
10. The storage of distilled spirits ~~and wines~~ in wooden barrels and casks.
11 The storage of fermented beverages with ethyl alcohol contents of 16% or less.

Reason: There is confusion about the applicability of flammable liquid (Chapter 57) hazardous materials (Chapter 50) provisions to distilled spirits because of the exceptions for distilled spirits and wines stored in wooden barrels and casks in IFC Chapters 50 and

57 (and NFPA 30). The issue arises because of the growing popularity of "boutique" or "craft" distillers locating their operations in urban areas. The proposed language clarifies bulk storage provisions for distilled spirits but does not alter the intent. The proposed language does not affect provisions applicable to use, nor those applicable to liquor storage in retail or wholesale establishments. First, note distilled spirits are Class 1C and Class 1B flammable liquids. They are primarily comprised of ethyl alcohol (ethanol) and water with concentrations ranging from approximately 19% to 99%. The boiling point of pure ethanol is approximately 178ºF so an ethanol mixture with water will boil between 178ºF and 212ºF. The closed cup flash point for a 19% concentration of ethanol in water is 100ºF and for a 58% concentration is 73ºF making the mixtures in this range Class 1C flammable liquids (these values are not adjusted for altitude). Ethanol concentrations in water between 58% and 99% are Class 1B flammable liquids.

Second, the Building Code establishes occupancy. If a quantity of a Class 1B or Class 1C flammable liquid exceeding the maximum allowable quantity (MAQ), the room in which it is located is an H3 Occupancy. Please remember this applies to bulk storage (casks, barrels, metal containers, etc. exceeding 1.3 gallon capacities) and not to liquor stores and wholesale distributors for which there are several exceptions.

Third, H occupancies have to be sprinklered. This is the primary provision overlooked because of the confusion noted above. This is not because wood is inherently safer than metal, plastic or glass – it is not. It was probably inserted in the legacy code(s) back when casks were stored in liquid storage warehouses separated by hundreds of feet from one another and urban distilleries weren't contemplated. It was probably held over today because there is not yet an established sprinkler criteria for the storage of Class 1C flammable liquids in wooden barrels and casks. THIS HOWEVER DOES NOT MEAN THESE ROOMS SHOULD BE EXEMPT FROM SPRINKLERING REQUIREMENTS! An engineered sprinkler design is required.

Fourth, the applicable code requirements have not been changed. The UBC legacy code excepted distilled spirits stored in wooden barrels and casks from the secondary containment and ventilation requirements normally mandated for flammable liquids. The exception was often misinterpreted even then to extend to the entire range of code provisions. When flammable liquids requirements were brought into the IFC, the exception was moved to the scoping provisions which created the confusion recurring today. The deletion of the exception in Section 5001.1 removes the confusion associated with the applicable requirements. The modifications to Sections 5004.2.2 and 5004.3 reestablish the exceptions to secondary containment and ventilation contained in the legacy code.

The Nonapplicability of Chapter 57 to distilled spirits is retained. The word "wines" is removed from the exception for two reasons:

a) if the intent to read "distilled wines" then distilled spirits already includes this; and
b) if the intent is to read "wines and distilled spirits" then wines is included in new item 11 (along with beer).

Cost Impact: This change will not affect the cost of construction.

5001.1-F-EMERICK

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The disapproval was based on the lack of technical justification for the proposed exception to Section 5004.2.2, the provisions of which appear to already be covered in current Section 5004.2.3. Also, current Section 5701.2, Exception 8 appears to cover the proposed change to that section.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Brad Emerick, Denver Fire Department, representing Fire Marshal's Association of Colorado (FMAC), requests Approval as Submitted.

Commenter's Reason: The proposed language clarifies bulk storage provisions for distilled spirits but does not alter the intent. The proposed language does not affect provisions applicable to use or those applicable to liquor storage in retail or wholesale establishments.

Occupancy is established in the IBC and H occupancies have to be sprinklered. This is the primary provision overlooked because of the exceptions for distilled spirits stored in wooden barrels and casks.

When flammable liquids requirements were brought into the IFC, the exceptions were moved to the scoping provisions which created the confusion recurring today.

The deletion of the exception in Section 5001.1 removes the confusion associated with the applicable requirements.

The modifications to Sections 5004.2.2 and 5004.3 reestablish the exceptions to secondary containment and ventilation.

The Nonapplicability of Chapter 57 to distilled spirits is retained.

The word “wines” is removed from the exception for two reasons:

a) if the intent to read “distilled wines” then distilled spirits already includes this; and
b) if the intent is to read “wines and distilled spirits” then wines is included in new item 11 (along with beer).

F285-13
Final Action: AS AM AMPC____ D

F295-13
5003.9, 5003.9.11 (New)

<u>Proposed Change as Submitted</u>

Proponent: John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care (john.williams@doh.wa.gov)

Revise as follows:

5003.9 General safety precautions. General precautions for the safe storage, handling or care of hazardous materials shall be in accordance with Sections 5003.9.1 through ~~5003.9.10~~ <u>5003.9.11</u>.

<u>**5003.9.11 Emergency showers and eyewash stations.** In Group I-2 Condition 2, where the eyes or body of any person are at risk for exposure to injurious corrosive materials, suitable facilities for quick drenching or flushing of the eyes and body shall be provided within the work area for immediate emergency use. The emergency showers and eyewash stations shall be installed in accordance with the *International Plumbing Code*.</u>

Reason: This proposal addresses KTag K134. The IPC already provides the installation requirements but the requirements are not called up in the IFC. This proposal uses verbiage from OSHA with some minor revisions to remove permissive language. The focus is only on corrosive materials which are defined in the IFC. The scope of this change is limited to Group I-2 condition 2 due to the scoping limitations of the Ad Hoc Healthcare Committee.

Source of verbiage (no copyright issues):

OSHA
1910.151(c)
Where the eyes or body of any person may be exposed to injurious corrosive materials, suitable facilities for quick drenching or flushing of the eyes and body shall be provided within the work area for immediate emergency use.

For Reference:

International Plumbing Code 2012

SECTION 411
EMERGENCY SHOWERS AND EYEWASH STATIONS

411.1 Approval. Emergency showers and eyewash stations shall conform to ISEA Z358.1.

411.2 Waste connection. Waste connections shall not be required for emergency showers and eyewash stations.

This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April, 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx

Cost impact:

5003.9-F-WILLIAMS-ADHOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The disapproval was based on the committee's judgment that the language of the proposal is vague and ambiguous and could lead to inconsistent enforcement. The committee also felt that including OSHA-type worker safety requirements in the code is inconsistent with the scope of the code and could lead to conflicts with OSHA regulations.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

5003.9 General safety precautions. General precautions for the safe storage, handling or care of hazardous materials shall be in accordance with Sections 5003.9.1 through 5003.9.11.

5003.9.11 Emergency showers and eyewash stations. In Group I-2 Condition 2, where the eyes or body of ~~any~~ a person ~~are~~ is at risk for exposure to ~~injurious~~ corrosive materials, ~~suitable facilities for quick drenching or flushing of the eyes and body~~ emergency showers or eyewash stations shall be provided within the work area for immediate emergency use. The emergency showers and eyewash stations shall be installed in accordance with the *International Plumbing Code*.

Commenter's Reason: How to install these systems is already in the IPC. The IFC does address hazards, so this trigger should be in the IFC. The modification is striking language that could be considered subjective.

F295-13

Final Action: AS AM AMPC____ D

F300-13
5203.7 (New), 5204.1

Proposed Change as Submitted

Proponent: Robert J Davidson, Davidson Code Concepts, LLC, representing the Biomass Feedstock Industry Committee on Codes and Standards (BFICOCS) (rjd@davidsoncodeconcepts.com)

Revise as follows:

5203.7 Sources of ignition. Sources of ignition shall comply with Sections 5203.7.1 through 5203.7.2.

5003.7.1 Smoking. Smoking shall be prohibited and “No Smoking” signs provided as follows:

1. In rooms or areas where materials are stored or dispensed or used in open systems .
2. Within 25 feet (7620 mm) of outdoor storage or open use areas.
3. Facilities or areas within facilities that have been designated as totally “no smoking” shall have “No Smoking” signs placed at all entrances to the facility or area. Designated areas within such facilities where smoking is permitted either permanently or temporarily, shall be identified with signs designating that smoking is permitted in these areas only.

Signs required by this section shall be in English as a primary language or in symbols allowed by this code and shall comply with Section 310.

5203.7.2 Open flames. Open flames and high-temperature devices shall not be used in a manner which creates a hazardous condition and shall be listed for use with the materials stored or used.

5204.1 General. Loose combustible fibers, not in suitable bales or packages and ~~whether housed or~~ stored outdoors in the open, shall ~~not be stored within 100 feet (30 480 mm) any structure, except as indicated in this chapter~~ comply with Section 2808 of this code. Occupancies involving the indoor storage of loose combustible fibers in amounts exceeding the maximum allowable quantity per control area as set forth in Section 5003.1 shall comply with Sections 5204.2 through 5204.6.

Reason: This proposal is part of a package of proposals concerning Chapter 52 Combustible Fibers. An issue identified in review of the current code language and structure is that though Chapter 52 Combustible Fibers is located in the "Hazardous Materials" portion of the code, combustibles fibers are not defined as a hazardous material.

> ***5001.2 Material classification.*** *Hazardous materials are those chemicals or substances defined as such in this code. Definitions of hazardous materials shall apply to all hazardous materials, including those materials regulated elsewhere in this code.*
>
> ***5001.2.1 Mixtures.*** *Mixtures shall be classified in accordance with hazards of the mixture as a whole. Mixtures of hazardous materials shall be classified in accordance with nationally recognized reference standards; by an approved qualified organization, individual, or Material Safety Data Sheet (MSDS); or by other approved methods.*
>
> ***5001.2.2 Hazard categories.*** *Hazardous materials shall be classified according to hazard categories. The categories include materials regulated by this chapter and materials regulated elsewhere in this code.*
>
> ***5001.2.2.1 Physical hazards.*** *The material categories listed in this section are classified as physical hazards. A material with a primary classification as a physical hazard can also pose a health hazard.*
>
> 1. *Explosives and blasting agents.*
> 2. *Combustible liquids.*
> 3. *Flammable solids, liquids and gases.*
> 4. *Organic peroxide solids or liquids.*
> 5. *Oxidizer, solids or liquids.*
> 6. *Oxidizing gases.*
> 7. *Pyrophoric solids, liquids or gases.*
> 8. *Unstable (reactive) solids, liquids or gases.*
> 9. *Water-reactive materials solids or liquids.*
> 10. *Cryogenic fluids.*

5001.2.2.2 Health hazards. *The material categories listed in this section are classified as health hazards. A material with a primary classification as a health hazard can also pose a physical hazard.*

1. *Highly toxic and toxic materials.*
2. *Corrosive materials.*

Combustible fibers do not fit into those parameters. A review of the definition of hazardous materials found within the code also documents that the materials regulated by Chapter 52 are not hazardous materials.

[F] HAZARDOUS MATERIALS. *Those chemicals or substances that are physical hazards or health hazards as classified in Section 307 and the International Fire Code, whether the materials are in usable or waste condition.*

[F] HEALTH HAZARD. *A classification of a chemical for which there is statistically significant evidence that acute or chronic health effects are capable of occurring in exposed persons. The term "health hazard" includes chemicals that are toxic or highly toxic, and corrosive.*

[F] PHYSICAL HAZARD. *A chemical for which there is evidence that it is a combustible liquid, cryogenic fluid, explosive, flammable (solid, liquid or gas), organic peroxide (solid or liquid), oxidizer (solid or liquid), oxidizing gas, pyrophoric (solid, liquid or gas), unstable (reactive) material (solid, liquid or gas) or water- reactive material (solid or liquid).*

Since the scoping of Chapter 50, including the sections within Chapter 50, are for the regulation of hazardous materials, even basic requirements found within Chapter 50 such as control of ignition hazards would not apply to the activities regulated by Chapter 52.

CHAPTER 50
HAZARDOUS MATERIALS—GENERAL PROVISIONS

SECTION 5001
GENERAL

5001.1 Scope. *Prevention, control and mitigation of dangerous conditions related to storage, dispensing, use and handling* ***of*** *hazardous materials shall be in accordance with this chapter.*

This chapter shall apply to all hazardous materials, including those materials regulated elsewhere in this code, except that when specific requirements are provided in other chapters, those specific requirements shall apply in accordance with the applicable chapter. Where a material has multiple hazards, all hazards shall be addressed.

SECTION 5003
GENERAL REQUIREMENTS

5003.1 Scope. *The storage, use and handling* ***of all hazardous materials*** *shall be in accordance with this section.*

This proposal addresses this issue by adding a Section 5203.7 "Sources of ignition" by extracting requirements from current Section 5003.7 "Sources of ignition" that would be appropriate for combustible fibers. In reality, there isn't any other section of Chapter 50 that provides for the regulation of combustible fibers.

In addition, this proposal is building upon a separate proposal to recognize the ability to control the hazards of combustible fibers just as the code provides for recognition of the control of combustible dust by modifying the language found in Section 5204.1.

Section 5204.1 is proposed to be modified to point to Section 2808 "STORAGE AND PROCESSING OF WOOD CHIPS, HOGGED MATERIAL, FINES, COMPOST AND RAW PRODUCT ASSOCIATED WITH YARD WASTE AND RECYCLING FACILITIES" of the fire code as the appropriate standard for the exterior storage of combustible fibers. The materials and hazards presented are similar.

Section 5204.1 is further modified to indicate that the more restrictive indoor storage of combustible fibers regulated by Sections 5204.2 through 5204.6 is for those facilities that have amounts exceeding the maximum allowable quantity per control area as set forth in Section 5003.1. If the hazards are controlled eliminating the application of IFC Table 5003.1.1/IBC [F]307.1.1(1) and Sections 307.4 and 307.5 of the IBC, the increased protection levels are not necessary.

The Biomass Feedstock Industry Committee on Codes and Standards (BFICOCS), led by Oak Ridge National Laboratory (ORNL), is an initiative of the Department of Energy Biomass Technologies Office (BTO). As part of the BTO integrated biorefinery efforts, the BFICOCS was assembled to conduct analysis of existing fire and building codes and to prepare proposed code changes designed to facilitate the development of the commercial-scale biomass industry while maintaining a focus on safety. The committee is made up of managers, engineers and code officials from industry, government laboratories, consulting firms, and the American Society of Agricultural and Biological Engineers.

Fire codes related to storage, handling, and preprocessing of biomass are based on industries that operate in a significantly different manner than the growing biomass-based energy industry. Applying current research on biomass properties and knowledge of conventional and emerging storage, handling, and preprocessing technologies, the BFICOCS has identified changes in the IFC that benefit industry and the public.

Cost Impact: The code change proposal will not increase the cost of construction.

5203.7 (NEW)-F-DAVIDSON

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee agreed with the proponent's reason statement that the code change provides a needed improvement to the provisions applicable to combustible fibers.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bob Eugene, representing UL LLC, requests Approval as Modified by Public Comment.

Modify the proposal as follows:

5203.7.2 Open flames. Open flames and high-temperature devices shall not be used in a manner which creates a hazardous condition<u>. High temperature devices and those devices utilizing an open flame</u> ~~and~~ shall be listed for use with the materials stored or used.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: As written the proposal would require open flames to be listed. This public comment clarifies that it is the devices utilizing the open flames that must be listed.

Final Action: AS AM AMPC____ D

F310-13
5307 (New), 908.7 (New), 105.6.4 (New), Table 105.6.8

Proposed Change as Submitted

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Add new text as follows:

SECTION 5307
CARBON DIOXIDE (CO_2) SYSTEMS USED IN BEVERAGE DISPENSING APPLICATIONS

5307.1 General. Carbon dioxide systems with 100 or more pounds of carbon dioxide used in beverage dispensing applications shall comply with Sections 5307.2 through 5307.5.2.

5307.2 Permits. Permits shall be required as set forth in Section 105.6.

5307.3 Equipment. The storage, use, and handling of liquid carbon dioxide shall be in accordance with Chapter 53 and the applicable requirements of NFPA 55, Chapter 13.

5307.4 Protection from damage. Carbon dioxide systems shall be installed so the storage tanks, cylinders, piping and fittings are protected from damage by occupants or equipment during normal facility operations.

5307.5 Required protection. Where carbon dioxide storage tanks, cylinders, piping and equipment are located indoors, rooms or areas containing carbon dioxide storage tanks, cylinders, piping and fittings and other areas where a leak of carbon dioxide can collect shall be provided with either ventilation in accordance with Section 5307.5.1 or an emergency alarm system in accordance with Section 5307.5.2.

5307.5.1 Ventilation. Mechanical ventilation shall be in accordance with the *International Mechanical Code* and shall comply with all of the following:

1. Mechanical ventilation in the room or area shall be at a rate of not less than 1 cubic foot per minute per square foot [0.00508 $m^3/(s \bullet m^2)$].
2. Exhaust shall be taken from a point within 12 inches (305 mm) of the floor.
3. The ventilation system shall be designed to operate at a negative pressure in relation to the surrounding area.

5307.5.2 Emergency alarm system. An emergency alarm system shall comply with all of the following:

1. Continuous gas detection shall be provided to monitor areas where carbon dioxide can accumulate.
2. The threshold for activation of an alarm shall not exceed 5,000 parts per million (9,000 mg/m^3).
3. Activation of the emergency alarm system shall initiate a local alarm at an approved location.

908.7 Carbon dioxide (CO_2) systems. Emergency alarm systems in accordance with Section 5307.5.2 shall be provided where required for compliance with Section 5307.5.

105.6.4 Carbon dioxide systems used in beverage dispensing applications. An operational permit is required for carbon dioxide systems used in beverage dispensing applications with more than 100 pounds of carbon dioxide.

(Renumber subsequent sections.)

Revise as follows:

TABLE 105.6.8
PERMIT AMOUNTS FOR COMPRESSED GASES

TYPE OF GAS	AMOUNT (cubic feet at NTP)
Inert and simple asphyxiant [a]	6,000

(Portions of table not shown remain unchanged)

For SI: 1 cubic foot = 0.02832 m^3.

a. For carbon dioxide used in beverage dispensing applications, see Section 105.6.4.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

This proposal is intended to address fatal CO_2 poisoning incidents in restaurants where CO_2 leaked from large storage tanks and displaced oxygen in these areas. Two such incidents can be found at:

http://articles.orlandosentinel.com/2005-02-12/news/0502120303_1_carbon-dioxide-central-florida-sanford

http://savannahnow.com/news/2011-09-14/carbon-dioxide-blamed-pooler-mcdonalds-death

Individual requirements are proposed based on the following:

105.6.4 and Table 105.6.8 – Operational permits are required for CO_2 systems used in the beverage dispensing applications covered by new Section 5307.

5307.1 – The intent of the proposal is to address locations where CO_2 is used in conjunction with carbonators to produce carbonated beverages. A minimum trigger of 100 lbs. was selected for these requirements because it was felt that systems with lesser amounts of CO_2 do not pose as great a risk of asphyxiation as is present with large quantities of the gas.

5307.2 – Provides a reference to permit requirements that is consistent with other such references in the code.

5307.3 - Components in a compressed gas system are already required to comply with Chapter 53 which will cover items such as pressure vessel and piping requirements, among others. An additional reference to NFPA 55, Chapter 13 brings in additional requirements that relate specifically to these installations.

5307.4 - This section includes basic requirements that are intended to protect CO_2 storage tanks, cylinders, piping and fittings are protected from damage by occupants or equipment during normal facility operations. This will decrease the chance of damage that may cause leaks, which is especially important in the facilities in which gas detection systems are not provided.

5307.5 – This section requires buildings in which the CO_2 systems are installed to be provided with either ventilation that complies with Section 5307.5.1 or an emergency alarm system that complies with Section 5307.5.2. It does not require that both ventilation and gas detection be required.

The hazard associated with these systems is that the heavier than air CO_2 may accumulate and displace oxygen, creating an asphyxiation hazard. Leaks are most likely from fittings and connections, but could also be from plastic or other runs of piping.

5307.5.2 – When the emergency alarm system option is selected, it shall include a continuous gas detection system with CO_2 detectors of adequate number and spacing to cover the protected area. The trigger level of 5000 ppm CO_2 is the OSHA Permissible Exposure Limit (PEL).

Cost Impact: This proposal will add to the cost of construction.

5307 (NEW)-F-ZUBIA-FCAC

Committee Action Hearing Results

Committee Action: Approved as Modified

Modify the proposal as follows:

5307.1 General. Carbon dioxide systems with more than 100 ~~or more~~ pounds of carbon dioxide used in beverage dispensing applications shall comply with Sections 5307.2 through 5307.5.2.

5307.3 Equipment. The storage, use, and handling of liquid carbon dioxide shall be in accordance with Chapter 53 and the applicable requirements of NFPA 55, Chapter 13. Insulated liquid carbon dioxide systems shall have pressure relief devices vented in accordance with NFPA 55.

5307.5.2 Emergency alarm system. An emergency alarm system shall comply with all of the following:

1. Continuous gas detection shall be provided to monitor areas where carbon dioxide can accumulate.
2. The threshold for activation of an alarm shall not exceed 5,000 parts per million (9,000 mg/m^3).
3. Activation of the emergency alarm system shall initiate a local alarm within the room or area in which the system is installed ~~at an approved location~~.

(Portions of the proposal not shown remain unchanged.)

Committee Reason: The committee agreed with the proponent that the code change focuses on an emerging life safety hazard for building occupants and first responders and, while it will need some adjustments, it should be put into the code now to provide important safeguards against accidental CO_2 asphyxiation. The modification to Section 5307.1 provides correlation with the permit requirements of Section 105.6.4. The modification to Section 5307.3 provides needed overpressure protection for insulated systems. The modification to Section 5307.5.2 better defines where an alarm must sound and provides correlation with CGA-6.5 which, although not referenced in the IFC, is a national standard on the subject.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Christopher B. Cantrell, Nebraska Boiler Inspection Program Manager (i.e. Chief Boiler Inspector), NDOL, representing State of Nebraska; Tony Oda, Chief Boiler Inspector, representing State of Washington; Gary L. Scribner, Deputy Chief, representing Missouri Division of Fire Safety; Robby D. Troutt, Texas Department of Licensing and Regulation State of Texas, request Approval as Modified by this Public Comment.

Further modify the proposal as follows:

5307.5 Required protection. Where insulated liquid carbon dioxide storage tanks are located indoors or in enclosed areas an emergency alarm system shall be provided in accordance with Section 5307.5.2. Where carbon dioxide storage tanks, cylinders, piping and equipment are located indoors, rooms or areas containing carbon dioxide storage tanks, cylinders, piping and fittings and other areas where a leak of carbon dioxide can collect shall be provided with either ventilation in accordance with Section 5307.5.1 or an emergency alarm system in accordance with Section 5307.5.2.

5307.5.2 Emergency alarm system. An emergency alarm system shall comply with all of the following:

1. Continuous gas detection shall be provided to monitor areas where carbon dioxide can accumulate.
2. The threshold for activation of a Low Level alarm shall not exceed 5,000 parts per million (9,000 mg/m3). The threshold for activation of a High Level alarm shall not exceed 30,000 parts per million (27,000 mg/m3).
3. Activation of the emergency alarm system shall initiate a local alarm within the room or area in which the system is installed.
4. Warning signs shall be posted at the entrance to the building, room, enclosure, or enclosed area where storage containers are located.
5. Additional instructional signage shall be posted outside of the area where storage containers are located and such signage shall contain at minimum the following information.
   5.1 Low Level Alarm (5,000ppm) – Provide appropriate cross ventilation to the area. Personnel are allowed to enter the area for a period of time not to exceed 15 minutes in order to identify and repair potential leaks.
   5.2 High Level Alarm (30,000ppm) – Personnel shall evacuate the area and no personnel shall enter the affected area without proper self-contained breathing apparatus until the area is adequately ventilated and the concentration of CO_2 is reduced below the high alarm limit.

(Portions of proposal not shown remain unchanged.)

Commenter's Reason: Paragraph 5307.5 allows either alarms or ventilation. This is in conflict with the requirements of NFPA 55 chapter 13 for insulated liquid carbon dioxide storage tanks that are filled on site (adopted by reference in paragraph 5307.3), and it is in conflict with the installation requirements found in the 2013 Edition of the National Board Inspection Code, Part 1 Supplement 3 (ANSI/NB23). The above change would eliminate these conflicting statements and add consistency across the Codes.

Paragraph 5307.5.2 requires a local alarm in areas where carbon dioxide may accumulate but does not address signage. CO2 monitoring systems have different stages of alarms. With carbon dioxide systems being installed in almost every fast food restaurant and convenience store, locations that normally have high turnover and employ younger workers it is imperative to give clear direction to avoid misunderstanding, direction and undue panic. The proposed wording is also consistent with the requirements of the 2013 Edition of the National Board Inspection Code, Part 1, Supplement 3 (ANSI/NB23). These changes not only provide consistency between the codes, but they will provide clear guidance to workers and first responders in locations where carbon dioxide systems are installed.

Public Comment 2:

Barry Greive, representing Target Corporation, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

SECTION 5307
CARBON DIOXIDE (CO_2) SYSTEMS USED IN BEVERAGE DISPENSING APPLICATIONS

5307.1 General. Carbon dioxide systems with 100 or more pounds of carbon dioxide used in beverage dispensing applications shall comply with Sections 5307.2 through 5307.5.2.

Exceptions:

1. (CO_2) tanks with 100 pounds of carbon dioxide that are open to spaces 5,000 to 10,000 square feet or greater.
2. (CO_2) tanks ≤ 300 pounds of carbon dioxide that are open to spaces greater than 10,000 to 20,000 square feet or greater.
3. (CO_2) tanks ≤ 500 pounds that are open to spaces greater than 20,000 to 50,000 square feet.
4. (CO_2) tanks over 500 pounds that are open to spaces greater than 50,000 square feet.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: There are many situations where the Carbon Dioxide tank is open to a much larger area and the levels of (CO_2) would not reach a hazardous level because of the sheer volume of air in the space. If the tanks are located in a small room or enclosed space then there is a justifiable need for additional safeguards. These system are widely used and throughout the food and beverage industry and are becoming more prevalent all the time.

The proposed exceptions are very conservative in nature for your average building and using methodology used for refrigeration system detection and alarming. The numbers were derived using a safe amount of 5.7 pounds of carbon dioxide per 1000 cubic feet.

F310-13

Final Action: AS AM AMPC____ D

F325-13
6003.1.4.1

Proposed Change as Submitted

Proponent: Elley Klausbruckner representing Klausbruckner & Associates Inc (ek@klausbruckner.com)

Revise as follows:

6003.1.4.1 Floors. In addition to the requirements set forth in Section 5004.12, floors of storage areas <u>where highly toxic and toxic liquids are stored</u> shall be of liquid-tight construction.

Reason: Liquid tight flooring for storage of highly toxic and toxic solids is illogical. We believe the code section was intended for storage of liquids only.

Cost Impact: The proposal will not increase the cost of construction.

6003.1.4.1-F-KLAUSBRUCKNER

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The disapproval was based on the committee's judgment that removal of the requirement for solids could create a hazard condition where firefighting water application would create a liquid mixture that should be contained.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Elley Klausbruckner, representing Klausbruckner & Associates Inc., requests Approval as Submitted.

Commenter's Reason: The code section has nothing to do with containment. This code change does not eliminate containment at all. It simply proposes that the requirements of liquid tight flooring does not apply to toxic or highly toxic <u>solids</u>.

Additionally the argument that toxic or highly toxic solids should be stored in rooms having liquid tight flooring because of the firefighting water application is illogical. Using the same argument warehouses containing many commonly used plastics should be also liquid tight since during pyrolysis many of the plastics can be considered as toxic which then creates the same situation if firefighting water is applied.

F325-13
Final Action: AS AM AMPC____ D

F327-13
Table 6104.3

Proposed Change as Submitted

Proponent: Bruce Swiecicki representing National Propane Gas Association (bswiecicki@npga.org)

Revise as follows:

TABLE 6104.3
LOCATION OF LP-GAS CONTAINERS

LP-GAS CONTAINER CAPACITY (water gallons)	MINIMUM SEPARATION BETWEEN LP-GAS CONTAINERS AND BUILDINGS~~, PUBLIC WAYS~~ OR LOT LINES OF ADJOINING PROPERTY THAT CAN BE BUILT UPON		MINIMUM SEPARATION BETWEEN LP-GAS CONTAINERS [b, c] (feet)
	Mounded or underground LP-gas containers [a] (feet)	Above-ground LP-gas containers [b] (feet)	

(Portions of table not shown remain unchanged)

Reason: The definition in the International Fire Code of "public way" is:
"A street, alley or other parcel of land open to the outside air leading to a street, that has been deeded, dedicated or otherwise permanently appropriated to the public for public use and which has a clear width and height of not less than 10 feet."

The Commentary to the IFC elaborates by saying:
"The Public way marks the termination of the exit discharge portion of the means of egress system. It is the final destination for occupants, and is presumed to be safe from the emergency occurring in the structure or that it will directly connect to other routes so that occupants can move a distance away from the danger."

Based on the history of the term "public way," the chief concern is being able to egress the occupants of a building in a manner that allows them to have access to a safe space outside the building. The presumption is that an emergency has occurred inside the building and the occupants must egress the building safely.

The restriction on the placement of a propane container with respect to a public way is not consistent with the purpose for establishing a public way because the threat to the occupants does not come from the propane container. The container is required to be located a specific distance from the building based on its size and therefore, the container will not be threatened by a fire event that occurs within the building. It has been shown that the distances required by Table 6104.3 are sufficient to maintain the safety of the container even if the building is on fire. Therefore, there is no threat to the occupants from the propane container as they egress the building. In addition, the potential concern of vehicular impact to the propane container is already addressed in Section 312 of the IFC.

Chapter 61 refers to NFPA 58 as a standard that "fills in the gaps" that may not be addressed in Chapter 61. In this case, NFPA 58 has a restriction (Table 6.5.3) on the location of product transfers with respect to public ways and places of public assembly. Transfers of propane into or out of the container are prohibited within 10 feet of a public way and within 50 feet of outdoor places of public assembly. Therefore, the threat to the general public during product transfer operations is addressed by NFPA 58.

The limitation in the IFC on the placement of containers with respect to public ways creates a conflict between Section 6104.3 with Table 6104.3 in the IFC and Section 6.3.1 with Table 6.3.1 in NFPA 58. This conflict has led to differing interpretations by various authorities having jurisdiction and we propose to delete the term "public ways" to resolve the conflict.

In summary, elimination of the term "public way" will not compromise the safety of the occupants of the building and will resolve a conflict between the IFC and NFPA 58.

Cost Impact: This proposal will not increase the cost of construction.

6104.3-F-SWIECICKI

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The disapproval was based on the committee's judgment that the public way, where owned by a municipality, could be used for any purpose and could even be sold for private development which would place the propane tank too close to the new private property line.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bruce Swiecicki, National Propane Gas Association, representing self, requests Approval as Submitted.

Commenter's Reason: The Committee Reason Statement is not solid justification for disapproving this code change because it does not recognize that a propane container can be moved to another location very easily.

The definition in the International Fire Code of "public way" is: "A street, alley or other parcel of land open to the outside air leading to a street, that has been deeded, dedicated or otherwise permanently appropriated to the public for public use and which has a clear width and height of not less than 10 feet." The Commentary to the IFC elaborates by saying: *"The Public way marks the termination of the exit discharge portion of the means of egress system. It is the final destination for occupants, and is presumed to be safe from the emergency occurring in the structure or that it will directly connect to other routes so that occupants can move a distance away from the danger."*

Based on the history of the term "public way," the chief concern is being able to egress the occupants of a building in a manner that allows them to have access to a safe space outside the building. The presumption is that an emergency has occurred inside the building and the occupants must egress the building safely.

The restriction on the placement of a propane container with respect to a public way is not consistent with the purpose for establishing a public way because the threat to the occupants does not come from the propane container. The container is required to be located a specific distance from the building based on its size and therefore, the container will not be threatened by a fire event that occurs within the building. It has been shown that the distances required by Table 6104.3 are sufficient to maintain the safety of the container even if the building is on fire. Therefore, there is no threat to the occupants from the propane container as they egress the building. In addition, the potential concern of vehicular impact to the propane container is already addressed in Section 312 of the IFC.

Chapter 61 refers to NFPA 58 as a standard that "fills in the gaps" that may not be addressed in Chapter 61. In this case, NFPA 58 has a restriction (Table 6.5.3) on the location of product transfers with respect to public ways and places of public assembly. Transfers of propane into or out of the container are prohibited within 10 feet of a public way and within 50 feet of outdoor places of public assembly. Therefore, the threat to the general public during product transfer operations is addressed by NFPA 58.

The limitation in the IFC on the placement of containers with respect to public ways creates a conflict between Section 6104.3 with Table 6104.3 in the IFC and Section 6.3.1 with Table 6.3.1 in NFPA 58. This conflict has led to differing interpretations by various authorities having jurisdiction and we propose to delete the term "public ways" to resolve the conflict.

In summary, elimination of the term "public way" will not compromise the safety of the occupants of the building and will resolve a conflict between the IFC and NFPA 58.

F327-13

Final Action: AS AM AMPC____ D

F328-13
Table 6104.3

Proposed Change as Submitted

Proponent: Bruce Swiecicki representing National Propane Gas Association (bswiecicki@npga.org)

Revise as follows:

TABLE 6104.3
LOCATION OF LP-GAS CONTAINERS

LP-GAS CONTAINER CAPACITY (water gallons)	**MINIMUM SEPARATION BETWEEN LP-GAS CONTAINERS AND BUILDINGS, PUBLIC WAYS OR LOT LINES OF ADJOINING PROPERTY THAT CAN BE BUILT UPON**		**MINIMUM SEPARATION BETWEEN LP-GAS CONTAINERS [b, c] (feet)**
	Mounded or underground LP-gas containers [a] (feet)	**Above-ground LP-gas containers [b] (feet)**	
Less than 125[c, d]	10	5 e	None
501 to 2,000	10	25 ~~e~~, f	3

(Portions of table not shown remain unchanged)

a through d *(No changes to current text)*

e. The following shall apply to above-ground containers installed alongside buildings:

1. LP-gas containers of less than a 125-gallon water capacity are allowed next to the building they serve when in compliance with Items 2, 3 and 4.
2. LP-gas containers of less than a 125-gallon water capacity are allowed next to a lot line of adjoining property.

~~2~~3. Department of Transportation (DOTn) specification LP-gas containers shall be located and installed so that the discharge from the container pressure relief device is at least 3 feet horizontally from building openings below the level of such discharge and shall not be beneath buildings unless the space is well ventilated to the outside and is not enclosed for more than 50 percent of its perimeter. The discharge from LP-gas container pressure relief devices shall be located not less than 5 feet from exterior sources of ignition, openings into direct-vent (sealed combustion system) appliances or mechanical ventilation air intakes.

~~3~~4. ASME LP-gas containers of less than a 125-gallon water capacity shall be located and installed such that the discharge from pressure relief devices shall not terminate in or beneath buildings and shall be located at least 5 feet horizontally from building openings below the level of such discharge and not less than 5 feet from exterior sources of ignition, openings into direct vent (sealed combustion system) appliances, or mechanical ventilation air intakes.

~~4~~5. The filling connection and the vent from liquid-level gauges on either DOTn or ASME LP-gas containers filled at the point of installation shall not be less than 10 feet from exterior sources of ignition, openings into direct vent (sealed combustion system) appliances or mechanical ventilation air intakes.

f. *(No change to current text)*

Reason: This proposal will bring the IFC into closer correlation with NFPA 58 regarding the installation of small containers next to buildings. There is no technical basis for permitting the installation of a small container next to a building and still mandating a separation distance from a lot line, as Note e to Table 6104.3 may currently be interpreted to require. ICC staff previously responded to a request for interpretation and agrees that an installation in which a small container is located next to a building does not constitute a violation if the property line is within 5 feet of the container.

The other change would strike the reference to Note e in the cell for 501-2000 gallon above-ground containers. Since Note e is only applicable to containers less than 125 gallons, there is no need to reference it in that cell.

Cost Impact: This proposal will not increase the cost of construction.

6104.3T #1-F-SWIECICKI

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The disapproval was based on the committee's concern that property lines can change through zoning changes or lot consolidations. It also appears that the revision to Note e.1 would contain two separate exceptions that should be shown as separate sub-notes.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bruce Swiecicki, National Propane Gas Association, representing self, requests Approval as Submitted.

Commenter's Reason: In rebuttal to the Committee Statement, propane containers, especially those less than 125 gallons, are easily relocated.

This proposal will bring the IFC into closer correlation with NFPA 58 regarding the installation of small containers next to buildings. There is no technical basis for permitting the installation of a small container next to a building and still mandating a separation distance from a lot line, as Note e to Table 6104.3 may currently be interpreted to require.

F328-13

Final Action: AS AM AMPC____ D

F332-13
6110.1, 6110.2

Proposed Change as Submitted

Proponent: Bruce Swiecicki representing National Propane Gas Association (bswiecicki@npga.org)

Revise as follows:

6110.1 ~~Temporarily out of service~~ Containers disconnected from service at consumer sites. LP-gas containers disconnected from service ~~whose use has been temporarily discontinued~~ at consumer sites shall comply with all of the following:

~~1. Be disconnected from appliance piping.~~
~~2~~1. ~~Have~~ The LP-gas container outlets, except pressure relief valves, shall be closed ~~or~~ and plugged or capped.
~~3~~2. ~~Be~~ The container shall be positioned with the pressure relief valve in direct communication with the LP-gas container vapor space.

6110.2 ~~Permanently out of service~~ Retrieval of disconnected containers. ~~LP-gas containers to be placed permanently out of service shall be removed from the site.~~ LP-gas containers that have been disconnected from service shall be retrieved by the owner.

Reason: As currently worded, the text in Section 6110 is confusing and difficult to implement. A reading of the 2012 Commentary indicates that the concern is over LP-gas containers that have been disconnected from service due to a customer's request, usually because the customer wants to switch suppliers. The text proposed above will clarify in concise terms what needs to be done in order to avoid the release of gas from a container that has been disconnected from service. The proposal accomplishes the following:

- The changed titles clarify the intent of these sections.
- The deletion of current #1 occurs because the first sentence of the paragraph establishes that the container has already been disconnected from the piping system.
- Changing "outlets" to "appurtenances" is more accurate since not every valve on a container is an "outlet." Container appurtenances are defined in NFPA 58 as "devices installed in container openings for safety, control or operating purposes."
- It is necessary not only to close the valve, but also to plug or cap it.

Current 6110.2 was reworded slightly to establish the responsibility lies with the container owner by recognizing that although the majority of propane tanks are owned by the propane marketer, some are owned by the property owner and therefore the marketer has no control over them.

Cost Impact: This proposal will not increase the cost of construction.

6101.1-**F-SWIECICKI**

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The disapproval was based on the committee's concern that the code change would allow disconnected containers to be left on the site for an indeterminate length of time, thereby increasing the hazard to firefighters. Section 6110.2 does not deal with all options of ownership of the container.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bruce Swiecicki, National Propane Gas Association, representing self, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

6110.1 ~~Temporarily~~ Containers out of service LP-gas containers ~~whose use has been temporarily discontinued~~ disconnected from service at consumer sites shall comply with all of the following:

1. Be disconnected from appliance piping.
2. ~~Have~~ The LP-gas container ~~outlets~~ valves and openings, except pressure relief valves, shall be closed ~~or~~ and plugged or capped.
3. ~~Be~~ The container shall be positioned with the pressure relief valve in direct communication with the ~~LP-gas container~~ vapor space of the container.

6110.2 ~~Permanently out of service~~ Retrieval of containers. LP-gas containers ~~to be placed permanently out of~~ disconnected from service shall be removed from the site.

Commenter's Reason: This proposal will "clean up" the language in 6110.1 and also incorporates the important safety provision of requiring valves to be not only closed, but also plugged and capped when the container is disconnected from service.

The title of Section 6110.2 can lead to confusion so we are proposing an alternative. Also, since a container that is disconnected from service is not necessarily "permanently out of service," the modification will clarify that this requirement is related to 6110.1.

F332-13

Final Action: AS AM AMPC____ D

F333-13
6111.2, 6111.2.1, 6111.2.2

Proposed Change as Submitted

Proponent: Bruce Swiecicki representing National Propane Gas Association (bswiecicki@npga.org)

Revise as follows:

6111.2 Unattended parking. The unattended parking of LP-Gas cargo tank vehicles not in service shall be in accordance with ~~Sections 6111.2.1 and 6111.2.2~~ one of the following:

1. Vehicles shall be parked within a LP-Gas Bulk Plant.
2. Vehicles shall be parked off of public streets, highways, public avenues or public alleys.
3. Vehicles shall be parked at other *approved* locations not less than 50 feet (15. 240 m) from buildings, other than those *approved* for the storage or servicing of such vehicles.

~~**6111.2.1 Near residential, educational and institutional occupancies and other high-risk areas.** LP-gas tank vehicles shall not be left unattended at any time on residential streets or within 500 feet (152 m) of a residential area, apartment or hotel complex, educational facility, hospital or care facility. Tank vehicles shall not be left unattended at any other place that would, in the opinion of the *fire code official*, pose an extreme life hazard.~~

~~**6111.2.2 Durations exceeding 1 hour.** LP-gas tank vehicles parked at any one point for longer than 1 hour shall be located as follows:~~

1. ~~Off public streets, highways, public avenues or public alleys.~~
2. ~~Inside of a bulk plant.~~
3. ~~At other *approved* locations not less than 50 feet (15 240 mm) from buildings other than those *approved* for the storage or servicing of such vehicles.~~

Reason: LP-gas tank vehicles are more commonly referred to as “cargo tank vehicles” and they are under the jurisdiction of the U.S. Department of Transportation, Title 49 of the Code of Federal Regulations. The transportation of hazardous materials (propane is classified as a flammable gas, Division 2.1) is regulated by the Hazardous Materials Regulations (Parts 171-185) and the Federal Motor Carrier Safety Regulations (Parts 350-399).

The current text in 6111.2 addresses “unattended” parking, in which the operator of the vehicle is not present and able to react to an emergency situation by either driving the vehicle or controlling the flow of product into or out of the cargo tank. A vehicle that is parked for the purpose of transferring product into or out of the cargo tank would not be considered to be “unattended” because paragraph 177.834 (i) requires the operator to be in attendance during the product transfer operation. Therefore, the requirements in 6111.2 would not be applicable whenever the cargo tank vehicle was being loaded or unloaded.

The requirements in 6111.2.1 address unattended parking with respect to certain occupancies and other locations that are termed “high-risk” areas. This paragraph is not needed in the code because it imposes requirements that are unwarranted and contradictory as compliance with 6111.2.1 and 6111.2.2 is muddled, i.e., it is not uncommon for LP-gas bulk plants to be located within 500 feet of the occupancies and locations that are mentioned in 6111.2.1. Therefore, the parking of cargo tank vehicles *even within the confines of the bulk plant could constitute a violation.*

Furthermore, the requirements from 49 CFR Part 397.7(b) makes no mention of the occupancies or locations described in 6111.2.1:

> *§ 397.7Parking*
> *(b) A motor vehicle which contains hazardous materials other than Division 1.1, 1.2, or 1.3 materials must not be parked on or within five feet of the traveled portion of public street or highway except for brief periods when the necessities of operation require the vehicle to be parked and make it impracticable to park the vehicle in any other place.*

The requirements in current paragraph 6111.2.2 are reasonable and do not impose an undue burden on operators of LP-gas cargo tank vehicles. Those requirements are more consistent (but not identical) with those in paragraph 9.7.2 of NFPA 58. Therefore, this wording is retained in 6111.2.

The 50-foot separation distance has been shown to be a valid separation distance to protect the cargo tank from exposure to nearby fires. The 50-foot separation is required for stationary containers greater than 2,000 gallons water capacity and has been justified by numerical modeling of steel containers exposed to fire. The research paper, (*Journal of Hazardous Materials*, April 2006) analyzed steel propane containers of the sizes referred to in Table 6104.3 that were exposed to a severe petroleum pool fire

100 feet in diameter. The modeling indicated that the temperatures of the container walls were well below the temperature at which steel begins to yield. Since all LPG cargo tank motor vehicles are less than 30,000 gallons water capacity, the fifty foot separation distance is justified.

Cost Impact: This proposal will not increase the cost of construction.

6111.2-F-SWIECICKI

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The disapproval was based on the committee's concern over the lack of technical documentation on why the distance should be changed from 500 feet all the way down to 50 feet.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bruce Swiecicki, National Propane Gas Association, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

6111.2 Unattended parking. The unattended parking of LP-Gas cargo tank vehicles not in service shall be in ~~accordance with~~ a LP-Gas bulk plant or the parking location shall comply with one of the following:

~~1. Vehicles shall be parked within a LP-Gas Bulk Plant.~~
~~2~~1. Vehicles shall be parked off of public streets, highways, public avenues or public alleys.
~~3~~2. Vehicles shall be parked at other approved locations not less than 50 feet (15. 240 m) from buildings, other than those *approved* for the storage or servicing of such vehicles.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: LP-gas tank vehicles are more commonly referred to as "cargo tank vehicles" and they are under the jurisdiction of the U.S. Department of Transportation, Title 49 of the Code of Federal Regulations. The transportation of hazardous materials (propane is classified as a flammable gas, Division 2.1) is regulated by the Hazardous Materials Regulations (Parts 171-185) and the Federal Motor Carrier Safety Regulations (Parts 350-399).

The current text in 6111.2 addresses "unattended" parking, in which the operator of the vehicle is not present and able to react to an emergency situation by either driving the vehicle or controlling the flow of product into or out of the cargo tank. A vehicle that is parked for the purpose of transferring product into or out of the cargo tank would not be considered to be "unattended" because paragraph 177.834 (i) requires the operator to be in attendance during the product transfer operation. Therefore, the requirements in 6111.2 would not be applicable whenever the cargo tank vehicle was being loaded or unloaded.

The requirements in 6111.2.1 address unattended parking with respect to certain occupancies and other locations that are termed "high-risk" areas. This paragraph is not needed in the code because it imposes requirements that are unwarranted and contradictory as compliance with 6111.2.1 and 6111.2.2 is muddled, i.e., it is not uncommon for LP-gas bulk plants to be located within 500 feet of the occupancies and locations that are mentioned in 6111.2.1. Therefore, the parking of cargo tank vehicles *even within the confines of the bulk plant could constitute a violation.*

Furthermore, the requirements from 49 CFR Part 397.7(b) makes no mention of the occupancies or locations described in 6111.2.1:

> *§ 397.7Parking*
> *(b) A motor vehicle which contains hazardous materials other than Division 1.1, 1.2, or 1.3 materials must not be parked on or within five feet of the traveled portion of public street or highway except for brief periods when the necessities of operation require the vehicle to be parked and make it impracticable to park the vehicle in any other place.*

The requirements in current paragraph 6111.2.2 are reasonable and do not impose an undue burden on operators of LP-gas cargo tank vehicles. Those requirements are more consistent (but not identical) with those in paragraph 9.7.2 of NFPA 58. Therefore, this wording is retained in 6111.2.

The 50-foot separation distance has been shown to be a valid separation distance to protect the cargo tank from exposure to nearby fires. The 50-foot separation is required for stationary containers greater than 2,000 gallons water capacity and has been justified by numerical modeling of steel containers exposed to fire. The research paper, (*Journal of Hazardous Materials*, April 2006) analyzed steel propane containers of the sizes referred to in Table 6104.3 that were exposed to a severe petroleum pool fire 100 feet in diameter. The modeling indicated that the temperatures of the container walls were well below the temperature at which steel begins to yield. Since all LPG cargo tank motor vehicles are less than 30,000 gallons water capacity, the fifty foot separation distance is justified.

Appendix B105.1, Table B105(1) (New), B105.2, Table B105(2) (New), Table B105.1

Proposed Change as Submitted

Proponent: Adolf Zubia, Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Revise as follows:

B105.1 One- and two-family dwellings, congregate living facilities of Groups R-3 and R-4 and townhouses,. The minimum fire-flow and flow duration requirements for one- and two-family *dwellings*, congregate living facilities of Group R-3 and R-4 and townhouses ~~having a fire-flow calculation area that does not exceed 3,600 square feet (344.5 m^2) shall be 1,000 gallons per minute (3785.4 L/min) for 1 hour. Fire-flow and flow duration for dwellings having a fire-flow calculation area in excess of 3,600 square feet (344.5m^2) shall not be less than that specified in Table B105.1.~~ shall be as specified in Tables B105(1) and B105(3).

> ~~**Exception:** A reduction in required fire-flow of 50 percent, as approved, is allowed when the building is equipped with an approved automatic sprinkler system.~~

TABLE B105(1)
REQUIRED FIRE-FLOW FOR ONE- AND TWO-FAMILY DWELLINGS, CONGREGRATE LIVING FACILITIES OF GROUP R-3 AND R-4 AND TOWNHOUSES,

FIRE-FLOW CALCLUATION AREA (square feet)	AUTOMATIC SPRINKLER SYSTEM (Design Standard)	MINIMUM FIRE-FLOW (gallons per minute)	FLOW DURATION (hours)
0-3,600	No automatic sprinkler system	1,000	1
3,601-greater	No automatic sprinkler system	Value in Table B105(3)	Duration in Table B105(3) at the required fire-flow rate
0-3,600	Section 903.3.1.3 of the *International Fire Code*. or Section P2904 of the *International Residential Code*	500	0.5
3,601-greater	Section 903.3.1.3 of the *International Fire Code*. or Section P2904 of the *International Residential Code*	½ value in Table B105(3)	1

B105.2 Buildings other than one- and two-family dwellings, congregate living facilities of Group R-3 and R-4 and Townhouses. The minimum fire-flow and flow duration for buildings other than one- and two-family *dwellings,* congregate living facilities of Group R-3 and R-4 and Townhouses shall be as specified in Tables ~~B105.1~~ B105(2) and B105(3).

> ~~**Exception:** A reduction in required fire-flow of up to 75 percent, as approved, is allowed when the building is provided with an approved automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2. The resulting fire-flow shall not be less than 1,500 gallons per minute (5678 L/min) for the prescribed duration as specified in Table B105.1.~~

TABLE B105(2)
REQUIRED FIRE-FLOW FOR BUILDINGS OTHER THAN ONE- AND TWO-FAMILY DWELLINGS, CONGREGRATE LIVING FACILITIES OF GROUP R-3 AND R-4 AND TOWNHOUSES,

AUTOMATIC SPRINKLER SYSTEM(Design Standard)	**MINIMUM FIRE-FLOW (gallons per minute)**	**FLOW DURATION (hours)**
No automatic sprinkler system	Value in Table B105.3	Duration in Table B105(3)
Section 903.3.1.1 of the *International Fire Code*.	25% of the value in Table B105(3)[a]	Duration in Table B105(3) at the reduced flow rate
Section 903.3.1.2 of the *International Fire Code*.	25% of the value in Table B105(3)[b]	Duration in Table B105(3) at the reduced flow rate

a. The reduced fire-flow shall not be less than 1,000 gallons per minute (5678 L/min)
b. The reduced fire-flow shall not be less than 1,500 gallons per minute (3785 L/min)

B105.3 Water supply for buildings equipped with an automatic sprinkler system. For buildings equipped with an approved *automatic sprinkler system*, the water supply shall be capable of providing the greater of:

1. The automatic *sprinkler system demand*, including hose stream allowance.
2. The required fire-flow.

TABLE ~~B105.1~~ B105(3)
~~MINIMUN REQUIRED FIRE FLOW AND FLOW DURATION FOR BUILDINGS~~
REFERENCE TABLE FOR TABLES B105(1) AND B102(2)

(Portions of table not shown remain unchanged)

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

1. Clarifies that "Townhouses" R-3 and R-4 congregate living facilities are to be treated as one-and-two family dwellings with respect to developing needed fire flow in accordance with appendix B.
2. Relocates the fire flow modifiers from the paragraph to a table format in B105(1) and B105(2) for easier readability and application by the user.
3. Recognizes the provisions of P2904 in the IRC as equivalent to NFPA 13D when determining needed fire flow.
4. Provides a reduction in the required duration of fire flow for fully sprinklered one-and two-family dwellings less than 3,600 square feet as a reasonable incentive for the installation of a fire sprinkler system. Experience with fire sprinklers shows that a vast majority of fires in one and two family dwellings will be controlled or extinguished by the fire sprinkler system. This duration modifier also provides an achievable fire flow in rural applications where the development of a 1 hour duration is unrealistic.
5. Provides reduction to 1,000 GPM, rather than 1,500 GPM, for buildings other than one-and two-family dwellings and townhomes protected in accordance with NFPA 13 sprinkler systems. Currently, the appendix treats both NFPA 13R and NFPA 13 systems similarly permitting a reduction in fire flow to 1,500 GPM. An NFPA 13 system provides a significantly greater level of protection via the system design area, water supply and protection of concealed combustible spaces. Due to this level of protection, there should be a reduced minimum fire flow for buildings protected in accordance with NFPA 13 systems as opposed to NFPA 13R systems.
6. The current language provides no guidance to the Fire Chief as to criteria upon which to base approval of the required fire flow reduction for sprinkler protected buildings. The change simply allows the reduction by the elimination of the exceptions and codifying the credits in the tables.
7. This code change proposal clarifies in B105.3 that a fire sprinkler demand should not be added to the manual fire flow demand in developing the needed fire flow. The greater of the sprinkler demand or the demand developed in accordance with Appendix B will be the required fire flow.
8. IFC Section 903.3.1.3 was revised last cycle to include Group R-3 and R-4 congregate residences as well as townhouses. Fair Housing by law requires group homes to be considered the same as single family.

Cost Impact: This code change will not increase the cost of construction

B105.1-F-ZUBIA-FCAC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The approval was based on the committee's judgment that the proposal recognizes the progress in the development of sprinkler technology and the corresponding reduction in required fire flows.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

B105.1 One- and two-family dwellings, ~~congregate living facilities of~~ Groups R-3 and R-4 and townhouses. The minimum fire-flow and flow duration requirements for one- and two-family *dwellings*, ~~congregate living facilities of~~ Group R-3 and R-4 buildings and townhouses shall be as specified in Tables B105.1(1) and B105.1(2)~~(3)~~.

TABLE B105.1(1)
REQUIRED FIRE-FLOW FOR ONE- AND TWO-FAMILY DWELLINGS, ~~CONGREGRATE LIVING FACILITIES OF~~ GROUP R-3 AND R-4 BUILDINGS AND TOWNHOUSES,

FIRE-FLOW CALCLUATION AREA (square feet)	AUTOMATIC SPRINKLER SYSTEM (Design Standard)	MINIMUM FIRE-FLOW (gallons per minute)	FLOW DURATION (hours)
0-3,600	No automatic sprinkler system	1,000	1
3,601-greater	No automatic sprinkler system	Value in Table B105.1(2)~~(3)~~	Duration in Table B105.1(2)~~(3)~~ at the required fire-flow rate
0-3,600	Section 903.3.1.3 of the *International Fire Code*. or Section P2904 of the *International Residential Code*	500	0.5
3,601-greater	Section 903.3.1.3 of the *International Fire Code*. or Section P2904 of the *International Residential Code*	½ value in Table B105.1(2)~~(3)~~	1

TABLE B105.1(2)~~(3)~~

(Portions of table not shown remain unchanged)

B105.2 Buildings other than one- and two-family dwellings, ~~congregate living facilities of~~ Group R-3 and R-4 buildings and townhouses. The minimum fire-flow and flow duration for buildings other than one- and two-family *dwellings,* ~~congregate living facilities of~~ Group R-3 and R-4 buildings and townhouses shall be as specified in Tables B105.2~~(2)~~ and B105.1(2)~~(3)~~.

TABLE B105.2~~(2)~~
REQUIRED FIRE-FLOW FOR BUILDINGS OTHER THAN ONE- AND TWO-FAMILY DWELLINGS, ~~CONGREGRATE LIVING FACILITIES OF~~ GROUP R-3 AND R-4 BUILDINGS AND TOWNHOUSES,

AUTOMATIC SPRINKLER SYSTEM(Design Standard)	MINIMUM FIRE-FLOW (gallons per minute)	FLOW DURATION (hours)
No automatic sprinkler system	Value in Table ~~B105.3~~ B105.2(2)	Duration in Table B105.1(2)~~(3)~~
Section 903.3.1.1 of the *International Fire Code*.	25% of the value in Table B105.1(2)~~(3)~~[a]	Duration in Table B105.1(2)~~(3)~~ at the reduced flow rate
Section 903.3.1.2 of the *International Fire Code*.	25% of the value in Table B105.1(2)~~(3)~~[b]	Duration in Table B105.1(2)~~(3)~~ at the reduced flow rate

a. The reduced fire-flow shall not be less than 1,000 gallons per minute (5678 L/min)
b. The reduced fire-flow shall not be less than 1,500 gallons per minute (3785 L/min)

B105.3 Water supply for buildings equipped with an automatic sprinkler system. For buildings equipped with an approved *automatic sprinkler system*, the water supply shall be capable of providing the greater of:

1. The automatic *sprinkler system demand*, including hose stream allowance.
2. The required fire-flow.

Commenter's Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

Group R-3 may resemble townhouses or one- or two- story dwellings. The current text does not address those types of Group R-3. Group R-4 are always congregate residences. Therefore, removing the term "congregate living facilities of" would allow for all Group R-3 and R-4 buildings to use this sprinkler option.

The changes to the table references are editorial for the correct numbering of tables in accordance standard code language.

F340-13
Final Action: AS AM AMPC____ D

F341-13
Appendix D106.3 (New)

Proposed Change as Submitted

Proponent: Anthony C. Apfelbeck, City of Altamonte Springs Building/Fire Safety Division, representing self (ACApfelbeck@Altamonte.org)

Add new text as follows:

D106.3 Remoteness. Where two fire apparatus access roads are required, they shall be placed a distance apart equal to not less than one half of the length of the maximum overall diagonal dimension of the property or area to be served, measured in a straight line between accesses.

Reason: Currently, Section D106, Multiple-Family Residential Developments, does not require fire apparatus access roads to be remote when more than one access road is required. D104, Commercial and Industrial Developments, and D107, One- or Two-Family Residential Developments already contain a "remoteness" provision.

This code change proposal duplicates the language from D104.3 into a new 106.3 placing new "Remoteness" language within the Section D106 that is directly relevant to Multiple-Family Residential Developments.

Cost Impact: This code change will increase the cost of construction.

D106.3-F-APFELBECK

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee approved the code change based on the proponent's reason statement and that the proposal provides long needed guidance for multi-family structures.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jeffrey M. Shapiro, P.E., International Code Consultants, representing National Multi Housing Council, requests Disapproval.

Commenter's Reason: The foundation of this proposal is paralleling the requirements for developments with one- and two-family dwellings and developments with multifamily dwellings. Simple duplication is not appropriate in this case because developments with one- and two-family dwellings may or may not include fire sprinklers in all of the buildings. In contrast, all new multi-family developments only include buildings that have fire sprinklers and minimum requirements for fire resistance apply.

No justification was offered by the original proposal to substantiate the change other than correlation, and because the situations dealt with by these two parts of the code are different, simply duplicating the text from one place to the other is not appropriate. At a minimum, some reduction in any separation requirement that may be proposed should be considered given the different levels of fire protection provided for homes vs. multifamily occupancies.

F341-13
Final Action: AS AM AMPC____ D

F345-13
Appendix K (New)

Proposed Change as Submitted

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee (cbaldassarra@rjagroup.com)

Add new text as follows:

Appendix K
Employee Qualifications

The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance.

SECTION K101
FIRE INSPECTOR
AND FIRE PLAN EXAMINER QUALIFICATIONS

K101.1. Fire inspector and fire plan examiner. The *fire code official* shall appoint or hire such number of officers, fire inspectors, fire plan examiners, assistants and other employees as shall be authorized by the jurisdiction. A person shall not be appointed or hired as a fire inspector or fire plans examiner who has less than five years' experience as a contractor, engineer, architect, a member of the fire service, or a member of a fire prevention organization. Any combination of education and experience that would confer equivalent knowledge and ability shall be deemed to satisfy this requirement. Fire inspectors and fire plan examiners shall be certified through a recognized certification program for such position.

Reason: This proposed change is a result of the CTC's investigation of the area of study entitled "NIST Charleston Sofa Store Fire Recommendations". The scope of the activity is noted as:

> Review the NIST and other investigative reports on the fire that occurred on the evening of June 18, 2007 in the Sofa Super Store in Charleston, South Carolina to identify issues that can be addressed by the International Codes.

In connection with their investigation, NIST analyzed the fire ground, consulted with other experts, and performed computer simulations of fire growth alternatives. Based on these analyses, NIST concluded that the following sequence of events is likely to have occurred. A fire began in packing material and discarded furniture outside an enclosed loading dock area. The fire spread to the loading dock, then into both the retail showroom and warehouse spaces. During the early stages of the fire in the two latter locations, the fire spread was slowed by the limited supply of fresh air. This under-ventilation led to generation of a large mass of pyrolyzed and only partially oxidized effluent. The smoke and combustible gases flowed into the interstitial space below the roof and above the suspended ceiling of the main retail showroom. As this space filled with unburned fuel, the hot smoke also seeped through the suspended ceiling into the main showroom and formed a hot smoke layer below the suspended ceiling. Up to this time, the extent of fire spread into the interstitial space was not visible to fire fighters in the store. If the fire spread had been visible to the fire fighters in the store, it would have provided a direct indication of a fire hazard in the showroom. Meanwhile, the fire at the back of the main showroom and the gas mixture below the suspended ceiling were both still fuel rich. When the front windows were broken out or vented, the inflow of additional air allowed the heat release rate of the fire to intensify rapidly and added air to the layer of unburned fuel below the suspended ceiling enabling the ignition of the unburned fuel/air mixture. The fire swept from the rear to the front of the main showroom extremely quickly, and then into the west and east showrooms. Nine fire fighters were killed in the Sofa Super Store fire. NIST developed eleven recommendations to help mitigate such future losses.

Recommendation 3 of the NIST report reads as follows:

> **"Qualified Fire Inspectors and Building Plan Examiners:** NIST recommends that all state and local jurisdictions ensure that fire inspectors and building plan examiners are professionally qualified to a national standard such as NFPA 1031 Standard for Professional Qualifications for Fire Inspector and Plan Examiner. Professional qualification may be demonstrated through a nationally accepted certification examination, such as the Fire Plan Examiner; Fire Inspector I and II, and Certified Fire Marshal."

Following a review of recommendation 3 of the NIST report a new Appendix K is proposed. This proposal is similar in scope and intent to Section A101.3 of Appendix A of the International Building Code where suggested qualifications for building official, chief inspector, inspector and plan examiner are established.

The purpose of this proposal is to provide optional criteria for qualifications of employees who enforce the Fire Code through inspections and plan examinations. A jurisdiction that wants to make this appendix a mandatory part of the code would need to specifically list this appendix in its adoption ordinance. In recognition of the fact that some jurisdictions are mandated by applicable state law to employ only persons licensed by the state to perform certain duties, the proposal was drafted as an Appendix.

This proposal would not require fire inspectors or fire plan examiners to have had previous experience in Fire Code enforcement, but would merely require that they possess experience in a related job category. It is not our intent to prohibit a plan review and inspection staff from hiring and training entry level employees. The training of entry level shall be supervised by trained and certified personnel.

This proposal is submitted by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/CTC/Pages/default.aspx. Since its inception in April/2005, the CTC has held twenty-five meetings - all open to the public. In 2012, three of the 25 face-to face meetings were held. In addition to the CTC meetings, the CTC established Study Groups (SG) of interested parties for each of the areas of study. These SG's are responsible for reviewing the available information and making recommendations to the CTC. All totaled, the SG's held over 70 conference calls in 2012.

Cost Impact: This code change proposal will not increase the cost of construction.

APPENDIX K (NEW)-F-BALDASSARRA-CTC

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The disapproval was based on the committee's judgment that the proposal has merit but is far from ready for the code, even if in an appendix. Suggested improvements included inclusion of entry-level personnel in the text (they were mentioned in the reason statement), provisions for continuing education need to be added and separate qualifications should be established for inspectors and plans examiners. Concern was also expressed that the proposed appendix could restrict a fire chief's options on how they administer their department by establishing employee qualification time frames that may conflict with state laws on the subject.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Carl Baldassarra, P.E., FSFPE, Chairman, ICC Code Technology Committee (cbaldassarra@rjagroup.com) and Adolf Zubia, Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azumiamia@yahoo.com), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

Appendix K
Employee Qualifications

The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance.

SECTION K101
FIRE INSPECTOR
AND FIRE PLAN EXAMINER QUALIFICATIONS

K101.1. Fire inspector and fire plan examiner. ~~The *fire code official* shall appoint or hire such number of officers, fire inspectors, fire plan examiners, assistants and other employees as shall be authorized by the jurisdiction~~. A person shall not be appointed ~~or hired~~ as a fire inspector or fire plans examiner who has less than five years' experience as a contractor, engineer, architect, a member of the fire service, or a member of a fire prevention organization. Any combination of education and experience that would confer equivalent knowledge and ability shall be deemed to satisfy this requirement. Fire inspectors and fire plan examiners shall be certified through a recognized certification program for such positions.

Exceptions:

1. Fire inspectors under direct supervision of a fire inspector who meets the qualifications of this section.
2. Plan reviewers under direct supervision of a plan reviewer who meets the qualifications of this section.

Commenter's Reason: This is a joint public comment submitted on behalf of the ICC Code Technology Committee (CTC) and the ICC Fire Code Action Committee (FCAC).

The exceptions address the issues raised by the code development committee. This will allow for a jurisdiction to appoint a person who does not yet have the full experience and certification as long as there is a supervision or training program while this person gains the appropriate knowledge. It is the committee's intent that direct supervision means oversight of and assuming the responsibility for inspection or plan review work.

Continuing education requirements will be set by the certification entity. If the time frame would conflict with state requirements, the jurisdiction can modify the requirements.

F345-13

Final Action: AS AM AMPC____ D

F349-13
3203.4

Proposed Change as Submitted

Proponent: Darren Meyers, P.E., International Energy Conservation Consultants, LLC, representing the Biomass Feedstock Industry Committee on Codes and Standards (dmeyers@ieccode.com)

Revise as follows:

3203.4 Class III commodities. Class III commodities are commodities of wood, paper, natural fiber cloth, or Group C plastics or products thereof, with or without pallets. Products are allowed to contain limited amounts of Group A or B plastics, such as metal bicycles with plastic handles, pedals, seats and tires. Group A plastics shall be limited in accordance with Section 3203.7.4. Examples of Class III commodities include, but are not limited to, the following:

Aerosol, Level 1 (see Chapter 28)
<u>Biomass briquettes, bagged, totes and static piles</u>
<u>Biomass pellets, bagged, totes and static piles</u>
<u>Charcoal</u>
Combustible fiberboard
Cork, baled
<u>Corn cobs, static piles</u>
<u>Corn stover, baled and chopped</u>
Feed, bagged
Fertilizers, bagged
<u>Firewood</u>
Food in plastic containers
<u>Forest residue, round wood or chipped (branches, bark, cross-cut ends, edgings and treetops)</u>
Furniture: wood, natural fiber, upholstered, non-plastic, wood or metal with plastic-padded and covered armrests
Glycol in combustible containers not exceeding 25 percent
Lubricating or hydraulic fluid in metal cans
Lumber
Mattresses, excluding foam rubber and foam plastics
Noncombustible liquids in plastic containers having a capacity of more than 5 gallons (19 L)
Paints, oil base, in metal cans
Paper, waste, baled
Paper and pulp, horizontal storage, or vertical storage that is banded or protected with *approved* wrap
Paper in cardboard boxes
<u>Peanut hulls, bagged, totes and static piles</u>
Pillows, excluding foam rubber and foam plastics
Plastic-coated paper food containers
Plywood
Rags, baled
<u>Recovered construction wood</u>
<u>Rice hulls, bagged, totes and static piles</u>
Rugs, without foam backing
<u>Seasonal grasses, baled and chopped</u>
<u>Straw, baled</u>
Sugar, bagged
Wood, baled
<u>Wood chips, bagged, totes and static piles</u>

Woody biomass, round wood or chipped (vase-shaped stubby bushes, bamboo, willows; branches, bark and stem wood)
Wood doors, frames and cabinets
Wood pellets, bagged, totes and static piles
Yarns of natural fiber and viscose

Reason: The additions clarify that certain "crop-residue" as solid, biomass feedstock as biofuel are appropriately identified as Class III commodities.

The Biomass Feedstock Industry Committee on Codes and Standards (BFICOCS), led by Oak Ridge National Laboratory (ORNL), is an initiative of the Department of Energy Biomass Technologies Office (BTO). As part of the BTO integrated biorefinery efforts, the BFICOCS was assembled to conduct analysis of existing fire and building codes and to prepare proposed code changes designed to facilitate the development of the commercial-scale biomass industry while maintaining a focus on safety. The committee is made up of managers, engineers and code officials from industry, government laboratories, consulting firms, and the American Society of Agricultural and Biological Engineers (ASABE).

Fire codes related to storage, handling, and pre-processing of biomass are based on industries that operate in a significantly different manner than the growing biomass-based energy industry. Applying current research on biomass properties and knowledge of conventional and emerging storage, handling, and pre-processing technologies, the BFICOCS has identified changes in the IFC that benefit both industry and the public.

Cost Impact: The code change proposal will not increase the cost of construction.

3203.4-F-MEYERS

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposal was disapproved as there is no specific fire data presented that was associated with storing these materials in a high-piled storage configuration.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Darren Meyers, P.E., International Energy Conservation Consultants, LLC, representing the Biomass Feedstock Industry Committee on Codes and Standards, requests Approval as Modified by this Public Comment.

Modify this proposal as follows:

3203.4 Class III commodities. Class III commodities are commodities of wood, paper, natural fiber cloth, or Group C plastics or products thereof, with or without pallets. Products are allowed to contain limited amounts of Group A or B plastics, such as metal bicycles with plastic handles, pedals, seats and tires. Group A plastics shall be limited in accordance with Section 3203.7.4. Examples of Class III commodities include, but are not limited to, the following:

Aerosol, Level 1 (see Chapter 28)
Biomass briquettes, bagged, ~~totes~~ and static piles
Biomass pellets, bagged, ~~totes~~ and static piles
Charcoal
Combustible fiberboard
Cork, baled
Corn cobs, static piles
Corn stover, baled and chopped

Feed, bagged
Fertilizers, bagged
Firewood
Food in plastic containers
Forest residue, round wood or chipped (branches, bark, cross-cut ends, edgings and treetops)
Furniture: wood, natural fiber, upholstered, non-plastic, wood or metal with plastic-padded and covered armrests
Glycol in combustible containers not exceeding 25 percent
Lubricating or hydraulic fluid in metal cans
Lumber
Mattresses, excluding foam rubber and foam plastics
Noncombustible liquids in plastic containers having a capacity of more than 5 gallons (19 L)
Paints, oil base, in metal cans
Paper, waste, baled
Paper and pulp, horizontal storage, or vertical storage that is banded or protected with *approved* wrap
Paper in cardboard boxes
Peanut hulls, bagged, ~~totes~~ and static piles
Pillows, excluding foam rubber and foam plastics
Plastic-coated paper food containers
Plywood
Rags, baled
Recovered construction wood
Rice hulls, bagged, ~~totes~~ and static piles
Rugs, without foam backing
Seasonal grasses, baled and chopped
Straw, baled
Sugar, bagged
Wood, baled
Wood chips, bagged, ~~totes~~ and static piles
Woody biomass, round wood or chipped (vase-shaped stubby bushes, bamboo, willows; branches, bark and stem wood)
Wood doors, frames and cabinets
Wood pellets, bagged, ~~totes~~ and static piles
Yarns of natural fiber and viscose

Commenter's Reason: The additions submitted to both the 2015 IFC and the 2015 revision cycle to NFPA 13-2006 via NFPA's Technical Committee on *Sprinkler System Discharge Criteria*, clarify that certain "crop-residue" as solid, biomass feedstock as biofuel are appropriately identified as Class III commodities. At the Public Hearings in Dallas, the IFC Committee requested specific fire data associated with these solid, biomass materials:

The tabulated data below was prepared by the Idaho National Laboratory (INL) Biological and Chemical Processing Group, to provide both the IFC Membership and the NFPA13 TC with: 1) Results for heat of combustion performed at INL using the standard test methods of ASTM D5865-10a, *Standard Test Method for Gross Calorific Value of Coal and Coke Using Either an Isoperibol or Adiabatic Bomb Calorimeter* and 2) Results that INL has drawn from n US and European literature based on values in the Phyllis database, the US DOE/EERE feedstock database, and selected literature sources, showing values for a range of cellulosic, solid biomass material.

This comparative and peer-reviewed literature demonstrates that the Higher Heating Values (HHVs) for the proposed set of biomass feedstock are less than those for the two grades of Coal (Bituminous and Sub-Bituminous), Charcoal, and Wood [Douglas fir wood and Douglas fir bark (i.e., Furniture)] required for the comparative classification of Class III Commodities in Section 3203.4 of the IFC and Table A.5.6.3.3 for Class III Commodities in the forthcoming 2016 Edition of NFPA 13.

Comparative Material	**HHV (GJ Mg-1)**	**HHV (Btu/lb)**
Bituminous Coal	31.7	13,629
Sub-Bituminous Coal	32.9	14,144
Charcoal[1]	31.0	13,328
Douglas fir	21.0	9,028

Biomass Material [2]	**HHV (GJ Mg-1)**	**HHV (Btu/lb)**
Beech	20.3	8,727
Corn Cobs	17.8	7,652
(Pellets)	*17.1*	*7,364*

Corn stalks/stover	19.2	8,250
Hulls/Shells, Ag. Residue	20.5	8,838
Eucalyptus grandis	19.4	8,340
Miscanthus	19.7	8,499
(Pellets)	*16.2*	*6,964*
Poplar	20.7	8,899
Rice hulls	15.3	6,578
Rice straw	15.8	6,793
Sugar cane bagasse	17.3	7,438
Sorghum	19.4	8,353
(Pellets)	*16.0*	*6,857*
Switchgrass	19.2	8,237
(Pellets)	*18.0*	*7,747*
Wheat straw	17.5	7,524
Wood chips (max.)	20.8	8,946

NOTE 1: "Charcoal – Bagged, Standard" already exists as a Class III Commodity as classified by NFPA 13-2013 [Section No. A.5.6.3.3]

NOTE 2: As can be seen upon reviewing the tabulated data, not one of the Biomass Materials exceeds the HHV for Comparative Class III Materials.

The Biomass Feedstock Industry Committee on Codes and Standards (BFICOCS), led by Oak Ridge National Laboratory (ORNL), is an initiative of the Department of Energy Biomass Technologies Office (BTO). As part of the BTO integrated biorefinery efforts, the BFICOCS was assembled to conduct analysis of existing fire and building codes and to prepare proposed code changes designed to facilitate the development of the commercial-scale biomass industry while maintaining a focus on safety. The committee is made up of managers, engineers and code officials from industry, government laboratories, consulting firms, and the American Society of Agricultural and Biological Engineers (ASABE).

Proposed Change as Submitted

Proponent: Darren Meyers, P.E., International Energy Conservation Consultants, LLC, representing the Biomass Feedstock Industry Committee on Codes and Standards (dmeyers@ieccode.com)

Revise as follows:

CHAPTER 28
LUMBER YARDS, AGRO-INDUSTRIAL, SOLID BIOMASS AND WOODWORKING FACILITIES

SECTION 2801
GENERAL

2801.1 Scope. The storage, manufacturing and processing of solid biomass feedstock, timber, lumber, plywood, veneers and agro-industrial byproducts shall be in accordance with this chapter.

SECTION 2802
DEFINITIONS

2802.1 Definitions. The following terms are defined in Chapter 2:

AGRO-INDUSTRIAL.
BIOMASS.
STATIC PILES.
SOLID BIOFUEL.
SOLID BIOMASS FEEDSTOCK.

SECTION 2804
FIRE PROTECTION

2804.1 General. Fire protection in timber and lumber production mills, ~~and~~ plywood and veneer mills, and agro-industrial facilities shall comply with Sections 2804.2 through 2804.4.

SECTION 2808
STORAGE AND PROCESSING OF WOOD CHIPS, HOGGED MATERIAL, FINES, COMPOST, SOLID BIOMASS FEEDSTOCK, AND RAW PRODUCT ASSOCIATED WITH YARD WASTE, AGRO-INDUSTRIAL AND RECYCLING FACILITIES

2808.1 General. The storage and processing of wood chips, hogged materials, fines, compost, solid biomass feedstock and raw product produced from yard waste, debris, agro-industrial and recycling facilities shall comply with Sections 2808.2 through 2808.10.

2808.2 Storage site. Storage sites shall be level and on solid ground, elevated soil lifts or other all-weather surface. Sites shall be thoroughly cleaned before transferring wood products to the site.

SECTION 2809
EXTERIOR STORAGE OF FINISHED LUMBER AND SOLID BIOFUEL PRODUCTS

2809.1 General. Exterior storage of finished lumber and solid biofuel products shall comply with Sections 2809.1 through 2809.5.

2809.2 Size of piles. Exterior ~~lumber~~ storage shall be arranged to form stable piles with a maximum height of 20 feet (6096 mm). Piles shall not exceed 150,000 cubic feet (4248 m^3) in volume.

2809.3 Fire apparatus access roads. Fire apparatus access roads in accordance with Section 503 shall be located so that a maximum grid system unit of 50 feet by 150 feet (15 240 mm by 45 720 mm) is established.

2809.4 Security. Permanent ~~lumber~~ storage areas shall be surrounded with an *approved* fence. Fences shall be a minimum of 6 feet (1829 mm) in height.

Exceptions:

1. Lumber piles inside of buildings and production mills for lumber, plywood and veneer.
2. Solid biofuel piles inside of buildings and agro-industrial processing facilities for solid biomass feedstock.

2809.5 Fire protection. An *approved* hydrant and hose system or portable fire-extinguishing equipment suitable for the fire hazard involved shall be provided for open storage yards. Hydrant and hose systems shall be installed in accordance with NFPA 24. Portable fire extinguishers complying with Section 906 shall be located so that the travel distance to the nearest unit does not exceed 75 feet (22 860 mm).

SECTION 202
GENERAL DEFINITIONS

AGRO-INDUSTRIAL. Technologies, methods and associated machinery used in transforming raw agricultural products into intermediate or consumable products.

BIOMASS. Plant or animal-based material of biological origin, including but not limited to materials originating from arboriculture, agriculture, aquaculture, horticulture and forestry, excluding material embedded in geological formations or transformed into fossil.

STATIC PILES. Piles in which processed wood product or solid, biomass feedstock is mounded and is not being turned or moved.

SOLID BIOFUEL. Densified biomass made with or without additives in the form of cubiform, polyhedral, polyhydric or cylindrical units, produced by compressing milled biomass.

SOLID BIOMASS FEEDSTOCK. The basic materials, including agricultural residues, including but not limited to corn cobs, corn stover, rice hulls, and peanut hulls; herbaceous crops, including but not limited to warm- and cool-seasonal grasses; forest residue, including but not limited to branches, bark, cross-cut ends, edgings and treetops; short-rotation woody crops, including but not limited to vase-shaped stubby bushes, bamboo, willows with five to ten-year rotations and their branches, bark and stem wood; agricultural waste, including but not limited to garden or park waste, grass or flower cuttings and hedge trimmings; and dried manure; from which biofuel is comprised, manufactured or made.

Reason: The proposed language facilitates fire control and reduces exposures to and from facilities storing and processing “crop-residue” as solid biomass feedstock for biofuel production.

The Biomass Feedstock Industry Committee on Codes and Standards (BFICOCS), led by Oak Ridge National Laboratory (ORNL), is an initiative of the Department of Energy Biomass Technologies Office (BTO). As part of the BTO integrated biorefinery efforts, the BFICOCS was assembled to conduct analysis of existing fire and building codes and to prepare proposed code changes designed to facilitate the development of the commercial-scale biomass industry while maintaining a focus on safety. The committee is made up of managers, engineers and code officials from industry, government laboratories, consulting firms, and the American Society of Agricultural and Biological Engineers (ASABE).

Fire codes related to storage, handling, and pre-processing of biomass are based on industries that operate in a significantly different manner than the growing biomass-based energy industry. Applying current research on biomass properties and knowledge of conventional and emerging storage, handling, and pre-processing technologies, the BFICOCS has identified changes in the IFC that benefit both industry and the public.

Cost Impact: The code change proposal will not increase the cost of construction.

2801.1-F-MEYERS

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The disapproval was based on the committee's judgment that the proposal has merit in recognizing emerging biofuel technology but needs additional work to be ready for the code. Issues with the proposal mentioned included the cumbersomeness of the SOLID BIOMASS FEEDSTOCK definition and its use of complicated, difficult to understand terms; that the proposal should take into account the seasonal increases in the volume of materials that will be stored yielding much larger piles; that the proposal should include provisions for indoor storage of these materials which appears to be a trend in portions of the country and that more guidance is needed on what types of fire protection systems would be appropriate for larger piles.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Darren Meyers, P.E., International Energy Conservation Consultants, LLC, representing the Biomass Feedstock Industry Committee on Codes and Standards, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION 202
GENERAL DEFINITIONS

AGRO-INDUSTRIAL. ~~Technologies, methods and associated machinery used in~~A facility, or portion thereof, housing operations involving the transforming raw agricultural products into intermediate or consumable products.

BIOMASS. Plant or animal-based material of biological origin, ~~including but not limited to materials originating from arboriculture, agriculture, aquaculture, horticulture and forestry,~~ excluding material embedded in geological formations or transformed into fossil.

STATIC PILES. Piles in which processed wood product or solid, biomass feedstock is mounded and is not being turned or moved.

SOLID BIOFUEL. Densified biomass made ~~with or without additives~~ in the form of cubiform, polyhedral, polyhydric or cylindrical units, produced by compressing milled biomass.

SOLID, BIOMASS FEEDSTOCK. The basic materials~~, including agricultural residues, including but not limited to corn cobs, corn stover, rice hulls, and peanut hulls; herbaceous crops, including but not limited to warm- and cool-seasonal grasses; forest residue, including but not limited to branches, bark, cross-cut ends, edgings and treetops; short-rotation woody crops, including but not limited to vase-shaped stubby bushes, bamboo, willows with five to ten-year rotations and their branches, bark and stem wood; agricultural waste, including but not limited to garden or park waste, grass or flower cuttings and hedge trimmings; and dried manure;~~ from which solid biofuel is comprised, manufactured or made.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: The proposed language submitted to both the 2015 IFC and the 2015 revision cycle to NFPA 13-2006 to facilitate characterization of agro-industrial biomass manufacturing operations by the IFC Membership and NFPA 13 users. Submission to and review by the NFPA Technical Committee on *Sprinkler System Discharge Criteria*, addresses such things as Commodity (Class III - see also F349-13) and Occupancy classification (Ordinary Hazard – Group2), storage (indoors and out-), as well as sprinkler system and discharge criteria for facilities storing and processing crop-residue and/or animal-based materials as "solid biomass feedstock" for industrial-scale, biofuel production.

At the Public Hearings in Dallas, the IFC Committee stated "the proposal has merit." However, Disapproval was based on:

1) Cumbersomeness of the SOLID BIOMASS FEEDSTOCK definition;

   Definitions (as modified) now use common language, are condensed and simplified.

2) Consideration for seasonal increases in volume of materials stored; and

Seasonal variances, sprinkler system selection and discharge criteria are addressed by material Commodity (Class III - see also F349-13) and
Occupancy classifications (Ordinary Hazard – Group2), storage location (indoors and out-), and the submission to and review by the NFPA 13
Technical Committee on *Sprinkler System Discharge Criteria*.

3) Consideration for indoor storage of materials including appropriate sprinkler systems and discharge criteria

(Please see our response to 2) above.)

NOTE ALSO, that the BFICOCS has provided evidence to support a Class III Commodity classification in the form of results for heat of combustion performed at INL using the standard test methods of ASTM D5865-10a, *Standard Test Method for Gross Calorific Value of Coal and Coke Using Either an Isoperibol or Adiabatic Bomb Calorimeter* and 2) Results that INL has drawn from n US and European literature based on values in the Phyllis database, the US DOE/EERE feedstock database, and selected literature sources, showing values for a range of cellulosic, solid biomass material.

This comparative and peer-reviewed literature demonstrates that the Higher Heating Values (HHVs) for the proposed set of biomass feedstock are less than those for the two grades of Coal (Bituminous and Sub-Bituminous), Charcoal, and Wood [Douglas fir wood and Douglas fir bark (i.e., Furniture)] required for the comparative classification of Class III Commodities in Section 3203.4 of the IFC and Table A.5.6.3.3 for Class III Commodities in the forthcoming 2016 Edition of NFPA 13 (see also F349-13)

The Biomass Feedstock Industry Committee on Codes and Standards (BFICOCS), led by Oak Ridge National Laboratory (ORNL), is an initiative of the Department of Energy Biomass Technologies Office (BTO). As part of the BTO integrated biorefinery efforts, the BFICOCS was assembled to conduct analysis of existing fire and building codes and to prepare proposed code changes designed to facilitate the development of the commercial-scale biomass industry while maintaining a focus on safety. The committee is made up of managers, engineers and code officials from industry, government laboratories, consulting firms, and the American Society of Agricultural and Biological Engineers (ASABE).

Final Action: AS AM AMPC____ D

F354-13
1701 (New)

Proposed Change as Submitted

Proponent: Joe McElvaney, representing self (joe.mcelvaney@gmail.com)

Add new text as follows:

CHAPTER 17
SPECIAL EVENTS

SECTION 1701
GENERAL

1701.1 Scope. Special events including trade shows and exhibitions, outdoor assembly events, outdoors mazes, special amusement buildings, and special scaffolding structures shall comply with this chapter and Section 1028. Temporary indoor vehicle displays and vehicle competition or demonstrations shall comply with this chapter and Section 314.

1701.2 Permits. Permits shall be required as set forth in Sections 105.6 and 105.7.

1701.3 Site plans. A detailed site plan shall be submitted to the fire code official with each permit application for approval.

1. **Outdoor events:** The permit application and site plan shall be submitted a minimum of 30

    1. Business days prior to the event. Site plans shall include, but not be limited to:
    2. Means of egress,
    3. Location and width of exits and aisles,
    4. Location of exit signs,
    5. Location of fencing or means used to confine attendees,
    6. Total square footage of enclosed space,
    7. Location and arrangement of all tents, booths or cooking equipment,
    8. Locations of fire apparatus access roads,
    9. Location of fire protection equipment,
    10. Type and location of heating and electrical equipment where applicable,
    11. Location of temporary staffed water stations and permanent water fountains.

2. **Trade shows and exhibitions:** The permit application and site plan shall be submitted a minimum of 30 business days prior to the event. Site plans shall include, but not be limited to:

    1. The means of egress,
    2. Location and width of exits and aisles,
    3. Location of exit signs,
    4. Total square footage of space,
    5. Location and arrangement of all booths and cooking equipment,
    6. Location of all fire protection equipment,
    7. Type and location of heating and electrical equipment where applicable, and
    8. Location of covered or multi-level exhibits or booths.

3. **Mazes.** The permit application and site plan shall be submitted a minimum of 30 business days prior to the event. Site plans shall include, but not be limited to:

    1. Means of egress,

2. Location and width of exits and aisles,
3. Location of exit signs,
4. Total square footage of space,
5. Location and arrangement of all booths and cooking equipment,
6. Location of all fire protection equipment,
7. Location of means to confine attendees,
8. Locations of fire apparatus access roads,
9. Type and location of heating and electrical equipment where applicable, and
10. Location of structures.

At the time of permit application, the event coordinator shall submit to the fire code official, a letter from the property owner authorizing the use of the site, the address of the site, dates and hours of operation and names and 24-hour phone numbers of at least two principals.

4. **Temporary indoor vehicle displays:** The permit application and site plan shall be submitted a minimum of 10 business days prior to the display of electric, liquid- or gas-fueled vehicles, boats or other motor craft. Floor plans shall include, but not be limited to:

   1. The means of egress,
   2. Location and width of exits and aisles,
   3. Location of exit signs,
   4. Total square footage of space,
   5. Location and arrangement of all booths and cooking equipment,
   6. Location of all fire protection equipment,
   7. Type and location of heating and electrical equipment where applicable and
   8. Location and size of exhibits and booths, and
   9. Location of structures.

   Exception: Auto dealerships.

5. **Vehicle competition or demonstration.** The permit application and site plan shall be submitted a minimum of 10 business days prior to the competition or demonstration of electric, liquid- or gas-fueled vehicles, boats or other motor craft. A floor plan shall include, but not be limited to:

   1. The means of egress,
   2. Location and width of exits and aisles,
   3. Location of exit signs,
   4. Total square footage of space,
   5. Location and arrangement of all booths and cooking equipment,
   6. Location of all fire protection equipment,
   7. Type and location of heating and electrical equipment where applicable and
   8. Location and size of exhibits and booths, and
   9. Location of structures, and
   10. Fire apparatus access roads where applicable.

SECTION 1702
DEFINITIONS

1702.1 Definitions. The following words and terms are defined in Chapter 2.

ALLOWABLE USE AREA.
CROSS AISLES.
EXHIBITS.
FIXTURES.
FLAME EFFECT.
MAIN AISLE.

MAZE.
OUTDOOR ASSEMBLY EVENT.
SPECIAL EVENT.
TEMPORARY STRUCTURES.
TRADE SHOWS OR EXHIBITIONS.

1703
GENERAL REQUIREMENTS

1703.1 Access for firefighting and medical services. Approved vehicle access for fire fighting and medical services shall be provided in accordance with Chapter 5.

1703.2 Combustible storage. Combustible materials stored at special events shall be stored in approved locations and containers.

1703.3 Crowd managers. Crowd managers shall be provided where the fire code official determines that an indoor or outdoor gathering warrants crowd control. Crowd managers shall be in accordance with Section 403.3.

1703.4 Decorative materials and furnishings. Curtains, drapes and decorations including, but is not limited to drapes, signs, banners, acoustical materials, cotton, hay, fabric, paper, straw, moss, split bamboo, and wood chips shall be flame resistant as demonstrated by testing in accordance with NFPA 701, or provide documentation of flame retardancy. Field flame test shall be in accordance with Section 317. Materials that cannot be treated for flame retardancy shall not be used unless approved by the fire code official. This includes but is not limited to oilcloth, tarpaper, nylon, plastic cloth, and other plastic materials.

1703.5 Fire protection equipment clearance. Clearance around all fire protection equipment shall be in accordance with Section 901.10.

1703.6 Fire extinguishers. Fire extinguishers shall be in accordance with Section 906 and NFPA 10

1703.7 Fire watch. Fire watch shall be in accordance with Sections 115 and 403.1.

1703.8 Fireworks, pyrotechnics. Fireworks and pyrotechnics shall comply with Chapter 56.

1703.9 Lasers. Lasers shall comply with State of Arizona regulations.

1703.10 Housekeeping. The special event area and related areas shall be kept free from combustible debris at all times

1703.11 LP-gas heaters. Fuel supplies for liquefied-petroleum gas-fired heaters shall comply with Chapter 61 and the International Fuel Gas Code.

1703.12 Open flame devices. Open flame devices shall comply with Section 308.

1703.13 Waste disposal. Combustible debris shall not be accumulated at special events. Combustible debris, rubbish and waste material shall be removed from special events at the end of each shift of work. Combustible debris, rubbish and waste material shall not be disposed of by burning on the site unless approved.

SECTION 1704
TRADE SHOWS AND EXHIBITIONS

1704.1 General. Trade shows and exhibitions conducted within any occupancy shall comply with Chapter 17 and Section 314.

1704.2 Vehicles. Liquid- and gas-fueled and electric vehicles, boats or other motor-craft **and equipment** used for display, competition or demonstration within a building shall be in accordance with Section 314.

1704.3 Means of egress. Means of egress shall comply with this section and the requirements of Chapter 10.

1704.3.1 Travel distance. The maximum travel distance from any point in an exhibit to an exit access shall not exceed 50 feet (15240mm).

1704.3.2 Aisles. Aisles shall comply with Sections 1704.3.2.1 and 1704.3.2.2.

1704.3.2.1 Aisle width. Minimum aisle width in a trade show or exhibition shall comply with the following:

Square Footage of Trade Show or Exhibition	Minimum Aisle Width
Greater than 15,000 square feet (1393m^2)	10 feet (4572mm)
5,000 square feet (465 square meters) to 15,000 square feet (1393m^2)	8 feet (2438mm)
Less than 5,000 square feet (465 m^2)	6 feet (1829mm)

1704.3.2.2 Obstructions. Aisles shall be kept clear of all obstructions, including but not limited to, fixtures and displays of goods for sale, chairs, tables, product, displays, vehicles, and trailer tongues.

1704.3.4 Exit signs. Exit signs shall be visible from all locations in the occupancy.

1704.4 Exhibit construction and materials. The materials used for an exhibit shall comply with Section 1704.6 and Chapter 8

1704.4.1 Materials. Exhibit materials shall be one of the following:

1. Noncombustible or limited-combustible materials.
2. Wood that is greater than ¼-inch (6mm) nominal thickness
3. Wood ¼-inch (6mm) nominal thickness or less that is pressure-treated fire-retardant wood meeting the requirements of NFPA 703, Standard for Fire Retardant Impregnated Wood and Fire Retardant Coatings for Building Materials. The product shall be marked or labeled by the manufacturer. The product shall not be painted or similarly modified until the material has been inspected and the marking or labeling verified, or provide documentation acceptable to the fire code official.

1704.4.1.1 Flame retardant materials. Materials shall comply with Chapter 8.

1704.4.1.2 Wall and ceiling coverings. Textile wall coverings, such as carpeting and similar products used as wall or ceiling finishes shall comply with Chapter 8 and NFPA 101 Chapter 10.

1704.4.1.3 Plastics. Plastics shall be limited to those that comply with Chapter 8. Plastics used in trade shows and exhibitions with an occupant load of 300 or more shall be Class A or Class B. Plastics used in trade shows and exhibitions with an occupant load of less than 300, shall be Class A, Class B or Class C.

1704.5 Combustible materials storage. Combustible materials storage shall comply with Sections 1704.5.1 and 1704.5.2.

1704.5.1 Quantity. Combustible materials shall be limited to a one-day supply

1704.5.2 Location. Storage of combustible materials behind exhibits, booths, or tents is prohibited. Combustible materials, including but not limited to wood crates, paper and cardboard boxes, shall be stored outside the building in an approved area or in a storeroom having a fire-resistance rating of at least one hour and protected by an approved automatic fire-extinguishing system

1704.6 Covered exhibit and booth fire protection. Fire protection for covered exhibits and booths shall comply with Sections 1704.6.1 and 1704.6.2.

1704.6.1 Automatic sprinkler systems. An approved automatic sprinkler system shall be provided in covered exhibits and booths exceeding 300 square feet. Each level of multi-level exhibit booths shall be protected throughout, including the uppermost level where the uppermost level is covered with a ceiling.

1704.6.2 Smoke detectors. Single-station smoke detectors shall be provided in all enclosed, covered exhibits and vehicles exceeding 120 square feet (111,484 cm^2).

1704.7 Multi-level booths. Construction documents for all multi-level exhibits shall be approved and stamped by a licensed structural engineer or architect and shall be submitted with the permit application. This includes any exhibit where a live load is proposed above the exhibit area floor level, regardless of the accessibility of the area to the public. Upper levels of multi-level booths with an occupant load greater than 10 persons shall have at least 2 remote exits.

1704.8 Hazardous Materials. Hazardous materials shall comply with Section 1704.10 and Chapters 51 through 67.

1704.8.1 Specific prohibitions. The following hazardous materials shall not be stored, handled or used in trade shows and exhibitions:

1. Division 1.1, 1.2, 1.3, and 1.5 explosives as classified by the U.S. Department of Transportation.
2. Detonable, Class I and Class II organic peroxides.
3. Class I-A flammable liquids.
4. Class 4 and Class 3 oxidizers.
5. Class 4 and Class 3 (unstable) reactive materials.
6. Class 3 water-reactive materials.
7. Pyrophoric materials.
8. Highly toxic materials
9. Toxic gases.
10. Fueling or defueling of flammable or combustible that are stored or used as liquids, cryogenics or compressed gases.

1704.9 Demonstration cooking and warming equipment or devices. Cooking and warming devices for demonstration purposes only shall be in accordance with Sections 1704.9.1 through 1704.9.4.1.

1704.9.1 Public Isolation. Equipment and devices shall be isolated from the public by not less than 4 feet (1219mm) or by a noncombustible 3-sided barrier between the equipment and devices and the public.

1704.9.2 Protection. Single-well cooking equipment using combustible oils or solids shall meet the following:

1. A noncombustible lid shall be immediately available. The lid shall be of sufficient size to cover the cooking well completely.
2. The cooking surface shall not exceed 288 square inches (18,580mm).
3. The equipment shall be placed on a noncombustible surface.
4. The equipment shall be separated from each other by a horizontal distance of not less than 2 feet (609mm).

1704.9.3 Cooking equipment shall be separated from combustible materials by a horizontal distance of at least 2 feet (609mm).

1704.9.4 Butane. Butane for cooking equipment shall be limited to one 10 oz cylinder and one spare in storage, of the same size, per appliance. Storage location shall be approved by the fire code official.

1704.9.4.1 Portable butane-fueled appliances. Portable butane-fueled appliances are allowed in restaurants and in attended commercial food catering operations where fueled by not more than two 10 oz (0.3 L) LP-Gas capacity, nonrefillable butane containers that have a water capacity not exceeding 1.08 lb (0.5 kg) per container. The containers shall be directly connected to the appliance, and manifolding of containers is not permitted. Storage of cylinders is limited to 24 containers, with an additional 24 permitted where protected by a 2-hour fire resistance–rated barrier.

SECTION 1705
OUTDOOR ASSEMBLY EVENTS

1705.1 General. Outdoor assembly events shall be in accordance with Section 1705.2 through 1705.4.6 and Chapter 10.

1705.2 Occupant load. The fire code official shall establish an occupant load for the event site.

1705.3 Exits. Exits shall comply with Chapter 10 and be as remote from each other as practical shall and be provided as follows:

Occupant Load	Minimum Number of Exits
1 to 500	2
501 to 1,000	3
1,001 or 1,500	4
each additional 500 persons	36 additional inches of exit width

1705.3.1 Width. The aggregate clear width of exits shall be a minimum of 36 inches wide (914mm) for each 500 persons to be accommodated.

1705.3.2 Signs. Exits shall be identified with signs that read “EXIT”. The signs shall be weather-resistant with lettering on a contrasting background. The lettering shall be of sufficient height and brush stroke to be immediately visible from 75 feet (22,860mm). Placement of the exit signs shall be approved by the fire code official.

1705.4 Concession stands, food booths, and retail booths. Concession stands/food booths and retail booths shall be in accordance with Sections 1705.4.1 through.

1705.4.1 Distances. A minimum of 20 feet (6096mm) shall be provided between every 150 linear feet (45,720mm) of booth space. A minimum of 30 feet (9144mm) shall be provided between booths used for cooking and the vehicles, generators, or any other internal combustion engine. A minimum of 10 feet (3048 mm) shall be provided between booths used for cooking and amusement rides or devices.

Exception: Hotdog carts that are licensed by the City for use in right-of-ways.

1705.4.2 Cooking appliances or devices isolation. Cooking appliances or devices shall be isolated from the public by not less than 4 feet (1219 mm) or by a non-combustible 3-sided barrier between the equipment and devices and the public.

1705.4.3 Cooking equipment protection. Single-well cooking equipment using combustible oils or solids shall comply with the following:

1. A noncombustible lid shall be immediately available. The lid shall be of sufficient size to cover the cooking well completely.
2. The cooking surface shall not exceed 288 square inches (18,580mm).

3. The equipment shall be placed on a noncombustible surface.

4. The equipment shall be separated from each other by a horizontal distance of not less than 2 feet (609mm).

1705.4.4 Liquefied petroleum gas (LP-gas). LP-gas shall be in accordance with Chapter 38 and NFPA 58.

1705.4.4.1 Maximum number and quantity. A maximum of a total aggregate water capacity of 50 gallons (95L) of LP-gas is permitted at one concession stand or booth used for cooking.

1705.4.4.2 LP-gas high-pressure cylinder hoses. Hoses shall be designed for a working pressure of 350 PSIG with a safety factor of 5 to 1 and shall be continuously marked with LP-GAS, PROPANE, 350 PSI WORKING PRESSURE, and the manufacturer's name or trademark. Hose assemblies, after the application of couplings, shall have a design capability of 700 PSIG. Hose shall not exceed 12 feet (3638 mm) unless approved by the fire code official.

1705.4.4.3 LP-gas low-pressure cylinder hoses. Hoses with a working pressure of 5 psig shall be allowed when a fix regulator is set a 5 psi and is connected directly to the LP GAS cylinder. The hose shall not exceed 12 feet (3638 mm) unless approved by the fire code official.

1705.4.4.4 Storage of containers. Containers shall be stored in accordance with Chapter 38.

1705.4.5 Generators / electrical. A permit from the Planning and Development Department shall be obtained where required. The generators shall be installed at least 10 feet (3048mm) from combustible materials, and shall be isolated from the public by physical guard, fence, or enclosure installed at least 3 feet (914mm) away from the internal combustion power source, and be provided with compliant portable fire extinguisher per Section 906 and NFPA 10.

1705.4.6 Temporary water stations. Where outdoor temperatures are expected to exceed 90^{o}F (35^{o}C$^{)}$, the event sponsor shall provide and maintain a minimum of one staffed water station for each 1,000-projected attendance. The water station shall include adequate water supply, cups, and a means for rapid replenishing of exhausted water. Each water station shall be located as far apart as practicable to allow ease of access for event attendees.

SECTION 1706
SPECIAL AMUSEMENT BUILDINGS

1706.1 General. [B] Special amusement buildings shall be in accordance with Sections 1706.2 through 1706.4.1 and Section 411 of the International Building Code.

Exception: Amusement buildings or portions thereof, which are without walls or a roof and are constructed to prevent the accumulation of smoke.

1706.2 Use of combustible decorative materials. Use of combustible decorative materials shall be in accordance with Chapter 8.

1706.3 Assistance. Adult monitors with flashlights shall be available to provide assistance in the event someone becomes lost or disoriented. One adult monitor shall be provided for every 60 person.

1706.4 Automatic sprinkler system. Special amusement buildings shall be equipped throughout with an automatic sprinkler system in accordance with Chapter 9.

1706.4.1 Temporary special amusement buildings. Where the special amusement building is temporary, the sprinkler water supply shall be of an approved temporary means. The sprinkler piping shall be connected to a temporary water supply having sufficient capacity (flow and pressure) to supply residential or standard quick spray response sprinkler heads at a minimum design density of 0.15 gpm per square foot of protected floor area. The design shall be based on flowing the six most hydraulically remote sprinkler heads. Should the temporary amusement building contain less than six heads, the design shall assume that all heads are flowing simultaneously.

The temporary water supply may be connected to a domestic water line, a fire line, or temporary on-site storage tank as long as the minimum design densities are met. An indicating type control valve shall be installed in an accessible location between the sprinkler system and the connection to the water supply.

When the temporary sprinkler system is installed from a domestic water line, back flow prevention shall be provided in accordance with the requirements of the Arizona State Plumbing Code.

SECTION 1707
MAZES

1707.1 General. Mazes including, but not limited to corn stalk or hedge mazes, shall be in accordance with Section 1707.

1707.1.2 Safe refuge areas. Safe refuge areas shall be established outside of the maze or building and structure, and not closer than 50 feet (15240mm).

1707.1.3 Paths. Paths throughout the maze shall be a minimum of 36 inches (914mm) clear and unobstructed width.

1707.1.4 Separation. A minimum of 20 feet (6096mm) shall be provided between mazes and buildings and structures. The 20-foot (6096mm) clearance shall be free from vegetation and obstructions.

1707.1.5 Means of egress. Each exit shall be a minimum of 6 feet (1828mm) wide.

1707.1.5.1 Travel distance. The maximum travel distance to reach an exit access shall not exceed 75 feet (22,860mm). The travel distance shall be determined by using the maze path.

1707.1.5.2 Number. The travel distance required to reach an exit access shall determine the number of exits required. Locking devices shall not be allowed on exits when the maze is occupied.

1707.1.5.3 Exit signs. Exit signs shall be provided next to or above each exit. The lettering shall be a minimum of 12 inches (305mm) high with 2-inch (51mm) brushstroke. The signs shall read EXIT with lettering in a color contrasting to the sign’s background.

1707.2 Event plans. The following plans shall be submitted to the fire code official.

1707.2.1 General fire safety plan. The plan shall include, but not be limited to procedures that shall be used to prevent over-drying of vegetation throughout the site, documentation of decorative materials flame-retardancy, the maximum number of attendees.

1707.2.2 Security plan. The plan shall document who shall provide security (e.g., off-duty Police Officers, Sheriff’s posse, employees). Each security personnel shall be provided with a 2-way radio and flashlight.

1707.2.3 Evacuation plans. The plan shall document the responsibilities of all on-site employees. The plan shall also document how attendees will be evacuated, and where they will be evacuated.

1707.2.4 Maze rules. Maze rules shall be posted at maze entrance.

1707.3 Employee responsibilities. Each employee shall be familiar with the evacuation plan and with fire extinguisher locations. Documentation of training shall be provided to the fire code official.

1707.3.1 Guides. An employee shall be responsible for guiding a group of not more than 14 attendees through the maze. Each employee shall be provided with a minimum of one flashlight and two-way radio. The employees shall be responsible for detecting and reporting fire or smoke to a competent person posted at the maze main entrance and begin evacuation procedures.

1707.3.2 Main entrance employee. Each maze shall be manned by an employee at the entrance. The employee shall be capable of communicating with the employees and shall be provided with a cellular telephone. When the main entrance employee receives a report of smoke, fire or injury, the employee shall immediately call 9-1-1.

1707.4 Watering. Corn stalk and hedge mazes shall be provided with sufficient water and at a frequency that prevents the vegetation from becoming dry or brittle. Failure to comply with this provision is an imminent hazard and the fire code official shall issue a stop order.

1707.5 Buildings and structures. When buildings and structures are intended to be occupied by attendees, the building and structure shall comply with Section 1706.

SECTION 1708
COVERED MALL BUILDINGS

1708.1 General. Temporary use of the common pedestrian area within a covered mall building for promotional, Group E, Group A, Group M or similar activities shall be in accordance with Section 1708.

1708.2 Main aisle width. Main aisles shall be a minimum of 10 feet (3048mm) in width or the minimum required means of egress width, whichever is greater, and shall be maintained in accordance with Chapter 10. Main aisles shall not be obstructed.

1708.2.1 Cross aisle width. Cross aisles shall be a minimum of 15 feet (4572mm) in width or the required means of egress width, whichever is greater, and shall be maintained in accordance with Chapter 10.

1708.2.2 Fueled equipment. Liquid- or gas-fueled, or electric appliances, tools, apparatus, craft or vehicles shall be displayed in a mall in accordance with Section 314. LP-gas powered floor maintenance machines may be used when in accordance with Chapter 38.

1708.3 Combustible decorative materials. Combustible decorative materials shall be in accordance with Chapter 8.

1708.4 Fixtures. Fixtures shall not be located in main aisles or cross aisles.

Reason: This new chapter provide rules and regulation for special event that occur indoor and outdoors in location that may not be designed to hold this type of event.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: The 11 proposed defined terms for Chapter 2 listed in in Section 1702.1 were not provided.

1701 (NEW)-F-MCELVANEY

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The disapproval was based on the committee's judgment that the code change is not yet ready for inclusion in the code. The committee noted that there are many terms in the proposal that need definitions and that more realistic thresholds for the requirements need to be established. The proposal also references Arizona state law which is inconsistent with code style. The proposal also lacks a comprehensive reason statement. It was suggested that this material could be suitable for an adoptable appendix.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

APPENDIX K
TRADE SHOWS AND EXHIBITIONS

The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance.

SECTION K101
GENERAL

K101.1 General. Trade shows and exhibitions with temporary vender displays or booths within any occupancy shall be in accordance with this appendix and all other applicable requirements of the International Fire Code.

Exceptions:

1. Exhibition areas that occupy less than 1500 square feet of floor area in unsprinklered buildings, provided they do not include any multi-level exhibits or booths and have at least two remote exits in compliance with IFC Section 1021.
2. Exhibition areas that occupy less than 3000 square feet of floor area in buildings equipped throughout with an approved automatic sprinkler system installed in accordance with Section 903.3.1.1, provided they do not include any covered or multi-level exhibits or booths and have at least two exits in compliance with IFC Section 1021.

K101.2 Permit required. An operational permit for trade shows and exhibitions shall be required as set forth in Section 105.6.

K101.3 Application. An application to hold a trade show or exhibition shall be provided to the fire code official prior to the start of the trade show in a time frame established by the local authority. The application shall include a site plan that identifies:

1. The means of egress,
2. Location and width of exits and aisles,
3. Location of exit signs,
4. Total square footage of space,
5. Location and arrangement of all booths and cooking equipment,
6. Location of all fire protection equipment,
7. Type and location of heating and electrical equipment where applicable,
8. Location of covered or multi-level booths.
9. Construction documents for multi-level booths
10. Location and quantity of highly combustible goods storage.

SECTION K102
DEFINITIONS

K102.1 Definitions. For the purpose of this appendix, certain terms are defined as follows:

COVERED BOOTH. An exhibit that has something placed over the exhibit above floor level that resembles a roof, canopy, tent or other obstruction, other than vertical signs or banners.

MULTI-LEVEL BOOTH. An exhibit that has a second level or tier constructed on top of the exhibit or portion of the exhibit that is accessible to the public, or that includes a live load above the exhibit area floor level, regardless of the accessibility of the area to the public.

SECTION K103
PUBLIC SAFETY FOR EVENTS

K103.1 Public safety plan. Where the *fire code official* determines that the nature of the exhibition, display or activities therein pose an increased hazard to public safety, the *fire code official* shall have the authority to order the development of public safety plan that complies with section 403.2.1.

K103.2 Fire watch personnel. When, in the opinion of the *fire code official*, it is essential for public safety in a trade show or exhibition because of the number of persons, or the nature of the performance, exhibition, display, or activity, the owner, agent or lessee shall provide one or more fire watch personnel in accordance with section 403.1.

K103.3 Crowd managers. Trained crowd managers shall be provided for trade shows and exhibitions in accordance with Section 403.3.

SECTION K104
INTERIOR FINISH AND DECORATIVE MATERIALS

K104.1 General. 801.1 Scope. Interior finish, trim, furnishings, and decorative materials used in exhibition areas shall comply with section K104 and Chapter 8.

K104.2 Interior finish. The materials used for wall and ceiling finishes of exhibits, booths and displays used in exhibition areas shall comply with one of the following:

1. Materials in exhibition areas in unsprinklered buildings shall comply with Class A requirements when tested in accordance ASTM E84 or UL 723.
2. Materials in exhibition areas in buildings equipped throughout with an approved automatic sprinkler system installed in accordance with Section 903.3.1.1 shall comply with Class B requirements when tested in accordance ASTM E84 or UL 723.
3. Materials in exhibition areas of sprinklered or unsprinklered building shall comply with NFPA 286 requirements in accordance with Section 803.1.2.

    Exceptions:

    1. Materials having a thickness less than 0.036 inch (0.9 mm) applied directly to the surface of walls and ceilings.
    2. Exposed portions of structural members complying with the requirements of buildings of Type IV construction in accordance with the International Building Code shall not be subject to interior finish requirements.

K104.3 Textiles. Textiles used as interior wall and ceiling finish materials, including materials having woven or nonwoven, napped, tufted, looped or similar surface, shall comply with Section 803.5.

K104.4 Decorative materials. All *decorative materials* applied over the booth or exhibit interior finish for decorative, acoustical or other effect including curtains, draperies, fabrics and streamers shall comply with Section 807.

K104.5 Signs. Foam plastic signs that are not affixed to interior building surfaces shall comply with Section 808.3.

K104.6 Fire-retardant coatings Fire retardant coatings shall comply with Section K104.1 and with Section 803.4.

SECTION K105
MULTI-LEVEL BOOTHS

K105.1 Construction documents. Construction documents for all *multi-level booths* shall be approved and stamped by a licensed structural engineer or architect and shall be submitted with the permit application.

K105.2 Structural design. *Multi-level booths* shall be designed and constructed to comply with Chapter 16 of the International Building Code.

K105.3 Means of egress. Upper levels of *multi-level booths* with an occupant load greater than 10 persons shall have at least 2 remote exits.
K105.4 Automatic sprinkler systems. An approved temporary automatic sprinkler system shall be provided in multi-level booths exceeding 300 square feet in floor area per story. Each covered level of multi-level exhibit booths shall be protected throughout.

K105.5 Smoke alarms. Smoke alarms shall be installed in an approved location on the ceiling of each covered level of multi-level booths when the floor area of a level exceeds 120 square feet.

SECTION K106
COVERED BOOTHS

K106.1 Automatic sprinkler systems. An approved temporary automatic sprinkler system shall be provided in covered booths exceeding 300 square feet in floor area.

K106.2 Smoke alarms. Smoke alarms shall be installed in an approved location on the ceiling of covered booths with a floor area that exceeds 120 square feet.

SECTION K107
STORAGE AND OPERATIONS

K107.1 Storage and operations. Storage and operation in trade shows and exhibition areas shall comply with Section K107.2 through K107.7.

K107.2 Hazardous materials. Hazardous materials shall not be stored, handled or used in trade shows and exhibitions except as specifically permitted elsewhere in this code for Group A occupancies.

K107.3 Vehicles. Liquid- or gas-fueled vehicles, boats or other motorcraft shall not be located in a trade show or exhibition area, except as permitted in section 314.4.

K107.4 Fueled equipment. Fueled equipment including, but not limited to, motorcycles, mopeds, lawn-care equipment, portable generators and portable cooking equipment, shall not be stored,
operated or repaired within a trade show or exhibition area, except as permitted in section 313.

K107.5 Highly combustible goods. The display of highly combustible goods, including but not limited to fireworks, flammable or combustible liquids, liquefied flammable gases, oxidizing materials, pyroxylin plastics and agricultural goods within 5 feet (1524 mm) of and exits and exterior exit doors is prohibited when a fire involving such goods would rapidly prevent or obstruct egress.

K107.6 Combustible materials. Combustible materials storage within trade show and exhibition areas shall comply with sections 315.

K107.7 Cooking and open flame devices. Cooking equipment and open flame devices shall not be used in exhibition areas except as allowed in Section 308. Cooking equipment shall be separated from combustible materials by a horizontal distance of not less than 2 feet.

SECTION K108
MEANS OF EGRESS

K108.1 Means of egress. Means of egress within the trade show and exhibition area shall comply with this section and Chapter 10, taking into consideration the exhibit layout and anticipated crowd movement during the event.

K108.2 Storage in aisles. Aisles in the exhibition area shall be kept free of obstructions that would inhibit egress from the exhibition area during all periods in which the general public is present, including rolled up floor coverings, exhibit containers, supplies and other materials.

Commenter's Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

The original proposal was a very complex set of requirements for covering special events. Similar sets of requirements have been successfully used in jurisdictions such as Phoenix and Las Vegas. The IFC committee disapproved the original proposal due to a number of factors, including a lack of definitions, a lack of minimum thresholds, a belief that the proposal was not yet ready for inclusion in the code, and might be better suited as an adoptable appendix.

The Fire Code Action Committee, who was not the original proponent, saw value in developing requirements for an adoptable appendix covering larger, more complex trade shows and exhibitions, especially those that include covered and multi-level booths, which pose unique safety hazards. The public comment addresses all of the concerns included in the committee reason statement, as follows:

This material is better suited for an adoptable appendix – DONE, the public comment is proposed as an adoptable Appendix K.

More realistic thresholds need to be established – DONE, the original proposal covered special events of all sizes, which conceivable covered a single tabletop booth. Section K101.1 limits the scope of the Appendix to exhibition areas over 1500 sq. ft. in unsprinklered buildings, and 3000 sq. ft. in sprinklered buildings. Exhibits including covered and multi-level booth are covered by these requirements regardless of size due to their unique safety concerns.

Several terms need definitions – DONE, with the scaled back scope and length of the proposal many of the terms that previously needed definitions were eliminated, Section K102 includes the definitions that are needed to properly apply the requirements in the proposed Appendix.
The proposal references Arizona state law – DONE, these references were removed.
Lacks a comprehensive reason statement – DONE, see the following:

> This proposed appendix is intended to address hazards associated with larger, more complex trade shows and exhibitions. Although many of these requirements are already included in various locations in the IFC, some of the more important items, such as requirements for covering covered booths and multi-story booths are not in the existing code. In addition, having the requirements covering these events in a single location makes it easier for those organizing exhibitions, and individual exhibitors who are unfamiliar with the entire fire code to locate the requirements that are applicable to them.

K101.1 The minimum square foot thresholds clarify that the appendix does not cover small trade shows, like those with traditional tabletop displays and small booths. It only covers the larger exhibitions, and those with covered and multi-level booths, which pose additional safety concerns.
K101.3 clearly defines the information needed to obtain a permit for one of these larger exhibitions. Having this information in writing makes it easier for all parties to understand the information needed to gain approval for the exhibition.
K103 includes a convenient pointer to public safety related requirements in Chapter 4 of the IFC.
K104 includes a set of interior finish requirements that are applicable to an event in a Group A occupancy where there is a significant amount of interior finish material in the exhibits and booth themselves that was not present in the building when it was initially designed. Due to the potential fuel loading in the exhibition area, interior finish and trim requirements are required to comply Class A and Class B in unsprinklered and sprinkler buildings, respectfully. Cross references to other applicable requirements in Chapter 8 were provided in this section as a convenience to the code user.
K105 and K106 include requirements designed to provide an acceptable level of safety for the hazards associated with multi-level and covered booths. Both of these booth types have the ability to block sprinkler protection provided in the room in which the exhibition is held, and also can include a significant amount of fuel loading, which justifies temporary automatic sprinklers for the larger booths. In addition multi-level booths present concerns with structural integrity, which warrants being designed and constructed in accordance with Chapter 16 of the IBC.
K107 includes basic requirements for storage in exhibitions, and certain operations.
K108 includes a pointer to Chapter 10 means of egress requirements, and also restricts storage in aisles of exhibitions when the general public is present.

F354-13
Final Action: AS AM AMPC____ D

F360-13

908.7 (IBC [F]908.7) through 908.7.7 (IBC [F]908.7.7) (New); 1103.9; 202

Proposed Change as Submitted

Proponent: Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee (azubiamia@yahoo.com)

Delete Sections 908.7 (IBC [F]908.7) and 908.7.1 (IBC [F]908.7.1) in their entirety and substitute as follows:

~~**908.7 (IBC [F]908.7) Carbon monoxide alarms.** Group I or R occupancies located in a building containing a fuel-burning appliance or in a building which has an attached garage shall be equipped with single-station carbon monoxide alarms. The carbon monoxide alarms shall be listed as complying with UL 2034 and be installed and maintained in accordance with NFPA 720 and the manufacturer's instructions. An open parking garage, as defined in Chapter 2 of the *International Building Code*, or an enclosed parking garage ventilated in accordance with Section 404 of the *International Mechanical Code* shall not be considered an attached garage.~~

> ~~**Exception:** *Sleeping units* or *dwelling units* which do not themselves contain a fuel-burning appliance or have an attached garage, but which are located in a building with a fuel-burning appliance or an attached garage, need not be equipped with single-station carbon monoxide alarms provided that:~~
>
> ~~1. The *sleeping unit* or *dwelling unit* is located more than one story above or below any story which contains a fuel-burning appliance or an attached garage;~~
> ~~2. The *sleeping unit* or *dwelling unit* is not connected by duct work or ventilation shafts to any room containing a fuel-burning appliance or to an attached garage; and~~
> ~~3. The building is equipped with a common area carbon monoxide alarm system.~~

~~**908.7.1 (IBC [F]908.7.1) Carbon monoxide detection systems.** Carbon monoxide detection systems, which include carbon monoxide detectors and audible notification appliances, installed and maintained in accordance with this section for carbon monoxide alarms and NFPA 720 shall be permitted. The carbon monoxide detectors shall be *listed* as complying with UL 2075.~~

908.7 (IBC [F]908.7) Carbon monoxide alarms. Carbon monoxide alarms shall be installed in new buildings in accordance with Sections 908.7.1 through 908.7.7. Carbon monoxide alarms shall be installed in existing buildings in accordance with Section 1103.9.

908.7.1 (IBC [F]908.7.1) Where required. Carbon monoxide alarms shall be provided in Group I-1, I-4, and R occupancies in the locations specified in 908.7.2 where any of the conditions in Sections 908.7.1.1 through 908.7.1.4 exist.

908.7.1.1 (IBC [F]908.7.1.1) Fuel-burning appliances and fuel burning fireplaces. Carbon monoxide alarms shall be provided in dwelling units and sleeping units that contain a fuel-burning appliance or a fuel burning fireplace.

908.7.1.2 (IBC [F]908.7.1.2) Forced air furnaces. Carbon monoxide alarms shall be provided in dwelling units and sleeping units served by a fuel-burning, forced air furnace.

908.7.1.3 (IBC [F]908.7.1.3) Fuel burning appliances outside of dwelling units and sleeping units. Carbon monoxide alarms shall be provided in dwelling units and sleeping units located in buildings that contain fuel-burning appliances or fuel burning fireplaces.

Exception:

1. Carbon monoxide alarms shall not be required in dwelling units and sleeping units if there are no communicating openings between the fuel-burning appliance or fuel burning fireplace and the dwelling unit or sleeping unit.
2. Carbon monoxide alarms shall not be required in dwelling units and sleeping units if a carbon monoxide alarm is provided:
   2.1 In an approved location between the fuel burning appliance or fuel burning fireplace and the dwelling unit or sleeping unit, or
   2.2 On the ceiling of the room containing the fuel burning appliance or fuel burning fireplace.

908.7.1.4 (IBC [F]908.7.1.4) Private garages. Carbon monoxide alarms shall be provided in dwelling units and sleeping units in buildings with attached private garages.

Exceptions:

1. Carbon monoxide alarms shall not be required if there are no communicating openings between the private garage and the dwelling unit or sleeping unit.
2. Carbon monoxide alarms shall not be required in dwelling units and sleeping units located more than one story above or below a private garage.
3. Carbon monoxide alarm shall not be required if the private garage connects to the building through an open-ended corridor.

908.7.1.4.1 (IBC [F]908.7.1.4.1) Exempt garages. For determining compliance with Section 908.7.1.4, an *open parking garage*, complying with Section 406.5 of the *International Building Code*, or an *enclosed parking garage* complying with Section 406.6 of the *International Building Code* shall not be considered a private garage.

908.7.2 (IBC [F]908.7.2) Locations. Where required by Section 908.7.1, carbon monoxide alarms shall be installed in the locations specified in Sections 908.7.2.1 through 908.7.2.2.

908.7.2.1 (IBC [F]908.7.2.1) Dwelling units. Carbon monoxide alarms shall be installed in dwelling units outside of each separate sleeping area in the immediate vicinity of the bedrooms. Where a fuel-burning appliance is located within a bedroom or its attached bathroom, a carbon monoxide alarm shall be installed within the bedroom.

908.7.2.2 (IBC [F]908.7.2.2) Sleeping units. Carbon monoxide alarms shall be installed in sleeping units.

Exception: Carbon monoxide alarms shall be allowed to be installed outside of each separate sleeping area in the immediate vicinity of the sleeping unit where the sleeping unit or its attached bathroom do not contain a fuel burning appliance and are not served by a forced air furnace.

908.7.3 (IBC [F]908.7.3) Power source. Carbon monoxide alarms shall receive their primary power from the building wiring where such wiring is served from a commercial source, and when primary power is interrupted, shall receive power from a battery. Wiring shall be permanent and without a disconnecting switch other than that required for overcurrent protection.

Exception: Where installed in buildings without commercial power, battery powered carbon monoxide alarms shall be an acceptable alternative.

908.7.4 (IBC [F]908.7.4) Listings. Carbon monoxide alarms shall be listed in accordance with UL 2034.

908.7.5 (IBC [F]908.7.5) Combination alarms. Combination carbon monoxide/smoke alarms shall be an acceptable alternative to carbon monoxide alarms. Combination carbon monoxide/smoke alarms shall be listed in accordance with UL 2034 and UL 217.

908.7.6 (IBC [F]908.7.6) Carbon monoxide detection systems. Carbon monoxide detection systems shall be an acceptable alternative to carbon monoxide alarms and shall comply with Sections 908.7.6.1 through 908.7.6.3.

908.7.6.1 (IBC [F]908.7.6.1) General. Carbon monoxide detection systems shall comply with NFPA 720. Carbon monoxide detectors shall be listed in accordance with UL 2075.

908.7.6.2 (IBC [F]908.7.6.2) Locations. Carbon monoxide detectors shall be installed in the locations specified in Section 908.7.2. These locations supersede the locations specified in NFPA 720.

908.7.6.3 (IBC [F]908.7.6.3) Combination detectors. Combination carbon monoxide/smoke detectors installed in carbon monoxide detection systems shall be an acceptable alternative to carbon monoxide detectors, provided they are listed in accordance with UL 2075 and UL 268.

908.7.7 Maintenance. Carbon monoxide alarms and carbon monoxide detection systems shall be maintained in accordance with NFPA 720. Carbon monoxide alarms and carbon monoxide detectors that become inoperable or begin producing end-of-life signals shall be replaced.

Add new text as follows:

SECTION 202
GENERAL DEFINITIONS

[B] PRIVATE GARAGE. A building or portion of a building in which motor vehicles used by the tenants of the building or buildings on the premises are stored or kept, without provisions for repairing or servicing such vehicles for profit

Revise as follows:

1103.9 Carbon monoxide alarms. Existing Group ~~I~~ I-1, I-4 and ~~or~~ R occupancies ~~located in a building containing a fuel-burning appliance or a building which has an attached garage~~ shall be provided with ~~be equipped with single-station~~ carbon monoxide alarms in accordance with Section 908.7, except that the carbon monoxide alarms shall be allowed to be solely battery powered.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

This proposal clarifies the requirements for carbon monoxide alarm installations. The intent is to provide protection for occupants of dwelling units and sleeping units within Group I-1, I-4, and R occupancies, which are locations where occupants are likely to be sleeping. Protection is provided from carbon monoxide that may be generated from faulty fuel burning appliance both inside and outside of the dwelling unit or sleeping unit, or from motor vehicle exhaust emanating from vehicles in attached private garages. It is assumed that a fuel burning appliance also includes a fuel burning fireplace. Specific details on the proposal are as follows.

1. The definition of PRIVATE GARAGE is identical to the IBC definition that was approved as part of proposal G59-12.
2. The entire section was reformatted to provide requirements in a more logical order.
3. Section 908.7 clarifies that the section only applies to new constructions, and that Section 1103.9 applies to existing occupancies.
4. Section 908.7.1 now only requires CO alarms are to be provided in Group I-1, I-4 and R occupancies, not all Group I occupancies as required in the existing code. It was felt that CO alarms were not warranted in Group I-2 and I-3 occupancies.
5. The code currently requires CO alarms to be provided in buildings that contain fuel burning appliances, with no additional details. Sections 908.7.1.1 through 908.7.1.3 describe the specific conditions when CO alarms are and are not required with regard to fuel-burning appliances.
6. Section 908.7.1.3 covers situations where dwelling units and sleeping units do not contain a fuel burning appliance, but such an appliance is included in a common area of the building. A good example of this is a multistory hotel that has all electric HVAC in the sleeping units, but perhaps a fireplace in the lobby, forced air heating in the common area, and a boiler in an equipment room. In these situations it is not reasonable to provide CO alarms in every sleeping room on every

floor of the hotel, where there are no sources of carbon monoxide. Having a few strategically located Co alarms in common areas will provide a reasonable level of protection for the sleeping units and dwelling units.

Exception 1 to this section covers situations where CO emanating from the fuel burning appliance has no direct path to a dwelling unit or sleeping unit, such as a water heater in an equipment room that only has access from the exterior of the building, and no openings through which the CO can get to dwelling units or sleeping units. An interior door, between this equipment room and a dwelling unit, even if it is self-closing, would not allow this exception to be used.

Exception 2 to this section requires the installation of a one or more CO alarms in approved locations between fuel burning appliances and the nearest dwelling unit or sleeping unit, or on the ceiling of the room in which a fuel burning appliance is located. CO alarms are only required where there are communicating openings including ducts, concealed spaces, interior hallways, stairs and spaces between the fuel-burning appliance or fuel burning fireplace and the dwelling unit or sleeping unit where air can flow from the appliance to the dwelling unit or sleeping unit.

7. The code currently requires CO alarms to be provided when the building has an attached garage, other than an open parking garages or enclosed parking garages that contain mechanical ventilation systems. The proposal keeps these basic concepts, but clarifies that CO alarms are required when the building has an attached private garage (which is defined in section 406.3 of the IBC). The proposal also does not require CO alarms to be provided when the private garage is attached to the building by an open ended corridor (a term used in the IBC and IFC, which is commonly called a breeze way).
8. The code currently deferred to NFPA 720 for identifying where CO alarms are to be located. In order to make the code more user friendly, Section 908.7.2 now describes the locations where CO alarms are to be provided. In some cases this differs from NFPA 720 required locations, but again is intended to provide protection for CO emanating from motor vehicles in attached private garages or from faulty fuel-burning appliances located either inside or outside of the dwelling unit or sleeping unit. .
9. Section 908.7.3 clarifies that CO alarms are required to be hard wired into building power, similar to smoke alarms, with one exception.
10. Section 908.7.5 addresses combination CO/smoke alarms, which are listed and readily available.
11. Section 908.7.6 includes more comprehensive requirements for CO detection systems as compared to the current code requirements. It requires these systems to comply with NFPA 720, but clarifies that detectors must be installed in the locations specified in Section 908.7.2 (not as specified in NFPA 720). It also allows combination CO/smoke detectors to be used.
12. Section 908.7.7 covers maintenance of devices and requires inoperative and end-of-life CO alarms to be replaced.
13. Section 1103.9 was revised to avoid duplicating section 908.7 requirements, and to allow battery powered CO alarms to be used to retrofit existing buildings, which is consistent with the retrofit provisions in the IRC.

Cost Impact: This code change will not increase the cost of construction

908.7 (NEW)-F-ZUBIA-FCAC

Committee Action Hearing Results

Committee Action: Approved as Modified

Modify proposal as follows:

908.7 (IBC [F] 908.7) Carbon monoxide alarms. Carbon monoxide alarms shall be installed in new buildings in accordance with Sections 908.7.1 through 908.7.7. Carbon monoxide alarms shall be installed in existing buildings in accordance with Section 1103.9.

908.7.1 (IBC [F] 908.7.1) Where required. Carbon monoxide alarms shall be provided in Group I-1, I-2, I-4, and R occupancies in the locations specified in 908.7.2 where any of the conditions in Sections 908.7.1.1 through 908.7.1.4 exist.

908.7.1.1 (IBC [F] 908.7.1.1) Fuel-burning appliances and fuel burning fireplaces. Carbon monoxide alarms shall be provided in dwelling units and sleeping units that contain a fuel-burning appliance or a fuel burning fireplace.

908.7.1.2 (IBC [F] 908.7.1.2) Forced air furnaces. Carbon monoxide alarms shall be provided in dwelling units and sleeping units served by a fuel-burning, forced air furnace.

908.7.1.3 (IBC [F] 908.7.1.3) Fuel burning appliances outside of dwelling units and sleeping units. Carbon monoxide alarms shall be provided in dwelling units and sleeping units located in buildings that contain fuel-burning appliances or fuel burning fireplaces.

Exception:

1. Carbon monoxide alarms shall not be required in dwelling units and sleeping units if there are no communicating openings between the fuel-burning appliance or fuel burning fireplace and the dwelling unit or sleeping unit.
2. Carbon monoxide alarms shall not be required in dwelling units and sleeping units if a carbon monoxide alarm is provided:
   2.1 In an approved location between the fuel burning appliance or fuel burning fireplace and the dwelling unit or sleeping unit, or

2.2 On the ceiling of the room containing the fuel burning appliance or fuel burning fireplace.

908.7.1.4 (IBC [F]908.7.1.4) Private garages. Carbon monoxide alarms shall be provided in dwelling units and sleeping units in buildings with attached private garages.

Exceptions:

1. Carbon monoxide alarms shall not be required if there are no communicating openings between the private garage and the dwelling unit or sleeping unit.
2. Carbon monoxide alarms shall not be required in dwelling units and sleeping units located more than one story above or below a private garage.
3. Carbon monoxide alarm shall not be required if the private garage connects to the building through an open-ended corridor.

908.7.1.4.1 (IBC [F]908.7.1.4.1) Exempt garages. For determining compliance with Section 908.7.1.4, an *open parking garage*, complying with Section 406.5 of the *International Building Code*, or an *enclosed parking garage* complying with Section 406.6 of the *International Building Code* shall not be considered a private garage.

908.7.2 (IBC [F]908.7.2) Locations. Where required by Section 908.7.1, carbon monoxide alarms shall be installed in the locations specified in Sections 908.7.2.1 through 908.7.2.2.

908.7.2.1 (IBC [F]908.7.2.1) Dwelling units. Carbon monoxide alarms shall be installed in dwelling units outside of each separate sleeping area in the immediate vicinity of the bedrooms. Where a fuel-burning appliance is located within a bedroom or its attached bathroom, a carbon monoxide alarm shall be installed within the bedroom.

908.7.2.2 (IBC [F]908.7.2.2) Sleeping units. Carbon monoxide alarms shall be installed in sleeping units.

Exception: Carbon monoxide alarms shall be allowed to be installed outside of each separate sleeping area in the immediate vicinity of the sleeping unit where the sleeping unit or its attached bathroom do not contain a fuel burning appliance and are not served by a forced air furnace.

908.7.3 (IBC [F]908.7.3) Power source. Carbon monoxide alarms shall receive their primary power from the building wiring where such wiring is served from a commercial source, and when primary power is interrupted, shall receive power from a battery. Wiring shall be permanent and without a disconnecting switch other than that required for overcurrent protection.

Exception: Where installed in buildings without commercial power, battery powered carbon monoxide alarms shall be an acceptable alternative.

908.7.4 (IBC [F]908.7.4) Listings. Carbon monoxide alarms shall be listed in accordance with UL 2034.

908.7.5 (IBC [F]908.7.5) Combination alarms. Combination carbon monoxide/smoke alarms shall be an acceptable alternative to carbon monoxide alarms. Combination carbon monoxide/smoke alarms shall be listed in accordance with UL 2034 and UL 217.

908.7.6 (IBC [F]908.7.6) Carbon monoxide detection systems. Carbon monoxide detection systems shall be an acceptable alternative to carbon monoxide alarms and shall comply with Sections 908.7.6.1 through 908.7.6.3.

908.7.6.1 (IBC [F]908.7.6.1) General. Carbon monoxide detection systems shall comply with NFPA 720. Carbon monoxide detectors shall be listed in accordance with UL 2075.

908.7.6.2 (IBC [F]908.7.6.2) Locations. Carbon monoxide detectors shall be installed in the locations specified in Section 908.7.2. These locations supersede the locations specified in NFPA 720.

908.7.6.3 (IBC [F]908.7.6.3) Combination detectors. Combination carbon monoxide/smoke detectors installed in carbon monoxide detection systems shall be an acceptable alternative to carbon monoxide detectors, provided they are listed in accordance with UL 2075 and UL 268.

908.7.7 Maintenance. Carbon monoxide alarms and carbon monoxide detection systems shall be maintained in accordance with NFPA 720. Carbon monoxide alarms and carbon monoxide detectors that become inoperable or begin producing end-of-life signals shall be replaced.

1103.9 Carbon monoxide alarms. Existing Group I-1, I-2, I-4 and R occupancies shall be provided with carbon monoxide alarms in accordance with Section 908.7, except that the carbon monoxide alarms shall be allowed to be solely battery powered.
Add new definition as follows:

SECTION 202
GENERAL DEFINITIONS

[B] PRIVATE GARAGE. A building or portion of a building in which motor vehicles used by the tenants of the building or buildings on the premises are stored or kept, without provisions for repairing or servicing such vehicles for profit

Committee Reason: The proposal was approved as the requirements associated with the more specific hazards within a building have been clarified. In addition, the placement of the CO alarms and CO detectors, where applicable, are more clearly specified. Previously the provisions were difficult to enforce. The modification simply added Group I-2 occupancies as it was requested that such occupancies be provided the same protection. The original provisions stated Group I occupancies which intended to address Group I-2.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION 915
CARBON MONOXIDE DETECTION

~~908.7~~ 915.1 Carbon monoxide ~~alarms~~ detection. Carbon monoxide ~~alarms~~ detection shall be installed in new buildings in accordance with Sections ~~908.7.1~~ 915.1.1 through ~~908.7.7~~ 915.6. Carbon monoxide ~~alarms~~ detection shall be installed in existing buildings in accordance with Section 1103.9.

~~908.7.1~~ 915.1.1 Where required. Carbon monoxide ~~alarms~~ detection shall be provided in Group I-1, I-2, I-4, and R occupancies, and in classrooms in Group E occupancies in the locations specified in ~~908.7.2~~ 915.2 where any of the conditions in Sections ~~908.7.1.1~~ 915.1.2 through ~~908.7.1.4.1~~ 915.1.6 exist.

~~908.7.1.1~~ 915.1.2 Fuel-burning appliances and fuel burning fireplaces. Carbon monoxide ~~alarms~~ detection shall be provided in dwelling units, ~~and~~ sleeping units and classrooms that contain a fuel-burning appliance or a fuel burning fireplace.

~~908.7.1.2~~ 915.1.3 Forced air furnaces. Carbon monoxide ~~alarms~~ detection shall be provided in dwelling units, ~~and~~ sleeping units and classrooms served by a fuel-burning, forced air furnace.

> **Exception:** Carbon monoxide detection shall not be required in dwelling units, sleeping units and classrooms if carbon monoxide detection is provided in the first room or area served by each main duct leaving the furnace, and the carbon monoxide alarm signals are automatically transmitted to an approved location.

~~908.7.1.3~~ 915.1.4 Fuel burning appliances outside of dwelling units, ~~and~~ sleeping units and classrooms. Carbon monoxide ~~alarms~~ detection shall be provided in dwelling units, ~~and~~ sleeping units and classrooms located in buildings that contain fuel-burning appliances or fuel burning fireplaces.

Exceptions:

1. Carbon monoxide ~~alarms~~ detection shall not be required in dwelling units, ~~and~~ sleeping units and classrooms if there are no communicating openings between the fuel-burning appliance or fuel burning fireplace and the dwelling unit, ~~or~~ sleeping unit or classroom.
2. Carbon monoxide ~~alarms~~ detection shall not be required in dwelling units, ~~and~~ sleeping units and classrooms if carbon monoxide ~~alarms~~ detection is provided in one of the following locations:
   2.1 In an approved location between the fuel burning appliance or fuel burning fireplace and the dwelling unit, ~~or~~ sleeping unit or classroom, or
   2.2 On the ceiling of the room containing the fuel burning appliance or fuel burning fireplace.

~~908.7.1.4~~ 915.1.5 Private garages. Carbon monoxide ~~alarms~~ detection shall be provided in dwelling units, ~~and~~ sleeping units, and classrooms in buildings with attached private garages.

Exceptions:

1. Carbon monoxide ~~alarms~~ detection shall not be required if there are no communicating openings between the private garage and the dwelling unit, ~~or~~ sleeping unit or classroom.
2. Carbon monoxide ~~alarms~~ detection shall not be required in dwelling units, ~~and~~ sleeping units and classrooms located more than one story above or below a private garage.
3. Carbon monoxide ~~alarms~~ detection shall not be required if the private garage connects to the building through an open-ended corridor.

4. <u>Where carbon monoxide detection is provided in an approved location between openings to a private garage and dwelling units, sleeping units or classrooms, carbon monoxide detection shall not be required in the dwelling units, sleeping units or classrooms.</u>

~~908.7.1.4.1~~ <u>915.1.6</u> Exempt garages. For determining compliance with Section ~~908.7.1.4~~ <u>915.1.5</u>, an *open parking garage*, complying with Section 406.5 of the *International Building Code*, or an *enclosed parking garage* complying with Section 406.6 of the *International Building Code* shall not be considered a private garage.

~~908.7.2~~ <u>915.2</u> Locations. Where required by Section ~~908.7.1~~ <u>915.1.1</u>, carbon monoxide ~~alarms~~ <u>detection</u> shall be installed in the locations specified in Sections ~~908.7.2.1~~ <u>915.2.1</u> through <u>915.2.3</u>.

~~908.7.2.1~~ <u>915.2.1</u> Dwelling units. Carbon monoxide ~~alarms~~ <u>detection</u> shall be installed in dwelling units outside of each separate sleeping area in the immediate vicinity of the bedrooms. Where a fuel-burning appliance is located within a bedroom or its attached bathroom, ~~a~~ carbon monoxide ~~alarm~~ <u>detection</u> shall be installed within the bedroom.

~~908.7.2.2~~ <u>915.2.2</u> Sleeping units. Carbon monoxide ~~alarms~~ <u>detection</u> shall be installed in sleeping units.

> **Exception:** Carbon monoxide ~~alarms~~ <u>detection</u> shall be allowed to be installed outside of each separate sleeping area in the immediate vicinity of the sleeping unit where the sleeping unit or its attached bathroom do not contain a fuel burning appliance and are not served by a forced air furnace.

<u>**915.2.3 Group E occupancies.** Carbon monoxide detection shall be installed in classrooms in Group E occupancies. Carbon monoxide alarm signals shall be automatically transmitted to an on-site location that is staffed by school personnel.</u>

> <u>**Exception:** Carbon monoxide alarm signals shall not be required to be automatically transmitted to an on-site location that is staffed by school personnel in Group E occupancies with an occupant load of 30 or less.</u>

<u>**915.3 Detection equipment.** Carbon monoxide detection required by 915.1 through 915.2.3 shall be provided with carbon monoxide alarms complying with Section 915.4 or with carbon monoxide detection systems complying with Section 915.5.</u>

<u>**915.4 Carbon monoxide alarms.** Carbon monoxide alarms shall comply with Section 915.4.1 through 915.4.3.</u>

~~908.7.3~~ <u>915.4.1</u> Power source. Carbon monoxide alarms shall receive their primary power from the building wiring where such wiring is served from a commercial source, and when primary power is interrupted, shall receive power from a battery. Wiring shall be permanent and without a disconnecting switch other than that required for overcurrent protection.

> **Exception:** Where installed in buildings without commercial power, battery powered carbon monoxide alarms shall be an acceptable alternative.

~~908.7.4~~ <u>915.4.2</u> Listings. Carbon monoxide alarms shall be listed in accordance with UL 2034.

~~908.7.5~~ <u>915.4.3</u> Combination alarms. Combination carbon monoxide/smoke alarms shall be an acceptable alternative to carbon monoxide alarms. Combination carbon monoxide/smoke alarms shall be listed in accordance with UL 2034 and UL 217.

~~908.7.6~~ <u>915.5</u> Carbon monoxide detection systems. Carbon monoxide detection systems shall be an acceptable alternative to carbon monoxide alarms and shall comply with Sections ~~908.7.6.1~~ <u>915.5.1</u> through ~~908.7.6.3~~ <u>915.5.3</u>.

~~908.7.6.1~~ <u>915.5.1</u> General. Carbon monoxide detection systems shall comply with NFPA 720. Carbon monoxide detectors shall be listed in accordance with UL 2075.

~~908.7.6.2~~ <u>915.5.2</u> Locations. Carbon monoxide detectors shall be installed in the locations specified in Section <u>915.2</u> ~~908.7.2~~. These locations supersede the locations specified in NFPA 720.

~~908.7.6.3~~ <u>915.5.3</u> Combination detectors. Combination carbon monoxide/smoke detectors installed in carbon monoxide detection systems shall be an acceptable alternative to carbon monoxide detectors, provided they are listed in accordance with UL 2075 and UL 268.

~~908.7.7~~ <u>915.6</u> Maintenance. Carbon monoxide alarms and carbon monoxide detection systems shall be maintained in accordance with NFPA 720. Carbon monoxide alarms and carbon monoxide detectors that become inoperable or begin producing end-of-life signals shall be replaced.

(portions of proposal not shown remain unchanged)

Commenter's Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

Proposals F180, F182, and F360 covered carbon monoxide alarms and were all approved in Dallas. F360 included requirements to protect occupants in dwelling units and sleeping unit from potential sources of carbon monoxide. F182 required CO detection in Group E occupancies, but differed from F360 in how the protection was to be provided.

This public comment was developed by the Fire Code Action Committee's carbon monoxide task group, which included a wide range of interested parties. It resolves conflicts between the proposals, and makes some editorial revisions to clarify the intent of the requirements, as follows:

- Changes references from "carbon monoxide alarm" to "carbon monoxide detection" in Sections 915.1, 915.2 and 1103.9 since detection can be provided by either carbon monoxide alarms or carbon monoxide detection systems.
- Maintains the same protection requirements for Group I-1, I-2, I-4, and R occupancies as approved in F360, and extends it to classrooms in Group E occupancies, except as noted below.
- For clarification, section 915.1.3 covers forced air furnaces that serve dwelling units, sleeping units or classrooms. This section only covers furnaces where a malfunction or crack in the heat exchange will cause CO to be spread from the combustion chamber to the ducts serving the building. This section does not apply to other heating systems such as boilers that circulate heated water to the building. An exception was added to 915.1.3 that allows carbon monoxide detection to be provided in the first room or area served by each main duct leaving the furnace, provided the carbon monoxide alarm signals are automatically transmitted to an approved location. Such an arrangement will detect carbon monoxide from the ducts and provide notification of the condition to an approved location, such as a reception area, engineering office, or central station. With this protection in place there is no need to provide carbon monoxide detection in each dwelling unit, sleeping unit or classroom served by the forced air furnace ducts.
- Section 915.2.3 requires carbon monoxide detection to be provided in classrooms in Group E occupancies, and not other rooms such as bathrooms, break rooms, interior hallways, gymnasiums, etc. The concept is to protect the students in rooms in which they spend a considerable amount of time in a relatively compact space. This is similar to the concept of only providing CO protection for sleeping units and dwelling units in Group I and R occupancies, and not rooms used for other purposes.
- F182 required carbon monoxide alarm signals In Group E occupancies to be automatically transmitted to a constantly attended on-site location. Proposed section 915.2.3 recognizes that many schools do not have a location that is constantly attended 24/7, requires carbon monoxide alarms to be automatically transmitted to an on-site location that is staffed by school personnel.
- Section 915.2.3 also includes an exception that does not require carbon monoxide alarms to be transmitted to an on-site location that is staffed by school personnel for very small schools with an occupant load of 30 or less. These occupancies may not have a location other than the classroom staffed by school personnel, and the carbon monoxide alarm in the classroom will provide the necessary alarm warning to the occupants. The trigger for 30 or less occupants corresponds with the fire alarm threshold for small Group E occupancies in 907.2.3.
- Section 915.3 was provided to clarify that protection can be provided by either carbon monoxide alarms or carbon monoxide detection systems, which are options recognized in F180, F360, and in the 2012 IFC.
- 915.1.5, Exception 4 was developed to provide an option for protecting against CO emanating from private garages by providing carbon monoxide detection in an approved location between openings to a private garage and dwelling units, sleeping units or classrooms. This same protection method is allowed for similar situations involving fuel burning appliances located outside of dwelling units, sleeping units and classrooms in section 915.1.4 Exceptions 2.

+++++

Suggested code commentary for these requirements is as follows:

The Fire Code Action Committee task group that developed the carbon monoxide (CO) detection requirements included not only industry and fire service, but also users whose facilities must include this protection, so providing effective protection in a cost effective manner was a key consideration. An explanation of the approach used to provide protection is as follows:

Protected areas (in I-1, I-2, I-4, R and E occupancies) – Dwelling units, sleeping units and classrooms are the only rooms in the building that require protection from sources of potential CO.

Sources of potential CO that require protection – CO detection is required for protected areas ONLY when there is a potential source of CO that can enter or build up in the protected area. This includes (1) a fuel burning appliance in the protected area, (2) a fuel burning appliance in the building but outside of the protected area, (3) a forced air, fuel burning furnace that serves the protected area (not a boiler type system or electric heat), or (4) a private garage attached to the building,. There are several exceptions in which CO detection is not required if it is unlikely for dangerous levels of CO to be transported to the protected areas, such as an open ended corridor between a private garage and the building.

Types of protection - The 2012 IFC and this proposal allow either single or multiple station CO alarms to be used to provide protection, or CO detection systems installed per NFPA 720. In some instances annunciation is required in certain approved locations, such as Group E occupancies. It is recognized that in many buildings, especially those that require fire alarm systems to be installed, a CO detection system will be the preferred design approach, since CO detectors or combination CO/smoke detectors can be connected to a required fire alarm system control unit.

++++++++++

There are several scenarios for providing CO protection for protected areas, and it is rarely necessary to provide CO detection in every protected area, as shown in the following examples:

Fuel burning appliance in the protected area – Consider these examples:

(1) A dwelling unit with a solid fuel burning fireplace, or a school classroom containing a gas-fired wall heater – CO detection must be provided in these protected areas, providing detection outside of the dwelling unit or classroom makes no sense

because the potential source of CO is within each unit. The CO alarm signal from the classroom must be transmitted to the school office.

(2) Apartment building with dwelling units that each contain a gas fireplace and gas fired water heater – CO detection must be provided in each dwelling unit. (This is likely to be a single or multiple station CO alarm).

Fuel burning appliance in the building but outside of the protected area – Consider these examples:

(1) A school building with a boiler providing heat to the classrooms, and a water heater in the same equipment room – A single CO detection unit can be provided in the equipment room, with annunciation of the CO alarm in the school office. o other CO detection is needed unless there are other sources of potential CO in the building.

(2) Hotel with a gas fireplace in the lobby and guest rooms on the same floor which are served by electric heat – A single CO detection unit can be installed on the lobby ceiling or in a location between the lobby fire place and the guest rooms. No other CO detection is needed unless there are other sources of potential CO in the building.

(3) Apartment building, with gas-fired pool heater for the indoor swimming pool, all electric heat and water heating in the dwelling units – A single CO detection unit can be installed in the pool equipment room.

Forced air, fuel burning furnace in the building – Consider this example.

(1) Patient rooms served by a forced air, fuel burning furnace – In this case providing CO detection on the furnace room ceiling does not necessarily provide protection for the patient rooms served by the furnace if, for example, the furnace has a cracked heat exchanger between the combustion chamber and the ducts serving the patient rooms, and it is pumping CO into those rooms. Protection can be provided by either (a) providing CO detection in all patient rooms served by the furnace (worst case condition) or (b) providing CO detection in the first room or area served by each main duct leaving the furnace, and a CO alarm signal that is automatically transmitted to an approved location, such as a nurses station or engineering office.

Private garage attached to a building – Consider these examples:

(1) Hotel with an attached private garage with entrances onto the first and second floor, no gas appliances – Provide CO detection in each corridor leading from the garage entrances, prior to the first guest room on each floor.

(2) Garden apartment with a breezeway attached to a private garage, no gas appliances – No CO detection is required to protect against CO emanating from the private garage.

Public Comment 2:

Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

1103.9 Carbon monoxide ~~alarms~~ detection. Existing Group I-1, I-2, I-4, ~~and~~ R and E occupancies shall be provided with carbon monoxide ~~alarms~~ detection in accordance with Section ~~908.7~~ 915.

Exceptions:

1. ~~except that the~~ Carbon monoxide alarms shall be allowed to be solely battery powered
2. Carbon monoxide alarm signals in Group E occupancies shall not be required to be transmitted to an on-site location that is staffed by school personnel.

Commenter's Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

Proposals F180, F182, and F360 covered carbon monoxide alarms and were all approved in Dallas. F360 included requirements to protect occupants in dwelling units and sleeping unit from potential sources of carbon monoxide. F182 required CO detection in Group E occupancies, but differed from F360 in how the protection was to be provided.

Two public comments were developed by the Fire Code Action Committee's carbon monoxide task group, which included a wide range of interested parties. They resolve conflicts between the proposals, and make some editorial revisions to clarify the intent of the requirements.

Section 1103.9 was revised to include an exception that carbon monoxide alarms in existing Group E occupancies can be solely battery powered, and that their alarm signals are not required to be transmitted to an on-site locationstaffed by school personnel. This is consistent with requirements for carbon monoxide alarms in existing Group I and R occupancies.

Public Comment 3:

John Williams, CBO, Chair, ICC Ad Hoc Committee on Health Care and Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee, request Approval as Modified by this Public Comment.

Further modify the proposal as follows:

908.7.1 (IBC [F] 908.7.1) Where required. Carbon monoxide alarms shall be provided in Group I-1, ~~I-2,~~ I-4, and R occupancies in the locations specified in 908.7.2 where any of the conditions in Sections 908.7.1.1 through 908.7.1.4 exist.

1103.9 Carbon monoxide alarms. Existing Group I-1, ~~I-2,~~ I-4 and R occupancies shall be provided with carbon monoxide alarms in accordance with Section 908.7, except that the carbon monoxide alarms shall be allowed to be solely battery powered.

(Portions of proposal not shown remain unchanged)

Reason: The committee added Group I-2 as a floor modification with no technical justification or materials presented. There have been no deaths in hospitals from carbon monoxide poisoning. A search for technical data for nursing homes was inconclusive. There is no identified need for these carbon monoxide detectors in these types of facilities.

This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering, a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April 2011, the AHC has held 8 open meetings and over 150 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

This proposal is being co-sponsored by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as “areas of study”. Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/CTC/Pages/default.aspx. Since its inception in April/2005, the CTC has held twenty five meetings - all open to the public.

Public Comment 3:

Thomas G. Daly, representing The Hospitality Security Consulting Group, LLC, requests Approval as Modified by the Code Committee as Published in the Report of the Committee Action Hearings.

Commenter’s Reasons: The proposed revisions to Sec. 908.7 and 1103.9 focus the requirements for CO alarm warning equipment at the source of CO producing appliances/equipment thereby providing for the earliest possible alarm and response. The changes would also allow for the use of combination CO/smoke alarms and detectors improving the flexibility for end users. Battery operated CO alarms would be allowed in existing buildings making such installations cost effective.

Public Comment 4:

Stacy N. Welch representing Marriott International, Inc, requests Approval as Modified by the Code Committee as Published in the Report of the Committee Action Hearings.

Commenter’s Reason: Marriott International, Inc. wishes to indicate its support for code change proposal F360 for the 2015 editions of the ICC’s International Building and Fire Codes with respect to carbon monoxide alarm for various occupancies.

With responsibility for the safety of our guests and employees I 3,800 hotels in 74 countries, carbon monoxide presents a sizable risk. With the increased awareness around carbon monoxide, in 2004 Marriott established a carbon monoxide detection policy for existing and new hotels.

The proposed code change language is clearer for both end users and enforcement officials to understand and implement; removes undefined terms which are in the 2012 IBC & IFC code sections dealing with this subject; focuses CO detection and alarms at the source of potential leaks providing earlier warning and reaction time, which closely aligns with Marriott’s long established policy.

F360-13

Final Action: AS AM AMPC____ D

FG1-13
IFGC [F] 413.2.3, IFGC [F] 413.3, IFGC [F] 413.4

Proposed Change as Submitted

Proponent: James Ranfone, American Gas Association (jranfone@aga.org)

Revise as follows:

IFGC [F] 413.2.3 General. Residential fueling *appliances* shall be *listed*. ~~The capacity of a residential fueling *appliance* shall not exceed 5 standard cubic feet per minute (0.14 standard cubic meter/min) of natural gas.~~

IFGC [F] 413.3 Location of dispensing operations and equipment. Compression, storage and dispensing *equipment* shall be located above ground ~~outside~~ outdoors.

Exceptions:

1. Compression, storage or dispensing *equipment* is allowed in buildings of noncombustible construction, as set forth in the *International Building Code*, that are unenclosed for three-quarters or more of the perimeter.
2. Compression, storage and dispensing *equipment* is allowed to be located indoors or in vaults in accordance with the *International Fire Code*.
3. Residential fueling *appliances* and *equipment* in accordance with Section 413.4. ~~shall be allowed to be installed indoors in accordance and the *equipment* manufacturer's instructions and Section 413.4.3~~.

IFGC [F] 413.4 Residential fueling appliance installation. Residential fueling *appliances* shall be installed in accordance with Sections 413.4.1 through 413.4.3.

IFGC [F] 413.4.2 Outdoor installation. Residential fueling *appliances* located outdoors shall be listed for outdoor installation and installed in accordance with the *appliance* manufacturer's instructions. Residential fueling *appliances* located outdoors shall be installed on a firm, noncombustible base.

IFGC [F] 413.4.3 Indoor installation. Residential fueling *appliances* located indoors shall be listed for indoor installation and installed in accordance with the *appliance* manufacturer's instructions. ~~Where located indoors,~~ Residential fueling *appliances* shall be vented to the outdoors. A gas detector set to operate at one-fifth of the lower limit of flammability of natural gas shall be installed in the room or space containing the *appliance*. The detector shall be located within 6 inches (152 mm) of the highest point in the room or space. The detector shall stop the operation of the *appliance* and activate an audible or visual alarm.

Reason: Residential fueling of natural gas vehicles represents a nationally-important opportunity to increase adoption of natural gas passenger cars and other light duty vehicles. Natural gas promises to be a major contributor toward reducing U. S. dependence upon foreign oil and petroleum products and making use of abundant, low cost U. S. natural gas supplies, the development of which is adding significantly to the recovery of U. S. economy.

However, the current text in IFGC Section 413.2.3 is inconsistent with modern approaches and gas flow rates being proposed for vehicle residential fueling by arbitrarily restricting residential fueling appliances to a gas flow rate of 5 standard cubic feet (of natural gas) per minute (scfm). Current research and technology development programs are targeting delivering natural gas at higher flow rates, especially at the initiation of the fueling cycle, to achieve practical vehicle refueling rates. A wide variety of technologies and commercial interests are focused on approaches for which the 5 scfm flow rate limitation would represent a technology barrier.

The current 5 scfm flow rate limitation in Section 413.2.3 raises a number of issues, including whether it is a reasonable, meaningful, or enforceable limit:

- The 5 scfm flow rate limit, if inferred as a potential leakage limit to an indoor garage or other space, is provided without a release time duration or profile, which would be required to determine how such a leak would present flammability hazards. As such, a 5 scfm limitation appears arbitrary and incomplete.

- Detailed fault tree analysis, failure modes and effects analysis, and computational fluid dynamics analysis of residential fueling appliance releases conducted by TIAX in 2004 showed that leak rates from various release scenarios and median residential garage air tightnesses and ventilation rates should be below 1 scfm to maintain steady state gas-in-air concentrations below combustible levels. The TIAX analysis suggests that a 5 scfm flow rate, when inferred as a potential leak rate, may be unsafe with respect combustion hazards in residential garages from releases from the vehicle fueling appliance and dispenser hose, as well as from the onboard vehicle fuel system.

- The 5 scfm flow limit may not be enforceable by code authorities, particularly if the listing standard (which is undefined by the current code language) does not readily provide a code official with gas flow information.
- Review of ICC records suggests that according to the 2006 ICC Code Commentary the 5 scfm limit as well as other technical provisions of Section 413 were adopted for consistency with National Fire Protection Association (NFPA) Standard 52 and based on flow rates for residential fueling appliances available at that time. NFPA Standard 52 records show that the flow rate was adopted in the 1988 standard cycle, but no specific technical justification for the flow rate limitation was provided.

Since requirements in Section 413.2.3 apply to the residential refueling appliance and specifically require it to be listed, leakage prevention and mitigation is most properly addressed in the listing standard. The proponent of this code change and a vast array of other organizations have convened a Technical Advisory Group (TAG) to draft a national consensus standard under the American National Standards Institute (ANSI) processes of CGA Group, an ANSI- recognized standards development organization (SDO) for natural gas vehicle standards. Completion of the standard is expected between 18 and 24 months from the submission date of this proposal.

The ANSI standard development activity is directly addressing the requirement in Section 413.2.3 for the residential fueling appliance to be listed and is addressing prevention and mitigation of leak hazards consistent with the 2004 TIAX analysis for critical leaks relevant to indoor refueling operations. In doing so, the ANSI standard is addressing the intent of the 5 scfm gas flow limitation but is based on preventing and mitigation releases must more conservatively than the current flow limitation approach. Leak mitigation is being included in the standard through a variety of performance-based automatic and redundant means and verified in standards-based methods of test in the design certification process. Since the ANSI process is open and invites public review, the adequacy and appropriateness of the listing requirements and methods of test a open to public input from all stakeholders and expertise. Therefore, the basis for leak prevention and mitigation will be likewise open to public review and comment.

Changes proposed to Section 413.4 address the lack of differentiation of residential fueling appliances designed for outdoor and indoor installation. The new language directs the authority having jurisdiction to the specific listing for outdoor or indoor installation and associated listing requirements for those environments, including leak prevention and hazard mitigation, environmental conditions, and other requirements for germane to the installation location. The proposed language is consistent with current direction in development of the ANSI standard, which makes this differentiation and applies relevant requirements to the appliance design certification.

Cost Impact: None.

[F] 413.2.3-FG-RANFONE

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The disapproval was based on the fact that the 2013 edition of NFPA 52 limits the residential fueling rate to 5 scfm which is being deleted from Section 413.2.3 without a compelling reason being offered; this would put the code at odds with the standard and create enforcement problems. It was also noted that the proposal is based in part upon future standards that are still under development. The committee was not prepared to approve the proposal on a “leap of faith” as suggested.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Ted A Williams, representing American Gas Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

[F] 413.2.3 General. Residential fueling *appliances* shall be *listed*. <u>The capacity of a residential fueling *appliance* for indoor refueling shall not exceed 5 standard cubic feet per minute (0.14 standard cubic meter/min) of natural gas.</u>
(Portions of proposal not shown remain unchanged)

Commenter's Reason: The modification to the proposal would reinstate the 5 scfm capacity limit for residential fueling appliances listed and installed indoors. Limiting flow rate for residential fueling appliances to flows of this magnitude is only relevant for appliance installations indoors where released flows of natural gas may produce a flammable atmosphere. The original intent of limiting flow capacity of residential fueling appliances, promulgated by the National Fire Protection Association (NFPA) Standard 52, was to limit unrestricted leak rates indoors to the 5 scfm capacity flow rate in the event of a breach in appliance fuel system integrity. The current code language does not distinguish between indoor and outdoor installation, imposing unnecessary restrictions on outdoor refueling and the opportunity to raise flow rates to achieve reasonable, faster vehicle refueling rates. The proposal adds clarifying language that terms of listing need to differentiate residential fueling appliances as listed for indoor or outdoor installation.

FG1-13

Final Action: AS AM AMPC____ D

G1-13
IBC [F] 307.1

<u>Proposed Change as Submitted</u>

Proponent: Maureen Traxler, City of Seattle, WA representing Washington Association of Building Officials (Maureen.Traxler@seattle.gov)

Revise as follows:

IBC [F] 307.1 High-hazard Group H. High-hazard Group H occupancy includes, among others, the use of a building or structure, or a portion thereof, that involves the manufacturing, processing, generation or storage of materials that constitute a physical or health hazard in quantities in excess of those allowed in *control areas* complying with Section 414, based on the maximum allowable quantity limits for *control areas* set forth in Tables 307.1(1) and 307.1(2). Hazardous occupancies are classified in Groups H-1, H-2, H-3, H-4 and H-5 and shall be in accordance with this section, the requirements of Section 415 and the *International Fire Code*. Hazardous materials stored, or used on top of roofs or canopies shall be classified as outdoor storage or use and shall comply with the *International Fire Code*.

Exceptions: The following shall not be classified as Group H, but shall be classified as the occupancy that they most nearly resemble.

1. Buildings and structures occupied for the application of flammable finishes, provided that such buildings or areas conform to the requirements of Section 416 and the *International Fire Code*.
2. Wholesale and retail sales and storage of flammable and combustible liquids in mercantile occupancies conforming to the *International Fire Code*.
3. Closed piping system containing flammable or combustible liquids or gases utilized for the operation of machinery or equipment.
4. Cleaning establishments that utilize combustible liquid solvents having a flash point of 140°F (60°C) or higher in closed systems employing equipment *listed* by an *approved* testing agency, provided that this occupancy is separated from all other areas of the building by 1-hour *fire barriers* constructed in accordance with Section 707 or 1-hour *horizontal assemblies* constructed in accordance with Section 711, or both.
5. Cleaning establishments that utilize a liquid solvent having a flash point at or above 200°F (93°C).
6. Liquor stores and distributors without bulk storage.

<u>7. The storage of distilled spirits and wines in wooden barrels and casks</u>

~~7~~<u>8</u>. Refrigeration systems.

~~8~~<u>9</u>. The storage or utilization of materials for agricultural purposes on the premises.

~~9~~<u>10</u>.Stationary batteries utilized for facility emergency power, uninterruptable power supply or telecommunication facilities, provided that the batteries are provided with safety venting caps and *ventilation* is provided in accordance with the *International Mechanical Code*.

~~10~~<u>11</u> Corrosives shall not include personal or household products in their original packaging used in retail display or commonly used building materials.

~~11~~<u>12</u>. Buildings and structures occupied for aerosol storage shall be classified as Group S-1, provided that such buildings conform to the requirements of the *International Fire Code.*

~~12~~<u>13</u>. Display and storage of nonflammable solid and nonflammable or noncombustible liquid hazardous materials in quantities not exceeding the maximum allowable quantity per *control area* in Group M or S occupancies complying with Section 414.2.5.

~~13~~<u>14</u>. The storage of black powder, smokeless propellant and small arms primers in Groups M and R-3 and special industrial explosive devices in Groups B, F, M and S, provided such storage conforms to the quantity limits and requirements prescribed in the *International Fire Code*.

Reason: IFC Section 5001.1 has an exception providing that "The storage of distilled spirits and wines in wooden barrels and casks" is not required to comply with the chapter's general requirements for hazardous materials. IFC Section 5701.2 states that Chapter 57's provisions for flammable and combustible liquids do not apply to "The storage of distilled spirits and wines in wooden barrels and casks". Similarly, Chapter 9 of NFPA 30-2012 Flammable and Combustible Liquids Code, exempts the storage of distilled spirits and wines in wooden barrels or casks from the general requirements for storage of liquids in containers. However, the Building Code classifies that same storage as an H-3 occupancy. It is inconsistent for the Building Code to classify an occupancy as a hazardous occupancy due to the presence of this type of storage if none of the mitigation measures are required by the Fire Code. The IFC exempts storage of spirits in wooden containers from all the IBC provisions that would otherwise apply. For example, IBC Section 415.4 requires sprinklers for all Group H occupancies—IFC Section 5004.5 requires sprinklers in indoor storage, but storage of spirits in wooden containers is not required to comply because it is exempt from Chapter 50. Adding this exception to the list of exceptions in IBC section 307.1 will eliminate this inconsistency between the codes and will eliminate unnecessary confusion about how to classify such uses and apply the IBC provisions.

Cost Impact: The code change will not increase the cost of construction.

[F] 307.1 #1-G-TRAXLER

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The disapproval was based on the committee's judgment that the materials in question do constitute a sufficient enough hazard to warrant a Group H occupancy group classification even though many of the IFC safeguards are not applicable.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Maureen Traxler, representing City of Seattle Dept of Planning & Development, requests Approval as Submitted.

Commenter's Reason: Contrary to the conclusion of the Fire Code Committee, the materials in question should not be classified as H-3 occupancies when no mitigation measures are required by the Fire Code. The relatively low hazard of distilled spirits and wines in wooden barrels or casks is recognized by NFPA 30 which exempts them from the general requirements for storage of liquids in containers. Similarly IFC Section 5001.1 exempts them from the Fire Code's general requirements for hazardous materials, and IFC Section 5701.2 exempts them from all the requirements for flammable and combustible liquids. It's unnecessary for the IBC to classify those materials as an H-3 occupancy.

This proposal also eliminates inconsistencies between the IBC and IFC. The IFC exempts storage of spirits and wine in wooden containers from most of the IBC provisions that would otherwise apply. For example, IFC Chapter 50 is the source of the limitations on maximum allowable quantities. In the IFC, storage of spirits in wooden containers is not required to comply because it is exempt from Chapter 50, but there is no such exception in the IBC. IBC Section 414.7.1 requires emergency alarms in buildings used for storage of hazardous materials. An identical provision appears in IFC Section 5004.9 but storage of spirits and wine in wooden containers is not required to comply because it is exempt from Chapter 50. There are many similar examples of conflicts between the IBC and IFC with regard to these materials.

Adding this exception to the list of exceptions in IBC section 307.1 will eliminate this inconsistency between the codes and will eliminate unnecessary confusion about how to classify such uses and apply the IBC provisions.

G1-13

Final Action: AS AM AMPC____ D

G9-13
IBC [F] 415.6

Proposed Change as Submitted

Proponent: Homer Maiel, PE, CBO, Town of Atherton (CA), representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay)

Revise as follows:

IBC [F] 415.6 Special provisions for Group H-1 occupancies. Group H-1 occupancies shall be in ~~buildings used for no other purpose, shall not exceed one *story* in height and be without basements, crawl spaces or other under-floor spaces.~~ *detached buildings*. Roofs shall be of lightweight construction with suitable thermal insulation to prevent sensitive material from reaching its decomposition temperature. Group H-1 occupancies containing materials that are in themselves both physical and health hazards in quantities exceeding the maximum allowable quantities per *control area* in Table 307.1(2) shall comply with requirements for both Group H-1 and H-4 occupancies.

Reason: This is only an editorial change. The entire stricken out portion is the definition for “detached buildings”. Hence replacing it with “detached buildings”

Cost Impact: This code change will not increase the cost of construction.

[F] 415.6-G-MAIEL.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The disapproval was based on the fact that the critical phrase “…used for no other purpose…” does not appear in the definition so the proponent’s premise that the definition can substitute for the stricken code text is incorrect.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Homer Maiel, PE, CBO, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

IBC [F] 415.6 Special provisions for Group H-1 occupancies. Group H-1 occupancies shall be in *detached buildings,* <u>used for no other purpose.</u> Roofs shall be of lightweight construction with suitable thermal insulation to prevent sensitive material from reaching its decomposition temperature. Group H-1 occupancies containing materials that are in themselves both physical and health hazards in quantities exceeding the maximum allowable quantities per *control area* in Table 307.1(2) shall comply with requirements for both Group H-1 and H-4 occupancies.

Commenter’s Reason: The original proposal has been modified in accordance to committee's comment back in Dallas.

G9-13
Final Action: AS AM AMPC____ D

G13-13
IBC [F] 415.10.6.4

Proposed Change as Submitted

Proponent: Robert J Davidson, Davidson Code Concepts, LLC, representing self (BFICOCS) (rjd@davidsoncodeconcepts.com)

Revise as follows:

IBC [F] 415.10.6.4 Installations in corridors and above other occupancies. The installation of HPM piping and tubing within the space defined by the walls of corridors and the floor or roof above, or in concealed spaces above other occupancies, shall be in accordance with Sections 415.10.6.1 through 415.10.6.3 and the following conditions:

1. through 3. *(No change to current text.)*
4. HPM supply piping and tubing and nonmetallic waste lines shall be separated from the corridor and from occupancies other than Group H-5 by fire barriers <u>or by an approved</u> <u>piping protective system</u> that have a fire-resistance rating of not less than 1 hour Where gypsum wallboard is used, joints on the piping side of the enclosure are not required to be taped~~, provided the joints occur over framing members~~. Access openings into the enclosure shall be protected by approved fire protection-rated assemblies.
5. *(No change to current text.)*

   Exception: Transverse crossings of the corridors by supply piping that is enclosed within a ferrous pipe or tube for the width of the corridor need not comply with Items 1 through 5.

Reason: The purpose of this proposal is to allow for additional methods of fire-resistance protection for supply piping and tubing. Depending on the configuration and installation details, a fire-resistance wrap material can provide the required fire-resistance rating.
An additional change is to eliminate the wording ", provided the joints occur over framing members" which addresses the elimination of taping joints on the supply piping side of the fire-resistance protection. The IBC Commentary states:
The elimination of the taping of the wallboard joints on the piping side of a rated assembly is in recognition of actual installation difficulties and the reduced likelihood of a fire on the interior of the wall cavity. To eliminate the taping of joints, however, the joints must occur over framing members.
If the elimination is related to the practical difficulty of taping on the inside of the barrier and the reduces likelihood of a fire on the interior of the cavity, in other words the protection is for an exposure fire, then elimination of the interior taping is not reliant on the joints being over framing members.

Cost Impact: The code change proposal will reduce the cost of construction.

[F] 415.10.6.4-G-DAVIDSON

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The disapproval was based on the proponent’s request for disapproval so he can submit a public comment to rearrange the text regarding joint taping.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Robert J. Davidson, Davidson Code Concepts, LLC, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

IBC [F] 415.10.6.4 Installations in corridors and above other occupancies. The installation of HPM piping and tubing within the space defined by the walls of corridors and the floor or roof above, or in concealed spaces above other occupancies, shall be in accordance with Sections 415.10.6.1 through 415.10.6.3 and the following conditions:

1. through 3. *(No change to current text.)*
4. HPM supply piping and tubing and nonmetallic waste lines shall be separated from the corridor and from occupancies other than Group H-5 by fire barriers or by an approved ~~piping protective system~~ method or assembly that ~~have~~ has a fire-resistance rating of not less than 1 hour. ~~Where gypsum wallboard is used, joints on the piping side of the enclosure are not required to be taped~~. Access openings into the enclosure shall be protected by approved fire protection-rated assemblies.
5. *(No change to current text.)*

   Exception: Transverse crossings of the corridors by supply piping that is enclosed within a ferrous pipe or tube for the width of the corridor need not comply with Items 1 through 5.

Commenter's Reason: In response to the committee and public testimony concerns the specific methods have been deleted to instead refer to a generic requirement of protection with "an approved method or assembly". In recognition of the committee discussion this modified wording provides for acceptance of a wider base of solutions.

G13-13

Final Action: AS AM AMPC____ D

G14-13

IBC [F] 421, Table 509.1, 202; IFC 5808 (New); 5802.1, 202

Proposed Change as Submitted

Proponent: Robert J Davidson, Davidson Code Concepts, LLC, representing National Renewable Energy Laboratory (NREL) (rjd@davidsoncodeconcepts.com)

Revise as follows:

IBC SECTION 421
HYDROGEN ~~CUTOFF~~ GAS ROOMS

[F] 421.1 General. Where required by the International Fire Code, hydrogen ~~cutoff~~ gas rooms shall be designed and constructed in accordance with Sections 421.1 through 421.8.

[F] 421.2 Definitions. The following terms are defined in Chapter 2:

GASEOUS HYDROGEN SYSTEM.

HYDROGEN ~~CUTOFF~~ GAS ROOM.

[F] 421.3 Location. Hydrogen ~~cutoff~~ gas rooms shall not be located below grade.

[F] 421.4 Design and construction. Hydrogen ~~cutoff~~ gas rooms not classified as Group H shall be ~~classified with respect to occupancy in accordance with Section 302.1 and~~ separated from other areas of the building in accordance with Section 509.1 ~~by not less than 1-hour fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 711, or both; or as required by Section 508.2, 508.3 or 508.4, as applicable~~ .

[F] 421.4.1 ~~Opening protectives~~ Pressure control. ~~Doors within the fire barriers, including doors to corridors, shall be self-closing in accordance with Section 716. Interior door openings shall be electronically interlocked to prevent operation of the hydrogen system when doors are opened or ajar or the room shall be provided with a mechanical exhaust ventilation system designed in accordance with Section 421.4.1.1.~~ Hydrogen gas rooms shall be provided with a ventilation system designed to maintain the room at a negative pressure in relation to surrounding rooms and spaces.

~~**[F] 421.4.1.1 Ventilation alternative**. Where an exhaust system is used in lieu of the interlock system required by Section 421.4.1, exhaust ventilation systems shall operate continuously and shall be designed to operate at a negative pressure in relation to the surrounding area. The average velocity of ventilation at the face of the door opening with the door in the fully open position shall not be less than 60 feet per minute (0.3048 m/s) and not less than 45 feet per minute (0.2287 m/s) at any point in the door opening.~~

[F] 421.4.2 Windows. Operable windows in interior walls shall not be permitted. Fixed windows shall be permitted where in accordance with Section 716.

[F] 421.5 Exhaust Ventilation. ~~Cutoff~~ Gas rooms shall be provided with mechanical exhaust ventilation in accordance with the applicable provisions ~~for repair garages in Chapter 5~~ of Section 502.16.1 of the *International Mechanical Code*.

[F] 421.6 Gas detection system. Hydrogen ~~cutoff~~ gas rooms shall be provided with an approved flammable gas detection system in accordance with Sections 421.6.1 through ~~421.6.3~~ 421.6.4.

[F] 421.6.1 System design. The flammable gas detection system shall be listed for use with hydrogen and any other flammable gases used in the room. The gas detection system shall be designed to activate when the level of flammable gas exceeds 25 percent of the lower flammability limit (LFL) for the gas or mixtures present at their anticipated temperature and pressure.

<u>**[F] 421.6.2 Gas detection system components.** Gas detection system control units shall be listed and labeled in accordance with UL 864 or UL 2017. Gas detectors shall be listed and labeled in accordance with UL 2075 for use with the gases and vapors being detected.</u>

[F] <u>421.6.3</u> ~~421.6.2~~ Operation. Activation of the gas detection system shall result in all of the following:

1. Initiation of distinct audible and visual alarm signals both inside and outside of the ~~cutoff~~ <u>gas</u> room.
2. Activation of the mechanical <u>exhaust</u> ventilation system.

[F] <u>421.6.4</u> ~~421.6.3~~ Failure of the gas detection system. Failure of the gas detection system shall result in activation of the mechanical <u>exhaust</u> ventilation system, cessation of hydrogen generation and the sounding of a trouble signal in an approved location.

[F] 421.7 Explosion control. Explosion control shall be provided ~~in accordance with Chapter 9 of the International Fire Code~~ <u>where required by Section [F] 414.5.1</u>. Mechanical ventilation and gas detection systems shall be connected to a standby power system in accordance with Chapter 27.

IBC TABLE 509.1
INCIDENTAL USES

ROOM OR AREA	SEPARATION AND/OR PROTECTION
Hydrogen ~~cutoff~~ <u>gas</u> rooms, not classified as Group H	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.

(Portions of table not shown remain unchanged)

IBC SECTION 202
DEFINITIONS

[F] HYDROGEN ~~CUTOFF~~ <u>GAS</u> ROOM. A room or space that is intended exclusively to house a gaseous hydrogen system.

Add new IFC text as follows:

<u>SECTION 5808</u>
<u>HYDROGEN GAS ROOMS</u>

<u>**5808.1 General.** Where required by the International Fire Code, hydrogen gas rooms shall be designed and constructed in accordance with Sections 5808.1 through 5808.7 and the *International Building Code*.</u>

<u>**5808.2 Location.** Hydrogen gas rooms shall not be located below grade.</u>

<u>**5808.3 Design and construction.** Hydrogen gas rooms not exceeding the maximum allowable quantities in Table 5003.1.1(1) shall be separated from other areas of the building in accordance with Section 509.1 of the *International Building Code*.</u>

<u>**5808.3.1 Pressure control.** Hydrogen gas rooms shall be provided with a ventilation system designed to maintain the room at a negative pressure in relation to surrounding rooms and spaces.</u>

<u>**5808.3.2 Windows.** Operable windows in interior walls shall not be permitted. Fixed windows shall be permitted where in accordance with Section 716 of the *International Building Code*.</u>

5808.4 Exhaust Ventilation. Gas rooms shall be provided with mechanical exhaust ventilation in accordance with the applicable provisions of Section 502.16.1 of the *International Mechanical Code*.

5808.5 Gas detection system. Hydrogen gas rooms shall be provided with an approved flammable gas detection system in accordance with Sections 5808.5.1 through 5808.5.4.

5808.5.1 System design. The flammable gas detection system shall be listed for use with hydrogen and any other flammable gases used in the room. The gas detection system shall be designed to activate when the level of flammable gas exceeds 25 percent of the lower flammability limit (LFL) for the gas or mixtures present at their anticipated temperature and pressure.

5808.5.2 Gas detection system components. Gas detection system control units shall be listed and labeled in accordance with UL 864 or UL 2017. Gas detectors shall be listed and labeled in accordance with UL 2075 for use with the gases and vapors being detected.

5808.5.3 Operation. Activation of the gas detection system shall result in all of the following:

1. Initiation of distinct audible and visual alarm signals both inside and outside of the gas room.
2. Activation of the mechanical exhaust ventilation system.

5808.5.4 Failure of the gas detection system. Failure of the gas detection system shall result in activation of the mechanical exhaust ventilation system, cessation of hydrogen generation and the sounding of a trouble signal in an approved location.

5808.6 Explosion control. Explosion control shall be provided where required by Section 911.

5808.7 Standby power. Mechanical ventilation and gas detection systems shall be connected to a standby power system in accordance with Chapter 6.

Add new IFC definition as follows:

IFC SECTION 202
DEFINITIONS

GASEOUS HYDROGEN SYSTEM. An assembly of piping, devices and apparatus designed to generate, store, contain, distribute or transport a nontoxic, gaseous hydrogen containing mixture having at least 95-percent hydrogen gas by volume and not more than 1-percent oxygen by volume. Gaseous hydrogen systems consist of items such as *compressed gas* containers, reactors and appurtenances, including pressure regulators, pressure relief devices, manifolds, pumps, compressors and interconnecting piping and tubing and controls.

HYDROGEN GAS ROOM. A room or space that is intended exclusively to house a *gaseous hydrogen system*.

Revise as follows:

5802.1 Definitions. The following terms are defined in Chapter 2:

FLAMMABLE GAS.
FLAMMABLE LIQUEFIED GAS.
GASEOUS HYDROGEN SYSTEM.
HYDROGEN GAS ROOM.
METAL HYDRIDE.
METAL HYDRIDE STORAGE SYSTEM.

Reason:

IBC Changes: The purpose of this submittal is cleanup of language, correlation with NFPA 2 "Hydrogen Technologies Code", and correlation with other portions of the IBC. NFPA 2 has been formed to provide a source document for the storage, use and handling of hydrogen and much work has gone into refining terms and requirements. For consistency the concepts and terms within the IFC, the IBC and NFPA should correlate for effective and efficient application of hydrogen technologies.

From the 2011 edition of NFPA 2:

Origin and Development of NFPA 2
"With the increased interest in hydrogen being used as a fuel source, the National Fire Protection Association was petitioned to develop an all-encompassing document that establishes the necessary requirements for hydrogen technologies. In 2006, the Technical Committee on Hydrogen Technology was formed and tasked to develop a document that addresses all aspects of hydrogen storage, use, and handling, that draws from existing NFPA codes and standards, and that identifies and fills technical gaps for a complete functional set of requirements for code users and enforcers. This document is also structured so that it works seamlessly with building and fire codes."

The term "Hydrogen Cutoff Room" is proposed to be changed to "Hydrogen Gas Room" which is the phrase used by NFPA 2 for consistency. The change would be reflected in the definition, titles and technical language found within the code.

Section [F]421.4 is modified to improved correlation of this section with Section 509 Incidental Uses. Hydrogen cutoff rooms not classified as a Group H are in Table 509 as an Incidental use. The specifications for separation are covered by 509.4.1. The "hydrogen cutoff room" was not intended to be an H Group, so the language referring to Group separated or non-separated uses is not necessary. That language will apply if a Group H classification is determined to apply. The change provides a cleaner, easier to understand application of these requirements

Section [F] 421.4.1 is modified to be consistent with the newer requirements found within NFPA 2 for hydrogen gas rooms.

Section [F]421.5 is modified to clarify that it is an "exhaust" ventilation system that is required and a pointer to the specific section in the IMC has been added instead of the generic Chapter 5 reference for clarity.

A new Section [F] 421.6.2 has been added to provide standards for the required gas detection system. This language and the referenced standards already exists in the IFC,IBC and IMC for when gas detection systems are required to be installed.

Section [F421.6.2, Item 2 and Section [F]421.6.3 are proposed to be modified by adding the word "exhaust" to add clarity that it is a "mechanical exhaust system" that is be required.

Section [F]421.7 has been modified to point to the explosion control requirements located within Chapter 4 of the IBC, they are a match for the requirements of the IFC.

IFC Changes: This is duplication of language that is currently in the building code. Because most of the requirements for hydrogen are in the Fire Code, there is a tendency to only use the IFC along with the IFGC and IMC for detailed requirements. The existence of the allowance for use of a hydrogen gas room is not always recognized. By copying the existing language to this new section in the fire code officials will not only provide for increase awareness on the application of hydrogen gas rooms, but will also highlight the systems that must be maintained.

The only modifications made were to fit the language to application out of this code as compared to the IBC as has been done with similar language duplication on other topics.

Cost Impact: The code change proposal will not increase the cost of construction.

[F] 421-G-DAVIDSON WITH 5808-F-DAVIDSON~COMBINED

Committee Action Hearing Results

Committee Action: Approved as Modified

Modify the proposal as follows:

IBC SECTION 421
HYDROGEN <u>FUEL</u> GAS ROOMS

[F] 421.1 General. Where required by the *International Fire Code*, hydrogen <u>fuel</u> gas rooms shall be designed and constructed in accordance with Sections 421.1 through 421.8.

[F] 421.2 Definitions. The following terms are defined in Chapter 2:

GASEOUS HYDROGEN SYSTEM.

HYDROGEN <u>FUEL</u> GAS ROOM.

[F] 421.3 Location. Hydrogen <u>fuel</u> gas rooms shall not be located below grade.

[F] 421.4 Design and construction. Hydrogen <u>fuel</u> gas rooms not classified as Group H shall be separated from other areas of the building in accordance with Section 509.1.

[F] 421.4.1 Pressure control. Hydrogen <u>fuel</u> gas rooms shall be provided with a ventilation system designed to maintain the room at a negative pressure in relation to surrounding rooms and spaces.

[F] 421.4.2 Windows. Operable windows in interior walls shall not be permitted. Fixed windows shall be permitted where in accordance with Section 716.

[F] 421.5 Exhaust Ventilation. <u>Hydrogen fuel</u> gas rooms shall be provided with mechanical exhaust ventilation in accordance with the applicable provisions of Section 502.16.1 of the *International Mechanical Code*.

[F] 421.6 Gas detection system. Hydrogen <u>fuel</u> gas rooms shall be provided with an approved flammable gas detection system in accordance with Sections 421.6.1 through 421.6.4.

[F] 421.6.1 System design. The flammable gas detection system shall be listed for use with hydrogen and any other flammable gases used in the <u>hydrogen fuel gas</u> room. The gas detection system shall be designed to activate when the level of flammable gas exceeds 25 percent of the lower flammability limit (LFL) for the gas or mixtures present at their anticipated temperature and pressure.

[F] 421.6.2 Gas detection system components. Gas detection system control units shall be listed and labeled in accordance with UL 864 or UL 2017. Gas detectors shall be listed and labeled in accordance with UL 2075 for use with the gases and vapors being detected.

[F] 421.6.3 Operation. Activation of the gas detection system shall result in all of the following:

1. Initiation of distinct audible and visual alarm signals both inside and outside of the <u>hydrogen fuel</u> gas room.
2. Activation of the mechanical exhaust ventilation system.

[F] 421.6.4 Failure of the gas detection system. Failure of the gas detection system shall result in activation of the mechanical exhaust ventilation system, cessation of hydrogen generation and the sounding of a trouble signal in an approved location.

[F] 421.7 Explosion control. Explosion control shall be provided where required by Section [F] 414.5.1. Mechanical ventilation and gas detection systems shall be connected to a standby power system in accordance with Chapter 27.

IBC TABLE 509.1
INCIDENTAL USES

ROOM OR AREA	SEPARATION AND/OR PROTECTION
Hydrogen <u>fuel</u> gas rooms, not classified as Group H	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.

(Portions of table not shown remain unchanged)

IBC SECTION 202
DEFINITIONS

[F] HYDROGEN <u>FUEL</u> GAS ROOM. A room or space that is intended exclusively to house a gaseous hydrogen system.

Add new IFC text as follows:

SECTION 5808
HYDROGEN <u>FUEL</u> GAS ROOMS

5808.1 General. Where required by this code<u>,</u> hydrogen <u>fuel</u> gas rooms shall be designed and constructed in accordance with Sections 5808.1 through 5808.7 and the *International Building Code*.

5808.2 Location. Hydrogen <u>fuel</u> gas rooms shall not be located below grade.

5808.3 Design and construction. Hydrogen <u>fuel</u> gas rooms not exceeding the maximum allowable quantities in Table 5003.1.1(1) shall be separated from other areas of the building in accordance with Section 509.1 of the *International Building Code*.

5808.3.1 Pressure control. Hydrogen <u>fuel</u> gas rooms shall be provided with a ventilation system designed to maintain the room at a negative pressure in relation to surrounding rooms and spaces.

5808.3.2 Windows. Operable windows in interior walls shall not be permitted. Fixed windows shall be permitted where in accordance with Section 716 of the *International Building Code*.

5808.4 Exhaust Ventilation. <u>Hydrogen fuel</u> gas rooms shall be provided with mechanical exhaust ventilation in accordance with the applicable provisions of Section 502.16.1 of the *International Mechanical Code*.

5808.5 Gas detection system. Hydrogen fuel gas rooms shall be provided with an approved flammable gas detection system in accordance with Sections 5808.5.1 through 5808.5.4.

5808.5.1 System design. The flammable gas detection system shall be listed for use with hydrogen and any other flammable gases used in the hydrogen fuel gas room. The gas detection system shall be designed to activate when the level of flammable gas exceeds 25 percent of the lower flammability limit (LFL) for the gas or mixtures present at their anticipated temperature and pressure.

5808.5.2 Gas detection system components. Gas detection system control units shall be listed and labeled in accordance with UL 864 or UL 2017. Gas detectors shall be listed and labeled in accordance with UL 2075 for use with the gases and vapors being detected.

5808.5.3 Operation. Activation of the gas detection system shall result in all of the following:

1. Initiation of distinct audible and visual alarm signals both inside and outside of the hydrogen fuel gas room.
2. Activation of the mechanical exhaust ventilation system.

5808.5.4 Failure of the gas detection system. Failure of the gas detection system shall result in activation of the mechanical exhaust ventilation system, cessation of hydrogen generation and the sounding of a trouble signal in an approved location.

5808.6 Explosion control. Explosion control shall be provided where required by Section 911.

5808.7 Standby power. Mechanical ventilation and gas detection systems shall be connected to a standby power system in accordance with Chapter 6.

Add new IFC definition as follows:

IFC SECTION 202
DEFINITIONS

GASEOUS HYDROGEN SYSTEM. An assembly of piping, devices and apparatus designed to generate, store, contain, distribute or transport a nontoxic, gaseous hydrogen containing mixture having at least 95-percent hydrogen gas by volume and not more than 1-percent oxygen by volume. Gaseous hydrogen systems consist of items such as *compressed gas* containers, reactors and appurtenances, including pressure regulators, pressure relief devices, manifolds, pumps, compressors and interconnecting piping and tubing and controls.

HYDROGEN FUEL GAS ROOM. A room or space that is intended exclusively to house a *gaseous hydrogen system*.

Revise as follows:

5802.1 Definitions. The following terms are defined in Chapter 2:

FLAMMABLE GAS.
FLAMMABLE LIQUEFIED GAS.
GASEOUS HYDROGEN SYSTEM.
HYDROGEN FUEL GAS ROOM.
METAL HYDRIDE.
METAL HYDRIDE STORAGE SYSTEM.

Committee Reason: The committee agreed with the proponent's reason statement that the code change provides needed revisions to the IBC and the addition of requirements in the IFC on emergent hydrogen fuel technology. Approval is also consistent with committee action on related code changes F254-13, F256-13 and F303-13. The modification sets hydrogen fuel gas rooms apart from the currently defined gas room. It was pointed out by the committee that new IFC Section 5808.5.3 should be reviewed for possible violation of the Americans with Disabilities Act (ADA).

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

<u>**604.2.19 (IBC [F] 2702.2.19) Hydrogen fuel gas rooms.** Standby power shall be provided for hydrogen fuel gas rooms as required in Section 5808.7.</u>

5808.7 Standby power. Mechanical ventilation and gas detection systems shall be connected to a standby power system in accordance with <u>Section 604</u> ~~Chapter 6~~.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx.

Section 5808.7 introduced new requirements for standby power systems for hydrogen fuel gas rooms. This proposal correlates the standby power requirements for these facilities with the [proposal F59, which reformatted all references to emergency and standby power. No substantive changes were made a result of this public comment.

G14-13

Final Action:	AS	AM	AMPC____	D

PM3-13
202

Proposed Change as Submitted

Proponent: Rebecca Morley, representing National Center for Healthy Housing

Revise as follows:

SECTION 202
DEFINITIONS

INFESTATION. The presence, within or contiguous to, a structure or premises of: insects including cockroaches, fleas, and bedbugs; pest rodents including rats and mice; vermin; or other pests. Visible pest residue or debris constitutes an infestation unless there is clear evidence that the pest is no longer present.

Reason: The current definition of infestation would appear to exclude rodents other than rats. However, rodents carry disease and, in the case of mice, may trigger an asthma attack. The proposal applies the term to all rodents.

Cockroaches, fleas and bedbugs are public health problems; the proposal specifies these insects to make clear that they are included.

The proposal clarifies that visible evidence of pest residues is a sufficient basis for action by a code official. The code official does not have to see a live pest. Many of the pests of most concern are nocturnal and their residue is the only evidence available during daylight.

Cost Impact: The proposal will not increase the cost of maintenance since this is a definition not a requirement.

202-INFESTATION-PM-MORLEY

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee felt the proposed revisions to the definition were ambiguous, in that the list of insects was incomplete. Further, they agreed that "visible" residue or debris did not necessarily indicate an infestation.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Jane Malone, National Center for Healthy Housing, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

INFESTATION. The presence, within or contiguous to, a structure or premises of insects, rodents~~rats~~, vermin, or other pests.

Commenter's Reason: The current definition of infestation appears to exclude rodents other than rats. However, rodents other than rats carry disease and, in the case of mice, may trigger an asthma attack. Mouse allergen has long been recognized as an important cause of occupational allergy and asthma, but only recently has it been implicated in asthma and allergic diseases in community settings. Recent studies have established that mouse allergen is detectable in most US homes, with strikingly high levels in some inner cities. In addition, about 25% of inner city children with asthma have evidence of IgE sensitization to mouse. Several studies have shown that the combination of sensitization and exposure to higher levels of mouse allergen is associated with substantial asthma morbidity, including hospitalizations.

(source: Matsui EC, Role of mouse allergens in allergic disease, Current Allergy Reports, 2009 Sep;9(5):370-5. http://www.ncbi.nlm.nih.gov/pubmed/19671380)

By approving this modest word change, the code official will be able to apply the term “infestation” to all pest rodents.

Public Comment 2:

Jane Malone, National Center for Healthy Housing, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

INFESTATION. The presence, within or contiguous to, a structure or premises of insects~~,~~ rats, vermin, or other pests; and the appearance of fresh pest droppings, residue or debris after pest elimination and cleaning have occurred.

Commenter’s Reason: The comment clarifies that new evidence of pest residues is a sufficient basis for action by a code official. The code official does not have to see a live pest. Many of the pests of most concern are nocturnal and their residue is the only evidence available during daylight.

PM3-13

Final Action: AS AM AMPC____ D

PM6-13
304.2.1 (New), 305.3.1 (New), Chapter 8

Proposed Change as Submitted

Proponent: Rebecca Morley, representing National Center for Healthy Housing

Add new text as follows:

304.2.1 Disturbance of existing painted surfaces. In any Group E, I-4, R-2, R-3, R-4 occupancies completed prior to 1978, where repairs disturb painted surfaces, the work shall comply with the information distribution, certification and work practice requirements of 40 CFR 745 for renovations.

> **Exception:** Where documentation is provided from an approved test in accordance with 40 CFR 745.82(a)(1) or (2) that proves that the disturbed paint contains lead levels below specified levels, the work is not required to comply with this section.

305.3.1 Disturbance of existing painted surfaces. In any Group E, I-4, R-2, R-3, R-4 occupancies completed prior to 1978, where repairs disturb painted surfaces, the work shall comply with the information distribution, certification and work practice requirements of 40 CFR 745 for renovations.

> **Exception:** Where documentation is provided from an approved test in accordance with 40 CFR 745.82(a)(1) or (2) that proves that the disturbed paint contains lead levels below specified levels, the work is not required to comply with this section.

Add new standard to Chapter 8 as follows:

EPA U.S. Environmental Protection Agency

40 CFR 745– July 1, 2012 Lead-Based Paint Poisoning Prevention in Certain Residential Structures

Reason: The purpose of this proposed code language for the surfaces of the structure is to incorporate measures that reflect current knowledge about working with paint that may contain lead-based paint and thereby prevent lead poisoning. The code already requires repair of paint in poor condition. This new subsection would further require compliance with federal regulations to promote the safe repair of deteriorated paint that is likely to contain lead. These regulations have been in effect since April 2010. This change would only affect structures likely to contain lead-based paint.

Multiple studies have demonstrated that lead dust, which is caused by deteriorated lead-based paint and some methods of paint repair, is the major source of lead exposure for young children. The dangers associated with exposure to lead based paint hazards are well-known: lead is associated with a range of serious health effects on children, including detrimental effects on cognitive and behavioral development with serious personal and social consequences that may persist throughout their lifetime. More than 36 million pre-1978 US housing units contain lead-based paint.

Sections 304.2 and 305.3 fail to specifically require, on older structures that are likely to contain lead-based paint, the use of precautionary practices in order to prevent the dispersal of lead before, during, and after the repair work, in the course of complying with the code requirement to repair peeling, flaking and chipping paint. The proposal improves the current Code by adding to each section a health-protective requirement to perform the repair safely around lead-based paint, a subject currently acknowledged in the Commentary but not in the Code. The addition of the proposed new language will protect children from lead poisoning by specifying the use of federally – or state - approved lead safe work practices in making the required repairs. The lead-safe work practices are required by EPA effective April 22, 2010, for most renovation, repair and painting work in all pre-1978 homes.

The federal renovation rule and this proposal are based on a rebuttable presumption of lead's presence, which allows the property owner to demonstrate that lead is not present to be exempt from the requirements. The proposed new language includes these exceptions: structures built after lead was banned from paint used in residential structures (1977 US; earlier in some US cities; 1909 France, Belgium, Austria), and structures where the deteriorated paint has been documented to not contain lead (such as by a lead-based paint inspection or risk assessment, by the use of a test kit by a certified renovator, or through completion of another government-approved test method or ANSI standard).

The EPA 40 CFR 745 standard is available at http://www.gpo.gov/fdsys/pkg/CFR-2012-title40-vol32/xml/CFR-2012-title40-vol32-part745.xml.

Cost Impact: This change will not increase the cost of maintenance since these federal and state requirements are already in place.

Staff analysis: A review of the standard proposed for inclusion in the code, EPA 40 CFR 745 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

Committee Action Hearing Results

For staff analysis of the content of EPA 40 CFR745 relative to CP#28, Section 3.6, please visit:
http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf

Committee Action: Disapproved

Committee Reason: The committee was concerned that code officials would not have the qualifications or certifications to determine compliance with these lead based paint work practices. Further, as written the proposal expands the scope of the proposed CFR standard in that the standard excludes schools and adult day care facilities. The committee suggests aligning the proposed code text with the standard scope. Lastly, there was some concern that the standard was not promulgated using a consensus process.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment :

Jane Malone, National Center for Healthy Housing, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

304.2.1 Disturbance of existing painted surfaces in buildings constructed before 1978. In Group E day care, Group I-4 child day care, Group R-2, R-3, R-4 occupancies, there shall not be visible dust, debris or residue remaining in the work area after completion of repairs that disturb painted surfaces.

> **Exception:** Where documentation from an approved test in accordance with 40 CFR 745.82(a) proves that the disturbed paint contains lead levels below specified levels, the work is not required to comply with this section.

305.3.1 Disturbance of existing painted surfaces in buildings constructed before 1978. In Group E day care, Group I-4 child day care, Group R-2, R-3, R-4 occupancies, there shall not be visible dust, debris or residue remaining in the work area after completion of repairs that disturb painted surfaces.

> **Exception:** Where documentation from an approved test in accordance with 40 CFR 745.82(a) proves that the disturbed paint contains lead levels below specified levels, the work is not required to comply with this section.

Add new standard to Chapter 8 as follows:

EPA U.S. Environmental Protection Agency

40 CFR 745– July 1, 2012 Lead-Based Paint Poisoning Prevention in Certain Residential Structures

Commenter's Reason: Based on the Committee decision, we have reduced this code change from a requirement for full compliance with the federal regulation to the essential but simple performance standard that will protect the occupant's and worker's children from exposure to harmful lead. It is consistent with the federal regulation in that clean-up is required at the end of renovation work. This requirement can be enforced by the code official with a visual inspection: no testing or special information is needed.

We have also clarified the Group I and E occupancies.

The exemption applies if the project meets one of these standards at 40 CFR 745.82(a):

1. a written determination has been made by a certified inspector or risk assessor that the components affected by the renovation are free of paint or other surface coatings that contain lead;
2. a certified renovator, using an EPA recognized test kit, has tested each component affected by the renovation and determined that the components are free of paint or other surface coatings that contain lead;
3. a certified renovator has collected a paint chip sample from each painted component affected by the renovation and a laboratory recognized by EPA has determined that the samples are free of paint or other surface coatings that contain lead.

Cost Impact: This change will not increase the cost of maintenance since federal and state renovation programs require a visual check for dust, debris or residue.

PM6-13
Final Action: AS AM AMPC____ D

PM9-13
305.3

Proposed Change as Submitted

Proponent: Rebecca Morley, representing National Center for Healthy Housing

Revise as follows:

305.3 Interior surfaces. All interior surfaces, including windows and doors, shall be maintained in good, clean and sanitary condition. Peeling, chipping, flaking or abraded paint shall be repaired, removed or covered. Cracked or loose plaster, decayed wood and other defective surface conditions shall be corrected. <u>Surfaces such as but not limited to wood, textiles, paint, cellulose insulation, and paper, including paper-faced gypsum board, shall have no signs of chronic or persistent excessive moisture. Material discolored or deteriorated by mold or mildew shall be cleaned, dried and repaired and the underlying cause shall be corrected. If the material has decayed or failed beyond repair, it shall be removed and replaced and the and the underlying cause shall be corrected.</u>

> <u>**Exception:** Porous materials that do not contain organic material, such as clean unpainted bricks and concrete.</u>

Reason: Mold typically grows in buildings affected by water damage. According to the Institute of Medicine of the National Academies' *Damp Indoor Spaces and Health* (2004), mold and damp indoor environments are associated with asthma symptoms in sensitized persons, coughing, wheezing, and upper respiratory tract symptoms. *See www.nap.edu/books/0309091934/html/*

In December 2007, the National Center for Healthy Housing (NCHH) and the U.S. Centers for Disease Control and Prevention (CDC) convened an Expert Panel consistent with National Institute of Health guidelines to assess the effectiveness of various interventions to make homes healthier and safer. NCHH and CDC published the report of the experts in January 2009. See www.nchh.org/LinkClick.aspx?fileticket=2lvaEDNBIdU%3d&tabid=229 for the full report.

The Expert Panel reviewed five peer-reviewed research studies on the issue of mold and allergens and concluded that "when implemented together, eliminating moisture intrusion and leaks and removal of moldy items were found to be effective in reducing asthma triggers and reducing exposures." Other provisions of the IPMC address eliminating moisture intrusion. But no provisions require action on building materials with chronic moisture issues including those materials that have failed beyond repair.

This proposal implements the Expert Panel's recommendation while providing flexibility in response to actual conditions – repair for reparable material, replacement for failed material. To ensure the health of the building's occupants, mitigation of moisture problems must be a part of the code.

Cost Impact: This code change proposal will increase the cost of maintenance.

305.3-PM-MORLEY

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this proposal for the following reasons; no benchmarks were provided for a code official to determine excessive levels of moisture, discoloration, decay, mold, mildew, etc.; test methods should be provided that determine these levels; the code official should not be responsible for making these determinations.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment :

Jane Malone, National Center for Healthy Housing, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

305.3 Interior surfaces. All interior surfaces, including windows and doors, shall be maintained in good, clean and sanitary condition. Peeling, chipping, flaking or abraded paint shall be repaired, removed or covered. Cracked or loose plaster, decayed wood and other defective surface conditions shall be corrected. <u>Carpet, paper-faced gypsum board, and other porous material that is discolored or deteriorated by persistent moisture shall be cleaned, dried and repaired, and the underlying cause of the moisture shall be corrected. If deteriorated material has decayed or failed beyond repair, it shall be removed and replaced.</u>

Commenter's Reason: Visual evidence of a moisture problem does not require special testing. To ensure the health of the building's occupants, mitigation of moisture problems must be a part of the code.

PM9-13

Final Action: AS AM AMPC____ D

PM10-13
202, 306.1, 306.1.2 New

Proposed Change as Submitted

Proponent: Meg Waltner, representing National Resource Defense Council, Andrew Burr, representing Institute for Market Transformation and Eric Makela, representing Britt Makela Group, Inc.

Add new definition as follows:

SECTION 202
DEFINITIONS

RETRO-COMMISSIONING. A systematic process for optimizing the energy efficiency of existing base building systems through the identification and correction of deficiencies in such systems, including but not limited to repairs of defects, cleaning, adjustments of valves, sensors, controls or programmed settings, and/or changes in operational practices.

Revise as follows:

SECTION 306
COMPONENT SERVICEABILITY

306.1 General. The components of a structure and equipment therein shall be maintained in good repair and operation, structurally sound and in a sanitary condition.

306.1.1 Unsafe conditions. (no change to current text)

306.1.2 Retro-commissioning. *Retro-commissioning* shall be performed on the base building systems for buildings 25,000 ft^2 or greater starting 5 years after issuance of the certificate of occupancy and continuing every 5 years for the life of the building. The building owner shall provide evidence that *retro-commissioning* has been performed and the evidence shall document that sufficient analysis, corrections and testing have been done ~~so~~ indicating that the base building systems meet items 1 through 4 below.

Exception: Retro-commissioning is not required for *let for occupancy* spaces of buildings.

1. Operating protocols, calibration, and sequencing for HVAC and service water heating systems:
   - 1.1. HVAC temperature and humidity set points and setbacks are appropriate and operating schedules reflect major space occupancy patterns and the current facility requirements;
   - 1.2. HVAC sensors are properly calibrated;
   - 1.3. HVAC controls are functioning and control sequences are appropriate for the current facility requirements;
   - 1.4. Loads are distributed equally across equipment when appropriate, such as for fans, boilers and pumps that operate in parallel;
   - 1.5. Ventilation rates are appropriate for the current facility requirements;
   - 1.6. System automatic reset functions are functioning appropriately, if applicable;
   - 1.7. Adjustments have been made to compensate for oversized or undersized equipment so that it is functioning as efficiently as possible;
   - 1.8. Simultaneous heating and cooling does not occur unless intended;
   - 1.9. HVAC system economizer controls are properly functioning, if applicable;
   - 1.10. The HVAC distribution systems, both air and water side, are balanced;

1.11 Domestic hot water systems have been checked to ensure proper temperature settings.
1.12. Water pumps are functioning as designed;
1.13. System water leaks have been identified and repaired;
1.14. HVAC equipment, such as vents, ducts, coils, valves and soot bins, is clean;
1.15. Filters are clean and protocols are in place to replace, as appropriate.

2. Operating protocols, calibration, and sequencing for lighting systems:
   2.1. Light levels are appropriate to the task;
   2.2. Lighting sensors and controls are functioning properly according to occupancy, schedule, and/or available daylight, where applicable;
3. Cleaning and repair:
   3.1. Motors, fans, and pumps, including components such as belts, pulleys, and bearings, are in good operating condition;
   3.2. Steam traps have been replaced as required to maintain efficient operation, if applicable;
   3.3. Manual overrides on existing equipment have been remediated;
   3.4. Boilers have been tuned for optimal efficiency, if applicable;
   3.5. Exposed hot and chilled water and steam pipes three (3) inches or greater in diameter with associated control valves are insulated in accordance with the International Energy Conservation Code;
   3.6 In all easily accessible locations, sealants and weather stripping are installed where appropriate and are in good condition.
4. Documentation:
   4.1. Permits for all HVAC, electrical and plumbing equipment are in order;
   4.2. Operational and maintenance record keeping procedures, such as log books and computer maintenance records, have been implemented;
   4.3. The operations and maintenance manuals, if such manuals are still available from the manufacturer, the maintenance contracts, and the most recent retro-commissioning report is on site and accessible.

Reason: A critical aspect of building maintenance is ensuring that the energy systems of a building are maintained in a state of good repair and are functioning efficiently. It has been found that, over time, due to system breakdowns and uncoordinated repairs and renovations, building energy systems drift out of proper performance -- sometimes quite dramatically. Sensors and controls can be reset so that building systems are running 24/7 rather than only when necessary, repairs can be made that solve an immediate problem but result in heating and cooling systems running simultaneously, etc. The result of these problems is a poorly performing building that can waste considerable energy while often being uncomfortable or even unhealthy.

For other equipment, such as automobiles, a regular tune-up to ensure safe and efficient operation is considered standard practice. This is becoming standard in buildings, also, through retro-commissioning. Retro-commissioning (RCx) is a process that has been developed in recent decades to ensure that building energy systems are essentially tuned up -- that they are running efficiently and that they are in a state of good repair. Retro-commissioning takes a careful look at the systems that are in place, analyzes how they could be repaired to run more efficiently, and then performs those repairs.

Several U.S. cities recently adopted RCx requirements for large buildings. In 2009, New York City passed an ordinance, Local Law 87, that requires nonresidential and multifamily housing properties over 50,000 square feet to perform RCx once every 10 years. In 2011, San Francisco passed an ordinance requiring energy audits or RCx once every 5 years.

Cost Impact: In 2009, Lawrence Berkeley National Laboratory published a study of building commissioning costs and benefits, looking at 643 buildings with a cumulative square footage of 100 million square feet. RCx was found to cost an average of $0.30 per square foot. The RCx resulted in a 16% whole-building median energy savings with an average payback of 1.1 years.

306.1-PM-BURR-MAKELA-WALTNER.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee felt that the proposed commissioning requirements were too broad and would be difficult for the code official to determine compliance. Further, these provisions do not belong in a maintenance code. A more appropriate location for these would be either the IECC or the IgCC.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment :

Eric Makela, representing Britt/Makela Group, Inc., requests Approval as Submitted.

Commenter's Reason: For other equipment, such as automobiles, a regular tune-up to ensure safe and efficient operation is considered standard practice. This is becoming standard in buildings, also, through retro-commissioning. Retro-commissioning (RCx) is a process that has been developed in recent decades to ensure that building energy systems are essentially tuned up -- that they are running efficiently and that they are in a state of good repair. Retro-commissioning takes a careful look at the systems that are in place, analyzes how they could be repaired to run more efficiently, and then performs those repairs.

Retro-commissioning for existing buildings on average cost $0.27/ft^2, has an average energy savings of 15% and resulting in a 0.7 year payback. Based on a study the end result is saving anywhere from $11/ft^2 to $0.72/ft^2. The retro-commissioning requirement would only apply to building 25,000 ft^2 or greater and would not apply to the let for occupancy spaces in buildings. This would limit the requirement to tenant owned buildings and not include small retail, office or other smaller buildings. Additional information on the benefits of retro-commissioning can be found in a white paper published on the Britt/Makela Group website (www.BrittMakela.com)

The retro-commissioning requirements are applied to a building starting 5 years after the issuance of certificate of occupancy. In some cases this will mean that older buildings will be required to retro-commissioned after the jurisdiction has adopted the code. For newer buildings, the requirement will not take effect until a few years after the code is adopted.

The retro-commissioning requirements fit well into the Property Maintenance Code because it is one of the few codes that requires the building to be maintained after issuance of the Certificate of Occupancy. There is no precedent in other codes (e.g. IECC) for ensuring that the building functions as built after certificate of occupancy. The requirements for retro-commissioning are very specific on what features must be commissioned for the HVAC, water heating and lighting systems of the building. Those performing retro-commissioning must also verify that all permits for work conducted on an energy feature of the building be present.

Several U.S. cities recently adopted RCx requirements for large buildings. In 2009, New York City passed an ordinance, Local Law 87, that requires nonresidential and multifamily housing properties over 50,000 square feet to perform RCx once every 10 years. In 2011, San Francisco passed an ordinance requiring energy audits or RCx once every 5 years.

PM10-13

Final Action: AS AM AMPC____ D

PM13-13
[F] 702.4 (IFC 1030.7)

Proposed Change as Submitted

THIS CHANGE WILL BE HEARD BY THE IFC COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Proponent: Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee (BajnaiC@chesterfield.gov)

Revise as follows:

[F] 702.4 (IFC 1030.7) Emergency escape <u>and rescue</u> openings. Required emergency escape <u>and rescue</u> openings shall be maintained in accordance with the code in effect at the time of construction, and the following. Required emergency escape and rescue openings shall be operational from the inside of the room without the use of keys or tools. Bars, grilles, grates or similar devices are permitted to be placed over emergency escape and rescue openings provided the minimum net clear opening size complies with the code that was in effect at the time of construction and such devices shall be releasable or removable from the inside without the use of a key, tool or force greater than that which is required for normal operation of the escape and rescue opening. <u>Where new bars, grilles, grates or similar devices, are installed in existing buildings where none presently exist, smoke alarms shall be installed in accordance with Section 907.2.11 of the *International Building Code*.</u>

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC) The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

This code proposal is attempting to clarify the requirements for existing openings that have previously approved bars, grilles, grates and similar devices on them, vs. existing or new openings that will be installing such devices on them.

The existing IBC Code Section 1029.4 states:

> 1029.4 Operational constraints. Emergency escape and rescue openings shall be operational from the inside of the room without the use of keys or tools. Bars, grilles, grates or similar devices are permitted to be placed over emergency escape and rescue openings provided the minimum net clear opening size complies with Section 1029.2 and such devices shall be releasable or removable from the inside without the use of a key, tool or force greater than that which is required for normal operation of the escape and rescue opening. Where such bars, grilles, grates or similar devices are installed in existing buildings, smoke alarms shall be installed in accordance with Section 907.2.11 regardless of the valuation of the alteration.

Existing IPMC Section 702.4's last sentence was revised to clearly state that it is only applicable to existing openings that have previously approved bars, grilles, grates and similar devices on them.

The new proposed last sentence in this code proposal is attempting to correlate the requirement of IBC Section 1029.4 with the IPMC Section 702.4. If a new opening is provided, or an existing opening is going to be provided, with bars, grilles, grates and similar devices, then the smoke alarm requirements of IBC Section 907.2.11 are applicable to the affected residential unit. If previously approved bars, grilles, grates and similar devices are only being repaired or replaced on an existing opening then the smoke alarm requirement of IBC Section 907.2.11 would still not be applicable.

The title and first sentence were revised to indicate "rescue" openings to be consistent with other I-code language.

Cost Impact: This proposal will not increase the cost of construction.

[F] 702.4-PM-BAJNAI-BCAC.DOC

Committee Action Hearing Results

This code change was heard by the IFC code development committee.

Committee Action: **Disapproved**

Committee Reason: The disapproval was based on the committee's concerns that the proposal would not require that the net clear opening size of the emergency escape and rescue opening be maintained, that smoke alarms are only required in residential dwelling or sleeping units and that it was unclear whether emergency escape and rescue openings could be covered with bars or grilles.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment :

Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee requests Approval as Submitted.

Commenter's Reason: The ICC Building Code Action Committee (BCAC) is submitting this proposal for **As Submitted** as a necessary life safety correlation between the Property Maintenance Code and IBC Section 1029.4 which states:

> *"Where such bars, grilles, grates or similar devices are installed in existing buildings, smoke alarms shall be installed in accordance with Section 907.2.11 regardless of the valuation of the alteration."*

Based upon the code development committee's reason statement they appear to have misunderstood the application of the new sentence as well as the current requirements of IPMC Section 702.4. / IFC 1030.7.

1. The code development committee indicated concern about the net clear opening. This code change has nothing to do with the opening size – it is about smoke alarms, and when they need to be added. But to answer their question, the opening size is already covered in the current language of IPMC Section 702.4/IFC 1030.7:

   "Bars, grilles, grates or similar devices are permitted to be placed over emergency escape and rescue openings provided the minimum net clear opening size complies with the code that was in effect at the time of construction …"

   This proposal does not change that language so the net clear opening in existence at time of construction is the minimum allowed.

2. The code development committee expressed concern that smoke alarms were only being required for dwelling or sleeping units, however, the section involved applies to "Emergency Escape Openings" that are only required for dwelling or sleeping units. This proposal does not change that application.
3. And lastly, the code development committee expressed a concern that it was unclear whether bars and grills could be installed over emergency escape and rescue openings. IBC/IFC Section 1029.4, IFC Section 1030.7 and PMC Section 704.4 all specifically allow the installation of the bars and grills over emergency and escape rescue openings.

PM13-13

Final Action: AS AM AMPC____ D

PM16-13
705 (New)

<u>Proposed Change as Submitted</u>

Proponent: Rebecca Morley, representing National Center for Healthy Housing

Add new text as follows:

<u>**SECTION 705**</u>
<u>**CARBON MONOXIDE ALARMS**</u>

<u>**705.1 General.** Carbon monoxide alarms shall be installed in accordance with Section 1103.9 of the *International Fire Code* in Group R occupancies and in dwellings not regulated as Group R occupancies.</u>

Reason: Carbon monoxide (CO) is an odorless, tasteless, invisible gas that kills more than 300 people in homes each year. Thousands more are admitted to the hospital with carbon monoxide poisoning. This is a serious issue that affects people nationwide is all regions of the country.

The International Residential Code requires CO alarms for residences with fuel-fired appliances or attached garages. This change would make the IPMC consistent with the IRC.

This proposal expands on the requirement to specifically include portable fuel burning space heaters since these devices may not be considered an appliance, since these devices may be introduced by the property owner after construction.

The following states have required CO alarms in existing residences: Alaska, California, Colorado, Illinois, Massachusetts, Michigan, Minnesota, Montana, New Jersey, New York, North Carolina, Oklahoma, Oregon, Rhode Island, Vermont and Wisconsin. Deaths from CO are spread throughout the country as residents unwittingly use dangerous methods to stay warm in unusually cold weather.

Cost Impact: Yes, this code change proposal will increase the cost of property maintenance. A carbon monoxide alarm typically costs approximately $25.

705 (NEW)-PM-MORLEY

<u>Committee Action Hearing Results</u>

Committee Action: **Disapproved**

Committee Reason: The committee felt that this mandate would be too broad as it would affect a large majority of existing buildings. The expense for building owners and the enforceability requirements for code officials would be too great.

Assembly Action: **None**

<u>Individual Consideration Agenda</u>

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment :

Jane Malone, National Center for Healthy Housing, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

705.1 General. Carbon monoxide alarms shall be installed in accordance with Section 1103.9 of the *International Fire Code* in Group R occupancies<u>.</u> ~~*and in dwellings not regulated as Group R occupancies.*~~

Commenter's Reason: While not needed in jurisdictions that have adopted the International Fire Code, the requirement is needed where the IFC is not in effect.

PM16-13

Final Action: AS AM AMPC____ D

RB2-13
R102.7.1

Proposed Change as Submitted

Proponent: David Bonowitz, Chair, Existing Buildings Subcommittee, Code Advisory Committee, representing National Council of Structural Engineers Associations (dbonowitz@att.net)

Revise as follows:

R102.7.1 Additions, alterations or repairs. Additions, alterations or repairs to any structure shall conform to the requirements for a new structure ~~without requiring the existing structure to comply with all of the requirements of this code, unless otherwise stated. Additions, alterations or repairs shall not cause an existing structure to become unsafe or adversely affect the performance of the building.~~ <u>Alterations and repairs shall be such that the existing structure is no less complying with the provisions of this code than the existing structure was prior to the alteration or repair. For additions, alterations to the existing structure shall be made so that the existing structure with the addition is no less complying with the provisions of this code than the existing structure was prior to the addition.</u>

Reason: This proposal updates the IRC language with respect to existing buildings, in coordination with the IBC and IEBC. It clarifies, but does not change, the current intent.

In general, the IRC (with or without Appendix J) is obsolete in its terminology and language regarding existing buildings. Especially regarding structural issues, its provisions continue to use terms and formulations that have long since been revised in IBC Chapter 34 and the IEBC Work Area method. (For examples, the term "unsafe" and the labels and definitions of project types in Appendix J.) This proposal does not seek complete uniformity with the other codes, but it does attempt to correct some obsolete language that is now prone to incorrect interpretation.

In the first sentence, the proposal clarifies the main purpose, which is to require the intended addition, alteration, or repair work itself to be as for new construction. The second half of the sentence is deleted, as it has been in IBC sections 3403.1 and 3404.1 and IEBC sections 402.1 and 403.1. The portion proposed for deletion is redundant, since the next sentence (either as is or as proposed) tells you when and how to consider the existing structure. It is also potentially confusing, since it incorrectly gives the impression that the only possibilities are either no upgrade or total upgrade of the entire building for "all of the requirements of this code."

The proposal replaces the second sentence in order to correct four problems with the current text:

- The proposal removes the word "unsafe." First, this term is redundant in R102.7.1, since any work that would make the building unsafe would certainly also "adversely affect the performance." Second, the IRC does not define "unsafe" and so relies on the IBC, but the IBC's definition is unorthodox, as it comes through the text of section 116.1, not through a formal definition. In any case, from a structural perspective, a building is unsafe when the structure is "dangerous" as defined in the IBC or IEBC, but that definition has in mind an extreme condition verging on collapse. We do not believe it is the intent of the IRC committee to allow structural modifications to dwellings that take them to a condition just shy of dangerous. (IRC Appendix J does have its own definition of dangerous, but section R102.7.1 must be able to stand on its own, since Appendix J will not necessarily be adopted. Besides, the Appendix J definition is obsolete as well and applies only to structural conditions.)
- It replaces the phrase "adversely affect the performance" with "no less complying" language consistent with IBC sections 3403.1 and 3404.1 and IEBC sections 402.1 and 403.1. The IRC is compliance-based, not performance-based, so vague reference to "performance" is not enforceable. More important, the "adversely affect" phrase suggests that the existing building cannot be made worse by any measure, a restriction more severe than is probably intended. That is, as long as the building still complies, some reduction in capacity should be allowed.
- It restates the provision as an enforceable instruction, not as a blanket prohibition. That is, provisions for existing buildings are more useful and effective when they say what must be done, not what is prohibited. The IBC and IEBC provisions have been revised and written with this approach since 2009.
- It separates the project types, where necessary. Here, the provisions for additions, alterations, and repairs do not vary much, but the proposal reorganizes the provision to set a precedent and make future revisions by project type easier. This is consistent with the 2009 revisions to IBC Chapter 34, the IEBC Work Area method and IRC Appendix J.

Cost Impact: None

R102.7.1 #1-RB-BONOWITZ

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee felt this change is not needed. The existing language on performance is already consistent with the IBC and IEBC.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

David Bonowitz, representing NCSEA Code Advisory Committee, Existing Buildings Subcommitteek requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R102.7.1 Additions, alterations or repairs. Additions, alterations or repairs to any structure shall conform to the requirements for a new structure. <u>Where more specific requirements do not apply,</u> alterations or repairs shall be such that the existing structure is no less complying with the provisions of this code than it was prior to the alteration or prior to the occurrence of the damage that is being repaired. For additions, <u>where more specific requirements do not apply,</u> alterations to the existing structure shall be made so that the existing structure with the addition is no less complying with the provisions of this code than the existing structure was prior to the addition.

Commenter's Reason: The IRC committee, which is not expert in existing building provisions or in the IEBC methodology, simply got this one wrong. Perhaps they were confused by incorrect statements made by committee members after testimony was closed. Whatever the reason, the confusion is evident from the fact that the committee's reason for disapproval is plainly false.

The committee reason states: "The existing language on performance is already consistent with the IBC and IEBC." This is plainly false because the existing language is *not at all consistent* with the IBC and IEBC:

- Since 2009, the IBC has separated additions, alterations, and repairs into separate sections to avoid just the sort of over-generality present in R102.7.1. The IEBC Work Area method, of course, has always had separate chapters for separate project types.
- IBC and IEBC provisions for existing buildings are specific and measured. They do not require or even suggest, as the 2012 language of R102.7.1 does, that an existing building *might* be required "to comply with all of the requirements" for new construction.
- The 2012 IRC provision sets the bar for unacceptable projects where they would make the existing building unsafe. Neither the IBC nor the IEBC has any such provision. Rather, the "no less complying" language of the proposal exists in IBC sections 3403.1 and 3404.1 and IEBC sections 402.1 and 403.1.
- The IBC and IEBC have no such vague provision about projects that would "adversely affect the performance of the building." In fact, extensive revisions to the IBC and IEBC over the last two cycles have quite intentionally removed such unenforceable language. Instead, the IBC and IEBC explicitly allow certain reductions in performance until a measurable and enforceable loss of compliance is reached.

If users of the IRC want the IRC to be taken seriously, they need to allow it to evolve and improve in coordination with the other I-codes. The IRC is clearly falling behind on the issue of existing IRC-eligible buildings. This proposal helps close the gap, as do proposals RB 469 and RB 470, both of which were approved as submitted for similar reasons.

Excerpts from the original proposal's reason statement:

- This proposal updates the IRC language with respect to existing buildings, in coordination with the IBC and IEBC. It clarifies, but does not change, the current intent. This proposal does not seek complete uniformity with the other codes, but it does attempt to correct some obsolete language that is now prone to incorrect interpretation.
- In the first sentence, the proposal clarifies the main purpose, which is to require the intended addition, alteration, or repair work itself to be as for new construction. The second half of the sentence is deleted, as it has been in IBC sections 3403.1 and 3404.1 and IEBC sections 402.1 and 403.1. The portion proposed for deletion is redundant, since the next sentence (either as is or as proposed) tells you when and how to consider the existing structure.
- The proposal replaces the second sentence in order to correct four problems with the current text:
  - The proposal removes the word "unsafe." We do not believe it is the intent of the IRC committee to allow modifications to dwellings that take them to a condition just shy of "dangerous" or "unsafe."

- It replaces the phrase "adversely affect the performance" with "no less complying" language consistent with IBC sections 3403.1 and 3404.1 and IEBC sections 402.1 and 403.1. The IRC is compliance-based, not performance-based, so vague reference to "performance" is not enforceable. More important, the "adversely affect" phrase suggests that the existing building cannot be made worse by any measure, a restriction more severe than is probably intended. That is, as long as the building still complies, some reduction in capacity should be allowed.
- It restates the provision as an enforceable instruction, not as a blanket prohibition. That is, provisions for existing buildings are more useful and effective when they say what must be done, not what is prohibited. The IBC and IEBC provisions have been revised and written with this approach since 2009.
- It separates the project types, where necessary. Here, the provisions for additions, alterations, and repairs do not vary much, but the proposal reorganizes the provision to set a precedent and make future revisions by project type easier. This is consistent with the 2009 revisions to IBC Chapter 34, the IEBC Work Area method and IRC Appendix J.

The original proposal is modified by this Public Comment to include the phrase "where more specific requirements do not apply" in two places. This modification maintains the intent of the current phrase "unless otherwise stated."

RB2-13

Final Action: AS AM AMPC____ D

RB4-13
R104.10.1, R105.3.1.1, R112.2.1, R112.2.2, R301.2.4, R322.1

Proposed Change as Submitted

Proponent: Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (Gregory.wilson2@fema.dhs.gov); Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net)

Revise as follows:

R104.10.1 Flood hazard areas. The building official shall not grant modifications to any provisions related to flood hazard areas as established by Table R301.2(1) ~~without the granting of a variance to such provisions by the board of appeals~~ unless a determination has been made that:

1. A showing of good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render the elevation standards of Section R322 inappropriate.
2. A determination that failure to grant the modification would result in exceptional hardship by rendering the lot undevelopable.
3. A determination that the granting of a modification will not result in increased flood heights, additional threats to public safety, extraordinary public expense, cause fraud on or victimization of the public, or conflict with existing laws or ordinances.
4. A determination that the modification is the minimum necessary to afford relief, considering the flood hazard.
5. Submission to the applicant of written notice specifying the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the design flood elevation increases risks to life and property.

R105.3.1.1 Determination of substantially improved or substantially damaged existing buildings in flood hazard areas. For applications for reconstruction, rehabilitation, alteration, repair, addition or other improvement of existing buildings or structures located in a flood hazard area as established by Table R301.2(1), the building official shall examine or cause to be examined the construction documents and shall make a determination ~~prepare a finding~~ with regard to the value of the proposed work. For buildings that have sustained damage of any origin, the value of the proposed work shall include the cost to repair the building or structure to its predamage condition. If the building official finds that the value of proposed work equals or exceeds 50 percent of the market value of the building or structure before the damage has occurred or the improvement is started, ~~the finding shall be provided to the board of appeals for a determination of substantial improvement or substantial damage. Applications determined by the board of appeals to constitute substantial improvement or substantial damage~~ the proposed work is a substantial improvement or restoration of substantial damage and the building official shall require all existing portions of the entire building or structure to meet the requirements of R322.

For the purpose of this determination, a substantial improvement means any repair, reconstruction, rehabilitation, addition or improvement of a building or structure, the cost of which equals or exceeds 50 percent of the market value of the building or structure before the improvement or repair is started. If the building or structure has sustained substantial damage, all repairs necessary to restore the building or structure to its pre-damaged condition are considered substantial improvement regardless of the actual repair work performed. The term does not include:

1. Improvements of a building or structure required to correct existing health, sanitary or safety code violations identified by the building official and which are the minimum necessary to assure safe living conditions; or
2. Any alteration of a historic building or structure, provided that the alteration will not preclude the

continued designation as a historic building or structure. For the purposes of this exclusion, a historic building is:

2.1. Listed or preliminarily determined to be eligible for listing in the National Register of Historic Places; or

2.2. Determined by the Secretary of the U.S. Department of Interior as contributing to the historical significance of a registered historic district or a district preliminarily determined to qualify as an historic district; or

2.3. Designated as historic under a state or local historic preservation program that is approved by the Department of Interior.

~~**R112.2.1 Determination of substantial improvement in flood hazard areas.** When the building official provides a finding required in Section R105.3.1.1, the board of appeals shall determine whether the value of the proposed work constitutes a substantial improvement. A substantial improvement means any repair, reconstruction, rehabilitation, addition or improvement of a building or structure, the cost of which equals or exceeds 50 percent of the market value of the building or structure before the improvement or repair is started. If the building or structure has sustained substantial damage, all repairs are considered substantial improvement regardless of the actual repair work performed. The term does not include:~~

1. ~~Improvements of a building or structure required to correct existing health, sanitary or safety code violations identified by the building official and which are the minimum necessary to assure safe living conditions; or~~
2. ~~Any alteration of a historic building or structure, provided that the alteration will not preclude the continued designation as a historic building or structure. For the purposes of this exclusion, a historic building is:~~
   - ~~2.1. Listed or preliminarily determined to be eligible for listing in the National Register of Historic Places; or~~
   - ~~2.2. Determined by the Secretary of the U.S. Department of Interior as contributing to the historical significance of a registered historic district or a district preliminarily determined to qualify as an historic district; or~~
   - ~~2.3. Designated as historic under a state or local historic preservation program that is approved by the Department of Interior.~~

~~**R112.2.2 Criteria for issuance of a variance for flood hazard areas.** A variance shall only be issued upon:~~

1. ~~A showing of good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render the elevation standards of Section 322 inappropriate.~~
2. ~~A determination that failure to grant the variance would result in exceptional hardship by rendering the lot undevelopable.~~
3. ~~A determination that the granting of a variance will not result in increased flood heights, additional threats to public safety, extraordinary public expense, cause fraud on or victimization of the public, or conflict with existing laws or ordinances.~~
4. ~~A determination that the variance is the minimum necessary to afford relief, considering the flood hazard.~~
5. ~~Submission to the applicant of written notice specifying the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the design flood elevation increases risks to life and property.~~

R301.2.4 Floodplain construction. Buildings and structures constructed in whole or in part in flood hazard areas (including A or V Zones) as established in Table R301.2(1), and substantial improvement and restoration of substantial damage of buildings and structures in flood hazard areas, shall be designed and constructed in accordance with the provisions of Section R322. Buildings and structures located in whole or in part in identified floodways shall be designed and constructed in accordance with ASCE 24.

R322.1 General. Buildings and structures constructed in whole or in part in flood hazard areas (including A or V Zones) as established in Table R301.2(1), and substantial improvement and restoration of substantial damage of buildings and structures in flood hazard areas, shall be designed and constructed in accordance with the provisions contained in this section. Buildings and structures located in whole or in part in identified floodways shall be designed and constructed in accordance with ASCE 24.

Reason: This proposal does three things related to existing dwellings in flood hazard areas:

1. Moves language from R112.2.2 to R104.10. The effect is to parallel both the IBC and IEBC which charge the building official with making certain determinations before granting modifications, rather than have the Board of Appeals make such determinations.
2. Moves language from R112.2.1 to R105.3.1.1. The effect is to more closely align the IRC with the IBC and IEBC, which rely on the building official to determine whether work on existing buildings in flood hazard areas meets the definitions "substantial improvement" and "substantial damage," rather than have the building official make a finding and have the Board of Appeals make such determinations
3. Clearly identify in R301.2.4 and R322.1, that the flood provisions apply to substantial improvement and substantial damage; R102.7.1 already makes clear that the IRC applies to additions, alterations, or repairs.

The IRC currently requires the Board of Appeals to do two things that are done by the building official under both the IBC and the IEBC – (1) determine whether requests for modifications to the flood provisions meet certain criteria and (2) determine whether work on existing dwellings constitutes substantial improvement or substantial damage (SI/SD). As stated in R112.1, the purpose of a Board of Appeals is to hear appeals of decisions, orders, and determinations of the building official. If the Board is charged with making decisions, such as the granting of a modification (variance) and the determination of SI/SD, then permit applicants and permittees have no recourse to appearl those decisions, except perhaps the courts. If building officials are capable of making these determinations under IBC and IEBC, then they should be permitted to do the same under the IRC.

The proposed changes to R301.2.4 and R322.1, which have the same phrasing, is to make clear that, as stated in R102.7.1, because the IRC applies to work on existing dwellings, the flood provisions apply to substantial improvement and substantial damage of existing dwellings. The added phrase is the same as used in IBC 1612.1.

Cost Impact: Costs will be reduced for permit applicants and permittees who challenge SI/SD determinations and decisions on requests for modifications (variances) because they can appeal the building official's decisions to the Board of Appeals instead of the courts. There is no change in the cost of compliance because the IRC already applies to existing dwellings and communities that participate in the NFIP have long required existing buildings that are SI/SD to be brought into compliance with the requirements for new construction.

R104.10.1-RB-QUINN-WILSON

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The committee disapproved this code change proposal because they felt that it substantially changes the description of a historic building in a manner that puts it in the hands of the federal government, which is the wrong direction.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Gregory Wilson (FEMA) and Rebecca Quinn (RCQuinn Consulting), representing US Dept of Homeland Security, Federal Emergency Management Agency and RCQuinn Consulting, Inc. representing FEMA, requests Approval as Modified by this Public Comment,

Replace the proposal with the following:

Revise as follows:

R105.3.1.1 Determination of substantially improved or substantially damaged existing buildings in flood hazard areas. For applications for reconstruction, rehabilitation, alteration, repair, addition or other improvement of existing buildings or structures located in a flood hazard area as established by Table R301.2(1), the building official shall examine or cause to be examined the construction documents and shall make a determination with regard to the value of the proposed work. For buildings that have sustained damage of any origin, the value of the proposed work shall include the cost to repair the building or structure to its predamage condition. If the building official finds that the value of proposed work equals or exceeds 50 percent of the market value of the building or structure before the damage has occurred or the improvement is started, the proposed work is a substantial improvement or restoration of substantial damage and the building official shall require all existing portions of the entire building or structure to meet the requirements of R322.

For the purpose of this determination, a substantial improvement shall mean any repair, reconstruction, rehabilitation, addition or improvement of a building or structure, the cost of which equals or exceeds 50 percent of the market value of the building or structure before the improvement or repair is started. If the building or structure has sustained substantial damage, all repairs necessary to restore the building or structure to its pre-damaged condition are considered substantial improvement regardless of the actual repair work performed. The term shall not include:

1. Improvements of a building or structure required to correct existing health, sanitary or safety code violations identified by the building official and which are the minimum necessary to assure safe living conditions; or
2. Any alteration of a historic building or structure, provided that the alteration will not preclude the continued designation as a historic building or structure. For the purposes of this exclusion, a historic building is:
   - 2.1. Listed or preliminarily determined to be eligible for listing in the National Register of Historic Places; or
   - 2.2. Determined by the Secretary of the U.S. Department of Interior as contributing to the historical significance of a registered historic district or a district preliminarily determined to qualify as an historic district; or
   - 2.3. Designated as historic under a state or local historic preservation program that is approved by the Department of Interior.

~~**R112.2.1 Determination of substantial improvement in flood hazard areas.** When the building official provides a finding required in Section R105.3.1.1, the board of appeals shall determine whether the value of the proposed work constitutes a substantial improvement. A substantial improvement means any repair, reconstruction, rehabilitation, addition or improvement of a building or structure, the cost of which equals or exceeds 50 percent of the market value of the building or structure before the improvement or repair is started. If the building or structure has sustained substantial damage, all repairs are considered substantial improvement regardless of the actual repair work performed. The term does not include:~~

1. ~~Improvements of a building or structure required to correct existing health, sanitary or safety code violations identified by the building official and which are the minimum necessary to assure safe living conditions; or~~
2. ~~Any alteration of a historic building or structure, provided that the alteration will not preclude the continued designation as a historic building or structure. For the purposes of this exclusion, a historic building is:~~
   - ~~2.1. Listed or preliminarily determined to be eligible for listing in the National Register of Historic Places; or~~
   - ~~2.2. Determined by the Secretary of the U.S. Department of Interior as contributing to the historical significance of a registered historic district or a district preliminarily determined to qualify as an historic district; or~~
   - ~~2.3. Designated as historic under a state or local historic preservation program that is approved by the Department of Interior.~~

~~**R112.2.2 Criteria for issuance of a variance for flood hazard areas.** A variance shall only be issued upon:~~

1. ~~A showing of good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render the elevation standards of Section 322 inappropriate.~~
2. ~~A determination that failure to grant the variance would result in exceptional hardship by rendering the lot undevelopable.~~
3. ~~A determination that the granting of a variance will not result in increased flood heights, additional threats to public safety, extraordinary public expense, cause fraud on or victimization of the public, or conflict with existing laws or ordinances.~~
4. ~~A determination that the variance is the minimum necessary to afford relief, considering the flood hazard.~~
5. ~~Submission to the applicant of written notice specifying the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the design flood elevation increases risks to life and property.~~

Commenter's Reason: The committee action on this code change proposal was Disapproval, explained only by a concern with the description of historic building. The proposal does not, as perceived by the committee, "substantially change the description of a historic building…." The text proposed for R105.3.1.1 is simply being moved from the existing Section R112.2.1. The same language qualifying the I-Codes definition for "historic building" is in the IBC Chapter 34 Section 3409.2 and in the IEBC 1101.4.

This public comment replaces the original proposal with ONLY the portions of that proposal that affect Chapter 1, with no change to any of the originally proposed language.

The primary objective is to move certain determinations from R112 Board of Appeals into R104 Duties and Powers of the Building Official and R105 Permits. The result is to be consistent with the administrative provisions of the IBC and the IEBC. If the building official is authorized and capable of making these determinations under the IBC and the IEBC, then the building official is also capable and should be authorized to the same under the IRC. Importantly, having the building official make these determinations rather than the board of appeals increases an applicant's ability to appeal those decisions at the local level.

Public Comment 2:

Gregory Wilson (FEMA) and Rebecca Quinn (RCQuinn Consulting), representing US Dept of Homeland Security, Federal Emergency Management Agency and RCQuinn Consulting, Inc. representing FEMA, requests Approval as Modified by this Public Comment,

Replace the proposal with the following:

Revise as follows:

R301.2.4 Floodplain construction. Buildings and structures constructed in whole or in part in flood hazard areas (including A or V Zones) as established in Table R301.2(1), and substantial improvement and restoration of substantial damage of buildings and structures in flood hazard areas, shall be designed and constructed in accordance with the provisions of Section R322. Buildings and structures located in whole or in part in identified floodways shall be designed and constructed in accordance with ASCE 24.

R322.1 General. Buildings and structures constructed in whole or in part in flood hazard areas (including A or V Zones) as established in Table R301.2(1), and substantial improvement and restoration of substantial damage of buildings and structures in flood hazard areas, shall be designed and constructed in accordance with the provisions contained in this section. Buildings and structures located in whole or in part in identified floodways shall be designed and constructed in accordance with ASCE 24.

Commenter's Reason: The committee action on this code change proposal was Disapproval, explained only by a concern with the description of historic buildings.

This public comment replaces the original proposal with ONLY the portions of that proposal that affect Chapter 3, with no change to any of the originally proposed language.

It is clear in IRC Section 102.7.1 that the IRC applies to existing buildings when those buildings have additions, alterations, or repairs. The phrase proposed to be added to R301.2.4 and R322.1 is the same wording used in the IBC 1612.1. This will make it clearer that when the code applies to existing dwellings in flood hazard areas, a determination must be made as to whether the proposed work constitutes Substantial Improvement or repair of Substantial Damage (see current provisions in R105.3.1.1 and R112.2.1, which call for the building official to make a finding and for the Board of Appeals to make determinations of substantial improvement and substantial damage).

Final Action: AS AM AMPC____ D

RB5-13
R105.1

Proposed Change as Submitted

Proponent: Joseph D. Belcher, JDB Code Services, Inc, representing the International Hurricane Protection Association (joe@jdbcodeservices.com)

Revise as follows:

R105.1 Required. Any owner or authorized agent who intends to construct, enlarge, alter, repair, move, demolish or change the occupancy of a building or structure, or to erect, install, enlarge, alter, repair, remove, convert or replace any <u>impact protective system</u>, electrical, gas, mechanical or plumbing system, the installation of which is regulated by this code, or to cause any such work to be done, shall first make application to the *building official* and obtain the required *permit*.

Reason: Opening protection by impact protective systems is an important aspect in maintaining structural integrity during a hurricane event. In addition to increasing the structural performance of buildings, they play a role in the life safety of the people weathering the storm out in their residence. Observations in the field reveal many installations do not meet the standards adopted for these devices as became apparent during storms in recent years. Unfortunately, many jurisdictions do not require permits or inspections for these important structural safeguards and life safety devices because they are not addressed in the section of the code addressing required permits. With the emphasis of emergency management shifting to defending in place due to the inability of the infrastructure to handle mass evacuations, these impact protective systems, be they impact rated glass or devices, and their proper installation becomes even more important.

The hurricane protection industry estimates annual sales in unapproved and mostly bogus “hurricane protection devices” at $30M to $40M at the minimum. These products have not been tested or investigated by anyone and meet no standards. The sellers of these products target citizens and give residents a false sense of security. Requiring permits and inspections for all impact protective systems would dramatically increase the protection provided to the residents of single family dwellings.

Cost Impact: The proposal may result in a slight increase for the cost of a permit solely for projects involving installation, alteration, repair or replacement projects. For new construction there should be no cost as the permit for the building would include the installation of the impact protective system. The benefit of the requirement, however, will far outweigh any added cost in permitting by increasing the assurance that these important structural and life safety protection devices are properly designed and installed. The industry has noted cases of substandard materials, inappropriate testing or claims of testing, and improper installation of products. We believe closer scrutiny of the design and installation of these important property protection and life safety systems will result in greater protection to the public and a better value to the consumer.

Staff Analysis: Mr. Belcher has a companion change for a new Section 614 that has criteria for impact protective systems. Requirements for these types of systems are in the IRC in Section 301.2.1.2 and 612.6.

R105.1-RB-BELCHER

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: Requiring a permit has the potential for unintended consequences of delay action before a storm. Could be further delay if a permit is required for WSP. The local jurisdiction can decide if a permit is required for this protective system.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Joseph D. Belcher, JDB Code Services, Inc., representing International Hurricane Protection Association (IHPA), requests Approval as Submitted.

Commenter's Reason: The purpose of this public comment is to request Approval as Submitted of a requirement for building permits for the installation of impact protective systems. The provision would not apply for new construction, as the building permit for the dwelling would include opening protection where required by the code. However, in light of recent history many states are engaged in wind mitigation programs to increase the ability of a structure to resist high winds encountered during hurricanes. Since the code requires opening protection in wind-borne debris regions, it only follows that permits should be required to assure oversight and code compliance to increase the safety of the public.

Opening protection by impact protective systems is an important aspect in maintaining structural integrity during a hurricane event. In addition to increasing the structural performance of buildings, they play a role in the life safety of the people weathering the storm out in their residence. Emergency management is moving toward defending in place as opposed to evacuation due to the inability of the infrastructure to safely evacuate many areas. As became apparent during storms in recent years many installations do not meet the standards adopted by the code for these devices. Unfortunately, many jurisdictions do not require permits or inspections for these important structural safeguards and life safety devices because they are not addressed in the section of the code addressing required permits. With the emphasis of emergency management shifting to defending in place due to the inability of the infrastructure to handle mass evacuations, these impact protective systems, be they impact rated glass or devices, and their proper installation becomes even more important.

The hurricane protection industry estimates annual sales in unapproved and mostly bogus "hurricane protection devices" at $30M to $40M at the minimum. These products have not been tested or investigated by anyone and meet no standards. The sellers of these products target citizens and give residents a false sense of security. Requiring permits and inspections for all impact protective systems would dramatically increase the protection provided to the residents of single family dwellings.

RB6-13
R105.2

Proposed Change as Submitted

Proponent: Rick Davidson, City of Maple Grove, representing Association of Minnesota Building Officials (rdavidson@maplegrovemn.gov)

Revise as follows:

R105.2 Work exempt from permit. *Permits* shall not be required for the following. Exemption from *permit* requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this *jurisdiction*.

Building:

1. One-story detached *accessory structures* used as tool and storage sheds, playhouses and similar uses, provided the floor area does not exceed 200 square feet (18.58 m^2).
2. Fences not over 7 feet (2134 mm) high.
3. Retaining walls that are not over 4 feet (1219 mm) in height measured from the bottom of the footing to the top of the wall, unless supporting a surcharge.
4. Water tanks supported directly upon *grade* if the capacity does not exceed 5,000 gallons (18 927 L) and the ratio of height to diameter or width does not exceed 2 to 1.
5. Sidewalks and driveways.
6. Painting, papering, tiling, carpeting, cabinets, counter tops and similar finish work.
7. Prefabricated swimming pools that are less than 24 inches (610 mm) deep.
8. Swings and other playground equipment.
9. Window awnings supported by an exterior wall which do not project more than 54 inches (1372 mm) from the exterior wall and do not require additional support.
10. Decks ~~not exceeding 200 square feet (18.58 m^2) in area,~~ that are not more than 30 inches (762 mm) above *grade* at any point~~, are not attached to a *dwelling*~~ and do not serve the exit door required by Section R311.4.

Reason: This proposal deletes certain provisions of the exemption for decks. 200 square feet is an arbitrary limit and without basis. If a jurisdiction wishes to limit the size of a deck, they may do so through their local zoning regulations. There is nothing unique about these structures that make a deck that is 210 square feet in area more dangerous than one that is 190 square feet.

Furthermore, whether or not it is attached to the dwelling should make no difference. It is common practice to set these low decks adjacent to the dwelling and often homeowners wish to attach them to the dwelling for added stability. Why would we want to discourage them from making their deck more secure by requiring a permit? All too often the regulations start to get pretty restrictive regarding the connections for these low decks. The owner may wish to add a few lag bolts to stabilize the deck or they may wish to support one entire length of the deck from the house.

The risks posed do not warrant the close regulations that permitting requires. Building department resources are stretched thin. Permit fees on these decks rarely cover the cost of enforcement. Public dollars can be better spent on more significant projects.

A common argument for requiring permits for these structures is for zoning compliance. That is a lousy reason for requiring a building permit. Local zoning ordinances often regulate other structures when a building permit is not required. Certain fences, arbors, trellises, and small accessory structures come to mind. Let the zoning folks carry their own water.

Cost Impact: None

R105.2 #1-RB-DAVIDSON

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee approved this proposed code change because they felt that it is possible to have the same condition that is regulated by this code section on decks of any size.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Glenn Mathewson, MCP, City of Westminster, Colorado, representing North American Deck and Railing Association, requests Disapproval.

Commenter's Reason: The proponent's reason statement fails to recognize all the hazards associated with deck construction. Homeowners relying on guidance from box stores or TV shows are misled into construction practices that are hazardous to their wellbeing and to the longevity of their property. The larger the deck, the more occupants it carries and the greater the probability of someone getting hurt. As a deck gets larger, so usually does its interface with the home. With this comes a greater likelihood that commonly overlooked hazards will occur. Decks constructed over emergency escape and rescue opening windows, over cat. IV appliance vents, ledgers blocking brick weepholes and foundation vents, decks under low overhead service cables, stairs near glazing, clearances at dryer exhaust vents, combustion air intake openings, and electrical service equipment working clearances…these are all subject to code violations from a poorly designed deck. With any regulation, a line has to be drawn. Why 30" of height, not 29"? Why 200 sf and not 210 sf? A line has to be drawn somewhere, 200 SF seems fair.

As for the connection to the house, poorly flashed connections will cause damage to the structure of the home. Exterior claddings such as stucco, adhered and anchored veneers, EIFS and vinyl siding must be appropriately handled when a deck is connected.

Pictures tell a thousand words.

This category IV appliance vent was going to be buried under this deck, as was the 24" egress window well for the basement of the house (note: constructed prior to 1994 UBC when 24" was the minimum).

The contactor attached it over siding with no flashing, and buried the siding with about eight inches of dirt excavated from the piers.

Public Comment 2:

Tim Pate, City and County of Broomfield, representing Colorado Chapter Code Change Committee, requests Disapproval.

Commenter's Reason: I do not agree with the proponent's original reason statement where he claims that since the existing 200 square foot limit is an arbitrary number and therefore we should just delete this limit and actually not require permits for any deck that is 30 inches or less. I do not think that most jurisdictions require permits for decks just due to zoning requirements but to verify structural designs.

I would argue that by requiring permits for decks we are able to verify that the structure is meeting the IRC requirements for structural design and therefore safe. In reality, the larger the deck, the bigger the number of people that can fit on the deck. There would be a very real possibility that if there was a failure of a deck that was 29" or 30" above the ground that people could get hurt or killed even falling at this height.

I would also argue that the best way to approach this would be to require permits for all decks no matter the size and no matter the height above ground rather than the approach that this proponent took.

Final Action: AS AM AMPC____ D

RB8-13
R106.1.4 (New), R702.8 (New), R703.13 (New); Chapter 44, AJ301.1.1.1 (New), AJ701 (New)

Proposed Change as Submitted

Proponent: Rebecca Morley, representing National Center for Healthy Housing

Add new text as follows:

IRC SECTION R106
CONSTRUCTION DOCUMENTS

R106.1.4 Certifications and plans where painted surfaces are disturbed. Where a dwelling was completed prior to 1978 and repair, alteration or addition being performed will result in the disturbance of painted surfaces, the contractor shall provide to the code official one of the following:

1. Copies of EPA or state renovation firm certification, renovator certification and a plan for compliance in accordance with 40 CFR 745 requirements for renovations.
2. Documentation from an approved test in accordance with 40 CFR 745.82(a)(1) or (2) that shows that the disturbed paint contains lead that is below specified levels.

IRC SECTION R702
INTERIOR COVERINGS

R702.8 Disturbance of existing painted surfaces. In any dwelling completed prior to 1978, repairs, alteration and additions where painted surfaces are disturbed shall comply with the information distribution, certification and work practice requirements of 40 CFR 745 for renovations.

> **Exception:** Where documentation is provided from an approved test in accordance with 40 CFR 745.82(a)(1) or (2) that proves that the disturbed paint contains lead levels below specified levels, the work is not required to comply with this section.

IRC SECTION R703
EXTERIOR COVERING

R703.13 Disturbance of existing painted surfaces. In any dwelling completed prior to 1978, repairs, alteration and additions where painted surfaces are disturbed shall comply with the information distribution, certification and work practice requirements of 40 CFR 745 for renovations.

> **Exception:** Where documentation is provided from an approved test in accordance with 40 CFR 745.82(a)(1) or (2) that proves that the disturbed paint contains lead levels below specified levels, the work is not required to comply with this section.

CHAPTER 44
REFERENCED STANDARDS

EPA
U.S. Environmental Protection Agency

40 CFR 745-July 1, 2012 Lead-Based Paint Poisoning Prevention in Certain Residential Structures

SECTION AJ301
REPAIRS

AJ301.1.1.1 Disturbance of existing painted surfaces. In any dwelling completed prior to 1978, repairs, alteration and additions where painted surfaces are disturbed shall comply with the information distribution, certification and work practice requirements of 40 CFR 745 for renovations.

> **Exception:** Where documentation is provided from an approved test in accordance with 40 CFR 745.82(a)(1) or (2) that proves that the disturbed paint contains lead levels below specified levels, the work is not required to comply with this section.

SECTION AJ701 REFERENCED STANDARDS

EPA
U.S. Environmental Protection Agency

40 CFR 745 Lead-Based Paint Poisoning Prevention in Certain Residential Structures

Reason: This code change proposal is to incorporate protection from lead-based paint by specifying (1) that additions, alterations, and repairs to pre-1978 homes comply with federal health-protective requirements to protect children from lead poisoning and (2) that permit applicants include, with the other construction documents, evidence of compliance.

The purpose of this proposed code language is to incorporate protection from lead-based paint into the Code through the requirement for construction documents. Once the Code requires permit applicants to demonstrate up front their knowledge of, and plans to follow, the federal and state renovation rule requirements, the code official will be positioned to provide important oversight and leadership in preventing lead poisoning without even leaving the office. This oversight will help level the playing field between contractors who are complying with the rule and noncompliant entities who are under-pricing and undercutting their competitors. By merely asking an applicant for the missing documents, the code official can influence entities not following the law into compliance before the work even starts. In a few cases, these entities may be unaware of the regulations. Although these regulations have been in effect since April 2010, and have been adopted by 12 states, reported non-compliance is affecting the compliant contractor and continuing the problem of lead poisoning in the US.

The proposed "plan for compliance in accordance with 40 CFR 745 requirements for renovations" with the federal disclosure and work practice requirements" can take different forms depending on what documents the builder is already using. Some builders who work on pre-1978 homes are already using a form to track their upfront assessments and another form for recordkeeping. Anyone working in pre-1978 homes should have an EPA or state certification for their firm, along with at least one individual renovator certification that the renovator received at the end of the required one-day training course. These requirements are already in effect in federal and state regulation.

The plan and certifications would only be needed for a structure likely to contain lead-based paint: a pre-1978 home. As noted under the exception, the requirement is waived if paint testing proves that the paint is not lead-based paint. A rebuttable presumption of lead's presence allows the builder to demonstrate that lead is not present and obtain exemption from the requirements. EPA-approved tests include lead-based paint inspection or risk assessment, test kit used by a certified renovator, and collection of a lead-based paint chips for laboratory analysis.

Renovation of painted surfaces is a significant source of lead dust that poisons children. The dangers associated with lead poisoning are well-known: serious health effects, detrimental effects on cognitive and behavioral development, with serious personal and social consequences that may persist throughout their lifetime.

Multiple studies have demonstrated that lead dust is the major source of lead poisoning for young children. There is no safe level of lead exposure for children; lead affects intelligence even at very low levels.[1,2,5,8,9] Indeed, the rate of IQ loss per 1 microgram of lead per deciliter of blood (μg/dL) is greatest at lead levels below 10 μg/dL. As a child's BLL increases from 1 to 10 μg/dL, experts estimate a child may lose anywhere from 3.9 to 7.4 IQ points, but from 10 to 30 μg/dL the decrement is 2.5 to 3.0 IQ points. Low-level chronic exposure may have an even greater effect on IQ than a single instance of very high BLL.[10]

Research indicates that a five-point negative shift in IQ at the population level would increase the number of children with an "extremely low" IQ by 57%, substantially increasing the cost of special education programs.[3] Considering the costs to the special education system alone, one study conservatively estimated that it costs $38,000 over three years to educate a child with lead poisoning.[11] Low-level exposure to lead has also been linked to factors other than IQ that can further impact educational outcomes. EBLLs are associated with Attention Deficit Hyperactivity Disorder (ADHD) and antisocial behavior, which in turn increase the likelihood of conduct disorder, criminal activity, and drug abuse.[1,4] Each 1 μg/dL reduction in the average preschool blood lead level saves $13.4 billion from the direct and indirect costs of crime.[1]

Several recent studies have explored the specific effects of lead on educational outcomes. These studies show a strong relationship between slightly elevated blood lead levels in young children and decreased scores on end-of-grade tests in elementary school. While similar educational effects were documented for higher blood levels decades ago,[12] the recent studies confirm that the connection between blood lead and poor educational outcomes remains true for blood levels as low as 3-4 μg/dL. A more recent study of 57,000 North Carolina children found that children with a BLL as low as 4 μg/dL at three years of age were significantly more likely to be classified as learning-disabled than children with a BLL of 1 μg/dL.[6]

The consequences of lead exposure are clear. This code change proposal seeks to reduce the risk of lead exposure during and after work performed on a pre-1978 home – and level the playing field among contractors working on pre-1978 properties.

The EPA 40 CFR 745 standard is available at http://www.gpo.gov/fdsys/pkg/CFR-2012-title40-vol32/xml/CFR-2012-title40-vol32-part745.xml.

Cost Impact: This code change proposal will not increase the cost of construction.

Staff analysis: A review of the standard proposed for inclusion in the code, EPA 40 CFR 745-July 1, 2012, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

R106.1.4 (NEW)-RB-MORLEY

Committee Action Hearing Results

Committee Action: Disapproved

For staff analysis of the content of U.S. EPA 40 CFR 745 relative to CP#28, Section 3.6, please visit:
http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf

Committee Reason: The committee disapproved this proposed code change because they felt that the requirements dealing with lead are federal and should remain in that domain. All federal requirements do not belong in the code.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Mark Henshall, representing US Environmental Protection Agency, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION R106
CONSTRUCTION DOCUMENTS

R106.1.4 Certifications and plans where painted surfaces are disturbed. Where a dwelling was completed prior to 1978 and repair, alteration or addition being performed will result in the disturbance of painted surfaces, the contractor shall provide to the code official ~~one of the following:~~

~~1.~~ a copy of a current Renovation Repair and Painting firm certification issued by either EPA in accordance with 40 CFR 745.89 or by a state program authorized by EPA in accordance with 40 CFR 745 Subpart Q. ~~Copies of EPA or state renovation firm certification, renovator certification and a plan for compliance in accordance with 40 CFR 745 requirements for renovations.~~

~~2. Documentation from an approved test in accordance with 40 CFR 745.82(a)(1) or (2) that shows that the disturbed paint contains lead that is below specified levels.~~

~~SECTION R702~~
~~INTERIOR COVERINGS~~

~~**R702.8 Disturbance of existing painted surfaces.** In any dwelling completed prior to 1978, repairs, alteration and additions where painted surfaces are disturbed shall comply with the information distribution, certification and work practice requirements of 40 CFR 745 for renovations.~~

~~**Exception:** Where documentation is provided from an approved test in accordance with 40 CFR 745.82(a)(1) or (2) that proves that the disturbed paint contains lead levels below specified levels, the work is not required to comply with this section.~~

~~SECTION R703~~
~~EXTERIOR COVERING~~

~~**R703.13 Disturbance of existing painted surfaces.** In any dwelling completed prior to 1978, repairs, alteration and additions where painted surfaces are disturbed shall comply with the information distribution, certification and work practice requirements of 40 CFR 745 for renovations.~~

~~**Exception:** Where documentation is provided from an approved test in accordance with 40 CFR 745.82(a)(1) or (2) that proves that the disturbed paint contains lead levels below specified levels, the work is not required to comply with this section.~~

CHAPTER 44
REFERENCED STANDARDS

EPA
U.S. Environmental Protection Agency

40 CFR 745-~~July 1, 2012~~ Lead-Based Paint Poisoning Prevention in Certain Residential Structures – July 1, 2012

Commenter's Reason: This code change proposal is to incorporate protection from lead-based paint by specifying that permit applicants include, with the other construction documents, evidence of compliance with the firm certification requirements of EPA's or an authorized states Renovation, Repair and Painting Regulation. The local building code official would have no other responsibility than to request a copy of a current Renovation Repair and Painting firm certification

EPA's Lead-Based Paint Renovation, Repair and Painting (RRP) Rule aims to protect the public from lead-based paint hazards associated with renovation, repair and painting activities. These activities can create hazardous lead dust when surfaces with lead paint, are disturbed. The rule requires workers to be certified and trained in the use of lead-safe work practices, and requires renovation, repair and painting firms to be EPA-certified. This training and adherence to lead-safe work practices will help ensure residents are not exposed to hazardous levels of lead contaminated dust.

The original proposal required "a plan for compliance for renovations in accordance with 40 CFR 745 requirements for renovations." Questions were raised as to what constituted a plan and what would be expected in terms of the code official approving such a plan. In addition, the original proposal could be interpreted to mean that local building officials were being asked to enforce a federal regulation. This modification to the original proposal has addressed these concerns.

Public Comment 2:

Jane Malone, National Center for Healthy Housing, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

Add new text as follows:

R702.8 Disturbance of existing painted surfaces. In any dwelling completed prior to 1978, repairs, alteration and additions where painted surfaces are disturbed shall not leave behind visible dust, debris or residue.

Exception: Where documentation is provided from an approved test in accordance with 40 CFR 745.82(a) that the disturbed paint contains lead levels below specified levels, the work is not required to comply with this section.

R703.13 Disturbance of existing painted surfaces. On any dwelling completed prior to 1978, repairs, alteration and additions where painted surfaces are disturbed shall not leave behind visible dust, debris or residue.

> **Exception:** Where documentation is provided from an approved test in accordance with 40 CFR 745.82(a) that the disturbed paint contains lead levels below specified levels, the work is not required to comply with this section.

CHAPTER 44
REFERENCED STANDARDS

EPA
U.S. Environmental Protection Agency
40 CFR 745-July 1, 2012 Lead-Based Paint Poisoning Prevention in Certain Residential Structures

SECTION AJ301
REPAIRS

AJ301.1.1.1 Disturbance of existing painted surfaces. In any dwelling completed prior to 1978, repairs, alterations and additions where painted surfaces are disturbed shall leave behind no visible dust, debris or residue.

> **Exception:** Where documentation is provided from an approved test in accordance with 40 CFR 745.82(a) that the disturbed paint contains lead levels below specified levels, the work is not required to comply with this section.

Commenter's Reason: Based on the Committee decision, we have reduced this code change from a requirement for full compliance with the federal regulation to the essential but simple performance standard that will protect occupant's and worker's children from exposure to harmful lead. It is consistent with the federal regulation in that clean-up is required at the end of renovation work. This requirement can be enforced by the code official with a visual inspection: no testing or special information is needed.

The exemption applies if the project meets one of these standards at 40 CFR 745.82(a):

1. a written determination has been made by a certified inspector or risk assessor that the components affected by the renovation are free of paint or other surface coatings that contain lead;
2. a certified renovator, using an EPA recognized test kit, has tested each component affected by the renovation and determined that the components are free of paint or other surface coatings that contain lead;
3. a certified renovator has collected a paint chip sample from each painted component affected by the renovation and a laboratory recognized by EPA has determined that the samples are free of paint or other surface coatings that contain lead.

RB8-13
Final Action: AS AM AMPC____ D

RB12-13
R202

Proposed Change as Submitted

Proponent: Rick Davidson, City of Maple Grove, Association of Minnesota Building Officials (rdavidson@maplegrovemn.gov)

Revise as follows:

SECTION R202
DEFINITIONS

ATTIC. The unfinished space between the ceiling assembly ~~of the top *story*~~ and the roof assembly.

Reason: The current definition of "attic" is insufficient in that it excludes spaces that clearly should be regulated. Attics exist at locations other than the top story. It encourages a lack of uniformity in enforcement and confusion from all users of the code.

Examples of areas where the current definition becomes problematic include rules regarding attics with limited storage, exposed foam plastics, insulation requirements, fire separations, draft stops, structural requirements, access, and ventilation. These rules are intended to apply to all attics, not just those defined as being above the top story.

Cost Impact: None

R202-ATTIC-RB-DAVIDSON

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that the term "top story" needs to be maintained for clarity purposes.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rick Davidson, City of Maple Grove, representing Association of Minnesota Building Officials, requests Approval as Submitted.

Commenter's Reason: This proposal deletes the reference to "top story" from the definition of attic. This proposal was disapproved by the IRC Committee because the reason statement says the term "top story" is needed for "clarity purposes". At the beginning of the IRC is a section titled "Effective Use of the International Residential Code". In that section is an explanation of terms defined in the IRC. It states that when a term is italicized it means that the definition is uniquely used in the IRC and in those cases the published definition applies.

What follows are a number of sections from the IRC where the italicized word "*attic"* is used and therefore the definition in the IRC is clearly intended to apply.

I ask that you read through some of these code sections and apply the IRC definition of the word "attic". Every place you see "attic", think only of the top story. Does the defined term add clarity as was stated by the IRC Committee? Or, are commonly used applications of the code null and void because the definition does not include attics that may not be in the top story of a building but where applications of the code would normally occur?

As a permit holder, I would be willing to push the envelope if I didn't feel a particular code section was necessary and the definition suited my needs. Prosecutions of such "violations" would never get past the city attorney's desk. You need to be able to prosecute violations, not just write correction orders.

For example, suppose I construct a 2 story dwelling with an attached one story garage. I place a lid on the garage ceiling. I don't provide an access. I don't install collar ties in my hand framed garage roof. And, I don't ventilate the space. Can you prosecute any of these items as a code violation even though they would clearly be required in the attic of the top story of the dwelling? Not given the current text in the code and knowledge by the persons involved of the definitions.

Those who enforce the code need to be able to explain the requirements to the public. When you have differing rules that apply to very similar conditions in the same structure, that task becomes difficult and suggests to the public that the rules makers don't know what they are doing and that in turn impacts credibility. The proposed code change needs to be approved to achieve clarity and consistency.

Effective Use of the International Residential Code
Where understanding a term's definition is key to or necessary for understanding a particular code provision, the term is shown in italics where it appears in the code. This is true only for those terms that have a meaning that is unique to the code. In other words, the generally understood meaning of a term or phrase might not be sufficient or consistent with the meaning prescribed by the code; therefore, it is essential that the code-defined meaning be known.

ATTIC. The unfinished space between the ceiling assembly of the top *story* and the roof assembly.

DRAFT STOP. A material, device or construction installed to restrict the movement of air within open spaces of concealed areas of building components such as crawl spaces, floor-ceiling assemblies, roof-ceiling assemblies and *attics*.

R302.3 Two-family dwellings. *Dwelling units* in two-family dwellings shall be separated from each other by wall and/or floor assemblies having not less than a 1-hour fire-resistance rating when tested in accordance with ASTM E 119 or UL 263. Fire-resistance-rated floor/ceiling and wall assemblies shall extend to and be tight against the *exterior wall*, and wall assemblies shall extend from the foundation to the underside of the roof sheathing.

Exceptions:

1. A fire-resistance rating of 1/2 hour shall be permitted in buildings equipped throughout with an automatic sprinkler system installed in accordance with NFPA 13.
2. Wall assemblies need not extend through *attic* spaces when the ceiling is protected by not less than 5/8-inch (15.9 mm) Type X gypsum board and an *attic* draft stop constructed as specified in Section R302.12.1 is provided above and along the wall assembly separating the *dwellings*. The structural framing supporting the ceiling shall also be protected by not less than 1/2-inch (12.7 mm) gypsum board or equivalent.

R302.10.1 Insulation. Insulation materials, including facings, such as vapor retarders and vapor-permeable membranes installed within floor/ceiling assemblies, roof/ ceiling assemblies, wall assemblies, crawl spaces and *attics* shall have a flame spread index not to exceed 25 with an accompanying smoke-developed index not to exceed 450 when tested in accordance with ASTM E 84 or UL 723.

R302.10.4 Exposed attic insulation. All exposed insulation materials installed on *attic* floors shall have a critical radiant flux not less than 0.12 watt per square centimeter.

R314.3 Location. Smoke alarms shall be installed in the following locations:

1. In each sleeping room.
2. Outside each separate sleeping area in the immediate vicinity of the bedrooms.
3. On each additional *story* of the *dwelling*, including *basements* and habitable attics but not including crawl spaces and uninhabitable *attics*. In *dwellings* or *dwelling units* with split levels and without an intervening door between the adjacent levels, a smoke alarm installed on the upper level shall suffice for the adjacent lower level provided that the lower level is less than one full *story* below the upper level.

R314.4 Power source. Smoke alarms shall receive their primary power from the building wiring when such wiring is served from a commercial source, and when primary power is interrupted, shall receive power from a battery. Wiring shall be permanent and without a disconnecting switch other than those required for overcurrent protection.

Exceptions:

1. Smoke alarms shall be permitted to be battery operated when installed in buildings without commercial power.
2. Hard wiring of smoke alarms in existing areas shall not be required where the *alterations* or repairs do not result in the removal of interior wall or ceiling finishes exposing the structure, unless there is an *attic*, crawl space or *basement* available which could provide access for hard wiring without the removal of interior finishes.

R316.5.3 Attics. The thermal barrier specified in Section R316.4 is not required where all of the following apply:

1. *Attic* access is required by Section R807.1.

R316.5.12 Sheathing. Foam plastic insulation used as sheathing shall comply with Section R316.3 and Section R316.4. Where the foam plastic sheathing is exposed to the *attic* space at a gable or kneewall, the provisions of Section R316.5.3 shall apply.

R501.1 Application. The provisions of this chapter shall control the design and construction of the floors for all buildings including the floors of *attic* spaces used to house mechanical or plumbing fixtures and *equipment*.

R502.3.1 Sleeping areas and attic joists. Table R502.3.1(1) shall be used to determine the maximum allowable span of floor joists that support sleeping areas and *attics* that are accessed by means of a fixed stairway in accordance with Section R311.7 provided that the design live load does not exceed 30 pounds per square foot (1.44 kPa) and the design dead load does not exceed 20 pounds per square foot (0.96 kPa). The allowable span of ceiling joists that support *attics* used for limited storage or no storage shall be determined in accordance with Section R802.4.

R502.3.2 Other floor joists. Table R502.3.1(2) shall be used to determine the maximum allowable span of floor joists that support all other areas of the building, other than sleeping rooms and *attics*, provided that the design live load does not exceed 40 pounds per square foot (1.92 kPa) and the design dead load does not exceed 20 pounds per square foot (0.96 kPa).

R603.3.2 Minimum stud sizes. Cold-formed steel walls shall be constructed in accordance with Figure R603.3.1(1), R603.3.1(2) or R603.3.1(3), as applicable. Exterior wall stud size and thickness shall be determined in accordance with the limits set forth in Tables R603.3.2(2) through R603.3.2(31). Interior load-bearing wall stud size and thickness shall be determined in accordance with the limits set forth in Tables R603.3.2(2) through R603.3.2(31) based upon an 85 miles per hour (38 m/s) Exposure A/B wind value and the building width, stud spacing and snow load, as appropriate. Fastening requirements shall be in accordance with Section R603.2.4 and Table R603.3.2(1). Top and bottom tracks shall have the same minimum thickness as the wall studs. Exterior wall studs shall be permitted to be reduced to the next thinner size, as shown in Tables R603.3.2(2) through R603.3.2(31), but not less than 33 mils (0.84 mm), where both of the following conditions exist:

1. Minimum of 1/2 inch (12.7 mm) gypsum board is installed and fastened in accordance with Section R702 on the interior surface.
2. Wood structural sheathing panels of minimum 7/16-inch-thick (11 mm) oriented strand board or 15/32-inch-thick (12 mm) plywood is installed and fastened in accordance with Section R603.9.1 and Table R603.3.2(1) on the outside surface.

Interior load-bearing walls shall be permitted to be reduced to the next thinner size, as shown in Tables R603.3.2(2) through R603.3.2(31), but not less than 33 mils (0.84 mm), where a minimum of 1/2-inch (12.7 mm) gypsum board is installed and fastened in accordance with Section R702 on both sides of the wall. The tabulated stud thickness for load- bearing walls shall be used when the *attic* load is 10 pounds per square feet (480 Pa) or less. A limited *attic* storage load of 20 pounds per square feet (960 Pa) shall be permitted provided that the next higher snow load column is used to select the stud size from Tables R603.3.2(2) through R603.3.2(31).

R611.2 Applicability limits. The provisions of this section shall apply to the construction of exterior concrete walls for buildings not greater than 60 feet (18 288 mm) in plan dimensions, floors with clear spans not greater than 32 feet (9754 mm) and roofs with clear spans not greater than 40 feet (12 192 mm). Buildings shall not exceed 35 feet (10 668 mm) in mean roof height or two stories in height above-grade. Floor/ceiling dead loads shall not exceed 10 pounds per square foot (479 Pa), roof/ceiling dead loads shall not exceed 15 pounds per square foot (718 Pa) and *attic* live loads shall not exceed 20 pounds per square foot (958 Pa).

R802.3.1 Ceiling joist and rafter connections. Ceiling joists and rafters shall be nailed to each other in accordance with Table R802.5.1(9), and the rafter shall be nailed to the top wall plate in accordance with Table R602.3(1). Ceiling joists shall be continuous or securely joined in accordance with Table R802.5.1(9) where they meet over interior partitions and are nailed to adjacent rafters to provide a continuous tie across the building when such joists are parallel to the rafters. Where ceiling joists are not connected to the rafters at the top wall plate, joists connected higher in the *attic* shall be installed as rafter ties, or rafter ties shall be installed to provide a continuous tie…

Collar ties or ridge straps to resist wind uplift shall be connected in the upper third of the *attic* space in accordance with Table R602.3(1).

R804.3.1.1 Minimum ceiling joist size. Ceiling joist size and thickness shall be determined in accordance with the limits set forth in Tables R804.3.1.1(1) through R804.3.1.1(8). When determining the size of ceiling joists, the lateral support of the top flange shall be classified as unbraced, braced at mid-span or braced at third points in accordance with Section R804.3.1.4. Where sheathing material is attached to the top flange of ceiling joists or where the bracing is spaced closer than third point of the joists, the "third point" values from Tables R804.3.1.1(1) through R804.3.1.1(8) shall be used. Ceiling joists shall have a bearing support length of not less than 11/2 inches (38 mm) and shall be connected to roof rafters (heel joint) with No. 10 screws in accordance with Figures R804.3.1.1(1) and R804.3.1.1(2) and Table 804.3.1.1(9). When continuous joists are framed across interior bearing supports, the interior bearing supports shall be located within 24 inches (610 mm) of midspan of the ceiling joist, and the individual spans shall not exceed the applicable spans in Tables R804.3.1.1(2), R804.3.1.1(4), R804.3.1.1(6) and R804.3.1.1(8). When the *attic* is to be used as an *occupied space,* the ceiling joists shall be designed in accordance with Section R505.

R806.1 Ventilation required. Enclosed *attics* and enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters shall have cross ventilation for each separate space by ventilating openings protected against the entrance of rain or snow.

R806.5 Unvented attic and unvented enclosed rafter assemblies. Unvented *attic* assemblies (spaces between the ceiling joists of the top *story* and the roof rafters) and unvented enclosed rafter assemblies (spaces between ceilings that are applied directly to the underside of roof framing members/rafters and the structural roof sheathing at the top of the roof framing members/rafters) shall be permitted if all the following conditions are met:

1. The unvented *attic* space is completely contained within the *building thermal envelope.*

R807.1 Attic access. Buildings with combustible ceiling or roof construction shall have an *attic* access opening to *attic* areas that exceed 30 square feet (2.8 m2) and have a vertical height of 30 inches (762 mm) or greater. The vertical height shall be measured from the top of the ceiling framing members to the underside of the roof framing members. The rough-framed opening shall not be less than 22 inches by 30 inches (559 mm by 762 mm) and shall be located in a hallway or other readily accessible location. When located in a wall, the opening shall be a minimum of 22 inches wide by 30 inches high (559 mm wide by 762 mm high). When the access is located in a ceiling, minimum unobstructed headroom in the *attic* space shall be 30 inches (762 mm) at some point above the access measured vertically from the bottom of ceiling framing members. See Section M1305.1.3 for access requirements where mechanical *equipment* is located in *attics.*

R1006.2 Exterior air intake. The exterior air intake shall be capable of supplying all *combustion air* from the exterior of the *dwelling* or from spaces within the *dwelling* ventilated with outside air such as nonmechanically ventilated crawl or *attic* spaces. The exterior air intake shall not be located within the garage or *basement* of the *dwelling* nor shall the air intake be located at an elevation higher than the firebox. The exterior air intake shall be covered with a corrosion-resistant screen of 1/4-inch (6 mm) mesh.

M1305.1.3 Appliances in attics. *Attics* containing *appliances* shall be provided with an opening and a clear and unobstructed passageway large enough to allow removal of the largest *appliance*, but not less than 30 inches (762 mm) high and 22 inches (559 mm) wide and not more than 20 feet (6096 mm) long measured along the centerline of the passageway from the opening to the *appliance*. The passageway shall have continuous solid flooring in accordance with Chapter 5 not less than 24 inches (610 mm) wide. A level service space at least 30 inches (762 mm) deep and 30 inches (762 mm) wide shall be present along all sides of the *appliance* where access is required. The clear access opening dimensions shall be a minimum of 20 inches by 30 inches (508 mm by 762 mm), and large enough to allow removal of the largest appliance.

Final Action: AS AM AMPC____ D

RB23-13
R202

Proposed Change as Submitted

Proponent: Joseph D. Belcher, JDB Code Services, Inc, representing the International Hurricane Protection Association (joe@jdbcodeservices.com)

Add new definition as follows:

R202
DEFINITIONS

IMPACT PROTECTIVE SYSTEM: Construction that has been shown by testing to withstand the impact of test missiles and that is applied, attached, or locked over exterior glazing.

Reason: Definition is added as companion to proposed change to Section R105.1 adding impact protective systems to the permitting requirements of the code. The definition is taken from ASCE 7-10 to assure consistency.

Cost Impact: The proposal is to add a definition and will have no cost.

Staff Analysis: Mr. Belcher has a companion change for a new Section 614 that has criteria for impact protective systems. Requirements for these types of systems are in the IRC in Section R301.2.1.2 and R612.6.

R202 IMPACT PROTECTIVE SYSTEM (NEW)-RB-BELCHER

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: This definition is not needed since the term is not used in the IRC. Also, there are alternate means other than testing that could be used.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Joseph D. Belcher, JDB Code Services, Inc., representing International Hurricane Protection Association (IHPA), requests Approval as Submitted.

Commenter's Reason: Impact protective systems are one means for complying with code requirements for opening protection in wind-borne debris regions. The code does not contain a definition for this important element in providing wind resistance in hurricane conditions. Both ASTM 1996 and ASCE 7-10 define Impact Protective System and the definition should be in the code to assure compliance. The definition is added as a companion to proposed change to Section R 105.1 (RB5-13) adding impact protective systems to the permitting requirements of the code. The definition is taken from ASCE 7-10 to assure consistency and because the ASCE definition indicates the requirement for testing.

RB23-13
Final Action: AS AM AMPC____ D

RB30-13
R202 (New)

Proposed Change as Submitted

Proponent: Gary J. Ehrlich, P.E., representing National Association of Home Builders (NAHB) (gehrlich@nahb.org)

Add new text as follows:

R202
DEFINITIONS

SHINGLE FASHION. A method of installing roof or wall coverings, water-resistive barriers, flashing, or other building components such that upper layers of material are placed overlapping lower layers of material to provide for drainage via gravity and moisture control.

Reason: The purpose of this code change is to introduce to the IRC a definition for "shingle fashion". This term is used in the IBC and IRC to describe the required method of applying moisture control layers such as roof underlayment and water-resistive barriers to the building. The intent is to direct the builder, contractor or installer to place upper layers of material lapping over lower layers of material, in the fashion of placing roof shingles, so moisture is provided with a clear path to drain down and away from the building. In field investigations of buildings with mold and moisture issues, it is frequently discovered that flashing, WRBs or underlayment have been placed in ***reverse*** shingle fashion, with the upper layer tucked behind the lower layer. This permits moisture to drain behind or below the intended protective layer or material where it can be trapped and lead to mold and decay of building components. The above definition was approved earlier this cycle (G21-12) for inclusion in the 2015 IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

R202-SHINGLE FASHION (NEW)-RB-EHRLICH

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

SHINGLE FASHION. A method of installing roof or wall coverings, water-resistive barriers, flashing, or other building components such that upper layers of material are placed overlapping lower layers of material to provide ~~for~~ drainage and protect against water intrusion at unsealed penetrations and joints or in combination with sealed joints ~~via gravity and moisture control~~.

Committee Reason: This adds a needed and important definition. This is consistent with the action for the IBC in Group A. The modification clarifies what the method is protecting against.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Theresa A. Weston, PhD., representing DuPont Building Innovations, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SHINGLE FASHION. A method of installing roof or wall coverings, water-resistive barriers, flashing, or other building components such that upper layers of material are placed overlapping lower layers of material to provide for drainage and protect against water intrusion at penetrations and joints ~~via gravity and moisture control.~~

Commenter's Reason: This modification simplifies the definition approved as modified by the committee. It does not need to be stated explicitly that shingle fashion can pertain to either sealed or unsealed joints as there are no other type of joint and this can be more simply stated as just "penetrations and joints" alone.

RB30-13

Final Action: AS AM AMPC____ D

RB38-13

Table R301.2(1)

Proposed Change as Submitted

Proponent: Matthew L. Mlakar, Barrish Pelham & Associates, Inc., representing Structural Engineers Association of California

Revise as follows:

TABLE R301.2(1)
CLIMATIC AND GEOGRAPHIC DESIGN CRITERIA

GROUND SNOW LOAD	WIND DESIGN				SEISMIC DESIGN CATEGORY[f]
	Speed[d] (mph)	Topographic effects[k]	Special wind region[l]	Wind-borne debris zone[m]	

(Portions of table not shown to remain unchanged.)

a through k *(No changes to text)*

l. In accordance with Table R301.2(4)B, where there is local historical data documenting unusual wind conditions, the jurisdiction shall fill in this part of the table with "YES" and identify any specific requirements. Otherwise, the jurisdiction shall indicate "NO" in this part of the table.

m. In accordance with Table R301.2(4)C, the jurisdiction shall indicate the wind-borne debris wind zone(s). Otherwise, the jurisdiction shall indicate "NO" in this part of the table.

Reason: Currently, the special wind regions in Table R301.2(4)B and the wind-borne debris regions in Table R301.2(4)C are shown on a single map for the entire continental United States. Attempting to interpret the map in areas where the contour lines occur can be difficult and may lead to mis-application of the tables especially since the contour lines do not follow county lines or readily identifiable borders. The identification of the transitions should be provided by the local *jurisdiction* to ensure that the proper coefficients are used.

Cost Impact: The proposed change will not impact the cost of construction.

R301.2(1)T-RB-MLAKAR

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because of potential conflicts if proposal RB39 does not pass at the Public Comment Hearings.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Matthew L. Mlakar, Barrish Pelham & Associates, representing Structural Engineers Association of California, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

TABLE R301.2(1)
CLIMATIC AND GEOGRAPHIC DESIGN CRITERIA

GROUND SNOW LOAD	WIND DESIGN				SEISMIC DESIGN CATEGORY[f]
	Speed[d] (mph)	Topographic effects[k]	Special wind region[l]	Wind-borne debris zone[m]	

(Portions of table and footnote not shown remain unchanged)

l. In accordance with ~~TableR301.2(4)B~~ FigureR301.2(4)A, where there is local historical data documenting unusual wind conditions, the jurisdiction shall fill in this part of the table with "YES" and identify any specific requirements. Otherwise, the jurisdiction shall indicate "NO" in this part of the table.
m. In accordance with ~~TableR301.2(4)C~~ SectionR301.2.1.2.1, the jurisdiction shall indicate the wind- borne debris wind zone(s). Otherwise, the jurisdiction shall indicate "NO" in this part of the table.

Commenter's Reason: The Committee's reasoning for disapproval during the hearing was that this code change proposal could cause potential conflicts if RB39 does not pass at the Public Comment Hearings. With the passage of the RB39 by the Committee and certain passage during the Public Comment Hearings, the inclusion of this proposal as amended by the Public Comment will provide clarity and needed direction to the user of the International Residential Code. The proposal requires the Authority Having Jurisdiction to include Special Wind Region Requirements and Wind-borne debris zone information into the Design Criteria table.

While these design requirements do not apply to most of the United States, when they are applicable they can have a major impact on the design and construction of the residential structure. With the passage of RB39 (and also in the current wind maps), the special wind regions in Figures R301.2(4)A and B are shown on a single map for the entire continental United States. Attempting to interpret the map in areas where the contour lines occur can be difficult and may lead to mis-application of the tables especially since the contour lines do not follow county lines or readily identifiable borders. The identification of the transitions should be provided by the local jurisdiction to ensure that the proper coefficients are used. It is important that these requirements be properly identified so as to be included in the construction requirements where applicable.

If there are uncertainties in the border location, then the Special Wind Requirements may be applied to locations where the requirements are not warranted. This can potentially drive up the cost of construction for sites adjacent to the Special Wind Regions.

RB38-13

Final Action: AS AM AMPC____ D

Proposed Change as Submitted

Proponent: Gary J. Ehrlich, P.E., National Association of Home Builders (NAHB);

Revise definitions as follows:

SECTION R202
DEFINITIONS

HURRICANE-PRONE REGIONS. Areas vulnerable to hurricanes, defined as the U.S. Atlantic Ocean and Gulf of Mexico coasts where the, ultimate design wind speed, *V_{ult}*~~,~~ ~~basic wind speed~~ is greater than 115 ~~90~~ miles per hour (51~~40~~ m/s), and Hawaii, Puerto Rico, Guam, Virgin Islands, and America Samoa.

WIND-BORNE DEBRIS REGION. Areas within *hurricane-prone regions* located ~~as designated in accordance with Figure R302.1(4)C.~~ :

1. Within 1 mile (1.61 km) of the coastal mean high water line where the ultimate design wind speed, V_{ult} is 130 mph (58 m/s) or greater; or
2. In areas where the ultimate design wind speed, V_{ult} is 140 mph (63.6 m/s) or greater; or Hawaii.

Revise as follows:

R301.2.1 Wind design criteria. Buildings and portions thereof shall be constructed in accordance with the wind provisions of this code using the ultimate design ~~basic~~ wind speed in Table R301.2(1) as determined from Figure R301.2(4)A. The structural provisions of this code for wind loads are not permitted where wind design is required as specified in Section R301.2.1.1. Where different construction methods and structural materials are used for various portions of a building, the applicable requirements of this section for each portion shall apply. Where not otherwise specified, the wind loads listed in Table R301.2(2) adjusted for height and exposure using Table R301.2(3) shall be used to determine design load performance requirements for wall coverings, curtain walls, roof coverings, exterior windows, skylights, garage doors and exterior doors. Asphalt shingles shall be designed for wind speeds in accordance with Section R905.2.4. A continuous load path shall be provided to transmit the applicable uplift forces in Section R802.11.1 from the roof assembly to the foundation.

R301.2.1.1 Wind limitations and wind design required. The wind provisions of this code shall not apply to the design of buildings where wind design is required in accordance with Figure R301.2(4)B ~~or where the basic wind speed from Figure R301.2(4)A equals or exceeds 110 miles per hour (49 m/s)~~.

Exceptions:

1. For concrete construction, the wind provisions of this code shall apply in accordance with the limitations of Sections R404 and R611.
2. For structural insulated panels, the wind provisions of this code shall apply in accordance with the limitations of Section R613.

In regions where wind design is required in accordance with Figure R301.2(4)B ~~or where the basic wind speed shown on Figure R301.2(4)A equals or exceeds 110 miles per hour (49 m/s)~~, the design of buildings for wind loads shall be in accordance with one or more of the following methods:

1. AF&PA *Wood Frame Construction Manual* (WFCM); or
2. ICC *Standard for Residential Construction in High-Wind Regions* (ICC 600); or
3. ASCE *Minimum Design Loads for Buildings and Other Structures* (ASCE 7); or
4. AISI *Standard for Cold-Formed Steel Framing—Prescriptive Method For One- and Two-Family Dwellings* (AISI S230); or
5. *International Building Code*.

The elements of design not addressed by the methods in Items 1 through 5 shall be in accordance with the provisions of this code. When ASCE 7 or the *International Building Code* is used for the design of the building, the wind speed map and exposure category requirements as specified in ASCE 7 and the *International Building Code* shall be used.

~~TABLE R301.2(2)~~

~~FIGURE R301.2(4)C~~
~~WIND-BORNE DEBRIS REGIONS~~

R301.2.1.2 Protection of openings. Exterior glazing in buildings located in windborne debris regions shall be protected from windborne debris. Glazed opening protection for windborne debris shall meet the requirements of the Large Missile Test of ASTM E 1996 and ASTM E 1886 as modified in Section R301.2.1.2.1 ~~referenced therein~~. ~~The applicable wind zones for establishing missile types in ASTM E 1996 are shown on Figure R301.2(4)C.~~ Garage door glazed opening protection for windborne debris shall meet the requirements of an *approved* impact-resisting standard or ANSI/DASMA 115.

> **Exception:** Wood structural panels with a minimum thickness of 7/16 inch (11 mm) and a maximum span of 8 feet (2438 mm) shall be permitted for opening protection in one- and two-story buildings. Panels shall be precut and attached to the framing surrounding the opening containing the product with the glazed opening. Panels shall be predrilled as required for the anchorage method and shall be secured with the attachment hardware provided. Attachments shall be designed to resist the component and cladding loads determined in accordance with either Table R301.2(2) or ASCE 7, with the permanent corrosion-resistant attachment hardware provided and anchors permanently installed on the building. Attachment in accordance with Table R301.2.1.2 is permitted for buildings with a mean roof height of 45 ~~33~~ feet (10 058 mm) or less where the ultimate design wind speed, V_{ult} is 180 mph or less. ~~located in Wind Zones 1 and 2 in accordance with Figure R301.2(4)C~~.

TABLE R301.2.1.2
WINDBORNE DEBRIS PROTECTION FASTENING SCHEDULE FOR WOOD STRUCTURAL PANELS[a,b,c,d]

a. This table is based on ~~130~~ 180 mph ultimate design wind speeds, V_{ult} and a 45 ~~33~~-foot mean roof height.

(Table and footnotes not shown to remain unchanged.)

R301.2.1.2.1. Application of ASTM E 1996. The text of Section 2.2 of ASTM E 1996 shall be substituted as follows:

> 2.2 *ASCE Standard:*

ASCE 7-10 American Society of Civil Engineers Minimum Design Loads for Buildings and Other Structures
The text of Section 6.2.2 of ASTM E 1996 shall be substituted as follows:

6.2.2 Unless otherwise specified, select the wind zone based on the strength design wind speed, V_{ult}, as follows:

6.2.2.1 *Wind Zone 1*—130 mph ≤ ultimate design wind speed, V_{ult} < 140 mph.

6.2.2.2 *Wind Zone 2*—140 mph ≤ ultimate design wind speed, V_{ult} < 150 mph at greater than one mile (1.6 km) from the coastline. The coastline shall be measured from the mean high water mark.

6.2.2.3 *Wind Zone 3*—150 mph (58 m/s) ≤ ultimate design wind speed, V_{ult} ≤ 160 mph (63 m/s), or 140 mph (54 m/s) ≤ ultimate design wind speed, V_{ult} ≤ 160 mph (63 m/s) and within one mile (1.6 km) of the coastline. The coastline shall be measured from the mean high water mark.

6.2.2.4 *Wind Zone 4*— ultimate design wind speed, V_{ult} >160 mph (63 m/s).

R301.2.1.3 Wind speed conversion. When referenced documents are based on nominal design ~~fastest mile~~ wind speeds, the ultimate design ~~three-second gust basic~~ wind speeds, V_{ult} ~~V_{3s}~~, of Figure R301.2(4)A shall be converted to nominal design ~~fastest mile~~ wind speeds, V_{asd} ~~V_{fm}~~, using Table R301.2.1.3.

a. Linear interpolation is permitted

R301.2.1.4 Exposure category. For each wind direction considered, an exposure category that adequately reflects the characteristics of ground surface irregularities shall be determined for the site at which the building or structure is to be constructed. For a site located in the transition zone between categories, the category resulting in the largest wind forces shall apply. Account shall be taken of variations in ground surface roughness that arise from natural topography and vegetation as well as from constructed features. For a site where multiple detached one- and two-family dwellings, townhouses or other structures are to be constructed as part of a subdivision, master-planned community, or otherwise designated as a developed area by the authority having jurisdiction, the exposure category for an individual structure shall be based upon the site conditions that will exist at the time when all adjacent structures on the site have been constructed, provided their construction is expected to begin within one year of the start of construction for the structure for which the exposure category is determined. For any given wind direction, the exposure in which a specific building or other structure is sited shall be assessed as being one of the following categories:

1. ~~Exposure A. Large city centers with at least 50 percent of the buildings having a height in excess of 70 feet (21 336 mm). Use of this exposure category shall be limited to those areas for which terrain representative of Exposure A prevails in the upwind direction for a distance of at least 0.5 mile (0.8 km) or 10 times the height of the building or other structure, whichever is greater.~~

~~Possible channeling effects or increased velocity pressures due to the building or structure being located in the wake of adjacent buildings shall be taken into account.~~

1~~2~~. Exposure B. Urban and suburban areas, wooded areas, or other terrain with numerous closely spaced obstructions having the size of single-family dwellings or larger. Exposure B shall be assumed unless the site meets the definition of another type exposure.

2~~3~~. Exposure C. Open terrain with scattered obstructions, including surface undulations or other irregularities, having heights generally less than 30 feet (9144 mm) extending more than 1,500 feet (457 m) from the building site in any quadrant. This exposure shall also apply to any building located within Exposure B type terrain where the building is directly adjacent to open areas of Exposure C type terrain in any quadrant for a distance of more than 600 feet (183 m). This category includes flat, open country and grasslands.

3~~4~~. Exposure D. Flat, unobstructed areas exposed to wind flowing over open water for a distance of at least 5000 feet (1,524 m) ~~1 mile (1.61 km). Shorelines in Exposure D include inland waterways, the Great Lakes, and coastal areas of California, Oregon, Washington and Alaska~~. This exposure shall apply only to those buildings and other structures exposed to the wind coming from over the water. Exposure D extends inland from the shoreline a distance of 600 feet (183 m) ~~1500 feet (457 m)~~ or 20 ~~10~~ times the height of the building or structure, whichever is greater. This category includes smooth mud flats, salt flats and unbroken ice.

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m^2, 1 mile per hour = 0.447 m/s, 1 pound per square foot = 0.0479 kPa.

Notes:

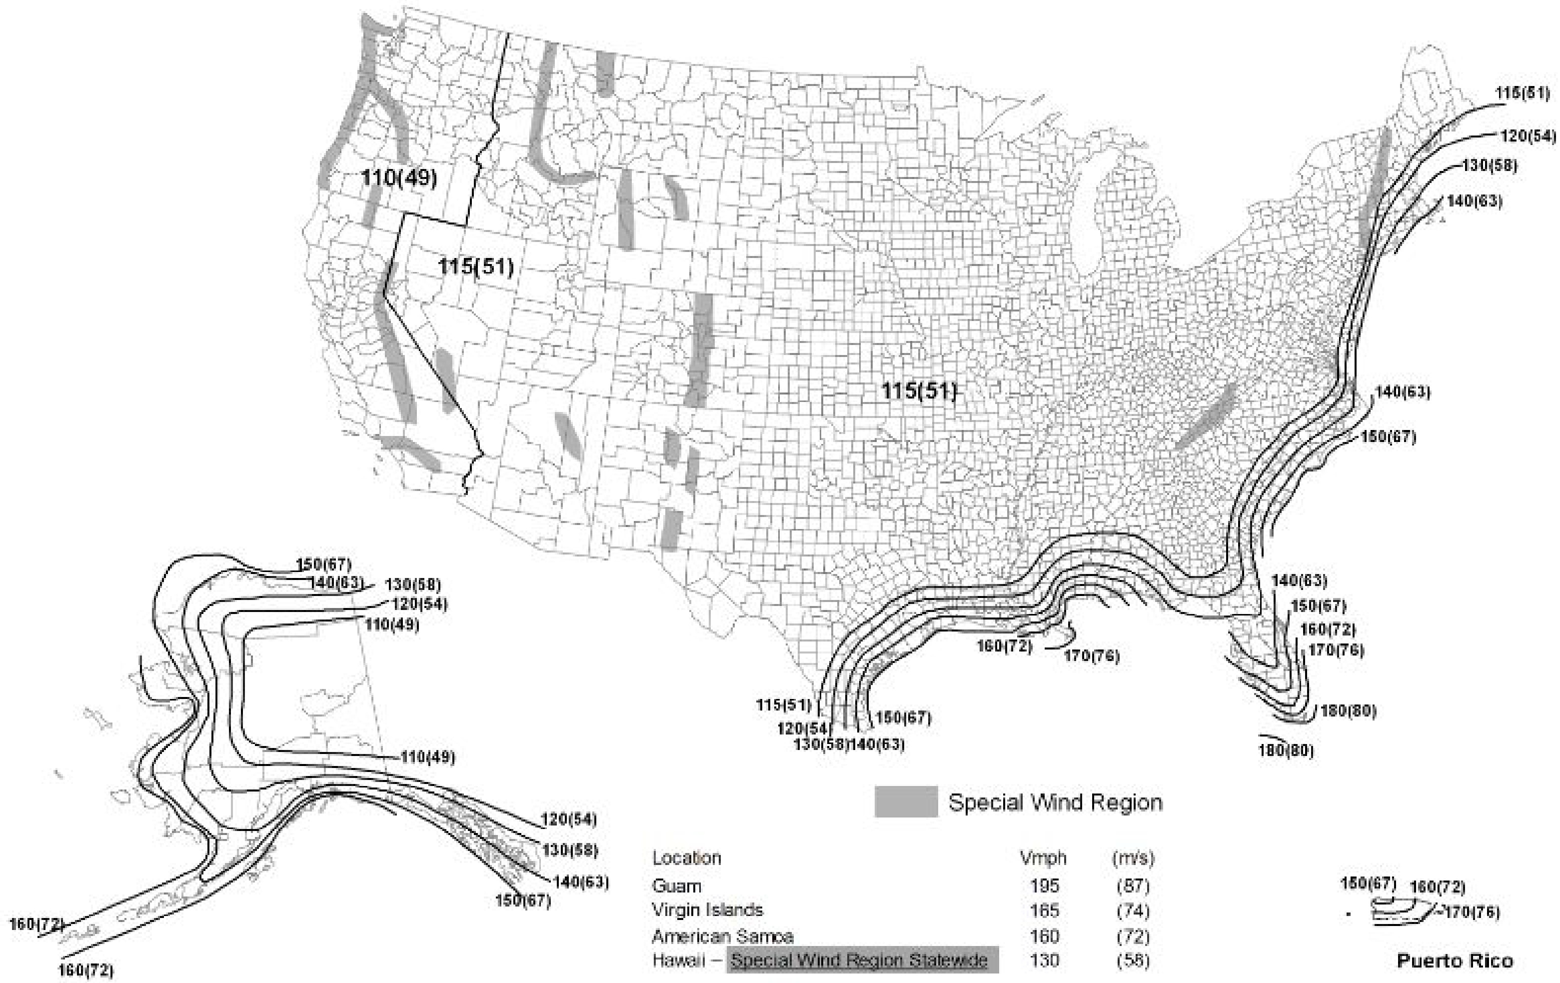
a. The effective wind area shall be equal to the span length multiplied by an effective width. This width shall be permitted to be not be less than one-third the span length. For cladding fasteners, the effective wind area shall not be greater than the area that is tributary to an individual fastener.

b. For effective areas between those given above, the load may be interpolated; otherwise, use the load associated with the lower effective area.

c. Table values shall be adjusted for height and exposure by multiplying by the adjustment coefficient in Table R301.2(3).

d. See Figure R301.2(7) for location of zones.

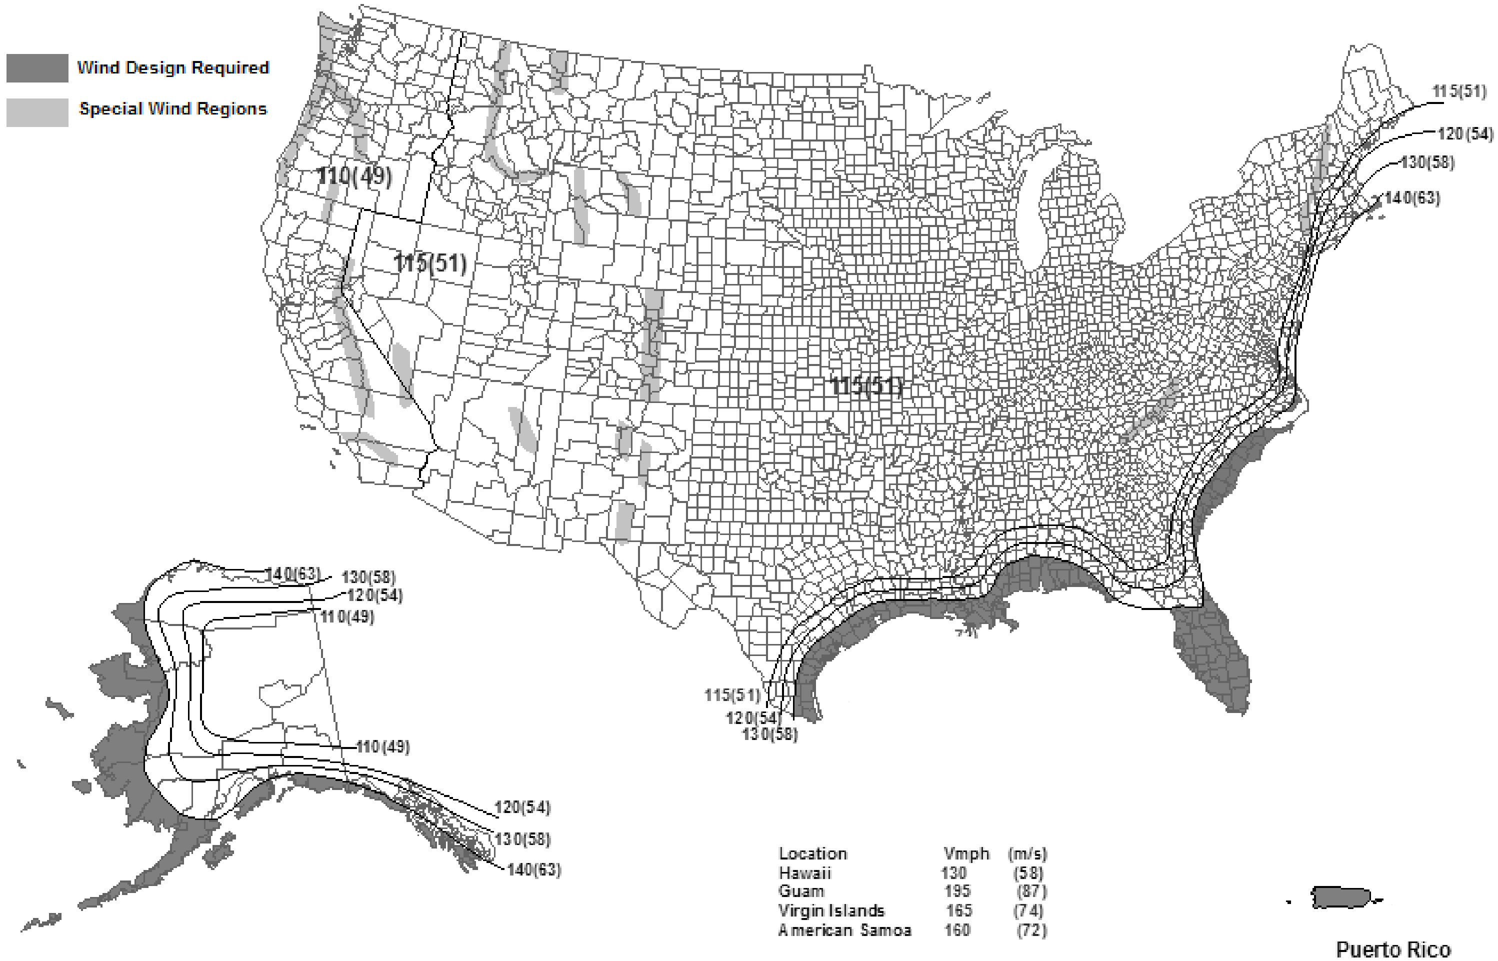
e. Plus and minus signs signify pressures acting toward and away from the building surfaces.



Location	Vmph	(m/s)
Guam	195	(87)
Virgin Islands	165	(74)
American Samoa	160	(72)
Hawaii – Special Wind Region Statewide	130	(58)

Notes:
1. Values are nominal design 3-second gust wind speeds in miles per hour (m/s) at 33 ft (10m) above ground for Exposure C category.
2. Linear interpolation between contours is permitted.
3. Islands and coastal areas outside the last contour shall use the last wind speed contour of the coastal area.
4. Mountainous terrain, gorges, ocean promontories, and special wind regions shall be examined for unusual wind conditions.
5. Wind speeds correspond to approximately a 7% probability of exceedance in 50 years (Annual Exceedance Probability = 0.00143, MRI = 700 Years).

FIGURE R301.2(4)A
ULTIMATE DESIGN WIND SPEEDS



Notes:
1. Values are nominal design 3-second gust wind speeds in miles per hour (m/s) at 33 ft (10m) above ground for Exposure C category.
2. Linear interpolation between contours is permitted.
3. Islands and coastal areas outside the last contour shall use the last wind speed contour of the coastal area.
4. Mountainous terrain, gorges, ocean promontories, and special wind regions shall be examined for unusual wind conditions.
5. Wind speeds correspond to approximately a 7% probability of exceedance in 50 years.

COMPONENT AND CLADDING PRESSURE ZONES

TABLE R301.7
ALLOWABLE DEFLECTION OF STRUCTURAL MEMBERS[a, b, c, d, e]

STRUCTURAL MEMBER	ALLOWABLE DEFLECTION
Exterior walls[a] ~~—wind loads[a]~~ with plaster or stucco finish	H/360
Exterior walls[a] with other brittle finishes	H/240
Exterior walls[a] with flexible finishes	H/120[d]
Lintels supporting masonry veneer walls [e]	L/600

Note: L = span length, H = span height.

a. The wind load shall be permitted to be taken as 0.7 times the Component and Cladding (ASD) loads obtained from Table R301.2(2) for the purpose of determining deflection limits herein.

(Footnotes not shown to remain unchanged.)

Reason: The purpose of this code change is to bring the wind provisions of the IRC in line with the 2012 IBC and ASCE 7-10. As a result of the schedule changes implemented during the 2009-2010 ICC code development cycle changes, there was not sufficient time to revise the IRC to fully implement the new ultimate wind speed basis of ASCE 7-10 and the 2012 IBC, due to the extent of prescriptive IRC provisions and tables which are directly related to basic wind speed.. New maps based on the ASCE 7-10 ultimate wind speed data but converted back down to nominal (ASD) basis were provided in the IRC. This has led to a fair amount of confusion among those stakeholders who work with both codes.

A working group of stakeholders including NAHB, the major material associations, ASCE, and the Insurance Institute for Business and Home Safety developed a series of IRC proposals to implement the new ultimate wind speed basis. This proposal updates the Chapter 3 design criteria, including definitions, a new ultimate wind speed map, a new map of the regions where special high-wind design is required, a conversion table to the nominal (ASD) wind speed basis for use with those standards which have not updated their provisions, and a revised table of component and cladding pressures.

It is noted the component and cladding pressure table is set up using the ultimate design wind speed, but reports pressures at an ASD level. That is, the listed pressures incorporate the 0.6 multiplier on wind loads per the allowable stress design load combinations shown in Section 1605.3 of the *International Building Code* and Section 2.3.2 of ASCE 7-10. This is done here and throughout this series of proposals to allow for easy adaptation of existing stock designs, construction documents and guidelines to the 2015 IRC, as the loads and pressures will be comparable to previous editions of the IRC for most sites.

The region in revised Figure R301.2(4)B where the use of alternate prescriptive high-wind standards or engineered design is required is defined using the 130mph contour along the Gulf Coast and along the southern portions of the Atlantic coast from Florida up to North Carolina. The 140mph contour is used for the northern portions of the Atlantic coast from Virginia up to Maine, and for Alaska. A 130mph trigger is also used for the assorted Caribbean and Pacific islands that are also considered part of the "hurricane-prone" region. This creates a region that approximately equals the region defined by the 110mph contour under the wind map used in the 2000 through 2009 IRC, maintains areas of Florida and the Gulf Coast traditionally outside of the prescriptive limits of the IRC, and maintains areas of New England traditionally included within the prescriptive limits of the IRC.

Code users desiring a more accurate determination in areas near or along a particular contour (or in general) can make use of the Applied Technology Council's Windspeed by Location web site (http://www.atcouncil.org/windspeed/) to obtain site-specific wind speeds using latitude/longitude or site address. This site was developed by ATC using the same data used to develop the wind maps for ASCE 7, the IBC and the IRC. As the site is not a reference standard or maintained by a government agency, we could not make a direct reference in the code figures. However, we include mention of the Windspeed by Location web site here to draw code users' attention to its existence and in hopes that mention of the web site could become part of the IRC Commentary.

Cost Impact: The code change proposal will not increase the cost of construction.

R301.2.1-RB-EHRLICH

Committee Action Hearing Results

The code change is contained in the Updates to the 2013 Proposed Changes posted on the ICC website. Please go to http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf for more information.

Committee Action: Approved as Submitted

Committee Reason: The committee approved this proposed code change because they felt that it creates consistency between the International Codes and ASCE 7.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Gary J Ehrlich, P.E., representing National Association of Home Builders (NAHB); Joseph D. Belcher, JDB Code Services Inc., representing the International Hurricane Protection Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R301.2.1.2.1 Application of ASTM E 1996. The text of Section 2.2 of ASTM E 1996 shall be substituted as follows:

2.2 *ASCE Standard:*
ASCE 7-10 American Society of Civil Engineers Minimum Design Loads for Buildings and Other Structures

The text of Section 6.2.2 of ASTM E 1996 shall be substituted as follows:

6.2.2 Unless otherwise specified, select the wind zone based on the ultimate ~~strength~~ design wind speed, V_{ult}, as follows:

6.2.2.1 *Wind Zone 1*—130 mph ≤ ultimate design wind speed, V_{ult} < 140 mph.

6.2.2.2 *Wind Zone 2*—140 mph ≤ ultimate design wind speed, V_{ult} < 150 mph at greater than one mile (1.6 km) from the coastline. The coastline shall be measured from the mean high water mark.

6.2.2.3 *Wind Zone 3*—150 mph (58 m/s) ≤ ultimate design wind speed, V_{ult} ≤ 170 ~~160~~ mph (76~~63~~ m/s), or 140 mph (54 m/s) ≤ ultimate design wind speed, V_{ult} ≤ 170 ~~160~~ mph (76~~63~~ m/s) and within one mile (1.6 km) of the coastline. The coastline shall be measured from the mean high water mark.

6.2.2.4 *Wind Zone 4*— ultimate design wind speed, V_{ult} > 170 ~~160~~ mph (63 m/s).

(Portions of proposal not shown to remain unchanged)

Commenter's Reason: The purpose of this public comment is to amend the definition for Wind Zone 4 in ASTM E1996. The original intent of Wind Zone 4 was to address higher requirements for impact-resistant glazing and impact-resistive systems in Miami-Dade County only. When similar language was added to the IBC last cycle to amend ASTM E1996 to work with ultimate design wind speeds, a direct conversion of the previous trigger was made. It was not realized until Florida was in the process of adopting the 2012 IBC that this had the effect of extending Wind Zone 4 north into Broward, Palm Beach, Martin and St. Lucie counties where it had not previously applied and was not intended to apply. The result is a potential increase of $2424 to $4248 for wind-borne debris protection of residential buildings in those counties.

The Florida Building Code was amended to correct the inadvertent extension of Wind Zone 4. The IHPA attempted a floor modification at the Committee Action Hearing which NAHB was prepared to support, but was ruled out of order by the moderator. This public comment advances the proposed modification and fixes the unintended consequences of the original ASTM E1996 amendment.

One editorial change is also made to correct "strength design wind speed" to "ultimate design wind speed" to correlate with the remainder of the IRC wind update proposals.

Public Comment 2:

Gary J Ehrlich, P.E., representing National Association of Home Builders (NAHB), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R301.2.1.4 Exposure category. For each wind direction considered, an exposure category that adequately reflects the characteristics of ground surface irregularities shall be determined for the site at which the building or structure is to be constructed. For a site located in the transition zone between categories, the category resulting in the largest wind forces shall apply. Account shall be taken of variations in ground surface roughness that arise from natural topography and vegetation as well as from constructed features. For a site where multiple detached one- and two-family dwellings, townhouses or other structures are to be constructed as part of a subdivision, master-planned community, or otherwise designated as a developed area by the authority having jurisdiction, the exposure category for an individual structure shall be based upon the site conditions that will exist at the time when all adjacent structures on the site have been constructed, provided their construction is expected to begin within one year of the start of construction for the structure for which the exposure category is determined. For any given wind direction, the exposure in which a specific building or other structure is sited shall be assessed as being one of the following categories:

1. Exposure B. Urban and suburban areas, wooded areas, or other terrain with numerous closely spaced obstructions having the size of single-family dwellings or larger. Exposure B shall be assumed unless the site meets the definition of another type exposure.
2. Exposure C. Open terrain with scattered obstructions, including surface undulations or other irregularities, having heights generally less than 30 feet (9144 mm) extending more than 1,500 feet (457 m) from the building site in any quadrant. This exposure shall also apply to any building located within Exposure B type terrain where the building is directly adjacent to open areas of Exposure C type terrain in any quadrant for a distance of more than 600 feet (183 m). This category includes flat, open country and grasslands.
3. Exposure D. Flat, unobstructed areas exposed to wind flowing over open water, smooth mud flats, salt flats or unbroken ice for a distance of at least 5000 feet (1,524 m). This exposure shall also apply ~~only~~ to any ~~those~~ building~~s~~ located within Exposure B or C type terrain where the site is within ~~and other structures exposed to the wind coming from over the water. Exposure D extends inland from the shoreline a distance of~~ 600 feet (183 m) or 20 times the height of the building ~~or structure~~, whichever is greater from an Exposure D condition. ~~This category includes smooth mud flats, salt flats and unbroken ice~~.

(Portions of proposal not shown to remain unchanged)

Commenter's Reason: The purpose of this public comment is to better correlate the definition of Exposure D with ASCE 7-10. The language proposed here is similar in concept to language proposed by SEAOC in RB45, but with better clarity. NAHB had worked with SEAOC to develop this language as a floor modification to RB39, but the modification was ruled out of order. A correlating public comment has been submitted for disapproval of RB45 if this public comment is approved.

Public Comment 3:

Gary J Ehrlich, P.E., representing National Association of Home Builders (NAHB), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

TABLE R301.2.1.5.1
~~BASIC~~ ULTIMATE DESIGN WIND SPEED MODIFICATION FOR TOPOGRAPHIC WIND EFFECT[a]

~~BASIC~~ ULTIMATE DESIGN WIND SPEED FROM FIGURE R301.2(4)	AVERAGE SLOPE OF THE TOP HALF OF HILL, RIDGE OR ESCARPMENT (percent)						
	0.10	0.125	0.15	0.175	0.20	0.23	0.25
	Required Ultimate Design ~~Basic~~ Wind Speed, Modified for Topographic Wind Speed-Up (rounded)						
110	132	137	142	147	152	158	162
115	138	143	148	154	159	165	169
120	144	149	155	160	166	172	176
130	156	162	168	174	179	N/A	N/A
140	168	174	181	N/A	N/A	N/A	N/A
150	180	N/A	N/A	N/A	N/A	N/A	N/A

a. Table applies to a feature height of 500 feet or less and dwellings sited a distance equal or greater than half the feature height.
b. Where the ultimate design wind speed as modified by Table R301.2.1.5.1 equals or exceeds 140mph, the building shall be considered as "wind design required" in accordance with Section R301.2.1.1

TABLE R301.7
ALLOWABLE DEFLECTION OF STRUCTURAL MEMBERS[a, b, c, d, e]

STRUCTURAL MEMBER	ALLOWABLE DEFLECTION
Exterior walls - wind loads[a] with plaster or stucco finish	H/360
Exterior walls - wind loads[a] with other brittle finishes	H/240
Exterior walls - wind loads[a] with flexible finishes	H/120[d]
Lintels supporting masonry veneer walls [e]	L/600

Note: L = span length, H = span height.
a The wind load shall be permitted to be taken as 0.7 times the Component and Cladding (ASD) loads obtained from Table R301.2(2) for the purpose of determining deflection limits herein.
b. (No changes)
c. (No changes)
d. (No changes)
e. (No changes)

(Portions of proposal not shown to remain unchanged)

Commenter's Reason: The purpose of this public comment is to insure the comprehensive Chapter 3 wind update is internally consistent with terminology and to correlate RB39 with other proposals.

In developing RB39, the wind speeds in Table R301.2.1.5.1, which provides simplified adjustments to wind speed for topographic effects, were updated to the new ultimate design wind speed basis. However, the term "basic wind speed" in the table was not changed to "ultimate design wind speed" as is done throughout the rest of the wind update (and in the 2012 IBC). This public comment picks up the change in terminology. A new footnote is also provided to clarify when the topographic wind effects make the site a "wind design required" region where use of the alternate standards (ICC-600, WFCM, AISI 230, etc.) are required.

The change to table R301.7 correlates RB39 with RB62, both of which were approved by the IRC Building Committee. As it stands, the committee actions would result in "wind loads" being deleted from the first exterior wall condition (plaster or stucco finish) but added to the other two conditions (brittle finishes and flexible finishes). This change will correlate the two proposals by insuring the "wind loads" language appears for all three conditions

Public Comment 4:

Bonnie Manley, American Iron and Steel Institute, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R301.2.1.3 Wind speed conversion. When referenced documents are based on nominal design wind speeds and do not provide the means for conversion between the ultimate design wind speeds and the nominal design wind speeds, the ultimate design wind speeds, V_{ult}, of Figure R301.2(4)A shall be converted to nominal design wind speeds, V_{asd} using Table R301.2.1.3.

(Portions of proposal not shown to remain unchanged)

Commenter's Reason: The purpose of this comment is to ensure that the conversion table, Table R301.2.1.3, does not override Table A1-3 of AISI S230-07 w/S3-12, as follows:

Table A1-3
Conversion of ASCE 7 Basic Wind Speeds to AISI S230 Basic Wind Speeds (mph) [1]

ASCE 7 Basic Wind Speed	110	115	126	139	152	164	177	190
AISI S230 Basic Wind Speed	85	90	100	110	120	130	140	150

[1] ASCE 7 permits linear interpolation between the contours of the basic wind speed maps.

This table is based upon ASCE 7-10 Table C26.5-6 and provides a direct conversion between the wind speeds, where V_{ult} is effectively listed as the row titled "ASCE 7 Basic Wind Speed" and V_{asd} is effectively listed as the row titled "AISI S230 Basic Wind Speed." This differs slightly from the conversion incorporated into Proposal RB39. However, for the purposes of cold-formed steel framing, it is important that the conversion process remains consistent between the IRC and AISI S230. Therefore, it is necessary to introduce a qualifier to the charging language in section R301.2.1.3 that recognizes that reference documents may include conversion tables of their own.

Public Comment 5:

Bonnie Manley, American Iron and Steel Institute, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R301.2.1.1 Wind limitations and wind design required. The wind provisions of this code shall not apply to the design of buildings where wind design is required in accordance with Figure R301.2(4)B.

Exceptions:

1. For concrete construction, the wind provisions of this code shall apply in accordance with the limitations of Sections R404 and R611.
2. For structural insulated panels, the wind provisions of this code shall apply in accordance with the limitations of Section R613.
3. For cold-formed steel light frame construction, the wind provisions of this code shall apply in accordance with the limitations of Sections R505, R603 and R804.

In regions where wind design is required in accordance with Figure R301.2(4)B, the design of buildings for wind loads shall be in accordance with one or more of the following methods:

1. AF&PA *Wood Frame Construction Manual (WFCM)*; or
2. ICC *Standard for Residential Construction in High-Wind Regions* (ICC 600); or
3. ASCE *Minimum Design Loads for Buildings and Other Structures* (ASCE 7); or
4. AISI *Standard for Cold-Formed Steel Framing—Prescriptive Method For One- and Two-Family Dwellings* (AISI S230); or
5. *International Building Code*.

The elements of design not addressed by the methods in Items 1 through 5 shall be in accordance with the provisions of this code. When ASCE 7 or the International Building Code is used for the design of the building, the wind speed map and exposure category requirements as specified in ASCE 7 and the *International Building Code* shall be used.

(Portions of proposal not shown to remain unchanged)

Commenter's Reason: The purpose of this comment is to ensure that the IRC wind design applicability limits for cold-formed steel light frame construction remain consistent with AISI S230-07 w/S3-12. AISI developed AISI S230-07 w/S3-12 to allow the 2007 edition of AISI S230 to be used in conjunction with the 2010 edition of ASCE 7. AISI S230-07 w/S3-13 incorporates the following conversion table:

Table A1-3
Conversion of ASCE 7 Basic Wind Speeds to AISI S230 Basic Wind Speeds (mph) [1]

ASCE 7 Basic Wind Speed	110	115	126	139	152	164	177	190
AISI S230 Basic Wind Speed	85	90	100	110	120	130	140	150

[1] ASCE 7 permits linear interpolation between the contours of the basic wind speed maps.

This table is based upon ASCE 7-10 Table C26.5-6 and provides a direct conversion between the wind speeds, which differs slightly from the conversion incorporated into Proposal RB39. Specifically, AISI has chosen to convert the ASCE 7-05 design wind speed ("AISI S230 Basic Wind Speed" in Table A1-3) of 110 mph to 139 mph instead of 140 mph. Since this particular wind speed is often a trigger for additional requirements, it is important that it remains consistent throughout the IRC – in Sections R301, R505, R603 and R804 – and AISI S230. Therefore, it is necessary to introduce an exception to Section R301.2.1.1 for cold-formed steel light frame construction similar to the ones in place for concrete and structural insulated panels.

RB39-13

Final Action: AS AM AMPC____ D

RB40-13
R301.2.1.1.1 (New), Chapter 44

<u>Proposed Change as Submitted</u>

Proponent: Julie Ruth, P.E., JRuth Code Consulting, representing the American Architectural Manufacturers Association (julruth@aol.com); Daniel J. Walker, P.E., Thomas Associates, representing the National Sunroom Association

Add new text as follows:

<u>**R301.2.1.1.1 Sunrooms.** Sunrooms shall comply with the wind loads, structural requirements and testing provisions of Section 5.2.1 of AAMA/NPEA/NSA 2100, with the following modifications:</u>

1. <u>Basic wind speed in miles per hour (mph) shall be determined in accordance with Section R301.2.1 of this code; and</u>
2. <u>Sunrooms including exposed structure, components, cladding, and roof covering shall be designed to resist the wind loads as established in Section R301.2.1 of this code.</u>

<u>For the purpose of applying the criteria of AAMA/NPEA/NSA-2100 based on the intended use, sunrooms shall be identified as one of the following categories by the permit applicant, design professional or the property owner in the *construction documents*. Component and Cladding pressures shall be used for the design of elements that do not qualify as main wind force resisting systems. Main wind force resisting systems pressures shall be used for the design of elements assigned to provide support and stability for the overall *sunroom*.</u>

<u>**Category I:** A *Thermally Isolated Sunroom* with walls that are open or enclosed with insect screening or 0.5 mm (20 mil) maximum thickness plastic film. The space is nonhabitable and unconditioned.</u>

<u>**Category II:** A *Thermally Isolated Sunroom* with enclosed walls. The openings are enclosed with translucent or transparent plastic or glass. The space is nonhabitable and unconditioned.</u>

<u>**Category III:** A *Thermally Isolated Sunroom* with enclosed walls. The openings are enclosed with translucent or transparent plastic or glass. The sunroom fenestration complies with additional requirements for air infiltration resistance and water-penetration resistance. The space is nonhabitable and unconditioned.</u>

<u>**Category IV:** A *Thermally Isolated Sunroom* with enclosed walls. The sunroom is designed to be heated or cooled by a separate temperature control or system and is thermally isolated from the primary structure. The sunroom fenestration complies with additional requirements for water penetration resistance, air infiltration resistance, and thermal performance. The space is nonhabitable and *conditioned*.</u>

<u>**Category V:** A *Sunroom* with enclosed walls. The sunroom is designed to be heated or cooled and is open to the main structure. The sunroom fenestration complies with additional requirements for water-penetration resistance, air infiltration resistance, and thermal performance. The space is *habitable* and *conditioned*.</u>

Add standards to Chapter 44 as follows:

AAMA American Architectural Manufacturers Association
1827 Walden Office Square, Suite 550
Schaumburg, IL 60173

AAMA/NSA/NPEA 2100-12 Specifications for Sunrooms

NSA National Sunroom Association

Cleveland, OH 44115-2851

AAMA/NSA/NPEA 2100-12 Specifications for Sunrooms

NPEA National Sunroom Association
1300 Sumner Ave.
Cleveland, OH 44115-2851

AAMA/NSA/NPEA 2100-12 Specifications for Sunrooms

Reason: The 2012 *International Residential Code* defines a sunroom as "A one-story structure attached to a *dwelling* with a *glazing area* in excess of 40 percent of the gross area of the structure's *exterior walls* and roof." These structures are typically constructed in one of two manners: 1) using typical wood framing techniques, or 2) using a stick system that consists of prefabricated framing of aluminum, fiberglass, wood or other materials, with glass or opaque wall or roof panels, and steel or aluminum connections.

The first technique can be done in accordance with the current provisions of the IRC for wood framed construction. There are no provisions in the IRC for the second method of constructing a sunroom other than by engineering analysis or demonstrating equivalence to the current provisions of the *International Residential Code* by some other means.

This proposal seeks to clarify the requirements for sunrooms under the IRC by adding reference to the provisions of AAMA/NPEA/NSA 2100 - 12 *Specifications for Sunrooms* to the available options for approval of sunroom construction in the IRC. Sunrooms designed and constructed in accordance with AAMA/NPEA/NSA 2100 are required within the standard to meet the structural provisions of the IRC or the IBC. Therefore, the appropriate engineering analysis has already been conducted for these structures. In addition, the standard establishes the specific requirements for these unique structures based upon their designated Category.

In 2002 the American Architectural Manufacturers Association (AAMA), the National Sunroom Association (NSA) and the National Patio Enclosure Association (NPEA) published the first U.S. standard for the design and specification of sunrooms – AAMA/NPEA/NSA 2100 – 02. The standard established five categories of sunrooms based upon the intended use of the space, and established specific design and performance criteria for them based on the end use.

As the document began to be used and referenced in various local codes (such as the Florida Building Code) the members of the AAMA Sunroom Council and NSA became aware that improvements and updates were needed. These improvements included revisions that would bring the document in line with the requirements of AAMA/WDMA/CSA 101/I.S.2/A440 for the design, testing and labeling of windows, glass doors and skylights, and revisions that would bring the foundation requirements more closely in line with the requirements of the *International Residential Code*. The most recent edition of the standard is AAMA/NPEA/NSA 2100-12. The table below provides an overview of the requirements of AAMA/NPEA/NSA 2100-12, as they apply to the various categories of sunrooms.

Minimum Requirements	**Cat. I**	**Cat. II**	**Cat. III**	**Cat. IV**	**Cat. V**
Structural Design in accordance with IRC or IBC.	x	x	x	x	x
Fenestration products comply with AAMA/WDMA/CSA 101/I.S.2/A440 (includes resistance to air leakage, water penetration, forced entry, etc. as well as structural design pressure rating).		x	x	x	x
Comply with IECC or IRC Chapter 11.				x	x
Comply with the Foundation/footings, site location, and emergency escape and rescue openings requirements of the IRC or local code.	x	x	x	x	x
Emergency escape and rescue openings are permitted to open onto sunroom.	x				
Comply with the natural lighting requirements of the IRC or local code.	x	x	x	x	x
Openings for natural lighting are permitted to open onto sunroom.	x				
Comply with the requirements of the IRC or local code for stairway and egress illumination.	x	x	x	x	x
Required to have exit lighting.		x	x	x	x
Receptacle outlets as required by NFPA 70, Article 314.				x	x

The 2002 edition of AAMA/NPEA/NSA 2100 has been used successfully in previous editions of the Florida Building Code. Reference to the 2012 edition in the 2015 IRC to facilitate its use on a nationwide basis is appropriate at this time.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [AAMA/NSA/NPEA 2100-12] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

R301.2.1.1.1 (NEW)-RB-RUTH-WALKER

Committee Action Hearing Results

For staff analysis of the content of AAMA/NSA/NPEA 2100 relative to CP#28, Section 3.6, please visit:
http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because there was no provision in the proposal for non-prefabricated sun rooms.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Julie Ruth, JRuth Code Consulting, representing American Architectural Manufacturers Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R301.2.1.1.1 Sunrooms. Sunrooms shall comply with ~~the wind loads, structural requirements and testing provisions of Section 5.2.1 of~~ AAMA/NPEA/NSA 2100~~. with the following modifications:~~

1. ~~Basic wind speed in miles per hour (mph) shall be determined in accordance with Section R301.2.1 of this code; and~~
2. ~~Sunrooms including exposed structure, components, cladding, and roof covering shall be designed to resist the wind loads as established in Section R301.2.1 of this code.~~

(Portions of code change not shown remain unchanged).

Commenter's Reason: The committee disapproved the proposed reference at the Code Development Hearings in Dallas, at least in part, due to confusion regarding the scope of the document. Concern was expressed that it only applies to prefabricated sunrooms. The standard, however, is not limited to prefabricated sunrooms and the opponents who spoke against it have not identified a single reference in the standard that would limit its application. Questions regarding matters such as egress, natural lighting and ventilation, resistance to air leakage and water penetration, etc. are pertinent to both site built and prefabricated sunrooms. Addressing them does not limit the application of the standard in any way.

The design wind load requirements of the IRC were converted from allowable stress design to strength design through the approval of RB39-13 and related proposals.

The original proposal provided specific cross references to determine the appropriate design wind pressures for the sunroom. There is now confusion with regards to these cross references, due to the changes in wind speed model on Section R301.

This Public Comment removes the potential cause for concern, and simply references AAMA/NPEA/NSA 2100 for sunrooms. This is consistent with language that has been included in the Florida Building Code – Residential since the 2004 edition.

AAMA/NPEA/NSA 2100, and the 5 categories of sunrooms it established, clarifies the criteria for these types of spaces with regards to egress, natural ventilation, resistance of the exterior envelop to air leakage and water penetration, etc.

Proposed Change as Submitted

Proponent: Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee and Virginia Building and Code Officials Association (bajnaic@chesterfield.gov)

Revise as follows:

TABLE R301.2.1.2
WINDBORNE DEBRIS PROTECTION FASTENING SCHEDULE
FOR WOOD STRUCTURAL PANELS

(Portions of table not shown remain unchanged)

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound = 4.448 N,
1 mile per hour = 0.447 m/s.

a. This table is based on a 130mph basic wind speeds~~s~~ and a 33-foot mean roof height.

b through d *(No change to current text)*

Revise as follows:

R505.1.1 Applicability limits. The provisions of this section shall control the construction of cold-formed steel floor framing for buildings not greater than 60 feet (18 288 mm) in length perpendicular to the joist span, not greater than 40 feet (12 192 mm) in width parallel to the joist span, and less than or equal to three stories above *grade* plane. Cold-formed steel floor framing constructed in accordance with the provisions of this section shall be limited to sites ~~subjected to a maximum~~ where the basic ~~design~~ wind speed is not greater than ~~of~~ 110 miles per hour (49 m/s), the Exposure Category is B or C, and the ~~a maximum~~ ground snow load is not greater than ~~of~~ 70 pounds per square foot (3.35 kPa).

Revise as follows:

TABLE R602.3.1
MAXIMUM ALLOWABLE LENGTH OF WOOD WALL STUDS[b, c, d] ~~EXPOSED TO WIND SPEEDS OF 100 mph OR LESS IN SEISMIC DESIGN CATEGORIES A, B, C, D0, D1 and D2~~

(Portions of table not shown remain unchanged)

a. Design required.

b. Table is limited to buildings located where the basic wind speed is 100mph or less and for which the seismic design category is A, B, C, D0, D1, or D2

c~~b~~. Applicability of this table assumes the following: Snow load not exceeding 25 psf, *fb* not less than 1310 psi determined by multiplying the AF&PA NDS tabular base design value by the repetitive use factor, and by the size factor for all species except southern pine, E not less than 1.6 × 106 psi, tributary dimensions for floors and roofs not exceeding 6 feet, maximum span for floors and roof not exceeding 12 feet, eaves not over 2 feet in dimension and exterior sheathing. Where the conditions are not within these parameters, design is required.

d~~c~~. Utility, standard, stud and No. 3 grade lumber of any species are not permitted.

TABLE R602.3(2)
ALTERNATE ATTACHMENTS TO TABLE R602.3(1)

(Portions of table not shown remain unchanged)

a through f *(No change to current text)*

g. Specified alternate attachments for roof sheathing shall be permitted for basic wind speeds less than 100 mph. Fasteners attaching wood structural panel roof sheathing to gable end wall framing shall be installed using the spacing listed for panel edges.

TABLE R602.3(3)
REQUIREMENTS FOR WOOD STRUCTURAL PANEL WALL SHEATHING USED TO RESIST WIND PRESSURES [a, b, c]

MINIMUM NAIL		MINIMUM WOOD STRUCTURAL PANEL SPAN RATING	MINIMUM NOMINAL PANEL THICKNESS (inches)	MAXIMUM WALL STUD SPACING (inches)	PANEL NAIL SPACING		MAXIMUM BASIC WIND SPEED (mph)		
Size	Penetration (inches)				Edges (inches o.c.)	Field (inches o.c.)	Wind exposure category		
							B	C	D

(Portions of table not shown remain unchanged)

TABLE R602.10.1.3
BRACED WALL LINE SPACING

APPLICATION	CONDITION	BUILDING TYPE	BRACED WALL LINE SPACING CRITERIA	
			Maximum Spacing	Exception to Maximum Spacing
Wind bracing	Basic wind speed 85mph to 110 mph	Detached, Townhouse	60 feet	None

(Portions of table not shown remain unchanged)

TABLE R602.10.3(1)
BRACING REQUIREMENTS BASED ON WIND SPEED

(Portions of table not shown remain unchanged)

For SI: 1 inch = 25.4 mm, 1 foot = 305 mm, 1 mile per hour = 0.447 m/s.
a through b *(No change to current text)*
c. Method CS-SFB does not apply where the basic wind speed is greater than 100 mph.

TABLE R602.10.4
BRACING METHODS

(Portions of table not shown remain unchanged)

a through c *(No change to current text)*
d. Method CS-SFB does not apply in Seismic Design Categories D0, D1 and D2 and in areas where the basic wind speed exceeds 100 mph.
e. *(No change to current text)*

TABLE R602.10.5
MINIMUM LENGTH OF BRACED WALL PANELS

METHOD (See Table R602.10.4)		MINIMUM LENGTH [a] (in)					CONTRIBUTING LENGTH (in)
		Wall Height					
		8 feet	9 feet	10 feet	11 feet	12 feet	
ABW	SDC A, B and C basic wind speed < 110 mph	28	32	34	38	42	48
	SDC D_o, D_1 and D_2, basic wind speed < 110 mph	32	32	34	NP	NP	

(Portions of table not shown remain unchanged.)

TABLE R602.10.6.1
MINIMUM HOLD-DOWN FORCES FOR METHOD ABW BRACED WALL PANELS

SEISMIC DESIGN CATEGORY AND WIND SPEED	SUPPORTING/STORY	HOLD DOWN FORCE (lb)				
		Height of Braced Wall Panel				
		8 ft	9 ft	10 ft	11 ft	12 ft
SDC A, B and C Basic w ~~W~~ind speed < 110 mph	One story	1800	1800	1800	2000	2200
	First of two story	3000	3000	3000	3300	3600
SDC D_0, D_1 and D_2 Basic w ~~W~~ind speed < 110 mph	One story	1800	1800	1800	NP [a]	NP [a]
	First of two story	3000	3000	3000	NP [a]	NP [a]

(Portions of table not shown remain unchanged.)

R602.10.6.5.1 Length of bracing. The length of bracing along each braced wall line shall be the greater of that required by the basic ~~design~~ wind speed and braced wall line spacing in accordance with Table R602.10.3(1) as adjusted by the factors in the Table R602.10.3(2) or the Seismic Design Category and braced wall line length in accordance with Table R602.10.6.5. Angled walls shall be permitted to be counted in accordance with Section R602.10.1.4, and braced wall panel location shall be in accordance with Section R602.10.2.2. The seismic adjustment factors in Table R602.10.3(4) shall not be applied to the length of bracing determined using Table R602.10.6.5. In no case shall the minimum total length of bracing in a braced wall line, after all adjustments have been taken, be less than 48 inches (1219 mm) total.

R602.10.8.2 Connections to roof framing. Top plates of exterior braced wall panels shall be attached to rafters or roof trusses above in accordance with Table R602.3(1) and this section. Where required by this section, blocking between rafters or roof trusses shall be attached to top plates of braced wall panels and to rafters and roof trusses in accordance with Table R602.3(1). A continuous band, rim, or header joist or roof truss parallel to the braced wall panels shall be permitted to replace the blocking required by this section. Blocking shall not be required over openings in continuously-sheathed braced wall lines. In addition to the requirements of this section, lateral support shall be provided for rafters and ceiling joists in accordance with Section R802.8 and for trusses in accordance with Section R802.10.3. Roof ventilation shall be provided in accordance with Section R806.1.

1. For Seismic Design Categories A, B and C and basic wind speeds less than 100 mph (45 m/s) where the distance from the top of the braced wall panel to the top of the rafters or roof trusses above is 91/4 inches (235 mm) or less, blocking between rafters or roof trusses shall not be required. Where the distance from the top of the braced wall panel to the top of the rafters or roof trusses above is between 91/4 inches (235 mm) and 151/4 inches (387 mm), blocking between rafters or roof trusses shall be provided above the braced wall panel in accordance with Figure R602.10.8.2(1).
2. For Seismic Design Categories D0, D1 and D2 or basic wind speeds of 100 mph (45 m/s) or greater, where the distance from the top of the braced wall panel to the top of the rafters or roof trusses is 151/4 inches (387 mm) or less, blocking between rafters or roof trusses shall be provided above the braced wall panel in accordance with Figure R602.10.8.2(1).
3. Where the distance from the top of the *braced wall panel* to the top of rafters or roof trusses exceeds $15^{1}/_{4}$ inches (387 mm), the top plates of the *braced wall panel* shall be connected to perpendicular rafters or roof trusses above in accordance with one or more of the following methods:
   3.1. Soffit blocking panels constructed in accordance with Figure R602.10.8.2(2);
   3.2. Vertical blocking panels constructed in accordance with Figure R602.10.8.2(3);
   3.3. Full-height engineered blocking panels designed in accordance with the AF&PA WFCM; or
   3.4. Blocking, blocking panels, or other methods of lateral load transfer designed in accordance with accepted engineering practice.

R603.1.1 Applicability limits. The provisions of this section shall control the construction of exterior cold-formed steel wall framing and interior load-bearing cold-formed steel wall framing for buildings not more than 60 feet (18 288 mm) long perpendicular to the joist or truss span, not more than 40 feet (12 192 mm) wide parallel to the joist or truss span, and less than or equal to three stories above *grade plane*. All exterior walls installed in accordance with the provisions of this section shall be considered as load-bearing walls. Cold-formed steel walls constructed in accordance with the provisions of this section shall be limited to sites ~~subjected to a maximum~~ where the basic ~~design~~ wind speed is not greater than ~~of~~ 110 miles per hour (49 m/s), the Exposure Category is B or C, and the ~~a maximum~~ ground snow load is not greater than ~~of~~ 70 pounds per square foot (3.35 kPa).

(Portions of table not shown remain unchanged.)

TABLE R603.8
HEAD AND SILL TRACK SPAN

(Portions of table not shown remain unchanged.)

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 mile per hour = 0.447 m/s.

a. Deflection limit: *L*/240.

b. Head and sill track spans are based on components and cladding wind pressures ~~speeds~~ and 48 inch tributary span.

c. For openings less than 4 feet in height that have both a head track and sill track, the above spans are permitted to be multiplied by 1.75. For openings less than or equal to 6 feet in height that have both a head track and a sill track, the above spans are permitted to be multiplied by a factor of 1.5.

R603.9.4.1 Wind speeds greater than 100 mph. Where the basic wind speed~~s are in excess of~~ exceeds 100 miles per hour (45 m/s) and~~,~~ Exposure C or D applies, walls shall be provided with ~~wind~~ direct uplift connections in accordance with AISI S230, Section E13.3, and AISI S230, Section F7.2, as required for 110 miles per hour (49 m/s), Exposure C.

R611.2 Applicability limits. The provisions of this section shall apply to the construction of exterior concrete walls for buildings not greater than 60 feet (18 288 mm) in plan dimensions, floors with clear spans not greater than 32 feet (9754 mm) and roofs with clear spans not greater than 40 feet (12 192 mm). Buildings shall not exceed 35 feet (10 668 mm) in mean roof height or two stories in height above-grade. Floor/ceiling dead loads shall not exceed 10 pounds per square foot (479 Pa), roof/ceiling dead loads shall not exceed 15 pounds per square foot (718 Pa) and *attic* live loads shall not exceed 20 pounds per square foot (958 Pa). Roof overhangs shall not exceed 2 feet (610 mm) of horizontal projection beyond the exterior wall and the dead load of the overhangs shall not exceed 8 pounds per square foot (383 Pa).

Walls constructed in accordance with the provisions of this section shall be limited to buildings ~~subjected to a maximum~~ where the basic ~~design~~ wind speed is not greater than ~~of~~ 130 miles per hour (58 m/s) Exposure B, 110 miles per hour (49 m/s) Exposure C and 100 miles per hour (45 m/s) Exposure D. Walls constructed in accordance with the provisions of this section shall be limited to detached one- and two-family *dwellings* and townhouses assigned to Seismic Design Category A or B, and detached one- and two-family *dwellings* assigned to Seismic Design Category C.

(Portions of table not shown remain unchanged.)

Revise as follows:

R802.10.2.1 Applicability limits. The provisions of this section shall control the design of truss roof framing when snow controls for buildings not greater than 60 feet (18 288 mm) in length perpendicular to the joist, rafter or truss span, not greater than 36 feet (10 973 mm) in width parallel to the joist, rafter or truss span, not greater than two stories in height with each *story* not greater than 10 feet (3048 mm) high, and roof slopes not smaller than 3:12 (25-percent slope) or greater than 12:12 (100-percent slope). Truss roof framing constructed in accordance with the provisions of this section shall be limited to sites ~~subjected to a maximum~~ where the basic ~~design~~ wind speed is not greater than ~~of~~ 110 miles per hour (49 m/s), the Exposure Category is A, B or C, and the ~~a maximum~~ ground snow load is not greater than ~~of~~ 70 pounds per square foot (3.35 kPa). For consistent loading of all truss types, roof snow load is to be computed as: 0.7 *p*g.

R804.1.1 Applicability limits. The provisions of this section shall control the construction of cold-formed steel roof framing for buildings not greater than 60 feet (18 288 mm) perpendicular to the joist, rafter or truss span, not greater than 40 feet (12 192 mm)in width parallel to the joist span or truss, less than or equal to three stories above *grade* plane and with roof slopes not less than 3:12 (25-percent slope) or greater than 12:12 (100 percent slope). Cold-formed steel roof framing constructed in accordance with the provisions of this section shall be limited to sites ~~subjected to a maximum~~ where the basic ~~design~~ wind speed is not greater than ~~of~~ 110 miles per hour (49 m/s), the Exposure Category is B or C, and the ~~a maximum~~ ground snow load is not greater than ~~of~~ 70 pounds per square foot (3.35 kPa).

R804.3.2.1 Minimum roof rafter sizes. Roof rafter size and thickness shall be determined in accordance with the limits set forth in Tables R804.3.2.1(1) and R804.3.2.1(2) based on the horizontal projection of the roof rafter span. For determination of roof rafter sizes, reduction of roof spans shall be permitted when a roof rafter support brace is installed in accordance with Section R804.3.2.2. The reduced roof rafter span shall be taken as the larger of the distance from the roof rafter support brace to the ridge or to the heel measured horizontally.

For the purpose of determining roof rafter sizes in Tables R804.3.2.1(1) and R804.3.2.1(2), basic wind speeds shall be converted to equivalent ground snow loads in accordance with Table R804.3.2.1(3). Roof rafter sizes shall be based on the higher of the ground snow load or the equivalent snow load converted from the basic wind speed.

R804.3.3 Hip framing. Hip framing shall consist of jack-rafters, hip members, hip support columns and connections in accordance with this section, or shall be in accordance with an *approved* design. The provisions of this section for hip members and hip support columns shall apply only where the jack rafter slope is greater than or equal to the roof slope. For the purposes of determining member sizes in this section, basic wind speeds shall be converted to equivalent ground snow load in accordance with Table R804.3.2.1(3).

Revise as follows:

R905.3.7 Application. Tile shall be applied in accordance with this chapter and the manufacturer's installation instructions, based on the following:

Clay and concrete roof tiles shall be fastened in accordance with this section and the manufacturer's installation instructions. Perimeter tiles shall be fastened with a minimum of one fastener per tile. Tiles with installed weight less than 9 pounds per square foot (0.4 kg/m2) require a minimum of one fastener per tile regardless of roof slope. Clay and concrete roof tile attachment shall be in accordance with the manufacturer's installation instructions where applied in areas where the basic wind speed exceeds 100 miles per hour (45 m/s) and on buildings where the roof is located more than 40 feet (12 192 mm) above *grade*. In areas subject to snow, a minimum of two fasteners per tile is required. In all other areas, clay and concrete roof tiles shall be attached in accordance with Table R905.3.7.

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC) The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

The purpose of this proposal is to coordinate terminology in the code. Figure R301.2.4(A) supplies the "basic wind speed", defined as the "three-second gust speed at 33 feet (10 058 mm) above the ground in Exposure C (see Section R301.2.1). This wind speed, derived from ASCE 7, is a design wind speed based on an extensive modeling process using historical data, wind characteristics and computer simulations. It is not necessarily the "maximum" wind speed that can be experienced by a site, nor does it suggest the "maximum" wind speed an element is capable of resisting due to factors of safety in material standards and design procedures. This proposal corrects references throughout the IRC to properly refer to "basic wind speed."

Cost Impact: None

R301.2.1.2T-RB-BAJNAI-BCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because the proponent requested disapproval in order to clean it up and bring it back in the public comment period.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee requests Approval as Modified by this Public Comment.

Replace proposal with the following:

Revise Chapter 6 as follows:

TABLE R602.3(1)
FASTENER SCHEDULE FOR STRUCTURAL MEMBERS

(Portions of table and footnotes not shown remain unchanged)

f. Where the ultimate design ~~For regions having basic~~ wind speed is ~~of~~ ~~110~~140 mph or greater, 8d deformed (21/2" × 0.120) nails shall be used for attaching plywood and wood structural panel roof sheathing to framing within minimum 48-inch distance from gable end walls, if mean roof height is more than 25 feet, up to 35 feet maximum.

g. Where the ultimate design ~~For regions having basic~~ wind speed is ~~of~~ ~~100~~130 mph or less, nails for attaching wood structural panel roof sheathing to gable end wall framing shall be spaced 6 inches on center. Where the ultimate design ~~When basic~~ wind speed is greater than ~~100~~130 mph, nails for attaching panel roof sheathing to intermediate supports shall be spaced 6 inches on center for minimum 48-inch distance from ridges, eaves and gable end walls; and 4 inches on center to gable end wall framing.

TABLE R602.3(2)
ALTERNATE ATTACHMENTS TO TABLE 602.3(1)

(Portions of table and footnotes not shown remain unchanged)

g. Specified alternate attachments for roof sheathing shall be permitted where the ultimate design wind speed is ~~for windspeeds~~ less than ~~100~~130 mph. Fasteners attaching wood structural panel roof sheathing to gable end wall framing shall be installed using the spacing listed for panel edges.

TABLE R602.3.1
MAXIMUM ALLOWABLE LENGTH OF WOOD WALL STUDS ~~EXPOSED TO WIND SPEEDS OF 100 mph OR LESS IN SEISMIC DESIGN CATEGORIES A, B, C, D0, D1 and D2~~

(Portions of table not shown remain unchanged)

a. Design required.
b. Table is limited to buildings located where the ultimate design wind speed is 130 mph or less and for which the seismic design category is A, B, C, D0, D1, or D2
c~~b~~. Applicability of this table assumes the following: Snow load not exceeding 25 psf, *fb* not less than 1310 psi determined by multiplying the AF&PA NDS tabular base design value by the repetitive use factor, and by the size factor for all species except southern pine, E not less than 1.6 × 106 psi, tributary dimensions for floors and roofs not exceeding 6 feet, maximum span for floors and roof not exceeding 12 feet, eaves not over 2 feet in dimension and exterior sheathing. Where the conditions are not within these parameters, design is required.
d~~c~~. Utility, standard, stud and No. 3 grade lumber of any species are not permitted.

R613.2 Applicability limits. The provisions of this section shall control the construction of exterior structural insulated panel walls and interior load-bearing structural insulated panel walls for buildings not greater than 60 feet (18 288mm) in length perpendicular to the joist or truss span, not greater than 40 feet (12 192 mm) in width parallel to the joist or truss span and not greater than two stories in height with each wall not greater than 10 feet (3048 mm) high. All exterior walls installed in accordance with the provisions of this section shall be considered as load-bearing walls. Structural insulated panel walls constructed in accordance with the provisions of this section shall be limited to sites ~~subjected to a maximum~~ where the ultimate design wind speed (V_{ult}) is not greater than of ~~120~~ 155 miles per hour (~~54~~ 69 m/s), Exposure ~~A or~~ B or ~~110~~ 140 miles per hour (~~49~~ 63 m/s) Exposure C, the ~~and a maximum~~ ground snow load is not greater than ~~of~~ 70 pounds per foot (3.35 kPa), and the Seismic Design Category is ~~ies~~ A, B or ~~and~~ C.

Revise Chapter 8 as follows:

R802.10.2.1 Applicability limits. The provisions of this section shall control the design of truss roof framing when snow controls for buildings not greater than 60 feet (18 288 mm) in length perpendicular to the joist, rafter or truss span, not greater than 36 feet (10 973 mm) in width parallel to the joist, rafter or truss span, not greater than two stories in height with each *story* not greater than 10 feet (3048 mm) high, and roof slopes not smaller than 3:12 (25-percent slope) or greater than 12:12 (100-percent slope). Truss roof framing constructed in accordance with the provisions of this section shall be limited to sites ~~subjected to a maximum~~ where the ultimate design wind speed is not greater than ~~of~~ 140 ~~110~~ miles per hour (63~~49~~ m/s), the Exposure Category is ~~A,~~ B or C, and the ~~a maximum~~ ground snow load is not greater than ~~of~~ 70 pounds per square foot (3.35 kPa). For consistent loading of all truss types, roof snow load is to be computed as: 0.7 p_g.

Revise Chapter 9 as follows:

R905.2.4.1 Wind resistance of asphalt shingles. Asphalt shingles shall be tested in accordance with ASTM D 7158. Asphalt shingles shall meet the classification requirements of Table R905.2.4.1 for the appropriate maximum ultimate design ~~basic~~ wind speed. Asphalt shingle packaging shall bear a label to indicate compliance with ASTM D 7158 and the required classification in Table R905.2.4.1(1).

R905.3.7 Application. Tile shall be applied in accordance with this chapter and the manufacturer's installation instructions, based on the following:

1. Climatic conditions.
2. Roof slope.
3. Underlayment system.
4. Type of tile being installed.

Clay and concrete roof tiles shall be fastened in accordance with this section and the manufacturer's installation instructions. Perimeter tiles shall be fastened with a minimum of one fastener per tile. Tiles with installed weight less than 9 pounds per square foot (0.4 kg/m2) require a minimum of one fastener per tile regardless of roof slope. Clay and concrete roof tile attachment shall be in accordance with the manufacturer's installation instructions where applied in areas where the ultimate design wind speed exceeds 130 ~~100~~ miles per hour (58~~45~~ m/s) and on buildings where the roof is located more than 40 feet (12 192 mm) above *grade*. In areas subject to snow, a minimum of two fasteners per tile is required. In all other areas, clay and concrete roof tiles shall be attached in accordance with Table R905.3.7.

Commenter's Reason: The Building Code Action Committee (BCAC) is submitting this public comment to coordinate terminology in the code. A comprehensive set of proposals was developed by a task group led by NAHB to update the IRC wind provisions to the ultimate wind speed basis of the 2012 IBC and ASCE 7-10. As part of that update, the term "basic wind speed" was changed to "ultimate design wind speed" to be consistent with the term used in the 2012 IBC (and also implemented in a similar update to ICC-600). RB43 as submitted would not have been consistent with those actions, and thus the BCAC requested disapproval during the Committee Action Hearings.

In correlating the actions taken on the comprehensive set of proposals to update the IRC wind provisions to the ultimate wind speed basis of the 2012 IBC and ASCE 7-10, several instances were found where the term "basic wind speed" was not changed to "ultimate design wind speed". This public comment has been developed to make the correlating change in one swoop, in lieu of submitting three separate public comments to RB271, RB396 and RB418. To avoid confusion, the corresponding changes to the wind speed contained in those proposals has been reflected here.

RB43-13

Final Action: AS AM AMPC____ D

RB45-13
R301.2.1.4

Proposed Change as Submitted

Proponent: Matthew L. Mlakar, Barrish Pelham and Associates, Inc., representing Structural Engineers Association of California
Revise as follows:

R301.2.1.4 Exposure category. For each wind direction considered, an exposure category that adequately reflects the characteristics of ground surface irregularities shall be determined for the site at which the building or structure is to be constructed. For a site located in the transition zone between categories, the category resulting in the largest wind forces shall apply. Account shall be taken of variations in ground surface roughness that arise from natural topography and vegetation as well as from constructed features. For a site where multiple detached one- and two-family dwellings, *townhouses* or other structures are to be constructed as part of a subdivision, master-planned community, or otherwise designated as a developed area by the authority having jurisdiction, the exposure category for an individual structure shall be based upon the site conditions that will exist at the time when all adjacent structures on the site have been constructed, provided their construction is expected to begin within one year of the start of construction for the structure for which the exposure category is determined. For any given wind direction, the exposure in which a specific building or other structure is sited shall be assessed as being one of the following categories:

1. Exposure A. Large city centers with at least 50 percent of the buildings having a height in excess of 70 feet (21 336 mm). Use of this exposure category shall be limited to those areas for which terrain representative of Exposure A prevails in the upwind direction for a distance of at least 0.5 mile (0.8 km) or 10 times the height of the building or other structure, whichever is greater. Possible channeling effects or increased velocity pressures due to the building or structure being located in the wake of adjacent buildings shall be taken into account.
2. Exposure B. Urban and suburban areas, wooded areas, or other terrain with numerous closely spaced obstructions having the size of single-family dwellings or larger. Exposure B shall be assumed unless the site meets the definition of another type exposure.
3. Exposure C. Open terrain with scattered obstructions, including surface undulations or other irregularities, having heights generally less than 30 feet (9144 mm) extending more than 1,500 feet (457 m) from the building site in any quadrant. This exposure shall also apply to any building located within Exposure B type terrain where the building is directly adjacent to open areas of Exposure C type terrain in any quadrant for a distance of more than 600 feet (183 m). This category includes flat open country and grasslands.
4. Exposure D. Flat, unobstructed areas exposed to wind flowing over open water, smooth mud flats, salt flats and unbroken ice for a distance of at least ~~1 mile (1.61 km)~~ 5000 feet (1,524m). ~~Shorelines in Exposure D include inland waterways, the Great Lakes, and coastal areas of California, Oregon, Washington and Alaska.~~ This exposure shall apply only to those buildings and other structures exposed to the wind coming from over the ~~water~~ unobstructed area. Exposure D extends ~~inland~~ downwind from the ~~shoreline~~ edge of the unobstructed area a distance of ~~1500 feet (457 m)~~ 600 feet (183 m) or ~~10~~ 20 times the height of the building or structure, whichever is greater.

Reason: The 2012 IRC definition for wind exposure category D does not match the definition in either the 2012 IBC or ASCE 7-10. Under ICC CP#28 policy section 1.3.1 the provisions of all codes shall be consistent with one another so that conflicts between codes do not occur. The proposed change is to incorporate the language of ASCE 7-10 section 26.7.3 into the IRC. It should be noted that ASCE 7-10 now requires the use of exposure D along hurricane coastlines. ASCE 7-10 commentary section C26.7, cites recent research which provides data showing that the surface roughness over the ocean in a hurricane is consistent with that of exposure D rather than exposure C.

The change to the exposure categories will bring the IRC in line with the IBC and industry standards.

Cost Impact: The proposal is editorial and will not impact the cost of construction.

R301.2.1.4 #2-RB-MLAKAR

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee approved this code change proposal because they felt that it created consistency with ASCE 7.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Gary J. Ehrlich, P.E., representing National Association of Home Builders (NAHB), requests Disapproval.

Commenter's Reason: The purpose of this public comment is to request disapproval of RB45. While NAHB supports in concept efforts to correlate the definition of Exposure D with ASCE 7-10, the implementation of the "flat unobstructed area" language in this proposal is potentially confusing. Also, the definition here does not correlate with the comprehensive update of the Chapter 3 wind provisions in RB39, which was approved unanimously by the IRC Building Committee.

NAHB worked with SEAOC to develop a floor modification to RB39 to revise the Exposure D definition along the lines of RB45, but with better clarity. The floor modification was ruled out of order, but has been submitted as a public comment to RB39. With approval of that public comment, RB45 should be disapproved.

Proposed Change as Submitted

Proponent: Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee (bajnaic@chesterfield.gov)

Revise as follows:

~~**R301.2.2.2.5 Irregular buildings.** The seismic provisions of this code shall not be used for irregular structures located in Seismic Design Categories C, D0, D1 and D2. Irregular portions of structures shall be designed in accordance with accepted engineering practice to the extent the irregular features affect the performance of the remaining structural system. When the forces associated with the irregularity are resisted by a structural system designed in accordance with accepted engineering practice, design of the remainder of the building shall be permitted using the provisions of this code. A building or portion of a building shall be considered to be irregular when one or more of the following conditions occur:~~

1. ~~When exterior shear wall lines or *braced wall panels* are not in one plane vertically from the foundation to the uppermost *story* in which they are required.~~

   ~~**Exception:** For wood light-frame construction, floors with cantilevers or setbacks not exceeding four times the nominal depth of the wood floor joists are permitted to support *braced wall panels* that are out of plane with *braced wall panels* below provided that:~~

   1. ~~Floor joists are nominal 2 inches by 10 inches (51 mm by 254 mm) or larger and spaced not more than 16 inches (406 mm) on center.~~
   2. ~~The ratio of the back span to the cantilever is at least 2 to 1.~~
   3. ~~Floor joists at ends of *braced wall panels* are doubled.~~
   4. ~~For wood-frame construction, a continuous rim joist is connected to ends of all cantilever joists. When spliced, the rim joists shall be spliced using a galvanized metal tie not less than 0.058 inch (1.5 mm) (16 gage) and 11/2 inches (38 mm) wide fastened with six 16d nails on each side of the splice or a block of the same size as the rim joist of sufficient length to fit securely between the joist space at which the splice occurs fastened with eight 16d nails on each side of the splice; and 5. Gravity loads carried at the end of cantilevered joists are limited to uniform wall and roof loads and the reactions from headers having a span of 8 feet (2438 mm) or less.~~

2. ~~When a section of floor or roof is not laterally supported by shear walls or *braced wall lines* on all edges.~~

   ~~**Exception:** Portions of floors that do not support shear walls or *braced wall panels* above, or roofs, shall be permitted to extend no more than 6 feet (1829 mm) beyond a shear wall or *braced wall line*.~~

3. ~~When the end of a *braced wall panel* occurs over an opening in the wall below and ends at a horizontal distance greater than 1 foot (305 mm) from the edge of the opening. This provision is applicable to shear walls and *braced wall panels* offset in plane and to *braced wall panels* offset out of plane as permitted by the exception to Item 1 above.~~

   ~~**Exception:** For wood light-frame wall construction, one end of a *braced wall panel* shall be permitted to extend more than 1 foot (305 mm) over an opening not more than 8 feet (2438 mm) wide in the wall below provided that the opening includes a header in accordance with the following:~~

1. ~~The building width, loading condition and framing member species limitations of Table R502.5(1) shall apply; and~~
2. ~~Not less than one 2 × 12 or two 2 × 10 for an opening not more than 4 feet (1219 mm) wide; or~~
3. ~~Not less than two 2 × 12 or three 2 × 10 for an opening not more than 6 feet (1829 mm) wide; or~~
4. ~~Not less than three 2 × 12 or four 2 × 10 for an opening not more than 8 feet (2438 mm) wide; and~~
5. ~~The entire length of the *braced wall panel* does not occur over an opening in the wall below.~~

4. ~~When an opening in a floor or roof exceeds the lesser of 12 feet (3658 mm) or 50 percent of the least floor or roof dimension.~~
5. ~~When portions of a floor level are vertically offset.~~

   ~~**Exceptions:**~~

   1. ~~Framing supported directly by continuous foundations at the perimeter of the building.~~
   2. ~~For wood light-frame construction, floors shall be permitted to be vertically offset when the floor framing is lapped or tied together as required by Section R502.6.1.~~

6. ~~When shear walls and *braced wall lines* do not occur in two perpendicular directions.~~
7. ~~When stories above *grade* plane partially or completely braced by wood wall framing in accordance with Section R602 or steel wall framing in accordance with Section R603 include masonry or concrete construction.~~

   ~~**Exception:** Fireplaces, chimneys and masonry veneer as permitted by this code. When this irregularity applies, the entire *story* shall be designed in accordance with accepted engineering practice.~~

R301.2.2.1.2 Alternative determination of Seismic Design Category E. Buildings located in Seismic Design Category E in accordance with Figure R301.2(2) are permitted to be reclassified as being in Seismic Design Category D 2 provided one of the following is done:

1. A more detailed evaluation of the seismic design category is made in accordance with the provisions and maps of the International Building Code. Buildings located in Seismic Design Category E per Table R301.2.2.1.1, but located in Seismic Design Category D per the International Building Code, may be designed using the Seismic Design Category D2 requirements of this code.
2. Buildings located in Seismic Design Category E that conform to the following additional restrictions are permit-ted to be constructed in accordance with the provisions for Seismic Design Category D2 of this code:
   2.1. All exterior shear wall lines or braced wall panels are in one plane vertically from the foundation to the uppermost story.
   2.2. Floors shall not cantilever past the exterior walls.2.3. The building <u>or portions of the building are constructed in accordance with the requirements for structures assigned to Seismic Design Category D2 elsewhere in this code.</u> ~~is within all of the requirements of Section R301.2.2.2.5 for being considered as regular.~~

Revise as follows:

R502.2 Design and construction. Floors shall be designed and constructed in accordance with the provisions of this chapter, Figure R502.2 and Sections R317 and R318 or in accordance with AF&PA/NDS.

R502.2.1 Framing at braced wall lines. A load path for lateral forces shall be provided between floor framing and *braced wall panels* located above or below a floor, as specified in Section R602.10.8.

R502.2.2 Vertically offset floor diaphragms in Seismic Design Category C, D0, D1 and D2. In structures or portions of structures in Seismic Design Category C, D0, D1 and D2, floor diaphragms or portions of floor diaphragms shall not be vertically offset.

Exceptions:

1. Framing supported directly by continuous foundations at the perimeter of the building.
2. For wood light-frame construction, floors shall be permitted to be vertically offset when the floor framing is lapped or tied together as required by Section R502.6.1.

R502.3.3 Floor cantilevers. Floor cantilever spans shall not exceed the nominal depth of the wood floor joist. Floor cantilevers constructed in accordance with Table R502.3.3(1) shall be permitted when supporting a light frame bearing wall and roof only. Floor cantilevers supporting an exterior balcony are permitted to be constructed in accordance with Table R502.3.3(2).

R502.3.3.1 Floor cantilevers in Seismic Design Categories D0, D1 or D2. Floor cantilevers supporting *braced wall panels* in all structures assigned to *Seismic Design Categories* D0, D1 or D2 and in townhouses in Seismic Design Category C shall be constructed in accordance with Section R602.10.9.

TABLE R502.3.3(1)
CANTILEVER SPANS FOR FLOOR JOISTS SUPPORTING LIGHT-FRAME EXTERIOR BEARING WALL AND ROOF ONLYa, b, c, f, g, h
(Floor Live Load ☐ 40 psf, Roof Live Load ☐20 psf)

(Potions of table not shown remain unchanged)

a through e *(No changes to text)*
f. See Section ~~R301.2.2.2.5~~ R602.10.9, Item 1, for additional limitations on cantilevered floor joists for ~~detached one- and two-family~~ dwellings in Seismic Design Category D0, D1, or D2 and townhouses in Seismic Design Category C.~~, D0, D1 or D2.~~
g through h *(No change to text)*

R502.10 Framing of openings. Openings in floor framing shall be framed with a header and trimmer joists. When the header joist span does not exceed 4 feet (1219 mm), the header joist may be a single member the same size as the floor joist. Single trimmer joists may be used to carry a single header joist that is located within 3 feet (914 mm) of the trimmer joist bearing. When the header joist span exceeds 4 feet (1219 mm), the trimmer joists and the header joist shall be doubled and of sufficient cross section to support the floor joists framing into the header. *Approved* hangers shall be used for the header joist to trimmer joist connections when the header joist span exceeds 6 feet (1829 mm). Tail joists over 12 feet (3658 mm) long shall be supported at the header by framing anchors or on ledger strips not less than 2 inches by 2 inches (51 mm by 51 mm).

R502.10.1 Framing of openings in Seismic Design Categories C, D0, D1 and D2. In structures in Seismic Design Category D0, D1 or D2 and in townhouses in Seismic Design Category C, where an opening in a floor exceeds the lesser of 12 feet (3658 mm) or 50 percent of the least floor dimension, that portion of the structure shall be designed in accordance with accepted engineering practice to the extent that the opening affects the performance of the remaining structural system.

Revise as follows:

R602.10 Wall bracing. Buildings shall be braced in accordance with this section or, when applicable, Section R602.12. Where a building, or portion thereof, does not comply with one or more of the bracing requirements in this section, those portions shall be designed and constructed in accordance with Section R301.1.

For all structures in Seismic Design Category D0, D1 or D2 and in townhouses in Seismic Design Category C, stories above *grade* plane partially or completely braced by wood wall framing in accordance with this section shall not include masonry or concrete construction or the entire *story* shall be designed in accordance with accepted engineering practice.

Exception: Fireplaces, chimneys and masonry veneer as permitted by this code.

R602.10.9 Braced wall panel support. *Braced wall panel* support shall be provided as follows:

1. Cantilevered floor joists complying with Section R502.3.3 shall be permitted to support *braced wall panel*s.

   For structures in Seismic Design Category D0, D1 and D2 and in townhouses in Seismic Design Category C, cantilevered floor joists supporting braced wall panels shall also comply with all of the following:

   1. Floor joists shall be nominal 2 inches by 10 inches (51 mm by 254 mm) or larger and spaced not more than 16 inches (406 mm) on center.
   2. The ratio of the back span to the cantilever shall be at least 2 to 1.
   3. Floor joists at ends of *braced wall panels* shall be doubled.
   4. For wood-frame construction, a continuous rim joist shall be connected to ends of all cantilever joists. When spliced, the rim joists shall be spliced using a galvanized metal tie not less than 0.058 inch (1.5 mm) (16 gage) in thickness and 11/2 inches (38 mm) in width fastened with six 16d nails on each side of the splice or a block of the same size as the rim joist of sufficient length to fit securely between the joist space at which the splice occurs fastened with eight 16d nails on each side of the splice; and
   5. Gravity loads carried at the end of cantilevered joists shall be limited to uniform wall and roof loads and the reactions from headers having a span of 8 feet (2438 mm) or less.

2. Elevated post or pier foundations supporting *braced wall panel*s shall be designed in accordance with accepted engineering practice.
3. Masonry stem walls with a length of 48 inches (1219 mm) or less supporting *braced wall panel*s shall be reinforced in accordance with Figure R602.10.9. Masonry stem walls with a length greater than 48 inches (1219 mm) supporting *braced wall panel* s shall be constructed in accordance with Section R403.1 Methods ABW and PFH shall not be permitted to attach to masonry stem walls.
4. Concrete stem walls with a length of 48 inches (1219 mm) or less, greater than 12 inches (305 mm) tall and less than 6 inches (152 mm) thick shall have reinforcement sized and located in accordance with Figure R602.10.9.
5. For all structures in Seismic Design Category D0, D1 or D2 and in townhouses in Seismic Design Category C, the end of a *braced wall panel* over an opening in the wall below shall not extend a horizontal distance greater than 1 foot (305 mm) from the end of the panel to the edge of the opening. This provision is applicable to *braced wall panels* offset in plane and to *braced wall panels* offset out of plane as permitted by the exception to Item 1 above.

   Exception: For wood light-frame wall construction, one end of a *braced wall panel* shall be permitted to extend more than 1 foot (305 mm) over an opening not more than 8 feet (2438 mm) wide in the wall below provided that the opening includes a header in accordance with the following:

   1. The building width, loading condition and framing member species limitations of Table R502.5(1) shall apply; and
   2. Not less than one 2 × 12 or two 2 × 10 for an opening not more than 4 feet (1219 mm) wide; or
   3. Not less than two 2 × 12 or three 2 × 10 for an opening not more than 6 feet (1829 mm) wide; or
   4. Not less than three 2 × 12 or four 2 × 10 for an opening not more than 8 feet (2438 mm) wide; and

5. The entire length of the *braced wall panel* does not occur over an opening in the wall below.

R603.1.1 Applicability limits. The provisions of this section shall control the construction of exterior cold-formed steel wall framing and interior load-bearing cold-formed steel wall framing for buildings not more than 60 feet (18 288 mm) long perpendicular to the joist or truss span, not more than 40 feet (12 192 mm) wide parallel to the joist or truss span, and less than or equal to three stories above *grade plane* . All exterior walls installed in accordance with the provisions of this section shall be considered as load-bearing walls. Cold-formed steel walls constructed in accordance with the provisions of this section shall be limited to sites subjected to a maximum design wind speed of 110 miles per hour (49 m/s) Exposure B or C and a maximum ground snow load of 70 pounds per square foot (3.35 kPa).

For all structures in Seismic Design Category D0, D1 or D2 and in townhouses in Seismic Design Category C, stories above *grade* plane walls partially or completely braced by cold-formed wall framing in accordance with this section shall not include masonry or concrete construction or the entire *story* shall be designed in accordance with accepted engineering practice.

Exception: Fireplaces, chimneys and masonry veneer as permitted by this code.

Revise as follows:

R802.9 Framing of openings. Openings in roof and ceiling framing shall be framed with header and trimmer joists. When the header joist span does not exceed 4 feet (1219 mm), the header joist may be a single member the same size as the ceiling joist or rafter. Single trimmer joists may be used to carry a single header joist that is located within 3 feet (914 mm) of the trimmer joist bearing. When the header joist span exceeds 4 feet (1219 mm), the trimmer joists and the header joist shall be doubled and of sufficient cross section to support the ceiling joists or rafter framing into the header. *Approved* hangers shall be used for the header joist to trimmer joist connections when the header joist span exceeds 6 feet (1829 mm). Tail joists over 12 feet (3658 mm) long shall be supported at the header by framing anchors or on ledger strips not less than 2 inches by 2 inches (51 mm by 51 mm).

R802.9.1 Framing of openings in Seismic Design Categories C, D0, D1 and D2. For structures or portions of structures in Seismic Design Category C, D0, D1 or D2 when an opening in a roof exceeds the lesser of 12 feet (3658 mm) or 50 percent of the least roof dimension, that portion of the structure shall be designed in accordance with accepted engineering practice to the extent the opening affects the performance of the remaining structural system.

Revise as follows:

SECTION AJ104
EVALUATION OF AN EXISTING BUILDING

AJ104.1 General. The *building official* may require an existing building to be investigated and evaluated by a registered design professional in the case of proposed reconstruction of any portion of a building. The evaluation shall determine the existence of any potential non-conformities to these provisions, and shall provide a basis for determining the impact of the proposed changes on the performance of the building. The evaluation shall use the following sources of information, as applicable:

1. Available documentation of the existing building.
   1.1. Field surveys.
   1.2. Tests (nondestructive and destructive).
   1.3. Laboratory analysis.

   Exception: Detached one- or two-family dwellings that comply with Section R102.7. ~~are not irregular buildings under Section R301.2.2.2.5~~ and are not undergoing an extensive reconstruction shall not be required to be evaluated.

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC) The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

This proposal is to delete the concept of "Irregular Structures" from Section R301.2.2.2.5 from the code and relocate the specific construction requirements of the irregular structures into the applicable sections of the code where they are relevant. As currently written, the list of items defining "Irregular Structures" in high seismic categories is a laundry list of items that cause the structure to be outside of the scope of this code. Then, for most of the defined irregularities there is an exception including technical construction requirements that, when done, allow the structure to not be classified as "Irregular". So, in essence, the current section of "Irregular structures" items are exceptions to the code. Then the exceptions to each item are exceptions to the exception. This makes poor code language.

In addition, many code users are not aware of these requirements because they are located in Chapter 3. As an example, when a code user is looking to the code to determine how to construct cantilever floor joists, they would go to Chapter 5, "Floor Framing". There is a section addressing cantilevers. However, in this section in Chapter 3 it says when a floor cantilevers and supports a wall above (not in the same vertical plane) it is irregular. Then the exception to the exception defines how to construct the floor so that it will not be considered irregular. The BCAC determined that it would be much better to actually include the cantilever construction requirements in the actual section in Chapter 5 that describes cantilevered floor construction.

This proposal does not make any technical changes to the code. It merely moves the construction requirements and limitations therein to the applicable sections that already exist in Chapter 5, Floor framing, Chapter 6, Wall framing and Chapter 8 Roof framing. The limitations are still applicable and by relocating them they will be more noticeable and apparent. The current code already has language and provisions to cover construction that exceeds the limitations of this code.

As shown below, R301.1 states that when, **"… construction is in accordance with the provision of this code…"** it is deemed to comply and the converse is true as well. When construction is NOT in accordance with the provisions it does not comply. Further, Section R301.1.3 it states that, **"…elements exceeding the limits of Section R301 or otherwise not conforming to this code."** shall require an engineered design. With the specific construction requirements now in the applicable code sections, those two provisions already exist and adequately address the cases when mandatory code requirements are exceeded.

> ***R301.1 Application.*** *Buildings and structures, and all parts thereof, shall be constructed to safely support all loads, including dead loads, live loads, roof loads, flood loads, snow loads, wind loads and seismic loads as prescribed by this code. The construction of buildings and structures* ***in accordance with the provisions of this code*** *shall result in a system that provides a complete load path that meets all requirements for the transfer of all loads from their point of origin through the load-resisting elements to the foundation. Buildings and structures constructed as prescribed by this code are deemed to comply with the requirements of this section.*
>
> ***R301.1.3 Engineered design.*** *When a building of otherwise conventional construction contains structural* ***elements exceeding the limits of Section R301 or otherwise not conforming to this code****, these elements shall be designed in accordance with accepted engineering practice. The extent of such design need only demonstrate compliance of nonconventional elements with other applicable provisions and shall be compatible with the performance of the conventional framed system. Engineered design in accordance with the International Building Code is permitted for all buildings and structures, and parts thereof, included in the scope of this code.*

The existing Section R301.2.2.2 defines limitations for the use and scope of this code for structures in Seismic Design Category C such as weights of materials, stone and masonry veneer, masonry and concrete construction. The existing Section R301.2.2.3 defines further limitations for Seismic Design Category D0, D1 and D2 in addition to the Seismic Design Category C limitations such as height limitations. These two sections remain as is and the current limitations apply.
The net effect is the same and proposal makes the code much more user friendly and will prevent the oversight of the specific construction requirements and limitations that now exist in Chapter 3.

Cost Impact: The code change does not change the existing requirements of the code and will not increase the cost of construction.

R301.2.2.2.5-RB-BAJNAI-BCAC

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The committee disapproved this code change proposal because they felt that the proposed simplification reduces clarity and usability of the code. In addition, the torsional irregularities are missing and the cold formed steel industry has concerns that they are receiving benefits to which they may not be entitled.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee requests Approval as Modified by this Public Comment.

Replace proposal with the following:

R502.2 Design and construction. Floors shall be designed and constructed in accordance with the provisions of this chapter, Figure R502.2 and Sections R317 and R318 or in accordance with AF&PA/NDS.

R502.2.1 Framing at braced wall lines. A load path for lateral forces shall be provided between floor framing and *braced wall panels* located above or below a floor, as specified in Section R602.10.8. In all structures or portions of structures in Seismic Design Category D0, D1 and D2 and in townhouses in Seismic Design Category C, vertical offsets in floor diaphragms and braced wall support shall comply with the requirements of Section R301.2.2.2.5

R502.3.3 Floor cantilevers. Floor cantilever spans shall not exceed the nominal depth of the wood floor joist. Floor cantilevers constructed in accordance with Table R502.3.3(1) shall be permitted when supporting a light frame bearing wall and roof only. Floor cantilevers supporting an exterior balcony are permitted to be constructed in accordance with Table R502.3.3(2). Floor cantilevers supporting *braced wall panels* in all structures assigned to *Seismic Design Categories* D0, D1 or D2 and in townhouses in Seismic Design Category C shall be constructed in accordance with Section R301.2.2.2.5, Item 1.

TABLE R502.3.3(1)
CANTILEVER SPANS FOR FLOOR JOISTS SUPPORTING LIGHT-FRAME EXTERIOR BEARING WALL AND ROOF ONLY[a, b, c, f, g, h]
(Floor Live Load ≤ 40 psf, Roof Live Load ≤ 20 psf)

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 0.0479 kPa.

(No change to the table)

(footnotes not shown remain unchanged)

f. See Section R301.2.2.2.5, Item 1, for additional limitations on cantilevered floor joists for ~~detached one- and two-family dwellings~~ all structures in Seismic Design Category D0, D1, or D2 and townhouses in Seismic Design Category C.~~, D0, D1 or D2.~~

R502.10 Framing of openings. Openings in floor framing shall be framed with a header and trimmer joists. When the header joist span does not exceed 4 feet (1219 mm), the header joist may be a single member the same size as the floor joist. Single trimmer joists may be used to carry a single header joist that is located within 3 feet (914 mm) of the trimmer joist bearing. When the header joist span exceeds 4 feet (1219 mm), the trimmer joists and the header joist shall be doubled and of sufficient cross section to support the floor joists framing into the header. *Approved* hangers shall be used for the header joist to trimmer joist connections when the header joist span exceeds 6 feet (1829 mm). Tail joists over 12 feet (3658 mm) long shall be supported at the header by framing anchors or on ledger strips not less than 2 inches by 2 inches (51 mm by 51 mm). In all structures in Seismic Design Category D0, D1 or D2 and in townhouses in Seismic Design Category C, openings shall be subject to the limitations of Section R301.2.2.2.5, Item 4.

R505.1.1 Applicability limits. The provisions of this section shall control the construction of cold-formed steel floor framing for buildings not greater than 60 feet (18 288 mm) in length perpendicular to the joist span, not greater than 40 feet (12 192 mm) in width parallel to the joist span, and less than or equal to three stories above *grade* plane. Cold-formed steel floor framing constructed in accordance with the provisions of this section shall be limited to sites subjected to a maximum design wind speed of 110 miles per hour (49 m/s), Exposure B or C, and a maximum ground snow load of 70 pounds per square foot (3.35 kPa). <u>All structures or portions of structures in Seismic Design Category D0, D1 and D2 and in townhouses in Seismic Design Category C, shall comply with the requirements of Section R301.2.2.2.5</u>

R505.3.8 Framing of floor openings. Openings in floors shall be framed with header and trimmer joists. Header joist spans shall not exceed 6 feet (1829 mm) or 8 feet (2438 mm) in length in accordance with Figure R505.3.8(1) or R505.3.8(2), respectively. Header and trimmer joists shall be fabricated from joist and track members, having a minimum size and thickness at least equivalent to the adjacent floor joists and shall be installed in accordance with Figures R505.3.8(1), R505.3.8(2), R505.3.8(3), and R505.3.8(4). Each header joist shall be connected to trimmer joists with four 2 inch by 2 inch (51 mm by 51 mm) clip angles. Each clip angle shall be fastened to both the header and trimmer joists with four No. 8 screws, evenly spaced, through each leg of the clip angle. The clip angles shall have a thickness not less than that of the floor joist. Each track section for a built-up header or trimmer joist shall extend the full length of the joist (continuous). <u>In all structures in Seismic Design Category D0, D1 or D2 and in townhouses in Seismic Design Category C, openings shall be subject to the limitations of Section R301.2.2.2.5,</u>

R602.10 Wall bracing. Buildings shall be braced in accordance with this section or, when applicable, Section R602.12. Where a building, or portion thereof, does not comply with one or more of the bracing requirements in this section, those portions shall be designed and constructed in accordance with Section R301.1. <u>In all structures in Seismic Design Category D0, D1 or D2 and in townhouses in Seismic Design Category C, wall bracing support shall comply with the requirements of Section R301.2.2.2.5.</u>

R602.10.9 Braced wall panel support. *Braced wall panel* support shall be provided as follows:

1. Cantilevered floor joists complying with Section R502.3.3 shall be permitted to support *braced wall panel*s. <u>In all structures in Seismic Design Category D0, D1 and D2 and in townhouses in Seismic Design Category C, cantilevered floor joists supporting braced wall panels shall comply with the requirements of Section R301.2.2.2.5, Item 1.</u>
2. *No change*.
3. *No change*
4. *No change*
5. <u>In all structures in Seismic Design Category D0, D1 or D2 and in townhouses in Seismic Design Category C, the end of a *braced wall panel* over an opening in the wall below shall comply with the requirements of Section R301.2.2.2.5, Item 3.</u>

R603.1.1 Applicability limits. The provisions of this section shall control the construction of exterior cold-formed steel wall framing and interior load-bearing cold-formed steel wall framing for buildings not more than 60 feet (18 288 mm) long perpendicular to the joist or truss span, not more than 40 feet (12 192 mm) wide parallel to the joist or truss span, and less than or equal to three stories above *grade plane* . All exterior walls installed in accordance with the provisions of this section shall be considered as load-bearing walls. Cold-formed steel walls constructed in accordance with the provisions of this section shall be limited to sites subjected to a maximum design wind speed of 110 miles per hour (49 m/s) Exposure B or C and a maximum ground snow load of 70 pounds per square foot (3.35 kPa). <u>In all structures in Seismic Design Category D0, D1 or D2 and in townhouses in Seismic Design Category C, wall bracing shall comply with the requirements of Section R301.2.2.2.5.</u>

R802.9 Framing of openings. Openings in roof and ceiling framing shall be framed with header and trimmer joists. When the header joist span does not exceed 4 feet (1219 mm), the header joist may be a single member the same size as the ceiling joist or rafter. Single trimmer joists may be used to carry a single header joist that is located within 3 feet (914 mm) of the trimmer joist bearing. When the header joist span exceeds 4 feet (1219 mm), the trimmer joists and the header joist shall be doubled and of sufficient cross section to support the ceiling joists or rafter framing into the header. *Approved* hangers shall be used for the header joist to trimmer joist connections when the header joist span exceeds 6 feet (1829 mm). Tail joists over 12 feet (3658 mm) long shall be supported at the header by framing anchors or on ledger strips not less than 2 inches by 2 inches (51 mm by 51 mm). <u>In all structures or portions of structures in Seismic Design Category C, D0, D1 or D2 and in townhouses in Seismic Design Category C, openings in roofs shall comply with the requirements of Section R301.2.2.2.5, Item 4.</u>

R804.1.1 Applicability limits. The provisions of this section shall control the construction of cold-formed steel roof framing for buildings not greater than 60 feet (18 288 mm) perpendicular to the joist, rafter or truss span, not greater than 40 feet (12 192 mm) in width parallel to the joist span or truss, less than or equal to three stories above *grade* plane and with roof slopes not less than 3:12 (25- percent slope) or greater than 12:12 (100-percent slope). Cold-formed steel roof framing constructed in accordance with the provisions of this section shall be limited to sites subjected to a maximum design wind speed of 110 miles per hour (49 m/s), Exposure B or C, and a maximum ground snow load of 70 pounds per square foot (3350 Pa). <u>In all structures in Seismic Design Category D0, D1 or D2 and in townhouses in Seismic Design Category C, cold-formed steel roof framing shall comply with the requirements of Section R301.2.2.2.5.</u>

R804.3.6 Framing of openings in roofs and ceilings. Openings in roofs and ceilings shall be framed with header and trimmer joists. Header joist spans shall not exceed 4 feet (1219 mm) in length. Header and trimmer joists shall be fabricated from joist and track members having a minimum size and thickness at least equivalent to the adjacent ceiling joists or roof rafters and shall be installed in accordance with Figures R804.3.6(1) and R804.3.6(2). Each header joist shall be connected to trimmer joists with a minimum of four 2-inch by 2-inch (51 by 51 mm) clip angles. Each clip angle shall be fastened to both the header and trimmer joists with four No. 8 screws, evenly spaced, through each leg of the clip angle. The steel thickness of the clip angles shall be not less than that of the ceiling joist or roof rafter. Each track section for a built-up header or trimmer joist shall extend the full length of the joist (continuous). In all structures or portions of structures in Seismic Design Category C, D0, D1 or D2 and in townhouses in Seismic Design Category C, openings in roofs shall comply with the requirements of Section R301.2.2.2.5, Item 4.

Reason: The Building Code Action Committee (BCAC) is requesting approval of this public comment that addresses the code development committees concerns. The original proposal intended to remove the requirements of “Irregular Structures” from Section R301.2.2.2.5 and relocate them into the applicable sections of the code where they are relevant. The reason was that many code users are not aware of these limitations and requirements because they are located in Chapter 3. Neither the original proposal nor this public comment make any technical changes to the code.

1. At the Committee Action Hearings, some of the code development committee members thought that the original proposal to remove the requirements from Section R301.2.2.2.5 reduced clarity and usability of the code. Therefore this public comment takes the opposite tact and leaves the current provisions in R301.2.2.2.5 and adds a pointer in each of the applicable code sections that might otherwise be overlooked. The provisions for torsional irregularities mentioned by the code development committee are also now unaffected and remain intact in Section R301.2.2.2.5.

In addition, there were comments made that the provisions for cold-formed steel construction were not adequately addressed. As stated, this public comment leaves the requirements and limitations in R301.2.2.2.5 where they are currently located and adds pointers to the applicable provisions of the cold-formed steel construction section.

Cost Impact: The code change does not change the existing requirements of the code and will not increase the cost of construction.

RB48-13

Final Action: AS AM AMPC____ D

RB56-13
R301.5, Table R301.5

Proposed Change as Submitted

Proponent: Stephen Kerr, S.E., Josephson Werdowatz and Associates Inc., representing self (skerr@jwa-se.com)

Revise as follows:

R301.5 Live load. The minimum uniformly distributed and concentrated live loads shall be as provided in Table R301.5.

TABLE R301.5
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS
AND MINIMUM CONCENTRATED LIVE LOADS
~~(in pounds per square foot)~~

~~OCCUPANCY OR~~ USE	~~LIVE LOAD~~ UNIFORM (psf)	CONCENTRATED (lbs.)
Uninhabitable attics without storage[b]	10	-
Uninhabitable attics with limited storage[b,g]	20	-
Habitable attics and attics served with fixed stairs	30	-
Balconies (exterior) and decks[e]	40	-
Fire escapes	40	-
Guardrails and handrails[d]	- ~~200[h]~~	200[h]
Guardrail in-fill components[f]	- ~~50[h]~~	50[h]
Passenger vehicle garages~~[a]~~	40 ~~50[a]~~	Note a
Rooms other than sleeping room	40	-
Sleeping rooms	30	-
Stairs	40~~[c]~~	300[c]

a. Elevated garage floors shall be capable of supporting a 3,000 ~~2,000~~ pound load applied on an area of ~~over a~~ 20 square-inches ~~area~~.

b (*No change to current text*)

c. The minimum concentrated load on stair treads shall be applied on ~~Individual stair treads shall be designed for the uniformly distributed live load or a 300-pound concentrated load acting over~~ an area of 4 square inches. This load need not be assumed to act concurrently with the uniform load.~~, whichever produces the greater stresses.~~

d through h (*No change to current text*)

Reason: As currently presented, the tile of Table R301.5 states that the loads as uniformly distributed and that the loads are in pounds per square foot. However, this is incorrect, since the guardrail and handrail loads shown are concentrated loads. By splitting the loads into two columns, the Live Load table will accurately represent what type of live load is shown. The passenger vehicle garage loads were also changed to reflect the changes that occurred to the live load in the 2012 IBC.

These changes will make the IRC Live Load table match the format and values of the IBC and ASCE 7 Live Load tables.

Cost Impact: This code change proposal will not increase construction cost.

R301.5-RB-KERR

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because a) no analysis was given for additional construction costs in accordance with CP#28, b) the stair criteria needs tweaks and c) we are dealing with residential garages, not apartment buildings, and 2,000 pounds has proved to be adequate for residential garages.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Stephen Kerr, Josephson Werdowatz and Associates, Inc., representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R301.5 Live load. The minimum uniformly distributed and concentrated live loads shall be as provided in Table R301.5.

TABLE R301.5
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS,
AND MINIMUM CONCENTRATED LIVE LOADS,

OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (lbs.)
Uninhabitable attics without storage[b]	10	-
Uninhabitable attics with limited storage[b,g]	20	-
Habitable attics and attics served with fixed stairs	30	-
Balconies (exterior) and decks[e]	40	-
Fire escapes	40	-
Guardrails and handrails[d]	-	200[h]
Guardrail in-fill components[f]	-	50[h]
Passenger vehicle garages[a]	40	Note a
Rooms other than sleeping room	40	-
Sleeping rooms	30	-
Stairs	40[c]	300[c]

a. Elevated garage floors shall be capable of supporting a ~~3,000~~ 2,000-pound load applied on an area of 20 square-inches.
c. The minimum concentrated load on stair treads shall be applied on an area of 4 square inches. This load need not be assumed to act concurrently with the uniform load.

(Footnotes not show to remain unchanged)

Commenter's Reason:
A) The issue of construction cost was raised with the original proposal changing the elevated garage floor point load to 3000 pounds. With the proposed modification to the keep the 2000 pound point load intact, there are no substantial changes to the language, and so the design under this As Modified proposal would be identical to a design under the current 2012 IRC. Therefore, there is no change in cost of construction as a result of the proposed change.
B) There was a comment that the stair point load needs to be tweaked. We disagree with the commenter's reasoning. With one exception, the proposed language is copied word-for-word from footnote f of the 2012 IBC. The only change, for consistency with the other footnotes in IRC Table R301.5, is that the point load is shown as "4 square inches" versus the IBC which uses "2 inch by 2 inch" to describe the size of the point load. The proposed change will bring consistency between the IBC and IRC and does not reflect any new loading on stair treads.
C) The concentrated point load for elevated garage floors is revised to keep the 2000 pound point load in the IRC. This will maintain continuity between the 2012 and 2015 IRC editions.

Public Comment 2:

Edwin T. Huston, Smith & Huston, Inc., Consulting Engineers, representing National Council of Structural Engineers Association (NCSEA) Code Advisory Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R301.5 Live load. The minimum uniformly distributed and concentrated live loads shall be as provided in Table R301.5.

TABLE R301.5
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS,
AND MINIMUM CONCENTRATED LIVE LOADS,

OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (lbs.)
Uninhabitable attics without storage[b]	10	-
Uninhabitable attics with limited storage[b,g]	20	-
Habitable attics and attics served with fixed stairs	30	-
Balconies (exterior) and decks[e]	40	-
Fire escapes	40	-
Guardrails and handrails[d]	-	200[h]
Guardrail in-fill components[f]	-	50[h]
Passenger vehicle garages[a]	40	Note a
Rooms other than sleeping room	40	-
Sleeping rooms	30	-
Stairs	40[c]	300[c]

a. Elevated garage floors shall be capable of supporting a 3,000 pound wheel load applied on an area of 20 square-inches.
b. The minimum concentrated load on stair treads shall be applied on an area of 4 square inches. This load need not be assumed to act concurrently with the uniform load.

(Portions of footnotes not shown remain unchanged)

Commenter's Reason: The IBC load for garages includes a 40 psf design load and a 3,000 pound concentrated load. This change in the 2003 IBC and was based on a Code Change Proposal S14-02 submitted by Jim Rossberg, then of the Structural Engineering Institute of ASCE. That Code Change Proposal read in part:

> SEI funded a study to arrive at an appropriate design value. A load survey of vehicle weights was conducted at 9 commercial parking garages in Chicago and Champaign, Illinois and Boston and Cambridge, Massachusetts. Statistical analyses of the maximum load effects on beams and columns due to vehicle loads over the garage's life were carried out using the survey results. The equivalent uniformly distributed loads that would product the 30-year maximum column axial force and mid-span beam bending moment are conservatively estimated at 34.8 (psf). The EUDL (Equivalent Uniform Design Load) is not sensitive to bay-size variation. Details of this study can be found in Wen and Yeo (1999).
>
> Because of the observation of the continued increase consumption by the public of very heavy passenger vehicles such as sport-utility vehicles, a design load of 40 psf was approved by the ASCE 7 standards committee with no allowance for reduction according to bay area and a corresponding increase in the concentrated load.
>
> Based on the above rationale and the published study by Wen and Yeo, the ASCE 7 standards committee approved a change to the live load provisions for passenger vehicle parking garages. This change would make the provisions of the IBC consistent with those of ASCE 7-02.
>
> REFERENCES
>
> *Wen Y.K. and Yeo, G. L.,.* "Design Live Loads for Parking Garages" available from ASCE, 1801 Alexander Bell Drive, Reston, Virginia, 20191. 1-800-548-2723.

This Public comment would add the word "wheel" so that this concentrated load is not confused with an axle load.

The IRC Building Committee noted in their reason for disapproval that "we are dealing with residential garages, not apartment buildings, and 2,000 pounds has proved to be adequate for residential garages".

A review of Gross Vehicle Weights (GVW) and Gross Axle Weight Ratings (GAWR) from manufacturer's specifications indicates that many popular light trucks and large sport-utility vehicles have axle ratings that exceed the 2,000 pound concentrated load. For example, consider the following:

Manufacturer	Model	GVW	GAWR
Ford	F 350	10,100 Pounds	6,262 pounds
Ford	F 450	14,000 Pounds	9,500 pounds
Chevrolet	Silverado 3500 HD	9,900 Pounds	6,390 pounds
Chevrolet	Suburban 2500	8,600 Pounds	5,500 pounds
Dodge	Ram 3,500	10,100 Pounds	6,200 Pounds

There are of course, many vehicles which are much lighter. One opponent at the Code Change Hearings also noted that there were Smart Cars and Minis being sold as well. Clearly, the provisions of the IRC should be based on typical heavy vehicles, not typical light vehicles.

If this Public Comment is approved, there will be a modest increase in construction costs for that small percentage of garages which are elevated. The majority of garages are built on a slab-on-grade. This change will not impact garages built on a slab-on-grade.

This change will align the IRC with the IBC with respect to the magnitude of the loads. This alignment meets the intent of CP-05 section 1.3.1 regarding code correlation.

"1.3.1 Code Correlation: The provisions of all Codes shall be consistent with one another so that conflicts between the Codes do not occur. Where a given subject matter or code text could appear in more than one Code, the ICC Board shall determine which Code shall be the primary document, and therefore which code development committee shall be responsible for review and maintenance of the code text. Duplication of content or text between Codes shall be limited to the minimum extent necessary for practical usability of the Codes, as determined in accordance with Section 4.4."

We urge you to overturn the committee so that we can bring this Public Comment to the floor.

RB56-13

Final Action: AS AM AMPC____ D

RB57-13
Table R301.5

Proposed Change as Submitted

Proponent: Larry Wainright, Qualtim, representing the Structural Building Components Association (lwainright@qualtim.com)

Revise as follows:

TABLE R301.5
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS
(in pounds per square foot)

(Portions of table not shown remain unchanged)

a through f *(No change to current text)*

g. Uninhabitable attics with limited storage are those where the maximum clear height between joists and rafters is 42 inches or greater, or where there are two or more adjacent trusses with web configurations capable of accommodating an assumed rectangle 42 inches in height by 24 inches in width, or greater, within the plane of the trusses. The live load need only be applied to those portions of the joists or truss bottom chords where all of the following conditions are met:

1. The attic area is accessible from an opening not less than 20 inches in width by 30 inches in length that is located where the clear height in the attic is a minimum of 30 inches.
2. The slopes of the joists or truss bottom chords are no greater than 2 inches vertical to 12 units horizontal.
3. Required insulation depth is less than the joist or truss bottom chord member depth.

The remaining portions of the joists or truss bottom chords shall be designed for a uniformly distributed <u>non-</u>concurrent live load of not less than 10 lb/ft2.

h. *(No change to current text)*

Reason The intent of this proposal is to bring the IRC into agreement with the IBC, Table 1607.1, footnote ‘i”; ASCE 7, Table 4-1, footnotes “l” and “m” and the IRC Table R301.5, footnote “b”.

The requirement for the 10 PSF live load on those portions of the bottom chords not serving as storage areas was originally intended to reflect the requirement to provide a 10 PSF load per Table R301.5, footnote “b” for uninhabitable attics without storage on those portions of the joist or truss where a storage load is not applied. Footnote b clearly indicates that this is a non-concurrent load (intended for occasional access for maintenance).This is confirmed by the Commentary to the 2012 IBC, Table 1607.1 which states in part, “…Historically, a minimum load of 10 psf (0.48 kN/m2) has been viewed as appropriate where occasional access to the attic is anticipated for maintenance purposes, but significant storage is restricted by physical constraints, such as low clearance or the configuration of truss webs. It provides a minimum degree of structural integrity, allowing for occasional access to an attic space for maintenance purposes. ***Allowing the application of this load to be independent of other live loads is deemed appropriate, since it would be rare for this load and other maximum live loads to occur at once.”[emphasis added]***

Current truss design methodology also treats this 10 PSF non-storage load as a non-concurrent live load intended for occasional access for maintenance purposes. Furthermore, the change to this section (S57-09/10) was intended to coordinate the language with the ASCE 7-10 which was in draft form at the time the original proposal was submitted. During the public comment period, ASCE 7 was corrected to show that this is a non-concurrent load but the change was not picked up in the IRC. This code change simply coordinates this footnote with Table 1607.1, Table R301.5 footnote b, ASCE 7, and with the original intent of S57-09/10.

For reference, Table R301.5, footnote “b” states:

b. Uninhabitable attics without storage are those where the maximum clear height between the joist and rafter is less than 42 inches, or where there are not two or more adjacent trusses with web configurations capable of accommodating an assumed rectangle 42 inches in height by 24 inches in width, or greater, within the plane of the trusses. **This live load need not be assumed to act concurrently with any other live load requirements.**

ASCE 7-10, Table 4-1,footnotes “l” and “m” state:

[l] Uninhabitable attic areas without storage are those where the maximum clear height between the joist and rafter is less than 42 in. (1,067 mm), or where there are not two or more adjacent trusses with web configurations capable of accommodating an assumed rectangle 42 in. (1,067 mm) in height by 24 in. (610 mm) in width, or greater, within the plane of the trusses. **This live load need not be assumed to act concurrently with any other live load requirement.**

[m] Uninhabitable attic areas with storage are those where the maximum clear height between the joist and rafter is 42 in. (1,067 mm) or greater, or where there are two or more adjacent trusses with web configurations capable of accommodating an assumed rectangle 42 in. (1,067 mm) in height by 24 in. (610 mm) in width, or greater, within the plane of the trusses. At the trusses, the live load need only be applied to those portions of the bottom chords where both of the following conditions are met:

i. The attic area is accessible from an opening not less than 20 in. (508 mm) in width by 30 in. (762 mm) in length that is located where the clear height in the attic is a minimum of 30 in. (762 mm); and
ii. The slope of the truss bottom chord is no greater than 2 units vertical to 12 units horizontal (9.5% slope).

The remaining portions of the bottom chords shall be designed for a uniformly distributed nonconcurrent live load of not less than 10 Ib/ft2 (0.48 kN/m2).
IBC Table 1607.1, footnote "I" states:

i. Uninhabitable attics without storage are those where the maximum clear height between the joists and rafters is less than 42 inches, or where there are not two or more adjacent trusses with web configurations capable of accommodating an assumed rectangle 42 inches in height by 24 inches in width, or greater, within the plane of the trusses. **This live load need not be assumed to act concurrently with any other live load requirements.**

Note that the IBC, Table 1607.1 footnote "j" is also inconsistent with ASCE 7, the IRC and the IBC, table 1607.1, footnote "i".

Cost Impact: This code change will not increase the cost of construction.

R301.5-RB-WAINRIGHT

Committee Action Hearing Results

Committee Action: Approved as Submitted

Committee Reason: The committee approved this proposed code change because they felt that it correlates the International Residential Code requirements with those of the International Building Code.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Edwin T. Huston, Smith & Huston, Inc., Consulting Engineers, representing National Council of Structural Engineers Association (NCSEA) Code Advisory Committee, requests Disapproval.

Commenter's Reason: The committee reason for Approval as Submitted was "*The committee approved this proposed code change because they felt that it correlates the International Residential Code requirements with those of the International Building Code*".

The proponent of RB57-13 opens their reason statement by saying that "*The intent of this proposal is to bring the IRC into agreement with the IBC, Table 1607.1, footnote 'i"; ASCE 7, Table 4-1, footnotes "l" and "m" and the IRC Table R301.5, footnote "b"."* This intent needs to be carefully followed to be understood. As written, the reason statement is, at best, unclear, if not deceptive. The IBC Table 1607.1, footnote 'i"; ASCE 7, Table 4-1, footnote "l" and the IRC Table R301.5, footnote "b" all deal with "uninhabitable attics ***without*** storage". The change is being made to "uninhabitable attic ***with*** storage". The intent of RB57-13 is to apply a provision from "uninhabitable attics without storage" to "uninhabitable attic with storage", and in so doing to lessen the requirements of the IRC. The result is **not** alignment of similar provisions of the IRC with the IBC, but to break that alignment!

The 10 psf live load in the IBC and the IRC for uninhabitable attics without storage "need not be assumed to act concurrently with any other live load requirement" to accommodate unanticipated storage loads as described below. This wording is the same in both codes.

When the attic has a large enough access opening; placed where the clear height in the attic is a minimum of 30 inches; is tall enough that "an assumed rectangle 42 inches in height by 24 inches in width, or greater" can be accommodated; it is considered to be an "uninhabitable attic with storage".

In the IBC and in the 2012 IRC the live load of an "uninhabitable attic with storage" is 20 psf where that assumed rectangle 42 inches in height by 24 inches in width, or greater" can be accommodated, and the "remaining portions of the joists or truss bottom chords shall be designed for a uniform concurrent live load of not less than" 10 psf. In other words, where you have enough height that you could store a couple of bankers boxes of old papers, a 20 psf load is required. When the roof slope reduces the clear height below 42 inches, then the load can be stepped down to 10 psf. This makes sense. There is less clear height, so those portions can be designed for a smaller load.

The intent of RB57-13 is to make the 10 psf portion of the load **non-**concurrent. This language is ambiguous, and may be unenforceable. Non-concurrent with what? Non-concurrent with the 20 psf load? Non-concurrent with "any other live load requirement"? The proponent doesn't say.

If home owners are storing material in an attic, they are not going to be only storing it in those areas where there is 42 inches of clear height. They will store more material where there is 42 inches of clear height, but they will also store material in those portions of the attic where there is less than 42 inches of clear height.

For example, if the attic access is at a location where there is only 30 inches of clear height, and a home owner is going to store material where there is 42 inches of clear height, then it stands to reason that they will also store material between that taller area and the attic access.

I have been in many attics after wind storms to document fallen tree damage to trusses, and I have routinely seen material being stored in areas where there is less than 42 inches of clear height.

If material is being stored, it will be present when there is live load or snow load on the roof, and it needs to therefore be concurrent.

Neither the IBC nor the IRC footnotes align with the footnotes of ASCE 7-10 on the loading requirements for "uninhabitable attic with storage". While RB57-13 would bring the IRC into closer alignment with ASCE 7-10, there would still be misalignment in other parts of these same footnotes. This section of ASCE 7-10 is currently being modified, so attempting to align with ASCE 7 is premature.

The committee may have been persuaded that they were correlating the IRC with the IBC, but in reality, they were not. I urge you to overturn the committee and disapprove the proposal.

RB57-13

Final Action: AS AM AMPC____ D

RB60-13
Table R301.7

Proposed Change as Submitted

Proponent: Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee and Virginia Building and Code Officials Association (bajnaic@chesterfield.gov)

Revise as follows:

TABLE R301.7
ALLOWABLE DEFLECTION OF STRUCTURAL MEMBERS [b,c]

STRUCTURAL MEMBER	ALLOWABLE DEFLECTION
Rafters having slopes greater than 3:12 with no finished ceiling attached to rafters	L/180
Interior walls and partitions	H/180
Floors~~/ceilings with plaster or stucco finish~~ <u>(including deck floors)</u>	L/360
<u>Ceilings with brittle finishes (plaster, stucco, etc)</u>	<u>L/360</u>
<u>Ceilings with flexible finishes (gypsum board, etc)</u>	<u>L/240</u>
All other structural members	L/240
Exterior walls—wind loads [a] with plaster or stucco finish	H/360
Exterior walls with other brittle finishes	H/240
Exterior walls with flexible finishes	H/120[d]
Lintels supporting masonry veneer walls [e]	L/600

Note: *L* = span length, *H* = span height.

a. The wind load shall be permitted to be taken as 0.7 times the Component and Cladding loads for the purpose of the determining deflection limits herein.

b For cantilever members, *L* shall be taken as twice the length of the cantilever.

c. For aluminum structural members or panels used in roofs or walls of sunroom additions or patio covers, not supporting edge of glass or sandwich panels, the total load deflection shall not exceed *L*/60. For continuous aluminum structural members supporting edge of glass, the total load deflection shall not exceed *L*/175 for each glass lite or *L*/60 for the entire length of the member, whichever is more stringent. For sandwich panels used in roofs or walls of sunroom additions or patio covers, the total load deflection shall not exceed *L*/120.

d. Deflection for exterior walls with interior gypsum board finish shall be limited to an allowable deflection of *H*/180.

e. Refer to Section R703.7.2.

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC) The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

This code change was intended to clarify two issues.

1. There is confusion regarding the deflection allowed for deck joists. It was not clear if the original authors intended deck joists to be considered as a floor joist (L/360) or as "other structural members" (L/240). This clarifies the intention.
2. The other significant change addresses the flexibility/stiffness of gypsum board which is a lot more common than either plaster of stucco in most parts of the country. There is now cleaner differentiation between materials and is consistent with the allowable deflection limits in Table R802.4(1) and R802.4(2).

Cost Impact: None.

R301.7T-RB-BAJNAI-BCAC

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The committee disapproved this code change proposal because they felt that, although it was a good idea conceptually, there was not enough consensus regarding the stiffness of the decking.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

TABLE R301.7
ALLOWABLE DEFLECTION OF STRUCTURAL MEMBERS [b,c]

STRUCTURAL MEMBER	ALLOWABLE DEFLECTION
Rafters having slopes greater than 3:12 with no finished ceiling attached to rafters	L/180
Interior walls and partitions	H/180
Floors ~~(including deck floors)~~	L/360
Ceilings with brittle finishes (<u>including </u>plaster~~,~~ <u>and </u>stucco~~, etc~~)	L/360
Ceilings with flexible finishes (<u>including</u> gypsum board~~, etc~~)	L/240
All other structural members	L/240
Exterior walls—wind loads [a] with plaster or stucco finish	H/360
Exterior walls with other brittle finishes	H/240
Exterior walls with flexible finishes	H/120[d]
Lintels supporting masonry veneer walls [e]	L/600

Note: *L* = span length, *H* = span height.

a. The wind load shall be permitted to be taken as 0.7 times the Component and Cladding loads for the purpose of the determining deflection limits herein.
b For cantilever members, *L* shall be taken as twice the length of the cantilever.
c. For aluminum structural members or panels used in roofs or walls of sunroom additions or patio covers, not supporting edge of glass or sandwich panels, the total load deflection shall not exceed *L*/60. For continuous aluminum structural members supporting edge of glass, the total load deflection shall not exceed *L*/175 for each glass lite or *L*/60 for the entire length of the member, whichever is more stringent. For sandwich panels used in roofs or walls of sunroom additions or patio covers, the total load deflection shall not exceed *L*/120.
d. Deflection for exterior walls with interior gypsum board finish shall be limited to an allowable deflection of *H*/180.
e. Refer to Section R703.7.2.

Reason: The ICC Building Code Action Committee (BCAC) is submitting this public comment to address the code development committees concerns:

The revisions to the original proposal are intended to do the following:

1) Removes a proposed reference to decks. There was no consensus as to whether deck floors meant deck boards or deck joists. We leave this controversy unresolved by removing the reference to decks from the original proposal.
2) Retains the separate lines in the table for floors and ceilings, so it is clear that all floors are L/360, which is the current intent of the table (the current entry for “floors/ceilings with plaster or stucco finish” is intended to apply to all floors and all ceilings with plaster or stucco finish);
3) Makes it clear that gypsum board is considered a flexible finish
4) Makes some minor editorial changes to remove “etc.” which is not typical code language.

In short, there are no technical changes to the content of this table with this public comment, only clarification.

RB60-13
Final Action: AS AM AMPC____ D

RB61-13
Table R301.7

Proposed Change as Submitted

Proponent: Cole Graveen PE, SE, Raths, Raths & Johnson, Inc., representing self (cwgraveen@rrj.com)

Revise as follows:

TABLE R301.7
ALLOWABLE DEFLECTION OF STRUCTURAL MEMBERS[b,c]

STRUCTURAL MEMBER	ALLOWABLE DEFLECTION
All other structural members	L/240
Guards[f,g] Post (horizontal deflection) Top Rail (horizontal deflection) Top Rail (vertical deflection)	 H/12 H/24 + L/96 L/96

(Portions of table not shown remain unchanged)

a through e *(No change to current text)*
f. For the guard post, H shall be taken as the distance from the top of the top rail to the first point of support.
g. For the guard top rail, H shall be taken as the height of the rail and L shall be taken as the distance between edges of the post supports. The deflection of the top rail is measured relative to the center of the two posts.

Reason: Specific deflection limits for guards are proposed to clarify serviceability requirements and to help ensure occupant safety and comfort.

The serviceability requirements for guards in the both the IBC and IRC are vague and open to interpretation. The IBC requires all structural systems and members to have adequate stiffness to limit deflections and lateral drift, Section 1604.3, however it contains no specific deflection limits for guards. The IRC contains a general deflection limit of L/240 in Table R301.7 for all structural members not otherwise listed in the table. However, it is not likely that this limit was originally intended to apply to guards nor does it appear that this limit is commonly applied to guards in design or code enforcement.

The deflection limits proposed in this code change are based upon existing requirements in ASTM E985, *Standard Specification for Permanent Metal Railing Systems and Rails for Buildings*, ASTM D7032, *Standard Specification for Establishing Performance Ratings for Wood-Plastic Composite Deck Boards and Guardrail Systems (Guards or Handrails)*, and ICC-ES AC273, *Acceptance Criteria for Handrails and Guards*. The proposed limits allow reasonable deflection of the guard post and top rail while still ensuring that the guard will perform its intended function of preventing accidental falls. It is important to note that while excessive deflection is undesirable, some deflection is desirable[4] as it can provide warning to the occupant that they are at an edge of an elevated surface and may be unduly loading the guard.

Specific deflection limits are needed not only for clarity, but also to establish acceptable performance. Guards are provided to minimize the possibility of occupants accidentally falling from an elevated surface. The ability of a guard to prevent such an accidental fall depends on its stiffness as well as its height and strength. Guards that meet the strength and height requirements of the code but that move excessively under load could potentially not prevent an accidental fall. Limiting guard deflections to appropriate amounts will help protect occupants against accidentally falling from an elevated surface.

In addition, specific deflection limits are also necessary to help ensure that occupants are comfortable and feel safe. Similar to floor deflection limits that ensure that occupants are not uncomfortable or annoyed with bouncy floors or building drift limits that ensure that occupants are not uncomfortable or sick due to the swaying motion of tall buildings, reasonable lateral deflection limits for guards will help ensure that occupants do not feel that the guard is unsafe.

Example: Under the proposed deflection provisions, the post for a residential guard with a top rail height of 36" above the walking surface and a point of support 3" below the walking surface would have a deflection limit of (36 + 3)/12 = 3.25 inches. The top rail spanning between 4" wide posts that are spaced 4' apart would have a horizontal deflection limit of (48 – 4)/96 + (36 + 3)/24 = 2.10 inches.

References:

1. ASTM E985-00(2006), Standard Specification for Permanent Metal Railing Systems and Rails for Buildings
2. ASTM D7032-08, Standard Specification for Establishing Performance Ratings for Wood-Plastic Composite Deck Boards and Guardrail Systems (Guards or Handrails)
3. ICC-ES AC273, Acceptance Criteria for Handrails and Guards, Corrected January 2009
4. Loferski, J., Albright, D., and Woeste, F. (July 2007) Tested Guardrail Post Connections for Residential Decks, Structure Magazine

Cost Impact: This code change proposal may increase the cost of construction by increasing the design costs. Designers may have to perform additional serviceability calculations.

R301.7T-RB-GRAVEEN

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that a) it permitted excessive levels of deflection that would be disconcerting to homeowners and b) there are problems with footnotes f and g that were pointed out in testimony on the floor.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Cole Graveen, Raths, Raths & Johnson, Inc., representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

TABLE R301.7
ALLOWABLE DEFLECTION OF STRUCTURAL MEMBERS[b,c]

STRUCTURAL MEMBER	ALLOWABLE DEFLECTION
All other structural members	L/240
Guards[f,g] Post (horizontal deflection) Top ~~Rail~~ of the guard (horizontal deflection) Top ~~Rail~~ of the guard (vertical deflection)	 H/12 H/24 + L/96 L/96

(*Portions of table not shown do not change)*

f. For the guard post, H shall be taken as the distance from the top of the ~~top rail~~ guard to the first point of support. The post deflection shall consider the rotation of the post support.

g. For the top of the guard ~~top rail~~, H shall be taken as the height of the ~~rail~~ guard and L shall be taken as the distance between edges of the post (vertical) supports. The deflection of the top ~~rail~~ of the guard is measured relative to the center of the two posts (vertical supports).

Commenter's Reason: This proposal, as modified, changes the deflection limits for guards in the IRC. The general deflection limit of L/240 which currently applies to guards under the *All other structural members* listing was most likely never intended to apply to guards and does not appear to be commonly applied to guards in design or code enforcement. Appropriate allowable deflections for guards, limits which are currently contained in ASTM and ICC-ES documents, are inserted into Table R301.7.

The modifications improve the original proposal by revising the text to more clearly indicate the proposed allowable deflection for guards.

The removal of the reference to the top rail addresses comments made at the public hearing that not all guards have rails. The text of the proposal was revised to simply refer to the top of the guard rather than the top rail.

The additional sentence in footnote f was added to make it clear that the post deflection includes the movement of the post and its support. If the effects of the support are not accounted for, a stiff post attached to a flimsy support could be considered to comply with the proposed limits even though the rotation at the bottom of the post would cause considerable deflection. Think of holding a long stick in your hand. Even slightly rotating your hand will cause the top of the stick to move. This effect cannot be ignored in deflection calculations.

In addition, the committee commented that they felt that this code change would permit excessive levels of deflection that would be disconcerting to homeowners. I disagree. The proposed limits are taken directly from ASTM E985, *Standard Specification for Permanent Metal Railing Systems and Rails for Buildings*, ASTM D7032, *Standard Specification for Establishing Performance*

Ratings for Wood-Plastic Composite Deck Boards and Guardrail Systems (Guards or Handrails), and ICC-ES AC273, *Acceptance Criteria for Handrails and Guards*. These documents are currently in use and I am unaware of any problems that have resulted from the application of these deflection limits.

It should be noted that if the current deflection limit of L/240 for *All other structural members* is applied to wood guards on common residential decks, as it should be per the current text of the IRC, it is highly likely that many of the typical wood guard constructions would not comply with L/240. The deflection of a typical mid-grade wood 4x4 post connected to a 2x10 band joist will exceed L/240 when both the bending deflection of the post and the rotation of the support is considered.

The proposed limits allow reasonable deflection of the guard post and the top of the guard while still ensuring that the guard will perform its intended function of preventing accidental falls. The proposed limits are taken from active published standards. The general deflection limit for *All other structural members* of L/240 was most likely never intended to apply to guards and this proposal clarifies this by inserting appropriate deflection limits for guards.

RB61-13

Final Action: AS AM AMPC____ D

RB64-13
R302.1

Proposed Change as Submitted

Proponent: Ali M. Fattah, P.E., City of San Diego, representing the San Diego Area Chapter of ICC (afattah@sandiego.gov)

Revise as follows:

R302.1 Exterior walls. Construction, projections, openings and penetrations of *exterior walls* of *dwellings* and accessory buildings shall comply with Table R302.1(1); or *dwellings* equipped throughout with an *automatic sprinkler system* installed in accordance with Section P2904 shall comply with Table R302.1(2).

<u>Where non-residential buildings are located on the same *lot* containing dwellings and their accessory structures, exterior wall and opening protection and the protection of projections based on fire separation distance shall be determined in accordance with the *International Building Code*.</u>

Exceptions:

1. Walls, projections, openings or penetrations in walls perpendicular to the line used to determine the *fire separation distance*.
2. Walls of *dwellings* and *accessory structures* located on the same *lot*.
3. Detached tool sheds and storage sheds, playhouses and similar structures exempted from permits are not required to provide wall protection based on location on the *lot*. Projections beyond the *exterior wall* shall not extend over the *lot line*.
4. Detached garages accessory to a *dwelling* located within 2 feet (610 mm) of a *lot line* are permitted to have roof eave projections not exceeding 4 inches (102 mm).
5. Foundation vents installed in compliance with this code are permitted.

Reason: Section R302.1 of the IRC is not clear as to when an imaginary line shall be used to determine protection due fire separation distance between dwellings and buildings other than dwellings or accessory structures thereto located on the same lot. Furthermore, the IBC in Chapter 5 allows for options other than assuming an imaginary line when determining fire separation distance.

The IBC Section 503.1.2 exempts multiple buildings located on the same lot from exterior fire protection due to fire separation distance when the when considered as portions of one building. Since the IRC does not limit the area of a building and does not require fire sprinkler protection for additions, the equivalent of Section 503.1.2 does not exist in the IRC.

This code change makes a reference to the IBC to make clear that the protection due to fire separation distance shall be determined based on the requirements of the IBC for both a dwelling and the non-residential building that is regulated by the IBC. Without this code change IBC Section 503.1.2 may be construed to not apply. While the IRC has been designed to be a standalone code, the building official will be regulating the non-residential building based on the IBC and this code change provides a clean reference.

Cost Impact: None. This code change will not increase the cost of construction.

R302.1 #1-RB-FATTAH

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that a) the term “non-residential” is not appropriate, b) the concept is good but the proposal should be changed to replace “non-residential” with “a structure built in accordance with the International Building Code,” and c) it is inappropriate to subject IRC buildings to the IBC for those standards.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Ali M. Fattah, City of San Diego, Development Services Department, representing San Diego Area Chapter ICC, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

R302.1 Exterior walls. Construction, projections, openings and penetrations of *exterior walls* of *dwellings* and accessory buildings shall comply with Table R302.1(1); or *dwellings* equipped throughout with an *automatic sprinkler system* installed in accordance with Section P2904 shall comply with Table R302.1(2).

<u>Where structures constructed in accordance with the International Building Code are located on the same *lot* containing dwellings and their accessory structures, exterior wall and opening protection and the protection of projections based on fire separation distance shall be determined in accordance with the *International Building Code*.</u>

Exceptions:

1. Walls, projections, openings or penetrations in walls perpendicular to the line used to determine the *fire separation distance*.
2. Walls of *dwellings* and *accessory structures* located on the same *lot*.
3. Detached tool sheds and storage sheds, playhouses and similar structures exempted from permits are not required to provide wall protection based on location on the *lot*. Projections beyond the *exterior wall* shall not extend over the *lot line*.
4. Detached garages accessory to a *dwelling* located within 2 feet (610 mm) of a *lot line* are permitted to have roof eave projections not exceeding 4 inches (102 mm).
5. Foundation vents installed in compliance with this code are permitted.

Commenter's Reason: Section R302.1 of the IRC is not clear on how to establish the imaginary line between when buildings conforming to the fire separation requirements of the IBC are located on the same lot as dwellings and their accessory conforming to the fire separation requirements of the IRC. Furthermore, the IBC in Chapter 5 allows for options other than assuming an imaginary line when determining fire separation distance.

IBC Section 503.1.2 exempts multiple buildings located on the same lot from exterior fire protection due to fire separation distance when the when considered as portions of one building. Since the IRC does not limit the area of a building and does not require fire sprinkler protection for additions, the equivalent of Section 503.1.2 does not exist in the IRC.

This code change makes a reference to the IBC to make clear that the protection due to fire separation distance shall be determined based on the requirements of the IBC for both a dwelling and the non-residential building that is regulated by the IBC. Without this code change IBC Section 503.1.2 may be construed to not apply. While the IRC has been designed to be a standalone code, the building official will be regulating the non-residential building based on the IBC and this code change provides a clean reference.

The fire hazards of buildings conforming to the international Building Code are more severe than those envisioned by the international Residential Code. While the requirements in the IBC due to fire separation distance may different, they address the same exterior wall and opening exposures and limitations on exterior projections in a similar fashion.

Public Comment 2:

Homer Maiel, City of Palo Alto/4LEAF Inc., representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R302.1 Exterior walls. Construction, projections, openings and penetrations of *exterior walls* of *dwellings* and accessory buildings shall comply with Table R302.1(1); or *dwellings* equipped throughout with an *automatic sprinkler system* installed in accordance with Section P2904 shall comply with Table R302.1(2).

Where ~~non-residential buildings~~ <u>structures built in accordance with the International Building Code</u> are located on the same *lot* containing dwellings and their accessory structures, exterior wall and opening protection and the protection of projections based on fire separation distance shall be determined in accordance with the *International Building Code*.

Exceptions:

1. Walls, projections, openings or penetrations in walls perpendicular to the line used to determine the *fire separation distance*.

2. Walls of *dwellings* and *accessory structures* located on the same *lot*.
3. Detached tool sheds and storage sheds, playhouses and similar structures exempted from permits are not required to provide wall protection based on location on the *lot*. Projections beyond the *exterior wall* shall not extend over the *lot line*.
4. Detached garages accessory to a *dwelling* located within 2 feet (610 mm) of a *lot line* are permitted to have roof eave projections not exceeding 4 inches (102 mm).
5. Foundation vents installed in compliance with this code are permitted.

Commenter's Reason: This change is a code clarification more than anything else. The committee in Dallas disapproved it based on 1) using "non-residential building" in lieu of what is added here. 2) the committee also disapproved based on the fact that it is inappropriate to subject IRC buildings to IBC requirement. That was a misunderstanding on their part. IBC requirements are not brought into IRC. This code change is basically is saying that whatever that is built under IBC should abide with IBC requirements in terms of fire separation distance, projections, etc.

RB64-13

Final Action: AS AM AMPC____ D

RB65-13
R302.1

Proposed Change as Submitted

Proponent: Ali M. Fattah, P.E., City of San Diego, representing the San Diego Area Chapter of ICC (afattah@sandiego.gov)

Revise as follows:

R302.1 Exterior walls. Construction, projections, openings and penetrations of *exterior walls* of *dwellings* and accessory buildings shall comply with Table R302.1(1); or *dwellings* equipped throughout with an *automatic sprinkler system* installed in accordance with Section P2904 shall comply with Table R302.1(2).

Exceptions:

1. Walls, projections, openings or penetrations in walls perpendicular to the line used to determine the *fireseparation distance*.
2. Walls of *dwellings* <u>shall not be separated from</u> ~~and~~ *accessory structures* located on the same *lot*.
3. Detached tool sheds and storage sheds, playhouses and similar structures exempted from permits are not required to provide wall protection based on location on the *lot*. Projections beyond the *exterior wall* shall not extend over the *lot line*.
4. Detached garages accessory to a *dwelling* located within 2 feet (610 mm) of a *lot line* are permitted to have roof eave projections not exceeding 4 inches (102 mm).
5. Foundation vents installed in compliance with this code are permitted.

Reason: Exception 2 of Section R302.1 of the IRC is not clear and can be read in two different ways. It may be read to exempt only accessory structures other than those discussed in exception 3 and 4 or all dwellings and structures accessory to any of them from the fire separation distance requirements. The IBC Section 503.1.2 exempts multiple buildings located on the same lot from exterior fire protection due to fire separation distance when the when considered as portions of one building. Since the IRC does not limit the area of a building and does not require fire sprinkler protection for additions, the equivalent of Section 503.1.2 does not exist in the IRC.

The National Institutes for Standards and Technology (NIST) has performed full scale fire testing on the fire exposure between buildings of light framed construction and in "NIST Technical Note 1600 - Residential Structure Separation Fire Experiments" (http://www.fire.nist.gov/bfrlpubs/fire08/PDF/f08034.pdf) concludes that "… an adjacent structure can be ignited if flames from a fire inside a house exit through window openings. The experiments illustrated how a fire resistant barrier can, in the scenario tested, slow down flame spread between two structures separated by 1.8 m (6 ft)." The full scale testing demonstrates the benefits of fire separation and the need to limit exterior wall openings and to protect exterior walls.

It is not clear why the IBC and IRC are different with respect to the issue of fire separation. Neither IBC Chapter 6 nor Chapter 7 exempts structures from protections due to fire separation distance, however the IRC through this exception 2 can be construed to exempt a dwelling from being protected relative to an adjacent dwelling owned and operated by a different owner. The definition of fire separation distance in Section R202 includes the use of an imaginary line between buildings, and without this proposed code change the IRC may only require fire separation distance to buildings on the same lot that are not dwellings or accessory structures.

Cost Impact: This code change will have a minimal increase to the cost of construction since land use regulations may restrict the separation between buildings on the same lot due to zoning and other considerations.

R302.1 #2-RB-FATTAH

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that it was unclear and may be interpreted to require separation.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Ali M. Fattah, City of San Diego, Development Services Department, representing San Diego Area Chapter ICC, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

Revise text as follows:

R302.1 Exterior walls. Construction, projections, openings and penetrations of *exterior walls* of *dwellings* and accessory buildings shall comply with Table R302.1(1); or *dwellings* equipped throughout with an *automatic sprinkler system* installed in accordance with Section P2904 shall comply with Table R302.1(2).

Exceptions:

1. Walls, projections, openings or penetrations in walls perpendicular to the line used to determine the *fire separation distance*.
2. Walls ~~of~~, projections, openings or penetrations in walls located adjacent to the line used to determine the *fire separation distance* between *dwellings* and their *accessory structures* where located on the same *lot*.
3. Detached tool sheds and storage sheds, playhouses and similar structures exempted from permits are not required to provide wall protection based on location on the *lot*. Projections beyond the *exterior wall* shall not extend over the *lot line*.
4. Detached garages accessory to a *dwelling* located within 2 feet (610 mm) of a *lot line* are permitted to have roof eave projections not exceeding 4 inches (102 mm).
5. Foundation vents installed in compliance with this code are permitted.

Reason: Exception 2 of Section R302.1 of the IRC is not clear and can be read in two different ways. It may be read to exempt only accessory structures other than those discussed in exception 3 and 4 or all dwellings and structures accessory to any of them from the fire separation distance requirements. The IBC Section 503.1.2 exempts multiple buildings located on the same lot from exterior fire protection due to fire separation distance when the when considered as portions of one building. Since the IRC does not limit the area of a building and does not require fire sprinkler protection for additions, the equivalent of Section 503.1.2 does not exist in the IRC.

The National Institutes for Standards and Technology (NIST) has performed full scale fire testing on the fire exposure between buildings of light framed construction and in "NIST Technical Note 1600 - Residential Structure Separation Fire Experiments" (http://www.fire.nist.gov/bfrlpubs/fire08/PDF/f08034.pdf) concludes that "… an adjacent structure can be ignited if flames from a fire inside a house exit through window openings. The experiments illustrated how a fire resistant barrier can, in the scenario tested, slow down flame spread between two structures separated by 1.8 m (6 ft)." The full scale testing demonstrates the benefits of fire separation and the need to limit exterior wall openings and to protect exterior walls.

It is not clear why the IBC and IRC are different with respect to the issue of fire separation. Neither IBC Chapter 6 nor Chapter 7 exempts structures from protections due to fire separation distance, however the IRC through this exception 2 can be construed to exempt a dwelling from being protected relative to an adjacent dwelling owned and operated by a different owner. The definition of fire separation distance in Section R202 includes the use of an imaginary line between buildings, and without this proposed code change the IRC may only require fire separation distance to buildings on the same lot that are not dwellings or accessory structures.

The proposed code change has been modified to clarify the original proposal that had an error as pointed out by the committee. The committee did not feel that the change was not appropriate.

Cost Impact: This code change will have a minimal increase to the cost of construction since land use regulations may restrict the separation between buildings on the same lot due to zoning and other considerations.

RB65-13

Final Action: AS AM AMPC____ D

RB66-13
R302.1

Proposed Change as Submitted

Proponent: Ali M. Fattah, P.E., City of San Diego, representing the San Diego Area Chapter of ICC (afattah@sandiego.gov)

Revise as follows:

R302.1 Exterior walls. Construction, projections, openings and penetrations of exterior walls of dwellings and accessory buildings shall comply with Table R302.1(1); or dwellings equipped throughout with an automatic sprinkler system installed in accordance with Section P2904 shall comply with Table R302.1(2).

Exceptions:

1. Walls, projections, openings or penetrations in walls perpendicular to the line used to determine the fire separation distance.
2. Walls of dwellings and accessory structures located on the same lot.
3. Detached tool sheds and storage sheds, playhouses and similar structures exempted from permits are not required to provide wall protection based on location on the lot. Projections beyond the exterior wall shall not extend over the lot line.
4. Detached garages accessory to a dwelling located within 2 feet (610 mm) of a lot line are permitted to have roof eave projections not exceeding 4 inches (102 mm).
5. Foundation vents installed in compliance with this code are permitted.
6. <u>Detached patio covers and deck structures located greater than 5 feet from dwellings or lot lines.</u>

Reason: Section R302.1 of the IRC is not clear insofar as detached patio covers and deck structures are concerned and can be read in two different ways. It may be read to exempt the detached accessory structures listed in exception 3 and require that detached patio covers and deck structures comply with fire separation distance requirements. The IBC does not regulate these accessory structures when associated with residential construction and does not exempt them either when associated with non-residential construction.

The IBC Section 503.1.2 exempts multiple buildings located on the same lot from exterior fire protection due to fire separation distance when the when considered as portions of one building. Since the IRC does not limit the area of a building and does not require fire sprinkler protection for additions, the equivalent of Section 503.1.2 does not exist in the IRC.

The National Institutes for Standards and Technology (NIST) has performed full scale fire testing on the fire exposure between buildings of light framed construction and in “NIST Technical Note 1600 - Residential Structure Separation Fire Experiments” (http://www.fire.nist.gov/bfrlpubs/fire08/PDF/f08034.pdf) concludes that “… an adjacent structure can be ignited if flames from a fire inside a house exit through window openings. The experiments illustrated how a fire resistant barrier can, in the scenario tested, slow down flame spread between two structures separated by 1.8 m (6 ft).” The full scale testing demonstrates the benefits of fire separation and the need to limit exterior wall openings and to protect exterior walls.

The proposed code change clarifies that if it is the intent of the IRC not to regulate the fire separation between accessory structures and between accessory structures and dwellings on the same lot that those accessory structures should at least be separated from lot lines as if they were dwellings.

Cost Impact: This code change will have a minimal increase to the cost of construction since land use regulations may restrict the separation between buildings on the same lot due to zoning and other considerations.

R302.1 #3-RB-FATTAH

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that it does not clearly address attached and detached decks and whether they are in the middle of the yard or adjacent to the building.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Ali M. Fattah, City of San Diego, Development Services Department, representing San Diego Area Chapter ICC, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R302.1 Exterior walls. Construction, projections, openings and penetrations of exterior walls of dwellings and accessory buildings shall comply with Table R302.1(1); or dwellings equipped throughout with an automatic sprinkler system installed in accordance with Section P2904 shall comply with Table R302.1(2).

Exceptions:

1. Walls, projections, openings or penetrations in walls perpendicular to the line used to determine the fire separation distance.
2. Walls of dwellings and accessory structures located on the same lot.
3. Detached tool sheds and storage sheds, playhouses and similar structures exempted from permits are not required to provide wall protection based on location on the lot. Projections beyond the exterior wall shall not extend over the lot line.
4. Detached garages accessory to a dwelling located within 2 feet (610 mm) of a lot line are permitted to have roof eave projections not exceeding 4 inches (102 mm).
5. Foundation vents installed in compliance with this code are permitted.
6. ~~Detached patio covers and deck structures located greater than 5 feet from dwellings or lot lines.~~ Exterior walls and openings on detached or attached patio covers and deck structures accessory to a dwelling that are located greater than 5 feet (1524.0 mm) from lot lines.

Reason: Section R302.1 of the IRC is not clear insofar as detached patio covers and deck structures are concerned and can be read in two different ways. It may be read to exempt the detached accessory structures listed in exception 3 and require that detached patio covers and deck structures comply with fire separation distance requirements. The IBC does not regulate these accessory structures when associated with residential construction and does not exempt them either when associated with non-residential construction.

The National Institutes for Standards and Technology (NIST) has performed full scale fire testing on the fire exposure between buildings of light framed construction and in "NIST Technical Note 1600 - Residential Structure Separation Fire Experiments" (http://www.fire.nist.gov/bfrlpubs/fire08/PDF/f08034.pdf) concludes that "… an adjacent structure can be ignited if flames from a fire inside a house exit through window openings. The experiments illustrated how a fire resistant barrier can, in the scenario tested, slow down flame spread between two structures separated by 1.8 m (6 ft)." The full scale testing demonstrates the benefits of fire separation and the need to limit exterior wall openings and to protect exterior walls and to separate unprotected combustible construction.

The proposed code change clarifies that if it is the intent of the IRC not to regulate the fire separation between accessory structures and between accessory structures and dwellings on the same lot that those accessory structures should at least be separated from lot lines as if they were dwellings.

The modified code change addresses fire separation relative to lot lines only since the IRC seems uninterested in requiring fire separation between dwellings and their accessory structures.

Cost Impact: This code change will have a minimal increase to the cost of construction since land use regulations may restrict the separation between buildings on the same lot due to zoning and other considerations.

RB66-13

Final Action: AS AM AMPC____ D

RB68-13
Table R302.1(1)

Proposed Change as Submitted

Proponent: Rick Davidson, City of Maple Grove, Association of Minnesota Building Officials (rdavidson@maplegrovemn.gov)

Revise as follows:

TABLE R302.1(1)
EXTERIOR WALLS

EXTERIOR WALL ELEMENT		MINIMUM FIRE-RESISTANCE RATING	MINIMUM FIRE SEPARATION DISTANCE
Walls	Fire-resistance rated	1 hour—tested in accordance with ASTM E 119 or UL 263 with exposure from both sides	< 5 feet
	Not fire-resistance rated	0 hours	^{3} 5 feet
Projections	Fire-resistance rated	1 hour on the underside	^{3} 2 feet to < 5 feet
	Not fire-resistance rated	0 hours	^{3} 5 feet
Openings in walls	Not allowed	N/A	< 3 feet
	25% maximum of wall area	0 hours	3 feet
	Unlimited	0 hours	5 feet
Penetrations	All	Comply with Section R302.4	< ~~5~~ 3 feet
		None required	~~5~~ 3 feet

For SI: 1 foot = 304.8 mm.
N/A = Not Applicable.

Reason: This proposal reduces the penetration protection requirements for non sprinklered buildings to the same level as sprinklered buildings. The code currently allows walls 3 feet from a lot line to have openings up to 25% of the wall area but penetrations are required to be protected. This is senseless. The code overreacts to penetration protection. Foundation vents can be installed without limitation up to a lot line. Walls can have openings up to 25% of the area of the wall at 3 feet from the lot line. But install a penetration for a sill cock at 4 feet and it needs protection! This proposal creates some sense of reason to this section of the code.

Cost Impact: None

R302.1(1)T-RB-DAVIDSON

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that, while doors and windows are generally visible, penetrations are not. Penetrations more readily allow a fire to enter into an assembly.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Rick Davidson, City of Maple Grove, representing Association of Minnesota Building Officials, requests Approval as Submitted.

Commenter's Reason: There are significant inconsistencies in how walls, openings, penetrations, parapets, and other components of walls are treated when they approach the line used to determine fire separation distance.

For example, openings are prohibited in walls less than 3 feet from the line used to determine fire separation distance in both sprinklered and non-sprinklered buildings. But foundation vents are permitted in walls right up to the line used to determine fire separation distance. The main purpose of the vents is to allow free movement of air and this will include smoke, flames, and hot gases in fire situations. This is an inconsistency.

Roofs are prohibited from having openings within 4 feet of the parapet wall for townhouses (even though permitted in the IBC), yet foundation vents are permitted.

RB84 was approved by the IRC Committee. If that proposal is not challenged it will allow an unlimited amount of attic vents be placed in an exterior wall (gable) that could be adjacent the line used to determine fire separation distance. Like foundation vents, the sole purpose of these vents is to draw air into a space and vent it out someplace else. These openings can also readily draw in flames, smoke, and hot gases. Again, this is an inconsistency.

This proposal chips away at but a small piece of the problem. It will allow unprotected penetrations in walls that are 3 feet or more from the line used to determine the fire separation distance. These penetrations may be a water spigot or a cable TV wire. The code already allows openings to occupy 25% of the area of the wall. The code allows unlimited openings for foundation vents (and possible attic vents) in walls right up to the line used to determine fire separation distance. There are not suggested to be any limits on the number of penetrations because realistically the number and size of common penetrations will never exceed the potential area of openings, foundation vents, and attic vents. Penetrations must be sealed for weather resistance and protection against intrusion by insects and rodents. This proposal will not result in gaping holes that would allow a fire to penetrate deep into the framework of a dwelling.

Let's look at a real world example. I construct a new building 4 ½ feet from the lot line. I can have an unlimited area of foundation vents. I can have up to 25% of the wall in openings. These openings are not required to have doors or glazing in them. They can be gaping holes in the walls. By RB84 I can have unlimited attic vents. But, if I install a water spigot in this wall, I need to make a trip down to the local building supply store and purchase a tube of expensive fire stop material of which I will use a small fraction and throw the rest away. Explain the rationale to your mayor or other elected official. Would you undergo the effort to write a correction notice and follow it up with a complaint to the local courts? Would you feel justified in explaining the need to seal a cable TV wire next to a large opening in the wall? Of course not. It isn't enough just to write a correction notice. You need to feel confident in bringing an action against the individual in court.

The IRC Committee suggests that penetrations more readily allow fire to penetrate an assembly than an opening would! The assembly will almost always have the stud cavity filled with insulation. The opening, foundation vent, or attic vent provides ample openings allowing free movement of air through them.

It is simply overregulation to require protection of these penetrations when one could have large unprotected openings nearby. Ironically, some of the penetrations labeled as a problem are sometimes run through windows and vents.

Public Comment 2:

Steve Orlowski, representing National Association Of Home Builders, requests Approval as Submitted.

Commenter's Reason: The committee's reason for disapproval misses the point that the proponent was attempting to make. There is a need for the code to make reasonable concessions regarding penetrations of the fire-resistant rated assemblies for small penetrations such as sill cocks, dryer vent terminations, mechanical draft terminals and electrical equipment. Keep in mind that these are small penetrations, often smaller then foundation vents which are currently exempt from complying with Table R302.1(1).

RB68-13

Final Action: AS AM AMPC____ D

RB69-13
Table R302.1(1), R302.1(2)

Proposed Change as Submitted

Proponent: Ali M. Fattah, P.E., City of San Diego, representing the San Diego Area Chapter of ICC (afattah@sandiego.gov)

Revise as follows:

TABLE R302.1(1)
EXTERIOR WALLS

EXTERIOR WALL ELEMENT		MINIMUM FIRE-RESISTANCE RATING	MINIMUM FIRE SEPARATION DISTANCE
Walls	Fire-resistance rated	1 hour—tested in accordance with ASTM E 119 or UL 263 with exposure from both sides	< 5 feet
	Not fire-resistance rated	0 hours	³ 5 feet
Projections	Fire-resistance rated	1 hour on the underside	³ >2 feet to < 5 feet distance to projection
	Not fire-resistance rated	0 hours	³ >5 feet distance to projection
Openings in walls	Not allowed	N/A	< 3 feet
	25% maximum of wall area	0 hours	3 feet
	Unlimited	0 hours	5 feet
Penetrations	All	Comply with Section R302.4	< 5 feet
		None required	5 feet

For SI: 1 foot = 304.8 mm.
N/A = Not Applicable.

TABLE R302.1(2)
EXTERIOR WALLS-DWELLINGS WITH FIRE SPRINKLERS

EXTERIOR WALL ELEMENT		MINIMUM FIRE-RESISTANCE RATING	MINIMUM FIRE SEPARATION DISTANCE
Walls	Fire-resistance rated	1 hour—tested in accordance with ASTM E 119 or UL 263 with exposure from the outside	0 feet
	Not fire-resistance rated	0 hours	3 feet[a]
Projections	Fire-resistance rated	1 hour on the underside	2 feet[a] distance to projection
	Not fire-resistance rated	0 hours	3 feet distance to projection
Openings in walls	Not allowed	N/A	< 3 feet

<table>
<tr><th colspan="2">EXTERIOR WALL ELEMENT</th><th>MINIMUM
FIRE-RESISTANCE RATING</th><th>MINIMUM FIRE SEPARATION DISTANCE</th></tr>
<tr><td></td><td>Unlimited</td><td>0 hours</td><td>3 feet[a]</td></tr>
<tr><td rowspan="2">Penetrations</td><td rowspan="2">All</td><td>Comply with Section R302.4</td><td>< 3 feet</td></tr>
<tr><td>None required</td><td>3 feet[a]</td></tr>
</table>

For SI: 1 foot = 304.8 mm.
N/A = Not Applicable

a. For residential subdivisions where all dwellings are equipped throughout with an automatic sprinkler system installed in accordance with P2904, the fire separation distance for nonrated exterior walls and rated projections shall be permitted to be reduced to 0 feet, and unlimited unprotected openings and penetrations shall be permitted, where the adjoining lot provides an open setback yard that is 6 feet or more in width on the opposite side of the property line.

Reason: Table R302.1(1) and Table R302.1(2) are not clear when restrictions on projections are concerned. The term fire separation distance is defined in Section R202 clarifies that the fire separation distance is established by measuring "from the building face" to an imaginary line, lot line or the center line of a street. As a result once a fire separation distance is established the exterior wall elements shown in column 1 of both tables are restricted or protected based on their location. Projections however are regulated by the amount that they encroach into the fire separation distance. This code change updates the table for consistency with the TABLE 705.2 of the IBC that limits the distance from the line used to determine fire separation distance to the projection. The IRC and IBC editions preceding the 2012 edition included regulations restricting the length of projections encroaching into the fire separation distance, he famous 1/3 to ½ the fire separation distance approach. This editorial code change proposes to clarify the table and to assist the user.

This code change is being offered in a text format or tabular format in separate code changes to allow the membership a choice in the way that the regulations are adopted into the 2015 IBC.

Cost Impact: None. This code change will not increase the cost of construction.

R302.1(1)T-RB-FATTAH

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that the proposed information is already covered in the code and, therefore, is unnecessary.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Ali M. Fattah, City of San Diego, Development Services Department, representing San Diego Area Chapter ICC, requests Approval as Submitted.

Commenter's Reason: The original proposal is being re-submitted as proposed based on a review of the published REPORT OF THE PUBLIC HEARING. The proponent was not able to attend the Code Development Hearing to explain the proposed code change. Committee feedback has been incorporated into the proposed code change. We disagree with the committee reason. Table R302.1 (1) were developed in the 2009 IRC to consolidate the requirements based on fire separation distance into a tabular format. However it has become clear that certain items in the table are incorporated within an exterior wall (openings, penetrations, wall construction) and as a consequence the wall position drives requirements. Projections on the other hand are different as the code intends to limit how close they can get to a lot line or imaginary line where applicable. As it currently exists in the 2009 IRC an exterior wall located 7 ft from a lot line may include projection that encroach into the 5 ft or 3 ft zone used to determine fire separation distance and a permit applicant can insist that the combustible projection can be non-rated and can project as close as desired to lot line.

The code change as proposed merely clarifies that the quantity in column 3 is triggered based on the distance to the projection rather than the wall it projects from. Alternatively the table needs to be restructured to pull out projections into a separate section as currently exists in the IBC. Code change RB71-13 was approved by the committee and addresses another deficiency in the table by prohibiting projections less than 2 ft and it is the intent of the RB66 proponent that the code correlation committees consolidate the two code changes.

Note staff: A typographical error appears in the submitted table R302.1(1) where the superscript 3 precedes the text in rows 2, 3 and 4 in column 3 and should not be included in the code change.

Public Comment 2:

Homer Maiel, PE, CBO, City of Palo Alto/4LEAF Inc., representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay), requests Approval as Submitted.

Commenter's Reason: Commenter's Reason: The proponent is making a very good case that definition of "Fire Separation Distance" is "distance measured from the building face.."

This proposal clarifies the distance, in case of projection, should be measured FROM the edge of the projection. The committee was not correct in saying that the proposed information is already covered in the code.

RB69-13

Final Action: AS AM AMPC____ D

RB72-13
Table R302.1(1)

Proposed Change as Submitted

Proponent: Maureen Traxler, Washington Association of Building Officials Technical Code Development Committee (maureen.traxler@seattle.gov)

Revise as follows:

TABLE R302.1(1)
EXTERIOR WALLS

EXTERIOR WALL ELEMENT		MINIMUM FIRE-RESISTANCE RATING	MINIMUM FIRE SEPARATION DISTANCE
Walls	Fire-resistance rated	1 hour—tested in accordance with ASTM E 119 or UL 263 with exposure from both sides	< 5 feet
	Not fire-resistance rated	0 hours	≥ 5 feet
Projections	Fire-resistance rated	1 hour on the underside	≥ 2 feet to < 5 feet
	Not fire-resistance rated	0 hours	≥ 5 feet
Openings in walls	Not allowed	N/A	< 3 feet
	25% maximum of wall area per story	0 hours	3 feet
	Unlimited	0 hours	5 feet
Penetrations	All	Comply with Section R302.4	< 5 feet
		None required	5 feet

For SI: 1 foot = 304.8 mm.
N/A = Not Applicable.

Reason: The IRC is ambiguous about how to calculate the percentage of openings allowed in exterior walls. The limitation could be calculated either as a percentage of the area of the entire exterior wall, or as a percentage of each story. This proposal requires that openings in exterior walls be calculated for each story. This method is consistent with IBC Section 705.8.1. Consider this example of the potential consequence of not using the proposed interpretation. If the area of openings was allowed to be calculated based on the entire face of the wall, on a 3-story building the first story of a building 3 feet from a property line could have 75% openings if there were no openings in the other 2 stories.

Cost Impact: None

R302.1(1)T-RB-TRAXLER

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that it limits design flexibility and is not appropriate for the residential code. If the intent is to limit, it should limit each story.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Homer Maiel, PE, CBO, City of Palo Alto/4LEAF Inc., representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay), requests Approval as Submitted.

Commenter's Reason: This proposal is needed to make the code requirement clear. In addition to proponent's example in her statement of reason, another example can be cited here. What if the second floor is popped out for couple of feet and it is has less FSD than the first floor? This is another reason for adding "per story" in the code. The committee's reason for disapproval was not a sound reason.

Public Comment 2:

C. Ray Allshouse AIA, CBO, City of Shoreline, Washington, representing WABO – Washington Association of Building Officials Technical Code Development Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

TABLE R302.1(1)
EXTERIOR WALLS

EXTERIOR WALL ELEMENT		**MINIMUM FIRE-RESISTANCE RATING**	**MINIMUM FIRE SEPARATION DISTANCE**
Walls	Fire-resistance rated	1 hour—tested in accordance with ASTM E 119 or UL 263 with exposure from both sides	< 5 feet
	Not fire-resistance rated	0 hours	≥ 5 feet
Projections	Fire-resistance rated	1 hour on the underside	≥ 2 feet to < 5 feet
	Not fire-resistance rated	0 hours	≥ 5 feet
Openings in walls	Not allowed	N/A	< 3 feet
	25% maximum of wall area ~~per~~ in any story	0 hours	3 feet
	Unlimited	0 hours	5 feet
Penetrations	All	Comply with Section R302.4	< 5 feet
		None required	5 feet

For SI: 1 foot = 304.8 mm.
N/A = Not Applicable.

Commenter's Reason: In response to the Committee's reason statement for disapproval suggesting that this change should limit the extent of maximum openings at each story, it is proposed that identical language be lifted from the IBC section as reflected by this public comment. This will remove any doubt as to how this limitation is to be applied and attains consistency with the IBC. This also removes what otherwise can be construed as a serious loophole to an important fire safety provision of the code. This proposed change provides clarification language to ensure an equivalent fire protection installation for a comparable condition.

RB72-13
Final Action: AS AM AMPC____ D

RB74-13
R302.1.1 (New)

<u>Proposed Change as Submitted</u>

Proponent: Ali M. Fattah, P.E., City of San Diego, representing the San Diego Area Chapter of ICC (afattah@sandiego.gov)

Add new text as follows:

R302.1 Exterior walls. Construction, projections, openings and penetrations of *exterior walls* of *dwellings* and accessory buildings shall comply with Table R302.1(1); or dwellings equipped throughout with an automatic sprinkler system installed in accordance with Section P2904 shall comply with Table R302.1(2).

Exceptions:

1. Walls, projections, openings or penetrations in walls perpendicular to the line used to determine the fire separation distance.
2. Walls of dwellings and accessory structures located on the same lot.
3. Detached tool sheds and storage sheds, playhouses and similar structures exempted from permits are not required to provide wall protection based on location on the lot. Projections beyond the exterior wall shall not extend over the lot line.
4. Detached garages accessory to a dwelling located within 2 feet (610 mm) of a lot line are permitted to have roof eave projections not exceeding 4 inches (102 mm).
5. Foundation vents installed in compliance with this code are permitted.

<u>**R302.1.1 Exterior stairways.** Exterior stairways located above grade shall have a minimum fire separation distance of 5 feet (1524 mm) as measured from the exterior edge of the *stairway*, including landings, to adjacent *lot lines* and from other buildings on the same lot.</u>

<u>**Exception:** Where the *exterior walls* and openings on the adjacent building on the same lot are protected in accordance with Table R302.1(1) based on *fire separation distance.*</u>

Reason: Section R302.1 of the IRC is not clear insofar as exterior stairways located in close proximity to lot lines. The IBC Section 1026.5 requires a fire separation distance of not less than 10 ft since it considers exterior stairways to be exits. The IRC does not fire protection for stairways and as a consequence a dwelling unit located on the second floor served independently with an exterior stairway can be served with a stairway located at a fire separation distance of 0 ft. This lack of protection to a combustible exterior exit element is not prudent as has been demonstrated by full scale fire testing for building exposures.

The National Institutes for Standards and Technology (NIST) has performed full scale fire testing on the fire exposure between buildings of light framed construction and in "NIST Technical Note 1600 - Residential Structure Separation Fire Experiments" (http://www.fire.nist.gov/bfrlpubs/fire08/PDF/f08034.pdf) concludes that "… an adjacent structure can be ignited if flames from a fire inside a house exit through window openings. The experiments illustrated how a fire resistant barrier can, in the scenario tested, slow down flame spread between two structures separated by 1.8 m (6 ft)." The full scale testing demonstrates the benefits of fire separation and the need to limit exterior wall openings and to protect exterior walls and by extension the reason that it is necessary to protect or separate elevated exterior exit ways.

Cost Impact: This code change will have a minimal increase to the code of construction since lad use regulations may restrict the separation between buildings on the same lot due to zoning and other considerations.

R302.1.1 (NEW) #1-RB-FATTAH

<u>Committee Action Hearing Results</u>

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that it needs more work. It appears that it may have been developed to address the exits for stacked two-family dwellings, but it has other obvious implications.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Ali M. Fattah, City of San Diego, Development Services Department, representing San Diego Area Chapter ICC, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R302.1 Exterior walls. Construction, projections, openings and penetrations of *exterior walls* of *dwellings* and accessory buildings shall comply with Table R302.1(1); or dwellings equipped throughout with an automatic sprinkler system installed in accordance with Section P2904 shall comply with Table R302.1(2).

Exceptions:

1. Walls, projections, openings or penetrations in walls perpendicular to the line used to determine the fire separation distance.
2. Walls of dwellings and accessory structures located on the same lot.
3. Detached tool sheds and storage sheds, playhouses and similar structures exempted from permits are not required to provide wall protection based on location on the lot. Projections beyond the exterior wall shall not extend over the lot line.
4. Detached garages accessory to a dwelling located within 2 feet (610 mm) of a lot line are permitted to have roof eave projections not exceeding 4 inches (102 mm).
5. Foundation vents installed in compliance with this code are permitted.

R302.1.1 Exterior stairways. ~~Exterior stairways located above grade shall have a minimum fire separation distance of 5 feet (1524 mm) as measured from the exterior edge of the *stairway*, including landings, to adjacent *lot lines* and from other buildings on the same lot.~~ <u>Exterior exit stairways located above grade and serving the primary means of egress door to a dwelling shall have a minimum fire separation distance of 5 feet (1524 mm) as measured from the exterior edge of the *stairway*, including landings, to adjacent *lot lines*.</u>

~~**Exception:** Where the *exterior walls* and openings on the adjacent building on the same lot are protected in accordance with Table R302.1(1) based on *fire separation distance.*~~

Commenter's Reason: Section R302.1 of the IRC is not clear insofar as exterior stairways located in close proximity to lot lines. IBC Section 1026.5 requires a fire separation distance of not less than 10 ft since it considers exterior stairways to be exits. The IRC does not require fire protection for stairways and as a consequence a dwelling unit located on the second floor served independently with an exterior stairway can be served with a stairway located at a fire separation distance of 0 ft. Additionally buildings located on sloping sites may provide access to the public way with a stairway that is not directly supported on grade and may also be located immediately adjacent to a lot line. This lack of protection to a combustible exterior exit element is not prudent as has been demonstrated by full scale fire testing for building exposures. In addition to providing protection for the egress path, the proposed code change provided protection for the stairway itself.

The National Institutes for Standards and Technology (NIST) has performed full scale fire testing on the fire exposure between buildings of light framed construction and in "NIST Technical Note 1600 - Residential Structure Separation Fire Experiments" (http://www.fire.nist.gov/bfrlpubs/fire08/PDF/f08034.pdf) concludes that "… an adjacent structure can be ignited if flames from a fire inside a house exit through window openings. The experiments illustrated how a fire resistant barrier can, in the scenario tested, slow down flame spread between two structures separated by 1.8 m (6 ft)." The full scale testing demonstrates the benefits of fire separation and the need to limit exterior wall openings and to protect exterior walls and by extension the reason that it is necessary to protect or separate elevated exterior exit ways.

The committee did not feel that the proposed code change was without merit however the reason statement was not consistent with the original proposal.

Cost Impact: This code change will have a minimal increase to the code of construction since lad use regulations may restrict the separation between buildings on the same lot due to zoning and other considerations.

RB74-13

Final Action: AS AM AMPC____ D

RB75-13
R302.1.1 (New)

<u>Proposed Change as Submitted</u>

Proponent: Ali M. Fattah, P.E., City of San Diego, representing the San Diego Area Chapter of ICC (afattah@sandiego.gov)

Add new text as follows:

R302.1 Exterior walls. Construction, projections, openings and penetrations of exterior walls of dwellings and accessory buildings shall comply with Table R302.1(1); or dwellings equipped throughout with an automatic sprinkler system installed in accordance with Section P2904 shall comply with Table R302.1(2).

Exceptions:

1. Walls, projections, openings or penetrations in walls perpendicular to the line used to determine the fire separation distance.
2. Walls of dwellings and accessory structures located on the same lot.
3. Detached tool sheds and storage sheds, playhouses and similar structures exempted from permits are not required to provide wall protection based on location on the lot. Projections beyond the exterior wall shall not extend over the lot line.
4. Detached garages accessory to a dwelling located within 2 feet (610 mm) of a lot line are permitted to have roof eave projections not exceeding 4 inches (102 mm).
5. Foundation vents installed in compliance with this code are permitted.

<u>**R302.1.1 Attached and detached accessory structures.** Accessory structures such as patio covers and deck structures, whether attached or detached, shall be located not less than a fire separation distance of 5 ft or more from lot lines.</u>

Reason: Section R302.1 of the IRC is not clear insofar as detached patio covers and deck structures are concerned and can be read in two different ways. It may be read to exempt the detached accessory structures listed in exception 3 and require that detached patio covers and deck structures comply with fire separation distance requirements. The IBC does not regulate these accessory structures when associated with residential construction and does not exempt them either when associated with non-residential construction.

The IBC Section 503.1.2 exempts multiple buildings located on the same lot from exterior fire protection due to fire separation distance when the when considered as portions of one building. Since the IRC does not limit the area of a building and does not require fire sprinkler protection for additions, the equivalent of Section 503.1.2 does not exist in the IRC.

The National Institutes for Standards and Technology (NIST) has performed full scale fire testing on the fire exposure between buildings of light framed construction and in “NIST Technical Note 1600 - Residential Structure Separation Fire Experiments” (http://www.fire.nist.gov/bfrlpubs/fire08/PDF/f08034.pdf) concludes that “… an adjacent structure can be ignited if flames from a fire inside a house exit through window openings. The experiments illustrated how a fire resistant barrier can, in the scenario tested, slow down flame spread between two structures separated by 1.8 m (6 ft).” The full scale testing demonstrates the benefits of fire separation and the need to limit exterior wall openings and to protect exterior walls.

The proposed code change clarifies that if it is the intent of the IRC not to regulate the fire separation between accessory structures and between accessory structures and dwellings on the same lot that those accessory structures should at least be separated from lot lines as if they were dwellings.

Cost Impact: This code change will have a minimal increase to the cost of construction since lad use regulations may restrict the separation between buildings on the same lot due to zoning and other considerations.

(NEW) #2-RB-FATTAH

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that accessory structures and decks should have more flexibility than allowed by the proposal.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Ali M. Fattah, City of San Diego, Development Services Department, representing San Diego Area Chapter ICC, requests Approval as Submitted.

Commenter's Reason: The proponent was not able to attend the Code Development Hearing to explain the proposed code change. Committee feedback has been considered based on a review of the published REPORT OF THE PUBLIC HEARING.

Section R302.1 of the IRC is not clear insofar as detached patio covers and deck structures are concerned and can be read in two different ways. It may be read to exempt the detached accessory structures listed in exception 3 and require that detached patio covers and deck structures comply with fire separation distance requirements. The IBC does not regulate these accessory structures when associated with residential construction and does not exempt them either when associated with non-residential construction.

The IRC unlike the IBC does not appear to be interested in the exposures to/from their accessory structures located on the same lot. Patio covers can include significant combustible loading due to plastics and upholstered furniture as well as what is typically constructed of unprotected combustible framing. Deck structures may or may not include patio covers and pose ladder fuels exposing a dwelling to which the deck structure is attached from an adjacent building that can be a building regulated by the IBC.

The National Institutes for Standards and Technology (NIST) has performed full scale fire testing on the fire exposure between buildings of light framed construction and in "NIST Technical Note 1600 - Residential Structure Separation Fire Experiments" (http://www.fire.nist.gov/bfrlpubs/fire08/PDF/f08034.pdf) concludes that "… an adjacent structure can be ignited if flames from a fire inside a house exit through window openings. The experiments illustrated how a fire resistant barrier can, in the scenario tested, slow down flame spread between two structures separated by 1.8 m (6 ft)." The full scale testing demonstrates the benefits of fire separation and the need to limit exterior wall openings and to protect exterior walls.

The proposed code change clarifies that if it is the intent of the IRC not to regulate the fire separation between accessory structures and between accessory structures and dwellings on the same lot and that those accessory structures should at least be separated from lot lines as if they were dwellings.

RB75-13

Final Action: AS AM AMPC____ D

RB76-13
R302.1.1 (New)

Proposed Change as Submitted

Proponent: Ali M. Fattah, P.E., City of San Diego, representing the San Diego Area Chapter of ICC(afattah@sandiego.gov)

Add new text as follows:

R302.1 Exterior walls. Construction, projections, openings and penetrations of exterior walls of dwellings and accessory buildings shall comply with Table R302.1(1); or dwellings equipped throughout with an automatic sprinkler system installed in accordance with Section P2904 shall comply with Table R302.1(2).

Exceptions:

1. Walls, projections, openings or penetrations in walls perpendicular to the line used to determine the fire separation distance.
2. Walls of dwellings and accessory structures located on the same lot.
3. Detached tool sheds and storage sheds, playhouses and similar structures exempted from permits are not required to provide wall protection based on location on the lot. Projections beyond the exterior wall shall not extend over the lot line.
4. Detached garages accessory to a dwelling located within 2 feet (610 mm) of a lot line are permitted to have roof eave projections not exceeding 4 inches (102 mm).
5. Foundation vents installed in compliance with this code are permitted.

R302.1.1 Projections. Projections shall be located a minimum distance from the line used to determine fire separation distance based on Table R302.1(1) and Table R302.1(2). Projections shall be fire resistance rated where required by Table R302.1(1) and Table R302.1(2).

Reason: Table R302.1(1) and Table R302.1(2) are not clear when restrictions on projections are concerned. The term fire separation distance is defined in Section R202 clarifies that the fire separation distance is established by measuring "from the building face" to an imaginary line, lot line or the center line of a street. As a result once a fire separation distance is established the exterior wall elements shown in column 1 of both tables are restricted or protected based on their location. Projections however are regulated by the amount that they encroach into the fire separation distance. This code change updates the table for consistency with the TABLE 705.2 of the IBC that limits the distance from the line used to determine fire separation distance to the projection. The IRC and IBC editions preceding the 2012 edition included regulations restricting the length of projections encroaching into the fire separation distance, he famous 1/3 to ½ the fire separation distance approach. This editorial code change proposes to clarify the table and to assist the user.

This code change is being offered in a text format or tabular format in separate code changes to allow the membership a choice in the way that the regulations are adopted into the 2015 IBC.

Cost Impact: None. This code change will not increase the cost of construction.

R302.1.1 (NEW) #3-RB-FATTAH

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that the language it contained was redundant.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Ali M. Fattah, City of San Diego, Development Services Department, representing San Diego Area Chapter ICC, requests Approval as Submitted.

Reason: We respectfully disagree with the committee that this is redundant language. We submitted RB69 and RB76 to allow the membership a choice however we favor RB76.

Table R302.1 (1) and Table R302.1(2) are not clear when restrictions on projections are concerned. The term fire separation distance is defined in Section R202 clarifies that the fire separation distance is established by measuring “from the building face” to an imaginary line, lot line or the center line of a street. As a result once a fire separation distance is established the exterior wall elements shown in column 1 of both tables are restricted or protected based on their location. Projections however are regulated by the amount that they encroach into the fire separation distance. This code change updates the table for consistency with the TABLE 705.2 of the IBC that limits the distance from the line used to determine fire separation distance to the projection.

The IRC and IBC editions preceding the 2012 edition included regulations restricting the length of projections encroaching into the fire separation distance, the famous projection encroachment of 1/3 to ½ into the fire separation distance approach. This editorial code change proposes to clarify the table and to assist the user. The 2009 IBC created a tabular form to display fire separation protection ad inadvertently mixed the separation of items protecting the exterior wall under consideration, as well as penetrations or openings in such wall with exterior wall projections that need to be protected based on how far they are from a lot line or imaginary line.

RB76-13

Final Action: AS AM AMPC____ D

RB77-13
R302.2

Proposed Change as Submitted

Proponent: Matt Archer, Douglas County, CO representing Colorado Chapter Code Change Committee (marcher@douglas.co.us)

Revise as follows:

R302.2 Townhouses. Each *townhouse* shall be considered a separate building and shall be separated by fire-resistance-rated wall assemblies meeting the requirements of Section R302.1 for exterior walls.

> **Exception:** A common 1-hour fire-resistance-rated wall assembly tested in accordance with ASTM E 119 or UL 263 is permitted for townhouses if such walls do not contain plumbing or mechanical equipment, ducts or vents in the cavity of the common wall. ~~The wall shall be rated for fire exposure from both sides. and shall extend to and be tight against exterior walls and the underside of the roof sheathing. Electrical installations shall be installed in accordance with Chapters 34 through 43. Penetrations of electrical outlet boxes shall be in accordance with Section R302.4.~~

Reason: This language is redundant and needs to be deleted because it is already covered in the next section, R302.2.1, Continuity**.**

"The fire-resistance-rated wall or assembly separating *townhouses* shall be continuous from the foundation to the underside of the roof sheathing, deck or slab. The fire-resistance rating shall extend the full length of the wall or assembly, including wall extensions through and separating attached enclosed *accessory structures*."

The language about electrical installations is not needed. This section is about fire-resistance-rated construction, not about how to wire a home.

Cost Impact: None

R302.2-RB-ARCHER

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The committee disapproved this code change proposal because they felt that the electrical references in the code should not be deleted and that the existing language is not redundant.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Homer Maiel, PE, CBO, City of Palo Alto/4LEAF Inc., representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay), requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

Revise as follows:

R302.2 Townhouses. Each *townhouse* shall be considered a separate building and shall be separated by fire-resistance-rated wall assemblies meeting the requirements of Section R302.1 for exterior walls.

> **Exception:** A common 1-hour fire-resistance-rated wall assembly tested in accordance with ASTM E 119 or UL 263 is permitted for townhouses if such walls do not contain plumbing or mechanical equipment, ducts or vents in the cavity of the

common wall. The wall shall be rated for fire exposure from both sides~~ and shall extend to and be tight against exterior walls and the underside of the roof sheathing~~. Electrical installations shall be installed in accordance with Chapters 34 through 43. Penetrations of electrical outlet boxes shall be in accordance with Section R302.4.

Commenter's Reason: The redundant portion of this section, which is repeated in Section R302.2.1, is deleted. The rest of the section is remaining unchanged.

RB77-13

Final Action: AS AM AMPC____ D

RB79-13
R302.2, R302.2.4

Proposed Change as Submitted

Proponent: Jeffrey M. Shapiro, representing IRC Fire Sprinkler Coalition (jeff.shapiro@intlcodeconsultants.com)

Revise as follows:

R302.2 Townhouses. Each *townhouse* shall be considered a separate building and shall be separated by fire-resistance rated wall assemblies meeting the requirements of Section R302.1 for exterior walls.

Exceptions:

1. Where a fire sprinkler system in accordance with Section P2904 is provided, a~~A~~ common 1-hour-fire-resistance-rated wall assembly tested in accordance with ASTM E 119 or UL 263 is permitted for townhouses if such walls do not contain plumbing or mechanical equipment, ducts or vents in the cavity of the common wall. The wall shall be rated for fire exposure from both sides and shall extend to and be tight against exterior walls and the underside of the roof sheathing. Electrical installations shall be installed in accordance with Chapters 34 through 43. Penetrations of electrical outlet boxes shall be in accordance with Section R302.4.
2. Where a fire sprinkler system in accordance with Section P2904 is not provided, a common 2-hour fire-resistance-rated wall assembly tested in accordance with ASTM E 119 or UL 263 is permitted for townhouses where such walls do not contain plumbing or mechanical equipment, ducts or vents in the cavity of the common wall. The wall shall be rated for fire exposure from both sides and shall extend to and be tight against exterior walls and the underside of the roof sheathing. Electrical installations shall be installed in accordance with Chapters 34 through 43. Penetrations of electrical outlet boxes shall be in accordance with Section R302.4.

R302.2.4 Structural independence. Each individual *townhouse* shall be structurally independent.

Exceptions:

1. Foundations supporting *exterior walls* or common walls.
2. Structural roof and wall sheathing from each unit may fasten to the common wall framing.
3. Nonstructural wall and roof coverings.
4. Flashing at termination of roof covering over common wall.
5. *Townhouses* separated by a common ~~1-hour fire resistance-rated~~ wall as provided in Section R302.2, Exceptions 1 or 2.

Reason: The 1-hour separation requirements in these sections were reduced from 2-hour ratings in prior editions of the IRC based on the assumption that fire sprinklers mandated by the IRC would be present in all townhouses. Because some jurisdictions are amending the IRC to remove the fire sprinkler requirement, it is essential that the IRC provide for townhouse separation fire ratings to be returned to 2-hours if sprinklers are not provided. No justification, other than sprinklers, was ever provided for allowing a 1-hour separation, and this reduced rating is inappropriate for non-sprinklered buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

R302.2-RB-SHAPIRO

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee approved this proposed code change because they felt that a) it takes care of an important omission in the code related to fire sprinkler systems and b) it addresses the many ways in which jurisdictions adopt the code and modify sprinkler requirements.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jonathan Humble, representing American Iron and Steel Institute; Wayne Jewell, Green Oak Charter Township, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R302.2 Townhouses. ~~Each *townhouse* shall be considered a separate building and shall be separated by fire-resistance rated wall assemblies meeting the requirements of Section R302.1 for exterior walls.~~ Common walls separating townhouses shall be assigned a fire resistance rating in accordance with Section R302.2 Item 1 or Item 2. The common wall shared by two *townhouses* shall be constructed without plumbing or mechanical equipment, ducts or vents in the cavity of the common wall. The wall shall be rated for fire exposure from both sides and shall extend to and be tight against exterior walls and the underside of the roof sheathing. Electrical installations shall be installed in accordance with Chapters 34 through 43. Penetrations of the membrane of common walls for electrical outlet boxes shall be in accordance with Section R302.4.

~~Exceptions:~~

1. Where a fire sprinkler system in accordance with Section P2904 is provided, ~~a~~ the common wall shall be not less than a 1-hour fire-resistance-rated wall assembly tested in accordance with ASTM E 119 or UL 263**.** ~~is permitted for townhouses if such walls do not contain plumbing or mechanical equipment, ducts or vents in the cavity of the common wall. The wall shall be rated for fire exposure from both sides and shall extend to and be tight against exterior walls and the underside of the roof sheathing. Electrical installations shall be installed in accordance with Chapters 34 through 43. Penetrations of electrical outlet boxes shall be in accordance with Section R302.4.~~
2. Where a fire sprinkler system in accordance with Section P2904 is not provided, ~~a~~ the common wall shall be not less than a 2-hour fire-resistance-rated wall assembly tested in accordance with ASTM E 119 or UL 263**.** ~~is permitted for townhouses where such walls do not contain plumbing or mechanical equipment, ducts or vents in the cavity of the common wall. The wall shall be rated for fire exposure from both sides and shall extend to and be tight against exterior walls and the underside of the roof sheathing. Electrical installations shall be installed in accordance with Chapters 34 through 43. Penetrations of electrical outlet boxes shall be in accordance with Section R302.4.~~

R302.2.4 Structural independence. Each individual *townhouse* shall be structurally independent.

Exceptions:

1. Foundations supporting *exterior walls* or common walls.
2. Structural roof and wall sheathing from each unit may fasten to the common wall framing.
3. Nonstructural wall and roof coverings.
4. Flashing at termination of roof covering over common wall.
5. *Townhouses* separated by a common 1-hour fire resistance-rated wall as provided in Section R302.2, Items ~~Exceptions~~ 1 or 2.

Commenter's Reason: This public comment proposes to further modify RB79-13 as follows:

Deletion of the original charging language:
When this proposal was developed there was no longer a need to retain the reference to Section R302.1 and Table R302.1 as the proposed language now covers the fire resistance requirements in R302.2. As a result, we propose to delete that language as part of this modification since it is redundant and rely on the new text to articulate the fire resistance requirements for common walls.

Addition of instructions:
We are proposing new charging language which allows the user to choose the design and construction of the common wall. This is consistent with the RB79-13 and the choice allowed in the exceptions.

Removal of duplicative language in the exceptions:
We also propose the removal of the construction limitations language from the two parts of RB79-13 as it is duplicative, and instead suggest it be relocated into the charging section, thus stating the limitations only once.

Exceptions to Parts:
We propose that the exceptions be labeled as items in order to coordinate with the other modification concerning the revised charging language where the user is allowed to choose a 1-hour or 2-hour rated wall design.

RB79-13

RB81-13
R302.2, R302.2.4, R313.1, R313.2 and R313.3 (New)

Proposed Change as Submitted

Proponent: Jason Thompson, P.E., National Concrete Masonry Association representing Masonry Alliance for Codes and Standards (jthompson@ncma.org)

Revise as follows:

R302.2 Townhouses. Each *townhouse* shall be considered a separate building and shall be separated by fire-resistance-rated wall assemblies meeting the requirements of Section R302.1 for exterior walls.

> **Exception:** A common 1-hour fire-resistance-rated wall assembly tested in accordance with ASTM E 119 or UL 263 is permitted for *townhouses* with automatic fire sprinkler systems in accordance with Section R313.1 if such walls do not contain plumbing or mechanical equipment, ducts or vents in the cavity of the common wall. The wall shall be rated for fire exposure from both sides and shall extend to and be tight against exterior walls and the underside of the roof sheathing. Electrical installations shall be installed in accordance with Chapters 34 through 43. Penetrations of electrical outlet boxes shall be in accordance with Section R302.4.

R302.2.4 Structural independence. Each individual townhouse shall be structurally independent.

Exceptions:

1. Foundations supporting exterior walls or common walls.
2. Structural roof and wall sheathing from each unit may fasten to the common wall framing.
3. Nonstructural wall coverings.
4. Flashing at termination of roof covering over common wall.
5. Townhouses separated by a common ~~1-hour fire-resistance-rated~~ wall as provided in Section R302.2 or Section R313.3.

R313.1 Townhouse automatic fire sprinkler systems. Except as provided in Section R313.3, ~~A~~ an automatic residential fire sprinkler system shall be installed in *townhouses*.

> **Exception:** An automatic residential fire sprinkler system shall not be required when *additions* or *alterations* are made to existing *townhouses* that do not have an automatic residential fire sprinkler system installed.

R313.1.1 Design and installation. Automatic residential fire sprinkler systems for *townhouses* shall be designed and installed in accordance with Section P2904.

R313.2 One- and two-family dwellings automatic fire systems. Except as provided in Section R313.3, ~~A~~ an automatic residential fire sprinkler system shall be installed in one- and two-family *dwellings*.

> **Exception:** An automatic residential fire sprinkler system shall not be required for *additions* or *alterations* to existing buildings that are not already provided with an automatic residential sprinkler system.

R313.2.1 Design and installation. Automatic residential fire sprinkler systems shall be designed and installed in accordance with Section P2904 or NFPA 13D.

R313.3 Automatic fire sprinkler system alternative. Where an automatic fire sprinkler system is not required to be installed by the adopting authority, the following requirements shall be met.

1. Construction, projections, openings and penetrations of *exterior walls* of *dwellings* shall comply with Table R302.1(1);
2. *Townhouses* constructed with a common wall assembly in accordance with the exception to Section R302.2 shall have a minimum 2-hour fire-resistance-rating. The common wall shall not contain plumbing or mechanical equipment, ducts or vents in the cavity of the common wall. The wall shall be rated for fire exposure from both sides and shall extend to and be tight against exterior walls and the underside of the roof sheathing. Electrical installations shall be installed in accordance with Chapters 34 through 43. Penetrations for electrical outlet boxes shall be in accordance with Section R302.4.

Reason: Where adoption of the 2009 and 2012 editions of the International Residential Building Code have been considered, many adopting authorities have made modifications to negate the requirement for mandatory automatic fire sprinkler protection. In some instances the adopting authorities have re-instated the previous requirements for the fire resistance for exterior walls for dwellings and the fire resistance for common walls separating townhouses to those established in the 2006 edition. However, some jurisdictions negated the mandatory automatic fire sprinkler protection but did not require the previous fire resistance requirements for these exterior walls and common walls resulting in reduced fire safety for the occupants and property.

This proposal provides an alternative within the code to permit adopting authorities an option to permit townhouses and one- and two-family dwellings to be unsprinklered provided the fire resistance rating for exterior walls and common walls are established at the code prescribed levels prior to the 2009 IRC.

Cost Impact: This proposal will not increase the cost of construction.

R302.2 #2-RB-THOMPSON

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The committee disapproved this code change proposal a) because the proponent requested disapproval and b) based on prior committee action on RB79.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards, requests Approval as Submitted.

Commenter's Reason: Where adoption of the 2009 and 2012 editions of the International Residential Building Code have been considered, many adopting authorities have made modifications to negate the requirement for mandatory automatic fire sprinkler protection. In some instances the adopting authorities have re-instated the previous requirements for the fire resistance for exterior walls for dwellings and the fire resistance for common walls separating townhouses to those established in the 2006 edition. However, some jurisdictions negated the mandatory automatic fire sprinkler protection but did not require the previous fire resistance requirements for these exterior walls and common walls resulting in reduced fire safety for the occupants and property.

During the first public hearing the IRC-B Code Development Committee approved Code Change RB79-13 which accomplished the same intent as this proposal. If the membership determines the format of RB79-13 is not acceptable then this proposal provides alternative language within the code to permit adopting authorities an option to permit townhouses and one- and two-family dwellings to be unsprinklered provided the fire resistance rating for exterior walls and common walls are established at the code prescribed levels prior to the 2009 IRC.

RB81-13

Final Action: AS AM AMPC____ D

RB83-13
302.2.1

Proposed Change as Submitted

Proponent: C. Ray Allshouse AIA, CBO, City of Shoreline, WA, representing the Washington Association of Building Officials Technical Code Development Committee (rallshouse@shorelinewa.gov)

Revise as follows:

R302.2.1 Continuity. The fire-resistance-rated wall or assembly separating *townhouses* shall be continuous from the foundation to the underside of the roof sheathing, deck or slab. The fire-resistance rating shall extend the full length of the wall or assembly, including wall extensions through and separating attached enclosed *accessory structures*. <u>Where a *story* extends beyond the *exterior wall* of a *story* below, one of the following shall apply:</u>

1. <u>The fire-resistance-rated wall or assembly shall extend to the outside edge of the upper *story*; or</u>
2. <u>The underside of the exposed floor-ceiling assembly shall be protected as required for projections in Section R302.</u>

Reason: Current townhouse code language is vague regarding the continuity of fire-resistance-rated assemblies, specifically in those instances where an upper story extends beyond the face of the wall immediately below. This represents a potential breach in the integrity of the fire resistance rated construction deemed necessary to ensure full dwelling unit separation in townhouse configured construction. This change clarifies the needed protection requirements. It is not uncommon for local zoning ordinances to include provisions specifically intended to break up continuous building facades as well as the large scale presentation of multifamily buildings. Developers typically utilize offsets between units to achieve these building modulation requirements that frequently result in this configuration. This proposed change provides language to cover this condition thereby helping ensure that the required dwelling separation is achieved.

Cost Impact: The code change proposal will not increase the cost of construction.

R302.2.1-RB-ALLSHOUSE

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that the fire separation requirement would extend to the whole building and not just to a perpendicular wall. The proponent should come back with a public comment and graphics to support the proposal.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

C. Ray Allshouse AIA, CBO, City of Shoreline, Washington, representing WABO – Washington Association of Building Officials Technical Code Development Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R302.2.1 Continuity. The fire-resistance-rated wall or assembly separating *townhouses* shall be continuous from the foundation to the underside of the roof sheathing, deck or slab. The fire-resistance rating shall extend the full length of the wall or assembly, including wall extensions through and separating attached enclosed *accessory structures*. Where a *story* extends beyond the *exterior wall* of a *story* below, one of the following shall apply:

1. The fire-resistance-rated wall or assembly shall extend to the outside edge of the upper *story*; or
2. The underside of the exposed floor-ceiling assembly shall be protected as required for projections in Section R302 <u>for a perpendicular distance of 4 feet (1219 mm) from the separating wall</u>.

Commenter's Reason: The code change proposal language has been revised in consideration of concerns raised by the Committee regarding a potential unintended consequence of requiring fire separation of the whole building and their additional recommendation to provide graphics in support of the proposal. The original proposal uses language consistent with that covering parapets in the immediately following section regarding extensions of separating walls; so this portion of the requirement is sound. However, questions were raised in testimony as to the extent of the protection on the underside of the exposed floor-ceiling assembly. A further referral to existing parapet construction exception language provides the basis for a minimum protection of 4 feet. The attached graphics are provided to help the assembly understand the two available options deemed necessary to ensure continuity of fire separation proposed by this change -- Items 1 and 2 depicted by Figures 1 and 2, respectively

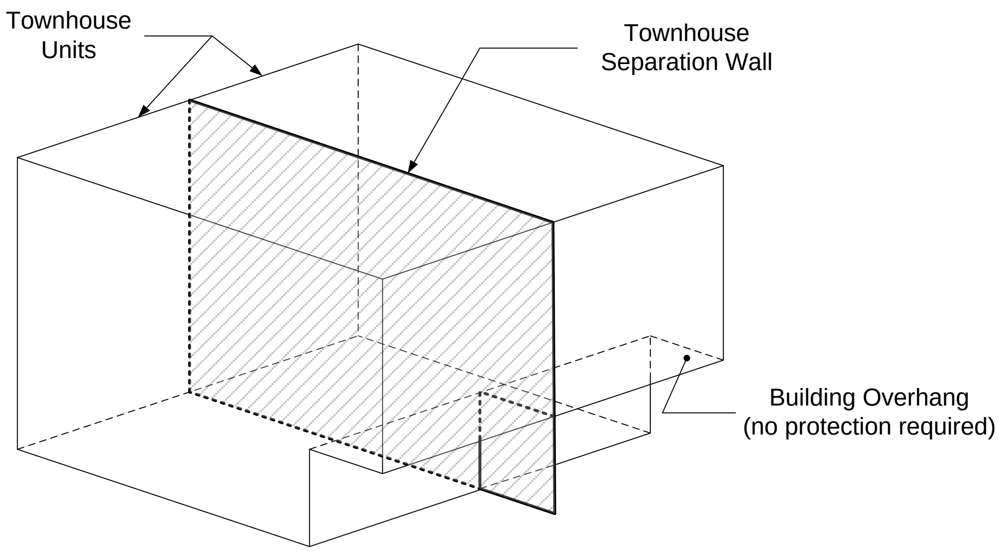

FIG. 1 – EXTENDED SEPARATION WALL

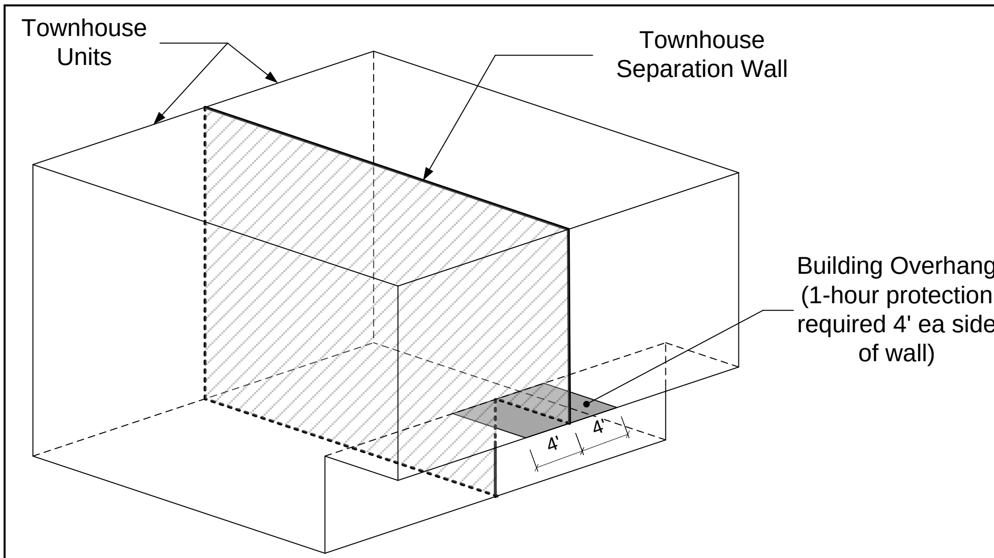

FIG. 2 – OVERHANG PROTECTION

Public Comment 2:

Lee Kranz, representing City of Bellevue, Washington and self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R302.2.1 Continuity. The fire-resistance-rated wall or assembly separating *townhouses* shall be continuous from the foundation to the underside of the roof sheathing, deck or slab. The fire-resistance rating shall extend the full length of the wall or assembly, including wall extensions through and separating attached enclosed *accessory structures*. Where a *story* extends beyond the *exterior wall* of a *story* below, one of the following shall apply:

1. The fire-resistance-rated wall or assembly shall extend to the outside edge of the upper *story*; or
2. The underside of the exposed floor-ceiling assembly shall be protected as required for projections in Section R302. <u>The protection shall extend the full depth of the soffit, but need not extend more than 4 feet on each side of the separating wall.</u>

Commenter's Reason: The proposed language has been revised in consideration of concerns raised by the Committee regarding a potential unintended consequence of requiring fire separation of the whole soffit area of the projecting floor or element above. It is acknowledged that protection of the entire underside of the exposed soffit assembly is not necessary and ought to be limited. The proposed text provides a reasonable alternative to extending the separation wall all the way out to the outside edge of the story or projecting element above to prevent a conflagration fire from occurring. This provision will provide clear direction in the design of the fire separation to keep a fire from spreading from one unit to another and give the fire department adequate time to arrive and put the fire out.

RB83-13

Final Action: AS AM AMPC____ D

RB84-13
R302.1

Proposed Change as Submitted

Proponent: Steve Orlowski, representing National Association of Home Builders (NAHB) (sorlowski@nahb.org)

Revise as follows:

R302.1 Exterior walls. Construction, projections, openings and penetrations of *exterior walls* of *dwellings* and accessory buildings shall comply with Table R302.1(1); or *dwellings* equipped throughout with an *automatic sprinkler system* installed in accordance with Section P2904 shall comply with Table R302.1(2).

Exceptions:

1. Walls, projections, openings or penetrations in walls perpendicular to the line used to determine the *fire separation distance*.
2. Walls of *dwellings* and *accessory structures* located on the same *lot*.
3. Detached tool sheds and storage sheds, playhouses and similar structures exempted from permits are not required to provide wall protection based on location on the *lot*. Projections beyond the *exterior wall* shall not extend over the *lot line*.
4. Detached garages accessory to a *dwelling* located within 2 feet (610 mm) of a *lot line* are permitted to have roof eave projections not exceeding 4 inches (102 mm).
5. Foundation <u>and attic</u> vents installed in compliance with this code are permitted.

Reason: After reviewing several UL listed fire-resistant rated assemblies, the NAHB discovered a problem between attempting to provide adequate attic ventilation to certain roof types (hip roofs, cathedral ceilings, etc) and achieving the one-hour fire resistance rating. The UL listed roof assemblies do not allow for any openings in the rated assembly for roofs, thereby creating a problem for proper roof ventilation as required in section R806. The NAHB proposes this code change to balance the needs of both adequate fire protection for exposure fires and proper ventilation of the attic. Under the 2012 IRC, projections are not permitted within two feet of the fire separation distance and the required ventilation opening for attics are minimal, 1/150 of the area of the vented space. The IRC also currently allows 25% of the wall space to be occupied by windows in exterior walls that are within 3'-0" of the fire separation distance. The IRC currently exempt foundation vents from being protected. NAHB suggest that due to the minimal openings required to provide ventilation in the attic, these openings should also be exempted.

Cost Impact: The code change proposal will not increase the cost of construction.

R302.1-RB-ORLOWSKI

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee approved this code change proposal because: they felt that attic vents are necessary; this does not compromise fire safety significantly; and because representatives of NAHB testified that less than 1% of fires are related to fires entering adjacent building through soffit vents.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Tim Pate, City and County of Broomfield, representing Colorado Chapter Code Change Committee, requests Disapproval.

Commenter's Reason: It does not make any sense to allow unlimited attic vents when located close to property lines and when fire rated construction is required.

The reason statement and testimony talked to the fact that these vents are typically not very large and are needed to satisfy the other code requirement for attic ventilation but the fact of the matter is the new language does not restrict the number nor the size so there could be many more than the minimum. I also understand the proponent was comparing this to the allowance to have unlimited size foundation vents (in a crawl space wall) but I would argue that these are very low to the ground and attic vents are up high and in the soffit overhang. If there was a fire on adjacent property this would be the perfect place for the fire to spread to this house and right into the attic space through these attic vents which are installed on the horizontal soffit.

It is very easy (and not expensive) to provide attic vents located on the slope of the roof located up off the wall line and these will perform adequately to meet the attic ventilation requirements. It would also make it easier for the builders who are in the climate zones which require the higher insulation depths since they would not have to use the baffles to allow the soffit vents work.

RB84-13

Final Action: AS AM AMPC____ D

RB86-13
R302.2.2

Proposed Change as Submitted

Proponent: Rick Davidson, City of Maple Grove, Association of Minnesota Building Officials (rdavidson@maplegrovemn.gov)

Revise as follows:

R302.2.2 Parapets. Parapets constructed in accordance with Section R302.2.3 shall be constructed for *townhouses* as an extension of exterior walls or common walls in accordance with the following:

1. Where roof surfaces adjacent to the wall or walls are at the same elevation, the parapet shall extend not less than 30 inches (762 mm) above the roof surfaces.
2. Where roof surfaces adjacent to the wall or walls are at different elevations and the higher roof is not more than 30 inches (762 mm) above the lower roof, the parapet shall extend not less than 30 inches (762 mm) above the lower roof surface.

   Exception: A parapet is not required in the two cases above when the roof is covered with a minimum class C roof covering, and the roof decking or sheathing is of noncombustible materials or *approved* fire-retardant treated wood for a distance of 4 feet (1219 mm) on each side of the wall or walls, or one layer of 5/8-inch (15.9 mm) Type X gypsum board is installed directly beneath the roof decking or sheathing, supported by a minimum of nominal 2-inch (51 mm) ledgers attached to the sides of the roof framing members, for a minimum distance of 4 feet (1219 mm) on each side of the wall or walls ~~and there are no openings or penetrations in the roof within 4 feet (1219 mm) of the exterior or common walls~~.

3. A parapet is not required where roof surfaces adjacent to the wall or walls are at different elevations and the higher roof is more than 30 inches (762 mm) above the lower roof. The common wall construction from the lower roof to the underside of the higher roof deck shall have not less than a 1-hour fire-resistance rating. The wall shall be rated for exposure from both sides.

Reason: The language proposed to be deleted was added in last code cycle and it was argued by the proponent that the change put the IRC in sync with the IBC. That is, it was argued that openings were not permitted within a certain distance of a townhouse separation wall in the IBC and the proposal made the IRC consistent with the IBC. This proposal was disapproved by the ICC IRC Committee with the following comment: "**Committee Reason:** This change would impose severe restrictions on penetrations at the roof. This does not mirror the IBC requirement on this issue." The IRC Committee action was right. However the membership approved the code change anyway.

The result is a more restrictive requirement in the IRC than in the IBC for the exact same application. This proposal deletes the conflicting language so that the IRC and IBC rules are again the same.

This proposal is necessary to maintain equivalencies for the same type of structures regulated by the IBC and IRC. The following language is from the IBC for information only (note the bold italicized text). Note that there is no regulation of openings under method 5.

2012 IBC

705.11 Parapets. Parapets shall be provided on *exterior walls* of buildings.

Exceptions: A parapet need not be provided on an *exterior wall* where any of the following conditions exist:

1. The wall is not required to be fire-resistance rated in accordance with Table 602 because of *fire separation distance*.
2. The building has an area of not more than 1,000 square feet (93 m2) on any floor.
3. Walls that terminate at roofs of not less than 2-hour fire-resistance-rated construction or where the roof, including the deck or slab and supporting construction, is constructed entirely of noncombustible materials.
4. One-hour fire-resistance-rated *exterior walls* that terminate at the underside of the roof sheathing, deck or slab, provided:
   4.1. Where the roof/ceiling framing elements are parallel to the walls, such framing and elements supporting such framing shall not be of less than 1-hour fire-resistance-rated construction for a width of 4 feet (1220

mm) for Groups R and U and 10 feet (3048 mm) for other occupancies, measured from the interior side of the wall.

4.2. Where roof/ceiling framing elements are not parallel to the wall, the entire span of such framing and elements supporting such framing shall not be of less than 1-hour fire-resistance-rated construction.

4.3. Openings in the roof shall not be located within 5 feet (1524 mm) of the 1-hour fire resistance-rated *exterior wall* for Groups R and U and 10 feet (3048 mm) for other occupancies, measured from the interior side of the wall.

4.4. The entire building shall be provided with not less than a Class B roof covering.

5. In Groups R-2 and R-3 where the entire building is provided with a Class C roof covering, the exterior wall shall be permitted to terminate at the underside of the roof sheathing or deck in Type III, IV and V construction, provided:

5.1. The roof sheathing or deck is constructed of approved noncombustible materials or of fire-retardant-treated wood for a distance of 4 feet (1220 mm); or

5.2. The roof is protected with 0.625-inch (16 mm) Type X gypsum board directly beneath the underside of the roof sheathing or deck, supported by a minimum of nominal 2-inch (51 mm) ledgers attached to the sides of the roof framing members for a minimum distance of 4 feet (1220 mm).

6. Where the wall is permitted to have at least 25 percent of the *exterior wall* areas containing unprotected openings based on *fire separation distance* as determined in accordance with Section 705.8.

There are no restrictions on openings in the roof under item #5 in the IBC. The IRC should follow suit.

Cost Impact: None

R302.2.2.2-RB-DAVIDSON

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The committee disapproved this code change proposal because they felt that the existing four foot separation requirement for openings is appropriate in relation to the parapet. Parapets are different in the IRC and IBC. It would be too easy for a fire in the IRC to jump from skylight to skylight.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rick Davidson, City of Maple Grove, representing Association of Minnesota Building Officials, requests Approval as Submitted.

Commenter's Reason: This proposal would delete the prohibition of openings in roofs adjoining a parapet for townhouse construction. The IRC has some conflicting exterior wall requirements and this is one of them.

The IBC does not prohibit openings in roof areas adjacent to a parapet ***that is an extension of an exterior wall*** for R-2 and R-3 occupancies (apartment houses, hotels, one and two family dwellings, and townhouses) of Types III, IV, and V construction. The IRC does prohibit openings so the IRC is more restrictive. For the IRC to prohibit openings is over-regulation.

There have been many statements made regarding the validity of the claim that the IBC does not regulate openings adjacent to parapets. That is understandable because there are two sections in the IBC that address parapets and some folks may be reading the wrong section.

The IBC sections are 705.11 and 706.6. IBC section 705.11 is the section of the IBC that regulates exterior walls and is the companion section of IRC Section R302.2.2. ***Only IBC Section 705.11 and IRC Section 302.2.2 regulate exterior walls.***

Let's be clear about this. IRC Section R302.2 regulates these walls as ***exterior walls***. The text that follows leaves no doubt: "**R302.2 Townhouses.** Each *townhouse* shall be considered a separate building and shall be separated by fire-resistance rated wall assemblies meeting the requirements of Section R302.1 for exterior walls."

The other IBC section that requires and regulates parapets is Section 706.6 which is the section on ***fire walls***. Fire walls separate buildings on the same lot and are not regulated in the same manner as exterior walls. Fire walls ***do restrict*** openings adjacent the fire wall but comparing the fire wall requirements in the IBC and the property line requirements of the IRC is comparing apples to oranges. The appropriate comparison is R302.2.2 in the IRC and 705.11 in the IBC.

The IRC Committee disapproved this code change for a number of reasons (see following). First, the reason statement says parapets are different in the IRC and IBC. A side by side comparison follows. The two codes are identical. There are no differences in parapet requirements for buildings of similar use and construction type. It is apparent that some committee members may have been directed to the wrong IBC section.

Second, the reason statement says it would be too easy for a fire in the IRC to jump from skylight to skylight. There was no testimony given to suggest that fires react differently depending on which code was used. Skylights are permitted in both the IRC and IBC.

But most puzzling is the action taken to deny this proposal coming on the heels of RB84 that was approved by the Committee. RB84 (assuming it survives the public comment period) will allow unlimited openings when used for attic ventilation in walls of all structures, not just townhouses, adjacent the line used to determine fire separation distance. The illustration following shows the area where unlimited attic vents would be allowed. This creates the situation where attic vents would not be permitted within 4 feet of the edge of the roof but would be unregulated in the wall that the parapet alternate is intended to protect! This is a blatant and unexplainable inconsistency.

A fire moving across the roof of one building doesn't need to breech an opening and burn down into the attic below. It can enter the adjoining attic through the unlimited vent openings.

The committee action statement for RB84 stated that NAHB Representatives had stated less than 1% of fires entered adjacent buildings through soffit vents. If less than 1% of fires enter through soffit vents, it stand to reason that very few, if any, enter an adjacent building through roof openings.

An owner can construct townhouses under the IBC and will not be limited by openings adjacent property line walls and they can be of greater height than under the IRC. Under the IRC those same openings are not permitted.

There is no justification for the IRC to be more restrictive than the IBC for these circumstances. When this text went into the code the only reason given was for consistency with the IBC. That reason was never true or the codes were misunderstood and the following comparison illustrates that. This unnecessary requirement needs to go and consistency must exist.

RB86-13

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that the existing four foot separation requirement for openings is appropriate in relation to the parapet. Parapets are different in the IRC and IBC. It would be too easy for a fire in the IRC to jump from skylight to skylight.

Assembly Action: **None**

IRC	IBC
R302.2.2 Parapets. Parapets constructed in accordance with Section R302.2.3 shall be constructed for *townhouses* as an extension of exterior walls or common walls in accordance with the following: 1. Where roof surfaces adjacent to the wall or walls are at the same elevation, the parapet shall extend not less than 30 inches (762 mm) above the roof surfaces. 2. Where roof surfaces adjacent to the wall or walls are at different elevations and the higher roof is not more than 30 inches (762 mm) above the lower roof, the parapet shall extend not less than 30 inches (762 mm) above the lower roof surface. **Exception:** A parapet is not required in the two cases above when the roof is covered with a minimum class C roof covering, and the roof decking or sheathing is of noncombustible materials or *approved* fire-retardant-treated wood for a distance of 4 feet (1219 mm) on each side of the wall or walls, or one layer of 5/8-inch (15.9 mm) Type X gypsum board is installed directly beneath the roof decking or sheathing, supported by a minimum of nominal 2-inch (51 mm) ledgers attached to the sides of the roof framing members, for a minimum distance of 4 feet (1219 mm) on each side of the wall or walls and there are no openings or penetrations in the roof within 4 feet (1219 mm) of the common walls. 3. A parapet is not required where roof surfaces adjacent to the wall or walls are at different elevations and the higher roof is more than 30 inches (762 mm) above the lower roof. The common wall construction from the lower roof to the underside of the higher roof deck shall have not less than a 1-hour fire-resistance rating. The wall shall be rated for exposure from both sides.	**705.11 Parapets.** Parapets shall be provided on *exterior walls* of buildings. **Exceptions:** A parapet need not be provided on an *exterior wall* where any of the following conditions exist: 1. The wall is not required to be fire-resistance rated in accordance with Table 602 because of *fire separation distance*. 2. The building has an area of not more than 1,000 square feet (93 m^2) on any floor. 3. Walls that terminate at roofs of not less than 2-hour fire-resistance-rated construction or where the roof, including the deck or slab and supporting construction, is constructed entirely of noncombustible materials. 4. One-hour fire-resistance-rated *exterior walls* that terminate at the underside of the roof sheathing, deck or slab, provided: 4.1. Where the roof/ceiling framing elements are parallel to the walls, such framing and elements supporting such framing shall not be of less than 1-hour fire-resistance-rated construction for a width of 4 feet (1220 mm) for Groups R and U and 10 feet (3048 mm) for other occupancies, measured from the interior side of the wall. 4.2. Where roof/ceiling framing elements are not parallel to the wall, the entire span of such framing and elements supporting such framing shall not be of less than 1-hour fire-resistance-rated construction. 4.3. Openings in the roof shall not be located within 5 feet (1524 mm) of the 1-hour fire resistance-rated *exterior wall* for Groups R and U and 10 feet (3048 mm) for other occupancies, measured from the interior side of the wall. 4.4. The entire building shall be provided with not less than a Class B roof covering. 5. In Groups R-2 and R-3 where the entire building is provided with a Class C roof covering, the *exterior wall* shall be permitted to terminate at the underside of the roof sheathing or deck in Type III, IV and V construction, provided: 5.1. The roof sheathing or deck is constructed of *approved* noncombustible materials or of *fire-retardant-treated wood* for a distance of 4 feet (1220 mm); or 5.2. The roof is protected with 0.625-inch (16 mm) Type X gypsum board directly beneath the underside of the roof sheathing or deck, supported by a minimum of nominal 2-inch (51 mm) ledgers attached to the sides of the roof framing members for a minimum distance of 4 feet (1220 mm). 6. Where the wall is permitted to have at least 25 percent of the *exterior wall* areas containing unprotected openings based on *fire separation distance* as determined in accordance with Section 705.8.

RB84-13

Committee Action: **Approved as Submitted**

Committee Reason: The committee approved this code change proposal because: they felt that attic vents are necessary; this does not compromise fire safety significantly; and because representatives of NAHB testified that less than 1% of fires are related to fires entering adjacent building through soffit vents.

Assembly Action: **None**

RB86-13

Final Action: AS AM AMPC____ D

RB88-13
R302.4.2

Proposed Change as Submitted

Proponent: Mark Nowak, M Nowak Consulting LLC, representing Steel Framing Alliance

Revise as follows:

R302.4.2 Membrane penetrations. Membrane penetrations shall comply with Section R302.4.1. Where walls are required to have a fire-resistance rating, recessed fixtures shall be installed so that the required fire-resistance rating will not be reduced.

Exceptions:

1. Membrane penetrations of maximum 2-hour fire-resistance-rated walls and partitions by steel electrical boxes that do not exceed 16 square inches (0.0103 m^2) in area provided the aggregate area of the openings through the membrane does not exceed 100 square inches (0.0645 m^2) in any 100 square feet (9.29 m)^2 of wall area. The annular space between the wall membrane and the box shall not exceed $^1/_8$ inch (3.1 mm). Such boxes on opposite sides of the wall shall be separated by one of the following:
   1.1. By a horizontal distance of not less than 24 inches (610 mm) where the wall or partition is constructed with individual noncommunicating stud cavities;
   1.2. By a horizontal distance of not less than the depth of the wall cavity when the wall cavity is filled with cellulose loose-fill, rockwool or slag mineral wool insulation;
   1.3. By solid fire blocking in accordance with Section R302.11;
   1.4. By protecting both boxes with listed putty pads; or
   1.5. By other listed materials and methods.
2. Membrane penetrations by listed electrical boxes of any materials provided the boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The annular space between the wall membrane and the box shall not exceed $^1/_8$ inch (3.1 mm) unless listed otherwise. Such boxes on opposite sides of the wall shall be separated by one of the following:
   2.1. By the horizontal distance specified in the listing of the electrical boxes;
   2.2. By solid fireblocking in accordance with Section R302.11;
   2.3. By protecting both boxes with listed putty pads; or
   2.4. By other listed materials and methods.
3. The annular space created by the penetration of a fire sprinkler provided it is covered by a metal escutcheon plate.
4. <u>Ceiling membranes of 1- and 2-hour fire-resistant assemblies are permitted to be interrupted by wall assembly double wood top plates, or steel top tracks complying with Sections 702.3.3 or R603.2.1, where the wall assembly complies with all of the following:</u>
   <u>4.1 The wall assembly is sheathed with Type X gypsum board,</u>
   <u>4.2 All penetrations through the top plate or track are protected in accordance with Section R302.4.1 and</u>
   <u>4.3 The ceiling membrane is installed tight to the top plate or track.</u>

Reason: This proposal is consistent with approved proposal FS76-12 for the 2015 IBC. However, it is inclusive of both wood top plates and steel top tracks. This proposal is needed only for the stacked duplex case in the IRC where the floor may be supported by a wall having at least equivalent fire resistance (R302.3.1) or where non-loadbearing walls are framed prior to installation of the membrane as is often necessary to route mechanical and electrical equipment. Thus, penetrations through the top plate or track are required to be protected per Section R302.4.1 to maintain the integrity and intent of the fire resistance requirement of floors separating stacked duplexes.

Cost Impact: The code change proposal will not increase the cost of construction.

R302.4.2-RB-NOWAK

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this proposal because the proponent requested disapproval and because the committee felt that the proposal might work for 1-hour ratings, but not 2-hour ratings. Penetrations in and out of the wall and through floor assemblies need to be addressed. This should be improved and brought back in the public comment period.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Tim Pate, City and County of Broomfield, representing Colorado Chapter Code Change Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R302.4.2 Membrane penetrations. Membrane penetrations shall comply with Section R302.4.1. Where walls are required to have a fire-resistance rating, recessed fixtures shall be installed so that the required fire-resistance rating will not be reduced.

Exceptions:

1. Membrane penetrations of maximum 2-hour fire-resistance-rated walls and partitions by steel electrical boxes that do not exceed 16 square inches (0.0103 m2) in area provided the aggregate area of the openings through the membrane does not exceed 100 square inches (0.0645 m2) in any 100 square feet (9.29 m)2 of wall area. The annular space between the wall membrane and the box shall not exceed 1/8 inch (3.1 mm). Such boxes on opposite sides of the wall shall be separated by one of the following:
   - 1.1. By a horizontal distance of not less than 24 inches (610 mm) where the wall or partition is constructed with individual noncommunicating stud cavities;
   - 1.2. By a horizontal distance of not less than the depth of the wall cavity when the wall cavity is filled with cellulose loose-fill, rockwool or slag mineral wool insulation;
   - 1.3. By solid fire blocking in accordance with Section R302.11;
   - 1.4. By protecting both boxes with listed putty pads; or
   - 1.5. By other listed materials and methods.
2. Membrane penetrations by listed electrical boxes of any materials provided the boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The annular space between the wall membrane and the box shall not exceed 1/8 inch (3.1 mm) unless listed otherwise. Such boxes on opposite sides of the wall shall be separated by one of the following:
   - 2.1. By the horizontal distance specified in the listing of the electrical boxes;
   - 2.2. By solid fireblocking in accordance with Section R302.11;
   - 2.3. By protecting both boxes with listed putty pads; or
   - 2.4. By other listed materials and methods.
3. The annular space created by the penetration of a fire sprinkler provided it is covered by a metal escutcheon plate.
4. Ceiling membranes of 1- ~~and 2-~~hour fire-resistant assemblies are permitted to be interrupted by wall assembly double wood top plates, ~~or steel top tracks complying with Sections 702.3.3 or R603.2.1~~, where the wall assembly complies with all of the following:
   - 4.1. The wall assembly is sheathed with Type X gypsum board,
   - 4.2. All penetrations through the top plate ~~or track~~ are protected in accordance with Section R302.4.1 and
   - 4.3. The ceiling membrane is installed tight to the top plate ~~or track~~.

Commenter's Reason: As I testified at the Dallas hearings there are no approved tested firestopping assemblies that can be used on a steel top plate that does not have a gypsum membrane that extends over the top of the steel top plate. The balance of the original code change is a good one in that it will match the same language that is now in the 2012 and 2015 IBC. I was the original proponent of getting this type of language into the IBC and encourage the membership in approving this code change as modified above.

I am also proposing to delete the reference to a 2 hour rated assembly since you would never have this condition under the IRC – this would effectively only apply to a stacked duplex which would have a 1 hour rated horizontal assembly.

Public Comment 2:

Dennis Pitts, representing American Wood Council, requests Disapproval.

Commenter's Reason: In residential construction it is common for joists to bear directly on the top plates of the wall below. Continuity of a fire-rated floor assembly is assumed from plate to plate, and there are no code provisions requiring uninterrupted continuity at the floor/wall intersection. If the wall/floor intersection needs protection, that question should be addressed more directly. This is adding an exception to a code requirement that doesn't exist, and by so doing implies that the intersection is already regulated as a membrane penetration. However, it is not, nor should it be.

If special protection is needed for steel top plates in this application, a positive requirement for their protection could be introduced into the code.

RB88-13
Final Action: AS AM AMPC____ D

RB90-13
R302.5.1

Proposed Change as Submitted

Proponent: Rick Davidson, City of Maple Grove, Association of Minnesota Building Officials (rdavidson@maplegrovemn.gov)

Revise as follows:

R302.5.1 Opening protection. Openings from a private garage directly into a room used for sleeping purposes shall not be permitted. Other openings between the garage and residence shall be equipped with solid wood doors not less than 1-3/8 inches (35 mm) in thickness, solid or honeycomb core steel doors not less than 1-3/8 inches (35 mm) thick, or 20-minute fire-rated doors~~, equipped with a self-closing device~~.

Reason: The IRC Committee and the ICC membership has consistently opposed closers on the door between a garage and dwelling in the past for a number of legitimate reasons not the least of which is the danger the closers pose to small children.

The effort to require closers on garage doors continued at the national level every year for perhaps fifteen years or more. Each year the membership denied the request because there was no statistical data to support the requirement and there had been no equivalent requirement in several of the legacy codes without an apparent problem.

During the last code cycle, this proposal was approved but again with erroneous and irrelevant arguments. There was no justification for the change and no evidence that a problem exists. Following is the justification from the fire service for the change published in the monograph during the last cycle.

> ***Reason:*** *There are times when proposed code submittals require a very lengthy substantiation, and then there are times when code change proposals just make sense. I would believe this is one of those times where a code change proposal makes a lot of sense. We are seeking a requirement to install items for very minimal costs yet great life saving potentials.*

If it "just makes sense", then there should be a justifiable reason for the requirement. If there is no reason, then it is overregulation. The presumption that the door between the house and garage will be left open is not rational. There is no evidence that the cost is minimal, that the benefit is real, or that any life saving would occur. Closers require maintenance and can easily be defeated by the homeowner. There is no standard specified in the code. It is obvious that there was no thought put into the proposal regarding the practicality, the need, or the ability to enforce. The closing force to engage the lock on a gasketed door can potentially be a hazard to young children who may get knocked over by the door or get fingers pinched in the closing side of the door or the latch side of the door upon closing. The vague language provides little guidance to install or approve these devices which can result in greater liability for the builder. Closers on these doors have not been required in many parts of the country for decades and there is no indication that it has created any hazard to life safety in those regions. This is a non-rated door in a non-rated frame in a non-rated wall.

Furthermore, there is no similar requirement for car ports. In fact, the code requires no protection of the wall between a dwelling and a carport. Windows are permitted. Hollow doors with glazing are permitted. Both structures house the same items including motor vehicles. A carport is enclosed on two or fewer sides. A garage is enclosed on more than two sides but one side can be completely open. And no vehicle door is required in either.

This amendment is necessary because it eliminates a potential for injury to small children, there is no data to support that there is a need for this rule, and it eliminates a source of potential liability for builders.

Cost Impact: None

R302.5.1-RB-DAVIDSON

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this proposal to create consistency as the language in this section has gone back and forth in various editions of the code. In accordance with the commentary to the IRC, the primary reason for this section is to limit the free flow of carbon monoxide and other products of combustion from entering the living area and that was not addressed at all by the proponent.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Rick Davidson, City of Maple Grove, representing Association of Minnesota Building Officials, requests Approval as Submitted.

Commenter's Reason: There has never been justification for closers on the door between the garage and the dwelling. There is no statistical evidence to suggest that homes are any safer because of the closers. For every anecdote that a home was saved, there is another anecdote where the closer caused frequent and severe injuries to children or the door was closed by the occupant when they sensed a fire as they had been taught to do since 1st grade.

The IRC Committee disapproved the proposal with the statement that "the primary reason for the section is to limit the free flow of carbon monoxide and other products of combustion from entering the living area…" The reason for the separation between the dwelling and garage has never been a barrier for carbon monoxide entering the home much less a primary one. The title of the section in which this requirement is located is "**FIRE-RESISTANT CONSTRUCTION".** There are no requirements in this section of the code that the membrane on the garage wall nor the door be air tight and serve as a barrier to carbon monoxide.

The requirement for this separation in the legacy codes for decades was as a fire separation and existed long before carbon monoxide became an issue in homes. Furthermore, no one speaking in opposition to the proposal or on the committee offered any evidence to suggest that any health issues are occurring because of these doors being left open and a home being contaminated by carbon monoxide. In fact, it isn't happening.

And for CO to be a problem, two things would need to occur. First, an automobile would need to be left running and unattended for long enough to pollute the air to dangerous levels. Numerous studies now show that the amount of CO given off by modern automobile engines is insufficient to cause a health issue. Second, the door between the garage and the dwelling would need to be left open. The primary reason someone would leave a car running would be to warm the car in a cold climate. If the car is in a cold garage and needed warming, the occupants of the dwelling would not leave the door open and subject themselves to the influx of cold air. To think otherwise lacks logic.

You will likely hear arguments about not changing rules back and forth from year to year. Baloney! That is a really lousy reason to keep a poor code requirement in the code. We should only have reasonable and necessary requirements in the code and shouldn't have to struggle to come up with reasons why they are there.

This is an unnecessary requirement that creates more injuries than it does good. There is no evidence to suggest any benefit. That being said, it is the worst possible code requirement; one that only serves to increase the cost of construction.

Public Comment 2:

Andrew J Hyun, Fire Door Consultant, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R302.5.1 Opening protection. Openings from a private garage directly into a room used for sleeping purposes shall not be permitted. Other openings between garage and residence shall be equipped with ~~solid wood doors not less than 1-3/8 inches (35 mm) in thickness, solid or honeycomb core steel doors not less than 1 3/8 inches (35 mm) thick, or~~ 20-minute fire-rated ~~doors~~ <u>door assemblies</u>, equipped with a self-closing device <u>and fire rated weather seal gasket</u>.

Commenter's Reason:

1. Decision of Committee, to disapprove Rick Davidson's proposal (RB90-13) to remove requirement of closing device, is very reasonable. Proponent, Rick Davidson, stated that "This (the door) is in a non-fire rated wall". However, Table R302.6 of IRC below indicates that (1) minimum ½" gypsum board is required for garage side wall as a separation to residence and (2) minimum ½" gypsum board is required for interior side of exterior walls which is located less than three feet from detached garage. Wall with ½ inch thick gypsum board is a fire rated wall as enclosed UL Directory Design No. U317 or No. U380. Therefore the intension of the IRC is to separate garage from residence with fire rated wall and fire rated opening.

Table R302.6 Dwelling/garage separation (Page 51 of IRC 2012)

Separation	Material
From the residence and attics	No less than ½ -inch gypsum board or equivalent applied to the garage side
From all habitable rooms above the garage	No less than 5/8-inch Type X gypsum board or equivalent
Structure(s) supporting floor/ceiling assemblies used for separation required by this section	No less than ½ -inch gypsum board or equivalent
Garage located less than 3 feet from a dwelling unit on the same lot	No less than ½ -inch gypsum board or equivalent applied to the interior side of exterior walls that are within this area

2. Additionally "fire door assembly", instead of "fire door", shall be specified in the code. All fire door, door frame and hardware set shall be fire rated for proper protection of opening. The door set would fail to maintain intended fire resistance, when only door is fire rated but door frame is not fire rated components. Currently State of Wisconsin and State of New York require "fire rated door assembly" with fire label attached.
3. Also, the descriptive definition of the fire door in the current code is not fire rated doors. Thickness of most fire door is typically 1-3/4 inch as specified in the enclosed typical fire door listing (20-min steel door by Therma-Tru). Contractor would select least expensive doors as long as the subjected doors comply with code. Less expensive, non-fire rated, doors would be installed, and opening protection would not be established to the level of fire protection intended by IRC code. "20-minute rated fire door assembly" must be required in order to provide adequate fire protection intended.

   Note: Problem of descriptive fire doors in 302.5.1.
   "solid wood doors not less than 1-3/8 inches (35 mm) in thickness": 1-3/8 inch thick door is not sufficient for 20-min fire protection (fire penetration property). Most wood fire door is 1-3/4 inch in thickness. Stile and Rail doors would be considered as acceptable "solid wood doors" in current code description, however the joint between panel and stile/rail is recessed in thickness (such as only 1 inch thick) and may not sufficient to prevent fire penetration at joint area.
   "solid or honeycomb core steel doors not less than 1 3/8 inches (35 mm) thick": 1-3/8 inch in thickness is not sufficient to prevent excessive door warp and separation of door from frame. Most of 20-minute rated steel door is 1-3/4 inch thick to prevent excessive door warp. Even 1-3/4 inch thick steel doors made with thin steel skin (such as 25 gauge) is not fire rated door due to the excessive warp of the door under heat.

4. Finally fire rated weather seal gasket should be included in the fire door assembly to prevent smoke infiltration to the living area from the origin of fire (garage). It is well known that spreading of smoke, including carbon monoxide, is the main killer in case of fire.

RB90-13
Final Action: AS AM AMPC____ D

RB94-13
R302.12, R302.12.2 (New)

<u>Proposed Change as Submitted</u>

Proponent: Sean DeCrane, Battalion Chief, representing Cleveland Division of Fire, International Association of Fire Fighters (rovloc93@aol.com)

Revise as follows:

R302.12 Draftstopping. <u>Draftstopping shall be provided in construction in accordance with this section.</u>

<u>R302.12.1 Concealed spaces.</u> In combustible construction where there is usable space both above and below the concealed space of a floor/ceiling assembly, draftstops shall be installed so that the area of the concealed space does not exceed 1,000 square feet (92.9 m2). Draftstopping shall divide the concealed space into approximately equal areas. Where the assembly is enclosed by a floor membrane above and a ceiling membrane below, draftstopping shall be provided in floor/ceiling assemblies under the following circumstances:

1. Ceiling is suspended under the floor framing.
2. Floor framing is constructed of truss-type open-web or perforated members.

<u>R302.12.2. Attics.</u> <u>Draftstopping shall be provided in attics with an area that exceeds 1,500 square feet (92.9 m^2). The draftstopping shall be installed such that each draftstopped area of the attic does not exceed 1,500 square feet (92.9 m^2).</u>

Reason: Void spaces, are areas of potentially large fire growth that can have explosive results for responding and operating fire fighters. We have seen multiple incidents where large single-family residences can simulate commercial size fires due to the large open areas. Modern construction techniques are providing home owners with a number of options including large open spaces. These large floor plans lead to increased amounts of void spaces in the attic and floor systems. When fire travels into these attic spaces, they are fuel enriched by the combustible wood truss and in many instances the sprayed insulation.
With large amounts of oxygen the fire can grow unchecked and on many occasions showing very little evidence on the exterior of amount of fire present. One side discovery of the original Underwriters Laboratories studies on lightweight construction in 2006, was the performance of the plastic ridge vent which when subjected to elevated temperatures would melt and create a seal at the peak of the ridge causing the increased pressures from the fires to push downward on top of operating fire fighters.
We have seen instances where fire fighters have been killed or injured. In 2010 Fire Fighter Kyle Wilson, of Price William County, was killed while performing Search and Rescue operations from a wind driven exterior fire that accumulated in the attic space until it exploded downward trapping Fire Fighter Wilson in the Master Bedroom causing him to burn to death.
In 2012 in Huntington, MD, ten fire fighters were injured, two seriously, when they were investigating the smell of smoke on the second floor. The fire originated in the chimney and travelled into the attic space where it had plenty of air to grow uncontrolled until the building pressure caused the fire to explosively escape from the attic downward on the fire fighters. Fire fighters were forced to dive down the stairwell and out the second story windows causing one fire fighter to break his back.
The author will acknowledge the lack of technical justification at the time of submission. There is current testing being conducted at Underwriters Laboratories and NIST and we hope to have additional test data available at the code hearing in Dallas.

Cost Impact: This proposal will increase the cost of construction

R302.12-RB-DECRANE

<u>Committee Action Hearing Results</u>

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because the proponent acknowledged the current lack of justification for the 3,000 square feet criteria. The committee felt that the attic draftstopping would definitely be an issue. Furthermore, the test data referenced by the proponent has not been completed and, therefore, has not been available for review by the committee.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Sean DeCrane, representing Cleveland Division of Fire / International Association of Fire Fighters, requests Approval as Submitted.

Commenter's Reason: Tests are continuing at Underwriters Laboratories, with test results demonstrating a performance time of an exterior wall fire gaining access into the attic space from 2 minutes 30 seconds to over 8 minutes with a combustible wall covering. This is demonstrating the importance of confining these fires once they gain entry into the attic spaces. These attic spaces are not protected with sprinkler systems and have a large volume of available air to sustain burning. If we can limit the available air pocket and provide some compartmentation we can reduce the larger fire growth in the attic space and reduce the danger to the occupants and responding fire fighters.

Public Comment 2:

Steve Orlowski and Tim Ryan, representing National Association Of Home Builders (NAHB) and International Association of Building Officials (IABO), requests Disapproval.

Commenter's Reason: We agree with the committee's action to disapprove the proposed code change based on the lack of technical justification to require draftstopping every 1,500 square feet in attic spaces. While the proponent has given examples of events that have led to the creation of the proposed code change, without some credible research which shows that dividing the attic space into 1,500 square foot compartments will prevent similar events from occurring this is premature. Until UL completes its study of the dynamics of fire growth in attics and the influence it will have on fire mitigation tactics and prevention, we urge the assembly to support the committee's action of disapproval.

RB94-13
Final Action: AS AM AMPC____ D

RB96-13, Part I

R302.13 (New)

<u>Proposed Change as Submitted</u>

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IRC COMMITTEE. PART II WILL BE HEARD BY THE IECC COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Duncan Prahl, IBACOS Inc, representing self (dprahl@ibacos.com)

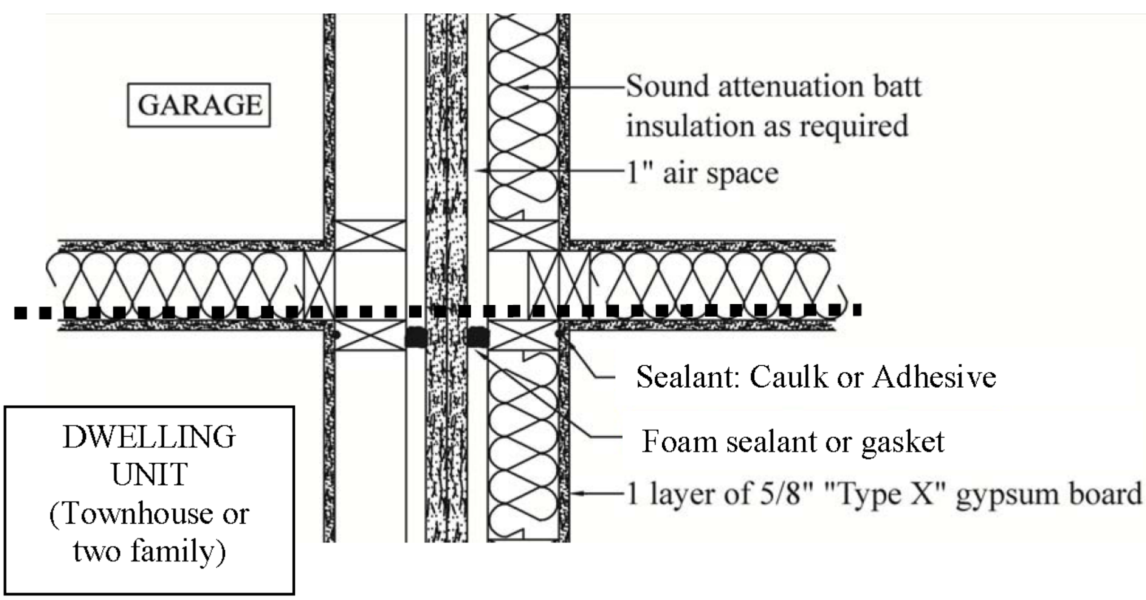
PART I - IRC-RB

Add new Text as follows:

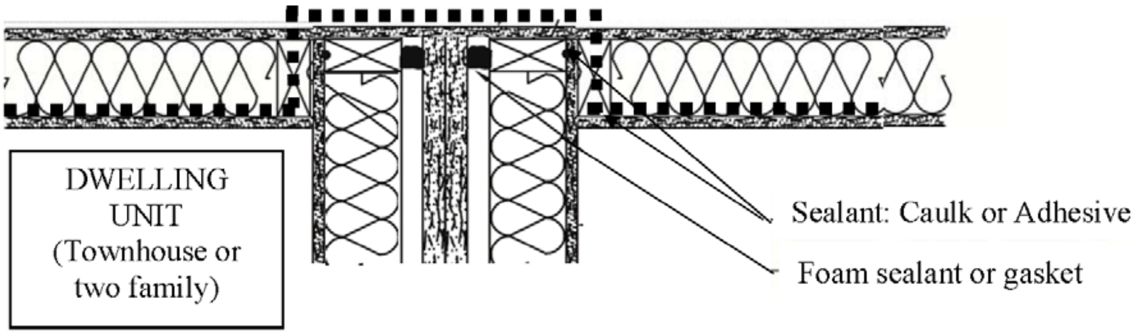
<u>**R302.13 Sealants.** In combustible construction, sealants that are used to limit air leakage in accordance with Section N1102.4 and Table N1102.4.1.1 shall not be required to comply with ASTM E 136 and shall not be required to be included in the fire tests required in association with the following:</u>
<u>1. Fire resistant assemblies where required by Sections R302.1, R302.2, R302.4, and R302.6;</u>
<u>2. Fireblocking where required by Section R302.11 and</u>
<u>3. Draftstopping where required by Section R302.12.</u>
(Existing Section R302.13 to be renumbered.)

Reason: Many ASTM E119 tested assemblies do not include any sealant materials for airtightness at the location where the assembly intersects the thermal enclosure of the building in the real world. Builders and code officials should be guided specifically on the airsealing that should be included at these locations. The materials used for sealing this location fall under the same criteria as sealants that the committee approved in for sealants used to fireblock annular spaces per R302.11. Many common sealants have an auto ignition temperature that is the same as or higher than the wood framing within the assembly and, as such, would only burn if the wood in the assembly was already on fire.

Examples of locations that are indicative of the need for sealants within fire separation assemblies follow. The heavy dotted line indicated the desired location of the airtightness layer within the constructed assembly as it appears in some typical details:



Two hour separation, plan view at garage



Two hour separation, plan view at exterior wall

Cost Impact: The code change proposal will not increase the cost of construction

R302.13 (NEW)-RB-PRAHL

Committee Action Hearing Results

PART I – IRC Building
Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that, if something is part of a fire assembly, it must meet the criteria for that assembly. If you change the assembly, the rating is no longer valid. Section R302.11 in the proposal basically says that compliance with the proposal should not reduce the fire rating, but no justification has been provided to support that. If a building burns down due to fire safety issues, it takes a lot of energy to rebuild. The balance between fire safety and energy concerns are not level. The concept of this proposal may be good, but many details need to be addressed.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Duncan Prahl, IBACOS, Inc., representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R302.13 Sealants~~.~~ ~~In combustible construction,~~ Sealants that are used to limit air leakage in accordance with Section N1102.4 and Table N1102.4.1.1 shall meet the *approved material* requirements of Section R302.11. 4. ~~not be required to comply with ASTM E 136 and shall not be required to be included in the fire tests required in association with the following:~~

~~1. Fire resistant assemblies where required by Sections R302.1, R302.2, R302.4, and R302.6;~~
~~2. Fireblocking where required by Section R302.11 and~~
~~3. Draftstopping where required by Section R302.12.~~

(Existing Section R302.13 to be renumbered.)

Commenter's Reason: ASTM E119-00a, section 4.4.4 states that the test method is not applicable to the "Simulation of the fire behavior of joints between building elements such as floor-wall or wall-wall, etc., connections."

The committee was concerned that the proposal would add something to the fire assembly. As the location is not actually part of the assembly, but at the joint between assemblies, this concern should now be addressed. Language has been modified to reflect that the sealant is to be used only at the joint, and not inside the assembly.

The intent of this proposal is to clarify that the location between interior fire assemblies and the building thermal envelope fire assemblies are to be considered a "joint. Since the IRC is silent on the subject of joints as they relate to fire separation assemblies, this language clarifies what is an acceptable material is to meet the requirements of Section N1102.4. As ASTM E119 is not intended to describe the fire behavior of joints, materials that are acceptable in other sections of the code should be considered to be acceptable in this “joint”.

RB96-13, Part I
Final Action: AS AM AMPC____ D

RB96-13, Part II
Table N1102.4.1.1 (R402.4.1.1)

Proposed Change as Submitted

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IRC COMMITTEE. PART II WILL BE HEARD BY THE IECC COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Duncan Prahl, IBACOS Inc, representing self (dprahl@ibacos.com)

PART II - IECC-RE

Revise as follows:

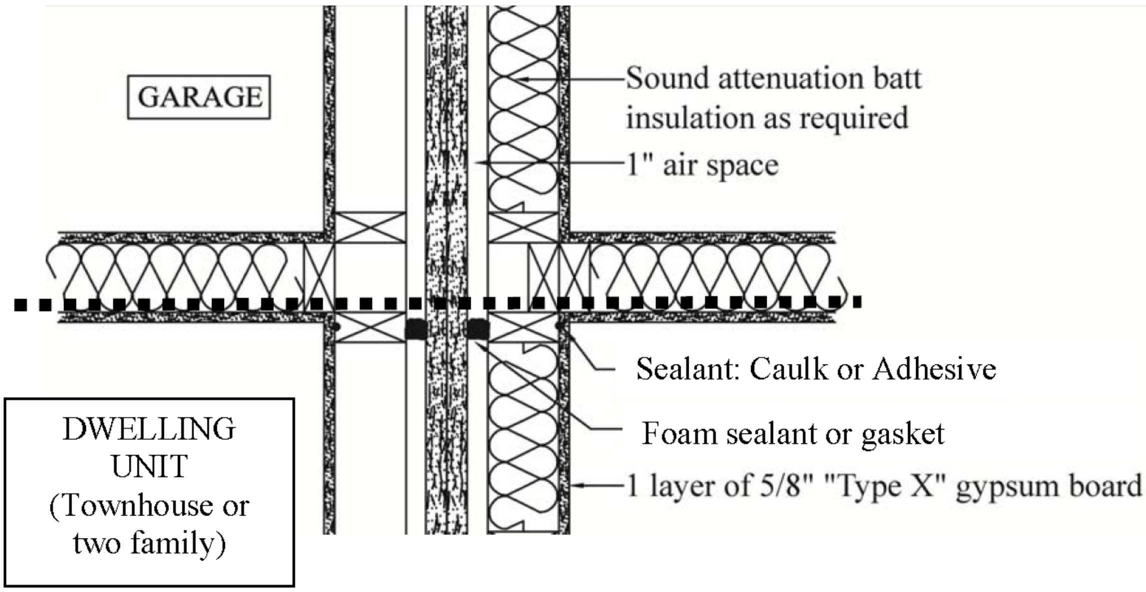
TABLE R402.4.1.1
AIR BARRIER AND INSULATION INSTALLATION

Fire separation assemblies in accordance with *International Residential Code* Sections R302.1, R302.2, R302.4, and R302.6, and fireblocking and draftstopping in accordance with *International Residential Code* Sections R302.11 and R302.12, respectively.	Air sealing shall be provided in all fire separation assemblies where the assembly, fireblocking or draftstopping is part of or intersects the thermal enclosure.
Garage separation	Air sealing shall be provided between the garage and conditioned spaces

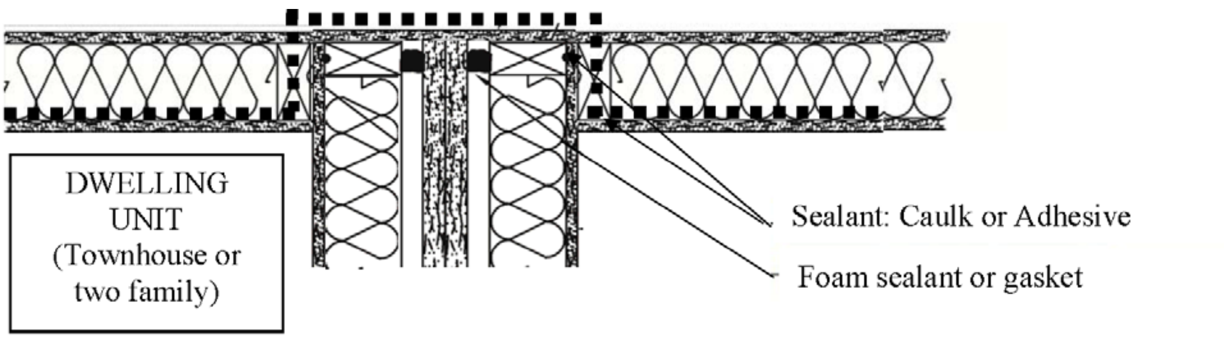
(Portions of table not shown to remain unchanged)

Reason: Many ASTM E119 tested assemblies do not include any sealant materials for airtightness at the location where the assembly intersects the thermal enclosure of the building in the real world. Builders and code officials should be guided specifically on the airsealing that should be included at these locations. The materials used for sealing this location fall under the same criteria as sealants that the committee approved in for sealants used to fireblock annular spaces per R302.11. Many common sealants have an auto ignition temperature that is the same as or higher than the wood framing within the assembly and, as such, would only burn if the wood in the assembly was already on fire.

Examples of locations that are indicative of the need for sealants within fire separation assemblies follow. The heavy dotted line indicated the desired location of the airtightness layer within the constructed assembly as it appears in some typical details:



Two hour separation, plan view at garage



Two hour separation, plan view at exterior wall

Cost Impact: The code change proposal will not increase the cost of construction

R302.13 (NEW)-RB-PRAHL

Committee Action Hearing Results

PART II – IECC – Residential
Committee Action: **Approved as Submitted**

Committee Reason: This area related to thermal envelope installation could easily be overlooked. Therefore the installation table is a good place to mention this.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Duncan Prahl, IBACOS, Inc., representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

TABLE R402.4.1.1
AIR BARRIER AND INSULATION INSTALLATION

Joints between fire separation assemblies in accordance with International Residential Code Sections R302.1, R302.2, R302.4, and R302.6, and fireblocking and draftstopping in accordance with International Residential Code Sections R302.11 and R302.12, respectively.	Air sealing shall be provided ~~in all~~ at the joint between fire separation assemblies that are part of the *building thermal envelope* and fire separation assemblies required by Section R302.2 ~~where the assembly, fireblocking or draftstopping is part of or intersects the thermal enclosure.~~
Garage separation	Air sealing shall be provided between the garage and conditioned spaces

Commenter's Reason: ASTM E119-00a, section 4.4.4 states that the test method is not applicable to the "Simulation of the fire behavior of joints between building elements such as floor-wall or wall-wall, etc., connections."

The committee was concerned that the proposal would add something to the fire assembly. As the location is not actually part of the assembly, but at the joint between assemblies, this concern should now be addressed. Language has been modified to reflect that the sealant is to be used only at the joint, and not inside the assembly.

The intent of this proposal is to clarify that the location between interior fire assemblies and the building thermal envelope fire assemblies are to be considered a "joint. Since the IRC is silent on the subject of joints as they relate to fire separation assemblies, this language clarifies what is an acceptable material is to meet the requirements of Section N1102.4. As ASTM E119 is not intended to describe the fire behavior of joints, materials that are acceptable in other sections of the code should be considered to be acceptable in this "joint".

RB97-13, Part I
R303.1

Proposed Change as Submitted

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IRC-RB COMMITTEE. PART II WILL BE HEARD BY THE IRC-PM COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Joe Lstiburek, Building Science Corporation; Mike Moore, P.E., Newport Ventures, representing Broan-NuTone (mmoore@newportpartnersllc.com); Thomas D. Culp, Birch Point Consulting, representing the Glazing Industry Code Committee

PART I-IRC-RB

Revise as follows:

R303.1 Habitable rooms. All habitable rooms shall have an aggregate glazing area of not less than 8 percent of the floor area of such rooms. Natural *ventilation* shall be through windows, doors, louvers or other *approved* openings to the outdoor air. Such openings shall be provided with ready access or shall otherwise be readily controllable by the building occupants. The minimum openable area to the outdoors shall be 4 percent of the floor area being ventilated.

Exceptions:

~~1. The glazed areas need not be openable where the opening is not required by Section R310 and a whole-house mechanical *ventilation* system is installed in accordance with Section M1507.~~

~~2~~1. The glazed areas need not be installed in habitable rooms without exterior walls, where an opening is not required by Section R310, mechanical ventilation is installed in accordance with Section M1507, and ~~Exception 1 above is satisfied and~~ artificial light is provided capable of producing an average illumination of 6 footcandles (65 lux) over the area of the room at a height of 30 inches (762 mm) above the floor level.

~~3~~2. Use of sunroom and patio covers, as defined in Section R202, shall be permitted for natural *ventilation* if in excess of 40 percent of the exterior sunroom walls are open, or are enclosed only by insect screening.

Reason: Experience from decades of work with builders confirms that achieving a home air tightness of around 3 to 5 ACH 50 is not difficult if the builder just addresses the "big holes" during construction.[1] The practice of addressing big holes was initially tackled by builders to reduce call backs associated with comfort complaints from homebuyers. Once builders figured out that plugging the big holes reduced callbacks, the practice went mainstream. In 2009, the steps required to plug the big holes were codified in the mandatory air barrier table (IRC Table N1102.4.2; IECC Table R402.4.1.1). At the end of 2012, 55% of the states had adopted the 2009 IECC or more stringent. Fast forward to 2015, and 76% of states (which accounted for 86% of the single family starts in 2011) are expected to have adopted the 2009 IECC or more stringent.[2]

This timeline shows that building tight (3 to 5 ACH 50) has become the new standard, regardless of whether or not a builder confirms the tightness with a blower door test. Of course, the one potential problem with building tight is the negative impact it can have on indoor air quality if mechanical ventilation is not provided; and there is broad consensus that air quality begins to be compromised at or below 5 ACH 50 if mechanical ventilation is not provided. Without mechanical ventilation, tight homes can experience elevated humidity levels; increased condensation potential on windows; higher concentrations of dust mites and allergens; and higher concentrations of pollutants such as chloroform, formaldehyde, acetaldehyde, and other VOCs that have negative health impacts.

With today's typical, code-minimum construction resulting in homes that easily achieve 3 to 5 ACH 50, a blower door test is not needed to confirm that these homes are less than 5 ACH 50 and in need of mechanical ventilation. At this point, mechanical ventilation is needed to provide minimum acceptable air quality for code-minimum construction. This change will ensure that the comfortable, energy efficient homes that builders are now building are also provided with minimum indoor air quality.

At the same time, we do not want to discourage the use of operable windows, which offer natural ventilation in addition to daylight and egress. Even with mechanical ventilation, a home occupant needs to be able to control their own environment, particularly in the case of an emergency such as a power failure (e.g. being able to open windows for airflow in the aftermath of a storm or blackout). As such, this proposal deletes exception 1 and modifies exception 2 of R303.1 to ensure operable windows in habitable rooms are still installed even with mechanical ventilation, only keeping the exception for interior rooms with no exterior walls. Note that the IRC still permits bathrooms and water closets to use local exhaust instead of windows, as per the exception to R303.3.

References:

2. U.S. DOE Building Energy Codes Program, "Status of State Energy Code Adoption, Residential: Projected" accessed from http://www.energycodes.gov/adoption/states on Nov 29, 2012.

Cost Impact: Because new standard construction practices will typically result in building envelope tightness levels of 3 to 5 ACH 50, these dwellings should already be provided with mechanical ventilation (based on R303.4). So, no additional costs should be incurred for mechanical ventilation systems. Also, removing the loophole of trading off windows for mechanical ventilation in habitable rooms is not expected to affect the practice of the overwhelming majority of builders who tend towards more windows, versus less, based on consumer demand.

R303.1-RB-CULP-LSTIBUREK-MOORE

Committee Action Hearing Results

PART I – IRC Building
Committee Action: Disapproved

Committee Reason: The committee disapproved this code change proposal because they felt the proposal does not work well without Part II, which was disapproved. The proponent points to another code section in their reason statement, but that section basically requires you to take a guess at what the air rates are, or requires a blower door test, before you can decide whether you need mechanical ventilation or not. That is after the fact and does not seem to be the proper order. Finally, there is no reason that a media room must be on an exterior wall.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Mike Moore, Newport Ventures, representing Broan-NuTone, requests Approval as Submitted.

Commenter's Reason: The specification of mechanical ventilation should not be used to over-write requirements for operable windows, which offer natural ventilation in addition to daylight and egress. Even with mechanical ventilation, a home occupant needs to be able to control their own environment, particularly in the case of an emergency such as a power failure (e.g. being able to open windows for airflow in the aftermath of a storm or blackout). As such, this proposal deletes exception 1 and modifies exception 2 of R303.1 to ensure operable windows in habitable rooms are still installed even with mechanical ventilation, only keeping the exception for interior rooms with no exterior walls. Note that the IRC still permits bathrooms and water closets to use local exhaust instead of windows, as per the exception to R303.3.

RB97-13, Part II
R303.4, M1507.1

Proposed Change as Submitted

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IRC-RB COMMITTEE. PART II WILL BE HEARD BY THE IRC-PM COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Joe Lstiburek, Building Science Corporation; Mike Moore, P.E., Newport Ventures, representing Broan-NuTone (mmoore@newportpartnersllc.com); Thomas D. Culp, Birch Point Consulting, representing the Glazing Industry Code Committee

PART II-IRC-RM

Revise as follows:

R303.4 Mechanical ventilation. ~~Where the air infiltration rate of a dwelling unit is less than 5 air changes per hour when tested with a blower door at a pressure of 0.2 inch w.c (50 Pa) in accordance with Section N1102.4.1.2, the d~~Dwelling unit<u>s</u> shall be provided with <u>local exhaust and</u> whole-house mechanical ventilation in accordance with Section M1507~~.3~~.

M1507.1 General. ~~Where l~~<u>L</u>ocal exhaust ~~or~~ <u>and</u> whole-house mechanical ventilation ~~is provided, the equipment~~ <u>systems</u> shall be designed <u>and installed</u> in accordance with this section.

Reason: Experience from decades of work with builders confirms that achieving a home air tightness of around 3 to 5 ACH 50 is not difficult if the builder just addresses the "big holes" during construction.[1] The practice of addressing big holes was initially tackled by builders to reduce call backs associated with comfort complaints from homebuyers. Once builders figured out that plugging the big holes reduced callbacks, the practice went mainstream. In 2009, the steps required to plug the big holes were codified in the mandatory air barrier table (IRC Table N1102.4.2; IECC Table R402.4.1.1). At the end of 2012, 55% of the states had adopted the 2009 IECC or more stringent. Fast forward to 2015, and 76% of states (which accounted for 86% of the single family starts in 2011) are expected to have adopted the 2009 IECC or more stringent.[2]

This timeline shows that building tight (3 to 5 ACH 50) has become the new standard, regardless of whether or not a builder confirms the tightness with a blower door test. Of course, the one potential problem with building tight is the negative impact it can have on indoor air quality if mechanical ventilation is not provided; and there is broad consensus that air quality begins to be compromised at or below 5 ACH 50 if mechanical ventilation is not provided. Without mechanical ventilation, tight homes can experience elevated humidity levels; increased condensation potential on windows; higher concentrations of dust mites and allergens; and higher concentrations of pollutants such as chloroform, formaldehyde, acetaldehyde, and other VOCs that have negative health impacts.

With today's typical, code-minimum construction resulting in homes that easily achieve 3 to 5 ACH 50, a blower door test is not needed to confirm that these homes are less than 5 ACH 50 and in need of mechanical ventilation. At this point, mechanical ventilation is needed to provide minimum acceptable air quality for code-minimum construction. This change will ensure that the comfortable, energy efficient homes that builders are now building are also provided with minimum indoor air quality.

At the same time, we do not want to discourage the use of operable windows, which offer natural ventilation in addition to daylight and egress. Even with mechanical ventilation, a home occupant needs to be able to control their own environment, particularly in the case of an emergency such as a power failure (e.g. being able to open windows for airflow in the aftermath of a storm or blackout). As such, this proposal deletes exception 1 and modifies exception 2 of R303.1 to ensure operable windows in habitable rooms are still installed even with mechanical ventilation, only keeping the exception for interior rooms with no exterior walls. Note that the IRC still permits bathrooms and water closets to use local exhaust instead of windows, as per the exception to R303.3.

References:

1. J.W. Lstiburek, "Just Right and Airtight" ASHRAE Journal, May 2011.
2. U.S. DOE Building Energy Codes Program, "Status of State Energy Code Adoption, Residential: Projected" accessed from http://www.energycodes.gov/adoption/states on Nov 29, 2012.

Cost Impact: Because new standard construction practices will typically result in building envelope tightness levels of 3 to 5 ACH 50, these dwellings should already be provided with mechanical ventilation (based on R303.4). So, no additional costs should be incurred for mechanical ventilation systems. Also, removing the loophole of trading off windows for mechanical ventilation in habitable rooms is not expected to affect the practice of the overwhelming majority of builders who tend towards more windows, versus less, based on consumer demand.

R303.1-RB-CULP-LSTIBUREK-MOORE

Committee Action Hearing Results

PART II – IRC – Mechanical
Committee Action: Disapproved

Committee Reason: Builders need a choice. The proposal will require mechanical ventilation whether or not it is needed. Section N1102.4.1.2 states how to provide outdoor air ventilation and this proposal deletes the reference to that section.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Mike Moore, Newport Ventures, representing Broan-NuTone, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R303.4 Mechanical ventilation. Dwelling units shall be provided with ~~local exhaust and whole-house~~ mechanical ventilation in accordance with Section M1507.

M1507.1 General. ~~Local exhaust and whole-house m~~Mechanical ventilation systems shall be designed and installed in accordance with this section.

Commenter's Reason: In Dallas, the committee disapproved this proposal because they said that "Builders need a choice. The proposal will require mechanical ventilation whether or not it is needed." However, the problem with the current language is that 75% of new residential starts are currently being built to the 2009 or 2012 IECC, and that *all* of these homes are subject to the mandatory air sealing requirements of Table R402.4.1.1. Multiple, independent studies have shown that a large percentage of these homes are being built tighter than 5 ACH 50, meaning that mechanical ventilation IS needed according to the 2012 IRC (R303.4).[3,4]

The problem is that despite being needed, mechanical ventilation is not required for these homes by the IRC because the requirement is based on an optional test. We already know that new residential starts across the nation are being built to very tight standards based on widespread adoption of the 2009 IECC, regardless of whether they're being tested. The way the code is currently written, it doesn't matter how tight the home is, because as long as the home isn't tested, no mechanical ventilation is required.

The IRC needs to respond to this current problem of building tight homes with inadequate ventilation. Without mechanical ventilation, tight homes can experience elevated humidity levels; increased condensation potential on windows; higher concentrations of dust mites and allergens; and higher concentrations of pollutants such as chloroform, formaldehyde, acetaldehyde, and other VOCs that have negative health impacts. Does anyone remember the sick building syndrome of the 1970s?[6]

The solution is to require mechanical ventilation for all new homes, understanding that new homes are tight homes. End the "don't ask; don't tell" policy for mechanical ventilation of tight homes, and provide home owners with the opportunity to have a safer and healthier environment.

At the same time, we do not want to discourage the use of operable windows, which offer natural ventilation in addition to daylight and egress. Even with mechanical ventilation, a home occupant needs to be able to control their own environment, particularly in the case of an emergency such as a power failure (e.g. being able to open windows for airflow in the aftermath of a storm or blackout). As such, this proposal deletes exception 1 and modifies exception 2 of R303.1 to ensure operable windows in habitable rooms are still installed even with mechanical ventilation, only keeping the exception for interior rooms with no exterior walls. Note that the IRC still permits bathrooms and water closets to use local exhaust instead of windows, as per the exception to R303.3.

RB97-13, Part II

Final Action: AS AM AMPC____ D

RB99-13
R303.1

Proposed Change as Submitted

Proponent: Jeff Inks, representing the Window & Door Manufacturers Association.

Revise as follows:

R303.1 Habitable rooms. All habitable rooms shall have an aggregate glazing area of not less than 8 percent of the floor area of such rooms. Natural *ventilation* shall be through windows, doors, louvers or other *approved* openings to the outdoor air. Such openings shall be provided with ready access or shall otherwise be readily controllable by the building occupants. The minimum openable area to the outdoors shall be 4 percent of the floor area being ventilated.

Exceptions:

~~1. The glazed areas need not be openable where the opening is not required by Section R310 and a whole-house mechanical *ventilation* system is installed in accordance with Section M1507.~~

~~2~~1. The glazed areas need not be installed in rooms ~~where Exception 1 above is satisfied and~~ without *exterior walls* where all of the following conditions are met:
   1.1 An opening is not required by Section R310.
   1.2 A~~a~~rtificial light is provided capable of producing an average illumination of 6 footcandles (65 lux) over the area of the room at a height of 30 inches (762 mm) above the floor level.
   1.3 A whole-house mechanical *ventilation* system is installed in accordance with Section M1507.

~~3~~2. Use of sunroom and patio covers, as defined in Section R202, shall be permitted for natural *ventilation* if in excess of 40 percent of the exterior sunroom walls are open, or are enclosed only by insect screening.

Reason: While whole-house mechanical ventilation systems can provide adequate ventilation when in operation, natural ventilation should still be provided as an option and more importantly, needs to be provided as a back-up in the event of power outages, especially when power outages can be prolonged for many hours or many days, or for problems that may occur with the ventilation system, or for in-home events such as cooking or burning food when supplemental natural ventilation may be needed or desired. Therefore, a blanket exception should not be provided.

The amendment to Exception 2 is proposed to maintain an exception for providing glazed areas in rooms (such as certain basement rooms) with no *exterior walls* as defined by the IRC provided they meet all of the same conditions required by the current provisions in order for the exception to R303.1 to apply.

Cost Impact: This code change may increase the cost of construction in some cases where fixed glazing may have been used in lieu of openable glazing and then depending on the glazing options being considered.

R303.1 #4-RB-INKS

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that the proponent's reason statement promotes retaining natural ventilation as an option or as a supplement to whole house ventilation. However, this proposal would make the whole house ventilation redundant except in a room without exterior walls. Only anecdotal evidence is provided to support such a change in philosophy. If the mechanical component of another proposed change that required mechanical ventilation had passed, the committee may have been able to support this proposal. The general logic is good, but it is too architecturally restrictive as proposed. Under the performance path in the energy code, given proposals passed at these hearings previously, you can go above 3 or 5 ACH50 using trade-offs under the performance path.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Jeff Inks, representing Window & Door Manufacturers Association, requests Approval as Submitted.

Commenter's Reason: We are requesting approval as submitted for the reasons stated in our proposal above, which we do not believe are anecdotal. In addition and in response to the committee's other reasons for disapproval: (1) This proposal does not retain or create an option for using natural ventilation in lieu of whole house mechanical ventilation where it may be or is required. The intent of the proposal is to ensure natural ventilation is provided as an option in most habitable rooms even when whole house mechanical ventilation is provided. (2) Ensuring natural ventilation is also provided as a supplement to whole house ventilation is precisely the intent of the proposal which better provides for ensuring occupant comfort, health and safety. (3) We do not believe limiting the exception makes whole house ventilation redundant for the reasons just stated. Both serve important purposes. (4) We respect the concern/opinion that limiting the exception to where glazed areas and natural ventilation do not have to be provided may be too architecturally restrictive however, we believe the exception should be more limited than it currently is, again for the reasons stated. (5) Even if 3 or 5 ACH (respectively) are exceeded, that does not alleviate the need for the providing adequate natural ventilation.

For these reasons in addition to the reasons provided in the proposal, we urge approval as submitted.

Public Comment 2:

Dr. Thomas D. Culp, Birch Point Consulting LLC, representing Glazing Industry Code Committee, requests Approval as Submitted.

Commenter's Reason: We were a co-proponent of RB97, but are instead asking for you to approve RB99 As Submitted as a simpler solution to the issue. The debate on RB97 Part 2 whether or not to require mechanical ventilation seemed to confuse the issue in RB97 Part 1 and this proposal RB99. Contrary to some of the discussion at the preliminary code hearings, this proposal does <u>not</u> require mechanical ventilation. It is simply modifying the exceptions so that <u>*if*</u> mechanical ventilation is installed (especially with tighter homes being required in the energy code), then operable windows should still be installed in accordance with the charging section. This is accomplished by deleting exception 1, and modifying exception 2 so that windows obviously don't need to be installed in interior rooms with no exterior walls.

We believe that much of the discussion of this proposal was confused with issues in other proposals. For example, the committee statement that this proposal is "too architecturally restrictive" simply does not make sense. This proposal does not cause a design change of the home layout – it simply requires that a portion of the windows that *already* must be installed to satisfy section R303.1 be operable windows, and not switched out for all fixed windows.

Mechanical ventilation is not foolproof, and the code should not discourage the use of operable windows, which offer natural ventilation in addition to daylight and egress. Even with mechanical ventilation, a home occupant needs to be able to control his or her own environment, particularly in the case of an emergency such as a power failure (e.g. being able to open windows for airflow in the aftermath of a storm or blackout).

We ask that you vote "NO" on the initial motion for disapproval, and then to vote "YES" on a motion to approve RB99 as-submitted.

Public Comment 3:

Julie Ruth, JRuth Code Consulting, representing American Architectural Manufacturers Association, requests Approval as Submitted.

Commenter's Reason: The 2012 IECC and 2012 IRC require that the air leakage of the building thermal envelope of homes be less than 3 Air Changes per Hour (ACH) when tested at 50 Pa. The 2012 IRC requires a whole house mechanical ventilation system in homes with less than 5 ACH at the same pressure differential.

The 2012 IRC, and earlier editions of the IRC, require windows for natural light and ventilation in the home. An exception is given when artificial light and whole house ventilation are provided.

The tighter air leakage requirements of the 2012 IRC and 2012 IECC would require whole house mechanical ventilation. This would then put into place the exception to the natural ventilation requirement of the IRC. Therefore, if a jurisdiction is enforcing the 2012 IECC without amendment the building must install a whole house mechanical ventilation system and no natural ventilation would be required.

Such a scenario could create significant health and life safety hazards in the home. Relying entirely upon a mechanical ventilation system to provide sufficient oxygen for the occupants to breath, sufficient combustion air for all fuel fired appliances to burn properly, sufficient air movement to prevent the growth of mold, sufficient air changes to remove harmful bacteria and viruses that may have been brought into the home, etc. could significantly impact human life even if the mechanical system operated as intended. If the mechanical system were to fail the results could be catastrophic.

It is important that sufficient means of natural ventilation be maintained in homes, particularly when considered with the increased requirements for air tightness of the building thermal envelope in the 2012 IECC and 2012 IRC.

RB99 keeps an exception to the requirement for natural ventilation when mechanical ventilation is required, but now limits it to specific spaces where it is not practical to provide natural ventilation. Specifically, the exception is limited to interior rooms that do not have exterior walls, are not required to have emergency escape and rescue openings, and which are provided with sufficient artificial lighting.

Limiting reliance upon a mechanical system in the home to provide adequate fresh air to these specific spaces maintains the life safety of the IRC. Since reliance upon natural ventilation in low rise residential construction is consistent with current practice RB99 would not contribute to the cost of a new home significantly.

RB99-13

Final Action: AS AM AMPC____ D

RB100-13
R303.4

Proposed Change as Submitted

Proponent: Mike Moore, P.E., Newport Ventures, representing Broan-NuTone (mmoore@newportpartnersllc.com), Jeremiah Williams representing U.S. Department of Energy (jeremiah.williams@ee.doe.gov)

THIS CODE CHANGE WILL BE HEARD BY THE IRC-PLUMBING/MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Revise as follows:

R303.4 Mechanical ventilation. Where the air infiltration rate of a dwelling unit is ~~less than~~ 5 air changes per hour <u>or less</u> when tested with a blower door at a pressure of 0.2 inch w.c (50 Pa) in accordance with Section N1102.4.1.2, the dwelling unit shall be provided with whole-house mechanical ventilation in accordance with Section M1507.3.

Reason (Moore): The current language is inconsistent with N1103.5, which requires mechanical ventilation for all dwellings, and also requires dwellings in climate zone 1 and 2 to have an air tightness "not exceeding" 5 ACH 50. By changing this language to 5 ACH or less, "the two sections are brought closer into alignment.

Reason (Williams) : Chapter R4 of the International Energy Conservation Code and Chapter 11 of the IRC require air leakage to be equal or less than 5 air changes per hour in climate zones 1 and 2, with lower rates required in other climate zones. This minor code change creates consistency where all buildings constructed to the air tightness levels of the IECC and IRC must have whole house mechanical ventilation systems.

Cost Impact (Moore): There is no additional cost, as mechanical ventilation is already required for these dwellings based on section N1103.5.

Cost Impact (Williams): The code change proposal will increase the cost of construction only if tested air leakage in climate zones 1 and 2 is exactly 5 air changes per hour.

R303.4-RB-MOORE

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: This proposal increases the cost of construction and takes away the ability to avoid having a whole- house ventilation system.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Mike Moore, P.E., Newport Ventures, representing Broan-NuTone, requests Approval as Submitted.

Commenter's Reason: In Dallas, the committee disapproved this proposal because they said it, "increases the cost of construction and takes away the ability to avoid a whole-house ventilation system." This statement shows a misunderstanding on the committee's part regarding the intent of this section and the limitations of blower door testing.

First, the intent of this section is to require that buildings that are built to the strict air tightness requirements of the IECC are provided with whole-house mechanical ventilation. The current language does not reflect the original intent because it introduces a loop hole for buildings that test to exactly 5.0 ACH 50. The difference in natural air changes between a building that has an air tightness of 5.0 ACH 50 and 4.9 ACH 50 is ridiculously small when taken over the course of the year, and there is no basis to say that a home at 5 ACH 50 should not need ventilation, whereas the 4.9 ACH 50 home does. In other words, we have a loop hole in the code with no technical basis whatsoever.

Another problem with this loop hole (besides the fact that there is no technical basis to justify it) is that specifications of mechanical ventilation systems happen far in advance of when the air tightness test is performed. It's a ridiculous proposition for a builder to plan to achieve exactly 5.0 ACH 50 on homes. The only way for a builder to plan for and consistently achieve a 5 ACH 50 on each home he builds is either to falsify the results or to build tighter than 5 ACH 50 and then punch holes in the envelope until the building leaks at just the right rate. By keeping the language the way that this is, you're incentivizing builders to follow one of these two paths.

Please approve this proposal as submitted to close the loop hole, provide consistency between the IRC and IECC, and stop incentivizing bad building practices.

Public Comment 2:

Jeremiah Williams, U.S. Department of Energy, requests Approval as Submitted.

Commenter's Reason: Chapter R4 of the International Energy Conservation Code and Chapter 11 of the IRC require air leakage to be 5 air changes per hour or less in climate zones 1 and 2, with lower rates required in other climate zones. This minor code change creates consistency by imposing the same whole-house mechanical ventilation requirements on all buildings constructed to the air tightness levels of the IECC and IRC.

DOE posted its draft proposals and public comments for the IECC on its Building Energy Codes website prior to submitting to the ICC. Interested parties were provided a 30 day public review in June 2013, for which notice was published in the *Federal Register* (Docket No. EERE-2012-BT-BC-0030) and announced via the DOE Building Energy Codes news email list. In response to stakeholder input, DOE revised its proposals and public comments, as appropriate, and submitted to the ICC.

For more information on DOE proposals and public comments, including how DOE participates in the ICC code development process, please visit: http://www.energycodes.gov/development.

RB100-13

Final Action: AS AM AMPC____ D

RB101-13
R303.5.1

Proposed Change as Submitted

Proponent: David Hall, CFM, Georgetown Texas representing the ICC PMG Code Action Committee (dave.hall@georgetown.org)

THIS CODE CHANGE WILL BE HEARD BY THE IRC-PLUMBING/MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Revise text as follows:

R303.5.1 Intake openings. Mechanical and gravity outdoor air intake openings shall be located a minimum of 10 feet (3048 mm) from any hazardous or noxious contaminant, such as vents, chimneys, plumbing vents, streets, alleys, parking lots and loading docks~~, except as otherwise specified in this code~~. ~~Where a source of contaminant is located within 10 feet (3048 mm) of an intake opening, such opening shall be located a minimum of 3 feet (914 mm) below the contaminant source~~.

For the purpose of this section, the exhaust from *dwelling* unit toilet rooms, bathrooms and kitchens shall not be considered as hazardous or noxious.

Exceptions:

1. The 10 foot (3048 mm) separation is not required where the intake opening is located 3 feet (914 mm) or greater below the contaminant source.
2. Separation distances for appliance vents shall be as allowed in Chapters 18 and 24.

Reason: This proposal is text cleanup**.** The phrase "except as otherwise specified in this code" is not user-friendly since it offers no guidance as to where something else is specified. The new exception # 2 provides the exact text for what is otherwise specified. New exception # 1 is just the original last sentence of this section reworded into an exception format, because it is actually an exception to the 10 foot rule.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: The code change proposal will not increase the cost of construction.

R303.5.1-RB-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Approval was based upon the proponent's published reason.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Paul Rimel, City of Staunton, representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA) and Virginia Building and Code Officials Association (VBCOA), requests Approval as Modified by this Public Comment.

Modify proposal as follows:

R303.5.1 Intake openings. Mechanical and gravity outdoor air intake openings shall be located a minimum of 10 feet (3048 mm) from any hazardous or noxious contaminant, such as vents, chimneys, plumbing vents, streets, alleys, parking lots and loading docks.

For the purpose of this section, the exhaust from *dwelling* unit toilet rooms, bathrooms and kitchens shall not be considered as hazardous or noxious.

Exceptions:

1. The 10 foot (3048 mm) separation is not required where the intake opening is located 3 feet (914 mm) or greater below the contaminant source.
2. ~~Separation distances for appliance vents shall be as allowed in Chapters 18 and 24.~~ Vents and chimneys swerving fuel-burning appliances shall be terminated in accordance with the applicable provisions of Chapter 18 and 24.
3. Clothes dryer exhaust ducts shall be terminated in accordance with M1502.3.

Commenter's Reason: RB101-13 does not reference the clothes dryer termination requirements found in M1502.3 and neither does the next section R303.5.2 (Exhaust openings). The 2nd sentence of the reason statement says "The new exception #2 provides the exact text for what is otherwise specified", however, no exception has been included that references the dryer exhaust separation distances found in Chapter 15. Deleting the current language "except as otherwise specified in the code" will only serve to further reduce the likelihood that users of the code will know to look elsewhere for the dryer termination requirements unless #3 is added to the list of exceptions.

The current wording of this proposal will cause many users of the code to think a dryer exhaust is required to meet the more restrictive provisions of R303.5.1 when it's actually M1502.3 that regulates the minimum distance a dryer exhaust duct is permitted to terminate from building openings. Per M1502.3, a dryer exhaust is only required to terminate 3 feet in any direction from building openings unless stated otherwise in the manufacturer's installation instruction. However, the use of R303.5.1 would require a 10 foot horizontal or 3 foot vertical separation for a type of non-hazardous/noxious exhaust that's already defined in the IMC as environmental air.

In the majority of cases, it would be very difficult to terminate a clothes dryer exhaust at least 10 feet horizontally or 3 feet vertically from all building openings in conventional residential construction and the common practice of terminating through a ground floor band board would be virtually eliminated in houses with crawlspaces due to the proximity of nearby crawlspace vents.

Exception #2 has been modified for clarity.

RB101-13

Final Action: AS AM AMPC____ D

RB102-13
R303.7, R303.7 (New), R303.7.1, R303.8 (New)

Proposed Change as Submitted

Proponent: Rick Davidson, City of Maple Grove, Association of Minnesota Building Officials (rdavidson@maplegrovemn.gov)

Revise as follows:

~~**R303.7 Stairway illumination.** All interior and exterior stairways shall be provided with a means to illuminate the stairs, including the landings and treads. Interior stairways shall be provided with an artificial light source located in the immediate vicinity of each landing of the stairway. For interior stairs the artificial light sources shall be capable of illuminating treads and landings to levels not less than 1 footcandle (11 lux) measured at the center of treads and landings. Exterior stairways shall be provided with an artificial light source located in the immediate vicinity of the top landing of the stairway. Exterior stairways providing access to a *basement* from the outside *grade* level shall be provided with an artificial light source located in the immediate vicinity of the bottom landing of the stairway.~~

> ~~**Exception:** An artificial light source is not required at the top and bottom landing, provided an artificial light source is located directly over each stairway section.~~

~~**R303.7.1 Light activation.** Where lighting outlets are installed in interior stairways, there shall be a wall switch at each floor level to control the lighting outlet where the stairway has six or more risers. The illumination of exterior stairways shall be controlled from inside the *dwelling* unit.~~

> ~~**Exception:** Lights that are continuously illuminated or automatically controlled.~~

R303.7 Interior stairway illumination. Interior stairways shall be provided with an artificial light source to illuminate the landings and treads. The light source shall be capable of illuminating treads and landings to levels of not less than 1 foot-candle (11 lux) as measured at the center of treads and landings. There shall be a wall switch at each floor level to control the light source where the stairway has six or more risers.

> **Exception:** A switch is not required where remote, central, or automatic control of lighting is provided.

R303.8 Exterior door illumination. At least one wall-switch-controlled lighting outlet shall be installed to provide illumination on the exterior side of each exterior door having grade level access, including exterior stairways providing access to a basement.

> **Exception:** A switch is not required where remote, central, or automatic control of lighting is provided.

(Renumber subsequent sections)

Reason: This section is proposed for revision for one reason – it is confusing. The first sentence says that all interior and exterior stairways, including treads and landings, shall be illuminated. The next two sentences state that interior stairs must have lights near the landings and provide a minimum of 1 foot-candle of light. Then the next sentence states that exterior stairs must be provided with a light source in the immediate vicinity of the top landing but seems to exclude treads and landings. So, going back to the first sentence, the code says exterior stairs need landings and tread illuminated. Now just the top landing is illuminated for exterior stairs. Which one is it? The reference to 1 foot-candle of light is only applicable to interior stairs. It seems there is no standard for exterior stairs. But some code officials apply the 1 foot-candle standard to exterior stairs and others do not. Some code officials require exterior stairs to be illuminated along their entire length. Others only require light at the top landing. Then there is the exception that appears to apply only to interior stairs but can be misconstrued to support the contention that exterior stairs must be lit for their entire length.

Furthermore, the code requires the light source be in specific locations and meet certain intensities. If the intensity is met, what difference does it make where the light source is? The text referencing the location of the light source for interior stairs is proposed for deletion since the interest is in the amount of light on the walking surface, not on the light location.

The electrical code will require a switched light at exterior doors but that may not illuminate exterior stairs. This proposal would not waive any requirement found in the electrical code but there seems to be a conflict between what could be argued is the intent of R303.7, which is to illuminate exterior stairs, and the electrical code which only requires illumination of the exterior side of exterior doors having access to grade.

> ***E3903.3 Additional locations.*** *At least one wall-switch-controlled lighting outlet shall be installed in hallways, stairways, attached garages, and detached garages with electric power.* ***At least one wall-switch-controlled lighting outlet shall be installed to provide illumination on the exterior side of each outdoor egress door having grade level access****, including outdoor egress doors for attached garages and detached garages with electric power. A vehicle door in a garage shall not be considered as an outdoor egress door. Where one or more lighting outlets are installed for interior stairways, there shall be a wall switch at each floor level and landing level that includes an entryway to control the lighting outlets where the stairway between floor levels has six or more risers.*
>
> > ***Exception:*** *In hallways, stairways, and at outdoor egress doors, remote, central, or automatic control of lighting shall be permitted.*

The proposed revisions create separate sections for interior stairways and exterior doorways. It eliminates a term that is difficult to enforce - "immediate vicinity". It uses the same text found in the electrical code to identify the light location at exterior doors and the exception addressing controls. Some text is editorially revised to eliminate repetitive language but the basic intent is left unchanged. The light levels and exceptions are retained as they are in the current rule. It is believed that this change helps to eliminate some confusion and improve uniformity of application and creates consistency between the building and electrical portions of the IRC.

Cost Impact: None

R303.7-RB-DAVIDSON

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that it should include language that requires that the light must shine on the stair.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rick Davidson, City of Maple Grove, representing Association of Minnesota Building Officials, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R303.7 Interior stairway illumination. Interior stairways shall be provided with an artificial light source to illuminate the landings and treads. The light source shall be capable of illuminating treads and landings to levels of not less than 1 foot-candle (11 lux) as measured at the center of treads and landings. There shall be a wall switch at each floor level to control the light source where the stairway has six or more risers.

> **Exception:** A switch is not required where remote, central, or automatic control of lighting is provided.

R303.8 Exterior ~~door~~ stairway illumination. ~~At least one wall-switch-controlled lighting outlet shall be installed to provide illumination on the exterior side of each exterior door having grade level access, including exterior stairways providing access to a basement~~. Exterior stairways shall be provided with an artificial light source located at the top landing of the stairway. Exterior stairways providing access to a *basement* from the outside *grade* level shall be provided with an artificial light source located at the bottom landing of the stairway.

> ~~**Exception:** A switch is not required where remote, central, or automatic control of lighting is provided.~~

(Portions of proposal not shown to remain unchanged)

Commenter's Reason: This proposal was presented as an ***editorial*** revision to the stair illumination requirements which is necessary to reduce the confusion that is occurring with application of the rule and to prevent a jurisdiction from finding themselves deep in the prosecution of a violation only to determine that no code requirement exists.

In the current code there is one paragraph that regulates both interior and exterior stairways. The proposal seeks to split the paragraph in two with one paragraph regulating interior and one paragraph regulating exterior stairs. There is no intent to change the meaning of the code or expand the requirements. It is believed that the current language confuses the application of stair illumination because of the structure of the paragraph which can lead the reader to believe that there are more to the rules for exterior stair illumination than exists.

Reading the existing text, the first sentence of the paragraph states that interior and exterior stairs must be illuminated. This is the sentence that causes the confusion because it states that exterior stairs must be illuminated. But this directive is clarified in the fourth sentence addressed below.

The second and third sentences provide direction on how ***interior*** stairs must be illuminated. It provides both a prescriptive standard for the location of the light source and a performance standard in the form of a minimum level of illumination. Because meeting the prescriptive standard does not mean meeting the performance standard and vice versa, only a performance standard of 1 foot-candle on each tread and at landings is proposed as the most reasonable and least hazardous.

The fourth (and troublesome) sentence provides direction on how ***exterior*** stairs must be illuminated. Current code language ***only provides that a light source be placed at the top landing of the stairway***. It provides ***no direction on illumination of the stair itself***.

This is supported by the IRC Commentary which follows and which states that "Exterior stairs require illumination only at the top landing".

As was stated at the Dallas hearings, this proposal is not intended to provide illumination on exterior stairs because that is not currently required. That would be another code change. This modification amends the original submittal to include the language in the current code regarding exterior stairs. It does delete references to "immediate vicinity" because the term is undefined and the electrical code provides direction on the location and operation of this light source.

You can argue all you wish that this proposal does not provide for illumination of exterior stairs and you would be right. But you can't get to illuminated exterior stairs with the current rules either.

If you want a light source on the treads of exterior stairs, the current language does not provide that and this proposal does not provide that. Another code change would need to be submitted that directs how exterior stairs should be illuminated and how the illumination would be controlled.

If you should disagree with this line of reasoning, the question that begs asking is "what is the standard of lighting that applies to exterior stairs?" If you believe that exterior stairs must be illuminated and you write a correction notice to that effect, what standard does a compliant lighting system need achieve? If you prosecute this as a violation and you are asked by a judge what standard is necessary to achieve compliance, what code section do you cite? It isn't enough that we just write correction orders for how we thing a building should be built, we need to be able to cite code sections that will withstand challenges on prosecution.

Let's get the language improved so that it is uniformly and rightly applied. If you wish to change expand the rule in the next cycle, please do.

Don't throw the baby out with the bathwater because exterior stair illumination is not provided here. The change is necessary to eliminate the confusion that was readily apparent at the Dallas hearings.

R303.6 Stairway illumination. All interior and exterior stairways shall be provided with a means to illuminate the stairs, including the landings and treads. Interior stairways shall be provided with an artificial light source located in the immediate vicinity of each landing of the stairway. For interior stairs the artificial light sources shall be capable of illuminating treads and landings to levels not less than 1 foot-candle (11 lux) measured at the center of treads and landings. Exterior stairways shall be provided with an artificial light source located in the immediate vicinity of the top landing of the stairway. Exterior stairways providing access to a basement from the outside grade level shall be provided with an artificial light source located in the immediate vicinity of the bottom landing of the stairway.

> **Exception:** An artificial light source is not required at the top and bottom landing, provided an artificial light source is located directly over each stairway section.

❖ Interior and exterior stairs may be illuminated in two ways. The first option is to install artificial lighting in the vicinity of each landing. This would include top, intermediate and bottom landings. For interior stairs, the artificial light must be capable of illuminating treads and landings to not less than 1 foot candle (11 lux). The measurement of 1 foot candle is to be taken at the center of landings and treads. Exterior stairs require illumination only at the top landing. See Commentary Figure R303.6.

Exterior stairs to a basement must have artificial illumination near the bottom landing.

The exception allows the light source to be installed over each individual stair section, thus eliminating the lighting over the landings.

RB102-13

Final Action: AS AM AMPC____ D

RB104-13
R202, R303.8

Proposed Change as Submitted

Proponent: Jonathan Siu, representing City of Seattle Department of Planning & Development (jon.siu@seattle.gov)

Revise text as follows:

SECTION R202
DEFINITIONS

COURT. A minimum 3-foot wide space on the *lot* on which a building is situated, open and unobstructed to the sky, located at or above *grade* level on a *lot* and bounded on three or more sides by walls or a building. The distance shall be measured at a right angle from the face of the walls.

YARD. ~~An~~ A minimum 3-foot wide open space, other than a court, unobstructed from the ground to the sky, except where specifically provided by this code, on the *lot* on which a building is situated. The distance shall be measured at a right angle from the face of the wall.

Revise as follows:

R303.8 Required glazed openings. Required glazed openings shall open directly onto a street or public alley, or a *yard* or court ~~located on the same *lot* as the building~~.

Exceptions:

1. Required glazed openings may face into a roofed porch where the porch abuts a street, *yard* or court and the longer side of the porch is at least 65 percent unobstructed and the ceiling height is not less than 7 feet (2134 mm).
2. Eave projections shall not be considered as obstructing the clear open space of a *yard* or court.
3. Required glazed openings may face into the area under a deck, balcony, bay or floor cantilever provided a clear vertical space at least 36 inches (914 mm) in height is provided.

Reason:

1. The intent of the proposed change to the definition of "court" is to clarify that the court must be on the same property as the building under consideration. This aligns its definition with that for "yard", since "court" only appears in conjunction with "yard" in this code. This proposal also reinforces a general (but unstated) principle in all the I-codes that a building cannot rely on features on an adjacent property to demonstrate compliance with the code. That is, each building must demonstrate compliance within its own property lines unless specifically provided for in the code, such as in Footnote a to Table R302.1(2), or for spaces such as rights-of way.
2. The reason for adding the 3-foot dimension to the definitions for "yard" and "court" is that their minimum dimension is not defined. The 3-foot dimension was chosen because it is consistent with the requirements for minimum separation distance for walls (Table R302.1(2)) and for minimum width of a window well for emergency escape windows (Section R310.2). The requirement to measure the 3 feet perpendicular to the wall is copied from the definition for "Fire Separation Distance" in Chapter 2.

   Such a minimum dimension is needed to define what size yard or court is eligible for consideration of:

   A. What can be called a townhouse. The definition for "townhouse" states the dwelling unit must have a yard or public way on at least two sides. However, because the code does not define a minimum dimension for the yard, a designer can argue that a 1-foot or even a 1-inch distance constitutes a yard, and therefore, dwelling units close to the property line may be considered townhouses. (See Figure 1 below.) That interpretation does not agree with the commonly understood concept of what constitutes a townhouse, so this proposal provides clear guidance to the designer and the building official.

B. What can be used for light and ventilation. Section 303.8 requires that glazed openings used for light and ventilation open into a yard or court. Similar to the argument for “townhouse,” a minimum dimension is necessary because the current code provisions could be construed to allow these openings to comply by receiving light and ventilation from a very small space. It stands to reason that some minimum space is required in order to allow sufficient light and ventilation to enter through the opening.

C. What can be used for a pathway to get to a right-of-way from an emergency escape and rescue opening. Section 310.1 requires emergency escape and rescue openings to open “directly into a public way, or to a yard or court that opens to a public way.” However, an inadequate width of yard or court would render the emergency escape opening useless. Section R310.2 requires a minimum 3-foot wide window well for below-grade emergency escape and rescue openings, and if at least 3 feet is required for a window well, it stands to reason a yard or court should be at least 3 feet wide as well, in order to provide an adequate pathway to the right-of-way.

It is to be noted that defining a yard as having a width of at least 3 feet will not adversely affect sections different from those mentioned above where “yard” is used (Table R302.1(2), Section R303.8.1, and in Appendix M, Sections AM103.1.1 and AM103.1.3). “Court” is not used in any sections other than those mentioned above.

3. The text being proposed for deletion in Section R303.8 is redundant with the proposed definition of “court” and the existing definition of “yard.”

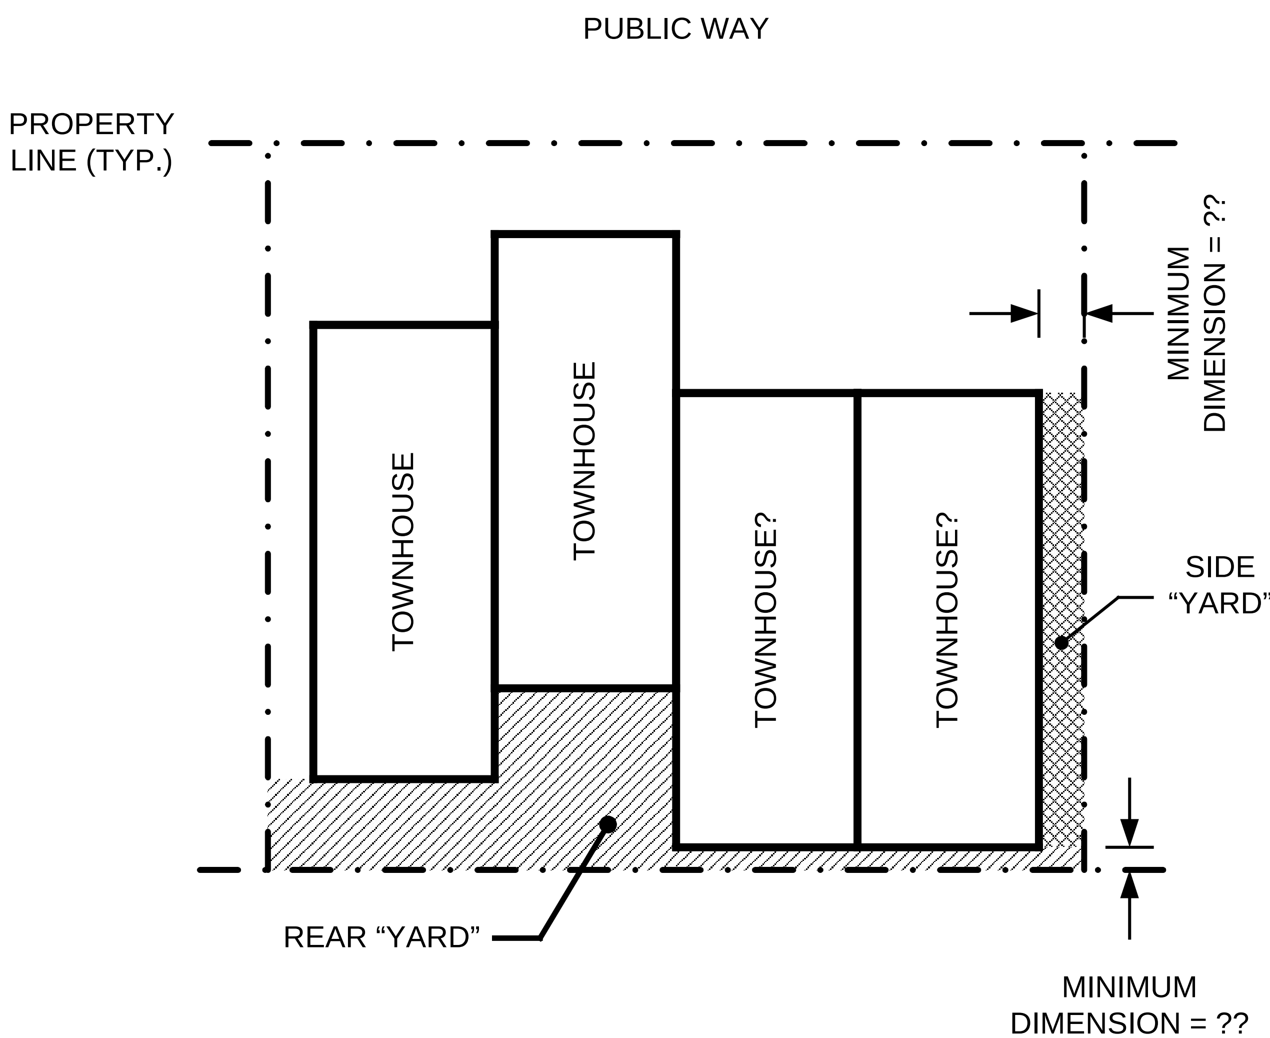

FIGURE 1 – PLAN VIEW

Cost Impact: Minimal, if any, increase to the cost of construction.

R303.8-RB-SIU

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this proposal because it introduced technical requirements into a definition. Technical requirements are appropriate in the body of the code, but not in definitions.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Maureen Traxler, representing City of Seattle Dept of Planning & Development, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

COURT. A ~~minimum 3-foot wide~~ space on the *lot* on which a building is situated, open and unobstructed to the sky, located at or above *grade* level on a *lot* and bounded on three or more sides by walls or a building. ~~The distance shall be measured at a right angle from the face of the walls.~~

YARD. ~~A minimum 3-foot wide~~ An open space, other than a court, unobstructed from the ground to the sky, except where specifically provided by this code, on the *lot* on which a building is situated. ~~The distance shall be measured at a right angle from the face of the wall.~~

R303.8 Required glazed openings. Required glazed openings shall open directly onto a street or public alley, or a *yard* or court. For compliance with Sections R303.8 and R303.8.1, the yard or court shall be at least 3 feet wide, measured at a right angle from the face of the walls.

Exceptions:

1. Required glazed openings may face into a roofed porch where the porch abuts a street, yard or court and the longer side of the porch is at least 65 percent unobstructed and the ceiling height is not less than 7 feet (2134 mm).
2. Eave projections shall not be considered as obstructing the clear open space of a yard or court.
3. Required glazed openings may face into the area under a deck, balcony, bay or floor cantilever provided a clear vertical space at least 36 inches (914 mm) in height is provided.

R303.8.1 Sunroom additions. Required glazed openings shall be permitted to open into sunroom *additions* or patio covers that abut a street, *yard* or court if in excess of 40 percent of the exterior sunroom walls are open, or are enclosed only by insect screening, and the ceiling height of the sunroom is not less than 7 feet (2134 mm).

R310.1 Emergency escape and rescue required. *Basements,* habitable attics and every sleeping room shall have at least one operable emergency escape and rescue opening. Where *basements* contain one or more sleeping rooms, emergency egress and rescue openings shall be required in each sleeping room. Where emergency escape and rescue openings are provided they shall have a sill height of not more than 44 inches (1118 mm) measured from the finished floor to the bottom of the clear opening. Where a door opening having a threshold below the adjacent ground elevation serves as an emergency escape and rescue opening and is provided with a bulkhead enclosure, the bulkhead enclosure shall comply with Section R310.3. The net clear opening dimensions required by this section shall be obtained by the normal operation of the emergency escape and rescue opening from the inside. Emergency escape and rescue openings with a finished sill height below the adjacent ground elevation shall be provided with a window well in accordance with Section R310.2. Emergency escape and rescue openings shall open directly into a public way, or to a minimum 3 foot wide *yard* or court that opens to a public way.

Exception: *Basements* used only to house mechanical *equipment* and not exceeding total floor area of 200 square feet (18.58 m2).

R310.5 Emergency escape windows under decks and porches. Emergency escape windows are allowed to be installed under decks and porches provided the location of the deck allows the emergency escape window to be fully opened and provides a path not less than 36 inches (914 mm) in height to a *yard* or court that is at least 3 feet wide.

Commenter's Reason: This comment specifies that yards or courts must be at least 3 feet wide. The code doesn't provide minimum dimensions for purposes of determining the size of the yard required for emergency escape windows or for protection of glazing. The 3-foot dimension is consistent with the minimum separation distance for walls required in Table R302.1(2) and the minimum width of a window well for emergency escape windows in Section R310.2. These are the only pertinent places in the IRC where these terms are used.

The original proposal regarding the definition of "court" is modified in this comment to retain the provision stating that courts must be located on the lot on which the building is located but deleting the minimum dimension. As stated in the reason for the original proposal, buildings should not rely on features on adjacent properties to demonstrate compliance with the code. Each property must comply on its own unless the code specifically allows otherwise.

Public Comment 2:

Maureen Traxler, representing City of Seattle Dept of Planning & Development, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R101.2 Scope. The provisions of the *International Residential Code for One- and Two-family Dwellings* shall apply to the construction, *alteration*, movement, enlargement, replacement, repair, equipment, use and occupancy, location, removal and demolition of detached one- and two-family dwellings and townhouses not more than three stories above *grade plane* in height with a separate means of egress and <u>a *yard* or public way not less than 3 feet wide on at least two sides</u>; and their *accessory structures*.

Exceptions:

1. Live/work units complying with the requirements of Section 419 of the *International Building Code* shall be permitted to be built as one- and two-family *dwellings* or townhouses. Fire suppression required by Section 419.5 of the *International Building Code* when constructed under the *International Residential Code for One- and Two-family Dwellings* shall conform to Section P2904.
2. Owner-occupied lodging houses with five or fewer guestrooms shall be permitted to be constructed in accordance with the *International Residential Code for One- and Two-family Dwellings* when equipped with a fire sprinkler system in accordance with Section P2904.

TOWNHOUSE. A single-family *dwelling unit* constructed in a group of three or more attached units in which each unit extends from foundation to roof ~~and with a *yard* or public way on at least two sides~~.

(Portions of proposal not shown to remain unchanged)

Commenter's Reason: This comment answers the question of how large a yard must be in order for a townhouse-type building to be allowed under the IRC. A sketch was included with the original proposal that illustrates the problem. With the cost of property escalating, there is increasing pressure on owners to use as much of each lot as possible. Specifying the minimum yard size will assist both owners and building officials by making this threshold requirement explicit.

RB104-13

Final Action: AS AM AMPC____ D

RB108-13
R305.1, R305.1.1

Proposed Change as Submitted

Proponent: Rick Davidson, City of Maple Grove, Association of Minnesota Building Officials (rdavidson@maplegrovemn.gov)

Revise as follows:

SECTION R305
CEILING HEIGHT

R305.1 Minimum height. *Habitable space*, hallways, ~~bathrooms, toilet rooms, laundry rooms~~ and portions of *basements* containing these spaces shall have a ceiling height of not less than 7 feet (2134 mm). Bathrooms, toilet rooms and laundry rooms shall have a ceiling height of not less than 6 feet 8 inches (2032 mm).

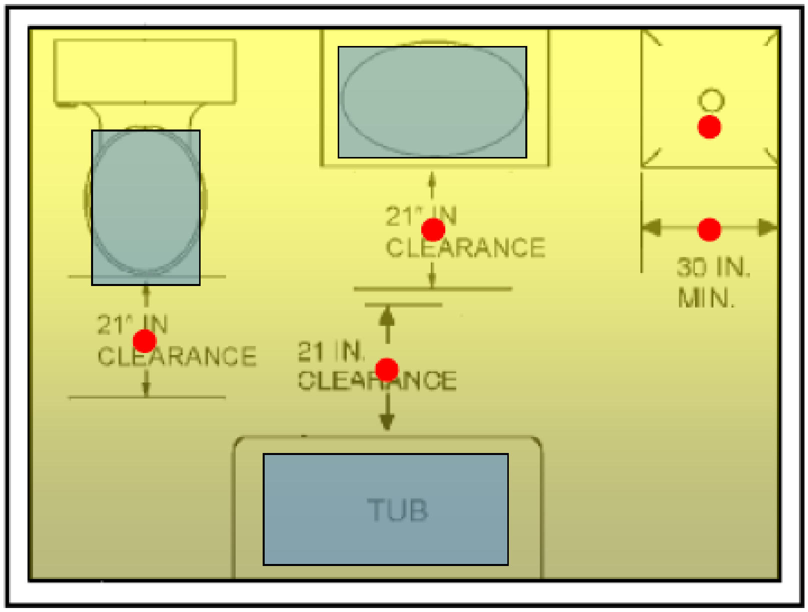
Exceptions:

1. For rooms with sloped ceilings, at least 50 percent of the required floor area of the room must have a ceiling height of at least 7 feet (2134 mm) and no portion of the required floor area may have a ceiling height of less than 5 feet (1524 mm).
2. ~~Bathrooms shall have a minimum ceiling height of 6 feet 8 inches (2032 mm) at the center of the front clearance area for fixtures as shown in Figure R307.1.~~ The ceiling height above bathroom and toilet room fixtures shall be such that the fixture is capable of being used for its intended purpose. A shower or tub equipped with a showerhead shall have a minimum ceiling height of 6 feet 8 inches (2032 mm) above a minimum area 30 inches (762 mm) by 30 inches (762 mm) at the showerhead.

R305.1.1 Basements. Portions of *basements* that do not contain *habitable space*~~,~~ or hallways~~, bathrooms, toilet rooms and laundry rooms~~ shall have a ceiling height of not less than 6 feet 8 inches (2032 mm).

Exception: Beams, girders, ducts or other obstructions may project to within 6 feet 4 inches (1931 mm) of the finished floor.

Reason: This proposal sets the required ceiling height for bathrooms, toilet rooms, and laundry rooms at 6 feet 8 inches. The current language requires ceiling heights in these spaces to be 7 feet. Then the exception allows the ceiling height to be 6 feet 8 inches in front of the fixtures (the most used area of the space) so the exception is really the rule. It only makes sense that the entire room be permitted to be 6 feet 8 inches, not just the most used areas of the room.



- 7" Ceiling height required.

- 6' 8" Ceiling height permitted.

- Fixture capable of being used.

Cost Impact: None

R305.1-RB-DAVIDSON

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee approved this code change proposal because they felt that, if the ceiling height can be 6'-8" in front of a plumbing fixture, why not the entire bathroom. This will provide more flexibility in basements. Laundries are similar to bathrooms in that their use is temporary and a lower ceiling in these types of spaces would not create an inconvenience or sacrifice health or safety concerns.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION R305
CEILING HEIGHT

R305.1 Minimum height. *Habitable* ~~*space*,~~ *spaces* and hallways~~, and portions of *basements* containing these spaces~~ shall have a ceiling height of not less than 7 feet (2134 mm). B~~athrooms, toilet rooms and laundry~~ Rooms that are not *habitable spaces* shall have a ceiling height of not less than 6 feet 8 inches (2032 mm).

Exceptions:

1. ~~For~~ Habitable rooms with sloped ceilings~~,~~ shall have at least 50 percent of the required floor area ~~of the room must have~~ with a ceiling height of at least 7 feet (2134 mm) and no portion of the required floor area may have a ceiling height of less than 5 feet (1524 mm).
2. ~~The ceiling height above bathroom and toilet room fixtures shall be such that the fixture is capable of being used for its intended purpose.~~ Rooms that are not habitable spaces with sloped ceilings shall have a ceiling height of not less than 6 feet 8 inches over 50 percent of the provided floor area. Bathrooms and toilet rooms shall have not less than 6 feet 8 inches at the front of fixtures. A shower or tub equipped with a showerhead shall have a minimum ceiling height of 6 feet 8 inches (2032 mm) above a minimum area 30 inches (762 mm) by 30 inches (762 mm) at the showerhead.

~~**R305.1.1 Basements.** Portions of *basements* that do not contain *habitable space* or hallways shall have a ceiling height of not less than 6 feet 8 inches (2032 mm).~~

~~**Exception:**~~

3. Beams, girders, ducts or other obstructions may project to within 6 feet 4 inches (1931 mm) of the finished floor.

Reason: The ICC Building Code Action Committee (BCAC) is submitting this public comment to address the code development committees concerns. The BCAC thinks that RB108 (*approved as submitted)* has technical flaws and reads poorly. The BCAC recommends several changes:

507.1. As we interpret the proponent's change, he wants to allow 7' ceilings in all habitable spaces and hallways and 6'-8" ceilings in all other non-habitable spaces.

In our public comment we rewrote this section to more clearly differentiate the requirements between habitable rooms/hallways with other non-habitable rooms: bathrooms, toilet rooms, laundry rooms plus closets, utility rooms, etc.

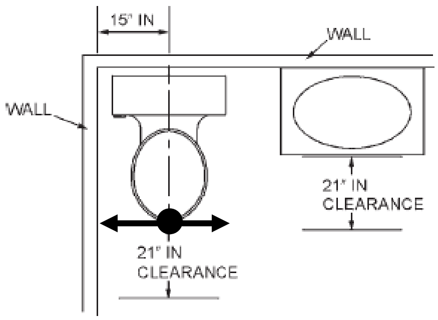
The BCAC tried to close a hole in the proponents proposal: what height are *other* non-habitable spaces, such as closets, utility rooms, corridors, storage rooms, etc, which were not mentioned – you don't know if they are supposed to be 6'-8" or 7'-0".

Exception 1: We tried to more clearly say that this exception only applies to habitable rooms and hallways with sloped ceilings. The existing language never applied to non-habitable rooms anyway, because they never had a "required floor area".

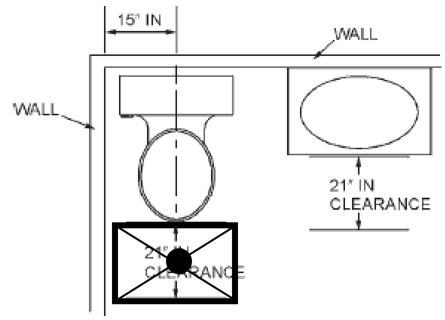
Exception 2 has flaws:

1. The proponent purposely eliminated the 6'-8" headroom requirement in front of bathroom and toilet room fixtures by striking the first sentence. He is relying on vague language that says that the headroom above the fixtures shall be such that it can accommodate the intended purpose of the fixture. THIS IS FUNDAMENTALLY WRONG! We are not designing for the "intended purpose" of the fixture, but rather the height of the user. The code has always designed for 6'-8" tall people (i.e. doorways, stairways, etc).
2. As currently approved, bathrooms and toilet rooms would have to have a minimum head room of 6'-8" and preclude many applications for powder rooms under stairs. Therefore we drafted a new first sentence to mirror exception 1, but for "other non-habitable rooms with sloped ceilings". Similar to exception 1, we added a provision that at least 50% of the *provided* floor area had to have at least 6'-8" headroom. We put back in the 6'-8" headroom requirement in front of fixtures for bathrooms and toilet rooms.
3. From the 2012 IRC: What does "center of the clearance area" really mean? I thought that this was perfectly clear, but after talking with others, I have found out that my interpretation was not universal. The existing language is confusing, and RB108, as submitted, does not rectify the issue.

Interpretation 1



Interpretation 2



Some folks would argue that the word "center" applies to the center of the *front* of the clearance area as in interpretation 1. I have always thought "center" applied to the center of the *clearance area*, as shown in interpretation 2 (i.e. half way back of the 21" clearance as measured from the edge of the fixture). Exception 2 was reworded to say that interpretation 1 is the intention.

R305.1.1

By changing the language in Section R305.1, Section R305.1.1 was no longer required.

We moved the exception up to number 3.

Public Comment 2:

Matt Black, Hampton city, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION R305
CEILING HEIGHT

R305.1 Minimum height. *Habitable spaces*~~,~~ and hallways ~~and portions of basements containing these spaces~~ shall have a ceiling height of not less than 7 feet (2134 mm). Bathrooms, toilet rooms, ~~and~~ laundry rooms, closets, storage rooms and utility spaces shall have a ceiling height of not less than 6 feet 8 inches (2032 mm).

Exceptions:

1. For rooms with sloped ceilings, at least 50 percent of the required floor area of the room must have a ceiling height of at least 7 feet (2134 mm) and no portion of the required floor area may have a ceiling height of less than 5 feet (1524 mm).
2. Bathrooms, toilet rooms, laundry rooms, closets, storage rooms and utility spaces with sloped ceilings shall have a ceiling height of not less than 6 feet-8 inches over 50 percent of the provided floor area or 35 square feet, whichever is the lesser. ~~The ceiling height above bathroom and toilet room fixtures shall be such that the fixture is capable of being used for its intended purpose.~~ Bathrooms and toilet rooms shall have a ceiling height of not less than 6 feet 8 inches at the front of fixtures. A shower or tub equipped with a showerhead shall have a minimum ceiling height of 6 feet 8 inches (2032 mm) above a minimum area 30 inches (762 mm) by 30 inches (762 mm) at the showerhead.
3. Crawl spaces and attic spaces shall not have a minimum head room clearance.

~~**R305.1.1 Basements.** Portions of *basements* that do not contain *habitable space* or hallways shall have a ceiling height of not less than 6 feet 8 inches (2032 mm).~~

~~**Exception:**~~

4. Beams, girders, ducts or other obstructions in basements may project to within 6 feet 4 inches (1931 mm) of the finished floor.

Commenter's Reason: RB108 was approved by the Committee but it has an inherent oversight, and this public comment is to fill in the missing blanks. The author specified the ceiling height for bathrooms, toilet rooms and laundry rooms, but did not specify the height of functional spaces, like closets and storage rooms. It also addresses when no ceiling height is required: crawl spaces and attic spaces. This public comment covers these other situations and does not leave the reader in the doubt.

The *50 percent or 35 square feet* is based on two different conditions: If the room is greater than 70 square feet, all you need is 35 square feet of ceiling at 6'-8"; if the room is like a powder room under a stair and is less than 70 square feet, the minimum area would be half of the floor area. In either case, you would need 6'-8" in front of any fixtures. The language of fixtures and their "intended purpose" is extremely vague and not consistent with good code language, and has been replaced.

Public Comment 3:

Michael D. Fischer, Kellen Company, representing American Institute of Building Design, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

Revise as follows:

SECTION R305
CEILING HEIGHT

R305.1 Minimum height. *Habitable space*, hallways, ~~bathrooms, toilet rooms, laundry rooms~~ and portions of *basements* containing these spaces shall have a ceiling height of not less than 7 feet (2134 mm). <u>Bathrooms, toilet rooms and laundry rooms shall have a ceiling height of not less than 6 feet 8 inches (2032 mm).</u>

Exceptions:

1. For rooms with sloped ceilings, at least 50 percent of the required floor area of the room must have a ceiling height of at least 7 feet (2134 mm) and no portion of the required floor area may have a ceiling height of less than 5 feet (1524 mm).
2. Bathrooms shall have a minimum ceiling height of 6 feet 8 inches (2032 mm) at the center of the front clearance area for fixtures as shown in Figure R307.1. The ceiling height above <u>bathroom and toilet room</u> fixtures shall be such that the fixture is capable of being used for its intended purpose. A shower or tub equipped with a showerhead shall have a minimum ceiling height of 6 feet 8 inches (2032 mm) above a minimum area 30 inches (762 mm) by 30 inches (762 mm) at the showerhead.
3. <u>Beams,girders, ducts or other obstructions in basements containing habitable space shall be permitted to project to within 6 feet 4 inches (1931mm) of the finished floor.</u>

R305.1.1 Basements. Portions of *basements* that do not contain *habitable space*, <u>or</u> hallways, ~~bathrooms, toilet rooms and laundry rooms~~ shall have a ceiling height of not less than 6 feet 8 inches (2032 mm).

Exception: Beams, girders, ducts or other obstructions may project to within 6 feet 4 inches (1931 mm) of the finished floor.

Commenter's Reason: During the past several code cycles, there have been numerous changes to the ceiling height and support beam projection height for habitable spaces in basements. This creates an issue when homes built to the previous standards include beams located in unfinished basements at heights that would allow the conversion to habitable space. Once the code changes, these spaces no longer fit the dimensions, and the option to convert this "future finished basement" evaporates. Rarely do codes become retro-active to previous construction, but this is one case where code changes can affect existing designs.

The 2003 IRC allowed ceiling heights in habitable basement spaces to be at 7 feet above the finished floor (a.f.f.), and beams could project 6 inches lower than the ceiling (to 6'6"). Non-habitable spaces in basements could have ceilings at 6'8", with beams at 6'4". Designers could set the non-habitable basement ceiling height at 7', with beams at 6'6", knowing that the space could later be converted to habitable space.

The 2009 IRC removed the 6" projection below the ceiling height as an option. Under this change, designers would have no option for any beam heights below 7' in any habitable basement space. Beams could be located at 6'4" in non-habitable basements. The proposed modification would reinstate the option to accommodate beams and girders in basements containing habitable spaces. With this language added, the designer can establish the ceiling height of an unfinished basement at 7 feet, while setting the beam height at 6'4" a.f.f., thus allowing for the basement to be converted to habitable space.

There are numerous reasons why restoring this design option make sense. Allowing ducts to be located within conditioned basement space can help improve the energy efficiency of the home, and finishing basements to add living space is an important design option- saving space and optimizing the available floor area. The sloped ceiling option would theoretically allow the designer to encase beams within sloped ceilings that are permitted to be as low as 5 feet a.f.f., so restoring this option does nothing to adversely impact ceiling clearances. This option provides greater design flexibility and versatility of the space, while maintaining appropriate levels of safety.

RB108-13

Final Action: AS AM AMPC____ D

RB109-13
R307.2

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org); Roger Harper, Louisa County, VA, representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA), Virginia Building Code Officials Association (VBCOA) and ICC Region 7 (sharper@louisa.org); Richard Grace of Fairfax County representing Virginia Plumbing and Mechanical Inspectors Association and Virginia Building and Code Officials Association (Richard.Grace@fairfaxcounty.gov)

Delete and substitute as follows:

~~**R307.2 Bathtub and shower spaces.** Bathtub and shower floors and walls above bathtubs with installed shower heads and in shower compartments shall be finished with a nonabsorbent surface. Such wall surfaces shall extend to a height of not less than 6 feet (1829 mm) above the floor.~~

R307.2 Bathtub and shower floors and walls. Bathtub floors, shower floors, wall areas above built-in tubs that have installed shower heads and walls in shower compartments shall be constructed of smooth, corrosion-resistant and nonabsorbent waterproof materials. Wall materials shall extend to a height of not less than 6 feet (1829 mm) above the room floor level and not less than 70 inches (1778 mm) above the drain of the tub or shower. Such walls shall form a water-tight joint with each other and with either the tub or shower floor.

Reason: This revised language was approved for the 2015 IPC. There is no reason for the two codes to have different language.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was Item no. X8 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will not increase the cost of construction.

R307.2-RB-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that determining the height of a finish material above a point that is hard to measure from, such as sloped floors near drains, would be difficult and would create disagreements between those that are attempting to comply with the code and those that are enforcing it. The measurement should be made from a readily identifiable point so that it can be easily verified.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh, Arlington County, VA, representing VA Plumbing & Mechanical Inspectors Association (VPMIA) & VA Building Code Officials Association (VBCOA), and ICC Region VII, requests Approval as Submitted.

Commenter's Reason: The new language in this change clarifies that the finish material within the bathtub floor and shower areas must be smooth, corrosion resistant, and nonabsorbent waterproof materials. The previous language only stated nonabsorbent surface. The committee's reason for disapproval was that the point of measurement was not clear however that is what this change was written to do. The current language states 6' above the floor. What floor was this measurement to be taken from the shower or tub floor or the floor just outside of these areas? The new language requires a minimum of 6' of smooth, corrosion resistant and nonabsorbent waterproof materials above the room floor level and not less than 70" above the drain of the tub of shower. This language does provide a readily identifiable point. Again this language would make the IRC and IPC language consistent.

RB109-13
Final Action: AS AM AMPC____ D

RB111-13
R308.4.2

Proposed Change as Submitted

Proponent: Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee and Virginia Building and Code Officials Association (bajnaic@chesterfield.gov)

Revise as follows:

R308.4.2 Glazing adjacent doors. Glazing in an individual fixed or operable panel adjacent to a door shall be considered a hazardous location ~~where the nearest vertical edge of the glazing is within a 24-inch (610 mm) arc of either vertical edge of the door in a closed position and where~~ if the bottom exposed edge of the glazing is less than 60 inches (1524 mm) above the floor or walking surface ~~shall be considered a hazardous location~~ and it meets either of the following conditions:

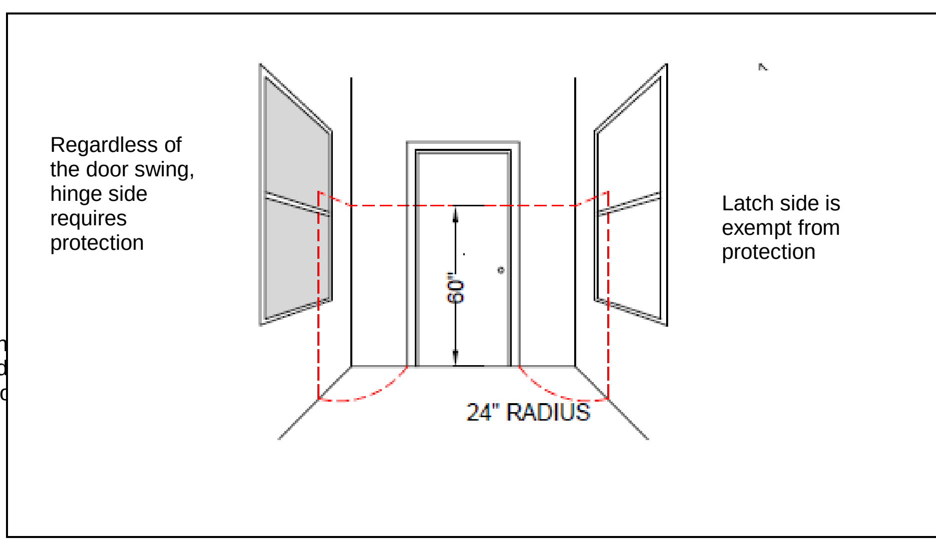
1. Where the glazing is within 24" of either side of the door in the plane of the door in a closed position,
2. Where the glazing is on a wall perpendicular to the plane of the door in a closed position and within 24" of the hinge side of an in-swinging door.

Exceptions:

1. Decorative glazing.
2. When there is an intervening wall or other permanent barrier between the door and the glazing.
3. ~~Glazing in walls on the latch side of and perpendicular to the plane of the door in a closed position~~
4. Where access through the door is to a closet or storage area 3 feet (914 mm) or less in depth. Glazing in this application shall comply with section R308.4.3.
5. Glazing that is adjacent to the fixed panel of patio doors.

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC) The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

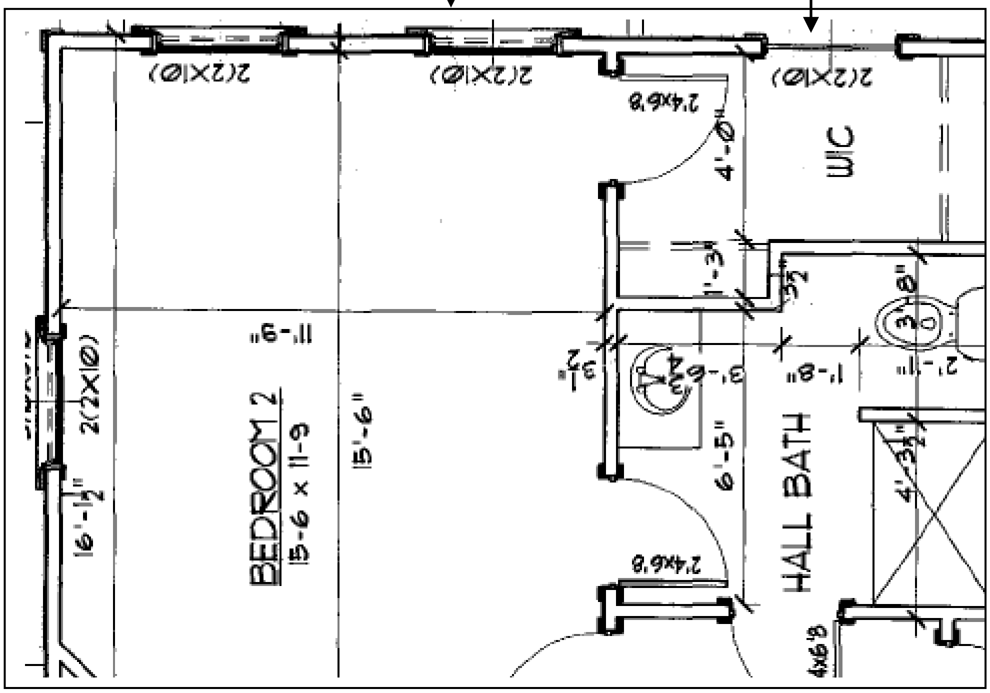
Exception 3: Currently the code requires safety glazing for windows on the hinge side of walls perpendicular to the door plane – regardless of the door swing. See sketch below.

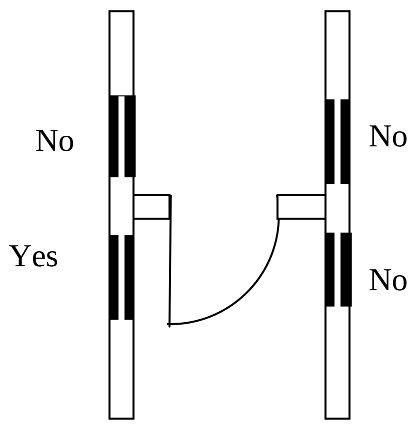


This code chan … oor where
someone could … threat for the
person on the c

Currently this window is NOT exempt by rule # 3 (or #4) and would have to be safety glazed. If this proposal is accepted, this window would NOT have to be safety glazed.

This window is currently exempt because the arc is more the 24" from the door hinge.





These are the four possible configurations of windows adjacent/perpendicular to a door. Only the one with an in-swinging door on the hinge side would be required to be safety glazed.

Cost Impact: This proposal may decrease the cost of construction.

R308.4.2 #1-RB-BAJNAI-BCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this proposed code change because they felt that the square foot area and height limits are intended to maintain a lesser mass that is appropriate for an accessory structure, and to coordinate with previous committee action on ADM2.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Homer Maiel, PE, CBO, City of Palo Alto/4LEAF Inc., representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay), requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

R308.4.2 Glazing adjacent doors. Glazing in an individual fixed or operable panel adjacent to a door where the nearest vertical edge of the glazing is within a 24-inch (610 mm) arc of either vertical edge of the door in a closed position and where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) above the floor or walking surface shall be considered a hazardous location.

Exceptions:

1. Decorative glazing.
2. When there is an intervening wall or other permanent barrier between the door and the glazing.
3. Glazing in walls on the latch side of and perpendicular to the plane of the door in a closed position.
4. Glazing in walls on the hinge side of and perpendicular to the plane of the door in a closed position and where the walls are in the direction opposite the door swing.

~~4~~ 5. Where access through the door is to a closet or storage area 3 feet (914 mm) or less in depth. Glazing in this application shall comply with section R308.4.3.

~~5~~ 6. Glazing that is adjacent to the fixed panel of patio doors.

Commenter's Reason: The committee approved the original proposal as submitted, but also noted that some details and wording should be addressed through public comment. The original proposal for R308.4.2 Item 1 appears to require safety glazing within 24" of either door edge only when the glazing is in the plane of the door. Item 2 requires safety glazing within 24" of the hinge side of an in-swinging door when the glazing is perpendicular to the plane of the door. The original proposal does not seem to address glazing in a wall that is not in the plane of the door nor perpendicular to the plane of the door. In other words, there is no requirement for glazing in a wall that is offset from the plane of the door but within the 24" arc, or in a wall that forms an angle between 90 and180 degrees with the plane of the door.

It is agreed with the original proposal that when the windows are perpendicular to a door, only the window on the hinge side of an in-swinging door would be required to be safety glazed. However, when the glazing is offset from the plane of the door or between 90 and 180 degrees to the plane of the door, the glazing and the wall containing the glazing are no longer parallel to the direction of travel to the door user, and the risk of impact would be greater.

The proposed modifications in this public comment would restore the original code language that requires safety glazing within a 24" arc. The proposed Exception 4 clarifies the exemption for glazing perpendicular to the plane of the door that is opposite the door swing direction.

RB111-13

Final Action: AS AM AMPC____ D

RB114-13
R308.4.6, R308.4.7

Proposed Change as Submitted

Proponent: Tim Pate, City and County of Broomfield, CO representing Colorado Chapter Code Change Committee

Revise as follows:

R308.4.6 Glazing adjacent to stairs and ramps. Glazing where the bottom exposed edge of the glazing is less than ~~36 inches (914 mm)~~ 60 inches (1524 mm) above the plane of the adjacent walking surface of stairways, landings between flights of stairs and ramps shall be considered a hazardous location.

Exceptions:

1. When a rail is installed on the accessible side(s) of the glazing 34 to 38 inches (864 to 965 mm) above walking surface. The rail shall be capable of capable of withstanding a horizontal load of 50 pounds per linear foot (730 N/m) without contacting the glass and be a minimum of 1 ½ inches (38 mm) in cross sectional height and the plane of glass is more than 18 inches (457 mm) horizontally from the rail.
2. Glazing 36 inches (914 mm) or more measured horizontally from the walking surface.

R308.4.7 Glazing adjacent to the bottom stair landing. Glazing adjacent to the landing at the bottom of a stairway where the glazing is less than ~~36 inches (914 mm)~~ 60 inches (1524 mm) above the landing and within 60 inches (1524 mm) horizontally of the bottom tread shall be considered a hazardous location.

Exception: The glazing is protected by a guard complying with Section 312 and the plane of the glass is more than 18 inches (457 mm) from the guard.

Reason: All of the previous editions of the IRC required glazing that was had bottom edge below 60 inches above the plane of walking surfaces of stairways, landings between flights of stairs and ramps, and adjacent to stair landings to be approved safety glazing. Code change was approved which changed the 36 inches back to 60 inches. There was a comprehensive code change (S218 09/10) that reformatted the entire safety glazing section and also changed the dimension from 60 inches down to 36 inches. This was approved and overrode my code change.

My reason statement for the code change during the 2009/2010 cycle was very clear in helping clean up the inconsistencies in the earlier codes. As you can see it specifically required the wall with glazing to be at least 18 inches away. The reason statement that the IRC change committee gave in approving the comprehensive change was that it should be lowered to 36" which would match the exception. I could never find a good reason as to why my code change that was approved by the IRC committee did not stand and get incorporated into the overall change also approved by the IRC code change committee.

I am copying my code change (RB40-09/10) and reason statement that the2009/2010 IRC committee agreed with:

Revise as follows:

R308.4 The following shall be considered specific hazardous locations for the purposes of glazing:

Items 1 through 6 remain unchanged

7. Glazing adjacent to stairways, landings, and ramps within 36 inches (914 m) horizontally of a walking surface when the exposed surface of the glazing is less than 60 inches (1524 mm) above the plane of the adjacent walking surface.

 Exceptions:

 1. ~~When a rail is installed on the accessible side(s) of the glazing 34 to 38 inches (864 to 965 mm) above the walking surface. The rail shall be capable of withstanding a horizontal load of 50 pounds per lineal foot (730 N/m) without contacting the glass and be a minimum of 1 ½ inches (38 mm) in cross sectional height.~~
 2. The side of the stairway has a guard~~rail~~ or handrail, including balusters or in-fill panels, complying with Sections R311.7.6 and R312 and the plane of the glazing is more than 18 inches (457 mm) from the railing; or

3. When a solid wall or panel extends from the plane of adjacent walking surface to 34 inches (863 mm) to 36 inches (914 mm) above the walking surface and the construction at the top of that wall or panel is capable of withstanding the same horizontal load as a guard and the plane of the glazing is more than 18 inches (457 mm) from the wall or panel.

8. Glazing adjacent to stairways within 60 inches (1524 m) horizontally of the bottom tread of a stairway in any direction when the exposed surface of the glazing is less than 60 inches (1524 mm) above he nose of the tread.

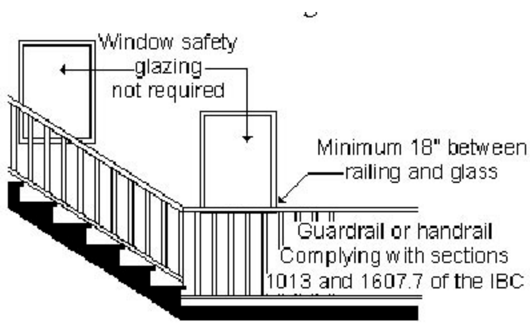
Exceptions:

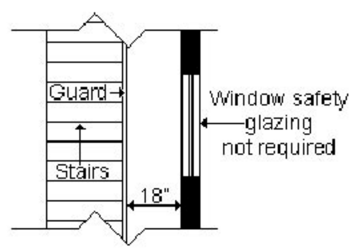
1. The side of the stairway has a guard~~rail~~ or handrail, including balusters or in-fill panels, complying with Sections R311.7.6 and R312 and the plane of the glazing is more than 18 inches (457 mm) from the railing; or
2. When a solid wall or panel extends from the plane of adjacent walking surface to 34 inches (863 mm) to 36 inches (914 mm) above the walking surface and the construction at the top of that wall or panel is capable of withstanding the same horizontal load as a guard and the plane of the glazing is more than 18 inches (457 mm) from the wall or panel.

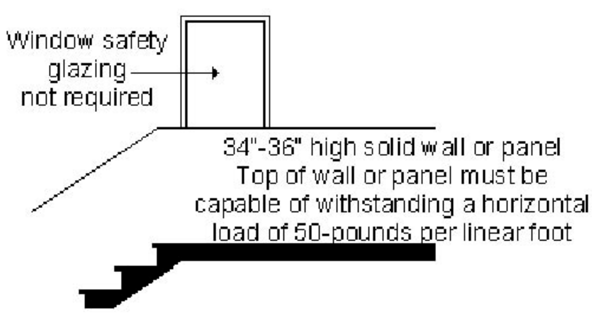
Reason: Code change RB15-00 added exception 9 (9.1 and 9.2) which allowed the protective bar but also required the glazing to be at least 18" away from the stair and bar. Code change RB16-00 was also approved in the same code change cycle which added the reference in exception #5 which would allow the protective bar but not require the 18" separation. This created a direct conflict between the two exceptions in the 2003 IRC and the 2006 IRC. IRC Section R308.4 was modified for the 2009 IRC by reformatting the requirements and exceptions in order to make it more user friendly but no technical changes were made.

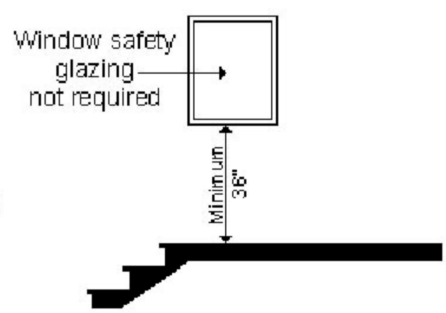
Stairs are inherently more dangerous for tripping hazards than normal walking surfaces. It does not make sense to a allow 1 ½" wide bar or a solid wall directly adjacent to stairs and landings and think this gives adequate protection for someone falling into glazing that is not safety glazing. Requiring the glazing to be at least 18" away would provide better protection if someone trips and falls which is exactly what 2009 IRC section R308.4 #7 Exception 2 requires.

The following diagrams illustrates what R308.4 #7 exception 2 allows which is the guard or handrail but also the 18" separation which is in conflict with what is allowed in #7 exception 1 or 3 which allows a rail or solid wall but does not require the 18" separation.









I was also successful in having the IBC safety glazing section changed back to 60 inches during the past Code Change Hearing in Dallas for the 2015 IBC. Here is the code change (S297-12) to IBC along with the reason statement – this code change was approved by Structural Code Change Committee and was not challenged at Final Action Hearings and therefore was approved on the consent agenda:

Revise as follows:

2406.4.7 Glazing adjacent to the bottom stair landing. Glazing adjacent to the landing at the bottom of a stairway where the glazing is less than ~~36 inches (914 mm)~~ <u>60 inches (1524 mm)</u> above the landing and within a 60 inches(1524 mm) horizontally of the bottom tread shall be considered a hazardous location.

Reason: Previous editions of the IBC before the 2012 required glazing that is less than 60" above the landing to be approved safety glazing. It is not clear why this requirement was changed in the 2012. It does not make sense that section 2406.4.6 applies to glazing that is less than 60" above the stairs and intermediate landings but the glazing at bottom landing is treated differently – only when below 36" The potential for falling through the glazing at bottom landing is the same. This change will bring back the 60" height which will then match the requirement at intermediate landings and stairs.

Both 2012 IBC sections 2406.4.6 and 2406.4.7 have exceptions which allow a guard but require the plane of glass to be at least 18" away from the guard.

This code change should be approved in order to make sure that people who use stairs, ramps, and landings remain safe in case they trip and fall and potentially fall through windows adjacent to the stairs and ramps. I do not feel that only protecting glazing that is below 36" above walking surface is adequate but that all glazing below 60" should be protected. The vast majority of people will have their hands and arms outstretched if falling at 48" or so high and would be falling through glass at this height or somewhat higher. Approving this code change will get both the IRC and IBC to match which is extremely important.

Cost Impact: Cost Impact: This code change will increase the cost of construction.

R308.4.6-RB-PATE

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The committee disapproved this proposal because they felt that there was no justification for the change. If a guard of similar dimensions is good for a stairway, it should be good here too.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Tim Pate, City and County of Broomfield, representing Colorado Chapter Code Change Committee, requests Approval as Submitted.

Commenter's Reason: I agree with the IRC code change committee that there has been an exception that allowed glazing that was protected by a rail located between 34" and 38" high above the walking surface. The code change that I had approved by the past IRC committee (as explained in my original reason statement) and then over turned by another larger code change attempted to fix this problem. It just does not make sense to think that a rail located at that height will keep someone from falling into and potentially through glazing. The code requires glazing that is adjacent to bathtubs, showers, etc. to be at least 60" above the floor – it does not make sense to not treat potential trip and falls at stairs and landings the same way.

The requirement for requiring the plane of glass to be at least 18" away from the rail in section R308.4.6 should also match the exception that is already located in section R308.4.7 so the two sections have consistency. The potential for falling through glazing is the same at the bottom stair landing as it is at the sides of stairs.

Finally I would reiterate that this same language was approved by the IBC Structural code change committee and will now be in the 2015 IBC for hazardous locations of glazing. It is imperative that the requirements for requiring safety glazing be the same in both the IBC and the IRC. Stairs and glazing do not know which code they fall under and the potential for severe injuries and potential death are the same when someone falls and hits glass by stairs and landings. Please remember that you will have the same sets of stairs located in single family homes and townhouses located within the same development as multifamily apartments or condos and these requirements should be the same.

As a Code Official these inconsistencies make it extremely difficult to explain why these sections and codes are different.

Public Comment 2:

Homer Maiel, PE, CBO, City of Palo Alto/4LEAF Inc., representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay), requests Approval as Submitted.

Commenter's Reason: The proponent is making changes to correlate the IBC and IRC requirements for glazing adjacent to stairways, landings and ramps. The proposal provides consistency between the IBC and IRC and eliminates confusion of code intent.

RB114-13

Final Action: AS AM AMPC____ D

RB115-13
R308.4.7

Proposed Change as Submitted

Proponent: Tim Pate, City and County of Broomfield, CO representing Colorado Chapter Code Change Committee

Revise as follows:

R308.4.7 Glazing adjacent to the bottom stair landing. Glazing adjacent to the landing at the bottom of a stairway where the glazing is less than 36 inches (914 mm above the landing and within <u>a</u> 60 inch~~es~~ (1524 mm) ~~horizontally of~~ <u>horizontal arc less than 180 degrees from</u> the bottom tread <u>nosing</u> shall be considered a hazardous location.

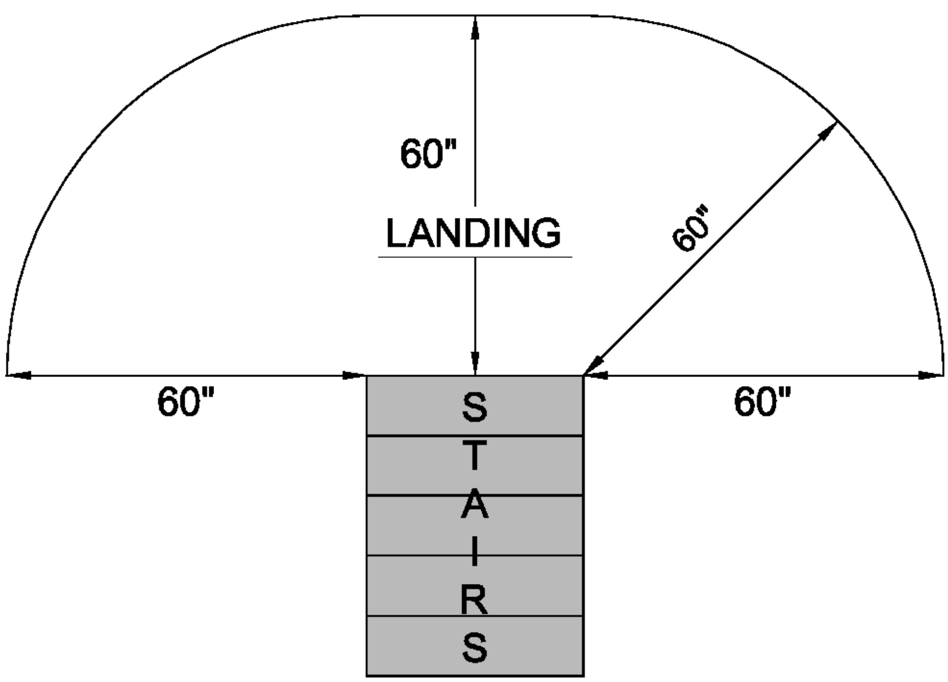
> **Exception:** The glazing is protected by a guard complying with Section 312 and the plane of the glass is more than 18 inches (457 mm) from the guard.

Reason: Previous editions of the IRC before the 2012 required glazing that is 60" horizontally in any direction to be approved safety glazing. It is not clear why this requirement was changed in the 2012. The previous editions had the additional wording "in any direction" when applying the 60" horizontal rule. This is due to the "splay" factor for when someone gets to the last tread and falls. The tendency is for someone to flail out in any direction.

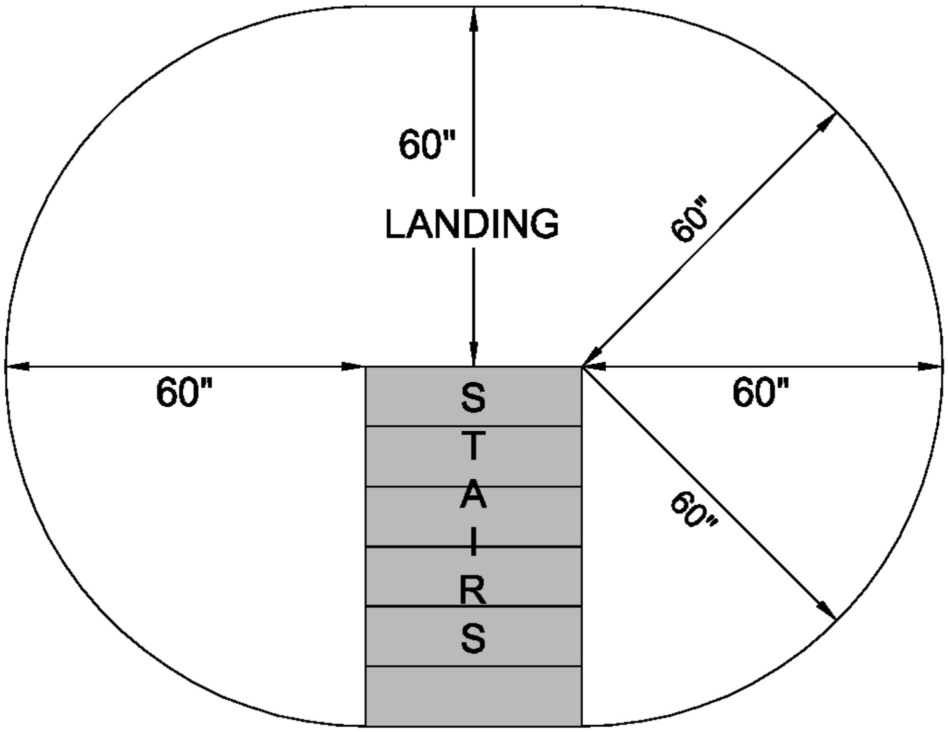
This added wording will make this section only apply to any glazing that is in a wall that is less than 180 degrees from the bottom tread nosing. I believe that adding the wording which would limit the area needing safety glazing to any glazing that falls within a 180 degree arc from bottom tread nosing and extending out 60" makes more sense since it is extremely unlikely that someone will fall out and backwards. I have added an illustration which should help everyone see what this changed wording will do.

Please note that there is still a requirement to provide approved safety glazing when located within 36" horizontally of the sides of the stairs.

The new code language will incorporate the areas shown in the following diagram:



The current code language incorporates the area shown below in the diagram:



This same code change proposal was reviewed and approved at the Final Action Hearings for the 2015 IBC – therefore this proposal for the IRC will get the two code sections to match which is important for consistency.

Cost Impact: This code change will reduce construction cost.

R308.4.7-RB-PATE

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee approved this code change proposal because they felt that, in this case, it is beneficial for the International Residential Code and the International Building Code to be coordinated. This language is preferable to other code changes that address similar code requirements. It would be nice if the drawing could be included in the code along with the language.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Tim Pate, City and County of Broomfield, representing Colorado Chapter Code Change Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

Add the following figure to the proposal:

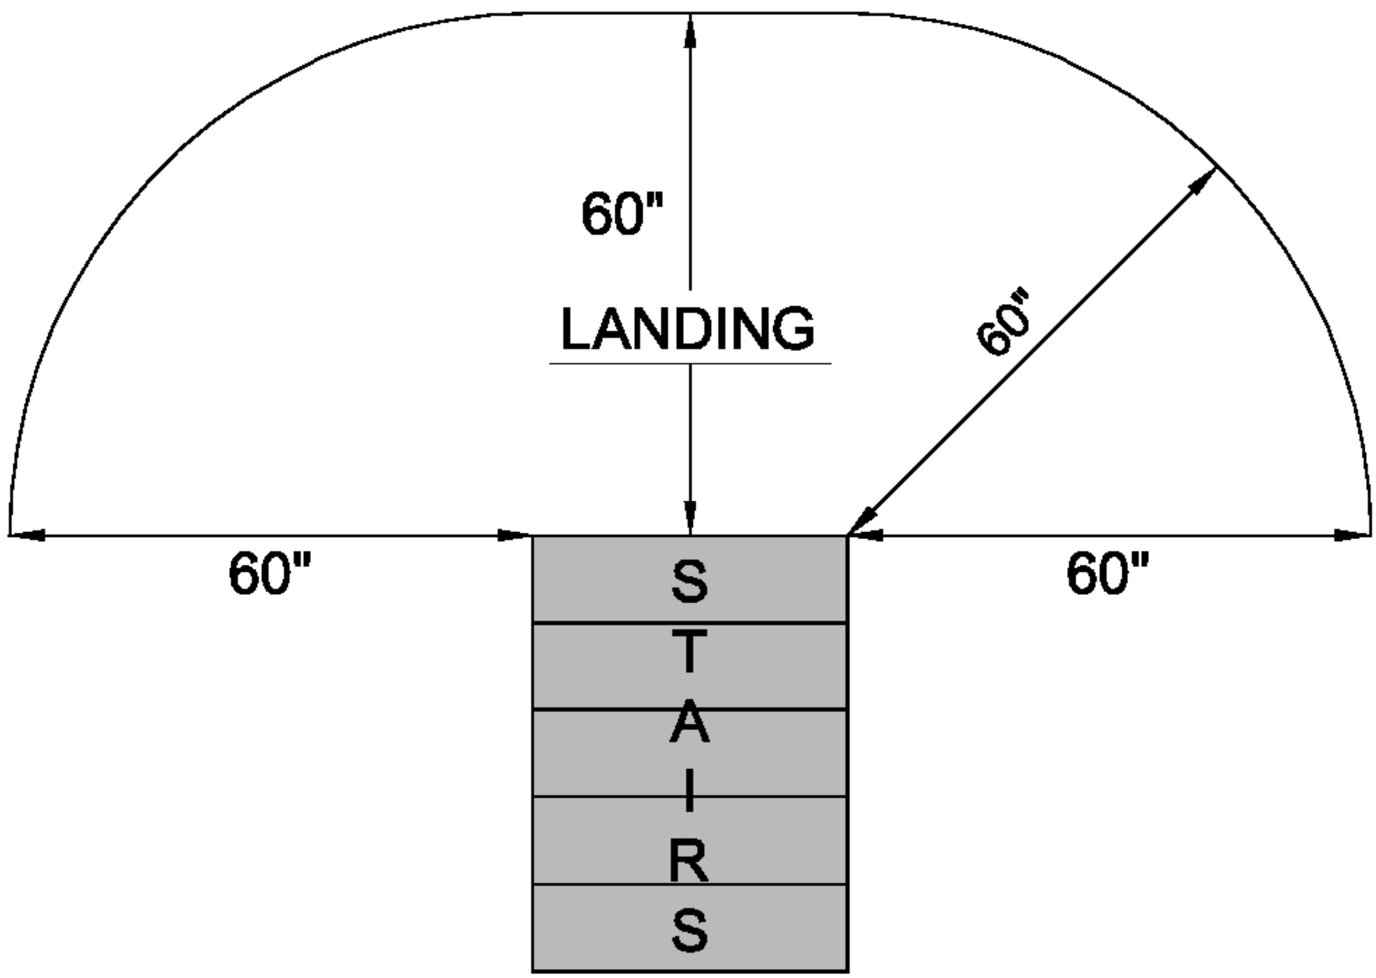


Figure R308.4.7

(Portions of proposal not shown to remain unchanged)

Commenter's Reason: Based on the recommendation from one of the IRC Code Change Committee members when approving my original code change proposal I suggest that the figure I provided in my original code change reason statement be added as a figure within the body of the Code so as to help code users understand the new code language – " a 60 inch horizontal arc less than 180 degrees from the bottom tread nosing …"

Final Action:	AS	AM	AMPC____	D

RB117-13
R310

Proposed Change as Submitted

Proponent: Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee (bajnaic@chesterfield.gov)

Delete and substitute as follows:

R310
EMERGENCY ESCAPE AND RESCUE OPENINGS

~~**R310.1 Emergency escape and rescue required.** Basements, habitable attics and every sleeping room shall have at least one operable emergency escape and rescue opening. Where basements contain one or more sleeping rooms, emergency egress and rescue opening shall be required in each sleeping room. Where emergency escape and rescue openings are provided, they shall have a sill height of not more than 44 inches (1118 mm) measured from the finished floor to the bottom of the clear opening. Where a door opening having a threshold below the adjacent ground elevation serves as an emergency escape and rescue opening and is provided with a bulkhead enclosure, the bulkhead enclosure shall comply with Section R310.3. The net clear opening dimensions required by this section shall be obtained by the normal operation of the emergency escape and rescue opening from the inside. Emergency and escape rescue openings with a finished sill height below the adjacent ground elevation shall be provided with a window well in accordance with Section R310.2. Emergency escape and rescue openings shall open directly into a public way, or to a yard or court that opens to a public way.~~

> ~~**Exception:** Storm shelters and basements used only to house mechanical equipment not exceeding total floor area of 200 square feet (18.58 m2)~~

~~**R310.1.1 Minimum opening area.** All emergency and escape rescue openings shall have a minimum met clear opening of 5.7 square feet.~~

> ~~**Exception:** Grade floor openings shall have a minimum net clear opening of 5 square feet.~~

~~**R310.1.2 Minimum opening height.** The minimum net clear opening height shall be 24 inches.~~

~~**R310.1.3 Minimum opening width.** The minimum net clear opening width shall be 20 inches (508 mm).~~

~~**R310.1.4 Operational constraints.** Emergency escape and rescue openings shall be operational from the inside of the room without the use of keys, tools or special knowledge.~~

~~**R310.2 Window wells.** The minimum horizontal area of the window well shall be 9 square feet (0.9 m2), with a minimum horizontal projection and width of 36 inches (914 mm). The area of the window well shall allow the emergency escape and rescue opening to be fully opened.~~

> ~~**Exception:** The ladder or steps required by SectionR310.2.1 shall be permitted to encroach a maximum of 6 inches (152mm) into the required dimensions of the window well.~~

~~**R310.2.1 Ladder and steps.** Window wells with a vertical depth greater than 44 inches (1118 m) shall be equipped with a permanently affixed ladder or steps usable with the window in the fully open position. Ladders or steps required by this section shall not be required to comply with Sections R311.7 and R311.8. Ladders or rungs shall have an inside width of at least 12 inches (305 mm), shall project at least 3 inches (76 mm) from the wall and shall be spaced not more than 18 inches (457mm)on center vertically for the full height of the window well.~~

~~**R310.2.2 Drainage.** Window wells shall be designed for proper drainage by connecting to the building's foundation drainage system required by Section R504.1 or by an approved alternative method.~~

> ~~**Exception:** A drainage system for window wells is not required when the foundation is on well-drained soil or sand-gravel mixture soils according to the United Soil Classification System, Group I Soils, as detailed in Table R405.1.~~

~~**R310.3 Bulkhead enclosures.** Bulkhead enclosures shall provide direct access to the basement. The bulkhead enclosure with the door panels in the fully open position shall provide the minimum net clear opening required by Section R310.1.1. Bulkhead enclosures shall also comply with Section R311.7.8.2.~~

~~**R310.4 Bars, grilles, covers and screens.** Bars, grilles, covers, screens or similar devices are permitted to be placed over emergency escape and rescue openings, bulkhead enclosures, or window wells that serve such openings, provided the minimum net clear opening size complies with Sections R310.1.1 to R310.1.3, and such devices shall be releasable or removable from the inside without the use of a key, tool, special knowledge or force greater than that which is required for normal operation of the escape and rescue opening.~~

~~**R310.5 Emergency escape windows under decks and porches.** Emergency escape windows are allowed to be installed under decks and porches provided the location of the deck allows the emergency escape window to be fully opened and provides a path not less than 36 inches (914 mm) in height to a yard or court.~~

R310.1 Emergency escape and rescue opening required. Basements, habitable attics and every sleeping room shall have at least one operable emergency escape and rescue opening. Where basements contain one or more sleeping rooms, an emergency escape and rescue opening shall be required in each sleeping room. Emergency escape and rescue openings shall open directly into a public way, or to a yard or court that opens to a public way.

> **Exception:** Storm shelters and basements used only to house mechanical equipment not exceeding a total floor area of 200 square feet (18.58 m2)

R310. 1.1 Operational constraints. Emergency escape and rescue openings shall be operational from the inside of the room without the use of keys, tools or special knowledge.

R310.2 Emergency escape and rescue openings. Emergency and escape rescue openings shall have minimum dimensions as specified in this section.

R310.2.1 Minimum opening area. All emergency and escape rescue openings shall have a minimum net clear opening of 5.7 square feet. The net clear opening dimensions required by this section shall be obtained by the normal operation of the emergency escape and rescue opening from the inside. The minimum net clear height opening shall be 24" and the minimum net clear width shall be 20"

> **Exception:** Grade floor or below-grade openings shall have a minimum net clear opening of 5 square feet.

R310.2.2 Window sill height. Where a window is provided as the emergency escape and rescue opening, it shall have a sill height of not more than 44 inches (1118 mm) above the floor; if the sill height is below-grade, it shall be provided with a window well in accordance with Section R310.2.3.

R310.2.3 Window wells. The minimum horizontal area of the window well shall be 9 square feet (0.9 m2), with a minimum horizontal projection and width of 36 inches (914 mm). The area of the window well shall allow the emergency escape and rescue opening to be fully opened.

Exception: The ladder or steps required by Section R310.2.1 shall be permitted to encroach a maximum of 6 inches (152mm) into the required dimensions of the window well.

R310.2.3.1 Ladder and steps. Window wells with a vertical depth greater than 44 inches (1118 m) shall be equipped with a permanently affixed ladder or steps usable with the window in the fully open position. Ladders or steps required by this section shall not be required to comply with Sections R311.7 and R311.8. Ladders or rungs shall have an inside width of at least 12 inches (305 mm), shall project at least 3 inches (76 mm) from the wall and shall be spaced not more than 18 inches (457mm)on center vertically for the full height of the window well.

R310.2.3.2 Drainage. Window wells shall be designed for proper drainage by connecting to the building's foundation drainage system required by Section R504.1 or by an approved alternative method.

Exception: A drainage system for window wells is not required when the foundation is on well-drained soil or sand-gravel mixture soils according to the United Soil Classification System, Group I Soils, as detailed in Table R405.1.

R310.2.4 Emergency escape and rescue openings under decks and porches. Emergency escape and rescue openings shall be permitted to be installed under decks and porches provided the location of the deck allows the emergency escape and rescue openings to be fully opened and provides a path not less than 36 inches (914 mm) in height to a yard or court.

R310.3 Emergency escape and rescue doors. Where a door is provided as the required emergency escape and rescue opening, it shall be permitted to be a side hinged door or a slider. Where the opening is below the adjacent ground elevation, it shall be provided with a bulkhead enclosure.

R310.3.1 Minimum door opening size. The minimum net clear height opening for any door that serves as an emergency and escape rescue opening shall be in accordance with Section R310.2.1.

R310.3.2 Bulkhead enclosures. Bulkhead enclosures shall provide direct access from the basement. The bulkhead enclosure shall provide the minimum net clear opening equal to the door in the fully open position.

R310.3.2.1 Drainage. Bulkhead enclosures shall be designed for proper drainage by connecting to the building's foundation drainage system required by Section R504.1 or by an approved alternative method.

Exception: A drainage system for bulkhead enclosures is not required when the foundation is on well-drained soil or sand-gravel mixture soils according to the United Soil Classification System, Group I Soils, as detailed in Table R405.1.

R310.4 Bars, grilles, covers and screens. Bars, grilles, covers, screens or similar devices are permitted to be placed over emergency escape and rescue openings, bulkhead enclosures, or window wells that serve such openings, provided the minimum net clear opening size complies with Sections R310.1.1 to R310.1.3, and such devices shall be releasable or removable from the inside without the use of a key, tool, special knowledge or force greater than that which is required for normal operation of the escape and rescue opening.

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC) The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

This code change is primarily for reorganizational purposes. It separates emergency escape and rescue openings (EERO) window and door provisions, which are currently intermingled. It also says that EERO doors do not have to be "egress" doors, that is, side hinged doors. The new code language allows sliders from basements.

Most people think of emergency escape and rescue openings as windows, and in fact, the current subsections in R310 all seem to define and quantify this type of application: minimum opening height, minimum opening width, window wells, ladders and steps from window wells, drainage from window wells, bars and grilles on windows, windows under decks.
However the most basic EERO is a door. In case of a fire, would prefer to exit through a door or a window? Will a fire fighter prefer to enter through a door or a window?

This revision acknowledges doors as a viable EERO and defines the minimum requirements for EERO doors. It allows side hinged doors or sliders to be used as EEROs.

An EERO door would not have to be an egress door but an egress door would automatically be an EERO door.

Cost Impact: None

R310.1-RB-BAJNAI-BCAC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee approved this proposed code change because they felt that it reorganized the code text in a manner that clarifies the code. While the application to doors is implied in the existing text, it is good to point it out.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Homer Maiel, PE, CBO, City of Palo Alto/4LEAF Inc., representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION R310
EMERGENCY ESCAPE AND RESCUE OPENINGS

R310.1 Emergency escape and rescue opening required. Basements, habitable attics and every sleeping room shall have at least one operable emergency escape and rescue opening. Where basements contain one or more sleeping rooms, an emergency escape and rescue opening shall be required in each sleeping room. Emergency escape and rescue openings shall open directly into a public way, or to a yard or court that opens to a public way.

Exception: Storm shelters and basements used only to house mechanical equipment not exceeding a total floor area of 200 square feet (18.58 m^2).

R310. 1.1 Operational constraints. Emergency escape and rescue openings shall be operational from the inside of the room without the use of keys, tools or special knowledge.

R310.2 Emergency escape and rescue openings. Emergency and escape rescue openings shall have minimum dimensions as specified in this section.

R310.2.1 Minimum opening ~~area~~ <u>size</u>. All emergency and escape rescue openings shall have a minimum net clear opening of 5.7 square feet. The net clear opening dimensions required by this section shall be obtained by the normal operation of the emergency escape and rescue opening from the inside. The minimum net clear height opening shall be 24" and the minimum net clear width shall be 20".

Exception: Grade floor ~~or below-grade~~ openings shall have a minimum net clear opening of 5 square feet.

R310.2.2 Window sill height. Where a window is provided as the emergency escape and rescue opening, it shall have a sill height of not more than 44 inches (1118 mm) above the floor; if the sill height is below-grade, it shall be provided with a window well in accordance with Section R310.2.3.

R310.2.3 Window wells. The minimum horizontal area of the window well shall be 9 square feet (0.9 m^2), with a minimum horizontal projection and width of 36 inches (914 mm). The area of the window well shall allow the emergency escape and rescue opening to be fully opened.

Exception: The ladder or steps required by Section ~~R310.2.1~~ R310.2.3.1 shall be permitted to encroach a maximum of 6 inches (152mm) into the required dimensions of the window well.

R310.2.3.1 Ladder and steps. Window wells with a vertical depth greater than 44 inches (1118 m) shall be equipped with a permanently affixed ladder or steps usable with the window in the fully open position. Ladders or steps required by this section shall not be required to comply with Sections R311.7 and R311.8. Ladders or rungs shall have an inside width of at least 12 inches (305 mm), shall project at least 3 inches (76 mm) from the wall and shall be spaced not more than 18 inches (457mm) on center vertically for the full height of the window well.

R310.2.3.2 Drainage. Window wells shall be designed for proper drainage by connecting to the building's foundation drainage system required by Section ~~R504.1~~ R405.1 or by an approved alternative method.

Exception: A drainage system for window wells is not required when the foundation is on well-drained soil or sand-gravel mixture soils according to the United Soil Classification System, Group I Soils, as detailed in Table R405.1.

R310.2.4 Emergency escape and rescue openings under decks and porches. Emergency escape and rescue openings shall be permitted to be installed under decks and porches provided the location of the deck allows the emergency escape and rescue openings to be fully opened and provides a path not less than 36 inches (914 mm) in height to a yard or court.

R310.3 Emergency escape and rescue doors. Where a door is provided as the required emergency escape and rescue opening, it shall be permitted to be a side hinged door or a slider. Where the opening is below the adjacent ground elevation, it shall be provided with a bulkhead enclosure.

R310.3.1 Minimum door opening size. The minimum net clear ~~height~~ opening for any door that serves as an emergency and escape rescue opening shall be in accordance with Section R310.2.1.

R310.3.2 Bulkhead enclosures. Bulkhead enclosures shall provide direct access from the basement. The bulkhead enclosure shall provide the minimum net clear opening equal to the door in the fully open position.

R310.3.2.1 Drainage. Bulkhead enclosures shall be designed for proper drainage by connecting to the building's foundation drainage system required by Section ~~R504.1~~ R405.1 or by an approved alternative method.

Exception: A drainage system for bulkhead enclosures is not required when the foundation is on well-drained soil or sand-gravel mixture soils according to the United Soil Classification System, Group I Soils, as detailed in Table R405.1.

R310.4 Bars, grilles, covers and screens. Bars, grilles, covers, screens or similar devices are permitted to be placed over emergency escape and rescue openings, bulkhead enclosures, or window wells that serve such openings, provided the minimum net clear opening size complies with Section~~s R310.1.1 to R310.1.3~~ R310.2.1, and such devices shall be releasable or removable from the inside without the use of a key, tool, special knowledge or force greater than that which is required for normal operation of the escape and rescue opening.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: The committee approved the original proposal as submitted.

The proposed modifications in this public comment mainly address editorial changes due to code text reorganization and section renumbering.

This public comment also addresses the 5 square feet exception to the 5.7 square feet minimum opening area. In the original proposal, the exception that allows 5 square feet for grade floor openings is also extended to below-grade openings. Only openings at grade level would be able to afford easier access for emergency escape and rescue that would justify reducing the minimum net clear opening to 5 square feet. Openings below grade would require greater efforts and should meet 5.7 square feet minimum opening area.

RB117-13

Final Action: AS AM AMPC____ D

RB122-13
R310.1.5 (New)

Proposed Change as Submitted

Proponent: Jeff Inks, Window and Door Manufacturers Association, representing the Window & Door Manufacturers Association.

Add new text as follows:

R310.1.5 Replacement windows. Replacement windows installed in buildings meeting the scope of this code shall be exempt from the maximum sill height requirements of Sections R310.1 and Sections R310.1.1, R310.1.2, and R310.1.3 provided the replacement window meets the following conditions:

1. The replacement window is the manufacturer's largest standard size window that will fit within the existing frame or existing rough opening. The replacement window shall be permitted to be of the same operating style as the existing window or a style that provides for an equal or greater window opening area than the existing window.
2. The replacement window is not part of a change of occupancy.

Reason: First, while this provision is applicable to existing construction (for the reasons stated below), it is being proposed for inclusion in the main body of the IRC because window replacements are more common than other significant changes made to existing one- or two-family homes and townhomes, and in addition, for consistency with what is being proposed for IRC Appendix J and IEBC Chap 7 by us and the ICC CTC.

The proposed provisions and language are also based on Minnesota's residential code which does effectively incorporate the provisions into the main body of the code in the same location (R310.1.5) being proposed above.

The provisions and language have also already been approved for IEBC Chap. 4 which occurred during the Group A proceedings.

Most importantly, it's important to note that the provisions do not allow for any decrease in safety and rather will help ensure improvements in safety can be made.

More specifically, the intent of this proposal is to ensure that the IRC does not discourage or prevent improvements in emergency escape and rescue openings, especially for fire safety, in older residential occupancies by requiring replacement windows to meet all of the provisions of Section 310 when doing so can only be accomplished by increasing the size of the rough opening or altering the interior wall.

Because many of these older buildings were constructed under codes that did not include the same emergency escape and rescue opening provisions that the IRC now requires for new construction, the only way to fully meet all of the requirements of Section 310 for new construction if required when windows are replaced is to enlarge the rough opening and/or make significant alterations to the interior wall in order to accommodate any increase in window size or lowering of a sill.

At the very least, the significant cost and design challenges of altering the rough opening and/or interior wall can discourage or prevent window replacement and at worst can discourage or prevent the replacement of older windows that are harder to operate or are inoperable all together because of their age or poor maintenance and, that are significantly less energy efficient. When that happens, improvements to safety as well as energy efficiency are needlessly compromised.

Furthermore and on the whole, while some bedroom windows in older homes may not provide the full clear opening that is required for new construction or may have a sill height above 44 inches, they nonetheless still provide a viable emergency and escape rescue opening which is the primary intent of the code. Replacement of these windows with the same type of operating window or other type that can provide an equal or greater clear opening than the existing window -- even if they do not fully meet the clear opening or sill height requirements of Section 310 – is always an improvement in safety, especially when a replacement opening can provide a larger clear opening than the existing window. Such improvements in safety should not be discouraged or prevented by overly onerous requirements for replacement windows.

This proposal will help ensure that doesn't happen by providing limited exceptions to the requirements of Section 310 that can only be applied when certain conditions are met and that as already noted, will not result in a decrease in safety.

The requirements for new construction that emergency escape and rescue openings be provided as well as the operational requirements of Section 310.1.4 are maintained and still applicable to replacement windows.

Cost Impact: This code change will not increase the cost of construction.

R310.1.5 (NEW) #1-RB-INKS

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this proposal because they felt that, although there are difficulties in replacing existing windows, the existing building provisions are a location where it might be appropriate to state conditions where full compliance is required versus some relief. Some older residences had windows for ventilation only that have sill heights that are 52" or are 3 by 3 double-hungs. At some point we need to address emergency escape and rescue openings where there is an opportunity. Where requirements are too restrictive it will discourage the maintenance and upkeep of older homes.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jeff Inks, representing Window & Door Manufacturers Association, requests Approval as Submitted.

Commenter's Reason: While these same provisions have been approved for the IRC Appendix J (RB-467) and the IEBC Chapter 7 (EB-15) for the reasons stated in those proposals, we are still requesting for approval as submitted of this proposal for the inclusion of them in the main body of the IRC for jurisdictions that do not adopt Appendix J.

The provisions are critical to providing needed, reasonable replacement requirements for EERO windows that do not discourage or prevent EERO window replacements while at the same time ensure there is no reduction in safety (as discussed in the above reason statement for the proposal). Jurisdictions that do not adopt Appendix J will lack these provisions, which is why we have also proposed them for inclusion in Chapter 3. Including them in Chapter 3 clarifies the applicability of **Section R102.7.1, Additions, alternations or repairs,** with respect to EERO window replacements.

We therefore urge approval as submitted for the reasons stated in the proposal to ensure these provisions are in place for all jurisdictions that adopt the IRC regardless of whether or not they adopt Appendix J

RB122-13
Final Action: AS AM AMPC____ D

RB124-13
R310.6 (New), R310.7 (New)

Proposed Change as Submitted

Proponent: Rick Davidson, City of Maple Grove, Association of Minnesota Building Officials (rdavidson@maplegrovemn.gov)

Revise as follows:

R310.6 Dwelling additions. Where dwelling additions occur that contain sleeping rooms, an emergency escape and rescue opening shall be provided in each new sleeping room. Where dwelling additions occur that have basements, an emergency escape and rescue opening shall be provided in the new basement.

Exceptions:

1. An emergency escape and rescue opening is not required in a new basement that contains a sleeping room with an emergency escape and rescue opening.
2. An emergency escape and rescue opening is not required in a new basement where there is an emergency escape and rescue opening in an existing basement that is accessible from the new basement.

R310.7 Alterations or repairs of existing basements. An emergency escape and rescue opening is not required where existing basements undergo alterations or repairs.
Exception: New sleeping rooms created in an existing basement shall be provided with emergency escape and rescue openings in accordance with R310.1.

(Portions of proposal not shown remain unchanged)

Reason: There continues to be confusion in the code enforcement community as to the requirements for emergency escape and rescue opening requirements as they apply to existing basements and additions. Hopefully this proposal will make it clearer that emergency escape and rescue openings are only required in additions if there are sleeping rooms and/or a basement and then only if the new basement does not have a sleeping room or access to an emergency escape and rescue opening in the existing basement. Furthermore, this amendment is intended to clarify that existing basements that do not undergo expansion and where no sleeping rooms are added need not have emergency escape and rescue openings installed when remodeling occurs. At least in our area, code officials sometimes require emergency escape and rescue openings be installed when basements are finished or remodeled even when no sleeping rooms occur. This was never the intent of the code.

Cost Impact: None

R310.6 (NEW)-RB-DAVIDSON

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee approved this code change proposal because they felt that it improves the clarity of the code with regard to existing buildings. Some requirements might be better located elsewhere in the code, but this is an improvement.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Joseph Day III and Marc St. Jean, DBOA President, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R310.7 ~~Alterations or~~ repairs of existing basements. An emergency escape and rescue opening is not required where existing basements undergo ~~alterations or~~ repairs.

> ~~**Exception:** New sleeping rooms created in an existing basement shall be provided with emergency escape and rescue openings in accordance with R310.1.~~

Commenter's Reason: The elimination of an emergency escape and rescue opening for alterations to existing basements weakens the code and the fire safety of the occupants of the dwelling and of the firefighters who will respond to the dwelling in the event of a fire. The conversion of an existing basement into habitable space falls under the definition of alteration. Allowing this type of alteration without requiring the installation of an emergency escape and rescue opening and reduces weakens the code by allowing the dwelling to be less safe after the alterations than its existing condition.

RB124-13

Final Action: AS AM AMPC____ D

RB129-13
R311.7

Proposed Change as Submitted

Proponent: Rick Davidson, City of Maple Grove, Association of Minnesota Building Officials (rdavidson@maplegrovemn.gov)

Add new text as follows:

R311.7 Stairways. Stairways serving a dwelling or accessory structure shall comply with this section. This shall include, but shall not be limited to, exterior stairs from a dwelling or garage to grade and those stairs serving decks, porches, balconies, sun rooms, and similar structures.

Exceptions:

1. Stairs serving attics or crawl spaces.
2. Stairs that only provide access to plumbing, mechanical, or electrical equipment.
3. Stairs that serve structures or spaces used by children as play areas.

Reason: When reading Section R311 of the IRC regarding stairs, the language supports only two interpretations on how stairs are regulated. Those two interpretations are that either all stairs must comply with the section or only those stairs that are a part of the means of egress should comply. There is no other language that allows vacillation between those interpretations.

The title of the section is "Means of Egress". R311.1 requires a means of egress from "all portions of the dwelling to the exterior of the dwelling…" R311.4 qualifies the charging language by stating that every habitable level including basements must either have an exterior exit door meeting the requirements of R311.2 or have a stair or ramp connecting that level to a level that has such a door. Note that it does not say "stairs" or "ramps" but "stair" or "ramp" (singular).

The text of the code does not support regulating stairs that are not a part of the "means of egress". This theory is apparently wide spread because many building officials are of the opinion that stairs used in landscaping are not regulated. Also, attempts to submit code changes to the ICC IRC Committee to give relief for stairs to attics and crawl spaces have been met with resistance from the Committee with the statement that they are already exempt. One can come to that conclusion only if you interpret the stair rules to apply to the means of egress and only one means of egress is required and that is only required from the dwelling, not attics, crawl spaces, and garages.

But if you take the position that the section only regulates those stairs that are part of the means of egress, stairways serving attics and crawl space and landscaping stairs would not be regulated but also stairs serving decks and the stairs commonly found serving as a path of travel from a dwelling to a garage would not be. In fact, R311.1 specifically prohibits a means of egress from traveling through a garage.

So there is confusion as to whether or not the code does regulate or intends to regulate certain stairs. This proposal makes it clear that all stairs are required to comply with the code unless specifically exempted. If this proposal is supported, stairs that are part of landscaping would be exempt unless they serve as a means of travel from a dwelling or accessory structure to grade. Stairs from a deck or from one level of a deck to another would be regulated. Stairs between a dwelling and garage would be regulated. Stairs serving an attic or crawl space would not be regulated. The current text already exempts stairs to crawl spaces by Section R311.4 but not directly. It exempts them because it does not list crawl spaces as a location where compliant stairs are required. But this also supports the possibility that the code does not regulate stairs serving a deck.

It is necessary to eliminate the confusion and inconsistency that exists in the enforcement of stair requirements that this language be approved. The proposal is reasonable because it puts into written format what is commonly accepted to be code language even if it cannot be supported by that text.

The following is for informational purposes only.

SECTION R311
MEANS OF EGRESS

R311.1 Means of egress. All *dwellings* shall be provided with a means of egress as provided in this section. The means of egress shall provide a continuous and unobstructed path of vertical and horizontal egress travel from all portions of the *dwelling* to the exterior of the *dwelling* at the required egress door without requiring travel through a garage.

And,

R311.4 Vertical egress. Egress from habitable levels including habitable attics and *basements* not provided with an egress door in accordance with Section R311.2 shall be by a ramp in accordance with Section R311.8 or a stairway in accordance with Section R311.7.

Cost Impact: None

R311.7-RB-DAVIDSON

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that, in proposed Exception 3, "stairs that serve spaces for children used as play areas" is not defined. This is the means of egress section and stairs are included in the proposal in this section that are not part of the means of egress.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rick Davidson, City of Maple Grove, representing Association of Minnesota Building Officials, requests Approval as Submitted.

Commenter's Reason: The intent of this proposal was to make clear what stairs were regulated and provide exceptions for certain applications including structures used by children. However, the committee disapproved this proposal with the statement that the proposal addressed stairs that are not part of the means of egress and this was the means of egress section.

I disagree. It is necessary to consider the application of stair requirements to the variety of stairs found in a building regulated by the IRC. Regardless of whether or not you direct a building owner to build in a certain way, you need to be able to prosecute that violation and if the text does not track, you will fail in that prosecution and likely you won't even get it past your city attorney's desk.

The code requires that all ***dwellings*** (not accessory structures) shall be provided with a means of egress (R311.1). Are we to assume that stairs in accessory structures are not regulated? If one creates an art studio on the second floor of a detached garage, is the stair to the second floor not regulated? If you believe it is regulated, what code section do you cite?

The code requires that a means of egress be provided but specifically prohibits that path from traveling through a garage (R311.1). Are we to assume that the stairs commonly found serving as a path of travel between the house and garage is not regulated? If you believe it is regulated, what code section do you cite?

The code requires at least one egress door and provides specific requirements for that door (R311.2). A sliding door commonly used to provide access to a deck does not meet that requirement so a path through one of these doors to grade via the deck and stairs is not a compliant means of egress. Does that mean the stairs to the deck are not regulated? If you believe it is regulated, what code section do you cite?

The code requires vertical egress from a basement but only if there is not an egress door provided from the basement (R311.4). So, for homes with walkout basements and a compliant basement egress door, are we to assume the stair to the main floor is not regulated? If you believe it is regulated, what code section do you cite?

And if you are of the opinion that it is the intent of the code to regulate those stairs that are not part of the means of egress and that serve locations other than the dwelling, you are cornered into applying the stair requirements in all cases unless there are exceptions to those unique situations. Such is the case for stairs serving an attic or a child's playhouse.

Clearly there are differences of opinion over the regulation, or lack thereof, of certain stairs. As code officials, it is imperative that we have clear direction on how we enforce rules on stairs which are one of the most common elements in a home. If you believe you have a violation that needs to be corrected, you need to be able to prosecute that violation.

This proposal starts by requiring all stairs to comply with the code. This includes stairs serving buildings that are not dwellings. It includes stairs from decks to grade. This clears up the question regarding which stairs are regulated.

The proposal then provides specific exemptions for stairs serving attics and crawl spaces and those areas that only house equipment. It also provides an exception for structures or areas used as children's play areas. For example, a two story children's play house is not exempted from permits. Is it reasonable to require stairs intended to serve such a space to meet the geometry and headroom requirements found in the code? Of course not! New and remodeled homes sometimes have elevated areas in bonus rooms for children's play areas. Again, it is appropriate to provide some relief from the strict application of the code to these uses.

This proposal provides some long missing direction and closes some gaps in the path to requiring compliance with stair requirements.

RB129-13

Final Action: AS AM AMPC____ D

RB130-13
R311.7.1

Proposed Change as Submitted

Proponent: David W. Cooper, Stair Manufacturing and Design Consultants, representing the Stairway Manufacturers' Association (sma@stairways.org)

Revise as follows:

R311.7.1 Width. *Stairways* shall not be less than 36 inches (914 mm) in clear width at all points above the permitted *handrail* height and below the required headroom height. *Handrails* shall not project more than ~~4.5~~ 6.5 inches (~~114~~165 mm) on either side of the *stairway* and the minimum clear width of the *stairway* at and below the *handrail* height, including treads and landings, shall not be less than 31½ inches (787 mm) where a *handrail* is installed on one side and 27 inches (698 mm) where *handrails* are provided on both sides.

Exception: The width of spiral *stairways* shall be in accordance with Section R311.7.10.1.

Reason: The required continuous handrail often needs to project an additional 2 inches from the side of the stairway to maintain the required finger clearance when passing nosing projections at a floor, landing, or return flight. This would not diminish the required width and would provide needed finger clearance to avoid nosing projections into the stairway.

Cost Impact: This code change will not increase the cost of construction

R311,7.1-RB-COOPER

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that the proposal would not limit the increased projection to only the stated problem area.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

David W. Cooper, Stair Manufacturing and Design Consulting, representing Stairway Manufacturers' Association, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

Revise text as follows:

R311.7.1 Width. *Stairways* shall not be less than 36 inches (914 mm) in clear width at all points above the permitted *handrail* height and below the required headroom height. *Handrails* shall not project more than 4.5 inches (114mm) on either side of the *stairway* and the minimum clear width of the *stairway* at and below the *handrail* height, including treads and landings, shall not be less than 31½ inches (787 mm) where a *handrail* is installed on one side and 27 inches (698 mm) where *handrails* are provided on both sides.

Exceptions:

1. The width of spiral *stairways* shall be in accordance with Section R311.7.10.1.

2. Handrails may project an additional 2¼ inches (57 mm) into the stairway where passing nosing projections at a floor, landing or return flight in order to provide the 1½ inches (38 mm) space required in Section R311.7.7.2, provided the handrails do not project into the required stairway widths at and below the handrails.

Commenter's Reason: The committee felt that the original proposal did not limit the additional projection to the problem areas stated in the original reason statement. This modification clearly does so by removing the changes proposed to R311.7.1, Width, and adding Exception 2. The new exception not only limits when additional projection is allowed but provides for handrail continuity and finger clearance with no intrusion into the required width. The additional projection needed will not reduce the width currently required. This most accurately reflects the most common interpretation and enforced solution in the problem areas cited.

RB130-13

Final Action: AS AM AMPC____ D

RB133-13
R311.7.5.1

Proposed Change as Submitted

Proponent: David W. Cooper, Stair Manufacturing and Design Consultants, representing the Stairway Manufacturers' Association (sma@stairways.org)

Revise as follows:

R311.7.5.1 Risers. The maximum riser height shall be 7¾ inches (196 mm). The riser shall be measured vertically between leading edges of the adjacent treads. The greatest riser height within any *flight* of *stairs* shall not exceed the smallest by more than ⅜ inch (9.5 mm). Risers shall be vertical or sloped from the underside of the nosing of the tread above at an angle not more than 30 degrees (0.51 rad) from the vertical. Open risers are permitted provided that ~~the opening between treads does not permit the passage of a 4-inch diameter (102 mm) sphere.~~ riser openings between treads located more than 30 inches (762 mm) measured vertically to the floor or grade below at any point within 36 inches (914 mm) horizontally to the lower edge of the riser do not permit the passage of a 4 inch diameter (102 mm) sphere.

> ~~**Exception:** The opening between adjacent treads is not limited on stairs with total rise of 30 inches (762 mm) or less.~~

Reason: The exception allows unrestricted openings in risers if the stair has a 30" total rise. This is a flawed requirement. Flights stacked in a well could have a total rise of 30 inches and an exposure to a much greater fall distance to the next level or flight below. This change correctly identifies the hazard and the needed requirement applies the language found in section R312, Guard and window fall protection.

Cost Impact: This code change would not increase the cost of construction.

R311.7.5.1-RB-COOPER

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this proposed code change because they felt that it creates enforcement problems in that many different measurements might be required, and because the proposed language was confusing.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

David W. Cooper, Stair Manufacturing and Design Consulting, representing Stairway Manufacturers' Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R311.7.5.1 Risers. The maximum riser height shall be 7¾ inches (196 mm). The riser shall be measured vertically between leading edges of the adjacent treads. The greatest riser height within any *flight* of *stairs* shall not exceed the smallest by more than ⅜ inch (9.5 mm). Risers shall be vertical or sloped from the underside of the nosing of the tread above at an angle not more than 30 degrees (0.51 rad) from the vertical. Open risers are permitted provided ~~that riser~~ the openings ~~between treads~~ located more than 30 inches (762 mm) measured vertically to the floor or grade below ~~at any point within 36 inches (914 mm) horizontally to the lower edge of the riser~~ do not permit the passage of a 4 inch diameter (102 mm) sphere.

Commenter's Reason: The current exception in the code allows unrestricted openings in risers if the stair has a 30" total rise. This is a flawed requirement. Flights stacked in a well could have a total rise of 30 inches and an exposure to a much greater fall distance to the next level or flight below. This change correctly identifies the hazard. The modification addresses the committee's concern by clearly stating the requirement in simple understandable terms and eliminates the need for the exception

RB133-13
Final Action: AS AM AMPC____ D

RB136-13
R311.7.8.2

Proposed Change as Submitted

Proponent: Rick Davidson, City of Maple Grove, Association of Minnesota Building Officials (rdavidson@maplegrovemn.gov)

Revise as follows:

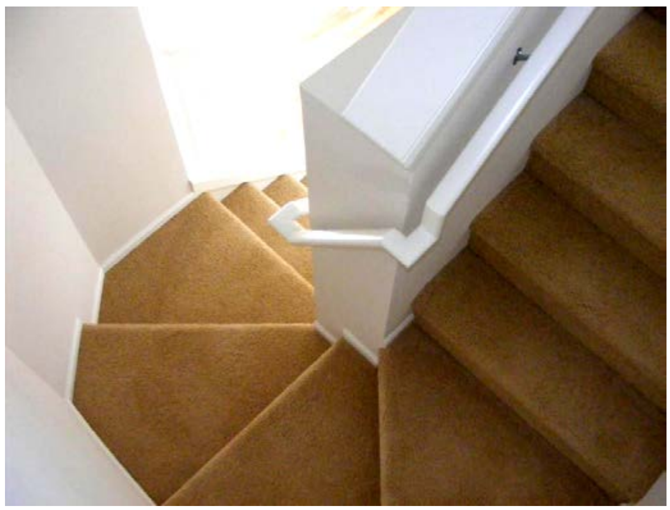
R311.7.8.2 Continuity. Handrails for stairways shall be continuous for the full length of the flight, from a point directly above the top riser of the flight to a point directly above the lowest riser of the flight. Handrail ends shall be returned or shall terminate in newel posts or safety terminals. Handrails adjacent to a wall shall have a space of not less than 1½ inch (38 mm) between the wall and the handrails.

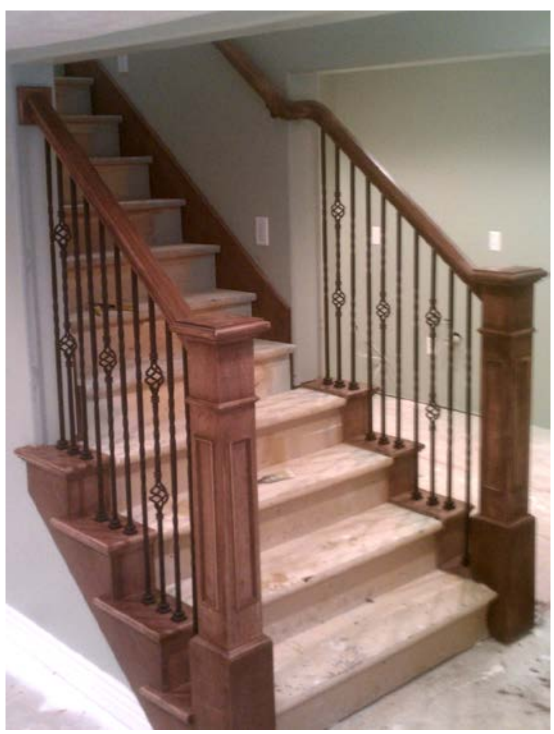
Exceptions:

1. Handrails shall be permitted to be interrupted ~~by a~~ newel posts ~~at the turn~~.
2. The use of a volute, turnout, starting easing or starting newel shall be allowed over the lowest tread.
3. Handrails shall be permitted to be interrupted at the transition from a wall to a guard.
4. Handrails shall be permitted to be interrupted where a flight changes direction.

Reason: Handrails are required by the IRC to be continuous with two exceptions. The first allows the rail to be interrupted by a newel post "at a turn". The term "at a turn" can be interpreted in different ways. Does this mean a ninety degree turn, a 180 degree turn, or perhaps a 45 degree turn? Does it apply only when flights are interrupted by a landing or does it also apply to winder stairs? But let's face it. These rails are in dwellings, not public settings. These rails are often installed by homeowners who lack even simple joinery skills. The users of the stairs are familiar with their surroundings. The rails are not required for accessibility purposes. Yet they are required to meet the same standard that applies to high occupant load commercial applications. That is overkill.

If it is safe to remove one's hand when maneuvering around a newel post "at a turn", why is it not safe to do the same on a straight run of a stair, or when negotiating a turn on a winder stair, or when transitioning from a stair enclosed on both sides to open on both sides? Following are some attempts at compliance with current code





Does anyone really believe that the user of any of these stairs would maintain contact between their hand and the railing during the complete traverse of the stair? Likely not, because it requires twisting the wrist and hand in ways that are uncomfortable if not impossible.

Let's be realistic. For dwelling applications, it is reasonable to allow greater leeway in handrail designs. Following are some examples of railings designs that are no more hazardous than the ones deemed 100% compliant. The last example is commonly found by field inspectors on owner (and sometimes contractor) constructed deck stairs. Intermediate posts are necessary to stabilize the guard. But the post interrupts the handrail and results in a correction notice to install a continuous rail. This is usually met by complaints by the homeowner that no unsafe condition exists and many people would agree. Installing an additional railing on this type of stair "just to meet the code" smacks of over-regulation, generates complaints about the unsightly finished product, and adds unnecessary cost to the construction of the stair not to mention the ill will created between building departments and taxpaying homeowners.

It is time to add some reasonableness to the handrail requirements for dwellings. This proposal adds a number of changes. First, it allows the rail to be discontinued whenever a newel post occurs. It deletes the ambiguous term "at the turn" and allows the newel post be placed at any change of direction or at mid flight if desired. Either the interruption of a rail by a newel post is a hazard all of the time or none of the time. This proposal takes the position that a newel post poses no hazard. The second change allows the handrail to be discontinued where the stair makes a change from having walls on the side of the stair to having guards as is illustrated below. The basis for the argument is that creating a turn in the handrail that may cause the wrist to make a full ninety degree turn at this transition is not reasonable and that the average individual will take their hand off the rail anyway to make this transition. Furthermore, this situation, oft encountered when basements are finished, is difficult for most homeowners to overcome. The last change adds an exception allowing the handrail to be discontinued when the stair makes a change in direction as may occur with a winder stair. The following pictures illustrate some of those applications.

This proposal will not lessen the safety of stairs. In some cases it may enhance the safety by creating handrails that are more ergonomically useable. It will enable homeowners to comply with the rules and stay within their skill levels thus keeping costs reasonable.

Cost Impact: None

R311.7.8.2-RB-DAVIDSON

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The committee disapproved this proposed code change because they felt that stairs account for many falls and that a continuous rail is important, whether or not it is held continuously, to reduce the incidence of falls. No technical data was submitted to support the proposal.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

David W. Cooper, Stair Manufacturing and Design Consulting, representing Stairway Manufacturers' Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R311.7.8.2 Continuity. Handrails for stairways shall be continuous for the full length of the flight, from a point directly above the top riser of the flight to a point directly above the lowest riser of the flight. Handrail ends shall be returned or shall terminate in newel posts or safety terminals. Handrails adjacent to a wall shall have a space of not less than 1½ inch (38 mm) between the wall and the handrails.

Exceptions:

1. Handrails shall be permitted to be interrupted by newel post~~s~~ at a turn or landing.
2. The use of a volute, turnout, starting easing or starting newel shall be allowed over the lowest tread.
3. ~~Handrails shall be permitted to be interrupted at the transition from a wall to a guard.~~ Handrails serving as the tops of guards shall be permitted to be interrupted by a wall provided a continuing handrail is provided on the same side of the stair at the same height as measured above the line of the nosings.
4. ~~Handrails shall be permitted to be interrupted where a flight changes direction.~~

Commenter's Reason: We spoke against this proposal in Dallas due to the proponent's intent to allow intermediate newels in a straight run to interrupt the handrail allowing newels to interrupt the handrail at any point without restriction. However we mentioned the proposal clearly pointed to other needed provisions within the code.

Exception 1: Our modification proposes language from **IBC 1012.4 Continuity** Exception 1 which states "turn or landing" and is a simple way to eliminate the need for exception 4 that is working well within the code.

Exception 2: Remains unchanged.

Exception 3: This has been reworded to include concerns for a smooth transition assuring both rails are at the same height. As stated in the Dallas testimony of the proponent we have been using "S fittings" for 20 years and the fact is people do not follow them with their hand and they contribute nothing to safe use of stairways. It is time to realize this and provide a solution that can be easily and affordably provided.

RB136-13

Final Action: AS AM AMPC____ D

RB141-13
R311.8.1

Proposed Change as Submitted

Proponent: Rick Davidson, City of Maple Grove Association of Minnesota Building Officials (rdavidson@maplegrovemn.gov)

Revise as follows:

R311.8.1 Maximum slope. Ramps <u>serving the egress door required by section R311.2</u> shall have a maximum slope of 1 unit vertical in 12 units horizontal (8.3-percent slope). <u>All other ramps shall have a maximum slope of 1 unit vertical to 8 units horizontal (12.5-percent slope).</u>

Exception: Where it is technically infeasible to comply because of site constraints, ramps may have a maximum slope of one unit vertical in eight horizontal (12.5-percent slope).

Reason: When ramp slope requirements were changed a few years back, the reason stated was to enable persons with disabilities to stay in their homes. However, the scope of the proposal included all ramps, even those that could not be used by persons with disabilities. For example, dwelling additions to older homes sometimes have new basements at a deeper level and the owner wishes to make the transition by ramp. A 1:12 slope can sometimes be difficult to achieve and absorbs much more space than need be. Media rooms are often designed to have sloping floors with ramps serving the seating and again the 1:12 slope is problematic. This proposal gives some relief for those situations where accessibility may not be an issue. This also is consistent with section 1010.3 of the IBC which allows a 1:8 slope for pedestrian ramps not used as a means of egress.

IBC
SECTION 1010
RAMPS

1010.3 Slope. *Ramps* used as part of a *means of egress* shall have a running slope not steeper than one unit vertical in 12 units horizontal (8-percent slope). The slope of other pedestrian *ramps* shall not be steeper than one unit vertical in eight units horizontal (12.5-percent slope).

Cost Impact: None

R311.8.1-RB-DAVIDSON

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee approved this code change proposal because they felt that a 1 in 12 ramp slope is a reasonable maximum when serving the egress door, but ramps serving other areas should have more flexible requirements.

Assembly Action: **Disapproved**

Individual Consideration Agenda

This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action of Disapproved and a public comment was submitted.

Public Comment:

Dominic Marinelli, representing United Spinal Association, requests Disapproval.

Commenter's Reason: United Spinal Association respectfully requests that RB-141-13(below)is disapproved.
The proposed added language to RB 311.8.1 "all other ramps shall have a maximum slope of 1 unit vertical to 8 units horizontal" would essentially create a large loophole given that only one egress door is required by R311.2, this language will permit

all ramps (other than the one ramp designated to serve the egress door), to have a maximum slope of 12.5%. As the intent of "Aging in Place" design features is to increase safety, accessibility, and independence for older adults in their own homes, permitting ramps to be constructed with a slope of 1 unit vertical to 8 units horizontal (12.5-percent slope) falls short of promoting accessibility, or aging in place features, where ramps are provided to areas of the home that would be utilized by the homeowner. Except for those areas where it is technically infeasible due to site constraints to provide a 1:12 maximum slope, United Spinal does not concur that all ramps (other than ramps serving egress doors) should be permitted to have a maximum slope of 1:8.

RB141 – 13 –
AS/DF
R311.8.1

Proponent: Rick Davidson, City of Maple Grove Association of Minnesota Building Officials (rdavidson@maplegrovemn.gov)
Revise as follows:

R311.8.1 Maximum slope. Ramps serving the egress door required by section R311.2 shall have a maximum slope of 1 unit vertical in 12 units horizontal (8.3- percent slope). All other ramps shall have a maximum slope of 1 unit vertical to 8 units horizontal (12.5-percent slope).

Exception: Where it is technically infeasible to comply because of site constraints, ramps may have a maximum slope of one unit vertical in eight horizontal (12.5-percent slope).

RB141-13
Final Action: AS AM AMPC____ D

RB144-13
R312.1.1, Chapter 44

Proposed Change as Submitted

Proponent: Mitch Markham, representing Ascend Restoration Services

Revise as follows:

R312.1.1 Where Required. *Guards* shall be located along open-sided walking surfaces, including stairs, ramps and landings that are located more than 30 inches (762 mm) measured vertically to the floor or *grade* below at any point within 36 inches (914 mm) horizontally to the edge of the open side. Insect screening shall not be considered as a *guard.*

> <u>**Exception:** Permanent fall arrest and restraint anchorage connector devices meeting ANSI/ASSE Z359.1 affixed for use during the entire roof covering lifetime shall be permitted where mechanical equipment, systems, devices and various components that require service are located on roof surfaces. Fall arrest/restraint devices shall be reevaluated for possible replacement when the entire roof covering is replaced. The devices shall be placed no more than 10 feet (3048 mm) on center along hip and ridge lines and placed not less than 10 feet (3048 mm) from the roof edge or open side of the walking surface.</u>

Add new standards to Chapter 44 as follows:

ANSI American National Standards Institute
25 West 43rd Street, Fourth Floor
New York, NY 10036

<u>Z359.1-07 Safety Requirements for Personal Fall Arrest Systems, Subsystems and Components</u>

ASSE American Society of Sanitary Engineering
901 Canterbury, Suite A
Westlake, OH 44145

<u>Z359.1-2007 Safety Requirements for Personal Fall Arrest Systems, Subsystems and Components</u>

Reason: This proposal is intended to correlate with E108-12 which was approved at the 2012 FAH as a consent agenda item during the code Group A process. This proposal is needed so there is consistency and correlation between the ICC codes. E108-12 added clarity to IBC sections 1013.6 and 1013.7, IFC sections 1013.6 and 1013.7, and IMC section 304.11. The existing code provisions requiring the construction of guards do not adequately address the expanding list of equipment, assemblies, systems, devices and items that are now commonly being placed on roof tops and elevated walking surfaces that require routine maintenance. The current requirement needs clarification and a cost effective alternative to constructing a guard on a roof since a guard is a method of fall protection required at the edge of elevated surfaces where people will walk and will provide service to roof-located equipment and other systems or devices. The code change proposal adds clarity to the current code language by identifying items within the exception that are now typical placements on roofs and elevated walking surfaces. This expands the fall protection, life-safety provisions to a growing number of trades and service workers that are working on elevated surfaces. The proposal also provides an alternate method of compliance with the inclusion of an exception which allows for the installation of fall arrest/restraint anchorage connector devices meeting ANSI Z359.1 which is the nationally recognized consensus general industry standard in use across the country. The proposed exception is a choice made by the designer and building owner that provides design flexibility and the opportunity to lower construction cost associated with building guards. The proposal will increase the uniform application of this section of the code. The Bureau of Labor Statistics, US Department of Labor reports the fatalities due to falls for the years from 1998 to 2010 are second to only highway incidents, with an average of 743 fatalities each year over this 12 year period. Of the 635 fatal falls in 2010, one third is from falls from ladders or roofs. In 2010 the construction industry had the highest number of fatal occupational injuries. In 2010 for nonfatal falls the median number of days away from work due to falls to a lower level was 14 days. Clearly the code needs to be improved to provide fall protection where mechanical equipment, appliances, equipment, fans, roof hatch openings, solar arrays, solar water heaters, photovoltaic panels, skylights, chimneys, attic vents, and ventilators, satellite dishes, antennas, television/radio/internet and other communication equipment and all other machinery and other components that require service are located on elevated surfaces more than 30 inches above a lover level.

Cost Impact: The code change proposal will not increase the cost of construction because the current code provisions can be interpreted to have the intent to require guards at all elevated working level more than 30 inches above a floor, roof or grade. The inclusion of an exception provides a choice to the builder and homeowner to lower the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, [ANSI/ASSE Z359.1-2007] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

R312.1.1-RB-MARKHAM

Committee Action Hearing Results

For staff analysis of the content of U.S. ANSI/ASSE Z359.1 relative to CP#28, Section 3.6, please visit:
http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf

Committee Action: Disapproved

Committee Reason: The committee disapproved this code change proposal because they felt that anchorage devices are used primarily for protection of workers and there is no point in leaving them permanently in place. They are not particularly attractive. This proposal may be more appropriate if reworked as an exception to Section M1304.1.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Ed Golden, representing Ascend Restoration Services requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R312.1.1 Where Required. *Guards* shall be located along open-sided walking surfaces, including stairs, ramps and landings that are located more than 30 inches (762 mm) measured vertically to the floor or *grade* below at any point within 36 inches (914 mm) horizontally to the edge of the open side. Insect screening shall not be considered as a *guard.*

> ~~**Exception:** Permanent fall arrest and restraint anchorage connector devices meeting ANSI/ASSE Z359.1 affixed for use during the entire roof covering lifetime shall be permitted where mechanical equipment, systems, devices and various components that require service are located on roof surfaces. Fall arrest/restraint devices shall be reevaluated for possible replacement when the entire roof covering is replaced. The devices shall be placed no more than 10 feet (3048 mm) on center along hip and ridge lines and placed not less than 10 feet (3048 mm) from the roof edge or open side of the walking surface.~~

Ml305.1 Appliance access for inspection service, repair and replacement. *Appliances* shall be accessible for inspection, service, repair and replacement without removing permanent construction, other *appliances,* or any other piping or ducts not connected to the *appliance* being inspected, serviced, repaired or replaced. A level working space at least 30 inches deep and 30 inches wide (762 mm by 762 mm) shall be provided in front of the control side to service an *appliance,* Installation of room heaters shall be permitted with at least an 18-inch (457 mm) working space. A platform shall not be required for room heaters.

> <u>**Exception:** Permanent fall arrest and restraint anchorage connector devices meeting ANSI/ASSE Z359.1affixed for use during the entire roof covering lifetime shall be permitted where mechanical equipment, systems, devices and various components that require service are located on roof surfaces. Fall arrest/restraint devices shall be reevaluated for possible replacement when the entire roof covering is replaced. The devices shall be placed no more than 10 feet (3048 mm) on center along hip and ridge lines and placed not less than 10 feet (3048 mm) from the roof edge or open side of the walking surface.</u>

(Portions of proposal not shown to remain unchanged)

Commenter's reason: Members of the IRC Code Development Committee said during deliberation of this code change that section M1305.1is the preferred location for this proposed exception since M1305.1requires a level working space 30 inches by 30 inches. This exception is appropriate as it is a cost effective alternate to creating a safe working place when mechanical equipment is located on peaked roofs. This proposal is intended to correlate with E108-12 which was approved at the 2012 FAH as a consent agenda item during the code Group A process.This proposal is needed so there is consistency and correlation between the ICC codes. E108-12 added clarity to IBC sections 1013.6 and1013.7,IFC sections 1013.6 and 1013.7,and IMC section 304.11.The existing code provisions requiring the construction of guards do not adequately address the expanding list of equipment, assemblies, systems,devices and items that are now commonly being placed on roof tops and elevated walking surfaces that require routine maintenance.The current requirement needs clarification and a cost effective alternative to constructing a guard on a roof since a guard is a method of fall protection required at the edge of elevated surfaces where people will walk and will provide service to roof-located equipment and other systems or devices. The code change proposal adds clarity to the current code language by identifying items within the exception that are now typical placements on roofs and elevated walking surfaces. This expands the fall protection, life-safety provisions to a growing number of trades and service workers that are working on elevated surfaces. The proposal also provides an alternate method of compliance with the inclusion of an exception which allows for the installation of fall arrest/restraint anchorage connector devices meeting ANSI Z359.1which is the nationally recognized consensus generalindustry standard in use across the country. The proposed exception is a choice made by the designer and building owner that provides design flexibility and the opportunity to lower construction cost associated with building guards. The proposal will increase the uniform application of this section of the code. The Bureau of Labor Statistics,US Department of Labor reports the fatalities due to falls for the years from 1998 to 2010 are second to only highway incidents, with an average of 743 fatalities each year over this 12 year period. Of the 635 fatal falls in 2010,one third is from falls from ladders or roofs. In 2010 the construction industry had the highest number of fatal occupational injuries.In 2010 for nonfatal falls the median number of days away from work due to falls to a lower level was 14 days. Clearly the code needs to be improved to provide fall protection where mechanical equipment, appliances, equipment, fans,roof hatch openings,solar arrays, solar water heaters, photovoltaic panels, skylights,chimneys,attic vents, and ventilators, satellite dishes, antennas, television/radio/internet and other communication equipment and all other machinery and other components that require service are located on elevated surfaces more than 30 inches above a lover level.

RB151-13
R313.2

Proposed Change as Submitted

Proponent: Ali M. Fattah, P.E., City of San Diego, representing the San Diego Area Chapter of ICC (afattah@sandiego.gov)

Revise as follows:

R313.2 One- and two-family dwellings automatic fire systems. An automatic residential fire sprinkler system shall be installed in new *dwelling units* and new ~~one- and two-family~~ *dwellings*.

> **Exception:** An automatic residential fire sprinkler system shall not be required for *additions* or *alterations* to existing ~~buildings~~ *dwellings or dwelling units* that are not already provided with an automatic residential sprinkler system.

Reason: The 2009 IRC adopted fire sprinkler regulations that continue in the 2012 IRC. However upon implementation of the regulations it is apparent that an inconsistency appears in Section R313.2 when compared with Section R313.1. Section R313.1 in its exception exempts additions and alterations to townhouses that are not already protected with fire sprinklers. The exception does not exempt new townhouses added adjacent to existing townhouses from protection. Section R202 defines a townhouse as "**TOWNHOUSE.** A single-family *dwelling unit* constructed in a group…" and as a consequence R313.1 will require the new townhouse to be protected since it is a "single family dwelling unit".

Section R313.2 address a second configuration of dwelling that may be one dwelling or two attached dwelling units. It is not uncommon in more urban environments for a new dwelling unit to be added and attached to an existing dwelling and as a consequence the new dwelling unit should be protected as would a townhouse added adjacent to another townhouse dwelling unit.

The term building is not defined in the IRC and is not consistent with the heading of Section R313.2 and therefore the terms dwelling and dwelling unit are more appropriate.

Cost Impact: This code change will minimally increase the valuation of construction by less than 1 %.

R313.2-RB-FATTAH

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that it contained information that is already sufficiently addressed by the code and there is no point in repeating it.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Ali M. Fattah, City of San Diego, Development Services Department, representing San Diego Area Chapter ICC, requests Approval as Submitted.

Commenter's Reason: The original proposal is being resubmitted after a review of the published REPORT OF THE PUBLIC HEARING. The proponent was not able to attend the Code Development Hearing to explain the proposed code change. We respectfully disagree with the committee that the proposed code change includes redundant language. We appreciate that code intends to limit impacts to existing buildings that are not protected with fire sprinklers and intends to regulate the impact to occupants in new dwellings (one or two attached dwelling units) as well as new townhouses (three or more attached townhouse units).

As published the IRC seems to require new fire sprinklers in townhouses that are separated from other townhouses with a common one hour wall. The IRC does not limit the total number of attached townhouses and does not require a lot line between townhouses. As a consequence a new dwelling unit that is attached or stand-alone can be added to an existing dwelling and be separated with a one-hour wall. It would appear that the hazards due to a new living unit whether a dwelling unit or townhouse or dwelling is the same however the latter is clearly required to include a fire sprinkler system. A dwelling unit addition, similar to a townhouse addition, normally includes limited alterations to the existing dwelling.

The 2009 IRC adopted fire sprinkler regulations that continue in the 2012 IRC. However upon implementation of the regulations it is apparent that an inconsistency appears in Section R313.2 when compared with Section R313.1.

- Section R313.1 in its exception exempts additions and alterations to townhouses that are not already protected with fire sprinklers. The exception does not exempt new townhouses added adjacent to existing townhouses from protection. Section R202 defines a townhouse as "**TOWNHOUSE.** A single-family *dwelling unit* constructed in a group…" and as a consequence R313.1 will require the new townhouse to be protected since it is a "single family dwelling unit".
- Section R313.2 address a second configuration of dwelling that may be one dwelling or two attached dwelling units. It is not uncommon in more urban environments for a new dwelling unit to be added and attached to an existing dwelling and as a consequence the new dwelling unit should be protected as would a townhouse added adjacent to another townhouse dwelling unit.

The term building is not defined in the IRC and is not consistent with the heading of Section R313.2 and therefore the terms dwelling and dwelling unit are more appropriate.

RB157-13
R314.3.1

Proposed Change as Submitted

Proponent: Rick Davidson, City of Maple Grove, Association of Minnesota Building Officials (rdavidson@maplegrovemn.gov)

Revise as follows:

R314.3.1 Alterations, repairs and additions. When *alterations*, repairs or *additions* requiring a *permit* occur, or when one or more sleeping rooms are added or created in existing *dwellings*, the individual *dwelling unit* shall be equipped with smoke alarms located as required for new *dwellings*.

Exceptions:

~~1. Work involving the exterior surfaces of *dwellings*, such as the replacement of roofing or siding, or the *addition* or replacement of windows or doors, or the *addition* of a porch or deck, are exempt from the requirements of this section.~~
~~2. Installation, *alteration* or repairs of plumbing or mechanical systems are exempt from the requirements of this section.~~
1. Addition, replacement or repair of windows or doors.
2. Replacement or repair of roofing, siding, masonry, stucco, or other exterior surfaces.
3. Additions of or repairs to porches, decks, or balconies.
4. Work involving detached accessory structures.
5. Installation of retaining walls or fences.
6. Installation, repair, or alteration of plumbing, mechanical, or electrical systems that occurs on the exterior of the dwelling or in an accessory structure.
7. Installation, alteration or repairs of plumbing or mechanical systems within a dwelling unit.

Reason: It is necessary to more definitively identify those circumstances when smoke alarms are not required when alterations, repairs and additions occur because of confusion within the code enforcement community over the current language. The same revision is proposed for the CO alarm section.

For example, if smoke alarms need not be installed when a home is reroofed, are they required when someone builds a storage shed in their back yard? Current language does not seem to exempt such work.

Cost Impact: None

R314.3.1-RB-DAVIDSON

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this proposed code change because the proponent requested disapproval so that it can be improved and brought back in the public comment period.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rick Davidson, City of Maple Grove, representing Association of Minnesota Building Officials, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R314.3.1 Alterations, repairs and additions. When *alterations*, repairs or *additions* requiring a *permit* occur, or when one or more sleeping rooms are added or created in existing *dwellings*, the individual *dwelling unit* shall be equipped with smoke alarms located as required for new *dwellings*.

Exceptions:

<u>1. Work involving the exterior of *dwellings*.</u>
<u>2. Installation, *alteration* or repairs of plumbing or mechanical systems are exempt from the requirements of this section.</u>
~~1. Addition, replacement or repair of windows or doors.~~
~~2. Replacement or repair of roofing, siding, masonry, stucco, or other exterior surfaces.~~
~~3. Additions of or repairs to porches, decks, or balconies.~~
~~4. Work involving detached accessory structures.~~
~~5. Installation of retaining walls or fences.~~
~~6. Installation, repair, or alteration of plumbing, mechanical, or electrical systems that occurs on the exterior of the dwelling or in an accessory structure.~~
~~7. Installation, alteration or repairs of plumbing or mechanical systems within a dwelling unit.~~

Add new definition as follows:

<u>**Exterior of dwellings.** Exterior of dwellings shall mean the addition, replacement, or repair of windows or doors; exterior coverings regulated in Section R703; roof assemblies regulated in Chapter 9; additions, alterations or repairs to porches, decks, or balconies; and work involving accessory structures.</u>

Commenter's Reason: The first versions of the IRC exempted work involving the exterior of the dwelling from triggering installation of smoke alarms in existing dwellings. Because of confusion over what constituted "work involving the exterior of the dwelling", a phrase was added to the section in an attempt to give direction. The phrase was not mandatory language. It is what many call "commentary language". The phrase starts with "such as". This does not mean all inclusive. It is the same as "for example". The deletion of any of the items in the phrase does not change the application of the section. It may only make it less clear.

The modification re-inserts most of the language that was stricken from the original proposal except for the "such as" phrase. It also creates a definition for the term "exterior of dwellings". Because there is a companion code change for CO alarms, it seems more appropriate to have a definition that fits both sections than repeating the language in each with the possibility of later amendments creating inconsistencies.

The new definition eliminates the commentary language and in its place are references to specific areas of the code that are intended to apply. This clarity is necessary to reduce the confusion that exists with the current commentary language.

RB157-13

Final Action: AS AM AMPC____ D

RB159-13
R314.5 (New)

Proposed Change as Submitted

Proponent: Thomas P. Hammerberg, representing Automatic Fire Alarm Association (TomHammerberg@afaa.org)

Add new text as follows:

R314.5. Residential Sprinkler Monitoring. Where a Residential Sprinkler System is installed, a sprinkler waterflow alarm-initiating device shall be permitted to be connected to the multiple-station alarm or household fire alarm system to activate an alarm signal.

Reason: This language is currently used in NFPA-72-2013, 29.7.7.7.3. The purpose is to provide notification to occupants of waterflow activation. If a sprinkler activates in another part of the dwelling unit, this provides earlier warning of the fire situation and will allow additional time to leave the premises. Since the time to escape has reduced significantly in recent years, this will improve fire safety for the occupants.

Cost Impact: Minimal

R314.5 (NEW)-RB-HAMMERBERG

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that the code is not intended to describe what may, can or might be done, but rather what is required to be done.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Thomas Norton, Norel Service Co., Inc, representing self, requests Approval as Submitted.

Commenter's Reason: This proposal seeks to permit the Authority Having Jurisdiction (AHJ) to allow the use of a water flow monitoring device, the installation of which is described in NFPA-72-2013 29.7.7.7.3.

RB159-13
Final Action: AS AM AMPC____ D

RB161-13
R315.3

Proposed Change as Submitted

Proponent: Jerry Anderson, City of Overland Park, Ks, representing self (jerry.anderson@opkansas.org)

Revise as follows:

R315.3 Where required in existing dwellings. Where work requiring a permit occurs in existing dwellings that have attached garages or in existing dwellings within which fuel fired appliances exist, carbon monoxide alarms shall be provided in accordance with Section R315.1.

Exceptions:

1. Work involving the exterior surfaces of dwellings, such as the replacement of roofing or siding, or the addition or replacement of windows or doors, or the addition of a porch or deck, are exempt from the requirements of this section.
2. Installation, alteration or repairs of plumbing or mechanical systems are exempt from the requirements of this section.

Reason: The purpose of the code change is to exempt some minor work from triggering carbon monoxide detectors. The exceptions to the base requirement for installing carbon monoxide detectors in existing dwellings are exactly the same as found in section R314.3.1 for smoke detectors. This change will make the code consistent in its approach in providing early warning detection devices in dwellings. It is unreasonable require the installation of carbon monoxide detectors for any work that is done on an existing dwelling.

Cost Impact: No cost associated with this change

R315.3-RB-ANDERSON

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee approved this code change proposal because they felt that it appears to exempt some minor work from carbon monoxide requirements. This action is consistent with the requirements of R314.3.1 for smoke detectors.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Matt Archer, City of Lone Tree, representing Colorado Chapter ICC, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R315.3 Where required in existing dwellings. Where work requiring a permit occurs in existing dwellings that have attached garages or in existing dwellings within which fuel fired appliances exist, carbon monoxide alarms shall be provided in accordance with Section R315.1.

Exceptions:

~~1.~~ Work involving the exterior surfaces of dwellings, such as the replacement of roofing or siding, or the addition or replacement of windows or doors, or the addition of a porch or deck, are exempt from the requirements of this section.

~~2. Installation, alteration or repairs of plumbing or mechanical systems are exempt from the requirements of this section.~~

Commenter's Reason: Why would we exempt the installation of a carbon monoxide producing appliance from the alarm requirement that protects the occupants from their combustion products?

The exemption of minor work, especially on the outside of the house, is needed to limit the scope from triggering the requirements for a carbon monoxide alarm. To cut and paste the same exceptions from smoke alarms is good for consistency but does not make sense in this case.

RB161-13

Final Action: AS AM AMPC____ D

RB162-13
R315.3

Proposed Change as Submitted

Proponent: Rick Davidson, City of Maple Grove, Association of Minnesota Building Officials (rdavidson@maplegrovemn.gov)

Revise as follows:

R315.3 Where required in existing dwellings. Where work requiring a *permit* occurs in an existing *dwelling~~s~~* that ~~have~~ has an attached garage~~s~~ or in an existing dwelling~~s~~ within which fuel fired *appliances* exist, carbon monoxide alarms shall be provided in accordance with Section R315.1.

Exceptions:

1. Addition, replacement or repair of windows or doors.
2. Replacement or repair of roofing, siding, masonry, stucco, or other exterior surfaces.
3. Additions of or repairs to porches, decks, or balconies.
4. Work involving detached accessory structures.
5. Installation of retaining walls or fences.
6. Installation, repair, or alteration of plumbing, mechanical, or electrical systems that occurs on the exterior of the dwelling or in an accessory structure.
7. Installation, alteration, or repairs of plumbing, mechanical, or electrical systems not involving a fuel fired appliance.

Reason: Given the low number of deaths caused by CO poisoning compared to injuries and deaths caused by falls, fires, and other household accidents, the current rules regarding CO alarms are overly restrictive. Without exception, the code requires CO alarms be installed in a dwelling even when a permit is issued for a such mundane exterior work as retaining wall! This means homeowners must provide access to the interior of their homes to contractors and inspectors to install and inspect CO alarms (but not smoke alarms). Bluntly, this is ridiculous. The proposed revisions create a number of exceptions when CO alarms need not be installed. Unless some relief is given for exterior and other work that does not involve directly the ability to install CO alarms, permits will never get final inspections completed in a timely manner and building departments will be faced with a huge backlog of open permits.

Some folks will argue that the text says CO alarms are only required when work occurs "in" existing dwellings meaning exterior work is exempt. I might agree except the language used for CO alarms is the same used for smoke alarms and we seem to agree, based on exceptions in the code, that exterior work would trigger the smoke alarm requirements unless we have the exceptions. So if the text means one thing in one section, we conclude the same text means the same thing in another section.

R314.3.1 Alterations, repairs and additions. When *alterations*, repairs or *additions* requiring a *permit* occur, or when one or more sleeping rooms are added or created in existing *dwellings*, the individual *dwelling unit* shall be equipped with smoke alarms located as required for new *dwellings*.

Exceptions:

1. Work involving the exterior surfaces of *dwellings*, such as the replacement of roofing or siding, or the *addition* or replacement of windows or

Cost Impact: None

R315.3-RB-DAVIDSON

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this proposed code change because the proponent requested disapproval so that it can be improved and brought back in the public comment period.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rick Davidson, City of Maple Grove, representing Association of Minnesota Building Officials, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R315.3 Where required in existing dwellings. Where work requiring a *permit* occurs in an existing *dwelling* that has an attached garage or in an existing dwellings within which fuel fired *appliances* exist, carbon monoxide alarms shall be provided in accordance with Section R315.1.

Exceptions:

~~1. Addition, replacement or repair of windows or doors.~~
~~2. Replacement or repair of roofing, siding, masonry, stucco, or other exterior surfaces.~~
~~3. Additions of or repairs to porches, decks, or balconies.~~
~~4. Work involving detached accessory structures.~~
~~5. Installation of retaining walls or fences.~~
~~6. Installation, repair, or alteration of plumbing, mechanical, or electrical systems that occurs on the exterior of the dwelling or in an accessory structure.~~
~~7. Installation, alteration, or repairs of plumbing, mechanical, or electrical systems not involving a fuel fired appliance.~~
1. Work involving the exterior of *dwellings*.
2. Installation, *alteration* or repairs of plumbing or mechanical systems are exempt from the requirements of this section.

Add new definition as follows:

Exterior of dwellings. Exterior of dwellings shall mean the addition, replacement, or repair of windows or doors; exterior coverings regulated in Section R703; roof assemblies regulated in Chapter 9; additions, alterations or repairs to porches, decks, or balconies; and work involving accessory structures.

Commenter's Reason: This proposal is identical to RB157 that addresses exemptions for installation of CO alarms in existing structures when work requiring a permit occurs. Assuming that other proposals survive the public comment period, there will be new text in the code exempting CO alarms when certain work occurs. This is an important step and needs to occur. What this proposal does is address the confusion that occurs when interpreting the meaning of "work involving the exterior of dwellings". As was pointed out in RB157, the code changed with the 2006 edition to include the phrase "such as….." This phrase provided a series of examples to aid in the interpretation of the section. The language is not mandatory but includes examples of work that are suggested would be exempt from triggering CO alarms in existing structures. This proposal seeks to build on the changes approved in Dallas by adding a definition for "exterior of dwellings" that inserts mandatory language rather than commentary language and better itemizes the kinds of work that applies. Even in this cycle, proposals have been submitted to delete terms from the "such as" phrase with the belief that such a change would impact the application of the rule. In fact all it would do is further confuse the issue. This change is needed to complete the need for clarity in applying this section of the code.

RB162-13
Final Action: AS AM AMPC____ D

RB163-13
R316.3

Proposed Change as Submitted

Proponent: Vytenis Babrauskas, PhD, Fire Science & Technology Inc., representing The American Institute of Architects, Cascadia Green Building Council, Development Center for Appropriate Technology, Green Science Policy Institute, Hammond Fine Homes, International Living Future Institute, Perkins + Will, San Francisco Firefighters Cancer Prevention Foundation and the United States Green Building Council of California

Revise as follows:

R316.3 Surface burning characteristics. Unless otherwise allowed in R316.5 or 316.6, all foam plastic or foam plastic cores used as a component in manufactured assemblies used in building construction shall have a flame spread index of not more than 75 and shall have a smoke-developed index of not more than 450 when tested in the maximum thickness intended for use in accordance with ASTM E 84 or UL 723. Loose-fill-type foam plastic insulation shall be tested as board stock for the flame spread index and smoke-developed index.

~~**Exception**~~ **Exceptions:**

1. Foam plastic insulation more than 4 inches (102 mm) thick shall have a maximum flame spread index of 75 and a smoke-developed index of 450 where tested at a minimum thickness of 4 inches (102 mm), provided the end use is *approved* in accordance with Sections R316.6 using the thickness and density intended for use.
2. Foam plastic insulation shall not be subject to this requirement where installed with a thermal barrier in accordance with Section R316.4.

Reason: This proposal addresses a material performance requirement currently in the code which is not supported by available evidence from fire science research. Removal of the performance requirement as proposed would provide choice for manufacturers and consumers by allowing foam plastic insulation materials without flame retardants to be used in compliance with the code in a fire safe way. This would result in a healthier product at a lower cost.

The proposed change considers fire safety, public health, fire fighter and emergency responder safety, and energy efficiency. It is not a tradeoff among them, and improves them in many ways relevant to the current code requirements as described below and in the Substantiation Section.

For applications in which foam plastics are required to meet flame spread and smoke developed requirements of R316.3 and to be separated from interior spaces by an approved thermal barrier per R316.4, research and testing conducted over many years demonstrate the following:

It is the approved thermal barrier and the fireblocking required by the code that provide the fire safety related to foam plastic insulation, not its meeting the required flame spread and smoke developed ratings of R316.3. Even when foam plastic insulation meets the requirements of R316.3, if it is not protected by a thermal barrier it still poses an unacceptable level of fire hazard (Babrauskas et al., 2012).

In order to meet the flame spread and smoke developed requirements of R316.3, flame retardant chemicals are added to foam plastic insulations.

The two most common flame retardants used, hexabromocyclododecane (HBCD or HBCDD) and Tris (1-chloro-2-propyl) phosphate (TCPP), add potential risks throughout the product life cycle. These include environmental pollution, fire toxicity and possible adverse health effects for building occupants, fire service professionals, and the general public (Babrauskas et al., 2012). These chemicals are added only to meet flame spread and smoke developed requirements; they do not prevent foam plastics from burning.

Thermal barriers prevent temperature rise and adequately protect foam plastic insulation from igniting during a fire. Fire statistics show very few fires, no fire deaths and very few injuries attributable to fire started or spread by insulation within structural areas (Ahrens, 2011).

A precedent for a similar approach exists in Sweden where foam plastic insulation without flame retardants is used with code mandated protection by fire safe materials and construction (Blomqvist, McNamee, & Thureson, 2011; Lassen, Maag, Høibye, Vesterlykke, & Lundegaard, 2011; POPRC, 2011; Posner, Roos, & Olsson, 2010). Since the transition to non-flame retardant foam, there has been no detrimental impact on fire safety statistics in Sweden (Harrami & McIntyre, 2006; Lundqvist, McIntyre, & Hedman, 2008; Remberger et al., 2004).

In light of the available evidence, changing the code as proposed could:

-reduce and prevent harm from flame retardants without resulting in a reduction in fire safety,
-better align with the intent of the codes to establish "minimum requirements to safeguard the public safety, health and general welfare" and to provide "safety to fire fighters and emergency responders during emergency operations (R101.3)," and
-increase use of foam plastic insulations which are important for building energy efficiency by decreasing cost and by allowing flame-retardant free materials to be used in a code-compliant way for those concerned about flame retardant chemicals.

Substantiation: A thermal barrier meets the criteria of NFPA 275 by preventing the energy of a fire from reaching the foam. Specifically, NFPA 275 states that after 15 minutes of a post-flashover fire, the temperature at the interface of the thermal barrier and foam cannot exceed 121°C average with 163°C at one peak value thermocouple. This is substantially below the auto-ignition temperature of plastic foams, which are in excess of 400°C for polystyrene and polyurethane (Babrauskas, 2003).

Due to protection by thermal barriers, fire statistics show that insulation very rarely starts or spreads home fires. Insulation within a structural area was the item first ignited in 2% of US home structure fires, resulting in 10 civilian deaths and 90 civilian injuries (0% and 1% of the death and injury totals for the whole US, respectively). Insulation within a structural area was the primary item contributing to flame spread in 2% of US home structure fires, resulting in 0 civilian deaths and 40 injuries (0% and 1% of the death and injury totals for the whole US, respectively) (Ahrens, 2011).

HBCD and TCPP are added to foam plastics to meet flame spread and smoke developed requirements. 90% percent of HBCD and 86% of TCPP produced is used for building insulation (EC, 2008; Env Can, 2012; US EPA, 2010). Both chemicals are now widespread global contaminants (Covaci et al., 2006; Marvin et al., 2011; Van der Veen & de Boer, 2012). The presence of flame retardant chemicals can significantly increase the toxicity of fires when materials burn (Stec & Hull, 2011). Materials with flame retardants can produce greater amounts of carbon monoxide, smoke, and soot, compared to non-flame retardant materials (Babrauskas, 1992; Purser, 2000; Schnipper, Smith-Hansen, & Thomsen, 1995; Wichman, 2003). When HBCD burns, it produces dioxins, which are potentially carcinogenic (Birnbaum, Staskal, & Diliberto, 2003; Desmet, Schelfaut, & Sandra, 2005; Ebert & Bahadir, 2003). Firefighters have higher rates of cancers associated with dioxin exposure (IARC, 2010; LeMasters et al., 2006).

Canada and the European Union have scheduled HBCD to be phased out in the next 3-4 years (EC, 2011; Env Can, 2012). The US Environmental Protection Agency states that the chemical is

> "…persistent in the environment, bioaccumulative in living organisms, and highly toxic to aquatic organisms."
> and
> "Human exposure is evidenced by the presence of HBCD in breast milk, adipose tissue, and blood, and it biomagnifies in the food chain. HBCD presents human health concerns based on animal test results indicating potential reproductive, developmental, and neurological effects. People may be exposed to HBCD from products and dust in the home and workplace, as well as its presence in the environment."
> (US EPA, 2012)

Less is known about TCPP but concerns include its persistence in the environment, human exposure, and the potential to cause cancer (Van der Veen & De Boer, 2012).

Sweden uses the Eurocode classification system to rate the combustibility of building components including foam plastic insulation. Foam plastics are classified as combustible, and thus building codes specify how these materials can be used in fire safe ways, such as behind thermal barriers, concrete or masonry, and with other construction techniques (Blomqvist et al., 2011; Lassen et al., 2011; POPRC, 2011; Posner et al., 2010). Since non-flame retardant foam plastics have been used in Sweden, building fires and deaths from building fires have not increased, indicating that fire safety is maintained by the code mandated measures (Harrami & McIntyre, 2006; Lundqvist et al., 2008; Remberger et al., 2004).

From IRC Section R101.3 Intent:

> The purpose of this code is to establish minimum requirements to safeguard the public safety, health and general welfare through affordability, structural strength, means of egress facilities, stability, sanitation, light and ventilation, energy conservation and safety to life and property from fire and other hazards attributed to the built environment and to provide safety to fire fighters and emergency responders during emergency operations.
>
> From IRC Section R316.4 Thermal Barrier:
> Unless otherwise allowed in Section R316.5 or Section R316.6, foam plastic shall be separated from the interior of a building by an *approved* thermal barrier of minimum 1/2 inch (12.7 mm) gypsum wallboard or a material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275.

Cost Impact: The code change proposal will not increase the cost of construction.

R316.3 #1-RB-BABRAUSKAS

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The committee disapproved this proposed code change because they felt that there needs to be more research into the health and safety issues related to foam plastics.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

David Eisenberg, Development Center for Appropriate Technology, representing Vytenis Babrauskas of Fire Science & Technology, Inc., Cascadia Green Building Council, Development Center for Appropriate Technology, Green Science Policy Institute, Hammond Fine Homes, International Living Future Institute, San Francisco Firefighters Cancer Prevention Foundation and the United States Green Building Council of California, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R316.3 Surface burning characteristics. Unless otherwise allowed in R316.5 or 316.6, all foam plastic or foam plastic cores used as a component in manufactured assemblies used in building construction shall have a flame spread index of not more than 75 and shall have a smoke-developed index of not more than 450 when tested in the maximum thickness intended for use in accordance with ASTM E 84 or UL 723. Loose-fill-type foam plastic insulation shall be tested as board stock for the flame spread index and smoke-developed index.

Exceptions:

1. Foam plastic insulation more than 4 inches (102 mm) thick shall have a maximum flame spread index of 75 and a smoke-developed index of 450 where tested at a minimum thickness of 4 inches (102 mm), provided the end use is *approved* in accordance with Sections R316.6 using the thickness and density intended for use.
2. Foam plastic insulation shall not be subject to this requirement where installed with a thermal barrier in accordance with Section R316.4 <u>on the interior side. Where foam plastic insulation is installed within 5 feet of a lot line it shall also be separated from the exterior of the building by an approved thermal barrier of not less than ½ inch (12.7 mm) gypsum wallboard or shall comply with Section R316.5 or Section R316.6. Where the exterior separation is required, foam plastic insulation shall comply with the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275.</u>

Commenter's Reason: This public comment modification addresses a concern raised about the original proposal and now includes protection from the exterior for foam plastic insulation in close proximity to lot lines. Using the thermal barrier requirements of Section R316.4 for exterior protection provides consistency with fire safety requirements already in the code. This addresses increasing concerns about building-to-building fire spread. The fire separation distances in Section R302.1 Exterior Walls, for unlimited openings in non-rated walls is the basis for specifying five feet from the lot line as the distance triggering the exterior thermal barrier requirement.

This change would not require any changes in current practices or preclude the use of flame-retarded foam insulation, but would create the possibility for manufacturers to meet the rapidly rising demand for insulation without halogenated flame retardants. The increasing number of architectural and engineering design firms large and small, their clients, home owners, and green building and product certification programs concerned about the toxicity of flame retardant chemicals is driving market demand that is stymied by the current code provisions. This change would create the opportunity for more diversity in the market, encouraging the development and use of products that are safer for humans and the environment without sacrificing any fire safety.

The US Environmental Protection Agency (EPA) has already identified that halogenated flame retardants are chemicals of concern. Enabling the market to serve the demand for healthier, safer products is not dependent on EPA establishing the degree of human and ecological health hazards related to this family of chemicals, as documented in thousands of independent peer reviewed studies. Rather, the intent of the code mandates that it address public safety, health and general welfare and provide safety to firefighters and emergency responders.

Multiple lines of foam boards already exist, such as termite resistant and non-termite resistant foam. The labeling of rigid foam insulation to differentiate product lines is commonplace. Spray foam insulation can be differentiated either by labeling and reporting requirements for the components as is done now for some products or by development of color-coding.

A precedent exists in Sweden where foam plastic insulation without flame retardants is used with code mandated protection by fire safe materials and construction (Blomqvist, McNamee, & Thureson, 2011; Lassen, Maag, Høibye, Vesterlykke, & Lundegaard, 2011; POPRC, 2011; Posner, Roos, & Olsson, 2010). Since the transition to non-flame retardant foam, there has been no detrimental impact on fire safety statistics in Sweden (Harrami & McIntyre, 2006; Lundqvist, McIntyre, & Hedman, 2008; Remberger et al., 2004).

The rationale for this code change proposal is the existence of relatively new information about hazards not previously considered in addressing fire safety – namely that the solutions offered to reduce one aspect of fire hazard not create serious hazards elsewhere - such as human and ecological health risks. When such solutions do create other hazards, they are not redundancies representing "a belt and suspenders approach" as was stated in testimony in opposition. Further, redundancy is not a valid basis for minimum building code requirements.

In light of the available evidence, changing the code as proposed would:

-reduce and prevent harm from flame retardants without resulting in a reduction in fire safety,
-better align with the intent of the codes to establish "minimum requirements to safeguard the public safety, health and general welfare" and to provide "safety to fire fighters and emergency responders during emergency operations (R101.3)," and
-increase use of foam plastic insulations which are important for building energy efficiency by potentially decreasing cost and by allowing flame-retardant free materials to be used in a code-compliant way for those concerned about flame retardant chemicals.

RB163-13
Final Action: AS AM AMPC____ D

RB164-13
R316.3

Proposed Change as Submitted

Proponent: Vytenis Babrauskas, PhD, Fire Science & Technology Inc., representing The American Institute of Architects, Cascadia Green Building Council, Development Center for Appropriate Technology, Green Science Policy Institute, Hammond Fine Homes, International Living Future Institute, Perkins + Will, San Francisco Firefighters Cancer Prevention Foundation, the United States Green Building Council of California

Revise as follows:

R316.3 Surface burning characteristics. Unless otherwise allowed in R316.5 or 316.6, all foam plastic or foam plastic cores used as a component in manufactured assemblies used in building construction shall have a flame spread index of not more than 75 and shall have a smoke-developed index of not more than 450 when tested in the maximum thickness intended for use in accordance with ASTM E 84 or UL 723. Loose-fill-type foam plastic insulation shall be tested as board stock for the flame spread index and smoke-developed index.

~~Exception~~ <u>**Exceptions:**</u>

<u>1</u>**.** Foam plastic insulation more than 4 inches (102 mm) thick shall have a maximum flame spread index of 75 and a smoke-developed index of 450 where tested at a minimum thickness of 4 inches (102 mm), provided the end use is *approved* in accordance with Sections R316.6 using the thickness and density intended for use.

<u>2. Foam plastic insulation shall not be subject to this requirement when used in a wall, floor, foundation or roof assembly where the foam plastic insulation is separated from the interior of the building by a minimum 1-inch (25 mm) thickness of masonry or concrete.</u>

Reason: This proposal addresses a material performance requirement currently in the code which is not supported by available evidence from fire science research. Removal of the performance requirement as proposed would provide choice for manufacturers and consumers by allowing foam plastic insulation materials without flame retardants to be used in compliance with the code in a fire safe way. This would result in a healthier product at a lower cost.

The proposed change considers fire safety, public health, fire fighter and emergency responder safety, and energy efficiency. It is not a tradeoff among them, and improves them in many ways relevant to the current code requirements as described below and in the Substantiation Section.

For applications in which foam plastics are required to meet flame spread and smoke developed requirements of R316.3 and to be separated from interior spaces by an approved thermal barrier per R316.4, research and testing conducted over many years demonstrate the following:

It is the thermal barrier and the fireblocking required by the code that provide the fire safety related to foam plastic insulation, not its meeting the required flame spread and smoke developed ratings of R316.3. Even when foam plastic insulation meets the requirements of R316.3, if it is not protected by a thermal barrier it still poses an unacceptable level of fire hazard (Babrauskas et al., 2012).

In order to meet the flame spread and smoke developed requirements of R316.3, flame retardant chemicals are added to foam plastic insulations.

The two most common flame retardants used, hexabromocyclododecane (HBCD or HBCDD) and Tris (1-chloro-2-propyl) phosphate (TCPP), add potential risks throughout the product life cycle. These include environmental pollution, fire toxicity and possible adverse health effects for building occupants, fire service professionals, and the general public (Babrauskas et al., 2012). These chemicals are added only to meet flame spread and smoke developed requirements; they do not prevent foam plastics from burning.

Thermal barriers prevent temperature rise and adequately protect foam plastic insulation from igniting during a fire. Fire statistics show very few fires, no fire deaths and very few injuries attributable to fire started or spread by insulation within structural areas (Ahrens, 2011).

The Commentary for the 2012 IRC for Section R316.5.1 Masonry or concrete construction states: "No thermal barrier is required when 1 inch (25 mm) or more of masonry or concrete is placed between the foam plastic and the interior of the building. The intent is to accept 1-inch (25 mm) of masonry or concrete as adequate protection against ignition, even though the concrete does not necessarily meet the performance criteria for thermal barriers."

This suggests that when foam plastic is separated from the interior of a building by minimum 1-inch (25mm) concrete or masonry, the flame spread and smoke developed requirements are not needed.

A precedent for a similar approach exists in Sweden where foam plastic insulation without flame retardants is used with code mandated protection by fire safe materials and construction (Blomqvist, McNamee, & Thureson, 2011; Lassen, Maag, Høibye, Vesterlykke, & Lundegaard, 2011; POPRC, 2011; Posner, Roos, & Olsson, 2010). Since the transition to non-flame retardant foam, there has been no detrimental impact on fire safety statistics in Sweden (Harrami & McIntyre, 2006; Lundqvist, McIntyre, & Hedman, 2008; Remberger et al., 2004).

In light of the available evidence, changing the code as proposed could:

-reduce and prevent harm from flame retardants without resulting in a reduction in fire safety,
-better align with the intent of the codes to establish "minimum requirements to safeguard the public safety, health and general welfare" and to provide "safety to fire fighters and emergency responders during emergency operations (R101.3)," and
-increase use of foam plastic insulations which are important for building energy efficiency by decreasing cost and by allowing flame-retardant free materials to be used in a code-compliant way for those concerned about flame retardant chemicals.

Substantiation: 1 inch (25 mm) or greater of concrete or masonry protects foam plastic from ignition in the same way as a thermal barrier which meets the criteria of NFPA 275- by preventing the energy of a fire from reaching the foam. Specifically, NFPA 275 states that after 15 minutes of a post-flashover fire, the temperature at the interface of the thermal barrier and foam cannot exceed 121°C average with 163°C at one peak value thermocouple. This is substantially below the auto-ignition temperature of plastic foams, which are in excess of 400°C for polystyrene and polyurethane (Babrauskas, 2003). As stated in the Commentary, concrete or masonry also has these characteristics.

Due to protection by thermal barriers, fire statistics show that insulation very rarely starts or spreads home fires. Insulation within a structural area was the item first ignited in 2% of US home structure fires, resulting in 10 civilian deaths and 90 civilian injuries (0% and 1% of the death and injury totals for the whole US, respectively). Insulation within a structural area was the primary item contributing to flame spread in 2% of US home structure fires, resulting in 0 civilian deaths and 40 injuries (0% and 1% of the death and injury totals for the whole US, respectively) (Ahrens, 2011).

HBCD and TCPP are added to foam plastics to meet flame spread and smoke developed requirements. 90% percent of HBCD and 86% of TCPP produced is used for building insulation (EC, 2008; Env Can, 2012; US EPA, 2010). Both chemicals are now widespread global contaminants (Covaci et al., 2006; Marvin et al., 2011; Van der Veen & de Boer, 2012). The presence of flame retardant chemicals can significantly increase the toxicity of fires when materials burn (Stec & Hull, 2011). Materials with flame retardants can produce greater amounts of carbon monoxide, smoke, and soot, compared to non-flame retardant materials (Babrauskas, 1992; Purser, 2000; Schnipper, Smith-Hansen, & Thomsen, 1995; Wichman, 2003). When HBCD burns, it produces dioxins, which are potentially carcinogenic (Birnbaum, Staskal, & Diliberto, 2003; Desmet, Schelfaut, & Sandra, 2005; Ebert & Bahadir, 2003). Firefighters have higher rates of cancers associated with dioxin exposure (IARC, 2010; LeMasters et al., 2006).

Canada and the European Union have scheduled HBCD to be phased out in the next 3-4 years (EC, 2011; Env Can, 2012). The US Environmental Protection Agency states that the chemical is

"…persistent in the environment, bioaccumulative in living organisms, and highly toxic to aquatic organisms."
and
"Human exposure is evidenced by the presence of HBCD in breast milk, adipose tissue, and blood, and it biomagnifies in the food chain. HBCD presents human health concerns based on animal test results indicating potential reproductive, developmental, and neurological effects. People may be exposed to HBCD from products and dust in the home and workplace, as well as its presence in the environment."
(US EPA, 2012)

Less is known about TCPP but concerns include its persistence in the environment, human exposure, and the potential to cause cancer (Van der Veen & De Boer, 2012).

Sweden uses the Eurocode classification system to rate the combustibility of building components including foam plastic insulation. Foam plastics are classified as combustible, and thus building codes specify how these materials can be used in fire safe ways, such as behind thermal barriers, concrete or masonry, and with other construction techniques (Blomqvist et al., 2011; Lassen et al., 2011; POPRC, 2011; Posner et al., 2010). Since non-flame retardant foam plastics have been used in Sweden, building fires and deaths from building fires have not increased, indicating that fire safety is maintained by the code mandated measures (Harrami & McIntyre, 2006; Lundqvist et al., 2008; Remberger et al., 2004).

From IRC Section 316.5.1 Commentary:

No thermal barrier is required when 1 inch (25 mm) or more of masonry or concrete is placed between the foam plastic and the interior of the building. The intent is to accept 1-inch (25 mm) of masonry or concrete as adequate protection against ignition, even though the concrete does not necessarily meet the performance criteria for thermal barriers. This condition can arise when foam plastics are installed either within a wall or on one side of a wall. Some common examples are when foam plastics are installed:

- In the cavity of a hollow masonry wall,
- As the core of a concrete-faced panel,
- On the exterior face of a masonry wall and covered with an exterior finish, or
- Within the cores of hollow masonry units.
- Encapsulated within a minimum of 1 inch (25 mm) concrete or masonry wall, floor or roof system, as in insulated tilt-up or pour-in-place

Also, the flame spread rating of the foam plastic used must comply with the requirements of Section R316.3, but the smoke-developed rating of the foam plastic is not limited.

From IRC Section R101.3 Intent:

> The purpose of this code is to establish minimum requirements to safeguard the public safety, health and general welfare through affordability, structural strength, means of egress facilities, stability, sanitation, light and ventilation, energy conservation and safety to life and property from fire and other hazards attributed to the built environment and to provide safety to fire fighters and emergency responders during emergency operations.

Cost Impact: The code change proposal will not increase the cost of construction.

R316.3 #2-RB-BABRAUSKAS

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this proposed code change because they felt that multiple types of foam may be difficult to identify and the related fire safety issue is too large to risk, and because this action is consistent with prior committee action on RB163. We have recourse in our system for some of the types of issues raised on the floor, that being is civil action. Further research may be in order to explore whether something is happening.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Veena Singla, Green Science Policy Institute, representing Green Science Policy Institute, Vytenis Babrauskas of Fire Science & Technology, Inc., Cascadia Green Building Council, Development Center for Appropriate Technology, Hammond Fine Homes, International Living Future Institute, San Francisco Firefighters Cancer Prevention Foundation and the United States Green Building Council of California, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R316.3 Surface burning characteristics. Unless otherwise allowed in R316.5 or 316.6, all foam plastic or foam plastic cores used as a component in manufactured assemblies used in building construction shall have a flame spread index of not more than 75 and shall have a smoke-developed index of not more than 450 when tested in the maximum thickness intended for use in accordance with ASTM E 84 or UL 723. Loose-fill-type foam plastic insulation shall be tested as board stock for the flame spread index and smoke-developed index.

Exceptions:

1. Foam plastic insulation more than 4 inches (102 mm) thick shall have a maximum flame spread index of 75 and a smoke-developed index of 450 where tested at a minimum thickness of 4 inches (102 mm), provided the end use is *approved* in accordance with Sections R316.6 using the thickness and density intended for use.
2. Foam plastic board insulation shall not be subject to this requirement when used in <u>or below</u> a ~~wall,~~ floor~~,~~ <u>or</u> in a foundation ~~or roof assembly~~ where the rigid foam plastic insulation <u>has continuous separation</u> ~~is separated~~ from the interior of the building by a minimum 1-inch (25 mm) thickness of masonry or concrete~~.~~<u>, or is installed below grade in accordance with Section R403.3.</u>

Commenter's Reason: Where there is no fire safety hazard from a particular application of foam plastic insulation in a building, there is no justification for requiring flame spread and smoke development testing.

Flame spread and smoke development requirements lead to the incorporation of halogenated flame retardant chemicals in foam plastics. As these flame retardant chemicals present human health, fire fighter health and environmental concerns, it is desirable to identify applications for which their use can be reduced or eliminated while maintaining fire safety.

Installation below continuous concrete slabs, in floors where a minimum of 1" of concrete separates the foam from the interior of the building, or in foundations where either concrete or soil provides the required separation or protection, represent just such a use. Foam plastic insulation presents no appreciable fire hazard when used in these applications, as there is little to no potential for foam to burn. Thus, it is not necessary for foam plastics to meet flame spread and smoke development requirements in these applications.

This change would not require any changes in current practices or preclude the use of flame-retarded foam insulation, but would create the possibility for manufacturers to meet the rapidly rising demand for foam plastic insulation without halogenated flame retardants. The increasing number of architectural and engineering design firms large and small, their clients, home owners, and green building and product certification programs concerned about the toxicity of flame retardant chemicals is driving market demand that is stymied by the current code provisions. This change would create the opportunity for more diversity in the market, encouraging the development and use of products that are safer for humans and the environment without sacrificing any fire safety.

Multiple lines of building products and foam in particular already exist such as for the use of termite resistant and non-termite resistant foam. The labeling of rigid foam insulation to differentiate product lines is widespread.

This proposal and modification represent a more complete risk assessment than current code as it incorporates a more accurate reflection of fire safety risks along with risks to public health, and fire fighter and emergency responders. As was amply documented in the original proposal, halogenated flame retardants are hazardous or potentially hazardous chemicals which are known to be persistent organic pollutants and global contaminants. Proposed replacements of these chemicals are of the same general class of chemicals and thus are likely to present similar risks (Babrauskas et al., 2012). Thus, the use of these chemicals increases rather than decreases the overall risks from foam building insulation when used in these applications.

In light of the available evidence, changing the code as proposed would:

-reduce and prevent harm from flame retardants without resulting in a reduction in fire safety,
-better align with the intent of the codes to establish "minimum requirements to safeguard the public safety, health and general welfare" and to provide "safety to fire fighters and emergency responders during emergency operations (R101.3)," and
-increase the use of foam plastic insulations which are important for building energy efficiency by potentially decreasing cost and by allowing flame-retardant free materials to be used in a code-compliant way for those concerned about flame retardant chemicals.

Proposed Change as Submitted

Proponent: Sean DeCrane, Battalion Chief, representing Cleveland Division of Fire, International Association of Fire Fighters (rovloc93@aol.com)

Revise as follows:

R316.4 Thermal barrier. Unless otherwise allowed in Section R316.5 or Section R316.6, foam plastic shall be separated from the interior of a building and the exterior of the building when installed within ten feet of a property line by an *approved* thermal barrier of minimum 1/2 inch (12.7 mm) gypsum wallboard or a material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275.

R316.5 Specific requirements. The following requirements shall apply to these uses of foam plastic unless specifically *approved* in accordance with Section R316.6 or by other sections of the code or the requirements of Sections R316.2 through R316.4 have been met.

R316.5.1 Masonry or concrete construction. The thermal barrier specified in Section R316.4 is not required in a masonry or concrete wall, floor or roof when the foam plastic insulation is separated from the interior of the building and the exterior of the building where installed within ten feet of a property line by a minimum 1-inch (25 mm) thickness of masonry or concrete.

R316.5.2 Roofing. The thermal barrier specified in Section R316.4 is not required when the foam plastic in a roof assembly or under a roof covering is installed in accordance with the code and the manufacturer's installation instructions and is separated from the interior of the building by tongue-and-groove wood planks or wood structural panel sheathing in accordance with Section R803, not less than 15/32 inch (11.9 mm) thick bonded with exterior glue and identified as Exposure 1, with edges supported by blocking or tongue-and-groove joints or an equivalent material. The smoke-developed index for roof applications shall not be limited. A thermal barrier meeting the requirements of R316.4 is required where foam plastic in a roof assembly is installed within 10 feet of a property line.

R316.5.3 Attics. The thermal barrier specified in Section R316.4 is not required in attics where all of the following apply:

1. *Attic* access is required by Section R807.1.
2. The space is entered only for purposes of repairs or maintenance.
3. The foam plastic insulation is protected against ignition using one of the following ignition barrier materials:
   3.1. 11/2-inch-thick (38 mm) mineral fiber insulation;
   3.2. 1/4-inch-thick (6.4 mm) wood structural panels;
   3.3. 3/8-inch (9.5 mm) particleboard;
   3.4. 1/4-inch (6.4 mm) hardboard;
   3.5. 3/8-inch (9.5 mm) gypsum board; or
   3.6. Corrosion-resistant steel having a base metal thickness of 0.016 inch (0.406 mm);
   3.7. 11/2-inch-thick (38 mm) cellulose insulation.

The above ignition barrier is not required where the foam plastic insulation has been tested in accordance with Section R316.6.

R316.5.4 Crawl spaces. The thermal barrier specified in Section R316.4 is not required where all of the following apply:

1. Crawlspace access is required by Section R408.4
2. Entry is made only for purposes of repairs or maintenance.
3. The foam plastic insulation is protected against ignition using one of the following ignition barrier materials:
   3.1. 11/2-inch-thick (38 mm) mineral fiber insulation;
   3.2. 1/4-inch-thick (6.4 mm) wood structural panels
   3.3. 3/8-inch (9.5 mm) particleboard;
   3.4. 1/4-inch (6.4 mm) hardboard;
   3.5. 3/8-inch (9.5 mm) gypsum board; or
   3.6. Corrosion-resistant steel having a base metal thickness of 0.016 inch (0.406 mm). The above ignition barrier is not required where the foam plastic insulation has been tested in accordance with Section R316.6.

The above ignition barrier is not required where the foam plastic insulation has been tested in accordance with Section R316.6.

R316.5.5 Foam-filled exterior doors. Foam-filled exterior doors are exempt from the requirements of Sections R316.3 and R316.4.

R316.5.6 Foam-filled garage doors. Foam-filled garage doors in attached or detached garages are exempt from the requirements of Sections R316.3 and R316.4.

~~**R316.5.7 Foam backer board.** The thermal barrier specified in Section R316.4 is not required where siding backer board foam plastic insulation has a maximum thickness of 0.5 inch (12.7 mm) and a potential heat of not more than 2000 Btu per square foot (22 720 kJ/m2) when tested in accordance with NFPA 259 provided that:~~

1. ~~The foam plastic insulation is separated from the interior of the building by not less than 2 inches (51mm) of mineral fiber insulation;~~
2. ~~The foam plastic insulation is installed over existing *exterior wall* finish in conjunction with re-siding; or~~
3. ~~The foam plastic insulation has been tested in accordance with Section R316.6.~~

~~**R316.5.8 Re-siding.** The thermal barrier specified in Section R316.4 is not required where the foam plastic insulation is installed over existing *exterior wall* finish in conjunction with re-siding provided the foam plastic has a maximum thickness of 0.5 inch (12.7 mm) and a potential heat of not more than 2000 Btu per square foot (22 720 kJ/ m2) when tested in accordance with NFPA 259.~~

R316.5.9 Interior trim. The thermal barrier specified in Section R316.4 is not required for exposed foam plastic interior trim, provided all of the following are met:

1. The minimum density is 20 pounds per cubic foot (320 kg/m3).
2. The maximum thickness of the trim is 0.5 inch (12.7 mm) and the maximum width is 8 inches (204 mm).
3. The interior trim shall not constitute more than 10 percent of the aggregate wall and ceiling area of any room or space.
4. The flame spread index does not exceed 75 when tested per ASTM E 84 or UL 723. The smoke-developed index is not limited.

R316.5.10 Interior finish. Foam plastics shall be permitted as interior finish where *approved* in accordance with Section R316.6 Foam plastics that are used as interior finish shall also meet the flame spread index and smoke developed index requirements of Sections R302.9.1 and R302.9.2.

R316.5.11 Sill plates and headers. Foam plastic shall be permitted to be spray applied to a sill plate and header without the thermal barrier specified in Section R316.4 subject to all of the following:

1. The maximum thickness of the foam plastic shall be 31/4 inches (83 mm).
2. The density of the foam plastic shall be in the range of 0.5 to 2.0 pounds per cubic foot (8 to 32 kg/m3).
3. The foam plastic shall have a flame spread index of 25 or less and an accompanying smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723.

R316.5.12 Sheathing. Foam plastic insulation used as sheathing shall comply with Section R316.3 and Section R316.4. Where the foam plastic sheathing is exposed to the *attic* space at a gable or kneewall, the provisions of Section R316.5.3 shall apply.

R316.5.13 Floors. The thermal barrier specified in Section R316.4 is not required to be installed on the walking surface of a structural floor system that contains foam plastic insulation when the foam plastic is covered by a minimum nominal 1/2-inch-thick (12.7 mm) wood structural panel or equivalent. The thermal barrier specified in Section R316.4 is required on the underside of the structural floor system that contains foam plastic insulation when the underside of the structural floor system is exposed to the interior of the building.

R316.6 Specific approval. Foam plastic not meeting the requirements of Sections R316.3 through R316.5 shall be specifically *approved* on the basis of one of the following *approved* tests: NFPA 286 with the acceptance criteria of Section R302.9.4, FM4880, UL 1040, or UL 1715, or fire tests related to actual end-use configurations. Approval shall be based on the actual end use configuration and shall be performed on the finished foam plastic assembly in the maximum thickness intended for use. Assemblies tested shall include seams, joints and other typical details used in the installation of the assembly and shall be tested in the manner intended for use.

R316.7 Termite damage. The use of foam plastics in areas of “very heavy” termite infestation probability shall be in accordance with Section R318.4.

Reason: One of the main challenges the fire service is encountering in today’s environment is a pressing need of resources. Across the United States we are experiencing the loss of structures due to exterior exposures. These exposure fires can have devastating effects on an individual’s home and also place responding fire fighters at risk for rapidly spreading fires.

As the Fire Service encounters the economic realities of smaller budgets and increased demand we are continuously being asked to do more with less. Responding units many times must address growing exposure fires due to the narrow property lines.

In today’s environment there is a growing trend to promote energy conservation. While this is widely supported, and a worthy goal, we must also factor in a level of safety. As with most things in life there must be a balance between efficiency and safety.

A search of the Vinyl Siding Institute’s website www.vinylsiding.org produces a great deal of information on the R-Values and potential cost benefits of increasing the use of foam backing on the vinyl siding. There is little information on the fire performance of these products. It is true many of the foam insulation products are given a Class A flame spread rating in an ASTM E 84 Test Standard. That is one of the problems, the E 84 is a horizontal test standard yet we install the foam insulation products vertically drastically impacting the true fire performance in the field. In fact to demonstrate the safety of vinyl siding it is compared to the performance of vinyl sheathed wiring: *“Additionally, vinyl meets the stringent National Fire Protection Association (NFPA) requirements. The NFPA Electrical Code recognizes the strong fire-safe characteristics of vinyl through its approved use as a residential wiring insulator. Millions of homes have been wired using safe vinyl-sheathed electrical systems for decades.*[1]

They further state; *Safe homes use fire-safe claddings, which include vinyl siding. Why does vinyl siding provide good fire performance? It is composed mainly of polyvinyl chloride, more commonly known as vinyl or PVC. Due to its chlorine base, vinyl siding does not ignite quickly and is inherently flame-retardant. Read on to discover more facts on vinyl siding’s fire performance…..All organic materials (that is, anything containing carbon) will ignite. But the higher the temperature a material has to reach before it flames, the safer it is. PVC won’t ignite, even from another flame, until it reaches about 730°F (387°C) and won’t self-ignite until about 850°F (454°C).* [1] Fire doesn’t propagate until 750°F, what is the temperature of flame? Again, our issue isn’t necessarily the siding it is the foam backing behind it as the siding when exposed to high temperatures will begin to melt and fall away exposing the increasing amounts of foam insulation.

Current tests are being conducted by UL and NIST and additional testimony and data will be presented during the code development process.

1. 2005 National Electrical Code, NFPA 70, Article 334.

Cost Impact: Will not increase the cost of construction

R316.4-RB-DECRANE

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this proposed code change because they felt that it was confusing and imposed undue restrictions on the use of foam plastics without technical support. It also may be in conflict with energy provisions and the cost related information appears to be inaccurate. The difference in offset requirements could substantially increase costs. The 10 foot distance requirement was not substantiated.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Sean DeCrane, representing Cleveland Division of Fire / International Association of Fire Fighters, requests Approval as Submitted.

Commenter's Reason: Tests are continuing at Underwriters Laboratories, with test results demonstrating the performance time of a combustible exterior wall to be very concerning to the fire service. Subjecting combustible wall siding to a 100 kilowatt fire quickly and easily penetrated the vinyl siding exposing the foam insulation behind the siding. This is leading to rapid fire travel up the side of a structure into the attic area.

This code change proposal is attempting to address the concern for the rapidly transferring exposure fire. Recently outside of Myrtle Beach over 100 apartments were lost to a brush fire that suddenly travelled from building to building. The propagation of flame from one structure to another is a challenge to the fire service. We have experienced staffing reductions in many areas of the country. This is causing Incident Commanders to deploy initial arriving companies into a position of exposure fire protection or not being able to provide exposure protection which leads to further damage of the neighboring structures.

This author is interested in identifying various options to protection. We are aware of energy conservation concerns but believe there has to be a balance between energy conservation and fire safety performance. Vinyl siding is engineered to melt and fall away when exposed to temperatures exceeding 750ºF. Again the concern is the unprotected foam, which in many cases is a petroleum based foam insulation product. If we don't want to require the performance of the exterior wall covering then we must provide the protection of distance.

.

Public Comment 2:

Steve Orlowski, representing National Association of Home Builders (NAHB), requests Disapproval.

Commenter's Reason: We agree with the committee's action to disapprove the proposed code change based on the lack of technical justification requiring all walls with foam insulation to be protected by a thermal barrier when the exterior wall is within ten feet of the property line. There have been studies conducted by NIST that prove the current requirements for fire separation are more than adequate to deal with the concerns raised by the proponent. These studies conducted by NIST showed that when dwellings are less than five feet from the point used for fire separation distance and are protected by a one-hour fire resistant rating, the potential of a fire from one dwelling to develop enough heat to ignite the adjacent structure is significantly reduced. The study further showed that the one-hour fire-resistant rating between the structures significantly delayed flame spread between dwellings and provide the fire service with a considerable amount of valuable time to respond and suppress the fire, further reducing the ability for an exposure fire. In addition, the proponent has provided no indication where the arbitrary ten foot requirement came from or why a wall within ten feet of a property line is a hazard, considering the face of the wall containing the product could face an alley or street.

RB166-13

Final Action: AS AM AMPC____ D

RB167-13
R316.4

Proposed Change as Submitted

Proponent: Dennis Pitts, American Wood Council, representing American Wood Council (dpitts@awc.org)

Revise as follows:

R316.4 Thermal barrier. Unless otherwise allowed in Section R316.5 or Section R316.6, foam plastic shall be separated from the interior of a building by an *approved* thermal barrier of minimum 1/2 inch (12.7 mm) gypsum wallboard, <u>23/32 inch (18.2 mm) wood structural panel</u> or a material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275.

Reason: Wood structural panels are permitted prescriptively as a thermal barrier in various thicknesses in subsections of R316.5. R316.5.2 allows 15/32" WSP as a thermal barrier in roofs, R316.5.3 allows ¼" WSP for attics, and R316.5.4 allows ¼" WSP for crawlspaces. This proposal would prescriptively allow a thicker WSP to be used as a thermal barrier in other applications that might arise.

Prior to a recent change in NFPA 275 that essentially requires a Class A flame spread rating for materials used as thermal barriers, 23/32" WSP complied with NFPA 275. This proposal prescriptively recognizes a history of satisfactory service as a thermal barrier, even for thinner panels, although the material isn't a Class A material.

Cost Impact: No increase in cost of construction.

R316.4-RB-PITTS

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee approved this code change proposal because they felt that such panels have been used for years between foam and the interior of the house and have served quite well. If the panels burn through, the problem will be greater than those caused by the foam.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Marcelo M. Hirschler (GBH International), requests Disapproval.

Commenter's Reason: Foam plastic insulation is required to be separated from the interior of a building to offer protection from fire exposure, because it is well known that a severe fire can result if foam plastic insulation is exposed to a fire and ignites. Therefore, foam plastic insulation is required to be protected from fire (for 15 minutes) by a thermal barrier. Traditionally such protection has been provided by "an approved thermal barrier of minimum ½ inch gypsum wallboard or an approved finish material equivalent to a thermal barrier material" as shown below, for the 2006 code.

> ***R316.4 Thermal barrier****. Unless otherwise allowed in Section R316.5 or Section R316.6, foam plastic shall be separated from the interior of a building by an approved thermal barrier of minimum 1/2 inch (12.7 mm) gypsum wallboard or an approved finish material equivalent to a thermal barrier material that will limit the average temperature rise of the unexposed surface to no more than 250°F (139°C) after 15 minutes of fire exposure complying with the ASTM E119 or UL 263 standard time temperature curve. The thermal barrier shall be installed in such a manner that it will remain in place for 15 minutes based on NFPA 286 with the acceptance criteria of Section R302.9.4, FM 4880, UL 1040 or UL 1715.*

The verbiage about “equivalent” was replaced by a reference to a material that complies with NFPA 275. NFPA 275 requires that, in order for a material to be listed as a thermal barrier, it must be tested in a room corner test (such as NFPA 286), over the foam plastic insulation intended for use behind the thermal barrier, and that the system complies with the following:

(1) No flashover for 15 minutes
(2) A peak heat release rate of less than 800 kW
(3) A total smoke release of less than 1,000 m^2

When a wood structural panel is tested in the NFPA 286 fire test the panel reaches flashover, irrespective of whether the foam plastic is behind the panel or not. That means that the wood structural panel is not providing the necessary protection that thermal barriers are intended to provide.

This proposal adds prescriptively a 23/32nd inch wood structural panel instead of a thermal barrier protecting the interior from the exposed foam plastic. That is not a safe approach as the fire safety is too low. We have had numerous examples of fires resulting from burning foam plastic insulation to go back to such a system. If the wood panels burn through (and it is known that they do that in just a very few minutes, even without the combustible foam behind them) the fire problem is exacerbated because we now have burning foam plastic. On the other hand, if a thermal barrier is in place, the thermal barrier will protect the interior of the building from the burning foam for a full 15 minutes.

The proposal reason incorrectly states that wood structural panels are permitted as a thermal barrier in sections of 316.5 but the referenced sections talk about “ignition barriers” and not about “thermal barriers”, and that is a very different concept. R316.5.3 permits the use of various wood products as ignition barriers (with added protections) for attics. Similarly, R316.5.4 permits the use of various wood products as ignition barriers for crawl spaces, again with added protections. Even R316.5.2, where 15/32nd inch wood structural panel sheathing is allowed instead of a thermal barrier for protection of roof assemblies requires added protections. Moreover, none of these applications would allow plain wood structural panels to be the only protection between foam plastic insulation and the interior of a building, without size limitations.

The “ignition barriers” discussed above (and mentioned by the submitter) all address unoccupiable spaces, while the thermal barriers which would be changed by this proposal address occupied spaces. If this proposal is not disapproved, the entire interior of a residential building can be lined with wood structural panels and foam plastic insulation, without protection from fire.

RB167-13

Final Action: AS AM AMPC____ D

RB174-13
R316.6

Proposed Change as Submitted

Proponent: Tony Crimi, A.C. Consulting Solutions, Inc., representing North American Insulation Manufacturers Association (NAIMA) (tcrimi@sympatico.ca)

Revise as follows:

R316.6 Specific approval. Foam plastic not meeting the requirements of Sections R316.3 through R316.5 shall be specifically *approved* on the basis of one of the following *approved* tests: NFPA 286 with the acceptance criteria of Section R302.9.4, FM4880, UL 1040, or UL 1715, or fire tests related to actual end-use configurations. Approval shall be based on the actual end use configuration and shall be performed on the finished foam plastic assembly in the maximum thickness intended for use. <u>Foam plastics that are used as an interior finish on the basis of special tests shall also conform to the smoke-developed requirements of Section R302.9.4 or Section R316.3.</u> Assemblies tested shall include seams, joints and other typical details used in the installation of the assembly and shall be tested in the manner intended for use.

Reason: At a minimum, the provision for special approvals for foamed plastics, which waives other requirements of the IRC for foamed plastics needs to provide a comparable level of performance and safety to the existing provisions. The exception for foamed plastics in R316.6 does not adequately cover smoke developed performance of foamed plastics. Current requirements for glass fiber, mineral fiber, cellulose and reflective plastic core insulation all require both flame spread and smoke development requirements either based on ASTM E84 or UL 723 or R302.10 Alternative methods are acceptable for use, however, their performance level needs to address the same hazards as the base requirement, plus any additional hazards that might arise as a result of a specific material. This proposal makes the section more consistent with the parallel provision in the IBC.

Justification: For all other thermal and sound insulating materials within the IRC, including non-combustible insulation materials, the minimum performance level for materials permitted to be used includes at least some requirements for both flame spread (fire growth) and smoke production. These requirements are primarily based on either ASTM E84 testing or alternative methods such as NFPA 286 and CAN/ULC-S102.2. However, in the case of foamed plastics, of the four alternative test methods permitted by 2603.9, only NFPA 286 contains any limits on smoke developed for any foamed plastics by virtue of the inclusion of a reference to section R302.9.4.

Room corner tests such as FM 4880, UL 1040, NFPA 286 or UL 1715 do evaluate fire growth and flashover. However, with the exception of the criteria for NFPA 286 in R302.9.4, the pass/fail criteria proposed for the room corner tests in the proposed acceptance criteria do not include quantitative evaluation of smoke density. Criteria for fire and smoke performance of building materials are based as much on issues arising from smoke production from burning materials, and smoke migration within the occupied spaces. It is not reasonable to provide an exception to the basic ASTM E84 flame spread and smoked developed requirements which apply to all other types of insulations, even non-combustible insulations, for foamed plastics based on room corner tests unless the limits on smoke production are applied to all of the room corner tests.

There are numerous reported instances of the hazards associated with smoke production from building materials. One is the tragic fire at the Greenwood Health Center in Hartford, CT on Feb 26 2003. The New York Times quoted Chief Charles A. Teale of the Hartford Fire Department as stating that “Most of the 10 residents killed, ranging in ages from 27 to 76, died of smoke inhalation”. The same article further goes on to quote officials as saying: “The nursing home itself suffered little damage, though, and the fire was put out in about 15 minutes. Most of the residents were then led back inside, and by midday, 84 of the 148 residents remained at the center”.

It is reasonable to allow alternative methods of testing materials to determine their acceptability for use, however, their performance criteria needs to address the same hazards as the base requirement, plus any additional hazards that might arise as a result of a specific material.

Cost Impact: This code change proposal will not increase the cost of construction.

R316.6-RB-CRIMI.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this proposed code change because they felt that it duplicated other code requirements and because the proponent needs to clarify what the phrase “special testing” refers to.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Tony Crimi, A.C. Consulting Solutions Inc., representing North American Insulation Manufacturers Association (NAIMA), requests Approval as Submitted.

Commenter’s Reason: This proposal aims to ensure that smoke development requirements are not inadvertently omitted for foamed plastics complying with R316.6.

The IRC has specific requirements for flame spread ratings and smoke developed index for Insulation materials. It begins in R302.10, which requires Insulation materials, including facings, to have a flame spread index not to exceed 25 with an accompanying smoke-developed index not to exceed 450 when tested in accordance with ASTM E 84 or UL 723. This section provides an exception for foamed plastics complying with R316.

R316.3 still requires foam plastic insulation more than 4 inches (102 mm) thick to have a maximum flame spread index of 75 and a smoke-developed index of 450 where tested at a minimum thickness of 4 inches (102 mm), provided the end use is also *approved* in accordance with Section R316.6 using the thickness and density intended for use. This exception does not waive the smoke developed requirements of R302.10 or R316.3.

The language in R316.3 begins by stating "Unless otherwise allowed in Section R316.5 or R316.6....". R316.5.10 for interior finish is very clear that foam plastics permitted as interior finish where *approved* in accordance with Section R316.6 shall also meet the flame spread index and smoke developed index requirements of Sections R302.9.1 and R302.9.2.

However, when a Code user goes directly from the Exceptions in R302.10 and R316.3 to R316.6, foam plastics used in all other applications identified in R302.10 and R316.3 such as all foam plastic or foam plastic cores used as a component in manufactured assemblies used in building construction, or foam plastic insulation, do not clearly require the smoke developed ratings. The requirement to comply with smoke developed ratings is unclear, because, with the exception of NFPA 286 and the criteria in R302.9.4, the room corner tests permitted to be used (such as FM 4880, UL 1040, and UL 1715) do not include quantitative evaluation of smoke density. Also, only the UL 723 and ASTM E84 can provide the "smoke developed" ratings required in the IRC.

At a minimum, the provision for special approvals for foamed plastics, which waives other requirements of the IRC for foamed plastics, needs to provide a comparable level of performance and safety to the existing provisions. The exception for foamed plastics in R316.6 does not adequately cover smoke developed performance of foamed plastics. Current requirements for glass fiber, mineral fiber, cellulose and reflective plastic core insulation all require both flame spread and smoke development requirements either based on ASTM E84 or UL 723 or R302.10 Alternative methods are acceptable for use, however, their performance level needs to address the same hazards as the base requirement, plus any additional hazards that might arise as a result of a specific material. This proposal makes the section more consistent with the parallel provision in the IBC.

Public Comment 2:

Jesse J. Beitel, Hughes Associates, Inc. representing The Extruded Polystyrene Foam Association, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

Revise text as follows:

R316.3 Surface burning characteristics. Unless otherwise allowed in Section R316.5 ~~or R316.6~~, all foam plastic or foam plastic cores used as a component in manufactured assemblies used in building construction shall have a flame spread index of not more than 75 and shall have a smokedeveloped index of not more than 450 when tested in the maximum thickness intended for use in accordance with ASTM E 84 or UL 723. Loose-fill-type foam plastic insulation shall be tested as board stock for the flame spread index and smoke-developed index.

> **Exception:** Foam plastic insulation more than 4 inches (102 mm) thick shall have a maximum flame spread index of 75 and a smoke-developed index of 450 where tested at a minimum thickness of 4 inches (102 mm), provided the end use is approved in accordance with Section R316.6 using the thickness and density intended for use.

R316.6 Specific approval. Foam plastic not meeting the requirements of Sections ~~R316.3~~ R316.4 through R316.5 shall be specifically *approved* on the basis of one of the following approved tests: NFPA 286 with the acceptance criteria of Section R302.9.4, FM 4880, UL 1040, or UL 1715, or fire tests related to actual end-use configurations. Approval shall be based on the actual end use configuration and shall be performed on the finished foam plastic assembly in the maximum thickness intended for use. Assemblies tested shall include seams, joints and other typical details used in the installation of the assembly and shall be tested in the manner intended for use.

Commenter's Reason: This comment will require that foam plastic insulations and foam plastic cores evaluated under Section R316.6 also meet the flame spread and smoke-developed requirements of Section R316.3. This requirement will bring the IRC into conformity with the requirements of the IBC.

Public Comment 3:

Marcelo M. Hirschler (GBH International), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R316.6 Specific approval. Foam plastic not meeting the requirements of Sections R316.3 through R316.5 shall be specifically *approved* on the basis of one of the following *approved* tests: NFPA 286 with the acceptance criteria of Section R302.9.4, FM4880, UL 1040, or UL 1715, or fire tests related to actual end-use configurations. Approval shall be based on the actual end use configuration and shall be performed on the finished foam plastic assembly in the maximum thickness intended for use. Foam plastics that are used as an interior finish on the basis of a fire test that does not assess smoke development shall also demonstrate adequate smoke development requirements such as, but not limited to, compliance with the requirements of Section R302.9.4 ~~shall also conform to the smoke developed requirements of Section R302.9.4 or Section R316.3~~. Assemblies tested shall include seams, joints and other typical details used in the installation of the assembly and shall be tested in the manner intended for use.

Commenter's Reason: This section requires that foam plastic that is not covered by a thermal barrier needs to meet requirements for flame spread (or heat release) and for smoke release. Moreover, this section also allows the use of other *approved* fire tests "related to actual end-use configurations". However, the section is not explicit that smoke development needs to be assessed in every "special approval" case. The section specifically mentions 4 full scale fire tests, but only 2 of the 4, namely NFPA 286 and UL 1715, require smoke measurements. Neither FM 4880 nor UL 1040 requires smoke measurements. Section R302.9.4 contains the requirements of smoke development for testing to NFPA 286. This proposal would allow the code official the leeway to decide what is an appropriate fire test for the foam plastics, while ensuring that smoke development is adequately assessed. When large scale fire tests are conducted, for example to FM 4880 or UL 1040, information on smoke is always available in the test report even if it may be qualitative or visual. That qualitative (or visual) information is likely to be sufficient for a code official to decide whether the material exhibits adequate smoke development.

RB174-13

Final Action: AS AM AMPC____ D

RB177-13
R320.1, R320.1.1 (New)

<u>Proposed Change as Submitted</u>

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee (cbaldassarra@rjagroup.com)

Revise as follows:

R320.1 Scope. Where there are four or more *dwelling* units ~~or *sleeping units*~~ in a single structure, the provisions of Chapter 11 of the *International Building Code* for Group R-3 shall apply.

<u>**R320.1.1 Guest rooms**. A dwelling with guestrooms shall comply with the provisions of Chapter 11 of the *International Building Code* for Group R-3. For the purpose of applying the requirements of IBC chapter 11, *guestrooms* shall be considered sleeping units.</u>

<u>**Exception:** Lodging houses.</u>

Reason: Residential and institutional occupancies with 6 or more residents are within the scope of the IBC only and cannot be constructed under the IRC. This is based on both the scope of the IRC and IBC. Scoping provisions of the IRC and IBC, and code provisions within the IBC permit some residential and institutional occupancies with 5 or fewer occupants to be constructed in accordance with the IRC as an alternative to compliance with the IBC. The IBC occupancies that allow use of the IRC for five or fewer guests are: Group R-3 lodging houses (see G40-13), lodging houses are also in the scope of the IRC in section 101.2 #2; section 308.3.1 for Group I-1 and 308.4.1 for Group I-2.

Per the 2010 ADA Standard for Accessible Design and the IBC 1103.2.11 owner occupied lodging houses with 5 or fewer guests are not required to be accessible. So compliance with the IRC works for this condition without causing any conflicts with the IBC. If the lodging house is not owner occupied or accommodates more than 5 guests the building is outside of the scope of the IRC and accessibility is addressed since the building will be constructed per the IBC.

The issue addressed by this code change is how to handle 2012 IBC Sections 308.3.1 for I-1 and 308.4.1 for I-2. These sections classify the building as Group R-3 or allow use of the IRC for these institutional uses that have 5 or fewer care recipients. If it is classified as Group R-3 then IBC section 1107.6.3 provides requirements for accessibility of the building. Clearly the intent of Section 1107.6.3 is that if you have 4 or 5 care recipients the "sleeping units" must be Type B (subject to Section 1107.7 exceptions). The problem is that IRC structures by scope and definition do not have sleeping units:

> **R101.2 Scope.** The provisions of the *International Residential Code for One- and Two-family Dwellings* shall apply to the construction, *alteration,* movement, enlargement, replacement, repair, equipment, use and occupancy, location, removal and demolition of detached one- and two-family dwellings and townhouses not more than three stories above *grade plane* in height with a separate means of egress and their *accessory structures.*
>
> **DWELLING.** Any building that contains one or two *dwelling units* used, intended, or designed to be built, used, rented, leased, let or hired out to be occupied, or that are occupied for living purposes.

Adding the IBC definition of sleeping units to the IRC does not work because IBC sleeping units are not part of a dwelling unit. The current IBC definition of sleeping units states that "Such rooms and spaces that are also part of a dwelling unit are not sleeping units". Having a building constructed under the IRC that is not a dwelling unit, but a building with multiple sleeping units, is outside of the scope of the IRC.

Any of the Group I uses for 5 and under that are built to the IRC should have the same accessibility requirements as a Group R-3 constructed building. The IRC does not have sleeping units. Under the IRC such facilities are a dwelling unit with guest rooms. While the IRC contains a definition for guestroom, it is not clear on how the guestrooms should be counted for accessibility. Since the resident rooms are not sleeping units but guest rooms the current Section R320.1 does not require accessibility per Chapter 11 of the IBC for any IRC structures that have multiple guest rooms in one dwelling unit. The solution proposed here is to delete sleeping units from Section R320.1 to remove the confusion about the scope of sleeping units in the IRC and to add new Section R320.1.1 to address guestrooms. The statement that guestrooms shall be considered sleeping units for the purpose of applying IBC Chapter 11 is necessary because we cannot change the IBC language until the 2018 cycle. We plan to propose a more coordinated change for both the IBC and IRC to address this issue in the 2018 cycle. The exception for lodging houses is to maintain the exemption from accessibility requirements for lodging houses consistent with IBC Section 1103.2.11.

The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as “areas of study”. Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/CTC/Pages/default.aspx. Since its inception in April/2005, the CTC has held twenty five meetings - all open to the public.

Cost Impact: None

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee approved this code change proposal because they felt that it provided a useful pointer to the related provisions in the International Building Code.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee and Steve Orlowski, representing National Association of Home Builders (NAHB), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R320.1 Scope. Where there are four or more *dwelling* units in a single structure, the provisions of Chapter 11 of the *International Building Code* for Group R-3 shall apply.

R320.1.1 Guest rooms. A dwelling with guestrooms shall comply with the provisions of Chapter 11 of the *International Building Code* for Group R-3. For the purpose of applying the requirements of IBC chapter 11, *guestrooms* shall be considered sleeping units.

> **Exception:** ~~Lodging houses.~~ <u>Owner-occupied lodging houses with five or fewer guestrooms constructed in accordance with the *International Residential Code* are not required to be accessible.</u>

Commenter's Reason: The original proposed language deals with townhouses and group homes/hotels separately. Unfortunately, with the passage of both RB177 and RB178, the result will be confusing. The proposed modification to the exception would do 3 things:

1. Include the more specific language for the exception in RB178
2. More closely align with IRC scoped for lodging houses (i.e., bed-n-breakfast), and
3. Would be consistent with the exemption IBC Group R-1 in Section 1103.2.11 (i.e., bed-n-breakfast).

The IRC scope now includes some small group homes, live/work units and bed-n-breakfast hotels. The 2012 IRC scope, Section 101.2, Exception 2, is limited to "Owner-occupied lodging houses with five or fewer guestrooms shall be permitted to be constructed in accordance with the IRC when equipped with a fire sprinkler system in accordance with Section P2904."

Guestrooms and lodging houses are defined in the IRC (see definitions below). Sleeping units are not defined in the IRC, but they are relevant to Fair Housing/Type B unit requirements.

Guestroom – Any room or rooms used or intended to be used by one or more guests for living or sleeping purposes.

Lodging House – A one-family dwelling, where one or more occupants are primarily permanent in nature, and rent is paid for guest rooms.

While some may not prefer to define sleeping rooms in group homes as guestrooms, with the current language, that is the best fit. The CTC will be looking at this next cycle to try and coordinate accessibility requirements and language between the IBC and IRC. They will also look at accessibility for live/work units.

This solution is supported by the proponents of both proposals, RB177 and RB178.

RB177-13

Final Action: AS AM AMPC____ D

RB178-13
R320.1

<u>Proposed Change as Submitted</u>

Proponent: Steve Orlowski, representing National Association of Home Builders (NAHB) (sorlowski@nahb.org)

Add new text as follows:

R320.1 Scope. Where there are four or more *dwelling* units or sleeping units in a single structure, the provisions of Chapter 11 of the *International Building Code* for Group R-3 shall apply.

> <u>**Exception:** Owner-occupied lodging houses with five or fewer guestrooms or sleeping units constructed in accordance with the *International Residential Code* are not required to be accessible.</u>

Reason: Based on the action taken during the Group A Hearings, Lodging houses are now referenced in the IBC. It was noted during the hearings, that lodging houses with five or fewer guest rooms or sleeping units are not required to be accessible under the 2010 ADA Guidelines. This proposal simply clarifies that lodging houses are not subject to the provisions of Chapter 11 of the IBC if they contain five or fewer guest rooms or sleeping units.

Cost Impact: The code change proposal will not increase the cost of construction.

R320.1-RB-ORLOWSKI

<u>Committee Action Hearing Results</u>

Committee Action: **Approved as Modified**

Modify proposal as follows:

R320.1 Scope. Where there are four or more *dwelling* units or ~~sleeping units~~ <u>guestrooms</u> in a single structure, the provisions of Chapter 11 of the *International Building Code* for Group R-3 shall apply.

> **Exception:** Owner-occupied lodging houses with five or fewer guestrooms ~~or sleeping units~~ constructed in accordance with the *International Residential Code* are not required to be accessible.

Committee Reason: The committee approved this code change proposal because it clarifies when related provisions in the International Building Code are applicable. The committee modified this proposed code change because the term "sleeping units" is not used in the International Residential Code.

Assembly Action: **None**

<u>Individual Consideration Agenda</u>

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee and Steve Orlowski, representing National Association of Home Builders (NAHB), requests Disapproval.

Commenter's Reason: RB177 and RB178 were developed as options to address accessibility concerns with the scoping to the IRC for small bed-n-breakfast hotels. With both passing, the end result would add confusion in the code. For coordination/clarification, the public comment for RB 177 should be approved, and this change needs to be disapproved. This solution is supported by the proponents of both proposals.

R322.1, R322.1.6, R322.1.8, R322.1.9, R322.2, R322.2.1, R322.3, R322.3.2, R322.3.3, R322.3.4, and R106.1.3

Proposed Change as Submitted

Proponent: Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (Gregory.wilson2@fema.dhs.gov; Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net).

Revise as follows:

R322.1 General. Buildings and structures constructed in whole or in part in flood hazard areas (including A or V Zones and Coastal A Zones) as established in Table R301.2(1) shall be designed and constructed in accordance with the provisions contained in this section. Buildings and structures located in whole or in part in identified floodways shall be designed and constructed in accordance with ASCE 24.

R322.1.6 Protection of mechanical and electrical systems. Electrical systems, equipment and components; heating, ventilating, air conditioning; plumbing appliances and plumbing fixtures; duct systems; and other service equipment shall be located at or above the elevation required in Section R322.2 (flood hazard areas including A Zones) or R322.3 (coastal high-hazard areas including V Zones and Coastal A Zones). If replaced as part of a substantial improvement, electrical systems, equipment and components; heating, ventilation, air conditioning and plumbing appliances and plumbing fixtures; duct systems; and other service equipment shall meet the requirements of this section. Systems, fixtures, and equipment and components shall not be mounted on or penetrate through walls intended to break away under flood loads.

> **Exception:** Locating electrical systems, equipment and components; heating, ventilating, air conditioning; plumbing appliances and plumbing fixtures; duct systems; and other service equipment is permitted below the elevation required in Section R322.2 (flood hazard areas including A Zones) or R322.3 (coastal high-hazard areas including V Zones and Coastal A Zones) provided that they are designed and installed to prevent water from entering or accumulating within the components and to resist hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding to the design flood elevation in accordance with ASCE 24. Electrical wiring systems are permitted to be located below the required elevation provided they conform to the provisions of the electrical part of this code for wet locations.

R322.1.8 Flood-resistant materials. Building materials used below the elevation required in Section R322.2 (flood hazard areas including A Zones) or R322.3 (coastal high-hazard areas including V Zones and Coastal A Zones) shall comply with the following:

1. All wood, including floor sheathing, shall be pressure-preservative-treated in accordance with AWPA U1 for the species, product, preservative and end use or be the decay–resistant heartwood of redwood, black locust or cedars. Preservatives shall be listed in Section 4 of AWPA U1.
2. Materials and installation methods used for flooring and interior and exterior walls and wall coverings shall conform to the provisions of FEMA-TB-2.

R322.1.9 Manufactured homes. New or replacement manufactured homes shall be elevated in accordance with Section R322.2 (flood hazard areas including A Zones) or Section R322.3 in coastal high-hazard areas (V Zones and Coastal A Zones). The anchor and tie-down requirements of Sections AE604 and AE605 of Appendix E shall apply. The foundation and anchorage of manufactured homes to be located in identified floodways shall be designed and constructed in accordance with ASCE 24.

R322.2 Flood hazard areas (including A Zones). All areas that have been determined to be prone to flooding but not subject to high-velocity wave action shall be designated as flood hazard areas. Flood hazard areas that have been delineated as subject to wave heights between 1.5 feet and 3 feet or otherwise designated by the jurisdiction shall be designated as Coastal A Zones and are subject to the requirements in Section R322.3. All buildings and structures constructed in whole or in part in flood hazard areas shall be designed and constructed in accordance with Sections R322.2.1 through R322.2.3.

R322.2.1 Elevation requirements.

1. Buildings and structures in flood hazard areas not designated as Coastal A Zones shall have the lowest floors elevated to or above the design flood elevation.
~~2. Buildings and structures in flood hazard areas designated as Coastal A Zones shall have the lowest floors elevated to or above the base flood elevation plus 1 foot (305 mm), or to the design flood elevation, whichever is higher.~~
2.~~3~~ In areas of shallow flooding (AO Zones), buildings and structures shall have the lowest floor (including basement) elevated at least as high above the highest adjacent grade as the depth number specified in feet (mm) on the FIRM, or at least 2 feet (610 mm) if a depth number is not specified.
3.~~4~~ Basement floors that are below grade on all sides shall be elevated to or above the design flood elevation.

Exception: Enclosed areas below the design flood elevation, including basements whose floors are not below grade on all sides, shall meet the requirements of Section R322.2.2.

R322.3 Coastal high-hazard areas (including V Zones and Coastal A Zones, where designated). Areas that have been determined to be subject to wave heights in excess of 3 feet (914 mm) or subject to high-velocity wave action or wave–induced erosion shall be designated as coastal high-hazard areas. Flood hazard areas that have been delineated as subject to wave heights between 1.5 feet and 3 feet or otherwise designated by the jurisdiction shall be designated as Coastal A Zones. All buildings and structures constructed in whole or in part in coastal high-hazard areas and in Coastal A Zones, where designated, shall be designed and constructed in accordance with Sections R322.3.1 through R322.3.6.

R322.3.2 Elevation requirements.

1. All buildings and structures erected within coastal high-hazard areas and Coastal A Zones, shall be elevated so that the lowest portion of all structural members supporting the lowest floor, with the exception of mat or raft foundations, piling, pile caps, columns, grade beams and bracing, is:
1.1 Located at or above the design flood elevation, if the lowest horizontal structural member is oriented parallel to the direction of wave approach, where parallel shall mean less than or equal to 20 degrees from the direction of approach, or
1.2 Located at the base flood elevation plus one foot (305 mm), or the design flood elevation, whichever is higher, if the lowest horizontal structural member is oriented perpendicular to the direction of wave approach, where perpendicular shall mean greater than 20 degrees from the direction of approach.
2. Basement floors that are below grade on all sides are prohibited.
3. The use of fill for structural support is prohibited.
4. Minor grading, and the placement of minor quantities of fill, shall be permitted for landscaping and for drainage purposes under and around buildings, and for support of parking slabs, pool decks, patios, and walkways.

Exception: Walls and partitions enclosing areas below the design flood elevation shall meet the requirements of Sections R322.3.4 and R322.3.5.

R322.3.3 Foundations. All buildings and structures erected in coastal high-hazard areas and Coastal A Zones, shall be supported on pilings or columns and shall be adequately anchored to such pilings or columns. The space below the elevated building shall be either free of obstruction or, if enclosed with walls, the walls shall meet the requirements of Section R322.3.4. Piling shall have adequate soil penetrations to resist the combined wave and wind loads (lateral and uplift). Water loading values used shall be those associated with the design flood. Wind loading values shall be those required by this code. Pile embedment shall include consideration of decreased resistance capacity caused by scour of soil strata surrounding the piling. Pile systems design and installation shall be certified in accordance with Section R322.3.6. Spread footing, mat, raft or other foundations that support columns shall not be permitted where soil investigations that are required in accordance with Section R401.4 indicate that soil material under the spread footing, mat, raft or other foundation is subject to scour or erosion from wave–velocity flow conditions. If permitted, spread footing, mat, raft or other foundations that support columns shall be designed in accordance with ASCE 24. Slabs, pools, pool decks and walkways shall be located and constructed to be structurally independent of buildings and structures and their foundations to prevent transfer of flood loads to the buildings and structures during conditions of flooding, scour or erosion from wave-velocity flow conditions, unless the buildings and structures and their foundation are designed to resist the additional flood load.

> **Exception:** In Coastal A Zones, stem wall foundations supporting a floor system above and backfilled with soil or gravel to the underside of the floor system shall be permitted provided the foundations are designed to account for wave action, debris impact, erosion, and local scour. Where soils are susceptible to erosion and local scour, stem wall foundations shall have deep footings to account for the loss of soil.

R322.3.4 Walls below design flood elevation. Walls and partitions are permitted below the elevated floor, provided that such walls and partitions are not part of the structural support of the building or structure and:

1. Electrical, mechanical, and plumbing system components are not to be mounted on or penetrate through walls that are designed to break away under flood loads; and
2. Are constructed with insect screening or open lattice; or
3. Are designed to break away or collapse without causing collapse, displacement or other structural damage to the elevated portion of the building or supporting foundation system. Such walls, framing and connections shall have a design safe loading resistance of not less than 10 (479 Pa) and no more than 20 pounds per square foot (958 Pa); or
4. Where wind loading values of this code exceed 20 pounds per square foot (958 Pa), the construction documents shall include documentation prepared and sealed by a registered design professional that:
   4.1. The walls and partitions below the design flood elevation have been designed to collapse from a water load less than that which would occur during the design flood.
   4.2. The elevated portion of the building and supporting foundation system have been designed to withstand the effects of wind and flood loads acting simultaneously on all building components (structural and nonstructural). Water loading values used shall be those associated with the design flood. Wind loading values used shall be those required by this code.
5. In Coastal A Zones walls shall be provided with flood openings that meet the criteria of Section 322.2.2.

Add new text as follows:

R106.1.3 Information for construction in flood hazard areas. For buildings and structures located in whole or in part in flood hazard areas as established by Table R301.2(1), construction documents shall include:

1. Delineation of flood hazard areas, floodway boundaries and flood zones and the design flood elevation, as appropriate;
2. The elevation of the proposed lowest floor, including basement; in areas of shallow flooding (AO zones), the height of the proposed lowest floor, including basement, above the highest adjacent finished grade; and

3. The elevation of the bottom of the lowest horizontal structural member in coastal high hazard areas (V Zone) <u>and in Coastal A Zones where such zones are delineated on flood hazard maps identified in Table R301.2(1) or otherwise designated by the jurisdiction</u>; and
4. If design flood elevations are not included on the community's Flood Insurance Rate Map (FIRM), the building official and the applicant shall obtain and reasonably utilize any design flood elevation and floodway data available from other sources.

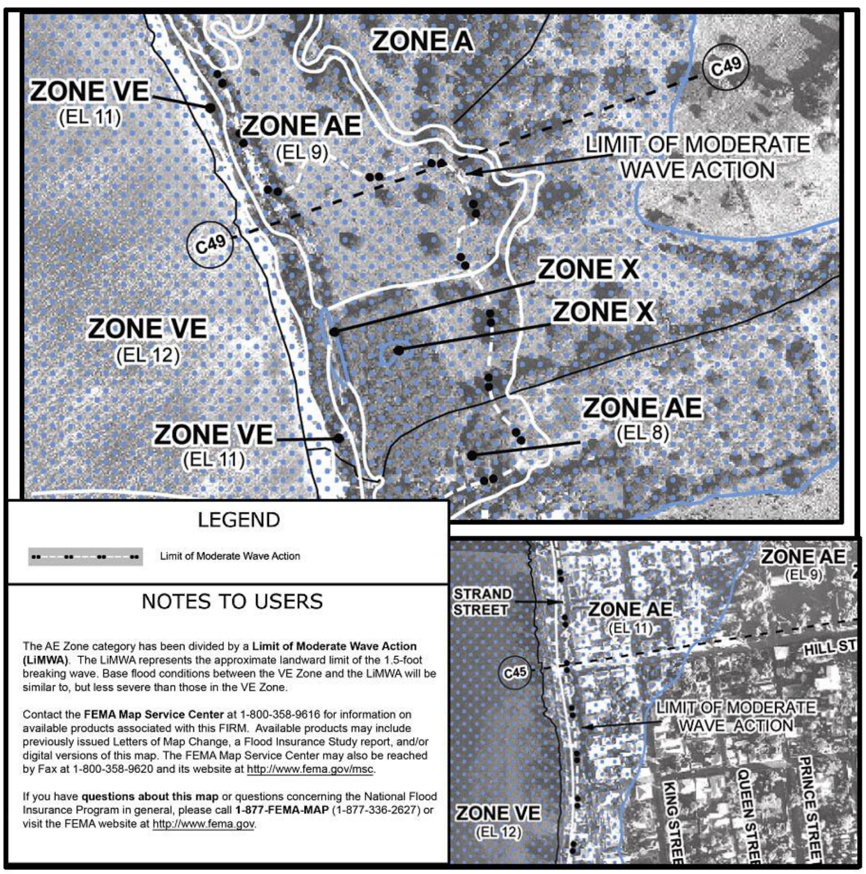
Reason: This proposal would require that dwellings in areas designated as "Coastal A Zones" meet the requirements of Section 322.3 for dwellings in coastal high hazard areas (Zone V), including open foundations (pilings or columns) with an exception that permits filled stemwalls.

The Coastal A Zone (CAZ) has been in ASCE 7 since the late '90s and in ASCE 24 since its initial publication in 1998. Recognition of CAZ was added to the 2009 edition of IRC Section R322.2, with the only requirement that if the area subject to waves between 1.5 ft and 3 ft is delineated, then the area is designated a Coastal A Zone and lowest floors shall be at least one-foot above the design flood elevation (i.e., in all other respects, the 2009 and 2012 IRC requires dwellings in Coastal A Zones to comply with the requirements for Zone A).

The inland boundary of the coastal high hazard area (Zone V) is drawn by FEMA where breaking wave heights are expected to drop below 3.0 ft during base flood conditions. The requirements for foundations of dwellings that are located just landward of the Zone V boundary are predicated on the assumption that hydrodynamic loads associated with waves – even waves that are 2.9-ft – are not significant and that conventional foundations such as perimeter walls can resist those loads and associated erosion and local scour.

FEMA's many post-disaster investigations after severe coastal storms have long recommended application of coastal high hazard area (Zone V) requirements to areas inland of the Zone V/Zone A boundary – in the area subject to waves between 1.5 ft and 3 ft – the area now referred to as "Coastal A Zone". Starting in fiscal year 2009, all coastal flood studies by FEMA will include analyses of moderate wave action and FIRMs will show the Limit of Moderate Wave Action (LiMWA).

The total land area that is likely to be designated as CAZ is small. FEMA has estimated that less than 3 percent of all mapped flood hazard areas are Zone V and the LiMWA generally is determined to be a relatively short distance inland from the Zone V boundary. The graphic below is from the December 2008 Procedure Memorandum No. 50 which established FEMA's policy to delineate the LiMWA on FIRMs



Every FEMA publication on coastal construction since mid-2000 has recommended the use of Zone V construction requirements in Coastal A Zones. As early as 1979 some communities were augmenting the minimum NFIP requirements because of observed wave damage to conventional, closed foundations (Santa Rosa Island Authority, Florida, 1979). FEMA's first Coastal Construction Manual, published in 1981, recognized that "high velocity water may be experienced due to the forward momentum of breaking waves, especially in the vicinity of the V zone/A zone interface." The defined term "Coastal A Zone" is used in the 1986 revision of the Coastal Construction Manual, and numerous papers and investigations have followed. Research performed in 1992 for the U.S. Army Corps of Engineers demonstrated that buildings on typical Zone A foundations (masonry walls, masonry piers, shallow piles, and slabs) "would be subject to failure for shallow erosion and /or wave heights less than 2-3 feet."

Observations after Superstorm Sandy continue to reinforce the damage potential in areas just inland of the Zone V boundary. FEMA's report based on field investigations will be completed mid-2013. Given that open foundations (piles and columns) perform well under velocity and wave conditions, FEMA believes it is time for the IRC to acknowledge that dwellings in Coastal A Zones should meet the same requirements as dwellings in coastal high hazard areas – with the exception of filled stemwalls that account for the potential for scour and erosion. Surveys and press reports after major coastal events such as Superstorm Sandy regularly report that citizens support stricter requirements (see www.reuters.com/article/2012/11/27/us-storm-sandy-newjersey-idUSBRE8AQ0V620121127, http://blog.nj.com/njv_editorial_page/2012/11/editorial_rebuild_carefully.html).

Cost Impact: This proposal will increase the cost of construction in areas shown on Flood Insurance Rate Maps as seaward of the Limit of Moderate Wave Action (or if a community elects to designate areas as "Coastal A Zones"). However, the risk of wave-induced damage or damage due to erosion and local scour is significantly reduced.

R322.1-RB-QUINN-WILSON

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The committee disapproved this code change proposal because they felt that the regulatory process provides an opportunity for everyone to participate, that is what congress intended and that is the procedure that needs to be followed. The proposal does not take into account that all coastal areas are not the same with regard to weather or wave action, yet this proposal applies to thousands and thousands of existing and new dwellings. Pulling coastal A areas into V Zones has far reaching implications. There have not been enough studies to justify this.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency; Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency, requests Approval as Submitted.

Commenter's Reason: The committee action on this proposal was Disapproval. The reasons for disapproval are not accurate and appear to be based on a misunderstanding of the forces associated with wave action, FEMA's initiative to delineate areas subject to moderate wave action areas on Flood Insurance Rate Maps, and how those areas are determined. When FEMA delineates such areas, a Limit of Moderate Wave Action (LiMWA) is shown on the FIRM and the area between the LiMWA and the Zone V boundary is called the Coastal A Zone (see R322.2).

By definition, the engineering analyses that evaluate wave action take into account that all coastal areas are not the same. Many locational factors are considered when FEMA evaluates whether to delineate a LiMWA, including fetch (length of open water over which wind blows to generate waves), orientation of the shoreline to prevalent direction of wind and waves, land elevation relative to water depths, and the presence of dunes, buildings, and other elements of the landscape that have the effect of breaking up waves. Many reaches of shoreline subject to tidal flooding do not have conditions that produce moderate wave action, in which case the FIRM will not show a LiMWA.

The concept of the Coastal A Zone and recognition of the fact that waves inland of the Zone V boundary, while less than 3-ft in height, cause damage was first documented in a paper presented by FEMA at the 1990 conference of the Association of State Floodplain Managers. Many subsequent studies and reports, and post-disaster investigations, have reinforced that finding.

For more than 20 years FEMA has documented Mitigation Assessment Team investigations that were conducted after many major coastal disasters. Virtually every report identifies damage due to moderate waves and calls for application of Zone V requirements: Hurricane Opal (1995), Hurricane Fran (1996), Hurricane Georges (1998), Hurricane Isabel (2003), Hurricane Ivan (2004), Hurricane Dennis (2005), Hurricane Katrina (2005), and Hurricane Ike (2008). In addition, the 1998 editions of ASCE 7 and ASCE 24 require consideration of moderate wave action and application of Zone V requirements in Coastal A Zones.

Observations after last year's Hurricane Sandy continue to reinforce the damage potential in <u>open coast</u> areas just inland of the Zone V boundary. FEMA's report based on field investigations will be completed mid-2013.

Given that open foundations (piles and columns) perform well under velocity and wave conditions, it is time for the IRC to acknowledge that dwellings in Coastal A Zones should meet the same requirements as dwellings in Zone V. The exception, as specified in the code proposal, is filled stemwalls that provide resistance to wave loads and that have deeper footings that account for the potential for scour and erosion. Surveys and press reports after major coastal events regularly report that citizens support stricter requirements (see http://www.reuters.com/article/2012/11/27/us-storm-sandy-newjersey-idUSBRE8AQ0V620121127 and http://blog.nj.com/njv_editorial_page/2012/11/editorial_rebuild_carefully.html).

RB180-13

Final Action: AS AM AMPC____ D

RB183-13
R322.1.8

Proposed Change as Submitted

Proponent: Dennis Pitts, American Wood Council, representing American Wood Council (dpitts@awc.org)

Revise as follows:

R322.1.8 Flood damage-resistant materials. Building materials and installation methods used below the elevation required in Section R322.2 (flood hazard areas including A Zones) or R322.3 (coastal high-hazard areas including V Zones) shall be flood damage-resistant materials that conform to the provisions of FEMA TB-2. ~~comply with the following:~~

1. ~~All wood, including floor sheathing, shall be pressure-preservative-treated in accordance with AWPA U1 for the species, product, preservative and end use or be the decay–resistant heartwood of redwood, black locust or cedars. Preservatives shall be listed in Section 4 of AWPA U1.~~
2. ~~Materials and installation methods used for flooring and interior and exterior walls and wall coverings shall conform to the provisions of FEMA-TB-2.~~

Reason: This proposal reflects changes approved to the IBC in FS150-12. Adoption of this change will make the IBC and IRC consistent. The specific requirement for preservative-treated wood or naturally decay-resistant wood below the elevation required in Section R322.2 is deleted because wood products such as plywood sheathing, plywood panel siding, and stud walls have been shown to be resistant to the effects of flood exposure without the aid of preservatives or the use of naturally durable wood.

Primary considerations for material performance and use in flood hazard areas are outlined in FEMA *TB2, Flood Resistant Materials Requirements for Buildings Located in Special Flood Hazard Areas*, which is already referenced in the IRC. A flood damage resistant material is one that is "… capable of withstanding direct and prolonged contact with floodwaters without sustaining significant damage." Evaluation consists of consideration of material performance following 72 hour immersion and presence of only limited damage requiring no more than cosmetic repair (i.e. cleaning, sanitizing and resurfacing such as sanding, repair of joints, repainting). Research conducted by Oak Ridge National Laboratory and Tuskegee University (ORNL/TM-2005/34 *Field Testing of Energy-Efficient Flood-Damage-Resistant Residential Envelope Systems Summary Report,* June 2004) and field observations of material performance from actual floods were considerations in the update of FEMA TB2-2008. Within TB2 examples of wood that are not required to be preservative treated for flood damage resistance that may form a part of exterior walls and floors include studs and Exterior and Marine plywood used as wall sheathing. While preservative treated studs and preservative treated exterior plywood sheathing were not tested in the ORNL/Tuskegee study, it is not expected that presence of preservative treatment would improve the already acceptable performance of these materials.

General requirements for preservative treated or naturally durable wood for protection from decay and termites are addressed elsewhere in the IRC, and those applications will continue to be in effect, including in flood hazard areas.

Cost Impact: No increase in the cost of construction.

R322.1.8-RB-PITTS

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify proposal as follows:

R322.1.8 Flood damage-resistant materials. Building materials and installation methods used for flooring and interior and exterior walls and wall coverings below the elevation required in Section R322.2 (flood hazard areas including A Zones) or R322.3 (coastal high-hazard areas including V Zones) shall be flood damage-resistant materials that conform to the provisions of FEMA TB-2.

Committee Reason: The committee approved this code change proposal because they felt that it clarifies where flood damage-resistant materials are required. The modification added language that specified the affected building components, thereby further clarifying the code.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Dallin Brooks, Western Wood Preservers Institute, representing Ted LaDoux, requests Disapproval.

Commenter's Reason: RB-183 removes the required use of preservative treated wood from FEMA Standard where not specified by other areas of the code in order for wood to be considered flood damage resistant below the base flood elevation. By eliminating the use of preservative treated wood from the code other wood panel products that are not pressure treated such as (for example OSB and fiberboard sheathing) and other engineered wood products can structurally fail upon wetting affecting the strength of various wood products. In addition the proposal lacks sufficient health information, and ignores conditions that may or may not be met by the builder/occupier resulting in higher risks, than if the code were to remain in effect as is.

The basis for RB-183 is a study done by the ORNL/Tuskegee entitled Field Testing of Energy-Efficient Flood-Damage-Resistant Residential Envelope Systems and published in June 2004.

However, as the report points out several factors were not taken into consideration.

1. "While flood damage resistance includes both physical and human health factors, the experimental modules were tested only for resistance to physical degradation that results from the wetting and drying cycle associated with flooding."

Ignoring the human health impact, while, suitable for a study is not suitable for code policy change. It clearly violates the ICC vision to "Protect the **health**, safety and welfare of people by creating safe buildings and communities." Information must be presented on the human health risks of using untreated wood below the base flood elevation in the event of a flood.

2. "Testing did not address the structural impact on the envelope of externally applied hydrostatic pressures."

The hydrostatic pressure is not differentiated between untreated and treated treated wood of the same product (for example treated plywood and untreated plywood) however substitute products such as fiberboard and OSB may preform differently.

3. "Bacteriological and toxic materials testing were not performed during this series of tests."

Bacteria, mold and fungi are more likely to grow on untreated wood than on preservative treated wood, again this brings up the issue of human health in areas after a flood.

The report also concludes

1. "…older, weathered siding of the same materials and/or repeated wetting and drying over several cycles is projected **to significantly degrade the restorability** of these siding materials."

Such a statement clearly indicates that some products need to be preserved more than others. Thus such a code change should address each individual application or should meet the lowest common factor where health and safety are concerned.

2. "Plywood sheathing maintained its integrity and mechanical properties. However, **it had not dried to preflood levels after 30 days**. Because water does not tend to escape quickly from behind plywood siding, the combination of [untreated] plywood siding and sheathing was not considered a good flood damage resistant system."

While pointing out that the strength is there, this does not address the fact that staying wet beyond 30 days raises the concern that no consideration was given for mold and bacteria effecting human health.

3. "*Wood Framing* - Moisture levels in wood studs that were above the flood level returned to preflood levels within the drying period. That portion of the studs below the flood level was drying towards the pre-flood moisture content, but had not in most cases achieved that level during the drying period. The wood studs also maintained their strength (all Modules). Wood studs were considered flood damage resistant **as long as the wall system will permit them to continue to dry to normal levels."**

Without clarifying the condition that a wall system must meet for the wood frame to dry to normal levels, one can assume two things, that some wall systems do not allow the studs to dry to normal levels, and that someone will build such a system below the flood base. Either way, without defining the conditions such a statement may have a negative effect on the building industry and human health and safety.

4. *"Floor Structure* - The sealed concrete floor slab in all slab-on-grade modules remained undamaged during and after flooding. The wood sub-flooring retained very high moisture content throughout the drying period when unfaced fiberglass batt insulation was installed underneath the sub-flooring. When no floor insulation was used, the subflooring returned to pre-flood moisture levels during the drying period. **Wood subflooring and framing insulated with fiberglass batts could experience long term moisture related problems."**

Long term moisture related problems are not as significant if the wood is preservative treated.

5. *"Foundation Vents -* The operable flood vents were closed prior to flooding and opened by themselves during the filling and draining of the flood water. They operated as designed. These vents were blocked open throughout the drying period. The crawl space humidity reached 100% and remained high during the drying period. **This humidity level is unacceptable in the long term since it could contribute to both mold and wood decay.** It is believed that the high humidity level in the crawl space was the result of the test module being placed in a basin that was subjected to significant amount of rain throughout the drying period. In order to keep from providing a path for mold to enter the interior of the module, the crawl space area must be effectively sealed from the interior of the house."

Wood decay is inhibited by the preservative in treated lumber, ensuring that such a situation is minimized.

Additional concerns for human factors that are not accounted for in RB-183.

1. How many people use their flood insurance, or let it go unfixed due to financial constraints such as deductible or increased rates?
2. How many renters, landlords or sellers do not report flooding to the next tenant? Previous flood damage, poses a risk of decay, bacteria and mold growing in the unseen wood structure.
3. It is generally accepted that floods are happening at an increasing rate, intensity and height due to climate change and other factors. This is having an increasingly large cost to insurance and rebuilding efforts. "The Federal Emergency Management Agency (FEMA) reports that each year approximately 90 percent of all disaster-related property damage results from flooding. Over the past decade, the average flood claim in the United States has been more than $46,000 with yearly totals averaging $3.5 billion per year." Structural Damage Due to Floods By Craig D. Rogers, P.E. http://wwpi.info/FloodStructuralDamage

Clearly the practical differs from the ideal, thus the ideal situation is to meet at the lowest common standard. While pressure treated wood is used in many applications already below the flood base, it clearly can meet the lower targets and avoid situations of neglect that may affect public health and safety.

When you have to put conditions on performance and those conditions are not also regulated then the performance to the non-conditioned state must be expected. Including the use of materials such as OSB and fiberboard that do not have the same performance characteristics when wetted. Hence there is significant concern for human health and safety that RB-183 should not be approved to allow untreated wood to be considered flood resistant until further research can be done. RB-183 should be disapproved for these reasons.

RB183-13

Final Action: AS AM AMPC____ D

RB187-13
R322.1.9 (New)

Proposed Change as Submitted

Proponent: Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (Gregory.wilson2@fema.dhs.gov); Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net).

Add new text as follows

R322.1.9 Stairways and ramps. Stairways and ramps that are located below the lowest floor elevations specified in Sections R322.2.1 or R322.3.2, as applicable to the flood hazard area, shall either:

1. Be designed and constructed to resist flood-related loads and to minimize transfer of flood-related loads to the building or structure; or
2. Break away during design flood conditions without causing damage to the building or structure; or
3. Be retractable, or be able to be raised, to or above the lowest floor elevations, provided the ability to be retracted or raised prior to onset of conditions of flooding is not contrary to means of egress requirements of the code.

(Renumber subsequent sections)

Reason: This proposal lays out options for satisfying the general requirement in R322.1.3 which requires "All buildings and structures erected in flood hazard areas shall be constructed by methods and practices that minimize flood damage." That means stairways and ramps should resist flood loads along with the dwellings they serve. These same requirements are included in ASCE 24-13.

In coastal high hazard areas (Zone V), stairs that are not properly constructed to meet the free-of-obstructions requirement below elevated buildings can damage the building when they fail. This damage has been observed during FEMA's post-flood investigations after numerous flood events (also see Figure 1 from NFIP Technical Bulletin 2 Free-of-Obstruction Requirements).

Figure 1. Stairs did not break away cleanly, resulting in damage to the elevated building.

Cost Impact: There should be no additional costs because of the existing requirement in R322.1.3.

R322.1.9-(NEW)-RB-QUINN-WILSON

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that it is difficult to anchor at a breakaway point and because anchorage is more important with regard to stairs. It becomes a life safety issue in the sense that proper anchorage ensures that no one falls and that the stair has a long life. In addition, there is no information to support cost benefits in A Zones and anything that breaks away is likely to damage something.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Gregory Wilson (FEMA) and Rebecca Quinn (RCQuinn Consulting), representing US Dept of Homeland Security, Federal Emergency Management Agency and RCQuinn Consulting, Inc. representing FEMA, requests Approval as Modified by this Public Comment,

Modify the proposal as follows:

~~R322.1.9~~ $322.3.6 Stairways and ramps. Stairways and ramps that are located below the lowest floor elevations specified in Section R322.3.2 ~~Sections R322.2.1 or R322.3.2, as applicable to the flood hazard area,~~ shall either:

1. Be designed and constructed to resist flood-related loads and to minimize transfer of flood-related loads to the building or structure; or
2. Break away during design flood conditions without causing damage to the building or structure; or
3. Be retractable, or be able to be raised, to or above the lowest floor elevations, provided the ability to be retracted or raised prior to onset of conditions of flooding is not contrary to means of egress requirements of the code.

Commenter's Reason: The committee action on this code change proposal was Disapproval. The proposed modification addresses the committee's concern about applying the requirement in Zone A by moving it to Section R322.3, which applies only in coastal high hazard areas (Zone V) where waves are expected to be 3 ft or higher during the base flood. The committee's reason statement also identified concerns with proper anchorage, however, as evidenced by post-disaster investigations, stairs and ramps may be adequately connected to the building to meet safety requirements but still be designed to break away under flood loads. Plus, the proposal has the alternative that stairs and ramps can remain intact provided they resist flood-related loads and minimize transfer of loads to the building, which has also been observed to be successful.

RB187-13
Final Action: AS AM AMPC____ D

RB190-13

R322.2.3, Table R322.2.3(1) (New), Table R322.2.3(2) (New), R404.1.3

Proposed Change as Submitted

Proponent: Greg Wilson, US Dept of Homeland Security, Federal Emergency Management Agency (Gregory.P.Wilson@dhs.gov); Glenn Overcash, URS Corporation representing FEMA

Revise as follows:

R322.2.3 Foundation design and construction. Foundation walls for all buildings and structures erected in flood hazard areas shall meet the requirements of Chapter 4 subject to the following limitations:

1. Plain masonry walls are not permitted.
2. Masonry walls in flood hazard areas not designated as Coastal A Zones, shall comply with Table R322.2.3(1) or shall be designed in accordance with ASCE 24.
3. Masonry walls in flood hazard areas designated as Coastal A Zones, shall comply with Table R322.2.3(2) or shall be designed in accordance with ASCE 24.

~~**Exception:** Unless designed in accordance with Section 404:~~

~~1. The unsupported height of 6-inch (152 mm) plain masonry walls shall be no more than 3 feet (914 mm).~~
~~2. The unsupported height of 8-inch (203 mm) plain masonry walls shall be no more than 4 feet (1219 mm).~~
~~3. The unsupported height of 8-inch (203 mm) reinforced masonry walls shall be no more than 8 feet (2438 mm).~~

~~For the purpose of this exception, unsupported height is the distance from the finished grade of the under-floor space to the top of the wall.~~

TABLE R322.2.3(1)
MASONRY WALLS IN FLOOD HAZARD AREAS NOT DESIGNATED AS COASTAL A ZONE (ZONE A)

WALL THICKNESS	MAXIMUM UNSUPPORTED WALL HEIGHT[a] (feet)	MINIMUM VERTICAL REINFORCEMENT AND SPACING (INCHES)[b,c]
8-inch, with reinforcing in accordance with Table R404.1.1(2)	7	#4 at 48
	10	#4 at 24 or #5 at 40
10-inch, with reinforcing in accordance with Table R404.1.1(3)	7	#4 at 56
	10	#4 at 32 or #5 at 48
12-inch, with reinforcing in accordance with Table R404.1.1(4)	7	#4 at 72
	10	#4 at 40 or #5 at 64

a. Unsupported wall height is the distance from the finished interior grade adjacent to the wall, or the footing, whichever is higher, to the top of the wall.

b. If unbalanced fill conditions exist, then vertical reinforcement shall be the greater of that required by this table or referenced table in Section R404 (Tables R404.1.2(2) through R404.1.2(4))

TABLE R322.2.3(2)
MASONRY WALLS IN FLOOD HAZARD AREAS DESIGNATED AS COASTAL A ZONE (ZONE A)

WALL THICKNESS	MAXIMUM UNSUPPORTED WALL HEIGHT[a] (feet)	MINIMUM VERTICAL REINFORCEMENT AND SPACING (INCHES)
8-inch, with reinforcing in accordance with Table R404.1.1(2)	2	#4 at 48
	3	#4 at 32 #5 at 48
10-inch, with reinforcing in accordance with Table R404.1.1(3)	4	#4 at 16 #5 at 24
12-inch, with reinforcing in accordance with Table R404.1.1(4)	5	#4 at 8 #6 at 16

a. Unsupported wall height is the distance from the finished interior grade adjacent to the wall, or the footing, whichever is higher, to the top of the wall.

Revise as follows:

R404.1.3 Design required. Concrete or masonry foundation walls shall be designed in accordance with accepted engineering practice when one ~~either~~ of the following conditions exists:

1. Walls are subject to hydrostatic pressure from groundwater.
2. Walls supporting more than 48 inches (1219 mm) of unbalanced backfill that do not have permanent lateral support at the top or bottom.
3. Masonry walls in flood hazard areas other than coastal high hazard areas that do not conform to the limitations in of R322.2.3 shall be designed in accordance with ASCE 24.

Reason: Current criteria for prescriptive masonry foundation wall construction per Tables R404.1.1(1) through (4) of Section R404 are based on wall height, soil classification, and unbalanced fill. However, for locations in flood hazard areas when wall sections are analyzed with applicable flood loads, the limits on wall height are typically driven by flood depth (per elevation requirements in R322.2.1) and are less often a function of site grade changes that result in lateral loads from unbalanced fill.

IRC Section R322.2.3 permits construction of masonry foundation walls in flood hazard areas per Section R404 with height restrictions on plain masonry and 8" reinforced masonry walls. The wall height limitations in R322.2.3 are based on analyses performed in 1998 for a range of flood depths and flood velocities. FEMA re-examined those limitations this year after observing wall damage.

Foundation walls in flood hazard areas may be susceptible to hydrostatic forces (addressed by the requirement for flood openings in R322.2.2) and hydrodynamic forces imposed by moving water and moderate breaking wave loads on vertical walls with wave heights between 1 ½ feet and 3 feet (see R322.2, if areas subject to such waves are delineated, they are designated "Coastal A Zones"). FEMA evaluated the resistance of masonry walls of variable heights, with flood openings, to a range of velocities and a range of wave heights, in combination with wind loading conditions covered in the IRC. FEMA used Allowable Stress Design (ASD) Load Combination 7, according to ASCE 7-10 Section 2.4.2 (2).

The hydrodynamic load analyses yielded the proposed wall height limitations and the corresponding minimum vertical reinforcement for 8", 10" and 12" thicknesses. Assumptions included:

1. 1- Story wood-framed residential structure supported on masonry foundation walls with flood openings installed per IRC R322.2.2
2. Top of foundation wall braced by elevated floor system
3. Material strengths per standards referenced in the IRC
4. All wood-frame shear resisting walls are on the exterior; foundation wall shear loads are limited by the capacity of the IRC-compliant light-frame braced walls
5. For analysis of wall sections in Zone A other than Coastal A Zones, the maximum flood velocity evaluated is 6 fps

As an example of how the results of the new analyses demonstrate the need to revise the limitations, the analysis indicates 8" reinforced masonry walls per Table 404.1.1.(2), with minimal reinforcement of #4 bar at 48" on center for an 8 ft high wall have a design strength of 32 ksi in axial tension and flexure. When just an 18" breaking wave load is applied to a 3' high wall at mid-height, the resulting ASD factored force in flexure exceeds 38 ksi.

The analyses also demonstrate the need to specify minimal reinforcement. When wind and flood loads are applied under Allowable Stress Design (ASD) Load Combination 7 per ASCE 7-10 Section 2.4.2 (2), net tension results at the top of the foundation wall from the minimum ASCE 7-10 basic wind speed of 115 mph (Exposure Category B). Higher design wind speeds result in greater uplift. The design criteria of ACI-530 Section 2.2.4 specifies that the tensile strength of unreinforced masonry shall be neglected when subjected to axial tension forces. Accordingly, unreinforced wall sections analyzed with net axial tension at the top of wall from the combined effects of wind and flood loading have been disallowed. ACI-530 commentary to Section 2.2.4 further stipulates, "*Net axial tension in unreinforced masonry walls due to axially applied load are not permitted. If axial tension develops in walls due to uplift of connected roofs or floors, the walls must be reinforced to resist the tension. Compressive stress from dead load can be used to offset axial tension."*

Evidence from FEMA's post-disaster Mitigation Assessment Team reports indicates residential unreinforced masonry (URM) wall failure under design wind (see FEMA P-908, Spring 2011 Tornadoes) and flood loads (see FEMA P-765, Midwest Floods of 2008 in Iowa and Wisconsin). MAT teams deployed shortly after Hurricane Sandy have documented numerous examples of failed unreinforced and lightly reinforced walls sections in areas shown on Flood Insurance Rate Maps as Zone A, both with and without moderate wave.

Cost Impact: The code change proposal will increase the cost of construction for a limited set of perimeter wall foundations in flood hazard areas, but will reduce the likelihood of failure under anticipated flood loads, and thus will decrease future costs associated with rebuilding after flood and flood/high wind events.

R322.2.3-RB-OVERCASH-WILSON

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The committee disapproved this code change proposal because they felt that it addressed property loss mitigation instead of life safety. The cost would be insignificant as compared to the savings. The increase in the first time costs could be significant. We may not want to use the code to mitigate costs to insurers. The proposal does not provide enough specific guidance.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Greg Wilson, US Dept of Homeland Security, Federal Emergency Management Agency and Glenn Overcash, URS Corporation representing FEMA, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R322.2.3 Foundation design and construction. Foundation walls for all buildings and structures erected in flood hazard areas shall meet the requirements of Chapter 4 subject to the following limitations:

1. Plain masonry walls are not permitted.
2. Masonry walls in flood hazard areas not designated as Coastal A Zones, shall comply with Table R322.2.3(1) or shall be designed in accordance with ASCE 24.
3. Masonry walls in flood hazard areas designated as Coastal A Zones, shall comply with Table R322.2.3(2) or shall be designed in accordance with ASCE 24.

TABLE R322.2.3(1)
MASONRY WALLS IN FLOOD HAZARD AREAS NOT DESIGNATED AS COASTAL A ZONE (ZONE A)

WALL THICKNESS	MAXIMUM UNSUPPORTED WALL HEIGHT[a] ~~(feet)~~	MINIMUM VERTICAL REINFORCEMENT AND SPACING (INCHES)[b]
8-inch, with reinforcing in accordance with Table R404.1.1(2)	7 feet 4 inches	#4 at 48
	8 feet	#4 at 40
	8 feet 8 inches	#4 at 32
	9 feet 4 inches	#4 at 24 or #5 at 40
	10 feet	#4 at 24 or #5 at 40
10-inch, with reinforcing in accordance with Table R404.1.1(3)	7 feet 4 inches	#4 at 56
	8 feet	#4 at 48
	8 feet 8 inches	#4 at 40
	9 feet 4 inches	#4 at 32 or #5 at 56
	10 feet	#4 at 32 or #5 at 48
12-inch, with reinforcing in accordance with Table R404.1.1(4)	7 feet 4 inches	#4 at 72
	8 feet	#4 at 64
	8 feet 8 inches	#4 at 48
	9 feet 4 inches	#4 at 40 or #5 at 72
	10 feet	#4 at 40 or #5 at 64

a. Unsupported wall height is the difference in height between the top of foundation wall and the lower of the top of the concrete footing that supports the foundation wall or the interior finish ground level. ~~distance from the finished interior grade adjacent to the wall, or the footing, whichever is higher, to the top of the wall.~~

b. If unbalanced fill conditions exist, then vertical reinforcement shall be the greater of that required by this table or referenced table in Section R404 (Tables R404.1.2(2) through R404.1.2(4))

TABLE R322.2.3(2)
MASONRY WALLS IN FLOOD HAZARD AREAS DESIGNATED AS COASTAL A ZONE (ZONE A)

WALL THICKNESS	UNSUPPORTED WALL HEIGHT[a] ~~(feet)~~	MINIMUM VERTICAL REINFORCEMENT AND SPACING (INCHES)
8-inch, with reinforcing in accordance with Table R404.1.1(2)	2 feet	#4 at 48
	2 feet 8 inches	#4 at 48 or #5 at 48
	3 feet 4 inches	#4 at 16 or #5 at 32
	4 feet	#5 at 8
10-inch, with reinforcing in accordance with Table R404.1.1(3)	4 feet	#4 at 16 or #5 at 24
	4 feet 8 inches	#5 at 8
12-inch, with reinforcing in accordance with Table R404.1.1(4)	4 feet 8 inches	#4 at 8 #5 at 16
	5 feet 4 inches	#5 at 8

a. Unsupported wall height is the difference in height between the top of foundation wall and the lower of the top of the concrete footing that supports the foundation wall or the interior finish ground level. ~~distance from the finished interior grade adjacent to the wall, or the footing, whichever is higher, to the top of the wall.~~

Revise as follows:

R404.1.3 Design required. Concrete or masonry foundation walls shall be designed in accordance with accepted engineering practice when one or more of the following conditions exist:

1. Walls are subject to hydrostatic pressure from groundwater.
2. Walls supporting more than 48 inches (1219 mm) of unbalanced backfill that do not have permanent lateral support at the top or bottom.
3. Masonry walls in flood hazard areas other than coastal high hazard areas that do not conform to the limitations in of R322.2.3 shall be designed in accordance with ASCE 24.

Commenter's Reason: Modifications to Code Change Proposal RB190-13 are in response to the Committee Reason for Disapproval that includes the statement that "(the) proposal does not provide enough specific guidance". To address the lack of individual prescriptive solutions for wall heights between 7 and 10 feet, rows were added to Table 322.2.3(1) to provide more efficient and economical solutions. Furthermore, wall heights are now indicated in 8" increments to match the format of Chapter 4 masonry wall reinforcement tables (Tables R404.1.1(2-4)). Modified wall height criteria that directly correspond with standard concrete masonry unit height will facilitate field application for the builder and subsequent verification by code officials.

In response to the Committee Reason for Disapproval that asserts Code Change Proposal RB190-13 "address(es) property loss mitigation instead of life safety" and that "(w)e may not want to use the code to mitigate costs to insurers", the following justification is offered: the committee's reason is not consistent with the intent of the IRC:

> "**R101.3 Intent.** The purpose of this code is to safeguard the public safety, health and general welfare through affordability, structural strength, means of egress facilities, stability … and safety to life and property from fire and other hazards attributed to the built environment and to provide safety to fire fighters and emergency responders during emergency operations." [emphasis added]

Some homeowners do not carry flood insurance and flood-related damage is not covered by homeowners insurance. Preventing failure of masonry foundation walls by providing prescriptive solutions that specifically address flood hazards clearly meets the intent of the IRC.

The current wall height limitations in R322.2.3 are based on analyses performed in 1998. FEMA re-examined those limitations in 2012 after observing unreinforced masonry wall damage during post-disaster investigations. The new analysis (described in detail in the original Proposal Reason Statement) was developed through collaboration with industry groups and applies flood loads using updated standards that are referenced in the 2012 IRC.

The new analysis results: some masonry wall solutions prescribed in the existing code for flood hazard areas are structurally deficient. Tables 322.2.3(1) and 322.2.3(2) correct those deficiencies and are more user-friendly than the existing provisions. The existing provisions of R322.2.3 are also difficult to interpret; Code Change Proposal RB190-13 clarifies requirements for builders and code officials.

RB190-13

Final Action: AS AM AMPC____ D

RB191-13

R322.2.4 (New), R322.3.3, R322.3.4 (New)

Proposed Change as Submitted

Proponent: Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (Gregory.wilson2@fema.dhs.gov); Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net).

Revise as follows:

R322.2.4 Concrete slabs. Concrete slabs used as parking pads, enclosure floors, landings, decks, walkways, patios and similar uses that are located below the base flood elevation shall be structurally independent of the primary foundation systems of buildings or, where structurally connected, the main structure shall be capable of resisting any added flood loads and effects of scour due to the presence of the slabs.

(Renumber subsequent sections.)

R322.3.3 Foundations. Buildings and structures erected in coastal high-hazard areas shall be supported on pilings or columns and shall be adequately anchored to such pilings or columns. The space below the elevated building shall be either free of obstruction or, if enclosed with walls, the walls shall meet the requirements of Section R322.3.4. Pilings shall have adequate soil penetrations to resist the combined wave and wind loads (lateral and uplift). Water loading values used shall be those associated with the design flood. Wind loading values shall be those required by this code. Pile embedment shall include consideration of decreased resistance capacity caused by scour of soil strata surrounding the piling. Pile systems design and installation shall be certified in accordance with Section R322.3.6. Spread footing, mat, raft or other foundations that support columns shall not be permitted where soil investigations that are required in accordance with Section 401.4 indicate that soil material under the spread footing, mat, raft or other foundation is subject to scour or erosion from wave-velocity flow conditions. If permitted, spread footing, mat, raft or other foundations that support columns shall be designed in accordance with ASCE 24. ~~Slabs, pools, pool decks and walkways shall be located and constructed to be structurally independent of buildings and structures and their foundations to prevent transfer of flood loads to the buildings and structures during conditions of flooding, scour or erosion from wave-velocity flow conditions, unless the buildings and structures and their foundation are designed to resist the additional flood load.~~

R322.3.4 Concrete slabs. Concrete slabs used as parking pads, enclosure floors, landings, decks, walkways, patios and similar uses that are located beneath or adjacent to structures shall be designed and constructed to:

1. Be structurally independent of the primary foundation system of the structure, do not transfer flood loads to the main structure, are constructed to break away cleanly, and are frangible so as to not produce debris capable of causing significant damage to any structure. Reinforcing of concrete slabs, including welded wire reinforcement, shall not be used so as to minimize the potential for concrete slabs being a source of debris. Slabs shall not have turned down edges and slab thickness shall be not more than 4 inches; or
2. Be self-supporting structural slabs capable of remaining intact and functional under base flood conditions, including expected erosion, and the main structure shall be capable of resisting any added flood loads and effects of local scour due to the presence of the slabs.

(Renumber subsequent sections.)

Reason: This proposal includes specifications for concrete slabs that are not found elsewhere in the IRC. Under flood conditions, the presence of concrete slabs can contribute to building damage. The existing language in R322.2 (Zone A) does not provide any specifications and the existing language in R322.3.3 (Zone V) does not provide any specifications for concrete slabs themselves; it only specifies that slabs are to be structurally independent of buildings, unless the buildings are designed to account for the added flood loads. The specific requirements are consistent with revised ASCE 24-13.

Cost Impact: There should be no added cost; the benefits are associated with less potential damage.

R322.2.4 (NEW) #1-RB-QUINN-WILSON

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The committee disapproved this code change proposal because they felt that it contained unenforceable language such as the phrase "debris that causes significant damage to a structure." In addition, scouring does not take place in all areas of the United States, yet these proposed changes apply to all areas. Sometimes slabs must have turned down edges for frost protection purposes.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency; Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R322.3.4 Concrete slabs. Concrete slabs used as parking pads, enclosure floors, landings, decks, walkways, patios and similar uses that are located beneath or adjacent to structures shall be designed and constructed:

1. To be structurally independent of the primary foundation system of the structure, to ~~do~~ not transfer flood loads to the main structure, and to be frangible and break away under conditions of the base flood ~~are constructed to break away cleanly, and are frangible so as to not produce debris capable of causing significant damage to any structure~~. Reinforcing of concrete slabs, including welded wire reinforcement, shall not be used so as to minimize the potential for concrete slabs being a source of debris. Slabs shall not have turned down edges and slab thickness shall be not more than 4 inches; or
2. To be self-supporting structural slabs capable of remaining intact and functional under base flood conditions, including expected erosion, and the main structure shall be capable of resisting any added flood loads and effects of local scour due to the presence of the slabs.

(Portions of proposal not shown to remain unchanged.)

Commenter's Reason: The committee action on this code change proposal was Disapproval. This public comment replaces the original proposal. It does not change the original proposed new Section R322.2.4 for Zone A flood hazard areas, and it does not change the original proposal to delete the last sentence of Section R322.3.3 for Zone V (coastal high hazard areas where wave heights are 3 feet had higher).

This public comment does modify the proposed new Section R322.3.4 by removing the phrase that the committee found objectionable. Instead, this public comment requires concrete slabs in Zone V to be frangible (means "easily broken") and to break away under flood conditions. The expectation is this will minimize the size of debris and thus minimize the likelihood of causing significant damage to structures. For many years, many local floodplain management ordinances adopted by coastal communities have used the term "frangible."

The limitation on turned-down edges in Zone V is retained. Field experience shows that slabs intended to breakaway but that have turned-down edges do not break away cleanly when undermined by wave scour or erosions, which can cause damage to foundations. In Zone V, concrete slabs are not permitted to be used as structural foundation elements, thus it is not problematic to limit turned-down edges and thickness for nonstructural slabs used for the stated purposes.

RB191-13

Final Action: AS AM AMPC____ D

RB192-13
R322.2.4 (New), R322.3.6 (New)

Proposed Change as Submitted

Proponent: Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (Gregory.wilson2@fema.dhs.gov); Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net).

Add new text as follows:

R322.2.4 Decks and porches. Attached and detached decks and porches that are not enclosed by solid, rigid walls and that are located below the elevations specified in Section R322.2.1 shall comply with the following:

1. Attached decks and porches shall be designed to function as a continuation of the building or structure.
2. Detached decks and porches shall be anchored to remain in place during base flood conditions.

R322.3.6 Decks and porches. Attached decks and porches shall meet the elevation requirements of Section R322.3.2 and shall meet the foundation requirements of this section or be cantilevered from or knee braced to the building or structure. Detached decks and patios that are below the elevation requirements of Section R322.3.2 shall not be enclosed by solid, rigid walls, including walls designed to break away. Detached decks and patios shall be designed and constructed to remain intact and shall be anchored to remain in place during base flood conditions, or shall be frangible and break away cleanly so as not to produce debris capable of causing significant damage to any structure.

Reason: The IRC does not have specific requirements for decks and porches that are common elements for dwellings. These same requirements are included in ASCE 24-13.

Attached decks and porches can be elevated to the same requirements as dwellings. If not elevated, they can contribute to loads on buildings under flood conditions, so the buildings should be designed to account for those added loads. Decks and patios can be detached (structurally independent), in which case they can be below the elevation of buildings (provide they are not enclosed with walls – screen and lattice are not walls for this purpose). Detached decks and patios either have to be anchored so they don't become large debris that can batter other buildings or block drainage structures.

Cost Impact: Electing to structurally attach decks or patios would likely increase foundation costs, but the alternative is to choose to use detached decks and patios. Decks and patios are structures and have always been subject to the general NFIP requirement to be constructed by methods and practices that minimize flood damage and to be stable under flood conditions, both are included in the IRC at R322.1.2 and R322.1.3.

R322.2.4 (NEW) #2-RB-QUINN

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that it left too many questions unanswered that create confusion for the designer, engineer and code official. Some of the proposed modifications helped, but were not enough. This proposal is far reaching. If it was narrowed down in scope to costal V Zones and areas where there is wave action it might be more worthy of consideration.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency; Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

Add new text as follows:

<u>**R322.3.6 Decks and porches.** Attached decks and porches shall meet the elevation requirements of Section R322.3.2 and shall either meet the foundation requirements of this section or shall be cantilevered from or knee braced to the building or structure. Detached decks and patios that are below the elevation requirements of Section R322.3.2 shall not be enclosed by solid, rigid walls, including walls designed to break away. Detached decks and patios shall be designed and constructed to remain in place during base flood conditions, or shall be frangible and break away under conditions of the base flood.</u>

Commenter's Reason: The committee action on this code change proposal was Disapproval. At the committee's suggestion, this public comment replaces the original proposal with the provision that applies only to decks in coastal high hazard areas (Zone V) where waves are expected to be 3 feet or higher during the base flood.

This public comment also modifies the original proposal for Zone V by removing language about damage to other structures, which the committee found objectionable in another proposal. The expectation is the requirement that decks not designed to remain intact are to be frangible (means "easily broken") which will minimize the size of debris and thus minimize the likelihood of causing significant damage to structures. For many years, many local floodplain management ordinances adopted by coastal communities have used the term "frangible."

RB192-13
Final Action: AS AM AMPC____ D

RB193-13
R322.2.4 (New), R322.3.7 (New), M2201.6

Proposed Change as Submitted

Proponent: Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (Gregory.wilson2@fema.dhs.gov); Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net).

Add new text as follows:

R322.2.4 Tanks. Underground tanks shall be anchored to prevent flotation, collapse and lateral movement under conditions of the base flood. Above-ground tanks shall be installed at or above the elevation required in Section R322.2.1 or shall be anchored to prevent flotation, collapse and lateral movement under conditions of the base flood and shall be protected from impact by floating debris.

R322.3.7 Tanks. Underground tanks shall be anchored to prevent flotation, collapse and lateral movement under conditions of the base flood. Above-ground tanks shall be installed at or above the elevation required in Section R322.3.2. Where elevated on platforms, the platforms shall conform to the foundation requirements of Section R322.3.

Revise as follows:

M2201.6 Flood-resistant installation. In flood hazard areas as established by Table R301.2(1), tanks shall be installed in accordance with Section R322.2.4 (flood hazard areas including Zone A) or Section R322.3.7 (coastal high-hazard areas including Zone V). ~~at or above the elevation required in Section R322.2.1 or R322.3.2 or shall be anchored to prevent flotation, collapse and lateral movement under conditions of the design flood.~~

Reason: This proposal more clearly separates underground tanks from above-ground tanks. Dislodged tanks not only can release contents into floodwaters, but they become battering debris that can contribute to structural damage.

Underground tanks need to be installed in ways that take into consideration the fact that soils may be saturated during flooding, creating conditions that can cause tanks to be dislodged. This occurs after many flood events; most recently, problems with tanks were observed throughout the Hurricane Sandy impact area.

How above-ground tanks that serve dwellings are handled depends on flood zone. In coastal high hazard areas (Zone V) above-ground tanks have to be elevated – they may be elevated on separate platforms or on platforms that are cantilevered from the elevated building/foundation. In other flood hazard areas (Zone A) above-ground tanks may be elevated, or may be below base flood elevation, provided they are adequately anchored.

These same requirements are included in ASCE 24-13. The NFIP considers tanks as structures and structures have always been subject to the general NFIP requirement to be constructed by methods and practices that minimize flood damage and to be stable under flood conditions, both are included in the IRC at R322.1.2 and R322.1.3.

Cost Impact: None. These requirements articulate how the basic NFIP requirements (and the requirements of R322) should have been applied.

R322.2.4 (NEW) #3-RB-QUINN-WILSON

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that it contained information that was not appropriate for the International Residential Code. Tanks are typically regulated by the fire code, zoning code, or fuel gas code. The proposal also lacks specificity with regard to the language “protected from impact by floating debris.”

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency; Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R322.2.4 Tanks. Underground tanks shall be anchored to prevent flotation, collapse and lateral movement under conditions of the base flood. Above-ground tanks shall be installed at or above the elevation required in Section R322.2.1 or shall be anchored to prevent flotation, collapse and lateral movement under conditions of the base flood~~ and shall be protected from impact by floating debris~~.

R322.3.7 Tanks. Underground tanks shall be anchored to prevent flotation, collapse and lateral movement under conditions of the base flood. Above-ground tanks shall be installed at or above the elevation required in Section R322.3.2. Where elevated on platforms, the platforms shall <u>be cantilevered from or knee braced to the building or shall be supported on foundations that</u> conform to the ~~foundation~~ requirements of Section R322.3.

M2201.6 Flood-resistant installation. In flood hazard areas as established by Table R301.2(1), tanks shall be installed in accordance with Section R322.2.4 (flood hazard areas including Zone A) or Section R322.3.7 (coastal high-hazard areas including Zone V).

Commenter's Reason: The committee action on this code change proposal was Disapproval because the committee suggests it is not appropriate for the IRC to have requirements for tanks. However, the IRC does regulate residential oil tanks under M2201 and thus it is appropriate for Section R322 to have specific requirements. In addition, FEMA has received questions about water tanks necessary to meet the IRC fire-suppression requirements in areas without public water supply, which reinforces the value of having requirements in Section R322. The committee also objected to language regarding protection from floating debris, which is removed in this public comment. The original language in R322.3.7 is amended to provide that platforms may either be supported by foundations or be attached to buildings.

RB193-13

Final Action: AS AM AMPC____ D

RB198-13
R322.3.5.1 (New)

<u>Proposed Change as Submitted</u>

Proponent: Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency (Gregory.wilson2@fema.dhs.gov); Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency (rcquinn@earthlink.net).

Add new text as follows:

<u>**R322.3.5.1 Protection of building envelope.** An exterior door that meets the requirements of Section R612 shall be installed at the top of stairs that are enclosed with walls designed to break away in accordance with Section R322.3.4.</u>

Reason: Walls below elevated buildings in coastal high hazard areas (Zone V) are permitted if the area enclosed by walls is used for parking of vehicles, building access or storage. If the enclosed area is used for building access, then a stairway provides access to the elevated building. R322.3.4 requires the walls to be designed and constructed to break away under flood loads. Post-disaster investigations have identified increased damage to the interior of elevated buildings because wave splash, wave run-up, and wind-driven rain can enter buildings through the unprotected doorway at the top of the stairs.

Cost Impact: The added cost of an exterior door is offset by reduced damage caused by wave splash, wave run-up, and wind-driven rain, some of which is not covered by NFIP flood insurance.

R322.3.5.1 (NEW)-RB-QUINN-WILSON

<u>Committee Action Hearing Results</u>

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that the proposed section requires a door at the top of the stair and makes no provisions for conditions where the stair leads to a deck. It is a good concept but it needs work. In hurricane prone areas, the doors that are being discussed could be interior doors and this could create undue additional costs.

Assembly Action: **None**

<u>Individual Consideration Agenda</u>

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rebecca Quinn, RCQuinn Consulting, Inc., representing Federal Emergency Management Agency; Gregory Wilson, representing Department of Homeland Security, Federal Emergency Management Agency, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R322.3.5.1 Protection of building envelope. An exterior door that meets the requirements of Section R612 shall be installed at the top of stairs <u>that provide access to the building and</u> that are enclosed with walls designed to break away in accordance with Section R322.3.4.

Commenter's Reason: The committee action on this code change proposal was Disapproval because no provision was made for stairs that lead to decks. Although it would be unusual for stairs that lead to decks to be enclosed by walls, the proposal is modified to clarify that the requirement for an exterior door at the top of stairs applies to stairs that lead to the building and that are also enclosed by breakaway walls. This proposal adds to Section R322.3, which applies in coastal high hazard areas (Zone V) where wave height of greater than 3 feet are expected during the base flood. Walls are permitted to enclose areas below elevated buildings if the walls are designed to break away under flood loads and if the areas are used only for parking, storage and building access (see R322.3.4).

The proposal calls for an exterior door instead of an interior door because the walls enclosing the stairs are designed to break away, thus exposing the door to both wind and water.

RB198-13

Final Action: AS AM AMPC____ D

RB200-13
R324 (New), R325 (New), R326 (New), R327 (New), R328 (New)

Proposed Change as Submitted

Proponent: Ali M. Fattah, P.E., City of San Diego, representing the San Diego Area Chapter of ICC (afattah@sandiego.gov)

Add new text as follows:

R324 Structural Tests and Special Inspections. Where structural tests and special inspections are required due to the methods of construction, the tests and inspections shall be performed and documented as is required in Chapter 17 of the *International Building Code*.

R325 Swimming Pool Enclosures and Safety Devices. Swimming pools shall comply with the requirements of Sections 3109.2 through 3109.5 and other applicable sections of the *International Building Code*.

R326 Encroachments Into The Public Right-Of- Way. Encroachments into the Public Right-of-Way shall comply with the standards in Chapter 32 of the *International Building Code*.

R327 Safeguards During Construction Provisions for safety during construction and the protection of adjacent public and private properties shall be governed by the requirements of Chapter 33 of the *International Building Code*.

R328 Sound Transmission. Wall and floor-ceiling assemblies separating dwelling units from each other shall provide airborne sound insulation for walls, and both airborne and impact sound insulation for floor-ceiling assemblies as required in Chapter 12 of the *International Building Code*.

Reason: The IRC is developed as a standalone code however it does not address certain issues regulated by the International Building Code. This code change provides a cross reference to the IBC in lieu of adopting IBC regulations by transcription. The IRC allows multi-unit dwellings and townhouses but does not address sound transmission control between dwelling units and townhouses. Additionally the IRC does not seem to regulate swimming pools, encroachments into the public right of way or safety during construction.

Section R324 is necessary since special inspections and tests may be required by product evaluation reports or due to non-conforming construction that was approved to comply with the IRC may need to be qualified by testing.

Cost Impact: This code change will not increase the cost of construction.

R324 (NEW)-RB-FATTAH

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee disapproved this code change proposal because they felt that it includes multiple references to the International Building Code. This is contrary to the intent of the International Residential Code, which is to be a stand-alone code.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Ali M. Fattah, City of San Diego, Development Services Department, representing San Diego Area Chapter ICC, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

Add new text as follows:

R301.1.4 Structural Tests and Special Inspections. Where structural tests and special inspections are required due to the methods of construction pursuant to a product evaluation report or when required by the Building Official, the tests and inspections shall be performed and documented in accordance with Chapter 17 of the *International Building Code*.

Add new Appendix R as follows:

APPENDIX R
ENCROACHMENTS INTO THE PUBLIC RIGHT-OF- WAY

GENERAL
SECTION AR101

AR101.1 Scope. The provisions of this Appendix chapter shall govern the encroachment of structures into the public right-of-way.

AR101.2 Measurement. The projection of any structure or portion thereof shall be the distance measured horizontally from the lot line to the outermost point of the projection.

AR101.3 Other laws. The provisions of this chapter shall not be construed to permit the violation of other laws or ordinances regulating the use and occupancy of public property.

AR101.4 Drainage. Drainage water collected from a roof, awning, canopy or marquee, and condensate from mechanical equipment shall not flow over a public walking surface.

SECTION AR102
ENCROACHMENTS

AR102.1 Encroachments below grade. Encroachments below grade shall comply with Sections AR102.1.1 through AR102.1.3.

AR102.1.1 Structural support. A part of a building erected below grade that is necessary for structural support of the building or structure shall not project beyond the lot lines, except that the footings of street walls or their supports which are located not less than 8 feet (2438 mm) below grade shall not project more than 12 inches (305 mm) beyond the street lot line.

AR102.1.2 Vaults and other enclosed spaces. The construction and utilization of vaults and other enclosed spaces below grade shall be subject to the terms and conditions of the applicable governing authority.

AR102.1.3 Areaways. Areaways shall be protected by grates, guards or other approved means.

AR102.2 Encroachments above grade and below 8 feet in height. Encroachments into the public right-of-way above grade and below 8 feet (2438 mm) in height shall be prohibited except as provided for in Sections AR102.2.1 through AR102.2.3. Doors and windows shall not open or project into the public right-of-way.

AR102.2.1 Steps. Steps shall not project more than 12inches (305 mm) and shall be guarded by approved devices not less than 3 feet (914 mm) in height, or shall be located between columns or pilasters.

AR102.2.2 Architectural features. Columns or pilasters, including bases and moldings shall not project more than12 inches (305 mm). Belt courses, lintels, sills, architraves, pediments and similar architectural features shall not project more than 4 inches (102 mm).

AR102.2.3 Awnings. The vertical clearance from the public right-of-way to the lowest part of any awning, including valances, shall be not less than 7 feet (2134 mm).

AR102.3 Encroachments 8 feet or more above grade. Encroachments 8 feet (2438 mm) or more above grade shall comply with Sections AR102.3.1 through AR102.3.4.

AR102.3.1 Awnings, canopies, marquees and signs. Awnings, canopies, marquees and signs shall be constructed so as to support applicable loads as specified in Chapter 3 or where applicable Chapter 16 of the International Building Code. Awnings, canopies, marquees and signs with less than 15 feet (4572 mm) clearance above the sidewalk shall not extend into or occupy more than two-thirds the width of the sidewalk measured from the building. Stanchions or columns that support awnings, canopies, marquees and signs shall be located not less than 2 feet (610 mm) in from the curb line.

AR102.3.2 Windows, balconies, architectural features and mechanical equipment. Where the vertical clearance above grade to projecting windows, balconies, architectural features or mechanical equipment is more than 8 feet (2438 mm), 1 inch (25 mm) of encroachment is permitted for each additional 1 inch (25 mm) of clearance above 8 feet (2438 mm), but the maximum encroachment shall be 4 feet (1219 mm).

AR102.3.3 Encroachments 15 feet or more above grade. Encroachments 15 feet (4572 mm) or more above grade shall not be limited.

AR102.3.4 Pedestrian walkways. The installation of a pedestrian walkway over a public right-of-way shall be subject to the approval of the applicable governing authority. The vertical clearance from the public right-of-way to the lowest part of a pedestrian walkway shall be not less than 15 feet (4572 mm).

AR102.4 Temporary encroachments. Where allowed by the applicable governing authority, vestibules and storm enclosures shall not be erected for a period of time exceeding seven months in any one year and shall not encroach more than 3 feet (914 mm) nor more than one-fourth of the width of the sidewalk beyond the street lot line. Temporary entrance awnings shall be erected with a clearance of not less than 7 feet (2134 mm) to the lowest portion of the hood or awning where supported on removable steel or other approved noncombustible support.

Add new Appendix S as follows:

APPENDIX S
SAFEGUARDS DURING CONSTRUCTION

SECTION AS101
GENERAL

AS101.1 Scope. The provisions of this Appendix chapter shall govern safety during construction and the protection of adjacent public and private properties.

AS101.2 Storage and placement. Construction equipment and materials shall be stored and placed so as not to endanger the public, the workers or adjoining property for the duration of the construction project.

SECTION AS102
CONSTRUCTION SAFEGUARDS

AS102.1 Alterations, repairs and additions. Required exits, existing structural elements, fire protection devices and sanitary safeguards shall be maintained at all times during alterations, repairs or additions to any building or structure.

Exceptions:

1. Where such required elements or devices are being altered or repaired, adequate substitute provisions shall be made.
2. Maintenance of such elements and devices is not required when the existing building is not occupied.

AS102.2 Manner of removal. Waste materials shall be removed in a manner which prevents injury or damage to persons, adjoining properties and public rights-of-way.

AS102.3 Fire safety during construction. Fire safety during construction shall comply with the applicable requirements of this code and the applicable provisions of Chapter 33 of the International Fire Code.

SECTION AS103
DEMOLITION

AS103.1 Construction documents. Construction documents and a schedule for demolition shall be submitted where required by the building official. Where such information is required, no work shall be done until such construction documents or schedule, or both, are approved.

AS103.2 Pedestrian protection. The work of demolishing any building shall not be commenced until pedestrian protection is in place as required by this chapter.

AS103.3 Means of egress. A horizontal exit shall not be destroyed unless and until a substitute means of egress has been provided and approved.

AS103.4 Vacant lot. Where a structure has been demolished or removed, the vacant lot shall be filled and maintained to the existing grade or in accordance with the ordinances of the jurisdiction having authority.

AS103.5 Water accumulation. Provision shall be made to prevent the accumulation of water or damage to any foundations on the premises or the adjoining property.

AS103.6 Utility connections. Service utility connections shall be discontinued and capped in accordance with the approved rules and the requirements of the applicable governing authority.

AS103.7 Fire safety during demolition. Fire safety during demolition shall comply with the applicable requirements of this code and the applicable provisions of Chapter 56 of the International Fire Code.

SECTION AS104
SITE WORK

AS104.1 Excavation and fill. Excavation and fill for buildings and structures shall be constructed or protected so as not to endanger life or property. Stumps and roots shall be removed from the soil to a depth of not less than 12 inches (305 mm) below the surface of the ground in the area to be occupied by the building. Wood forms which have been used in placing concrete, if within the ground or between foundation sills and the ground, shall be removed before a building is occupied or used for any purpose. Before completion, loose or casual wood shall be removed from direct contact with the ground under the building.

AS104.1.1 Slope limits. Slopes for permanent fill shall be not steeper than one unit vertical in two units horizontal (50-percent slope). Cut slopes for permanent excavations shall be not steeper than one unit vertical in two units horizontal (50-percent slope). Deviation from the foregoing limitations for cut slopes shall be permitted only upon the presentation of a soil investigation report acceptable to the building official.

AS104.1.2 Surcharge. No fill or other surcharge loads shall be placed adjacent to any building or structure unless such building or structure is capable of withstanding the additional loads caused by the fill or surcharge. Existing footings or foundations that can be affected by any excavation shall be underpinned adequately or otherwise protected against settlement and shall be protected against later movement.

AS104.1.3 Footings on adjacent slopes. For footings on adjacent slopes, see Chapter 4.

SECTION AS105
PROTECTION OF PEDESTRIANS

AS105.1 Protection required. Pedestrians shall be protected during construction, remodeling and demolition activities as required by this chapter and Table AS105. Signs shall be provided to direct pedestrian traffic.

AS105.2 Walkways. A walkway shall be provided for pedestrian travel in front of every construction and demolition site unless the applicable governing authority authorizes the sidewalk to be fenced or closed. Walkways shall be of sufficient width to accommodate the pedestrian traffic, but in no case shall they be less than 4 feet (1219 mm) in width. Walkways shall be provided with a durable walking surface. Walkways shall be accessible in accordance with Chapter 11 of the International Building Code and shall be designed to support all imposed loads and in no case shall the design live load be less than 150 pounds per square foot (psf) (7.2 kN/m2).

AS105.3 Directional barricades. Pedestrian traffic shall be protected by a directional barricade where the walkway extends into the street. The directional barricade shall be of sufficient size and construction to direct vehicular traffic away from the pedestrian path.

AS105.4 Construction railings. Construction railings shall be not less than 42 inches (1067 mm) in height and shall be sufficient to direct pedestrians around construction areas.

AS105.5 Barriers. Barriers shall be not less than 8 feet (2438 mm) in height and shall be placed on the side of the walkway nearest the construction. Barriers shall extend the entire length of the construction site. Openings in such barriers shall be protected by doors that are normally kept closed.

AS105.6 Barrier design. Barriers shall be designed to resist loads required in Chapter 16 unless constructed as follows:

1. Barriers shall be provided with 2-inch by 4-inch (51mm by 102 mm) top and bottom plates.
2. The barrier material shall be boards not less than 3/4-inch (19.1 mm) thick or wood structural panels not less than 1/4-inch (6.4 mm) thick.
3. Wood structural use panels shall be bonded with an adhesive identical to that for exterior wood structural use panels.
4. Wood structural use panels 1/4 inch (6.4 mm) or 5/16 inch (23.8 mm) in thickness shall have studs spaced not more than 2 feet (610 mm) on center (o.c.).
5. Wood structural use panels 3/8 inch (9.5 mm) or 1/2 inch (12.7 mm) in thickness shall have studs spaced not more than 4 feet (1219 mm) on center provided a 2- inch by 4-inch (51 mm by 102 mm) stiffener is placed horizontally at mid height where the stud spacing is greater than 2 feet (610 mm) on center.
6. Wood structural use panels 5/8 inch (15.9 mm) or thicker shall not span over 8 feet (2438 mm).

AS105.7 Covered walkways. Covered walkways shall have a clear height of not less than 8 feet (2438 mm) as measured from the floor surface to the canopy overhead. Adequate lighting shall be provided at all times. Covered walkways shall be designed to support all imposed loads. In no case shall the design live load be less than 150 psf (7.2 kN/m2) for the entire structure.

Exception: Roofs and supporting structures of covered walkways for new, light-frame construction not exceeding two stories above grade plane shall be designed for a live load of 75 psf (3.6kN/m2) or the loads imposed on them, whichever is greater. In lieu of such designs, the roof and supporting structure of a covered walkway shall be constructed as follows:

1. Footings shall be continuous 2-inch by 6-inch (51 mm by 152 mm) members.
2. Posts not less than 4 inches by 6 inches (102 mm by 152 mm) shall be provided on both sides of the roof and spaced not more than 12 feet (3658 mm) on center.
3. Stringers not less than 4 inches by 12 inches (102 mm by 305 mm) shall be placed on edge upon the posts.
4. Joists resting on the stringers shall be not less than 2 inches by 8 inches (51 mm by 203 mm) and shall be spaced not more than 2 feet (610 mm) on center.
5. The deck shall be planks not less than 2 inches (51 mm) thick or wood structural panels with an exterior exposure durability classification not less than 23/32 inch (18.3 mm) thick nailed to the joists.

TABLE AS105
PROTECTION OF PEDESTRIANS

HEIGHT OF CONSTRUCTION	DISTANCE FROM CONSTRUCTION TO LOT LINE	TYPE OF PROTECTION REQUIRED
8 feet or less	Less than 5 feet Construction railings	Less than 5 feet Construction railings
	5 feet or more None	5 feet or more None
More than 8 feet	Less than 5 feet Barrier and covered walkway	Less than 5 feet Barrier and covered walkway
	5 feet or more, but not more than one-fourth the height of construction Barrier and covered walkway	5 feet or more, but not more than one-fourth the height of construction Barrier and covered walkway
	5 feet or more, but between one-fourth and one-half the height of construction Barrier	5 feet or more, but between one-fourth and one-half the height of construction Barrier
	5 feet or more, but exceeding one-half the height of construction None	5 feet or more, but exceeding one-half the height of construction None

For SI: 1 foot = 304.8 mm.

AS105.8 Repair, maintenance and removal. Pedestrian protection required by this appendix shall be maintained in place and kept in good order for the entire length of time pedestrians are subject to being endangered. The owner or the owner's agent, upon the completion of the construction activity, shall immediately remove walkways, debris and other obstructions and leave such public property in as good a condition as it was before such work was commenced.

AS105.9 Adjacent to excavations. Every excavation on a site located 5 feet (1524 mm) or less from the street lot line shall be enclosed with a barrier not less than 6 feet (1829 mm) in height. Where located more than 5 feet (1524 mm) from the street lot line, a barrier shall be erected where required by the building official . Barriers shall be of adequate strength to resist wind pressure as specified in Chapter 3.

SECTION AS106
PROTECTION OF ADJOINING PROPERTY

AS106.1 Protection required. Adjoining public and private property shall be protected from damage during construction, remodeling and demolition work. Protection shall be provided for footings, foundations, party walls, chimneys, skylights and roofs. Provisions shall be made to control water runoff and erosion during construction or demolition activities. The person making or causing an excavation to be made shall provide written notice to the owners of adjoining buildings advising them that the excavation is to be made and that the adjoining buildings should be protected. Said notification shall be delivered not less than 10 days prior to the scheduled starting date of the excavation.

SECTION AS107
TEMPORARY USE OF STREETS, ALLEYS AND PUBLIC PROPERTY

AS107.1 Storage and handling of materials. The temporary use of streets or public property for the storage or handling of materials or of equipment required for construction or demolition, and the protection provided to the public shall comply with the provisions of the applicable governing authority and this chapter.

AS107.1.1 Obstructions. Construction materials and equipment shall not be placed or stored so as to obstruct access to fire hydrants, standpipes, fire or police alarm boxes, catch basins or manholes, nor shall such material or equipment be located within 20 feet (6096 mm) of a street intersection, or placed so as to obstruct normal observations of traffic signals or to hinder the use of public transit loading platforms.

AS107.2 Utility fixtures. Building materials, fences, sheds or any obstruction of any kind shall not be placed so as to obstruct free approach to any fire hydrant, fire department connection, utility pole, manhole, fire alarm box or catch basin, or so as to interfere with the passage of water in the gutter. Protection against damage shall be provided to such utility fixtures during the progress of the work, but sight of them shall not be obstructed.

SECTION AS108
FIRE EXTINGUISHERS

AS108.1 Where required. All structures under construction, alteration or demolition shall be provided with not less than one approved portable fire extinguisher in accordance with Section 906 of the *International Building Code* and sized for not less than ordinary hazard as follows:

1. At each stairway on all floor levels where combustible materials have accumulated.
2. In every storage and construction shed.
3. Additional portable fire extinguishers shall be provided where special hazards exist, such as the storage and use of flammable and combustible liquids.

AS108.2 Fire hazards. The provisions of this appendix and where applicable the *International Fire Code* shall be strictly observed to safeguard against all fire hazards attendant upon construction operations.

SECTION AS109
MEANS OF EGRESS

AS109.1 Maintenance of means of egress. Required means of egress shall be maintained at all times during construction, demolition, remodeling or alterations and additions to any building.

> **Exception:** Existing means of egress need not be maintained where approved temporary means of egress systems and facilities are provided.

SECTION AS110
AUTOMATIC SPRINKLER SYSTEM

AS110.1 Completion before occupancy. In buildings where an automatic sprinkler system is required by this code, it shall be unlawful to occupy any portion of a building or structure until the automatic sprinkler system installation has been tested and approved, except as provided in Section 111.3 of the *International Building Code*.

SECTION AS111
WATER SUPPLY FOR FIRE PROTECTION

AS111.1 Where required. An approved water supply for fire protection, either temporary or permanent, shall be made available as soon as combustible material arrives on the site.

Commenter's Reason: The original proposal is being resubmitted with modifications after a review of the published REPORT OF THE PUBLIC HEARING. The proponent was not able to attend the Code Development Hearing to explain the proposed code change.

Section R324 as proposed has been relocated to the scoping portion of Chapter 3 that serves as a sort of road map to IRC technical requirements. Proposed Section R325 and R328 were not included since Appendix G and K address the topics in the proposed section.

Section R326 and R327 were deleted however Appendices R and S were transcribed from IBC chapter 32 and 33 respectively with format modifications to fit the IRC. Additionally, requirements are not applicable to dwellings and townhouses. While reference s made to the IFC and the IBC where necessary, proponents would like to remind the membership that the International family of cods is advertised as a coordinated set of codes designed to work together. So it is very unlikely that the IFC or a fire code is adopted by a jurisdiction using the IRC or IBC.

While the IRC is developed as a standalone code, it does not address certain issues regulated by the International Building Code. This code change provides the IBC regulations by transcription.

Section R301.1.3 is necessary since special inspections and tests may be required by product evaluation reports or due to non-conforming construction that was approved to comply with the IRC and may need to be qualified by testing. For example the use of post installed adhesive or mechanical anchors require special inspections that need to be performed in accordance with the IBC.

Public Comment 2:

Ali M. Fattah, City of San Diego, Development Services Department, representing San Diego Area Chapter ICC, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

R301.1.4 Structural Tests and Special Inspections. Where structural tests and special inspections are required due to the methods of construction pursuant to a product evaluation report or when required by the Building Official, the tests and inspections shall be performed and documented as is required in Chapter 17 of the *International Building Code*.

R324 Encroachments Into The Public Right-Of- Way. Encroachments into the Public Right-of-Way shall comply with the standards in Chapter 32 of the *International Building Code*.

R325 Safeguards During Construction. Provisions for safety during construction and the protection of adjacent public and private properties shall be governed by the requirements of Chapter 33 of the *International Building Code*.

Commenter's Reason: The original proposal is being replaced after a review of the published REPORT OF THE PUBLIC HEARING. The proponent was not able to attend the Code Development Hearing to explain the proposed code change. We offer this as an option in lieu of transcribing IBC text into the IRC.

Section R324 as proposed has been relocated to scoping portion of Chapter 3 that serves as a sort of road map to IRC technical requirements. Proposed Section R325 and R328 were not included since Appendix G and K address the topics in the proposed section.

Section R324 and R325 were retained in lieu of transcribing IBC chapter 32 and 33 respectively with format modifications to fit the IRC. While this is contrary to the intent of the IRC to function as a standalone code, adoption of the IRC throughout the United States is varying in some cases only the building portions in chapters 1 through 10 are being adopted. Urban jurisdictions enforce the IBC and IFC so when a situation arises it should not be overly difficult to apply the standards of the IBC as applicable when referenced in the IRC. By addressing inadvertent omissions ensures that IRC enforcers who like the IBC more will not tend to consider less restrictive IRC requirements as errors and omissions.

While references are made to the IBC where necessary, proponents would like to remind the membership that the International family of cods is advertised as a coordinated set of codes designed to work together. So it is very unlikely that the IFC or IBC are not adopted by a jurisdiction using the IRC.

RB200-13

Final Action: AS AM AMPC____ D

RB201-13
R324 (New), R202, Chapter 44

Proposed Change as Submitted

Proponent: David P. Kapturowski representing the American Association of Radon Scientist & Technologists

Add new text as follows:

SECTION R324
RADON REDUCTION

R324.1 General. This Section applies to radon control methods for buildings and structures within EPA Radon Zones 1 & 2, as defined in Section R324.42. *Rough-Ins* or complete *Active Soil Depressurization* (ASD) systems shall be installed as necessary to reduce soil gas entry and vapor intrusion so as to establish indoor radon levels below the *National Radon Action Level* (NRAL).

R324.2 Mitigation system required. A *mitigation system Rough-In* shall be installed in *dwellings* located in *radon* potential zones 1 and 2 in accordance with Section R324.8. The *radon* potential zones shall be determined in accordance with Section R324.42.

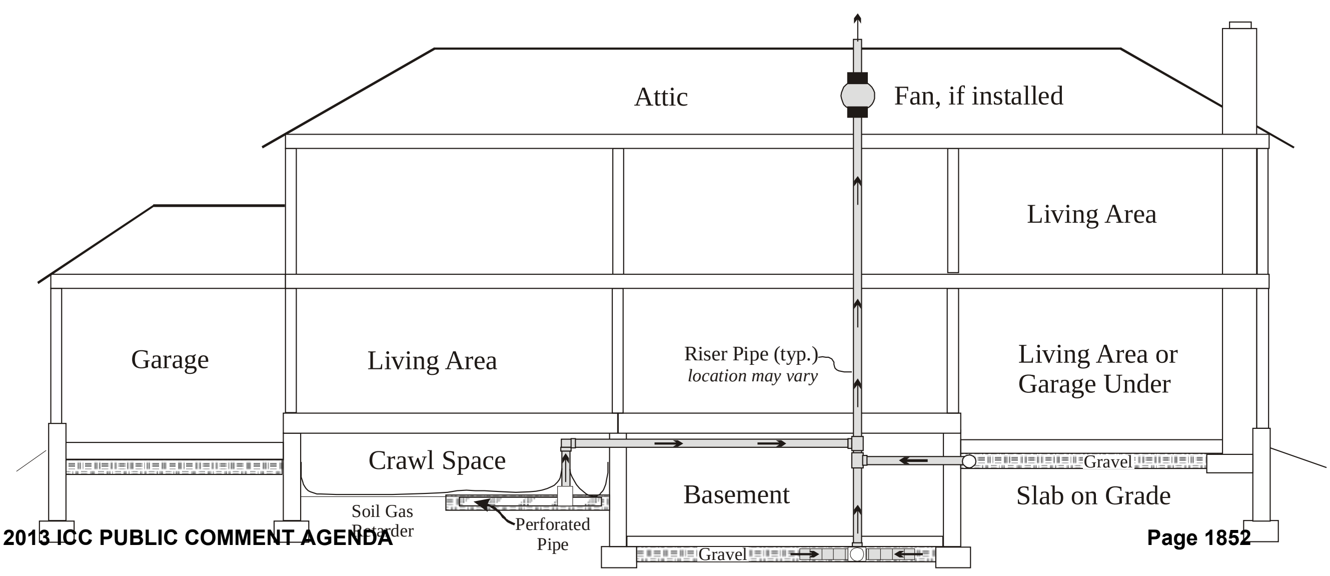
> **Exception:** Where the foundation system does not have any enclosed area of soil contact and where prior to occupancy, testing in accordance with Section R324.41 indicates that the building has a *radon* level below the *National Action Level* (*NAL*).

R324.3 Design. The design of *radon mitigation systems* shall comply with Section R324 and, for buildings having a total foundation area of greater than 2500 square feet [232 sq. m], shall be performed by a *mitigator* who is *certified* or *licensed* to design such systems. Designs of *radon mitigation systems* for foundation types other than those specified herein shall be performed by a *mitigator* who is *certified* or *licensed* to design such systems.

R324.4 Foundation area. The foundation area shall be calculated from the inside perimeter dimensions of the foundation walls.

R324.5 Mitigation system rough-in required. The *Rough-In* installation of a *mitigation system* shall be required for all foundations and *combination foundations* types, including *crawl space*, basement, slab-on-grade and slab-on-grade garage located below a living area. The installation shall be in accordance with Sections R324.6 through R324.28. Figure R324.5 illustrates the four foundation types.

FIGURE R324.5
FOUNDATION TYPES



R324.6 Soil gas collection plenums. Foundation areas shall be constructed so as to create sealed *soil gas collection plenums* in accordance with Sections R324.7 through R324.9.6.

R324.7 Submembrane soil gas collection plenums in crawl spaces with earthen floors. For each *suction point*, a *soil gas collector* shall be installed in accordance with Sections R324.7.1 through R324.7.7 and Section R324.9.

R324.7.1 Soil gas collector. One *soil gas collector* for each *suction point* in accordance with Section R324.7.1.1 shall be installed in accordance with Section R324.7.1.1, R324.7.1.2 or R324.7.1.3.

R324.7.1.1 Pipe soil gas collector. The *soil gas collector* shall consist of a perforated pipe with a nominal diameter of not less than 4 inches [102 mm]. The pipe shall be not less than 10 feet [3048 mm] in length. Such piping shall be placed in a trench backfilled with clean aggregate meeting the criteria of Section R324.8.1.1.1 such that the pipe is completely surrounded by not less than 4 inches [102 mm] of aggregate.

R324.7.1.1.2 Geotextile soil gas collector. The *soil gas collector* shall consist of a strip of geotextile drain matting not less than 10 feet [3048 mm] in length and having a cross sectional area of not less than 12 square inches [7742 sq. mm]. The strip of matting shall be placed on top of the soil or in a trench.

R324.7.1.1.3 Gravel soil gas collector. A uniform layer of clean aggregate, not less than 4 inches [102 mm] in depth, shall be placed over the soil. The aggregate shall have a void ratio of not less than 35 percent or shall be in accordance with Size Number 4, 5, 56, or 6 as classified by ASTM C33.

R324.7.2 Suction points. One *suction point* shall be provided for each *soil gas collector*. *Suction points* shall be installed in accordance with Section R324.7.2.1, R324.7.2.2 or R324.7.2.3, as applicable for the type of plenum installed.

R324.7.2.1 Suction point for pipe soil gas collector. The *suction point* for a pipe *soil gas collector* shall consist of a pipe fitting or other device having not less than three openings with two openings oriented so as to create multiple horizontal intake openings. The perforated pipe plenum shall be inserted into both of the horizontal openings of the pipe fitting or device. One opening of the fitting or device shall be oriented in a vertical “up” position. Alternatively, the sub-membrane area and the other foundation types shall be interconnected by a *pipe loop soil gas collector* that is constructed in accordance with Section R324.8.1.1.3 and served by one or more *suction points*.

R324.7.2.2 Suction point for geotextile soil gas collector. The *suction point* for a geotextile *soil gas collector* shall consist of a pipe fitting or other device having not less than three openings with two openings oriented so as to create multiple horizontal intake openings. The horizontal openings shall be connected to the matting in a manner to facilitate airflow from the collector. One opening of the fitting or device shall be oriented in a vertical “up” position.

R324.7.2.3 Suction point for gravel soil gas collector. The *suction point* for a *gravel soil gas collector* shall consist of a pipe fitting or other device having not less than three openings with two openings oriented so as to create multiple horizontal intake openings. The horizontal openings shall be provided with not less than 5 feet [1524 mm] of perforated pipe extending from each opening of the fitting or device into the *gravel* layer. Such perforated pipe shall provide not less than 1 square inch [645 sq. mm] of open perforation area per lineal foot of pipe.

R324.7.3 Suction points not permitted. *Suction points* are not permitted on sump lids

R324.7.4 Fasten suction points. *Suction point* fittings and devices shall be fixed in place to prevent dislocation.

R324.7.5 Seal top of the soil gas collection plenum. A *soil gas retarder* shall cover the top of the *soil gas collection plenum* and all exposed soil. The installation of the *soil gas retarder* shall be in accordance with Sections R324.7.5.1 through R324.7.5.4.

R324.7.5.1 Sheeting. The *soil gas retarder* membrane shall meet ASTM E1745 Class A, B or C.

R324.7.5.2 Seams. The seams between adjacent membrane sheets shall be overlapped not less than 12 inches [305 mm] and shall be sealed by one of the following methods:

1. A tape recommended by the membrane manufacturer.
2. Caulk complying with ASTM C920 class 25 or greater.
3. An equivalent method.

R324.7.5.3 Repairs. Tears or punctures in the membrane shall be sealed by one or more of the following methods:

1. A tape recommended by the membrane manufacturer.
2. An additional sheet of the membrane material that covers and overlaps the tear or puncture not less than 12 inches [305 mm] on all sides and that is sealed with a caulk complying with ASTM C920 class 25 or greater.
3. An equivalent method.

R324.7.5.4 Penetrations. Openings in the *soil gas retarder* membrane for piping, utilities, structural supports or similar penetrations shall be sealed.

R324.7.6 Seal sides of the soil gas collection plenum. The *soil gas retarder* membrane shall turn up onto foundation walls not less than 6 inches [152 mm] and shall be continuously sealed to the wall along the full perimeter with a caulk complying with ASTM C920 class 25 or higher or equivalent method.

R324.7.7 Membrane label required. *Soil gas retarder* membranes shall be marked in a conspicuous place with a label to identify that the membrane is a component of a *radon* reduction system. The label lettering shall be not less than 1/4 inch [6.35 mm] in height and shall be of a color in contrast to the color of the background on which the lettering is applied.

R324.8 Subslab soil gas collection plenums for concrete floors. The floors of basement, concrete crawlspace and slab-on-grade foundation systems shall be provided with a *soil gas collection plenum* installed in accordance with Sections R324.8.1 through R324.9.6.

R324.8.1 Soil gas collector. A *soil gas collector* shall be installed in accordance with Section R324.8.1.1, R324.8.1.2 or R324.8.1.3.

R324.8.1.1 Gravel. A uniform layer of clean aggregate, not less than 4 inches [102 mm] in depth, shall be placed over the soil. The aggregate shall have a void ratio of not less than 35 percent or shall be in accordance with Size Number 4, 5, 56, or 6 as classified by ASTM C33.

R324.8.1.2 Geotextile. A layer of geotextile drainage matting shall be placed over a uniform layer of either soil or sand. The geotextile drainage matting shall be designed to allow the lateral flow of *soil gases* to the system's *suction point* fitting. The *geotextile matting* shall have a cross-sectional area of not less than 12 square inches [7742 sq. mm] and shall be placed, at a minimum, along the entire inside perimeter of the foundation at a distance of 12 inches [305 mm] to 18 inches [457 mm] from the foundation wall to the edge of the drainage matting. Deviation from the 12 inch [305 mm] to 18 inch [457 mm] distance to the foundation wall shall be allowed to avoid obstacles such as plumbing and other utilities.

R324.8.1.3 Pipe loop. A loop of not less than 4 inch [102 mm] diameter perforated pipe shall be placed along the entire inside perimeter of the foundation at a distance of 12 inches [305 mm] to 18 inches [457 mm] from the centerline of the pipe to the foundation walls. Such piping shall be placed in a trench backfilled with clean aggregate meeting the criteria of Section R324.8.1.1 and surrounding the pipe on at least 2 sides. The cross-sectional area of the aggregate and pipe *soil gas collector* shall be not less than 50 square inches [32,258 sq. mm]. The piping shall form a continuous loop and pipe sections shall be joined with a connector device or method recommended by the manufacturer. Deviation from the 12 inch [305 mm] to 18 inch [457 mm] distance to the foundation wall shall be allowed to avoid obstacles such as plumbing and other utilities.

R324.8.2 Suction points. One *suction point* shall be provided for each *soil gas collector*. Not less than one *suction point* shall be provided for each foundation type. Alternatively, each *soil gas collector* shall be interconnected by a *pipe loop soil gas collector* that is constructed in accordance with Section R324.8.3 and served by one or more *suction points*. *Suction points* shall be installed in accordance with Sections R324.8.2.1, R324.8.2.2 or R324.8.2.3 as applicable for the type of *soil gas collector* installed.

R324.8.2.1 Gravel layer soil gas collector. A *suction point* for a *gravel* type *soil gas collector* shall consist of a pipe fitting or other device having not less than two openings oriented so as to create multiple horizontal intake openings within the *gravel* layer. The horizontal openings shall be provided with not less than 5 feet [1534 mm] of perforated pipe extending from each opening of the fitting or device into the *gravel* layer. Said perforated pipe shall provide a not less than 1 square inch [645 sq. mm] of open perforation area per lineal foot of pipe. *Suction point* openings above the slab shall be protected from the entry of aggregate, concrete and debris.

R324.8.2.2 Geotextile layer soil gas collector. A *suction point* for a geotextile type *soil gas collector* shall consist of a pipe fitting or other device having not less than three openings with two oriented so as to create multiple horizontal intake openings connected to the geotextile mat in a manner to maintain airflow capacity from the plenum. *Suction point* openings above the slab shall be protected from the entry of aggregate, concrete and debris.

R324.8.2.3 Pipe loop soil gas collector. A *suction point* for a *pipe loop* type collector shall consist of a pipe tee fitting or pipe saddle device installed in the loop piping. *Suction point* openings above the slab shall be protected from the entry of aggregate, concrete and debris.

R324.8.3 Multiple soil gas collection plenums. Where interior footings divide a *soil gas collector* into two or more areas, each such area shall be provided with the required *suction points* and joined with *mitigation system* piping in accordance with Section R324.10. Alternatively, each area so created by the interior footings shall be interconnected by a *pipe loop soil gas collector* that is constructed in accordance with Section R324.8.1.3 and served by one or more *suction points*.

R324.8.4 Suction points not permitted. *Suction points* are not permitted on sump lids.

R324.8.5 Fasten suction points. *Suction point* fittings and piping shall be fastened in place to prevent dislocation during placement of the gas permeable layer, *soil gas retarder* and concrete.

R324.8.6 Seal top of the soil gas plenum. The *soil gas collector* and all exposed soil shall be covered with a *soil gas retarder* installed in accordance with Section R324.8.6.1.

R324.8.6.1 Sheeting. Polyethylene sheeting of not less than 6 *mils* [0.152 mm] in thickness, or cross-laminated polyethylene sheeting of not less than 3 *mils* [0.076 mm] in thickness shall be installed on top of the *soil gas collector* and shall completely cover the area under the concrete floor and shall be sealed in accordance with Sections R324.8.6.1.1 through R324.8.6.1.3. Where sheet foam board insulation is installed on top of the *soil gas collector*, the polyethylene sheeting shall be installed below the foam board insulation.

R324.11.8.1.1 Seams. Seams between adjacent polyethylene sheets shall be overlapped not less than 12 inches [305 mm] and sealed with a caulk complying with ASTM C920 class 25 or higher, or equivalent method.

R324.11.8.1.2 Repairs. Tears or punctures in the polyethylene sheeting shall be sealed or an additional sheet of polyethylene shall cover the tear or puncture with an overlap of not less than 12 inches [305 mm] on all sides. Such additional sheet shall be sealed and fixed in place to prevent displacement during slab casting.

R324.11.8.1.3 Penetrations. Openings in the *soil gas retarder* membrane for piping, utilities, structural posts and similar penetrations shall be sealed.

R324.8.7 Concrete floors. The concrete floor shall be cast directly upon the *soil gas retarder* or upon the sheet foam board insulation where it is installed on top of the *soil gas retarder*.

R324.8.8 Penetrations. Penetrations through the concrete slab and *soil gas retarder* shall be sealed with a caulk complying with ASTM C920 class 25 or higher, or equivalent method.

R324.8.9 Block-outs. Where openings are cast or constructed in the concrete slab under plumbing fixtures, the openings shall be filled with expanding foam or a non-shrink grout or an approved equivalent method. Exposed openings shall be sealed with non-shrink grout or an approved equivalent method.

R324.8.10 Seal sides of the soil gas collection plenum. The intersection of floors and foundation walls shall be sealed with a caulk complying with ASTM C920 class 25 or higher or an approved equivalent method. Sealing shall be performed in accordance with Section R324.8.10.1, R324.8.10.2 or R324.8.10.3.

R324.8.10.1 Seal floor to wall. The intersection of floors and foundation walls shall be sealed.

R324.8.10.2 Seal soil gas retarder to footing or wall. Where foundation walls are solid concrete, the *soil gas retarder* shall be sealed to the footing or to the foundation wall.

R324.8.10.3 Seal soil gas retarder to wall. Where foundation walls are masonry block, the *soil gas retarder* shall be sealed to the foundation wall.

R324.9 General sealing of soil gas collection plenums. Sealing of potential *soil gas* pathways shall be in accordance with Sections R324.9.1 through R324.9.6.

R324.9.1 Sumps in floors. Sumps in interior floors shall have a rigid lid and the lid shall be sealed with a gasket or silicone caulk and mechanically fastened in a manner to facilitate removal for maintenance. Pipe and wiring penetrations through the lid shall be sealed. The intersection of the floor and sump basin shall be sealed with a caulk complying with ASTM C920 class 25 or higher or equivalent method.

R324.9.2 Hollow masonry unit walls. The top course of hollow block masonry walls shall be made of solid masonry units or the top course shall be fully grouted. The top course under the full width of door and window openings shall be made of solid masonry units or the hollow masonry units shall be fully grouted. Where a brick veneer or other masonry ledge is installed, the course immediately below that ledge shall be made of solid masonry units or the top course shall be fully grouted**.** Other penetrations through foundation walls shall be sealed**.**

R324.9.3 Floor drains. Floor drains and condensate drains shall not allow *soil gas* entry.

R324.9.4 Air ducts. Air ducts located below concrete slabs shall be sealed to prevent *radon* entry and constructed in accordance with Chapter 16.

R324.9.5 Foundation drains. Gravity foundation drainage systems shall include a *check valve* or other mechanical means to isolate the *soil gas collection plenum* from any exterior drain piping. Access shall be provided for maintenance.

R324.9.6 Access openings. Access openings in the floor provided for drain maintenance shall not allow *soil gas* entry.

R324.10 Mitigation system piping. The *mitigation system* piping that extends from the *soil gas* plenum to the point of discharge shall be rigid, non-perforated pipe in accordance with Sections R324.11 through R324.19.

R324.11 Pipe size. *Mitigation system* pipe shall be not less than 3 inch [76 mm] nominal inside diameter.

R324.12 ABS piping. ABS pipe shall comply with ASTM D2661, F628 or F1488. The pipe wall thickness shall be Schedule 40.

R324.13 PVC piping. PVC pipe shall comply with ASTM D2665, F891, or F1488. The pipe wall thickness shall be Schedule 40.

> **Exception:** Rigid, non-perforated PVC pipe meeting ASTM D2949 shall be an alternative to the material specified herein, where installed vertically within enclosed wall cavities.

R324.14 Slope. Above ground piping shall have a slope of not less than 1/8 inch [3.2 mm] per foot [305 mm]. Piping shall slope downwards towards the *suction point*. Piping arrangements that could allow water to collect are prohibited.

R324.15 Joints. Plastic pipe joints shall be solvent welded in accordance with Sections R324.15.1 and R324.15.2. Where disassembly of piping is required such as for removal of a fan, the joints shall be made with flexible couplings complying with ASTM D5926 or ASTM C1173 or an approved equivalent method.

R324.15.1 ABS plastic pipe joints. ABS plastic pipe joints shall be solvent welded in accordance with the pipe manufacturer's instructions with solvent cement conforming to ASTM D 2235.

R324.15.2 PVC plastic pipe joints. The joint surfaces for PVC plastic pipe and fittings to be solvent welded shall be prepared with a primer conforming to ASTM F 656. PVC plastic pipe joints shall be solvent welded in accordance with the pipe manufacturer's instructions with solvent cement conforming to ASTM D 2564.

R324.16 Support. Above ground piping shall be supported by the structure of the building using hangers or strapping designed for piping support. Supports for horizontal piping shall be installed at intervals of not more than 4 feet [1219 mm] and supports for vertical piping shall be installed at intervals of not more than 10 feet [3048 mm].

R324.17 Protection against physical damage. Where pipes penetrate top or bottom plates of stud walls and the nearest edge of the hole is within 1 ½ inches [38 mm] of the face of the member, the pipe shall be protected by steel shield plates. Such shield plates shall have a thickness of not less than 0.0575 inches [1.463 mm] (No. 16 gage). Such plates shall cover the area of the pipe where the plate is bored, and shall extend not less than 2 inches [51 mm] above bottom plates and not less than 2 inches [51 mm] below top plates.

R324.18 Insulation required. In spaces where *mitigation system* piping is subject to freezing temperatures and in spaces where the exterior of *mitigation system* piping is subject to the formation of condensation, such piping shall be provided with insulation having an external vapor barrier and an R-value of not less than 1.8.

R324.19 Labels required (piping). *Mitigation system* piping shall be marked prior to the closing of wall cavities with not less than one label at each floor level and at intervals not more than 10 feet [3048 mm] along the developed length of the piping. The label shall identify that the item is a component of a *radon* reduction system. The label lettering shall be not less than 1/4 inch [6.35 mm] in height and shall be of a color in contrast to the color of the background on which the lettering is applied.

R324.20 Mitigation system termination. The discharge point of a *mitigation system* shall be to the outdoors and shall be directed vertically upward.

R324.21 Elevation and vertical walls. The point of discharge of a *mitigation system* shall comply with all of the following:

1. It shall be not less than 1 foot [305 mm] above the roof at the point penetrated.
2. It shall be not less than 10 feet [3048 mm] above grade nearest the point of discharge.
3. It shall be not less than 10 feet [3048 mm] horizontally from a vertical wall that extends above the roof penetrated.

R324.22 Windows and doors. The discharge point of a *mitigation system* shall be not less than 2 feet [610 mm] above or not less than 10 feet [3048 mm] from windows, doors or other gravity intake openings into the structure or an adjacent structure excluding attic ventilation openings. The 10 foot [3048 mm] distance shall be measured around intervening obstacles.

R324.23 Equipment air intake. The discharge point of a *mitigation system* shall be not less than 3 feet [914 mm] above or 10 feet [3048 mm] away from mechanical air intake openings such as those for evaporative coolers, make-up air, and heat energy recovery ventilators. The 10 foot [3048 mm] distance shall be measured around intervening obstacles.

R324.24 Provision for Active Soil Depressurization (ASD) fan. A space having a vertical height of not less than 48 inches [1219 mm] and a diameter of not less than 21 inches [533 mm] shall be provided in the area where the *ASD fan* will be installed if required. The space provided for the *ASD fan* shall be located according to Section 901.8. The *ASD* pipe shall be centered in this space.

R324.25 Electrical. A receptacle outlet supplied by branch circuit conductors shall be located within 6 feet [1.8 m] of an interior *ASD fan* location

R324.25.1 Label. The over-current device for the branch circuit supplying the *ASD fan* shall be labeled to indicate that it supplies the *radon* fan.

R324.25.2 Disconnect required. Where the fan is not cord and plug connected, a means of electrical disconnect shall be provided for and in sight of the *ASD fan*. The electrical disconnect shall be labeled as to its purpose.

R324.26 Fan access. Limited *access* shall be provided for each *ASD fan* location to allow installation of *ASD fans* and replacement of same. *Access* entry shall be located not more than 20 feet [6096 mm] from the *ASD fan* location.

R324.27 Radon test kit required. A minimum of one long term *radon*-in-air test kit from a *certified* and/or *licensed* laboratory shall be provided for the occupants of each *dwelling* unit.

R324.28 Completion of ASD system. Prior to occupancy, the *ASD* system shall be completed and activated in accordance with Sections R324.30 through R324.41.

> **Exception:** Where prior to occupancy, testing in accordance with Section R324.41 indicates that the building has a *radon* level below the *National Action Level* (*NAL*) and the *Rough-In* piping is labeled in accordance with Section R324.29.

R324.29 Labels required, system Rough-in. *Mitigation system* piping shall be marked with not less than one label in a conspicuous location. An additional label shall be placed on or within 12 inches [305 mm] of the electrical service panel. The labels shall state the following: **"**This radon system is nonfunctional because the system has NOT been activated with a radon fan. The building should be tested for radon at least every 2 years or as recommended by the state or USEPA." The label lettering shall be of a height of not less than 1/4 inch [6.35 mm] and shall be of a color that is in contrast to the color of the background on which the lettering is applied.

R324.30 Fan selection. Fans installed in the *ASD* system shall be recommended by the manufacturer for *radon* mitigation. Such fans shall be designed and sealed by the manufacturer to minimize leakage of water or *soil gas* from the fan housing and shall be sized in accordance with Table R324.33 or as specified by a *certified* or *licensed radon mitigator*.

TABLE R324.30
FAN SIZING

PIPE SIZE Nominal (I.D.)	**TOTAL FOUNDATION AREA**		
	Less Than 1600 sq. feet	**1600 to 2500 sq. feet**	**Greater than 2500 sq. feet**
	Less Than 149 sq. meters	**149 to 232 sq. meters**	**Greater than 232 sq. meters**
(3 inch) [76 mm]	Use Radon Fan Type: **RF1** RF1 Minimum rating:[a] 50 *cfm* @ 0.5 *in. WC* [85m^3/*hr* @ 125 *Pa*]	Use Radon Fan Type: **RF2** RF2 Minimum rating:[a] 75 *cfm* @ 1.0 *in. WC* [127m^3/*hr* @ 250 *Pa*]	*Radon* fan to be sized by *certified* and/or *licensed radon mitigator*
(4 inch) [102 mm]	Use Radon Fan Type: **RF1** RF1 Minimum rating:[a] 50 *cfm* @ 0.5 *in. WC* [85m^3/*hr* @ 125 *Pa*]	Use Radon Fan Type: **RF1** RF1 Minimum rating:[a] 50 *cfm* @ 0.5 *in. WC* [85m^3/*hr* @ 125 *Pa*]	*Radon* fan to be sized by *certified* and/or *licensed radon mitigator*

a. Radon Fan Types RF1 & RF2 minimum flow and pressure ratings are manufacturer specifications.

R324.31 Orientation. *ASD* inline fans shall be installed only on vertical *ASD* piping.

R324.32 Installation. *ASD fans* shall be installed in accordance with the manufacturer's instructions.

R324.33 Flexible connectors required. *ASD fans* shall be connected to the *ASD* piping using flexible unshielded couplings complying with ASTM D5926 or ASTM C1173 or an equivalent method. Connections shall be air and water-tight.

R324.34 Fan start-up. *ASD fans* shall be electrically energized upon installation on the *ASD* system piping.

R324.35 Fan location. *ASD fans* shall be installed only outdoors, in attics or in garages that are not beneath conditioned spaces. *ASD fans* shall not be installed below ground, in conditioned spaces, in occupiable spaces of a building or in a basement, crawlspace or other interior location that is directly beneath a conditioned or occupiable space of a building. *ASD fans* shall not be mounted in a location where pipe that is positively pressurized by the fan is located inside of conditioned or occupiable space.

R324.36 System monitor required. Each *ASD* system shall be provided with a system negative pressure monitor, such as, but not limited to, manometer type pressure gauges, to indicate system operation. The system monitor shall be located indoors in an area where the monitor is readily observable by the occupants.

R324.37 Startup marking. *ASD* system monitors shall be clearly marked to indicate the pressure that existed when the system was initially activated. The monitor device shall have a durable label on or in close proximity to it that describes how to interpret the monitor and what to do if the monitor indicates that system performance has degraded.

R324.38 Automatic reset. Pressure activated electrical *ASD* system monitors, whether visual or audible, shall be supplied by un-switched electrical branch circuits and shall be designed to reset automatically when power is restored after power supply failure. Battery operated monitoring devices shall not be used except where they are equipped with a low power warning feature.

R324.39 Labels required (system and sump). System description labels made of durable material shall be placed on or within 12 inches [30 cm] of the electric service panel and also on the *ASD* system or other prominent location. The lettering on the label shall be not less than 1/4 inch [6.35 mm] in height and shall be of a color in contrast to the color of the background on which the lettering is applied. The label shall state the following: "Radon Reduction System;" the installer's name, phone number, and applicable certification identification; date of installation, an advisory stating that the building should be tested for *radon* at least every 2 years or as required or recommended by state or federal agencies. and shall include notice of additional *radon* resources at www.epa.gov/radon and the *radon* hotline 1-800-SOS-RADON (767-7236).

R324.39.1 Label sump basins. Sump basin covers shall be identified with a durable label that reads as follows: "Component of a Radon Reduction System. Do not tamper with or disconnect." or approved equivalent wording. The lettering on the label shall be not less than 1/4 inch [6.35 mm] in height and shall be of a color in contrast to the color of the background on which the lettering is applied.

R324.40 Documentation package. The occupants of the *dwelling* shall be provided with a documentation package that includes the following:

1. A description of system operation, such as shown in Exhibit 1 "Understanding a Radon Reduction System".
2. All *radon* test data for the property.
3. The annual energy consumption of the installed *ASD fan*(s), whether estimated or actual, and the projected monetary cost of such energy.

R324.41 Radon testing prior to occupancy. A *radon* test shall be performed prior to occupancy and shall be performed by a *certified* or *licensed* measurement professional. Testing shall be performed in accordance with applicable state protocols or requirements; or if there are no state protocols or requirements, with accepted Federal protocols or "Protocols for Radon Measurements in Homes", AARST Consortium on National Radon Standards. Where testing results are greater than the *NAL*, a *certified* and/or *licensed mitigator* shall be required to perform *diagnostic tests* and remediation action. Further *radon* testing shall be required until *radon* concentrations below the *NAL* are achieved.

R324.42 EPA established zones. The *radon* potential of a building site shall be estimated from Figure R324.42 or from Table R324.42. Where state or local jurisdictions have published *radon* potential data, such data shall supersede the information in Figure R324.42 and Table R324.42.

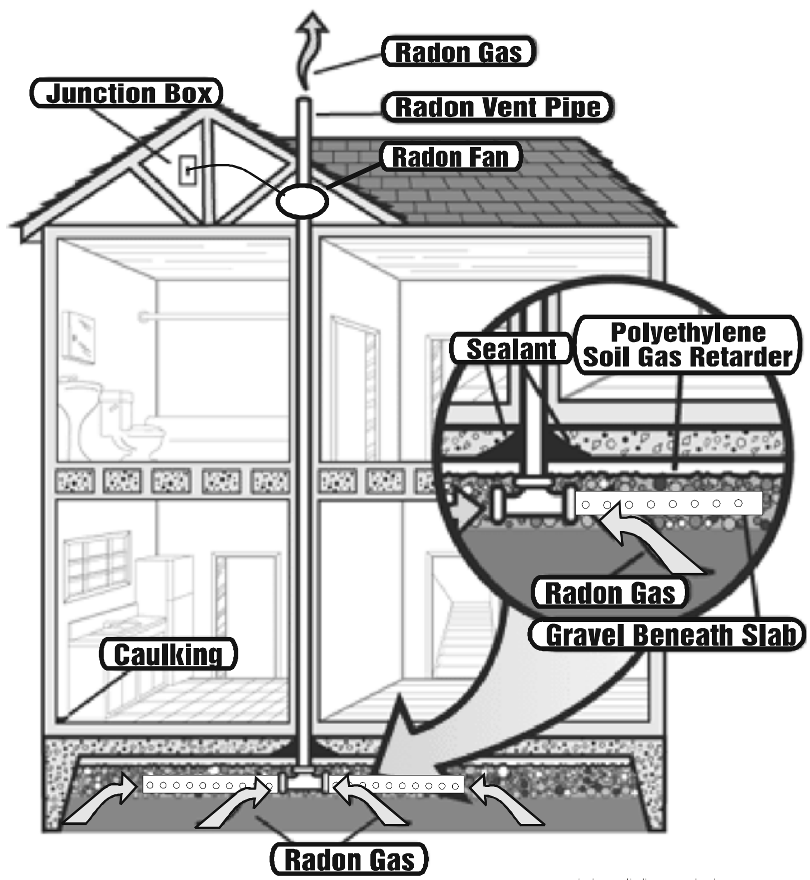
R324.46

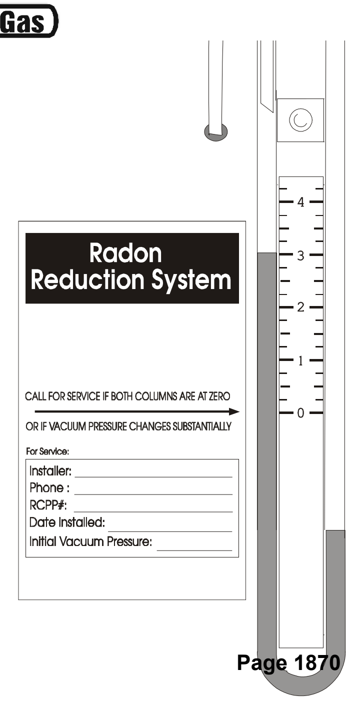
Exhibit 1 - Understanding a Radon Reduction System (Occupants)

General: *Radon* is a radioactive gas that has been found in homes all over the United States. It comes from the natural breakdown of uranium in soil, rock and water and gets into the air you breathe. The *radon* potential of any specific building lot is dependent on whether there is sufficient *radon* source material in the ground below the home and sufficient upward air movement for the *radon* to be near your home's foundation. *Radon* typically moves up through the ground to the air above and into your home through gaps and other holes in the foundation. The primary health concern associated with *radon* is lung cancer. The Environmental Protection Agency (EPA) estimates that 21,000 people die in the US each year from *radon*-induced lung cancer.



Radon Reduction System: Your new home was constructed with an *Active Subslab Depressurization* (*ASD*) System to protect your family's health. The *ASD* system is designed to limit *radon* entry into your home by keeping the soil under your home at a lower pressure than the air in your home. In doing so, *radon* and other *soil gases* from below your home are exhausted above your roof through a specially designed *radon* fan. An *ASD* system is recognized by the EPA as the Best Available Technology for *radon* control because it keeps much of the *radon* from entering your home. The system is designed to run 24 hours a day, 7 days a week. The electrical power required to run the fan, which is the only active component in the system, will typically cost 5 to 25 cents per day depending upon the type of fan and your electrical utility rates. Cost to operate this fan would be less than operating a normal light bulb.

System Maintenance: Your *ASD* System is designed to provide many years of service under normal conditions without significant maintenance. As the occupant of this home, you need to routinely check the system pressure gauge or other system monitor to verify that the fan is operating correctly. There are various labeled components of your *radon* system such as pipe, crawlspace membrane, fan, system pressure monitor and sump basin. DO NOT ALTER OR DISCONNECT any of these components. If the sump basin is opened for required maintenance or repair, restore to the original condition immediately after completing work. You also need to be aware that foundation settling, renovations or additions to your home can change your indoor *radon* concentrations. A *certified/licensed radon mitigator* can provide guidance when changes are to be made to the *dwelling* or provide a routine check-up on the operation of the system.



Understanding the System Pressure Gauge: The pressure gauge shown on the right is typical of a gauge used to monitor the pressure developed in the piping system by the *radon* fan. Your fan pressure should be checked regularly to ensure the fan system continues to operate properly. This gauge measures pressure in Inches Water Column (*in. WC*). This gauge does NOT measure *radon*.

Call for service if the measure changes substantially (20% or more) or if the gauge reads zero pressure (both columns equal).

Your *ASD* system may have an audible alarm to alert you to call for service in the event of a problem.

Radon Testing: Your builder left behind a long term test kit for you to use to test your home after you move in. The way you and your family live in your new home, how you set heating and cooling controls or use your clothes dryer and other exhaust fans can affect indoor *radon* levels. It is recommended that you test for a minimum of 3 months or preferably longer to determine your actual *radon* exposure in the home. Be sure to check the warranty your builder provides to make certain you complete your testing before the end of the new home warranty period.
Follow the instructions provided by the test laboratory to open, activate and place the test kit to test your *radon* levels.

The USEPA recommends that you retest your home at least every 2 years or if major renovations or additions are made to the *dwelling*.

Other sources of radon: *Radon* can also be found in the water from private wells. Testing can determine if your well contains significant amounts of *radon*.

More Info: For more information on *radon*, *radon* testing or *radon* removal: **www.epa.gov/radon**

NOTE: Exhibit 1 may be reprinted without license.

Add definitions as follows:

R202
DEFINITIONS

ACCESS (limited). For the purposes of Section R324, the point of entry to fan location that allows service personnel to reach an *ASD fan* or intended fan location for the purpose of installing or replacing an *ASD fan*. Such access does not require walkways, service platforms, level working spaces, receptacle and lighting outlets or clear and unobstructed passageways with continuous solid flooring such as are typically required for appliances that require periodic maintenance, servicing and inspection.

ACTIVE SOIL DEPRESSURIZATION (ASD). A family of *radon mitigation systems* involving fan-powered soil depressurization, including but not limited to *sub-slab depressurization* and *sub-membrane depressurization*.

ASD FAN. A particular type of fan that is designed and rated by the manufacturer for continuous duty and for use in an *ASD* system.

CERTIFIED. For the purposes of Section R324, a designation applied to individuals or companies that have met qualification requirements or are authorized by the state to provide *radon* laboratory, measurement or mitigation services. Programs providing national certifications for *radon* laboratories, measurement and mitigation professionals are those of the National Radon Proficiency Program (NRPP) and the National Radon Safety Board (NRSB). Also see LICENSED.

CHECK VALVE. A mechanical device that will allow water to flow in one direction while preventing airflow in the opposite direction.

DEPRESSURIZATION. A negative pressure induced in one area relative to another.

DIAGNOSTIC TESTS. For the purposes of Section R324, procedures, including Communication Tests and other tests, used to identify or characterize conditions under, beside and within buildings that could contribute to *radon* entry or elevated *radon* levels or that could provide information regarding the performance of a *radon mitigation system*.

GEOTEXTILE MATTING. A product suitable for soil contact, that provides a void space laterally through the material to allow air movement. The void space is created through a matrix of woven mesh, "egg crate" support of a fabric enclosure or similar means. Also referred to as "Vent Strip".

LICENSED. For the purposes of Section R324, a designation applied to individuals and/or companies that are qualified and specifically authorized as *radon* laboratories, measurement and/or mitigation professionals within certain states or jurisdictions that regulate *radon* services. Also see CERTIFIED.

MITIGATOR. For the purposes of Section R324, a *certified/licensed* individual who designs, installs or directly supervises the installation of the *radon ASD mitigation systems*.

MITIGATION SYSTEM. For the purposes of Section R324, any system or steps designed to reduce *radon* concentrations in the indoor air of a building.

NATIONAL RADON ACTION LEVEL (NRAL). The indoor *radon* concentration at which mitigation is recommended. The *NAL* is defined as the US Environmental Protection Agency's Action Level of 4 *pCi/L* [148 Bq/m^3].

PIPE LOOP. A continuous length of perforated pipe extending around the inside perimeter of the foundation.

RADON. A naturally occurring, chemically inert, radioactive element (Rn-222) which exists as a gas.

ROUGH-IN. For the purposes of Section R324, the installation of all parts and materials of an *ASD* system that must be completed prior to the placement of concrete, prior to the closure of building cavities and prior to the installation of finish materials. Such parts and materials are gas permeable layers, *soil gas retarders*, plenums, membranes, piping, *suction points*, discharge points and wiring.

SOIL GAS. The gas mixture present in soil, which could contain *radon* and water vapor.

SOIL GAS COLLECTION PLENUM. A constructed enclosure for collecting *radon* and other *soil gases* from under a foundation.

SOIL GAS COLLECTOR. A gas permeable conduit constructed of *gravel*, perforated pipe or *geotextile matting* for collecting *radon* and other *soil gases* from within a *soil gas collection plenum* and connecting the plenum to the *ASD* pipe system.

SOIL GAS RETARDER. A continuous membrane or other comparable material laid over a *soil gas* plenum or earthen floor area that is used to retard the flow of *soil gases* into a building.

SUB-MEMBRANE DEPRESSURIZATION. A *radon* mitigation technique designed to maintain lower air pressure in the space under a *soil gas retarder* membrane than above it by use of an *ASD fan* drawing air from beneath the membrane.

SUB-SLAB DEPRESSURIZATION. A *radon* mitigation technique designed to maintain lower air pressure under a floor slab than above it. An *ASD fan* is installed in the *radon* system piping that draws air from below the floor slab.

SUCTION POINT. For the purposes of Section R324, the location where the *soil gas collector* is connected to the *ASD* system piping.

Add standards to Chapter 44 as follows:

ASTM

D5926-11 "Standard Specification for Poly (Vinyl Chloride) (PVC) Gaskets for Drain, Waste, and Vent (DWV), Sewer, Sanitary, and Storm Plumbing Systems "

E1745-11 "Standard Specification for Plastic Water Vapor Retarders Used in Contact with Soil or Granular Fill under Concrete Slabs"

Reason: 21,000 Americans die each year from radon-induced lung cancer. The primary source of exposure to radon for the general public is the home. Geographical areas of the highest radon potential in the United States are located in EPA radon zones 1 & 2. Application of the methods contained in this proposed code change will ensure all new homes built in radon zones 1 & 2 will be tested to be below the EPA Action Level of 4 pCi/L prior to occupancy.

The code change proposal presented herein was developed as an ANSI consensus standard by the AARST Radon Standards Consortium. This standard, AARST/ANSI #CCAH *"Reducing Radon in New Construction of 1 & 2 Family Dwellings and Townhouses,"* was produced by a committee of (27) representing radon professionals, home inspectors, home builders, architects, code officials, consumer advocates and state and federal government.

There is no requirement in the Residential Code to apply radon reduction methods to new construction and thereby prevent elevated radon concentrations in newly built homes. Appendix F of the IRC (Radon Control Methods) is inadequate, 20 years old and not a mandatory part of the building code unless voluntarily adopted by a local jurisdiction.

This proposal adds requirements to homes in the high risk radon counties. Like snow and wind load, seismic and flood-resistance provisions, this proposal targets requirements to the areas with the greatest likelihood of exposure. The EPA estimates that 1 out of 15 of all homes in the US has elevated indoor radon levels. The incidence of elevated radon may be greater than 7 out of 10 homes in some high radon areas. Nonrandomized industry data shows a significant number of homes across the United States have tested high for elevated indoor radon concentrations. Builders of new homes will continue to add to the existing inventory of homes with elevated radon without changes in the residential code that address this important life/safety issue.

Radon Test Results Data by State

WY	WYOMING	25,090	5.2	39.6
TOTALS		**1,834,775**		

Source: AARST radon industry test data; published 10/29/2012.

Cost Impact: This change proposal will slightly increase the cost of construction. Most homes can be built with only a mitigation system rough-in. If the home tests high for elevated radon then the system can be upgraded with a fan to reduce the indoor radon levels.

Cost of mitigation system rough-in (passive) =$296*

Cost of fan driven mitigation system = $707* (total cost, not in addition to $296)

Source: Annual Builder Practices Report 2011, NAHB Research Center, Inc.

The cost savings for reduced health care resulting from a healthier indoor environment has not been calculated.

Analysis: A review of the standards proposed for inclusion in the code, [ASTM D5926-11 and ASTM E1745-11] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

R324 (NEW)-RB-KAPTUROWSKI

Committee Action Hearing Results

For staff analysis of the content of ASTM D5926 and ASTM E1745 relative to CP#28, Section 3.6, please visit: http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf

Committee Action: Disapproved

Committee Reason: The committee disapproved this code change proposal because they felt that information related to radon gas should remain in the appendix, and because what may sometimes be needed should not always be required. This can be done independently at the local level. There are other ways to mitigate radon. An educational brochure seems to be included in the proposal, which is not appropriate for the code. It is not clear why a certified third party is required. The proposal requires a performance standard on top of prescriptive requirements with no guarantee that the performance requirements will be met. This committee and building and building code professionals are not industrial hygienists and should not be expected to enforce health related requirements.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

David Kapturowski, Spruce Environmental Technologies, Inc, representing American Association of Radon Scientists and Technologists (AARST), requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

SECTION R324
RADON REDUCTION

R324.1 General. This Section applies to *radon* control methods for buildings and structures within EPA *radon* zones 1 & 2, as defined in Section R324.42. *Rough-Ins* or complete *Active Soil Depressurization (ASD)* systems shall be installed as necessary to reduce soil gas entry and vapor intrusion so as to establish indoor *radon* levels below the *National Radon Action Level (NRAL*).

R324.2 Mitigation system required. A *mitigation system Rough-In* shall be installed in dwellings located in *radon* potential zones 1 and 2 in accordance with Section R324.5. The *radon* potential zones shall be determined in accordance with Section R324.42.

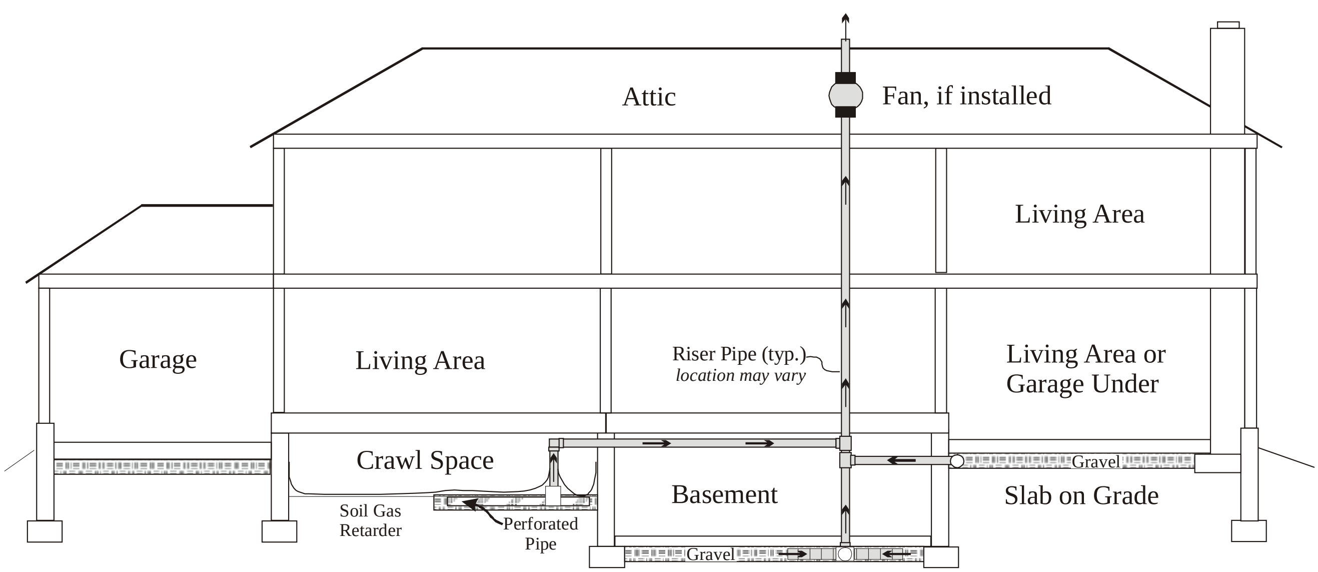
> **Exception:** Where prior to occupancy, testing in accordance with Section R324.41 indicates that the building has a *radon* level below the *National Radon Action Level* (*NRAL*).

R324.3 Design. The design of *radon mitigation systems* shall comply with Section R324 and for buildings having a total foundation area of greater than 2500 square feet [232 sq. m], shall be performed by a *mitigator* who is *certified* or *licensed* to design such systems. Designs of *radon mitigation systems* for foundation types other than those specified herein shall be performed by a *mitigator* who is *certified* or *licensed* to design such systems.

R324.4 Foundation area. The foundation area shall be calculated from the inside perimeter dimensions of the foundation walls.

R324.5 Mitigation system rough-in required. The *Rough-In* installation of a *mitigation system* shall be required for all foundations and combination foundations types, including crawl space, basement, slab-on-grade and slab-on-grade garage located below a living area. The installation shall be in accordance with Sections R324.6 through R324.28. Figure R324.5 illustrates the four foundation types.

FIGURE R324.5
FOUNDATION TYPES



R324.6 Soil gas collection plenums. Foundation areas shall be constructed so as to create sealed *soil gas collection plenums* in accordance with Sections R324.7 through R324.9.6.

R324.7 Submembrane soil gas collection plenums in crawl spaces with earthen floors. For each *suction point*, a *soil gas collector* shall be installed in accordance with Sections R324.7.1 through R324.7.7 and Section R324.9.

R324.7.1 Soil gas collector. One *soil gas collector* for each *suction point* (R324.7.2) shall be installed in accordance with Section R324.7.1.1, R324.7.1.2 or R324.7.1.3.

R324.7.1.1 Pipe soil gas collector. The *soil gas collector* shall consist of a perforated pipe with a nominal diameter of not less than 4 inches [102 mm]. The pipe shall be not less than 10 feet [3048 mm] in length. Such piping shall be placed in a trench backfilled with clean aggregate meeting the criteria of Section R324.8.1.1.1 such that the pipe is completely surrounded by not less than 4 inches [102 mm] of aggregate.

R324.7.1.1.2 Geotextile soil gas collector. The *soil gas collector* shall consist of a strip of geotextile drain matting not less than 10 feet [3048 mm] in length and having a cross sectional area of not less than 12 square inches [7742 sq. mm]. The strip of matting shall be placed on top of the soil or in a trench.

R324.7.1.1.3 Gravel soil gas collector. A uniform layer of clean aggregate, not less than 4 inches [102 mm] in depth, shall be placed over the soil. The aggregate shall have a void ratio of not less than 35 percent or shall be in accordance with Size Number 4, 5, 56, or 6 as classified by ASTM C33.

R324.7.2 Suction points. One *suction point* shall be provided for each *soil gas collector*. *Suction points* shall be installed in accordance with Section R324.7.2.1, R324.7.2.2 or R324.7.2.3, as applicable for the type of plenum installed.

R324.7.2.1 Suction point for pipe soil gas collector. The *suction point* for a pipe *soil gas collector* shall consist of a pipe fitting or other device having not less than three openings with two openings oriented so as to create multiple horizontal intake openings. The perforated pipe plenum shall be inserted into both of the horizontal openings of the pipe fitting or device. One opening of the fitting or device shall be oriented in a vertical "up" position. Alternatively, the sub-membrane area and the other foundation types shall be interconnected by a *pipe loop soil gas collector* that is constructed in accordance with Section R324.8.1.1.3 and served by one or more *suction points*.

R324.7.2.2 Suction point for geotextile soil gas collector. The *suction point* for a geotextile *soil gas collector* shall consist of a pipe fitting or other device having not less three openings with two openings oriented so as to create multiple horizontal intake openings. The horizontal openings shall be connected to the matting in a manner that facilitates airflow from the collector. One opening of the fitting or device shall be oriented in a vertical "up" position.

R324.7.2.3 Suction point for gravel soil gas collector. The *suction point* for a gravel *soil gas collector* shall consist of a pipe fitting or other device having not less than three openings with two openings oriented so as to create multiple horizontal intake openings. The horizontal openings shall be provided with not less than 5 feet [1524 mm] of perforated pipe extending from each opening of the fitting or device into the gravel layer. Such perforated pipe shall provide not less than 1 square inch [645 sq. mm] of open perforation area per lineal foot of pipe.

R324.7.3 Suction points not permitted. *Suction points* shall not be permitted on sump lids

R324.7.4 Fasten suction points. *Suction point* fittings and devices shall be fixed in place to prevent dislocation.

R324.7.5 Seal top of the soil gas collection plenum. A *soil gas retarder* shall cover the top of the *soil gas collection plenum* and all exposed soil. The installation of the *soil gas retarder* shall be in accordance with Sections R324.7.5.1 through R324.7.5.4.

R324.7.5.1 Sheeting. The *soil gas retarder* membrane shall comply with ASTM E1745 Class A, B or C.

R324.7.5.2 Seams. The seams between adjacent membrane sheets shall be overlapped not less than 12 inches [305 mm] and shall be sealed by one of the following methods:

1. A tape recommended by the membrane manufacturer.
2. Caulk complying with ASTM C920 class 25 or greater.
3. An equivalent method.

R324.7.5.3 Repairs. Tears or punctures in the membrane shall be sealed by one or more of the following methods:

1. A tape recommended by the membrane manufacturer.
2. An additional sheet of the membrane material that covers and overlaps the tear or puncture not less than 12 inches [305 mm] on all sides and that is sealed with a caulk complying with ASTM C920 class 25 or greater.
3. An equivalent method.

R324.7.5.4 Penetrations. Openings in the *soil gas retarder* membrane for piping, utilities, structural supports or similar penetrations shall be sealed.

R324.7.6 Seal sides of the soil gas collection plenum. The *soil gas retarder* membrane shall turn up onto foundation walls not less than 6 inches [152 mm] and shall be continuously sealed to the wall along the full perimeter with a caulk complying with ASTM C920 class 25 or higher or equivalent method.

R324.7.7 Label required (membranes). *Soil gas retarder* membranes shall be marked in a conspicuous place with a label to identify that the membrane is a component of a *radon* reduction system. The label lettering shall be of a height of not less than 1/4 inch [6.35 mm] and shall be of a color in contrast to the color of the background on which the lettering is applied.

R324.8.1 Subslab soil gas collection plenums for concrete floors. The floors of basement, concrete crawlspace and slab-on-grade foundation systems shall be provided with a *soil gas collection plenum* installed in accordance with Sections R324.8.1.1 through R324.9.6.

R324.8.1.1 Soil gas collector. A *soil gas collector* shall be installed in accordance with Section R324.8.1.1.1, R324.8.1.1.2 or R324.8.1.1.3.

R324.8.1.1.1 Gravel. A uniform layer of clean aggregate, not less than 4 inches [102 mm] in depth, shall be placed over the soil. The aggregate shall have a void ratio of not less than 35 percent or shall be in accordance with Size Number 4, 5, 56, or 6 as classified by ASTM C33.

R324.8.1.1.2 Geotextile. A layer of geotextile drainage matting shall be placed over a uniform layer of either soil or sand. The geotextile drainage matting shall be designed to allow the lateral flow of *soil gases* to the system's *suction point* fitting. The *geotextile matting* shall have a cross-sectional area of not less than 12 square inches [7742 sq. mm] and shall be placed, at a minimum, along the entire inside perimeter of the foundation at a distance of 12 inches [305 mm] to 18 inches [457 mm] from the foundation wall to the edge of the drainage matting. Deviation from the 12 inch [305 mm] to 18 inch [457 mm] distance to the foundation wall shall be allowed to avoid obstacles such as plumbing and other utilities.

R324.8.1.1.3 Pipe loop. A loop of not less than 4 inch [102 mm] diameter perforated pipe shall be placed along the entire inside perimeter of the foundation at a distance of 12 inches [305 mm] to 18 inches [457 mm] from the centerline of the pipe to the foundation walls. Such piping shall be placed in a trench backfilled with clean aggregate meeting the criteria of Section R324.8.1.1.1 and surrounding the pipe on at least 2 sides. The cross-sectional area of the aggregate and pipe *soil gas collector* shall be at least 50 square inches [32,258 sq. mm]. The piping shall form a continuous loop and pipe sections shall be joined with a connector device or method recommended by the manufacturer. Deviation from the 12 inch [305 mm] to 18 inch [457 mm] distance to the foundation wall shall be allowed to avoid obstacles such as plumbing and other utilities.

R324.8.2 Suction points. One *suction point* shall be provided for each *soil gas collector*. Not less than one *suction point* shall be provided for each foundation type. Alternatively, each *soil gas collector* shall be interconnected by a *pipe loop soil gas collector* that is constructed in accordance with Section R324.8.3 and served by one or more *suction points*. *Suction points* shall be installed in accordance with Sections R324.8.2.1, R324.8.2.2 or R324.8.2.3 as applicable for the type of *soil gas collector* installed.

R324.8.2.1 Gravel layer soil gas collector. A *suction point* for a *gravel* type *soil gas collector* shall consist of a pipe fitting or other device having not less than two openings oriented so as to create multiple horizontal intake openings within the gravel layer. The horizontal openings shall be provided with not less than 5 feet [1534 mm] of perforated pipe extending from each opening of the fitting or device into the gravel layer. Said perforated pipe shall provide a minimum of 1 square inch [645 sq. mm] of open perforation area in each lineal foot of pipe. *Suction point* openings above the slab shall be protected from the entry of aggregate, concrete and debris.

R324.8.2.2 Geotextile layer soil gas collector. A *suction point* for a geotextile type *soil gas collector* shall consist of a pipe fitting or other device having not less than three openings with two oriented so as to create multiple horizontal intake openings connected to the geotextile mat in a manner that maintains airflow capacity from the plenum. *Suction point* openings above the slab shall be protected from the entry of aggregate, concrete and debris.

R324.8.2.3 Pipe loop soil gas collector. A *suction point* for a *pipe loop* type collector shall consist of a pipe tee fitting or pipe saddle device installed in the loop piping. *Suction point* openings above the slab shall be protected from the entry of aggregate, concrete and debris.

R324.8.3 Multiple soil gas collection plenums. Where interior footings divide a *soil gas collector* into two or more areas, each such area shall be provided with the required *suction points* and joined with *mitigation system* piping in accordance with Section R324.10. Alternatively, each area so created by the interior footings shall be interconnected by a *pipe loop soil gas collector* that is constructed in accordance with Section R324.8.1.1.3 and served by one or more *suction points*.

R324.8.4 Suction points not permitted. *Suction points* shall not be permitted on sump lids.

R324.8.5 Fasten suction points. *Suction point* fittings and piping shall be fastened in place to prevent dislocation during placement of the gas permeable layer, *soil gas retarder* and concrete.

R324.8.6 Seal top of the soil gas plenum. The *soil gas collector* and all exposed soil shall be covered with a *soil gas retarder* that is installed in accordance with Section R324.8.6.1.

R324.8.6.1 Sheeting. Polyethylene sheeting of not less than 6 *mils* [0.152 mm] in thickness, or cross-laminated polyethylene sheeting of not less than 3 *mils* [0.076 mm] in thickness shall be installed on top of the *soil gas collector* and shall completely cover the area under the concrete floor and shall be sealed in accordance with Sections R324.8.6.1.1 through R324.8.6.1.3. Where sheet foam board insulation is installed on top of the *soil gas collector*, the polyethylene sheeting shall be installed below the foam board insulation.

R324.8.6.1.1 Seams. Seams between adjacent polyethylene sheets shall be overlapped not less than 12 inches [305 mm] and sealed with a caulk complying with ASTM C920 class 25 or higher, or equivalent method.

R324.8.6.1.2 Repairs. Tears or punctures in the polyethylene sheeting shall be sealed or an additional sheet of polyethylene shall cover the tear or puncture with an overlap of not less than 12 inches [305 mm] on all sides. Such additional sheet shall be sealed and fixed in place to prevent displacement during slab casting.

R324.8.6.1.3 Penetrations. Openings in the *soil gas retarder* membrane for piping, utilities, structural posts and similar penetrations shall be sealed.

R324.8.7 Concrete floors. The concrete floor shall be cast directly upon the *soil gas retarder* or upon the sheet foam board insulation where it is installed on top of the *soil gas retarder*.

R324.8.8 Penetrations. Penetrations through the concrete slab and *soil gas retarder* shall be sealed with a caulk complying with ASTM C920 class 25 or higher, or equivalent method.

R324.8.9 Block-outs. Where openings are cast or constructed in the concrete slab under plumbing fixtures, the openings shall be filled with expanding foam or a non-shrink grout or an approved equivalent method. Exposed openings shall be sealed with non-shrink grout or an approved equivalent method.

R324.8.10 Seal sides of the soil gas collection plenum. The intersection of floors and foundation walls shall be sealed with a caulk complying with ASTM C920 class 25 or higher or an approved equivalent method. Sealing shall be performed in accordance with Section R324.8.10.1, R324.8.10.2 or R324.8.10.3.

R324.8.10.1 Seal floor to wall. The intersection of floors and foundation walls shall be sealed.

R324.8.10.2 Seal soil gas retarder to footing or wall. Where foundation walls are solid concrete, the *soil gas retarder* shall be sealed to the footing or to the foundation wall.

R324.8.10.3 Seal soil gas retarder to wall. Where foundation walls are masonry block, the *soil gas retarder* shall be sealed to the foundation wall.

R324.9 General sealing of soil gas collection plenums. Sealing of potential *soil gas* pathways shall be in accordance with Sections R324.9.1 through R324.9.6.

R324.9.1 Sumps in floors. Sumps in interior floors shall have a rigid lid and the lid shall be sealed with a gasket or silicone caulk and mechanically fastened in a manner that facilitates removal for maintenance. Pipe and wiring penetrations through the lid shall be sealed. The intersection of the floor and sump basin shall be sealed with a caulk complying with ASTM C920 class 25 or higher or equivalent method.

R324.9.2 Hollow masonry unit walls. The top course of hollow block masonry walls shall be made of solid masonry units or shall be fully grouted. The top course under the full width of door and window openings shall be made of solid masonry units or the hollow masonry units shall be fully grouted. Where a brick veneer or other masonry ledge is installed, the course immediately below that ledge shall be made of solid masonry units or the top course shall be fully grouted**.** Other penetrations through foundation walls shall be sealed**.**

R324.9.3 Floor drains. Floor drains and condensate drains shall not allow *soil gas* entry.

R324.9.4 Air ducts. Air ducts located below concrete slabs shall be sealed to prevent *radon* entry and constructed in accordance with Chapter 16.

R324.9.5 Foundation drains. Gravity foundation drainage systems shall include a *check valve* or other mechanical means to isolate the *soil gas collection plenum* from any exterior drain piping. Access shall be provided for maintenance.

R324.9.6 Access openings. Access openings in the floor provided for drain maintenance shall not allow *soil gas* entry.

R324.10 Mitigation system piping. The *mitigation system* piping that extends from the *soil gas* plenum to the point of discharge shall be rigid, non-perforated pipe in accordance with Sections R324.11 through R324.19.

R324.11 Pipe size. *Mitigation system* pipe shall be not less than 3 inch [76 mm] nominal inside diameter.

R324.12 ABS piping. ABS pipe shall comply with ASTM D2661, F628 or F1488. The pipe wall thickness shall be Schedule 40.

R324.13 PVC piping. PVC pipe shall comply with ASTM D2665, F891, or F1488. The pipe wall thickness shall be Schedule 40.

Exception: Rigid, non-perforated PVC pipe complying with ASTM D2949 shall be an alternative to the material specified herein, where installed vertically within enclosed wall cavities.

R324.14 Slope. Above ground piping shall have a slope of not less than 1/8 inch [3.2 mm] per foot [305 mm]. Piping shall slope downwards towards the *suction point*. Piping arrangements that allow water to collect shall be prohibited.

R324.15 Joints. Plastic pipe joints shall be solvent welded in accordance with Sections R324.15.1 and R324.15.2. Where disassembly of piping is required such as for removal of a fan, the joints shall be made with flexible couplings complying with ASTM D5926 or ASTM C1173 or an approved equivalent method.

R324.15.1 ABS plastic pipe joints. ABS plastic pipe joints shall be solvent welded in accordance with the pipe manufacturer's instructions with solvent cement conforming to ASTM D 2235.

R324.15.2 PVC plastic pipe joints. The joint surfaces for PVC plastic pipe and fittings to be solvent welded shall be prepared with a primer conforming to ASTM F 656. PVC plastic pipe joints shall be solvent welded in accordance with the pipe manufacturer's instructions with solvent cement conforming to ASTM D 2564.

R324.16 Support. Above ground piping shall be supported by the structure of the building using hangers or strapping designed for piping support. Supports for horizontal piping shall be installed at intervals not exceeding 4 feet [1219 mm] and supports for vertical piping shall be installed at intervals not exceeding 10 feet [3048 mm].

R324.17 Protection against physical damage. Where pipes penetrate top or bottom plates of stud walls and the nearest edge of the hole is within 1 ½ inches [38 mm] of the face of the member, the pipe shall be protected by steel shield plates. Such shield plates shall have a thickness of not less than 0.0575 inches [1.463 mm] (No. 16 gage). Such plates shall cover the area of the pipe where the plate is bored, and shall extend not less than 2 inches [51 mm] above bottom plates and not less than 2 inches [51 mm] below top plates.

R324.18 Insulation required. In spaces where *mitigation system* piping is subject to freezing temperatures and in spaces where the exterior of *mitigation system* piping is subject to the formation of condensation, such piping shall be provided with insulation having an external vapor barrier and an R-value of not less than 1.8.

R324.19 Piping labels required. *Mitigation system* piping shall be marked prior to the closing of wall cavities with not less than one label at each floor level and at intervals not greater than 10 feet [3048 mm] along the developed length of the piping. The label shall identify that the item is a component of a *radon* reduction system. The label lettering height shall be not less than 1/4 inch [6.35 mm] and shall be of a color in contrast to the color of the background on which the lettering is applied.

R324.20 Mitigation system termination. The discharge point of a *mitigation system* shall be to the outdoors and shall be directed vertically upward.

R324.21 Elevation and vertical walls. The point of discharge of a *mitigation system* shall comply with all of the following:

1. It shall be not less than 1 foot [305 mm] above the roof at the point penetrated.
2. It shall be not less than 10 feet [3048 mm] above grade nearest the point of discharge.
3. It shall be not less than 10 feet [3048 mm] horizontally from a vertical wall that extends above the roof penetrated.

R324.22 Windows and doors. The discharge point of a *mitigation system* shall be not less than 2 feet [610 mm] above or not less than 10 feet [3048 mm] from windows, doors or other gravity intake openings into the structure or an adjacent structure excluding attic ventilation openings. The 10 foot [3048 mm] distance shall be measured around intervening obstacles.

R324.23 Equipment air intake. The discharge point of a *mitigation system* shall be not less than 3 feet [914 mm] above or 10 feet [3048 mm] away from mechanical air intake openings such as those for evaporative coolers, make-up air, and heat energy recovery ventilators. The 10 foot [3048 mm] distance shall be measured around intervening obstacles.

R324.24 Provision for Active Soil Depressurization (ASD) fan. A space having a vertical height of not less than 48 inches [1219 mm] and a diameter of not less than 21 inches [533 mm] shall be provided in the area where a required *ASD fan* is installed. The space provided for the *ASD fan* shall be located in accordance with Section R324.35. The *ASD* pipe shall be centered in this space.

R324.25 Electrical. A receptacle outlet supplied by branch circuit conductors shall be located within 6 feet [1.8 m] of an interior *ASD fan* location

R324.25.1 Label. The over-current device for the branch circuit supplying the *ASD fan* shall be labeled to indicate that it supplies the *radon* fan.

R324.25.2 Disconnect required. Where the fan is not cord and plug connected, a means of electrical disconnect shall be provided for and in sight of the *ASD fan*. The electrical disconnect shall be labeled to indicate its purpose.

R324.26 Fan access. Limited *access* shall be provided for each *ASD fan* location to allow installation and replacement of *the fan*. *Access* entry shall be located not greater than 20 feet [6096 mm] from the *ASD fan* location.

R324.27 Radon test kit required. A minimum of one long term *radon*-in-air test kit from a *certified* or *licensed* laboratory shall be provided for the occupants of each dwelling unit.

R324.28 Completion of ASD system. Prior to occupancy, the *ASD* system shall be completed by a *certified* or *licensed radon mitigator* and activated in accordance with Sections R324.30 through R324.40.

> **Exception:** Where prior to occupancy, testing in accordance with Section R324.41 indicates that the building has a *radon* level below the *National Radon Action Level* (*NRAL*) and the *Rough-In* piping is labeled in accordance with Section R324.29.

R324.29 Labels required, system *Rough-In*. *Mitigation system* piping shall be marked with not less than one label in a conspicuous location. An additional label shall be placed on or within 12 inches [305 mm] of the electrical service panel. The labels shall state the following: **"**This radon system is nonfunctional because the system has NOT been activated with a radon fan. The building should be tested for radon at least every 2 years or as recommended by the state or USEPA." The label lettering shall be of a height of not less than 1/4 inch [6.35 mm] and shall be of a color that is in contrast to the color of the background on which the lettering is applied.

R324.30 Fan selection. Fans installed in the *ASD* system shall be recommended by the manufacturer for *radon* mitigation. Such fans shall be designed and sealed by the manufacturer to minimize leakage of water or *soil gas* from the fan housing and shall be sized in accordance with Table R324.33 or as specified by a *certified* or *licensed radon mitigator*.

TABLE R324.30
FAN SIZING

PIPE SIZE Nominal (I.D.)	TOTAL FOUNDATION AREA		
	Less Than 1600 sq. feet	**1600 to 2500 sq. feet**	**Greater than 2500 sq. feet**
	Less Than 149 sq. meters	**149 to 232 sq. meters**	**Greater than 232 sq. meters**
(3 inch) [76 mm]	Use Radon Fan Type: **RF1** RF1 Minimum rating:[a] 50 cfm @ 0.5 in. WC [85m^3/hr @ 125 Pa]	Use Radon Fan Type: **RF2** RF2 Minimum rating:[a] 75 cfm @ 1.0 in. WC [127m^3/hr @ 250 Pa]	*Radon* fan to be sized by *certified* and/or *licensed radon mitigator*
(4 inch) [102 mm]	Use Radon Fan Type: **RF1** RF1 Minimum rating:[a] 50 cfm @ 0.5 in. WC [85m^3/hr @ 125 Pa]	Use Radon Fan Type: **RF1** RF1 Minimum rating:[a] 50 cfm @ 0.5 in. WC [85m^3/hr @ 125 Pa]	*Radon* fan to be sized by *certified* and/or *licensed radon mitigator*

a. Radon Fan Types RF1 & RF2 minimum flow and pressure ratings are manufacturer specifications.

R324.31 Orientation. *ASD* inline fans shall be installed only on vertical *ASD* piping.

R324.32 Installation. *ASD fans* shall be installed in accordance with the manufacturer's instructions.

R324.33 Flexible connectors required. *ASD fans* shall be connected to the *ASD* piping using flexible unshielded couplings complying with ASTM D5926 or ASTM C1173 or an equivalent method. Connections shall be air and water-tight.

R324.34 Fan start-up. *ASD fans* shall be electrically energized upon installation on the *ASD* system piping.

R324.35 Fan location. *ASD fans* shall be installed only outdoors, in attics or in garages that are not beneath conditioned spaces. *ASD fans* shall not be installed below ground, in conditioned spaces, in occupiable spaces of a building or in any basement, crawlspace or other interior location that is directly beneath a conditioned or occupiable space of a building. *ASD fans* shall not be mounted in any location where pipe that is positively pressurized by the fan is located inside of conditioned or occupiable space.

R324.36 System monitor required. Each *ASD* system shall be provided with a system negative pressure monitor such as, but not limited to, a manometer type pressure gauge to indicate system operation. The system monitor shall be located indoors in an area where the monitor is readily observable by the occupants.

R324.37 Startup marking. *ASD* system monitors shall be clearly marked to indicate the pressure that existed when the system was initially activated. The monitor device shall have a durable label on or in close proximity to it that describes how to interpret the monitor and what to do if the monitor indicates that system performance has degraded.

R324.38 Automatic reset. Pressure activated electrical *ASD* system monitors, whether visual or audible, shall be supplied by un-switched electrical branch circuits and shall be designed to reset automatically when power is restored after power supply failure. Battery operated monitoring devices shall not be used except where they are equipped with a low power warning feature.

R324.39 Labels required (system and sump). System description labels made of durable material shall be placed on or within 12 inches [30 cm] of the electric service panel and also on the *ASD* system or other prominent location. The lettering on the label shall be not less than 1/4 inch [6.35 mm] in height and shall be of a color that is in contrast with the color of the background on which the lettering is applied. The label shall state the following: "Radon Reduction System;" the installer's name, phone number, and applicable certification identification; date of installation, an advisory stating that the building should be tested for *radon* at least every 2 years or as required or recommended by state or federal agencies. and shall include notice of additional *radon* resources at www.epa.gov/radon and the *radon* hotline 1-800-SOS-RADON (767-7236).

R324.39.1 Label sump basins. Sump basin covers shall be identified with a durable label that reads as follows: "Component of a Radon Reduction System. Do not tamper with or disconnect." or equivalent wording. The lettering on the label shall be not less than 1/4 inch [6.35 mm] in height and shall be of a color that is in contrast with the color of the background on which the lettering is applied.

R324.40 Documentation package. The occupants of the dwelling shall be provided with a documentation package that includes the following:

1. A description of system operation.
2. All *radon* test data for the property performed by a *licensed or certified* measurement professional.
3. The annual energy consumption of the installed *ASD fan*(s), whether estimated or actual, and the projected monetary cost of such energy.

R324.41 Radon testing prior to occupancy. A *radon* test shall be performed prior to occupancy and shall be performed by a *certified* or *licensed* measurement professional. Testing shall be performed in accordance with applicable state protocols or requirements; or if there are no state protocols or requirements, with accepted Federal protocols or "Protocols for Radon Measurements in Homes", AARST Consortium on National Radon Standards. Where testing results are greater than the *NRAL*, a *certified* and/or *licensed mitigator* shall be required to perform *diagnostic tests* and remediation action. Further *radon* testing shall be required until *radon* concentrations below the *NRAL* are achieved.

R324.42 EPA established zones. The *radon* potential of a building site shall be estimated from Figure R324.42 or from Table R324.42 except that, where state or local jurisdictions have published *radon* potential data, such data shall supersede the information in Figure R324.42 and Table R324.42.

Add to Chapter 3 Bibliography

ASTM D5926-11 – "Standard Specification for Poly (Vinyl Chloride) (PVC) Gaskets for Drain, Waste, and Vent (DWV), Sewer, Sanitary, and Storm Plumbing Systems "

ASTM E1745-11 – "Standard Specification for Plastic Water Vapor Retarders Used in Contact with Soil or Granular Fill under Concrete Slabs"

Add new definitions as follows:

ACCESS (limited). For the purposes of Section R324, the point of entry to a fan location that allows service personnel to reach an *ASD fan* or intended fan location for the purpose of installing or replacing an *ASD fan*. Such access does not require walkways, service platforms, level working spaces, receptacle and lighting outlets or clear and unobstructed passageways with continuous solid flooring such as are typically required for appliances that require periodic maintenance, servicing and inspection.

ACTIVE SOIL DEPRESSURIZATION (ASD). A family of *radon mitigation systems* involving fan-powered soil depressurization, including but not limited to *sub-slab depressurization* and *sub-membrane depressurization*.

ASD FAN. A particular type of fan that is designed and rated by the manufacturer for continuous duty and for use in an *ASD* system.

CERTIFIED. For the purposes of Section R324, a designation applied to individuals or companies that have met qualification requirements or are authorized by the state to provide *radon* laboratory, measurement or mitigation services. Programs providing national certifications for *radon* laboratories, measurement and mitigation professionals shall be those of the National Radon Proficiency Program (NRPP) and the National Radon Safety Board (NRSB). Also see LICENSED.

CHECK VALVE. For the purposes of Section R324, a mechanical device that will allow water to flow in one direction while preventing airflow in the opposite direction.

DEPRESSURIZATION. A negative pressure induced in one area relative to another.

DIAGNOSTIC TESTS. For the purposes of Section R324, procedures, including Communication Tests and other tests, used to identify or characterize conditions under, beside and within buildings that could contribute to *radon* entry or elevated *radon* levels or that could provide information regarding the performance of a *radon mitigation system*.

GEOTEXTILE MATTING. A product suitable for soil contact, that provides a void space laterally through the material to allow air movement. The void space is created through a matrix of woven mesh, "egg crate" support of a fabric enclosure or similar means. Also referred to as "Vent Strip".

LICENSED. For the purposes of Section R324, a designation applied to individuals and/or companies that are qualified and specifically authorized as *radon* laboratories, measurement and/or mitigation professionals within certain states or jurisdictions that regulate *radon* services. Also see CERTIFIED.

MITIGATOR. For the purposes of Section R324, a *certified/licensed* individual who designs, installs or directly supervises the installation of the *radon ASD mitigation systems*.

MITIGATION SYSTEM. For the purposes of Section R324, any system or steps designed to reduce *radon* concentrations in the indoor air of a building.

NATIONAL RADON ACTION LEVEL (NRAL). The indoor *radon* concentration at which mitigation is recommended. The *NRAL* is defined as the US Environmental Protection Agency's Action Level of 4 *pCi/L* [148 Bq/m^3].

PIPE LOOP. For the purposes of Section R324, a continuous length of perforated pipe extending around the inside perimeter of the foundation.

RADON. A naturally occurring, chemically inert, radioactive element (Rn-222) which exists as a gas.

ROUGH-IN. For the purposes of Section R324, the installation of all parts and materials of an *ASD* system that must be completed prior to the placement of concrete, prior to the closure of building cavities and prior to the installation of finish materials. Such parts and materials are gas permeable layers, *soil gas retarders*, plenums, membranes, piping, *suction points*, discharge points and wiring.

SOIL GAS. The gas mixture present in soil, which could contain *radon* and water vapor.

SOIL GAS COLLECTION PLENUM. A constructed enclosure for collecting *radon* and other *soil gases* from under a foundation.

SOIL GAS COLLECTOR. A gas permeable conduit constructed of *gravel*, perforated pipe or *geotextile matting* for collecting *radon* and other *soil gases* from within a *soil gas collection plenum* and connecting the plenum to the *ASD* pipe system.

SOIL GAS RETARDER. A continuous membrane or other comparable material laid over a *soil gas* plenum or earthen floor area that is used to retard the flow of *soil gases* into a building.

SUB-MEMBRANE DEPRESSURIZATION. A *radon* mitigation technique designed to maintain lower air pressure in the space under a *soil gas retarder* membrane than above it by use of an *ASD fan* drawing air from beneath the membrane.

SUB-SLAB DEPRESSURIZATION. A *radon* mitigation technique designed to maintain lower air pressure under a floor slab than above it. An *ASD fan* is installed in the *radon* system piping that draws air from below the floor slab.

SUCTION POINT. For the purposes of Section R324, the location where the *soil gas collector* is connected to the *ASD* system piping.

Commenter's Reason: Exhibit 1 was deleted from the original proposal because the committee felt it was not appropriate for code. The Exception in R324.2 was modified to allow for alternate radon mitigation techniques and provides a performance only path. The Exception in R324.2 also provides the opportunity to not require a system where local conditions determine it is not necessary. In the prescriptive path where a complete Active Soil Depressurization system is installed the builder will not be required to test prior to occupancy.

This proposed section on radon reduction is consistent with the stated goals of the IRC as stated in **R103.1 Intent: "***The purpose of this code is to establish minimum requirements to safeguard the public safety, health and general welfare…………".* The prescriptive requirements of this proposed section and the requirements for certified/licensed radon professionals relieves the building official from a need for detailed knowledge on testing and remediating this Class "A" carcinogen from the built environment and so they need not be an industrial hygienist or an expert on radon.

Radon is a Life/Safety issue which exists in residential construction because of the way homes are constructed and the soil underlying a dwelling's foundation. 21,000 Americans die each year from radon-induced lung cancer. The primary source of exposure to radon for the general public is the home. Geographical areas of the highest radon potential in the United States are located in EPA radon zones 1 and 2. If the radon system is not needed it does not need to be roughed-in or completed.

There is currently no requirement in the Residential Code to apply radon reduction methods to new construction and thereby prevent elevated radon concentrations in newly built homes unless voluntarily adopted by a local jurisdiction. Because of the lack of code requirement we have added 2.5 million new homes with elevated indoor radon to the country's housing inventory in the past 25 years.

The EPA estimates that 1 out of 15 of all homes in the US has elevated indoor radon levels. The incidence of elevated radon may be greater than 7 out of 10 homes in some high radon areas. Nonrandomized industry data shows a significant number of homes across the United States have tested high for elevated indoor radon concentrations. Builders of new homes will continue to add to the existing inventory of homes with elevated radon without changes in the residential code that address this important life/safety issue.

Radon Test Results Data by State

STATE	STATENAME	TOTAL # TESTS	AVG (pCi/L)	% > EPA Action Level of 4 pCi/L

TOTALS		**1,834,775**		

Source: AARST radon industry test data; published 10/29/2012.

This change proposal will slightly increase the cost of construction. Most homes can be built with only a mitigation system Rough-In. If the home tests high for elevated radon then the system can be upgraded with a fan to reduce the indoor radon levels.

Cost of mitigation system Rough-In (passive) =$296*

Cost of fan driven mitigation system = $707* (total cost, not in addition to $296)

Source: Annual Builder Practices Report 2011, NAHB Research Center, Inc.

The cost savings for reduced health care resulting from a healthier indoor environment has not been calculated.

Public Comment 2:

Mathew Koch, Southern Radon Reduction, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

Add new text as follows:

SECTION R324
RADON

R324.1 *Radon* Testing. Where a building site indicates a potential for elevated indoor *radon* concentrations, as shown by the United States Environmental Protection Agency Zones 1 and 2 in Figure 324.1 or from the United States Environmental Protection Agency *radon* potential by county listing in Table 324.2, the *building official* shall determine whether to require a *radon* test be performed by a *licensed or certified radon* measurement professional prior to occupancy. Where state or local jurisdictions have published *radon* potential data, such data shall supersede the information in Figure 324.1 and Table 324.2.

Add new definitions as follows:

CERTIFIED. For the purposes of Section R324, a designation applied to individuals or companies that have met qualification requirements or are authorized by the state to provide *radon* laboratory, measurement or mitigation services. Programs providing national certifications for *radon* laboratories, measurement and mitigation professionals are those of the National Radon Proficiency Program and the National Radon Safety Board. Also see LICENSED.

LICENSED. For the purposes of Section R324, a designation applied to individuals and/or companies that are qualified and specifically authorized as *radon* laboratories, measurement or mitigation professionals within certain states or jurisdictions that regulate *radon* services. Also see CERTIFIED.

RADON. A naturally occurring, chemically inert, radioactive element (Rn-222) which exists as a gas.

--------end-------

Commenter's Reason: The EPA estimates that 1 out of 15 of all homes in the US has elevated indoor radon levels. The incidence of elevated radon may be greater than 7 out of 10 homes in some high radon areas. Nonrandomized industry data shows a significant number of homes across the United States have tested high for elevated indoor radon concentrations. Builders of new homes will continue to add to the existing inventory of homes with elevated radon without changes in the residential code to identify homes with excessive levels of this Class "A" carcinogen.

Radon Test Results Data by State

STATE	STATENAME	TOTAL # TESTS	AVG (pCi/L)	% > EPA Action Level of 4 pCi/L

TOTALS		**1,834,775**		

Source: AARST radon industry test data; published 10/29/2012.

Cost Impact: This change proposal will slightly increase the cost of construction by adding a radon test if required by the building official.

Cost of radon test =$125

The cost savings for reduced health care resulting from a healthier indoor environment has not been calculated.

Final Action: AS AM AMPC____ D

RB203-13
R202, R301.2.2.3.1, R324 (New)

Proposed Change as Submitted

Proponent: Maureen Traxler/City of Seattle/Washington Association of Building Officials Technical Code Development Committee (maureen.traxler@seattle.gov)

Revise as follows:

SECTION R202
DEFINITIONS

MEZZANINE~~, LOFT~~. An intermediate level or levels between the floor and ceiling of any *story* ~~with an aggregate floor area of not more than one-third of the area of the room or space in which the level or levels are located~~.

Revise as follows:

R301.2.2.3.1 Height limitations. Wood-framed buildings shall be limited to three stories above *grade* plane or the limits given in Table R602.10.3(3). Cold-formed, steel-framed buildings shall be limited to less than or equal to three stories above *grade* plane in accordance with AISI S230. Mezzanines as defined in Section R202 that comply with Section R324 shall not be considered as stories. Structural insulated panel buildings shall be limited to two stories above *grade* plane.

SECTION R324
MEZZANINES

R324.1 General. *Mezzanines* shall comply with Section R324.

R324.2 Mezzanines. The clear height above and below *mezzanine* floor construction shall be not less than 7 feet (2134 mm).

R324.3 Area limitation. The aggregate area of a *mezzanine or mezzanines* shall be not greater than one-third of the floor area of the room or space in which they are located. The enclosed portion of a room shall not be included in a determination of the floor area of the room in which the *mezzanine* is located.

R324.4 Means of egress. The *means of egress* for *mezzanines* shall comply with the applicable provisions of Section R311.

R324.5 Openness. *Mezzanines* shall be open and unobstructed to the room in which they *are* located except for walls not more than 42 inches (1067 mm) in height, columns and posts.

Exceptions:

1. *Mezzanines* or portions thereof are not required to be open to the room in which they are located, provided that the aggregate floor area of the enclosed space is not greater than 10 percent of the *mezzanine* area.
2. In buildings that are no more than two *stories* above *grade plane* and equipped throughout with an *automatic sprinkler system* in accordance with NFPA 13R, NFPA 13D or Appendix S, a *mezzanine* having two or more *means of egress* shall not be required to be open to the room in which the *mezzanine* is located.

Reason: The IRC provisions for mezzanines are incomplete. The code provides a definition of "mezzanine, loft" but doesn't include any other provisions to clarify the allowable size or extent of mezzanines. This proposal copies relevant portions of IBC Section 505.2 into the IRC.

Mezzanines are allowed to be considered not to be stories because they are limited in size and because they are subject to provisions that provide protection from fire hazards. Mezzanines are required to be open to the room in which they are located, which provides early warning to occupants should a fire occur in either the mezzanine or in the room. The IBC provisions also include more specific provisions for determining the portion of the room that can be included in the allowable area of the mezzanine.

There is also reason to limit the size of mezzanines. Section R301.2.2.3.1 states that mezzanines are not considered stories in the context of height limitations for buildings in higher seismic design categories. Mezzanines that are large in relation to the size of the story will act more like a story in response to seismic forces and should be treated as stories.

In addition, we are proposing to delete the word "loft" from the definition of mezzanine. The word is not used anywhere in the code, so it is not necessary to define it.

Cost Impact: The code change proposal will not increase the cost of construction.

R324 (NEW)-RB-TRAXLER

Committee Action Hearing Results

Committee Action: Approved as Modified

Modify proposal as follows:

R324.5 Openness. *Mezzanines* shall be open and unobstructed to the room in which they *are* located except for walls not more than ~~42~~ 36 inches (1067 mm) in height, columns and posts.

Exceptions:

1. *Mezzanines* or portions thereof are not required to be open to the room in which they are located, provided that the aggregate floor area of the enclosed space is not greater than 10 percent of the *mezzanine* area.
2. In buildings that are no more than two *stories* above *grade plane* and equipped throughout with an *automatic sprinkler system* in accordance with ~~NFPA 13R, NFPA 13D or Appendix S~~ Section R313, a *mezzanine* ~~having two or more *means of egress*~~ shall not be required to be open to the room in which the *mezzanine* is located.

(Portions of proposal not shown to remain as originally proposed.)

Committee Reason: The committee approved this code change proposal because they felt that it appropriately removes requirement s that should be in the body of the code from the definitions section of the code. The term "loft" does not add anything. The modification adds clarity.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Homer Maiel, PE, CBO, City of Palo Alto/4LEAF Inc., representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R324.5 Openness. *Mezzanines* shall be open and unobstructed to the room in which they *are* located except for walls not more than ~~42~~ 36 inches (1067 mm) in height, columns and posts.

Exceptions:

1. *Mezzanines* or portions thereof are not required to be open to the room in which they are located, provided that the aggregate floor area of the enclosed space is not greater than 10 percent of the *mezzanine* area.
2. In buildings that are no more than two stories above grade plane and equipped throughout with an automatic sprinkler system in accordance with NFPA 13R, NFPA 13D or Appendix S Section R313, a mezzanine having two or more means of egress shall not be required to be open to the room in which the mezzanine is located.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: The committee voted to modify the original proposal. We agree with the original proposal and the modifications made by the committee with the one exception of the allowable wall height. The wall height was modified from 42 inch to 36 inch maximum height by the committee. The current code and original proposal permits up to a 42-inch high wall enclosure to qualify as open for purposes of establishing a mezzanine. The modification from 42 to 36 inch was probably done to correlate with the guard height requirements. The 36-inch is a minimum height for guards. One should not be penalized for installing a guard taller than the minimum...and arguably, safer.

RB203-13

Final Action: AS AM AMPC____ D

RB206-13
R401.5 (New)

Proposed Change as Submitted

Proponent: Jonathan Siu, City of Seattle Department of Planning & Development, representing Washington Association of Building Officials Technical Code Development Committee (jon.siu@seattle.gov)

Add new text as follows:

<u>**R401.5 Protection of adjoining property.** Adjoining public and private property shall be protected from damage during construction, remodeling and demolition work. Protection shall be provided for footings, foundations, party walls, chimneys, skylights, roofs and other building elements. Provisions shall be made to control water runoff and erosion during construction or demolition activities.</u>

Reason: Currently, the IRC contains no provisions requiring adjacent property be protected from construction activities. This proposal brings text from IBC Section 3307 (Protection of Adjoining Property) into the IRC, bringing the codes into closer alignment. One difference between this proposal and the IBC text is the addition of "and other building elements" in the second sentence. The WABO TCD Committee feels it is just as important to protect elements such as bay or garden windows with roof-like components from hazards as it is to protect roofs and skylights.

It is to be noted that there is a requirement in the IBC text to notify owners of adjoining buildings at least 10 days prior to the start of excavation. The WABO TCD Committee considers this to be unenforceable language, and therefore has not included it in this proposal. However, if the committee feels led to do so, the following text (verbatim from IBC Section 3307.1) can be added to the proposal as a committee modification, in order to get complete consistency between the codes:

"<u>The person making or causing an excavation to be made shall provide written notice to the *owners* of adjoining buildings advising them that the excavation is to be made and that the adjoining buildings should be protected. Said notification shall be delivered not less than 10 days prior to the scheduled starting date of the excavation.</u>"

Cost Impact: Potential increase in initial cost of construction since this is not currently specifically regulated in the code, but may reduce potential for lawsuits where precautions are not already being taken.

R401.5 (NEW) #1-RB-SIU.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The building department is not involved with encroachment on adjacent property. There are local, state and federal laws that address this issue. This is consistent with the committees action on RB205-13.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jonathan Siu, City of Seattle, Dept of Planning & Development, representing Washington Association of Building Officials Technical Code Development Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R401.5 Protection of adjoining property. Adjoining public and private property shall be protected from damage during construction, remodeling and demolition work. Protection shall be provided for footings, foundations, party walls, chimneys, skylights, roofs and other building elements. ~~Provisions shall be made to control water runoff and erosion during construction or demolition activities.~~

Commenter's Reason: This proposal simply aligns the IRC more closely with the IBC. The recent tragedy in Philadelphia demonstrates the need for this type of regulation. The modification is being proposed in response to the comments received at the Committee Action Hearings stating drainage issues are not handled by the Building Official, although it is notable that the identical text appears in the IBC, as stated below. In further response to the published and unpublished comments received at the hearings:

1. The first published reason for the Committee's action is that the building department is not involved with encroachment on adjacent property. However, the proposed text is contained in Section 3307.1 of the 2012 IBC (reproduced below for reference), including the text regarding the control of water runoff and erosion. There were no proposals in Group A to change that section, so the identical text will appear in the 2015 IBC. Therefore, we would contend the building department is already involved in these types of issues.
2. One commenter said this is handled by local ordinances, a statement that is echoed in the published reason for the Committee's disapproval. However, not all jurisdictions pass local ordinances to deal with this type of issue, and some jurisdictions are prohibited from amending the IRC. The I-codes form a family of <u>model</u> codes. As such, this text provides model code language that jurisdictions can adopt to protect neighboring properties. These may be especially helpful to those jurisdictions who are restricted from adopting amendments to the model code. For those jurisdictions who have already adopted local ordinances, this text can serve either to refine their current regulations, or eliminate the need to adopt a separate local ordinance.
3. One commenter said these provisions were "best practice," not minimum code. Similar to the first response above, since similar text appears in the IBC, it does not appear to be a "best-practice," but was considered to be minimum code for other types of buildings, and should be applicable to IRC-scope buildings as well.

2012 IBC Section 3307.1, with text extracted for the original proposal underlined:

3307.1 Protection required. <u>Adjoining public and private property shall be protected from damage during construction, remodeling and demolition work. Protection shall be provided for footings, foundations, party walls, chimneys, skylights and roofs. Provisions shall be made to control water runoff and erosion during construction or demolition activities.</u> The person making or causing an excavation to be made shall provide written notice to the *owners* of adjoining buildings advising them that the excavation is to be made and that the adjoining buildings should be protected. Said notification shall be delivered not less than 10 days prior to the scheduled starting date of the excavation.

RB206-13

Final Action: AS AM AMPC____ D

RB207-13
R401.5 (New), R403.1, Chapter 44

Proposed Change as Submitted

Proponent: Jonathan Siu, City of Seattle Department of Planning & Development, representing Washington Association of Building Officials Technical Code Development Committee (jon.siu@seattle.gov)

Revise as follows:

R401.5 Site work. Site work shall be performed in accordance with Sections R401.5.1 through R401.5.4.

R401.5.1 Excavation and fill. Excavation and fill for buildings and structures shall be constructed or protected so as not to endanger life or property. Excavation, fill, or shoring, whether temporary or permanent, shall not extend onto adjacent property. Existing footings or foundations that can be affected by any excavation shall be underpinned adequately or otherwise protected against settlement and shall be protected against lateral movement.

R401.5.2 Slope limits. Slopes for permanent fill shall be not steeper than one unit vertical in two units horizontal (50-percent slope). Cut slopes for permanent excavations shall be not steeper than one unit vertical in two units horizontal (50-percent slope). Deviation from the foregoing limitations for cut slopes shall be permitted only upon the submittal of a geotechnical report acceptable to the *building official*.

R401.5.3 Surcharge. No fill or other surcharge loads shall be placed adjacent to any building or structure, or caused to be imposed on them, unless such building or structure is designed to resist the additional loads caused by the fill or surcharge.

R401.5.4 Soil supporting foundations. Footings and foundations shall be supported on undisturbed natural soils or engineered fill. Fill to be used to support the footings or foundations of any building or structure shall comply with the provisions of a geotechnical report acceptable to the *building official*. The compaction shall be verified by a *registered design professional*.

> **Exception:** Compacted fill material 12 inches (305 mm) in depth or less need not comply with a geotechnical report, provided the in-place dry density is not less than 90 percent of the maximum dry density at optimum moisture content determined in accordance with ASTM D 1557, and the compaction is verified by a *registered design professional*.

R403.1 General. All exterior walls shall be supported on continuous solid or fully grouted masonry or concrete footings, crushed stone footings, wood foundations, or other *approved* structural systems which shall be of sufficient design to accommodate all loads according to Section R301 and to transmit the resulting loads to the soil within the limitations as determined from the character of the soil. ~~Footings shall be supported on undisturbed natural soils or engineered fill.~~ Concrete footing shall be designed and constructed in accordance with the provisions of Section R403 or in accordance with ACI 332.

Add new standard to Chapter 44 as follows:

ASTM

D 1557-07 - Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort [56,000 ft-lb/ft3 (2,700 KN m/m3)]

Reason: This proposal adds provisions to the IRC to protect adjacent structures and property from the effects of site work. Currently, there are no regulations in the IRC that would prevent an excavation for a foundation or footing from endangering adjacent buildings or property, nor is guidance given for fill material properties. An extreme example of where this was a problem was the collapse of the Lotus Riverside apartment building in Shanghai in 2009. There, the contractor stockpiled up to 10 meters of soil on one side of the building, while excavating on the other, leading to the building tipping over (see http://www.chinadaily.com.cn/china/2009-07/03/content_8376126.htm). For IRC-type buildings, the failures would not be as dramatic, but can still become a headache for the building official. This proposal is based on text found in IBC Section 3304, which would bring the two codes into closer alignment. Specifically:

R401.5.1 – Requires excavations or fill not endanger (undercut or overhang) adjacent buildings or property. It also clearly states that all site work (temporary or permanent) has to stay within the property lines—a principle that is understood by most people, but not stated anywhere in the I-codes. This does not preclude other approved alternates, such as a temporary easement, from being employed to allow work to extend onto the adjacent property, since those can be approved under Section R104.11. Finally, this section states that any footings or foundations that are undercut by an adjacent excavation must be underpinned or supported by other means. If the affected foundation is on the adjacent property, the shoring or permanent foundation wall being constructed must be designed for the appropriate surcharge to support the adjacent foundation. (See also proposed Section R401.5.3.)

R401.5.2 – Sets some practical limits on permanent cut or fill slopes. A geotechnical report (usually by a geotechnical engineer) can set different parameters, but the text gives the building official the opportunity to review the report to see if the recommendations are based on an appropriate investigation.

R401.5.3 – Requires structures supporting surcharge loads to be designed for those loads. Examples of sources of surcharge loads might be: a steep slope being supported by a retaining wall; vehicular loads from an adjacent right-of-way; foundation/footing loads from adjacent buildings; or fill placed next to an existing structure. All these and other sources can impose additional loads on foundation or retaining walls (or even temporary shoring walls) that must be accounted for in a design.

R401.5.4 – Replaces a general requirement in IRC Section 403.1, and gives more guidance. Requires structures be supported by natural soils or structural fill. Structural fill properties must be determined in a geotechnical report. Since special inspections are not included in the IRC but compaction must be verified, a registered design professional (again, usually a geotechnical engineer) is required to conduct the verification. The exception gives an alternative to the full geotechnical report, allowing field verification of 90% compaction in accordance with the ASTM standard if the compaction is again verified by a registered design professional.

Chapter 44 – The standard has already been adopted into the IBC, so the addition in Chapter 44 just brings it into the IRC in order to provide appropriate guidance for the purposes of the exception.

Cost Impact: The code change proposal will not increase the cost of construction, if site development is being done in accordance with IBC requirements as a matter of course, it may increase the cost of construction if not.

Analysis: A review of the standard proposed for inclusion in the code, ASTM D1557 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2012.

R401.5 (NEW) #2-RB-SIU.doc

Committee Action Hearing Results

For staff analysis of the content of ASTM D1557-07 relative to CP#28, Section 3.6, please visit:
http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf

Committee Action: Disapproved

Committee Reason: This committee feels this is outside the scope of the IRC and should be handled by ordinance at the local jurisdiction.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Jonathan Siu, City of Seattle, Dept of Planning & Development, representing Washington Association of Building Officials Technical Code Development Committee, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

R403.1 General. All exterior walls shall be supported on continuous solid or fully grouted masonry or concrete footings, crushed stone footings, wood foundations, or other *approved* structural systems which shall be of sufficient design to accommodate all loads according to Section R301 and to transmit the resulting loads to the soil within the limitations as determined from the character of the soil. ~~Footings shall be supported on undisturbed natural soils or engineered fill.~~ Concrete footing shall be designed and constructed in accordance with the provisions of Section R403 or in accordance with ACI 332.

R403.1.7 Soil supporting foundations. Footings and foundations shall be supported on undisturbed natural soils or engineered fill. Where fill is used to support the footings or foundations of a building or structure this fill shall comply with the provisions of a geotechnical report acceptable to the *building official*. The compaction shall be verified by a *registered design professional*.

> **Exception:** Compacted fill material 12 inches (305 mm) in depth or less need not comply with a geotechnical report, provided the in-place dry density is not less than 90 percent of the maximum dry density at optimum moisture content determined in accordance with ASTM D 1557, and the compaction is verified by a *registered design professional*.

(Renumber subsequent subsections.)

Add new standard to Chapter 44 as follows:

ASTM

D 1557-12 - Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort [56,000 ft-lb/ft3 (2,700 KN m/m3)]

Commenter's Reason: This proposal simply brings the IRC and the IBC into closer alignment on how to adequately support foundations.

Because the original proposal addressed two separate issues in a single proposal, we have divided them in two Public Comments. This Public Comment addresses soil supporting building foundations. A separate Public Comment will address the other site work requirements. It is notable there were no technical objections raised to this part of the proposal by the Committee or other speakers at the Committee Action Hearings.

This public comment only adopts the regulations regarding how foundations are supported. This will replace the more general statement in Section 403.1 with clearer, more specific requirements as to what constitutes acceptable fill materials for foundation support. The proposed text is based on Section 3304.1.4 and 1804.5 of the 2012 IBC, which are reproduced below for reference. No proposals were made to change these sections in the Group A development process, so they should remain as shown in the 2015 IBC.

As a modification to the original proposal which placed the requirements in the more general Section R401.5, this Public Comment places the added text before the other subsections dealing with soils issues (R403.1.7, footings on or adjacent to slopes, and R403.1.8, foundations on expansive soils). While it may seem to be important enough that the requirement should appear as the first subsection under R403.1, it seemed logical to the WABO committee that it should be grouped with the other soils issues.

A second modification has been made to the original proposal, updating the edition of ASTM D 1557 to the 2012 version, as approved by the Administrative Provisions Committee for the IBC in item ADM62-13.

2012 IBC Section 3304.1.4 and 1804.5:

3304.1.4 Fill supporting foundations. Fill to be used to support the foundations of any building or structure shall comply with Section 1804.5. *Special inspections* of compacted fill shall be in accordance with Section 1704.7.

1804.5 Compacted fill material. Where shallow foundations will bear on compacted fill material, the compacted fill shall comply with the provisions of an *approved* geotechnical report, as set forth in Section 1803.

> **Exception:** Compacted fill material 12 inches (305 mm) in depth or less need not comply with an *approved* report, provided the in-place dry density is not less than 90 percent of the maximum dry density at optimum moisture content determined in accordance with ASTM D 1557. The compaction shall be verified by *special inspection* in accordance with Section 1705.6.

Public Comment 2:

Jonathan Siu, City of Seattle, Dept of Planning & Development, representing Washington Association of Building Officials Technical Code Development Committee, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

R401.5 Site work. Site work shall be performed in accordance with Sections R401.5.1 through R401.5.3.

R401.5.1 Excavation and fill. Excavation and fill for buildings and structures shall be constructed or protected so as not to endanger life or property. Excavation, fill, or shoring, whether temporary or permanent, shall not extend onto adjacent property. Existing footings or foundations that can be affected by an excavation shall be underpinned adequately or otherwise protected against settlement and shall be protected against lateral movement.

R401.5.2 Slope limits. Slopes for permanent fill shall be not more than one unit vertical in two units horizontal (50-percent slope). Cut slopes for permanent excavations shall be not more than one unit vertical in two units horizontal (50-percent slope). Deviation from the foregoing limitations for cut slopes shall be permitted only upon the submittal of a geotechnical report acceptable to the *building official*.

R401.5.3 Surcharge. No fill or other surcharge loads shall be placed adjacent to a building or structure, or caused to be imposed on them, unless such building or structure is designed to resist the additional loads caused by the fill or surcharge.

Exception: Minor surcharge loads from grading for landscaping purposes shall be permitted where approved by the building official, or where:

1. The grading is done with walk-behind equipment, AND
2. The grade is not increased more than one foot from original design grade.

Commenter's Reason: This proposal simply brings the IRC and the IBC into closer alignment on protection of adjacent property. Our experience has been that when the work being performed damages adjacent property (or is perceived to be the cause of damage), it creates a problem for everyone involved—owners, contractors, designers, and code officials—regardless of whether or not it is addressed in the code. The WABO Technical Code Development Committee believes this is an area of regulation that is missing in the current IRC, especially when compared to the IBC. Putting these regulations in place will likely reduce the hassles for everyone.

However, because it can be viewed as two separate issues are being addressed by the original code change proposal, we have divided them in two Public Comments. This Public Comment addresses the site development aspects of the code change proposal. A separate Public Comment will address the support for foundations.

This public comment adopts regulations regarding site work. As stated in the reason statement for the original proposal, this clearly states whoever is doing the work is responsible to keep the effects of construction on the subject property. Without this text, it can be easily construed to be the adjacent property owner who is responsible to protect his/her own property from the effects of construction—something they are not causing. In addition, under the general code principle "if something is not prohibited, it's allowed," the current code allows cuts or fills to be extend onto adjacent property. We do not believe this is what the code intends, and this Public Comment clarifies the issue. The proposed text is based on Section 3304.1 of the 2012 IBC (which is reproduced below for reference), but adds a new exception based on a change to 2015 IBC Section 1808.3.2 to allow minor surcharges from landscaping activities (Item S184-12). No proposals were made to change IBC Section 3304.1 in the Group A development process, so the 2015 IBC section will be the same as 2012.

The Committee's published reason for disapproval states this is outside the scope of the IRC and should be handled by ordinance at the local jurisdiction. In response:

1. There is nothing in the Scope or Intent sections in the IRC (R101.2 and R101.3) that confine the regulations to the actual building. In fact, Section R101.3 specifically refers to establishing minimum requirements to safeguard the public through "safety to life ***and property*** [emphasis ours]".
2. Other regulations in the code are in place to protect adjacent property from the effects of the new construction (e.g., the requirements in Section R302 for protecting openings near the property line). This proposal is no different, as it also seeks to protect the adjacent property from the effects of the new construction.
3. As stated above, the proposed text is based on text already found in the IBC. For the issue of protecting adjacent property, there is nothing unique about a dwelling built in accordance with the IRC versus one built in accordance with the IBC provisions for R-3 occupancies. That is, protection of adjacent property is an issue for any construction. It therefore follows that if the IBC regulates this issue, there is no reason why the IRC shouldn't.
4. Not all jurisdictions pass local ordinances to deal with this type of issue, and some jurisdictions are prohibited from amending the IRC. The fact that many jurisdictions adopt ordinances regulating this demonstrates there is a need for them in the code. The I-codes form a family of model codes. As such, this text provides model code language that jurisdictions can adopt to protect neighboring properties. This may be especially helpful to those jurisdictions who are restricted from adopting amendments to the model code. For those jurisdictions who have already adopted local ordinances, this text can serve either to refine their current regulations, or eliminate the need to adopt a separate local ordinance.

2012 IBC Section 3304.1, with text extracted for the original proposal underlined:

3304.1 Excavation and fill. Excavation and fill for buildings and structures shall be constructed or protected so as not to endanger life or property. Stumps and roots shall be removed from the soil to a depth of not less than 12 inches (305 mm) below the surface of the ground in the area to be occupied by the building. Wood forms which have been used in placing concrete, if within the ground or between foundation sills and the ground, shall be removed before a building is occupied or used for any purpose. Before completion, loose or casual wood shall be removed from direct contact with the ground under the building.

3304.1.1 Slope limits. Slopes for permanent fill shall be not steeper than one unit vertical in two units horizontal (50-percent slope). Cut slopes for permanent excavations shall be not steeper than one unit vertical in two units horizontal (50-percent slope). Deviation from the foregoing limitations for cut slopes shall be permitted only upon the presentation of a soil investigation report acceptable to the *building official*.

3304.1.2 Surcharge. No fill or other surcharge loads shall be placed adjacent to any building or structure unless such building or structure is capable of withstanding the additional loads caused by the fill or surcharge. Existing footings or foundations which can be affected by any excavation shall be underpinned adequately or otherwise protected against settlement and shall be protected against later movement.

Final Action: AS AM AMPC____ D

RB210-13

R403.1, Figure R403.3(1) (NEW)

<u>Proposed Change as Submitted</u>

Proponent: Jason Thompson, National Concrete Masonry Association representing Masonry Alliance for Codes and Standards (jthompson@ncma.org)

Revise as follows:

R403.1 General. All exterior walls shall be supported on continuous solid or fully grouted masonry or concrete footings, crushed stone footings, wood foundations, or other *approved* structural systems which shall be of sufficient design to accommodate all loads according to Section R301 and to transmit the resulting loads to the soil within the limitations as determined from the character of the soil. Footings shall be supported on undisturbed natural soils or engineered fill. Concrete footing shall be designed and constructed in accordance with the provisions of Section R403 or in accordance with ACI 332.

<u>At transitions between footings located at different elevations, precast concrete lintels complying with Figure R403.1(1) shall be permitted in Seismic Design Categories A, B, and C.</u>

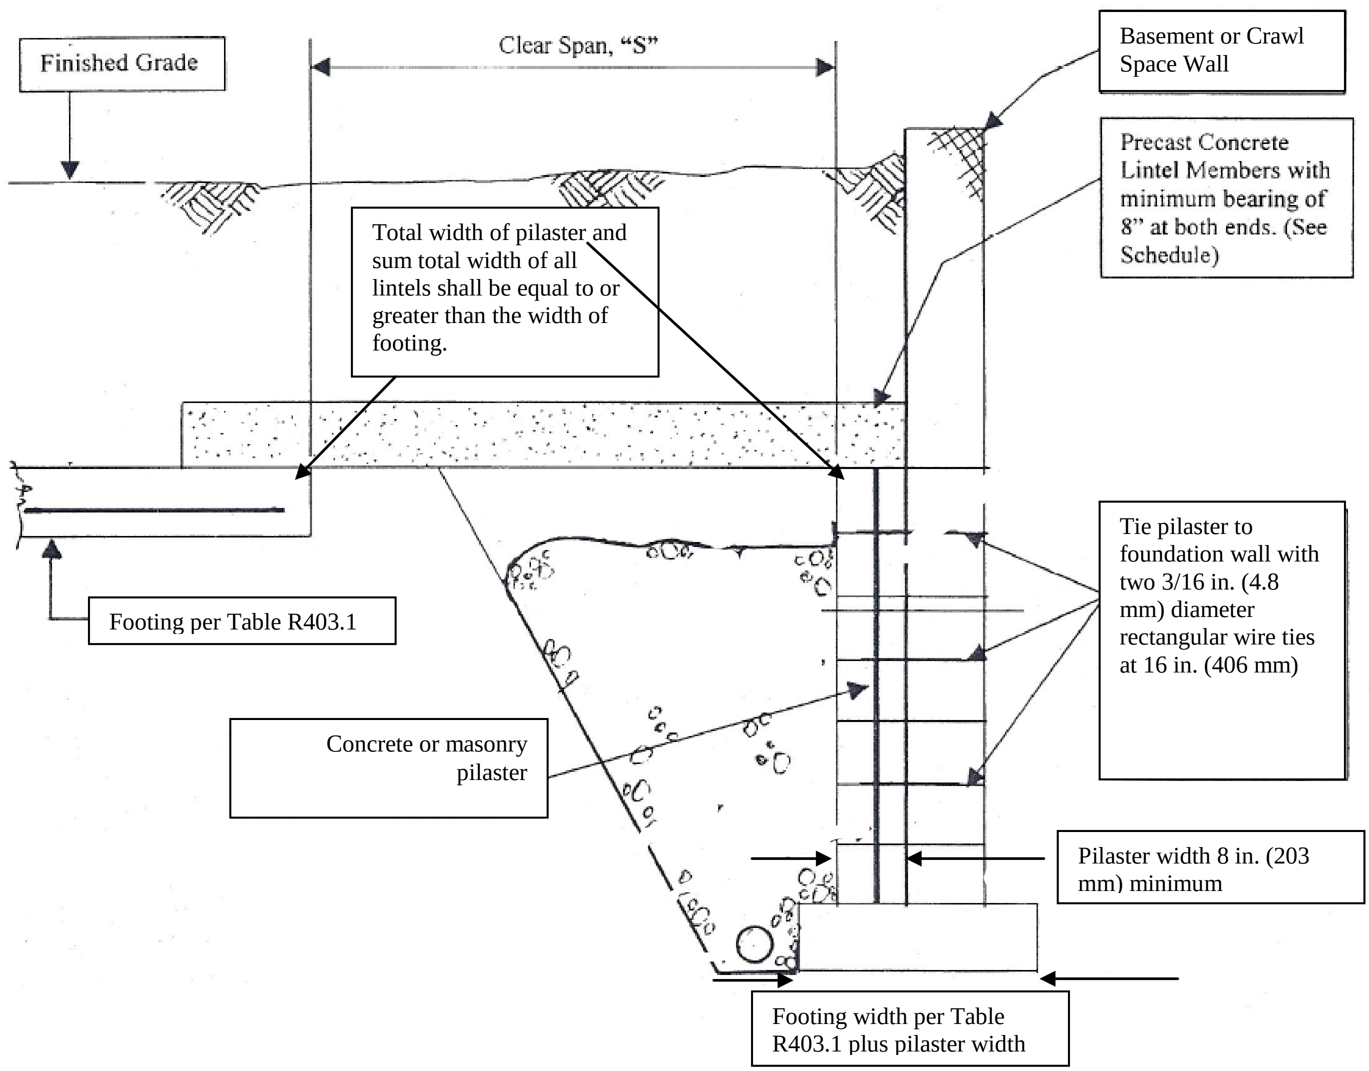

FIGURE 403.1(1) DISCONTINUOUS FOOTERS

Required Reinforcement for Each 4 in. by 8 in. Lintel			Required Reinforcement for Each 6 in. by 8 in. Lintel		
Clear Span, S	Top Bar Size	Bottom Bar Size	Clear Span, S	Top Bar Size	Bottom Bar Size
4'-0"	No. 3	No. 3	4'-0"	No. 3	No. 3
4'-8"	No. 3	No. 3	4'-8"	No. 3	No. 3
5'-4"	No. 3	No. 3	5'-4"	No. 3	No. 3
6'-0"	No. 3	No. 3	6'-0"	No. 3	No. 3
6'-8"	No. 3	No. 3	6'-8"	No. 3	No. 4
7'-4"	No. 3	No. 4	7'-4"	No. 3	No. 5
8'-0"	No. 3	No. 5	8'-0"	No. 3	No. 5

1. All reinforcing bars shall comply with ASTM A615, Grade 60.
2. Minimum 28 day compressive strength of the lintel shall be 3,000 psi.

Reason: Situations often arise in the field whereby it is not practical to have a continuous footing around the perimeter of a residence, such as at the transition between a basement wall and a stem wall below a garage, which is further complicated due to excavating around the basement. A common solution to this situation is to span between the stem wall footer and basement wall footer using a precast lintel to support surcharge loads applied from above.

This change proposes to introduce an alternative design and construction option to allow discontinuous footers when complying with the requirements of the proposed new Figure 403.1(1). Similar detailing has been used successfully for years in various regions of the country.

The detailing options presented here are applicable only to structures assigned to SDC A, B, and C. For higher seismic design categories, the provisions of Section R403.1.3 are still applicable.

Cost Impact: This code change will not increase the cost of construction.

R403.1-RB-THOMPSON.doc

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The committee feels this has merit but the figure is confusing. The proponent should work with the structural engineers and clarify the details and bring this back later.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards, requests Approval as Modified by this Public Comment.

Modify the proposal as follows (delete proposed Figure 403.1(1) and replacing with new Figure 403.1(1)

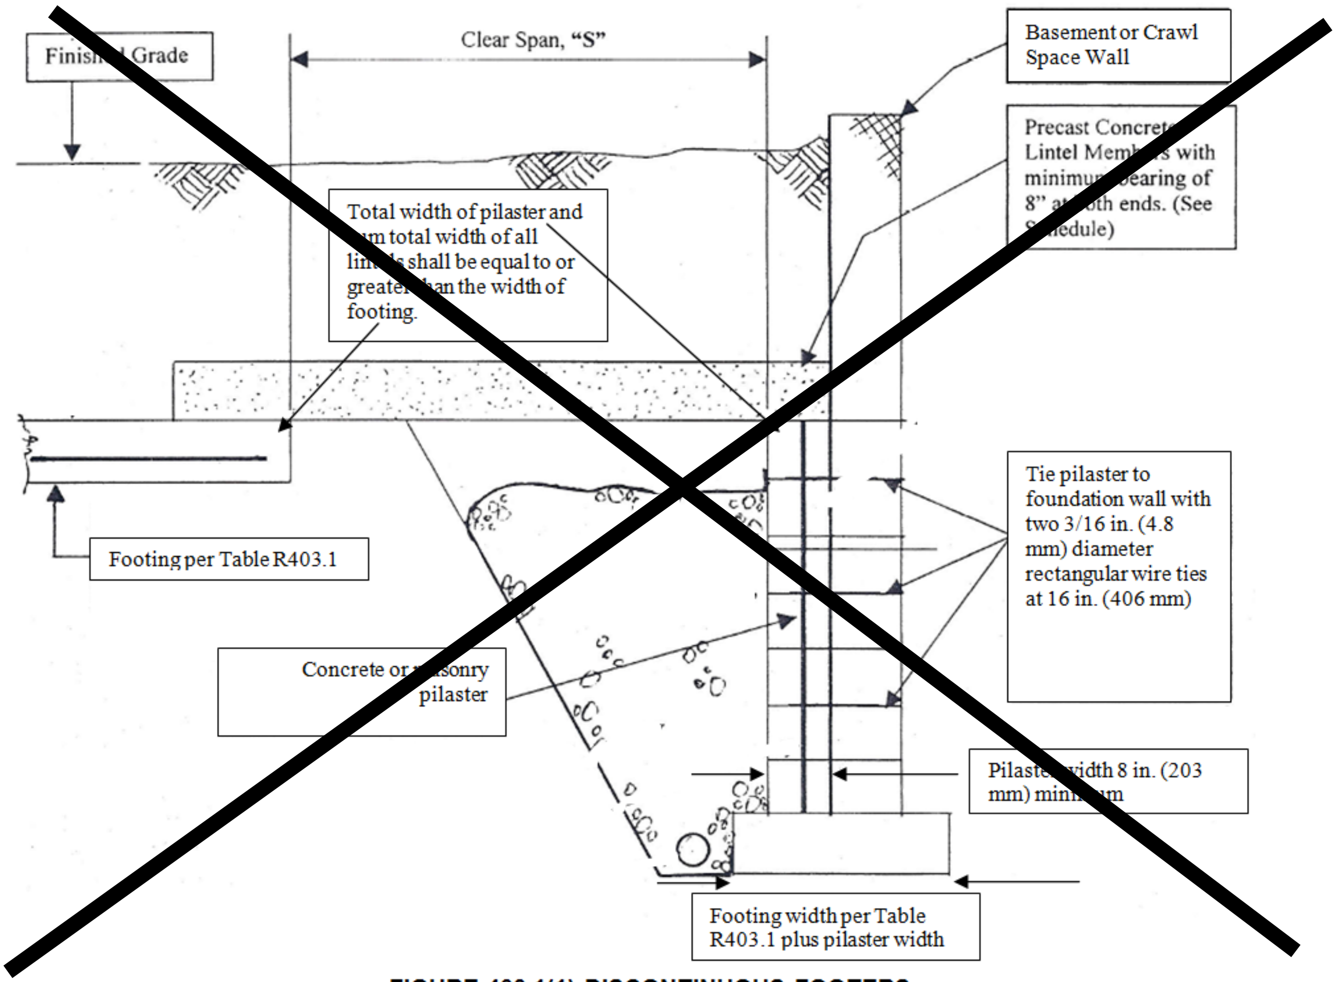

FIGURE 403.1(1) DISCONTINUOUS FOOTERS

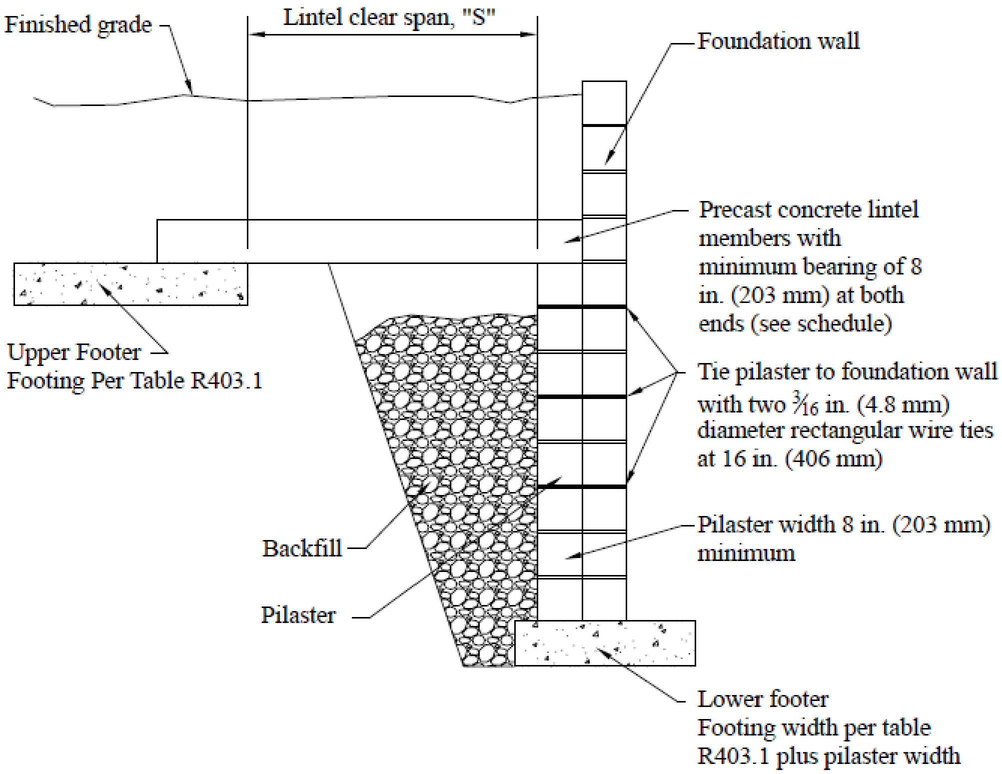
Elevation



Finished grade
Lintel clear span, "S"
Foundation wall
Precast concrete lintel members with minimum bearing of 8 in. (203 mm) at both ends (see schedule)
Upper Footer
Footing Per Table R403.1
Tie pilaster to foundation wall with two 3/16 in. (4.8 mm) diameter rectangular wire ties at 16 in. (406 mm)
Backfill
Pilaster width 8 in. (203 mm) minimum
Pilaster
Lower footer
Footing width per table R403.1 plus pilaster width

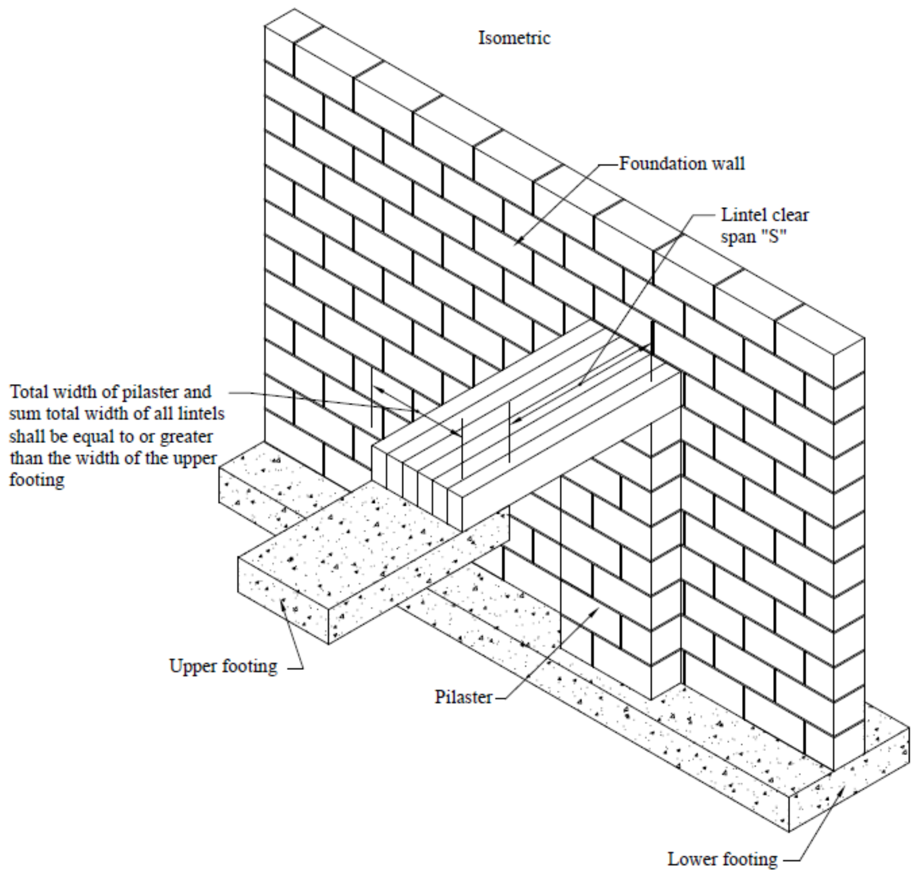


FIGURE 403.1(1) DISCONTINUOUS FOOTERS

Commenter's Reason: At the committee hearings earlier this year several commented that the original figure proposed with RB210-13 could be misinterpreted. The modifications proposed by this public comment incorporate a revised detail shown in both elevation and isometric to illustrate the concept of spanning between footings located at different elevations. These proposed modifications only improve clarity and do not propose any technical changes to the original code change proposal.

R403.1.1, Table R403.1(1), Table 403.1(2) (New), Table R403.1(3) (NEW)

Proposed Change as Submitted

Proponent: Charles S. Bajnai, Chesterfield County, VA, representing ICC Building Code Action Committee and Virginia Building and Code Officials Association, (BajnaiC@chesterfield.gov), James R. Baty II, Technical Director of Concrete Foundations Association, and Matthew R. Senecal, Senior Engineer, American Concrete Institute

Revise as follows:

R403.1.1 Minimum size. The minimum ~~sizes~~ width, W, and thickness, T, for concrete ~~and masonry~~ footings shall be ~~as set forth~~ in accordance with Table R403.1(1) through R403.1(3) and Figure R403.1(1). The footing width~~, W,~~ shall be based on the load-bearing value of the soil in accordance with Table R401.4.1. ~~Spread footings shall be at least 6 inches (152 mm) in thickness, T.~~ Footing projections, P, shall be at least 2 inches (51 mm) and shall not exceed the thickness of the footing. Footing thickness and projection for fireplaces shall be in accordance with Section R1001.2. The size of footings supporting piers and columns shall be based on the tributary load and allowable soil pressure in accordance with Table R401.4.1. Footings for wood foundations shall be in accordance with the details set forth in Section R403.2, and Figures R403.1(2) and R403.1(3).

1. Interpolation allowed. Extrapolation is not allowed
2. Based on 32 foot wide house with load bearing center wall that carries half of the tributary attic, and floor framing. For every 2 feet of adjustment to the width of the house add or subtract 2 inches of footing width and 1 inch of footing thickness (but not less than 6 inches thick).

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC) The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

The existing table was based on:

- a snow load of 50 psf
- 20 feet of tributary roof area
- 16 feet of tributary floor area
- 10 feet first floor height
- 8 feet second and third floor heights

For some parts of the country, the table's assumptions may not "fit" well.

1. These new tables factor in four snow live load conditions that were not previously acknowledged: 20 psf (the minimum allowed per Table R301.6), 30 psf, 50 psf and 70 psf (the maximum to be designed prescriptively by R301.2.3). Between these increments, the table allows for interpolation.
2. The tables account for additional soil bearing conditions. They now provide sizing for 1500 psf, 2000 psf, 2500 psf, and 3000 psf, 3500 psf and 4000psf soil bearing locations.
3. The tables take into consideration the same three framing types as the current table:
    a. Conventional light framing,
    b. Conventional light framing with veneer, and
    c. Cast-in-place concrete or full masonry wall construction.
4. The new tables were expanded to cover more conditions. They now differentiate houses built:
    a. 1, 2 and 3 stories built slab on grade (without a first floor load),
    b. 1, 2 and 3 stories built over a crawl space (with a first floor load and foundation wall/footing),
    c. 1, 2 and 3 stories built with basement (with a first floor load and basement walls. Previously, the table was silent on how to handle the extra load from a masonry or concrete basement wall).
5. The tables also provide the width of the footing based on the loads and the minimum projection – whichever governs. 6" is the minimum thickness already required by Section R403.1.1.
6. The table are based on the loading case of: TL = DL + .75LL
7. General assumptions, formulas and example follow for peer review:

ASSUMPTIONS

House width	32	
Roof ground snow load	varies	psf
Roof dead load	10	psf
Rafter length of house	16	ft
Roof overhang	2	ft

Cost Impact: The code change proposal may increase the cost of construction.

R403.1(1)-RB-BAJNAI-BATY-SENECAL-BCAC.doc

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee feels this provides useful tables and provides additional option for builders. This improves the prescribed minimum footing sizes.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Charles S. Bajnai, Chesterfield County, VA, representing ICC Building Code Action Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

Table R403.1 (3)
MINIMUM WIDTH AND THICKNESS FOR CONCRETE FOOTINGS with CAST-IN-PLACE CONCRETE or FULLY GROUTED MASONONRY WALL CONSTRUCTION

(Portions of code change proposal not shown remain unchanged)

Commenter's Reason: The ICC Building Code Action Committee (BCAC) is submitting this public comment to address an inconsistency discovered by ICC staff following Dallas. The values were checked and an error was detected in the spreadsheet producing the footing sizes for the third table, which is corrected with this public comment.

Public Comment 2:

Stephen S. Szoke, Portland Cement Association and Masonry Alliance for Codes and Standards requests Disapproval.

Commenter's Reason: The committee action on the proposed code change should be overturned for the following eleven reasons. Code change proposal RB211-13 should be disapproved because it:

1) unintentionally or otherwise eliminates the use of masonry footings;
2) contains errors in the tables;
3) contains errors in the calculations based on the assumptions;
4) many of the assumptions are inaccurate and misleading;
5) results in overdesigned footings for many systems;
6) concrete and masonry walls are unfairly penalized as typical foundation systems will be required to have larger footings than necessary;
7) lacks the necessary guidance to the designer, builder and code official on the use and determination of the values provided in the tables;
8) does not eliminate the need the calculate dead and live loads to determine footing size;
9) does not provide sufficient technical information for evaluating code compliance;
10) creates confusion which increases the risk of structural failure; and
11) precludes wall constructions otherwise permitted by the code. Each of these reasons for overturn committee action is described below.

1) **Masonry Footers Eliminated**. Code change removes "and masonry" as a permissible footer system eliminating the use of masonry foundation systems previously permitted in the code although they have proven effective footing systems and especially useful in areas, primarily rural areas, too far from a ready-mixed concrete batch site or sites not readily accessible by ready-mixed concrete trucks. Approval of this code change modifying section R403.1.1 and related tables should be overturned so that the use of masonry footer systems can continue to be permitted.

2) **Errors in Tabular Values**. There are numerous errors in the tabular values. For example in Table R403.1(3) the minimum footer size for a one-story structure with a crawlspace where the snow load is 30 psf and soil bearing capacity is 2000 psf, is listed as a 15 x 6 footing. The minimum footing size for a one-story structure with a crawlspace where the snow load is 50 psf and the soil bearing capacity is 2000 psf, is 14 x 6. It is illogical that the footing size decreases when as the snow load increases and the only variation is snow load.

Excerpts from Table R403.1(3)

Snow Load or Roof Live Load	Story and Type of Structure with CMU	Load-Bearing Value of Soil (psf) 2000
30 psf	1 story – with crawl space	15 x 6
50 psf	1 story – with crawl space	14 x 6

3) **Errors in Assumptions and Sample Calculations.** The assumptions advise that the weight of a concrete masonry unit wall is 100 pounds per linear foot of height and the height of the third floor wall systems is 8 feet. These assumptions result in a weight per linear foot of 800 pounds [100 #/vert. ft. X 8 feet]. The sample calculations provided in the reasoning statement show the weight of the third floor portion of the wall as 480 pounds per linear foot of footing length.

Dead weight of CMU wall 100 lb per vert. ft x 8 ft = 800 lb per linear ft.
Dead weight shown in SAMPLE CALCULATION WITH FORMULAS: 480 lb per linear ft.

4) **Assumptions Are Inaccurate**. Masonry veneers are not only applied over the exterior wall surface, but also over the band joists of interim floors. Similarly, for concrete and concrete masonry walls, joists are typically fire cut into the wall assembly or hung with joist hangers. This results in additional weight for the concrete or concrete masonry wall height covering the band joists. Where floor construction consists of 2x10 joists and the walls are constructed of concrete masonry units which per the assumptions weighs 100 pounds per vertical foot the result is over 150 pounds per linear foot in a three story building on a slab-on-grade foundation that are not accounted for in determining the minimum footer thickness.
While this may be relatively insignificant for single-story structures, for three-story structures the additional load could be excessive. If the load for the masonry spanning band joists was accounted for in the wall weight, then the loads for single-story structures are conservative. However, if the loads were not accounted for, then the calculated loads are less than required to satisfy the bearing conditions and could lead to failures.

Deadweight of Concrete Masonry Wall

Stories	Foundation System	Without Considering Band Joists	Considering Band Joists
1	Slab on Ground	1000 lb	1000 lb
1	Basement	2000 lb	1083 lb
2	Slab on Ground	1900 lb	1983 lb
2	Basement	2900 lb	3067 lb
3	Slab on Ground	2700 lb	2867 lb
3	Basement	3700 lb	3950 lb

5) **Over Design**. Many of the assumptions result in the determination of conservative loads and thus conservative footing dimensions. The basement wall height is assumed to be 10 feet in height. For new homes where the basement wall height is only 8 feet, using the assumptions presented in the proposed code change, the difference in dead load on the footing would be over 200 pounds per linear foot.

6) **Mass Wall Unfairly Penalized**. In the proposed change, concrete and masonry walls are assumed to have a weight per linear foot of wall height of 100 lbs. This weight ranges from 18 to 60% heavier than most common 8" concrete and masonry wall systems unfairly penalizing these systems by increasing footing size and respective costs as compared to other wall systems. Since the footing sizes in the the proposed table are minimum footing sizes, for most applications the proposed change is requiring substantially larger footings than necessary to distribute loads to soil. This is especially true for concrete and masonry wall systems. The result is inefficient and less sustainably utilization of materials. For some commonly used basement and above grade concrete masonry walls the weight used in the assumptions is is 65% larger than the actual wall weight. Shown below are some weights of various concrete and concrete masonry wall systems.

Wall System	Material Density lb per cubic foot	Wall Thickness Nominal (Actual)	Wall Weight lb/ per vertical foot
8" Light weight CMU (52% solid)	120 unit concrete	8" (7.625")	35
8" Light weight CMU (Partially Grouted (4' o.c. vert and horiz.)	120 unit concrete 140 grout	8" (7.625")	50
8" Light weight CMU (Fully grouted)	120 unit concrete 140 grout	8" (7.625")	77

4" Cast-in Place (Stay-in-Place Forms)	140 Concrete	4" (3.5")	41
8" Lightweight Precast (50% Solid)	140 Concrete	8" (7.5")	44

7) **Lack of Guidance**. All assumptions in calculated minimum footing should be included as footnotes to the proposed Table so that alternative designs may be appropriately determined to avoid excess and unnecessary costs and use of materials where weights of wall systems deviate from the assumptions.

8) **Calculations Still Required**. Calculations of actual dead and live loads are still required because the assumptions are unknown and table provides minimum thickness. Designer, builder and/or code official would still need to calculate the loads to determine if the minimum footing size needs to be increased.

9) **Insufficient Information for Code.** The information provided does not address the actual building systems. This information might be appropriate for commentary should all assumption be included and the values correctly calculated. Alternatively, direct design table could be generated for use in the code or provided in referenced standards.

10) **Confusion and Risk of Failure.** The increased complexity provided with the tables implies that this is the footing size provided is the size that should be used and does not appropriately or adequately communicate that these are still minimum footing sizes. Since calculations are still required to determine if minimum footing size the tables serve no significant benefit and suggest that for the conditions described, the minimum footing size is adequate. However, the code proposal does not include all assumptions which means the footing may be undersized and increase the potential for failures.

Exclusive to Select Wall Systems. The tables are inappropriate as they do not address many wall systems. For example, there are not provisions for log home and other alternative construction methods.

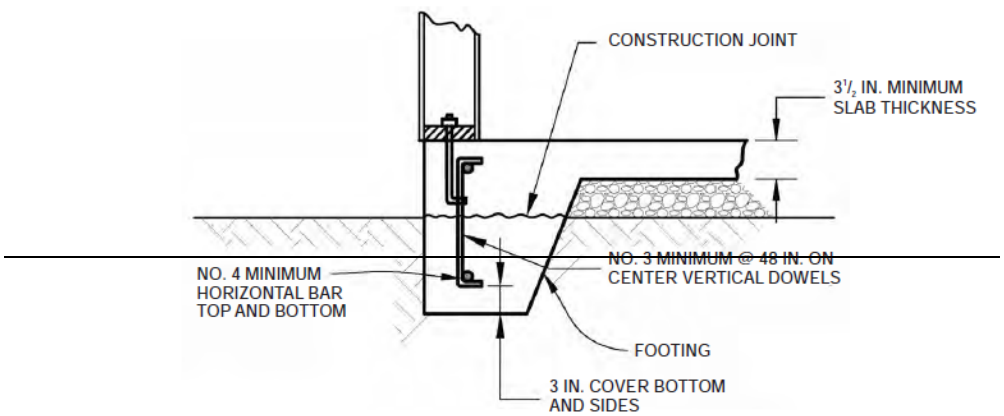
R403.1.3.2 Slabs-on-ground with turned-down footings. Slabs on ground with turned down footings shall have a minimum of one No. 4 bar at the top and the bottom of the footing

Exception: For slabs-on-ground cast monolithically with the footing, locating one No. 5 bar or two No. 4 bars in the middle third of the footing depth shall be permitted as an alternative to placement at the footing top and bottom.

Where the slab is not cast monolithically with the footing, No. 3 or larger vertical dowels with standard hooks on each end shall be provided in accordance with Figure ~~R403.1.3.2~~ R403.1(2), detail 2. Standard hooks shall comply with Section R611.5.4.5.



For SI: 1 inch = 25.4 mm.

FIGURE R403.1.3.2
DOWELS FOR SLABS-ON-GROUND WITH TURNED-DOWN FOOTINGS

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC) The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

This proposal is to revise and update the existing footing figures in the code. The revised figures improve the graphic quality of the figures and add information that is helpful to the code user. In addition, the current figures do not show, describe or address the specific reinforcement requirements for Seismic Design Categories D0, D1 and D2. Initial attempts to incorporate the SDC reinforcement requirements into the set of figures resulted in overly complex details that would contain information not necessary to code users in lower SDC's. Therefore, the committee decided to generate a second set of figures specifically detailing the reinforcement requirements for the applicable SDC's.

This proposal also moves existing figure R403.1.3.2 to Figure R403.1(2) and changes the reference in section R403.1.3.2. The footnotes were also expanded to alert the code user to other applicable sections relating to foundations but were not necessarily helpful to add to the figures such as vapor barriers and ventilation.

This proposal does not change any requirements in the current code and are a great improvement to the code enabling the code user to visualize the code requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

R403.1(1)-F-RB-BAJNAI-BCAC.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee likes the concept and it would add useful figures to the code. However, there are some inaccuracies in the figures related to reinforcing for high seismic. The proponent should rework this and bring it back.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

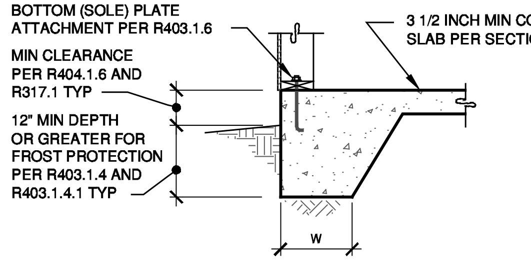
Charles S. Bajnai, Chesterfield County, VA, representing ICC Building Code Action Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

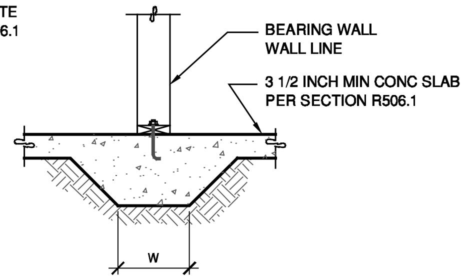
R403.1.1 Minimum size. Minimum sizes for concrete and masonry footings shall be as set forth in Table R403.1 and Figure R403.1(1) or Figure R403.1.3, as applicable. The footing width, W, shall be based on the load-bearing value of the soil in accordance with Table R401.4.1. Spread footings shall be at least 6 inches (152 mm) in thickness, T. Footing projections, P, shall be at least 2 inches (51 mm) and shall not exceed the thickness of the footing. The size of footings supporting piers and columns shall be based on the tributary load and allowable soil pressure in accordance with Table R401.4.1. Footings for wood foundations shall be in accordance with the details set forth in Section R403.2, and Figures R403.1(2) and R403.1(3).

R403.1.3 Seismic reinforcing. Concrete footings located in Seismic Design Categories D0, D1 and D2, as established in Table R301.2(1), shall have minimum reinforcement in accordance with this Section and Figure R403.1.3. Bottom reinforcement shall be located a minimum of 3 inches (76 mm) clear from the bottom of the footing. In Seismic Design Categories D0, D1 and D2 where a construction joint is created between a concrete footing and a stem wall, a minimum of one No. 4 bar shall be installed at not more than 4 feet (1219 mm) on center. The vertical bar shall extend to 3 inches (76 mm) clear of the bottom of the footing, have a standard hook and extend a minimum of 14 inches (357 mm) into the stem wall. In Seismic Design Categories D0, D1 and D2 where a grouted masonry stem wall is supported on a concrete footing and stem wall, a minimum of one No. 4 bar shall be installed at not more than 4 feet (1219 mm) on center. The vertical bar shall extend to 3 inches (76 mm) clear of the bottom of the footing and have a standard hook. In Seismic Design Categories D0, D1 and D2 masonry stem walls without solid grout and vertical reinforcing are not permitted.

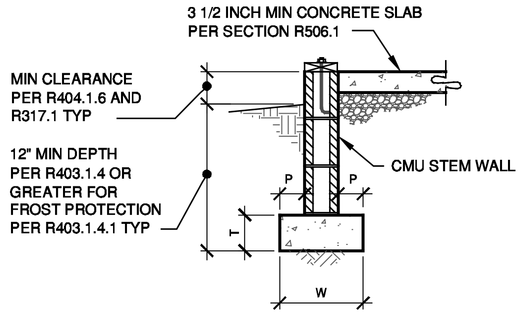
Replace Figure R403.1(1) as follows:



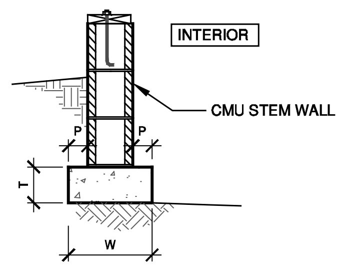
1 MONOLITHIC SLAB ON GROUND WITH TURNED DOWN FOOTING
SCALE: NOT TO SCALE



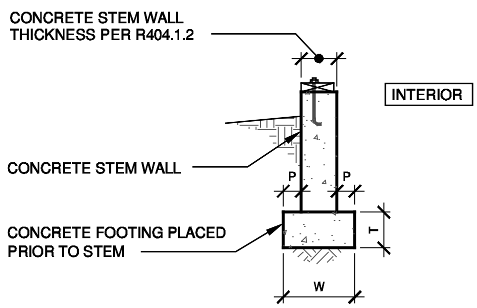
2 THICKENED SLAB ON GROUND FOOTING AT BEARING WALLS OR BRACED WALL LINES
SCALE: NOT TO SCALE



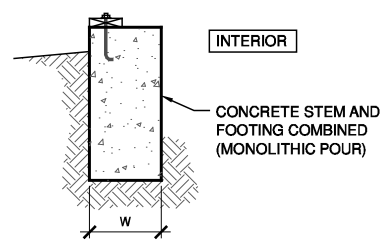
3 SLAB ON GROUND WITH MASONRY STEM WALL AND SPREAD FOOTING
SCALE: NOT TO SCALE



4 BASEMENT OR CRAWLSPACE WITH MASONRY WALL AND SPREAD FOOTING
SCALE: NOT TO SCALE



5 BASEMENT OR CRAWL SPACE CONCRETE WALL AND SPREAD FOOTING
SCALE: NOT TO SCALE



6 BASEMENT OR CRAWLSPACE WITH FOUNDATION WALL BEARING DIRECTLY ON SOIL
SCALE: NOT TO SCALE

W=WIDTH OF FOOTING, T=THICKNESS OF FOOTING AND P=PROJECTION PER SECTION R403.1.1.

FIGURE R403.1(2) ~~R403.1(3)~~
PERMANENT WOOD FOUNDATION BASEMENT WALL SECTION

FIGURE R403.1(3) ~~R403.1(4)~~
PERMANENT WOOD FOUNDATION CRAWL SPACE SECTION

R403.1.3.2 Slabs-on-ground with turned-down footings. Slabs on ground with turned down footings shall have a minimum of one No. 4 bar at the top and the bottom of the footing

Exception: For slabs-on-ground cast monolithically with the footing, locating one No. 5 bar or two No. 4 bars in the middle third of the footing depth shall be permitted as an alternative to placement at the footing top and bottom.

Where the slab is not cast monolithically with the footing, No. 3 or larger vertical dowels with standard hooks on each end shall be provided in accordance with Figure R403.1.3 ~~(2)~~, detail 2. Standard hooks shall comply with Section R611.5.4.5.

Commenter's Reason: The ICC Building Code Action Committee (BCAC) is submitting this public comment to address the code development committee's concerns. The code development committee thought the details added a lot of understanding but found a few minor flaws:

1. The title of Figure R403.1(1) was corrected to reflect that the details apply to SDC A,B and C only.

2. The numbering in the second figure was changed to reflect that the details apply to Section R403.1.3 for SDC D_0, D_1 and D_2 .

3. The appropriate figure references have been provided in Section R403.1.1 and R403.1.3.

Proposed Change as Submitted

Proponent: Charles S. Bajnai, Chesterfield County, VA, representing ICC Building Code Action Committee (BajnaiC@chesterfield.gov)

Revise as follows:

R403.1.3 ~~Seismic reinforcing~~ Footing and stem wall reinforcing in Seismic Design Categories D_0, D_1 and D_2 . Concrete footings located in Seismic Design Categories D_0, D_1 and D_2, as established in Table R301.2(1), shall have minimum reinforcement in accordance with this section. ~~Bottom~~ ~~r~~Reinforcement shall be ~~located~~ installed in accordance with Section R403.1.3.5. ~~a minimum of 3 inches (76 mm) clear from the bottom of the footing.~~

~~In Seismic Design Categories D_0, D_1 and D_2 where a construction joint is created between a concrete footing and a stem wall, a minimum of one No. 4 bar shall be installed at not more than 4 feet (1219 mm) on center. The vertical bar shall extend to 3 inches (76 mm) clear of the bottom of the footing have a standard hook and extend a minimum of 14 inches (357 mm) into the stem wall.~~

~~In Seismic Design Categories D_0, D_1 and D_2 where a grouted masonry stem wall is supported on a concrete footing and stem wall, a minimum of one No. 4 bar shall be installed at not more than 4 feet (1219 mm) on center. The vertical bar shall extend to 3 inches (76 mm) clear of the bottom of the footing and have a standard hook. In Seismic Design Categories D_0, D_1 and D_2 masonry stem walls without solid grout and vertical reinforcing are not permitted.~~

> ~~**Exception:** In detached one- and two-family *dwellings* which are three stories or less in height and constructed with stud bearing walls, isolated plain concrete footings, supporting columns or pedestals are permitted.~~

~~**R403.1.3.1 Foundations with stemwalls.** Foundations with stem walls shall have installed a minimum of one No. 4 bar within 12 inches (305 mm) of the top of the wall and one No. 4 bar located 3 inches (76 mm) to 4 inches (102 mm) from the bottom of the footing.~~

R403.1.3.1 Concrete stem walls with concrete footings. In Seismic Design Categories D_0, D_1 and D_2 where a construction joint is created between a concrete footing and a concrete stem wall, a minimum of one No. 4 vertical bar shall be installed at not more than 4 feet (1219 mm) on center. The vertical bar shall extend to the bottom of the footing and shall have a standard hook and extend a minimum of 14 inches (357 mm) into the stem wall. Standard hooks shall comply with Section R611.5.4.5. A minimum of one No. 4 horizontal bar shall be installed within 12 inches (305 mm) of the top of the stem wall and one No. 4 horizontal bar shall be located three to four inches from the bottom of the footing.

R403.1.3.2 Masonry stem walls with concrete footings. In Seismic Design Categories D_0, D_1 and D_2 where a masonry stem wall is supported on a concrete footing, a minimum of one No. 4 vertical bar shall be installed at not more than 4 feet (1219 mm) on center. The vertical bar shall extend to the bottom of the footing and have a standard hook and extend a minimum of 14 inches (357 mm) into the stem wall. Standard hooks shall comply with Section R611.5.4.5. A minimum of one No. 4 horizontal bar shall be installed within 12 inches (305 mm) of the top of the wall and one No. 4 horizontal bar shall be located three to four inches from the bottom of the footing. Masonry stem walls shall be solid grouted.

~~R403.1.3.2~~ **R403.1.3.3 Slabs-on-ground with turned-down footings.** In Seismic Design Categories D_0, D_1 and D_2, Slabs on ground cast monolithically with turned down footings shall have a minimum of one No. 4 bar at the top and the bottom of the footing or one No. 5 bar or two No. 4 bars in the middle third of the footing depth..

> ~~**Exception:** For slabs-on-ground cast monolithically with the footing, locating one No. 5 bar or two No. 4 bars in the middle third of the footing depth shall be permitted as an alternative to placement at the footing top and bottom.~~

Where the slab is not cast monolithically with the footing~~,~~ one No. 3 or larger vertical dowels with standard hooks on each end shall be ~~provided~~ installed at not more than 4 feet (1219 mm) on center in accordance with Figure R403.1.3.2 . Standard hooks shall comply with Section R611.5.4.5.

~~**R403.1.4.2 Seismic conditions**~~ **R403.1.3.4 Interior bearing and braced wall panel footings in Seismic Design Categories D_0, D_1 and D_2.** In Seismic Design Categories D_0, D_1 and D_2, interior footings supporting bearing walls or *braced wall panels,* ~~bracing walls~~ and cast monolithically with a slab on *grade*~~,~~ shall extend to a depth of not less than 12 inches (305 mm) below the top of the slab.

R403.1.3.5 Reinforcement. Footing and stem wall reinforcement shall comply with Sections R403.1.3.5.1 through R403.1.3.5.4.

R403.1.3.5.1 Steel reinforcement. Steel reinforcement shall comply with the requirements of ASTM A 615, A 706, or A 996. ASTM A 996 bars produced from rail steel shall be Type R. In buildings assigned to Seismic Design Category A, B or C, the minimum yield strength of reinforcing steel shall be 40,000 psi (Grade 40) (276 MPa). In buildings assigned to Seismic Design Category D0, D1 or D2, reinforcing steel shall comply with the requirements of ASTM A 706 for low-alloy steel with a minimum yield strength of 60,000 psi (Grade 60) (414 MPa).

R403.1.3.5.2 Location of reinforcement in wall. The center of vertical reinforcement in stem walls shall be located at the centerline of the wall. Horizontal and vertical reinforcement shall be located in footings and stem walls to provide the minimum cover required by Section R403.1.3.5.3.

R403.1.3.5.3 Support and cover. Reinforcement shall be secured in the proper location in the forms with tie wire or other bar support system to prevent displacement during the concrete placement operation. Steel reinforcement in concrete cast against the earth shall have a minimum cover of 3 inches (75 mm). Minimum cover for reinforcement in concrete cast in removable forms that will be exposed to the earth or weather shall be 1-1/2 inches (38 mm) for No. 5 bars and smaller, and 2 inches (50 mm) for No. 6 bars and larger. For concrete cast in removable forms that will not be exposed to the earth or weather, and for concrete cast in stay-in-place forms, minimum cover shall be 3/4 inch (19 mm). The minus tolerance for cover shall not exceed the smaller of one-third the required cover or 3/8 inch (10 mm).

R403.1.3.5.4 Lap splices. Vertical and horizontal reinforcement shall be the longest lengths practical. Where splices are necessary in reinforcement, the length of lap splice shall be in accordance with Table R611.5.4.(1) and Figure R611.5.4(1). The maximum gap between noncontact parallel bars at a lap splice shall not exceed the smaller of one-fifth the required lap length and 6 inches (152 mm). See Figure R611.5.4(1).

R403.1.3.6 Isolated concrete footings. In detached one- and two-family *dwellings* which are three stories or less in height and constructed with stud bearing walls, isolated plain concrete footings, supporting columns or pedestals are permitted.

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC) The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

The International Code Council's Building Code Action Committee identified several items in Chapter 4, "Foundations", that are in conflict with other provisions of the code or lack clarity. This proposal specifically addresses conflicts and confusing language in the current sections of code that address reinforcement required for Seismic Design Categories D0, D1 and D2.

The title and language in section R403.1.3 is changed for clarity. Additionally, a note is added that references a new section, R403.1.3.4, that defines the installation requirements for the reinforcement.

The existing language describing concrete stem walls and masonry stem walls on concrete footings are separated into two sections, "Concrete stem walls" and "Masonry stem walls" respectively.

Section R403.1.3.1 describes the existing requirements for the horizontal reinforcement at the top of the stem wall and the bottom of the footing. This proposal deletes that section and incorporates the language into the two sections describing the requirements for the stem wall, R403.1.3.1 and R403.1.3.2 respectively.

The language in the existing section R403.1.3.2 for slabs on ground is changed to clarify that this section is addressing turned down footings cast monolithically with the slab since there are new provisions in the code to allow turned down footings that are not cast monolithically with the slab. Also, the existing exception for the reinforcement to be installed in the middle third of the footing have been moved into the section instead of being an exception.

Cost Impact: The code change proposal will not increase the cost of construction.

R403.1.3-RB-BAJNAI-BCAC.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposal needs additional work and brought back. An inappropriate standard, ASTM A706 is referenced in R403.1.3.5.1. Sections R403.1.3.1 and R403.1.3.2 require vertical bars to extend to the bottom of the footing and no clearance is specified.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Charles S. Bajnai, Chesterfield County, VA, representing ICC Building Code Action Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R403.1.3 Footing and stem wall reinforcing in Seismic Design Categories D_0, D_1 and D_2 . Concrete footings located in Seismic Design Categories D_0, D_1 and D_2, as established in Table R301.2(1), shall have minimum reinforcement in accordance with this section. Reinforcement shall be installed with support and cover in accordance with Section R403.1.3.5.

R403.1.3.1 Concrete stem walls with concrete footings. In Seismic Design Categories D_0, D_1 and D_2 where a construction joint is created between a concrete footing and a concrete stem wall, a minimum of one No. 4 vertical bar shall be installed at not more than 4 feet (1219 mm) on center. The vertical bar shall have a standard hook and extend to the bottom of the footing and shall have support and cover as specified in Section R403.1.3.5.3. ~~a standard hook~~ and extend a minimum of 14 inches (357 mm) into the stem wall. Standard hooks shall comply with Section R611.5.4.5. A minimum of one No. 4 horizontal bar shall be installed within 12 inches (305 mm) of the top of the stem wall and one No. 4 horizontal bar shall be located at the bottom of the footing.

R403.1.3.2 Masonry stem walls with concrete footings. In Seismic Design Categories D_0, D_1 and D_2 where a masonry stem wall is supported on a concrete footing, a minimum of one No. 4 vertical bar shall be installed at not more than 4 feet (1219 mm) on center. The vertical bar shall have a standard hook and extend to the bottom of the footing and shall have support and cover as specified in Section R403.1.3.5.3.~~and have a standard hook.~~ and extend a minimum of 14 inches (357 mm) into the stem wall.

Standard hooks shall comply with Section R611.5.4.5. A minimum of one No. 4 horizontal bar shall be installed within 12 inches (305 mm) of the top of the wall and one No. 4 horizontal bar shall be at the bottom of the footing. Masonry stem walls shall be solid grouted.

R403.1.3.3 Slabs-on-ground with turned-down footings. In Seismic Design Categories D_0, D_1 and D_2, Slabs on ground cast monolithically with turned down footings shall have a minimum of one No. 4 bar at the top and the bottom of the footing or one No. 5 bar or two No. 4 bars in the middle third of the footing depth.

Where the slab is not cast monolithically with the footing, one No. 3 or larger vertical dowels with standard hooks on each end shall be installed at not more than 4 feet (1219 mm) on center in accordance with Figure R403.1(1). Standard hooks shall comply with Section R611.5.4.5.

R403.1.3.4 Interior bearing and braced wall panel footings in Seismic Design Categories D_0, D_1 and D_2. In Seismic Design Categories D0, D1 and D2, interior footings supporting bearing walls or *braced wall panels* and cast monolithically with a slab on *grade* shall extend to a depth of not less than 12 inches (305 mm) below the top of the slab.

R403.1.3.5 Reinforcement. Footing and stem wall reinforcement shall comply with Sections R403.1.3.5.1 through R403.1.3.5.4

R403.1.3.5.1 Steel reinforcement. Steel reinforcement shall comply with the requirements of ASTM A 615, A 706, or A 996. ASTM A 996 bars produced from rail steel shall be Type R~~. In buildings assigned to Seismic Design Category A, B or C, t~~The minimum yield strength of reinforcing steel shall be 40,000 psi (Grade 40) (276 MPa). ~~In buildings assigned to Seismic Design Category D0, D1 or D2, reinforcing steel shall comply with the requirements of ASTM A 706 for low-alloy steel with a minimum yield strength of 60,000 psi (Grade 60) (414 MPa).~~

R403.1.3.5.2 Location of reinforcement in wall. The center of vertical reinforcement in stem walls shall be located at the centerline of the wall. Horizontal and vertical reinforcement shall be located in footings and stem walls to provide the minimum cover required by Section R403.1.3.5.3.

R403.1.3.5.3 Support and cover. Reinforcement shall be secured in the proper location in the forms with tie wire or other bar support system to prevent displacement during the concrete placement operation. Steel reinforcement in concrete cast against the earth shall have a minimum cover of 3 inches (75 mm). Minimum cover for reinforcement in concrete cast in removable forms that will be exposed to the earth or weather shall be 1-1/2 inches (38 mm) for No. 5 bars and smaller, and 2 inches (50 mm) for No. 6 bars and larger. For concrete cast in removable forms that will not be exposed to the earth or weather, and for concrete cast in stay-in-place forms, minimum cover shall be 3/4 inch (19 mm). ~~The minus tolerance for cover shall not exceed the smaller of one-third the required cover or 3/8 inch (10 mm).~~

R403.1.3.5.4 Lap splices. Vertical and horizontal reinforcement shall be the longest lengths practical. Where splices are necessary in reinforcement, the length of lap splice shall be in accordance with Table R611.5.4(1) and Figure R611.5.4(1). The maximum gap between noncontact parallel bars at a lap splice shall not exceed the smaller of one-fifth the required lap length and 6 inches (152 mm). See Figure R611.5.4(1).

R403.1.3.5 Isolated concrete footings. In detached one- and two-family *dwellings* which are three stories or less in height and constructed with stud bearing walls, isolated plain concrete footings, supporting columns or pedestals are permitted.

Commenter's Reason: The ICC Building Code Action Committee (BCAC) identified several items in Chapter 4, "Foundations", that are in conflict with other provisions of the code or lack clarity. The original proposal specifically addressed conflicts and confusing language in the current sections of code that address reinforcement required for Seismic Design Categories D0, D1 and D2. The items that were intended to be addressed are listed in the original reason statement.

There were some items about the original proposal that were brought up at the Committee Action Hearings and this public comment addresses those items.

1. There was an inaccurate reference to ASTM A706 standard in R403.1.3.5.1. This language is not new in the code. The new section (R403.1.3.5.1) in the proposal specifying the reinforcement materials was copied from the existing section R404.1.2.3.7. The portions of the section that are deleted from R403.1.3.5.1 in this public comment should not have been copied over.

2. The Report of Hearings also stated that in Sections R403.1.3.1 and R403.1.3.2 the proposed language merely specified that ***"…the vertical bars to extend to the bottom of the footing and no clearance is specified."*** This was intentional in the original proposal. The original language in this section specified that*, "The vertical bar shall extend to 3 inches (76mm) clear of the bottom of the footing…"* In section R403.1.3.1 it stated that footings shall have *"…one No. 4 bar located 3 inches (76mm) to 4 inches (102mm) from the bottom of the footing."* There were no other clearances specified such as to the formwork or where the concrete will not be exposed to earth or weather. These clearances are defined in ACI standards and also currently exist in R404.1.2.3.7.4. The original proposal removed the one specific clearance requirement and added a new section, copied from R404.1.2.3.7.4, to cover all clearances and support. This new section is referenced in the charging statement in R403.1.3 and applies to all the sections that follow.

Final Action: AS AM AMPC____ D

RB219-13
R403.1.6

Proposed Change as Submitted

Proponent: Hope Medina, Colorado Code Consulting, representing Colorado Chapter of ICC (hmedina@coloradocode.net)

Revise as follows:

R403.1.6 Foundation anchorage. Sill plates and walls supported directly on continuous foundations shall be anchored to the foundation in accordance with this section.

Wood sole plates at all exterior walls on monolithic slabs, wood sole plates of braced wall panels at building interiors on monolithic slabs and all wood sill plates shall be anchored to the foundation with anchor bolts spaced a maximum of 6 feet (1829 mm) on center. Bolts shall be at least 1/2 inch (12.7 mm) in diameter and shall extend a minimum of 7 inches (178 mm) into concrete or grouted cells of concrete masonry units. <u>The bolts shall be located a minimum 1 ¾" from the plate's edge or in the middle third of the plate's edge.</u> A nut and washer shall be tightened on each anchor bolt. There shall be a minimum of two bolts per plate section with one bolt located not more than 12 inches (305 mm) or less than seven bolt diameters from each end of the plate section. Interior bearing wall sole plates on monolithic slab foundation that are not part of a braced wall panel shall be positively anchored with approved fasteners. Sill plates and sole plates shall be protected against decay and termites where required by Sections R317 and R318. Cold-formed steel framing systems shall be fastened to wood sill plates or anchored directly to the foundation as required in Section R505.3.1 or R603.3.1.

Exceptions:

1. Foundation anchorage, spaced as required to provide equivalent anchorage to 1/2-inch-diameter (12.7 mm) anchor bolts.
2. Walls 24 inches (610 mm) total length or shorter connecting offset *braced wall panels* shall be anchored to the foundation with a minimum of one anchor bolt located in the center third of the plate section and shall be attached to adjacent *braced wall panels* at corners as shown in item 8 of Table R602.3(1).
3. Connection of walls 12 inches (305 mm) total length or shorter connecting offset *braced wall panels* to the foundation without anchor bolts shall be permitted. The wall shall be attached to adjacent *braced wall panels* at corners as shown in item 8 of Table R602.3(1).

Reason: It has become a common occurrence to see an anchor bolt placed at the edge of the sole plate, and on many occasions the threads of the bolt are visible. The "practicing industry standard" is for the bolt to be located at least two bolt diameters from the plate's edge, but there is nothing in the IRC to govern this. We require two bolts per plate, within 12" of a break, and spaced no more than 6 feet apart, but nothing plainly referencing it's placement from the plates edge. Having a specified placement of the bolt in the bottom plate allows for proper enforcement while still giving some flexibility to the contractors.
Simpson Strong Tie has performed tests demonstrating that the bolt lost the expected anchoring capacity when placed closer than 1 ¾" from the plate's edge.

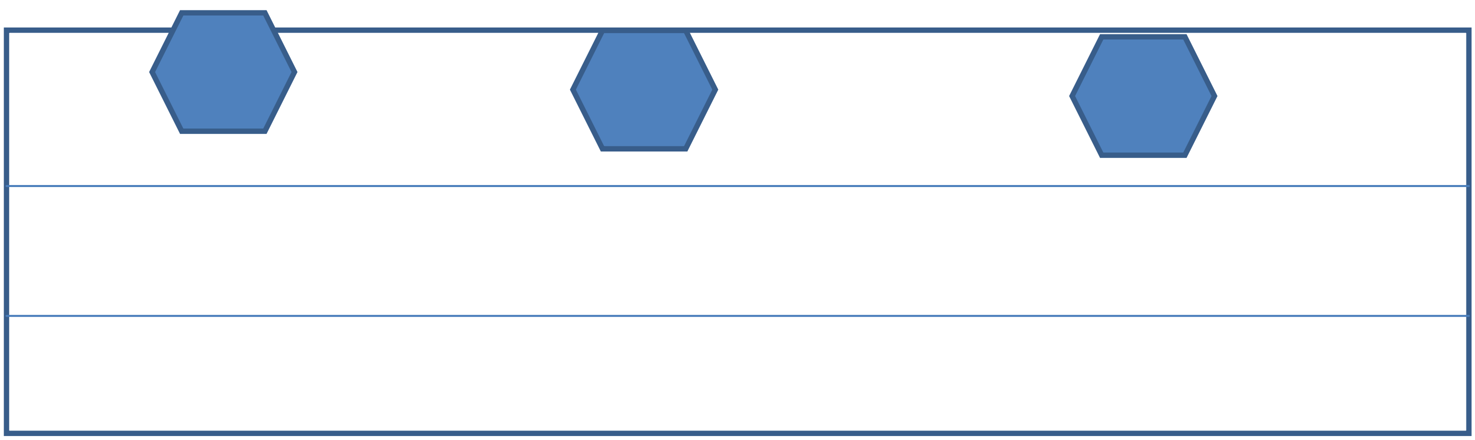
Both the Simpson Strong Tie Wood Construction Connectors 2011-2012 edition and the USP Structural Connectors state that their connectors must have a minimum placement of 1 ¾ inches from the edge.
The IRC reference the NDS for wood design for items not covered in the code like wood edge and end distances. The 2012 NDS has edge distance of ¾" for shear and 2" for wind loads (Table 11.5.1C). So if the edge distance is 1-1/8" you would need to reduce the anchor capacity with an 0.56 allowable load adjustment factor (1.125/2) when resisting wind loads. So you can space in the middle 1/3 of plate, but you may need to increase the number of bolts for wind.

In chapter 7 of the National Design Specifications for wood construction reference of anchor bolt placement.

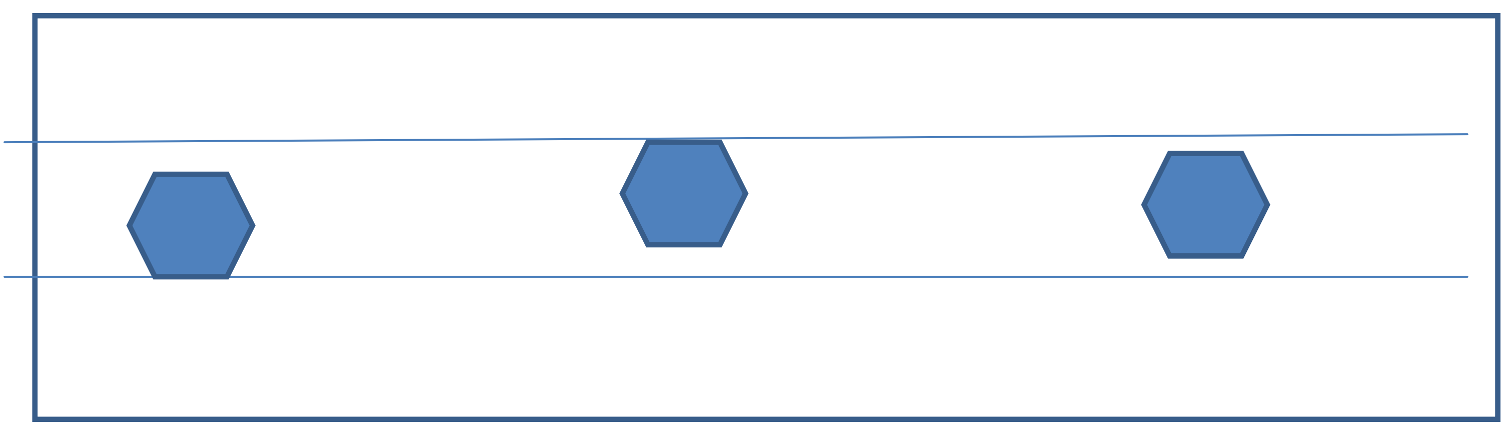
Spacing, Edge, and End Distance

The center-to-center distance along the grain should be at least four times the bolt diameter for parallel-to-grain loading. The minimum center-to-center spacing of bolts in the across-the-grain direction for loads acting through metal side plates and parallel to the grain need only be sufficient to permit the tightening of the nuts. For wood side plates, the spacing is controlled by the rules applying to loads acting parallel to grain if the design load approaches the bolt-bearing capacity of the side plates. When the design load is less than the bolt-bearing capacity of the side plates, the spacing may be reduced below that required to develop their maximum capacity.

COMMON PLACEMENT OF BOLTS IN THE FIELD



PROPER PLACEMENT OF BOLTS WITH CODE CHANGE



Cost Impact: The code change proposal will not increase the cost of construction.

R403.1.6-RB-MEDINA.doc

Committee Action Hearing Results

Committee Action: Approved as Modified

Modify the proposal as follows:

R403.1.6 Foundation anchorage. Sill plates and walls supported directly on continuous foundations shall be anchored to the foundation in accordance with this section.

Wood sole plates at all exterior walls on monolithic slabs, wood sole plates of braced wall panels at building interiors on monolithic slabs and all wood sill plates shall be anchored to the foundation with anchor bolts spaced a maximum of 6 feet (1829 mm) on center. Bolts shall be at least 1/2 inch (12.7 mm) in diameter and shall extend a minimum of 7 inches (178 mm) into concrete or grouted cells of concrete masonry units. The bolts shall be located ~~a minimum 1 ¾" from the plate's edge or~~ in the middle third of the plate~~'s edge~~. A nut and washer shall be tightened on each anchor bolt. There shall be a minimum of two bolts per plate section with one bolt located not more than 12 inches (305 mm) or less than seven bolt diameters from each end of the plate section. Interior bearing wall sole plates on monolithic slab foundation that are not part of a braced wall panel shall be positively anchored with approved fasteners. Sill plates and sole plates shall be protected against decay and termites where required by Sections R317 and R318. Cold-formed steel framing systems shall be fastened to wood sill plates or anchored directly to the foundation as required in Section R505.3.1 or R603.3.1.

(Portions of code change not shown remain unchanged)

Committee Reason: Approval was based upon the proponent's published reason. The modification clarifies the location of the anchor bolt relative to the middle third of the plate.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Hope Medina, Cherry Hills Village, representing Colorado Code Consulting, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

R403.1.6 Foundation anchorage. Sill plates and walls supported directly on continuous foundations shall be anchored to the foundation in accordance with this section.

Wood sole plates at all exterior walls on monolithic slabs, wood sole plates of braced wall panels at building interiors on monolithic slabs and all wood sill plates shall be anchored to the foundation with anchor bolts spaced a maximum of 6 feet (1829 mm) on center. Bolts shall be at least 1/2 inch (12.7 mm) in diameter and shall extend a minimum of 7 inches (178 mm) into concrete or grouted cells of concrete masonry units. The bolts shall be located in the middle third of the <u>width of the</u> plate. A nut and washer shall be tightened on each anchor bolt. There shall be a minimum of two bolts per plate section with one bolt located not more than 12 inches (305 mm) or less than seven bolt diameters from each end of the plate section. Interior bearing wall sole plates on monolithic slab foundation that are not part of a braced wall panel shall be positively anchored with approved fasteners. Sill plates and sole plates shall be protected against decay and termites where required by Sections R317 and R318. Cold-formed steel framing systems shall be fastened to wood sill plates or anchored directly to the foundation as required in Section R505.3.1 or R603.3.1.

Exceptions:

1. Foundation anchorage, spaced as required to provide equivalent anchorage to 1/2-inch-diameter (12.7 mm) anchor bolts.
2. Walls 24 inches (610 mm) total length or shorter connecting offset *braced wall panels* shall be anchored to the foundation with a minimum of one anchor bolt located in the center third of the plate section and shall be attached to adjacent *braced wall panels* at corners as shown in item 8 of Table R602.3(1).
3. Connection of walls 12 inches (305 mm) total length or shorter connecting offset *braced wall panels* to the foundation without anchor bolts shall be permitted. The wall shall be attached to adjacent *braced wall panels* at corners as shown in item 8 of Table R602.3(1).

Commenter's Reason: The addition of the word width was added to circumvent any misunderstandings of where the middle third of the plate is located

Proposed Change as Submitted

Table R404.1.1(1)

Proponent: Stephen Kerr, S.E., Josephson Werdowatz and Associates, Inc., representing self (skerr@jwa-se.com)

Revise as follows:

TABLE R404.1.1(1)
PLAIN MASONRY FOUNDATION WALLS

MAXIMUM WALL HEIGHT (feet)	MAXIMUM UNBALANCED BACKFILL HEIGHT[c] (feet)	PLAIN MASONRY[a] MINIMUM NOMINAL WALL THICKNESS (inches)		
		Soil classes[b]		
		GW, GP, SW and SP	GM, GC, SM, SM-SC and ML	SC, MH, ML-CL and inorganic CL
5	4	6 solid[d] or 8	6 solid[d] or 8	6 solid[d] or 8
	5	6 solid[d] or 8	8	8
6	4	6 solid[d] or 8	6 solid[d] or 8	6 solid[d] or 8
	5	6 solid[d] or 8	8	10
	6	8	10	12
7	4	6 solid[d] or 8	8	8
	5	6 solid[d] or 8	10	10
	6	10	12	10 solid[d]
	7	12	10 solid[d]	12 solid[d]
8	4	6 solid[d] or 8	6 solid[d] or 8	8
	5	6 solid[d] or 8	10	12
	6	10	12	12 solid[d]
	7	12	12 solid[d]	Footnote e
	8	10 ~~solid~~grout[d]	12 ~~solid~~ grout[d]	Footnote e
9	4	6 ~~solid~~grout[d] or 8 solid[d] or 12	6 ~~solid~~grout[d] or 8 solid[d]	8 grout[d] or 10 solid[d]
	5	~~8~~ 6 grout[d] or 10 solid[d]	~~10~~8 grout[d] or 12 solid[d]	~~12~~8 grout[d]
	6	~~10~~ 8 grout[d] or 12 solid[d]	~~12~~10 grout[d]	~~12 solid~~10 grout[d]
	7	~~12~~ 10 grout[d]	~~12 solid~~10 grout[d]	12 grout~~Footnote e~~
	8	~~12 solid~~10 grout[d]	12 grout~~Footnote e~~	Footnote e
	9	12 grout~~Footnote e~~	Footnote e	Footnote e

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square inch = 6.895 Pa.

a. Mortar shall be Type M or S and masonry shall be laid in running bond. Ungrouted hollow masonry units are permitted except where otherwise indicated.
b. Soil classes are in accordance with the Unified Soil Classification System. Refer to Table R405.1.
c. Unbalanced backfill height is the difference in height between the exterior finish ground level and the lower of the top of the concrete footing that supports the foundation wall or the interior finish ground level. Where an interior concrete slab-on-grade is provided and is in contact with the interior surface of the foundation wall, measurement of the unbalanced backfill height from the exterior finish ground level to the top of the interior concrete slab is permitted.
d. Solid indicates solid masonry unit, grout indicates grouted hollow units~~ or solid masonry units~~.
e. Wall construction shall be in accordance with either Table R404.1.1(2), Table R404.1.1(3), Table 404.1.1(4), or a design shall be provided.

Reason: For plain masonry walls with a maximum height of 9 ft., all backfill depths, and 8ft. tall walls with 8ft. of backfill, the wall construction limitations of Table R404.1.1 (1) exceed the prescriptive requirements of TMS 402/ACI 530/ASCE 5 section 5.6.3 and

Table 5.6.3.1. For these specific walls, when analyzed in accordance with TMS 402/ACI 530/ASCE 5, using the allowable flexural tensile stresses in Table 2.2.3.2, the values shown in Table R404.1.1 (1) cannot be justified. The proposed change is to make the values shown in Table R404.1.1 (1) compliant with the prescriptive and analytical requirements of TMS 402/ACI 530/ASCE 5.

It should be noted that in Table R404.1.1 (1) footnote d currently lumps solid grouted hollow units with solid masonry units. However, in both TMS 402/ACI 530/ASCE 5 Tables 5.6.3.1 and 2.2.3.2 the limitations of solid units are less than those of solid grouted hollow units. Depending on the type of mortar, the capacity from Table 2.2.3.2 for solid units is either 62% or 40% the capacity of solid grouted hollow units.

With this proposal the IRC table for plain masonry wall will meet the requirements found in the referenced standard.

Cost Impact: The cost of construction for 8ft and 9ft tall plain masonry walls will slightly increase. The cost increase will primarily only impact the 8ft and 9ft walls where solid masonry units are currently specified.

R404.1.1(1)T-RB-KERR.doc

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: There was no technical justification provided that there have been any wide spread failures of 8 ft or 9 ft hollow masonry walls.

Assembly Action: Approved as Submitted

Individual Consideration Agenda

This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action of Approved as Submitted.

RB228-13
R202, R404.1.3, R404.4

Proposed Change as Submitted

Proponent: Charles S. Bajnai, Chesterfield County, VA, representing ICC Building Code Action Committee (BajnaiC@chesterfield.gov)

Revise as follows:

R404.1.3 Design required. Concrete or masonry foundation walls shall be designed in accordance with accepted engineering practice when either of the following conditions exists:

1. Walls are subject to hydrostatic pressure from groundwater.
2. Walls supporting more than 48 inches (1219 mm) of unbalanced backfill that do not have permanent lateral support at the top ~~or~~ <u>and</u> bottom.

R404.4 Retaining walls. Retaining walls that are not laterally supported at the top and that retain in excess of ~~24~~ <u>48</u> inches (610 mm) of unbalanced fill<u>, or retaining walls exceeding 24 inches in height that resist lateral loads in addition to soil,</u> shall be designed <u>in accordance with accepted engineering practice</u> to ensure stability against overturning, sliding, excessive foundation pressure and water uplift. Retaining walls shall be designed for a safety factor of 1.5 against lateral sliding and overturning

Revise definition as follows:

WALL, RETAINING. A wall not laterally supported at the top, that resists <u>only</u> lateral ~~soil~~ load<u>.</u> ~~and other imposed loads.~~

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC) The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

The International Code Council's Building Code Action Committee identified several items in Chapter 4, "Foundations", that are in conflict with other provisions of the code or lack clarity. This proposal specifically addresses conflicts and confusing language for when a design is required in Section R404.1.3 and retaining walls in Section R404.4.

Section R404.1.3 specifically requires that walls supporting more than 48 inches of unbalanced fill and not laterally supported require an engineered design. Section R404.4 addresses the same walls where they are not supported at the top but states that a design is required when the height of the unbalanced fill exceeds 24 inches. The two sections are in direct conflict. This proposal changes the trigger height in R404.4 to 48 inches to be consistent with other sections of the code.

In addition, this proposal clarifies, in R404.1.3 that the lateral support is required at the top **and** bottom. The definition of "WALL, RETAINING" is modified to be consistent with the intent of section R404.4. The type of wall addressed in R404.4 is a self-standing retaining wall that is not supported at the top and is laterally supported at the bottom against sliding and overturning by a factor of 1.5. This type of wall would typically be a site retaining wall where it is primarily resisting only lateral soil loads. The definition is modified to clarify that this type of wall is not intended to support structural loads. A similar wall that does support structural loads would be addressed by other sections.

Cost Impact: The code change will not increase the cost of construction.

R404.4-RB-BAJNAI-BCAC.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: It is unclear whether the change would prohibit temporary bracing. There are inconsistencies within the text. The committee prefers the current definition of retaining wall.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Charles S. Bajnai, Chesterfield County, VA, representing ICC Building Code Action Committee, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:
