R404.4 Retaining walls. Retaining walls that are not laterally supported at the top and that retain in excess of ~~24~~ 48 inches (610 mm) of unbalanced fill, or retaining walls exceeding 24 inches in height that resist lateral loads in addition to soil, shall be designed in accordance with accepted engineering practice to ensure stability against overturning, sliding, excessive foundation pressure and water uplift. Retaining walls shall be designed for a safety factor of 1.5 against lateral sliding and overturning. This section shall not apply to foundation walls supporting buildings.

Commenter's Reason: The International Code Council's Building Code Action Committee identified several items in Chapter 4, "Foundations", that are in conflict with other provisions of the code or lack clarity. The original proposal specifically addressed conflicts and confusing language for when a design is required in Section R404.1.3 and retaining walls in Section R404.4.

Based on comments received, the proposed change to the language in section R404.1.3 may, in some cases, cause further confusion and misapplication. This public comment removes the proposed changes to that section and it will remain as it currently is in the 2012 code. This public comment replaces the original proposal and only modifies section R404.4 to be consistent with other provisions in the code that allow a concrete or masonry wall supporting not more than 48 inches of backfill to be constructed without an engineered design . If the wall resists lateral loads in addition to soil, such as vehicle surcharges and fences built on top of the wall that are subject to wind loads, the height of the unbalanced fill is then limited to 24 inches as currently stated in the code.

Also, in the original proposal there was a proposed modification to the definition of RETAINING WALL. This public comment removes the suggested change and leaves the definition as it currently exists.

At the Committee Action Hearings, there was a question raised about this proposal prohibiting temporary bracing. The concern is not germane to the proposed code revision. The code does not specify requirements or limitations on how structures are braced or supported during construction. Those specifications and requirement are specified and regulated by agencies or organizations whose specific purpose is for construction site and worker safety such as OSHA. Nothing is specified requiring or prohibiting temporary bracing or shoring during construction.

RB228-13

Final Action: AS AM AMPC____ D

RB236-13
R501.3

Proposed Change as Submitted

Proponent: Jeffrey M. Hugo, CBO, National Fire Sprinkler Association (hugo@nfsa.org)

Revise as follows:

R501.3 Fire protection of floors. Floor assemblies, not required elsewhere in this code to be fire-resistance rated, shall be provided with a 1/2-inch (12.7 mm) gypsum wallboard membrane, 5/8-inch (16 mm) wood structural panel membrane, or equivalent on the underside of the floor framing member.

Exceptions:

1. Floor assemblies ~~located directly over a space~~ in dwellings protected throughout by an automatic sprinkler system in accordance with Section P2904~~,~~ or NFPA13D~~,~~. ~~or other approved equivalent sprinkler system.~~
2. Floor assemblies located directly over a crawl space not intended for storage or fuel-fired appliances.
3. Portions of floor assemblies can be unprotected when complying with the following:
   3.1. The aggregate area of the unprotected portions shall not exceed 80 square feet per story
   3.2 Fire blocking in accordance with Section R302.11.1 shall be installed along the perimeter of the unprotected portion to separate the unprotected portion from the remainder of the floor assembly.
4. Wood floor assemblies using dimension lumber or structural composite lumber equal to or greater than 2-inch by 10-inch (50.8 mm by 254 mm) nominal dimension, or other approved floor assemblies demonstrating equivalent fire performance.

Reason: In several areas where the IRC is adopted, Section 501.3 Exception #1 "…or other approved equivalent sprinkler system." is interpreted to permit the dwelling unit to only have a partial residential sprinkler "system" installed in the unprotected ceiling space, i.e. only fire sprinklers in the basement ceiling. This was not the intent of the authors of this text in the previous code cycle.

A residential fire sprinkler system designed according to NFPA 13D and/or P2904 is considered "sprinklered throughout" and does not have criteria or rules for partial systems. When a partial system is installed, it would violate not only the standards for installation, but the very requirement that mandated the system in the first place, Exception #1 of Section 501.3.

Cost Impact: The code change proposal will not increase the cost of construction.

R501.3-RB-HUGO.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee feels that Section P2904 permits a partial system and other approved systems needs to be retained.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jeffrey M. Hugo, CBO representing National Fire Sprinkler Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R501.3 Fire protection of floors. Floor assemblies, not required elsewhere in this code to be fire-resistance rated, shall be provided with a 1/2-inch (12.7 mm) gypsum wallboard membrane, 5/8-inch (16 mm) wood structural panel membrane, or equivalent on the underside of the floor framing member.

Exceptions:

1. Floor assemblies in dwellings protected throughout by an automatic sprinkler system in accordance with Section P2904, ~~or~~ NFPA13D, <u>or other approved equivalent sprinkler system</u>.
2. Floor assemblies located directly over a crawl space not intended for storage or fuel-fired appliances.
3. Portions of floor assemblies can be unprotected when complying with the following:
   3.1. The aggregate area of the unprotected portions shall not exceed 80 square feet per story
   3.2. Fire blocking in accordance with Section R302.11.1 shall be installed along the perimeter of the unprotected portion to separate the unprotected portion from the remainder of the floor assembly.
4. Wood floor assemblies using dimension lumber or structural composite lumber equal to or greater than 2-inch by 10-inch (50.8 mm by 254 mm) nominal dimension, or other approved floor assemblies demonstrating equivalent fire performance.

Commenter's Reason: Sprinkler systems installed according to NFPA 13D and P2904 are intended to be installed throughout the dwelling unit. Both NFPA 13D and P2904 have areas that are exempt from sprinklers, but neither of these standards have any provisions or rules for partially installed systems, including a partial system protecting a lightweight floor system.

It is contrary to draft code language that directs a user to a standard that does not have the provisions for which the code language is requiring. For this section to offer an exception for an incomplete system is not an exception and this puts the code official, the jurisdiction, and more importantly the occupants in the home at risk.

This public comment retains the committee's desire to keep the "other approved equivalent sprinkler system" language.

RB236-13

Final Action: AS AM AMPC____ D

RB237-13
R501.3

Proposed Change as Submitted

Proponent: Sean DeCrane, Cleveland Division of Fire, representing Cleveland Division of Fire/ International Association of Fire Fighters (rovloc93@aol.com)

Revise as follows:

R501.3 Fire protection of floors. Floor assemblies, not required elsewhere in this code to be fire-resistant rated, shall be provided with a ½-inch (12.7 mm) gypsum wallboard membrane, 5/8-inch (16 mm) wood structural panel membrane, or equivalent on the underside of the floor framing member.

Exceptions:

1. Floor assemblies located directly over a space protected by an automatic sprinkler system in accordance with Section P2904, NFPA 13D, or other approved equivalent sprinkler system.
2. Floor assemblies located directly over a crawl space not intended for storage or fuel-fired appliances.
3. Portions of the floor assembly can be unprotected when complying with the following:
   3.1. The aggregate area of the unprotected portions shall not exceed 80 square feet per story.
   3.2. Fire blocking in accordance with Section R302.11.1 shall be installed along the perimeter of the unprotected portion to separate the unprotected portion from the remainder of the floor assembly.
4. Wood floor assemblies using dimension lumber or structural composite lumber equal to or greater than 2-inch by 10-inch (50.8 mm by 254 mm) nominal dimension, ~~or other approved floor assemblies demonstrating equivalent fire performance.~~

Reason: This author was the original proponent of the current language in the IRC and appreciates the assistance of the representatives from NAHB and the American Wood Council who worked hard to place this language in the code providing additional protection to the responding fire fighters and the residents occupying these occupancies.

Since passage of this language it has become apparent there is cause for concern in portions of the language. One serious concern that has been demonstrated through additional testing at Underwriters Laboratories involves the language in Exception 4 permitting the use of *other approved floor assemblies demonstrating equivalent fire performance*. While this language was placed in the body of the code its intent was to allow the equivalency for a protected floor assembly. The language in Exception 4 allows the equivalency to an unprotected floor assembly.

We also want to ask the question, demonstrating the equivalent performance by what Standard? If it is to the ASTM E 119 Standard the ICC-ES has already permitted a deviation from a true E 119 test. In recent hearings, despite testimony to the contrary and evidence that the decision was based on misrepresented numbers the ICC –ES permits the reduction of the applied load to 50% of the design load, submitted as AC 14. A proponent is also not required to test a full assembly; simply testing two joists would be permitted.

There is a great concern on the reduction of the applied load. Further testing completed at Underwriters Laboratories has demonstrated the importance the applied load and the misrepresentation of true performance under fire conditions. I have provided a link at the bottom where the UL Tests reports can be accessed in detail.

The results of the original UL furnace testing on the performance of lightweight floor systems was instrumental in demonstrating the concern on the lack of performance in fire conditions of specific engineered products. Just a short recap, with a modified load of 40 lb/ft² on two sides of the floor system and two 300 pound fire fighter mannequins' tests results demonstrated:

- Unprotected 2 x 10 Dimensional Lumber collapsed at 18:45.
- Unprotected 16" I-Joists collapsed at 6:03.
- The use of ½" gypsum wallboard as protection allowed the 2 x 10 Dimensional to collapse at 44:45.
- The use of ½" gypsum wallboard as protection allowed the 16" I-Joist to collapse at 26:45.

A substantial improvement was realized simply by adding the gypsum board.

Let us now review recent test results conducted in the ASTM E 119 Standard test furnace. This report was issued in 2011 prior to the ICC-ES hearing. In the follow up tests there was an attempt to replicate test results for consistency plus there had been discussions on how some of the floor systems were not tested to a true E 119 test standard of 100% design load. The question would be; how would the applied load impact the performance of the floor? As you can clearly realize below, the test load has a direct impact on time performance.

- A 16" I-Joist floor assembly unprotected with a full design load collapsed at 2:02, a full four minutes earlier than the previous test to a modified load;
- A 2 x 10 dimensional lumber floor assembly with a full design load collapsed at 7:00, a full eleven minute difference to a modified load;
- A potential "equivalent" floor protection system (Intumescent paint) was tested to a modified load (40 lb/ft² on two sides and fire fighters in the middle) collapsed at 8:40. We saw a reduction in performance with the full load applied to the 2 x 10 dimensional lumber. What is the true performance when subjected to a full load? We will not know as the equivalency requirements allow the reduce test parameters including small samplings. (Test report language and timeline are listed below).

"Experiment 5 examined an engineered I-joist floor assembly with a spray applied fire retardant coating and the modified loading configuration (Figure 61 and Figure 62). The floor assembly failed at 8:40 after ignition. Observations made during the experiment of the exposed and unexposed sides of the floor assembly are detailed in Table 17. The average furnace temperature during the experiment followed the standard curve closely until approximately 6 minutes when the floor system was involved in flames (Figure 63).

The furnace pressure and oxygen concentration measured in the furnace are presented in Figure 64 and Figure 65 respectively. The pressure remained between -0.3 in. w.c. and 0.6 in. w.c. but fluctuated around 0 for most of the experiment. The oxygen concentration fluctuated and then decreased to less than 5 % by 7 minutes and remained at or below that concentration until collapse." [1]See UL Report Fire Service Collapse Hazard Floor Furnace Experiments.

Exp. Time, Min:Sec	Surface Observations
1:15	Crackling could be heard and smoke was present at West edge.
2:00	More frequent crackling could be heard.
2:00	Too dark to seen in furnace.
3:10	Crackling and smoke ceased.
3:45	Crackling and smoke started again.
4:00	Material on joists began to lighten in color and started to crack.
4:15	More intense smoke and crackling was present.
4:45	Significant flaming could be seen from first two joist bays on the north end of the assembly.
5:10	Crackling continued.
6:00	Smoke from subfloor joints was present.
6:00	Joist orange in color and looked like charring wood.
6:45	Significant flaming over entire exposed surface.
7:00	Kneeling mannequin began to vibrate vertically.
7:30	Entire assembly began to deflect into the furnace.
7:30	Vision obscured by fall off material circulating throughout the furnace.
8:10	Larger vertical vibrations could be seen on both mannequins.
8:15	Noticeable deflection could be seen at the centerline of the assembly.
8:30	Joist webs started to burn through.
8:40	Structural failure.

In recent years the fire service has become concerned on the performance of "modern" lumber and the use of engineered trees to produce lumber in a shorter time frame. While the elimination of this code language does not address this concern it does require manufacturers to produce products that will be tested and compared to a protected floor assembly as opposed to an unprotected floor. There is currently a proposal to ICC-ES, at the time of this submission, AC 450, to consider the approval of the use of an intumescent product, eerily similar to the test parameters of Test #5. The previous approval of AC 14 now allows the reduced floor assembly and test load in the comparable.

As we have demonstrated the concern in allowing reduced test parameters to address equivalencies in structural floor systems. We believe we should be using equivalencies to meet protected floor systems. The other question we would like to present would be what is the expected equivalent performance? Is it the 2 x 10 dimensional lumber's performance to a 100% design load? We saw a test performance of seven minutes, very close to the performance time of lightweight systems in the original tests that moved the ICC membership to require the protection of these floor systems. This is a question yet to be truly answered by the current language and that is why the membership must remove the equivalency language in Exception 4.

Traditionally the International Residential Code has been a prescriptive code. While the intent of this code language was not to promote gypsum board specifically we must ensure any substitute for a known consistent protection feature be held to a comparative Standard of performance to ensure consistency and safety.
http://www.ul.com/global/documents/offerings/industries/buildingmaterials/fireservice/basementfires/2009%20NIST%20ARRA%20Appendix%20B%20-%20Fire%20Service%20Collapse%20Hazard%20Floor%20Furnace%20Experiments.pdf

[1.] Underwriters Laboratories,

Cost Impact: This proposal may or may not increase costs depending on cost of equivalent product.

R501.3-RB-DECRANE.doc

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The committee feels it is important to keep the requirement that permits approved assemblies with equivalency to 2x10 lumber.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Sean DeCrane, Cleveland Division of Fire, representing International Association of Fire Fighters, requests Approval as Submitted.

Commenter's Reason: We are requesting this proposal to be Approved As Submitted. Since this section was approved in the Residential Code there has been some question as to the equivalency that is required. We require the protection of the lightweight assemblies that have been demonstrated to fail early in fire conditions due to the dangers to the occupants of these homes and also the responding fire fighters.

The code requires the installation of gypsum board to protect the floor assemblies, not because of industry influence but rather it is a proven product that has demonstrated its performance in many tests and real conditions. We encourage other industries to develop products that can meet the equivalency performance. Additional products are coming to the marketplace as we speak. The challenge to the AHJ is to identify which products meet the equivalency performance requirements. By placing this language in Exception 4 it has caused some confusion for officials. Currently manufacturers can meet the equivalency performance by going through Chapter 1. This requires manufacturers to take the proper steps of going through a recognized Evaluation Service to have their product reviewed, judged and properly evaluated for performance.

Some may say this is common sense but there are individuals who have proposed products that can meet ASTM E 84 flame spread performances and advocate this E 84 performance as the equivalency of a load bearing test such as the ASTM E119/UL 263 test. There are also individuals who have proposed Engineering Evaluations advocating Metal Plated Connected Wood Truss performs the equal to dimensional lumber. This despite the poor performance of a 3 minute 58 second collapse time, from ignition, in a full scale test at UL and NIST sponsored test.

By removing the equivalency from Exception 4 and requiring manufacturers to achieve their equivalency through the performance requirements in Chapter 1 we can provide the proper guidance to local AHJ's who are looking for assistance in determining products that have truly been evaluated properly for performance claims and can be installed in the field.

Public Comment 2:

J. William Degnan, President, National Association of State Fire Marshals, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R501.3 Fire protection of floors. Floor assemblies, not required elsewhere in this code to be fire-resistant rated, shall be provided with a ½-inch (12.7 mm) gypsum wallboard membrane, 5/8-inch (16 mm) wood structural panel membrane, or equivalent on the underside of the floor framing member.

Exceptions:

1. Floor assemblies located directly over a space protected by an automatic sprinkler system in accordance with Section P2904, NFPA 13D, or other approved equivalent sprinkler system.
2. Floor assemblies located directly over a crawl space not intended for storage or fuel-fired appliances.
3. Portions of the floor assembly can be unprotected when complying with the following:
    3.1. The aggregate area of the unprotected portions shall not exceed 80 square feet per story.
    3.2. Fire blocking in accordance with Section R302.11.1 shall be installed along the perimeter of the unprotected portion to separate the unprotected portion from the remainder of the floor assembly.
4. Wood floor assemblies using dimension lumber or structural composite lumber equal to or greater than 2-inch by 10-inch (50.8 mm by 254 mm) nominal dimension.
5. <u>Other approved floor assemblies demonstrating equivalent fire performance.</u>

Commenter's Reason: The committee disapproved the proposal because the committee felt "it is important to keep the requirement that permits approved assemblies with equivalency to 2X10 lumber".

The proponent pointed out to the committee that while the language had intended to allow an equivalency for a protected floor assembly, the exception in its present form allows the equivalency to an unprotected floor assembly. The proponent went further by pointing out the defects of the current language based on UL conducted tests but in spite of these tests, the committee felt that it was important to keep the requirement. If so, then this modification would correctly format the exception to cause the approval to be based on or compared to the charging section and not exception #4. Furthermore, as asked by the proponent, to what standard is the equivalency to 2X10 lumber to be determined?

RB237-13

Final Action: AS AM AMPC____ D

RB240-13
R501.3

Proposed Change as Submitted

Proponent: Thomas Peterson, Box Elder County, representing Utah Chapter of ICC (tpeterson@boxeldercounty.org)

Delete without substitution as follows:

~~**R501.3 Fire protection of floors.** Floor assemblies, not required elsewhere in this code to be fire-resistance rated, shall be provided with a $^{1}/_{2}$-inch (12.7 mm) gypsum wallboard membrane, $^{5}/_{8}$-inch (16 mm) wood structural panel membrane, or equivalent on the underside of the floor framing member.~~

~~**Exceptions:**~~

1. ~~Floor assemblies located directly over a space protected by an automatic sprinkler system in accordance with Section P2904, NFPA13D, or other approved equivalent sprinkler system.~~
2. ~~Floor assemblies located directly over a crawl space not intended for storage or fuel-fired appliances.~~
3. ~~Portions of floor assemblies can be unprotected when complying with the following:~~
   - ~~3.1. The aggregate area of the unprotected portions shall not exceed 80 square feet per story~~
   - ~~3.2. Fire blocking in accordance with Section R302.11.1 shall be installed along the perimeter of the unprotected portion to separate the unprotected portion from the remainder of the floor assembly.~~
4. ~~Wood floor assemblies using dimension lumber or structural composite lumber equal to or greater than 2-inch by 10-inch (50.8 mm by 254 mm) nominal dimension, or other approved floor assemblies demonstrating equivalent fire performance.~~

Reason: The code reference is not needed as one of the exceptions of requiring the fire protection of floors is that an NFPA 13D system be installed. NFPA 13D systems are required by Section R313 of this code in all structures. Section R501.3 is not applicable and should be removed from the code to prevent confusion of what is required.

Cost Impact: This code change proposal will not increase the cost of construction.

R501.3-RB-PETERSON.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee feels this section should be retained. This section is needed where jurisdictions amend out the sprinkler requirements.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Thomas Peterson, Box Elder County, UT, representing self, requests Approval as Submitted.

Commenter's Reason: The committee's reason for disapproving this code change was because a jurisdiction "may" amend out the requirement for fire suppression systems. This code should not be written to require things that may cover what some jurisdictions may or may not amend out. We are opening Pandora's Box by allowing the code to have requirements "just in case" certain jurisdictions amend out a code requirement. If that many jurisdictions are amending out the requirement for fire suppression then maybe that needs to be removed instead. If that were the case then this section would make perfect sense.

RB240-13

Final Action: AS AM AMPC____ D

RB241-13
R502.1 (NEW), R502.1.1, R502.1.1.1, R502.1.2, R502.2.2 (NEW)

Proposed Change as Submitted

Proponent: Dennis Pitts, American Wood Council (dpitts@awc.org)

Revise as follows:

R502.1 General. Wood and wood-based products used for load-supporting purposes shall conform to the applicable provisions of this section.

~~**R502.1**~~ **R502.1.1** ~~**Identification**~~**. Sawn Lumber.** ~~Load-bearing dimension~~ Sawn lumber ~~for joists, beams and girders~~ shall be identified by a grade *mark* of ~~a~~ an accredited lumber grading or inspection agency ~~that has been *approved* by~~ and have design values certified by an accreditation body that complies with DOC PS 20. In lieu of a grade *mark*, a certificate of inspection issued by a lumber grading or inspection agency meeting the requirements of this section shall be accepted.

~~**R502.1.1**~~ **R502.1.1.1 Preservative-treated lumber.** Preservative treated dimension lumber shall also be identified as required by Section R317.2.

~~**R502.1.2 Blocking and subflooring.** Blocking shall be a minimum of utility grade lumber. Subflooring may be a minimum of utility grade lumber or No. 4 common grade boards.~~

R502.2.2 Blocking and subflooring. Blocking for fastening panel edges or fixures shall be a minimum of utility grade lumber. Subflooring shall be a minimum of utility grade lumber or No. 4 common grade boards. Fireblocking shall be of any grade lumber.

Reason: The change is intended to clarify the process by which lumber design values are certified and recognized in the code. The current process, which has been used since 1970, relies on the internationally recognized U.S. Department of Commerce Voluntary Product Standard PS20. Because the current format of the section can be incorrectly interpreted to place a number of wood products under the identification requirements of PS20, a new format is proposed that clearly states this standard is only for sawn lumber. The format proposed is nearly identical to what is used in Section 2302 of the International Building Code. Wood products other than sawn lumber have unique manufacturing standards, design value development, and quality control criteria. This new format clarifies that these other wood products must comply with specific product standards.

Cost Impact: This code change proposal will not increase the cost of construction.

R502.1 (NEW)-RB-PITTS.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee feels that proposed Section R502.2.2 would prohibit WSP for subflooring.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Dennis Pitts, American Wood Council, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION R502
WOOD FLOOR FRAMING

R502.1 General. Wood and wood-based products used for load-supporting purposes shall conform to the applicable provisions of this section.

R502.1.1 Sawn Lumber. Sawn lumber shall be identified by a grade *mark* of an accredited lumber grading or inspection agency and have design values certified by an accreditation body that complies with DOC PS 20. In lieu of a grade *mark*, a certificate of inspection issued by a lumber grading or inspection agency meeting the requirements of this section shall be accepted.

R502.1.1.1 Preservative-treated lumber. Preservative treated dimension lumber shall also be identified as required by Section R317.2.

~~R502.1.3~~ <u>R502.1.1.2</u> End-jointed lumber. *Approved* end-jointed lumber identified by a grade *mark* conforming to Section R502.1 may be used interchangeably with solid-sawn members of the same species and grade. End-jointed lumber used in an assembly required elsewhere in this code to have a fire-resistance rating shall have the designation "Heat Resistant Adhesive" or "HRA" included in its grade mark.

~~R502.1.4~~ <u>R502.1.2</u> Prefabricated wood I-joists. Structural capacities and design provisions for prefabricated wood I-joists shall be established and monitored in accordance with ASTM D 5055.

~~R502.1.5~~ <u>R502.1.3</u> Structural glued laminated timbers. Glued laminated timbers shall be manufactured and identified as required in ANSI/AITC A190.1 and ASTM D 3737.

~~R502.1.6~~ <u>R502.1.4</u> Structural log members. Stress grading of structural log members of nonrectangular shape, as typically used in log buildings, shall be in accordance with ASTM D 3957. Such structural log members shall be identified by the grade *mark* of an *approved* lumber grading or inspection agency. In lieu of a grade *mark* on the material, a certificate of inspection as to species and grade issued by a lumber-grading or inspection agency meeting the requirements of this section shall be permitted to be accepted.

~~R502.1.7~~ <u>R502.1.5</u> Structural composite lumber. Structural capacities for structural composite lumber shall be established and monitored in accordance with ASTM D 5456.

RELOCATE THE FOLLOWING SECTION:

R502.2.2 Blocking and subflooring. Blocking for fastening panel edges or fix<u>t</u>ures shall be a minimum of utility grade lumber. Subflooring shall be a minimum of utility grade lumber<u>,</u> ~~or~~ No. 4 common grade boards<u>, or wood structural panels as specified in Section R503.2</u>. Fireblocking shall be of any grade lumber.

Commenter's Reason: RB241-13 was one of three proposals intended to be format changes to clarify the application of DOC PS20, and there was no intent to make technical changes in any of them. The other two proposals – RB269-13 and RB393-13 – were recommended for approval as submitted. However, the IRC Committee felt that the relocated Sec. R502.2.2 in RB241 ignored the use of wood structural panels for subflooring and recommended disapproval for that reason. The use of wood structural panels in subflooring is addressed in Sec. R503.2, and the text being relocated in our original proposal exists in the code today. However, to address the committee's concern and to avoid possible conflict, this public comment adds a reference to R503.2. It also corrects a typo in the word "fixtures."

RB241-13

Final Action: AS AM AMPC____ D

RB250-13

Table R502.5(1), Table R502.5(2), Table R802.4(1), Table R802.4(2), Table R802.5.1(1) through R802.5.1(8)

Proposed Change as Submitted

Proponent: Dennis Pitts, American Wood Council (dpitts@awc.org)

Revise as follows:

TABLE R502.5(1)
GIRDER SPANS [a, b] AND HEADER SPANS [a, b] FOR EXTERIOR BEARING WALLS
(Maximum spans for Douglas fir-larch, hem-fir, southern pine and spruce-pine-fir[~~b~~] and required number of jack studs)

(Portions of Table not shown remain unchanged)

For SI: 1 inch = 25.4 mm, 1 pound per square foot = 0.0479 kPa.
a. Spans are given in feet and inches.
b. No. 1 or better grade lumber shall be used for Southern Pine 2x4s. Other tabulated values assume #2 grade lumber.
c. Building width is measured perpendicular to the ridge. For widths between those shown, spans are permitted to be interpolated.
d. NJ - Number of jack studs required to support each end. Where the number of required jack studs equals one, the header is permitted to be supported by an approved framing anchor attached to the full-height wall stud and to the header.
e. Use 30 psf ground snow load for cases in which ground snow load is less than 30 psf and the roof live load is equal to or less than 20 psf.

TABLE R502.5(2)
GIRDER SPANS [a, b] AND HEADER SPANS [a, b] FOR INTERIOR BEARING WALLS
(Maximum spans for Douglas fir-larch, hem-fir, southern pine and spruce-pine-fir[~~b~~] and required number of jack studs)

(Portions of Table not shown remain unchanged)

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.
a. Spans are given in feet and inches.
b. No. 1 or better grade lumber shall be used for Southern Pine 2x4s. Other tabulated values assume #2 grade lumber.
c. Building width is measured perpendicular to the ridge. For widths between those shown, spans are permitted to be interpolated.
d. NJ - Number of jack studs required to support each end. Where the number of required jack studs equals one, the header is permitted to be supported by an approved framing anchor attached to the full-height wall stud and to the header.

Revise as follows:

TABLE R802.4(1)
CEILING JOIST SPANS FOR COMMON LUMBER SPECIES
(Uninhabitable attics without storage, live load = 10 psf, L/Δ = 240)

CEILING JOIST SPACING (inches)	SPECIES AND GRADE		DEAD LOAD = 5 psf			
			2x4	2x6	2x8	2x10

(Portions of Table not shown remain unchanged)

Reason: New design values for 2x4 Southern Pine #2 and all lower grades (i.e. #3, Stud, Construction, Standard, and Utility) were certified by the American Lumber Standards Committee Board of Review (BOR) on January 11, 2012, and became effective on June 1, 2012. This proposed change to multiple tables of the IRC reflects lower spans resulting from the newly certified design values. It is anticipated the Board of Review will certify new design values for other widths and grades of southern pine in early 2013. The use of the phrase "no change" is intended to mean that, as of the January 3, 2013 code change deadline, there are no revisions to these table entries. Further, it is likely there will be changes affecting these entries during the time period of the Group B development cycle. If new design values are certified and there is time prior to the IRC Committee hearings, AWC will prepare a floor modification to amend all the affected spans. Alternatively, the revised span tables will be developed for consideration during the Final Action Hearings. Regardless, approval of these spans by the Committee will allow the greatest degree of flexibility to further modify the spans at the Final Action Hearings.

In October 2012, the ICC membership approved code changes S281-12 and S283-12. These changes established a link between changes made to span tables in the IRC to identical IBC span tables. Since design values for wider width southern pine lumber were not available for the IBC Group A development cycle, S281-12 and S283-12 instruct ICC staff to extract the appropriate tables from the 2015 IRC. This will ensure that the 2015 IBC and 2015 IRC have identical state-of-the-art spans for southern pine.

Cost Impact: The code change will not increase the cost of construction.

Committee Action Hearing Results

Committee Action: Approved as Modified

Modify the proposal as follows:

TABLE R502.5(1)
GIRDER SPANS [a, b] AND HEADER SPANS [a, b] FOR EXTERIOR BEARING WALLS
(Maximum spans for Douglas fir-larch, hem-fir, southern pine and spruce-pine-fir and required number of jack studs)

(Portions of Table not shown remain unchanged)

For SI: 1 inch = 25.4 mm, 1 pound per square foot = 0.0479 kPa.

a. Spans are given in feet and inches.
b. No. 1 or better grade lumber shall be used for Southern Pine ~~2x4s~~. Other tabulated values assume #2 grade lumber.
c. Building width is measured perpendicular to the ridge. For widths between those shown, spans are permitted to be interpolated.
d. NJ - Number of jack studs required to support each end. Where the number of required jack studs equals one, the header is permitted to be supported by an approved framing anchor attached to the full-height wall stud and to the header.
e. Use 30 psf ground snow load for cases in which ground snow load is less than 30 psf and the roof live load is equal to or less than 20 psf.

TABLE R502.5(2)
GIRDER SPANS [a, b] AND HEADER SPANS [a, b] FOR INTERIOR BEARING WALLS
(Maximum spans for Douglas fir-larch, hem-fir, southern pine and spruce-pine-fir and required number of jack studs)

(Portions of Table not shown remain unchanged)

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. Spans are given in feet and inches.
b. No. 1 or better grade lumber shall be used for Southern Pine ~~2x4s.~~ Other tabulated values assume #2 grade lumber.
c. Building width is measured perpendicular to the ridge. For widths between those shown, spans are permitted to be interpolated.
d. NJ - Number of jack studs required to support each end. Where the number of required jack studs equals one, the header is permitted to be supported by an approved framing anchor attached to the full-height wall stud and to the header.

Add the tables as follows:

TABLE R502.3.1(1)
FLOOR JOIST SPANS FOR COMMON LUMBER SPECIES

Check sources for availability of lumber in lengths greater than 20 feet.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 0.0479 kPa.

a. The tabulated rafter spans assume that ceiling joists are located at the bottom of the attic space or that some other method of resisting the outward push of the rafters on the bearing walls, such as rafter ties, is provided at that location. When ceiling joists or rafter ties are located higher in the attic space, the rafter spans shall be multiplied by the factors given below:

(Portions of table not shown remain unchanged)

H_C/H_R	Rafter Span Adjustment Factor
1/3	0.67
1/4	0.76
1/5	0.83
1/6	0.90
1/7.5 or less	1.00

where:

H_C = Height of ceiling joists or rafter ties measured vertically above the top of the rafter support walls.

H_R = Height of roof ridge measured vertically above the top of the rafter support walls.

b. Span exceeds 26 feet in length.

Check sources for availability of lumber in lengths greater than 20 feet.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 0.0479 kPa.

a. The tabulated rafter spans assume that ceiling joists are located at the bottom of the attic space or that some other method of resisting the outward push of the rafters on the bearing walls, such as rafter ties, is provided at that location. When ceiling joists or rafter ties are located higher in the attic space, the rafter spans shall be multiplied by the factors given below:

(Portions of table not shown remain unchanged)

H_C/H_R	Rafter Span Adjustment Factor
1/3	0.67
1/4	0.76
1/5	0.83
1/6	0.90
1/7.5 or less	1.00

where:
H_C = Height of ceiling joists or rafter ties measured vertically above the top of the rafter support walls.
H_R = Height of roof ridge measured vertically above the top of the rafter support walls.
b. Span exceeds 26 feet in length.

Check sources for availability of lumber in lengths greater than 20 feet.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 0.0479 kPa.

a. The tabulated rafter spans assume that ceiling joists are located at the bottom of the attic space or that some other method of resisting the outward push of the rafters on the bearing walls, such as rafter ties, is provided at that location. When ceiling joists or rafter ties are located higher in the attic space, the rafter spans shall be multiplied by the factors given below:

(Portions of table not shown remain unchanged)

H_C/H_R	Rafter Span Adjustment Factor
1/3	0.67
1/4	0.76
1/5	0.83
1/6	0.90
1/7.5 or less	1.00

where:

H_C = Height of ceiling joists or rafter ties measured vertically above the top of the rafter support walls.
H_R = Height of roof ridge measured vertically above the top of the rafter support walls.
b. Span exceeds 26 feet in length.

a. The tabulated rafter spans assume that ceiling joists are located at the bottom of the attic space or that some other method of resisting the outward push of the rafters on the bearing walls, such as rafter ties, is provided at that location. When ceiling joists or rafter ties are located higher in the attic space, the rafter spans shall be multiplied by the factors given below:

(Portions of table not shown remain unchanged)

H_C/H_R	Rafter Span Adjustment Factor
1/3	0.67
1/4	0.76
1/5	0.83
1/6	0.90
1/10 or less	1.00

where:
H_C = Height of ceiling joists or rafter ties measured vertically above the top of the rafter support walls.
H_R = Height of roof ridge measured vertically above the top of the rafter support walls.

Committee Reason: Approval was based upon the proponent's published reason. The modifications updated the span tables for southern pine based on the current design values certified by the American Lumber Standards Committee Board of Review.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Dennis Pitts, American Wood Council, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

TABLE R502.3.1(1)
FLOOR JOIST SPANS FOR COMMON LUMBER SPECIES
(Residential sleeping areas, live load = 30 psf, L/Δ = 360)[a]

JOIST SPACING (inches)	**SPECIES AND GRADE**		**DEAD LOAD = 10psf**
			2 x 8
			Maximum floor joist spans
			(ft – in)
16	Southern pine	#3	~~10-10~~ 10-0

(Portions of Table not shown remain unchanged)

Commenter's Reason: This public comment corrects a typo in our original proposal.

RB250-13
Final Action: AS AM AMPC____ D

RB262-13
R507.2.3, Figure R507.2.3(2) (NEW)

Proposed Change as Submitted

Proponent: Hoyt Jeter, Eagle Eye Consulting Engineers, representing Washington Association of Building Officials Technical Code Development Committee (hoytjeter@centurytel.net)

Revise as follows:

R507.2.3 Deck lateral load connection. The lateral load connection required by Section R507.1 shall be permitted to be in accordance with Figures R507.2.3(1) or R507.2.3(2). Where the lateral load connection is provided in accordance with Figure 507.2.3(1), hold-down tension devices shall be installed in not less than two locations per deck, and each device shall have an allowable stress design capacity of not less than 1500 pounds (6672 N). Where the lateral load connections is provided in accordance with Figure R507.2.3(2), the hold-down tension devices shall be installed in not less than 4 locations per deck, and each device shall have an allowable stress design capacity of not less than 750 pounds (3336 N).

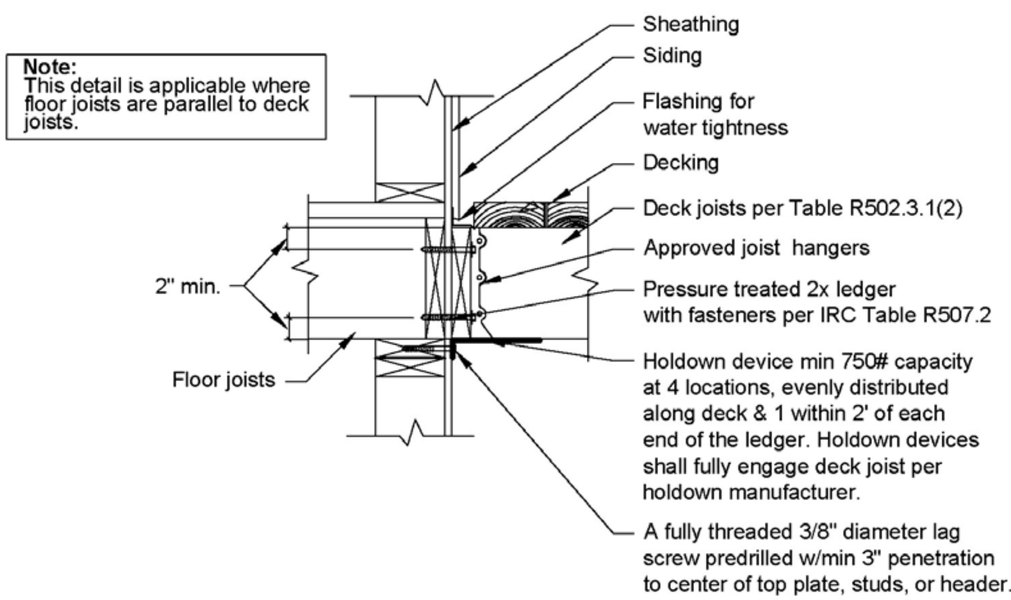

FIGURE R507.2.3(2)

Reason: This proposal provides an alternative prescriptive method to achieve an acceptable lateral load connection for residential decks. For new or replacement decks on existing homes, builders or homeowners must often remove interior sheet rock on ceilings in order to install hold-down tension devices as required by Figure 507.2.3. This proposal achieves an acceptable lateral load connection between the deck and primary structure by permitting the installation of surface mounted hold-down connection devices spread out along the length of the ledger and precludes the need to make expensive and unnecessary ceiling repairs.

Typical deck failures occur because joists separate from the joist-hangers which are fastened to the ledger. This is due to the lack of an adequate tension connection between the joist and the hanger at this joint. This proposal provides a better connection between at least 4 joists and the primary structure thereby reducing the potential failure of the joist to joist-hanger connection and better support form complete collapse of the deck and will reduce the chance of injury.

Cost Impact: The code change proposal will not increase the cost of construction, it will decrease the cost.

R507.2.3 #3-JETER.doc

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Approval was based upon the proponent's published reason.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Lee J. Kranz, City of Bellevue, Development Services, representing Washington Association of Building Officials Technical Code Development Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

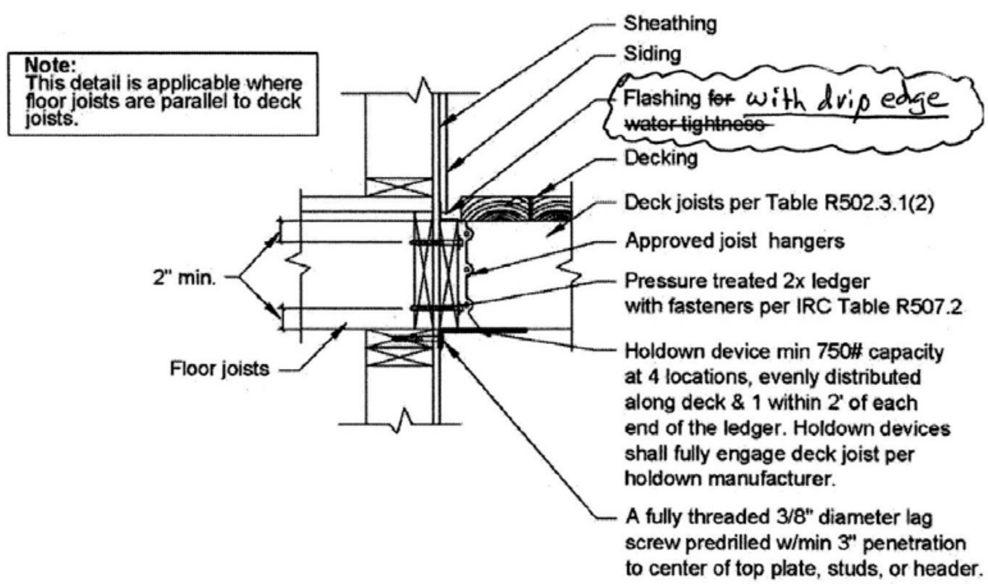

FIGURE R507.2.3(2)

(Portions of Code Change Proposal not shown remain unchanged)

Commenter's Reason: The attached modification was discussed in Dallas by the IRC Building Committee as part of the testimony related to the RB-262 code change proposal and received favorable responses from members of the Committee. After hearing testimony on the floor modification and the original proposal the Committee voted to endorse RB262 and it was approved as submitted. Subsequent to the final vote it was noted that the modification should have been included in the motion but was not. The Committee Chair suggested that a public comment be submitted to have it added to the original proposal.

The modification changes the original proposal slightly to require that the deck ledger flashing to have a drip edge to divert moisture away from the ledger.

Public Comment 2:

Glenn Mathewson, MCP, City of Westminster, CO, representing North American Deck and Railing Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R507.2.3 Deck lateral load connection. The lateral load connection required by Section R507.1 shall be permitted to be in accordance with Figures R507.2.3(1) or R507.2.3(2). Where the lateral load connection is provided in accordance with Figure 507.2.3(1), hold-down tension devices shall be installed in not less than two locations per deck, and each device shall have an allowable stress design capacity of not less than 1500 pounds (6672 N). Where the lateral load connections is provided in accordance with Figure R507.2.3(2), the hold-down tension devices shall be installed in not less than 4 locations per deck, and each device shall have an allowable stress design capacity of not less than 750 pounds (3336 N).

<u>Proposed Change as Submitted</u>

Proponent: Charles S. Bajnai, Chesterfield County, VA, representing ICC Building Code Action Committee and Virginia Building and Code Officials Association (bajnaic@chesterfield.gov)

Revise as follows:

R507.1 Decks. Where supported by attachment to an exterior wall, decks shall be positively anchored to the primary structure and designed for both vertical and lateral loads.

> <u>**Exception:** Design for lateral loads, and connectors in accordance with Section R507.3, shall not be required for decks that do not require guards in accordance with Section R312.1.1, provided that the deck ledger is connected to the band joist in accordance with Section R507.2.</u>

Such attachment shall not be accomplished by the use of toenails or nails subject to withdrawal. Where positive connection to the primary building structure cannot be verified during inspection, decks shall be self-supporting. For decks with cantilevered framing members, connections to exterior walls or other framing members, shall be designed and constructed to resist uplift resulting from the full live load specified in Table R301.5 acting on the cantilevered portion of the deck.

~~R507.2.3~~ <u>R507.3</u> Deck lateral load connection. The lateral load connection required by Section R507.1 shall be permitted to be in accordance with Figure R507.~~2.~~3. Where the lateral load connection is provided in accordance with figure 507.~~2.~~3, hold-down tension devices shall be installed in not less than two locations per deck, and each device shall have an allowable stress design capacity of not less than 1500 pounds (6672 N).

FIGURE ~~507.2.3~~ <u>507.3</u>
DECK ATTACHMENT FOR LATERAL LOADS

(Figure remains unchanged)

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC) The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

The provisions for deck design and attachment to the house have evolved in recent years. The IRC is now very strong on appropriate attachment to the main structure, as it should be. However, the specific provision in R507.1 that requires design for lateral loads, and the prescriptive hold-down tension connector alternative of R507.2.3, seem overly conservative for decks that are at grade, when these decks do not even require guardrails. For at-grade decks, the lag screw/bolt connections from deck ledger to band joist required by R507.2 are adequate. Elevated decks would still be required to be designed for lateral loads in accordance with R507.1 or the prescriptive hold-down tension devices specified in R507.2.3 (figure included below for convenience).

The renumbering of current Section R507.2.3 to R507.3 is necessary because current Section R507.2.3 serves as a prescriptive alternative to the requirement for design for lateral loads in R507.1. The purpose of the exception is to retain the requirement for ledger-to-band joist lags or bolts in current R507.2, R507.2.1, and R507.2.2, but exempt low decks from the prescriptive hold-down tension devices (or design for lateral load) in current section R507.2.3. Moving current R507.2.3 to its own section allows easier reference to the lag/screw connection requirements.

Cost Impact: The code change proposal could reduce the cost of construction. It could reduce the cost of construction.

R507.1-RB-BAJNAI-BCAC.doc

<u>Committee Action Hearing Results</u>

Committee Action: **Approved as Submitted**

Committee Reason: This is a needed exception for decks without guards. This allows decks without guards to be attached without the lateral hold downs.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Glenn Mathewson, MCP, City of Westminster, CO, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R507.1 ~~Decks~~ General. Decks shall be designed in accordance with this section and accepted engineering practice to resist both vertical and lateral loads as required by Section R301.1. Ledger connections to exterior walls shall not be made to any wall cladding or veneers and shall be made to the primary structure. ~~Where supported by attachment to an exterior wall, decks shall be positively anchored to the primary structure and designed for both vertical and lateral loads.~~

> ~~**Exception:** Design for lateral loads, and connectors in accordance with Section R507.3, shall not be required for decks that do not require guards in accordance with Section R312.1.1, provided that the deck ledger is connected to the band joist in accordance with Section R507.2.~~

Such ~~attachment~~ connection shall not be accomplished by the use of toenails or nails subject to withdrawal. Where positive connection to the primary building structure cannot be verified during inspection, decks shall be self-supporting.

For decks with cantilevered framing members, connections to exterior walls or other framing members, shall be designed and constructed to resist uplift resulting from the full live load specified in Table R301.5 acting on the cantilevered portion of the deck.

~~**R507.3 Deck lateral load connection.** The lateral load connection required by Section R507.1 shall be permitted to be in accordance with Figure R507.2.3. Where the lateral load connection is provided in accordance with figure 507.2.3, hold-down tension devices shall be installed in not less than two locations per deck, and each device shall have an allowable stress design capacity of not less than 1500 pounds (6672 N).~~

~~**Figure R507.2.3**~~
~~**Deck attachment for lateral loads.**~~

Commenter's Reason: As you consider this public comment modification, please review the additional information at the end that provides a better undesrstanding of the history and implications of the IRC lateral load provisions on the construction industry. Rather than only exempting low-level decks from lateral load connections as RB263 proposes, this public comments provides evidence that it's not required on most if not all decks.

In the summer of 2013, a month before this public comment was due, the Forest Products Society published an edition of Wood Design Focus containing research articles providing results from Washington State University and Virginia Tech regarding testing of decks for lateral loads. Seven years after the lateral load provisions were put in the IRC, only NOW we finally have real information. The following results of these tests provide the validated information the decking and code industry has been waiting for. While more research is necessary for a complete prescriptive lateral load design method in the IRC, the research to date is sufficient enough to prove that what has been in the IRC is a fallacy and must be removed. Quality structural provisions based on real data will be more appropriately developed for the 2018 with a clean slate. There is no justification and has never been any justification for building code, products or alternatives based on what is in the 2012 IRC for deck lateral loads.
The following quotes from this document are provided below under "fair use" permitted by the publisher, the Forest Products Society.

Wind Analysis from Washington State University.
To determine the effects of wind on typical deck construction, load calculations for a 12 x 12 deck 10 ft. above grade were performed. The following text is from this research report.

> "From the assumptions in the example, the largest ASD wind load was 1,299 lb using ASCE 7-10 methodology and data. The resulting hold-down force for a 12 ft by 12 ft deck would be approximately 650 lb. This load is smaller than the 1,500 lb hold-down requirement in the 2009 IRC, Section 502.2.2.3. From this analysis, the 1,500 lb minimum design capacity is conservatively high for wind lateral loads. An allowable design capacity of 650 lb would be sufficient to resist the wind lateral loads based on the assumptions and calculations given in this paper. Unless you are in a hurricane or special wind

region, the hold-down forces will be significantly smaller. Based on the above assumptions, the hold down forces would be approximately 266 lb."

According to the study of this deck, in a hurricane or special wind region, the lateral load developed at the connection device would be 650 lb. However, more common wind zones (i.e. the minimum standard) would only require a 266 lb design resistance. This is well below the 1500 lb currently in the IRC.

Seismic Analysis from Washington State University.
To determine the effects of seismic activity on typical deck construction, load calculations for a 12 x 12 deck 10 ft above grade were performed. The calculations and the resulting loads are based on seismic design category D. The following text is from this research report.

> "Based on our seismic analyses with the stated assumptions, and using the equivalent lateral load provisions in ASCE 7-10, hold-down requirements significantly lower than 1,500 lb can be justified when seismic loads govern. From our analyses, a maximum ASD-factored seismic load of 1,250 lb would be reasonable, resulting in hold-down requirements of approximately 625 lb. This can be achieved through a variety of hardware solutions."

Again, we will compare these values at the end of this report. To summarize, in a very high seismic region (D), only 625 lb. of load would require resistance. It is safe to assume it will be less for lower seismic regions. This is well below the 1500 lb currently in the IRC.

Lateral Load from Occupants Testing from Washington State University.
To determine the magnitude of lateral load that could be generated by the movement of occupants on a deck, tests were conducted on a full-scale deck with human subjects. The following text is from this research report.

> "The highest lateral load observed in all tests was 12.1 psf shown in Table 2. In this case, deck boards were oriented parallel to the deck ledger, resulting in a very flexible deck that swayed back and forth approximately 7 inches each way at a frequency of approximately 1 Hz. These large displacements caused significant inertial forces from the mass of the deck and also allowed the occupants to "feel" the deck movement, making it easier for them to synchronize their movements. As displacement of the deck reached maximum values of approximately 7 inches, the occupants started pivoting their hips (like downhill skiers) with the deck while leaving their upper body nearly motionless. At this point, it could be argued that the majority of the force generated is coming from deck inertial forces rather than from the occupants. This would imply that if lateral sway/acceleration of a deck is adequately restrained, these inertial forces could be reduced or eliminated. For example, when the cyclic motion was perpendicular to the deck ledger (the stiffest orientation), the maximum traction load was 4.5 psf. In summary it could be argued for the design that 12 psf would provide a reasonable upper estimate of lateral loads from occupants for flexible decks."

Let's look at some key parts of this information.

1) The test revealed that a 12 x12 deck loaded to 40psf with moving occupants, would experience approximately 7 inches maximum of displacement. This deflection is measured from the outer corner of the deck, at 12 ft from the ledger side of the deck. This is with perpendicular decking installed.
2) At the above described maximum expected deflection, the maximum load expected to be generated by the occupants is conservatively 12 psf.
3) It is important to note that this load is based on a deck built that allows sway up to 7 inches. Had the deck been designed appropriately, to resist such deformation, the researcher states the loads would be reduced.

Ledger Connection Testing by Virginia State.
The same researcher that conducted the ledger connection tests that were the basis of the ledger fastening table in the 2009 IRC performed this research. Two 12 x 12 decks were constructed identically with perpendicular decking. One deck had lateral hold down anchors installed, the other did not. The decks were fastened with a strut along the center of the 12 ft. joists spans to simulate the resultant location of a uniformly loaded deck. The decks were pulled laterally at this midpoint to a displacement of 17 inches, far greater than anything the occupants in the previously described test could generate. The following text from the research report describes the damage observed by these large loads.

> "In both tests, splitting of the top edges of the deck joists was the main source of damage, and was caused by the couple from the deck screws that induced stresses perpendicular to the grain. Splitting propagated along the longitudinal axis of the wood. Each deck joist completely split, to the depth of screw penetration, from the load drag strut to the ledger board. Significant yielding and fracture of deck board screws was also observed in this region. Minimal joist splitting and screw yielding was seen in the region from the load drag strut to the outer deck beam. In both tests, no damage was observed in the deck ledger to house rim board connection. A maximum separation of 0.1 inches when hold-downs were used and 0.15 inches when hold-downs were not used was recorded between the deck ledger and diaphragm rim board at the tension chord of the deck. No damage was observed in the simulated house diaphragm."

It is critical at this time to remember the original motivation for including the lateral load provisions in the 2009 IRC was the connection of the band joists to the house, as shown in the clip below:

Reason: Researchers at Virginia Tech University and Washington University have tested simulated deck-ledger to house-band-joist connections in their respective laboratories. A practical range of pressure-preservative-treated (PPT) deck ledger lumber (incised Hem-fir and Southern Pine) was attached to a simulated Spruce-Pine-Fir band joist by ½-inch lag screws or bolts with washers. The deck ledger was separated from the house band joist by placing a piece of 15/32" wall sheathing in the connection, and in another test case for bolts only, a ½-inch stack of washers was inserted into the connection to produce a drainage plane. The specimens were tested to failure and the average test results ware divided by a factor of 3.0, intended to provide an adequate in-service safety factor, and further divided by 1.6 to convert from a "test duration" to a "normal duration" of ten years recognized by the NDS and IBC as the proper duration for occupancy live load.

The proposed on-center spacing is the closest spacing for the two cases of deck ledger lumber studied. Due to the limited investigation into the performance of composite type house rimboards (only DFL was evaluated) and the possibility of rimboards entering the market being a lower quality than what was tested at Washington State University, engineered rimboards are not included in the scope of the proposed fastener spacing table. Instead, footnote 6 is proposed to refer the contractor and official to the manufacturer of the rimboard product. The two papers cited in the Bibliography gives the testing procedure and results for the cases included in the caption to the proposed table.

Cost Impact: The code change proposal will increase the cost of construction.

Committee Action: **Approved as Submitted**

Committee Reason: This is a much needed addition to the code and it brings in a new table that is a good starting point for the attachment of the deck ledger to the band joist. The committee urges additional study of the attachment of the band joist to the framing.

Assembly Action: **None**

2007 ICC FINAL ACTION AGENDA **445**

The committee reason in the clip above, approving the ledger fastening table, is provided below:

> "Committee Reason: This is a much needed addition to the and brings in a new table that is a good starting point of the attachment of the ledger to a band joist. The committee urges additional study of the attachment of the band joist to the framing."

The test above, by the original researcher of the ledger connection, reveals that no damage occurred to the simulated house diaphragm, even under the most maximum loads in the test and a 17 inch horizontal deflection that split the tops of the joists. The band joist attachment to the framing did not require any additional connection. Seven years later, the study has been provided.

Many have questioned, "Doesn't a ledger connected with lag screws resist at least some lateral load?" The following text is from the research report.

> "The two outermost lag screws in tension resisted most of the chord force and the sum of the forces in all the lag screws located in the tension region of the deck agree well with the calculated overturning tension force (Figure 6). Furthermore, even though the two outermost lag screws carried most of the force, these lag screws did not show any visible signs of withdrawal at a maximum load of approximately 7,000 lbs (Figure 5)"

According to the graph below from the research, the deck experienced a horizontal deflection at approximately 17 inches at a load just shy of 3500 lbs. However, when loading continued upwards of 7,000 lbs, "the lag screws did not show any visible signs of withdrawal". I think the answer is that lag screws do withstand lateral loads, and band joists don't get pulled from homes.

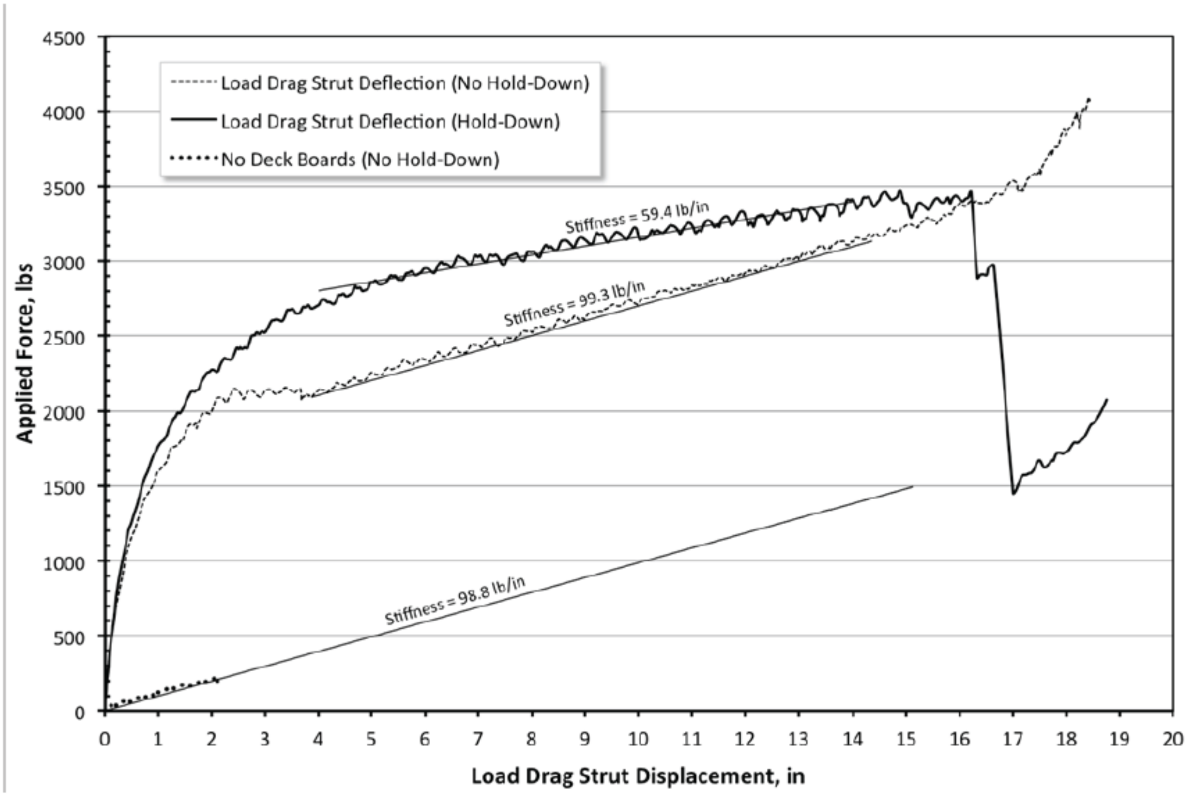

Figure 4. Load-Displacement Curves for Deck With and Without Hold-downs

There is still more to be said about the lateral load anchors and the ledger connection in this test. The following text is from this research report.

> "*Hold-down behavior and geometric effects.*--If the deck behaved as a rigid body, the tension chord forces can be calculated using simple statics as given in Equation 4.3-7 of the 2008 *Special Design Provisions for Wind and Seismic* (AF&PA, 2008), and are shown in Figure 7. However, due to the flexibility of the deck, the measured forces in the hold-down connectors were dramatically different than expected. <u>The hold-down expected to resist overturning tension forces actually diminished to zero as the deck deformed."</u>

The lateral load detail provided in the IRC with no structural basis, indeed…has no structural basis. It doesn't even work as intended and clearly doesn't belong in the IRC. The following text is from this research report.

> "Ledger attachment -- Deck ledgers were attached with 0.5-inch diameter lag screws in a staggered pattern as specified in IRC Table R502.2.2.1. The research basis for the IRC provisions was Carradine et al. (2007;; 2008). <u>The deck ledger-to-house attachment appeared to be adequate for the conditions studied. When no tension hold-down connectors were used, the outer two lag screws carried most of the withdrawal load with no visible signs of failure</u> (Figure 6). <u>Testing was terminated before an ultimate strength was achieved at a load of approximately 7,000 lb for both decks. The two lag screws nearest the deck tension chord experienced the largest forces, yet did not fail in withdrawal. These results point to the effectiveness of 0.5-in diameter lag screws when selected and installed per the IRC deck ledger connection provisions in Table R502.2.2.1 (ICC 2009b).</u> The results obtained in this study should generally apply to decks with an aspect ratio of 1:1 and less, where aspect ratio is defined as the deck dimension perpendicular to the house divided by the dimension parallel to the house. The study results should not be applied to decks having an aspect ratio greater than 1:1 as the failure modes and deck behavior may substantially change."

7,000 lb. of lateral load placed at the centroid of the deck and the lag screws "did not fail in withdrawal" and the band joist experienced no visible sign of anything.

The summary of all this is simple. Wind and seismic don't produce lateral loads on standard decks with sufficient magnitude to justify a special lateral connection across all zones.
Occupants can only produce about 12 psf of lateral force uniformly across a deck. A 12 x 12 deck attached per the IRC ledger-fastening table and WITHOUT lateral anchors was able to resist a resultant lateral force of 7,000 lb. The joists split and failed while there was only a fraction of an inch of movement in the ledger and no visible sign of any change to the rim joist. The equivalent load

that could be produced by occupants is 1728 lb. 1/4th of a 7,000 lb test that still did not separate the ledger or band joist from the home.

Based on 12 psf of lateral load design, it would take 583 square feet to generate 7,000 lb. With the longest common framing material available being 18 ft. long, a 583 sf deck would be 18 ft. x 32 ft. This reduces the aspect ratio from 1:1 for the 12 x 12 deck to 1:1.77. This reduction in aspect ratio reduces the resultant force at the ledger ends. It also increases the length of the lag-screwed ledger from 12 ft. to 32 ft, meaning more fasteners to resist the additional load. With this consideration and extrapolating the test results, a deck constructed of common dimensional lumber can be built of any size without exceeding the values found in these tests, provided the deck aspect ratio is no greater than 1:1.

Occupants' movement will not disconnect a ledger attached per the IRC fastening table. Lateral devices are just not even close to necessary.

In summary, the request of the committee from the 2009 code development to have further testing of the band joist connection has been satisfied. The real data from research clearly disproves the necessity of the lateral load anchor details "permitted" in the IRC

The current lateral load provisions first came to the code as late as possible, as a public comment. It's no wonder they are now found to be flawed. With an approval as modified of this public comment, lateral load provisions can be developed as they should be. With a clean start and a lot learned, provisions can be based on real research, vetted by professionals nationwide, and introduced at the beginning of the code development process.

ADDITIONAL INFORMATION

How did Figure R507.2.3 get in the IRC?

During the development of the 2009 IRC, (supplement cycle), a new proposal was submitted at the start of the modification process. This proposal provided a much needed ledger connection table for the fastening of a deck ledger to a band joist. Extensive testing conducted by Dr. Frank Woste and peers conducted at Virginia Tech was the basis of this critical addition to the IRC.

During the committee hearings, the committee approved the ledger connection table. They did provide a comment, however, stating that this provided a great connection between the ledger and the band joist, but they would like to see more research regarding the connection of the band joist to the remaining framing.

To address this committee comment regarding the sufficiency of the band joist connection to the structure, the lateral load detail and provisions were submitted as a modification to the ledger connection table. During the final hearings, the voting membership in attendance approved the modification. Without being fully vetted through the entire code modification process, the lateral load provisions were printed in the 2009 IRC. They were approved for the IRC after only being alive in the process for 46 days. This created the following implications:

1) A prescriptive structural provision was included in the code without any scientific or statistic basis what-so-ever. The 1500 lb value is a mere guess.
2) It requires fastening of floor sheathing greater than that required by perscriptive code for floor construction.
3) It is described as a connection that "shall be permitted". This phrase is used as a clarifier in the IRC for when an installation would be otherwise prohibited. This language created confusion in code administration leading to it being considered a "requirement".
4) A proprietary based fastening solution, complete with artwork, as the sole remedy.

The origin for the lateral load detail in the IRC is from a FEMA document for earthquake resistant design. Though not tied to any siesmic zone, the IRC detail is MORE RESTRICTIVE than the FEMA detail in that it requires additional fastening of the floor sheathing to the joist with the hold down.

How have the IRC lateral load provisions affected the construction industry.

The domino effect of including an unfounded structural value for an unothodox "permissable" connection utilizing proprietary products in the IRC has been dramatic. To the decking industry, it has un-necesarrily driven up the cost of construction. Most alarming is that the added expense and inconvenience without foundation has served as motivation to homeowners to have their deck built without permit. Installation of the hold-down detail requires invasive remodeling that most homeowners will not accept.

Another impact is the code insutry itself, where it has devalued the legitimacy of the IRC provisions with unfounded structural designs and supports a demand for proprietary products. As a code administrator, I am appauled, as are many of my colleagues. Many of the following graphics are intended to show how the lateral load provisions have caused unwarranted delimna.

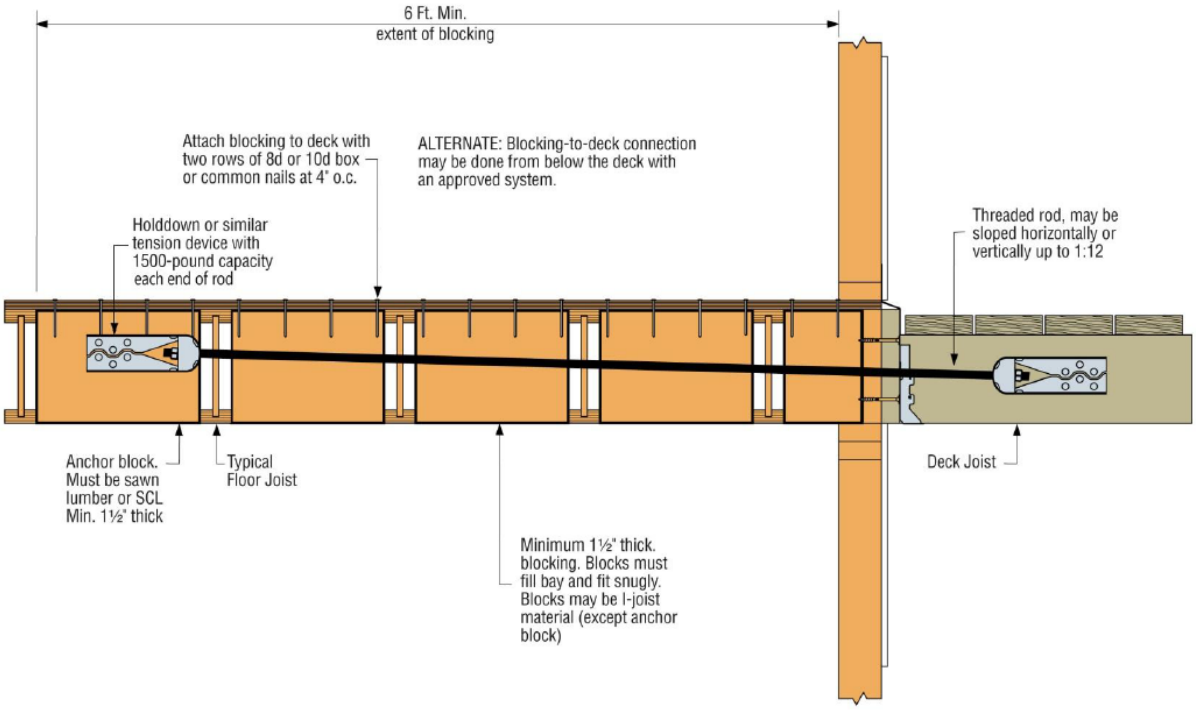
Wood I-joist Manufacturers Association.

I-joist manufacturers, fielding inquiries regarding how to connect a 1500 lb load device to their floor systems, had to respond. The Wood I-joist Manufacturers Assocation did just that with the publication of a technical report. With no choice but to use the 1500 lb figure published in the IRC, they were forced to create details such as those below.

Take a moment and look at the details and some of the potential ramifications.

- Removal of floor finish
- Removal of ceiling finish
- Threaded rod extending at least 6 feet into the floor system with blocking in every bay.
- Floor sheathing that must be fastened to he blocking at 4 inches on center.

This is to satisfy an IRC load that is not proven and not even required.



As mentioned previously, the lateral load detail and provisions is unusually included in the code as a “permitted” method to resist lateral loads…that are undefined and undetermined. Being unorthodox language for the IRC, it is promoted as if it is required by many organizations, manufacturers and professionals. The text shown below is copied from the WIJMA details and appears to promote a “requirement” for this connection that is merely “permitted”.

Deck Lateral Load Connection to Prefabricated Wood I-Joist Floor System

The International Residential Code (IRC) includes provisions for resisting lateral forces of an exterior deck that is attached to a structure. Specifically, 2009 IRC R502.2.2.3 and 2012 IRC R507.2.3 require connections at two locations that resist a minimum lateral load of 1500 lbs per connection.

ICC-ES Acceptance Criteria Development
In December of 2010 ICC Evaluation Services began development of an acceptance criteria, AC430, for “Deck harness devices”. The purpose of these criteria was to test alternative methods of lateral load connection other than the hold-down/threaded rod method provided in the 2009 IRC. Interestingly, here is a statement by ICC-ES staff regarding this subject.

TO: **PARTIES INTERESTED IN DECK HARNESS DEVICES AND ASSEMBLIES FOR RESIDENTIAL DECKS**

SUBJECT: Proposed Acceptance Criteria for Deck Harness Devices and Assemblies for Residential Decks, Subject AC430-0211-R1 (MO/JS)

> The ICC-ES staff is of the opinion that the devices specified in IRC Section R502.2.2.3 are prescriptive requirements, in lieu of engineered connections to the primary structure. Regardless of whether the hold-down tension devices specified in IRC Section R502.2.2.3 are to be considered components within the primary structural support system, or as safety devices within a backup system, the devices clearly serve a structural purpose, as indicated by the minimum required ASD capacity of 1500 pounds (6672 N).

Though the lateral load detail was approved for the 2009 IRC as merely a "permitted detail" and not outright required, it became the easy answer. Note that the justification for this connection, according to ICC-ES, is that "…the devices clearly serve a structural purpose, as indicated by the minimum required ASD capacity of 1500 pounds." At this point, the reason why the lateral load provisions were originally included in the IRC are starting to be lost. ICC-ES doesn't know if it is part of the primary design or a backup safety device. The answer is that it is out of concern of the band joist (rim joist) detaching from the structure.

Proposed Change as Submitted

Proponent: Brian Foley, P.E. Fairfax County, VA, representing Virginia Building and Code Officials Association (brian.foley@fairfaxcounty.gov), Glenn Mathewson, M.C.P., North American Deck and Railing Association, Randy Shackleford, P.E., Simpson Strong-Tie

Revise as follows:

R507.1 Decks. Wood decks shall be in accordance with this section. Where supported by attachment to an exterior wall, decks shall be positively anchored to the primary structure and designed for both vertical and lateral loads. Such attachment shall not be accomplished by the use of toenails or nails subject to withdrawal. Where positive connection to the primary building structure cannot be verified during inspection, decks shall be self-supporting. For decks with cantilevered framing members, connections to exterior walls or other framing members, shall be designed and constructed to resist uplift resulting from the full live load specified in Table R301.5 acting on the cantilevered portion of the deck. The use of other grades, species, loading, materials and conditions not described herein shall be permitted be in accordance with Section R301.

R507.4 Decking. Wood decking shall be at least a nominal 2-inch (51 mm) in thickness and placed at an angle between 45 and 90 degrees to deck joists spaced a maximum of 24-inches (610 mm) on-center. Wood decking shall be attached to each supporting member with a minimum of (2)8d threaded nails or (2)#8 wood screws.

Exceptions:

1. Wood decking with a minimum nominal thickness of 1 $^1/_4$ inches (32 mm) shall be permitted to be installed at 90 degrees to deck joists spaced a maximum of 24 inches (610 mm) on center and not less than 45 degrees to deck joists spaced a maximum of 16 inches (406 mm) on center.
2. Wood/plastic composite decking in accordance with Section R507.3.

R507.5 Allowable deck joist spans. Spans for wood deck joists, as shown in Figure R507.5, shall be in accordance with Table R507.5. Deck joist shall be permitted to cantilever a maximum of one-fourth of the joist span.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. No. 2 grade with wet service factor.
b. Ground snow load, live load = 40 psf, dead load = 10 psf, L/Δ = 360.
c. Ground snow load, live load = 40 psf, dead load = 10 psf, L/Δ = 360 at main span, L/Δ = 180 at cantilever with a 220 pound point load applied to end.
d. Includes incising factor.
e. Northern species with no incising factor

R507.5.1 Lateral restraint at supports. Joist ends and bearing locations shall be provided with lateral restraint to prevent rotation. Where lateral restraint is provided by joist hangers or blocking between joists, their depth shall equal not less than 60 percent of the joist depth. Where lateral restraint is provided by rim joists, they shall be secured to the end of each joist with a minimum of (3)10d threaded nails or (3)#10x3 inch (76 mm) long wood screws.

R507.6 Deck Beams. Spans for deck beams, as shown in Figure R507.6, shall be in accordance with Table R507.6. Beam plies shall be fastened with two rows of 10d threaded nails minimum at 16 inches (406 mm) on center along each edge. Beams shall be permitted to cantilever at each end up to one-fourth of the beam span. Splices of multi-span beams shall be located at interior post locations.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

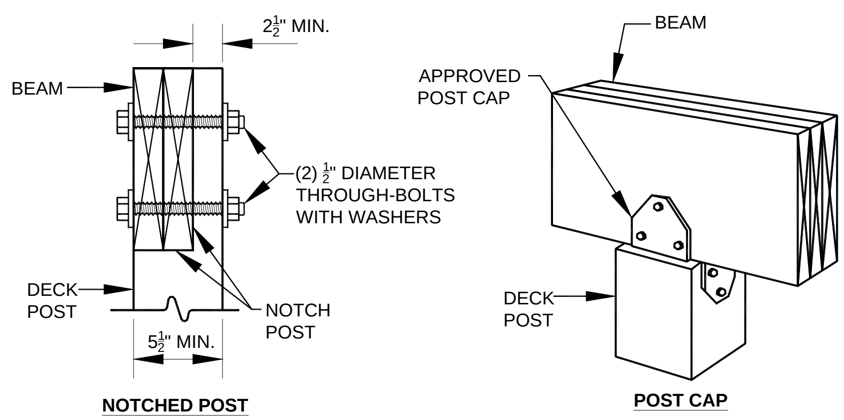
a. Ground snow load, live load = 40 psf, dead load = 10 psf, L/Δ = 360 at main span, L/Δ = 180 at cantilever with a 220 pound point load applied at the end.
b. Beams supporting deck joists from one side only.
c. No 2 grade, wet service factor.
d. Beam depth shall be greater than or equal to depth of joists with a flush beam condition.
e. Includes incising factor.
f. Northern species with no incising factor.

R507.7 Deck joist and deck beam bearing. The ends of each joist and beam shall have not less than 1.5 inches (38 mm) of bearing on wood or metal and not less than 3 inches (76 mm) on concrete or masonry for the entire width of the beam. Joist framing into the side of a ledger board or beam shall be supported by approved joist hangers. Beam bearing at deck posts shall be in accordance with Section R507.8.1.

R507.8 Deck posts. For single level wood decks with beams sized in accordance with Table R507.6, posts shall be a minimum nominal 6x6 with a maximum height of 14 feet (5486 mm) measured to the underside of the beam.

Exception: Nominal 4x4 or 4x6 posts shall be permitted with a maximum height of 8 feet (2438 mm).

R507.8.1 Deck post to deck beam. Deck beams shall be attached to deck posts in accordance with Figure R507.8.1. Post to beam connections shall be constructed to resist lateral displacement. Manufactured post-to-beam connectors shall be sized for the post and beam sizes. All bolts shall have washers under the head and nut.



For SI: 1 inch = 25.4 mm

FIGURE R507.8.1
DECK BEAM TO DECK POST

R507.8.2 Deck post to deck footing. Posts shall bear on footings in accordance with Section R403 and Figure R507.8.2.

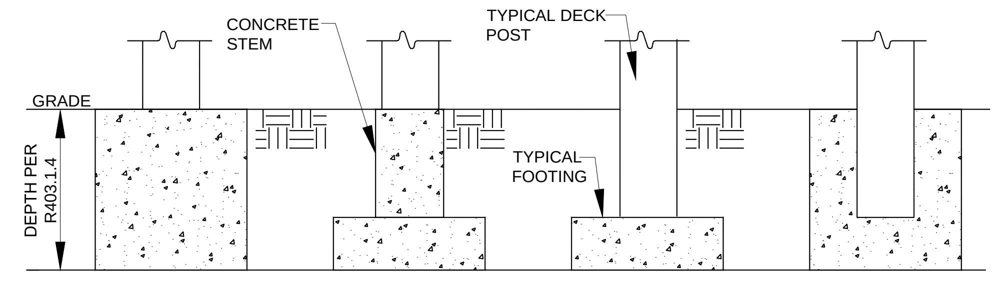


FIGURE R507.8.2
TYPICAL DECK POSTS TO DECK FOOTINGS

Reason: Wood decks are the most prolific structure to be constructed to a residential dwelling, yet there is very little guidance in the IRC regarding the structural capacity of the joists, beams and posts. The existing span tables in Chapter 5 do not address wood decks due to the differences in their design considerations. Some builders and code officials often rely on span tables developed by AHJs or the DCA6 published by the American Wood Council, while others have nothing to refer to.

With the permission of the American Wood Council, we have provided in this proposal their span tables for typical joists and beams and height requirements for typical posts based on the most common wood species and grade used throughout the country. Attachment and bearing requirements are also provided to give the user guidance on how these elements connect. With the existing provisions already in Section 507, the IRC user would be able to design and construct a safe wood deck.

Careful attention was given to ensure these new provisions did not and could not deter the construction of decks composed of other materials and in different configurations and conditions.

Cost Impact: The code change proposal will not increase the cost of construction.

R507.1-RB-FOLEY.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee felt this proposal needs reworking and brought back. There is no criteria for the threaded nails. Language is unclear. There is no provision for the deck post to footing to be raised above grade for moisture protection.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Brian Foley, Fairfax County, VA, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R507.1 Decks. Wood-framed decks shall be in accordance with this section or Section R301 for materials and conditions not prescribed herein. Where supported by attachment to an exterior wall, decks shall be positively anchored to the primary structure and designed for both vertical and lateral loads. Such attachment shall not be accomplished by the use of toenails or nails subject to withdrawal. Where positive connection to the primary building structure cannot be verified during inspection, decks shall be self-supporting. For decks with cantilevered framing members, connections to exterior walls or other framing members, shall be designed and constructed to resist uplift resulting from the full live load specified in Table R301.5 acting on the cantilevered portion of the deck. ~~The use of other grades, species, loading, materials and conditions not described herein shall be permitted be in accordance with Section R301.~~

~~**R507.4 Decking.** Wood decking shall be at least a nominal 2-inch (51 mm) in thickness and placed at an angle between 45 and 90 degrees to deck joists spaced a maximum of 24-inches (610 mm) on-center. Wood decking shall be attached to each supporting member with a minimum of (2)8d threaded nails or (2)#8 wood screws.~~

~~**Exceptions:**~~

~~3. Wood decking with a minimum nominal thickness of $^5/_4$ inches (32 mm) shall be permitted to be installed at 90 degrees to deck joists spaced a maximum of 24 inches (610 mm) on center and not less than 45 degrees to deck joists spaced a maximum of 16 inches (406 mm) on center.~~

~~4. Wood/plastic composite decking in accordance with Section R507.3.~~

R507.~~5~~4 Allowable deck joist spans. Spans for wood deck joists, as shown in Figure R507.~~5~~4, shall be in accordance with Table R507.~~5~~4. Deck joists shall be permitted to cantilever a maximum of one-fourth of the actual joist span.

~~**TYPICAL DECK POSTS TO DECK FOOTINGS**~~

Commenter's Reason: There are no provisions for building a wood-framed, exterior deck under the prescriptive provisions of the existing IRC. Decks have notoriously never been address comprehensively in any building standard in our country, and therefore there are a great variety of construction methods that have long been in practice. An informal and open group of professionals and organizations have been working together to recognize this variety and develop well-rounded provisions suitable for the IRC. The provisions proposed in the original RB264-13 represented what could generally be agreed upon by the majority, however, testimony during the hearings on this and other deck-related proposals drew doubt from the committee that industry-wide agreement had been met.

This group continues to work together and will likely do so toward 2018 IRC proposals. Until then, the nation is left without clear guidance for joist and beams spans intended specifically for conventionally framed decks in wet-use environments. The joist span tables currently in the IRC are not suitable for exterior, treated or incised lumber and there is no method for sizing beams appropriately. RB264-13, in this public comment, has been edited to include joist, beam and post sizing only such that the most basic of deck structural elements can be recognized in the code. Tens of thousands of decks will be built every year and permitted by building officials. With this proposed change, the IRC will address them better.

Public Comment 2:

Glenn Mathewson, Westminster, CO, representing North American Deck and Railing Association (NADRA) requests Approval as Modified by this Public Comment.

Modify the proposal as follows

R507.1 Decks. Wood-framed decks shall be in accordance with this section or Section R301 for materials and conditions not prescribed herein. . Where supported by attachment to an exterior wall, decks shall be positively anchored to the primary structure and designed for both vertical and lateral loads. Such attachment shall not be accomplished by the use of toenails or nails subject to withdrawal. Where positive connection to the primary building structure cannot be verified during inspection, decks shall be self-supporting. For decks with cantilevered framing members, connections to exterior walls or other framing members, shall be designed and constructed to resist uplift resulting from the full live load specified in Table R301.5 acting on the cantilevered portion of the deck. ~~The use of other grades, species, loading, materials and conditions not described herein shall be permitted be in accordance with Section R301.~~

R507.4 Decking. Maximum allowable spacing for joists supporting ~~wood~~ decking shall be in accordance with Table R507.4. ~~at least a nominal 2-inch (51 mm) in thickness and placed at an angle between 45 and 90 degrees to deck joists spaced a maximum of 24-inches (610 mm) on-center.~~ Wood decking shall be attached to each supporting member with a minimum of (2)8d nails or (2)#8 wood screws.

~~**Exceptions:**~~

~~5. Wood decking with a minimum nominal thickness of $^5/_4$ inches (32 mm) shall be permitted to be installed at 90 degrees to deck joists spaced a maximum of 24 inches (610 mm) on center and not less than 45 degrees to deck joists spaced a maximum of 16 inches (406 mm) on center.~~

~~6. Wood/plastic composite decking in accordance with Section R507.3.~~

Table R507.4
Maximum joist spacing

Material type and nominal size	Maximum on-center joist spacing	
	Perpendicular to joist	Diagonal to joist[a]
5/4-inch thick wood	16 inches	12 inches
2-inch thick wood	24 inches	16 inches
Plastic composite	Per R507.3	Per R507.3

For SI: 1 inch = 25.4 mm
a. Maximum angle of 45 degrees from perpendicular for wood deck boards

R507.5 ~~Allowable~~ Deck joists ~~spans~~. Maximum allowable spans for wood deck joists, as shown in Figure R507.5, shall be in accordance with Table R507.5. Deck joist shall be permitted to cantilever a maximum of one-fourth of the actual, adjacent joist span.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

l. No. 2 grade with wet service factor.
m. Ground snow load, live load = 40 psf, dead load = 10 psf, L/Δ = 360.
n. Ground snow load, live load = 40 psf, dead load = 10 psf, L/Δ = 360 at main span, L/Δ = 180 at cantilever with a 220 pound point load applied to end.
o. Includes incising factor.
p. Northern species with no incising factor
q. Cantilevered spans not exceeding the nominal depth of the joist are permitted.

R507.5.1 Lateral restraint at supports. Joist ends and bearing locations shall be provided with lateral restraint to prevent rotation. Where lateral restraint is provided by joist hangers or blocking between joists, their depth shall equal not less than 60 percent of the joist depth. Where lateral restraint is provided by rim joists, they shall be secured to the end of each joist with a minimum of (3) 10d (3" x 0.128") ~~threaded~~ nails or (3) #10x3 inch (76 mm) long wood screws.

R507.6 Deck Beams. Maximum allowable spans for wood deck beams, as shown in Figure R507.6, shall be in accordance with Table R507.6. Beam plies shall be fastened with two rows of 10d (3" 0.128") ~~threaded~~ nails minimum at 16 inches (406 mm) on center along each edge. Beams shall be permitted to cantilever at each end up to one-fourth of the actual beam span. Splices of multi-span beams shall be located at interior post locations.

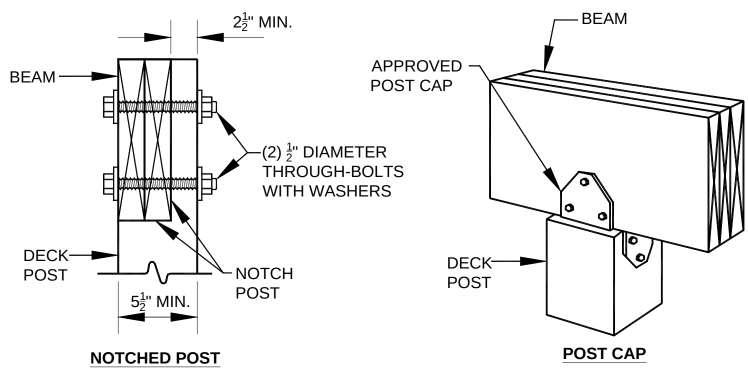
	3-2x12	13-11	12-1	10-9	9-10	9-1	8-6	8-1

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.
m. Ground snow load, live load = 40 psf, dead load = 10 psf, L/Δ = 360 at main span, L/Δ = 180 at cantilever with a 220 pound point load applied at the end.
n. Beams supporting deck joists from one side only.
o. No 2 grade, wet service factor.
p. Beam depth shall be greater than or equal to depth of joists with a flush beam condition.
q. Includes incising factor.
r. Northern species with no incising factor.

R507.7 Deck joist and deck beam bearing. The ends of each joist and beam shall have not less than 1.5 inches (38 mm) of bearing on wood or metal and not less than 3 inches (76 mm) on concrete or masonry for the entire width of the beam. Joist framing into the side of a ledger board or beam shall be supported by approved joist hangers. Joists bearing on a beam shall be connected to the beam to resist lateral displacement. ~~Beam bearing at deck posts shall be in accordance with Section R507.8.1.~~

R507.~~8~~7.1 Deck post to deck beam. Deck beams shall be attached to deck posts in accordance with Figure R507.8.1 or by other equivalent means capable ~~Post to beam connections shall be constructed~~ to resist lateral displacement. Manufactured post-to-beam connectors shall be sized for the post and beam sizes. All bolts shall have washers under the head and nut.

Exception: Where deck beams bear directly on footings in accordance with Section R507.8.2



For SI: 1 inch = 25.4 mm

FIGURE R507.8.1
DECK BEAM TO DECK POST

R507.8 Deck posts. For single level wood-framed decks with beams sized in accordance with Table R507.6, deck post size shall be ~~a minimum nominal 6x6 with a maximum height of 14 feet (5486 mm) measured to the underside of the beam.~~ in accordance with Table R507.8.

~~**Exception:** Nominal 4x4 or 4x6 posts shall be permitted with a maximum height of 8 feet (2438 mm).~~

Table R507.8
Deck Post Height

Deck Post Size	Maximum Height
4x4	8’
4x6	8’
6x6	14’

a. Measured to the underside of the beam.

R507.8.2 Deck post to deck footing. Posts shall bear on footings in accordance with Section R403 and Figure R507.8.2. Posts shall be restrained to prevent lateral displacement at the bottom support. Such lateral restraint shall be provided by manufactured connectors installed in accordance with Section R507 and the manufacturers’ installation instructions or a minimum post embedment of 12-inches in surrounding soils or concrete piers.

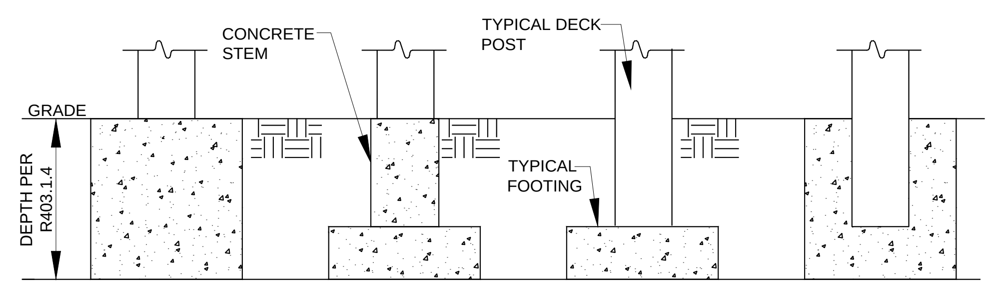


FIGURE R507.8.2
TYPICAL DECK POSTS TO DECK FOOTINGS

R317.1.4 Wood columns. Wood columns shall be approved wood of natural decay resistance or approved pressure-preservative-treated wood.

Exceptions:

1. Columns exposed to the weather or in basements when supported by concrete piers or metal pedestals projecting 1 inch (25.4 m) above a concrete floor or 6 inches above exposed earth and the earth is covered by an approved impervious moisture barrier.
2. Columns in enclosed crawl spaces or unexcavated areas located within the periphery of the building when supported by a concrete pier or metal pedestal at a height more than 8 inches from exposed earth and the earth is covered by an impervious moisture barrier.
3. <u>Deck posts supported by concrete piers or metal pedestals projecting a minimum of 1 inch above a concrete floor or 6 inches above exposed earth.</u>

Commenter's Reason: There is no method in which any typical, wood-framed, exterior deck can be built under the prescriptive provisions of the IRC. Decks have notoriously never been address comprehensively in any building standard in our country, and therefore there are a great variety of construction methods that have long been in practice. An informal and open group of professionals and organizations have been working together to recognize this variety and develop well-rounded provisions suitable for the IRC. It hasn't and won't be easy or quick. The provisions proposed in the original RB264-13 represented what could generally be agreed upon by the majority, however, testimony during the hearings on this and other deck-related proposals drew doubt from the committee that industry-wide agreement had been met.

RB264-13, in this public comment, has been expanded and re-written to recognize further consensus from the discussion group, to better present code provisions, and to address opposition testimony from the committee hearings.

The decking provisions have been rewritten to better describe the angled vs. perpendicular conditions. The new table proposed, R507.4, mirrors the organization and language of another long-standing IRC table for lumber floor sheathing, R503.1.

The post-sizing provisions have also been presented in table form for better presentation of the information.
Concerns regarding Figure R507.8.2 and the lack of a projection of the foundations above grade level were brought up during the hearing and were recognized in this public comment. It was agreed by the proponents of this comment that foundation details are not the appropriate location for provisions regarding the decay resistance of wood members. To better clarify the relationship between the height of footing and the decay resistance of the posts, a third exception specifically addressing decks was added to the current provisions for post (column) decay resistance, R317.1.4, "Wood columns"

Span tables were updated to the new design values for southern pine, and other minor clarifications were made throughout the proposal.

RB264-13

Final Action: AS AM AMPC____ D

RB265-13

R507.2, Table 507.2, R507.2.1, R507.2.2, R507.2.3 (NEW)

Proposed Change as Submitted

Proponent: Glenn Mathewson, North American Deck and Railing Association, representing The Colorado Chapter of the International Code Council, (GlennMathewson@nadra.org)

Revise as follows:

R507.2 Deck leger connection to band joist. ~~For decks supporting a total design load of 50 pounds per square foot (2394 Pa) [40 pounds per square foot (1915 Pa) live load plus 10 pounds per square foot (479 Pa) dead load], the connection between a deck ledger of pressure-preservative-treated Southern Pine, incised pressure-preservative-treated Hem-Fir, or *approved* decay-resistant species, and a 2-inch (51mm) nominal lumber band joist bearing on a sill plate or wall plate shall be constructed with ½-inch (12.7 mm) lag screws or bolts with washers in accordance with Table R507.2. Lag screws, bolts and washers shall be hot-dipped galvanized or stainless steel.~~ Deck ledger connections to band joists shall be in accordance with this section and Table R507.2, Table R507.2.1, Figure R507.2.1(1) and Figure R507.2.1(2). For other grades, species, connection details, and loading conditions, decks shall be designed in accordance with section R301.

~~**R507.2.1 Placement of lag screws or bolts in deck ledgers and band joists.** The lag screws or bolts in deck ledgers and band joists shall be placed in accordance with Table R507.2.1 and Figures R507.2.1(1) and R507.2.1 (2).~~

R507.2.1 Ledger details. Deck ledgers installed in accordance with section R507.2 shall be a minimum 2 x 8 nominal, pressure-preservative-treated or approved, naturally durable, No. 2 grade or better lumber. Deck ledgers installed in accordance with section R507.2 shall not support concentrated loads from beams or girders. Deck ledgers shall not be supported on stone or masonry veneer.

~~**R507.2.2 Alternate deck ledger connections.** Deck ledger connections not conforming to Table R507.2 shall be designed in accordance with accepted engineering practice. Girders supporting deck joists shall not be supported on deck ledgers or band joists. Deck ledgers shall not be supported on stone or masonry veneer.~~

R507.2.2 Band joist details. Band joists attached by a ledger in accordance with section R507.2 shall be a minimum 2-inch-nominal, solid-sawn, spruce-pine-fir lumber or a minimum 1 x 9.5 dimensional, Douglas fir, laminated veneer lumber. Band joists attached by a ledger in accordance with section R507.2 shall be fully supported by a wall or sill plate below.

R707.2.3 Ledger to band joist fastener details. Fasteners used in deck ledger connections in accordance with Table R507.2 shall be hot-dipped galvanized or stainless steel and shall be installed in accordance with Table R507.2.1 and Figure R507.2.1(1) and Figure R507.2.1(2).

TABLE R507.2
~~FASTENER SPACING FOR A SOUTHERN PINE OR HEM-FIR DECK LEDGER AND A 2-INCH-NOMINAL SOLID-SAWN SPRUCE-PINE-FIR BAND JOIST~~[~~c, f, g~~]
DECK LEDGER CONNECTION TO BAND JOIST[c, d, e]
(Deck live load = 40 psf, deck dead load = 10 psf, snow load <= 40 psf)

	JOIST SPAN						
~~JOIST SPAN~~	6' and less	6'1" to 8'	8'1" to 10'	10'1" to 12'	12'1" to 14'	14'1" to 16'	16'1" to 18'
Connection details	On-center spacing of fasteners[~~d, e~~]						

½ inch diameter lag screw with $^{15}/_{32}$ inch maximum sheathing[a]	30	23	18	15	13	11	10
½ inch diameter bolt with $^{15}/_{32}$ inch maximum sheathing	36	36	34	29	24	21	19
½ inch diameter bolt with ~~$^{15}/_{32}$~~ 1 inch maximum sheathing ~~and ½ inch washers~~[~~b, h~~ b]	36	36	29	24	21	18	16

For SI: 1 inch =n 25.4 mm, 1 foot = 304.8 mm. 1 pound per square foot = 0.0479 kPa.

a. The tip of the lag screw shall fully extend beyond the inside face of the band joist.

~~b. The maximum gap between the face of the ledger board and face of the wall sheathing shall be ½ inch.~~

b. Up to ½-inch thickness of stacked washers shall be permitted to substitute for up to ½-inch of allowable sheathing thickness.

c. Ledgers shall be flashed in accordance with Section R703.8 to prevent water from contacting the house band joist.

~~d. Lag screws and bolts shall be staggered in accordance with Section R507.2.1~~

~~e. Deck ledger shall be minimum 2 x 8 pressure-preservative-treated No. 2 grade lumber, or other approved materials as established by standard engineering practice.~~

~~f. When solid-sawn pressure-preservative-treated deck ledgers are attached to a minimum 1-inch-thick engineered wood product (structural composite lumber, laminated veneer lumber or wood structural panel band joist), the ledger attachment shall be designed in accordance with accepted engineering practice.~~

~~g. A minimum 1 x 9 1/2 Douglas Fir laminated veneer lumber rimboard shall be permitted in lieu of the 2-inch nominal band joist~~

~~h~~ d. Wood structural panel ~~sheathing~~, gypsum board ~~sheathing~~, fiberboard, lumber, or foam sheathing ~~not exceeding 1 inch in thickness~~ shall be permitted. ~~The maximum distance between the face of the ledger board and the face of the band joist shall be 1 inch.~~

e. Snow load shall not be assumed to act concurrently with live load.

Reason: The prescriptive ledger bolting provisions are very specific, yet difficult to understand and somewhat contradictory between the language in Section R507.2 and that of Table R507.2. Overall, this code modification proposal does not intend to change the application of the current provisions.

--Footnote "h" is the only place where the description of the type of sheathing permitted is provided. However, footnote "h" is only referenced in one of the three connection methods in the table. This has been corrected to reflect that the various sheathing types are allowed under all methods by placing the footnote reference in the main title of the table.

--Fiberboard ("black celotex®" or "thermoply® for example) and lumber sheathing (diagonal wood sheathing) is likely to be encountered in deck construction on existing homes. The current provision provides a blanket approval of "foam sheathing" which includes varying compositions and performance levels without regard. Under that consideration, fiberboard and lumber should certainly be acceptable up to the same maximum thickness.

--Footnote "b" and "h" are discussing the same topic but with different points of references. This is confusing, and has been corrected.

--Why list various engineered wood products in footnote f and reference what we already know about engineered alternatives. This is unnecessary text. They are alternatives and need to be approved under R104.11 or R301.

--In the current language, the description of allowable species for ledger material is not consistent between the section language, table title and table footnotes. The Section refers to decay resistant properties of PPT pine or hem-fir, and then continues with an ambiguous reference to "approved decay-resistant species" leaving it to the building official to decide. The Table heading, however, refers only to the pine and hem-fir and not the use of decay-resistant species. It is further confused with the references in the table footnotes for use of any PPT, No 2 grade lumber species or engineering. There is no consistency and it is not user friendly. The proposed language makes use of the IRC-defined term "naturally durable lumber" as opposed to "decay-resistant" and clearly explains the materials allowed under this connection method in the body of the code as opposed to footnotes in a table.

--"Rim Board" is a registered trademark of APA. The use of the term "rimboard" in discussions unique to engineered wood products used as band joists infers that said engineered band joist must be one rated by APA. The IRC does not require engineered lumber band joists to be APA rated "Rim Board". It is simply too similar to a proprietary trademark to be appropriate terminology for the IRC, when the industry- and IRC-wide term "band joist" is available for use.

--The description of the allowable materials for the home's band joist are described in the Section, the Table title and then again in the footnotes. As with the ledger material, this is now described only in the body of the code section.

--The current language would prohibit the connection of a deck ledger to a band joist that was larger in it's narrow cross-section than 2-inches, thus the term "minimum" has been moved in front of this size description.

Prohibition to supporting beams/girders on ledgers and band joist after the sentence about "engineering practice" and under the heading of "alternate deck ledger connections" is misleading. A design professional should not be prohibited from making such design. The intent has been presented more clearly in this proposal, that simply the fastening schedule does not anticipate concentrated loads from beams.

Cost Impact: This code change proposal will not increase the cost of construction.

R507.2-RB-MATHEWSON.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proponent's reason is very confusing. The deck provisions are evolving and once these changes are proven the proposal should be reworked and brought back.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Glenn Mathewson, MCP, City of Westminster, CO, representing North American Deck and Railing Association and the Colorado Chapter of ICC, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R507.2 Deck leger connection to band joist. Deck ledger connections to band joists shall be in accordance with this section and Table R507.2, Table R507.2.1, Figure R507.2.1(1) and Figure R507.2.1(2). For other grades, species, connection details, and loading conditions, ~~decks~~ ledger connections shall be designed in accordance with section R301.

R507.2.1 Ledger details. Deck ledgers installed in accordance with section R507.2 shall be a minimum 2 x 8 nominal, pressure-preservative-treated Southern Pine, incised pressure-preservative-treated Hem-Fir, or approved, naturally durable, No. 2 grade or better lumber. Deck ledgers installed in accordance with section R507.2 shall not support concentrated loads from beams or girders. Deck ledgers shall not be supported on stone or masonry veneer.

R507.2.2 Band joist details. Band joists attached by a ledger in accordance with section R507.2 shall be a minimum 2-inch-nominal, solid-sawn, spruce-pine-fir lumber or a minimum 1 x 9.5 dimensional, Douglas fir, laminated veneer lumber. Band joists attached by a ledger in accordance with section R507.2 shall be fully supported by a wall or sill plate below.

R507.2.3 Ledger to band joist fastener details. Fasteners used in deck ledger connections in accordance with Table R507.2 shall be hot-dipped galvanized or stainless steel and shall be installed in accordance with Table R507.2.1 and Figure R507.2.1(1) and Figure R507.2.1(2).

TABLE R507.2
DECK LEDGER CONNECTION TO BAND JOIST[c, d, e]
(Deck live load = 40 psf, deck dead load = 10 psf, snow load <= 40 psf)

	Joist span						
	6' and less	**6'1" to 8'**	**8'1" to 10'**	**10'1" to 12'**	**12'1" to 14'**	**14'1" to 16'**	**16'1" to 18'**
Connection details	**On-center spacing of fasteners**						
1/2 inch diameter lag screw with ~~15/32~~ 1/2 inch maximum sheathing[a]	30	23	18	15	13	11	10
1/2 inch diameter bolt with ~~15/32~~ 1/2 inch maximum sheathing	36	36	34	29	24	21	19
1/2 inch diameter bolt with 1 inch maximum sheathing [b]	36	36	29	24	21	18	16

For SI: 1 inch =n 25.4 mm, 1 foot = 304.8 mm. 1 pound per square foot = 0.0479 kPa.

a. The tip of the lag screw shall fully extend beyond the inside face of the band joist.
b. Up to ½-inch thickness of stacked washers shall be permitted to substitute for up to ½-inch of allowable wood structural panel or lumber sheathing thickness.
c. Ledgers shall be flashed in accordance with section R703.8.
d. Wood structural panel, gypsum board, fiberboard, lumber, or foam sheathing shall be permitted.
e. Snow load shall not be assumed to act concurrently with live load.

Commenter's Reason: During the hearings, the committee expressed concern that the species Southern Pine had been removed from the code language. Though the original proposal did not preclude this species from use, it has been retained from the current 2012 language in this public comment, along with Hem-Fir.

Floor modifications were presented by both the original proponent and opposition in regard to sheathing types, and may have complicated the proposal. Both of the complications that arose during the committee hearing are explained below.

1) Tightening washers over foam sheathing is not sensible and was not tested.

In the original ledger testing that lead to these provisions in the 2009 IRC, only 15/32-inch thick wood structural panels were tested with a stack of ½ inch washers. The current language in the 2012 IRC allows washers over foam sheathing. Retaining this allowance in the proposed modification drew opposition. With that consideration, and some empirical experience, this public comment modification provides limitations to what sheathing may be used with washers. Stacked washers should only be used with wood structural panel or lumber sheathing. The photo below shows how easily a washer can be pressed into foam sheathing with my hand, a result that would be expected from tightening washers over foam and loading the deck.

2) The fastening schedule for the first two rows (lag screws or bolts with 1/2 inch sheathing) currently provides no guidance for what sheathing is allowed.

Opposition to the original proposal did not believe that ledgers should be placed over any 1/2-inch sheathing other than wood structural panels. This was not based on evidence of failure for such conditions, rather that such condition has not been specifically laboratory tested. This is indeed true; the only known laboratory tests on such connection are with wood structural panel. However……shall we throw away decades of real world experience simply from the absence of a specific laboratory facsimile? Decks have been constructed for generations being attached over siding, stucco, brick veneers and whatever else could not be bothered for removal at the time. They used nails in the ledgers, lacked hangers, were attached to cantilevered floors and were often without any flashing. None of this was good, but decks got little attention…until recently. Now we are finding the worst of the worst construction collapsing under load, those old, forgotten decks that have never been maintained beyond a "sand and stain". Rightfully so, the sins of the past are haunting the deck industry. However, we must look at why these decks are failing. I have. It's not properly flashed and lag screwed decks attached to fully supported band joists that are failing…even when attached over siding as they have been (incorrectly) for years. There is no need to take the decking industry from a free-for-all to overbearing regulation. We must find some balance between both; neither one more important than the other. The balance this public comment is asking for is simple. Will a properly flashed ledger attached to a fully supported band joist with lag screws structurally fail because of 1/2 inch of foam in between? We don't see evidence or history to support that it will. As a plan's analyst, I don't want to have to ask what sheathing is hiding behind my customers' homes as I try to verify their proposed lag screw connection and get their permit issued. For this reason, I am maintaining the allowance of any sheathing to be used in any of the connection methods…likely how code administrators are already interpreting it.

Further modifications have also been prompted since the committee action hearings.

The sheathing thickness of 15/32 inch has been changed to ½ inch to accommodate the thickness of common foam sheathing. This is only a 1/32-inch (6.5%) increase in allowable thickness.

Under section R507.2 the reference to "deck" design has been changed to "deck ledger connections". The subject of this section is the ledger connection, not the entire deck.

It is the intention of this commenter to collect and conduct further research on this matter and make it available at www.decktesting.com.

Public Comment 2:

Randall Shackelford, P.E., Simpson Strong-Tie Company, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

TABLE R507.2
DECK LEDGER CONNECTION TO BAND JOIST [~~c, d, e~~ a, b]
(Deck live load = 40 psf, deck dead load = 10 psf, snow load <= 40 psf)

½ in diameter lag screw with 15/32 inch maximum sheathing[~~a~~ c , d]	30	23	18	15	13	11	10
½ inch diameter bolt with 15/32 inch maximum sheathing[d]	36	36	34	29	24	21	19
½ inch diameter bolt with 1 inch maximum sheathing[~~b~~ e]	36	36	29	24	21	18	16

a. Ledgers shall be flashed in accordance with Section R703.8 to prevent water from contacting the house band joist.

b. Snow load shall not be assumed to act concurrently with live load.

~~a~~ c. The tip of the lag screw shall fully extend beyond the inside face of the band joist.

d. Sheathing shall be wood structural panel or solid sawn lumber.

~~b~~ e. Sheathing shall be permitted to be wood structural panel, gypsum board, fiberboard, lumber, or foam sheathing. Up to ½-inch thickness of stacked washers shall be permitted to substitute for up to ½-inch of allowable sheathing thickness when combined with wood structural panel or lumber sheathing.

~~c. Ledgers shall be flashed in accordance with Section R703.8 to prevent water from contacting the house band joist.~~

~~d. Wood structural panel, gypsum board, fiberboard, lumber, or foam sheathing shall be permitted.~~

~~e. Snow load shall not be assumed to act concurrently with live load.~~

Commenter's Reason: We think Mr. Matthewson and NADRA did a good job of re-organizing the requirements for deck ledger to band joist connection. The deck ledger to band joist connection is the most important connection on a deck and deserves the attention to make sure it is done in a safe manner. With one notable exception, we agree that the proposal simply improves the section without making technical changes. The one area where it appears that a technical change was made is the application of the proposed footnote d, which would allow any type of sheathing between the band joist and the deck ledger. Placement of footnote d at the title of the table applies that note to all three situations.

We went back and reviewed the testing that was performed to develop the existing table in the IRC. There were only three configurations tested: ½" lag screw with 15/32" OSB between the ledger and the band; ½" bolt with 15/32" OSB between the ledger and the band, and ½" bolt with ½" stack of washers and 15/32" OSB between the ledger and the band.

These three cases correspond to the three rows in the ledger table. Based on the testing, the additional gap can only be permitted in the third row of the table. The first two rows must have the ledger directly against wood structural panel sheathing or the band joist.

So we have revised the footnotes to do several things:

1. Re-arrange footnotes c and e so that they are footnotes a and b and they apply to the table title.
2. Add new footnote d that applies to the first two lines so that only wood structural panel or lumber sheathing is permitted between the ledger board and the band joist
3. Combine footnotes b and d from the original proposal into new footnote e, and change the reference so that it only applies to the last line in the table. Additional clarification was added that stacked washers can only be used with wood structural panel or lumber sheathing.

An article published in the December 2005 Building Safety Journal is included showing the basis for the existing table.

Proposed Change as Submitted

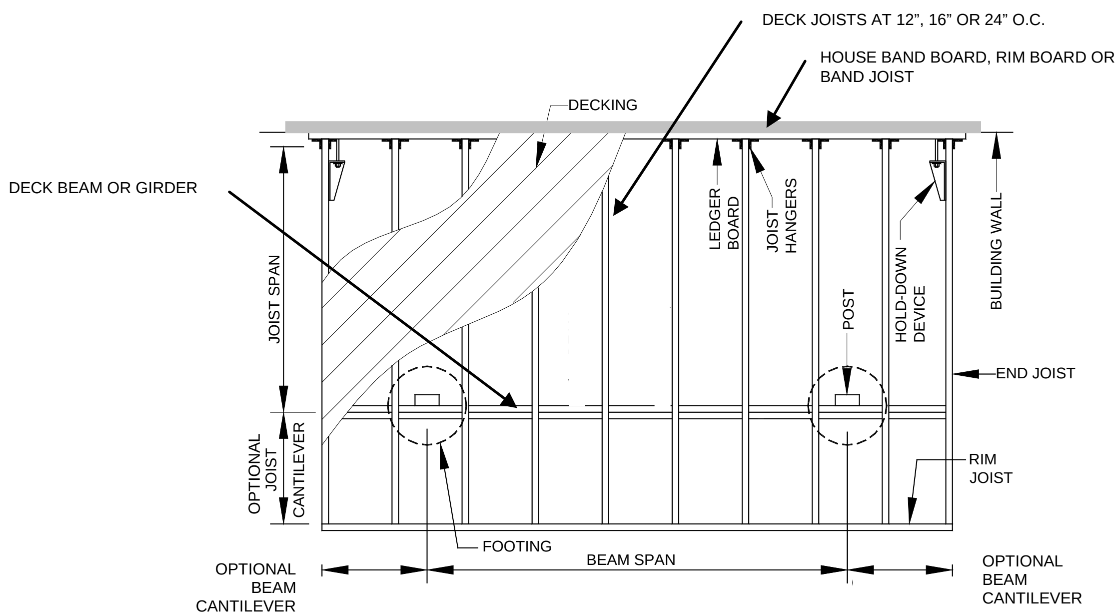
Proponent: Charles S. Bajnai, Chesterfield County, VA, representing self (bajnaic@chesterfield.gov), Randy Shackelford, Simpson Strong Tie (rshackelford@strongtie.com)

Add new text as follows:

SECTION R507
DECKS

R507.1 Wood decks. Typical wood decks shall be designed and constructed in accordance with this section. Other grades, species, loading, materials and conditions not described herein shall be permitted in accordance with Section 301. Loading for large concentrated loads, such as hot tubs, is beyond the scope of this section.

R507.2 Requirements. Deck construction shall be capable of accommodating applied loads and transmitting them to the supporting structural elements. Figure R507.2 is intended for purposes of identifying typical parts, and not to limit the design.



For SI: 1 inch = 25.4 mm

FIGURE R507.2
DECK CONSTRUCTION

R507.3 Materials. Materials used in the construction of a deck shall comply with the provisions of this section.

R507.3.1 Preservative-treated lumber. All lumber for decks shall be either naturally durable, minimum No.2 grade dimension lumber and identified in accordance with Section R502.1 or, preservative-treated in accordance with Section R317. All lumber in contact with the ground shall be identified as suitable for ground contact.

R507.3.2 Wood Decking. Wood decking shall comply with any of the following materials:

1. Wood decking with a minimum nominal thickness of 1 $^{1}/_{4}$ inches (32 mm) shall be installed at 90 degrees to deck joists that are spaced at a maximum of 16 inches (406 mm) on center and up to 45 degrees when spaced at a maximum of 12 inches (305 mm) on center.
2. Wood decking with a nominal 2 inch (51 mm) thickness shall be installed at an angle between 45 and 90 degrees to deck joists that are spaced at a maximum of 24 inches (610 mm) on center.
3. Wood decking shall be attached to each supporting member with a minimum of (2)8d threaded nails or (2)#8 wood screws.

R507.3.3 Wood/plastic composites. Wood/plastic composites used as exterior deck boards, stair treads, handrails and guardrail systems shall be permitted in accordance with manufacturer's instructions.

R507.3.4 Metal guardrail systems. Metal guardrail and handrail systems shall be permitted in accordance with the manufacturer's instructions.

R507.3.5 Fasteners and connectors. Nails, bolts with nuts and washers, screws and connectors shall be coated in accordance with Section R317.3. Proprietary fasteners shall be permitted provided they are compatible with the pressure-preservative-treated lumber being used. Fasteners and connectors within 300 feet of salt water shoreline shall be stainless steel.

R507.3.6 Flashing. Flashing shall be corrosion-resistant metal of minimum nominal 0.019 inch (0.5 mm) thickness or approved non-metallic material.

R507.4 Deck joists. Spans for typical wood deck joist configurations, as shown in Figure R507.4, shall be in accordance with Table R507.4. Deck joists shall be permitted to cantilever a maximum of one-fourth of the joist span.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. No. 2 grade with wet service factor.

b. Deck joists shall be designed to carry the deck live load in Table R301.5 or the ground snow load, which ever is greater. This table is based on ground snow load or live load = 40 psf, dead load = 10 psf, L/Δ = 360.

c. Deck joists shall be designed to carry the deck live load in Table R301.5 or the ground snow load, which ever is greater. This table is based on ground snow load or live load = 40 psf, dead load = 10 psf, L/Δ = 360 at main span, L/Δ = 180 at cantilever with a 220 pound point load applied to end.

d. Includes incising factor.

e. Northern species with no incising factor

R507.4.1 Joist bearing. Joist ends shall be provided with vertical and rotational support. The ends of joists shall have a minimum of 1.5 inches (38 mm) of bearing on a wood ledger board or on metal hangers. Where rotational support is provided by joist hangers or blocking between joists, their depth shall equal not less than 60 percent of the joist depth. Where rotational support is provided by rim joists, they shall be secured to the end of each joist with a minimum of (3)10d threaded nails or (3)#10x3 inch (76 mm) long wood screws. For free-standing decks, rotational support of the joist ends adjacent to the building wall shall be permitted by a rim joist or full depth nominal 2x blocking toe nailed at each end with (3)10d nails.

R507.5 Deck Beams. The maximum span for deck beams, as shown in Figure R507.2, shall be in accordance Table R507.5. Beams shall be permitted to cantilever at each end up to one-fourth of the beam span. The plies of a multi-ply beam shall be fastened with a minimum of two rows of 10d threaded nails at 16 inches (406 mm) on center along each edge. Splices of multi-span beams shall be located at interior post locations.

TABLE R507.5
MAXIMUM BEAM SPAN LENGTHS [a]

SPECIES	SIZE [b]	MAIN JOIST SPAN (ft.) LESS THAN OR EQUAL TO:

	3-2x12	13-11	12-1	10-9	9-10	9-1	8-6	8-1

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. Deck beams shall be designed to carry the deck live load in Table R301.5 or the ground snow load, which ever is greater. This table is based on ground snow load or live load = 40 psf, dead load = 10 psf, L/Δ = 360 at main span, L/Δ = 180 at cantilever with a 220 pound point load applied to end .No 2 grade, wet service factor.

b. Beam depth shall be greater than or equal to depth of joists with a flush beam condition.

c. Includes incising factor.

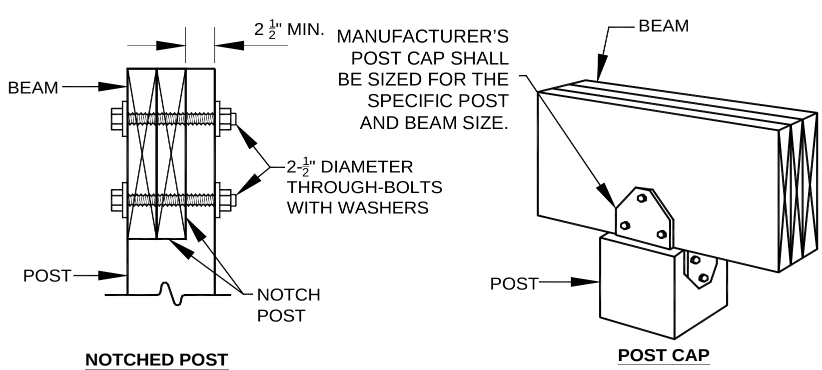
d. Northern species with no incising factor.

R507.5.1 Beam bearing. Single-ply beams and multi-ply beams shall have all of their bearing directly on wood posts or on an approved metal post cap in accordance with Figure R507.6.1 and not less than 3 inches (76 mm) on concrete or masonry.

R507.6 Deck posts. For typical single level wood decks, posts shall be measured from the top of the footing to the underside of the beam. The maximum height of the post shall be in accordance with the following:

1. Posts comprised of a minimum nominal 4x4 shall be permitted to a maximum height of 8 feet (2438 mm),
2. Posts comprised of a minimum nominal 6x6 shall be permitted to a maximum height of 14 feet (5486 mm).
3. Posts comprised of southern pine, of 4x4 or 4x6, grade #2 shall be permitted to a maximum height of 10 feet (3048 mm).
4. Posts comprised of southern pine, of 6x6 shall be permitted to a maximum height of 18 feet (5486 mm).

R507.6.1 Deck post to deck beam connection. Deck beams shall be attached to deck posts in accordance with Figure R507.6.1. Post to beam connections shall be constructed to resist lateral displacement. Manufactured post-to-beam connectors shall be sized for the post and beam sizes. All bolts shall have washers under the head and nut.



For SI: 1 inch = 25.4 mm

FIGURE R507.6.1
TYPICAL BEAM BEARING

R507.7 Deck footings. Deck footings shall be constructed in accordance with Section R403 and Figure R507.7. The size of the footing shall be adequate for the load applied by the posts.

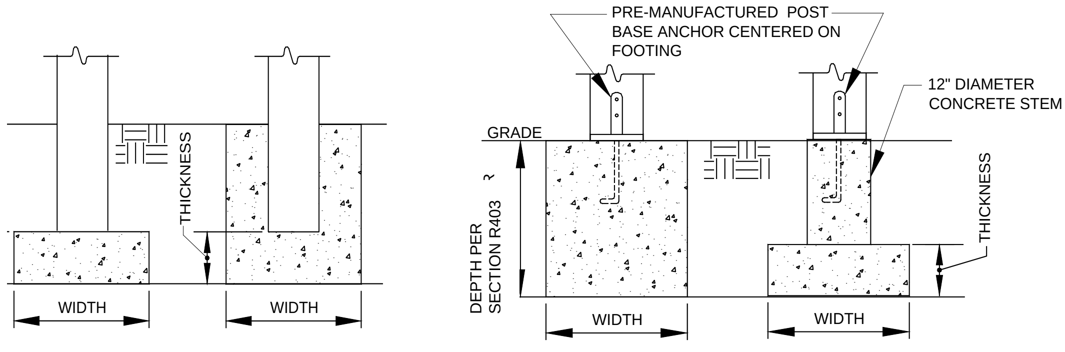


FIGURE R507.7
TYPICAL DECK FOOTINGS

R507.7.1 Footing depth. The minimum depth of footings shall be in accordance with Section R403.1.4 or as approved by the building official. A deck footing within 4 feet of the house shall be sit at least to the depth of the house footing.

R507.7.2 Post connection to footing. Where the top of the footings are at or above grade, the posts shall be prevented from being displaced by a connector between the post and the concrete. Where the top of the footings are below grade the post shall be permitted to sit on top of the footing or may be embedded in the concrete.

R507.8 Deck ledger connection to the building.. The connection between a deck ledger and the building shall be in accordance with this section.

R507.8.1 Deck ledger connection to band joist. The deck ledger shall be connected to a 2-inch nominal lumber band joist with ½-inch lag screws or bolts with washers in accordance with Table R507.8.1 and Figure R507.8.1(1). The bolts or lag screws shall be spaced in accordance with Figure R507.8.1(2). As an alternative to the detail in Figure R507.8.1, the ledger boards shall be permitted to be offset from the band joist a maximum distance of ½ inch (13 mm) with the installation of stacked washers. The exterior wall finish shall be removed prior to installation of the ledger board. Flashing at a door threshold shall be installed to prevent water intrusion from rain or melting ice and snow.

R507.8.2 Deck ledger connection to concrete foundation walls. A ledger board shall be connected to a concrete or solid masonry foundation wall with approved ½ inch (13 mm) diameter expansion anchors at a spacing specified in Table R507.8.1(1) and as shown in Figure R507.8.2. Expansion anchors shall be installed per the manufacturer.

R507.8.3 Ledger board to hollow masonry foundation wall. A ledger board shall be connected to a hollow masonry foundation wall with approved ½ inch (13 mm) diameter epoxy anchors at a spacing specified in Table R507.8.1(1) and as shown in Figure R507.8.3. Epoxy anchors shall be installed per the manufacturer.

R507.8.4 Alternate connections. An approved engineered wood rim board with a minimum thickness of 1 inch (25 mm) shall be permitted to substitute for a 2x lumber band joist provided it was designed and manufactured to support a deck. A ledger board attachment to a masonry or stone veneer, ribbon board of open web floor trusses, band joist of a cantilevered floor and other conditions not addressed herein shall be designed in accordance with accepted engineering practice, or the deck shall be free-standing in accordance with Section R507.10.

TABLE R507.8.1(1)
FASTENER SPACING

FASTENER	BAND BOARD	JOIST SPAN						
		≤6'	> 6'-8'	> 8'-10'	> 10'-12'	> 12'-14'	> 14'-16'	> 16'-18'

LEDGER BOARD TO SOLID FOUNDATION WALL ATTACHMENT

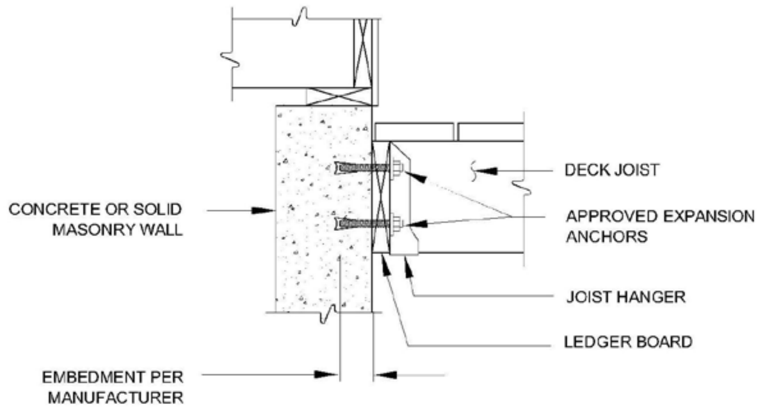

FIGURE R507.8.3
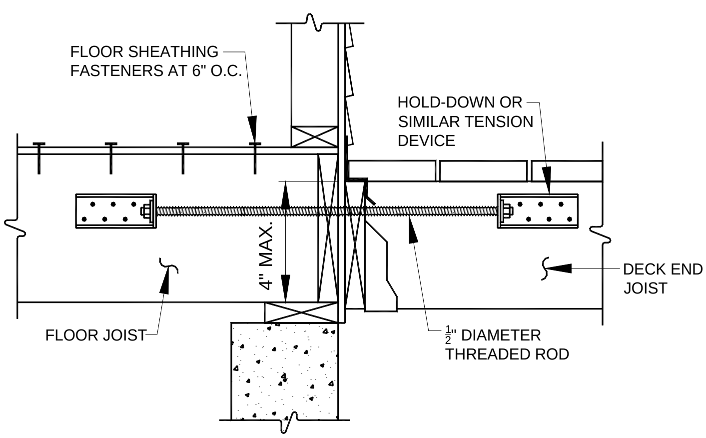
LEDGER BOARD TO HOLLOW MASONR FOUNDATION WALL ATTACHMENT

R507.9.3 Attachment to resist lateral load. A lateral load connection is required by Section R507.2. The following options shall be deemed to comply; other design solutions are permitted in accordance with R301.

R507.9.3.1 Connection at parallel joists. Where floor joists and deck joists are parallel, a hold-down or similar tension device with a minimum capacity of 1,500 pounds (6672 N) at each end joist as shown in Figures R507.3.1(1) and R507.9.3.1(2) shall be permitted. Floor sheathing to floor joists fasteners shall be permitted to be substituted with two reinforcing angles on each side of the joist with a minimum capacity of 375 pounds (1668 N).



For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm

FIGURE R507.9.3.1(1)
CONNECTION AT PARALLEL JOISTS

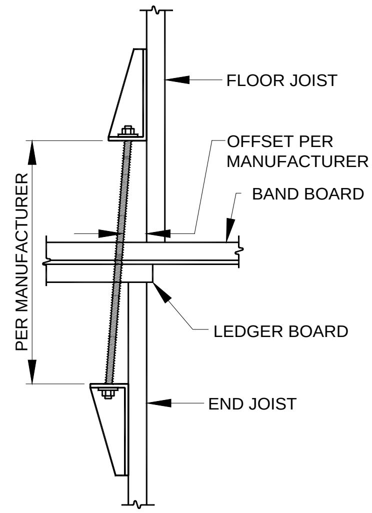


FIGURE R507.9.3.1(2)
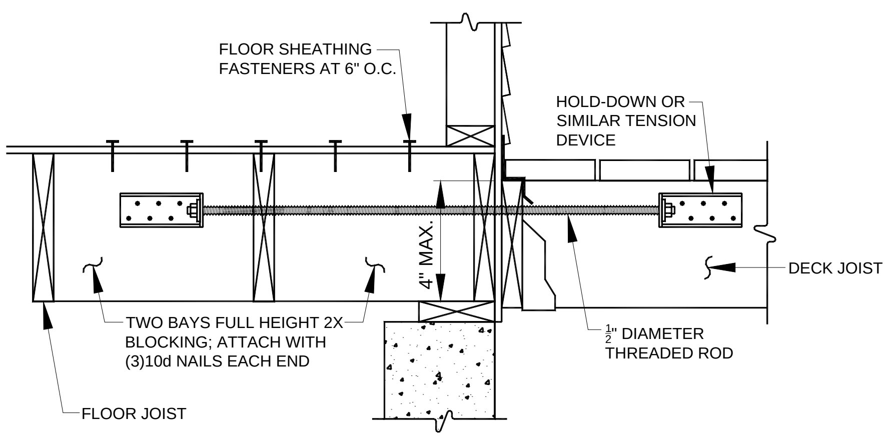
OFFSET AT PARALLEL JOISTS

R507.9.3.2 Connection at perpendicular joists. Where floor joists and deck joists are perpendicular, provide a hold-down or similar tension device with a minimum capacity of 1,500 pounds (6672 N) at each end joist and blocking between floor joists as shown in Figure R507.9.3.2. Floor sheathing to floor joists fasteners shall be permitted to be substituted with two reinforcing angles on each side of the joist with a minimum capacity of 375 pounds (1668 N).



For SI: 1 inch = 25.4 mm

FIGURE R507.9.3.2
LATERAL SUPPORT WHERE INTERIOR JOIST PERPENDICULAR TO DECK

R507.10 Free-standing decks. As shown in Figure R507.10, free-standing decks shall have an additional beam and posts adjacent the building exterior wall in place of a ledger board attachment. The beam shall be sized in accordance with Section R507.6 and shall be located adjacent the exterior wall or at a maximum distance equal to the allowable joist cantilever.

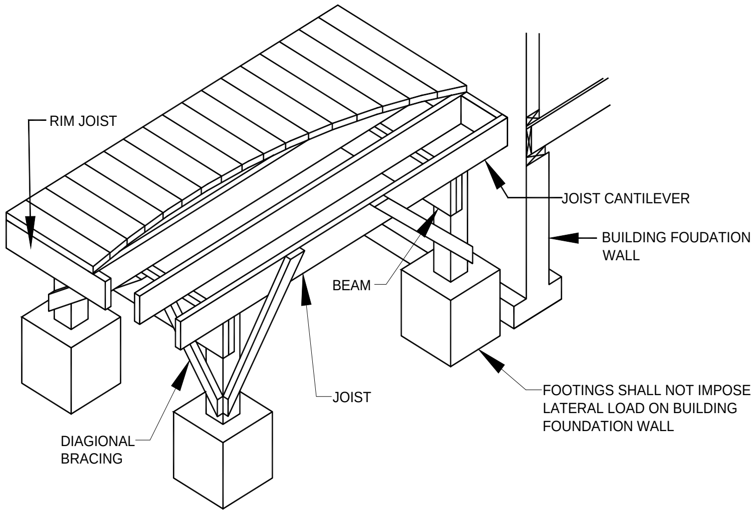


FIGURE R507.10
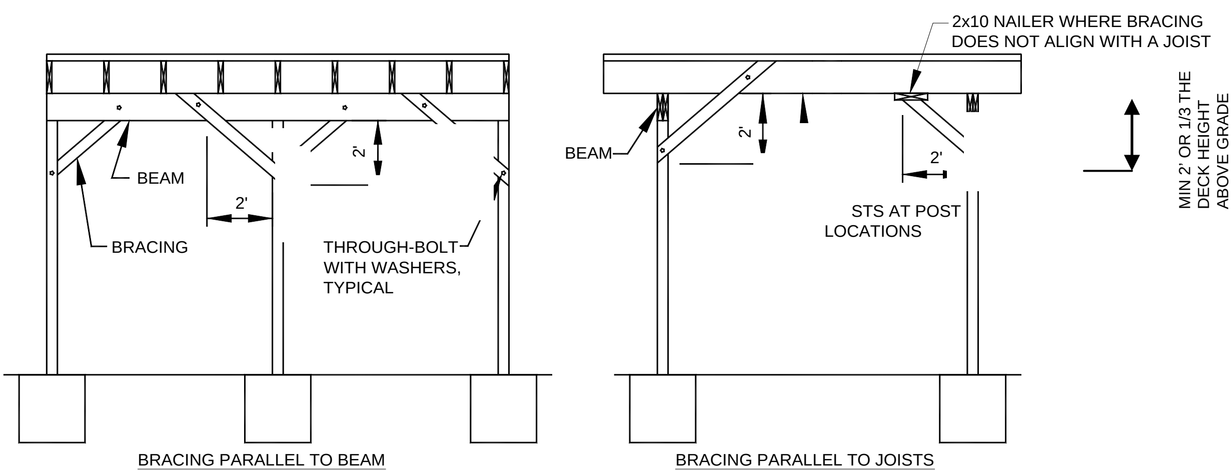
FREE-STANDING DECK

R507.10.1 Diagonal bracing. Diagonal bracing shall be installed on free-standing decks greater than 30 inches (762 mm) above grade in accordance with Figure R507.10.1. Bracing shall be placed at a 45 degree angle at each post location in the parallel and perpendicular directions to the beam. Bracing shall be a minimum of nominal 2x4 lumber and shall be fastened to framing with one 1/2 inch (9 mm) diameter through bolt with washers at each end. The diagonal brace shall be a minimum of 2 feet long measured as shown in Figure R507.10.1 or at least 1/3 the height of the deck above grade.

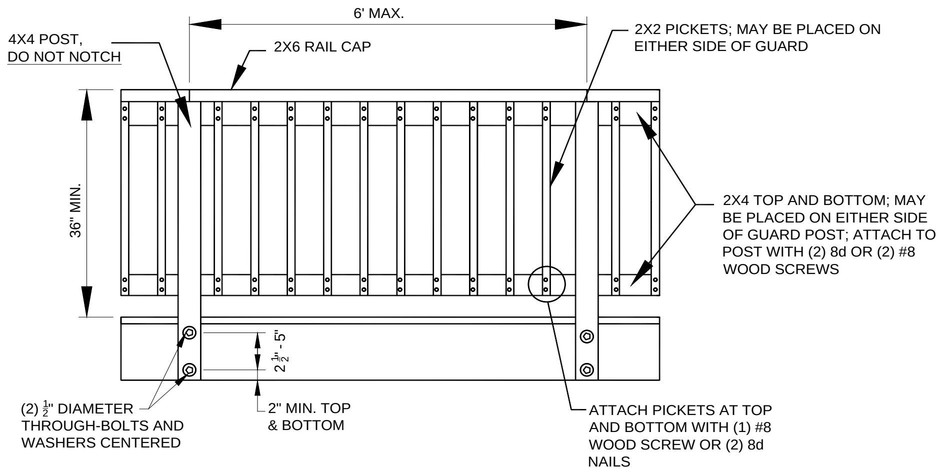


For SI: 1 foot = 304.8 mm

FIGURE R507.10.1
FREE-STANDING DECK DIAGONAL BRACING

R507.12 Deck guards. Deck guards shall be designed and constructed in accordance with Sections R301.5 and R312. Other materials and construction techniques shall be permitted in accordance with Section R301.

R507.12.1 Guard construction. Where the guard requirements of Sections R301.5 and R312 are met using the details shown in Figures R507.12.1(1) through R507.12.1(3), guard posts shall be attached to the inside or outside face of the rim joist or end joist. Hold-down anchors shall have a minimum capacity of 1,800 pounds (8006 N).



For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm

FIGURE R507.12.1(1)
DECK GUARD

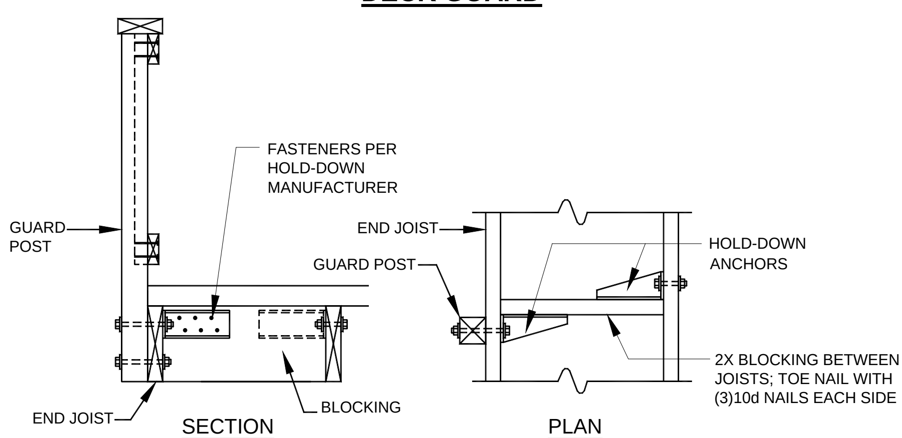


FIGURE R507.12.1(2)
GUARD POST TO END JOIST

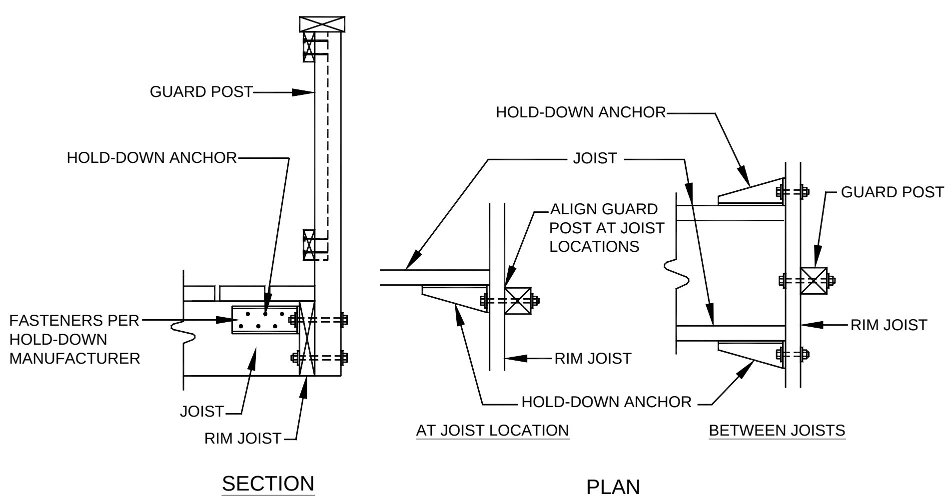

FIGURE R507.12.1(3)
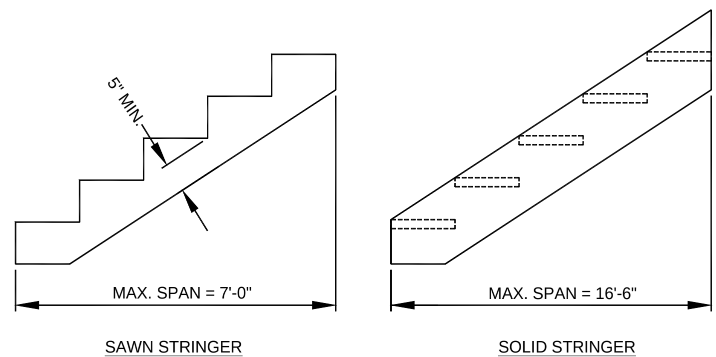
GUARD POST TO RIM JOIST

R507.13 Deck stairs. Deck stairs shall be constructed in accordance with this section and Section R311.7. Where a flight of stairs has a vertical rise greater than that allowed per Section R311.7.3, an intermediate landing shall be provided in accordance with Section R311.7.6 and designed as a free-standing deck in accordance with Section R507.10.

R507.13.1 Stair stringers. Stair stringers shall be constructed of sawn nominal 2x12 members at 18 inches (457 mm) on center with a throat dimension of 5 inches (127 mm) and a maximum span length as shown in Figure R507.13.1. Stairs with a width equal to 36 inches (914 mm) shall be permitted to be constructed with two solid 2x12 stringers with a maximum span length as shown in Figure R507.13.1.



For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm

FIGURE R507.13.1
STAIR STRINGER REQUIREMENTS

R507.13.2 Stringer bearing. Stringers shall be attached to posts or bear on joist hangers attached to the deck structure and on footings at grade in accordance with Figure R507.13.2. Joist hangers shall be specifically designed to accommodate sloped connections and shall have a minimum capacity of 625 pounds (2780 N). Reinforcing angles at rim joist locations only shall have a minimum capacity of 325 pounds (1446 N).

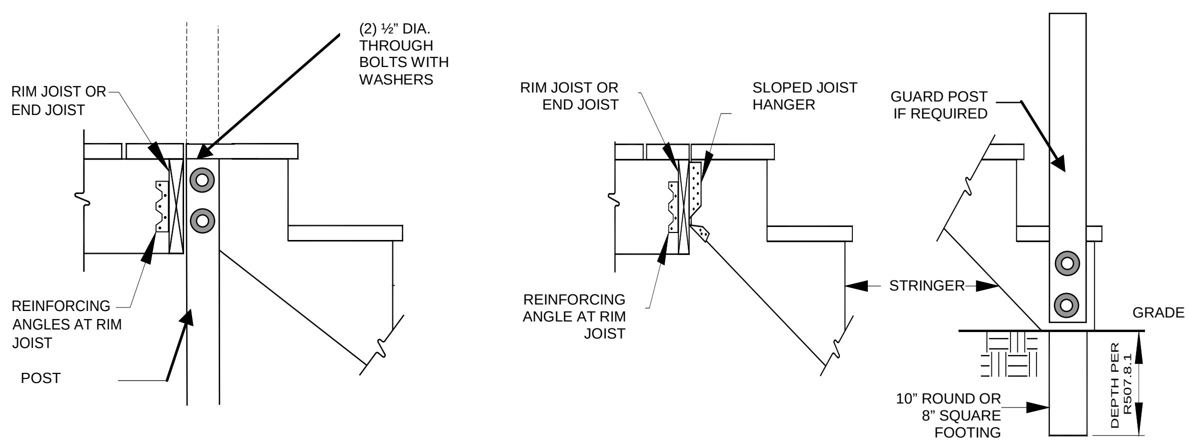


FIGURE R507.13.2
STRINGER BEARING

R507.13.3 Treads and risers. Stair treads shall be constructed in accordance with Section R311.7 and Figure R507.13.3. Treads shall be composed of nominal 2x6 lumber. Treads of stairs constructed with solid stringers shall be permitted to be composed of span rated decking. Risers shall be permitted to be composed of nominal 1x lumber. Openings in risers shall not allow the passage of a 4 inch (102 mm) diameter sphere.

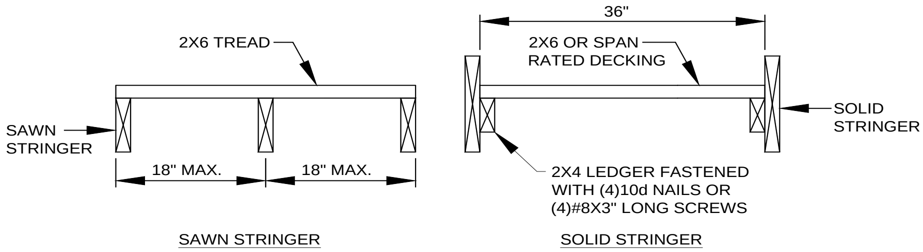

FIGURE R507.13.3
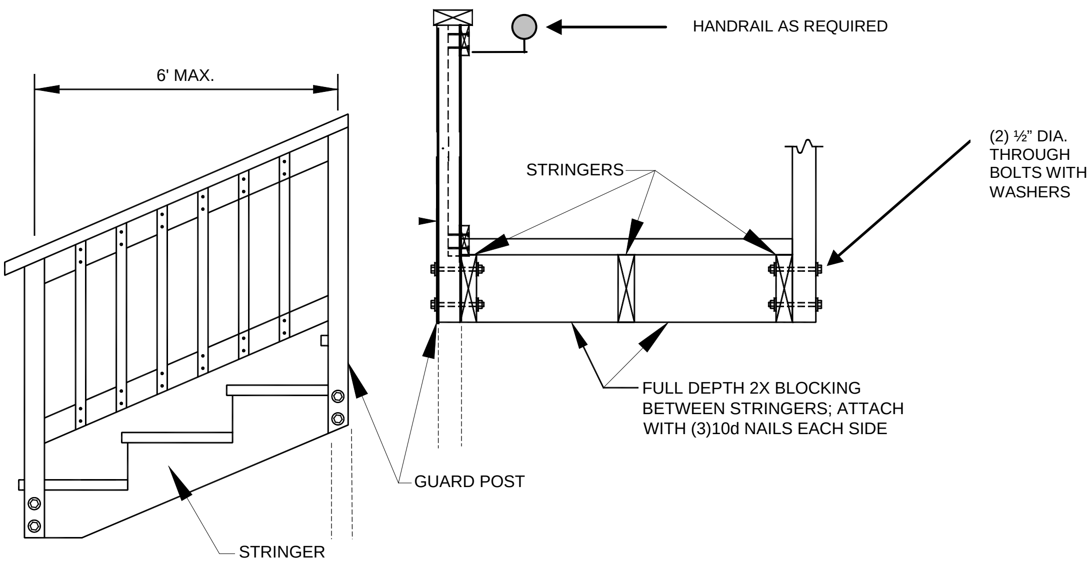
TREAD REQUIREMENTS

R507.13.4 Stair guard. Guards for stairs shall be as required per Section R312.1.1 and constructed in accordance with Section R507.12. The attachment of a stair guard post to the stringers shall be constructed in accordance with Figure R507.13.4.



For SI: 1 foot = 304.8 mm

FIGURE R507.13.4
STAIR GUARD CONNECTION

R507.13.5 Stair handrails. When required, handrails for stairs shall be as required per Section R311.7.8. When required and where the top guard rail does not comply with the handrail grip-size requirements in Section R311.7.8.3, a separate, conforming handrail shall be required.

R507.13.6 Ramps. Ramps from decks shall be as required in Section R311.8. Details for stringers, guards and handrails shall be similar to those for stairs.

Reason: With the increasing attention being paid to deck safety, the 2012 IRC took a major step forward by establishing a new Section R507 that covers deck construction. However, Section R507 consists almost entirely of connection details for anchoring the deck to the house, and does not provide any prescriptive requirements for building the deck itself. Some information is completely missing, like joist spans for naturally durable wood species, joist spans for wet lumber, beam spans, post sizes, bracing, footings and stair stringer spans.

Currently about one-third of the building permits pulled in our county are for decks. A significant number of these decks are built by homeowners or "handymen", rather than professional deck or home builders. Since the current code provides them no prescriptive guidelines, many jurisdictions across the country have tried to help either by creating locally developed deck guides or by directing the homeowner/builder to the *Prescriptive Residential Wood Deck Construction Guide (DCA6)*, a free document published by the American Wood Council (AWC).

Background on the *DCA6:* it is a document that originated in August 2006 when an ad-hoc task group was created to address prescriptive provisions for residential wood deck construction. While not a true consensus standard committee, the group was fairly balanced with representatives of ICC, AWC, home builders, municipal representative from Fairfax County, VA, construction hardware manufacturers, and the truss industry represented. The provisions of the *DCA6* gather requirements from throughout the IRC into one place, whether they be prescriptive requirements already contained in other sections, or new solutions derived from the performance provisions. A *Commentary* is also included in the document, to give the user an understanding of the data and/or experience upon which the provision is based.

While deck guides written outside the code development process have served a purpose, we think it is important that a set of deck construction provisions be contained in the IRC itself.

This submittal is based largely upon the provisions of the *DCA6*, with the intent to create a simple yet complete deck code section that provides prescriptive methods for safe deck construction. The submittal is presented in a simplified format so that it can be used by building officials, builders, inspectors and homeowners. The proponents recognize that every possible construction detail or condition is not covered by this submittal – the intent is to provide permitted methods for meeting the code, and not to preclude the use of other construction methods or materials that can always approved by the authority having jurisdiction using R104.11 or R301.

I have been privy to several other alternate deck proposals that are being considered for the 2015 IRC. My thought is that these proposals are well intentioned, but essential components were omitted for political reasons. Along with members of industry, I have developed what I believe to be a cleaner, more organized, more complete proposal with most of the same provisions of these other drafts and *DCA6* without the worry that some provisions might be politically improper to some constituents.

In conclusion, the average deck builder, plan reviewer and inspector have nothing in the IRC to help them with a deck design. Homeowners and non-professionals need to have simple prescriptive methods for building a safe deck, and we believe this proposal provides those guidelines.

DCA6. http://www.awc.org/publications/DCA/DCA6/DCA6-09.pdf

Cost Impact: The code change proposal may increase the cost of construction.

R507-RB-BAJNAI-SHACKELFORD.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee felt this is a needed change but there are too many technical flaws such as the diagonal bracing for lateral loads is lacking. The proponent's should work with industry to resolve any differences and bring it back.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

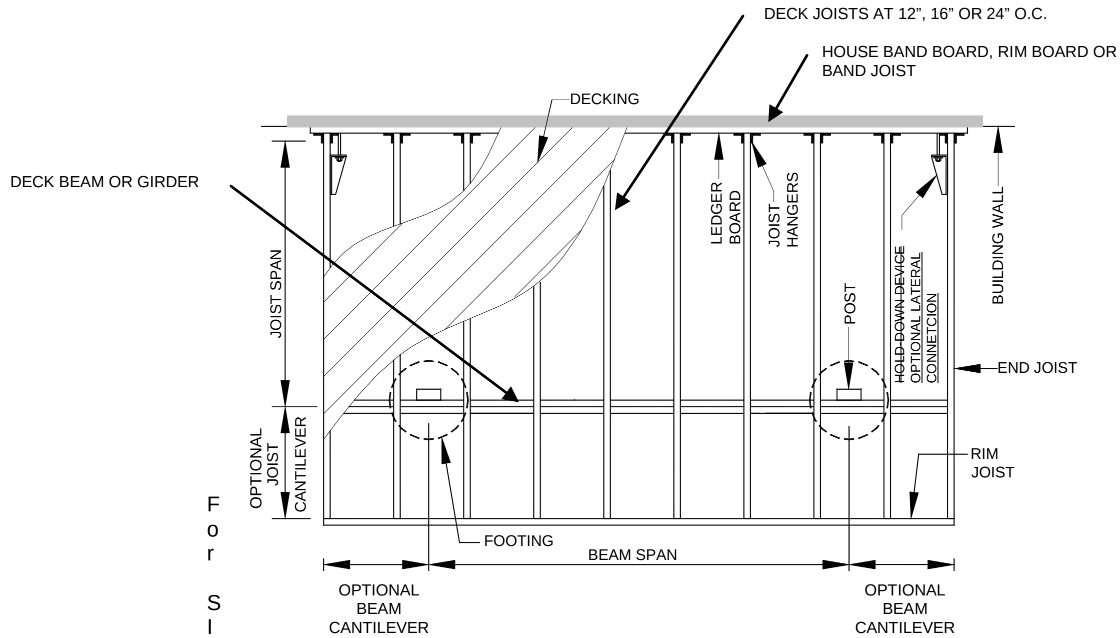
Chuck Bajnai, Chesterfield County, VA, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION R507
DECKS

R507.1 Wood decks. ~~Typical wood decks~~ Decks of wood-frame construction shall be designed and constructed in accordance with this section. ~~Other grades, species, loading, materials and conditions~~ The use of other species of lumber or lesser grades of materials or different loading conditions not described herein shall be permitted in accordance with Section 301.1.1. ~~Loading for large concentrated loads, such as hot tubs, is beyond the scope of this section.~~

R507.2 Requirements. Deck construction shall be capable of accommodating ~~applied loads~~ all vertical and lateral loads in accordance with Section R301 and transmitting them to the supporting structural elements. Figure R507.2 is intended for purposes of identifying typical parts, and not to limit the design.



For SI: 1 inch = 25.4 mm

For SI: 1 inch = 25.4 mm

FIGURE R507.2
DECK CONSTRUCTION

R507.3 Materials. Materials used in the construction of a wood-framed deck shall comply with the ~~provisions~~ requirements of this section.

R507.3.1 ~~Preservative-treated l~~Lumber. All lumber shall be minimum No 2 grade dimension lumber. Lumber may be cut, drilled or notched in accordance with Section R502.8 except where prohibited in Section R507.11. In geographical areas where decay-resistant lumber is required, ~~All~~ lumber ~~for decks~~ shall be either naturally durable~~, minimum No.2 grade dimension lumber~~ and identified in accordance with Section R502.1, or~~,~~ preservative-treated in accordance with Section R317. ~~All lumber in contact with the ground shall be identified as suitable for ground contact.~~ Where termite-resistant lumber is required per Table R301.2 (1), lumber shall comply with Section R318.

~~**R507.3.2 Wood Decking.** Wood decking shall comply with any of the following materials:~~

1. ~~Wood decking with a minimum nominal thickness of $^5/_4$ inches (32 mm) shall be installed at 90 degrees to deck joists that are spaced at a maximum of 16 inches (406 mm) on center and up to 45 degrees when spaced at a maximum of 12 inches (305 mm) on center.~~
2. ~~Wood decking with a nominal 2 inch (51 mm) thickness shall be installed at an angle between 45 and 90 degrees to deck joists that are spaced at a maximum of 24 inches (610 mm) on center.~~
3. ~~Wood decking shall be attached to each supporting member with a minimum of (2)8d threaded nails or (2)#8 wood screws.~~

R507.~~3.3~~ 3.2 ~~Wood/p~~Plastic composites. ~~Wood/p~~Plastic composite~~s used as exterior~~ deck boards, stair treads, ~~handrails and guardrail~~ guard and handrail systems shall ~~be permitted~~ comply with the requirements of R317.4 and installed in accordance with the manufacturer's installation instructions.

R507.~~3.4~~ 3.3 ~~Metal guardrail systems~~ Other materials. ~~Metal guardrail and handrail systems~~ Metal, glass, concrete or other materials used for deck construction, including guard and handrail systems shall be permitted in accordance with the requirements in Chapter 3 and installed in accordance with the manufacturer's installation instructions.

R507.~~3.5~~ 3.4 Fasteners and connectors. Nails, bolts with nuts and washers, screws, fasteners and connectors shall be ~~coated~~ protected in accordance with Section R317.3. ~~Proprietary fasteners shall be permitted provided they are compatible with the preservative-treated lumber being used.~~
~~Fasteners and connectors within 300 feet of salt water shoreline shall be stainless steel.~~ Fasteners and connectors shall be installed in accordance with manufacturer's installation instructions.

R507.~~3.6~~ 3.5 Flashing. Flashing shall be corrosion-resistant metal of minimum nominal 0.019 inch (0.5 mm) thickness or approved non-metallic material.

R507.4 Deck boards. Deck board spans shall comply with the requirements of Table R507.4. Wood deck boards shall be attached to each supporting member with a minimum of (2) 8d nails or (2) #8 wood screws.

TABLE R507.4
MAXIMUM DECK BOARD SPANS

MATERIAL TYPE AND NOMINAL SIZE	DECK BOARDS PERPENDICULAR TO JOIST	DECK BOARDS DIAGONAL TO JOIST[a]
5/4-inch thick wood	16 inches	12 inches
2-inch thick wood	24 inches	16 inches
Plastic composite	Per R507.3	Per R507.3

For SI: 1 inch = 25.4 mm

a. Maximum angle of 45 degrees from perpendicular for wood deck boards

R507.4 5 Deck joists. Spans for typical wood deck joist configurations~~,~~ shall be measured as shown in Figure R507.4 5, and shall ~~be in accordance with~~ not exceed the span lengths per Table R507.4 5. Deck joists shall be permitted to cantilever a maximum of one-fourth of the actual joist span.

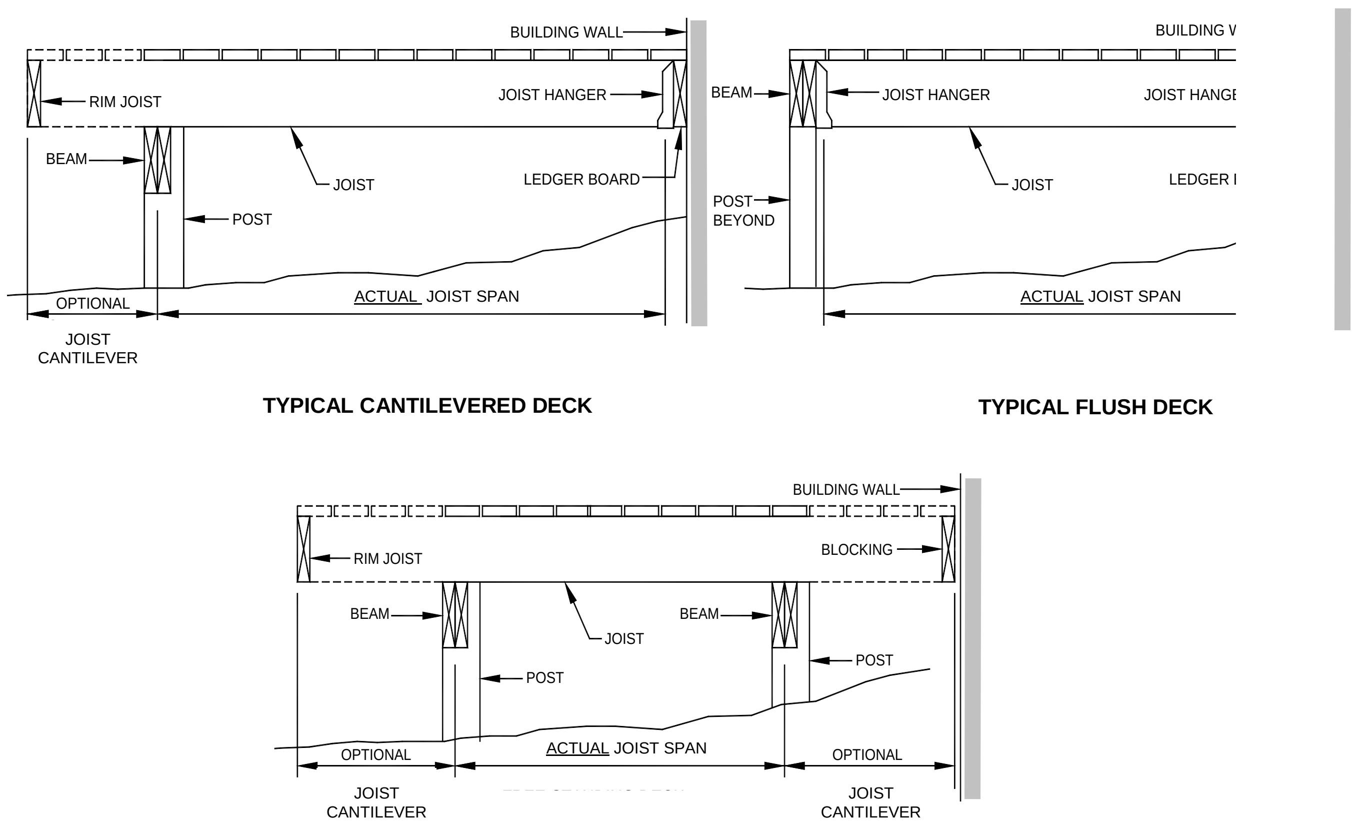


FIGURE R507.4 5
TYPICAL DECK JOIST CONFIGURATIONS

R507.~~4.1~~ 5.1 ~~Joist bearing~~ Deck joist support. ~~Joist ends~~ Ends of deck joists shall be ~~provided with~~ supported to prevent vertical and ~~rotational support.~~ lateral displacement. The ends of joists shall have a minimum of 1.5 inches (38 mm) of bearing on a deck beam, wood ledger board or on metal hangers. Joists shall be connected to deck beams with approved fasteners or connectors. Where ~~rotational~~ lateral support is provided by joist hangers or blocking between joists, ~~their~~ the depth of hanger or blocking shall equal not less than 60 percent of the joist depth. Where ~~rotational~~ lateral support is provided by rim joists, ~~they~~ the rim joist shall be secured to the end of each joist with a minimum of (3)10d ~~threaded~~ nails or (3)#10x3 inch (76 mm) long wood screws. ~~For free-standing decks, rotational support of the joist ends adjacent to the building wall shall be permitted by a rim joist or full depth nominal 2x blocking toe nailed at each end with (3)10d nails.~~

R507.~~5~~ 6 Deck Beams. The maximum ~~span for deck beams, as shown in Figure R507.2 shall be in accordance with Table R507.5~~ allowable deck beam span for single or multiple ply deck beams shall be in accordance with Table R507.6. Beams shall be permitted to cantilever at each end up to one-fourth of the adjacent beam span. The plies of a multi-ply beam shall be fastened with a minimum of two rows of 10d ~~threaded~~ nails at 16 inches (406 mm) or equivalent screws or bolts. ~~on center along each edge. Splices of multi-span beams shall be located at interior post locations.~~

TABLE R507.~~4~~ 5
MAXIMUM DECK JOIST SPANS FOR COMMON LUMBER SPECIES (ft.-in.)

SPECIES [a]	JOIST SIZE	~~MAXIMUM SPACING OF~~ DECK JOIST SPACING WITHOUT ~~NO~~ CANTILEVER [b,f] (in.)			~~MAXIMUM SPACING OF~~ DECK JOIST SPACING WITH CANTILEVERS [c] (in.)

	2 x 12	17-5	15-1	12-4	16-5	15-1	12-4

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. No. 2 grade with wet service factor.
b. Deck joists shall be designed to carry the deck live load in Table R301.5 or the ground snow load, which ever is greater. This table is based on ground snow load or live load = 40 psf, dead load = 10 psf, L/Δ = 360.
c. Deck joists shall be designed to carry the deck live load in Table R301.5 or the ground snow load, which ever is greater. This table is based on ground snow load or live load = 40 psf, dead load = 10 psf, L/Δ = 360 at main span, L/Δ = 180 at cantilever with a 220 pound point load applied to end.
d. Includes incising factor.
e. Northern species with no incising factor.
f. Joists are permitted to cantilever from the deck beam by a length not to exceed the depth of the deck joist.

R507.~~5.1~~ 6.1 Beam bearing. Single-ply ~~beams~~ and multi-ply beams shall ~~have all of their bearing~~ bear directly on wood posts or on an approved metal post cap in accordance with Figure R507.~~6.1~~ 7.1 and not less than 3 inches (76 mm) on concrete or masonry walls or piers.

R507.~~6~~ 7 Deck posts. ~~For typical single level wood decks, p~~Posts shall be measured from the top of the footing to the underside of the beam. The maximum height of the post shall be in accordance with Table R507.7. ~~the following:~~

~~5. Posts comprised of a minimum nominal 4x4 shall be permitted to a maximum height of 8 feet (2438 mm).~~
~~2. Posts comprised of a minimum nominal 6x6 shall be permitted to a maximum height of 14 feet (5486 mm).~~
~~3. Posts comprised of southern pine, of 4x4 or 4x6, grade #2 shall be permitted to a maximum height of 10 feet (3048 mm).~~
~~4. Posts comprised of southern pine, of 6x6 shall be permitted to a maximum height of 18 feet (5486 mm).~~

TABLE R507.~~5~~ 6
MAXIMUM BEAM SPAN LENGTHS [a]

SPECIES	BEAM SIZE [b]	**MAXIMUM MAIN JOIST SPAN** (ft-in.) ~~**LESS THAN OR EQUAL TO:**~~

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

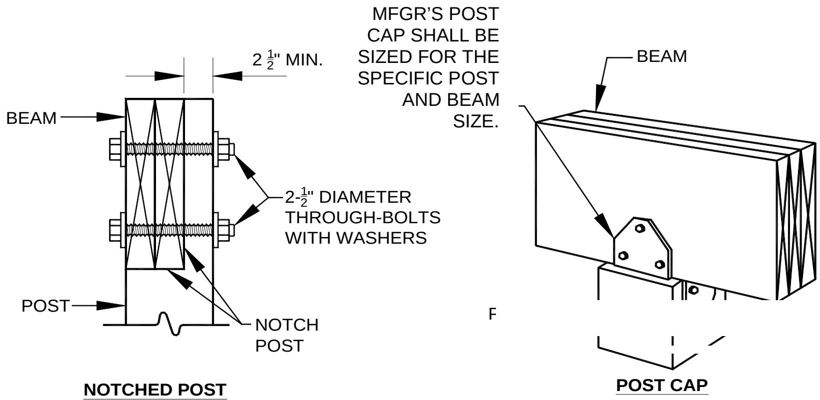
a. Deck beams shall be designed to carry the deck live load in Table R301.5 or the ground snow load, which ever is greater. This table is based on ground snow load or live load = 40 psf, dead load = 10 psf, L/Δ = 360 at main span, L/Δ = 180 at cantilever with a 220 pound point load applied to end .No 2 grade, wet service factor.
b. Beam depth shall be greater than or equal to depth of joists with a flush beam condition.
c. Includes incising factor.
d. Northern species with no incising factor.

TABLE R507.7
DECK POST HEIGHT

NOMINAL DECK POST SIZE	MAXIMUM HEIGHT
4x4	8'
4x6	8'
6x6	14'

For SI: 1 foot = 304.8 mm.

507.~~6.1~~ 7.1 Deck post connection to deck beam ~~connection.~~ Deck beams shall be attached to wood deck posts in accordance with Figure R507.~~6.1~~ 7.1. Other optional ~~P~~post to beam connections shall be ~~constructed~~ permitted to resist lateral displacement. Manufactured post-to-beam connectors shall be sized for the post and beam sizes. All bolts shall have washers under the head and nut.



For SI: 1 inch = 25.4 mm

FIGURE R507.~~6.1~~ 7.1
TYPICAL BEAM BEARING ON WOOD POST

R507.~~7~~ 8 Deck footings. Deck footings shall be constructed in accordance with Section R403 ~~and Figure R507.7~~. The ~~size~~ cross sectional area of the footing shall be adequate to carry the load applied by the posts based on the bearing capacity of the soil.

R507.~~7.1~~ 8.1 Footing depth. The minimum depth of footings shall be in accordance with Section R403.1.4 or as approved by the building official~~. A deck footing within 4 feet of the house shall be sit at least to the depth of the house footing.~~ Where a deck footing is within 4 feet of an existing, adjacent footing, the deck footing shall bear at the same depth as the existing footing.

R507.~~7.2~~ 8.2 Deck ~~P~~post connection to footing. ~~Where the top of the footings are at or above grade, the posts shall be restrained to prevent lateral displacement at the bottom end of the post. Where the top of the footings are below grade the post shall be permitted to sit on top of the footing or may be embedded in the concrete.~~ Deck posts shall be restrained to prevent lateral displacement at the bottom end. Such lateral restraint shall be provided by manufactured connectors or a minimum post embedment of 12-inches in surrounding soils or concrete as shown in Figure R507.8.2.

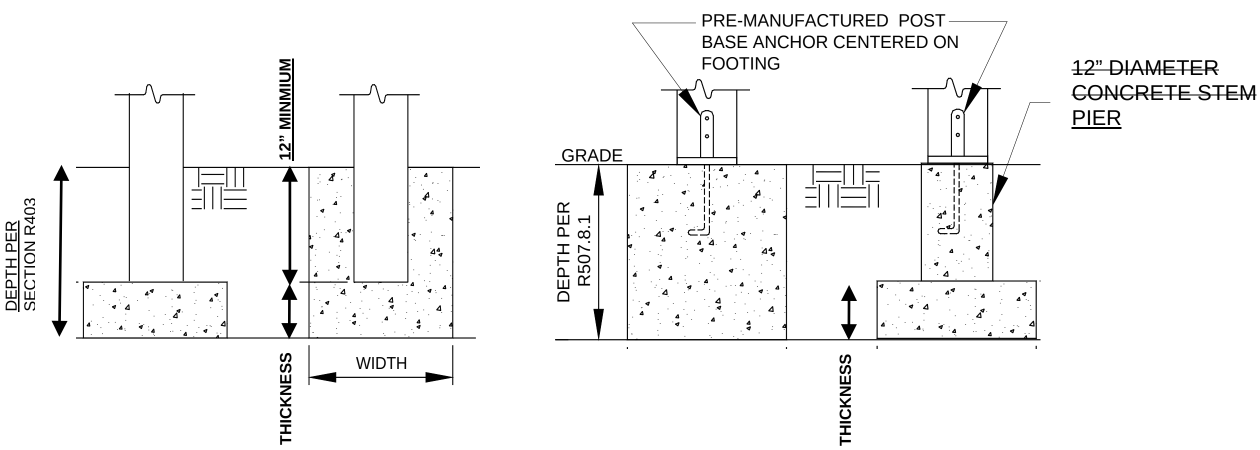


FIGURE R507.~~7.7~~ 8.2
TYPICAL DECK FOOTINGS

R507.~~8~~ 9 Deck ledger board connection to the building. The connection between a deck ledger board and the building shall be in accordance with this section.

R507.~~8.1~~ 9.1 Deck ledger board connection to band joist. The deck ledger board shall be connected to a nominal 2-inch thick ~~nominal~~ lumber band joist with ½-inch lag screws or bolts with washers in accordance with ~~Table R507.8.1 and~~ Figures R507.9.1(1) and R507.9.1(2) and ~~. .2 The bolts or lag screws shall be~~ spaced in accordance with ~~Figure R507.8.1 (2).~~ Table R507.9.1. As an alternative to the detail in Figure R507.~~8.1~~ 9.1(2), the ledger board shall be permitted to be offset from the house band joist or exterior sheathing a maximum distance of ½ inch (13 mm) with the installation of stacked washers.

The exterior wall finish shall be removed prior to installation of the ledger board. Flashing at a door threshold shall be installed to prevent water intrusion from rain or melting ice and snow.

R507.~~8.2~~ 9.2 Deck ledger board connection to concrete foundation walls. A ledger board shall be connected to a concrete or solid masonry foundation wall with approved ½ inch (13 mm) diameter ~~expansion~~ anchors ~~at a spacing specified~~ spaced in accordance with Table R507.~~8.1(1)~~ 9.1 and as shown in Figure R507.~~8.2~~ 9.2. ~~Expansion~~ Adhesive or mechanical ~~A~~ anchors shall be installed per the manufacturer's installation instructions.

R507.~~8.3~~ 9.3 Ledger board connection to hollow masonry foundation wall. A ledger board shall be connected to a hollow masonry foundation wall with approved ½ inch (13 mm) diameter ~~epoxy anchors at a spacing specified in Table R507.8.1(1)~~ anchors spaced in accordance with Table R507.9.1 and as shown in Figure R507.~~8.3~~ 9.3. ~~Epoxy~~ Adhesive or mechanical anchors shall be installed per the manufacturer's installation instructions.

R507.~~8.4~~ 9.4 Alternate connections. An ~~approved~~ engineered wood rim board with a minimum thickness of 1 inch (25 mm) shall be permitted to substitute for a 2x lumber band joist provided ~~it~~ the engineered wood rim board was designed ~~and~~ by the manufacturer~~ed~~ to support a deck. A ledger board attachment to a masonry or stone veneer, ribbon board of open web floor trusses, band joist of a cantilevered floor ~~and~~ or other conditions not addressed herein shall be designed in accordance with accepted engineering practice, or the deck shall be free-standing in accordance with Section R507.10.

TABLE R507.~~8.1(1)~~ 9.1
FASTENER SPACING

FASTENER	BAND BOARD	JOIST SPAN						
		≤6'	> 6'-8'	> 8'-10'	> 10'-12'	> 12'-14'	> 14'-16'	> 16'-18'

LEDGER BOARD TO ~~SOLID~~ HOLLOW MASONRY FOUNDATION WALL ATTACHMENT

R507.~~9.3~~ 9.5 Attachment to resist lateral load. A lateral load connection is required by Section R507.2. The following ~~options~~ connections shall be deemed to comply; other design solutions are permitted in accordance with R301.

R507.~~9.3.1~~ 9.5.1 Connection at parallel joists. Where floor joists and deck joists are parallel to each other, a hold-down or similar tension device with a minimum capacity of 1,500 pounds (6672 N) ~~at each end joist~~ as shown in Figures ~~R507.3.1(1)~~ R507.9.5.1(1) and R507.~~9.3~~ 9.5.1(2) shall be permitted. The hold-down device shall be located within 24 inches of each end joist. ~~Floor sheathing to floor joists~~ The floor sheathing fasteners shall be permitted to be substituted with two reinforcing angles with a minimum capacity of 375 pounds (1668 N) each on each side of the joist ~~with a minimum capacity of 375 pounds (1668 N)~~.

R507.~~9.3.2~~ 9.5.2 Connection at perpendicular joists. Where the floor joists and deck joists are perpendicular to each other, ~~provide~~ a hold-down or similar tension device with a minimum capacity of 1,500 pounds (6672 N) ~~at each end joist and blocking between floor joist~~ shall be provided as shown in Figure R507.~~9.3.2~~ 9.5.2. The hold-down device shall be located within 24 inches of each end joist. The ~~F~~floor sheathing ~~to floor joists fasteners~~ shall be permitted to be substituted with two reinforcing angles ~~on each side of the joist with a minimum capacity of 375 pounds (1668 N~~ with a minimum capacity of 375 pounds (1668 N) each on each side of the joist.

LATERAL SUPPORT WHERE INTERIOR JOIST ARE PERPENDICULAR TO DECK

R507.10 Free-standing decks. As shown in Figures R507.5 and R507.10, free-standing decks shall ~~have an additional beam and posts adjacent the building exterior wall in place of a ledger board attachment.~~ transfer all of the deck loads directly to the footings. ~~The b~~Beams shall be sized in accordance with Section R507.6 ~~and shall be located adjacent the exterior wall or at a maximum distance equal to the allowable joist cantilever~~.

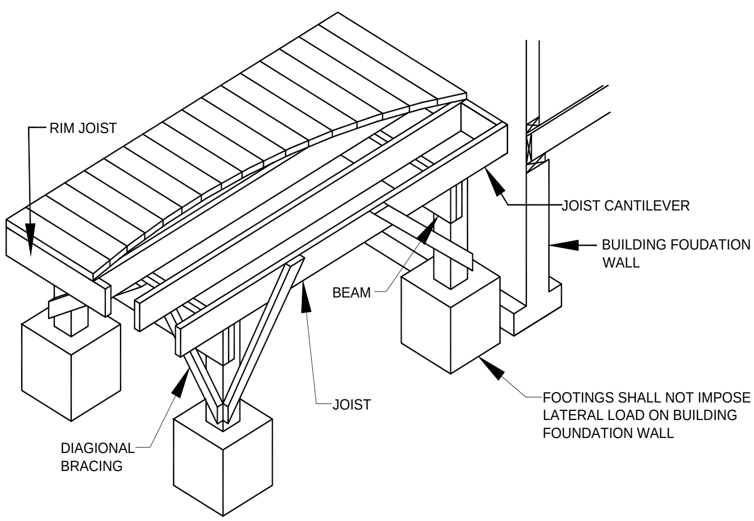

FIGURE R507.10
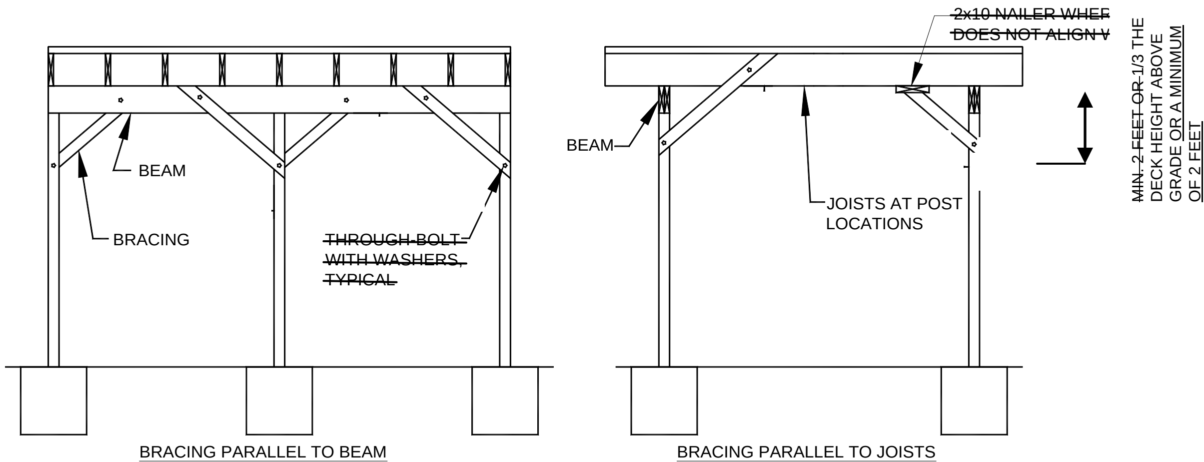
TYPICAL FREE-STANDING DECK

R507.10.1 Diagonal bracing. Diagonal bracing shall be ~~installed~~ provided in accordance with Figure R507.10.1 on free-standing decks greater than 30 inches above grade ~~in accordance with Figure R507.10.1~~. Bracing shall be placed at a 45 degree angle at each post location in the parallel and perpendicular directions to the beam. Bracing shall be constructed with ~~minimum of~~ nominal 2x4 lumber and shall be fastened to framing with one 1/2 inch (9 mm) diameter through bolt ~~with washers at each end~~ or by the use of other mechanical devices. The length of the diagonal brace shall be ~~a minimum of 2 feet long measured as shown in Figure R507.10.1 or at least~~ 1/3 the height of the deck above grade or a minimum of 2 feet.



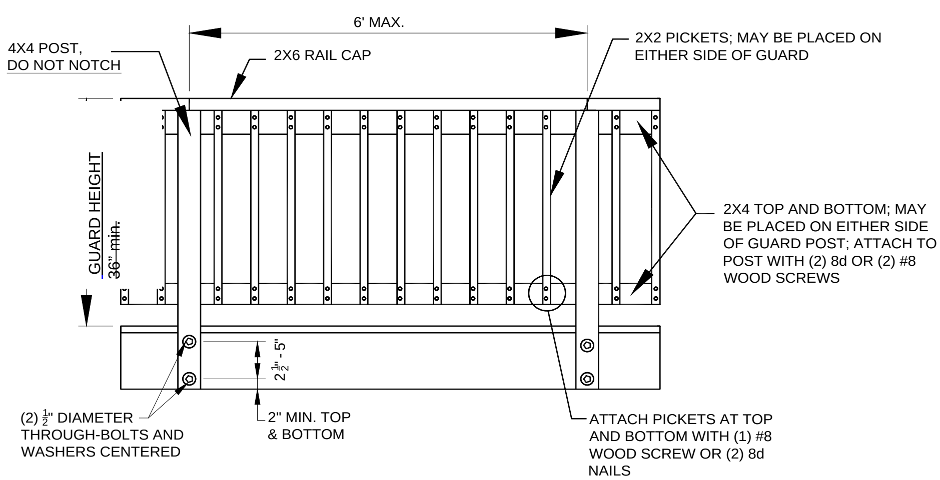
For SI: 1 foot = 304.8 mm

FIGURE R507.10.1
FREE-STANDING DECK DIAGONAL BRACING

R507.~~12~~ 11 Deck guards. Deck guards shall be designed and constructed in accordance with Sections R301.5 and R312. Other materials and construction ~~techniques~~ details shall be permitted in accordance with Section R301. Wood deck guards shall not be notched.

R507.~~12.1~~ 11.1 Guard construction. ~~Where the guard requirements of Sections R301.5 and R312 are met using the details shown in Figures R507.12.1(1) through R507.12.1(3),~~ Guard posts shall be attached to the inside or outside face of the rim joist or end joist as shown in Figures R507.11.1(1) through R507.11.1(3), Hold-down ~~anchors~~ fasteners shall have a minimum capacity of 1,800 pounds (8006 N).

R507.11.2 Guard rail construction. The guard rail cap shall be nailed to the top of the guard post with a minimum of four 16d common nails or #12 by 3" long screws, or an alternate connection that will resist 200 pounds of shear force.



For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm

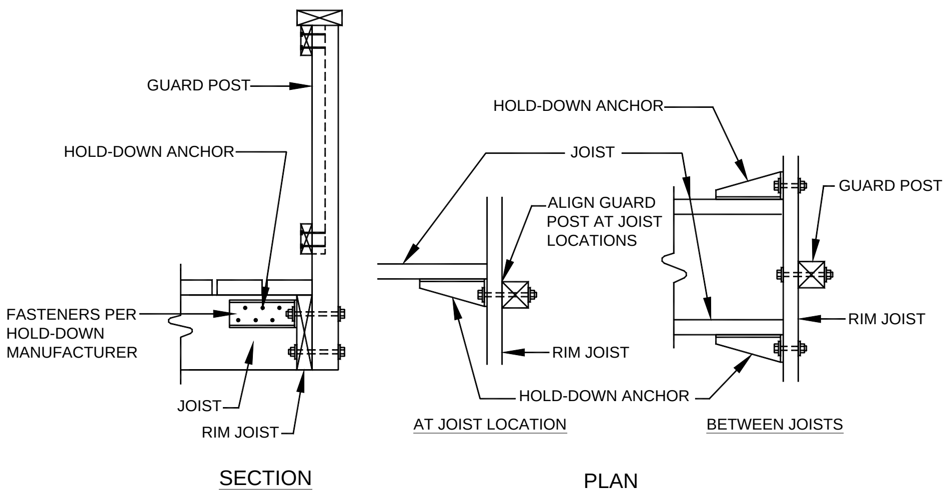

FIGURE R507.~~12.1(3)~~ 11.1(3)
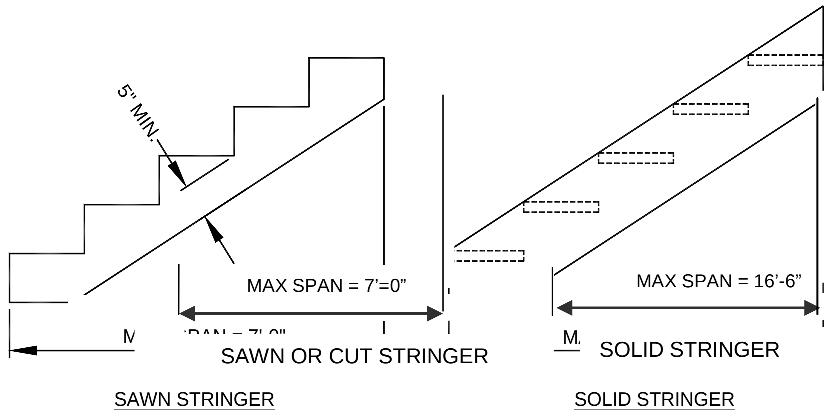
GUARD POST TO RIM JOIST CONNECTION

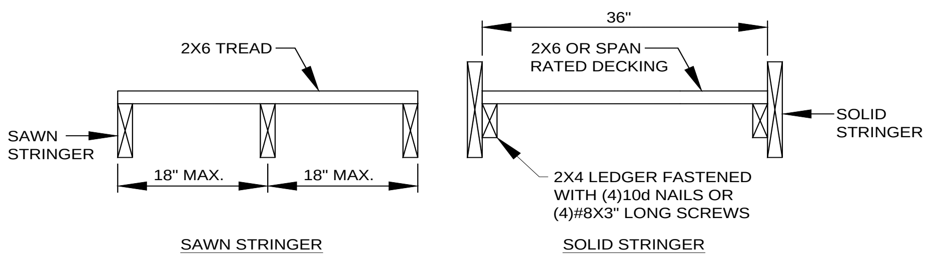
R507.~~13~~ 12 Deck stairs. Deck stairs shall be constructed in accordance with this section and Section R311.7. Where a flight of stairs has a vertical rise greater than that allowed per Section R311.7.3, an intermediate landing shall be provided ~~in accordance with Section R311.7.6 and designed as a free-standing deck in accordance with Section R507.10~~.

R507.~~13.1~~ 12.1 Stair stringers. Stair stringers shall be constructed of ~~sawn~~ nominal 2x12 ~~members at 18 inches on center with a throat dimension of 5 inches and a maximum span length~~ lumber as shown in Figures R507.~~13.1~~ 12.1(1) and R507.12.1(2) ~~Stairs with a width equal to 36 inches shall be permitted to be constructed with two solid 2x12 stringers wit a maximum span length as shown in Figure R507.13.1.~~ Stringers with spans greater than those shown in Figure R507.12.1(1) shall be supported with intermediate posts and footings spaced along its length.



~~For SI: 1 inch = 25.4 mm, 1 foot = 304.8mm~~

FIGURE R507.13.1 12.1(1)
STAIR STRINGER REQUIREMENTS



For SI: 1 inch = 25.4 mm

FIGURE R507.~~13.3~~ 12.1(2)
~~TREAD~~ STRINGER WIDTH REQUIREMENTS

~~**R507.13.2 Stringer bearing.** Stringers shall be attached to posts or bear on joist hangers attached to the deck structure and on footings at grade in accordance with Figure R507.13.2. Joist hangers shall be specifically designed to accommodate sloped connections and shall have a minimum capacity of 625 pounds (2780 N). Reinforcing angles at rim joist locations only shall have a minimum capacity of 325 pounds (1446 N).~~

~~**FIGURE R507.13.2**~~
~~**STRINGER BEARING**~~

R507.~~13.3~~ 12.2 Treads and risers. Stair treads shall be constructed in accordance with Section R311.7 and Figure R507.~~13.3~~ 12.1(2). Treads shall be composed of nominal 2x~~6~~ lumber or plastic composites. ~~Treads of stairs constructed with solid stringers shall be permitted to be composed of span rated decking.~~ Risers shall be permitted to be composed of nominal 1x lumber. Openings in risers shall not allow the passage of a 4 inch (102 mm) diameter sphere.

R507.~~13.4~~ 12.3 Stair guards. Guards for stairs shall be as required per Section R312.1.1 ~~and constructed in accordance with Section R507.12. The attachment of a stair guard post to the stringers shall be constructed in accordance with Figure R507.13.4~~.

~~**FIGURE R507.13.4**~~
~~**STAIR GUARD CONNECTION**~~

R507.~~13.5~~ 12.4 Stair handrails. ~~When required, handrails for stairs shall be as required~~ A stair handrail may be required per Section R311.7.8. ~~When required and where the top guard rail does not comply with the handrail grip-size requirements in Section R311.7.8.3, a separate, conforming handrail shall be required.~~ When a guard is required in accordance with Section R312.1.1, the top rail shall comply with the handrail grip size requirements of Section R311.7.8.3 or a separate handrail shall be provided.

R507.~~13.6~~ 13 Ramps. Ramps from decks shall be as required in Section R311.8. Details for stringers, guards and handrails shall be similar to those for stairs.

Commenter's Reason: This proposal was originally submitted to address the lack of prescriptive deck construction details in the IRC. Prescriptive details are needed in the code to help the "weekend warrior" or other inexperienced builders who do not build decks on a regular basis. The construction of safe decks is an important issue that warrants inclusion in the IRC.

The committee in Dallas agreed that Section R507 was woefully deficient in providing minimum prescriptive deck criteria. This public comment integrates many comments from multiple interested parties.

Arguing in support of this proposal in Dallas, several proponents rightfully pointed out that many jurisdictions across the country have deferred to DCA6 as an acceptable guide for building decks. In the absence of IRC criteria, DCA6 was a respected alternative. This submission is based on many of the provisions in DCA6.

The opponents in Dallas argued that some of the details were different than those used in their parts of the country. They missed the opening sentences in the first section – that this proposed code change was intended to provide 1) *typical* requirements and details and 2) other materials and methods were equally acceptable. It was argued that providing minimum requirements for the average homeowner in no way was intended to stifle deck craftsmen.

Numerous examples of engineered solutions and commonly accepted details have been sent to me from many parts of the country. There are YouTube videos from well established stores, like Home Depot, that are offering "how to" videos that are teaching the average homeowner wrong ways to build decks. Some of these are so egregiously wrong that they could jeopardize life safety. In the absence of good code, the handy homeowner will resort to anything – good or bad: to paraphrase a TV commercial: "everyone knows that everything on the internet is correct"

In conclusion, there are several public comments to RB 264 and RB268 being submitted to fill the void on how to build decks safely. There is a short version, a medium length version and this more complete version. We think that less is less, and more is better. We submit this longer version because the average deck builders, plan reviewers and inspectors have nothing in the IRC to help them with a deck design. Homeowners and non-professionals need to have simple prescriptive methods for building a safe deck, and we believe this proposal provides those guidelines.

I strongly recommend that you support RB268 so that we will have prescriptive criteria in the code for building decks.

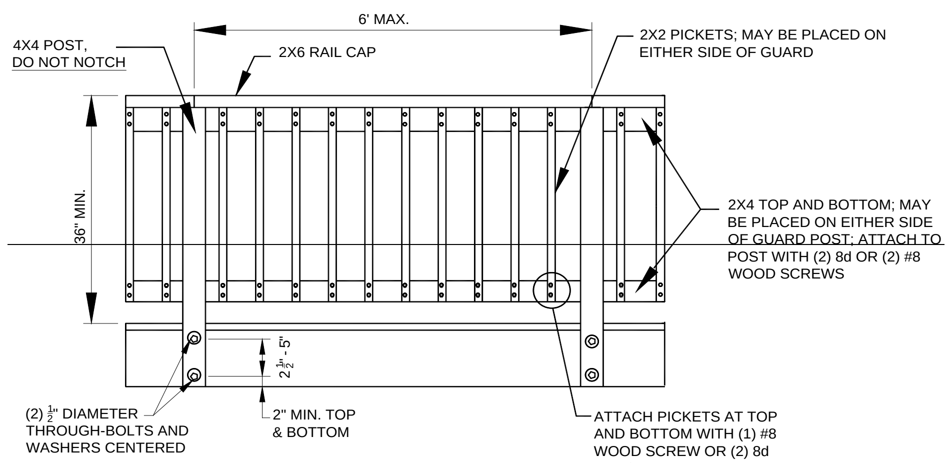
Public Comment 2:

Chuck Bajnai, Chesterfield County, VA, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

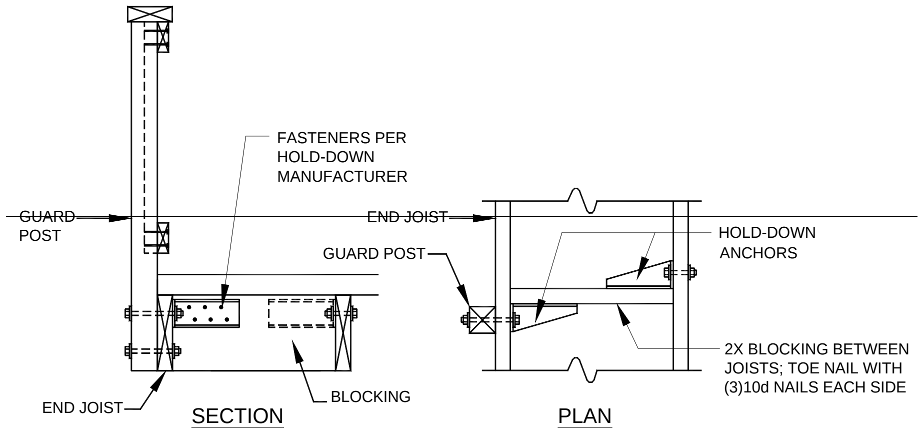
R507.12 Deck guards. Deck guards shall be designed and constructed in accordance with Sections R301.5 and R312. ~~Other materials and construction techniques shall be permitted in accordance with Section R301.~~ <u>Deck guards shall not be notched.</u>

~~**R507.12.1 Guard construction.** Guard posts shall be attached to the inside or outside face of the rim joist or end as shown in Figures R507.12.1(1) through R507.12.1(3), Hold-down anchors shall have a minimum capacity of 1,800 pounds (8006 N).~~

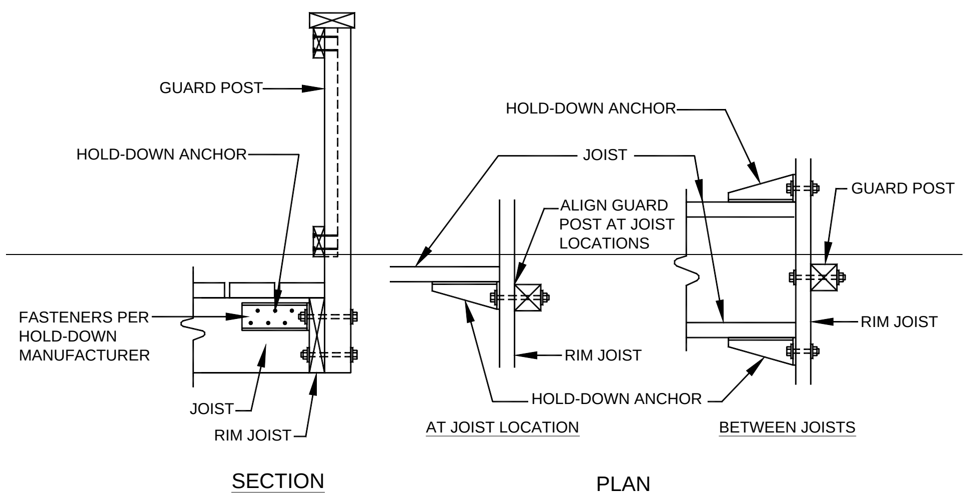


~~For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm~~

~~**FIGURE R507.12.1(1)**~~
~~**DECK GUARD**~~



~~FIGURE R507.12.1(2)~~
~~GUARD POST TO END JOIST~~



~~FIGURE R507.12.1(3)~~
~~GUARD POST TO RIM JOIST~~

Commenter's Reason: The guard post detail was created after extensive testing by Virginia Tech. The connector in the detail was the only solution they could get to pass the testing criteria for a guard rail. While other devices or details may be available, no one has provided engineering test data for any other options.

Having said that, a major objection to RB268 by the opponents was this guard-rim joist connection detail. As an effort to reach a compromise, I am requesting these details be deleted.

Public Comment 3:

John Orang, Barefoot Decks, representing self, requests Disapproval.

Commenter's Reason: We have been building decks in Colorado since 1994. During that time we have built hundreds of decks and learned a lot along the way.

When I heard of the new lateral post attachment method that is proposed for the 2015 IRC, I had to stop and take a hard look at it. We have spent several years addressing this very issue and in the past year have come up with our very own patent pending bracket that has tested very well. Our crews are very comfortable with the ease of use that this bracket offers and me. As the company owner, I am extremely happy with the stability of the rail as well as minimum deflection.

The reason I am writing a response to this hearing isn't to pitch my product but only to voice my opinion against being forced to use a product that in my opinion performs less favorably, especially when it comes to deflection.

I am sure there are a variety of methods to achieve the current 500 lb safety factor and forcing one product on thousands of creative deck builders seems to go against the grain of what we are all about.

Thanks for your consideration

RB268-13

Final Action: AS AM AMPC____ D

RB270-13
R602.3, R602.4

Proposed Change as Submitted

Proponent: Dennis St. Denis, D & L Quality Homes, representing self (lstdenis2@cogeco.ca)

Revise as follows:

R602.3 Design and construction. Exterior walls of woodframe construction shall be designed and constructed in accordance with the provisions of this chapter and Figures R602.3(1) and R602.3(2) or in accordance with AF&PA's NDS. Components of exterior walls shall be fastened in accordance with Tables R602.3(1) through R602.3(4). Wall sheathing shall be fastened directly to framing members and, when placed on the exterior side of an exterior wall shall be capable of resisting the wind pressures listed in Table R301.2(2) adjusted for height and exposure using Table R301.2(3). Wood structural panel sheathing used for exterior walls shall conform to DOC PS 1, DOC PS 2 or, when manufactured in Canada, CSA O437 or CSA O325. All panels shall be identified for grade, bond classification, and performance Category by a grade mark or certificate of inspection issued by an approved agency and shall conform to the requirements of Table R602.3(3). Wall sheathing used only for exterior wall covering purposes shall comply with Section R703.

Studs shall be continuous from support at the sole plate to a support at the top plate to resist loads perpendicular to the wall. The support shall be a foundation or floor, ceiling or roof diaphragm or shall be designed in accordance with accepted engineering practice. <u>Load Bearing Warning Signs shall be installed on every second stud along the full length of the load bearing wall, at a height of 5 feet and attached with screws or nails.</u>

> **Exception:** Jack studs, trimmer studs and cripple studs at openings in walls that comply with Tables R502.5(1) and R502.5(2).

R602.4 Interior load-bearing walls. Interior load-bearing walls shall be constructed, framed and fireblocked <u>and Load Bearing Warning Signs installed</u> as specified for exterior walls.

Reason: Load Bearing Walls and Load Points are being removed by homeowners and contractors during renovations and also being cut into by sub-contractors during new home construction or renovations without knowing what the possible outcome can be. The resulting problems are people being severly injured, ceilings and/or roofs collapsing and fatalities. All of this can be avoided if these SAFETY WARNING SIGNS were enforced as a building code.

Cost Impact: This code change proposal will increase the cost of construction.

R602.3-RB-STDENIS.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The adding of warning signs may not prevent cutting into load bearing walls. The signs are hidden within the wall cavity and may never be seen prior to cutting into the wall.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment:

Dennis St Denis, D&L Quality Homes, representing self, Guy Bourdeau, representing self, E. Hillfrich, Hilfrich, Inc, Lanielle St Denis, representing self, request Approval as Submitted.

Commenter's Reason:

(**D. St Denis):** I am asking the committee to reconsider their decision and approve my code change AS SUBMITTED. The opponent's arguments in my opinion were non-valid. Some of the arguments were, size and lettering on the signs, people not being able to read English, stamps on roof truss, renovators/people cutting into walls. These arguments do not compare to structure being compromised, sever injuries and death. Through research, I have proof of injuries, fatalities and structural compromise. The opponents provided no proof to back their arguments.

Opponents arguments.

Size and lettering on signs: Load Bearing Warning Signs are currently on the market, in production in Canada and soon The United States. Therefore size and lettering would be consistent.

People not being able to read English: English is the official language in the USA and the signs are available in bilingual. Therefore this argument is non-valid.

Stamps on roof trust: This is not related to this code change.

People cutting into walls: I have over 30 years in construction and have yet to see someone grab a saw and cut into a wall. People also do think of electrical wires and plumbing inside walls before cutting into them. The electrical code alone states that wall plugs must be a certain distance from one another. This puts electrical plugs on every wall. People who see this will not attempt to cut through a wall, its common sense. Removing the outer/finish layer is the preferred and most widely used way in home renovations.

I have submitted proof with my code change that there is a drastic need for warning signs on load bearing structure. This matter needs to be addressed as soon as possible. How many other people must get injured? How many other people must loose there life before something is done? The committee should stand by their commitment and make the right decision in ensuring public safety in the built environment.

I have also submitted along with this public comment form, more proof from the Ministry of Labour (Federal Government of Canada) showing injuries reported from walls collapsing due to removing structure. The search was done from 2006 until 2011 with 9 reports during this short time. You cannot get any more clear proof then this. No matter what country I search in, what state or province, there is proof showing that warning signs on load bearing walls is needed in the building code. The committee should stand behind building safety month, promoting safety in the built environment as stated on the website.

(Bourdeau): I wish the council would change its position and approve the code change as proposed. The industry spoke against the code change giving reasons such as; home owners not being able to read or understand the signs, building inspectors not being able to enforce the change, people not tearing the wall apart but cutting the wall down.

All these reasons can be accepted at face value but the opposite can also be argued to the effect that some people can read, building inspectors have to check the site after the framing is done at which point the signs would be on, and most people do not cut walls down as there are wires and plumbing hidden inside the walls. So the industries arguments are shallow.

Please do not forget that the purpose of the council is to create a code that protects the residential homeowner. This can be achieved by creating standards and tables that insures a construction is up to par. The council can also use another level of protection as does the electrical industry, plumbing industry and the department of highways. That level of protection is the use of warning signs.

Using the arguments of the building industry and applying them to the electrical industry would read as follows, do not put no entry warning signs on electric fencing around electric substations because people cannot read those signs, because it is not enforceable by the inspectors.

Using the arguments of the building industry, and applying them to the department of highway, would mean taking out warning signs of upcoming curves, of falling rocks and other such signs because people cannot read them or understand what they mean.

As a homeowner and past contractor/renovator, load bearing warning signs would have made my job easier and would have saved from damage to property in several instances. I would like to recall to the council's attention the death of employees in Bangladesh who were crushed under the collapse of their building. I would also like to recall the collapse of the mall in Northern Ontario which killed two people. I would also like to draw your attention to the proponent's research which submits twelve or more incidents in the residential sector of collapse, injury and death.

I therefore expect that the council will consider the proponent's submission with a positive outcome.

(Hilfrich): This proposal will go a long way to reducing the risks of damage to or removal of loadbearing wall elements during renovation work by untrained persons and thereby increase the safety and longevity of these structures. Too often, individual homeowners, or unskilled or poorly trained contractors remove or damage loadbearing elements of a structure without providing any replacement structural members. Inclusion of the small warning signage will significantly reduce these type of situations from going unnoticed and uncorrected.

(L. St Denis): I am asking the council to change its position and approve the code change as proposed. This is a growing problem, as many people are being killed and seriously injured when it comes to construction and renovation of homes. A list of such injuries and deaths has been submitted by the proponent . The issues that were addressed at the public hearing held in Texas by the community are issues that all building code proposals face when created and altered. There are some contractors that are illiterate and/or from other dialects that may not be able to read the signs, but the sign can be altered to suit. The same issues can be said when reading the book of building codes, however you have overcome that issue. There may be some confusion as to where the signs may be exposed, such as not being in the appropriate places, but I'm sure the inspectors that need to locate these signs will know where they should be and this will give them the opportunity to educate the contractors that get it wrong, as to what a load bearing wall is. There was also the issue of how contractors remove walls to obtain the open concept. Some take the drywall off, while others cut into the walls in the place they wish to open. Regardless of the method of removal, the signs will still be visible as they need to be placed 5 feet from the floor, which is almost at eye level and on every second stud. If a cutting tool is used, when they encounter the sign, it will be more difficult to cut through and this will prompt them to take a look and see the sign.

The loss of life and serious injuries caused by load points being removed without the proper education is a subject that the building code association needs to keep in mind when making the decision of accepting or rejecting this proposal. The purpose of your existence is to prevent death and injury and this proposal is exactly what you need to do so. This is a growing problem that not only entails do it yourselfers that don't know what they're doing, but also scab/immoral contractors that do everything they can to save a dollar. These people don't have the desire they need to do things right and the committee is there to push them to change. This building code proposal is exactly what you need to accomplish this goal.

RB270-13

Final Action: AS AM AMPC____ D

RB277-13
Table R602.3(1), Table R703.4

Proposed Change as Submitted

Proponent: Edward L. Keith, APA – The Engineered Wood Association (ed.keith@apawood.org)

Revise as follows:

TABLE R602.3(1)
FASTNER SCHEDULE FOR STRUCTURAL MEMBERS

ITEM	DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER	SPACING OF FASTENERS
32	Water-repellent siding (weighing less than 11 psf) attachment to Wood Structural Panel sheathing, either direct or over foam insulation [k]	Ring shank nail (0.148" min. dia.)	12” o.c. (per 12” of siding width)[l]
		Smooth or screw shank nail (0.148" min. dia.)	3” o.c. (per 12” of siding width)[l]
		Vinyl siding nail (0.120" min. dia.)	3” o.c. (per 12” of siding width)[l]
		#6 screw (0.138" min. dia.)	12” o.c. (per 12” of siding width)[l]
		#8 screw (0.164" min. dia.)	16” o.c. (per 12” of siding width)[l]

(Portions of table not shown remain unchanged)

k. Fastener length shall be sufficient to penetrate back side of the minimum 7/16" WSP sheathing by at least ¼”.
l. Spacing of fasteners is per 12" of siding width. For other siding widths, multiply SPACING OF FASTENERS above by a factor of 12/s, where s is the siding width in inches. For example, if 8" lap siding, multiply SPACING OF FASTENERS above by 12/8 or 1.5. Fastener spacing shall never be greater than the manufacturer's minimum recommendations.

Revise as follows:

TABLE R703.4
WEATHER-RESISTANT SIDING ATTACHMENT AND MINIMUM THICKNESS

SIDING MATERIAL	NOMINAL THICKNESS[a] (inches)	JOINT TREATMENT	WATER-RESISTIVE BARRIER REQUIRED	TYPE OF SUPPORTS FOR THE SIDING MATERIAL AND FASTENERS[b, c, d]					
				Wood or wood structural panel sheathing into stud	Fiberboard sheathing into stud	Gypsum sheathing into stud	Foam plastic sheathing into stud	Direct to studs	Number or spacing of fasteners

(Portions of Table not shown remain unchanged)

d. Nails or staples shall be aluminum, galvanized, or rust-preventative coated and shall be driven into the studs where fiberboard, gypsum or foam plastic sheathing backing is used. Where wood or wood structural panel sheathing is used, fasteners shall be driven into studs unless otherwise permitted to be driven into sheathing in accordance with the siding manufacturer’s installation instructions or Table R602.3(1).

Reason:
1. With the elimination of the term “nailable sheathing” in Chapter 7 last cycle, users of Table R703.4 are left without guidance on how to attach siding products to wood structural panel sheathing alone. Additionally, the trend toward the use of non-structural foam sheathing over structural sheathing has led to the development of the proposal for Item 32 above. It provides attachment recommendations for any siding products with an applied weight of less than 11 psf direct to wood structural panel sheathing or through any thicknesses of foam sheathing without having to penetrate the wall framing. This can be essential when attaching siding through thicker foam insulation panels as actually finding the framing with fasteners can be a challenge.

Footnote k requires the fastener used to penetrate the wood structural panel sheathing back side by at least ¼ inch. This will ensure that the cylindrical shank of the fastener is engaged in the wood structural panel, providing the maximum withdrawal capacity. This also provides the user with the maximum flexibility when selecting fasteners. For example, when attaching vinyl siding over 2 inches of foam sheathing into 7/16-inch wood structural panel sheathing, the fastener can be any length greater than

(1/8" + 2" + 7/16" + ¼"=) 2-13/16 inches, so a 3-inch long nail should work. For a smooth shank nail, a 10d Common nail (3" x 0.148") meets both the length and diameter requirements. If 1 inch of penetration was required in the stud, a nail of (1/8" + 2" + 7/16" + 1"=) 3-9/16 inches would be required. As such, 20d box nail (4" x 0.148") or some specialty nail would be required.

Footnote l provides the methodology for adjusting the fastener spacing to accommodate lap siding greater or less than 12 inches in width. The adjustment calls for 12" to be divided by the siding width. The fastener spacing provided for in Item 32 is then multiplied by this factor.

The above proposal is based on ASCE 7-10 V_{ult}, <140 miles per hour, maximum 30 ft building height, Exposure C or less.

The table was developed based on the principle of engineering mechanics and confirmed by full-scale wind tunnel tests at the Insurance Institute for Business & Home Safety (IBHS) Research Center in Chester County, South Carolina. The wind tunnel test report is available at http://www.apawood.org/TechnicalPapers/IBHS_WindTunnelTestReport.pdf or by contacting the APA help desk at help@apawood.org.

2. Footnote d to Table R703.4 was changes to add proposed item 32 to the list of information sources available for nailing direct to wood structural panel sheathing.

Cost Impact: This code change proposal will not increase the cost of construction.

R602.3(1)T-RB-KEITH.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: There is an undefined term "water-repellant siding". The 3" o.c. nail of vertical vinyl siding is impractical.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Edward L. Keith, representing APA – The Engineered Wood Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

TABLE R602.3(1)
FASTNER SCHEDULE FOR STRUCTURAL MEMBERS

ITEM	DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER	SPACING OF FASTENERS
32	~~Water-repellent siding~~ Exterior wall covering (weighing less than 11 psf) attachment to ~~Wood Structural Panel~~ wood structural panel sheathing, either direct or over foam ~~insulation~~ sheathing a maximum of 2 inches thick.[k]	Ring shank roofing nail (0.120" min. dia.)	12" o.c. (per 12" of siding width)[l]
		Ring shank nail (0.148" min. dia.)	~~12"~~ 15" o.c. (per 12" of siding width)[l]
		~~Smooth or screw shank nail (0.148" min. dia.)~~	~~3" o.c. (per 12" of siding width)[l]~~
		~~Vinyl siding nail (0.120" min. dia.)~~	~~3" o.c. (per 12" of siding width)[l]~~
		#6 screw (0.138" min. dia.)	12" o.c. (per 12" of siding width)[l]
		#8 screw (0.164" min. dia.)	16" o.c. (per 12" of siding width)[l]

k. Fastener length shall be sufficient to penetrate back side of the ~~minimum 7/16"~~ wood structural panel sheathing by at least 1/4". The wood structural panel sheathing shall be 7/16" or thicker in thickness.

l. Spacing of fasteners is per 12" of siding width. For other siding widths, multiply SPACING OF FASTENERS above by a factor of 12/s, where s is the siding width in inches. For example, if 8" lap siding, multiply SPACING OF FASTENERS above by 12/8 or 1.5. Fastener spacing shall never be greater than the manufacturer's minimum recommendations.

(Portions of table/footnotes not shown remain unchanged)

TABLE R703.4
WEATHER-RESISTANT SIDING ATTACHMENT AND MINIMUM THICKNESS

d. Nails or staples shall be aluminum, galvanized, or rust-preventative coated and shall be driven into the studs where fiberboard, gypsum or foam plastic sheathing backing is used. Where wood or wood structural panel sheathing is used, fasteners shall be driven into studs unless otherwise permitted to be driven into sheathing in accordance with the siding manufacture's installation instructions or Table R602.3(1).

(Portions of table/footnotes not shown remain unchanged)

Commenter's Reason: APA attempted to work with other industries while developing this code change proposal. There was, however, not sufficient time to fully resolve some of the outstanding issues with the Vinyl Siding Institute (VSI) in December 2012. This PC reflects the resolution between APA and the VSI. We also took this opportunity to make some adjustments to the original proposal that we were unable to make through the Floor Modification procedure.

Additional proposal adjustments –

1. Recent research conducted by the foam industry suggests that limiting the thickness of the foam sheathing to 2 inches or less will minimize the potential for long term sagging of the siding material. With thicker foam sheathing, the fasteners used to attach the foam are essentially cantilevered through the foam away from the main member of the connection. For smaller diameter fasteners, the cantilevered fasteners can bend over time causing the water-resistant barrier to sag downward. Even though the use of the wall sheathing alone to anchor the siding requires a closer fastener spacing than that tested by the foam industry and should result in greater resistance to long term sagging of the siding, we have chosen to be conservative in our proposal to ensure good performance of the siding and its attachment to the wood structural panel sheathing.
2. We also changed the term "foam insulation" to "foam sheathing" to be consistent with the code definition.
3. We changed "Water repellent siding" to "Exterior wall covering" as it seemed more clearly described as such.
4. Footnote K was rewritten separating the requirements of the footnote into two separate sentences to ensure correct interpretation of the provisions. The requirements are:
    a. Full penetration of the wood structural panel sheathing by at least ¼ inch to ensure that the pyramidal tip of the fastener is not considered in the "depth of penetration" of the fastener, as the tip contributes nothing to the withdrawal capacity of the fastener. We want the nail to penetrate the wood structural panel sheathing, *regardless of thickness* to provide a visual indication of the nails' presence, adequate length and penetration of the wood structural panel sheathing.
    b. The second separate requirement is the minimum thickness of the wood structural panel sheathing. The tables are based on the use of 7/16" minimum thickness sheathing.
5. Two entries were eliminated as the unadjusted spacing of 3" on center was deemed to be far less useful than the deformed-shank fastener information provided.
6. The ring-shank roofing nail was added to the table as they have been used in part of the country.

RB277-13

Final Action: AS AM AMPC____ D

RB278-13
Table R602.3(1)

Proposed Change as Submitted

Proponent: Charles S. Bajnai, Chesterfield County, VA, representing ICC Building Code Action Committee and Virginia Building and Code Officials Association (bajnaic@chesterfield.gov)

Revise as follows:

Table R602.3(1)
FASTENING SCHEDULE ~~FOR STRUCTURAL MEMBERS~~

~~37~~36	1/2" gypsum sheathing [d]	1 1/2" galvanized roofing nail; staple galvanized, 1 1/2" long; 1 1/4 screws, Type W or S	7	7
~~38~~37	5/8" gypsum sheathing [d]	1 3/4" galvanized roofing nail; staple galvanized, 1 5/8" long; 1 5/8" screws, Type W or S	7	7
Wood structural panels, combination subfloor underlayment to framing				
~~39~~38	3/4" and less	6d deformed (2" × 0.120") nail; or 8d common (2 1/2" × 0.131") nail	6	12
~~40~~39	7/8" - 1"	8d common (2 1/2" × 0.131") nail; or 8d deformed (2 1/2" × 0.120") nail	6	12
~~41~~40	1 1/8" - 1 1/4"	10d common (3" × 0.148") nail; or 8d deformed (2 1/2" × 0.120") nail	6	12

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 mile per hour = 0.447 m/s; 1 Ksi = 6.895 MPa.

a. All nails are smooth-common, box or deformed shanks except where otherwise stated. Nails used for framing and sheathing connections shall have minimum average bending yield strengths as shown: 80 ksi for shank diameter of 0.192 inch (20d common nail), 90 ksi for shank diameters larger than 0.142 inch but not larger than 0.177 inch, and 100 ksi for shank diameters of 0.142 inch or less.

b. Staples are 16 gage wire and have a minimum 7/16-inch on diameter crown width.

c. Nails shall be spaced at not more than 6 inches on center at all supports where spans are 48 inches or greater.

d. Four-foot by 8-foot or 4-foot by 9-foot panels shall be applied vertically.

e. Spacing of fasteners not included in this table shall be based on Table R602.3(2).

f. For regions having basic wind speed of 110 mph or greater, 8d deformed (21/2" × 0.120) nails shall be used for attaching plywood and wood structural panel roof sheathing to framing within minimum 48-inch distance from gable end walls, if mean roof height is more than 25 feet, up to 35 feet maximum.

g. For regions having basic wind speed of 100 mph or less, nails for attaching wood structural panel roof sheathing to gable end wall framing shall be spaced 6 inches on center. When basic wind speed is greater than 100 mph, nails for attaching panel roof sheathing to intermediate supports shall be spaced 6 inches on center for minimum 48-inch distance from ridges, eaves and gable end walls; and 4 inches on center to gable end wall framing.

h. Gypsum sheathing shall conform to ASTM C 1396 and shall be installed in accordance with GA 253. Fiberboard sheathing shall conform to ASTM C 208.

i. Spacing of fasteners on floor sheathing panel edges applies to panel edges supported by framing members and required blocking and at all floor perimeters only. Spacing of fasteners on roof sheathing panel edges applies to panel edges supported by framing members and required blocking. Blocking of roof or floor sheathing panel edges perpendicular to the framing members need not be provided except as required by other provisions of this code. Floor perimeter shall be supported by framing members or solid blocking.

j. Where a rafter is fastened to an adjacent parallel ceiling joist in accordance with this schedule, provide two toe nails on one side of the rafter and toe nails from the ceiling joist to top plate in accordance with this schedule. The toe nail on the opposite side of the rafter shall not be required.

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC) The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

This proposed change is the second part of an effort by the ICC Building Code Action Committee to create a consistent format for the conventional wood frame fastener schedules in the IBC and the IRC. The revised descriptions in this proposed change were approved in the corresponding Table 2304.9.1 of the IBC (see S265). The row descriptions and organization of the IBC table (and now proposed in this IRC table) will be substantially the same, allowing for ease of use.

Complete consistency between the actual fastening specified in the two codes was beyond the scope of the committee work. In the approved IBC table some changes were made in order to provide alternatives currently permitted in the IRC, and to establish some common nail equivalents. No substantial changes are proposed to the IRC fastening, since the existing table generally permits the substitution of box nails for common nails, and the current fastening is well established. Rather, changes have been limited to the ordering, modification, addition, or combining of the fastening descriptions for clarity and consistency.

Cost Impact: The code change proposal will not increase the cost of construction.

R602.3(1)-RB-BAJNAI-BCAC.doc

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The committee feels this does not add clarity. The committee prefers RB272-13.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Charles S. Bajnai, Chesterfield County, VA, representing ICC Building Code Action Committee, and Dennis Pitts, American Wood Council request Approval as Submitted.

Commenter's Reason:

(Bajnai): The ICC Building Code Action Committee (BCAC) request that the code development committee be overturned and this proposal be *approved as submitted.*

Confusion during testimony at the hearings inferred that RB278 was in conflict with RB272. The BCAC worked with AWC to be sure they are completely compatible.

1. This is the second half of a two part code change to reformat the prescriptive fastener schedule in the IRC with IBC, Table 2304.9.1. The first half was approved in the last cycle (S265-12) in Portland.

2. RB272-13, submitted by the American Wood Council, primarily makes adjustments to the actual fastenings specified (number and size of nails) in order to increase flexibility of options and also to establish baseline capacities for all the connections, when comparing the codes.

3. Approval of both RB278 and RB272 will result in a uniform table format, as well as more uniform fastener specifications, between the two codes. Merging the two proposals will not be difficult since one adjusts the descriptions, and the other the specified fastening.

(Pitts): We support the formatting revisions put forward by the BCAC in RB278 and consider them compatible with RB272. This change revises descriptions of some entries to be consistent with what was approved for the prescriptive fastener schedule in the IBC (see S265-12). With RB272 and RB278 both approved, the final table would appear as follows:

Table R602.3(1)
FASTENING SCHEDULE

	DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER [a, b, c]	SPACING AND LOCATION
		Roof	
1	Blocking between ceiling joists or rafters to top plate	4-8d box (2.5 " x 0.113"); or 3-8d common (2.5" x 0.131"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails	at each end, toe nail
2	Ceiling joists to top plate	4-8d box (2.5 " x 0.113"); or 3-8d common (2.5" x 0.131"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails	per joist, toe nail
3	Ceiling joist not attached to parallel rafter laps over partitions (see Section R802.3.1, R802.3.2, Table R802.5.1(9))	4-10d box (3"x 0.128"); or 3-16d common (3.5" x 0.162"); or 4-3" x 0.131" nails	Face nail
4	Ceiling joist attached to parallel rafter (heel joint) (see Section R802.3.1, R802.3.2,	Per Table R802.5.1(9)	Face nail

	Table R802.5.1(9))		
5	Collar tie to rafter, or 1 1/4” x 20 gage ridge strap to rafter	4 -10d box (3”x 0.128”); or 3-10d common (3" x 0.148"); or 4-3” x 0.131” nails	Face nail
6	Rafter or roof truss to plate	3-16d box nails (3.5” x 0.135”); or 3-10d common nails (3” x 0.148”); or 4-10d box (3" x 0.128"); or 4-3” x 0.131 nails	2 toe nails on one side and 1 toe nail on opposite side of each rafter or truss [j]
7	Roof rafters to ridge, valley or hip rafters; or, roof rafter to minimum 2-inch ridge beam	4-16d box (3.5 ” x 0.135”); or 3-10d common (3.5” x 0.148”); or 4-10d box (3" x 0.128"); or 4-3” x 0.131” nails 3-16d box (3.5 ” x 0.135”) 2-16d common (3.5” x 0.162”); or 3-10d box (3" x 0.128"); or 3-3” x 0.131” nails	Toe nail End nail
Wall			
8	Stud to stud (not at braced wall panels)	16d common (3.5” x 0.162”) 10d box (3" x 0.128"); or 3” x 0.131” nails	24” o.c. face nail 16” o.c.
9	Stud to stud and abutting studs at intersecting wall corners (at braced wall panels)	16d box (3.5 ” x 0.135”); or 3” x 0.131” nails 16d common (3.5” x 0.162”)	12” o.c. face nail 16” o.c.
10	Built-up header (2-inch to 2-inch header)	16d common (3.5" x 0.162") 16d box (3.5” x 0.135”)	16" o.c. each edge face nail 12” o.c. along each edge
11	Continuous header to stud	5-8d box (2.5 ″ × 0.113″); or 4-8d common (2.5" x 0.131"); or 4-10d box (3" x 0.128")	Toe nail
12	Top plate to top plate	16d common (3.5" x 0.162") 10d box (3" x 0.128"); or 3” x 0.131” nails	16" o.c. face nail 12” o.c.
13	Top plate to top plate, at end joints	8-16d common (3.5" x 0.162"); or 12-16d box (3.5" x 0.135"); or 12-10d box (3" x 0.128"); or 12-3” x 0.131” nails	Face nail on each side of end joint (minimum 24” lap splice length each side of end joint)
14	Bottom plate to joist, rim joist, band joist or blocking (not at braced wall panels)	16d common (3.5" x 0.162") 16d box (3.5" x 0.135"); or 3” x 0.131” nails	16" o.c. face nail 12” o.c.
15	Bottom plate to joist, rim joist, band joist or blocking at braced wall panels	3-16d box (3.5″ × 0.135″); or 2-16d common (3.5" x 0.162"); or 4-3” x 0.131” nails	16" o.c. face nail
16	Stud to bottom plate	4-8d box (2.5″ × 0.113″);or 3-16d box (3.5″ × 0.135″); or 4-8d common (2.5" x 0.131"); or 4-10d box (3" x 0.128"); or 4-3” x 0.131” nails	Toe nail End nail
17	Top or bottom plate to stud	3-16d box (3.5″ × 0.135″); or 2-16d common (3.5" x 0.162"); or 3-10d box (3" x 0.128"); or 3-3” x 0.131” nails	End nail
18	Top plates, laps at corners and intersections	3-10d box (3″ × 0.128″); or 2-16d common (3.5" x 0.162"); or 3-3" x 0.131" nails	Face nail
19	1" brace to each stud and plate	3-8d box (2.5″ × 0.113″); or 2-8d common (2.5" x 0.131"); or 2-10d box (3" x 0.128") 2 staples 1.75″	Face nail
20	1" × 6" sheathing to each bearing	3-8d box (2.5″ × 0.113″); or 2-8d common (2.5" x 0.131"); or 2-10d box (3" x 0.128") 2 staples, 1” crown, 16 ga., 1.75″ long	Face nail

21	1” x 8” and wider sheathing to each bearing	1”x 8”: 3-8d box (2.5″ × 0.113″); or 3-8d common (2.5" x 0.131"); or 3-10d box (3" x 0.128") 3 staples, 1” crown, 16 ga., 13/4″ long Wider than 1”x 8”: 4-8d box (2.5″ × 0.113″); or 3-8d common (2.5" x 0.131"); or 3-10d box (3" x 0.128") 4 staples, 1” crown, 16 ga., 1.75" long	Face nail	
Floor				
22	Joist to sill, top plate, or girder	4-8d box (2.5″ × 0.113″); or 3-8d common (2.5" x 0.131"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails	Toe nail	
23	Rim joist, band joist, or blocking to sill or top plate (roof application also)	8d box (2.5″ × 0.113″) 8d common (2.5" x 0.131"); or 10d box (3" x 0.128"); or 3" x 0.131" nails	4” o.c. toe nail 6" o.c.	
24	1" × 6" subfloor or less to each joist	3-8d box (2.5″ × 0.113″); or 2-8d common (2.5" x 0.131"); or 3-10d box (3" x 0.128") 2 staples, 1” crown, 16 ga., 1.75″ long	Face nail	
25	2" subfloor to joist or girder	3-16d box (3.5″ × 0.135″); or 2-16d common (3.5" x 0.162")	Blind and face nail	
26	2" planks (plank & beam - floor & roof)	3-16d box (3.5″ × 0.135″); or 2-16d common (3.5" x 0.162")	at each bearing, face nail	
27	Built-up girders and beams, 2-inch lumber layers	20d common (4” x 0.192”); or 10d box (3" x 0.128"); or 3" x 0.131" nails And: 2-20d common (4” x 0.192”); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails	Nail each layer as follows: 32″ o.c. at top and bottom and staggered. 24” o.c. face nail at top and bottom staggered on opposite sides Face nail at ends and at each splice	
28	Ledger strip supporting joists or rafters	4-16d box (3.5″ × 0.135″); or 3-16d common (3.5" x 0.162"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails	At each joist or rafter, face nail	
29	Joist to band joist or rim joist	4-10d (3" x 0.128")	End nail	
30	Bridging to joist	2-10d (3" x 0.128")	Each end, toenail	
	DESCRIPTION OF BUILDING MATERIALS	**DESCRIPTION OF FASTENER[b,c,e]**	**SPACING OF FASTENERS**

		galvanized, 11/2" long; 11/4 screws, Type W or S		
37	5/8" gypsum sheathing [d]	1.75" galvanized roofing nail; staple galvanized, 15/8" long; 15/8" screws, Type W or S	7	7
Wood structural panels, combination subfloor underlayment to framing				
38	3/4" and less	6d deformed (2" × 0.120") nail; or 8d common (2.5" × 0.131") nail	6	12
39	7/8" - 1"	8d common (2.5" × 0.131") nail; or 8d deformed (2.5" × 0.120") nail	6	12
40	11/8" - 11/4"	10d common (3" × 0.148") nail; or 8d deformed (2.5" × 0.120") nail	6	12

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 mile per hour = 0.447 m/s; 1 Ksi = 6.895 MPa.

a. All nails are smooth-common, box or deformed shanks except where otherwise stated. Nails used for framing and sheathing connections shall have minimum average bending yield strengths as shown: 80 ksi for shank diameter of 0.192 inch (20d common nail), 90 ksi for shank diameters larger than 0.142 inch but not larger than 0.177 inch, and 100 ksi for shank diameters of 0.142 inch or less.
b. Staples are 16 gage wire and have a minimum 7/16-inch on diameter crown width.
c. Nails shall be spaced at not more than 6 inches on center at all supports where spans are 48 inches or greater.
d. Four-foot by 8-foot or 4-foot by 9-foot panels shall be applied vertically.
e. Spacing of fasteners not included in this table shall be based on Table R602.3(2).
f. For regions having basic wind speed of 110 mph or greater, 8d deformed (21/2" × 0.120) nails shall be used for attaching plywood and wood structural panel roof sheathing to framing within minimum 48-inch distance from gable end walls, if mean roof height is more than 25 feet, up to 35 feet maximum.
g. For regions having basic wind speed of 100 mph or less, nails for attaching wood structural panel roof sheathing to gable end wall framing shall be spaced 6 inches on center. When basic wind speed is greater than 100 mph, nails for attaching panel roof sheathing to intermediate supports shall be spaced 6 inches on center for minimum 48-inch distance from ridges, eaves and gable end walls; and 4 inches on center to gable end wall framing.
h. Gypsum sheathing shall conform to ASTM C 1396 and shall be installed in accordance with GA 253. Fiberboard sheathing shall conform to ASTM C 208.
i. Spacing of fasteners on floor sheathing panel edges applies to panel edges supported by framing members and required blocking and at all floor perimeters only. Spacing of fasteners on roof sheathing panel edges applies to panel edges supported by framing members and required blocking. Blocking of roof or floor sheathing panel edges perpendicular to the framing members need not be provided except as required by other provisions of this code. Floor perimeter shall be supported by framing members or solid blocking.
j. Where a rafter is fastened to an adjacent parallel ceiling joist in accordance with this schedule, provide two toe nails on one side of the rafter and toe nails from the ceiling joist to top plate in accordance with this schedule. The toe nail on the opposite side of the rafter shall not be required.

The above final table reflects the following:

RB278 deleted current row 10, whereas RB 272 modified the fastenings—deletion of current row 10 was assumed to be the final result.

RB278 deleted current row 12, whereas RB 272 modified the fastenings—deletion of current row 12 was assumed to be the final result.

RB278 deleted current row 22, whereas RB 272 modified the fastenings—deletion of current row 22 was assumed to be the final result.

RB278 deleted current row 26, whereas RB 272 modified the fastenings—deletion of current row 26 was assumed to be the final result.

The deleted rows contained descriptions that were combined into other rows by virtue of the reformatting in RB278, so the deleted rows fastenings are contained in other rows of the proposed table and nothing is lost.

Public Comment 2:

Randall Shackelford, Simpson Strong-Tie Company, requests Approval as Modified by this Public Comment.

Table R602.3(1)
FASTENING SCHEDULE

	DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER [a, b, c]	SPACING AND LOCATION
	Roof		
1	Blocking between ceiling joists or rafters to top plate	3-8d (2 ½ " x 0.113")	~~at each end~~ toe nail
2	Ceiling joists to top plate	3-8d (2 ½ " x 0.113")	per joist, toe nail
3	Ceiling joist not attached to parallel rafter laps over partitions~~-~~(see Section R802.3.1, R802.3.2, Table R802.5.1(9))	3-10d (3" x 0.128")	Face nail
4	Ceiling joist attached to parallel rafter (heel joint) (see Section R802.3.1, R802.3.2, Table R802.5.1(9))	Per Table R802.5.1(9)	Face nail
5	Collar tie to rafter, or 1 1/4" x 20 gage ridge strap to rafter	3-10d (3" x 0.128")	Face nail each rafter
6	Rafter or roof truss to plate	3-16d box nails (3 ½" x 0.135"); or 3-10d common nails (3" x 0.148")	2 toe nails on one side and 1 toe nail on opposite side of each rafter or truss [j]
7	Roof rafters to ridge, valley or hip rafters: or, roof rafter to minimum 2-inch ridge beam	4-16d (3 ½ " x 0.135") 3-16d (3 ½ " x 0.135")	Toe nail End nail
	Wall		
8	Stud to stud (not at braced wall panels)	10d (3" x 0.128")	24" o.c. face nail
9	Stud to stud and abutting studs at intersecting wall corners (at braced wall panels)	16d (3 ½ " x 0.135")	12" o.c. face nail
10	Built-up header (2-inch to 2-inch header with ½" spacer)	16d (3 ½" × 0.135")	16" o.c. along each edge, face nail
11	Continuous header to stud	4-8d (2 ½ " × 0.113")	Toe nail
12	Top plate to top plate	10d (3" × 0.128")	24" o.c. face nail
13	Top plate to top plate, at end joints	8-16d (3 ½ " × 0.135")	Face nail on each side of end joint (minimum 24" lap splice length each side of end joint)
14	Bottom plate to joist, rim joist, band joist or blocking (not at braced wall panels)	16d (3 ½ " × 0.135")	16" o.c. face nail
15	Bottom plate to joist, rim joist, band joist or blocking at braced wall panels	3-16d (31/2" × 0.135")	3 each 16", face nail
16	Stud to bottom plate	3-8d (21/2" × 0.113") or 2-16d (31/2" × 0.135")	Toe nail End nail
17	Top ~~or bottom~~ plate to stud	2-16d (31/2" × 0.135")	End nail
18	Top plates, laps at corners and intersections	2-10d (3" × 0.128")	Face nail
19	1" brace to each stud and plate	2-8d (21/2" × 0.113") 2 staples 13/4"	Face nail --
20	1" × 6" sheathing to each bearing	2-8d (21/2" × 0.113") 2 staples, 1" crown, 16 ga., 13/4"long	Face nail --
21	1" x 8" and wider sheathing to each bearing	1"x 8": 2-8d (21/2" × 0.113") 3 staples, 1" crown, 16 ga., 13/4" long Wider than 1"x 8": 3-8d (21/2" × 0.113") 4 staples, 1" crown, 16 ga., 13/4" long	Face nail --
	Floor		

Commenter's Reason: We support the BCAC's reorganization of this table for consistency with the IBC's fastening for Conventional Construction. There are just a few items that we think can be improved.

- Line 1, for blocking between roof members, the toe nails are to the top plate along the length of the blocking, not at each end into the ceiling joist or rafter. The purpose of the blocking is to transfer shear forces into the top plate, and the toenailing has to be into the top plate to do this.
- Line 5, the fastening of the collar tie or ridge strap has to be into *each* rafter, not just a total of three nails.
- Line 10, the fastening of the built-up header uses 16d 3-1/2" long nails, so the minimum thickness of the built-up header must be 3-1/2". Therefore there must be a spacer, so we propose restoring the words "with ½" spacer".
- Line 10, the nails are installed "along" each edge, so we propose restoring that word to the fastener location.
- Line 15, the fastening at braced wall panels requires that three 16d nails be installed every 16". We propose adding "3 each" to remove the possibility for interpreting this as requiring only one nail every 16" o.c.
- Line 17, the fastening of stud to bottom plate is already covered in the previous line, so it can be deleted here.

RB278-13

Final Action: AS AM AMPC____ D

RB281-13
Table R602.3(5)

Proposed Change as Submitted

Proponent: Charles S. Bajnai, Chesterfield County, VA, representing ICC Building Code Action Committee and Virginia Building and Code Officials Association

Revise as follows:

TABLE R602.3(5)
SIZE, HEIGHT AND SPACING OF WOOD STUDS[a]

a. Listed heights are distances between points of lateral support placed perpendicular to the plane of the wall. Increases in unsupported height are permitted where ~~justified by analysis~~ in compliance with exception 2 of Section R602.3.1 or designed in accordance with accepted engineering practice.

(Portions of Table not shown remain unchanged)

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC) The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

The BCAC discussed what was inferred by "…where justified by analysis." meant. The conclusion was that this footnote should say that stud wall can be increased above 10 feet when the wall is compliant with exception 2 of Section R602.3.1 – in which case an engineered solution is not required.

Cost Impact: The code change proposal will not increase the cost of construction.

R602.3(5)-RB-BAJNAI-BCAC.doc

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: This change removes ambiguous language and adds clarity to the footnote.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Charles S. Bajnai, Chesterfield County, VA, representing ICC Building Code Action Committee, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

TABLE R602.3(5)
SIZE, HEIGHT AND SPACING OF WOOD STUDS[a]

a. Listed heights are distances between points of lateral support placed perpendicular to the plane of the wall. Bearing walls shall be sheathed on at least one side or bridging shall be installed not greater than 4 feet apart measured vertically from either end of the stud. Increases in unsupported height are permitted where in compliance with exception 2 of Section R602.3.1 or designed in accordance with accepted engineering practice.

(Portions of Table not shown remain unchanged)

Commenter's Reason: This proposal was ***approved as submitted***. The ICC Building Code Action committee (BCAC) submits this public comment address an omission.

The stud table, Table R602.3(5), assumes there is gypsum wall board or sheathing applied to at least one side of the studs to stabilize weak axis bending. It came to our attention that this is not explicit in the other sections of the code, though it is implied. This further modification addresses the possible omission. Without wall finish on at least one side, the studs would not be within the L / d limit required by the AWC/AF&PA NDS and the buckling capacity of the studs in the weak direction could be exceeded.

RB281-13

Final Action: AS AM AMPC____ D

RB282-13
Table R602.3.1

<u>Proposed Change as Submitted</u>

Proponent: James Bela, Oregon Earthquake Awarenes

Revise as follows:

TABLE R602.3.1
MAXIMUM ALLOWABLE LENGTH OF WOOD WALL STUDS EXPOSED TO WIND SPEEDS OF 100 MPH OR LESS
IN SEISMIC DESIGN CATEGORIES A, B, C $^{\underline{b,c}}$, D_0 $^{\underline{b,c}}$, D_1 $^{\underline{b,c}}$, and D_2^{b,c}

c. <u>Dimension Lumber grades for wood wall studs shall be minimum Construction grade lumber.</u> Utility, standard, stud and No. 3 grade lumber of any species are not permitted.

(Portions of Table not shown remain unchanged)

Reason: (a) Wood is an orthotropic material; and it therefore exhibits "unique and independent material properties" in 3 different orthogonal directions. Trees, unfortunately, also produce naturally occurring but "strength reducing characteristics" in sawn lumber: such as knots, shakes, and splits. Therefore wall studs at the MAXIMUM ALLOWABLE LENGTH limits will have their performances, in actuality, determined by this combination or mixture of "clear wood and strength reducing characteristics."
[http://bssc.nibs.org/client/assets/files/bssc/Topic13-SeismicDesignofWoodStructuresNotes.pdf]

(b) All of the SEISMIC DESIGN CATEGORIES (C, D_0, D_1 and D_2) are at risk to experience damaging intensities of earthquake shaking; and they are not, as too often is incorrectly assumed, *guarantees* of "low - to moderate - to high" earthquake loading (comparable to other external loadings that one might anticipate and design for – such as snow load.
See IRC-14-3_FIG. R301.2(2) SEISMIC DESIGN CATEGORIES SITE CLASS D.doc for a full discussion on the systemic errors and fundamental flaws in designating SEISMIC DESIGN CATEGORIES under the USGS National Seismic Hazard Maps (as incorporated now into ASCE 7-10).

Since earthquake damage results from multiple factors: Strength of shaking, Length of shaking, Type of soil, Type of building materials, and Type of building "lateral force resisting system" – WOOD WALL STUDS should exhibit the same lumber grade.

See Buildings and earthquakes—Which stands? Which falls?
http://www.iris.edu/hq/files/programs/education_and_outreach/retm/tm_100112_haiti/BuildingsInEQs_2.pdf

(c) Finally, since the lower SEISMIC DESIGN CATEGORIES downgrade the expected earthquake effects; they permit fewer lateral force resisting elements in walls (and also allow brittle elements (gypsum sheathing) rather than ductile elements (nailed wood shear walls: alternately referred to as "braced wall panels" in the IRC).

Summary: Above 10 ft in height, where we are beginning to push the limits of a "prescriptive code," WOOD WALL STUDS should all exhibit the same engineering properties of "minimum construction grade lumber" – in order to ensure both adequate and reasonable earthquake safety performance.

STUD *LIGHT* . . . is no match for earthquakes!

See Graphic: Damage to wood stud wall – 1994 Northridge EQ

See also: IRC-14-3FIG. R301.2(2) SEISMIC DESIGN CATEGORIES SITE CLASS D.doc

Cost Impact: The code change proposal will not increase the cost of construction.

R602.3.1T-RB-BELA.doc

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: This change does not clarify the code nor change the technical requirements.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jonathan Siu, City of Seattle, Dept of Planning & Development, representing FEMA/NIBS Code Resource Support Committee and City of Seattle DPD, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

TABLE R602.3.1
MAXIMUM ALLOWABLE LENGTH OF WOOD WALL STUDS EXPOSED TO WIND SPEEDS OF 100 MPH OR LESS, IN ALL SEISMIC DESIGN CATEGORIES ~~A, B, C [b,c], D_0 [b,c], D_1 [b,c], and D_2~~ [b,c]

c. ~~Dimension Lumber grades for wood wall studs shall be minimum Construction grade lumber.~~ Utility, standard, stud and No. 3 grade lumber of any species are not permitted.

Commenter's Reason: The proponent of the original code change has correctly identified a point of confusion as to the application of footnotes b and c to this table: do they apply just to Seismic Design Category (SDC) D2, or to other SDC's as well? While the proponent suggested applying them to SDC's C through D2, the Code Resource Support Committee (CRSC) came to the conclusion that the intent was the footnotes apply to all SDC's. The CRSC also came to the conclusion that allowing construction grade lumber in these walls was not appropriate, and the footnote should remain unchanged from the 2012 IRC. At the Committee Action Hearings, the CRSC proposed a modification to make these changes, but the Committee decided to disapprove the whole item.

Given the apparent confusion, the CRSC feels there is value in clarifying the code. The modifications proposed in this Public Comment are identical to the modification submitted at the Committee Action Hearings:

1. The table title is modified to delete the individual listing of Seismic Design Categories
2. Footnotes b and c now clearly apply to all Seismic Design Categories.

3. The originally proposed change to Footnote c is not adopted, resulting in the retention of the original 2012 IRC text.

RB282-13

Final Action: AS AM AMPC____ D

RB283-13
R602.3.1, Table R602.3.1

Proposed Change as Submitted

Proponent: Charles S. Bajnai, Chesterfield County, VA, representing ICC Building Code Action Committee and Virginia Building and Code Officials Association (bajnaic@chesterfield.gov)

Revise as follows:

R602.3.1 Stud size, height and spacing. The size, height and spacing of studs shall be in accordance with Table R602.3(5).

Exceptions:

1. Utility grade studs shall not be spaced more than 16 inches (406 mm) on center, shall not support more than a roof and ceiling, and shall not exceed 8 feet (2438 mm) in height for exterior walls and load-bearing walls or 10 feet (3048 mm) for interior nonload-bearing walls.
2. ~~Studs more than 10 feet in height which are in accordance with Table R602.3.1.~~
   Where snow loads do not exceed 25 pounds per square foot, walls exposed to wind loads of 100 mph or less shall be permitted over 12 feet tall for either supporting a roof load with not more than 6' of tributary length, or for a gable end wall. The studs shall be a minimum 2x6 at 16 inches on center with a maximum height of 18 feet or 2x6 at 12 inches on center with a maximum height of 20 feet. Openings shall be permitted with jack studs supporting the header in accordance with Section R602.7 and double king studs outboard of the jacks on each side of the opening. If any portion of the two-story wall is required to be a qualified braced wall panel to achieve compliance with Section R602.10.2 for either floor, then the wall shall be designed by a registered design professional in accordance with the International Building Code.

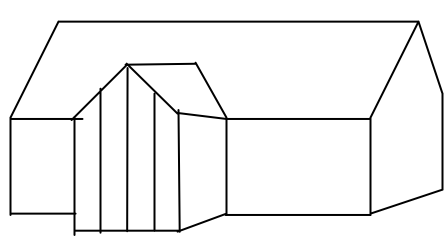
~~TABLE R602.3.1~~
~~MAXIMUM ALLOWABLE LENGTH OF WOOD STUDS EXPOSE TO WIND SPEEDS OF 100 MPH OR LESS IN SEISMIC DESIGN CATEGORIES A, B, C,~~ $\cancel{D_0}$, $\cancel{D_1}$, ~~and~~ $\cancel{D_2}$ ~~[b,c]~~

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC) The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

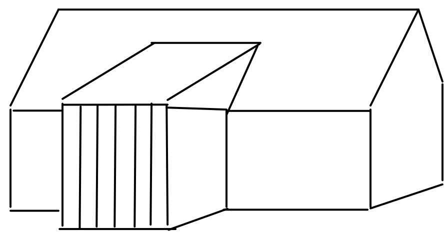
Table R602.3.1 has been the source of a lot of confusion. The footnote b is seldom read or understood. This change is submitted to:

1. Eliminate the table - the source of the confusion
2. Provide clarification as to where it can be applied (see the three options below)
3. Write in code language the requirements for when tall studs can be used.
4. To say that you cannot use these tall studs where the wall is an integral part of the wall bracing system.

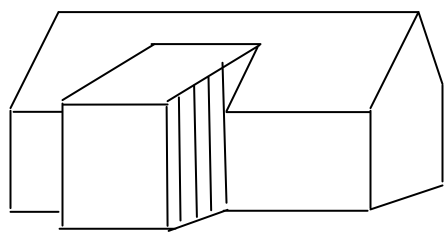
Tall studs could be used for two-story gable ended wall supporting nothing more than self weight.



Tall studs could be used for a two-story projection where the roof framing runs perpendicular to the wall so long as the overbuilt roof has a trib length of 6' or less



Tall studs could be used for a two-story projection where the roof framing runs parallel to the wall such that it was supporting nothing more than self weight



Cost Impact: The code change proposal will not increase the cost of construction.

R602.3.1-RB-BAJNAI-BCAC.doc

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The reason is unclear and the revision will not add any clarity to the code provisions. This would remove the use of the prescriptive design in the WFCM and require an engineered design.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

R602.3.1 Stud size, height and spacing. The size, height and spacing of studs shall be in accordance with Table R602.3(5).

Exceptions:

1. Utility grade studs shall not be spaced more than 16 inches (406 mm) on center, shall not support more than a roof and ceiling, and shall not exceed 8 feet (2438 mm) in height for exterior walls and load-bearing walls or 10 feet (3048 mm) for interior nonload-bearing walls.
2. ~~Studs more than 10 feet in height which are in accordance with Table R602.3.1.~~ <u>Where snow loads are less than or equal to 25 pounds per square foot, and the ultimate design wind speed is less than or equal to 130 mph, 2x6 studs supporting a roof load with not more than 6' of tributary length shall have a maximum height of 18 feet where spaced</u>

at 16 inches on center, or 20 feet where spaced at 12 inches on center. Studs shall be minimum No. 2 grade lumber.

~~**TABLE R602.3.1**~~
~~**MAXIMUM ALLOWABLE LENGTH OF WOOD STUDS EXPOSE TO WIND SPEEDS OF 100 MPH OR LESS IN SEISMIC DESIGN CATEGORIES A, B, C, D_0, D_1, and D_2 [b,c]**~~

Commenter's Reason: The ICC Building Code Action Committee (BCAC) is submitting this public comment to address the code development committee's concerns.

1. The BCAC expressed in the original code change that the table could be more clearly understood in text rather than in table format. The code development committee disagreed. The BCAC has rewritten the text to make it even more clear.

2. This public comment removes reference to the IBC and engineered design so that design in accordance with WFCM is still permitted.

3. The reason the original code change proposal was written was because the footnote b to the table is frequently missed or applied incorrectly.
The basic stud table only allows studs to be 10 feet tall.
The exception in the wall bracing section will allow studs to be 12 feet tall.
Studs can go to 20 feet when the footnote b to Table R602.3.1 is applied, namely walls can carry a maximum of 6' of tributary width.

RB283-13
Final Action: AS AM AMPC____ D

RB284-13
R602.3.2

<u>Proposed Change as Submitted</u>

Proponent: Edward L. Keith, P.E., APA – The Engineered Wood Association (ed.keith@apawood.org)

Revise as follows:

R602.3.2 Top plate. Wood stud walls shall be capped with a double top plate installed to provide overlapping at corners and intersections with bearing partitions. End joints in top plates shall be offset at least 24 inches (610 mm). Joints in plates need not occur over studs. Plates shall be not less than 2-inches (51 mm) nominal thickness and have a width at least equal to the width of the studs.

> ~~**Exception:** A single top plate may be installed in stud walls, provided the plate is adequately tied at joints, corners and intersecting walls by a minimum 3-inch by 6-inch by a 0.036-inch-thick (76 mm by 152 mm by 0.914 mm) galvanized steel plate that is nailed to each wall or segment of wall by six 8d nails on each side provided the rafters or joists are centered over the studs with a tolerance of no more than 1 inch (25 mm). The top plate may be omitted over lintels that are adequately tied to adjacent wall sections with steel plates or equivalent as previously described.~~
>
> <u>**Exception:** A single top plate used as an alternative to a double top plate shall comply with the following:</u>
>
> 1. <u>The top plate shall be tied at corners an intersecting walls with a 3-inch by 6-inch by 0.036-inch-thick (76 mm by 152 mm by .0914 mm) galvanized steel plate or equivalent.</u>
> 2. <u>The steel plate tie at corners and intersecting walls shall be natiled to each wall or segment of wall with six 8d (2-1/2” x 0.113”) nails on each side of the joint.</u>
> 3. <u>Splices in the top plate at butt joints shall be tied with a 3-inch by 12-inch by 0.036-inch-thick (76 mm by 304 mm by 0.914 mm) galvanized steel plate or equivalent.</u>
> 4. <u>The steel plate tie at butt joints shall be nailed to each segment of wall with twelve 8d (2-1/2” x 0.113”) nails on each side of the joint.</u>
> 5. <u>The rafters or joists shall be centered over the studs with a tolerance of not more than 1-inch (25 mm).</u>
> 6. <u>Omission of the top plate is permitted over headers where the headers are adequately tied to adjacent wall sections in accordance with Items 1 and 2 for header connections at corners and intersections, and Items 3 and 4 for header connections made along a single wall line.</u>

Reason: This is a companion item to S284-12/13 <u>adopted</u> in Portland in the October Final Action Hearing.

Item 14 of the 2012 IRC Table R602.3(1) establishes the minimum capacity required to insure an adequate tension splice in top plates. Aside from simply providing continuity between wall segments, the top-plate splice also acts as a tension tie (often called a collector or drag strut) to distribute the roof and floor shear loads into the bracing elements often spaced as much as 20 feet apart. Assuming spruce-pine-fir top plates the Table R602.3(1), item 14 requires a top-plate splice with eight 16d box nails on each side of the splice. In accordance with the NDS Table 11N, assuming SPF plates and a duration of load of 1.6 for lateral loads, the design capacity of the item 14 connection is (88 lb/nail x 8 nails x 1.6 dol =) 1126 lbs.

While sufficient for intersections and corners the *3-inch by 6-inch by a 0.036-inch-thick (76 mm by 152 mm by 0.914 mm) galvanized steel plate that is nailed to each wall or segment of wall by six 8d nails on each side…”* only provides about 600 lbf tension capacity (NDS Table 11P, SPF framing, box nails: 60 lbf/nail x 6 nails x 1.6 dol = 576 lbf). This is about ½ of what is requires in Table R602.3(1), item 14. As such, the splice plate requirement for in-line butt joints in single top plate systems should be twice what is currently required:

> “…<u>at least the equivalent of 3-inch by 12-inch by a 0.036-inch-thick (76 mm by 304 mm by 0.914 mm) galvanized steel plate that is nailed to each wall or segment of wall by twelve 8d (2-1.2” x 0.113”) nails on each side…”</u>

As a matter of clarification the type of nail to be used was described as only the penny-weight was specified. This is in keeping with current code style guidelines. I also specified which splice type was appropriate for headers when present. As these are neither corners nor intersections, it is clear that the butt-joint splice was the appropriate reference.

In addition, the reference to “a minimum” was deleted in favor of “at least the equivalent of” as it seemed more appropriate. “Lintels” was also changed in favor of “headers”, as lintels is a term more often associated with concrete construction where headers is more commonly used in wood construction.

Cost Impact: The code change proposal will not increase the cost of construction.

R602.3.2-RB-KEITH.doc

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: This change needs additional work based on the committee's previous action on RB274-13. The proponent will submit a public comment and bring back to the public comment hearing.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Edward L. Keith, representing APA – The Engineered Wood Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R602.3.2 Top plate. Wood stud walls shall be capped with a double top plate installed to provide overlapping at corners and intersections with bearing partitions. End joints in top plates shall be offset at least 24 inches (610 mm). Joints in plates need not occur over studs. Plates shall be not less than 2-inches (51 mm) nominal thickness and have a width at least equal to the width of the studs.

~~**Exception:** A single top plate used as an alternative to a double top plate shall comply with the following:~~

1. ~~The top plate shall be tied at corners an intersecting walls with a 3-inch by 6-inch by 0.036-inch-thick (76 mm by 152 mm by .0914 mm) galvanized steel plate or equivalent.~~
2. ~~The steel plate tie at corners and intersecting walls shall be nailed to each wall or segment of wall with six 8d (2-1/2" x 0.113") nails on each side of the joint.~~
3. ~~Splices in the top plate at butt joints shall be tied with a 3-inch by 12-inch by 0.036-inch-thick (76 mm by 304 mm by 0.914 mm) galvanized steel plate or equivalent.~~
4. ~~The steel plate tie at butt joints shall be nailed to each segment of wall with twelve 8d (2-1/2" x 0.113") nails on each side of the joint.~~
5. ~~The rafters or joists shall be centered over the studs with a tolerance of not more than 1-inch (25 mm).~~
6. ~~Omission of the top plate is permitted over headers where the headers are adequately tied to adjacent wall sections in accordance with Items 1 and 2 for header connections at corners and intersections, and Items 3 and 4 for header connections made along a single wall line.~~

Exceptions: A single top plate used as an alternative to a double top plate shall comply with the following:

1. The single top plate shall be tied at corners, intersecting walls, and at in-line splices in straight wall lines in accordance with Table R602.3.2.
2. The rafters or joists shall be centered over the studs with a tolerance of not more than 1-inch (25 mm).
3. Omission of the top plate is permitted over headers where the headers are adequately tied to adjacent wall sections in accordance with Table R602.3.2.

TABLE R602.3.2
SINGLE TOP-PLATE SPLICE CONNECTION DETAILS.

CONDITION	TOP-PLATE SPLICE LOCATION			
	Corners and Intersecting Walls		Butt Joints in Straight Walls	
	Splice Plate Size	Min. Nails Each Side of Joint	Splice Plate Size	Min. Nails Each Side of Joint
Structures in SDC A – C; and in SDC D_0, D_1 and D_2 with braced wall line spacing less than 25 feet	3" x 6" x 0.036" galvanized steel plate or equivalent	(6) 8d box(2-1/2" x 0.113") nails	3' x 12" x 0.036" galvanized steel plate or equivalent	(12) 8d box (2-1/2" x 0.113") nails
Structures in SDC D_0, D_1 and D_2, with braced wall line	3" by 8" by 0.036" galvanized steel plate	(9) 8d box (2-1/2" x 0.113") nails	3' x 16" x 0.036" galvanized steel plate	(18) 8d box (2-1/2" x 0.113") nails

spacing greater than or equal to 25 feet:	or equivalent		or equivalent	

For SI: 1 inch = 25.4mm. 1 foot = 304.8mm.

Commenter's Reason: The original code change proposal is a companion item to S284-12/13 adopted in Portland in the October Final Action Hearing. Item 14 of the 2012 IRC Table R602.3(1) establishes the minimum capacity required to insure an adequate tension splice when using a single top plate splice. We, as the proponents, asked for disapproved to permit us to alter this proposal to account for the second *double* top plate splice added to Table R602.3(1) via RB274-13. RB274-13 recognized the increased *double* top plate attachment requirements for higher seismic SDCs and when the braced wall spacing is 25 feet or greater. This new requirement for double top plate splices at in-line joints and at corners or intersections increases the required nailing by 50%.

As such, the *single* top plate splice requirements also increase by 50% when splices occur in SDC D_0, D_1 and D_2 with braced wall line spacing greater than or equal to 25 feet. With the addition of the high seismic double top plate requirement in IRC Table R602.3(1) as a result of RB274-13, it became necessary to ensure that the same capacity could be obtained by the prescriptive single top-plate splice provisions in Section R602.3.2. This Public Comment adds the single top plate splice requirements for SDC D_0, D_1 and D_2 with braced wall line spacing greater than or equal to 25 feet.

RB284-13

Final Action: AS AM AMPC____ D

RB286-13

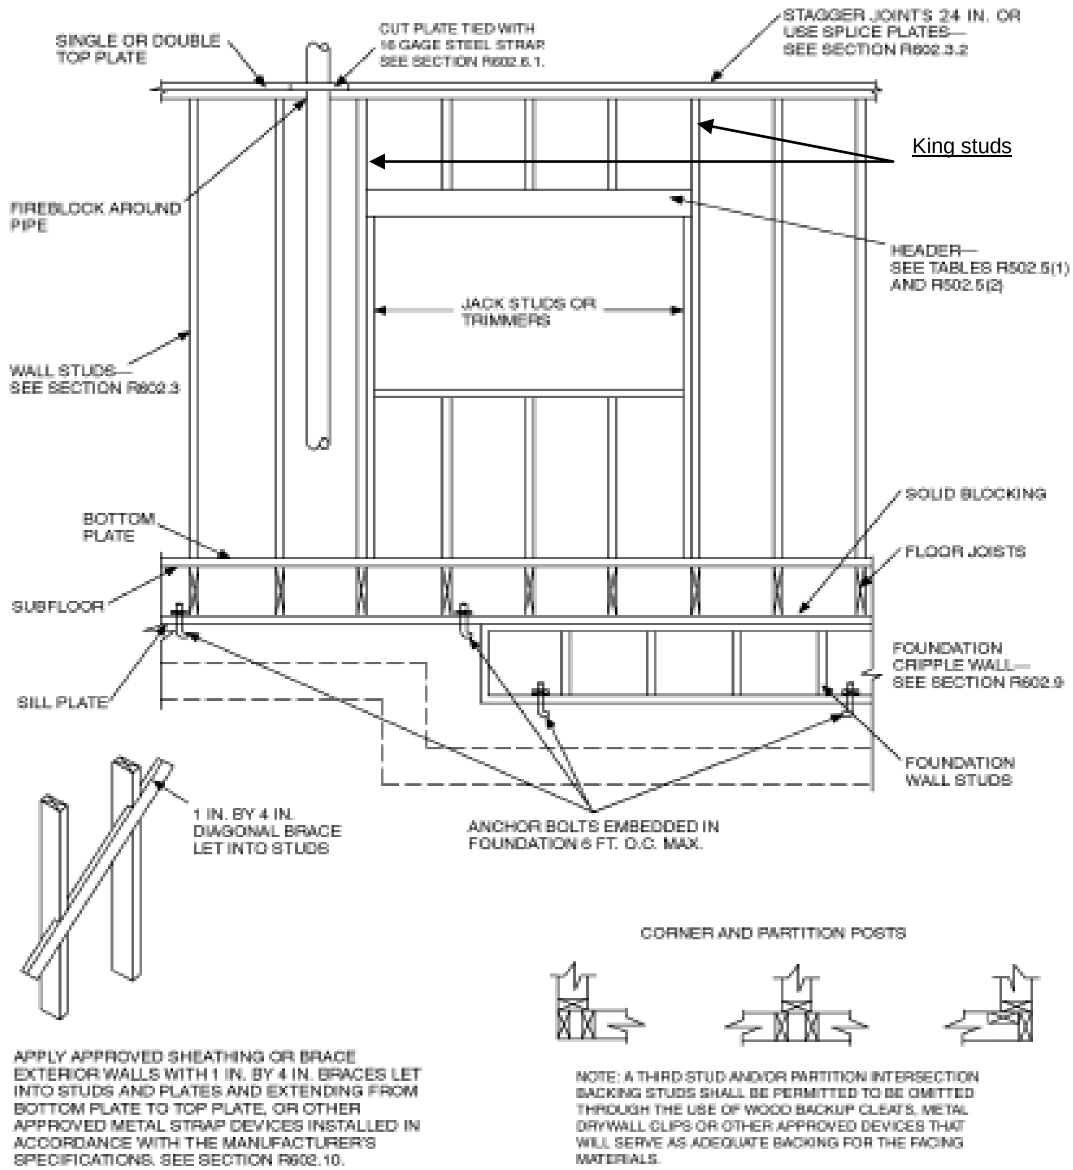
<u>Proposed Change as Submitted</u>

Proponent: Charles S. Bajnai, Chesterfield County, VA, representing ICC Building Code Action Committee and Virginia Building and Code Officials Association (bajnaic@chesterfield.gov)

Revise as follows:



For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

FIGURE R602.3(2)
FRAMING DETAILS

<u>602.7.4 Supports for headers.</u> <u>Headers shall be supported on each end with one or more jack studs in accordance with Table R502.5(1) or Table R502.5(2). A king stud shall be adjacent to the jack stud on each end of the header and nailed at each end of the header with 4-16d nails.</u>

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC) The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

The code is silent about how headers should be supported to prevent header rotation. The king studs should be used to stabilize the header with nails on each end.

Cost Impact: The code change proposal will not increase the cost of construction.

R602.7.4 (NEW)-RB-BAJNAI-BCAC.doc

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

602.7.4 Supports for headers. Headers shall be supported on each end with one or more jack studs in accordance with Table R502.5(1) or Table R502.5(2), or approved framing anchors.. A king stud shall be installed ~~adjacent to the jack stud~~ on each end of the header and face nailed at each end of the header with 4-16d nails (3.5" x 0.135").

Committee Reason: Approval was based upon the proponent's published reason and the modification. The modification adds clarity for the header supports.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

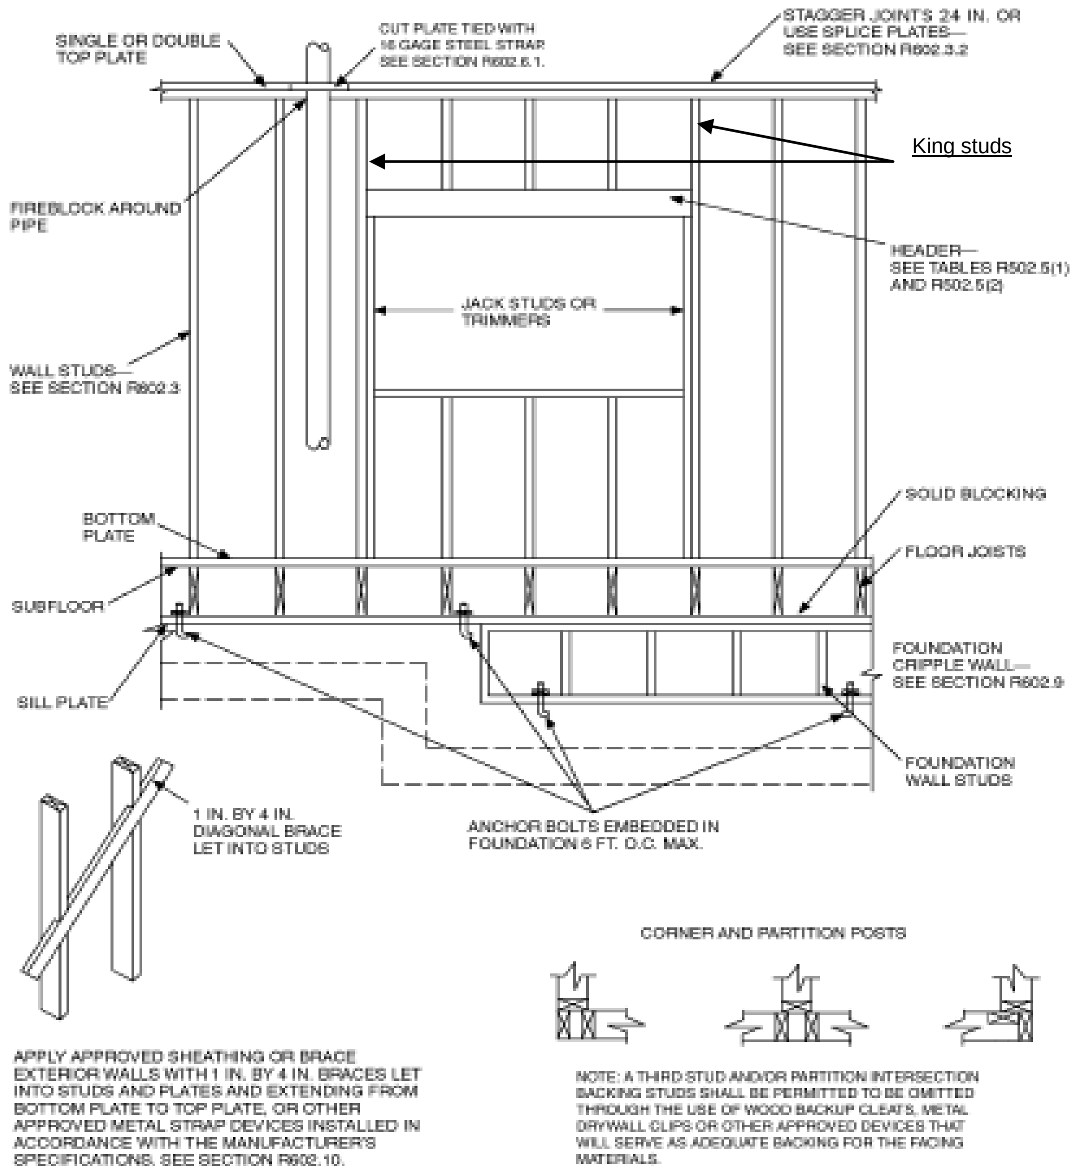
Dennis Pitts, American Wood Counctil, requests Approval as Modified by this Public Comment.

Further Modify the proposal as follows:

602.7.4 Supports for headers. Headers shall be supported on each end with one or more jack studs or with approved framing anchors in accordance with Table R502.5(1) or Table R502.5(2) ~~, or approved framing anchors~~. ~~A king stud shall be installed~~ The full height stud adjacent to ~~on~~ each end of the header ~~and~~ shall be ~~face~~ end nailed ~~at~~ to each end of the header with 4-16d nails (3.5"x 0.135"). The minimum number of full height studs at each end of a header shall be in accordance with Table R602.7.4.

TABLE R602.7.4
MINIMUM NUMBER OF FULL HEIGHT STUDS
AT EACH END OF HEADERS IN EXTERIOR WALLS

Header Span (feet)	Maximum Stud Spacing (in.) per Table R602.3(5)	
	16	24
≤ 3'	1	1
4'	2	1
8'	3	2
12'	5	3
16'	6	4



For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

FIGURE R602.3(2)
FRAMING DETAILS

Replace “KING STUDS” with “FULL HEIGHT STUDS ADJACENT TO HEADER – SEE SECTION R602.7.4”

Commenter’s Reason: During the Committee Hearings, several proposals were approved with varying requirements for full height stud at ends of headers (i.e. RB286, RB287 and RB288). This public comment intends to provide consistency in requirements. Separate public comments to RB287 and RB288 are proposed to allow coordination with proposed revisions in this public comment.

Proposed modifications utilize the term “full height stud” in lieu of “king stud” to be more consistent with terminology currently used in the IRC and Wood Frame Construction Manual (WFCM). The minimum number of full height studs is based on header span and maximum stud spacing in order to maintain the number of studs displaced by the opening over which the header spans. The current requirement for only one full-height at each end of longer headers is appropriate for shorter header spans but inadequate for longer header spans.

The maximum stud spacing per Table R602.3(5) is specifically listed in the column heading to make clear that the maximum stud spacing, not actual stud spacing, is the determining factor for the number of required full height studs at each end of the header. In construction, actual stud spacing is often 16” on center; however, the maximum stud spacing often permitted in the IRC is 24” on center. If the actual stud spacing is used and is less than the maximum stud spacing per Table R602.3(5), the required number of full height studs at each end of the header would be over-estimated.

RB286-13

Final Action: AS AM AMPC____ D

RB287-13
R602.7, R602.7.1, Table R602.7.1, Table R602.7.1(2) (NEW)

Proposed Change as Submitted

Proponent: Jay Crandell, P.E., ARES Consulting, representing self (jcrandell@aresconsulting.biz)

Revise as follows:

R602.7 Headers. For header spans see Tables R502.5(1), R502.5(2), and R602.7.1(1).

R602.7.1 Single member headers. Single headers shall be framed with a single flat 2-inch-nominal (51 mm) member or wall plate not less in width than the wall studs on the top and bottom of the header in accordance with Figures R602.7.1(1) and R602.7.1(2). The number of king studs required at each end of a single member header shall comply with Table R602.7.1(2). The total number of king studs provided at both ends of a single member header need not exceed the number of layout studs displaced by the wall opening.

TABLE R602.7.1(1)
SPANS FOR MINIMUM No.2 GRADE SINGLE HEADER[a, b, c, f]

For SI: 1 inch=25.4 mm, 1 pound per square foot = 0.0479 kPa.

a. Spans are given in feet and inches.

b. Table is based on a maximum roof-ceiling dead load of 15 psf.

c. The header is permitted to be supported by an approved framing anchor attached to the full-height wall stud and to the header in lieu of the required jack stud.

d. The 20 psf ground snow load condition shall apply only when the roof pitch is 9:12 or greater. In conditions where the ground snow load is 30 psf or less and the roof pitch is less than 9:12, use the 30 psf ground snow load condition.

e. Building width is measured perpendicular to the ridge. For widths between those shown, spans are permitted to be interpolated.

f. The header shall bear on a minimum of one jack stud at each end.

TABLE R602.7.1(2)
NUMBER OF KING STUDS REQUIRED AT EACH END OF A SINGLE MEMBER HEADER[a]

STUD SIZE	OPENING WIDTH (FEET)	BASIC WIND SPEED (MPH) & EXPOSURE CONDITION																	
		85/B			90/B			100/B, 85/C			110/B, 90/C, 85/D			120/B, 100/C, 90/D			130/B, 110/C, 100/D		
		WALL HEIGHT (FEET)

	4	1	2	2	2	2	2	2	2	3	2	3	3	2	3	4	3	3	4
	6	2	2	3	2	2	3	2	3	3	3	3	4	3	4	5	4	4	5
	8	2	3	3	2	3	3	3	3	4	3	4	5	4	5	6	4	5	7
	10	2	3	4	3	3	4	3	4	5	4	5	6	4	6	7	5	6	8
2x6	2	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	2
	3	1	1	1	1	1	1	1	1	1	1	1	1	1	1	2	1	2	2
	4	1	1	1	1	1	1	1	1	1	1	1	2	1	2	2	2	2	2
	6	1	1	1	1	1	2	1	2	2	1	2	2	2	2	2	2	2	3
	8	1	1	2	1	2	2	2	2	2	2	2	2	2	2	3	2	3	3
	10	1	2	2	1	2	2	2	2	2	2	2	3	2	3	3	3	3	4

For SI: 1 foot = 305 mm, 1 pound per square foot = 0.0479 kPa, 1 mile per hour = 1.609 km/h.

a. Table is based on minimum Stud grade Spruce-Pine-Fir (South) lumber.

Reason: This proposal provides king stud requirements for wall openings spanned by single member headers to ensure structural integrity to compensate for removal of full-height layout studs over the span of the wall opening. The number of king studs required is based on wind loading only because the jack stud required with single member headers supports gravity loading (as is the case with the header requirements in Chapter 5). This proposal is in response to discussions with a concerned code official subsequent to approval of the single member header provisions last code cycle. The changes to renumbered Table R602.7.1(1) are intended to align with Southern Pine design value changes forthcoming for the respective single member header sizes.

Cost Impact: The code change proposal will increase the cost of construction.

R602.7-RB-CRANDELL.doc

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: This is a needed change that addresses the issue of king studs at single headers.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Dennis Pitts, American Wood Council, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

R602.7.1 Single member headers. Single headers shall be framed with a single flat 2-inch-nominal (51 mm) member or wall plate not less in width than the wall studs on the top and bottom of the header in accordance with Figures R602.7.1(1) and R602.7.1(2) and face nailed to the top and bottom of the header with 10d box nails (3" x 0.128") spaced 12" o.c.

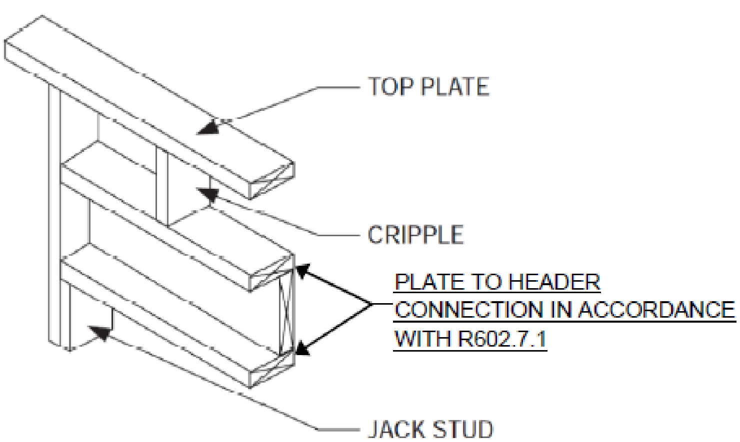

FIGURE R602.7.1(1)
SINGLE MEMBER HEADER IN EXTERIOR BEARING WALL

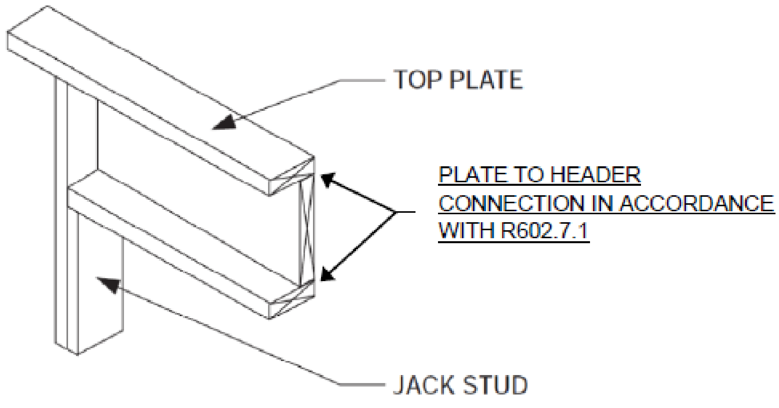

FIGURE R602.7.1(2)
ALTERNATIVE SINGLE MEMBER HEADER WITHOUT CRIPPLE

Commenter's Reason: This proposal specifies nailing of the plates to the header as a means of bracing the header to limit development of out-of-plane buckling under gravity loads. The specified nailing matches recommended nailing for double top plate connections in accordance with RB272 (which was approved as submitted). Additional labeling of the referenced single ply header figure is provided to clarify location of intended nailing between plates and header.

Replacement of RB287 (which was recommended for approval as submitted) is being proposed with this public comment to remove inconsistencies and duplication resulting from two other proposals as follows:

a) RB286 (approved as modified) addresses full-height stud requirements for all headers – not just single ply headers. Retention of full-height stud requirements in RB287 as approved by the IRC committee will result in inconsistent full-height stud requirements for support of single ply headers relative to multi-ply headers.

b) RB252 (approved as submitted) corrects spans for single ply headers to account for Southern Pine design values changes and incorporates single ply header spans in the existing header table. Retention of single ply header spans in RB287 as approved by the IRC committee will result in inconsistent header spans from those in the approved as modified version of RB252 to reflect new Southern Pine design values.

RB287-13

Final Action: AS AM AMPC____ D

RB288-13

R602.7, R602.7.2 (NEW), Table R602.7.2(1) (NEW), Table R602.7.2(2) (NEW), Table R602.7.3(1) (NEW), R602.7.3(2) (NEW), Figure R602.7.2 (NEW)

Proposed Change as Submitted

Proponent: Vladimir Kochkin, NAHB Research Center, Inc. (vkochkin@nahbrc.org), Jay H. Crandell, P.E., ARES Consulting (jcrandell@aresconsulting.biz)

Revise as follows:

R602.7 Headers. For header spans and number of jack studs required, see Tables R502.5(1), R502.5(2)~~,~~ ~~and~~. For single member header requirements, refer to Section R602.7.1. For rim board header requirements, refer to Section R602.7.2.

R602.7.2 Rim Board Headers. Rim board header size, material, and span shall be in accordance with Tables R602.7.2(1) and R602.7.2(2). Rim board headers shall be constructed in accordance with Figure R602.7.2 and shall be supported at each end by king studs. The number of king studs required to support each end of a rim board header shall comply with greater number from Table R602.7.3(1) and Table R602.7.3(2). For 2x6 walls with a single top plate and for 2x4 walls, the number of king studs shall not be less than two at each end of a two-ply rim board header. The total number of king studs provided at both ends of the rim board header need not exceed the number of layout studs displaced by the wall opening. Each ply of built-up king studs shall be face-nailed to the adjacent ply with 2-10d (3” x 0.128”) nails at 16 inches on center. Rim board headers supporting concentrated loads, such as reactions from floor or roof girders or wall opening framing above the rim board header, shall be designed.

TABLE R602.7.2(1)
MAXIMUM ALLOWABLE SPANS FOR SINGLE-PLY RIM BOARD HEADERS[a,b]

For SI: 1 inch = 25.4 mm, 1 foot = 305 mm, 1 pound per square foot = 0.0479 kPa.

a. Spans are given in feet and inches.
b. Table is based on a maximum roof-ceiling dead load of 15 psf, floor dead load of 10 psf, and floor live load of 40 psf.
c. Floor joists framing into rim header shall be attached to the rim header using joist hangers sized to support the joist bearing load or an approved design.
d. Solid sawn wood rim members shall be minimum No. 2 grade. Engineered wood rim members shall meet or exceed the following material design properties and comply with applicable usage limitations in accordance with the manufacturer's approved data:
1-1/8" members: F_b=600 psi, F_v=270 psi, E=550,000 psi, $F_{c,perp}$=550 psi
1-1/4" members: F_b=1,130 psi, F_v=355 psi, E=660,750 psi, $F_{c,perp}$=680 psi
e. The 20 psf ground snow load condition shall apply only when the roof pitch is 9:12 or greater. In conditions where the ground snow load is 30 psf or less and the roof pitch is less than 9:12, use the 30 psf ground snow load condition.
f. To determine the allowable span for rim board headers parallel to floor joists and supporting non-load bearing walls above, use table column for 20 psf ground snow load and 20 ft building width with "roof, ceiling, and wall" support condition.

TABLE R602.7.2(2)
MAXIMUM ALLOWABLE SPANS FOR TWO-PLY RIM BOARD HEADERS[a,b]

For SI: 1 inch = 25.4 mm, 1 foot = 305 mm, 1 pound per square foot = 0.0479 kPa.

a. Spans are given in feet and inches.

b. Table is based on a maximum roof-ceiling dead load of 15 psf, floor dead load of 10 psf, and floor live load of 40 psf.

c. Floor joists framing into rim header shall be attached to the rim header using joist hangers sized to support the joist bearing load or an approved design.

d. For solid sawn wood, refer to Table R502.5(1). Engineered wood rim members shall meet or exceed the following material design properties and comply with applicable usage limitations in accordance with the manufacturer’s approved data and usage limitations:
1-1/8” members: F_b=600 psi, F_v=270 psi, E=550,000 psi, $F_{c,perp}$=550 psi
1-1/4” members: F_b=1,130 psi, F_v=355 psi, E=660,750 psi, $F_{c,perp}$=680 psi

e. The 20 psf ground snow load condition shall apply only when the roof pitch is 9:12 or greater. In conditions where the ground snow load is 30 psf or less and the roof pitch is less than 9:12, use the 30 psf ground snow load condition.

f. To determine the allowable span for rim board headers parallel to floor joists and supporting non-load bearing walls above, use table column for 20 psf ground snow load and 20 ft building width with “roof, ceiling, and wall” support condition.

TABLE R602.7.3(1)
NUMBER OF KING STUDS REQUIRED FOR GRAVITY LOAD RESISTANCE[a]

	12	2	2	2	2	2	2	2	2	3	2	3	3	2	3	4	3	4	4

For SI: 1 foot = 305 mm, 1 pound per square foot = 0.0479 kPa, 1 mile per hour = 1.609 km/h.

a. Table is based on minimum Stud grade Spruce-Pine-Fir (South) lumber.

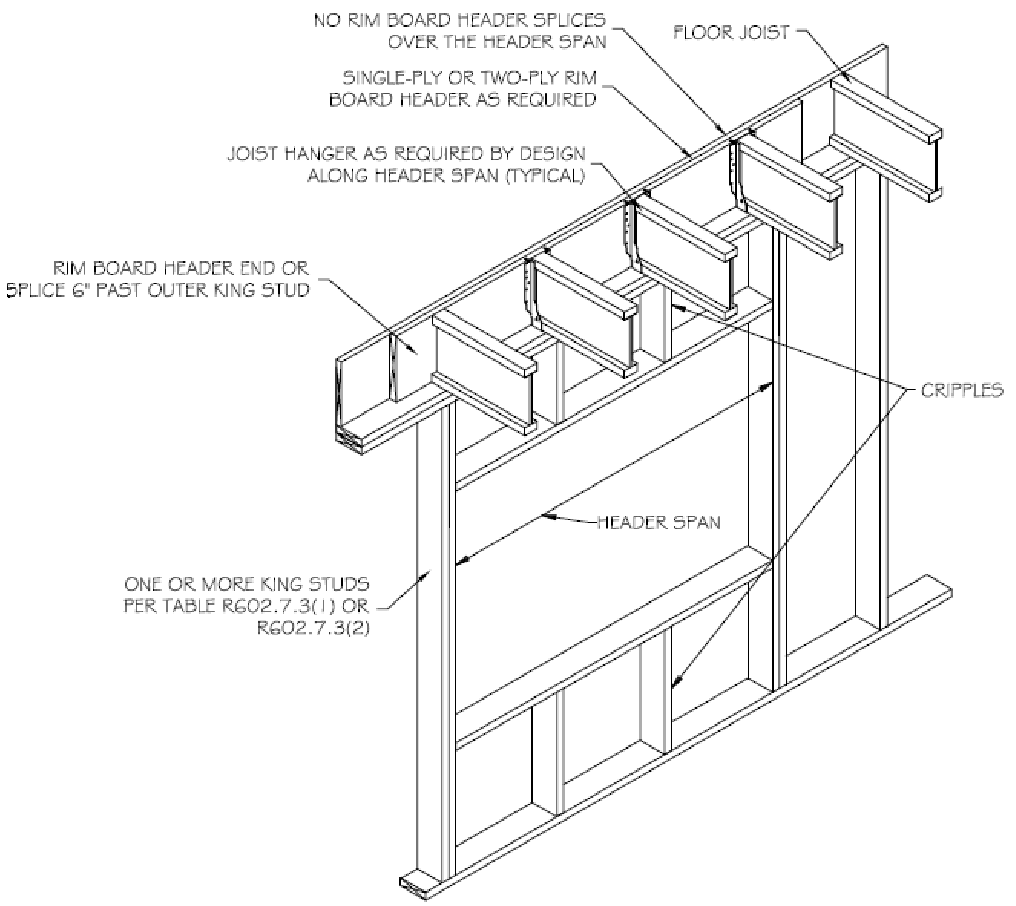

FIGURE R602.7.2
RIM BOARD HEADER CONSTRUCTION

Reason: This proposal adds a rim board header option to promote more resource and energy efficient wall framing. The analysis of rim board headers for this proposal is based on the same methodology applied for the existing IRC provisions for single headers and is consistent with header analysis as applied in the Wood Frame Construction Manual (WFCM). Both solid sawn and engineered wood members are included. King stud requirements are added to ensure adequate support of rim board headers and out-of-plane wind load resistance as this type of header construction uses only king studs which serve as jamb or trimmer studs for the wall opening below.

Cost Impact: The code change proposal will not increase the cost of construction.

R602.7-RB-KOCHKIN.doc

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: This is a much needed change because rim board headers are more energy efficient and it brings advanced framing technique in the code. The opponent will work with the proponent to bring back a public comment to address the changes in the modification that was disallowed.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Dennis Pitts, American Wood Council, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

R602.7.2 Rim Board Headers. Rim board header size, material, and span shall be in accordance with Table R602.7.1 for single-ply rim board headers and Table R502.5(1) for two-ply rim board headers. Rim board headers shall be constructed in accordance with Figure R602.7.2 and shall be supported at each end by full height studs. The number of full height studs at each end shall not be less than the number of studs displaced by half of the header span based on the maximum stud spacing in accordance with Table R602.3(5). Rim board headers supporting concentrated loads shall be designed in accordance with accepted engineering practice.

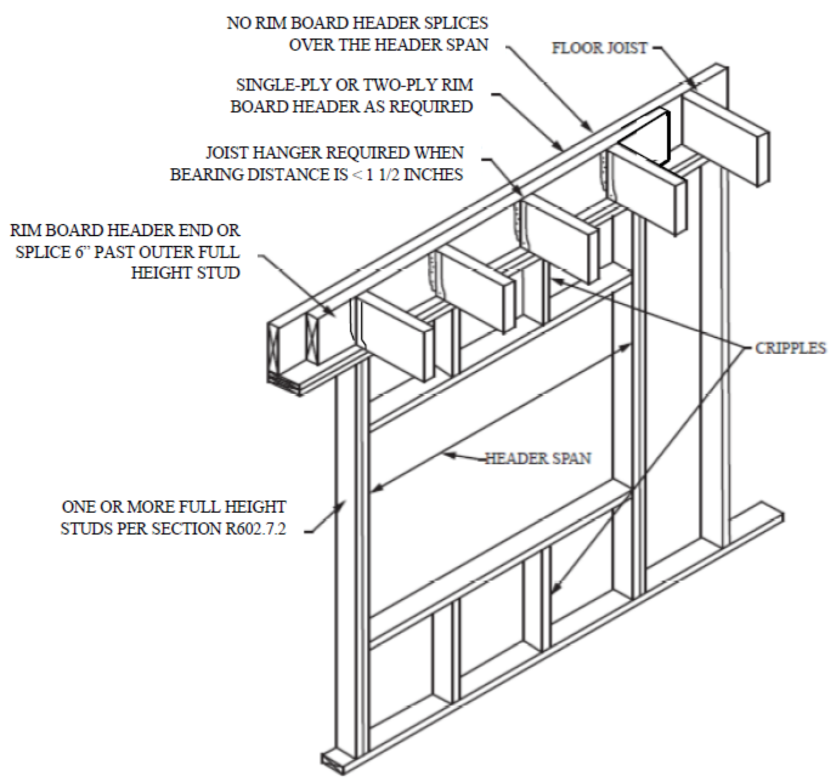

FIGURE R602.7.2
RIM BOARD HEADER CONSTRUCTION

Commenter's Reason: This public comment replaces RB288 (which was recommended for approval as submitted) with simplified requirements for sawn lumber rim board headers based on referencing existing header tables updated by Committee action on RB250 (which was approved as modified), RB252 (which was approved as submitted), and RB286 (which was approved as modified).

Committee action on RB250 and RB252 establishes updated header spans for single ply and multi ply headers to account for changes in Southern Pine design values. Those header spans are equally applicable to rim board headers without required duplication of span information in separate rim board header tables. Reference to existing header tables removes unwarranted inconsistencies in tabulated spans and simplifies the code. It should be noted that RB252-13 combines Tables R602.7.1 and R502.5(1) into a single table R602.7(1). That change will necessitate the reference in the first sentence of this proposal to be changed to "Rim board header size, material, and span shall be in accordance with Table R602.7(1)."

Committee action on RB286 established full height stud requirements. A public comment to RB286 accounts for varying required number of full height studs based on header span and maximum stud spacing. This public comment is based on the same approach for determining the number of full height studs to support the rim board header and greatly simplifies the code while ensuring adequate full height stud support of rim board headers.

Importantly, this public comment is applicable to only sawn lumber rim board headers. Spans for engineered rim board headers are not included in this public comment because standardized design values across manufacturers are not available and in some cases engineered rim boards are not permitted to span over openings. A modification proposed at the hearing in Dallas by the proponent was ruled out of order. The committee indicated that they wanted a public comment to make the corrections even though the floor modification was ruled out of order. AWC has worked with the proponent to develop this public comment.

Nailing of full height studs it is addressed by minimum nailing for stud to stud connections and is therefore not included in the simplified proposal to avoid unnecessary duplication with the minimum nailing schedule table.

RB288-13

Final Action: AS AM AMPC____ D

RB302-13
Table R602.10.3(4)

Proposed Change as Submitted

Proponent: Edward L. Keith, APA – The Engineered Wood Association (ed.keith@apawood.org)

Revise as follows:

TABLE R602.10.3(4)
SEISMIC ADJUSTMENT FACTORS TO THE REQUIRED LENGTH OF WALL BRACING

ADJUSTMENT BASED ON:	STORY/SUPPORTING	CONDITION	ADJUSTMENT FACTOR [a,b] [Multiply length from Table R602.10.3(3) by this factor]	APPLICABLE METHODS
Walls with stone or masonry veneer, town-houses in SDC-C [~~d~~,e,f]	(Figure)	1.0		All intermittent and continuous methods
	(Figure)	1.5		
	(Figure)	1.5		

For SI: 1 foot = 304.8 mm, 1 pound per square foot = 0.0479 kPa.
a. Linear interpolation shall be permitted.
b. The total length of bracing required for a given wall line is the product of all applicable adjustment factors.
c. The length-to-width ratio for the floor/roof *diaphragm* shall not exceed 3:1. The top plate lap splice nailing shall be a minimum of 12-16d nails on each side of the splice.
d. Applies to stone or masonry veneer exceeding the first story height. See Section R602.10.6.5 for requirements when stone or masonry veneer does not exceed the first story height.
e. The adjustment factor for stone or masonry veneer shall be applied to all exterior *braced wall lines* and all *braced wall lines* on the interior of the building, backing or perpendicular to and laterally supported veneered walls.
f. Applies to stone and masonry veneer exceeding the first story height and not extending up into the gable end.

(Portions of Table not shown remain unchanged)

Reason: The purpose of these proposals is to clarify the IRC.

1. The reference to Section R602.10.6.5 in the second portion of Footnote d is clearly applicable to SDCs D_0, D_1 and D_2 only. The above portion of the table is applicable to townhouses in SDC C. It is confusing referencing a footnote, part of which is clearly not relevant. It calls into question the relevant portions of the footnote. As the first portion of footnote d is applicable to townhouses in SDC C, to avoid confusion we propose the relevant information be duplicated in its own Footnote f.
2. The second portion of the proposed footnote adds the gable end to the not-to-extend criteria. The IRC is clear that the line of demarcation between using the standard bracing provisions and the Method BV-WSP is when the brick or masonry veneer extends up past the first story height. It is not clear what to do when the veneer extends up the gable-end wall. The definition of story in Chapter 2 provided below could lead one to believe that the gable–end wall was part of the story below:

   STORY. *That portion of a building included between the upper surface of a floor and the upper surface of the floor or roof next above.*

   From a structural perspective, however the mass in a gable end-wall can equal or exceed the mass of a veneered second story. For example, a 40-foot wide building with a 12:12 pitch can have gable-end wall that is a maximum of 20 feet tall above the top of the wall below. As the area is triangular the average height of this gable-end wall is 10 feet tall. This is the same mass as a veneered 10 foot second story wall.

   It is clearly NOT the intent of the IRC to permit the standard bracing provisions for only a single story UNLESS the same or larger mass is part of a gable-end wall. The above proposal clarifies the intent of this section with respect to veneered gable-end walls.

   This portion of the proposed change is duplicated in another code change proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

R602.10.3(4)T #2-RB-KEITH.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: Based upon the proponent's request for disapproval. There is information missing and a pointer is needed to refer back to the proper code section.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Edward L. Keith, APA – The engineered Wood Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

TABLE R602.10.3(4)
SEISMIC ADJUSTMENT FACTORS TO THE REQUIRED LENGTH OF WALL BRACING

ADJUSTMENT BASED ON:	STORY/SUPPORTING	CONDITION	ADJUSTMENT FACTOR [a,b] [Multiply length from Table R602.10.3(3) by this factor]	APPLICABLE METHODS
Walls with stone or masonry veneer, town-houses in SDC-C [d,e~~,f~~]	(Figure)	1.0		All intermittent and continuous methods
	(Figure)	1.5		
	(Figure)	1.5		
Walls with stone or masonry veneer, detached one-and two-family dwellings in SDC $D_0 – D_2$ [d,f]	Any story	See Table R602.10.6.5		BV-WSP

For SI: 1 foot = 304.8 mm, 1 pound per square foot = 0.0479 kPa.

a. Linear interpolation shall be permitted.

b. The total length of bracing required for a given wall line is the product of all applicable adjustment factors.

c. The length-to-width ratio for the floor/roof *diaphragm* shall not exceed 3:1. The top plate lap splice nailing shall be a minimum of 12-16d nails on each side of the splice.

d. Applies to stone or masonry veneer exceeding the first story height. ~~See Section R602.10.6.5 for requirements when stone or masonry veneer does not exceed the first story height~~.

e. The adjustment factor for stone or masonry veneer shall be applied to all exterior *braced wall lines* and all *braced wall lines* on the interior of the building, backing or perpendicular to and laterally supported veneered walls.

f. ~~Applies to stone and masonry veneer exceeding the first story height and not extending up into the gable end~~. See Section R602.10.6.5 for requirements when stone or masonry veneer does not exceed the first story height

Commenter's Reason: While RB302 accurately reflects the intent of the existing provisions of the 2012 IRC, clarifying the intent has made it evident that there was a hole in the existing provisions. The existing provisions fail to provide guidance on what to do when the brick or stone veneer extends up into the gable end. APA worked with industry to try to fill this hole but was *unable to come up with an agreement* on just how to do so. It was also pointed out that any addition of such new material to the code could be construed as being outside the scope of a Public Comment.

As an agreement was *not to be reached* at this time I am submitting this public comment to only correct the footnote problems currently in the code and described in the original code submittal.

In short, the reference to Section R602.10.6.5 in the second portion of footnote d is clearly applicable to SDCs D_0, D_1 and D_2 only. The table as published in the 2012 IRC has this footnote listed is applicable to townhouses in SDC C, as shown above. It is confusing to the user to have a footnote, part of which is clearly not relevant as it calls into question the relevant portions of the footnote. As the first portion of footnote d is applicable to townhouses in SDC C as well as SDC D+, to avoid confusion we propose to remove the portion of footnote d that is relevant only for SDC D+ and move that SDC D+-only portion to a new footnote (footnote f) and reference this only in SDC D+ row in the table.

The portion of the proposed footnote, "~~and not extending up into the gable end~~" was not part of the original footnote d and was part of the compromise that *could not be achieved* during the interim. It is thus removed, making the proposed change as modified by this Public Comment essentially an editorial clarification of the table.

We recommend overturning the committee's recommendation for denial and approve this much needed footnote clarification.

RB302-13

Final Action: AS AM AMPC____ D

RB308-13
R602.10.4.4 (NEW), Table R602.10.4.4 (NEW)

Proposed Change as Submitted

Proponent: Kirk Grundahl, Qualtim, representing the Structural Building Components Association (SBCA) (kgrundahl@qualtim.com)

Add new text as follows:

R602.10.4.4 Design Values. For the purpose of braced wall design, the capacity of wood structural panels to resist lateral loads, as found in Table R 602.10.3(1) are found in Table R602.10.4.4.

TABLE R602.10.4.4
SIMPLIFIED SHEAR VALUES FOR BRACED WALL LINES

Sheathing Material	**Bottom plate connection to foundation**	**Fastener**	**Fastener Spacing**	**Any Species Stud Framing**		
				Tested capacity	**System Effects Factor**	**IRC Lateral Design Capacity**
3/8", 7/16" or 15/32" WSP @16" and 24" o.c framing -- Wind.	Anchor bolts in accordance with code requirements	6d (2" x 0.113" nails) or 8d (2 1/2 x 0.131"	6:12	335	1.80	600
3/8", 7/16" or 15/32" WSP @16" and 24" o.c framing (with 1/2" gypsum on interior face of wall. -- Wind	Anchor bolts in accordance with code requirements	6d (2" x 0.113") or 8d (2 1/2 x 0.131"nails and Types S or W drywall screws.	6:12 WSP & 16:16 for GWB	465	1.80	840

a.The lateral design capacity of braced wall panels is based on full scale wall assembly tests using the minimum restraint provisions of the IRC, further adjusted by the partial restraint/systems effect factor.

Reason: Over the past several years, SBCRI has conducted a great deal of research into the requirements of the IRC, section R602.10 and the design capacity of wall assemblies built to those provisions. Table R602.10.3(1), Bracing Requirements Based on Wind Speed, was developed by the Ad-Hoc Wall Bracing Committee. The Lateral Design Capacity shown in the table above is the capacity determined by the committee to be used as the nominal strength of braced wall panels built to the minimum requirements of the IRC and using Method WSP. The braced wall panel lengths shown in Table R602.10.3(1) were calculated using these values. The system effect factor shown simply shows the factor required to be multiplied by the actual performance wood structural panels in buildings constructed to the minimum requirements of the IRC in order to achieve the stated lateral design capacity. This factor accounts for the increase in capacities due to additional framing, interior partitions, floor and ceiling framing, corner framing, etc. The tested capacities shown are the approximate capacities of wood structural panels used in buildings built to the minimum requirements of the IRC. Table R602.10.1 simply adds design value transparency to this section to show what the assumed system effect is once all of the building's construction detailing has been completed (i.e. additional strength from the addition of interior partitions, windows and doors, corner framing, interior gypsum, etc.). This approach is intended to be an aid to all registered design professionals as they make decisions about how best to resist applied loads and the safety considerations thereof. Full details of this research can be found at http://sbcri.info/bwpex.php and additional background on current design values is found here http://sbcri.info/bcters.php In addition, the Background on how the IRC wall bracing provisions were derived can be found in an article by Crandell-Martin in the spring 2009 edition of Wood Design Focus, " The Story Behind the 2009 IRC Wall Bracing Provisions (Part 2: New Wind Bracing Requirements)"

Cost Impact: This code change proposal will not increase the cost of construction.

R602.10.4.4 (NEW)-RB-GRUNDAHL.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: Based upon the proponent's request for disapproval and the committee's action on RB309-13.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Larry Wainright, Qualtim, representing Structural Building Components Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

TABLE R602.10.4.4
SIMPLIFIED SHEAR VALUES FOR WIND LOADING BRACED WALL LINES

Sheathing Material	Bottom plate connection to foundation	Fastener	Fastener Spacing	Any Species Stud Framing		
				Tested capacity	System Effects Factor	IRC Lateral Design Capacity
3/8", 7/16" or 15/32" WSP @16" and 24" o.c framing -- ~~Wind.~~	Anchor bolts in accordance with code requirements	6d (2" x 0.113" nails) or 8d (2 1/2 x 0.131"	6:12	~~335~~ 350	1.80	600
3/8", 7/16" or 15/32" WSP @16" and 24" o.c framing (with 1/2" gypsum on interior face of wall~~. -- Wind~~	Anchor bolts in accordance with code requirements	6d (2" x 0.113") or 8d (2 1/2 x 0.131"nails and Types S or W drywall screws.	6:12 WSP & 16:16 for GWB	~~465~~ 450	1.80	840

a.The lateral design capacity of braced wall panels is based on full scale wall assembly tests using the minimum restraint provisions of the IRC, further adjusted by the partial restraint/systems effect factor.

(Portions of code change proposal not shown remain unchanged)

Commenter's Reason: In addition to the original reason statements provided in RB308 and RB309 the following should be considered:
SBCRI has completed additional testing and as a result, proposes the modifications shown above. The proposed 350 plf for wood structural panels (WSP's) installed without gypsum is the tested capacity of WSP's in full scale tests as well as in 23' wall assemblies when built to the minimum requirements of the IRC. The stated System Effects factor is simply a factor used to convert the tested capacities to the capacity currently in use in the IRC. It is recognized that the systems effect factor does not exactly result in the stated IRC capacity. The calculated value is rounded to the capacity currently in use. This proposal does not seek to modify what is currently in use. (i.e. the tested capacity, 350 plf times the systems effect factor of 1.8 equals 630 plf. This was rounded down to the 600 plf currently in use.)

When the Ad-Hoc Wall Bracing Committee (AHWBC) first developed these provisions, they did the best that they could, given the testing that was available at the time. Most of the testing that was available came from testing of fully restrained walls. This testing formed the basis of the committees work and judgments were made with regard to the partial restraint of buildings constructed to the IRC as well as the systems effects of completed construction. The table able does not change any of that work, but simply restates the basis of the design capacities using the capacities from tests of buildings constructed in accordance with the minimum IRC and then applying the factor necessary to get back to the current IRC design values.

With regard to the addition of gypsum to braced wall panels: The Ad-Hoc Wall bracing committee used 200 plf as the capacity of the gypsum added to the back side of the braced wall panel. The 200 plf capacity is predicated on the use of nailing at 7" o.c. at the edges of the panel and in the field. **Additionally, the gypsum must be installed vertically (See Table R602.3 (1), Line 37 and footnote "d").** This orientation and fastening pattern is rarely accomplished in the field. The more common fastening is in accordance with the interior coverings section (R702.3.5) which allows both horizontal and vertical applications and screw spacing at 16” o.c. SBCRI tested both of these conditions. The 200 plf capacity of the gypsum is confirmed when installed per the AHWBC assumptions, but only achieves 100 plf when installed with 16:16 screws.

The IRC-Building Committee’s stated two reasons for disapproving RB309 follow. First, the proposal was not limited to wind as stated in testimony. While the limitation was stated in the table, the revision above moves the wind limitation to the title of the table to be clearer as to the application. Second, they stated that design values do not belong in a prescriptive code. However, there are often parts of a building that do not comply with the IRC and that must be designed. Currently, the only direction a building designer has to obtain design values to use engineering based reference documents such as SDPWS which provide design capacities based on fully restrained conditions. This proposal simply gives the building designer an accurate assessment of the design capacities currently provided for in the IRC using the minimum IRC construction as the basis of the capacity.

RB308-13

Final Action: AS AM AMPC____ D

RB310-13
Table R602.10.5

Proposed Change as Submitted

Proponent: Edward L. Keith, APA – The Engineered Wood Association (ed.keith@apawood.org)

Revise as follows:

TABLE R602.10.5
MINIMUM LENGTH OF BRACED WALL PANELS

METHOD (See Table R602.10.4)		MINIMUM LENGTH[a] (in.)					CONTRIBUTING LENGTH (in.)
		WALL HEIGHT					
		8 ft	9 ft	10 ft	11 ft	12 ft	
CS-PF	SDC A, B and C	16	18	20	22[e]	24[e]	1.5 x Actual[b]
	SDC D_0, D_1 and D_2	16	18	20	22[e]	24[e]	Actual[b]

(Portions of Table not shown remain unchanged)

Reason: Currently Method PFG (Portal Frame at Garage) is permitted in the 2012 IRC Table R602.10.5 with a 1.5 multiplier to convert the leg length to a length contributing to bracing. The multiplier was permitted because Method PFG was restricted for use in areas of low seismicity (SDCs A, B and C).

Cyclic testing conducted at APA in 2006 of the CS-PF (Continuous Sheathed – Portal Frame) showed that the CS-PF has a design strength at least as high as the PFG tested in a similar manner. Based on the results of this testing it is reasonable to permit the same multiplier to be applied to the Method CS-PF when similarly restricted to areas of low seismicity as is Method PFG.

Please note that the CS-PF portal frame can have a leg length as small at 16 inches, where the PFG has a minimum leg length of 24 inches. What makes the CS-PF perform as well or better than the PFG, even with a shorter leg length, is the fact that the CS-PF has nearly twice as many fasteners as the PFG. It is the fastener interaction between the framing and sheathing that determine the ultimate capacity of this wood-structural-panel/framing bracing system.

Note that the IRC bracing provisions are difficult to meet in many cases as a result of narrow building lots and the aesthetic requirements of modern homes. Areas around garages and picture windows are especially difficult to accommodate and still meet the minimum bracing requirements of the code. Permitting the equal-to-stronger minimum 16-inch CS-PF the same multiplier as the 24-inch PFG is both rational and extremely helpful in making the 2012 IRC bracing provisions viable.

We ask the committee to extend the same multiplier to the 16-inch CS-PF that is applied to the 24-inch PFG when the same use restrictions are applied. This is based on full-scale cyclic load tests described in APA Test Report T2006-29 and NAHB-Research Center Test Report EG5522_08216.

Cost Impact: The code change proposal will not increase the cost of construction.

R602.10.5T-RB-KEITH.doc

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Approval was based upon the proponent's published reason. Also, it provides a useful option for using method CS-PF in low seismic areas.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Randall Shackelford, P.E., Simpson Strong-Tie Company, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

TABLE R602.10.5
MINIMUM LENGTH OF BRACED WALL PANELS

METHOD (See Table R602.10.4)		MINIMUM LENGTH [a] (in.) WALL HEIGHT					CONTRIBUTING LENGTH (in.)
		8 ft	9 ft	10 ft	11 ft	12 ft	
CS-PF	~~SDC A, B, and C~~	~~16~~	~~18~~	~~20~~	~~22~~	~~24~~	~~1.5 × Actual [b]~~
	~~SDC D_0, D_1, and D_2~~	16	18	20	22	24	Actual [b<u>, c</u>]

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 mile per hour = 0.447 m/s.
NP = Not Permitted.
a. Linear interpolation shall be permitted.
b. Use the actual length when it is greater than or equal to the minimum length.
<u>c. In SDC A, B, or C, where Method CS-PF is installed on a concrete foundation, supporting a roof or one story and a roof, and on either side of a garage, the contributing length shall be 1.5 times the actual length.</u>
~~c~~ <u>d</u>. Maximum header height for PFH is 10 feet in accordance with Figure R602.10.6.2, but wall height may be increased to 12 feet with pony wall.
~~d~~ <u>e</u>. Maximum opening height for PFG is 10 feet in accordance with Figure R602.10.6.3, but wall height may be increased to 12 feet with pony wall.
~~e~~ <u>f</u>. Maximum opening height for CS-PF is 10 feet in accordance with Figure R602.10.6.4, but wall height may be increased to 12 feet with pony wall.

Commenter's Reason: The purpose of this Public Comment is to allow the CS-PF bracing method to count for 1.5 times its width, as method PFG does, when the exact same limitations are used.

The original proponent's reason statement ended with the following: "We ask the committee to extend the same multiplier to the 16-inch CS-PF that is applied to the 24-inch PFG <u>when the same use restrictions are applied</u>. This is based on full-scale cyclic load tests described in APA Test Report T2006-29 and NAHB-Research Center Test Report EG5522_08216." (*Emphasis by proponent*).

However, the same use restrictions do not apply to the CS-PF as the PFG.
Besides being limited to Seismic Design Category A, B, and C, the PFG is also required to be installed on a concrete foundation, be on either side of a garage opening, and be supporting a roof only or one story and a roof.

The CS-PF can be installed on the first of three stories, on a second or third story, at any wall opening, and with up to 4 portal frames on a braced wall line.

Although the original proposal looked fairly simple, the end result is that the CS-PF will have a 50% increase in capacity, which is significant. But the proponent submitted absolutely no data as evidence to justify this 50% increase. The two tests referenced are not available anywhere that I could find. So our first thought was to argue for denial of this proposal.

But we heard the members testify at the Committee Action Hearing that they needed this increase at garage openings to help houses meet the 2012 bracing amounts.

So this Public Comment will allow the 50% increase in capacity, but only when the CS-PF has the same limitations as Method PFG, just as the proponent asked.

RB310-13
Final Action: AS AM AMPC____ D

RB320-13
R602.10.8.2(3)

Proposed Change as Submitted

Proponent: Edward L. Keith, APA – The Engineered Wood Association (ed.keith@apawood.org)

Revise as follows:

Add detail as shown below to Figure R602.10.8.2(3): (Remainder unchanged)

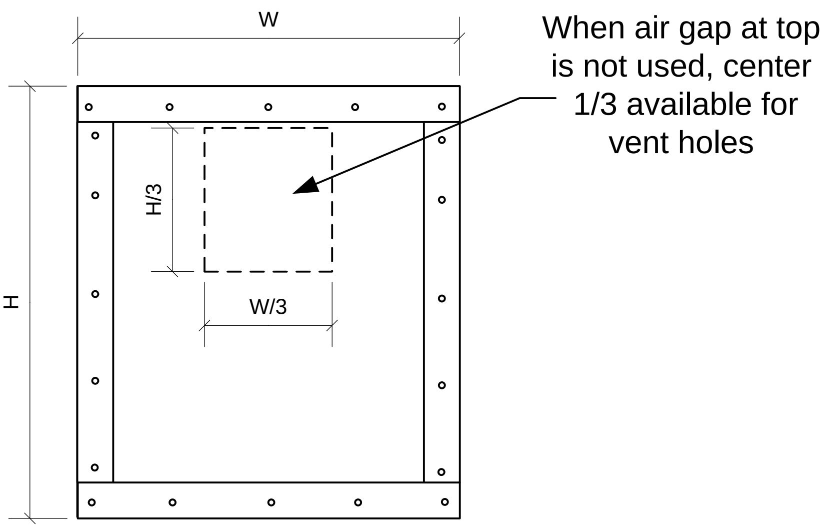

FIGURE R602.10.8.2(3)
BRACED WALL PANEL CONNECTION OPTION TO PERPENDICULAR RAFTERS OR ROOF TRUSSES

Reason: When the air gap is not desired, as in the case of an engineered roof system, the ventilation requirements can be met by placing an opening in the fabricated blocking panels. An opening sized as shown above will not compromise the ability of the fabricated blocking panel to resist overturning or transfer shear from the roof diaphragm to the wall below.

Cost Impact: The code change proposal will not increase the cost of construction.

R602.10.8.2(3)F-RB-KEITH.doc

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Approval was based upon the proponent's published reason. Also, provides missing information on how to deal with ventilation.

Assembly Action: **None**

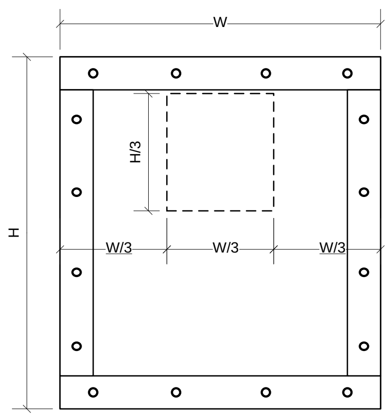
Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Edward L. Keith, representing APA – The Engineered Wood Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:



~~When~~ Where air gap at top is not used, center ~~1/3~~ W/3 available for vent holes

FIGURE R602.10.8.2(3)
BRACED WALL PANEL CONNECTION OPTION TO PERPENDICULAR RAFTERS OR ROOF TRUSSES

Commenter's Reason: While the original proposal was recommended for approval as submitted, a number of minor editorial improvements were recommended be attendees at the mid-year meeting. The minor changes are:

- The addition of "W/3" to either side of the opening.
- Changing "When" to "Where" in the annotation.
- Changing "1/3" to "W/3" in the annotation.

This public comment makes these editorial improvements, making the code easier to understand, administer and use.

RB320-13

Final Action:	AS	AM	AMPC____	D

RB324-13
R602.12, Table R602.12.4

Proposed Change as Submitted

Proponent: Brian Foley, P.E., Fairfax County, VA, representing Virginia Building and Code Officials Association (brian.foley@fairfaxcounty.gov)

Revise as follows:

R602.12 Simplified wall bracing. Buildings meeting all of the conditions listed below shall be permitted to be braced in accordance with this section as an alternate to the requirements of Section R602.10. The entire building shall be braced in accordance with this section; the use of other bracing provisions of R602.10, except as specified herein, shall not be permitted.

1. There shall be no more than ~~two~~ three stories above the top of a concrete or masonry foundation or basement wall. Permanent wood foundations shall not be permitted.
2. Floors shall not cantilever more than 24 inches (607 mm) beyond the foundation or bearing wall below.
3. Wall height shall not be greater than 10 feet (2743 mm).
4. The building shall have a roof eave-to-ridge height of 15 feet (4572 mm) or less.
5. All exterior walls shall have gypsum board with a minimum thickness of $^1/_2$ inches (12.7 mm) installed on the interior side fastened in accordance with Table R702.3.5.
6. The structure shall be located where the basic wind speed is less than or equal to ~~90~~ 100 mph (~~40~~ 44 m/s), and the Exposure Category is A or B.
7. The structure shall be located in Seismic Design Category of A, B or C for detached one- and two-family dwellings or Seismic Design Category A or B for townhouses.
8. Cripple walls shall not be permitted in ~~two~~three-story buildings.

TABLE R602.12.4
MINIMUM NUMBER OF BRACING UNITS ON EACH SIDE OF THE CIRCUMSCRIBED RECTANGLE

WIND SPEED	STORY LEVEL	EAVE-TO RIDGE HEIGHT (FEET)	MINIMUM NUMBER OF BRACING UNITS ON EACH LONG SIDE [a,b]						MINIMUM NUMBER OF BRACING UNITS ON EACH SHORT SIDE [a,b]					
			Length of short side (ft) [c]						Length of long side (ft) [c]					
			10	20	30	40	50	60	10	20	30	40	50	60
90		10	1	2	2	2	3	3	1	2	2	2	3	3
			2	3	3	4	5	6	2	3	3	4	5	6
			2	3	4	6	7	8	2	3	4	6	7	8
		15	1	2	3	3	4	4	1	2	3	3	4	4
			2	3	4	5	6	7	2	3	4	5	6	7
			2	4	5	6	7	9	2	4	5	6	7	9

WIND SPEED	STORY LEVEL	EAVE-TO RIDGE HEIGHT (FEET)	MINIMUM NUMBER OF BRACING UNITS ON EACH LONG SIDE [a,b]						MINIMUM NUMBER OF BRACING UNITS ON EACH SHORT SIDE [a,b]					
			Length of short side (ft) [c]						Length of long side (ft) [c]					
			10	20	30	40	50	60	10	20	30	40	50	60
100		10	1	2	2	3	3	4	1	2	2	3	3	4
			2	3	4	5	6	7	2	3	4	5	6	7
			2	4	5	7	8	10	2	4	5	7	8	10
		15	2	3	3	4	4	6	2	3	3	4	4	6
			3	4	6	7	8	10	3	4	6	7	8	10
			3	6	7	10	11	13	3	6	7	10	11	13

For SI: 1 ft = 304.8 mm

a. Interpolation shall not be permitted.

b. Cripple walls or wood-framed basement walls in a walk-out condition of a one-story structure shall be designed as the first floor of a two-story house.

c. Actual lengths of the sides of the circumscribed rectangle shall be rounded to the next highest unit of 10 when using this table.

Reason: Using the wall bracing values for wind speed of 100 mph and three stories from Section R602.10, the use of Simplified Wall Bracing can be expanded to a wide range of areas and building types without impacting safety. Since the 90 mph values in Table R602.12.4 were calculated from R602.10, then the 100 mph will create an accurate bracing amounts as it would if calculated from the wind tables of R602.10.

Cost Impact: The code change proposal will not increase the cost of construction.

R602.12 #3-RB-FOLEY.doc

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

TABLE R602.12.4
MINIMUM NUMBER OF BRACING UNITS ON EACH SIDE OF THE CIRCUMSCRIBED RECTANGLE

For SI: 1 ft = 304.8 mm

a. Interpolation shall not be permitted.

b. Cripple walls or wood-framed basement walls in a walk-out condition ~~of a one-story structure~~ shall be ~~designed~~ designated as the first ~~floor~~ story ~~of a two-story house~~ and the stories above shall be redesignated as the second and third stories, respectively, and shall be prohibited in a three-story structure..

c. Actual lengths of the sides of the circumscribed rectangle shall be rounded to the next highest unit of 10 when using this table.

Committee Reason: Approval was based upon the proponent's published reason. The modification clarifies where a cripple wall or wood-framed basement wall is considered a story.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Brian Foley, P.E. Fairfax County, VA, representing Virginia Building and Code Officials Association and Gary J. Ehrlich, P.E., National Association of Home Builders (NAHB), request Approval as Modified by this Public Comment.

Further modify the proposal as follows:

R602.12 Simplified wall bracing. Buildings meeting all of the conditions listed in items 1-8 shall be permitted to be braced in accordance with this section as an alternative to the requirements of Section R602.10. The entire building shall be braced in accordance with this section; the use of other bracing provisions of R602.10, except as specified herein, shall not be permitted.

1. There shall be no more than three stories above the top of a concrete or masonry foundation or basement wall. Permanent wood foundations shall not be permitted.
2. Floors shall not cantilever more than 24 inches (607 mm) beyond the foundation or bearing wall below.
3. Wall height shall not be greater than 10 feet (2743 mm).
4. The building shall have a roof eave-to-ridge height of 15 feet (4572 mm) or less.
5. All exterior walls shall have gypsum board with a minimum thickness of ½ inch (12.7 mm) installed on the interior side fastened in accordance with Table R702.3.5.
6. The structure shall be located where the ~~basic~~ ultimate design wind speed is less than or equal to 130 ~~100~~ mph (58 m/s) ~~(44 m/s)~~, and the Exposure Category is ~~A,~~ B or C.
7. The structure shall be located in Seismic Design Category A, B or C for detached one- and two-family dwellings or Seismic Design Category A or B for townhouses.
8. Cripple walls shall not be permitted in three-story buildings.

(Portions of code change proposal not show remain unchanged)

Commenter's Reason: The purpose of this public comment is to correlate RB324 with the comprehensive update of the IRC wind provisions to the ultimate design wind speed basis of ASCE 7-10 and the 2012 IBC. RB324 increased the scope of the simplified wall bracing method from 90mph to 100mph, but those wind speeds reflect the old ASCE 7-05 basis (now the "nominal design wind speed" or V_{ASD}). This code change converts the limit from 100mph V_{ASD} to the equivalent 130mph V_{ULT}.

RB324-13

Final Action: AS AM AMPC____ D

RB327-13
R602.12.6.2

Proposed Change as Submitted

Proponent: Edward L. Keith, APA – The Engineered Wood Association (ed.keith@apawood.org)

Revise as follows:

R602.12.6.2 Method CS-PF *Braced wall panels* constructed as Method CS-PF in accordance with Section R602.10.6.4 shall be permitted when all framed portions of all exterior walls are sheathed with wood structural panels. Each CS-PF panel shall equal ~~0.5~~ 0.75 bracing units. A maximum of four CS-PF panels shall be permitted on all segments of walls parallel to each side of the circumscribed rectangle. Segments of walls which include a Method CS-PF panel shall meet the requirements of Section R602.10.4.2.

Reason: Currently each Method PFG (Portal Frame at Garage) is permitted in the 2012 IRC Section R602.12.6.3 to contributing 0.75 bracing units to the required amount of bracing. The contribution amount is based on the 1.5 multiplier to the length of the vertical leg of the portal frame permitted in Table R602.10.5. This multiplier was added in the "legacy" IRC provisions because Method PFG was restricted for use in areas of low seismicity (SDCs A, B and C).

Cyclic testing conducted at APA in 2006 of the CS-PF (Continuous Sheathed – Portal Frame) showed that the CS-PF has a design strength at least as high as the PFG tested in a similar manner. Based on the results of this testing it is reasonable to permit the same contributing amount of bracing units for the Method CS-PF when similarly restricted to areas of low seismicity as is the Simplified Method.

Please note that the CS-PF portal frame can have a leg length as small at 16 inches, where the PFG has a minimum leg length of 24 inches. What makes the CS-PF perform as well or better than the PFG, even with a shorter leg length, is the fact that the CS-PF has nearly twice as many fasteners as the PFG. It is the fastener interaction between the framing and sheathing that determine the ultimate capacity of this wood-structural-panel/framing bracing system.

Note that the IRC bracing provisions are difficult to meet in many cases as a result of narrow lot widths and the aesthetic requirements of modern homes. Areas around garages and picture windows are especially difficult to accommodate and still meet the minimum bracing requirements of the code. Permitting the equal-to-stronger minimum 16-inch CS-PF the to have the same adjustment factor as the 24-inch PFG is both rational and extremely helpful in broadening the scope of the 2012 IRC Simplified Bracing provisions.

We ask the committee to permit the 16-inch CS-PF the same 0.75 bracing unit contribution as is applied to the 24-inch PFG when used in the Simplified Bracing Method. This is based on full-scale cyclic load tests described in APA Test Report T2006-29 and NAHB-Research Center Test Report EG5522_08216.

Cost Impact: The code change proposal will not increase the cost of construction.

R602.12.6.2-RB-KEITH.doc

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Based upon the committee's previous action on RB310-13 and the proponent's published reason.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Randall Shackelford, P.E., Simpson Strong-Tie Company, requests Disapproval.

Commenter's Reason: We ask that the membership deny RB327 for the following reasons:

1. This is a 50 percent increase in capacity requested with absolutely no technical substantiation submitted. The referenced test reports are no longer available anywhere that I could find.
2. In the simplified method, the CS-PF *ALREADY* counts for 1.5 times its width. The CS-PF counts for 0.5 bracing units, or one half of a braced wall panel. The CS-PF is 16" wide, increase that by 50% and you get 24" wide, which is exactly half a braced wall panel. So this is a completely different issue than RB310. This is double dipping. Asking for a 50% increase on top of an already existing 50% increase.
3. Even if RB310 is approved, that proposal does NOT say that the CS-PF should count for exactly the same length as the PFG method. It says that they both should count for 1.5 times their width. The PFG is 24" wide, times 1.5 equals 36" or 0.75 of a bracing unit, which is what the code says. The CS-PF is 16" wide, times 1.5 equals 24", which is 0.5 of a bracing unit, which is what the code says. So the code already treats the CS-PF and PFG exactly the same by counting them as 1.5 times their width.
4. The proponent's reason states that "it is reasonable to permit the same contributing amount of bracing units for the Method CS-PF <u>when similarly restricted to areas of low seismicity</u> as is the Simplified Method." However, the proponent mentions nothing of the other code limitations that apply to Method PFG, such as the requirements that the portal be installed on a concrete foundation, at garage openings only, and only where supporting a roof or one story and a roof.

Therefore this proposal is not needed.

R602.10 Wall bracing. Buildings, and portions thereof, shall be braced in accordance with one or more of the following sections using bracing materials and methods complying with Section R602.10.1 and load path detailing in accordance with Section R602.10.5:

1. Intermittent bracing per Section R602.10.2,
2. Continuous sheathing per Section R602.10.3,
3. Engineered design per Section R602.10.4, or
4. Appendix R – Wall Bracing Supplemental Provisions

Where a building, or portion thereof, does not comply with Section R602.10.2, Section R602.10.3, or Section R602.10.5, those portions shall be designed and constructed in accordance with Section R602.10.4. Townhouses in Seismic Design Category C and all buildings in Seismic Design Categories D_0, D_1, and D_2 shall comply with the bracing requirements in Appendix R or be designed in accordance with Section R602.10.4.

R602.10.1 Bracing materials and methods. Wall bracing materials and methods shall comply with Table R602.10.1.

TABLE R602.10.1
BRACING METHODS[a,b]

Method	Minimum Brace Material Thickness or Size	Minimum Braced Wall Panel Width or Brace Angle	Connection Criteria: Minimum Fasteners	Connection Criteria: Maximum Spacing
LIB Let-in Bracing	1x4 wood brace (or approved metal brace installed per manufacturer instructions)	45^o angle and maximum 16"oc stud spacing[c]	2-8d common nails or 3-8d box nails (2-1/2" long x 0.113" dia.)	Per stud and top and bottom plates
DWB Diagonal wood boards	¾" (1" nominal)	48"	2-8d box nails (2-1/2" long x 0.113" diameter) or 2 – 1-3/4" long 16ga. staples	Per stud and top and bottom plates
WSP Wood structural panel	3/8"	48"[d]	6d common nail or 8d box nail (2-1/2" long x 0.113" diameter)	6" edges, 12" field
SFB Structural Fiberboard Sheathing	½"	48"[d]	1-1/2" long x 0.120" dia. galvanized roofing nails	3" edges, 6" field
GB Gypsum Board (installed on both sides of wall)	½"	96" (48" for use with Section R602.10.3)	5d cooler nails or #6 screws	7" edges, 7" field (including top and bottom plates)
PCP Portland cement	¾" (maximum	48"	1-1/2" long, 11 gage, 7/16"	6" o.c. on all framing

plaster	16"oc stud spacing)		diameter head nails or 7/8" long, 16 gage staples	members
CS-WSP[e] Continuously sheathed WSP	3/8"	Refer to Table R602.10.1.1	Same as WSP	Same as WSP
CS-SFB[e] Continuously sheathed SFB	½"		Same as SFB	Same as SFB
PF Portal Frame[f]	7/16"	See Figure R602.10.1	See Figure R602.10.1	See Figure R602.10.1

For SI: 1 inch = 25.4 mm

a. Alternative bracing materials and methods, when approved in accordance with Section R104.11, shall be permitted to be used as a substitute for any of the bracing materials listed in Table R602.10.1 provided at least equivalent performance is demonstrated. Where the tested bracing strength or stiffness differs from tabulated materials, the bracing amount required for the alternative material shall be permitted to be factored to achieve equivalence.

b. All edges of panel-type wall bracing shall be attached to framing or blocking, except GB bracing horizontal joints shall not be required to be blocked where joints are finished.

c. Method LIB shall not be permitted for walls supporting a roof and two stories. Two LIB braces installed at a 60^{o} angle shall be permitted to be substituted for each 45^{o} angle LIB brace.

d. A braced wall panel shall be permitted to be reduced to a 32-inch length when studs at each end of the braced wall panel are anchored to foundation or framing below using hold-down device with minimum 2,800 lbs design tension capacity. For detached single story garages and attached garages supporting roof only, a minimum 24-inch brace panel length shall be permitted on one wall containing one or more garage door openings.

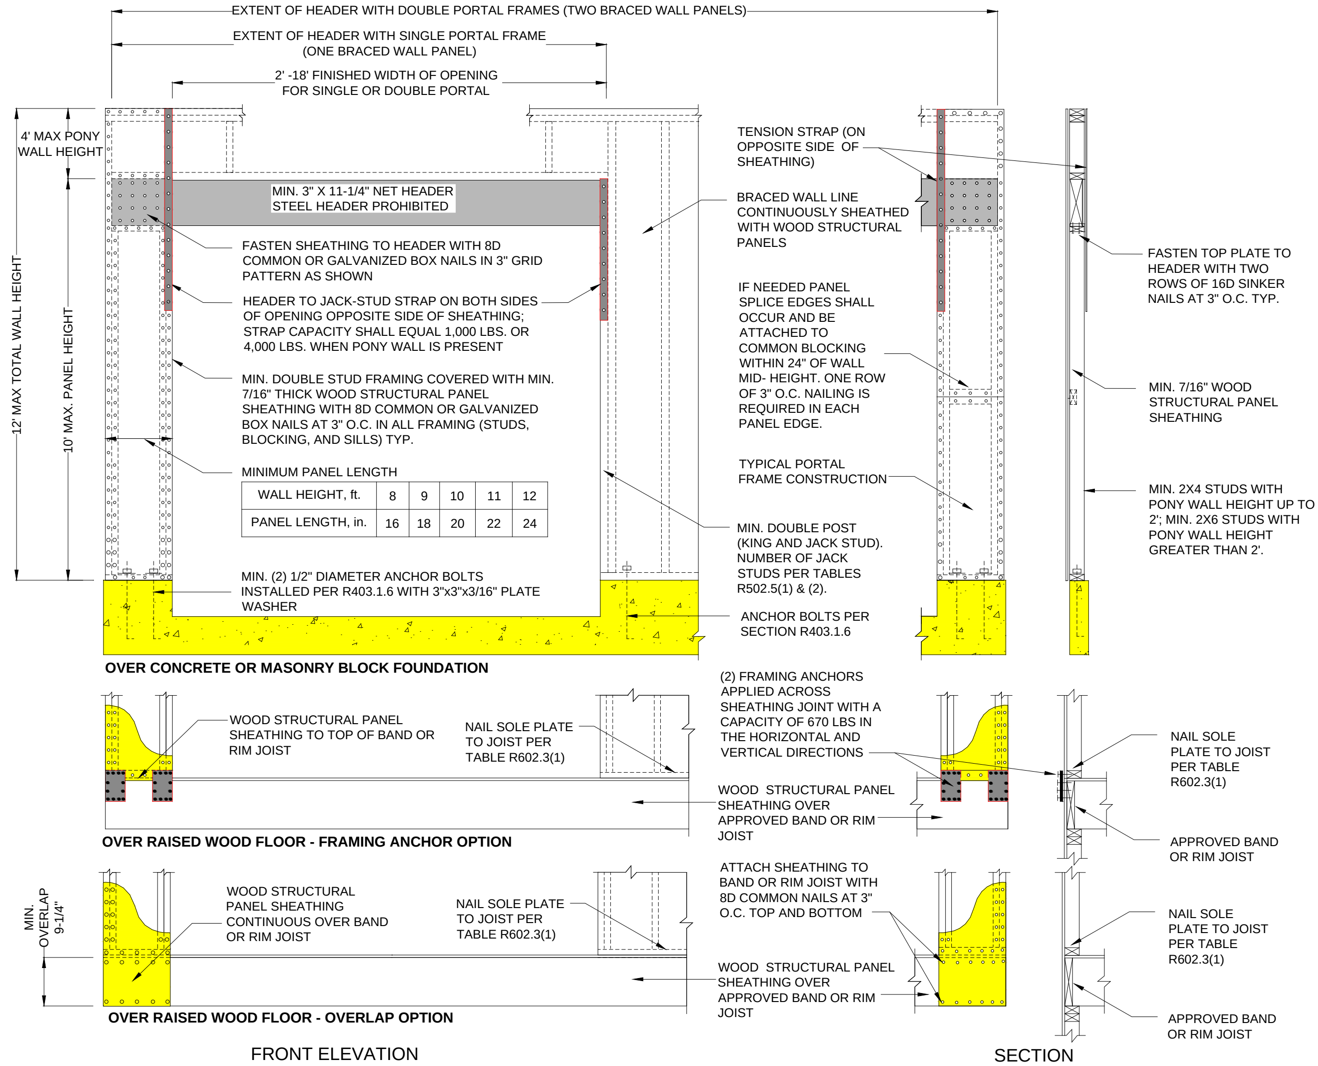
e. Bracing methods CS-WSP and CS-SFB shall have sheathing installed on all sheathable surfaces above, below, and between wall openings.

f. For purposes of bracing in accordance with Section R602.10.2, two Method PF brace panels having a minimum width of 24-inches each shall be considered equivalent to one braced wall panel.

TABLE R602.10.1.1
MINIMUM WIDTHS OF METHOD CS-WSP AND CS-SFB BRACED WALL PANELS

Maximum Opening Height Adjacent to Braced Wall Panel	**Minimum Length of Braced Wall Panel (inches)**			
	8' tall wall	**9' tall wall**	**10' tall wall**	**12' tall wall**
Up to 5' – 4"	24	27	30	36
Up to 6' – 8"	32	30	30	36
Up to 8'	48	41	38	36
Up to 9'	-	54	46	41
Up to 10'	-	-	60	48
Up to 12'	-	-	-	72

For SI: 1 foot = 305 mm, 1 inch = 25.4 mm



For SI: 1 inch = 25.4 mm, 1 foot = 305 mm, 1 lb = 4.45 N

NOTE: Minimum PF panel length shall be 24 inches (610 mm) for use with Section R602.10.2.

FIGURE R602.10.1

METHOD PF – PORTAL FRAME CONSTRUCTION

602.10.2. Intermittent Bracing. Intermittent bracing shall comply with Sections R602.10.2.1 and R602.10.2.2.

R602.10.2.1 Limitations. The intermittent bracing requirements of Section R602.10.2.2 shall be limited to the following conditions of use:

1. Basic design wind speed shall not exceed 100 mph (161 km/h).
2. Bracing methods shall be LIB, DWB, WSP, SFB, GB, PCP, and PF in accordance with Table R602.10.1.
3. Overall plan length of the house is limited to 75 feet (22.9 m) and the overall plan width shall be no less than one-third the overall plan length.
4. Wall height at each story level shall not exceed 10 feet (3.05 m).
5. Roof eave-to-ridge height shall not exceed 10 feet (3.05 m) unless the roof is considered as an additional story for the purpose of determining bracing amounts required.
6. Except where used as bracing method GB, minimum ½-inch-thick gypsum wall board interior finish, or approved interior finish of equivalent or greater shear resistance, shall be installed on the interior side of exterior walls and both sides of interior walls and fastened in accordance with Table R702.3.5.
7. Floors supporting brace panels shall not cantilever more than 24 inches (607 mm) beyond the foundation or bearing wall below.
8. Townhouses shall be stabilized independently of adjacent units unless a design is provided to permit lateral load transfer between adjacent units.

R602.10.2.2 Requirements. Braced wall panels shall be constructed of bracing methods, materials, and minimum braced panel lengths complying with Table R602.10.1. The number of braced wall panels required for each side of a building (elevation view) at each story level of the building shall comply with Table R602.10.2 and shall be oriented parallel to the building side. The following additional requirements shall apply:

1. In no case shall the amount of bracing be less than two braced wall panels on exterior walls comprising each side of a building (elevation view) for each story level of the building.
2. Braced wall panel shall be located on each building side at each story level in accordance with Figure R602.10.2.2.
3. No more than one-half the number of braced wall panels required on a building side shall be permitted to be relocated from exterior walls to interior walls oriented in the same plan direction and within one-half the floor plan dimension perpendicular to the exterior wall.
4. Use of multiple bracing methods and materials complying with Table R602.10.1 shall be permitted.
5. Houses with skewed wings shall be constructed in accordance with either Section R602.10.3 or designed in accordance with Section R602.10.4.
6. Garage door openings supporting a floor load above shall be braced using Method PF unless the building plan level containing the garage opening wall complies with all the bracing requirements of this section.
7. The bracing amount provided on an upper story building side shall be "deemed-to-comply" where it equals or exceeds the amount of bracing required for the story immediately below.

TABLE R602.10.2
NUMBER OF BRACED WALL PANELS REQUIRED
FOR EACH HOUSE ELEVATION (BUILDING SIDE) AT EACH STORY LEVEL[1]

Wind Velocity	Story Level Supporting:	Longest Overall Dimension of Floor Plan for a Given Story Level		
		25'	50'	75'
90 mph	Roof Only	1	2	3
	Roof + 1 Story	2	4	6
	Roof + 2 Stories	3	6	9
100 mph	Roof Only	2	3	4
	Roof + 1 Story	3	5	8
	Roof + 2 Stories	4	8	11

For SI: 1 foot = 305 mm
a. Interpolation between dimensions shall be permitted. Extrapolation is prohibited.
b. Table applies to wind exposure B. For wind exposure C or D, multiply number of braced wall panels required by 1.3 or 1.6, respectively.
c. Fractions of panels shall be rounded to the nearest one-half braced wall panel. The following braced wall panel conditions shall be permitted to be counted as one-half a braced wall panel: (1) one 60 degree LIB, (2) one 48" GB or one 96" GB with gypsum wall board on one side, or (3) one 36" WSP, SFB, or PCP braced wall panel for wall heights not more than 9 feet (2.75 m).

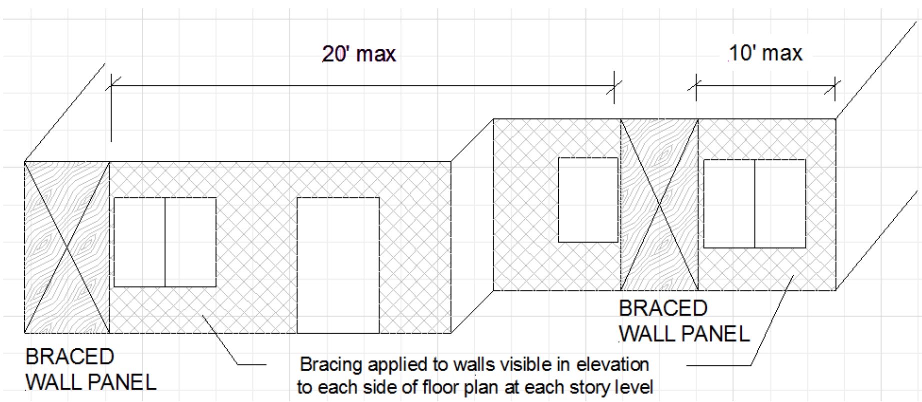


FIGURE R602.10.2.2
LOCATION OF BRACED WALL PANELS

R602.10.3 Continuous Sheathing.

R602.10.3.1 Limitations. The continuous sheathing requirements of Section R602.10.3 shall be limited to bracing methods CS-WSP and CS-SFB in accordance with Table R602.10.1 with the following conditions of use:

1. Basic design wind speed shall not exceed 110 mph (177 km/h).
2. Wall height at each story level shall not exceed 12 feet (3.66 m).
3. Eave to ridge height shall not exceed 20 feet (6.10 m).
4. Exterior walls shall be sheathed on all sheathable surfaces including infill areas between braced wall panels, above and below wall openings and on gable end walls.
5. Except where used as bracing method GB, minimum ½-inch-thick gypsum wall board interior finish, or approved interior finish of equivalent or greater shear resistance, shall be installed on the interior side of exterior walls and both sides of interior walls and fastened in accordance with Table R702.3.5.
6. Floors supporting braced wall panels shall not cantilever more than 24 inches (607 mm) beyond the foundation or bearing wall below.
7. Townhouses shall be stabilized independently of adjacent units, unless a design is provided to permit lateral load transfer between adjacent units.

R602.10.3.2 Requirements. The required length of bracing for each side of a building (plan elevation) at each story level shall be determined using Table R602.10.3 and Figure R602.10.3(1). The cumulative contributing length of braced wall panels assigned to a rectangle side and each complying with Table R602.10.1.1 shall be greater than or equal to the required length of bracing. The following additional requirements shall apply:

1. Braced wall panels on exterior or interior walls shall be assigned to the nearest rectangle side as shown in Figure R602.10.3(2) for each story level floor plan.
2. Braced wall panels shall be distributed and installed in accordance with Figure R602.10.3(3).
3. A minimum of one-half the required bracing amount for each rectangle side should be located on exterior walls within 8 feet of the location of the rectangle side.
4. Interior braced wall panels using Method GB shall be assigned to the closest parallel rectangle side and shall contribute 0.5 times their actual length.
5. The bracing amount provided on an upper story building side shall be "deemed-to-comply" where it equals or exceeds the amount of bracing required for the story immediately below.

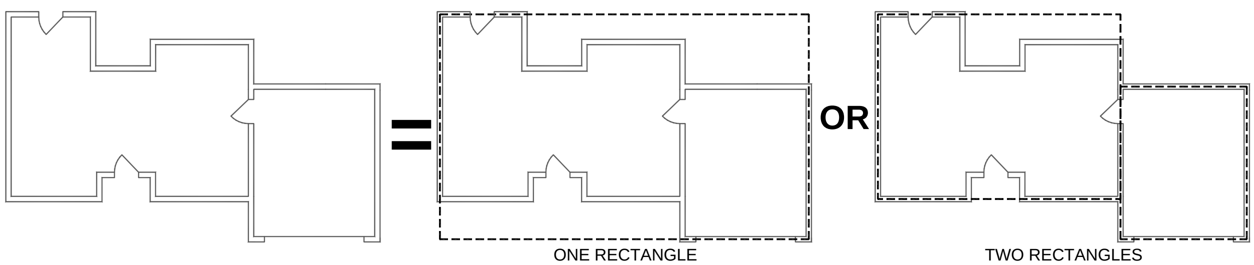

FIGURE R602.10.3(1)
CIRCUMSCRIBED RECTANGLES[a,b,c]

a. Each floor plan level shall be circumscribed with one or more rectangles around the entire floor plan at the floor level under consideration as shown in Figure R602.10.3.
b. Rectangles shall surround all enclosed offsets and projections such as sunrooms and attached garages for a given story level floor plan. Chimneys, partial height projections, and open structures, such as carports and decks, shall be excluded from the rectangle.
c. Each rectangle shall have no side greater than 80 feet (24.4 m) with a maximum rectangle length-to-width ratio of 3:1. Rectangles shall be permitted to be skewed to accommodate diagonal walls.

TABLE R602.10.3
REQUIRED LENGTH OF BRACING ALONG EACH SIDE OF A CIRCUMSCRIBED RECTANGLE [a,b,c,d]

WIND SPEED	EAVE-TO RIDGE HEIGHT (FEET)	NUMBER OF LEVELS ABOVE [e]	REQUIRED LENGTH (FEET) OF BRACING ON ANYSIDE OF RECTANGLE — Length of perpendicular side (ft)[f]: 10	20	30	40	50	60	70	80

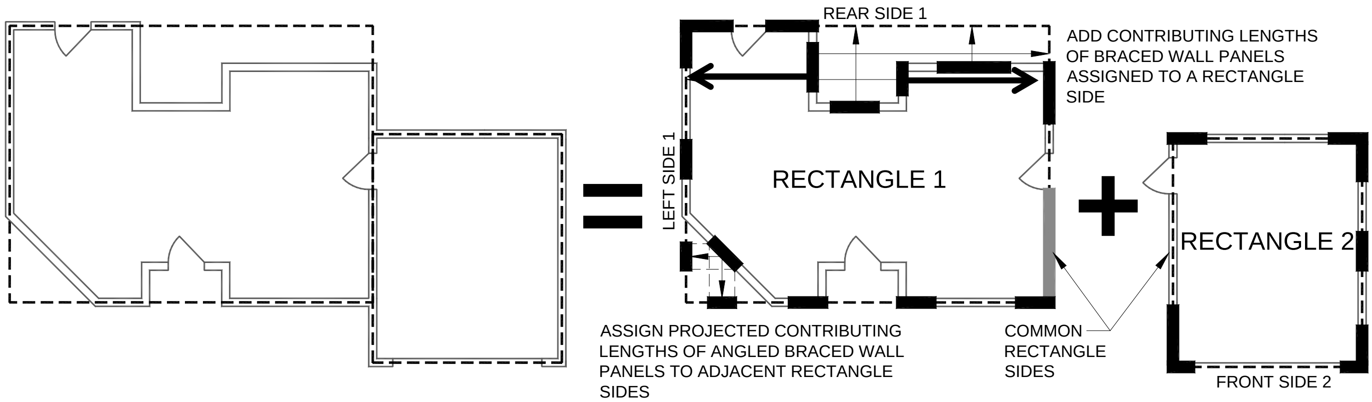
		One story	7.2	12.6	17.4	22.9	28.3	33.0	38.5	44.0
		Two stories	9.1	17.4	24.9	32.4	39.9	46.6	54.4	62.2

For SI: 1 ft = 304.8 mm

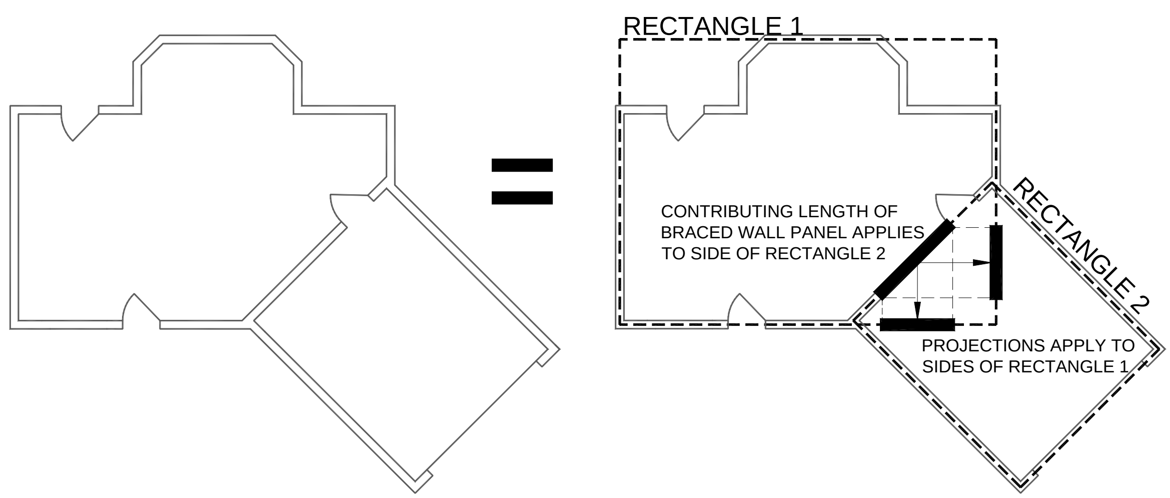
a. Interpolation shall be permitted; extrapolation shall be prohibited.

b. For Exposure Category C or D, multiply the required length of bracing by a factor of 1.3 or 1.6, respectively.

c. For wall heights other than 10 ft (3.05 m), multiply the required length of bracing by the following factors: 0.90 for 8 feet (2.44 m), 0.95 for 9 feet (2.74 m), 1.05 for 11 feet (3.35 m) and 1.10 for 12 feet (3.66 m).
d. Where minimum ½" gypsum wall board interior finish is not provided, the required bracing amount for the affected rectangle side shall be multiplied by 1.40.
e. A floor, habitable or otherwise, contained wholly within the roof rafters or roof trusses need not be considered a story for purposes of determining wall bracing provided the eave to ridge height does not exceed 20 feet (6.10 m).
f. Perpendicular sides to the front and rear sides are the left and right sides. Perpendicular sides to the left and right sides are the front and rear sides.



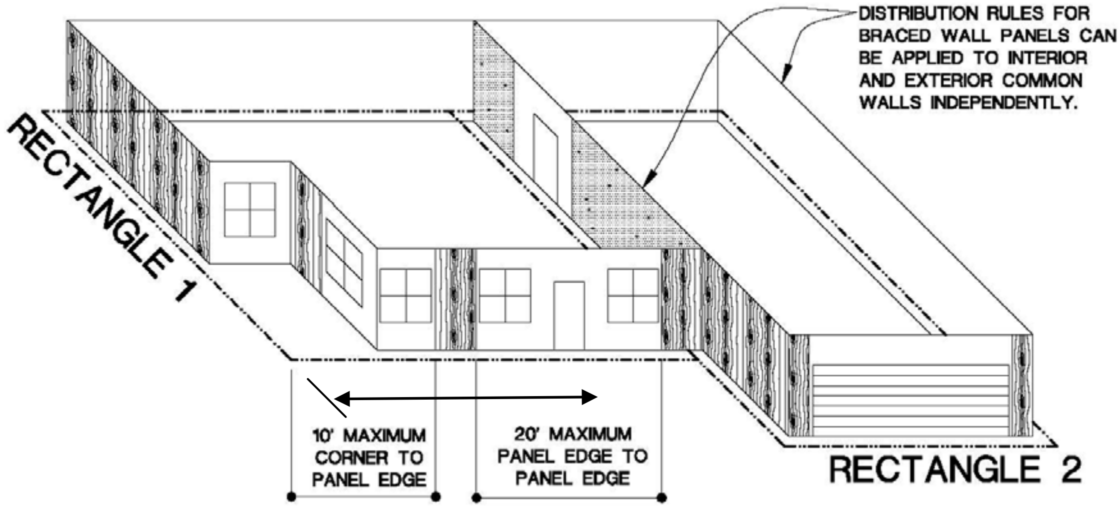
(a) Regular Floor Plan



(b) Skewed Floor Plan

FIGURE R602.10.3(2)
ASSIGNMENT OF BRACED WALL PANELS CIRCUMSCRIBED RECTANGLE SIDES[a,b,c]

a. Projected contributing lengths of angled braced wall panels shall be assigned to the closest rectangle sides.
b. Where multiple rectangles share a common side or sides, as shown in Figure R602.10.3(2)(a), the total required length of bracing on the common side shall equal the sum of the required lengths from each of the shared rectangle sides.
c. Braced wall panels located on a common wall where skewed rectangles intersect, as shown in Figure R602.10.3(2)(b), shall have their contributing length applied towards the required length of bracing for the parallel rectangle side and its projected contributing lengths towards the adjacent skewed rectangle sides. Where the common side of rectangle 2 as shown in Figure R602.10.3(2)(b) has no physical wall, the portion shall be designed in accordance with Section R602.10.4.



For SI: 1 ft = 304.8 mm

FIGURE R602.10.3(3)
DISTRIBUTION OF BRACED WALL PANELS[a,b,c,d]

a. A braced wall panel complying with Table R602.10.1.1 shall be located on each elevation view within 10 feet (3.05 m) of the corners of circumscribed rectangles.
b. The distance between adjacent edges of braced wall panels shall be no more than 20 feet (6.10 m) as measured along the rectangle side.
c. A minimum 24-inch-wide CS-WSP or 32-inch-wide CS-SFB panel shall be located on each side of inside and outside corners or an 800 lb rated tie-down shall be fastened to the edge of the braced wall panel closest to each corner.
d. Interior and exterior wall segments which contribute to the common sides of multiple rectangles shall be permitted to apply the distribution requirements given above to each wall segment independently.

R602.10.4 Wall bracing by engineered design. Designs using bracing materials and methods listed in Table R602.10.1 or approved alternative materials and methods shall be permitted and shall comply with accepted engineering practice. Accepted engineering practice shall include the following:

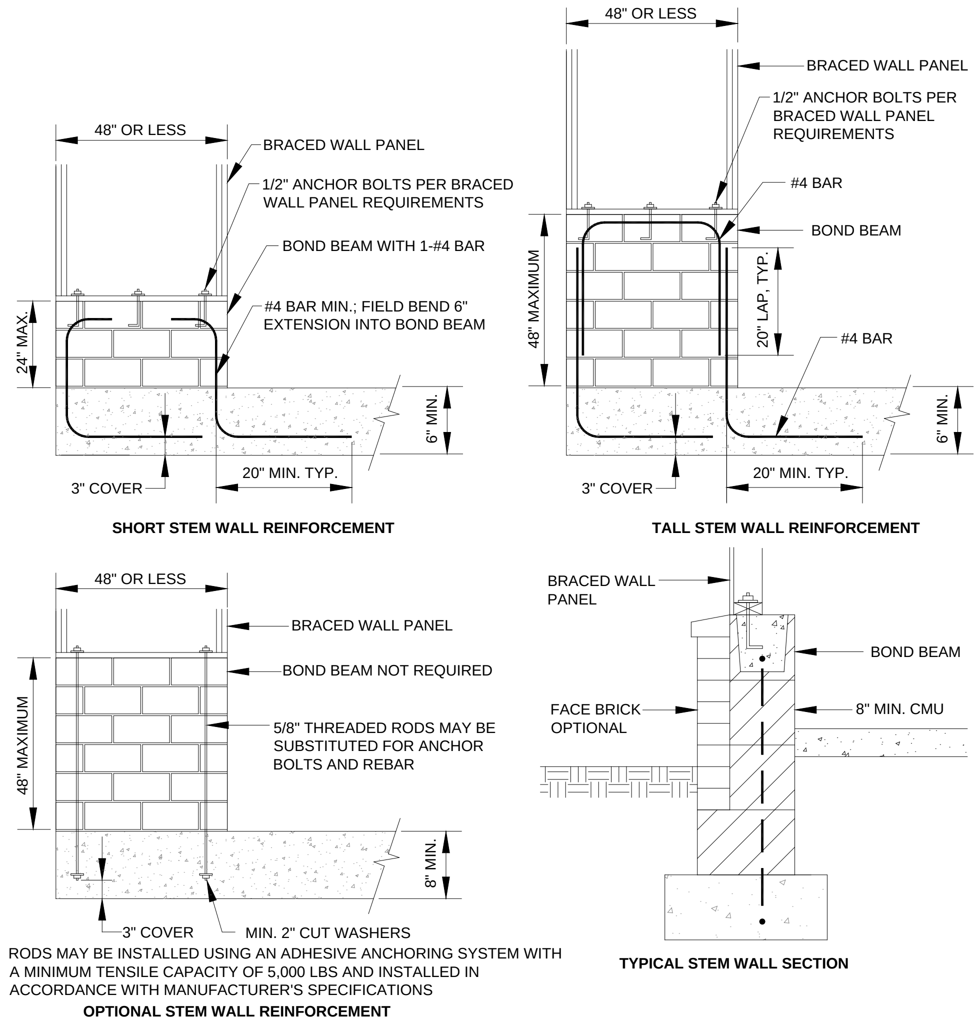
1. Design in accordance with Section R301, or
2. Design equivalent to the analysis basis and scope of the prescriptive provisions of R602.10, including determination of design loads, design unit shear values, and bracing amounts.

R602.10.5 Load path details. Construction shall comply with applicable detailing requirements of this section to ensure an adequate continuous load path for transfer of bracing loads and uplift loads from the roof to the foundation.

R602.10.5.1 Wind uplift load path. Framing connections to transfer roof uplift forces shall comply with Section R602.3.5 and Section R802.11.

R602.10.5.2 Foundation anchorage. Braced wall panels shall be connected to the foundation per Section R403.1.6 and as required in Figure R602.10.1 for portal frames (Method PF).

R602.10.5.3 Masonry or concrete pedestals. Masonry or concrete stem walls with a length of 48 inches (1220 mm) or less supporting braced wall panels shall be reinforced in accordance with Figure R602.10.4.3. Concrete stem walls shall be 6” nominal minimum thickness.



NOTE: GROUT BOND BEAMS AND ALL CELLS WHICH CONTAIN REBAR, THREADED RODS AND ANCHOR BOLTS.

For SI: 1 in=25.4 mm

FIGURE R602.10.5.3
MASONRY STEM WALLS SUPPORTING BRACED WALL PANELS

R602.10.5.4 Blocking of floor framing. When parallel to floor framing, braced wall panels shall be connected to a band, rim or header joist, floor framing or perpendicular full-height solid blocking between floor framing at 16 inches (406 mm) on center. When perpendicular to floor framing, braced wall panels shall be connected to full-height solid blocking between floor framing. Attachments shall be in accordance with Table R602.3(1). Manufactured lumber or truss blocking panels shall be permitted to substitute for full-height solid blocking.

R602.10.5.5 Blocking of roof framing. When parallel to roof framing, braced wall panels shall be connected to a band, rim or header joist, or roof truss. When perpendicular to roof framing, the top plates of exterior braced wall panels shall be connected to the rafters or roof trusses above in accordance with Table R602.10.5.5 and fastened in accordance with Table R602.3(1).

TABLE R602.10.5.5

For SI: 1 inch = 25.4 mm

FIGURE R602.10.5.5(1)
BRACED WALL PANEL CONNECTION TO PERPENDICULAR RAFTERS OR TRUSSES

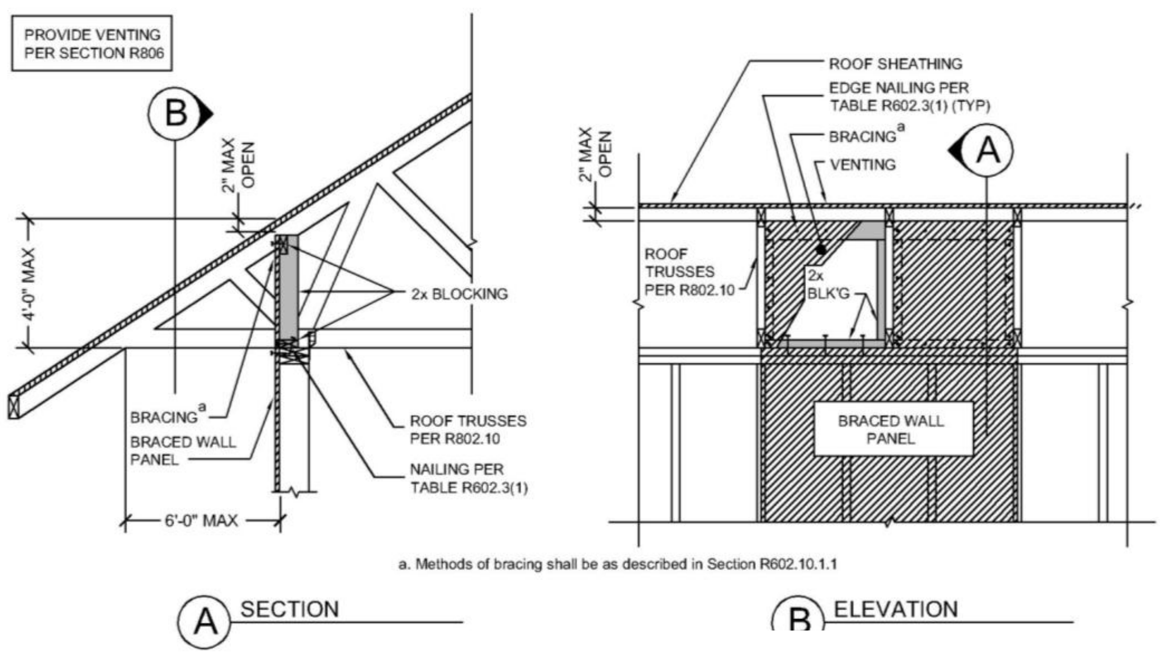

FIGURE R602.10.5.5(2)
BRACED WALL PANEL CONNECTION TO PERPENDICULAR RAFTERS OR ROOF TRUSSES

R602.10.5.6 Cripple walls and framed walls of walk-out basements. The required length of bracing for cripple walls with a maximum height of 48 inches (1220 mm) or less along its entire length shall be equal to the wall above. The required length of bracing for cripple walls with a height greater than 48 inches (1220 mm) at any location along its length and for framed walls of a walk-out basement shall be determined in accordance with Section R602.10.2 or R602.10.3, considering the cripple wall or walk-out basement as an additional story. As an alternative, the required length of bracing shall be permitted to equal to the wall above multiplied by a factor of 1.15.

R602.10.5.7 Open Elevated Foundations. Open elevated foundations, such as pile foundations shall be constructed to transfer all lateral loads from the wall bracing system to the piles or elevated piers, including shears, overturning, and uplift loads. Piles or elevated piers along with their foundations shall be sized and/or embedded to transfer all lateral loads imposed by the wall bracing system to the ground.

R602.10.5.8 Balloon frame wall bracing. Balloon frame walls shall have a maximum height of two stories unless constructed in accordance with an approved design. Wall framing shall be continuous from lowest floor to the wall top plate at the roof. Braced wall panels shall extend to the full-height of the balloon frame wall. All edges of sheathing shall be supported on and fastened to blocking or framing. The required brace wall panel length assigned to the balloon frame wall shall be based on the bracing required for the lowest floor level supporting the balloon frame wall as determined in accordance with Section R602.10.2 or R602.10.3. For balloon framed walls having a maximum height of two stories and a maximum length of 12 feet (3.66 m), braced wall panels shall be permitted to be placed parallel to the balloon framed wall on each side and at each story adjacent to the balloon framed wall, and no bracing shall be required for the balloon frame wall portion. Two story interior open ceiling areas shall not extend into the building from the balloon frame wall more than one-half the distance to the opposite building side unless bracing around the opening in the floor diaphragm is designed in accordance with Section R602.10.4.

~~**R602.12 Simplified wall bracing.** Buildings meeting all of the conditions listed in items 1-8 shall be permitted to be braced in accordance with this section as an alternative to the requirements of Section R602.10. The entire building shall be braced in accordance with this section; the use of other bracing provisions of R602.10, except as specified herein, shall not be permitted.~~

1. ~~There shall be no more than two stories above the top of a concrete or masonry foundation or basement wall.Permanent wood foundations shall not be permitted.~~
2. ~~Floors shall not cantilever more than 24 inches (607 mm) beyond the foundation or bearing wall below.~~
3. ~~Wall height shall not be greater than 10 feet (2743 mm).~~
4. ~~The building shall have a roof eave-to-ridge height of 15 feet (4572 mm) or less.~~
5. ~~All exterior walls shall have gypsum board with a minimum thickness of $^1/_2$ inch (12.7 mm) installed on the interior side fastened in accordance with Table R702.3.5.~~
6. ~~The structure shall be located where the basic wind speed is less than or equal to 90 mph (40 m/s), and the Exposure Category is A or B.~~
7. ~~The structure shall be located in Seismic Design Category A, B or C for detached one- and two-family dwellings or Seismic Design Category A or B for townhouses.~~
8. ~~Cripple walls shall not be permitted in two-story buildings.~~

~~**R602.12.1 Circumscribed rectangle.** The bracing required for each building shall be determined by circumscribing a rectangle around the entire building on each floor as shown in Figure R602.12.1. The rectangle shall surround all enclosed offsets and projections such as sunrooms and attached garages. Open structures, such as carports and decks, shall be permitted to be excluded. The rectangle shall have no side greater than 60 feet (18 288 mm), and the ratio between the long side and short side shall be a maximum of 3:1.~~

~~**R602.12.2 Sheathing materials.** The following sheathing materials installed on the exterior side of exterior walls shall be used to construct a bracing unit as defined in Section R602.12.3. Mixing materials is prohibited.~~

1. ~~Wood structural panels with a minimum thickness of $^3/_8$ inch (9.5 mm) fastened in accordance with Table R602.3(3).~~

2. ~~Structural fiberboard sheathing with a minimum thickness of $^1/_2$ inch (12.7 mm) fastened in accordance with Table R602.3(1).~~

~~**R602.12.3 Bracing unit.** A bracing unit shall be a full-height sheathed segment of the exterior wall with no openings or vertical or horizontal offsets and a minimum length as specified herein. Interior walls shall not contribute toward the amount of required bracing. Mixing of Items 1 and 2 is prohibited on the same story.~~

1. ~~Where all framed portions of all exterior walls are sheathed in accordance with Section R602.12.2, including wall areas between bracing units, above and below openings and on gable end walls, the minimum length of a bracing unit shall be 3 feet (914 mm).~~
2. ~~Where the exterior walls are braced with sheathing panels in accordance with Section R602.12.2 and areas between bracing units are covered with other materials, the minimum length of a bracing unit shall be 4 feet (1219 mm).~~

~~**R602.12.3.1 Multiple bracing units.** Segments of wall compliant with Section R602.12.3 and longer than the minimum bracing unit length shall be considered as multiple bracing units. The number of bracing units shall be determined by dividing the wall segment length by the minimum bracing unit length. Full-height sheathed segments of wall narrower than the minimum bracing unit length shall not contribute toward a bracing unit except as specified in Section R602.12.6.~~

~~**R602.12.4 Number of bracing units.** Each side of the circumscribed rectangle, as shown in Figure R602.12.1, shall have, at a minimum, the number of bracing units in accordance with Table R602.12.4 placed on the parallel exterior walls facing the side of the rectangle. Bracing units shall then be placed using the distribution requirements specified in Section R602.12.5.~~

~~**R602.12.5 Distribution of bracing units.** The placement of bracing units on exterior walls shall meet all of the following requirements as shown in Figure R602.12.5.~~

1. ~~A bracing unit shall begin no more than 12 feet (3658 mm) from any wall corner.~~
2. ~~The distance between adjacent edges of bracing units shall be no greater than 20 feet (6096 mm).~~
3. ~~Segments of wall greater than 8 feet (2438 mm) in length shall have a minimum of one bracing unit.~~

~~**R602.12.6 Narrow panels.** The bracing methods referenced in Section R602.10 and specified in Sections R602.12.6.1 through R602.12.6.3 shall be permitted when using simplified wall bracing.~~

~~**R602.12.6.1 Method CS-G.** *Braced wall panels* constructed as Method CS-G in accordance with Tables R602.10.4 and R602.10.5 shall be permitted for one-story garages when all framed portions of all exterior walls are sheathed with wood structural panels. Each CS-G panel shall be equivalent to 0.5 of a bracing unit. Segments of wall which include a Method CS-G panel shall meet the requirements of Section R602.10.4.2.~~

~~**R602.12.6.2 Method CS-PF.** *Braced wall panels* constructed as Method CS-PF in accordance with Section R602.10.6.4 shall be permitted when all framed portions of all exterior walls are sheathed with wood structural panels. Each CS-PF panel shall equal 0.5 bracing units. A maximum of four CS-PF panels shall be permitted on all segments of walls parallel to each side of the circumscribed rectangle. Segments of wall which include a Method CS-PF panel shall meet the requirements of Section R602.10.4.2.~~

~~**R602.12.6.3 Methods PFH and PFG.** *Braced wall panels* constructed as Method PFH and PFG shall be permitted when bracing units are constructed using wood structural panels. Each PFH panel shall equal one bracing unit and each PFG panel shall be equal to 0.75 bracing units.~~

~~**R602.12.7 Lateral support.** For bracing units located along the eaves, the vertical distance from the outside edge of the top wall plate to the roof sheathing above shall not exceed 9.25 inches (235 mm) at the location of a bracing unit unless lateral support is provided in accordance with Section R602.10.8.2.~~

~~**R602.12.8 Stem walls.** Masonry stem walls with a height and length of 48 inches (1219 mm) or less supporting a bracing unit or a Method CS-G, CS-PF or PFG *braced wall panel* shall be constructed in accordance with Figure R602.10.9. Concrete stem walls with a length of 48 inches (1219 mm) or less, greater than 12 inches (305 mm) tall and less than 6 inches (152 mm) thick shall be reinforced sized and located in accordance with Figure R602.10.9.~~

Reason: In recent years, great concern has arisen regarding the complexity of the IRC wall bracing provisions. Much good work was done by the ICC Ad Hoc Wall Bracing Committee to resolve significant technical issues and deficiencies in the IRC bracing provisions, including conventional bracing provisions which had not kept up with changes in housing over the years, resulting in concerns with structural safety and performance. Unfortunately, the technical solutions required added complexity to resolve. Now, in an understandable reaction to this added complexity, many attempts are being made to simplify the wall bracing provisions. However, some of these attempts at simplicity are doing so by essentially picking “winners and losers” (e.g., removing certain bracing methods and materials from consideration in a favored simplified approach). The approach of this proposal is to be inclusive and simple while adhering to the technical advancements achieved by the ICC Ad Hoc Wall Bracing Committee.

The proposal is formatted as follows for ease of use:

1. Section R602.10 -- provides charging language for two simplified bracing approaches (intermittent and continuous), an engineered approach, and the existing IRC 2012 provisions (Appendix R).
2. Section R602.10.1 – provides bracing methods and materials common to both simplified methods and is non-exclusive. [1 sentence, 2 Tables, and 1 Figure]
3. Section R602.10.2 – simplified intermittent bracing (for low wind only, 90 and 100 mph) [1 page of text, 1 Table, 1 Figure]
4. Section R602.10.3 – simplified continuous bracing (for up to 110 mph, wind); [1 page of text, 1 Table and 3 Figures]
5. Section R602.10.4 – provides two engineering approaches, one of which is consistent with IRC bracing provisions to permit engineered solutions analyzed in a manner equivalent to the IRC; [1 paragraph of text]
6. Section R602.10.5 – provides various load path details important to overall building performance and connectivity for any bracing method.[2-1/2 pages including text, figures, and table]

To achieve the goal of this proposal, several factors have been considered as described next.

First, Canada recently updated its residential wall bracing provisions considering the same issues and data that the ICC Ad Hoc Committee considered. However, they ended up with a different solution worthy of consideration and, thus, influenced the approach taken in this proposal. Their approach essentially continued traditional (conventional) bracing practices in the lowest hazard regions of the country in recognition that bracing problems were rare (even in newer homes) in this condition. Thus, for much of the country the simple “status quo” was considered adequate absent any strong evidence to the contrary. This same approach is relevant to the US. In moderate hazard regions of the country, an approach similar to that developed by the IRC Ad Hoc Wall Bracing Committee was implemented in Canada. Finally, in the most extreme high hazard regions of Canada engineered design was implemented (which is already the case for many of the high hazard areas in the US).

Second, a simple and limited scope conventional bracing practice is still effective in the IBC, Section 2308. If these provisions are still considered adequate for commercial building applications, then are they not also suitable for housing? The continuing existence and use of the IBC 2308 conventional wall bracing provisions, as well as past experience, suggest strongly that the answer is YES. The IBC 2308 conventional bracing provisions are inclusive and simple to use. Further, they have been recently reformatted for clarity in IBC 2015 proposal S273-11/12 which was approved at the Group A FAH last fall. Therefore, this proposal makes use of this concept, upgrades the approach to improve bracing performance for wind, and applies it in a limited set of conditions for housing in the IRC applicable only to the lowest hazard regions where past experience has been successful. Again, this action also is consistent with the approach taken in Canada after deliberations of a special task group.

Third, for a broader range of hazard conditions covered by the IRC, a simplified approach based primarily on continuous sheathing methods is adopted. This approach is similar to that being considered in various states (including VA from which this approach was derived). As hazards become greater and bracing loads on homes increase, continuous sheathed bracing becomes a more viable and practical bracing method for homes. This is driven by practicality and performance, not simply as a matter of picking “winners and losers” in the interest of simplifying the code by reducing bracing options and restricting market competition without clear cause in even the lowest hazard regions.

Fourth, in areas where hazards and bracing loads are extreme, engineered solutions provide a better means of maintaining simplicity, affordability or efficiency, and performance. An engineered design has a greater ability and flexibility in addressing load path details which are difficult and complex to adequately address in a prescriptive building code (without making the code more complex than many users are willing to tolerate). In this case, engineering provides a value-added solution. However, to fully realize the value potential of engineering, engineers must be equipped with the same efficient design methodology used by the IRC Ad Hoc Wall Bracing Committee to upgrade the IRC wall bracing provisions. Otherwise, engineering will be non-competitive and resisted by the housing market for no other reason than not having access to the design methods as used to develop the IRC wall bracing provisions. Therefore, this proposal recognizes conventional engineering practices (e.g., IBC and IRC Section 301) and also includes the option to use design consistent with the IRC for buildings within the scope of the IRC. The IRC commentary should be coordinated with the proposal by referencing the following peer-reviewed journal paper explaining the engineering basis of the IRC bracing provisions:

Crandell, J. and Martin, Z., "The Story Behind the 2009 IRC Wall Bracing Provisions (Part 2: New Wind Bracing Requirements)", *Wood Design Focus*, Forest Products Society, Madison, WI, Spring 2009.

Fifth, for special conditions not addressed in the proposed simplified conventional bracing and continuous sheathing methods addressed in this proposal, the existing IRC provisions are listed as one of the accepted means of a bracing design and are placed in Appendix R. The more complex provisions of the IRC should only be required in special cases, realizing that these provisions add significant complexity not necessary for most homes in most states and regions of the US.

Finally, bracing materials and methods in the IRC were evaluated using very specific performance criteria that are not currently made explicit such that innovation is encouraged and competition between incumbent materials and new materials is conducted on a fair and level playing field. Therefore, this proposal includes language to allow equivalency on the basis of equivalent bracing performance, not just a narrow equivalency concept based only on equivalency of materials (e.g., a weaker bracing material should be considered as equivalent when a greater amount is required to provide equivalent bracing performance of a building in end use). While this seems like common sense, it has been a major barrier to innovation, evaluation, acceptance, and fair market competition of alternative means and methods of bracing. This also affects the ability to provide competitive and consistent engineered solutions.

Based on the above points and a clear need to take the IRC wall bracing provisions to the next step to better promote simplicity, affordability, performance, and innovation, your support for approval of this proposal is requested.

Cost Impact: The code change proposal will not increase the cost of construction.

R602.10 (NEW)-RB-CRANDELL-LAUTRUP-WAINRIGHT.doc

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The separation of seismic and non-seismic bracing could just as easily be done within the code. Jurisdiction doesn't always adopt the appendix. Placing the seismic bracing into the appendix would leave a significant portion of the country without a prescriptive high-seismic bracing design.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jay H. Crandell, ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

APPENDIX R
SIMPLIFIED WALL BRACING PROVISIONS FOR LOW-HAZARD REGIONS

(This appendix is informative and is not part of the *code*.)

AR101 Scope. These bracing provisions shall apply to one- and two-family dwellings located in regions where the ultimate design wind speed does not exceed 140 mph (225 km/h) and where the Seismic Design Category is A or B, or Seismic Design Category C for single-family detached homes, as determined in accordance with Table R301.2(1) of the *International Residential Code*.

AR102 Wall bracing. Buildings, and portions thereof, shall be braced in accordance with one or more of the following sections using bracing materials and methods complying with Section AR102.1 and load path detailing in accordance with Section AR102.5:

1. Intermittent bracing per Section AR102.2,
2. Continuous sheathing per Section AR102.3, or
3. Engineered design per Section AR102.4.

Where a building, or portion thereof, does not comply with Section AR102.2 or Section AR102.3, those portions shall be designed and constructed in accordance with Section AR102.4.

AR102.1 Bracing materials and methods. Wall bracing materials and methods shall comply with Table AR102.1(1).

TABLE AR102.1(1)
BRACING METHODS[a,b]

Method	Minimum Brace Material Thickness or Size	Minimum Braced Wall Panel Width or Brace Angle	Connection Criteria	
			Minimum Fasteners	**Maximum Spacing**
LIB[c] Let-in Bracing	1x4 wood brace (or approved metal brace installed per manufacturer instructions)	45° angle and maximum 16”oc stud spacing[c]	2-8d common nails or 3-8d box nails (2-1/2” long x 0.113” dia.)	Per stud and top and bottom plates
DWB Diagonal wood boards	¾” (1” nominal)	48”	2-8d box nails (2-1/2” long x 0.113” diameter) or 2 – 1-3/4” long 16ga. staples	Per stud and top and bottom plates
WSP Wood structural panel	3/8”	48”[d]	6d common nail or 8d box nail (2-1/2” long x 0.113” diameter)	6” edges, 12” field
SFB Structural Fiberboard Sheathing	½”	48”[d]	1-1/2” long x 0.120” dia. galvanized roofing nails	3” edges, 6” field
GB Gypsum Board (installed on both sides of wall)	½”	96” (48” for use with Section AR102.3)	5d cooler nails or #6 screws	7” edges, 7” field (including top and bottom plates)
PCP Portland cement plaster	¾” (maximum 16”oc stud spacing)	48”	1-1/2” long, 11 gage, 7/16” diameter head nails or 7/8” long, 16 gage staples	6” o.c. on all framing members
CS-WSP[e] Continuously sheathed WSP	3/8”	Refer to Table AR102.1(2)	Same as WSP	Same as WSP
CS-SFB[e] Continuously sheathed SFB	½”		Same as SFB	Same as SFB
PF Portal Frame[f]	7/16”	See Figure AR102.1	See Figure AR102.1	See Figure AR102.1

For SI: 1 inch = 25.4 mm

a. Alternative bracing materials and methods, when approved in accordance with Section R104.11, shall be permitted to be used as a substitute for any of the bracing materials listed in Table A102.1 provided at least equivalent performance is demonstrated. Where the tested bracing strength or stiffness differs from tabulated materials, the bracing amount required for the alternative material shall be permitted to be factored to achieve equivalence.

b. All edges of panel-type wall bracing shall be attached to framing or blocking, except GB bracing horizontal joints shall not be required to be blocked where joints are finished.

c. Method LIB shall not be permitted for walls supporting a roof and two stories. Two LIB braces installed at a 60° angle shall be permitted to be substituted for each 45° angle LIB brace.

d. A braced wall panel shall be permitted to be reduced to a 32-inch (810 mm) length when studs at each end of the braced wall panel are anchored to foundation or framing below using hold-down device with minimum 2,800 lbs (12.5 kN) design tension capacity. For detached single story garages and attached garages supporting roof only, a minimum 24-inch (610 mm) brace panel length shall be permitted on one wall containing one or more garage door openings.

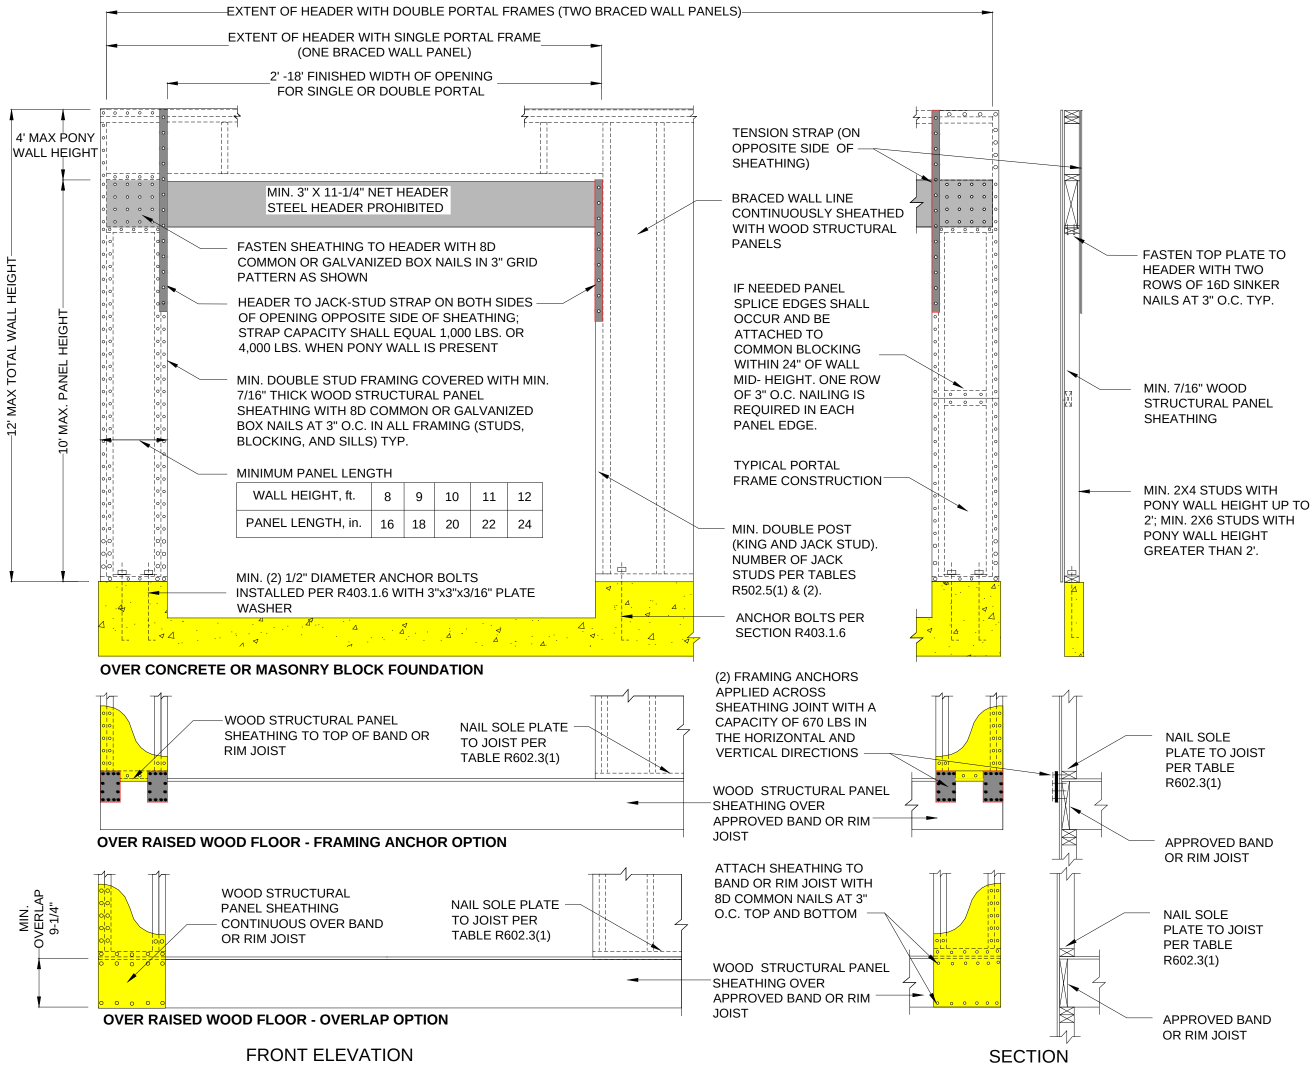
e. Bracing methods CS-WSP and CS-SFB shall have sheathing installed on all sheathable surfaces above, below, and between wall openings.

TABLE AR102.1(2)
MINIMUM WIDTHS OF METHOD CS-WSP AND CS-SFB BRACED WALL PANELS

Maximum Opening Height Adjacent to Braced Wall Panel	Minimum Length of Braced Wall Panel (inches)			
	8’ tall wall	**9’ tall wall**	**10’ tall wall**	**12’ tall wall**
Up to 5’ – 4”	24	27	30	36
Up to 6’ – 8”	32	30	30	36
Up to 8’	48	41	38	36
Up to 9’	-	54	46	41

Up to 10’	-	-	60	48
Up to 12’	-	-	-	72

For SI: 1 foot = 305 mm, 1 inch = 25.4 mm



For SI: 1 inch = 25.4 mm, 1 foot = 305 mm, 1 lb = 4.45 N

NOTE: Minimum PF panel length shall be 24 inches (610 mm) for use with Section AR102.2.

FIGURE AR102.1

METHOD PF – PORTAL FRAME CONSTRUCTION

AR102.2 Intermittent Bracing. Intermittent bracing shall comply with Sections AR102.2.1 and AR102.2.2.

AR102.2.1 Limitations. The intermittent bracing requirements of Section R102.2.2 shall be limited to the following conditions of use:

1. Basic design wind speed shall not exceed 130 mph (209 km/h).
2. Bracing methods shall be limited to LIB, DWB, WSP, SFB, GB, PCP, and PF in accordance with Table AR102.1(1).
3. Overall plan length of the house shall not exceed 75 feet (22.9 m) and the overall plan width shall be no less than one-third the overall plan length.
4. Wall height at each story level shall not exceed 10 feet (3.05 m).
5. Roof eave-to-ridge height shall not exceed 10 feet (3.05 m) unless the roof is considered as an additional story for the purpose of determining bracing amounts required.
6. Except where used as bracing method GB, minimum ½-inch-thick gypsum wall board interior finish, or approved interior finish of equivalent or greater shear resistance, shall be installed on the interior side of exterior walls and both sides of interior walls and fastened in accordance with Table R702.3.5 of the *International Residential Code*.
7. Floors supporting brace panels shall not cantilever more than 24 inches (607 mm) beyond the foundation or bearing wall below.
8. Townhouses shall be stabilized independently of adjacent units unless a design is provided to permit lateral load transfer between adjacent units.

AR102.2.2 Requirements. Braced wall panels shall be constructed of bracing methods, materials, and minimum braced panel lengths complying with Table AR102.1(1). The number of braced wall panels required for each side of a building (elevation view) at each story level of the building shall comply with Table AR102.2.2 and shall be oriented parallel to the building side. The following additional requirements shall apply:

1. In no case shall the amount of bracing be less than two braced wall panels on exterior walls comprising each side of a building (elevation view) for each story level of the building.
2. Braced wall panels shall be located on each building side at each story level in accordance with Figure AR102.2.2.
3. No more than one-half the number of braced wall panels required on a building side shall be permitted to be relocated from exterior walls to interior walls oriented in the same plan direction and within one-half the floor plan dimension perpendicular to the exterior wall.
4. Use of multiple bracing methods and materials complying with Table AR102.1(1) shall be permitted.
5. Houses with skewed wings shall be constructed in accordance with either Section AR102.3 or designed in accordance with Section AR102.4.
6. Garage door openings supporting a floor load above shall be braced using Method PF unless the building plan level containing the garage opening wall complies with all the bracing requirements of this section.
7. The bracing amount provided on an upper story building side shall be "deemed-to-comply" where it equals or exceeds the amount of bracing required for the story immediately below.

TABLE AR102.2.2
NUMBER OF BRACED WALL PANELS REQUIRED
FOR EACH HOUSE ELEVATION (BUILDING SIDE) AT EACH STORY LEVEL[1]

Wind Velocity	Story Level Supporting:	Longest Overall Dimension of Floor Plan for a Given Story Level		
		25'	50'	75'
115 mph	Roof Only	1	2	3
	Roof + 1 Story	2	4	6
	Roof + 2 Stories	3	6	9
130 mph	Roof Only	2	3	4
	Roof + 1 Story	3	5	8
	Roof + 2 Stories	4	8	11

For SI: 1foot = 305 mm; 1 mph = 1.61 km/h
a. Interpolation between dimensions shall be permitted. Extrapolation is prohibited.
b. Table applies to wind exposure B. For wind exposure C or D, multiply number of braced wall panels required by 1.3 or 1.6, respectively.
c. Fractions of panels shall be rounded to the nearest one-half braced wall panel. The following braced wall panel conditions shall be permitted to be counted as one-half a braced wall panel: (1) one 60 degree LIB, (2) one 48" GB or one 96" GB with gypsum wall board on one side, or (3) one 36" WSP, SFB, PCP braced wall panel for wall heights not more than 9 feet (2.75 m), or (4) one Method PF brace panel having a minimum width of 24 inches (610 mm).

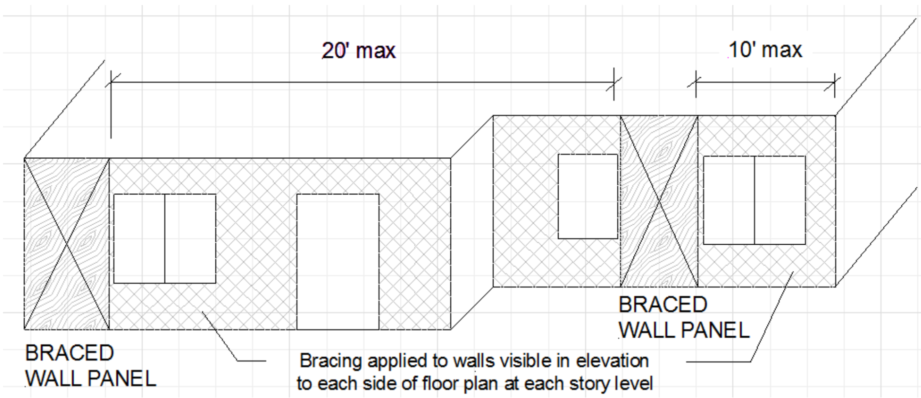


FIGURE AR102.2.2
LOCATION OF BRACED WALL PANELS

AR102.3 Continuous Sheathing.

AR102.3.1 Limitations. The continuous sheathing requirements of Section AR102.3 shall be limited to bracing methods CS-WSP and CS-SFB in accordance with Table AR102.1(1) with the following conditions of use:

1. Basic design wind speed shall not exceed 140 mph (225 km/h).
2. Wall height at each story level shall not exceed 12 feet (3.66 m).
3. Eave to ridge height shall not exceed 20 feet (6.10 m).
4. Exterior walls shall be sheathed on all sheathable surfaces including infill areas between braced wall panels, above and below wall openings and on gable end walls.
5. Except where used as bracing method GB, minimum ½-inch-thick gypsum wall board interior finish, or approved interior finish of equivalent or greater shear resistance, shall be installed on the interior side of exterior walls and both sides of interior walls and fastened in accordance with Table R702.3.5 of the *International Residential Code*.
6. Floors supporting braced wall panels shall not cantilever more than 24 inches (607 mm) beyond the foundation or bearing wall below.
7. Townhouses shall be stabilized independently of adjacent units, unless a design is provided to permit lateral load transfer between adjacent units.

AR102.3.2 Requirements. The required length of bracing for each side of a building (plan elevation) at each story level shall be determined using Table AR102.3.2 and Figure AR102.3(1). The cumulative contributing length of braced wall panels assigned to a rectangle side, each complying with Table AR102.1(1), shall be greater than or equal to the required length of bracing. The following additional requirements shall apply:

1. Braced wall panels on exterior or interior walls shall be assigned to the nearest rectangle side as shown in Figure AR102.3(2) for each story level floor plan.
2. Braced wall panels shall be distributed and installed in accordance with Figure AR102.3(3).
3. A minimum of one-half the required bracing amount for each rectangle side shall be located on exterior walls within 8 feet of the location of the rectangle side.
4. Interior braced wall panels using Method GB shall be assigned to the closest parallel rectangle side and shall contribute 0.5 times their actual length.
5. The bracing amount provided on an upper story building side shall be “deemed-to-comply” where it equals or exceeds the amount of bracing required for the story immediately below.

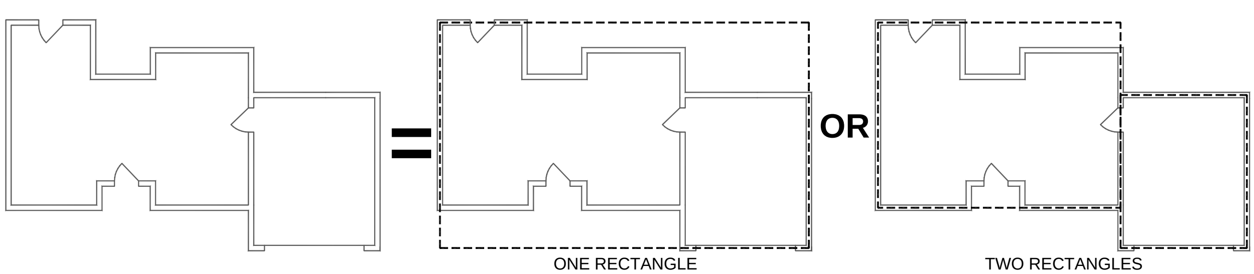

FIGURE AR102.3(1)
CIRCUMSCRIBED RECTANGLES[a,b,c]

a. Each floor plan level shall be circumscribed with one or more rectangles around the entire floor plan at the floor level under consideration as shown in Figure AR102.3(1).

b. Rectangles shall surround all enclosed offsets and projections such as sunrooms and attached garages for a given story level floor plan. Chimneys, partial height projections, and open structures, such as carports and decks, shall be excluded from the rectangle.

c. Each rectangle shall have no side greater than 80 feet (24.4 m) with a maximum rectangle length-to-width ratio of 3:1. Rectangles shall be permitted to be skewed to accommodate diagonal walls.

TABLE AR102.3.2
REQUIRED LENGTH OF BRACING ALONG EACH SIDE OF A CIRCUMSCRIBED RECTANGLE [a,b,c,d]

WIND SPEED	EAVE-TO RIDGE HEIGHT (FEET)	NUMBER OF LEVELS ABOVE [e]	REQUIRED LENGTH (FEET) OF BRACING ON ANYSIDE OF RECTANGLE — Length of perpendicular side (ft)[f]

For SI: 1 ft = 305 mm; 1 mph = 1.61 km/h

a. Interpolation shall be permitted; extrapolation shall be prohibited.

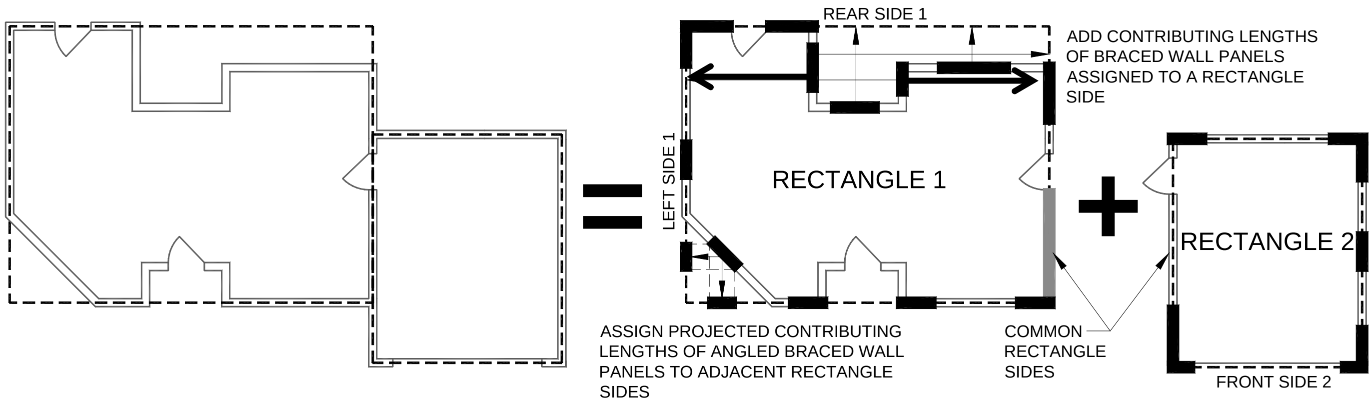
b. For Exposure Category C or D, multiply the required length of bracing by a factor of 1.3 or 1.6, respectively.

c. For wall heights other than 10 ft (3.05 m), multiply the required length of bracing by the following factors: 0.90 for 8 feet (2.44 m), 0.95 for 9 feet (2.74 m), 1.05 for 11 feet (3.35 m) and 1.10 for 12 feet (3.66 m).

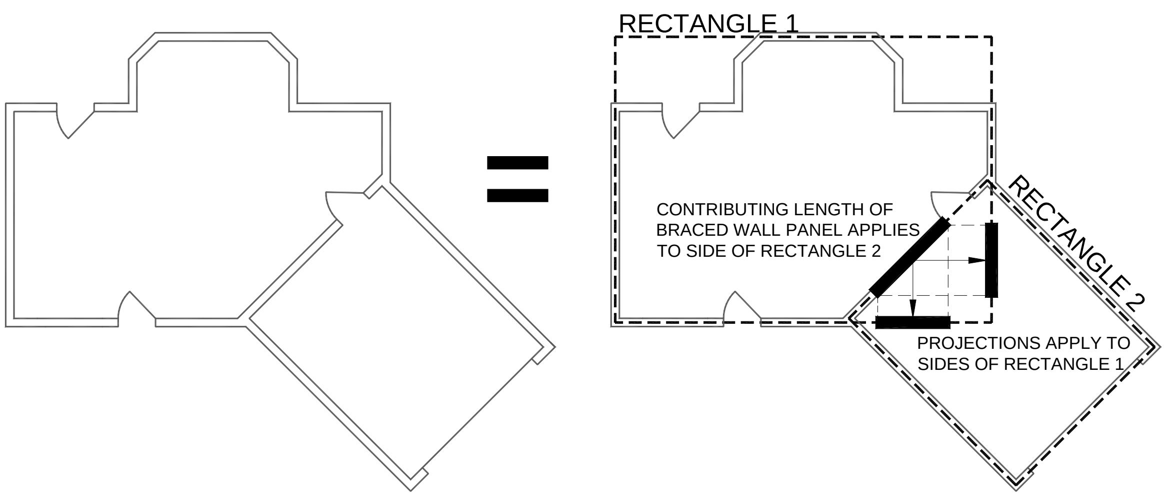
d. Where minimum ½" gypsum wall board interior finish is not provided, the required bracing amount for the affected rectangle side shall be multiplied by 1.40.

e. A floor, habitable or otherwise, contained wholly within the roof rafters or roof trusses need not be considered a story for purposes of determining wall bracing provided the eave to ridge height does not exceed 20 feet (6.10 m).

f. Perpendicular sides to the front and rear sides are the left and right sides. Perpendicular sides to the left and right sides are the front and rear sides.



(a) Regular Floor Plan



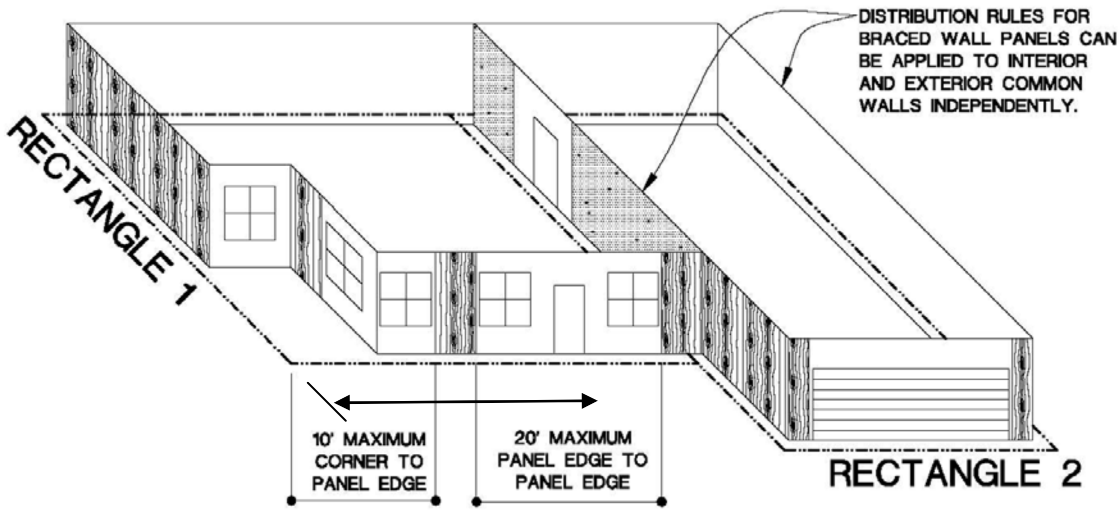
(b) Skewed Floor Plan

FIGURE AR102.3(2)
ASSIGNMENT OF BRACED WALL PANELS
CIRCUMSCRIBED RECTANGLE SIDES[a,b,c]

a. Projected contributing lengths of angled braced wall panels shall be assigned to the closest rectangle sides.

b. Where multiple rectangles share a common side or sides, as shown in Figure AR102.3(2)(a), the total required length of bracing on the common side shall equal the sum of the required lengths from each of the shared rectangle sides.

c. Braced wall panels located on a common wall where skewed rectangles intersect, as shown in Figure AR102.3(2)(b), shall have their contributing length applied towards the required length of bracing for the parallel rectangle side and its projected contributing lengths towards the adjacent skewed rectangle sides. Where the common side of rectangle 2 as shown in Figure AR102.3(2)(b) has no physical wall, the portion shall be designed in accordance with Section AR102.4.



For SI: 1 ft = 304.8 mm

FIGURE AR102.3(3)
DISTRIBUTION OF BRACED WALL PANELS[a,b,c,d]

a. A braced wall panel complying with Table AR102.1(1) shall be located on each elevation view within 10 feet (3.05 m) of the corners of circumscribed rectangles. Only qualified braced wall panel locations are shown; CS-WSP or CS-SFB sheathing shall be applied to all sheathable surfaces of the wall, including areas above and below wall openings.
b. The distance between adjacent edges of braced wall panels shall be no more than 20 feet (6.10 m) as measured along the rectangle side.
c. A minimum 24-inch-wide CS-WSP or 32-inch-wide CS-SFB panel shall be located on each side of inside and outside corners or an 800 lb rated tie-down shall be fastened to the edge of the braced wall panel closest to each corner.
d. Interior and exterior wall segments which contribute to the common sides of multiple rectangles shall be permitted to apply the distribution requirements given above to each wall segment independently.

AR102.4 Wall bracing by engineered design. Designs using bracing materials and methods listed in Table AR102.1(1) or approved alternative materials and methods shall be permitted and shall comply with accepted engineering practice. Accepted engineering practice shall include the following:

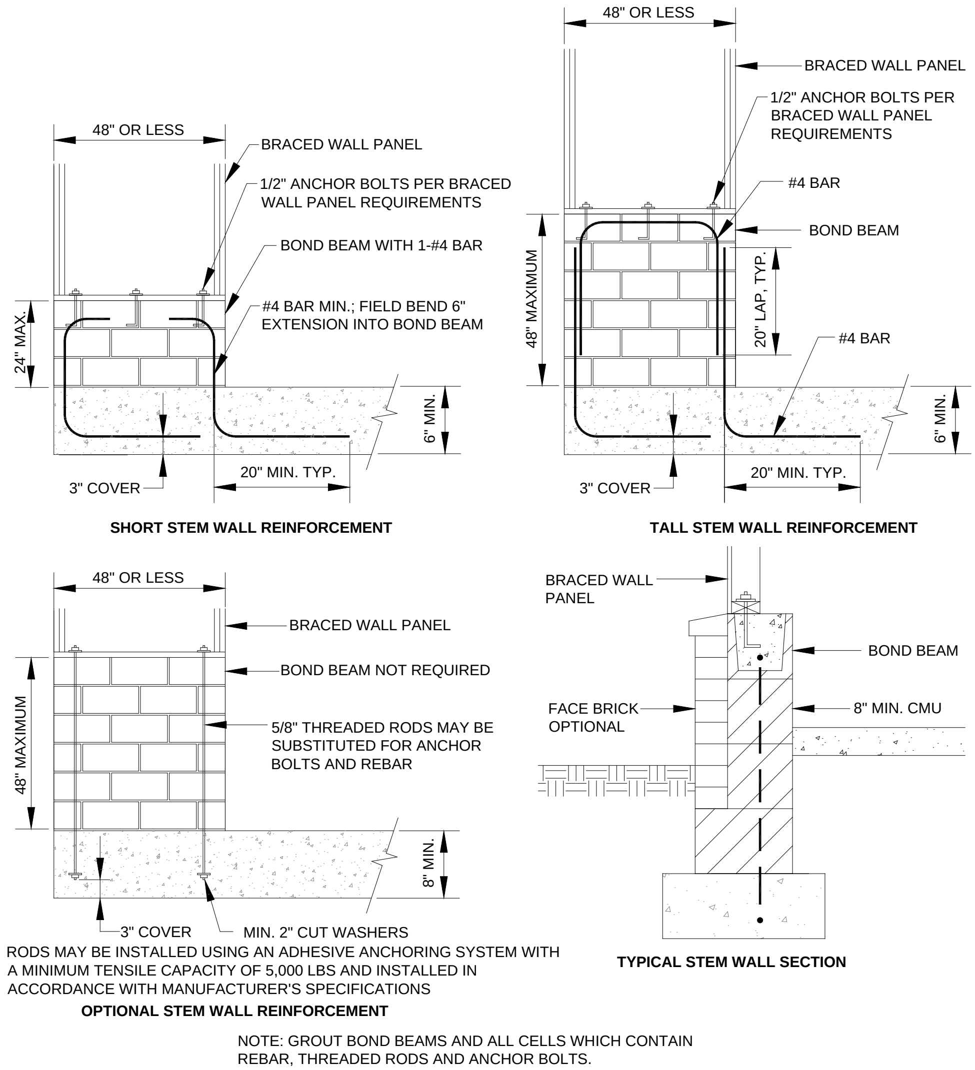
1. Design in accordance with Section R301, or
2. Design equivalent to the analysis basis and scope of the prescriptive provisions of Section R602.10 of the *International Residential Code*, including determination of design loads, design unit shear values, and bracing amounts.
3. Design based on the bracing manufacturer's approved design data and installation instructions.

AR102.5 Load path details. Construction shall comply with applicable detailing requirements of this section to ensure an adequate continuous load path for transfer of bracing loads and uplift loads from the roof to the foundation.

AR102.5.1 Wind uplift load path. Framing connections to transfer roof uplift forces shall comply with Section R602.3.5 and Section R802.11 of the *International Residential Code*.

AR102.5.2 Foundation anchorage. Braced wall panels shall be connected to the foundation per Section R403.1.6 of the *International Residential Code* and as required in Figure AR102.1 for portal frames (Method PF).

AR102.5.3 Masonry or concrete pedestals. Masonry or concrete stem walls with a length of 48 inches (1220 mm) or less supporting braced wall panels shall be reinforced in accordance with Figure AR102.5.3. Concrete stem walls shall be 6" nominal minimum thickness.



For SI: 1 in=25.4 mm

FIGURE AR102.5.3
MASONRY STEM WALLS SUPPORTING BRACED WALL PANELS

AR102.5.4 Blocking of floor framing. Where parallel to floor framing, braced wall panels shall be connected to a band, rim or header joist, floor framing or perpendicular full-height solid blocking between floor framing at 16 inches (406 mm) on center. Where perpendicular to floor framing, braced wall panels shall be connected to full-height solid blocking between floor framing. Attachments shall be in accordance with Table R602.3(1) of the *International Residential Code*. Manufactured lumber or truss blocking panels shall be permitted to substitute for full-height solid blocking.

AR102.5.5 Blocking of roof framing. Where parallel to roof framing, braced wall panels shall be connected to a band, rim or header joist, or roof truss. Where perpendicular to roof framing, the top plates of exterior braced wall panels shall be connected to the rafters or roof trusses above in accordance with Table AR102.5.5 and fastened in accordance with Table R602.3(1) of the *International Residential Code*.

TABLE AR102.5.5
BRACED WALL PANEL CONNECTIONS TO PERPENDICULAR ROOF FRAMING

DISTANCE FROM TOP OF BRACED WALL PANEL TO TOP OF RAFTER OR ROOF TRUSS, (in)	REQUIREMENT	REFERENCED FIGURE

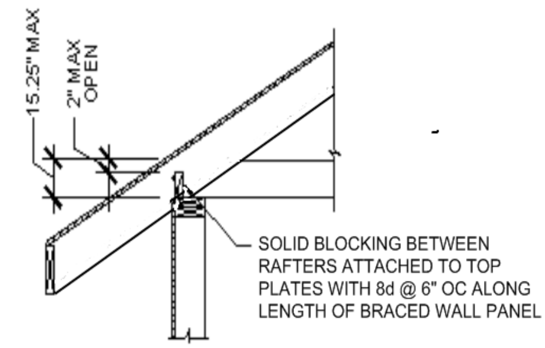
15.25 – 48	Vertical blocking panels	AR102.5.5(2)
> 48	Designed in accordance with accepted engineering practice	NA

For SI: 1 inch = 25.4 mm



For SI: 1 inch = 25.4 mm

FIGURE AR102.5.5(1)
BRACED WALL PANEL CONNECTION TO PERPENDICULAR RAFTERS OR TRUSSES

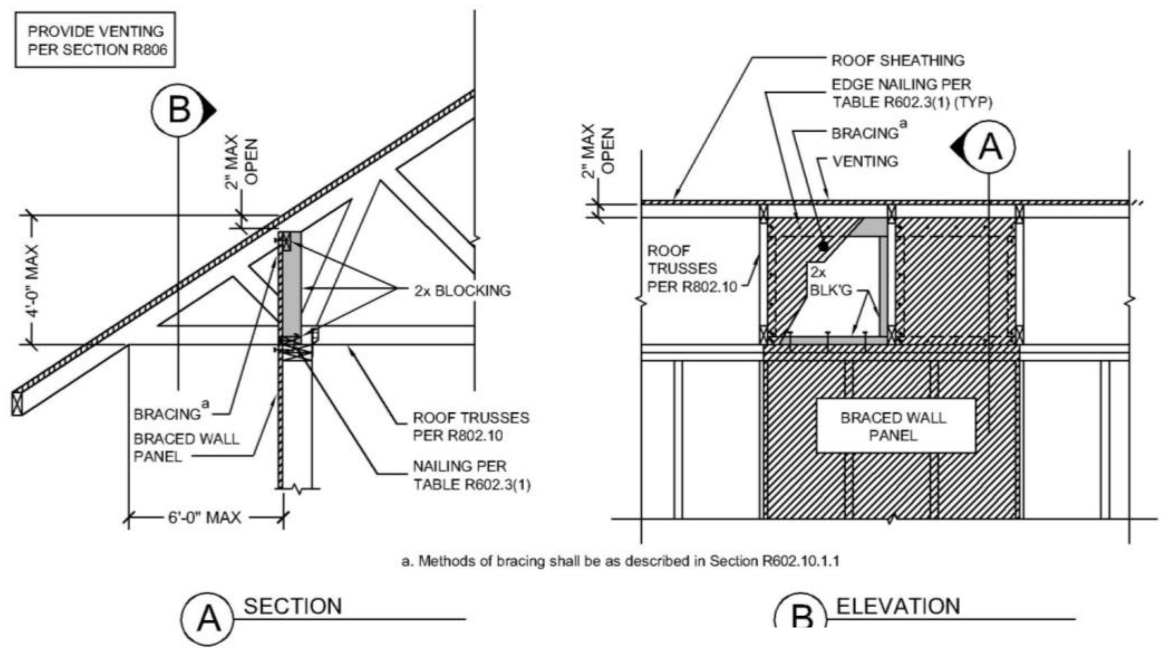


FIGURE AR102.5.5(2)
BRACED WALL PANEL CONNECTION TO PERPENDICULAR RAFTERS OR ROOF TRUSSES

AR102.5.6 Cripple walls and framed walls of walk-out basements. The required length of bracing for cripple walls with a maximum height of 48 inches (1220 mm) or less along its entire length shall be equal to the wall above. The required length of bracing for cripple walls with a height greater than 48 inches (1220 mm) at any location along its length and for framed walls of a walk-out basement shall be determined in accordance with Section AR102.2 or AR102.3, considering the cripple wall or walk-out basement as an additional story. As an alternative, the required length of bracing shall be permitted to equal the length required for the wall above multiplied by a factor of 1.15.

AR102.5.7 Open Elevated Foundations. Open elevated foundations, such as pile foundations shall be constructed to transfer all lateral loads from the wall bracing system to the piles or elevated piers, including shears, overturning, and uplift loads. Piles or elevated piers along with their foundations shall be sized and/or embedded to transfer all lateral loads imposed by the wall bracing system to the ground.

AR102.5.8 Balloon frame wall bracing. Balloon frame walls shall have a maximum height of two stories unless constructed in accordance with an approved design. Wall framing shall be continuous from lowest floor to the wall top plate at the roof. Braced wall panels shall extend to the full-height of the balloon frame wall. All edges of sheathing shall be supported on and fastened to blocking or framing. The required brace wall panel length assigned to the balloon frame wall shall be based on the bracing required for the lowest floor level supporting the balloon frame wall as determined in accordance with Section AR102.2 or Section AR102.3. For balloon framed walls having a maximum height of two stories and a maximum length of 12 feet (3.66 m), braced wall panels shall be permitted to be placed parallel to the balloon framed wall on each side and at each story adjacent to the balloon framed wall, and no bracing shall be required for the balloon frame wall portion. Two story interior open ceiling areas shall not extend into the building from the balloon frame wall more than one-half the distance to the opposite building side unless bracing around the opening in the floor diaphragm is designed in accordance with Section AR102.4.

Commenter's Reason: The original proposal is revised based on feedback and direction provided at the first hearing by the code development committee and constructive testimony. The revisions in the public comment are non-technical and only reformat the original proposal and coordinate with other proposals regarding use of ultimate design wind speeds. The existing 2012 IRC bracing provisions remain unchanged and the proposed new simplified bracing provisions are provided as a non-mandatory appendix. States and localities that qualify for use of these provisions can adopt and modify them on an as needed basis to find relief from the complexity of current IRC provisions. Having the appendix will also afford the opportunity for future improvements without constantly changing the provisions in the code that challenge the ability for code users to keep up. The technical justification for the original RB329-13 proposal and this public comment is documented in the proposal agenda for the first hearing.

RB329-13

Final Action: AS AM AMPC____ D

RB337-13
R612.1

Proposed Change as Submitted

Proponent: Jeff Inks, Window and Door Manufacturers Association

Revise as follows:

R612.1 General. This section prescribes performance and construction requirements for exterior windows and doors installed in walls. Windows and doors shall be installed ~~and flashed~~ in accordance with the fenestration manufacturer's written installation instructions. Window and door openings shall be flashed in accordance with Section R703.8. Written installation instructions shall be provided by the fenestration manufacturer for each window or door.

Reason: The intent of this proposal is to clarify that flashing requirements for window and door assemblies are provided exclusively in Chapter 7, Section 703.8. The proposal also corrects conflicting language with 703.8 which expressly allows the use of flashing installation alternatives in addition to the window or door manufacturer's installation instructions when applicable.

In addition this proposal provides an editorial correction by making "door", "window", and "wall" in the first sentence plural.

Cost Impact: The code change will not increase the cost of construction.

R612.1 #1-RB-INKS.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The fenestration manufacturer's written instruction for flashing is needed in addition to the Section R703.8 provisions.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Jeff Inks, Window & Door Manufacturers Association, requests Approval as Submitted.

Commenter's Reason: The committee's action does not address the intent of the proposal which is to correct the conflict that currently exists in the IRC between Section 612.1 and Section 703.8. As stated in the proposal, flashing requirements for window and door assemblies are provided exclusively in Chapter 7, Section 703.8. Maintaining "and flashed" in section 612.1 is counter to the intent of Section 703.8 and needs to corrected as proposed.

Section 703.8 allows necessary options for flashing to be installed in accordance with the flashing manufacturer's installations instructions for applications not covered by the fenestration manufacturer's instructions. It also provides two additional options, which are either in accordance with a method of registered design professional or other approved materials. Those provisions were approved in the last cycle but the term "flashing" was not removed from Section 612.1 creating the conflict.

Regarding the committee's statement (and reason for disapproval) that the fenestration manufacturers flashing installation instructions are needed in addition to the Section 703.8, manufacturers must still provide them in addition to the provisions of Section 703.8 which provide builders with much greater flexibility.

We therefore urge approval as submitted.

Public Comment 2:

Julie Ruth, JRuth Code Consulting, representing American Architectural Manufacturers Association, requests Approval as Submitted.

Commenter's Reason: RB337 removes a redundant requirement in Section R612.1 for the flashing of windows and exterior doors. The requirement that windows and doors are to be flashed in accordance with the fenestration manufacturer's installation instructions is redundant to the criteria of Section 703.8, which is also referenced in Section R612.1. The redundancy is confusing and introduces the possibility for conflict within the IRC.

Section R703.8 requires flashing to be installed in accordance with the fenestration manufacturer's installation and flashing instructions. Applications not addressed in the fenestration manufacturer's instructions are to be flashed in accordance with the flashing manufacturer's instructions. If installation instructions are not provided by the fenestration or flashing manufacturer, window and door openings are to be flashed in accordance with the flashing design or method of a registered design professional, or in accordance with other approved methods.

Section R703.8 further specifies that where flashing instructions or details are not provided by the fenestration or flashing manufacturer, pan flashing shall be installed at the sill of exterior window and door openings. Specific details on the manner in which pan flashing is to be installed, if used, are given in Section R703.8.

Finally, Section R703.8 specifies that flashing at exterior window and door openings shall extend to the surface of the exterior wall finish or to the water-resistive barrier for subsequent drainage. The charging paragraph of Section R703.8 specifies that all flashing shall be corrosion resistant, and shall be applied shingle-fashion in a manner to prevent entry of water into the wall cavity or penetration of water to the building structural framing components. It further specifies that self-adhered membranes used as flashing shall comply with AAMA 711 and that the flashing shall extend to the surface of the exterior wall finish.

The provisions of Section R703.8 have been carefully crafted to provide to the appropriate flashing of exterior wall fenestration. Reference to other requirements in Section R612.2 serve no purpose, and have the potential to create confusion. It is also possible that the code user may never get to Section 703.8 if they only look for the installation instructions provided by the fenestration manufacturer. If that occurs, the window installation may not be done correctly and serious problems with water penetration into the exterior wall cavity can occur.

For this reason it is important that the redundant requirement for flashing of exterior windows and doors in accordance with the fenestration manufacturer's installation instructions be removed. Its removal will then point the code user to Section 703.8 for the flashing of exterior windows and doors, where much more complete provisions abide.

RB337-13

Final Action: AS AM AMPC____ D

RB338-13
R612.1

Proposed Change as Submitted

Proponent: Jeff Inks, Window and Door Manufacturers Association

Revise as follows:

R612.1 General. This section prescribes performance and construction requirements for windows and doors installed in walls. Windows and doors shall be installed and flashed in accordance with the fenestration manufacturer's ~~written~~ published installation instructions. Window and door openings shall be flashed in accordance with Section R703.8. Written installation instructions shall be provided by the fenestration manufacturer for each window or door.

Reason: This proposals provides an editorial correction by making "door", "window", and "wall" in the first sentence plural and in addition replaces the term "written" with "published" given manufacturers provide installation instructions in both printed and electronic format which can also be printed by the user. The term "published" more clearly reflects how installation instructions are being provided by manufacturers.

Cost Impact: The code change will not increase the cost of construction.

R612.1 #2-RB-INKS.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The installation instructions from the manufacturer needs to be included with the windows and door just like other manufactured components.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jeff Inks, Window & Door Manufacturers Association, and Julie Ruth JRuth Code Consulting, representing American Architectural Manufacturers Association request Approval as Modified by this Public Comment.

Modify the proposal as follows:

R612.1 General. This section prescribes performance and construction requirements for windows and doors installed in walls. Windows and doors shall be installed and flashed in accordance with the fenestration manufacturer's published installation instructions. Window and door openings shall be flashed in accordance with Section R703.8. ~~Written~~ Published installation instructions shall be provided by the fenestration manufacturer for each window or door.

Commenter's Reason:

(Inks): The modification in this public comment reflects the revisions proposed in the original proposal and also replaces "Written" with "Published" in the last sentence for consistency (which should have been included in the original proposal).

The primary intent of the original proposal is to replace the term "written" with "published" given manufacturers provide installation instructions in both printed and electronic format which can also be printed by the installer. Manufacturers must still and do provide installation instructions for all of their products. The term "published" more clearly reflects how installation instructions are being provided by manufacturers, and can avoid multiple copies of the same installation instructions for the same windows or doors on the job site which ultimately are not used and become a waste.

The other intent of the original proposal is to make an editorial correction in the first sentence by making “door”, “window”, and “wall” in the first sentence plural and we also maintain that intent.

(Ruth): The intent of RB338 was to permit the use of installation instructions that are published, such as on a website, rather than require written installation instructions to be provided.

The proposal was disapproved by the IRC Code Change committee at the Code Development Hearings. Some committee members expressed concern regarding obtaining installation instructions off of a website.

In reality, however, it is much easier and faster to obtain information off of a fenestration manufacturer’s website than it is to obtain printed copies of their installation instructions direct from the manufacturer if the original copy of the instructions is in any way misplaced or damaged in transit from the manufacturer’s facility to the distributor’s warehouse to the jobsite. For example, a simple Google search for “windows installation instructions” yields installation instructions for a number of major North American fenestration manufacturers. If the name of the fenestration manufacturer is included in the search the results are more specific to that particular manufacturer’s product. Instructions received in this manner can easily be distributed to all concerned interested parties, including the installer and the code official, without the need to first obtain a single printed copy from the manufacturer, then have multiple copies made and then distributing them by hand.

This Public Comment replaces “written” with “published” in the last sentence of Section R612.1. This modification would provide for consistency with the proposed change to the second sentence of the same section.

RB338-13

Final Action: AS AM AMPC____ D

RB-339-13
R612.1, R612.2, R612.3

Proposed Change as Submitted

Proponent: Julie Ruth/JRuth Code Consulting, representing American Architectural Manufacturers Association (julruth@aol.com)

Revise as follows:

R612.1 General. This section prescribes performance and construction requirements for exterior window and door assemblies installed in walls. Windows and doors shall be installed and flashed in accordance with the fenestration manufacturer's written installation instructions. Window and door openings shall be flashed in accordance with Section R703.8. Written installation instructions shall be provided by the fenestration manufacturer for each window or door.

R612.2 Performance. Exterior window~~s~~ and door~~s~~ assemblies shall be designed to resist the design wind loads specified in Table R301.2(2) adjusted for height and exposure in accordance with Table R301.2(3).

R612.3 Testing and labeling. Exterior window~~s~~ and sliding door assemblies shall be tested by an *approved* independent laboratory, and bear a *label* identifying manufacturer, performance characteristics and *approved* inspection agency to indicate compliance with AAMA/WDMA/CSA 101/I.S.2/A440. Exterior side-hinged door assemblies shall be tested and *labeled* as conforming to AAMA/WDMA/CSA 101/I.S.2/A440 or comply with Section R612.5.

Reason: This proposal clarifies that the performance of the entire window or door assembly must be evaluated to determine compliance with the IRC. Window and door assemblies include the frame, hardware, weather stripping, thresholds, etc as well as the sash (window) or door slab (door). Only by evaluating the entire assembly can it be determined if the opening provides appropriate resistance to wind load, water penetration and air leakage.

Cost Impact: The code change proposal will not increase the cost of construction.

R612.1-RB-RUTH.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: Many window and door assemblies are site assembled. This would require testing of site assembled fenestration which is not practical.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Julie Ruth, JRuth Code Consulting, representing American Architectural Manufacturers Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R612.1 General. This section prescribes performance and construction requirements for exterior ~~windows and~~ door assemblies and windows installed in walls. ~~Windows and d~~Doors~~s~~ assemblies and windows shall be installed and flashed in accordance with the fenestration manufacturer's written installation instructions. ~~Window and d~~Door and window openings shall be flashed in accordance with Section R703.8. Written installation instructions shall be provided by the fenestration manufacturer for each door assembly or window ~~or door~~.

R612.2 Performance. Exterior ~~windows and~~ door~~s~~ assemblies and windows shall be designed to resist the design wind loads specified in Table R301.2(2) adjusted for height and exposure in accordance with Table R301.2(3).

R612.3 Testing and labeling. Exterior ~~windows and~~ sliding door assemblies and windows shall be tested by an *approved* independent laboratory, and bear a *label* identifying manufacturer, performance characteristics and *approved* inspection agency to indicate compliance with AAMA/WDMA/CSA 101/I.S.2/A440. Exterior side-hinged door assemblies shall be tested and *labeled* as conforming to AAMA/WDMA/CSA 101/I.S.2/A440 or comply with Section R612.5.

Commenter's Reason: The intent of the original proposal, and this Public Comment, is to clarify that the entire door assembly must be evaluated to determine compliance with code section R612 of the IRC.

During the Dallas CDH there was confusion as to whether the word "assembly" would also apply to windows, and if so, to what extent should other components such as window seats, awnings, etc. be considered part of that assembly?

It was not the intent of the original proposal to require "window assemblies" to be evaluated. The word "window" is understood to mean the assembly of all the components that go into the makeup of a window, including glazing, framing, hardware and sills. Therefore clarification is not needed, and there is a risk that applying it to windows in this section could have the unintended consequences of applying the criteria to components that were not intended.

This Public Comment alters the order in which "windows and doors" appears in the applicable sections. This modification clarifies that the word "assemblies" is only intended to be applied to doors, and not both windows and doors.

The same intent as occurs with "windows" is not as clear with regards to the word "door" in this section. Although the standards referenced by this section clearly intend that the entire door assembly, including door slab, hardware, framing and sill, be evaluated to determine compliance, there is a common misinterpretation of this section that evaluation of the entire assembly is not currently required.

At the present time Section R612.3 of the IRC requires exterior sliding doors to be tested and labeled in accordance with AAMA/WDMA/CSA 101/I.S.2/A440. Exterior side hinged doors are to be tested and labeled in accordance with this same standard, or comply with Section R612.5. Section R612.5 requires exterior door assemblies that are outside the scope of Section R612.3 to be tested in accordance with ASTM E330.

AAMA/WDMA/CSA 101/I.S.2/A440 requires the testing of the entire door assembly to determine the design pressure rating as well as the air and water penetration resistance of that assembly.

Section R612.5 requires the door assembly to be tested in accordance with ASTM E330 only, to determine its design pressure rating. The test method provided in ASTM E330 is for testing of a fenestration assembly – whether a door, window, curtainwall or storefront system.

During the Dallas CDH RB340 was approved by the IRC Building Committee. If upheld at the FAH, RB340 will add reference to ANSI/AMD 100-13 to Section R612.3. Specifically, R612.3 will then require exterior side-hinged doors to be tested and labeled as conforming to AAMA/WDMA/CSA 101/I.S.2/A440 or AMD 100, or comply with Section R612.5.

ANSI/AMD 100-13 also requires evaluation of the door assembly for compliance with Section R612.3. ANSI/AMD 100 – 13 requires structural testing of the entire door assembly to ASTM E330 to achieve an initial rating, and retesting of the entire assembly if more than one component is substituted into the assembly.

Section 7.3 of ANSI/AMD 100-13 states that "verification of the construction and performance of the originally rated door system shall be required before any component substitution can take place. Components considered for substitution shall be tested in an assembly that uses the same interactive components, anchorage, and installation as the rated door system as defined in the component evaluation sections of this standard."

The requirements in each of these standards (AAMA/WDMA/CSA 101/I.S.2/A440, ASTM E330 and ANSI/AMD 100-13) points to the need to consider the entire door assembly when evaluating the door's capability of maintaining the integrity of the exterior wall in which it occurs. The entire door system includes not just the slab, but attachment hardware such as hinges, locks and latches, as well as thresholds, sills and framing. Change to any one of these can alter how well the integrity of the opening is maintained during severe wind events. For this reason, component substitution must be reviewed on a component by component basis, with consideration of the entire assembly into which the component is being proposed for substitution.

AAMA believes it is important that the inspecting code official be aware of the need to evaluate the entire door assembly in determining compliance with this section. This Public Comment emphasizes that need, and we urge its approval.

RB339-13

Final Action: AS AM AMPC____ D

RB340-13
R612.3, Chapter 44

Proposed Change as Submitted

Proponent: Jessica Ferris, Association of Millwork Distributors (jferris@amdweb.com)

Revise as follows:

R612.3 Testing and labeling. Exterior windows and sliding doors shall be tested by an *approved* independent laboratory, and bear a *label* identifying manufacturer, performance characteristics and *approved* inspection agency to indicate compliance with AAMA/WDMA/CSA 101/I.S.2/A440. Exterior side-hinged doors shall be tested and *labeled* as conforming to AAMA/WDMA/CSA 101/I.S.2/A440 or AMD 100, or comply with Section R612.5.

Add new standard to Chapter 44 as follows:

AMD Association of Millwork Distributors
10047 Robert Trent Jones Parkway
New Port Richey, FL 34655-4649

AMD 100 - Structural Performance Rating of Side-Hinged Exterior Door Systems and Procedures for Component Substitution

Reason: The purpose of this proposed code change is to add a new standard to this section of the code, which provides manufacturers of side-hinged exterior doors the option to certify to a structural standard that includes procedures for component substitution.

Incorporating reference to the AMD 100 standard in Section 612.3 will provide producers of side-hinged exterior door systems (SHEDS) with an acceptable alternative method for testing and labeling structural performance requirements. AMD 100 allows for the interchange or substitution of components while maintaining a structurally rated system, which eases the burden of having to test each door configuration assembled for the marketplace. Like AAMA/WDMA/CSA 101/I.S.2/A440, AMD 100 utilizes the ASTM E330 test method for obtaining design pressure ratings of SHEDS.

SHEDS have requirements that are quite different from exterior windows and sliding doors, and as such, have different considerations. The door industry is comprised of not only manufacturers but also smaller distributor and pre-hanger companies, dealers, and builders that purchase their door components from multiple suppliers and interchange these components in their systems regularly depending on customer needs. AMD 100 upgrades SHEDS without negatively affecting this supply chain.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, AMD 100 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2012.

R612.3-RB-FERRIS.doc

Committee Action Hearing Results

For staff analysis of the content of AMD 100 relative to CP#28, Section 3.6, please visit:
http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf

Committee Action: **Approved as Submitted**

Committee Reason: The issue of component substitution for tested side hinged exterior door has been a controversy for years. Industry now has an ANSI approved standard to address this and it is now needed in the code.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Julie Ruth, JRuth Code Consulting, representing American Architectural Manufacturers Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R612.3 Testing and labeling. Exterior windows and sliding doors shall be tested by an *approved* independent laboratory, and bear a *label* identifying manufacturer, performance characteristics and *approved* inspection agency to indicate compliance with AAMA/WDMA/CSA 101/I.S.2/A440. Exterior side-hinged doors shall be tested and *labeled* as conforming to AAMA/WDMA/CSA 101/I.S.2/A440 or ANSI/AMD 100, or comply with Section R612.5.

Add new standard to Chapter 44 as follows:

AMD Association of Millwork Distributors
10047 Robert Trent Jones Parkway
New Port Richey, FL 34655-4649

ANSI/AMD 100 - 13 - Structural Performance Rating of Side-Hinged Exterior Door Systems and Procedures for Component Substitution

Commenter's Reason: The proposal, as submitted, does not specify the edition of AMD 100 that is to be considered for reference in the 2015 IRC. There are multiple editions of AMD 100 currently in circulation. Most notable of those are AMD 100 – 12, and ANSI AMD 100 – 13. It is not clear which edition of the standard was reviewed and approved by the IRC – Building Code Change Committee.

There are significant differences between AMD 100 -12 and ANSI/AMD 100 – 13. The methodology used in AMD 100 – 12 to determine the design pressure rating of exterior side hinged doors is significantly flawed. If put into practice it will lead to failures of exterior door systems. Although AAMA still has some concerns with some aspects of ANSI/AMD 100-13, overall the methodology provided in this edition of the standard is a significant improvement over that provided in AMD 100 – 12, and previous versions of that standard. Therefore, if the 2015 IRC is to reference AMD 100 for the design pressure rating of exterior side hinged doors, it is critical that the correct edition of the standard be referenced.

The earlier editions of the standard – AMD 100 – 12 and previous editions, permitted the design pressure rating of an exterior side hinged door assembly to be determined strictly based upon the design pressure rating of the individual components in the assembly. AAMA has determined through testing that this methodology does not work. Specifically, variation from the mean of as much as 37% was witnessed when assemblies constructed of components with the same design pressure rating were tested in accordance with ASTM E330.

ANSI/AMD 100 – 13 requires the entire door assembly to be tested first, and then permits the substitution of individual components into the assembly in a controlled and prescribed manner. This is similar to the approach taken by AAMA in its program to certify doors to AAMA/WDMA/CSA 101/I.S.2/A440.

We believe this is the appropriate approach to be taken in the evaluation of exterior side hinged doors. This Public Comment clarifies that the edition of AMD 100 to which the exterior side hinged door is to be tested and labeled in ANSI/AMD 100 – 13.

RB340-13

Proposed Change as Submitted

Proponent: Stephen Kerr S.E., Josephson Werdowatz and Associates, Inc., representing self

Revise as follows:

R613.3.1 Core. The core material shall be composed of foam plastic insulation meeting one of the following requirements:

1. Expanded Polystyrene (EPS) in accordance with ASTM C 578 and have a minimum density of 0.90 pounds per cubic feet (14.4 kg/m^3); or
2 Extruded polystyrene (XPS) in accordance with ASTM C 578 and have a minimum density of 1.3 pounds per cubic feet (14.4 kg/m^3); or
~~2~~3. Polyurethane meeting the physical properties shown in Table R613.3.1, or;
~~3~~4. An *approved* alternative.

All cores shall meet the requirements of Section R316.

R613.3.7 Thermal Barrier. SIP walls shall be separated from the interior of a building by an *approved* thermal barrier in accordance with section R316.4.

R613.5.3 Panel to panel connection. SIPs shall be connected at vertical in-plane joints in accordance with Figure R613.5.3 or by other *approved* methods.

R613.5.4 Corner framing. Corner framing of SIP walls shall be constructed in accordance with Figure R613.5.4.

~~**R613.5.3**~~ **R613.5.5 Wall bracing.** SIP walls shall be braced in accordance with Section R602.10. SIP walls shall be considered continuous wood structural panel sheathing for purposes of computing required bracing. SIP walls shall meet the requirements of Section R602.10.4.2 except that SIPs corners shall be fabricated as shown in Figure R613.9. When SIP walls are used for wall bracing, the SIP bottom plate shall be attached to wood framing below in accordance with Table R602.3(1).

~~**R613.8 Connection.** SIPs shall be connected at vertical in-plane joints in accordance with Figure R613.8 or by other *approved* methods.~~

~~**R613.9 Corner framing.** Corner framing of SIP walls shall be constructed in accordance with Figure R613.9.~~

~~**R613.10**~~ **R613.8 Headers.** SIP headers shall be designed and constructed in accordance with Table R613.~~10~~8 and Figure R613.5.1. SIPs headers shall be continuous sections without splines. Headers shall be at least 11 7/8 inches (302 mm) deep. Headers longer than 4 feet (1219 mm) shall be constructed in accordance with Section R602.7.

~~**R613.10.1 Wood structural panel box headers.** Wood structural panel box headers shall be allowed where SIP headers are not applicable. Wood structural panel box headers shall be constructed in accordance with Figure R602.7.2 and Table R602.7.2.~~

e. Building width is in the direction of horizontal framing members supported by the header.

Reason: The proposal is a reorganization of the entire Structural Insulated Panels (SIPs) section. The intention is to add clarity to the proposal as it is currently written. The original SIP language was based on the HUD document Prescriptive Method for Structural Insulated Panels (SIPs) Used In Wall Systems In Residential Construction. Since the inclusion of SIPs in the IRC, there have been several changes that have revised the SIP requirements, however, in some instances the changes have do not match the language used in other materials (wood, cold formed steel, ect.). Proposed changes are intended to bring the SIPs provisions more in line with the other sections of the IRC.

To Summarize the changes:

- R613.3.1 changes to the core requirements – to bring the specifications from the Structural Insulated Panel Association specifications into the code
- R613.3.7 add thermal barrier requirements from the HUD document into section R613.
- R613.5.3/4 move the connection requirements into the section designated for connections.
- R613.10.1 – remove wood structural headers, since section R602.7 already includes wood structural headers. This section is redundant and not necessary.
- Table 613.5 (1) & (2) – add footnotes to match the presentation of the wood and cold form steel tables. Changes to the values are to bring the thickness from the original HUD document back to the tables.
- Figure changes are editorial and take into account the original HUD and the current Structural Insulated Panel Association detail requirements.
- Table 613.10 header span table, based on the allowable HUD header SIP capacities, revise the allowable spans.

Bibliography: *Prescriptive Method for Structural Insulated Panels (SIPs) Used In Wall Systems In Residential Construction,* U.S. Department of Housing and Urban Development Office of Policy Development and Research, Washington, DC, 2007.

Cost Impact: The code change proposal will not increase the cost of construction.

R613.3.1-RB-KERR.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: Based upon the proponent's request for disapproval. Also, the committee's previous action on RB344-13 clarified some issues. The proponent will work with industry and bring back a public comment.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Stephen Kerr S.E., Josephson Werdowatz and Associates, Inc., representing self, and Edward L. Keith, P.E., APA – The Engineered Wood Association, request Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION R613
STRUCTURAL INSULATED PANEL WALL
CONSTRUCTION

R613.1 General. Structural insulated panel (SIP) walls shall be designed in accordance with the provisions of this section. When the provisions of this section are used to design structural insulated panel walls, project drawings, typical details and specifications are not required to bear the seal of the architect or engineer responsible for design, unless otherwise required by the state law of the *jurisdiction* having authority.

R613.2 Applicability limits. The provisions of this section shall control the construction of exterior structural insulated panel walls and interior load-bearing structural insulated panel walls for buildings not greater than 60 feet (18 288 mm) in length perpendicular to the joist or truss span, not greater than 40 feet (12 192 mm) in width parallel to the joist or truss span and not greater than two stories in height with each wall not greater than 10 feet (3048 mm) high. All exterior walls installed in accordance with the provisions of this section shall be considered as load-bearing walls. Structural insulated panel walls constructed in accordance with the provisions of this section shall be limited to sites subjected to a maximum ultimate design wind speed (V_{ult}) of ~~120~~ 155 miles per hour (~~54~~ 69 m/s), Exposure A or B or ~~110~~ 140 miles per hour (~~49~~ 63 m/s) Exposure C, and a maximum ground snow load of 70 pounds per foot (3.35 kPa), and Seismic Design Categories A, B, and C.

R613.3 Materials. SIPs shall comply with the following criteria:

R613.3.1 Core. The core material shall be composed of foam plastic insulation meeting one of the following requirements:

1. Expanded Polystyrene (EPS) in accordance with ASTM C 578 and have a minimum density of 0.90 pounds per cubic feet (14.4 kg/m^3); or
2. Extruded polystyrene (XPS) in accordance with ASTM C 578 and have a minimum density of 1.3 pounds per cubic feet (~~14.4~~ 20.8 kg/m^3); or
3. Polyurethane meeting the physical properties shown in Table R613.3.1, or;
4. An *approved* alternative.

All cores shall meet the requirements of Section R316.

TABLE R613.3.1
MINIMUM PROPERTIES FOR POLYURETHANE INSULATION USED AS SIPS CORE

PHYSICAL PROPERTY	POLYURETHANE
Density, core nominal (ASTM D 1622)	2.2 lb/ft^3
Compressive resistance at yield or 10% deformation, whichever occurs first (ASTM D 1621)	19 psi (perpendicular to rise)
Flexural strength, min. (ASTM C 203)	30 psi
Tensile strength, min. (ASTM D 1623)	35 psi
Shear strength, min. (ASTM C 273)	25 psi
Substrate adhesion, min. (ASTM D 1623)	22 psi
Water vapor permeance of 1.00-in. thickness, max. (ASTM E 96)	2.3 perm
Water absorption by total immersion, max. (ASTM C 272)	4.3% (volume)
Dimensional stability (change in dimensions), max. [ASTM D 2126 (7 days at 158°F/100% humidity and 7 days at -20°F)]	2%

For SI: 1 pound per cubic foot = 16.02 kg/m^3, 1 pound per square inch= 6.895 kPa, °C = [(°F) - 32]1.8.

R613.3.2 Facing. Facing materials for SIPs shall be wood structural panels conforming to DOC PS 1 or DOC PS 2, each having a minimum nominal thickness of 7/16 inch (11 mm) and shall meet the additional minimum properties specified in Table R613.3.2. Facing shall be identified by a grade mark or certificate of inspection issued by an *approved* agency.

TABLE R613.3.2
MINIMUM PROPERTIES[a] FOR ORIENTED STRAND BOARD FACER MATERIAL IN SIP WALLS

Thickness (inch)	Product	Flatwise Stiffness[b] (lbf-in2/ft)		Flatwise Strength[c] (lbf-in/ft)		Tension[c] (lbf/ft)		Density[d] (pcf)
		Along	Across	Along	Across	Along	Across	
7/16	Sheathing	55,600	16,500	1,040	460	7,450	5,800	34

For SI: 1 inch = 25.4 mm, 1 lbf-in^2/ft = 9.415 x 10^{-6} kPa/m, 1 lbf-in/ft = 3.707 x 10^{-4} kN/m, 1 lbf/ft = 0.0146 N/mm, 1 pound per cubic foot = 16.018 kg/m^3.

a. Values listed in Table R613.3.2 are qualification test values and are not to be used for design purposes.
b. Mean test value shall be in accordance with Section 7.6 of DOC PS 2.
c. Characteristic test value (5th percent with 75% confidence).
d. Density shall be based on oven-dry weight and oven-dry volume.

R613.3.3 Adhesive. Adhesives used to structurally laminate the foam plastic insulation core material to the structural wood factors shall conform to ASTM D 2559 or *approved* alternative specifically intended for use as an adhesive used in the lamination of structural insulated panels. Each container of adhesive shall bear a *label* with the adhesive manufacturer's name, adhesive name and type and the name of the quality assurance agency.

R613.3.4 Lumber. The minimum lumber framing material used for SIPs prescribed in this document is NLGA graded No. 2 Spruce-pine-fir. Substitution of other wood species/grades that meet or exceed the mechanical properties and specific gravity of No. 2 Spruce-pine-fir shall be permitted.

R613.3.5 SIP screws. Screws used for the erection of SIPs as specified in Section R613.5 shall be fabricated from steel, shall be provided by the SIPs manufacturer and shall be sized to penetrate the wood member to which the assembly is being attached by a minimum of 1 inch (25 mm). The screws shall be corrosion resistant and have a minimum shank diameter of 0.188 inch (4.7 mm) and a minimum head diameter of 0.620 inch (15.5 mm).

R613.3.6 Nails. Nails specified in Section R613 shall be common or galvanized box unless otherwise stated.

R613.3.7 Thermal Barrier. SIP walls shall be separated from the interior of a building by an *approved* thermal barrier in accordance with section R316.4.

R613.4 SIP wall panels. SIPs shall comply with Figure R613.4 and shall have minimum panel thickness in accordance with Tables R613.5(1) and R613.5(2) for above-grade walls. All SIPs shall be identified by grade mark or certificate of inspection issued by an *approved* agency

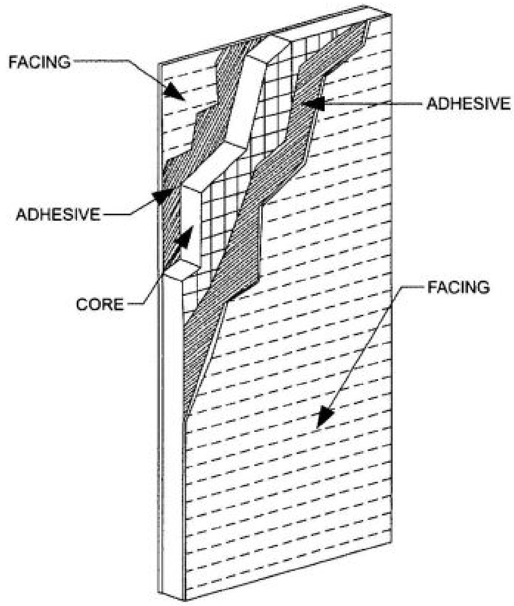

FIGURE R613.4
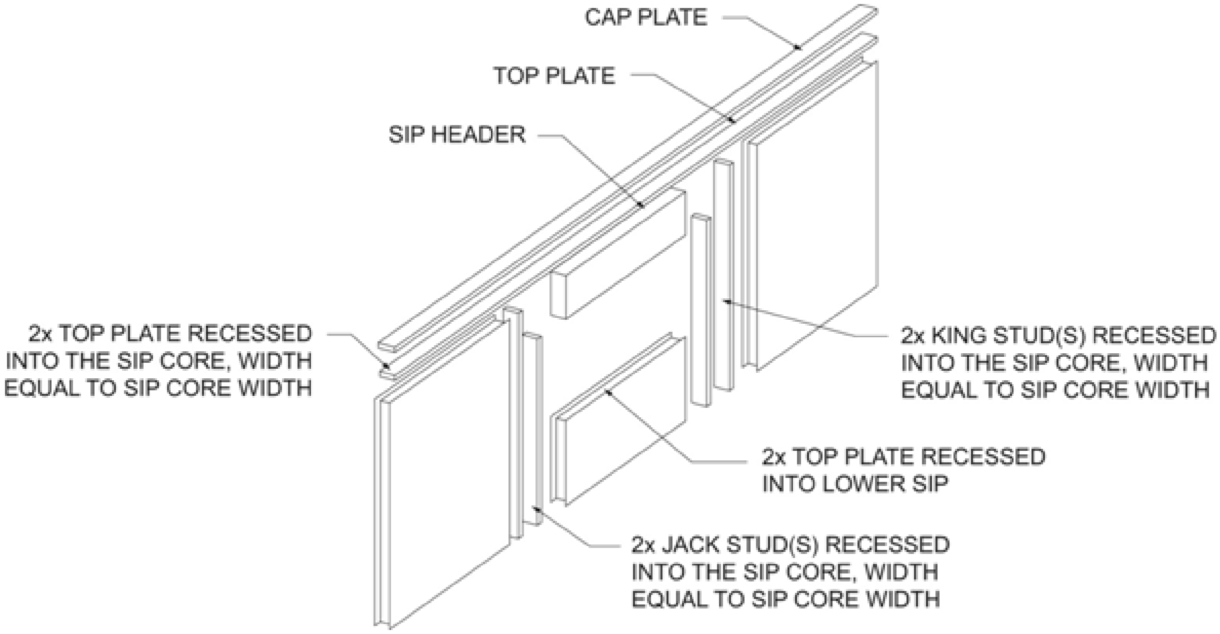
SIP WALL PANEL

R613.4.1. Labeling. All panels shall be identified by grade mark or certificate of inspection issued by an *approved* agency. Each (SIP) shall bear a stamp or *label* with the following minimum information:

1. Manufacturer name/logo.
2. Identification of the assembly.
3. Quality assurance agency.

R613.5 Wall construction. Exterior walls of SIP construction shall be designed and constructed in accordance with the provisions of this section, Tables R613.5(1) and R613.5(2), and Figures R613.5(1) through R613.5(6). SIP walls shall be fastened to other wood building components in accordance with Tables R602.3(1) through R602.3(4).

Framing shall be attached in accordance with Table R602.3(1) unless otherwise provided for in Section R613.



For SI: I inch = 24.4 mm.

Note:
1. Top plates shall be continuous over header
2. Lower 2 x top plate shall have a width equal to the SIP core width and shall be recessed into the top edge of the panel. Cap plate shall be placed over the recessed top plate and shall have a width equal to the SIP width.
3. SIP facing surface shall be nailed to all framing and cripples with 8d common or galvanized box nails spaced 6 inches on center.

FIGURE R613.5(1)
SIP WALL FRAMING CONFIGURATION

R613.5.1 Top plate connection. SIP walls shall be capped with a double to plate installed to provide overlapping at corner, intersections and splines in accordance with Figure R613.5(1). The double top plates shall be made up of a single 2 by top plate having a width equal to the width of the panel core, and shall be recessed into the SIP below. Over this top plate a cap plate shall be placed. The cap plate width shall match the SIP thickness and overlap the facers on both sides of the panel. End joints in top plates shall be offset at least 24 inches (610 mm).

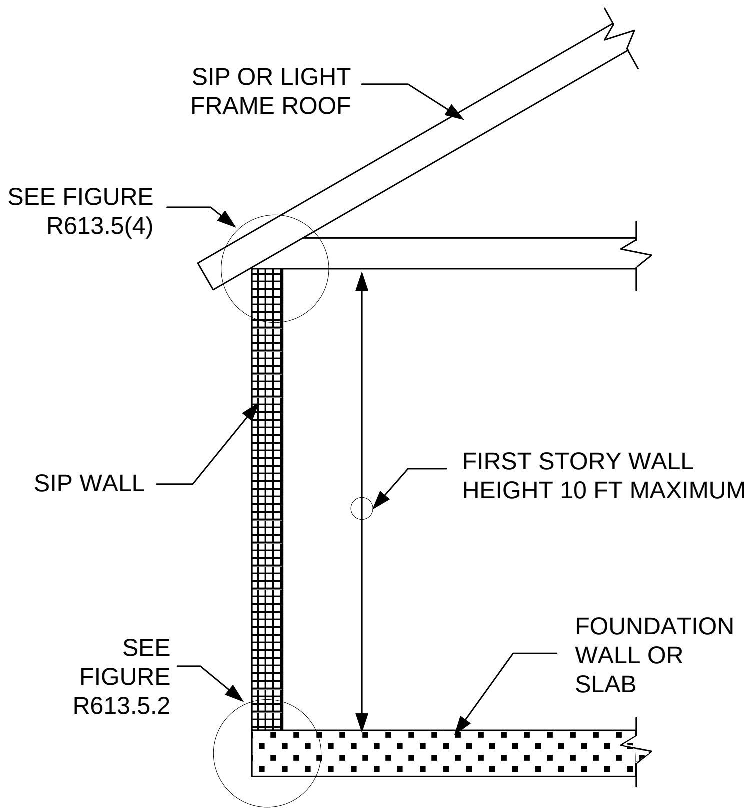


FIGURE R613.5(~~1~~2)
MAXIMUM ALLOWABLE HEIGHT OF SIP WALLS

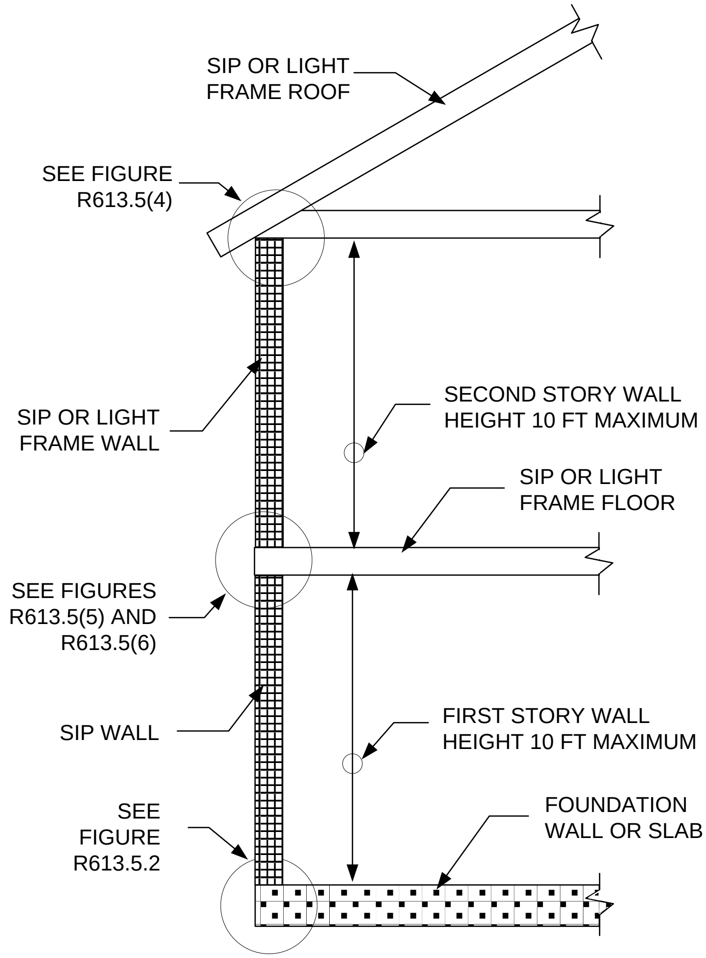

FIGURE R613.5(~~2~~3)
MAXIMUM ALLOWABLE HEIGHT OF SIP WALLS

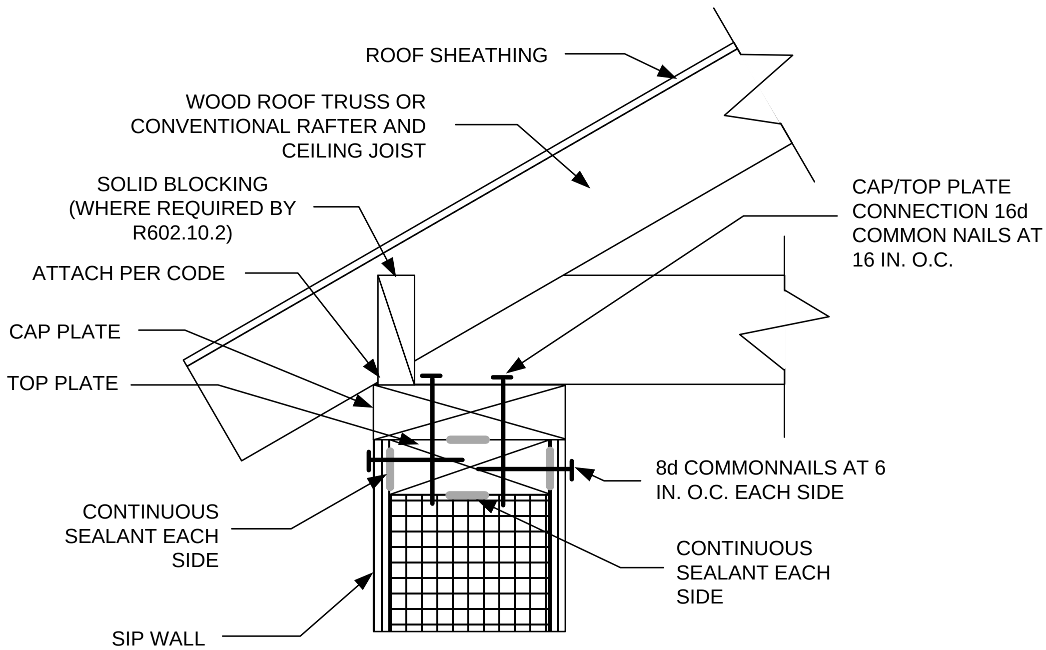

FIGURE R613.5(~~3~~4)
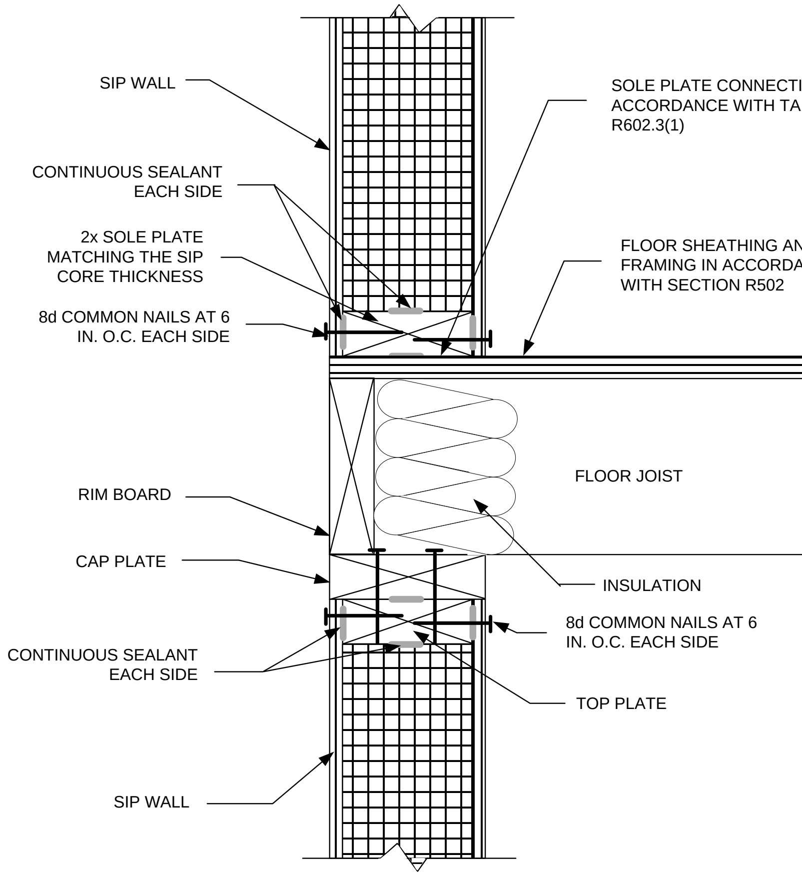
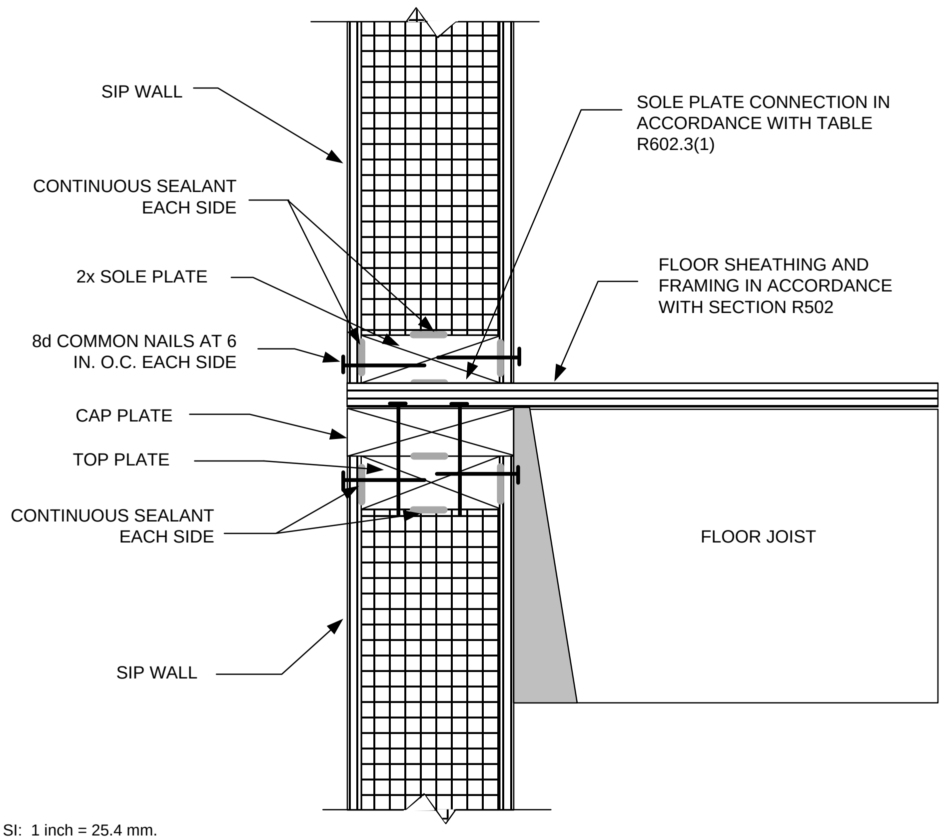
TRUSS OR CONVENTIONAL RAFTER TO TOP PLATE CONNECTION



For SI: 1 inch = 25.4 mm.
Note: Figures illustrate SIP-specific attachment requirements. Other connections shall be made in accordance with Tables R602.3(1) and (2) as appropriate.

FIGURE R613.5(45)
SIP WALL-TO-WALL PLATFORM FRAME CONNECTION



For SI: 1 inch = 25.4 mm.

Note: Figures illustrate SIP-specific attachment requirements. Other connections shall be made in accordance with Tables R602.3(1) and (2) as appropriate.

FIGURE R613.5(~~5~~6)
SIP WALL-TO-WALL HANGING-FLOOR FRAME CONNECTION

R613.5.2 Bottom (sole) plate connection. SIP walls shall have full bearing on a sole plate having a width equal to the nominal width of the foam core. When SIP walls are supported directly on continuous foundations, the wall wood sill plate shall be anchored to the foundation in accordance with Figure R613.5.2 and Section R403.1.

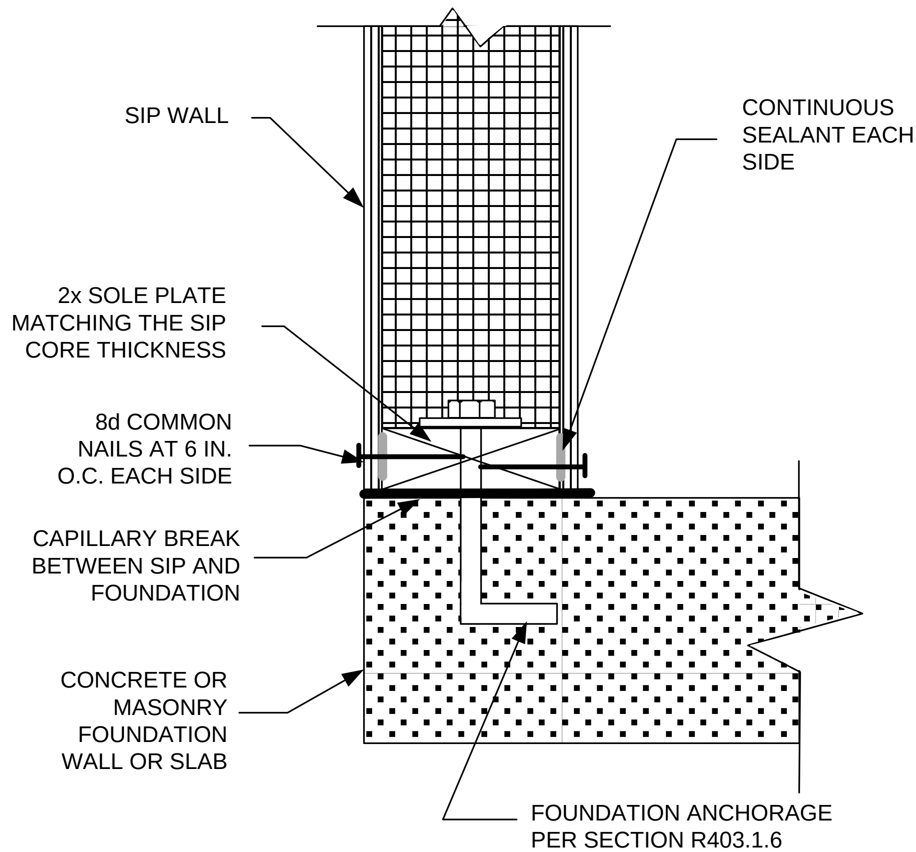


FIGURE R613.5.2
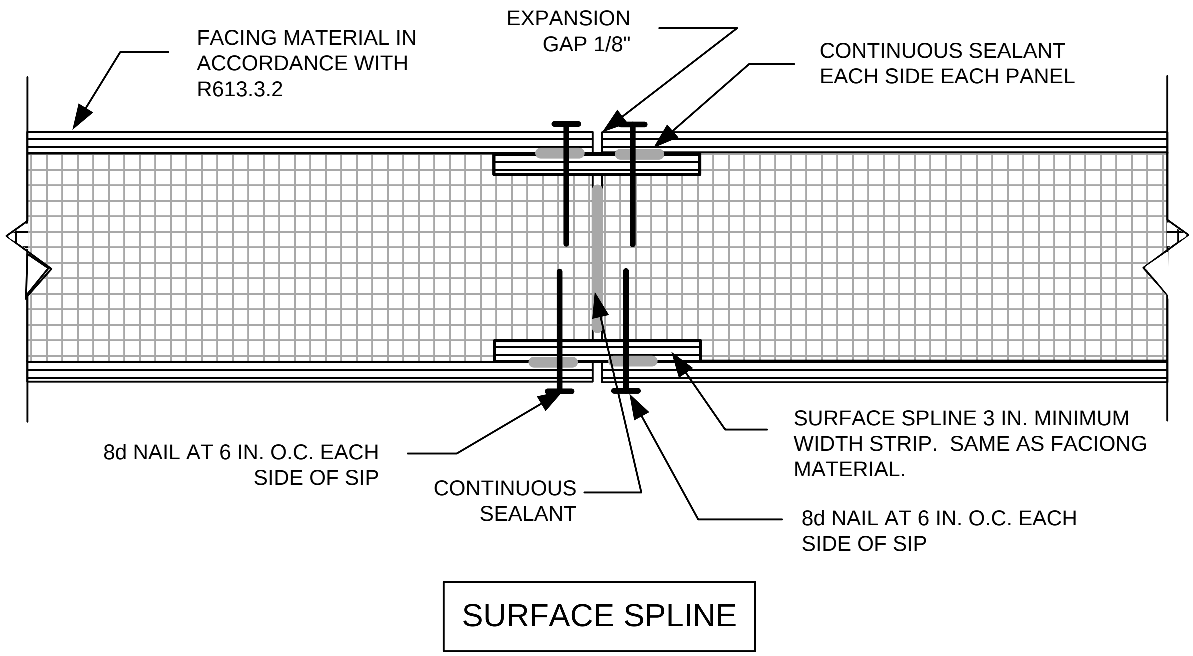
SIP WALL-TO-CONCRETE SLAB OR FOUNDATION WALL ATTACHMENT

R613.5.3 Panel to panel connection. SIPs shall be connected at vertical in-plane joints in accordance with Figure R613.5.3 or by other *approved* methods.



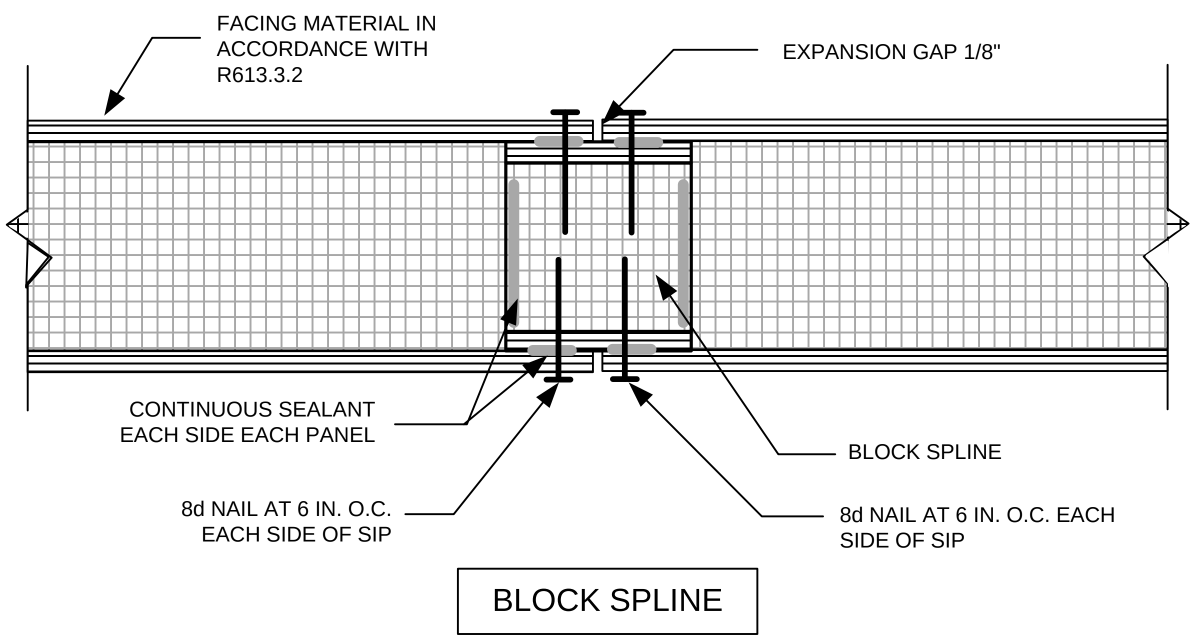


FIGURE R613.5.3
TYPICAL SIP WALL PANEL-TO-PANEL CONNECTION DETAILS

R613.5.4 Corner framing. Corner framing of SIP walls shall be constructed in accordance with Figure R613.5.4.

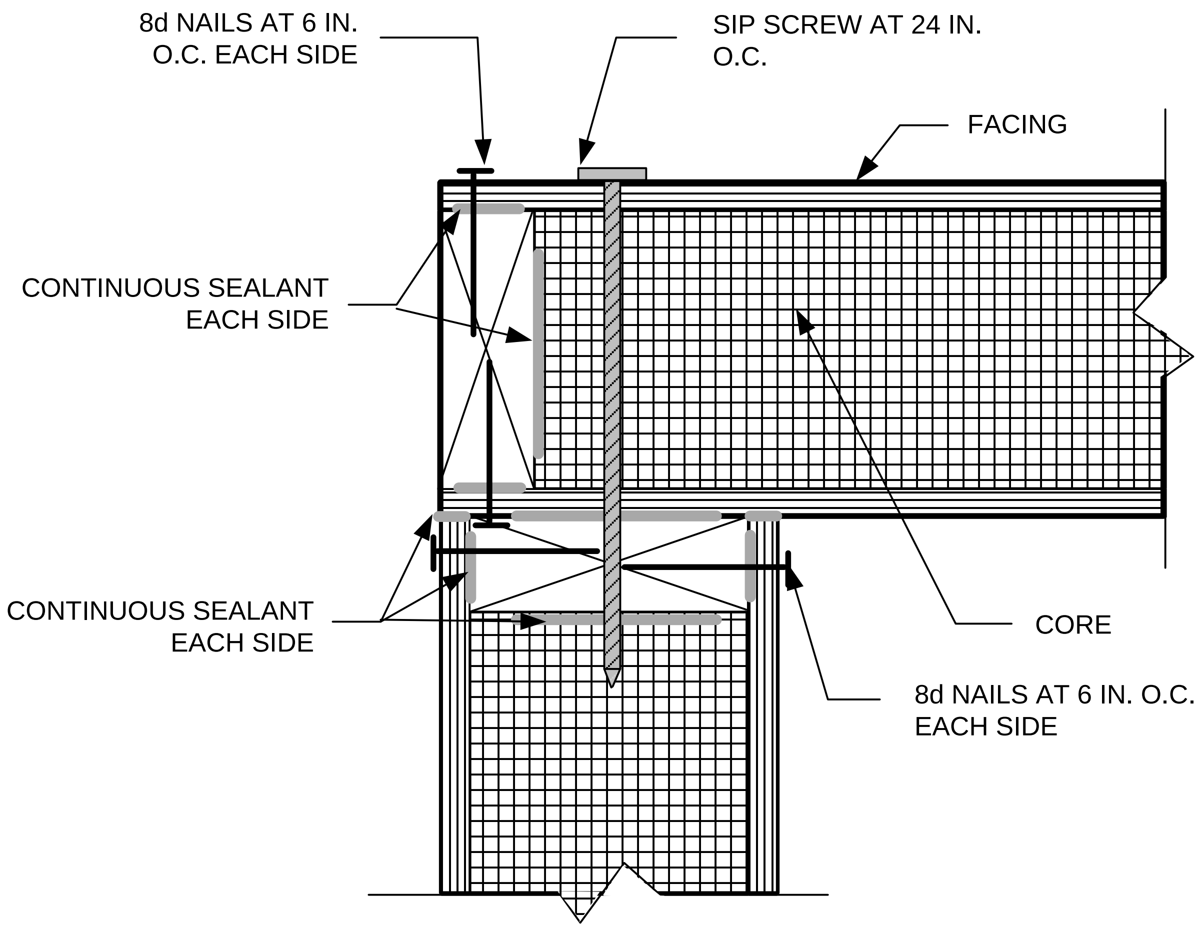

FIGURE R613.5.4
SIP CORNER FRAMING DETAIL

R613.5.5 Wall bracing. SIP walls shall be braced in accordance with Section R602.10. SIP walls shall be considered continuous wood structural panel sheathing for purposes of computing required bracing. SIP walls shall meet the requirements of Section R602.10.4.2 except that SIPs corners shall be fabricated as shown in Figure R613.9. When SIP walls are used for wall bracing, the SIP bottom plate shall be attached to wood framing below in accordance with Table R602.3(1).

R613.6 Interior load-bearing walls. Interior load-bearing walls shall be constructed as specified for exterior walls.

R613.7 Drilling and notching. The maximum vertical chase penetration in SIPs shall have a maximum side dimension of 2 inches (51 mm) centered in the panel core. Vertical chases shall have a minimum spacing of 24-inches (610 mm) on center. Maximum of two horizontal chases shall be permitted in each wall panel, one at 14 inches (360 mm) from the bottom of the panel and one at mid-height of the wall panel. The maximum allowable penetration size in a wall panel shall be circular or rectangular with a maximum dimension of 12 inches (305 mm). Overcutting of holes in facing panels shall not be permitted.

R613.8 Headers. SIP headers shall be designed and constructed in accordance with Table R613.8 and Figure R613.5.1. SIPs headers shall be continuous sections without splines. Headers shall be at least 11 7/8 inches (302 mm) deep. Headers longer than 4 feet (1219 mm) shall be constructed in accordance with Section R602.7.

R613.8.1 Wood structural panel box headers. Wood structural panel box headers shall be allowed where SIP headers are not applicable. Wood structural panel box headers shall be constructed in accordance with Figure R602.7.2 and Table R602.7.2.

~~e. Building width is in the direction of horizontal framing members supported by the header.~~
a. Design assumptions:
Maximum deflection criteria: L/240.
Maximum roof dead load: 10 psf.
Maximum ceiling dead load: 5 psf.
Maximum ceiling live load: 20 psf.
Maximum second floor dead load: 10 psf.
Maximum second floor live load: 30 psf.
Maximum second floor dead load from walls: 10 psf.
Maximum first floor dead load: 10 psf.
Wind loads based on Table R301.2 (2).
Strength axis of facing material applied vertically.
DR indicates Design Required.
b. Building width is in the direction of horizontal framing members supported by the header.
c. The table provides for roof slopes between 3:12 and 12:12.
d. The maximum roof overhang is 24 inches (610 mm).

Commenter's Reason: The proponent and APA requested disapproval of this proposal at the mid-year meeting to permit the proponent and APA time together to correct some issues with the proposal as submitted. This public comment, submitted by the proponent of the original code change AND co submitted by APA is the result of our collaboration. While the section is long the actual Public Comment Changes are actually few and are described below:

- Section R613.3.1 – Corrected the metric equivalent to 1.3 pounds per cubic ft.
- Section R613.5.1 - A charging statement was added to Section R613.5.1 to recognize Figure R613.5 and Figure R613.5 was renumbered to R613.5(1). Original Figures R613.5(1) through R613.5(5) were renumbered accordingly. Annotations in affected figures have been changed to reflect the proposed numbering system.
- Section R613.8.1 – Deleted by the original proposal, this section was re-added by this Public Comment.
- Tables R613.5(1) and R613.5(2) - Were deleted and replaced by the appropriate Ultimate Design Wind Speed Tables provided in RB271.
- Tables R613.5(1) and R613.5(2) older footnotes inadvertently deleted in the 2009 IRC were re-added per RB344.
- Footnote b was added to Tables R613.5(1) and (2), and R613.8 to clarify the intent of the tables.
- Table R613.8 the limitation on the minimum depth of the header was re-added to the title of the table.
- Note that all figures have been redrawn and reformatted to provide a cleaner, more easily understood IRC.

We encourage the code body to accept this public comment providing requisite clarity in addition to updating the provisions to reflect ASCE 7-10 with respect to Ultimate Design Wind Speed.

Final Action: AS AM AMPC____ D

RB348-13
R614 (NEW)

Proposed Change as Submitted

Proponent: Joseph D. Belcher, JDB Code Services, Inc, representing the International Hurricane Protection Association (joe@jdbcodeservices.com)

Add new text as follows:

SECTION R614
IMPACT PROTECTIVE SYSTEMS

R614.1 Safety factor. Impact protective systems shall be tested at 1.5 times the design pressure (positive or negative) expressed in pounds per square feet as determined by the Section R301.2.1.1 of this code for which the specimen is to be tested.

R614.1.1 Labels required. Impact protective systems shall be approved and shall be tested in accordance with Section R301.2.1.2 and shall be labeled as conforming to the standards listed in Section R301.2.1.2 and in accordance with the provisions of this section. Impact resistant glazing shall be labeled in accordance with Section R612.6.1

R614.2 Labels. A permanent label shall be provided on all impact protective systems.

Exception: Wood structural panels permitted at section R301.2.1.2.

R614.2.1 Label information required. The following information shall be included on the labels on impact protective systems:

1. The manufacturer's name and address,
2. The approved testing and labeling agency, and
3. The rated wind design pressure, positive and negative.

Exception: Impact resistant glazing shall comply with Section R612.6.1

R614.3 Location of label. The location of the label on the impact protective systems shall be as follows:

1. Accordions: Bottom of the locking bar or center mate facing the exterior or outside.
2. Rollup: On the bottom of the hood facing the exterior or outside or on the bottom slat facing the exterior or outside.
3. Bahama Awning or Colonial Hinged: On the bottom, placed on the back of the impact protective system.
4. Panels: For metal and plastic panels the label may be embossed or printed spaced not more than every three (3) lineal feet on each panel. The label shall be applied by the manufacturer and shall face the exterior or outside.
5. Framed products: The label shall be on the side or bottom facing the exterior or outside.
6. Labels on all other products shall face the exterior or outside.

Exception: Labels for impact resistant glazing shall comply with Section R612.6.1

R614.4 Installation. All impact protective systems shall be installed in accordance with the manufacturer's installation instructions. Installation instructions shall be provided and shall be available to inspection personnel on the job site.

Reason: Similar provisions have been adopted in the Florida Building Code to assist code enforcement personnel in the inspection of impact protective systems. The Garage Door-Window Labeling Work Group was appointed by the Florida Building Commission in response to problems cited by building officials in determining if the proper impact resistant coverings were provided on a job. In many cases it was found the homeowner was not getting a good product or the product was installed incorrectly. The Workgroup consisted of broad range of interests including a number of manufacturers of both impact protective covering systems and impact rated glazing products, contractors, insurance industry representatives, and code enforcement personnel which identified and worked on the issues. This proposal incorporates the recommendations of the Workgroup.

Cost Impact: The cost of providing labels on impact resistant covering products is estimated by the industry as follows:

a. Water Resistant Self-adhering Permanent Labels approximately $0.15 per label. Such labels would most likely be used on Accordion, Roll, Bahama, and Colonial style shutters.

b. Embossed or ink jet labels used on metal and plastic panels would cost approximately $0.05 per label.

There is no added cost to impact resistant glazing products as they are currently required by the code to be labeled.

The industry believes the minor cost involved is by far outweighed by the benefits to the public by providing data permitting inspection personnel and the general public to ascertain the proper impact resistant covering is provided and installed in accordance with the manufacturer's installation instructions.

R614 (NEW)-RB-BELCHER.doc

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The change has too many undefined terms. The labeling requirements are too restrictive and go beyond what is necessary. Also, the standards are not required to be listed on the label.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Joseph D. Belcher, JDB Code Service, Inc, representing International Hurricane Protection Association (IHPA), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION R614
IMPACT PROTECTIVE SYSTEMS

R614.1 Safety factor. Impact protective systems shall be tested at 1.5 times the design pressure (positive or negative) expressed in pounds per square feet as determined by the Section R301.2.1.1 of this code for which the specimen is to be tested.

R614.1.1 Labels required. Impact protective systems shall be approved and shall be tested in accordance with Section R301.2.1.2 and shall be labeled as conforming to the standards listed in Section R301.2.1.2 and in accordance with the provisions of this section. Impact resistant glazing shall be labeled in accordance with Section R612.6.1

R614.2 Labels. A permanent label shall be provided on all impact protective systems.

Exception: Wood structural panels permitted at section R301.2.1.2.

R614.2.1 Label information required. The following information shall be included on the labels on impact protective systems:

1. The manufacturer's name and address,
2. The approved testing and labeling agency, and
3. The rated wind design pressure, positive and negative.

Exception: Impact resistant glazing shall comply with Section R612.6.1

~~**R614.3 Location of label.** The location of the label on the impact protective systems shall be as follows:~~

~~1. Accordions: Bottom of the locking bar or center mate facing the exterior or outside.~~
~~2. Rollup: On the bottom of the hood facing the exterior or outside or on the bottom slat facing the exterior or outside.~~

~~3. Bahama Awning or Colonial Hinged: On the bottom, placed on the back of the impact protective system.~~
~~4. Panels: For metal and plastic panels the label may be embossed or printed spaced not more than every three (3) lineal feet on each panel. The label shall be applied by the manufacturer and shall face the exterior or outside.~~
~~5. Framed products: The label shall be on the side or bottom facing the exterior or outside.~~
~~6. Labels on all other products shall face the exterior or outside.~~

~~**Exception:** Labels for impact resistant glazing shall comply with Section R612.6.1~~

R614.4 Installation.
All impact protective systems shall be installed in accordance with the manufacturer's <u>written</u> installation instructions. <u>Written installation instructions shall be provided by the impact protective system manufacturer for each product to be installed.</u> ~~Installation instructions shall be provided and shall be available to inspection personnel on the job site.~~

Commenter's Reason: Safety factor. Currently there are no testing criteria, other than impact and cyclic testing, specified for impact protective systems. The change is an effort to establish a safety factor for the structural testing of such products, i.e. the ability to stay in place during a high wind event. Testimony was provided in Dallas regarding the specified Safety Factor of 1.5 times the design pressure. The safety factor is the same as that specified for the structural testing provisions of ASTM E 330 (ASTM E 330-02 §5.3) and for exterior window and door assemblies not provided for in Section 1710.5.1 in the IBC. (IBC §1710.5.2)

Labels. The code is rife with labeling requirements. Windows, doors, fireplaces, electrical outlets, mechanical equipment, and the list goes on. Labels are a way to ascertain that a manufactured product meets the standards adopted or specified by the code. Impact protective systems are installed to comply with code requirements for opening protection. Without labels, the field inspector, the builder, and the home owner have no way to verify the product installed is the proper product. The label information specified is similar to the requirements for fenestration and is considered the minimum to allow tracking of the product.

Location of label. The location of the label was included to assist inspection personnel by reducing the time needed to find the label on a product. While manufactures of these products are familiar with the various types, testimony was provided at the Code Action Hearings that the types of impact protective systems listed were not defined in the code and persons outside the industry may not be familiar with the nomenclature. The section specifying the label location is stricken to address that concern.

Installation. The intent of the requirement to have manufacturer's installation instructions on the job site was to save the builder a delay for a rejection when the inspection was disapproved because there was nothing for the inspector to use in conducting the inspection of a code requirement. However, I have modified the provision to reflect the manner in which manufacturer's installation instructions are addressed in other parts of the code. (IRC §R612.1Since IRC Section R106.1.2 requires the manufacturer's installation instructions to be on the job site at the time of inspection, that portion of the proposed change is deleted.

Similar provisions have been adopted in the Florida Building Code at the request of code enforcement personnel. Inspectors in the field had no guidelines to inspect by as the impact protective systems are not typically detailed on the plans submitted. The information needed to properly inspect the systems is typically contained in the manufacturer's installation instructions.

RB348-13
Final Action: AS AM AMPC____ D

RB353-13

R302.6, Table R702.3.5

Proposed Change as Submitted

Proponent: Robert Rice, Josephine County, OR, representing Oregon Building Officials Association (structdesigner@yahoo.com)

Revise as follows:

R302.6 Dwelling/garage fire separation. The garage shall be separated as required by Table R302.6. Attachment of gypsum board shall comply with Table R702.3.5. Openings in garage walls shall comply with Section R302.5. ~~This~~ The wall separation provisions of Table R302.6 ~~does~~ do not apply to garage walls that are perpendicular to the adjacent *dwelling unit* wall.

TABLE R702.3.5
MINIMUM THICKNESS AND APPLICATION OF GYPSUM BOARD

THICKNESS OF GYPSUM BOARD (inches)	APPLICATION	ORIENTATION OF GYPSUM BOARD TO FRAMING	MAXIMUM SPACING OF FRAMING MEMBERS (inches o.c.)	MAXIMUM SPACING OF FASTENERS (inches)		SIZE OF NAILS FOR APPLICATION TO WOOD FRAMING[c]
				Nails[a]	Screws[b]	
Application without adhesive						
$^{3}/_{8}$	Ceiling[d]	Perpendicular	16	7	12	13 gage, $1^{1}/_{4}$" long, $^{19}/_{64}$" head; 0.098" diameter, $1^{1}/_{4}$" long, annular-ringed; or 4d cooler nail, 0.080" diameter, $1^{3}/_{8}$" long, $^{7}/_{32}$" head.
	Wall	Either direction	16	8	16	
$^{1}/_{2}$	Ceiling	Either direction	16	7	12	13 gage, $1^{3}/_{8}$" long, $^{19}/_{64}$" head; 0.098" diameter, $1^{1}/_{4}$" long, annular-ringed; 5d cooler nail, 0.086" diameter, $1^{5}/_{8}$" long, $^{15}/_{64}$" head; or gypsum board nail, 0.086″ diameter, 1 $^{5}/_{8}$" long, $^{9}/_{32}$" head.
	Ceiling[d]	Perpendicular	24	7	12	
	Wall	Either direction	24	8	12	
	Wall	Either direction	16	8	16	
$^{5}/_{8}$	Ceiling	Either direction	16	7	12	13 gage, $1^{5}/_{8}$" long, $^{19}/_{64}$" head; 0.098" diameter, $1^{3}/_{8}$" long, annular-ringed; 6d cooler nail, 0.092" diameter, $1^{7}/_{8}$" long, ¼" head; or gypsum board nail, 0.0915" diameter, $1^{7}/_{8}$" long, $^{19}/_{64}$" head.
	Ceiling[e]	Perpendicular	24	7	12	
	Type X at garage ceiling beneath habitable rooms	Perpendicular	24	6	6	1 7/8 inches 6d coated nails or equivalent drywall screws.
	Wall	Either direction	24	8	12	13 gage, $1^{5}/_{8}$" long, $^{19}/_{64}$" head; 0.098" diameter, $1^{3}/_{8}$" long, annular-ringed; 6d cooler nail, 0.092" diameter, $1^{7}/_{8}$" long, $^{1}/_{4}$" head; or gypsum board nail, 0.0915" diameter, $1^{7}/_{8}$" long, $^{19}/_{64}$" head.
	Wall	Either direction	16	8	16	
Application with adhesive						
$^{3}/_{8}$	Ceiling[d]	Perpendicular	16	16	16	Same as above for $^{3}/_{8}$" gypsum board

	Wall	Either direction	16	16	24	
$^{1}/_{2}$ or $^{5}/_{8}$	Ceiling	Either direction	16	16	16	Same as above for $^{1}/_{2}$" and $^{5}/_{8}$" gypsum board, respectively
	Ceiling[d]	Perpendicular	24	12	16	
	Wall	Either direction	24	16	24	
Two $^{3}/_{8}$ layers	Ceiling	Perpendicular	16	16	16	Base ply nailed as above for $^{1}/_{2}$" gypsum board; face ply installed with adhesive
	Wall	Either direction	24	24	24	

For SI: 1 inch = 25.4 mm.

a. For application without adhesive, a pair of nails spaced not less than 2 inches apart or more than $2^{1}/_{2}$ inches apart may be used with the pair of nails spaced 12 inches on center.

b. Screws shall be in accordance with Section R702.3.6. Screws for attaching gypsum board to structural insulated panels shall penetrate the wood structural panel facing not less than $^{7}/_{16}$ inch.

c. Where cold-formed steel framing is used with a clinching design to receive nails by two edges of metal, the nails shall be not less than $^{5}/_{8}$ inch longer than the gypsum board thickness and shall have ringed shanks. Where the cold-formed steel framing has a nailing groove formed to receive the nails, the nails shall have barbed shanks or be 5d, $13^{1}/_{2}$ gage, $^{15}/_{8}$ inches long, $^{15}/_{64}$-inch head for $^{1}/_{2}$-inch gypsum board; and 6d, 13 gage, $1^{7}/_{8}$ inches long, $^{15}/_{64}$-inch head for $^{5}/_{8}$-inch gypsum board.

d. Three-eighths-inch-thick single-ply gypsum board shall not be used on a ceiling where a water-based textured finish is to be applied, or where it will be required to support insulation above a ceiling. On ceiling applications to receive a water-based texture material, either hand or spray applied, the gypsum board shall be applied perpendicular to framing. When applying a water-based texture material, the minimum gypsum board thickness shall be increased from $^{3}/_{8}$ inch to $^{1}/_{2}$ inch for 16-inch on center framing, and from $^{1}/_{2}$ inch to $^{5}/_{8}$ inch for 24-inch on center framing or $^{1}/_{2}$-inch sag-resistant gypsum ceiling board shall be used.

~~e. Type X gypsum board for garage ceilings beneath habitable rooms shall be installed perpendicular to the ceiling framing and shall be fastened at maximum 6 inches o.c. by minimum $1^{7}/_{8}$ inches 6d coated nails or equivalent drywall screws.~~

Reason: The existing code requires 5/8" Type X gypsum board on garage ceilings when there are habitable rooms above. The general requirement for separations is stated in R302.6 and that section refers to Table R302.6 (shown below) for the specific requirements. The code also has special attachment requirements for this application that are different from other gypsum board attachments. The problem with the current code is that the requirement for the attachment is in a footnote to Table R702.3(5) and is often overlooked. This proposal is to move the requirement for the attachment from the footnote of Table R702.3(5) to the table itself. A sentence is added to R302.6 to point the user to the attachment requirements in Table R702.3(5).

TABLE R302.6
DWELLING/GARAGE SEPARATION

SEPARATION	MATERIAL
From the residence and attics	Not less than $^{1}/_{2}$-inch gypsum board or equivalent applied to the garage side
From all habitable rooms above the garage	Not less than $^{5}/_{8}$-inch Type X gypsum board or equivalent
Structure(s) supporting floor/ceiling assemblies used for separation required by this section	Not less than $^{1}/_{2}$-inch gypsum board or equivalent
Garages located less than 3 feet from a dwelling unit on the same lot	Not less than $^{1}/_{2}$-inch gypsum board or equivalent applied to the interior side of exterior walls that are within this area

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

In addition, since Section R302.6 refers to the Table that covers both walls and ceilings, language is added to clarify the existing language. The current text says, "This provision does not apply to garage walls that are perpendicular to the adjacent *dwelling unit* wall". As currently written, it says the provisions of R302.6 don't apply which is the whole section R302.6. Since R302.6 is scoping in nature and sends the user to Table R702.3(5) for technical requirements this change makes it clear that the ceiling requirements still apply.

This proposal does not change any requirements in the existing code.

Cost Impact: The code change proposal will not increase the cost of construction.

RB353-13

R702.3.5T-RB-RICE.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The new language will exclude alternative materials.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Robert Rice, CBO, Josephine County Oregon, representing Oregon Building Officials Association, requests Approved as Modified by this Public Comment.

Modify the proposal as follows:

R302.6 Dwelling/garage fire separation. The garage shall be separated as required by Table R302.6. ~~Attachment of g~~ Gypsum board used to provide the required separation shall ~~comply~~ be attached in accordance with Table R702.3.5. Openings in garage walls shall comply with Section R302.5. The wall separation provisions of Table R302.6 do not apply to garage walls that are perpendicular to the adjacent *dwelling unit* wall.

(Portions of code change proposal not shown remain unchanged)

Commenter's Reason: The existing code requires that the garage be separated in accordance with Table R302.6 as shown in the original proposal. The attachment of gypsum board is also already specified in Table R702.3.5. In the current code, the required attachment of 5/8" Type X gypsum board on garage ceilings is specified in footnote "e" of Table R702.3.5 and is different from the attachment of other 5/8" gypsum board. However, this requirement is often overlooked because it is a footnote to the table. The purpose of the original proposal (and this public comment) is to move this existing fastening requirement from the footnote into the table and make reference to it in R302.6. No change is proposed to the existing requirements.

At the Committee Action Hearings, there was concern expressed, *"The new language will exclude alternative materials".* There are **no new requirements or limitations** in the original proposal or this public comment. The existing requirement in Table R302.6 is, "*Not less than 5/8-inch Type X gypsum board or equivalent"* and is not changed by this proposal.

This public comment re-words the second sentence of R302.6 so it is clearer that the separation may or may not be accomplished with gypsum board which is consistent with the language ("…or equivalent".) in Table R302.6.

This proposal does not change any requirements in the existing code.

RB353-13

Final Action: AS AM AMPC____ D

RB355-13

R702.4.2, Table R702.4.2 (New), Chapter 44

Proposed Change as Submitted

Proponent: John Mulder, Intertek Testing Services NA, Inc., representing International Standards Organization Technical Committee 77, *Products in Fibre-reinforced Cement* and Self

Revise as follows:

R702.4.2 Backer Boards **~~Fiber-cement, fiber-mat reinforced cementitious backer units, glass mat gypsum backers and fiber-reinforced gypsum backers.~~** ~~Fiber-cement, fiber mat reinforced cementitious backer units, glass mat gypsum backers or fiber-reinforced gypsum backers in compliance with ASTM C 1288, C 1325, C 1178 or C 1278, respectively, and installed in accordance with manufacturers' recommendations shall be~~ Materials used as backers for wall tile in tub and shower areas and wall panels in shower areas shall be of materials listed in Table R702.4.2, and installed in accordance with the manufacturer's recommendations.

R702.4.2
BACKER BOARD MATERIALS

MATERIAL	STANDARD
Glass mat gypsum backing panel	ASTM C 1178
Fiber-reinforced gypsum panels	ASTM C 1278
Nonabestos fiber-cement backer board	ASTM C 1288 or ISO 8336, Category C
Nonasbestos fiber mat reinforced cementitious backer units	ASTM C 1325

Add new standard to Chapter 44 as follows:

ISO

ISO 8336 Fibre-Cement Flat Sheets – Product Specification and Test Methods

Reason: The current wording is cumbersome for the backer board materials permitted for use in this section. The text is revised to reference permitted backer board materials now defined in new TABLE R702.4.2 where all 4 permitted products would now be listed. This revision also makes the addition of future recognized products to the Code easier by simple addition to the table. Performance requirements of ISO 8336, *Fibre-cement flat sheets – Product specification and test methods*, have been harmonized with the performance requirements of ASTM C1288, *Standard Specification for Discrete Non-Asbestos Fiber-Cement Interior Substrate Sheets*. Fiber-cement producers in Mexico, Central and South America, Europe, Asia, Australia and New Zealand currently manufacture and test their fiber-cement products for compliance with ISO 8336. The inclusion of this Standard reference in the IRC will permit manufacturers worldwide to demonstrate product compliance to IBC requirements. The addition of a reference to ISO 8336 in the Code removes a barrier to trade.

IBC Section 2509.2 has, as a result of the Group A IBC Code Hearings, been revised to adopt this format for approved product presentation. The addition of the new referenced ISO standard and "product category" were also approved during the Group A IBC Code Hearings. This proposed revision brings the two building codes (IBC & IRC) and the applicable code sections and standards references into general alignment.

Cost Impact: The code change proposal will not increase the cost of construction because the proposed code change is editorial in nature to better clarify and present the backer board products currently recognized in the Code.

Analysis: A review of the standard proposed for inclusion in the code, ISO 8336 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2012.

R702.4.2-RB-MULDER.doc

Committee Action Hearing Results

For staff analysis of the content of ISO8336 relative to CP#28, Section 3.6, please visit:
http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf

Committee Action: **Approved as Submitted**

Committee Reason: Based upon the committee's previous action on RB256-13 and RB257-13. Also, this is consistent with the IBC structural committee action in Group A.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

John Mulder, Intertek Testing Services NA, Inc., representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R702.4.2 Backer Boards Materials used as backers for wall tile in tub and shower areas and wall panels in shower areas shall be ~~of materials~~ as listed in Table R702.4.2, and installed in accordance with the manufacturer's recommendations.

Commenter's Reason: The proposed editorial change corrects the grammar of the sentence deleting the double use of the word "materials"

R702.7, R702.7.1, Table R702.7.1, R702.7.2

Proposed Change as Submitted

Proponent: Jay Crandell, P.E., ARES Consulting, representing Foam Sheathing Committee / American Chemistry Council (jcrandell@aresconsulting.biz)

Revise as follows:

R702.7 Vapor retarders. Vapor retarders as described in Section R702.7.3 shall be provided in accordance with Sections R702.7.1 and R702.7.2 or an approved design using accepted engineering practice for hygrothermal analysis.

R702.7.1 Class I and II Vapor Retarders. Class I or II vapor retarder membranes shall not be provided on the interior face of frame walls in Climate Zones 1 and 2. Class I vapor retarder membranes shall not be provided on the interior face of frame walls in Climate Zones 3 and 4. A Class I or II vapor retarder material ~~are required~~ shall be provided on the interior side of frame walls in Climate Zones 5, 6, 7, 8 and Marine 4. The appropriate Climate Zone shall be selected in accordance with Table N1101.10

Exceptions:

1. Basement walls.
2. Below-grade portion of any wall.
3. Construction where moisture or its freezing will not damage the materials.
4. Conditions where Class III vapor retarders are required in Section R702.7.2.

~~R702.7.1~~R702.7.2 Class III vapor retarders. Class III vapor retarders shall be permitted where any one of the conditions in Table R702.7.1 is met. Only Class III vapor retarder membranes in accordance with Section R702.7.3 shall be used on the interior face of frame walls where continuous insulation with perm rating of less than 1 perm is applied in accordance with Table R702.7.1 on the exterior side of the frame wall.

~~R702.7.2~~ R702.7.3 Material vapor retarder class. The *vapor retarder class* of any material used as a vapor retarder shall be based on the manufacturer's certified testing or a tested assembly. The following vapor retarder membranes shall be deemed to meet the class specified:

Class I: Sheet polyethylene, nonperforated aluminum foil
Class II: Kraft-faced fiberglass batts or paint with a perm rating greater than 0.1 and less than or equal to 1.0.
Class III: Latex or enamel paint.

TABLE R702.7.1
CLASS III VAPOR RETARDERS

CLIMATE ZONE	CLASS III VAPOR RETARDERS PERMITTED FOR:[a]
Marine 4	Vented cladding over wood structural panels. Vented cladding over fiberboard. Vented cladding over gypsum. ~~Insulated sheathing~~ Exterior continuous insulation with R-value ≥2.5 over 2x4 wall. ~~Insulated sheathing~~ Exterior continuous insulation with R-value ≥3.75 over 2x6 wall
5	Vented cladding over wood structural panels. Vented cladding over fiberboard.

	Vented cladding over gypsum. ~~Insulated sheathing~~ Exterior continuous insulation with R-value ≥5 over 2x4 wall. ~~Insulated sheathing~~ Exterior continuous insulation with R-value ≥7.5 over 2x6 wall
6	Vented cladding over fiberboard. Vented cladding over gypsum. ~~Insulated sheathing~~ Exterior continuous insulation with R-value ≥7.5 over 2x4 wall. ~~Insulated sheathing~~ Exterior continuous insulation with R-value ≥11.25 over 2x6 wall
7 and 8	~~Insulated sheathing~~ Exterior continuous insulation with R-value ≥10 over 2x4 wall. ~~Insulated sheathing~~ Exterior continuous insulation with R-value ≥15 over 2x6 wall

For SI: 1 pound per cubic foot = 16 kg/m^3.

a. Spray foam with minimum density of 2 lb/ft^3 applied to the interior cavity side of wood structural panels, fiberboard, insulated sheathing or gypsum is deemed to meet the ~~insulated sheathing~~ exterior continuous insulation requirement where the spray foam R-value or the combination of spray foam and exterior continuous insulation R-value meets or exceeds the specified ~~insulated sheathing~~ exterior continuous insulation R-value.

Reason: A similar proposal was approved as submitted for the 2015 IBC (FS 160-12). In this coordinating proposal for the IRC, vapor retarder provisions are identically strengthened to better promote seasonal drying of walls and avoid a "double vapor barrier" condition in combination with a "warm wall" design using insulating sheathing in cold climates. In addition, requirements are clarified to promote proper application and enforcement. For example, provision is added to clarify that low perm vapor retarder membranes on the interior face of walls shall not be used in the warmer climate zones as indicated to avoid a reversed vapor retarder and creation of a condensation plane. Where appropriate, language also is added to differentiate from membrane-type vapor retarders and other materials or practices, such as use of foam plastics which can control vapor condensation as a vapor retarder material and insulation material to prevent dew-point temperatures from occurring within an envelope assembly. Finally, the term "insulated sheathing" is replaced with "continuous insulation" to provide a more generic requirement that is inclusive of a variety of materials that can be used for this purpose.

Cost Impact: The code change proposal will not increase the cost of construction.

R702.7-RB-CRANDELL.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee feels this is an important issue but the proposal is needlessly complex. The proponent should rework with the modification submitted and bring back.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jay H. Crandell, ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council, and Michael D. Fischer, Kellen Company, representing Kellen Codes, Standards and Regulatory Advocacy, request Approval as Modified by this Public Comment.

Replace the proposal as follows:

R702.7 Vapor retarders. Vapor retarders complying with Section R702.7.1 shall be provided in accordance with Table R702.7(1).~~Class I or II vapor retarders are required on the interior side of frame walls in Climate Zones 5, 6, 7, 8 and Marine 4.~~

Exceptions:

1. Basement walls.
2. Below-grade portion of any wall.
3. Construction where moisture or its freezing will not damage the materials.
4. Assemblies designed and constructed in accordance with an approved hygrothermal analysis.

~~**R702.7.2 Class III vapor retarders.** Class III vapor retarders shall be permitted where any one of the conditions in Table R702.7.1 is met.~~

R702.7.~~3.~~1 Material vapor retarder class. The *vapor retarder class* of any material used as a vapor retarder shall be based on the manufacturer's certified testing or a tested assembly. The following vapor retarder membranes shall be deemed to meet the class specified:

Class I: Sheet polyethylene, nonperforated aluminum foil
Class II: Kraft-faced fiberglass batts or paint with a perm rating greater than 0.1 and less than or equal to 1.0.
Class III: Latex or enamel paint.

TABLE R702.7(1)
REQUIREMENTS FOR VAPOR RETARDER
ON INTERIOR FACE OF ASSEMBLIES

Climate Zone[a]	Class I	Class II	Class III
1-2	not permitted[b]		permitted
3-4	not permitted	permitted[c]	
4 Marine, 5-8	Required[c] -- Class I[d], Class II , or Class III[e]		

a. Climate Zone shall be selected in accordance with Table N1101.10
b. Kraft paper insulation facer or other Class II vapor retarders with equal or greater perm rating shall be permitted.
c. Use of exterior continuous insulation in Climate Zones 4-8 with a Class I or II interior vapor retarder shall be in accordance with the additional requirements of Table R702.7(2)
d. A Class I vapor retarder shall not be provided on the interior face of the assembly where a Class I vapor retarder material is installed on the exterior face of the assembly.
e. The use of Class III vapor retarders in Climate Zones 4 Marine and 5-8 shall be in accordance with Table R702.7(3).

TABLE R702.7(2)
EXTERIOR CONTINUOUS INSULATION
WITH CLASS I OR CLASS II INTERIOR VAPOR RETARDERS

CLIMATE ZONE	Maximum Heating Degree Days ($HDD65^{o}F$)	Minimum R_e/R_i Ratio[a]
1-3	n/a	n/a
4	5,400	0.2
5	7,200	0.2
6	9,000	0.2
7	12,600	0.35
8	15,000	0.45
8	20,000	0.6
8	>20,000	0.75

For SI: °C = [(°F)-32]/1.8.; 1 R = 0.176 RSI

a. R_e = exterior continuous insulation R-value; R_i = permeable cavity insulation R-value interior of continuous insulation. The minimum ratio of R_e/R_i shall be used to determine acceptable combinations of continuous insulation and cavity insulation. Interpolation for intermediate values of heating degree days shall be permitted.

b. Spray foam with a maximum permeance of 1.5 perms at the installed thickness, applied to the interior cavity side of wood structural panels, fiberboard, insulating sheathing or gypsum shall be permitted to apply its R-value to the R_e value.

TABLE R702.7(3)~~.1~~
CLASS III INTERIOR VAPOR RETARDERS

CLIMATE ZONE	CLASS III VAPOR RETARDERS PERMITTED FOR:[a]
Marine 4	Vented cladding over wood structural panels.
	Vented cladding over fiberboard.
	Vented cladding over gypsum.
	Insulated sheathing with *R*-value ≥ 2.5 over 2 × 4 wall.
	Insulated sheathing with *R*-value ≥ 3.75 over 2 × 6 wall.
5	Vented cladding over wood structural panels.
	Vented cladding over fiberboard.
	Vented cladding over gypsum.
	Insulated sheathing with *R*-value ≥ 5 over 2 × 4 wall.
	Insulated sheathing with *R*-value ≥ 7.5 over 2 × 6 wall.
6	Vented cladding over fiberboard.
	Vented cladding over gypsum.
	Insulated sheathing with *R*-value ≥ 7.5 over 2 × 4 wall.
	Insulated sheathing with *R*-value ≥ 11.25 over 2 × 6 wall.
7 and 8	Insulated sheathing with *R*-value ≥ 10 over 2 × 4 wall.
	Insulated sheathing with *R*-value ≥ 15 over 2 × 6 wall.

(Portions of Table not shown remain unchanged)

Commenter's Reason:

(Crandell): The original RB358-13 proposal and a floor modification received positive technical feedback and discussion at the code development hearing and the committee recognized that "this is an important issue" (see reason statement with the original proposal). But, the committee also felt that the floor modification needed to be simplified and directed the proponent to "rework with the modification submitted and bring back" to the final action hearing. This public comment is submitted for that purpose.

The following is a brief explanation and summary of the key features of this proposal:

1. There are no technical changes included in this public comment on the original proposal and floor modification as presented at the first hearing (except to coordinate with committee action on RB357).
2. As requested by the committee, the original proposal and floor modification have been reworked to provide a simple means of determining vapor retarder requirements. For most construction, it's a one-step look-up process that begins and ends with Table R702.7(1).
3. If a Class III vapor barrier is used in Climate Zones 4 Marine and 5-8, a simple table is used to look-up requirements (same as existing table in the code, just renumbered to Table R702.7(3))
4. If continuous insulation is used, sizing of the insulation package (ratio of continuous insulation R-value vs. cavity R-value) is provided in Table R702.7(2) to ensure that the insides of such walls are warm enough in a given climate to control condensation potential (e.g., limit occurrence of dew-point temperature within the wall). These provisions are based on a review of scientific literature and successful practices included in the National Building Code (NBC) of Canada since 1995 (1)(2). This approach allows for many compliant solutions. Table R702.7(2) does not apply to walls without exterior continuous insulation.

In addition to the above, this proposal includes clear language to prohibit construction of walls that are dual vapor barrier assemblies which do not provide adequate drying potential of assemblies (refer to Table R702.7(1), footnote d). Furthermore, the proposed Table R702.7(1) makes it very clear where interior vapor retarders of the three classes are permitted, not permitted, or required such that occurrences of a "reversed" vapor retarder wall are avoided (e.g., table clearly prohibits use of a Class I vapor retarder in the inside of walls in hot/humid climates where this causes well-documented condensation and moisture-related problems).

Finally, it is important to note that this proposal introduces no new requirements that are not already intended, except for new Table R702.7(2) which addresses appropriate vapor retarder requirements only for walls with continuous insulation. For additional information on this public comment, including technical references and practical guidance, refer to the additional technical information to be provided at http://fsc.americanchemistry.com .

References on NBC provisions:

"NBC 9.25.1.2: The on-going development of building code requirements to address low air and vapour permeance materials", NRCC-47656, 10th Canadian Conference on Building Science and the Integrated Design Process, May 12-13, 2005, National Research Council Canada

(2) Kumaran, M.K. and Haysom, J.C. (2000) "Low-Permeance Materials in Building Envelopes", Construction Technology Update No. 41, Institute for Research in Construction, National Research Council of Canada. Revised March 2002.

(Fischer): The proposed modification in this public comment includes a consideration for the use of spray foam to comply with the continuous insulation prescriptions contained in the proposed tables. This revision brings the comment into agreement with the IRC Building code committee action on RB357-13, and insures that the committee intent on that proposal is maintained in this additional change.

The building science concepts carried in this proposal will improve moisture management within wall assemblies, and thus improve building performance, durability, and effective energy efficiency. It provides clear direction on the use of vapor barriers in high performance walls, and helps to ensure that vapor barrier systems are properly designed, selected, and installed.

RB358-13

Final Action: AS AM AMPC____ D

RB362-13
R703.2, Chapter 44

Proposed Change as Submitted

Proponent: Theresa A. Weston, PhD., DuPont Building Innovations (theresa.a.weston@usa.dupont.com)

Revise as follows:

R703.2 Water-resistive barrier. One layer of ~~No.15 asphalt felt~~ water-resistive barrier, free from holes and breaks, complying with ASTM E 2556, such as ASTM D 226 ~~for~~ Type 1 felt, or other approved water-resistive barrier shall be applied over studs or sheathing of all exterior walls. ~~Such felt or material~~ The water-resistive barrier shall be applied horizontally, with the upper layer lapped over the lower layer not less than 2 inches (51 mm). Where joints occur, ~~felt~~ the water-resistive barrier shall be lapped not less than 6 inches (152 mm). The ~~felt or other approved material~~ water-resistive barrier shall be continuous to the top of walls and terminated at penetrations and building appendages in a manner to meet the requirements of the exterior wall envelope as described in Section R703.1.

Exception: Omission of the water-resistive barrier is permitted in the following situations:

1. In detached accessory buildings.
2. Under exterior wall finish materials as permitted in Table R703.4.
3. Under paperbacked stucco lath when the paper backing is an approved water-resistive barrier.

Add new standard to Chapter 44 as follows:

ASTM

E2556-10 Standard Specification for Vapor Permeable Flexible Sheet Water-Resistive Barriers Intended for Mechanical Attachment

Reason: The proposal updates the water-resistive barrier reference to the most consensus standard. ASTM E2556 includes house wrap materials, and building papers in addition to traditional felt, and therefore is more representative of the state of the industry. ASTM E2556 is consistent with the current ICC-ES acceptance criteria for water-resistive barriers and therefore should not limit the use of current WRB's. The materials included in ASTM E2556 – felt, Grad D paper, and building wraps – are all installed in the manner currently prescribed in this section of the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E 2556 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2012.

R703.2 #2-RB-WESTON.doc

Committee Action Hearing Results

For staff analysis of the content of ASTM E2556-10 relative to CP#28, Section 3.6, please visit: http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf

Committee Action: Disapproved

Committee Reason: The committee feels the language contains commentary. The reference standard is not appropriate for the application and the complete system should be tested in lieu of the components.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Theresa A. Weston, PhD., Dupont Building Innovations, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R703.2 Water-resistive barrier. One layer water-resistive barrier, free from holes and breaks, complying with ASTM E 2556, ~~such as ASTM D 226 Type 1 felt~~, or other approved water-resistive barrier shall be applied over studs or sheathing of all exterior walls. The water-resistive barrier shall be applied horizontally, with the upper layer lapped over the lower layer not less than 2 inches (51 mm). Where joints occur, the water-resistive barrier shall be lapped not less than 6 inches (152 mm). The water-resistive barrier shall be continuous to the top of walls and terminated at penetrations and building appendages in a manner to meet the requirements of the exterior wall envelope as described in Section R703.1.

Exception: Omission of the water-resistive barrier is permitted in the following situations:

1. In detached accessory buildings.
2. Under exterior wall finish materials as permitted in Table R703.4.
3. Under paperbacked stucco lath when the paper backing is an approved water-resistive barrier.

Commenter's Reason: The original proposal updates the water-resistive barrier reference to include consensus standard for water-resistive barrier materials. ASTM E2556 includes house wrap materials, and building papers in addition to traditional felt, and therefore updates the code to include practices that are have been used for the last two decades and, are in fact, used by the majority of the industry. ASTM E2556 is consistent with the current ICC-ES acceptance criteria for water-resistive barriers and therefore should not limit or change the use of current WRB's. The materials included in ASTM E2556 – felt, Grade D paper, and building wraps – are all installed in the manner currently prescribed in this section of the code, "applied horizontally, with the upper layer lapped over the lower layer" and therefore, the inclusion of a material only standard is appropriate. The modification does address the committee's comments on commentary and deletes the commentary the committee identified.

RB362-13

Final Action: AS AM AMPC____ D

RB364-13
R703.2, Chapter 44

Proposed Change as Submitted

Proponent: Theresa A. Weston, PhD., DuPont Building Innovations (theresa.a.weston@usa.dupont.com)

Revise as follows:

R703.2 Water-resistive barrier. One layer of No. 15 asphalt felt, free from holes and breaks, complying with ASTM D 226 for Type 1 felt or other approved water-resistive barrier shall be applied over studs or sheathing of all exterior walls. Such felt or material shall be applied horizontally, with the upper layer lapped over the lower layer not less than 2 inches (51 mm). Where joints occur, felt shall be lapped not less than 6 inches (152 mm). The felt or other approved material shall be continuous to the top of walls and terminated at penetrations and building appendages in a manner to meet the requirements of the exterior wall envelope as described in Section R703.1.

Exception: Omission of the water-resistive barrier is permitted in the following situations:

1. In detached accessory buildings.
2. Under exterior wall finish materials as permitted in Table R703.4.
3. Under paperbacked stucco lath when the paper backing is an approved water-resistive barrier.
4. In a wall assembly that has been tested in accordance with and meets the requirements of AAMA 504.

Add new standard to Chapter 44 as follows:

AAMA

AAMA 504-05 Voluntary Laboratory Test Method to Qualify Fenestration Installation Procedures

Reason: This proposal provides a testing alternative to the prescriptive water-resistive barrier material and installation provided in R703.2. This will allow for innovation while still ensuring the performance and durability of the WRB system. AAMA 504 is an industry standard that includes the water resistance testing of assemblies including "*certain physical loading and temperature cycling conditions to simulate service conditions*". The inclusion of physical loading and temperature cycling as a durability assessment is important to water-resistive barrier systems as they have low accessibility after construction and are critical to moisture performance of the wall system.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, AAMA 504 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2012.

R703.2 #1-RB-WESTON.docc

Committee Action Hearing Results

For staff analysis of the content of AAMA 504-05 relative to CP#28, Section 3.6, please visit: http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf

Committee Action: **Disapproved**

Committee Reason: The committee feels that the standard only tests a component and not the assembly.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Theresa A. Weston, PhD., Dupont Building Innovations, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R703.2 Water-resistive barrier. One layer of No. 15 asphalt felt, free from holes and breaks, complying with ASTM D 226 for Type 1 felt or other approved water-resistive barrier shall be applied over studs or sheathing of all exterior walls in accordance with Section R703.2.1. ~~Such felt or material shall be applied horizontally, with the upper layer lapped over the lower layer not less than 2 inches (51 mm). Where joints occur, felt shall be lapped not less than 6 inches (152 mm). The felt or other approved material shall be continuous to the top of walls and terminated at penetrations and building appendages in a manner to meet the requirements of the exterior wall envelope as described in Section R703.1.~~

Exception: Omission of the water-resistive barrier is permitted in the following situations:

1. In detached accessory buildings.
2. Under exterior wall finish materials as permitted in Table R703.4.
3. Under paperbacked stucco lath when the paper backing is an approved water-resistive barrier.
4. ~~In a wall assembly that has been tested in accordance with and meets the requirements of AAMA 504.~~

R703.2.1 Application. Such felt or material shall be applied horizontally, with the upper layer lapped over the lower layer not less than 2 inches (51 mm). Where joints occur, felt shall be lapped not less than 6 inches (152 mm). The felt or other approved material shall be continuous to the top of walls and terminated at penetrations and building appendages in a manner to meet the requirements of the exterior wall envelope as described in Section R703.1. Fenestration openings shall be flashed in accordance with R703.8 or tested in accordance with, and meet the requirements of, AAMA 504.

Commenter's Reason: The original proposal provides a testing alternative to the prescriptive water-resistive barrier material and installation provided in R703.2. AAMA 504 is an industry standard that includes the water resistance testing of assemblies including "*certain physical loading and temperature cycling conditions to simulate service conditions*". The inclusion of physical loading and temperature cycling as a durability assessment is important to water-resistive barrier and integrated flashing systems as they have low accessibility after construction and are critical to moisture performance of the wall system.

The modified proposal answers the committee's concerns on the applicability of the test standard in two ways. First, it separates the application of water-resistive barriers from the water-resistive barrier material requirements. The proposed test method reference addresses the interface of materials. The performance and durability of alternate water-resistive barrier materials must be separately addressed in addition to testing installation methods. Second, the modification limits the use of the test method to be more consistent with the scope of the reference standard.

Public Comment 2:

Julie Ruth, JRuth Code Consulting, representing American Architectural Manufacturers Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R703.2 Water-resistive barrier. One layer of No. 15 asphalt felt, free from holes and breaks, complying with ASTM D 226 for Type 1 felt or other approved water-resistive barrier shall be applied over studs or sheathing of all exterior walls. Such felt or material shall be applied horizontally, with the upper layer lapped over the lower layer not less than 2 inches (51 mm). Where joints occur, felt shall be lapped not less than 6 inches (152 mm). The felt or other approved material shall be continuous to the top of walls and terminated at penetrations and building appendages in a manner to meet the requirements of the exterior wall envelope as described in Section R703.1. Fenestration openings shall be flashed in accordance with R703.8 or tested in accordance with, and meet the requirements of, AAMA 504.

Exception: Omission of the water-resistive barrier is permitted in the following situations:

1. In detached accessory buildings.
2. Under exterior wall finish materials as permitted in Table R703.4.
3. Under paperbacked stucco lath when the paper backing is an approved water-resistive barrier.
4. ~~In a wall assembly that has been tested in accordance with and meets the requirements of AAMA 504.~~

(Portions of code change proposal not shown remain unchanged)

Commenter's Reason: The original proposal provided an exception to the requirement for a water resistive barrier in wall assemblies that have been tested in accordance with AAMA 504 and met its requirements. The committee disapproved the proposal as submitted because they felt the standard only tested a component of a wall assembly and not the entire assembly and therefore was not appropriate as an exception to a requirement for the entire assembly.

In actuality AAMA 504 is intended as a test method for verifying the continuity of the water resistive barrier from the exterior wall assembly through to fenestration placed in that assembly. So the committee was correct in their understanding that AAMA 504 was not intended to test a wall assembly. it does, however, test more than a single component. It tests the assembly of components that are used to create an interface between the exterior wall assembly and fenestration placed within that wall.

The integrity of the water resistive barrier through the interface between the exterior wall and fenestration is an important aspect of proper window and door installation. AAMA's members have spent many years studying the properties of water, water penetration, water resistance, and how to properly install a window into an exterior wall while preventing water penetration into the wall from the exterior.

Section R703.2 addresses the water resistive barrier in an exterior wall, and penetration and appendages to that wall. Specifically, penetrations through the exterior wall are required to comply with Section R703.1.

The continuity of the water resistive barrier around and through fenestration openings, however, is not addressed in Section R703.1. This Public Comment modifies the original proposal to specifically address fenestration openings in the exterior wall assembly. It specifies that fenestration openings are to be flashed in accordance with Section R703.8, or they shall be tested in accordance with, and meet the requirements of, AAMA 504. Both methods are appropriate means of providing continuity of the water resistive barrier through and around fenestration openings.

RB364-13

Final Action: AS AM AMPC____ D

RB365-13
R703.1.1, R703.2, R703.2.1 (NEW), R703.2.2 (NEW), R703.8

Proposed Change as Submitted

Proponent: Jay Crandell, P.E., ARES Consulting, representing Foam Sheathing Committee and American Chemistry Council (jcrandell@aresconsulting.biz)

Revise as follows:

R703.1.1 Water resistance. The exterior wall envelope shall be designed and constructed in a manner that prevents the accumulation of water within the wall assembly by providing a water-resistant barrier behind the exterior veneer as required by Section R703.2 and a means of draining to the exterior water that enters the assembly.
Protection against condensation in the exterior wall assembly shall be provided in accordance with Section R702.7 of this code.

Exceptions:

1. A weather-resistant exterior wall envelope shall not be required over concrete or masonry walls designed in accordance with Chapter 6 and flashed according to Section R703.7 or R703.8.
2. Compliance with the requirements for a means of drainage, and the requirements of Sections R703.2 and R703.8, shall not be required for an exterior wall envelope that has been demonstrated to resist wind-driven rain through testing of the exterior wall envelope, including joints, penetrations and intersections with dissimilar materials, in accordance with ASTM E 331 under the following conditions:
    2.1. Exterior wall envelope test assemblies shall include at least one opening, one control joint, one wall/eave interface and one wall sill. All tested openings and penetrations shall be representative of the intended end-use configuration.
    2.2. Exterior wall envelope test assemblies shall be at least 4 feet by 8 feet (1219 mm by 2438 mm) in size.
    2.3. Exterior wall assemblies shall be tested at a minimum differential pressure of 6.24 pounds per square foot (299 Pa).
    2.4. Exterior wall envelope assemblies shall be subjected to the minimum test exposure for a minimum of 2 hours.

    The exterior wall envelope design shall be considered to resist wind-driven rain where the results of testing indicate that water did not penetrate control joints in the exterior wall envelope, joints at the perimeter of openings penetration or intersections of terminations with dissimilar materials.

3. <u>Water resistive barrier materials and methods used as an alternative to Section R703.2.1 or R703.2.2 shall comply with the following:</u>

    1. <u>The testing required by Exception 2 of Section R703.1.1 applies except:</u>

        <u>1.1. Cladding is not required.</u>
        <u>1.2. The minimum pressure differential shall be 2.86 pounds per square foot (137Pa).</u>
        <u>1.3. The minimum test exposure time shall be 15 minutes.</u>

1.4. <u>The performance need not exceed the performance of the water resistive barrier installation specified in Section R703.2.1 or R703.2.2 as tested under identical minimum pressure and exposure time conditions.</u>

2. <u>The alternative water resistive barrier shall be installed in accordance with the manufacturer's installation instructions.</u>

R703.2 Water-resistive barrier. <u>Water-resistive barriers shall comply with Section R703.2.1 or R703.2.2, or shall be approved in accordance with Section R703.1.1, exception #3.</u>

Exception: Omission of the water-resistive barrier is permitted in the following situations:

1. In detached accessory buildings.
2. Under exterior wall finish materials as permitted in Table R703.4.
3. Under paperbacked stucco lath when the paper backing is an approved water-resistive barrier.

<u>**R703.2.1 No. 15 asphalt felt.**</u> One layer of No. 15 asphalt felt, free from holes and breaks, complying with ASTM D 226 for Type 1 felt ~~or other approved water-resistive barrier~~ shall be applied over studs or sheathing of all exterior walls. Such felt ~~or material~~ shall be applied horizontally, with the upper layer lapped over the lower layer not less than 2 inches (51 mm). Where joints occur, felt shall be lapped not less than 6 inches (152 mm). The felt ~~or other approved material~~ shall be continuous to the top of walls and terminated at penetrations and building appendages in a manner to meet the requirements of the exterior wall envelope as described in Section R703.1.

<u>**R703.2.2 Grade D paper.** Grade D paper behind exterior plaster and lath shall installed in accordance with Section R703.6.3.</u>

R703.8 Flashing. *Approved* corrosion-resistant flashing shall be applied shingle-fashion in a manner to prevent entry of water into the wall cavity or penetration of water to the building structural framing components. Self-adhered membranes used as flashing shall comply with AAMA 711. The flashing shall extend to the surface of the exterior wall finish <u>or a water-resistive barrier complying with Section R703.2</u>. *Approved* corrosion-resistant flashings shall be installed at all of the following locations:

1. Exterior window and door openings. Flashing at exterior window and door openings shall extend to the surface of the exterior wall finish or to the water-resistive barrier for subsequent drainage. Flashing at exterior window and door openings shall be installed in accordance with one or more of the following:
   - 1.1. The fenestration manufacturer's installation and flashing instructions, or for applications not addressed in the fenestration manufacturer's instructions, in accordance with the flashing manufacturer's instructions. Where flashing instructions or details are not provided, pan flashing shall be installed at the sill of exterior window and door openings. Pan flashing shall be sealed or sloped in such a manner as to direct water to the surface of the exterior wall finish or to the water-resistive barrier for subsequent drainage. Openings using pan flashing shall also incorporate flashing or protection at the head and sides.
   - 1.2. In accordance with the flashing design or method of a registered design professional.
   - 1.3. In accordance with other approved methods.
2. At the intersection of chimneys or other masonry construction with frame or stucco walls, with projecting lips on both sides under stucco copings.
3. Under and at the ends of masonry, wood or metal copings and sills.
4. Continuously above all projecting wood trim.
5. Where exterior porches, decks or stairs attach to a wall or floor assembly of wood-frame construction.
6. At wall and roof intersections.

7. At built-in gutters.

Reason:

This proposal reorganizes Section R703.2 and coordinates with water-resistance requirements of Section R703.1.1 to more completely and clearly address the types of water-resistive barriers currently included in the IRC and define requirements for alternatives. It also coordinates proper integration of flashing with the water-resistive barrier layer in Section R703.8.

Most importantly, this proposal addresses a critical gap in the code by establishing a uniform water penetration performance requirement for all types of “other approved” (alternative) water resistive barriers. The proposed water resistance requirements rely on the same test method already include in Section R703.1.1 and modifies the criteria to be appropriate for testing the WRB layer alone (not including cladding) such that alternative WRB’s can be used with any cladding material without having to test a full assembly for each type of cladding or apply criteria in Section R703.1.1 that are meant to be applied with cladding present. The proposed water resistance test criteria (2.86 psf and 15 minute duration) are identical to requirements for water penetration testing of water-resistive barrier coatings in accordance with ASTM E2570 and are appropriately more restrictive than the water-resistance criteria applied to water-resistive air-barrier materials per ASTM E1677.

This change is necessary because some alternative water-resistive barrier materials, such as polymer-based barriers (i.e., “building wraps”) are approved for use only requiring a material property to be tested and standards for this type of material, such as ASTM E2556, do not address actual installed performance of the water-resistive barrier including penetrations, fastenings, joint detailing and other factors representative of end-use conditions. In fact, ASTM E 2556 states in its scope that “this specification is limited to the evaluation of materials and does not address installed performance.” Installed performance is surely the most important consideration and it is neglected in current standards for some materials.

The main reason for this proposal is that WRB performance is largely governed by how it performs as an installed assembly under in-service moisture exposure conditions. This concern is addressed for some types of WRB materials and installations (e.g., WRB panels, WRB coatings, etc.), but not for others (e.g, polymer-based barriers or wraps).

The significance of this concern over the lack of a uniform water-penetration resistance requirement is documented in the literature (Hall, G.D. and Hoigard, K.R., “Water-Resistive Barriers: How do they compare?”, *Interface*, November 205). In particular, this reference evaluated current code requirements, acceptance criteria, and field experience. It also reports comparative test data under installed water exposure conditions. The primary conclusions from the study include:

“Current building code provisions offer no rational means of assessing the equivalency of alternative WRB products to ASTM D-266 type 1 asphalt-saturated felt…”

“The three water resistance test methods specified in AC38 vary so significantly in test duration and applied hydrostatic pressure that no meaningful comparison of test data can be made. They fail to address several important moisture transport mechanisms that affect the in-service performance of WRBs.”

“Laboratory tests performed by the authors to simulate potential in-service conditions not addressed by AC38 resulted in water penetration through several commercially available WRB materials that, according to published manufacturer information, passed the requirements of AC38 for Grade D barriers.”

Clearly, these issues must be addressed in the IRC to ensure acceptable and consistent performance of various types of WRB materials and assemblies. Your approval of this proposal will establish a sound foundation for evaluation of alternative WRB materials and installations to avoid inconsistent requirements resulting in poor or inconsistent performance among alternative WRB materials.

Cost Impact: This proposal will not increase the cost of construction.

R703.1.1-RB-CRANDELL.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee feels the tests methods should be in a standard and not in the code text.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jay H. Crandell, AREA Consulting, representing Foam Sheathing Committee of the American Chemistry Council, request Approval as Submitted.

Commenter's Reason: This proposal provides testing requirements for testing of WRB materials as an assembly based on testing criteria that are already included in the code text for wall assemblies with cladding applied (but which are not appropriately and consistently applied to WRB materials and assemblies when tested without cladding applied for qualification purposes). Thus, the code already establishes a precedent for dealing with such matters in the code when existing standards are silent or inconsistent. Thus, the code development committee's reason that performance test should not be included in the code are inconsistent with current and past practice, especially when the code is supposed to provide consistent direction and a uniform performance baseline in these matters. The need for this proposal, as a means of establishing appropriate and consistent minimum test criteria for water-resistance testing of WRB assemblies, is thoroughly presented and supported by the technical literature in the original proposal submission as published in the agenda for the code development committee hearing. Please refer to the original proposal's reasons statement for technical justification. Your support of this PC at the final action hearing will ensure that enforcement of approved WRB materials and assemblies will result in consistent minimum performance across all WRB material types.

Final Action: AS AM AMPC____ D

RB367-13
R703.4, Table R703.5 (NEW)

Proposed Change as Submitted

Proponent: Andrew Herseth, US Dept of Homeland Security, Federal Emergency Management Agency (FEMA) and Glenn Overcash, URS Corporation representing FEMA

Revise as follows:

R703.4 Attachments. Unless specified otherwise, all wall coverings shall be securely fastened in accordance with Table R703.4 or with other *approved* aluminum, stainless steel, zinc-coated or other *approved* corrosion-resistive fasteners. The use of Table R703.4 shall be limited according to the building mean roof height, ultimate design wind speed in accordance with Figure R301.2(4)A, and exposure category in accordance with Section R301.2.1.4 as shown in Table R703.5. Where ~~the basic wind speed in accordance with Figure R301.2(4)A is 110 miles per hour (49 m/s) or higher~~ the limits of Table R703.5 are exceeded, the attachment of wall coverings shall be designed to resist the component and cladding loads specified in Table R301.2(2), adjusted for height and exposure in accordance with Table R301.2(3). For the determination of wall covering attachment, component and cladding loads shall be determined using an effective wind area of 10 ft^2.

TABLE R703.5
LIMITS FOR ATTACHMENT PER TABLE R703.4

Maximum Mean Roof Height			
Basic Wind Speed (mph-3-second gust)	**Exposure**		
	B	C	D
115	NL	50'	20'
120	NL	30'	DR
130	60'	15'	DR

NL = not limited by Table R703.5, DR = Design Required
For SI: 1 foot = 304.8 mm, 1 mile per hour = 0.447 m/s

Reason: The proposal is intended to better establish the current limits of the prescriptive fastening table for wall coverings. The prescriptive fastening requirements in Table R703.4 are limited to a maximum design pressure of 30 psf. According to Table R301.2(2), for Zone 5 and an effective wind area of 10 ft^2, the maximum negative pressure for a basic wind speed of 110 mph is 29.1 psf. This value – less than 30 psf – correlates directly with the 110 mph limitation in Section R703.4. However, the tabulated pressures in Table R301.2(2) are for an assumed Exposure B site condition and a mean roof height of 30 feet. For residential buildings with a basic wind speed of 110 mph and Exposure C or D, or a mean roof height greater than 30 feet, the maximum negative pressure would be substantially higher than 30 psf. For example, consider the case of a residential building located in Exposure C, with a mean roof height of 45 ft. The adjustment factor from Table R301.2(3) would be 1.53. The resulting maximum negative design pressure for a basic wind speed of 110 mph would be (29.1 psf) x 1.53 = 44.5 psf. This wall cladding load far exceeds the current implied limitation of Table R703.4 which is 30 psf.

Table R703.5 has been added to simplify the determination of whether prescriptive fastening provisions of Table R703.4 apply to a specific building. The limits in the table indicate where component and cladding pressures exceed 30 psf as a function of wind speed exposure and mean roof height. In most cases, especially in areas with lower wind speeds, the prescriptive fastening requirements in Table R703.4 will be verified as applicable. Chapter 7 of ICC 600 includes prescriptive attachment schedules for exterior wall coverings that may be applied when mean roof height limits per Table R703.5 are exceeded.

FEMA P-499, *Home Builder's Guide to Coastal Construction* (FEMA, 2009), includes Technical Fact Sheet 5.3 which addresses the attachment of siding in areas where wind loads for wall cladding exceed 30 psf as a result of wind speed, and/or exposure category and/or roof mean height by recommending the selection of a siding product rated for those conditions or higher. The manufacturer's product literature or installation instructions should specify the fastener type, size and spacing, and any other installation details such as requirements for the sheathing materials behind vinyl siding that is needed to achieve the product rating.

New language is also added to require design wind pressures to be determined using an effective wind are of 10 ft^2. For wall cladding, the effective wind area will be governed by the effective wind area of an individual fastener which will almost always be less than 10 ft^2.Guidance for Determining Site-Specific Loads in Chapter 8 of FEMA P-55, *Coastal Construction Manual* (FEMA, 2011), recommends that "for cladding and fasteners, the effective wind area should not be greater than the area that is tributary to an individual fastener. In ASCE 7-10, there is no adjustment for wind areas less than 10 ft2; therefore, sheathing suction loads (should be) based on an effective wind area of 10 ft2 for different zones on the roof."

Changing the trigger for using Table R703.4 from a wind speed limit to a pressure limit will result in better correlation of the actual limits of the table. The new attachment criteria would also make IRC consistent w/ ICC 600 and the Florida Building Code (FBC) where attachment provisions for exterior wall coverings are pressure-triggered.

Cost Impact: The code change proposal will not increase the cost of construction.

R703.4-RB-HERSETH-OVERCASH.doc

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

R703.4 Attachments. Unless specified otherwise, all wall coverings shall be securely fastened in accordance with Table R703.4 or with other *approved* aluminum, stainless steel, zinc-coated or other *approved* corrosion-resistive fasteners. ~~The use of Table R703.4 shall be limited according to the building mean roof height, ultimate design wind speed in accordance with Figure R301.2(4)A, and exposure category in accordance with Section R301.2.1.4 as shown in Table R703.5.~~ Where the design wind pressure exceeds 30 psf or where the limits of Table R703.5 are exceeded, the attachment of wall coverings shall be designed to resist the component and cladding loads specified in Table R301.2(2), adjusted for height and exposure in accordance with Table R301.2(3). For the determination of wall covering attachment, component and cladding loads shall be determined using an effective wind area of 10 ft^2.

TABLE R703.5
LIMITS FOR ATTACHMENT PER TABLE R703.4

Maximum Mean Roof Height			
~~Basic~~ Ultimate Wind Speed (mph-3-second gust)	**Exposure**		
	B	C	D
115	NL	50'	20'
120	NL	30'	DR
130	60'	15'	DR
140	35'	DR	DR

NL = not limited by Table R703.5, DR = Design Required
For SI: 1 foot = 304.8 mm, 1 mile per hour = 0.447 m/s

Committee Reason: The change provides for a method to determine that the limits of fastening in Table R703.4 are not exceeded. The modification clarifies the new language and corrects the table.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jay H. Crandell, ARES Consulting, representing Foam Sheathing Committee of the American Council and the Steel Framing Alliance, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

R703.4 Attachments. Unless specified otherwise, all wall coverings shall be securely fastened in accordance with Table R703.4(1) or with other *approved* aluminum, stainless steel, zinc-coated or other *approved* corrosion-resistive fasteners. Unless specified otherwise in accordance with this code, furring attachments to wall framing shall comply with Table R703.4(2). Where the design wind pressure exceeds 30 psf or where the limits of Table R703.5 are exceeded, the attachment of wall coverings and furring shall be designed to resist the component and cladding loads specified in Table R301.2(2), adjusted for height and exposure in accordance with Table R301.2(3). For the determination of wall covering attachment, component and cladding loads shall be determined using an effective wind area of 10 ft^2.

TABLE R703.4 (1)
WEATHER-RESISTANT SIDING ATTACHMENT AND MINIMUM THICKNESS

(Portions of Table not shown remain unchanged)

TABLE R703.4(2)
MINIMUM FURRING AND ATTACHMENT REQUIREMENTS
TO RESIST MAXIMUM 30 PSF DESIGN WIND LOAD[1,2,3]

Connection Method	16" Furring Spacing		24" Furring Spacing	
	1x3 Wood Furring	1x4 Wood Furring	1x3 or 1x4 Wood Furring	2x3 Wood Furring
8d common nail (2-1/2"x0.131"), minimum 1-1/4 penetration	1 at 12"oc or 2 at 16"oc	2 at 24"oc	2 at 16"oc	2 at 16"oc
#10 Wood Screw (minimum 1" penetration)	1 at 16"oc	1 at 24"oc	1 at 16"oc	1 at 24"oc
#8 screw[4] to minimum 33mil or thicker steel stud (minimum penetration of steel thickness + 3 threads)	1 at 16"oc	2 at 24"oc	1 at 12"oc or 2 at 16"oc	1 at 12"oc or 2 at 24"oc

For SI: 1 inch = 25.4mm

1. Wood furring and wall framing shall be Spruce-Pine-Fir or any wood species with a specific gravity of 0.42 or greater in accordance with AFPA/NDS. Wood structural panel wall sheathing of equal or greater effective specific gravity for withdrawal shall be permitted to be included in the penetration depth. The span of 1x4 furring across studs or between fastening points shall not exceed 24" inches for a maximum 16"oc furring spacing. In all other cases, 1x3 or 1x4 wood furring shall not exceed a 16" span across studs or between fastening points.
2. Where the required cladding fastener penetration into wood material exceeds ¾ inch (19.1 mm) and is not more than 1-1/2 inches (38.1 mm), a minimum 2x3 wood furring shall be used or an approved design. Minimum fastener penetration into wall framing shall not be reduced with use of thicker furring member.
3. Cold formed steel framing (studs, tracks, and hat channels) shall be minimum 33 ksi and minimum 33 mil thickness. A minimum 7/8-inch (22.2mm) deep steel hat channel shall be permitted to be substituted for 1x3 or 1x4 wood furring and shall use the respective fastening schedule. A minimum 1.5-inch (38.1mm) deep steel hat channel shall be permitted to be substituted for a 2x furring. Hat channels shall have a minimum 1-1/4 inch (31.8mm) top width, minimum ½-inch (12.7mm) side flanges, and a minimum total width of 2-1/2 inches (63.5mm).
4. Screws into cold formed steel framing shall comply with ASTM C1513. The minimum screw head size shall be 0.285 inches (7.2mm)

TABLE R703.5
LIMITS FOR ATTACHMENT PER TABLE R703.4(1) AND TABLE R703.4(2)

(Portions of Table not shown remain unchanged)

Commenter's Reason: RB367-13 was approved as modified to provide clear limits t prescriptive wall covering attachments for wind load resistance. The intent of this public comment is to further improve the goal of RB367-13 and to coordinate with the committee's action to approve as modified RB389-13 and RB390-13. This proposal is also consistent with the committee's approval of RB392-13 as modified with provisions for cladding connection to steel framing.

Furring attachments are often a part of a wall covering assembly and compatible attachment limits are needed to ensure a complete wind load path from the wall covering, through the furring, and to the framing. The topic of wind pressure resistance of furring attachments was included in proposals RB389-13 and RB390-13 for wood and cold-formed steel framing, but was removed by the proponent's modification approved by the code development committee. The code development committee recognized that wind pressure requirements for furring would be "better handled by other sections of the code" that are broader in scope of application. The appropriate section of code to address this issue is Section R703.4. Thus, it is appropriate to further modify RB367-13 which is directly related to the wind pressure concern for attachment of wall coverings (and furring is used as part of a wall covering assembly). Such information is currently missing from the code and can create a "weak link" for the wind load path through wall covering assemblies to framing.

The furring and attachments in proposed new Table R703.4(2) comply with the maximum 30 psf wind load limit for the IRC which is consistent with the limitations given in Table R703.5 added by RB367-13. The prescribed furring attachment in the proposed new Table R703.4(2) are limited by the lesser of:

1. allowable fastener withdrawal (based on the NDS and AISI S-100)
2. allowable bending strength of furring (based on NDS and AISI S-100)
3. fastener head pull-through (based on test data and literature-topic not addressed in design standard)

Proposed Change as Submitted

Proponent: David Roodvoets, DLR Consultants, representing Cedar Shake & Shingle Bureau

Revise as follows:

R703.5.1 Application. Wood shakes or shingles shall be applied either single-course or double-course over nominal $^{1}/_{2}$-inch (13 mm) wood-based sheathing or to furring strips over $^{1}/_{2}$-inch (13 mm) nominal nonwood sheathing . A permeable water-resistive barrier shall be provided over all sheathing, with horizontal overlaps in the membrane of not less than 2 inches (51 mm) and vertical overlaps of not less than 6 inches (152 mm). Where furring strips are used, they shall be 1 inch by 3 inches or 1 inch by 4 inches (25 mm by 76 mm or 25 mm by 102 mm) and shall be fastened horizontally to the studs with 7d or 8d box nails and shall be spaced a distance on center equal to the actual weather exposure of the shakes or shingles, not to exceed the maximum exposure specified in Table R703.5.2. The spacing between adjacent shingles to allow for expansion shall ~~not exceed $^{1}/_{4}$ inch (6 mm)~~ be 1/8 inch (3 mm) to ¼ inch (6 mm) apart and between adjacent shakes, ~~it~~ shall ~~not exceed $^{1}/_{2}$ inch (13 mm)~~ be 3/8 inch (10 mm) to ½ inch (13 mm) apart. The offset spacing between joints in adjacent courses shall be a minimum of $1^{1}/_{2}$ inches (38 mm).

24	~~11 ½~~ 10 ½	18

For SI: 1 inch = 25.4 mm.

a. Dimensions given are for No. 1 grade.
b. A maximum ~~10-inch~~ 9-inch exposure is permitted for No. 2 grade.
c. A maximum ~~11-inch~~ 10inch exposure is permitted for No. 2 grade.
d. A maximum 14-inch exposure is permitted for No. 2 grade.

~~**R703.5.3 Attachment.** Each shake or shingle shall be held in place by two hot-dipped zinc-coated, stainless steel, or aluminum nails or staples. The fasteners shall be long enough to penetrate the sheathing or furring strips by a minimum of $^{1}/_{2}$ inch (13 mm) and shall not be overdriven.~~

703.5.3 Attachment. Wood shakes or shingles shall be installed according to this chapter and the manufacturer's installation instructions. Each shake or shingle shall be held in place by two~~.~~ stainless steel Type 304 , Type 316 or hot-dipped zinc coated galvanized (conforming to minimum standard ASTM A 153 D (1.0 oz./ft^2)) corrosion resistant box nails in accordance with Table R703.5.1(2) or R703.5.1 (3). Alternatively, 16 gauge stainless steel Type 304 or Type 316 staples with crown widths 7/16 inch (11 mm) minimum, ¾ inch (19 mm) maximum shall be used and the crown of the staple shall be placed parallel with the butt of the shake or the shingle. In single-course application, the fasteners shall be concealed by the course above and shall be driven approximately 1 inch (25 mm) above the butt line of the succeeding course and ¾" (19 mm) from the edge. In double-course applications, the exposed shake or shingle shall be face-nailed with two fasteners, driven approximately 2 inches (51 mm) above the butt line and 3/4 inch (19 mm) from each edge. Fasteners installed within 15 miles 24 km) of salt water coastal areas shall be stainless steel Type 316. Fasteners for fire-retardant-treated in accordance with Section R902 or pressure-impregnated-preservative-treated shakes or shingles in accordance with AWPA U1 shall be, stainless steel Type 316. The fasteners shall be long enough to penetrate and shall penetrate the sheathing or furring strips by a minimum of ½ inch (13mm) and shall not be overdriven. Fasteners for untreated (natural) and treated products shall comply with ASTM F1667.

~~**R703.5.3.1 Staple attachment.** Wood shakes or shingles shall be installed according to this chapter and the manufacturer's installation instructions. Staples for untreated (natural) wood shakes or wood shingles shall be 16 gauge Stainless Steel Type 304,Type 316 (Fasteners installed within 15 miles of salt water coastal areas shall be stainless steel Type 316.) Staples shall not be less than 16 gauge and shall have a crown width of not less than minimum 7/16 inch (11mm), maximum of ¾" and the crown of the staples shall be parallel with the butt of the shake or shingle.~~
~~In single-course application, the fasteners shall be concealed by the course above and shall be driven approximately 1 inch (25mm) above the butt line of the succeeding course and ¾" (19mm) from the edge. In double-course applications, the exposed shake or shingle shall be face-nailed with two casing nails~~ staples~~, driven approximately 2 inches (51mm) above the butt line and 3/4" inch (19mm) from each edge. In all application, staples shall be concealed by the course above. With shingles wider than 810 inches (203254mm) two additional nails~~ staples ~~shall be required and shall be nailed driven approximately 1 inch (25mm) apart near the center of the shingle. Fasteners for fire-retardant-treated (as defined in section R902.2) shingles, shakes or pressure-impregnated-preservative-treated shingles or shakes in accordance with AWPA U1 shall be Stainless Steel Type 316, applied as above. Fasteners for untreated (natural) and treated products shall comply with ASTM F1667.~~

Revise as follows:

R905.7.5 Application. Wood shingles shall be installed according to this chapter and the manufacturer's installation instructions. Wood shingles shall be laid with a side lap not less than 1 ½" (38mm) between joints in courses, and no two joints in any three adjacent courses shall be in direct alignment. Spacing between shingles shall not be less than ¼" to 3/8" (6mm to 10mm). Weather exposures for wood shingles shall not exceed those set in Table R905.7.5. Fasteners for untreated (naturally durable) wood shingles shall be ~~corrosion resistant with a minimum penetration of ½ inch (13mm) into the sheathing~~. ~~For sheathing less than ½ inch (13mm) in thickness, the fasteners shall extend through the sheathing.~~ stainless steel Type 304, Type 316 or hot-dipped zinc coated galvanized (conforming to minimum standard ASTM A 153 D (1.0 oz./ft^2)) box nails in accordance with table R905.7.5 (2). Alternatively, 16 gauge stainless steel Type 304, or Type 316 staples with crown widths 7/16" (11mm) minimum, ¾" (19 mm) maximum shall be used. Fasteners installed within 15 miles (24km) of salt water coastal areas shall be stainless steel Type 316. All fasteners shall have a minimum penetration into the sheathing of ¾ inch (19 mm). For roof sheathing less than ~~½"~~ ¾" in (19 mm) thickness, each fastener shall ~~extend~~ penetrate through the sheathing. Wood shingles shall be attached to the roof with two fasteners per shingle positioned ~~no more than ¾" from each edge and no more than 1 inch (25mm) above the exposure line.~~ in accordance with the manufacturers installation instructions. Fasteners for fire-retardant-treated shingles in accordance with Section R902 or pressure-impregnated-preservative-treated shingles of naturally durable wood in accordance with AWPA U1 shall be stainless steel Type 316 and applied as above. Fasteners for untreated (natural) and treated products shall comply with ASTM F1667.

TABLE R905.7.5 (2)
NAIL REQUIREMENTS FOR WOOD SHAKES AND WOOD SHINGLES

Shakes	**ASTM F 1667 Nail Type and Minimum Length**
18" Straight-Split	5d Box 1 ¾"
18" and 24" Handsplit and Resawn	6d Box 2
24" Tapersplit	5d Box 1 ¾"
18" and 24" Tapersawn	6d Box 2
Shingles	**ASTM F 1667 Nail Type and Minimum Length**
16" and 18"	3d Box 1 ¼"
24"	4d Box 1 ½"

R905.8.6 Application. Wood shakes shall be installed according to this chapter and the manufacturer's installation instructions. Wood shakes shall be laid with a side lap not less than 1 ½" (38mm) between joints in adjacent courses. Spacing between shakes in the same course shall be 3/8 inch to 5/8 inch (9.5mm to 15.9mm) for shakes ~~and~~ including tapersawn shakes ~~of naturally durable wood shall be 3/8 inch to 5/8 inch (9.5 mm to 15.9 mm) for preservative-treated taper sawn shakes.~~ Weather exposures for wood shakes shall not exceed those set in Table R905.8.6. Fasteners for untreated (naturally durable) wood shakes shall be ~~corrosion resistant with a minimum penetration of ½ inch (12.7mm) into the sheathing~~. ~~For sheathing less than ½ inch (13mm) thick, the fasteners shall extend through the sheathing.~~ stainless steel Type 304, Type 316 or hot-dipped zinc coated galvanized (conforming to minimum standard ASTM A 153 D (1.0 oz./ft^2)) corrosion resistant box nails in accordance with Table R905.7.5.(2). Alternatively, 16 gauge Type 304 or Type 316 stainless steel staples, with crowns width 7/16" minimum, ¾" maximum shall be used. Fasteners installed within 15 miles (24 km) of salt water coastal areas shall be stainless steel Type 316. All fasteners shall have a minimum penetration into the sheathing of ¾" inch (19 mm). Where the roof is less than ¾" (19 mm) thick, each fastener shall penetrate through the sheathing. Wood shakes shall be attached to the roof with two fasteners per shake positioned ~~no more than 1 inch (25mm) no more than 2inches (25 mm) above the exposure line.~~ in accordance with the manufacturer's installation instructions Fasteners for fire-retardant-treated (as defined in section R902) shakes or pressure-impregnated-preservative-treated shakes of naturally durable wood in accordance with AWPA U1 shall be stainless steel Type 316 and applied as above. Fasteners for untreated (natural) and treated products shall comply with ASTM F1667.

Reason: There are known cases of wood shakes and shingles falling off roofs due to the use of inferior fasteners and rather than waiting for these incidents to include wall applications it is a proactive measure to increase the specifics of the fasteners used.

Specifying “corrosion resistant” is no longer sufficient; the type of fastener to be used is determined by various environmental factors and product types. Increased specifics will improve wall system integrity and lifespan.

Shakes and shingles shall not be applied with the vertical edges tight together as doing this does not leave room for expansion. Defining the spacing requirements further will eliminate this incorrect application method which causes fish-mouthing, cupping and curling.

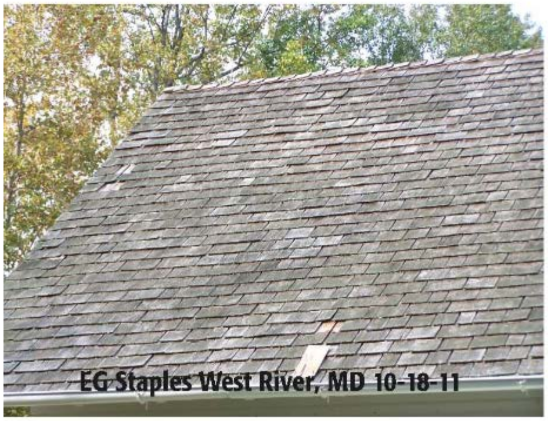
There are known cases of wood shakes and shingles falling off roofs due to the use of inferior fasteners. Specifying “corrosion resistant” is no longer sufficient; the type of fastener to be used is determined by various environmental factors and product type. Increased specifics will improve roof system integrity and lifespan.

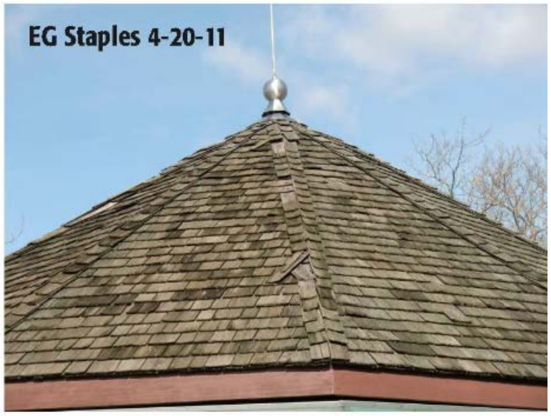
Penetration into sheathing more than ½” thick must be at minimum ¾” or all the way through the sheathing in order to attach the product strongly enough to hold in place and prevent loosening of the fastener.

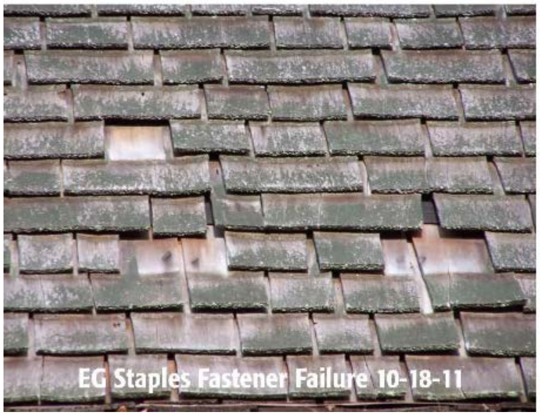
This change simplifies the code.

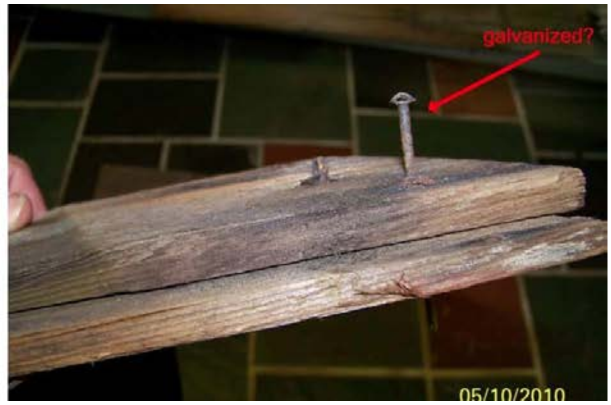
Following are examples of the failures that this code change is designed to prevent:

Shingles falling off buildings because of corroded fasteners or fasteners that did not adequately penetrate the substrate.









Cost Impact: The increased cost of these changes in comparison to the cost of the entire wall application is negligible.

R703.5.1-RB-ROODVOETS.doc

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The proposal provides little or no substantiation. There is no substantiation for the cost impact that was provided. This should be reworked with the modification that was ruled out of order and brought back.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

David L. Roodvoets, DLR Consultants, representing Cedar Shake & Shingle Bureau #2, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R703.5.1 Application. Wood shakes or shingles shall be installed according to this chapter and the manufacturer's installation instructions. Wood shakes or shingles shall be applied either single-course or double course over nominal ½ -inch (13mm) wood-based sheathing, or to furring strips over 1/2-inch (13mm) nominal non-wood sheathing. A ~~permeable~~ water-resistive barrier shall be provided over all sheathing, with horizontal overlaps in the membrane of not less than 2 inches (51mm) and vertical overlaps of not less than 6 inches (152mm). Where horizontal furring strips are used, they shall be 1 inch by 3 inches or 1 inch by 4 inches (25mm by 76mm or 25mm by 102 mm) and shall be fastened ~~horizontally~~ to the studs with minimum 7d box nails spaced a distance on center equal to the actual weather exposure of the shake or shingle, not to exceed the maximum exposure specified in Table R703.5.2. When installing shakes or shingles over a non-permeable water resistive barrier, furring strips shall be placed first vertically over the barrier and, in addition horizontal furring strips shall be fastened to the vertical furring strips prior to attaching the shakes or shingles to the horizontal furring strips. The spacing between adjacent shingles to allow for expansion shall be 1/8" (3) mm to ¼" (6mm) apart ~~and~~ between adjacent shakes shall be 3/8" (10 mm) to ½" (13mm) apart. The offset spacing between joints in adjacent courses shall be a minimum 1½inches (38mm).

(Portions of code change proposal not shown remain unchanged)

Commenter's Reason: In response to testimony at the committee hearing the requirement for a permeable water-resistive barrier (WRB) is deleted. If a non-permeable water-resistive barrier is installed, continued durability and functionality requires that the shakes or shingles be spaced away from the WRB with furring strips. Literature and experience show that wood based exterior sidings perform best when there is a vertical channel behind the siding, but since the shakes and shingles must be nailed on horizontal furring there is a need for vertical furring to create the vertical air channel and the horizontal furring to create a nailing support. This is supported in "Reroofing and Residing to Save Energy", Building and Construction Technology Program, Department of Environmental Conservation, University of Massachusetts at Amherst.
Historically Cedar Sakes & Shingles have performed well when vapor permeable WRB's are used over wood. This is supported by the APA publication "Build Energy Efficient Walls" Form J440 The Engineered Wood Association.

The change requiring adding vertical and horizontal furring over WRB's will add cost to the construction, however it will also make the use of continuous insulation and non-permeable WRB's practical and durable. In fact the entire wall is expected to have superior moisture performance.
Other changes have eliminated redundant references not required in this section. Wording changes to clarify that 7d box nails are minimal and larger nails can be used where required for increased strength.

- Table 703.5.2 is unchanged from the original public proposal, however there were questions about the effect of the proposed changes on the cost of construction. This proposed code change reduces the exposure length of the shingles and shakes. The change is required as the longer exposure lengths allowed in the code are no longer considered practical. Exposure lengths have been decreased in accordance with manufacturers installation requirements that have been in installation manuals since 2002, and in practice in most areas long before that. Although the changes in size as proposed in this code change will theoretically increase costs, no practical change in cost is implicated as products installed according to manufacturers' requirements complied with this table. This change will increase the cost of construction over the costs if the current minimum code requirements are followed.

Public Comment 2:

David L. Roodvoets, DLR Consultants, representing Cedar Shake & Shingle Bureau #2, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

Table R703.5.1(2)
Nail Requirements for Wood Shakes and Wood Shingles

Single Course Sidewall Fasteners			
Product Type	**Nail Type & Minimum length**	**Minimum Head Diameter**	**Minimum Shank Thickness**
R & R and Sanded Shingles			
16" and 18" shingles	3d box - 1 ¼"	0.19"	0.08"
24" Shingles	4d box - 1 ½"	0.19"	0.08"
Grooved Shingles			
16" and 18" shingles	3d box - 1 ¼"	0.19"	0.08"
24" shingles	4d box - 1 ½"	0.19"	0.08
Split and Sawn Shakes			
18" Straight-Split Shakes	5d box - 1 ¾"	0.19"	0.08"
18" and 24" Handsplit Shakes	6d box - 2"	0.19"	0.0915"
24" Tapersplit Shakes	5d Box-1 3/4	0.19"	0.08"
18" and 24" Tapersawn Shakes	6d Box- 2	0.19"	0.0915"

TableR703.5.1 (3)
Nail Requirements for Wood Shakes and Wood Shingles

Double Course Sidewall Fasteners			
Product Type	**Nail Type & Minimum length**	**Minimum Head Diameter**	**Minimum Shank Thickness**
R & R and Sanded Shingles			
16" and 18" and 24" shingles	5d box - 1 ¾" Or same size casing nail	0.19"	0.08"
Grooved Shingles			
16" and 18" and 24"shingles	5d box - 1 ¾"	0.19"	0.08"
Split and Sawn Shakes			
18" Straight-Split Shakes	7d box - 2 ¼" or 8d box 2 ½"	0.19"	0.099"
18" and 24" Handsplit Shakes	7d box - 2 ¼" or 8d box 2 ½"	0.19"	0.099"
24" Tapersplit Shakes	7d box - 2 ¼" or 8d box 2 ½"	0.19"	0.099"
18" and 24" Tapersawn Shakes	7d box - 2 ¼" or 8d box 2 ½"	0.19"	0.099"

(Portions of code change proposal not shown remain unchanged)

Commenter's Reason: In accordance with comments made at the public hearing the Tables now prescribe minimum length, head diameter and thickness of the fasteners to be used.

Public Comment 3:

David L. Roodvoets, DLR Consultants, representing Cedar Shake & Shingle Bureau #2, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

Table R 905.7.5 (2)
Nail Requirements for Wood Shakes and Wood Shingles

Shakes	**~~ASTM F1667~~ Nail Type and Minimum Length**	**Minimum Head Size**	**Minimum Shank Diameter**
18" Straight-Split	5d Box 1 ¾"	0.19'	.080"
18" and 24" Handsplit and Resawn	6d Box 2	0.19"	.0915"
24" Tapersplit	5d Box 1 ¾"	0.19"	.080"
18" and 24" Tapersawn	6d Box 2	0.19"	.0915"
Shingles	**~~ASTM F1667~~ Nail Type and Minimum Length**		
16" and 18"	3d Box 1 ¼"	0.19"	.080"
24"	4d Box 1 ½"	0.19"	.080"

(Portions of code change proposal not shown remain unchanged)

Commenter's Reason: In accordance with comments made at the public hearing the Tables now prescribe minimum length, head diameter and thickness of the fasteners to be used.

Public Comment 4:

David L. Roodvoets, DLR Consultants, representing Cedar Shake & Shingle Bureau #2, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R703.5.3 Attachment. Wood shakes or shingles shall be installed according to this chapter and the manufacturer's installation instructions. Each shake or shingle shall be held in place by two~~.~~ ~~stainless steel Type 304 , Type 316 or hot-dipped zinc coated galvanized (conforming to minimum standard ASTM A 153 D (1.0 oz./ft²)) corrosion resistant~~ box nails in accordance with Table R703.5.1(2) or R703.5.1 (3). Nails shall be stainless steel Type 304 or Type 316 or hot-dipped galvanized, with a coating weight of ASTM A 153 Class D (1.0 oz/ft²) Alternatively, two 16 gauge stainless steel Type 304 or Type 316 staples with crown widths 7/16 inch (11 mm) minimum, ¾ inch (19 mm) maximum shall be used and the crown of the staple shall be placed parallel with the butt of the shake or the shingle. In single-course application, the fasteners shall be concealed by the course above and shall be driven approximately 1 inch (25 mm) above the butt line of the succeeding course and ¾" (19 mm) from the edge. In double-course applications, the exposed shake or shingle shall be face-nailed with two fasteners, driven approximately 2 inches (51 mm) above the butt line and 3/4 inch (19 mm) from each edge. Fasteners installed within 15 miles 24 km) of salt water coastal areas shall be stainless steel Type 316. Fasteners for fire-retardant-treated in accordance with Section R902 or pressure-impregnated-preservative-treated shakes or shingles in accordance with AWPA U1 shall be, stainless steel Type 316. The fasteners shall be long enough to penetrate and shall penetrate the sheathing or furring strips by a minimum of ½ inch (13mm) and shall not be overdriven. ~~Fasteners for untreated (natural) and treated products shall comply with ASTM F1667.~~ . Fastener packaging shall bear a label indicating the appropriate grade material or coating weight,

(Portions of code change proposal not shown remain unchanged)

Commenter's Reason: The primary reason for this proposed code change is to better clarify the corrosion resistance of the fasteners.

Corroded wall fasteners have been noted in several areas, with the expectation that the corrosion will progress, resulting in shingles falling off walls. It is a proactive measure to increase the specifics of the fasteners used. Wall fastener corrosion similar to that of roofs fasteners has been noted where there are known cases of wood shakes and shingles falling off roofs due to the use of inferior fasteners.

Specifying "corrosion resistant" is no longer sufficient; the type of fastener to be used is determined by various environmental factors and product types. Increased specifics will improve wall system integrity and lifespan. The code currently requires more corrosion resistant fasteners in several applications as noted in **R402.1.1 Fasteners. (**Fasteners used below *grade*----shall be of Type 304 or 316 stainless steel.)

(From Randall Shackelford committee approved proposed code change RB176-13) "There has been a lot of work done on fasteners and connectors in contact with treated wood in the last 8-10 years. All the testing and historical performance of stainless steel were based on the traditional use of 300 series stainless steel. Yet there are many types of stainless steel, and some are much less corrosion resistant than others. By limiting the types of stainless steel to these specific series types, it ensures that the stainless steel fasteners will be corrosion resistant when exposed to treated wood."

Use of stainless steel or hot dipped galvanized fasteners will result in a very small increase the cost of construction over inferior fasteners previously allowed.

In response to testimony at the committee hearings the reference to ASTM F1667 was removed and replaced with specific minimum fastener length, diameter and head sizes in new table 703.5.1 in accordance with current industry practice. No added cost is expected from this better definition of the fasteners required.

Public Comment 5:

David L. Roodvoets, DLR Consultants, representing Cedar Shake & Shingle Bureau #2, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R905.7.5 Application. Wood shingles shall be installed according to this chapter and the manufacturer's installation instructions. Wood shingles shall be laid with a side lap not less than 1 ½" (38mm) between joints in courses, and no two joints in any three adjacent courses shall be in direct alignment. Spacing between shingles shall not be less than ¼" to 3/8" (6mm to 10mm). Weather exposures for wood shingles shall not exceed those set in Table R905.7.5. Fasteners for untreated (naturally durable) wood shingles shall be ~~stainless steel Type 304, Type 316 or hot-dipped zinc coated galvanized (conforming to minimum standard ASTM A 153 D (1.0 oz./ft^2))~~ box nails in accordance with table R905.7.5 (2). Nails shall be stainless steel Type 304 or Type 316 or hot-dipped galvanized, with a coating weight of ASTM A 153 Class D (1.0 oz/ft^2) Alternatively, two 16 gauge stainless steel Type 304, or Type 316 staples with crown widths 7/16" (11mm) minimum, ¾" (19 mm) maximum shall be used. Fasteners installed within 15 miles (24km) of salt water coastal areas shall be stainless steel Type 316. All fasteners shall have a minimum penetration into the sheathing of ¾ inch (19 mm). For roof sheathing less than ¾" in (19 mm) thickness, each fastener shall penetrate through the sheathing. Wood shingles shall be attached to the roof with two fasteners per shingle positioned in accordance with the manufacturers installation instructions. Fasteners for fire-retardant-treated shingles in accordance with Section R902 or pressure-impregnated-preservative-treated shingles of naturally durable wood in accordance with AWPA U1 shall be stainless steel Type 316 and applied as above. ~~Fasteners for untreated (natural) and treated products shall comply with ASTM F1667.~~ . Fastener packaging shall bear a label indicating the appropriate grade material or coating weight,

R905.8.6 Application. Wood shakes shall be installed according to this chapter and the manufacturer's installation instructions. Wood shakes shall be laid with a side lap not less than 1 ½" (38mm) between joints in adjacent courses. Spacing between shakes in the same course shall be 3/8 inch to 5/8 inch (9.5mm to 15.9mm) for shakes including tapersawn shakes Weather exposures for wood shakes shall not exceed those set in Table R905.8.6. Fasteners for untreated (naturally durable) wood shakes shall be ~~stainless steel Type 304, Type 316 or hot-dipped zinc coated galvanized (conforming to minimum standard ASTM A 153 D (1.0 oz./ft^2)) corrosion resistant~~ box nails in accordance with Table R905.7.5.(2). Nails shall be stainless steel Type 304 or Type 316 or hot-dipped galvanized, with a coating weight of ASTM A 153 Class D (1.0 oz/ft^2) Alternatively, two 16 gauge Type 304 or Type 316 stainless steel staples, with crowns width 7/16" minimum, ¾" maximum shall be used. Fasteners installed within 15 miles (24 km) of salt water coastal areas shall be stainless steel Type 316. All fasteners shall have a minimum penetration into the sheathing of ¾" inch (19 mm). Where the roof is less than ¾" (19 mm) thick, each fastener shall penetrate through the sheathing. Wood shakes shall be attached to the roof with two fasteners per shake positioned in accordance with the manufacturer's installation instructions Fasteners for fire-retardant-treated (as defined in section R902) shakes or pressure-impregnated-preservative-treated shakes of naturally durable wood in accordance with AWPA U1 shall be stainless steel Type 316 and applied as above. ~~Fasteners for untreated (natural) and treated products shall comply with ASTM F1667.~~ . Fastener packaging shall bear a label indicating the appropriate grade material or coating weight.

(Portions of code change proposal not shown remain unchanged)

Commenter's Reason: This modification is to clean up difficult language in the original proposal, and require labeling of the fasteners.

The primary reason for these code changes is the need to more clearly define the fasteners required.

There are known cases of wood shakes and shingles falling off roofs due to the use of inferior fasteners. Specifying "corrosion resistant" is no longer sufficient; the type of fastener to be used is determined by various environmental factors and product type. Increased specifics will improve roof system integrity and lifespan. The code currently requires more corrosion resistant fasteners in several applications as noted in **R402.1.1 Fasteners. (**Fasteners used *below grade*----shall be of Type 304 or 316 stainless steel.

(From Randall Shackelford in committee approved proposed code change RB176-13)"There has been a lot of work done on fasteners and connectors in contact with treated wood in the last 8-10 years. All the testing and historical performance of stainless steel were based on the traditional use of 300 series stainless steel. Yet there are many types of stainless steel, and some are much less corrosion resistant than others. By limiting the types of stainless steel to these specific series, it ensures that the stainless steel fasteners will be corrosion resistant when exposed to treated wood."

Corrosion of fasteners has been found relatively far inland, the 15 mile requirement reduces the possibility of fastener corrosion. It is supported by the Stainless Steel Institutes recommendations.

Penetration into sheathing more than ½" thick must be at minimum ¾" or all the way through the sheathing in order to attach the product strongly enough to hold in place and prevent loosening of the fastener.

Public Comment 6:

Jay H. Crandell, ARES Consulting, Foam Sheathing Committee of the American Chemistry Council, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R703.5.1 Application. Wood shakes or shingles shall be installed according to this chapter and the manufacturer's installation instructions. Wood shakes or shingles shall be applied either single-course or double-course over nominal 1/2-inch (13 mm) wood-based sheathing or to furring strips over 1/2-inch (13 mm) nominal nonwood sheathing . A permeable water-resistive barrier shall be provided in accordance with Section R703.2~~. over all sheathing, with horizontal overlaps in the membrane of not less than 2 inches (51 mm) and vertical overlaps of not less than 6 inches (152 mm).~~ A non-permeable water-resistive barrier shall be permitted where horizontal furring strips are used. Where horizontal furring strips are used, they shall be 1 inch by 3 inches or 1 inch by 4 inches (25 mm by 76 mm or 25 mm by 102 mm), placed over the water-resistive barrier, and ~~shall be~~ fastened horizontally to the studs with minimum 7d or 8d box nails. Horizontal furring ~~and~~ shall be spaced a distance on center equal to the actual weather exposure of the shakes or shingles, not to exceed the maximum exposure specified in Table R703.5.2. The spacing between adjacent shingles to allow for expansion shall be 1/8 inch (3 mm) to ¼ inch (6 mm) apart and between adjacent shakes shall be 3/8 inch (10 mm) to ½ inch (13 mm) apart. The offset spacing between joints in adjacent courses shall be a minimum of ½ inches (38 mm).

(Portions of code change proposal not shown remain unchanged)

Commenter's Reason: This public comment makes the following technical improvements:

1. References water-resistive barrier requirements in Section R703.2 and removes redundant installation information in Section R703.5.1.
2. With furring strips creating a ¾-inch air-space behind the shake or shingle installation (which is an air-permeable cladding), it is unnecessary and overly restrictive to also require use of a "permeable" water-resistive barrier.
3. The furring nails should be specified as a minimum size. Larger fasteners can be necessary for adequate wind resistance and also to attach furring when installed over foam sheathing or other non-wood sheathings, especially when greater than 1/2-inch thick (for example, see separate committee-approved proposals RB389 and RB390).

RB369-13

Final Action:	AS	AM	AMPC____	D

RB370-13
R703.6.3. Chapter 44

Proposed Change as Submitted

Proponent: Theresa Weston, DuPont Building Innovations (Theresa.a.weston@usa.dupont.com)

Revise as follows:

R703.6.3 Water-resistive barriers. Water-resistive barriers shall be installed as required in Section R703.2 and, where applied over wood-based sheathing, shall include a water-resistive vapor-permeable barrier with a performance at least equivalent to two layers of ~~Grade D paper~~ water-resistive barrier complying with ASTM E 2556 Type I. The individual layers shall be installed independently such that each layer provides a separate continuous plane and any flashing (installed in accordance with Section R703.8) intended to drain to the water-resistive barrier is directed between the layers.

> **Exception:** Where the water-resistive barrier that is applied over wood-based sheathing has a water resistance equal to or greater than that of ~~60 minute Grade D paper~~ a water-resistive barrier complying with ASTM E 2556 Type II and is separated from the stucco by an intervening, substantially nonwater-absorbing layer or designed drainage space.

Add new standard to Chapter 44 as follows:

ASTM

E 2556 Standard Specification for Vapor Permeable Flexible Sheet Water-Resistive Barriers Intended for Mechanical Attachment

Reason: The proposal updates the water-resistive barrier reference to the most recent consensus standard. ASTM E2556 includes housewrap materials, building papers and felt, instead of just building paper and therefore is more representative of the state of the industry. Within ASTM E2556 Grade D paper is a Type I WRB and 60 minute Grade D paper is a Type II WRB. ASTM E2556 is consistent with the current ICC-ES acceptance criteria for water-resistive barriers (AC-38) and therefore should not limit the use of current WRBs.

Cost Impact: This code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E 2556 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2012.

RB370-13

R703.6.3-RB-WESTON.doc

Committee Action Hearing Results

For staff analysis of the content of ASTM E2556 relative to CP#28, Section 3.6, please visit: http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf

Committee Action: **Disapproved**

Committee Reason: The committee is concerned about the equivalency of ASTM E2556 to two layers of Grade D under stucco. Also, the standard covers products other than Grade D.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Theresa A. Weston, PhD., DuPont Building Innovations, requests Approval as Submitted.

Commenter's Reason: The proposal updates the water-resistive barrier reference to the most recent consensus standard. ASTM E2556 includes housewrap materials, building papers and felt, instead of just building paper and includes practices that are have been used for the last two decades and is therefore is more representative of the state of the industry than the current code language. Within ASTM E2556 Grade D paper is a Type I WRB and 60 minute Grade D paper is a Type II WRB. ASTM E2556 is consistent with the current ICC-ES acceptance criteria for water-resistive barriers (AC-38) and therefore should not limit or change the use of current WRBs. In the committee's reason statement concern "about the equivalency of ASTM E2556 to two layers of Grade D under stucco" was expressed. However, this proposal makes does not allow a single layer of E2556 material to replace two layers of Grade D Paper, and in fact, clarifies that two layers of water-resistive barrier are required over wood based sheathing.

ASTM E2556 was included in the correlated section in the IBC-2015 by approval of S310-12 and so this proposal will provide consistency between the two codes.

RB370-13

Final Action: AS AM AMPC____ D

RB382-13
R703.10.1, Chapter 44

Proposed Change as Submitted

Proponent: John Mulder, Intertek Testing Services NA, Inc., representing International Standards Organization Technical Committee 77, *Products in Fibre-reinforced Cement* and self

Revise as follows:

R703.10.1 Panel siding. Fiber-cement panels shall comply with the requirements of ASTM C 1186, Type A, minimum Grade II <u>or ISO 8336, Category A, minimum Class 2</u>. Panels shall be installed with the long dimension either parallel or perpendicular to framing. Vertical and horizontal joints shall occur over framing members and shall be sealed with caulking, covered with battens or shall be designed to comply with Section R703.1. Panel siding shall be installed with fasteners according to Table R703.4 or *approved* manufacturer's installation instructions.

Add new standard to Chapter 44 as follows:

ISO

<u>8336 – Fibre-Cement Flat Sheets – Product Specification and Test Methods</u>

Reason: Performance requirements of ISO 8336, *Fibre-cement flat sheets – Product specification and test methods*, have been harmonized with the performance requirements of ASTM C1186, *Standard Specification for Flat Non-Asbestos Fiber-Cement Sheets*. Fiber-cement siding producers in Mexico, Central and South America, Europe, Asia, Australia and New Zealand currently manufacture and test their fiber-cement siding products for compliance with ISO 8336. The inclusion of this Standard reference in the IBC will permit manufacturers worldwide to demonstrate product compliance to IBC requirements. The addition of a reference to ISO 8336 in the Code removes a barrier to trade. Additional editorial changes are proposed to clarify the nature of the required vertical and/or horizontal joint protection to include reference to *approved* caulking and the recognition of both vertical or horizontal shiplap joints as a means of protecting the joints as is also common with wood panel siding.

IBC Section 1405.16.1 has, as a result of the IBC Group A Code Hearings, been revised to adopt this additional Standards reference (see attached Committee Action). This proposed revision brings the two building codes (IBC & IRC) and the applicable code sections and standards references into general alignment.

Cost Impact: The code change proposal will not increase the cost of construction because the product is already recognized for use in the Code. Reference to compliance with this alternative standard, an International Standard requiring the same performance as the ASTM Standard, will reduce barriers to trade by allowing foreign products complying with ISO 8336, Category A, minimum Class 2, market access to the United States without the need for additional product compliance documentation.

Analysis: A review of the standard proposed for inclusion in the code, ISO 8336 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2012.

Committee Action Hearing Results

For staff analysis of the content of ISO 8336 relative to CP#28, Section 3.6, please visit: http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf

Committee Action: **Approved as Submitted**

Committee Reason: The committee feels this is consistent with the action for the IBC in Group A but would urge the proponent to submit a public comment to bring it closer to alignment with the IBC.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

John Mulder, Intertek Testing Services NA, Inc., representing James Hardie Building Products, Inc., requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R703.10.1 Panel siding. Fiber-cement panels shall comply with the requirements of ASTM C 1186, Type A, minimum Grade II or ISO 8336, Category A, minimum Class 2. Panels shall be installed with the long dimension either parallel or perpendicular to framing. Vertical and horizontal joints shall occur over framing members and shall be ~~sealed~~ protected with caulking, or ~~covered~~ with battens, or flashing, or be vertical or horizontal shiplap, or otherwise ~~shall be~~ designed to comply with Section R703.1. Panel siding shall be installed with fasteners according to Table R703.4 or *approved* manufacturer's installation instructions.

Commenter's Reason: The proposed additional revisions bring this section of the IRC in to alignment with the equivalent section of the IBC, Section1405.16.1, previously approved during the April 2012 IBC Committee Hearings (see below action)

As approved for 2015 IBC:

FS170-12

For staff analysis of the content of ISO 8336-2009 relative to CP#28, Section 3.6, please visit: http://www.iccsafe.org/cs/codes/Documents/2012-13cycle/Proposed-A/2012ProposedStandards.pdf.

Committee Action: **Approved as Modified**

Modify proposal as follows:

1405.16.1 Panel siding. Fiber-cement panels shall comply with the requirements of ASTM C1186, Type A, minimum Grade II or ISO 8336, Category A, minimum Class 2. Panels shall be installed with the long dimension either parallel or perpendicular to framing. Vertical and horizontal joints shall occur over framing members and shall be protected with ~~*approved*~~ caulking, or with battens, or flashing, or be vertical or horizontal shiplap, or otherwise designed to comply with Section 1403.2. Panel siding shall be installed with fasteners in accordance with the *approved* manufacturer's instructions.

Proposed Change as Submitted

Proponent: Dennis Pitts, American Wood Council (dpitts@awc.org)

Revise as follows:

R703.11.2 Vinyl siding used with ~~F~~foam plastic sheathing. Vinyl siding used with foam plastic sheathing shall be installed in accordance with Section R703.11.2.1, R703.11.2.2, or R703.11.2.3.

R703.11.2.1 ~~**Exception:**~~ Where the foam plastic sheathing is applied directly over wood structural panels, fiberboard, gypsum sheathing or other *approved* backing capable of independently resisting the design wind pressure, the vinyl siding shall be installed in accordance with Section R703.11.1.

~~**R703.11.2.1 Basic wind speed not exceeding 90 miles per hour and Exposure Category B.** Where the basic wind speed does not exceed 90 miles per hour (40 m/s), the Exposure Category is B and gypsum wall board or equivalent is installed on the side of the wall opposite the foam plastic sheathing, the minimum siding fastener penetration into wood framing shall be 11/4 inches (32 mm) using minimum 0.120-inch diameter nail (shank) with a minimum 0.313-inch diameter head, 16 inches on center. The foam plastic sheathing shall be minimum 1/2-inch-thick (12.7 mm) (nominal) extruded polystyrene per ASTM C 578, 1/2-inch-thick (12.7 mm) (nominal) polyisocyanurate per ASTM C 1289, or 1-inch-thick (25 mm) (nominal) expanded polystyrene per ASTM C 578.~~

~~**R703.11.2.2 Basic wind speed exceeding 90 miles per hour or Exposure Categories C and D.** Where the basic wind speed exceeds 90 miles per hour (40 m/s) or the Exposure Category is C or D, or all conditions of Section R703.11.2.1 are not met, the adjusted design pressure rating for the assembly shall meet or exceed the loads listed in Tables R301.2(2) adjusted for height and exposure using Table R301.2(3). The design wind pressure rating of the vinyl siding for installation over solid sheathing as provided in the vinyl siding manufacturer's product specifications shall be adjusted for the following wall assembly conditions:~~

1. ~~For wall assemblies with foam plastic sheathing on the exterior side and gypsum wall board or equivalent on the interior side of the wall, the vinyl siding's design wind pressure rating shall be multiplied by 0.39.~~
2. ~~For wall assemblies with foam plastic sheathing on the exterior side and no gypsum wall board or equivalent on the interior side of wall, the vinyl siding's design wind pressure rating shall be multiplied by 0.27.~~

R703.11.2.2 Where the foam plastic sheathing is installed directly over studs and the foam plastic sheathing attachment is not designed to separately resist 100% of the wind load, the design wind pressure rating of the vinyl siding shall be multiplied by 0.27 and the result shall not be less than the design wind pressure load as determined in Section 703.1.2. The vinyl siding shall be installed in accordance with the manufacturer's instructions for the design wind pressure resistance rating.

> **Exception:** For conditions where the design wind suction load as determined in Section 703.1.2 does not exceed 30 psf and the interior surface of the wall is sheathed with 1/2-in gypsum wallboard or equivalent, the design wind pressure rating of the vinyl siding shall be permitted to be multiplied by 0.30 rather than 0.27.

Reason: The proposed revisions intend to bring provisions for use of vinyl siding to secure foam plastic sheathing to resist wind suction loads more in line with requirements for sheathing products used structurally for wind resistance. Specifically, revisions are based on an assumption that the same wind suction loads applicable for securing exterior structural sheathing products to wall studs (i.e. either 100% or 90% of the wind suction loads) are also applicable for vinyl siding securing foam plastic sheathing to studs.

The following revisions are implemented: 1) removal of the 90 mph and less wind speed provisions of 703.11.2 due to inadequate wind resistance provided by the requirements when judged against standard requirements for wind design; and 2) reduction of the 0.39 wind pressure rating adjustment factor to 0.30 based on an assumption that the vinyl siding used to secure exterior foam plastic sheathing to wall studs should resist the same loads as required for design of the foam plastic sheathing to resist wind loads (i.e. 90% of the wind loads versus 70% of the wind loads associated with the 0.39 factor). Two options for use of vinyl to secure foam plastic sheathing to studs are unchanged by this proposal: the 0.27 factor in R703.11.2.2 for cases where vinyl siding secures foam plastic sheathing to studs and interior gypsum is not present; and R703.11.2.3 which relies on availability and approval of vinyl siding manufacturer's instructions specifically for use over foam plastic sheathing for wind resistance.

Proposed revisions are summarized in Table 1. Additional details on revised wind pressure rating adjustment factors, wind load requirements for other structural sheathing products, and elimination of the 90 mph and less wind speed provisions are provided below.

PEF - Pressure Equalization Factor SF - Safety Factor WPR - Wind Pressure Rating adjustment factor WPR = 0.36*1.5/PEF/SF									

Basis of vinyl siding wind rating adjustment factors

Vinyl siding wind pressure ratings are established using provisions in ASTM D 3679 Annex 1 and assume that the vinyl siding is installed over a backing material capable of resisting 100% of the wind suction loads (i.e. PEF=1.0). In those provisions, the test pressure of 15.73 psf is established as a minimum requirement based on an assumption that the vinyl siding resists only 36% of the wind suction loads (i.e. PEF=0.36) and a safety factor of 1.5. These assumptions, referred to herein as the reference case assumptions for vinyl siding wind pressure rating, are shown in Equation 1. Equation 1 can be found in ASTM D 3679 and relates test pressure, P_t, to design pressure, D_p:

$$P_t = D_p \times 0.36 \times 1.5 \qquad \text{Eq. 1}$$

For a design suction pressure, D_p, of 29.12 lb/ft^2 associated with 110 mph wind speed, Exposure B and 30 ft mean roof height, the required test pressure, P_t, is 15.73 lb/ft^2.

In 2006, changes were brought forward to address how to use these ASTM D 3679 design wind pressure ratings when vinyl siding is installed over a backing material that can't independently resist 100% of the wind loads, such as when used over many of the foam plastic sheathing products which rely on vinyl siding and its fastening to studs to secure the foam plastic sheathing to the wall studs. At that time, a wind pressure rating adjustment factor of 0.39 was approved for applications where vinyl siding was used to secure foam plastic sheathing to wall studs based on the assumption that it was securing the foam plastic sheathing for 70% of the wind suction loads (i.e. PEF = 0.70) acting on the exterior foam plastic sheathing while the remaining 30% was assumed to be resisted by interior gypsum wallboard. In addition to accounting for increased wind loads resisted by the vinyl siding (from 36% to 70%), the 0.39 factor also accounted for an increase in safety factor from 1.5 to 2.0 in recognition of the increased importance of vinyl siding when used to structurally secure foam plastic sheathing to wall studs.

Rationale for use 0.30 adjustment factor in lieu of the 0.39 factor in R703.11.2.

Since the original code change that introduced wind pressure rating adjustment factors, progress has been made to standardize the wind resistance of foam plastic sheathing with the development of ANSI/SBCA FS 100-12 *Standard Requirements for Wind Pressure Resistance of Foam Plastic Insulating Sheathing Used in Exterior Wall Covering Assemblies*. Notably, for applications where gypsum wallboard or equivalent material is provided as an interior finish, design of the foam plastic sheathing layer for 90% of the wind suction loads (i.e. PEF=0.90) is permitted per SBCA FS 100-12 Section 6.4 as follows:

"6.4 Pressure Equalization Factor (PEF). A PEF of 1.0 shall be required for *exterior wall sheathing* applications.

Exceptions:

1. For conditions where the design negative wind pressure load determined in accordance with Section 4.0 does not exceed 30 psf, a PEF of 0.9 shall be permitted to determine negative wind pressure resistance only for *exterior wall sheathing* on wall assemblies having an interior finish of at least 0.5-inch-thick gypsum wall board (ASTM C1396) or any material of at least equivalent bending strength, rigidity and air permeability."

Design using a PEF value of 0.9, or 90% of the wind suction loads, represents an approximate 29 percent increase in loads in the foam plastic sheathing layer relative to the 70% wind load assumption used in derivation of the 0.39 factor. Consistent with the original derivation, the vinyl siding used to secure the foam plastic sheathing to the wall studs must also be designed to resist the load for which the sheathing is designed. As a result, the 0.39 factor is reduced to 0.30 in recognition of the increase from 70% to 90% of wind loads on the foam plastic sheathing layer and resisted by the vinyl siding: 0.39 x (0.7/0.9) = 0.30. Additional information on the derivation of the 0.30 factor, consistent with assumptions in derivation of existing factors in the IRC, is provided below as additional background.

For the reference case where vinyl siding wind pressure resistance is based on installation over structural sheathing capable of resisting 100% of the wind loads, test pressure, P_t, and design pressure, D_p, are related as previously shown in Equation 1 and repeated in Equation 2 for ease of reference. In this case, vinyl siding is assumed to resist 36% of the wind loads and a safety factor of 1.5 is applicable.

$P_t = D_p(\text{reference}) \times 0.36 \times 1.5$ Eq. 2

For the structural case where vinyl siding is used to secure foam plastic sheathing to wall studs for resistance to wind suction loads, test pressure, P_t, and design pressure, D_p, are related as shown in Equation 3. In this case, vinyl siding is assumed to resist 90% of the wind loads (the same loads as used for design of the foam plastic sheathing) and a safety factor of 2 is applicable.

$P_t = D_p(\text{structural}) \times 0.90 \times 2.0$ Eq. 3

Equating P_t from Equation 2 and 3 and solving for D_p(structural) results in a factor of 0.30 as follows:

$D_p(\text{structural}) = 0.30\ D_p(\text{reference})$ Eq. 4

The PEF of 0.9 recognizes that gypsum wallboard on the interior face of the wall has been shown to resist a portion of the full wind load. It is important to note; however, that the amount resisted by the gypsum wallboard continues to be studied since the contribution is a function of the relative air permeability of the exterior wall sheathing and the interior gypsum wallboard and the relative strength and stiffness of the exterior wall sheathing and the interior gypsum wallboard to name a few variables, many of which are difficult to quantify and control at time of fabrication and over time. These are among some of the reasons why the PEF of 0.7 previously assumed for development of the 0.39 factor was increased to a PEF of 0.9 resulting in a 0.30 factor. Given the sensitivity of pressure equalization to level of pressure, relative porosity of the inside wall layer to the outside wall layer, pressures used in PEF testing, and in recognition of use of gypsum wallboard in much of the underlying PEF testing, the 0.30 adjustment is only applicable when the design wind suction load does not exceed 30 psf.

The adjustment factor of 0.27 in R703.11.2.2 remains unchanged by this proposal

Where vinyl siding is used to hold the foam plastic sheathing onto the wall studs and gypsum wallboard or equivalent interior finish is not present, the default condition in SBCA FS 100-12 applies and PEF of 1.0 is used (i.e. 100% of wind load resisted by exterior foam plastic sheathing). In this case, the vinyl siding used to secure the foam plastic sheathing to the wall studs must also be designed to resist 100% of the load, equal to the load for which the sheathing is designed. The resulting wind pressure rating factor is 0.27 and remains unchanged in the proposed revisions.

Basis for removal of the 90 mph and less wind speed provisions of current R703.11.2.1

The current provisions of R703.11.2.1 have been proposed for deletion. These provisions exempt the user from checking the wind resistance of the vinyl siding if the building is located in an area where the wind speed is 90 mph or less, Wind Exposure B, and the interior finish is gypsum wallboard. These provisions result in significantly lower wind resistance than required by section R703.1.2. For example, the wind loads associated with 90 mph Exposure B is a maximum suction (negative) pressure of 19.5 psf for a 30' mean roof height (see Table 2). The minimum required test pressure for vinyl siding in accordance with ASTM D 3679 is only 15.73 psf. In this example, the minimum required test pressure is only 80% of the design pressure. It is important to note that the minimum test pressure should substantially exceed the design pressure to provide a margin of safety.

Table 2. Design wind pressure for wall claddings and cladding attachments (psf)

Wind exposure category	Mean roof height (ft)	BASIC WIND SPEED, V_{ASD} (mph-3-second gust)							
		85		90		100		110	
		max +	max -	max +	max -	max +	max -	max +	max -
B	0-15	13.0	-17.4	14.6	**-19.5**	18.0	-24.1	21.8	-29.1
	20	13.0	-17.4	14.6	**-19.5**	18.0	-24.1	21.8	-29.1
	25	13.0	-17.4	14.6	**-19.5**	18.0	-24.1	21.8	-29.1
	30	13.0	-17.4	14.6	**-19.5**	18.0	-24.1	21.8	**-29.1**
	35	13.6	-18.2	15.2	**-20.4**	18.8	-25.2	22.7	-30.5
C	0-15	15.7	-21.1	17.7	-23.6	21.8	-29.2	26.4	-35.3
	20	16.7	-22.4	18.8	-25.1	23.2	-31.0	28.0	-37.5
	25	17.5	-23.5	19.7	-26.3	24.3	-32.5	29.4	-39.3
	30	18.2	-24.4	20.4	-27.4	25.2	-33.8	30.5	-40.9
	35	18.8	-25.2	21.1	-28.3	26.1	-34.9	31.5	-42.2

Note: Design wind pressures calculated by combining wall cladding loads (for effective wind area of 10 ft^2) in Table R301.2(2) and height and exposure coefficients in Table R301.2(3). Negative (-) wind pressures represent wind suction pressures.

The extent of under-design of the vinyl siding is exacerbated when considering that 15.73 psf represents an average of 3-4 test results and does not reflect minimum values. Application of the wind pressure resistance rating described above demonstrates the extent of under-design. For the case where interior gypsum finish is present, the adjusted wind pressure resistance for the minimum vinyl siding per ASTM D 3679 becomes 0.30 x 29.1 = 8.7 psf. The value of 8.7 psf is less than half of the 19.5 psf value required for 90 mph wind speeds, Exposure B at a 30'mean roof height.

In summary, this proposal deletes the current R703.11.2.1 provisions that exempt the user from checking the wind resistance of the vinyl siding in a 90 mph Exposure B area. Both the revised section R703.11.2.2 and existing section R703.11.2.3 still remain and allow the proper installation of vinyl siding installed over foam sheathing in accordance with the vinyl siding manufacturer's installation instructions.

Cost Impact: The code change proposal will increase the cost of construction.

RB384-13

R703.11.2-RB-PITTS.doc

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The committee felt there was no compelling reason to change what is in the code. The proposal seemed overreaching.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Dennis Pitts, American Wood Council, requests Approval as Submitted.

Commenter's Reason: Vinyl siding per ASTM D3679 has its wind resistance rating established from testing over sheathing that is independently attached to studs for 100% of the wind load without the need for the siding to hold the underlying sheathing on to the studs. However, per Section R703.11.2.1 and R203.11.2.2, the vinyl siding per ASTM D3679 is used to secure foam plastic sheathing direct to wall studs for resistance to wind suction loads. The code has permitted this mis-application (when judged against requirements of ASTM D3679) of vinyl siding for some time and with wind resistance far lower than design wind pressures required by the code.

Testimony during the IRC Committee hearing was highly technical and strayed in many different directions. The primary issue, however, is that the current installation provisions in R703.11.2.1 permit attachment of exterior foam plastic sheathing with vinyl siding that has significantly lower wind resistance than is required by R703.1.2 and R602.3. Current Section R703.11.2.1 allows the securing of exterior foam plastic sheathing to wall studs with vinyl siding that has test pressure resistance that is 20% less than the minimum design wind loads (see Figure 1). Proposed revisions in RB384 would require test pressures to exceed the design wind loads with a factor of safety consistent with that provided by Section R703.11.2.2(2). A slight 10% reduction in required test pressure permitted by RB384 recognizes a load sharing effect with gypsum wallboard on the inside face of the wall assembly – consistent with the 0.90 PEF factor for design of foam plastic sheathing in *ANSI/SBCA FS100-12 Standard Requirements for Wind Pressure Resistance of Foam Plastic Insulating Sheathing Used in Exterior Wall Covering Assemblies.*

For applications where vinyl siding is used to secure foam plastic sheathing to wall studs not sheathed on the interior with gypsum wallboard, RB384 proposes no change in test pressure requirements (e.g. 39 psf test pressure remains unchanged by RB384), and that a minimum safety factor of 2.0 is maintained (see Figure 1). RB384 also proposes no change to requirements of R703.11.2.3 where use of an approved design wind pressure rating for installation over foam plastic sheathing in accordance with the vinyl siding manufacturer's product specifications is permitted.

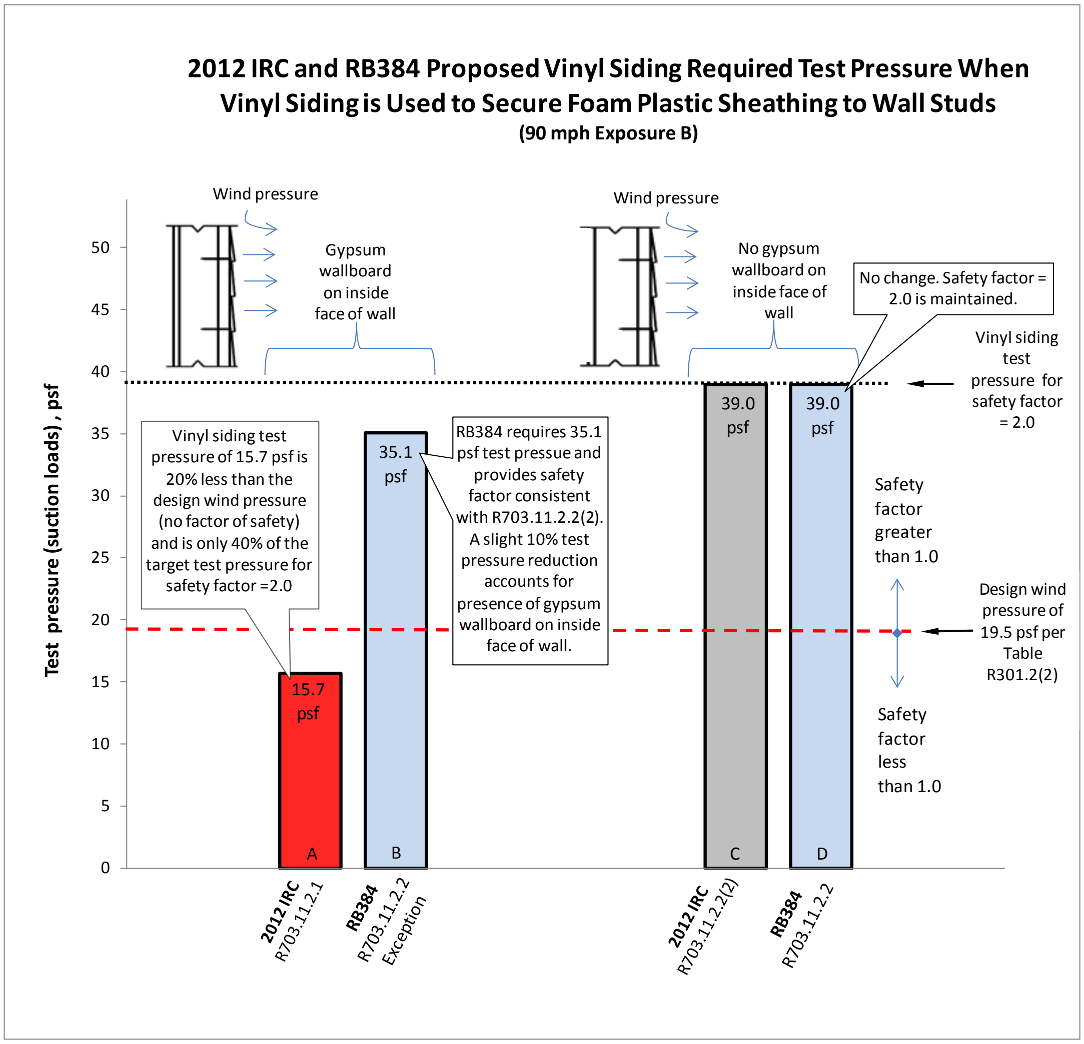

Figure 1. Comparison of vinyl siding required test pressure to design pressure under 2012 IRC and RB384.

Also, in the Reason statement provided with the original proposal, there was a typo in the section numbers in the first column of Table 1 and the description of the 30 psf limit (associated with proposed R703.11.2.2 Exception) could be incorrectly interpreted as being applicable to both the 2012 IRC and RB384. A corrected Table 1 is provided below.

Table 1. Summary of proposed change (corrected)

Proposed Change as Submitted

Proponent: Matt Dobson, Vinyl Siding Institute (mdobson@vinylsiding.org)

Revise as follows:

TABLE R703.4
WEATHER-RESISTANT SIDING ATTACHMENT AND MINIMUM THICKNESS

SIDING MATERIAL	NOMINAL THICKNESS[a] (inches)	JOINT TREATMENT	WATER-RESISTIVE BARRIER REQUIRED	TYPE OF SUPPORTS FOR THE SIDING MATERIAL AND FASTENERS[b, c, d]					
				Wood or wood structural panel sheathing into stud	Fiberboard sheathing into stud	Gypsum sheathing into stud	Foam plastic sheathing into stud	Direct to studs	Number or spacing of fasteners
Insulated Vinyl Siding[aa]	035 (vinyl siding layer only)	Lap	Yes	0.120 nail (shank) with a 0.313 head or 16 gauge crown[y,z]	0.120 nail (shank) with a 0.313 head or 16 gauge crown[y]	0.120 nail (shank) with a 0.313 head or 16 gauge crown[y]	0.120 nail (shank) with a 0.313 head per Section R703.11.2	Not Allowed	16 inches on center or specified by manufacturer instructions, test report or other sections of this code.

(Portions of Table not shown remain unchanged)

For SI: 1 inch = 25.4 mm.

a. Based on stud spacing of 16 inches on center where studs are spaced 24 inches, siding shall be applied to sheathing approved for that spacing.
b. Nail is a general description and shall be T-head, modified round head, or round head with smooth or deformed shanks.
c. Staples shall have a minimum crown width of $^{7}/_{16}$-inch outside diameter and be manufactured of minimum 16-gage wire.
d. Nails or staples shall be aluminum, galvanized, or rust-preventative coated and shall be driven into the studs where fiberboard, gypsum, or foam plastic sheathing backing is used. Where wood or wood structural panel sheathing is used, fasteners shall be driven into studs unless otherwise permitted to be driven into sheathing in accordance with the siding manufacturer's installation instructions.
e. Aluminum nails shall be used to attach aluminum siding.
f. Aluminum (0.019 inch) shall be unbacked only when the maximum panel width is 10 inches and the maximum flat area is 8 inches. The tolerance for aluminum siding shall be +0.002 inch of the nominal dimension.
g. All attachments shall be coated with a corrosion-resistant coating.
h. Shall be of approved type.
i. Three-eighths-inch plywood shall not be applied directly to studs spaced more than 16 inches on center when long dimension is parallel to studs. Plywood $^{1}/_{2}$-inch or thinner shall not be applied directly to studs spaced more than 24 inches on center. The stud spacing shall not exceed the panel span rating provided by the manufacturer unless the panels are installed with the face grain perpendicular to the studs or over sheathing approved for that stud spacing.
j. Wood board sidings applied vertically shall be nailed to horizontal nailing strips or blocking set 24 inches on center. Nails shall penetrate $1^{1}/_{2}$ inches into studs, studs and wood sheathing combined or blocking.
k. Hardboard siding shall comply with CPA/ANSI A135.6.
l. Vinyl siding shall comply with ASTM D 3679.
m. Minimum shank diameter of 0.092 inch, minimum head diameter of 0.225 inch, and nail length must accommodate sheathing and penetrate framing $1^{1}/_{2}$ inches.
n. When used to resist shear forces, the spacing must be 4 inches at panel edges and 8 inches on interior supports.
o. Minimum shank diameter of 0.099 inch, minimum head diameter of 0.240 inch, and nail length must accommodate sheathing and penetrate framing $1^{1}/_{2}$ inches.
p. Vertical end joints shall occur at studs and shall be covered with a joint cover or shall be caulked.
Q . See Section R703.10.1.
r. Fasteners shall comply with the nominal dimensions in ASTM F 1667.
s. See Section R703.10.2.
t. Face nailing: one 6d common nail through the over lap ping planks at each stud. Concealed nailing: one 11 gage $1^{1}/_{2}$ inch long galv. roofing nail through the top edge of each plank at each stud.

u. See Section R703.2 exceptions.
v. Minimum nail length must accommodate sheathing and penetrate framing $1^1/_2$ inches.
w. Adhered masonry veneer shall comply with the requirements of Section R703.6.3 and shall comply with the requirements in Sections 6.1 and 6.3 of TMS-402 ACI 530/ASCE 5.
x. Vertical joints, if staggered shall be permitted to be away from studs if applied over wood structural panel sheathing.
y. Minimum fastener length must accommodate sheathing and penetrate framing 0.75 inches or in accordance with the manufacturer's installation instructions.
z. Where approved by the manufacturer's instructions or test report siding shall be permitted to be installed with fasteners.
<u>aa. Insulated vinyl siding shall comply with ASTM D 7793.</u>

R703.11.2 Foam plastic sheathing. Vinyl siding<u> and insulated vinyl siding</u> used with foam plastic sheathing shall be installed in accordance with Section R703.11.2.1, R703.11.2.2, or R703.11.2.3.

Reason: There is general consensus among manufacturers on the installation practices for insulated vinyl siding, including several requirements the can be integrated into the installation requirements in Table R703.4. Installation specifications are very similar to vinyl siding.

These include:
- Minimum thickness requirement from ASTM D7793
- That the siding must be installed over a water-resistive Barrier
- Size of nail and/or staple and penetration depth into the stud
- Provision for how it should be installed over foam sheathing
- Fastener spacing
- Installation over foam sheathing should be treated the same as vinyl siding, the principals of section R703.11.2 will apply

Additional footnotes "aa", "y" and "z" refer to the ASTM standard for insulated vinyl siding, ASTM D7793, and fastening prescriptions similar to vinyl siding involving penetration into the stud 0.75 inches and an allowance for variation to this requirement when approved by the manufacturer.

An additional reference was added to the use of vinyl siding with foam plastic sheathing to include insulated vinyl siding. The application of insulated vinyl siding with foam sheathing is the same as vinyl siding, therefore the provision can simply apply.

For more information, go to www.insulatedsiding.info.

Cost Impact: The code change proposal will not increase the cost of construction.

RB385-13

R703.4T-RB-DOBSON.doc

<u>Committee Action Hearing Results</u>

Committee Action: Approved as Submitted

Committee Reason: Approval was based upon the proponent's published reason. Consistent with the committee action on RB386-13

Assembly Action: None

<u>Individual Consideration Agenda</u>

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Dennis Pitts, American Wood Council, requests Approved as Modified by this Public Comment.

Modify the proposal as follows:

R703.11.2 Foam plastic sheathing. Vinyl siding ~~and insulated vinyl siding~~ used with foam plastic sheathing shall be installed in accordance with Section R703.11.2.1, R703.11.2.2, or R703.11.2.3.

TABLE R703.4
WEATHER-RESISTANT SIDING ATTACHMENT AND MINIMUM THICKNESS

SIDING MATERIAL	NOMINAL THICKNESS[a] (inches)	JOINT TREATMENT	WATER-RESISTIVE BARRIER REQUIRED	TYPE OF SUPPORTS FOR THE SIDING MATERIAL AND FASTENERS[b, c, d]					
				Wood or wood structural panel sheathing into stud	Fiberboard sheathing into stud	Gypsum sheathing into stud	Foam plastic sheathing into stud	Direct to studs	Number or spacing of fasteners
Insulated Vinyl Siding[aa]	035 (vinyl siding layer only)	Lap	Yes	0.120 nail (shank) with a 0.313 head or 16 gauge crown[y,z]	0.120 nail (shank) with a 0.313 head or 16 gauge crown[y]	0.120 nail (shank) with a 0.313 head or 16 gauge crown[y]	~~0.120 nail (shank) with a 0.313 head per Section R703.11.2~~ Not Allowed	Not Allowed	16 inches on center or specified by manufacturer instructions, test report or other sections of this code.

(Portions of code proposal and Table not shown remain unchanged)

Commenter's Reason: Insulated vinyl siding is proposed to be added to R703.11.2 which would allow it to be used to structurally secure exterior foam sheathing to wall studs; however, no justification has been provided to demonstrate that it provides adequate wind resistance. Note that if RB384 is approved, then this public comment is not necessary because the required wind resistance will be increased to a more acceptable level in that proposal.

RB385-13
Final Action: AS AM AMPC____ D

RB386-13

R202 (New), R703.13 (New), R703.13.1 (Neq), Chapter 44

Proposed Change as Submitted

Proponent: Matt Dobson, Vinyl Siding Institute (mdobson@vinylsiding.org)

Add new text as follows:

703.13 Insulated vinyl siding. Insulated vinyl siding shall be certified and labeled as conforming to the requirements of ASTM D7793 by an approved quality control agency.

703.13.1 Insulated vinyl siding and accessories. Insulated vinyl siding and accessories shall be installed in accordance with manufacturer's installation instructions.

Add new definition as follows:

INSULATED VINYL SIDING. A vinyl cladding product with manufacturer-installed foam plastic insulating material as an integral part of the cladding product, having a minimum thermal resistance of R-2.

Add new standard to Chapter 44 as follows:

ASTM

D 7793 – 12 Standard Specification for Insulated Vinyl Siding

Reason: This definition is based on the current ASTM standard for insulated vinyl siding, ASTM D7793. Insulated vinyl siding has been available for over ten years and is now certified to an ASTM standard by an approved quality control agency. Therefore, it makes sense to introduce the standard and third party certification into the code as insulated vinyl siding grows and is embraced as a form of a cladding and home insulation. Performance requirements are specified by ASTM, ensuring that insulated vinyl siding can meet the necessary demands as a cladding and home insulation.

This change also provides a method for building officials to verify that insulated vinyl siding is code compliant, since there are separate standards for vinyl siding and insulated vinyl siding.

- Insulated vinyl siding is vinyl siding with rigid foam insulation laminated or permanently attached to the panel.
- In energy codes and energy efficiency programs, insulated siding is recognized as a form of "continuous insulation," or insulation installed on the exterior of the building that helps reduce energy loss through framing or other building material.
- Insulated siding products that bear the Certified Insulated Siding Label and are found on VSI's *Official List of Certified Products and Colors* have been independently certified by a third-party, accredited quality control agency to meet or exceed ASTM D7793.

Certified insulated vinyl siding**:**

- Meets or exceeds the industry standard for quality and performance (ASTM D7793), as verified by an independent, accredited quality control agency through twice yearly, unannounced plant inspections, product testing and quality review.
- Has demonstrated a minimum thermal resistance, or R-value, of at least R-2.0, as verified by an independent quality control agency.
- Withstands the impacts of recommended installation procedures.
- Lies straight on a flat wall and does not buckle under normal conditions.
- Weathers the effects of sunshine, rain and heavy winds of at least 110 mph.
- Meets manufacturer's advertised specifications for length, width, thickness and gloss.
- Can be identified by a variety of program logos and/or labels.
- Meets or exceeds the industry standard for performance (ASTM D7793), as verified by an independent, accredited quality control agency through twice yearly, unannounced plant inspections, product testing and quality review.

Fire Performance

Due to vinyl's chlorine base, the siding portion of insulated siding does not readily ignite and burn and resists flame spread. Vinyl siding routinely demonstrates a Class A flame spread rating (that is, a flame spread index of 25 or less when tested under ASTM E84). Rigid vinyl will not sustain combustion without an external source of heat and will tend to self-extinguish if that heat is removed. Foam plastics used in the insulation portion contain a flame retardant designed to limit rapid flame spread. Foam plastic insulation products are tested and classified for flame spread and smoke-development under ASTM E84/UL 723 by Underwriters Laboratories and other certified agencies.

Moisture Performance

Insulated siding provides a supplemental rain screen that reduces the amount of water that reaches the underlying water-resistive barrier. With a properly applied water-resistive barrier, insulated siding minimizes moisture penetration from the exterior into the wall assembly and provides a way for moisture to readily drain and dry. The presence of a layer of thermal insulation filling the space between the insulated siding and the wall sheathing also aids in the moisture management system.

For more information, go to www.insulatedsiding.info.

Cost Impact: The code change proposal will increase the cost of construction. This change will have minimal cost impact as there are products on the market certified.

Analysis: A review of the standard proposed for inclusion in the code, ASTM D 7793 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2012.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Matthew Dobson, representing Vinyl Siding Institute, Inc., requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

D 7793 – ~~12~~13 Standard Specification for Insulated Vinyl Siding

Commenter's Reason: This change simply modifies the approved change to ensure the code has most up to date version of this standard. Over the course of the past few months the standard has been updated to include refinement of certain testing protocols necessary to ensure proper product evaluation including: 1) alternative test methods for demonstrating adhesive qualification; 2) the effect of differential thermal expansion is handled through distortion testing rather than through thermal expansion coefficient; and 3) evaluation of laps for siding that does not include laps, such as vertical siding, is eliminated. By referencing this 13 standard vs. the 12 standard these important refinements will be included and certified products will be consistent with the code requirements.

Proposed Change as Submitted

Proponent: Matt Dobson, Vinyl Siding Institute (mdobson@vinylsiding.org)

Revise as follows:

TABLE R703.4
WEATHER-RESISTANT SIDING ATTACHMENT AND MINIMUM THICKNESS

SIDING MATERIAL	NOMINAL THICKNESS[a] (inches)	JOINT TREATMENT	WATER-RESISTIVE BARRIER REQUIRED	TYPE OF SUPPORTS FOR THE SIDING MATERIAL AND FASTENERS[b, c, d]					
				Wood or wood structural panel sheathing into stud	Fiberboard sheathing into stud	Gypsum sheathing into stud	Foam plastic sheathing into stud	Direct to studs	Number or spacing of fasteners
Polypropylene Siding[aa]	Not applicable.	Lap	Yes	Section 703.13.1	Not Allowed	As specified by the manufacturer instructions, test report or other sections of this code.	Polypropylene Siding[aa]	Not applicable.	Lap

(Portions of Table not shown remain unchanged)

For SI: 1 inch = 25.4 mm.

a. Based on stud spacing of 16 inches on center where studs are spaced 24 inches, siding shall be applied to sheathing approved for that spacing.
b. Nail is a general description and shall be T-head, modified round head, or round head with smooth or deformed shanks.
c. Staples shall have a minimum crown width of $^{7}/_{16}$-inch outside diameter and be manufactured of minimum 16-gage wire.
d. Nails or staples shall be aluminum, galvanized, or rust-preventative coated and shall be driven into the studs where fiberboard, gypsum, or foam plastic sheathing backing is used. Where wood or wood structural panel sheathing is used, fasteners shall be driven into studs unless otherwise permitted to be driven into sheathing in accordance with the siding manufacturer's installation instructions.
e. Aluminum nails shall be used to attach aluminum siding.
f. Aluminum (0.019 inch) shall be unbacked only when the maximum panel width is 10 inches and the maximum flat area is 8 inches. The tolerance for aluminum siding shall be +0.002 inch of the nominal dimension.
g. All attachments shall be coated with a corrosion-resistant coating.
h. Shall be of approved type.
i. Three-eighths-inch plywood shall not be applied directly to studs spaced more than 16 inches on center when long dimension is parallel to studs. Plywood $^{1}/_{2}$-inch or thinner shall not be applied directly to studs spaced more than 24 inches on center. The stud spacing shall not exceed the panel span rating provided by the manufacturer unless the panels are installed with the face grain perpendicular to the studs or over sheathing approved for that stud spacing.
j. Wood board sidings applied vertically shall be nailed to horizontal nailing strips or blocking set 24 inches on center. Nails shall penetrate $1^{1}/_{2}$ inches into studs, studs and wood sheathing combined or blocking.
k. Hardboard siding shall comply with CPA/ANSI A135.6.
l. Vinyl siding shall comply with ASTM D 3679.
m. Minimum shank diameter of 0.092 inch, minimum head diameter of 0.225 inch, and nail length must accommodate sheathing and penetrate framing $1^{1}/_{2}$ inches.
n. When used to resist shear forces, the spacing must be 4 inches at panel edges and 8 inches on interior supports.
o. Minimum shank diameter of 0.099 inch, minimum head diameter of 0.240 inch, and nail length must accommodate sheathing and penetrate framing $1^{1}/_{2}$ inches.
p. Vertical end joints shall occur at studs and shall be covered with a joint cover or shall be caulked.
q. See Section R703.10.1.
r. Fasteners shall comply with the nominal dimensions in ASTM F 1667.
s. See Section R703.10.2.

t. Face nailing: one 6d common nail through the over lap ping planks at each stud. Concealed nailing: one 11 gage $1^1/_2$ inch long galv. roofing nail through the top edge of each plank at each stud.
u. See Section R703.2 exceptions.
v. Minimum nail length must accommodate sheathing and penetrate framing $1^1/_2$ inches.
w. Adhered masonry veneer shall comply with the requirements of Section R703.6.3 and shall comply with the requirements in Sections 6.1 and 6.3 of TMS-402 ACI 530/ASCE 5.
x. Vertical joints, if staggered shall be permitted to be away from studs if applied over wood structural panel sheathing.
y. Minimum fastener length must accommodate sheathing and penetrate framing 0.75 inches or in accordance with the manufacturer's installation instructions.
z. Where approved by the manufacturer's instructions or test report siding shall be permitted to be installed with fasteners penetrating not less than 0.75 inches through wood or wood structural sheathing with or without penetration into the framing.
aa. Polypropylene siding shall comply with ASTM D7254.

703.13 Polypropylene siding. Polypropylene siding shall be certified and labeled as conforming to the requirements of ASTM D7254 by an approved quality control agency.

703.13.1 Polypropylene siding and accessories shall be installed in accordance with manufacturer's installation instructions.

703.13.1.1 Polypropylene siding shall be installed over and attached to sheathing or other substrate, composed of wood or wood-based material with minimum thickness of 7/16 -inch, or other materials and fasteners having equivalent withdrawal resistance.

703.13.1.2 Fastener requirements. Unless otherwise specified in the approved manufacturer's instructions, nails shall be corrosion resistant, with a minimum 0.120 shank and minimum 0.313 head diameter and fully penetrate sheathing or penetrate the substrate a minimum 3/4 inch. The end of the fastener shall extend a minimum of ¼ inch beyond the opposite face of the sheathing or nailable sheathing. Staples are not permitted.

703.13.2 Polypropylene siding shall comply with section 703.13.2.1

703.13.2.1 Polypropylene siding shall not be installed on walls with a fire separation distance of less than 5 feet (1524 mm) and walls not closer than 10 feet to a building on another lot.

Exception: Walls perpendicular to the line used to determine the *fire separation distance*.

Add new definition as follow:

POLYPROPYLENE SIDING. A shaped material, made principally from polypropylene homopolymer, or copolymer, which in some cases contains fillers or reinforcements, that is used to clad *exterior walls* or buildings.

Add new standard to Chapter 44 as follows:

ASTM

D 7254 Standard Specification for Polypropylene (PP) Siding

Reason: This change mirrors requirements for polypropylene siding in the 2012/2015 International Building Code (IBC), by adding them to the International Residential Code.
This provision sets minimum performance requirements for polypropylene siding and requires a third party quality control agency to verify compliance to an internationally accepted ASTM standard. Additionally, confusion in the marketplace and by building officials on use of polypropylene siding vs. vinyl siding is removed, as appropriate installation and use of polypropylene siding are detailed. The proposed definition conforms to the definition in the IBC and ASTM D7254 standard. Use of polypropylene siding is also limited on walls that face each other in high density settings, similar to the intent of the requirement in the IBC.
Not all polypropylene siding products on the market today are third party certified to internationally accepted standards which set minimum performance; our industry believes there should be minimum performance requirements for compliance with the building code.

 

The *VSI Product Certification Program* added certification of polypropylene siding in 2010. Additionally, several manufacturers have code compliant evaluation reports for their products. The *VSI Product Certification Program* allows manufacturers to certify, with independent third-party verification by an approved quality control agency, that certain polypropylene siding meets or exceeds the ASTM D7254 Standard Specification for Polypropylene (PP) Siding. The program is not exclusive to VSI members and any manufacturer can participate. It has been in place since 1998 when vinyl siding certification began.
Polypropylene siding certified through the program is verified by a third-party, approved quality control agency to meet or exceed the ASTM D7254 Standard Specification for Polypropylene (PP) Siding. Certified polypropylene siding is tested to:

- Weather the elements over time without cracking, chipping, flaking, pitting, or peeling.
- Meet impact resistance requirements.
- Withstand wind pressures equivalent to 110 mph or more.
- Demonstrate flame spread performance equivalent to or better than wood materials commonly used in building construction.

Although polypropylene siding panels are specific to each manufacturer, there is general consensus among manufacturers on several installation requirements. These include:

- Use of a water-resistive barrier
- Substrate installed with polypropylene siding panels, typically OSB or plywood, must have a minimum fastener withdrawal resistance because fastener spacing varies from 5 inches to 12 inches. The fasteners must have a substrate to penetrate because they will not penetrate studs in most cases because of the typical 16 inch on center spacing.
- No attachment directly over studs
- Fastener size and length are specified; staples are not allowed
- Manufacturer specified fastener spacing

Specifications for installation, including underlayment and fasteners, are necessary for polypropylene siding, so building officials and specifiers recognize the differences between installation of vinyl siding and polypropylene siding.
For more information on polypropylene siding, go to http://www.polypropylenesiding.org/.

Cost Impact: This change will have minimal cost impact as many products on the market are already certified.

Analysis: A review of the standard proposed for inclusion in the code, ASTM D 7254 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2012.

RB387-13

R703.13 (NEW) #1-RB-DOBSON.doc

Committee Action Hearing Results

The code change is contained in the Updates to the 2013 Proposed Changes posted on the ICC website. Please go to http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf for more information.

For staff analysis of the content of ASTM D7254-07 relative to CP#28, Section 3.6, please visit: http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf

Committee Action: Approved as Modified

Modify the proposal as follows:

R703.13 Polypropylene siding. Polypropylene siding shall be certified and labeled as conforming to the requirements of ASTM D7254 by an approved quality control agency.

R703.13.1 Polypropylene siding and accessories shall be installed in accordance with manufacturer's installation instructions.

R703.13.1.1 Polypropylene siding shall be installed over and attached to wood structural panel sheathing ~~or other substrate, composed of wood or wood-based material~~ with minimum thickness of 7/16 -inch~~,~~ or other substrate, composed of wood or wood-based material ~~materials~~ and fasteners having equivalent withdrawal resistance.

R703.13.1.2 Fastener requirements. Unless otherwise specified in the approved manufacturer's instructions, nails shall be corrosion resistant, with a minimum 0.120 shank and minimum 0.313 head diameter. Nails shall be a minimum of 1 1/4'" long or as necessary to ~~and fully~~ penetrate sheathing or ~~penetrate the~~ substrate a minimum 3/4 inch. Where the nail fully penetrates the sheathing or nailable substrate, the ~~The~~ end of the fastener shall extend a minimum of ¼ inch beyond the opposite face of the sheathing or ~~nailable sheathing~~. Substrate. Staples are not permitted.

~~**703.13.2** Polypropylene siding shall comply with section 703.13.2.1~~

~~**703.13.2.1**~~ **R703.13.2** Polypropylene siding shall not be installed on walls with a fire separation distance of less than 5 feet (1524 mm) and walls ~~not~~ closer than 10 feet to a building on another lot.

Exception: Walls perpendicular to the line used to determine the *fire separation distance*.

Committee Reason: This change introduces a new product and a new standard into the code. The modification clarifies the text and adds a minimum length for the nails.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Marcelo M Hirschler, GBH International, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

R703.13.2 Polypropylene siding shall comply with section 703.13.2.1 or section 703.13.2.2.

~~**R703.13.2**~~ **R703.13.2.1** Polypropylene siding shall not be installed on walls with a fire separation distance of less than 5 feet (1524 mm) and walls not closer than 10 feet to a building on another lot.

Exception: Walls perpendicular to the line used to determine the *fire separation distance*.

R703.13.2.2 The certification of the flame spread index shall be accompanied by a test report stating that all portions of the test specimen ahead of the flame front remained in position during the test in accordance with ASTM E84 or UL 723.

(Portions of code change proposal not shown remain unchanged)

Commenter's Reason: This change is essential for 2 reasons: (a) this brings the IRC into consistency with the IBC and (b) this will provide the necessary incentive for manufacturers to develop a polypropylene (PP) siding product that is actually safe in the case of fire.

In the absence of this section the IRC would introduce a dangerous product with some protection (10 feet separation) but no incentive for manufacturers to make an alternate product that has a lower flame spread index.

This proposed language is consistent not only with the IBC (2012) but also with requirements in the IBC (2015) for plastic composite decking and proposed language in the IRC (2015), accepted by the committee, for the same type of material.

Some data showing the problems associated with the polypropylene siding that meets the ASTM E84 200 flame spread index while melting ahead of the flame front were presented at the proposal stage in proposal RB388 and are repeated here. Further new information is added also.

A key issue continues to be the fact that polypropylene, unless properly modified, melts and causes flames that generate a pool fire from which the material can radiate heat energy to neighboring buildings. Since PP generates extremely high heat release when it burns (much higher than the vast majority of plastics and certainly than any plastic used exposed in construction), the probability of it causing ignition of siding in nearby buildings cannot be excluded. Note that PP is not allowed to be used exposed inside buildings (section 803.12 of the IBC 2012) unless it passes a test much more severe than the one recommended here: NFPA 286.

It is easy for the consumer to confuse PP siding with vinyl siding, especially since most retailers carry them together. However, PP siding is very different in fire performance than either vinyl siding or wood (cedar) siding. The table below shows recent fire tests on two different PP siding materials and on a wood (cedar) siding using the cone calorimeter, ASTM E1354, at an incident heat flux of 25 kW/m^2, as well as some material tests on vinyl (PVC) and on a fire retarded polypropylene.

Cone Calorimeter (ASTM E1354) Tests at 25 kW/m^2 incident heat flux		
	Peak Heat Release Rate (in kW/m^2)	**Effective Heat of Combustion (in MJ/kg)**
Siding Tests		
Cedar siding	309	13
PP siding	546	25
PP siding 2	878	32
Material Tests		
Vinyl (PVC)	190	9
FR Polypropylene	200	25

The table below shows that polypropylene can be made so that it meets the requirements indicated above, in the ASTM E84 test without melting, and perform just like PVC (vinyl) or wood products.

ASTM E84 (Steiner tunnel) tests on some exemplar materials		
Material	**Flame Spread Index**	**Flaming on Floor Ahead of Flame Front**
PVC (vinyl)	10	None
FR Polypropylene	50	None
Western red cedar	70	None
Douglas fir	70-100	None
Western white pine	75	None

The data below is a table from NFPA 556 (Guide on Methods for Evaluating Fire Hazard to Occupants of Passenger Road Vehicles) showing that PP can be made with better fire properties with a variety of systems, but the industry needs incentives to manufacture such safer polypropylene siding.

Table 11.2.4.2(b) Cone Calorimeter Data for Nine Fire-Retarded Polypropylene Materials at Heat Flux Indicated (in kW/m^2)

	t_{ig} (sec)	$PHRR_a$ (kW/m^2)	FPI (sec m^2/kW)	$HRR_{180\ sec}$ (kW/m^2)	$H_{c,\ eff}$ (MJ/kg)	Mass Loss (percent)

# 8	71	188	0.38	139	25.8	66
# 9	67	172	0.39	127	25.7	66

The IBC (2012) reads as follows:

IBC 1404.12 Polypropylene siding. *Polypropylene siding shall be certified and labeled as conforming to the requirements of ASTM D7254 and those of Section 1404.12.1 or 1404.12.2 by an approved quality control agency. Polypropylene siding shall be installed in accordance with the requirements of Section 1405.18 and in accordance with the manufacturer's installation instructions. Polypropylene siding shall be secured to the building so as to provide weather protection for the exterior walls of the building.*

IBC 1404.12.1 Flame spread index. *The certification of the flame spread index shall be accompanied by a test report stating that all portions of the test specimen ahead of the flame front remained in position during the test in accordance with ASTM E84 or UL 723.*

IBC 1404.12.2 Fire separation distance. *The fire separation distance between a building with polypropylene siding and the adjacent building shall be no less than 10 feet (3048 mm).*

Proposed Change as Submitted

Proponent: Gary J. Ehrlich, P.E., National Association of Home Builders (NAHB) (gehrlich@nahb.org)

Revise as follows:

R703.2 Water-resistive barrier. One layer of No. 15 asphalt felt, free from holes and breaks, complying with ASTM D 226 for Type 1 felt or other approved water-resistive barrier shall be applied over studs or sheathing of all exterior walls. Such felt or material shall be applied horizontally, with the upper layer lapped over the lower layer not less than 2 inches (51 mm). Where joints occur, felt shall be lapped not less than 6 inches (152 mm). The felt or other approved material shall be continuous to the top of walls and terminated at penetrations and building appendages in a manner to meet the requirements of the exterior wall envelope as described in Section R703.1.

Exception: Omission of the water-resistive barrier is permitted in the following situations:

1. In detached accessory buildings.
2. ~~Under exterior wall finish materials as permitted in Table R703.4.~~

~~3~~ 2. Under paperbacked stucco lath when the paper backing is an approved water-resistive barrier.

~~R703.4~~ R703.3 Nominal thickness and attachments. ~~Unless specified otherwise, all~~ The nominal thickness and attachment of exterior wall coverings shall be ~~securely fastened~~ in accordance with Table ~~R703.4~~ R703.3, the wall covering material requirements of this section, and the wall covering manufacturer's installation instructions ~~or with other *approved* aluminum, stainless steel, zinc-coated or other *approved* corrosion-resistive fasteners~~. Nominal material thicknesses in Table R703.3 are based on a maximum stud spacing of 16 inches on center. Where specified by the siding manufacturer's instructions and supported by a test report or other documentation, attachment to studs with greater spacing is permitted. Fasteners for exterior wall coverings shall be in accordance with Section R703.3.2

R703.3.1 Wind limitations. Where the basic wind speed in accordance with Figure R301.2(4)A is 110 miles per hour (49 m/s) or higher, the attachment of wall coverings shall be designed to resist the component and cladding loads specified in Table R301.2(2), adjusted for height and exposure in accordance with Table R301.2(3).

R703.3.2 Fasteners. Exterior wall coverings shall be securely fastened with aluminum, galvanized, stainless steel or rust-preventative coated nails or staples in accordance with Table R703.3 or with other *approved* corrosion-resistant fasteners in accordance with the wall covering manufacturer's installation instructions. Nails and staples shall comply with ASTM F 1667. Nails shall be T-head, modified round head, or round head with smooth or deformed shanks. Staples shall have a minimum crown width of 7/16-inch outside diameter and be manufactured of minimum 16 gage wire. Where fiberboard, gypsum, or foam plastic sheathing backing is used, nails or staples shall be driven into the studs. Where wood or wood structural panel sheathing is used, fasteners shall be driven into studs unless otherwise permitted to be driven into sheathing in accordance with the siding manufacturer's installation instructions.

R703.3.3 Minimum fastener length and penetration. Fasteners shall have the greater of the minimum length specified in Table R703.3 or as required to provide a minimum penetration into framing as follows:

1. Fasteners for horizontal aluminum siding, steel siding, particleboard panel siding, wood structural panel siding per ANSI/APA-PRP 210, fiber-cement panel siding, and fiber-cement lap siding installed over foam plastic sheathing shall penetrate a minimum of 1-1/2 inches into framing or shall be in accordance with the manufacturer's installation instructions.
2. Fasteners for hardboard panel and lap siding shall penetrate a minimum of 1-1/2 inches into framing.
3. Fasteners for vinyl siding installed over wood or wood structural panel sheathing shall penetrate a minimum of 1-1/4 inches into sheathing and framing combined. Where approved by the manufacturer's instructions or test report, vinyl siding shall be permitted to be installed with fasteners penetrating not less than .75 inches through wood or wood structural sheathing with or without penetration into the framing. Fasteners for vinyl siding installed over foam plastic sheathing shall be in accordance with Section R703.11.2. Fasteners for vinyl siding installed over fiberboard or gypsum sheathing or direct to studs shall penetrate a minimum of 1-1/4 inches into framing.
4. Fasteners for vertical or horizontal wood siding shall penetrate a minimum of 1-1/2 inches into studs, studs and wood sheathing combined, or blocking.
5. Fasteners for siding material installed over foam plastic sheathing shall have sufficient length to accommodate foam plastic sheathing thickness and to penetrate framing or sheathing and framing combined as specified above.

~~R703.8~~ R703.4 Flashing. *Approved* corrosion-resistant flashing shall be applied shingle-fashion in a manner to prevent entry of water into the wall cavity or penetration of water to the building structural framing components. Self-adhered membranes used as flashing shall comply with AAMA 711. The flashing shall extend to the surface of the exterior wall finish. *Approved* corrosion-resistant flashings shall be installed at all of the following locations:

1. Exterior window and door openings. Flashing at exterior window and door openings shall extend to the surface of the exterior wall finish or to the water-resistive barrier for subsequent drainage. Flashing at exterior window and door openings shall be installed in accordance with one or more of the following:
   - 1.1. The fenestration manufacturer's installation and flashing instructions, or for applications not addressed in the fenestration manufacturer's instructions, in accordance with the flashing manufacturer's instructions. Where flashing instructions or details are not provided, pan flashing shall be installed at the sill of exterior window and door openings. Pan flashing shall be sealed or sloped in such a manner as to direct water to the surface of the exterior wall finish or to the water-resistive barrier for subsequent drainage. Openings using pan flashing shall also incorporate flashing or protection at the head and sides.
   - 1.2. In accordance with the flashing design or method of a registered design professional.
   - 1.3. In accordance with other approved methods.
2. At the intersection of chimneys or other masonry construction with frame or stucco walls, with projecting lips on both sides under stucco copings.
3. Under and at the ends of masonry, wood or metal copings and sills.
4. Continuously above all projecting wood trim.
5. Where exterior porches, decks or stairs attach to a wall or floor assembly of wood-frame construction.
6. At wall and roof intersections.
7. At built-in gutters.

~~R703.3~~ R703.5 Wood, hardboard and wood structural panel siding. Wood, hardboard, and wood structural panel siding shall be installed in accordance with this section and Table R703.3. Hardboard siding shall comply with CPA/ANSI A135.6.

R703.5.1 Vertical wood siding. Wood siding applied vertically shall be nailed to horizontal nailing strips or blocking set no more than 24 inches on center.

~~R703.3.1~~ **R703.5.2 Panel siding.** 3/8” wood structural panel siding shall not be applied directly to studs spaced more than 16 inches on center when long dimension is parallel to studs. 7/16” wood structural panel siding or thinner shall not be applied directly to studs spaced more than 24 inches on center. The stud spacing shall not exceed the panel span rating provided by the manufacturer unless the panels are installed with the face grain perpendicular to the studs or over sheathing approved for that stud spacing.

Joints in wood, hardboard or wood structural panel siding shall be made as follows unless otherwise approved. Vertical joints in panel siding shall occur over framing members, unless wood or wood structural panel sheathing is used, and shall be shiplapped or covered with a batten. Horizontal joints in panel siding shall be lapped a minimum of 1 inch (25 mm) or shall be shiplapped or shall be flashed with Z-flashing and occur over solid blocking, wood or wood structural panel sheathing.

~~R703.3.2~~ **R703.5.3 Horizontal wood siding.** Horizontal lap siding shall be installed in accordance with the manufacturer’s recommendations. Where there are no recommendations the siding shall be lapped a minimum of 1 inch (25 mm), or 1/2 inch (13 mm) if rabbeted, and shall have the ends caulked, covered with a batten or sealed and installed over a strip of flashing.

R703.12 Adhered masonry veneer installation. Adhered masonry veneer shall comply with the requirements of Section R703.6.3. Adhered masonry veneer shall be attached in accordance with Section R703.6.1 or the manufacturer’s instructions. Adhered masonry veneer shall be installed in accordance with Sections 6.1 and 6.3 of TMS 402/ACI 530/ASCE 5 or the manufacturer’s instructions.

R703.12.3 Water-resistive barrier. ~~The~~ A water-resistive barrier shall be installed~~,~~ as required by Section R703.2 and shall comply with the requirements of Section R703.6.3. The water-resistive barrier ~~Table R703.4, Footnote w,~~ shall lap over the exterior of the attachment flange of the screed or flashing provided in accordance with Section R703.12.2.

TABLE R703.3
SIDING MINIMUM ATTACHMENT AND MINIMUM THICKNESS

SIDING MATERIAL		NOMINAL THICKNESS(inches)	JOINT TREAT-MENT	TYPE OF SUPPORTS FOR THE SIDING MATERIAL AND FASTENERS					
				Wood or wood structural panel sheathing into stud	Fiberboard sheathing into stud	Gypsum sheathing into stud	Foam plastic sheathing into stud	Direct to studs	Number or spacing of fasteners

For SI: 1 inch = 25.4 mm.

a. Aluminum nails shall be used to attach aluminum siding.
b. Aluminum (0.019 inch) shall be unbacked only when the maximum panel width is 10 inches and the maximum flat area is 8 inches. The tolerance for aluminum siding shall be +0.002 inch of the nominal dimension.
c. Shall be of approved type.
d. When used to resist shear forces, the spacing must be 4 inches at panel edges and 8 inches on interior supports.
e. Vertical end joints shall occur at studs and shall be covered with a joint cover or shall be caulked.
f. Face nailing: one 6d common nail through the overlapping planks at each stud. Concealed nailing: one 11 gage 1½ inch long galv. roofing nail through the top edge of each plank at each stud in accordance with the manufacturer’s installation instruction.
g. Vertical joints, if staggered shall be permitted to be away from studs if applied over wood structural panel sheathing.

~~For SI: 1 inch = 25.4 mm.~~

~~a. Based on stud spacing of 16 inches on center where studs are spaced 24 inches, siding shall be applied to sheathing approved for that spacing.~~

~~b. Nail is a general description and shall be T-head, modified round head, or round head with smooth or deformed shanks.~~

~~c. Staples shall have a minimum crown width of $^{7}/_{16}$-inch outside diameter and be manufactured of minimum 16-gage wire.~~

~~d. Nails or staples shall be aluminum, galvanized, or rust-preventative coated and shall be driven into the studs where fiberboard, gypsum, or foam plastic sheathing backing is used. Where wood or wood structural panel sheathing is used, fasteners shall be driven into studs unless otherwise permitted to be driven into sheathing in accordance with the siding manufacturer's installation instructions.~~

~~e. Aluminum nails shall be used to attach aluminum siding.~~

~~f. Aluminum (0.019 inch) shall be unbacked only when the maximum panel width is 10 inches and the maximum flat area is 8 inches. The tolerance for aluminum siding shall be +0.002 inch of the nominal dimension.~~

~~g. All attachments shall be coated with a corrosion-resistant coating.~~

~~h. Shall be of approved type.~~

~~i. Three-eighths-inch plywood shall not be applied directly to studs spaced more than 16 inches on center when long dimension is parallel to studs. Plywood $^{1}/_{2}$-inch or thinner shall not be applied directly to studs spaced more than 24 inches on center. The stud spacing shall not exceed the panel span rating provided by the manufacturer unless the panels are installed with the face grain perpendicular to the studs or over sheathing approved for that stud spacing.~~

~~j. Wood board sidings applied vertically shall be nailed to horizontal nailing strips or blocking set 24 inches on center. Nails shall penetrate 1$^{1}/_{2}$ inches into studs, studs and wood sheathing combined or blocking.~~

~~k. Hardboard siding shall comply with CPA/ANSI A135.6.~~

~~l. Vinyl siding shall comply with ASTM D 3679.~~

~~m. Minimum shank diameter of 0.092 inch, minimum head diameter of 0.225 inch, and nail length must accommodate sheathing and penetrate framing 1$^{1}/_{2}$ inches.~~

~~n. When used to resist shear forces, the spacing must be 4 inches at panel edges and 8 inches on interior supports.~~
~~o. Minimum shank diameter of 0.099 inch, minimum head diameter of 0.240 inch, and nail length must accommodate sheathing and penetrate framing $1^1/_2$ inches.~~
~~p. Vertical end joints shall occur at studs and shall be covered with a joint cover or shall be caulked.~~
~~q. See Section R703.10.1.~~
~~r. Fasteners shall comply with the nominal dimensions in ASTM F 1667.~~
~~s. See Section R703.10.2.~~
~~t. Face nailing: one 6d common nail through the over lap ping planks at each stud. Concealed nailing: one 11 gage $1^1/_2$ inch long galv. roofing nail through the top edge of each plank at each stud.~~
~~u. See Section R703.2 exceptions.~~
~~v. Minimum nail length must accommodate sheathing and penetrate framing $1^1/_2$ inches.~~
~~w. Adhered masonry veneer shall comply with the requirements of Section R703.6.3 and shall comply with the requirements in Sections 6.1 and 6.3 of TMS-402 ACI 530/ASCE 5.~~
~~x. Vertical joints, if staggered shall be permitted to be away from studs if applied over wood structural panel sheathing.~~
~~y. Minimum fastener length must accommodate sheathing and penetrate framing 0.75 inches or in accordance with the manufacturer's installation instructions.~~

Reason: The purpose of this code change is to replace the existing Table R703.4 with a revised and simplified version and improve the code text relating to siding attachment. While reviewing several code change proposals last cycle dealing with siding attachment, we identified a number of conflicts between the table and code text, as well as discovering several errata. Additionally, we found the 2009 IRC version of the table hard to work with because of the small font and the extensive footnotes. The 2012 version of the table was printed in a larger font in an effort to improve readability, but this has not fixed all of the issues and we have identified new errata. This code change replaces the table with a new version and introduces new charging language and additional code revisions to move material from footnotes to the main body of the code where they can be more easily located. The key changes are as follows:

(1) Existing Section R703.4 is clarified and revised. The nail requirement is relocated to a new subsection. Footnote (a) is moved to the section. The entire section is moved to become R703.3, placing it immediately following the WRB section ahead of the wood siding section.
(2) To the extent possible, nail specifications are formatted to match the standard used in Table R602.3(1) and elsewhere, where the nail type is specified, followed by the length x shank diameter.
(3) A new Section R703.3.2 on fasteners combines existing footnotes (b), (c), (d), (g) and (r). It is noted all nails and staples need to comply with ASTM F 1667, not just those for fiber-cement siding.
(4) Footnotes (i) and (j) are moved to the existing section on wood, hardboard and wood structural panel siding. Separate subsections are created for the requirements relevant to horizontal wood siding, vertical wood siding, and panel siding products. Minimum fastener size and minimum penetration requirements, along with other installation details, are coordinated with current installation guides such as those available from WRCLA or WWPA.
(5) The existing footnote (k) reference to the hardboard siding standard is moved to Section R703.5 (formerly Section R703.3).
(6) The existing footnote (l) reference to the vinyl siding standard is not needed as the standard is called out in Section R703.11. A pointer is added under the material listing.
(7) A new Section R703.3.3 is created dealing with fastener length and penetration. The penetration requirements from footnotes (m) and (o) for hardboard siding and footnotes (v), (y), and (z) are moved to items under this new section.
(8) The shank and head diameters in footnotes (m) and (o) for hardboard siding are moved into Table.R703.3.
(9) The fiber-cement section references from existing footnotes (q) and (s) are provided under the respective material listings. The shank diameter and length for the 6d common nail is provided. The "corrosion-resistant nail" language is removed since it is already required by the charging language for Table R703.3 (formerly Table R703.4).
(10) The "water-resistive barrier required" column is deleted. As of the 2012 IRC, all the products in Table R703.4 required a WRB unless covered by the exceptions under Section R703.2 for detached accessory buildings and for certain paper-backed stucco lath products. Since Section R703.2 always applies, existing footnote (u) is redundant.
(11) The existing footnote (w) reference to TMS 402 is relocated to the adhered veneer section.

Cost Impact: The code change proposal will not increase the cost of construction.

R703.2-RB-EHRLICH.doc

Committee Action Hearing Results

Committee Action: Approved as Modified

Modify the proposal as follows:

R703.3 Nominal thickness and attachments. The nominal thickness and attachment of exterior wall coverings shall be in accordance with Table R703.3, the wall covering material requirements of this section, and the wall covering manufacturer's installation instructions. Nominal material thicknesses in Table R703.3 are based on a maximum stud spacing of 16 inches on center. Where specified by the siding manufacturer's instructions and supported by a test report or other documentation, attachment to studs with greater spacing is permitted. Fasteners for exterior wall coverings <u>attached to wood framing</u> shall be in accordance with Section R703.3.2. <u>Exterior wall coverings shall be attached to cold-formed steel light framing in accordance with the cladding manufacturer's installation instructions or an approved design.</u>

R703.3.3 Minimum fastener length and penetration. Fasteners shall have the greater of the minimum length specified in Table R703.3 or as required to provide a minimum penetration into framing as follows:

1. Fasteners for horizontal aluminum siding, steel siding, particleboard panel siding, wood structural panel siding per ANSI/APA-PRP 210, fiber-cement panel siding, and fiber-cement lap siding installed over foam plastic sheathing shall penetrate a minimum of 1-1/2 inches into framing or shall be in accordance with the manufacturer's installation instructions.
2. Fasteners for hardboard panel and lap siding shall penetrate a minimum of 1-1/2 inches into framing.
3. Fasteners for vinyl siding installed over wood or wood structural panel sheathing shall penetrate a minimum of 1-1/4 inches into sheathing and framing combined. ~~Where approved by the manufacturer's instructions or test report,~~ vinyl siding shall be permitted to be installed with fasteners penetrating ~~not less than .75 inches~~ into or through wood or wood structural sheathing of minimum thickness as specified by the manufacturer's instructions or test report, with or without penetration into the framing. Where3 the fastener penetrates fully through the sheathing, the end of the fastener shall extend a minimum of ¼ inch beyond the opposite face of the sheathing. Fasteners for vinyl siding installed over foam plastic sheathing shall be in accordance with Section R703.11.2. Fasteners for vinyl siding installed over fiberboard or gypsum sheathing ~~or direct to studs~~ shall penetrate a minimum of 1-1/4 inches into framing.
4. Fasteners for vertical or horizontal wood siding shall penetrate a minimum of 1-1/2 inches into studs, studs and wood sheathing combined, or blocking.
5. Fasteners for siding material installed over foam plastic sheathing shall have sufficient length to accommodate foam plastic sheathing thickness and to penetrate framing or sheathing and framing combined as specified above.

(Portions of proposal not shown remain unchanged)

Committee Reason: Approval was based upon the proponent's published reason. The modification addresses fastening to cold-formed steel framing and clarifies the fastener penetration for wood structural panels.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Jay H. Crandell, d/b/a ARES Consulting, representing Steel Framing Alliance, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

R703.3 Nominal thickness and attachments. The nominal thickness and attachment of exterior wall coverings shall be in accordance with Table R703.3, the wall covering material requirements of this section, and the wall covering manufacturer's installation instructions. Nominal material thicknesses in Table R703.3 are based on a maximum stud spacing of 16 inches on center. Where specified by the siding manufacturer's instructions and supported by a test report or other documentation, attachment to studs with greater spacing is permitted. Fasteners for exterior wall coverings attached to wood framing shall be in accordance with Section R703.3.2. Exterior wall coverings shall be attached to cold-formed steel light ~~framing~~ frame construction in accordance with the cladding manufacturer's installation instructions, the requirements of Table R703.3 using screw fasteners substituted for the nails specified in accordance with Table R703.4, or an approved design.

TABLE R703.3(1)
SIDING MINIMUM ATTACHMENT AND MINIMUM THICKNESS
(portions of table not shown remain unchanged)

TABLE R703.3(2)
SCREW FASTENER SUBSTITUTION FOR SIDING ATTACHMENT TO COLD-FORMED STEEL LIGHT FRAME CONSTRUCTION[a,b,c,d,e]

Nail Diameter per Table R703.3	Minimum Screw Fastener Size
0.099"	#6
0.113"	#7
0.120"	#8

For SI: 1 inch = 25.4 mm

a. Screws shall comply with ASTM C1513 and shall penetrate a minimum of three threads through minimum 33 mil (20 gauge) cold-formed steel frame construction.
b. Screw head diameter shall not be less than the nail head diameter required by Table R703.3(1).

c. Number and spacing of screw fasteners shall comply with Table R703.3(1).
d. Pan head, hex washer head, modified truss head, or other screw head types with a flat attachment surface under the head shall be used for vinyl siding attachment.
e. Aluminum siding shall not be fastened directly to cold-formed steel light frame construction.

(Portions of code change proposal not shown remain unchanged)

Commenter's Reason: At the committee action hearing, the committee realized the need to address siding connections to cold-formed steel framing. The code currently includes prescriptive fastening solutions for wood framing, but nothing for steel framing. This public comment builds on the committee's action and adds a simple prescriptive solution that makes use of and is based on equivalence to the nail fastening requirements already in the code.

Public Comment 2:

Matthew Dobson, Vinyl Siding Institute, Inc., requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

R703.3 Nominal thickness and attachments. The nominal thickness and attachment of exterior wall coverings shall be in accordance with Table R703.3, the wall covering material requirements of this section, and the wall covering manufacturer's installation instructions. Nominal material thicknesses in Table R703.3 are based on a maximum stud spacing of 16 inches on center. Where specified by the siding manufacturer's instructions and supported by a test report or other documentation, attachment to studs with greater spacing is permitted. Fasteners for exterior wall coverings attached to wood framing shall be in accordance with Section R703.3.2 and Table 703.3. Exterior wall coverings shall be attached to cold-formed steel light framing in accordance with the cladding manufacturer's installation instructions or an approved design.

R703.3.3 Minimum fastener length and penetration. Fasteners shall have the greater of the minimum length specified in Table R703.3 or as required to provide a minimum penetration into framing as follows:

3. Fasteners for vinyl siding and insulated vinyl siding installed over wood or wood structural panel sheathing shall penetrate a minimum of 1-1/4 inches into sheathing and framing combined. Vinyl siding and insulated vinyl siding shall be permitted to be installed with fasteners penetrating not less than .75 inches into or through wood or wood structural sheathing of minimum thickness as specified by the manufacturer's instructions or test report, with or without penetration into the framing. Where the fastener penetrates fully through the sheathing, the end of the fastener shall extend a minimum of ¼ inch beyond the opposite face of the sheathing. Fasteners for vinyl siding and insulated vinyl siding installed over foam plastic sheathing shall be in accordance with Section R703.11.2. Fasteners for vinyl siding and insulated vinyl siding installed over fiberboard or gypsum sheathing shall penetrate a minimum of 1-1/4 inches into framing.

(Portions of code change proposal not shown remain unchanged)

TABLE R703.3
SIDING MINIMUM ATTACHMENT AND MINIMUM THICKNESS

SIDING MATERIAL	NOMINAL THICKNESS (inches)	Joint Treatment	TYPE OF SUPPORTS FOR THE SIDING MATERIAL AND FASTENERS					
			Wood or wood structural panel sheathing into stud	Fiberboard sheathing into stud	Gypsum sheathing into stud	Foam plastic sheathing into stud	Direct to studs	Number or spacing of fasteners
Editorial Note: Insert after Hardboard lap siding in new table. Insulated Vinyl Siding (See Section R703.X)	0.035 (vinyl siding layer only)	Lap	0.120 nail (shank) with a 0.313 head or 16 gauge crown	0.120 nail (shank) with a 0.313 head or 16 gauge crown	0.120 nail (shank) with a 0.313 head or 16 gauge crown	0.120 nail (shank) with a 0.313 head per Section R703.11.2	Not Allowed	16 inches on center or specified by manufacturer instructions, test report or other sections of this code.

Editorial Note: Insert after Particleboard panels in new table. Polypropylene Siding (See Section R703.X)	Not Applicable.	Lap	See section 703.13.1	See section 703.13.1	See section 703.13.1	See section 703.13.1	Not Allowed	As specified by the manufacturer instructions, test report or other sections of this code.

(Portions of code change proposal not shown remain unchanged)

Commenter's Reason: This change brings approved changes on installation from RB385 and RB387 into the new accepted formatting of RB392. The installation specifications were accepted but because of the changes in RB392 it is necessary to bring them along with this change.

Public Comment 3:

David Johnston, Vinyl Siding Institute, Inc., requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

R703.3.1 Wind limitations. Where ~~the basic wind speed in accordance with Figure R301.2(4)A is 110 miles per hour (49 m/s) or higher,~~ the design wind pressure exceeds 30 psf, or where the limits of Table R703.3.1 are exceeded, the attachment of wall coverings shall be designed to resist the component and cladding loads specified in Table R301.2(2), adjusted for height and exposure in accordance with Table R301.2(3). For the determination of wall covering attachment, component and cladding loads shall be determined using an effective wind area of 10 ft^2.

TABLE R703.3.1
LIMITS FOR ATTACHMENT PER TABLE R703.3

Maximum Mean Roof Height

Ultimate Wind Speed (mph-3-second gust)	Exposure		
	B	C	D
115	NL	50'	20'
120	NL	30'	DR
130	60'	15'	DR
140	35'	DR	DR

NL = not limited by Table R703.3.1, DR = Design Required
For SI: 1 foot = 304.8 mm, 1 mile per hour = 0.447 m/s

(Portions of code change proposal not shown remain unchanged)

Commenter's Reason: This public comment will merge the results of committee action on RB366 and RB367 into the committee action on RB392, and satisfy the intent of all proponents. The committee action on RB366 was to update the wind speed in the first sentence of the paragraph from the old 110 mph ASD basis to the new 140 mph Ultimate basis. This sentence states the maximum wind speed for which the attachment methods in Table 703.4 are applicable.
Committee action on RB367 was to delete this sentence but substitute similar criteria for the use of current Table R703.4 based on wind pressure rather than wind speed. The 30 psf threshold pressure matches the threshold for required design in ICC 600 and is slightly higher than the pressure that would result from either the previous 110 mph nominal (ASD) wind or a 140 mph (ultimate) wind in Exposure Category B with a mean roof height of 30 feet. RB367 also provides a table with maximum roof heights in different combinations of wind speed and exposure category that would produce 30 psf, so that use of the attachments table would also be limited to those roof heights.

Meanwhile, RB392 relocated section R703.4 and Table R703.4 to R703.3, and broke out a separate section R703.3.1 to state the wind limitation on the use of the table attachments. It makes sense to incorporate the changes made in RB366 and RB367 into this comprehensive proposal. This public comment thus would delete the sentence in R703.3.1 related to the wind *speed* limitation and substitute the wind *pressure* limitations, consistent with committee action on RB367. The roof height limitation table from RB367 would also be carried over and be designated Table R703.3.1.

The effect of all these changes would be to make the limitations of the attachment methods in Table R703.3 clearer and more complete, and consistent with ICC 600 and the other upgrades to the wind speed provisions being made to the IRC during this cycle.

Public Comment 4:

Edward L. Keith, representing APA – The Engineered Wood Association, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

R703.3.2 Fasteners. Exterior wall coverings shall be securely fastened with aluminum, galvanized, stainless steel or rust-preventative coated nails or staples in accordance with Table R703.3 or with other *approved* corrosion-resistant fasteners in accordance with the wall covering manufacturer's installation instructions. Nails and staples shall comply with ASTM F 1667. Nails shall be T-head, modified round head, or round head with smooth or deformed shanks. Staples shall have a minimum crown width of 7/16-inch outside diameter and be manufactured of minimum 16 gage wire. Where fiberboard, gypsum, or foam plastic sheathing backing is used, nails or staples shall be driven into the studs. Where wood or wood structural panel sheathing is used, fasteners shall be driven into the studs unless otherwise permitted to be driven into sheathing in accordance with the siding manufacturer's installation instructions or in accordance with the Table R703.3.2.

Table R703.3.2
Optional Siding Attachment Schedule For Fasteners Where No Stud Penetration Necessary

APPLICATION	NUMBER AND TYPE OF FASTENER	SPACING OF FASTENERS[b]
Exterior wall covering (weighing less than 11 psf) attachment to wood structural panel sheathing, either direct or over foam sheathing a maximum of 2 inches thick.[a] Note: Does not apply to vertical siding.	Ring shank roofing nail (0.120" min. dia.)	12" o.c.
	Ring shank nail (0.148" min. dia.)	15" o.c.
	#6 screw (0.138" min. dia.)	12" o.c.
	#8 screw (0.164" min. dia.)	16" o.c.

a. Fastener length shall be sufficient to penetrate back side of the wood structural panel sheathing by at least 1/4". The wood structural panel sheathing shall be 7/16" or thicker in thickness.

b. Spacing of fasteners is per 12" of siding width. For other siding widths, multiply SPACING OF FASTENERS above by a factor of 12/s, where s is the siding width in inches. For example, if 8" lap siding, multiply SPACING OF FASTENERS above by 12/8 or 1.5. Fastener spacing shall never be greater than the manufacturer's minimum recommendations.

(Portions of code change proposal not shown remain unchanged)

Commenter's Reason: APA attempted to work with other industries while developing this code change proposal. There was, however, not sufficient time to fully resolve some of the outstanding issues with the Vinyl Siding Institute (VSI) in December 2012. This PC reflects the resolution between APA and the VSI. We also took this opportunity to make some adjustments to the original proposal that we were unable to make through the Floor Modification procedure.

The most compelling of the arguments received from the other industries was that this information would fit better in Chapter 7 and that the changes proposed and accepted as modified during the Committee Action Hearing to proposal RB392 provided the ideal location in Chapter 7. As such APA has submitted this Public Comment to RB392 and has submitted a similar Public Comment to RB277 where this proposal originally appeared. We will ask for RB277 to be heard after RB392 so that if we are successful with this public comment we will request denial for RB277.

Additional proposal adjustments – The below discusses the various modifications made to the table originally proposed for RB277.

1. The format of the able was changed slightly to account for the fact that the original proposal, RB277, was part of an existing table. In this Public Comment to RB392 the proposed is a free-standing table.
2. Recent research conducted by the foam industry suggests that limiting the thickness of the foam sheathing to 2 inches or less will minimize the potential for long term sagging of the siding material. With thicker foam sheathing the fasteners used to attach the foam are essentially cantilevered through the foam away from the main member of the connection. For smaller diameter fasteners the cantilevered fasteners can bend over time causing the water-resistant barrier to sag downward. Even though the use of the wall sheathing alone to anchor the siding requires a closer fastener spacing than that tested by the foam industry and should result in greater resistance to long term sagging of the siding, we have chosen to be conservative in our proposal to ensure good performance of the siding and its attachment to the wood structural panel sheathing.
3. We also changed the term "foam insulation" to "foam sheathing" to be consistent with the code definition.
4. Footnote "a" was rewritten separating the requirements of the footnote into two separate sentences to ensure correct interpretation of the provisions. The requirements are:
   a. Full penetration of the wood structural panel sheathing by at least ¼ inch to ensure that the pyramidal tip of the fastener is not considered in the "depth of penetration" of the fastener, as the tip contributes nothing to the withdrawal capacity of the fastener. We want the nail to penetrate the wood structural panel sheathing, *regardless of thickness* to provide a visual indication of the nails' presence, adequate length and penetration of the wood structural panel sheathing.
   b. The second separate requirement is the minimum thickness of the wood structural panel sheathing. The tables are based on the use of 7/16" minimum thickness sheathing.

5. The ring-shank roofing nail was added to the table as they have been used in part of the country.

RB392-13

Final Action: AS AM AMPC____ D

RB395-13
Table R602.3(1), R802.3.1, Figure 802.5.1

Proposed Change as Submitted

Proponent: Rick Davidson, City of Maple Grove, MN, representing Association of Minnesota Building Officials (rdavidson@maplegrovemn.gov)

Revise as follows:

TABLE R602.3(1)
FASTENER SCHEDULE FOR STRUCTURAL MEMBERS

ITEM	DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER[a,b,c]	SPACING OF FASTENERS
Roof			
~~4~~	~~Collar tie to rafter, face nail or 1 ¼" x 20 gage ridge strap~~	~~3-10d (3" x 0.128")~~	~~-~~

(Portions of Table not shown remain unchanged)

Revise as follows:

R802.3.1 Ceiling joist and rafter connections. Ceiling joists and rafters shall be nailed to each other in accordance with Table R802.5.1(9)~~,~~ to provide a continuous tie across the building. ~~and the rafter~~ Rafters and ceiling joists shall be nailed to the top wall plate in accordance with Table R602.3(1). Ceiling joists shall be continuous or ~~securely~~ joined in accordance with Table R802.5.1(9). ~~where they meet over interior partitions and are nailed to adjacent rafters to provide a continuous tie across the building when such joists are parallel to the rafters.~~ Laps or butts of ceiling joists shall be in accordance with Section R802.3.2.

~~Where ceiling joists are not connected to the rafters at the top wall plate, joists connected higher in the *attic* shall be installed as rafter ties, or rafter ties shall be installed to provide a continuous tie. Where ceiling joists are not parallel to rafters, rafter ties shall be installed. Rafter ties shall be a minimum of 2 inches by 4 inches (51 mm by 102 mm) (nominal), installed in accordance with the connection requirements in Table R802.5.1(9), or connections of equivalent capacities shall be provided. Where ceiling joists or rafter ties are not provided, the ridge formed by these rafters shall be supported by a wall or girder designed in accordance with accepted engineering practice.~~

~~Collar ties or ridge straps to resist wind uplift shall be connected in the upper third of the *attic* space in accordance with Table R602.3(1).~~

~~Collar ties shall be a minimum of 1 inch by 4 inches (25 mm by 102 mm) (nominal), spaced not more than 4 feet (1219 mm) on center.~~

Where ceiling joists are connected to rafters above the top wall plate, they shall also meet the requirements for rafter ties. Where ceiling joists run perpendicular to rafters, rafter ties shall be installed. Rafter ties shall be a minimum of 2 inches by 4 inches (51 mm by 102 mm) (nominal) and be installed in accordance with Figure R802.5.1 and the connection requirements in Table R802.5.1(9).

Where ceiling joists or rafter ties are not provided, the ridge formed by these rafters shall be supported by a wall or girder designed in accordance with accepted engineering practice.

Delete without substitution:

Delete references to "collar tie" in Figure R802.5.1

Reason: The current language is confusing to read. It contains unnecessary repetition.

In the first paragraph, the first and last sentences are combined. Language is inserted to address the connection of ceiling joists to the top plate. The word "securely" is being deleted as ceiling joists joined per the code are presumed to be secure. Laps or butts are already regulated in R802.3.2.

Specific direction on rafter ties has been editorially revised so it is more easily understood.

References to "collar ties" are being deleted because there is no place in the IRC that makes collars ties a requirement. The sentences says "Collar ties or ridge straps to resist wind uplift shall be connected in the upper third of the attic space in accordance with Table R602.3(1)." The code says where they are to be connected, not when they are required. Something is missing. This text first appeared in the 2006 IRC but there isn't a valid explanation in ICC guides or manuals. Collar ties were not part of any previous I-Code. Why have rules for components that are not required? Such rules are unenforceable.

Cost Impact: The code change proposal will not increase the cost of construction.

R802.3.1-RB-DAVIDSON.doc

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: Based upon the proponent's request for disapproval. This would eliminate a design option without any technical justification.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rick Davidson, City of Maple Grove, representing Association of Minnesota Building Officials, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

TABLE R602.3(1)
FASTENER SCHEDULE FOR STRUCTURAL MEMBERS

ITEM	DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER[a,b,c]	SPACING OF FASTENERS
	Roof		
4	Collar tie to rafter, face nail or 1 ¼" x 20 gage ridge strap	3-10d (3" x 0.128")	-

(Portions of Table not shown remain unchanged)

R802.3.1 Ceiling joist and rafter connections. Ceiling joists and rafters shall be nailed to each other in accordance with Table R802.5.1(9) to provide a continuous tie across the building. Rafters and ceiling joists shall be nailed to the top wall plate in accordance with Table R602.3(1). Ceiling joists shall be continuous or joined in accordance with Table R802.5.1(9). Laps or butts of ceiling joists shall be in accordance with Section R802.3.2.

Collar ties or ridge straps shall be installed in the upper third of the rafters in accordance with Table R602.3(1). Ridge straps shall be a minimum of 1 ¼" X 20 gage. Collar ties shall be a minimum of 1 inch by 4 inches (25 mm by 102 mm) (nominal) and spaced not more than 4 feet (1219 mm) on center.

Where ceiling joists are connected to rafters above the top wall plate, they shall also meet the requirements for rafter ties. Where ceiling joists run perpendicular to rafters, rafter ties shall be installed. Rafter ties shall be a minimum of 2 inches by 4 inches (51 mm by 102 mm) (nominal) and be installed in accordance with Figure R802.5.1 and the connection requirements in Table R802.5.1(9).

Where ceiling joists or rafter ties are not provided, the ridge formed by these rafters shall be supported by a wall or girder designed in accordance with accepted engineering practice.

~~Delete references to "collar tie" in Figure R802.5.1~~

Commenter's Reason: The original proposal was requested to be denied to correct problems.

The current text in the IRC regarding ceiling joist and rafter connections is confusing to read.
The proposal intends to clarify the application of the code.
The modification revises the text for collar ties into mandatory language which is the intent. This had been omitted from the original submittal.

RB395-13
Final Action: AS AM AMPC____ D

RB396-13
R802.10.2.1, R802.11.1, Table R802.11

Proposed Change as Submitted

Proponent: Gary J. Ehrlich, P.E., National Association of Home Builders (NAHB) (gehrlich@nahb.org)

Revise as follows:

R802.10.2.1 Applicability limits. The provisions of this section shall control the design of truss roof framing when snow controls for buildings not greater than 60 feet (18 288 mm) in length perpendicular to the joist, rafter or truss span, not greater than 36 feet (10 973 mm) in width parallel to the joist, rafter or truss span, not more than three stories above grade plane in height, and roof slopes not smaller than 3:12 (25 percent slope) or greater than 12:12 (100 percent slope). Truss roof framing constructed in accordance with the provisions of this section shall be limited to sites subjected to a maximum design wind speed of 140 ~~110~~ miles per hour (63~~49~~ m/s), Exposure A, B or C, and a maximum ground snow load of 70 psf (3352 Pa). For consistent loading of all truss types, roof snow load is to be computed as: 0.7 p_g.

R802.11.1 Uplift resistance. Roof assemblies shall have uplift resistance in accordance with Sections R802.11.1.2 and R802.11.1.3.

Where the uplift force does not exceed 200 pounds, rafters and trusses spaced not more than 24 inches (610 mm) on center shall be permitted to be attached to their supporting wall assemblies in accordance with Table R602.3(1).

Where the basic wind speed does not exceed 115 mph ~~90 mph~~, the wind exposure category is B, the roof pitch is 5:12 or greater, and the roof span is 32 feet (9754 mm) or less, rafters and trusses spaced not more than 24 inches (610 mm) on center shall be permitted to be attached to their supporting wall assemblies in accordance with Table R602.3(1).

~~For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 mile per hour = 0.447 m/s, 1 pound = 0.454 kg, 1 pound per linear foot = 14.5 N/m.~~

a. ~~The uplift connection forces are based on a maximum 33-foot mean roof height and Wind Exposure Category B or C. For Exposure D, the uplift connection force shall be selected from the Exposure C portion of the table using the next highest tabulated basic wind speed. The Adjustment Coefficients in Table R301.2(3) shall not be used to multiply the above forces for Exposures C and D or for other mean roof heights.~~

b. ~~The uplift connection forces include an allowance for roof and ceiling assembly dead load of 15 psf.~~

c. ~~The tabulated uplift connection forces are limited to a maximum roof overhang of 24 inches.~~

d. ~~The tabulated uplift connection forces shall be permitted to be multiplied by 0.75 for connections not located within 8 feet of building corners.~~

e. ~~For buildings with hip roofs with 5:12 and greater pitch, the tabulated uplift connection forces shall be permitted to be multiplied by 0.70. This reduction shall not be combined with any other reduction in tabulated forces.~~

f. ~~For wall-to-wall and wall-to-foundation connections, the uplift connection force shall be permitted to be reduced by 60 plf for each full wall above.~~

g. ~~Linear interpolation between tabulated roof spans and wind speeds shall be permitted.~~

h. ~~The tabulated forces for a 12-inch on-center spacing shall be permitted to be used to determine the uplift load in pounds per linear foot.~~

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 mph = 0.447 m/s, 1 pound = 0.454 kg.

a. The uplift connection forces are based on a maximum 33 foot mean roof height and Wind Exposure Category B or C. For Exposure D, the uplift connection force shall be selected from the Exposure C portion of the table using the next highest tabulated ultimate design wind speed. The Adjustment Coefficients in Table R301.2(3) shall not be used to multiply the above forces for Exposures C and D or for other mean roof heights.
b. The uplift connection forces include an allowance for roof and ceiling assembly dead load of 15 psf.
c. The tabulated uplift connection forces are limited to a maximum roof overhang of 24 inches.
d. The tabulated uplift connection forces shall be permitted to be multiplied by 0.75 for connections not located within 8 feet of building corners.
e. For buildings with hip roofs with 5:12 and greater pitch, the tabulated uplift connection forces shall be permitted to be multiplied by 0.70. This reduction shall not be combined with any other reduction in tabulated forces.
f. For wall-to-wall and wall-to-foundation connections, the uplift connection force shall be permitted to be reduced by 60 plf for each full wall above.
g. Linear interpolation between tabulated roof spans and wind speeds shall be permitted.
h. The tabulated forces for a 12” on center spacing shall be permitted to be used to determine the uplift load in pounds per linear foot.

Reason: The purpose of this code change is to bring the wind provisions of the IRC in line with the 2012 IBC and ASCE 7-10. As a result of the schedule changes implemented during the 2009-2010 ICC code development cycle, there was not sufficient time to revise the IRC to fully implement the new ultimate wind speed basis of ASCE 7-10 and the 2012 IBC, due to the extent of prescriptive IRC provisions and tables which are directly related to basic wind speed.. New maps based on the ASCE 7-10 ultimate wind speed data but converted back down to nominal (ASD) basis were provided in the IRC. This has led to a fair amount of confusion among those stakeholders who work with both codes.

A working group of stakeholders including NAHB, the major material associations, ASCE, and the Insurance Institute for Business and Home Safety developed a series of IRC proposals to implement the new ultimate wind speed basis. This proposal updates Chapter 8, including wood truss applicability limits and roof uplift connection provisions. It is noted that the changes necessary to update the appropriate Section R804 cold-formed steel provisions are contained in a separate AISI proposal which comprehensively revises the cold-formed steel provisions.

Cost Impact: The code change proposal will not increase the cost of construction.

RB396-13

R802.10.2.1-RB-EHRLICH.doc

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

	48	508	442	626	545	882	767	1166	1014

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 mile per hour = 0.447 m/s, 1 pound = 0.454 kg, 1 pound per linear foot = 14.5 N/m.

a. The uplift connection forces are based on a maximum 33-foot mean roof height and Wind Exposure Category B or C. For Exposure D, the uplift connection force shall be selected from the Exposure C portion of the table using the next highest tabulated basic wind speed. The Adjustment Coefficients in Table R301.2(3) shall not be used to multiply the above forces for Exposures C and D or for other mean roof heights.

b. The uplift connection forces include an allowance for roof and ceiling assembly dead load of 15 psf.

c. The tabulated uplift connection forces are limited to a maximum roof overhang of 24 inches.

d. The tabulated uplift connection forces shall be permitted to be multiplied by 0.75 for connections not located within 8 feet of building corners.

e. For buildings with hip roofs with 5:12 and greater pitch, the tabulated uplift connection forces shall be permitted to be multiplied by 0.70. This reduction shall not be combined with any other reduction in tabulated forces.

f. For wall-to-wall and wall-to-foundation connections, the uplift connection force shall be permitted to be reduced by 60 plf for each full wall above.

g. Linear interpolation between tabulated roof spans and wind speeds shall be permitted.

h. The tabulated forces for a 12-inch on-center spacing shall be permitted to be used to determine the uplift load in pounds per linear foot.

	48	512	468	604	556	698	646	900	840	1120	1048

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 mph = 0.447 m/s, 1 pound = 0.454 kg.

a. The uplift connection forces are based on a maximum 33 foot mean roof height and Wind Exposure Category B or C. For Exposure D, the uplift connection force shall be selected from the Exposure C portion of the table using the next highest tabulated ultimate design wind speed. The Adjustment Coefficients in Table R301.2(3) shall not be used to multiply the above forces for Exposures C and D or for other mean roof heights.

b. The uplift connection forces include an allowance for roof and ceiling assembly dead load of 15 psf.

c. The tabulated uplift connection forces are limited to a maximum roof overhang of 24 inches.

d. The tabulated uplift connection forces shall be permitted to be multiplied by 0.75 for connections not located within 8 feet of building corners.

e. For buildings with hip roofs with 5:12 and greater pitch, the tabulated uplift connection forces shall be permitted to be multiplied by 0.70. This reduction shall not be combined with any other reduction in tabulated forces.

f. For wall-to-wall and wall-to-foundation connections, the uplift connection force shall be permitted to be reduced by 60 plf for each full wall above.
g. Linear interpolation between tabulated roof spans and wind speeds shall be permitted.
h. The tabulated forces for a 12" on center spacing shall be permitted to be used to determine the uplift load in pounds per linear foot.

(Portions of code change proposal not shown remain unchanged)

Commenter's Reason: The purpose of this public comment is to complete the updating of the IRC Chapter 8 provisions to correlate with the ultimate wind speed basis of the 2012 IBC and ASCE 7-10. A review of the new roof uplift load table by AWC shortly before the Committee Action Hearings uncovered an error in the calculations for 5:12 roof slopes and greater. (The values for roof slopes less than 5:12 were correct.) Since there was not time to track down the error and prepare an amended table in time for the hearings, and we did not want to ask for disapproval given the remaining portions of the wind update heard up to that point had passed, we opted to maintain the original table but identify the wind speeds as "nominal design wind speeds" using the V_{ASD} term introduced in the 2012 IBC.

The error in the calculations has now been identified and corrected and a new version of Table R802.11 generated using ultimate design wind speeds. This public comment supplies the new table and values to replace the existing V_{ASD} table and complete the updating of the IRC wind provisions. It is noted the values proposed here have been checked against AWC's calculations and confirmed.

RB396-13

Final Action: AS AM AMPC____ D

RB397-13
R802.11.1.2

Proposed Change as Submitted

Proponent: Gary J. Ehrlich, P.E., National Association of Home Builders (NAHB) (gehrlich@nahb.org)

Revise as follows:

R802.11.1.2 Truss uplift resistance. Trusses shall be attached to supporting wall assemblies by connections capable of resisting uplift forces as specified on the Truss Design Drawings <u>for the basic wind speed as determined by Figure R301.2(4)A and listed in Table R301.2(1).</u> Uplift forces shall be permitted to be determined as specified by Table R802.11, if applicable, or as determined by accepted engineering practice.

Reason: The purpose of this code change is to clarify the requirements for determining uplift loads for trusses. The proposal adds a pointer to the Climatic and Geographic Design Criteria table and the Basic Wind Speed figure. This emphasizes the need for the Truss Designer to correctly select the proper wind speed and other criteria for the site and building in the truss design software and not just pick the highest wind speed applicable in a state or the highest mean roof height permitted. It is critical the Truss Design Drawings reflect the correct uplift reactions for the site and building in question and not a more conservative reaction. Otherwise, the builder (and homeowner) would be required to install extra (or larger) uplift connectors than would normally be necessary for the loads anticipated at the site.

Cost Impact: The code change proposal will not increase the cost of construction.

RB397-13

R802.11.1.2-RB-EHRLICH.doc

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Approval was based upon the proponent's published reason.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Gary J. Ehrlich, P.E., National Association of Home Builders (NAHB), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R802.11.1.2 Truss uplift resistance. Trusses shall be attached to supporting wall assemblies by connections capable of resisting uplift forces as specified on the Truss Design Drawings for the ~~basic~~ <u>ultimate design</u> wind speed as determined by Figure R301.2(4) and listed in Table R301.2(1). Uplift forces shall be permitted to be determined as specified by Table R802.11, if applicable, or as determined by accepted engineering practice.

Commenter's Reason: The purpose of this public comment is to correlate the original proposal with the update of the IRC wind provisions to the ultimate wind speed basis of the 2012 IBC and ASCE 7-10. The term "basic wind speed" is amended to "ultimate design wind speed" in keeping with the set of approved code changes which comprehensively implement the new wind provisions.

Public Comment 2:

Larry Wainright, Qualtim, representing Structural Building Components Association, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R802.11.1.2 Truss uplift resistance. Trusses shall be attached to supporting wall assemblies by connections capable of resisting uplift forces as specified on the Truss Design Drawings for the basic wind speed as determined by Figure R301.2(4)A and listed in Table R301.2(1) or as shown on the construction documents. Uplift forces shall be permitted to be determined as specified by Table R802.11, if applicable, or as determined by accepted engineering practice.

Commenter's Reason: While SBCA agrees in concept that that trusses should be designed at a minimum to the wind speeds determined by Figure R301.2(4) and listed in Table R301.2(1), truss designers are not building designers. In accordance with ANSI/TPI 1, chapter 2 (the truss design standard referenced by the IRC) truss designers must design the trusses in accordance with the construction documents provided. It is the prerogative of the building designer to specify design parameters above the minimum code requirements. As written, the code would not allow the truss designer to do truss design in accordance with the building designer's specification if it is greater than the minimum requirements.

RB397-13
Final Action: AS AM AMPC____ D

R806.1

Proposed Change as Submitted

Proponent: Michael D. Fischer, Kellen Company, representing the Asphalt Roofing Manufacturers Association (mfischer@kellencompany.com)

Revise as follows:

R806.1 Ventilation required. Enclosed *attics* and enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters shall have cross ventilation for each separate space by ventilating openings protected against the entrance of rain or snow. Ventilation openings shall have a least dimension of 1/16 inch (1.6 mm) minimum and 1/4 inch (6.4 mm) maximum. Ventilation openings having a least dimension larger than 1/4 inch (6.4 mm) shall be provided with corrosion-resistant wire cloth screening, hardware cloth, or similar material with openings having a least dimension of 1/16 inch (1.6 mm) minimum and 1/4 inch (6.4 mm) maximum.
Openings in roof framing members shall conform to the requirements of Section R802.7. Required ventilation openings shall open directly to the outside air.

> ~~**Exception:** Attic ventilation shall not be required when determined not necessary by the code official due to atmospheric or climatic conditions.~~

Reason: With recent revisions to the IRC roof ventilation requirements, and an IBC change approved last year, both codes now contain specific details on both vented and unvented attics with detailed requirements related to the use of vapor retarders and climate specific instructions on the use of air-impermeable insulation. Now that the IRC contains these provisions, the current exception creates a conflict and an unnecessary alternative. Additionally, since the exception is based on climatic conditions, with no direction to the code official on matters related to construction methods or details, it cannot be applied on a project-by-project basis.

Cost Impact: The code change proposal will not increase the cost of construction.

R806.1-RB-FISCHER.doc

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Approval was based upon the proponent's published reason.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Gary J. Ehrlich, P.E., National Association of Home Builders (NAHB), requests Disapproved

Commenter's Reason: The purpose of this public comment is to restore the language permitting the building official to waive attic ventilation requirements. With the increasing complexity of today's houses, building tightness requirements, and energy efficiency requirements, the proper construction of enclosed attic and rafter spaces is critical. The code needs to give building officials clear flexibility to work with builders in cases where local climate conditions (microclimates), complex roof shapes, or other challenges (e.g. PV systems taking up a large area of the roof) make complying either with traditional ventilation requirements for enclosed attic and rafter spaces or the unvented roof provisions of the IRC difficult. Restoring this provision will provide building officials with the discretion to accommodate these unusual cases.

Examples of conditions where this exception is used include occupied roof decks, low slope (flat) roofs or vaulted ceilings using rafters with drywall attached to directly to the underside of the solid combination rafter-ceiling joist. In many cases it is not possible to provide the 3 ft elevation difference between the high and low vents on low slope roofs and where low slope roofs include parapets and therefore no eave vents. These types of roof assemblies are particularly popular in the hot, dry, desert climates of the Southwest. Building officials in that region have been allowing exemptions to ventilated roof assemblies (without requiring the type of unvented roof required by the IRC) going back to when the UBC was in force. In fact, it was a building official from San Diego who reintroduced the current exception to the code, based on the good performance of unvented roof assemblies in that region.

Another example of a condition where flexibility is needed is in wildland-urban regions. In areas at higher risk of wildfires and/or where water supplies for firefighting are insufficient, the IWUIC imposes stringent requirements on construction. Eaves and soffits must be constructed of ignition-resistant materials or materials providing a 1-hour fire rating. Eave and soffit vents prohibited, and other vents are limited to a total area of 144 square inches. These requirements could have the effect of leaving builders in these areas with little choice but to construct an unvented rafter or roof assembly, even if such an assembly is not recommended for their particular climate. The exception will provide builders and building officials flexibility to deal with these areas.

It is noted a similar code change deleting this exception for the 2015 IBC was disapproved by the IBC-FS Committee and the final assembly in Portland.

Proposed Change as Submitted

Proponent: Charles S. Bajnai, Chesterfield County, VA,, representing ICC Building Code Action Committee and Virginia Building and Code Officials Association (bajnaic@chesterfield.gov), Joseph Lstiburek, Building Science Corporation

Revise as follows:

SECTION R806
ROOF VENTILATION

~~**R806.1 Ventilation required.** Enclosed *attics* and enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters shall have cross ventilation for each separate space by ventilating openings protected against the entrance of rain or snow. Ventilation openings shall have a least dimension of 1/16 inch (1.6 mm) minimum and 1/4 inch (6.4 mm) maximum. Ventilation openings having a least dimension larger than 1/4 inch (6.4 mm) shall be provided with corrosion-resistant wire cloth screening, hardware cloth, or similar material with openings having a least dimension of 1/16 inch (1.6 mm) minimum and 1/4 inch (6.4 mm) maximum. Openings in roof framing members shall conform to the requirements of Section R802.7. Required ventilation openings shall open directly to the outside air.~~

> ~~**Exception:** Attic ventilation shall not be required when determined not necessary by the code official due to atmospheric or climatic conditions.~~

~~**R806.2 Minimum vent area.** The minimum net free ventilating area shall be 1/150 of the area of the vented space.~~

> ~~**Exception:** The minimum net free ventilation area shall be 1/300 of the vented space provided one or more of the following conditions are met:~~
>
> 1. ~~In Climate Zones 6, 7 and 8, a Class I or II vapor retarder is installed on the warm-in-winter side of the ceiling.~~
> 2. ~~At least 40 percent and not more than 50 percent of the required ventilating area is provided by ventilators located in the upper portion of the attic or rafter space. Upper ventilators shall be located no more than 3 feet (914 mm) below the ridge or highest point of the space, measured vertically, with the balance of the required ventilation provided by eave or cornice vents. Where the location of wall or roof framing members conflicts with the installation of upper ventilators, installation more than 3 feet (914 mm) below the ridge or highest point of the space shall be permitted.~~

<u>**R806.1 Ventilation.** The requirements for vented and unvented attic space and enclosed rafter space shall be in accordance with this section.</u>

<u>**R806.2 Vented attics.** Vented attics shall have a minimum net free ventilation area at least 1/300 of the area of the vented space. Between half and two thirds of the provided ventilation shall be installed at the eaves. The ventilation openings shall have a least dimension of 1/16 inch (1.6 mm) minimum and 1/4 inch (6.4 mm) maximum. Ventilation openings having a least dimension larger than 1/4 inch (6.4 mm) shall be provided with corrosion-resistant wire cloth screening, hardware cloth, or similar material with openings having a least dimension of 1/16 inch (1.6 mm) minimum and 1/4 inch (6.4 mm) maximum. Openings in roof framing members shall conform to the requirements of Section R802.7. Required ventilation openings shall open directly to the outside air.</u>

~~**R806.3 Vent and insulation clearance.**~~ Where eave or cornice vents are installed, insulation shall not block the free flow of air. A minimum of a 1-inch (25 mm) space shall be provided between the insulation and the roof sheathing and at the location of the vent.

~~**R806.4**~~ **R806.2.1 Installation and weather protection.** Ventilators shall be installed in accordance with manufacturer's installation instructions. Installation of ventilators in roof systems shall be in accordance with the requirements of Section R903. Installation of ventilators in wall systems shall be in accordance with the requirements of Section R703.1.

~~**R806.5**~~ **R806.3 Unvented attic and unvented enclosed rafter assemblies**. Unvented *attic* assemblies (spaces between the ceiling joists of the top *story* and the roof rafters) and unvented enclosed rafter assemblies (spaces between ceilings that are applied directly to the underside of roof framing members/rafters and the structural roof sheathing at the top of the roof framing members/rafters) shall be permitted if all the following conditions are met:

1. The unvented *attic* space is completely contained within the *building thermal envelope.*
2. No interior Class I vapor retarders are installed on the ceiling side (*attic* floor) of the unvented *attic* assembly or on the ceiling side of the unvented enclosed rafter assembly.
3. Where wood shingles or shakes are used, a minimum $^{1}/_{4}$-inch (6 mm) vented air space separates the shingles or shakes and the roofing underlayment above the structural sheathing.
4. In Climate Zones 5, 6, 7 and 8, any *air-impermeable insulation* shall be a Class II vapor retarder, or shall have a Class III vapor retarder coating or covering in direct contact with the underside of the insulation.
5. Either Items 5.1, 5.2 or 5.3 shall be met, depending on the air permeability of the insulation directly under the structural roof sheathing.
   - 5.1. *Air-impermeable insulation* only. Insulation shall be applied in direct contact with the underside of the structural roof sheathing.
   - 5.2. Air-permeable insulation only. In addition to the air-permeable insulation installed directly below the structural sheathing, rigid board or sheet insulation shall be installed directly above the structural roof sheathing as specified in Table R806.5 for condensation control.
   - 5.3. Air-impermeable and air-permeable insulation. The *air-impermeable insulation* shall be applied in direct contact with the underside of the structural roof sheathing as specified in Table R806.5 for condensation control. The air-permeable insulation shall be installed directly under the *air-impermeable insulation.*
   - 5.4. Where preformed insulation board is used as the air-impermeable insulation layer, it shall be sealed at the perimeter of each individual sheet interior surface to form a continuous layer.

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC) The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 6 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

1. This section was rewritten to clarify vented and unvented attics. The current charging language in the first sentence of Section R806.1 says that all attics shall have cross ventilation, and yet Section R806.5 acknowledges unvented attics. The new Section R806.1 offers charging language for both conditions.
2. More importantly however, Section 806.2 now incorporates the concepts that were passed in Portland for the IBC, namely that more than half of the incoming ventilation for attics should come from low sources (eaves) and exit up high (roof vent, mechanical vents, gable end vents, etc.). A range is provided: ½ to 2/3 should be low at the eaves for proper chimney effect. Currently the code would allow 100% of the attic ventilation to be from ridge vents…where would the cross ventilation come from?

Cost Impact: The code change proposal will not increase the cost of construction.

RB402-13

R806.1-RB-BAJNAI-BCAC.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: This change would eliminate some venting configurations, such as gable end vents that have proved reliable for years. Also, there are some situations where eave vents cannot be installed. The committee likes the proposed reorganization and the proponent should rework and bring back.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Charles S. Bajnai, Chesterfield County, VA, ICC Building Code Action Committee requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R806.2 Vented attics. Vented attics shall have a minimum net free ventilation area at least 1/300 of the area of the vented space. ~~Between half and two thirds of the provided ventilation shall be installed at the eaves.~~ A minimum of 50 percent and a maximum of 60 percent of the provided ventilation shall be served by eave, gable or cornice vents. The remaining ventilation shall be located no more than 3 feet (914 mm) below the ridge or highest point of the space, measured vertically. The ventilation openings shall have a least dimension of 1/16 inch (1.6 mm) minimum and 1/4 inch (6.4 mm) maximum. Ventilation openings having a least dimension larger than 1/4 inch (6.4 mm) shall be provided with corrosion-resistant wire cloth screening, hardware cloth, or similar material with openings having a least dimension of 1/16 inch (1.6 mm) minimum and 1/4 inch (6.4 mm) maximum. Openings in roof framing members shall conform to the requirements of Section R802.7. Required ventilation openings shall open directly to the outside air.

(Portions of code change proposal not shown remain unchanged)

Commenter's Reason: The ICC Building Code Action Committee (BCAC) is submitting this public comment to address the code development committees concerns.

1. Working with opponents, the BCAC further reduced the amount of ventilation area required at the eaves to a maximum of 60% of the total required ventilation area;
2. added optional methods of venting at the lowest portions of attics: gable and cornice vents; and
3. clarified where the upper ventilation shall be measured from: 3' *measured vertically*.

RB402-13

Final Action: AS AM AMPC____ D

RB406-13
R807.1

Proposed Change as Submitted

Proponent: Rick Davidson, City of Maple Grove, MN, representing Association of Minnesota Building Officials (rdavidson@maplegrovemn.gov)

Revise as follows:

R807.1 Attic Access. ~~Buildings~~ Dwellings with concealed ~~combustible ceilings or roof construction~~ attics shall have an attic access opening to attic areas that ~~exceed 30 square feet and~~ have a vertical height of 30 inches or more. The vertical height shall be measured from the top of the ceiling framing members to the underside of the roof framing members.

The rough-framed opening shall not be less than 22 inches by 30 inches (559 mm by 762 mm) ~~and shall be located in a hallway or other readily accessible location~~. When located in a wall, the opening shall be a minimum of 22 inches wide by 30 inches high (559 mm wide by 762 mm high). When the access is located in a ceiling, minimum unobstructed headroom in the *attic* space shall be 30 inches (762 mm) at some point above the access measured vertically from the bottom of ceiling framing members. See Section M1305.1.3 for access requirements where mechanical *equipment* is located in *attics.*

Exception: An attic access is not required:

1. for attics above unconditioned space or
2. where the area of the attic is less than 300 square feet

Reason: The ICC Commentary for the IRC states: *The requirement for an attic access is predicated on the likelihood that during the life of the structure, access to an attic space for repair of piping, electrical and mechanical systems will be required.*

If this is true, then language in the section that states *"Buildings with combustible ceilings or roof construction shall have…."* is misleading because attics of non-combustible construction are just as likely to have piping, electrical and mechanical systems. The ***IBC*** makes no mention of combustibility in its attic access requirements. And, the mechanical code (M1305.1.3) already requires access for equipment in an attic. It is less obvious why access is need for piping or electrical systems that would never need service. So the purpose of the access is universally poorly understood.

If it is believed that access should be provided regardless of equipment, a more realistic approach would be to require access to any attic that contains concealed spaces and without regard to construction materials used. Furthermore, direction on the location of the access needs to be more useful. Currently the code says the access must be "in a hallway or other readily accessible location". There are a number of problems with this language. It leads one to believe that the access must be interior to the dwelling. Why couldn't the access be via a gable end hatch, through a knee wall, or via a garage attic? Eliminating the access within the dwelling solves a problem involving heat loss and air infiltration.

Another confusing component is that the term "readily accessible" is somewhat defined in the code as follows:

> *Ready Access (to). That which enables a device, appliance or equipment to be directly reached, without requiring the removal or movement of any panel, door, or similar obstruction, and without requiring the use of portable access equipment.*

This poses another dilemma. It states that "ready access" may not require removal of a panel or movement of a door and must be accessed by means other than a portable device such as a ladder. So interpreted literally would mean that the access could not be in a room accessed by a door, swinging or sliding, and it must be accessed by means of a stair or fixed ladder. This is not the norm practiced in the industry.

Then there is the issue of providing access to spaces as small as 30 square feet which means even some small porch attics would require access. 30 square feet is just too small an area to regulate.

The IBC provides no direction on where the access must be. It only requires that there be one and stipulates the size.
To alleviate these issues, this proposal would require an access for all attics in dwellings that have concealed spaces, would not dictate where the access must be consistent with the IBC, and provides two exceptions where access would typically serve no useful purpose such as a garage attic or areas with very small attics.

It should also be remembered that an access can be provided even if the code does not require one and that creating an opening in a ceiling or wall that does not contain an opening is a very simple operation.

Cost Impact: The code change proposal will not increase the cost of construction.

R807.1-RB-DAVIDSON.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee feels the 30 square feet criteria should be retained and prefers RB407-13.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rick Davidson, City of Maple Grove, representing Association of Minnesota Building Officials, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R807.1 Attic Access. Buildings ~~Dwellings~~ with concealed attics shall have an attic access opening to attic areas that exceed 30 square feet and have a vertical height of 30 inches or more. The vertical height shall be measured from the top of the ceiling framing members to the underside of the roof framing members.

The rough-framed opening shall not be less than 22 inches by 30 inches (559 mm by 762 mm). When located in a wall, the opening shall be a minimum of 22 inches wide by 30 inches high (559 mm wide by 762 mm high). When the access is located in a ceiling, minimum unobstructed headroom in the *attic* space shall be 30 inches (762 mm) at some point above the access measured vertically from the bottom of ceiling framing members. See Section M1305.1.3 for access requirements where mechanical *equipment* is located in *attics.*

~~**Exception:** An attic access is not required:~~

~~1. for attics above unconditioned space or~~
~~2. where the area of the attic is less than 300 square feet~~

Commenter's Reason: In denying this proposal, the committee objected to the deletion of the 30 square foot trigger for access. This modification reinserts that phrase. The committee also expressed concern about the deletion of attic access created by the exceptions so the modification deletes the exceptions. The committee also expressed concern that attic access would only apply to dwellings so the term "buildings" has been reinserted in the first sentence.

The committee did agree on two points. First, they agreed that access to an attic should be provided whether or not the roof construction was combustible because of the potential for mechanical equipment to be serviced and for other inspection or maintenance purposes so the modification retains that revision. The committee also agreed that the access requirements should be consistent with the IBC so the location requirement is retained.

RB406-13

Final Action: AS AM AMPC____ D

RB425-13
R905.2.7.1

Proposed Change as Submitted

Proponent: Bill McHugh, Chicago Roofing Contractors Association (bill@crca.org)

Revise as follows:

R905.2.7.1 Ice barrier. In areas where there has been a history of ice forming along the eaves causing a backup of water as designated in Table R301.2(1), an ice barrier that consists of a least two layers of underlayment cemented together or of a self-adhering polymer modified bitumen sheet, shall be used in lieu of normal underlayment and extend from the lowest edges of all roof surfaces to a point at least 24 inches (610 mm) inside the exterior wall line of the building.

Exceptions:

1. Detached *accessory structures* that contain no *conditioned floor area*.
2. Roofs with slope equal to or greater than 8 units vertical in 12 units horizontal, the ice barrier shall be applied not less than 36 inches (914 mm) measured along the roof slope from the eave edge of the building.

Reason: In steep slope applications in climates where ice forms at the eave edge of roofs, ice melts due to heat from below, then freezes where the water meets roof surfaces that are over unheated areas, making a buildup of ice. This buildup becomes a 'dam' that backs water up under the roof covering and underlayment leaking into the building.

The purpose of this proposal is to bring the Code into alignment with the practical application of the ice barrier underlayment products in the field. Since gravity stops water from backing up very far on super steep slopes greater than 8" in 12" there needs to be a limit to the amount of ice barrier underlayment applied.

On very steep sloped roofs, the ice dams will still occur. However, buildup of ice cannot build far beyond the ball that forms at the gutter edge on slopes greater than 8" in 12" due to the slope. Secondly, the water will not defy gravity and move very far upward, when the physics of the application are that the water will drip over the dam first.

For very high sloped roofs where the vertical surface never intersects the heated wall, complete coverage of underlayment is needed. In short, the way the current code is written, ice barrier material may be needed on the complete 'high sloped' roof deck rather than protect just the eave edges and 3' up slope. The intent of 3' of underlayment applied past the warm vertical wall intersection up slope is met with this change.

Through clarifying this requirement with the second exception, the intent of the code is met while not burdening the building official with a variance request on a very small cost item.

Cost Impact: The code change proposal will not increase the cost of construction. It decreases the cost.

RB425-13

R905.2.7.1 #1-RB-MCHUGH.doc

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

R905.2.7.1 Ice barrier. In areas where there has been a history of ice forming along the eaves causing a backup of water as designated in Table R301.2(1), an ice barrier that consists of a least two layers of underlayment cemented together or of a self-adhering polymer modified bitumen sheet, shall be used in lieu of normal underlayment and extend from the lowest edges of all roof surfaces to a point at least 24 inches (610 mm) inside the exterior wall line of the building. Roofs with slope equal to or greater than 8 units vertical in 12 units horizontal, the ice barrier shall be applied not less than 36 inches (914 mm) measured along the roof slope from the eave edge of the building.

Exceptions:

~~1.~~ Detached *accessory structures* that contain no *conditioned floor area*.

2. ~~Roofs with slope equal to or greater than 8 units vertical in 12 units horizontal, the ice barrier shall be applied not less than 36 inches (914 mm) measured along the roof slope from the eave edge of the building.~~

Committee Reason: Approval was based upon the proponent's published reason. The modification adds clarity by moving the exception into the body of the text.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Gary J. Ehrlich, P.E., National Association of Home Builders (NAHB), requests Approved as Modified by this Public Comment.

Further modify the proposal as follows:

R905.2.7.1 Ice barrier. In areas where there has been a history of ice forming along the eaves causing a backup of water as designated in Table R301.2(1), an ice barrier that consists of a least two layers of underlayment cemented together or of a self-adhering polymer modified bitumen sheet, shall be used in lieu of normal underlayment and extend from the lowest edges of all roof surfaces to a point at least 24 inches (610 mm) inside the exterior wall line of the building~~. Roofs~~ <u>On roofs</u> with slope equal to or greater than 8 units vertical in 12 units horizontal, the ice barrier shall <u>also</u> be applied not less than 36 inches (914 mm) measured along the roof slope from the eave edge of the building.

Exception: Detached *accessory structures* that contain no *conditioned floor area*.

Commenter's Reason: The purpose of this public comment is to further amend RB425 as it was modified at the IRC Building hearings. The approved floor modification is an improvement to the original proposal, however it still leaves a potential issue with the application of ice barriers. The critical dimension for applying ice barriers to reduce the risk of ice dams is the 24" horizontal measurement inward from the exterior wall line of the building. This applies regardless of the length of the overhang. The language approved in Dallas has the potential to result in the ice barrier not extending inward 24" horizontally from the exterior wall line if a steep overhang is sufficiently long, thus increasing the risk of ice dams. This public comment makes a further modification to insure that both requirements apply and the proper length of ice barrier is provided.

RB425-13

Final Action: AS AM AMPC____ D

RB426-13
R905.2.7.1

Proposed Change as Submitted

Proponent: Bill McHugh, Chicago Roofing Contractors Association (bill@crca.org)

Revise as follows:

R905.2.7.1 Ice barrier. In areas where there has been a history of ice forming along the eaves causing a backup of water as designated in Table R301.2(1), an ice barrier that consists of a least two layers of underlayment cemented together or of a self-adhering polymer modified bitumen sheet, shall be used in lieu of normal underlayment and extend <u>2 inches (51 mm) down the fascia and under the drip edge and</u> from the lowest edges of all roof surfaces to a point at least 24 inches (610 mm) inside the exterior wall line of the building.

Reason: In steep slope applications in climates where ice forms at the eave edge of roofs, ice melts due to heat from below, then freezes where the water meets roof surfaces that are over unheated areas. The frozen water builds, resulting in a dam that blocks water flow of water that continues to flow due to heat. That 'dam' blocks water flow causing water to stand on the roof, even when it has slope. The result is that the 'dam' buildup forces water upslope under roof covering causing leaks.

Studies show that roof recover applications typically fail at flashings on all roof slopes. The roof edge flashings are most susceptible to leaks from water backing up under the underlayment and roof covering because it freezes at the eave edge first causing water back up the slope of the structure.

According to CRCA roofing contractors, if the code required underlayment is applied to the top of the metal drip edge, a seal may be difficult and the water will leak into the structure where a void exists. Voids form due to joints in the metal, uneven or dirty surfaces before application of the underlayment. Further, if underlayment is applied to these flashings, water can be pushed by the ice dam working on the 'back water lap' up slope possibly causing leaks. The leak(s) may be difficult to detect in the concealed space location.

In new construction, tear off and roof replacement situations, the roofing underlayment is easily installed before the drip edges at the eave edge. In reroofing and roof-recover applications, it does mean removing edge metal and reapplication.

We believe this will provide needed guidance to both new construction, reroofing, roof recover and roof replacements providing better service to the residential building owner.

Cost Impact: This may slightly increase cost of reroofing, roof recover. There is a very small increase in cost for new construction.

RB426-13

R905.2.7.1 #2-RB-MCHUGH.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The method described is contrary to building science. The method should be shingle fashion which would require the lap to be over not under.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bill McHugh, Chicago Roofing Contractors Association, requests Approved as Submitted.

Commenter's Reason: At the Committee Action Hearings in Dallas, the committee may have misunderstood previous testimony regarding water flow over shingles in varied conditions. On siding, water flow is still downward due to the vertical orientation of siding.

The roof edge flashings are most susceptible to leaks from water backing up under the underlayment and roof covering because it freezes at the eave edge first causing ice and water to lay on the roof. The ice forms a dam, driving water back up the slope of the structure opposite it's normal flow. The behavior of water that is running down a typical roof slope in a ice dam condition is not down the shingle, but instead up and under the shingle due to backup from the ice dam. That's why ice barrier is required in these applications…a material that self seals around nail holes making a continuous membrane that does not leak. This is unlike shingles that are laid and nailed.

If the ice barrier is installed on top of the metal, a 'back water lap' is created where water is driving at the lap in the opposite direction of the normal downward shingle fashion. This common practice is in manufacturer's literature and needs to be codified to provide protection from an important code requirement to consumers.

We believe this will provide needed guidance in new construction, reroofing, roof recover and roof replacements providing better service and less leaks to the residential building owner.

RB426-13

Final Action: AS AM AMPC____ D

RB436-13
R905.2.8.3

Proposed Change as Submitted

Proponent: Kirk Nagle, City of Arvada, CO, representing self (knagle@arvada.org)

Revise as follows:

R905.2.8.3 Sidewall flashing. Base flashing against a vertical sidewall shall be ~~continuous or~~ step flashing and shall be a minimum of 4 inches (102 mm) in height and 4 inches (102 mm) in width and shall direct water away from the vertical sidewall onto the roof and/or into the gutter. Where siding is provided on the vertical sidewall, the vertical leg of the flashing shall be continuous under the siding. Where anchored masonry veneer is provided on the vertical sidewall, the base flashing shall be provided in accordance with this section and counterflashing shall be provided in accordance with Section R703.7.2.2. Where exterior plaster or adhered masonry veneer is provided on the vertical sidewall, the base flashing shall be provided in accordance with this section and Section R703.6.3.

Reason: Step flashing is the approved method of installation by the asphalt roofing manufacturers for sidewall intersections. The method of continuous flashing was removed from the codes in the late 90's because it was a serious problem for leaking, deteriorated roof sheathing and mold. The step flashing moves the water from each layer onto the top of the shingle below so it can move to the gutter and not under the roofing material. If a continuous piece of flashing is used the water can continue under the shingles and eventually onto the underlayment where it can leak and keep the underside of the roofing material wet for long periods of time causing the growth of mold. This installation was used by roofing contractors and was continuous problem for the owners of buildings/homes. The problem was initially thought to be solved by allowing continuous flashing with a kick back (a piece of the metal bent back at over 45 degrees approximately ½ inch of metal) that would keep the water on the continuous flashing and eventually to the gutter, however this created water under the roofing material which would allow for mold growth and leaking. Proper step flashing applied to each shingle puts the water on the upper part of the shingle below and onto the exposed roofing material, which will prevent mold growth and leaking, by having the water under the shingles. I have repaired this problem on many roofs in the past and as a roofing inspector diagnosed the problem of leaks and observed roofing material destroyed by water, roof sheathing destroyed by mold and leaking because water go under the shingles. The water behaves like a funnel one it has a place to go it moves in that direction, just like a siphon. The water moves under the shingles, builds up hydrostatic pressure and forces its way into the tiniest of holes to leak or just keep the underside of the roofing material wet. The continuous flashing was removed from the codes for these reasons and should be removed from the codes today to have proper water resistive systems in place for all buildings/homes.

Cost Impact: The code change proposal will not increase the cost of construction, but will reduce the cost of building maintenance.

RB436-13

R905.2.8.3-RB-NAGLE.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: Continuous flashing is not a problem when installed properly. The committee feels this change is not needed.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Kirk Nagle, City of Arvada, CO, representing self, requests Approval as Submitted.

Commenter's Reason: Step flashing is the approved method of installation by the asphalt roofing manufacturers for side wall intersections. The method of continuous flashing was removed from the codes in the 90's because it was a serious problem for leaking, deteriorated roof sheathing and mold. The step flashing moves the water from each layer onto the top of the shingle below so it can move to the gutter and not under the roofing material. If a continuous piece of flashing is used the water can continue under the shingles and eventually onto the underlayment where it can leak and keep the underside of the roofing material wet for long periods of time causing the growth of mold. This installation was used by roofing contractors and was a continuous problem for the owners of buildings/homes. The problem was initially thought to be solved by allowing continuous with a kick back(a piece of metal bent back at over 45 degrees approximately ½ inch of material) that would keep the water on the continuous flashing and eventually into the gutter. However this created water under the roofing material which would allow for mold growth and leaking. by having the water under the shingles. I have repaired this problem on many roofs in the past and as a roofing inspector diagnosed the problem of leaks and observed roofing material destroyed by water, roof sheathing destroyed by mold and leaking because water got under the shingles. The water behaves like a funnel once it has a place to go it moves in that direction, like a siphon. The water moves under the shingles, builds up hydrostatic pressure and forces its way into the tiniest of holes to leak or just keep the underside of the roofing material wet. Continuous flashing was removed from the codes for these reasons and should be removed from the codes today to have proper water resistive systems in place for all buildings.

Cost Impact: This will not impact the cost of construction but will reduce the cost of building maintenance.

Final Action: AS AM AMPC____ D

RB438-13
R905.2.8.5

Proposed Change as Submitted

Proponent: Bill McHugh, Chicago Roofing Contractors Association (bill@crca.org)

Revise as follows:

R905.2.8.5 Drip edge. A drip edge shall be provided at eaves and gables of shingle roofs. Adjacent pieces of drip edge shall be overlapped a minimum of 2 inches (51 mm). Drip edges shall extend a minimum of 0.25 inch (6.4 mm) below the roof sheathing and extend up the roof deck a minimum of 2 inches (51 mm). Drip edges shall be mechanically fastened to the roof deck at a maximum of 12 inches (305 mm) o.c. with fasteners as specified in Section R905.2.5. Underlayment shall be installed ~~over~~ <u>under</u> the drip edge along eaves and under the underlayment on gables. Unless specified differently by the shingle manufacturer, shingles are permitted to be flush with the drip edge.

Reason: The roof edge flashings are most susceptible to leaks from water backing up under the underlayment and roof covering because it freezes at the eave edge first causing water to lay on the roof driving water back up the slope of the structure.

According to CRCA roofing contractors, if the code required underlayment is applied to the top of the metal drip edge, a seal may be difficult and the water will leak into the structure where a void exists. Voids form due to joints in the metal, uneven or dirty surfaces before application of the underlayment. Further, if underlayment is applied to these flashings, water can be pushed by the ice dam working on the 'back water lap' up slope possibly causing leaks. The leak(s) may be difficult to detect in the concealed space location.

We believe this will provide needed guidance in new construction, reroofing, roof recover and roof replacements providing better service and less leaks to the residential building owner.

Cost Impact: This proposal will not increase the cost of construction.

R905.2.8.5-RB-MCHUGH.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: Based on the committee's previous action on RB426-13.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bill McHugh, Chicago Roofing Contractors Association, requests Approved as Submitted.

Commenter's Reason: At the Committee Action Hearings in Dallas, the committee may have misunderstood previous testimony regarding water flow over shingles in varied conditions on both this and RB 426. Therefore, the public comments and reason statements are the same.

On siding, water flow is still downward due to the vertical orientation of siding. The roof edge flashings are most susceptible to leaks from water backing up under the underlayment and roof covering because it freezes at the eave edge first causing ice and water to lay on the roof. The ice forms a dam, driving water back up the slope of the structure opposite it's normal flow. The behavior of water that is running down a typical roof slope in a ice dam condition is not down the shingle, but instead up and under the shingle due to backup from the ice dam. That's why ice barrier is required in these applications…a material that self seals around nail holes making a continuous membrane that does not leak. This is unlike shingles that are laid and nailed.

If the ice barrier is installed on top of the metal, a 'back water lap' is created where water is driving at the lap in the opposite direction of the normal downward shingle fashion. This common practice is in manufacturer's literature and needs to be codified to provide protection from an important code requirement to consumers.

We believe this will provide needed guidance in new construction, reroofing, roof recover and roof replacements providing better service and less leaks to the residential building owner.

RB438-13

Final Action:	AS	AM	AMPC____	D

RB440-13
R905.2.8.5

Proposed Change as Submitted

Proponent: Rick Davidson, City of Maple Grove, MN, representing Association of Minnesota Building Officials (rdavidson@maplegrovemn.gov)

Delete without substitution as follows:

~~**R905.2.8.5 Drip edge.** A drip edge shall be provided at eaves and gables of shingle roofs. Adjacent pieces of drip edge shall be overlapped a minimum of 2 inches (51 mm). Drip edges shall extend a minimum of 0.25 inch (6.4 mm) below the roof sheathing and extend up the roof deck a minimum of 2 inches (51 mm). Drip edges shall be mechanically fastened to the roof deck at a maximum of 12 inches (305 mm) o.c. with fasteners as specified in Section R905.2.5. Underlayment shall be installed over the drip edge along eaves and under the underlayment on gables. Unless specified differently by the shingle manufacturer, shingles are permitted to be flush with the drip edge.~~

Reason: The requirement for drip edge was placed in the code during the past cycle. Following is the reason given by the proponent for the change:

> **Reason:** Unlike the IBC, the IRC does not include drip edge requirements for shingle roofs. This new text brings the IRC into uniformity with the IBC, reflects manufacturers' requirements for shingle roof installations, and uses identical wording and placement as found in IBC 1507.2.9.3.
>
> **Cost Impact:** The code change proposal will not increase the cost of construction.

The proponent's arguments are somewhat conflicted. Although the IBC does require drip edge, the solution for consistency should have been to remove it from the IBC rather than add it to the IRC. The proponent stated that it reflects manufacturer's requirements for shingle roof installations. The proponent provided no evidence of this in support of the statement and, if manufacturers do require drip edge, it would be required by existing language in the IRC (see end of section). In fact, the Asphalt Roofing Manufacturer's Association only ***recommends*** the use of drip edge; they do not say it is required. Then the proponent stated that requiring drip edge where it wasn't previously required would ***not*** increase the cost of construction. Clearly this will increase the cost of construction.

While the committee approved this proposal, their reason statement makes little sense. They state that the drip edge "will provide protection of the shingles and give(s) rigidity to the shingle edges". I'm not sure how drip edge protects the shingles and the projection of the shingles over the roof edge is governed by the manufacturer's installation instructions. Sometimes finding a good reason to approve something is a struggle.

> **Committee Reason:** This is a good change that will provide protection of the shingles and gives rigidity to the shingle edges. This is consistent with the IBC.

The code language also creates a number or problems that need to be considered. The 2012 IRC has been amended to permit overlays (again). The question that comes up is how drip edge can or should be installed in an overlay situation. The Asphalt Roofing Manufacture's Association and drip edge manufacturers don't address that problem. Also, installing drip edge on existing homes with gutters creates another unique problem. Many of the attachment methods for gutters make it virtually impossible to install drip edge along an eave without cutting the drip edge to pieces or removing and reinstalling the gutters which drives up the cost. And there are sure to be roofing contractors who will use the new rules to increase installation costs on their customers and blame the increase on the local building department.

SECTION R905
REQUIREMENTS FOR ROOF COVERINGS

> ***R905.1 Roof covering application.*** *Roof coverings shall be applied in accordance with the applicable provisions of this section and the manufacturer's installation instructions. Unless otherwise specified in this section, roof coverings shall be installed to resist the component and cladding loads specified in Table R301.2(2), adjusted for height and exposure in accordance with Table R301.2(3).*

It is reasonable that this proposal be approved because the current language in the IRC is not well thought out, will create conflicts for reroofing, was not shown to be necessary or to serve any useful purpose, and will increase the cost of construction.

Cost Impact: The code change proposal will not increase the cost of construction.

R905.2.8.5-RB-DAVIDSON.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee feels this needs to remain in the code. The drip edge does a good job of breaking the capillary action. The drip edge is not a problem for new construction.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rick Davidson, City of Maple Grove, representing Association of Minnesota Building Officials, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R905.2.8.5 Drip edge. A drip edge shall be provided at eaves and gables of shingle roofs. Adjacent pieces of drip edge shall be overlapped a minimum of 2 inches (51 mm). Drip edges shall extend a minimum of 0.25 inch (6.4 mm) below the roof sheathing and extend up the roof deck a minimum of 2 inches (51 mm). Drip edges shall be mechanically fastened to the roof deck at a maximum of 12 inches (305 mm) o.c. with fasteners as specified in Section R905.2.5. Underlayment shall be installed over the drip edge along eaves and under the underlayment on gables. Unless specified differently by the shingle manufacturer, shingles are permitted to be flush with the drip edge.

Exception: Reroofing in accordance with Section R907.

Commenter's Reason: The original proposal was to delete drip edge in its entirety for consistency with manufacturer's installation instructions. The IRC Committee, in disapproving the proposal, stated that it isn't a problem installing drip edge in new construction. The modification leaves the drip edge requirement in place but provides an exception for reroofing.

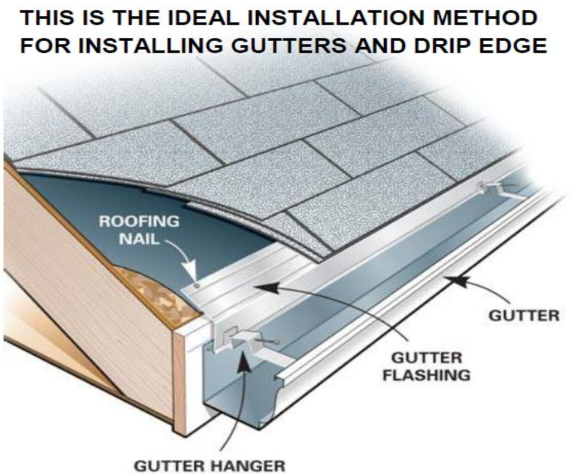
While drip edge can be incorporated in the design of new buildings, existing buildings often have roof details and gutters that make installation of drip edge very expensive to install.

Remember that many thousands if not millions of homes have been constructed and reroofed without drip edge. They exist with all of the existing flashings, gutters, and leaf guards in place. In almost every case, homes with gutters would need to have them removed and then reinstalled to accommodate a drip edge. This creates a significant expense which may include compete replacement of the gutter system if it is damaged upon removal or is not compatible with the drip edge.

In many locales, devices to keep debris out of gutters is a necessity and makes installing drip edge difficult or impossible or at the very least leaves an undesirable visual. Eliminating the ability to have debris guards on gutters increases maintenance costs and increases the likelihood of falls while homeowners clean gutters of leaves and other debris.

Furthermore, the change in the code to permit overlays creates another installation concern that is not addressed in roofing manufacturer's installation instructions.

Does the benefit of a device not required by the manufacturer warrant the cost to install when gutters have to be removed or other expensive steps must be taken? Of course not. Following are some illustrations that depict some of the issues.



THIS IS THE IDEAL INSTALLATION METHOD
FOR INSTALLING GUTTERS AND DRIP EDGE

R905.16, R905.16.1, R905.16.2, R905.16.3, R905.16.4, R905.16.4.1, R905.16.4.2

Proposed Change as Submitted

Proponent: Mark S. Graham, National Roofing Contractors Association (mgraham@nrca.net)

Revise as follows:

R905.16 Photovoltaic ~~modules/~~shingles. The installation of photovoltaic ~~modules/~~shingles shall comply with the provisions of this section, Section M2302 and NFPA 70.

R905.16.1 Deck requirements. Photovoltaic shingles shall be applied to a solid or closely-fitted deck, except where the roof covering is specifically designed to be applied over spaced sheathing.

R905.16.2 Deck slope. Photovoltaic shingles shall be used only on roof slopes of three units vertical in 12 units horizontal (3:12) or greater.

R905.16.3 Underlayment. Unless otherwise noted, required underlayment shall conform to ASTM D 4869 or ASTM D6757.

R905.16.4 Underlayment application. Underlayment shall be applied shingle fashion, parallel to and starting from the eave, lapped 2 inches (51 mm) and fastened sufficiently to hold in place.

R905.16.4.1 Ice barrier. In areas where there has been a history of ice forming along the eaves causing a backup of water as designated in Table R301.2(1), an ice barrier that consists of at least two layers of underlayment cemented together or of a self-adhering polymer modified bitumen sheet, shall be used in lieu of normal underlayment and extend from the lowest edges of all roof surfaces to a point at least 24 inches (610 mm) inside the exterior wall line of the building.

Exception: Detached *accessory structures* that contain no *conditioned floor area*.

R905.16.4.2 Underlayment and high winds. Underlayment applied in areas subject to high winds [above 110 mph (49 m/s) in accordance with Figure R301.2(4)A] shall be applied with corrosion-resistant fasteners in accordance with manufacturer's installation instructions. Fasteners are to be applied along the overlap not farther apart than 36 inches (914 mm) on center.

Underlayment installed where the basic wind speed equals or exceeds 120 mph (54 m/s) shall comply with ASTM D 4869 Type IV, or ASTM D 6757. The underlayment shall be attached in a grid pattern of 12 inches (305 mm) between side laps with a 6-inch (152 mm) spacing at the side laps. Underlayment shall be applied in accordance with Section R905.2.7 except all laps shall be a minimum of 4 inches (102 mm). Underlayment shall be attached using metal or plastic cap nails with a head diameter of not less than 1 inch (25.4 mm) with a thickness of at least 32-gauge sheet metal. The cap-nail shank shall be a minimum of 12 gauge (0.105 inches) with a length to penetrate through the roof sheathing or a minimum of 3/4 inch (19 mm) into the roof sheathing.

Exception: As an alternative, adhered underlayment complying with ASTM D 1970 shall be permitted.

~~R905.16.1~~ R905.16.5 **Material standards.** Photovoltaic ~~modules/~~shingles shall be listed and labeled in accordance with UL 1703.

~~R905.16.2~~ R905.16.6 **Attachment.** Photovoltaic ~~modules/~~shingles shall be attached in accordance with the manufacturer's installation instructions.

~~**R905.16.3**~~ **R905.16.7 Wind resistance.** Photovoltaic ~~modules/~~shingles shall be tested in accordance with procedures and acceptance criteria in ASTM D 3161. Photovoltaic ~~modules/~~shingles shall comply with the classification requirements of Table R905.2.4.1(2) for the appropriate maximum basic wind speed. Photovoltaic ~~modules/~~shingle packaging shall bear a label to indicate compliance with the procedures in ASTM D 3161 and the required classification from Table R905.2.4.1(2).

Reason: This code change proposal adds specific requirements for roof decks, roof deck slope, underlayment, underlayment application, ice barrier, and underlayment for high wind areas to Section R905.16.

The specific requirements being added are consistent with similar attributes for other steep-slope, shingle-type roof coverings.

Reference to IRC Section M2302-Photovoltaic Solar Energy Systems and NFPA 70 is added.

This same code change proposal was submitted for consideration as S47-12 for Group A of the International Building Code and was Approved as Modified; the modifications are included as a part of this text here

Cost Impact: The code change proposal will not increase the cost of construction.

R905.16-RB-GRAHAM.doc

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The committee feels the PV requirement should be in an appendix and this proposal does not fix all the issues.

Assembly Action: Approved as Modified

Modify the proposal as follows:

R905.16.2 Deck slope. Photovoltaic shingles shall be used only on roof slopes of ~~three~~ two units vertical in 12 units horizontal (~~3~~ 2:12) or greater.

(Portions of proposal not shown remain unchanged)

Individual Consideration Agenda

This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action of Approved as Modified and a Public Comment was submitted.

Modify the proposal as follows:

R905.16.2 Deck slope. Photovoltaic shingles shall be used only on roof slopes of ~~three~~ two units vertical in 12 units horizontal (~~3~~ 2:12) or greater.

(Portions of proposal not shown remain unchanged

Public Comment:

Mark S. Graham, National Roofing Contractors Association, requests Approved as Modified by Assembly Floor Action.

Commenter's Reason: Seeking approval of proposal as approved by assembly floor action as published in the ROH.

RB446-13

Final Action: AS AM AMPC____ D

RB447-13
R907 (NEW)

Proposed Change as Submitted

Proponent: Mark S. Graham, National Roofing Contractors Association (mgraham@nrca.net)

Add new text as follows:

SECTION R907
ROOFTOP-MOUNTED PHOTVOLTAIC SYSTEMS

R907.1 Rooftop-mounted photovoltaic systems. Rooftop-mounted photovoltaic panels or modules shall be installed in accordance with this section, Section M2302 and NFPA 70.

R907.2 Wind resistance. Rooftop-mounted photovoltaic panel or modules systems shall be installed to resist the component and cladding loads specified in Table R301.2(2), adjusted for height and exposure in accordance with Table R301.2(3).

R907.3 Fire classification. Rooftop-mounted photovoltaic panels or modules shall have the same fire classification as the roof assembly required in Section R902.

R907.4 Installation. Rooftop mounted photovoltaic panels or modules shall be installed in accordance with the manufacturer's installation instructions.

R907.5 Photovoltaic panels and modules. Rooftop-mounted photovoltaic panels and modules shall be listed and labeled in accordance with UL 1703 and shall be installed in accordance with the manufacturer's printed installation instructions.

Reason: : This code change proposal is intended to add specific requirements applicable to rooftop-mounted photovoltaic panels and modules, and complement the already existing requirements for photovoltaic solar energy systems in Section M2302.

The roofing-specific requirements proposed here are adapted from IBC Section 1509.7-Photovoltaic Systems, which address rooftop-mounted panel and rack systems.

Building-integrated photovoltaic systems, such as photovoltaic shingles, are already addressed in IRC Section 905.16.

Cost Impact: The code change proposal will not increase the cost of construction.

RB447-13

R907 (NEW)-RB-GRAHAM.doc

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Approval was based upon the proponent's published reason.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

John Smirnow and Joseph H. Cain, P.E., Solar Energy Industries Association (SEIA), request Approved as Modified by this Public Comment.

Modify the proposal as follows:

~~SECTION R907~~
~~ROOFTOP-MOUNTED PHOTVOLTAIC SYSTEMS~~

~~**R907.1 Rooftop-mounted photovoltaic systems.** Rooftop-mounted photovoltaic panels or modules shall be installed in accordance with this section, Section M2302 and NFPA 70.~~

R907.2 Wind resistance. Rooftop-mounted photovoltaic panel or modules systems shall be installed to resist the component and cladding loads specified in Table R301.2(2), adjusted for height and exposure in accordance with Table R301.2(3).

~~**R907.3 Fire classification.** Rooftop-mounted photovoltaic panels or modules shall have the same fire classification as the roof assembly required in Section R902.~~

~~**R907.4 Installation.** Rooftop mounted photovoltaic panels or modules shall be installed in accordance with the manufacturer's installation instructions.~~

~~**R907.5 Photovoltaic panels and modules.** Rooftop-mounted photovoltaic panels and modules shall be listed and labeled in accordance with UL 1703 and shall be installed in accordance with the manufacturer's printed installation instructions.~~

Commenter's Reason: Sections referenced as R907.1 and R907.3 through R907.5 are duplicative of language approved by the IRC-Building Committee under RM98-13 Part II, and are no longer needed. This proposal will eliminate conflicts with language approved under RM98 Part II.

Public Comment 2:

John Smirnow and Joseph H. Cain, P.E., Solar Energy Industries Association (SEIA), request Approved as Modified by this Public Comment.

Modify the proposal as follows:

SECTION R907
ROOFTOP-MOUNTED PHOTVOLTAIC SYSTEMS

R907.1 Rooftop-mounted photovoltaic systems. Rooftop-mounted photovoltaic panels or modules shall be installed in accordance with this section, Section M2302 and NFPA 70.

~~R907.2~~ R908.1.2.1 Wind resistance. Rooftop-mounted photovoltaic panel or modules systems shall be designed and installed to resist ~~the~~ component and cladding loads. Component and cladding wind pressures shall be as specified in Table R301.2(2), adjusted for height and exposure in accordance with Table R301.2(3), or determined according to accepted engineering practice.

R907.3 Fire classification. Rooftop-mounted photovoltaic panels or modules shall have the same fire classification as the roof assembly required in Section R902.

R907.4 Installation. Rooftop mounted photovoltaic panels or modules shall be installed in accordance with the manufacturer's installation instructions.

R907.5 Photovoltaic panels and modules. Rooftop-mounted photovoltaic panels and modules shall be listed and labeled in accordance with UL 1703 and shall be installed in accordance with the manufacturer's printed installation instructions.

Commenter's Reason: Proposed Section R907.2 is revised to Section R908.1.2.1 to correlate with RM98-13, as approved by the ICC Building Committee.

Determination of applicable wind pressure in Section R908.1.2.1 should not be limited to use of Table R301.2(2) only, as Table R301.2(2) is overly restrictive in most cases. Accepted engineering practice should be specifically referenced, as it is also appropriate to determine wind pressures by more accurate methods. For example, systems conforming to the simple constraints in ICC Evaluation Services Acceptance Criteria AC 428 should be allowed to be designed according to the wind calculation method found in AC 428.

RB447-13

Final Action: AS AM AMPC____ D

RB450-13
R202 (NEW), R907 (NEW), Chapter 44

Proposed Change as Submitted

Proponent: Vickie Lovell, InterCode Incorporated, representing the Reflective Insulation Manufacturers Association International (Vickie@intercodeinc.com)

Revise as follows:

SECTION R907
RADIANT BARRIER-ABOVE DECK

R907.1 General. A radiant barrier installed above a deck shall comply with Sections R907.2 through R907.4.

R907.2 Fire Testing. Radiant barriers shall be permitted for use above decks where the radiant barrier is covered with an *approved* roof covering and the system consisting of the radiant barrier and the roof covering complies with the requirements of either FM 4550 or UL 1256.

R907.3 Installation. The low emittance surface of the radiant barrier shall face the continuous air space between the barrier and the roof covering.

R907.4 Material standards. A radiant barrier installed above a deck shall comply with ASTM C1313/C1313M.

Add new definition as follows:

RADIANT BARRIER. A material having a low emittance surface of 0.1 or less installed in building assemblies.

Add new standard to Chapter 44 as follows:

ASTM

C1313/C1313M-12 Standard Specification for Sheet Radiant Barriers for Building Construction Applications

Reason: The IBC understood this and accepted S51-12, which introduced a new section 1509, following section 1508 on Roof Insulation, associated with Radiant barriers above deck. The present proposal uses the same language accepted into the IBC and proposes it for the IRC, once more following the section on roof insulation (R906) and not as another part of that section.

The new text is necessary for the following reasons:

(1) An important issue that needs to be addressed in the new proposed section R907 is how the fire testing of the system is to be done. The fire testing (FM 4550 or 1256) must be done using the combination of the radiant barrier **and** the approved roof covering and the total system needs to pass the fire test.
(2) A definition is needed for radiant barriers, and one is being proposed, which is identical to the one adopted by the IBC.
(3) A standard specification needs to be referenced, and the same specification (ASTM C1313) is being proposed as was adopted by the IBC.
(4) A key requirement for the installation of radiant barrier products is that there needs to be an air space or air gap between the radiant barrier and the roof covering. This is explained in the proposed section on installation. There is confusion in the market place concerning this “air space” or “air gap”. All radiant barrier applications require an air space on at least one low emittance side of the material. Installations that do not to include an air space do not provide the desired radiant barrier benefit.

Radiant barrier products have been on the market for over 24 years and are used by 87 of the top 100 US Builders. They have an established history and have been accepted into several regional code requirements [building codes in Hawaii, Austin, Texas, Florida and I California’s Title 24] and are included in the Energy Star Homes Guidelines.

For information, ASTM has issued separate specifications for radiant barriers used in buildings ASTM C1313, "Standard Specification for Sheet Radiant Barriers for Building Construction Applications" and for reflective insulations used in buildings ASTM C1224, "Standard Specification for Reflective Insulation for Building Applications". This proposal includes a reference to the appropriate specification, ASTM C1313. The scope of ASTM C1313 reads as follows. "This specification covers the general physical property requirements of radiant barrier materials for use in building construction. The scope is specifically limited to requirements for radiant barrier sheet materials that consist of at least one surface, such as metallic foils or metallic deposits mounted or unmounted on substrates. Sheet radiant barrier materials shall consist of low emittance surface(s) that may be in combination with any substrates and adhesives required to meet the specified physical material properties. The following test methods shall be performed: surface emittance; water vapor transmission; surface burning characteristics; corrosivity; tear resistance; and adhesive performance."

Cost Impact: This proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASTM C 1313/ C1313M with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2012.

RB450-13

Committee Action: **Disapproved**

Committee Reason: The committee feels this application is for commercial buildings and is not needed in the IRC. The proponent will rework and bring it back.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Vickie Lovell, Intercode, Inc., representing Reflective Insulation Manufacturers Association – International, requests Approved as Modified by this Public Comment.

Modify the proposal as follows:

SECTION R907
RADIANT BARRIER-~~ABOVE DECK~~

R907.1 General. ~~A~~ Where provided, radiant barriers ~~installed above a deck~~ shall comply with Sections R907.2 through R907.4.

R907.2 Fire Testing. ~~Radiant barriers shall be permitted for use above decks where the radiant barrier is covered with an *approved* roof covering and the system consisting of the radiant barrier and the roof covering complies with the requirements of either FM 4550 or UL 1256.~~ Radiant barriers shall be tested in accordance with ASTM E84.

R907.3 Installation. Radiant barrier shall be installed in accordance with the manufacturer's installation instructions. The low emittance surface of the radiant barrier shall face ~~the~~ a continuous air space. ~~between the barrier and the roof covering.~~

R907.4 Material standards. ~~A r~~ Radiant barriers ~~installed above a deck~~ shall comply with ASTM C1313/C1313M.

Add new definition as follows:

RADIANT BARRIER. A material having a low emittance surface of 0.1 or less installed in building assemblies.

ASTM

C1313/C1313M-12 Standard Specification for Sheet Radiant Barriers for Building Construction Applications

Commenter's Reason: There was very valuable feedback that has been taken into account in the revisions included within this public comment. The revision of this proposal appropriately gears this section towards the elements that are important for a residential application for this product type. Those key elements include:

- Fire testing per E84
- All radiant barriers must have a continuous air space on the low emittance (shiny) side of the product
- The Public Comment provides an ASTM reference – ASTM C1313

This language is important to be included in the code because it clarifies important product fire testing and the key installation requirement, that the product must face a continuous air space – this primary feature is important for Code Officials to be aware of.

Some roofers will install the product as felt – between the deck and shingles – this installation is improper and does not provide a radiant barrier benefit.

Radiant barrier products have been on the market for over 24 years and are used by 87 of the top 100 US Builders. They have an established history and have been accepted into several regional code requirements [building codes in Hawaii, Austin, Texas, Florida and I California's Title 24] and are included in the Energy Star Homes Guidelines.

RB452-13
R907.3, R907.4, R907.5, R907.6

Proposed Change as Submitted

Proponent: Andy Williams, Metal Construction Association (afwilliams@metalconstruction.org)

Revise as follows:

R907.3 Fire classification. The roof covering fire classification shall not be reduced due to repairs from the fire classification required when installed. The roof covering fire classification for a recovering shall comply with the fire classification in Section R902.

~~**R907.3**~~ **R907.4 Recovering versus replacement.** New roof coverings shall not be installed without first removing all existing layers of roof coverings where any of the following conditions exist:

1. Where the existing roof or roof covering is water soaked or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing.
2. Where the existing roof covering is wood shake, slate, clay, cement or asbestos-cement tile.
3. Where the existing roof has two or more applications of any type of roof covering.

Exceptions:

1. Complete and separate roofing systems, such as standing-seam metal roof systems, that are designed to transmit the roof loads directly to the building's structural system and that do not rely on existing roofs and roof coverings for support, shall not require the removal of existing roof coverings.
2. Installation of metal panel, metal shingle and concrete and clay tile roof coverings over existing wood shake roofs shall be permitted when the application is in accordance with Section R907.5.
3. The application of new protective coating over existing spray polyurethane foam roofing systems shall be permitted without tear-off of existing roof coverings.
4. Where the existing roof assembly includes an ice barrier membrane that is adhered to the roof deck, the existing ice barrier membrane shall be permitted to remain in place and covered with an additional layer of ice barrier membrane in accordance with Section R905.

~~**R907.4**~~ **R907.5 Roof recovering.** Where the application of a new roof covering over wood shingle or shake roofs creates a combustible concealed space, the entire existing surface shall be covered with gypsum board, mineral fiber, glass fiber or other *approved* materials securely fastened in place.

~~**R907.5**~~ **R907.6 Reinstallation of materials.** Existing slate, clay or cement tile shall be permitted for reinstallation, except that damaged, cracked or broken slate or tile shall not be reinstalled. Any existing flashings, edgings, outlets, vents or similar devices that are a part of the assembly shall be replaced when rusted, damaged or deteriorated. Aggregate surfacing materials shall not be reinstalled.

~~**R907.6**~~ **R907.7 Flashings.** Flashings shall be reconstructed in accordance with *approved* manufacturer's installation instructions. Metal flashing to which bituminous materials are to be adhered shall be primed prior to installation.

Reason: Section R907.3 is added to clarify that the roof covering is required to comply with the fire classification mandated by the IRC. For repairs to a roof covering, the repairs are required to maintain the roof covering fire classification required by the IRC when the roof covering was initially installed. For a recovering, the roof covering is required to have the fire classification required by the IRC adopted at the time of the recovering.

Cost Impact: The code change proposal will not increase the cost of construction.

RB452-13

R907.3 (NEW)-RB-WILLIAMS.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee feels this is already covered in the code and this would introduce redundant language.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

J. William Degnan, President, National Association of State Fire Marshals, requests Approved as Submitted.

Commenter's Reason: This change represents an important concept for the continued protection of roof covering fire classifications where roofs have been recovered or repaired, and bears repeated reference in this Section of the IRC. In addition, the Committee Reason Statement has provided no technical justification for the Disapproval of this concept to be included as a part of the IRC requirements for roof covering repairs or replacements.

RB452-13

Final Action: AS AM AMPC____ D

RB458-13
R1003.18

<u>Proposed Change as Submitted</u>

Proponent: Jim Buckley, Buckley Rumford Co. representing Masonry Alliance for Codes and Standards and Clay Lining Institute (buckley@rumford.com)

Revise as follows:

R1003.18 Chimney clearances. Any portion of a masonry chimney located in the interior of the building or within the exterior wall of the building shall have a minimum air space clearance to combustibles of 2 inches (51 mm). Chimneys located entirely outside the exterior walls of the building, including chimneys that pass through the soffit or cornice, shall have a minimum air space clearance of 1 inch (25 mm). The air space shall not be filled, except to provide fire blocking in accordance with Section R1003.19.

Exceptions:

1. Masonry chimneys equipped with a chimney lining system listed and *labeled* for use in chimneys in contact with combustibles in accordance with UL 1777 and installed in accordance with the manufacturer's installation instructions are permitted to have combustible material in contact with their exterior surfaces.
2. When masonry chimneys are constructed as part of masonry or concrete walls, combustible materials shall not be in contact with the masonry or concrete wall less than 12 inches (305 mm) from the inside surface of the nearest flue lining.
3. Exposed combustible trim and the edges of sheathing materials, such as wood siding and flooring, shall be permitted to abut the masonry chimney side walls, in accordance with Figure R1003.18, provided such combustible trim or sheathing is a minimum of ~~12 inches (305 mm)~~ <u>8 inches (203 mm)</u> from the inside surface of the nearest flue lining. ~~Combustible material and trim shall not overlap the corners of the chimney by more than 1 inch (25 mm).~~

Reason: Tests have shown that the currently required 12" chimney wall thickness for the chimney to be in contact with combustible trim is overly restrictive. Chimneys with enclosing walls of 8" in contact with combustible material are at least as safe as the current basic code requiring chimneys to have 4" thick solid masonry walls two inches clear of combustibles. This change would provide for timber frame or wood ceilings to safely abut a masonry chimney.

Eight Inch Chimney Wall Test
In support of Buckley Code Change Proposal R1003.18 - 9/20/12

Purpose of test: To determine if a chimney built so that the clay flue liner is enclosed with 8" of solid masonry in contact with combustible materials is as safe as the current code requirement that the clay flue liner be enclosed with 4" of solid masonry plus 2" of air space to combustible materials.

We conclude that building chimney walls 8" thick in contact with combustible materials is at least as safe as building chimneys with 4" thick walls 2" clear of combustible materials which is current code.

Method: To build a masonry chimney with one side built to code - 4" thick wall plus 2" of air space to combustibles - and the opposite side built 8" thick in contact with combustibles and subject the chimney to flue gas temperatures representing an over fire or chimney fire condition. If the combustibles in contact with the 8" thick masonry did not become as hot as the combustibles 2" clear of a 4" thick masonry chimney wall (the code compliant condition) we can conclude that a chimney with 8" thick walls in contact with combustibles is at least as safe as the code compliant chimney with 4" walls plus a 2" air space to combustibles.

Results:

The combustibles on the code compliant side - 4" thick wall plus 2" of air space to combustibles - reached 90 deg.F above ambient temperature after four hours at a flue gas temperature of 1,000 deg. F while the combustibles in contact with the 8" thick side made it to five hours before reaching 90 degrees above ambient. By that time the combustibles on the code compliant side had reached 45 deg.F above the 90 deg.F above ambient failure temperature.

RB458-13

R1003.18-RB-BUCKLEY.doc

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Approval was based upon the proponent's published reason.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

J. William Degnan, President, National Association of State Fire Marshals, requests Disapproved

Commenter's Reason: This Code change has been made without acceptable technical justification. Very limited descriptive information has been provided regarding the methodology and substantiation of tests used to justify these reductions in clearances from masonry chimneys to exposed combustible trim and the edges of sheathing materials. Such changes should be reserved pending the use of more widely known or recognized testing criteria.

RB458-13

Final Action: AS AM AMPC____ D

RB460-13
R1005.2

Proposed Change as Submitted

Proponent: Jim Buckley, Buckley Rumford Co., representing Masonry Alliance for Codes and Standards and Clay Lining Institute (buckley@rumford.com)

Revise as follows:

R1005.2 Decorative shrouds. Decorative shrouds shall not be installed at the termination of factory-built chimneys except where the shrouds are *listed* and *labeled* for use with the specific factory-built chimney system and installed in accordance with the manufacturer's installation instructions <u>or comply with Section R1003.9</u>.

Reason: It is impractical to test each custom decorative shroud with every listed chimney system so the manufacturers of the various UL listed chimney systems have added "supplementary instructions" to provide minimum dimensions and construction guidelines that are written in prescriptive language that is similar to that already in Section R1003.9 of the code. Individual home builders and manufacturers of chimney rain caps, spark arrestors, chimney caps or shrouds should not have to list their decorative shrouds as long as they meet the requirements set forth in Section R1003.9. This change would not prevent the use of listed decorative shrouds but it would provide for a safe way to install custom decorative shrouds - unlisted by complying with code.

Cost Impact: The code change proposal will not increase the cost of construction, it will reduce the cost.

RB460-13

R1005.2-RB-BUCKLEY.doc

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposed referenced section is for masonry chimneys and is not appropriate for factory built chimneys. This could have the effect of violating the listing.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Jim Buckley, Buckley Rumford Co., representing Masonry Alliance for Codes and Standards and Clay Lining Institute, requests Approved as Modified by this Public Comment.

Modify the proposal as follows:

~~**R1005.2 Decorative shrouds.** Decorative shrouds shall not be installed at the termination of factory-built chimneys except where the shrouds are listed and labeled for use with the specific factory-built chimney system and installed in accordance with the manufacturer's installation instructions or comply with Section R1003.9.~~

Commenter's Reason: We had sought to add a prescriptive option as an alternative to the requirement for a listing for decorative shrouds by referencing Section R1003.9. One member of the IRC Committee said that would be "inappropriate because it cited a masonry section of code."

So now we would like to propose eliminating the whole section R1005.2. Builders would still have to comply with the requirements of R1003.9 which applies to all chimneys - not just listed chimneys - and would still have to use decorative shrouds listed and labeled for use with the specific factory-built chimney system if that is required by the listing for the specific chimney.

Cost Impact: The code change proposal will not increase the cost of construction, it will reduce

Public Comment 2:

Gregg Achman, Hearth & Home Technologies, requests Disapproved.

Commenter's Reason: Section R1003.9 is for masonry chimneys and cannot be applied to factory built chimney systems. Factory built chimney system chases are built with combustible materials and any decorative shroud needs to be tested with the factory built chimney system to ensure that it will not create a fire hazard. Most factory built chimney system shrouds employ added heat shielding, or other design feature requirements, to ensure there is not a fire hazard, since masonry chimneys are made of non-combustible materials there is not a fire hazard concern and the requirements of R1003.9 can be applied safely. The addition of section R1003.9 would likely cause a fire hazard condition if applied to factory built chimney systems, therefore, this comment must be disapproved.

RB460-13
Final Action: AS AM AMPC____ D

RB462-13
Appendix F

Proposed Change as Submitted

Proponent: Rick Davidson, City of Maple Grove, Association of Minnesota Building Officials (rdavidson@maplegrovemn.gov)

Revise as follows:

APPENDIX F
~~RADON CONTROL METHODS~~
PASSIVE RADON GAS CONTROLS
(The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance.)

SECTION AF101
SCOPE

AF101.1 General. This appendix contains requirements for new construction in *jurisdictions* where radon-resistant construction is required. These requirements are intended to provide a passive means of resisting radon gas entry and prepare the dwelling for post-construction radon mitigation, if necessary (see Figure AF102). Active construction techniques may be used in lieu of passive techniques where approved.

Inclusion of this appendix by *jurisdictions* shall be determined through the use of locally available data or determination of Zone 1 designation in Figure AF101 and Table AF101(1).

SECTION AF102
DEFINITIONS

AF102.1 General. For the purpose of these requirements, the terms used shall be defined as follows:

DRAIN TILE LOOP. A continuous length of drain tile or perforated pipe extending around all or part of the internal or external perimeter of a *basement* or crawl space footing.

ENCLOSED CRAWL SPACE. A crawl space that is enclosed with foundation walls that may include windows, doors, access openings, and required vents.

GAS-PERMEABLE LAYER. A gas-permeable layer shall consist of one of the following:

1. A uniform layer of clean aggregate that is not less than 4 inches (102 mm) thick. The aggregate shall consist of material that will pass through a 2-inch (51 mm) sieve and be retained by a 1/4-inch (6.4 mm) sieve.
2. A uniform layer of sand (native or fill) that is not less than 4 inches (102 mm) thick and that is overlain by a soil gas collection mat or soil gas matting installed in accordance with the manufacturer's installation instructions.

RADON GAS. A naturally occurring, chemically inert, radioactive gas ~~that is not detectable by human senses. As a gas, it can move readily through particles of soil and rock, and can accumulate under the slabs and foundations of homes where it can easily enter into the living space through construction cracks and openings.~~

SOIL-GAS-RETARDER. A continuous membrane of 6-mil (0.15 mm) polyethylene ~~or other equivalent material~~ used to retard the flow of soil gases into a ~~building~~ dwelling.

SUBMEMBRANE DEPRESSURIZATION SYSTEM (Passive). A system designed to achieve lower submembrane air pressure relative to basement or crawl space air pressure by use of a vent pipe drawing air from beneath the soil-gas-retarder membrane.

~~**SUBSLAB DEPRESSURIZATION SYSTEM (Active).** A system designed to achieve lower subslab air pressure relative to indoor air pressure by use of a fan-powered vent drawing air from beneath the slab.~~

SUBSLAB DEPRESSURIZATION SYSTEM (Passive). A system designed to achieve lower subslab air pressure relative to indoor air pressure by use of a vent pipe ~~routed through the *conditioned space* of a building and connecting the subslab area with outdoor air, thereby relying on the convective flow of air upward in the vent to draw air from beneath the slab~~ drawing air from beneath concrete floor slabs or other floor assemblies that are in contact with the ground.

VENT PIPE. Not less than a 3-inch diameter (76 mm) ABS or PVC gastight pipe extending from the gas permeable layer through the roof.

SECTION AF103
~~REQUIREMENTS~~
PASSIVE RADON RESISTANT SYSTEM REQUIREMENTS

AF103.1 General. ~~The following construction techniques are intended to resist radon entry and prepare the building for post-construction radon mitigation, if necessary (see Figure AF102). These techniques are required in areas where designated by the *jurisdiction*.~~ The following components of a passive submembrane or subslab depressurization system shall be installed during construction.

~~**AF103.2 Subfloor preparation.** A layer of gas-permeable material shall be placed under all concrete slabs and other floor systems that directly contact the ground and are within the walls of the living spaces of the building, to facilitate future installation of a subslab depressurization system, if needed. The gas-permeable layer shall consist of one of the following:~~

1. ~~A uniform layer of clean aggregate, a minimum of 4 inches (102 mm) thick. The aggregate shall consist of material that will pass through a 2-inch (51 mm) sieve and be retained by a 1/4-inch (6.4 mm) sieve.~~
2. ~~A uniform layer of sand (native or fill), a minimum of 4 inches (102 mm) thick, overlain by a layer or strips of geotextile drainage matting designed to allow the lateral flow of soil gases.~~
3. ~~Other materials, systems or floor designs with demonstrated capability to permit depressurization across the entire subfloor area.~~

~~**AF103.3 Soil-gas-retarder.** A minimum 6-mil (0.15 mm) [or 3-mil (0.075 mm) cross-laminated] polyethylene or equivalent flexible sheeting material shall be placed on top of the gas-permeable layer prior to casting the slab or placing the floor assembly to serve as a soil-gas-retarder by bridging any cracks that develop in the slab or floor assembly, and to prevent concrete from entering the void spaces in the aggregate base material. The sheeting shall cover the entire floor area with separate sections of sheeting lapped at least 12 inches (305 mm). The sheeting shall fit closely around any pipe, wire or other penetrations of the material. All punctures or tears in the material shall be sealed or covered with additional sheeting.~~

~~AF103.4~~ AF103.2 Entry routes. Potential radon entry routes shall be closed in accordance with Sections ~~AF103.4.1~~ AF103.2.1 through ~~AF103.4.10~~ AF103.2.8.

~~AF103.4.1~~ AF103.2.1 Floor openings. Openings around bathtubs, showers, water closets, pipes, wires or other objects that penetrate concrete slabs~~,~~ or other floor assemblies~~,~~ shall be filled with a polyurethane caulk~~,~~ or expanding foam ~~or equivalent sealant~~ applied in accordance with the manufacturer's ~~recommendations~~ installation instructions.

~~**AF103.4.2 Concrete joints.** All control joints, isolation joints, construction joints, and any other joints in concrete slabs or between slabs and foundation walls shall be sealed with a caulk or sealant. Gaps and joints shall be cleared of loose material and filled with polyurethane caulk or other elastomeric sealant applied in accordance with the manufacturer's recommendations.~~

~~**AF103.4.3 Condensate drains.** Condensate drains shall be trapped or routed through nonperforated pipe to daylight.~~

~~**AF103.4.4**~~ **AF103.2.2 Sumps.** Sumps ~~pits~~ open to soil or serving as the termination point for subslab or exterior drain tile loops shall be covered with a gasketed or ~~otherwise~~ sealed lid. Sumps used as the suction point in a subslab depressurization system shall have a lid designed to accommodate the vent pipe. Sumps used as a floor drain shall have a lid equipped with a trapped inlet.

~~**AF103.4.5**~~ **AF103.2.3 Foundation walls.** Hollow block masonry foundation walls shall be constructed with either a continuous course of *solid masonry*, one course of masonry grouted solid, or a solid concrete beam at or above ~~finished ground surface~~ grade ~~to prevent the passage of air from the interior of the wall into the living space~~. Where a brick veneer or other masonry ledge is installed, the course immediately below that ledge shall be ~~sealed~~ solid masonry, one course of masonry grouted solid, or a solid concrete beam. Joints, cracks or other openings around all penetrations of both exterior and interior surfaces of ~~masonry block or wood~~ foundation walls below ~~the ground surface~~ grade shall be filled with polyurethane caulk ~~or equivalent sealant~~. ~~Penetrations of concrete walls shall be filled.~~

~~**AF103.4.6**~~ **AF103.2.4 Dampproofing.** The exterior surfaces of ~~portions of~~ ~~concrete and masonry block~~ foundation walls below ~~the ground surface~~ grade shall be dampproofed in accordance with Section R406.

~~**AF103.4.7**~~ **AF103.2.5** ~~**Air-handling units**~~ **Air-conditioning systems.** ~~Air-handling units~~ Entry points, joints, or other openings into air conditioning systems in enclosed crawl spaces shall be sealed ~~to prevent air from being drawn into the unit~~.

> **Exception:** ~~Units~~ Systems with gasketed seams or ~~units~~ that are otherwise sealed by the manufacturer ~~to prevent leakage~~.

~~**AF103.4.8**~~ **AF103.2.6 Ducts.** Ductwork passing through or beneath a slab within a dwelling shall be of seamless material unless the ~~air-handling~~ air-conditioning system is designed to maintain continuous positive pressure within such ducting. Joints in such ductwork shall be sealed ~~to prevent air leakage~~.

Ductwork located in enclosed crawl spaces shall have all seams and joints sealed by closure systems in accordance with Section M1601.4.1.

~~**AF103.4.9 Crawl space floors.** Openings around all penetrations through floors above crawl spaces shall be caulked or otherwise filled to prevent air leakage.~~

~~**AF103.4.10**~~ **AF103.2.7 Crawl space access.** Access doors and other openings or penetrations between *basements* and adjoining crawl spaces shall be closed, gasketed or ~~otherwise filled to prevent air leakage~~ sealed.

~~**AF103.5 Passive submembrane depressurization system**~~ **AF103.3 Basements or enclosed crawl spaces with soil floors.** In ~~buildings~~ dwellings with basements or enclosed crawl spaces ~~foundations~~ with soil floors, the following components of a passive submembrane depressurization system shall be installed during construction.

> **Exception:** ~~Buildings in which an *approved* mechanical crawl space ventilation system or other equivalent system is installed.~~ Basements or enclosed crawl spaces that are provided with a continuously operated mechanical exhaust system in accordance with Section R408.3.

~~**AF103.5.1 Ventilation.** Crawl spaces shall be provided with vents to the exterior of the building. The minimum net area of ventilation openings shall comply with Section R408.1.~~

~~**AF103.5.2**~~ **AF103.3.1 Soil-gas-retarder.** The soil in basements and enclosed crawl spaces shall be covered with a ~~continuous layer of minimum 6- mil (0.15 mm) polyethylene~~ soil-gas-retarder. The ~~ground cover~~ soil-gas-retarder shall be lapped a minimum of 12 inches (305 mm) at joints and shall extend to all foundation walls enclosing the basement or crawl space ~~area~~. The soil-gas-retarder shall fit closely around any pipe, wire or other penetrations of the material. All punctures or tears in the material shall be sealed or covered with additional sheeting.

~~**AF103.5.3 Vent pipe**~~ **AF103.3.2 "T" fitting and vent pipe.** ~~A plumbing tee or other *approved* connection~~ A 3- or 4-inch "T" fitting shall be inserted ~~horizontally~~ beneath the ~~sheeting~~ soil gas retarder ~~and connected to a 3- or 4-inch-diameter (76 or 102 mm) fitting with a vertical vent pipe installed through the sheeting~~ and be connected to a vent pipe. The vent pipe shall ~~be extended up through the building floors,~~ extend through the conditioned space of the dwelling and terminate at least 12 inches (305 mm) above the roof in a location at least 10 feet (3048 mm) away from any window or other opening into the *conditioned spaces* of the building that is less than 2 feet (610 mm) below the exhaust point~~, and 10 feet (3048 mm) from any window or other opening in adjoining or adjacent buildings~~.

~~**AF103.6**~~ **AF103.4** ~~**Passive subslab depressurization system**~~ **Basements or enclosed crawl spaces with concrete floors or other floor systems and slab on grade dwellings.** ~~In *basement* or slab-on-grade buildings, the~~ The following components of a passive subslab depressurization system shall be installed during construction in slab on grade dwellings or in dwellings with basements or crawl spaces with concrete or other floor systems.

AF103.4.1 Sub-slab preparation. A layer of gas-permeable material shall be placed under all concrete slabs and other floor systems that directly contact the ground and are within the walls of the dwelling.

AF103.4.2 Soil-gas-retarder. A soil gas retarder shall be placed on top of the gas-permeable layer prior to casting the slab or placing the floor assembly. The soil-gas-retarder shall cover the entire floor area with separate sections lapped at least 12 inches (305 mm). The soil-gas-retarder shall fit closely around any pipe, wire, or other penetrations of the material. All punctures or tears in the material shall be sealed or covered.

~~**AF103.6.1**~~ **AF103.4.3** ~~**Vent pipe**~~ **"T" fitting and vent pipe.** ~~A minimum 3-inch-diameter (76 mm) ABS, PVC or equivalent gas-tight pipe shall be embedded vertically into the subslab aggregate or other permeable material before the slab is cast. A "T" fitting or equivalent method shall be used to ensure that the pipe opening remains within the subslab permeable material. Alternatively, the 3-inch (76 mm) pipe shall be inserted directly into an interior perimeter drain tile loop or through a sealed sump cover where the sump is exposed to the subslab aggregate or connected to it through a drainage system.~~

~~The pipe shall be extended up through the building floors, and terminate at least 12 inches (305 mm) above the surface of the roof in a location at least 10 feet (3048 mm) away from any window or other opening into the *conditioned spaces* of the building that is less than 2 feet (610 mm) below the exhaust point, and 10 feet (3048 mm) from any window or other opening in adjoining or adjacent buildings.~~ Before a slab is cast or other floor system is installed, a "T" fitting shall be inserted below the slab or other floor system and the soil-gas-retarder. The "T" fitting shall be connected to a vent pipe. The vent pipe shall extend through the conditioned space of the dwelling and terminate not less than 12 inches (305 mm) above the roof in a location at least 10 feet (3048 mm) away from any window or other opening into the *conditioned spaces* of the building that is less than 2 feet (610 mm) below the exhaust point.

AF103.5 Drain tile and sump used for depressurization. As an alternative to inserting a vent pipe into a "T" fitting, a vent pipe shall be permitted to be inserted directly into an interior perimeter drain tile loop or through a sump cover where the drain tile and/or sump is exposed to the gas permeable layer.

~~**AF103.6.2**~~ **AF103.6 Multiple vent pipes.** In ~~buildings~~ dwellings where interior footings or other barriers separate the ~~subslab aggregate or other~~ gas-permeable ~~material~~ layer, each area shall be fitted with an individual vent pipe. Vent pipes shall connect to a single vent that terminates above the roof or each individual vent pipe shall terminate separately above the roof.

AF103.7 Combination foundations. Where basement or crawl space floors are on different levels, each level shall have a separate vent pipe. Multiple vent pipes may be connected to a single vent pipe that terminates above the roof.

~~**AF103.7**~~ **AF103.8 Vent pipe drainage.** All components of the radon vent pipe system shall be installed to provide positive drainage to the ground beneath the ~~slab or~~ soil-gas-retarder.

~~**AF103.8 Vent pipe accessibility.** Radon vent pipes shall be accessible for future fan installation through an *attic* or other area outside the *habitable space*.~~

> ~~**Exception:** The radon vent pipe need not be accessible in an *attic* space where an *approved* roof-top electrical supply is provided for future use.~~

AF103.9 Vent pipe identification. All exposed and visible interior ~~radon~~ vent pipes shall be identified with at least one *label* on each floor and in accessible *attics*. The *label* shall read: "Radon Reduction System."

~~**AF103.10 Combination foundations.** Combination *basement*/ crawl space or slab-on-grade/crawl space foundations shall have separate radon vent pipes installed in each type of foundation area. Each radon vent pipe shall terminate above the roof or shall be connected to a single vent that terminates above the roof.~~

~~**AF103.11 Building depressurization.** Joints in air ducts and plenums in un*conditioned spaces* shall meet the requirements of Section M1601. Thermal envelope air infiltration requirements shall comply with the energy conservation provisions in Chapter 11. Fireblocking shall meet the requirements contained in Section R302.11.~~

~~**AF103.12**~~ **AF103.10 Power source and access for future radon fan.** To provide for future installation of ~~an active submembrane or subslab depressurization system~~ a radon fan, an electrical circuit terminated in an *approved* box shall be installed during construction in the ~~*attic* or other~~ anticipated location of ~~vent pipe~~ the radon fans. ~~An electrical supply shall also be accessible in anticipated locations of system failure alarms.~~ An accessible clear space 24 inches in diameter by 3 feet in height adjacent to the vent pipe shall be provided at the anticipated location of a future radon fan.

Reason: First is it important to point out that the current radon rules only require a "passive" system. The current rules do not require a radon fan and do not regulate fans or "active" systems when they are installed. This proposal does not change that.

Second, there may be flaws in the existing language other than what are pointed out here. For example, current code language does not address some of the fine points of installing a soil-gas-retarder. Someone with greater expertise will need to correct those problems in subsequent code changes if they believe it is necessary.

And third, these rules have gone unchanged since being placed in the appendix of the 2000 IRC. Because they are in the appendix and because they are very infrequently adopted, they have not received the attention they might otherwise have had if they had been in the main body of the code. For those jurisdictions that have had the misfortune of having to enforce radon rules, they have proven problematic because the current rules are not well written and include conflicts, repetitive language, and vagaries. This proposal is intended to rearrange the sections in a more logical manner, create new definitions, delete unnecessary and repetitive language, and eliminate conflicts.

What follows is a section by section explanation of the revisions that are proposed.

APPENDIX F
~~**RADON CONTROL METHODS**~~
PASSIVE RADON GAS CONTROLS

(The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance.)

Reason: *The proposed title revision is intended to make clear that this appendix chapter only requires "passive radon controls".*

SECTION AF101
SCOPE

AF101.1 General. This appendix contains requirements for new construction in *jurisdictions* where radon-resistant construction is required. These requirements are intended to provide a passive means of resisting radon gas entry and prepare the dwelling for post-construction radon mitigation, if necessary (see Figure AF102). Active construction techniques may be used in lieu of passive techniques when approved.

Inclusion of this appendix by *jurisdictions* shall be determined through the use of locally available data or determination of Zone 1 designation in Figure AF101 and Table AF101(1).

Reason: *The language added to the Scope has been relocated from AF103.1. It seems more appropriate to have this explanatory language in the scope. It further explains that "Active" systems are permitted when approved. There is no attempt here to provide any direction on an appropriate active system since there is none in the current rule.*

SECTION AF102
DEFINITIONS

AF102.1 General. For the purpose of these requirements, the terms used shall be defined as follows:

DRAIN TILE LOOP. A continuous length of drain tile or perforated pipe extending around all or part of the internal or external perimeter of a *basement* or crawl space footing.

ENCLOSED CRAWL SPACE. A crawl space that is enclosed with foundation walls that may include windows, doors, access openings, and required vents.

Reason: *This definition is necessary because the term "crawl space" is frequently used in the section but there is no differentiation between an enclosed and unenclosed crawl space. The presumption here is that a crawl space that is open to the exterior (ex. dwelling constructed on piers) does not pose a risk from radon gas. The application proposed in this revision is that we are only concerned with enclosed crawl spaces.*

GAS-PERMEABLE LAYER. A gas-permeable layer shall consist of one of the following:

1. A uniform layer of clean aggregate that is a minimum of 4 inches (102 mm) thick. The aggregate shall consist of material that will pass through a 2-inch (51 mm) sieve and be retained by a 1/4-inch (6.4 mm) sieve.
2. A uniform layer of sand (native or fill) that is a minimum of 4 inches (102 mm) thick and that is overlain by a soil gas collection mat or soil gas matting installed in accordance with the manufacturer's installation instructions.

Reason: *Rather than frequent repetition of what constitutes a gas-permeable layer, a definition is proposed. This language is taken from AF103.2. Furthermore, the term "geotextile drainage matting" is replaced with "soil gas collection mat or soil gas matting" which is the term found in the EPA handbook entitled "Build Radon Out". An internet search of those terms will result in many "hits".*

A. Gas Permeable Layer

Usually a 4-inch layer of clean, coarse gravel is used beneath the slab to allow the soil gas to move freely underneath the house. Other options are to install a loop of perforated pipe or soil gas collection mat (also known as drainage mat or soil gas matting).

Additionally, it is proposed that soil gas collection mats be installed in accordance with the manufacturer's installation instructions. The following link is an example of the installation instructions for this particular product indicating that there is significant detail and direction given.
http://www.radon.biz/soilgascollectormattingpriceperrollcomesin45footrolls.aspx

Placing the Mat

1. Lay out the Soil Gas Collector (SGC) on the sub grade after the final preparation and before the concrete is poured. It is typically laid out in a rectangular loop in the largest area with branches or legs into the smaller areas.
2. Position the "T-Riser" in appropriate location and nail down with a 12-inch spike through hole in center.
3. Slide the SGC into openings in "T-Riser" with a portion of the fabric around the outside. Tape the fabric to the outside of the "T-Riser" with duct tape and staple the SGC to the ground with a landscaping staple near the "T-Riser"

4. Roll out the SGC, smooth it onto the ground. To avoid wrinkles and buckling, work away from the "'T-Riser", stapling it to the ground as you go. The SGC should be stapled to the ground every three to four feet, in addition to the corners, "tee's" and ends.
5. Corners are constructed by peeling back the filter fabric, cutting the two ends of the SGC matrix at 45 angles and butting (or overlap no more than 1\2 inch) the matrix together. Pull the filter fabric back and tape into place. Staple across the joint of the matrix and each leg of the corner. Use a minimum of four staples at each corner - two across the joint and one on each leg.
6. The "tees" for branches or legs are constructed by slitting the fabric of the main loop at the location desired. Cut the fabric of branch at the edges and expose 2 inches of the matrix. Cut off the exposed matrix and butt the matrix of the branch (or overlap no more than 1\2 inch) to the matrix of the main loop. Pull the filter fabric of the branch back over the main loop and tape into place. Staple across the joint of the matrix with two staples and one each on the branch and the main loop. Use a minimum of four staples at each "tee"- two across the joint and one on each on the loop and branch
7. All openings in the fabric at joints, "tee's and ends of the branches should be taped to keep out the concrete.
8. When the building is ready for the soil gas vent pipe to be installed, the top of the "T-Riser" is cut off and a four-inch pipe is inserted, caulked with polyurethane and secured with screws. The vent pipe should be labeled to avoid confusion with the plumbing pipes.

Note: The openings in the riser are laid out at 180 to accommodate straight runs of the SGC only. If the riser is to be located in a corner, which is Not uncommon, the front of the "tee" can be cut off and the SGC inserted into the new opening. The side of the "tee" which will not be used should be sealed with duct tape. This creates a "90 tee" which will allow the riser to be placed in a corner with either end of the SGC loop running into the "tee" at a 90 angle.

Pouring Concrete:
The filter fabric that comes sewn around the soil gas collector prevents the wet concrete from entering the mat and reducing its air collection capacity. The only precaution that needs to be taken is that the fabric is duct tape closed at seams of splices and corners sufficiently to keep the uncured concrete from entering.
The mat also needs to be secured to the soil with landscape staples to prevent the concrete from lifting it off the soil while it is being applied. Reinforcing bars and wire can be laid right on top of the mat.
Note that the mat is strong enough to withstand concrete workers and their wheelbarrows as they cross over it during the course of installing the slab.
Riser has special hole and spike for securing it in place.
Making Corners and Splices
The mat should be routed around the inside perimeter of the foundation. This will require an occasional corner. Furthermore, splices will have to be made to join two lengths of mat together. Corners and splices are very easy to make, and do not require any special fittings. Cut back the filter fabric to expose the core material. In the case of a splice merely overlap the core by at least one corrugation replace the cloth and tape it. Use two landscape staples to hold the splice in place. In the case of a corner slice the core of two adjoining legs of the mat at 45-degree angles, overlap the edges by one corrugation, tape the cloth and landscape staple together. The corner is illustrated below:
Cut back the cloth. Cut the core at a 45 degree angle. Overlap corrugations
Replace filter cloth. Duct tape edges to keep out concrete. Staple in place.
Connecting The Mat To The Riser
A convenient riser with a dual entry allows for either end of the loop of mat to be secured to the soil gas vent riser. Slide the mat into either end of the riser and tape the edge to prevent wet concrete from entering.
The riser comes with a molded cap to keep out concrete Later this cap can be cut off and the 4" Sch. 40 PVC riser can be inserted, screwed and caulked into place
Risers are often placed in corners for convenience of later pipe routing. The plastic riser "tee" can be cut to allow for such situations.

RADON GAS. A naturally occurring, chemically inert, radioactive gas ~~that is not detectable by human senses. As a gas, it can move readily through particles of soil and rock, and can accumulate under the slabs and foundations of homes where it can easily enter into the living space through construction cracks and openings.~~

Reason: *There is a significant amount of commentary and unnecessary language in this definition that is proposed for deletion.*

SOIL-GAS-RETARDER. A continuous membrane of 6-mil (0.15 mm) polyethylene ~~or other equivalent material~~ used to retard the flow of soil gases into a ~~building~~ dwelling.

Reason: *There are two editorial revisions in this definition. The first deletes the reference to equivalencies which is frequently found in the section. Equivalencies are always permitted by R104.11. The second revision replaces the term "building" with "dwelling" here and throughout the section. This is to help make clear that the rules apply only to the dwelling and not an accessory building such as a garage.*

SUBMEMBRANE DEPRESSURIZATION SYSTEM (Passive). A system designed to achieve lower submembrane air pressure relative to basement or crawl space air pressure by use of a vent pipe drawing air from beneath the soil-gas-retarder membrane.

Reason: *The term "basement or" is added to avoid conflicts where an underfloor space that meets the definition of a basement does not have a concrete or other floor system but only a soil floor.*

~~**SUBSLAB DEPRESSURIZATION SYSTEM (Active).** A system designed to achieve lower subslab air pressure relative to indoor air pressure by use of a fan-powered vent drawing air from beneath the slab.~~

__Reason:__ It is necessary that code language be easily understood by the public and code enforcement. Including language in the code that references non-required systems conflicts with that goal and can mislead the use and interpretation of the rule simply because the extra language exists. The feeling is that it must somehow apply because it is there. Users of the code may confuse the definition for active systems with passive systems and misapply the rule. The IRC language only requires a ***passive*** *system. While it is necessary to define a passive system, it is not necessary to define an active system. It is therefore reasonable to delete this language as it serves no purpose.*

SUBSLAB DEPRESSURIZATION SYSTEM (Passive). A system designed to achieve lower subslab air pressure relative to indoor air pressure by use of a vent pipe ~~routed through the *conditioned space* of a building and connecting the subslab area with outdoor air, thereby relying on the convective flow of air upward in the vent to draw air from beneath the slab~~ drawing air from beneath concrete floor slabs or other floor assemblies that are in contact with the ground.

__Reason:__ It is not necessary to repeat language in the definition that is found elsewhere. Furthermore, a definition is proposed for the term "vent pipe" that contains the deleted language. The added language is for clarification and consistency with the definition of submembrane depressurization system.

VENT PIPE. A minimum 3-inch diameter (76 mm) ABS or PVC gastight pipe extending from the gas permeable layer through the roof.

__Reason:__ Again this definition is proposed to avoid the need to frequently repeat what a vent pipe is.

SECTION AF103
~~REQUIREMENTS~~
PASSIVE RADON RESISTANT SYSTEM REQUIREMENTS

AF103.1 General. ~~The following construction techniques are intended to resist radon entry and prepare the building for post-construction radon mitigation, if necessary (see Figure AF102). These techniques are required in areas where designated by the *jurisdiction*.~~ The following components of a passive submembrane or subslab depressurization system shall be installed during construction.

__Reason:__ The sentence deleted has been moved to the Scope as that is a more appropriate location.

~~**AF103.2 Subfloor preparation.** A layer of gas-permeable material shall be placed under all concrete slabs and other floor systems that directly contact the ground and are within the walls of the living spaces of the building, to facilitate future installation of a subslab depressurization system, if needed. The gas-permeable layer shall consist of one of the following:~~

1. ~~A uniform layer of clean aggregate, a minimum of 4 inches (102 mm) thick. The aggregate shall consist of material that will pass through a 2-inch (51 mm) sieve and be retained by a 1/4-inch (6.4 mm) sieve.~~
2. ~~A uniform layer of sand (native or fill), a minimum of 4 inches (102 mm) thick, overlain by a layer or strips of geotextile drainage matting designed to allow the lateral flow of soil gases.~~
3. ~~Other materials, systems or floor designs with demonstrated capability to permit depressurization across the entire subfloor area.~~

~~**AF103.3 Soil-gas-retarder.** A minimum 6-mil (0.15 mm) [or 3-mil (0.075 mm) cross-laminated] polyethylene or equivalent flexible sheeting material shall be placed on top of the gas-permeable layer prior to casting the slab or placing the floor assembly to serve as a soil-gas-retarder by bridging any cracks that develop in the slab or floor assembly, and to prevent concrete from entering the void spaces in the aggregate base material. The sheeting shall cover the entire floor area with separate sections of sheeting lapped at least 12 inches (305 mm). The sheeting shall fit closely around any pipe, wire or other penetrations of the material. All punctures or tears in the material shall be sealed or covered with additional sheeting.~~

__Reason:__ The two previous sections have been relocated to the subslab and submembrane sections below so that they are located more appropriately. Also, a new definition for "gas-permeable layer" has been added to the definitions that incorporates much of the language in AF103.3.

~~AF103.4~~ AF103.2 Entry routes. Potential radon entry routes shall be closed in accordance with Sections ~~AF103.4.1~~ AF103.2.1 through ~~AF103.4.10~~ AF103.2.7.

~~AF103.4.1~~ AF103.2.1 Floor openings. Openings around bathtubs, showers, water closets, pipes, wires or other objects that penetrate concrete slabs~~,~~ or other floor assemblies~~,~~ shall be filled with a polyurethane caulk~~,~~ or expanding foam ~~or equivalent sealant~~ applied in accordance with the manufacturer's ~~recommendations~~ installation instructions.

__Reason:__ These are largely editorial revisions but also provide for the use of expanding foam in larger spaces where caulking is not appropriate.

~~**AF103.4.2 Concrete joints.** All control joints, isolation joints, construction joints, and any other joints in concrete slabs or between slabs and foundation walls shall be sealed with a caulk or sealant. Gaps and joints shall be cleared of loose material and filled with polyurethane caulk or other elastomeric sealant applied in accordance with the manufacturer's recommendations.~~

__Reason:__ This section requires that various joints in the floor slab be "sealed". The EPA booklet "Build Radon Out" gives some perspective on the need to "seal" these joints. The text found on page 51 follows:

Seal control joints

Control joints in the concrete slab, whether they are saw cut or made with grooving tools, should be cleaned and filled with caulk. Even if they are not cracked initially, they will likely develop cracks in the future and caulking them before the floor finishes are in place makes sense. A gun-grade polyurethane or a flowable polyurethane can be used. This seal does not interfere with the expansion of the control joint, but does block radon entry.

The presumption advanced by the EPA booklet is that these joints, even if not initially cracked, will eventually crack and "caulking them before the floor finishes are in place makes sense".

However, the EPA booklet also states that one purpose for installing the soil gas membrane (plastic sheeting), is that it can bridge cracks that develop in the floor. This is stated on page 42 of the booklet.

Laying plastic sheeting between the gas permeable layer and the concrete slab or floor assembly serves several important purposes. The sheeting can prevent concrete from flowing down and clogging the gas permeable layer. It can also bridge any cracks that may develop in the slab or floor assembly, thereby reducing soil gas entry. Finally, the plastic sheeting can act as a vapor barrier to reduce moisture and other soil gas entry into the home.

If the plastic serves to bridge cracks, installing a sealant in the joints at the time of construction is redundant and unnecessary. The plastic will always be there. My argument is that the radon doesn't know what kind of crack it is trying to penetrate so that it cannot be more aggressive with a construction joint than it can with a crack due to shrinkage or expansion.

Also, I have received complaints from new homeowners that the sealant used in the joints in basement floors is slow to cure and that it gets on shoes and is tracked all over the new home. Clearly this is not an acceptable situation.

Also, flooring contractors complain about the caulking joint causing visible ridges in some flooring products and they almost always scrape the floors before installation removing most, if not all, of the caulking.

If the home has a crawl space, the plastic sheeting only need be overlapped by twelve inches. It is not required to be sealed. It is therefore unreasonable to seal a joint in a concrete floor over a plastic sheet when laps in the sheet do not need any special treatment when there is no floor. There just is no reasonable explanation that can be given.

Therefore, it is necessary that this section of the rule be deleted. This proposal is reasonable because sealing the joints is redundant given the language in the EPA booklet and laps in plastic sheeting need not be sealed when there is no floor.

~~**AF103.4.3 Condensate drains.** Condensate drains shall be trapped or routed through nonperforated pipe to daylight.~~

Reason: *Why can't condensate drains discharge to a floor drain or a sump? Why must they be trapped? This is already regulated by M1411.3.*

~~**AF103.4.4**~~ **AF103.2.2 Sumps.** Sumps ~~pits~~ open to soil or serving as the termination point for subslab or exterior drain tile loops shall be covered with a gasketed or ~~otherwise~~ sealed lid. Sumps used as the suction point in a subslab depressurization system shall have a lid designed to accommodate the vent pipe. Sumps used as a floor drain shall have a lid equipped with a trapped inlet.

~~**AF103.4.5**~~ **AF103.2.3 Foundation walls.** Hollow block masonry foundation walls shall be constructed with either a continuous course of *solid masonry*, one course of masonry grouted solid, or a solid concrete beam at or above ~~finished ground surface~~ grade ~~to prevent the passage of air from the interior of the wall into the living space~~. Where a brick veneer or other masonry ledge is installed, the course immediately below that ledge shall be ~~sealed~~ solid masonry, one course of masonry grouted solid, or a solid concrete beam. Joints, cracks or other openings around all penetrations of both exterior and interior surfaces of ~~masonry block or wood~~ foundation walls below ~~the ground surface~~ grade shall be filled with polyurethane caulk ~~or equivalent sealant~~. ~~Penetrations of concrete walls shall be filled.~~

Reason: *Revisions are editorial to eliminate repetition, commentary language, and for clarity.*

~~**AF103.4.6**~~ **AF103.2.4 Dampproofing.** The exterior surfaces of ~~portions of concrete and masonry block~~ foundation walls below ~~the ground surface~~ grade shall be dampproofed in accordance with Section R406.

Reason: *Editorial revisions.*

~~**AF103.4.7**~~ **AF103.2.5** ~~**Air-handling units**~~ **Air-conditioning systems.** ~~Air-handling units~~ Entry points, joints, or other openings into air conditioning systems in enclosed crawl spaces shall be sealed ~~to prevent air from being drawn into the unit~~.

Exception: ~~Units~~ Systems with gasketed seams or ~~units~~ that are otherwise sealed by the manufacturer ~~to prevent leakage~~.

Reason: *The term "air-handling units" is not defined. "Air-conditioning systems" is defined in the IRC as: A system that consists of heat exchangers, blowers, filters, supply, exhaust and return-air systems, and shall include any apparatus installed in connection therewith." It is best to use a defined term to avoid confusion.*

~~**AF103.4.8**~~ **AF103.2.6 Ducts.** Ductwork passing through or beneath a slab within a dwelling shall be of seamless material unless the ~~air-handling~~ air-conditioning system is designed to maintain continuous positive pressure within such ducting. Joints in such ductwork shall be sealed ~~to prevent air leakage~~.

Ductwork located in enclosed crawl spaces shall have all seams and joints sealed by closure systems in accordance with Section M1601.4.1.

Reason: *Editorial revisions. Additionally, when the code includes language such as "to prevent air leakage", some code officials will interpret that to create a standard and that some testing is undertaken to illustrate that the standard is met. Some code officials will require a pressure test of the space to demonstrate that there is no air leakage. The presumption here is that such a standard was not intended.*

~~**AF103.4.9 Crawl space floors.** Openings around all penetrations through floors above crawl spaces shall be caulked or otherwise filled to prevent air leakage.~~

Reason: *These openings are already required to be sealed for purposes of fireblocking in section R302.11.*

~~**AF103.4.10**~~ **AF103.2.7 Crawl space access.** Access doors and other openings or penetrations between *basements* and adjoining crawl spaces shall be closed, gasketed or ~~otherwise filled to prevent air leakage~~ sealed.

Reason: *Elimination of commentary language. Additionally, when the code includes language such as "to prevent air leakage", some code officials will interpret that to create a standard and that some testing is undertaken to illustrate that the standard is met. Some code officials will require a pressure test of the space to demonstrate that there is no air leakage. The presumption here is that such a standard was not intended.*

~~**AF103.5 Passive submembrane depressurization system**~~ **AF103.3 Basements or enclosed crawl spaces having soil floors.** In ~~buildings~~ dwellings with basements or enclosed crawl spaces ~~foundations~~ with soil floors, the following components of a passive submembrane depressurization system shall be installed during construction.

Exception: ~~Buildings in which an *approved* mechanical crawl space ventilation system or other equivalent system is installed.~~ Basements or enclosed crawl spaces that are provided with a continuously operated mechanical exhaust system in accordance with R408.3.

__Reason:__ Editorial revisions. Revisions also recognize any underfloor space with a soil floor regardless of what the space is called. Also, the exception references an "approved mechanical crawl space ventilation system or other equivalent system." It is not clear what the criteria might be for approving such a system or an equivalent system to that approved. So what is proposed here is the continuous mechanical exhaust system identified in R408.3.

~~**AF103.5.1 Ventilation.** Crawl spaces shall be provided with vents to the exterior of the building. The minimum net area of ventilation openings shall comply with Section R408.1.~~

__Reason:__ Crawl spaces are already required to be ventilated by R408.1. It isn't necessary to repeat that language here.

~~**AF103.5.2**~~ **AF103.3.1 Soil-gas-retarder.** The soil in basements and enclosed crawl spaces shall be covered with a ~~continuous layer of minimum 6- mil (0.15 mm) polyethylene~~ soil-gas-retarder. The ~~ground cover~~ soil-gas-retarder shall be lapped a minimum of 12 inches (305 mm) at joints and shall extend to all foundation walls enclosing the basement or crawl space ~~area~~. The soil-gas-retarder shall fit closely around any pipe, wire or other penetrations of the material. All punctures or tears in the material shall be sealed or covered with additional sheeting.

__Reason:__ Editorial revisions. The last two sentences are taken from AF103.3 as the rules are applicable at this location.

~~**AF103.5.3 Vent pipe**~~ **AF103.3.2 "T" fitting and vent pipe.** ~~A plumbing tee or other *approved* connection~~ A 3- or 4-inch "T" fitting shall be inserted ~~horizontally~~ beneath the ~~sheeting~~ soil gas retarder ~~and connected to a 3- or 4-inch-diameter (76 or 102 mm) fitting with a vertical vent pipe installed through the sheeting~~ and be connected to a vent pipe. The vent pipe shall ~~be extended up through the building floors,~~ extend through the conditioned space of the dwelling and terminate at least 12 inches (305 mm) above the roof in a location at least 10 feet (3048 mm) away from any window or other opening into the *conditioned spaces* of the building that is less than 2 feet (610 mm) below the exhaust point~~, and 10 feet (3048 mm) from any window or other opening in adjoining or adjacent buildings~~.

__Reason:__ Largely editorial but also recognizing that definitions address the deleted language.

~~**AF103.6**~~ **AF103.4** ~~**Passive subslab depressurization system**~~ **Basements or enclosed crawl spaces having concrete floors or other floor systems and slab on grade dwellings.** ~~In *basement* or slab-on-grade buildings, the~~ The following components of a passive subslab depressurization system shall be installed during construction in slab on grade dwellings or in dwellings with basements or crawl spaces having concrete or other floor systems.

__Reason:__ Editorial revisions. Revisions also recognize any underfloor space with a concrete or other floor system regardless of what the space is called. It is not uncommon for crawl spaces to have concrete floors.

AF103.4.1 Sub-slab preparation. A layer of gas-permeable material shall be placed under all concrete slabs and other floor systems that directly contact the ground and are within the walls of the dwelling.

__Reason:__ This is text that has been relocated from AF103.2.

AF103.4.2 Soil-gas-retarder. A soil gas retarder shall be placed on top of the gas-permeable layer prior to casting the slab or placing the floor assembly. The soil-gas-retarder shall cover the entire floor area with separate sections lapped at least 12 inches (305 mm). The soil-gas-retarder shall fit closely around any pipe, wire, or other penetrations of the material. All punctures or tears in the material shall be sealed or covered.

__Reason:__ This text has been relocated from AF103.3.

~~**AF103.6.1**~~ **AF103.4.3** ~~**Vent pipe**~~ **"T" fitting and vent pipe.** ~~A minimum 3-inch-diameter (76 mm) ABS, PVC or equivalent gas-tight pipe shall be embedded vertically into the subslab aggregate or other permeable material before the slab is cast. A "T" fitting or equivalent method shall be used to ensure that the pipe opening remains within the subslab permeable material. Alternatively, the 3-inch (76 mm) pipe shall be inserted directly into an interior perimeter drain tile loop or through a sealed sump cover where the sump is exposed to the subslab aggregate or connected to it through a drainage system. The pipe shall be extended up through the building floors, and terminate at least 12 inches (305 mm) above the surface of the roof in a location at least 10 feet (3048 mm) away from any window or other opening into the *conditioned spaces* of the building that is less than 2 feet (610 mm) below the exhaust point, and 10 feet (3048 mm) from any window or other opening in adjoining or adjacent buildings.~~ Before a slab is cast or other floor system is installed, a "T" fitting shall be inserted below the slab or other floor system and the soil-gas-retarder. The "T" fitting shall be connected to a vent pipe. The vent pipe shall extend through the conditioned space of the dwelling and terminate at least 12 inches (305 mm) above the roof in a location at least 10 feet (3048 mm) away from any window or other opening into the *conditioned spaces* of the building that is less than 2 feet (610 mm) below the exhaust point.

__Reason:__ Largely editorial but also recognizing that definitions address the deleted language. A portion of the new text came from AF103.3.

AF103.5 Drain tile and sump used for depressurization. As an alternative to inserting a vent pipe into a "T" fitting, a vent pipe may be inserted directly into an interior perimeter drain tile loop or through a sump cover where the drain tile and/or sump is exposed to the gas permeable layer.

__Reason:__ This is new text that recognizes that a sump or drain tile can be used in a passive radon system.

~~**AF103.6.2**~~ **AF103.5 Multiple vent pipes.** In ~~buildings~~ dwellings where interior footings or other barriers separate the ~~subslab aggregate or other~~ gas-permeable ~~material~~ layer, each area shall be fitted with an individual vent pipe. Vent pipes shall connect to a single vent that terminates above the roof or each individual vent pipe shall terminate separately above the roof.

__Reason:__ Editorial revisions.

AF103.5 Combination foundations. Where basement or crawl space floors are on different levels, each level shall have a separate vent pipe. Multiple vent pipes may be connected to a single vent pipe that terminates above the roof.

__Reason:__ This section has been relocated from later in the section to group like requirements. It has also been editorially revised for clarity.

~~**AF103.7**~~ **AF103.8 Vent pipe drainage.** All components of the radon vent pipe system shall be installed to provide positive drainage to the ground beneath the ~~slab or~~ soil-gas-retarder.

~~**AF103.8 Vent pipe accessibility.** Radon vent pipes shall be accessible for future fan installation through an *attic* or other area outside the *habitable space*.~~

~~**Exception:** The radon vent pipe need not be accessible in an *attic* space where an *approved* roof-top electrical supply is provided for future use.~~

__Reason:__ This section has been moved to the end of the section to group like requirements.

~~**AF103.9**~~ **AF103.9 Vent pipe identification.** All exposed and visible interior ~~radon~~ vent pipes shall be identified with at least one *label* on each floor and in accessible *attics*. The *label* shall read: "Radon Reduction System."

~~**AF103.10 Combination foundations.** Combination *basement*/ crawl space or slab-on-grade/crawl space foundations shall have separate radon vent pipes installed in each type of foundation area. Each radon vent pipe shall terminate above the roof or shall be connected to a single vent that terminates above the roof.~~

__Reason:__ This section has been moved up to group like requirements.

~~**AF103.11 Building depressurization.** Joints in air ducts and plenums in un*conditioned spaces* shall meet the requirements of Section M1601. Thermal envelope air infiltration requirements shall comply with the energy conservation provisions in Chapter 11. Fireblocking shall meet the requirements contained in Section R302.11.~~

__Reason:__ It seems unnecessary to repeat requirements that are found elsewhere in the code.

~~**AF103.12**~~ **AF103.10 Power source and access for future radon fan.** To provide for future installation of ~~an active submembrane or subslab depressurization system~~ a radon fan, an electrical circuit terminated in an *approved* box shall be installed during construction in the ~~*attic* or other~~ anticipated location of ~~vent pipe~~ the radon fan~~s~~. ~~An electrical supply shall also be accessible in anticipated locations of system failure alarms.~~ An accessible clear space 24 inches in diameter by 3 feet in height adjacent to the vent pipe shall be provided at the anticipated location of a future radon fan.

__Reason:__ This text applies to providing a space and power source for the future installation of a radon fan. The term "attic" has been deleted as it unnecessarily confuses where the placement of the electrical termination should be. The term "other anticipated location" implies that the fan could be placed anywhere, not just an attic. And since active systems aren't regulated, there will be no oversight to the final location of a fan anyway. The reference to "system failure alarms" is deleted as there are non-electrical ways of monitoring active systems and it would seem that the same box used to power the fan could power the alarm.

To aid in understanding the impact of these changes, what follows is the revised text minus the cross-outs and underlines.

APPENDIX F
PASSIVE RADON GAS CONTROLS

(The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance.)

SECTION AF101
SCOPE

AF101.1 General. This appendix contains requirements for new construction in *jurisdictions* where radon-resistant construction is required. These requirements are intended to provide a passive means of resisting radon gas entry and prepare the dwelling for post-construction radon mitigation, if necessary (see Figure AF102). Active construction techniques may be used in lieu of passive techniques when approved.

Inclusion of this appendix by *jurisdictions* shall be determined through the use of locally available data or determination of Zone 1 designation in Figure AF101 and Table AF101(1).

SECTION AF102
DEFINITIONS

AF102.1 General. For the purpose of these requirements, the terms used shall be defined as follows:

DRAIN TILE LOOP. A continuous length of drain tile or perforated pipe extending around all or part of the internal or external perimeter of a *basement* or crawl space footing.

ENCLOSED CRAWL SPACE. A crawl space that is enclosed with foundation walls that may include windows, doors, access openings, and required vents.

GAS-PERMEABLE LAYER. A gas-permeable layer shall consist of one of the following:

1. A uniform layer of clean aggregate that is a minimum of 4 inches (102 mm) thick. The aggregate shall consist of material that will pass through a 2-inch (51 mm) sieve and be retained by a 1/4-inch (6.4 mm) sieve.
2. A uniform layer of sand (native or fill) that is a minimum of 4 inches (102 mm) thick and that is overlain by a soil gas collection mat or soil gas matting installed in accordance with the manufacturer's installation instructions.

RADON GAS. A naturally occurring, chemically inert, radioactive gas.

SOIL-GAS-RETARDER. A continuous membrane of 6-mil (0.15 mm) polyethylene used to retard the flow of soil gases into a dwelling.

SUBMEMBRANE DEPRESSURIZATION SYSTEM (Passive). A system designed to achieve lower submembrane air pressure relative to basement or crawl space air pressure by use of a vent pipe drawing air from beneath the soil-gas-retarder membrane.

SUBSLAB DEPRESSURIZATION SYSTEM (Passive). A system designed to achieve lower subslab air pressure relative to indoor air pressure by use of a vent drawing air from beneath concrete floor slabs or other floor assemblies that are in contact with the ground.

VENT PIPE. A minimum 3-inch diameter (76 mm) ABS or PVC gastight pipe extending from the gas permeable layer through the roof.

SECTION AF103
PASSIVE RADON RESISTANT SYSTEM REQUIREMENTS

AF103.1 General. The following components of a passive submembrane or subslab depressurization system shall be installed during construction.

AF103.2 Entry routes. Potential radon entry routes shall be closed in accordance with Sections AF103.2.1 through AF103.2.8.

AF103.2.1 Floor openings. Openings around bathtubs, showers, water closets, pipes, wires or other objects that penetrate concrete slabs or other floor assemblies shall be filled with a polyurethane caulk or expanding foam applied in accordance with the manufacturer's installation instructions.

AF103.2.2 Sumps. Sumps open to soil or serving as the termination point for subslab or exterior drain tile loops shall be covered with a gasketed or sealed lid. Sumps used as the suction point in a subslab depressurization system shall have a lid designed to accommodate the vent pipe. Sumps used as a floor drain shall have a lid equipped with a trapped inlet.

AF103.2.3 Foundation walls. Hollow block masonry foundation walls shall be constructed with either a continuous course of *solid masonry*, one course of masonry grouted solid, or a solid concrete beam at or above grade. Where a brick veneer or other masonry ledge is installed, the course immediately below that ledge shall be solid masonry, one course of masonry grouted solid, or a solid concrete beam. Joints, cracks or other openings around all penetrations of both exterior and interior surfaces of foundation walls below grade shall be filled with polyurethane caulk.

AF103.2.4 Dampproofing. The exterior surfaces of foundation walls below grade shall be dampproofed in accordance with Section R406.

AF103.2.5 Air-conditioning systems. Entry points, joints, or other openings into air conditioning systems in enclosed crawl spaces shall be sealed.

Exception: Systems with gasketed seams or that are otherwise sealed by the manufacturer.

AF103.2.6 Ducts. Ductwork passing through or beneath a slab within a dwelling shall be of seamless material unless the air-conditioning system is designed to maintain continuous positive pressure within such ducting. Joints in such ductwork shall be sealed.

Ductwork located in enclosed crawl spaces shall have all seams and joints sealed by closure systems in accordance with Section M1601.4.1.

AF103.2.7 Crawl space access. Access doors and other openings or penetrations between *basements* and adjoining crawl spaces shall be closed, gasketed or sealed.

AF103.3 Basements or enclosed crawl spaces having soil floors. In dwellings with basements or enclosed crawl spaces with soil floors, the following components of a passive submembrane depressurization system shall be installed during construction.

Exception: Basements or enclosed crawl spaces that are provided with a continuously operated mechanical exhaust system in accordance with R408.3.

AF103.3.1 Soil-gas-retarder. The soil in basements and enclosed crawl spaces shall be covered with a soil-gas-retarder. The soil-gas-retarder shall be lapped a minimum of 12 inches (305 mm) at joints and shall extend to all foundation walls enclosing the basement or crawl space. The soil-gas-retarder shall fit closely around any pipe, wire or other penetrations of the material. All punctures or tears in the material shall be sealed or covered with additional sheeting.

AF103.3.2 "T" fitting and vent pipe. A 3- or 4-inch "T" fitting shall be inserted beneath the soil gas retarder and be connected to a vent pipe. The vent pipe shall extend through the conditioned space of the dwelling and terminate at least 12 inches (305 mm) above the roof in a location at least 10 feet (3048 mm) away from any window or other opening into the *conditioned spaces* of the building that is less than 2 feet (610 mm) below the exhaust point.

AF103.4 Basements or enclosed crawl spaces having concrete floors or other floor systems and slab on grade dwellings. The following components of a passive subslab depressurization system shall be installed during construction in slab on grade dwellings or in dwellings with basements or crawl spaces having concrete or other floor systems.

AF103.4.1 Sub-slab preparation. A layer of gas-permeable material shall be placed under all concrete slabs and other floor systems that directly contact the ground and are within the walls of the dwelling.

AF103.4.2 Soil-gas-retarder. A soil gas retarder shall be placed on top of the gas-permeable layer prior to casting the slab or placing the floor assembly. The soil-gas-retarder shall cover the entire floor area with separate sections lapped at least 12 inches (305 mm). The soil-gas-retarder shall fit closely around any pipe, wire, or other penetrations of the material. All punctures or tears in the material shall be sealed or covered.

AF103.4.3 "T" fitting and vent pipe. Before a slab is cast or other floor system is installed, a "T" fitting shall be inserted below the slab or other floor system and the soil-gas-retarder. The "T" fitting shall be connected to a vent pipe. The vent pipe shall extend through the conditioned space of the dwelling and terminate at least 12 inches (305 mm) above the roof in a location at least 10 feet (3048 mm) away from any window or other opening into the *conditioned spaces* of the building that is less than 2 feet (610 mm) below the exhaust point.

AF103.5 Drain tile and sump used for depressurization. As an alternative to inserting a vent pipe into a "T" fitting, a vent pipe may be inserted directly into an interior perimeter drain tile loop or through a sump cover where the drain tile and/or sump is exposed to the gas permeable layer.

AF103.6 Multiple vent pipes. In dwellings where interior footings or other barriers separate the gas-permeable layer, each area shall be fitted with an individual vent pipe. Vent pipes shall connect to a single vent that terminates above the roof or each individual vent pipe shall terminate separately above the roof.

AF103.7 Combination foundations. Where basement or crawl space floors are on different levels, each level shall have a separate vent pipe. Multiple vent pipes may be connected to a single vent pipe that terminates above the roof.

AF103.8 Vent pipe drainage. All components of the radon vent pipe system shall be installed to provide positive drainage to the ground beneath the soil-gas-retarder.

AF103.9 Vent pipe identification. All exposed and visible interior vent pipes shall be identified with at least one *label* on each floor and in accessible *attics*. The *label* shall read: "Radon Reduction System."

AF103.10 Power source and access for future radon fan. To provide for future installation of a radon fan, an electrical circuit terminated in an *approved* box shall be installed during construction in the anticipated location of the radon fan. An accessible clear space 24 inches in diameter by 3 feet in height adjacent to the vent pipe shall be provided at the anticipated location of a future radon fan.

Cost Impact: None

APPENDIX F-RB-DAVIDSON

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: This is a good and needed update and reorganization of the appendix. The proponent should reach out to the radon experts and resolve the technical issues and bring back a public comment.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

David Kapturowski, Spruce Environmental Technologies, Inc, representing American Association of Radon Scientists and Technologists (AARST), requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

Delete Appendix F in its entirety and substitute as follows:

~~APPENDIX F~~
~~RADON CONTROL METHODS~~

APPENDIX F
RADON REDUCTION

SECTION AF101
SCOPE

AF101.1 This appendix contains requirements for new construction in *jurisdictions* where significant potential for elevated indoor *radon* exists. Inclusion of this appendix by *jurisdictions* shall be determined through the use of locally available data or determination of *radon* zone 1 & 2 designation in accordance with section AF103.42.

SECTION AF102
DEFINITIONS

ACCESS (limited). For the purpose of Appendix F, the point of entry to a fan location that allows service personnel to reach an *ASD fan* or intended fan location for the purpose of installing or replacing an *ASD fan*. Such access does not require walkways, service platforms, level working spaces, receptacle and lighting outlets or clear and unobstructed passageways with continuous solid flooring such as are typically required for appliances that require periodic maintenance, servicing and inspection.

ACTIVE SOIL DEPRESSURIZATION (ASD). A family of *radon mitigation systems* involving fan-powered soil depressurization, including but not limited to *sub-slab depressurization* and *sub-membrane depressurization*.

ASD FAN. A particular type of fan that is designed and rated by the manufacturer for continuous duty and for use in an *ASD* system.

CERTIFIED. For the purpose of Appendix F, a designation applied to individuals or companies that have met qualification requirements or are authorized by the state to provide *radon* laboratory, measurement or mitigation services. Programs providing national certifications for *radon* laboratories, measurement and mitigation professionals are those of the National Radon Proficiency Program (NRPP) and the National Radon Safety Board (NRSB). Also see LICENSED.

CHECK VALVE. For the purpose of Appendix F, a mechanical device that will allow water to flow in one direction while preventing airflow in the opposite direction.

DEPRESSURIZATION. A negative pressure induced in one area relative to another.

DIAGNOSTIC TESTS. Procedures, including Communication Tests and other tests, used to identify or characterize conditions under, beside and within buildings that could contribute to *radon* entry or elevated *radon* levels or that could provide information regarding the performance of a *radon mitigation system*.

GEOTEXTILE MATTING. A product suitable for soil contact, that provides a void space laterally through the material to allow air movement. The void space is created through a matrix of woven mesh, "egg crate" support of a fabric enclosure or similar means. Also referred to as "Vent Strip".

LICENSED. For the purpose of Appendix F, a designation applied to individuals or companies that are qualified and specifically authorized as *radon* laboratories, measurement or mitigation professionals within certain states or jurisdictions that regulate *radon* services. Also see CERTIFIED.

MITIGATOR. For the purpose of Appendix F, a *certified* or *licensed* individual who designs, installs or directly supervises the installation of the *radon ASD mitigation systems*.

MITIGATION SYSTEM. Any system or steps designed to reduce *radon* concentrations in the indoor air of a building.

NATIONAL RADON ACTION LEVEL (NRAL). The indoor *radon* concentration at which mitigation is recommended. The *NRAL* is defined as the US Environmental Protection Agency's Action Level of 4 *pCi/L* [148 Bq/m^3].

PIPE LOOP. For the purpose of Appendix F, a continuous length of perforated pipe extending around the inside perimeter of the foundation.

RADON. A naturally occurring, chemically inert, radioactive element (Rn-222) which exists as a gas.

ROUGH-IN. For the purpose of Section AF103, the installation of all parts and materials of an *ASD* system that must be completed prior to the placement of concrete, prior to the closure of building cavities and prior to the installation of finish materials. Such parts and materials are gas permeable layers, *soil gas retarders*, plenums, membranes, piping, *suction points*, discharge points and wiring.

SOIL GAS. The gas mixture present in soil, which could contain *radon* and water vapor.

SOIL GAS COLLECTION PLENUM. A constructed enclosure for collecting *radon* and other *soil gases* from under a foundation.

SOIL GAS COLLECTOR. A gas permeable conduit constructed of *gravel*, perforated pipe or *geotextile matting* for collecting *radon* and other *soil gases* from within a *soil gas collection plenum* and connecting the plenum to the *ASD* pipe system.

SOIL GAS RETARDER. A continuous membrane or other comparable material laid over a *soil gas* plenum or earthen floor area that is used to retard the flow of *soil gases* into a building.

SUB-MEMBRANE DEPRESSURIZATION. A *radon* mitigation technique designed to maintain lower air pressure in the space under a *soil gas retarder* membrane than above it by use of an *ASD fan* drawing air from beneath the membrane.
SUB-SLAB DEPRESSURIZATION. A *radon* mitigation technique designed to maintain lower air pressure under a floor slab than above it. An *ASD fan* is installed in the *radon* system piping that draws air from below the floor slab.

SUCTION POINT. For the purpose of Appendix F, the location where the *soil gas collector* is connected to the *ASD* system piping.

SECTION AF103
RADON REDUCTION

AF103.1 General. This Section applies to *radon* control methods for buildings and structures within EPA *radon* zones 1 & 2, as defined in Section AF103.42. *Rough-Ins* or complete *Active Soil Depressurization (ASD)* systems shall be installed as necessary to reduce soil gas entry and vapor intrusion so as to establish indoor *radon* levels below the *National Radon Action Level (NRAL*).

AF103.2 Mitigation system required. A *mitigation system Rough-In* shall be installed in dwellings located in *radon* potential zones 1 and 2 in accordance with Section AF103.5. The *radon* potential zones shall be determined in accordance with Section AF103.42.

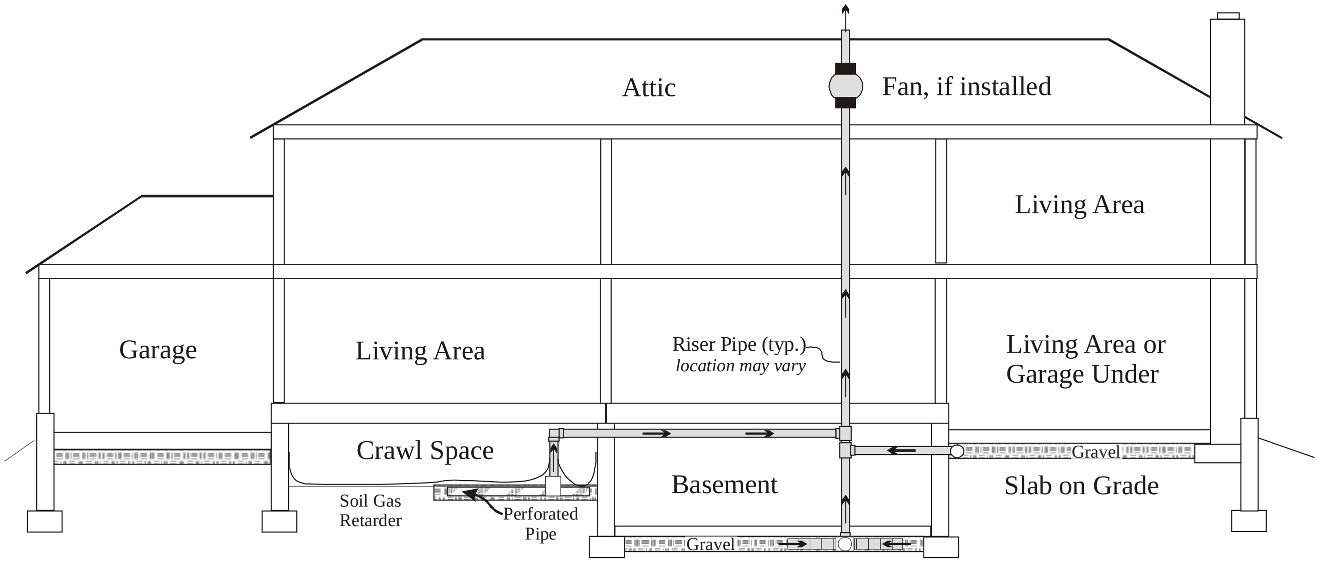
> **Exception:** Where the foundation system does not have any enclosed area of soil contact and where prior to occupancy, testing in accordance with Section AF103.41 indicates that the building has a *radon* level below the *National Radon Action Level* (*NRAL*).

AF103.3 Design. The design of *radon mitigation systems* shall comply with Section AF103 and for buildings having a total foundation area of greater than 2500 square feet [232 sq. m], shall be performed by a *mitigator* that is *certified* or *licensed* to design such systems. Designs of *radon mitigation systems* for foundation types other than those specified herein shall be performed by a *mitigator* that is *certified* or *licensed* to design such systems.

AF103.4 Foundation area. The foundation area shall be calculated from the inside perimeter dimensions of the foundation walls.

AF103.5 Mitigation system rough-in required. The *rough-in* installation of a *mitigation system* shall be required for all foundations and combination foundations types, including crawl space, basement, slab-on-grade and slab-on-grade garage located below a living area. The installation shall be in accordance with Sections AF103.6 through AF103.28. Figure AF103.5 illustrates the four foundation types.

FIGURE AF103.5
FOUNDATION TYPES



AF103.6 Soil gas collection plenums. Foundation areas shall be constructed so as to create sealed *soil gas collection plenums* in accordance with Sections AF103.7 through AF103.9.6.

AF103.7 Submembrane soil gas collection plenums in crawl spaces with earthen floors. For each *suction point*, a *soil gas collector* shall be installed in accordance with Sections AF103.7.1 through AF103.7.7 and Section AF103.9.

AF103.7.1 Soil gas collector. One *soil gas collector* for each *suction point* (AF103.7.2) shall be installed in accordance with Section AF103.7.1.1, AF103.7.1.2 or AF103.7.1.3.

AF103.7.1.1 Pipe soil gas collector. The *soil gas collector* shall consist of a perforated pipe with a nominal diameter of not less than 4 inches [102 mm]. The pipe shall be not less than 10 feet [3048 mm] in length. Such piping shall be placed in a trench backfilled with clean aggregate meeting the criteria of Section AF103.8.1.1.1 such that the pipe is completely surrounded by not less than 4 inches [102 mm] of aggregate.

AF103.7.1.1.2 Geotextile soil gas collector. The *soil gas collector* shall consist of a strip of geotextile drain matting not less than 10 feet [3048 mm] in length and having a cross sectional area of not less than 12 square inches [7742 sq. mm]. The strip of matting shall be placed on top of the soil or in a trench.

AF103.7.1.1.3 Gravel soil gas collector. A uniform layer of clean aggregate, not less than 4 inches [102 mm] in depth, shall be placed over the soil. The aggregate shall have a void ratio of not less than 35 percent or shall be in accordance with Size Number 4, 5, 56, or 6 as classified by ASTM C33.

AF103.7.2 Suction points. One *suction point* shall be provided for each *soil gas collector*. *Suction points* shall be installed in accordance with Section AF103.7.2.1, AF103.7.2.2 or AF103.7.2.3, as applicable for the type of plenum installed.

AF103.7.2.1 Suction point for pipe soil gas collector. The *suction point* for a pipe *soil gas collector* shall consist of a pipe fitting or other device having not less than three openings with two openings oriented so as to create multiple horizontal intake openings. The perforated pipe plenum shall be inserted into both of the horizontal openings of the pipe fitting or device. One opening of the fitting or device shall be oriented in a vertical "up" position. Alternatively, the sub-membrane area and the other foundation types shall be interconnected by a *pipe loop soil gas collector* that is constructed in accordance with Section AF103.8.1.1.3 and served by one or more *suction points*.

AF103.7.2.2 Suction point for geotextile soil gas collector. The *suction point* for a geotextile *soil gas collector* shall consist of a pipe fitting or other device having not less three openings with two openings oriented so as to create multiple horizontal intake openings. The horizontal openings shall be connected to the matting in a manner to facilitate airflow from the collector. One opening of the fitting or device shall be oriented in a vertical "up" position.

AF103.7.2.3 Suction point for gravel soil gas collector. The *suction point* for a gravel *soil gas collector* shall consist of a pipe fitting or other device having not less than three openings with two openings oriented so as to create multiple horizontal intake openings. The horizontal openings shall be provided with not less than 5 feet [1524 mm] of perforated pipe extending from each opening of the fitting or device into the gravel layer. Such perforated pipe shall provide not less than 1 square inch [645 sq. mm] of open perforation area per lineal foot of pipe.

AF103.7.3 Suction points not permitted. *Suction points* shall not be permitted on sump lids

AF103.7.4 Fasten suction points. *Suction point* fittings and devices shall be fixed in place to prevent dislocation.

AF103.7.5 Seal top of the soil gas collection plenum. A *soil gas retarder* shall cover the top of the *soil gas collection plenum* and all exposed soil. The installation of the *soil gas retarder* shall be in accordance with Sections AF103.7.5.1 through AF103.7.5.4.

AF103.7.5.1 Sheeting. The *soil gas retarder* membrane shall comply withASTM E1745
Class A, B or C.

AF103.7.5.2 Seams. The seams between adjacent membrane sheets shall be overlapped not less than 12 inches [305 mm] and shall be sealed by one of the following methods:

1. A tape recommended by the membrane manufacturer.
2. Caulk complying with ASTM C920 class 25 or greater.
3. An equivalent method.

AF103.7.5.3 Repairs. Tears or punctures in the membrane shall be sealed by one or more of the following methods:

1. A tape recommended by the membrane manufacturer.
2. An additional sheet of the membrane material that covers and overlaps the tear or puncture not less than 12 inches [305 mm] on all sides and that is sealed with a caulk complying with ASTM C920 class 25 or greater.
3. An equivalent method.

AF103.7.5.4 Penetrations. Openings in the *soil gas retarder* membrane for piping, utilities, structural supports or similar penetrations shall be sealed.

AF103.7.6 Seal sides of the soil gas collection plenum. The *soil gas retarder* membrane shall turn up onto foundation walls not less than 6 inches [152 mm] and shall be continuously sealed to the wall along the full perimeter with a caulk complying with ASTM C920 class 25 or higher or equivalent method.

AF103.7.7 Membrane label required. *Soil gas retarder* membranes shall be marked in a conspicuous place with a label to identify that the membrane is a component of a *radon* reduction system. The label lettering shall be not less than 1/4 inch [6.35 mm] in height and shall be of a color in contrast with the color of the background on which the lettering is applied.

AF103.8.1 Subslab soil gas collection plenums for concrete floors. The floors of basement, concrete crawlspace and slab-on-grade foundation systems shall be provided with a *soil gas collection plenum* installed in accordance with Sections AF103.8.1.1 through AF103.9.6.

AF103.8.1.1 Soil gas collector. A *soil gas collector* shall be installed in accordance with Section AF103.8.1.1.1, AF103.8.1.1.2 or AF103.8.1.1.3.

AF103.8.1.1.1 Gravel. A uniform layer of clean aggregate, not less than 4 inches [102 mm] in depth, shall be placed over the soil. The aggregate shall have a void ratio of not less than 35 percent or shall be in accordance with Size Number 4, 5, 56, or 6 as classified in accordance with ASTM C33.

AF103.8.1.1.2 Geotextile. A layer of geotextile drainage matting shall be placed over a uniform layer of either soil or sand. The geotextile drainage matting shall be designed to allow the lateral flow of *soil gases* to the system's *suction point* fitting. The *geotextile matting* shall have a cross-sectional area of not less than 12 square inches [7742 sq. mm] and shall be placed, at a minimum, along the entire inside perimeter of the foundation at a distance of 12 inches [305 mm] to 18 inches [457 mm] from the foundation wall to the edge of the drainage matting. Deviation from the 12 inch [305 mm] to 18 inch [457 mm] distance to the foundation wall shall be allowed to avoid obstacles such as plumbing and other utilities.

AF103.8.1.1.3 Pipe loop. A loop of not less than 4 inch [102 mm] diameter perforated pipe shall be placed along the entire inside perimeter of the foundation at a distance of 12 inches [305 mm] to 18 inches [457 mm] from the centerline of the pipe to the foundation walls. Such piping shall be placed in a trench backfilled with clean aggregate that complies with Section AF103.8.1.1.1 and surrounds the pipe on not less than 2 sides. The cross-sectional area of the aggregate and pipe *soil gas collector* shall be not less than 50 square inches [32,258 sq. mm]. The piping shall form a continuous loop and pipe sections shall be joined with a connector device or a method recommended by the manufacturer. Deviation from the 12 inch [305 mm] to 18 inch [457 mm] distance to the foundation wall shall be allowed to avoid obstacles such as plumbing and other utilities.

AF103.8.2 Suction points. One *suction point* shall be provided for each *soil gas collector*. Not less than one *suction point* shall be provided for each foundation type. Alternatively, each *soil gas collector* shall be interconnected by a *pipe loop soil gas collector* that is constructed in accordance with Section AF103.8.3 and served by one or more *suction points*. *Suction points* shall be installed in accordance with Sections AF103.8.2.1, AF103.8.2.2 or AF103.8.2.3 as applicable for the type of *soil gas collector* installed.

AF103.8.2.1 Gravel layer soil gas collector. A *suction point* for a *gravel* type *soil gas collector* shall consist of a pipe fitting or other device having not less than two openings oriented so as to create multiple horizontal intake openings within the gravel layer. The horizontal openings shall be provided with not less than 5 feet [1534 mm] of perforated pipe extending from each opening of the fitting or device into the gravel layer. Such perforated pipe shall provide a not less than 1 square inch [645 sq. mm] of open perforation area per lineal foot of pipe. *Suction point* openings above the slab shall be protected from the entry of aggregate, concrete and debris.

AF103.8.2.2 Geotextile layer soil gas collector. A *suction point* for a geotextile type *soil gas collector* shall consist of a pipe fitting or other device having not less than three openings with two oriented so as to create multiple horizontal intake openings connected to the geotextile mat in a manner that maintains airflow capacity from the plenum. *Suction point* openings above the slab shall be protected from the entry of aggregate, concrete and debris.

AF103.8.2.3 Pipe loop soil gas collector. A *suction point* for a *pipe loop* type collector shall consist of a pipe tee fitting or pipe saddle device installed in the loop piping. *Suction point* openings above the slab shall be protected from the entry of aggregate, concrete and debris.

AF103.8.3 Multiple soil gas collection plenums. Where interior footings divide a *soil gas collector* into two or more areas, each such area shall be provided with the required *suction points* and joined with *mitigation system* piping in accordance with Section AF103.10. Alternatively, each area so created by the interior footings shall be interconnected by a *pipe loop soil gas collector* that is constructed in accordance with Section AF103.8.1.1.3 and is served by not less than one *suction point*.

AF103.8.4 Suction points not permitted. *Suction points* shall not be permitted on sump lids.

AF103.8.5 Fasten suction points. *Suction point* fittings and piping shall be fastened in place to prevent dislocation during placement of the gas permeable layer, *soil gas retarder* and concrete.

AF103.8.6 Seal top of the soil gas plenum. The *soil gas collector* and all exposed soil shall be covered with a *soil gas retarder* installed in accordance with Section AF103.8.6.1.

AF103.8.6.1 Sheeting. Polyethylene sheeting not less than 6 *mils* [0.152 mm] thick, or cross-laminated polyethylene sheeting not less than 3 *mils* [0.076 mm] thick shall be installed on top of the *soil gas collector*, shall completely cover the area under the concrete floor and shall be sealed in accordance with Sections AF103.8.6.1.1 through AF103.8.6.1.3. Where sheet foam board insulation is installed on top of the *soil gas collector*, the polyethylene sheeting shall be installed below the foam board insulation.

AF103.8.6.1.1 Seams. Seams between adjacent polyethylene sheets shall be overlapped not less than 12 inches [305 mm] and sealed with a caulk complying with ASTM C920 class 25 or higher, or equivalent method.

AF103.8.6.1.2 Repairs. Tears or punctures in the polyethylene sheeting shall be sealed or an additional sheet of polyethylene shall cover the tear or puncture with an overlap of not less than 12 inches [305 mm] on all sides. Such additional sheet shall be sealed and fixed in place to prevent displacement during slab casting.

AF103.8.6.1.3 Penetrations. Openings in the *soil gas retarder* membrane for piping, utilities, structural posts and similar penetrations shall be sealed.

AF103.8.7 Concrete floors. The concrete floor shall be cast directly upon the *soil gas retarder,* or upon the sheet foam board insulation where it is installed on top of the *soil gas retarder*.

AF103.8.8 Penetrations. Penetrations through the concrete slab and *soil gas retarder* shall be sealed with a caulk complying with ASTM C920 class 25 or higher, or equivalent method.

AF103.8.9 Block-outs. Where openings are cast or constructed in the concrete slab under plumbing fixtures, the openings shall be filled with expanding foam or a non-shrink grout or an approved equivalent method. Exposed openings shall be sealed with non-shrink grout or an approved equivalent method.

AF103.8.10 Seal sides of the soil gas collection plenum. The intersection of floors and foundation walls shall be sealed with a caulk complying with ASTM C920 class 25 or higher or an approved equivalent method. Sealing shall be performed in accordance with Section AF103.8.10.1, AF103.8.10.2 or AF103.8.10.3.

AF103.8.10.1 Seal floor to wall. The intersection of floors and foundation walls shall be sealed.

AF103.8.10.2 Seal soil gas retarder to footing or wall. Where foundation walls are solid concrete, the *soil gas retarder* shall be sealed to the footing or to the foundation wall.

AF103.8.10.3 Seal soil gas retarder to wall. Where foundation walls are masonry block, the *soil gas retarder* shall be sealed to the foundation wall.

AF103.9 General sealing of soil gas collection plenums. Sealing of potential *soil gas* pathways shall be in accordance with Sections AF103.9.1 through AF103.9.6.

AF103.9.1 Sumps in floors. Sumps in interior floors shall have a rigid lid that is sealed with a gasket or silicone caulk and mechanically fastened in a manner that facilitates removal for maintenance. Pipe and wiring penetrations through the lid shall be sealed. The intersection of the floor and sump basin shall be sealed with a caulk complying with ASTM C920 class 25 or higher or equivalent method.

AF103.9.2 Hollow masonry unit walls. The top course of hollow block masonry walls shall be made of solid masonry units or shall be fully grouted. The top course under the full width of door and window openings shall be made of solid masonry units or the hollow masonry units shall be fully grouted. Where a brick veneer or other masonry ledge is installed, the course immediately below that ledge shall be made of solid masonry units or the top course shall be fully grouted**.** Other penetrations through foundation walls shall be sealed**.**

AF103.9.3 Floor drains. Floor drains and condensate drains shall not allow *soil gas* entry.

AF103.9.4 Air ducts. Air ducts located below concrete slabs shall be sealed to prevent *radon* entry and constructed in accordance with Chapter 16.

AF103.9.5 Foundation drains. Gravity foundation drainage systems shall include a *check valve* or other mechanical means to isolate the *soil gas collection plenum* from any exterior drain piping. Access shall be provided for maintenance.

AF103.9.6 Access openings. Access openings in the floor provided for drain maintenance shall not allow *soil gas* entry.

AF103.10 Mitigation system piping. The *mitigation system* piping that extends from the *soil gas* plenum to the point of discharge shall be rigid, non-perforated pipe in accordance with Sections AF103.11 through AF103.19.

AF103.11 Pipe size. *Mitigation system* pipe shall be not less than 3 inch [76 mm] nominal inside diameter.

AF103.12 ABS piping. ABS pipe shall comply with ASTM D2661, F628 or F1488. The pipe wall thickness shall be Schedule 40.

AF103.13 PVC piping. PVC pipe shall comply with ASTM D2665, F891, or F1488. The pipe wall thickness shall be Schedule 40.

> **Exception:** Rigid, non-perforated PVC pipe complying with ASTM D2949 shall be an alternative to the material specified herein, where installed vertically within enclosed wall cavities.

AF103.14 Slope. Above ground piping shall have a slope of not less than 1/8 inch [3.2 mm] per foot [305 mm]. Piping shall slope downwards towards the *suction point*. Piping arrangements that allow water to collect shall be prohibited.

AF103.15 Joints. Plastic pipe joints shall be solvent welded in accordance with Sections AF103.15.1 and AF103.15.2. Where disassembly of piping is required such as for removal of a fan, the joints shall be made with flexible couplings complying with ASTM D5926 or ASTM C1173 or an approved equivalent method.

AF103.15.1 ABS plastic pipe joints. ABS plastic pipe joints shall be solvent welded in accordance with the pipe manufacturer's instructions with solvent cement conforming to ASTM D 2235.

AF103.15.2 PVC plastic pipe joints. The joint surfaces for PVC plastic pipe and fittings to be solvent welded shall be prepared with a primer conforming to ASTM F 656. PVC plastic pipe joints shall be solvent welded in accordance with the pipe manufacturer's instructions with solvent cement conforming to ASTM D 2564.

AF103.16 Support. Above ground piping shall be supported by the structure of the building using hangers or strapping designed for piping support. Supports for horizontal piping shall be installed at intervals not exceeding 4 feet [1219 mm] and supports for vertical piping shall be installed at intervals not exceeding 10 feet [3048 mm].

AF103.17 Protection against physical damage. Where pipes penetrate top or bottom plates of stud walls and the nearest edge of the hole is within 1 ½ inches [38 mm] of the face of the member, the pipe shall be protected by steel shield plates. Such shield plates shall have a thickness of not less than 0.0575 inches [1.463 mm] (No. 16 gage). Such plates shall cover the area of the pipe where the plate is bored, and shall extend not less than 2 inches [51 mm] above bottom plates and not less than 2 inches [51 mm] below top plates.

AF103.18 Insulation required. In spaces where *mitigation system* piping is subject to freezing temperatures and in spaces where the exterior of *mitigation system* piping is subject to the formation of condensation, such piping shall be provided with insulation having an external vapor barrier and an R-value of not less than 1.8.

AF103.19 Labels required (piping). *Mitigation system* piping shall be marked prior to the closing of wall cavities with not less than one label at each floor level and at intervals not greater than 10 feet [3048 mm] along the developed length of the piping. The label shall identify that the item is a component of a *radon* reduction system. The label lettering shall be not less than 1/4 inch [6.35 mm] in height and shall be of a color that contrasts with the color of the background on which the lettering is applied.

AF103.20 Mitigation system termination. The discharge point of a *mitigation system* shall be to the outdoors and shall be directed vertically upward.

AF103.21 Elevation and vertical walls. The point of discharge of a *mitigation system* shall comply with all of the following:

1. It shall be not less than 1 foot [305 mm] above the roof at the point penetrated.
2. It shall be not less than 10 feet [3048 mm] above grade nearest the point of discharge.
3. It shall be not less than 10 feet [3048 mm] horizontally from a vertical wall that extends above the roof penetrated.

AF103.22 Windows and doors. The discharge point of a *mitigation system* shall be not less than 2 feet [610 mm] above or not less than 10 feet [3048 mm] from windows, doors or other gravity intake openings into the structure or an adjacent structure excluding attic ventilation openings. The 10 foot [3048 mm] distance shall be measured around intervening obstacles.

AF103.23 Equipment air intake. The discharge point of a *mitigation system* shall be not less than 3 feet [914 mm] above or 10 feet [3048 mm] away from mechanical air intake openings such, but not limited to, those for evaporative coolers, make-up air, and heat energy recovery ventilators. The 10 foot [3048 mm] distance shall be measured around intervening obstacles.

AF103.24 Provision for Active Soil Depressurization (ASD) fan. A space having a vertical height of not less than 48 inches [1219 mm] and a diameter of not less than 21 inches [533 mm] shall be provided in the area where a required *ASD fan* will be installed. The space provided for the *ASD fan* shall be located in accordance with AF103.35. The *ASD* pipe shall be centered in this space.

AF103.25 Electrical. A receptacle outlet supplied by branch circuit conductors shall be located within 6 feet [1.8 m] of an interior *ASD fan* location

AF103.25.1 Label. The over-current device for the branch circuit supplying *ASD fans* shall be labeled to indicate that it supplies the *radon* fan.

AF103.25.2 Disconnect required. Where the fan is not cord and plug connected, a means of electrical disconnect shall be provided for and in sight of the *ASD fan*. The electrical disconnect shall be labeled to indicate its purpose.

AF103.26 Fan access. Limited *access* shall be provided for each *ASD fan* location to allow installation of *ASD fans* and replacement of same. *Access* entry shall be located not more than 20 feet [6096 mm] from the *ASD fan* location.

AF103.27 Radon test kit required. Not less than one long term *radon*-in-air test kit from a *certified* or *licensed* laboratory shall be provided for the occupants of each dwelling unit.

AF103.28 Completion of ASD system. Prior to occupancy, the *ASD* system shall be completed and activated in accordance with Sections AF103.30 through AF103.41.

> **Exception:** Where prior to occupancy, testing in accordance with Section AF103.41 indicates that the building has a *radon* level below the *National Radon Action Level* (*NRAL*) and the *Rough-In* piping is labeled in accordance with Section AF103.29.

AF103.29 Labels required, system *Rough-In*. *Mitigation system* piping shall be marked with not less than one label in a conspicuous location. An additional label shall be placed on or within 12 inches [305 mm] of the electrical service panel. The labels shall state the following: **"**This radon system is nonfunctional because the system has NOT been activated with a radon fan. The building should be tested for radon at least every 2 years or as recommended by the state or USEPA." The label lettering shall be of a height of not less than 1/4 inch [6.35 mm] and shall be of a color that contrasts with the color of the background on which the lettering is applied.

AF103.30 Fan selection. Fans installed in the *ASD* system shall be recommended by the manufacturer for *radon* mitigation. Such fans shall be designed and sealed by the manufacturer to minimize leakage of water or *soil gas* from the fan housing and shall be sized in accordance with Table AF103.33 or as specified by a *certified* or *licensed radon mitigator*.

TABLE AF103.30
FAN SIZING

PIPE SIZE Nominal (I.D.)	TOTAL FOUNDATION AREA		
	Less Than 1600 sq. feet	**1600 to 2500 sq. feet**	**Greater than 2500 sq. feet**
	Less Than 149 sq. meters	**149 to 232 sq. meters**	**Greater than 232 sq. meters**
(3 inch) [76 mm]	Use Radon Fan Type: **RF1** RF1 Minimum rating:[a] 50 cfm @ 0.5 in. WC [85m^3/hr @ 125 Pa]	Use Radon Fan Type: **RF2** RF2 Minimum rating:[a] 75 cfm @ 1.0 in. WC [127m^3/hr @ 250 Pa]	*Radon* fan to be sized by *certified* and/or *licensed radon mitigator*
(4 inch) [102 mm]	Use Radon Fan Type: **RF1** RF1 Minimum rating:[a] 50 cfm @ 0.5 in. WC [85m^3/hr @ 125 Pa]	Use Radon Fan Type: **RF1** RF1 Minimum rating:[a] 50 cfm @ 0.5 in. WC [85m^3/hr @ 125 Pa]	*Radon* fan to be sized by *certified* and/or *licensed radon mitigator*

a. Radon Fan Types RF1 & RF2 minimum flow and pressure ratings are manufacturer specifications.

AF103.31 Orientation. *ASD* inline fans shall be installed only on vertical *ASD* piping.

AF103.32 Installation. *ASD fans* shall be installed in accordance with the manufacturer's instructions.

AF103.33 Flexible connectors required. *ASD fans* shall be connected to the *ASD* piping using flexible unshielded couplings complying with ASTM D5926 or ASTM C1173 or an equivalent method. Connections shall be air and water-tight.

AF103.34 Fan start-up. *ASD fans* shall be electrically energized upon installation on the *ASD* system piping.

AF103.35 Fan location. *ASD fans* shall be installed only outdoors, in attics or in garages that are not beneath conditioned spaces. *ASD fans* shall not be installed below ground, in conditioned spaces, in occupiable spaces of a building or in any basement, crawlspace or other interior location that is directly beneath a conditioned or occupiable space of a building. *ASD fans* shall not be mounted in any location where pipe that is positively pressurized by the fan is located inside of conditioned or occupiable space.

AF103.36 System monitor required. Each *ASD* system shall be provided with a system negative pressure monitor such as, but not limited to, a manometer type pressure gauge to indicate system operation. The system monitor shall be located indoors in an area where the monitor is readily observable by the occupants.

AF103.37 Startup marking. *ASD* system monitors shall be clearly marked to indicate the pressure that existed when the system was initially activated. The monitor device shall have a durable label on or in close proximity to it that describes how to interpret the monitor and what to do if the monitor indicates that system performance has degraded.

AF103.38 Automatic reset. Pressure activated electrical *ASD* system monitors, whether visual or audible, shall be supplied by un-switched electrical branch circuits and shall be designed to reset automatically when power is restored after power supply failure. Battery operated monitoring devices shall not be used except where they are equipped with a low power warning feature.

AF103.39 Labels required (system and sump). System description labels made of durable material shall be placed on or within 12 inches [30 cm] of the electric service panel and also on the *ASD* system or other prominent location. The lettering on the label shall be not less than 1/4 inch [6.35 mm] in height and shall be of a color that contrasts with the color of the background on which the lettering is applied. The label shall state the following: "Radon Reduction System;" the installer's name, phone number, and applicable certification identification; date of installation, an advisory stating that the building should be tested for *radon* at least every 2 years or as required or recommended by state or federal agencies. and shall include notice of additional *radon* resources at www.epa.gov/radon and the *radon* hotline 1-800-SOS-RADON (767-7236).

AF103.39.1 Label sump basins. Sump basin covers shall be identified with a durable label that reads as follows: "Component of a Radon Reduction System. Do not tamper with or disconnect." or equivalent wording. The lettering on the label shall be not less than 1/4 inch [6.35 mm] in height and shall be of a color that contrasts with the color of the background on which the lettering is applied.

AF103.40 Documentation package. The occupants of the dwelling shall be provided with a documentation package that includes the following:

1. A description of system operation, such as shown in Exhibit 1 "Understanding a Radon Reduction System".
2. All *radon* test data for the property.
3. The annual energy consumption of the installed *ASD fan*(s), whether estimated or actual, and the projected monetary cost of such energy.

AF103.41 Radon testing prior to occupancy. A *radon* test shall be performed prior to occupancy by a *certified* or *licensed* measurement professional. Testing shall be performed in accordance with applicable state protocols or requirements; or if there are no state protocols or requirements, with accepted Federal protocols or "Protocols for Radon Measurements in Homes", AARST Consortium on National Radon Standards. Where testing results are greater than the *NRAL*, a *certified* or *licensed mitigator* shall be required to perform *diagnostic tests* and remediation action. Further *radon* testing shall be required until *radon* concentrations below the *NRAL* are achieved.

AF103.42 EPA established zones. The *radon* potential of a building site shall be estimated from Figure AF103.42 or from Table AF103.42. Where state or local jurisdictions have published *radon* potential data, such data shall supersede the information in Figure AF103.42 and Table AF103.42.

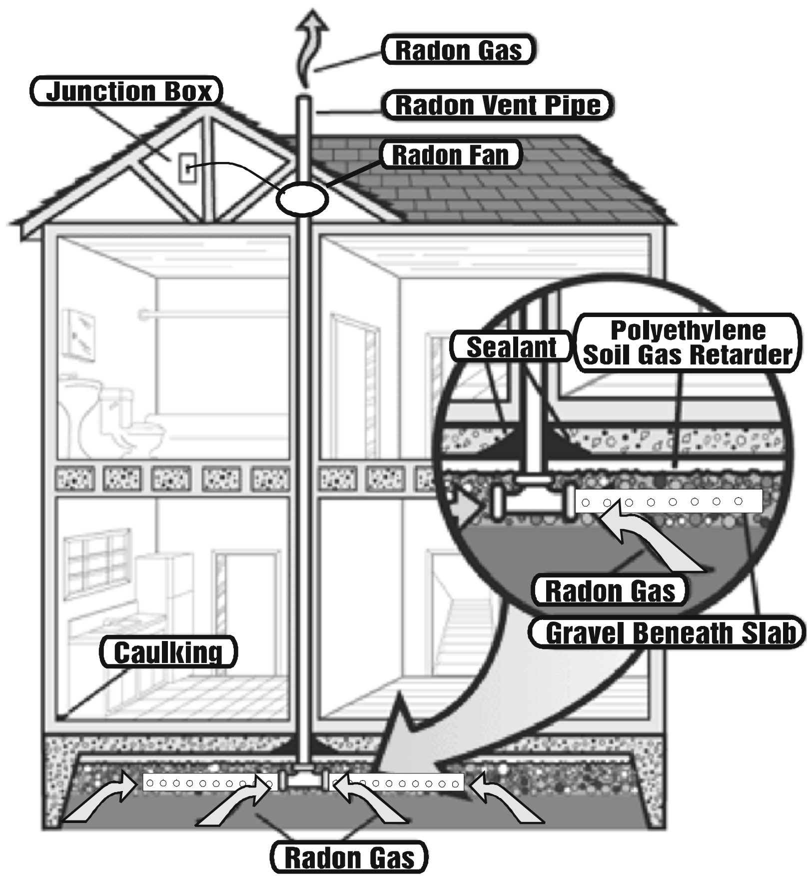
AF103.43: Exhibit 1 - Understanding a Radon Reduction System (Occupants)

General: *Radon* is a radioactive gas that has been found in homes all over the United States. It comes from the natural breakdown of uranium in soil, rock and water and gets into the air you breathe. The *radon* potential of any specific building lot is dependent on whether there is sufficient *radon* source material in the ground below the home and sufficient upward air movement for the *radon* to be near your home's foundation. *Radon* typically moves up through the ground to the air above and into your home through gaps and other holes in the foundation. The primary health concern associated with *radon* is lung cancer. The Environmental Protection Agency (EPA) estimates that 21,000 people die in the US each year from *radon*-induced lung cancer.

Radon Reduction System: Your new home was constructed with an *Active Subslab Depressurization* (*ASD*) System to protect your family's health. The *ASD* system is designed to limit *radon* entry into your home by keeping the soil under your home at a lower pressure than the air in your home. In doing so, *radon* and other *soil gases* from below your home are exhausted above your roof through a specially designed *radon* fan. An *ASD* system is recognized by the EPA as the Best Available Technology for *radon* control because it keeps much of the *radon* from entering your home. The system is designed to run 24 hours a day, 7 days a week. The electrical power required to run the fan, which is the only active component in the system, will typically cost 5 to 25 cents per day depending upon the type of fan and your electrical utility rates. Cost to operate this fan would be less than operating a normal light bulb.



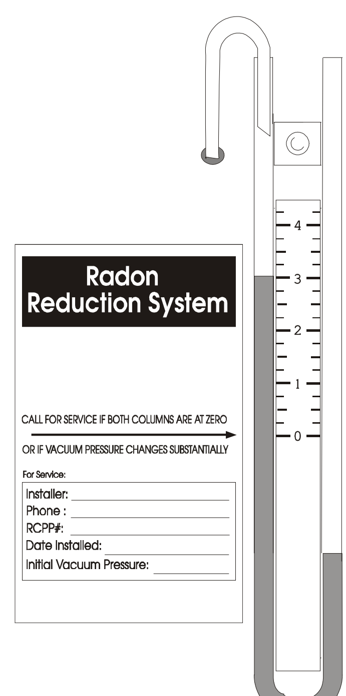
System Maintenance: Your *ASD* System is designed to provide many years of service under normal conditions without significant maintenance. As the occupant of this home, you need to routinely check the system pressure gauge or other system monitor to verify that the fan is operating correctly. There are various labeled components of your *radon* system such as pipe, crawlspace membrane, fan, system pressure monitor and sump basin. DO NOT ALTER OR DISCONNECT any of these components. If the sump basin is opened for required maintenance or repair, restore to the original condition immediately after completing work. You also need to be aware that foundation settling, renovations or additions to your home can change your indoor *radon* concentrations. A *certified/licensed radon mitigator* can provide guidance when changes are to be made to the *dwelling* or provide a routine check-up on the operation of the system.

Understanding the System Pressure Gauge: The pressure gauge shown on the right is typical of a gauge used to monitor the pressure developed in the piping system by the *radon* fan. Your fan pressure should be checked regularly to ensure the fan system continues to operate properly. This gauge measures pressure in Inches Water Column (in. WC). This gauge does NOT measure *radon*.

Call for service if the measure changes substantially (20% or more) or if the gauge reads zero pressure (both columns equal).

Your *ASD* system may have an audible alarm to alert you to call for service in the event of a problem.

Radon Testing: Your builder left behind a long term test kit for you to use to test your home after you move in. The way you and your family live in your new home, how you set heating and cooling controls or use your clothes dryer and other exhaust fans can affect indoor *radon* levels. It is recommended that you test for a minimum of 3 months or preferably longer to determine your actual *radon* exposure in the home. Be sure to check the warranty your builder provides to make certain you complete your testing before the end of the new home warranty period.
Follow the instructions provided by the test laboratory to open, activate and place the test kit to test your *radon* levels.



The USEPA recommends that you retest your home at least every 2 years or if major renovations or additions are made to the *dwelling*.

Other sources of radon: *Radon* can also be found in the water from private wells. Testing can determine if your well contains significant amounts of *radon*.

More Info: For more information on *radon*, *radon* testing or *radon* removal: **www.epa.gov/radon**

NOTE: Exhibit 1 may be reprinted without license.

Add to Chapter 3 Bibliography as follows:

ASTM D5926-11 – "Standard Specification for Poly (Vinyl Chloride) (PVC) Gaskets for Drain, Waste, and Vent (DWV), Sewer, Sanitary, and Storm Plumbing Systems "
ASTM E1745-11 – "Standard Specification for Plastic Water Vapor Retarders Used in Contact with Soil or Granular Fill under Concrete Slabs"

Commenter's Reason: 21,000 Americans die each year from radon-induced lung cancer. The primary source of exposure to radon for the general public is the home. Geographical areas of the highest radon potential in the United States are located in EPA radon zones 1 & 2. More than 2 million homes being constructed in the US with elevated indoor radon concentrations in the past 25 years. Voluntary adoption of this Appendix can reduce the risk of radon exposure and prevent lung cancer.

The existing Appendix F of the IRC (Radon Control Methods) is inadequate and 20 years old. The proposal presented herein was developed as an ANSI consensus standard by the AARST Radon Standards Consortium. This standard, AARST/ANSI #CCAH-2013 *"Reducing Radon in New Construction of 1 & 2 Family Dwellings and Townhouses,"* was produced by a committee of (27) representing radon professionals, home inspectors, home builders, architects, code officials, consumer advocates and state and federal government.

The EPA estimates that 1 out of 15 of all homes in the US has elevated indoor radon levels. The incidence of elevated radon may be greater than 7 out of 10 homes in some high radon areas. Nonrandomized industry data shows a significant number of homes across the United States have tested high for elevated indoor radon concentrations. Builders of new homes will continue to add to the existing inventory of homes with elevated radon without changes in the residential code that address this important life/safety issue.

TOTALS		**1,834,775**		

Source: AARST radon industry test data; published 10/29/2012.

Cost Impact: This change proposal will slightly increase the cost of construction where adopted. Most homes can be built with only a mitigation system Rough-In. If the home tests high for elevated radon then the system can be upgraded with a fan to reduce the indoor radon levels.

Cost of mitigation system Rough-In (passive) =$296*

Cost of fan driven mitigation system = $707* (total cost, not in addition to $296)

Source: Annual Builder Practices Report 2011, NAHB Research Center, Inc.

The cost savings for reduced health care resulting from a healthier indoor environment has not been calculated.

RB462-13

Final Action: AS AM AMPC____ D

RB465-13

Appendix G, R324 (New), R324.1 (New)

Proposed Change as Submitted

Proponent: Kris Bridges, CBO, Chair, ICC Swimming Pool Code Drafting Committee (SPCDC)

Delete Appendix G in its entirety:

~~APPENDIX G~~
~~SWIMMING POOLS, SPAS AND HOT TUBS~~

Add new Section and new text as follows:

SECTION R324
SWIMMING POOLS, SPAS AND HOT TUBS

R324.1 General. The design and construction of aquatic vessels shall comply with the *International Swimming Pool and Spa Code*.

Reason: The drafting of the *International Swimming Pool and Spa Code* (ISPSC) started in October/2010 by the Swimming Pool Code Drafting Committee (SPCDC) which was established by the ICC Board of Directors, with the Association of Pool & Spa Professionals (APSP) as a Cooperating Sponsor. The SPCDC was a broad based committee representing a balance of interests composed of 15 individuals from public, private and nonprofit sectors with expertise in disciplines critical to the topics in the *International Swimming Pool and Spa Code*. The SPCDC was supported by four Work Groups composed of numerous interested parties and stakeholders.
The intent was to develop a comprehensive set of regulations for swimming pools and spas consistent and coordinated with the I-Codes. Technical content was developed from provisions from the International Codes and the applicable APSP standards. The APSP standards considered were:

- ANSI-1 2003 Public Swimming Pools
- ANSI-2 1999 Public Spas
- ANSI-3 1999 Permanent Residential Spas
- ANSI-4 2007 Aboveground/On-ground Residential Swimming Pools
- ANSI-5 2003 Residential In-ground Swimming Pools
- ANSI-6 1999 Portal Spas
- ANSI-7 2006 Suction Entrapment Avoidance
- ANSI-8 2005 Model Barrier Code
- ANSI-9 2005 Aquatic Recreational Facilities
- ANSI-11 2009 Standard for water quality in public swimming pools and spas

The SPCDC and its Work Groups comprehensively reviewed the requirements in the existing 2009 International Codes and the standards noted above in an effort to draft comprehensive language for pool and spa safety while at the same time making sure the language resulted in adoptable and enforceable I-Code language.
The SPCDC held three face-to-face drafting meetings and there were weekly work group conference calls. The drafting effort of the SBCDC culminated in Public Version 1.0 (PV 1.0) which was completed in February/2011.
Public Version 1.0 was then subjected to a full cycle of ICC Code Development in 2011 as follows:

- PV 1.0 posted for code change submittals on February 1, 2011
- 100 code changes were submitted
- The ISPSC code committee comprised of both SBCDC members and new members acted on the code changes at the 2011 Code Development Hearings held May 16, 2011 in Dallas.
- Public comments were submitted on 22 of the code changes and were acted on by the ICC membership at the 2011 Final Action Hearings held October 31, 2011 in Phoenix
- The 2012 International Swimming Pool and Spa Code is published.

The ISPSC uses the term “aquatic vessels” to cover all types of vessels including pools, water parks, spas and hot tubs. This proposal is limited to the use and application of vessels under the IRC, including pools, spas and hot tubs. The ISPSC provisions comprehensively address all aspects of such vessels including;

- Administration and Definitions

- Construction features for pools including size and depth, wall and floor construction, and calculation of bather occupant load
- Safety features such as barriers to pool entry, depth markers and throwing ropes
- Mechanical, plumbing and electrical provisions
- Equipment such as suction entrapment avoidance, circulation, filters, pumps and motors, skimmers, heaters, return and suction fittings
- Appurtenances such as ladders and diving equipment

The ISPSC covers both residential and public aquatic vessels. A similar proposal was submitted to Section 3109 of the IBC in Group A 2012 (G193 Part I). The committee action was AM. The final action was D.

Cost Impact: This code change proposal will not increase the cost of construction.

APPENDIX G-RB-BRIDGES.doc

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: This change is appropriate and provides a pointer to the ISPSC. The proponent should work with the opponents to resolve the questions about the pool deck interface and bring back a public comment.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Matt Archer, City of Lone Tree, representing Colorado Chapter ICC, requests Disapproval.

Commenter's Reason: This proposal broke the most cardinal rule of the IRC, everything you need to build a house is in one book. If the SPCDC wants these requirements in the IRC they should include them individually, not by reference.
Second, this proposal moved an appendix which talks about flood ways and barriers to the body of the code and THEN replaced it with a whole host of new requirements:

Additional administration section
Mechanical, plumbing and electrical provisions
Ladders and diving equipment
Pool construction
Calculation of occupant loads
Throwing ropes
New decking requirements
And on and on….

This change went too far too fast without proper vetting of all the details the SPCDC wanted to add to the IRC.

Public Comment 2:

Glenn Mathewson, MCP, City of Westminster, Colorado, representing North American Deck and Railing Association, requests Disapproval.

Commenter's Reason: Eliminating Appendix G and referencing the Swimming Pool and Spa Code will have negative affects on code administration and the decking industry.

Eliminates the option of separately adopting pool and spa provisions in the appendix from general residential construction provisions in the body of the IRC:

Unlike other common construction features throughout the IRC, swimming pools and spas are specialized, and they're only installed in a limited percentage of homes in many regions of the county. Locally, there can be some controversy over the building code regulating prefabricated and kit pools and spas, as in a consumer protection agenda. Many jurisdictions do not wish to regulate the filling of a 30-inch deep flexible plastic pool with an inflatable ring. If they did, they'd likely only look at the security barrier…the one that can be adopted by choice with Appendix G and found conveniently in the IRC. Maintaining pool and spa provisions in the appendix chapter allows more flexibility in governmental code adoption.

Makes the security barrier provisions most referenced by local code administrators and general contractors much more inaccessible:

Including excerpts from specialized standards within the appendix makes those standards accessible and affordable for widespread use and application. For the average code administrator, they are not capable of enforcing fine details of swimming pool and spa construction, either from a lack of knowledge or lack of resources. Specialized pool contractors and spa manufacturers stay on top of these standards. Where the appendix is adopted, code administrators are able to easily access the information these contractors are not generally knowledgeable in, such as the security barrier. Removing the security barrier provisions from the IRC forces administrators to reference and purchase an additional document, the ISPSC, thus raising the cost to maintain access to provisions they once possessed.

Expanded subject matter in the ISPSC, beyond the standards currently referenced in Appendix G, was not fully vetted by industry and will blindside local jurisdictions and contractors with regulation they were not prepared for or agreeable to:

The ISPSC section 306 provides very specific provisions for wood and composite decks adjacent to pools and spas. These new provisions are not common practice in either the deck industry or code administration. By replacing the provisions and references within Appendix G with a blanket reference to the ISPSC, considerably controversial provisions NOT accepted by or developed with the decking industry, will be newly required. A 15 minute video explaining these provisions is available at www.deckcodes.com. These brand new provisions for decking around pools and hot tubs should not become a reference from the IRC without further industry wide knowledge, contribution and approval. The reference to the pool and spa code is not an even swap with Appendix G. The ISPSC is brand new and is not widely adopted across the nation. This code should be fully vetted and proven successful as a standard before becoming tied to the IRC.

With a disapproval vote, code adoption and enforcement can be flexible to the needs of each jurisdiction. The following are examples of such variety:

1. A jurisdiction **does not** want to regulate pools and spas at the local level: They choose not to adopt Appendix G. Installers and manufacturers are still expected to follow Federal regulations and standards.
2. A jurisdiction **does** want to regulate pools and spas at the local level, and they intend to inspect security barriers: They choose to adopt appendix G. They get easy access to security barrier provisions and the installers and manufacturers are still expected to follow the requirements in the referenced standards and any Federal regulations.
3. A jurisdiction **does** want to regulate pools and spas at the local level and wishes to be very knowledgeable on the subject. They like having lots of codebooks on their shelves and in their budget. They choose not to adopt appendix G but they do adopt the ISPSC and purchase the reference to the security barrier and other information. Prior to adoption of the ISPSC, they will likely review it. At that time, they may decide they do not agree with the heavy-handed provisions for composite and wood decks around pools and hot tubs.

This commenter encourages the proponent of this proposal to consider a future proposal where architectural and general provisions from the ISPSC that are most likely to be administered at the local level are referenced in Appendix G. Perhaps similar to how the IFGC provisions are referenced in brackets.

RB465-13

Final Action: AS AM AMPC____ D

RB467-13
Appendix J

Proposed Change as Submitted

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee (cbaldassarra@rjagroup.com)

Revise as follows:

AJ102.4 Replacement windows and replacement safety glazing. Regardless of the category of work, when an existing window, including the sash and glazed portion, or safety glazing is replaced, the replacement window or safety glazing shall comply with the following requirements as applicable: ~~of Chapter 11.~~

AJ102.4.1 Energy efficiency. Replacement windows shall comply with the requirements of Chapter 11.

AJ102.4.2 Safety glazing. Replacement glazing in hazardous locations shall comply with the safety glazing requirements of Section R308.

AJ102.4.3 Emergency escape and rescue openings. Where windows are required to provide *emergency escape and rescue openings*, replacement windows shall be exempt from the maximum sill height requirements of Sections R310.1 and the requirements of Sections R310.1.1, R310.1.2, R310.1.3 and R310.2 provided the replacement window meets the following conditions:

1. The replacement window is the manufacturer's largest standard size window that will fit within the existing frame or existing rough opening. The replacement window shall be permitted to be of the same operating style as the existing window or a style that provides for an equal or greater window opening area than the existing window.
2. The replacement window is not part of a change of occupancy.
3. Window opening control devices complying with ASTM F 2090 shall be permitted for use on windows required to provide *emergency escape and rescue openings.*

AJ102.4.4 Window control devices. Where window fall prevention devices complying with ASTM F2090 are not provided, window opening control devices complying with ASTM F 2090 shall be installed where an existing window is replaced and where all the following apply to the replacement window:

1. The window is operable;
2. The window replacement includes replacement of the sash and the frame;
3. The top of the sill of the window opening is at a height less than 24 inches (610 mm) above the finished floor;
4. The window will permit openings that will allow passage of a 4-inch diameter (102 mm) sphere when the window is in its largest opened position; and,
5. The vertical distance from the top of the sill of the window opening to the finished grade or other surface below, on the exterior of the building, is greater than 72 inches (1829 mm).

The window opening control device, after operation to release the control device allowing the window to fully open, shall not reduce the minimum net clear opening area of the window unit.

~~**AJ301.3 Safety glazing.** Replacement glazing in hazardous locations shall comply with the safety glazing requirements of Section R308.1.~~

Reason: This proposed change is a result of the CTC's investigation of the area of study entitled "Child Window Safety". The scope of the activity is noted as:

To evaluate the necessity of developing code proposals for the inclusion of requirements dealing with the conditions, circumstances and devices for window safety which could reduce the number of falls by children to surfaces below.

The purpose of this proposal is to coordinate the existing building provisions of the IRC with the changes approved to the IBC/IEBC in the 2012 Group A cycle. Code changes G225-12 and G227-12 were approved as modified by public comment to revise Section 3407 of the IBC (IEBC Section 406 – see below). In addition, Code change G201-12 last cycle removed the existing building provisions from Chapter 34 of the IBC in favor of a reference to the IEBC. This action was subsequently affirmed by the ICC Board as this was a code change related to I-Code scoping.

The format/terminology of Appendix J in the IRC is a bit different than the approach in the IEBC. However, Section AJ102 stipulates that the provisions of the section are applicable to all categories of work. It is for this reason that the provisions have been comprehensively located in AJ102 versus the sections that deal with the different categories of work (ie repairs in AJ301; renovations in AJ401; and alterations in AJ501.

For reference, the approved IEBC text is as follows:

IEBC SECTION 406
GLASS REPLACEMENT AND REPLACEMENT WINDOWS

406.1 Replacement glass. *The installation or replacement of glass shall be as required for new installations.*

406.2 Replacement Window Opening Control Devices. *In Group R-2 or R-3 buildings containing dwelling units, window opening control devices complying with ASTM F2090 shall be installed where an existing window is replaced and where all the following apply to the replacement window:*

1. *The window is operable;*
2. *The window replacement includes replacement of the sash and the frame;*
3. *The top of the sill of the window opening is at a height less than 36 inches (915 mm) above the finished floor;*
4. *The window will permit openings that will allow passage of a 4-inch diameter (102 mm) sphere when the window is in its largest opened position; and*
5. *The vertical distance from the top of the sill of the window opening to the finished grade or other surface below, on the exterior of the building, is greater than 72 inches (1829 mm).*

The window opening control device, after operation to release the control device allowing the window to fully open, shall not reduce the minimum net clear opening area of the window unit to less than the area required by Section 1029.2.

Exceptions:

1. *Operable windows where the top of the sill of the window opening is located more than 75 feet (22.86 m) above the finished grade or other surface below, on the exterior of the room, space or building, and that are provided with window fall prevention devices that comply with ASTM F 2006.*
2. *Operable windows with openings that are provided with window fall prevention devices that comply with ASTM F2090.*

406.3 Replacement Window Emergency Escape and Rescue Openings. *Where windows are required to provide emergency escape and rescue openings in Group R-2 and R-3 occupancies, replacement windows shall be exempt from the requirements of Sections 1029.2, 1029.3 and 1029.5 provided the replacement window meets the following conditions:*

1. *The replacement window is the manufacturer's largest standard size window that will fit within the existing frame or existing rough opening. The replacement window shall be permitted to be of the same operating style as the existing window or a style that provides for an equal or greater window opening area than the existing window.*
2. *The replacement of the window is not part of a change of occupancy.*

This proposal is submitted by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as “areas of study”. Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/CTC/Pages/default.aspx. Since its inception in April/2005, the CTC has held twenty-five meetings - all open to the public. In 2012, three of the 25 face-to face meetings were held. In addition to the CTC meetings, the CTC established Study Groups (SG) of interested parties for each of the areas of study. These SG’s are responsible for reviewing the available information and making recommendations to the CTC. All totaled, the SG’s held over 70 conference calls in 2012.

Cost Impact: This code change proposal will not increase the cost of construction.

AJ102.4-RB-BALDASSARRA-CTC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Approval was based upon the proponent's published reason. The proponent should bring back a public comment to address the committee's concern about the largest standard window size.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

J. William Degnan, President, representing National Association of State Fire Marshals, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

~~**AJ102.4.3 Emergency escape and rescue openings**. Where windows are required to provide *emergency escape and rescue openings*, replacement windows shall be exempt from the maximum sill height requirements of Sections R310.1 and the requirements of Sections R310.1.1, R310.1.2, R310.1.3 and R310.2 provided the replacement window meets the following conditions:~~

1. ~~The replacement window is the manufacturer's largest standard size window that will fit within the existing frame or existing rough opening. The replacement window shall be permitted to be of the same operating style as the existing window or a style that provides for an equal or greater window opening area than the existing window.~~
2. ~~The replacement window is not part of a change of occupancy.~~
3. ~~Window opening control devices complying with ASTM F 2090 shall be permitted for use on windows required to provide *emergency escape and rescue openings.*~~

(Renumber subsequent sections)

(Portions of proposal not shown remain unchanged)

Commenter's Reason: The purpose of this Comment is to delete the Exceptions for increases to maximum sill heights for replacement windows. It is also intended to retain the requirements for maximum sill heights for emergency escape openings as currently stated in other Code provisions.

The sill heights for openings utilized as emergency escape for occupants of residential spaces, as well as for emergency access by first responders, play a critical role in the emergency escape from fires. As stated, AJ 102.4.3 would provide no restriction for the sill heights for replacement windows along emergency escape routes from dwelling units. Even though a size criteria remains, access to the opening by occupants remains a primary consideration for the overall intended use of the escape opening, by both building occupants seeking escape from the fire and for fire service personnel seeking escape from untenable conditions. In addition, the lack of restriction of sill heights could present further restriction of fire department rescue operations from both inside and outside of the dwelling unit.

It is understood that the proponent was directed to address issues concerning the largest standard window size. It is the intent of this Comment that the maximum sill height issue also be considered in the overall approach to the use of these openings for both emergency escape and rescue.

RB467-13

Final Action: AS AM AMPC____ D

RM2-13
M1305.1

<u>Proposed Change as Submitted</u>

Proponent: David Hall CFM, Georgetown Texas representing the ICC PMG Code Action Committee (dave.hall@georgetown.org)

Revise as follows:

M1305.1 Appliance access for inspection service, repair and replacement. *Appliances* shall be accessible for inspection, service, repair and replacement without removing permanent construction, other *appliances*, or any other piping or ducts not connected to the *appliance* being inspected, serviced, repaired or replaced. A level working space at least 30 inches deep and 30 inches wide (762 mm by 762 mm) shall be provided in front of the control side to service an *appliance*. ~~Installation of room heaters shall be permitted with at least an 18-inch (457 mm) working space. A platform shall not be required for room heaters.~~

<u>**Exception:** The installation of room heaters shall comply with manufacturer's instructions.</u>

Reason: This revision is a simple text cleanup to eliminate permissive language and unclear text. The current next to last sentence says that room heaters are allowed to have a working space of 18 inches, but does not actually require that. What is an 18 inch work space? 18" x 18", 18" x 30" ?? The last sentence says that a platform is not required, yet nowhere in this section is a platform ever required. The working space is assumed to be the floor area. In the case of room heaters, it is simple to defer to the manufacturer's instructions for the required service access. This is generally not an issue anyway because room heaters are necessarily out in the open.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: The code change proposal will not increase the cost of construction.

M1305.1-RM-HALL-PMGCAC

<u>Committee Action Hearing Results</u>

Committee Action: **Approved as Submitted**

Committee Reason: Approval was based upon the proponent's published reason**.**

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Richard Grace, Fairfax County Government, representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA) and Virginia Building and Code Officials Association (VBCOA), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

M1305.1 Appliance access for inspection service, repair and replacement. *Appliances* shall be accessible for inspection, service, repair and replacement without removing permanent construction, other *appliances*, or any other piping or ducts not connected to the *appliance* being inspected, serviced, repaired or replaced. A level working space at least 30 inches deep and 30 inches wide (762 mm by 762 mm) shall be provided in front of the control side to service an *appliance*.

~~**Exception:** The installation of room heaters shall comply with manufacturer's instructions.~~

Commenter's Reason: The exception is redundant. M1410.1 already covers this. If we are to make an exception here directing the access for room heaters to meet the manufacturer's instructions, then we will need to do the same for radiant heating systems (M1406.1), duct heaters (M1407.1), vented floor furnaces (M1408.1) and so on and on.

RM2-13
Final Action: AS AM AMPC____ D

RM3-13
M1305.1.3.1

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown Texas representing the ICC PMG Code Action Committee (dave.hall@georgetown.org)

Revise as follows:

M1305.1.3.1 Electrical requirements. A luminaire controlled by a switch located at the required passageway opening and a receptacle outlet shall be installed at or near the *appliance* location in accordance with Chapter 39. Exposed lamps shall be protected from damage by location or lamp guards.

Reason: The typical lamp holder (fixture) used for attics and crawl spaces is a porcelain lamp holder with a naked incandescent lamp in it. It is often placed such that service personnel can impact it with their body, tools or materials. The result is broken glass, falling hot metal lamp filaments, possible lacerations, a shock hazard and sudden darkness to top it all off. The use of simple lamp cages/guards or locating the lamp holders out of harm's way will protect service personnel, which is the intent of this entire code section.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: The code change proposal will not increase the cost of construction.

M1305.1.3.1-RM-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Approval was based upon the proponent's published reason. No additional cost is involved to simply locate the lamp where impact is unlikely.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Dan Buuck, CBO, representing National Association of Home Builders (NAHB), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

M1305.1.3.1 Electrical requirements. A luminaire controlled by a switch located at the required passageway opening and a receptacle outlet shall be installed at or near the *appliance* location in accordance with Chapter 39. Exposed lamps shall be protected from damage by ~~location or~~ lamp guards or one of the following methods:

1. Exposed lamps shall not be located over the passageway access opening, the appliance, or the required passageway between the passageway access opening and the appliance.
2. Exposed lamps shall be located not less than 6 feet 8 inches above the walking surface of the passageway and above the passageway access opening..

Commenter's Reason: The language approved by the committee is very subjective and would lead to a lack of uniform enforcement. This public comment would solve that problem by defining the space where lamp guards are required. This will aid enforcement and simplify compliance by removing any ambiguity for the code official and the installer.

RM3-13

Final Action: AS AM AMPC____ D

RM4-13
M1305.1.4.3

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown Texas representing the ICC PMG Code Action Committee (dave.hall@georgetown.org)

Revise as follows:

M1305.1.4.3 Electrical requirements. A luminaire controlled by a switch located at the required passageway opening and a receptacle outlet shall be installed at or near the *appliance* location in accordance with Chapter 39. <u>Exposed lamps shall be protected from damage by location or lamp guards.</u>

Reason: The typical lamp holder (fixture) used for attics and crawl spaces is a porcelain lamp holder with a naked incandescent lamp in it. It is often placed such that service personnel can impact it with their body, tools or materials. The result is broken glass, falling hot metal lamp filaments, possible lacerations, a shock hazard and sudden darkness to top it all off. The use of simple lamp cages/guards or locating the lamp holders out of harm's way will protect service personnel, which is the intent of this entire code section.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. RM8-13
M1308.1, M1308.2.1 (New), M1308.2.2 (New), M1308.2.3 (New)

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown Texas representing the ICC PMG Code Action Committee (dave.hall@georgetown.org)

Revise as follows:

M1308.1 Protection against physical damage. ~~In concealed locations where *piping*, other than cast iron or galvanized steel, is installed through holes or notches in studs, joists, rafters or similar members less than 1-1/2 inches (38 mm) from the nearest edge of the member, the pipe shall be protected by steel shield plates. Such shield plates shall have a thickness of not less than 0.0575 inch (1.463 mm) (No. 16 gage). Such plates shall cover the area of the pipe where the member is notched or bored and shall extend not less than 2 inches (51 mm) above sole plates and below top plates.~~ Where piping will be concealed within light-frame construction assemblies, the piping shall be protected against penetration by fasteners in accordance with Sections M1308.2.1 through M1308.2.3.

Exception: Cast iron piping and galvanized steel piping shall not be required to be protected.

Add new text as follows:

M1308.2.1 Piping through bored holes or notches. Where *piping* is installed through holes or notches in framing members and the piping is located less than 1 ½ inches (38 mm) from the framing member face to which wall, ceiling or floor membranes will be attached, the pipe shall be protected by shield plates that cover the width of the pipe and the framing member and that extend 2 inches (51 mm) to each side of the framing member. Where the framing member that the piping passes through is a bottom plate, bottom track, top plate or top track, the shield plates shall cover the framing member and extend 2 inches (51 mm) above the bottom framing member and 2 inches (51 mm) below the top framing member.

M1308.2.2 Piping in other locations. Where the piping is located within a framing member and is less than 1 ½ inches (38 mm) from the framing member face to which wall, ceiling or floor membranes will be attached, the piping shall be protected by shield plates that cover the width and length of the piping. Where the piping is located outside of a framing member and is located less than 1 ½ inches (38 mm) from the nearest edge of the face of the framing member to which the membrane will be attached, the piping shall be protected by shield plates that cover the width and length of the piping.

M1308.2.3 Shield plates. Shield plates shall be of steel material having a thickness of not less than 0.0575 inch (1.463 mm) (No. 16 gage).

Reason: This proposal was approved for the 2015 IFGC. This proposal provides clear requirements for where shield plates are needed. Section M1308.1 uses the term “light frame construction assemblies” to describe wall, floor and roof assembles that can be made up from either wood members or light frame, cold formed steel members.

Section M1308.2.1 covers applications where piping runs perpendicular to a framing member and passes through a bored hole or notch in the framing member. This text is nearly the same as what is currently in the IRC. If the piping is within 1 ½ inches of the face of the member where wall, ceiling or floor membranes will be attached, then the piping is required to be protected by a shield plate that covers the width of the piping by the width of the framing member plus 2 inches on either side of the framing member. Protection of the piping on either side of the framing member is needed because it is too easy for a membrane/fastener installer to miss the framing member’s fastening face or penetrate the member at an angle and hit the piping that is just outside of the framing member. Section M1308.2.1 also covers the application where piping runs perpendicular to and penetrates top and bottom plates, or top and bottom tracks. Protection of the piping above the bottom framing member (or below the top framing member) is needed because it is too easy for a membrane/fastener installer to miss the framing member’s fastening face or penetrate the member at an angle and hit the piping just outside of the framing member. The code fails to address the situation where piping is run within the C-channel of a metal stud or joist and it also fails to address piping run parallel to a framing member.

Section M1308.2.2 covers applications where the piping runs alongside of a framing member or in the case of a light frame, cold formed steel framing member, piping that runs parallel to the length of and within the framing member (in other words, within the channel section). If the piping is within 1 ½ inches of the face of the member where wall, ceiling or floor membranes will be attached, then the piping is required to be protected by a shield pate that covers the width of the piping by the length of piping that is within the 1 ½ inch proximity of the framing member's fastening face. Piping that is located behind the fastening face of the member and within 1 ½ inches of the fastening face of the member obviously needs protection from fastener penetration. Piping that is located adjacent to and within 1 ½ inches of the fastening face of the member needs protection because it is too easy for a membrane/fastener installer to miss the framing member's fastening face or penetrate the member at an angle and hit the piping that is just outside of the framing member. A similar requirement in Section E3802.1 applies to wiring run parallel to framing members.

The opposition to this proposal for the IPC was related to the requirement to protect the length of piping that is run parallel to a framing member and less than 1 ½ inches from the member face to which wall board will be screwed or nailed. The concern was expressed that it would be difficult to protect the pipe for its full length, making the assumption that the pipe ran from the bottom plate up through the top plate in walls. First of all, it is unlikely that an installer would install piping from plate to plate that close to the stud, since it would be nearly impossible to drill holes that close to the stud. Secondly, the obvious way to avoid installing protection for the pipe is to simply keep it at least 1 ½ inches away from the framing member. With a little planning, the installation of pipe protection could be easily avoided.

The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: The code change proposal will increase the cost of construction.

M1308.1-RM-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: Approved as Submitted

Committee Reason: Approval was based upon the proponent's published reason. The proposal will provide protection for refrigeration piping in walls.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Michael Cudahy, representing Plastic Pipe and Fitting Association (PPFA) , requests Disapproval.

Commenter's Reason: This change could have serious negative implications, including requiring extensive shielding for floor, wall, and ceiling radiant heating systems based on hydronic tubing in residential construction. The proposal will increase cost of construction and the level of hazard found in the fuel gas code, which does have shielding requirements, is far greater compared with hydronic systems found in the mechanical code. Urge disapproval.

Public Comment 2:

Richard Grace, Fairfax County Government, representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA) and Virginia Building and Code Officials Association (VBCOA), requests Disapproval.

Commenter's Reason: The protection requirements contained within this code text is overly aggressive. A basic example of this would be having a 2" hydronic pipe installed vertical, secured to a 2 x 4 stud. If this pipe extended the full distance of the 8' stud, a shield plate will have to be installed the entire length of the stud, on both sides of the stud, extending out beyond the hydronic pipe; or a shield plate that will measure at least 8' x 4". This leaves no area to attach a wall membrane.

This same proposal was disapproved by IMC, IPC, and IFGC committees. More interesting, the same IRC-Plumbing and Mechanical committee that approved this proposal, previously <u>disapproved</u> the identical companion proposal RP13-13.

Public Comment 3:

Gary Kozan, CPD, Ridgeway Plumbing, representing Florida Association of Plumbing Heating Cooling Contractors, requests Disapproval.

Commenter's Reason: This proposal represents an unnecessary rewrite of existing text, and adds new requirements to protect every pipe that falls within 1-1/2 inches from a stud. There is no justification that residential refrigerant lines or condensate lines need more protection than currently provided. Identical proposals have been previously rejected by the IMC, IPC, and IRC-P committees. Let's maintain consistency by also disapproving in the IRC-M.

M1401.3

Proposed Change as Submitted

Proponent: Richard Grace, Fairfax County VA, representing The Virginia Plumbing and Mechanical Inspectors Association and the Virginia Building and Code Officials Association

Revise as follows:

M1401.3 Equipment/appliance Sizing. Heating and cooling equipment and appliances shall be sized in accordance with ACCA Manual S based on building loads calculated in accordance with ACCA Manual J or other approved heating and cooling calculation methodologies.

> **Exception:** Heating and cooling equipment and appliances shall not be limited to the capacities determined in accordance with Manual S where any of the following conditions apply:
>
> 1. The specified equipment or appliance utilizes multi-stage technology or variable refrigerant flow technology and the loads calculated in accordance with Manual J fall within the range of the manufacturer's published capacities for that equipment or appliance.
> 2. The specified equipment or appliance manufacturer's published capacities cannot satisfy both the total and sensible heat gains calculated in accordance with Manual J and the manufacturer's next larger standard size unit is specified.
> 3. The specified equipment or appliance is the lowest capacity unit available from the specified manufacturer.

Reason: Item 1 - Current technology is widely available that incorporates multi-stage or VRF systems for increased efficiency. Some of these appliances have such a wide span of functionality that they extend beyond the allowable requirements outlined in Manual S. However, this technology allows the appliance to operate between minimum and maximum capacities, based on loads imposed, thus eliminating the problems associated with single-stage, oversized appliances. Additionally, the appliance will operate efficiently during times where outdoor air temperatures exceed those used to calculate the loads in Manual J.

Item 2 - Often times, the appliance manufacturer's published total and sensible capacities are at odds with the requirements of Manual S. There are many cases where the total capacity of the appliance will fall within the parameters of Manual S in relation to the calculated total gain, however the sensible capacity of the appliance may fall short of the calculated sensible gain, thus unable to provide efficient sensible cooling for the space. When the manufacturer's next standard size larger is chosen to meet the sensible gain, the total capacity of the appliance may then exceed the requirements of Manual S. Choosing the larger appliance will enable a more efficient and effective system.

Item 3 - The current code language does not have provisions for sizing appliances for minimal dwelling unit or dwelling addition loads, other than forcing owners and contractors to change appliances to less desirable systems. For example; a 2 story townhouse, in climate zone 4, with 600 square feet per floor wants to utilize a two-zone system, or a separate heat pump system for each floor. A 1.5 ton unit per floor would exceed the requirements of Manual S, however a 1.5 ton unit could be the smallest available appliance made by the desired manufacturer. Current language would require a complete design change, such as utilizing a single appliance to serve the entire dwelling rather than the more desirable two-zone system, or requiring a system that utilizes electric baseboard heating and window-mounted air conditioning units. This is absurd, and an unfair to an owner that desires to reduce energy costs.

Cost Impact: none

M1401.3-RM-GRACE.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The text should be better defined with some calculations. The concept should be adapted for regional differences. The proposal should be reworked in a public comment.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Richard Grace, Fairfax County Government, representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA) and Virginia Building and Code Officials Association (VBCOA), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

M1401.3 Equipment/appliance Sizing. Heating and cooling equipment and appliances shall be sized in accordance with ACCA Manual S <u>or other approved sizing methodologies,</u> based on building loads calculated in accordance with ACCA Manual J or other approved heating and cooling calculation methodologies.

> **Exception:** Heating and cooling equipment and appliance~~s~~ <u>sizing</u> shall not be limited to the capacities determined in accordance with Manual S <u>or other approved sizing methodologies,</u> where either of the following conditions apply:
>
> 1. The specified equipment or appliance utilizes multi-stage technology or variable refrigerant flow technology and the loads calculated in accordance with ~~Manual J~~ <u>the approved heating and cooling calculation methodology</u> are within the range of the manufacturer's published capacities for that equipment or appliance.
> 2. The specified equipment or appliance manufacturer's published capacities cannot satisfy both the total and sensible heat gains calculated in accordance with ~~Manual J~~ <u>the approved heating and cooling calculation methodology</u> and the ~~manufacturer's~~ next larger standard size unit is specified.
> 3. ~~The specified equipment or appliance is the lowest capacity unit available from the specified manufacturer.~~

Commenter's Reason: After listening to the discussions presented during the Committee Action Hearings, we have incorporated those concerns within this modification. The first being the addition of "other approved sizing methodologies". ACCA's Manual S is not the ***only*** approved, appropriate sizing methodology available to size residential HVAC equipment. The current language would not permit other sizing methodologies such as ASHRAE's Handbook series. The second modification was to reword the language to provide clarity to the text. The third modification was to remove the third exception based on concerns voiced during testimony about the broad aspects that such an exception would permit.

The following is from the original reason statement:

Item 1 - Current technology is widely available that incorporates multi-stage or VRF systems for increased efficiency. Some of these appliances have such a wide span of functionality that they extend beyond the allowable requirements outlined in Manual S. However, this technology allows the appliance to operate between minimum and maximum capacities, based on loads imposed, thus eliminating the problems associated with single-stage, oversized appliances. Additionally, the appliance will operate efficiently during times where outdoor air temperatures exceed those used to calculate the loads in Manual J.

Item 2 - Often times, the appliance manufacturer's published total and sensible capacities are at odds with the requirements of Manual S. There are many cases where the total capacity of the appliance will fall within the parameters of Manual S in relation to the calculated total gain, however the sensible capacity of the appliance may fall short of the calculated sensible gain, thus unable to provide efficient sensible cooling for the space. When the manufacturer's next standard size larger is chosen to meet the sensible gain, the total capacity of the appliance may then exceed the requirements of Manual S. Choosing the larger appliance will enable a more efficient and effective system.

Public Comment 2:

Luis Romeo Escobar, representing ACCA (Air Conditioning Contractors of America), requests Disapproval.

Commenter's Reason: The proposed exceptions to ACCA Manual S should be disapproved for the following reasons:

1. Variable refrigerant flow (VRF) technology is addressed in the revised Manual S. The committee that led the revision effort included representatives of VRF manufacturers. The new Manual S over size limits have been vetted by these committee members and is based on the available OEM expanded performance data. ACCA is following ICC procedures to ensure that the updated Manual S is the one referenced in the 2015 IRC and IECC.
2. Exceptions #2 and #3 are not based on sound technical grounds, but instead are contrived to benefit sales of a particular product class. This is specifically against the entire intent of Manual S and exactly what the industry needs to get away from.
3. The cost impact of this proposed change is not "none" as indicated by the proponents. Larger-than-necessary equipment will generally have higher initial costs (longer pay-back), higher energy costs due to constant cycling on-and-off of the

equipment, shortened equipment lifespan (again, due to the wear-and-tear of constant cycling), and will have higher maintenance costs if the proponents' example of two oversized units for one house is the case (homeowners are generally charged based on the number of units being serviced).

4. In the reasoning for item 3 the proponents state that a homeowner will see reduced energy costs by installing two oversized units as opposed to one properly sized unit – this patently absurd and unsubstantiated. The proponents, unfortunately not unlike many design practitioners, seem to think that installing two units is the only way to properly zone a home, which is not the case.
5. The main reason why the industry has a standard to avoid oversizing is in order to ensure that there is proper humidity control in the home. Severely oversized equipment does not stay on long enough for the coil to reach a low enough temperature for adequate moisture removal. This can result in the presence of mold and mildew, not to mention lead to an uncomfortable interior ambience (the dry-bulb temperature will be low, but the humidity high so it will feel clammy to the occupant). Clearly, this proposal would in no way makes a home safer, but instead puts the occupants in greater risk of developing serious health issues from the presence of moisture.
6. Manual S is not a suggestion, as the proponents erroneously purport. It is an industry developed, ANSI recognized standard that sets clear oversize limits that must be adhered to. While the old Manual S did have permissive language that may not have been adequately addressed by the directions on the inside cover, great care has been taken to ensure that the normative sections of the new Manual S are written in mandatory, enforceable language that is acceptable for the i-codes. It will undergo a second ANSI public review, during which anyone (proponents included) may submit a comment to correct any deficiencies.
7. Any exceptions to Manual S should be based on industry research, and not on personal anecdote. To date, no credible research has been produced that supports the claim that hugely oversized HVAC equipment is desirable or leads to a safer, more sustainable, more affordable, or more resilient home.
8. For situations in which the OEM expanded performance data is not available, the new Manual S provides a path for compliance in which the manufacturer certifies that the equipment meets the home's physical requirements.
9. Manual S already has procedures that allow for regional differences (the comparison of heating degree days to cooling degree days for qualification of different heat pump sizing limits).
10. One common problem that is used as justification for gross oversizing is that the specified OEM doesn't offer equipment with small enough capacity for the load requirements. Unfortunately, this will continue to be that case as long as the Manual S requirements are not enforced. This proposal is effectively asks code officials to compensate for a lack of OEM product offerings, which is not the purpose of the building codes (in fact, it will serve as a catch 22 that will prolong the same problem).

RM9-13

Final Action: AS AM AMPC____ D

RM21-13
M1411.3.3 (New)

Proposed Change as Submitted

Proponents: David Hall CFM, Georgetown Texas representing the ICC PMG Code Action Committee (dave.hall@georgetown.org); Andrew Scott Jones, President, A Better Deal Heating and Air Conditioning, Inc., a Texas Corporation, representing himself.

Add new text as follows:

M1411.3.3 Drain Line Maintenance. Condensate drain lines shall be configured to permit the clearing of blockages and performance of maintenance without requiring the drain line to be cut.

Reason:
(Hall-PMGCAC): This new language was approved for the 2015 IMC. Drain line stoppages in evaporative coils drain pan drain lines are unavoidable and common occurrences requiring clearing the drain line. Clearing these lines almost always involves cutting the drain line itself, causing water to leak into the attic, crawlspace, closet, etc. The cut must be repaired by reconnecting the drain line with a PVC coupling and solvent cement.

This process exposes the surrounding area to water leakage and spilling with the risk of damage and mold, as well as the extra time and effort of carrying extra equipment, parts and flammable solvent. The repair process takes extra time and costs the homeowner more money.

(Jones): This language is identical to the language of M32-12 which was recently adopted in Portland, Oregon. We are advised by JB Engineering that this language will be in the IMC and IPC for 2015. There appears to be no reason not to accept this identical language in the IRC. Drain line stoppages in evaporative coils drain pan drain lines are unavoidable and common occurrences requiring clearing the drain line. Clearing these lines almost always involves cutting the drain line itself, causing water to leak into the attic or closet where the drain is located, possibly collected in a bucket or soaked up with rags or paper towels. Then the technician blows compressed air through the drain line in both directions from the cut. The cut must be repaired by resealing the drain line with a PVC coupling and solvent.

This process exposes the surrounding area to water leakage and spilling with the risk of damage, mold, spilling, as well as the extra time and effort of carrying extra equipment, parts and flammable solvent. The process takes extra time and costs the homeowner more money.

With a device that permits the introduction of compressed air or nitrogen directly into the drain system permitting clearing in both directions, there is no spillage of water, no cost for the couplings or solvent and no risk of water damage or mold. The entire process requires less than ten minutes.

Typically the cost of clearing a drain equipped with such a device is at least 50% less to the homeowner than the cost of clearing a blockage through the common method of cutting the pipe, attempting to collect the condensate water and repairing the cut in the drain line.

Each time a drain line is cleared though the cutting/repair process, the repair could be accomplished by installing a $15.00 line clearing device rather than a simple coupling. Drain lines can also be plumbed without installing a device at the time of installation.

Also, if clearing the drain lines were part of regular maintenance, line blockages could largely be prevented in the first place.

Cost Impact:
(Hall-PMGCAC): The code change will increase the cost of construction.

(Jones): The code change will increase the cost of construction, totaling an estimated $15.00 per unit.

M1411.3.3 (NEW)-RM-HALL-PMGCAC-JONES.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposal will increase the cost of construction and goes beyond the minimum code threshold. It is not costly to cut and repair the drain pipe. Cleanouts should be optional. Such drains can be cleaned from the terminal outlet end.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Andrew Scott Jones, A Better Deal Heating and Air Conditioning, Inc., representing self, requests Approval as Submitted.

Commenter's Reason: The Committee Stated in response to RM 21-13 that "The proposal will increase the cost of construction and goes beyond a minimum code threshold. It is not costly to cut and repair the drain pipe. Cleanouts should be optional. Such drains can be cleaned from the terminal outlet end." The comment incorrectly states that the terminal outlet end will work, as condensate drain lines need to be cleared in both directions. The new proposal can be complied with even without purchasing any piece of equipment, as the problem can be "plumbed around." There is a real problem with cutting clogged drain lines, as water can leak all over insulation, not to mention the time consumed in cutting, clearing the drain and repairing the cut with a collar. Eventually, the line will have to be replaced itself.

Drain line stoppages in evaporative coils drain pan drain lines are unavoidable and common occurrences requiring clearing the drain line. Clearing these lines almost always involves cutting the drain line itself, causing water to leak into the attic or closet where the drain is located, possibly collected in a bucket or soaked up with rags or paper towels. Then the technician blows compressed air through the drain line in both directions from the cut. The cut must be repaired by resealing the drain line with a PVC coupling and solvent.

This process exposes the surrounding area to water leakage and spilling with the risk of damage, mold, spilling, as well as, the extra time and effort of carrying extra equipment, parts and flammable solvent. The process takes extra time and costs the homeowner more money.

With a device that permits the introduction of compressed air or nitrogen directly into the drain system, permitting clearing in both directions, there is no spillage of water, no cost for the couplings or solvent and no risk of water damage or mold. The entire process requires less than ten minutes.

Typically the cost of clearing a drain equipped with such a device is at least 50% less to the homeowner than the cost of clearing a blockage through the common method of cutting the pipe, attempting to collect the condensate water and repairing the cut in the drain line.

Each time a drain line is cleared through the cutting/repair process, the repair could be accomplished by installing a $15.00 line clearing device rather than a simple coupling. Drain lines can also be plumbed without installing a device at the time of installation.

Also, if clearing the drain lines were part of regular maintenance, line blockages could largely be prevented in the first place

Public Comment 2:

Vickie Lovell, INTERCODE, INC., representing Rectorseal, requests Approval as Submitted.

Commenter's Reason: The proponent disagrees with the committee that cleanouts for condensate lines should be optional for the following reasons:

1. Committee stated that the proposal will increase the cost of construction. Proponent agrees. The cost of a manual cleanout costs the owner about $15.00 at the time of equipment installation. However, the cost of the damage from a leak often goes beyond the cost of the repair, especially if the leak is undetected for some time.
2. Committee stated that it is not costly to cut and repair the drain pipe. Proponent disagrees. To call a professional and pay for a service call and repair and any other damage to the interior spaces is not inexpensive in comparison to the price of cleanout installed with the equipment.
3. Committee stated that such drains can be cleaned from the terminal outlet end. Proponent disagrees. This may or may not be easily accomplished depending on accessibility. In in a multi-story home, or a large single story home where multiple air conditioning units are tied into a common condensate line, a clog in the disposal line will cause water to back up into the drain pans of a lower unit tied into the condensate disposal line. This will occur even if all units are equipped with water-level detection devices due to the fact that the equipment on the lower level will shut down due to a backup, but the equipment on the higher level will continue to operate until water reaches the water-level detection device at that level.

The code does not prohibit drain piping to be cut, but it should. When a line is cut, there is the risk of an ineffective repair which exposes the owner to another leak, more damage, and another repair. A manual cleanout installed at the time of the HVAC equipment is a far superior, nominal-cost alternative to cutting a drain line which allows for removal of the clog within the line without cutting the condensate line to do so. These common-sense devices provide visual inspection that allows for viewing of the check valve and the flow of condensate.

Public Comment 3:

Stuart Oakner, representing MSD Research, Inc., requests Approval as Submitted.

Commenter's Reason: Condensate drain lines that are cut in order to be cleared have no guidelines on how to be joined back together therefore creating a situation in which the drain line may not meet the original code requirements on drain line installations. Cutting condensate drain lines that are filled with water lead to water and mold damage as there is not always enough space to catch water when the line is cut. There is not always room to cut drain lines as the initial installation does not call for drain clearing access, this can lead to the reconfiguring of the drain line to gain access which could create a new drain line that does not meet the original code requirements.

The terminal outlet of drains is not always accessible and even when it is it can lead to severe water damage by having to blow back into the drain line toward the already filled unit drain pan. The code language approved in the fMC, M32-12 states: Condensate drain lines shall be configured to permit the clearing of blockages and performance of maintenance without requiring the drain line to be cut. Therefore this same language should be allowed in the IRC section RM21-13.

RM21-13

Final Action: AS AM AMPC____ D

RM22-13
M1411.4 (New)

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown Texas representing the ICC PMG Code Action Committee (dave.hall@georgetown.org); Guy McMann, Jefferson County Co., representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

Add new text as follows:

M1411.4 Condensate pumps. Condensate pumps located in uninhabitable spaces, such as attics and crawl spaces, shall be connected to the appliance or equipment served such that when the pump fails, the appliance or equipment will be prevented from operating. Pumps shall be installed in accordance with the manufacturer's instructions.

Reason:
(Hall-PMGCAC): Most condensate pumps are factory equipped with float switch controls for this purpose. This new text simply requires the switch to be utilized. Spaces such as attics and crawls are out of sight and out of mind, therefore condensate overflow will not be noticed until damage occurs. The overflow kill switch will shut off the equipment that produces the condensate before water damage can occur.

(McMann): This was approved in the Fuel Gas Code and the IMC. Pumps that are not connected in this fashion will permit the appliances to keep operating, spilling waste water where ever the appliance is located. When this condition continues over time, it could result in damage to building components or other property. This overflow condition may result in mold issues among other things. Most pump manufacturers already have this feature incorporated into the pump but the code does not require it to be connected. Damage as a result of not connecting this feature could prove to be very costly. This is not as much of a concern when appliances are readily accessible to occupants where leakage may be noticed in a timely manner.

Cost Impact: None

M1411.4 (NEW)-RM-HALL-PMGCAC-MCMANN.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposal could cause a heating system to shut off in freezing weather resulting in freeze damage to piping.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Vickie Lovell, INTERCODE, INC. representing Rectorseal requests Approval as Submitted.

Commenter's Reason: The reason for disapproval from the RM Committee is not satisfactory. They stated that the approval of this "proposal could cause a heating system to shut off in freezing weather resulting in freeze damage to piping."

In reality, freeze damage to piping in the winter can occur for numerous reasons unrelated to condensation overflow. So, to NOT connect a condensate pump to an appliance, including those appliances that come with a condensate pump as part of the original equipment, for a reason that may not even occur seems very short-sighted, especially in climates where a hard freeze is not likely or even impossible to occur.

Most of the content of the codes is intended to be proactive to specifically prevent all kinds of unsafe conditions or costly problems. Condensation overflow can result in both unsafe and costly problems. It is a solvable problem that equipment and component manufacturers have recognized and provided homeowners with a solution. To not address this in the code is puzzling.

This proposal already approved during the Group A hearings and final action for the 2015 International Mechanical and Fuel Gas Codes, should also be approved in the 2015 residential mechanical requirements.

Public Comment 2:

Shawn Strausbaugh of Arlington County, Virginia representing the ICC PMG Code Action Committee requests Approval as Submitted.

Commenter's Reason: This change is needed for consistency with the IMC and IFGC which will both contain this text in the 2015 editions. The committee recommended disapproval because of the concern that a failed pump might turn off a condensing furnace or boiler and cause the house to freeze if the occupants were away for extended periods. This section would apply only to appliances located in out of sight spaces where condensate spillage would go unnoticed. A condensate pump safety shutoff switch is just one of many controls that can shut down a heating system and therefore adds little additional risk. Section M1411.4 would apply to electric and oil fired appliances only because Chapter 24 covers gas appliances and Chapter 24 will duplicate the same provision that will be in the 2015 IFGC.

RM22-13
Final Action: AS AM AMPC____ D

RM27-13
M1501.2 (New)

Proposed Change as Submitted

Proponent: Dan Buuck, representing National Association of Home Builders (NAHB) (dbuuck@nahb.org)

Add text as follows:

M1501.2 Transfer air. Air transferred from occupiable spaces, other than kitchens, bathrooms and toilet rooms, shall not be prohibited from serving as makeup air for exhaust systems. Transfer openings between spaces shall be of the same cross-sectional area as the free area of the makeup air openings. Where louvers and grilles are installed, the required size of openings shall be based on the net free area of each opening. Where the design and free area of louvers and grilles are not known, it shall be assumed that wood louvers have 25-percent free area and metal louvers and grilles have 75-percent free area.

Reason: The IMC contains language allowing makeup air to be provided from areas other than the room where the exhaust system is located (transfer air). It is just as important to clarify the allowable use of transfer air for exhaust systems in the IRC as it is in the IMC. Without this provision, Section M1503.4 can be interpreted that the total amount of makeup air is required to be introduced in the direct vicinity of the exhaust. This is not required in commercial construction, and so the IRC should be brought into alignment with the IMC in this area.

Most of the language is taken from existing sections of the code. They include: Transfer air: IMC Section 403; Transfer openings: Section M1602 Item 6; and Louvers and grilles: Section G2407.10.

Cost Impact: The code change proposal will not increase the cost of construction.

M1501.2-RM-BUUCK.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposed text is difficult to comprehend. Calculations should have been submitted to illustrate. The intent to state that outdoor air can be delivered to other than the kitchen is not clear.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Dan Buuck, CBO, representing National Association of Home Builders (NAHB), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

~~**M1501.2 Transfer air.** Air transferred from occupiable spaces, other than kitchens, bathrooms and toilet rooms, shall not be prohibited from serving as makeup air for exhaust systems. Transfer openings between spaces shall be of the same cross-sectional area as the free area of the makeup air openings. Where louvers and grilles are installed, the required size of openings shall be based on the net free area of each opening. Where the design and free area of louvers and grilles are not known, it shall be assumed that wood louvers have 25-percent free area and metal louvers and grilles have 75-percent free area.~~

M1503.4.1 Location Kitchen exhaust makeup air shall be discharged into the same room in which the exhaust system is located or into rooms or *duct systems* that communicate through one or more permanent openings with the room in which such exhaust

<u>system is located. Such permanent openings shall have a net cross-sectional area not less than the required area of the makeup air supply openings.</u>

Commenter's Reason: The reason proposal RM27 on Transfer Air was disapproved by the committee in Dallas was that it felt the text was too complicated. This public comment would accomplish the same thing with language that better fits the IRC. The provision is also being relocated to the range hood section, because it is meant to deal solely with kitchen exhaust makeup air.

The concern driving this code change is that kitchen exhaust makeup air has only been a commercial concept until fairly recently. Makeup air in a commercial kitchen has very specific requirements which are not necessary in a residential setting. For example, the makeup air opening in a commercial kitchen needs to be located in the direct vicinity of the draft hood. Homeowners, however, have valid reasons for not wanting the opening in the kitchen, including comfort, practicality, and aesthetics. Locating the opening in another room or bringing the makeup air in through the duct system allows the unconditioned air to mix and temper which is vital in harsher climates. When these openings are required in the kitchen, there is a much greater possibility that they will be covered or otherwise disabled.

RM27-13

Final Action: AS AM AMPC____ D

RM31-13
202, M1503.4

Proposed Change as Submitted

Proponent: Mike Moore, P.E., Newport Ventures, representing Broan-NuTone (mmoore@newportventures.net)

Add new definitions as follows:

AIR, MAKEUP. Any combination of outdoor and transfer air intended to replace exhaust air and exfiltration

AIR, OUTDOOR. Ambient air that enters a building through a ventilation system, through intentional openings for natural ventilation, or by infiltration.

AIR, TRANSFER. Air moved from one indoor space to another

INFILTRATION. Uncontrolled inward air leakage to conditioned spaces through unintentional openings in ceilings, floors, and walls from unconditioned spaces or the outdoors caused by pressure differences across these openings resulting from wind, indoor/outdoor temperature differences and imbalances between supply and exhaust airflow rates.

EXFILTRATION. Uncontrolled outward air leakage from conditioned spaces through unintentional openings in ceilings, floors, and walls to unconditioned spaces or the outdoors caused by pressure differences across these openings resulting from wind, indoor/outdoor temperature differences and imbalances between supply and exhaust airflow rates.

Revise text as follows:

M1503.4 Makeup air required. Kitchen ~~E~~exhaust ~~hood~~ systems capable of exhausting in excess of 400 cubic feet per minute (0.19 m3/s) shall be provided with makeup air at a rate approximately equal to the exhaust air rate. Such makeup air systems shall be equipped with not less than one motorized damper ~~a means of closure and~~ that shall be automatically controlled to ~~start and~~ operate simultaneously with the exhaust system.

> **Exception:** Intentional openings for makeup air are not required for kitchen exhaust systems capable of exhausting not greater than 600 cubic feet per minute provided that one of the following conditions is met:
>
> 1. Where the floor area within the air barrier of a dwelling unit is at least 1500 square feet, and where natural draft or mechanical draft space-or water-heating appliances are not located within the air barrier.
> 2. Where the floor area within the air barrier of a dwelling unit is at least 3000 square feet, and where natural draft space-or water-heating appliances are not located within the air barrier.

Reason: The language in 1503.4 is confusing and needs to be reworked. This proposal accomplishes the following. Detailed rationale follows the bullets.

1. Recognizes that makeup air (MUA) requirements are indifferent to the type of exhaust system (same MUA requirements should apply whether it's a hood, down draft, through the wall vent, or any other type)
2. Clarifies where MUA comes from (transfer and outdoor air), and updates definitions to align with IMC
3. Clarifies what type of MUA system should be specified (at a minimum, one motorized, automatically controlled damper)
4. Provides an exception to relax the MUA requirements where the home is assumed to have sufficient natural infiltration to minimize the chance of backdrafting for the combustion appliances within the air barrier.

First, the current language only addresses exhaust hood systems, but the physics of back drafting are indifferent as to whether the exhaust system is a hood, a down draft, a through the wall vent, or any other type of exhaust system. So, the word “hood” is removed to reflect this fact.

Second, several definitions from the 2015 IMC are inserted clarify how the MUA system operates – things like where the MUA comes from, where the air must be introduced, etc. These definitions are also aligned with ASHRAE 62.

Third, this change clarifies the minimum required component of a MUA system (at least one motorized damper). A motorized damper is required because gravity dampers can malfunction at the low pressure differentials at which naturally vented appliances can potentially back draft (i.e., 3-5 Pascals based on info from BPI, CMHC, and CAN/CSA F326-M91; see references below). Malfunction can occur through improper balancing and slight restrictions in the damper caused by dirt, debris, or other matter.

Fourth, MUA should not be required where the home is deemed sufficiently leaky to minimize the chance of backdrafting for the combustion appliances within the air barrier. This exception assumes that mechanical draft combustion appliances can be operated safely to a pressure of -15 Pascals, and that direct vent appliances can be operated safely to a pressure of -50 Pascals. It also assumes that the home has a leakage of 3 ACH 50 and that there is good pressure distribution throughout the home. Ceiling height is assumed to be 8.5 ft. Equations used to estimate building leakage at the pressures of -15 Pa and -50 Pa were sourced from 2009 ASHRAE Fundamentals 16.15 (equations 41, 43 assuming a pressure exponent of 0.65).

Cost Impact: This proposal has the potential to reduce the cost of construction by adding exceptions for MUA requirements when a dedicated MUA system is not needed.

M1503.4#1-RM-MOORE.DOC

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: Disapproval is based upon the preference for RM34 which allows a gravity damper. The proposed definitions are vague.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Mike Moore, Newport Ventures, representing Broan-NuTone, requests Approval as Submitted.

Commenter’s Reason: The committee disapproved this proposal in deference to RM34, which specifically approved gravity dampers for makeup air. Please cross reference my public comment on RM34 which explains why the committee got this one wrong, and why gravity dampers for makeup air are generally a bad solution that can pose a threat to life safety.

In keeping with the original intention of this section of the code, RM31 prohibits gravity dampers for kitchen exhaust makeup air. In addition to taking this measure to safeguard the life safety of occupants, RM31 introduces several improvements to this section that accomplish the following.

1. Recognizes that makeup air (MUA) requirements are indifferent to the type of exhaust system (same MUA requirements should apply whether it’s a hood, down draft, through the wall vent, or any other type)
2. Clarifies where MUA comes from (transfer and outdoor air), and updates definitions to align with IMC
3. Clarifies what type of MUA system should be specified (at a minimum, one motorized, automatically controlled damper)
4. Provides an exception to relax the MUA requirements where the home is assumed to have sufficient natural infiltration to minimize the chance of back drafting for the combustion appliances within the air barrier.

Detailed rationale for the previous four bullets is as follows:

First, the current language only addresses exhaust hood systems, but the physics of back drafting are indifferent as to whether the exhaust system is a hood, a down draft, a through the wall vent, or any other type of exhaust system. So, the word “hood” is removed to reflect this fact.

Second, several definitions from the 2015 IMC are inserted to clarify how the MUA system operates – things like where the MUA comes from, where the air must be introduced, etc. These definitions are also aligned with ASHRAE 62, and are important because they provide code officials, builders, and contractors with a better understanding and terminology for MUA.

Third, this change clarifies the minimum required component of a MUA system (at least one motorized damper). A motorized damper is required because gravity dampers can malfunction at the low pressure differentials at which naturally vented appliances can potentially back draft (i.e., 3-5 Pascals based on info from ACCA Manual D, BPI, CMHC, and CAN/CSA F326-M91; see references below). Malfunction can occur through improper balancing and slight restrictions in the damper caused by dirt, debris, or other matter.

Fourth, MUA should not be required by a minimum code when the home is deemed sufficiently leaky to minimize the chance of back drafting for the combustion appliances within the air barrier. This exception assumes that mechanical draft combustion appliances can be operated safely to a pressure of -15 Pascals, and that direct vent appliances can be operated safely to a pressure of -50 Pascals. It also assumes that the home has a leakage of 3 ACH 50 and that there is good pressure distribution throughout the home. Ceiling height is assumed to be 8.5 ft. Equations used to estimate building leakage at the pressures of -15 Pa and -50 Pa were sourced from 2009 ASHRAE Fundamentals 16.15 (equations 41, 43 assuming a pressure exponent of 0.65).

RM31-13

Final Action: AS AM AMPC____ D

RM33-13
M1503.4

Proposed Change as Submitted

Proponent: Dan Buuck, National Association of Home Builders (NAHB) (dbuuck@nahb.org)

Revise as follows:

M1503.4 Makeup air required. Exhaust hood systems capable of exhausting in excess of ~~400~~ 600 cubic feet per minute (0.19 m^3/s) shall be provided with makeup air at a rate approximately equal to the exhaust air rate. Such makeup air systems shall be equipped with a means of closure and shall be automatically controlled to start and operate simultaneously with the exhaust system.

Reason: The threshold for makeup air was originally set at 400 cfm, because it was believed that most residential kitchen exhaust systems fall below that number. Many down-draft exhaust systems, however, are rated between 400 and 600 cfm, penalizing homeowners who prefer these systems by adding a lot of cost and complexity to their homes. Everyone can agree that there are certain 'monster' exhaust hoods (e.g. 1200 cfm) that need makeup air, but the current threshold is set too low.

The PMG CAC supported this change for the IMC during the Group A Final Action Hearings.

Cost Impact: The code change proposal will not increase the cost of construction.

M1503.4-RM-BUUCK.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposed increase to 600 cfm will increase the possibility of depressurization that could result in CO poisoning. The proposed text requires makeup air for the entire exhaust rate, as opposed to just the amount that is in excess of 400.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Dan Buuck, CBO, representing National Association of Home Builders (NAHB), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

M1503.4 Makeup air required. Exhaust hood systems capable of exhausting ~~in excess of 600~~ more than 400 cubic feet per minute (0.19 m^3/s) shall be provided with makeup air at a rate approximately equal to the exhaust air rate that is in excess of 400 cubic feet per minute. Such makeup air systems shall be equipped with a means of closure and shall be automatically controlled to start and operate simultaneously with the exhaust system.

> **Exception:** Where all appliances in the house are direct-vent, power-vent, unvented, or electric, makeup air shall be provided where exhaust fans are capable of exhausting more than 600 cubic feet per minute (0.28 m^3/s). Exhaust hood systems capable of exhausting more than 600 cubic feet per minute shall be provided with makeup air at a rate approximately equal to the exhaust air rate that is in excess of 600 cubic feet per minute.

Commenter's Reason: As originally written in the 2009 IRC, this section allows range hoods up to 400 cfm to be installed without makeup air. It would be consistent to require makeup air equaling the amount above and beyond 400 cfm for larger fans. Essentially, there would be no difference between the effect a 400 cfm fan has on a house and a 600 cfm fan with 200 cfm of makeup air. This would also improve the feasibility and acceptance of this code section as well as cut down on the amount of wasted energy and potential occupant discomfort caused by needlessly introducing excessive amounts of unconditioned air.

Currently this section of the code does not take into effect the difference between homes where all appliances in the home are of sealed combustion, power-vent, unvented or electric, power and those which contain one or more naturally vented appliances. Because the potential for appliance back drafting is greatly reduced where naturally vented appliances are not present, the 400 cfm threshold can be raised to 600 cfm where only sealed combust ion, power-vent, unvented, or electric, power appliances are used in the dwelling. This would allow for the use of more effective, common residential 500 to 600 cfm down-draft exhaust fans without the need to unnecessarily add makeup air.

RM33-13

Final Action: AS AM AMPC____ D

RM34-13
M1503.4

Proposed Change as Submitted

Proponent: Dan Buuck, National Association of Home Builders (NAHB); David Hall CFM, Georgetown Texas representing the ICC PMG Code Action Committee (dave.hall@georgetown.org)

Revise as follows:

M1503.4 Makeup air required. Exhaust hood systems capable of exhausting in excess of 400 cubic feet per minute (0.19 m^3/s) shall be <u>mechanically or naturally</u> provided with makeup air at a rate approximately equal to the exhaust air rate. Such makeup air systems shall be equipped with ~~a~~ <u>not less than one damper. Each damper shall be a gravity damper or an electrically operated damper that automatically opens when the exhaust system operates</u> ~~means of closure and shall be automatically controlled to start and operate simultaneously with the exhaust system.~~ <u>Dampers shall be accessible for inspection, service, repair and replacement without removing permanent construction or any other ducts not connected to the damper being inspected, serviced, repaired or replaced.</u>

Reason: The first change adds the words 'mechanically or naturally'. It is important to explicitly state that both mechanical ventilation (i.e. a fan) and natural ventilation (i.e. a passive opening) is allowed by this provision for the following reasons. First of all, It is not being interpreted the same in all jurisdictions. Secondly, there is no precedence for mechanical makeup air in the IRC.
The second change deals with the type of damper that is allowed. The only reason to require a 'means of closure' to the makeup air system is to limit the amount of conditioned air that leaves the building when the exhaust is not running. Both electrically-operated and gravity dampers achieve this goal, and it is important to clarify that both are allowed. Again, it is not being interpreted the same in all jurisdictions. (Some are allowing gravity dampers, but not all.) Secondly, allowing a gravity damper is in keeping with similar applications within the IRC—nowhere are automatic (motorized) dampers required for makeup or ventilation air. Finally, a gravity damper has the added benefit of equalizing depressurization in the house for any other reason (e.g. bath fans and clothes dryers).
The last sentence was taken and modified from Section M1305.1 on appliance access. It emphasizes that both types of dampers, gravity and motorized, require maintenance and may need to be replaced at some time.

Cost Impact: The code change proposal will not increase the cost of construction.

M1503.4-RM-BUUCK-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Approval was based upon the proponent's published reason. Running the exhaust fan at less than full speed will allow the gravity damper to open partially, thereby limiting the entry of outdoor air.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Disapproval.

Commenter's Reason: This was not approved by the mechanical committee. Sustaining the committee action will only cause confusion and inconsistent enforcement. Not striking the word "hood" does not capture downdraft systems. Gravity dampers are unreliable as everything affects them. They are subject to pressure differentials' that renders them unreliable. Running the fan at lower speeds does not assure the damper will partially open if at all as one committee member stated. Gravity dampers will permit unwanted air to come in under many conditions when the fan is not operating that will be very undesirable in hot humid locations and in cold climates. The point of the original text was to make sure the damper in only open when the fan is operating, *not when the wind is blowing*. This can only be achieved with an electrically powered damper and will be much more effective.

Public Comment 2:

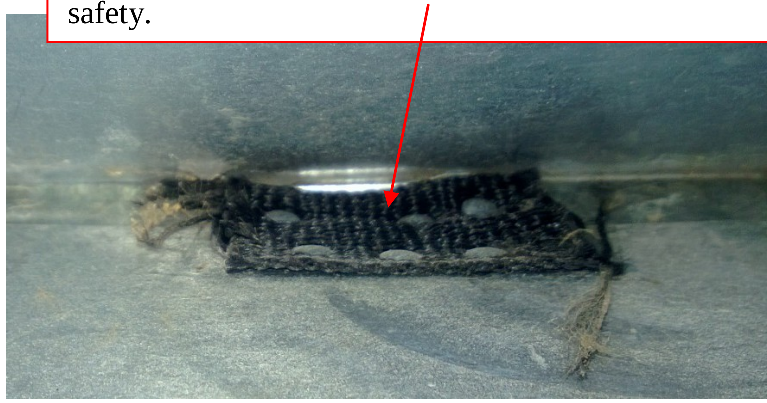
Mike Moore, Newport Ventures, representing Broan-NuTone, requests Disapproval.

Commenter's Reason: In its current form, M1503.4 does not permit gravity dampers to be used in makeup air systems, and for good reason. Makeup air dampers must be able to operate at very low depressurization levels to ensure that combustion appliances like water heaters and furnaces do not back draft when a large range hood is operating. For example, Appendix 14 of ACCA Manual D states, "Properly vented combustion equipment can back draft when the space pressure is as small as -1 to -5 Pascals."

Unfortunately, gravity dampers for residential applications are rarely provided with data on the minimum depressurization level required for them to open.* Without consistent data on operation of gravity dampers as a function of depressurization, and with no code requirements for the minimum depressurization level at which gravity dampers must operate, approving gravity dampers could introduce a life safety risk in tight homes with combustion appliances and large kitchen exhaust systems; therefore, this proposal should be disapproved.

**To determine what data are available on non-motorized damper operation (e.g., "gravity", "static pressure regulating", "fresh air intake", "barometric", "pressure relief" etc.), we reviewed the installation manuals of 30 products from 7 manufacturers that are available through the nation's largest HVACR distributor's website. Of these, only 7 products were provided with data on the pressure differential at which the damper would begin to open, with an average of 17 Pascals across the products with published data. This cut-in operation pressure is over 3 times the recommended depressurization limit for combustion appliances according to ACCA!*

Here's an example of a gravity damper that would be approved if RM34 is approved. Can you guess what depressurization level is required to open this damper? If you don't know the answer, then RM34 should be disapproved.



Images: Contractor-made gravity damper that came off a single family home built in 2000. Notice the canvas hinge (picture on right) attached with rivets (shown on left). It's clever, but I wouldn't count on it for life safety.

RM34-13

Final Action: AS AM AMPC____ D

RM35-13
M1503.4

Proposed Change as Submitted

Proponent: Guy McMann, MCP, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

Revise as follows:

M1503.4 Makeup air required. Kitchen exhaust ~~hood~~ systems capable of exhausting in excess of 400 cubic feet per minute (0.19 m3/s) shall be mechanically or naturally provided with makeup air at a rate approximately equal to the exhaust air rate. ~~Such~~ Gravity or mechanical makeup air systems shall be equipped with a motorized means of closure and shall be automatically controlled to ~~start and~~ operate simultaneously with the exhaust system

Reason: This proposal clarifies that the makeup air systems may be mechanical or gravity depending on the designer's preferences. This also clarifies that in either case, a motorized damper will be required to ensure a positive means of closure. Striking the word "hood" captures downdraft equipment which could be construed as not being included.

Cost Impact: None

M1503.4-RM-MCMANN.DOC

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: Motorized dampers should not be the only option. The term "naturally" implies infiltration which is inappropriate. One remedy can't cover all conditions.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Mike Moore, Newport Ventures, representing Broan-NuTone, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

M1503.4 Makeup air required. Kitchen exhaust systems capable of exhausting in excess of 400 cubic feet per minute (0.19 m3/s) shall be mechanically or naturally provided with makeup air at a rate approximately equal to the exhaust air rate. ~~Gravity or mechanical~~ ~~m~~Makeup air systems shall be equipped with not less than one ~~a~~ motorized damper ~~means of closure and~~ that shall be automatically controlled to operate simultaneously with the exhaust system.

Commenter's Reason: The committee made a mistake at the Dallas hearings in approving gravity dampers for makeup air. This change is needed to clarify that gravity dampers are not an appropriate solution for makeup air for the following reasons:

1. The pressure differentials at which combustion appliances are expected to back draft are very low (-1 to -5 Pascals; -0.004 to -0.020 inches of water column)*, and code officials have no guarantee that gravity dampers will work at these low depressurization levels required to avoid back drafting of combustion appliances.
2. Few manufacturers provide any data on operation of gravity dampers, and where provided, results typically show that the gravity dampers do not open at the low depressurization levels required to avoid back drafting of combustion appliances.**

3. The original intention of this section was to require motorized dampers, as per conversation with the original proponent of M1503.4 in an ICC PMG CAC committee conference call on June 4, 2013.

* *Appendix 14 of ACCA Manual D states, "Properly vented combustion equipment can back draft when the space pressure is as small as -1 to -5 Pascals."*
***To determine what data are available on non-motorized damper operation (e.g., "gravity", "static pressure regulating", "fresh air intake", "barometric", "pressure relief" etc.), we reviewed the installation manuals of 30 products from 7 manufacturers that are available through the nation's largest HVACR distributor's website. Of these, only 7 products were provided with data on the pressure differential at which the damper would begin to open, with an average of 17 Pascals across the products with published data. This cut-in operation pressure is over 3 times the recommended depressurization limit for combustion appliances according to ACCA Manual D!*

RM35-13
Final Action: AS AM AMPC____ D

RM36-13
M1506, M1507, and Chapter 44

Proposed Change as Submitted

Proponent: Mike Moore, P.E., Newport Ventures, representing Broan-NuTone (mmoore@newportventures.net)

Revise as follows:

M1506.1 Duct~~s~~ construction. Where exhaust duct construction is not specified in this chapter, construction shall comply with Chapter 16.

M1506.2. Duct length. The length of exhaust and supply ducts used for ventilating equipment shall not exceed the maximum lengths determined in accordance with Table M1506.2.

> **Exception:** Duct length shall not be limited where the duct system complies with the manufacturer's design criteria or where the flow rate of the installed ventilating equipment is verified by the installer or approved third party using a flow hood, flow grid, or other airflow measuring device.

M1506.~~2~~3 Exhaust openings. Air exhaust openings shall terminate not less than 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable and nonoperable openings into the building and 10 feet (3048 mm) from mechanical air intakes except where the opening is located 3 feet (914 mm) above the air intake. Openings shall comply with Sections R303.5.2 and R303.6.

TABLE M1506.2
DUCT LENGTH

Duct Type	**Flex Duct**								**Smooth-Wall Duct**							
Fan Airflow Rating CFM @ 0.25 in. wc[1]	50	80	100	125	150	200	250	300	50	80	100	125	150	200	250	300
Diameter[2] in.	Maximum Length[3,4,5] ft.															
3	X	X	X	X	X	X	X	X	5	X	X	X	X	X	X	X
4	56	4	X	X	X	X	X	X	114	31	10	X	X	X	X	X
5	NL	81	42	16	2	X	X	X	NL	152	91	51	28	4	X	X
6	NL	NL	158	91	55	18	1	X	NL	NL	NL	168	112	53	25	9
7	NL	NL	NL	NL	161	78	40	19	NL	NL	NL	NL	NL	148	88	54
8 and above	NL	NL	NL	NL	NL	189	111	69	NL	NL	NL	NL	NL	NL	198	133

1. Fan airflow rating shall be in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51.

2. For non-circular ducts, calculate the diameter as four times the cross-sectional area divided by the perimeter.
3. This table assumes that elbows are not used. Fifteen feet (5 m) of allowable duct length shall be deducted for each elbow installed in the duct run.
4. NL = no limit on duct length of this size.
5. X = not allowed, Any length of duct of this size with assumed turns and fittings will exceed the rated pressure drop.

M1507.1 General. Where local exhaust or whole-house mechanical ventilation is provided, the equipment shall be designed in accordance with this section.

M1507.2 Flow Rate Verification. The flow rate for ventilating equipment shall be verified in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51 or the flow rate shall be verified by the installer or approved third party using a flow hood, flow grid, or other airflow measuring device.

Add new standard to Chapter 44 as follows:

ANSI/AMCA 210-ANSI/ASHRAE 51-07, Laboratory Methods of Testing Fans for Aerodynamic Performance Rating.

Reason: Section M1507 establishes the minimum design flow rates required for local exhaust and whole house mechanical ventilation (WHMV) fans. However, field tests of ventilating fans often show that actual flow rates fall short of design. Failure of fans to meet design rates can generally be attributed to one of two reasons: either the ductwork is poorly matched to the fan, or the fan's actual airflow does not match its label (i.e., has not been verified via a standardized laboratory test). By providing a prescriptive duct sizing table, this proposal takes the guess work out of whether a fan should operate per the design rate. By requiring that either the fan flow rate be verified by the manufacturer in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51 or be field verified by the installer or approved third party, this proposal provides a minimum level of quality assurance and control to the installation of ventilation fans.

The proposed table is taken directly from ASHRAE 62.2-2010, addendum F. Confirmation that a ventilation fan's flow rate is in compliance with ANSI/AMCA 210-ANSI/ASHRAE 51 is as simple as looking for an HVI sticker in the fan housing. Ventilating fans exceeding the maximum CFM in Table M1506.2 would comply with Section M1506.2 by using the exception (i.e., installing ducts in accordance with the manufacturer's design criteria or by field confirmation of the flow rate).

Cost Impact: Incremental costs associated with this proposal are expected to be minimal to zero, since this proposal reflects the minimum design practice needed to ensure that installed rates match design rates.

Analysis: A review of the standard proposed for inclusion in the code, [ANSI/AMCA 210-ANSI/ASHRAE 51-07] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

M1506.2 (NEW)-RM-MOORE.DOC

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The table is confusing as it appears that smooth-wall ducts are not allowed to be longer than flex ducts. Verification of flow rates will be difficult for code officials.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Mike Moore, P.E., Newport Ventures, representing Broan-NuTone requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION M1506
EXHAUST DUCTS AND EXHAUST OPENINGS

M1506.1 Duct construction. Where exhaust duct construction is not specified in this chapter, construction shall comply with Chapter 16.

~~**M1506.2. Duct length**. The length of exhaust and supply ducts used for ventilating equipment shall not exceed the maximum lengths determined in accordance with Table M1506.2.~~

> ~~**Exception:** Duct length shall not be limited where the duct system complies with the manufacturer's design criteria or where the flow rate of the installed ventilating equipment is verified by the installer or approved third party using a flow hood, flow grid, or other airflow measuring device.~~

~~**M1506.3**~~ **M1506.2 Exhaust openings.** Air exhaust openings shall terminate not less than 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable and nonoperable openings into the building and 10 feet (3048 mm) from mechanical air intakes except where the opening is located 3 feet (914 mm) above the air intake. Openings shall comply with Sections R303.5.2 and R303.6.

M1507.1 General. Where local exhaust or whole-house mechanical ventilation is provided, the equipment shall be designed in accordance with this section.

M1507.2 Flow Rate Verification. ~~The flow rate for~~ Ventilating equipment shall be ~~verified~~ listed and labeled in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51, or the flow rate of the installed system shall be verified by the installer or an approved third party using a flow hood, flow grid, or other airflow measuring device.

1. ~~Fan airflow rating shall be in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51.~~
2. ~~For non-circular ducts, calculate the diameter as four times the cross-sectional area divided by the perimeter.~~

3. ~~This table assumes no elbows. Deduct 15 feet (5 m) of allowable duct length for each elbow.~~
4. ~~NL = no limit on duct length of this size.~~
5. ~~X = not allowed, any length of duct of this size with assumed turns and fitting will exceed the rated pressure drop.~~

CHAPTER 44
REFERENCED STANDARDS

Add new standard as follows:

ANSI/AMCA 210-ANSI/ASHRAE 51, Laboratory Methods of Testing Fans for Aerodynamic Performance Rating.

Commenter's Reason: This proposal is intended to ensure that ventilating fans are factory or field tested to achieve minimum ventilation flow rates. By requiring that either the fan flow rate be listed and labeled in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51 or be field verified by the installer or approved third party, this proposal provides a minimum level of quality assurance and control to the specification of ventilating fans.

After receiving committee input in Dallas, this public comment improved upon the original proposal by making the following changes:

- Removed the maximum duct length table, which the committee found to be confusing
- Removed reference to "exhaust and supply" ducts, since this section only applies to exhaust ducts.
- Inserted clarification for code officials that fans shall be "listed and labeled" in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51. Listing and labeling of these products is currently maintained by the Home Ventilating Institute.

The Home Ventilating Institute is an example of an organization that for the past 4 decades has maintained a list of ANSI/AMCA 210-ANSI/ASHRAE 51 compliant range hoods and fans for bathrooms and toilet rooms in its certified products directory, which is freely available to the public (http://www.hvi.org/proddirectory/index.cfm) and contains over 3000 listings. For fans that are HVI certified to ANSI/AMCA 210-ANSI/ASHRAE 51, confirmation that the flow rate is in compliance with ANSI/AMCA 210-ANSI/ASHRAE 51 is as simple as looking for an HVI sticker in the fan housing.

Public Comment 2:

Shawn Strausbaugh of Arlington County, Virginia representing the ICC PMG Code Action Committee requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

M1506.1 Duct construction. Where exhaust duct construction is not specified in this chapter, construction shall comply with Chapter 16.

M1506.2. Duct length. The length of exhaust and supply ducts used for ventilating equipment shall not exceed the maximum lengths determined in accordance with Table M1506.2.

> **Exception:** Duct length shall not be limited where the duct system complies with the manufacturer's design criteria or where the flow rate of the installed ventilating equipment is verified by the installer or approved third party using a flow hood, flow grid, or other airflow measuring device.

M1506.3 Exhaust openings. Air exhaust openings shall terminate not less than 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable and nonoperable openings into the building and 10 feet (3048 mm) from mechanical air intakes except where the opening is located 3 feet (914 mm) above the air intake. Openings shall comply with Sections R303.5.2 and R303.6.

TABLE M1506.2

7	NL	NL	NL	NL	161	78	40	19	NL	NL	NL	NL	NL	148	88	54
8 and above	NL	NL	NL	NL	NL	189	111	69	NL	NL	NL	NL	NL	NL	198	133

1. Fan airflow rating shall be in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51.
2. For non-circular ducts, calculate the diameter as four times the cross-sectional area divided by the perimeter.
3. This table assumes that elbows are not used. Fifteen feet (5 m) of allowable duct length shall be deducted for each elbow installed in the duct run.
4. NL = no limit on duct length of this size.
5. X = not allowed, Any length of duct of this size with assumed turns and fittings will exceed the rated pressure drop.

M1507.1 General. Where local exhaust or whole-house mechanical ventilation is provided, the equipment shall be designed in accordance with this section.

~~**M1507.2 Flow Rate Verification**. The flow rate for ventilating equipment shall be verified in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51 or the flow rate shall be verified by the installer or approved third party using a flow hood, flow grid, or other airflow measuring device.~~

ANSI/AMCA 210-ANSI/ASHRAE 51-07, Laboratory Methods of Testing Fans for Aerodynamic Performance Rating.

Commenter's Reason: The committee felt that verifying the flow rate would be difficult for code enforcement personnel. The only other concern was with the table which was printed such that it was hard to read in the original proposal.

The committee reason for recommending disapproval was based on the fact that the proposed table was printed with some numbers offset such that it was difficult to read. They also felt that the code official would not be able to verify the fan flow rates. Fans are labeled by HVI which demonstrates that the fan flow rate specified by the manufacturer is accurate. The offset numbers in the table have been corrected as shown in this public comment. Without this text, exhaust fans will continue to be installed with ducts that will not allow the fan to reach its intended flow rate. A 50 cfm fan with high resistance ductwork might exhaust only a small fraction of the 50 cfm. Installing the proper size fan is pointless if the proper size and length of ductwork is not connected to it.

202, M1506.2

Proposed Change as Submitted

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IRC-PLUMBING AND MECHANICAL COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Proponent: Mike Moore, P.E., Newport Ventures, representing Broan-NuTone (mmoore@newportventures.net)

PART I - IRC MECHANICAL

Add new definition as follows:

<u>**ENVIRONMENTAL AIR.** Air that is conveyed to or from occupied areas through ducts that are not part of the heating or air-conditioning system, such as ventilation for human usage, domestic kitchen range exhaust, bathroom exhaust and domestic clothes dryer exhaust.</u>

Revise text as follows:

M1506.2 Exhaust openings. ~~Air exhaust openings shall terminate not less than 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable and nonoperable openings into the building and 10 feet (3048 mm) from mechanical air intakes except where the opening is located 3 feet (914 mm) above the air intake.~~ Openings shall comply with Sections R303.5.2 and R303.6.

Cost Impact: No impact.

M1506.2-RM-MOORE.DOC

Committee Action Hearing Results

PART I – IRC – Mechanical
Committee Action: **Approved as Submitted**

Committee Reason: The proposed text is consistent with the IMC.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Disapproval.

Commenter's Reason: It makes perfect sense for exhaust requirements to be located in the exhaust chapter. This requirement was installed in this chapter a few cycles ago and is a convenient location for the user.

Public Comment 2:

Paul Rimel, City of Staunton, representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA) and Virginia Building and Code Officials Association (VBCOA), requests Disapproval.

Commenter's Reason: RM37 is presented as a two-part proposal but approval of one part without the other would duplicate or completely remove the separation requirements for environmental exhaust.

If Part I is disapproved and Part II is approved, the separation requirements will exist in both M1506.2 and R303.5.2 and this would add unnecessary language to the code.

If Part I is approved and Part II is disapproved, the text that's been deleted in Part I won't exist in R303.5.2.

There are at least two important reasons Part II should not be approved, so the consequences of approving Part II should be carefully evaluated prior to voting in support of Part I.

RM37-13, Part I

Final Action: AS AM AMPC____ D

RM37-13, Part II
R303.5, R303.5.1, R303.5.2

<u>Proposed Change as Submitted</u>

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IRC-PLUMBING AND MECHANICAL COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Proponent: Mike Moore, P.E., Newport Ventures, representing Broan-NuTone (mmoore@newportventures.net)

PART II - IRC BUILDING

R303.5 Opening location. Outdoor intake and exhaust openings shall be located in accordance with Sections R303.5.1 and R303.5.2.

R303.5.1 Intake openings. Mechanical and gravity outdoor air intake openings shall be located a minimum of 10 feet (3048 mm) from any hazardous or noxious contaminant <u>source</u>, such as vents, chimneys, plumbing vents, streets, alleys, parking lots and loading docks, except as otherwise specified in this code. Where a ~~source of~~ contaminant <u>source</u> is located within 10 feet (3048 mm) of an intake opening, such opening shall be located not less than 3 feet (914 mm) below the contaminant source. For the purpose of this section, <u>environmental air other than domestic clothes dryer exhaust</u> ~~the exhaust from *dwelling* unit toilet rooms, bathrooms and kitchens~~ shall not be considered as hazardous or noxious.

R303.5.2 Exhaust openings. Exhaust air shall not be directed onto walkways. <u>Air exhaust openings shall terminate not less than: 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable and nonoperable openings into the building; and 10 feet (3048 mm) from mechanical air intakes except where the exhaust opening is located not less than 3 feet (914 mm) above the air intake.</u>

> <u>**Exception**: The minimum termination distances from the building's operable openings, nonoperable openings, and mechanical air intakes shall not be required where the exhaust source is environmental air other than domestic clothes dryer exhaust.</u>

Reason: The language on exhaust and intake openings is redundant and confusing in that it is spread throughout the code, and permits exhausts to be located near intakes but does not permit intakes to be located near exhausts. This change seeks to simplify the language, reorganize into one section, and ensure that the allowances for intakes are consistent with the allowances for exhaust. Improvements include the following:

1. Include exhaust from occupied areas among the list of non-hazardous exhaust. R303.5.1 states that exhaust from toilet rooms, bathrooms, and kitchens shall not be considered as hazardous. This list is not comprehensive, notably excluding exhaust from occupied areas like living rooms or bedrooms, which are likely to contain even less contaminants than exhaust from toilet rooms, bathrooms, and kitchens. To fix this, I've borrowed the definition of "Environmental Air" from the IMC and excluded clothes dryer exhaust and parking garage exhaust, since this section does not currently permit these.
2. Move the text of M1506.2 to R303.5.2, and reduce the text of M1506.2 to a reference.
3. Add an exception to R303.5.2 that aligns with the language in R303.5.1. To simplify, the code currently states that A can be close to B, but B can't be close to A, which doesn't make sense. R303.5.1 specifically eliminates the minimum separation distance between intakes and exhaust terminations of toilet rooms, bathrooms, or kitchens. However, M1506.2 still states that all exhaust terminations must still observe minimum separation distances from intakes. Adding the exception to R303.5.2 brings consistency to these two sections.

Cost Impact: No impact.

M1506.2-RM-MOORE.DOC

Committee Action Hearing Results

PART II – IRC – Building
Committee Action: **Approved as Submitted**

Committee Reason: Approval was based upon the proponent's published reason. The proposed text provides design flexibility for exhaust outlet locations.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Disapproval.

Commenter's Reason: It makes perfect sense for exhaust requirements to be located in the exhaust chapter. This requirement was installed in this chapter a few cycles ago and is a convenient location for the user.

Public Comment 2:

Paul Rimel, City of Staunton, representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA) and Virginia Building and Code Officials Association (VBCOA), requests Disapproval.

Commenter's Reason: This proposal would radically change the current requirements by permitting zero separation from domestic range and bathroom exhaust to both mechanical and gravity intake openings. The exception to R303.5.2 would literally allow an exhaust outlet from a kitchen or bathroom to be directly adjacent to a mechanical air intake or operable/nonoperable opening with no vertical separation required between the two. As a point of reference, Section 501.3.1 (#3) of the 2012 IMC has the same separation distances as the text being relocated from M1506.2 to R303.5.2 however, the IMC has no exception because those distances are intended to apply to all environmental exhaust outlets without any further reduction. This exception has never appeared in any ICC code previously and it should not be added now.

Just because the exhaust from a range hood or bath fan isn't considered hazardous or noxious, that doesn't mean the minimum distance from a mechanical air intake should change from 10 feet horizontal (or 3 feet vertical) to zero or, that the minimum distance from an operable or nonoperable opening should change from 3 feet (either horizontally or vertically) to zero.

The 4'th sentence of bullet point #3 in the reason statement is misleading in that it states "M1506.2 still states that all exhaust terminations must still observe minimum separation distances from intakes." M1506.2 has been reduced to no more than a reference but more importantly, the text moved from there to R303.5.2 now includes a brand new exception that completely eliminates all separation requirements for domestic range and bath fan exhausts!

Additionally, Part I of this proposal includes domestic clothes dryer exhaust in the definition of environmental air but Part II excludes dryer exhaust from the less stringent separation requirements that apply to other non-hazardous exhaust terminations. If clothes dryer exhaust is not hazardous or noxious by definition, then why should it be subject to more restrictive separation distances than other types of environmental exhaust? The new text in the last sentence of R303.5.1 "<u>environmental air other than domestic clothes dryer exhaust</u>" implies that dryer exhaust is hazardous or noxious which would likely cause many users of the code to incorrectly apply the more stringent requirements of R303.5.1 to clothes dryer exhaust instead of the correct but somewhat obscure requirements located in M1502.3. This is especially true for those who support the popular notion that all intake/exhaust requirements should be consolidated into a single location in Chapter 3.

In the majority of cases, it would be very difficult to terminate a clothes dryer exhaust at least 10 feet horizontally or 3 feet vertically from all building openings in conventional residential construction and the common practice of terminating through a ground floor band board would be virtually eliminated in houses without basements due to the proximity of nearby crawlspace vents. There is no precedent in the code that deems domestic clothes dryer exhaust to be hazardous or noxious and the proponent has offered no reason or supporting data that indicates dryer exhaust should be treated any differently than other types of environmental air. This is obviously not the intent of the definition proposed in Part I since that definition makes no such distinction.

RM37-13, Part II
Final Action: AS AM AMPC____ D

RM38-13
M1506.2

Proposed Change as Submitted

Proponent: Mike Winkler, Chair of the IRC Interpretations Committee, representing our committee

Revise as follows:

M1506.2 ~~Exhaust openings~~. Location of exhaust outlets. ~~Air~~ Exhaust air- ~~openings~~ outlets shall terminate not less than 3 feet (914mm) from property lines. Exhaust air outlets shall terminate not less than 3 feet from ~~operable and non-operable~~ openings that have the potential for allowing exhaust air back into the building, except where the exhaust air outlet is located not less 3 feet (914mm) above such openings. ~~and~~ Exhaust air outlets shall terminate not less than 10 feet (3048mm) from mechanical air intakes, except where the exhaust air outlet ~~opening~~ is located not less than 3 feet (914mm) above the mechanical air intake.

Reason: The IRC interpretation committee is attempting to revise the language for two reasons. First, to have the title be consistent with the IMC and second, to clarify the intent. The IRC interpretation committee received a request for a formal interpretation and could not reach a consensus regarding what exactly the current text requires. A "non-operable" opening could be viewed as a fixed louver or as a fixed glass window panel. Neither can be operated but one will let air into the building and the other will not.

The text is also revised so that the terms "opening" and "exhaust air outlet" are used consistently throughout the section. The current text stated *opening* where it meant *exhaust outlet* near the end of the 1st sentence. The exhaust outlets are now clearly distinct from the "openings", since "opening" in this context refers to air intake openings. The current text stated that exhaust openings had to be exactly 3 feet above the air intake, so, if it was 4 feet above, the allowance would not apply. The text was poorly formatted in a long run-on sentence which made it unclear if the exception for being 3 foot above applied only to the mechanical air intakes or if it also applied to other openings that could let exhaust back into the building. Breaking the run-on sentence into separate thoughts makes it perfectly clear that it applies in both cases. The proposed revisions mean to clarify what the interpretation committee believes to be the actual intent of this section, as well improve to readability of the text overall.

Cost Impact: The code change proposal will not increase the cost of construction.

M1506.2-RM-WINKLER.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: Approval of RM37 Parts I and II makes this proposal unnecessary.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Mike Moore, Newport Ventures, representing Broan-NuTone, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

M1506.2 Location of exhaust openings. Exhaust air outlets shall terminate as follows:

1. Not less than 3 feet (914 mm) from property lines.
2. Not less than 3 feet (914 mm) from air intake openings into the building, including doors, louvers and grilles and operable windows.

3. Not less than 10 feet (3048 mm) from mechanical air intake openings except where the exhaust air outlet is located not less than 3 feet (914 mm) above the mechanical air intake opening.

~~**M1506.2 Location of exhaust outlets.** Exhaust air outlets shall terminate not less than 3 feet (914mm) from property lines. Exhaust air outlets shall terminate not less than 3 feet from openings that have the potential for allowing exhaust air back into the building, except where the exhaust air outlet is located not less 3 feet (914mm) above such openings. Exhaust air outlets shall terminate not less than 10 feet (3048mm) from mechanical air intakes, except where the exhaust air outlet is located not less than 3 feet (914mm) above the mechanical air intake.~~

Commenter's Reason: The committee disapproved RM38 because they thought that RM37 accomplished the same thing and they approved RM37. However, RM38 intended to clarify what is meant by "operable and non-operable" openings and RM37 did not do this. RM38 is needed regardless of what happens to RM37, as they have different intents.

By approving this proposal as modified, the structure of the language within R303.5.2 is improved and clarified, and the requirement that prohibits exhaust terminals from being located near inoperable windows is removed.

RM38-13

Final Action: AS AM AMPC____ D

RM39-13
M1506.3 (New)

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown Texas representing the ICC PMG Code Action Committee (dave.hall@georgetown.org)

Add new text as follows:

M1506.3 Exhaust fans. Exhaust fans shall not discharge through common ducts.

Reason: Some installers attempt to join the outlets of two or more bathroom exhaust fans into a common discharge duct. This presents multiple problems including: 1) The common duct is typically undersized which prevents the fans from achieving their intended flow rate. 2) The backdraft dampers in such fans are not designed to be airtight or to prevent reverse flow from other fans. The result is that discharge from one fan is pushed back through any fan that is not operating. 3) The fan manufacturers provide no guidance for this nor do they recommend the practice. 4) The tees used for such arrangements often create flow resistance and direct the flow such that the air streams oppose each other. 5) If fans in different dwelling units were joined to a common duct, there would be direct communication between the two dwellings.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: The code change proposal will not increase the cost of construction.

M1506.3 (NEW)-RM-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

M1506.3 Exhaust fans. The discharge from two or more exhaust fans shall not be combined in a common duct.

Committee Reason: Approval was based upon the proponent's published reason. The modification clarifies that a central fan with multiple inlets is allowed. The intended prohibition is the connecting together of the discharge side of 2 or more fans. As modified, the proposal will not increase the number of roof penetrations.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Richard Grace, Fairfax County Government, representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA) and Virginia Building and Code Officials Association (VBCOA), requests Disapproval.

Commenter's Reason: This new code section will remove a perfectly acceptable design system that has not been proven to be a problem either in the past or the present. When a system is designed properly (duct sizing, fittings, and backdraft dampers), all of the problems associated with the original proponents reason statement are eliminated. The way to prevent problems associated with an installation is not to eliminate the option for the design, but to educate the installer as to the design criteria during the inspection process.

Additionally, if this language is approved, it will eliminate the ability to provide one common opening through the exterior of a dwelling unit for exhaust, or more simply put, require many additional openings to be cut into the exterior envelope, ensuring additional energy waste associated with this installation.

The CAH proposal for this code change stated that the following for the cost impact: “The code change proposal will not increase the cost of construction.” What this statement failed to include was what the cost impact would be to the homeowner after requiring multiple holes to be installed in their thermal envelope rather than only one hole, or what additional heat losses and gains are associated with these “holes”, and the cost impact on the HVAC equipment meant to offset this requirement. There WILL be a cost associated with this requirement.

RM39-13

Final Action: AS AM AMPC____ D

RM40-13
M1507.3

Proposed Change as Submitted

Proponent: Mike Moore, P.E., Newport Ventures, representing Broan-NuTone (mmoore@newportpartnersllc.com)

Add new text as follows:

M1507.3 Sound Ratings. Ventilation fans shall have a sound performance in accordance with the following:

1. For whole-house or continuous ventilation fans: maximum of 1.0 sone.
2. For intermittent local exhaust fans: maximum of 3.0 sone.

Exceptions:

1. Fans having a maximum rated airflow exceeding 400 cfm.
2. HVAC air handlers and fans mounted with not less than 4 ft (1 m) of ductwork between the fan and the intake grille.

(Renumber subsequent sections.)

Reason: Ventilation fans only work when they're turned on, and the number one reason typically given by home owners for not turning on a ventilation fan is, "it's too noisy".[1,2,3] As homes have become tighter, the use of whole house mechanical ventilation (WHMV) for maintaining acceptable indoor air quality and local exhaust fans to capture and expel pollutants at their source (esp. in bathrooms and kitchens) has become necessary. Installing a fan that will not be operated due to noise is a disservice to the homeowner, a liability to their health, and a risk to the home's durability (can lead to excess condensation on windows, increased potential for mold and rot, etc.).

This proposed requirement mirrors that adopted by the state of California and ASHRAE 62.2. Maximum sone levels have been enforced by Washington State's code since the late 1980s. The sone values proposed above have been widely accepted by the industry. A sone is linear measure of loudness, meaning that a three sone fan is three times as loud as a one sone fan. The Home Ventilating Institute describes the sone scale as follows:

- 0.5 sone: rustling leaves
- 1.0 sone: refrigerator
- 3.0 sone: typical office
- 4.0 sone: typical television operating

For a fan which operates only occasionally (like a bath fan), a maximum sone level of 3.0 is considered acceptable. For a fan which is designed to operate continuously (e.g., a WHMV fan), a maximum sone level of 1.0 is necessary to avoid occupants turning off the fan from noise irritation.

The overwhelming majority of intermittent exhaust fans listed in the HVI products directory achieve a sone rating of 3 or less, so this requirement weeds out only the worst performers and therefore should have little to no impact to builders when specifying HVI certified products. The 1.0 sone requirement for WHMV fans has been achieved by over 500 fans listed in the Home Ventilating Institute's certified product directory (www.hvi.org). Further, the 1.0 sone requirement for WHMV fans can be viewed as a cost-saving measure. To find out why, see the cost impact section below.

References:

1. Nagda, N. L., M. D. Koontz, R. C. Fortmann, and I. H. Billick (1989) "Prevalence, Use, and Effectiveness of Range-Exhaust Fans." *Environment International* 15(1-6): 615–620.
2. Parrott, K., J. Emmel, and J. Beamish (2003) "Use of Kitchen Ventilation: Impact on Indoor Air Quality." In *The Forum for Family and Consumer Issues*, edited, North Carolina State University, Raleigh North Carolina.
3. Singer, B.C., W. W. Delp, and M. G. Apte (2011) *Experimental Evaluation of Installed Cooking Exhaust Fan Performance*. LBNL-4183E. Ernest Orlando Lawrence Berkeley National Laboratory, Berkeley, California.
4. Email communication with Don Stevens, Panasonic, dated 11/29/2012.

Cost Impact: Whole house mechanical ventilation (WHMV) fans are required by IRC N1103.5.1 to have a minimum fan efficacy greater than or equal to minimum required for Energy Star fans, meaning that whole-house mechanical ventilation fans are likely to also be Energy Star rated. To achieve the Energy Star rating, a fan must have a noise rating less than or equal to 1.0 sone. So, a WHMV fan which meets the energy efficacy requirements of the IRC is also likely to have a sone rating of 1.0 or less; therefore, no additional costs are expected from this change. Supposing a jurisdiction does not adopt Chapter 11 of the IRC, a builder could theoretically install a WHMV fan that has a sone rating of 3 or higher. If he does, the homeowners are not likely to operate the fan due to unacceptable noise levels, and when they experience poor indoor air quality as a result, a call-back is the next step. The cost of a call-back far outweighs the incremental cost of a 1.0 sone WHMV fan, making the 1.0 sone WHMV fan a cost-savings measure for those builders who are not currently specifying them.

M1507.3 (NEW)-RM-MOORE.DOC

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The code official cannot easily identify the sone ratings of fans from the HVI directory. The proposal could require more costly fans and this is not appropriate for a minimum code.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Mike Moore, Newport Ventures, representing Broan-NuTone, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

M1507.3 Sound Ratings. Ventilation fans <u>intended to operate continuously or as a component of a whole-house mechanical ventilation system</u> shall have a <u>maximum</u> sound performance <u>of 1.0 sone.</u>~~in accordance with the following:~~

~~1. For whole-house or continuous ventilation fans: maximum of 1.0 sone.~~
~~2. For intermittent local exhaust fans: maximum of 3.0 sone.~~

Exceptions:

1. Fans having a maximum rated airflow exceeding 400 cfm.
2. ~~HVAC air handlers and~~ Fans mounted with not less than 4 ft (1 m) of ductwork between the fan and the intake grille.
3. <u>Heating and cooling equipment air handlers.</u>

Commenter's Reason: Based on the committee's resistance to a maximum sound requirement for intermittently operating fans, this proposal has been modified to only address sound requirements for whole-house mechanical ventilation fans and fans that are intended to be operated continuously (e.g., a bath fan at 20 cfm per section M1507.4). This change is proposed to ensure that the fans which are critical to maintaining indoor air quality meet minimum requirements for acceptable levels of noise.

Ventilation fans only work when they're turned on, and the number one reason typically given by home owners for not turning on a ventilation fan is, "it's too noisy".[1,2,3] As homes have become tighter, the use of whole house mechanical ventilation (WHMV) for maintaining acceptable indoor air quality has become necessary. Installing a fan that will not be operated due to noise is a disservice to the homeowner, a liability to their health, and a risk to the home's durability (can lead to excess condensation on windows, increased potential for mold and rot, etc.).

This proposed requirement mirrors that adopted by the state of California and ASHRAE 62.2. Maximum sone levels for WHMV fans have been enforced by Washington State's code since the late 1980s. The sone values proposed above have been widely accepted by the industry. A sone is linear measure of loudness, meaning that a 1.0 sone fan is over three times as loud as the best rated fans in the HVI directory (i.e., 0.3 sones). The Home Ventilating Institute describes the sone scale as follows:

- 0.5 sone: rustling leaves
- 1.0 sone: refrigerator
- 3.0 sone: typical office
- 4.0 sone: typical television operating

For a fan which is designed to operate continuously (e.g., a WHMV fan), a maximum sone level of 1.0 is necessary to reduce the number of occupants that would turn off the fan due to noise irritation.

The 1.0 sone requirement for WHMV fans has been achieved by over 500 fans listed in the Home Ventilating Institute's certified product directory (www.hvi.org), with many fans operating at less than 0.3 sones.

RM40-13

Final Action: AS AM AMPC____ D

RM41-13
M1507.3.1

Proposed Change as Submitted

Proponent: Jerry Anderson, City of Overland Park, KS, representing self (jerry.anderson@opkansas.org)

Revise as follows:

M1507.3.1 System design. The whole-house ventilation system shall consist of one or more supply or exhaust fans, or a combination of such, and associated ducts and controls. Local exhaust or supply fans are permitted to serve as such a system. <u>Systems designed to supply air shall supply outdoor air.</u> ~~Outdoor air ducts connected to the return side of an air handler shall be considered to provide supply ventilation.~~

Reason: The purpose of this code change is to make it clear that the airflow for mechanical ventilation systems designed to supply air shall take that air from the outdoors. The sentence being deleted is no longer necessary. It doesn't matter how the outdoor air is distributed. What matters in this code section is that supply air comes from the outdoors.

Cost Impact: No cost associated with this change.

M1507.3.1-RM-ANDERSON.DOC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Approval was based upon the proponent's published reason.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Richard Grace, Fairfax County Government, representing Virginia Plumbing and Mechanical Inspectors Association (VPMIA) and Virginia Building and Code Officials Association (VBCOA), requests Disapproval.

Commenter's Reason: This proposal completely changed the intent of this section. This language can now be interpreted as requiring 100% outdoor air to be delivered; no recirculation of indoor air is permitted with this language.

RM41-13
Final Action: AS AM AMPC____ D

RM42-13
M1507.3.2

Proposed Change as Submitted

Proponent: Jerry Anderson, representing the City of Overland Park, Kansas

Revise as follows:

M1507.3.2 System controls. ~~The~~ Whole-house mechanical ventilation systems designed for intermittent operation in accordance with Section M1507.3.3 shall utilize a 24 hour timer control capable of cycling the fan(s) on and off as needed. Whole-house mechanical ventilation systems shall be provided with controls that enable manual override.

Reason: The purpose of the code change is to require an automatic timer switch for those fans that are designed to be run intermittently. In the exception to Section M1507.3.3 the code allows for whole-house mechanical ventilation systems to be operated intermittently. The word "intermittently" can mean different things to different people. A local exhaust fan operated manually by a wall switch could easily be considered to be an intermittent fan system. I think that the code assumes that there will be some sort of automation built into intermittent systems. I don't think that the code intends the systems to be manually operated. Therefore, I have inserted language which makes it clear that a manual switch is not allowed.

Cost Impact: There would be a small cost associated with the timer switch, if they are not already being provide for.

M1507.3.2-RM-ANDERSON.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposal will increase the cost of construction. Twenty-four hours is not the proper time interval.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Gerald Anderson, representing the City of Overland Park, Kansas, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

M1507.3.2 System controls. Whole-house mechanical ventilation systems designed for intermittent operation in accordance with Section M1507.3.3 shall utilize a ~~24 hour timer~~ control device capable of cycling the fan(s) on and off automatically as needed. Whole-house mechanical ventilation systems shall be provided with controls that enable manual override.

Commenter's Reason: The purpose of the code change is to require an automatic timer switch for those fans that are designed to be run intermittently. In the exception to Section M1507.3.3 the code allows for whole-house mechanical ventilation systems to be operated intermittently. The word "intermittently" can mean different things to different people. A local exhaust fan operated manually by a wall switch could easily be considered to be an intermittent fan system. I think that the code assumes that there will be some sort of automation built into intermittent systems. I don't think that the code intends the systems to be manually operated. Therefore, I have inserted language which makes it clear that a manual switch is not allowed.

RM42-13
Final Action: AS AM AMPC____ D

RM44-13
M1508.1 (New)

Proposed Change as Submitted

Proponent: Craig Conner, representing self

Add text as follows:

M1508.1 Venting and Depressurization. Gas-and oil-fired space- heating and gas-and oil-fired water-heating combustion appliances in new dwelling units shall comply with at least one of the following:

1. Space- heating and water-heating combustion appliances located within a dwelling unit's air barrier shall be of the direct-vent type.
2. Space heating appliances and water heating appliances located within a dwelling unit's air barrier shall be of the direct- vent or mechanical draft type. Mechanical ventilation shall be provided in accordance with Section M1507. Makeup air shall be provided for each of the dwelling unit's three largest exhaust systems at a rate approximately equal to or greater than the design exhaust rate. Makeup air systems shall be equipped with not less than one gravity or motorized damper. Motorized dampers shall be automatically controlled to operate simultaneously with the exhaust systems.
3. Space-heating and water-heating combustion appliances shall not be located within a dwelling unit's air barrier. For purposes of this option, appliances located in a mechanical room separated from the conditioned space by an air barrier shall be considered to be outside of a dwelling unit's air barrier.

Exceptions: The section shall not apply to:

1. Dwelling units with a tested air tightness of greater than 3 ACH50
2. Dwelling units having a tested depressurization that is within the limits specified by an approved test.

Reason: Backdrafting combustion appliances can lead to serious health consequences. The IECC and common practices are increasing the potential for backdrafting in homes. The IECC requires a building envelope tested to be 3 ACH50 or less in the middle and northern climate zones. This change is designed to greatly reduce the likelihood of backdrafting in those tight homes.

Back drafting is most likely to occur if three things are true- construction is airtight, exhaust-only ventilation is used, and atmospherically vented (natural draft) combustion appliances are in conditioned spaces. The IECC has both testing and prescriptive measures to increase envelope tightness and should routinely produce airtight construction. Mechanical ventilation is required for residences, with the least expensive form of mechanical ventilation being the exhaust-only ventilation fans already in common use. The energy code no longer encourages more efficient condensing furnaces by recognizing their high energy efficiency; thereby, removing some of the motivation for condensing furnaces. The trend towards large exhaust fans, such as kitchen hoods, also contributes to the problem. This combination is a recipe for back drafting problems.

The proposed change gives several options. These options prevent back drafting by eliminating at least one of major contributor; eliminating the natural draft (atmospherically vented) combustion appliances, eliminating the large exhaust-only ventilation, or taking the combustion outside the air barrier. An exception adds a depressurization test option, which tests for excessive depressurization levels in dwelling units.

Cost Impact: The code change proposal will not increase the cost of construction.

M1508 (NEW)-RM-CONNER.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: Same reason as RM32-13.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Craig Conner, Building Quality, representing self and Dan Buuck, CBO, representing National Association of Home Builders (NAHB), request Approval as Modified by this Public Comment.

Modify the proposal as follows:

M1508.1 Venting and Depressurization. Gas-and oil-fired space- heating and gas-and oil-fired water-heating combustion appliances in new dwelling units shall comply with one or more of the following:

1. Space- heating and water-heating combustion appliances located within a dwelling unit's air barrier shall be of the direct-vent type.
2. Space heating ~~appliances~~ and water heating combustion appliances located within a dwelling unit's air barrier shall be of the ~~direct-vent or~~ *mechanical draft* type or a combination of mechanical draft and direct-vent types. Mechanical ventilation shall be provided in accordance with Section M1507. Makeup air shall be provided for each of the dwelling unit's ~~three~~ two largest exhaust systems, other than the kitchen exhaust system, at a rate approximately equal to or greater than the design exhaust rate. Makeup air systems shall be equipped with not less than one gravity or motorized damper. Motorized dampers shall be automatically controlled to operate simultaneously with the exhaust systems. Kitchen exhaust systems shall be provided makeup air in accordance with Section M1503.4.
3. Space-heating and water-heating combustion appliances shall not be located within a dwelling unit's air barrier~~. For purposes of this option, appliances located in a mechanical room separated from the conditioned space by an air barrier shall be considered to be outside of a dwelling unit's air barrier~~.

   Exceptions: The section shall not apply to:

   1. Dwelling units with a tested air tightness of greater than 3 ACH50.
   2. Dwelling units having a tested depressurization that is within the limits specified by an approved test.
   3. Dwelling units that do not have an exhaust-only whole-house mechanical ventilation system.
   4. Space-heating and water-heating combustion appliances that are located in a mechanical room and provided with combustion air supplied entirely from ducts to the outdoors or direct openings to the outdoors.

Commenter's Reason:
Conner: This modification:

--lets the existing kitchen exhaust section in the IRC continue to handle kitchen exhaust
--clarifies the language on the option for equipment in mechanical rooms
--makes it clear that eliminating exhaust-only ventilation is one option, but not a requirement

Buuck: Builders are concerned that more stringent energy codes have made previously acceptable building practices unsafe due to tighter building envelope requirements. This code change would create a new section to address depressurization concerns for the house as a system.

This public comment fixes a conflict in Item 2 with Section M1503.4 which addresses makeup air for kitchen exhaust systems. The originally proposed language requires makeup air to be "provided for each of the dwelling unit's three largest exhaust systems at a rate approximately equal to or greater than the design exhaust rate." This would apply to kitchen exhaust systems as well, and they are already covered in their own section.

The original proposal does not differentiate between appliances which draw their combustion air entirely from indoors and those that are supplied with outdoor combustion air only (either the one or two permanent opening method). Appliances that are supplied with air from permanent openings to the outside and located in a separate room will be "invisible" to depressurization elsewhere in the dwelling. (G2407.6).

Although creating a mechanical room that is separated from the conditioned space by an air barrier (see Item 3) may seem reasonable at first, this would be extremely difficult in those regions of the country where the furnace is in the same space as the water heater. It would be very difficult to create an air barrier around all the ductwork penetrating the mechanical room enclosure. In the residences where this option works, locating the appliances in a mechanical room closed off from the rest of the dwelling and supplying that room with combustion air directly from the outdoors protects the appliances from the effects of exhaust systems elsewhere in the dwelling.

The word "combustion" was added to Item 2 to correlate it with the language used in Items 1 and 3.

RM44-13
Final Action: AS AM AMPC____ D

RM45-13
M1601.1.1

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown Texas representing the ICC PMG Code Action Committee (dave.hall@georgetown.org)

Revise as follows:

M1601.1.1 Above-ground duct systems. Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to a maximum of 250ºF (121ºC).
2. Factory-made air ducts shall be constructed of Class 0 or Class 1 materials as designated in Table M1601.1.1(1).
3. Fibrous duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards*.
4. Minimum thickness of metal duct material shall be as listed in Table M1601.1.1(2). Galvanized steel shall conform to ASTM A 653. Metallic ducts shall be fabricated in accordance with SMACNA Duct Construction Standards Metal and Flexible.
5. Use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.

~~6. *Duct systems* shall be constructed of materials having a flame spread index not greater than 200.~~

~~7.~~ 6. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:

~~7.1~~ 6.1. These cavities or spaces shall not be used as a plenum for supply air.
~~7.2~~ 6.2. These cavities or spaces shall not be part of required fire-resistance-rated assembly.
~~7.3~~ 6.3. Stud wall cavities shall not convey air from more than one floor level.
~~7.4~~ 6.4 Stud wall cavities and joist-space plenum shall be isolated from adjacent concealed spaces by tight-fitting fire blocking in accordance with Section R602.8.
~~7.5~~ 6.5. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.

Reason: Considering the subject of items #2 and #3, it is not apparent what item #6 is intended to address. Item #2 requires factory-made ducts to have a maximum flame spread index of 50, so why does item #6 state an index of 200 maximum?? Current section M1601.2 requires factory-made ducts to comply with UL 181, and UL 181 requires all ducts to have a maximum flame spread index of 50. If item #6 addresses factory-made ducts, then it conflicts with Item #2 and Section M1601.2.
If item #6 was intended to address plastic ducts, it then begs the question as whether plastic ducts are allowed above ground in dwellings. An ICC formal interpretation on this exact question was issued and it states that plastic ducts are allowed above ground if they can meet class 0 or class 1, meaning that the maximum flame spread index could not exceed 50. With the broad definition of "*duct systems*" in the IRC, the purpose of item #6 is even more unclear. Item #6 is confusing and appears to be unnecessary because the code already addresses the various duct materials in other text.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: The code change proposal will not increase the cost of construction.

M1601.1.1 #1-RM-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposal eliminates the use of plastic ducts, registers and grills.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Shawn Strausbaugh of Arlington County, Virginia representing the ICC PMG Code Action Committee requests Approval as Submitted.

Commenter's Reason: Reason: Section 603.8.3 of the IMC specifically prohibits the use of plastic ducts and fittings in above-ground applications. Plastic ducts and fittings are not allowed in the IMC because they have not demonstrated equivalency with established performance, flame spread and smoke generation requirements for above ground ducts and fittings. As currently worded, Section 1601.1.1 item 6 can be interpreted to allow plastic ducts and fittings in above-ground applications.

Current requirements for aboveground ducts (SMACNA, NAIMA and UL) include performance requirements such as corrosion resistance, mold growth resistance, puncture, static load, impact, leakage, erosion, and other requirements as specified in the appropriate document. All of these ducts are required to meet a smoke generation index of 50 or less in addition to the flame spread index of 25 or less. All ducts should be required to meet the established performance, flame and smoke generation requirements which are vital to these systems.

Public Comment 2:

Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., representing General Plastics, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

M1601.1.1 Above-ground duct systems. Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to a maximum of 250ºF (121ºC).
2. Factory-made air ducts shall be constructed of Class 0 or Class 1 materials as designated in Table M1601.1.1(1).
3. Fibrous duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards*.
4. Minimum thickness of metal duct material shall be as listed in Table M1601.1.1(2). Galvanized steel shall conform to ASTM A 653. Metallic ducts shall be fabricated in accordance with SMACNA Duct Construction Standards Metal and Flexible.
5. Use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. <u>Plastic</u> duct systems shall be constructed of materials having a flame spread index not greater than 200.
7. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
   7.1 These cavities or spaces shall not be used as a plenum for supply air.
   7.2 These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
   7.3 Stud wall cavities shall not convey air from more than one floor level.
   7.4 Stud wall cavities and joist-space plenum shall be isolated from adjacent concealed spaces by tight-fitting fire blocking in accordance with Section R602.8.
   7.5 Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.

Commenter's Reason: While the PMG CAC indicated that they did not know the origin of this requirement, it was pointed out at the Dallas hearing that the requirement was based on the allowance of plastic duct systems above ground. Since this is the purpose of this section, rather than deleting the requirement, I have added clarity so that it would be understood what is permitted.
This code requirement can be traced back to a change that I proposed to allow plastic ducts above ground. The Committee chose to add an Item 6 rather than accept my more extensive change on plastic ducts. The Committee recognized that by inserting Item 6 my

change to allow plastic ducts was also accomplished.

It is unfortunate that this requirement has been misinterpreted. Adding the word “plastic” may eliminate all the misinterpretations.

RM45-13

Final Action: AS AM AMPC____ D

RM53-13
M1601.4.1

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown Texas representing the ICC PMG Code Action Committee (dave.hall@georgetown.org); Vickie Lovell, InterCode Inc., representing DuctMate Industries (Vickie@intercodeinc.com)

Revise as follows:

M1601.4.1 Joints, seams and connections. All longitudal and transverse joints, seams and connections in metallic and nonmetallic ducts shall be constructed as specified in SMACNA HVAC Duct Construction Standards—Metal and Flexible and NAIMA Fibrous Glass Duct Construction Standards. All joints, longitudinal and transverse seams, and connections in ductwork shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems or tapes. Closure systems used to seal flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked "181 B-FX" for pressure sensitive tape or "181 BM" for mastic. Duct connections to flanges of air distribution system equipment shall be sealed and mechanically fastened. Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked 181B-C. Crimp joints for round metallic ducts shall have a contact lap of not less than 1 inch (25.4 mm) and shall be mechanically fastened by means of not less than three sheet-metal screws or rivets equally spaced around the joint. Closure systems used to seal metal ductwork shall be installed in accordance with the manufacturers' instructions. Round metallic ducts shall be mechanically fastened by means of at least three sheet metal screws or rivets spaced equally around the joint. Unlisted duct tape shall not be permitted as a sealant on any duct.

Exceptions:

1. Spray polyurethane foam shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.
3. ~~Continuously welded and locking type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.~~ <u>For ducts having a static pressure classification of less than 2 inches of water column (500Pa), additional closure systems shall not be required for continuously welded joints and seams and locking-type joints and seams of other than the snap-lock and button-lock types.</u>

Reason:
(Hall-PMGCAC): Unless sealant or a gasket is used, snap-lock and button-lock type seams will leak significantly. The current exception attempted to prevent unnecessary sealing for joints and seams that leak very little or not at all, but it went too far by including all locking type joints and seams. Some locking joints are leakproof such as mechanically folded seams used for spiral seam duct, but this cannot be said for all locking joints. This text was approved for the 2015 IMC.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Lovell): This proposed text is derived from a revision to the International Mechanical Code that was proposed by the PMG Code Action Committee in M151-12 and was approved by the voting membership in Portland for the 2015 IMC. That reason statement is supplied below:

Unless sealant or a gasket is used, snap-lock and button-lock type seams will leak significantly. The current exception attempted to prevent unnecessary sealing for joints and seams that leak very little or not at all, but it went too far by including all locking type joints and seams. Some locking joints are leakproof such as mechanically folded seams used for spiral seam duct, but this cannot be said for all locking joints.

The identical proposal that was approved As Submitted in the Mechanical Code hearings in Portland is being submitted to the 2015 IECC residential requirements for consistency.

Cost Impact:
(Hall-PMGCAC): The code change proposal will not increase the cost of construction.

(Lovell): This proposal reduces the cost of installation.

M1601.4.1 #2-RM-HALL-LOVELL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposal increases the cost of construction and provides insufficient benefit for the added cost. Duct leakage within the thermal envelope is not a problem.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Vickie Lovell, INTERCODE, INC., representing Rectorseal, requests Approval as Submitted.

Commenter's Reason: We respectfully disagree with the committee's reason for disapproval. Leakage in ducts with snap-lock and button type seam IS a problem unless a sealant or gasket is used. The small increase in cost provides a realized cost-benefit from the optimum performance of the HVAC system to cool and heat the house.

The IMC code development committee and the voting audience agreed and voted for approval of this code change proposal for the 2015 IMC. The ICC PMG Code Action Committee and the IECC Code Development Committee also recommended approval of this proposal**.**

Public Comment 2:

Shawn Strausbaugh of Arlington County, Virginia representing the ICC PMG Code Action Committee requests Approval as Submitted.

Commenter's Reason: The committee believed that ducts should be able to leak into the conditioned spaces, however, this section addresses ducts in all locations including those outside of the conditioned space. Duct leakage is detrimental even within the conditioned space because the system will not deliver air to the intended spaces if the ducts leak air into unintended locations. The system will result in overheated or over cooled spaces and under heated or under cooled spaces which causes thermostat adjustments to overcome the thermal discomfort of the occupants. This results in poor energy performance.

RM53-13
Final Action: AS AM AMPC____ D

RM54-13
M1601.4.10 (New)

<u>Proposed Change as Submitted</u>

Proponent: Josh O'Connor, representing self

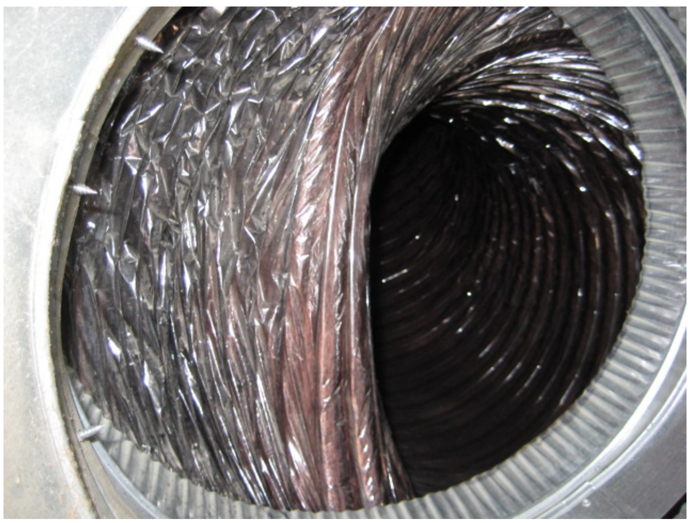
Add new text as follows:

<u>**M1601.4.10 Wall Pass-Through.** The opening in a concrete or masonry foundation wall through which supply and return air ducts from an HVAC unit are intended to pass shall have a width of not less than 42 inches.</u>

Reason: National homebuilders are making this opening only 32 inches wide. This is not wide enough for the supply and return air ducts to have a straight run through the wall from the supply and return ports on the HVAC unit.

When the air ducts have to veer sharply in one direction after they come off of the port in order to get to the opening in the wall, airflow is restricted inside the duct. NOTE: the ports open straight forward, facing the wall of the house. When the duct veers, it blocks the opening of the port. The ducts need a straight run.

Three (3) photos are attached to this proposal form. (photos were taken at my residence, after rain hood was removed from the HVAC unit)



Cost Impact: NONE

M1601.4.10-RM-O'CONNOR.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The opening size depends on the size of the ducts, not some arbitrary dimension such as 42 inches. Proper fittings should be used.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Josh O'Connor, representing self, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

~~M1604.4.10~~ R404.6 Wall Pass-Through. The opening in a concrete or masonry foundation wall through which supply and return air ducts from an HVAC unit are intended to pass shall have a width of not less than 42 inches.

Commenter's Reason: This proposal should never have been placed in Mechanical because this proposal addresses the building of the foundation wall, not the installation of mechanical. This proposal was disapproved in Committee Action Hearings in Mechanical.

RM54-13

Final Action: AS AM AMPC____ D

RM56-13
M1601.4.3

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown Texas representing the ICC PMG Code Action Committee (dave.hall@georgetown.org)

Revise as follows:

M1601.4.3 Support. ~~Metal ducts shall be supported by 1/2-inch (13 mm) wide 18-gage metal straps or 12-gage galvanized wire at intervals not exceeding 10 feet (3048 mm) or other *approved* means. Nonmetallic ducts shall be supported in accordance with the manufacturer's installation instructions.~~ Ducts shall be supported in accordance with SMACNA *HVAC Duct Construction Standards—Metal and Flexible*.

Reason: This section should just reference the SMACNA standards as opposed to specifying a support interval. The 10 foot interval requirement is too broad and is inappropriate for many sizes and types of ducts . Many ducts require closer supports. This text could be easily interpreted as allowing 10 feet maximum support intervals for all ducts. This section is not being enforced since nobody installs 18 gage metal straps to support residential ducts.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: The code change proposal will increase the cost of construction.

. **M1601.4.3-RM-HALL-PMGCAC**

Committee Action Hearing Results

Committee Action: **Disapproval**

Committee Reason: Multiple attempts to modify the proposal indicate that it needs to be reworked in a public comment.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County, Virginia representing the ICC PMG Code Action Committee requests Approval as Modified by this Public Comment.

Replace proposal as follows:

M1601.4.3 Support. ~~Metal ducts shall be supported by 1/2-inch (13 mm) wide 18-gage metal straps or 12-gage galvanized wire at intervals not exceeding 10 feet (3048 mm) or other *approved* means. Nonmetallic ducts shall be supported in accordance with the manufacturer's installation instructions.~~ Factory made ducts listed in accordance with UL181 shall be supported in accordance with the manufacturer's installation instructions. Field- and shop-fabricated fibrous glass ducts shall be supported in accordance the SMACNA *Fibrous Glass Duct Construction Standards* or the NAIMA *Fibrous Glass Duct Construction Standards*. Field- and shop-fabricated metal and flexible ducts shall be supported in accordance with the SMACNA *HVAC Duct Construction Standards—Metal and Flexible*.

Reason: The 10 foot interval requirement is too broad and is inappropriate for many sizes and types of ducts . Many ducts require closer supports. This text could be easily interpreted as allowing 10 feet maximum support intervals for all ducts. This section should just reference the appropriate support requirements as specified in the applicable manual or listing. Definitions are added to clarify intent of terminology for the different type of ducts

RM56-13

Final Action: AS AM AMPC____ D

RM58-13
M1602.4 (New), M1602.4.1 (New)

Proposed Change as Submitted

Proponent: Jeff Sonne, Florida Solar Energy Center, representing the Florida Solar Energy Center, (jeff@fsec.ucf.edu)

Add new text as follows:

M1602.4 Balanced return air. Provisions shall be made to prevent unbalanced air flows and pressure differentials caused by restricted return air flow. Pressure differentials caused by air distribution systems across individually closed interior doors, where return air intakes are centrally located, shall be limited to 0.01 inch WC (2.5 pascals). Pressure differentials across fire walls and other partitions within ceiling space plenums shall be limited to 0.01 inch WC (2.5 pascals) by providing air duct pathways or air transfer pathways from the high pressure zone to the low pressure zone.

M1602.4.1 Prescriptive alternatives. The following are alternatives to the requirements of Section M1602.4 and apply only to habitable rooms.

1. Transfer ducts or other transfer pathways shall be provided and shall have an area that is not less than 1½ times the cross sectional area of the supply duct or supply ducts serving the room or space. In addition, the room entry door shall have an unrestricted 1 inch (25.4 mm) or greater undercut.
2. Transfer grilles shall be provided and shall have an area of not less than 0.50 square inches for each 1 cfm of supply air. In addition, the room entry door shall have an unrestricted 1 inch (25.4 mm) or greater undercut.

Reason: Restricted return air affects building pressures and increases air infiltration which in turn increases energy use and can cause comfort, building durability, and health and safety issues. A similar balanced return air requirement is already in the Florida Building Code for these reasons.

Supporting publication: Cummings, J., C. Withers, "Balanced Return Air, Duct Airtightness, and Combustion/Dilution Air Code Compliance in 40 Central Florida Homes" Florida Solar Energy Center, FSEC-CR-1789-06, Nov. 29, 2006. (http://www.fsec.ucf.edu/en/publications/pdf/FSEC-CR-1789-06.pdf)

Cost Impact: The code change proposal will increase the cost of construction. A Florida HVAC contractor indicates the extra material cost for a three bedroom home is $60 and 1.5 hours of labor. In his opinion, a very small price for the extra comfort and avoidance of problems.

M1602.4 (NEW)-RM-SONNE.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposed text:

1. Increases the cost of construction.
2. Is too confusing.
3. Is above minimum code.
4. Is Florida specific.
5. Will be difficult to inspect.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jeff Sonne representing Florida Solar Energy Center, requests Approval as Submitted.

Committee Reason: The proposed text:

1. Increases the cost of construction.
   a. Comment: while installing return air pathways adds to first cost, it reduces energy waste that results from increased air infiltration and yields a reduced life-cycle cost. Monitored energy savings finds payback of 3 years.
2. Is too confusing.
   a. Comment: this has been successfully implemented in Florida with little difficulty. Comparison of homes built prior to the code change to those after the code change showed a 74% reduction in pressure differentials across closed interior doors, from an average of 9.1 pascals to 2.4 pascals.
3. Is above minimum code.
   a. Comment: Providing return air pathways should be minimum code requirements and has been accepted as good practice for decades.
4. Is Florida specific.
   a. Comment: While much of the research has been done in Florida, the problem exists across the United States, wherever unequal return and supply air flows occur within an enclosed space.
      i. In hot and humid climates, the unbalanced return air causes significant increase in air flow across the building envelope, adding to space conditioning loads and increasing latent loads and indoor relative humidity.
      ii. In cold climates, unbalanced return air also causes significant increase in air flow across the building envelope, which increases space conditioning loads, may push indoor relative humidity to unacceptably low levels, and may lead to freezing of pipes.
5. Will be difficult to inspect.
   a. Comment: The prescriptive alternatives are widely used in Florida, and there have been few problems in verifying compliance in Florida code jurisdictions. Inspection of these alternatives is straightforward.
   b. Contractors readily learn what steps are required to achieve the 2.5 pascal target.

RM58-13

Final Action: AS AM AMPC____ D

RM59-13
M1804.4 (New)

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown Texas representing the ICC PMG Code Action Committee (dave.hall@georgetown.org)

Add new text as follows:

M1804.4 Door swing. Appliance and equipment vent terminals shall be located such that doors cannot swing within 12 inches (305 mm) horizontally of the vent terminals. Door stops or closures shall not be installed to obtain this clearance.

Reason: This new language was approved for the 2015 IMC. Any appliance vent can be subject to damage as a result of a door swing even when the vent has been installed in accordance with the manufacturer's instructions. Most manufacturers do not address proximity to doors on a different plane. Even if the door doesn't come in contact with the vent terminal, the door could be left too close to the vent when the appliance is operating and possibly overheating the door and/or interfering with the operation of the vent terminal.

Cost Impact: None

M1804.4 (NEW)-RM-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: This text is not needed because it is covered in section G2427.6.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO), requests Approval as Submitted.

Commenter's Reason: This was approved by the Mechanical and Fuel Gas committees and is applicable in this Section. The Committee concern was that this will already be covered in Chapter 24. Chapter 24 will have this exact same text because it was approved in the IFGC. Chapter 24 extracts the IFGC text. Putting this text in Chapter 18 will cover vent terminals from oil and biomass-fired appliances.

Public Comment 2:

Shawn Strausbaugh of Arlington County, Virginia representing the ICC PMG Code Action Committee requests Approval as Submitted.

Commenter's Reason: The committee stated that this proposed text is already provided in Section G2427.6 of the IRC. The venting provisions related to doors and windows found in Chapter 24 have nothing to do with the door swing issue addressed by the proposed new text. Chapter 24 deals with the concern for vent gasses entering the building, not the concern for the door impacting the vent terminal. Neither the codes nor the manufacturer's instructions cover the issue of doors swinging into vent terminals.

Chapter 18 covers other than gas-fired appliance vent terminals. The new text in this proposal will automatically be added to Chapter 24 as it is taken from the IFGC.

Final Action: AS AM AMPC____ D

RM62-13
M2001.1

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown Texas representing the ICC PMG Code Action Committee (dave.hall@georgetown.org)

Revise as follows:

M2001.1 Standards. Packaged oil-fired boilers ~~and their control systems shall~~ be listed and labeled in accordance with UL 726. Packaged electric boilers ~~and their control systems~~ shall be listed and labeled in accordance with UL 834. Solid-fuel-fired boilers shall be listed and labeled in accordance with UL 2523. Boilers shall be designed, ~~and~~ constructed and certified in accordance with the requirements of ASME CSD-1 and as applicable, the ASME *Boiler and Pressure Vessel Code*, Section I or IV. Controls and safety devices for boilers with fuel input ratings of 12,500,000 Btu/hr (3 663 388 watts) or less shall meet the requirements of ASME CSD-1. Gas fired boilers shall conform to the requirements listed in Chapter 24.

Reason: This revised language was approved for the 2015 IMC. Current wording is not correct since ASME CSD-1 is not a construction standard. The proposed wording starts with the vessel construction requirements and continues with the acceptable standards for complete appliances. The proposed wording is no change from the intent of the previous wording.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Cost Impact: The code change proposal will not increase the cost of construction.

M2001.1-RM-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: Approval was based upon the proponent's published reason.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County, Virginia representing the ICC PMG Code Action Committee requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

M2001.1 Standards. Packaged oil-fired boilers be listed and labeled in accordance with UL 726. Packaged electric boilers shall be listed and labeled in accordance with UL 834. Solid-fuel-fired boilers shall be listed and labeled in accordance with UL 2523. Boilers shall be designed, constructed and certified in accordance with the ~~requirements of ASME CSD-1 and as applicable, the~~ ASME *Boiler and Pressure Vessel Code*, Section I or IV. Controls and safety devices for boilers with fuel input ratings of 12,500,000 Btu/hr (3 663 388 watts) or less shall meet the requirements of ASME CSD-1. Gas fired boilers shall conform to the requirements listed in Chapter 24.

Commenter's Reason: The proposed wording was recommended for approval by the committee but the text does not match the parallel section in the IMC. Boilers are not constructed in accordance with ASME CSD-1. The intent of this proposal was to match the IMC, therefore a slight modification is needed to accomplish this.

RM62-13

Final Action: AS AM AMPC____ D

RM72-13
M2103.3, Chapter 44

Proposed Change as Submitted

Proponent: Pennie L. Feehan, Pennie L. Feehan Consulting, representing Copper Development Association (penniefeehan@me.com)

Revise as follows:

M2103.3 Piping joints. <u>Copper and copper alloys systems shall be soldered in accordance with ASTM B828. Fluxes for soldering shall be in accordance with ASTM B813 and shall become noncorrosive and non-toxic after soldering. Brazing fluxes shall be in accordance with AWS A5.31.</u> Piping joints that are embedded shall be installed in accordance with the following requirements:

Add new standard to Chapter 44 as follows:

<u>ANSI/AWS A5.31M/A5.31:2012 Specification for Fluxes for Brazing and Braze Welding Edition: 2nd</u>

Reason: Because hydronic systems are not potable system, inspectors and installers are not following the proper methods of installing copper pipe and tubing. Fluxes used for soldering copper tube and fittings must meet the requirements of ASTM B813.

Cost Impact: None

Analysis: A review of the standard proposed for inclusion in the code, [ANSI/AWS A5.31M/A5.31-2012] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

M2103.3-RM-FEEHAN.DOC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The proposal will improve joint quality.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh, Arlington County, VA, representing VA Plumbing & Mechanical Inspectors Association (VPMIA) & VA Building Code Officials Association (VBCOA), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

M2103.3 Piping joints. Copper and copper alloys systems shall be soldered in accordance with ASTM B828. Fluxes for soldering shall be in accordance with ASTM B813 ~~and shall become noncorrosive and non-toxic after soldering~~. Brazing fluxes shall be in accordance with AWS A5.31. Piping joints that are embedded shall be installed in accordance with the following requirements:

Items 1 through 6 *(no change to current text)*

Commenter's Reason: The additional language shown struck out is not needed in the code text as fluxes are required to be non corrosive and non toxic per ASTMB813. The field inspector must rely on the standard to specify this and will not be able to test for the non corrosiveness or toxicity in the field.

RM72-13

Final Action: AS AM AMPC____ D

RM77-13

M2301.2.2 (New), M2301.2.2, M2301.2.2.2 (New), Chapter 44

Proposed Change as Submitted

Proponent: David Hall, Vice Chair, Plumbing/Mechanical/Gas Code Action Committee, (dave.hall@georgetown.org) and Brenda A. Thompson, Clark County Building Department, Las Vegas NV, Chair, Sustainability, Energy & High Performance Code Action Committee (bat@ClarkCountyNV.gov)

Revise as follows:

M2301.2.2 Collectors and panels. Solar collectors and panels shall comply with Sections M2301.2.2.1 and M2301.2.2.2.

M2301.2.2.1 ~~**M2301.2.2**~~ **Roof-mounted collectors.** The roof shall be constructed to support the loads imposed by roof-mounted solar collectors. Roof-mounted solar collectors that serve as a roof covering shall conform to the requirements for roof coverings in Chapter 9 of this code. Where mounted on or above the roof coverings, the collectors and supporting structure shall be constructed of noncombustible materials or fire-retardant-treated wood equivalent to that required for the roof construction.

M2301.2.2.2 Collector sensors. Collector sensor installation, sensor location and the protection of exposed sensor wires from ultraviolet light shall be in accordance with SRCC 300.

Add new standard to Chapter 44 as follows:

SRCC
Solar Rating & Certification Corporation
400 High Point Drive, Suite 400
Cocoa, Florida 32926

SRCC 300-13 Standard 300 For Solar Water Heating Systems

Reason: This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) and the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The PMGCAC and SEHPCAC were established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since their inception in July, 2011, the PMGCAC and SEHPCAC have held multiple open meetings and conference calls and workgroup calls which included members of the PMGCAC and SEHPCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

This proposal revises existing Section M2301.2.2 into a parent section and two subsections. This was done in order to reference requirements related to collector sensors that are contained in SRCC 300. These collector sensor requirements are based on the manner in which the New York State Field Inspection Guidelines for Solar Heating Systems reference the SRCC standards.

Please note that the proponents have also submitted other proposals that are coordinated with this proposal. In the spirit of the IRC as a one stop code for one- and two-family dwellings and townhouses, these proposals enhance, update, clarify and improve the usability of the solar energy provisions of Chapter 23 of the IRC and make it truly comprehensive and much more direct and intuitive. This proposal, however, is intended to stand alone and is not contingent upon the success of other PMGCAC or SEHPCAC proposals.

Cost Impact: Where solar systems are provided, this proposal may increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, [SRCC 300-13] with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28), will be posted on the ICC website on or before April 1, 2013.

M2301.2.2 (NEW)-RM-HALL-THOMPSON-SEHPCAC.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposed text is in the wrong location in the code. SRCC 300 is not appropriate for Solar voltaic systems.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Brenda Thompson, CBCO, Manager Building Inspections, Clark County Development Services, ICC Sustainability, Energy and High Performance Code Action Committee (SEHPCAC) Chair requests Approval as Submitted.

Commenter's Reason: The IRC Committee's reason for disapproval of RM77 was that "The proposed text is in the wrong location in the code" and that "SRCC 300 is not appropriate for "solar voltaic systems." However, the proposal was not to portions of the code that addressed "solar voltaic systems." It was to portions of Section M2301 which, in the 2012 IRC, addresses solar thermal systems. It is Section M2302 of the 2012 IRC that addresses "solar voltaic systems." SRCC 300 is a standard that is related to solar thermal systems. Thus the proposal appears to be appropriate as properly evaluated by the committee's evaluation criteria.

This public comment is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held numerous open meetings and workgroup calls which included members of the SEHPCAC, as well as interested parties, to discuss and debate proposed changes and public comments.

Proposed Change as Submitted

Proponent: David Hall, Vice Chair, Plumbing/Mechanical/Gas Code Action Committee, (dave.hall@georgetown.org) and Brenda A. Thompson, Clark County Building Department, Las Vegas NV, Chair, Sustainability, Energy & High Performance Code Action Committee (bat@ClarkCountyNV.gov)

Delete as follows:

~~**M2301.2.2 Roof-mounted collectors.** The roof shall be constructed to support the loads imposed by roof-mounted solar collectors. Roof-mounted solar collectors that serve as a roof covering shall conform to the requirements for roof coverings in Chapter 9 of this code. Where mounted on or above the roof coverings, the collectors and supporting structure shall be constructed of noncombustible materials or fire-retardant-treated wood equivalent to that required for the roof construction.~~

~~**M2301.2.7 Roof and wall penetrations.** Roof and wall penetrations shall be flashed and sealed in accordance with Chapter 9 of this code to prevent entry of water, rodents and insects.~~

~~**M2302.2.1 Roof-mounted panels and modules.** Where photovoltaic panels and modules are installed on roofs, the roof shall be constructed to support the loads imposed by such modules. Roof-mounted photovoltaic panels and modules that serve as roof covering shall conform to the requirements for roof coverings in Chapter 9. Where mounted on or above the roof coverings, the photovoltaic panels and modules and supporting structure shall be constructed of noncombustible materials or fire retardant treated wood equivalent to that required for the roof construction.~~

~~**M2302.2.2 Roof and wall penetrations.** Roof and wall penetrations shall be flashed and sealed in accordance with Chapter 9 to prevent entry of water, rodents and insects.~~

Add new definitions as follows:

SECTION R202
DEFINITIONS

BUILDING INTEGRATED PHOTOVOLTAIC PRODUCT. A building product that incorporates photovoltaic modules and functions as a component of the building envelope.

PHOTOVOLTAIC MODULE. A complete, environmentally protected unit consisting of solar cells, optics and other components, exclusive of tracking hardware, designed to generate DC power when exposed to sunlight.

PHOTOVOLTAIC PANEL. A collection of modules mechanically fastened together, wired, and designed to provide a field-installable unit.

PHOTOVOLTAIC PANEL SYSTEM. A system that incorporates discrete photovoltaic panels, that converts solar radiation into electricity, including rack support systems.

PHOTOVOLTAIC SHINGLES. A roof covering resembling shingles that incorporates photovoltaic modules.

SOLAR THERMAL COLLECTOR. A device that incorporates one or more solar thermal absorbers to absorb incident solar radiation, to convert it to thermal energy, and to transfer the thermal energy to a gas or liquid coming in contact with it.

SOLAR THERMAL LOOP. The portion of the solar thermal system that transports a heated gas or liquid to a collector or storage.

SOLAR THERMAL ABSORBER. A component of a solar collector for absorbing radiant energy and transferring that energy as heat into a fluid.

SOLAR THERMAL PANEL. A solar thermal collector individually mounted or mounted to or within a frame, fastened, and designed to provide a field installable unit.

SOLAR THERMAL PANEL SYSTEM. A system that incorporates discrete solar thermal panels that convert solar radiation into solar energy, including structural support systems such as frames or racks.

SOLAR THERMAL SYSTEM. An assembly of components and subsystems that, in combination, convert solar radiant energy into thermal energy and transfer it to a gas or liquid passing through the system. The heated gas or liquid is then stored or used to provide hot water, space heating, or cooling.

Add new text as follows:

SECTION M2301
GENERAL

M2301.1 General. This chapter provides for the design, construction, installation, alteration and repair of solar energy systems. Solar thermal systems shall comply with Sections M2301 and M2302. Photovoltaic solar energy systems shall comply with Sections M2301 and M2303.

M2301.2 Solar energy equipment and appliances. Solar energy system equipment, appliances and components shall be used and installed in accordance with the manufacturer's instructions and the provisions of this code.

M2301.3 Solar energy system structural requirements. Structural requirements for solar energy systems shall be based upon the type, location and configuration of the system.

M2301.3.1 Systems mounted directly to or above the roof covering. Rooftop solar thermal systems, solar thermal panel systems, and photovoltaic panel systems that are mounted above the roof covering shall be designed in accordance with the International Building Code to support the system and withstand applicable loads. The roof upon which these systems are installed shall be constructed to support the loads imposed by such systems in accordance with Chapter 8. Systems mounted directly to or above the roof covering shall be constructed of noncombustible materials or fire-retardant treated wood.

M2301.3.2 Systems that serve as roof coverings. Where solar thermal systems, solar thermal panel systems, and building integrated photovoltaic systems including, photovoltaic shingles, serve as the roof covering, they shall conform to the requirements for roof coverings in Chapter 9.

M2301.3.3 Ground mounted systems. Ground mounted solar thermal systems, solar thermal panel systems, and photovoltaic systems shall conform to Section R301.

M2301.4 Corrosion prevention. Solar equipment and systems shall be designed to inhibit galvanic and other corrosion between dissimilar metals of solar collectors, panels, modules, supports, fasteners and metal roofs. Paints shall not be used as galvanic corrosion protection.

M2301.5 Interference. Solar collectors, panels and modules shall not obstruct or interfere with the function or operation of access hatchways, roof access doorways, standpipe connections, expansion joints, skylights, operable windows, plumbing vents and mechanical equipment.

M2301.6 Roof and wall penetrations. Roof and wall penetrations shall be flashed in accordance with Chapter 9, Section R703.8 and, where required, shall be sealed in accordance with Chapter 11.

M2301.7 Rooftop mounted system fire classification. Rooftop mounted solar systems shall comply with Section 902.1.

Reason: This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) and the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The PMGCAC and SEHPCAC were established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since their inception in July, 2011, the PMGCAC and SEHPCAC have held multiple open meetings and conference calls and workgroup calls which included members of the PMGCAC and SEHPCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Reasons for this proposal are as follows:

a. Proposed new Section M2301 creates general provisions which are applicable to both solar thermal and solar photovoltaic systems. Solar system designers and installers, as well as code enforcement officials, are often confused as to what is applicable to solar systems.
b. Although it may appear at first glance that existing Sections M2301.2.2 and M2302.2.1 of the 2012 IRC, which address roof-mounted collectors, panels and modules, are being deleted, this proposal moves and clarifies those requirements in proposed new Sections M2301.3 through M2301.3.3.
c. Although it may appear at first glance that existing Sections M2302.2.2 and M2301.2.7 of the 2012 IRC, which address roof and wall penetrations, are being deleted, this proposal moves and clarifies those requirements in proposed new Section M2301.6. New Section M2301.6 also clarifies where the flashing as sealing requirements are located in the code.
d. The definitions for the following are based on definitions as they will appear in the 2015 IBC: photovoltaic panel, photovoltaic module, photovoltaic shingle, building integrated photovoltaic product and photovoltaic panel system.
e. Proposed Section M2301.2 is a modification of Section 1401.4 of the 2012 International Mechanical Code.
f. Proposed Sections M2301.3 through M2301.3.3 provide requirements related to the structural implications of various types of solar systems as related to the way in which they are mounted, supported and located. ICC ES AC428 and AC365 acceptance criteria may also be valuable in the approval of systems for compliance with this section, subject to the evaluation of the local building official.
g. Proposed Sections M2301.4, M2301.5 and M2301.6 are derived from the California Solar Permitting Guidebook.
h. Existing Section M2302.2.2 is revised and renumbered/relocated to proposed Section M2301.6.
i. Proposed Section M2301.7 is essentially a pointer that alerts manufacturers, designers and contractors to the fact that Section 902.1 may have significant implications on solar systems. In cases where the building is located within 3 feet of lot lines, testing for fire classification is required for rooftop systems.

Please note that the proponents have also submitted other proposals that are coordinated with this proposal. In the spirit of the IRC as a one stop code for one- and two-family dwellings and townhouses, these proposals enhance, update, clarify and improve the usability of the solar energy provisions of Chapter 23 of the IRC and make it truly comprehensive and much more direct and intuitive. This proposal, however, is intended to stand alone and is not contingent upon the success of other PMGCAC or SEHPCAC proposals.

Cost Impact: Where solar systems are provided, this proposal may increase the cost of construction.

M2301.2.2-RM-HALL-THOMPSON-SEHPCAC.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposed text is in the wrong location in the code.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Brenda Thompson, CBCO, Manager Building Inspections, Clark County Development Services, ICC Sustainability, Energy and High Performance Code Action Committee (SEHPCAC) Chair requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

SECTION R324
SOLAR ENERGY SYSTEMS

R324.1 General. Solar energy systems shall comply with the provisions of Section R324.

R324.1.1 Ground mounted collectors, panels and modules. Ground mounted solar collectors, panels and modules shall be subject to the fire separation distance requirements of Section R302.1.

Commenter's Reason: The IRC Building Committee's reason for disapproval was that "The proposed text is in the wrong location in the code." The committee approved RM98 Part II, which created a new Section R324 for general solar provisions, references and revises Chapter 23 so that it only addresses solar thermal systems, and relocates the solar photovoltaic provisions to Section R324.4 and Chapter 9. This proposal recognizes these new solar scenarios and revises RM78 to add a subsection to the new "general" solar energy system provisions of Section R324.1, as proposed by RM98 Part II. This new subsection addresses fire separation distance requirements for both solar thermal and solar photovoltaic ground mounted solar systems. As proposed, this public comment will work whether or not RM78 is ultimately approved.

This public comment is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held numerous open meetings and workgroup calls which included members of the SEHPCAC, as well as interested parties, to discuss and debate proposed changes and public comments.

Add new text as follows:

SECTION M2301
GENERAL

M2301.1 General. This chapter provides for the design, construction, installation, alteration and repair of solar energy systems. Solar thermal systems shall comply with Sections M2301 and M2302. Photovoltaic solar energy systems shall comply with Sections M2301 and M2303.

M2301.2 Solar energy equipment and appliances. Solar energy system equipment, appliances and components shall be used and installed in accordance with the manufacturer's instructions and the provisions of this code.

M2301.3 Solar energy system structural requirements. Structural requirements for solar energy systems shall be based upon the type, location and configuration of the system.

M2301.3.1 Systems mounted directly to or above the roof covering. Rooftop solar thermal systems, solar thermal panel systems, and photovoltaic panel systems that are mounted above the roof covering shall be designed in accordance with the International Building Code to support the system and withstand applicable loads. The roof upon which these systems are installed shall be constructed to support the loads imposed by such systems in accordance with Chapter 8. Systems mounted directly to or above the roof covering shall be constructed of noncombustible materials or fire-retardant treated wood.

M2301.3.2 Systems that serve as roof coverings. Where solar thermal systems, solar thermal panel systems, and building integrated photovoltaic systems including, photovoltaic shingles, serve as the roof covering, they shall conform to the requirements for roof coverings in Chapter 9.

M2301.3.3 Ground mounted systems. Ground mounted solar thermal systems, solar thermal panel systems, and photovoltaic systems shall conform to Section R301.

M2301.4 Corrosion prevention. Solar equipment and systems shall be designed to inhibit galvanic and other corrosion between dissimilar metals of solar collectors, panels, modules, supports, fasteners and metal roofs. Paints shall not be used as galvanic corrosion protection.

M2301.5 Interference. Solar collectors, panels and modules shall not obstruct or interfere with the function or operation of access hatchways, roof access doorways, standpipe connections, expansion joints, skylights, operable windows, plumbing vents and mechanical equipment.

M2301.6 Roof and wall penetrations. Roof and wall penetrations shall be flashed in accordance with Chapter 9, Section R703.8 and, where required, shall be sealed in accordance with Chapter 11.

M2301.7 Rooftop mounted system fire classification. Rooftop mounted solar systems shall comply with Section 902.1.

Reason: This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) and the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The PMGCAC and SEHPCAC were established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since their inception in July, 2011, the PMGCAC and SEHPCAC have held multiple open meetings and conference calls and workgroup calls which included members of the PMGCAC and SEHPCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Reasons for this proposal are as follows:

a. Proposed new Section M2301 creates general provisions which are applicable to both solar thermal and solar photovoltaic systems. Solar system designers and installers, as well as code enforcement officials, are often confused as to what is applicable to solar systems.
b. Although it may appear at first glance that existing Sections M2301.2.2 and M2302.2.1 of the 2012 IRC, which address roof-mounted collectors, panels and modules, are being deleted, this proposal moves and clarifies those requirements in proposed new Sections M2301.3 through M2301.3.3.
c. Although it may appear at first glance that existing Sections M2302.2.2 and M2301.2.7 of the 2012 IRC, which address roof and wall penetrations, are being deleted, this proposal moves and clarifies those requirements in proposed new Section M2301.6. New Section M2301.6 also clarifies where the flashing as sealing requirements are located in the code.
d. The definitions for the following are based on definitions as they will appear in the 2015 IBC: photovoltaic panel, photovoltaic module, photovoltaic shingle, building integrated photovoltaic product and photovoltaic panel system.
e. Proposed Section M2301.2 is a modification of Section 1401.4 of the 2012 International Mechanical Code.
f. Proposed Sections M2301.3 through M2301.3.3 provide requirements related to the structural implications of various types of solar systems as related to the way in which they are mounted, supported and located. ICC ES AC428 and AC365 acceptance criteria may also be valuable in the approval of systems for compliance with this section, subject to the evaluation of the local building official.
g. Proposed Sections M2301.4, M2301.5 and M2301.6 are derived from the California Solar Permitting Guidebook.
h. Existing Section M2302.2.2 is revised and renumbered/relocated to proposed Section M2301.6.
i. Proposed Section M2301.7 is essentially a pointer that alerts manufacturers, designers and contractors to the fact that Section 902.1 may have significant implications on solar systems. In cases where the building is located within 3 feet of lot lines, testing for fire classification is required for rooftop systems.

Please note that the proponents have also submitted other proposals that are coordinated with this proposal. In the spirit of the IRC as a one stop code for one- and two-family dwellings and townhouses, these proposals enhance, update, clarify and improve the usability of the solar energy provisions of Chapter 23 of the IRC and make it truly comprehensive and much more direct and intuitive. This proposal, however, is intended to stand alone and is not contingent upon the success of other PMGCAC or SEHPCAC proposals.

Cost Impact: Where solar systems are provided, this proposal may increase the cost of construction.

M2301.2.2-RM-HALL-THOMPSON-SEHPCAC.DOC

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The proposed text does not belong in the mechanical section of the code. Ground mounted systems should not be considered as structures. The wrong UL standard is referenced.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Brenda Thompson, CBCO, Manager Building Inspections, Clark County Development Services, ICC Sustainability, Energy and High Performance Code Action Committee (SEHPCAC) Chair requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION R202
DEFINITIONS

~~**BUILDING INTEGRATED PHOTOVOLTAIC PRODUCT.** A building product that incorporates photovoltaic modules and functions as a component of the building envelope.~~

~~**PHOTOVOLTAIC MODULE.** A complete, environmentally protected unit consisting of solar cells, optics and other components, exclusive of tracking hardware, designed to generate DC power when exposed to sunlight.~~

~~**PHOTOVOLTAIC PANEL.** A collection of modules mechanically fastened together, wired, and designed to provide a field-installable unit.~~

~~**PHOTOVOLTAIC PANEL SYSTEM.** A system that incorporates discrete photovoltaic panels, that converts solar radiation into electricity, including rack support systems.~~

~~**PHOTOVOLTAIC SHINGLES.** A roof covering resembling shingles that incorporates photovoltaic modules.~~

SOLAR THERMAL COLLECTOR. A device that incorporates one or more solar thermal absorbers to absorb incident solar radiation, to convert it to thermal energy, and to transfer the thermal energy to a gas or liquid coming in contact with it.

SOLAR THERMAL LOOP. The portion of the solar thermal system that transports a heated gas or liquid to a collector or storage.

SOLAR THERMAL ABSORBER. A component of a solar collector for absorbing radiant energy and transferring that energy as heat into a fluid.

SOLAR THERMAL PANEL. A solar thermal collector individually mounted or mounted to or within a frame, fastened, and designed to provide a field installable unit.

SOLAR THERMAL PANEL SYSTEM. A system that incorporates discrete solar thermal panels that convert solar radiation into solar energy, including structural support systems such as frames or racks.

SOLAR THERMAL SYSTEM. An assembly of components and subsystems that, in combination, convert solar radiant energy into thermal energy and transfer it to a gas or liquid passing through the system. The heated gas or liquid is then stored or used to provide hot water, space heating, or cooling.

SECTION ~~M2301~~ <u>R324</u>
GENERAL

<u>R324.1</u> ~~M2301.1~~ General. <u>Solar energy systems shall comply with the provisions of Section R324.1.1 thru R324.2.5.</u> ~~This chapter provides for the design, construction, installation, alteration and repair of solar energy systems. Solar thermal systems shall comply with Sections M2301 and M2302. Photovoltaic solar energy systems shall comply with Sections M2301 and M2303.~~

<u>R324.1.1</u> ~~M2301.2~~ Solar energy equipment and appliances. Solar <u>thermal and solar photovoltaic</u> energy system equipment, appliances and components shall be used and installed in accordance with the manufacturer's instructions and the provisions of this code.

<u>R324.1.2</u> ~~M2301.4~~ Corrosion prevention. Solar <u>thermal and solar photovoltaic</u> equipment and systems shall be designed to inhibit galvanic and other corrosion between dissimilar metals of solar collectors, panels, modules, supports, fasteners and metal roofs. Paints shall not be used as galvanic corrosion protection.

<u>R324.1.3</u> ~~M2301.5~~ Interference. Solar <u>thermal and solar photovoltaic</u> collectors, panels and modules shall not obstruct or interfere with the function or operation of access hatchways, roof access doorways, standpipe connections, expansion joints, skylights, operable windows, plumbing vents and mechanical equipment.

R324.2 Solar thermal systems. Solar thermal systems shall be designed and installed in accordance with Chapter 23, Section R324.1 and Sections R324.2.1 through R324.2.5.

R324.2.1 ~~**M2301.3 Solar energy system**~~ **Structural requirements.** Structural requirements for solar thermal energy systems shall be based upon the type, location and configuration of the system.

R324.2.2 ~~**M2301.3.1**~~ **Systems mounted directly to or above the roof covering.** Rooftop solar thermal systems, and solar thermal panel systems~~, and photovoltaic panel systems~~ that are mounted above the roof covering shall be designed in accordance with ~~the International Building Code~~ Section R301 to support the system and withstand applicable loads. The roof upon which these systems are installed shall be constructed to support the loads imposed by such systems in accordance with Chapter 8. Systems mounted directly to or above the roof covering shall be constructed of noncombustible materials or fire-retardant treated wood.

R324.2.3 ~~**M2301.3.2**~~ **Systems that serve as roof coverings.** Where solar thermal systems, or solar thermal panel systems~~, and building integrated photovoltaic systems including, photovoltaic shingles,~~ serve as the roof covering, they shall conform to the requirements for roof coverings in Chapter 9.

~~**M2301.3.3 Ground mounted systems.** Ground mounted solar thermal systems, solar thermal panel systems, and photovoltaic systems shall conform to Section R301.~~

R324.2.4 ~~**M2301.6**~~ **Roof and wall penetrations.** Roof and wall penetrations shall be flashed in accordance with Chapter 9, Section R703.8 and, where required, shall be sealed in accordance with Chapter 11.

R324.2.5 ~~**M2301.7**~~ **Rooftop mounted system fire classification.** Rooftop mounted solar thermal systems shall comply with Section 902.1.

Commenter's Reason: The committee's reasons for disapproval were that 1) "the proposed text does not belong in the mechanical section of the code 2) "ground mounted systems should not be considered as structures" and 3) "the wrong UL standard is referenced."

Response to Reason 1: This public comment moves the general solar provisions of the original proposal to a new Section R324.1, which aligns with the IRC Building Committee's recommendation to approve RM98, which created a new Section R324 titled "Solar energy."

Response to Reason 2: Ground mounted systems are indeed structures. Section R202 defines "structure" as "that which is built or constructed." This public comment, however, references Section 301 of the IRC instead of sending the user directly to the IBC.

Response to Reason 3: This proposal did not and does not reference any UL standards.

This proposal is coordinated with, does not conflict with, and is not dependent upon the final action on RM98. This public comment further revises the original proposal to fill in gaps related to solar thermal, and to delete requirements related to solar photovoltaic that may conflict or be redundant with RM98.

This public comment is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held numerous open meetings and workgroup calls which included members of the SEHPCAC as well as interested parties to discuss and debate proposed changes and public comments.

Public Comment 2:

Lorraine A Ross, Intech Consulting Inc, representing The Dow Chemical Company, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION R202
DEFINITIONS

BUILDING INTEGRATED PHOTOVOLTAIC PRODUCT. A building product that incorporates photovoltaic modules and functions as a component of the building envelope.

PHOTOVOLTAIC MODULE. A complete, environmentally protected unit consisting of solar cells, optics and other components, exclusive of ~~tracking hardware~~ a tracker, designed to generate DC power when exposed to sunlight.

PHOTOVOLTAIC PANEL. A collection of modules mechanically fastened together, wired, and designed to provide a field-installable unit.

PHOTOVOLTAIC PANEL SYSTEM. A system that incorporates discrete photovoltaic panels, that converts solar radiation into electricity, including rack support systems.

PHOTOVOLTAIC SHINGLES. A roof covering resembling shingles that incorporates photovoltaic modules.

SOLAR THERMAL COLLECTOR. ~~A device that incorporates one or more solar thermal absorbers to absorb incident solar radiation, to convert it to thermal energy, and to transfer the thermal energy to a gas or liquid coming in contact with it.~~ A device that absorbs incident solar radiation, converts it to thermal energy, and transfers thermal energy to a heat transfer medium.

SOLAR THERMAL LOOP. The portion of the solar thermal system that transports a heated gas or liquid to a collector or storage.

SOLAR THERMAL ABSORBER. A component of a solar collector for absorbing radiant energy and transferring that energy as heat into a fluid.

SOLAR THERMAL PANEL. A solar thermal collector ~~individually mounted or~~ mounted ~~to or~~ within a frame, ~~fastened,~~ and designed to provide a field installable unit.

SOLAR THERMAL PANEL SYSTEM. A system that incorporates one or more ~~discrete~~ solar thermal panels that convert solar radiation into solar energy, including structural support systems such as frames or racks.

SOLAR THERMAL SYSTEM. An assembly of components and subsystems that, in combination, convert solar radiant energy into thermal energy that is transferred directly or indirectly ~~and transfer it~~ to a gas or liquid and ~~passing through the system. The heated gas or liquid~~ that is then stored or used to provide hot water, space heating, or cooling.

~~SECTION M2301~~
~~GENERAL~~

~~**M2301.1 General.** . This chapter provides for the design, construction, installation, alteration and repair of solar energy systems. Solar thermal systems shall comply with Sections M2301 and M2302. Photovoltaic solar energy systems shall comply with Sections M2301 and M2303.~~

~~**M2301.2 Solar energy equipment and appliances.** Solar energy system equipment, appliances and components shall be used and installed in accordance with the manufacturer's instructions and the provisions of this code.~~

~~**M2301.3 Solar energy system Structural requirements.** Structural requirements for solar energy systems shall be based upon the type, location and configuration of the system.~~

~~**M2301.3.1 Systems mounted directly to or above the roof covering.** Rooftop solar thermal systems solar thermal panel systems, and photovoltaic panel systems that are mounted above the roof covering shall be designed in accordance with the International Building Code to support the system and withstand applicable loads. The roof upon which these systems are installed shall be constructed to support the loads imposed by such systems in accordance with Chapter 8. Systems mounted directly to or above the roof covering shall be constructed of noncombustible materials or fire-retardant treated wood.~~

~~**M2301.3.2 Systems that serve as roof coverings.** Where solar thermal systems, solar thermal panel systems, and building integrated photovoltaic systems including, photovoltaic shingles, serve as the roof covering, they shall conform to the requirements for roof coverings in Chapter 9.~~

~~**M2301.3.3 Ground mounted systems.** Ground mounted solar thermal systems, solar thermal panel systems, and photovoltaic systems shall conform to Section R301.~~

~~**M2301.4 Corrosion prevention.** Solar equipment and systems shall be designed to inhibit galvanic and other corrosion between dissimilar metals of solar collectors, panels, modules, supports, fasteners and metal roofs. Paints shall not be used as galvanic corrosion protection.~~

~~**M2301.5 Interference.** Solar collectors, panels and modules shall not obstruct or interfere with the function or operation of access hatchways, roof access doorways, standpipe connections, expansion joints, skylights, operable windows, plumbing vents and mechanical equipment.~~

~~**M2301.6 Roof and wall penetrations.** Roof and wall penetrations shall be flashed in accordance with Chapter 9, Section R703.8 and, where required, shall be sealed in accordance with Chapter 11.~~

~~**M2301.7 Rooftop mounted system fire classification.** Rooftop mounted solar systems shall comply with Section 902.1.~~

Commenter's Reason: This public comment preserves the suggested definitions for the different types of solar energy systems. The definitions have been modified where necessary to conform with other IRC proposals that were approved. Similarly, the Committee Approval as Modified of RM98-13 established a new general section for Solar Energy Systems – R324. Therefore, Section M2301 as shown is deleted.

RM80-13

Final Action: AS AM AMPC____ D

RM87-13
M2301.2.6 (New), M2301.2.7 (New)

Proposed Change as Submitted

Proponents: David Hall, Vice Chair, Plumbing/Mechanical/Gas Code Action Committee, (dave.hall@georgetown.org) and Brenda A. Thompson, Clark County Building Department, Las Vegas NV, Chair, Sustainability, Energy & High Performance Code Action Committee (bat@ClarkCountyNV.gov)

Add new text as follows:

M2301.2.6 Mixing valves. Where heated water is discharged from a solar thermal system to a hot water distribution system, a thermostatic mixing valve complying with ASSE 1017 shall be installed to temper the water to a temperature of not greater than 140^{o}F. Solar thermal systems supplying hot water for both space heating and domestic uses shall comply with Section P2802.2. A temperature indicating device shall be installed to indicate the temperature of the water discharged from the outlet of the mixing valve. The thermostatic mixing valve required by this section shall not be a substitute for water temperature limiting devices required by Chapter 27 for specific fixtures.

M2301.2.7 Isolation valves. Isolation valves shall be provided on the cold water feed to the water heater. Isolation valves and associated piping shall be provided to bypass solar storage tanks where the system contains multiple storage tanks.

Reason: This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) and the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The PMGCAC and SEHPCAC were established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since their inception in July, 2011, the PMGCAC and SEHPCAC have held multiple open meetings and conference calls and workgroup calls which included members of the PMGCAC and SEHPCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

These proposed new sections address mixing valves and isolation valves in solar thermal systems. They are based on Section P2803.3 of the 2012 IRC and criteria in the New York State Field Inspection Guidelines for Solar (thermal) Heating Systems.

Please note that the proponents have also submitted other proposals that are coordinated with this proposal. In the spirit of the IRC as a one stop code for one- and two-family dwellings and townhouses, these proposals enhance, update, clarify and improve the usability of the solar energy provisions of Chapter 23 of the IRC and make it truly comprehensive and much more direct and intuitive. This proposal, however, is intended to stand alone and is not contingent upon the success of other PMGCAC or SEHPCAC proposals.

Cost Impact: Where solar systems are provided, this proposal may increase the cost of construction.

M2301.2.6 (NEW) #2-RM-HALL-THOMPSON-SEPHCAC.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposed text belongs in the plumbing chapters. Related subject text should be pulled together and placed in the proper location.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Brenda Thompson, CBCO, Manager Building Inspections, Clark County Development Services, ICC Sustainability, Energy and High Performance Code Action Committee (SEHPCAC) Chair requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

Add new text as follows:

SECTION P2802
SOLAR WATER HEATING SYSTEMS

P2802.1 Water temperature control. Where heated water is discharged from a solar thermal system to a hot water distribution system, a thermostatic mixing valve complying with ASSE 1017 shall be installed to temper the water to a temperature of not greater than 140^{o}F. Solar thermal systems supplying hot water for both space heating and domestic uses shall comply with Section P2802.2. A temperature indicating device shall be installed to indicate the temperature of the water discharged from the outlet of the mixing valve. The thermostatic mixing valve required by this section shall not be a substitute for water temperature limiting devices required by Chapter 27 for specific fixtures.

P2802.2 Isolation valves. Isolation valves in accordance with P2903.9.2 shall be provided on the cold water feed to the water heater. Isolation valves and associated piping shall be provided to bypass solar storage tanks where the system contains multiple storage tanks.

Commenter's Reason: The PMGCAC and SEHPCAC agree with the committee's recommendation to place the new information in the plumbing section of the code.

This public comment is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMGCAC) and the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The PMGCAC and SEHPCAC were established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since their inception, the PMGCAC and SEHPCAC have held numerous open meetings and workgroup calls which included members of the PMGCAC and SEHPCAC, as well as interested parties, to discuss and debate proposed changes and public comments.

RM87-13

Final Action: AS AM AMPC____ D

RM92-13
M2301.6 (New)

Proposed Change as Submitted

Proponents: David Hall, Vice Chair, Plumbing/Mechanical/Gas Code Action Committee, (dave.hall@georgetown.org) and Brenda A. Thompson, Clark County Building Department, Las Vegas NV, Chair, Sustainability, Energy & High Performance Code Action Committee (bat@ClarkCountyNV.gov)

Add new text as follows:

M2301.6 Filtering. Air provided to occupied spaces through rock or other dust-producing materials shall be filtered for particulates at the outlet of the heat storage system.

> **Exception:** Filters shall not be required where air movement is by means of natural convection.

Reason: This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) and the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The PMGCAC and SEHPCAC were established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since their inception in July, 2011, the PMGCAC and SEHPCAC have held multiple open meetings and conference calls and workgroup calls which included members of the PMGCAC and SEHPCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Reasons for this proposal are as follows: This proposed new section is similar to Section 1402.7 of the 2012 International Mechanical Code. It requires filtering in order to remove dust and particulates from mechanically forced air that has passed through a thermal storage area containing materials such as, but not limited to, pebbles or rock. A filter is not required for passive systems because the air velocity is typically not sufficient to carry particulates. Furthermore, a filter in a passive system could greatly impede natural convective airflow.

Please note that the proponents have also submitted other proposals that are coordinated with this proposal. In the spirit of the IRC as a one stop code for one- and two-family dwellings and townhouses, these proposals enhance, update, clarify and improve the usability of the solar energy provisions of Chapter 23 of the IRC and make it truly comprehensive and much more direct and intuitive. This proposal, however, is intended to stand alone and is not contingent upon the success of other PMGCAC or SEHPCAC proposals.

Cost Impact: Where rock based or dust-producing heat storage systems are provided, this proposal may increase the cost of construction.

M2301.6 (NEW) #1-RM-HALL-THOMPSON-SEHPCAC.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The code should refer to the manufacturer's instructions for dust- producing materials. "Dust-producing" is not defined.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Brenda Thompson, CBCO, Manager Building Inspections, Clark County Development Services, ICC Sustainability, Energy and High Performance Code Action Committee (SEHPCAC) Chair requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

M2301.6 Filtering. Air provided to occupied spaces <u>that passes through thermal mass storage systems by mechanical means</u> ~~through rock or other dust-producing materials~~ shall be filtered for particulates at the outlet of the ~~heat~~ <u>thermal mass</u> storage system.

~~**Exception:** Filters shall not be required where air movement is by means of natural convection.~~

Commenter's Reason: The committee's reason for disapproval was that "dust-producing materials" was not defined. This public comment revises the proposal to remove that term from the proposal.

This public comment is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held numerous open meetings and workgroup calls which included members of the SEHPCAC, as well as interested parties, to discuss and debate proposed changes and public comments.

RM92-13

Final Action: AS AM AMPC____ D

RM93-13

M2301.6 (New), M2301.6.1 (New), M2301.6.2 (New), P2902.5.5

Proposed Change as Submitted

Proponents: David Hall, Vice Chair, Plumbing/Mechanical/Gas Code Action Committee, (dave.hall@georgetown.org) and Brenda A. Thompson, Clark County Building Department, Las Vegas NV, Chair, Sustainability, Energy & High Performance Code Action Committee (bat@ClarkCountyNV.gov)

Add new text as follows:

M2301.6 Solar systems for heating potable water. Where a solar energy system heats potable water to supply a potable hot water distribution system, the solar energy system shall be in accordance with Sections M2301.6.1, M2301.6.2 and P2902.5.5.

M2301.6.1 Indirect systems. Heat exchangers that are components of indirect heating systems shall comply with Section P2902.5.2.

M2301.6.2 Direct systems. Where potable water is directly heated, the pipe, fittings and valves between the solar collectors and the hot water storage tanks shall comply with NSF 61.

Revise as follows:

P2902.5.5 Solar systems. ~~The potable water supply to a solar system shall be equipped with a backflow preventer with intermediate atmospheric vent complying with ASSE 1012 or a reduced pressure principle backflow preventer complying with ASSE 1013. Where chemicals are used, the potable water supply shall be protected by a reduced pressure principle backflow preventer.~~ Where a potable water supply is connected to the solar collector circulation loop piping of an indirect solar water heating system and chemicals are not used in the circulation loop piping, a backflow preventer in accordance with ASSE 1012 shall be installed between the potable water system and the circulation loop piping. Where chemicals are used in the solar collector circulation loop piping, such backflow preventer shall be in accordance with ASSE 1013.

> ~~**Exception:** Where all solar system piping is a part of the potable water distribution system, in accordance with the requirements of the *International Plumbing Code*, and all components of the piping system are listed for potable water use, cross-connection protection measures shall not be required.~~

Reason: This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) and the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The PMGCAC and SEHPCAC were established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since their inception in July, 2011, the PMGCAC and SEHPCAC have held multiple open meetings and conference calls and workgroup calls which included members of the PMGCAC and SEHPCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Reasons for this proposal are as follows:

Chapter 23 should include Sections M2301.6, M2301.6.1 and M2301.6.2 in order to address specific requirements for solar energy systems where they are used to heat potable water for supply to a potable hot water distribution system. Section M2301.6.1 is a pointer to a section that covers heat exchangers in the plumbing code section of the IRC:

> **P2902.5.2 Heat exchangers.** Heat exchangers using an essentially toxic transfer fluid shall be separated from the potable water by double-wall construction. An air gap open to the atmosphere shall be provided between the two walls. Heat exchangers utilizing an essentially nontoxic transfer fluid shall be permitted to be of single-wall construction.

This section would apply where potable water was indirectly heated by the solar energy system. Section M2301.6.2 requires NSF 61 compliance for pipe, fittings and valves in a system that directly heats potable water as this is the same requirement for pipe, fittings and valves that the plumbing code requires for the hot water distribution system.

Section P2902.5.5 is modified as the section has been unclear for many cycles. Some have interpreted the existing section to require a backflow preventer on the cold water supply to any water heater that has a solar energy water heating system connected to the water heater. This makes no sense for a system that directly heats the water for distribution to the potable hot water distribution system. The section is modified to make the language address where the backflow preventer is needed (only for connections to solar collector circulation loop piping of indirect heating systems).

Please note that the proponents have also submitted other proposals that are coordinated with this proposal. In the spirit of the IRC as a one stop code for one- and two-family dwellings and townhouses, these proposals enhance, update, clarify and improve the usability of the solar energy provisions of Chapter 23 of the IRC and make it truly comprehensive and much more direct and intuitive. This proposal, however, is intended to stand alone and is not contingent upon the success of other PMGCAC or SEHPCAC proposals.

Cost Impact: Where solar water heating systems are provided, this proposal may increase the cost of construction.

2301.6 (NEW) #2-RM-HALL-THOMPSON-SEPHCAC.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The subject of backflow protection does not belong in this part of the code.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

David Hall, Vice Chair, Plumbing/Mechanical/Gas Code Action Committee and Brenda Thompson, CBCO, Manager Building Inspections, Clark County Development Services, ICC Sustainability, Energy and High Performance Code Action Committee (SEHPCAC) Chair request Approval as Modified by this Public Comment.

Replace proposal as follows:

Add new text as follows:

M2301.6 Solar systems for heating potable water. Where a solar energy system heats potable water to supply a potable hot water distribution system, the solar energy system shall be in accordance with Sections M2301.6.1, M2301.6.2 and P2902.5.5.

M2301.6.1 Indirect systems. Heat exchangers that are components of indirect heating systems shall comply with Section P2902.5.2.

M2301.6.2 Direct systems. Where potable water is directly heated, pipe, fittings, valves and other components that are in contact with the potable water in the solar heating system shall comply with the requirements of Chapter 29.

Revise as follows:

P2902.5.5 Solar systems. ~~The potable water supply to a solar system shall be equipped with a backflow preventer with intermediate atmospheric vent complying with ASSE 1012 or a reduced pressure principle backflow preventer complying with ASSE 1013. Where chemicals are used, the potable water supply shall be protected by a reduced pressure principle backflow preventer.~~

> ~~**Exception:** Where all solar system piping is a part of the potable water distribution system, in accordance with the requirements of the *International Plumbing Code*, and all components of the piping system are listed for potable water use, cross-connection protection measures shall not be required.~~

P2902.5.5 Solar thermal systems. Where a solar energy system heats potable water to supply a potable hot water distribution or a other type of heating system, the solar energy system shall be in accordance with Section P2902.5.5.1or P2902.5.5.2 as applicable.

P2902.5.5.1 Indirect systems. Water supplies of any kind shall not be connected to the solar heating loop of an indirect solar water heating system. This requirement shall not prohibit the presence of inlets or outlets on the solar heating loop for the purposes of servicing the fluid in the solar heating loop.

P2902.5.5.2 Direct systems. Where a solar water heating system directly heats potable water for a potable water distribution system, the pipe, fittings, valves and other components that are in contact with the potable water in the system shall comply with the requirements of Chapter 29.

Where a solar water heating system directly heats water for a system other than a potable water distribution system, a potable water supply connected to such system shall be protected by a backflow preventer with intermediate atmospheric vent complying with ASSE 1012. Where a solar water heating system directly heats water for a system other than a potable water distribution system and that system will have chemicals added, a potable water supply connected to such system shall be protected by a reduced pressure principle backflow preventer complying with ASSE 1013.

Commenter's Reason: This public comment changes the new section in the mechanical code part of the IRC to simply point to appropriate sections of the plumbing code to ensure that the solar system designer and installer don't miss these important plumbing code requirements. The modification for Section P2902.5.5 stays the same as the original proposal as it is fixing a problem recognized long ago. The plumbing code committee is not nearly as familiar with solar systems as the people who are aiding and supporting the SEHPCAC on this topic of solar thermal systems. Thus, including this plumbing code section in this proposal and public comment is appropriate.

This public comment is submitted by the ICC Sustainability Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the SEHPCAC has held numerous open meetings and workgroup calls which included members of the SEHPCAC, as well as interested parties, to discuss and debate proposed changes and public comments.

Public Comment 2:

Lorraine A Ross, Intech Consulting Inc, representing The Dow Chemical Company, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

M2301.6 Solar thermal systems for heating potable water. Where a solar thermal ~~energy~~ system heats potable water to supply a potable hot water distribution system, the solar thermal ~~energy~~ system shall be in accordance with Sections M2301.6.1, M2301.6.2 and P2902.5.5.

M2301.6.1 Indirect systems. Heat exchangers that are components of indirect solar thermal heating systems shall comply with Section P2902.5.2.

M2301.6.2 Direct systems. Where potable water is directly heated by a solar thermal system. The pipe, fittings, valves and other components that are in contact with the potable water in the solar heating system shall comply with the requirements of Chapter 29.

~~**M2301.6.2 Direct systems.** Where potable water is directly heated, the pipe, fittings and valves between the solar collectors and the hot water storage tanks shall comply with NSF 61.~~

Revise as follows:

P2902.5.5 Solar thermal systems. Where a solar thermal system heats potable water to supply a potable hot water distribution or any other type of heating system, the solar thermal system shall be in accordance with Section P2902.5.5.1, P2902.5.5.2 or P2902.5.5.3 as applicable.

~~**P2902.5.5 Solar systems.** Where a potable water supply is connected to the solar collector circulation loop piping of an indirect solar water heating system and chemicals are not used in the circulation loop piping, a backflow preventer in accordance with ASSE 1012 shall be installed between the potable water system and the circulation loop piping. Where chemicals are used in the solar collector circulation loop piping, such backflow preventer shall be in accordance with ASSE 1013.~~

P2902.5.5.1 Indirect systems. Water supplies of any type shall not be connected to the solar heating loop of an indirect solar thermal hot water heating system. This requirement shall not prohibit the presence of inlets or outlets on the solar heating loop for the purposes of servicing the fluid in the solar heating loop.

P2902.5.5.2 Direct systems for potable water distribution systems. Where a solar thermal system directly heats potable water for a potable water distribution system, the pipe, fittings, valves and other components that are in contact with the potable water in the system shall comply with the requirements of Chapter 29.

P2902.5.5.3 Direct systems for other than potable water distribution systems. Where a solar thermal system directly heats water for a system other than a potable water distribution system, a potable water supply connected to such system shall be protected by a backflow

<u>preventer with an intermediate atmospheric vent complying with ASSE 1012. Where a solar thermal system directly heats chemically treated water for a system other than a potable water distribution system, a potable water supply connected to such system shall be protected by a reduced pressure principle backflow preventer complying with ASSE 1013.</u>

Commenter's Reason: This public comment clarifies that these sections pertain specifically to solar **thermal** energy systems. The new sections are added to the IRC Plumbing Chapter to clarify requirements for direct and indirect systems connected to potable or other than potable water distribution systems.

RM93-13

Final Action: AS AM AMPC____ D

RM95-13

M2302.2, M2302.2.1, M2302.2.2 thru M2302.2.2s.2.5 (New), M2302.2.2 thru M2302.4

Proposed Change as Submitted

Proponent: Adria Smith, Fountain Valley Fire Department, Representing the California Fire Chiefs Association; Kevin Reinertson, Division Chief, Representing the California State Fire Marshal's Office (adria.smith@fountainvalley.org)

Revise as follows:

M2302.2 Requirements. The installation, inspection, maintenance, repair and replacement of photovoltaic systems and all system components shall comply with the manufacturer's instructions, Sections M2302.21 through ~~M2302.2.3~~ M2302.2.7 and NFPA 70.

M2302.2.1 Roof-mounted panels and modules. Where photovoltaic panels and modules are installed on roofs, the roof shall be constructed to support the loads imposed by such modules. Roof-mounted photovoltaic panels and modules that serve as roof covering shall conform to the requirements for roof coverings in Chapter 9. Where mounted on or above the roof coverings, the photovoltaic panels and modules and supporting structure shall be constructed of noncombustible materials or fire-retardant treated wood equivalent to that required for the roof construction.

> **Exception:** Detached, nonhabitable structures including, but not limited to, parking shade structures, carports, solar trellises and similar structures shall not be subject to the requirements of this section.

M2302.2.2 Access and pathways. Roof access, pathways, and spacing requirements shall be provided in accordance with Sections M2302.2.2.1 through M2302.2.2.2.5.

M2302.2.2.1 Roof access points. Roof access points shall be located in areas that do not require the placement of ground ladders over openings such as windows or doors, and located at strong points of building construction in locations where the access point does not conflict with overhead obstructions such as tree limbs, wires, or signs.

M2302.2.2.2 Solar photovoltaic systems. Solar photovoltaic systems for shall comply with SectionsM2302.2.2.2.1 through M2302.2.2.2.5.

M2302.2.2.2.1 Size of solar photovoltaic array. Each photovoltaic array shall be limited to 150 feet (45 720 mm) by 150 feet (45 720 mm). Multiple arrays shall be separated by a clear access pathway not less than 3 feet in width.

M2302.2.2.2.2 Hip roof layouts. Panels and modules installed on dwellings with hip roof layouts shall be located in a manner that provides a clear access pathway not less than 3 feet in width from the eave to the ridge on each roof slope where panels and modules are located. The access pathway shall be located at a structurally strong location on the building capable of supporting the live load of fire fighters accessing the roof.

> **Exception:** These requirements shall not apply to roofs with slopes of two units vertical in 12 units horizontal (2:12) and less.

M2302.2.2.2.3 Single ridge roofs. Panels and modules installed on dwellings with a single ridge shall be located in a manner that provides two, 3-foot-wide (914 mm) access pathways from the eave to the ridge on each roof slope where panels or modules are located.

Exception: This requirement shall not apply to roofs with slopes of two units vertical in 12 units horizontal (2:12) and less.

M2302.2.2.2.4 Roofs with hips and valleys. Panels and modules installed on dwellings with roof hips or valleys shall be located not closer than 18 inches (457 mm) to a hip or valley where panels or modules are to be placed on both sides of a hip or valley. Where panels are to be located on one side only of a hip or valley that is of equal length, the 18 inch clearance does not apply.

Exception: These requirements shall not apply to roofs with slopes of two units vertical in 12 units horizontal (2:12) and less.

M2302.2.2.2.5 Allowance for smoke ventilation operations. Panels and modules installed on dwellings shall be located not less than 3 feet (914 mm) below the roof ridge to allow for fire department smoke ventilation operations.

Exception: Where an alternative ventilation method approved by the code official has been provided or where the code official has determined that vertical ventilation techniques will not be employed, clearance from the roof ridge is not required.

~~M2302.2.2~~M2302.2.3 Roof and wall penetrations. Roof and wall penetrations shall be flashed and sealed in accordance with Chapter 9 to prevent entry of water, rodents, and insects.

~~M2302.2.3~~M2302.2.4 Ground-mounted panels and modules. Ground-mounted panels and modules shall be installed in accordance with Sections M2302.2.2 through M2302.2.3 and the manufacturer's instructions.

~~M2302.3~~M2302.2.5 Photovoltaic panels and modules. Photovoltaic panels and modules shall be listed and labeled in accordance with UL 1703.

~~M2302.4~~M2302.2.6 Inverters. Inverters shall be listed and labeled in accordance with UL 1741. Systems connected to the utility grid shall use inverters listed for utility interaction.

Reason: We propose to reproduce the applicable provisions of International Fire Code 605.11 into the International Residential Code to provide for uniform design and enforcement. Many jurisdictions currently provide enforcement of the solar photovoltaic power systems guidelines in International Fire Code Section 605.11, or other locally adopted provisions through the building department/official which typically do not enforce the International Fire Code. Furthermore, the intent to have these provisions reproduced into the International Residential Code is to afford local communities the ability to provide adequate enforcement without the reference to a different code or standard. (IFC 605.11.3.3 through 605.11.3.3.3 are not reproduced, such provisions are not applicable to one- and two-family dwellings or townhouses).

Cost Impact: This proposal will not increase the cost of construction; these provisions are currently contained in the IFC.

M2302.2-RM-SMITH-REINERTSON.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Modify the proposal as follows:

M2302.2 Requirements. The installation, inspection, maintenance, repair and replacement of photovoltaic systems and all system components shall comply with the manufacturer's instructions, Sections M2302.21 through M2302.2.7 and NFPA 70.

M2302.2.1 Roof-mounted panels and modules. Where photovoltaic panels and modules are installed on roofs, the roof shall be constructed to support the loads imposed by such modules. Roof-mounted photovoltaic panels and modules that serve as roof covering shall conform to the requirements for roof coverings in Chapter 9. Where mounted on or above the roof coverings, the photovoltaic panels and modules and supporting structure shall be constructed of noncombustible materials or fire-retardant treated wood equivalent to that required for the roof construction.

~~**Exception:** Detached, nonhabitable structures including, but not limited to, parking shade structures, carports, solar trellises and similar structures shall not be subject to the requirements of this section.~~

M2302.2.2 Access and pathways. Roof access, pathways, and spacing requirements shall be provided in accordance with Sections M2302.2.2.1 through M2302.2.2.2.5.

Exceptions:

1. Detached garages and accessory structures to one-and two-family dwellings and townhouses such as parking shade structures, carports, solar trellises, and similar structures.
2. Roof access, pathways and spacing requirements need not be provided where an alternative ventilation method approved by the code official has been provided or where the code official has determined that vertical ventilation techniques will not be employed.

M2302.2.2.1 Roof access points. Roof access points shall be located in areas that do not require the placement of ground ladders over openings such as windows or doors, and located at strong points of building construction in locations where the access point does not conflict with overhead obstructions such as tree limbs, wires, or signs.

M2302.2.2.2 Solar photovoltaic systems. Solar photovoltaic systems shall comply with SectionsM2302.2.2.2.1 through M2302.2.2.2.5.

M2302.2.2.2.1 Size of solar photovoltaic array. Each photovoltaic array shall be limited to 150 feet (45 720 mm) by 150 feet (45 720 mm). Multiple arrays shall be separated by a clear access pathway not less than 3 feet in width.

M2302.2.2.2.2 Hip roof layouts. Panels and modules installed on dwellings with hip roof layouts shall be located in a manner that provides a clear access pathway not less than 3 feet in width from the eave to the ridge on each roof slope where panels and modules are located. The access pathway shall be located at a structurally strong location on the building capable of supporting the live load of fire fighters accessing the roof.

Exception: These requirements shall not apply to roofs with slopes of two units vertical in 12 units horizontal (2:12) and less.

M2302.2.2.2.3 Single ridge roofs. Panels and modules installed on dwellings with a single ridge shall be located in a manner that provides two, 3-foot-wide (914 mm) access pathways from the eave to the ridge on each roof slope where panels or modules are located.

Exception: This requirement shall not apply to roofs with slopes of two units vertical in 12 units horizontal (2:12) and less.

M2302.2.2.2.4 Roofs with hips and valleys. Panels and modules installed on dwellings with roof hips or valleys shall be located not closer than 18 inches (457 mm) to a hip or valley where panels or modules are to be placed on both sides of a hip or valley. Where panels are to be located on one side only of a hip or valley that is of equal length, the 18 inch clearance does not apply.

Exception: These requirements shall not apply to roofs with slopes of two units vertical in 12 units horizontal (2:12) and less.

M2302.2.2.2.5 Allowance for smoke ventilation operations. Panels and modules installed on dwellings shall be located not less than 3 feet (914 mm) below the roof ridge to allow for fire department smoke ventilation operations.

Exception: Where an alternative ventilation method approved by the code official has been provided or where the code official has determined that vertical ventilation techniques will not be employed, clearance from the roof ridge is not required.

M2302.2.3_ Roof and wall penetrations. Roof and wall penetrations shall be flashed and sealed in accordance with Chapter 9 to prevent entry of water, rodents, and insects.

M2302.2.4_ Ground-mounted panels and modules. Ground-mounted panels and modules shall be installed in accordance with Sections M2302.2.2 through M2302.2.3 and the manufacturer's instructions.

M2302.2.5 Photovoltaic panels and modules. Photovoltaic panels and modules shall be listed and labeled in accordance with UL 1703.

M2302.2.6 Inverters. Inverters shall be listed and labeled in accordance with UL 1741. Systems connected to the utility grid shall use inverters listed for utility interaction.

Committee Reason: Same reason as for RM94-13

Assembly Action: Approved as Modified

Individual Consideration Agenda

This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action of Approved as Modified by the Floor and public comments were submitted.

Public Comment 1:

Kevin Reinertson, Division Chief, Representing the California State Fire Marshal's Office; John Smirnow and Joseph H. Cain P.E. representing Solar Energy Industries Association (SEIA); Adria Smith, Fountain Valley Fire Department, representing the California Fire Chiefs Association; And Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee, request Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION 324
SOLAR ENERGY SYSTEMS

~~M2302.2.2~~ R324.3.3 Access and pathways. Roof access, pathways, and spacing requirements shall be provided in accordance with Sections ~~M2302.2.2.1~~ R324.3.3.1 through ~~M2302.2.2.2.5~~ R324.3.3.2.5.

Exceptions:

1. Detached garages and accessory structures, ~~to one-and two-family dwellings and townhouses~~ such as parking shade structures, carports, solar trellises, and similar structures.
2. Roof access, pathways and spacing requirements need not be provided ~~where an alternative ventilation method approved by the code official has been provided or~~ where the code official has determined ~~that vertical ventilation techniques~~rooftop operations will not be employed.

~~M2302.2.2.1~~ R324.3.3.1 Roof access points. Roof access points shall be located in areas that do not require the placement of ground ladders over openings such as windows or doors, and located at strong points of building construction in locations where the access point does not conflict with overhead obstructions such as tree limbs, wires, or signs.

M2302.2.2.2 ~~Solar photovoltaic systems~~Size and layout. Solar photovoltaic systems shall comply with Sections ~~M2302.2.2.2.1 through M2302.2.2.2.5.~~ R324.3.3.2.1 through R324.3.3.2.5.

~~M2302.2.2.2.1~~ R324.3.3.2.1 Size of solar photovoltaic array. Each photovoltaic array shall be limited to 150 feet (45 720 mm) by 150 feet (45 720 mm). Multiple arrays shall be separated by a clear access pathway not less than 3 feet in width.

~~M2302.2.2.2.2~~ R324.3.3.2.2 Hip roof layouts. Panels and modules installed on ~~one- and two-family~~ dwellings with hip roof layouts shall be located in a manner that provides a 3-foot-wide (914 mm) clear access pathway from the eave to the ridge on each roof slope where panels and modules are located. The access pathway shall be located at a structurally strong location on the building capable of supporting the live load of fire fighters accessing the roof.

Exception: These requirements shall not apply to roofs with slopes of two units vertical in 12 units horizontal (2:12) or less.

~~M2302.2.2.2.3~~ R324.3.3 Single ridge roofs. Panels and modules installed on dwellings with a single ridge shall be located in a manner that provides two, 3-foot-wide (914 mm) access pathways from the eave to the ridge on each roof slope where panels or modules are located.

Exception: This requirement shall not apply to roofs with slopes of two units vertical in 12 units horizontal (2:12) and less.

~~M2302.2.2.2.4~~ R324.3.3.2.4 Roofs with hips and valleys. Panels and modules installed on dwellings with roof hips or valleys shall be located not closer than 18 inches (457 mm) to a hip or valley where panels or modules are to be placed on both sides of a hip or valley. Where panels are to be located on one side only of a hip or valley that is of equal length, the 18 inch clearance does not apply.

Exception: These requirements shall not apply to roofs with slopes of two units vertical in 12 units horizontal (2:12) and less.

~~M2302.2.2.2.5~~ R324.3.3.2.5 Allowance for smoke ventilation operations. Panels and modules installed on dwellings shall be located not less than 3 feet (914 mm) below the roof ridge to allow for fire department smoke ventilation operations.

Exception: Where an alternative ventilation method approved by the code official has been provided or where the code official has determined that vertical ventilation techniques will not be employed, clearance from the roof ridge is not required.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: This public comment takes the photovoltaic access and pathways requirements approved by the assembly on RM95-13 and move them to the new Section R324 for Solar Energy Systems, specifically to a subsection of R324.3 Photovoltaic energy systems, which was proposed by RM98-13 Part II. This move is necessary since RM98-13, Part 1, if approved, deletes section M2302. Other than section renumbering, specific edits made in the public comment to the approved as amended language are as follows:

This public comment only includes those changes from the original proposal, M2302.2.2 to M2302.2.2.2.5, that specifically address access and pathways, as remaining provisions are not necessary due to previous committee action on RM98-13. Also, several unnecessary references to one- and two-family dwellings were removed since this is the IRC.

R324.3.3, Exception 2 - It is recognized that providing access and pathways for rooftop photovoltaic systems is a significant firefighter safety issue if they are likely to be deployed on a rooftop during firefighting operations. However many local fire departments have policies in place to not allow rooftop operations. This exception will waive all access, pathway and spacing requirements for rooftop photovoltaic systems if the code official has determined that rooftop operations will not be deployed in the jurisdiction, which should be determined in consultation with the local fire chief.

R324.3.3.1 – No changes from approved as modified proposal.

R324.3.3.2 – Title changes from "Solar photovoltaic systems" to "Size and layout" to better reflect the requirements.

R324.3.3.2.1 to R324.3.3.2.5 – No changes from approved as modified proposal.

This public comment received input from several interested parties, including the fire service and industry. As stated by the Fire Code Committee on the IBC/IFC companion proposal, "The proposal also represents a successful collaborative effort between the fire service and the solar energy stakeholders."

Public Comment 2:

Douglas Smith, Kaysville City, Utah, representing Utah Chapter ICC, requests Disapproval.

Commenter's Reason: Proposal RM95 should be disapproved because its provisions are too restrictive for residential photovoltaic systems and has flaws in its provisions. The Committee originally disapproved RM95 which has excessive provisions for roof access, array size, and requiring access for smoke ventilation techniques. The Committee's reason for disapproval was as such: "The proposed text is overkill for residential buildings and is more commercial property related. The text would prohibit PV installations on homes." However, the Committee's decision was overturned and the proposal was modified and approved by assembly action. The Committee had it right to disapprove such restrictive requirements and are justified in their reason for doing so, but the assembly modification from the floor has also shown some flaws in that Section M2302.2.4 in the modification requires that all ground-mounted panels and modules meet the same requirements as those located on the roof. These requirements that *ground-mounted* systems must follow, as noted in the text, include: *roof* access and pathways, *roof* access points, *hip roof* layouts, single ridge *roofs*, *roofs* with hips and valleys, allowance for smoke ventilation requirements (at the *roof*), and *roof* penetrations. To require ground-mounted systems to meet the same requirements for those on the roof does not make any sense. From this we can see that when writing code, modifications from the floor is not good practice and this is evident here, which further justifies disapproving RM95 altogether.

There are some portions of this proposal that already exist and are word for word in the 2012 IRC, such as: M2302.2 Requirements, M2302.2.1 Roof-mounted panels and modules, M2302.2.3 Roof and wall penetrations, M2302.2.4 Ground-mounted panels and modules (except that proposal RM95 states they also must meet the new roofing requirements), M2302.2.5 Photovoltaic panels and modules, and M2302.2.6 Inverters. All these noted sections would remain as worded in the 2012 IRC (other than M2302.2.4) if RM95 is disapproved and would not be effected other than by numbering of sections.

Disapproval of RM95 would mean that all its excessive requirements for roof access, array size, roof venting, and the requirements for ground-mounted systems meeting the roofing requirements would all be kept out of the IRC. The Committee had it right the first time, RM95 needs to be disapproved.

RM95-13

Final Action: AS AM AMPC____ D

RM97-13, Part II
M2302

***NOTE:** PART I DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART I IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART II.*

Proposed Change as Submitted

Proponents: John Smirnow and Joseph H. Cain P.E. representing Solar Energy Industries Association (SEIA) (jsmirnow@seia.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY IRC-PLUMBING/MECHANICAL COMMITTEE; PART II WILL BE HEARD BY IRC-RESIDENTIAL/BUILDING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART II – IRC- BUILDING

Revise as follows:

SECTION M2302
PHOTOVOLTAIC SOLAR ENERGY SYSTEMS

M2302.1 General. This section provides for the design, construction, installation, alteration, and repair of photovoltaic equipment and systems.

M2302.2 General ~~R~~requirements. The installation, inspection, maintenance, repair and replacement of photovoltaic systems and all system components shall comply with the manufacturer's instructions, Sections ~~M2302.2.1~~ M2302.3 through ~~M2302.2.3~~ M2302.8 and NFPA 70.

~~M2302.2.1~~ M2302.3 Roof-mounted ~~panels and modules~~ photovoltaic panel systems. Rooftop-mounted photovoltaic panel systems shall be designed in accordance with this section. ~~The roof shall be constructed to support the loads imposed by roof-mounted solar collectors. Roof-mounted solar collectors that serve as a roof covering shall conform to the requirements for roof coverings in Chapter 9 of this code. Where mounted on or above the roof coverings, the collectors and supporting structure shall be constructed of noncombustible materials or fire-retardant-treated wood equivalent to that required for the roof construction.~~

M2302.3.1 Structural requirements. Rooftop-mounted photovoltaic panel systems shall be designed in accordance with the *International Building Code* to support the system and withstand applicable loads. The roof shall be constructed to support the loads imposed by rooftop-mounted photovoltaic panel systems in accordance with Chapter 8 of this code or the *International Building Code.*

M2302.3.1.1 Wind load. Rooftop-mounted photovoltaic panel systems shall be designed for wind load in accordance with the *International Building Code* and ASCE 7, using an effective wind area in accordance with ASCE 7.

M2302.3.1.2 Roof live load. Roof structures that provide support for photovoltaic panel systems shall be designed for applicable roof live load. The design of roof structures need not include roof live load in the areas covered by photovoltaic panel systems. Portions of roof structures not covered by photovoltaic panels shall be designed for roof live load. Roof structures that provide support for photovoltaic panel systems shall be designed for live load L_R for the load case when the photovoltaic panel system is not present.

M2302.4 Building integrated photovoltaic systems. Building integrated photovoltaic systems that serve as roof coverings shall be designed and installed in accordance with Section R905.16.

~~**M2302.2.2**~~ **M2302.5 Roof and wall penetrations.** Roof and wall penetrations shall be flashed and sealed in accordance with Chapter 9. ~~to prevent entry of water, rodents, and insects.~~

~~**M2302.2.3**~~ **M2302.6 Ground-mounted** ~~**panels and modules.**~~ **photovoltaic panel systems.** Ground-mounted ~~panels and modules~~ photovoltaic panel systems shall be designed in accordance with the *International Building Code* and installed in accordance with the manufacturer's instructions.

~~**M2302.3**~~ **M2302.7 Photovoltaic panels and modules.** Photovoltaic panels and modules shall be listed and labeled in accordance with UL 1703.

~~**M2302.4**~~ **M2302.8 Inverters.** Inverters shall be listed and labeled in accordance with UL 1741. Systems connected to the utility grid shall use inverters listed for utility interaction.

Reason: This code change proposal is the result of a consensus process established by the Solar Energy Industries Association's (SEIA) Codes and Standards Working Group. Established in 1974, SEIA is the national trade association of the U.S. solar energy industry. As the voice of the industry, SEIA works with its member companies to make solar a mainstream and significant energy source by expanding markets, removing market barriers, strengthening the industry, and educating the public on the benefits of solar energy.

New definitions are added to provide clarity in requirements for photovoltaic systems.

Sections are re-numbered for better flow.

The sentence that references "roof mounted solar collectors that serve as a roof covering" is relocated into its own section and revised to clarify the requirements for Building Integrated Photovoltaic (BIPV) systems.

The sentence that references "noncombustible materials or fire-retardant treated wood" is deleted, as it is obsolete. Photovoltaic panel systems are constructed entirely of noncombustible components, other than seals between the glass panels and frames.

The first sentence of M2302.3.1 clarifies the system of hardware that becomes the mounting system for rooftop-mounted photovoltaic panel systems must be qualified by methods found in the International Building Code. There are no applicable provisions found in the International Residential Code for these systems of mounting hardware. These mounting systems must be qualified by calculations or physical testing, as prescribed in the IBC. New definitions are needed to provide this clarity.

The second sentence of M2302.3.1 clarifies the roof system must be checked or designed to support the resultant loads imposed on it by the mounting system of the photovoltaic panel system. This check can be accomplished by using appropriate span tables in IRC Chapter 8, or by structural analysis according to IBC provisions.

A new section on wind load is added for guidance to appropriate codes and standards where wind design provisions are found. Effective Wind Area is defined in ASCE 7-10 Section 26.2. Effective Wind Area is also referenced in Footnote a of Table R301.2(2) of this code. Effective Wind Area used in design of photovoltaic systems must be consistent with the definition found in ASCE 7 in order to be compatible with the wind design calculation methods found in ASCE 7.

A new section on roof live load is added to clarify provisions already formalized in Final Action for the 2015 IBC, with some modifications as appropriate for one- and two-family dwellings. In one load case, roof live load need not be modeled in the area(s) of the roof covered by PV panels, as nobody will be walking on top of the panels or on the roof area covered by the panels. In another load case for new construction, the code-prescribed roof live load must be modeled as if the photovoltaic panels are not present.

The section on ground-mounted systems is revised to clarify that design provisions applicable to ground mount installations are found in the IBC and not found within the IRC.

Cost Impact: This proposal will reduce construction costs.

M2302.2-RM-CAIN-SMIRNOW.DOC

Committee Action Hearing Results

PART II – IRC – Building
Committee Action: Approved as Modified

Replace the proposal as follows:

R324.3.1.1 Roof live load. Roof structures that provide support for photovoltaic panel systems shall be designed for applicable roof live load. The design of roof structures need not include roof live load in the areas covered by photovoltaic panel systems. Portions of roof structures not covered by photovoltaic panels shall be designed for roof live load. Roof structures that provide support for photovoltaic panel systems shall be designed for live load L_R for the load case when the photovoltaic panel system is not present.

Committee Reason: Approval was based upon the proponent's published reason and the modification. The modification clarifies how to design the PV system for roof live load and correlates with previous action on RM98-13, Part II.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

John Smirnow and Joseph H. Cain, P.E, representing Solar Energy Industries Association (SEIA), request Approval as Modified by this Public Comment.

Modify the proposal as follows:

R324.3.1.1 Roof live load. Roof structures that provide support for photovoltaic panel systems shall be designed for applicable roof live load. The design of roof structures need not include roof live load in the area(s) covered by photovoltaic panel systems. Portions of roof structures not covered by photovoltaic panels shall be designed for roof live load. ~~The exclusion of the roof live load in the area(s) covered by the panels does not preclude the design of building roofs from being designed for roof live load requirements for the loading condition where the photovoltaic panel system may be removed or not installed.~~ <u>Roof structures that provide support for photovoltaic panel systems shall be designed for live load L_R for the load case where the photovoltaic panel system is not present.</u>

Commenter's Reason: The purpose of this proposal is to correct a mistake in the SEIA Floor Modification only.

Proposal RM97-13 Part II was Approved as Modified by unanimous vote of the IRC-Building Committee. The Floor Modification submitted by the Solar Energy Industries Association (SEIA) was to strike out all sections other than the section on Roof live load, with intent to keep the language in the Roof live load section unchanged. SEIA testimony to the IRC-Building Committee included statements that the language in this remaining section was unchanged from the Monograph.

The Floor Modification also revised the section number to correlate with the language approved by the IRC-Building Committee under RM98-13 Part II.

After the committee vote, ICC staff recognized that the SEIA Floor Modification inadvertently and erroneously reintroduced old language in the last sentence that was revised prior to publishing the Group B Monograph. This was never our intent. This proposal strikes out the erroneous last sentence inadvertently reintroduced in the Floor Modification, and replaces it with the correct last sentence as published in the Monograph. This will restore clarity for readers of the IRC.

Further to this correction, note the correct last sentence – as included in this Public Comment – was inadvertently published in the Report on Committee Hearings, even though the last sentence in the Floor Modification was incorrect. An Errata Update is expected that will correct the record by showing the Floor Modification last sentence, even though it was incorrect. This Public Comment will restore the correct last sentence, as shown in the Monograph.

RM97-13, Part II

Final Action: AS AM AMPC____ D

NOTE: PART I REPRODUCED FOR INFORMATIONAL PURPOSES ONLY – SEE ABOVE

RM97 – 13, Part I
M2302

Proponents: John Smirnow and Joseph H. Cain P.E. representing Solar Energy Industries Association (SEIA) (jsmirnow@seia.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY IRC-PLUMBING/MECHANICAL COMMITTEE; PART II WILL BE HEARD BY IRC-RESIDENTIAL/BUILDING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IRC- MECHANICAL

Add new definitions as follows:

<u>**BUILDING INTEGRATED PHOTOVOLTAIC (BIPV) PRODUCT.** A building product that incorporates photovoltaic modules and functions as a component of the building envelope.</u>

<u>**PHOTOVOLTAIC MODULE.** A complete, environmentally protected unit consisting of solar cells, optics and other components, designed to generate DC power when exposed to sunlight.</u>

PHOTOVOLTAIC PANEL. A collection of modules mechanically fastened together, wired, and designed to provide a field-installable unit.

PHOTOVOLTAIC PANEL SYSTEM. A system that incorporates discrete photovoltaic panels, that converts solar radiation into electricity, including rack support systems.

Revise as follows:

PHOTOVOLTAIC ~~MODULES/~~SHINGLES. A *roof covering* ~~composed of flat-plate photovoltaic modules fabricated into shingles.~~ that resembles shingles and that incorporates photovoltaic modules.

Reason: This code change proposal is the result of a consensus process established by the Solar Energy Industries Association's (SEIA) Codes and Standards Working Group. Established in 1974, SEIA is the national trade association of the U.S. solar energy industry. As the voice of the industry, SEIA works with its member companies to make solar a mainstream and significant energy source by expanding markets, removing market barriers, strengthening the industry, and educating the public on the benefits of solar energy.

New definitions are added to provide clarity in requirements for photovoltaic systems.

Sections are re-numbered for better flow.

The sentence that references "roof mounted solar collectors that serve as a roof covering" is relocated into its own section and revised to clarify the requirements for Building Integrated Photovoltaic (BIPV) systems.

The sentence that references "noncombustible materials or fire-retardant treated wood" is deleted, as it is obsolete. Photovoltaic panel systems are constructed entirely of noncombustible components, other than seals between the glass panels and frames.

The first sentence of M2302.3.1 clarifies the system of hardware that becomes the mounting system for rooftop-mounted photovoltaic panel systems must be qualified by methods found in the International Building Code. There are no applicable provisions found in the International Residential Code for these systems of mounting hardware. These mounting systems must be qualified by calculations or physical testing, as prescribed in the IBC. New definitions are needed to provide this clarity.

The second sentence of M2302.3.1 clarifies the roof system must be checked or designed to support the resultant loads imposed on it by the mounting system of the photovoltaic panel system. This check can be accomplished by using appropriate span tables in IRC Chapter 8, or by structural analysis according to IBC provisions.

A new section on wind load is added for guidance to appropriate codes and standards where wind design provisions are found. Effective Wind Area is defined in ASCE 7-10 Section 26.2. Effective Wind Area is also referenced in Footnote a of Table R301.2(2) of this code. Effective Wind Area used in design of photovoltaic systems must be consistent with the definition found in ASCE 7 in order to be compatible with the wind design calculation methods found in ASCE 7.

A new section on roof live load is added to clarify provisions already formalized in Final Action for the 2015 IBC, with some modifications as appropriate for one- and two-family dwellings. In one load case, roof live load need not be modeled in the area(s) of the roof covered by PV panels, as nobody will be walking on top of the panels or on the roof area covered by the panels. In another load case for new construction, the code-prescribed roof live load must be modeled as if the photovoltaic panels are not present.

The section on ground-mounted systems is revised to clarify that design provisions applicable to ground mount installations are found in the IBC and not found within the IRC.

Cost Impact: This proposal will reduce construction costs.

PART I – IRC – Mechanical
Committee Action: **Disapproved**

Committee Reason: The proponent asked for disapproval because the definitions were addressed in other proposals.

Assembly Action: **None**

RM98-13, Part II
R902, R905, R908 (New)

NOTE: *PART I DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART II IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART II.*

Proposed Change as Submitted

Proponent: Lorraine Ross, Intech Consulting Inc., representing The Dow Chemical Company

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IRC-PLUMBING/MECHANICAL COMMITTEE; PART II WILL BE HEARD BY THE IRC-RESIDENTIAL/BUILDING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART II – IRC- BUILDING

SECTION R902
~~ROOF~~ FIRE CLASSIFICATION

Revise as follows:

R902.1 Roofing covering materials. Roofs shall be covered with materials as set forth in Sections R904 and R905. Class A, B or C roofing shall be installed in ~~areas~~ jurisdictions designated by law as requiring their use or where the edge of the roof is less than 3 feet (914 mm) from a lot line. Classes A, B and C roofing required by this section to be listed shall be tested in accordance with UL 790 or ASTM E 108.

Exceptions:

1. Class A roof assemblies include those with coverings of brick, masonry and exposed concrete roof deck.
2. Class A roof assemblies also include ferrous or copper shingles or sheets, metal sheets and shingles, clay or concrete roof tile, or slate installed on noncombustible decks.
3. Class A roof assemblies include minimum 16 oz/ft^2 copper sheets installed over combustible decks.

R902.3 Building integrated photovoltaic product. Building integrated photovoltaic products installed as the roof covering shall be tested, listed and labeled for fire classification in accordance with Section R902.1.

R902.4 Rooftop mounted photovoltaic panels and modules. Rooftop mounted photovoltaic panels and modules installed on or above the roof covering shall be tested, listed and identified with a fire classification in accordance with UL 1703. Class A, B or C photovoltaic panels and modules shall be installed in jurisdictions designated by law as requiring their use or where the edge of the roof is less than 3 feet (914 mm) from a lot line.

SECTION R905
REQUIREMENTS FOR ROOF COVERINGS

R905.16 Photovoltaic ~~modules/~~shingles. The installation of photovoltaic ~~modules/~~shingles shall comply with the provisions of this section.
R905.16.1 Material standards. Photovoltaic ~~modules/~~shingles shall be listed and labeled in accordance with UL 1703.

R905.16.2 Attachment. Photovoltaic ~~modules/~~shingles shall be attached in accordance with the manufacturer's installation instructions.

R905.16.3 Wind resistance. Photovoltaic ~~modules/~~shingles shall be tested in accordance with procedures and acceptance criteria in ASTM D 3161. Photovoltaic ~~modules/~~shingles shall comply with the classification requirements of Table R905.2.4.1(2) for the appropriate maximum basic wind speed. Photovoltaic ~~modules/~~shingle packaging shall bear a label to indicate compliance with the procedures in ASTM D 3161 and the required classification from Table R905.2.4.1(2).

SECTION R908
ROOFTOP MOUNTED PHOTOVOLTAIC PANEL SYSTEMS

R908.1 General. The installation of photovoltaic panel systems that are mounted on or above the roof covering shall comply with the provisions of this code, the *International Fire Code* and *NFPA 70*.

R908.1.1 Material standards. Photovoltaic panels and modules shall be listed and labeled in accordance with UL 1703.

R908.1.2 Structural requirements. Rooftop mounted photovoltaic panel systems shall be designed to structurally support the system and withstand applicable loads in accordance with Chapter 3. The roof upon which these systems are installed shall be constructed to support the loads imposed by such systems in accordance with Chapter 8.

R908.1.3 Installation. Rooftop mounted photovoltaic systems shall be installed in accordance with the manufacturer's instructions. Roof penetrations shall be flashed and sealed in accordance with this chapter.

Add new text as follows:

SECTION 324
SOLAR ENERGY SYSTEMS

R324.1 General. Solar energy systems shall comply with the provisions of this section.

R324.2 Solar thermal systems. Solar thermal systems shall be designed and installed in accordance with Chapter 23 and the International Fire Code.

R324.3 Photovoltaic solar energy systems. Photovoltaic energy systems shall be designed and installed in accordance with this section, the International Fire Code and NFPA 70. Inverters shall be listed and labeled in accordance with UL 1741. Systems connected to the utility grid shall use inverters listed for utility interaction.

R324.3.1 Rooftop mounted photovoltaic systems. Rooftop mounted photovoltaic panel systems installed on or above the roof covering shall be designed and installed in accordance with Section 908.

R324.3.2 Building integrated photovoltaic systems. Building integrated photovoltaic systems that serve as roof coverings shall be designed and installed in accordance with Section 905.

R324.3.2.1 Photovoltaic shingles. Photovoltaic shingles shall comply with Section R905.16.

R324.4 Ground mounted photovoltaic systems. Ground mounted photovoltaic systems shall be designed and installed in accordance with Section R301.

R324.4.1 Fire Separation distances. Ground mounted photovoltaic systems shall be subject to the fire separation distance requirements determined by the local jurisdiction.

Reason: Currently, provisions for solar energy systems are sprinkled throughout the International Residential Code. Furthermore, there are also significant gaps, many of which were debated and approved in the 2015 *International Building Code* development process. This proposed change consolidates and organizes these provisions, with necessary section revisions, and section additions, in an easily used format that also sets the stage for easy integration of code requirements for new solar energy technology and applications as they emerge in the market. The following is an explanation of each new and revised section pertinent to the newly proposed Section R324 Solar Energy Systems:

1. **Chapter 2 New Definitions Section R202:**
   Four definitions are added for BUILDING INTEGRATED PHOTOVOLTAIC (BIPV) PRODUCT, PHOTOVOLTAIC MODULE, PHOTOVOLTAIC PANEL and PHOTOVOLTAIC PANEL SYSTEM. All of these definitions are necessary and were approved for inclusion in the 2015 *International Building Code*.
2. **Chapter 2 Revised Definition Section R202:**
   A revised definition for PHOTOVOLTAIC SHINGLES is proposed, which was also approved for inclusion in the 2015 *International Building Code*.
3. **Add new SECTION R324 SOLAR ENERGY SYSTEMS:**
   Chapter 3 is entitled Building Planning and therefore is an appropriate place to list the general provisions for installation of solar energy systems on buildings within the scope of the *International Residential Code.* Newly proposed Section 324 contains general provisions for solar energy systems and then, with subsections, serves as pointers to specific code requirements for solar energy systems based on type and location. This section is based upon requirements generally found in Chapter 23 which this proposal also revises. See below for details.
   Setting up this section will also allow easy inclusion for new solar energy system types and locations. For example, if there are building integrated photovoltaic wall systems, a new subsection can be created, with an appropriate reference to Chapter 7.
4. **Revise Section R902 Roof Classification:**
   This section has been renamed Fire Classification in order to clarify the subject of the section. Two new sections have been added to clearly identify the fire classification requirements for both building integrated photovoltaic products that serve as the roof covering and rooftop mounted photovoltaic panel systems. There is also a change to clarify Section 902.1, where the word “area” was changed to “jurisdiction” because there has been interpretation that the word “area” referred to is a place on the roof itself rather than a geographic area, such as the Urban Wildfire Interface Zone or other jurisdictional requirements for fire classified roofs. Section 902 is in place to prevent fire from spreading from rooftop to rooftop.
5. **Revise Section R902.16 Photovoltaic Shingles:**
   This section, along with the revised definition for photovoltaic shingles, has been editorially revised to match comparable changes approved in the 2015 *International Building Code*.
6. **Add new section R908 ROOFTOP MOUNTED PHOTOVOLTAIC PANEL SYSTEMS:**
   This new section outlines specific requirements for rooftop photovoltaic panel systems installed on or above roof coverings. As shown, material standards, structural requirements and installation details for these systems is detailed.
7. **Revise CHAPTER 23 and delete Section M2302 PHOTOVOLTAIC SOLAR ENERGY SYSTEMS:**
   Chapter 23 is renamed as SOLAR THERMAL ENERGY SYSTEMS which limits the chapter to solar thermal energy systems only as identified in newly proposed R324.

8. **Delete Section M2302 PHOTOVOLTAIC SOLAR ENERGY SYSTEMS:**
   As shown in Item 7, Chapter 23 is limited to solar thermal energy systems only. Therefore, Section M2302 PHOTOVOLTAIC SOLAR ENERGY SYSTEMS is deleted. Photovoltaic energy systems are electrical in nature. Placing requirements for these systems in the Mechanical part of the code is illogical and was only added in the 2012 International Residential Code because there was no other available place. This proposal sets up a new section R324 in Chapter 3 Building Planning for all solar energy systems with pointers to the type of system that will be used on the building. Provisions for photovoltaic energy systems currently in Section M2302 have been moved as appropriate to the newly proposed R324 SOLAR ENERGY SYSTEMS.

Cost Impact: This code change does not increase the cost of construction.

M2302-RM-ROSS.DOC

Committee Action Hearing Results

The code change is contained in the Updates to the 2013 Proposed Changes posted on the ICC website. Please go to http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf for more information.

PART II – IRC – Building
Committee Action: Approved as Modified

Modify the proposal as follows:

R908.1 General. The installation of photovoltaic panel systems that are mounted on or above the roof covering shall comply with the provisions of this code, ~~the *International Fire Code*~~ and *NFPA 70*.

R908.1.2 Structural requirements. Rooftop mounted photovoltaic panel systems shall be designed to structurally support the system and withstand applicable gravity loads in accordance with Chapter 3. The roof upon which these systems are installed shall be designed and constructed to support the loads imposed by such systems in accordance with Chapter 8.

(Portions of proposal not shown remain unchanged)

Committee Reason: Approval was based upon the proponent's published reason and the modification. The modification deleted reference to the IFC and added the requirement that the PV system must be design for the gravity loads and the roof support system must be designed to support the PV system loads.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Lorraine A Ross, Intech Consulting Inc, representing The Dow Chemical Company, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION R324
SOLAR ENERGY SYSTEMS

R324.1 General. Solar energy systems shall comply with the provisions of this section.

R324.2 Solar thermal systems. Solar thermal systems shall be designed and installed in accordance with Chapter 23 ~~and the International Fire Code~~.

R324.3 Photovoltaic solar energy systems. Photovoltaic solar energy systems shall be designed and installed in accordance with this section~~, the International Fire Code~~ and NFPA 70. Inverters shall be listed and labeled in accordance with UL 1741. Systems connected to the utility grid shall use inverters listed for utility interaction.

(Portions of approved proposal not shown remain unchanged)

Commenter's Reason: As stated in the Report of Hearing, RM 98 was approved based upon the proponent's published reason and the modification. The modification deleted reference to the IFC and added the requirement that the PV system must be designed for the gravity loads and the roof support system must be designed to support the PV system loads.

This public comment is a "clean-up" of Section R324 by deleting the reference to the IFC in conformance with the modification approved at the Dallas hearings. This Public Comment also editorially inserts the "R" designation to the section title and adds the word "solar" in the first sentence of R324.3 for clarity.

Public Comment 2:

Kevin Reinertson, Division Chief, Representing the California State Fire Marshal's Office; John Smirnow and Joseph H. Cain P.E. representing Solar Energy Industries Association (SEIA); Adria Smith, Fountain Valley Fire Department, representing the California Fire Chiefs Association; And Adolf Zubia. Chairman IAFC Fire and Life Safety Section, representing ICC Fire Code Action Committee, request Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION R324
SOLAR ENERGY SYSTEMS

R324.1 General. Solar energy systems shall comply with the provisions of this section.

R324.2 Solar thermal systems. Solar thermal systems shall be designed and installed in accordance with Chapter 23 ~~and the *International Fire Code*~~.

R324.3 Photovoltaic ~~solar energy~~ systems. Photovoltaic ~~energy~~ systems shall be designed and installed in accordance with this section~~, the *International Fire Code*~~ and *NFPA 70*. ~~Inverters shall be listed and labeled in accordance with UL 1741. Systems connected to the utility grid shall use inverters listed for utility interaction.~~

R324.3.1 Equipment listings. Photovoltaic panels and modules shall be listed and labeled in accordance with UL 1703. Inverters shall be listed and labeled in accordance with UL 1741. Systems connected to the utility grid shall use inverters listed for utility interaction.

R324.4 ~~R324.3.1~~ Rooftop mounted photovoltaic systems. Rooftop mounted photovoltaic panel systems installed on or above the roof covering shall be designed and installed in accordance with Section R908 ~~908~~.

R324.5 ~~R324.3.2~~ Building integrated photovoltaic systems. Building integrated photovoltaic systems that serve as roof coverings shall be designed and installed in accordance with Section R905 ~~905~~.

R324.5.1 ~~R324.3.2.1~~ Photovoltaic shingles. Photovoltaic shingles shall comply with Section R905.16.

R324.6 ~~R324.4~~ Ground mounted photovoltaic systems. Ground mounted photovoltaic systems shall be designed and installed in accordance with Chapter 3 ~~Section R301~~.

R324.6.1 ~~R324.4.1~~ Fire Separation distances. Ground mounted photovoltaic systems shall be subject to the fire separation distance requirements determined by the local jurisdiction.

SECTION R908
ROOFTOP MOUNTED PHOTOVOLTAIC PANEL SYSTEMS

R908.1 General. The installation of photovoltaic panel systems that are mounted on or above the roof covering shall comply with ~~the provisions of this code~~ this section, section R324, and *NFPA 70*.

~~**R908.1.1 Material standards.** Photovoltaic panels and modules shall be listed and labeled in accordance with UL 1703.~~

R908.2 ~~R908.1.2~~ Structural requirements. Rooftop mounted photovoltaic panel systems shall be designed to structurally support the system and withstand applicable gravity loads in accordance with Chapter 3. The roof upon which these systems are installed shall be designed and constructed to support the loads imposed by such systems in accordance with Chapter 8.

R908.3 ~~R908.1.3~~ Installation. Rooftop mounted photovoltaic systems shall be installed in accordance with the manufacturer's instructions. Roof penetrations shall be flashed and sealed in accordance with this chapter.

Commenter's Reason: This public comment cleans up the proposal as follows.

General – For consistency the term "photovoltaic systems" replaces "photovoltaic energy systems" and "photovoltaic panel systems".
R324.2 – Reference to the IFC was deleted since it does not include specific requirements for solar thermal systems.
R324.3 – Reference to the IFC was deleted to be consistent with R908.1.
R324.3.1 – A title was added to this section, which focuses on listing requirements. The listing requirements for photovoltaic panels and modules was moved from R908.1.1 to here because this is a more logical location, and since listing of these devices is also required for ground mounted systems.
R324.6 – The structural requirements were revised from Section R301.1 to Chapter 3 to be consistent with R908.2.
R908.1 – For the convenience of the code user a reference to Section R324 was added.
R908.1.1 – As previously mentioned, these requirements were moved to R324.3.1.

Public Comment 3:

Steve Orlowski, representing National Association Of Home Builders, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

R324.3 Photovoltaic solar energy systems. Photovoltaic energy systems shall be designed and installed in accordance with this section~~, the International Fire Code~~ and NFPA 70. Inverters shall be listed and labeled in accordance with UL 1741. Systems connected to the utility grid shall use inverters listed for utility interaction.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: This public comment correlates action taken by the committee when it approved the modification at the Dallas hearings. The proponent of the original code change submitted a modification deleting the reference to the International Fire Code, after the committee approved a code change that brought the requirements directly into the IRC. The committee failed to delete this additional reference to the IFC, in this section, because it was referenced in the errata which did not appear in the original monograph or in the modification that was approved.

RM98-13, Part II
Final Action: AS AM AMPC____ D

NOTE: PART I REPRODUCED FOR INFORMATIONAL PURPOSES ONLY – SEE ABOVE

RM98 – 13, Part I
202, M2302

Proponents: John Smirnow and Joseph H. Cain P.E. representing Solar Energy Industries Association (SEIA) (jsmirnow@seia.org)

Proponent: Lorraine Ross, Intech Consulting Inc., representing The Dow Chemical Company

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IRC-PLUMBING/MECHANICAL COMMITTEE; PART II WILL BE HEARD BY THE IRC-RESIDENTIAL/BUILDING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IRC- MECHANICAL

Add new definitions as follows:

SECTION 202
DEFINITIONS

BUILDING INTEGRATED PHOTOVOLTAIC PRODUCT. A building product that incorporates photovoltaic modules, and functions as a component of the building envelope.

PHOTOVOLTAIC MODULE. A complete,environmentally protected unit consisting of solar cells,optics and other components,exclusive of a tracker, designed to generate DC power when exposed to sunlight.

PHOTOVOLTAIC PANEL. A collection of photovoltaic modules mechanically fastened together,wired,and designed to provide a field-installable unit.

PHOTOVOLTAIC PANEL SYSTEM. A system that incorporates discrete photovoltaic panels, that convert solar radiation into electricity, including rack support systems.

Revise as follows:

PHOTOVOLTAIC ~~MODULES/~~SHINGLES. A *roof covering* ~~composed of flat-plate photovoltaicmodules fabricated into~~ resembles shingles and that incorporates photovoltaic modules.

CHAPTER 23
SOLAR THERMAL ENERGY SYSTEMS

Delete without substitution:

~~**SECTION M2302**~~
~~**PHOTOVOLTAIC SOLAR ENERGY SYSTEMS**~~

~~**SECTION M2302**~~
~~**PHOTOVOLTAIC SOLAR ENERGY SYSTEMS**~~

~~**M2302.1 General.** This section provides for the design, construction,installation, alteration, and repair of photovoltaic equipment and systems.~~

~~**M2302.2 Requirements.** The installation, inspection, maintenance,repair and replacement of photovoltaic systems and all system components shall comply with the manufacturer's instructions, Sections M2302.2.1 through M2302.2.3 and NFPA 70.~~

~~**M2302.2.1 Roof-mounted panels and modules.** Where photovoltaic panels and modules are installed on roofs, the roof shall be constructed to support the loads imposed by such modules. Roof-mounted photovoltaic panels and modules that serve as roof covering shall conform to the requirements for roof coverings in Chapter 9. Where mounted on or above the roof coverings, the photovoltaic panels and modules and supporting structure shall be constructed of noncombustible materials or fire-retardant treated wood equivalent to that required for the roof construction~~

~~**M2302.2.2 Roof and wall penetrations.** Roof and wall penetrations shall be flashed and sealed in accordance with Chapter 9 to prevent entry of water, rodents, and insects.~~

~~**M2302.2.3 Ground-mounted panels and modules.** Ground-mounted panels and modules shall be installed in accordance with the manufacturer's instructions.~~

~~**M2302.3 Photovoltaic panels and modules.** Photovoltaic panels and modules shall be listed and labeled in accordance with UL 1703.~~

~~**M2302.4 Inverters.** Inverters shall be listed and labeled in accordance with UL 1741. Systems connected to the utility grid shall use inverters listed for utility interaction.~~

The code change is contained in the Updates to the 2013 Proposed Changes posted on the ICC website. Please go to http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf for more information.

PART I – IRC – Mechanical
Committee Action: **Approved as Submitted**

Committee Reason: Approval was based upon the proponent's published reason. PV is not mechanical and does not belong in Chapter 23.

Assembly Action: **None**

RP1-13
P2502.1

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2502.1 Existing building sewers and building drains. ~~Existing *building sewers* and drains shall be used in connection with new systems when found by examination and/or test to conform to the requirements prescribed by this document.~~ Where the entire sanitary drainage system of an existing building is replaced, existing building drains under concrete slabs and existing building sewers that will serve the new system shall be internally examined to verify that the piping is sloping in the correct direction, is not broken, is not obstructed and is sized for the drainage load of the new plumbing drainage system to be installed.

Reason: Before the technical reasons for the changes in this section are provided, the PMGCAC wants to readers of PMGCAC proposals to understand that many of our proposals for changing the IRC are focused on language improvements and intent clarity that do not change the meaning of what the 2012 IRC (and earlier editions) have required. Much of the existing language in the plumbing chapters came from the old CABO codes. “Seasoned” code officials knew what this language intended and inspected based upon a wealth of knowledge gathered over the many years of development of those older codes. Our concern is for the newer code officials and inspectors who do not have this experience and more often than not, are being required to enforce the code just as it is written. If the code is not clear, a variety of interpretations result and all users of the code suffer the consequences. The code needs to actually state the intent in clear terms. Even though many people already “know” what is intended by a particular code section and don’t think it necessary to make any changes, the development of the codes needs to consider all people who use the codes whether they are experienced or a newcomer. We hope that the readers of the PMGCAC proposals will carefully consider and approve our “editorial proposals” towards making a better code for the future.

Technical reason for Section P2502.1:

Use of “and/or” and “when” in code text is undesirable code format. What kind of “test”? The phrase “requirements prescribed by this document” is vague. Overall, the application of this section is unclear. The revised language provides clear, prescriptive requirements.

Consider a few situations that happen to houses. 1) A slab-on grade house burns down or is wind damaged such that only the remaining slab foundation will be used to re-construct a new building. Re-use of the building drain would be desirable to avoid extensive slab rework. 2) A house is completely razed or the entire plumbing drainage system of a house needs replaced such that only the building sewer remains. Re-use of the building sewer would be desirable to avoid extensive costs and possible complications for replacing the sewer (such as crossing a public street to connect to the public sewer). Why tear out good, serviceable building drains and building sewers for the sake of replacing with new material? The only way to know if existing building drains and existing building sewers are serviceable is to internally examine the piping for problems.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 11 on the PMGCAC IRC-P list. For PMGCAC member reference, this was item no.1 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will not increase the cost of construction.

P2502.1-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The required internal examination would increase the cost of construction that is not justified.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Submitted.

Commenter's Reason: The original code language already required an "examination and/or test" for sewers and drains that are going to be "re-used". Thus, this proposal does not cause additional cost of construction. Because all the piping is below grade, how else could you examine the piping if not by video camera? Testing (assuming pressure testing) of the piping doesn't tell you if the pipe has back slope or obstruction issues. This section was originally put into the code because some code officials were forcing complete replacement of building drains below slabs and building sewers (and even some under concrete driveways and public streets) when a house was completely rebuilt. This section is being revised only to clarify what this section originally intended.

RP1-13
Final Action: AS AM AMPC____ D

RP2-13
P2502.2

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2502.2 Additions, alterations or repairs. Additions, *alterations*, renovations or repairs to a~~ny~~ plumbing system<u>s</u> shall conform to that required for a new plumbing system without requiring the existing plumbing system<u>s</u> to comply with all the requirements of this code. Additions, *alterations* or repairs shall not cause an existing system to become unsafe, insanitary or overloaded.

Minor additions, <u>minor</u> *alterations*, <u>minor</u> renovations ~~and~~ <u>or</u> <u>minor</u> repairs to <u>an</u> existing plumbing system~~s shall be permitted~~ <u>that are performed</u> in the same manner and arrangement as in the existing system <u>but do not comply with this code,</u> <u>shall not create a hazardous condition and shall require approval by the *building official*.</u> ~~, provided that such repairs or replacement~~ are ~~not hazardous~~ ~~and are *approved*~~ .

Reason: "Shall be permitted" is not mandatory code language. The existing second paragraph is really an exception to allow "old methods and arrangements", not compliant with the current code, to be used in certain situations that are determined to be not hazardous. For example, a drum trap on a bathtub is not allowed by current code. It's old technology but drum traps are not known to create a hazardous condition. Changing a defective drum trap over to a standard trap arrangement might prove to be very difficult and unnecessarily costly when a replacement with a new drum trap will work. An S-trap arrangement for an existing pedestal lavatory might be the only economical way to provide for a replacement trap to the lavatory because of the physical constraints. The previous S-trap installation worked successfully and is not a hazardous condition. The second sentence in this section provides appropriate relief for repair situations instead of forcing an extensive and costly event for what started off as a simple repair project. The revised language makes the intent clear.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 11 on the PMGCAC IRC-P list. For PMGCAC member reference, this was item no.2 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will not increase the cost of construction.

P2502.2-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The term "minor" is not defined and is used too many times in the proposal. The committee believes that the phrase "shall be permitted" is mandatory language that is acceptable for the code.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Submitted.

Commenter's Reason: "Shall be permitted" is not mandatory code language. Granted, the phrase is used throughout the I-codes as if it was mandatory code language but the truth is that this phrase only means you are allowed to do something. Unless the code prohibits something, you are allowed to do anything you want without saying that you are permitted to do so. The phrase "shall be permitted" doesn't mandate anything and doesn't prohibit anything. This is unacceptable code language.

The term "minor" was added to alterations, renovations and repairs because there has been always the question as to whether "minor" was meant as an adjective for all those terms or just for additions. We believe "minor" applies to all those words. There is no definition for "minor" but that problem existed in the original code language. It is up to the code official to decide what is "minor" as it is difficult to prescribe what constitutes "minor" in every situation. This revised language does not change the intent of the original language. It just puts the intent in mandatory language code format.

Final Action: AS AM AMPC____ D

RP3-13
P2503.4, P2503.4.1 (New), P2503.4.2 (New)

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Delete and substitute as follows:

~~**P2503.4 Building sewer testing.** The *building sewer* shall be tested by insertion of a test plug at the point of connection with the public sewer and filling the *building sewer* with water, testing with not less than a 10-foot (3048 mm) head of water and be able to maintain such pressure for 15 minutes.~~

P2503.4 Gravity-flow building sewer test. Gravity-flow *building sewer* piping shall be tested in accordance with Section P2503.4.1 or P2503.4.2. Plastic piping shall not be tested using air or gas.

P2503.4.1 Water test. The piping shall be filled with water. Additional water shall be forced into the piping to increase the pressure in the piping by not less than 10 feet of water column (4.3 psi) (30 kPa). The source of pressure shall be isolated and disconnected from the piping except where a standpipe is used to generate the test pressure. Where a standpipe is used to generate the test pressure, water shall not be added to the standpipe during the test observation period. The test shall be successful where there is not any change in pressure gauge indication during an observation period of 15 minutes. The pressure gauge shall comply with the requirements of Section P2503.9.

P2503.4.2 Air test. The piping shall be pressurized with air to not less than 4.3 psi (30 kPa). The air pressure shall be retained in the piping and the air pressure source shall be disconnected from the piping. The test shall be successful where there is not any change in pressure gauge indication during an observation period of 15 minutes. The pressure gauge shall comply with the requirements of Section P2503.9.

Reason: This section needs to apply *only* to gravity flow sewers to distinguish it from the testing requirements for forced flow sewers (another proposal by the PMGCAC. The testing requirements between the two types are vastly different.

Code language should not, in general, include unnecessary "instructions" for the performance of the work. For example, "insertion of a test plug at the point of connection to the…" is unnecessary as the requirement for pressurizing the piping automatically requires that the contractor make the necessary arrangements (such as plugging and capping) to be able to pressurize the piping. To the "public sewer" is inaccurate as a building sewer could terminate at a septic tank, a private sewer or a private waste treatment plant.

The existing code language requires that the "piping maintain the test pressure". This is archaic language because the piping doesn't "maintain" anything. What is intended is that the test pressure in the piping not decrease during the observation period. The code language is revised to more clearly state the condition for a successful test.

A common method for water testing is to attach a standpipe to the piping being tested and filling the piping and the standpipe with water so that the water in the standpipe produces the required test pressure in the piping. The test pressure is easily verified by measuring the height of the standpipe. A "loss of pressure" (indicating a leak) in the system *could* be determined by observing the water level in the standpipe. However, in many cases, observing the water level in the standpipe might require the inspector to climb a ladder to visually see the water level at the top of the standpipe. The inspector is now challenged as to how much of a drop in water level in the standpipe constitutes a test failure? At first, it might be easy to say "none". However, if a pressure gauge is connected to the system to determine pressure loss, the minimum "readability" of the gauge for this pressure range allows for *some* pressure loss (or drop in standpipe water level). For example, Section P2503.9 requires that the pressure gauge have increments of 0.1 psi. Therefore, the gauge can be read to an accuracy of half of the increment or 0.05 psi. In other words, where using a reasonably sized, typical dial pressure gauge, it would be very difficult to observe that the pressure gauge needle moved by an increment less than 0.05 psi. So, by reading a pressure gauge, the amount of pressure drop allowed in the system under test is 0.05 psi. This pressure converts to 1.4 inches of water column. So, theoretically, to be fair and equivalent to the reading of a pressure gauge (such as used for an air test), the water level in the test standpipe could drop 1.4 inches and still be considered acceptable. Some code officials will fail a water test on piping because of a *change in shape of the water meniscus in the standpipe*! This is not realistic, is unnecessarily restrictive and is not what is intended by the code. By requiring that a gauge be used for determining the success of a water test allows for the code official to remain in a safe location (not having to climb ladders) and provides for a reasonable allowance for leakage of a system that essentially experiences no pressure while in service.

Another way to pressurize the piping with water is to force water into the piping with a hydrostatic pump (usually a small hand pump). The current language doesn't seem to consider this method and some code officials might balk at this method just because they think the language requires a 10 foot standpipe full of water to generate the test pressure. The revised language is now open to allow for water pressurization by a pump (typically a hand pump) instead of a standpipe.

A new section for *air testing* of gravity flow sewers is added as there is no technical reason why air cannot be used as a test medium provided that the piping is not of plastic material. Note that the test pressure is 4.3 psi to be the pressure equivalent to 10 feet head of water. In other sections of the current code, air test pressures are stated as 5 psi. As test gauges are required (see Section P2903.9) to have increments of 0.1 psi, there is no need to 'round' the test pressure up to 5 psi so that the pressure can be read on a gauge. For other code sections that use the 5 psi for air testing, other proposals are being offered to change the test pressure to 4.3 psi. There is no need (and it doesn't make sense) to air test at 5 psi when water testing is only required at 4.3 psi (10 feet of water head).

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 11 on the PMGCAC IRC-P list. For PMGCAC member reference, this was item no. 3 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will not increase the cost of construction.

P2503.4-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The proposal would increase cost because of additional labor needed to do the test. There is not adequate cost justification for this increase in cost.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Modified by this Public Comment.

Further modify proposal as follows:

P2503.4 Gravity-flow building sewer test. Gravity-flow *building sewer* piping shall be tested in accordance with Section P2503.4.1 or P2503.4.2. Plastic<u>, concrete and vitrified clay</u> piping shall not be tested using air or gas.

Commenter's Reason: We don't understand the committee's reason as to why there would be additional labor to perform the test that has a gauge. Putting a test gauge on the system to be pressure tested is just a matter of have a fitting in place to attach the gauge. Putting a gauge in place for air testing isn't anything new so why would it be so much "additional labor" for attaching a gauge for a water test?

The important thing to realize is *that this language allows for water testing without the use of a 10-foot test head standpipe full of water!* The reasoning that proponents of RP4 used to support the elimination of any water test head pressure for sewers was that they were concerned about flooding the house if a test plug didn't hold. The water test method in this proposal allows for the use of hand hydrotest pump to generate the test pressure. By this method, if the test pressure "lets go", the release of water is very minimal - maybe a cup?

We don't agree with the committee that there would be an increase in cost because special gauges are now required. We believe that the committee was swayed by an opponent's testimony that this proposal *now* requires special test gauges that might be unobtainable and highly expensive. This is not true because the code has required that gauges used for testing meet Section P2503.8 ever since the 2003 edition of the IRC (and IPC). By now, all plumbing contractors should have the appropriate test gages at their shop or on the truck. This proposal did not add the specification for test gauges, it only points to the section that has required this type of gauge for 10 years. Installers use the same test gauges for air pressure tests for DWV systems. These gauges are not left at the site but are simply attached for the test observation period. These gauges are obtainable and are the same gauges used for air testing of building DWV system.

In this public comment, we are further modifying Section P2503.4 to add other types of sewer piping that must not be tested by air, that being concrete and vitrified clay. These products can become cracked during installation and applying air pressure could result in a pipe failure which could send out projectiles that could cause injury, not unlike what could happen with air testing of plastic piping.

RP3-13

Final Action: AS AM AMPC____ D

RP4-13
P2503.4

Proposed Change as Submitted

Proponent: Gary Kozan, CPD, Ridgeway Plumbing, representing Florida Association of Plumbing Heating Cooling Contractors (garyk@ridgewayplumbing.com)

Revise as follows:

P2503.4 Building sewer testing. The building sewer shall be tested by insertion of a test plug at the point of connection with the public sewer and filling the building sewer with water <u>to the highest point thereof.</u>~~, testing with not less than a 10-foot (3048) head of water and be able to maintain such pressure for 15 minutes.~~ <u>The building sewer shall be watertight at all points. Forced sewer tests shall consist of pressurizing the piping to a pressure of not less than 5 psi (34.5 kPa) greater than the pump rating and maintaining such pressure for not less than 15 minutes. The forced sewer shall be watertight at all points.</u>

Reason: Subjecting a gravity house sewer to a 10-foot head is both unnecessary and impractical. By the time the building sewer is able to be connected, the plumbing fixtures have often already been installed. That means that both ends of the sewer line must be plugged off in order to prevent the house from flooding. Leaks on house sewers are rare, considering that most are constructed with plastic pipe, are typically short, and contain few fittings and joints. Public sewer mains and branch laterals are not similarly tested.

This revised text is identical to that found in the other model plumbing code (UPC). It acknowledges the difficulties associated with pressure testing house sewers. It would be appropriate for the IRC to adopt this proven method.

This proposal also adds language for testing forced sewers, identical to that found in the IPC.

Cost Impact: This code change proposal will not increase the cost of construction.

P2503.14-RP-KOZAN.DOC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: This method of testing is a safer, more logical way to perform the testing.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Modified by this Public Comment.

Further modify proposal as follows:

P2503.4 Building sewer testing. The building sewer shall be tested by insertion of a test plug at the point of connection with the public sewer<u>,</u> ~~and~~ filling the building sewer with water <u>and pressurizing the sewer to not less than 10-foot (3048 mm) head of water.</u> ~~to the highest point thereof.~~ <u>The test pressure shall not decrease during a period of not less than 15 minutes.</u> The building sewer shall be watertight at all points.

Forced sewer tests shall consist of pressurizing the piping to a pressure of not less than 5 psi (34.5 kPa) greater than the pump rating and maintaining such pressure for not less than 15 minutes. The forced sewer shall be watertight at all points.

Commenter's Reason: Certainly, gravity sewer testing with water at practically zero pressure is "safer" (because the house won't flood when testing with a 10 foot stand pipe full of water and a test plug blows out) BUT does the test really prove anything? We understand that in normal service, a gravity building sewer experiences no pressure. However, the 10 foot water head test pressure is necessary to determine *the mechanical integrity of the joints*. For example, the installation might have a joint that is just "stuck together" without a coupling being tightened (hubless) or solvent welded (plastic); or a glued joint that might have squeezed the pipe partially out of the fitting socket before setting up. A little ground movement along with some invasive tree roots are going to eventually cause a root-clogging problem at these weak joints. The purpose of the 10 foot test head is not to necessarily duplicate an actual in-service condition but to ensure a level of quality for the workmanship. The 10-foot test head has been in the code for decades and there is not any technical justification for lowering the test pressure.

Plumbing contractors are usually inventive enough to know how to protect their own, and their customer's interests by making sure that homes and buildings will not be flooded during a building sewer test.

Note, however, we prefer RP3 as modified by our public comment over RP4 because of the following shortcomings of this RP4 proposal:

1) A test pressure for a forced sewer of 5 psi greater than the pump pressure rating is unnecessary. The pump cannot develop any more pressure than its rating so why test at a higher pressure?
2) The proposed language implies that a successful test on the sewer is where no observed leaks are found. How does the code official do that when the trench is muddy or where it might have rained a short time ago? Does the code official need to get down in the trench and look for evidence of leakage?
3) Why shouldn't an air test be acceptable for those piping systems that are not plastic, concrete or vitrified clay? The code allows air tests for drain, waste and vent piping (not plastic) so why not for sewers?
4) The original proposal does not require a period of time for the gravity test.

This public comment is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Submitted.

Commenter's Reason: This is a simple editorial cleanup of the language. We are perplexed as to why the committee didn't approve this because acronyms are generally problematic in code text.

RP6-13
Final Action: AS AM AMPC____ D

RP7-13
P2503.5.1, P2503.5.1.1 (New), P2503.5.1.2 (New)

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2503.5.1 Rough-in test ~~plumbing~~. ~~DWV~~ The rough-in piping for the drain, waste and vent systems~~s~~ shall be tested ~~on completion of the rough piping installation by~~ in accordance with Section P2503.5.1.1 or P2503.5.1.2 . Plastic piping shall not be tested using air or gas. ~~water or for piping systems other than plastic, by air with no evidence of leakage. Either test shall be applied to the drainage system in its entirety or in sections after rough piping has been installed, as follows:~~

1. ~~Water test. Each section shall be filled with water to a point not less than 10 feet (3048 mm) above the highest fitting connection in that section, or the highest point in the completed system. Water shall be held in the section under test for a period of 15 minutes. The system shall prove leak free by visual inspection.~~
2. Air test. The portion under test shall be maintained at a gauge pressure of 5 pounds per square inch (psi) (34 kPa) or 10 inches of mercury column (34 kPa). This pressure shall be held without introduction of additional air for a period of 15 minutes.

P2503.5.1.1 Water test. The piping shall be filled with water. Additional water shall be forced into the piping to increase the pressure in the piping by not less than 10 feet (3048 mm) of water column (4.3 psi) (30 kPa). The source of pressure shall be isolated and disconnected from the piping except where a standpipe is used to generate the test pressure. Where a standpipe is used to generate the test pressure, water shall not be added to the standpipe during the test observation period. The test shall be successful where there is not any change in pressure gauge indication during an observation period of 15 minutes. The pressure gauge shall comply with the requirements of Section P2503.9.

> **Exception:** Vent piping that is within 10 feet (3048) below the elevation of the termination of the vent piping above a roof shall only be required to be filled with water and shall not be required to be pressurized by 10 feet (3048 mm) of water column (4.3 psi) (30 kPa).

P2503.5.1.2 Air test. The piping shall be pressurized with not less than 4.3 psi (30 kPa) of air. The air pressure shall be retained and the source of air pressure shall be disconnected from the piping. ~~The portion under test shall be maintained at a gauge pressure of 5 pounds per square inch (psi) (34 kPa) or 10 inches of mercury column (34 kPa).This shall be held without introduction of additional air for a period of 15 minutes.~~ The test shall be successful where there is not any change in pressure gauge indication during an observation period of 15 minutes. The pressure gauge shall comply with the requirements of Section P2503.9.

> **Exception:** The highest vent piping joint in a completed drain waste and vent system and the pipe above such point in the vent system shall not be required to be tested.

Reason: The existing section language has some convoluted language regarding a personnel safety-related prohibition, appears to allow testing using gases other than air which is equally dangerous to personnel, uses an acronym in the code language (an undesirable practice), has archaic terminology, fails to consider certain DWV piping arrangements that are now allowed by the code and, depending on a code official's interpretation, puts onerous and perhaps impossible demands on the inspector to visually inspect all of the pipe, fittings and connections for water leaks.

Water testing:

A common method for water testing is to attach a standpipe to the piping being tested and filling the piping and the standpipe with water so that the water in the standpipe produces the required test pressure in the piping. The test pressure is easily verified by measuring the height of the standpipe. A “loss of pressure” (indicating a leak) in the system *could* be determined by observing the water level in the standpipe. However, in many cases, observing the water level in the standpipe might require the inspector to climb a ladder to visually see the water level at the top of the standpipe. The inspector is now challenged as to how much of a drop in water level in the standpipe constitutes a test failure? At first, it might be easy to say “none”. However, if a pressure gauge is connected to the system to determine pressure loss, the minimum “readability” of the gauge for this pressure range allows for *some* pressure loss (or drop in standpipe water level). For example, Section P2503.9 requires that the pressure gauge have increments of 0.1 psi. Therefore, the gauge can be read to an accuracy of half of the increment or 0.05 psi. In other words, where using a reasonably sized, typical dial pressure gauge, it would be very difficult to observe that the pressure gauge needle moved by an increment less than 0.05 psi. So, by reading a pressure gauge, the amount of pressure drop allowed in the system under test is 0.05 psi. This pressure converts to 1.4 inches of water column. So, theoretically, to be fair and equivalent to the reading of a pressure gauge (such as used for an air text), the water level in the test standpipe could drop 1.4 inches and still be considered acceptable. Some code officials will fail a water test on piping because of a *change in shape of the water meniscus in the standpipe*! This is not realistic, is unnecessarily restrictive and is not what is intended by the code. By requiring that a gauge be used for determining the success of a water test allows for the code official to remain in a safe location (not having to climb ladders) and provides for a reasonable allowance for leakage of a system that essentially experiences no pressure while in service.

Another way to pressurize the piping with water is to force water into the piping with a hydrostatic pump (usually a small hand pump). The current language doesn’t seem to consider this method and some code officials might balk at this method just because they think the language requires a 10 foot standpipe full of water to generate the test pressure. The revised language is now open to allow for water pressurization by a pump (typically a hand pump) instead of a standpipe.

The exception for P2503.5.1.1 is provided to accommodate the age old method of just filling the completed piping system to the overflow point at the vent terminal above the roof. (This is the same allowance that is in the current section language). Vent piping, especially so near to the opening to the outdoors, experiences negligible pressure in actual service so testing at not less than “10 feet of water column” is not critical. Simply filling this section of vent piping with water is good enough as it has been for decades.

Air testing:

This proposal adds the prohibition of the use of gas for testing plastic piping systems as someone could claim that they were not using air for testing but gas (such as nitrogen or carbon dioxide) for testing--the hazard (explosion of the piping) is still the same.

The test pressure of “5 psi of air” was changed to 4.3 psi to be equivalent to 10 feet head of water as it doesn’t make sense to “penalize a system” with a higher test pressure just because of the test method chosen. The 5 psi air pressure was originally chosen because in the past, gauges with 1 psi increments were commonly used. Now, the code requires (Section P2503.9) that the pressure gauge have 0.1 psi increments so it is easily possible to pressurize with accuracy to 4.3 psi. There is no need (and it doesn’t make sense) to air test at 5 psi when water testing is only required at 4.3 psi (10 feet of water head).

Test instruments using mercury are rarely, if ever anymore, used for plumbing system testing. Because of the environmental issues associated with a mercury spill from such test instruments, references to this type of test apparatus should be eliminated. The exception to Section P2503.5.1.2 is provided so that contractors will not have to climb roofs (sometimes very steep and slick) to “cap off” a vent pipe for a test and then return to the roof to uncap the vent pipe after the test. Such work can be easily and safely performed in an attic space. In actual service, the vent system experiences negligible pressure at this point so testing of this final connection isn’t critical. Let’s not make the plumbers do something that we know is dangerous (accessing roofs).

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 11 on the PMGCAC IRC-P list. For PMGCAC member reference, this was item no. 6 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will not increase the cost of construction.

P2503.5.1-RP-HALL-PMGCAC

Committee Action Hearing Results

The following is errata that was not posted to the ICC website.

P2503.5.1 Rough-in test ~~plumbing~~. ~~DWV~~ The rough-in piping for the drain, waste and vent system~~s~~ shall be tested ~~on completion of the rough piping installation~~ ~~by~~ in accordance with Section P2503.5.1.1 or P2503.5.1.2 . Plastic piping shall not be tested using air or gas. ~~water or for piping systems other than plastic, by air with no evidence of leakage. Either test shall be applied to the drainage system in its entirety or in sections after rough piping has been installed, as follows:~~

1. ~~Water test. Each section shall be filled with water to a point not less than 10 feet (3048 mm) above the highest fitting connection in that section, or the highest point in the completed system. Water shall be held in the section under test for a period of 15 minutes. The system shall prove leak free by visual inspection.~~

2. ~~Air test. The portion under test shall be maintained at a gauge pressure of 5 pounds per square inch (psi) (34 kPa) or 10 inches of mercury column (34 kPa). This pressure shall be held without introduction of additional air for a period of 15 minutes.~~

Committee Action: **Disapproved**

Committee Reason: The language in the proposal is more confusing than the existing text. The proposal prohibits a commonly used test and there is no technical justification for this.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Submitted.

Commenter's Reason: Perhaps the committee was confused by the presence of errata, that being item 2 being left in the proposal. The water and air testing requirements for were already in the code. No test method is being deleted. The proposal made the requirements into sub-sections of the main section and provided clear and consistent wording. The wording of these two sub-sections is consistent with what we proposed in RP3 for water and air testing for sewers. The reasons in the original proposal provide a clear understanding of why we are revising the language.

RP7-13
Final Action: AS AM AMPC____ D

RP8-13
P2503.5.1

Proposed Change as Submitted

Proponent: Gary Kozan, CPD, Ridgeway Plumbing, representing Florida Association of Plumbing Heating Cooling Contractors (garyk@ridgewayplumbing.com)

Revise as follows:

P2503.5.1 Rough plumbing. DWV systems shall be tested on completion of the rough piping installation by water or for piping systems other than plastic, by air with no evidence of leakage. Either test shall be applied to the drainage system in its entirety or in sections after rough piping has been installed, as follows:

1. Water test. Each section shall be filled with water to a point not less than ~~10~~ 5 feet (~~3048~~ 1524 mm) above the highest fitting connection in that section, or to the highest point in the completed system. Water shall be held in the section under test for a period of 15 minutes. The system shall prove leak free by visual inspection.
2. Air test. The portion under test shall be maintained at a gauge pressure of 5 pounds per square inch (psi) (34 KPa) or 10 inches of mercury column (34 KPa). This pressure shall be held without introduction of additional air for a period of 15 minutes.

Reason: When testing a DWV system, the actual head pressure is not nearly as critical as the visual nature of the test. 10-foot head tests are commonly verified by the inspector "shaking the stack." If water splashes out, the system is considered to be watertight. Mirrors and ladders are seldom used. Lowering the fill stack to 5 feet enables both the installer and the inspector to put eyeballs on the water level inside the pipe. Seeing is believing.

There is nothing magical about a 10-foot head. The reality is a 10-foot (4.34 psi) head test is unlikely to reveal any leaks or defects that would not be detected by a 5-foot (2.17 psi) head test. Many jurisdictions favor the 5-foot head test as superior overall to a 10-foot head test. Florida, for example, adopted the 5-foot head test statewide more than ten years ago. It is time for the IRC to recognize this common sense approach.

Cost Impact: This code change proposal will not increase the cost of construction.

2503.5.1-RP-KOZAN.DOC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: This is a good, common sense change because it is hard for inspectors to see the water level in a 10 foot tall standpipe.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Disapproval.

Commenter's Reason: With respect to ensuring integrity of the piping installation, we see no technical justification for lowering the test pressure. And with the water level in the test standpipe now being easily visible, then the inspector could interpret a slight change in the *meniscus* of the water as a reason to reject the installation. What if the water level drops by 1/8 inch over a 15 minute period? Is that reason enough for failure? Granted, the existing language of this section leaves the door open for such problems, but to lower the top of the test standpipe for easy visibility opens the door even wider for disputes. (Note that our RP7 proposal offers a way to make water tests fair for both parties).

The purpose of the 10 foot test head is not to necessarily duplicate an actual in-service condition but to ensure a level of quality for the workmanship. The 10 foot water head test pressure is necessary to determine the mechanical integrity of the joints. For example, the installation might have a joint that is just ‘stuck together’ without a coupling being tightened adequately (hubless) or solvent welded (plastic); or a solvent welded joint that might have squeezed the pipe partially out of the fitting socket before setting up. A 10 foot head will find more of these installation problems.

The 10 foot test head *could* be representative of a real condition in a building. Consider a home with a basement (or in Florida, a ground level garage under a raised first floor) with a building drain below the basement floor level, but no fixtures on that floor level. The sewer clogs and backs up to the lowest fixture on the first floor. The building drain and a portion of the stack in the basement (or Florida garage) are now under a pressure that exceeds 5 foot of water head.

The 10-foot test head has been in the code for decades and coincides with typical home construction having 8-foot ceiling heights. We can see no technical justification for lowering the test pressure.

This public comment is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes.

Final Action: AS AM AMPC____ D

RP9-13

P2503.5.2, P2503.5.2.1 (New), P2503.5.2.2 (New), P2503.5.2.2.1 (New)

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2503.5.2 Finished test ~~plumbing~~. After the plumbing fixtures ~~have been~~ are ~~set~~ installed, ~~and their~~ traps filled with water and any air admittance valves installed, a test in accordance with Section P2503.5.2.1 shall be performed. Where required by the *building official*, one or more tests in accordance with P2503.5.2.2 shall be performed. ~~their connections shall be tested and proved gas tight and/or water tight as follows:~~

P2503.5.2.1 Water leakage ~~tightness~~. ~~Each~~ Fixtures shall be operated while exposed piping, fixture and faucet connections are observed for leaks. The test shall be successful where there is not any evidence of water leakage. ~~filled and then drained. Traps and fixture connections shall be proven water tight by visual inspection.~~ This section shall not be construed as requiring the building official to witness the operation of all fixtures.

P2503.5.2.2 Gas leakage ~~tightness~~. Only when required by the ~~local administrative authority~~ *building official*, testing in accordance with Section P2503.5.2.2.1 or P2503.5.2.2.2 shall be performed. ~~a final test for gas tightness of the DWV system shall be made by the smoke or peppermint test as follows:~~

P2503.5.2.2.1 Smoke test. ~~Introduce~~ A pungent, thick smoke ~~into the system~~ shall be forced into the drainage, waste and vent system, on the downstream side of traps, using a pressure of 1 inch water column (249 Pa) or less. ~~When~~ After the smoke appears at the outdoor vent terminals, ~~such~~ the terminals shall be temporarily sealed to prevent smoke leakage and the piping shall be pressurized to 1-inch water column (249 Pa) by a continuous source of air. ~~and a pressure equivalent to a 1-inch water column (249 Pa) shall be applied and maintained~~ for a ~~test period of not less than 15 minutes~~. The test shall be successful where there is not any smoke observed inside the building during an observation period of 15 minutes. Smoke generating materials such as bombs, canisters and flares shall not be placed into the drain, waste and vent system piping.

P2503.5.2.2.2 Peppermint test. All but one outdoor vent terminal of the piping shall be temporarily sealed to prevent odor leakage. Two ~~Introduce 2~~ ounces (59 mL) of oil of peppermint shall be poured into the open outdoor vent terminal followed by ~~into the system. Add~~ 10 quarts (9464 mL) of hot water. ~~and seal all vent terminals~~. The vent terminal shall be temporarily sealed gas tight. The test shall be successful where the odor of peppermint is not detected in the building during an observation period of 15 minutes. ~~The odor of peppermint shall not be detected at any trap or other point in the system.~~ Persons who have performed the addition of oil and hot water to the system shall not enter the building until after the observation period.

Reason: This section has some convoluted language, some archaic terminology and fails to address certain important specifics of the test methods such as making sure air admittance valves are installed. The revised language makes the intent clear. The last sentence of Section P2503.5.2.1 allows the building official to randomly select (or select none) of the fixtures to operate during inspection so as to not waste precious time for inspection. The plumbing installer should have already performed a final leak test of all fixtures before inspection. The plumbing installer is responsible for finding and resolving any leaks before and after inspection. This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 11 on the PMGCAC IRC-P list. For PMGCAC member reference, this was item no. 7 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will not increase the cost of construction.

P2503.5.2-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposal is too lengthy. Plumbers know what they are doing and don't need a handbook to instruct them on how to do testing.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Submitted.

Commenter's Reason: The only lengthy parts of the proposal were the sections about gas leakage tests (smoke and peppermint testing). Those tests are so rarely used (mostly for resolving problems after the building is occupied) that there really does need to be specifics on how to do these tests properly. Many plumbing contractors might not need to do such tests for many, many years so they will be unfamiliar with how to do them correctly when the time comes. Building officials might also be unfamiliar with how such tests are to be correctly performed.

The "everyday parts" of this proposal are very short (Sections P2503.5.2 and P2503.5.2.1) and are no longer than the existing code. The key updates are that air admittance valves are to be installed and that "each" fixture does not have to be operated and observed by the building official – he or she can arbitrary pick any fixture to operate or not pick any. Ultimately, the plumbing contractor will be called by the builder or homeowner if there are any leaks after the building is occupied and will be responsible for repairing such problems. The code official's final inspection has more to do with making sure that fixtures are installed in a correct manner and that the required backflow protection is provided.

We are certain that the strike-out-and-underline format was really confusing to the committee. The following shows the final code format:

P2503.5.2 Finished test. After the plumbing fixtures installed, traps filled with water and any air admittance valves installed, a test in accordance with Section P2503.5.2.1 shall be performed. Where required by the *building official*, one or more tests in accordance with P2503.5.2.2 shall be performed.

P2503.5.2.1 Water leakage. Fixtures shall be operated while exposed piping, fixture and faucet connections are observed for leaks. The test shall be successful where there is not any evidence of water leakage. This section shall not be construed as requiring the building official to witness the operation of all fixtures.

P2503.5.2.2 Gas leakage. Only when required by the *building official*, testing in accordance with Section P2503.5.2.2.1 or P2503.5.2.2.2 shall be performed.

P2503.5.2.2.1 Smoke test. A pungent, thick smoke shall be forced into the drainage, waste and vent system, on the downstream side of traps, using a pressure of 1 inch water column (249 Pa) or less. After the smoke appears at the outdoor vent terminals, the terminals shall be temporarily sealed to prevent smoke leakage and the piping shall be pressurized to 1-inch water column (249 Pa) by a continuous source of air. The test shall be successful where there is not any smoke observed inside the building during an observation period of 15 minutes. Smoke generating materials such as bombs, canisters and flares shall not be placed into the drain, waste and vent system piping.

P2503.5.2.2.2 Peppermint test. All but one outdoor vent terminal of the piping shall be temporarily sealed to prevent odor leakage. Two ounces (59 mL) of oil of peppermint shall be poured into the open outdoor vent terminal followed by 10 quarts (9464 mL) of hot water. The vent terminal shall be temporarily sealed gas tight. The test shall be successful where the odor of peppermint is not detected in the building during an observation period of 15 minutes. Persons who have performed the addition of oil and hot water to the system shall not enter the building until after the observation period.

RP9-13

Final Action: AS AM AMPC____ D

RP10-13
P2503.7, P2503.7.1 (New), P2503.7.2 (New)

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2503.7 Water~~-supply~~ service and distribution systems test~~ing~~. ~~Upon completion of~~ The water service piping system and water distribution piping system ~~-supply system~~ or ~~section of it~~, ~~system or portion completed~~ shall be tested ~~and proved tight under a water pressure of not less than the working pressure of the system or, for piping systems other than plastic, by an air test of not less than 50 psi (345 kPa).~~ in accordance with Section P2503.7.1 or P2503.7.2. ~~This pressure shall be held for not less than 15 minutes. The water used for tests shall be obtained from a potable water source.~~ Plastic piping shall not be tested using air or gas.

P2503.7.1 Water test. The piping shall be filled with potable water. The water in the piping system shall be pressurized to not less than the working pressure of the system. The pressure shall be retained and the source of pressure shall be isolated from the piping being tested. The test shall be successful where there is not any change in pressure gauge indication during an observation period of 15 minutes. The pressure gauge shall comply with requirements of Section P2503.9.

P2503.7.2 Air test. The piping shall be pressurized with not less than 50 psi (345 kPa) of air. The pressure shall be retained in the piping and the source of air pressure shall be disconnected from the piping. The test shall be successful where there is not any change in pressure gauge indication during an observation period of 15 minutes. The pressure gauge shall comply with requirements of Section P2503.9.

Reason: This section has some convoluted language, some archaic terminology and fails to address certain important specifics of the test methods. The revised language makes the intent clear. Compressed gas was added to the plastic piping prohibition because someone could claim that they were not using air. Some people might say “Why have a pressure gauge to check for leaks when testing with water? You’ll be able to see the leaks”. Consider a water service line in a muddy trench. Or it starts to rain on the trench. Or the water distribution system of a large multi-story house. Or the house is not rain tight and there is rainwater dripping everywhere. Does the building official want to go around checking for drips? That’s the plumbers responsibility if the system doesn’t hold pressure. The pressure gauge method for inspection provides a single point for building official to look at.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 11 on the PMGCAC IRC-P list. For PMGCAC member reference, this was item no. 8 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will not increase the cost of construction.

P2507.5.7-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposal is too lengthy. The language is better off being left alone because it will be consistent with the IPC.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Submitted.

Commenter's Reason: The existing section was expanded to separate the water and air testing requirements so the proposal does appear to be "lengthy". However, we do not feel that "too lengthy" is a valid reason to reject a proposal when the purpose of the proposal is to simply clarify the intent of rather convoluted existing code language. This proposal does not make any technical changes other than to require that the source of pressure be disconnected from the piping for the test.

The first section of the proposal is hard to read with strike-out-and-underline format. Here's what it will look like if approved:

P2503.7 Water service and distribution systems test. The water service piping system and water distribution piping system shall be tested in accordance with Section P2503.7.1 or P2503.7.2. Plastic piping shall not be tested using air or gas.

RP10-13

Final Action: AS AM AMPC____ D

RP12-13
P2602.1, P2602.2, Chapter 14

<u>Proposed Change as Submitted</u>

Proponent: Dan Buuck, National Association of Home Builders (NAHB); David Hall CFM, Georgetown Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

SECTION P2602
INDIVIDUAL WATER SUPPLY AND SEWAGE DISPOSAL

P2602.1 General. The water-distribution and drainage system of any building or premises where plumbing fixtures are installed shall be connected to a public water supply or sewer system, respectively, if available. When either a public water supply or sewer system, or both, are not available, or connection to them is not feasible, an individual water supply or individual (private) sewage-disposal system, or both, shall be provided. <u>Individual water supplies shall be constructed in accordance with state and local laws or in accordance with ANSI/NGWA-01-07.</u>

P2602.2 Flood-resistant installation. In flood hazard areas as established by Table R301.2(1):

1. Water supply systems shall be designed and constructed to prevent infiltration of floodwaters.
2. Pipes for sewage disposal systems shall be designed and constructed to prevent infiltration of floodwaters into the systems and discharges from the systems into floodwaters.

Add new standard to Chapter 14 as follows:

<u>National Ground Water Association</u>
<u>601 Dempsey Road</u>
<u>Westerville, OH 43081-8978</u>

<u>NGWA</u>

<u>ANSI/NGWA-01-07 Water Well Construction Standard</u>

Reason: The IRC currently refers the user to the IPC for requirements regarding well construction, as it does for all plumbing not addressed in the IRC (P2601.1). Does it make sense to have code language regarding wells when many states and counties have laws that regulate their construction? The provisions for wells in the IPC are also incomplete and spread out through several sections of the code making tracking difficult. This proposal is a simple change that clarifies where to go for well construction requirements—either your local regulations or an ANSI standard.

The Water Well Construction Standard is expected to complete the ANSI process and be published by the end of summer 2013.

Cost Impact: The code change proposal will not increase the cost of construction.

P2602.1-RP-BUUCK-HALL-PMGCAC

Committee Action Hearing Results

For staff analysis of the content of ANSI/NGWA-01-07 relative to CP#28, Section 3.6, please visit:
http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf

Committee Action: **Approved as Submitted**

Committee Reason: This proposal fills in the gap where state or local law might not exist for private wells.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Dan Buuck, CBO, National Association of Home Builders (NAHB) representing the National Association of Home Builders (NAHB) (dbuuck@nahb.org) and Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Modified by this Public Comment

Modify the proposal as follows:

P2602.1 General. The water-distribution and drainage system of any building or premises where plumbing fixtures are installed shall be connected to a public water supply or sewer system, respectively, if available. When either a public water supply or sewer system, or both, are not available, or connection to them is not feasible, an individual water supply or individual (private) sewage-disposal system, or both, shall be provided. Individual water supplies shall be constructed in accordance with <u>the applicable</u> state and local laws ~~or~~<u>. Where the construction of individual water supplies is not regulated by state or local laws, such individual water supplies shall be constructed</u> in accordance with ANSI/NGWA-01-07.

Commenter's Reason: Although the proposal was approved as submitted at the committee action hearings in Dallas, some committee members felt the section needed additional language to clarify that the ANSI/NGWA standard could not preempt state and local laws. This public comment adjusts the language to require that NGWA-0-07 be the fallback requirement if there are no state or local laws controlling the construction of individual water supplies.

Final Action: AS AM AMPC____ D

RP13-13
P2603.2.1, P2603.2.1.1 (New), P2603.2.1.2 (New), P2603.2.1.3 (New)

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2603.2.1 Protection against physical damage. ~~In concealed locations where *piping*, other than cast iron or galvanized steel, is installed through holes or notches in studs, joists, rafters or similar members less than 1-1/2 inches (38 mm) from the nearest edge of the member, the pipe shall be protected by steel shield plates. Such shield plates shall have a thickness of not less than 0.0575 inch (1.463 mm) (No. 16 gage). Such plates shall cover the area of the pipe where the member is notched or bored and shall extend not less than 2 inches (51 mm) above sole plates and below top plates.~~ Where piping will be concealed within light-frame construction assemblies, the piping shall be protected against penetration by fasteners in accordance with Sections P2603.2.1.1 through P2603.2.1.3.

Exception: Cast iron piping and galvanized steel piping shall not be required to be protected.

P2603.2.1.1 Piping through bored holes or notches. Where *piping* is installed through holes or notches in framing members and the piping is located less than 1 ½ inches (38 mm) from the framing member face to which wall, ceiling or floor membranes will be attached, the pipe shall be protected by shield plates that cover the width of the pipe and the framing member and that extend 2 inches (51 mm) to each side of the framing member. Where the framing member that the piping passes through is a bottom plate, bottom track, top plate or top track, the shield plates shall cover the framing member and extend 2 inches (51 mm) above the bottom framing member and 2 inches (51 mm) below the top framing member.

P2603.2.1.2 Piping in other locations. Where the piping is located within a framing member and is less than 1 ½ inches (38 mm) from the framing member face to which wall, ceiling or floor membranes will be attached, the piping shall be protected by shield plates that cover the width and length of the piping. Where the piping is located outside of a framing member and is located less than 1 ½ inches (38 mm) from the nearest edge of the face of the framing member to which the membrane will be attached, the piping shall be protected by shield plates that cover the width and length of the piping.

P2603.2.1.3 Shield plates. Shield plates shall be of steel material having a thickness of not less than 0.0575 inch (1.463 mm) (No. 16 gage).

Reason: This proposal provides clear requirements of where shield plates are needed. Section P2603.2.1uses the term "light frame construction assemblies" to describe wall, floor and roof assembles that can be made up from either wood members or light frame, cold formed steel members.

Section P2603.2.1.1 covers applications where piping runs perpendicular to a framing member and passes through a bored hole or notch in the framing member. This text is nearly the same as what is currently in the IRC. If the piping is within 1 ½ inches of the face of the member where wall ceiling or floor membranes will be attached, then the piping is required to be protected by a shield pate that covers the width of the piping by the width of the framing member plus 2 inches on either side of the framing member. Protection of the piping on either side of the framing member is needed because it is too easy for a membrane/fastener installer to miss the framing member's fastening face or penetrate the member at an angle and hit the piping that is just outside of the framing member.

Section P2603.2.1.1 also covers the application where piping runs perpendicular to and penetrates top and bottom plates, or top and bottom tracks. Protection of the piping above the bottom framing member (or below the top framing member) is needed because it is too easy for a membrane/fastener installer to miss the framing member's fastening face or penetrate the member at an angle and hit the piping just outside of the framing member. The code fails to address the situation where piping is run within the C-channel of a metal stud or joist and it also fails to address piping run parallel to a framing member.

Section P2603.2.1.2 covers applications where the piping runs alongside of a framing member or in the case of a light frame, cold formed steel framing member, piping that runs parallel to the length of and within the framing member (in other words, within the channel section). If the piping is within 1 ½ inches of the face of the member where wall, ceiling or floor membranes will be attached, then the piping is required to be protected by a shield pate that covers the width of the piping by the length of piping that is within the 1 ½ inch proximity of the framing member's fastening face. Piping that is located behind the fastening face of the member and within 1 ½ inches of the fastening face of the member obviously needs protection from fastener penetration. Piping that is located adjacent to and within 1 ½ inches of the fastening face of the member needs protection because it is too easy for a membrane/fastener installer to miss the framing member's fastening face or penetrate the member at an angle and hit the piping that is just outside of the framing member.

The opposition to this proposal for the IPC was related to the requirement to protect the length of piping that is run parallel to a framing member and within 1 ½ inches from the member face to which wall board will be screwed or nailed. The concern was expressed that it would be difficult to protect the pipe for its full length, making the assumption that the pipe ran from the bottom plate up through the top plate in walls. First of all, it is unlikely that an installer would install piping from plate to plate that close to the stud, since it would be nearly impossible to drill holes that close to the stud. Secondly, the obvious way to avoid installing protection for the pipe is to simply keep it at least 1 ½ inches away from the framing member. With a little planning, the installation of pipe protection could be easily avoided.

This proposal was approved for the 2015 IFGC.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 11 on the PMGCAC IRC-P list. For PMGCAC member reference, this was item no. 11 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will increase the cost of construction.

P2603.2.1-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: This proposed language would create more problems than it is trying to solve. In slab on grade construction where framing is installed after the piping installed, the plumber would have no control on the location of the framing with respect to the piping.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Submitted.

Commenter's Reason: The same proposal was Approved as Submitted for both the Mechanical and Fuel Gas portions of the IRC. This proposal should be approved for consistency in the IRC.

RP13-13

Final Action: AS AM AMPC____ D

RP16-13
P2603.3

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Delete and substitute as follows:

~~**P2603.3 Breakage and corrosion.** Pipes passing through concrete or cinder walls and floors, cold-formed steel framing or other corrosive material shall be protected against external corrosion by a protective sheathing or wrapping or other means that will withstand any reaction from lime and acid of concrete, cinder or other corrosive material. Sheathing or wrapping shall allow for movement including expansion and contraction of piping. The wall thickness of material shall be not less than 0.025 inch (0.64 mm).~~

P2603.3 Protection against corrosion. Metallic piping, except for cast iron, ductile iron and galvanized steel, shall not be placed in direct contact with steel framing members, concrete or masonry. Metallic piping shall not be placed in direct contact with corrosive soil. Where sheathing is used to prevent direct contact, the sheathing material thickness shall be not less than 0.008 inch (8 mil) (0.203 mm) and shall be made of plastic. Where sheathing protects piping that penetrates concrete or masonry walls or floors, the sheathing shall be installed in a manner that allows movement of the piping within the sheathing.

Reason: One clear intent of this code section is to protect metallic piping from direct contact with concrete, masonry, corrosive soils and cold formed steel framing members as direct contact could cause exterior corrosion of the piping. However, it is not clear exactly what the sentence “Sheathing or wrapping shall allow for movement including expansion and contraction of piping” is intended to mean. Committee comments from the 2012 IPC hearings on a similar proposal seem to indicate that where sheathing or wrapping (presumably with plastic materials) are used to protect a pipe passing through concrete (such as a pipe below a slab coming up through and cast in the slab), the sheathing must allow for some “give” between the pipe and the concrete or masonry.

The wall thickness of the sheathing material is in question. To our knowledge, no one is using this thick of material and jurisdictions are not enforcing the requirement for 0.025 inch (25 mils) thick material. Much thinner plastic sheathing materials are commonly being used across the country for decades without any reported adverse effects. Cast iron and ductile iron manufacturers recommend, for corrosive soil conditions, the use of either 0.008 inch thick low density polyethylene sheathing or 0.004 inch thick, high strength cross laminated polyethylene sheathing for corrosive soil conditions. For small metallic pipes such as copper tubing (1/2” to 1 ¼”) passing through concrete or masonry, plumbing supply houses normally stock 0.004 and .006 inch thick low density “flat tube” plastic sheathing materials and that is what is being used. To make it easy, requiring 0.008 inch thick material for all types of metallic piping is reasonable.

The revised language improves understanding what the code intends.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 11 on the PMGCAC IRC-P list. For PMGCAC member reference, this was item no. 10 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will not increase the cost of construction.

P2603.3-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The proposed language is much more clear than the existing and allows thinner sheathing material which has been used without any problems for years.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Pennie L. Feehan, Pennie L. Feehan Consulting representing Copper Development Association (penniefeehan@me.com) requests Disapproval.

Commenter's Reason: The original code section referred to piping passing through foundations, floors, and walls. This proposal implies pipe incased in, supported by, or lying on will need protection. As an example, strapping or supporting horizontal pipe to a concrete wall would require protection. The cost of construction will be increased because of additional labor and materials to comply with this section. If the sheathing thickness is the issue, then that should be changed.

RP16-13

Final Action: AS AM AMPC____ D

RP19-13
P2605.1

Proposed Change as Submitted

Proponent: Michael Cudahy, Plastic Pipe and Fittings Association representing the Plastic Pipe and Fittings Association (mikec@cmservnet.com)

Revise as follows:

TABLE P2605.1
PIPING SUPPORT

PIPING MATERIAL	MAXIMUM HORIZONTAL SPACING (feet)	MAXIMUM VERTICAL SPACING (feet)
Cross-linked polyethylene (PEX) pipe, 1 inch and smaller	2.67 (32 inches)	10b
Cross-linked polyethylene (PEX) pipe, 1 ¼ inch and larger	4	10[b]

(Portions of table and footnotes not shown remain unchanged)

Reason: PEX tubing, like other materials currently in the table, is being made in larger diameters that are stiffer and require less support.

Cost Impact: None

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The code currently lacks support information for larger sizes of PEX pipe so this information is needed in the code.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Larry Gill, IPEX USA LLC, requests Approval as Modified by this Public Comment.

TABLE P2605.1
PIPING SUPPORT

PIPING MATERIAL	MAXIMUM HORIZONTAL SPACING (feet)	MAXIMUM VERTICAL SPACING (feet)
Cross-linked polyethylene (PEX) pipe, 1 inch and smaller	2.67 (32 inches)	10[b]
Cross-linked polyethylene (PEX) pipe, 1 ¼ inch and larger	4	10[b]
Polyethylene of Raised Temperature (PE-RT) pipe, 1 inch and smaller	2.67 (32 inches)	10[b]
Polyethylene of Raised Temperature (PE-RT) pipe, 1 ¼ inch and larger	4	10[b]

Commenter's Reason: Support values for PEX were added to the IRC and approved. PE-RT support spacing is already in the IRC but we need to make the above noted changes to clarify that there are different support spacing's for 1 inch and smaller and 1 ¼ inch and larger. If approved, the values for PEX and PE-RT would match.

RP19-13

Final Action: AS AM AMPC____ D

RP23-13
P2607.1, P2607.2 (New)

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2607.1 ~~**General**~~ **<u>Pipes penetrating roofs</u>.** <u>Where a pipe penetrates a</u> roof, <u>a flashing of lead, copper, galvanized steel or an *approved* elastomeric material shall be installed in manner that prevents water entry into the building.</u> Counterflashing <u>into the opening of pipe serving as a vent terminal</u> shall not ~~restrict~~ <u>reduce</u> the required internal cross-sectional area of <u>the vent pipe to less than the internal cross-sectional area of one pipe size smaller.</u> ~~any vent~~. ~~and exterior wall penetrations shall be made water tight. Joints at the roof, around vent pipes, shall be made water tight by the use of lead, copper or galvanized iron flashings or an *approved* elastomeric material.~~

Add new text as follows:

<u>**P2607.2 Pipes penetrating exterior walls.** Where a pipe penetrates an exterior wall, a waterproof sealant shall be applied at the joint between the wall and the pipe, on the exterior of the wall.</u>

Reason: The phrase "made water tight" is archaic language. The existing section needs to be broken into two sections for clarity. Additional wording makes the intent clear. Counterflashing will *always* reduce the inside cross-sectional area of the vent pipe so the issue is how much reduction is acceptable. An area that is not less than one pipe smaller seems reasonable.

The new section just separates the wall sealing requirement out of the previous section and makes the language clear.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 15 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will not increase the cost of construction.

P2607.1-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The proposed language provides needed clarity on how large an opening is needed when peening over flashing into the vent termination.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Forest Hampton III, Oatey Co., requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

P2607.2 Pipes penetrating exterior walls. Where a pipe penetrates an exterior wall, ~~a waterproof sealant shall be applied at the joint between the wall and the pipe, on the exterior of the wall.~~ a waterproof seal shall be made on the exterior of the wall by one of the following methods:

1. A waterproof sealant applied at the joint between the wall and the pipe.
2. A flashing of an approved elastomeric material.

Commenter's Reason: Flat sidewall elastomeric flashings that are made from equivalent materials as elastomeric roof flashing are available in the field for use in sidewall penetrations.

RP23-13

Final Action: AS AM AMPC____ D

RP26-13
P2609.3

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2609.3 Plastic pipe, fittings and components. All plastic pipe, fittings and components, including brass fittings, shall be third-party certified as conforming to NSF 14.

Reason: Testing and certification requirements were added to NSF 14 to provided dezincification resistant brass fittings for plastic piping systems. NSF 14 was changed to reflect these requirements as a result of widespread failure of brass fittings and a large number of law suits across the United States. This proposed change to the IRC is required to update the language in the code to be consistent with changes to NSF 14. The current language could be interpreted to mean that only plastic fittings need comply with NSF 14, which the CAC does not believe is the intent.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 76 (added after 15DEC2012) on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will not increase the cost of construction.

P2609.3-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The existing language already includes fittings for plastic pipe. This change singles out one type of material.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Submitted.

Commenter's Reason: We believe that the issue of dezincification of brass components is a serious issue and that the code needs to require that brass fittings be dezincification resistant.

Public Comment 2:

Pennie L. Feehan, Pennie L. Feehan Consulting representing Copper Development Association (penniefeehan@me.com) requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

P2609.3 Plastic pipe, fittings and components. All plastic pipe, fittings and components, including ~~brass~~ copper alloy fittings, shall be third-party certified as conforming to NSF 14.

Commenter's Reason: Changing brass to copper alloy is consistent with other approved proposals. Dezincification testing and certification requirements were added to NSF 14 for plastic piping systems. NSF 14 was changed to reflect these requirements as a result of widespread failure of brass fittings and a large number of law suits across the United States. This proposed change to the IRC is required to update the language in the code to be consistent with changes to NSF 14.

Final Action: AS AM AMPC____ D

RP31-13

P2701.2 (New), P2705.1, P2705.1.1 (New), P2705.1.2 (New), P2705.1.3 (New), P2705.1.4 (New), P2705.1.5 (New), P2705.1.6 (New)

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2701.2 Fixture fitting mounting surfaces. Integral fixture-fitting mounting surfaces on manufactured plumbing fixtures or plumbing fixtures constructed on site shall meet the design requirements of ASME A112.19.2/CSA B45.1 or ASME A112.19.3/CSA B45.1.

P2705.1 General. The installation of fixtures shall ~~conform~~ be in accordance with Sections P2705.1.1 through P2705.1.6. ~~to the following:~~

P2705.1.1 Floor-outlet and floor-mounted fixtures. ~~1.~~ Floor-mounted ~~or~~ and floor-outlet fixtures shall be ~~secured to the drainage connection and~~ fastened to the floor or fastened to a water closet flange that is fastened to the floor. ~~where so designed, by screws, bolts, washers, nuts and similar fasteners of copper, brass or other corrosion-resistant material.~~ Fasteners shall be of corrosion-resistant material and shall be screws or bolts.

P2705.1.2 Wall-hung fixtures. ~~2.~~ Wall-hung fixtures shall be ~~rigidly~~ supported by the wall or where a fixture carrier is provided, supported by the carrier. The piping connected to the fixture shall not provide support for the fixture. ~~so that strain is not transmitted to the plumbing system.~~

P2705.1.3 Sealing required. ~~**3.** Where fixtures come in contact with walls and floors, the contact area shall be water tight.~~ Joints formed where fixtures come in contact with walls or floors shall be sealed water tight.

~~4. Plumbing fixtures shall be usable.~~

P2705.1.4 Clearances. ~~**5.** Water closets, lavatories and bidets~~. A water closet, lavatory or bidet shall not be set closer than 15 inches (381 mm) from its center to any side wall, partition or vanity or closer than 30 inches (762 mm) center-to-center between adjacent fixtures. ~~There shall be~~ A clearance of not less than ~~a~~ 21-inches (533 mm) shall be provided in front of a water closet, lavatory or bidet to any wall, fixture or closed door.

P2705.1.5 Interference with doors and windows. ~~6.~~The location of plumbing piping, plumbing fixtures or plumbing equipment shall not interfere with the operation of doors ~~or~~ and windows.

P2705.1.6 Flood hazard areas. ~~7.~~ In flood hazard areas as established by Table R301.2(1), plumbing fixtures shall be located or installed in accordance with Section R322.1.7.

~~8. Integral fixture-fitting mounting surfaces on manufactured plumbing fixtures or plumbing fixtures constructed on site, shall meet the design requirements of ASME A112.19.2/CSA B45.1 or ASME A112.19.3/CSA B45.1.~~

Reason: The items in this section are a mixture of subjects and should be separated into separate sections. Numerous clarifications have been added to make the each section clearer. The term "rigidly" is vague and unenforceable. Item 4 is covered by the requirements in P2705.1.4 and elsewhere in the code. Item number 8 doesn't belong under installation and should be located in Section P2701 (that is why new Section P2701.2 has been added).

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 21 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will not increase the cost of construction.

P2701.2 (NEW)-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposal language is much more confusing than the existing language and doesn't simplify the code.

Assembly Action: **Approved as Submitted**

Individual Consideration Agenda

This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action of Approved as Submitted by the Floor.

RP31-13

Final Action: AS AM AMPC____ D

RP36-13
P2701.1

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2701.1 Quality of fixtures. Plumbing fixtures, faucets and fixture fittings ~~shall be constructed of *approved* materials,~~ shall have smooth impervious surfaces~~,~~ shall be free from defects and shall not have concealed fouling surfaces.~~, and shall conform to the standards cited in this code. Plumbing fixtures shall be provided with an adequate supply of potable water to flush and keep the fixtures in a clean and sanitary condition without danger of backflow or cross connection.~~

Reason: The current code text is very old and comes from a time where there were not many standards existed for plumbing fixtures and fittings. According to the first sentence of this section, the code official must approve materials, even those that are in compliance with the standards referenced in the code. The first sentence is revised to make a general statement about the quality of fixtures. The last sentence has nothing to do with quality of fixtures. The subject matter is covered adequately elsewhere in the code so this sentence needs removed.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 18 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will not increase the cost of construction.

P2707.1-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee agreed with the proponent's reason statement.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

P2701.1 Quality of fixtures. Plumbing fixtures, faucets and fixture fittings shall have smooth impervious surfaces, shall be free from defects, ~~and~~ shall not have concealed fouling surfaces and shall conform to the standards cited in this code.

Commenter's Reason: Approved proposals RP36 and RP28 are in conflict with one another because RP36 deletes a section of text that RP28 is modifying. This public comment corrects the problem by making this proposal in agreement with what RP28 accomplishes. The change in RP28 is prudent and we agree with its intent.

RP36-13

Final Action: AS AM AMPC____ D

RP37-13
P2708.3

Proposed Change as Submitted

Proponent: Edward R. Osann, Natural Resources Defense Council, representing self. (eosann@nrdc.org)

Revise as follows:

P2708.3 Shower control valves. Individual shower and tub/shower combination valves shall be equipped with control valves of the pressure-balance, thermostatic-mixing or combination pressure-balance/thermostatic-mixing valve types with a high limit stop in accordance with ASSE 1016 or ASME A112.18.1/CSA B125.1. <u>Shower control valves shall provide thermal shock protection for the rated flow rate of the installed showerhead or a flow rate of 1.5 gpm ± 0.1 gpm (5.75 L/m ± 0.35 L/m), whichever is less</u>. The high limit stop shall be set to limit the water temperature to not greater than 120°F (49°C). <u>Each valve shall be factory marked with the manufacturer's minimum rated flow, and such marking shall be in an accessible position so as to make inspection readily possible following installation.</u> In-line thermostatic valves shall not be used for compliance with this section.

Reason: The thermal protection afforded by shower valves can be compromised if the flow rate of the showerhead is less than the flow rate for which the protective components of the valve have been designed. As noted by Martin and Johnson (2008) (as cited in Codes and Standards Enhancement Initiative (CASE), "Multi-Head Showers and Lower-Flow Shower Heads," *2013 California Building Energy Efficiency Standards,* California Utilities Statewide Codes and Standards Team, September 2011), combinations of valves and shower heads were tested to determine whether pressure-compensating valves and thermostatic valves rated for 2.5gpm would perform adequately at lower flow rates. The tests included 22 shower valves from six manufacturers, and the valves were assessed on their ability to maintain water temperature within certain bounds for a given time after a change in pressure event, as described by the ASSE 1016-2005 standard for shower valves. The results indicated that a significant share of shower valves rated for 2.5 gpm failed to provide the thermal protection specified by ASSE 1016 when tested at lower flow rates. As summarized in the CASE report (p. 15): "These results indicate that shower valve temperature maintenance is strongly affected by flow rate, and that new showers with lower-flow shower heads would have to be installed with valves that are designed for 2.0 and lower flow rates."

Showerheads with maximum flow rates below 2.5 gpm are widely available on the market today, and simple replacement of a showerhead is typically not subject to code. Since shower valve components are located behind finished walls, replacement of showerheads is likely to be more frequent than replacement of shower valves. This proposed change seeks to reduce the likelihood that consumers replacing a showerhead will compromise the thermal protection offered by a building subject to this code by ensuring that shower valves can fully accommodate showerheads with lower flow rates than the current maximum federal standard of 2.5 gpm. The current EPA WaterSense specification for showerheads has a maximum flow rate of 2.0 gpm, and many showerheads are already available with flow rates between 2.0 and 1.5 gpm. As manufacturers continue to innovate with more water- and energy-efficient showerheads, the code change proposed here will help ensure that new buildings built to this code can safely accommodate showerheads with lower flow rates that may be selected by building occupants in future years.

Note that this language does not require that the showerhead itself have a flow rate of 1.5 gpm, but simply that the shower valve provide the thermal protection called for under the recognized standard when tested at a flow rate as low as 1.5 gpm. In the event that the showerhead selected for initial installation has a flow rate of less than 1.5 gpm, the minimum rated flow if the shower valve must match the flow rate of the showerhead.

The marking requirement is necessary to facilitate inspection. To the extent that the mark is permanent, it will provide a point of reference for building occupants to consider when changing showerheads in future years.

Cost Impact: Conforming products are on the market today without a significant cost premium. The code change proposal will not increase the cost of construction.

P2708.3-RP-OSANN.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The required marking of this proposal is not going to solve the problem after initial installation when the showerhead is replaced.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Edward R. Osann, Natural Resources Defense Council representing himself (eosann@nrdc.org) requests Approval as Modified by this Public Comment

Modify the proposal as follows:

P2708.3 Shower control valves. Individual shower and tub/shower combination valves shall be equipped with control valves of the pressure-balance, thermostatic-mixing or combination pressure-balance/thermostatic-mixing valve types with a high limit stop in accordance with ASSE 1016 or ASME A112.18.1/CSA B125.1. Shower control valves shall provide scald and thermal shock protection for the rated flow rate of the installed showerhead ~~or a flow rate of 1.5 gpm ± 0.1 gpm (5.75 L/m ± 0.35 L/m), whichever is less~~. The high limit stop shall be set to limit the exiting water temperature to not greater than 120°F (49°C). ~~Each valve shall be factory marked with the manufacturer's minimum rated flow, and such marking shall be in an accessible position so as to make inspection readily possible following installation.~~ In-line thermostatic valves shall not be used for compliance with this section.

P2708.3.1 Shower valve marking. Each shower control valve shall be factory marked with the valve's minimum rated flow, and such marking shall be located so as to be readily visible in accordance with one or more of the following conditions:

1. prior to installation of the escutcheon associated with the valve
2. after installation of the escutcheon associated with the valve
3. through an access opening provided for servicing the valve

Commenter's Reason: Current language in the code is inadequate to ensure that the health and safety protection provided by a shower mixing valve is not diminished by mismatching the rated flow of the valve with the flow rate of the showerhead during installation. The committee's disapproval of the proposal focused on the inadequacy of the proposal's marking requirement, while overlooking the need for the code to ensure that these components are properly matched when initially installed. The 2012 Uniform Plumbing Code is more protective of health and safety in this regard. This comment revises the original proposal by including a more workable marking requirement and a more simplified requirement to properly match the valve and showerhead during installation.

This comment proposes changes to the original submittal as follows:

1. Removes the requirement that all shower valves provide thermal protection at flow rates as low as 1.5 gpm, while retaining the requirement that a valve's rated flow for thermal protection be compatible with the design flow rate of the installed showerhead.
2. Eliminates the requirement for the flow rate marking to be visible on the escutcheon and instead only requires the marking to be visible under any one of the following 3 conditions:

   a. prior to installation of the escutcheon associated with the valve,
   b. after installation of the escutcheon associated with the valve, or
   c. through an access opening for servicing the valve.

3. Provides additional clarity to the text.

Two additional points of note:

1. The 2012 Uniform Plumbing Code, Section 408.3, contains similar provisions as to 'matching' valve and showerhead flow rates as follows:

   "Showers and tub-shower combinations shall be provided with individual control valves of the pressure balance, thermostatic, or combination pressure balance/thermostatic mixing valve type that provide scald and thermal shock protection for the rated flow of the installed showerhead." The IRC should be no less protective of health and safety than the UPC.

2. The two relevant product standards (ASSE 1016-2011/ASME A112.1016-2011/CSA B125.16-11 for shower control valves and ASME A112.18.1-2011/CSA B125.1-11 for showerheads) both provide for marking of flow rates on their respective packaging. Showerheads are required to be marked with their flow rate; however, the 1016 standard does not require shower control valves to be marked with the minimum rated flow. Both standards also *recommend* on their packaging that showerhead and shower control valve be matched as to flow rate.

As noted in the original proposal on shower control valves, the thermal protection afforded by shower valves can be compromised if the flow rate of the showerhead is less than the flow rate for which the protective components of the valve have been designed. Results of Martin and Johnson (2008), cited in the original proposal, indicate that a significant share of shower valves rated for 2.5 gpm failed to provide the thermal protection specified by ASSE 1016 when tested at lower flow rates. Showerheads with maximum flow rates below 2.5 gpm are widely available on the market today The current U.S. EPA WaterSense specification for showerheads has a maximum flow rate of 2.0 gpm, and over 800 WaterSense showerheads (from 45 manufacturers) are already available with flow rates between 2.0 and 1.5 gpm. Given the findings of the studies, the WaterSense specification, and current manufacturing trends, matching of showerheads to shower control valves is more essential to user health and safety than was the case previously.

Note that this language <u>does not require</u> that the showerhead or the shower control valve be set by code at some predetermined flow rate. Rather, this language simply provides that the valve be rated to provide thermal protection at the flow rate of the showerhead being installed. In the event that a consumer or building owner decides to replace an aging showerhead on an existing shower, this language also assures that the flow rate of the previously installed shower control valve is readily visible either upon removal of the escutcheon covering that valve or through an access opening.

RP37-13

Final Action: AS AM AMPC____ D

RP41-13
P2712.1.1 (New)

<u>Proposed Change as Submitted</u>

Proponent: Christopher Salazar, Penguin Toilets LLC., representing Penguin Toilets LLC.

Add new text as follows:

<u>**P2712.1.1 Overflow protection.** Where a water closet is installed in a location where an overflow of the water closet will cause damage to the building, the building shall be protected from water damage by one of the following:</u>

1. <u>A water closet listed to provide overflow protection.</u>
2. <u>A floor drain installed within same area as the water closet.</u>
3. <u>A method of protection *approved* by the building official.</u>

Reason: To be in compliance with IRC section 101 .3: (to provide minimum standards to safeguard life or limb, health, property and public welfare) Toilet overflow (BLACKWATER spill) has not been addressed in the current code. Different from a grey water spill, a black water spill pose an unhealthy environment and is a very expensive event to mediate/repair. Adding this section into the code provides an additional safeguard to health, property and public welfare thus improving this code.

Cost Impact: Code change proposal will not increase the cost of construction. Cost impact is none too little depending on method of protection.

P2712.1.1 (NEW)-RP-SALAZAR.DOC

<u>Committee Action Hearing Results</u>

Committee Action: **Disapproved**

Committee Reason: The technology of these types of water closets is not proven. This is not something that needs to be forced by the code.

Assembly Action: **None**

<u>Individual Consideration Agenda</u>

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Christopher Salazar, Penguin Toilets representing Penguin Toilets (chris@penguintoilets.com) requests Approval as Submitted.

Commenter's Reason: The committee did not address how to deal with black water. The committee also felt this new code provision would be proprietary.

As submitted by the original proposal this offers a simple way to address black water spills. Note: black water spills are hazardous to human health and safety which costs insurance companies millions of dollars to fix.

This is not proprietary code change because there are multiple ways to address this subject.

RP41-13

Final Action: AS AM AMPC____ D

RP44-13
P2717.2, P2717.3

<u>Proposed Change as Submitted</u>

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2717.2 Sink and dishwasher. <u>The combined discharge from</u> a sink and dishwasher <u>shall be served by</u> ~~are permitted to discharge through~~ a single <u>trap</u> <u>of not less than</u> 1 1/2 inches (38 mm) <u>in nominal diameter</u> ~~trap~~. The discharge pipe from the dishwasher shall be increased <u>in size</u> to not less than 3/4 inch (19 mm) in<u>side</u> diameter ~~and~~ <u>before</u> shall be connect~~ed~~<u>ing</u> ~~with~~ <u>to</u> a wye fitting <u>in</u> ~~to~~ the sink tailpiece. The <u>waste discharge pipe from the</u> dishwasher ~~waste line~~ shall rise and be ~~securely~~ fastened <u>or held in a position</u> ~~to~~ <u>at</u> the underside of the counter before connecting to the wye ~~sink tailpiece~~.

P2717.3 Sink, dishwasher and food <u>waste</u> grinder. The combined discharge from a sink, dishwasher, and <u>food waste</u> grinder <u>shall be served by a single trap of not less than</u> ~~is permitted to discharge through a single~~ 1 1/2 inch (38 mm) <u>in nominal diameter</u> ~~trap~~. The discharge pipe from the dishwasher shall be increased <u>in size</u> to not less than 3/4 inch (19 mm) in<u>side</u> diameter ~~and shall~~ before connect<u>ing</u> ~~with~~ <u>to</u> a wye fitting between the discharge of the food-waste grinder and the trap inlet. <u>Alternatively, the discharge pipe from the dishwasher shall connect</u> ~~or~~ to the head of the food <u>waste</u> grinder. The dishwasher <u>discharge pipe</u> ~~waste line~~ shall rise and be ~~securely~~ fastened <u>or held in a position</u> ~~to~~ <u>at</u> the underside of the counter before connecting to the <u>wye</u> ~~sink tail piece~~ or the <u>head of the</u> food <u>waste</u> grinder.

Reason: The term "is permitted" is not mandatory code language. The proper term for a food grinder is a food waste grinder. The term "securely" is unenforceable. The term "or held in a position" was added primarily because the existing language seems to imply that the discharge pipe *has to be fastened* to the underside of the counter. This is a problem with granite countertops. The intent is that the piping be routed to the underside of the countertop and be held in some manner at that point. A common way to accomplish this is to drill a hole in the cabinet wall between the dishwasher and the sink cabinet, at the top of the cabinet wall (if the cabinet wall goes up to the underside of the countertop. Sometimes, the cabinet wall is not as tall and there a small gap. Then route the dishwasher discharge pipe through the hole or over the top of the cabinet wall. No fastening is needed (as it is very difficult to get into the cabinet and reach up between the sink and the cabinet wall to install a "fastener"). Intelligent routing is all that is necessary. This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 27 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will not increase the cost of construction.

P2717.2-RP-HALL-PMGCAC

<u>Committee Action Hearing Results</u>

Committee Action: **Disapproved**

Committee Reason: The ¾ inch inside diameter will not match up to the sink tailpiece fitting connection.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Modified by this Public Comment.

Replace proposal as follows:

Revise as follows:

P2717.2 Sink and dishwasher. ~~A sink and dishwasher are permitted to discharge through a single 1 1/2 inches (38 mm) trap. The discharge pipe from the dishwasher shall be increased to not less than 3/4 inch (19 mm) in diameter and shall be connected with a wye fitting to the sink tailpiece. The dishwasher waste line shall rise and be securely fastened to the underside of the counter before connecting to the wye sink tailpiece.~~ The combined discharge from a dishwasher and a one- or two– compartment sink, with or without a food waste disposer, shall be served by a trap of not less than 1 1/2 inches (38 mm) in outside diameter. The dishwasher discharge pipe or tubing shall rise to the underside of the counter and be fastened or otherwise held in that position before connecting to the head of the food waste disposer or to a wye fitting in the sink tailpiece.

~~**P2717.3 Sink, dishwasher and food grinder.** The combined discharge from a sink, dishwasher, and grinder is permitted to discharge through a single 1 1/2 inch (38 mm) trap . The discharge pipe from the dishwasher shall be increased to not less than 3/4 inch (19 mm) in diameter and shall before connect with a wye fitting between the discharge of the food-waste grinder and the trap inlet. or to the head of the food grinder. The dishwasher waste line shall rise and be securely fastened to the underside of the counter before connecting to the sink tail piece or the food grinder.~~

Commenter's Reason: The committee reason for disapproval caused us to dig deeper into what the standards indicate for tubular sink tailpieces with dishwasher connection branches. The code referenced standards are ASME A112.18.2/CSA B125.2 (covering metal and plastic waste fittings) and ASTM F409 (covering only plastic fittings). The ASME/CSA standard does not indicate dimensions for the dishwasher connect branch. The ASTM standard indicates an outside diameter of either 5/8 inch or 7/8 inch. A survey of several manufacturers' product lines of both metallic and plastic tubular sink tailpieces with dishwasher connection branches reveals a number of available configurations, some of which do not comply with ¾ inch diameter (*note that even the ASTM F409 standard doesn't comply with the 3/4 inch diameter!*). Our conclusion is that the size of the dishwasher connection branch should not be indicated in these code sections. The standards for these fittings are already covered by Table P2701.1 (for Plumbing fixture waste fittings). The manufacturers of these fittings are obviously coordinating design of their products to meet the requirements for a variety of dishwasher discharge pipe, hose and tubing connections. The installer simply has to provide the correct fitting for the application or use an adapter/connector to make the connection. The wye's tube size is not critical and does not need to be specified – industry takes care of this. This revised proposal eliminates a size indication conflict in the code that has existed for many editions.

Upon further examination of the original proposal, we determined that the two sections could be easily combined as they are virtually identical. In this public comment, the wording has been greatly simplified. We changed the size of the trap to outside diameter to encompass tubular size traps. Also note that a clarification was added to indicate that the "sink" could have one- or two-compartments. There was some concern expressed within the PMGCAC that "sink" might only mean a single compartment sink when in fact, two compartment sinks, with or without a food waste disposer, and with a dishwasher have been installed in this manner for decades.

Some may object to being so specific about limiting the number of compartments that can be handled by the single trap arrangement. With the trend of higher end residential kitchens using "quasi-commercial" plumbing fixtures in the kitchen, we have concerns that a 1-1/2 inch tubular trap might not be able to pass enough flow if 3 (or more) compartment sinks are discharging at the same time that the dishwasher is discharging (let alone if a disposer is forcing waste into the system). Because we only know that a 2 compartment arrangement work, based on extensive field use, we didn't want to relax the limit to accommodate all multi-compartment sinks. We leave that discussion for future code change proposals.

Final Action: AS AM AMPC____ D

RP45-13
P2718.2 (New)

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Add new text as follows:

P2718.2 Water connection. The water supply to an automatic clothes washer shall be protected against backflow by an air gap complying with ASME A112.1.3 or A112.1.2 that is installed integrally within the machine or a backflow preventer in accordance with Section P2902.

Reason: The requirement for automatic clothes washing machines to comply with ASSE 1007 (covering the requirement for an internal air gap on the water supply) was removed from the 2012 code because ACW manufacturers are no longer certifying their machines to ASSE 1007. Standards that they do comply with, ASME A112.1.3 or A112.1.2 are being included in this section so that inspectors are able to verify that the ACWs have an integral backflow protection. A similar proposal to the IPC was Approved as Submitted.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 28 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will not increase the cost of construction.

P2718.2 (NEW)-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: These standards needed because ASSE discontinued the ASSE 1007 standard.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Pennie L. Feehan, Pennie L. Feehan Consulting representing Copper Development Association (penniefeehan@me.com) requests Disapproval.

Commenter's Reason This proposal is unenforceable by a field inspector. In most cases the washer and dryers are not on site at the final inspection. Would the contractor need to provide a clothes washer at final inspection?

RP45-13
Final Action: AS AM AMPC____ D

RP46-13
P2722.2

Proposed Change as Submitted

Proponent: Len Swatkowski, Plumbing Manufacturers International (PMI), representing Plumbing Manufacturers International (lswatkowski@pmihome.org)

Revise as follows:

P2722.2 Operation for hot water. Faucets and bath tub mixing valves having two separate control handles for hot and cold water shall be installed with the left-hand handle controlling the hot water flow. Left-hand orientation shall be determined from the position of the user when using the plumbing fixture or in the case of a bathtub, the position of the user when in the tub. ~~Fixture fittings supplied with both hot and cold water shall be installed and adjusted so that the left-hand side of the water temperature control represents the flow of hot water when facing the outlet.~~ Shower and tub/shower mixing valves conforming to ASSE 1016 or ASME A112.18.1/CSA B125.1 shall have markings on the device that indicate the handle position for hot water flow.

> ~~**Exception:** Shower and tub/shower mixing valves conforming to ASSE 1016 or ASME A112.18.1/CSA B125.1, where the water temperature control corresponds to the markings on the device.~~

Reason: There have been calls from a number of code officials about how to apply this code section to these “side control” faucets. Technically, because the control does not have a left side and does not cause hot water to flow when moving a lever to the left, some code officials are calling this a non-compliant faucet. This language will correct the misinterpretation.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The proponent indicated in his proposal submission that the standards shown in this code section, ASSE 1016 and ASME A112.18.1/CSA B125.1 have been recently harmonized into standard ASSE 1016-2011/ASME A112.1016-2011/CSA B125.16-11. The proponent’s request for updating the standard for this section has been processed and will be included in a proposal for all standard updates that will be heard by the ADMIN committee in proposal ADM 62-13.

P2722.2-RP-SWATKOWSKI.DOC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: This language is easier to understand and it clarifies how tub only faucets need to be installed.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh, Arlington County, VA, representing VA Plumbing & Mechanical Inspectors Association (VPMIA) & VA Building Code Officials Association (VBCOA), requests Disapproval.

Commenter’s Reason: The proposed new language seems to further confuse the issue. Why are we now calling the control a handle? The control is not always a handle. The existing language was clear and does not need to be changed.

Final Action: AS AM AMPC____ D

RP47-13
P2725 (New), P2725.1 (New)

Proposed Change as Submitted

Proponent: Jeremy Brown, NSF International (brown@nsf.org)

Add new text as follows:

SECTION P2725
NON-LIQUID SATURATED TREATMENT SYSTEMS

P2725.1 General. Materials, design, construction and performance of non-liquid saturated treatment systems shall comply with NSF 41.

Add new standard to Chapter 44:

NSF
NSF 41-11 Non-Liquid Saturated Treatment Systems

Reason: NSF/ANSI-41 *Non-liquid Saturated Treatment Systems* is the American National Standard for the materials, design, construction and performance of composting toilets treating residential black water. Composting Toilets are a viable alternative are a viable alternative to traditional water closets and offer advantages of low water consumption. NSF/ANSI 41 is currently required in the IGCC.

Cost Impact: This code change proposal will not increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, CSA 22.2 No. 130 and UL 515 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1 2013.

P2725(NEW)-RP-BROWN.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: Composting toilets should only be in the IgCC, not in the IRC.

Assembly Action: **Approved as Submitted**

Individual Consideration Agenda

This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action of Approved as Submitted by the Floor.

RP47-13
Final Action: AS AM AMPC____ D

RP49-13
P2801.2 (New)

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Add new text as follows:

<u>**P2801.2 Drain valves**. Drain valves for emptying shall be installed at the bottom of each tank-type water heater and hot water storage tank. The drain valve inlet shall be a ¾ inch nominal iron pipe size and the outlet shall be provided with a male garden hose thread.</u>

(Renumber subsequent sections)

Reason: The new language proposed provides for minimum requirements for water heater drain valves. Drain valves are necessary for draining water (and sediment) out of the tank. Yes, we know that it would be rare for a storage water heater or hot water storage tank to not be provided with a drain valve BUT if the code doesn't require it, the manufacturers (or installers) could save costs by eliminating the valve (they could claim that the tank could be drained by pumping from the inlet or outlet of the tank.) The IPC has had the valve requirement for a long time. The IRC needs to have the same coverage. A similar proposal to the 2015 IPC was Approved as Submitted.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 29 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will not increase the cost of construction.

P2801.2 (NEW)-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: This requirement needs to be stated in the code to back up what water heater manufacturers already provide for tank type water heaters.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh, Arlington County, VA, representing VA Plumbing & Mechanical Inspectors Association (VPMIA) & VA Building Code Officials Association (VBCOA), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

P2801.2 Drain valves. Drain valves for emptying shall be installed at the bottom of each tank-type water heater and hot water storage tank. The drain valve inlet shall be <u>not less than</u> ¾ inch nominal iron pipe size and the outlet shall be provided with a male ~~garden~~ hose thread.

Commenter's Reason: Additional wording is needed to allow the drain valve to be not less than ¾" so that a larger drain valve could be provided if needed or supplied with the water heater. With the current wording an inspection agency may disapprove a drain valve that is larger than ¾". The term garden is jargon and is struck as the term hose thread is clear enough.

RP49-13

Final Action: AS AM AMPC____ D

RP51-13
P2801.5

Proposed Change as Submitted

Proponent: Jim Whitehead, IPS Corporation.

Revise as follows:

P2801.5 Required pan. Where a storage tank-type water heater or hot water storage tank is installed in a location where water leakage from the tank will cause damage, the tank shall be installed in a pan constructed of one of the following:

1. galvanized steel ~~pan having a material thickness~~ of ~~not less than 0.0236 inch (0.6010 mm)~~ ~~(~~No. 24~~)~~ gage or a lesser gage number,
2. aluminum not less than 0.030 inch (0.8 mm) in thickness,
3. plastic not less than 0.036 inch (0.9 mm) in thickness
4. ~~other pans~~ *approved* materials ~~for such use~~.

~~Listed pans shall comply with CSA LC3.~~ A plastic pan shall not be installed beneath a gas-fired water water.

Reason: Aluminum and plastic water heater pans are frequently and commonly installed all across the United States even though the code doesn't currently include these materials as an option. I know this is a fact because IPS and other manufacturers produce and sell *tens of thousands* of aluminum and plastic water heater pans every year. In most areas, building officials really don't care what material the pan is made of, just as long as there is a pan. So why not make the code match what is current practice for many areas? Let's face it-a galvanized steel pan is ugly. It eventually gets rusty looking. The top edges, if not hemmed, are sharp (a cutting hazard) and the square corners are hard to seal. The top of the square corners can puncture things (like human flesh and the bottoms of jugs). THEN you want to require that galvanized steel pan to be installed in a finished area like a indoor utility room or a laundry room in a home? The home owner just doesn't want it.

Yes, the existing section currently says "or other pans approved for such use". But does the building official really need to be spending the time approving "other pans" for use on a job-by-job basis? In reality, when the building official shows up to inspect, the pan is in place (beneath a water heater that is plumbed and filled with water). Is that the time for the building official to be making a decision about whether the pan material is *approved*? This proposal will eliminate the questions and free up building official time in order to deal with more important issues.

So if aluminum pans and plastic pans are being *approved* (and again we know that they must be as *tens of thousands* of these pans are sold every year), then there needs to be some criteria for these types of pans. The thicknesses indicated for aluminum and plastic materials have been determined to be at least equivalent to the galvanized steel with regard to deflection (of the sides of the pan) and puncture resistance. NOT ALL MANUFACTURERS OF ALUMINUM AND PLASTIC PANS HAVE CONSIDERED THIS IN THEIR SELECTION OF MATERIAL THICKNESSES. And we are positive that some building officials have developed a bad opinion about allowing the use of aluminum and plastic because of their experiences with competitor's products that use lighter weight materials than what is proposed. There are at least a few of us responsible manufacturers who produce quality aluminum and plastic pans that meet the proposed requirements. Based upon our field surveys of our pans in use, these thicknesses provide for a durable product that remains serviceable, corrosion free and good looking for the life of a typical water heater if not two water heater lives.

"Listed pans shall comply with CSA LC3" is being deleted because there is not any pan produced in the United States that complies with that standard. When this standard was introduced into to the code, there was a product, available to the market, that met this standard. The standard was actually developed around this pan/stand design. Furthermore this standard was developed using the stand/pan in combination. Most pans are placed directly on the floor and not elevated on a stand. Also. the product was discontinued because of design problems. (The product was a combination elevation stand and pan assembly). CSA withdrew the standard in November 2011. There is not a need to have this standard in the code any longer and we don't want someone trying to bring a product to the market that meets this standard. Obviously, the standard isn't up to snuff because the products made to the standard didn't work out. The standard needs to be deleted from the code.

The last line about prohibiting the use of a plastic pan under a gas fired water heater is simple common sense. Although we have not heard of any problems with the use of our plastic pans for gas water heaters, the radiant heat coming from the bottom of a gas fired water heater could make a plastic pan more susceptible to puncturing (such as might be caused by the legs of a water heater). The Uniform Plumbing Code has this prohibition so the same prohibition in the I-codes seems appropriate.

Cost Impact: The code change proposal will not increase the cost of construction. In fact, factory-made aluminum and plastic water heater pans are, by far, much more economical than a galvanized steel pan that is made in a local sheet metal shop.

P2801.5-RP-WHITEHEAD

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

P2801.5 Required pan. Where a storage tank-type water heater or hot water storage tank is installed in a location where water leakage from the tank will cause damage, the tank shall be installed in a pan constructed of one of the following:

1. galvanized steel or aluminum of not less than 0.0236 inch (0.6010 mm) ~~24 gage or a lesser gage number,~~
~~2. aluminum not less than 0.030 inch (0.8 mm) in thickness,~~
~~3.~~ 2. plastic not less than 0.036 inch (0.9 mm) in thickness
~~4.~~ 3. other *approved* materials.

A plastic pan shall not be installed beneath a gas-fired water ~~water~~ heater.

Committee Reason: The modification allows for more options for drain pans. The overall reason for approving the proposal is agreement with the proponent's reason statement.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jim Whitehead, IPS Corporation representing IPS Corporation (Jim.whitehead@ipscorp.com) requests Approval as Submitted.

Commenter's Reason: Based on sound technical reasoning, we request that our original proposal be Approved as Submitted instead of the Committee approved modification (that was suggested from a proposed floor modification). The members should realize that a pan of 0.0236" aluminum is more likely to being damaged if stepped on, or punctured/torn by the legs of a water heater (as found on some gas fired models). Such damage could result in a pan leak which could cause failure of the floor beneath the water heater, possibly causing the water heater to fall over. Other industries recognize that aluminum has a lower tensile strength than steel and therefore, when converting from a steel design to an aluminum design, thicker material is necessary in order to maintain the integrity of the product. Specifying an aluminum material to be the *same* thickness as a steel material is not technically logical. As a manufacturer of water heater pans for over 30 years, IPS recognizes the importance of providing a product that will withstand the rigors of installation and long term service. The 0.030" thick material for aluminum pans has proven to be the minimum acceptable thickness for durability. Many companies such as ours have standardized on this thickness. We have witnessed many problems with aluminum pans made of 0.0236" thick (and thinner) material made by some of our competitors. We know that reducing the aluminum material thickness to be more competitive with manufacturers of those thinner material pans is **not** a viable solution. If it was, we and other manufacturers like us would have already reduced the thickness to match theirs. Again, based upon our 30 years of experience of our pans and our (thinner material) competitor's pans, allowing 0.0236 inch aluminum material would be significantly lowering the bar for safety.

RP51-13
Final Action: AS AM AMPC____ D

RP52-13
P2801.5.1

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2801.5.1 Pan size and drain. The pan shall be not less than $1\frac{1}{2}$ inches (38 mm) deep and shall be not less than 3 inches (76 mm) greater in diameter than the diameter of the water heater or hot water storage tank. ~~be of~~ ~~sufficient size and shape to receive all dripping or condensate from the tank or water heater.~~ The pan shall be drained by a~~n indirect waste~~ drain pipe connected to the pan. The drain pipe shall be ~~of~~ not less than $\frac{3}{4}$ inch (19 mm) nominal diameter~~.~~ ~~Piping for safety pan drains~~ and shall be of any of the ~~those~~ materials ~~listed~~ indicated in Table P2905.5. Pipe fittings for the drain pipe shall be in accordance with Section P2905.6 except that insert-type fittings shall not be installed in the drain piping.

Reason: This section needs to include the horizontal dimension of the pan with respect to the water heater. Some installations have been observed where the pan exactly fits the bottom of the water heater. This does not allow any space for water in the pan to flow to the pan drain on the side of the pan. The drain is now specifically required to be on the side of the pan so that it is less likely to become blocked. The improved wording also prevents a water heater from being located in the pan where the water heater blocks the drain outlet on the side of the pan. The 3 inches over sizing was based on the same pan requirement in the mechanical code for HVAC units. The struck language in the first sentence is archaic and vague. The existing language also failed to identify what fittings should be used for drain piping. The new language corrects this omission. While the existing language specifies the type of pipe to be used, it doesn't specify the fittings. The last sentence is added to clarify the fittings that must be used. Note the restriction against using insert fittings…the ¾ inches minimum size is already small enough without putting insert fittings in the piping to further reduce the diameter. Such reductions in internal diameter could catch lint and rust particles that could easily block flow.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 32 on the PMGCAC IRC-P list.

Cost impact: The code change proposal will not increase the cost of construction.

P2801.5.1-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: There is not any evidence that bigger pans are needed as not many catastrophic water heater failures actually occur.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

P2801.5.1 Pan size and drain. The pan shall be not less than 11/2 inches (38 mm) deep. <u>The pan horizontal dimension</u> ~~and~~ shall be not less than ~~3 inches (76 mm) greater in diameter than~~ the diameter of the water heater or hot water storage tank. <u>Where the flat bottom of a tank will rest directly on the bottom of the pan, the pan dimension shall be not less than 1 inch (25.4 mm) larger than the tank diameter.</u> <u>The drain outlet in the pan shall not be blocked by a tank in the pan or any materials in the pan used to raise a tank above the bottom of a pan.</u>

The pan shall be drained by drain pipe connected to the pan. The drain pipe shall be not less than 3/4 inch (19 mm) nominal diameter and shall be of any of the materials indicated in Table P2905.5. Pipe fittings for the drain pipe shall be in accordance with Section P2905.6 except that insert-type fittings shall not be installed in the drain piping.

Commenter's Reason: Our original intent for specifying a pan size was to eliminate the ambiguous phrase "sufficient size and shape". Another intent was to prevent a situation where the supplied (especially a round) pan was of the same diameter as the bottom of diameter of a flat bottomed tank (typically a standard electric water heater or hot water storage tank) resulting in a side drain outlet of the pan being blocked so there was not a flow path for the escaping water to travel to the drain outlet.

Since we made the original proposal, additional concerns came to us about the trend of future water heaters and hot water storage tanks having thicker insulation (thanks to the federal energy laws). In the situation of replacing an existing water heater, any requirement for a pan to be larger in size than the outside of the tank could present installation problems. For example, the water heater in a narrow closet. Therefore, this public comment changes the proposed language for pan size to only require the pan to be as large as the outside of the (insulated) tank. It also adds a requirement that the water heater not be "offset" in the pan such that the drain outlet not be blocked. In other words, don't position the water heater in the pan up against the drain pan outlet. Or, if the drain is on the bottom of the pan, don't place a flat bottom tank right on top of the drain (the installer can raise the tank by placing the tank on suitable "risers"). While it should be *common sense* to make sure that the drain outlet isn't blocked, putting it in the code provides the basis for the code official to reject careless installations that could result in installed pans not doing what they were intended to do (to catch and drain the leaking water)

The added exception language "except where the flat bottom of a tank will rest directly on the pan," requires some (minimal) "flow path" around the tank in that situation. However, if for some reason the pan cannot be 1 inch larger that the tank (this obviously being a *really* tight fit installation), then the installer could always raise the flat bottom tank slightly (or more) above the pan bottom by placing the tank on pieces of "suitable" material (such as metallic plates, concrete cap blocks or bricks) so that the escaping water can flow *under* the tank to the drain outlet.

RP52-13

Final Action: AS AM AMPC____ D

RP54-13
P2803.1, P2803.2 (New)

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2803.1 Relief valves required. <u>Storage water heaters and hot water storage tanks</u> ~~Appliances and equipment used for heating water or storing hot water~~ shall be protected <u>against over-pressure</u> <u>and over-temperature conditions</u> by <u>one of the following methods</u>:

1. A separate pressure-relief valve and a separate temperature-relief valve ~~; or~~
2. A combination pressure- and temperature-relief valve.

<u>**P2803.2 Instantaneous fuel-gas fired water heater relief valve.** A fuel-gas fired instantaneous water heater shall be protected against over-pressure conditions by a pressure relief valve. The valve shall be located on the cold water inlet piping to the heater at a point that is downstream of all external valves except where the heater manufacturer's instructions require the valve be located elsewhere.</u>

(Renumber subsequent sections)

Reason: In Section P2803.1, the terms "appliances and equipment" is not specific to the coverage that is intended by the code. Chapter 28 is about water heaters. Example: an electric hot drinking-waterunit (under a kitchen sink) is an appliance that heats and stores water. The section never says what the heaters or tanks are being protected against. Adding "over-pressure" and "over temperature" clarifies this.

A question that is often asked is whether existing Section P2803.1 applied to instantaneous ("tankless") water heaters as it is impossible to install a temperature relief valve (in accordance with Section P2803.4) as there is no tank! A new section is added to cover gas instantaneous ("tankless") water heaters. The fuel gas-fired instantaneous water heater industry is waffling about whether a pressure relief valve is required and most have in their instructions " it's up the local code official or jurisdiction". Many questions come up about this and code officials are not sure what to do. We need to settle the debate by simply requiring the pressure relief valve at least for the gas-fired tankless water heaters. Note that electric instantaneous water heaters are exempt from having a PRV by the UL listing for those products. While the code *could* be written to require PRVs for electric tankless water heaters, it is impractical to install PRVs for the small electric units (think of the one fixture, under the cabinet type) and then the issue is where to route the discharge pipe. Generally, the gas instantaneous ("tankless") water heaters are for the whole building and are installed in a basement, garage or other location (outside) where routing of the PRV pipe is no more difficult than it is for a storage tank water heater.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 34 on the PMGCAC IRC-P list.

Cost impact: The code change proposal will not increase the cost of construction.

P2803.1-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: This proposal doesn't address small tankless water heaters. The manufacturer's instructions take precedence.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Submitted.

Commenter's Reason: The committee wanted "small tankless" units to be addressed. We can only assume that the committee's comment meant electric instantaneous (tankless) units as small as point-of-use type units.

The committee's comment that "the manufacturer's instructions take precedence" deserves a reiteration of what was in our reason statement in the original proposal:

> "The fuel gas-fired instantaneous water heater industry is waffling about whether a pressure relief valve is required and most have in their instructions "it's up the local code official or jurisdiction". Many questions come up about this and code officials are not sure what to do. We need to settle the debate by simply requiring the pressure relief valve, at least, for the gas-fired tankless water heaters."

With respect to electric tankless water heaters, the requirements for pressure relief valves by the manufacturers (and the standard for listing for these products, UL499) is even more muddy than it is for gas-fired instantaneous tankless water heaters. Electric instantaneous (tankless) water heater manufacturers are stating the following in their instruction manuals:

> "This unit is not required by UL to have a Pressure and Temperature safety relief valve (PTRV). You should check with local codes to find out if one is required in your area."
>
> "Tankless water heaters such as the <model name> are not required to be equipped with a Pressure and Temperature Relief Valve (except in Massachusetts)."
>
> "Tankless water heaters such as the <model name> are not required to be equipped with a pressure and temperature relief valve (p&t). If the local inspector will not pass the installation without a p&t, it should be installed on the hot water outlet side of the unit."

Recent discussions with listing and labeling agencies about electric tankless water heaters revealed that *some* designs of electric tankless water heaters are required to have "pressure relief devices". Some of these devices are integral to the product design, are not mentioned in the unit's instructions and provide no way to connect a discharge pipe to route the discharge to a safe location. Some electric tankless water heaters *do* require a traditional pressure relief valve but the listing requires that the valve be factory-installed prior to shipment.

And keep in mind the *practicality* of requiring pressure relief valves for ALL electric instantaneous (tankless) units. Consider a unit serving one lavatory in a powder room that is in the middle of the home. Where will the discharge pipe from the relief valve be routed to? Trying to determine which electric tankless water heaters needs to have a pressure relief valves is too difficult to unravel. The original proposal only addressed gas-fired tankless water heaters for good reason – this subject related to electric tankless water heaters is too complex to address at this time.

We believe it is prudent to approve the original proposal simply because a gas-fired appliance that has to potential to rapidly heat water constitutes a safety hazard. Designers and installers need consistent guidance everywhere that the code is adopted so that the decision as to whether a pressure relief valve is needed is not made on a jurisdiction to jurisdiction basis.

RP57-13
P2901.1, P2901.2 (New), P2901.2.1 (New), P2901.2.2 (New), P2901.2.3 (New)

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2901.1 Potable water required. Potable water shall be supplied to plumbing fixtures and plumbing appliances ~~in *dwelling units* shall be supplied with potable water in the amounts and pressures specified in this chapter~~ except where treated rainwater, treated gray water or municipal reclaimed water is supplied to water closets, urinals and trap primers. ~~Where a nonpotable water-distribution systems is installed, the nonpotable system shall be identified by color marking, metal tags or other appropriate method. Where color is used for marking, purple shall be used to identify municipally reclaimed water, rainwater and graywater distribution systems. Nonpotable water outlets that could inadvertently be used for drinking or domestic purposes shall be posted.~~

P2901.2 Identification of nonpotable water systems. Where *nonpotable* water systems are installed, the piping conveying the nonpotable water shall be identified either by color marking, metal tags or tape in accordance with Sections P2901.2.1 through P2901.2.2.3.

P2901.2.1 Signage Required. All nonpotable water outlets such as hose connections, open ended pipes, and faucets shall be identified with signage that reads as follows: "Non-potable water is utilized for [application name]. Caution: non-potable water. DO NOT DRINK."The words shall be legibly and indelibly printed on a tag or sign constructed of corrosion-resistant waterproof material or shall be indelibly printed on the fixture. The letters of the words shall be not less than 0.5 inches in height and in colors in contrast to the background on which they are applied. In addition to the required wordage, the pictograph shown in Figure P2901.2.1 shall appear on the signage required by this section.

FIGURE P2901.2.1
Pictograph – DO NOT DRINK

P2901.2.2 Distribution Pipe Labeling and Marking. Non-potable distribution piping shall be of the color purple and shall be embossed or integrally stamped or marked with the words: "CAUTION: NONPOTABLE WATER – DO NOT DRINK" or shall be installed with a purple identification tape or wrap. Pipe identification shall include the contents of the piping system and an arrow indicating the direction of flow. Hazardous piping systems shall also contain information addressing the nature of the hazard. Pipe identification shall be repeated at intervals not exceeding 25 feet (7620 mm) and at each point where the piping passes through a wall, floor or roof. Lettering shall be readily observable within the room or space where the piping is located.

P2901.2.2 .1 Color. The color of the pipe identification shall be discernable and consistent throughout the building. The color purple shall be used to identify reclaimed, rain and gray water distribution systems.

P2901.2.2 .2 Lettering Size. The size of the background color field and lettering shall comply with Table P2901.2.2.2.

TABLE P2901.2.2.2
SIZE OF PIPE IDENTIFICATION

PIPE DIAMETER (inches)	LENGTH BACKGROUND COLOR FIELD (inches)	SIZE OF LETTERS (inches)
¾ to 1 ¼	8	0.5
1 ½ to 2	8	0.75
2 ½ to 6	12	1.25
8 to 10	2	2.5
over 10	32	3.5

For SI: 1 inch = 25.4 mm.

P2901.2.2 .3 Identification Tape. Where used, identification tape shall be at least 3 inches wide and have white or black lettering on purple field stating "CAUTION: NON-POTABLE WATER – DO NOT DRINK". Identification tape shall be installed on top of non-potable rainwater distribution pipes, fastened at least every 10 feet to each pipe length and run continuously the entire length of the pipe.

Reason: The phrase "in *dwelling units* shall be supplied with water in the amounts and pressures specified in this chapter" is not necessary because the code already spells out the requirements in other sections.

Water distribution systems of other than potable water are being installed in buildings and the code needs to require marking of the piping and signage for the outlets for safety reasons. The basis for this new language is text from the IgCC and is written to be in alignment with the IgCC requirements. A similar proposal to the 2015 IPC was Approved as Modified by Public Comment.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 36 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will increase the cost of construction

P2901.1-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: This is necessary for the safety of the public when nonpotable water is being used in the building.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh, Arlington County, VA, representing VA Plumbing & Mechanical Inspectors Association (VPMIA) & VA Building Code Officials Association (VBCOA), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

P2901.2.1 Signage Required. All nonpotable water outlets such as hose connections, open ended pipes, and faucets shall be identified with signage that reads as follows: "Non-potable water is utilized for [application name]. Caution: non-potable water. DO NOT DRINK."The words shall be legibly and indelibly printed on a tag or sign constructed of corrosion-resistant waterproof material or shall be indelibly printed on the fixture. The letters of the words shall be not less than 0.5 inches in height and in colors in contrast to the background on which they are applied. In addition to the required wordage, the pictograph shown in Figure P2901.2.1 shall appear on the signage required by this section.<u> The requirements of this section shall not be construed to require signage for water closets and urinals utilizing nonpotable water for flushing.</u>

Commenter's Reason: The proposed additional language is to make it clear that no signage is required for water closets or urinals that are being supplied with a non potable water source. The existing language could be interpreted that signage is required for water closets and urinals using a non potable water source however we feel that this was not the intent of this language and want to make it clear that such signage is not required specifically for these two fixtures.

RP57-13

Final Action: AS AM AMPC____ D

RP64-13
P2902.3.3

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2902.3.3 Backflow preventer with intermediate atmospheric vent. Backflow preventers with intermediate atmospheric vents shall conform to ASSE 1012 or CSA B64.3. These devices shall be <u>designed for the outlet to be</u> ~~permitted to be installed where~~ subject to continuous pressure conditions. The relief opening shall discharge by air gap and shall be prevented from being submerged.

Reason: The term "shall be permitted" is not mandatory code language. The section was reworded to eliminate the term.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 40 on the PMGCAC IRC-P list.

Cost impact: The code change proposal will not increase the cost of construction.

P2902.3.3-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Diapproved**

Committee Reason: The term "design" shouldn't be in the section. The standard for the product covers the design.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Modified by this Public Comment.

Replace proposal as follows:

Revise as follows:

P2902.3.3 Backflow preventer with intermediate atmospheric vent. Backflow preventers with intermediate atmospheric vents shall conform to ASSE 1012 or CSA B64.3. ~~These devices shall be permitted to be installed where subject to continuous pressure conditions.~~ The relief opening shall discharge by air gap and shall be prevented from being submerged.

Commenter's Reason: We are simply trying to remove the "shall be permitted" from the section. But after review of the sentence having "shall be permitted" in it, we see no value of the sentence in the code. The sentence is really not clear in its intent. The installer must follow the installation instructions for the product so it is unnecessary for this sentence to remain in the code.

RP64-13
Final Action: AS AM AMPC____ D

RP66-13
P2902.3.4

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2902.3.4 Pressure vacuum breaker assemblies. Pressure vacuum breaker assemblies shall conform to ASSE 1020 or CSA B64.1.2. Spill-resistant vacuum breaker assemblies shall comply with ASSE 1056. These assemblies ~~are~~ shall be designed for the outlet to be subject to ~~installation under~~ continuous pressure conditions. ~~where the critical level is installed at the required height.~~ Pressure vacuum breaker assemblies shall not be installed in locations where ~~spillage~~ leakage of water from the assembly could cause damage to the structure.

Reason: The third sentence is in non-mandatory language and the critical height has nothing to do with the assembly's capability to accept pressure on the outlet of the assembly. The term "spillage" is vague (spillage of what?) and doesn't truly say what the intent is.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 41 on the PMGCAC IRC-P list.

Cost impact: The code change proposal will not increase the cost of construction.

P2902.3.4-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The committee preferred RP67.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Modified by this Public Comment.

Replace proposal as follows:

Revise as follows:

P2902.3.4 Pressure vacuum breaker assemblies. Pressure vacuum breaker assemblies shall conform to ASSE 1020 or CSA B64.1.2. Spill-resistant vacuum breaker assemblies shall comply with ASSE 1056. ~~These assemblies are designed for installation under continuous pressure conditions.~~ Pressure vacuum breaker assemblies shall not be installed in locations where ~~spillage~~ leakage of water from the assembly could cause damage to the structure.

Commenter's Reason: We are simply trying to remove the "shall be permitted" from the section and clarify the meaning of "spillage". But after review of the sentence having "shall be permitted" in it, we see no value of the sentence in the code. In fact, the sentence could lead someone to believe that the device is suitable for protection under a backpressure condition. Table P2902.3 indicates that these devices offer protection against only backsiphonage conditions. The installer must follow the installation instructions for the product so it is unnecessary for this sentence to remain in the code. The term "spillage" is slang so the last sentence is modified to really say what is intended so that these devices are not inadvertently installed in an area where leakage of water would create an issue.

RP66-13

Final Action: AS AM AMPC____ D

RP68-13
P2902.3.5

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2902.3.5 Reduced pressure principle backflow prevention assemblies. Reduced pressure principle backflow prevention assemblies and reduced pressure principle fire protection backflow prevention assemblies shall conform to ASSE 1013, AWWA C511, CSA B64.4 or CSA B64.4.1. Reduced pressure detector fire protection backflow prevention assemblies shall conform to ASSE 1047. These ~~devices~~ assemblies shall be designed for the outlet to be ~~permitted to be installed where~~ subject to continuous pressure conditions. The relief opening shall discharge by air gap and shall be prevented from being submerged.

Reason: The term "shall be permitted" is not mandatory code language. The language was revised to make the intent clear.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. P2902.5.1

Proposed Change as Submitted

Proponent: Michael S. Moss, representing American Backflow Prevention Association (msmoss@utah.gov)

Revise as follows:

P2902.5.1 Connections to boilers. ~~The potable supply to the boiler shall be equipped with a backflow preventer with an intermediate atmospheric vent complying with ASSE 1012 or CSA B64.3. Where conditioning chemicals are introduced into the system,~~ The potable water connection to a boiler shall be protected by an *air gap* or a reduced pressure principle backflow prevent~~er~~ion assembly complying with ASSE 1013, CSA B64.4 or AWWA C511.

Reason: These assemblies are designed and sold for high-health hazard installations according to manufacturer specification sheets. They are adequate for chemical additions or injections. Reduced pressure principle backflow *preventer* corrected to reduced pressure principle backflow *prevention assembly* to provide consistent terminology throughout the code for reference and comparison.

Cost Impact: The code change proposal will not increase the cost of construction.

. **P2902.5.1-RP-MOSS**

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

P2902.5.1 Connections to boilers. The potable supply to the boiler shall be permitted to be equipped with a backflow preventer with an intermediate atmospheric vent complying with ASSE 1012 or CSA B64.3. Where conditioning chemicals are introduced into the system, the potable water connection to a boiler shall be protected by an *air gap* or a reduced pressure principle backflow prevention assembly complying with ASSE 1013, CSA B64.4 or AWWA C511.

Committee Reason: The modification puts backflow preventers covered by ASSE 1012 back into the code for this application. The overall proposal provides consistency that is needed.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Michael S. Moss of the American Backflow Prevention Association (msmoss@utah.gov) requests Approval as Modified by this Public Comment

Further modify proposal as follows:

P2902.5.1 Connections to boilers. Where chemicals will not be introduced into a boiler, the potable water supply to the boiler shall be ~~permitted~~ ~~to be equipped with~~ protected from the boiler by a backflow preventer with an intermediate atmospheric vent complying with ASSE 1012 or CSA B64.3. Where ~~conditioning~~ chemicals ~~are~~ will be introduced into ~~the~~ a boiler ~~system~~, the potable water supply ~~connection~~ to ~~a~~ the boiler shall be protected from the boiler by an *air gap* or a reduced pressure principle backflow prevention assembly complying with ASSE 1013, CSA B64.4 or AWWA C511.

Commenter's Reason: In reviewing the language of the floor proposal submitted during the Committee Action Hearings, I recognize the need to reword this proposal to make it clearly mandatory language. Also my intent is to ensure that the proposal provides adequate and appropriate protection based upon addition of chemicals into the boiler system. I recommend that this proposal be accepted and approved as modified.

RP75-13

Final Action: AS AM AMPC____ D

RP78-13
P2902.5.6 (New)

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Add new text as follows:

<u>**P2902.5.6 Yard hydrants.** The potable water supply to a frost proof yard hydrant having a stop-and-waste valve located underground or below grade shall be protected against backflow by a reduced pressure principle backflow prevention assembly.</u>

Reason: There is no way to know what type of health hazard the stop and waste opening of a yard hydrant will be exposed to. The contaminants could include lawn fertilizer, animal wastes, garden fertilizer or septic tank effluent. The code currently lacks coverage for what type of backflow protection is necessary for this application which has some code officials choosing simple a dual check valve which is only suitable for low hazard. This is an accident waiting to happen.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 53 on the PMGCAC IRC-P list.

Cost impact: The code change proposal will increase the cost of construction.

P2902.5.6 (NEW)-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: This proposal is much too restrictive as it requires a specific backflow device for a supplying a yard hydrant.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

P2902.5.6 Yard hydrants. The potable water supply to a ~~frostproof~~ <u>freezeproof</u> yard hydrant having a stop-and- waste valve located underground or below grade shall be protected against backflow by <u>a backflow preventer with intermediate atmospheric vent, a pressure vacuum breaker assembly, a spill-resistant vacuum breaker assembly or</u> a reduced pressure principle backflow prevention assembly.

Commenter's Reason: As the committee indicated, they wanted more options for backflow protection. This public comment provides options. We have changed “frostproof” to “freezproof” to be in alignment with existing Section P2903.9.5 terminology.

RP78-13
Final Action: AS AM AMPC____ D

RP81-13
Table P2903.2

Proposed Change as Submitted

Proponent: Edward R. Osann, Natural Resources Defense Council, representing himself (eosann@nrdc.org)

Revise as follows:

TABLE P2903.2
MAXIMUM FLOW RATES AND CONSUMPTION
FOR PLUMBING FIXTURES AND FIXTURE FITTINGS[b]

PLUMBING FIXTURE OR FIXTURE FITTING	~~PLUMBING FIXTURE OR FIXTURE FITTING~~ MAXIMUM FLOW RATE OR QUANTITY
Lavatory faucet	~~2.2~~ 1.5 gpm at 60 psi
Shower head[a]	~~2.5~~ 2.0 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Water closet	~~1.6~~ 1.3 gallons per flushing cycle[c]

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m,1 pound per square inch = 6.895 kPa.
a. A hand-held shower spray is also a shower head.
b. Consumption tolerances shall be determined from referenced standards.
c. The effective flush volume for a dual-flush water closet is defined as the composite, average flush volume of two reduced flushes and one full flush.

Reason: The maximum flow rates and water consumption levels in the current Table P2903.2 for water closets, shower heads, and lavatory faucets equate to nationwide standards enacted nearly 20 years ago. In December, 2010, the US Department of Energy determined that states were no longer preempted from adopting more stringent efficiency standards for these products. (*Federal Register*, Vol. 75, No. 245, December 22, 2010, p. 80289; this document is attached).

Today, fixtures and fittings that perform well at flush volumes and flow rates lower than the values in Table P2903.2 are widely available. Since 2006, the establishment of the WaterSense voluntary labeling program for water efficient products and services by the Environmental Protection Agency has provided a framework for the recognition of products that are substantially more efficient than minimum federal requirements while maintaining full functionality and customer satisfaction. WaterSense criteria were established for tank-type toilets (1.28 gpf) in 2007; lavatory faucets (1.5 gpm @ 60 psi) in 2007; and showerheads (2.0 gpm @ 80 psi) in 2010. Manufacturers have responded by bringing large numbers of models to market that meet or exceed WaterSense specifications. Based on the most recent reports by WaterSense partners, the following figures regarding the number of WaterSense labeled models available as of December 2012 indicate the widespread availability and commercial viability of plumbing products that are more efficient than the federal minimum standards shown in the current Table P2903.2:

- Tank-type water closets 1,475 models from 87 brands
- Lavatory faucets and accessories 5,207 models from 134 brands
- Showerheads 808 models from 45 brands

With the pace of introduction of new models that meet WaterSense specifications, it is reasonable to expect that these figures will be substantially larger by 2015.

Improving the water efficiency of water closets, shower heads, and lavatory faucets in new residential construction will save future building owners money and reduce the likelihood of municipal water and wastewater capacity constraints that can lead to moratoria on new connections.

NRDC estimates that nationwide adoption of the values in this proposal in all newly constructed single-family homes, effective 2016, can be expected to yield substantial additional savings of resources and dollars, as follows:

- 110 million gallons of water per day in 2030;
- 3,200 1,644 Gigawatt-hours of electricity per year in 2030;
- 118 million therms of natural gas per year in 2030; and
- Cumulative savings for consumers of $632 million through 2030.

Cost Impact: While the costs of plumbing fixtures and fittings vary greatly due to style, trim, colors, and materials, the incremental cost of greater efficiency alone for products meeting the flush volumes and flow rates contained in this proposal is negligible. This code change proposal will not increase the cost of construction.

P2903.2T-RP-OSANN.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Modify the proposal as follows:

Committee Reason: Older drainage systems might not be able to handle the lower flows allowed by this proposed table. This belongs in the IgCC.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Edward R. Osann, Natural Resources Defense Council on behalf of self (eosann@nrdc.org); Julius Ballanco, JB Engineering and Code Consulting, P.C (JBENGINEER@aol.com); John Koeller, Koeller and Company (koeller@earthlink.net); and Harry Misuriello, American Council for an Energy-Efficient Economy (misuriello@verizon.net) request Approval as Modified by this Public Comment

Modify the proposal as follows:

TABLE P2903.2
MAXIMUM FLOW RATES AND CONSUMPTION
FOR PLUMBING FIXTURES AND FIXTURE FITTINGS[b]

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY
Lavatory faucet	1.5 gpm at 60 psi
Shower head[a]	2.0 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Water closet	1.3 gallons per flushing cycle[c,d]

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray is also a shower head.

b. Consumption tolerances shall be determined from referenced standards.

c. The effective flush volume for a dual-flush water closet is defined as the composite, average flush volume of two reduced flushes and one full flush.

d. The maximum flow shall be1.6 gallons per flushing cycle for water closets connected to the sanitary drainage system of an existing building.

Commenter's Reason: The committee's stated reason for disapproval, "Older drainage systems might not be able to handle the lower flows allowed by this proposed table," is addressed by adding an exception to the new standard for water closet installations in existing buildings that might be subject to code. As the committee implies, drainage from new water closets operating at 1.3 gpf in newly-constructed one- and two family homes is not an issue. These products have achieved widespread acceptance in the US market. In 2011, over half of all tank-type toilets sold in the US were certified to meet the EPA WaterSense specification of 1.28 gpf, according to the EPA. In order to achieve the WaterSense label, a product must "Perform as well or better than their less efficient counterparts." A number of ratings reports, including those published by *Consumer Reports* and the City of Austin, Texas (as well as unpublished reports from the cities of Eugene, Oregon and Los Angeles, California) consistently identify toilets and showerheads that operate at the flows identified in this proposal as receiving good to excellent ratings.

It is also important to note that the Plumbing Manufacturers Institute (PMI) identified the very same flow rates and water consumption levels as proposed here in its own "PMI PRODUCT WATER EFFICIENCY POSITIONS: Residential Products &

Applications," published in August 2012 (available at: http://www.pmihome.org/files/PMI_Water_Efficiency_Sustainability_Statement.pdf).

The proposed changes -- lavatory faucets at 1.5 gpm and showerheads at 2.0 gpm) are identical to PMI's position statement; the proposed change to 1.3 gpf for water closets is the rounded equivalent to PMI's suggested 1.28 gpf. PMI identified 2014 as the appropriate timing for a 1.28 gpf requirement for water closets; January, 2010 as appropriate timing for lavatory faucets at 1.28 gpm; and August, 2012 for showerheads at 2.0 gpm. As the changes proposed here would be implemented in the 2015 IRC base code, with likely field applicability in 2016 at the earliest, this proposal fully accommodates the timetable identified by PMI as acceptable to the plumbing industry.

Final Action: AS AM AMPC____ D

RP83-13
P2903.4, P2903.4.1, P2903.4.2

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2903.4 Thermal expansion control. ~~A means for controlling increased pressure caused by thermal expansion shall be installed where required in accordance with Sections P2903.4.1 and P2903.4.2.~~ <u>Where a storage water heater is supplied with cold water that passes through a check valve, pressure reducing valve or backflow preventer, a thermal expansion tank shall be connected to the water heater cold water supply pipe at a point that is downstream of all check valves, pressure reducing valves and backflow preventers. Thermal expansion tanks shall be sized in accordance with the tank manufacturer's instructions and shall be sized such that the pressure in the water distribution system shall not exceed that required by Section P2903.3.1.</u>

~~**P2903.4.1 Pressure-reducing valve.** For water service system sizes up to and including 2 inches (51 mm), a device for controlling pressure shall be installed where, because of thermal expansion, the pressure on the downstream side of a pressure-reducing valve exceeds the pressure reducing valve setting.~~

~~**P2903.4.2 Backflow prevention device or check valve.** Where a backflow prevention device, check valve or other device is installed on a water supply system using storage water heating equipment such that thermal expansion causes an increase in pressure, a device for controlling pressure shall be installed.~~

Reason: Any location there is a pressure reducing device, a check valve or a backflow preventer in the cold water piping to a storage-type water heater, a means to compensate for thermal expansion must be installed. This is typically accomplished with an expansion tank. Other methods for relieving thermal expansion pressure, such additional relief valves, waste water for the life of the system. Thermal expansion tanks are required by most storage water heater manufacturers to protect the water heater. Expansion tank manufacturers typically size their tanks so that the water distribution system pressure will remain just shy of the pressure required to open a 150 psi water heater relief valve. This will allow the system pressure to exceed the maximum pressure intended by Section P2903.3.1, which is unacceptable. A similar proposal for the 2015 IPC was Approved as Submitted.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 47 on the PMGCAC IRC-P list.

Cost impact: The code change proposal will increase the cost of construction.

P2903.4-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: This would prevent the use of other devices to prevent thermal expansion pressure increase that have been used successfully in the past.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Submitted.

Commenter's Reason: This proposed language is already cast for the 2015 IPC. Do you really want to have the IRC have different requirements for controlling thermal expansion than the IPC? This will lead to confusion so we urge approval of this proposal.

RP83-13
Final Action: AS AM AMPC____ D

RP84-13
P2903.7

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2903.7 Size of water-service mains, branch mains and risers. The size of the water service pipe shall be not less than 3/4 inch (19 mm) diameter. The size of water service mains, branch mains and risers shall be determined according to water supply demand [gpm (L/m)], available water pressure [psi (kPa)] and friction loss caused by the water meter and *developed length* of pipe [feet (m)], including *equivalent length* of fittings. The sizes of piping in ~~of~~ ~~each~~ a water distribution system shall be determined ~~according to~~ by design methods conforming to ~~acceptable~~ accepted engineering practice. ~~, such as those methods in Appendix~~ ~~P~~ ~~and shall~~ Such methods shall be *approved.* ~~by the code *official*~~.

Reason: The code should never direct or refer the reader to an appendix. What is “acceptable” ? What is intended is “accepted”. See definition for *accepted engineering practice* in the IPC. The material in the appendix is not normally adopted and in many cases, does not exist in the adopted code of a jurisdiction. The reference needs to be deleted. “Approved by the building official” is redundant. *Approved* already means approval by the building official.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 48 on the PMGCAC IRC-P list.

Cost impact: The code change proposal will not increase the cost of construction.

P2903.7-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: An appendix should not be referred to by the code.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

David Beahm, County of Warren, representing VA Plumbing & Mechanical Inspectors Association (VPMIA) & VA Building Code Officials Association (VBCOA), requests Disapproval.

Commenter’s Reason: The Code already clearly defines that acceptable engineering design practices may be used to meet this requirement, but it also allows the code official direct guidance that Appendix P is considered an acceptable method of compliance without having to have other documents. This Code change does nothing more than remove a reference to Appendix P that some code officials rely on for the justification for it to be used.

RP84-13
Final Action: AS AM AMPC____ D

RP88-13
P2903.9.1

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2903.9.1 ~~Service~~ Main water valves. Each *dwelling unit* shall be provided with an accessible, full-open main water ~~shutoff~~ valve ~~near~~ within 18 inches (457 mm) ~~the entrance~~ of where the water service pipe enters the structure at a foundation wall or where the water service extends above the floor of a concrete slab-on-grade. ~~The valve shall be of a full-open type having nominal restriction to flow, with provision for drainage such as a bleed orifice or installation of a separate drain valve. Additionally,~~ Where the supply of water for the structure is from a public water main, a valve shall be provided between the end of the utility-owned water supply pipe and the beginning of the water service pipe. ~~shall be valved at the curb or lot line in accordance with local requirements.~~

Reason: The terms "near" and "nominal restriction" are vague and unenforceable. The term "bleed orifice" and "valved" are slang terminology. The word "additionally" is unnecessary.

The industry seems to understand what constitutes a "full open" valve. The dimension of 18 inches for the location of the valve is offered to the Development Committee as a starting point for specifying the proximity of the valve to the entrance into the structure. The Committee can easily change this dimension if it chooses. The point in specifying a distance is to provide better guidance and more leeway than simply stating "at" the entrance.

A "bleed orifice" on a main water shut off valve is used so rarely that if it did get used many years after installation, the orifice is frequently useless because it is clogged and corroded. It is wishful thinking to believe that a modern water distribution system can be completely drained through a "bleed orifice" (or a drain valve) at the main water valve. Many jurisdictions have not enforced this feature for many years. The IPC contains no such requirement.

The last line is revised to remove slang terminology ("valved").

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 49 on the PMGCAC IRC-P list.

Cost impact: The code change proposal will not increase the cost of construction.

P2903.9.1-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproval**

Committee Reason: This proposal appears to add an additional, unnecessary valve to the system and the dimension for locating the valve is too restrictive.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Modified by this Public Comment.

Replace proposal as follows:

Revise as follows:

P2903.9.1 ~~Service~~ Main water valve. Each *dwelling unit* shall be provided with an accessible, full-open main water shutoff valve. ~~near the entrance of the water service~~. For water supplied by a water utility, the location of the valve shall be at any point between the utility point-of-delivery and the first branch connection of the water distribution system for the *dwelling unit*. The required valve shall not be utility-owned. For individual water supply systems, the valve shall be located at any point between the source of water pressure such as a pressure tank, and the first branch connection of the water distribution system for the *dwelling unit*. ~~The valve shall be of a full-open type having nominal restriction to flow, with provision for drainage such as a bleed orifice or installation of a separate drain valve. Additionally, the water service shall be valved at the curb or lot line in accordance with local requirements.~~

Commenter's Reason: In our original proposal, the public hearing committee tried to modify the proposed "too restrictive" 18 inch dimension to 5 feet but that modification was not successful. After discussion among the members of the PMGCAC and with a few interested parties, we believe that attempting to put *any* dimension in this section is futile – there are just too many arrangements to consider. One dimension just can't fit all circumstances. Therefore, we propose new language for location of the valve to provide for the widest latitude for all possible circumstances and geographic regions.

The fourth sentence was added because for individual water supply systems (such as a well system) we believe there needs to be clarification that the required valve needs to be between the source of pressure and the first branch of the water distribution system. Putting a valve in the water service pipe from the well to the pressure tank isn't what is intended because the pressure tank can deliver a fair amount of water after the pump is isolated from the tank. The intent of having a main water valve is to be able to shut off the water pressure quickly for emergencies and service work.

The first part of the second to the last sentence of the existing text was struck out because "full open" is an understood term to most plumbers. In the past, a full-open valve meant a full-port gate valve. In recent years, full-port ball valves are more commonly used for full-open valve applications.

The second part of the second to the last sentence of the existing text was struck out because, as stated in the original proposal, requiring a "bleed orifice" on a main water shut off valve (or a separate drain valve) is useless in the majority of situations. The main water valve might not be in a location (such as in a wall) where the bleed orifice cannot be easily directed into a bucket. If a bleed orifice was used many, many years after installation of the valve, the orifice is frequently useless because it is clogged and corroded. Use of the bleed orifice usually results in having to replace the valve. And, where the valve is located underground, having a bleed orifice (or a separate drain valve) below grade would violate the intent of Section P2903.9.5 (Potable water openings below grade are prohibited). It is wishful thinking to believe that a modern water distribution system can be completely drained through a "bleed orifice" (or a drain valve) at the main water valve. Many jurisdictions don't appear to be enforcing the "bleed orifice" or "separate drain valve" requirement. The topic of winterizing water supply systems in buildings is far more extensive than a simple requirement for a drain point. Note that the IPC contains no requirement for a water system drain point.

The last sentence was struck out because the water utility is going to supply a valve at the utility point-of-delivery as part of a water meter or as a curb stop accessed through a "buffalo box" or "B-box", as some call it. There is no need for the code to discuss this valve because the utility supplies that valve. In some jurisdictions, it is illegal for anyone, other than the utility, to operate their valve (especially if that valve is upstream of a meter). The code should not allow a utility-owned valve to serve as the code-required valve. We added the third sentence to make this clear.

RP88-13

Final Action: AS AM AMPC____ D

RP89-13
P2903.9.2

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2903.9.2 Water heater valve. A *readily accessible* full open valve shall be installed in the cold-water supply pipe to each water heater. ~~at or near~~ Such valve shall be within 18 inches (457 mm) of the water heater.

Reason: The term "near" is vague and unenforceable. The term "at" is too restrictive. The dimension of 18 inches for the location of the valve is offered to the Development Committee as a starting point for specifying the proximity of the valve to the water heater. The Committee can easily change this dimension if it chooses. The point in specifying a distance is to provide better guidance and more leeway than simply stating "at" or "near" the entrance.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 50 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will not increase the cost of construction.

P2903.9.2-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The dimension for locating the valve is too restrictive.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Submitted.

Commenter's Reason: Most of the time, an installer is going to put the valve right at the water heater, as we believe, is the right location. The dimension of 18 inches is not overly restrictive. Yes, there could be situations where the installer might want to put a valve in some other location for easy access by the homeowner. For example, an installer putting a water heater in an attic might want to put a valve that can be accessed from the floor below so that the homeowner can easily turn off water to the water heater. Such valves would be in addition to the required "at" the water heater. Having the valve "at" the water heater allows service personnel to perform maintenance and repairs quickly and easily without having to go up and down stairs or travel some distance away from the water heater to turn the water off and on. Note that the 18 inch dimension is NOT indicated as a developed pipe length. The required valve could be located anywhere within 18 inches of the water heater. For example, the 18 inch requirement would not preclude locating the valve alongside of and at some distance from the top of a storage tank water heater that was on an elevation stand in a garage so that the valve would be within easy reach for the homeowner.

RP89-13

Final Action: AS AM AMPC____ D

RP93-13
P2903.9.5

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P2903.9.5 Outlets and stop-and-waste valves prohibited below grade. Potable water outlets and ~~combination~~ stop-and-waste valves shall not be installed underground or below grade. Freezeproof yard hydrants that drain the riser into the ground ~~are~~ shall be considered to be stop-and-waste valves.

> **Exception:** Installation of freezeproof yard hydrants that drain the riser into the ground shall be permitted provided that ~~if~~ the potable water supply to such hydrants is protected upstream of the hydrants in accordance with Section P2902.5.6 and the hydrants are permanently identified as nonpotable outlets by *approved* signage ~~that reads as~~ having the followings~~s~~ words: “CAUTION, NONPOTABLE WATER. DO NOT DRINK.

Reason: The term “combination” is not needed and confuses the intent of the section. The plumbing industry knows what a stop and waste valve is. Use of the phrase “shall be permitted” in the exception is frequently not acceptable but in this situation, it does work because specific conditions are required for such hydrant use. The term “if” needs to be changed to “provided that” in order to format the remainder of the statement as the conditions of installation. The last line is revised to because signs don’t “read”, they only have words printed on them.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 54 on the PMGCAC IRC-P list.

Cost impact: The code change proposal will increase the cost of construction.

P2903.9.5-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproval**

Committee Reason: The exception is referring to Section P2902.5.6 which doesn’t exist in the code.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

P2903.9.5 Outlets and stop-and-waste valves prohibited below grade. Potable water outlets and stop-and-waste valves shall not be installed underground or below grade. Freezeproof yard hydrants that drain the riser into the ground shall be considered to be stop-and-waste valves.

Exception: Installation of freezeproof yard hydrants that drain the riser into the ground shall be permitted provided that the potable water supply to such hydrants is protected upstream of the hydrants in accordance with Section P2902~~.5.6~~ and the hydrants are permanently identified as nonpotable outlets by *approved* signage having the following~~s~~ words: "CAUTION, NONPOTABLE WATER. DO NOT DRINK".

Commenter's Reason: The committee was right in that there isn't a Section P2902.5.6. This public comment corrects the error.

RP93-13

Final Action: AS AM AMPC____ D

RP94-13
P2903.10

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Delete and substitute as follows:

~~**P2903.10 Hose bibb shut off valve.** Hose bibbs subject to freezing, including the "frost-proof" type, shall be equipped with an accessible stop-and-waste-type valve inside the building so that they can be controlled and drained during cold periods.~~

> ~~**Exception:** Frostproof hose bibbs installed such that the stem extends through the building insulation into an open heated or semiconditioned space need not be separately valved (see Figure P2903.10).~~

P2903.10 Outdoor hose connection faucets. Hose-connection faucets such as hose bibbs, sillcocks and lawn faucets that are located on the building and exposed to the outdoors shall have a stop-and-waste valve installed on the fixture supply pipe to the faucet. The stop-and-waste valve shall be accessible and shall be located in an area of the building where the valve is not subject to freezing.

> **Exceptions:**
>
> 1. The stop-and-waste valve shall not be required where the winter design temperature indicated in Table R301.2.(1) is greater than 32°F (0° C).
> 2. The stop-and-waste valve shall not be required where the valve seat of the hose connection faucet is located in an area of the building that is not subject to freezing temperatures (see Figure P2903.10).

Reason: The hose bibb is not "equipped" with a stop-and-waste valve; the water supply pipe to the hose bibb is to have the stop and waste valve. Are hose bibbs really "controlled"? "Valved" is slang terminology. What is a "semiconditioned" space? The revised text eliminates improper language and makes the intent clear.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 55 on the PMGCAC IRC-P list.

Cost impact: The code change proposal will increase the cost of construction.

P2903.10-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproval**

Committee Reason: The proposed language is not clear. The existing language is clearer.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

P2903.10 Outdoor hose connection faucets. Hose-connection faucets such as hose bibbs, sillcocks and lawn faucets that are located on the exterior of the building and subject to freezing ~~exposed to the outdoors~~ shall have a stop-and-waste valve installed on the fixture supply pipe to the faucet. The stop-and-waste valve shall be accessible and shall be located in an area of the building where the valve is not subject to freezing.

Exception~~s~~:

~~1. The stop-and-waste valve shall not be required where the winter design temperature indicated in Table R301.2.(1) is greater than 32°F (0° C).~~

~~2.~~ The stop-and-waste valve shall not be required where the valve seat of the hose-connection faucet is located in an area of the building that is not subject to freezing temperatures (see Figure P2903.10).

Commenter's Reason: We believe that the original proposal language is clearer than the existing language. We think that the real reason for committee disapproval was that they did not like having the specific conditions called out for where freezing conditions could exist. We have reworked the proposal to continue to allow for ambiguity as to where (geographically) freezing conditions will occur.

1	5.81	5.49	5.17	4.43	5.53	5.56	5.56	3.91
1¼	8.70	8.36	8.09	6.61	9.66	8.49	8.49	5.81
1½	12.18	11.83	11.45	9.22	13.20	13.88	13.88	8.09
2	21.08	20.58	20.04	15.79	21.88	21.48	21.48	13.86

For SI: 1 inch = 25.4 mm, 1 liquid ounce = 0.0296 liters, 1.0 ounce = 0.00781 gallons,
0.5 gallon (1.9 liters) = 64.0 liquid ounces

Reason: Cold or tepid water in the initial draw from a hot water outlet is often unusable for its intended purpose, and is frequently purged, resulting in a waste of water, energy, and time for building occupants. Pipe insulation significantly reduces heat loss and helps to ensure that hot water gets to the user sooner. However, a complementary strategy is to reduce the volume of water contained in the hot water distribution system in the first place.

This proposal, which is comparable to the criteria adopted by the US EPA WaterSense for New Homes specification in 2009, establishes a maximum volume of 0.5 gallons for water in a hot water supply line, based on internal volumes specific to the piping material. By allowing the volume limitation to be computed from runs from recirculation loops, this provision allows designers additional flexibility in larger homes while effectively limiting the amount of cooled down water to be purged to ½ gallon per draw.

Cost Impact: This code change proposal is a design requirement that will not increase the cost of construction.

P2904 (NEW) #1-RP-OSANN.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: This is a water reducing proposal that would be better suited for the IgCC. Also, same comment as for RP95. The added cost of construction could not be afforded by some customers.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Edward R. Osann, Natural Resources Defense Council on behalf of self (eosann@nrdc.org) requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SECTION P2904
HOT WATER DISTRIBUTION SYSTEMS

P2904.1 Hot water pipe volume. ~~The volume in the piping between the end of a *hot water fixture supply* and the piping connection to a *hot water* source shall not exceed 0.5 gallon (1.9 liters).~~ The volume of water in a service hot water system between the termination of a supply pipe to individual fixtures indicated in Section P2904.1.1 and the nearest source of hot water shall not exceed 128 ounces (3.8 liters). The hot water source shall be a recirculating system pipe~~, a heat-traced pipe~~ or a water heater. The volume shall be the sum of the internal volumes of pipe, fittings, valves, meters and manifolds located between the hot water source and the fixture supply pipe termination. The volume in the piping shall be calculated using the values in Table P2904.1. The calculation of the internal volume of plumbing appurtenances and piping materials or dimensions not included in Table P2904.1 shall be documented and *approved.*

P2904.1.1 Scope. The volume limitation in Section P2904.1 shall apply to hot water supplied to all of the following fixtures:

1. lavatories
2. kitchen sinks
3. showers
4. combination tub-showers

TABLE P2904.1
INTERNAL VOLUME OF VARIOUS WATER DISTRIBUTION PIPING

	LIQUID OUNCES OF WATER PER FOOT LENGTH OF HOT WATER TUBING									
Nominal Size (Inches)	**Copper Type M**	**Copper Type L**	**Copper Type K**	**CPVC CTS SDR 11**	**CPVC SCH 40**	**CPVC SCH 80**	**~~PEX-AL-PEX~~ Composite ASTM F 1281**	**~~PE-AL-PE~~**	**PE-RT SDR 9**	**PEX CTS SDR 9**
⅜	1.06	0.97	0.84	N/A	1.17	N/A	0.63	~~0.63~~	0.64	0.64
½	1.69	1.55	1.45	1.25	1.89	1.46	1.31	~~1.31~~	1.18	1.18
⅝	~~2.49~~	~~2.31~~	~~2.22~~	~~N/A~~	~~N/A~~		~~2.12~~	~~2.12~~		~~1.72~~
¾	3.43	3.22	2.90	2.67	3.38	2.74	3.39	~~3.39~~	2.35	2.35
1	5.81	5.49	5.17	4.43	5.53	4.57	5.56	~~5.56~~	3.91	3.91
1¼	8.70	8.36	8.09	6.61	9.66	8.24	8.49	~~8.49~~	5.81	5.81
1½	12.18	11.83	11.45	9.22	13.20	11.38	13.88	~~13.88~~	8.09	8.09
2	21.08	20.58	20.04	15.79	21.88	19.11	21.48	~~21.48~~	13.86	13.86

For SI: 1 inch = 25.4 mm, 1 liquid ounce = 0.0296 liters, 1.0 ounce = 0.00781 gallons, ~~0.5~~ 1 gallon (~~1.9~~ 3.8 liters) = ~~64.0~~ 128 liquid ounces

Commenter's Reason: In response to the committee's concern that the original proposal was too stringent for a minimum code, and after further discussion with builders, this public comment modifies the proposal in several important ways, most notably by increasing the maximum volume permitted within a hot water supply pipe to any individual fixture to 1 gallon (128 ounces), up from ½ gallon in the original proposal. Additionally, this comment simplifies and clarifies the original proposal in the following ways:

- Limits the applicability of the proposal to hot water piping serving three types of fixtures:
  - Showers and tub-shower combinations.

- Kitchen sinks.
- Lavatories.

- Conforms the table of internal volumes for various types and diameters of piping material to the values in Table E202.1 of the International Plumbing Code as approved for 2015.
- Clarifies that the permissible volume of water is to be calculated from the "nearest" source of hot water to an "individual" fixture.
- Removes reference to heat traced pipe as a source of hot water, an application more likely to be found in multifamily residential or commercial construction, and thus not germane here.
- Adds a sentence to clarify the inclusion of the internal volume of valves, manifolds, and similar devices that may be located on hot water piping between the nearest heat source and the termination of the supply pipe at a fixture.
- Adds a sentence to allow calculation of the internal volume of plumbing appurtenances such as manifolds and pipe materials or dimensions that are not included in the table, with documentation satisfactory to the code official.

The initial purging of cooled-down hot water that is insufficiently hot for its intended purpose results in a waste of water, energy, and time for building occupants. Pipe insulation significantly reduces heat loss and helps to ensure that hot water gets to the user sooner. However, a complementary strategy is to reduce the volume of water contained in hot water piping in the first place.

A 2009 paper authored by Robert Hendron of the National Renewable Energy Laboratory[1] and others quantified the waste of hot water in initial draws waiting for water to reach 105ºF. Modeling the plumbing typical of a 3-bedroom, 2-bath, single-story home with a hot water distribution simulation tool found that an estimated 12 % of all hot water used on an annual basis is wasted. When viewed by fixture, the results are even more instructive:

- Showers – over 10 % wastage.
- Kitchen sinks – 18 % wastage.
- Lavatories – over 30 % wastage.

Purging at these fixtures is responsible for 95 % of the estimated total of nearly 3,000 gallons of hot water wastage annually. Of course, many new homes are built with more hot water outlets than this model's base case, and hot water distribution systems that are far less efficient. Nevertheless, this revision to RP97 will direct the attention of designers, installers, and code officials to the piping of fixtures that are responsible for most hot water waste.

The table in the proposal is simply a computational aid, to provide a handy, standardized reference for determining the volume of water per linear foot of pipe. The internal diameters of various types of piping material are different enough that including specific values for each type of pipe material is useful, helping designers find the desired combination of pipe length and permissible volume. Modifications to the table in this comment are simply to conform the Table to the values and materials already accepted for Table E202.1 in the IPC. Code officials we consulted viewed the table as helpful for inspection purposes as well.

The committee assumed, in its stated reason for disapproval, that this proposal would add construction costs. On the contrary, the hot water volume limit in the proposal can be achieved with attention to water heater placement and piping layout at the design stage, and need not require additional costs. The downsizing of pipe diameters and the substitution of piping materials with smaller internal diameters are additional strategies available to designers and installers. Reducing pipe length, reducing pipe diameter, and substituting composite piping material with smaller internal diameter each have the effect of reducing installation costs. And the designation of a recirculation system pipe as a heat source for purposes of calculating permissible hot water volume offers additional design flexibility for homes employing a recirculation system, an option often preferable to an additional water heater in a large home.

The IRC, as a minimum code, has a crucial role to play in curbing excessive waste of water and energy during the design and construction of new homes. An inefficient hot water distribution system is likely to remain in place for the life of the building, leaving owners without access to options that would have only been practical at the time of construction.

---

RP97-13

Final Action: AS AM AMPC____ D

RP98-13
P2904 (New), P2904.1 (New)

<u>Proposed Change as Submitted</u>

Proponent: Edward R. Osann, Natural Resources Defense Council, representing himself. (eosann@nrdc.org)

Add new text as follows:

<u>P2904</u>
<u>HOT WATER DISTRIBUTION SYSTEMS</u>

<u>**2904.1 Hot or tempered water supply to fixtures.** The developed length of hot water piping and tempered water piping from the end of a hot or tempered water *fixture supply* to the piping connection to a hot or tempered water source shall not exceed 50 feet (15 240 mm). The hot or tempered water source shall be a recirculating system pipe, a heat-traced pipe or a water heater.</u>

Reason: This proposal sets a maximum length of 50 feet for hot (or tempered) water supply piping running from a heat source to any fixture. The language the first sentence is identical to Section 607.2 of the International Plumbing Code, which typically applies to much larger buildings than one- and two-family homes. Excessively long hot water piping results in excessive amounts of cooled water that must be purged before use, especially for showers and wash basins. For example, 70 feet of ¾ inch pipe contains nearly 2 gallons of water. At an average shower flow rate of 2.2 gallons per minute, a shower served by such a long pipe run would be running for over 50 seconds just to purge cold water from the hot water supply line, plus the additional time needed to warm the pipe between the heat source and the shower – all water, energy, and time wasted. A 50 foot limit will encourage money-saving choices about the placement of water heaters and hot water outlets in the design of large homes. This provision makes sense in the IPC and will make sense in the IRC as well.

The last line of the section simply ensures that when either recirculating systems or heat-traced piping are present, they are to be considered sources of hot or tempered water.

Cost Impact: This code change proposal is a design requirement that will not increase the cost of construction.

P2904 (NEW) #2-RP-OSANN.DOC

<u>Committee Action Hearing Results</u>

Committee Action: **Disapproval**

Committee Reason: This proposal could require multiple water heaters and recirculation piping which would unnecessarily add to the cost of construction of a home.

Assembly Action: **None**

<u>Individual Consideration Agenda</u>

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Edward R. Osann, Natural Resources Defense Council on behalf of self (eosann@nrdc.org) Julius Ballanco, JB Engineering and Code Consulting, P.C (JBENGINEER@aol.com); Harry Misuriello, American Council for an Energy-Efficient Economy (misuriello@verizon.net) requests Approval as Submitted.

Commenter's Reason: The committee's stated reason for disapproval, that this proposal ***could*** [emphasis added] require multiple water heaters and recirculation piping, is speculation. The proposal sets a maximum length of 50 feet for hot (or tempered) water supply piping running from a hot water source to any fixture. This limit can be readily achieved with attention to water heater placement and piping layout at the design stage, and **does not require** multiple water heaters or recirculation piping. The designation of a recirculation system pipe as a hot water source for purposes of calculating the 50-foot length limit is to provide design flexibility, not to require the installation of a recirculation system. Indeed, the language in the first sentence – "The developed length of hot water piping and tempered water piping from the end of a hot or tempered water *fixture supply* to the piping connection to a hot or tempered water source shall not exceed 50 feet (15 240 mm)" is identical to Section 607.2 of the International Plumbing Code (IPC), which typically applies to much larger buildings than one- and two-family homes. There is no evidence that this requirement in the IPC has led to any increase in development costs. Indeed, commercial buildings routinely use 50 feet or less for hot (or tempered) water supply piping from a hot water source. If this limitation can work in commercial buildings, it can certainly work in a residential setting. This provision makes sense in the IPC and will make sense in the IRC as well.

Excessively long hot water piping results in excessive amounts of cooled water that must be purged before use, especially for showers and wash basins. For example, 70 feet of ¾ inch pipe contains nearly 2 gallons of water. If connected to a tub-shower combination with an average shower flow rate of 2.2 gallons per minute, a shower served by such a long pipe run would be running for over 50 seconds just to purge cold water from the hot water supply line, plus the additional time needed to warm the pipe between the heat source and the shower – all water, energy, and time wasted. A 50 foot limit will encourage money-saving choices about the placement of water heaters and hot water outlets in the design of large homes.

RP98-13

Final Action: AS AM AMPC____ D

RP105-13
Table P2905.4, P3004.3, Table P3302.1

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

TABLE P2905.4
WATER SERVICE PIPE

MATERIAL	STANDARD
~~Asbestos-cement pipe~~	~~ASTM C296~~

(Portions of table not shown are unchanged)

~~**P3003.4 Asbestos-cement.** Joints between asbestos-cement pipe or fittings shall be made with a sleeve coupling of the same composition as the pipe, sealed with an elastomeric ring conforming to ASTM D 1869.~~

TABLE P3302.1
SUBSOIL DRAIN PIPE

MATERIAL	STANDARD
~~Asbestos-cement pipe~~	~~ASTM C508~~

(Portions of table not shown are unchanged)

Reason: Asbestos cement pipe is no longer manufactured in North America. The potential health issues associated with asbestos make this piping material unsuitable for use. The material needs to be removed from the code. A similar proposal to the 2015 IPC was Approved as Submitted.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 58 on the PMGCAC IRC-P list.

Cost impact: The code change proposal will not increase the cost of construction.

P2905.4T #1-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Approve as Submitted**

Committee Reason: The material is no longer made in this country so there is no need to have it in the code.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Modified by this Public Comment.

Further modify proposal as follows:

TABLE P3002.1(2)
UNDERGROUND BUILDING DRAINAGE AND VENT PIPE

PIPE	STANDARD
~~Asbestos-cement pipe~~	~~ASTM C 428~~

TABLE P3002.2
BUILDING SEWER PIPE

MATERIAL	STANDARD
~~Asbestos-cement pipe~~	~~ASTM C 428~~

TABLE P3002.3
PIPE FITTINGS

PIPE MATERIAL	FITTING STANDARD
~~Asbestos cement~~	~~ASTM C 428~~

Commenter's Reason: We forgot to include the removal of asbestos-cement pipe from several tables in Chapter 30, Sanitary Drainage. This public comment corrects the oversight.

RP105-13
Final Action: AS AM AMPC____ D

RP114-13
P2905.14, Chapter 44

Proposed Change as Submitted

Proponent: Pennie L. Feehan, Pennie L. Feehan Consulting representing the Copper Development Association (penniefeehan@me.com)

Revise as follows:

P2905.14 Soldered and brazed joints. Soldered joints in copper and copper alloy tubing shall be made with fittings approved for water piping and shall conform to ASTM B 828. Surfaces to be soldered shall be cleaned bright. Fluxes for soldering shall be in accordance with ASTM B813 and shall become noncorrosive and non-toxic after soldering. Brazing fluxes shall be in accordance with AWS A5.31. ~~The joints shall be properly fluxed and made with approved solder.~~ Solders and fluxes used in potable water-supply systems shall have a lead content of not greater than 0.2 percent. ~~Fluxes shall conform to ASTM B 813.~~

Add standard to Chapter 44 as follows:

AWS
A5.31-2012 Specification for Fluxes for Brazing and Braze Welding

Reason: This proposal relocated existing sections, ensures copper and copper alloy systems are installed correctly and removes redundant language to aid the end user.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, ASME A112.18.8 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1 2013.

P2905.14-RP-FEEHAN.DOC

Committee Action Hearing Results

For staff analysis of the content of ASME A112.18.8 relative to CP#28, Section 3.6, please visit:
http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf

Committee Action: **Approved as Submitted**

Committee Reason: Potable water piping can no longer be soldered, it has to be brazed based on the fact the material is used and the heat required to join piping. The proposal addresses this and provides the standard in which to use it by. It also addresses non-toxic and non-corrosive soldering.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh, Arlington County, VA, representing VA Plumbing & Mechanical Inspectors Association (VPMIA) & VA Building Code Officials Association (VBCOA), requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

P2905.14 Soldered and brazed joints. Soldered joints in copper and copper alloy tubing shall be made with fittings approved for water piping and shall conform to ASTM B 828. Surfaces to be soldered shall be cleaned bright. Fluxes for soldering shall be in accordance with ASTM B813 ~~and shall become noncorrosive and non-toxic after soldering~~. Brazing fluxes shall be in accordance with AWS A5.31. The joints shall be properly fluxed and made with approved solder. Solders and fluxes used in potable water-supply systems shall have a lead content of not greater than 0.2 percent. Fluxes shall conform to ASTM B 813.

Commenter's Reason: ASTM B813 already requires fluxes to be non corrosive and non toxic after soldering. This additional language is not needed as how would an inspector verify this in the field?

RP114-13

Final Action: AS AM AMPC____ D

RP119-13
P2909 (New)

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Add new section and text as follows:

P2909
BRASS FITTINGS AND VALVES

P2909.1 Brass fittings and brass valves for plastic piping systems. Where used as components of plastic piping systems and where made from copper alloys, brass fittings and brass valves shall comply with NSF14.

Reason: Dezincification of yellow brass fittings and valves has become an expensive and widespread problem. In Las Vegas alone there are 32,000 houses that are being re-piped at a cost in excess of $300 million because of dezincification of brass fittings in PEX domestic water systems. Other parts of the country, e.g. southern California, Minnesota and Hawaii are also experiencing these failures. Failure of imported brass valves was experienced 20 years ago but corrective action taken at the time eliminated the problem. However, increasing use of imports by many companies and the deteriorating water quality in parts of the US has resulted in a 10 to 100-fold recurrence of this problem.

Since ASTM standards allow multiple copper alloys and the codes do not specifically define acceptable alloys for applications, some manufacturers choose an alloy based on cost. Brass valves and fittings made from these low-cost materials may be suitable for domestic water lines in Chicago, or drain lines, air lines or condenser water line in Las Vegas or San Diego but may fail in short order in a domestic water line in Las Vegas, San Diego or Honolulu and yet meet current codes.

This proposal provides a solution by clearly requiring compliance of all brass fittings and valves used in plastic piping systems to comply with the dezincification requirements of NSF 14. The dezincification test in NSF 14 has been accepted and used world-wide for over 30 years. The test is an effective, simple and inexpensive method for fitting and valve producers to sort corrosion-prone from corrosion-resistant alloys. Use of the dezincification performance standard in NSF 14 was developed and accepted by a broad base of fitting and valve producers and sellers. It provides a method to achieve the minimum material requirement necessary to prevent a repeat of the recent field failures that have resulted in class-action lawsuits.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 62 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: This code change proposal references NSF Standard 14, which is already referenced in the code. However, the proposed change to code text is written to correlate with a new edition of the standard NSF Standard 14-2010a, rather than the edition presently referenced in the code, which is the 2008e edition. The update to this standard will be considered by the Administrative Code Committee during the 2013 Code Development Cycle. Should this code change proposal be approved, but the update to the standard not be approved, the code text will revert to the text as it appears in the 2012 Edition of the Code.

P2909 #1 (NEW)-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Disapproval**

Committee Reason: The subject of the proposal is already covered by Section P2609.3. The cost implications could be huge.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Submitted.

Commenter's Reason: We believe that the issue of dezincification of brass components is a serious issue that the code needs to require that brass fittings be dezincification resistant.

Public Comment 2:

Pennie L. Feehan, Pennie L. Feehan Consulting representing Copper Development Association (penniefeehan@me.com) requests Approval as Modified by this Public Comment

Modify the proposal as follows:

P2909
~~BRASS~~ COPPER ALLOY FITTINGS AND VALVES

P2909.1 ~~Brass~~ Copper alloy fittings and ~~brass~~ copper alloy valves for plastic piping systems. Where used as components of plastic piping systems and where made from copper alloys, ~~brass~~ fittings and ~~brass~~ valves shall comply with NSF14.

Commenter's Reason: Changing brass to copper alloy is consistent with other approved proposals. Dezincification testing and certification requirements were added to NSF 14 for plastic piping systems. NSF 14 was changed to reflect these requirements as a result of widespread failure of brass fittings and a large number of law suits across the United States. This proposed change to the IRC is required to update the language in the code to be consistent with changes to NSF 14.

RP119-13
Final Action: AS AM AMPC____ D

RP141-13

P3010 (New), Chapter 44

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Add new text as follows:

SECTION P3010
REPLACEMENT OF UNDERGROUND SEWERS
BY PIPE BURSTING METHODS

P3010.1 General. This section shall govern the replacement of existing building sewer piping by pipe-bursting methods.

P3010.2 Applicability. The replacement of building sewer piping by pipe bursting methods shall be limited to gravity drainage piping of sizes 6 inches and smaller. The replacement piping shall be of the same nominal size as the existing piping.

P3010.3 Pre-installation inspection. The existing piping sections to be replaced shall be inspected internally by a recorded video camera survey. The survey shall include notations of the position of cleanouts and the depth of connections to the existing piping.

P3010.4 Pipe. The replacement piping shall be of extra high molecular weight PE3408 material and shall be manufactured with an SDR of 17 and in compliance with ASTM F 714.

P3010.5 Pipe fittings. Pipe fittings to be connected to the replacement piping shall be of extra high molecular weight PE3408 material and shall be manufactured with an SDR of 17 and in compliance with ASTM D2683.

P3010.6 Cleanouts. Where the existing building sewer did not have cleanouts meeting the requirements of this code, cleanout fittings shall be installed as required by this code.

P3010.7 Post-installation inspection. The completed replacement piping section shall be inspected internally by a recorded video camera survey. The video survey shall be reviewed and approved by the code official prior to pressure testing of the replacement piping system.

P3010.8 Pressure testing. The replacement piping system as well as the connections to the replacement piping shall be tested in accordance with Section P2503.4.

Add standards to Chapter 44 as follows:

ASTM F 714-06a Standard Specification for Polyethylene (PE) Plastic Pipe (SDR-PR) based on Outside Diameter.

D2683-04 Standard Specification for Polyethylene Fittings for Outside Diameter Controlled Polyethylene Pipe and Tubing.

Reason: The IRC lacks coverage concerning the replacement of sewer systems by pipe bursting methods. These methods are being widely used throughout the country. Proper guidance concerning this type of replacement provides additional value to the code. This proposal to the 2015 IPC was Approved as Modified by Public Comment.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of

referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 69 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will not increase the cost of construction.

P3010 (NEW)-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee agreed with the proponent's reason statement.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Shawn Strausbaugh of Arlington County Virginia representing the ICC PMG Code Action Committee requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

P3010.4 Pipe. The replacement piping shall be ~~of extra high molecular weight PE3408 and shall be~~ manufactured with an SDR of 17 and in compliance with ASTM F 714.

P3010.5 Pipe fittings. Pipe fittings to be connected to the replacement piping shall be ~~of extra high molecular weight PE3408 and shall be~~ manufactured with an SDR of 17 and in compliance with ASTM D2683.

Commenter's Reason: This proposal for the IPC was changed in the public comment period to remove the phrase "extra high molecular weight". We overlooked this in our original proposal and this public comment corrects this so that the IRC is coordinated with the IPC.

Public Comment 2:

Michael Cudahy of Plastic Pipe and Fitting Association (PPFA) representing the Plastic Pipe and Fitting Association (PPFA) (mikec@cmservnet.com) requests Approval as Modified by this Public Comment

Modify the proposal as follows:

P3010.4 Pipe. The replacement pip<u>e</u>~~ing~~ shall be ~~of extra high molecular weight~~ <u>made of a high density polyethylene (HDPE) that conforms to cell classification number</u> ~~PE3408~~ ~~material~~ <u>PE3608, PE4608 or PE4710 as indicated in ASTM F714.</u> <u>The pipe</u> ~~and~~ shall be manufactured with an SDR of 17 and in compliance with ASTM F 714.

P3010.5 Pipe fittings. Pipe fittings to be connected to the replacement piping shall be <u>made</u> of ~~extra high molecular weight~~ <u>a high density polyethylene (HDPE) that conforms to cell classification number</u> ~~PE3408~~ ~~material~~ <u>PE3608, PE4608 or PE4710 as indicated in ASTM F714. The pipe fittings</u> shall be manufactured with an SDR of 17 and in compliance with ASTM D2683.

Commenter's Reason: The section is a welcome addition to the code, but is in need of several updates to reflect current polyethylene nomenclature and materials.

The phrase "extra high molecular weight" has no meaning in this code, nor in the way the pipe resin is specified, and should be deleted. Changes to the methodology on how the classification numbers for polyethylene resin are specified have made the designation "PE3408" obsolete. Resins that could be used in this application include; PE3608, PE4608, and PE4710, which are the modern classification designations. SDR 17 pipe is the thinnest wall pipe that can be used.

Proposed Change as Submitted

Proponent: Ron George, Certified Plumbing Designer, President, Plumb-Tech Design & Consulting Services LLC. (Ron@Plumb-TechLLC.com)

Revise as follows:

P2704.1 General. Slip joints shall be made with an *approved* elastomeric gasket and shall be installed only on the inlet and outlet of an inline sanitary waste valve, a trap outlet, a trap inlet and within the trap seal. Fixtures with concealed slip-joint connections shall be provided with an access panel or utility space not less than 12 inches (305 mm) in its smallest dimension or other *approved* arrangement so as to provide access to the slip connections for inspection and repair.

P2717.2 Sink and dishwasher. A sink and dishwasher are permitted to discharge through a single 1-1/2 inch (38 mm) inline sanitary waste valve in accordance with Section P3201.6.1 or a trap. The discharge pipe from the dishwasher shall be increased to not less than 3/4 inch (19 mm) in diameter and shall be connected with a wye fitting to the sink tailpiece. The dishwasher waste line shall rise and be securely fastened to the underside of the counter before connecting to the sink tailpiece.

P2717.3 Sink, dishwasher and food grinder. The combined discharge from a sink, dishwasher, and waste grinder is permitted to discharge through a single 1-1/2 inch (38.1 mm) inline sanitary waste valve in accordance with Section P3201.6.1 or a trap. The discharge pipe from the dishwasher shall be increased to not less than 3/4 inch (19 mm) in diameter and shall connect with a wye fitting between the discharge of the food-waste grinder and the trap inlet, the inline sanitary waste valve or ~~to~~ the head of the food grinder. The dishwasher waste line shall rise and be securely fastened to the underside of the counter before connecting to the sink tail piece or the food grinder.

P3002.3.1 Drainage. Drainage fittings shall have a smooth interior waterway of the same diameter as the piping served. All fittings shall conform to the type of pipe used. Drainage fittings shall have no ledges, shoulders or reductions which can retard or obstruct drainage flow in the piping. Threaded drainage pipe fittings shall be of the recessed drainage type, black or galvanized. Drainage fittings shall be designed to maintain one-fourth unit vertical in 12 units horizontal (2-percent slope) grade. This section shall not be applicable to tubular waste fittings used to convey vertical flow upstream of an inline sanitary waste valve in accordance with Section P3201.6.1 or the trap seal liquid level of a fixture trap.

P3101.2.1 Venting required. Every *trap* and trapped fixture shall be vented in accordance with one of the venting methods specified in this chapter. Inline sanitary waste valves in accordance with Section P3201.6.1 shall not be required to be vented.

P3201.6 ~~Number of fixtures per~~ A trap or inline sanitary waste valve required for each fixture. Each plumbing fixture shall independently discharge to an inline sanitary waste valve in accordance with Section P3201.6.1 or to a *trap*.~~be separately trapped by a water seal trap.~~ The vertical distance from the fixture outlet to the *trap* weir shall not exceed 24 inches (610 mm) and the horizontal distance shall not exceed 30 inches (762 mm) measured from the center line of the fixture outlet to the centerline of the inlet of the *trap*. The height of a clothes washer standpipe above a *trap* shall conform to Section P2706.2. Fixtures shall not be double trapped.

Exceptions:

1. Fixtures that have integral traps.
2. A single trap shall be permitted to serve two or three like fixtures limited to kitchen sinks, laundry tubs and lavatories. Such fixtures shall be adjacent to each other and located in the same room with a continuous waste arrangement. The trap shall be installed at the center fixture where three fixtures are installed. Common trapped fixture outlets shall be not more than 30 inches (762 mm) apart.
3. Connection of a laundry tray waste line into a standpipe for the automatic clothes-washer drain shall be permitted in accordance with Section P2706.2.1.

P3201.6.1 Inline sanitary waste valves. Inline sanitary waste valves shall comply with ASME A112.18.8. Such valves shall be installed only on fixture outlets having 1-1/4 inch (31.8mm) or 1-1/2 inch (38.1 mm) outside diameter tubular waste piping. Valves conveying the waste from a food waste disposer shall be installed only in a vertical orientation. Such valves shall not be installed on the outlet of a urinal. The valves shall be installed in a vertical orientation or a horizontal orientation. Where installed in a horizontal orientation, the valve body shall be oriented with the ribs on the exterior of the valve body located on the bottom of the valve. The valves shall be *accessible*.

P3005.2.9 Cleanout size. Cleanouts shall be the same nominal size as the pipe they serve up to 4 inches (102 mm). For pipes larger than 4 inches (102 mm) nominal size, the size of the cleanout shall be not less than 4 inches (102 mm).

Exceptions:

1. Inline sanitary waste valves in accordance with Section P3201.6.1, "P" trap connections with slip joints or ground joint connections, or stack cleanouts that are not more than one pipe diameter smaller than the drain served, shall be permitted.
2. Cast-iron cleanouts sized in accordance with the referenced standards in Table P3002.3, ASTM A 74 for hub and spigot fittings or ASTM A 888 or CISPI 301 for hubless fittings.

P3005.2.10 Cleanout equivalent. An inline sanitary waste valve in accordance with Section P3201.6.1, a fixture trap or a fixture with integral trap, readily removable without disturbing concealed piping shall be acceptable as a cleanout equivalent.

P3102.1 Required vent extension. The vent system serving each *building drain* shall have at least one vent pipe that extends to the outdoors. Sanitary drainage systems that do not have traps and have only inline sanitary waste valves in accordance with Section P3201.6.1 shall be provided with at least one vent.

Add new standard to Chapter 44 as follows:

ASME
A112.18.8–2009 In-Line Sanitary Waste Valves for Plumbing Drainage

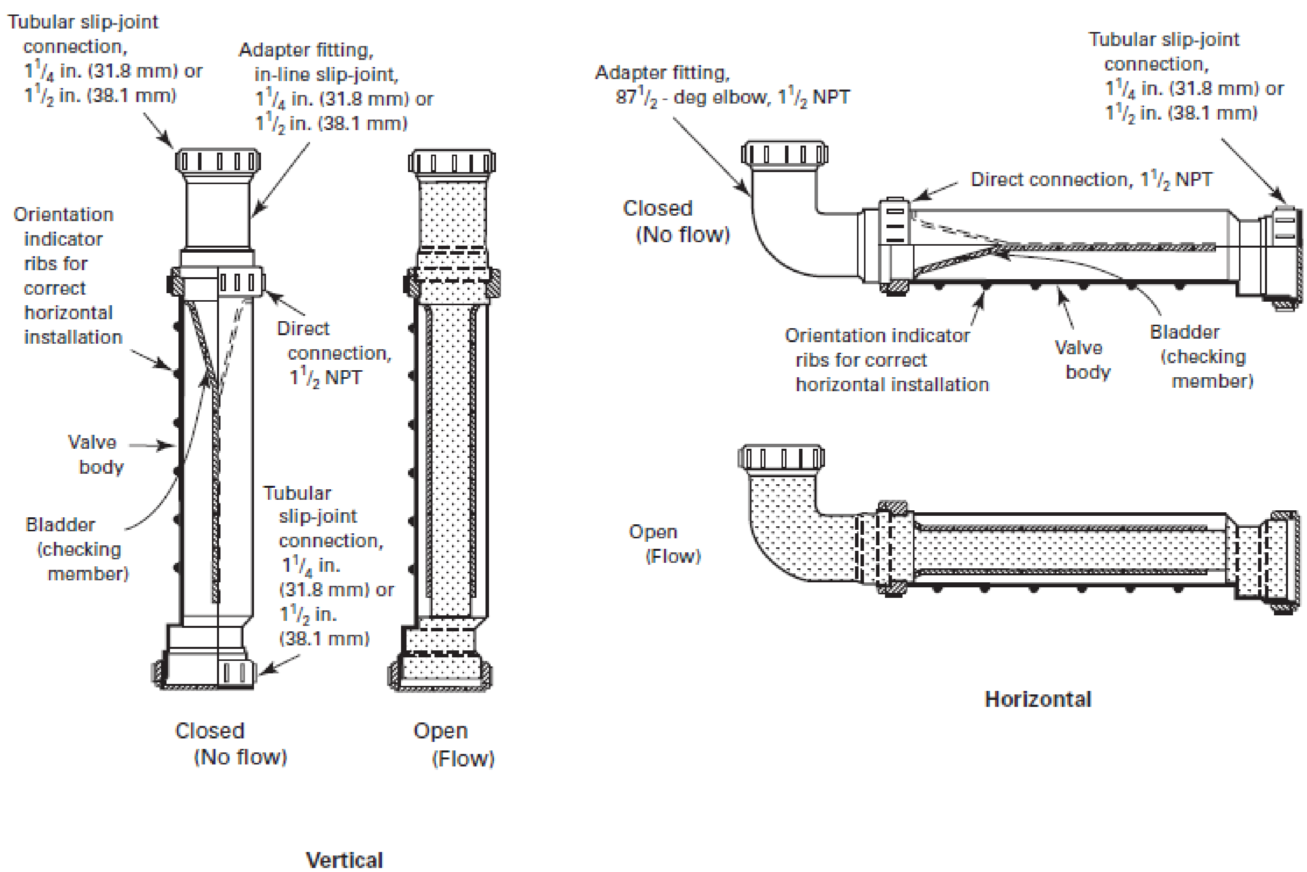
Reason: There is a new ASME standard ASME A112.18.8 that has been developed for sanitary waste valves and there are products that have been tested to meet or exceed the standard's requirements. Last year elastomeric trap seal protection devices were added to the IPC. This device is similar, but limited to tubular drains in lieu of a p-trap. It is not subject to floor wax and debris that a floor drain will receive. The key sections of this proposal are Section P3201.6 and new Section P3201.6.1 that add an alternative to liquid seal traps. All other sections being modified are in support of adding this alternative to the code. Inline sanitary waste valves can only be used on fixtures that have 1-1/4 inch or 1-1/2 inch OD tubular waste outlets from fixtures, so their application is generally limited to sinks, lavatories and bathtubs. The testing requirements of the standard for inline sanitary waste valves are stringent. In many applications, inline sanitary waste valves offer better, more reliable protection (against sewer gas coming out of a fixture) than a liquid seal trap.

In-Line sanitary waste valves now have an Industry standard ASME A112.18.8–2009 titled: "In-Line Sanitary Waste Valves for Plumbing Drainage". These devices have been tested and certified by third party testing labs and they have been proven over many years of use to provide a reliable gas-tight seal when used in lieu of a p-trap. They provide a seal which is not dependent on operating conditions and is not affected by evaporation or siphonage. These valves are mainly used in situations where sanitary fixtures see only occasional use, where freezing conditions, low humidity, persistent high temperature conditions, or where there are limited or confined space conditions. Examples include guest bathrooms, seasonal occupancy dwellings, manufactured housing and in remote cabins. Other common uses for this type of device are in Recreational Vehicles and boats for the freeze resistance and splash resistance. The performance requirements for the device are covered within the ASME A112.18.8 ANSI approved Standard, which includes a gas-tight seal test, flow rate test, long term cycling tests, a grease or lard test and many other chemical resistance and solids tests. These valves perform in a similar manner to a trap seal protection valve. Elastomeric type devices in the drainage system are already approved in the International Plumbing Code. In 2012 when the Trap Seal Protection Devices which comply with ASSE 1072 were approved for the 2015 International Plumbing Code at the final action hearings in Portland in 2012. These devices are very similar to trap seal protection valves except the ASME A112.18.8–2009 In-Line Sanitary Waste Valves for Plumbing Drainage limits their use to installations where a 1-1/4 inch or 1-1/2" tubular p-traps would normally be permitted. These devices are not intended for use on floor drains, water closets or similar fixtures.

The scope of the ASME A112.18.8 Standard establishes minimum requirements for materials in the construction of sanitary waste valves for use as an alternate to tubular p-traps, and prescribes minimum test requirements for the performance of the valve, together with methods of marking and identification. The ASME A112.18.8 Standard does not define the requirements for products to be used in urinals or water closets. It is not intended that products meeting this Standard will be used in a urinal or water closet.

ASME A112.18.8-2009

Fig. 1 Typical Cross-Section
(For Illustrative Purposes Only)



Testing includes the following tests:

3.1 Waterway Flow Rate
3.2 One-Way Sealing Performance of the Valve
3.3 Airway Flow Rate
3.4 Recovery From an Excess Back Pressure (Inversion) Condition
3.5 Leak Tightness
3.6 Thermal Cycling
3.7 Cyclic Fatigue
3.8 Resistance to Household Substances
3.9 Resistance to Chemicals and Solvents
3.10 Drop Test

3.11 Life Cycle

Section 4 of the Standard also covers Marking and Identification Instructions.

The valve shall be permanently and legibly marked with the following:

(a) manufacturer's name
(b) product name/brand name
(c) nominal size of inlet and outlet
(d) date of manufacture
(e) predominant material
(f) direction of flow indicator
(g) indication of the orientation of the installation of the device

4.2 Instructions

The manufacturer shall provide instructions on packaging or accompanying literature indicating, where appropriate, both of the following:

(a) the orientation of the installation of the device
(b) limitations on the use and type of drain-cleaning chemicals and tools

TECHNICAL DESIGN GUIDE

HepVO™

Sanitary Waste Valve

- A HYGIENIC ALTERNATIVE TO CONVENTIONAL TRAPS

HepVO is a self sealing valve designed to close the waste connection below a sanitary fixture to prevent the escape of foul sewer air into the dwelling.

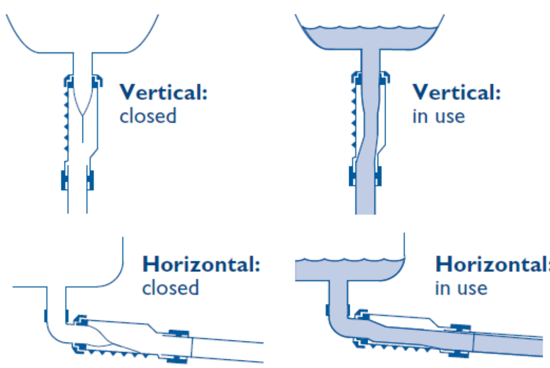
HepVO unlike conventional waste traps, does not rely on trapped water to create a seal. Water seals are prone to failure by Evaporation, Siphonage and other mechanisms. Instead, HepVO uses a self sealing membrane which performs the same function as a water seal trap but without the risk of depletion or freezing.

The HepVO Sanitary Waste Valve means enhanced plumbing design and system efficiency, without compromising performance or risking the escape of foul air into the living space from the drain or sewer.

HepVO - Operation

HepVO a Barrier between Living Space and the Drainage System.

Foul sewer gas must be prevented from entering the building. The loss of the water seal in a conventional trap can cause gurgling noises, objectionable smells, allow insect ingress, and has the potential to allow the spread of health hazards (such as SARS).



The HepVO Sanitary Waste Valve opens under the water pressure of a fixture emptying and closes to form a tight seal after the fixture has discharged.

HepVO - Product Features

- **Dry Seal Technology - cannot fail by evaporation or siphonage**
- **Admits Air - Auxiliary Venting Not Required**
- **One Way Valve - Prevents Foul Odors**

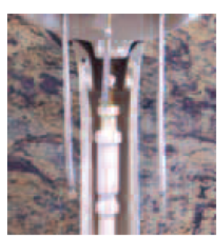
HepVO will out-perform a conventional trap by preventing the escape of foul air under excessive operating conditions up to 10 times greater than those normally experienced in a correctly designed Soil & Waste system. By comparison, conventional traps allow foul sewer air to bubble-through the seal at relatively low positive pressures.

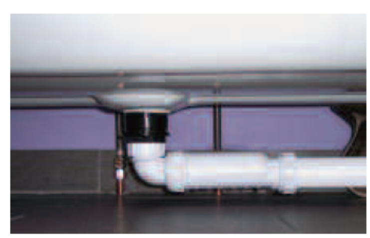
In addition because HepVO does not trap water that may contain food scraps or other waste, microbiological growth of a fungal, bacterial or viral nature is less likely.

HepVO - Applications

- Lavatories
- Bath Tubs
- Sink
- Bidet
- Washing Machine
- Garbage Disposal (Vertical Only)
- Urinal (Vertical Only)*
- Air Conditioning Condensate*
- Overflow
- Dishwasher
- Shower

* applications outside the scope of the ASME/ANSI A112.18.8 Standard and approval





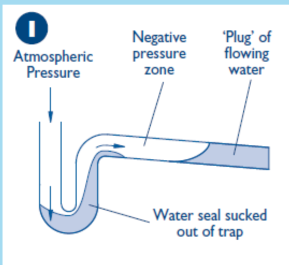
Minimizes the space required behind a lavatory or beneath a bath tub/shower tray.

HepvO - Design and Performance

The PROBLEM: Conventional waste traps work by having a water seal to prevent foul odors entering buildings. However a water trap can fail under a number of conditions.

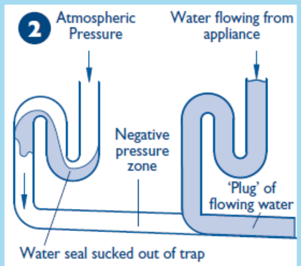
The following diagrams show several problems that result in loss of water seal, gurgling and foul smells.

Self Siphonage



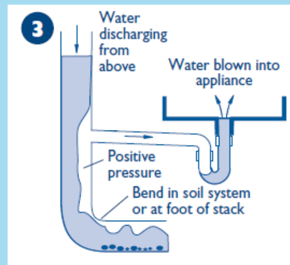
Self Siphonage: water flowing down the discharge pipe draws the water from the trap.

Induced Siphonage



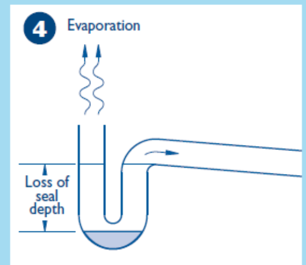
Induced Siphonage: the water seal is drawn out of the trap by water discharging from a fixture downstream (e.g. washing machine).

Compression



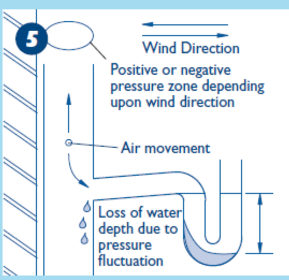
Compression: water is pushed out of the trap by a positive pressure caused by discharging of fixtures located above (e.g. WC).

Evaporation



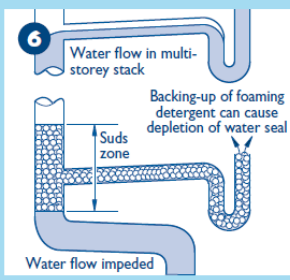
Evaporation: water in the trap evaporates during periods of non-use (e.g. during vacation or when fixtures are not being used).

Wind Effect (wavering out)



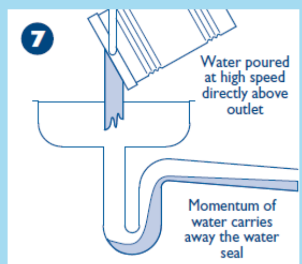
Wind Effect: air movement across the top of the Soil & Vent Pipe causes reciprocation of water in the trap and potential for loss of seal depth.

Foaming



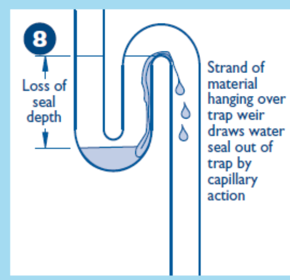
Foaming: agitation of waste water containing detergents in the Soil and Vent pipe creates foaming which pushes water out of the trap.

Momentum



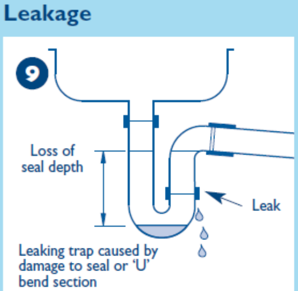
Momentum: waste water from a bowl or pail poured directly in to the waste outlet carries water out of the trap due to speed of discharge. This is also common with modern, funnel shaped basin designs.

Capillary Action



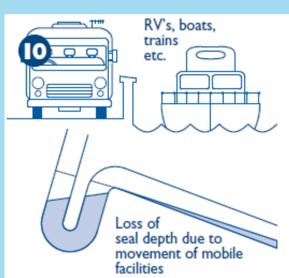
Capillary Action: fibrous material retained in the trap and hanging over the weir draws water out of the trap.

Leakage



Leakage: badly fitting or loose components and/or damaged seals can allow water to leak causing loss of seal depth.

Movement



Movement: In mobile facilities such as RV's and boats movement can cause potential for loss of water in the trap.

HepvO - The SOLUTION

When installed in accordance with manufacturer's instructions the unique HepvO Sanitary Waste Valve is the solution to all these problems.

HepvO provides a constant seal against sewer gas ingress, which is maintained under all normal operating conditions.

HepvO Sanitary Waste Valve actively eliminates negative pressure within the waste system by opening and allowing in fresh air until a state of equilibrium with atmosphere is reached.

HepvO Sanitary Waste Valve resists blockages, prevents nasty smells, gurgling sounds and stagnant water under all circumstances.

HepvO - Installation Benefits

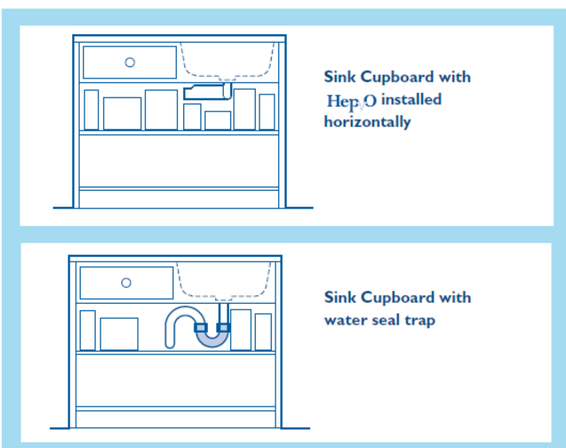
HepvO is a new concept in the prevention of foul air escaping into the building while actively eliminating negative pressure in soil and waste installations. It allows the designer greater flexibility on fixture and venting installation without compromising the performance of their sanitary seals.

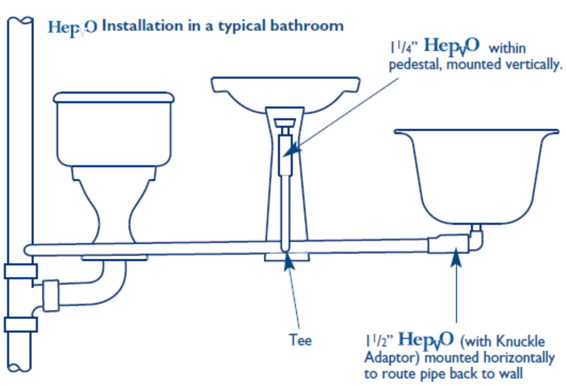
System Simplification - *Design Freedom and Economic Benefits*

Regulations for waste system design set limits on length and slope of pipes and the number of fixtures which can be connected to a waste pipe in order to keep pressure fluctuations to a minimum. This may be rectified by the incorporation of vent pipes at appropriate design locations.

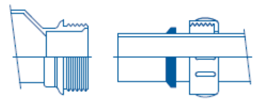
The incorporation of HepvO provides a good sanitary system offering minimum resistance to flow.

1. Compact design, flexibility of location and ability to actively eliminate negative pressure improves system performance.
2. A typical fixture will drain more quickly when a HepvO is installed compared to a p-trap installation. This helps keep downstream piping cleaner and reduces maintenance requirements.
3. There is no trap to vent distance limitations based on the slope of the pipe and the elevation of the vent connection.
4. Where necessary tight radius bends can be used, without fear of siphonage or compression.





HepvO - Installation & Maintenance



Capnut and sealing cone on pipe end ready for insertion of pipe into compression socket.

INSTALLATION

1. Cut the tube to length, allowing for the full compression socket depth, (preferably using an appropriate tube cutter).
2. If using plastic tube remove any loose material from the end. If using metallic tube remove any 'burr', and file if necessary to remove any external sharp edges. Mark the socket depth on the tube, and check that the tube section to be joined is free of any surface damage which may affect the joint seal.
3. Unscrew the cap from the outlet/inlet adaptor and slide the cap and rubber seal onto the tube.
4. Insert the tube end fully into the socket.
5. Slide the rubber seal and screwed cap up against the face of the socket, and tighten the cap by hand, (check that the cap is square to the body and does not 'cross-thread'), hand tight should be adequate to form a proper seal.
6. Threaded connections can be made to the inlet or outlet of the HepvO valve. At the outlet it is first necessary to remove the cap and rubber seal. If making connections to threaded components that do not have an integral seal (for example connection to DWV adaptors) PTFE/TEFLON tape should be applied to the thread prior to assembly.

MAINTENANCE

If mechanical devices such as spiral cables, rippers or water jetters are required to clear blockages in the waste system, the HepvO valve must be removed first.

It is good practice to rinse the HepvO valve with a little clean water before replacing it in the system.

Frequently Asked Questions

1 **Is HepvO used in addition to a conventional trap?**

NO, unlike other products which prevent foul odors entering the living space, HepvO is used instead of a conventional water-seal trap.

2 **Will I still need to install auxiliary venting on waste pipe branches?**

NO, HepvO acts as a highly effective local air admittance device, removing the need for secondary venting.

3 **Can I use acidic drain cleaning chemicals?**

YES, the HepvO valve is manufactured from a highly inert material and has passed extensive testing with a very wide range of chemicals including both acid and alkaline products.

4 **Do I still need to connect each fixture on its own dedicated waste branch?**

NO, HepvO prevents induced siphonage between adjacent fixture traps so it is now possible to make multiple connections on the same branch. This can save yards of tubing or piping and gives great flexibility for locating fixtures and designing waste systems.

5 **HepvO is a new product to me - how can I be confident that it will give a good installed performance?**

HepvO is new to the North American market but it is not a new product. It has been in volume production in the UK since 1997 and it is widely used in Europe, Australia and the Far East. It has attained numerous international approvals against very demanding standards and has achieved an enviable track record of trouble-free performance.

6 **Will HepvO promote better hygiene by stopping the escape of foul sewer air into habitable spaces?**

YES - The valve has been proven to perform under conditions in which traditional water seal traps are vulnerable to failure. It will continue to perform under back pressures 10 times greater than those experienced in correctly designed soil and waste systems.

7 **Does the air tight seal break down if a strand of cloth or hair collects in the strainer and falls down between the faces of the valve?**

NO - HepvO has undergone extensive foreign body testing (IAPMO IGC203-04). Tests show that the valve will maintain an air tight seal around an obstruction such as hair, fabric strands or spaghetti.

8 **What is the life expectancy of HepvO?**

Installed correctly HepvO can be expected to have a life expectancy at least equivalent to current water sealed traps. In addition HepvO is guaranteed against defects in materials or manufacturing for a period of 3 years.

9 **Will HepvO block easily for example if fat is discharged through it?**

NO - Extensive testing has shown that HepvO is less prone to blockage than traditional water seal traps. ***Note: because the 'straight through' design of HepvO does not trap debris discharged through the waste fixture care should be taken with jewelry and other valuables.***

10 **Will the seal be maintained even when the fixture hasn't been used for some time?**

YES - HepvO does not depend on a water seal and so it will continue to maintain a seal whether a fixture never gets used or is used very infrequently.

11 **Does the valve make a noise?**

Under normal conditions HepvO operates silently, unlike normal traps that are prone to 'gurgle'

12 **Will HepvO support microbiological growth?**

NO - The materials used to manufacture HepvO will not support microbiological growth for example mold and mildew.

HepvO/USA/11/12/3528

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, ASME A112.18.8 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

P3201.1-RP-GEORGE.doc

Committee Action Hearing Results

For staff analysis of the content of ASME A112.18.8 relative to CP#28, Section 3.6, please visit:
http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf

Committee Action: **Approved as Submitted**

Committee Reason: This proposal provides another option for a p-trap where conditions are not favorable for installation of a p-trap.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh, Arlington County, VA, representing VA Plumbing & Mechanical Inspectors Association (VPMIA) & VA Building Code Officials Association (VBCOA), requests Disapproval.

Commenter's Reason: The inline sanitary waste valve is a trap with moving parts which is prohibited by IRC section P3201.5. The proponent's reason statement compares this device to the trap seal protection device. These two devices are not the same and just because the trap seal protection device has been accepted into the 2015 IPC this does not mean these devices should also be accepted. The inline sanitary waste valve is the only means of preventing sewer gas from entering the structure as a trap seal protection device is secondary to the required trap. The trap seal protection device is intended to protect the trap seal from evaporation and not serve as the trap seal itself. The proponent also states that these devices have been proven over many years of use however the standard for these devices was only published in 2009.

RP149-13
Final Action: AS AM AMPC____ D

RP152-13
P3201.7, Table P3201.7

Proposed Change as Submitted

Proponent: David Hall CFM, Georgetown, Texas representing the ICC PMG Code Action Committee (Dave.Hall@georgetown.org)

Revise as follows:

P3201.7 Size of fixture traps. ~~Fixture~~ Trap sizes for plumbing fixtures shall be ~~sufficient to drain the fixture rapidly and~~ ~~not less than the size~~ as indicated in Table P3201.7. Where the tailpiece of a plumbing fixture is larger than that indicated in Table P3201.7, the trap size shall be the same nominal size as the fixture tailpiece. A trap shall not be larger than the drainage pipe into which the trap discharges.

TABLE P3201.7
REQUIRED SIZES OF TRAPS ~~AND TRAP ARMS~~ FOR PLUMBING FIXTURES

PLUMBING FIXTURE	REQUIRED TRAP SIZE ~~MINIMUM~~ (inches)
Lavatory	1 ¼ or 1 1/2
~~Water closet~~	~~Note a~~

~~Consult fixture standards for trap dimensions of specific bowls.~~

(Portions of table not shown remain unchanged)

Reason: "Sufficient to drain the fixture rapidly" is unenforceable language. The trap sizes in the table should not be minimum sizes but required sizes because too large of trap doesn't allow for proper scouring and cleaning action in the trap. The term "trap arm" is slang. As a water closet has an integral trap, it should not be listed in the table so footnote a was deleted.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the PMGCAC has held 2 open meetings, multiple conference calls and multiple workgroup calls which included members of the PMGCAC. Interested parties also participated in all of the meetings and conference calls to discuss and debate the proposed changes. For PMGCAC member reference, this was item no. 73 on the PMGCAC IRC-P list.

Cost Impact: The code change proposal will not increase the cost of construction.

P3201.7-RP-HALL-PMGCAC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The proposal provides necessary clarity for minimum trap size.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

David Beahm, Building Official Warren County Virginia, representing VA Plumbing & Mechanical Inspectors Association (VPMIA) and VA Building Code Officials Association (VBCOA) (dbeahm@warrencountyva.net) requests As Modified by this Public Comment.

Modify the proposal as follows:

TABLE P3201.7
REQUIRED SIZES OF TRAPS FOR PLUMBING FIXTURES

PLUMBING FIXTURE	**~~REQUIRED~~ TRAP SIZE <u>MINIMUM</u> (inches)**
Lavatory	1 ¼ ~~or 1 ½~~

Commenter's Reason: The code change proposal as approved by the committee would in fact, further confuse what is intended by this section and table. By adding the word "required" and removing the word "minimum" in the table indicates this is what is required, but which is required for a lavatory, 1 ¼ or 1 ½ or possibly something larger because the added language indicates that if the tail piece is larger, the trap must be the same nominal size. This single item would now require three different sizes for the trap. By removing the proposed table language "required" and leaving "minimum in addition to removing the new size for the lavatory trap of 1 ½ the unintended consequences would not require three different sizes.

RP152-13

Final Action: AS AM AMPC____ D

RP155-13
P2905.9.1.2

Proposed Change as Submitted

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C. representing self (JBEngineer@aol.com)

Revise as follows:

P2905.9.1.2 Solvent cementing. Joint surfaces shall be clean and free from moisture~~,~~. Joints shall be made in accordance with the pipe, fitting or solvent cement manufacturer's installation instructions. Where such instructions require a primer to be used, ~~and~~ an *approved* primer shall be applied,~~.~~ and a solvent cement, orange in color and conforming to ASTM F 493, shall be applied to joint surfaces. Where such instructions allow for a one step solvent cement, yellow or red in color and conforming to ASTM F 493, to be used, the joint surfaces shall not require application of a primer before the solvent cement is applied. The joint shall be made while the cement is wet, and in accordance with ASTM D 2846 or ASTM F 493. Solvent cement joints shall be permitted above or below ground.

~~**Exception:** A primer is not required where all of the following conditions apply:~~

~~1. The solvent cement used is third-party certified as conforming to ASTM F 493.~~
~~2. The solvent cement used is yellow in color.~~
~~3. The solvent cement is used only for joining ½ inch (12.7 mm) through 2 inch (51 mm) diameter CPVC pipe and fittings.~~
~~4. The CPVC pipe and fittings are manufactured in accordance with ASTM D 2846.~~

Reason: This section is currently very convoluted. The requirements can be simplified by referencing the pipe manufacturer's installation instructions. The installation instructions are part of the listing which is required by the code. This will also recognize changes to the listing of the joining method, rather than requiring constant changing of this section.

The current requirements are incorrect since UL lists ASTM F442 for joining with one-step solvent cement. Furthermore, UL lists the joining for pipe up to 3 inch in diameter. Neither requirement is addressed in the current code text. UL also requires the solvent cement to be red in color. Hence, when doing a multipurpose piping system, the CPVC solvent cement would have to be red in color.

Cost Impact: This change does not increase the cost of construction.

P2905.9.1.2-RP-BALLANCO.DOC

Committee Action Hearing Results

The code change is contained in the Updates to the 2013 Proposed Changes posted on the ICC website. Please go to http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf for more information.

Committee Action: **Approved as Submitted**

Committee Reason: The proposal makes a needed cleanup of the language and informs the installer that a primer is not needed for smaller pipe sizes.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh, Arlington County, VA, representing VA Plumbing & Mechanical Inspectors Association (VPMIA) & VA Building Code Officials Association (VBCOA), requests Disapproval.

Commenter's Reason: Based upon what was submitted as part of the original change the incorrect language is shown – The title of P2905.9.1.2 is CPVC plastic pipe. It is unclear if the intent was to change this language as it is not underlined or struck or if this was just an editorial omission. The proponents reason states ASTM F 442 is the joining method per a UL listing for one step solvent cementing however this standard is not included in the proposed change. Was it the intent of the proponent to input the ASTM F 442 standard into this revised section as it is stated that the UL lists ASTM F 442 as the joining method for one step solvent cement? Will this section of the code now conflict with the UL listing of a specific piping system?

RP155-13
Final Action: AS AM AMPC____ D

RP157-13
P3111.1

Proposed Change as Submitted

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C. representing self (JBEngineer@aol.com)

Revise as follows:

P3111.1 Type of fixtures. A combination waste and vent system shall not serve fixtures other than floor drains, sinks, and lavatories. ~~A combination waste and vent systems shall not receive the discharge of a food waste grinder.~~

Reason: There is no technical justification for prohibiting a food waste grinder from discharging to a combination waste and vent system. A food waste grinder does not change the pressure in the piping system any differently than a sink operating without a food waste grinder. The food waste grinder will not impact the performance of the combination waste and vent system. A video was made showing the discharge from a food waste grinder. The video of the clear pipe shows the flow from a food waste grinder as being the same as the flow from the sink without a food waste grinder. Unfortunately, there is a mistaken belief that the discharge from a food waste grinder is a pumped waste.

Cost Impact: This change does not increase the cost of construction.

P3111.1-RP-BALLANCO.DOC

Committee Action Hearing Results

The code change is contained in the Updates to the 2013 Proposed Changes posted on the ICC website. Please go to http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf for more information.

Committee Action: **Approved as Submitted**

Committee Reason: The proposal provides more flexibility for plumbing installations. The test results prove that the restriction against food waste disposers on combination waste and vent was not justified.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Shawn Strausbaugh, Arlington County, VA, representing VA Plumbing & Mechanical Inspectors Association (VPMIA) & VA Building Code Officials Association (VBCOA), requests Disapproval.

Commenter's Reason: The use of food waste grinder on a combination waste and vent system was not permitted due to the lower flow velocities of these system due to the piping being oversized and the fact that semi solid material will be introduced to this portion of the drainage system which could lead to a build up and possible reduction in the pipe size and venting capabilities of this sanitary drainage and vent system. The video viewed shows a brand new piping system which is does not replicate conditions of piping that may be encountered in existing structures or in structures that have been in use for a period of time. It is inherent that the inner pipe walls will accumulate materials over time and this is exacerbated due to the low flow velocities of the combination drain and vent system and if permitted the discharge of a food waste grinder will only make this situation worse.

RP157-13
Final Action: AS AM AMPC____ D

SP1-13
105.3

Proposed Change as Submitted

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals (jhatfield@apsp.org)

Revise as follows:

105.3 Construction documents. *Construction documents*, engineering calculations, diagrams and other such data shall be submitted in two or more sets with each application for a *permit*. The *code official* shall require construction documents, computations and specifications to be prepared and designed by a registered design professional when required by state law. *Construction documents* shall be drawn to scale and shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that the work conforms to the provisions of this code. <u>Manufacturer's instructions shall serve as *construction documents* for onground storable pools that are supplied by the manufacturer as a kit that includes all pipe, fittings and components.</u>

Reason: This change is necessary because construction documents for these types of pools are the instruction manuals themselves, there are not other type of *construction documents.* Therefore, if an onground storable pool is found to fall within the scope of this code, this change will provide that a construction document can consist of the instruction manuals for a fully self-contained on-ground storable pool.

Cost Impact: The code change proposal will not increase the cost of construction.

105.3-SP-HATFIELD.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposal was disapproved because it would limit the authority having jurisdiction from determining what constitutes acceptable construction documents for onground storable pools.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals requests Approval as Submitted.

Commenter's Reason: The public comment alleviates an unnecessary and potentially costly burden on homeowners who install onground storable pools sold as a complete kit. These pools include detailed manufacturer instructions as provided in APSP-4, which serve the same purpose as *construction documents* in ensuring safe and proper installation.

SP1-13
Final Action: AS AM AMPC____ D

SP3-13

Proposed Change as Submitted

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals (jhatfield@apsp.org)

Revise as follows:

AQUATIC VESSEL. A vessel, permanent or temporary, intended for swimming, bathing, or wading and that is designed and manufactured to be connected to a *circulation system*. ~~Portable vessels 12 inches (305 mm) or less in designed water depth which are drained and filled daily are not considered aquatic vessels.~~ For purposes of this code, the term is used to identify all the types of vessels governed by this code, including: swimming pools, aquatic facilities, *spas* and hot tubs, and related equipment. Such vessels are either used in a *residential* application or in a public application.

Reason: The sentence being removed is unnecessary and only adds confusion as it leads the reader to think that vessels over 12 inches in water depth are aquatic vessels. If an aquatic vessel has a circulation system, then it is an aquatic vessel, no matter what the depth is. Whereas there are, for example, 18 inch portable vessels that are drained and filled daily and do not have a circulation system.

Cost Impact: The code change proposal will not increase the cost of construction.

202-AQUATIC VESSEL #1-SP-HATFIELD.DOC

Committee Action Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The proposal was approved because the change makes an important clarification that the code only applies to pools and spas that have or are intended to have circulation systems.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals requests Disapproval.

Commenter's Reason: Although we are in agreement with the committee action for the original proposal, requesting disapproval because it may no longer be necessary if the public comment for SP 4 is approved.

SP3-13
Final Action: AS AM AMPC____ D

SP4-13
202

Proposed Change as Submitted

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals (jhatfield@apsp.org)

Revise as follows:

POOL AND SPA ~~**AQUATIC VESSEL.**~~ A vessel, permanent or temporary, intended for swimming, bathing, or wading and that is designed and manufactured to be connected to a *circulation system*. Portable vessels 12 inches (305 mm) or less in designed water depth which are drained and filled daily are not considered aquatic vessels. For purposes of this code, the term is used to identify all the types of vessels governed by this code, including: *swimming pools*, *onground storable pools*, *aquatic recreation facilities*, *spas* and hot tubs, and related equipment. Such vessels are either used in a *residential* application or in a *public* application.

Reason: This proposal is being submitted due to the comments received from various I-code participants/users: builders, building departments, and others in the audience at the most recent I-code hearings for group A. There is a view that the term "aquatic vessel" is misleading or just not a good term because they associate it with a boat, not a pool. This concern resulted in a code proposal for the IBC, to reference the ISPSC and the new term, to not be adopted. Therefore, this proposal is offering a possible solution, to simply provide the term "pool and spa" to incorporate all the different pools and spas that exist.

Cost Impact: The code change proposal will not increase the cost of construction.

202-AQUATIC VESSEL #2-SP-HATFIELD.DOC

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

POOL ~~**AND**~~ **OR SPA.** A vessel, permanent or temporary, intended for swimming, bathing, or wading and that is designed and manufactured to be connected to a *circulation system*. Portable vessels 12 inches (305 mm) or less in designed water depth which are drained and filled daily are not considered aquatic vessels. For purposes of this code, the term is used to identify all the types of vessels governed by this code, including: *swimming pools*, *onground storable pools*, *aquatic recreation facilities*, *spas* and hot tubs, and related equipment. Such vessels are either used in a *residential* application or in a *public* application.

Committee Reason: The term "and" was changed to "or" because pools and spas are different constructions. There is not a construction that is both. The overall reason for approving the proposal was that the term "aquatic vessel" is misleading. The code needs to refer to these constructions by the names that are commonly used in the industry.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals requests Approval as Modified by this Public Comment

Further modify the proposal as follows:

Revise text as follows:

~~**POOL OR SPA.** A vessel, permanent or temporary, intended for swimming, bathing, or wading and that is designed and manufactured to be connected to a *circulation system*. Portable vessels 12 inches (305 mm) or less in designed water depth which are drained and filled daily are not considered aquatic vessels. For purposes of this code, the term is used to identify all the types of vessels governed by this code, including: *swimming pools*, *onground storable pools*, *aquatic recreation facilities*, *spas* and hot tubs, and related equipment. Such vessels are either used in a *residential* application or in a *public* application.~~

101.2 Scope. The provisions of this code shall apply to the construction, alteration, movement, renovation, replacement, repair and maintenance of ~~*aquatic vessels*~~ *aquatic recreation facilities*, *pools* and *spas*, The pools and spas covered by this code are either permanent or temporary, and shall be only those that are designed and manufactured to be connected to a *circulation system* and that are intended for swimming, bathing, or wading.

102.6 Moved ~~aquatic vessels~~ pools and spas. Except as determined by Section 102.2, systems that are a part of ~~*aquatic vessels*~~ *pools* or *spas* or systems moved into or within the *jurisdiction* shall comply with the provisions of this code for new installations.

BACKWASH CYCLE. The time required to *backwash* the filter medium and/or elements and to remove debris in the *pool* or *spa* *filter* ~~vessel~~.

BARRIER. A permanent fence, wall, building wall, or combination thereof that completely surrounds the ~~aquatic vessels~~ *pool* or *spa* and obstructs the access to the ~~vessel~~ *pool* or *spa*. Permanent shall mean "not being able to be removed, lifted, or relocated without the use of a tool."

EXERCISE SPA (Also known as a swim spa). Variants of a *spa* in which the design and construction includes specific features and equipment to produce a water flow intended to allow recreational physical activity including, but not limited to, swimming in place. Exercise *spas* can include peripheral jetted seats intended for water therapy, heater, circulation and *filtration* system, or can be a separate distinct portion of a combination spa/exercise spa and can have separate controls. These ~~aquatic vessels~~ *spas* are of a design and size such that it has an unobstructed volume of water large enough to allow the 99th Percentile Man as specified in APSP 16 to swim or exercise in place.

NONENTRY AREA. An area of the deck from which entry into the ~~vessel~~ *pool* or *spa* is not permitted.

~~SWIMMING~~ POOL. See "*public swimming pool*" and "*residential swimming pool*."

301.1 Scope. The provisions of this chapter shall govern the general design and construction of *public* and *residential* ~~*aquatic vessels*~~ *pools* and *spas* and all related piping, equipment, and materials. Provisions that are unique to a specific type of ~~*aquatic vessels*~~ *pool* or *spa* are located in Chapters 4 through 10.

304.2.1 ~~Aquatic vessels~~ Pools and spas located in designated floodways. Where ~~*aquatic vessels*~~ *pools* and *spas* are located in designated floodways, documentation shall be submitted to the *code official* that demonstrates that the construction of the ~~*aquatic vessel*~~ *pools* or *spas* will not increase the design flood elevation at any point within the jurisdiction.

304.2.2 ~~Aquatic vessels~~ Pools and spas located where floodways have not been designated. Where ~~*aquatic vessels*~~ *pools* or *spas* are located where design flood elevations are specified but floodways have not been designated, the applicant shall provide a floodway analysis that demonstrates that the proposed ~~*aquatic vessel*~~ *pools* or *spas* and any associated grading and filling, will not increase the design flood elevation more than 1 foot (305 mm) at any point within the jurisdiction.

305.1 General. The provisions of this section shall apply to the design of *barriers* for ~~*aquatic vessels*~~ *pools* and *spas*. These design controls are intended to provide protection against the potential drowning and near drowning by restricting access to such ~~vessels~~ *pools* or *spas*. These requirements provide an integrated level of protection against potential drowning through the use of physical barriers and warning devices.

Exceptions:

1. *Spas* and hot tubs with a lockable safety cover that complies with ASTM F 1346.
2. Swimming pools with a *powered safety cover* that complies with ASTM F 1346.

305.2.1 Barrier height and clearances. Barrier heights and clearances shall be in accordance with all of the following:

1. The top of the *barrier* shall be not less than 48 inches (1219 mm) above grade where measured on the side of the *barrier* that faces away from the ~~*aquatic vessel*~~ *pool* or *spa*. Such height shall exist around the entire perimeter of the ~~*vessel*~~ *pool* or *spa* and for a distance of 3 feet (914 mm) where measured horizontally from the required *barrier*.
2. The vertical clearance between grade and the bottom of the *barrier* shall not exceed 2 inches (51 mm) for grade surfaces that are not solid, such as grass or gravel, where measured on the side of the barrier that faces away from the ~~*vessel*~~ *pool* or *spa*.
3. The vertical clearance between a surface below the barrier to a solid surface, such as concrete, and the bottom of the required *barrier* shall not exceed 4 inches (102 mm) where measured on the side of the required barrier that faces away from the ~~*vessel*~~ *pool* or *spa*.
4. Where the top of the ~~*vessel*~~ *pool* or *spa* structure is above grade, the *barrier* shall be installed on grade or shall be mounted on top of the ~~*vessel*~~ *pool* or *spa* structure. Where the *barrier* is mounted on the top of the ~~*vessel*~~ *pool* or *spa*, the vertical clearance between the top of the ~~*vessel*~~ *pool* or *spa* and the bottom of the *barrier* shall not exceed 4 inches (102 mm).

305.3 Gates. Access gates shall comply with the requirements of Sections 305.3.1 through 305.3.3 and shall be equipped to accommodate a locking device. Pedestrian access gates shall open outward away from the ~~*vessel*~~ *pool* or *spa* and shall be self-closing and have a self-latching device.

305.3.3 Latches. Where the release mechanism of the self-latching device is located less than 54 inches (1372 mm) from grade, the release mechanism shall be located on the ~~*vessel*~~ *pool* or *spa* side of the gate at least 3 inches (76 mm) below the top of the gate, and the gate and *barrier* shall not have openings greater than $^1/_2$ inch (12.7 mm) within 18 inches (457 mm) of the release mechanism.

305.6 Natural barriers. In the case where the ~~*vessel*~~ *pool* or *spa* area abuts the edge of a lake or other natural body of water, public access is not permitted or allowed along the shoreline, and required *barriers* extend to and beyond the water's edge a minimum of 18 inches (457 mm), a *barrier* is not required between the natural body of water shoreline and the ~~*vessel*~~ *pool* or *spa*.

307.7 Colors and finishes. The colors, patterns, or finishes of the ~~*vessel*~~ *pool* or *spa* interior shall not obscure objects or surfaces within the ~~*vessel*~~ *pool* or *spa*.

Exception: *Residential pools* and *spas*.

307.8 Roofs or canopies. Roofs or canopies over ~~*aquatic vessels*~~ *pools* and *spas* shall be in accordance with the *International Building Code* or *International Residential Code*, as applicable in accordance with Section 102.7.1 and shall be constructed so as to prevent water runoff into the ~~*aquatic vessel*~~ *pool* or *spa*.

307.9 Accessibility. An accessible route to the public ~~*aquatic vessels*~~ *pool* or *spa* shall be provided in accordance with the *International Building Code*. Accessibility within the public ~~*aquatic vessels*~~ *pool* or *spa* shall be provided as required by the accessible recreational facilities provisions of the *International Building Code.* Accessibility for ~~*aquatic vessels*~~ *pools* and *spas* accessory to detached one- and two-family dwellings and townhouses not more than three stories in height shall be provided where required by the *International Residential Code*.

319.2 Chemical feeders. Where installed, chemical feed systems shall be installed in accordance with the manufacturer's specifications. Chemical feed pumps shall be wired so that they cannot operate unless there is adequate return flow to disburse the chemical throughout the ~~*vessel*~~ *pool* or *spa* as designed.

321.1 General. The provisions of Sections 321.2 and 321.3 apply to lighting for public ~~*aquatic vessels*~~ *pools* and *spas*. The provisions of Section 321.4 shall apply to *lighting* for *residential* ~~*aquatic vessels*~~ *pools* or *spas*.

608.1 Occupant load. The occupant load for the ~~*aquatic vessels*~~ *pools* or *spas* in the facility shall be calculated in accordance with Table 608.1. The occupant load shall be the combined total of the number of users based on the ~~*vessel*~~ *pool* or *spa* water surface area and the deck area surrounding the ~~*vessel*~~ *pool* or *spa*. The deck area occupant load shall be based on the occupant load calculated where a deck is provided or based on an assumed 4-foot-wide (1219 mm) deck surrounding the entire perimeter of the ~~*vessel*~~ *pool* or *spa*, whichever is greater.

610.6 Swimouts. *Swimouts* shall be located completely outside of the water current or wave action of the ~~*aquatic vessel*~~ *pool* or *spa* and can be located in shallow or deep areas of water.

801.1 Scope. The provisions of this chapter shall govern permanent inground *residential swimming pools* that are installed for *residential* use. This chapter covers new construction, modification or *repair* ~~and *residential aquatic vessels*~~.

Throughout the following sections of the code, replace the term "*aquatic vessel(s)*" with "*pool(s)* or *spa(s)*":

102.2
102.4
102.5
104.2
105.1
107.3
107.4
107.6
107.7.2
108.2.1
Section 202, under the following defined terms: "alteration","existing aquatic vessel", "repair"
305.2.5
305.2.10
305.4
305.7
308.3
309.1
311.2.1
311.4
311.9

313.7
322.1
323.1
409.2.2

Throughout the following sections of the code, replace the term "*aquatic vessel(s)*" with "*pool(s)* and *spa(s)*":

101.3
102.3
106.3
302.2
302.5
302.6
302.8
304.1
304.2
304.3

315.4
316.1
316.4.2
317.1
319.1
607.1
608.2

Commenter's Reason: Even though the committee approved changing 'aquatic vessel' to 'pool or spa', it is still essential that the term 'aquatic vessel' be replaced in the remaining chapters to 'pool or spa' each of the many times it appears. That is why numerous sections are addressed in this single Public Comment. Otherwise there would be wide spread confusion in the pool industry and inspectors will have a difficult time enforcing the code. Therefore, we cannot afford to disapprove this proposal because we must eliminate 'aquatic vessel.' The committee was in agreement with that. This public comment provides for the complete path to properly eliminate the 'aquatic vessel' term and to ensure that the more common term, "pool or spa" or "pool and spa" or just "spa" is inserted as appropriate throughout the code. The definition "pool or spa" is deleted because what is defined has either been moved to the scope section of the code or already exists within definitions that already exist in Chapter 2, i.e. "pool," "residential swimming pool," "public swimming pool," "spa," and "aquatic recreation facility."

Final Action: AS AM AMPC____ D

SP12-13
202, 405.1

Proposed Change as Submitted

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals (jhatfield@apsp.org)

Revise as follows:

PUBLIC POOL. …..

CLASS A, COMPETITION POOL. A pool intended for use for accredited competitive aquatic events such as Federation Internationale De Natation (FINA), USA Swimming, USA Diving, USA Synchronized Swimming, USA Water Polo, National Collegiate Athletic Association(NCAA), National Federation of State High School Associations(NFHS). ~~The use of the~~ <u>Such</u> pool<u>s</u> <u>are often used</u> for <u>recreation and other water activities</u> in addition to ~~is not limited to~~ competitive events.

CLASS B, PUBLIC POOL. A pool intended for public recreational use <u>that is not identified in the other classifications of public pools.</u>

<u>**CLASS F.** Class F pools are wading pools and are covered within the scope of this code as set forth in Section 405.</u>

405.1 Wading pools. *<u>Class F</u>* wading pools shall be separate pools with an independent *circulation system* and shall be physically separated from the main pool. <u>Such</u> wading pools shall be constructed in accordance with Sections 405.2 through 405.6.

Reason: : A definition of wading pool was missing from the current ISPSC edition and this terminology follows the APSP-1 standard re-write on defining a wading pool as CLASS F and referencing the section of the standard that provides the specific requirements for the wading pool. Also updated CLASS A and CLASS B, per the APSP-1 rewrite.

Cost Impact: The code change proposal will not increase the cost of construction

202-PUBLIC SWIMMING POOL-SP-HATFIELD

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The last sentence for Class A, competition pool contains the word “often”. Those pools might not ever be used for recreation and other water activities.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals requests Approval as Modified by this Public Comment.

Modify proposal as follows:

PUBLIC POOL. …..

> **CLASS A, COMPETITION POOL.** A pool intended for use for accredited competitive aquatic events such as Federation Internationale De Natation (FINA), USA Swimming, USA Diving, USA Synchronized Swimming, USA Water Polo, National Collegiate Athletic Association (NCAA), National Federation of State High School Associations (NFHS). ~~Such pools are often used for recreation and other water activities and in addition to competitive events.~~

405.1 Wading pools. *Class F* wading pools shall be separate pools with an independent *circulation system*, ~~and~~ shall be physically separated from the main pool, and~~. Wading pools~~ shall be constructed in accordance with Sections 405.2 through 405.6.

Commenter's Reason: The committee disapproved this code change due to wording within the original proposal that included "such" and "often," which was deemed by the committee as poor code language. The public comment removes that language and retains the intent of the original proposal. The last line in the Class A definition is not needed because it is commentary.

SP12-13

Final Action: AS AM AMPC____ D

SP13-13
202

Proposed Change as Submitted

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals (jhatfield@apsp.org)

Revise as follows:

SAFETY COVER. ~~A *barrier* intended to be completely removed before entry of users for swimming pools, *spas*, hot tubs or wading pools, attendant appurtenances and/or anchoring mechanisms that will, when properly labeled, installed, used, and maintained in accordance with the manufacturer's' published instructions These *covers* are either a power or manual type.~~ A structure, fabric or assembly, along with attendant appurtenances and anchoring mechanisms, that is temporarily placed or installed over an entire pool, spa or hot tub and secured in place after all bathers are absent from the water. A safety cover is intended to be completely removed before users enter the pool, spa or hot tub. A safety cover is not complete unless the placement, installation, securing and maintenance of such covers is in accordance with the manufacturer's instructions. The primary purpose for installation of a safety cover is to inhibit access to the contained body of water by children under five years of age so as to reduce the risk of drowning. Safety covers are designed to limit the amount of water, such as from rainwater and snowmelt, that could collect on the surface of the cover so as to reduce the risk of children drowning in the collected water. Such covers are either a power type or a manual type.

Reason: Currently does not follow the ASTM F 1346 cover standard definition (see Section 3.1.17) for safety cover and as currently written the sentence does not make sense. The changes above align with the ASTM standard and address the concern that the term "labeled" would be confused with "*listed* and *labeled*".

Cost Impact: The code change proposal will not increase the cost of construction.

202-SAFETY COVER-SP-HATFIELD.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The definition is much too long. The first sentence says what needs to be said for this term. The remainder of the wording should be, if necessary, put into the body of the code. Definitions need to be short and concise.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

SAFETY COVER. A structure, fabric or assembly, along with attendant appurtenances and anchoring mechanisms, that is temporarily placed or installed over an entire pool, spa or hot tub and secured in place after all bathers are absent from the water. ~~A safety cover is intended to be completely removed before users enter the pool, spa or hot tub. A safety cover is not complete unless the placement, installation, securing and maintenance of such covers is in accordance with the manufacturer's instructions. The primary purpose for installation of a safety cover is to inhibit access to the contained body of water by children under five years of~~

~~age so as to reduce the risk of drowning. Safety covers are designed to limit the amount of water, such as from rainwater and snowmelt, that could collect on the surface of the cover so as to reduce the risk of children drowning in the collected water.~~ Such covers are either a power type or a manual type.

Commenter's Reason: The public comment addresses the committee's reason for disapproval, which was that the definition was too long. The wording that remains will provide the aim of the original proposal, which was to ensure consistency with the ASTM F 1346, 1991 edition, of the cover standard manufacturers must follow.

SP13-13
Final Action: AS AM AMPC____ D

SP19-13, Part I
303.1

Proposed Change as Submitted

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals (jhatfield@apsp.org)

THIS IS A 3 PART CODE CHANGE. PART I WILL BE HEARD BY THE ISPSC COMMITTEE, Part II WILL BE HEARD BY THE IECC-CE COMMITTEE, PART III WILL BE HEARD BY THE IECC-RE COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - ISPSC

Revise as follows:

303.1 ~~General~~ Pool and spa energy consumption. The energy consumption of ~~requirements for~~ pools and ~~inground permanently~~ ~~installed~~ *permanent residential spas* shall be controlled by the requirements ~~as specified~~ in Sections 303.~~2~~ 1.1 through 303.1.4. ~~and APSP 15. The energy requirements for residential portable electric spas shall be in accordance with APSP 14.~~

303.1.1 Residential pools and permanent residential spas. *Residential swimming pools* and *permanent residential spas* shall be in accordance with APSP-15.

303.1.2 Heaters. The electric power to heaters shall be ~~equipped~~ ~~with~~ controlled by ~~an~~ readily accessible ~~external~~ on-off switch that is mounted on the exterior of the heater or external to and within 3 feet (914 mm) of the heater. Operation of such switch shall not change the setting of the heater thermostat. Such switches shall be in addition to a circuit breaker for the power to the heater. ~~to allow the heater to be shutoff without adjusting the thermostat setting.~~ ~~Such switch shall be provided with ready access~~. Gas-fired heaters shall not be equipped with ~~continuous pilot burners~~ continuously-burning ignition pilots.

> ~~**Exception:** Portable residential spas and portable residential exercise spas.~~

303.1.3 Time switches. Time switches or other control methods that can automatically turn off and on heaters and pump~~s~~ motors according to a preset schedule shall be installed ~~with~~ for ~~on~~ ~~all~~ heaters and pump motors. Heaters and~~,~~ pump~~s and~~ motors that have built-in timer~~s~~ switches shall be ~~deemed~~ in compliance with this section ~~requirement~~.

Exceptions:

1. Where public health standards require 24-hour pump operation.
2. Pumps that operate solar- or waste-heat recovery pool heating systems.
3. ~~Portable residential spas and portable residential exercise spas.~~

303.1.4 Covers. Outdoor heated pools and outdoor ~~inground permanently-installed~~ *permanent residential spas* shall be provided with a vapor retardant cover, a liquid cover or other *approved* vapor retardant means in accordance with 104.11.

> **Exception:** Where more than 70 percent of the energy for heating, computed over an operating season, is from site-recovered energy such as from a heat pump or solar energy source, covers or other vapor retardant means shall not be required.

303.2 Portable residential spas. The energy consumption of electric-powered *portable residential spas* shall be controlled by the requirements of APSP 14.

Reason:
PART I: This code change provides for the following:

1. All parts work to provide consistent language with pool and spa energy provisions found in the ISPSC and IECC. Some portions have been added here that were already included in the ISPSC and vice versa on part II and III of this proposal below.
2. Clarifies APSP-15 only applies to residential pools and inground spas.
3. Changes wording to use defined terms, as found in Chapter 2 of the ISPSC.
4. Clarifications regarding on-off switches for heaters.
6. Consistent verbiage within the time switch requirements.
7. Provides for clarity that the cover requirements are only for outdoor pools.
8. Provides for options when it comes to pool and spa covers to ensure one can comply with more intricately designed pools and spas (shape, size/infinity pools/etc.). Otherwise if only one type of method can be used then the code is limiting the design of any pool or spa. The "typical" rectangle pool is no longer the norm.

Cost impact: These code change proposals will not increase the cost of construction.

Analysis: Standards APSP 14 and APSP-15 are in the 2012 ISPSC.

303.1-SP-HATFIELD.DOC

Committee Action Hearing Results

The code change is contained in the Updates to the 2013 Proposed Changes posted on the ICC website. Please go to http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf for more information.

PART I – ISPSC

Heard by the ISPSC Committee

Committee Action: Disapproved

Committee Reason: The proposal was disapproved because it does not give credit to heaters that have on-off switches integral to the product. Shutting off power to some controls might cause the control to revert back to factory settings. Covers are only required for outdoor pools and spas. Indoor pools and spas should also have covers. Liquid covers are relatively new but there are no standards for this type of product. A standard for this product should be available before it is required by the code.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

303.1 Energy consumption of pools and permanent spas. The energy consumption of pools and *permanent ~~residential~~ spas* shall be controlled by the requirements in Sections 303.1.1 through 303.1.~~4~~3.

~~**303.1.1 Residential pools and permanent residential spas.** *Residential swimming pools* and *permanent residential spas* shall be in accordance with APSP-15.~~

303.1.~~2~~1 Heaters. The electric power to heaters shall be controlled by a readily accessible on-off switch that is an integral part of the heater, mounted on the exterior of the heater or external to and within 3 feet (914 mm) of the heater. Operation of such switch shall not change the setting of the heater thermostat. Such switches shall be in addition to a circuit breaker for the power to the heater. Gas-fired heaters shall not be equipped with continuously-burning ignition pilots.

303.1.~~3~~2 Time switches. Time switches or other control methods that can automatically turn off and on heaters and pump motors according to a preset schedule shall be installed for heaters and pump motors. Heaters and pump motors that have built-in timer switches shall be deemed in compliance with this section.

Exceptions:

1. Where public health standards require 24-hour pump operation.
2. Pumps that operate solar- or waste-heat recovery pool heating systems.

303.1.~~4~~3 Covers. Outdoor heated pools and outdoor *permanent ~~residential~~ spas* shall be provided with a vapor retardant cover~~, a liquid cover~~ or other *approved* vapor retardant means in accordance with Section 104.11.

Exception: Where more than 70 percent of the energy for heating, computed over an operating season, is from site-recovered energy such as from a heat pump or solar energy source, covers or other vapor retardant means shall not be required.

303.2 Portable ~~residential~~ spas. The energy consumption of electric-powered *portable ~~residential~~ spas* shall be controlled by the requirements of APSP 14.

303.3 Residential pools and permanent residential spas. The energy consumption of *residential swimming pools* and *permanent residential spas* shall be controlled in accordance with the requirements of APSP 15.

Commenter's Reason: As it stands now there are inconsistent energy efficiency requirements between the IECC and ISPSC, which is why this three part public comment is essential to ensure that these codes are consistent with ANSI approved APSP Standards. Otherwise code officials, owners, manufacturers and installers will be faced with conflicting and possibly incompatible language. The public comment addresses the ISPSC committee's concerns, some of which was addressed in the IECC parts of the proposal in Dallas by floor modification after the input received by the ISPSC committee under Part I. This public comment implements those IECC changes to the ISPSC (Part I) portion of the proposal, but makes further clarifications to all parts to ensure the two I-codes have consistent energy efficient requirements for pools and spas.

Specifically in regards to Part I of the proposal, the public comment addresses the ISPSC committees reason for disapproval by a) adding in the integral on and off switches for heaters (already done in the IECC), b) removing the specific reference to a liquid cover, and allowing the AHJ to determine what other "approved vapor retardant means" can be used consistent with Chapter 1 (already done in the IECC), and 3) clarifying which provisions apply to public as opposed to residential *pools or permanent spas or portable spas.* This last aspect is critical to ensure it is only residential pools and spas that must meet the APSP Standard, as intended by the Standard, and the remaining portions are for both public and residential.

Part II of the proposal simply modifies the committee action by correcting a section reference. Part III of the proposal clarifies what provisions apply to public versus residential *pools as opposed to permanent spas or portable spas* – ensuring consistency between the respective Codes and the APSP Standard, following the proposed modifications under Part I.

SP19-13, Part I

Final Action: AS AM AMPC____ D

SP19-13, Part II
IECC C404.7, C404.7.1, C404.7.2, C404.7.3, C404.8, Chapter 5

Proposed Change as Submitted

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals (jhatfield@apsp.org)

THIS IS A 3 PART CODE CHANGE. PART I WILL BE HEARD BY THE ISPSC COMMITTEE, Part II WILL BE HEARD BY THE IECC-CE COMMITTEE, PART III WILL BE HEARD BY THE IECC-RE COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART II - IECC-COMMERCIAL PROVISIONS

Revise as follows:

C404.7 Pools and spa energy consumption ~~inground permanently installed spas.~~ (Mandatory). ~~Pools and inground permanently installed spas shall comply with Sections C404.7.1 through C404.7.3.~~ The energy consumption of pools and ~~inground~~ permanent residential spas shall be controlled by the requirements in Sections C404.7.1 through C404.7.4.

C404.7.1 Heaters. The electric power to ~~all~~ heaters shall be ~~equipped~~ ~~with~~ controlled by a~~n~~ readily accessible ~~external~~ on-off switch that is mounted on the exterior of the heater or external to and within 3 feet (914 mm) of the heater. Operation of such switch shall not change the setting of the heater thermostat. Such switches shall be in addition to a circuit breaker for the power to the heater. ~~to allow the heater to be shutoff without adjusting the thermostat setting.~~ ~~Such switch shall be provided with ready access~~. Gas-fired heaters shall not be equipped with ~~continuous pilot burners~~ continuously-burning ignition pilots.

> ~~**Exception:** Portable residential spas and portable residential exercise spas.~~

C404.7.2 Time switches. Time switches or other control methods that can automatically turn off and on heaters and pump motors according to a preset schedule shall be installed ~~with~~ for ~~on~~ ~~all~~ heaters and pump motors. Heaters and~~,~~ pump~~s and~~ motors that have built-in time~~rs~~ switches shall be ~~deemed~~ in compliance with this section ~~requirement~~.

Exceptions:

1. Where public health standards require 24-hour pump operation.
2. ~~Where~~ Pumps that ~~are required to~~ operate solar- and waste-heat-recovery pool heating systems.

C404.7.3 Covers. Outdoor heated pools and outdoor ~~inground permanently-installed~~ permanent residential spas shall be provided with a vapor retardant cover, a liquid cover or other *approved* vapor retardant means.

> **Exception:** ~~A vapor-retardant cover is not required for pools deriving over 70 percent of the energy for heating from site-recovered energy, such as a heat pump or solar energy source computed over an operating season.~~ Where more than 70 percent of the energy for heating, computed over an operating season, is from site-recovered energy such as from a heat pump or solar energy source, covers or other vapor retardant means shall not be required.

C404.8 Portable residential spas (Mandatory). The energy consumption of electric-powered portable residential spas shall be controlled by the requirements of APSP 14.

Add new standard to Chapter 5:

The Association of Pool & Spa Professionals
2111 Eisenhower Avenue
Alexandria, VA 22314

APSP

14-11 American National Standard for Portable Electric Spa Efficiency

Reason:

PART II Reason: This code change provides for the following:

1. All parts work to provide consistent language with pool and spa energy provisions found in the ISPSC and IECC. Some portions have been added here that were already included in the ISPSC and vice versa on part II and III of this proposal below.
2. Changes wording to use defined terms, as found in Chapter 2 of the ISPSC.
3. Clarifications regarding on-off switches for heaters.
4. Consistent verbiage within the time switch requirements.
5. Provides for clarity that the cover requirements are only for outdoor pools.
6. Provides for options when it comes to pool and spa covers to ensure one can comply with more intricately designed pools and spas (shape, size/infinity pools/etc.). Otherwise if only one type of method can be used then the code is limiting the design of any pool or spa. The "typical" rectangle pool is no longer the norm.
7. Provides for a new subsection to address portable residential spas in the rare case they would be used for more than a four story building and therefore fall under the commercial code.

Cost impact: These code change proposals will not increase the cost of construction.

Analysis: Standards APSP 14 and APSP-15 are in the 2012 ISPSC.

303.1-SP-HATFIELD.DOC

Committee Action Hearing Results

The code change is contained in the Updates to the 2013 Proposed Changes posted on the ICC website. Please go to http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf for more information.

PART II – IECC - Commercial

Heard by the IECC-Commercial Provisions Committee

Committee Action: Approved as Modified

Modify the proposal as follows:

C404.7 Pools and permanent spa energy consumption (Mandatory). The energy consumption of pools and permanent ~~residential~~ spas shall be controlled by the requirements in Sections C404.7.1 through C404.7.4.

C404.7.1 Heaters. The electric power to heaters shall be controlled by a readily accessible on-off switch that is an integral part of the heater, mounted on the exterior of the heater or external to and within 3 feet (914 mm) of the heater. Operation of such switch shall not change the setting of the heater thermostat. Such switches shall be in addition to a circuit breaker for the power to the heater. Gas-fired heaters shall not be equipped with continuously-burning ignition pilots.

C404.7.2 Time switches. Time switches or other control methods that can automatically turn off and on heaters and pump motors according to a preset schedule shall be installed for heaters and pump motors. Heaters and pump motors that have built-in time switches shall be in compliance with this section.

Exceptions:

1. Where public health standards require 24-hour pump operation.
2. Pumps that operate solar- and waste-heat-recovery pool heating systems.

C404.7.3 Covers. Outdoor heated pools and outdoor permanent ~~residential~~ spas shall be provided with a vapor retardant cover~~, a liquid cover~~ or other *approved* vapor retardant means.

Exception: Where more than 70 percent of the energy for heating, computed over an operating season, is from site-recovered energy such as from a heat pump or solar energy source, covers or other vapor retardant means shall not be required.
C404.8 Portable ~~residential~~ spas (Mandatory). The energy consumption of electric-powered portable ~~residential~~ spas shall be controlled by the requirements of APSP 14.

Committee Reason: The reason for making the modification is that this limits the energy requirements to permanent spas only. The reason for approving the overall proposal is that the proposal coordinates the energy requirements between the IECC and the ISPSC.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

C404.7 Energy consumption of pools and permanent spas (Mandatory). The energy consumption of pools and permanent spas shall be controlled by the requirements in Sections C404.7.1 through C404.7.~~4~~3.

Commenter's Reason: This public comment simply modifies the committee action by fixing a section reference. There is not a Section C404.7.4.

Public Comment 2:

Edward R. Osann, Natural Resources Defense Council on behalf of self (eosann@nrdc.org) requests Approval as Modified by this Public Comment

Further modify the proposal as follows:

C404.7.3 Covers. ~~Outdoor~~ Heated pools and outdoor permanent spas shall be provided with a vapor retardant cover or other *approved* vapor retardant means.

Exception: Where more than 70 percent of the energy for heating, computed over an operating season, is from site-recovered energy such as from a heat pump or solar energy source, covers or other vapor retardant means shall not be required.

Commenter's Reason: Without explanation or justification, the proposal as submitted would weaken current code language by removing the requirement that a pool cover be provided for all heated pools, whether located indoors or out. There is important value provided by a cover for an indoor pool, including humidity management, which has important energy implications. The modification in this comment would restore the current requirement that new heated indoor pools be provided with a vapor retardant cover.

Proposed Change as Submitted

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals (jhatfield@apsp.org)

THIS IS A 3 PART CODE CHANGE. PART I WILL BE HEARD BY THE ISPSC COMMITTEE, Part II WILL BE HEARD BY THE IECC-CE COMMITTEE, PART III WILL BE HEARD BY THE IECC-RE COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Part III - IECC-Residential Provisions

Revise as follows:

.

R403.9 (N1104.9) Pools and spa energy consumption ~~inground permanently installed spas.~~ (Mandatory). ~~Pools and inground permanently installed spas shall comply with Sections R403.9.1 through R403.9.3.~~ The energy consumption of pools and ~~inground~~ permanent residential spas shall be controlled by the requirements in Sections R403.9.1 through R403.9.4.

R403.9.1 Residential pools and permanent residential spas. Swimming pools and permanent spas that are accessory to detached one- and two- family dwellings and townhouses 3 stories or less in height above ground plane and that are available only to the household and its guests shall be in accordance with APSP-15.

R403.9.2 (N1104.9.2) Heaters. The electric power to heaters shall be ~~equipped~~ ~~with~~ controlled by ~~an~~ readily accessible ~~external~~ on-off switch that is mounted on the exterior of the heater or external to and within 3 feet (914 mm) of the heater. Operation of such switch shall not change the setting of the heater thermostat. Such switches shall be in addition to a circuit breaker for the power to the heater. ~~to allow the heater to be shutoff without adjusting the thermostat setting. Such switch shall be provided with ready access~~. Gas-fired heaters shall not be equipped with ~~continuous pilot burners~~ continuously-burning ignition pilots.

R403.9.3 (N1104.9.3) Time switches. Time switches or other control methods that can automatically turn off and on heaters and pump motors according to a preset schedule shall be installed ~~with~~ for ~~on all~~ heaters and pump motors. Heaters and~~,~~ pump~~s and~~ motors that have built-in tim~~ers~~ switches shall be ~~deemed~~ in compliance with this section ~~requirement~~.

Exceptions:

1. Where public health standards require 24-hour pump operation.
2. ~~Where~~ Pumps that ~~are required to~~ operate solar- and waste-heat-recovery pool heating systems.

R403.9.4 (N1104.9.4) Covers. Outdoor heated pools and outdoor ~~inground permanently-installed~~ permanent residential spas shall be provided with a vapor retardant cover, a liquid cover or other *approved* vapor retardant means.

Exception: ~~A vapor-retardant cover is not required for pools deriving over 70 percent of the energy for heating from site-recovered energy, such as a heat pump or solar energy source computed over an operating season.~~ Where more than 70 percent of the energy for heating, computed over an operating season, is from site-recovered energy such as from a heat pump or solar energy source, covers or other vapor retardant means shall not be required.

R403.10 (N1103.10) Portable residential spas (Mandatory). The energy consumption of electric-powered portable residential spas shall be controlled by the requirements of APSP 14.

Add new standards to Chapter 5 (IRC Chapter 44):

The Association of Pool & Spa Professionals
2111 Eisenhower Avenue
Alexandria, VA 22314

APSP

14-11 American National Standard for Portable Electric Spa Efficiency

15-11 American National Standard for Residential Swimming Pool and Spa Energy Efficiency

Reason:

PART III Reason: This code change provides for the following:

1. All parts work to provide consistent language with pool and spa energy provisions found in the ISPSC and IECC. Some portions have been added here that were already included in the ISPSC and vice versa on part II and III of this proposal below.
2. Clarifies APSP-15 only applies to residential pools and inground spas.
3. Changes wording to use defined terms, as found in Chapter 2 of the ISPSC.
4. Clarifications regarding on-off switches for heaters.
5. Consistent verbiage within the time switch requirements.
6. Provides for clarity that the cover requirements are only for outdoor pools.
7. Provides for options when it comes to pool and spa covers to ensure one can comply with more intricately designed pools and spas (shape, size/infinity pools/etc.). Otherwise if only one type of method can be used then the code is limiting the design of any pool or spa. The "typical" rectangle pool is no longer the norm.
8. Provides for a new subsection to address portable residential spas, requiring their compliance with the APSP-14 energy standard, consistent with the ISPSC.

Cost impact: These code change proposals will not increase the cost of construction.

Analysis: Standards APSP 14 and APSP-15 are in the 2012 ISPSC.

303.1-SP-HATFIELD.DOC

Committee Action Hearing Results

The code change is contained in the Updates to the 2013 Proposed Changes posted on the ICC website. Please go to http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/00-CompleteGroupB-MonographUpdates.pdf for more information.

PART III – IECC – Residential

Heard by the IECC-Residential Provisions Committee

Committee Action: Approved as Modified

Modify the proposal as follows:

R403.9 (N1104.9) Pools and permanent spa energy consumption (Mandatory). The energy consumption of pools and permanent residential spas shall be controlled by the requirements in Sections R403.9.1 through R403.~~9.4~~ 9.3.

> **Exception:** ~~**R403.9.1 Residential pools and permanent residential spas.**~~ Heaters and time switches for swimming pools and permanent spas that are accessory to detached one- and two- family dwellings and townhouses 3 stories or less in height above ground plane and that are available only to the household and its guests shall be in accordance with APSP-15.

R403.9.~~2~~ 1 (N1104.9.~~2~~ 1) Heaters. The electric power to heaters shall be controlled by a readily accessible on-off switch that is an integral part of the heater, mounted on the exterior of the heater or external to and within 3 feet (914 mm) of the heater. Operation of such switch shall not change the setting of the heater thermostat. Such switches shall be in addition to a circuit breaker for the power to the heater. Gas-fired heaters shall not be equipped with continuously-burning ignition pilots.

R403.9.~~3~~ 2 (N1104.9. ~~3~~ 2) Time switches. Time switches or other control methods that can automatically turn off and on heaters and pump motors according to a preset schedule shall be installed for ~~on~~ ~~all~~ heaters and pump motors. Heaters and~~,~~ pump~~s and~~ motors that have built-in time switches shall be in compliance with this section.

Exceptions:

1. Where public health standards require 24-hour pump operation.
2. Pumps that operate solar- and waste-heat-recovery pool heating systems.

R403.~~9.4~~ 9.3 (N1104. ~~9.4~~ 9.3) Covers. Outdoor heated pools and outdoor ~~permanent~~ residential spas shall be provided with a vapor retardant cover~~, a liquid cover~~ or other *approved* vapor retardant means.

Exception: Where more than 70 percent of the energy for heating, computed over an operating season, is from site-recovered energy such as from a heat pump or solar energy source, covers or other vapor retardant means shall not be required

Committee Reason: For the modification, the committee agreed with the testimony from the proponent of floor modification that heaters and time switches for pools and spas accessory to IRC-type buildings do not need to comply with the same, more stringent, requirements for commercial applications. For the overall proposal, the committee agreed with the proponent's reason statement.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

R403.9 (N1104.9)) Pools and permanent spa energy consumption (Mandatory). The energy consumption of pools and permanent ~~residential~~ spas shall be controlled by the requirements in Sections R403.9.1 through R403.9.3.

~~**Exception:** Heaters and time switches for swimming pools and permanent spas that are accessory to detached one- and two-family dwellings and townhouses 3 stories or less in height above ground plane and that are available only to the household and its guests shall be in accordance with APSP-15.~~

R403.9.3 (N1104.9.3) Covers. Outdoor heated pools and outdoor permanent ~~residential~~ spas shall be provided with a vapor retardant cover or other *approved* vapor retardant means.

Exception: Where more than 70 percent of the energy for heating, computed over an operating season, is from site-recovered energy such as from a heat pump or solar energy source, covers or other vapor retardant means shall not be required

R403.10 (N110~~3~~4.10) Portable ~~residential~~ spas (Mandatory). The energy consumption of electric-powered portable ~~residential~~ spas shall be controlled by the requirements of APSP 14.

R403.11 (N1104.11) Residential pools and permanent residential spas. Residential swimming pools and permanent residential spas that are accessory to detached one- and two- family dwellings and townhouses 3 stories or less in height above grade plane and that are available only to the household and its guests shall be in accordance with APSP-15.

Commenter's Reason: This public comment simply clarifies what provisions apply to public versus residential pools as opposed to permanent spas or portable spas, also ensuring consistency between the respective codes.

Public Comment 2:

Edward R. Osann, Natural Resources Defense Council on behalf of self (eosann@nrdc.org) requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

R403.9.3 (N1104.9.3) Covers. ~~Outdoor~~ Heated pools and outdoor residential spas shall be provided with a vapor retardant cover or other *approved* vapor retardant means.

> **Exception:** Where more than 70 percent of the energy for heating, computed over an operating season, is from site-recovered energy such as from a heat pump or solar energy source, covers or other vapor retardant means shall not be required

Commenter's Reason: Without explanation or justification, the proposal as submitted would weaken current code language by removing the requirement that a pool cover be provided for all heated pools, whether located indoors or out. There is important value provided by a cover for an indoor pool, including humidity management, which has important energy implications. The modification in this comment would restore the current requirement that new heated indoor pools be provided with a vapor retardant cover.

SP19-13, Part III

Final Action: AS AM AMPC____ D

SP26-13
305.4

Proposed Change as Submitted

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals (jhatfield@apsp.org)

Revise as follows:

305.4 Structure wall as a barrier. Where a wall of a dwelling or structure serves as part of the *barrier*~~,~~ and where any doors ~~and~~ or operable windows in the wall have ~~with a~~ sill heights of less than 48 inches (1219 mm) above the indoor floor ~~that~~ and where any of those doors or windows provide direct access to the *aquatic vessel* through the wall, ~~shall be equipped with~~ one ~~or more~~ of the following shall be required:

1. The doors and operable windows having a sill height of less than 48 inches (1219 mm) above the indoor floor shall have an alarm that produces an audible warning when the door, ~~or~~ window or their ~~its~~ screens ~~or window, is~~ are opened. The alarm shall be *listed* and *labeled* as a water hazard entrance alarm in accordance with UL 2017. In dwellings or structures not required to be Accessible units, Type A units or Type B units, alarm ~~the~~ deactivation switches shall be located 54 inches (1372 mm) or more above the threshold of the door. In dwellings or structures required to be Accessible units, Type A units or Type B units, alarm ~~the~~ deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1219 mm) above the threshold of the door.
2. A safety cover that is *listed* and *labeled* in accordance with ASTM F 1346 is provided for the aquatic vessel.
3. An *approved* means of protection, such as self-closing doors with self-latching devices is provided. Such means of protection shall provide ~~that the~~ a degree of protection ~~afforded~~ that is not less than the protection afforded by Item~~s~~ 1 or 2.

Reason: How the charging paragraph originally was written, it did not make sense that doors and windows would be equipped with a safety cover, the proposed language clarifies what was the original intention

Cost Impact: The code change proposal will not increase the cost of construction.

305.4-SP-HATFIELD.DOC

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

305.4 Structure wall as a barrier. Where a wall of a dwelling or structure serves as part of the *barrier*~~,~~ and where any doors or operable windows in the wall have sill heights of less than 48 inches (1219 mm) above the indoor floor and where any of those doors or windows provide direct access to the *aquatic vessel* through the wall, one of the following shall be required:

1. The doors and operable windows having a sill height of less than 48 inches (1219 mm) above the indoor floor shall have an alarm that produces an audible warning when the door, window or their screens are opened. The alarm shall be *listed* and *labeled* as a water hazard entrance alarm in accordance with UL 2017. In dwellings or structures not required to be Accessible units, Type A units or Type B units, alarm deactivation switches shall be located 54 inches (1372 mm) or more above the threshold of the door. In dwellings or structures required to be Accessible units, Type A units or Type B units, alarm deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1219 mm) above the threshold of the door.
2. A safety cover that is *listed* and *labeled* in accordance with ASTM F 1346 is ~~provided~~ installed on ~~for~~ the aquatic vessel.
3. An *approved* means of protection, such as self-closing doors with self-latching devices is provided. Such means of protection shall provide a degree of protection that is not less than the protection afforded by Item~~s~~ 1 or 2.

Committee Reason: The reason for the modification is so the inspector can see that the cover fits properly at the time of inspection. The remainder of the proposal provides a necessary clarification that doors and windows do not require safety covers.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee (cbaldassarra@RJAGroup.com) and Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals (jhatfield@apsp.org) request Approval as Modified by this Public Comment

Further modify the proposal as follows:

305.4 Structure wall as a barrier. Where a wall of a dwelling or structure serves as part of the *barrier* ~~and where any doors or operable windows in the wall have sill heights of less than 48 inches (1219 mm) above the indoor floor~~ and where ~~any of those~~ doors or windows provide direct access to the *aquatic vessel* through ~~the~~ that wall, one of the following shall be required:

1. ~~The doors and~~ Operable windows having a sill height of less than 48 inches (1219 mm) above the indoor finished floor and doors shall have an alarm that produces an audible warning when the ~~door,~~ window, door or their screens are opened. The alarm shall be *listed* and *labeled* as a water hazard entrance alarm in accordance with UL 2017. In dwellings or structures not required to be Accessible units, Type A units or Type B units, the operable parts of the alarm deactivation switches shall be located 54 inches (1372 mm) or more above the ~~threshold of the door~~ finished floor. In dwellings or structures required to be Accessible units, Type A units or Type B units, the operable parts of the alarm deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1219 mm) above the ~~threshold of the door~~ finished floor.
2. A safety cover that is *listed* and *labeled* in accordance with ASTM F 1346 is installed for the aquatic vessel.
3. An *approved* means of protection, such as self-closing doors with self-latching devices is provided. Such means of protection shall provide a degree of protection that is not less than the protection afforded by Item 1 or 2.

Commenter's Reason: The original proposal added the window sill height requirements to Item 1, therefore it no longer needs to be in the main paragraph. This clarifies the intent and application – which was the intent of the original proposal.

The language in Item 1 uses qualifier for doors and windows without consideration of what may not apply to both elements. One of our concerns it that this language could cause a misunderstanding regarding allowable door threshold height; thus the reordering of windows and doors. This makes it clear that the 48 inch sill is only associated with the window. The threshold of the door does not provide a location to measure for the windows. IBC Section 1008.1.9.2 uses 'finished floor', which would be an appropriate reference point for doors and windows. The reach concern is to the operable parts on the device, not the entire device. This is especially relevant for the Accessible, Type A and Type B units.

While not included in this proposal, since it is outside of the scope of the change, the language regarding height limits within Accessible, Type A and Type B units should also be in Section 305.3.3 for gates. See IBC Sections 1008.1.9.2 and 3109.4.7 for gate and door criteria. All three sections should be coordinated next round to include gates, doors and windows.

This proposal is being co-sponsored by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/CTC/Pages/default.aspx. Since its inception in April/2005, the CTC has held twenty five meetings - all open to the public.

Final Action: AS AM AMPC____ D

SP33-13
307.4, Table 307.4 (New), 502.1, Table 502.1

Proposed Change as Submitted

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals (jhatfield@apsp.org)

Revise as follows:

307.4 Materials and structural design. ~~The structural design of~~ *Aquatic vessels* shall conform to one or more of the standards indicated in Table 307.4. The structural design of aquatic vessels shall be in accordance with the *International Building Code* or *International Residential Code*, as applicable in accordance with Section 102.7.1 of this code.

TABLE 307.4
RESERVOIRS AND SHELLS

MATERIAL	STANDARD
Dry shotcrete	ACI 304.2, ACI 308, ACI 318, ACI 506.2
Fiberglass reinforced plastic	ANSI Z124.7
Plastic	ANSI Z124.7
Poured-in-Place Concrete	ACI 318
Stainless steel (type 316, 316L, 304, 304L)	ASTM A 240
Tile	ASC A108/A118/A136.1
Vinyl	ASTM D 1593
Wet Shotcrete	ACI 306, ACI 305, ACI 308, ACI 318, ACI 506.2

Delete without substitution as follows:

~~**502.1 Reservoirs and shells.** *Spa* and *exercise spa* reservoirs shall conform to one or more of the standards listed in Table 502.1.~~

~~**TABLE 502.1**~~
~~**RESERVOIRS AND SHELLS**~~

~~MATERIAL~~	~~STANDARD~~
~~Dry Shotcrete~~	~~ACI 304.2, ACI 308, ACI 506.2~~
~~Fiberglass Reinforced Plastic~~	~~ANSI Z124.7~~
~~Plastic~~	~~ANSI Z124.7~~
~~Poured-in-Place Concrete~~	~~ACI 318~~
~~Stainless Steel (Type 316, 316L, 304, 304L)~~	~~ASTM A 240~~
~~Tile~~	~~ASC A108/A118/A136.1~~
~~Vinyl~~	~~ASTM D 1593~~
Wet Shotcrete	ACI 306, ACI 305, ACI 308, ACI 506.2

Reason: It appears this table and requirement provided for in Section 502.1 for public spas and exercise spas was not provided for when addressing all other aquatic vessels. Therefore appears to be a need to submit under Chapter 3 and eliminating the requirements within Chapter 5.

Cost Impact: The code change proposal will not increase the cost of construction.

307.4-SP-HATFIELD.DOC

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: There are inconsistencies between what this table indicates as standards for the materials and what the IBC indicates the standards are for these materials.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals requests Approval as Modified by this Public Comment

Modify the proposal as follows:

307.4 Materials and structural design. *Aquatic vessels* shall conform to one or more of the standards indicated in Table 307.4. The structural design of aquatic vessels shall be in accordance with the *International Building Code* or *International Residential Code*, as applicable in accordance with Section 102.7.1 of this code.

TABLE 307.4
RESERVOIRS AND SHELLS

MATERIAL	STANDARD
~~Dry shotcrete~~	~~ACI 304.2, ACI 308, ACI 318, ACI 506.2~~
Fiberglass reinforced plastic	ANSI Z124.7
Plastic	ANSI Z124.7
~~Poured-in-Place Concrete~~	~~ACI 318~~
Stainless steel (type 316, 316L, 304, 304L)	ASTM A 240
Tile	ASC A108/A118/A136.1
Vinyl	ASTM D 1593
~~Wet Shotcrete~~	~~ACI 306, ACI 305, ACI 308, ACI 318, ACI 506.2~~

~~**TABLE 502.1**~~
~~**RESERVOIRS AND SHELLS**~~

~~Wet Shotcrete~~	~~ACI 306, ACI 305, ACI 308, ACI 318, ACI 506.2~~

Commenter's Reason: This addresses the committee's reason for disapproval by removing the dry and wet shotcrete and poured in place concrete parts of Table 307.4, which are not necessary and if left in would make for inconsistencies, as they are already covered under the IBC and IRC.

The title for Table 502.1 is being shown again, even though it was struck out in the original proposal so that the last line in the table, "wet shotcrete", could be shown struck out. The error was discovered after the Report of Hearings so I included it in this public comment so that there wouldn't be any misunderstanding about what was intended.

311.1, 312.1, 313.1, 315.1, 704.1 (New), 704.2 (New), 704.1, 704.2, 704.5 (New), 704.6 (New), 704.6.1 (New), 704.6.2 (New), 704.7 (New), 704.7.1 (New), 704.7.2 (New), 704.7.3 (New), 704.8 (New), 704.9 (New), 704.9.1 (New), 704.9.2 (New), 704.9.3 (New)

Proposed Change as Submitted

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals (jhatfield@apsp.org)

Revise as follows:

311.1 General. The provisions of this section apply to *circulation systems* for *aquatic vessels.*

Exceptions:

1. *Portable residential spas* and portable *residential exercise spas*.
2. Onground storable pools supplied by the pool manufacturer as a kit that includes circulation system equipment that is accordance with Section 704.

312.1 General. The provisions of this section apply to *filters* for all *aquatic vessels*.

Exceptions:

1. *Portable residential spas* and portable *residential exercise spas*.
2. Onground storable pools supplied by the pool manufacturer as a kit that includes a filter that is in accordance with Section 704.

313.1 General. The provisions of this section apply to pumps and motors for *aquatic vessels*.

Exceptions:

1. *Portable residential spas* and portable *residential exercise spas*.
2. Onground storable pools supplied by the pool manufacturer as a kit that includes a pump and motor that is in accordance with Section 704.

315.1 General. The provisions of this section apply to *skimmers* for *aquatic vessels*.

Exceptions:

1. *Portable residential spas* and portable *residential exercise spas*.
2. Onground storable pools supplied by the pool manufacturer as a kit that includes a skimming system that is in accordance with Section 704.

704.1 General. A circulation system consisting of pumps, hoses, tubing, piping, return inlets, suction outlets, filters and other related equipment that provides for the circulation of water throughout the pool shall be located so that such items cannot be used by young children as a means of access to the pool.

704.2 Installation and support. Circulation equipment shall be installed, mounted and supported in accordance with the manufacturer's instructions.

704.3~~1~~ Draining the system. In climates subject to freezing, *circulation system* equipment shall be designed and fabricated to drain the pool water from the equipment and exposed piping, by removal of drain plugs and manipulating valves or by other methods in accordance with the manufacturer's instructions.

704.4~~2~~ Turnover. A pump including a motor shall be provided for circulation of the pool water. ~~Where *circulation equipment* is required by the manufacturer,~~ The equipment shall be sized to provide a turnover of the pool water ~~at least~~ not less than once every 12 hours. The system shall be designed to provide the required *turnover rate* based on the manufacturer's specified maximum flow rate of the filter, with a clean media condition of the filter. The system flow shall not exceed the filter manufacturer's maximum filter flow rate.

704.5 Piping and fittings. The process piping of the circulation system, including but not limited to hoses, tubing, piping, and fittings, shall be made of non-toxic material and shall be capable of withstanding an internal pressure of not less than 1½ times the rated pressure of the pump. Piping on the suction side of the pump shall not collapse when flow into such piping is blocked.

704.6 Filters. Pressure-type filters shall have an automatic internal means or a manual external means to relieve accumulated air pressure inside the filter tank. Filter tanks composed of upper and lower tank lids that are held in place by a perimeter clamp shall have a perimeter clamp that provides for a slow and safe release of air pressure before the clamp disengages the lids.

704.6.1 Automatic internal air relief. Filter tanks incorporating an automatic internal air relief as the principal means of air release shall be designed with a means to provide for a slow and safe release of pressure.

704.6.2 Separation tank. A separation tank used in conjunction with a filter tank shall have a manual air release or the tank shall be designed to provide for a slow and safe release of pressure when the tank is opened.

704.7 Pumps. Pool pumps shall be tested and certified by a nationally recognized testing laboratory in accordance with an edition of UL 1081 that is the latest edition published by UL at the time of manufacture of the pump. The pump horsepower rating and that rating indicated on the label cannot exceed the brake horsepower of the motor.

704.7.1 Cleanable strainer. Where a pressure-type filter is installed, a cleanable strainer or screen that captures materials such as solids, debris, hair and lint shall be provided upstream of the circulation pump.

704.7.2 Accessibile pumps and motors. Pumps and motors shall be accessible for inspection and service in accordance with the pump and motor manufacturer's instructions.

704.7.3 Pump shut-off valves. An *accessible* means of shut-off of the suction and discharge piping for the pump shall be provided for maintenance and removal of the pump.

704.8 Suction outlets and return inlets. Suction outlets and return inlets shall be provided and arranged to produce uniform circulation of water so that sanitizer residual is maintained throughout the pool. Where installed, submerged suction outlets shall conform to APSP 16.

704.9 Surface skimmer systems. The surface skimming system provided shall be designed and constructed to skim the pool surface when the water level is maintained between the minimum and maximum fill level of the pool.

704.9.1 Coverage when used as a sole outlet. Where surface skimmers are used as the only pool water outlet system, not less than one skimmer shall be provided for each 800 ft^2 (74.3 m^2), or fraction thereof, of the water surface area.

704.9.2 Coverage when used in combination with other outlets. Where surface skimmers are not the only outlet for pool water, they shall be considered to cover only that fraction of the 800 ft^2 (74.3 m^2).

704.9.3 Location and venting. Skimmers shall be equipped with a vent that serves as a vacuum break.

Reason: This change is consistent with APSP-4 that requires onground storable pools to follow different requirements than for all other pools.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Regarding Section 704.7, ICC CP#28, Code Development, requires a specific edition of a standard for reference to allow understanding and approval of the detailed requirements proposed for the 2015 edition of the ISPSC. Further, the language proposed will enable variations on the specifications required on different projects.

311.1-SP-HATFIELD.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposal was disapproved because there were numerous modifications that were proposed which were making the proposal very confusing. The final reason for disapproval was that the term "suction outlet" was used in several locations and it was felt that the word "suction" should not be used with "outlet". Not all outlets are directly connected to the suction side of a pump.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals requests Approval as Modified by this Public Comment

Modify the proposal as follows:

311.1 General. The provisions of this section apply to *circulation systems* for *aquatic vessels.*

Exceptions:

1. *Portable residential spas* and portable *residential exercise spas*.
2. Onground storable pools supplied by the pool manufacturer as a kit that includes circulation system equipment that is in accordance with Section 704.

704.4 Turnover. A pump, including a motor, shall be provided for circulation of the pool water. The equipment shall be sized to provide a turnover of the pool water not less than once every 12 hours. The system shall be designed to provide the required *turnover rate* based on the manufacturer's specified maximum flow rate of the filter, with a clean media condition of the filter. The system flow shall not exceed the filter manufacturer's maximum filter flow rate.

704.7 Pumps. Pool pumps shall be tested and certified by a nationally recognized testing laboratory in accordance with ~~an edition of~~ UL 1081 ~~that is the latest edition published by UL at the time of manufacture of the pump.~~ ~~The pump horsepower rating and that rating indicated on the label cannot exceed the brake horsepower of the motor.~~

704.8 ~~Suction~~ Outlets and return inlets. ~~Suction~~ Outlets or suction outlets, and return inlets shall be provided and arranged to produce uniform circulation of water so that sanitizer residual is maintained throughout the pool. Where installed, submerged suction outlets shall conform to APSP 16.

Commenter's Reason: This public comment addresses the committee's concern about using the term "suction" to describe "outlet". Not all outlets from a pool are suction outlets. For example, a pool can be designed for proper circulation with the inlet to the pool near the bottom of the pool and the outlet being a skimmer (a gravity outlet) at the pool water surface. Changing the terminology in Section 704.8 allows for such an arrangement.

This public comment also removes language in the first sentence of Section 704.7: "that is the latest edition published by UL at the time of manufacture of the pump". The I-codes reference specific editions of standards because the code must refer to a specific document that becomes law, not some unknown moving target. Open–ended references to standards are not compatible with ICC format.

Another change in this public comment was to remove the second sentence of Section 704.7. Because APSP 15 (for energy efficiency of residential swimming pool systems) applies to onground storable pools (as required by Section 303.1) there is no need for this requirement in this chapter.

And finally, this public comment corrects a few typos in other proposed sections. The changes in this public comment along with the changes in the original proposal are necessary to ensure consistency with APSP-4, which provides specific requirements for onground storable pools.

SP36-13

Final Action: AS AM AMPC____ D

SP40-13
315.2, 315.3, 315.4

Proposed Change as Submitted

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals (jhatfield@apsp.org)

Revise as follows:

315.2 Required. A *surface skimming system* shall be provided for public aquatic vessels and shall be *listed* and *labeled* in accordance with NSF 50. Either a *surface skimming system* or a perimeter overflow system shall be provided for permanent inground *residential pools* and *permanent residential spas*. ~~The~~ Where installed, *surface skimming systems* shall be designed and constructed to create a skimming action on the pool water surface when the water level in the pool is ~~to skim the surface when the water level is maintained~~ within ~~the~~ operational parameters.

Exception: *Class D public pools* designed in accordance with Chapter 6.

315.2.1 Circulation systems. Public pool circulation systems shall be designed to process a minimum of 100 percent of the turnover rate through *skimmers*.

TABLE 315.3
SKIMMER SIZING TABLE

AQUATIC VESSEL	AREA PER SKIMMER (SQ. FT)
Public pool	~~400~~ 500
Residential pool	800
Spa (all types)	150

For SI: 1 square foot = 0.09 m^2.

Reason: This proposal tries to address several aspects:
- Section 315.2.1 doesn't follow what is in APSP-5 and in NSF 50. But 315.2.1 IS found in APSP-1, so the proposed change limits it to public pools.
- Regarding the NSF 50 aspect, after noting that all the APSP standards appear to require surface skimming systems to comply with NSF 50, added that aspect in the first sentence, but used the language as written in other areas of the ISPSC when requiring compliance with NSF 50.
- Added *permanent residential spas* in first sentence b/c APSP-3 states: 11.2 **Design and Construction**: Skimming devices shall be provided on all residential spas,…"
- Inserting "where installed" makes clear to the code official that, for example, the automatic surface skimmer isn't required necessarily, but where one is installed, it must follow certain specifications.
- See 12.3 in APSP 1, provides for 500 sq ft, so change in Table 315.2 makes the standard and what is in the ISPSC consistent

Cost Impact: The code change proposal will not increase the cost of construction.

315.2-SP-HATFIELD.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: Exception No. 2 is too confusing. Maintained illumination appears to involve maintenance requirements. The code cannot be concerned with maintenance functions.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bob Eugene of UL LLC representing UL LLC request s Approval as Modified by this Public Comment

Modify the proposal as follows:

315.2 Required. A *surface skimming system* shall be provided for public aquatic vessels and shall be *listed* and *labeled* in accordance with NSF 50. Either a *surface skimming system* or a perimeter overflow system shall be provided for permanent in-ground *residential pools* and *permanent residential spas*. Where installed, *surface skimming systems* shall be designed and constructed to create a skimming action on the pool water surface when the water level in the pool is within operational parameters.

Exceptions:

1. *Class D public pools* designed in accordance with Chapter 6.
2. Skimmers that are an integral part of a spa that has been listed and labeled in accordance with UL1563 shall not be required to be listed and labeled in accordance with NSF 50.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: UL 1563 includes provisions for skimmers. Listing and labeling spas to UL 1563 provides for the required entrapment protection. Similar language has been included in the committee action for SP34-13 and SP35-13.

SP40-13

Final Action: AS AM AMPC____ D

SP42-13
202, 321.2, 321.2.1, 321.2.2, 321.2.3, 321.3, 321.4

Proposed Change as Submitted

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals (jhatfield@apsp.org)

Add new definition:

MAINTAINED ILLUMINATION. The value, in foot-candles or equivalent units, below which the average illuminance on a specified surface is not allowed to fall. The average illuminance value on the specified surface at the time when maintenance of the lighting system must be carried out.

Revise as follows:

321.2 Artificial lighting required. When a pool is open during periods of low natural illumination, artificial lighting shall be provided so that all areas of the pool, including the ~~*main drains*~~ *suction outlets on the bottom of the pool,* will be visible. Illumination shall be sufficient to enable a lifeguard or other persons standing on the deck or sitting on a lifeguard stand adjacent to the pool edge to determine if a pool user is lying on the bottom of the pool and if the pool water is transparent and free from cloudiness.

These two conditions shall be met when all suction outlets are visible from the edge of the deck at all times when artificial lighting is illuminated and when an 8 inch (152 mm) diameter black disk, placed at the bottom of the pool in the deepest point, is visible from the edge of the pool deck at all times when artificial lighting is illuminated.

321.2.1 Pool and deck illumination. Overhead lighting, ~~or~~ underwater lighting or both shall be provided to illuminate the pool and adjacent deck areas. ~~Such~~ The lighting shall be *listed*~~,~~ and *labeled.* ~~And~~ The lighting shall be installed in accordance with NFPA 70. ~~or the *International Residential Code*, as applicable in accordance with Section 102.7.1.~~

321.2.2 Illumination intensity. For outdoor pools, ~~the~~ a combination of overhead and underwater lighting shall provide maintained illumination not less than 10 horizontal ~~3~~ foot-candles at the pool water surface. For indoor pools, ~~the~~ a combination of overhead and underwater lighting shall provide maintained illumination not less than 30 horizontal ~~of 10~~ foot-candles at the pool water surface. Deck area lighting for both indoor and outdoor pools shall provide maintained illumination not less than 10 horizontal foot-candles at the walking surface of the deck.

321.2.3 Underwater lighting. Underwater lighting shall provide not less than 8 lumens per square foot of pool water surface area.

Exceptions:

1. The requirement of this section shall not apply where the total wattage of incandescent underwater lighting is not less than ½ watt/ft^2 (5.4 watts/m^2) of pool water surface.
2. The requirement of this section shall not apply where overhead lighting provides not less than 15 foot-candles of *maintained illumination* at the pool water surface, the overhead lighting provides visibility, without glare, of all areas of the pool ~~are visible without glare,~~ and underwater lighting provides a *maintained illumination* at the pool water surface that is equal to or greater than the difference between the *maintained illumination* required by Section 321.2.2 and the *maintained illumination* provided at the pool water surface by the overhead lighting. Underwater lighting shall not be required where such difference is less than zero.

321.3 Emergency illumination. *Public pools* and <u>public</u> pool areas that operate during periods of low illumination shall be provided with emergency lighting <u>that will automatically turn on</u> to permit evacuation of the pool and securing of the area in the event of power failure. <u>Emergency lighting facilities shall be arranged to provide initial illumination that is not less than 0.1 foot-candle measured at any point on the water surface and at any point on the walking surface of the deck, and not less than an average of 1 foot-candle. At the end of the emergency lighting time duration, the illumination level shall be not less than 0.06 foot-candle measured at any point on the water surface and at any point on the walking surface of the deck, and not less than an average of 0.6 foot-candle. A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded.</u> ~~The emergency lighting intensity shall be not less than 1 foot-candle at the water surface and the walking surface of the deck.~~

321.4 Residential pool and deck illumination. Where <u>lighting is</u> installed <u>for, and</u> in, *residential pools* and *permanent residential spas,* <u>such</u> <u>l</u>ighting shall be installed in accordance with NFPA 70 or the *International Residential Code*, as applicable in accordance with Section 102.7.1.

Reason: The changes proposed are due to the following:

1. Deletes "main drain" to be consistent with definition now routinely used, which is "suction outlet." Further – can now DELETE the definition of main drain in Chapter 2 because this was the ONLY section in the ISPSC that utilized the word "Main Drain." See this proposal under Chapter 2 definitions.
2. Under 321.2.2 Illumination intensity, proposal changes the requirements to conform more to aspects of the Model Aquatic Health Code and IESNA RP-6-01 (Illuminating Engineering Society of North America), both of which include requirements for indoor and outdoor pools and decks (regardless of whether indoors or outdoors). This is a good approach for most general public pools.
3. Under 321.2.3 provides new language stemming from the APSP-1 revisions. It also incorporates a lumen-based standard made necessary by new low-power lighting technologies. Additionally, the existing wattage/sq ft requirement for incandescent underwater lights is maintained as an exception.
4. Under 321.3, made consistent with IBC Section 1006.3.1 Emergency illumination requirements.
5. Under 321.4, adding "lighting is" makes it clear as to what is being discussed. Adding "for, and in" makes it clear that coverage is for lighting in and out of the pool or spa.

Cost Impact: The code change proposal will not increase the cost of construction.

321.2-SP-HATFIELD.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: Exception No. 2 is too confusing. Maintained illumination appears to involve maintenance requirements. The code cannot be concerned with maintenance functions.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals requests Approval as Modified by this Public Comment

Modify the proposal as follows:

MAINTAINED ILLUMINATION. The value, in foot-candles or equivalent units, below which the average illuminance on a specified surface is not allowed to fall. ~~The average illuminance value on the specified surface at the time when maintenance of the lighting system must be carried out.~~ <u>Maintained illumination equals the initial average illuminance on the specified surface with new lamps, multiplied by the light loss factor (LLF), to account for reduction in lamp intensity over time.</u>

321.2 Artificial lighting required. When a pool is open during periods of low natural illumination, artificial lighting shall be provided so that all areas of the pool, including ~~the~~ <u>all</u> *suction outlets* on the bottom of the pool, will be visible. Illumination shall be sufficient to enable a lifeguard or other persons standing on the deck or sitting on a lifeguard stand adjacent to the pool edge to determine if a pool user is lying on the bottom of the pool and if the pool water is transparent and free from cloudiness.

These two conditions shall be met when all suction outlets are visible from the edge of the deck at all times when artificial lighting is illuminated and when an 8 inch (152 mm) diameter black disk, placed at the bottom of the pool in the deepest point, is visible from the edge of the pool deck at all times when artificial lighting is illuminated.

321.2.1 Pool and deck illumination. Overhead lighting, underwater lighting or both shall be provided to illuminate the pool and adjacent deck areas. The lighting shall be *listed* and *labeled.* The lighting shall be installed in accordance with NFPA 70.

321.2.2 Illumination intensity. For outdoor pools, any combination of overhead and underwater lighting shall provide maintained illumination not less than 10 horizontal foot-candles (10 lumens per square foot) [108 lux] at the pool water surface. For indoor pools, any combination of overhead and underwater lighting shall provide maintained illumination not less than 30 horizontal foot-candles (30 lumens per square foot) [323 lux] at the pool water surface. Deck area lighting for both indoor and outdoor pools shall provide maintained illumination not less than 10 horizontal foot-candles (10 lumens per square foot) [108 lux] at the walking surface of the deck.

321.2.3 Underwater lighting. Underwater lighting shall provide not less than 8 horizontal foot-candles (8 lumens per square foot) [86 lux] ~~of~~ at the pool water surface area, or not less than a total wattage of ½ watt/ft^2 (5.4 watts/m^2) of pool water surface for incandescent underwater lighting where the fixtures and lamps are rated in watts.

Exception~~s~~:

~~1. The requirement of this section shall not apply where the total wattage of incandescent underwater lighting is not less than ½ watt/ft^2 (5.4 watts/m^2) of pool water surface.~~

~~2.~~ The requirement of this section shall not apply where overhead lighting provides not less than 15 foot-candles (15 lumens per square foot) [161 lux] of *maintained illumination* at the pool water surface, the overhead lighting provides visibility, without glare, of all areas of the pool, and the requirements of Section 321.2.2 are met or exceeded ~~and underwater lighting provides a *maintained illumination* at the pool water surface that is equal to or greater than the difference between the *maintained illumination* required by Section 321.2.2 and the *maintained illumination* provided at the pool water surface by the overhead lighting. Underwater lighting shall not be required where such difference is less than zero~~.

Commenter's Reason: The public comment addresses the committee reasoning for disapproval by clarifying what is required under Section 321.2.3 and it revises the definition of *maintained illumination* to clarify that this is not a maintenance requirement. *Maintained Illumination* is a standard design quantity utilized in the lighting industry and defined by the Illuminating Engineering Society of North America (IESNA) standards and guidelines to represent the minimum amount of illumination that is allowed to exist given that the intensity of the artificial lighting will naturally decrease over time. *It* refers to a level of lighting which is evaluated at the initial planning and design stage, and not to any maintenance requirement or methodology. Use of this term therefore brings ISPSC into harmony with the standard definitions and practices used in the industry and reflected in the IESNA Standards and documents that are utilized by architects, engineers, lighting manufacturers, and installers when they design and install lighting systems. The public comment also ensures that all sections use both foot-candles and lumens. It also changes "the" to "all" in reference to suction outlets in Section 321.2 to ensure 1) that it remains consistent with APSP-7 as referenced in this Code, which provides that suction outlets are optional and 2) that when suction outlets are used, all are visible.

SP42-13

Final Action: AS AM AMPC____ D

SP44-13
323.2.1

Proposed Change as Submitted

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals (jhatfield@apsp.org)

Revise as follows:

323.2.1 Height. Handrails shall be between 34 inches (864mm) and 38 inches (965 mm) above the ramp or step surface as measured at the nosing of the step or finished surface of the slope.

<u>**Exception:** The requirements of this section shall not apply to *residential aquatic vessels.*</u>

Reason: What is the justification for this height range requirement applying to both public and residential installations? The 34"-38" height is already a requirement for stair and ramp rails in the ADA Standards for Accessible Design for public facilities. Many of rails do not meet the height requirements. The handrail height requirement should be removed from the general requirements section and placed into the public swimming pools section or exempt out the residential vessels, as proposed here. For inground residential swimming pools, the range for the rail height can be broader, or not specified.

Cost Impact: The code change proposal will not increase the cost of construction.

323.2.1-SP-HATFIELD.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The proposal was disapproved because the handrail height dimensions have been proven to be the optimum dimensions for safety. The same level of safety should be provided for residential pools where handrails are installed.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals requests Approval as Modified by this Public Comment

Modify the proposal as follows:

323.2.1 Height. <u>The top of the gripping surface of handrails for public *pools and public spas*</u> shall be ~~between~~ 34 inches (864mm) ~~and~~ <u>to</u> 38 inches (965 mm) above the ramp or step surface as measured at the nosing of the step or finished surface of the slope. <u>The top of the gripping surface of handrails for residential *pools and* residential *spas* shall be 30 inches (762 mm) to 38 inches (965 mm) above the ramp or step surface as measured at the nosing of the step or finished surface of the slope.</u>

~~**Exception:** The requirements of this section shall not apply to *residential aquatic vessels.*~~

Commenter's Reason: The proposal was disapproved because the committee believed the same level of safety should be provided for residential pools as in public pools where handrails are installed. However, the 34" – 38" height requirement is derived solely from ADA Accessibility guidelines which apply only to public facilities, and bears no relationship to safety. Prior to the implementation of the ADA, public facilities relied on OSHA height requirements for handrails, which are were 30"-36". The OSHA requirements are based on safety, where the ADA requirements are based on accessibility. Therefore, the 34"-38" height specification should not be a requirement for a residential installation. Rather than provide an exception, this public comment simply clarifies that the 34-38 inches applies to public pools and then allows the 30-36 inch dimension for residential application.

It is important to note that the standard handrails that are sold into the residential market do not meet the 34"-38" requirements and if the code does not clarify that this only applies to public pool and spa handrails, a large number of products will have to be revised with great expense (whereas the commercial handrail product lines have made the change to the federal ADA requirements). The industry has been selling these standard rails for years and is not aware of any reports on injuries or safety issues or complaints related to the height of the products. The ADA requirement of 34-38 inches should not be applied to the residential market and this proposal makes that clarification all the while still providing for the safety that the committee was concerned about in their disapproval.

SP44-13

Final Action: AS AM AMPC____ D

SP47-13
406.4 (New), 406.5 (New)

Proposed Change as Submitted

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals (jhatfield@apsp.org)

Add new text as follows:

406.4 Decks between pools and spas. Decks between pools, spas or any combination of pools and spas, shall have a width of not less than 6 feet (1829 mm).

406.5 Deck covering. Walking surfaces of decks within 4 feet (1219 mm) of a pool or spa that are not equivalent in the strength, durability and slip resistance of the surface of a concrete deck shall be prohibited. Wooden walking surfaces and carpeted walking surfaces shall not be placed within 4 feet (1219 mm) of a *pool.*

(Renumber subsequent sections)

Reason: These are requirements found in many state health codes and are considered construction; therefore should be included in the ISPSC.

Cost Impact: The code change proposal will not increase the cost of construction.

406.4 (NEW) -SP-HATFIELD.DOC

Committee Action Hearing Results

Committee Action: **Disapproved**

Committee Reason: The slip resistance of the surface of a concrete deck is too vague. Concrete decks can have a variety of finishes, each having different slip resistances.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals requests Approval as Modified by this Public Comment

Modify the proposal as follows:

406.5 Deck covering. Walking surfaces of decks within 4 feet (1219 mm) of a pool or spa shall be *slip resistant.* ~~that are not equivalent in the strength, durability and slip resistance of the surface of a concrete deck shall be prohibited. Wooden walking surfaces and carpeted walking surfaces shall not be placed within 4 feet (1219 mm) of a *pool.*~~

Commenter's Reason: The proposal was disapproved because the slip resistance of the surface of a concrete deck was too vague. This public comment simplifies the proposal to require deck coverings to be slip resistant, which is then defined in the code.

SP47-13

Final Action: AS AM AMPC____ D

SP50-13
411.1

Proposed Change as Submitted

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals (jhatfield@apsp.org)

Revise as follows:

411.1 Entry and exit. Pools shall have ~~at least~~ not less than two means of entry and exit~~,~~ that are located so as to serve both ends of a pool. Chair lifts that provide for pool entry and exit by persons with physical disabilities shall not be counted as a means of entry or exit that is required by this section.

Reason: This language is included in the APSP-1 revisions and with new ADA requirements now in effect it is good to make this clarification.

Cost Impact: The code change proposal will not increase the cost of construction.

411.1-SP-HATFIELD.DOC

Committee Action Hearing Results

Committee Action: **Approved as Modified**

Modify the proposal as follows:

411.1 Entry and exit. Pools shall have not less than two means of entry and exit that are located so as to serve both ends of a pool. ~~Chair~~ Pool lifts that provide for pool entry and exit by persons with physical disabilities shall not be counted as a means of entry or exit that is required by this section.

Committee Reason: The reason for the modification is that "pool" lifts is the proper terminology, not chair lifts. The reason for approval of the overall change is that this provides a necessary clarification to the code so that lifts are not considered as the required means of exit and entry.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee (cbaldassarra@RJAGroup.com) and Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals (jhatfield@apsp.org) request Approval as Modified by this Public Comment.

Further modify the proposal as follows:

411.1 Entry and exit. Pools shall have not less than two means of entry and exit that are located so as to serve both ends of a pool. Pool lifts, transfer walls and transfer system that provide for pool entry and exit by persons with physical disabilities in accordance with Section 307.9 shall not be counted as a means of entry or exit ~~that is~~ required by this section.

Commenter's Reason: We wish to further modify what was already approved because there are other entry options provided for in ICC A117.1 (and ADA) for persons with disabilities. See the pictures below for graphics of the three types that would not work for general entry.

Section 307.9 references the IBC for accessibility, which in turn references the ICC A117.1 for technical criteria for these three types of entries.

This proposal is being co-sponsored by the ICC Code Technology Committee. The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/CTC/Pages/default.aspx. Since its inception in April/2005, the CTC has held twenty five meetings - all open to the public.

SP59-13
702.2.1, Chapter 11

Proposed Change as Submitted

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals (jhatfield@apsp.org)

Revise as follows:

702.2.1 Barrier required. Ladders in the pool shall have a physical barrier to prevent children from swimming through the riser openings or behind the ladder. Ladders made by ladder manufacturers that provide a certification statement that their ladder meets the acceptance criteria for the entrapment tests of APSP 4 shall be considered to be in compliance with this section.

Add standard to Chapter 11:

APSP
APSP 4-2012 Standard for Aboveground/Onground Residential Swimming Pools

Reason: The change follows what is in the 2012 APSP-4 revisions; all the code official will need to see is the certificate.

Cost Impact: The code change proposal will not increase the cost of construction

702.2.1-SP-HATFIELD.DOC

Committee Action Hearing Results

Committee Action: Disapproved

Committee Reason: The committee disapproved this proposal because allowing the ladder manufacturer to provide the certification statement doesn't require that a third party verify that the ladder actually does meet the entrapment tests of APSP 4.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comments were submitted.

Public Comment 1:

Jennifer Hatfield, J. Hatfield & Associates, PL, representing the Association of Pool & Spa Professionals requests Approval as Modified by Public Comment

Modify the proposal as follows:

702.2.1 Barrier required. Ladders in the pool shall have a physical barrier to prevent children from swimming through the riser openings or behind the ladder. ~~Ladders made by ladder manufacturers that provide a certification statement that their ladder meets the acceptance criteria for the entrapment tests of APSP 4 shall be considered to be in compliance with this section.~~

> **Exception:** Barriers for the ladder shall not be required where the ladder manufacturer provides a test report by an *approved* third party testing agency certifying that the ladder complies with the ladder entrapment test requirements of APSP 4 or where the ladder is *listed* and *labeled* as complying with the requirements of APSP 4.

Commenter's Reason: This public comment is intended to maximize protection from ladder entrapment in all onground pool designs, including those for which a physical barrier is not practical. This issue was investigated at length by the ANSI/APSP-4 writing committee, resulting in the alternative compliance test. The test is conducted using a fully assembled ladder and pool wall, and is based on recognized biomechanical principles including the ASTM F1148-09 Standard for consumer playground safety. It ensures that a bather cannot be entrapped between the ladder risers or the ladder and pool wall. The test checks the spaces between the rungs as well as the space between the ladder and the pool wall.

Testing would be performed by an approved third party testing agency and the manufacturer would demonstrate compliance with either: 1) a test report included in the installation instructions, 2) a tag attached to the ladder with a link to where the test report and/or listing can be downloaded by the inspector, or 3) a label affixed to the ladder itself. As the original proposal noted, this alternative is found in the 2012 edition of the ANSI/APSP-4 Standard and is being added to ensure consistency with the ISPSC and the ANSI/APSP standards.

Public Comment 2:

Matthew Whalen, Director of Risk Management, representing Intex Recreation Corp requests Approval as Modified by Public Comment

Modify the proposal as follows:

702.2.1 Barrier required. Ladders in the pool shall have a physical barrier to prevent children from swimming through the riser openings or behind the ladder. ~~Ladders made by ladder manufacturers that provide a certification statement that their ladder meets the acceptance criteria for the entrapment tests of APSP 4 shall be considered to be in compliance with this section.~~

> **Exception:** Barriers for ladders shall not be required where the ladder manufacturer provides a certification statement that the ladder complies with the ladder entrapment test requirements of APSP 4.

Commenter's Reason: This public comment is intended to maximize protection from ladder entrapment in all onground pool designs, including those for which a physical barrier is not practical. This issue was investigated at length by the ANSI/APSP-4 writing committee, resulting in the alternative compliance test. The test is conducted using a fully assembled ladder and pool wall, and is based on recognized biomechanical principles including the ASTM F1148-09 Standard for consumer playground safety. It ensures that a bather cannot be entrapped between the ladder risers or the ladder and pool wall. The test checks the spaces between the rungs as well as the space between the ladder and the pool wall.

The public comment rewords the original proposal to clarify that the ladder entrapment test is an alternative to the physical barrier requirement found in 702.2.1, thereby providing consistency with the ANSI/APSP-4 Standard. Performance of the ladder entrapment test is readily within the capabilities of onground pool manufacturers, and therefore, as with virtually all other aspects of ANSI/APSP-4, this proposal recognizes self-testing and self-certification, which can be documented on the ladder or in contained product literature.

SP59-13

Final Action: AS AM AMPC____ D

WUIC2-13
503.2, Chapter 7

<u>Proposed Change as Submitted</u>

Proponent: Joseph Holland (jholland@frtw.com) and Dave Bueche (dbueche@frtw.com), representing Hoover Treated Wood Products, Inc. dbueche@frtw.com

Revise as follows:

503.2 Ignition-resistant building material. Ignition-resistant building materials shall comply with any one of the following:

1. <u>Material shall</u> <u>be tested on all sides with the</u> ~~E~~<u>e</u>xtended ASTM E 84 <u>(UL 723)</u> test~~ing~~ or <u>ASTM E2768, except panel products shall be permitted to test only the front and back faces. Panel products shall be tested with a ripped or cut longitudinal gap of 1/8 inch.</u> Materials that, when tested in accordance with the test procedures set forth in ASTM E 84 or UL 723, for a test period of 30 minutes, <u>or ASTM E2768,</u> comply with the following:
   1.1 through 1.4 *(No change to current text)*

2 through 4 *(No change to current text)*

Add new standard to Chapter 7 as follows:

ASTM
<u>E2768-11</u> <u>Standard Test Method for Extended Duration Surface Burning Characteristics of Building Materials (30 Minute Tunnel Test)</u>

Reason: The code is not specific as to the testing of materials with a surface treatment. There are painted and laminated products in the marketplace that are painted or laminated on only one side and are only tested on that side. This is inappropriate for many of the applications where "ignition-resistant material" is permitted; e.g., decks, lapped siding, exposed facia and other installations with a gap between the material.

The recommendations of the approved agencies for panel products require a 1/8 inch gap between sheets. Because panel products with a surface treatment will be cut in the field and are mandated a 1/8 inch gap it is important that non factory edges be tested to evaluate the effect of their performance in a fire.

ASTM developed a standard for testing materials for 30 minutes in the E84 or UL723 tunnel. Use of the standard is appropriate for "ignition-resistant material" used in the Wildland/Urban Interface. The standard uses E84 as the basis with the extended time period of 30 minutes

Cost Impact: As all products should be testing in this manner the will be no cost impact.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E2768-11, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 1, 2013.

503.2-WUIC-BUECHE-HOLLAND

<u>Committee Action Hearing Results</u>

For staff analysis of the content of ASTM E2768-11 relative to CP#28, Section 3.6, please visit:
http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/ProposedStandards.pdf

Committee Action: **Approved as Submitted**

Committee Reason: The committee approved the code change based on the proponent's reason statement.

Assembly Action: **None**

<u>Individual Consideration Agenda</u>

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Marcelo M Hirschler, GBH International, requests Approval as Modified by this Public Comment.

Modify the proposal as follows:

503.2 Ignition-resistant building material. Ignition-resistant building materials shall comply with any one of the following:

1. Material shall be tested on all sides with the extended ASTM E 84 (UL 723) test or ASTM E2768, except panel products shall be permitted to test only the front and back faces. Panel products shall be tested with a ripped or cut longitudinal gap of 1/8 inch. Materials that, when tested in accordance with the test procedures set forth in ASTM E 84 or UL 723, for a test period of 30 minutes, or ASTM E2768, comply with the following:

   1.1 through 1.4 *(No change to current text)*

   <u>**Exception:** Materials comprised of a combustible core and a noncombustible exterior covering shall not be required to be tested with a ripped or cut longitudinal gap.</u>

2. through 4. *(No change to current text)*

Add new standard to Chapter 7 as follows:

ASTM
E2768-11 Standard Test Method for Extended Duration Surface Burning Characteristics of Building Materials (30 Minute Tunnel Test)

Commenter's Reason: The reason for the exception is that the rip or cut gap is intended to deal purely with materials that have a coating on a single side only instead of being treated for fire performance throughout the core of the material. It does not make sense to treat materials with a noncombustible outer layer, such as MCM materials (metal composite materials) or IMP panels (insulated metal panels) the same way as panels with combustible outer layers because such materials should not be damaged for testing. Such materials are manufactured in such a way as to protect the combustible cores and any damage to the face would render the material unusable and would require replacement in an actual application.

The intent of the use of the rip or cut gap is to avoid that a material passes the extended ASTM E84 (or ASTM E2768) test simply with an outer coating on a single side.

Public Comment 2:

Andrew Williams, PE, Metal Construction Association; William E. Koffel, PE, FSFPE, representing Alucobond and 3A Composites , request Approval as Modified by this Public Comment.

Modify the proposal as follows:

503.2 Ignition-resistant building material. Ignition-resistant building materials shall comply with any one of the following:

1. Material shall be tested on all sides with the extended ASTM E 84 (UL 723) test or ASTM E2768, except panel products shall be permitted to test only the front and back faces. Panel products shall be tested with a ripped or cut longitudinal gap of 1/8 inch. Materials that, when tested in accordance with the test procedures set forth in ASTM E 84 or UL 723, for a test period of 30 minutes, or ASTM E2768, comply with the following:

   1.1 through 1.4 *(No change to current text)*

   <u>**Exception:** Materials comprised of a combustible core and a noncombustible exterior covering, comprised of either aluminum at a minimum 0.019" thickness or corrosion resistant steel at a minimum 0.0149" thickness, shall not be required to be tested with a ripped or cut longitudinal gap.</u>

2. through 4. *(No change to current text)*

Add new standard to Chapter 7 as follows:

ASTM

E2768-11 Standard Test Method for Extended Duration Surface Burning Characteristics of Building Materials (30 Minute Tunnel Test)

Commenter's Reason: The reason for the exception is that the rip or cut gap is intended to deal purely with materials that have a coating on a single side only instead of being treated for fire performance throughout the core of the material. It does not make sense to treat materials with a noncombustible outer layer, such as MCM materials (metal composite materials) or IMP panels (insulated metal panels) the same way as panels with combustible outer layers because such materials should not be damaged for testing. Such materials are manufactured in such a way as to protect the combustible cores and any damage to the face would render the material unusable and would require replacement in an actual application.

The specific noncombustible outer layers specified originate in Table 1405.2 of the IBC and correspond to minimum acceptable thicknesses of some specific weather coverings. An alternate more generic amendment is also being proposed.

The intent of the use of the rip or cut gap is to avoid that a material passes the extended ASTM E84 (or ASTM E2768) test simply with an outer coating on a single side and this proposed change does not modify that.

WUIC2-13

Final Action: AS AM AMPC____ D

WUIC3-13
503.2, Chapter 7

Proposed Change as Submitted

Proponent: John Woestman, Kellen Company, representing Composite Lumber Manufacturers Association (CLMA) (jwoestman@kellencompany.com)

Revise as follows:

503.2 Ignition-resistant building material. Ignition-resistant building materials shall comply with any one of the following:

~~1. Extended ASTM E 84 testing. Materials that, when tested in accordance with the test procedures set forth in ASTM E 84 or UL 723, for a test period of 30 minutes, comply with the following:~~
   ~~1.1. Flame spread. Material shall exhibit a flame spread index not exceeding 25 and shall show no evidence of progressive combustion following the extended 30-minute test.~~
   ~~1.2. Flame front. Material shall exhibit a flame front that does not progress more than 101/2 feet (3200 mm) beyond the centerline of the burner at any time during the extended 30-minute test.~~
   ~~1.3. Weathering. Ignition-resistant building materials shall maintain their performance in accordance with this section under conditions of use. Materials shall meet the performance requirements for weathering (including exposure to temperature, moisture and ultraviolet radiation) contained in the following standards, as applicable to the materials and the conditions of use:~~
      ~~1.3.1. Method A "Test Method for Accelerated Weathering of Fire-Retardant- Treated Wood for Fire Testing" in ASTM D 2898, for fire-retardant treated wood, wood-plastic composite and plastic lumber materials.~~
      ~~1.3.2. ASTM D 7032 for wood-plastic composite materials.~~
      ~~1.3.3. ASTM D 6662 for plastic lumber materials.~~
   ~~1.4. Identification. All materials shall bear identification showing the fire test results.~~

~~2~~1. Noncombustible material. Material that complies with the requirements for *noncombustible* materials in Section 202.
~~3~~2. Fire-retardant-treated wood. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the *International Building Code*.
~~4~~3. Fire-retardant-treated wood roof coverings. Roof assemblies containing fire-retardant-treated wood shingles and shakes which comply with the requirements of Section 1505.6 of the *International Building Code* and classified as Class A roof assemblies as required in Section 1505.2 of the *International Building Code*.
4. Exterior deck materials. Exterior deck materials complying with ASTM D7032 and the requirements of 4.1, or 4.2, or 4.3.
   4.1 Exterior deck materials complying with all of the following:
      4.1.1 Tested in accordance with ASTM E2632 and meeting the following acceptance criteria: peak heat release rate not greater than 25 kW/ft^2; and absence of sustained flaming or glowing combustion of any kind at the conclusion of the 40 minute observation period; and absence of structural failure of any deck board; and absence of falling particles that are still burning when reaching the burner or floor.
      4.1.2 Tested in accordance with ASTM E2726 / E2726M using the Class A brand and meeting the acceptance criteria of X1.6.1 or X1.6.2 of ASTM E2726 / E2726M.
      4.1.3 Tested in accordance with ASTM E84 and meeting the Class A flame spread index with the test extended by 20 minutes.
   4.2. Exterior deck materials complying with both of the following:

4.2.1 Tested in accordance with ASTM E2632 with a peak heat release rate not greater than 25 kW/ft^2.

4.2.2 Tested in accordance with ASTM E84 and meeting the Class B flame spread index.

4.3. Exterior deck materials installed where the exterior wall covering to which the deck is attached and within 10 feet of the deck is of noncombustible or ignition resistant material and the exterior deck materials complying with both of the following:

4.3.1 Tested in accordance with ASTM E2632 with a peak heat release rate not greater than 25 kW/ft^2.

4.3.2 Tested in accordance with ASTM E84 and meeting the Class C flame spread index.

Add new standards to Chapter 7 as follows:

ASTM

E2632-13 Standard Test Method for Evaluating the Under-Deck Fire Test Response of Deck Materials

E2726 / E2726M–12a Standard Test Method for Evaluating the Fire-Test-Response of Deck Structures to Burning Brands

Reason: This proposal introduces, in new Item 4 of Section 503.2, compliance alternatives for decking materials that are consistent with current California Building Code requirements for wildfire exposure (i.e. wildland urban interface areas), and deletes the existing text of Item 1, which would be redundant with the new text.

This proposal revises the IWUIC performance requirements for decking materials to incorporate two ASTM standards specifically developed for evaluating the fire performance characteristics of exterior decking materials. These two standards have been developed from current test requirements in the California building code. ASTM work product WK12052, which will become ASTM E2632-13, is currently at the society review status of approval. ASTM E2632 is commonly described as the under-deck fire test for exterior decks. ASTM E2726 / E2726M received final approval last year, and is commonly described as the burning brand test for exterior deck walking surfaces.

ASTM E2632 was developed from California's 2010 Building Code fire test 12-7A-4 Part A, and ASTM E2726 was developed from 12-7A-4 Part B.

The criteria of 4.1 is intended to be equivalent to the compliance "path" of the 2010 California Building code for wildfire exposure in 709A.3, Item 1. This criteria of 4.1 is similar to, but more stringent than, the criteria for "testing of alternative decking materials" of the San Diego County Consolidated Fire Code in Section 26.3.6.2.1, which is for the Wildland / Urban Interface Area. (Note: Criteria 4.1 would be consistent with San Diego County requirements if 4.1.2 is revised to a Class B brand, and 4.1.3 is deleted.)

The criteria of 4.2 is consistent with the 2010 California Building Code for wildfire exposure in the Exception to 709A.3. The criteria of 4.3 is consistent with the 2010 California Building Code for wildfire exposure in 709A.3, Item 4.

Cost Impact: None

Analysis: A review of the standards proposed for inclusion in the code, ASTM E2632-13 and ASTM E2726/E2726M-12a,with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28), will be posted on the ICC website on or before April 1, 2013.

503.2-WUIC-WOESTMAN

Committee Action Hearing Results

For staff analysis of the content of ASTM E2632-13 and ASTM E2726/E2726M-12a relative to CP#28, Section 3.6, please visit: http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/ProposedStandards.pdf

Committee Action: Disapproved

Committee Reason: The committee's disapproval was based on its concern that the proposal would inappropriately lower the standards for testing of exterior deck materials.

Assembly Action: None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

John Woestman, Kellen Company, representing Composite Lumber Manufacturers Association (CLMA), requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

504.7 Appendages and projections. *Unenclosed accessory structures* attached to buildings with habitable spaces and projections, such as decks, shall be a minimum of 1-hour fire resistance-rated construction, heavy timber construction or constructed of one of the following:

1. *Approved noncombustible* materials;
2. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the *International Building Code*; or
3. Ignition-resistant building materials in accordance with Section 503.2.
4. Deck boards, stair treads, guards, and handrails complying with 4.1 and 4.2, or comply with 4.3:
   - 4.1. Material weathered in accordance with ASTM D7032 and tested in accordance with ASTM E1354. The weathering shall not decrease the time to ignition by more than 15%, and shall not increase the effective heat of combustion by more than 15%, and shall not increase the peak heat release rate by more than 15%.
   - 4.2. Material tested in accordance with ASTM E2632 / E2632M with a peak heat release rate no greater than 25 kW/ft^2 (269 kW/m^2).
   - 4.3. Material tested in accordance with ASTM E2632 / E2632M after weathering as defined by ASTM D7032 with a peak heat release rate no greater than 25 kW/ft^2 (269 kW/m^2).

505.7 Appendages and projections. *Unenclosed accessory structures* attached to buildings with habitable spaces and projections, such as decks, shall be a minimum of 1-hour fire resistance-rated construction, heavy timber construction or constructed of one of the following:

1. *Approved noncombustible* materials;
2. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the *International Building Code*; or
3. Ignition-resistant building materials in accordance with Section 503.2.
4. Deck boards, stair treads, guards, and handrails complying with 4.1 and 4.2, or complying with 4.3:
   - 4.1. Material weathered in accordance with ASTM D7032 and tested in accordance with ASTM E1354. The weathering shall not decrease the time to ignition by more than 15%, and shall not increase the effective heat of combustion by more than 15%, and shall not increase the peak heat release rate by more than 15%.
   - 4.2. Material tested in accordance with ASTM E2632 / E2632M with a peak heat release rate no greater than 25 kW/ft^2 (269 kW/m^2).
   - 4.3. Material tested in accordance with ASTM E2632 / E2632M after weathering as defined by ASTM D7032 with a peak heat release rate no greater than 25 kW/ft^2 (269 kW/m^2).

Add new standards to Chapter 7 as follows:

ASTM

ASTM E1354-13 Standard Test Method for Heat and Visible Smoke Release Rates for Materials and Products Using an Oxygen Consumption Calorimeter

ASTM E2632 / E2632M-13e1 Standard Test Method for Evaluating the Under-Deck Fire Test Response of Deck Materials

Commenter's Reason: This public comment is addressing testimony, comments, and questions received during the Committee Action Hearings (CAH) in Dallas in April, 2013.

This public comment does not modify the requirements for ignition-resistant building materials in Section 503.2. Also, this public comment moves proposed requirements to Section 504.7 (and Section 505.7) as suggested by opposition testimony at the CAH.

This public comment explicitly requires fire testing to evaluate the effects of weathering, as requested by testimony at the CAH, in criteria 4.1 and 4.3.

Additionally, the requirements of criteria 4.2 and 4.3 rely on a fire test specifically designed to test and evaluate the performance of deck components when constructed as a deck assembly in simulated WUI fire exposure (in contrast with the ASTM E84 test of Section 503.2 for ignition-resistant building materials). The test configuration and test requirements of ASTM E2632 of criteria 4.2 and 4.3 were developed specifically for deck materials in WUI applications.

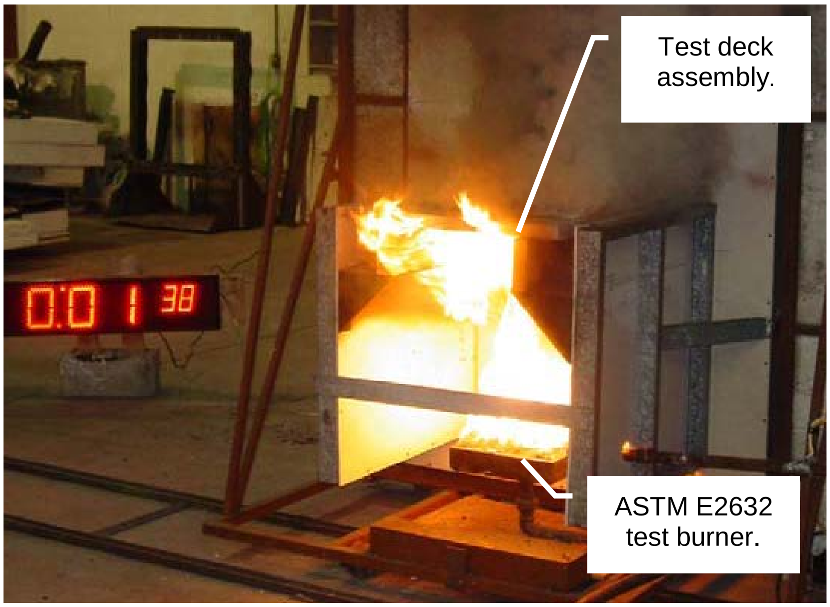
This public comment, as in the original proposal, is limited to deck boards, stair treads, guards, and handrails, and is focused on products tested to ASTM D7032. The requirements in this proposal complement existing IBC and IRC requirements, but are more rigorous than the current IBC and IRC requirements for deck boards, stair treads, guards, and handrails made of plastic composites, which are required by the IBC and the IRC to comply with ASTM D7032.

The ASTM E2632 test procedure requires constructing a small deck structure (joists and deck boards) consistent with the manufacturer's installation instructions, and this small deck structure is placed over a burner, which when ignited is designed to simulate a WUI fire occurring under the deck. The test deck structure is subject to the flame and heat from the burner for 3 minutes, and the performance of the deck structure is evaluated for the next 40 minutes.

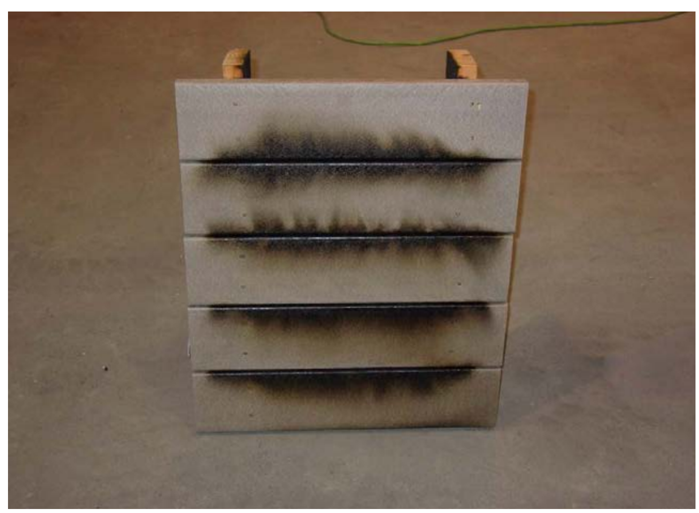
Below are pictures of the ASTM E2632 / E2632M test. Notice the configuration of this small test deck and the wall to which the deck is adjacent, simulating an actual installation of a deck attached to the structure.

Photo 1. ASTM E2632 under-deck test in progress.

The test deck assembly is subjected to the flame and heat of the burner for 3 minutes (80 kW), simulating a WUIC fire causing combustibles beneath a deck to burn.



After the 3-minutes of flame and heat from the burner, the test deck assembly is observed for 40 minutes and fire performance data is collected during this time period. This test deck assembly was stood on end after the fire test to illustrate the effects of a simulated WUI fire under the deck.



Photos courtesy Western Fire Center, Inc.

Photo 4. Test deck assembly ASTM E2632 fire test failure.
During the ASTM E2632 fire test 40-minute observation period, this test deck assembly had a peak heat release rate in excess of 25 kW/ft^2. This decking material would not meet the criteria for use in a WUI area as it exceeded the proposed maximum peak heat release rate.

Photo courtesy Fiberon,.

Analysis: ASTM D7032 is currently referenced in the IWUIC. ASTM E1354 is currently referenced in the IBC. ASTM E2632/ E2632M was submitted with the original proposal. For staff analysis of the content of ASTM E2632/ E2632M-13 relative to CP#28, Section 3.6, please visit: http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/ProposedStandards.pdf

WUIC3-13
Final Action: AS AM AMPC____ D

WUIC4-13
504.2, Chapter 7

Proposed Change as Submitted

Proponent: Marcelo M. Hirschler, GBH International (gbhint@aol.com)

Revise as follows:

504.2 Roof covering. Roofs shall have a roof assembly that complies with a Class A rating when tested in accordance with ASTM E 108 or UL 790 ~~roof assembly~~. For roof coverings where the profile allows a space between the roof covering and roof decking, the space at the eave ends shall be firestopped to preclude entry of flames or embers, or have one layer of 72-pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 installed over the combustible decking.

Add new standard to Chapter 7 as follows:

ASTM
E108-11 Standard Test Methods for Fire Tests of Roof Coverings

UL
UL 790-2004 Standard Test Methods for Fire Tests of Roof Coverings with revisions through October 2008

Reason: This is basically simple clarification, to clarify the test method for the Class A rating. It adds the same ASTM and UL standards contained in the IBC for the application.

Cost Impact: None

Analysis: The standards proposed for inclusion in the code, ASTM E108-07a and UL 790-2004, are currently referenced in the IBC. Updates in year editions will be accomplished by an administrative standards update code change to be heard by the ADM Code Development Committee.

504.2-WUIC-HIRSCHLER

Committee Action Hearing Results

For staff analysis of the content of ASTM E108.11 and UL 790-2004 relative to CP#28, Section 3.6, please visit: http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/ProposedStandards.pdf

Committee Action: **Approved as Submitted**

Committee Reason: The approval was based on the committee's judgment that the proposal provides a needed clarification of exactly what standards are to be used in determining Class A roof assemblies. The committee also agreed with testimony that indicated that the IBC uses the same standards but goes a step further by including a list of acceptable materials for code user guidance. The committee suggested that a public comment could be submitted to duplicate such a list in this section rather than relying on a search in the IBC or IRC, especially since neither code is referenced in this section.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Marcelo M Hirschler, GBH International; Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards, request Approval as Modified by this Public Comment.

Modify the proposal as follows:

504.2 Roof covering. Roofs shall have a roof assembly that complies with a Class A rating when tested in accordance with ASTM E 108 or UL 790. For roof coverings where the profile allows a space between the roof covering and roof decking, the space at the eave ends shall be firestopped to preclude entry of flames or embers, or have one layer of 72-pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 installed over the combustible decking.

<u>**Exceptions:**</u>

1. <u>Class A roof assemblies include those with coverings of brick, masonry or an exposed concrete roof deck.</u>
2. <u>Class A roof assemblies also include ferrous or copper shingles or sheets, metal sheets and shingles, clay or concrete roof tile or slate installed on noncombustible decks or ferrous, copper or metal sheets installed without a roof deck on noncombustible framing.</u>
3. <u>Class A roof assemblies include minimum 16 oz/sq. ft. (0.0416 kg/m^2) copper sheets installed over combustible decks.</u>

Add new standards to Chapter 7 as follows:

ASTM
E108-11 Standard Test Methods for Fire Tests of Roof Coverings

UL
UL 790-2004 Standard Test Methods for Fire Tests of Roof Coverings with revisions through October 2008

Commenter's Reason:
Hirschler: The exceptions shown are copied from the IBC and would comply with the committee's suggestion that they be added for consistency.

IBC reads as follows:

1505.2 Class A roof assemblies. Class A roof assemblies are those that are effective against severe fire test exposure. Class A roof assemblies and roof coverings shall be *listed* and identified as Class A by an *approved* testing agency. Class A roof assemblies shall be permitted for use in buildings or structures of all types of construction.

Exceptions:

1. Class A roof assemblies include those with coverings of brick, masonry or an exposed concrete roof deck.
2. Class A roof assemblies also include ferrous or copper shingles or sheets, metal sheets and shingles, clay or concrete roof tile or slate installed on noncombustible decks or ferrous, copper or metal sheets installed without a roof deck on noncombustible framing.
3. Class A roof assemblies include minimum 16 oz/sq. ft. (0.0416 kg/m^2) copper sheets installed over combustible decks.

Thompson: Code change WUIC4-13 placed requirements in the Wildland Urban Interface Code (WUIFC) to specify the testing requirements for Class A roof assemblies consistent with the International Building Code (IBC). During the 1st public hearing it was pointed out to the Code Development Committee that the proposal did not include the provisions for roof assemblies and covering that are exempt from the testing requirements in the exceptions to Section 1505.2. The Code Development Committee approved the original proposal and encouraged a public comment be submitted to make this section of the WUIFC consistent with the IBC for Class A roof assemblies. This proposal accomplishes that goal by adding those roof assemblies and coverings permitted by the IBC as acceptable systems to meet the Class A requirements.

WUIC4-13
Final Action: AS AM AMPC____ D

WUIC5-13
504.10

Proposed Change as Submitted

Proponent: John D. Nicholas, Perceptive Solutions LLC (john@perceptivesolutionsllc.com)

Revise as follows:

504.10 Vents. Attic ventilation openings, foundation or underfloor vents, or other ventilation openings in vertical exterior walls and vents through roofs shall not exceed 144 square inches (0.0929 m^2) each. Such vents shall be ~~covered with noncombustible corrosion-resistant mesh with openings not to exceed 1/4 inch (6.4 mm), or shall be designed~~ protected with materials or devices that prevent the passage of flame, hot gases, and embers sufficient to ignite cotton waste when tested using the Cotton Pad Test of ASTM E119 and *approved* to prevent flame, hot gases ~~or~~ and ember penetration into the structure.

Reason: This proposed code change introduces similar language used by the International Building Code®, the Residential Code®, and the International Mechanical Code® that states "…protected with materials that prevent the passage of flame and hot gases sufficient to ignite cotton waste…"

This change also provides clarity to the means to be used to determine whether a material or device meets the requirements of to prevent flame, hot gases, and ember penetration into the structure. Section 7.5 of ASTM E119 provides a specific means to employ a cotton pad test.

This proposed language addresses construction that employs a material or device to protect a vent or ventilation opening, which can be tested as a vertical or horizontal test assembly that is an interior or exterior part of the structure. As with any fire scenario, the fire exposure subjected to vented construction can vary. However, the means to determine compliance with the intent to provide protection to the structure should be a constant.

This proposed language provides a means to address variables typically seen in construction. Many times vents are located in storage rooms and other areas where combustibles are stacked. Exterior vents are often in contact with landscaping (vegetation or forestation or both). In some cases, these combustibles are just inches from the vent. When these combustibles are subject to flash over conditions a fire may instantaneously occur with immediate flame impingement upon the vent or ventilation opening. Other times the Wildland fire generates a significant amount of hot gases and embers. Both of which can cause a fire within the structure if not prevented from entering it. The use of a cotton pad test provides a means to determine whether the material or device is meeting the prevention requirements.

Cost Impact: This change will not affect the cost of construction.

Analysis: ASTM E119 is currently referenced in the IWUIC. Updates in year edition will be accomplished by an administrative standards update code change to be heard by the ADM Code Development Committee.

504.10-WUIC-NICHOLAS

Committee Action Hearing Results

For staff analysis of the content of ASTM E119-08a relative to CP#28, Section 3.6, please visit: http://www.iccsafe.org/cs/codes/Documents/2012-2014Cycle/Proposed-B/ProposedStandards.pdf

Committee Action: **Disapproved**

Committee Reason: The committee's disapproval was based on its concern that the proposal would remove the proven protection of openings provided by the current ¼-inch mesh. The proposal was also considered excessive because it would, in effect, be creating a required protection similar to a penetration protection device where there is no fire resistance rated assembly at risk.

Assembly Action: **None**

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

John D. Nicholas, Perceptive Solutions LLC, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

504.10 Vents. Attic ventilation openings, foundation or underfloor vents, or other ventilation openings in vertical exterior walls and vents through roofs shall not exceed 144 square inches (0.0929 m^2) each. Such vents shall be covered with noncombustible corrosion-resistant mesh with openings not to exceed 1/4 inch (6.4 mm), or shall be designed and *approved* to prevent flame or ember penetration into the structure. <u>Flame penetration shall be determined using a standardized cotton pad test intended to detect flame and ensure the integrity of the vent, which is designed and *approved* for preventing flame penetration into the structure.</u>

Commenter's Reason: This change provides a standardized test that has been used for over 50 years (also referred internationally as an integrity test, flame test or ignition test). This simple test is used to detect flame and is referenced in many American National standards (ANSI), ASTM International standards, NFPA standards, and UL standards. This is a very simple cost-effective method to provide an enforcement provision for the 504.10 requirement and increase life safety.

The modifications submitted to this proposal are also intended to address the Committee's opinion related to 1/4-inch mesh as a proven method that prevents flame penetration into the structure. Erroneous re-rebuttal testimony misled also the Committee by calling the cotton pad test a fire resistance test used for building materials and penetration protection devices. The cotton pad test (described below) is no more of a fire resistance test than is the hose stream (water) test cited in ASTM E119. This clarification and modification submitted clearly resolves both of these Committee comments.

One of the many test methods citing the standardized cotton pad, which tests the vent's integrity to prevent flame penetration, is described in ASTM E2912.

1. ASTM E2912 provides an Integrity Test to assess whether a venting device prevents flame penetration. This test method defines integrity as "the ability of a test assembly, when exposed to fire from one side, to prevent the passage of flame or hot gases through it or the occurrence of flames on its unexposed side."
2. ASTM E2912 is not a fire resistance test: there is no fire resistance rating created or furnace time-temperature curve used. Rather, this test method is a fire performance test based on flame impingement used to assess a "venting device used as part of vented construction intended to resist the transfer of hot gas, radiation, and flame."
3. This test method is used to assess flame penetration through a "…building element or construction feature (such as a floor, wall, roof, ceiling, joint, door or wall cavity, crawl space, air gap, etc.) that includes an opening(s) used for venting…"that is referred to as "vented construction".
4. ASTM E2912 provides fire performance information about both interior and exterior vents that "are subject to a sudden direct flame impingement".
5. ASTM E2912 was under development for over four years and received a 100% affirmative vote (no editorial changes were even required) of ASTM Committee E05 on Fire, which is extremely rare for a new ASTM Committee E05 fire standard. This test method is also an American National Standard.

The following is an excerpt from the ASTM E2912 example cited above that describes the cotton pad test used to determine a venting device's integrity:

"11. Integrity Test

11.1 Record any flames on the unexposed side of the test specimen including the flame's location and duration.

11.2 Record flaming and ignition of cotton pad by hot gases or radiation, or both, throughout the test's duration. Record the time when ignition of the cotton pad occurs.

11.2.1 Use the materials and devices described in Annex A1 Cotton Pad Test Materials and Equipment.

11.2.2 Follow the Ignition Test Procedure in Annex A2.

11.2.3When no ignition (defined in A2.4) of the cotton pad occurs during the 30-s application, make screening tests that involve short duration application of the cotton pad over and around such areas. Charring of the pad provides only an indication of imminent failure. Employ an unused cotton pad to confirm an integrity failure.

11.3 When possible, photograph the test specimen when any flames occur on its unexposed side or when the cotton pad ignites, or both. Otherwise, refer to the video recording for this information.

ANNEX
(Mandatory Information)

A1. COTTON PAD TEST MATERIALS AND EQUIPMENT

A1.1 Where required by the conditions of acceptance in other sections of this standard to determine that the test specimen has not allowed the passage of gases or radiation hot enough to ignite a cotton pad, the cotton pad test shall be conducted in accordance with A2 during the fire-resistance test whenever a crack, hole, opened joint, or other similar void or defect through which hot gases are capable of passing is observed in the unexposed surface of the test specimen.

A1.2 The cotton pad test shall be conducted using a cotton pad as described in A1.3 and A1.4 in a wire frame provided with a handle as described in A1.5.

A1.3 The cotton pad shall comply with the physical characteristics described in A1.3.1 through A1.3.3.

A1.3.1 The cotton pad shall be nominally 4 by 4 in. (100 by 100 mm) by 0.75 in. (19 mm) thick.

A1.3.2 The cotton pad shall consist of new, undyed, soft cotton fibers, without any admixture of artificial fibers.

A1.3.3 The cotton pad shall weigh 0.12 ± 0.02 oz (3.5 ± 0.5 g).

A1.4 The cotton pad shall be conditioned prior to the test by drying in an oven at 212 ± 9°F (100 ± 5°C) for a period of not less than 30 min. Immediately upon removal from the drying oven, the cotton pad shall be stored in a desiccator for a period of not less than 24 h prior to the fire-resistance test.

A1.5 The frame used to hold the cotton pad for the purpose of the cotton waste test shall be constructed using No. 16 AWG (0.05 in.) (1.3 mm) steel wire which has been fastened to a handle that has a length that reaches all points on the unexposed surface of the test specimen. See Fig. A1.

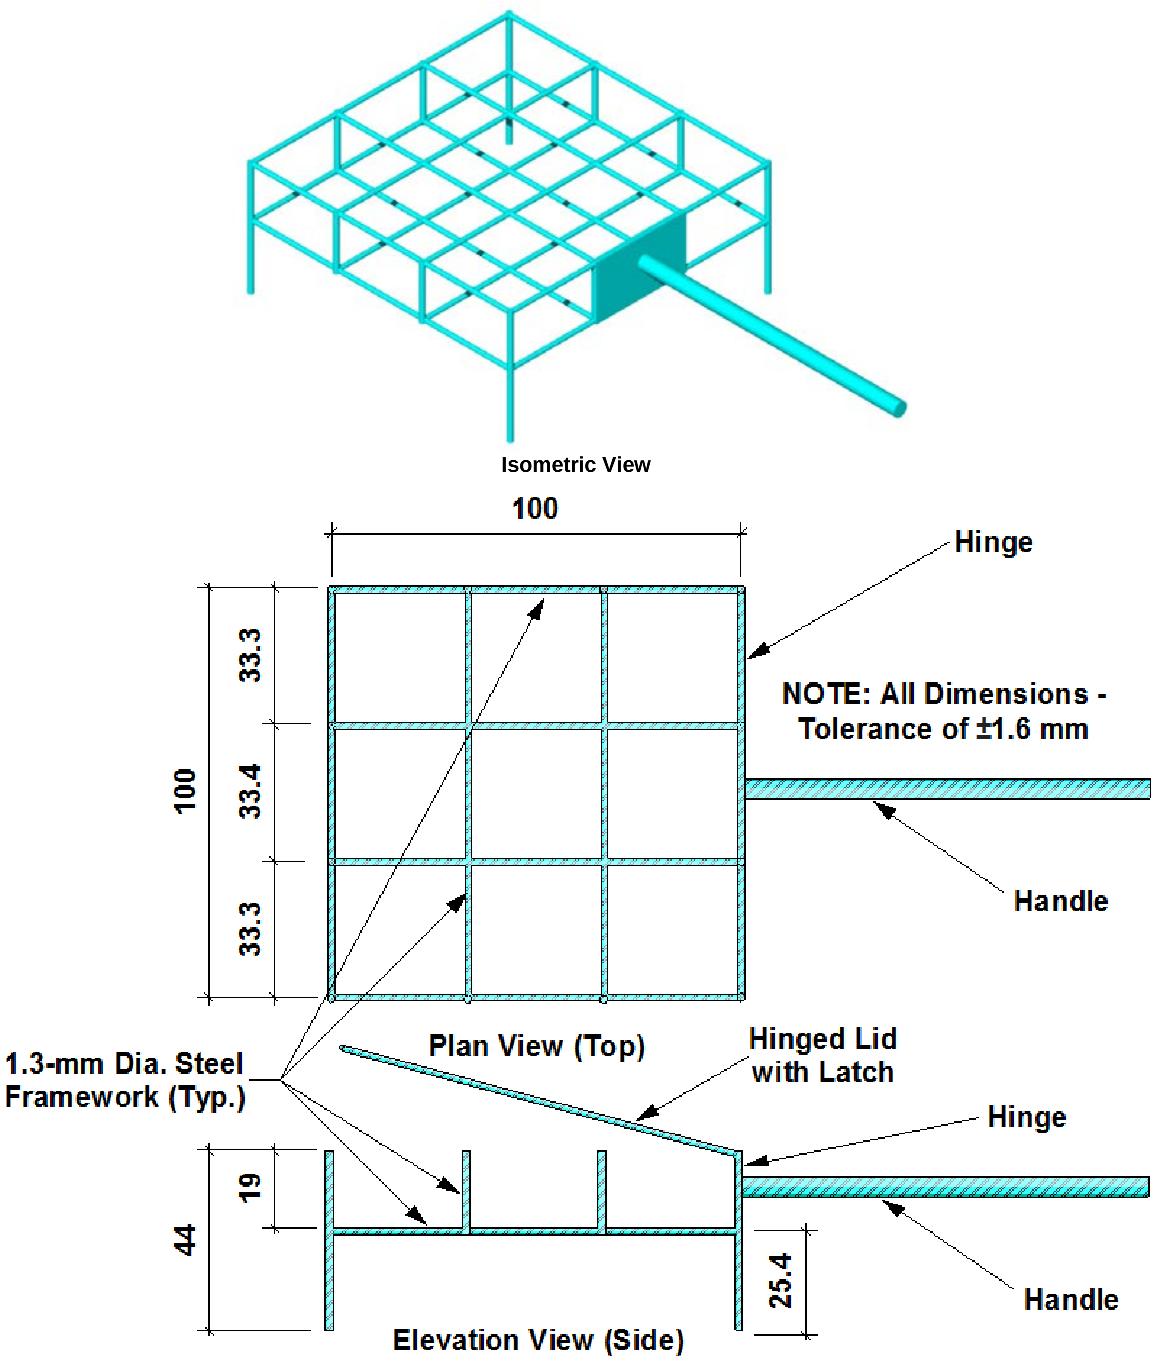


Fig. A1 Typical Cotton Pad Holder

A2. IGNITION TEST PROCEDURE

A2.1 Conduct the cotton pad test using an unused cotton pad.
A2.2 Position the cotton pad directly over the observed crack, hole, opened joint, or other similar void or defect in the unexposed surface of the test specimen, approximately 1 ± 1⁄8 in. (25 ± 3 mm) from the surface, for a period of 30 ± 1 s or until ignition of the cotton pad, whichever occurs first.
A2.3 All test locations previously tested in accordance with A2.2 shall be retested as close as practical to the end of the desired fire-resistance period. An unused cotton pad shall be positioned over each previously tested location on the unexposed surface of the test specimen.
A2.4 Ignition of the cotton pad shall be defined as glowing, flaming or smoldering of the cotton pad. Charring of the cotton pad shall not be an indication of ignition.
A2.5 If ignition of the cotton pad occurs, record the time at which ignition occurs, and report the description of the crack, hole, opened joint, or other similar void or defect and the location where it occurs.

Public Comment 2:

Eivind Elnan, Ax Innovasjon AS, requests Approval as Modified by this Public Comment.

Replace the proposal as follows:

504.10 Vents. Attic ventilation openings, foundation or underfloor vents, or other ventilation openings in vertical exterior walls and vents through roofs shall not exceed 144 square inches (0.0929 m^2) each. Such vents shall be covered with noncombustible corrosion-resistant mesh with openings not to exceed ~~1/4~~ 1/8 inch (~~6.4~~ 3.2 mm), or shall be designed and approved to prevent flame or ember penetration into the structure.

Commenter's Reason: This change is proposed as continuity between wildfire codes to improve life safety and reduce property damage. The change from "1/4 inch (6.4 mm)" to "1/8-inch (3.2mm)" is based on the 2010 California Building Code (CBC), Title 24, Part 2 (First Printing), Includes Errata Supplement through July 1, 2012 under Chapter 7A - Materials and Construction Methods for Exterior Wildfire Exposure. This change is presented even though there are other more restrictive requirements for wildfire protection cited based on wildfire experience worldwide and ember penetration testing, such as in Australia that allows a maximum of 2mm openings or NIST documents that suggest approximately 1mm openings are far greater ember penetration protection than the "¼-inch mesh".

CBC SECTION 706A VENTS states, "706A.1 General. Where provided, ventilation openings for enclosed attics, enclosed eave soffit spaces, enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters, and underfloor ventilation shall be in accordance with Section 1203 and Sections 706A.1 through 706A.3 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings.

706A.2 Requirements. Ventilation openings for enclosed attics, enclosed eave soffit spaces, enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters, and underfloor ventilation openings shall be fully covered with metal wire mesh, vents, other materials or other devices that meet the following requirements:

1. The dimensions of the openings therein shall be a minimum of 1/16-inch (1.6 mm) and shall not exceed 1/8-inch (3.2mm).
2. The materials used shall be noncombustible.

   Exception: Vents located under the roof covering, along the ridge of roofs, with the exposed surface of the vent covered by noncombustible wire mesh, may be of combustible materials.

3. The materials used shall be corrosion resistant."

WUIC5-13

Final Action: AS AM AMPC____ D
